New Findings from University of Vale do Paraiba in the Area of Cheilitis Described (Optical diagnosis of actinic cheilitis by infrared spectroscopy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Mouth Diseases and Conditions - Cheilitis. According to news reporting originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "Actinic cheilitis (AC) is considered a potentially malignant disorder of the lip. Biomolecular markers study is important to understand malignant transformation into squamous cell carcinoma."

Financial supporters for this research include Brazilian agencies FAPESP, CAPES, CNPq.

Our news editors obtained a quote from the research from the University of Vale do Paraiba, "Fourier transform infra red (FT-IR) spectroscopy was used to analyze AC in this study. The aim of the study was to evaluate if FT-IR spectral regions of nucleic acids and collagen can help in early diagnosis of malignant transformation. Tissues biopsies of 14 patients diagnosed with AC and 14 normal tissues were obtained. FTIR spectra were measured at five different
points resulting in 70 spectra of each. Analysis of Principal components analysis (PCA) and linear discrimination analysis (LDA) model were also used. In order to verify the statistical difference in the spectra, Mann-Whitney U test was performed in each variable (wavenumber) with p-value <0.05. After the Mann-Whitney U test the vibrational modes of CO (Collagen 1), PO2 (Nucleic Acids) and C=0 asymmetric (Triglycerides/Lipids) were observed as a possible spectral biomarker. These bands were chosen because they represent the vibrational modes related to collagen and DNA, which are supposed to be changed in AC samples. Based on the PCA-LDA results, the predictive model corresponding to the area under the curve was 0.91 for the fingerprint region and 0.83 for the high wavenumber region, showing the greater accuracy of the test."

According to the news editors, the research concluded: "FT-IR changes in collagen and nucelic acids could be used as molecular biomarkers for malignant transformation."

For more information on this research see: Optical diagnosis of actinic cheilitis by infrared spectroscopy. Photodiagnosis and Photodynamic Therapy, 2016;16():27-34. Photodiagnosis and Photodynamic Therapy can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Heart Disorders and Diseases - Heart Failure

New Findings from University of Washington Update Understanding of Heart Failure [Loss of beta-adrenergic-stimulated phosphorylation of Ca(V)1.2 channels on Ser1700 leads to heart failure]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Failure. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "L-type Ca2+ currents conducted by voltage-gated calcium channel 1.2 (Ca(V) 1.2) initiate excitation-contraction coupling in the heart, and altered expression of Ca(V)1.2 causes heart failure in mice. Here we show unexpectedly that reducing beta-adrenergic regulation of Ca(V)1.2 channels by mutation of a single PKA site, Ser1700, in the proximal C-terminal domain causes reduced contractile function, cardiac hypertrophy, and heart failure without changes in expression, localization, or function of the Ca(V)1.2 protein in the mutant mice (SA mice)."
Our news journalists obtained a quote from the research from the University of Washington, "These deficits were aggravated with aging. Dual mutation of Ser1700 and a nearby casein-kinase II site (Thr1704) caused accelerated hypertrophy, heart failure, and death in mice with these mutations (STAA mice). Cardiac hypertrophy was increased by voluntary exercise and by persistent beta-adrenergic stimulation. PKA expression was increased, and PKA sites Ser2808 in ryanodine receptor type-2, Ser16 in phospholamban, and Ser23/24 in troponin-I were hyperphosphorylated in SA mice, whereas phosphorylation of substrates for calcium/calmodulin-dependent protein kinase II was unchanged. The Ca2+ pool in the sarcoplasmic reticulum was increased, the activity of calcineurin was elevated, and calcineurin inhibitors improved contractility and ameliorated cardiac hypertrophy. Cardio-specific expression of the SA mutation also caused reduced contractility and hypertrophy. These results suggest engagement of compensatory mechanisms, which initially may enhance the contractility of individual myocytes but eventually contribute to an increased sensitivity to cardiovascular stress and to heart failure in vivo."

According to the news editors, the research concluded: "Our results demonstrate that normal regulation of Ca(V)1.2 channels by phosphorylation of Ser1700 in cardiomyocytes is required for cardiovascular homeostasis and normal physiological regulation in vivo.”

For more information on this research see: *Loss of beta-adrenergic-stimulated phosphorylation of Ca(V)1.2 channels on Ser1700 leads to heart failure*. Proceedings of the National Academy of Sciences of the United States of America, 2016;113(49):E7976-E7985.

New Findings from University of Washington in the Area of Dyspnea

**New Findings from University of Washington in the Area of Dyspnea Reported (Emergent radiation therapy as definite airway management for dyspnea with mediastinal mass)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Respiratory Tract Diseases and Conditions - Dyspnea is the subject of a report. According to news reporting originating from Seattle, Washington, by NewsRx correspondents, research stated, "A previously healthy 21-year-old woman presented with an a large mediastinal mass in respiratory distress, maximally extracting oxygen by arterial venous blood gas differential, but without hypoxia or airway obstruction in the upright posture with supplemental oxygen. Computed tomographic scan showed near total compression..."
of long sections of her primary bronchi bilaterally."

Our news editors obtained a quote from the research from the University of Washington, "The patient was not intubated secondary to high risk to total airway occlusion. As the computed tomography suggested lymphoma as the most likely etiology of the mass, she was started on steroids and transferred for emergent radiation."

According to the news editors, the research concluded: "She remained in intensive care for with daily treatments, avoiding intubation, and was discharged 17 days later markedly improved."

The news editors report that additional information may be obtained by contacting E.M. Dorn, University of Washington, Dept. of Emergency Med, Harborview Med Center, Seattle, WA 98104, United States.

Keywords for this news article include: Seattle, Washington, United States, North and Central America, Respiratory Tract Diseases and Conditions, Respiration Disorders, Drugs and Therapies, Radiation Therapy, Dyspnea, University of Washington.

**Liver Diseases and Conditions - Hepatitis C Virus**

**New Findings from University of Washington in the Area of Hepatitis C Virus Reported (Hepatitis-C-virus-induced microRNAs dampen interferon-mediated antiviral signaling)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Hepatitis C Virus have been published. According to news reporting originating in Seattle, Washington, by NewsRx journalists, research stated, "Hepatitis C virus (HCV) infects 200 million people globally, and 60-80% of cases persist as a chronic infection that will progress to cirrhosis and liver cancer in 2-10% of patients(1-3). We recently demonstrated that HCV induces aberrant expression of two host microRNAs (miRNAs), miR-208b and miR-499a-5p, encoded by myosin genes in infected hepatocytes(4)."

The news reporters obtained a quote from the research from the University of Washington, "These miRNAs, along with AU-rich-element-mediated decay, suppress IFNL2 and IFNL3, members of the type III interferon (IFN) gene family, to support viral persistence. In this study, we show that miR-208b and miR-499a-5p also dampen type I IFN signaling in HCV-infected hepatocytes by directly down-regulating expression of the type I IFN receptor chain, IFNAR1. Inhibition of these miRNAs by using miRNA inhibitors during HCV infection increased expression of IFNAR1. Additionally, inhibition rescued the antiviral response to exogenous type I IFN, as measured by a marked increase in IFN-stimulated genes and a decrease in HCV load. Treatment of HCV-infected hepatocytes with type I IFN increased expression of myosins over HCV infection alone."
According to the news reporters, the research concluded: "Since these miRNAs can suppress type III IFN family members, these data collectively define a novel cross-regulation between type I and III IFNs during HCV infection."

For more information on this research see: Hepatitis-C-virus-induced microRNAs dampen interferon-mediated antiviral signaling. Nature Medicine, 2016;22(12):1475-1481,151. Transfusion Medicine - Blood Transfusion

New Findings from University of Western Australia in the Area of Blood Transfusion Reported (The potential for nanotechnology to improve delivery of therapy to the acute ischemic heart)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Transfusion Medicine - Blood Transfusion are presented in a new report. According to news reporting originating in Crawley, Australia, by NewsRx journalists, research stated, "Treatment of acute cardiac ischemia remains an area in which there are opportunities for therapeutic improvement. Despite significant advances, many patients still progress to cardiac hypertrophy and heart failure."

The news reporters obtained a quote from the research from the University of Western Australia, "Timely reperfusion is critical in rescuing vulnerable ischemic tissue and is directly related to patient outcome, but reperfusion of the ischemic myocardium also contributes to damage. Overproduction of reactive oxygen species, initiation of an inflammatory response and deregulation of calcium homeostasis all contribute to injury, and difficulties in delivering a sufficient quantity of drug to the affected tissue in a controlled manner is a limitation of current therapies. Nanotechnology may offer significant improvements in this respect."

According to the news reporters, the research concluded: "Here, we review recent examples of how nanoparticles can be used to improve delivery to the ischemic myocardium, and suggest some approaches that may lead to improved therapies for acute cardiac ischemia."

For more information on this research see: The potential for nanotechnology to

Our news correspondents report that additional information may be obtained by contacting C.W. Evans, School of Chemistry & Biochemistry, The University of Western Australia, 35 Stirling Hwy, Crawley, WA 6009, Australia. Additional authors for this research include K.S. Iyer and L.C Hool.

Drugs and Therapies - Toxicology and Pharmacology

New Findings from University of Wurzburg in the Area of Toxicology and Pharmacology Described (A quantitative weight of evidence methodology for the assessment of reproductive and developmental toxicity and its application for classification ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Toxicology and Pharmacology are presented in a new report. According to news reporting from Wurzburg, Germany, by NewsRx journalists, research stated, "Hazard assessment of chemicals usually applies narrative assessments with a number of weaknesses. Therefore, application of weight of evidence (WoE) approaches are often mandated but guidance to perform a WoE assessment is lacking."

The news correspondents obtained a quote from the research from the University of Wurzburg, "This manuscript describes a quantitative WoE (QWoE) assessment for reproductive toxicity data and its application for classification and labeling (C&L). Because C&L criteria are based on animal studies, the scope is restricted to animal toxicity data. The QWoE methodology utilizes numerical scoring sheets to assess reliability of a publication and the toxicological relevance of reported effects. Scores are given for fourteen quality aspects, best practice receives the highest score. The relevance/effects scores (0 to four) are adjusted to the key elements of the toxic response for the endpoint and include weighting factors for effects on different levels of the biological organization. The relevance/effects scores are then assessed against the criteria dose-response, magnitude and persistence of effects, consistency of observations with the hypothesis, and relation of effects to human disease. The quality/reliability scores and the relevance/effect scores are then multiplied to give a numerical strength of evidence for adverse effects."

According to the news reporters, the research concluded: "This total score is then used to assign the chemical to the different classes employed in classification.

For more information on this research see: A quantitative weight of evidence methodology for the assessment of reproductive and developmental toxicity and its application for classification and labeling of chemicals. Regulatory Toxicology and Pharmacology,
New Findings from University of Ziekenhuis Update Understanding of Angiology (Anomalous right coronary artery in a middle-aged patient A case report and review of the literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Angiology is the subject of a report. According to news reporting originating in Jette, Belgium, by NewsRx journalists, research stated, "An anomalous right coronary artery originating from the left sinus of Valsalva is a rare, but often incidental, finding in middle-aged to elderly people. Prevalence is difficult to define, as well as determining potential harmful hemodynamic consequences."

The news reporters obtained a quote from the research from the University of Ziekenhuis, "Moreover, the optimal treatment remains debatable. Case summary: The authors present a case of a middle-aged patient diagnosed with an anomalous right coronary artery causing ischemia, who was treated surgically. By reviewing literature, the authors conclude that choice of treatment depends on age, symptoms, and certain anatomic features of this anomaly."

According to the news reporters, the research concluded: "However, there are no randomized trials available in this field."

For more information on this research see: Anomalous right coronary artery in a middle-aged patient A case report and review of the literature. Medicine, 2016;95(49):247-251. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Our news correspondents report that additional information may be obtained by contacting L. Rosseel, Univ Ziekenhuis Brussel, Dept. of Cardiol, B-1090 Jette, Belgium. Additional authors for this research include H. Bonnier and J. Sonck.

New Findings from V. Catalan et al Broadens Understanding of Type 2 Diabetes (Increased Interleukin-32 Levels in Obesity Promote Adipose Tissue Inflammation and Extracellular Matrix Remodeling: Effect of Weight Loss)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news originating from Pamplona, Spain, by NewsRx correspondents, research stated, "Interleukin (IL)-32 is a recently described cytokine involved in the regulation of inflammation. We aimed to explore whether IL-32 could function as an inflammatory and angiogenic factor in human obesity and obesity-associated type 2 diabetes."

Funders for this research include Fondo de Investigacion Sanitaria-Fondo Europeo de Desarrollo Regional, Fundacion Caja Navarra.

Our news journalists obtained a quote from the research, "Samples obtained from 90 subjects were used in the study. Obese patients exhibited higher expression levels of IL-32 in visceral adipose tissue (AT) as well as in subcutaneous AT and peripheral blood mononuclear cells. IL32 was mainly expressed by stromovascular fraction cells, and its expression was significantly enhanced by inflammatory stimuli and hypoxia, whereas no changes were found after the incubation with anti-inflammatory cytokines. The addition of exogenous IL-32 induced the expression of inflammation and extracellular matrix-related genes in human adipocyte cultures, and IL32-silenced adipocytes showed a downregulation of inflammatory genes. Furthermore, adipocyte-conditioned media obtained from obese patients increased IL32 gene expression in human monocyte cultures, whereas the adipocyte-conditioned media from lean volunteers had no effect on IL32 mRNA levels."

According to the news editors, the research concluded: "These findings provide evidence, for the first time, about the inflammatory and remodeling properties of IL-32 in AT, implicating this cytokine in obesity-associated comorbidities."

The news correspondents report that additional information may be obtained from V. Catalan, IdiSNA, Inst Invest Sanitaria Navarra, Obes & Adipobiol Grp, Pamplona, Spain. Additional authors for this research include J. Gomez-Ambrosi, A. Rodriguez, B. Ramirez, V. Valenti, R. Moncada, M.F. Landecho, C. Silva, J. Salvador and G. Fruhbeck.

New Findings from V.J. Savage and Co-Authors Describe Advances in Neisseria gonorrhoeae (Efficacy of a Novel Tricyclic Topoisomerase Inhibitor in a Murine Model of Neisseria gonorrhoeae Infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Neisseria gonorrhoeae are discussed in a new report. According to news reporting out of Cheshire, United Kingdom, by NewsRx editors, research stated, "There is an urgent need for new antibiotics to treat multidrug-resistant Neisseria gonorrhoeae."

Our news journalists obtained a quote from the research, "In this report, the microbiology, in vivo pharmacokinetics, and efficacy of REDX05931, a representative novel tricyclic topoisomerase inhibitor, were evaluated. REDX05931 demonstrated high oral bioavailability in mice and reduced N. gonorrhoeae infection after a single dose in a mouse model of gonorrhea."

According to the news editors, the research concluded: "These data support the potential of this series of small molecules as a new treatment for drug-resistant gonorrheal infections."

For more information on this research see: Efficacy of a Novel Tricyclic Topoisomerase Inhibitor in a Murine Model of Neisseria gonorrhoeae Infection. Antimicrobial Agents and Chemotherapy, 2016;60(9):5592-5594. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. New Findings from Vanderbilt University Describe Advances in Venous Thrombosis (Elevated D-Dimer Is Not Predictive of Symptomatic Deep Venous Thrombosis After Total Joint Arthroplasty)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Venous Thrombosis. According to news reporting originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "Serum D-dimer is a common screening test for symptomatic deep venous thrombosis (DVT) after total joint arthroplasty. This study characterized the longitudinal resolution of D-dimer measurements after total hip and knee arthroplasty (THA/TKA) over a 6-week period."

Our news editors obtained a quote from the research from Vanderbilt University, "The authors hypothesized that serum D-dimer would not return to baseline or be below the institutional threshold for a positive test at 6 weeks after uncomplicated total joint arthroplasty, suggesting that quantitative D-dimer has limited clinical utility for postoperative DVT screening. An institutional review board-approved retrospective cohort study was conducted with consecutive patients between January 2013 and June 2015. A total of 177 adult patients aged 40-88 years who underwent a primary hip or knee arthroplasty with a Charlson Comorbidity Index <3 were included in the study. Serum D-dimer was measured at preoperative, perioperative, and postoperative 2- and 6-week time points. D-dimer measurements peaked 2 weeks postoperatively for both TKA and THA. At the 6-week time point, the peak serum D-dimer measurement resolved by 54.3% and 76.6% for TKA and THA, respectively. At 6 weeks after operation, 92% of THA patient and 100% of TKA patients had serum D-dimer measurements higher than the institutional threshold (0.40 µg/mL) for a 'positive' quantitative test. No symptomatic DVTs were reported for the THA and TKA cohorts during the study period. The results suggest that serum D-dimer is an ineffective screening test for the diagnosis of symptomatic DVT in the acute postoperative period."

According to the news editors, the research concluded: "The authors propose that extravascular fibrinolysis, a process essential for wound healing, has a crucial role in the prolonged elevation of serum D-dimer in the postoperative period."

The news editors report that additional information may be obtained by contacting J.G. Schoenecker, Vanderbilt University, Dept. of Pharmacol, Nashville, TN, United States. Additional authors for this research include S.M. Engstrom, W.K. Oelsner, M.A. Benvenuti, G.G. Polkowski and J.G. Schoenecker.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.arth.2016.02.059. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Head and Neck Cancer

New Findings from Vanderbilt University in the Area of Head and Neck Cancer Described (Perceived Symptom Experience in Head and Neck Cancer Patients with Lymphedema)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Head and Neck Cancer. According to news reporting out of Nashville, Tennessee, by NewsRx editors, research stated, "Lymphedema frequently develops as a long-term effect from cancer and/or its treatment, including head and neck cancer (HNC). There is a substantial lack of understanding regarding the symptoms and experiences related to head and neck lymphedema."

Our news journalists obtained a quote from the research from Vanderbilt University, "The objective of this study was to explore HNC patients' experiences of lymphedema, with emphasis on physical findings and associated symptom burden. This was a qualitative, descriptive study. A purposive sample of 20 HNC patients who completed lymphedema therapy participated in semistructured, face-to-face interviews. Thematic content analysis was utilized to assess data. Participants delineated the time when lymphedema onset presented and the sites of involvement. Most participants first noticed external or internal lymphedema/swelling within three months following either surgery or radiation therapy. Participants described a broad array of concurrent symptoms and functional deficits, including altered sensations, altered functions, neck-shoulder musculoskeletal/skin impairments, and psychosocial symptoms. HNC patients experienced multiple physical and psychosocial symptoms during the time they experienced lymphedema."

According to the news editors, the research concluded: "Clinicians need to inquire about tissue swelling and associated symptoms early in the post-treatment period to initiate lymphedema management strategies in a timely manner and facilitate reduction of long-term symptom burden and functional deficits."

Our news journalists report that additional information may be obtained by contacting J. Deng, Vanderbilt University, Sch Nursing, Nashville, TN 37240, United States. Additional authors for this research include S. Ridner, R. Rothman, B. Murphy, K. Sherman, L. Moore, K. Hall and B. Weiner.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1089/jpm.2016.0174. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings from Veterans Affairs Medical Center in the Area of Antibiotics Reported (Clinical Utility of On-Demand Multiplex Respiratory Pathogen Testing among Adult Outpatients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antibiotics have been published. According to news reporting from West Haven, Connecticut, by NewsRx journalists, research stated, "Multiplex tests for respiratory tract infections include up to 20 targets for common pathogens, predominantly viruses. A specific therapeutic intervention is available for individuals testing positive for influenza viruses (oseltamivir), and it is potentially beneficial to identify non-influenza viruses to avoid unnecessary antibiotic use."

The news correspondents obtained a quote from the research from Veterans Affairs Medical Center, "We evaluated antimicrobial prescriptions following respiratory pathogen testing among outpatients at a large Veterans Administration (VA) medical center. Results of the Film-Array respiratory panel (BioFire, Salt Lake City, UT) from 15 December 2014 to 15 April 2015 were evaluated among 408 outpatients, and patient medical records were reviewed. Differences in antibiotic and oseltamivir prescription rates were analyzed. Among 408 patients tested in outpatient centers (emergency departments, urgent care clinics, and outpatient clinics), 295 (72.3%) were managed as outpatients. Among these 295 outpatients, 105 (35.6%) tested positive for influenza virus, 109 (36.9%) tested positive for a non-influenza virus pathogen, and 81 (27.5%) had no respiratory pathogen detected. Rates of oseltamivir and antibiotic prescriptions were significantly different among the three test groups (chi-squared values of 167.6 [P < 0.0001] and 10.48 [P = 0.005], respectively), but there was no significant difference in antibiotic prescription rates between the non-influenza virus pathogen group and those who tested negative (chi-square value, 0; P = 1.0). Among adult outpatients, testing positive for influenza virus was associated with receiving fewer antibiotic prescriptions, but no such effect was seen for those who tested positive for a non-influenza virus."

According to the news reporters, the research concluded: "These data suggest that testing for influenza viruses alone may be sufficient and more cost-effective than multiplex pathogen testing for outpatients."

For more information on this research see: Clinical Utility of On-Demand Multiplex Respiratory Pathogen Testing among Adult Outpatients. *Journal of Clinical Microbiology*, 2016;54(12):2950-2955. *Journal of Clinical Microbiology* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

Our news journalists report that additional information may be obtained by contacting D.R. Peaper, West Haven Vet Adm Hosp, Pathol & Lab Med Serv, West Haven, CT 06516, United States. Additional authors for this research include L. Hitoaliaj, B. Kotansky, S.M. Campbell and D.R. Peaper.

New Findings from Veterans Affairs Medical Center in the Area of Hypertension Described (Targeting cytokine signaling in salt-sensitive hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Hypertension are discussed in a new report. According to news reporting out of Durham, North Carolina, by NewsRx editors, research stated, "Activated immune cell populations contribute to hypertension in part through inciting damage to the kidney and by provoking inappropriate sodium reabsorption in the nephron. Inflammatory mediators called cytokines produced by T lymphocytes and macrophages act on specific sodium transporters in the kidney, augmenting their activity or expression, with consequent expansion of intravascular fluid volume and cardiac output."

Our news journalists obtained a quote from the research from Veterans Affairs Medical Center, "The overlapping functions of these cytokines, each of which may activate multiple receptors, present challenges in precisely targeting inflammatory signaling cascades in hypertension. Moreover, broad immune suppression could expose the hypertensive patient to disproportional risks of infection or malignancy."

According to the news editors, the research concluded: "Nevertheless, the possibility that incisive immunomodulatory therapies could provide cardiovascular and renal protection through both blood pressure-dependent and - independent mechanisms justifies comprehensive investigation into the relevant signaling pathways and tissue sites in which inflammatory cytokines function to exaggerate blood pressure elevation and target organ damage in hypertension."

Our news journalists report that additional information may be obtained by contacting S.D. Crowley, Durham Vet Affairs Med Center, Durham, NC, United States.

Keywords for this news article include: Durham, North Carolina, United States, North and Central America, Intercellular Signaling Peptides and Proteins, Cardiovascular Diseases and Conditions, Blood Pressure, Hemodynamics, Hypertension, Cytokines, Veterans Affairs Medical Center.

New Findings from Vrije University in the Area of Human Genetics
Described (The Genetic Overlap Between Hair and Eye Color)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genetics - Human Genetics have been published. According to news reporting originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "We identified the genetic variants for eye color by Genome-Wide Association Study (GWAS) in a Dutch Caucasian family-based population sample and examined the genetic correlation between hair and eye color using data from unrelated participants from the Netherlands Twin Register. With the Genome-wide Complex Trait Analysis software package, we found strong genetic correlations between various combinations of hair and eye colors."

Our news editors obtained a quote from the research from Vrije University, "The strongest positive correlations were found for blue eyes with blond hair (0.87) and brown eyes with dark hair (0.71), whereas blue eyes with dark hair and brown eyes with blond hair showed the strongest negative correlations (-0.64 and -0.94, respectively). Red hair with green/hazel eyes showed the weakest correlation (-0.14). All analyses were corrected for age and sex, and we explored the effects of correcting for principal components (PCs) that represent ancestry and describe the genetic stratification of the Netherlands. When including the first three PCs as covariates, the genetic correlations between the phenotypes disappeared. This is not unexpected since hair and eye colors strongly indicate the ancestry of an individual."

According to the news editors, the research concluded: "This makes it difficult to separate the effects of population stratification and the true genetic effects of variants on these particular phenotypes."

For more information on this research see: The Genetic Overlap Between Hair and Eye Color. Twin Research and Human Genetics, 2016;19(6):595-599. Twin Research and Human Genetics can be contacted at: Cambridge Univ Press, 32 Avenue Of The Americas, New York, NY 10013-2473, USA. New Findings from Washington University Update Understanding of Antimalarial Agents (Whole-Genome Sequencing to Evaluate the Resistance Landscape Following Antimalarial Treatment Failure With Fosmidomycin-Clindamycin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antimalarial Agents have been published. According to news reporting originating in St. Louis, Missouri, by NewsRx journalists, research stated, "Novel antimalarial therapies are needed in the face of emerging resistance to artemisinin combination therapies. A previous study found a high cure rate in Mozambican children with uncomplicated Plasmodium falciparum malaria 7 days after combination treatment with fosmidomycin-clindamycin."

Funders for this research include Children's Discovery Institute of Washington University and St. Louis Children's Hospital, National Institute of Allergy and Infectious Diseases, National Institutes of Health, The March of Dimes, National Institute of General Medical Sciences, Washington University Monsanto Excellence Fund, National Cancer Institute, National Institutes of Health National Center for Research Resources, NIH Roadmap for Medical Research.

The news reporters obtained a quote from the research from Washington University, "However, 28-day cure rates were low (45.9%), owing to parasite recrudescence. We sought to identify any genetic changes underlying parasite recrudescence. To this end, we used a selective whole-genome amplification method to amplify parasite genomes from blood spot DNA samples. Parasite genomes from pretreatment and postrecrudescence samples were subjected to whole-genome sequencing to identify nucleotide variants. Our data did not support the existence of a genetic change responsible for recrudescence following fosmidomycin-clindamycin treatment. Additionally, we found that previously described resistance alleles for these drugs do not represent biomarkers of recrudescence."

According to the news reporters, the research concluded: "Future studies should continue to optimize fosmidomycin combinations for use as antimalarial therapies."

Our news correspondents report that additional information may be obtained by contacting A.R. Odom, Washington University, Sch Med, Dept. of Mol Microbiol, St Louis, MO 63110, United States. Additional authors for this research include S.A. Sundararaman, M. Lanaspa, C. Moraleda, R. Gonzalez, A. Mayor, P. Cistero, D. Hutchinson, P.G. Kremsner, B.H. Hahn, Q. Bassat and A.R. Odom.

New Findings from Wayne State University Update Understanding of Central Nervous System Agents (Drug Toxicities of Common Analgesic Medications in the Emergency Department)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Central Nervous System Agents have been published. According to news reporting originating from Detroit, Michigan, by NewsRx correspondents, research stated, "About 75% of patients present to the emergency department with a complaint of pain."

Our news editors obtained a quote from the research from Wayne State University, "There are multiple prescribed and over-the-counter medications that are available for the treatment of pain. Acetaminophen, opioids, and aspirin are commonly used agents that are available as single agents or in combination with other medications."

According to the news editors, the research concluded: "However, all of these agents are susceptible to toxic overdose, which requires prompt recognition through clinical and laboratory assessment modalities and initiation of therapy to reduce the risk of morbidity and mortality."

The news editors report that additional information may be obtained by contacting E. Dubey, Wayne State University, Sch Med, Dept. of Emergency Med, Detroit, MI 48201, United States. Additional authors for this research include K. Nguyen, M.H. Bluth and E. Dubey.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cll.2016.07.003. This DOI is a link to an online electronic document that is either free or for purchase.

Life Science Research - Cell Biology

New Findings from Weizmann Institute of Science in the Area of Cell Biology Reported (Microbiota Diurnal Rhythmicity Programs Host Transcriptome Oscillations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Life Science Research - Cell Biology is the subject of a report. According to news reporting out of Rehovot, Israel, by NewsRx editors, research stated, "The intestinal microbiota undergoes diurnal compositional and functional oscillations that affect metabolic homeostasis, but the mechanisms by which the rhythmic microbiota influences host circadian activity remain elusive. Using integrated multi-omics and imaging approaches, we demonstrate that the gut microbiota features oscillating biogeographical localization and metabolome patterns that determine the rhythmic exposure of the intestinal epithelium to different bacterial species and their metabolites over the course of a day."

Our news journalists obtained a quote from the research from the Weizmann Institute of Science, "This diurnal microbial behavior drives, in turn, the global programming of the host circadian transcriptional, epigenetic, and metabolite oscillations. Surprisingly, disruption of homeostatic microbiome rhythmicity not only abrogates normal chromatin and transcriptional oscillations of the host, but also incites genome-wide de novo oscillations in both intestine and liver, thereby impacting diurnal fluctuations of host physiology and disease susceptibility."

According to the news editors, the research concluded: "As such, the rhythmic biogeography and metabolome of the intestinal microbiota regulates the temporal organization and functional outcome of host transcriptional and epigenetic programs."

For more information on this research see: Microbiota Diurnal Rhythmicity Programs Host Transcriptome Oscillations. Cell, 2016;167(6):1495-1510,123-134. Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell - www.journals.elsevier.com/cell/)

Clinical Research - Clinical Trials and Studies

New Findings from William Paterson University in the Area of Clinical Trials and Studies Described (The Special Supplemental Nutrition Program for Women, Infants, and Children Fresh Start Randomized Controlled Trial: Baseline Participant ...)

Obesity, Fitness & Wellness Week - January 14, 2017 - Page 4075
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Clinical Research - Clinical Trials and Studies is the subject of a report. According to news reporting from Wayne, New Jersey, by NewsRx journalists, research stated, "The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) Fresh Start (WFS) is a randomized controlled trial of nutrition education to promote farmers' market fruit and vegetable (F/V) purchases and consumption among women enrolled in WIC. To describe the baseline characteristics (demographics and F/V intake [including F/V juice]) of WFS participants, compare the characteristics with those of WIC participants in New Jersey and nationwide, and examine the baseline reliability of study measures. Cross-sectional."

The news correspondents obtained a quote from the research from William Paterson University, "Seven hundred forty-four women served by a New Jersey-based WIC agency located in a densely populated, urban area. Demographic characteristics; newly developed measures of farmers' market-related knowledge, attitudes, and skills; and validated measures of F/V intake. Statistical analyses Descriptive statistics to characterize the sample. One-sample t and one-sample sign tests to compare the characteristics with reference values. For dietary behaviors, comparisons were with state and national estimates of the frequency and quantity of F/V intake. Participants had a mean age of 28.9 +/- 6.8 years and were predominantly Hispanic (59%), US-born (60%), never married (41%), unemployed (62%), receiving assistance other than WIC (70%), and food insecure (55%). Half reported a high school education or less. Higher proportions of WFS participants than WIC participants nationwide were represented among demographic groups at increased risk of inadequate F/V intake. WFS participants consumed more fruit (2.7 cups/day) but less vegetables (1.4 cups/day) than did women nationwide (1.1 and 1.4 cups/day, respectively; P<0.01). Although participants consumed recommended amounts of fruit, their vegetable intake was below recommended levels. All but two of the measures developed for the study had reliability coefficients at or above 0.60. Intervention is warranted to improve participants' vegetable intake."

According to the news reporters, the research concluded: "Registered dietitian nutritionists should be aware of F/V intake differences that may require differential intervention strategies."

Our news journalists report that additional information may be obtained by contacting J. Di Noia, William Paterson Univ, Dept. of Sociol, Wayne, NJ 07470, United States. Additional authors for this research include D. Monica, H.L. Gray and K.W. Cullen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jand.2016.07.020. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings from Wingate University in Pharmaceutical Education Provides New Insights (Evidence of Criterion Validity for One Pharmacy School's Progress Examination Program)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Education - Pharmaceutical Education. According to news originating from Wingate, North Carolina, by NewsRx correspondents, research stated, "To provide evidence that the progress examination program accurately assesses student failure to demonstrate competence. A progress examination program aligned with each grade level was locally developed and administered annually to 289 PharmD students in the spring of their first year - fourth year."

Our news journalists obtained a quote from the research from Wingate University, "Correlations and linear regressions were performed to compare the examination scores to performance on national licensing examinations and cumulative didactic grade point average (GPA). Odds ratio analysis was run to determine the ability of the passing scores of the progress examination to identify students at increased risk of failing to graduate on time, earn a GPA below 3.0, and fail the licensing examinations on their first attempt. Progress examination scores were strongly correlated to GPA and national licensing examination scores and weakly correlated to jurisprudence examination scores. Regression analysis indicated a significant linear relationship between examination scores and both GPA and the licensing examinations. Students who performed poorly on the progress examinations were more likely fail the national licensing examination, more likely to fail to graduate on time, and more likely to earn a cumulative didactic GPA below 3.0."

According to the news editors, the research concluded: "The second-year examination program strongly predicts students at risk for failure to graduate on time or achieve a GPA below 3.0, while all four examinations identify students at risk of failing the national licensing examination on their first attempt."

For more information on this research see: Evidence of Criterion Validity for One Pharmacy School's Progress Examination Program. American Journal of Pharmaceutical Education, 2016;80(8):131-144. American Journal of Pharmaceutical Education can be contacted at: Amer Assoc Coll Pharmacy, 1426 Prince Street, Alexandria, VA 22314-2815, USA.

The news correspondents report that additional information may be obtained from G.L. Alston, Wingate Univ, Sch Pharm, Wingate, NC 28174, United States.

New Findings from Wuhan University in the Area of Type 1 Diabetes Mellitus Described (Biopatterned CTLA4/Fc Matrices Facilitate Local Immunomodulation, Engraftment, and Glucose Homeostasis After Pancreatic Islet Transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus is now available. According to news originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "Pancreatic islet transplantation (PIT) represents a potential therapy to circumvent the need for exogenous insulin in type 1 diabetes. However, PIT remains limited by lack of donor islets and the need for long-term multidrug immunosuppression to prevent alloimmune islet rejection."

Funders for this research include JDRF, Plastic Surgery Foundation and Musculoskeletal Transplant Foundation.

Our news journalists obtained a quote from the research from Wuhan University, "Our goal was to evaluate a local immunoregulatory strategy that sustains islet allograft survival and restores glucose homeostasis in the absence of systemic immunosuppression. Nanogram quantities of murine CTLA4/Fc fusion protein were controllably delivered within human acellular dermal matrix scaffolds using an inkjet-based biopatterning technology and cotransplanted with allogeneic islets under the renal capsule to create an immunoregulatory microenvironment around the islet allograft. We achieved long-term engraftment of small loads of allogeneic islet cells with 40% of MHC-mismatched mouse recipients maintaining sustained normoglycemia following pancreatic beta-cell ablation by streptozotocin. Biopatterned CTLA4/Fc local therapy was associated with expansion of Foxpr regulatory T cells and shifts in cytokine production and gene expression from proinflammatory to regulatory profiles, thus substantially benefiting islet allografts survival and function."

According to the news editors, the research concluded: "This study is a new paradigm for targeted therapies in PIT that demonstrates the favorable effects of immune alterations in the transplant milieu and suggests a unique strategy for minimizing systemic immunosuppression and promoting islet allograft survival."

For more information on this research see: Biopatterned CTLA4/Fc Matrices Facilitate Local Immunomodulation, Engraftment, and Glucose Homeostasis After Pancreatic Islet Transplantation. Diabetes, 2016;65(12):3660-3666. Diabetes can be contacted at: Amer Diabetes Assoc, 1701 N Beauregard St, Alexandria, VA 22311-1717, USA. Musculoskeletal Diseases and Conditions —

New Findings from X. Zhang and Co-Authors in the Area of Osteoarthritis Reported (Chondromodulin-1 ameliorates osteoarthritis progression by inhibiting HIF-2 alpha activity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Musculoskeletal Diseases and Conditions - Osteoarthritis. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Hypoxia is known to stabilize hypoxia-inducible factor (HIF) and initiate angiogenic signaling cascade. However, cartilage living in hypoxia environment can maintain vascularity."

The news reporters obtained a quote from the research, "It is well known that abrogation of avascularity is related to cartilage degradation in osteoarthritis (OA). The aims of present study were to investigate the role of chondromodulin-1 (ChM-1), an endogenously antiangiogenic protein in cartilage, during chondrocyte maturation and OA progression, as well as to explore the molecular mechanisms underlying the function of ChM-1 with a focus on HIF-2 alpha pathway. Angiogenic-related markers were evaluated in OA cartilage and different stages of chondrocyte differentiation. Chondrocytes transfected with ChM-1 lentivirus or siRNA was treated with tumor necrosis factor (TNF-alpha) to investigate the role of ChM-1 in chondrocyte hypertrophic changes. In vivo study was conducted by using a surgical induced OA rat model with intra-articular injection of lentivirus ChM-1 (LV-ChM-1) or mock lentivirus (LV-GFP) control. Transcriptional activity of HIF-2 alpha was determined by chromatin immunoprecipitation (ChIP) assay to unveil the mechanisms of ChM-1. Majority angiogenic factors increased in severe OA cartilage, while anti-angiogenic factors including ChM-1 decreased. ChM-1 expression was strongly related with chondrocyte differentiation and chondrogenesis in vitro. ChM-1 overexpression protected chondrocytes from TNF-alpha induced hypertrophy, and intra-articular injection of LV-ChM-1 delayed OA progression. ChM-1 delayed HIF-2 alpha nuclear translocation at early time-points and decreased transcriptional activity of HIF-2 alpha on collagen type. alpha 1 (COL10A1), vascular endothelial growth factor A (VEGFA) and matrix metallopeptidase-13 (MMP-13)."

According to the news reporters, the research concluded: "ChM-1 maintains cartilage homeostasis by inhibiting HIF-2 alpha induced catabolic activity and regulation of ChM-1 in cartilage may be a promising therapeutic strategy for OA."

Our news correspondents report that additional information may be obtained by contacting X. Zhang, Sun Yat Sen UniversityGuangdong Prov Key Lab Stomatol, Guanghua Sch Stomatol, Dept. of Operat Dental & Endodont, Guangzhou 510055, Guangdong, People's

Musculoskeletal Diseases and Conditions - …

New Findings from Xi'an Jiao Tong University Describe Advances in Osteonecrosis (Single-nucleotide polymorphisms of MMP2 in MMP/TIMP pathways associated with the risk of alcohol-induced osteonecrosis of the femoral head in Chinese males A …)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Osteonecrosis have been published. According to news reporting from Shaanxi, People's Republic of China, by NewsRx journalists, research stated, "The proportion of alcohol-induced osteonecrosis of the femoral head (ONFH) in all ONFH patients was 30.7%, with males prevailing among the ONFH patients in mainland China (70.1%). Matrix metalloproteinase 2 (MMP2), a member of the MMP gene family, encodes the enzyme MMP2, which can promote osteoclast migration, attachment, and bone matrix degradation."

The news correspondents obtained a quote from the research from Xi'an Jiao Tong University, "In this case-control study, we aimed to investigate the association between MMP2 and the alcohol-induced ONFH in Chinese males. In total, 299 patients with alcohol-induced ONFH and 396 healthy controls were recruited for a case-control association study. Five single-nucleotide polymorphisms within the MMP2 locus were genotyped and examined for their correlation with the risk of alcohol-induced ONFH and treatment response using Pearson chi(2) test and unconditional logistic regression analysis. We identified 3 risk alleles for carriers: the allele 'T' of rs243849 increased the risk of alcohol-induced ONFH in the allele model, the log-additive model without adjustment, and the log-additive model with adjustment for age. Conversely, the genotypes 'CC' in rs7201 and 'CC' in rs243832 decreased the risk of alcohol-induced ONFH, as revealed by the recessive model. After the Bonferroni multiple adjustment, no significant association was found. Furthermore, the haplotype analysis showed that the 'TT' haplotype of MMP2 was more frequent among patients with alcohol-induced ONFH by unconditional logistic regression analysis adjusted for age."

According to the news reporters, the research concluded: "There may be an association between MMP2 and the risk of alcohol-induced ONFH in North-Chinese males. However, studies on larger populations are needed to confirm this hypothesis; these data may provide a theoretical foundation for future studies."

For more information on this research see: Single-nucleotide polymorphisms of MMP2 in MMP/TIMP pathways associated with the risk of alcohol-induced osteonecrosis of the femoral head in Chinese males A case-control study. Medicine, 2016;95(49):100-105. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine -
Kidney Diseases and Conditions - Hemolytic Uremic Syndrome

New Findings from Xi'an Jiao Tong University in the Area of Hemolytic Uremic Syndrome Reported (Association among Complement Factor H Autoantibodies, Deletions of CFHR, and the Risk of Atypical Hemolytic Uremic Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Kidney Diseases and Conditions - Hemolytic Uremic Syndrome have been published. According to news reporting originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "To evaluate the association among complement factor H-related (CFHRs) gene deficiency, complement factor H (CFH) autoantibodies, and atypical hemolytic uremic syndrome (aHUS) susceptibility. EMBASE, PubMed, and the ISI Web of Science databases were searched for all eligible studies on the relationship among CFHRs deficiency, anti-FH autoantibodies, and aHUS risk."

Our news editors obtained a quote from the research from Xi'an Jiao Tong University, "Eight case-control studies with 927 cases and 1182 controls were included in this study. CFHR1 deficiency was significantly associated with an increased risk of aHUS (odds ratio (OR) = 3.61, 95% confidence interval (95% CI), 1.96, 6.63, p < 0.001), while no association was demonstrated in individuals with only CFHR1/R3 deficiency (OR = 1.32, 95% CI, 0.50, 3.50, p = 0.56). Moreover, a more significant correlation was observed in people with both FH-anti autoantibodies and CFHR1 deficiency (OR = 11.75, 95% CI, 4.53, 30.44, p< 0.001 in contrast to those with only CFHR1 deficiency. In addition, the results were essentially consistent among subgroups stratified by study quality, ethnicity, and gene detection methods."

According to the news editors, the research concluded: "The present meta-analysis indicated that CFHR1 deletion was significantly associated with the risk of aHUS, particularly when combined with anti-FH autoantibodies, indicating that potential interactions among CFHR1 deficiency and anti-FH autoantibodies might impact the risk of aHUS."

The news editors report that additional information may be obtained by contacting H. Jiang, Xi An Jiao Tong Univ, Sch Public Hlth, Hlth Sci Center, Xian 710061, People's Republic of China. Additional authors for this research include M.N. Fan, M. Yang, C. Lu, M. Zhang.
New Findings from Y. Shiraishi and Co-Researchers in the Area of Heart Failure Described (Correlation of Pre- and In-Hospital Systolic Blood Pressure in Acute Heart Failure Patients and the Prognostic Implications - Report From the Tokyo ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Systolic blood pressure (SBP) is an important prognostic indicator for patients with acute heart failure (AHF). However, its changes and the effects in the different phases of the acute management process are not well known."

Our news journalists obtained a quote from the research, "The Tokyo CCU Network prospectively collects on-site information about AHF from emergency medical services (EMS) and the emergency room (ER). The association between in-hospital death and SBP at 2 different time points (on-site SBP [measured by EMS] and in-hospital SBP [measured at the ER; ER-SBP]) was analyzed. From 2010 to 2012, a total of 5,669 patients were registered and stratified into groups according to both their on-site SBP and ER-SBP: >160 mmHg; 100-160 mmHg; and <100 mmHg. In-hospital mortality rates increased when both on-site SBP and ER-SBP were low. After multivariate adjustment, both SBPs were inversely associated with in-hospital death. Notably, the risk for patients with ER-SBP of 100-160 mmHg (intermediate risk) differed according to their on-site SBP; those with on-site SBP <100 or 100-160 mmHg were at higher risk (OR, 7.39; 95% CI, 4.00-13.6 and OR, 2.73; 95% CI, 1.83-4.08, respectively [P <0.001 for both]) than patients with on-site SBP >160 mmHg."

According to the news editors, the research concluded: "Monitoring changes in SBP assisted risk stratification of AHF patients, particularly patients with intermediate ER-SBP measurements."

For more information on this research see: Correlation of Pre- and In-Hospital Systolic Blood Pressure in Acute Heart Failure Patients and the Prognostic Implications - Report From the Tokyo Cardiac Care Unit Network Emergency Medical Service Database. Circulation Journal, 2016;80(12):2473-2481,89-91. Choline

New Findings from Yale University in the Area of Choline Reported (Secretagogue-dependent and -independent transport of zinc hydration forms in rat parietal cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Choline are presented in a new report. According to news reporting out of New Haven, Connecticut, by NewsRx editors, research stated, "Prolonged exposure to gastric acid is a leading cause of gastroesophageal reflux disease (GERD) and esophagitis. With the ever increasing number of patients showing insensitivity to proton-pump-inhibitor (PPI) therapy with recurrence of symptoms over time, alternative treatment options remain an important issue."

Financial support for this research came from Charles Ohse.

Our news journalists obtained a quote from the research from Yale University, "Previous studies from our laboratory have shown that a zinc sulfate salt can inhibit HCl generation at the cellular level of the parietal cell. In this paper, we examine the difference between two hydration forms of ZnSO4 (monohydrate H2O and heptahydrate 7H(2)O) in their entry characteristics into the parietal cell under several physiological conditions associated with acid secretion. Using the Zn sensitive fluorochrome Newport Green, we examined the rate of Zn entry in Delta fluorescent units/second (Delta FU/second), at two different concentrations for both hydration states on both fasted and non-fasted animals. In a separate series of studies, we examined the effects of secretagogues on the entry rates and transport mechanisms. Exposure of the secretagogue carbachol transformed the resting parietal cell to an activated state and represents a stimulated condition through the neuronal pathway. The hormonal activation of the parietal cell was achieved by using histamine. Non-fasted conditions were considered to be a state between hormonal and neuronal activation. To demonstrate that ZnSO4 enters the parietal cell through the NKCC1 co-transporter, the inhibitor bumetanide was applied during secretagogue-stimulated acid secretion. Both salts, monohydrate and heptahydrate ZnSO4, show a concentration-dependent cell entry under all conditions studied. During stimulated acid secretion, induced through either the neuronal or the hormonal pathway, heptahydrate ZnSO4 enters the parietal cell significantly faster than monohydrate ZnSO4, whereas monohydrate ZnSO4 exhibits faster entry during resting conditions in fasted animals. At 30 mu M following stimulation with histamine, heptahydrate ZnSO4 enters the cell faster than monohydrate ZnSO4 (Delta FU/second 30 mu M (ZnSO4*7H2O + histamine) = 1.782, Delta FU/second 30 mu M (ZnSO4*H2O+histamine) = 1.038, respectively). Three hundred micromolar, heptahydrate ZnSO4 shows a faster entry into the cells (Delta FU/second (ZnSO4*7H2O300)mu M + carbachol = 4.02407) compared to monohydrate ZnSO4 (Delta FU/second (ZnSO4*H2O300 mu M + carbachol) = 3.225) following exposure to carbachol."
According to the news editors, the research concluded: "The mechanism of entry of both salts was found to be predominantly via the basolateral NKCC1 transporter with the rate of zinc entry decreasing to minimal values (ΔFU/second = 0.275) after application of bumetanide during stimulated conditions."

Our news journalists report that additional information may be obtained by contacting J.P. Geibel, Yale University, Sch Med, Dept. of Cellular & Mol Physiol, New Haven, CT 06510, United States. Additional authors for this research include A.M. Kitay, R.M. Trattning, A. Alsaihat and J.P. Geibel.

**Cardiovascular Diseases and Conditions -...**

**New Findings from Yale University in the Area of Hypertension Described (Incarceration History and Uncontrolled Blood Pressure in a Multi-Site Cohort)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating from New Haven, Connecticut, by NewsRx correspondents, research stated, "Incarceration is associated with increased risk of hypertension and cardiovascular disease mortality. We used data from the Veterans Aging Cohort Study (VACS) to explore the impact of incarceration on blood pressure (BP) control."

Our news editors obtained a quote from the research from Yale University, "Among hypertensive VACS participants, we measured the association between self-reported recent incarceration or past (not recent) history of incarceration and BP control in the year following the survey. To analyze the association between incarceration and BP control, we used logistic regression models adjusted for sociodemographic characteristics, clinical factors (HIV status and body mass index), and behavioral factors (history of smoking, unhealthy alcohol use, illicit drug use). We explored potential mediators including post-traumatic stress disorder (PTSD), depression, primary care engagement, and adherence to antihypertensive medications. Among the 3515 eligible VACS participants, 2304 participants met the inclusion criteria. Of these, 163 (7 %) reported recent incarceration, and 904 (39 %) reported a past history of incarceration. Participants with recent or past history of incarceration were more likely to have uncontrolled
BP than those without a history of incarceration (67% vs. 56% vs. 51%, p<0.001). In multivariable analysis, recent incarceration (adjusted odds ratio [AOR] = 1.57 95% confidence interval [CI]: 1.09-2.26), but not a past history of incarceration (AOR = 1.08 95% CI: 0.90-1.30), was associated with uncontrolled BP compared with those who were never incarcerated. Among patients with a history of hypertension, recent incarceration is associated with having uncontrolled BP following release.”

According to the news editors, the research concluded: "Interventions are needed for recently released individuals to improve hypertension outcomes."

The news editors report that additional information may be obtained by contacting B.A. Howell, Yale University, Sch Med, Dept. of Internal Med, New Haven, CT 06520, United States. Additional authors for this research include J.B. Long, J. Edelman, K.A. McGinnis, D. Rimland, D.A. Fiellin, A.C. Justice and E.A. Wang.

**Cardiovascular Research**

**New Findings from Yeungnam University in the Area of Cardiovascular Research Reported (CHOP deficiency inhibits methylglyoxal-induced endothelial dysfunction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Research. According to news reporting originating from Daegu, South Korea, by NewsRx correspondents, research stated, "Epidemiological studies suggested that diabetic patients are susceptible to develop cardiovascular complications along with having endothelial dysfunction. It has been suggested that methylglyoxal (MGO), a glycolytic metabolite, has more detrimental effects on endothelial dysfunction rather than glucose itself."

Financial supporters for this research include Basic Science Research Program, Ministry of Science, ICT, and Future Planning.

Our news editors obtained a quote from the research from Yeungnam University, "Here, we investigated the molecular mechanism by which MGO induces endothelial dysfunction via the regulation of ER stress. Biochemical data showed that 4-PBA significantly inhibited MGO-induced protein cleavages of PARP-1 and caspase-3. In addition, it was found that high glucose induced endothelial apoptosis was enhanced in the presence of GLO1"
inhibitor, suggesting the role of endogenous MGO in high glucose-induced endothelial dysfunction. MGO-induced endothelial apoptosis was significantly diminished by the depletion of CHOP with si-RNA against human CHOP, but not by SP600125, a specific inhibitor of JNK. The physiological relevance of this signaling pathway was demonstrated in CHOP deficiency mouse model, in which instillation of osmotic pump containing MGO led to aortic endothelial dysfunction. Notably, the aortic endothelial dysfunction response to MGO infusion was significantly improved in CHOP deficiency mice compared to littermate control."

According to the news editors, the research concluded: "Taken together, these findings indicate that MGO specifically induces endothelial dysfunction in a CHOP dependent manner, suggesting the therapeutic potential of CHOP inhibition in diabetic cardiovascular complications."

For more information on this research see: CHOP deficiency inhibits methylglyoxal-induced endothelial dysfunction. Biochemical and Biophysical Research Communications, 2016;480(3):362-368. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Skin Diseases and Conditions - Alopecia

New Findings from Yonsei University in the Area of Alopecia Described (Relationship between androgenetic alopecia and cardiovascular risk factors according to BASP classification in Koreans)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Skin Diseases and Conditions - Alopecia have been published. According to news reporting out of Wonju, South Korea, by NewsRx editors, research stated, "There have been many studies on the relationship between androgenetic alopecia (AGA) and cardiovascular risk factors, but the study results were inconsistent and research on AGA in Asians remains insufficient. This study investigated the relationship between Korean AGA and various cardiovascular risk factors, considering life habits, type of hair loss and sex."

Our news journalists obtained a quote from the research from Yonsei University, "We investigated subjects who visited a hospital for public or industrial health medical examinations between October 2012 and December 2014. A questionnaire as well as
anthropometric measurements and a blood test were performed. Among the 1884 total subjects, 52.6% had AGA. AGA patients displayed a significantly higher prevalence rate of cardiovascular diseases, smoking rate, fasting glucose and triglyceride, and a significantly lower high-density lipoprotein cholesterol level than did the non-AGA group. The results of the subgroup analysis showed higher prevalence rates of hypertension, stroke, metabolic syndrome and smoking in male AGA patients. The more severe the AGA, the higher the incidences of hypertension, diabetes and smoking were observed. According to the analysis results by BASP classification, the F-type AGA patients displayed a higher body mass index, waist circumference and diastolic blood pressure, and had a significantly higher prevalence rate of hypertension.

According to the news editors, the research concluded: "As a result of the large population-based study, modifications in lifestyle and early screening for cardiovascular disease, as well as hypertension and diabetes, are suggested."

Our news journalists report that additional information may be obtained by contacting W.S. Lee, Yonsei University, Wonju Coll Med, Inst Hair & Cosmet Med, Wonju, South Korea. Additional authors for this research include S.S. Oh and W.S. Lee.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1346-8138.13355. This DOI is a link to an online electronic document that is either free or for purchase.

Nephrology

New Findings from Zhejiang University in Nephrology Provides New Insights (Multiple Drug Transporters Are Involved in Renal Secretion of Entecavir)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nephrology are discussed in a new report. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "Entecavir (ETV) is a first-line antiviral agent for the treatment of chronic hepatitis B virus infection. Renal excretion is the major elimination path of ETV, in which tubular secretion plays the key role."

Funders for this research include Zhejiang Provincial Science and Technology Foundation of China, International Science and Technology Cooperation Program of China, National Natural Science Foundation of China (NSFC).

The news reporters obtained a quote from the research from Zhejiang University,
"However, the secretion mechanism has not been clarified. We speculated that renal transporters mediated the secretion of ETV. Therefore, the aim of our study was to elucidate which transporters contribute to the renal disposition of ETV. Our results revealed that ETV (50 μM) remarkably reduced the accumulation of probe substrates in MDCK cells stably expressing human multidrug and toxin efflux extrusion proteins (hMATE1/2-K), organic cation transporter 2 (hOCT2), and carnitine/organic cation transporters (hOCTNs) and increased the substrate accumulation in cells transfected with multidrug resistance-associated protein 2 (hMRP2) or multidrug resistance protein 1 (hMDR1). Moreover, ETV was proved to be a substrate of the above-described transporters. In transwell studies, the transport of ETV in MDCK-hOCT2-hMATE1 showed a distinct directionality from BL (hOCT2) to AP (hMATE1), and the cellular accumulation of ETV in cells expressing hMATE1 was dramatically lower than that of the mock-treated cells. The accumulation of ETV in mouse primary renal tubular cells was obviously affected by inhibitors of organic anion transporter 1/3 (Oat1/3), Oct2, Octn1/2, and Mrp2."

According to the news reporters, the research concluded: "Therefore, the renal uptake of ETV is likely mediated by OAT1/3 and OCT2 while the efflux is mediated by MATEs, MDR1, and MRP2, and OCTN1/2 may participate in both renal secretion and reabsorption."

For more information on this research see: Multiple Drug Transporters Are Involved in Renal Secretion of Entecavir. Antimicrobial Agents and Chemotherapy, 2016;60(10):6260-6270. Oncology - Bladder Cancer

New Findings from Zhengzhou University in the Area of Bladder Cancer Described (Association of thymosin beta 4 expression with clinicopathological parameters and clinical outcomes of bladder cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Bladder Cancer is now available. According to news originating from Zhengzhou, People's Republic of China, by NewsRx correspondents, research stated, "The clinical significance of thymosin beta 4 (T beta 4) expression in bladder
transitional cell carcinoma (BTCC) remains unclear. The present study assessed the relationship between the expression of T beta 4 protein and the clinicopathological features, as well as the prognosis of bladder cancer patients."

Our news journalists obtained a quote from the research from Zhengzhou University, "T beta 4 protein expression in 24 normal bladder and 138 primary BTCC tissue specimens was detected by immunohistochemistry, and the association of this expression with BTCC clinicopathological features and recurrence as well as patient survival was analyzed. T beta 4 expression was significantly stronger in BTCC patients than in normal volunteers. The expression of T beta 4 was significantly associated with differentiation capability, tumor stage and lymph node metastasis (P = 0.025, 0.043, and 0.039, respectively). Moreover, T beta 4 expression was positively correlated with integrin-linked kinase (ILK) and (beta-catenin expression (P = 0.042, 0.031, respectively) and inversely correlated with E-cadherin expression (P = 0.022). In the present cohort of bladder cancer patients, T beta 4 expression was found to be a predictor of poor survival (P < 0.05); however, high T beta 4 expression exhibited unfavorable prognostic value for recurrence. These data suggested that T beta 4 is correlated with the pathogenesis of BTCC."

According to the news editors, the research concluded: "In addition, the patients with higher T beta 4 expression had a shorter survival."

For more information on this research see: Association of thymosin beta 4 expression with clinicopathological parameters and clinical outcomes of bladder cancer patients. Neoplasma, 2016;63(6):991-998. Neoplasma can be contacted at: Aepress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

The news correspondents report that additional information may be obtained from Z.Y. Wang, Zhengzhou Univ, Affiliated Hosp 1, Dept. of Urol, Zhengzhou, Henan Province, People's Republic of China. Additional authors for this research include W. Zhang, J.J. Yang, D.K. Song, J.X. Wei and S. Gao.

Cardiovascular Diseases and Conditions - Abdominal...

New Findings in Abdominal Aortic Aneurysm Described from Department of Vascular Surgery (Management of a dislocated endovascular aneurysm repair in a challenging giant abdominal aortic aneurysm)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm. According to news reporting originating in Turnhout, Belgium, by NewsRx journalists, research stated, "A case report of a contained rupture of an abdominal aneurysm, treated by endovascular technique (EVAR), but complicated by perioperative endoprosthesis limb dislocation. Case report An 81-year old male presented at the emergency department with a contained rupture of an infrarenal aortic aneurysm and bilateral extensive iliac aneurysmatic disease."
The news reporters obtained a quote from the research from the Department of Vascular Surgery, "Open repair was no option, due to the pulmonary condition. The patient was prepped for an emergency EVAR. After placing a bifurcated endoprosthesis, angiography revealed a type IIIa endoleak, due to a dislocation between two left iliac extensions. We converted to a right-sided aorto-uni-iliac endoprosthesis with a femorofemoral bypass. A postoperative CT-scan showed a complete exclusion of the aneurysm, a patent aorto-uni-iliac endoprosthesis and a femorofemoral bypass without an endoleak. EVAR is feasible with a hostile neck AAA, even in a ruptured AAA."

According to the news reporters, the research concluded: "In large AAA, one should consider an overlap larger than suggested in the instructions for use."

Our news correspondents report that additional information may be obtained by contacting J. Geers, Dept. of Vasc Surg, B-2300 Turnhout, Belgium. Additional authors for this research include G. Daenen and P. Stabel.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1080/00015458.2015.1136487. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Antibiotics**

**New Findings in Antibiotics Described from Zagazig University**

[Phenolic extracts of clove (Syzygium aromaticum) with novel antioxidant and antibacterial activities]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antibiotics. According to news reporting originating in Zagazig, Egypt, by NewsRx journalists, research stated, "Clove (Syzygium aromaticum) is a rich source of bioactive compounds. The goal of this study was to test different extracts of clove in terms of their phenolic contents, their antioxidant potential and their antibacterial action against pathogenic bacteria."

The news reporters obtained a quote from the research from Zagazig University, "Ethyl acetate, ethanol (80%) and water were used to extract bioactive phytochemicals from clove. Recovered extracts were studied in terms of total phenolic compounds, total flavonoids, antioxidant properties and antibacterial activity. Scanning and transmission electron microscopy was applied to study the effect of ethanol extracts on the morphology and membranes of tested bacterial cells. Ethanol and water were the best solvents for extracting phenolics (ca. 230 mg GAE g(1) extract) but water was the best solvent for extracting flavonoids (17.5 mg QE g (1) extract). Antioxidant potential of clove extracts was estimated using DPPH center dot (1,1-
diphenyl-2 picrylhydrazyl), ABTS(center dot) + 2, 2'azino bis-(3-ethylbenzthiazoline-6-sulfonic acid), beta-carotene-linoleic bleaching assay and ferric reducing antioxidant power (FRAP). Ethanol and water extracts showed comparable antioxidant activity to the synthetic antioxidant tert-butylhydroquinone (TBHQ). The DPPH center dot radical quenching activity varied from 25.3 to 91.4%, while clove extracts showed ABTS(center dot)+ scavenging activities from 49.4 to 99.4%. Clove extracts inhibited the bleaching of beta-carotene wherein the order of decreasing activity was water > ethanol > ethyl acetate extracts as compared with TBHQ. Extracts showed strong antibacterial activities against Staphylococcus aureus ATCC 6538, Listeria monocytogenes Scott A, Salmonella enteritidis PT4, Serratia marcescens and Escherichia coli ATCC 8739. Clove extracts exhibited antibacterial activities against the growth of S. aureus and E. coli in concentration range from 50 to 100 μg/mL. The results indicated that the extracts with stronger antibacterial capacity also had higher phenolic content. Scanning and transmission electron microscopy showed that ethanol extract damaged the morphology and membranes of tested bacterial cells. Using cloves and their extracts in food or pharmaceutical products may be an effective antioxidant and antimicrobial control strategy."

According to the news reporters, the research concluded: "Data from this study might be used for developing natural preservatives and bioactive agents with health promoting activities."

Our news correspondents report that additional information may be obtained by contacting M.F. Ramadan, Zagazig Univ, Fac Agr, Dept. of Agr Biochem, Zagazig 44519, Egypt. Additional authors for this research include S.A. Mahgoub, S.M. Labib, A.M.A. Al-Gaby and M.F. Ramadan.

Drugs and Therapies - Antihyperlipidemic Agents

New Findings in Antihyperlipidemic Agents Described from University of Arkansas [The Vitamin E Analog Gamma-Tocotrienol (GT3) and Statins Synergistically Up-Regulate Endothelial Thrombomodulin (TM)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antihyperlipidemic Agents have been presented. According to news reporting originating in Little Rock, Arkansas, by NewsRx
Journalists, research stated, "Statins; a class of routinely prescribed cholesterol-lowering drugs; inhibit 3-hydroxy-3-methylglutaryl-coenzymeA reductase (HMGCR) and strongly induce endothelial thrombomodulin™; which is known to have anti-inflammatory; anti-coagulation; anti-oxidant; and radioprotective properties. However; high-dose toxicity limits the clinical use of statins."

The news reporters obtained a quote from the research from the University of Arkansas, "The vitamin E family member gamma-tocotrienol (GT3) also suppresses HMGCR activity and induces TM expression without causing significant adverse side effects; even at high concentrations. To investigate the synergistic effect of statins and GT3 on TM; a low dose of atorvastatin and GT3 was used to treat human primary endothelial cells. Protein-level TM expression was measured by flow cytometry. TM functional activity was determined by activated protein C (APC) generation assay. Expression of Kruppel-like factor 2 (KLF2), one of the key transcription factors of TM, was measured by quantitative reverse transcription polymerase chain reaction (qRT-PCR). TM expression increased in a dose-dependent manner after both atorvastatin and GT3 treatment. A combined treatment of a low-dose of atorvastatin and GT3 synergistically up-regulated TM expression and functional activity. Finally; atorvastatin and GT3 synergistically increased KLF2 expression."

According to the news reporters, the research concluded: "These findings suggest that combined treatment of statins with GT3 may provide significant health benefits in treating a number of pathophysiological conditions; including inflammatory and cardiovascular diseases."

For more information on this research see: The Vitamin E Analog Gamma-Tocotrienol (GT3) and Statins Synergistically Up-Regulate Endothelial Thrombomodulin™, International Journal of Molecular Sciences. 2016;17(11):2445-2454. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Our news correspondents report that additional information may be obtained by contacting R. Pathak, University of Arkansas, Coll Pharm, Div Radiat Hlth, Little Rock, AR 72205, United States. Additional authors for this research include S.P. Ghosh, D. Zhou and M. Hauer-Jensen.

**Drugs and Therapies - Antimicrobial Agents and…**

**New Findings in Antimicrobial Agents and Chemotherapy Described from University of California (Fluconazole Susceptibility in Cryptococcus gattii Is Dependent on the ABC Transporter Pdr11)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antimicrobial Agents and Chemotherapy have been published. According to news reporting originating in Davis, California, by NewsRx journalists, research stated, "Cryptococcus gattii isolates from the Pacific Northwest have exhibited higher fluconazole MICs than isolates from other sites. The
The mechanism of fluconazole resistance in C. gattii is unknown.

The news reporters obtained a quote from the research from the University of California, "We sought to determine the role of the efflux pumps Mdr1 and Pdr11 in fluconazole susceptibility. Using biolistic transformation of the parent isolate, we created a strain lacking Mdr1 (mdr1D) and another strain lacking Pdr11 (pdr11D). Phenotypic virulence factors were assessed by standard methods (capsule size, melanin production, growth at 30 and 37 °C). Survival was assessed in an intranasal murine model of cryptococcosis. Antifungal MICs were determined by the M27-A3 methodology. No differences in key virulence phenotypic components were identified. Fluconazole susceptibility was unchanged in the Mdr1 knockout or reconstituted isolates. However, fluconazole MICs decreased from 32 mg/ml for the wild-type isolate to <0.03 mg/ml for the pdr11D strain and reverted to 32 mg/ml for the reconstituted strain. In murine models, no difference in virulence was observed between wild-type, knockout, or reconstituted isolates."

According to the news reporters, the research concluded: "Pdr11 plays an essential role in fluconazole susceptibility in C. gattii. Genomic and expression differences between resistant and susceptible C. gattii clinical isolates should be assessed further in order to identify other potential mechanisms of resistance."

For more information on this research see: Fluconazole Susceptibility in Cryptococcus gattii Is Dependent on the ABC Transporter Pdr11. Antimicrobial Agents and Chemotherapy, 2015;60(3):1202-7. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting A. Gelli, Dept. of Pharmacology, School of Medicine, University of California, Genome and Biomedical Sciences Facility, Davis, California, United States. Additional authors for this research include J. Apoptosis

New Findings in Apoptosis Described from Medical University (Pax8 plays a pivotal role in regulation of cardiomyocyte growth and senescence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Apoptosis. According to news reporting originating from Wenzhou, People's Republic of China, by NewsRx correspondents, research stated, "Congenital heart disease (CHD) is a worldwide health problem, particularly in young populations. In spite of the advancement and progress in medical research and technology, the underlying causative factors and mechanisms of CHD still remain unclear."

Financial supporters for this research include National Natural Science Foundation of China, Wenzhou Science and Technology Project.
Our news editors obtained a quote from the research from Medical University, "Bone morphogenetic protein receptor IA (ALK3) mediates the development of ventricular septal defect (VSD). We have recently found that paired box gene 8 (Pax8) may be the downstream molecule of ALK3. Paired box gene 8 plays an essential role in VSD, and apoptosis and proliferation imbalance leads to septal dysplasia. Recent studies have also disclosed that cellular senescence also participates in embryonic development. Whether programmed senescence exists in cardiac organogenesis has not ever been reported. We hypothesized that together with various biological processes, such as apoptosis, enhanced cellular senescence may occur actively in the development of Pax8 null mice murine hearts. In H9C2 myogenic cells, Pax8 overexpression can rescue caspase-dependent apoptosis induced by ALK3 silencing. Senescent cells and senescence-associated mediators in Pax8 knockout hearts increased compared with the wild-type ones in an age-dependent manner."

According to the news editors, the research concluded: "These results suggest that Pax8 maybe the downstream molecule of ALK3, it mediates the murine heart development perhaps via cellular senescence, which may serve as a mechanism that compensates for the cell loss via apoptosis in heart development."

The news editors report that additional information may be obtained by contacting Y. Wu, Division of Cardiology, The First Affiliated Hospital of Wenzhou Medical University, Wenzhou, People's Republic of China. Additional authors for this research include X. Zhou, X. Huang, Q. Xia, Z. Chen, X. Zhang, D. Yang and Y.J Geng.

Cardiovascular Diseases and Conditions -...

New Findings in Atherosclerosis Described from Free University (The relationship between vitamin K and peripheral arterial disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Atherosclerosis is now available. According to news originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "A high dietary intake of vitamin K1 (phylloquinone) and vitamin K2 (menaquinones) is thought to decrease cardiovascular disease risk by reducing vascular calcification. The objective of this study is to explore if there is a relationship between
phyllloquinone and menaquinones intake and risk of PAD."

Our news journalists obtained a quote from the research from Free University, "We investigated the association between intake of phylloquinone and menaquinones with PAD in a prospective cohort with 36,629 participants. Occurrence of PAD was obtained by linkage to national registries. Baseline intake of phylloquinone and menaquinones was estimated using a validated food-frequency questionnaire. Multivariate Cox regression was used to estimate adjusted hazard ratio's for the association. During 12.1 years (standard deviation 2.1 years) of follow-up, 489 incident cases of PAD were documented. Menaquinones intake was associated with a reduced risk of PAD with a hazard ratio (HR) of 0.71, 95% CI; 0.53-0.95 for the highest versus lowest quartile. A stronger association was observed (p interaction 0.0001) in participants with hypertension (HRQ4 versus (Q1) 0.59; 95% CI 0.39-0.87) or diabetes (HRQ4 versus (Q1) 0.56; 95% CI 0.18-1.91), though confidence intervals were wide in the small (n = 530) diabetes stratum. Phylloquinone intake was not associated with PAD risk. High intake of menaquinones was associated with a reduced risk of PAD, at least in hypertensive participants."

According to the news editors, the research concluded: "High intake of phylloquinone was not associated with a reduced risk of PAD."

Heart Disorders and Diseases - Atrial Fibrillation

New Findings in Atrial Fibrillation Described from Southlake Regional Health Center (Predictors for Progression of Atrial Fibrillation in Patients Awaiting Atrial Fibrillation Ablation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting originating from Newmarket, Canada, by NewsRx correspondents, research stated, "Success rates of atrial fibrillation (AF) ablation have been shown to be significantly lower for patients with persistent AF. However, little is known about the risk factors predicting progression to persistent AF in patients awaiting AF ablation."

Our news editors obtained a quote from the research from Southlake Regional Health Center.

According to the news editors, the research concluded: "High intake of phylloquinone was not associated with a reduced risk of PAD."

For more information on this research see: The relationship between vitamin K and peripheral arterial disease. Atherosclerosis, 2016;252():15-20. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Center, "We performed a retrospective, single-centre investigation of patients with paroxysmal AF at the time of placement on the ablation waiting list. Patients were defined as having progressed if they had developed self-reported or electrocardiogram-recorded AF durations more than 7 days while awaiting ablation. After ablation, clinical visits at 3, 6, 9, 12, and 18 months were performed with a minimum of a 48-hour-Holter and electrocardiogram. Baseline characteristics including left atrial diameter (LA) and the HATCH score were analyzed by univariable and multivariable analysis for predicting progression to persistent AF. During a median waiting time of 9.7 (6.1, 14.2) months, 60 of 564 patients (11%) progressed to persistent AF. In patients who progressed, ablation took longer (180 [150, 249] minutes vs 157 [125, 210] minutes; P = 0.009) and was associated with a higher rate of recurrence after a median of 12 months (53.3% vs 39.1%; P< 0.001). The HATCH score was a poor predictor of AF progression (area under the curve 0.54), whereas an LA diameter of more than 45 mm (odds ratio 3.46, P< 0.001) and heart failure (odds ratio 3.11, P = 0.036) were strong and independent predictors of AF progression in multivariable analysis. Patients with an increased LA diameter or heart failure have a significantly increased risk of progression to persistent AF."

According to the news editors, the research concluded: "These characteristics may define patients who should undergo earlier catheter ablation to optimize outcome."

**Heart Disorders and Diseases - Atrial Fibrillation**

**New Findings in Atrial Fibrillation Described from University of Maryland (Diltiazem versus metoprolol for rate control in atrial fibrillation with rapid ventricular response in the emergency department)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Atrial Fibrillation are presented in a new report. According to news reporting originating from Baltimore, Maryland,
by NewsRx correspondents, research stated, "The impact of patient-specific factors on the choice of beta-blocker versus calcium channel blocker therapy for rate control in emergency department (ED) patients treated for atrial fibrillation (AF) was investigated. A retrospective cohort study was conducted to evaluate the influence of demographics, prior medication use, hemodynamic and clinical characteristics, and other variables on selection of first-line therapy for AF among patients admitted to the ED of an academic medical center over a 22-month period (October 2012-July 2014) who received i.v. treatment with either the beta-blocker metoprolol (n = 45) or the calcium channel blocker diltiazem (n = 55) for rate control."

Our news editors obtained a quote from the research from the University of Maryland, "Significant predictors of the selection of metoprolol versus diltiazem included a past history of AF (odds ratio [OR], 8.3; 95% confidence interval [CI], 1.396-72.713; p = 0.032) or diabetes mellitus (OR, 7.2; 95% CI, 1.208-58.490; p = 0.042) and being prescribed a beta-blocker prior to presentation (OR, 27.8; 95% CI, 4.704-272.894; p = 0.001); a history of calcium channel blocker use prior to ED presentation was a negative predictor of beta-blocker use for initial rate control (OR, 0.1; 95% CI, 0.005-0.265; p = 0.002). No differences in the effectiveness or safety of diltiazem and metoprolol were identified. Indicators of hemodynamic and clinical response to ED management were not predictive of discharge medication selection."

According to the news editors, the research concluded: "The drug class used for rate control prior to ED admission was the most significant predictor of medication selection for rate control in the ED setting."

For more information on this research see: Diltiazem versus metoprolol for rate control in atrial fibrillation with rapid ventricular response in the emergency department. American Journal of Health-System Pharmacy, 2016;73(24):2068-2076. New Findings in Biotherapies and Biologicals Described by M. Beck and Co-Researchers (Rheumatologists' Perceptions of Biosimilar Medicines Prescription: Findings from a French Web-Based Survey)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Biotherapies and Biologicals have been published. According to news originating from Strasbourg, France, by NewsRx correspondents, research stated, "Healthcare cost savings are closely linked to prescribers' confidence in and acceptance of the prescription of biosimilar drugs. The aim of this study was to assess the knowledge, experience and opinions of hospital-based and office-based French rheumatologists with regard to biosimilar medicines and to identify the barriers to and possible options to promote their prescription."

Our news journalists obtained a quote from the research, "A web-based, self-administered survey was conducted among French rheumatologists from June 8 to August 2, 2015. A total of 116 rheumatologists responded to the survey. Many reported having little knowledge and a lack of available information about biosimilar drugs, especially office-based rheumatologists. 98.3% of the respondents had at least one question about biosimilars, and seven in ten raised issues regarding substitution, iatrogenic effects or cost savings that might be achievable. Only eight rheumatologists had already prescribed a biosimilar drug. The most common barriers reported were indication extrapolation and a lack of data about tolerability. Nine out of ten physicians thought that starting a treatment with a biosimilar drug in biologic treatment-naïve patients was possible. The rheumatologists' opinions were rather favorable towards the implementation of biosimilars, but a majority expressed a negative opinion about substitution by the pharmacist. Our survey gave a better appreciation of the concerns associated with biosimilar prescriptions."

According to the news editors, the research concluded: "Targeted communication initiatives, deeper experience and availability of new clinical data may help to address the outstanding questions and should overcome the misunderstandings surrounding biosimilar drugs among rheumatologists."

The news correspondents report that additional information may be obtained from M. Beck, OMEDIT Alsace, Agence Reg Sante Alsace Champagne Ardenne, F-67084 Strasbourg, France. Additional authors for this research include B. Michel, M.C. Rybarczyk-Vigouret, D. Leveque, C. Sordet, J. Sibilia and M. Velten.

New Findings in Bisphosphonates Described from Keio University (Ibandronate concomitantly blocks immobilization-induced bone and muscle atrophy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Bisphosphonates is the subject of a report. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Both bone and muscle volume is concomitantly reduced under immobilization conditions; however, no single drug is currently available to block these outcomes simultaneously. Bisphosphonates are utilized clinically to inhibit osteoclast-dependent bone resorption, but their effects on muscle are largely unknown."

Financial supporters for this research include Japan Agency for Medical Research and Development, Grant-in-aid for Scientific Research, Translational Research Network Program, Chugai pharmaceutical company.

The news correspondents obtained a quote from the research from Keio University, "Here we show that skeletal muscle is a direct target of the bisphosphonate ibandronate (IBN) and that reduced muscle volume and induction of Atrogin-1 and MuRF1, both atrogienes, are significantly inhibited by IBN administration in vivo using a mouse model of muscle atrophy. IBN treatment also significantly blocked immobilization-induced bone loss in vivo. We also report that expression of Atrogin-1 and MuRF1 and accumulation of Smad2/3 proteins, which are upstream of atrogienes, occurred following serum starvation of myogenic C2C12 cells in vitro, effects significantly inhibited by IBN treatment. Interestingly, IBN effects on C2C12 cells were abrogated by MG132, an ubiquitin/proteasome inhibitor, suggesting that IBN functions via the ubiquitin-proteasome system."

According to the news reporters, the research concluded: "Our findings lend new insight into the role of IBN in preventing muscle atrophy."

For more information on this research see: Ibandronate concomitantly blocks immobilization-induced bone and muscle atrophy. Biochemical and Biophysical Research Communications, 2016;480(4):662-668. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Biochemical and Biophysical Research Communications - www.journals.elsevier.com/biochemical-and-biophysical-research-communications/)

Our news journalists report that additional information may be obtained by contacting T. Miyamoto, Keio University, Sch Med, Dept. of Adv Therapy Musculoskeletal Disorders, Shinjuku Ku, Tokyo 1608582, Japan. Additional authors for this research include N. Fujita, S. Takeda, Y. Sato, T. Kobayashi, M. Morita, T. Oike, K. Miyamoto, Y. Matsumoto, M. Matsumoto, M. Nakamura and T. Miyamoto.

New Findings in Bladder Cancer Described from University of Turin (H2AX Phosphorylation Level in Peripheral Blood Mononuclear Cells as an Event-Free Survival Predictor for Bladder Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Bladder Cancer are discussed in a new report. According to news reporting originating in Turin, Italy, by NewsRx journalists, research stated, "Bladder cancer (BC) has a typical aetiology characterized by a multistep carcinogenesis due to environmental exposures, genetic susceptibility, and their interaction. Several lines of evidence suggest that DNA repair plays a role in the development and progression of BC."

The news reporters obtained a quote from the research from the University of Turin, "In particular, the study of individual susceptibility to DNA double strand breaks (DSBs) may provide valuable information on BC risk, and help to identify those patients at high-risk of either recurrence or progression of the disease, possibly personalizing both surveillance and treatment. Among the different DSB markers, the most well characterized is phosphorylation of the histone H2AX (gamma-H2AX). We assessed any potential role of gamma-H2AX as a molecular biomarker in a case-control study (146 cases and 146 controls) to identify individuals with increased BC risk and at high-risk of disease recurrence or progression. We investigated gamma-H2AX levels in peripheral blood mononuclear cells before and after their exposure to ionizing radiation (IR). We did not find any significant difference among cases and controls. However, we observed a significant association between gamma-H2AX basal levels and risk of disease recurrence or progression. In particular, both BC patients as a whole and the subgroup of non-muscle invasive BC (NMIBC) with high basal H2AX phosphorylation levels had a decreased risk of recurrence or progression (for all BC HR 0.70, 95% CI 0.52-0.94, P = 0.02; for NMIBC HR 0.68, 95% CI 0.50-0.92, P = 0.01), suggesting a protective effect of basal DSB signaling."

According to the news reporters, the research concluded: "Our data suggest that gamma-H2AX can be considered as a potential molecular biomarker to identify patients with a higher risk of BC recurrence."

Our news correspondents report that additional information may be obtained by contacting V. Turinetto, University of Turin, Dept. of Clin & Biol Sci, Turin, Italy. Additional authors for this research include B. Pardini, A. Allione, G. Fiorito, C. Viberti, S. Guarrera, A. Russo, S. Anglesio, M.G.R. Redda, G. Casetta, G. Cucchiarale, P. Destefanis, M. Oderda, P. Gontero, L. Rolle, B. Frea, P. Vineis, C. Sacerdote, C. Giachino and .

New Findings in Blood Transfusion Described from University of Newcastle (Association of Cortical Vein Filling with Clot Location and Clinical Outcomes in Acute Ischaemic Stroke Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Transfusion Medicine - Blood Transfusion have been presented. According to news originating from Callaghan, Australia, by NewsRx correspondents, research stated, "Delay in cortical vein filling during the late-venous phase (delayed-LCVF) is characterized by opacification of cerebral veins despite contrast clearance from contralateral veins on dynamic computed tomography angiography (dCTA) in acute ischemic stroke (AIS) patients. The aim of the study was to investigate the associations of delayed-LCVF with clot location, reperfusion status at 24 hours, and 90-days functional outcome in AIS patients who received reperfusion therapy."

Our news journalists obtained a quote from the research from the University of Newcastle, "A prospective cohort of AIS patients treated with intravenous thrombolysis was studied. Groupwise comparison, univariate, and multivariate regression analyses were used to study the association of delayed-LCVF with clot location and clinical outcomes. Of 93 patients (mean age = 72 +/- 12 years) with hemispheric AIS included in the study, 46 (49%) demonstrated delayed-LCVF. Patients with delayed-LCVF demonstrated a significantly higher proportion of proximal occlusion (72% vs 13%, P =<0.0001), and poor reperfusion at 24 hours (41% vs 11%, P = 0.001). The proportion of poor functional outcome at 90 days was not significantly different (22/56 (48%) vs 17/61 (36%), P = 0.297)."

According to the news editors, the research concluded: "The appearance of delayed-LCVF on baseline dCTA may be a surrogate for large vessel occlusion, and an early marker for poor 24-hour angiographic reperfusion."

The news correspondents report that additional information may be obtained from S. Bhaskar, University of Newcastle, Hunter Med Res Inst, Callaghan, NSW, Australia. Additional authors for this research include A. Bivard, P. Stanwell, J.R. Attia, M. Parsons, M. Nilsson and C. Levi.

Keywords for this news article include: Callaghan, Australia, Australia and New Zealand, Transfusion Medicine, Blood Transfusion, Medical Devices, Reperfusion, Cardiology, Angiology, University of Newcastle.

New Findings in Bradycardia Described from Shanghai Jiao-Tong University (Potential Role of Regulator of G-Protein Signaling 5 in the Protection of Vagal-Related Bradycardia and Atrial Tachyarrhythmia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Bradycardia. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "The regulator of G-protein signaling 5 (Rgs5), which functions as the regulator of G-protein-coupled receptor (GPCR) including muscarinic receptors, has a potential effect on atrial muscarinic receptor-activated IKACH current. In the present study, hearts of Rgs5 knockout (KO) mice had decreased low-frequency/high-frequency ratio in spectral measures of heart rate variability."

The news reporters obtained a quote from the research from Shanghai Jiao-Tong University, "Loss of Rgs5 provoked dramatically exaggerated bradycardia and significantly (p <0.05) prolonged sinus nodal recovery time in response to carbachol (0.1?mg/kg, intraperitoneally). Compared to those from wild-type (WT) mice, Langendorff perfused hearts from Rgs5 KO mice had significantly (p <0.01) abbreviated atrial effective refractory periods and increased dominant frequency after administration of acetylcholine (ACh; 1?mmol/L). In addition, whole patch clamp analyses of single atrial myocytes revealed that the ACh-regulated potassium current (IKACH) was significant increased in the time course of activation and deactivation (p <0.01) in Rgs5 KO, compared to those in WT, mice. To further determine the effect of Rgs5, transgenic mice with cardiac-specific overexpression of human Rgs5 were found to be resistant to ACh-related effects in bradycardia, atrial electrophysiology, and atrial tachyarrhythmia (AT)."

According to the news reporters, the research concluded: "The results of this study indicate that, as a critical regulator of parasympathetic activation in the heart, Rgs5 prevents vagal-related bradycardia and AT through negatively regulating the IKACH current."

Our news correspondents report that additional information may be obtained by contacting M. Qin, Dept. of Cardiology, Shanghai Chest Hospital Affiliated to Shanghai Jiaotong University, Shanghai, People's Republic of China. Additional authors for this research include X. Liu, T. Liu, T. Wang and C. Huang.

Keywords for this news article include: Asia, Shanghai, Genetics, Cardiology, Bradycardia, Tachycardia, Heart Disease, Cardiac Arrhythmias, People's Republic of China, Heart Disorders and Diseases.

Oncology - Breast Cancer

New Findings in Breast Cancer Described from University of Kentucky (An approach for deciphering patient-specific variations with application to breast cancer molecular expression profiles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting out of Lexington, Kentucky, by NewsRx editors, research stated, "Several studies have successfully used molecular expression profiling in conjunction with classification techniques for discerning distinct disease groups. However, a majority of these studies do not provide sufficient insights into potential patient-specific variations within the disease groups."

Our news journalists obtained a quote from the research from the University of Kentucky, "Such variations are ubiquitous and manifests across multiple scales with varying resolution. There is an urgent need for novel approaches that falls within the objective of precision medicine and provide novel insights into patient-specific variations and sub-populations within disease groups while discerning the disease groups of interest so as to enable timely and targeted intervention of select subjects. This study presents a selective-voting ensemble classification approach (SVA) for discerning good and poor-prognosis breast cancer samples from their 70-gene molecular expression profile revealing patient-specific variations within the poor-prognosis group. In contrast to traditional classification, SVA adapts the feature sets in a sample-specific manner capturing the proclivity of the samples to each of the disease groups. Correlation between normalized vote counts from SVA and clinical outcomes of the subjects is elucidated. Performance of Support Vector Machine and Naive Bayes classifier is investigated within the WA framework and compared to established clinical criteria (Nottingham Prognostic Index, Adjuvant Online, St. Gallen) and Mammaprint approach. Weighted undirected graph abstractions of the ensemble sets of the poor-prognosis test samples is also shown to exhibit markedly different topologies with varying proclivities."

According to the news editors, the research concluded: "These patient-specific networks may reflect inherent variations in underlying signaling mechanisms in the poor-prognosis subjects and reveal potential targets for personalized therapeutic intervention."

Our news journalists report that additional information may be obtained by contacting R. Nagarajan, University of Kentucky, Coll Med, Div Biomed Informat, Lexington, KY 40536, United States.

New Findings in Carcinomas Described from Institute for Cancer Research and Treatment (IRCCS) (A phase II study of sorafenib in recurrent and/or metastatic salivary gland carcinomas: Translational analyses and clinical impact)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Carcinomas. According to news reporting out of Milan, Italy, by NewsRx editors, research stated, "Pre-clinical and clinical evidence suggests a rationale for the use of anti-angiogenic agents, including sorafenib, in recurrent and/or metastatic salivary gland carcinomas (RMSGCs). This study evaluates the activity of sorafenib in patients with RMSGCs and also investigates whether the activity of sorafenib could be related to its main tailored targets (i.e."

Our news journalists obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "BRAF, vascular endothelial growth factor receptor 2 [VEGFR2], platelet-derived growth factor receptor a [PDGFR alpha] and beta, RET, KIT). Patients received sorafenib at 400 mg BID. The primary end-point was response rate (RR) including complete response or partial response (PR); secondary endpoints included RR according to Choi criteria, disease control rate (DCR), overall survival (OS), and progression-free survival (PFS). Thirty-seven patients (19 adenoid cystic cancers, ACC) were enrolled. Six PRs were recorded. RR was 16% (95% confidence interval [CI]: 6-32; 11% in ACC and 22% in non-ACC). Choi criteria could be applied in 30 out of 37 cases with a RR of 50% (95% CI: 31-69%); DCR was 76% (95% CI: 59-88%). Incidence of >= G3 adverse events was 29.7%. Median PFS and OS for the entire population were 5.9 months and 23.4 months, respectively. Median PFS and OS were 8.9 and 26.4 months for ACC versus 4.2 and 12.3 months for non-ACC patients. All the cases showed expression of PDGFR beta in the stroma and VEGFR2 in endothelial cells; PDGFR alpha positivity was found in the stroma of four (27%) cases. All except for two cases showed no PDGFR beta, VEGFR2 and PDGFR alpha expression in the tumour cells. KIT expression was restricted to ACC and a weak RET expression was limited to one adenocarcinoma, not otherwise specified (NOS). No BRAF mutation was found. No correlation was observed between the sorafenib activity and the expression of its markers although all six responders (two ACC, one adenocarcinoma, NOS, one salivary duct cancer [SDC], one high-grade mucoepidermoid [HG-MEC] and one poorly-differentiated cancer) are enriched in the stromal component showing a PDGFR beta immunodecoration. In ACCs, immunohistochemistry revealed MYB protein expression in 15/16 cases (94%) and the MYB-NFIB fusion oncogene was observed in 9/14 (64%). Sorafenib is the first anti-angiogenic agent to demonstrate activity in RMSGC patients, particularly in some histotypes such as HG-MEC, SDC and adenocarcinoma, NOS."

According to the news editors, the research concluded: "The PDGFRb-positive rich stromal component characterising these histotypes and the lack of correlation between the activity of sorafenib and its targets suggests anti-angiogenic effect as the prevalent mechanism of action of sorafenib in SGCs."

For more information on this research see: A phase II study of sorafenib in recurrent and/or metastatic salivary gland carcinomas: Translational analyses and clinical impact. European Journal of Cancer, 2016;69():158-165. European Journal of Cancer can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Oncology - Carcinomas

New Findings in Carcinomas Described from Tom Baker Cancer Center (Repurposing Sunitinib with Oncolytic Reovirus as a Novel Immunotherapeutic Strategy for Renal Cell Carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Carcinomas. According to news reporting originating from Calgary, Canada, by NewsRx correspondents, research stated, "In addition to their direct cytopathic effects, oncolytic viruses are capable of priming antitumor immune responses. However, strategies to enhance the immunotherapeutic potential of these agents are lacking."

Our news editors obtained a quote from the research from Tom Baker Cancer Center, "Here, we investigated the ability of the multi-tyrosine kinase inhibitor and first-line metastatic renal cell carcinoma (RCC) agent, sunitinib, to augment the antitumor immune response generated by oncolytic reovirus. In vitro, oncolysis and chemokine production were assessed in a panel of human and murine RCC cell lines after exposure to reovirus, sunitinib, or their combination. In vivo, the RENCA syngeneic murine model of RCC was employed to determine therapeutic and tumor-specific immune responses after treatment with reovirus (intratumoral), sunitinib, or their combination. Parallel investigations employing the KLN205 syngeneic murine model of lung squamous cell carcinoma (NSCLC) were conducted for further validation.

Reovirus-mediated oncolysis and chemokine production was observed following RCC infection. Reovirus monotherapy reduced tumor burden and was capable of generating a systemic adaptive antitumor immune response evidenced by increased numbers of tumor-specific CD8(+) IFN gamma-producing cells. Coadministration of sunitinib with reovirus further reduced tumor burden resulting in improved survival, decreased accumulation of immune suppressor cells, and the establishment of protective immunity upon tumor rechallenge. Similar results were observed for KLN205 tumor-bearing mice, highlighting the potential broad applicability of this approach."

According to the news editors, the research concluded: "The ability to repurpose sunitinib for augmentation of reovirus' immunotherapeutic efficacy positions this novel
combination therapy as an attractive strategy ready for clinical testing against a range of histologies, including RCC and NSCLC."

For more information on this research see: Repurposing Sunitinib with Oncolytic Reovirus as a Novel Immunotherapeutic Strategy for Renal Cell Carcinoma. *Clinical Cancer Research*, 2016;22(23):5839-5850. *Clinical Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. **Cardiology**

**New Findings in Cardiology Described from Henry Ford Hospital**

*(Outcomes on Continuous Flow Left Ventricular Assist Devices: A Single Institutional 9-Year Experience)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting originating from Detroit, Michigan, by NewsRx correspondents, research stated, "Continuous-flow left ventricular assist devices (LVADs) have become the standard of care for patients with advanced heart failure. The goal of this study was to review our 9-year institutional experience."

Our news editors obtained a quote from the research from Henry Ford Hospital, "From March 2006 through May 2015, 231 patients underwent implantation of 240 CF LVADs, HeartMate II LVAD (Thoratec Corp., Pleasanton, CA; n=205) or HVAD (HeartWare Inc., Framingham, MA; n=35). Of these, 127 devices (52.9%) were implanted as bridge to transplantation (BTT) and 113 (47.1%) as destination therapy (DT). Mean age was 51.2 +/- 11.9 years for BTT patients and 58.2 +/- 11.4 years for DT patients (p < 0.001). There was a higher incidence of preoperative diabetes, renal insufficiency, peripheral vascular disease, and previous cardiac operation in DT patients (p < 0.05). Survival was higher for BTT patients, with 1-, 6-, 12-, and 24-month survivals of 91.0%, 90.0%, 88.5%, and 72.1%, respectively, versus 85.3%, 81.1%, 75.6%, and 59.0%, respectively, for DT patients (p=0.038). Gastrointestinal bleeding was the most common complication (29.6%), followed by right ventricular failure (22.5%) and stroke (15.0%), with a similar incidence for BTT and DT patients. Preoperative liver biopsy
(hazard ratio [HR] 2.27, p=0.036), mechanical support (HR 1.82, p=0.025), aspartate transaminase (HR 1.07, p=0.001), and alanine aminotransferase (HR 0.95, p=0.024) were severe independent predictors of survival in multivariate analysis. These data indicate excellent survival for BTT and DT patients on long-term LVAD support."

According to the news editors, the research concluded: "However, for LVAD therapy to become a plausible alternative to heart transplantation, we need to further decrease the incidence of postoperative complications."

The news editors report that additional information may be obtained by contacting J.A. Morgan, Henry Ford Hospital, Inst Heart & Vasc, Div Cardiothorac Surg, Detroit, MI 48202, United States. Drugs and Therapies - Central Nervous System Agents

New Findings in Central Nervous System Agents Described from University of Rey Juan Carlos (Time Trend in Psychotropic Medication Use in Spain: A Nationwide Population-Based Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Central Nervous System Agents have been presented. According to news reporting originating from Alcorcon, Spain, by NewsRx correspondents, research stated, "We performed an epidemiologic study to analyze nationwide time trends in adult psychotropic drug use over a period from 2006 to 2012, and to identify those factors associated with the likelihood of consumption of these drugs during the study period; Methods: Cross-sectional study on psychotropic medication in the Spanish adult population. We used secondary individualized data drawn from the 2006 and 2012 Spanish National Health Surveys (SNHS)."

Our news editors obtained a quote from the research from the University of Rey Juan Carlos, "The dependent variable was the use of psychotropic drugs in the previous two weeks. Independent variables included socio-demographic characteristics, comorbidity, lifestyles and healthcare resource utilization. Using logistic multivariate regression models, we analyzed the temporal evolution of psychotropic medication consumption between 2006 and 2012 in both sexes; Results: The prevalence of psychotropic drug use was significantly greater in women
In Spanish women, the variables associated with a greater probability of psychotropic use were, age, unemployment (adjusted odds ratio (AOR), 1.60; 95% CI, 1.24-2.07), negative perception of health or taking non-psychotropic drugs. Among men, psychotropic use is associated with presence of chronic disease, negative perception of health (AOR, 3.27; 95% CI, 2.62-4.07 in 2012) or inactive status; Conclusions: Between 2006 and 2012, the probability of having taken psychotropic drugs increased by 16% among women. Unemployed women aged >= 45 years with a negative perception of their health constitute a clear risk profile in terms of psychotropic drug use."

According to the news editors, the research concluded: "Inactive men who have a negative perception of their health are the group most likely to consume psychotropic drugs."

The news editors report that additional information may be obtained by contacting P. Carrasco-Garrido, Rey Juan Carlos Univ, Fac Hlth Sci, Prevent Med & Public Hlth Teaching & Res Unit, Alcorcon 28922, Spain. Additional authors for this research include V. Hernandez-Barrera, I. **Drugs and Therapies - Chemotherapy**

**New Findings in Chemotherapy Described from University of California (Posaconazole Plasma Concentrations on Days Three to Five Predict Steady-State Levels)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Chemotherapy have been published. According to news reporting originating from San Diego, California, by NewsRx correspondents, research stated, "Low posaconazole plasma concentrations (PPCs) have been associated with breakthrough invasive fungal infections."

Funders for this research include Merck Investigator Studies Program, Oesterreichische Nationalbank (OeNB).

Our news editors obtained a quote from the research from the University of California, "We assessed the correlation between pre-steady-state PPCs (obtained between days 3 and 5) and PPCs obtained during steady state in 48 patients with underlying hematological malignancies receiving posaconazole oral-solution prophylaxis. Pre-steady-state PPCs correlated significantly with PPCs obtained at steady state (Spearman r = 0.754; P< 0.001)."

According to the news editors, the research concluded: "Receiver operating characteristic (ROC) curve analysis of pre-steady-state PPCs revealed an area under the curve (AUC) of 0.884 (95% confidence interval [CI], 0.790 to 0.977) for predicting satisfactory PPCs..."
at steady state."

**Digestive System Diseases and Conditions -...**

**New Findings in Cholangitis Described from Capital Medical University**

(A multicenter, randomized, double-blind trial comparing the efficacy and safety of TUDCA and UDCA in Chinese patients with primary biliary cholangitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Digestive System Diseases and Conditions - Cholangitis are presented in a new report. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Tauroursodeoxycholic acid (TUDCA) is a taurine conjugated form of ursodeoxycholic acid (UDCA) with higher hydrophility. To further evaluate the efficacy and safety of TUDCA for primary biliary cholangitis (PBC), we performed this study on Chinese patients."

Our news journalists obtained a quote from the research from Capital Medical University. "199 PBC patients were randomly assigned to either 250mg TUDCA plus UDCA placebo or 250mg UDCA plus TUDCA placebo, 3 times per day for 24 weeks. The primary endpoint was defined as percentage of patients achieving serum alkaline phosphatase (ALP) reduction of more than 25% from baseline. At week 24, 75.97% of patients in the TUDCA group and 80.88% of patients in the UDCA group achieved a serum ALP reduction of more than 25% from baseline (P=0.453). The percentage of patients with serum ALP levels declined more than 40% following 24 weeks of treatment was 55.81% in the TUDCA group and 52.94% in the UDCA group (P=0.699). Both groups showed similar improvement in serum levels of ALP, aspartate aminotransferase, and total bilirubin (P >0.05). The proportion of patients with pruritus/scratch increased from 1.43% to 10.00% in UDCA group, while there's no change in TUDCA group (P=0.023). Both drugs were well tolerated, with comparable adverse event rates between the 2 groups."

According to the news editors, the research concluded: "TUDCA is safe and as efficacious as UDCA for the treatment of PBC, and may be better to relieve symptoms than UDCA."
For more information on this research see: A multicenter, randomized, double-blind trial comparing the efficacy and safety of TUDCA and UDCA in Chinese patients with primary biliary cholangitis. *Medicine*, 2016;95(47):147-152. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Digestive System Diseases and Conditions**

**New Findings in Cholelithiasis Described from University of Milan (Non-steroid anti-inflammatory drugs for biliary colic)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Digestive System Diseases and Conditions - Cholelithiasis is now available. According to news reporting originating from Milan, Italy, by NewsRx correspondents, research stated, "Cholelithiasis refers to the presence of gallstones, which are concretions that form in the biliary tract, usually in the gallbladder. Cholelithiasis is one of the most common surgical problems worldwide and is particularly prevalent in most Western countries."

Our news editors obtained a quote from the research from the University of Milan, "Biliary colic is the term used for gallbladder pain experienced by a person with gallstones and without overt infection around the gallbladder. It is the most common manifestation of cholelithiasis, observed in over one-third of people with gallstones over the course of 10 or more years. Non-steroid anti-inflammatory drugs (NSAIDs) have been widely used to relieve biliary colic pain, but their role needs further elucidation. They may decrease the frequency of short-term complications, such as mild form of acute cholecystitis, jaundice, cholangitis, and acute pancreatitis, but they may also increase the occurrence of more severe and possibly life-threatening adverse events such as gastrointestinal bleeding, renal function impairment, cardiovascular events, or milder events such as abdominal pain, drowsiness, headache, dizziness, or cutaneous manifestations. To assess the benefits and harms of NSAIDs in people with biliary colic. Search methods We searched the Cochrane Hepato-Biliary Controlled Trials Register, Cochrane Central Register of Controlled Trials (CENTRAL) in the Cochrane Library, MEDLINE (Ovid SP), Embase (Ovid SP), Science Citation Index Expanded (Web of Science), and ClinicalTrials.gov until July 2016. We applied no language limitation. Selection criteria Randomised clinical trials recruiting participants presenting with biliary colic and comparing NSAIDs versus no intervention, placebo, or other drugs. Data collection and analysis Two review authors (MF and AC) independently identified trials for inclusion. We used risk ratios (RR) to express intervention effect estimates, and we analysed the data with both fixed-effect
and random-effects model meta-analyses, depending on the amount of heterogeneity. We controlled random errors with Trial Sequential Analysis. We assessed the methodological quality of the evidence using GRADE criteria. Twelve randomised clinical trials (RCTs) met our predefined review protocol criteria for analysis. We found only one trial to be at low risk of bias, considering the remaining trials to be at high risk of bias. The risk of selection bias in nine studies was unclear due to poor reporting, leading to uncertainty in the pooled effect estimates. Five trials compared NSAIDs versus placebo, four trials compared NSAID versus opioids, and four trials compared NSAID versus spasmolytic drugs (one of the 12 trials was a three-arm study comparing NSAIDs versus both opioids and spasmolytic drugs). There were 828 randomised participants (minimum 30 and maximum 324 per trial), of whom 416 received NSAIDs and 412 received placebo, spasmolytic drugs, or opioids. Twenty-four per cent of the participants were males. The age of the participants in the trials ranged from 18 to 86 years. All people were admitted to emergency departments for acute biliary pain. There was no mortality. When compared with placebo, NSAIDs obtained a significantly lower proportion of participants without complete pain relief (RR 0.27, 95% confidence interval (CI) 0.19 to 0.40; I² = 0%; 5 trials; moderate-quality evidence), which was confirmed by Trial Sequential Analysis, but not regarding participants with complications (RR 0.66, 95% CI 0.38 to 1.15; I² = 26%; 3 trials; very low-quality evidence). NSAIDs showed more pain control than spasmolytic drugs (RR 0.51, 95% CI 0.37 to 0.71; I² = 0%; 4 trials; low-quality evidence), which was not confirmed by Trial Sequential Analysis, and a significantly lower proportion of participants with complications (RR 0.27, 95% CI 0.12 to 0.57; I² = 0%; 2 trials; low-quality evidence), which was also not confirmed by Trial Sequential Analysis. We found no difference in the proportions of participants without complete pain relief when comparing NSAIDs versus opioids (RR 0.98, 95% CI 0.47 to 2.07; I² = 52%), suggesting moderate heterogeneity among trials (4 trials; very low-quality evidence). Only one trial comparing NSAIDs versus opioids reported results on complications, finding no significant difference between treatments. None of the included trials reported severe adverse events. Seven out of the 12 trials assessed non-severe adverse events: in two out of the seven trials, adverse events were not observed, and minor events were reported in the remaining five trials. In addition, we found one ongoing RCT assessing the analgesic efficacy of intravenous ibuprofen in biliary colic. Authors' conclusions NSAIDs have been assessed in relatively few trials including a limited number of participants for biliary colic, considering its common occurrence. We found only one trial to be at low risk of bias. There was no mortality. None of the included trials reported quality of life. The generalisability of the review is low as most of the RCTs included neither elderly people nor participants with comorbidities, who are more prone to complications as compared to others with biliary colic. The beneficial effect of NSAIDs compared with placebo on pain relief was confirmed when we applied Trial Sequential Analysis. The quality of evidence according to GRADE criteria was moderate for the comparison of NSAIDs versus placebo regarding the outcome lack of pain relief and low or very low for the other outcomes and comparisons. We found only one trial at low risk of bias, following the predefined 'Risk of bias' domains."

According to the news editors, the research concluded: "We found the risk of selection bias to be unclear in nine studies due to poor reporting, leading to uncertainty in the pooled effect estimates."

For more information on this research see: Non-steroid anti-inflammatory drugs for biliary colic. *Cochrane Database of Systematic Reviews*, 2016;(9):1223-1280. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news editors report that additional information may be obtained by contacting M. Fraquelli, University of Milan, Dept. of Pathophysiol & Transplantat, Gastroenterol &
Kidney Diseases and Conditions - Chronic Kidney...

**New Findings in Chronic Kidney Disease Described by K. Zhang and Co-Researchers (MICS, an easily ignored contributor to arterial calcification in CKD patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Kidney Diseases and Conditions - Chronic Kidney Disease. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "In chronic kidney disease (CKD), simultaneous mineral and skeleton changes are prevalent, known as CKD-mineral bone disorder (CKD-MBD). Arterial calcification (AC) is a clinically important complication of CKD-MBD."

The news correspondents obtained a quote from the research, "It can increase arterial stiffness, which leads to severe cardiovascular events. However, current treatments have little effect on regression of AC, as its mechanisms are still unclear. There are multiple risk factors of AC, among which Malnutrition-Inflammation Complex Syndrome (MICS) is a new and crucial one. MICS, a combined syndrome of malnutrition and inflammation, generally begins at the early stage of CKD and becomes obvious in end-stage renal disease (ESRD). It was linked to reverse epidemiology and associated with increased cardiovascular mortality in ESRD patients. Recent data suggest that MICS can trigger CKD-MBD and accelerate the course of AC. In this present review, we summarize the recent understanding about the aggravating effects of MICS on AC and discuss the possible underlying mechanisms."

According to the news reporters, the research concluded: "A series of findings indicate that targeting MICS will provide a potential strategy for treating AC in CKD."

Our news journalists report that additional information may be obtained by contacting H. Huang, Guangdong Prov Key Lab Arrhythmia & Electrophysio, Guangzhou, Guangdong, People's Republic of China. Additional authors for this research include J.W. Gao, J. Chen, X. Liu, Q.Q. Cai, P.M. Liu and H. Huang.

Kidney Diseases and Conditions - Chronic Kidney...

New Findings in Chronic Kidney Disease Described from Federal University (Asymptomatic Ventricular Arrhythmia and Clinical Outcomes in Chronic Kidney Disease: A Pilot Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Kidney Diseases and Conditions - Chronic Kidney Disease. According to news reporting from Sao Paulo, Brazil, by NewsRx journalists, research stated, "Ventricular arrhythmia is associated with increased risk of cardiovascular events and death in the general population. Sudden death is a leading cause of death in end-stage renal disease."

The news correspondents obtained a quote from the research from Federal University, "We aimed at evaluating the effects of ventricular arrhythmia on clinical outcomes in patients with earlier stages of chronic kidney disease (CKD). In a prospective study of 109 nondialyzed CKD patients (estimated glomerular filtration rate 34.8 +/- 16.1 ml/min/1.73 m(2), 57 +/- 11.4 years, 61% male, 24% diabetics), we tested the hypothesis that the presence of subclinical complex ventricular arrhythmia, assessed by 24-hour electrocardiogram, is associated with increased risks of cardiovascular events, hospitalization, and death and with their composite outcome during 24 months of follow-up. Complex ventricular arrhythmia was defined as the presence of multifocal ventricular extrasystoles, paired ventricular extrasystoles, nonsustained ventricular tachycardia, or R wave over T wave. We identified complex ventricular arrhythmia in 14% of participants at baseline. During follow-up, 11 cardiovascular events, 15 hospitalizations, and 4 deaths occurred. The presence of complex ventricular arrhythmia was associated with cardiovascular events (p < 0.001), hospitalization (p = 0.018), mortality (p < 0.001), and the composite outcome (p < 0.001). In multivariate Cox regression analysis, adjusting for demographic characteristics, complex ventricular arrhythmia was associated with increased risk of the composite outcome (HR 4.40; 95% CI 1.60-12.12; p = 0.004)."

According to the news reporters, the research concluded: "In this pilot study, the presence of asymptomatic complex ventricular arrhythmia was associated with poor clinical outcomes in nondialed CKD patients."

Our news journalists report that additional information may be obtained by contacting M.E.F. Canziani, Federal University of Sao Paulo, Div Nephrol, Dept. of Internal Med, BR-04039000 Sao Paulo, SP, Brazil. Additional authors for this research include R. Watanabe, M.M. Lemos, J.L. Cassiolato, M. Wolf and M.E.F. Canziani.

Musculoskeletal Diseases and Conditions - Chronic...

New Findings in Chronic Pain Described from St. Louis University School of Medicine (Identification of A3 adenosine receptor agonists as novel non-narcotic analgesics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Musculoskeletal Diseases and Conditions - Chronic Pain is the subject of a report. According to news reporting originating in St. Louis, Missouri, by NewsRx journalists, research stated, "Chronic pain negatively impacts the quality of life in a variety of patient populations. The current therapeutic repertoire is inadequate in managing patient pain and warrants the development of new therapeutics."

Funders for this research include NIDDK Intramural Research Program, Mayday Fund, National Cancer Institute, Leukemia and Lymphoma Society Translational Research Program.

The news reporters obtained a quote from the research from the St. Louis University School of Medicine, "Adenosine and its four cognate receptors (A1, A2A, A2B and A3) have important roles in physiological and pathophysiological states, including chronic pain. Preclinical and clinical studies have revealed that while adenosine and agonists of the A1 and A2A receptors have antinociceptive properties, their therapeutic utility is limited by adverse cardiovascular side effects. In contrast, our understanding of the A3 receptor is only in its infancy, but exciting preclinical observations of A3 receptor antinociception, which have been bolstered by clinical trials of A3 receptor agonists in other disease states, suggest pain relief without cardiovascular side effects and with sufficient tolerability. Our goal herein is to briefly discuss adenosine and its receptors in the context of pathological pain and to consider the current data regarding A3 receptor-mediated antinociception. We will highlight recent findings regarding the impact of the A3 receptor on pain pathways and examine the current state of selective A3 receptor agonists used for these studies."

According to the news reporters, the research concluded: "The adenosine-to-A3 receptor pathway represents an important endogenous system that can be targeted to provide safe, effective pain relief from chronic pain."

Our news correspondents report that additional information may be obtained by contacting K. Janes, Dept. of Pharmacology and Physiology, Saint Louis University School of Medicine, St Louis, MO, United States. Additional authors for this research include A.M. Symons-Liguori, K.A. Jacobson and D. Salvemini.

Cirrhosis

New Findings in Cirrhosis Described from Laboratory of Human Genetics of Infectious Diseases (Impact of IL28B, APOH and ITPA Polymorphisms on Efficacy and Safety of TVR- or BOC-Based Triple Therapy in Treatment-Experienced HCV-1 Patients with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cirrhosis is now available. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "Human genetic factors influence the outcome of pegylated interferon and ribavirin hepatitis C therapy. We explored the role of IL28B, APOH and ITPA SNPs on the outcomes of triple therapy including telaprevir or boceprevir in patients with compensated cirrhosis chronically infected with HCV-1."

The news reporters obtained a quote from the research from the Laboratory of Human Genetics of Infectious Diseases, "A total of 256 HCV-1 Caucasian treatment-experienced patients with compensated cirrhosis from the ANRS CO[2]0-CUPIC cohort were genotyped for a total of 10 candidate SNPs in IL28B (rs12979860 and rs368234815), APOH (rs8178822, rs12944940, rs10048158, rs52979880, rs1801689 and rs1801690) and ITPA (rs1127354 and rs7270101). We tested the association of IL28B and APOH SNPs with sustained virological response and of ITPA SNPs with anemia related phenotypes by means of logistic regression assuming an additive genetic model. None of the six APOH SNPs were associated with sustained virological response. The favorable alleles of the IL28B SNPs rs12979860 and rs368234815 were associated with sustained virological response (rs12979860: OR=2.35[1.50-3.70], p=2x10(-4)). Refined analysis showed that the effect of IL28B SNPs on sustained virological response was restricted to prior PegIFN/RBV relapse (OR=3.80[1.82-8.92], p=8x10(-4)). We also confirmed the association between ITPA low activity alleles and protection against early hemoglobin decline in triple therapy (p=2x10(-5))."

According to the news reporters, the research concluded: "Our results suggest that the screening of rs12979860 may remain interesting for decision making in prior relapse HCV-1 Caucasian patients with compensated cirrhosis eligible for a telaprevir-or boceprevir-based therapy."

For more information on this research see: Impact of IL28B, APOH and ITPA Polymorphisms on Efficacy and Safety of TVR- or BOC-Based Triple Therapy in Treatment-Experienced HCV-1 Patients with Compensated Cirrhosis from the ANRS CO20-CUPIC Study.
Clinical Research - Clinical Trials and Studies

New Findings in Clinical Trials and Studies Described by B. Tan and Co-Researchers (Incidence and cost of stress ulcer prophylaxis after discharge from the intensive care unit: a retrospective study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Research - Clinical Trials and Studies. According to news reporting originating in Perth, Australia, by NewsRx journalists, research stated, "To describe current patterns in initiation and cessation of proton pump inhibitors (PPIs) for stress ulcer prophylaxis (SUP) in intensive care units, and to assess the costs associated with inappropriate (non-evidence-based) SUP. setting and participants: Retrospective observational study in five ICUs in Western Australia."

The news reporters obtained a quote from the research, "We assessed the medical records of consecutive patients admitted to the ICUs between September 2013 and January 2015. Patients aged < 18 years were excluded. We included 531 patients in the study. Of the 184 patients in whom PPIs were initiated for SUP in the ICU, 90 (48.9%) were still taking the therapy at the time of discharge from hospital. A documented indication for ongoing therapy was present in only nine patients (10%). We assumed a 10-year life expectancy after ICU discharge and that most patients continued taking a PPI, and calculated an additional cost of $180.20 per patient admitted to the ICU. This was based only on unnecessary PPI costs (ignoring costs of managing additional adverse events). The direct cumulative annual cost to the WA health system of PPIs continued unnecessarily for patients at discharge from hospital is estimated to be $250 800 for each year they continue to receive them. A substantial proportion of patients prescribed SUP in the ICU continue receiving this therapy at hospital discharge despite no clear indication."

According to the news reporters, the research concluded: "In addition to potential adverse clinical effects, this is associated with major direct and indirect cost implications."

For more information on this research see: Incidence and cost of stress ulcer prophylaxis after discharge from the intensive care unit: a retrospective study. Critical Care and Resuscitation, 2016;18(4):270-274. Critical Care and Resuscitation can be contacted at:
Our news correspondents report that additional information may be obtained by contacting B. Tan, Fiona Stanley Hosp, Perth, WA, Australia. Additional authors for this research include R. Norman, E. Litton, C. Heath, D.J. Hawkins, R. Krishnamurthy, R. Sonawane and M.H. Anstey.

Clinical Research - Clinical Trials and Studies

New Findings in Clinical Trials and Studies Described from Fujian University of Traditional Chinese Medicine (Clinical Efficacy of Acupuncture Treatment in Combination With RehaCom Cognitive Training for Improving Cognitive Function in Stroke: ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Research - Clinical Trials and Studies. According to news reporting originating from Fujian, People's Republic of China, by NewsRx correspondents, research stated, "The aim of this study was to identify the clinical efficacy of acupuncture in combination with RehaCom cognitive training in poststroke patients with cognitive dysfunction. This study was a 2 x 2 factorial design randomized controlled trial comparing acupuncture, computer-assisted cognitive rehabilitation, and the usual treatment by per-protocol analysis."

Our news editors obtained a quote from the research from the Fujian University of Traditional Chinese Medicine, "The trial was completed by 204 stroke patients, including 49 patients in a control group, 52 patients in an acupuncture treatment group, 51 patients in a RehaCom training group, and 52 patients in an acupuncture combined with RehaCom group. All of the patients accepted basic treatment and health education. The interventions continued for 12 weeks (30 minutes per day, 5 days per week). The relative cognitive and functional outcomes were measured at baseline and 12 weeks (at the end of intervention) using the Mini-Mental State Examination (MMSE), Montreal Cognitive Assessment (MoCA), and Functional Independence Measure (FIM) scales. After 12 weeks of treatment, the functional statuses of the patients in each of the 4 groups showed varying degrees of improvement. Multiple comparisons of the changes in the MMSE, MoCA, and FIM scores indicated that acupuncture combined with RehaCom cognitive training (ACR) had enhanced therapeutic effects on the functional statuses of the stroke patients (P < .05). In addition, ACR had similar therapeutic effects on the functional statuses of the stroke patients according to each of the assessment scales applied (P Delta(change) (value) MMSE = 0.399, P Delta MoCA = 0.794, P Delta FIM = 0.862). The interaction effect values between acupuncture and RehaCom training (acceptance or nonacceptance) were as follows: Delta MMSE: F = 6.251, P = .013; Delta MoCA: F = 4.991, P = .027; and Delta FIM: F = 6.317, P = .013. Further, the main effect values for acupuncture and RehaCom training were both significant (P < .05). There is an interaction effect in the treatment of stroke patients using ACR."
According to the news editors, the research concluded: "The use of acupuncture in combination with RehaCom training has better therapeutic effects on the functional statuses of poststroke patients than the use of either treatment alone, demonstrating the clinical significance of this combination therapy."

The news editors report that additional information may be obtained by contacting L.D. Chen, Fujian Univ Tradit Chinese Med, Fuzhou 350108, Fujian, People's Republic of China. Clinical Research - Clinical Trials and Studies

**New Findings in Clinical Trials and Studies Described from Medical University ("Threshold-crossing"A Useful Way to Establish the Counterfactual in Clinical Trials?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting out of Vienna, Austria, by NewsRx editors, research stated, "A central question in the assessment of benefit/harm of new treatments is: how does the average outcome on the new treatment (the factual) compare to the average outcome had patients received no treatment or a different treatment known to be effective (the counterfactual)? Randomized controlled trials (RCTs) are the standard for comparing the factual with the counterfactual. Recent developments necessitate and enable a new way of determining the counterfactual for some new medicines."

Our news journalists obtained a quote from the research from Medical University, "For select situations, we propose a new framework for evidence generation, which we call threshold-crossing. This framework leverages the wealth of information that is becoming available from completed RCTs and from real world data sources. Relying on formalized procedures, information gleaned from these data is used to estimate the counterfactual, enabling efficacy assessment of new drugs."

According to the news editors, the research concluded: "We propose future (research) activities to enable threshold-crossing for carefully selected products and indications in which RCTs are not feasible."

For more information on this research see: "Threshold-crossing"A Useful Way to
New Findings in Clinical Trials and Studies Described from University of Iowa (Patient-activation and guideline-concordant pharmacological treatment after bone density testing: the PAADR trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Clinical Research - Clinical Trials and Studies are presented in a new report. According to news reporting from Iowa City, Iowa, by NewsRx journalists, research stated, "Patients often do not know or understand their bone density test results, and pharmacological treatment rates are low. In a clinical trial of 7749 patients, we used a tailored patient-activation result letter accompanied by a bone health brochure to improve appropriate pharmacological treatment."

Financial supporters for this research include National Institute on Aging, National Institute for Arthritis and Musculoskeletal Diseases, National Institute for Arthritis and Musculoskeletal Diseases.

The news correspondents obtained a quote from the research from the University of Iowa, "Treatment rates, however, did not improve. Patients often do not know or understand their dual-energy x-ray absorptiometry (DXA) test results, which may lead to suboptimal care. We tested whether usual care augmented by a tailored patient-activation DXA result letter accompanied by an educational brochure would improve guideline-concordant pharmacological treatment compared to usual care only. We conducted a randomized, controlled, double-blinded, pragmatic clinical trial at three health care centers in the USA. We randomized 7749 patients aged >50 years old and presenting for DXA between February 2012 and August 2014. The primary clinical endpoint at 12 and 52 weeks post-DXA was receiving guideline-concordant pharmacological treatment. We also examined four of the steps along the pathway from DXA testing to that clinical endpoint, including (1) receiving and (2) understanding their DXA results and (3) having subsequent contact with their provider and (4) discussing their results and options. Mean age was 66.6 years, 83.8% were women, and 75.3% were non-Hispanic whites. Intention-to-treat analyses revealed that guideline-concordant pharmacological treatment was not improved at either 12 weeks (65.1 vs. 64.3%, p = 0.506) or 52 weeks (65.2 vs. 63.8%, p =
0.250) post-DXA, even though patients in the intervention group were more likely (all p< 0.001) to recall receiving their DXA results letter at 12 weeks, correctly identify their results at 12 and 52 weeks, have contact with their provider at 52 weeks, and have discussed their results with their provider at 12 and 52 weeks."

According to the news reporters, the research concluded: "A tailored DXA result letter and educational brochure failed to improve guideline-concordant care in patients who received DXA."

For more information on this research see: Patient-activation and guideline-concordant pharmacological treatment after bone density testing: the PAADRN randomized controlled trial. Osteoporosis International, 2016;27(12):3513-3524. Osteoporosis International can be contacted at: Springer London Ltd, 236 Grays Inn Rd, 6TH Floor, London WC1X 8HL, England. DNA Research

New Findings in DNA Research Described from University of Sao Paulo
(An Aromatic Diamidine That Targets Kinetoplast DNA, Impairs the Cell Cycle in Trypanosoma cruzi, and Diminishes Trypomastigote Release from Infected Mammalian Host Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on DNA Research is the subject of a report. According to news reporting out of Sao Paulo, Brazil, by NewsRx editors, research stated, "Trypanosoma cruzi is the etiological agent of Chagas disease, affecting approximately 10 million people in the Americas and with some 40 million people at risk. The objective of this study was to evaluate the anti-T. cruzi activity of three new diamidines that have a 3,4-ethylenedioxy extension of the thiophene core, designated MB17, MB19, and MB38."

Funders for this research include The Ministry of Science, Education and Sports of the Republic of Croatia, MCTI | Conselho Nacional de Desenvolvimento Cientifico e Tecnologico (CNpq), Fundacao de Amparo a Pesquisa do Estado de Sao Paulo (FAPESP).

Our news journalists obtained a quote from the research from the University of Sao Paulo, "All three diamidines exhibited dose-dependent inhibition of epimastigote replication. The mechanisms of action of these diamidines were investigated. Unlike MB17 and MB19, MB38 exhibited a significant increase in the number of annexin-propidium iodide double-
labeled cells compared to levels in control parasites. As MB17 had shown a lower 50% inhibitory concentration (IC50) against epimastigote growth, the mechanism of action of this drug was studied in more detail. MB17 triggered a decrease in the intracellular ATP levels. As a consequence, MB17 affected the genomic DNA and kinetoplast DNA (kDNA) and impaired the parasite cell cycle. Moreover, MB17 caused DNA fragmentation, with a more severe effect on kDNA than on nuclear DNA, resulting in dyskinetoplastic cells. MB17 was tested for toxicity and effectiveness for the treatment of infected CHO-K-1 cells, exhibiting a 50% cytotoxic concentration (CC50) of 13.47 +/- 0.37 μM and an IC50 of 0.14 +/- 0.12 μM against trypomastigote release.

According to the news editors, the research concluded: "MB17 also diminished the infection index by 60% at 0.5 μM. Despite belonging to the same family, these diamidines have different efficiencies. To summarize, MB17 was the most potent of these diamidines against epimastigotes, producing DNA damage preferentially in kDNA, impairing the parasite cell cycle, and decreasing the infection index and trypomastigote release from infected mammalian host cells, with a high selectivity index (SI) (< 90). These data suggest that MB17 could be an interesting lead compound against T. cruzi."

For more information on this research see: An Aromatic Diamidine That Targets Kinetoplast DNA, Impairs the Cell Cycle in Trypanosoma cruzi, and Diminishes Trypomastigote Release from Infected Mammalian Host Cells. *Antimicrobial Agents and Chemotherapy*, 2016;60(10):5867-5877. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Genetics - DNA Research**

**New Findings in DNA Research Described from University of Toulouse (Analysis of DNA Replication by Optical Mapping in Nanochannels)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics - DNA Research is now available. According to news reporting out of Toulouse, France, by NewsRx editors, research stated, "DNA replication is essential to maintain genome integrity in S phase of the cell division cycle. Accumulation of stalled replication forks is a major source of genetic instability, and likely constitutes a key driver of tumorigenesis."

Financial supporters for this research include Plan Cancer, Agence Nationale de la
Our news journalists obtained a quote from the research from the University of Toulouse, "The mechanisms of regulation of replication fork progression have therefore been extensively investigated, in particular with DNA combing, an optical mapping technique that allows the stretching of single molecules and the mapping of active region for DNA synthesis by fluorescence microscopy. DNA linearization in nanochannels has been successfully used to probe genomic information patterns along single chromosomes, and has been proposed to be a competitive alternative to DNA combing. Yet this conjecture remains to be confirmed experimentally. Here, two complementary techniques are established to detect the genomic distribution of tracks of newly synthesized DNA in human cells by optical mapping in nanochannels. Their respective advantages and limitations are compared, and applied them to detect deregulations of the replication program induced by the antitumor drug hydroxyurea."

According to the news editors, the research concluded: "The developments here thus broaden the field of applications accessible to nanofluidic technologies, and can be used in the future as part for molecular diagnostics in the context of high throughput cancer drug screening."

Our news journalists report that additional information may be obtained by contacting A. Bancaud, Univ Toulouse, LAAS, F-31400 Toulouse, France. Additional authors for this research include S. Pelofy, C. Blatche, M.J. Pillaire, S. Huet, C. Chapuis, J.S. Hoffmann and A. Bancaud.

Drugs and Therapies - Drug Resistance

New Findings in Drug Resistance Described from Yuncheng University (Stability Analysis Of A Two-strain Epidemic Model On Complex Networks With Latency)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Drug Resistance. According to news reporting out of Yuncheng, People's Republic of China, by NewsRx editors, research stated, "In this paper, a two-strain epidemic model on a complex network is proposed. The two strains are the drug-sensitive strain and the drug-resistant strain."

Our news journalists obtained a quote from the research from Yuncheng University, "The related basic reproduction numbers R-s and R-r are obtained. If R-0 = maxR-s, R-r < 1, then the disease-free equilibrium is globally asymptotically stable. If R-r > 1, then there is a
unique drug-resistant strain dominated equilibrium E-r, which is locally asymptotically stable if the invasion reproduction number R-r(s) < 1. If R-s > 1 and R-s > R-r, then there is a unique coexistence equilibrium E*. The persistence of the model is also proved."

According to the news editors, the research concluded: "The theoretical results are supported with numerical simulations."

For more information on this research see: Stability Analysis Of A Two-strain Epidemic Model On Complex Networks With Latency. *Discrete and Continuous Dynamical Systems-Series B*, 2016;21(8):2851-2866. *Discrete and Continuous Dynamical Systems-Series B* can be contacted at: Amer Inst Mathematical Sciences-Aims, PO Box 2604, Springfield, MO 65801-2604, USA.

Our news journalists report that additional information may be obtained by contacting J.Y. Yang, Yuncheng Univ, Dept. of Appl Math, Yuncheng 044000, Shanxi, People's Republic of China. Additional authors for this research include Y.M. Chen and J.M. Liu.

**Oncology - Esophageal Cancer**

**New Findings in Esophageal Cancer Described from Chinese Academy of Sciences (Exhaled gases online measurements for esophageal cancer patients and healthy people by proton transfer reaction mass spectrometry)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Esophageal Cancer. According to news reporting originating from Hefei, People's Republic of China, by NewsRx correspondents, research stated, "Esophageal cancer is a prevalent malignancy. There is a considerable demand for developing a fast and noninvasive method to screen out the suspect esophageal cancer patients who may undergo further clinical diagnosis."

Our news editors obtained a quote from the research from the Chinese Academy of Sciences, "The exhaled breathes from 29 esophageal cancer patients and 57 healthy people were directly measured using our home-made proton transfer reaction mass spectrometer (PTR-MS). Mann-Whitney U test and stepwise discriminant analysis were applied to identify the ions in the breath mass spectral data which can distinguish cancer cohort from healthy group. Receiver operating characteristics (ROC) analysis was also performed. Seven kinds of ions in the breath mass spectrum, viz., m/z 136, m/z 34, m/z 63, m/z 27, m/z 95, m/z 107 and m/z 45, have been found to distinguish between the esophageal cancer patients and healthy people with a sensitivity of 86.2% and a specificity of 89.5%, respectively. Compared with that from the healthy people, the breath mass spectra from esophageal cancer patients show that the mediant intensities of five kinds of ions were decrease and the rest two kinds of ions were increase. ROC analysis gave the area under the curve (AUC) of 0.943. This pilot study shows that the ionic characteristics of exhaled VOCs detected by PTR-MS may be used to differentiate between the
esophageal cancer patients and the healthy people."

According to the news editors, the research concluded: "Although the breath tests for more patients are needed to confirm such results, the present work indicates that the PTR-MS may be a promising method in the esophageal cancer screening."

Keywords for this news article include: Hefei, People's Republic of China, Asia, Cancer, Diagnostics and Screening, Esophageal Cancer, Gastroenterology, Oncology, Chinese Academy of Sciences.

**Oncology - Esophageal Cancer**

**New Findings in Esophageal Cancer Described from Oregon Health and Science University (Significant understaging is seen in clinically staged T2N0 esophageal cancer patients undergoing esophagectomy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Esophageal Cancer have been published. According to news reporting from Portland, Oregon, by NewsRx journalists, research stated, "This study aimed to determine the impact of preoperative staging on the treatment of clinical T2N0 (cT2N0) esophageal cancer patients undergoing esophagectomy. We reviewed a retrospective cohort of 27 patients treated at a single institution between 1999 and 2011."

The news correspondents obtained a quote from the research from Oregon Health and Science University, "Clinical staging was performed with computed tomography, positron emission tomography, and endoscopic ultrasound. Patients were separated into two groups: neoadjuvant therapy followed by surgery (NEOSURG) and surgery alone (SURG). There were 11 patients (41%) in the NEOSURG group and 16 patients (59%) in the SURG group. In the NEOSURG group, three of 11 patients (27%) had a pathological complete response and eight (73%) were partial or nonresponders after neoadjuvant therapy. In the SURG group, nine of 16 patients (56%) were understaged, 6 (38%) were overstaged, and 1 (6%) was correctly staged. In the entire cohort, despite being clinically node negative, 14 of 27 patients (52%) had node-positive disease (5/11 [45%] in the NEOSURG group, and 9/16 [56%] in the SURG group). Overall survival rate was not statistically significant between the two groups (P = 0.96). Many cT2N0 patients are clinically understaged and show no preoperative evidence of node-positive disease."

According to the news reporters, the research concluded: "Consequently, neoadjuvant therapy may have a beneficial role in treatment."

Keywords for this news article include: Portland, Oregon, United States, North and Central America, Digestive System Surgical Procedures, Combined Modality Therapy, Drugs and Therapies, Neoadjuvant Therapy, Esophageal Cancer, Gastroenterology, Esophagectomy, Oncology, Surgery, Oregon Health and Science University.

Proteins - Extracellular Matrix Proteins

**New Findings in Extracellular Matrix Proteins Described from University of Texas Southwestern (Endotrophin, a multifaceted player in metabolic dysregulation and cancer progression, is a predictive biomarker for the response to PPAR gamma ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Proteins - Extracellular Matrix Proteins are presented in a new report. According to news reporting from Dallas, Texas, by NewsRx journalists, research stated, "Endotrophin is a cleavage product derived from the collagen VI(alpha 3) chain. Collagen VI is expressed in a number of different tissues, but adipose tissue is a particularly prominent source for this extracellular matrix constituent."

The news correspondents obtained a quote from the research from the University of Texas Southwestern, "Mice lacking collagen VI are metabolically healthier due to reduced fibrosis in adipose tissue. Endotrophin seems to be one of the key players of collagen VI-mediated signalling effects, including its pro-fibrotic nature and chemoattractant properties for macrophages, while also playing an important role in cancer progression and the chemoresistance of tumour cells. The glucose-lowering class of thiazolidinediones (TZDs) that mediate their action through the nuclear receptor peroxisome proliferator-activated receptor (PPAR)gamma also exerts important effects on endotrophin by reducing the transcription of parental collagen VI molecules. As with many other pharmacological interventions, there is a range of responses observed in a diabetic patient population. In this issue of Diabetologia, Karsdal and colleagues (DOI:) demonstrate that baseline endotrophin levels offer excellent predictive values to indicate individuals who will show an optimised response to TZDs with respect to the lowering of HbA(1c) and reduced risk of adverse side effects."

According to the news reporters, the research concluded: "The identification of a predictive biomarker for optimal responders is an important step in highlighting the continued viability of TZDs as an effective glucose-lowering class of compounds."
For more information on this research see: Endotrophin, a multifaceted player in metabolic dysregulation and cancer progression, is a predictive biomarker for the response to PPAR gamma agonist treatment. *Diabetologia*, 2017;60(1):24-29. *Diabetologia* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Oncology - Gastric Cancer**

**New Findings in Gastric Cancer Described from Royal Marsden Hospital (Novel targets in the treatment of advanced gastric cancer: a perspective review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gastric Cancer. According to news reporting originating in Sutton, United Kingdom, by NewsRx journalists, research stated, "Gastric cancer is responsible for a high burden of disease globally. Although more extensive use of chemotherapy together with the recent introduction of the two targeted agents trastuzumab and ramucirumab have contributed to marginal outcome prolongation, overall survival for patients with advanced stage disease remains poor."

The news reporters obtained a quote from the research from Royal Marsden Hospital, "Over the last decade, a number of novel agents have been examined in clinical trials with largely disappointing results. Potential explanations for this are the absence of molecularly selected trial populations or weak predictive biomarkers within the context of a highly heterogeneous disease. In the recently published gastric cancer The Cancer Genome Atlas (TCGA) project a new classification of four different tumor subtypes according to different molecular characteristics has been proposed. With some overlap, several relatively distinct and potentially targetable pathways have been identified for each subtype."

According to the news reporters, the research concluded: "In this perspective review we match recent trial results with the subtypes described in the gastric cancer TCGA aiming to highlight data regarding novel agents under evaluation and to discuss whether this publication might provide a framework for future drug development."

For more information on this research see: Novel targets in the treatment of advanced gastric cancer: a perspective review. *Therapeutic Advances In Medical Oncology*, 2016;8(2):113-25. (Sage Publications - www.sagepub.com; Therapeutic Advances In Medical Oncology - tam.sagepub.com)

**Oncology - Gastric Cancer**

**New Findings in Gastric Cancer Described from Shanxi Cancer Hospital (RAD51B as a potential biomarker for early detection and poor prognostic evaluation contributes to tumorigenesis of gastric cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news reporting originating in Taiyuan, People's Republic of China, by NewsRx journalists, research stated, "Gastric cancer (GC) is a common and deadly disease worldwide. Outcomes of patients are poor largely due to chemoresistance or recurrence."

Financial support for this research came from The National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Shanxi Cancer Hospital, "Thus, identifying novel biomarkers to predict response to therapy and/or prognosis are urgently needed. RAD51B, a key player in DNA repair/recombination, has the potential to be a candidate oncogene and biomarker for cancer diagnosis and prognosis. However, its relationship with GC remains unclear. To evaluate clinicopathological and prognostic significance of RAD51B in GC, we examined messenger RNA (mRNA) and protein expression via quantitative real-time polymerase chain reaction (qRT-PCR) from 69 and tissue microarray from 144 GC patients, respectively. Our results showed that RAD51BmRNAexpression was significantly up-regulated in tumors compared to that of matched noncancerous tissues (P < 0.001). In parallel, RAD51B protein showed a mainly nucleus-staining pattern, and the positive rate in tumors and stomach atypical hyperplasia was significantly higher than that in matched noncancerous tissues (P = 0.015). Moreover, high level of RAD51B protein was correlated with advanced stage (P = 0.009), aggressive differentiation (P = 0.022), and lymph node metastasis (P = 0.001). Further, Kaplan-Meier analysis indicated that patients with high level of RAD51B expression exhibited worse overall survival compared to patients with low level (P = 0.040). A multivariate Cox regression analysis suggested that RAD51B may be an independent prognostic factor for GC patients in Chinese population (P = 0.004). Additionally, functional studies indicated that overexpression of RAD51B promoted cell proliferation, aneuploidy, and drug resistance, while RAD51B knockdown led to G1 arrest and sensitized cells to 5-fluorouracil (5-FU)."

According to the news reporters, the research concluded: "RAD51B may act as an oncogene during GC progression, and its hyperexpression may be a potential biomarker for early detection and poor prognosis of GC."

Oncology - Gliomas

**New Findings in Gliomas Described from Central South University**

(*Overexpression of RACK1 Promotes Metastasis by Enhancing Epithelial-Mesenchymal Transition and Predicts Poor Prognosis in Human Glioma*)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Gliomas are presented in a new report. According to news reporting out of Changsha, People's Republic of China, by NewsRx editors, research stated, "Emerging studies show that dysregulation of the receptor of activated protein kinase C1 (RACK1) plays a crucial role in tumorigenesis and progression of various cancers. However, the biological function and underlying mechanism of RACK1 in glioma remains poorly defined."

Our news journalists obtained a quote from the research from Central South University, "Here, we found that RACK1 was significantly up-regulated in glioma tissues compared with normal brain tissues, being closely related to clinical stage of glioma both in mRNA and protein levels. Moreover, Kaplan-Meier analysis demonstrated that patients with high RACK1 expression had a poor prognosis (p = 0.0062, HR = 1.898, 95% CI: 1.225-3.203). In vitro functional assays indicated that silencing of RACK1 could dramatically promote apoptosis and inhibit cell proliferation, migration, and invasion of glioma cells. More importantly, knockdown of RACK1 led to a vast accumulation of cells in G0/G1 phase and their reduced proportions at the S phase by suppressing the expression of G1/S transition key regulators Cyclin D1 and CDK6."

According to the news editors, the research concluded: "Additionally, this forced down-regulation of RACK1 significantly suppressed migration and invasion via inhibiting the epithelial-mesenchymal transition (EMT) markers, such as MMP2, MMP9, ZEB1, N-Cadherin, and Integrin-beta 1. Collectively, our study revealed that RACK1 might act as a valuable prognostic biomarker and potential therapeutic target for glioma."

For more information on this research see: Overexpression of RACK1 Promotes Metastasis by Enhancing Epithelial-Mesenchymal Transition and Predicts Poor Prognosis in Human Glioma. *International Journal of Environmental Research and Public Health*, 2016;13 (10):1174-1188. *International Journal of Environmental Research and Public Health* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.
New Findings in HIV/AIDS Described from Department of Molecular Virology (Human Immunodeficiency Virus Type 1 Two-Long Terminal Repeat Circles: A Subject for Debate)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - HIV/AIDS are presented in a new report. According to news reporting from Madrid, Spain, by NewsRx journalists, research stated, "HIV-1 infections are characterized by the integration of the reverse transcribed genomic RNA into the host chromosomes making up the provirus. In addition to the integrated proviral DNA, there are other forms of linear and circular unintegrated viral DNA in HIV-1-infected cells."

The news correspondents obtained a quote from the research from the Department of Molecular Virology, "One of these forms, known as two-long terminal repeat circles, has been extensively studied and characterized both in in vitro infected cells and in cells from patients. Detection of two-long terminal repeat circles has been proposed as a marker of antiretroviral treatment efficacy or ongoing replication in patients with undetectable viral load. But not all authors agree with this use because of the uncertainty about the lifespan of the two-long terminal repeat circles. We review the major studies estimating the half-life of the two-long terminal repeat circles as well as those proposing its detection as a marker of ongoing replication or therapeutic efficacy. We also review the characteristic of these circular forms and the difficulties in its detection and quantification. The variety of approaches and methods used in the two-long terminal repeat quantification as well as the low reliability of some methods make the comparison between results difficult."

According to the news reporters, the research concluded: "We conclude that it is not possible to draw a clear supposition about the lifespan of two-long terminal repeat circles and consequently they should not be used as a marker of ongoing replication without a careful analysis of the methods and results."

Our news journalists report that additional information may be obtained by contacting I. Olivares, Dept. of Molecular Virology, Centro Nacional de Microbiologia, Instituto de Salud Carlos III, Majadahonda, Madrid, Spain. Additional authors for this research include M. Pernas, C. Casado and C. Lopez-Galindez.

**New Findings in HIV/AIDS Described from San Francisco State University (Relationship-Based Predictors of Sexual Risk for HIV Among MSM Couples: A Systematic Review of the Literature)***

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immune System Diseases and Conditions - HIV/AIDS. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "Behavioral and epidemiological studies report high risk for HIV among MSM couples. Over the last decade, studies have examined relationship dynamics associated with sexual risk for HIV."

Our news editors obtained a quote from the research from San Francisco State University, "It is important to examine the impact this research has had on HIV prevention and what is still needed. We conducted a review of the literature focusing on relationship dynamics associated with sexual risk for HIV among MSM couples. Procedures used for this review were guided by the Preferred Reporting Items for Systematic Reviews and Meta-Analyses established to provide a framework for collecting, reviewing and reporting studies systematically (Mohler et al. in Ann Intern Med 151(4):264-269, 2009). We found that positive relationship dynamics are associated with less risk with partners outside the relationship, but were associated with greater odds of unprotected anal intercourse with primary partners."

According to the news editors, the research concluded: "We also discuss other factors including sexual agreements about outside partners and make recommendations for next steps in HIV prevention research among MSM couples."

The news editors report that additional information may be obtained by contacting C.C. Hoff, San Francisco State Univ, Center Res & Educ Gender & Sexual, San Francisco, CA 94103, United States. Additional authors for this research include C.K. Campbell, D. Chakravarty and L.A. Darbes.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s10461-016-1350-9. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings in HIV/AIDS Described from University of California (Use of HIV pre-exposure prophylaxis during the preconception, antepartum and postpartum periods at two United States medical centers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immune System Diseases and Conditions - HIV/AIDS is the subject of a report. According to news originating from San Francisco, California, by NewsRx correspondents, research stated, "Pregnancy may increase a woman's susceptibility to HIV. Maternal HIV acquisition during pregnancy and lactation is associated with increased perinatal and lactational HIV transmission."

Our news journalists obtained a quote from the research from the University of California, "There are no published reports of preexposure prophylaxis use after the first trimester of pregnancy or during lactation. The purpose of this study was to report the use of preexposure prophylaxis and to identify gaps in HIV prevention services for women who were at substantial risk of HIV preconception and during pregnancy and lactation at 2 United States medical centers. Chart review was performed on women who were identified as 'at significant risk' for HIV acquisition preconception (women desiring pregnancy) and during pregnancy and lactation at 2 medical centers in San Francisco and New York from 2010-2015. Women were referred to specialty clinics for women who were living with or were at substantial risk of HIV. Twenty-seven women who were identified had a median age of 27 years. One-half of the women had unstable housing, 22% of the women had ongoing intimate partner violence, and 22% of the women had active substance use. Twenty-six women had a male partner living with HIV, and 1 woman had a male partner who had sex with men. Of the partners who were living with HIV, 73% (19/26) were receiving antiretroviral therapy, and 42% (11/26) had documented viral suppression. Thirty-nine percent (10/26) of partners had known detectable virus, and 19% (5/26) had unknown viral loads. Women were identified by clinicians, health educators, and health departments. Approximately one-third of the women were identified preconception (8/27); the majority of the women were identified during pregnancy (18/27) with a median gestational age of 20 weeks (interquartile range, 11e23), and 1 woman was identified in the postpartum period. None of the pregnant referrals had received safer conception counseling to reduce HIV transmission. Twenty-six percent of all women (7/27) were eligible for postexposure prophylaxis at referral, of whom 57% (4/7) were offered postexposure prophylaxis. In 30% (8/27), the last HIV exposure was not assessed and postexposure prophylaxis was not offered. The median time from identification as 'at substantial risk' to consultation was 30 days (interquartile range, 2e62). Two women were lost to follow up before consultation. One woman who was identified as 'at significant risk' was not referred because of multiple pregnancy complications. She remained in obstetrics care and was HIV-negative at delivery but was lost to follow up until 10 months after delivery when she was diagnosed with HIV. No other seroconversions were identified. Of referrals who presented and were offered preexposure prophylaxis, 67% women (16/24) chose to take it, which was relatively consistent whether the women were preconception (5/8), pregnant (10/15), or after delivery (1/1). Median length of time on preexposure prophylaxis was 30 weeks (interquartile range, 20e53). One-half of women (10/20) who were in care at delivery did not attend a postpartum visit. Women at 2 United States centers frequently chose to use preexposure prophylaxis for HIV
prevention when it was offered preconception and during pregnancy and lactation. Further research and education are needed to close critical gaps in screening for women who are at risk of HIV for pre-and postexposure prophylaxis eligibility and gaps in care linkage before and during pregnancy and lactation.

According to the news editors, the research concluded: "Postpartum women are particularly vulnerable to loss-to-follow-up and miss opportunities for safe and effective HIV prevention."

The news correspondents report that additional information may be obtained from D.L. Seidman, University of California, Sch Med, San Francisco, CA 94143, United States. Additional authors for this research include S. Weber, M.T. Timoney, K.K. Oza, E. Mullins, D.L. Cohan and R.L. Wright.

Heart Disorders and Diseases - Heart Attack

**New Findings in Heart Attack Described from Annamalai University (Anti-inflammatory and anti-thrombotic effects of zingerone in a rat model of myocardial infarction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Attack is now available. According to news reporting from Tamil Nadu, India, by NewsRx journalists, research stated, "Myocardial infarction continues to be a major public health problem. Reduction in mortality rate and prevention of myocardial infarction are of utmost importance."

The news correspondents obtained a quote from the research from Annamalai University, "Inflammation and thrombosis play an important role in the pathogenesis of myocardial infarction. The anti-inflammatory and anti-thrombotic effects of zingerone were evaluated in isoproterenol induced myocardial infarcted rats. Rats were pretreated with zingerone (6 mg/kg body weight) daily for 14 days and were then induced myocardial infarction with isoproterenol (100 mg/kg body weight) on 15th and 16th day. Isoproterenol induced myocardial infarcted rats showed significant (P < 0.05) increase in the levels/activities of cardiac troponin-I (cTnI), high sensitive C-reactive protein (Hs CRP), lysosomal hydrolases in the serum and concentration of heart lysosomal lipid peroxidation (LPO) products. RT-PCR study revealed over expression of myocardial tumour necrosis factor - alpha (TNF-alpha),
interleukin-1 beta (IL-1 beta) and interleukin-6 (IL-6) genes in the myocardial infarcted rats. Histopathology of heart and coronary artery revealed marked inflammation and coronary thrombosis. Zingerone pretreatment significantly (P < 0.05) decreased serum cTnI, Hs CRP, lysosomal hydrolases and heart lysosomal LPO and down regulated myocardial TNF-alpha, IL-1 beta and IL-6 genes and prevented coronary thrombosis in isoproterenol induced myocardial infarcted rats."

According to the news reporters, the research concluded: "The observed effects of zingerone could be attributed to its anti-inflammatory and anti-thrombotic properties."

Our news journalists report that additional information may be obtained by contacting P.S.M. Prince, Annamalai Univ, Dept. of Biochem & Biotechnol, Annamalainagar 608002, Tamil Nadu, India.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejphar.2016.08.023. This DOI is a link to an online electronic document that is either free or for purchase.

**Stem Cell Research - Hematopoietic Stem Cells**

**New Findings in Hematopoietic Stem Cells Described from University of Debrecen (Evaluation of Mannose-Binding Lectin is a Useful Approach to Predict the Risk of Infectious Complications Following Autologous Hematopoietic Stem Cell ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Stem Cell Research - Hematopoietic Stem Cells are presented in a new report. According to news reporting from Debrecen, Hungary, by NewsRx journalists, research stated, "Hematopoietic stem cell transplantation (HSCT) associated immunocompromised state carries high risk of infectious complications. Mannose-binding lectin (MBL) is an acute phase protein involved in innate immune response."

The news correspondents obtained a quote from the research from the University of Debrecen, "Serum MBL level is genetically determined and quite stable. According to literature, significant association was shown between low MBL concentrations and serious infections. The association between serum MBL level and frequency and severity of infections was studied in 186 patients following autologous HSCT. Double-monoclonal antibody sandwich enzyme-linked immunosorbent assay was used to determine MBL antigen level in sera. MBL levels were
measured around 100 days following transplantation, in a period without active infection. Twenty-one patients (11%) were MBL deficient. The median time of first infection and number of infections during the first year post-transplantation were not significantly different between patients with MBL deficiency and those without MBL deficiency. The occurrence and number of infections after HSCT correlated with the MBL/C-reactive protein ratio. The number of severe infections was not higher among those with MBL deficiency. The occurrence of infections after the pre-engraftment period during the first year post transplantation was significantly different in patient groups separated by MBL cut-off level. The MBL/C-reactive protein ratio might be a useful marker of infectious complications. MBL measurement may be helpful in antibiotic treatment.

According to the news reporters, the research concluded: "In case of MBL deficiency, earlier and more intensive treatment may be indicated."

Our news journalists report that additional information may be obtained by contacting Z.B. Radnay, Univ Debrecen, Inst Internal Med, Dept. of Hematol, Fac Med, H-4032 Debrecen, Hungary. Additional authors for this research include M. Udvardy, M. Papp, J. Harsfalvi, L. Rejto, I. Pal, A. Illes and A. Kiss.

Nervous System Diseases and Conditions - Hemiplegia

New Findings in Hemiplegia Described from International Hospital (Pinball-Like Free-Floating Left Atrial Ball Thrombus Presenting with Hemiplegia: A Challenging Treatment Decision)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nervous System Diseases and Conditions - Hemiplegia. According to news reporting originating from Istanbul, Turkey, by NewsRx correspondents, research stated, "We describe a case of a patient with a history of chronic atrial fibrillation who presented with sudden onset of left hemiplegia. Nine months earlier the longstanding warfarin therapy had been suspended due to a hemorrhagic stroke."

Our news editors obtained a quote from the research from International Hospital, "Transthoracic echocardiography revealed a large free-floating highly mobile mass in the left atrium and severe mitral valve regurgitation. Due to the potential risk of an embolic event or a
hemodynamic collapse, a decision to carry out an emergency operation was made irrespective of the neurological condition of the patient."

According to the news editors, the research concluded: "Unfortunately, the patient died on the 18th postoperative day after a freshly occurring hemorrhagic stroke."

The news editors report that additional information may be obtained by contacting T. Demir, Dept. of Cardiovascular Surgery, Kolan International Hospital, Istanbul, Turkey. Additional authors for this research include M.U. Ergenoglu, N. Tanrikulu, A.Y. Cizgici, K.I. Yildirim and E. Demirsoy.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1532/hsf.1344. This DOI is a link to an online electronic document that is either free or for purchase.

**Immunology - Immunoglobulins**

**New Findings in Immunoglobulins Described by N. Poirier and Co-Researchers (First-in-Human Study in Healthy Subjects with FR104, a Pegylated Monoclonal Antibody Fragment Antagonist of CD28)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immunology - Immunoglobulins are presented in a new report. According to news reporting out of Nantes, France, by NewsRx editors, research stated, "FR104 is a monovalent pegylated Fab' Ab, antagonist of CD28, under development for treatment of transplant rejection and autoimmune diseases. In contrast to CD80/86 antagonists (CTLA4-Ig), FR104 selectively blunts CD28 costimulation while sparing CTLA-4 and PD-L1 coinhibitory signals."

Our news journalists obtained a quote from the research, "In the present work, FR104 has been evaluated in a first-in-human study to evaluate the safety, pharmacokinetics, pharmacodynamics, and potency of i.v. administrations in healthy subjects. Sixty-four subjects were randomly assigned to four single ascending dose groups, two double dose groups and four single ascending dose groups challenged with keyhole limpet hemocyanin. Subjects were followed up over a maximum of 113 d. Overall, the pharmacokinetics of FR104 after a single and double infusions was approximately linear at doses >= 0.200 mg/kg. CD28 receptor occupancy by FR104 was saturated at the first sampling time point (0.5 h) at doses above 0.02 mg/kg and returned to 50% in a dose-dependent manner, by day 15 (0.020 mg/kg) to 85 (1.500 mg/kg). FR104 was well tolerated, with no evidence of cytokine-release syndrome and no impact on blood lymphocyte subsets. Inhibition of anti-keyhole limpet hemocyanin Ab response was dose-dependent in FR104 recipients and was already apparent at a dose of 0.02 mg/kg. Abs to FR104 were detected in 22/46 (48%) of FR104 recipients and only 1/46 (2.2%) was detected during drug exposure."
According to the news editors, the research concluded: "Selective blockade of CD28 with FR104 was safe and well tolerated at the doses tested. The observed immunosuppressive activity indicated that FR104 has potential to show clinical activity in the treatment of immune-mediated diseases."

For more information on this research see: First-in-Human Study in Healthy Subjects with FR104, a Pegylated Monoclonal Antibody Fragment Antagonist of CD28. *Journal of Immunology*, 2016;197(12):4593-4602. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Membrane Proteins - Immunologic Receptors

**New Findings in Immunologic Receptors Described from Karolinska Institute (Tetraspanin CD151 and integrin a6b1 mediate platelet-enhanced endothelial colony forming cell angiogenesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Membrane Proteins - Immunologic Receptors are discussed in a new report. According to news reporting originating in Stockholm, Sweden, by NewsRx journalists, research stated, "ESSENTIALS: Platelet releasates (PRs) enhance endothelial colony forming cell (ECFC) angiogenesis. The impact of platelet membrane components on ECFC angiogenesis was studied by a tube formation assay."

Funders for this research include Hjart-Lungfonden, Vetenskapsradet, Cancerfonden, Karolinska Institutet, Stockholms Lans Landsting, China Scholarship Council.

The news reporters obtained a quote from the research from Karolinska Institute, "Platelets enhanced ECFC angiogenesis more potently than PR, via tetraspanin CD151 and integrin a6b1. Optimal enhancement of ECFC angiogenesis by platelets requires both membrane proteins and PR. Platelets promote angiogenesis of endothelial colony forming cells (ECFCs), with the underlying mechanisms not being fully understood. To investigate if platelets regulate the angiogenic property of ECFCs via mechanisms beyond platelet-released angiogenic regulators. Endothelial colony forming cells were generated by ECFC-directed cell culture of peripheral blood mononuclear cells. Capillary-like tube formation of ECFCs was assessed using a Matrigel assay. Platelets promoted ECFC tube formation in both basic and complete ECFC medium. Importantly, the ECFC angiogenic responses induced by platelets were stronger than
those induced by platelet releasates. Thus, the branching points of ECFC tube formation (30.5 \pm 9.0/field, ECFC alone) were increased by platelet releasates (58.2 \pm 8.3/field) and even more profoundly by platelets (95.5 \pm 17.6/field), indicating that platelet membrane components also promoted ECFC tube formation. The latter was further supported by evidence that fixed platelets did enhance ECFC tube formation. Subsequent experiments revealed that the promotion was dependent on platelet-surface glycoproteins, as removal of sialic acid from platelet glycoproteins by neuraminidase abolished the enhancement. Furthermore, platelet-expressed, but not ECFC-expressed, CD151 was important for the enhancement, as pretreatment of platelets, but not ECFCs, with a CD151-blocking antibody attenuated the effect. Integrin \( \alpha 6\beta 1 \) on both ECFCs and platelets also participated in platelet-induced tube formation, as integrin \( \alpha 6 \) or \( \beta 1 \) blockade of either cell type markedly or totally inhibited the phenomenon. Moreover, platelets exerted the enhancement via the Src-PI3K signaling pathway of ECFCs."

According to the news reporters, the research concluded: "Platelet-enhanced ECFC angiogenesis requires platelet tetraspanin CD151 and \( \alpha 6\beta 1 \) integrin, as well as ECFC \( \alpha 6\beta 1 \) integrin and Src-PI3K signaling."

For more information on this research see: Tetraspanin CD151 and integrin \( \alpha 6\beta 1 \) mediate platelet-enhanced endothelial colony forming cell angiogenesis. *Journal of Thrombosis and Haemostasis*, 2016;14(3):606-18. (Wiley-Blackwell - www.wiley.com; Journal of Thrombosis and Haemostasis - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1538-7836)

**New Findings in Immunosuppressive Agents**

**New Findings in Immunosuppressive Agents Described from University of California [In Vitro and In Vivo Sustained Zero-Order Delivery of Rapamycin (Sirolimus) From a Biodegradable Intraocular Device]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Immunosuppressive Agents. According to news reporting out of San Francisco, California, by NewsRx editors, research stated, "We created implantable intraocular devices capable of constant and continuous rapamycin release on the scale of months to years. Polycaprolactone (PCL) thin films were used to encapsulate rapamycin to create implantable and biodegradable intraocular devices."

Our news journalists obtained a quote from the research from the University of California, "Different film devices were studied by modifying the size, thickness, and porosity of the PCL films. In vitro release of rapamycin was observed to be constant (zero-order) through
14 weeks of study. Release rates were tunable by altering PCL film porosity and thickness. In vivo release of rapamycin was observed out through 16 weeks with concentrations in the retina-choroid in the therapeutic range. Rapamycin concentration in the blood was below the lower limit of quantification. The drug remaining in the device was chemically stable in vitro and in vivo, and was sufficient to last for upwards of 2 years of total release. The mechanism of release is related to the dissolution kinetics of crystalline rapamycin."

According to the news editors, the research concluded: "Microporous PCL thin film devices demonstrate good ocular compatibility and the ability to release rapamycin locally to the eye over the course of many weeks."

Our news journalists report that additional information may be obtained by contacting K.D. Lance, University of California at Berkeley-University of California, San Francisco Bioengineering Graduate Program, San Francisco, California, United States. Additional authors for this research include S.D. Good, T.S. Mendes, M. Ishikiriyama, P. Chew, L.S. Estes, K. Yamada, S. Mudumba, R.B. Bhisiitkul and T.A Desai.

Inflammation

**New Findings in Inflammation Described from Wenzhou Medical University (Loss of PINK1 inhibits apoptosis by upregulating a-synuclein in inflammation -sensitized hypoxic-ischemic injury in the immature brains)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Inflammation have been published. According to news reporting originating in Wenzhou, People's Republic of China, by NewsRx journalists, research stated, "The incidence of preterm birth is rising worldwide. Among preterm infants, many face a lifetime of neurologic impairments."

The news reporters obtained a quote from the research from Wenzhou Medical University, "Recent studies have revealed that systemic inflammation can sensitize the immature brain to hypoxic-ischemic (HI) injury. Therefore, it is important to identify the mechanisms involved in inflammation sensitized HI injury in immature brains. PTEN-induced putative kinase 1 (PINK1) is a regulatory protein that is highly expressed in the brain. We have previously found that PINK1 gene knockout can protect matured brains from HI injury in postnatal day 10 mice. However, the mechanisms are unknown. In this study, we employed an
inflammation-sensitized HI injury model using postnatal day 3 mice to study the roles and mechanisms that PINK1 plays in the immature brains. Lipopolysaccharide (LPS) was injected intraperitoneally into the mice before HI treatment to set up the model. We found that PINK1-knockout mice had fewer brain infarcts and less cell apoptosis than did the wild-type mice. Furthermore, we found that a-synuclein was markedly higher in the PINK1-knockout mice than in the wild-type mice, and inhibition of a-synuclein through small interfering RNA (siRNA) reversed the protective effect in the PINK1-knockout mice."

According to the news reporters, the research concluded: "Collectively, these findings indicate that loss of PINK1 plays a novel role in the protection of inflammation-sensitized HI brain damage."

For more information on this research see: Loss of PINK1 inhibits apoptosis by upregulating a-synuclein in inflammation-sensitized hypoxic-ischemic injury in the immature brains. Lung Diseases and Conditions - Interstitial Lung...

New Findings in Interstitial Lung Disease Described from Columbia University (Rheumatoid arthritis-associated autoantibodies and subclinical interstitial lung disease: the Multi-Ethnic Study of Atherosclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Interstitial Lung Disease. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Adults with interstitial lung disease (ILD) often have serologic evidence of autoimmunity of uncertain significance without overt autoimmune disease. We examined associations of rheumatoid arthritis (RA)-associated antibodies with subclinical ILD in community-dwelling adults."

Funders for this research include National Heart, Lung, and Blood Institute, Arthritis Foundation, Pulmonary Fibrosis Foundation, National Center for Research Resources.

Our news journalists obtained a quote from the research from Columbia University, "We measured serum rheumatoid factor (RF) and anticyclic citrullinated peptide antibody (anti-CCP) and high attenuation areas (HAAs; CT attenuation values between -600 and -250 Hounsfield units) on cardiac CT in 6736 community-dwelling US adults enrolled in the Multi-Ethnic Study of Atherosclerosis. We measured interstitial lung abnormalities (ILAs) in 2907 full-lung CTs at 9.5-year median follow-up. We used generalised linear and additive models to
examine associations between autoantibodies and both HAA and ILA, and tested for effect modification by smoking. In adjusted models, HAA increased by 0.49% (95% CI 0.11% to 0.86%) per doubling of RF IgM and by 0.95% (95% CI 0.50% to 1.40%) per RF IgA doubling. ILA prevalence increased by 11% (95% CI 3% to 20%) per RF IgA doubling. Smoking modified the associations of both RF IgM and anti-CCP with both HAA and ILA (interaction p values varied from 0.01 to 0.09). Among ever smokers, HAA increased by 0.81% (95% CI 0.33% to 1.30%) and ILA prevalence increased by 14% (95% CI 5% to 24%), per RF IgM doubling; and HAA increased by 1.31% (95% CI 0.45% to 2.18%) and ILA prevalence increased by 13% (95% CI 2% to 24%) per anti-CCP doubling. Among never smokers, no meaningful associations were detected.

According to the news editors, the research concluded: "RA-related autoimmunity is associated with both quantitative and qualitative subclinical ILD phenotypes on CT, particularly among ever smokers."

The news correspondents report that additional information may be obtained from D.J. Lederer, Columbia University, Medical Center, Dept. of Epidemiol, New York, NY, United States. Additional authors for this research include R.G. Barr, J.H.M. Austin, S.M. Kawut, G. Raghu, J.L. Sell, E.A. Hoffman, J.R. Newell, J.R. Watts, H. Nath, S.K. Sonavane, J.M. Bathon, D.S. Majka and D.J. Lederer.

**Digestive System Diseases and Conditions** -

**New Findings in Intestinal Pseudo-Obstruction Described from University of Genoa (Chronic Intestinal Pseudo-Obstruction in a Child Harboring a Founder Hirschsprung RET Mutation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Intestinal Pseudo-Obstruction have been published. According to news reporting originating in Genoa, Italy, by NewsRx journalists, research stated, "Chronic intestinal pseudo obstruction (CIPO) is a rare clinical entity characterized by symptoms and signs of intestinal obstruction without either recognizable anatomical abnormalities or intestinal aganglionosis. A Chinese
female infant presented to our institution with a clinical diagnosis of CIPO."

The news reporters obtained a quote from the research from the University of Genoa, "Aganglionosis was ruled out by full thickness colonic and ileal biopsies and by rectal suction biopsies. Unexpectedly, direct sequencing and PCR amplification of RET proto-oncogene from peripheral blood extracted DNA identified a RET R114H mutation. This mutation has already been reported as strongly associated with Asian patients affected by Hirschsprung's disease (HSCR) and is considered a founder mutation in Asia. The same mutation has never been reported in patients with CIPO, so far. These findings support the role of RET in the development of the enteric nervous system but underline the importance of other genetic or environmental factors contributing to the gastrointestinal phenotype of the disease."

According to the news reporters, the research concluded: "Somehow, this RET R114H mutation proved to have a role in the etiology of both CIPO and HSCR and could contribute to a more diffuse imbalance of gut dysmotility."

Our news correspondents report that additional information may be obtained by contacting V. Rossi, University of Genoa, DINOGMI, Genoa, Italy. Additional authors for this research include M. Mosconi, P. Nozza, D. Murgia, G. Mattioli, I. Ceccherini and A.P. Prato.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/ajmg.a.37787. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings in Iron Deficiency Described from Hyogo College of Medicine (Iron is associated with the development of hypoxia-induced pulmonary vascular remodeling in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Iron Deficiency is the subject of a report. According to news originating from Nishinomiya, Japan, by NewsRx correspondents, research stated, "Several recent observations provide the association of iron deficiency with pulmonary hypertension (PH) in human and animal studies. However, it remains completely unknown whether PH leads to iron deficiency or iron deficiency enhances the development of PH."

Financial supporters for this research include A Grant-in-Aid for Scientific Research (C), The Salt Science Research Foundation.

Our news journalists obtained a quote from the research from the Hyogo College of
Medicine, "In addition, it is obscure whether iron is associated with the development of pulmonary vascular remodeling in PH. In this study, we investigate the impacts of dietary iron restriction on the development of hypoxia-induced pulmonary vascular remodeling in mice. Eight- to ten-week-old male C57BL/6J mice were exposed to chronic hypoxia for 4 weeks. Mice exposed to hypoxia were randomly divided into two groups and were given a normal diet or an iron-restricted diet. Mice maintained in room air served as normoxic controls. Chronic hypoxia induced pulmonary vascular remodeling, while iron restriction led a modest attenuation of this change. In addition, chronic hypoxia exhibited increased RV systolic pressure, which was attenuated by iron restriction. Moreover, the increase in RV cardiomyocyte cross-sectional area and RV interstitial fibrosis was observed in mice exposed to chronic hypoxia. In contrast, iron restriction suppressed these changes. Consistent with these changes, RV weight to left ventricular + interventricular septum weight ratio was increased in mice exposed to chronic hypoxia, while this increment was inhibited by iron restriction."

According to the news editors, the research concluded: "Taken together, these results suggest that iron is associated with the development of hypoxia-induced pulmonary vascular remodeling in mice."

For more information on this research see: Iron is associated with the development of hypoxia-induced pulmonary vascular remodeling in mice. *Heart and Vessels*, 2016;31 (12):2074-2079. *Heart and Vessels* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Oncology - Liposarcomas**

**New Findings in Liposarcomas Described from Second Military Medical University (Surgical management of spinal liposarcoma: a case series of 7 patients and literature review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liposarcomas have been published. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Liposarcoma, one of the most common soft tissue sarcomas originates from primitive mesenchymal cells. But spinal involvement of either primary or metastatic liposarcoma is rare."
Our news journalists obtained a quote from the research from Second Military Medical University, "Here we present our experience of seven consecutive patients with spinal liposarcoma. We retrospectively reviewed our patients who have spinal liposarcoma from January 2009 to December 2013. All patients were surgically treated at least once at our spine tumor center and be confirmed as liposarcoma after surgery. All patients' information and follow-up data were collected afterwards. A total of six male and one female patients have been included. Five of them had mobile spinal involvement while the others had sacral involvement. Six piecemeal and one en-bloc resections were successfully performed. Patients' Frankel scores were upgraded with one level or at least preserved postoperatively. The average time of follow-up was 24.6 +/- 13.9 months. Three patients died 13, 15 and 24 months after surgical treatment, respectively while the other four patients were still alive and one of them alive with disease at the end of follow-up. The outcome and prognosis of spinal liposarcoma is poor, and surgical resections should be considered when diagnosis is confirmed. For those whose tumors were too large to resect and/or with multiple metastases, effective treatment options are currently limited."

According to the news editors, the research concluded: "Therefore, multidisciplinary treatment should be adopted, intraoperative chemotherapy, systemic chemotherapy and radiotherapy for instance."

For more information on this research see: Surgical management of spinal liposarcoma: a case series of 7 patients and literature review. European Spine Journal, 2016;25 (12):4088-4093. European Spine Journal can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; European Spine Journal - www.springerlink.com/content/0940-6719/)

**Biotechnology - Liposomes**

**New Findings in Liposomes Described from University of Hohenheim**

*(In vitro release of grape-seed polyphenols encapsulated from uncoated and chitosan-coated liposomes)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biotechnology - Liposomes is the subject of a report. According to news reporting originating from Stuttgart, Germany, by NewsRx correspondents, research stated, "Grape-seed extract (GSE), a rich source for polyphenols, was incorporated into liposomes (1.1% w/w soy lecithin) using high-pressure homogenization (22,500 psi). A chitosan coating (1% w/w) was used to obtain more stable liposomes."
Financial support for this research came from University of Hohenheim Experiment Station.

Our news editors obtained a quote from the research from the University of Hohenheim, "Physiochemical properties (zeta-potential, mean particle size) of all liposomes were analyzed. In vitro release of GSE-polyphenols from various liposomes was investigated by measuring the total phenolic content of the dialysate (acetate buffer, pH 3.8 +/- 0.1, 25 mM) over time. Diverse kinetic models were used to describe the release of the polyphenols incorporated from liposomes. Z-average particle diameters increased with the incorporation of GSE and chitosan coating. Chitosan-coated liposomes containing GSE had larger particle sizes than coated liposomes without GSE. The zeta-potential changed from -38 mV in uncoated liposomes to +65 mV in coated liposomes. Entrapment efficiency for uncoated and coated liposomes was 88.2 +/- 4.7% and 99.5 +/- 2.3%, respectively. The release rate increased gradually by increasing time. In vitro release of GSE polyphenols from both uncoated and coated liposomes followed an exponential equation (first order Q(t) = a.(1 - exp(-k. t))). The release from coated liposomes was much lower than uncoated liposomes. The release rate after 24 h from uncoated liposomes was 0.55 and from coated liposomes was 0.24."

According to the news editors, the research concluded: "This study indicates that the release of bioactive compounds from liposomes can be reduced by coating with chitosan, allowing an application of coated liposomes with a controlled release of GSE polyphenols in water-based foods."

For more information on this research see: In vitro release of grape-seed polyphenols encapsulated from uncoated and chitosan-coated liposomes. Food Research International, 2016;88():105-113. Food Research International can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Oncology - Lung Cancer

New Findings in Lung Cancer Described by S. Barbierio and Co-Researchers (Single-fraction flattening filter-free volumetric modulated arc therapy for lung cancer: Dosimetric results and comparison with flattened beams technique)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Lung Cancer is the subject of a report. According to news originating from Aviano, Italy, by NewsRx correspondents, research stated,
"To report on single-fraction stereotactic body radiotherapy (RT) (SBRT) with flattening filter (FF)-free (FFF) volumetric modulated arc therapy (VMAT) for lung cancer and to compare dosimetric results with VMAT with FF. Overall, 25 patients were treated with 6-MV FFF VMAT (Varian TrueBeam STx LINAC) to a prescribed dose of 24 Gy in a single fraction."

Our news journalists obtained a quote from the research, "Treatment plans were recreated using FF VMAT. Dose-volume indices, monitor units (MU), and treatment times were compared between FFF and FF VMAT techniques. Dose constraints to PTV, spinal cord, and lungs were reached in FFF and FF plans. In FFF plans, average conformity index was 1.13 (95% CI: 1.07 to1.38). Maximum doses to spinal cord, heart, esophagus, and trachea were 2.9 Gy (95% CI: 0.4 to 6.7 Gy), 0.8 Gy (95% CI: 0 to 3.6 Gy), 3.3 Gy (95% CI: 0.02 to 13.9 Gy), and 1.5 Gy (95% CI: 0 to 4.9 Gy), respectively. Average V7 Gy, V7.4 Gy, and mean dose to the healthy lung were 126.5 cc (95% CI: 41.3 to 248.9 cc), 107.3 cc (95% CI: 18.7 to 232.8 cc), and 1.1 Gy (95% CI: 0.3 to 2.2 Gy), respectively. No statistically significant differences were found in dosimetric results and MU between FF and FFF treatments. Treatment time was reduced by an average factor of 2.31 (95% CI: 2.15 to 2.43) from FF treatments to FFF, and the difference was statistically significant."

According to the news editors, the research concluded: "FFF VMAT for lung SBRT provides equivalent dosimetric results to the target and organs at risk as FF VMAT while significantly reducing treatment time."

The news correspondents report that additional information may be obtained from M. Avanzo, Center Riferimento Oncol, Medical Phys Div, Aviano, Italy. Additional authors for this research include A. Rink, F. Matteucci, D. Fedele, F. Paiair, F. Pasqualetti and M. Avanzo.

Mosquito-Borne Diseases - Malaria

New Findings in Malaria Described from Albert Einstein College of Medicine [Targeting the Plasmodium vivax equilibrative nucleoside transporter 1 (PvENT1) for antimalarial drug development]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mosquito-Borne Diseases - Malaria have been published. According to news reporting originating in Bronx, New York, by NewsRx journalists, research stated, "Infection with Plasmodium falciparum and vivax cause most cases of malaria. Emerging resistance to current antimalarial medications makes new drug development imperative."

Funders for this research include NIGMS Medical Scientist Training Program, NIH.

The news reporters obtained a quote from the research from the Albert Einstein
College of Medicine, "Ideally a new antimalarial drug should treat both falciparum and vivax malaria. Because malaria parasites are purine auxotrophic, they rely on purines imported from the host erythrocyte via Equilibrative Nucleoside Transporters (ENTs). Thus, the purine import transporters represent a potential target for antimalarial drug development. For falciparum parasites the primary purine transporter is the \textit{P. falciparum} Equilibrative Nucleoside Transporter Type 1 (PfENT1). Recently we identified potent PfENT1 inhibitors with nanomolar IC\text{[50]} values using a robust, yeast-based high throughput screening assay. In the current work we characterized the \textit{Plasmodium vivax} ENT1 (PvENT1) homologue and its sensitivity to the PfENT1 inhibitors. We expressed a yeast codon-optimized PvENT1 gene in \textit{Saccharomyces cerevisiae}. PvENT1-expressing yeast imported both purines ((3)H\textit{H})adenosine and pyrimidines ((3)H\textit{H})uridine), whereas wild type (fui1D) yeast did not. Based on radiolabel substrate uptake inhibition experiments, inosine had the lowest IC\text{[50]} (3.8 mM), compared to guanosine (14.9 mM) and adenosine (142 mM). For pyrimidines, thymidine had an IC\text{[50]} of 183 mM (vs. cytidine and uridine; mM range). IC\text{[50]} values were higher for nucleobases compared to the corresponding nucleosides; hypoxanthine had a 25-fold higher IC\text{[50]} than inosine. The archetypal human ENT1 inhibitor 4-nitrobenzylthiokinose (NBMPR) had no effect on PvENT1, whereas dipyridamole inhibited PvENT1, albeit with a 40 mM IC\text{[50]}, a 1000-fold less sensitive than human ENT1 (hENT1). The PfENT1 inhibitors blocked transport activity of PvENT1 and the five known naturally occurring non-synonymous single nucleotide polymorphisms (SNPs) with similar IC\text{[50]} values. Thus, the PfENT1 inhibitors also target PvENT1."

According to the news reporters, the research concluded: "This implies that development of novel antimalarial drugs that target both falciparum and vivax ENT1 may be feasible."

For more information on this research see: Targeting the \textit{Plasmodium vivax} equilibrative nucleoside transporter 1 (PvENT1) for antimalarial drug development. \textit{International Journal for Parasitology Drugs and Drug Resistance}, 2015;6(1):1-11.

Our news correspondents report that additional information may be obtained by contacting R. Deniskin, Dept. of Physiology & Biophysics, Albert Einstein College of Medicine, Bronx, New York, United States. Additional authors for this research include I.J. Frame, Y. Sosa and M.H Akabas.

**Mononuclear Leukocytes**

**New Findings in Mononuclear Leukocytes Described from Kyushu University (Hedgehog signaling regulates PDL-1 expression in cancer cells to induce anti-tumor activity by activated lymphocytes)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mononuclear Leukocytes are presented in a new report. According to news originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "We investigated whether hypoxia-induced activation of Hh signaling contributes to PDL-1 expression in cancer and whether it affects the anti-tumor function of activated lymphocytes. Hypoxia augmented PDL-1 expression and inhibition of Hh signaling reduced PDL-1 expression under hypoxia."

Financial support for this research came from JSPS KAKENHI.

Our news journalists obtained a quote from the research from Kyushu University, "When activated lymphocytes were cocultured with cancers treated with a Hh inhibitor, activated lymphocyte cell numbers increased under hypoxia. In contrast, this increase was abrogated when cancer cells were treated with a PDL-1 neutralizing antibody."

According to the news editors, the research concluded: "These results suggest that Hh signaling is one of regulatory pathways of PDL-1 expression under hypoxia and that inhibiting Hh signaling may induce lymphocyte anti-tumor activity."

For more information on this research see: Hedgehog signaling regulates PDL-1 expression in cancer cells to induce anti-tumor activity by activated lymphocytes. *Cellular Immunology*, 2016;310():199-204. *Cellular Immunology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Cellular Immunology - www.journals.elsevier.com/cellular-immunology/)

The news correspondents report that additional information may be obtained from H. Onishi, Kyushu University, Grad Sch Med Sci, Dept. of Canc Therapy & Res, Fukuoka, Japan. Heart Disorders and Diseases - Myocardial Ischemia

New Findings in Myocardial Ischemia Described from University of Copenhagen (Diagnostic accuracy of static CT perfusion for the detection of myocardial ischemia. A systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Myocardial Ischemia are discussed in a new report. According to news reporting originating in Copenhagen, Denmark, by NewsRx journalists, research stated, "The aim of this study is to provide a meta-analysis of all published studies assessing the diagnostic accuracy of stress CT myocardial perfusion imaging (CTP) in patients suspected of or with known coronary artery disease. This
analysis is limited to static stress CTP."

The news reporters obtained a quote from the research from the University of Copenhagen, "Systematic literature review and meta-analysis of studies examining the diagnostic accuracy of static CTP imaging alone or combined with coronary CT angiography (CTA) in comparison to single photon emission computed tomography (SPECT), magnetic resonance perfusion (MRP), and/or invasive coronary angiography with and without fractional flow reserve (FFR). The search revealed 19 eligible studies including 1188 patients. Pooled results showed that CTP had a good agreement with SPECT and MRP. On a per-patient level, sensitivity, specificity and AUC were 0.85 (95% CI: 0.70-0.93), 0.81 (95% CI: 0.59-0.93), 0.90 (95% CI: 0.87-0.92). On a per-artery level, sensitivity, specificity and AUC were 0.80 (95% CI: 0.67-0.88), 0.81 (95% CI: 0.72-0.88) and 0.87 (95% CI: 0.84-0.90). When invasive coronary angiography was used as reference standard, combined coronary CTA and CTP compared to coronary CTA alone significantly improved the specificity from 0.62 (95% CI: 0.52-0.70) to 0.84 (95% CI: 0.74-0.91) on a per-patient level (p = 0.008) and from 0.72 (95% CI: 0.63-0.79) to 0.90 (95% CI: 0.85-0.93) on a per-artery level (p = 0.0001) without significant decrease in sensitivity (p = 0.59 and p = 0.23, respectively). In selected patients, static CT myocardial perfusion has high diagnostic accuracy to detecting myocardial ischemia."

According to the news reporters, the research concluded: "Specificity increases significantly when CT myocardial perfusion is combined with coronary CFA."

Our news correspondents report that additional information may be obtained by contacting M.H. Sorgaard, University of Copenhagen, Rigshospitalet, Center Heart, Dept. of Cardiol, DK-2100 Copenhagen, Denmark. Additional authors for this research include K.F. Kofoed, J.J. Linde, R.T. George, C.E. Rochitte, G. Feuchtner, J.A.C. Lima and J. Abdulla.

Nanotechnology - Nanoindentation

New Findings in Nanoindentation Described from Harbin Medical University (Fabrication of atomic force microscope spherical tips and its application in determining the mechanical property of cancer cells)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nanotechnology - Nanoindentation.

According to news reporting from Heilongjiang, People's Republic of China, by NewsRx journalists, research stated, "The process of cancer metastasis is closely related to the mechanical property of cells. Using the atomic force microscope (AFM)-based nanoindentation technique, the mechanical properties of cancer cells can be measured in liquid and at 37 degrees C. However, the conventional AFM tip is too sharp to finish this process."

The news correspondents obtained a quote from the research from Harbin Medical University, "The AFM tip with a microsphere at the end is usually used. How to adhere a microsphere to the tip apex has become a big concern up to now. In this work, an easy and simple method based on the employment of carbon nanotube bundles is presented. The microsphere is successfully adhered to the tip and the elastic constant of the cantilever is calibrated with the Cleveland method. Using the developed tip, the nanoindentation tests on two kinds of lung cancer cells (A549 and AGZY-83a), which exhibit different metastatic properties, are carried out in liquid and at 37 degrees C. Based on the Hertz contact equation between the spherical tip and the cell, the stress relaxation model is used to calculate the Young's modulus and viscoelastic properties of the cells."

According to the news reporters, the research concluded: "Experimental results confirm the feasibility of the method proposed in this work."

Our news journalists report that additional information may be obtained by contacting Y.M. Han, Harbin Med Univ, Subsidiary Hosp 3, Dept. of Gynaecol, Harbin 150040, Heilongjiang, People's Republic of China. Additional authors for this research include J.H. Wang, K. Wang and S. Dong.

**Oncology**

**New Findings in Oncology Described from Mayo Clinic (Custom Gene Capture and Next-Generation Sequencing to Resolve Discordant ALK Status by FISH and IHC in Lung Adenocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology are discussed in a new report. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "We performed a genomic study in lung adenocarcinoma cases with discordant
anaplastic lymphoma receptor tyrosine kinase gene (ALK) status by fluorescent in situ hybridization (FISH) and immunohistochemical (IHC) analysis. DNA from formalin-fixed paraffin-embedded tissues of 16 discordant (four FISH-positive/IHC-negative and 12 FISH-negative/IHC-positive) cases by Vysis ALK Break Apart FISH and ALK IHC testing (ALK1 clone) were subjected to whole gene capture and next-generation sequencing (NGS) of nine genes, including ALK, echinoderm microtubule associated protein like 4 gene (EML4), kinesin family member 5B gene (KIF5B), staphylococcal nuclease and tudor domain containing 1 gene (SND1), BRAF, ret proto-oncogene (RET), ezrin gene (EZR), ROS1, and telomerase reverse transcriptase (TERT).

Our news editors obtained a quote from the research from Mayo Clinic, "All discordant cases (except one FISH-negative/IHC-positive case without sufficient tissue) were analyzed by IHC with D5F3 antibody. In one case with fresh frozen tissue, whole transcriptome sequencing was also performed. Twenty-six concordant (16 FISH-positive/IHC-positive and 10 FISH-negative/IHC-negative) cases were included as controls. In four ALK FISH-positive/IHC-negative cases, no EML4-ALK fusion gene was observed by NGS, but in one case using fresh frozen tissue, we identified EML4-baculoviral AIP repeat containing 6 gene (BIRC6) and AP2 associated kinase 1 gene 1 gene (AAK1)-ALK fusion genes. Whole transcriptome sequencing revealed a highly expressed EML4-BIRC6 fusion transcript and a minimally expressed AAK1 transcript. Among the 12 FISH-negative/IHC-positive cases, no evidence of ALK gene rearrangement was detected by NGS. Eleven of 12 FISH-negative/IHC-positive cases detected by ALK1 clone were concordant by repeat ALK IHC with D5F3 antibody (i.e., FISH-negative/IHC-negative by D5F3 clone). Among the 16 ALK FISH-positive/IHC-positive positive controls, whole gene capture identified ALK gene fusion in 15 cases, including in one case with Huntington interacting protein 1 gene (HIP1)-ALK. No ALK fusion gene was observed in any of the 10 FISH-negative/IHC-negative cases. Other fusion genes involving ROS1, EZR, BRAF, and SND1 were also found. ALK FISH results appeared to be false positive in three of four FISH-positive/IHC-negative cases, whereas no false-negative ALK FISH case was identified among 12 ALK FISH-negative/IHC-positive cases by ALK1 clone, which was in keeping with the concordant FISH-negative/IHC-negative status by D5F3 clone."

According to the news editors, the research concluded: "Our targeted whole gene capture approach using formalin-fixed paraffin embedded samples was effective for detecting rearrangements involving ALK and other actionable oncogenes."

New Findings in Oral Cancer Described from China Medical University and Hospital (Taiwanin C selectively inhibits arecoline and 4-NQO-induced oral cancer cell proliferation via ERK1/2 inactivation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Oral Cancer are presented in a new report. According to news originating from Taichung, Taiwan, by NewsRx correspondents, research stated, "Arecoline, the most abundant alkaloid in betel nut is known to promote abnormal proliferation of epithelial cells by enhancing epidermal growth factor receptor (EGFR) activation and cyclooxygenase-2 (COX2) expression. Taiwanin C, a naturally occurring lignan extracted from Taiwania cryptomerioides, has been found to be a potential inhibitor of COX2 expression."

Financial support for this research came from Taiwan Ministry of Health and Welfare Clinical Trial and Research Center of Excellence.

Our news journalists obtained a quote from the research from China Medical University and Hospital, "Based on the MTT assay results, taiwanin C was found to be effective in inhibiting the tumorous T28 cell than the non-tumorous N28 cells. The modulations in the expression of relevant proteins were determined to understand the mechanism induced by taiwanin C to inhibit T28 cell proliferation. The levels of activated EGFR and COX2 were found to be abnormally high in the T28 oral cancer cells. However, taiwanin C was found to inhibit the activation of EGFR and regulated other related downstream proteins and thereby inhibited the T28 cell proliferation."

According to the news editors, the research concluded: "In conclusion the results indicate that taiwanin C suppresses COX2-EGFR and enhances P27 pathways to suppress arecoline induced oral cancer cell proliferation via ERK1/2 inactivation. ? 2015 Wiley Periodicals, Inc. Environ Toxicol 32:62-69." For more information on this research see: Taiwanin C selectively inhibits arecoline and 4-NQO-induced oral cancer cell proliferation via ERK1/2 inactivation. Environmental Toxicology, 2015;32(1):62-69. (Wiley-Blackwell - www.wiley.com; Environmental Toxicology - onlinelibrary.wiley.com/journal/10.1002/(ISSN)1522-7278)

The news correspondents report that additional information may be obtained from K.H. Lin, Emergency Department, China Medical University Hospital, Taichung, Taiwan. Oxides

New Findings in Oxides Described from Research Hospital (Treatment in carbon monoxide poisoning patients with headache: a prospective, multicenter, double-blind, controlled clinical trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oxides is now available. According to news reporting from Istanbul, Turkey, by NewsRx journalists, research stated, "There is a lack of specificity of the analgesic agents used to treat headache and underlying acute carbon monoxide poisoning. To compare effectiveness of 'oxygen alone' vs 'metoclopramide plus oxygen' vs 'metamizole plus oxygen' therapy in treating carbon monoxide-induced headache."

The news correspondents obtained a quote from the research from Research Hospital, "A prospective, multicenter, double-blind, controlled trial. Three emergency departments in Turkey. Adult carbon monoxide poisoning patients with headache. A total of 117 carbon monoxide-intoxicated patients with headache were randomized into 3 groups and assessed at baseline, 30 minutes, 90 minutes, and 4 hours. The primary outcome was patient-reported improvement rates for headache. Secondary end points included nausea, need for rescue medication during treatment, and reduction in carboxyhemoglobin levels. During observation, there was no statistical difference between drug type and visual analog scale score change at 30 minutes, 90 minutes, or 4 hours, for either headache or nausea. No rescue medication was needed during the study period. The reduction in carboxyhemoglobin levels did not differ among the 3 groups."

According to the news reporters, the research concluded: "The use of 'oxygen alone' is as efficacious as 'oxygen plus metoclopramide' or 'oxygen plus metamizole sodium' in the treatment of carbon monoxide-induced headache."

Our news journalists report that additional information may be obtained by contacting T. Ocak, Kanuni Sultan Suleyman Educ & Res Hosp, Dept. of Emergency Med, Istanbul, Turkey. Additional authors for this research include E. Tekin, M. Basturk, A. Duran, M. Serinken and M. Emet.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajem.2016.08.002. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings in Pain Described from Washington University School of Medicine (Eact, a small molecule activator of TMEM16A, activates TRPV1 and elicits pain- and itch-related behaviours)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Neurologic Manifestations - Pain have been presented. According to news reporting originating in St. Louis, Missouri, by NewsRx journalists, research stated, "TMEM16A, also known as anoctamin 1 channel, is a member of the Ca(2+)-activated chloride channels family and serves as a heat sensor in the primary nociceptors. Eact is a recently discovered small molecule activator of the TMEM16A channel."

Financial support for this research came from National Institutes of Health.

The news reporters obtained a quote from the research from the Washington University School of Medicine, "Here, we asked if Eact produces pain-and itch-related responses in vivo and investigated the cellular and molecular basis of Eact-elicited responses in dorsal root ganglia (DRG) neurons. We employed behavioural testing combined with pharmacological inhibition and genetic ablation approaches to identify transient receptor potential vanilloid 1 (TRPV1) as the prominent mediator for Eact-evoked itch-or pain-related responses. We investigated the effects of Eact on TRPV1 and TMEM16A channels expressed in HEK293T cells and in DRG neurons isolated from wild type and Trpv1(-/-) mice using Ca(2+) imaging and patch-clamp recordings. We also used site-directed mutagenesis to determine the molecular basis of Eact activation of TRPV1. Administration of Eact elicited both itch-and pain-related behaviours. Unexpectedly, the Eact-elicited behavioural responses were dependent on the function of TRPV1, as shown by pharmacological inhibition and genetic ablation studies. Eact activated membrane currents and increased intracellular free Ca(2+) in both TRPV1-expressing HEK293T cells and isolated DRG neurons in a TRPV1-dependent manner. Eact activation of the TRPV1 channel was severely attenuated by mutations disrupting the capsaicin-binding sites."

According to the news reporters, the research concluded: "Our results suggest that Eact activates primary sensory nociceptors and produces both pain and itch responses mainly through direct activation of TRPV1 channels."

Our news correspondents report that additional information may be obtained by contacting S. Liu, Dept. of Anesthesiology, The Center for the Study of Itch, Washington University School of Medicine, St Louis, MO, 63110, United States. Additional authors for this research include J. Feng, J. Luo, P. Yang, T.J. Brett and H. Hu.

New Findings in Palliative and Supportive Care Described from Christian Medical College (The patient who 'must not be told': demographic factors associated with collusion in a retrospective study in South India)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Palliative and Supportive Care have been published. According to news reporting originating in Tamil Nadu, India, by NewsRx journalists, research stated, "Patients with cancer need adequate information about diagnosis, treatment options, and possible outcomes and prognosis to make therapeutic decisions. In cultures where the family plays the dominant role in healthcare decisions, doctors are often requested to collude in withholding distressing information from the patient."

The news reporters obtained a quote from the research from Christian Medical College, "This challenging situation has not been well studied and there is limited knowledge on the different factors that may contribute to collusion. To study the prevalence of collusion among adult cancer patients attending a palliative care outpatient clinic and the contributing factors. The healthcare records of 306 adult cancer patients who had visited the palliative care outpatient clinic at least three times with follow-up until death were retrospectively reviewed. Details on information shared and why it was not shared were retrieved from the documentation in the communication sheet in the patient chart. The prevalence, sociodemographic and clinical factors that could contribute to collusion in doctor-patient communication were studied. Collusion was present in 40% of cases at the time of referral to the palliative care outpatient clinic (collusion regarding diagnosis in 18%; collusion regarding prognosis in 40%). Collusion was later addressed in 35%. Collusion was significantly higher among female patients (p=0.005), manual workers (p=0.035), those not accompanied by a spouse (p=0.000) and with no oncological treatment (p=0.001). Collusion regarding diagnosis or prognosis is common among cancer patients referred for palliative care."

According to the news reporters, the research concluded: "It was more prevalent among female patients, manual workers, patients who had not received oncological treatment, and patients not accompanied by a spouse."

Our news correspondents report that additional information may be obtained by contacting J. Jeba, Christian Medical College, Palliat Care Unit, Vellore 632004, Tamil Nadu, India. Additional authors for this research include A. Jacob, R. Kandasamy and R. George.

New Findings in Pharmacology and Experimental Therapeutics
Described from University of Michigan (Intranasal Opioid Administration in Rhesus Monkeys: PET Imaging and Antinociception)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Pharmacology and Experimental Therapeutics have been presented. According to news reporting from Ann Arbor, Michigan, by NewsRx journalists, research stated, "The goal of this study was to evaluate the effects of intranasally administered opioids in rhesus monkeys using the tail-withdrawal assay, and to correlate these effects with measures of receptor occupancy using positron emission tomography (PET) imaging. Initial experiments characterized the antinociceptive effects of intranasal (IN) fentanyl and buprenorphine relative to intramuscular (IM) injection."

The news correspondents obtained a quote from the research from the University of Michigan, "Fentanyl (0.010-0.032 mg/kg) and buprenorphine (0.1-1.0 mg/kg) produced dose-dependent increases in tail-withdrawal latency that did not differ between routes of delivery. The second experiment compared the ability of IN and intravenous (IV) naloxone (NLX) to block the antinociceptive effects IV fentanyl, and to measure receptor occupancy at equipotent doses of NLX using PET imaging. IN and IV NLX (0.0032-0.032 mg/kg) produced dose-dependent decreases in fentanyl-induced antinociception. Again, there was no difference observed in overall potency between routes. PET imaging showed that IV and IN NLX produced similar decreases in receptor occupancy as measured by [C-11] carfentanil blocking, although there was a trend for IV NLX to produce marginally greater occupancy changes."

According to the news reporters, the research concluded: "This study validated the first procedures to evaluate the IN effects of opioids in rhesus monkeys."

Our news journalists report that additional information may be obtained by contacting P.A. Saccone, University of Michigan, Sch Med, Dept. of Pharmacol, Ann Arbor, MI 48109, United States. Additional authors for this research include A.M. Lindsey, R.A. Koeppe, K.A. Zelenock, X. Shao, P. Sherman, C.A. Quesada, J.H. Woods and P.J.H. Scott.

Gram-Negative Bacteria - Pseudomonas aeruginosa

New Findings in Pseudomonas aeruginosa Described from Hannover School of Medicine (Intraclonal genome diversity of the major Pseudomonas aeruginosa clones C and PA14)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Pseudomonas aeruginosa are presented in a new report. According to news reporting from Hannover, Germany, by NewsRx journalists, research stated, "Bacterial populations differentiate at the subspecies level into clonal complexes. Intraclonal genome diversity was studied in 100 isolates of the two dominant Pseudomonas aeruginosa clones C and PA14 collected from the inanimate environment, acute and chronic infections."

Funders for this research include Christiane Herzog Stiftung, Deutsche Forschungsgemeinschaft, Bundesministerium für Bildung und Forschung.

The news correspondents obtained a quote from the research from the Hannover School of Medicine, "The core genome was highly conserved among clone members with a median pairwise within-clone single nucleotide sequence diversity of 8 ? 10(-6) for clone C and 2 ? 10(-5) for clone PA14. The composition of the accessory genome was, on the other hand, as variable within the clone as between unrelated clones. Each strain carried a large cargo of unique genes."

According to the news reporters, the research concluded: "The two dominant worldwide distributed P. aeruginosa clones combine an almost invariant core with the flexible gain and loss of genetic elements that spread by horizontal transfer."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1758-2229.12372. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings in Rectal Cancer Described by C. Huang and Co-Researchers (Clinical comparison of laparoscopy vs open surgery in a radical operation for rectal cancer: A retrospective case-control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Rectal Cancer. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "To assess the diverse immediate and long-term clinical outcomes, a retrospective comparison between laparoscopic and conventional operation was performed. A total number of 916 clinical cases, from January 2006 to December 2013 in our hospital, were analyzed which covered 492 patients underwent the laparoscopy in radical resection (LRR) and 424 cases in open radical resection (ORR)."

The news reporters obtained a quote from the research, "A retrospective analysis was proceeded by comparing the general information, surgery performance, pathologic data, postoperative recovery and complications as well as long-term survival to investigate the diversity of immediate and long-term clinical outcomes of laparoscopic radical operation. There were no statistically significance differences between gender, age, height, weight, body mass index (BMI), tumor loci, tumor node metastasis stages, cell differentiation degree or American Society of Anesthesiologists scores of the patients (p >0.05). In contrast to the ORR group, the LRR group experienced less operating time (p <0.001), a lower blood loss (p <0.001), and had a 2.44% probability of conversion to open surgery. Postoperative bowel function recovered more quickly, analgesic usage and the average hospital stay (p <0.001) were reduced after LRR. Lymph node dissection during LRR appeared to be slightly more than in ORR (p=0.338). There were no obvious differences in the lengths and margins (p=0.182). And the occurrence rate in the two groups was similar (p=0.081). Overall survival rate of ORR and LRR for 1, 3 and 5 years were 94.0% and 93.6% (p=0.534), 78.1% and 80.9% (p=0.284) and 75.2% and 77.0% (p=0.416), respectively. Laparoscopy as a radical operation for rectal cancer was a safe, produced better immediate outcomes."

According to the news reporters, the research concluded: "Long-term survival of laparoscopy revealed that it was similar to the open operation."

Our news correspondents report that additional information may be obtained by contacting C. Huang, Chen Huang, Jing Zhang, Tao Jiang, Wei-Dong Wu, Jun Cao, Ke-Jian Huang, Zheng-Jun Qiu, Dept. of General Surgery, Shanghai First People’s Hospital, School of Medicine, Shanghai Jiao Tong University, Shanghai 200080, People's Republic of China. Additional authors for this research include J.C. Shen, J. Zhang, T. Jiang, W.D. Wu, J. Cao, K.J. Huang and Z.J Qiu.

**Oncology - Renal Cell Carcinoma**

**New Findings in Renal Cell Carcinoma Described from Charles University (Morphological, immunohistochemical, and chromosomal analysis of multicystic chromophobe renal cell carcinoma, an architecturally unusual challenging variant)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Renal Cell Carcinoma. According to news reporting originating in Plzen, Czech Republic, by NewsRx journalists, research stated, "Chromophobe renal cell carcinoma (ChRCC) is typically composed of large leaf-like cells and smaller eosinophilic cells arranged in a solid-alveolar pattern. Eosinophilic, adenomatoid/pigmented, or neuroendocrine variants have also been described."

Funders for this research include Charles University Research Fund, Fakultni Nemocnice Plzen, Lekaska Fakulta v Plzni, Univerzita Karlova.

The news reporters obtained a quote from the research from Charles University, "We collected 10 cases of ChRCC with a distinct multicystic pattern out of 733 ChRCCs from our registry, and subsequently analyzed these by morphology, immunohistochemistry, and array comparative genomic hybridization. Of the 10 patients, 6 were males with an age range of 50-89 years (mean 68, median 69). Tumor size ranged between 1.2 and 20 cm (mean 5.32, median 3). Clinical follow-up was available for seven patients, ranging 1-19 years (mean 7.2, median 2.5). No aggressive behavior was documented. We observed two growth patterns, which were similar in all tumors: (1) variable-sized cysts, resembling multilocular cystic neoplasm of low malignant potential and (2) compressed cystic and tubular pattern with slit-like spaces. Raisinoid nuclei were consistently present while necrosis was absent in all cases. Half of the cases showed eosinophilic/oncocytic cytology, deposits of pigment (lipochrome) and microcalcifications. The other half was composed of pale or mixed cell populations. Immunostains for epithelial membrane antigen (EMA), CK7, OSCAR, CD117, parvalbumin, MIA, and Pax 8 were positive in all tumors while negative for vimentin, TFE3, CANH 9, HMB45, cathepsin K, and AMACR. Ki67 immunostain was positive in up to 1% of neoplastic cells. Molecular genetic examination revealed multiple chromosomal losses in two fifths analyzable tumors, while three cases showed no chromosomal numerical aberrations. ChRCC are rarely arranged in a prominent multicystic pattern, which is probably an extreme form of the microcystic adenomatoid pigmented variant of ChRCC. The spectrum of tumors entering the differential diagnosis of ChRCC is quite different from that of conventional ChRCC. The immunophenotype of ChRCC is identical with that of conventional ChRCC. Chromosomal numerical aberration pattern was variable; no chromosomal numerical aberrations were found in three cases."

According to the news reporters, the research concluded: "All the cases in this series have shown an indolent and non-aggressive behavior."

For more information on this research see: Morphological, immunohistochemical, and chromosomal analysis of multicystic chromophobe renal cell carcinoma, an architecturally unusual challenging variant. Virchows Archiv, 2016;469(6):669-678. Virchows Archiv can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer -

Oncology - Small Cell Lung Cancer

New Findings in Small Cell Lung Cancer Described from Maastricht University (Development of symptomatic brain metastases after chemoradiotherapy for stage III non-small cell lung cancer: Does the type of chemotherapy regimen matter?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Small Cell Lung Cancer. According to news originating from Maastricht, Netherlands, by NewsRx correspondents, research stated, "Symptomatic brain metastases (BM) occur frequently after chemoradiotherapy (CRT) for stage III NSCLC. Aim of the current study was to determine whether the specific chemotherapy used in a CRT regimen influences BM development."

Our news journalists obtained a quote from the research from Maastricht University, "Retrospective multicenter study including all consecutive stage III NSCLC who completed CRT. Primary endpoints: symptomatic BM development, whether this was the only site of first relapse. Differences between regimens were assessed with a logistic regression model including known BM risk factors and the specific chemotherapy: concurrent versus sequential (cCRT/sCRT), within cCRT: daily low dose cisplatin (LDC)-cyclic dose polychemotherapy; LDC-(non-)taxane cyclic dose; LDC-polychemotherapy subgroups of >= 50 patients. Between January 2006 and June 2014, 838 patients were eligible (737 cCRT, 101 5CRT). 18.2% developed symptomatic BM, 8.0% had BM as only site of first relapse. BM patients were significantly younger, female, had more advanced N-stage and had adenocarcinoma histology. In both cCRT and sCRT BM were found in 18% (p=0.904). In cyclic dose cCRT (N=346) and LDC (N=391) BM were found in 18.8% and 17.9%, respectively (p=0.757). In 7.2% and 8.7%, respectively, BM were the only site of first relapse (p = 0.463). The chemotherapy used (cCRT versus SCRT) had no influence on BM development, not for all brain relapses nor as only site of first relapse (OR 0.88 (p= 0.669), OR 0.93 (p = 0.855), respectively). LDC versus cyclic dose cCRT was not significantly different: neither for all brain relapses nor as only site of first relapse (OR 0.96 (p = 0.819), OR 1.21 (p= 0.498), respectively).Comparable results were found for LDC versus cyclic dose non-taxane (N = 277) and cyclic dose taxane regimens (N = 69) and
for cCRT regimens with >= 50 patients (LDC versus cisplatin/etoposide (N=188), cisplatin/vinorelbine (N= 65), weekly cisplatin/docetaxel (N= 60))."

According to the news editors, the research concluded: "Approximately 18% developed symptomatic BM after stage III diagnosis, not dependent on type of chemotherapy regimen used within a CRT treatment."

For more information on this research see: Development of symptomatic brain metastases after chemoradiotherapy for stage III non-small cell lung cancer: Does the type of chemotherapy regimen matter? Lung Cancer, 2016;101():68-75. Lung Cancer can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Life Science Research - Spinal Research

New Findings in Spinal Research Described from Nanjing University School of Medicine (Replication of Association Between 53 Single-Nucleotide Polymorphisms in a DNA-Based Diagnostic Test and AIS Progression in Chinese Han Population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Spinal Research. According to news originating from Nanjing, People's Republic of China, by NewsRx correspondents, research stated, "A case-only study. The aim of this study was to evaluate the association of the 53 single-nucleotide polymorphisms (SNPs) in a prognostic test with curve progression in Chinese adolescent idiopathic scoliosis (AIS) patients. 'ScoliScore' was the first diagnostic kit developed for curve progression of AIS in the white population."

Our news journalists obtained a quote from the research from the Nanjing University School of Medicine, "To date, there is still a paucity of validation of ScoliScore in Chinese Han population. A total of 670 AIS patients were included in the study, with 313 patients assigned to the nonprogression group and the other 357 patients assigned to the progression group. A panel of 53 SNPs encompassed in ScoliScore were genotyped using the PCR-based Invader assay. The allele frequencies were compared between AIS patients with progressive curve and those with
nonprogressive curve. SNP rs9945359 and rs17044552 are the only 2 SNPs that had significantly different allele frequencies between the 2 groups. Allele A of rs9945359 was significantly higher in the progression group than in the nonprogression group (25.7% vs 19.5%, p=0.01), and allele A of rs17044552 was significantly lower in the progression group (11.5% vs 16.4%, p=0.01). The odds ratio (OR) of these 2 SNPs were 1.42 [95% confidence interval (95% CI) 1.09-1.88] and 0.65 (95% CI 0.47-0.91), respectively. As for the allele frequencies of the other 51 SNPs, no significant difference was found between the 2 groups. ScoliScore could not be able to predict the curve progression of AIS in Chinese Han population."

According to the news editors, the research concluded: "However, the role of this test in other populations cannot be totally excluded, and additional replication studies in other ethnic groups are warranted to evaluate the significance of these SNPs."

For more information on this research see: Replication of Association Between 53 Single-Nucleotide Polymorphisms in a DNA-Based Diagnostic Test and AIS Progression in Chinese Han Population. Spine, 2016;41(4):306-10. (Lippincott Williams and Wilkins - www.lww.com; Spine - journals.lww.com/spinejournal/pages/default.aspx)

**Spiro Compounds**

**New Findings in Spiro Compounds Described from University of Kerala [Fluorescein-labeled fluoroapatite nanocrystals codoped with Yb(III) and Ho(III) for trimodal (downconversion, upconversion and magnetic resonance) imaging of cancer cells]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Spiro Compounds have been presented. According to news reporting originating from Trivandrum, India, by NewsRx correspondents, research stated, "The authors report on upconversion nanocrystals (NCs) based on a fluoroapatite (FAP) support that was engineered to enable multimodal imaging by fluorescence imaging (FI), magnetic resonance imaging (MRI), and upconversion luminescence imaging. A fluorescein based fluorophore (FITC) was incorporated into the FAP nanocrystals and then doped with Yb(III) and Ho(III) by microwave-assisted solution combustion synthesis."

Financial support for this research came from UGC, India.

Our news editors obtained a quote from the research from the University of Kerala, "The hexagonal phase nanocrystals (FITC-FAP:Yb/Ho) exhibit spindle like morphology with an average diameter and length of 15 nm and 196 nm, respectively. The doping concentration of the Yb (5 %) and Ho (0.6 %) was determined by ICP-MS. The nanocrystals exhibit
upconversion luminescence when irradiated with NIR light of wavelength 980 nm. The emission spectrum consists of two bands centered at 542 nm (green emission) and 654 nm (red emission) corresponding to two transitions of Ho(III). The pump power dependence of upconversion luminescence intensity confirmed the 2-photon process. The presence of FITC in the nanocrystal imparts green fluorescence (peaking at 521 nm) by a conventional downconversion process. The presence of Ho(III) endows the NCs with paramagnetism. The magnetization is 21.063 emu g\(^{-1}\) at room temperature. The NCs exhibit a longitudinal relaxivity \(r_1\) of 0.12 s\(^{-1}\)mM\(^{-1}\), and a transverse relaxivity \(r_2\) of 29 s\(^{-1}\)mM\(^{-1}\), which makes the system suitable for developing T2 MRI contrast agents. The nanocrystals are surface aminated using polyethyleneimine (PEI) and covalently conjugated to folic acid (FA) in order to target the folate receptors that are overexpressed in many cancer cells. The FA-conjugated nanocrystals have been tested for their applicability in fluorescence imaging of HeLa cells.\(^{\text{a}}\)

According to the news editors, the research concluded: "Their biocompatibility, upconversion and downconversion luminescence, and magnetism render these NCs potentially powerful nanoprobes for trimodal imaging."

For more information on this research see: Fluorescein-labeled fluoroapatite nanocrystals codoped with Yb(III) and Ho(III) for trimodal (downconversion, upconversion and magnetic resonance) imaging of cancer cells. *Microchimica Acta*, 2016;183(12):3209-3219. *Microchimica Acta* can be contacted at: Springer Wien, Sachsenplatz 4-6, PO Box 89, A-1201 Wien, Austria. **Succinic Acid**

**New Findings in Succinic Acid Described from Harbin Medical University (Nanoemulsion enhances alpha-tocopherol succinate bioavailability in rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Succinic Acid is now available. According to news reporting originating in Harbin, People's Republic of China, by NewsRx journalists, research stated, "The vitamin E analogue, alpha-tocopherol succinate (alpha-TOS), has a broad anti-tumor effect. alpha-TOS can induce cancer cells apoptosis and suppress tumor growth by targeting mitochondria. Low bioavailability of alpha-TOS is the major problem encountered with formulation development."

The news reporters obtained a quote from the research from Harbin Medical
University, "In our study, alpha-TOS nanoemulsion (alpha-TOS-NE) was demonstrated as a new drug delivery system of alpha-TOS to increase the bioavailability. MTT-based cytotoxicity assay and mitochondrial membrane potential (DY) were performed on human breast cancer cell lines MCF-7 and human oral epithelial cancer cell lines KB to evaluate in vitro anticancer efficacy of alpha-TOS-NE. In comparison with free alpha-TOS, alpha-TOS-NE exhibited a stronger cytotoxicity and decreased Delta Psi. Pharmacokinetic profiles of I.V. alpha-TOS-NE group, I.P. alpha-TOS-NE group, and I.P. free alpha-TOS group (7% DMSO/93% PEG) were drawn. First of all, nanoemulsion (NE) enables the I.V. injection of alpha-TOS, make it possible to be an I.V. preparation. Second, compare to the I.P. free alpha-TOS group, I.P. alpha-TOS-NE group had a higher bioavailability. Thus, NE improved the strong anti-cancer efficacy of alpha-TOS while increasing its in vivo bioavailability in rats."

According to the news reporters, the research concluded: "Our laboratory-made NE was a safe drug delivery system for clinical trials and could be a promising formulation for alpha-TOS by I.V administration."

**Respiratory Tract Diseases and Conditions - Thoracic...**

**New Findings in Thoracic Aortic Aneurysm Described from Health Science Center (Type A Aortic Dissection After Thoracic Endovascular Aortic Repair)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Respiratory Tract Diseases and Conditions - Thoracic Aortic Aneurysm are presented in a new report. According to news reporting originating in Kochi, Japan, by NewsRx journalists, research stated, "Type A aortic dissection (TAAD) is a rare complication associated with thoracic endovascular aortic repair (TEVAR). Although TAAD can result in catastrophic outcomes, the pathology of the condition has not been thoroughly clarified yet."

The news reporters obtained a quote from the research from Health Science Center, "We retrospectively reviewed details from the medical records of 546 patients with diseases of the thoracic aorta (thoracic aortic aneurysm, n = 362; aortic dissection, n = 178; and fistula between the descending thoracic aorta and esophagus, n = 6) who underwent TEVAR in five
hospitals from May 1997 through February 2015 to identify patients in whom TAAD developed during or after TEVAR. TEVAR-associated TAAD developed in 12 patients (2.2%). Pathologies originally treated with TEVAR were aortic dissection in 10 patients (83%) and true thoracic aortic aneurysm in 2 (17%). Type A aortic dissection developed during hospitalization in 4 patients (33%), within 1 year in 5 (42%), and more than 1 year later in 3 (25%). The entry tear was located in the ascending aorta or the aortic arch away from the edges of stent grafts in 8 patients (67%), whereas it was found just at the proximal edges of stent grafts in 4 patients (33%). Nine patients underwent ascending aortic replacement with or without concomitant aortic arch replacement, and 3 patients underwent medical management. Overall, 2 patients (17%) died during hospitalization. Type A aortic dissection can develop during TEVAR or even years after TEVAR."

According to the news reporters, the research concluded: "Careful operative procedures and follow-up should be mandatory for patients with aortic dissection as TAAD seems to occur more frequently among these patients."

Our news correspondents report that additional information may be obtained by contacting T. Higashigawa, Kochi Hlth Sci Center, Dept. of Cardiovasc Surg, Kochi, Japan. Additional authors for this research include N. Kato, S. Chino, T. Hashimoto, H. Shimpo, T. Tokui, T. Mizumoto, T. Sato, M. Okabe and H. Sakuma.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.04.024. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions - Thrombosis

New Findings in Thrombosis Described from Heinrich-Heine-University (Platelet-vessel wall interactions and drug effects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Thrombosis. According to news reporting originating from Dusseldorf, Germany, by NewsRx correspondents, research stated, "Platelet-vessel wall interaction is necessary for hemostasis and vascular repair, but also plays a fundamental role in the early and late development of atherosclerosis and atherothrombotic vascular events. A plethora of adhesion molecules, biological mediators and receptors are engaged in the regulation of platelet function in hemostasis and thrombosis."

Our news editors obtained a quote from the research from Heinrich-Heine-University, "Currently available antiplatelet drugs act on targets that are critical for both,
physiological hemostasis and pathological intravascular thrombosis. Consequently, their major disadvantage is bleeding complications, especially when different antiplatelet drugs are combined or applied together with anticoagulants, such as in antithrombotic therapy of acute coronary syndromes. Aspirin, clopidogrel and GPIIb/IIIa antagonists are commonly used inhibitors of platelet aggregation or secretion. In addition, they modify platelet interactions with the vessel wall, which may contribute to or modulate their antithrombotic action. Some commonly used drugs without primary antiplatelet effects, such as heparins or statins, also appear to modify platelet interaction with the vessel wall. Present research on antithrombotic drug targets aims to identify new pharmacological concepts which more specifically address the pathophysiological mechanisms leading to intravascular thrombosis, thus intending to reduce interference with hemostasis."

According to the news editors, the research concluded: "This review article summarizes the biological and pathological mechanisms involved in thrombogenic platelet vessel wall interaction, describes the current knowledge on the clinically available drugs in this field and gives an outlook on emerging concepts and innovative pharmacological compounds, which may improve efficacy and safety of antiplatelet therapy in the future."

For more information on this research see: Platelet-vessel wall interactions and drug effects. *Pharmacology & Therapeutics, 2016;167():74-84. **Tobacco Research**

**New Findings in Tobacco Research Described from Duke University**

*(Efficacy of a Nurse-Delivered Intervention to Prevent and Delay Postpartum Return to Smoking: The Quit for Two Trial)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Tobacco Research is the subject of a report. According to news reporting originating from Durham, North Carolina, by NewsRx correspondents, research stated, "Most pregnant women who quit smoking return to smoking postpartum. Trials to prevent this return have been unsuccessful."

Financial support for this research came from National Institutes of Health.

Our news editors obtained a quote from the research from Duke University, "We tested the efficacy of a nurse-delivered intervention in maintaining smoking abstinence after delivery among pregnant women who quit smoking that was tailored on their high risk of
relapse (eg, had strong intentions to return). We recruited 382 English-speaking spontaneous pregnant quitters from 14 prenatal clinics and randomized them to receive either a smoking abstinence booklet plus newsletters about parenting and stress (control) or a nurse-delivered smoking abstinence intervention that differed in intensity for the high and low risk groups. Our primary outcome was smoking abstinence at 12 months postpartum. Using intent-to-treat analyses, there was a high rate of biochemically validated smoking abstinence at 12 months postpartum but no arm differences (Control: 36% [95% confidence interval [CI]: 29-43] vs. 35% [95% CI: 28-43], P = .81). Among women at low risk of returning to smoking, the crude abstinence rate was significantly higher in the control arm (46%) than in the intervention arm (33%); among women at high risk of returning to smoking, the crude abstinence rate was slightly lower but not different in the control arm (31%) than in the intervention arm (37%). Low-risk women fared better with a minimal intervention that focused on parenting skills and stress than when they received an intensive smoking abstinence intervention. The opposite was true for women who were at high risk of returning to smoking. Clinicians might need to tailor their approach based on whether women are at high or low risk of returning to smoking. Results suggest that high-risk and low-risk women might benefit from different types of smoking relapse interventions."

According to the news editors, the research concluded: "Those who are lower risk of returning to smoking might benefit from stress reduction that is devoid of smoking content, whereas those who are higher risk might benefit from smoking relapse prevention."

The news editors report that additional information may be obtained by contacting K.I. Pollak, Duke University, Sch Med, Dept. of Community & Family Med, Durham, NC 27705, United States. Additional authors for this research include L.J. Fish, P. Lyna, B.L. Peterson, E.R. Myers, X.M. Gao, G.K. Swamy, A. Brown-Johnson, P. Whitecar, A.K. Bilheimer and P.K. Pletsch.

Type 2 Diabetes are discussed in a new report. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "To evaluate whether low glycosylated hemoglobin (HbA1c), blood pressure (BP), and total cholesterol (TC) are associated with lower risk of all-cause mortality in very old individuals with type 2 diabetes mellitus. Population-based cohort study."

Financial supporters for this research include King’s College London, National Institute for Health Research, Biomedical Research Centre at Guy's and St Thomas’ National Health Service Foundation Trust.

Our news editors obtained a quote from the research from King's College, "Primary care database in the United Kingdom. Individuals aged 80 and older with type 2 diabetes mellitus (N = 25,966). Associations between baseline HbA1c, BP, and TC and all-cause mortality were evaluated in Cox proportional hazards models. Analyses were adjusted for sex, age, duration of diabetes mellitus, lifestyle variables, HbA1c, BP, TC, comorbidities, prescribing of antidiabetic and cardiovascular drugs, and participants' general practice. There were 4,490 deaths during follow-up (median 2.0 years; mortality 104.7 per 1,000 person-years). Mortality in participants with low (<6.0% (<42 mmol/mol)) or high (>= 8.5% (>= 69 mmol/mol)) HbA1c was similar to that in those with the reference HbA1c (8.0-8.4% (64-68 mmol/mol)). Mortality was lowest in individuals with HbA1c of 7.0-7.4% (53-57 mmol/mol) (80.9 per 1,000 person-years, adjusted hazard ratio (aHR) = 0.80, 95% confidence interval (CI) = 0.70-0.91, P = .001). Mortality was higher in individuals with lower BP (e.g., <130/70 mmHg, 151.7 per 1,000 person-years, aHR = 1.52, 95% CI = 1.34-1.72, P< .001 vs reference BP <150/90 mmHg) and in the lowest TC category (<3.0 mmol/L, 138.7 per 1,000 person-years, aHR = 1.42, 95% CI = 1.24-1.64, P< .001 vs reference TC 4.5-4.9 mmol/L). The relationship between TC and mortality varied according to sex and prescription of lipid-lowering drugs. Low HbA1c, BP, and TC may be associated with higher mortality in very old adults with type 2 diabetes mellitus."

According to the news editors, the research concluded: "Further research is required to understand these associations and to identify optimal treatment targets in this population."

For more information on this research see: Mortality in Individuals Aged 80 and Older with Type 2 Diabetes Mellitus in Relation to Glycosylated Hemoglobin, Blood Pressure, and Total Cholesterol. *Journal of the American Geriatrics Society*, 2016;64(7):1425-1431. 

The news editors report that additional information may be obtained by contacting S. Hamada, Kings Coll London, Dept. of Primary Care & Public Hlth Sci, London SE1 1UL, United Kingdom.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jgs.14215. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings in the Area of Anidulafungin Therapy Reported from J.B. Locke and Colleagues
(Characterization of In Vitro Resistance Development to the Novel Echinocandin CD101 in Candida Species)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Anidulafungin Therapy is now available. According to news originating from San Diego, California, by NewsRx correspondents, research stated, "CD101 is a novel echinocandin with a long half-life undergoing clinical development for treatment of candidemia/invasive candidiasis and vulvovaginal candidiasis. The potential for and mechanisms underlying the development of resistance to CD101 in Candida species were investigated by using spontaneous resistance and serial passage selection methodologies. Four Candida spp. (C. albicans, C. glabrata, C. parapsilosis, and C. krusei) were chosen for resistance characterization with CD101, anidulafungin, and caspofungin."

Our news journalists obtained a quote from the research, "The frequency of spontaneous, single-step mutations conferring reduced susceptibility to CD101 at 1 x the agar growth inhibition concentration was low across all species, with median frequencies ranging from 1.35 x10(-8) to 3.86 x 10(-9), similar to ranges generated for anidulafungin and caspofungin. Serial passage of Candida spp. on agar plates containing drug gradients demonstrated a low potential for resistance development, with passage 20 CD101-selected strains possessing increases in MICs equivalent to or lower than those for the majority of strains generated under selection with anidulafungin and caspofungin. A total of 12 fks 'hot spot' mutations were identified, typically in strains with the highest MIC shifts. Cross-resistance was broadly observed among the 3 echinocandins evaluated, with no CD101-selected mutants (with or without fks hot spot mutations) exhibiting reduced susceptibility to CD101 but not also to anidulafungin and/or caspofungin."

According to the news editors, the research concluded: "Consistent with currently approved echinocandins, CD101 demonstrates a low potential for resistance development, which could be further enhanced in vivo by the high maximum concentration of drug in serum (Cmax)/area under the concentration-time curve (AUC) plasma drug exposure achieved with once-weekly dosing of CD101."

For more information on this research see: Characterization of In Vitro Resistance Development to the Novel Echinocandin CD101 in Candida Species. Antimicrobial Agents and Chemotherapy, 2016;60(10):6100-6107. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news correspondents report that additional information may be obtained from J.B. Locke, Cidara Therapeut Inc, San Diego, CA 92121, United States. Additional authors for this research include A.L. Almaguer, D.E. Zuill and K. Bartizal.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AAC.00620-16. This DOI is a link to an online electronic document that is either free or for purchase.

Health and Medicine - Cardiovascular Research

New Findings in the Area of Cardiovascular Research Reported from J.S. Shinbane and Colleagues (Digital monitoring and care: Virtual medicine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Health and Medicine - Cardiovascular Research is now available. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "Remote digital health monitoring technologies can be synergistically organized to create a virtual medical system providing more continuous care centered on the patient rather than the bricks and mortar medical complex."

Our news journalists obtained a quote from the research, "Utilization of the digitalized patient health monitoring can facilitate diagnosis, treatment plans, physician-patient interaction, and accelerate the progress of medical research, education, and training. The field of cardiac electrophysiology has been an early adopter of this shift in care and serves as a paradigm applicable to all areas of medicine."

According to the news editors, the research concluded: "The overall impact of this remote virtual care model on the quality of medical care and patient experience requires greater study, as well as vigilance as to the differences between technology and care in order to preserve the intangible and immeasurable factors that bring humanity to the art and science of medicine."

Our news journalists report that additional information may be obtained by contacting L.A. Saxon, Univ Southern Calif, Keck Sch Med, Center Body Comp, Div Cardiovasc Med, Los Angeles, CA 90007, United States.

New Findings in the Area of Clinical Trials and Studies Reported from A. Bottomley and Colleagues (Analysing data from patient-reported outcome and quality of life endpoints for cancer clinical trials: a start in setting international standards)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Research - Clinical Trials and Studies. According to news reporting from Brussels, Belgium, by NewsRx journalists, research stated, "Measures of health-related quality of life (HRQOL) and other patient-reported outcomes generate important data in cancer randomised trials to assist in assessing the risks and benefits of cancer therapies and fostering patient-centred cancer care. However, the various ways these measures are analysed and interpreted make it difficult to compare results across trials, and hinders the application of research findings to inform publications, product labelling, clinical guidelines, and health policy."

The news correspondents obtained a quote from the research, "To address these problems, the Setting International Standards in Analyzing Patient-Reported Outcomes and Quality of Life Endpoints Data (SISAQOL) initiative has been established. This consortium, directed by the European Organisation for Research and Treatment of Cancer (EORTC), was convened to provide recommendations on how to standardise the analysis of HRQOL and other patient-reported outcomes data in cancer randomised trials."

According to the news reporters, the research concluded: "This Personal View discusses the reasons why this project was initiated, the rationale for the planned work, and the expected benefits to cancer research, patient and provider decision making, care delivery, and policy making."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/S1470-2045(16)%2930510-1. This DOI is a link to an online electronic document that is either free or for purchase.

Enzymes and Coenzymes - ADP Ribose Transferases

New Findings on ADP Ribose Transferases Discussed by Researchers at University of Shandong [Poly(ADP-ribose)polymerase 1 inhibition protects against age-dependent endothelial dysfunction]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Enzymes and Coenzymes - ADP Ribose Transferases is now available. According to news reporting out of Jinan, People's Republic of China, by NewsRx editors, research stated, "Age-related endothelial dysfunction is closely associated with the local production of reactive oxygen species (ROS) within and in the vicinity of the vascular endothelium. Oxidant-induced DNA damage can activate the nuclear enzyme poly(ADP-ribose) polymerase 1 (PARP-1), leading to endothelial dysfunction in various pathophysiological conditions."

Financial supporters for this research include Scientific and Technologic Development Program of Shandong Province, Natural Science Foundation of Shandong Province, Jinan City College Independent Innovation, Seed Fund of the Second Hospital of Shandong University.

Our news journalists obtained a quote from the research from the University of Shandong, "The present study aimed to investigate the role of PARP-1 in age-dependent changes in endothelial cell function and its underlying mechanism. Wild-type (WT) and PARP-1(-/-) mice were divided into young (2 months) and old (12 months) groups. Isolated aortic rings were suspended to record isometric tension to assess endothelial function. Nitric oxide (NO) production and content in plasma were detected by spectrophotometry. Superoxide (O2(-)) production was detected by dihydroethidium. Expression of PARP-1, endothelial nitric oxide synthase (eNOS), induced nitric oxide synthase (iNOS), and arginase-2 (Arg2) was assessed by western blot analysis. Endothelium-dependent relaxation in response to acetylcholine was lost in old WT, but not PARP-1(-/-), mice. Endothelium-independent vasodilation was not impaired in aging mice. Production of O2(-) was greater in aging WT mice than young or aging PARP-1(-/-) mice. eNOS expression was not affected by aging in WT or PARP-1(-/-) mice, but p-eNOS expression decreased and iNOS and Arg2 levels were upregulated only in aging WT mice." According to the news editors, the research concluded: "PARP-1 inhibition may protect against age-dependent endothelial dysfunction, potentially by regulating NO bioavailability via iNOS. Inhibition of PARP-1 may help in vascular aging prevention."

For more information on this research see: Poly(ADP-ribose)polymerase 1 inhibition protects against age-dependent endothelial dysfunction. Clinical and Experimental Pharmacology and Physiology, 2015;42(12):1266-74. (Wiley-Blackwell - www.wiley.com; Clinical and Experimental Pharmacology and Physiology - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1440-1681)

Our news journalists report that additional information may be obtained by contacting G.H. Zhang, Dept. of Cardiology, The Second Hospital of Shandong University, Jinan, People's Republic of China. Gram-Negative Bacteria - Acinetobacter baumannii

New Findings on Acinetobacter baumannii from United States Military Academy Summarized (Evaluation of Virulence Gene Expression Patterns in Acinetobacter baumannii Using Quantitative Real-Time Polymerase Chain Reaction Array)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Acinetobacter baumannii are discussed in a new report. According to news reporting originating from West Point, New York, by NewsRx correspondents, research stated, "According to the Centers for Disease Control's recently devised National Strategy for Combating Antibiotic-Resistant Bacteria, Acinetobacter baumannii is a 'serious' threat level pathogen. A. baumannii’s notoriety stems from the fact that a large number of modern strains are multidrug resistant and persist in the hospital setting, thus causing numerous deaths per year. It is imperative that research focus on a more fundamental understanding of the factors responsible for the success of A. baumannii."

Our news editors obtained a quote from the research from United States Military Academy, "Toward this end, our group investigated virulence gene expression patterns in a recently characterized wound isolate, AB5075, using quantitative real-time polymerase chain reaction array. Notably, several genes showed statistically significant upregulation at 37 degrees C compared to 25 degrees C; MviM, Wbbj, CarO, and certain genes of the Bas, Bar, and Csu operons. Additionally, we found that in vitro biofilm formation by Csu transposon insertion mutant strains is attenuated. These findings validate previous reports that suggest a link between the Csu operon and biofilm formation."

According to the news editors, the research concluded: "More importantly, our results demonstrate a successful method for evaluating the significance of previously identified virulence factors in a modern and clinically relevant strain of A. baumannii, thereby providing a path toward a more fundamental understanding of the pathogenicity of A. baumannii."

For more information on this research see: Evaluation of Virulence Gene Expression Patterns in Acinetobacter baumannii Using Quantitative Real-Time Polymerase Chain Reaction Array. *Military Medicine*, 2016;181(9):1108-1113. *Military Medicine* can be contacted at: Assoc Military Surg Us, 9320 Old Georgetown Rd, Bethesda, MD 20814, USA.

The news editors report that additional information may be obtained by contacting F.M. Lannan, US Military Academy, Dept. of Chem & Life Sci, West Point, NY 10996, United States. Our news journalists obtained a quote from the research from the University of Montreal, "We investigated the influence of polymorphisms in doxorubicin metabolic and functional pathways on late-onset CT as estimated by echocardiography in 251 childhood acute lymphoblastic leukemia (cALL) patients. Association analyses revealed a modulating effect of two variants: A-1629 T in ABCC5, an ATP-binding cassette transporter, and G894T in the NOS3 endothelial nitric oxide synthase gene. Individuals with the ABCC5 TT-1629 genotype had an average of 8-12% reduction of ejection (EF) and shortening fractions (SF; EF: P<0.0001, and SF: P = 0.001, respectively). A protective effect of the NOS3 TT894 genotype on EF was seen in high-risk patients (P = 0.02), especially in those who did not receive dexrazoxane (P = 0.002). Analysis of an additional cohort of 44 cALL patients replicated the ABCC5 association but was underpowered for NOS3."

According to the news editors, the research concluded: "In summary, we identified two biomarkers that may contribute to cALL anthracycline CT risk stratification."

Our news journalists report that additional information may be obtained by contacting M. Krajinovic, University of Montreal, Dept. of Pharmacol, Montreal, PQ, Canada. New Findings on Acute Myeloid Leukemia Described by Investigators at University Hospital (Natural killer cells in acute myeloid leukemia patients: from phenotype to transcriptomic analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Myeloid Leukemia. According to news reporting from Marseille, France, by NewsRx journalists, research stated, "Chemotherapies allow complete remission in more than 50% of patients with acute myeloid leukemia (AML), however, with frequent relapse. This suggests that residual leukemic cells may escape to chemotherapy and immune system."

The news correspondents obtained a quote from the research from University Hospital, "Natural killer (NK) cells from AML patients (AML-NK) have a weaker natural cytotoxicity-activating receptors (NCRs) expression than NK cells from healthy donors (HD-NK). Coding genes for NCR1/NKp46, NCR2/NKp44 and NCR3/NKp30 are located at different loci on two different chromosomes; however, their expression is tightly coordinated. Most NK cells express either high (NCRbright) or low levels (NCRdull) of all three NCRs. This suggests the existence of negative/positive regulation factor(s) common to the three receptors. In order to find transcription factor(s) or pathway(s) involved in NCRs co-regulation, this study compared the transcriptomic signature of HD-NK and AML-NK cells, before and after in vitro NK cells culture. Microarrays analysis revealed a specific NK cells transcriptomic signature in patients with AML. However, in vitro NK cells expansion erased this signature and up-regulated expression of central molecules of NK functions, such as NCR, NKG2D and also ETS-1, regardless of their origin, i.e., AML-NK vs HD-NK. ETS-1 transcription factor was shown to bind to a specific and common region in the NCRs promoters, thus appearing as a good candidate to explain the coordinated regulation of three NCRs."

According to the news reporters, the research concluded: "Such results are encouraging regarding in vitro AML-NK cytotoxicity restoration and provide a new conceptual support for innovative cellular therapy based on in vitro NK cells expansion before their reinfusion in AML patients."

For more information on this research see: Natural killer cells in acute myeloid leukemia patients: from phenotype to transcriptomic analysis. *Immunologic Research*, 2016;64 (5-6):1225-1236. *Immunologic Research* can be contacted at: Humana Press Inc, 999 Riverview Drive Suite 208, Totowa, NJ 07512, USA. New Findings on Adenosine Therapy Described by Investigators at Third Military Medical University (Adenosine A1-Receptors Modulate mTOR Signaling to Regulate White Matter Inflammatory Lesions Induced by Chronic Cerebral Hypoperfusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Adenosine Therapy is now available. According to news reporting out of Chongqing, People's Republic of China, by NewsRx editors, research stated, "We sought to investigate the role of the adenosine A1 receptors (A1ARs) in white matter lesions under chronic cerebral hypoperfusion (CCH) and explore the potential repair mechanisms by activation of the receptors. A right unilateral common carotid artery occlusion (rUCCAO) method was used to construct a CCH model. 2-chloro-N6-cyclopentyladenosine (CCPA), a specific agonist of A1ARs, was used to explore the biological mechanisms of repair in white matter lesions under CCH."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Third Military Medical University, "The expression of mammalian target of rapamycin (mTOR), phosphorylation of mTOR (P-mTOR), myelin basic protein (MBP, a marker of white matter myelination) were detected by Western-blot. Pro-inflammatory cytokine tumor necrosis factor-alpha (TNF-alpha) and anti-inflammatory cytokine interleukin-10 (IL-10) levels were determined by ELISA."

According to the news editors, the research concluded: "Compared with the control groups on week 2, 4 and 6, in CCPA-treated groups, the ratio of P-mTOR/mTOR, expression of MBP and IL-10 increased markedly, while the expression of TNF-alpha reduced at week 6. A1ARs appears to reduce inflammation in white matter via the mTOR signaling pathway in the rUCCAO mice. Therefore, A1ARs may serve as a therapeutic target during the repair of white matter lesions under CCH."

For more information on this research see: Adenosine A1-Receptors Modulate mTOR Signaling to Regulate White Matter Inflammatory Lesions Induced by Chronic Cerebral Hypoperfusion. New Findings on Advanced Nursing Described by Investigators at University of Notre Dame (The Cancer Nurse Coordinator Service in Western Australia: perspectives of specialist cancer nurse coordinators)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nursing - Advanced Nursing have been presented. According to news reporting from Fremantle, Australia, by NewsRx journalists, research stated, "In Western Australia the cancer nurse coordinator (CNC) role is unique, state wide and situated in nursing. It requires the domains of clinical expert, resource consultant, educator, change agent, researcher and advocate to facilitate seamless coordination of care for patients across metropolitan, rural and remote geographical areas of Western Australia."

The news correspondents obtained a quote from the research from the University of Notre Dame, "This study examined the role, function and impact of CNCs from the perspective of coordinators themselves. Prospective two-phase mixed method study. This paper reports data from the Self Report Activity Questionnaire in Phase one. The state-wide Western Australian Cancer Nurse Coordinator Service. Metropolitan and rural CNCs (n = 18) who had worked in the role for at least six months. Overall, CNCs spent 70% of time in clinical consultation and 41% of CNCs reported having an educational role. Most CNCs (71%) noted that at least half of their patients had complex psychosocial needs at referral. Key role-related activities related to direct nursing care and patient education were performed most frequently on a daily basis. Tasks related to care management planning, patient advocacy and multidisciplinary clinical care were performed weekly. Strategic, team communication and professional development activities were performed less frequently. Diversity of the CNC role was demonstrated with findings showing that CNCs fulfilled the core components of the specialist cancer nurse."

According to the news reporters, the research concluded: "Given the clear need to provide consistent support to cancer patients in an increasingly individualised and integrated manner, we consider the CNC role a fundamental element of quality cancer care."

New Findings on Allergic Rhinitis Discussed by Researchers at Nova Southeastern University (The role of allergen immunotherapy in the management of allergic rhinitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immune System Diseases and Conditions - Allergic Rhinitis is now available. According to news originating from Davie, Florida, by NewsRx editors, the research stated, "To evaluate the role of allergen immunotherapy (AIT) in the treatment of allergic rhinitis (AR). Individual studies, systematic reviews, and practice guidelines that included information on sublingual AIT (SLIT) and subcutaneous AIT (SCIT) in the treatment of AR were considered."

Our news journalists obtained a quote from the research from Nova Southeastern University, "AIT via the SLIT or SCIT route has been shown to be effective in treating AR symptoms with resultant improvements in overall quality of life, comorbid illnesses, and medication requirements. Persistent clinical benefits have been demonstrated years after AIT treatment discontinuation. AIT may prevent the progression of AR to asthma. In addition, studies that evaluated the pharmacoeconomics of AR treatment indicate that AIT may be more cost effective than pharmacotherapy. The AIT cost savings are likely underestimated in that few cost comparison studies considered AIT's long-term benefits or preventive effects. Multiple individual studies and systematic reviews provide strong evidence for the clinical effectiveness of AIT in the treatment of AR."

According to the news editors, the research concluded: "Cost-effectiveness and disease modification are additional advantages of AIT compared with standard drug treatment in the management of AR."

For more information on this research see: The role of allergen immunotherapy in the management of allergic rhinitis. *American Journal of Rhinology & Allergy*, 2016;30(1):48-53.

The news correspondents report that additional information may be obtained from L. Cox, Dept. of Medicine, Nova Southeastern University, Davie, Florida, United States.

Neurodegenerative Diseases and Conditions –...

New Findings on Alzheimer Disease from University of Lisbon Summarized (Recent progress in multifunctional metal chelators as potential drugs for Alzheimer’s disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting out of Lisbon, Portugal, by NewsRx editors, research stated, 'Alzheimer's disease (AD) is a chronic and irreversible neurodegenerative illness, which involves the progressive deterioration of intellectual functions and behavioral disorders. Several therapeutic approaches have been proposed, but only four acetylcholinesterase inhibitors and one N-methyl-D-aspartate receptor antagonist have been approved by the US Food and Drug Administration, which have quite limited effectiveness and that mostly provide palliative therapy.'

Financial support for this research came from FCT.

Our news journalists obtained a quote from the research from the University of Lisbon, "The complex pathology of this multifaceted disease and the possible interconnections among numerous intervening factors have led to the development of several multi-target candidate drugs. This review describes the most recent progress in multifunctional compounds containing a biometal (Fe, Cu, Zn) chelating unity for potential AD prevention/therapy. The importance of including a chelating moiety in these anti-AD drug candidates is associated with the recognized roles played by metal dyshomeostasis and related oxidative stress in AD pathogenesis, particularly by preceding or inducing the hallmark pathologies of this disease (neurofibrillary tangles, senile plaques, and reactive oxygen species)."

According to the news editors, the research concluded: "This review focuses on recent approaches based on the combination or fusion of different functions in a unique molecular entity, including chelating moieties, with various types of donor atoms and denticity in several scaffolds, i.e., 8-hydroxyquinolines, beta-aminopyridines and other diamino-based chelators, phenol-amino derivatives, amino/hydroxyl chalcones, 3-hydroxy-4-pyridinones, flavonoids, and hydroxyanthraquinones."

For more information on this research see: Recent progress in multifunctional metal chelators as potential drugs for Alzheimer's disease. Coordination Chemistry Reviews, 2016;327():287-303. New Findings on Aneurysm from Kyoto University Summarized (Compressed Sensing 3-Dimensional Time-of-Flight Magnetic Resonance Angiography for Cerebral Aneurysms: Optimization and Evaluation)

According to news reporting out of Kyoto, Japan, by NewsRx editors, research stated, "The aims of this study were to optimize parameters for Nesterov algorithm (NESTA) in reconstruction of 3-dimensional time-of-flight (TOF) magnetic resonance angiography (MRA) at 3 T by performing an exhaustive search and to validate the performance of compressed sensing (CS) by applying it to data from cerebral aneurysms and evaluating diagnostic quality. Three-dimensional TOF-MRA was obtained using a 3 T MR system with a 32-channel head coil for both healthy volunteers and 10 patients (11 aneurysms)."

Our news journalists obtained a quote from the research from Kyoto University, "No undersampling was applied for imaging parameters, including parallel imaging or other partial Fourier sampling. In the first step, the experimental setup was for healthy subjects to optimize CS parameters of NESTA and the undersampling mask pattern, so 24,696 different reconstruction conditions were surveyed for sampling rates of 8.0X and 5.0X. Mean square error (MSE) was calculated for each image reconstructed with the undersampling pattern and CS parameter sets. Evaluation was by normalized MSE, edge sharpness for MRA reconstructed using fully sampled data (MRA-full), zero-filled MRA (ZF-MRA) with Poisson disk undersampling mask, and CS-MRA (5.0X and 8.0X) with iterations of 5, 10, 15, 20, 25, 30, 35, 40, 45, and 50. CS-MRA (5.0X and 8.0X) with 5, 10, and 50 iterations of the sampling pattern and CS parameter set with the lowest MSE were visually inspected by 2 neuroradiologists to check the diagnostic quality. The sampling pattern and CS parameter set with the lowest MSE were identical for both CS-MRA 5.0X and CS-MRA 8.0X. At the initial 5 to 15 iterations, MSE of both sampling rates greatly decreased from that of ZF-MRA. For subsequent iterations, the decrease in MSE was relatively small. For CS-MRA, sharpness greatly increased from that of ZF-MRA within the initial 5 to 15 iterations, followed by slight increases with further iterations. Two neuroradiologists graded most aneurysms as excellent, with the exception of 1 to 4 aneurysms recognized as good by 1 observer in CS-MRA (8.0X). Optimization of NESTA in the reconstruction of 3-dimensional TOF-MRA was conducted, and the parameters and undersampling mask with the lowest MSE were determined. Caliber measurement should be performed with CS (5.0X) with 25 or 30 iterations."

According to the news editors, the research concluded: "Most cerebral aneurysms were sufficiently recognized using CS-MRA (5.0X) or CS-MRA (8.0X) with 10 iterations."

For more information on this research see: Compressed Sensing 3-Dimensional Time-of-Flight Magnetic Resonance Angiography for Cerebral Aneurysms: Optimization and Evaluation. Investigative Radiology, 2016;51(4):228-35. (Lippincott Williams and Wilkins - www.lww.com; Investigative Radiology - journals.lww.com/investigativeradiology/pages/default.aspx)

**Cardiovascular Diseases and Conditions - Aneurysm**

**New Findings on Aneurysm from University of Utah Summarized (Inter-rater reliability of published flow diversion occlusion scales)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Aneurysm have been published. According to news reporting from Salt Lake City, Utah, by NewsRx journalists, research stated, "With increasing use of flow-diverting stents for the treatment of intracranial aneurysms, standardized methods and a common language to evaluate angiographic outcomes are needed. Multiple grading scales have been developed for this purpose but none has been widely adopted."

The news correspondents obtained a quote from the research from the University of Utah, "To analyze these scales to determine interobserver reliability. Four independent assessors scored the intraprocedural angiograms of patients who underwent flow-diverting stent deployment for an intracranial saccular or fusiform aneurysm at our institution between October 2012 and June 2015. Angiographic outcome immediately after flow-diverting stent deployment was scored using three grading scales (Kamran-Byrne (KB), Simple Measurement of Aneurysm Residual after Treatment (SMART), and O'Kelley, Kriangs, Marotta (OKM)). Statistical analysis was performed using Light's kappa for multiple raters (kappa), Kendall's coefficient of concordance (W), and intraclass correlation (ICC). We included the angiograms of 50 consecutive patients (mean age 58 years, range 30-79) who underwent flow-diverting stent deployment for an intracranial aneurysm (40 saccular, 10 fusiform). Six aneurysms were located in the posterior circulation. The inter-rater reliability was typically poor or fair: SMART aneurysm filling (kappa=0.30, W=0.36, ICC=0.12), SMART parent vessel stenosis (kappa=0.07, W=0.33, ICC=0.12), KB axis I (kappa=0.24, W=0.50, ICC=0.25), KB axis II (kappa=0.07, W=0.30, ICC=0.06), OKM aneurysm filling (kappa=0.23, W=0.45, ICC=0.13), OKM contrast stasis (kappa=0.36, W=0.71, ICC=0.54)."

According to the news reporters, the research concluded: "Existing flow-diverting stent grading scales have low inter-rater reliability for most categories."

New Findings on Antibiotics Described by Investigators at Federal University (Evaluation Of Aerobic And Anaerobic Biodegradability And Toxicity Assessment Of Real Pharmaceutical Wastewater From Industrial Production Of Antibiotics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antibiotics is the subject of a report. According to news reporting from Belo Horizonte, Brazil, by NewsRx journalists, research stated, "This study evaluates aerobic and anaerobic biodegradability and toxicity of a real pharmaceutical wastewater, which focuses on antibiotics production. Zahn-Wellens and Organization for Economic Cooperation and Development (OECD) methodologies were applied in order to verify the wastewater's biodegradability and Microtox ® analysis was performed for toxicity tests."

The news correspondents obtained a quote from the research from Federal University, "Tests achieved more than 89% and 63% of Total Organic Carbon reduction, showing 80% and 50% of antibiotic removal, for aerobic and anaerobic processes, respectively. Moreover, acute ecotoxicological tests revealed that both techniques decreased the toxic character of real pharmaceutical wastewater. Desorption tests showed that the antibiotic was not degraded, but, in fact, adsorbed onto the sludge. Since biological treatment is the most widely used method for industrial wastewater treatment, this study indicates that this kind of treatment is probably unable to mineralize antibiotics present in pharmaceutical wastewaters, which may induce the development of resistant pathogens."

According to the news reporters, the research concluded: "Therefore, efforts must be taken to elucidate the main mechanisms of biological antibiotic removal from wastewaters since the presence of antibiotics in the environment is considered to be an emerging environmental issue."

For more information on this research see: Evaluation Of Aerobic And Anaerobic Biodegradability And Toxicity Assessment Of Real Pharmaceutical Wastewater From Industrial Production Of Antibiotics. Drugs and Therapies - Antibiotics

New Findings on Antibiotics Described by Investigators at University of Tennessee (A single-center retrospective review of postoperative infectious complications in the surgical management of mandibular fractures: Postoperative antibiotics add ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antibiotics. According to news reporting originating in Chattanooga, Tennessee, by NewsRx journalists, research stated, "Mandibular fractures are common facial injuries and treatment may be complicated by post-operative infection. Risk of infection from contamination with oral flora is well established but no consensus exists regarding antibiotic prophylaxis."

The news reporters obtained a quote from the research from the University of Tennessee, "The purpose of this study is to assess risk factors and perioperative antibiotics on surgical site infection (SSI) rates following mandibular fracture surgery. Retrospective medical record review was completed for trauma patients of any age surgically treated for mandibular fractures at a Level I Trauma Center from September 2006 to June 2012. Outcomes analysis was performed to determine SSI rates related to perioperative antibiotic use and other risk factors that may contribute to SSI. 359 patients met inclusion criteria for analysis. 76% were male. Mean age was 30.5 years. Thirty-eight patients developed SSI (10.6%). SSI rate was lower in closed versus open surgery (3.2% vs. 16.3%, p=0.0001), and in closed versus open fractures (1% vs. 14%, p=0.0005). SSI rate increased in patients with tobacco, alcohol, and drug use (14.6%, 13.2%, 53.6%, p<0.0001), traumatic dental injuries (19.6%, p=0.0110), and patients in motor vehicle crashes (12.2%, p=0.0062). SSI rates stratified by Injury Severity Score (ISS) less than or equal to 16 (23/255 [9%]) versus ISS greater than 16 (15/104 [14%]) trended toward more severely injured patients developing SSI, p=0.1347. SSI rate was similar in patients who did and did not receive post-operative antibiotics (14.7% vs. 9.6%, p=0.2556). Type of antibiotic, duration of post-operative antibiotic administration, and duration between injury and surgery did not effect SSI rate."

According to the news reporters, the research concluded: "Findings suggest that following surgical treatment of mandible fractures, open surgery, open fractures, and risk factors including substance abuse, traumatic dental injury, and mechanism of injury significantly increase SSI rates, while post-operative antibiotics do not appear to provide additional benefit compared to pre-operative antibiotics alone."

For more information on this research see: A single-center retrospective review of
postoperative infectious complications in the surgical management of mandibular fractures: Postoperative antibiotics add no benefit. *Journal of Trauma and Acute Care Surgery*, 2016;81 (6):1109-1114. *Journal of Trauma and Acute Care Surgery* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Drugs and Therapies - Antibiotics**

**New Findings on Antibiotics from Weizmann Institute of Science Summarized (A novel pleuromutilin antibacterial compound, its binding mode and selectivity mechanism)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antibiotics is the subject of a report. According to news reporting originating from Rehovot, Israel, by NewsRx correspondents, research stated, "The increasing appearance of pathogenic bacteria with antibiotic resistance is a global threat. Consequently, clinically available potent antibiotics that are active against multidrug resistant pathogens are becoming exceedingly scarce."

Our news editors obtained a quote from the research from the Weizmann Institute of Science, "Ribosomes are a main target for antibiotics, and hence are an objective for novel drug development. Lefamulin, a semi-synthetic pleuromutilin compound highly active against multi-resistant pathogens, is a promising antibiotic currently in phase III trials for the treatment of community-acquired bacterial pneumonia in adults. The crystal structure of the Staphylococcus aureus large ribosomal subunit in complex with lefamulin reveals its protein synthesis inhibition mechanism and the rationale for its potency."

According to the news editors, the research concluded: "In addition, analysis of the bacterial and eukaryotes ribosome structures around the pleuromutilin binding pocket has elucidated the key for the drug's selectivity."

The news editors report that additional information may be obtained by contacting A. Yonath, Weizmann Inst Sci, Dept. of Biol Struct, IL-7610001 Rehovot, Israel. Additional authors for this research include D. Matzov, M. Krupkin, S. Paukner, R. Riedl, H. Rozenberg, E. Zimmerman, A. Bashan and A. Yonath.

Drugs and Therapies - Antidepressants

New Findings on Antidepressants from University of Texas Summarized (Ontogeny of Norepinephrine Transporter Expression and Antidepressant-Like Response to Desipramine in Wild-Type and Serotonin Transporter Mutant Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antidepressants are presented in a new report. According to news reporting from San Antonio, Texas, by NewsRx journalists, research stated, "Depression is a major public health concern with symptoms that are often poorly controlled by treatment with common antidepressants. This problem is compounded in juveniles and adolescents, because therapeutic options are limited to selective serotonin reuptake inhibitors (SSRIs)."

The news correspondents obtained a quote from the research from the University of Texas, "Moreover, therapeutic benefits of SSRIs are often especially limited in certain subpopulations of depressed patients, including children and carriers of low-expressing serotonin transporter (SERT) gene variants. Tricyclic antidepressants (TCAs) offer an alternative to SSRIs; however, how age and SERT expression influence antidepressant response to TCAs is not understood. We investigated the relation between antidepressant-like response to the TCA desipramine using the tail suspension test and saturation binding of [H-3]nisoxetine to the norepinephrine transporter (NET), the primary target of desipramine, in juvenile (21 days postnatal [P21]), adolescent (P28), and adult (P90) wild-type (SERT+/+) mice. To model carriers of low-expressing SERT gene variants, we used mice with reduced SERT expression (SERT+/-) or lacking SERT (SERT-/-). The potency and maximal antidepressant-like effect of desipramine was greater in P21 mice than in P90 mice and was SERT genotype independent. NET expression decreased with age in the locus coeruleus and increased with age in several terminal regions (e.g., the cornu ammonis CA1 and CA3 regions of the hippocampus). Binding affinity of [H-3]nisoxetine did not vary as a function of age or SERT genotype."

According to the news reporters, the research concluded: "These data show age-dependent shifts for desipramine to produce antidepressant-like effects that correlate with NET expression in the locus coeruleus and suggest that drugs with NET-blocking activity may be an effective alternative to SSRIs in juveniles."

For more information on this research see: Ontogeny of Norepinephrine Transporter Expression and Antidepressant-Like Response to Desipramine in Wild-Type and Serotonin Transporter Mutant Mice. *Journal of Pharmacology and Experimental Therapeutics*, 2017;360 (1):84-94. *Journal of Pharmacology and Experimental Therapeutics* can be contacted at: Amer Soc Pharmacology Experimental Therapeutics, 9650 Rockville Pike, Bethesda, MD 20814-3995, USA.

Drugs and Therapies - Antiinfectives

New Findings on Antiinfectives Described by Investigators at Federal University (Nitazoxanide induces in vitro metabolic acidosis in Taenia crassiceps cysticerci)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiinfectives have been published. According to news reporting originating in Goiania, Brazil, by NewsRx journalists, research stated, "Nitazoxanide (NTZ) is a broad-spectrum anti-parasitic drug used against a wide variety of protozoans and helminthes. Albendazole, its active metabolite albendazole sulfoxide (ABZSO), is one of the drugs of choice to treat both intestinal and tissue helminth and protozoan infections."

The news reporters obtained a quote from the research from Federal University, "However little is known regarding their impact on the metabolism of parasites. The aim of this study was to compare the in vitro effect of NTZ and ABZSO in the glycolysis of Taenia crassiceps cysticerci. The cysticerci were treated with 1.2; 0.6; 0.3 or 0.15 μg/mL of NTZ or ABZSO. Chromatographic and spectrophotometric analyses were performed in the culture medium and in the cysticerci extract. Regarding the glucose concentrations was possible to observe two responses: impair of the uptake and gluconeogenesis. The pyruvate concentrations were increased in the ABZSO treated group. Lactate concentrations were increased in the culture medium of NTZ treated groups."

According to the news reporters, the research concluded: "Therefore it was possible to infer that the metabolic acidosis was greater in the group treated with NTZ than in the ABZSO treated group indicating that this is one of the modes of action used by this drug to induce the parasite death."

For more information on this research see: Nitazoxanide induces in vitro metabolic acidosis in Taenia crassiceps cysticerci. Experimental Parasitology, 2016;171():17-22. Experimental Parasitology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Drugs and Therapies - Antineoplastics

New Findings on Antineoplastics Discussed by Researchers at Zhejiang University (Autophagy in 5-Fluorouracil Therapy in Gastrointestinal Cancer: Trends and Challenges)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antineoplastics is the subject of a report. According to news reporting out of Hangzhou, People's Republic of China, by NewsRx editors, research stated, "5-Fluorouracil (5-FU)-based combination therapies are standard treatments for gastrointestinal cancer, where the modulation of autophagy is becoming increasingly important in offering effective treatment for patients in clinical practice. This review focuses on the role of autophagy in 5-FU-induced tumor suppression and cancer therapy in the digestive system."

Our news journalists obtained a quote from the research from Zhejiang University, "All articles published in English from 1996 to date those assess the synergistic effect of autophagy and 5-FU in gastrointestinal cancer therapy were identified through a systematic online search by use of PubMed. The search terms were 'autophagy' and '5-FU' and ('colorectal cancer' or 'hepatocellular carcinoma' or 'pancreatic adenocarcinoma' or 'esophageal cancer' or 'gallbladder carcinoma' or 'gastric cancer'). Critical reviews on relevant aspects and original articles reporting in vitro and/or in vivo results regarding the efficiency of autophagy and 5-FU in gastrointestinal cancer therapy were reviewed, analyzed, and summarized. The exclusion criteria for the articles were as follows: (1) new materials (e.g., nanomaterial)-induced autophagy; (2) clinical and experimental studies on diagnostic and/or prognostic biomarkers in digestive system cancers; and (3) immunogenic cell death for anticancer chemotherapy. Most cell and animal experiments showed inhibition of autophagy by either pharmacological approaches or via genetic silencing of autophagy regulatory gene, resulting in a promotion of 5-FU-induced cancer cells death. Meanwhile, autophagy also plays a pro-death role and may mediate cell death in certain cancer cells where apoptosis is defective or difficult to induce. The dual role of autophagy complicates the use of autophagy inhibitor or inducer in cancer chemotherapy and generates inconsistency to an extent in clinic trials."

According to the news editors, the research concluded: "Autophagy might be a therapeutic target that sensitizes the 5-FU treatment in gastrointestinal cancer."

Our news journalists report that additional information may be obtained by contacting X.J. Cai, Dept. of General Surgery, Zhejiang Province Key Laboratory of Laparoscopic Technology, Sir Run Run Shaw Hospital, Zhejiang University, Hangzhou, Zhejiang 310016, People's Republic of China. Additional authors for this research include Y.L. Feng, X. Liang and X.J Cai.
New Findings on Antiretrovirals from National Institute of Cholera and Enteric Diseases Summarized (Ribavirin suppresses bacterial virulence by targeting LysR-type transcriptional regulators)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiretrovirals have been published. According to news reporting originating from Kolkata, India, by NewsRx correspondents, research stated, "Targeting bacterial virulence mechanisms without compromising bacterial growth is a promising strategy to prevent drug resistance. LysR-type transcriptional regulators (LTTRs) possess structural conservation across bacterial species and regulate virulence in numerous pathogens, making them attractive targets for antimicrobial agents."

Our news editors obtained a quote from the research from the National Institute of Cholera and Enteric Diseases, "We targeted AphB, a Vibrio cholerae LTTR, which regulates the expression of genes encoding cholera toxin and toxin-co-regulated pilus for inhibitor designing. Since AphB ligand is unknown, we followed a molecular fragment-based approach for ligand designing using FDA-approved drugs and subsequent screen to identify molecules that exhibited high-affinity binding to AphB ligand-binding pocket. Among the identified compounds, ribavirin, an anti-viral drug, antagonized AphB functions. Ribavirin perturbed Vibrio cholerae pathogenesis in animal models. The inhibitory effects of the drug was limited to the bacteria expressing wild type AphB, but not its constitutively active mutant (AphB(N100E)), which represents the ligand-bound state, suggesting that ribavirin binds to the active site of AphB to exert its inhibitory role and there exists no AphB-independent mechanism of its action. Similarly, ribavirin suppressed the functions of Salmonella Typhi LTTR Hrg, indicating its broad spectrum efficacy. Moreover, ribavirin did not affect the bacterial viability in culture."

According to the news editors, the research concluded: "This study cites an example of drug repurposing for anti-infective therapy."

For more information on this research see: Ribavirin suppresses bacterial virulence by targeting LysR-type transcriptional regulators. Scientific Reports, 2016;6():1-16. Drugs and Therapies - Antiretrovirals

New Findings on Antiretrovirals from University of Alabama Summarized (Cost considerations in the current antiretroviral era)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antiretrovirals have been presented. According to news originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "US national guidelines call for cost-conscious practices including the selection of antiretroviral therapy. The objective is to analyze the relative cost-effectiveness of contemporary antiretroviral therapy in real-world clinical settings."

Our news journalists obtained a quote from the research from the University of Alabama, "Observational cohort study. Retrospective follow-up study of treatment-naive persons living with HIV initiating antiretroviral therapy (ART) between January 2007 and December 2012 at an academically affiliated HIV clinic was conducted. Analysis was restricted to patients with the five most commonly prescribed regimens (N = 491). Patients were followed until December 14 to determine the durability of the initial regimen prescribed; median durations were calculated using Kaplan-Meier survival analyses. The average 340b price of the ART regimen 30-day supply was used for cost. Sensitivity analyses were performed adjusting for missing data and pricing indices and using mean durability (+/- 1 SD). Initial regimens contained emtricitabine and tenofovir, along with a third drug. Median durability was shortest for ritonavir-boosted atazanavir (31.9 months) and longest for ritonavir-boosted darunavir and raltegravir (both 47.8 months). All regimens were dominated, meaning less durable and more costly, relative to efavirenz ($710.64/month) and raltegravir-based regimens ($1075.03/month). These findings were reproduced in sensitivity analysis, although rilpivirine became a valuable option in some scenarios. Relative to the efavirenz-based regimen, raltegravir had an incremental cost of $47/month of additional therapy. In this sample, raltegravir and efavirenz-based regimens are the most cost-effective options for treatment-naive patients. Sensitivity analyses suggest rilpivirine is a reasonable choice in limited scenarios. These findings are relevant given changes in recommended regimens for treatment-naive persons, which include raltegravir and darunavir but exclude efavirenz and rilpivirine-based regimens. Of five commonly prescribed regimens for treatment-naive HIV patients in one clinic (2007-2012), emtricitabine and tenofovir with efavirenz and raltegravir were the only consistently cost-effective options; the rilpivirine-based regimen was valuable in limited scenarios."

According to the news editors, the research concluded: "Further data on the comparative effectiveness of efavirenz and rilpivirine are needed before they are abandoned."

For more information on this research see: Cost considerations in the current antiretroviral era. Aids, 2016;30(14):2215-2219. Aids can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott

Physiology - Applied Physiology

New Findings on Applied Physiology from Sansom Institute for Health Research Summarized (Validity of a perceptually-regulated step test protocol for assessing cardiorespiratory fitness in healthy adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Physiology - Applied Physiology is now available. According to news originating from Adelaide, Australia, by NewsRx correspondents, research stated, "To determine whether maximal oxygen uptake (VO\(_{2}\)max) could be predicted accurately and reliably from a 2-step, perceptually-regulated exercise test (PRET) in healthy adults. Sixteen participants (31.7 +/- 11.3 years, 3 females) completed three PRETs (separated by 24-72 h) and one maximal, perceptually-regulated, graded exercise test (PRETmax) on a motorized treadmill."

Our news journalists obtained a quote from the research from Sansom Institute for Health Research, "Oxygen uptake (VO2) and heart rate (HR) were recorded during each test. VO2 values for RPE range 9-15 were extrapolated to RPE 20 and age-predicted maximal HR (HRmax) using individual linear regression analysis to predict VO(2)max values compared to measured VO(2)max. VO2 and HR values were consistent between each of four RPE levels of the PRET. ICC values ranged between 0.76 and 0.85. Predicted VO(2)max from both methods were lower than measured VO(2)max (p < 0.01). Limits of agreement (LoA) for measured (41.4 +/- 5.3 ml kg(-1) min(-1)) versus predicted VO(2)max from each of the three PRETs using RPE20 were -1.2 +/- 15.6, -1.0 +/- 7.2 and -2.1 +/- 5.5 and for HRmax were -1.8 +/- 4.2; -2.6 +/- 4.2 and -2.4 +/- 4.4 ml kg(-1) min(-1) for PRET 1, 2 and 3, respectively. The step PRET elicited significant and reliable increases in VO2 across the four RPE levels, but under-estimated treadmill VO(2)max. However, there was better agreement between measured and predicted VO(2)max when extrapolated to HRmax."

According to the news editors, the research concluded: "As evidence indicates the underestimation of VO(2)max is explained by the difference in the mode of exercise, the step PRET provides a simple and convenient test of cardiorespiratory fitness."

New Findings on Arachnodactyly Described by Investigators at Research Institute (Whole exome sequencing identifies a novel missense FBN2 mutation co-segregating in a four-generation Chinese family with congenital contractural arachnodactyly)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Musculoskeletal Diseases and Conditions - Arachnodactyly. According to news reporting out of Taiyuan, People's Republic of China, by NewsRx editors, research stated, "Congenital contractural arachnodactyly (CCA) is an autosomal dominant rare genetic disease, estimated to be less than 1 in 10,000 worldwide. People with this condition often have permanently bent joints (contractures), like bent fingers and toes (camptodactyly)."

Our news journalists obtained a quote from the research from Research Institute, "Case presentation: In this study, we investigated the genetic aetiology of CCA in a four-generation Chinese family. The blood samples were collected from 22 living members of the family in the Yangquan County, Shanxi Province, China. Of those, eight individuals across 3 generations have CCA. Whole exome sequencing (WES) identified a missense mutation involving a T-to-G transition at position 3229 (c.3229 T> G) in exon 25 of the FBN2 gene, resulting in a Cys 1077 to Gly change (p.C1077G). This previously unreported mutation was found in all 8 affected individuals, but absent in 14 unaffected family members. SIFT/PolyPhen prediction and protein conservation analysis suggest that this novel mutation is pathogenic. Our study extended causative mutation spectrum of FBN2 gene in CCA patients."

According to the news editors, the research concluded: "This study has identified a novel missense mutation in FBN2 gene (p.C1077G) resulting in CCA in a family of China."

For more information on this research see: Whole exome sequencing identifies a novel missense FBN2 mutation co-segregating in a four-generation Chinese family with congenital contractural arachnodactyly. *BMC Medical Genetics*, 2016;17():1-5. *BMC Medical Genetics* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. **Arrhythmia**

**New Findings on Arrhythmia from University Hospital Summarized (Asymptomatic Intradialytic Supraventricular Arrhythmias and Adverse Outcomes in Patients on Hemodialysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Arrhythmia. According to news reporting originating from Madrid, Spain, by NewsRx correspondents, research stated, "Supraventricular arrhythmias are associated with high morbidity and mortality. Nevertheless, this condition has received little attention in patients on hemodialysis."

Our news editors obtained a quote from the research from University Hospital, "The objective of this study was to analyze the incidence of intradialysis supraventricular arrhythmia and its long term prognostic value. We designed an observational and prospective study in a cohort of patients on hemodialysis with a 10-year follow-up period. All patients were recruited for study participation and were not recruited for clinical indications. The study population comprised 77 patients (42 men and 35 women; mean age =58 +/- 15 years old) with sinus rhythm monitored using a Holter electrocardiogram over six consecutive hemodialysis sessions at recruitment. Hypertension was present in 68.8% of patients, and diabetes was present in 29.9% of patients. Supraventricular arrhythmias were recorded in 38 patients (49.3%); all of these were short, asymptomatic, and self-limiting. Age (hazard ratio, 1.04 per year; 95% confidence interval, 1.00 to 1.08) and right atrial enlargement (hazard ratio, 4.29; 95% confidence interval, 1.30 to 14.09) were associated with supraventricular arrhythmia in the multivariate analysis. During a median follow-up of 40 months, 57 patients died, and cardiovascular disease was the main cause of death (52.6%). The variables associated with all-cause mortality in the Cox model were age (hazard ratio, 1.04 per year; 95% confidence interval, 1.00 to 1.08), C-reactive protein (hazard ratio, 1.04 per 1 mg/L; 95% confidence interval, 1.00 to 1.08), and supraventricular arrhythmia (hazard ratio, 3.21; 95% confidence interval, 1.29 to 7.96). Patients with supraventricular arrhythmia also had a higher risk of nonfatal cardiovascular events (hazard ratio, 4.32; 95% confidence interval, 2.11 to 8.83) and symptomatic atrial fibrillation during follow-up (hazard ratio, 17.19; 95% confidence interval, 2.03 to 145.15). The incidence of intradialysis supraventricular arrhythmia was high in our hemodialysis study population."

According to the news editors, the research concluded: "Supraventricular arrhythmias were short, asymptomatic, and self-limiting, and although silent, these arrhythmias were independently associated with mortality and cardiovascular events."

The news editors report that additional information may be obtained by contacting E. Verde, Hosp Gen Univ Gregorio Maranon, Dept. of Nephrol, Madrid 28007, Spain. **Biological Factors - Arthropod Venoms**

**New Findings on Arthropod Venoms from Fourth Military Medical University Summarized (Involvement of Rac1 signalling pathway in the development and maintenance of acute inflammatory pain induced by bee venom injection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biological Factors - Arthropod Venoms. According to news reporting originating in Xi’an, People’s Republic of China, by NewsRx journalists, research stated, "The Rho GTPase, Rac1, is involved in the pathogenesis of neuropathic pain induced by malformation of dendritic spines in the spinal dorsal horn (sDH) neurons. In the present study, the contribution of spinal Rac1 to peripheral inflammatory pain was studied. Effects of s.c. bee venom (BV) injection on cellular localization of Rac1 in the rat sDH was determined with double labelling immunofluorescence.”

Financial supporters for this research include Social Development Project of Shaanxi Province, National Natural Science Foundation of China, Twelfth Five-Year project, National Key Technology R&D Program, National Basic Research Program of China.

The news reporters obtained a quote from the research from Fourth Military Medical University, "Activation of Rac1 and its downstream effector p21-activated kinase (PAK), ERKs and p38 MAPK in inflammatory pain states was evaluated with a pull-down assay and Western blotting. The preventive and therapeutic analgesic effects of intrathecal administration of NSC23766, a selective inhibitor of Rac1, on BV-induced spontaneous noception and pain hypersensitivity were investigated. Rac1 labelling was mainly localized within neurons in both the superficial and deep layers of the sDH in rats of naive, vehicle-treated and inflamed (BV injected) groups. GTP-Rac1-PAK and ERKs/p38 were activated following s.c. BV injection. Post-treatment with intrathecal NSC23766 significantly inhibited GTP-Rac1 activity and phosphorylation of Rac1-PAK, ERKs and p38 MAPK in the sDH. Both pre-treatment and post-treatment with intrathecal NSC23766 dose-dependently attenuated the paw flinches, primary thermal and mechanical hyperalgesia and the mirror-image thermal hyperalgesia induced by BV...
injection, but without affecting the baseline pain sensitivity and motor coordination."

According to the news reporters, the research concluded: "The spinal GTP-Rac1-PAK-ERK/p38MAPK signalling pathway is involved in both the development and maintenance of peripheral inflammatory pain and can be used as a potential molecular target for developing a novel therapeutic strategy for clinical pain."

Our news correspondents report that additional information may be obtained by contacting Y. Wang, Institute for Biomedical Sciences of Pain, Tangdu Hospital, The Fourth Military Medical University, Xi'an, 710038, People's Republic of China. Additional authors for this research include Y.F. New Findings on Atherosclerosis from Guangxi Medical University Summarized (Arsenic Exposure and Predicted 10-Year Atherosclerotic Cardiovascular Risk Using the Pooled Cohort Equations in US Hypertensive Adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news reporting out of Nanning, People's Republic of China, by NewsRx editors, research stated, "This study was to evaluate the association of urine arsenic with predicted 10-year atherosclerotic cardiovascular disease (ASCVD) risk in U.S. adults with hypertension. Cross-sectional analysis was conducted in 1570 hypertensive adults aged 40-79 years in the 2003-2012 National Health and Nutrition Examination Survey (NHANES) with determinations of urine arsenic."

Our news journalists obtained a quote from the research from Guangxi Medical University. "Predicted 10-year ASCVD risk was estimated by the Pooled Cohort Equations, developed by the American College of Cardiology/American Heart Association in 2013. For men, after adjustment for sociodemographic factors, urine dilution, ASCVD risk factors and organic arsenic intake from seafood, participants in the highest quartiles of urine arsenic had higher 10-year predicted ASCVD risk than in the lowest quartiles; the increases were 24% (95%
confidence interval (CI): 2%, 53%) for total arsenic, 13% (95% CI: 2%, 25%) for
dimethylarsinate and 22% (95% CI: 5%, 40%) for total arsenic minus arsenobetaine separately.
For women, the corresponding increases were 5% (95% CI: 15%, 29%), 10% (95% CI: 8%,
30%) and 0% (95% CI: 15%, 19%), respectively. Arsenic exposure, even at low levels, may
contribute to increased ASCVD risk in men with hypertension."

According to the news editors, the research concluded: "Furthermore, our findings
suggest that particular circumstances need urgently to be considered while elucidating
cardiovascular effects of low inorganic arsenic levels."

Cardiovascular Diseases and Conditions...

New Findings on Atherosclerosis from University of California
Summarized (Endothelial-mesenchymal transition in atherosclerotic
lesion calcification)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Current study results on Cardiovascular Diseases and Conditions -
Atherosclerosis have been published. According to news reporting from Los Angeles,
California, by NewsRx journalists, research stated, "Endothelial-mesenchymal transitions
(EndMTs) in endothelial cells (ECs) contribute to vascular disease. We used ApoE(-/-) mice fed
a high-fat/high-cholesterol diet."

The news correspondents obtained a quote from the research from the University of
California, "We reported evidence of EndMT in atherosclerotic lesions contributing to
calcification. Stem cell and mesenchymal markers, including sex-determining region Y-box 2
(Sox2), were upregulated in aortic ECs of fat-fed ApoE(-/-) mice. Limiting Sox2 decreased
marker expression and calcification in ApoE(-/-) aortas. Furthermore, a complex of serine
proteases was upregulated in ApoE(-/-) aortic ECs. Blockade of these proteases reduced
expression of Sox2 and atherosclerotic lesion calcification."

According to the news reporters, the research concluded: "Together, our data suggest
that EndMTs contribute to atherosclerotic lesion calcification."

For more information on this research see: Endothelial-mesenchymal transition in
atherosclerotic lesion calcification. Atherosclerosis, 2016;253():124-127. Atherosclerosis can
be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co,
Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Heart Disorders and Diseases - Atrial Fibrillation

New Findings on Atrial Fibrillation Described by Investigators at University Hospital (Direct Oral Anticoagulants for Very Elderly People With Atrial Fibrillation: Efficacy and Safe Enough?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting originating in Udine, Italy, by NewsRx journalists, research stated, "Four direct oral anticoagulants (DOACs) have been licensed for the treatment of atrial fibrillation (AF); efficacy and safety have been shown in clinical trials, but its real use in elderly and very elderly people is still unclear. To evaluate the impact of DOACs in our patients (pts) aged 75 years and switched from other treatments."

The news reporters obtained a quote from the research from University Hospital, "From September 2013 to May 2015, all consecutive pts aged 75 years, males and females, in treatment for AF and switched to DOACs are considered in this study. Follow-up (FU) was scheduled after 3 and 6 months by phone and after 12 months by visit. Two hundred thirty-two pts in treatment for AF were switched to DOACs, among these 143 (61.6%) pts aged 75 years (mean age, 81 years). The medium FU was 9.6 months, during which 4 minor bleedings in 4 different pts and 1 clinically relevant nonmajor bleeding were reported, all treated with temporary cessation or reduction in DOACs. Two strokes occurred in pts in treatment with dabigatran 110 mg, both resolved without serious sequelae; 2.8% of pts had nausea, itching, vomiting, or discomfort, half of these returned to acenocumarol, and the remaining switched to other DOAC. Four pts died, but the deaths were not related to anticoagulation. As reported for general people, also in our elderly population, DOACs resulted in a good alternative to old antithrombotic therapies."

According to the news reporters, the research concluded: "Efficacy and safety associated with a higher compliance by pts bring these drugs to be the first choice for long-term anticoagulation."

New Findings on Atrial Fibrillation Described by Investigators at University of Belgrade (Uncoupling of cardiac and respiratory rhythm in atrial fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting from Belgrade, Serbia, by NewsRx journalists, research stated, "Rearranged origin of heart rhythm in patients with atrial fibrillation (AF) influences the regulation of the heart and consequently the respiratory rhythm, and the bidirectional interaction of these rhythms not documented. Hence, we examined coupling of the RR interval and the respiration (Resp) signal by coherence, Granger causality and the cross-sample entropy method of time series analysis in patients with AF and a healthy control group."

The news correspondents obtained a quote from the research from the University of Belgrade, "In healthy subjects, the influence of respiration on cardiac rhythm was found as increased coherence at the breathing frequency (BF) range, significantly stronger interaction and synchrony from Resp to RR than from RR to Resp. On the contrary, in patients with AF, coherence at BF diminished, there were no causal interactions between signals in both directions, which resulted in equally great asynchrony between them."

According to the news reporters, the research concluded: "In AF, the absence of full functionality of the sinoatrial node, as an integrator of neural cardiac control, resulted in diminished vagal modulation of heart periods and consequently impaired bidirectional cardio-respiratory interaction."

For more information on this research see: Uncoupling of cardiac and respiratory rhythm in atrial fibrillation. Biomedical Engineering-Biomedizinische Technik, 2016;61(6):657-663. Biomedical Engineering-Biomedizinische Technik can be contacted at: Walter De Gruyter Gmbh, Genthiner Strasse 13, D-10785 Berlin, Germany.

Our news journalists report that additional information may be obtained by contacting M.M. Platisa, University of Belgrade, KCS, Fac Med, Inst Biophys, Belgrade 11129, Serbia. Additional authors for this research include T. Bojic, S.U. Pavlovic, N.N. Radovanovic and A. Kalauzi.

Keywords for this news article include: Belgrade, Serbia, Europe, Heart Disorders and Diseases, Atrial Fibrillation, Cardiac Arrhythmias, Heart Disease, Cardiology, University of Belgrade.
Heart Disorders and Diseases - Atrial Fibrillation

New Findings on Atrial Fibrillation from Hiroshima International University Summarized (Dosage Adjustment of Dabigatran Etexilate Based on Creatinine Clearance in Patients With Cardioembolic Stroke or Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Fibrillation have been presented. According to news reporting out of Hiroshima, Japan, by NewsRx editors, research stated, "A recommendation for dosage adjustment of dabigatran etexilate, a prodrug of dabigatran, seems to be desirable based on creatinine clearance to avoid bleeding and stroke. Outpatients and inpatients having a history of cardioembolic stroke or atrial fibrillation were included."

Our news journalists obtained a quote from the research from Hiroshima International University, "After taking dabigatran etexilate orally (75-150 mg twice daily) for at least 1 week, plasma trough concentration (C-trough, ng/mL) of dabigatran and creatinine clearance (CLcr, mL/min) of patients according to Cockcroft and Gault equation were determined. Among the 38 patients studied, Ctrough of dabigatran and CLcr were scattered in a range from 31.4 to 329.5 ng/mL and 15.4-133.4 mL/min, respectively. Temporal CLtotal (Temp-CLtotal) of dabigatran, estimated by dividing the daily absorbed amount of dabigatran etexilate with C-trough of dabigatran, was linearly correlated with CLcr of patients (P = 0.0018). Based on the findings, the daily dose of dabigatran etexilate that provides C-trough of dabigatran at approximately 70 ng/mL was estimated. A linear relationship was found between Temp-CLtotal of dabigatran and CLcr of patients."

According to the news editors, the research concluded: "Depending on CLxr of patients, we recommend 4 different dosages of dabigatran etexilate to obtain C-trough of dabigatran at approximately 70 ng/mL."

For more information on this research see: Dosage Adjustment of Dabigatran Etexilate Based on Creatinine Clearance in Patients With Cardioembolic Stroke or Atrial Fibrillation. Therapeutic Drug Monitoring, 2016;38(6):670-676. Therapeutic Drug Monitoring can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Autoimmune Diseases and Conditions

New Findings on Autoimmune Diseases and Conditions from National Institutes of Health Summarized (Targeting cytokine signaling in autoimmunity: back to the future and beyond)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autoimmune Diseases and Conditions have been presented. According to news originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "Cytokines represent structurally diverse soluble factors with critical roles in normal immune function and the pathogenesis of autoimmunity. The emergence of many successful biological therapies targeting cytokines and cytokine receptors exemplifies the importance of cytokines in driving human autoimmune disease; unsurprisingly, there is no paucity of reviews on this subject."

Funders for this research include National Institute of Arthritis and Musculoskeletal and Skin Diseases, NIH.

Our news journalists obtained a quote from the research from the National Institutes of Health, "Nonetheless, many patients with autoimmune disease do not respond to biologicals, and cure remains an unmet goal. Thus, targeting the intracellular pathways employed by cytokines provides new therapeutic opportunities. A subset of cytokines utilizes the Janus kinase-signal transducer of activators of transcription (JAK-STAT) pathway as a mode of signal transduction. First generation JAK inhibitors (jakinibs) are used to treat rheumatologic disease, and second-generation jakinibs are being developed. Simultaneously, rapid advances are being made in our understanding of the genomic and epigenomic impact of cytokines."

According to the news editors, the research concluded: "In this review, we will briefly review the role of JAKSTAT-dependent cytokines in immune-mediated disease, the current status of Jakinibs, and future possibilities for therapeutic intervention using genomic insights."

For more information on this research see: Targeting cytokine signaling in autoimmunity: back to the future and beyond. Current Opinion in Immunology, 2016;43():89-97. Current Opinion in Immunology can be contacted at: Current Biology Ltd, 84 Theobalds Rd, London WC1X 8RR, England. (Elsevier - www.elsevier.com; Current Opinion in Immunology - www.journals.elsevier.com/current-opinion-in-immunology/)

The news correspondents report that additional information may be obtained from J.J. O'Shea, NIAMS, Mol Immunol & Inflammat Branch, National Institutes of Health, Bethesda, MD 20892, United States. Additional authors for this research include D. Schwartz, M. Gadina, Y. Kanno and J.J. O'Shea.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.coi.2016.10.001. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings on B-Cell Lymphoma Described by Investigators at University of Wisconsin (Epigenetic gene regulation by Janus kinase 1 in diffuse large B-cell lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - B-Cell Lymphoma is the subject of a report. According to news originating from Madison, Wisconsin, by NewsRx correspondents, research stated, "Janus kinases (JAKs) classically signal by activating STAT transcription factors but can also regulate gene expression by epigenetically phosphorylating histone H3 on tyrosine 41 (H3Y41-P). In diffuse large B-cell lymphomas (DLBCLs), JAK signaling is a feature of the activated B-cell (ABC) subtype and is triggered by autocrine production of IL-6 and IL-10."

Financial support for this research came from HHS | NIH | National Cancer Institute (NCI).

Our news journalists obtained a quote from the research from the University of Wisconsin, "Whether this signaling involves STAT activation, epigenetic modification of chromatin, or both mechanisms is unknown. Here we use genetic and pharmacological inhibition to show that JAK1 signaling sustains the survival of ABC DLBCL cells. Whereas STAT3 contributed to the survival of ABC DLBCL cell lines, forced STAT3 activity could not protect these cells from death following JAK1 inhibition, suggesting epigenetic JAK1 action. JAK1 regulated the expression of nearly 3,000 genes in ABC DLBCL cells, and the chromatin surrounding many of these genes was modified by H3Y41-P marks that were diminished by JAK1 inhibition. These JAK1 epigenetic target genes encode important regulators of ABC DLBCL proliferation and survival, including IRF4, MYD88, and MYC."

According to the news editors, the research concluded: "A small molecule JAK1 inhibitor cooperated with the BTK inhibitor ibrutinib in reducing IRF4 levels and acted synergistically to kill ABC DLBCL cells, suggesting that this combination should be evaluated in clinical trials."

The news correspondents report that additional information may be obtained from L.X. Rui, University of Wisconsin, Sch Med & Public Hlth, Carbone Canc Center, Madison, WI 53705, United States. Additional authors for this research include A.C. Drennan, M. Ceribelli, F. Zhu, G.W. Wright, D.W. Huang, W.M. Xiao, Y.G. Li, K.M. Grindle, L. Lu, D.J. Hodson, A.L. Shaffer, H. Zhao, W.H. Xu, Y.D. Yang and L.M. Staudt.

**Biological Structures**

**New Findings on Biological Structures Described by Investigators at University of Sassari (The subcortical maternal complex: multiple functions for one biological structure?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Biological Structures are presented in a new report. According to news reporting out of Sassari, Italy, by NewsRx editors, research stated, "The subcortical maternal complex (SCMC) is a multiprotein complex uniquely expressed in mammalian oocytes and early embryos, essential for zygote progression beyond the first embryonic cell divisions."

Our news journalists obtained a quote from the research from the University of Sassari, "Similar to other factors encoded by maternal effect genes, the physiological role of SCMC remains unclear, although recent evidence has provided important molecular insights into different possible functions. Its potential involvement in human fertility is attracting increasing attention; however, the complete story is far from being told."

According to the news editors, the research concluded: "The present mini review provides an overview of recent findings related to the SCMC and discusses its potential physiological role/s with the aim of inspiring new directions for future research."

Our news journalists report that additional information may be obtained by contacting D. Bebbere, University of Sassari, Dept. of Vet Med, I-07100 Sassari, Italy. Additional authors for this research include L. Masala, D.F. Albertini and S. Ledda.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s10815-016-0788-z. This DOI is a link to an online electronic document that is either free or for purchase.

Blood Vessels

New Findings on Blood Vessels from Children's Hospital Summarized
(A Novel Method for Epicardial Defibrillator Lead Placement in Young Children: Coil Between the Great Arteries)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Blood Vessels is the subject of a report. According to news reporting out of San Diego, California, by NewsRx editors, research stated, "The primary and secondary prevention of sudden cardiac death resulting from malignant arrhythmia, channelopathy, and hypertrophic cardiomyopathy often requires the implantation of automatic internal cardiac defibrillators (AICDs) in the pediatric population."

Our news journalists obtained a quote from the research from Children's Hospital, "In young patients, the small size of the systemic veins, complex anatomy of congenital heart disease, and body habitus often preclude safe and durable transvenous placement of the AICD coil, requiring innovative methods to circumvent this problem."

According to the news editors, the research concluded: "This report describes the technique used at Rady Children's Hospital San Diego/UCSD for the epicardial placement of an ICD system with a transvenous ICD coil placed between the aorta and pulmonary artery, thereby producing a stable location and excellent coil-to-can vector for successful defibrillation."

Our news journalists report that additional information may be obtained by contacting R. Murthy, Rady Childrens Hosp, Dept. of Cardiovascular Surg, Dept. of Cardiol, San Diego, CA, United States. Additional authors for this research include M.R. Williams, J.C. Perry, S. Shepard and D. DiBardino.

Bone Research

New Findings on Bone Research Reported by S. Manor et al (High-resolution HLA A similar to B similar to DRB1 haplotype frequencies from the Ezer Mizion Bone Marrow Donor Registry in Israel)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Current study results on Bone Research have been published. According to news originating from Petah Tiqwa, Israel, by NewsRx correspondents, research stated, "We have investigated HLA population alleles and haplotype frequencies for the ethnicities that comprise the contemporary population of Israel, using a large data set from the Ezer Mizion Bone Barrow Donor Registry."

Our news journalists obtained a quote from the research, "We genotyped 275,699 individuals at the HLA-A,-B and -DRB1 loci using HLA genotyping methods. HLA A similar to B similar to DRB1 haplotype frequencies were estimated from 19 sub-ethnic Jewish populations and other non-Jewish minorities using the maximum likelihood model, which accommodates typing ambiguities."

According to the news editors, the research concluded: "We present overall and sub-ethnicity specific HLA diversity results of the registry, which will help guide a data-driven strategy for future registry expansion."

For more information on this research see: High-resolution HLA A similar to B similar to DRB1 haplotype frequencies from the Ezer Mizion Bone Marrow Donor Registry in Israel. *Human Immunology*, 2016;77(12):1114-1119. *Human Immunology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Human Immunology - www.journals.elsevier.com/human-immunology/)

The news correspondents report that additional information may be obtained from S. Manor, Ezer Mizion Bone Marrow Donor Registry, Petah Tiqwa, Israel. Additional authors for this research include M. Halagan, N. Shriki, I. Yaniv, B. Zisser, M. Maiers, A. Madbouly and J. Stein.

**Oncology - Breast Cancer**

**New Findings on Breast Cancer Described by Investigators at Department of Oncology (GEMOX: An Active Regimen for the Treatment of Luminal and Human Epidermal Growth Factor Receptor 2-Positive Metastatic Breast Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting originating in Brescia, Italy, by NewsRx journalists, research stated, "Pretreated metastatic breast cancer (MBC) remains a formidable challenge with unmet needs both in terms of prolonged survival and quality-of-life-related issues. We collected data from 27 MBC patients treated with gemcitabine and oxaliplatin (GEMOX) at our institution between June 2009 and April 2015."

The news reporters obtained a quote from the research from the Department of Oncology, "The patients were heavily pretreated, and all had previously been exposed to anthracyclines and taxanes. We achieved a complete response in 1 patient (4%), a partial response in 7 patients (26%) and stable disease in 12 patients (44%), while 6 patients (22%) experienced progressive disease. The response of 1 patient (4%) could not be evaluated because she interrupted her treatment during the first cycle due to a major reaction to oxaliplatin. We
observed grade 4 hypertransaminasaemia in only 1 patient (4%) and grade 2 neuropathy in 16 patients (59%). Grade 3 leuconeutropenia was observed in 5 patients (18%). The median progression-free survival was 5.9 months and the median overall survival was 9.6 months."

According to the news reporters, the research concluded: "GEMOX is an efficient and well-tolerated salvage regimen for MBC patients."

Our news correspondents report that additional information may be obtained by contacting A. Zaniboni, Fdn Poliambulanza, Dept. of Oncol, IT-25124 Brescia, Italy. Additional authors for this research include F. Aroldi, P. Bertocchi, T. Prochilo, S. Mutti, G. Savelli, A.P. Fraccon and A. Zaniboni.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000445936. This DOI is a link to an online electronic document that is either free or for purchase.

**New Findings on Breast Cancer Discussed by Researchers at Yamaguchi University (Tissue-Specific Expression of Estrogen Receptor 1 Is Regulated by DNA Methylation in a T-DMR)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news originating from Ube, Japan, by NewsRx correspondents, research stated, "The mechanism controlling tissue-specific expression of estrogen receptor 1 (ESR1) is unclear. In other genes, DNA methylation of a region called the tissue-dependent and differentially methylated region (T-DMR) has been associated with tissue-specific gene expression."

Our news journalists obtained a quote from the research from Yamaguchi University, "This study investigated whether human ESR1 has a T-DMR and whether DNA methylation of the T-DMR regulates its expression. ESR1 expression was tissue-specific, being high in the endometrium and mammary gland and low/nil in the placenta and skin. Therefore, DNA methylation profiles of the promoter of ESR1 were analyzed in these tissues and in breast cancer tissues. In all of the normal tissues, the proximal promoter regions were unmethylated. On the other hand, the distal regions (T-DMR) were unmethylated in the endometrium and mammary gland, but were moderately methylated and hypermethylated in the placenta and skin, respectively. T-DMR-methylated reporter assay was performed to examine whether DNA methylation at the T-DMR suppresses ESR1 transcription. T-DMR, but not the promoter region, had transcriptional activities and DNA methylation of the T-DMR suppressed ESR1
transcription. Early growth response protein 1 was shown to be a possible transcription factor to bind the T-DMR and up-regulate ESR1 expression. ESR1 has several upstream exons, and each upstream exon, Exon-A/Exon-B/Exon-C, had its own T-DMR. In some breast cancer cases and breast cancer cell lines, ESR1 expression was not regulated by DNA methylation at T-DMR as it is in normal tissues."

According to the news editors, the research concluded: "ESR1 has a T-DMR. DNA methylation status at the T-DMR is involved in tissue-specific ESR1 expression in normal tissues but not always in breast cancer."

For more information on this research see: Tissue-Specific Expression of Estrogen Receptor 1 Is Regulated by DNA Methylation in a T-DMR. *Molecular Endocrinology*, 2015;30 (3):335-47. (The Endocrine Society - www.endo-society.org/; Molecular Endocrinology - mend.endojournals.org/)

The news correspondents report that additional information may be obtained from R. Maekawa, Departments of Obstetrics and Gynecology (RM, SS, MO, LL, IT, KJ, TK, HA, YY, HT, NS) and Digestive Surgery and Surgical Oncology (SY), Yamaguchi University Graduate School of Medicine, Ube 755-8505, Japan. **Oncology - Breast Cancer**

**New Findings on Breast Cancer from Curtin University Summarized (Breast cancer risk and the interaction between adolescent body size and weight gain in later life: A case-control study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news originating from Perth, Australia, by NewsRx correspondents, research stated, "While the breast cancer risk associated with increasing adult BMI in postmenopausal women can be explained by increases in concentrations of endogenous estrogens the biologic mechanisms behind the inverse association between adolescent BMI and breast cancer risk are still a subject of controversial debate. We investigated the association of breast cancer with body size and changes in body size across life time estimated by age-specific BMI Z scores and changes in BMI Z scores from teenage years to middle age in an age-matched population-based case-control study of 2994 Australian women."

Our news journalists obtained a quote from the research from Curtin University, "Logistic regression adjusted for the matching factor age and further potential confounders was used. Adolescent body leanness in postmenopausal women and excess adult weight gain in all study participants were associated with an increased breast cancer risk with an odds ratio [95%
confidence interval] of 1.29 [1.08,1.54] and 1.31 [1.09,1.59], respectively. Interaction analyses restricted to postmenopausal women revealed an increased risk of breast cancer in those who were lean during adolescence and gained excess weight during adulthood (odds ratio [95% confidence interval]: 1.52 [1.19,1.95]) but not in women who were lean during adolescence and did not gain excess weight during adulthood (1.20 [0.97,1.48]) and not in women who were not lean during adolescence and but gained excess weight during adulthood (1.10 [0.95,1.27]) compared to postmenopausal women who were neither lean during adolescence nor gained excess weight."

According to the news editors, the research concluded: "In postmenopausal women adolescent leanness was only associated with increased breast cancer risk when excess weight was gained during adulthood."

For more information on this research see: Breast cancer risk and the interaction between adolescent body size and weight gain in later life: A case-control study. Cancer Epidemiology, 2016;45():135-144. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Cancer Epidemiology - www.journals.elsevier.com/cancer-epidemiology/)

The news correspondents report that additional information may be obtained from I. Florath, Curtin University, Sch Public Hlth. Perth, WA, Australia. Additional authors for this research include D. Sarink, C. Saunders, J. Heyworth and L. Fritschi.

**Oncology - Breast Cancer**

**New Findings on Breast Cancer from Fudan University Summarized**

(***PA-MSHA inhibits the growth of doxorubicin-resistant MCF-7/ADR human breast cancer cells by downregulating Nrf2/p62***)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Acquired resistance to doxorubicin in breast cancer is a serious therapeutic problem. In this study, we investigated whether Pseudomonas aeruginosa mannose-sensitive hemagglutinin (PA-MSHA) could inhibit the growth of doxorubicin-resistant breast cancer cells."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Fudan University, "We found that the expressions of Nrf2 and p62 in breast cancer were higher than that in the corresponding adjacent normal tissues and benign breast epithelial cell. The expressions of Nrf2 and p62 in breast cancer doxorubicin-resistant cells MCF-7/ADR were higher than that in doxorubicin-sensitive cells MCF-7. Silencing of Nrf2 or p62 rendered breast cancer cells more..."
susceptible to doxorubicin. We further demonstrated that PA-MSHA inhibited growth and induced apoptosis of MCF-7/ADR cells but not MCF-7 cells. Subcutaneous administration of PA-MSHA greatly inhibited the growth of xenograft tumors from MCF-7/ADR cells in nude mice. In addition, PA-MSHA could downregulate Nrf2 and p62 in vitro and in vivo. These results suggested that activation of Nrf2 and p62 was associated with doxorubicin resistance in breast cancer. PA-MSHA could inhibit the growth of doxorubicin-resistant MCF-7/ADR cells and its potential mechanism might be due to the suppression of Nrf2/p62."

According to the news editors, the research concluded: "It indicated the possibility of using PA-MSHA in doxorubicin-resistant breast cancer."

Our news journalists report that additional information may be obtained by contacting N. Zhang, Fudan University, Sch Basic Med Sci, Dept. of Pathol, Shanghai, People's Republic of China. Additional authors for this research include D.Y. Liu, X.X. Jin, P. Gao, Q.Y. Wang, J.W. Zhang and N. Zhang.

Bullying

New Findings on Bullying Reported by B. Venkatesh et al (Prevalence of bullying, discrimination and sexual harassment among trainees and Fellows of the College of Intensive Care Medicine of Australia and New Zealand)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Bullying are presented in a new report. According to news originating from Melbourne, Australia, by NewsRx correspondents, research stated, "Anecdotal reports about bullying behaviour in intensive care emerged during College of Intensive Care Medicine (CICM) hospital accreditation visits. Bullying, discrimination and sexual harassment (BDSH) in the medical profession, particularly in surgery, were widely reported in the media recently."

Our news journalists obtained a quote from the research, "This prompted the College to formally survey its Fellows and trainees to identify the prevalence of these behaviours in the intensive care workplace. An online survey of all trainees (n = 951) and Fellows (n = 970) of the CICM. The survey response rate was 51% (Fellows, 60%; trainees, 41%). The overall prevalences of bullying, discrimination and sexual harassment were 32%, 12% and 3%,
respectively. The proportions of Fellows and trainees who reported being bullied and discriminated against were similar across all age groups. Women reported a greater prevalence of sexual harassment (odds ratio [OR], 2.97 [95% CI, 1.35-6.51]; P=0.006) and discrimination (OR, 2.10 [95% CI, 1.39-3.17]; P = 0.0004) than men. Respondents who obtained their primary medical qualification in Asia or Africa appeared to have been at increased risk of discrimination (OR, 1.88 [95% CI, 1.15-3.05]; P = 0.03). Respondents who obtained their degree in Australia, New Zealand or Hong Kong may have been at increased risk of being bullied. In all three domains of unprofessional behaviour, the perpetrators were predominantly consultants (70% overall), and the highest proportion of these was ICU consultants."

According to the news editors, the research concluded: "The occurrence of BDSH appears to be common in the intensive care environment in Australia and New Zealand."

The news correspondents report that additional information may be obtained from B. Venkatesh, Board Coll Intens Care Med Australia & New Zealan, Melbourne, Vic, Australia. Additional authors for this research include C. Corke, R. Raper, M. Pinder, D. Stephens, G. Joynt, P. Morley, R. Bellomo, R. Bevan, R. Freebairn, B. Varghese, M. Ashbolt, F. Hawker, S. Jacobe and S. Yong.

the National Cancer Institute Common Terminology Criteria for Adverse Events version 4.0. CIN was observed in nine patients. Univariate analysis revealed that cardiac disease and lower baseline serum albumin (Alb) values conferred a higher risk of nephrotoxicity (p <0.05). The cut-off value of Alb was 3.8 g/dL, calculated by receiver operating characteristics (ROC) curves. Multivariable logistic regression analysis revealed that cardiac disease (odds ratio=11.7; p=0.002) and hypoalbuminemia (odds ratio=6.99 p=0.025 significantly correlated with nephrotoxicity."

According to the news reporters, the research concluded: "Cardiac disease and low baseline Alb values are possible risk factors for CIN."

co-activator p300. C/EBP beta is expressed in several isoforms from alternative translational start codons. We have previously demonstrated that helenalin acetate selectively inhibits only the full-length (liver-enriched activating protein* (LAP*)) isoform but not the slightly shorter (LAP) isoform. Consistent with this, helenalin acetate binds to the LAP* but not to the LAP isoform, explaining why its inhibitory activity is selective for LAP*. Although helenalin acetate contains reactive groups that are able to interact covalently with cysteine residues, as exemplified by its effect on NF-kappa B, the inhibition of C/EBP beta by helenalin acetate is not due to irreversible reaction with cysteine residues of C/EBP beta. In summary, helenalin acetate is the first highly active small-molecule C/EBP beta inhibitor that inhibits C/EBP beta by a direct binding mechanism.

According to the news reporters, the research concluded: "Its selectivity for the LAP* isoform also makes helenalin acetate an interesting tool to dissect the functions of the LAP* and LAP isoforms."

For more information on this research see: Helenalin Acetate, a Natural Sesquiterpene Lactone with Anti-inflammatory and Anti-cancer Activity, Disrupts the Cooperation of CCAAT Box/Enhancer-binding Protein beta (C/EBP beta) and Co-activator p300. *Journal of Biological Chemistry*, 2016;291(50):26098-26108. *Journal of Biological Chemistry* can be contacted at: Amer Soc Biochemistry Molecular Biology Inc, 9650 Rockville Pike, Bethesda, MD 20814-3996, USA. **Cardiology**

**New Findings on Cardiology Described by Investigators at Cedars-Sinai Heart Institute (Mitraval annular calcification is not associated vvith decreased procedural success, durability of repair, or left ventricular remodelling in percutaneous ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiology are discussed in a new report. According to news reporting originating in Los Angeles, California, by NewsRx journalists, research stated, "Mitraval annular calcification (MAC) negatively influences outcomes in surgical mitral valve (MV) repair for mitral regurgitation (MR). However, there are no data on whether MAC impacts on outcomes of MitraClip percutaneous MV edge-to-edge repair."

The news reporters obtained a quote from the research from Cedars-Sinai Heart Institute, "This study sought to investigate whether the presence of MAC impacts on the procedural success and durability of percutaneous transcatheter repair of MR using the MitraClip. One hundred and seventy-three patients undergoing MitraClip repair for significant
MR were studied. Patients with moderate-or-severe MAC (n=28) were compared to those with no-or-mild MAC. Post-procedural MR severity was not different (p=0.642) and MR reduction to moderate-or-less was equally high in patients with moderate-or-severe MAC (100%) and those without (96.7%), p=1.000. At one year, MR severity was not different (p=0.831), and there was no difference in the repair durability when comparing patients with moderate-or-severe MAC (93.8%) to those without (90.6%), p=1.000. All patients with moderate-or-severe MAC assessed at one year were in NYHA functional Class I-II and had haemodynamic improvements with a decrease in pulmonary artery systolic pressure (-6.5 +/- 13.1 mmHg), p=0.021, and end-diastolic left ventricular internal diameter (-3.9 +/- 6.5 mm), p=0.034, not different to those achieved by patients without MAC (both p>0.100). Moderate-or-severe MAC scored by echocardiography and confirmed on fluoroscopy was not associated with decreased procedural success or durability of repair.

According to the news reporters, the research concluded: "Patients with moderate-or-severe MAC had improvements in clinical symptoms and haemodynamics, as well as decreased left ventricular dimensions."

For more information on this research see: Mitral annular calcification is not associated with decreased procedural success, durability of repair, or left ventricular remodelling in percutaneous edge-to-edge repair of mitral regurgitation. *Eurointervention*, 2016;12(9):1176-1184. *Eurointervention* can be contacted at: Europa Edition, 19 Allee Jean Jaures B P 61508, Toulouse Cedex 6, 31015, France.

**Cardiology**

**New Findings on Cardiology Described by Investigators at Stanford University (Engineered Substrate-Specific Delta PKC Antagonists to Enhance Cardiac Therapeutics)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting originating in Stanford, California, by NewsRx journalists, research stated, "Most protein kinases phosphorylate multiple substrates, each of which induces different and sometimes opposing functions. Determining the role of phosphorylation of each substrate following a specific stimulus is challenging but is essential to elucidate the role of that substrate in the signaling event."

The news reporters obtained a quote from the research from Stanford University, "Here we describe a rational approach to identify inhibitors of delta protein kinase C (delta PKC), each inhibiting the phosphorylation of only one of delta PKC’s substrates. delta PKC regulates many signaling events and we hypothesized that a docking inhibitor of a given substrate to delta PKC should selectively abrogate the phosphorylation of only that substrate,
without affecting the phosphorylation of the other delta PKC substrates. Here we report the
development of selective inhibitors of three delta PKC substrates (in vitro K-d approximate to 3
nm); two greatly reduced ischemia-induced cardiac injury with an IC50 of approximate to 200
nm and the third had no effect, indicating that its respective substrate phosphorylation by delta
PKC has no role in the response to cardiac ischemia and reperfusion. The three inhibitors are
highly specific; even at 1 mm, the phosphorylation of other delta PKC protein substrates was
unaffected."

According to the news reporters, the research concluded: "The rationale we describe
is likely applicable for the development of other substrate-specific inhibitors as well."

For more information on this research see: Engineered Substrate-Specific Delta
PKC Antagonists to Enhance Cardiac Therapeutics. *Angewandte Chemie-International Edition*,

**Cardiology**

**New Findings on Cardiology Described by Investigators at University of
California (Regulation of human cardiac potassium channels by full-
length KCNE3 and KCNE4)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness &
Wellness Week -- Researchers detail new data in Cardiology. According to news reporting
from Irvine, California, by NewsRx editors, the research stated, "Voltage-gated potassium (Kv)
channels comprise pore-forming a subunits and a multiplicity of regulatory proteins, including
the cardiac-expressed and cardiac arrhythmia-linked transmembrane KCNE subunits. After
recently uncovering novel, N-terminally extended (L) KCNE3 and KCNE4 isoforms and
detecting their transcripts in human atrium, reported here are their functional effects on human
cardiac Kv channel a subunits expressed in Xenopus laevis oocytes."

The news correspondents obtained a quote from the research from the University of
California, "As previously reported for short isoforms KCNE3S and KCNE4S, KCNE3L
inhibited hERG; KCNE4L inhibited Kv1.1; neither form regulated the HCN1 pacemaker
channel. Unlike KCNE4S, KCNE4L was a potent inhibitor of Kv4.2 and Kv4.3; co-expression
of cytosolic beta subunit KChIP2, which regulates Kv4 channels in cardiac myocytes, partially
relieved Kv4.3 but not Kv4.2 inhibition. Inhibition of Kv4.2 and Kv4.3 by KCNE3L was
weaker, and its inhibition of Kv4.2 abolished by KChIP2. KCNE3L and KCNE4L also
exhibited subunit-specific effects on Kv4 channel complex inactivation kinetics, voltage
dependence and recovery. Further supporting the potential physiological significance of the robust functional effects of KCNE4L on Kv4 channels, KCNE4L protein was detected in human atrium, where it co-localized with Kv4.3."

According to the news reporters, the research concluded: "The findings establish functional effects of novel human cardiac-expressed KCNE isoforms and further contribute to our understanding of the potential mechanisms influencing cardiomyocyte repolarization."

For more information on this research see: Regulation of human cardiac potassium channels by full-length KCNE3 and KCNE4. Scientific Reports, 2016;6():1-12. **Cardiology**

**New Findings on Cardiology from Thomas Jefferson University Summarized (Strategic Positioning and Biased Activity of the Mitochondrial Calcium Uniporter in Cardiac Muscle)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Control of myocardial energetics by Ca2+ signal propagation to the mitochondrial matrix includes local Ca2+ delivery from sarcoplasmic reticulum (SR) ryanodine receptors (RyR2) to the inner mitochondrial membrane (IMM) Ca2+ uniporter (mtCU). mtCU activity in cardiac mitochondria is relatively low, whereas the IMM surface is large, due to extensive cristae folding. Hence, stochastically distributed mtCU may not suffice to support local Ca2+ transfer."

Financial supporters for this research include National Institutes of Health, American Heart Association.

The news correspondents obtained a quote from the research from Thomas Jefferson University, "We hypothesized that mtCU concentrated at mitochondria-SR associations would promote the effective Ca2+ transfer. mtCU distribution was determined by tracking MCU and EMRE, the proteins essential for channel formation. Both proteins were enriched in the IMM-outer mitochondrial membrane (OMM) contact point submitochondrial fraction and, as super-resolution microscopy revealed, located more to the mitochondrial periphery (inner boundary membrane) than inside the cristae, indicating high accessibility to cytosol-derived Ca2+ inputs. Furthermore, MCU immunofluorescence distribution was biased toward the mitochondria-SR interface (RyR2), and this bias was promoted by Ca2+ signaling activity in intact cardiomyocytes. The SR fraction of heart homogenate contains mitochondria with extensive SR associations, and these mitochondria are highly enriched in EMRE. Size exclusion chromatography suggested for EMRE- and MCU-containing complexes a wide size range and also revealed MCU-containing complexes devoid of EMRE (thus disabled) in the mitochondrial but not the SR fraction. Functional measurements suggested more effective mtCU-mediated Ca2+ uptake activity by the mitochondria of the SR than of the mitochondrial fraction."

According to the news reporters, the research concluded: "Thus, mtCU 'hot spots' can
be formed at the cardiac muscle mitochondria-SR associations via localization and assembly bias, serving local Ca2+ signaling and the excitation-energetics coupling."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.755496. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Diseases**

**New Findings on Cardiovascular Diseases Described by Investigators at Duke University (Cardiovascular Disease and HIV: Pathophysiology, Treatment Considerations, and Nursing Implications)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases is the subject of a report. According to news reporting originating from Durham, North Carolina, by NewsRx correspondents, research stated, "HIV infection has progressed from an acute, terminal disease to a chronic illness with cardiovascular disease as the leading cause of death among persons living with HIV. As persons living with HIV infection continue to become older, traditional risk factors for atherosclerosis compounded by the pathophysiological effects of HIV infection and antiretroviral therapy markedly increase the risk for cardiovascular disease."

Our news editors obtained a quote from the research from Duke University, "Further, persons living with HIV are also at high risk for cardiomyopathy. Critical care nurses must recognize the risk factors for cardiovascular disease and the pathophysiology and complex treatment options in order to manage care of these patients and facilitate multidisciplinary collaboration."

According to the news editors, the research concluded: "Two case studies are used to highlight the treatment options and nursing considerations associated with cardiovascular disease among persons living with HIV."

For more information on this research see: Cardiovascular Disease and HIV: Pathophysiology, Treatment Considerations, and Nursing Implications. *Critical Care Nurse*, 2016;36(5):37-46. *Critical Care Nurse* can be contacted at: Amer Assoc Critical Care Nurses,
New Findings on Carotid Stenosis Described by Investigators at Sakarya University (Relationship Between Carotid Stenosis and Infarct Volume in Ischemic Stroke Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Carotid Stenosis. According to news originating from Sakarya, Turkey, by NewsRx correspondents, research stated, "Stroke is a serious health problem all over the world. Ischemia causes 85% of strokes and 75% of these ischemic strokes occur within the area supplied by the internal carotid artery (ICA)."

Our news journalists obtained a quote from the research from Sakarya University, "This study included 47 acute stroke patients who were in the large-artery atherosclerosis group according to Trial of ORG 10172 in Acute Stroke Treatment (TOAST) classification and who had an infarct in the area supplied by the internal carotid artery. We sought to determine whether there was a significant correlation between the infarct volume of the patients as measured by diffusion-weighted magnetic resonance imaging (DW MRI), their National Institutes of Health Stroke Scale (NIHSS), and degree of carotid stenosis as identified by carotid computed tomography angiography (CTA). A significant correlation was observed between the percentage of carotid artery stenosis and infarct volume (p < 0.001). In addition, there was a significant positive correlation between the NIHSS and infarct volume; the correlation was of moderate strength (r= 0.366, p= 0.001)."

According to the news editors, the research concluded: "Our findings indicate that the percentage of carotid artery stenosis could be useful in predicting the infarct volume of the stroke."

For more information on this research see: Relationship Between Carotid Stenosis and Infarct Volume in Ischemic Stroke Patients. *Medical Science Monitor*, 2016;22():4954-4959. *Medical Science Monitor* can be contacted at: Int Scientific Literature, Inc, 361 Forest Lane, Smithtown, NY 11787, USA.

The news correspondents report that additional information may be obtained from...
New Findings on Cell Biochemistry Described by Investigators at Pusan National University (Hedgehog Signaling is Associated with Liver Response to Fractionated Irradiation in Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cell Biochemistry is now available. According to news reporting out of Pusan, South Korea, by NewsRx editors, research stated, "Radiation-induced liver disease (RILD) is a major obstacle in treating liver cancer; however, the mechanisms underlying RILD development remain unclear. Hedgehog (Hh) orchestrates liver response to injury."

Our news journalists obtained a quote from the research from Pusan National University, "Herein, we investigated the liver response with Hh to fractionated irradiation (FI) using a small murine model for RILD. Male mice exposed to liver-targeted FI with 6Gy in 5 consecutive weekly fractions were sacrificed at one day after weekly irradiation and 6 or 10 weeks post 5(th) FI for the acute and late response model, respectively. The levels of ALT/AST and apoptosis were elevated in all radiation groups. The expression of Hh ligand, Sonic and Indian Hh, and Hh activator, smoothened and gli2, was higher in the acute groups than the control group. Pro-fibrogenic markers were also up-regulated in this model compared with the control group. Histomorphological changes and ballooned hepatocytes were observed in the late response model. Both the expression of Hh and profibrotic genes and the fibrosis level increased in this model compared with the control groups."

According to the news editors, the research concluded: "Enhanced Hedgehog signaling and liver injury with fibrosis in RILD murine model suggests hedgehog as the potential regulator in RILD progression and the suitability of this model for studying RILD."

Our news journalists report that additional information may be obtained by contacting Y. Jung, Pusan National University, Coll Nat Sci, Dept. of Biol Sci, Pusan, South
New Findings on Cell Science from Shanghai Medical College of Fudan University Summarized (MBD3L2 promotes Tet2 enzymatic activity for mediating 5-methylcytosine oxidation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Life Science Research - Cell Science is the subject of a report. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Ten-eleven translocation (Tet) proteins are key players involved in the dynamic regulation of cytosine methylation and demethylation. Inactivating mutations of Tet2 are frequently found in human malignancies, highlighting the essential role of Tet2 in cellular transformation."

Funders for this research include National Natural Science Foundation of China, National Basic Research Program of China 973 Program, The Major Project of Basic Research of Technology Committee in Shanghai of China.

Our news journalists obtained a quote from the research from the Shanghai Medical College of Fudan University, "However, the factors that control Tet enzymatic activity remain largely unknown. Here, we found that methyl-CpG-binding domain protein 3 (MBD3) and its homolog MBD3-like 2 (MBD3L2) can specifically modulate the enzymatic activity of Tet2 protein, but not Tet1 and Tet3 proteins, in converting 5-methylcytosine (5mC) into 5-hydroxymethylcytosine (5hmC). Moreover, MBD3L2 is more effective than MBD3 in promoting Tet2 enzymatic activity through strengthening the binding affinity between Tet2 and the methylated DNA target. Further analysis revealed pronounced decreases in 5mC levels at MBD3L2 and Tet2 co-occupied genomic regions, most of which are promoter elements associated with either cancer-related genes or genes involved in the regulation of cellular metabolic processes. Our data add new insights into the regulation of Tet2 activity by MBD3 and MBD3L2, and into how that affects Tet2-mediated modulation of its target genes in cancer development."

According to the news editors, the research concluded: "Thus, they have important applications in understanding how dysregulation of Tet2 might contribute to human malignancy."

The news correspondents report that additional information may be obtained from F. Wu, Laboratory of Epigenetics, School of Basic Medicine and Institutes of Biomedical Research.
Transplant Medicine - Cell Transplants

New Findings on Cell Transplants Described by Investigators at University College (Optimisation and quality control of cell processing for autologous stem cell transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Cell Transplants have been published. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Clinical practice and the technology of cell processing for autologous stem cell transplantation has continued to evolve over the last two decades and merits review of current quality control expectations."

Financial support for this research came from National Institute for Health Research.

Our news editors obtained a quote from the research from University College, "The external regulatory era has improved quality and safety standards but there is still variable practice, with specific risks illuminated by a number of clinical incidents. Viable CD34(+) cell assays may fail to indicate significant losses in progenitor function during storage, particularly after cryopreservation, and there is a need to develop an alternative, real time functional assay to replace colony assays."

According to the news editors, the research concluded: "The ultimate guide to potency and successful cell processing for haematopoietic progenitor cell products is prompt and reproducible engraftment and close monitoring is essential for safety and quality control."

The news editors report that additional information may be obtained by contacting M.J. Watts, UCL, London, United Kingdom.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bjh.14378. This DOI is a link to an online electronic document that is either free or for purchase.

**Digestive System Diseases and Conditions**

**New Findings on Cholangitis from Shizuoka Cancer Center Summarized**

(Evaluation of Streptococcus pneumoniae in bile samples: A case series review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Digestive System Diseases and Conditions - Cholangitis are presented in a new report. According to news originating from Shizuoka, Japan, by NewsRx correspondents, research stated, "Although Streptococcus pneumoniae is an important pathogen of humans, pneumococcal cholangitis is rare because of the rapid autolysis of S. pneumoniae. The aim of this case series was to review patients with bile cultures positive for S. pneumoniae."

Our news journalists obtained a quote from the research from Shizuoka Cancer Center, "This study was a single center retrospective case series review of patients with S. pneumoniae in their bile at a tertiary-care cancer center between September 2002 and August 2015. Subjects consisted of all patients in whom S. pneumoniae was isolated in their bile during the study period. Bile specimens for culture were obtained from biliary drainage procedures such as endoscopic retrograde biliary drainage, endoscopic nasobiliary drainage, and percutaneous transhepatic biliary drainage. There were 20 patients with bile cultures positive for S. pneumoniae during the study period. All patients presented with extrahepatic obstructive jaundice due to hepatopancreatobiliary tumors. Nineteen of 20 patients underwent the placement of plastic intrabiliary tubes. The mean time between the first-time drainage and the positive culture was 26 days (range 0-313 days). Although 12 of 20 patients met our definition of cholangitis, 5 were clinically treated with antibiotics based on a physician's assessment of whether there was a true infection. The present study is the largest case series of patients with S. pneumoniae in their bile."

According to the news editors, the research concluded: "Based on our findings, the isolation of S. pneumoniae from bile may be attributed to the placement of biliary drainage devices."

For more information on this research see: Evaluation of Streptococcus pneumoniae in bile samples: A case series review. *Journal of Infection and Chemotherapy*, 2016;22(6):383-386. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. New Findings on Clinical Trials and Studies from French National Institute of Health and Medical Research (INSERM) Summarized (High level of depressive symptoms as a barrier to reach an ideal cardiovascular health. The Paris Prospective Study ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "We hypothesized that depression might represent a barrier to reach an ideal cardiovascular health (CVH) as estimated by the 7-item tool proposed by the American Heart Association. Between 2008 and 2012, 9,417 subjects 50-75 years of age were examined in a large health center and enrolled in the Paris Prospective Study III (PPS3)."

Our news editors obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "Participants with 0-2, 3-4 and 5-7 health metrics at the ideal level were categorized as having poor, intermediate and ideal CVH, respectively. Participants with a score (>=) 7 on the 13-item Questionnaire of Depression 2nd version, Abridged or who were on antidepressants were referred as having high level of depressive symptoms (HLDS). The mean age of the 9417 study participants was 59.57 (SD 6.28) years and 61.16% were males. A total of 9.55% had HLDS. Poor, intermediate and ideal CVH was present in 40.38%, 49.52% and 10.10% of the participants. In multivariate polytomous logistic regression analysis, HLDS was inversely associated with ideal CVH (odds ratio=0.70; 95% CI: 0.55;0.90). This was driven by an association with the behavioural component of the CVH."

According to the news editors, the research concluded: "Participants with HLDS had a substantial reduced chance of reaching an ideal CVH."

For more information on this research see: High level of depressive symptoms as a barrier to reach an ideal cardiovascular health. The Paris Prospective Study III. Scientific Reports, 2016;6():18951. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Digestive System Diseases and Conditions - Colitis

New Findings on Colitis from Department of Gastroenterology Summarized (Segmental colitis caused by idiopathic myointimal hyperplasia of mesenteric veins)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Digestive System Diseases and Conditions - Colitis are discussed in a new report. According to news reporting from Lisbon, Portugal, by NewsRx journalists, research stated, "Diseases causing colonic ischemia may be mistaken with other causes of segmental colitis such as inflammatory bowel disease, especially in young patients. The authors present the case of a 47-year-old male with severe proctosigmoiditis."

The news correspondents obtained a quote from the research from the Department of Gastroenterology, "Assessment excluded infectious causes, thrombophilia and systemic vasculitis. The initial histological specimen was suggestive of inflammatory bowel disease and therapy was initiated with intravenous steroids and, at day 5, infliximab, with no response. The patient was proposed for surgery. Pathological examination of the surgical specimen revealed an idiopathic myointimal hyperplasia of mesenteric veins, a rare entity exhibiting necrotizing phlebitis with rapid progression to segmental necrosis in the rectosigmoid colon."

According to the news reporters, the research concluded: "In this paper the authors discuss the differential diagnosis of proctosigmoiditis in young ages and the approach to this exceptionally rare ischemic entity."

Our news journalists report that additional information may be obtained by contacting M.N. Costa, Center Hosp Lisboa Cent, Dept. of Gastroenterol, Lisbon, Portugal. Additional authors for this research include J. Saiote, M.J. Pinheiro, P. Duarte, T. Bentes, M. Ferraz-Oliveira and J. Ramos.

Digestive System Diseases and Conditions - Colitis

New Findings on Colitis from Stanford University Summarized (Control of inflammation by stromal Hedgehog pathway activation restrains colitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Colitis. According to news reporting out of Stanford, California, by NewsRx
editors, research stated, "Inflammation disrupts tissue architecture and function, thereby contributing to the pathogenesis of diverse diseases; the signals that promote or restrict tissue inflammation thus represent potential targets for therapeutic intervention. Here, we report that genetic or pharmacologic Hedgehog pathway inhibition intensifies colon inflammation (colitis) in mice."

Funders for this research include Howard Hughes Medical Institute (HHMI), HHS | NIH | National Cancer Institute (NCI).

Our news journalists obtained a quote from the research from Stanford University, "Conversely, genetic augmentation of Hedgehog response and systemic small-molecule Hedgehog pathway activation potently ameliorate colitis and restrain initiation and progression of colitis-induced adenocarcinoma. Within the colon, the Hedgehog protein signal does not act directly on the epithelium itself, but on underlying stromal cells to induce expression of IL-10, an immune-modulatory cytokine long known to suppress inflammatory intestinal damage. IL-10 function is required for the full protective effect of small-molecule Hedgehog pathway activation in colitis; this pharmacologic augmentation of Hedgehog pathway activity and stromal IL-10 expression are associated with increased presence of CD4(+) Foxp3(+) regulatory T cells."

According to the news editors, the research concluded: "We thus identify stromal cells as cellular coordinators of colon inflammation and suggest their pharmacologic manipulation as a potential means to treat colitis."

Our news journalists report that additional information may be obtained by contacting P.A. Beachy, Stanford University, Sch Med, Stanford Canc Inst, Stanford, CA 94305, United States. Additional authors for this research include M.E. Rothenberg, E.S. Seeley, B. Zimdahl, S. Kawano, W.J. Lu, K. Shin, T. Sakata-Kato, J.K. Chen, M. Diehn, M.F. Clarke and P.A. Beachy.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1073/pnas.1616447113. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings on Colon Cancer from Emory University Summarized
(Novel synthetic curcumin analogs as potent antiangiogenic agents in colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news reporting originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "The transcription factor NF-B plays a central role in angiogenesis in colorectal cancer (CRC). Curcumin is a natural dietary product that inhibits NF-B."

Our news editors obtained a quote from the research from Emory University, "The objective of this study is to evaluate the antiangiogenic effects of curcumin and two potent synthetic analogues (EF31 and UBS109) in CRC. IC50 values for curcumin, EF31, and UBS109 were determined in the HCT116 and HT-29 cell lines. HUVEC tube formation, egg CAM assay, and matrigel plug assays revealed decreased angiogenesis in cell lines treated with curcumin, EF31, or UBS109. Curcumin and its analogues significantly inhibited VEGF-A synthesis and secretion in both cell lines in association with loss of HIF-1, COX-2, and p-STAT-3 expression. Nuclear NF-B expression was inhibited by curcumin, EF31, and UBS109. Transfection of p65-NF-B in HCT116 and HT-29 cells resulted in increased expression of HIF-1, COX-2, STAT-3, and VEGF-A. Treatment with curcumin, EF31, or UBS109 inhibited these effects in transfected cell lines. In mice carrying HCT116 and HT-29 cell xenografts, EF31 and UBS109 inhibited subcutaneous tumor growth and potentiated the effects of oxaliplatin and 5-FU. Tumors from treated animals revealed inhibition of HIF-1, COX-2, p-STAT-3, and VEGF expression. Our findings suggest that inhibition of NF-B leading to decreased transcription and expression of HIF-1, COX-2, STAT-3, and VEGF is a rational approach for antiangiogenic therapy in CRC."

According to the news editors, the research concluded: "The distinctive properties of EF31 and UBS109 make them promising therapeutic agents for development in CRC as single agents or as part of combination chemotherapy regimens."

The news editors report that additional information may be obtained by contacting B.F. El-Rayes, Emory University, Winship Canc Inst, Dept. of Hematol & Med Oncol, Atlanta, GA 30322, United States. Additional authors for this research include G.P. Nagaraju, W.L. Shaib, O.B. Alese, J.P. Snyder, M. Shoji, S. Pattnaik, A. Alam and B.F. El-Rayes.

New Findings on Dopaminergic Antiparkinsonism Agents from R. Sant'Anna and Co-Authors Summarized (Repositioning tolcapone as a potent inhibitor of transthyretin amyloidogenesis and associated cellular toxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Dopaminergic Antiparkinsonism Agents have been published. According to news reporting originating from Bellaterra, Spain, by NewsRx correspondents, research stated, "Transthyretin (TTR) is a plasma homotetrameric protein implicated in fatal systemic amyloidoses. TTR tetramer dissociation precedes pathological TTR aggregation."

Our news editors obtained a quote from the research, "Native state stabilizers are promising drugs to treat TTR amyloidoses. Here we repurpose tolcapone, an FDA-approved molecule for Parkinson's disease, as a potent TTR aggregation inhibitor. Tolcapone binds specifically to TTR in human plasma, stabilizes the native tetramer in vivo in mice and humans and inhibits TTR cytotoxicity. Crystal structures of tolcapone bound to wild-type TTR and to the V122I cardiomyopathy-associated variant show that it docks better into the TTR T4 pocket than tafamidis, so far the only drug on the market to treat TTR amyloidoses."

According to the news editors, the research concluded: "These data indicate that tolcapone, already in clinical trials for familial amyloid polyneuropathy, is a strong candidate for therapeutic intervention in these diseases, including those affecting the central nervous system, for which no small-molecule therapy exists."

For more information on this research see: Repositioning tolcapone as a potent inhibitor of transthyretin amyloidogenesis and associated cellular toxicity. Nature Communications, 2016;7():10787. (Nature Publishing Group - www.nature.com/ncomms/)

The news editors report that additional information may be obtained by contacting R. Sant'Anna, Institut de Biotecnologia i Biomedicina and Departament de Bioquimica i Biologia Molecular, Universitat Autonoma de Barcelona, Bellaterra, Barcelona 08193, Spain. New Findings on Duchenne Muscular Dystrophy from M. Rodrigues and Co-Authors Summarized (Impaired regenerative capacity and lower revertant fibre expansion in dystrophin-deficient mdx muscles on DBA/2 background)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Musculoskeletal Diseases and Conditions - Duchenne Muscular Dystrophy is now available. According to news originating from Edmonton, Canada, by NewsRx correspondents, research stated, "Duchenne muscular dystrophy, one of the most common lethal genetic disorders, is caused by mutations in the DMD gene and a lack of dystrophin protein. In most DMD patients and animal models, sporadic dystrophin-positive muscle fibres, called revertant fibres (RFs), are observed in otherwise dystrophin-negative backgrounds."

Our news journalists obtained a quote from the research, "RFs are thought to arise from skeletal muscle precursor cells and clonally expand with age due to the frequent regeneration of necrotic fibres. Here we examined the effects of genetic background on muscle regeneration and RF expansion by comparing dystrophin-deficient mdx mice on the C57BL/6 background (mdx-B6) with those on the DBA/2 background (mdx-DBA), which have a more severe phenotype. Interestingly, mdx-DBA muscles had significantly lower RF expansion than mdx-B6 in all age groups, including 2, 6, 12, and 18 months. The percentage of centrally nucleated fibres was also significantly lower in mdx-DBA mice compared to mdx-B6, indicating that less muscle regeneration occurs in mdx-DBA."

According to the news editors, the research concluded: "Our study aligns with the model that RF expansion reflects the activity of precursor cells in skeletal muscles, and it serves as an index of muscle regeneration capacity."

For more information on this research see: Impaired regenerative capacity and lower revertant fibre expansion in dystrophin-deficient mdx muscles on DBA/2 background. Scientific Reports, 2016;6():1-9. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from T. Yokota, Muscular Dystrophy Canada Res Chair, Edmonton, AB T6G 2H7, Canada. Additional authors for this research include Y. Echigoya, R. Maruyama, K.R.Q. Lim, S. Fukada and T. Yokota.

New Findings on Eicosanoids from Copenhagen University HospitalSummarized (The vasopressin type 2 receptor and prosta
glandin receptors EP2 and EP4 can increase aquaporin-2 plasma membrane
targeting through a cAMP-independent pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Biological Factors - Eicosanoids.
According to news reporting originating from Copenhagen, Denmark, by NewsRx
correspondents, research stated, "Apical membrane targeting of the collecting duct water
channel aquaporin-2 (AQP2) is essential for body water balance. As this event is regulated by
Gs coupled 7-transmembrane receptors such as the vasopressin type 2 receptor (V2R) and the
prostanoid receptors EP2 and EP4, it is believed to be cAMP dependent."

Our news editors obtained a quote from the research from Copenhagen University
Hospital, "However, on the basis of recent reports, it was hypothesized in the current study that
increased cAMP levels are not necessary for AQP2 membrane targeting. The role and dynamics
of cAMP signaling in AQP2 membrane targeting in Madin-Darby canine kidney and mouse
cortical collecting duct (mpkCCD(14)) cells was examined using selective agonists against the
V2R (dDAVP), EP2 (butaprost), and EP4 (CAY10580). During EP2 stimulation, AQP2
membrane targeting continually increased during 80 min of stimulation; whereas cAMP levels
reached a plateau after 10 min. EP4 stimulation caused a rapid and transient increase in AQP2
membrane targeting, but did not significantly increase cAMP levels. After washout of the EP2
agonist or dDAVP, AQP2 membrane abundance remained elevated for at least 80 min, whereas
cAMP levels rapidly decreased. Similar effects of the EP2 agonist were also observed for AQP2
constitutively nonphosphorylated at ser-269. The adenylyl cyclase inhibitor SQ22536 did not
prevent AQP2 targeting during stimulation of each receptor, nor after dDAVP washout."

According to the news editors, the research concluded: "This study demonstrates that
although direct stimulation with cAMP causes AQP2 membrane targeting, cAMP is not
necessary for receptor-mediated AQP2 membrane targeting and Gs-coupled receptors can also
signal through an alternative pathway that increases AQP2 membrane targeting."

For more information on this research see: The vasopressin type 2 receptor and
prostaglandin receptors EP2 and EP4 can increase aquaporin-2 plasma membrane targeting
through a cAMP-independent pathway. American Journal of Physiology-Renal Physiology,
2016;311(5):F935-F944. American Journal of Physiology-Renal Physiology can be contacted

**Epithelial Cells**

**New Findings on Epithelial Cells from Harvard School of Medicine Summarized (Characterization of oncocytes in deep esophageal glands)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Epithelial Cells is the subject of a report. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Deep esophageal glands play a vital role in the protection and regeneration of the esophageal mucosa. Conditions such as gastroesophageal reflux disease and Barrett's esophagus have been associated with a change in the usual glands by oncocytic metaplasia."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "However, little is known regarding the function of oncocytes or the relevance of this metaplastic change in the human esophagus. We hypothesized that oncocytes of deep esophageal glands also express markers characteristic of a ductal epithelial phenotype because similar oncocytes have been described as part of large ductal epithelial cells in salivary glands. We used immunohistochemical stains to define structural, functional, proliferative, and potential stem/progenitor characteristics of oncocytes. Oncocytes did not express mucins or lysozyme C, two molecules found in mucous cells and used for antimicrobial defense. Oncocytes did not express CK5, a cytokeratin found in myoepithelial cells and basal epithelial cells, but expressed CK7, a cytokeratin found in intralobular ductal epithelial cells and luminal epithelial cells of the main duct. Oncocytes expressed cystic fibrosis transmembrane conductance regulator and sodium/potassium ATPase, ion channels that play a role in bicarbonate secretion. Membrane-bound beta-catenin was detected in oncocytes, but these cells did not express the proliferative marker Ki67. Approximately, a third of oncocytes expressed SOX9 and p63, transcription factors expressed in epithelial progenitor cells in multiple organs. Moreover, oncocytes expressed CD44, a transmembrane Glycoprotein expressed in cancer stem cells. Taken together, our data show that oncocytes express markers of intralobular ductal epithelial cells and luminal epithelial cells of the main duct. Additionally, our observations suggest that oncocytes act as epithelial progenitor cells and play a role in bicarbonate secretion. Since oncocytic metaplasia is associated with conditions of chronic acid injury, it is possible that oncocytes replace the mucous cells in deep esophageal glands (dEG) as an adaptive change to counteract injury from acid reflux. The marker characterization suggests that oncocytes may originate from transdifferentiation of myoepithelial and mucous cells."

According to the news reporters, the research concluded: "This transdifferentiation might lead to an overall decrease of mucins production and secretion by the dEG and a subsequent reduction of the protection conferred by the viscoelastic mucous layer."

Our news journalists report that additional information may be obtained by contacting G. Gonzalez, Harvard Med Sch, Boston, MA, United States. Additional authors for this research include Q. Huang and H. Mashimo.

Keywords for this news article include: Boston, Massachusetts, United States, North and Central America, Epithelial Cells, Genetics, Harvard School of Medicine.

New Findings on Escherichia coli from SASTRA University Summarized
(Escherichia coli MazEF toxin-antitoxin system does not mediate programmed cell death)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gram-Negative Bacteria - Escherichia coli. According to news reporting originating from Thanjavur, India, by NewsRx correspondents, research stated, "Toxin-antitoxins systems (TAS) are prokaryotic operons containing two small overlapping genes which encode two components referred to as toxin and antitoxin. Involvement of TAS in bacterial programmed cell death (PCD) is highly controversial."

Our news editors obtained a quote from the research from SASTRA University, "MazEF, a typical type II TAS, is particularly implicated in mediating PCD in Escherichia coli. Hence, we compared the metabolic fitness and stress tolerance of E. coli strains (MC4100 and its mazEF-derivative) which were extensively used by proponents of mazEF-mediated PCD. We found that both the strains are deficient in relA gene and that the Delta mazEF strain has lower fitness and stress tolerance compared to wild type MC4100."

According to the news editors, the research concluded: "We could not reproduce mazEF mediated PCD which emphasizes the need for skeptic approach to the PCD hypothesis."

The news editors report that additional information may be obtained by contacting B.C.M. Ramisetty, SASTRA Univ, Sch Chem & Biotechnol, Thirumalaisamudram 613402, Thanjavur, India. Additional authors for this research include S. Raj and D. Ghosh.

New Findings on Esophageal Cancer Described by Investigators at Shandong University
(Postoperative radiation therapy of pT2-3N0M0 esophageal carcinoma-a review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Esophageal Cancer are presented in a new report.
According to news originating from Shandong, People's Republic of China, by NewsRx correspondents, research stated, "Esophageal cancer is one of the most malignant gastrointestinal cancers worldwide. Despite advances in surgical technique, 5-year survival in pathologic stage T2-3N0M0 esophageal squamous cell carcinoma patients who are treated with surgery alone is still poor."

Our news journalists obtained a quote from the research from Shandong University, "The addition of adjuvant radiotherapy may confer a benefit for these patients. However, not all patients could get a benefit from radiotherapy and patients with esophageal squamous cell carcinoma receiving radiotherapy seem to have a disparity in treatment response. Thus, identifying effective prognostic indicator to complement current clinical staging approaches is extremely important. Those prognostic factors could give rise to a novel prognostic stratification system, which serve as criteria for selecting patients for adjuvant therapy."

According to the news editors, the research concluded: "Consequently, it may help to define the subgroups who are more likely to benefit from postoperative radiation therapy."

For more information on this research see: Postoperative radiation therapy of pT2-3N0M0 esophageal carcinoma-a review. Tumor Biology, 2016;37(11):14443-14450. Tumor Biology can be contacted at: Springer, Van Godewijkstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

The news correspondents report that additional information may be obtained from Y.J. Luo, Shandong University, Shandong Canc Hosp, Dept. of Radiat Oncol & Radiol, Jinan 250117, Shandong, People's Republic of China. Additional authors for this research include X.L. Wang, J.M. Yu, B. Zhang and M.H. Li.

Evolution

New Findings on Evolution from University of Chicago Summarized (Genotype-by-genotype interactions between an insect and its pathogen)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Evolution are presented in a new report. According to news originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Genotype-by-genotype (GxG) interactions are an essential requirement for the coevolution of hosts and parasites, but have only been documented in a small number of animal model systems. GxG effects arise from interactions between host and pathogen genotypes, such that some pathogen strains are more infectious in certain hosts and some hosts are more susceptible to certain pathogen strains."

Our news journalists obtained a quote from the research from the University of Chicago, "We tested for GxG interactions in the gypsy moth (Lymantria dispar) and its baculovirus. We infected 21 full-sib families of gypsy moths with each of 16 isolates of baculovirus and measured the between-isolate correlations of infection rate across host families.
for all pair-wise combinations of isolates. Mean infectiousness varied among isolates and
disease susceptibility varied among host families. Between-isolate correlations of infection rate
were generally less than one, indicating nonadditive effects of host and pathogen type consistent
with GxG interactions."

According to the news editors, the research concluded: "Our results support the
presence of GxG effects in the gypsy moth-baculovirus interaction and provide empirical
evidence that correlations in infection rates between field-collected isolates are consistent with
values that mathematical models have previously shown to increase the likelihood of pathogen
polymorphism."

For more information on this research see: Genotype-by-genotype interactions

differentiated/undifferentiated carcinoma had an increased risk of cancer mortality. Widowed patients had the highest percentage of women and elderly, and were more susceptible to well and moderately differentiated gastric carcinomas and gastric adenocarcinoma with earlier TNM stage and lowest rate of surgery and radiation therapy. In addition, they also had the worst 5-year GCSS. Our study suggests that unmarried GC patients, especially widowed patients, are at a high risk of GCSS."

According to the news reporters, the research concluded: "Additionally, the survival benefit is more significant among married GC patients in higher malignancy status."

Our news journalists report that additional information may be obtained by contacting R. Zhou, Dept. of General Surgery, The Affiliated Jiangning Hospital of Nanjing Medical University, Nanjing, Jiangsu Province, People's Republic of China. Additional authors for this research include S. Yan and J. Li.

**Oncology - Gastric Cancer**

**New Findings on Gastric Cancer from Yonsei University Summarized**

*(Incidence and impact of scheduled endoscopic surveillance on recurrence after curative endoscopic resection for early gastric cancer)*

---

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gastric Cancer have been presented. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "The aim of this study was to identify the incidence of recurrent lesions after endoscopic submucosal dissection (ESD) and to determine whether scheduled endoscopic surveillance might control their development and treatment. We reviewed the clinical data of patients who underwent gastric ESD between March 2007 and April 2014."

Our news journalists obtained a quote from the research from Yonsei University, "A total of 1347 patients who underwent curative ESD for early gastric cancer that met the expanded indication for ESD were analyzed. Of these, recurrence at the previous ESD site occurred in 39 patients, whereas recurrence in the stomach at a site other than the ESD site occurred in 102 patients. Older age, intestinal metaplasia, flat or depressed lesions, and ESD criteria were associated with recurrence in the stomach in places other than the ESD site. The annual incidence was 2.48% for recurrence in the stomach at other than the ESD site. In cases of local recurrence and metachronous lesions, there was a significant difference between the short-and long-surveillance interval group (<= 12 months vs > 12 months) in the proportions of recurrent adenocarcinoma (31.9% vs 60.9%, P =
.021), additional gastrectomy (7.1% vs 46.2%, P = .033), and size (8.92 +/- 4.17 mm vs 18.08 +/- 10.47 mm, P = .010). Scheduled endoscopy surveillance is necessary for detecting recurrent lesions.

According to the news editors, the research concluded: "In addition, scheduled endoscopy surveillance might help to detect recurrent lesions at a stage early enough for a curative resection."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.gie.2016.03.1404. This DOI is a link to an online electronic document that is either free or for purchase.

Genetic Disorders

New Findings on Genetic Disorders from Duke University Summarized (The continuum of causality in human genetic disorders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Genetic Disorders are presented in a new report. According to news reporting out of Durham, North Carolina, by NewsRx editors, the research stated, "Studies of human genetic disorders have traditionally followed a reductionist paradigm."

Our news journalists obtained a quote from the research from Duke University, "Traits are defined as Mendelian or complex based on family pedigree and population data, whereas alleles are deemed rare, common, benign, or deleterious based on their population frequencies. The availability of exome and genome data, as well as gene and allele discovery for various conditions, is beginning to challenge classic definitions of genetic causality."

According to the news editors, the research concluded: "Here, I discuss recent advances in our understanding of the overlap between rare and complex diseases and the context-dependent effect of both rare and common alleles that underscores the need for revising the traditional categorizations of genetic traits."

For more information on this research see: The continuum of causality in human genetic disorders. Genome Biology, 2016;17():38-42. Genome Biology can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. (BioMed Central - www.biomedcentral.com/; Genome Biology - genmbiology.com)

Genetics

New Findings on Genetics from University of Tokyo Summarized (Multiple facets of p53 in senescence induction and maintenance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Genetics are presented in a new report. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Cellular senescence is a state of durable cell cycle arrest with metabolic activities distinct from those of the proliferative state. Since senescence was originally reported to be induced by various genotoxic stressors, such as telomere erosion and oncogenic signaling, it has been proposed to play a pivotal role in aging-related changes and as an antitumorigenic barrier in vivo."

Financial support for this research came from Ministry of Education, Culture, Sports, Science, and Technology.

Our news editors obtained a quote from the research from the University of Tokyo, "However, the mechanisms underlying its induction and maintenance remain entirely elusive. We have recently found that abrupt activation of p53 at G(2) results in a cell skipping mitosis and subsequently undergoing senescence. Surprisingly, we have also found that downregulation of p53 by SCFFb xo22 is crucial for the induction of a senescence-associated phenotype."

According to the news editors, the research concluded: "In this review, we provide an overview of recent advances in understanding the mechanisms underlying the timing and magnitude of activation of p53 during senescence."

The news editors report that additional information may be obtained by contacting M. Nakanishi, University of Tokyo, Instuite Med Sci, Dept. of Canc Biol, Div Canc Cell Biol, Tokyo, Japan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/cas.13060. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings on Glioblastomas Discussed by Researchers at Department of Neurosurgery (Inhibiting receptor tyrosine kinase AXL with small molecule inhibitor BMS-777607 reduces glioblastoma growth, migration, and invasion in vitro and in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Glioblastomas have been published. According to news originating from Berlin, Germany, by NewsRx correspondents, research stated, "Receptor tyrosine kinase AXL (RTK-AXL) is regarded as suitable target in glioma therapy. Here we evaluate the anti-tumoral effect of small molecule inhibitor BMS-777607 targeting RTK-AXL in a preclinical glioma model and provide evidence that RTK-AXL is expressed and phosphorylated in primary and recurrent glioblastoma multiforme (GBM)."

Our news journalists obtained a quote from the research from the Department of Neurosurgery, "We studied the impact of BMS-777607 targeting RTK-AXL in GBM models in vitro and in vivo utilizing glioma cells SF126 and U118MG. Impact on proliferation, apoptosis and angiogenesis was investigated by immunohistochemistry (IHC) and functional assays in vitro and in vivo. Tumor growth was assessed with MRI. Human GBM tissue was analyzed in terms of RTK-AXL phosphorylation by immunoprecipitation and immunohistochemistry. BMS-777607 displayed various anti-cancer effects dependent on increased apoptosis, decreased proliferation and migration in vitro and ex vivo in SF126 and U118 GBM cells. In vivo we observed a 56% tumor volume reduction in SF126 xenografts and remission in U118MG xenografts of more than 91%. The tube formation assay confirmed the anti-angiogenic effect of BMS-777607, which became also apparent in tumor xenografts. IHC of human GBM tissue localized phosphorylated RTK-AXL in hypercellular tumor regions, the migratory front of tumor cells in pseudo-palisades, and in vascular proliferates within the tumor. We further proved RTK-AXL phosphorylation in primary and recurrent disease state."

According to the news editors, the research concluded: "Collectively, these data strongly suggest that targeting RTK-AXL with BMS-777607 could represent a novel and potent regimen for the treatment of primary and recurrent GBM."

For more information on this research see: Inhibiting receptor tyrosine kinase AXL with small molecule inhibitor BMS-777607 reduces glioblastoma growth, migration, and invasion in vitro and in vivo. Oncotarget, 2016;7(9):9876-89.

The news correspondents report that additional information may be obtained from J. Onken, Dept. of Neurosurgery, Charite, Berlin, Germany. Additional authors for this research include R. Torka, S. Korsing, J. Radke, I. Krementeskaia, M. Nieminen, X. Bai, A. Ullrich, F. Heppner and P. Vajkoczy.

Oncology - Gliomas

New Findings on Gliomas Described by Investigators at University of Toronto (External beam radiation dose escalation for high grade glioma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gliomas have been presented. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "The incidence of high grade glioma (HGG) is approximately 5 per 100,000 person-years in Europe and North America. To assess the effects of postoperative external beam radiation dose escalation in adults with HGG."

Our news editors obtained a quote from the research from the University of Toronto, "Search methods We searched the Cochrane Central Register of Controlled Trials (CENTRAL) (2015, Issue 9), MEDLINE (1977 to October 2015) and Embase (1980 to end October 2015) for relevant randomised phase III trials. Selection criteria We included adults with a pathological diagnosis of HGG randomised to the following external beam radiation regimens. 1. Daily conventionally fractionated radiation therapy versus no radiation therapy. 2. Hypofractionated radiation therapy versus daily conventionally fractionated radiation therapy. 3. Hyperfractionated radiation therapy versus daily conventionally fractionated radiation therapy. 4. Accelerated radiation therapy versus daily conventionally fractionated radiation therapy. Data collection and analysis The primary outcomes were overall survival and adverse effects. The secondary outcomes were progression-free survival and quality of life. We used the standard methodological procedures expected by Cochrane. We used the GRADE approach, as outlined by Cochrane, to interpret the overall quality of the evidence from included studies. We included 11 randomised controlled trials (RCTs) with a total of 2062 participants and 1537 in the relevant arms for this review. There was an overall survival benefit for HGG participants receiving postoperative radiotherapy compared to the participants receiving postoperative supportive care. For the four pooled RCTs (397 participants), the overall hazard ratio (HR) for survival was 2.01 (95% confidence interval (CI) 1.58 to 2.55, P<0.00001), moderate GRADE quality evidence favouring postoperative radiotherapy. Although these trials may not have completely reported adverse effects, they did not note any significant toxicity attributable to radiation. Progression free survival and quality of life could not be pooled due to lack of data. Overall survival was similar between hypofractionated versus conventional radiotherapy in five trials (943 participants), where the HR was 0.95 (95% CI 0.78 to 1.17, P = 0.63), very low GRADE quality evidence. The trials reported that hypofractionated and conventional radiotherapy were well tolerated with mild acute adverse effects. These trials only reported one patient in the hypofractionated arm developing symptomatic radiation necrosis that required surgery. Progression free survival and quality of life could not be pooled due to the lack of data. Overall survival was also similar between hypofractionated versus conventional radiotherapy in the subset of two trials (293 participants) which included 60 years and older participants with glioblastoma. For this category, the HR was 1.16 (95% CI 0.92 to 1.46, P = 0.21), high GRADE quality evidence. There were two trials which compared hyperfractionated radiation therapy versus conventional radiation and one trial which compared accelerated radiation therapy versus conventional radiation. However, the results could not be pooled. The conventionally fractionated radiation therapy regimens were 4500 to 6000 cGy given in 180 to 200 cGy daily fractions, over 5 to 6 weeks. All these trials generally included participants with World Health Organization (WHO) performance status from 0 to 2 and Karnofsky performance status of 50..."
and higher. The risk of selection bias was generally low among these randomized trials. The number of participants lost to follow-up for the outcome of overall survival was low. Attrition, performance, detection and reporting bias for the outcome of overall survival was low. There was unclear attrition, performance, detection and reporting bias relating to the outcomes of adverse effects, progression free survival and quality of life. Authors' conclusions Postoperative conventional daily radiotherapy improves survival for adults with good performance status and HGG as compared to no postoperative radiotherapy. Hypofractionated radiation therapy has similar efficacy for survival as compared to conventional radiotherapy, particularly for individuals aged 60 and older with glioblastoma. There is insufficient data regarding hyperfractionation versus conventionally fractionated radiation (without chemotherapy) and for accelerated radiation versus conventionally fractionated radiation (without chemotherapy). There are HGG subsets who have poor prognosis even with treatment (e.g. glioblastoma histology, older age and poor performance status). These poor prognosis HGG individuals have generally been excluded from the randomised trials based on poor performance status."

According to the news editors, the research concluded: "No randomised trial has compared comfort measures or best supportive care with an active intervention using radiotherapy or chemotherapy in these poor prognosis patients."

For more information on this research see: External beam radiation dose escalation for high grade glioma. *Cochrane Database of Systematic Reviews*, 2016;(8):2221-2277. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news editors report that additional information may be obtained by contacting M.N. Tsao, University of Toronto, Radiat Oncol, Toronto, ON M4N 3M5, Canada. Additional authors for this research include H. Soliman, A. Sahgal, J. Perry, W. Xu and M.N. Tsao.

**Oncology - Gynecologic Oncology**

**New Findings on Gynecologic Oncology Described by Investigators at University of Texas (Sexual health of endometrial cancer survivors before and after a physical activity intervention: A retrospective cohort analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Gynecologic Oncology is now available. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Sexual dysfunction is common in endometrial cancer survivors (ECS). Our group previously tested a six-month exercise intervention in ECS."

The news correspondents obtained a quote from the research from the University of Texas, "We performed a secondary analysis to determine intervention's impact on sexual health. We studied 100 post-treatment Stage I-IIa sedentary ECS who participated in a non-controlled, single-arm, home-based exercise intervention utilizing telephone counseling, printed material,
and pedometers. Quality-of-life and physical activity measures were collected at baseline and six months. Sexual function (SF) and sexual interest (SI) scores were extracted from the QIACS questionnaire. Baseline SF and SI were lower in survivors with less than a four-year college degree (P < 0.001). Baseline SI was higher in survivors who were married or living with a significant other (P = 0.012). No significant differences in SF or SI were observed based on obesity status, race, time since diagnosis, or treatment type. Post intervention, mean SF score improved (P = 0.002), 51% of participants had improved SI, and 43% had improved SF. When controlled for age and time since diagnosis, a one-hour increase in weekly physical activity was associated with a 6.5% increased likelihood of improved SI (P = 0.04). Increased physical activity was not associated with improved SF. Although causation cannot be determined in this study, the correlation between receipt of an exercise intervention and improved sexual health for ECS is a novel finding."

According to the news reporters, the research concluded: "This finding suggests a role for physical activity as a strategy to improve the sexual health of ECS, which our group is examining in a larger prospective study."

Our news journalists report that additional information may be obtained by contacting S.D. Armbruster, Univ Texas MD Anderson Canc Center, Dept. of Reprod Med, Houston, TX 77030, United States. Additional authors for this research include J. Song, A. Bradford, C.L. Carmack, K.H. Lu and K.M. Basen-Engquist.

**Immune System Diseases and Conditions - HIV/AIDS**

**New Findings on HIV/AIDS from K.I. Persson and Co-Authors Summarized (Motivators and barriers for HIV testing among men who have sex with men in Sweden)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news originating from Solna, Sweden, by NewsRx correspondents, research stated, "Aims and objectives. To explore motivators and barriers to HIV testing and to assess the factors associated with testing among men who have sex with men."

Financial support for this research came from Public Health Agency of Sweden. Our news journalists obtained a quote from the research, "Previous research has
considered fear, worries and structural barriers as hindrances to HIV testing among men who have sex with men. However, few studies have included assessments of actual HIV testing when exploring barriers or motivators for such testing. The design of the study was a stratified cross-sectional online survey (n = 2373). Factor analysis was conducted to analyse the barriers and motivators for HIV testing. Logistic regression analysis was conducted to assess predictors for HIV testing. Many men who have sex with men test for HIV regularly, and specific reasons for testing were having unprotected sex or starting/ending a relationship. A lack of awareness and a perception of being at low risk for exposure were common reasons for never being tested. Fear and anxiety as well as barriers related to the use of test services remain important hindrances for testing. Predictors associated with having been tested within the past 12 months were: younger age (15-25 years old compared with 47+); knowledge on where to take an HIV test on short notice as well as having talked with a counsellor, having received condoms for free, or having had unprotected anal intercourse with casual partners within the last 12 months. Easily accessible test services offering testing and counselling on short notice should be available for all men who have sex with men. Outreach activities, distribution of free condoms and testing at venues where men who have sex with men meet are important prevention add-ons that can contribute to increased awareness about HIV and testing. Relevance to clinical practice."

According to the news editors, the research concluded: "Test services must ensure confidentiality and health care professionals who meet men who have sex with men for testing need competency with regards to men who have sex with men sexual health needs."

The news correspondents report that additional information may be obtained from K.I. Persson, Public Hlth Agcy Sweden, Dept. of Knowledge Dev, Unit Hlth & Sexual, Solna, Sweden. Additional authors for this research include T. Berglund, J. Bergstrom, L.E. Eriksson, R. Tikkanen, A. Thorson and B.C. Forsberg.

Attack. According to news reporting out of Valencia, Spain, by NewsRx editors, research stated, "Decision-making in acute chest pain remains challenging despite normal (below ninety-ninth percentile) high-sensitivity troponin (hs-cTn). Some studies suggest that undetectable hs-cTn, far below the ninety-ninth percentile, might rule out acute coronary syndrome."

Our news journalists obtained a quote from the research from the University of Valencia, "We investigated clinical data in comparison to undetectable hs-cTnT. The study comprised 682 patients (November 2010 to September 2011) presenting at the emergency department with chest pain and normal hs-cTnT (<14 ng/l). The main end point was major adverse cardiac events (MACE: death, myocardial infarction, readmission for unstable angina, or revascularization) at a 4-year median follow-up; secondary end point was 30-day MACE. A clinical score was built by assigning points according to hazard ratios of the independent predictive variables: 1 point (male and effort-related pain) and 2 points (recurrent pain and prior ischemic heart disease). The negative predictive values of the clinical score and undetectable hs-cTnT (<5 ng/l), were tested. A total of 72 (10.6%) patients suffered long-term MACE. The C-statistics of the clinical score for long-term (0.75) and 30-day (0.88) MACE, were higher than with the TIMI(Thrombolysis In Myocardial Infarction) risk (0.68, 0.77) or GRACE(Global Registry of Acute Coronary Events) (0.50, 0.47) scores. Likewise, the negative predictive values of score = 0 (97.5%, 100%) and <= 1 point (95.9%, 100%) were higher than using undetectable hs-cTnT (91.9%, 98.1%). Both clinical scores of 0 and <= 1 better classified patients at risk of MACE (p = 0.0001, log-rank test) than hs-cTnT <5 ng/l (p = 0.06)."

According to the news editors, the research concluded: "Clinical data can guide decision-making and perform at least equally well as undetectable hs-cTnT, in patients presenting at the emergency department with chest pain and normal hs-cTnT."

Our news journalists report that additional information may be obtained by contacting J. Sanchis, University of Valencia, Dept. of Med, Valencia, Spain. Additional authors for this research include S. Garcia-Blas, A. Carratala, E. Valero, A. Mollar, G. Minana, V. Ruiz, J.V. Balaguer, M. Roque, X. Bosch and J. Nunez.

New Findings on Heart Attack from New York University Summarized (Cardiac Arrest and Resuscitation Unique to Pregnancy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Attack have been presented. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Maternal cardiopulmonary arrest (MCPA) is a catastrophic event that can cause significant morbidity and mortality. A prepared, multidisciplinary team is necessary to perform basic and advanced cardiac life support specific to the anatomic and physiologic changes of pregnancy."

Our news journalists obtained a quote from the research from New York University, "MCPA is a challenging clinical scenario for any provider. Overall, it is an infrequent occurrence that involves 2 patients."

According to the news editors, the research concluded: "However, key clinical intervention performed concurrently can save the life of both mother and baby."

Our news journalists report that additional information may be obtained by contacting C.M. Zelop, New York University, Sch Med, Dept. of Obstet & Gynecol, New York, NY, United States. Additional authors for this research include V.L. Katz and C.M. Zelop.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ogc.2016.07.011. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings on Heart Attack from P. Wise and Co-Authors Summarized (Excessive volume of hydrogel injectates may compromise the efficacy for the treatment of acute myocardial infarction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Attack are discussed in a new report. According to news reporting out of Johannesburg, South Africa, by NewsRx editors, research stated, "Biomaterial injectates are promising as a therapy for myocardial infarction to inhibit the adverse ventricular remodeling. The current study explored
interrelated effects of injectate volume and infarct size on treatment efficacy."

Our news journalists obtained a quote from the research, "A finite element model of a rat heart was utilized to represent ischemic infarcts of 10%, 20%, and 38% of left ventricular wall volume and polyethylene glycol hydrogel injectates of 25%, 50%, and 75% of the infarct volume. Ejection fraction was 49.7% in the healthy left ventricle and 44.9%, 46.4%, 47.4%, and 47.3% in the untreated 10% infarct and treated with 25%, 50%, and 75% injectate, respectively. Maximum end-systolic infarct fiber stress was 41.6, 53.4, 44.7, 44.0, and 45.3 kPa in the healthy heart, the untreated 10% infarct, and when treated with the three injectate volumes, respectively. Treating the 10% and 38% infarcts with the 25% injectate volume reduced the maximum end-systolic fiber stress by 16.3% and 34.7% and the associated strain by 30.2% and 9.8%, respectively. The results indicate the existence of a threshold for injectate volume above which efficacy does not further increase but may decrease."

According to the news editors, the research concluded: "The efficacy of an injectate in reducing infarct stress and strain changes with infarct size."

Our news journalists report that additional information may be obtained by contacting T. Franz, Center High Performance Comp, Johannesburg, South Africa. Additional authors for this research include N.H. Davies, M.S. Sirry, J. Kortsmit, L. Dubuis, C.K. Chai, F.P.T. Baaijens and T. Franz.

Keywords for this news article include: Johannesburg, South Africa, Africa, Vascular Diseases and Conditions, Heart Disorders and Diseases, Myocardial Infarction, Polyethylene Glycols, Myocardial Ischemia, Organic Chemicals, Heart Disease, Heart Attack, Cardiology, Alcohols, Hydrogel.

Heart Disorders and Diseases - Heart Attack

New Findings on Heart Attack from University of Copenhagen
Summarized (Recognition of out-of-hospital cardiac arrest by medical dispatchers in emergency medical dispatch centres in two countries)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Attack. According to news reporting originating from Ballerup, Denmark, by NewsRx correspondents, research stated, "Survival after out-of-hospital cardiac arrest (OHCA) remains low. Early recognition by emergency medical dispatchers is essential for an effective chain of actions, leading to early cardiopulmonary resuscitation, use of an automated external defibrillator and rapid dispatching of the emergency medical services."

Our news editors obtained a quote from the research from the University of Copenhagen, "To analyse and compare the accuracy of OHCA recognition by medical
dispatchers in two countries. An observational register-based study collecting data from national cardiac arrest registers in Denmark and Sweden during a six-month period in 2013. Data were analysed in two steps; registry data were merged with electronically registered emergency call data from the emergency medical dispatch centres in the two regions. Cases with missing or non-OHCA dispatch codes were analysed further by auditing emergency call recordings using a uniform data collection template. The sensitivity for recognition of OHCA was 40.9% (95% CI: 37.1-44.7%) in the Capital Region of Denmark and 78.4% (95% CI: 73.2-83.0%) in the Skane Region in Sweden (p < 0.001). With additional data from the emergency call recordings, the sensitivity was 80.7% (95% CI: 77.7-84.3%) and 86.0% (95% CI: 81.3-89.8%) for the two regions (p = 0.06). The majority of the non-recognised OHCA were dispatched with the highest priority. The accuracy of OHCA recognition was high and comparable. We identified large differences in data registration practices despite the use of similar dispatch tools.

According to the news editors, the research concluded: "This raises a discussion of definitions and transparency in general in scientific reporting of OHCA recognition, which is essential if used as quality indicator in emergency medical services."

The news editors report that additional information may be obtained by contacting T.P. Moller, University of Copenhagen, Emergency Med Serv Copenhagen, DK-2750 Ballerup, Denmark. Additional authors for this research include C. Andrell, S. Viereck, L. Todorova, H. Friberg and F.K. Lippert.

Heart Disorders and Diseases - Heart Attack

New Findings on Heart Attack from University of Zurich Summarized (Treatment and outcomes of patients with recurrent myocardial infarction: A prospective observational cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Attack. According to news reporting out of Zurich, Switzerland, by NewsRx editors, research stated, "Little is known about differences in therapies and outcomes of patients with first myocardial infarction (MI) or recurrent MI (reMI). This study aimed to evaluate the impact of prior MI on therapies and outcomes in patients who presented with ST-elevation MI (STEMI)."

Our news journalists obtained a quote from the research from the University of Zurich, "All STEMI patients enrolled from 2002 to 2014 in the AMIS Plus registry were included. Outcome was analyzed using logistic multivariate regression. From 19,665 STEMI
patients, 2845 (14%) had reMI. These patients were older (69.5y vs. 64.2y; p< 0.001), more frequently male, with more risk factors (hypertension, dyslipidemia), and more comorbidities. Patients with reMI presented 25 min earlier than those with first MI, were more frequently in Killip class 3/4 (12% vs. 7%; p< 0.001), and were less likely to receive guideline recommended drug therapy: aspirin (93% vs. 97%; p< 0.001), P2Y12 inhibitors (76% vs. 83%; p< 0.001), or statins (73% vs. 77%; p< 0.001), or undergo primary percutaneous coronary intervention (77% vs. 87%; p< 0.001). These patients developed more frequently cardiogenic shock (7% vs. 5%; p< 0.001) and reinfarction (2% vs. 1%; p< 0.001) during hospitalization, and had higher crude mortality (10% vs. 5%; p< 0.001) than patients without prior MI. Prior MI was an independent predictor of in-hospital mortality in STEMI patients (OR 1.27; 95% CI 1.05-1.53; p< 0.001). A subgroup (n = 4486) was followed 1 year after discharge (3893 with first MI and 593 with reMI at initial hospitalization). Crude mortality was 2.9% for patients with first MI vs. 6.7% for those with reMI (OR 1.68, 95% CI 1.14-2.47; p = 0.008). Although patients with reMI are high-risk patients, they were less likely to receive evidence-based treatment and had worse in-hospital and 1-year outcomes compared to patients with first MI.

According to the news editors, the research concluded: "Short- and long-term management of patients with recurring MI should be improved."

For more information on this research see: Treatment and outcomes of patients with recurrent myocardial infarction: A prospective observational cohort study. Journal of Cardiology, 2016;68(5-6):498-503. Journal of Cardiology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **New Findings on Heart Failure from Medical University Summarized**

*(Impaired hepato-renal function defined by the MELD XI score as prognosticator in acute heart failure)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Failure are presented in a new report. According to news reporting out of Wroclaw, Poland, by NewsRx editors, research stated, "Multi-organ dysfunction often complicates the natural course of acute heart failure (AHF) and identifies patients with poor prognosis. The MELD score (Model of End-
Stage Liver Dysfunction) combines data reflecting liver and kidney function, which makes it a potentially useful tool for the assessment of patients with AHF."

Our news journalists obtained a quote from the research from Medical University, "The aim of this study was to assess the prognostic utility of the MELD score in patients with AHF. The MELD score was calculated on admission and during hospital stay (days 2-3) using a formula that does not take into account the international normalized ratio (MELD XI). The study population consisted of 203 AHF patients (mean age 65 +/- 12 years, 76% male). The mean MELD XI score was -14.8 +/- 4.5 points on admission and 13.9 +/- 4.3 points during hospitalization. Contributors of elevated MELD XI score at baseline and during hospital stay were isolated increase in creatinine in 22-25%, isolated increase in bilirubin in 17-19%, and abnormal values of both in 40-46% of patients. During 1-year follow-up, 67 (33%) patients died. After adjustment for well-established prognosticators, MELD XI score at baseline and during hospital stay were significant predictors of poor outcome [hazard ratio (95% confidence interval): 1.11 (1.05-1.2) and 1.14 (1.09-1.2), respectively, P < 0.001]. An increase in the MELD XI score during hospital stay occurred in 31% of patients and was related to increased risk of death at 1 year [1.97 (1.2-3.2), P < 0.005]."

According to the news editors, the research concluded: "Impairment of hepato-renal function defined by the MELD XI score is common and carries unfavourable prognosis in AHF patients."

Our news journalists report that additional information may be obtained by contacting P. Ponikowski, Medical University Lublin, Dept. of Heart Dis, Wroclaw, Poland. Additional authors for this research include R. Zymlinski, M. Sokolski, P. Siwolowski, P. Gajewski, S. Nawrocka-Millward, E. Poniewierka, E.A. Jankowska, W. Banasiak and P. Ponikowski.

**Heart Disorders and Diseases - Heart Failure**

**New Findings on Heart Failure from Odense University Hospital Summarized (Incidence of cancer in patients with chronic heart failure: a long-term follow-up study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Failure. According to news reporting originating from Odense, Denmark, by NewsRx correspondents, research stated, "With improvement in survival of chronic heart failure (HF), the clinical importance of co-morbidity is increasing. The aim of this study was to assess the
incidence and risk of cancer and all-cause mortality in a large Danish HF cohort."

Financial support for this research came from Hjerteforeningen.

Our news editors obtained a quote from the research from Odense University Hospital, "A total of 9307 outpatients with verified HF without a prior diagnosis of cancer (27% female, mean age 68 years, 89% with LVEF <45%) were included in the study. A diagnosis of any cancer and all-cause mortality was obtained from Danish national registries. Outcome was compared with the general Danish population. Overall and type-specific risk of cancer was analysed in an adjusted Poisson and Cox regression analysis. The 975 diagnoses of cancer in the HF cohort and 330 843 in the background population corresponded to incidence rates per 10 000 patient-years of 188.9 [95% confidence interval (CI) 177.2-200.6] and 63.0 (95% CI 63.0-63.4), respectively. When stratified by age, incidence rates were increased in all age groups in the HF cohort. Risk of any type of cancer was increased, with an incidence rate ratio of 1.24 (95% CI 1.15-1.33, c<0.0001). Type-specific analysis demonstrated an increased hazard ratio for all major types of cancer except for prostate cancer. All-cause mortality was higher in HF patients with cancer compared with cancer patients from the background population."

According to the news editors, the research concluded: "Patients with HF have an increased risk of cancer, which persists after the first year after the diagnosis of HF, and their prognosis is worse compared with that of cancer patients without HF."

The news editors report that additional information may be obtained by contacting A. Banke, Dept. of Cardiology, Odense University Hospital, Odense, Denmark. Additional authors for this research include M. Schou, L. Videbaek, J.E. Møller, C. Torp-Pedersen, F. Gustafsson, J.S. Dahl, L. Kober, P.R. Hildebrandt and G.H Gislason.

**Transplant Medicine - Heart Transplants**

**New Findings on Heart Transplants Described by Investigators at University Hospital (Quality of Life According to Urgency Status in De Novo Heart Transplant Recipients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Transplant Medicine - Heart Transplants have been presented. According to news reporting out of Oviedo, Spain, by NewsRx editors, research stated, "Elective heart transplantation (HTX) aims to improve physical ability, increase survival, and improve health-related quality of life (HRQoL) in patients with chronic heart failure. Nevertheless, most patients who undergo urgent HTX are previously healthy, and a transplant
could be perceived as a limitation."

Our news journalists obtained a quote from the research from University Hospital, "The aim of this study is to compare HRQoL between elective and urgent heart transplant recipients. Cohort study including patients undergoing heart transplantation between January 1998 and March 2012 in a single center. Patients with retransplantation or multiorgan transplantation were excluded. Clinical variables including comorbidities were collected. For assessment of HRQoL, the Kansas City Cardiomyopathy Questionnaire (KCCQ) was completed by the survivors on March 2013. Univariate analysis (Mann-Whitney U test) was performed. Questionnaires were collected from 95 of 106 elective recipients and 28 of 33 urgent recipients. Urgent heart recipients were younger, with more cardiovascular risk factors, and ischemic etiology was the leading cause of transplant. All domain results were higher in elective heart transplant recipients, but after univariate analysis only the punctuation of the self-efficacy domain remained superior in the elective HTX group (87.5 vs 79.7, P = .034)."

According to the news editors, the research concluded: "Both urgent and elective heart transplant patients reported a good HRQoL, and there were no significant differences between their scores."

For more information on this research see: Quality of Life According to Urgency Status in De Novo Heart Transplant Recipients. Transplantation Proceedings, 2016;48 (9):3024-3026. Transplantation Proceedings can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Transplantation Proceedings - www.journals.elsevier.com/transplantation-proceedings/)

Our news journalists report that additional information may be obtained by contacting B. Diaz-Molina, Hosp Univ Cent Asturias, Dept. of Cardiol, Oviedo, Spain. Additional authors for this research include J.L. Lambert, F.G. Vilchez, F. Cadenas, M.J. Bernardo, E. Velasco, M. Martin and C. Moris.

Stem Cell Research - Hematopoietic Stem Cells

New Findings on Hematopoietic Stem Cells from Department of Hematology Summarized (Successful T-cell Replete Hematopoietic Stem Cell Boost Without Conditioning for Late Graft Failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Stem Cell Research - Hematopoietic Stem Cells have been published. According to news reporting originating from Hakodate, Japan, by NewsRx correspondents, research stated, "Late graft failure is a rare but significant complication after allogeneic stem cell transplantation, which is often complicated by severe infections."

Our news editors obtained a quote from the research from the Department of
Hematology, "We report a case of late graft failure, which was successfully treated with a T-cell replete hematopoietic stem cell boost without conditioning that induced rapid engraftment and relieved the patient of infection. Discontinuation of immunosuppressants and nilotinib administration suppressed the host cells."

According to the news editors, the research concluded: "Achieving full donor chimerism allowed us to administer a peripheral blood stem cell boost without conditioning."

The news editors report that additional information may be obtained by contacting Y. Tsutsumi, Hakodate Municipal Hosp, Dept. of Hematol, Hakodate, Hokkaido 0418680, Japan. Additional authors for this research include T. Tateno, S. Ito, S. Shiratori and T. Teshima.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.transproceed.2016.06.035. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings on Hemochromatosis Described by Investigators at Oregon Health and Science University (Highly accurate molecular genetic testing for HFE hereditary hemochromatosis: results from 10 years of blinded proficiency surveys by the ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Hemochromatosis. According to news reporting out of Portland, Oregon, by NewsRx editors, research stated, "The College of American Pathologists offers blinded proficiency testing (PT) for laboratories performing HFE genetic tests for hereditary hemochromatosis (common C282Y and H63D variants). This study used 10 years of PT data to determine laboratory performance for HFE analytical genotyping and clinical interpretation."

Our news journalists obtained a quote from the research from Oregon Health and Science University, "Laboratories were graded for accuracy of genotype determination (six possible C282Y/H63D genotypes) and clinical interpretation regarding whether the genotype was likely to have contributed to iron overload in a hypothetical patient. The analytical genotyping error rate was low (0.73%) in 7,663 results (from 257 unique laboratories). Genotyping errors were significantly higher in C282Y heterozygous, H63D homozygous, and C282Y homozygous samples, in non-American laboratories, and in laboratories with lower testing volume. Analytical sensitivity and specificity were >98.5 and >99.5%. The interpretive error rate (4.3%) was higher than the genotyping error rate, with two problematic genotypes (C282Y heterozygous and H63D homozygous) accounting for 77% of total interpretive errors. There was a time-dependent improvement in the interpretation of the clinical significance of..."
HFE genotypes. HFE molecular genetic testing, performed by non US Food and Drug Administration-approved laboratory-developed tests, demonstrated excellent accuracy, sensitivity, and specificity."

According to the news editors, the research concluded: "Clinical interpretations were more heterogeneous, probably owing to the low clinical penetrance of some common HFE genotypes."

For more information on this research see: Highly accurate molecular genetic testing for HFE hereditary hemochromatosis: results from 10 years of blinded proficiency surveys by the College of American Pathologists. Genetics in Medicine, 2016;18(12):1206-1213. Genetics in Medicine can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. Herpesvirus Diseases and Conditions - Herpes…

New Findings on Herpes Simplex Virus 1 from Oswaldo Cruz Institute Summarized (Effects of RNA interference therapy against herpes simplex virus type 1 encephalitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Herpesvirus Diseases and Conditions - Herpes Simplex Virus 1. According to news reporting originating from Rio de Janeiro, Brazil, by NewsRx correspondents, research stated, "Herpetic encephalitis (HSE) is caused mainly by herpes simplex virus type 1 (HSV-1) with an annual incidence of 1-4 cases/million inhabitants. Currently, HSE treatment faces difficulties such as the use of antivirals with elevated toxicity, metabolic side effects and HSV-1 resistance."

Our news editors obtained a quote from the research from Oswaldo Cruz Institute, "An alternative to antivirals is the use of small interfering RNA (siRNA) as a viral replication inhibitor. In this work, siRNA targeting the UL-39 region was evaluated for HSE treatment in vivo. BALB/c mice were inoculated with HSV-1 and treated with siRNA. The treatment was evaluated through kinetics of HSV-1 replication inhibition, number of siRNA doses administered and treatment with siRNA plus acyclovir. All groups were evaluated for signs of HSE, mortality and HSV-1 replication inhibition. The treated group of the kinetic experiment
demonstrated a reduction of HSE signs and an HSV-1 replication inhibition of 43.6-99.9% in the brain and 53-98% in trigeminal ganglia (TG). Animals treated with one or two doses of siRNA had a prolonged survival time, reduced clinical signs of HSE and HSV-1 replication inhibition of 67.7% in brains and 85.7% in TG of animals treated with two doses of siRNA. Also, animals treated with siRNA plus acyclovir demonstrated reduced signs of HSE and mortality, as well as HSV-1 replication inhibition in the brain (83.2%) and TG (74.5%). These findings demonstrated that siRNA was capable of reducing HSE clinical signs, prolonging survival time and inhibiting HSV-1 replication in mice."

According to the news editors, the research concluded: "Thus, siRNA can be a potential alternative to the standard HSE treatment especially to reduce clinical signs and extend survival time in vivo."

The news editors report that additional information may be obtained by contacting A.S. da Silva, Fundacao Oswaldo Cruz, Inst Oswaldo Cruz, Lab Viral Technol Dev, Rio De Janeiro, Brazil. Additional authors for this research include J.V. Raposo, T.C. Pereira, M.A. Pinto and V.S. de Paula.

Keywords for this news article include: Rio de Janeiro, Brazil, South America, Central Nervous System Viral Diseases and Conditions, Central Nervous System Diseases and Conditions, Herpesvirus Diseases and Conditions, Viral Skin Diseases and Conditions, Central Nervous System Infections, Virus Diseases and Conditions, Brain Diseases and Conditions, Herpes Simplex Virus 1, Encephalitis, Viral RNA, Genetics, Virology, Therapy, HSV-1, Oswaldo Cruz Institute.

Parathyroid Diseases and Conditions - …

New Findings on Hyperparathyroidism Described by Investigators at University of Valladolid (Parathyroid Hormone Polymorphism RS6254 is Associated with the Development and Severity of Osteoporosis in Asymptomatic but not Normocalcemic …)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Parathyroid Diseases and Conditions - Hyperparathyroidism. According to news reporting originating from Valladolid, Spain, by NewsRx correspondents, research stated, "Although normocalcemic and asymptomatic hyperparathyroidism (HPT) are becoming more common, they remain only partially understood. Parathyroid hormone (PTH) polymorphisms have been associated with disease severity in classical HPT."

Our news editors obtained a quote from the research from the University of Valladolid, "The aim of the present study was to evaluate the clinical effect of PTH polymorphism (rs6254) in normocalcemic and asymptomatic HPT. A prospective study of 61 consecutive patients with normocalcemic or asymptomatic HPT was carried out. Secondary causes of HPT were ruled out. All patients were followed for >= 1 year. Calcium and
phosphorus metabolism parameters were assessed at least twice during the follow-up period to classify as normocalcemic or asymptomatic HPT. Bone mineral density (BMD) and the rs6254 polymorphism genotypes were also assessed. Genotype rs6254GG was observed in 23 patients (37.7%) whereas GA and AA genotypes were presented in 29 (47.5%) and 9 (14.8%) patients, respectively. Age, sex and genotype distributions were comparable in both groups. In asymptomatic but not normocalcemic HPT patients, the GG genotype was associated with a significantly higher level of intact PTH [200.2 (SD 76.5) vs. 113.3 (SD 25.9) pg/ml; p<0.01], and significantly lower Z-score densitometry at the femoral neck, proximal femur, and lumbar spine. Both remained significant after adjusting for major confounding factors by multiple linear regression. The present study supports the independent pathogenic effect of rs6254GA polymorphism on the development and severity of BMD complications in patients with asymptomatic but not normocalcemic HPT.

According to the news editors, the research concluded: "Further studies are needed to confirm this finding and to assess the effect of other polymorphisms in normocalcemic and asymptomatic HPT."

For more information on this research see: Parathyroid Hormone Polymorphism RS6254 is Associated with the Development and Severity of Osteoporosis in Asymptomatic but Not Normocalcemic Hyperparathyroidism. *Hormone and Metabolic Research*, 2016;48 (12):828-833. *Hormone and Metabolic Research* can be contacted at: Georg Thieme Verlag Kg, Rudigerstr 14, D-70469 Stuttgart, Germany. (Thieme - www.thieme.com)

**Heart Disorders and Diseases - Hypertrophic…**

**New Findings on Hypertrophic Cardiomyopathy from University of Michigan Summarized (Genotype-Dependent and -Independent Calcium Signaling Dysregulation in Human Hypertrophic Cardiomyopathy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Hypertrophic Cardiomyopathy are discussed in a new report. According to news originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "Aberrant calcium signaling may contribute to arrhythmias and adverse remodeling in hypertrophic cardiomyopathy (HCM). Mutations in sarcomere genes may distinctly alter calcium handling pathways."

Our news journalists obtained a quote from the research from the University of Michigan, "We analyzed gene expression, protein levels, and functional assays for calcium regulatory pathways in human HCM surgical samples with (n=25) and without (n=10)
sarcoglycan mutations compared with control hearts (n=8). Gene expression and protein levels for calsequestrin, L-type calcium channel, sodium-calcium exchanger, phospholamban, calcineurin, and calcium/calmodulin-dependent protein kinase type II (CaMKII) were similar in HCM samples compared with controls. CaMKII protein abundance was increased only in sarcomere-mutation HCM (P <0.001). The CaMKII target pT17-phospholamban was 5.5-fold increased only in sarcomere-mutation HCM (P=0.01), as was autophosphorylated CaMKII (P <0.01), suggestive of constitutive activation. Calcineurin (PPP3CB) mRNA was not increased, nor was RCAN1 mRNA level, indicating a lack of calcineurin activation. Furthermore, myocyte enhancer factor 2 and nuclear factor of activated T cell transcription factor activity was not increased in HCM, suggesting that calcineurin pathway activation is not an upstream cause of increased CAMKII protein abundance or activation. SERCA2A mRNA transcript levels were reduced in HCM regardless of genotype, as was sarcoplasmic endoplasmic reticular calcium ATPase 2/phospholamban protein ratio (45% reduced; P=0.03). Ca-45 sarcoplasmic endoplasmic reticular calcium ATPase uptake assay showed reduced uptake velocity in HCM regardless of genotype (P=0.01). The cardiac ryanodine receptor was not altered in transcript, protein, or phosphorylated (pS2808, pS2814) protein abundance, and [H-3]ryanodine binding was not different in HCM, consistent with no major modification of the ryanodine receptor. Human HCM demonstrates calcium mishandling through both genotype-specific and common pathways."

According to the news editors, the research concluded: "Posttranslational activation of the CaMKII pathway is specific to sarcomere mutation-positive HCM, whereas sarcoplasmic endoplasmic reticular calcium ATPase 2 abundance and sarcoplasmic reticulum Ca uptake are depressed in both sarcomere mutation-positive and -negative HCM."

For more information on this research see: Genotype-Dependent and -Independent Calcium Signaling Dysregulation in Human Hypertrophic Cardiomyopathy. Circulation, 2016;134(22):1738-1748. Circulation can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

The news correspondents report that additional information may be obtained from A.S. Helms, University of Michigan, Dept. of Internal Med, Ann Arbor, MI 48109, United States. Additional authors for this research include F.J. Alvarado, J. Yob, V.T. Tang, F. Pagani, M.W. Russell, H.H. Valdivia and S.M. Day.

Keywords for this news article include: Ann Arbor, Michigan, United States, North and Central America, Intracellular Signaling Peptides and Proteins, Cardiovascular Diseases and Conditions, Heart Disorders and Diseases, Phosphoprotein Phosphatases, Hypertrophic Cardiomyopathy, Enzymes and Coenzymes, Cellular Structures, Intracellular Space, Cardiomyopathies, Heart Disease, Calcineurin, Hydrolases, Sarcomeres, Myofibrils, Organelles, Cardiology, Esterases, Cytoplasm, Genetics, ATPase, University of Michigan.

Immunology - Immunoglobulins

New Findings on Immunoglobulins from Lukas Hospital Summarized
(High affinity anti-BSEP antibodies after liver transplantation for PFIC-2-Successful treatment with immuno adsorption and B-cell depletion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Immunoglobulins.
According to news reporting originating in Neuss, Germany, by NewsRx journalists, research stated, "PFIC due to BSEP mutations (PFIC type 2) often necessitates OLT. It has recently been recognized that some PFIC-2 patients develop phenotypic disease recurrence post-OLT due to the appearance of anti-BSEP antibodies."

The news reporters obtained a quote from the research from Lukas Hospital, "Here, we describe a boy who became cholestatic four yr after OLT during modification of immunosuppression. Canalicular antibody deposits were detected in biopsies of the transplant and antibodies specifically reacting with BSEP were identified at high titers in his serum. These antibodies bound extracellular epitopes of BSEP and inhibited BS transport and were assumed to cause disease recurrence. Consequently, anti-BSEP antibody depletion was pursued by IA and B-cell depletion by antiCD20 antibodies (rituximab) along with a switch of immunosuppression. This treatment resulted in prolonged relief of symptoms."

According to the news reporters, the research concluded: "Depletion of pathogenic anti-BSEP antibodies causing AIBD after OLT in PFIC-2 patients should be considered as a central therapeutic goal."

Keywords for this news article include: Neuss, Germany, Europe, Immunoglobulins, Blood Proteins, Immunology, Antibodies, Lukas Hospital.

Intermediate Filament Proteins

New Findings on Intermediate Filament Proteins Described by Investigators at Texas A&M University (Nebulette is a powerful cytolinker organizing desmin and actin in mouse hearts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Intermediate Filament Proteins is the subject of a report. According to news reporting out of College Station, Texas, by NewsRx editors, research stated, "In the hearts of patients bearing nebulette mutations, a severe general disorganization in cardiomyocytes of the extrasarcomeric desmin intermediate filament system is frequently observed. However, the molecular and functional relationship between the desmin cytoskeleton and nebulette-containing sarcomeres is still unclear."

Our news journalists obtained a quote from the research from Texas A&M University, "Here we report a high-affinity in vitro interaction between nebulette and desmin filaments. A major interaction site has been mapped to the desmin a-helical rod domain, indicating that the filament core is directly involved in the binding of nebulette. The disease-
mutant desmin variants E245D and T453I exhibited increased binding affinity for nebulette, delayed filament assembly kinetics, and caused significant weakening of networks. In isolated chick cardiomyocytes and sections from canine heart, we revealed by ground-state depletion and confocal microscopies that module 5 of nebulette extends outward from Z-disk-associated desmin filaments toward the center of the sarcomere. Accordingly, in the myocardium of Des (-/-) mice, elevated levels of cardiac actin correlated with alterations in the distribution of nebulette. Our data suggest that a well-organized desmin network is required to accommodate an optimal conformation of nebulette on sarcomeres to bind and recruit cardiac α-actin.

According to the news editors, the research concluded: "Hence we propose that nebulette acts in synergy with nebulin to reinforce and temporally fine-tune striated muscle relaxation-contraction cycles."

For more information on this research see: Nebulette is a powerful cytolinker organizing desmin and actin in mouse hearts. *Molecular Biology of the Cell*, 2016;27(24):3869-3882. *Molecular Biology of the Cell* can be contacted at: Amer Soc Cell Biology, 8120 Woodmont Ave, Ste 750, Bethesda, MD 20814-2755, USA.

**Gram-Negative Bacteria - Klebsiella**

**New Findings on Klebsiella Described by Investigators at University of Melbourne (Klebsiella pneumoniae Population Genomics and Antimicrobial-Resistant Clones)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Klebsiella is now available. According to news reporting originating from Parkville, Australia, by NewsRx correspondents, research stated, "Antimicrobial-resistant Klebsiella pneumoniae (Kp) has emerged as a major global public health problem. While resistance can occur across a broad range of Kp clones, a small number have become globally distributed and commonly cause outbreaks in hospital settings."

Our news editors obtained a quote from the research from the University of Melbourne, "Here we describe recent comparative genomics investigations that have shed light on Kp population structure and the evolution of antimicrobial-resistant clones. These studies provide the basic framework within which genomic epidemiology and evolution can be understood, but have merely scratched the surface of what can and should be explored."

According to the news editors, the research concluded: "We assert that further large-
scale comparative and functional genomics studies are urgently needed to better understand the biology of this clinically important bacterium."

The news editors report that additional information may be obtained by contacting K.E. Holt, University of Melbourne, Mol Sci & Biotechnol Inst Bio21, Dept. of Biochem & Mol Biol, Parkville, Vic 3010, Australia.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.tim.2016.09.007. This DOI is a link to an online electronic document that is either free or for purchase.

**Parasitic Diseases and Conditions - Leishmaniasis**

**New Findings on Leishmaniasis Described by Investigators at Abdul Wali Khan University (Plants as Antileishmanial Agents: Current Scenario)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Parasitic Diseases and Conditions - Leishmaniasis. According to news originating from Mardan, Pakistan, by NewsRx correspondents, research stated, "Leishmaniasis is a clinical manifestation caused by the parasites of the genus Leishmania. Plants are reservoirs of bioactive compounds, which are known to be chemically balanced, effective and least injurious as compared with synthetic medicines."

Our news journalists obtained a quote from the research from Abdul Wali Khan University, "The current resistance and the toxic effects of the available drugs have brought the trend to assess the antileishmanial effect of various plant extracts and their purified compound/s, which are summarized in this review. Moreover, it also highlights various traditional remedies used by local healers against leishmaniasis. A systematic cross-sectional study for antileishmanial activity of natural products was carried out using multiple literature databases. The records retrieved since 2000 till year 2016 were analysed and summarized in the form of comprehensive tables and graphs. Natural products are potential source of new and selective agents that can significantly contribute to primary healthcare and probably are promising substitutes of chemicals for the treatment of protozoan diseases like leishmaniasis. Where the researchers prefer to use alcoholic solvents for the extraction of antileishmanial agents from plants, most of the studies are limited to in vitro conditions majorly on using promastigote forms of Leishmania. Thus, there is a need to carry out such activities in vivo and in host macrophages."
According to the news editors, the research concluded: "Further, there is a need of mechanistic studies that can help taking few of the promising pure compounds to clinical level."

The news correspondents report that additional information may be obtained from N. Ullah, Abdul Wali Khan Univ Mardan, Fac Chem & Life Sci, Dept. of Biotechnol, Mardan, Pakistan. Additional authors for this research include A. Nadhman, S. Siddiq, S. Mehwish, A. Islam, L. Jafri and M. Hamayun.

**Oncology - Liver Cancer**

**New Findings on Liver Cancer from Fudan University Summarized (Lamp2a is required for tumor growth and promotes tumor recurrence of hepatocellular carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Liver Cancer are presented in a new report. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Exploring the function of chaperone-mediated autophagy (CMA) in cancer has promoted progress in cancer treatment through the regulation of CMA pathways. However, CMA status and function in hepatocellular carcinoma (HCC) by focusing on the regulatory role of lysosome-associated membrane protein type 2a (Lamp2a) remain to be clarified."

Our news editors obtained a quote from the research from Fudan University, "We examined Lamp2a in a normal human liver cell line, 6 HCC cell lines, 10 normal liver samples as well as 42 HCC tissue and para-tumor tissues samples, and then validated it in 228 HCC patients to assess the relationship between Lamp2a and clinical prognosis. Gain and loss of Lamp2a function were also explored in HCC cell lines and xenograft models. Significantly lower level of Lamp2a expression was found in HCC cells and tissues compared with normal hepatic cells, para-tumor tissues and normal livers. Although no differences in HCC cell morphology or function were observed in relation to Lamp2a expression under normal culture or shortterm starvation conditions, Lamp2a blockage significantly inhibited HCC cell viability under prolonged starvation. Critically, Lamp2a is required for HCC xenograft growth in vivo by helping cells to avoid apoptosis and promoting cell proliferation. Furthermore, a significant correlation between Lamp2a expression and tumor size or cumulative recurrence was uncovered in HCC patients. Collectively, the present study shows that impaired Lamp2a expression in HCC contributes to tumor cell viability and promotes tumor growth and recurrence."

According to the news editors, the research concluded: "Targeting chaperone-mediated autophagy through Lamp2a may also imply a potentially novel treatment strategy for
HCC.

Keywords for this news article include: Shanghai, People's Republic of China, Asia, Xenotransplantation, Biotechnology, Liver Cancer, Xenografts, Carcinomas, Oncology, Fudan University.

**Oncology - Lung Cancer**

**New Findings on Lung Cancer from Brussels Free University Summarized (Development of controlled-release cisplatin dry powders for inhalation against lung cancers)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news originating from Brussels, Belgium, by NewsRx correspondents, research stated, "The present study focuses on the development of dry powders for inhalation as adjuvant chemotherapy in lung cancer treatment. Cisplatin was chosen as a potential candidate for a local treatment as it remains the main platinum component used in conventional chemotherapies, despite its high and cumulative systemic toxicities."

Our news journalists obtained a quote from the research from Brussels Free University, "Bulk cisplatin was reduced to submicron sizes using high-pressure homogenization, mixed with a solubilized lipid and/or PEGylated component and then spray-dried to produce controlled-release dry powder formulations. The obtained formulations were characterized for their physicochemical properties (particle size and morphology), aerodynamic performance and release profiles. Cisplatin content and integrity were assessed by electrothermal atomic absorption spectrometry and Pt-195 nuclear magnetic resonance spectroscopy. DPI formulations with cisplatin contents ranging from 48.5 to 101.0% w/w exhibited high fine particle fractions ranging from 37.3% to 51.5% of the nominal dose. Formulations containing cisplatin microcrystals dispersed in solid lipid microparticles based on acceptable triglycerides for inhalation and PEGylated excipients showed a controlled-release for more than 24 h and a limited burst effect."

According to the news editors, the research concluded: "These new formulations could provide an interesting approach to increasing and prolonging drug exposure in the lung while minimizing systemic toxicities."

For more information on this research see: Development of controlled-release cisplatin dry powders for inhalation against lung cancers. *International Journal of Pharmaceutics*, 2016;515(1-2):209-220. *International Journal of Pharmaceutics* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier -
New Findings on Lung Cancer from New York University Summarized (The IASLC Mesothelioma Staging Project: Improving Staging of a Rare Disease Through International Participation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lung Cancer. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "For nearly 40 years, there was no generally accepted staging system for malignant pleural mesothelioma. In 1994, members of the International Mesothelioma Interest Group, in collaboration with the International Association for the Study of Lung Cancer, proposed a TNM staging system based on analyses of outcomes in retrospective surgical series and small clinical trials."

Our news editors obtained a quote from the research from New York University, "Subsequently accepted by the American Joint Commission on Cancer and the Union for International Cancer Control for the sixth editions of their staging manuals, this system has since been the international staging standard. However, it has significant limitations, particularly with respect to clinical staging and to the categories for lymph node staging. Here we provide an overview of the development of the International Association for the Study of Lung Cancer malignant pleural mesothelioma staging database, which was designed to address these limitations through the development of a large international data set."

According to the news editors, the research concluded: "Analyses of this database, described in papers linked to this overview, are being used to inform revisions in the eighth editions of the American Joint Commission on Cancer and Union for International Cancer Control staging systems."

For more information on this research see: The IASLC Mesothelioma Staging Project: Improving Staging of a Rare Disease Through International Participation. Journal of Thoracic Oncology, 2016;11(12):2082-2088. Journal of Thoracic Oncology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Lippincott Williams and Wilkins - www.lww.com; Journal of Thoracic Oncology -
Immunology - Lymphoid Tissue

**New Findings on Lymphoid Tissue Described by Investigators at Georgetown University** (Copy number and expression analysis of FOSL1, GSTP1, NTSR1, FADD and CCND1 genes in primary breast tumors with axillary lymph node metastasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunology - Lymphoid Tissue. According to news reporting from Washington, District of Columbia, by NewsRx journalists, research stated, "In breast cancer, lymph node (LN) metastasis is one of the strongest prognostic factors at diagnosis. Therefore the identification of molecular markers with metastatic potential that promote the development of LN metastasis is of critical clinical relevance."

Financial supporters for this research include Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior (CAPES), Conselho Nacional de Desenvolvimento Cientifico e Tecnologico (CNPq).

The news correspondents obtained a quote from the research from Georgetown University. "In this study, we evaluated the copy number status of the FOSL1, GSTP1, NTSR1, FADD and CCND1 genes by TaqMan assays in 137 breast cancer patients, 84 with LN metastasis (LN+) and 53 with no LN metastasis (LN). The copy number data for four of these genes (FOSL1, GSTP1, FADD and CCND1) were integrated with their mRNA expression levels in 31 patients. In both groups of patients, gains were the most frequent copy number alteration (CNA) observed, involving mainly the CCND1, NTSR1 and FADD genes; mRNA overexpression was more commonly observed for the CCND1 and FADD genes. For the FADD gene in the LN+ group, gene expression was shown to be dependent on CNAs; for the other genes no association was found."

According to the news reporters, the research concluded: "Increase copy number and mRNA overexpression of FOSL1, GSTP1, FADD, NTSR1 and CCND1 genes are frequently observed in primary breast tumors, and except for the FADD gene, they occur independently and irrespectively of the patients' LN axillary metastatic status."

For more information on this research see: Copy number and expression analysis of FOSL1, GSTP1, NTSR1, FADD and CCND1 genes in primary breast tumors with axillary...

Our news journalists report that additional information may be obtained by contacting L.R. Cavalli, Georgetown University, Dept. of Oncol, Lombardi Comprehens Canc Center, Washington, DC, United States. Additional authors for this research include I.J. Cavalli, R.S. Lima, T.S. Jucoski, C. Torresan, C.A. Urban, F. Kuroda, K.F. Anselmi, L.R. Cavalli and E. Ribeiro.

Oncology - Lymphoma

New Findings on Lymphoma from Catholic University of the Sacred Heart Summarized (CD68+ cell count, early evaluation with PET and plasma TARC levels predict response in Hodgkin lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Lymphoma is now available. According to news reporting from Rome, Italy, by NewsRx journalists, research stated, "Early response evaluation with [(18) F]fluordeoxyglucose (FDG) positron emission tomography after 2 cycles of chemotherapy (interim PET) has been indicated as the strongest predictor for outcome in classical Hodgkin lymphoma (HL). We studied the prognostic role of the number of tumor-infiltrating CD68+ cells and of the plasma levels of TARC (thymus and activation-regulated chemokine) in the context of interim PET in 102 patients with classical HL treated with Adriamycin, Bleomycin, Vinblastine, Dacarbazine (ABVD)."

Financial supporters for this research include Associazione Italiana per la Ricerca sul Cancro, MURST (Ministero dell' Universitari e della Ricerca Scientifica e Tecnologica), Fondi d'Ateneo, Linea D1, Universita Cattolica del Sacro Cuore, Fondazione Roma - Progetto Cellule Staminali.

The news correspondents obtained a quote from the research from the Catholic University of the Sacred Heart, "After 2 ABVD cycles, interim PET according to Deauville criteria was negative (score 0-3) in 85 patients and positive (score 4-5) in 15 patients (2 patients technically not evaluable). TARC levels were elevated in 89% of patients at diagnosis, and decreased after 2 cycles in 82% of patients. Persistently elevated TARC levels in 18% of patients were significantly associated with a positive PET result (p=0.007). Strong predictors for progression-free survival (PFS) were a negative interim PET (85% vs. 28%, p<0.0001) and CD68+ cell counts <5% (89% vs. 67%, p=0.006), while TARC levels at diagnosis and at interim evaluation had no prognostic role. In multivariate analysis, interim PET, CD68+ cell counts and presence of B-symptoms were independently associated with PFS. We conclude that although TARC levels are a biomarker for early response evaluation, they cannot substitute for
interim PET as outcome predictor in HL."

According to the news reporters, the research concluded: "The evaluation of CD68 counts and B-symptoms at diagnosis may help to identify low-risk patients regardless positive interim PET."

Our news journalists report that additional information may be obtained by contacting A. Cuccaro, Institute of Hematology, Catholic University of the Sacred Heart, Rome, Italy. Additional authors for this research include S. Annunziata, E. Cupelli, M. Martini, M.L. Calcagni, V. Rufini, M. Giachelia, F. Bartolomei, E. Galli, F. D'Alo, M.T. Voso, G. Leone, A. Giordano, L.M. Larocca and S. Hohaus.

Mosquito-Borne Diseases - Malaria

New Findings on Malaria Described by Investigators at Uniformed Services University of the Health Sciences [Using Hematology Data from Malaria Vaccine Research Trials in Humans and Rhesus Macaques (Macaca mulatta) To Guide Volume Limits for ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mosquito-Borne Diseases - Malaria have been published. According to news reporting out of Bethesda, Maryland, by NewsRx editors, research stated, "Guidelines on safe volume limits for blood collection from research participants in both humans and laboratory animals vary widely between institutions. The main adverse event that may be encountered in large blood volume withdrawal is iron-deficiency anemia."

Our news journalists obtained a quote from the research from the Uniformed Services University of the Health Sciences, "Monitoring various parameters in a standard blood panel may help to prevent this outcome. To this end, we analyzed the Hgb and MCV values from 43 humans and 46 macaques in malaria vaccine research trials. Although the percentage of blood volume removed was greater for macaques than humans, macaques demonstrated an overall increase of MCV over time, indicating the ability to respond appropriately to frequent volume withdrawals. In contrast, humans showed a consistent declining trend in MCV. These declines in human MCV and Hgb were significant from the beginning to end of the study despite withdrawals that were smaller than recommended volume limits. Limiting the volume withdrawn to no more than 12.5% seemed to be sufficient for macaques, and at 14% or more individual animals tended to fail to respond appropriately to large-volume blood loss, as demonstrated by a decrease in MCV. The overall positive erythropoietic response seen in
macaques was likely due to the controlled, iron-fortified diet they received.

According to the news editors, the research concluded: "The lack of erythropoietic response in the human subjects may warrant iron supplementation or reconsideration of current blood volume withdrawal guidelines."

For more information on this research see: Using Hematology Data from Malaria Vaccine Research Trials in Humans and Rhesus Macaques (Macaca mulatta) To Guide Volume Limits for Blood Withdrawal. Comparative Medicine, 2016;66(6):474-479. Comparative Medicine can be contacted at: Amer Assoc Laboratory Animal Science, 9190 Crestwyn Hills Dr, Memphis, TN 38125, USA.

Our news journalists report that additional information may be obtained by contacting S.R. Hegge, Uniformed Services University for Health Science, Dept. of Prevent Med & Biostat, Bethesda, MD 20814, United States. Additional authors for this research include B.W. Hickey, S.M. McGrath and V.A. Stewart.

New Findings on Metabolic Syndrome Described by Investigators at Pusan National University (Association between uterine leiomyoma and metabolic syndrome in parous premenopausal women A case-control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Metabolic Syndrome is now available. According to news originating from Yangsan, South Korea, by NewsRx correspondents, research stated, "Previous studies have reported that uterine leiomyoma (UL) may share pathogenic features with obesity and hypertension, which are components of metabolic syndrome (MetS). We examined the association between UL and MetS in premenopausal parous women."

Our news journalists obtained a quote from the research from Pusan National University, "This 1:1 case-control study was conducted on 615 asymptomatic women with UL and 615 women without UL that were matched for age, reproductive history, and hormonal use, who underwent a comprehensive health examination. UL was diagnosed by a gynecologist based on transvaginal ultrasonography findings. Blood pressure (BP), body composition, fasting plasma glucose, lipid profiles, insulin, and HOMA-IR were checked. Median age of the 1230 study subjects was 44 (40-47) years and 7% had MetS. Women with UL had significantly higher waist circumferences and body fat, BP, and low-density lipoprotein cholesterol (LDL-C) than women without UL. Although nonsignificant, the prevalence of MetS was higher in the UL group than in the non-UL group (9.3% vs 5.7%). In addition, the prevalence of UL increased as the number of abnormal metabolic components increased and was higher than in women without UL. Conditional logistic regression analysis, after adjustment for confounding factors, showed that hyperglycemia was significantly associated with an increased risk of UL (odds ratio=1.45; 95% confidence interval, 1.10-1.89). Prevalence of abnormal metabolic component
was higher in premenopausal women with UL than in normal controls, regardless of age or reproductive history."

According to the news editors, the research concluded: "Furthermore, the study suggests that UL may share pathogenic features with the components of MetS and that women with UL be considered eligible for the early screening of metabolic abnormalities."

For more information on this research see: Association between uterine leiomyoma and metabolic syndrome in parous premenopausal women A case-control study. *Medicine*, 2016;95(46):210-216. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Molecular Medicine**

**New Findings on Molecular Medicine Described by Investigators at Department of Radiology (The Importance of Biopsy in the Era of Molecular Medicine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Molecular Medicine. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Recent advances in the molecular characterization of cancers have triggered interest in developing a new taxonomy of disease in oncology with the goal of using the molecular profile of a patient's tumor to predict response to treatment."

The news reporters obtained a quote from the research from the Department of Radiology, "Image-guided needle biopsy is central to this 'precision medicine' effort. In this review, we first discuss the current role of biopsy in relation to clinical examples of molecular medicine."

According to the news reporters, the research concluded: "We then outline important bottlenecks to the advancement of precision medicine and highlight the potential role of image-guided biopsy to address these challenges."

For more information on this research see: The Importance of Biopsy in the Era of Molecular Medicine. *Cancer Journal*, 2016;22(6):418-422. *Cancer Journal* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Our news correspondents report that additional information may be obtained by contacting E. Ziv, Mem Sloan Kettering Canc Center, Dept. of Radiol, Intervent Radiol Serv, New York, NY 10065, United States. Additional authors for this research include J.C. Durack.
New Findings on Mucositis Described by Investigators at Spanish National Research Council (CSIC) (Susceptibility of lactic acid bacteria, bifidobacteria and other bacteria of intestinal origin to chemotherapeutic agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Digestive System Diseases and Conditions - Mucositis. According to news reporting originating from Villaviciosa, Spain, by NewsRx correspondents, research stated, "Chemotherapy is a cornerstone of cancer treatment but it can have serious side effects, such as intestinal mucositis. This work reports the susceptibility/resistance profiles of 34 species of lactic acid bacteria (LAB), bifidobacteria and other intestinal bacteria from different collections to various chemotherapeutic agents (CAs) currently used in cancer treatments in an attempt to identify microorganisms that could prevent or treat mucositis symptoms."

Financial supporters for this research include Spanish Ministry of Economy and Competitiveness (MINECO), CSIC.

Our news editors obtained a quote from the research from Spanish National Research Council (CSIC), "The highest concentrations of the CAs tested were equal to or higher than those reached in plasma during anticancer treatments. All 34 species proved to be resistant at the highest concentrations assayed [minimum inhibitory concentrations (MICs) > 128 μg/mL] to capecitabine, cyclophosphamide, docetaxel, erlotinib, gefitinib, irinotecan and paclitaxel. For doxorubicin, 5-fluorouracil, gemcitabine and, especially, afatinib and pemetrexed, interspecies variation in the MIC was observed. In further work to assess the interspecies and intraspecies variability, MICs of the CAs pemetrexed and afatinib were determined for 32 strains belonging to four Bifidobacterium spp. of intestinal origin. For pemetrexed, a bimodal MIC curve was obtained (modes < 2-8 μg/mL and > 256 μg/mL), whilst a normal unimodal curve was obtained for afatinib (mode 128 μg/mL). Altogether, these results suggest that the majority of CAs should not, by themselves, perturb the microbial populations of the gut microbiota (but considering that they could be transformed in vivo into more toxic compounds)."

According to the news editors, the research concluded: "However, LAB and bifidobacteria, which are key players in the intestinal microbial balance of the healthy state, might be particularly inhibited by CAs such as gemcitabine or doxorubicin."

The news editors report that additional information may be obtained by contacting
A.B. Florez, CSIC, IPLA, Dept. of Microbiol & Bioquim, Asturias 33300, Villaviciosa, Spain. Additional authors for this research include M. Sierra, P. Ruas-Madiedo and B. Mayo.

Autoimmune Diseases and Conditions - Multiple
New Findings on Multiple Sclerosis from Beijing Normal University Summarized (Amelioration of Experimental Autoimmune Encephalomyelitis by Isogarcinol Extracted from Garcinia mangostana L. Mangosteen)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Autoimmune Diseases and Conditions - Multiple Sclerosis are presented in a new report. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Isogarcinol is a new natural immunosuppressant that was extracted from Garcinia mangostana L. in our laboratory. Knowledge of its effects on treatable diseases and its mechanism of action is still very limited."

The news reporters obtained a quote from the research from Beijing Normal University, "In this study, we explored the therapeutic effect of isogarcinol in experimental autoimmune encephalomyelitis (EAE), a murine model of multiple sclerosis (MS). Treatment with oral 100 mg/kg isogarcinol markedly ameliorated clinical scores, alleviated inflammation and demyelination of the spinal cord, and reduced intracranial lesions in EAE mice. The percentages of Th cells and macrophages were also strongly reduced. Isogarcinol appeared to act by inhibiting T helper (Th) 1 and Th17 cell differentiation via the janus kinase/signal transducers and activators of transcription pathway and by impairing macrophage function."

According to the news reporters, the research concluded: "Our data suggest that isogarcinol has the potential to be an effective therapeutic agent of low toxicity for treating MS and other autoimmune diseases."

For more information on this research see: Amelioration of Experimental Autoimmune Encephalomyelitis by Isogarcinol Extracted from Garcinia mangostana L. Mangosteen. Journal of Agricultural and Food Chemistry, 2016;64(47):9012-9021. Journal of Agricultural and Food Chemistry can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. New Findings on Nephrology from M. Postorino and Co-Authors 
Summarized (Body mass index trend in haemodialysis patients: the shift of nutritional disorders in two Italian regions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Nephrology have been published. According to news reporting originating from Reggio di Calabria, Italy, by NewsRx correspondents, research stated, "In the USA, the increase in the prevalence of obesity in the general population has been accompanied by a marked increase in the prevalence and incidence of obesity in the dialysis population. However, secular trends of body mass index (BMI) have not been investigated in European renal registries."

Our news editors obtained a quote from the research, "We investigated the secular trend of BMI across 18 years (1994-2011) in two haemodialysis (HD) registries (Calabria in southern Italy and Emilia in northern Italy) on a total of 16 201 prevalent HD patients and in a series of 3559 incident HD patients. We compared trends in BMI for HD patients with those in the background general population of the same regions. The average BMI rose from 23.5 kg/m^2 in 1994 to 25.5 (+8.5%) in 2011 in the Calabria registry and from 23.7 in 1998 to 25.4 (+7.1%) in 2011 in the Emilia registry (P < 0.001). The proportion of obese patients (i.e. with BMI > 30 kg/m^2) rose from 6 to 14% in Calabria and from 6 to 16% in Emilia (P < 0.001). These patterns were fully confirmed in incident patients and were mirrored by a substantial decline in the prevalence of underweight-normal and underweight (P < 0.001) patients. Of note, the steepness of the increase in BMI in haemodialysis patients was 3.7 times more pronounced than that in the coeval, age- and sex-matched general population of Calabria and Emilia. In two regional haemodialysis registries in Italy a steady increase in overweight and obese patients is observed. These patterns are more pronounced than those found in the general population."

According to the news editors, the research concluded: "If further confirmed in other European haemodialysis cohorts, these findings may have relevant public health implications."

The news editors report that additional information may be obtained by contacting C. Zoccali, CNR IFC Clin Epidemiol & Pathophysiol Renal Dis &. Reggio Di Calabria, Italy.

Oncology - Non-Small Cell Lung Cancer

New Findings on Non-Small Cell Lung Cancer Described by Investigators at University of Pennsylvania (Carboplatin and pemetrexed with or without pembrolizumab for advanced, non-squamous non-small-cell lung cancer: a randomised, phase 2 cohort of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "Limited evidence exists to show that adding a third agent to platinum-doublet chemotherapy improves efficacy in the first-line advanced non-small-cell lung cancer (NSCLC) setting. The anti-PD-1 antibody pembrolizumab has shown efficacy as monotherapy in patients with advanced NSCLC and has a non-overlapping toxicity profile with chemotherapy."

Our news journalists obtained a quote from the research from the University of Pennsylvania, "We assessed whether the addition of pembrolizumab to platinum-doublet chemotherapy improves efficacy in patients with advanced non-squamous NSCLC. In this randomised, open-label, phase 2 cohort of a multicohort study (KEYNOTE-021), patients were enrolled at 26 medical centres in the USA and Taiwan. Patients with chemotherapy-naive, stage IIIIB or IV, non-squamous NSCLC without targetable EGFR or ALK genetic aberrations were randomly assigned (1: 1) in blocks of four stratified by PD-L1 tumour proportion score (<1% vs >= 1%) using an interactive voice-response system to 4 cycles of pembrolizumab 200 mg plus carboplatin area under curve 5 mg/mL per min and pemetrexed 500 mg/m(2) every 3 weeks followed by pembrolizumab for 24 months and indefinite pemetrexed maintenance therapy or to 4 cycles of carboplatin and pemetrexed alone followed by indefinite pemetrexed maintenance therapy. The primary endpoint was the proportion of patients who achieved an objective response, defined as the percentage of patients with radiologically confirmed complete or partial response according to Response Evaluation Criteria in Solid Tumors version 1.1 assessed by masked, independent central review, in the intention-to-treat population, defined as all patients who were allocated to study treatment. Significance threshold was p<0.025 (one sided). Safety was assessed in the as-treated population, defined as all patients who received at least one dose of the assigned study treatment. This trial, which is closed for enrolment but continuing for follow-up, is registered with ClinicalTrials.gov, number NCT02039674. Between Nov 25, 2014, and Jan 25, 2016, 123 patients were enrolled; 60 were randomly assigned to the pembrolizumab plus chemotherapy group and 63 to the chemotherapy alone group. 33 (55%; 95% CI 42-68) of
60 patients in the pembrolizumab plus chemotherapy group achieved an objective response compared with 18 (29%; 18-41) of 63 patients in the chemotherapy alone group (estimated treatment difference 26% [95% CI 9-42%]; p=0.0016). The incidence of grade 3 or worse treatment-related adverse events was similar between groups (23 [39%] of 59 patients in the pembrolizumab plus chemotherapy group and 16 [26%] of 62 in the chemotherapy alone group). The most common grade 3 or worse treatment-related adverse events in the pembrolizumab plus chemotherapy group were anaemia (seven [12%] of 59) and decreased neutrophil count (three [5%]); an additional six events each occurred in two (3%) for acute kidney injury, decreased lymphocyte count, fatigue, neutropenia, and sepsis, and thrombocytopenia. In the chemotherapy alone group, the most common grade 3 or worse events were anaemia (nine [15%] of 62) and decreased neutrophil count, pancytopenia, and thrombocytopenia (two [3%] each). One (2%) of 59 patients in the pembrolizumab plus chemotherapy group experienced treatment-related death because of sepsis compared with two (3%) of 62 patients in the chemotherapy group: one because of sepsis and one because of pancytopenia. Combination of pembrolizumab, carboplatin, and pemetrexed could be an effective and tolerable first-line treatment option for patients with advanced non-squamous NSCLC."

According to the news editors, the research concluded: "This finding is being further explored in an ongoing international, randomised, double-blind, phase 3 study."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/S1470-2045(16)30498-3. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings on Obesity Described by Investigators at Brown University (Overeat Today, Skip the Scale Tomorrow: An Examination of Caloric Intake Predicting Nonadherence to Daily Self-Weighing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating from Providence, Rhode Island, by NewsRx correspondents, research stated, "Daily self-weighing is an effective weight loss strategy. Little is known about 'micro' factors influencing nonadherence to self-weighing (e.g., daily overeating)."

Our news editors obtained a quote from the research from Brown University, "It was hypothesized that increased caloric intake on a given day would increase odds of not self-weighing the following day. Daily self-reports of weight and caloric intake were collected from 74 adults with overweight and obesity (mean BMI = 31.2 +/- 4.5 kg/m(2), age=50.6 +/- 10 years, 69% female, 87% Caucasian) throughout a 12-week Internet-based weight management intervention. Multilevel logistic regression investigated odds of nonadherence to self-weighing on a given day based on the previous day's caloric intake. Self-monitoring adherence was high (weights: 87%; calories: 85%); adherence was associated with greater 12-week weight loss (weighing: \( r = -0.24, P = 0.04 \); calories: \( r = -0.26, P = 0.04 \)). Increased caloric intake on a given day, relative to the individual's average intake, was associated with increased odds of nonadherence to self-weighing the next day \( (F-(1,F=5106) = 12.66, P = 0.0004, \beta = 0.001) \). For example, following a day of eating 300 calories more than usual, odds of not self-weighing increased by 1.33. Odds of nonadherence to self-weighing increased following a day with higher-than-usual caloric intake."

According to the news editors, the research concluded: "Weight management interventions collecting daily self-monitoring data could provide support to participants who report increased caloric intake to prevent self-weighing nonadherence."

The news editors report that additional information may be obtained by contacting R.R. Wing, Brown University, Dept. of Psychiat & Human Behav, Warren Alpert Med Sch, Miriam HospWeight Control & Diabet Res Center, Providence, RI 02912, United States. Additional authors for this research include K.M. Ross and R.R. Wing.

New Findings on Obstructive Sleep Apnea Described by Investigators at Tel Aviv University (Adenoidectomy for Obstructive Sleep Apnea in Children)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea. According to news reporting originating in Tel Aviv, Israel, by NewsRx journalists, research stated, "Adenotonsillectomy is the recommended treatment for children with obstructive sleep apnea (OSA). Since adenoidectomy alone may be associated with significantly lower morbidity, mortality, and cost, we aimed to investigate whether adenoidectomy alone is a reasonable and appropriate treatment for children with OSA."

The news reporters obtained a quote from the research from Tel Aviv University, "Five-hundred fifteen consecutive children diagnosed with moderate-to-severe OSA (apnea-hypopnea index > 5) based on polysomnography and who underwent adenoidectomy or adenotonsillectomy were reevaluated after 17-73 months (mean 41) for residual or recurrent OSA using a validated questionnaire (Pediatric Sleep Questionnaire, PSQ). Failure of OSA resolution was defined as a positive mean PSQ score >= 0.33. Contribution of age, obesity, tonsil size, and OSA severity at baseline to adenoidectomy or adenotonsillectomy failure was examined. Positive PSQ score occurred in 15% of the entire sample and was not influenced by age or gender. No difference in failure rate was observed between adenoidectomy and adenotonsillectomy for children who were not obese with apnea-hypopnea index < 10 and had small tonsils (< 3). Children with apnea-hypopnea index >= 10 and/ or tonsil size >= 3 showed a higher failure rate after adenoidectomy compared to adenotonsillectomy (20% versus 9.8%, p = 0.028). We suggest that subjective, long term outcomes of adenoidectomy are comparable to those of adenotonsillectomy in non-obese children under 7 years old with moderately OSA and small tonsils. Hence, adenoidectomy alone is a reasonable option in some children."

According to the news reporters, the research concluded: "Future prospective randomized studies are warranted to define children who may benefit from adenoidectomy alone and those children in whom adenoidectomy alone is unlikely to succeed."

For more information on this research see: Adenoidectomy for Obstructive Sleep Apnea in Children. Journal of Clinical Sleep Medicine, 2016;12(9):1285-1291. Journal of Clinical Sleep Medicine can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

New Findings on Oncology from University of Athens Summarized (Aberrant microRNA expression in tumor mycosis fungoides)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology is the subject of a report. According to news reporting from Athens, Greece, by NewsRx journalists, research stated, "Herein, miRNA candidates relevant to mycosis fungoides were investigated to provide data on the molecular mechanisms underlying the pathogenesis of the disease. The miRNA expression profile of skin biopsies from patients with tumor stage MF (tMF) and normal donors was compared using miRNA microarrays."

The news correspondents obtained a quote from the research from the University of Athens, "Overall, 154 miRNAs were found differentially expressed between tMF and the control cohort with the majority of them being up-regulated (57 %). Among the upregulated miRNAs, miR-3177, miR-514b-3p, miR-1267, and miR-1282 were exclusively detected in 70 % of tMF. Additional upregulated miRNAs included miR-34a, miR-29a, let-7a*, and miR-210, while miR-200c* was identified among the downregulated ones. Quantitative real-time polymerase chain reaction was used to further investigate the expression profiles of miR-34a and miR-29a and validated the overexpression of miR-34a. Enrichment studies revealed that the target genes of the differentially expressed miRNAs were important in several cancer-related signaling pathways. The overlapping relationship of the target genes among tMF, Sezary syndrome, and atopic dermatitis revealed several common and disease-specific genes."

According to the news reporters, the research concluded: "Collectively, our study modulated miR-34a as a candidate oncogenic molecule and miR-29a as a putative tumor suppressor highlighting their promising potential in the molecular pathogenesis of tMF."

For more information on this research see: Aberrant microRNA expression in tumor mycosis fungoides. Tumor Biology, 2016;37(11):14667-14675. New Findings on Osteoarthritis Described by Investigators at
Maastricht University (Celecoxib-loaded PEA microspheres as an auto regulatory drug-delivery system after intra-articular injection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Musculoskeletal Diseases and Conditions - Osteoarthritis is now available. According to news reporting originating from Maastricht, Netherlands, by NewsRx correspondents, research stated, "In this study, we investigated the potential of celecoxib-loaded polyester amide (PEA) microspheres as an autoregulating drug delivery system for the treatment of pain associated with knee osteoarthritis (OA). Celecoxib release from PEA microspheres and inflammation responsive release of a small molecule from PEA was investigated in vitro."

Financial supporters for this research include Maastricht University Medical Center, Dutch Arthritis Foundation, Annadal Foundation of Maastricht University Medical Center.

Our news editors obtained a quote from the research from Maastricht University, "Inflammation responsive release of a small molecule from PEA was observed when PEA was exposed to cell lysates obtained from a neutrophil-like HI-60 cell line. Following a short initial burst release of similar to 15% of the total drug load in the first days, celecoxib was slowly released throughout a period of >80 days. To investigate biocompatibility and degradation behavior in vivo, celecoxib-loaded PEA microspheres were injected in OA-induced (ACLT+pMMx) or contralateral healthy knee joints of male Lewis rats. Bioactivity of celecoxib from loaded PEA microspheres was confirmed by PGE(2) measurements in total rat knee homogenates. Intra-articular biocompatibility was demonstrated histologically, where no cartilage damage or synovial thickening and necrosis were observed after intra-articular injections with PEA microspheres. Degradation of PEA microspheres was significantly higher in OA induced knees compared to contralateral healthy knee joints, while loading the PEA microspheres with celecoxib significantly inhibited degradation, indicating a drug delivery system with auto regulatory behavior."

According to the news editors, the research concluded: "This study suggests the potential of celecoxib-loaded PEA microspheres to be used as a safe drug delivery system with auto regulatory behavior for treatment of pain associated with OA of the knee."

For more information on this research see: Celecoxib-loaded PEA microspheres as an auto regulatory drug-delivery system after intra-articular injection. Journal of Controlled Release, 2016;244():30-40. Journal of Controlled Release can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Controlled Release - www.journals.elsevier.com/journal-of-controlled-release/)

Musculoskeletal Diseases and Conditions —

New Findings on Osteoarthritis from University of Tokyo Summarized
(Messenger RNA delivery of a cartilage-anabolic transcription factor as a disease-modifying strategy for osteoarthritis treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Musculoskeletal Diseases and Conditions - Osteoarthritis are discussed in a new report. According to news reporting from Bunkyo ku, Japan, by NewsRx journalists, research stated, "Osteoarthritis (OA) is a chronic degenerative joint disease and a major health problem in the elderly population. No disease-modifying osteoarthritis drug (DMOAD) has been made available for clinical use."

The news correspondents obtained a quote from the research from the University of Tokyo, "Here we present a disease-modifying strategy for OA, focusing on messenger RNA (mRNA) delivery of a therapeutic transcription factor using polyethylene glycol (PEG)-polyamino acid block copolymer-based polyplex nanomicelles. When polyplex nanomicelles carrying the cartilage-anabolic, runt-related transcription factor (RUNX) 1 mRNA were injected into mouse OA knee joints, OA progression was significantly suppressed compared with the non-treatment control. Expressions of cartilage-anabolic markers and proliferation were augmented in articular chondrocytes of the RUNX1-injected knees."

According to the news reporters, the research concluded: "Thus, this study provides a proof of concept of the treatment of degenerative diseases such as OA by the in situ mRNA delivery of therapeutic transcription factors; the presented approach will directly connect basic findings on disease-protective or tissue-regenerating factors to disease treatment."

For more information on this research see: Messenger RNA delivery of a cartilage-anabolic transcription factor as a disease-modifying strategy for osteoarthritis treatment. Scientific Reports, 2016;6():18743. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting H. Aini, Dept. of Bioengineering, The University of Tokyo Graduate School of Engineering, 7-3-1 Hongo, Bunkyo-ku, Tokyo 113-8656, Japan. Additional authors for this research include K. Itaka, A. Fujisawa, H. Uchida, S. Uchida, S. Fukushima, K. Kataoka, T. Saito, U.I. Chung and S. Ohba.

New Findings on Osteolysis from New York University Summarized

(Progranulin suppresses titanium particle induced inflammatory osteolysis by targeting TNFa signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Osteolysis have been published. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Aseptic loosening is a major complication of prosthetic joint surgery, characterized by chronic inflammation, pain, and osteolysis surrounding the bone-implant interface. Progranulin (PGRN) is known to have anti-inflammatory action by binding to Tumor Necrosis Factor (TNF) receptors and antagonizing TNFa."

Our news editors obtained a quote from the research from New York University, "Here we report that titanium particles significantly induced PGRN expression in RAW264.7 cells and also in a mouse air-pouch model of inflammation. PGRN-deficiency enhanced, whereas administration of recombinant PGRN effectively inhibited, titanium particle-induced inflammation in an air pouch model. In addition, PGRN also significantly inhibited titanium particle-induced osteoclastogenesis and calvarial osteolysis in vitro, ex vivo and in vivo. Mechanistic studies demonstrated that the inhibition of PGRN on titanium particle induced-inflammation is primarily via neutralizing the titanium particle-activated TNFa/NF-kB signaling pathway and this is evidenced by the suppression of particle-induced IkB phosphorylation, NF-kB p65 nuclear translocation, and activity of the NF-kB-specific reporter gene."

According to the news editors, the research concluded: "Collectively, these findings not only demonstrate that PGRN plays an important role in inhibiting titanium particle-induced inflammation, but also provide a potential therapeutic agent for the prevention of wear debris-induced inflammation and osteolysis."

For more information on this research see: Progranulin suppresses titanium particle induced inflammatory osteolysis by targeting TNFa signaling. Scientific Reports, 2016;6 ():20909. (Nature Publishing Group - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting Y.P. Zhao, Dept. of Orthopaedic Surgery, New York University Medical Center, New York, NY, 10003, United States. New Findings on Osteosarcomas from Central South University
Summarized (Visfatin triggers the in vitro migration of osteosarcoma cells via activation of NF-kappa B/IL-6 signals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Osteosarcomas have been published. According to news reporting out of Changsha, People's Republic of China, by NewsRx editors, research stated, "Pulmonary metastasis is the major challenge for clinical treatment of osteosarcoma patients. Recent studies indicated that visfatin, a 52 kDa adipocytokine, can trigger the cell motility of various cancers, while its role in the progression of osteosarcoma remains not clear."

Our news journalists obtained a quote from the research from Central South University, "Our present study revealed that visfatin can significantly promote the in vitro migration and invasion of osteosarcoma MG-63 and HOS cells and up regulate the expression of matrix metalloproteinase-2 (MMP-2) and fibronectin (FN). Furthermore, visfatin treatment also increased the expression of IL-6 in both MG-63 and HOS cells via a time dependent manner, while anti-IL-6 antibody can significantly attenuate visfatin induced cell invasion and up regulation of MMP-2 and FN. It suggested that up regulation of IL-6 mediated visfatin induced in vitro motility of osteosarcoma cells. Visfatin treatment can increase the phosphorylation of both p65 and ERK1/2 in MG-63 and HOS cells, while only the inhibitor of NF-kappa B, BAY 11-7082, can abolish visfatin induced up regulation of IL-6. BAY 11-7082 also attenuated visfatin induced upregulation of MMP-2 and FN in MG-63 cells. Western blot analysis revealed that visfatin treatment can significantly increase the phosphorylation of IKB alpha and IKK beta in MG-63 cells. ACHP, the inhibitor of IKK-beta, blocked visfatin induced expression of IL-6 mRNA in both MG-63 and HOS cells. Collectively, our data suggested that visfatin can increase the motility of osteosarcoma cells via up regulation of NF-kappa B/IL-6 signals."

According to the news editors, the research concluded: "It indicated that visfatin might be a potential therapeutic target of osteosarcoma treatment."

Our news journalists report that additional information may be obtained by contacting K.H. Li, Central South University, Xiangya Hosp, Dept. of Orthopaed, Changsha 410008, Hunan, People's Republic of China. Additional authors for this research include N.J. Shen, L. Cheng, Y.H. Fang, H. Huang and K.H. Li.

Keywords for this news article include: Changsha, People's Republic of China, Asia, Transcription Factors, DNA-Binding Proteins, Nuclear Proteins, Osteosarcomas, Orthopedics, NF-kappa B, Oncology, Genetics, Central South University.

New Findings on Pancreatic Cancer Described by Investigators at Harvard School of Medicine (Phase I study of safety and pharmacokinetics of the anti-MUC16 antibody-drug conjugate DMUC5754A in patients with platinum-resistant ovarian cancer or ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Pancreatic Cancer have been presented. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "MUC16 is a tumor-specific antigen overexpressed in ovarian (OC) and pancreatic (PC) cancers. The antibody-drug conjugate (ADC), DMUC5754A, contains the humanized anti-MUC16 monoclonal antibody conjugated to the microtubule-disrupting agent, monomethyl auristatin E (MMAE)."

Our news editors obtained a quote from the research from the Harvard School of Medicine, "This phase I study evaluated safety, pharmacokinetics (PK), and pharmacodynamics of DMUC5754A given every 3 weeks (Q3W, 0.3-3.2 mg/kg) or weekly (Q1W, 0.8-1.6 mg/kg) to patients with advanced recurrent platinum-resistant OC or unresectable PC. Biomarker studies were also undertaken. Patients (66 OC, 11 PC) were treated with DMUC5754A (54 Q3W, 23 Q1W). Common related adverse events (AEs) in > 20% of patients (all grades) over all dose levels were fatigue, peripheral neuropathy, nausea, decreased appetite, vomiting, diarrhea, alopecia, and pyrexia in Q3W patients, and nausea, vomiting, anemia, fatigue, neutropenia, alopecia, decreased appetite, diarrhea, and hypomagnesemia in Q1W patients. Grade >= 3-related AE in >= 5% of patients included neutropenia (9%) and fatigue (7%) in Q3W patients, and neutropenia (17%), diarrhea (9%), and hyponatremia (9%) in Q1W patients. Plasma antibody-conjugated MMAE (acMMAE) and serum total antibody exhibited non-linear PK across tested doses. Minimal accumulation of acMMAE, total antibody, or unconjugated MMAE was observed. Confirmed responses (1 CR, 6 PRs) occurred in OC patients whose tumors were MUC16-positive by IHC (2+ or 3+). Two OC patients had unconfirmed PRs; six OC patients had stable disease lasting > 6 months. For CA125, a cut-off of >= 70% reduction was more suitable for monitoring treatment response due to the binding and clearance of serum CA125 by MUC16 ADC. We identified circulating HE4 as a potential novel surrogate biomarker for monitoring treatment response of MUC16 ADC and other anti-MUC16 therapies in OC. DMUC5754A has an acceptable safety profile and evidence of anti-tumor activity in patients with MUC16-expressing tumors."

According to the news editors, the research concluded: "Objective responses were only observed in MUC16-high patients, although prospective validation is required. NCT01335958."

Oncology - Pancreatic Cancer

New Findings on Pancreatic Cancer Described by Investigators at University of Kragujevac (Epidemiology of pancreatic cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news reporting from Kragujevac, Serbia, by NewsRx journalists, research stated, "Cancer of the pancreas remains one of the deadliest cancer types. Based on the GLOBOCAN 2012 estimates, pancreatic cancer causes more than 331000 deaths per year, ranking as the seventh leading cause of cancer death in both sexes together."

The news correspondents obtained a quote from the research from the University of Kragujevac, "Globally, about 338000 people had pancreatic cancer in 2012, making it the 11th most common cancer. The highest incidence and mortality rates of pancreatic cancer are found in developed countries. Trends for pancreatic cancer incidence and mortality varied considerably in the world. A known cause of pancreatic cancer is tobacco smoking. This risk factor is likely to explain some of the international variations and gender differences. The overall five-year survival rate is about 6% (ranges from 2% to 9%), but this vary very small between developed and developing countries. To date, the causes of pancreatic cancer are still insufficiently known, although certain risk factors have been identified, such as smoking, obesity, genetics, diabetes, diet, inactivity. There are no current screening recommendations for pancreatic cancer, so primary prevention is of utmost importance."

According to the news reporters, the research concluded: "A better understanding of the etiology and identifying the risk factors is essential for the primary prevention of this disease."

Our news journalists report that additional information may be obtained by contacting M. Ilic, University of Kragujevac, Fac Med Sci, Kragujevac 34000, Serbia.

New Findings on Parkinson's Disease from Kyung Hee University Summarized (Mulberry fruit ameliorates Parkinson's-disease-related pathology by reducing alpha-synuclein and ubiquitin levels in a ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Parkinson's disease. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Mulberry fruit, which has been long used in traditional oriental medicine, was reported to ameliorate motor dysfunction and dopaminergic neuronal degeneration via antioxidant and antiapoptotic effects in an animal model of Parkinson's disease (PD). More than 95% of PD patients exhibit nonmotor problems such as olfactory dysfunction and gastrointestinal constipation, which are generally considered to be early symptoms of PD."

Our news editors obtained a quote from the research from Kyung Hee University, "However, few studies have actually examined potential drugs to treat early PD symptoms. The present study examined the protective effects of mulberry fruit extract (ME) against neurotoxicity in a 1-methyl-4-phenyl 1,2,3,6-tetrahydropyridine/probenecid (MPTP/p) model of early PD. MPTP/p model was developed by systemic administration with MPTP (25 mg/kg) and probenecid (250 mg/kg) over 5 weeks. The behavioral studies showed that treatment of mice with ME significantly improved PD-related nonmotor symptoms as well as motor impairment, demonstrated by utilizing the olfactory, pole, rotarod and open field tests. In addition, immunohistochemical analysis indicated that ME exhibits the protective effects against dopaminergic neuronal damage induced by MPTP/p in the substantia nigra and striatum. Moreover, by using Western blot analysis, we found that treatment with ME inhibited the up-regulation of a-synuclein and ubiquitin, well known as composition of Lewy bodies in the substantia nigra and striatum of the MPTP/p mice."

According to the news editors, the research concluded: "Taken together, these data suggest that ME may have therapeutic potential for preventing PD."

The news editors report that additional information may be obtained by contacting M.S. Oh, Kyung Hee Univ, Kyung Hee East West Pharmaceut Res Inst, Seoul 130701, South Korea. Additional authors for this research include M. Moon, J.G. Choi and M.S. Oh.
Enzymes and Coenzymes - Peptide Hydrolases

New Findings on Peptide Hydrolases Described by Investigators at Uppsala University (The association between serum cathepsin L and mortality in older adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - Peptide Hydrolases. According to news reporting out of Uppsala, Sweden, by NewsRx editors, research stated, "Research suggests that the protease cathepsin L is causally involved in atherosclerosis. However, data on cathepsin L as a risk marker are lacking."

Our news journalists obtained a quote from the research from Uppsala University, "Therefore, we investigated associations between circulating cathepsin L and cardiovascular mortality. Two independent community-based cohorts were used: Uppsala Longitudinal Study of Adult Men (ULSAM); n = 776; mean age 77 years; baseline 1997-2001; 185 cardiovascular deaths during 9.7 years follow-up, and Prospective Investigation of the Vasculature in Uppsala Seniors (PIVUS); n = 993; 50% women; mean age 70 years; baseline 2001-2004; 42 cardiovascular deaths during 10.0 years follow-up. Higher serum cathepsin L was associated with an increased risk for cardiovascular mortality in age- and sex-adjusted models in both cohorts (ULSAM: hazard ratio (HR) for 1-standard deviation (SD) increase, 1.17 [95% CI, 1.01-1.34], p = 0.032 PIVUS: HR 1.35 [95% CI, 1.07-1.72], p = 0.013). When merging the cohorts, these associations were independent of inflammatory markers and cardiovascular risk factors, but non-significant adjusting for kidney function. Individuals with a combination of elevated cathepsin L and increased inflammation, kidney dysfunction, or prevalent cardiovascular disease had a markedly increased risk, while no increased risk was associated with elevated cathepsin L, in the absence of these disease states. An association between higher serum cathepsin L and increased risk of cardiovascular mortality was found in two independent cohorts. Impaired kidney function appears to be an important moderator or mediator of these associations."

According to the news editors, the research concluded: "Further studies are needed to delineate the underlying mechanisms and to evaluate whether the measurement of cathepsin L might have clinical utility."

Our news journalists report that additional information may be obtained by contacting J. Arnlov, Uppsala University, Dept. of Med Sci, Uppsala, Sweden.
authors for this research include A.C. Carlsson, U. Riserus, A. Larsson, L. Lind and J. Arnlov.

Peptides and Proteins

New Findings on Peptides and Proteins Discussed by Researchers at Medical University (In Vitro Evaluation of the Allergic Potential of Antibacterial Peptides: Camel and Citropin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Peptides and Proteins have been published. According to news reporting from Gdansk, Poland, by NewsRx journalists, research stated, "Peptide-based drugs are promising group of compounds which are characterized by specificity to their in vivo targets and high potency of action (antineoplastic, immunoregulatory, antibacterial). The peptides, however, involve a relatively high risk of allergic reactions that are not predictable on the basis of their sequence and chemical properties."

Financial support for this research came from Innovative Economy Operational Programme.

The news correspondents obtained a quote from the research from Medical University, "In this study, peripheral blood was obtained from 53 patients including 38 hypersensitive patients and 15 control patients. Basophil activation stimulated by two antibacterial peptides (camel, citropin 1.1), and acetylsalicylic acid was assessed by means of BAT (basophil activation test). Basophil activation stimulated by camel occurred in 7 of 38 patients with hypersensitivity (18.42%) as well as in 2 of 15 control patients (13.33%). Basophils were activated by citropin 1.1 in 7 of 38 hypersensitive patients (18.42%) and in none of the control patients. Using the Structural Database of Allergenic Proteins, we confirmed that the examined peptides share some structural similarities with common environmental allergens. Therefore, the cross-reactivity between potentially present anti-allergen IgE with examined peptides cannot be excluded."

According to the news reporters, the research concluded: "Our study proved that BAT, together with other biological tests and specific databases of allergenic compounds, may serve as an initial selection of new active peptides and proteins."

Our news journalists report that additional information may be obtained by contacting M. Pikula, Dept. of Clinical Immunology and Transplantology, Medical University of Gdansk, Debinki 7, 80-211, Gdansk, Poland. Additional authors for this research include M.
Drugs and Therapies - Pharmacoepidemiology

New Findings on Pharmacoepidemiology from University of Groningen Summarized [Estimating time-varying drug adherence using electronic records: extending the proportion of days covered (PDC) method]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Pharmacoepidemiology. According to news reporting originating from Groningen, Netherlands, by NewsRx correspondents, research stated, "Accurate measurement of drug adherence is essential for valid risk-benefit assessments of pharmacologic interventions. To date, measures of drug adherence have almost exclusively been applied for a fixed-time interval and without considering changes over time."

Our news editors obtained a quote from the research from the University of Groningen, "However, patients with irregular dosing behaviour commonly have a different prognosis than patients with stable dosing behaviour. We propose a method, based on the proportion of days covered (PDC) method, to measure time-varying drug adherence and drug dosage using electronic records. We compare a time-fixed PDC method with the time-varying PDC method through detailed examples and through summary statistics of 100 randomly selected patients on statin therapy. We demonstrate that time-varying PDC method better distinguishes an irregularly dosing patient from a stably dosing patient and demonstrate how the time-fixed method can result in a biased estimate of drug adherence. Furthermore, the time-varying PDC method may be better used to reduce certain types of confounding and misclassification of exposure."

According to the news editors, the research concluded: "The time-varying PDC method may improve longitudinal and time-to-event studies that associate adherence with a clinical outcome or (intervention) studies that seek to describe changes in adherence over time."

The news editors report that additional information may be obtained by contacting M.J. Bijlsma, Unit PharmacoEpidemiology & PharmacoEconomics (PE2), Dept. of Pharmacy, University of Groningen, Groningen, Netherlands. Additional authors for this research include
F. Janssen and E. Hak.

Pharmacology

New Findings on Pharmacology Described by Investigators at Federal University [Pharmacological Properties of Biocompounds from Spores of the Lingzhi or Reishi Medicinal Mushroom Ganoderma lucidum (Agaricomycetes): A Review]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacology. According to news reporting originating in Curitiba, Brazil, by NewsRx journalists, research stated, "Ganoderma lucidum is a well-known representative of mushrooms that have been used in traditional Chinese medicine for centuries. New discoveries related to this medicinal mushroom and its biological properties are frequently reported."

The news reporters obtained a quote from the research from Federal University, "However, only recently have scientists started to pay special attention to G. lucidum spores. This is in part because of the recent development of methods for breaking the spore wall and extracting biocompounds from the spore. Although some research groups are working with G. lucidum spores, data in the literature are still limited, and the methods used have not been systematized. This review therefore describes the main advances in techniques for breaking the spore wall and extracting biocompounds from the spore."

According to the news reporters, the research concluded: "In addition, the major active components identified and their biological properties, such as neurological activity and antiaging and cell-protective effects, are investigated because these are of importance for potential drug development."

For more information on this research see: Pharmacological Properties of Biocompounds from Spores of the Lingzhi or Reishi Medicinal Mushroom Ganoderma lucidum (Agaricomycetes): A Review. International Journal of Medicinal Mushrooms, 2016;18(9):757-767. International Journal of Medicinal Mushrooms can be contacted at: Begell House Inc, 50 North St, Danbury, CT 06810, USA.

Our news correspondents report that additional information may be obtained by contacting C.R. Soccol, Federal University of Parana, Dept. of Bioproc Engn & Biotechnol, BR-81531980 Curitiba, Parana, Brazil. Additional authors for this research include L.Y. Bissoqui, C. Rodrigues, R. Rubel, S. Sella, F. Leifa, L.P.D. Vandenberghae and V.T. Soccol.

Enzymes and Coenzymes - Phosphoric Monoester…

New Findings on Phosphoric Monoester Hydrolases Discussed by Researchers at Ventana Medical Systems (Quinone Methide Signal Amplification: Covalent Reporter Labeling of Cancer Epitopes using Alkaline Phosphatase Substrates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Phosphoric Monoester Hydrolases have been published. According to news reporting originating in Tucson, Arizona, by NewsRx journalists, research stated, "Diagnostic assays with the sensitivity required to improve cancer therapeutics depend on the development of new signal amplification technologies. Herein, we report the development and application of a novel amplification system which utilizes latent quinone methides (QMs) activated by alkaline phosphatase (AP) for signal amplification in solid-phase immunohistochemical (IHC) assays."

The news reporters obtained a quote from the research from Ventana Medical Systems, "Phosphate-protected QM precursor substrates were prepared and conjugated to either biotin or a fluorophore through an amine-functionalized linker group. Upon reaction with AP, the phosphate group is cleaved, followed by elimination of the leaving group and formation of the highly reactive and short-lived QM. The QMs either react with tissue nucleophiles in close proximity to their site of generation, or are quenched by nucleophiles in the reaction media. The reporter molecules that covalently bind to the tissue were then detected visually by fluorescence microscopy in the case of fluorophore reporters, or brightfield microscopy using diaminobenzidine (DAB) in the case of biotin reporters. With multiple reporters deposited per enzyme, significant signal amplification was observed utilizing QM precursor substrates containing either benzyl difluoro or benzyl monofluoro leaving group functionalities."

According to the news reporters, the research concluded: "However, the benzyl monofluoro leaving group gave superior results with respect to both signal intensity and discretion, the latter of which was found to be imperative for use in diagnostic IHC assays."

Our news correspondents report that additional information may be obtained by contacting N.W. Polaske, Ventana Medical Systems, Inc, 1910 East Innovation Park Drive, Tucson, Arizona 85755, United States. Additional authors for this research include B.D. Kelly, J. Ashworth-Sharpe and C. Bieniarz.

Enzymes and Coenzymes - Phosphotransferases...

New Findings on Phosphotransferases (Alcohol Group Acceptor) Described by Investigators at University of Vermont (Rho kinase activity governs arteriolar myogenic depolarization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - Phosphotransferases (Alcohol Group Acceptor). According to news originating from Burlington, Vermont, by NewsRx correspondents, research stated, "Cerebral arterioles contribute critically to regulation of local and global blood flow within the brain. Dysfunction of these blood vessels is implicated in numerous cardiovascular diseases."

Our news journalists obtained a quote from the research from the University of Vermont, "However, treatments are limited due to incomplete understanding of fundamental control mechanisms at this level of circulation. Emerging evidence points to a key role of Rho-associated protein kinase in regulation of microvascular contractility. This study sought to decipher the mechanisms of Rho-associated protein kinase-mediated myogenic vasoconstriction in cerebral parenchymal arterioles. Here, we report that the Rho-associated protein kinase inhibitor H1152 strongly attenuated pressure-induced constriction, cytosolic [Ca2+] increases, and depolarization of isolated parenchymal arterioles. Further, the RhoA activator CN03 potentiated parenchymal arteriole myogenic constriction and depolarization, indicating important involvement of RhoA/Rho-associated protein kinase signaling in myogenic excitation-contraction mechanisms. Because of the well-established role of TRPM4 in pressure-induced depolarization, possible modulatory effects of Rho-associated protein kinase on TRPM4 currents were explored using patch clamp electrophysiology. TRPM4 currents were suppressed by H1152 and enhanced by CN03. Finally, H1152 elevated the apparent [Ca2+]-threshold for TRPM4 activation, suggesting that Rho-associated protein kinase activates TRPM4 by increasing its Ca2+-sensitivity."

According to the news editors, the research concluded: "Our results support a novel mechanism whereby Rho-associated protein kinase-mediated myogenic vasoconstriction occurs primarily through activation of TRPM4 channels, smooth muscle depolarization, and cytosolic [Ca2+] increases in cerebral arterioles."

The news correspondents report that additional information may be obtained from J.E. Brayden, Univ Vermont, Dept. of Pharmacol, Burlington, VT 05405, United States.

Lung Diseases and Conditions - Pneumonia

New Findings on Pneumonia Described by Investigators at University of Florida (Intubated Trauma Patients Receiving Prolonged Antibiotics for Pneumonia despite Negative Cultures: Predictors and Outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Pneumonia have been published. According to news reporting originating from Gainesville, Florida, by NewsRx correspondents, research stated, "Despite the excellent negative predictive value of sterile respiratory cultures, antibiotics often are continued after negative endotracheal aspirate (ETA) or bronchoalveolar lavage (BAL) for critically ill trauma patients. We hypothesized that persistent elevation of the Clinical Pulmonary Infection Score (CPIS) would predict continued antibiotic therapy after a negative respiratory culture for intubated trauma patients, and that prolonged antibiotics would provide no benefit."

Our news editors obtained a quote from the research from the University of Florida, "We performed a four-year retrospective cohort analysis (May 1, 2011-September 30, 2015), including patients from our trauma database with ETA or BAL, excluding patients with any infection other than pneumonia or bacteremia. Cultures with <2(+) organisms on gram stain and <2(+) or 10(4) organisms on culture were considered negative. The CPIS was assessed at the time of culture and five days later, when all cultures were final. Multiple logistic regression was used to identify predictors of long-term antibiotic therapy. A series of 106 patients with negative cultures were included, of whom 61 had 5d of antibiotics and 45 had >5d of antibiotics. There were no differences in injury severity, head or chest trauma, initial CPIS, or subsequent culture results between the groups. Long-term antibiotic therapy did not affect intensive care unit (ICU) length of stay (LOS), ventilator days, hospital LOS, or death. Factors predicting long-term antibiotic therapy included development of a localized chest radiograph infiltrate (odds ratio [OR] 6.8; 95% confidence interval [CI] 1.7-28), CPIS >5 fivedays after culture (OR 6.1; 95% CI 1.2-32), and a colonized culture (OR 3.3; 95% CI 1.3-8.3). Long-term antibiotic therapy for intubated trauma patients with negative respiratory cultures provided no benefit and was predicted by development of a localized chest radiograph infiltrate, persistently elevated CPIS, and a contaminated/colonized culture."

According to the news editors, the research concluded: "Although long-term antibiotic use did not worsen outcomes, better strategies are needed to diagnose pneumonia accurately and ensure timely discontinuation of antibiotics when appropriate."

For more information on this research see: Intubated Trauma Patients Receiving Prolonged Antibiotics for Pneumonia despite Negative Cultures: Predictors and Outcomes. Surgical Infections, 2016;17(6):766-772. Surgical Infections can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Gram-Negative Bacteria - Prevotella intermedia

New Findings on Prevotella intermedia Discussed by Researchers at Kyung Hee University (In Vitro Effects of Polyphosphate against Prevotella intermedia in Planktonic Phase and Biofilm)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Prevotella intermedia. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Polyphosphate (polyP) has gained a wide interest in the food industry due to its potential as a decontaminating agent. In this study, we examined the effect of sodium triplypolyphosphate (polyP3; Na5P3O10) against planktonic and biofilm cells of Prevotella intermedia, a major oral pathogen."

Financial support for this research came from Ministry of Education, Science and Technology, South Korea.

Our news journalists obtained a quote from the research from Kyung Hee University, "The MIC of polyP3 against P. intermedia ATCC 49046 determined by agar dilution method was 0.075%, while 0.05% polyP3 was bactericidal against P. intermedia in time-kill analysis performed using liquid medium. A crystal violet binding assay for the assessment of biofilm formation by P. intermedia showed that sub-MICs of polyP3 significantly decreased biofilm formation. Under the scanning electron microscope, decreased numbers of P. intermedia cells forming the biofilms were observed when the bacterial cells were incubated with 0.025% or higher concentrations of polyP3. Assessment of biofilm viability with LIVE/DEAD staining and viable cell count methods showed that 0.05% or higher concentrations of polyP3 significantly decreased the viability of the preformed biofilms in a concentration-dependent manner. The zone sizes of alpha-hemolysis formed on horse blood agar produced by P. intermedia were decreased in the presence of polyP3. The expression of the genes encoding hemolysins and the genes of the hemin uptake (hmu) locus was downregulated by polyP3."

According to the news editors, the research concluded: "Collectively, our results show that polyP is an effective antimicrobial agent against P. intermedia in biofilms as well as planktonic phase, interfering with the process of hemin acquisition by the bacterium."

For more information on this research see: In Vitro Effects of Polyphosphate against Prevotella intermedia in Planktonic Phase and Biofilm. Antimicrobial Agents and Chemotherapy, 2015;60(2):818-26. (American Society for Microbiology - www.asm.org;

Neurodegenerative Diseases and Conditions - ...

New Findings on Progressive Supranuclear Palsy Discussed by Researchers at Hospital of the Holy Cross and St. Paul (Copy number variation analysis of the 17q21.31 region and its role in neurodegenerative diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurodegenerative Diseases and Conditions - Progressive Supranuclear Palsy are presented in a new report. According to news reporting from Barcelona, Spain, by NewsRx journalists, research stated, "The H1 haplotype of the 17q21.31 inversion polymorphism has been consistently associated with progressive supranuclear palsy, corticobasal degeneration, and Parkinson's disease in Caucasians. Recently, large polymorphic segmental duplications resulting into complex rearrangements at this locus with a high diversity range in human populations have been revealed."

Funders for this research include Instituto de Salud Carlos III, Spanish Ministry of Science and Innovation.

The news correspondents obtained a quote from the research from the Hospital of the Holy Cross and St. Paul, "We sought to explore whether the two multi-allelic copy number variants that are present in the H1 clade (with segmental duplications of 300 and 218 kilobases in length) could be responsible for the known H1-related risk of developing these neurodegenerative disorders. A total of 857 Spanish subjects including 330 patients with Parkinson's disease, 96 with progressive supranuclear palsy, 55 with corticobasal degeneration, 51 dementia with Lewy bodies, and 325 neurologically healthy controls, were genotyped for the H1/H2 haplotype. Subsequently, the two copy number variants that are characteristic of the H1 haplotype were evaluated through a high-resolution approach based on droplet digital polymerase chain reaction, in all H1 homozygous subjects. The H1 allele was significantly overrepresented in all diagnostic groups compared with controls (Parkinson's disease, p=0.0001; progressive supranuclear palsy, p=1.22 \times 10^{-6}; corticobasal degeneration, p=0.0002; and dementia with Lewy bodies, p=0.032). However, no dosage differences were found for any of the two copy number variants analyzed. The H1 haplotype is associated with the risk of several"
neurodegenerative disorders, including dementia with Lewy bodies."

According to the news reporters, the research concluded: "However, common structural diversity within the 17q21.31-H1 clade does not explain this genetic association."

Our news journalists report that additional information may be obtained by contacting L. Cervera-Carles, Memory Unit, Dept. of Neurology, IIB Sant Pau, Hospital de la Santa Creu i Sant Pau, Barcelona, Spain. Additional authors for this research include J. Pagonabarraga, B. Pascual-Sedano, P. Pastor, A. Campolongo, J. Fortea, R. Blesa, D. Alcolea, E. Morenas-Rodriguez, I. Sala, A. Lleo, J. Kulisevsky and J. Clarimon.

New Findings on Proline Described by Investigators at Chinese Academy of Sciences (Transformation and products of captopril with humic constituents during laccase-catalyzed oxidation: Role of reactive intermediates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proline. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "The transformation of captopril (CAP), a widely-used thiol drug, was studied with the presence of dissolved model humic constituents (HCs) in a laccase-catalyzed system. Reaction products were analyzed by ultra-performance liquid chromatography coupled to time-of-flight mass spectrometry and condensed fukui function computation."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the Chinese Academy of Sciences, "CAP reacted with different model HCs in the enzymatic system for 1 h, ranging from 75% (syringic acid) to 96% (p-coumaric acid). In the absence of HCs, only 15% of CAP was removed through self-coupling. The presence of HCs apparently changed the transformation of CAP in aqueous environment, and the HC reactive intermediates played an important role. First, during laccase catalysis, HCs with different structures were oxidized to produce reactive intermediates, including phenoxy radical cation, ortho-, and para-quinone intermediates. Second, these intermediates were readily attacked by CAP via nucleophilic reactions, forming
C-S-C covalent conjugates. More importantly, the standard reduction potential of these intermediates is a critical parameter, as PCA showed the highest reactivity to the nucleophilic addition reaction with CAP by forming phenoxy radical cations. While SYR showed the least reactivity due to the formation of quinone intermediates. Therefore, the functional groups on HCs could greatly influence the cross-coupling with CAP, as well as the type and stability of the coupling products.

According to the news editors, the research concluded: "This work clearly demonstrated the transformation of CAP and other thiol drugs with the presence of HCs in aqueous environment, which is similar to the natural humification process."

Our news journalists report that additional information may be obtained by contacting H. Zhao, Chinese Academy Sci, Beijing Engr Res Center Proc Pollut Control, Inst Proc Engr, Div Environm Technol & Engn, Beijing 100190, People's Republic of China. Oncology - Prostate Cancer

New Findings on Prostate Cancer Described by Investigators at University of Udine (Can multiparametric MRI replace Roach equations in staging prostate cancer before external beam radiation therapy?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Prostate Cancer have been presented. According to news reporting originating from Udine, Italy, by NewsRx correspondents, research stated, "To investigate the agreement between Roach equations (RE) and multiparametric magnetic resonance imaging (mpMRI) in assessing the T-stage of prostate cancer (PCa). Seventy-three patients with biopsy-proven PCa and previous RE assessment prospectively underwent mpMRI on a 3.0T magnet before external beam radiation therapy (EBRT)."

Our news editors obtained a quote from the research from the University of Udine, "Using Cohen's kappa statistic, we assessed the agreement between RE and mpMRI in defining the T-stage (> = T3 vs. T <= 2) and risk category according to the National comprehensive cancer network criteria (< intermediate vs. > = high). We also calculated sensitivity and specificity for > = T3 stage in an additional group of thirty-seven patients with post-prostatectomy histological examination (mpMRI validation group). The agreement between RE and mpMRI in assessing
the T stage and risk category was moderate (k=0.53 and 0.56, respectively). mpMRI changed the T stage and risk category in 21.9% (95% C.I. 13.4-33-4) and 20.5% (95% C.I. 12.3-31.9), respectively, prevalently downstaging PCa compared to RE. Sensitivity and specificity for >= T3 stage in the mpMRI validation group were 81.8% (95% C.I. 65.1-91.9) and 88.5% (72.8-96.1). RE and mpMRI show moderate agreement only in assessing the T-stage of PCa, translating into an mpMRI-induced change in risk assessment in about one fifth of patients."

According to the news editors, the research concluded: "As supported by high sensitivity/specificity for >= T3 stage in the validation group, the discrepancy we found is in favour of mpMRI as a tool to stage PCa before ERBT."

The news editors report that additional information may be obtained by contacting R. Girometti, University of Udine, Dept. of Med & Biol Sci, Inst Diagnost Radiol, Azienda Osped Univ Santa Maria della Misericordia, I-33100 Udine, Italy. Additional authors for this research include M.A. Signor, M. Pancot, L. Cereser and C. Zuiani.

Proteomics

New Findings on Proteomics from National Institute of Radiological Sciences Summarized (PU-H71, a novel Hsp90 inhibitor, as a potential cancer-specific sensitizer to carbon-ion beam therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Proteomics is the subject of a report. According to news reporting originating in Chiba, Japan, by NewsRx journalists, research stated, "PU-H71, a heat shock protein 90 (Hsp90) inhibitor, has yielded therapeutic efficacy in many preclinical models and is currently in clinical trials. Carbon-ion radiotherapy (CIRT) has provided successful tumor control; however, there is still room for improvement, particularly in terms of tumor-specific radiosensitization."

The news reporters obtained a quote from the research from the National Institute of Radiological Sciences, "The Hsp90 inhibitor PU-H71 has been shown to sensitize tumor cells to X-ray radiation. A murine osteosarcoma cell line (LM8) and a normal human fibroblast cell line (AG01522) were treated with PU-H71 before X-ray, 14- or 50-keV/w mm carbon-ion beam (C-ion) irradiation. Cell survival and protein expression were evaluated with colony formation and western blot, respectively. Treatment with PU-H71 alone was shown to be non-toxic to both cell lines; however, PU-H71 was shown to significantly sensitize LM8 cells to not only X-ray,
but also to C-ion irradiation, while only a minimal sensitizing effect was observed in AG01522 cells. PU-H71 treatment was found to suppress the protein expression levels of Rad51 and Ku70, which are associated with the homologous recombination pathway and the non-homologous end-joining pathway of double-strand break repair."

According to the news reporters, the research concluded: "The findings reported here suggest that PU-H71 could be a promising radiosensitizer for CIRT."

Our news correspondents report that additional information may be obtained by contacting Y. Furusawa, Natl Inst Radiol Sci, Res Center Charged Particle Therapy, Inage Ku, Chiba 2638555, Japan. Additional authors for this research include Y. Matsumoto, Y. Furusawa and T. Kamada.

**Lung Diseases and Conditions - Pulmonary Embolism**

**New Findings on Pulmonary Embolism from Rovigo General Hospital Summarized (Rheolytic thrombectomy in patient with acute pulmonary embolism, heparin-induced thrombocytopenia and recent stoke. When percutaneous treatment is the only therapeutic ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lung Diseases and Conditions - Pulmonary Embolism have been presented. According to news reporting from Rovigo, Italy, by NewsRx journalists, research stated, "To report the combined use of rheolytic thrombectomy (RT) and inferior vena cava (IVC) filter placement in the setting of acute pulmonary embolism (PE), heparin-induced thrombocytopenia (HIT) type II (HIT-II) and recent ischemic stroke. A 66-year-old man with an HIT-II and recent ischemic stroke was referred to our institution from a secondary regional center for acute PE and left deep vein thrombosis (DVT), confirmed at chest computed tomography (CT) and lower limb ultrasound, respectively."

The news correspondents obtained a quote from the research from Rovigo General Hospital, "RT was attempted because intravenous heparin anticoagulation was contraindicated by the patient's medical history while recent ischemic stroke contraindicated thrombolysis. An Angiojet ® catheter was used to perform RT. An IVC filter was placed after the procedure. The patient was discharged after 13 days and did very well, both at the 6- and 12-month follow-ups, with no recurrence of the venous thromboembolism."

According to the news reporters, the research concluded: "This case demonstrates the usefulness of RT in treating acute PE in clinically difficult scenarios, especially when
thrombolytic therapy is contraindicated."

For more information on this research see: Rheolytic thrombectomy in patient with acute pulmonary embolism, heparin-induced thrombocytopenia and recent stroke. When percutaneous treatment is the only therapeutic alternative. Perfusion-Uk, 2016;31(8):703-705. Quality of Life

New Findings on Quality of Life Described by Investigators at Royal North Shore Hospital [Nutritional issues and body weight in long-term survivors of allogeneic blood and marrow transplant (BMT) in NSW Australia]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Quality of Life is the subject of a report. According to news reporting originating in St. Leonards, Australia, by NewsRx journalists, research stated, "The aims of this study were to describe the long-term nutrition, body weight and body image issues facing survivors of Allogeneic Blood and Marrow Transplant (BMT) and their impact on quality of life. It also describes survivors' perception of enteral feeding during BMT."

The news reporters obtained a quote from the research from Royal North Shore Hospital, "Four hundred and forty-one survivors who had undergone a BMT in NSW, Australia between 2000 and 2012 (n = 441/583) completed the Sydney Post BMT Study Survey (SPBS). Forty-five percent of survivors less than 2-year post-transplant reported a dry mouth, 36 % reported mouth ulcers and 19 % had diarrhoea. This was consistent across all survivor groups, regardless of time since transplant. Patients with one or more gastrointestinal (GI) symptoms had significantly lower quality of life scores. There was a significant difference in quality of life scores when comparing those with no GI symptoms to those with one or more symptoms (P <= 0.0001). Quality of life was significantly higher in those who once again enjoyed mealtimes (P < 0.0001). Males were more likely to be satisfied with their body weight compared to females (P = 0.009). The median body mass index (BMI) for all patients reporting body weight satisfaction was significantly lower (BMI 23.5) than those reporting dissatisfaction (BMI 27.5) (P <= 0.0001). Survivors who had a normal BMI had significantly higher rates of body weight satisfaction compared to underweight, overweight and obese survivors (P <= 0.0001). Those survivors who were overweight or obese were significantly more likely to be diabetic (P = 0.008). This study revealed an important relationship between gastrointestinal symptoms, body...
weight and body image and survivor's quality of life."

According to the news reporters, the research concluded: "It provides further support for the importance of nutrition therapy post-BMT."

For more information on this research see: Nutritional issues and body weight in long-term survivors of allogeneic blood and marrow transplant (BMT) in NSW Australia. Drugs and Therapies - Radiation Therapy

New Findings on Radiation Therapy Discussed by Researchers at Polytechnic University (Tumor radio-sensitivity assessment by means of volume data and magnetic resonance indices measured on prostate tumor bearing rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Radiation Therapy are discussed in a new report. According to news reporting originating in Milan, Italy, by NewsRx journalists, research stated, "Radiation therapy is one of the most common treatments in the fight against prostate cancer, since it is used to control the tumor (early stages), to slow its progression, and even to control pain (metastasis). Although many factors (e.g., tumor oxygenation) are known to influence treatment efficacy, radiotherapy doses and fractionation schedules are often prescribed according to the principle 'one-fits-all,' with little personalization."

Financial supporters for this research include National Cancer Institute (NCI), National Institute of Biomedical Imaging and Bioengineering (NIBIB).

The news reporters obtained a quote from the research from Polytechnic University, "Therefore, the authors aim at predicting the outcome of radiation therapy a priori starting from morphologic and functional information to move a step forward in the treatment customization. The authors propose a two-step protocol to predict the effects of radiation therapy on individual basis. First, one macroscopic mathematical model of tumor evolution was trained on tumor volume progression, measured by caliper, of eighteen Dunning R3327-AT1 bearing rats. Nine rats inhaled 100% O2 during irradiation (oxy), while the others were allowed to breathe air. Second, a supervised learning of the weight and biases of two feedforward neural networks was
performed to predict the radio-sensitivity (target) from the initial volume and oxygenation-related information (inputs) for each rat group (air and oxygen breathing). To this purpose, four MRI-based indices related to blood and tissue oxygenation were computed, namely, the variation of signal intensity DSI in interleaved blood oxygen level dependent and tissue oxygen level dependent (IBT) sequences as well as changes in longitudinal DR1 and transverse DR2(*) relaxation rates. An inverse correlation of the radio-sensitivity parameter, assessed by the model, was found with respect the DR2(*) (-0.65) for the oxy group. A further subdivision according to positive and negative values of DR2(*) showed a larger average radio-sensitivity for the oxy rats with DR2(*) <0 and a significant difference in the two distributions (p <0.05). Finally, a leave-one-out procedure yielded a radio-sensitivity error lower than 20% in both neural networks.

According to the news reporters, the research concluded: "While preliminary, these specific results suggest that subjects affected by the same pathology can benefit differently from the same irradiation modalities and support the usefulness of IBT in discriminating between different responses."

For more information on this research see: Tumor radio-sensitivity assessment by means of volume data and magnetic resonance indices measured on prostate tumor bearing rats. tract infections (LRTIs). The association of pneumococcal colonization with disease has been suggested as a means to increase the diagnostic precision."

The news reporters obtained a quote from the research from Royal Liverpool and Broadgreen University Hospital, "We compared the pneumococcal colonization rates and the densities of nasal pneumococcal colonization by (i) classical culture and (ii) quantitative real-time PCR (qPCR) targetinglyAin patients with LRTIs admitted to a hospital in the United Kingdom and control patients. A total of 826 patients were screened for inclusion in this prospective case-control study. Of these, 38 patients were recruited, 19 with confirmed LRTIs and 19 controls with other diagnoses. Nasal wash (NW) samples were collected at the time of recruitment. Pneumococcal colonization was detected in 1 patient with LRTI and 3 controls (p=0.6) by classical culture. By qPCR, pneumococcal colonization was detected in 10 LRTI patients and 8 controls (p=0.5). Antibiotic usage prior to sampling was significantly higher in the LRTI group than in the control group (19 versus 3; p<0.001). With a clinically relevant cutoff of >8,000 copies/ml on qPCR, pneumococcal colonization was found in 3 LRTI patients and 4 controls (p>0.05). We conclude that neither the prevalence nor the density of nasal pneumococcal colonization (by culture and qPCR) can be used as a method of microbiological diagnosis in hospitalized adults with LRTI in the United Kingdom."

According to the news reporters, the research concluded: "A community-based study recruiting patients prior to antibiotic therapy may be a useful future step."

For more information on this research see: Pneumococcal Colonization Rates in Patients Admitted to a United Kingdom Hospital with Lower Respiratory Tract Infection: a Prospective Case-Control Study. Journal of Clinical Microbiology, 2016;54(4):944-9.

Respiratory Tract

New Findings on Respiratory Tract from University of Texas Summarized (Interferon-gamma promotes double-stranded RNA-induced TLR3-dependent apoptosis via upregulation of transcription factor Runx3 in airway epithelial cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Respiratory Tract. According to news reporting from Tyler, Texas, by NewsRx journalists, research stated, "Viral respiratory tract
infections are the most common illness in humans. Infection of the respiratory viruses results in accumulation of viral replicative double-stranded RNA (dsRNA), which is one of the important components of infecting viruses for the induction of lung epithelial cell apoptosis and innate immune response, including the production of interferon (IFN)."

The news correspondents obtained a quote from the research from the University of Texas, "In the present study, we have investigated the regulation of dsRNA-induced airway epithelial cell apoptosis by IFN. We found that transcription factor Runx3 was strongly induced by type-II IFN gamma, slightly by type-III IFN lambda, but essentially not by type-I IFN alpha in airway epithelial cells. IFN gamma-induced expression of Runx3 was predominantly mediated by JAK-STAT1 pathway and partially by NF-kappa B pathway. Interestingly, Runx3 can be synergistically induced by IFN gamma with a synthetic analog of viral dsRNA polyinosinic-polycytidylic acid [poly(I:C)] or tumor necrosis factor-alpha (TNF alpha) through both JAK-STAT1 and NF-kappa B pathways. We further found that dsRNA poly(I:C)-induced apoptosis of airway epithelial cells was mediated by dsRNA receptor toll-like receptor 3 (TLR3) and was markedly augmented by IFN gamma through the enhanced expression of TLR3 and subsequent activation of both extrinsic and intrinsic apoptosis pathways. Last, we demonstrated that upregulation of Runx3 by IFN gamma promoted TLR3 expression, thus amplifying the dsRNA-induced apoptosis in airway epithelial cells. These novel findings indicate that IFN gamma promotes dsRNA-induced TLR3-dependent apoptosis via upregulation of transcription factor Runx3 in airway epithelial cells."

According to the news reporters, the research concluded: "Findings from our study may provide new insights into the regulation of airway epithelial cell apoptosis by IFN gamma during viral respiratory tract infection."

Our news journalists report that additional information may be obtained by contacting H. Tang, Univ Texas Hlth Sci Center Tyler, Dept. of Cellular & Mol Biol, Tyler, TX 75708, United States. Additional authors for this research include Q. Hao, S. Idell and H. Tang.

Engineering - Safety Engineering

New Findings on Safety Engineering from Technical University Summarized (Occupational risk-prevention diagnosis: A study of construction SMEs in Spain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Engineering - Safety Engineering.
According to news reporting originating from Madrid, Spain, by NewsRx correspondents, research stated, "Occupational risk-prevention implementation and its integration in the management systems of Small and Medium Enterprises (SMEs) are studied in the Spanish Construction Sector, through a prospective analysis of data collected from a sample of 106 firms (SMEs) in the Autonomous Community of Castile-La Mancha (Spain). The selected sample is well suited to the economic reality of that Autonomous Community, considering the size of the population and the chosen confidence intervals and probabilities."

Our news editors obtained a quote from the research from Technical University, "The following data-collection techniques were used: surveys, open questions, closed questions, and dichotomous questions. Qualitative Focus-Group techniques were chosen, to contrast the information and to validate its reliability, in view of the training criteria and the hierarchical position of the interviewees working for firms with experience in the Construction Sector. Participants included risk-prevention experts from the public administrations."

According to the news editors, the research concluded: "The results point to difficulties with the integration of Occupational Risk Prevention (ORP) in the Management Systems of SMEs in the Spanish construction sector, outside the corporate structure of the firm."

For more information on this research see: Occupational risk-prevention diagnosis: A study of construction SMEs in Spain. Safety Science, 2017:92():104-115. Safety Science can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands.

The news editors report that additional information may be obtained by contacting A.R. Barriuso, Technical Univ Madrid, Madrid, Spain. Additional authors for this research include B.M.V. Escribano, M.N.G. Garcia, A.R. Barriuso and A.R. Saiz.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ssci.2016.09.016. This DOI is a link to an online electronic document that is either free or for purchase.

Science

New Findings on Science from Max-Planck-Institute for Biophysics Summarized (Two pathways regulate cortical granule translocation to prevent polyspermy in mouse oocytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news originating from Gottingen, Germany, by NewsRx correspondents, research stated, "An egg must be fertilized by a single sperm only. To prevent polyspermy, the zona pellucida, a structure that surrounds mammalian eggs, becomes impermeable upon fertilization, preventing the entry of further sperm."

Our news journalists obtained a quote from the research from Max-Planck-Institute for Biophysics, "The structural changes in the zona upon fertilization are driven by the exocytosis of cortical granules. These translocate from the oocyte's centre to the plasma membrane during meiosis. However, very little is known about the mechanism of cortical granule translocation. Here we investigate cortical granule transport and dynamics in live
mammalian oocytes by using Rab27a as a marker. We show that two separate mechanisms drive their transport: myosin Va-dependent movement along actin filaments, and an unexpected vesicle hitchhiking mechanism by which cortical granules bind to Rab11a vesicles powered by myosin Vb."

According to the news editors, the research concluded: "Inhibiting cortical granule translocation severely impaired the block to sperm entry, suggesting that translocation defects could contribute to miscarriages that are caused by polyspermy."

The news correspondents report that additional information may be obtained from M. Schuh, Max Planck Inst Biophys Chem, D-37077 Gottingen, Germany. Additional authors for this research include J. Boulanger, L.M. Bond and M. Schuh.

Keywords for this news article include: Gottingen, Germany, Europe, Science, Genetics, Max-Planck-Institute for Biophysics.

New Findings on Sickle Cell Anemia from E. Charrin and Co-Authors Summarized (Inflammatory and oxidative stress phenotypes in transgenic sickle cell mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematologic Diseases and Conditions - Sickle Cell Anemia have been published. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "The Townes mouse model of homozygous sickle cell disease (SS) has emerged as the major experimental model for studying pathophysiological mechanisms of human sickle cell disease (SCD). We therefore investigated hematological and hemorheological parameters as well as organ-specific inflammatory and oxidative stress molecular profiles in these animals in steady state conditions."

Our news editors obtained a quote from the research, "Evidences of SCD-related intravascular hemolysis, impaired red blood cell (RBC) deformability, leukocytosis and altered plasma nitric oxide byproducts (NOx) level were found in the SS mice. The SS mice have damaged, enlarged and dysfunctional spleen as attested by high AOPP levels, low SOD and GPx activities and low pro-inflammatory cytokines mRNA expression. SS mice exhibited cardiomegaly, high cardiac mRNA levels of proinflammatory markers and low cardiac GPx activity. While lungs did not display any noticeable defects, liver and kidney were particularly sensitive to oxidative stress and inflammation as suggested by high AOPP levels in both organs, elevated renal NF-kappa B and TNF-alpha, and increased hepatic VCAM-1 and IL-1 beta."

According to the news editors, the research concluded: "Our data indicate a tissue-specific phenotype regarding oxidative stress and inflammation in SS mice that may help to optimize the development of novel potential drug treatments."

For more information on this research see: Inflammatory and oxidative stress...

The news editors report that additional information may be obtained by contacting C. Martin, Lab Excellence GR Ex, Paris, France. Additional authors for this research include S.F. Ofori-Acquah, E. Nader, S. Skinner, P. Connes, V. Pialoux, P. Joly and C. Martin.

**Stainless Steel**

**New Findings on Stainless Steel Reported by B. Moen et al (Microbiota formed on attached stainless steel coupons correlates with the natural biofilm of the sink surface in domestic kitchens)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Stainless Steel have been presented. According to news reporting from As, Norway, by NewsRx journalists, research stated, "Stainless steel coupons are frequently used in biofilm studies in the laboratory, as this material is commonly used in the food industry. The coupons are attached to different surfaces to create a 'natural' biofilm to be studied further in laboratory trials."

The news correspondents obtained a quote from the research, "However, little has been done to investigate how well the microbiota on such coupons represents the surrounding environment. The microbiota on sink wall surfaces and on new stainless steel coupons attached to the sink wall for 3 months in 8 domestic kitchen sinks was investigated by next-generation sequencing (MiSeq) of the 16S rRNA gene derived from DNA and RNA (cDNA), and by plating and identification of colonies. The mean number of colony-forming units was about 10-fold higher for coupons than sink surfaces, and more variation in bacterial counts between kitchens was seen on sink surfaces than coupons. The microbiota in the majority of biofilms was dominated by Moraxellaceae (genus Moraxella/Enhydrobacter) and Micrococcaceae (genus Kocuria). The results demonstrated that the variation in the microbiota was mainly due to differences between kitchens (38.2%), followed by the different nucleic acid template (DNA vs RNA) (10.8%), and that only 5.1% of the variation was a result of differences between coupons and sink surfaces. The microbiota variation between sink surfaces and coupons was smaller for samples based on their RNA than on their DNA."

According to the news reporters, the research concluded: "Overall, our results suggest that new stainless steel coupons are suited to model the dominating part of the natural microbiota of the surrounding environment and, furthermore, are suitable for different downstream studies."

For more information on this research see: Microbiota formed on attached stainless steel coupons correlates with the natural biofilm of the sink surface in domestic kitchens.
New Findings on Staphylococcus aureus from University of Lausanne Summarized (In Vitro and In Vivo Effectiveness of an Innovative Silver-Copper Nanoparticle Coating of Catheters To Prevent Methicillin-Resistant Staphylococcus aureus Infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gram-Positive Bacteria - Staphylococcus aureus. According to news reporting originating from Lausanne, Switzerland, by NewsRx correspondents, research stated, "In this study, silver/copper (Ag/Cu)-coated catheters were investigated for their efficacy in preventing methicillin-resistant Staphylococcus aureus (MRSA) infection in vitro and in vivo. Ag and Cu were sputtered (67/33% atomic ratio) on polyurethane catheters by direct-current magnetron sputtering."

Financial support for this research came from Swiss National Science Foundation.

Our news editors obtained a quote from the research from the University of Lausanne, "In vitro, Ag/Cu-coated and uncoated catheters were immersed in phosphate-buffered saline (PBS) or rat plasma and exposed to MRSA ATCC 43300 at 10(4) to 10(8) CFU/ml. In vivo, Ag/Cu-coated and uncoated catheters were placed in the jugular vein of rats. Directly after, MRSA (10(7) CFU/ml) was inoculated in the tail vein. Catheters were removed 48 h later and cultured. In vitro, Ag/Cu-coated catheters preincubated in PBS and exposed to 10(4) to 10(7) CFU/ml prevented the adherence of MRSA (0 to 12% colonization) compared to uncoated catheters (50 to 100% colonization; P<0.005) and Ag/Cu-coated catheters retained their activity (0 to 20% colonization) when preincubated in rat plasma, whereas colonization of uncoated catheters increased (83 to 100%; P<0.005). Ag/Cu-coating protection diminished with 10(8) CFU/ml in both PBS and plasma (50 to 100% colonization). In vivo, Ag/Cu-coated catheters reduced the incidence of catheter infection compared to uncoated catheters (57% versus 79%,
respectively; P = 0.16) and bacteremia (31% versus 68%, respectively; P<0.05). Scanning electron microscopy of explanted catheters suggests that the suboptimal activity of Ag/Cu catheters in vivo was due to the formation of a dense fibrin sheath over their surface. Ag/Cu-coated catheters thus may be able to prevent MRSA infections."

According to the news editors, the research concluded: "Their activity might be improved by limiting plasma protein adsorption on their surfaces."

For more information on this research see: In Vitro and In Vivo Effectiveness of an Innovative Silver-Copper Nanoparticle Coating of Catheters To Prevent Methicillin-Resistant Staphylococcus aureus Infection. Oncology - Stomach Cancer

New Findings on Stomach Cancer from Jilin University Summarized (Enhanced recovery after surgery with laparoscopic radical gastrectomy for stomach carcinomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Stomach Cancer have been published. According to news originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "To study the efficacy of the enhanced recovery after surgery (ERAS) program in laparoscopic radical gastrectomy for stomach carcinomas. From June 2010 to December 2012, 61 gastric cancer patients who underwent laparoscopic-assisted radical gastrectomy with D2 lymphadenectomy at First Hospital of Jilin University were enrolled in this randomized controlled trial. (Clinical Trials.gov, registration ID: NCT01955096)."

Our news journalists obtained a quote from the research from Jilin University, "The subjects were divided into the ERAS program group and the conventional control group. The clinical characteristics, recovery variables, and complications of patients were analyzed. The time to first ambulation, oral food intake, and time to defecation were significantly shorter in the
ERAS group (n=30), compared to the conventional group (n=31; p=0.04, 0.003, and 0.01, respectively). The postoperative hospital stay was less in the ERAS group (6.8 ± 1.1 d) compared to the conventional group (7.7 ± 1.1 d) (p=0.002). There was no significant difference in postoperative complications between the ERAS (1/30) and conventional care groups (2/31) (p=1.00). There were no readmissions or mortality during the 30-d follow-up period. The ERAS program is associated with a shorter hospital stay in gastric cancer patients undergoing laparoscopic radical gastrectomy."

According to the news editors, the research concluded: "The ERAS protocol is useful in the treatment of gastric cancer."

The news correspondents report that additional information may be obtained from I. Abdikarim, Ikram Abdikarim, Xue-Yuan Cao, Shou-Zhen Li, Yin-Quan Zhao, Yerlan Taupyk, Quan Wang, Dept. of Gastric and Colorectal Surgery, First Hospital of Jilin University, Changchun 130021, Jilin Province, People's Republic of China. Additional authors for this research include X.Y. Cao, S.Z. Li, Y.Q. Zhao, Y. Taupyk and Q. Wang.

Ear Diseases and Conditions - Suppurative Otitis Media

**New Findings on Suppurative Otitis Media from Seoul National University Summarized (Changes in antibiotic resistance in recurrent Pseudomonas aeruginosa infections of chronic suppurative otitis media)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Ear Diseases and Conditions - Suppurative Otitis Media. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "This study investigated the changes in antibiotic resistance in recurrent Pseudomonas aeruginosa infections in chronic suppurative otitis media (CSOM). Its aim was to provide a treatment strategy for P aeruginosa infections in CSOM for the prevention of multidrug resistance."

The news reporters obtained a quote from the research from Seoul National University, "A case control study was conducted in tertiary teachinghospitals in Korea. The experimental group included patients with recurrent P aeruginosa infection who had relapsed within 2 months after the successful control of a previous P aeruginosa infection. The control group consisted of patients with a P aeruginosa infection who had no history of such an infection. An antibiotic sensitivity test was performed for each culture. The proportion
of recurrent P. aeruginosa infection was 22.69% (98 of 432 cases). Drug resistance to amikacin, tobramycin, netilmicin, ciprofloxacin, and levofloxacin was significantly changed after recurrent infection. The fluoroquinolone strains seen in recurrent P. aeruginosa showed high cross-resistance to other drugs."

According to the research reporters, the research concluded: "Antibiotic resistance of P. aeruginosa in CSOM changed with recurrent infection."

For more information on this research see: Changes in antibiotic resistance in recurrent Pseudomonas aeruginosa infections of chronic suppurative otitis media. ENT-Ear Nose & Throat Journal, 2016;95(10-11):446-451. ENT-Ear Nose & Throat Journal can be contacted at: Vendome Group LLC, 6 East 32 St, 8 Floor, New York, NY 10016, USA.

Neurodegenerative Diseases and Conditions - TDP-...

New Findings on TDP-43 Proteinopathies Described by Investigators at Johns Hopkins University (Depletion of TDP-43 decreases fibril and plaque beta-amyloid and exacerbates neurodegeneration in an Alzheimer’s mouse model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Neurodegenerative Diseases and Conditions - TDP-43 Proteinopathies is the subject of a report. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "TDP-43 proteinopathy, initially associated with ALS and FTD, is also found in 30-60% of Alzheimer’s disease (AD) cases and correlates with worsened cognition and neurodegeneration. A major component of this proteinopathy is depletion of this RNA-binding protein from the nucleus, which compromises repression of non-conserved cryptic exons in neurodegenerative diseases."

The news correspondents obtained a quote from the research from Johns Hopkins University, "To test whether nuclear depletion of TDP-43 may contribute to the pathogenesis of AD cases with TDP-43 proteinopathy, we examined the impact of depletion of TDP-43 in populations of neurons vulnerable in AD, and on neurodegeneration in an AD-linked context. Here, we show that some populations of pyramidal neurons that are selectively vulnerable in AD are also vulnerable to TDP-43 depletion in mice, while other forebrain neurons appear spared. Moreover, TDP-43 depletion in forebrain neurons of an AD mouse model exacerbates neurodegeneration, and correlates with increased prefibrillar oligomeric A beta and decreased A beta plaque burden."
According to the news reporters, the research concluded: "These findings support a role for nuclear depletion of TDP-43 in the pathogenesis of AD and provide strong rationale for developing novel therapeutics to alleviate the depletion of TDP-43 and functional antemortem biomarkers associated with its nuclear loss."

Our news journalists report that additional information may be obtained by contacting P.C. Wong, Johns Hopkins University, Sch Med, Cellular & Mol Med Program, Baltimore, MD 21205, United States. Additional authors for this research include A. Donde, J.P. Ling, Y.H. Jeong, R. Chhabra, L.J. Martin and P.C. Wong.

**Drugs and Therapies - Toxicology and Pharmacology**

**New Findings on Toxicology and Pharmacology from National Institute for Public Health and the Environment Summarized (Critical elements for human health risk assessment of less than lifetime exposures)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Toxicology and Pharmacology is the subject of a report. According to news reporting originating in Bilthoven, Netherlands, by NewsRx journalists, research stated, "Less than lifetime exposure has confronted risk assessors as to how to interpret the risks for human health in case a chronic health-based limit is exceeded. Intermittent, fluctuating and peak exposures do not match with the basis of the chronic limit values possibly leading to conservative outcomes."

Financial support for this research came from The Netherlands Food and Consumer Product Safety Authority (NVWA).

The news reporters obtained a quote from the research from National Institute for Public Health and the Environment, "This paper presents guidance on how to deal with human risk assessment of less than lifetime exposure. Important steps to be considered are characterization of the human exposure situation, evaluation whether the human less than lifetime exposure scenario corresponds to a non-chronic internal exposure: toxicokinetic and toxicodynamic considerations, and, finally, re-evaluation of the risk assessment. Critical elements for these steps are the mode of action, Haber's rule, and toxicokinetics (ADME) amongst others. Previous work for the endpoints non-genotoxic carcinogenicity and developmental toxicity is included in the guidance."

According to the news reporters, the research concluded: "The guidance provides a way to consider the critical elements, without setting default factors to correct for the less than
lifetime exposure in risk assessment."

Our news correspondents report that additional information may be obtained by contacting W. Ter Burg, Natl Inst Public Hlth & Environm RIVM, NL-3720 BA Bilthoven, Netherlands. Additional authors for this research include M.M. Nijkamp and W. Ter Burg.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.yrtph.2016.09.026. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Toxicology and Pharmacology**

**New Findings on Toxicology and Pharmacology from T. Zhang and Co-Authors Summarized (The comparison of animal models for premature ovarian failure established by several different source of inducers)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Toxicology and Pharmacology. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The objective of this study was to compare premature ovarian failure animal models established by several different source of inducers. Female ICR mice, KM mice, and SD rats were treated by cyclophosphamide at 120 mg/kg, busulfan at 12 mg/kg, cisplatin at 3 or 4 mg/kg, 4-vinylcyclohexene diepoxide at 160 mg/kg, 35% galactose food pellet, and tripterygium glycosides at 50 mg/kg, respectively."

Our news journalists obtained a quote from the research, "Parameters were analyzed by body weight, serum concentration level of related hormones, ovarian and uterine pathological examination. The results indicated the body weight of mice increased very slowly following single dose of cyclophosphamide (p < 0.05) with damaged ovary; repeated doses of cisplatin could induce body weight significantly decreased (p < 0.01) with a rising trend of serum LH concentration, declining tendency of serum E2 concentration and injured ovary and uterus; 4-vinylcyclohexene diepoxide also hindered the mice growing (p < 0.05) with damaged ovary and uterus; the body weight of mice feed by 35% galactose food pellet increased slowly (p < 0.05) with dramatically higher serum concentration level of galactose, albumin, and total protein (p < 0.001) and injured ovary. Busulfan and tripterygium glycosides did not present obvious evidences."

According to the news editors, the research concluded: "The inducers presented their respective features in such animal models and should be appropriately applied in preventive methods."
For more information on this research see: The comparison of animal models for premature ovarian failure established by several different source of inducers. *Regulatory Toxicology and Pharmacology*, 2016;81():223-232. *Regulatory Toxicology and Pharmacology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Mycobacterium Infections - Tuberculosis**

**New Findings on Tuberculosis Described by Investigators at Anacor Pharmaceuticals (Discovery of Novel Oral Protein Synthesis Inhibitors of Mycobacterium tuberculosis That Target Leucyl-tRNA Synthetase)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mycobacterium Infections - Tuberculosis have been published. According to news reporting out of Palo Alto, California, by NewsRx editors, research stated, "The recent development and spread of extensively drug-resistant and totally drug-resistant resistant (TDR) strains of Mycobacterium tuberculosis highlight the need for new antitubercular drugs. Protein synthesis inhibitors have played an important role in the treatment of tuberculosis (TB) starting with the inclusion of streptomycin in the first combination therapies."

Our news journalists obtained a quote from the research from Anacor Pharmaceuticals, "Although parenteral aminoglycosides are a key component of therapy for multidrug-resistant TB, the oxazolidinone linezolid is the only orally available protein synthesis inhibitor that is effective against TB. Here, we show that small-molecule inhibitors of aminoacyl-tRNA synthetases (AARSs), which are known to be excellent antibacterial protein synthesis targets, are orally bioavailable and effective against M. tuberculosis in TB mouse infection models. We applied the oxaborole tRNA-trapping (OBORT) mechanism, which was first developed to target fungal cytoplasmic leucyl-tRNA synthetase (LeuRS), to M. tuberculosis LeuRS. X-ray crystallography was used to guide the design of LeuRS inhibitors that have good biochemical potency and excellent whole-cell activity against M. tuberculosis."

According to the news editors, the research concluded: "Importantly, their good oral bioavailability translates into in vivo efficacy in both the acute and chronic mouse models of TB with potency comparable to that of the frontline drug isoniazid."

For more information on this research see: Discovery of Novel Oral Protein Synthesis Inhibitors of Mycobacterium tuberculosis That Target Leucyl-tRNA Synthetase.
New Findings on Tuberculosis Described by Investigators at Ondokuz Mayis University [Multicenter evaluation of crystal violet decolorization assay (CVDA) for rapid detection of isoniazid and rifampicin resistance in Mycobacterium tuberculosis]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Mycobacterium Infections - Tuberculosis have been presented. According to news reporting originating in Samsun, Turkey, by NewsRx journalists, research stated, "The aim of this multicenter study was to evaluate the performance of the crystal violet decolorization assay (CVDA) for detection of multidrug resistant tuberculosis (MDR-TB). This study was performed in 11 centers in two phases."

The news reporters obtained a quote from the research from Ondokuz Mayis University, "A total of 156 isolates were tested for INH and RIF resistance. In the phase I, 106 clinical isolates were tested in the Center 1-7. In the phase 2, 156 clinical isolates were tested in the center 1-6, center 8-11. Eighty six of 156 tested isolates were the same in phase I. Agreements were 96.2-96.8% for INH and 98.1-98.7% for RIF in the phase I-II, respectively. Mean time to obtain the results in the phase I was 14.3 +/- 5.4 days. In the phase II, mean time to obtain the results was 11.6 +/- 3.5 days. Test results were obtained within 14days for 62.3% (66/106) of isolates in the phase I and 81.4% (127/156) of isolates in the phase II."

According to the news reporters, the research concluded: "CVDA is rapid, reliable, inexpensive, and easy to perform for rapid detection of MDR-TB isolates. In addition, it could be adapted for drug susceptibility testing with all drugs both in developed and developing countries."

For more information on this research see: Multicenter evaluation of crystal violet decolorization assay (CVDA) for rapid detection of isoniazid and rifampicin resistance in Mycobacterium tuberculosis.

**Mycobacterium Infections - Tuberculosis**

**New Findings on Tuberculosis Described by Investigators at School of Public Health (Pyrazinamide Resistance Assays and Two-Month Sputum Culture Status in Patients with Multidrug-Resistant Tuberculosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mycobacterium Infections - Tuberculosis have been published. According to research originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Phenotypic drug susceptibility testing is the current 'gold standard' for detecting Mycobacterium tuberculosis susceptibility to antituberculous drugs. Pyrazinamide is one antituberculous drug for which the correlation between in vitro resistance and clinical outcomes remains unclear."

Financial support for this research came from HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID).

Our news journalists obtained a quote from the research from the School of Public Health, "Here we performed latent class analysis (LCA) to develop a consensus gold standard definition of pyrazinamide resistance using three paired standard pyrazinamide resistance assays. We then compared this consensus measure to the 2-month culture results for patients with multidrug-resistant tuberculosis (MDR-TB) who were treated for 2 months with first-line antituberculous drugs before their resistance results were known. Among 121 patients with MDR-TB, 60 (49.6%) were resistant to pyrazinamide by the Wayne method (L. G. Wayne, Am Rev Respir Dis 109: 147-151, 1974), 71 (58.7%) were resistant by the Bactec MGIT 960 method, and 68 (56.2%) were resistant by pncA sequencing. LCA grouped isolates with positive results by at least two assays into a category which we considered the 'consensus gold standard' for pyrazinamide resistance. The sensitivity and specificity for this consensus gold standard were 82.4% and 92.5%, respectively, for the Wayne method; 95.6% and 88.7%, respectively, for the Bactec MGIT 960 method; and 92.6% and 90.6%, respectively, for pncA sequencing. After we adjusted for other factors associated with poor outcomes, including age, sex, alcohol use,
and baseline ethambutol resistance, patients whose isolates were resistant by the LCA-derived consensus gold standard were more likely to be culture positive at 2 months with an odds ratio of 1.95 (95% confidence interval, 0.74 to 5.11), but this result was not statistically significant.

According to the news editors, the research concluded: "These findings underscore the need for improved diagnostics for routine use in programmatic settings."

For more information on this research see: Pyrazinamide Resistance Assays and Two-Month Sputum Culture Status in Patients with Multidrug-Resistant Tuberculosis. Antimicrobial Agents and Chemotherapy, 2016;60(11):6766-6773. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Nutritional and Metabolic Diseases and Conditions ...

New Findings on Type 1 Diabetes Mellitus from Department of Clinical Chemistry Summarized (Taurine Transporter Gene Expression in Mononuclear Blood Cells of Type 1 Diabetes Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus are discussed in a new report. According to news reporting originating in Pistoia, Italy, by NewsRx journalists, research stated, "Taurine transporter gene expression (RNA-TauT) has a role in retinal cell function and is modulated in vitro and in vivo by hyperglycemia and/or oxidative stress. This study was aimed at testing whether RNA-TauT gene expression is modified in blood mononuclear peripheral cells (MPCs) of type 1 diabetic patients, is related to plasma markers of oxidative stress or endothelial dysfunction, or, finally, is related to presence of retinopathy."

Financial supporters for this research include Fondazione Cassa di Risparmio di Pistoia e Pescia, Accademia Medica Pistoiese.

The news reporters obtained a quote from the research from the Department of Clinical Chemistry, "RNA-TauT was measured in MPCs by real-time PCR-analysis in 35 type 1 diabetic patients and in 33 age-and sex-matched controls, additionally measuring plasma and
cell taurine and markers of oxidative stress and endothelial dysfunction. RNA-TauT, expressed as 2(-DDCt), was significantly higher in MPCs of type 1 diabetic patients than in controls [median (interquartile range): 1.32(0.31) versus 1.00(0.15); p=0.01]. In diabetic patients RNA-TauT was related to HbA1c (r=0.42; p=0.01) and inversely to plasma homocysteine (r=-0.39; p=0.02) being additionally significantly higher in MPCs of patients without retinopathy [(n=22); 1.36(0.34)] compared to those with retinopathy [(n=13); 1.16(0.20)], independently from HbA1c or diabetes duration. RNA-TauT gene expression is significantly upregulated in MPCs of type 1 diabetes patients and is related to HbA1c levels and inversely to plasma homocysteine."

According to the news reporters, the research concluded: "Finally, in diabetes patients, RNA-TauT upregulation seems to be blunted in patients with retinopathy independently of their metabolic control or longer diabetes duration."

For more information on this research see: Taurine Transporter Gene Expression in Mononuclear Blood Cells of Type 1 Diabetes Patients. Journal of Diabetes Research, 2016;2016():7313162.

Our news correspondents report that additional information may be obtained by contacting Z. Napoli, Dept. of Clinical Chemistry, S Jacopo Hospital, 51100 Pistoia, Italy. Additional authors for this research include G. Seghieri, L. Bianchi, R. Anichini, A. De Bellis, I. Campesi, C. Carru, S. Occhioni, A. Zinellu and F. Franconi.

Nutritional and Metabolic Diseases and Conditions - …

New Findings on Type 1 Diabetes Mellitus from Department of Internal Medicine Summarized (Adherence to insulin therapeutic regimens in patients with type 1 diabetes. A nationwide survey in Brazil)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus have been published. According to news reporting originating in Sao Paulo, Brazil, by NewsRx journalists, research stated, "Determine the relationship between self-reported adherence to insulin therapeutic regimens in Brazilian patients with type 1 diabetes and demographic, clinical data, glycemic control and cardiovascular risk factors. This was a cross-sectional, multicenter study conducted between August 2011 and August 2014 in 10 Brazilian cities."

The news reporters obtained a quote from the research from the Department of Internal Medicine, "Data were obtained from 1698 patients, aged 30.0 +/- 11.90 years (55.5% females, 53.6% Caucasians) with a diabetes duration of 15.4 +/- 1.9 years. Adherence was evaluated using an adapted 4-item Morisky Medication Scale (MMAS) questionnaire. A total of
166 (9.8%), 717 (42.2%) and 815 (48.0%) of the patients reported maximal (group 0), moderate (group 1) and minimal (group 2) adherence to their insulin therapeutic regimen, respectively. A significant difference in HbA1c was observed in patients from group 2, 9.2 +/- 2.2% (77 +/- 25 mmol/mol) compared to group 1, 8.9 +/- 2.0% (74 +/- 22 mmol/mol) and group 0, 8.6 +/- 1.9% (71 +/- 21 mmol/mol) (p = 0.003). A multivariate logistic analysis revealed that the significant independent variables related to higher insulin therapeutic regimen adherence were older age, higher adherence to diet, lower rate of self-reported hypoglycemia in the last month, low economic status and living in the Southeast region. Insulin therapeutic regimens, number of daily insulin injections, self-monitoring of blood glucose, gender, ethnicity and cardiovascular risk factors were not related to adherence. Most Brazilian T1D patients did not adhere to their prescribed insulin therapeutic regimen, according to the MMAS 4-item scale.

According to the news reporters, the research concluded: "This tool should be initially used to identify non-adherent patients and help them overcome the barriers to adherence to their prescriptions."

Our news correspondents report that additional information may be obtained by contacting C.A. Negrato, Baurus Diabet Assoc, Dept. of Internal Med, Sao Paulo, Brazil.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.diabres.2016.07.011. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Sao Paulo, Brazil, South America, Type 1 Diabetes Mellitus, Nutritional and Metabolic Diseases and Conditions, Insulin Dependent Diabetes Mellitus, Cardiology, Epidemiology, Risk and Prevention, Peptide Proteins, Peptide Hormones, Type 1 Diabetes, Cardiovascular, Proinsulin, Department of Internal Medicine.

Nutritional and Metabolic Diseases and Conditions -…

New Findings on Type 2 Diabetes Described by Investigators at University of Copenhagen (Ionizing Radiation Potentiates High-Fat Diet-Induced Insulin Resistance and Reprograms Skeletal Muscle and Adipose Progenitor Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been presented. According to news originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "Exposure to ionizing radiation increases the risk of chronic metabolic disorders such as insulin resistance and type 2 diabetes later in life. We hypothesized that irradiation reprograms the epigenome of metabolic progenitor cells, which could account for impaired metabolism after cancer treatment."

Our news journalists obtained a quote from the research from the University of
Copenhagen, "C57BI/6 mice were treated with a single dose of irradiation and subjected to high-fat diet (HFD). RNA sequencing and reduced representation bisulfite sequencing were used to create transcriptomic and epigenomic profiles of preadipocytes and skeletal muscle satellite cells collected from irradiated mice. Mice subjected to total body irradiation showed alterations in glucose metabolism and, when challenged with HFD, marked hyperinsulinemia. Insulin signaling was chronically disrupted in skeletal muscle and adipose progenitor cells collected from irradiated mice and differentiated in culture. Epigenomic profiling of skeletal muscle and adipose progenitor cells from irradiated animals revealed substantial DNA methylation changes, notably for genes regulating the cell cycle, glucose/lipid metabolism, and expression of epigenetic modifiers."

According to the news editors, the research concluded: "Our results show that total body irradiation alters intracellular signaling and epigenetic pathways regulating cell proliferation and differentiation of skeletal muscle and adipose progenitor cells and provide a possible mechanism by which irradiation used in cancer treatment increases the risk for metabolic disease later in life."

The news correspondents report that additional information may be obtained from R. Barres, University of Copenhagen, Novo Nordisk Fdn Center Basic Metab Res, Fac Hlth & Med Sci, Copenhagen, Denmark. Additional authors for this research include L.R. Ingerslev, E. Andersen, O. Fabre, C. Garde, M. Rasmussen, K. Citirikkaya, J. Baek, G.L. Christensen, M. Aznar, L. Specht, D. Simar and R. Barres.

New Findings on Type 2 Diabetes from Huazhong University of Science and Technology Summarized (Entada phaseoloides extract suppresses hepatic gluconeogenesis via activation of the AMPK signaling pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting from Hubei, People's Republic of China, by NewsRx journalists, research stated, "Ethnopharmacological relevance: The seed of Entada phaseoloides (L.) Merr. (Entada phaseoloides) has been long used as a folk medicine for the treatment of Diabetes mellitus by Chinese ethnic minorities. Recent reports have demonstrated that total saponins from Entada phaseoloides (TSEP) could reduce fasting blood glucose in type 2 diabetic rats."
The news correspondents obtained a quote from the research from the Huazhong University of Science and Technology, "However, the mechanism has not been fully elucidated. The aim of this study was to explore the underlying mechanisms of TSEP on type 2 Diabetes mellitus (T2DM). Primary mouse hepatocytes and HepG2 cells were used to investigate the effects of TSEP on gluconeogenesis. After treatment with TSEP, glucose production, genes expression levels of Glucose-6-phosphatase (G6pase) and Phosphoenolpyruvate carboxykinase (Pepck) were detected. The efficacy and underlying mechanism of TSEP on AMP-activated protein kinase (AMPK) signaling pathway were determined. TSEP significantly inhibited glucose production and the gluconeogenic gene expression. Treatment with TSEP elevated the phosphorylation of AMPK, which in turn promoted the phosphorylation of acetyl coenzyme A (ACC) and Akt/glycogen synthase kinase 3 beta (GSK3 beta), respectively. Furthermore, TSEP reduced lipid accumulation and improved insulin sensitivity in hepatocytes."

According to the news reporters, the research concluded: "These findings provide evidence that TSEP exerts an antidiabetic effect by suppressing hepatic gluconeogenesis via the AMPK signaling pathway."

in a vaginal swab from a 25-year-old pregnant woman suffering from vaginitis."

Our news editors obtained a quote from the research from Jiangsu University, "Viral metagenomics method was used to detect the viral sequences in 88 vaginal swab samples collected from 88 pregnant women with vaginitis. A novel papillomavirus, named HPV-ZJ01 (GenBank no. KX082661), was detected in one sample and its complete genome sequence was amplified by PCR and sequenced by Sanger walking. Phylogenetic analyses based on the complete genome and the L1 protein of HPV-ZJ01 and other representative human papillomaviruses were done, respectively. Further PCR screening was performed in vaginal swabs (n = 135), cervical smears (n = 40) and cervical cancer tissues (n = 40) using nested-PCR primers designed based on HPV-ZJ01 sequence to investigate the prevalence of HPV-ZJ01. The genome of HPV-ZJ01 is 7,358 bp in length with a GC content of 37.8 %. HPV-ZJ01 was predicted to contain six open reading frames (E6, E7, E1, E2, L2, and L1) and a non-coding long control region (LCR). The genome shared the highest overall similarity to HPV-166, with 70.6 % nucleotide sequence identity while its L1 gene shared the highest nucleotide similarity to HPV-162, with 71.1 % sequence identity. Phylogenetic analysis suggested that HPV-ZJ01 belongs to a novel HPV type in the Gamma-PV genus, species Gamma-19, already containing HPV-161, HPV-162 and HPV-166. PCR screening results indicated that none of the other samples were positive for HPV-ZJ01 except the original HPV-ZJ01 positive vaginal swab specimen. The genome sequence of a novel type of species Gamma-19 HPV was characterized. The screening PCR results suggested that HPV-ZJ01 is not associated with any of the cervical cancer samples tested."

According to the news editors, the research concluded: "In order to confirm the prevalence and disease association, if any, for HPV-ZJ01, a further study with different sample types and a larger sample size is needed."

The news editors report that additional information may be obtained by contacting W. Zhang, Jiangsu Univ, Sch Med, Dept. of Microbiol, Zhenjiang 212013, Jiangsu, People's Republic of China. Additional authors for this research include S.X. Yang, Y. Wang, Q. Shen, Y. Yang, X.T. Deng, W. Zhang and E. Delwart.

Varicocele. According to news reporting originating from Esfahan, Iran, by NewsRx correspondents, research stated, "We aimed to compare the expression of phospholipase C zeta (PLC zeta), as one of the main sperm factors involved in oocyte activation, at both RNA and protein levels in fertile men and those with varicocele. This study included 35 individuals with male factor infertility presenting primary infertility with grade II and III unilateral varicocele and 20 fertile men without varicocele."

Our news editors obtained a quote from the research, "Semen parameters were assessed according to WHO 2010. Sperm DNA fragmentation, relative expression of PLC zeta at messenger RNA, and protein levels were evaluated by sperm chromatin structure assay (SCSA), real-time PCR, and Western blot analysis, respectively. The results of this study reveal that the mean relative expression of PLC zeta was significantly lower in individuals with varicocele compared to fertile men at both transcription and translation levels. In addition, the percentage of DNA fragmentation was significantly higher in infertile men with varicocele compared to fertile men. The findings of the present study illustrate that one of the etiologies of reduced fertility associated with varicocele is the low expression of PLC zeta. This effect could subsequently reduce the sperm ability to induce oocyte activation."

According to the news editors, the research concluded: "Therefore, these results hold promise to modify our understanding of reproductive physiology of varicocele state."

The news editors report that additional information may be obtained by contacting M.H. Esfahani, Isfahan Fertil & Infertil Center, Esfahan, Iran. Additional authors for this research include N. Ghazavi-Khorasgani, M. Tavalaee, D. Zohrabi, H. Abbasi and M.H. Esfahani.

Keywords for this news article include: Esfahan, Iran, Asia, Male Urogenital Diseases and Conditions, Cardiovascular Diseases and Conditions, Reproductive Diseases and Conditions, Male Genital Diseases and Conditions, Men's Health, Infertility, Varicocele, Genetics.

Cardiovascular Diseases and Conditions - Venous...

New Findings on Venous Thromboembolism from Thomas Jefferson University Hospital Summarized (Aspirin Can Be Used as Prophylaxis for Prevention of Venous Thromboembolism After Revision Hip and Knee Arthroplasty)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Venous Thromboembolism is the subject of a report. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "The optimal prophylaxis for prevention of venous thromboembolic events (VTEs) after revision total joint arthroplasty (TJA) remains unknown. The objective of this study was to evaluate whether aspirin, known to be effective for
prevention of VTEs after primary arthroplasty, is also effective after revision TJA."

Our news journalists obtained a quote from the research from Thomas Jefferson University Hospital, "We studied 2997 consecutive patients who underwent revision TJA between 2005 and 2013 and were treated with intermittent pneumatic compression devices and either aspirin (534 patients) or warfarin (2463 patients) for VTE prophylaxis. Pertinent data including the incidence of symptomatic VTEs, bleeding events, infection, and mortality were retrieved from our prospectively collected database. The incidence of symptomatic VTEs was significantly higher in the warfarin group at 1.75% (43 of 2463) compared with 0.56% (3 of 534) in the aspirin group (odds ratio: 3.2; 95% CI: 1.03-16.3; P = .03). There was a higher rate of bleeding events with administration of warfarin (1.5%) compared with aspirin (0.4%; P = .02; odds ratio: 4.1; 95% CI: 1.2-34.0). The rate of surgical site infection was similar between the aspirin group and the warfarin group (1.61% and 1.70%, respectively)."

According to the news editors, the research concluded: "Administration of aspirin as prophylaxis against VTEs after revision arthroplasty may be a viable option as it appears to be more effective than warfarin in prevention of symptomatic VTEs and is associated with a lower rate of complications."

Our news journalists report that additional information may be obtained by contacting J. Parvizi, Thomas Jefferson University Hospital, Rothman Inst, Philadelphia, PA 19107, United States. Additional authors for this research include S. Heller, E.B. Smith, M. Maltenfort, A.F. Chen and J. Parvizi.

China, by NewsRx journalists, research stated, "This study evaluated the synergistic effects of the selective serotonin reuptake inhibitor, fluoxetine, in combination with azoles against Candida albicans both in vitro and in vivo and explored the underlying mechanism. MICs, sessile MICs, and time-kill curves were determined for resistant C. albicans."

Funders for this research include Shandong Provincial Natural Science Foundation, Department of Science and Technology of Shandong Province.

The news reporters obtained a quote from the research from Shandong University, "Galleria mellonella was used as a nonvertebrate model for determining the efficacy of the drug combinations against C. albicans in vivo. For the mechanism study, gene expression levels of the SAP gene family were determined by reverse transcription (RT)-PCR, and extracellular phospholipase activities were detected in vitro by the egg yolk agar method. The combinations resulted in synergistic activity against C. albicans strains, but the same effect was not found for the non-albicans Candida strains. For the biofilms formed over 4, 8, and 12 h, synergism was seen for the combination of fluconazole and fluoxetine. In addition, the time-kill curves confirmed the synergism dynamically. The results of the G. mellonella studies agreed with the in vitro analysis. In the mechanism study, we observed that fluconazole plus fluoxetine caused downregulation of the gene expression levels of SAP1 to SAP4 and weakened the extracellular phospholipase activities of resistant C. albicans."

According to the news reporters, the research concluded: "The combinations of azoles and fluoxetine showed synergistic effects against resistant C. albicans may diminish the virulence properties of C. albicans."

For more information on this research see: The Synergistic Effect of Azoles and Fluoxetine against Resistant Candida albicans Strains Is Attributed to Attenuating Fungal Virulence. Antimicrobial Agents and Chemotherapy, 2016;60(10):6179-6188. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting S.J. Sun, Shandong University, Qianfoshan Hosp, Dept. of Pharm, Jinan, Shandong, People's Republic of China. Additional authors for this research include D.M. Guo, L.P. Zhang, D.M. Xu and S.J. Sun.

Science - Food Science

New Food Science Study Findings Have Been Reported by Investigators at Huazhong Agricultural University (Development and Application of a Multiplex Real-Time PCR Assay as an Indicator of Potential Allergenicity
in Citrus Fruits)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Science - Food Science have been presented. According to news reporting out of Wuhan, People's Republic of China, by NewsRx editors, research stated, "The effects of tissue type, harvest maturity, and genetic factors on the expression of genes that related to citrus fruit allergies remain poorly understood. In the present study, a multiplex real-time PCR assay was developed to monitor the expression of citrus allergen genes individually with the advantages of much fewer sample requirements and simultaneously multiple target genes detection."

Funders for this research include Ministry of Education of the People's Republic of China, Ministry of Science and Technology of the People's Republic of China, Ministry of Agriculture of the People's Republic of China, National Natural Science Foundation of China, Independent Scientific and Technological Innovation Foundation, Huazhong Agricultural University.

Our news journalists obtained a quote from the research from Huazhong Agricultural University, "Gene specific primer pairs and Taqman probes of three citrus allergen genes Cit s 1.01, Cit s 2.01, and Cit s 3.01 and the house-keeping gene beta-actin were designed based on gene sequence differences. The PCR results showed that differential expression patterns were found during the ripening process. The expression levels of Cit s 3.01 were much higher than those of Cit s 1.01 and Cit s 2.01 in both peel and pulp tissues among 10 citrus cultivars. Data suggested that Kao Phuang Pummelo could be safely consumed with a potential low risk in allergenicity."

According to the news editors, the research concluded: "Considering that assessing allergenicity is one of the tests in food safety, this assay might also facilitate the breeding and production of 'allergy-friendly' citrus fruits."

Our news journalists report that additional information may be obtained by contacting Z.C. Ma, Huazhong Agricultural University, Minist Educ, Key Lab Hort Plant Biol, Wuhan 430070, People's Republic of China. Additional authors for this research include L. Chen, D.B. Lin, Z.C. Ma and X.X. Deng.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.jafc.6b03410. This DOI is a link to an online electronic document that is either free or for purchase.

New Foot and Mouth Disease Virus Study Findings Reported from GlaxoSmithKline (Pharmacological Characterization of the avb6 Integrin Binding and Internalization Kinetics of the Foot-and-Mouth Disease Virus Derived Peptide A20FMDV2)

2017 JAN 14 (NewsRx) -- By a News Reporter--Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in RNA Viruses - Foot and Mouth Disease Virus. According to news reporting from Stevenage, United Kingdom, by NewsRx journalists, research stated, "A20FMDV2 is a peptide derived from the foot-and-mouth disease virus with a high affinity and selectivity for the alpha-v beta-6 (avb6) arginyl-glycinyl-aspartic acid (RGD)-binding integrin. It has been shown to be an informative tool ligand in pre-clinical imaging studies for selective labelling of the avb6 integrin in a number of disease models."

The news correspondents obtained a quote from the research from GlaxoSmithKline, "In a radioligand binding assay using a radiolabelled form of the peptide ([3H]A20FMDV2), its high affinity (K(D): 0.22 nmol/l) and selectivity (at least 85-fold) for avb6 over the other members of the RGD integrin family was confirmed. [3H]A20FMDV2 avb6 binding could be fully reversed only in the presence of EDTA, whereas a partial reversal was observed in the presence of excess concentrations of an RGD-mimetic small molecule (SC-68448) or unlabelled A20FMDV2. Using flow cytometry on bronchial epithelial cells, the ligand-induced internalization of avb6 by A20FMDV2 and latency-associated peptide-1 was shown to be fast (t (1/2): 1.5 and 3.1 min, respectively), concentration-dependent (EC50: values 1.1 and 3.6 nmol/l, respectively) and was followed by a moderately slow return of integrin to the surface. The results of the radioligand binding studies suggest that the binding of A20FMDV2 to the RGD-binding site on avb6 is required to maintain its engagement with the hypothesised A20FMDV2 synergy site on the integrin. In addition, there is evidence from flow cytometric studies that the RGD-ligand engagement of avb6 post-internalization plays a role in delaying recycling of the integrin to the cell surface."

According to the news reporters, the research concluded: "This mechanism may act as a homeostatic control of membrane avb6 following RGD ligand engagement."

Our news journalists report that additional information may be obtained by contacting R.J. Slack, Fibrosis and Lung Injury Discovery Performance Unit, Respiratory TAU, GlaxoSmithKline, Gunnels Wood Road, Stevenage, Hertfordshire, UK. Additional authors for this research include M. Hafeji, R. Rogers, S.B. Ludbrook, J.F. Marshall, D.J. Flint, S. Pyne and J.C Denyer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000443180. This DOI is a link to an online electronic document that is either free or for purchase.

New Fragile X Syndrome Findings from Stanford University Reported
(The Role of Executive Function in Independent Living Skills in Female Adolescents and Young Adults With Fragile X Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetic Diseases and Conditions - Fragile X Syndrome. According to news reporting originating from Stanford, California, by NewsRx correspondents, research stated, "Fragile X syndrome (FXS) is associated with executive function (EF) and independent living skills (ILS) deficits. We examined the role of childhood EF in ILS during adolescence/early adulthood in females with FXS and two comparison groups in the same age range (matched for IQ [IQ/Age group] and with another genetic condition, Turner syndrome [TS group])."

Our news editors obtained a quote from the research from Stanford University, "EF and ILS were significantly higher for the FXS group than the IQ/Age group but did not differ from the TS group. For the FXS group, age and EF were significant predictors of ILS during adolescence/early adulthood, but there were no statistically significant longitudinal associations between EF and ILS."

According to the news editors, the research concluded: "Our findings suggest that impairments in EF may have a significant effect on ILS in FXS."

The news editors report that additional information may be obtained by contacting A.L. Reiss, Stanford University, CIBSR, Stanford, CA 94305, United States. Additional authors for this research include E.M. Quintin, S.S. Hall and A.L. Reiss.

Friedreich's Ataxia
New Friedreich's Ataxia Study Findings Reported from M. Kearney and Co-Authors (Pharmacological treatments for Friedreich ataxia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Friedreich's ataxia have been published. According to news reporting originating from Wicklow, Ireland, by NewsRx correspondents, research stated, "Friedreich ataxia is a rare inherited autosomal recessive neurological disorder, characterised initially by unsteadiness in standing and walking, slowly progressing to wheelchair dependency usually in the late teens or early twenties. It is associated with slurred speech, scoliosis, and pes cavus."

Our news editors obtained a quote from the research, "Heart abnormalities cause premature death in 60% of people with the disorder. There is no easily defined clinical or biochemical marker and no known treatment. This is the second update of a review first published in 2009 and previously updated in 2012. To assess the effects of pharmacological treatments for Friedreich ataxia. Search methods On 29 February 2016 we searched The Cochrane Neuromuscular Specialised Register, CENTRAL, MEDLINE, EMBASE and CINAHL Plus. On 7 March 2016 we searched ORPHANET and TRIP. We also checked clinical trials registers for ongoing studies. Selection criteria We considered randomised controlled trials (RCTs) or quasi-RCTs of pharmacological treatments (including vitamins) in people with genetically-confirmed Friedreich ataxia. The primary outcome was change in a validated Friedreich ataxia neurological score after 12 months. Secondary outcomes were changes in cardiac status as measured by magnetic resonance imaging or echocardiography, quality of life, mild and serious adverse events, and survival. We excluded trials of duration shorter than 12 months. Data collection and analysis Three review authors selected trials and two review authors extracted data. We obtained missing data from the two RCTs that met our inclusion criteria. We collected adverse event data from included studies. We used standard methodological procedures expected by Cochrane. We identified more than 12 studies that used antioxidants in the treatment of Friedreich ataxia, but only two small RCTs, with a combined total of 72 participants, both fulfilled the selection criteria for this review and published results. One of these trials compared idebenone with placebo, the other compared high-dose versus low-dose coenzyme Q10 and vitamin E (the trialists considered the low-dose medication to be the placebo). We identified two other completed RCTs, which remain unpublished; the interventions in these trials were pioglitazone (40 participants) and idebenone (232 participants). Other RCTs were of insufficient duration for inclusion. In the included studies, the primary outcome specified for the review, change in a validated Friedreich ataxia rating score, was measured using the International Co-operative Ataxia Rating Scale (ICARS). The results did not reveal any significant difference between the antioxidant-treated and the placebo groups (mean difference 0.79 points, 95% confidence interval -1.97 to 3.55 points; low-quality evidence). The published included studies did not assess the first secondary outcome, change in cardiac status as measured by magnetic resonance imaging. Both studies reported changes in cardiac measurements assessed by echocardiogram. The ejection fraction was not measured in the larger of the included studies (44 participants). In the smaller study (28 participants), it was normal at baseline and did not change with treatment. End-diastolic interventricular septal thickness showed a small decrease in the smaller of the two included studies. In the larger included study, there was no decrease, showing significant heterogeneity in the study results; our overall assessment of the quality of evidence for this outcome was very low. Left ventricular mass (LVM) was only available for the smaller RCT, which showed a significant decrease. The
relevance of this change is unclear and the quality of evidence low. There were no deaths related to the treatment with antioxidants. We considered the published included studies at low risk of bias in six of seven domains assessed. One unpublished included RCT, a year-long study using idebenone (232 participants), published an interim report in May 2010 stating that the study reached neither its primary endpoint, which was change in the ICARS score, nor a key cardiological secondary endpoint, but data were not available for verification and analysis. Authors' conclusions Low-quality evidence from two small, published, randomised controlled trials neither support nor refute an effect from antioxidants (idebenone, or a combination of coenzyme Q10 and vitamin E) on the neurological status of people with Friedreich ataxia, measured with a validated neurological rating scale. A large unpublished study of idebenone that reportedly failed to meet neurological or key cardiological endpoints, and a trial of pioglitazone remain unpublished, but on publication will very likely influence quality assessments and conclusions. A single study of idebenone provided low-quality evidence for a decrease in LVM, which is of uncertain clinical significance but of potential importance that needs to be clarified. According to low-quality evidence, serious and non-serious adverse events were rare in both antioxidant and placebo groups."

According to the news editors, the research concluded: "No non-antioxidant agents have been investigated in RCTs of 12 months' duration."

For more information on this research see: Pharmacological treatments for Friedreich ataxia. Cochrane Database of Systematic Reviews, 2016;(8):2373-2413. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news editors report that additional information may be obtained by contacting M. Kearney, Irish Coll Gen Practitioners, Gen Practice, Dunlavin, Wicklow, Ireland. Additional authors for this research include R.W. Orrell, M. Fahey, R. Brassington and M. Pandolfo.

Keywords for this news article include: Wicklow, Ireland, Europe, Friedreich's Ataxia, Central Nervous System Diseases and Conditions, Neurodegenerative Diseases and Conditions, Mitochondrial Diseases and Conditions, Spinal Cord Diseases and Conditions, Cerebellar Diseases and Conditions, Metabolic Diseases and Conditions, Spinocerebellar Degenerations, Brain Diseases and Conditions, Clinical Trials and Studies, Vitamin E, Article Review, Neurologic Manifestations, Protective Agents, Clinical Research, Friedreich Ataxia, Antioxidants, Pharmacology, Dyskinesias, Cardiology, Neurology, Genetics, Therapy.

Fusion Proteins

New Fusion Proteins Findings from Harvard School of Medicine Described (NUP98 Fusion Proteins Interact with the NSL and MLL1 Complexes to Drive Leukemogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Fusion Proteins. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "The nucleoporin 98 gene (NUP98) is fused to a variety of partner genes in multiple hematopoietic malignancies. Here, we demonstrate that NUP98 fusion proteins, including NUP98-HOXA9 (NHA9), NUP98-HOXD13 (NHD13), NUP98-NSD1, NUP98-PHF23, and NUP98-TOPI physically interact with mixed lineage leukemia 1 (MLL1) and the non-specific lethal (NSL)
histone-modifying complexes."

Financial supporters for this research include NIH, Gabrielle's Angel Research Foundation, DoD Bone Marrow Failure Postdoctoral Fellowship, Cure Childhood Cancer Foundation.

The news reporters obtained a quote from the research from the Harvard School of Medicine, "Chromatin immunoprecipitation sequencing illustrates that NHA9 and MLL1 co-localize on chromatin and are found associated with Hox gene promoter regions. Furthermore, MLL1 is required for the proliferation of NHA9 cells in vitro and in vivo. Inactivation of MLL1 leads to decreased expression of genes bound by NHA9 and MLL1 and reverses a gene expression signature found in NUP98-rearranged human leukemias."

According to the news reporters, the research concluded: "Our data reveal a molecular dependency on MLL1 function in NUP98-fusion-driven leukemogenesis."

For more information on this research see: NUP98 Fusion Proteins Interact with the NSL and MLL1 Complexes to Drive Leukemogenesis. Cancer Cell, 2016;30(6):863-878. Cancer Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cancer Cell - www.journals.elsevier.com/cancer-cell/)

**Oncology - Gallbladder Cancer**

**New Gallbladder Cancer Findings from Shanghai Jiao-Tong University Described (The lncRNA MALAT1 functions as a competing endogenous RNA to regulate MCL-1 expression by sponging miR-363-3p in gallbladder cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gallbladder Cancer. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Gallbladder carcinoma (GBC) is an aggressive neoplasm, and the treatment options for advanced GBC are limited. Recently, long non-coding RNAs (lncRNAs) have emerged as new gene regulators and prognostic markers in several cancers."

Financial support for this research came from National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from Shanghai Jiao-
Tong University, "In this study, we found that metastasis-associated lung adenocarcinoma transcript 1 (MALAT1) expression was up-regulated in GBC tissues (P < 0.05). Luciferase reporter assays and RNA pull down assays showed that MALAT1 is a target of miR-363-3p. Real-time quantitative PCR and Western blot analysis indicated that MALAT1 regulated Myeloid cell leukaemia-1 (MCL-1) expression as a competing endogenous RNA (ceRNA) for miR-363-3p in GBC cells. Furthermore, MALAT1 silencing decreased GBC cell proliferation and the S phase cell population and induced apoptosis in vitro. In vivo, tumour volumes were significantly decreased in the MALAT1 silencing group compared with those in the control group. These data demonstrated that the MALAT1/miR-363-3p/MCL-1 regulatory pathway controls the progression of GBC."

According to the news reporters, the research concluded: "Inhibition of MALAT1 expression may be a novel therapeutic strategy for gallbladder cancer."

Our news journalists report that additional information may be obtained by contacting J.D. Wang, Shanghai Jiao Tong University, Sch Med, Xinhua Hosp, Dept. of Gen Surg, Shanghai, People's Republic of China. Additional authors for this research include W.J. Zhang, X.C. Wu, M.Z. Weng, M.D. Zhang, Q. Cai, Di Zhou, J.D. Wang and Z.W. Quan. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jcmm.12920. **Oncology - Gallbladder Cancer**

**New Gallbladder Cancer Study Findings Have Been Reported by Investigators at Department of Pharmacology (Prognostic Significance of HER-2 and p53 Expression in Gallbladder Carcinoma in North Indian Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gallbladder Cancer have been published. According to news reporting originating in New Delhi, India, by NewsRx journalists, research stated, "Proto-oncogenes (HER-2) and tumor suppressor genes (p53) are commonly deregulated in gallbladder cancer (GBC). Available literature discloses skewed data from endemic Asian countries, especially north India."

The news reporters obtained a quote from the research from the Department of Pharmacology, "This study evaluates the prognostic significance of HER-2 and p53 in GBC patients from two major hospitals. Sixty resectable tumor and control specimens were prospectively collected from December 2012 to January 2016. Immunohistochemical staining
was done using monoclonal antibodies to semiquantitatively evaluate HER 2 and p53 protein expression. The criterion for HER-2 positivity was set at >30% tumor cells showing complete, membranous staining while p53 positivity was established at <50% tumor cells showing complete nuclear staining. Clinicopathological correlations were drawn with major clinical outcomes. It was observed that 36.67% (22/60) tumor cases and 5% (3/60) control cases showed strong HER-2 overexpression significantly correlating with sex, T-stage, nodal spread and distant metastasis (p < 0.05), while 33.3% (20/60) positivity was observed for p53 in tumor cases and 1.7% (1/60) in control cases. Multivariate analysis showed HER-2 (p = 0.04; hazard ratio: 2.36; 95% confidence interval: 1.04-5.33) and p53 (p = 0.03; hazard ratio: 5.63; 95% confidence interval: 1.21-26.26) expression to be independent prognostic factors.

According to the research reporters, the research concluded: "Our study thus suggests the plausible role of HER-2 and p53 expression in worse prognosis of GBC in a north Indian population."

For more information on this research see: Prognostic Significance of HER-2 and p53 Expression in Gallbladder Carcinoma in North Indian Patients. Oncology, 2016;91(6):354-360. Oncology - Gastric Cancer

New Gastric Cancer Data Have Been Reported by Researchers at Ulsan University School of Medicine (Use of a clinical pathway in laparoscopic gastrectomy for gastric cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "To evaluate the implementation of a clinical pathway and identify clinical factors affecting the clinical pathway for laparoscopic gastrectomy. A standardized clinical pathway for gastric cancer (GC) patients was developed in 2001 by the GC surgery team at the Asan Medical Center."

The news reporters obtained a quote from the research from the Ulsan University School of Medicine, "We reviewed the collected data of 4800 consecutive patients treated using the clinical pathway following laparoscopic gastrectomy with lymph node dissection for GC
involving intracorporeal and extracorporeal anastomosis. The patients were treated between August 2004 and October 2013 in a single institution. To evaluate the rate of completion and risk factors affecting dropout from the clinical pathway, we used a multivariate logistic regression analysis. The overall completion rate of the clinical pathway for laparoscopic gastrectomy was 84.1% (n=4038). In the comparison between groups of intracorporeal anastomosis and extracorporeal anastomosis patients, the completion rates were 83.88% (n=1740) and 84.36% (n=2071), respectively, showing no statistically significant difference. The main reasons for dropping out were postoperative complications (n=463, 9.7%) and the need for patient observation (n=299, 6.2%). Among the discharged patients treated using the clinical pathway, the number of patients who were readmitted within 30 d due to postoperative complications was 54 (1.1%). In a multivariate analysis, the intraoperative events (OR=2.558) were the most predictable risk factors for dropping out of the clinical pathway. Additionally, being male (OR=1.459), advanced age (OR=1.727), total gastrectomy (OR=2.444), combined operation (OR=1.731), and ASA score (OR=1.889) were significant risk factors affecting the dropout rate from the clinical pathway. Laparoscopic gastrectomy appears to be a good indication for the application of a clinical pathway.

According to the news reporters, the research concluded: "For successful application, patients with risk factors should be managed carefully."

Our news correspondents report that additional information may be obtained by contacting H.S. Kim, Hee Sung Kim, Byung Sik Kim, Dept. of Gastric Surgery, Asan Medical Center, Ulsan University School of Medicine, Seoul 138-736, South Korea. Additional authors for this research include S.O. Kim and B.S Kim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v21.i48.13507. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Gastric Cancer**

**New Gastric Cancer Findings Has Been Reported by Investigators at University Medical Center (Esophageal and Gastric Cancer Pearl: a nationwide clinical biobanking project in the Netherlands)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Gastric Cancer. According to news reporting out of Utrecht, Netherlands, by NewsRx editors, research stated, "Esophageal and gastric cancer is associated with a poor prognosis since many patients develop recurrent disease. Treatment requires specific expertise and a structured multidisciplinary approach."
Our news journalists obtained a quote from the research from University Medical Center, "In the Netherlands, this type of expertise is mainly found at the University Medical Centers (UMCs) and a few specialized nonacademic centers. Aim of this study is to implement a national infrastructure for research to gain more insight in the etiology and prognosis of esophageal and gastric cancer and to evaluate and improve the response on (neoadjuvant) treatment. Clinical data are collected in a prospective database, which is linked to the patients' biomaterial. The collection and storage of biomaterial is performed according to standard operating procedures in all participating UMCs as established within the Parelsoer Institute. The collected biomaterial consists of tumor biopsies, blood samples, samples of malignant and healthy tissue of the resected specimen and biopsies of recurrence. The collected material is stored in the local biobanks and is encoded to respect the privacy of the donors. After approval of the study was obtained from the Institutional Review Board, the first patient was included in October 2014. The target aim is to include 300 patients annually."

According to the news editors, the research concluded: "The eight UMCs of the Netherlands collaborated to establish a nationwide database of clinical information and biomaterial of patients with esophageal and gastric cancer. Due to the national coverage, a high number of patients are expected to be included. This will provide opportunity for future studies to gain more insight in the etiology, treatment and prognosis of esophageal and gastric cancer."

Oncology - Gastric Cancer

New Gastric Cancer Findings Has Been Reported by Researchers at Kyoto Prefectural University (Histological evaluation for chemotherapeutic responses of metastatic lymph nodes in gastric cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Gastric Cancer are discussed in a new report. According to news originating from Kyoto, Japan, by NewsRx correspondents, research stated, "To investigate the effect of preoperative chemotherapy (pre-CTX) for metastatic lymph nodes (MLNs) of gastric cancer (GC). A retrospective cohort of patients with advanced GC, who underwent pre-CTX followed by gastrectomy, was reviewed."
Our news journalists obtained a quote from the research from Kyoto Prefectural University. "The histological tumor regression grade (TRG), which considered the percentage of residual cancer in the visible tumor bed, was applied to primary tumors and individual MLNs: G1a (complete response), G1b (<10%), G2 (10%-50%) and G3 (>50%). The clinical response to pre-CTx was retrospectively evaluated using only MLNs information, and we compared the histological and clinical evaluations of MLNs. Twenty-eight patients were enrolled. A total of 438 MLNs were retrieved, and 22 (5%), 48 (11%), 63 (14%) and 305 (70%) LNs were assigned as G1a, G1b, G2 and G3, respectively. Stratification of the residual MLNs based on the TRGs was as follows: 28 G1b MLNs (9%), 48 G2 MLNs (15%), and 253 G3 MLNs (76%) in the D1 region; 20 (23%), 15 (17%), and 52 (60%) in the D2 region, respectively. However, no significant correlation was found between TRGs in MLNs and clinical response in the subgroup for which evaluation of clinical response was available."

According to the news editors, the research concluded: "Pre-CTx does not provide any outstanding histological benefit for MLNs, and an appropriate D2 lymphadenectomy should routinely be performed to offer the chance of curative resection."

The news correspondents report that additional information may be obtained from O. Kinoshita, Osamu Kinoshita, Daisuke Ichikawa, Shuhei Komatsu, Kazuma Okamoto, Eigo Otsuji, Dept. of Surgery, Division of Digestive Surgery, Kyoto Prefectural University of Medicine, Kyoto 602-8566, Japan. Additional authors for this research include D. Ichikawa, Y. Ichijo, S. Komatsu, K. Okamoto, M. Kishimoto, A. Yanagisawa and E. Otsuji.

Oncology - Gastric Cancer

New Gastric Cancer Findings Has Been Reported by Researchers at Otto-von-Guericke-University (Expression of aurora kinase A correlates with the Wnt-modulator RACGAP1 in gastric cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gastric Cancer is the subject of a report. According to news originating from Magdeburg, Germany, by NewsRx correspondents, research stated, "Canonical Wnt signaling is involved in gastric carcinogenesis. The aim of this study was to identify the link between Wnt signaling and aurora kinase A (AURKA), a target for the treatment of gastrointestinal cancers."

Financial supporters for this research include Seventh Framework Programme, Bundesministerium fur Bildung und Forschung.
Our news journalists obtained a quote from the research from Otto-von-Guericke-
University. "Publicly available microarray data were used to identify phenotype-specific protein-
protein interaction (PPI) subnetworks. The in silico analysis revealed a gastric cancer-specific
PPI subnetwork consisting of 2745 proteins and 50,935 interactions. We focused on the link of
AURKA to a Wnt-specific interaction module consisting of 92 proteins. There was a direct
association of AURKA with Rac GTPase-activating protein 1 (RACGAP1), as well as with
CTNBB1 (b-catenin) and CDKN1A as second-order interactors. Differential expression analysis
revealed a significant downregulation of both AURKA and RACGAP1 in gastric cancer
compared to noncancer controls. Biopsies from a prospective cohort of 56 patients with gastric
cancer (32 intestinal type, 24 diffuse type) and 20 noncancer controls were used for validation of
the identified targets. The RT-PCR data confirmed a strong correlation of AURKA and
RACGAP1 gene expression both in the tumor, the tumor-adjacent and the tumor-distant
mucosa. RACGAP1 in the tumor was also associated with CTNBB1 expression, and inversely
associated with CDKN1A gene expression. Immunohistochemistry confirmed expression of the
RACGAP1 protein in gastric cancer and the tumor-adjacent mucosa. RACGAP1 expression was
not associated with tumor stage, grading, Lauren type, Helicobacter pylori infection, or age."

According to the news editors, the research concluded: "AURKA is directly
associated with the expression of RACGAP1, a modulator of the canonical Wnt signaling
pathway."

For more information on this research see: Expression of aurora kinase A correlates

Oncology - Gastric Cancer

New Gastric Cancer Findings Reported from Tongji Medical College
(Detection and Characterization of Metastatic Cancer Cells in the
Mesogastrium of Gastric Cancer Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators discuss new findings in Oncology - Gastric Cancer.
According to news reporting originating in Hubei, People's Republic of China, by NewsRx
journalists, research stated, "Gastric cancer is the second leading cause of cancer death
worldwide. Here, we propose a novel type of tumor metastasis designated as Metastasis V in
gastric cancer."

The news reporters obtained a quote from the research from Tongji Medical College, "Metastasis V is defined as the appearance of cancer cells in the mesogastrium with perigastric adipose tissue. To detect its incidence and characterize its clinic pathological features, large cross sectional tissue analysis of mesogastrium from 74 patients were used. Metastasis V was detected in 1 of 40 (2.5%) patients with early gastric cancer, 8 of 34 (24%) patients with advanced gastric cancer. The mean distance of Metastasis V from gastric wall was approximately 2.6 cm. Metastasis V was closely associated with tumor invasion depth, along with a number of positive lymph node metastasis. The prognosis of patients with Metastasis V was significantly (p <0.05) worse than those with tumor cell-free mesogastrium."

According to the news reporters, the research concluded: "These findings indicate that by using whole-sectional analysis, Metastasis V can be detected in the mesogastrium of gastric cancer patients, and also suggests that it may be a risk factor for patient survival after radical surgery."

For more information on this research see: Detection and Characterization of Metastatic Cancer Cells in the Mesogastrium of Gastric Cancer Patients. Plos One, 2015;10 (11):e0142970. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news correspondents report that additional information may be obtained by contacting D. Xie, Tongji Cancer Research Institute, Tongji Hospital, Tongji Medical College in Huazhong University of Science and Technology, Wuhan, Hubei, People's Republic of China. Oncology - Gastric Cancer

New Gastric Cancer Findings from China Pharmaceutical University Discussed (E platinum, a newly synthesized platinum compound, induces apoptosis through ROS-triggered ER stress in gastric carcinoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gastric Cancer is the subject of a report. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Gastric cancer (GC) is still one of the leading causes of death in cancer-related diseases. In this study, we aimed to investigate the antitumor effect of E Platinum, a newly platinum-based chemotherapeutic agent bearing the basic structure of Oxaliplatin, in a variety of gastric carcinoma cells and the underlying mechanisms."

The news correspondents obtained a quote from the research from China Pharmaceutical University, "We demonstrated that E Platinum significantly induced apoptosis in gastric cancer cells via mitochondrial apoptotic pathway as a result of increased reactive
oxygen species (ROS). We also found that E Platinum enhanced Ca2+ flux out from the endoplasmic reticulum by increasing the protein expression of IP3R type 1 (IP3R1) and decreasing the expression of ERp44. Dysfunction of Ca2+ homeostasis in endoplasmic reticulum (ER) leads to accumulation of unfolded proteins and ER stress. Mechanically, E Platinum increased ER stress associated protein expression such as GRP78, p-PERK, p-eIF2, ATF4, and CHOP. However, knocking down CHOP reversed E Platinum-induced apoptosis by blocking mitochondrial apoptotic pathway. Furthermore, 10mg/kg of E Platinum significantly suppressed BGC-823 tumor growth in vivo without toxicity, which correlated with induction of apoptosis and expression of ER stress related proteins in tumor tissues. Taken together, E Platinum inhibited tumor growth and induced apoptosis by ROS-mediated ER stress activation both in vitro and in vivo."

According to the news reporters, the research concluded: "Our study indicated that E Platinum may be a potential and effective treatment for gastric cancer in clinical."

Our news journalists report that additional information may be obtained by contacting Z. Chen, China Pharmaceutical University, Expt & Teaching Center Med Basis Pharm, Nanjing 210009, Jiangsu, People's Republic of China. Additional authors for this research include Q.L. Guo, L. Tao, L. Zhao, Y. Chen, T. An, Z. Chen and R. Fu.

Oncology - Gastric Cancer

New Gastric Cancer Findings from Department of Oncology Reported (Autophagy Protects from Raddeanin A-Induced Apoptosis in SGC-7901 Human Gastric Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Gastric Cancer are presented in a new report. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "Raddeanin A (RA) is an extractive from Anemone raddeana Regel, a traditional Chinese medicine. The aim of this study is to assess the efficacy of RA against human gastric cancer (GC) cells (SGC-7901) and explore its mechanism."

Our news journalists obtained a quote from the research from the Department of Oncology, "MTT assay showed that RA inhibition of proliferation of SGC-7901 cells increased in a dose-dependent manner. Flow cytometry analysis and Hoechst 33258 staining showed that RA induced apoptosis on SGC-7901 cells. Meanwhile, it induced autophagy. Western blotting analysis showed that the RA induces apoptosis and autophagy by activating p38 MAPK pathway and inhibiting mTOR pathway. Further studies showed that autophagy inhibition could protect
According to the news editors, the research concluded: "RA can induce SGC-7901 cell apoptosis and autophagy by activating p38 MAPK pathway. And autophagy can protect SGC-7901 cells from apoptosis induced by RA."

For more information on this research see: Autophagy Protects from Raddeanin A-Induced Apoptosis in SGC-7901 Human Gastric Cancer Cells. Oncology - Gastric Cancer

New Gastric Cancer Findings from Sun Yat Sen University Described (Low expression of MAP1LC3B, associated with low Beclin-1, predicts lymph node metastasis and poor prognosis of gastric cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Gastric Cancer are presented in a new report. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Since the roles of autophagy in gastric cancer remain unclear, we aim to investigate the expression of autophagy-related proteins MAP1LC3B and Beclin-1 in human gastric cancer and discuss their clinical significance and correlation with prognosis of patients with gastric cancer. A total of 160 consecutive patients with gastric cancer who had undergone gastrectomy were enrolled in this study."

Financial support for this research came from Doctoral Fund of Ministry of Education of China.

The news reporters obtained a quote from the research from Sun Yat Sen University, "The expressions of MAP1LC3B and Beclin-1 were assessed by immunohistochemistry. The protein expression rates were analyzed with chi(2) and Fisher's exact tests. Survival analysis (overall survival (OS) and relapse-free survival (RFS)) was determined using the Kaplan-Meier method and Cox's proportional hazard regression model. Both the expressions of MAP1LC3B and Beclin-1 were lower in gastric cancer tissues than adjacent normal tissues (57 vs. 82 %, p = 0.007; 72 vs. 88 %, p = 0.046, respectively). Relativity analysis indicated MAP1LC3B expression was positively correlated with Beclin-1 expression (r = 0.424, p< 0.001). Both the MAP1LC3B-high-expression patients and Beclin-1-high-expression patients have longer OS
time and RFS time than MAP1LC3B-low-expression patients and Beclin-1-low-expression patients (MAP1LC3B: both p < 0.001; Beclin-1: p = 0.014, p = 0.015, respectively). High simultaneous MAP1LC3B and Beclin-1 expressions were associated with longer OS and RFS compared with low simultaneous MAP1LC3B and Beclin-1 expressions (56.77 vs. 24.42 months, p < 0.001; 53.56 vs. 22.33 months, p < 0.001, respectively). Multivariate survival analysis showed both MAP1LC3B and Beclin-1 were independent prognostic factors for OS time (p = 0.016, p = 0.041, respectively). However, MAP1LC3B (p = 0.022) was an independent prognostic factor for RFS. Moreover, low expressions of MAP1LC3B and Beclin-1 were significantly associated with lymph node metastasis (p = 0.007, p = 0.030, respectively).

According to the news reporters, the research concluded: "The loss of MAP1LC3B, correlated with loss of Beclin-1, was observed in gastric cancer and correlated with poor prognosis and lymph node metastasis of gastric cancer patients."

For more information on this research see: Low expression of MAP1LC3B, associated with low Beclin-1, predicts lymph node metastasis and poor prognosis of gastric cancer. Tumor Biology, 2016;37(11):15007-15017. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. Oncology - Gastric Cancer

New Gastric Cancer Findings from University of Medicine Described (Patient preferences for palliative treatment of locally advanced or metastatic gastric cancer and adenocarcinoma of the gastroesophageal junction: a choice-based conjoint ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Gastric Cancer are discussed in a new report. According to news reporting originating in Mannheim, Germany, by NewsRx journalists, research stated, "Decisions on palliative chemotherapy (CT) for locally advanced or metastatic gastric cancer (mGC) require trade-offs between potential benefits and risks for patients. Healthcare providers and payers agree that patient-preferences should be considered."

The news reporters obtained a quote from the research from the University of Medicine, "We conducted a choice-based conjoint (CBC) analysis study in pre-treated patients from Germany with mGC or locally advanced or metastatic adenocarcinoma of the gastroesophageal junction (mGEJ-Ca), to evaluate their preferences when hypothetically..."
selecting a CT regimen. German oncologists and gastroenterologists were contacted to identify patients with mGC or mGEJ-Ca who had completed >= 2 cycles of palliative CT in first or later lines of therapy (CT ongoing or complete). The primary objective was to quantify patient preferences for palliative CT by CBC analysis. Six in-depth qualitative interviews identified 3 attributes: treatment tolerability, quality of life in terms of ability of self-care, and additional survival benefit. The CBC matrix was constructed with 4 factor levels per attribute and each participant was presented with 15 different iterations of these levels. A minimum of 50 participants was needed. Consenting patients completed the CBC survey, choosing systematically among profiles. CBC models were estimated by multinomial logistic regression (MLR) and hierarchical Bayesian (HB) analysis. Estimates of importance for each attribute and factor-level were calculated. Fifty-five patients participated in the CBC survey (78.2% male, median age 63 years, 81.8% currently receiving CT). Across this sample, low treatment toxicity was ranked highest (44.6% relative importance, MLR analysis), followed by ability to self-care (32.3%), and an additional survival benefit of up to 3 months (3 months 23.1%, 2 months 18.3%, 1 month 11.2%). The MLR analysis showed high validity (certainty 37.9%, chi square p < 0.01, root-likelihood 0.505). The HB analysis yielded similar results. Patients' preferences related to a new hypothetical palliative CT of mGC or mGEJ-Ca can be assessed by CBC analysis."

According to the news reporters, the research concluded: "Although in real-life, patients initially need to decide on CT before they have any experience, and patients' varied experiences with CT will have impacted specific responses, low toxicity and self-care ability were considered as most important by this group of patients with mGC or mGEJ-Ca."

For more information on this research see: Patient preferences for palliative treatment of locally advanced or metastatic gastric cancer and adenocarcinoma of the gastroesophageal junction: a choice-based conjoint analysis study from Germany. *BMC Cancer*, 2016;16():1-9. *BMC Cancer* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. **Oncology - Gastric Cancer**

**New Gastric Cancer Study Findings Have Been Reported by Investigators at University College (The first European family with gastric adenocarcinoma and proximal polyposis of the stomach: case report and review of the literature)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Researchers detail new data in Oncology - Gastric Cancer. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "Gastric adenocarcinoma and proximal polyposis of the stomach (GAPPS) has to date been recognized in only 8 families worldwide. Recently, different point mutations within the Ying Yang 1 (YY1) binding motif in promoter 1B of the APC gene were assigned as causal in 6 families with GAPPS."

The news reporters obtained a quote from the research from University College, "We diagnosed GAPPS across 3 generations in a Czech white family. The proband's mother died of gastric cancer at 49 years of age. The proband died of gastric cancer at 56 years of age. All 3 of the proband's daughters inherited polyposis, involving exclusively the gastric fundus and body, with relative sparing of the lesser curve. The daughters have all been regularly surveyed endoscopically. Polyposis progressed rapidly with intestinal differentiated low-grade and high-grade dysplasia present on polypectomy specimens 5 years after the original diagnosis. On this basis, all 3 of the proband's daughters were scheduled for prophylactic total gastrectomy. Unfortunately, the middle daughter presented with generalized gastric adenocarcinoma and died at the age of 26 years. The other 2 daughters (aged 30 and 23 years) underwent total gastrectomy within 6 weeks of their sister's death; histology of surgical specimens showed gastric adenocarcinoma stage IA (pT1a, N0, M0) in both cases. Bi-directional Sanger sequencing of promoter 1B revealed a point mutation (c.-191 T>C) in all 3 daughters of the proband."

According to the news reporters, the research concluded: "Atypical endoscopic progression of the fundic gland polyposis, with the presence of dysplasia on polypectomy specimens and genetic testing with recently discovered mutations in promoter 1B of the APC gene might help clinicians to decide whether prophylactic gastrectomy should be performed."

Our news correspondents report that additional information may be obtained by contacting D. Kohoutova, UCL, Div Surg & Intervent Sci, London, United Kingdom. Additional authors for this research include D. Kohoutova, M. Podhola, S. Rejchrt, M. Minarik, L. Benesova, M. Lesko and J. Bures.

**New Gastric Cancer Study Findings Have Been Reported by Researchers at Chinese Academy of Medical Sciences (DNA Methylation mediated down-regulating of MicroRNA-33b and its role in gastric cancer)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gastric Cancer. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "The discovery of microRNAs (miRNAs) provides a new and powerful tool for studying the mechanism, diagnosis and treatment of human cancers. Currently, down-regulation of tumor suppressive miRNAs by CpG island hypermethylation is emerging as a common hallmark of cancer."

The news correspondents obtained a quote from the research from the Chinese Academy of Medical Sciences, "Here, we reported that the down-regulation of miR-33b was associated with pM stage of gastric cancer (GC) patients. Ectopic expression of miR-33b in HGC-27 and MGC-803 cells inhibited cell proliferation, migration and invasion, which might be due to miR-33b targeting oncogene c-Myc. Moreover, enhanced methylation level of the CpG island upstream of miR-33b in GC patients with down-regulated miR-33b was confirmed by methylation-specific PCR (MSP) amplification. Furthermore, re-introduction of miR-33b significantly suppressed tumorigenesis of GC cells in the nude mice."

According to the news reporters, the research concluded: "MiR-33b acts as a tumor suppressor and hypermethylation of the CpG island upstream of miR-33b is responsible for its down-regulation in gastric cancer."

For more information on this research see: DNA Methylation mediated down-regulating of MicroRNA-33b and its role in gastric cancer. Scientific Reports, 2016;6():18824. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting H. Yin, Dept. of Biochemistry, Institute of Basic Medical Sciences, Chinese Academy of Medical Sciences (CAMS) & Peking Union Medical College (PUMC), Beijing 100005, People's Republic of China. Oncology - Gastric Cancer

New Gastric Cancer Study Findings Have Been Reported by Researchers at Hannover School of Medicine (Different gastric microbiota compositions in two human populations with high and low gastric cancer risk in Colombia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gastric Cancer have been presented. According to news reporting originating from Hannover, Germany, by NewsRx correspondents, research stated, "Inhabitants of T?querres in the Colombian Andes have a 25-fold higher risk of gastric cancer than inhabitants of the coastal town Tumaco, despite similar H. pylori"
prevalences. The gastric microbiota was recently shown in animal models to accelerate the development of *H. pylori*-induced precancerous lesions. 20 individuals from each town, matched for age and sex, were selected, and gastric microbiota analyses were performed by deep sequencing of amplified 16S rDNA."

Our news editors obtained a quote from the research from the Hannover School of Medicine, "In parallel, analyses of *H. pylori* status, carriage of the cag pathogenicity island and assignment of *H. pylori* to phylogeographic groups were performed to test for correlations between *H. pylori* strain properties and microbiota composition. The gastric microbiota composition was highly variable between individuals, but showed a significant correlation with the town of origin. Multiple OTUs were detected exclusively in either Tumaco or T?querres. Two operational taxonomic units (OTUs), Leptotrichia wadei and a Veillonella sp., were significantly more abundant in T?querres, and 16 OTUs, including a Staphylococcus sp. were significantly more abundant in Tumaco. There was no significant correlation of *H. pylori* phylogeographic population or carriage of the cagPAI with microbiota composition."

According to the news editors, the research concluded: "From these data, testable hypotheses can be generated and examined in suitable animal models and prospective clinical trials."

For more information on this research see: Different gastric microbiota compositions in two human populations with high and low gastric cancer risk in Colombia. *Scientific Reports*, 2016;6():18594. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting I. Yang, Institute of Medical Microbiology and Hospital Epidemiology, Hannover Medical School, Carl-Neuberg-Str 1, 30625 Hannover, Germany. Additional authors for this research include S. Woltemate, M.B. Piazuelo, L.E. Bravo, M.C. Yepez, J. Romero-Gallo, A.G. Delgado, K.T. Wilson, R.M. Peek, P. Correa, C. Josenhans, J.G. Fox and S. Suerbaum.

**Oncology - Gastric Cancer**

**New Gastric Cancer Study Findings Have Been Reported by Researchers at Peking University Third Hospital (Helicobacter Pylori and Gastric Cancer: Clinical Aspects)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gastric Cancer. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Although *Helicobacter pylori* (*H. pylori*) is considered as the main etiological factor for gastric cancer, the strategy of screening and treating the oncogenic bacterium is still controversial. The objective was to evaluate the status and progress of the cognition about the relationship between *H. pylori* infection and gastric cancer from a clinical aspect."
Our news journalists obtained a quote from the research from Peking University Third Hospital. "The data used in this review were mainly from the PubMed articles published in English from 1984 to 2015. Clinical research articles were selected mainly according to their level of relevance to this topic. Gastric cancer is the fifth most common malignancy and the third leading cause of cancer deaths worldwide. The main etiological factor for gastric cancer is H. pylori infection. About 74.7-89.0% gastric cancer was related to H. pylori infection. Up to date, some regional gastric cancer prevention programs including the detection and treatment of H. pylori infection are under way. Current data obtained from the randomized controlled trials suggest that population-based H. pylori screening and treatment is feasible and cost-effective in preventing gastric cancer; however, a population-based H. pylori eradication campaign would potentially lead to bacterial resistance to the corresponding antibiotics, as well as a negative impact on the normal flora."

According to the news editors, the research concluded: "The important questions of feasibility, program costs, appropriate target groups for intervention, and the potential harm of mass therapy with antibiotics must first be answered before implementing any large-scale program."

The news correspondents report that additional information may be obtained from L.Y. Zhou, Dept. of Gastroenterology, Peking University Third Hospital, Beijing 100191, People's Republic of China.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0366-6999.169107. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Gastric Cancer

New Gastric Cancer Study Findings Have Been Reported by Researchers at Yonsei University College of Medicine (Laparoscopic gastric cancer surgery: Current evidence and future perspectives)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Gastric Cancer are discussed in a new report. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Laparoscopic gastrectomy has been widely accepted as a standard alternative for the treatment of early-stage gastric adenocarcinoma because of its favorable short-term
outcomes. Although controversies exist, such as establishing clear indications, proper preoperative staging, and oncologic safety, experienced surgeons and institutions have applied this approach, along with various types of function-preserving surgery, for the treatment of advanced gastric cancer.

Our news journalists obtained a quote from the research from the Yonsei University College of Medicine, "With technical advancement and the advent of state-of-the-art instruments, indications for laparoscopic gastrectomy are expected to expand as far as locally advanced gastric cancer. Laparoscopic gastrectomy appears to be promising; however, scientific evidence necessary to generalize this approach to a standard treatment for all relevant patients and care providers remains to be gathered. Several multicenter, prospective randomized trials in high-incidence countries are ongoing, and results from these trials will highlight the short- and long-term outcomes of the approach."

According to the news editors, the research concluded: "In this review, we describe up-to-date findings and critical issues regarding laparoscopic gastrectomy for gastric cancer."

The news correspondents report that additional information may be obtained from T. Son, Taeil Son, Woo Jin Hyung, Dept. of Surgery, Yonsei University College of Medicine, Seoul 120-752, South Korea.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i2.727. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Gastric Cancer

New Gastric Cancer Study Findings Have Been Reported from Maastricht University (Use of Proton Pump Inhibitors and Risks of Fundic Gland Polyps and Gastric Cancer: Systematic Review and Meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gastric Cancer is the subject of a report. According to news reporting out of Maastricht, Netherlands, by NewsRx editors, research stated, "There have been increasing numbers of case reports and observational studies of adverse events in patients receiving long-term therapy with proton pump inhibitors (PPIs). The effects of PPI therapy on risks of fundic gland polyps (FGPs) and gastric cancer have received considerable attention."

Our news journalists obtained a quote from the research from Maastricht University, "We performed a systematic review with a meta-analysis of randomized controlled trials and observational studies that assessed these risks. We searched the PUBMED, EMBASE, and
Cochrane Central Register of Controlled Trials databases for relevant studies published through July 2015. We calculated pooled odds ratio for FGPs and the risk ratio for gastric cancer in PPI users compared with PPI nonusers using fixed and random-effects models. We analyzed data from 12 studies, comprising more than 87,324 patients: 1 randomized controlled trial reporting the effect of PPIs on gastric polyps (location not specified), 6 cohort and 1 case-control studies on FGPs, and 1 cohort and 3 case-control studies on gastric cancer. Pooled odds ratios for FGPs were 1.43 (95% confidence interval, 1.24-1.64) and 2.45 (95% confidence interval, 1.24-4.83) from fixed- and random-effects models, respectively. The pooled risk ratio for gastric cancer was 1.43 (95% confidence interval, 1.23-1.66) from each model. We observed significant heterogeneity among studies reporting on FGPs, but not among studies reporting on gastric cancer. Based on a systematic review with meta-analysis, long-term use of PPIs (1.2 months) is associated with an increased risk of FGPs."

According to the news editors, the research concluded: "PPI therapy might also increase the risk of gastric cancer, but this association could be biased, because of the limited number of studies and possible confounding factors."

Our news journalists report that additional information may be obtained by contacting T.D. An, Maastricht University, Medical Center, Dept. of Clin Epidemiol & Med Technol Assessment, NL-6202 AZ Maastricht, Netherlands. Additional authors for this research include B. Spaetgens, A.W. Hoes, N.J. de Wit and C.D.A. Stehouwer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cgh.2016.05.018. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Gastric Cancer

New Gastric Cancer Study Findings Recently Were Reported by Researchers at University of Pennsylvania (Neoadjuvant therapy for gastric cancer: current evidence and future directions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Gastric Cancer is now available. According to news reporting originating in Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Although surgical resection remains the only potentially curative treatment for gastric cancer (GC), poor long-term outcomes with resection alone compel a multimodality approach to this disease. Multimodality strategies vary widely; while adjuvant approaches are typically favored in Asia and the United States (USA), a growing body of evidence supports neoadjuvant
and/or perioperative strategies in locally advanced tumors."

The news reporters obtained a quote from the research from the University of Pennsylvania, "Neoadjuvant approaches are particularly attractive given the morbidity associated with surgical management of GC and the substantial risk of omission of adjuvant therapy. The specific advantages of chemoradiotherapy (CRT) compared to chemotherapy have not been well defined, particularly in the preoperative setting and trials aimed at determining the optimal elements and sequencing of therapy are underway."

According to the news reporters, the research concluded: "Future studies will also define the role of targeted and biologic therapies."

Our news correspondents report that additional information may be obtained by contacting A.D. Newton, 1 Dept. of Surgery, 2 Division of Hematology, Oncology, Dept. of Medicine, University of Pennsylvania Perelman School of Medicine, Philadelphia, PA, United States. Additional authors for this research include J. Datta, A. Loaiza-Bonilla, G.C. Karakousis and R.E Roses.

Keywords for this news article include: Oncology, Philadelphia, Pennsylvania, United States, Article Review, Gastric Cancer, Gastroenterology, Drugs and Therapies, Neoadjuvant Therapy, North and Central America, Combined Modality Therapy.

Oncology - Gastric Cancer

New Gastric Cancer Study Findings Reported from Ningbo University (Novel long non-coding RNA GACAT3 promotes gastric cancer cell proliferation through the IL-6/STAT3 signaling pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gastric Cancer is the subject of a report. According to news reporting from Zhejiang, People's Republic of China, by NewsRx journalists, research stated, "Long non-coding RNAs (lncRNAs) play an important role in cancer occurrence and development. We previously demonstrated that lncRNA gastric cancer-associated transcript 3 (GACAT3) was positively correlated with TNM stages, tumor size, and distant metastasis of patients with gastric cancer."

Financial supporters for this research include National Natural Science Foundation of China, Natural Science Foundation of Ningbo, Scientific Innovation Team Project of Ningbo.

The news correspondents obtained a quote from the research from Ningbo University, "However, the role of GACAT3 in gastric cancer remains unclear. In this study, to investigate its function, we synthesized small interference RNAs (siRNAs) against GACTA3 and developed a GACAT3 overexpression vector (pcDNA3-GACAT3), respectively. The siRNA-mediated knockdown of GACAT3 significantly decreased cell proliferation of the gastric cancer HGC-27 cells, in which GACAT3 is overexpressed. Furthermore, GACAT3 overexpression in gastric cancer SGC-7901 cells promoted cell growth. Moreover, GACAT3 expression in HGC-27 cells was greatly upregulated by IL-6 treatment in a concentration-dependent manner. In contrast, siRNA-mediated knockdown of STAT3 decreased GACAT3 expression even in the presence of IL-6."
According to the news reporters, the research concluded: "These results demonstrated that as a downstream target of the IL6/STAT3 signaling, IncRNA GACAT3 promotes gastric cancer cell growth suggesting that GACAT3 is an inflammatory response gene and may be served as a valuable potential target for the treatment of gastric cancer."

For more information on this research see: Novel long non-coding RNA GACAT3 promotes gastric cancer cell proliferation through the IL-6/STAT3 signaling pathway. Tumor Biology, 2016;37(11):14895-14902. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Digestive System Diseases and Conditions -...

New Gastroenteritis Study Findings Have Been Reported by Investigators at University of Calgary (Ondansetron Oral Dissolve Tab Vs. Oral Solution In Children Presenting To The Emergency Department With Gastroenteritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Gastroenteritis. According to news originating from Calgary, Canada, by NewsRx correspondents, research stated, "Ondansetron is often used in the emergency department (ED) to promote oral rehydration in children with acute gastroenteritis (AGE), yet medication solutions administered orally may be poorly tolerated in this population. We compared the tolerability of ondansetron oral dissolve tab (ODT) to oral solution (OS) in children presenting to the ED with AGE."

Our news journalists obtained a quote from the research from the University of Calgary, "Using alternate-day controlled clinical trial design, children aged 3 months to 10 years received either ondansetron ODT or OS. Our primary outcome was early vomiting (within 15 min of drug administration). The secondary outcome was intravenous (i.v.) fluid administration. There were 462/534 eligible children who met study criteria. Demographics, severity, and duration of illness were similar between groups. Using intention-to-treat analysis, early vomiting occurred in 8/209 ODT vs. 19/253 OS children (3.8% vs. 7.5%; odds ratio [OR] 0.49; 95% confidence interval [CI] 0.18-1.21). Using as-treated analysis, 6/222 (2.7%) children receiving ODT experienced early vomiting, compared with 21/221 (9.5%) of the OS group (OR 0.26; 95% CI 0.09-0.70). The proportion of children discharged without i.v. fluids was not different
(intention-to-treat: ODT = 91.4% (191/209), OS = 94.1% (238/253), OR 1.49, 95% CI 0.69-3.28; as-treated: ODT = 92.3% (205/222), OS = 93.2% (206/221), OR 0.88, 95% CI 0.40-1.93).

Using a conservative intention-to-treat analysis, we found that children presenting to an ED with AGE did not have statistically less early vomiting with ondansetron ODT as compared with OS. However, our as-treated analysis demonstrates that children receiving ondansetron ODT experienced early vomiting approximately one-third as often as those receiving OS.

According to the news editors, the research concluded: "The rate of i. v. fluid administration was no different between groups regardless of the type of analysis used."

The news correspondents report that additional information may be obtained from G.C. Thompson, University of Calgary, Alberta Childrens Hosp, Dept. of Pediat, Calgary, AB, Canada. Additional authors for this research include E.L. Morrison, D. Chaulk, H. Wobma, S. Kwong and D.W. Johnson.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jemermed.2016.06.051. This DOI is a link to an online electronic document that is either free or for purchase.

**Gastroenterology**

**New Gastroenterology Findings from National University Described [Laparoendoscopic Transgastric Enucleation of an awkardly sited Peri-Cardial Gastrointestinal Stromal Tumour (GIST): A Multi- Modal Approach]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gastroenterology. According to news reporting originating from Kuala Lumpur, Malaysia, by NewsRx correspondents, research stated, "In the modern era of surgery, minimally invasive surgery is increasingly applied for excision of gastrointestinal stromal tumors. Site, size and tumor location are important factors that affect the surgical approach and excision."

Our news editors obtained a quote from the research from National University, "We performed a laparoendoscopic transgastric enucleation of a 4-cm pericardial endophytic gastrointestinal stromal tumor (GIST) using an energy device. The surgery was successful and post-operative recovery uneventful. No tumor recurrence was detected on surveillance gastroscopy. In the safe hands of a well-trained laparoscopic upper gastrointestinal surgeon,
pericardial GIST can be enucleated safely by this method."

According to the news editors, the research concluded: "The avoidance of surgical staplers is not only cost-effective, but also reduces the risk of associated complications."

The news editors report that additional information may be obtained by contacting N.R. Kosai, Departments of 1Surgery, Minimally Invasive, Upper Gastrointestinal and Bariatric Surgery Unit, Universiti Kebangsaan Malaysia Medical Centre, 56000 Cheras, Kuala Lumpur, Malaysia. Additional authors for this research include R. Rajan, E.J. Roslan, P.A. Sutton, M. Mustafa and S. Das.

Keywords for this news article include: Asia, Surgery, Malaysia, Cardiology, Pericardial, Kuala Lumpur, Gastroenterology.

Gastroenterology

New Gastroenterology Study Findings Have Been Reported from Weill Cornell Medical College (Leaky gut - concept or clinical entity?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gastroenterology is now available. According to news reporting originating from Houston, Texas, by NewsRx editors, the research stated, "This article evaluates the current status of the gut barrier in gastrointestinal disorders. The gut barrier is a complex, multicomponent, interactive, and bidirectional entity that includes, but is not restricted to, the epithelial cell layer."

Our news editors obtained a quote from the research from Weill Cornell Medical College, "Intestinal permeability, the phenomenon most readily and commonly studied, reflects just one (albeit an important one) function of the barrier that is intimately related to and interacts with luminal contents, including the microbiota. The mucosal immune response also influences barrier integrity; effects of inflammation per se must be accounted for in the interpretation of permeability studies in disease states. Although several aspects of barrier function can be assessed in man, one must be aware of exactly what a given test measures, as well as of its limitations. The temptation to employ results from a test of paracellular flux to imply a role for barrier dysfunction in disorders thought to be based on bacterial or macromolecular translocation must be resisted. Although changes in barrier function have been described in several gastrointestinal disorders, their primacy remains to be defined."

According to the news editors, the research concluded: "At present, few studies support efficacy for an intervention that improves barrier function in altering the natural history of a disease process."

For more information on this research see: Leaky gut - concept or clinical entity? Current Opinion In Gastroenterology, 2016;32(2):74-9. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Gastroenterology - journals.lww.com/co-gastroenterology/pages/default.aspx)

The news editors report that additional information may be obtained by contacting E.M. Quigley, Division of Gastroenterology and Hepatology, Lynda K and David M Underwood
New Gastroparesis Data Have Been Reported by Investigators at University of Louisville (Treating an oft-unrecognized and troublesome entity: using gastric electrical stimulation to reduce symptoms of malignancy-associated gastroparesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Digestive System Diseases and Conditions - Gastroparesis have been presented. According to news originating from Louisville, Kentucky, by NewsRx correspondents, research stated, "Malignancy-associated gastroparesis (MAG) is a cause of morbidity in cancer patients but therapies are lacking. Gastric electrical stimulation (GES) is a novel treatment for MAG."

Our news journalists obtained a quote from the research from the University of Louisville, "Here, we describe 19 patients with MAG who underwent temporary GES placement. Nineteen patients (6 males, 13 females) with various malignancies were reviewed for symptom scores and physiologic measures at baseline and after temporary GES placement. Symptoms were scored by three variables: nausea (N), vomiting (V), and GI total symptom score (TSS). Physiologic profiles were measured by solid and liquid phase gastric emptying scans (GET) at 1, 2, and 4 h and cutaneous electrogastrogram (EGG) and mucosal electrogram (EG) frequencies. Symptoms were measured for 5 days after temporary endoscopic GES placement, and measures were repeated post GES placement. Baseline GET results displayed delayed gastric emptying in 16 of 19 patients (mean solid retention 21.7 % at 4 h, normal < 10 %; mean liquid retention 10.4 % at 4 h, normal < 5 %). Cutaneous EGG (mean frequency 5.5 cpm) and EG (mean proximal frequency 5.1 cpm; mean distal frequency 5.1 cpm) showed evidence of neuromuscular dysfunction (normal 2.5-3.3 cpm). Symptom scores in N, V, and TSS showed statistically significant reduction after GES placement. A small sample of patients with MAG and receiving temporary GES experienced symptom improvement, with less change on gastric emptying time or gastric electrical amplitude or frequency. GES may provide a potential therapeutic option for symptomatic management of MAG and evaluation of these MAG patients after permanent GES placement is ongoing."

According to the news editors, the research concluded: "Prospective studies of MAG using temporary and permanent GES may be warranted."

For more information on this research see: Treating an oft-unrecognized and troublesome entity: using gastric electrical stimulation to reduce symptoms of malignancy-associated gastroparesis. New Gene Therapy Data Have Been Reported by Researchers at Tianjin University (Multitargeting Gene Delivery Systems for Enhancing the Transfection of Endothelial Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biotechnology - Gene Therapy is the subject of a report. According to news reporting out of Tianjin, People's Republic of China, by NewsRx editors, research stated, "Gene therapy demonstrates promising prospects on cardiovascular diseases. However, nonviral gene delivery system has relatively low transfection efficiency, especially for endothelial cells (ECs)."

Funders for this research include National Natural Science Foundation of China, State Key Project of Research and Development, International Science & Technology Cooperation Program of China, Wenzhou government's startup fund, Wenzhou Science and Technology Bureau.

Our news journalists obtained a quote from the research from Tianjin University, "Herein, typical cell-penetrating peptide (TAT), nuclear localization signals (NLSs), and REDV functional peptide have been used to prepare multitargeting complexes. These complexes exhibit higher transfection efficiency owing to the targeting sequences of REDV and NLSs as well as the cell-penetrating function of TAT. The multifunction of the complexes provides high cell uptake, endo/lysosomal escape, and nucleus accumulation of the encapsulated DNA."

According to the news editors, the research concluded: "Thus these multitargeting complexes can provide a potential platform for gene delivery, especially for EC transfection."

Our news journalists report that additional information may be obtained by contacting Y.K. Feng, Tianjin University, Helmholtz Zentrum, Geesthacht Joint Lab Biomat &
New General Surgery Findings Has Been Reported by Investigators at Metaxa Cancer Hospital (Re-admissions for delayed complications after cytoreductive surgery and HIPEC)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Surgery - General Surgery. According to news reporting from Piraeus, Greece, by NewsRx journalists, research stated, "Peritoneal metastasis (PM) is currently treated with the complex procedure of cytoreductive surgery and hyperthermic intra-peritoneal chemotherapy (CRS_HIPEC). This procedure presents high morbidity and mortality rates, but they have only been examined in the immediate post-operative period."

The news correspondents obtained a quote from the research from Metaxa Cancer Hospital, "The aim of our study is to present, describe and analyze the post-operative events, secondary to a cytoreductive surgery and HIPEC procedure that occurs after the patients' discharge from the hospital. We examine retrospectively 219 patients who were discharged from our hospital from the initial 230 patients with PM, who were operated on from August 2005 to August 2015 and underwent CRS and HIPEC. Complications are investigated from the patient's discharge date until the 90th post-operative day, and are categorized with the Clavien-Dindo classification. We identified 17 patients (7.8%) who developed late complications. No major differences in patient characteristics were identified between this group of 17 patients and the rest, apart from a slightly higher PCI (23.5 vs. 22.3). Mean length of stay at the re-admission was 11.7 days. 5 of the patients (29.4%) had to be re-operated on, whereas we found a mortality of 11.8% (2/17 patients). The most common complications involved abdominal abscesses (17.6%), ureteral strictures (17.6%) and enterocutaneous fistulae (17.6%). Our study highlights the late complications following CRS plus HIPEC procedures, that occur after the patient's discharge from the hospital, an issue that has not been investigated thoroughly yet and may have serious impact on the post-operative quality of life."

According to the news reporters, the research concluded: "The role of adjuvant chemotherapy following CRS and HIPEC procedures in the onset of such complications appears to be important and needs further investigation."

For more information on this research see: Re-admissions for delayed complications after cytoreductive surgery and HIPEC. Acta Chirurgica Belgica, 2016;116(2):96-100. Acta Chirurgica Belgica can be contacted at: Acta Medical Belgica, Avenue Circulaire 138 A, B-1180 Brussels, Belgium.

New Genetics Findings from Xavier University of Louisiana Reported (Mutant TP53 disrupts age-related accumulation patterns of somatic mutations in multiple cancer types)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Genetics. According to news reporting out of New Orleans, Louisiana, by NewsRx editors, research stated, "Most cancers are driven by somatic mutations in proto-oncogenes and tumor suppressor genes. Genetic changes in a tumor may accumulate in the tissue self-renewal phase prior to neoplasm."

Financial supporters for this research include NIH NIMHD-RCMI, DOD ARO, Louisiana Cancer Research Consortium (LCRC), NIH.

Our news journalists obtained a quote from the research from the Xavier University of Louisiana, "The risk of sporadic mutations increases with age. In this regard, a positive association between patient age and the accumulated mutation burden in tumors exists for many cancer types. However, the reported lines of evidence for such a connection are still limited. TP53 is the most frequently mutated cancer gene. The encoded p53 protein plays crucial roles in DNA repair. Hereby, we speculate that mutant TP53 can disrupt the age-related accumulation patterns of somatic mutations in tumors. We performed linear model analysis on the clinically-annotated genomic data published by TOGA. We found that there was a significant interaction between TP53 genotype (mutant versus wild-type) and patient age at the initial clinical date on somatic mutation burden for five cancers. That is, the regression coefficients of mutation burden on patient age were significant (p < 0.05) for TP53 wild-type tumors but not the mutant counterparts. This disparity was further verified by comparing the group-specific regression coefficients."

According to the news editors, the research concluded: "This finding confirmed our hypothesis and provided unique insights into p53-related tumorigenesis such as the potential temporal order of driver mutations."

Our news journalists report that additional information may be obtained by contacting K. Zhang, Xavier Univ Louisiana, Dept. of Comp Sci, New Orleans, LA 70125, United States. Additional authors for this research include E.K. Flemington and K. Zhang.

**Genetics**

**New Genetics Study Findings Have Been Reported by Investigators at Mount Sinai School of Medicine (Emerging roles of p53 and other tumour-suppressor genes in immune regulation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Genetics have been presented. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Tumour-suppressor genes are indispensable for the maintenance of genomic integrity. Recently, several of these genes, including those encoding p53, PTEN, RB1 and ARF, have been implicated in immune responses and inflammatory diseases."

Our news journalists obtained a quote from the research from the Mount Sinai School of Medicine, "In particular, the p53 tumour-suppressor pathway is involved in crucial aspects of tumour immunology and in homeostatic regulation of immune responses. Other studies have identified roles for p53 in various cellular processes, including metabolism and stem cell maintenance. Here, we discuss the emerging roles of p53 and other tumour-suppressor genes in tumour immunology, as well as in additional immunological settings, such as virus infection. This relatively unexplored area could yield important insights into the homeostatic control of immune cells in health and disease and facilitate the development of more effective immunotherapies."

According to the news editors, the research concluded: "Consequently, tumour-suppressor genes are emerging as potential guardians of immune integrity."

The news correspondents report that additional information may be obtained from S.A. Aaronson, Mt Sinai Sch Med, Dept. of Oncol Sci, New York, NY 10029, United States. Additional authors for this research include A. Mandinova, S.A. Aaronson and S.W. Lee.

**New Genetics Study Findings Recently Were Reported by Researchers at Rutgers State University (MicroRNA Control of p53)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics. According to news reporting originating from New Brunswick, New Jersey, by NewsRx correspondents, research stated, "Tumor suppressor p53 plays a central role in tumor suppression. As a transcription factor, p53 mainly exerts its tumor suppressive function through transcriptional regulation of many target genes."

Our news editors obtained a quote from the research from Rutgers State University, "To maintain the proper function of p53, p53 protein level and activity are exquisitely controlled by a group of positive and negative regulators in cells. Thus, p53, its regulators, and regulated genes form a complicated p53 signaling network. microRNAs (miRNAs) are a group of endogenous small non-coding RNA molecules. miRNAs play an important role in regulation of gene expression by blocking translational protein synthesis and/or degrading target mRNAs. Recent studies have demonstrated that p53 and its network are regulated by miRNAs at multiple levels. Some miRNAs regulate the level and function of p53 through directly targeting p53, whereas some other miRNAs target regulators of p53, such as MDM2 and MDM4, to indirectly regulate the activity and function of p53. On the other hand, p53 also regulates the transcriptional expression and the biogenesis of a group of miRNAs, which contributes to the tumor suppressive function of p53. p53 is the most frequently mutated gene in human cancer. Many tumor-associated mutant p53, which have gain-of-function activities in tumorigenesis independently of wild type p53, can regulate the expression of different miRNAs and modulate the biogenesis of specific miRNAs to promote tumorigenesis."

According to the news editors, the research concluded: "These findings have demonstrated that miRNAs are important regulators and mediators of p53 and its signaling pathway, which highlights a pivotal role of miRNAs in the p53 network and cancer. J. Cell. Biochem. 118: 7-14, 2017."

The news editors report that additional information may be obtained by contacting J. Liu, Rutgers State University, Rutgers Canc Inst New Jersey, Dept. of Radiat Oncol, New Brunswick, NJ 08903, United States. Additional authors for this research include C. Zhang, Y.H. Zhao and Z.H. Feng.

New Genetics Study Findings Recently Were Reported by Researchers at Yonsei University College of Medicine (Cellular localization of NRF2 determines the self-renewal and osteogenic differentiation potential of human MSCs via the P53-SIRT1 axis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "NRF2 (nuclear factor erythroid-derived 2-like 2) plays an important role in defense against oxidative stress at the cellular level. Recently, the roles of NRF2 in embryonic and adult stem cells have been reported, but its role in maintaining self-renewal and differentiation potential remains unknown."

Our news editors obtained a quote from the research from the Yonsei University College of Medicine, "We studied the mechanisms of NRF2 action in mesenchymal stem cells (MSCs) derived from human bone marrow. We found that the cellular localization of NRF2 changed during prolonged cell passage and osteogenic differentiation. Blocking the nuclear import of NRF2 using ochratoxin A (OTA) induced the loss of the self-renewal and osteogenic potential of early-passage (EP) MSCs. Conversely, reinforcing the nuclear import of NRF2 using tert-butylhydroquinone (t-BHQ) improved the self-renewal capacity and maintained the differentiation potential in the osteogenic lineage of EP MSCs. Real-time quantitative PCR and western blot analysis showed that NRF2 positively regulates sirtuin 1 (SIRT1) at the mRNA and protein levels via the negative regulation of p53. The self-renewal and osteogenic potential suppressed in OTA-treated or NRF2-targeting small hairpin RNA (shRNA)-infected EP MSCs were rescued by introducing small interfering RNA (siRNA) targeting p53. t-BHQ treatment in late-passage (LP) MSCs, which lost their self-renewal and osteogenic potential, reversed these effects. In LP MSCs treated with t-BHQ for &sim;7 days, the phosphorylation and nuclear localization of NRF2 improved and SIRT1 protein level increased, whereas p53 protein levels decreased. Therefore, our results suggest that NRF2 plays an important role in regulating p53 and SIRT1 to maintain MSC stemness."

According to the news editors, the research concluded: "This study is the first to establish a functional link between NRF2 and SIRT1 expression in the maintenance of MSC self-renewal and differentiation potential."

For more information on this research see: Cellular localization of NRF2 determines the self-renewal and osteogenic differentiation potential of human MSCs via the P53-SIRT1 axis. New Genitourinary Tract Agents Study Results Reported from Konkuk University (Oxytocin Protects Hippocampal Memory and Plasticity from Uncontrollable Stress)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Genitourinary Tract Agents is the subject of a report. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "The hippocampus is vulnerable to uncontrollable stress and is enriched with oxytocin receptors, but their interactive influences on hippocampal functioning are unknown. This study aimed to determine the effects of intranasal oxytocin administration on stress-induced alterations in synaptic plasticity and spatial memory in male rats."

The news correspondents obtained a quote from the research from Konkuk University, "While vehicle-administered stressed rats showed impairment in long-term potentiation, enhancement in long-term depression, and weakened spatial memory, these changes were not observed in oxytocin-administered stressed rats. To reveal the potential signaling mechanism mediating these effects, levels of phosphorylated extracellular signal-regulated kinases (pERK) in the hippocampus was examined. Western blotting showed that oxytocin treatment blocked stress-induced alterations of pERK. Additionally, the oxytocin receptor antagonist L-368,899 inhibited the oxytocin's protective effects on hippocampal memory to stress. Thus, intranasal administration of oxytocin reduced stress effects on hippocampal synaptic plasticity and memory in rats via acting on oxytocin receptors and regulating ERK activity."

According to the news reporters, the research concluded: "This study suggests that exogenous oxytocin may be a therapeutically effective means to counter the detrimental neurocognitive effects of stress."

For more information on this research see: Oxytocin Protects Hippocampal Memory and Plasticity from Uncontrollable Stress. Scientific Reports, 2015;5():18540. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

New Genomics Findings Has Been Reported by Investigators at Johns Hopkins University Bloomberg School of Public Health (Whole-genome analysis of the methylome and hydroxymethylome in normal and malignant lung and liver)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biotechnology - Genomics have been published. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "DNA methylation at the 5-position of cytosine (5mC) is an epigenetic modification that regulates gene expression and cellular plasticity in development and disease. The ten-eleven translocation (TET) gene family oxidizes 5mC to 5-hydroxy-methylcytosine (5hmC), providing an active mechanism for DNA demethylation, and it may also provide its own regulatory function."

Financial support for this research came from National Institutes of Health (NIH). The news reporters obtained a quote from the research from the Johns Hopkins University Bloomberg School of Public Health, "Here we applied oxidative bisulfite sequencing to generate whole-genome DNA methylation and hydroxymethylation maps at single-base resolution in human normal liver and lung as well as paired tumor tissues. We found that 5hmC is significantly enriched in CpG island (CGI) shores while depleted in CGIs themselves, especially in active genes, which exhibit a bimodal distribution of 5hmC around CGI that corresponds to H3K4me1 modifications. Hydroxymethylation on promoters, gene bodies, and transcription termination regions (TTRs) showed strong positive correlation with gene expression within and across tissues, suggesting that 5hmC is a marker of active genes and could play a role in gene expression mediated by DNA demethylation. Comparative analysis of methylomes and hydroxymethylomes revealed that 5hmC is significantly enriched in both tissue-specific DMRs (t-DMRs) and cancer-specific DMRs (c-DMRs), and 5hmC is negatively correlated with methylation changes, especially in non-CGI-associated DMRs. These findings revealed novel reciprocity between epigenetic markers at CGI shores corresponding to differential gene expression in normal tissues and matching tumors."

According to the news reporters, the research concluded: "Overall, our study provided a comprehensive analysis of the interplay between the methylome, hydroxymethylome, and histone modifications during tumorigenesis."

For more information on this research see: Whole-genome analysis of the methylome and hydroxymethylome in normal and malignant lung and liver. Genome Research, 2016;26(12):1730-1741. Genome Research can be contacted at: Cold Spring Harbor Lab Press, Publications Dept, 1 Bungtown Rd, Cold Spring Harbor, NY 11724, USA.

Our news correspondents report that additional information may be obtained by contacting A. Feinberg, Johns Hopkins Bloomberg Sch Public Hlth, Dept. of Mental Hlth, Baltimore, MD 21205, United States. Additional authors for this research include Y. Liu, T. Salz, K.D. Hansen and A. Feinberg.

New Genomics Findings from Laval University Described (RNA expression profile of calcified bicuspid, tricuspid, and normal human aortic valves by RNA sequencing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology - Genomics. According to news originating from Quebec City, Canada, by NewsRx correspondents, research stated, "The molecular mechanisms leading to premature development of aortic valve stenosis (AS) in individuals with a bicuspid aortic valve are unknown. The objective of this study was to identify genes differentially expressed between calcified bicuspid aortic valves (BAVc) and tricuspid valves with (TAVc) and without (TAVn) AS using RNA sequencing (RNA-Seq)."

Financial support for this research came from Gouvernement du Canada | Canadian Institutes of Health Research (Instituts de recherche en santé du Canada). Our news journalists obtained a quote from the research from Laval University, "We collected 10 human BAVc and nine TAVc from men who underwent primary aortic valve replacement. Eight TAVn were obtained from men who underwent heart transplantation. mRNA levels were measured by RNA-Seq and compared between valve groups. Two genes were upregulated, and none were downregulated in BAVc compared with TAVc, suggesting a similar gene expression response to AS in individuals with bicuspid and tricuspid valves. There were 462 genes upregulated and 282 downregulated in BAVc compared with TAVn. In TAVc compared with TAVn, 329 genes were up and 170 were downregulated. A total of 273 upregulated and 147 downregulated genes were concordantly altered between BAVc vs. TAVn and TAVc vs. TAVn, which represent 56 and 84% of significant genes in the first and second comparisons, respectively. This indicates that extra genes and pathways were altered in BAVc. Shared pathways between calcified (BAVc and TAVc) and normal (TAVn) aortic valves were also more extensively altered in BAVc. The top pathway enriched for genes differentially expressed in calcified compared with normal valves was fibrosis, which support the remodeling process as a therapeutic target."

According to the news editors, the research concluded: "These findings are relevant to understand the molecular basis of AS in patients with bicuspid and tricuspid valves."

For more information on this research see: RNA expression profile of calcified bicuspid, tricuspid, and normal human aortic valves by RNA sequencing. *Physiological Genomics*, 2016;48(10):749-761. *Physiological Genomics* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

The news correspondents report that additional information may be obtained from Y. Bosse, Laval University, Dept. of Mol Med, Quebec City, PQ, Canada. Additional authors for this research include A. Droit, J. Tremblay-Marchand, N. Gaudreault, D. Kalavrouziotis, F. Dagenais, J.G. Seidman, S.C. Body, P. Pibarot, P. Mathieu and Y. Bosse.

New Genomics and Genetics Study Findings Recently Were Reported by Researchers at Mayo Clinic (Molecular and Functional Characterization of Rare CACNA1C Variants in Sudden Unexplained Death in the Young)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genomics and Genetics have been published. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Perturbations in the CACNA1C-encoded L-type calcium channel a-subunit have been linked recently to heritable arrhythmia syndromes, including Timothy syndrome, Brugada syndrome, early repolarization syndrome, and long QT syndrome. These heritable arrhythmia syndromes may serve as a pathogenic basis for autopsy-negative sudden unexplained death in the young (SUDY)."

Our news editors obtained a quote from the research from Mayo Clinic, "However, the contribution of CACNA1C mutations to SUDY is unknown. We set out to determine the spectrum, prevalence, and pathophysiology of rare CACNA1C variants in SUDY. Mutational analysis of CACNA1C was conducted in 82 SUDY cases using polymerase chain reaction, denaturing high-performance liquid chromatography, and direct sequencing. Identified variants were engineered using site-directed mutagenesis, and heterologously expressed in TSA-201 or HEK293 cells. Two SUDY cases (2.4%) harbored functional variants in CACNA1C. The E850del and N2091S variants involve highly conserved residues and localize to the II-III linker and C-terminus, respectively. Although observed in publically available exome databases, both variants confer abnormal CaV1.2 electrophysiological characteristics. Examination of the electrophysiological properties revealed the E850del mutation in CACNA1C led to a 95% loss-of-function in ICa, and the N2091S variant led to a 105% gain-of-function in ICa. Additionally, N2091S led to minor kinetic alterations including a -3.4 mV shift in V1/2 of activation."

According to the news editors, the research concluded: "This study provides molecular and functional evidence that rare CACNA1C genetic variants may contribute to the underlying pathogenic basis for some cases of SUDY in either a gain or loss-of-function mechanism."

For more information on this research see: Molecular and Functional Characterization of Rare CACNA1C Variants in Sudden Unexplained Death in the Young. Congenital Heart Disease, 2016;11(6):683-692. Congenital Heart Disease can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com/; Congenital Heart Disease - onlinelibrary.wiley.com/journal/10.1111/(ISSN) 1747-0803)

The news editors report that additional information may be obtained by contacting M.J. Ackerman, Mayo Clinic, Dept. of Pediat, Div Pediat Cardiol, Rochester, MN, United States. Additional authors for this research include N.J. Boczek, H. Barajas-Martinez, D. Hu, D. Ye, D.J. Tester, C. Antzelevitch and M.J. Ackerman.
New Giant Cell Arteritis Study Results from Mayo Clinic Described
(Evaluating the Incidence of Arteritic Ischemic Optic Neuropathy and Other Causes of Vision Loss from Giant Cell Arteritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Vascular Diseases and Conditions - Giant Cell Arteritis is the subject of a report. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "To determine the incidence of permanent visual loss from giant cell arteritis (GCA). Retrospective, population-based cohort."

The news correspondents obtained a quote from the research from Mayo Clinic, "All residents of Olmsted County, Minnesota, diagnosed with GCA between January 1, 1950, and December 31, 2009. All cases of GCA were identified using the Rochester Epidemiology Project (REP), which is a record-linkage system of medical records for all patient-physician encounters among Olmsted County, Minnesota, residents. The medical records were reviewed to identify and determine the cause of permanent vision loss among patients with GCA. Systemic symptoms of GCA and visual outcomes also were determined. Incidence and outcomes of permanent vision loss from GCA. Among the 245 new cases of GCA over the 60-year period, 20 patients (8.2%) had permanent vision loss due to GCA. The frequency of arteritic ischemic optic neuropathy (A-ION) was 6.9% (95% confidence interval [CI], 4.0-11.1) accounting for 85% of cases of permanent vision loss. The frequency of central retinal artery occlusion (CRAO) was 1.6% (95% CI, 0.4-4.2), and the frequency of cilioretinal artery occlusion was 0.4% (95% CI, 0.01-2.3). The population-based age-and sex-adjusted annual incidence of A-ION from GCA among persons aged >= 50 years was 1.3 (95% CI, 0.7-2.0) per 100,000 population. Some 20% of patients with permanent vision loss from GCA had vision loss without constitutional symptoms of GCA. Overall, there was no significant difference between presenting and final visual acuities. These population-based data provide the most accurate incidence of permanent vision loss from GCA."

According to the news reporters, the research concluded: "This study confirms that visual outcomes from GCA-related vision loss are poor and that 20% of patients with permanent visual loss from GCA can present without systemic symptoms of GCA."

Our news journalists report that additional information may be obtained by contacting J.J. Chen, Mayo Clinic, Dept. of Ophthalmol, Rochester, MN 55905, United States. Additional authors for this research include J.A. Leavitt, C. Fang, C.S. Crowson, E.L. Matteson and K.J. Warrington.

New Glaucoma Findings from University of California Described (Deep Retinal Layer Microvasculature Dropout Detected by the Optical Coherence Tomography Angiography in Glaucoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Eye Diseases and Conditions - Glaucoma are discussed in a new report. According to news reporting out of La Jolla, California, by NewsRx editors, research stated, "To investigate factors associated with dropout of the parapapillary deep retinal layer microvasculature assessed by optical coherence tomography angiography (OCTA) in glaucomatous eyes. Cross-sectional study. Seventy-one eyes from 71 primary open-angle glaucoma (POAG) patients with beta-zone parapapillary atrophy (beta PPA) enrolled in the Diagnostic Innovations in Glaucoma Study."

Our news journalists obtained a quote from the research from the University of California, "Parapapillary deep-layer microvasculature dropout was defined as a complete loss of the microvasculature located within the deep retinal layer of the beta PPA from OCTA-derived optic nerve head vessel density maps by standardized qualitative assessment. Circumpapillary vessel density (cpVD) within the retinal nerve fiber layer (RNFL) also was calculated using OCTA. Choroidal thickness and presence of focal lamina cribrosa (LC) defects were determined using swept-source optical coherence tomography. M-EASURES: Presence of parapapillary deep-layer microvasculature dropout. Parameters including age, systolic and diastolic blood pressure, axial length, intraocular pressure, disc hemorrhage, cpVD, visual field (VF) mean deviation (MD), focal LC defects beta PPA area, and choroidal thickness were analyzed. Parapapillary deep-layer microvasculature dropout was detected in 37 POAG eyes (52.1%). Eyes with microvasculature dropout had a higher prevalence of LC defects (70.3% vs. 32.4%), lower cpVD (52.7% vs. 58.8%), worse VF MD (-9.06 dB vs. -3.83 dB), thinner total choroidal thickness (126.5 μm vs. 169.1 μm), longer axial length (24.7 mm vs. 24.0 mm), larger beta PPA (1.2 mm² vs. 0.76 mm²), and lower diastolic blood pressure (74.7 mmHg vs. 81.7 mmHg) than those without dropout (P < 0.05, respectively). In the multivariate logistic regression analysis, higher prevalence of focal LC defects (odds ratio [OR], 6.27; P = 0.012), reduced cpVD (OR, 1.27; P = 0.002), worse VF MD (OR, 1.27; P = 0.001), thinner choroidal thickness (OR, 1.02; P = 0.014), and lower diastolic blood pressure (OR, 1.16; P = 0.003) were associated significantly with the dropout. Systemic and ocular factors including focal LC defects more advanced glaucoma, reduced RNFL vessel density, thinner choroidal thickness, and lower
diastolic blood pressure were factors associated with the parapapillary deep-layer microvasculature dropout in glaucomatous eyes."

According to the news editors, the research concluded: "Longitudinal studies are required to elucidate the temporal relationship between parapapillary deep-layer microvasculature dropout and systemic and ocular factors."

Our news journalists report that additional information may be obtained by contacting R.N. Weinreb, University of California, Dept. of Ophthalmol, La Jolla, CA 92093, United States. Oncology - Glioblastomas

New Glioblastomas Findings from Provincial Hospital Discussed
(Icaritin inhibits the invasion and epithelial-to-mesenchymal transition of glioblastoma cells by targeting EMMPRIN via PTEN/AKt/HIF-1a signalling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Glioblastomas have been presented. According to news reporting originating in Shandong, People's Republic of China, by NewsRx journalists, research stated, "Icaritin, a hydrolytic product of icarin from the Epimedium genus, exerts anti-tumour effects on a variety of tumor cell types, mainly by inhibiting cell proliferation and inducing apoptosis. However, little is known about the role of icaritin in cancer invasion and epithelial-to-mesenchymal transition (EMT)."

The news reporters obtained a quote from the research from Provincial Hospital, "In the present study, the glioblastoma (GBM) cell line U87MG was used as a model to investigate the effects of icaritin on the invasion and EMT of cancer cells. The results showed that icaritin significantly inhibited the invasion and EMT of GBM cells by targeting extracellular matrix metalloproteinase (EMMPRIN). Furthermore, the findings strongly indicate that the modulatory effect of icaritin on EMMPRIN is mediated via the PTEN/Akt/HIF-1a signalling pathway."

According to the news reporters, the research concluded: "The data provide the first experimental evidence of the inhibitory effect of icaritin on cancer cell invasion and EMT, thus highlighting the potential of icaritin to be employed as a promising anti-cancer agent in the
treatment of GBM."

For more information on this research see: Icaritin inhibits the invasion and epithelial-to-mesenchymal transition of glioblastoma cells by targeting EMMPRIN via PTEN/AKt/HIF-1α signalling. *Clinical and Experimental Pharmacology and Physiology*, 2015;42(12):1296-307. **New Glioblastomas Findings from University of Otago Reported (A combination of tyrosine kinase inhibitors, crizotinib and dasatinib for the treatment of glioblastoma multiforme)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Glioblastomas have been published. According to news reporting from Dunedin, New Zealand, by NewsRx journalists, research stated, "Glioblastoma multiforme (GBM) is the most common and aggressive primary brain tumor. Despite the advances in surgery, radiotherapy and chemotherapy, patient survival averages only 14.6 months."

The news correspondents obtained a quote from the research from the University of Otago, "In most GBM tumors, tyrosine kinases show increased activity and/or expression and actively contribute to the development, recurrence and onset of treatment resistance; making their inhibition an appealing therapeutic strategy. We compared the cytotoxicity of 12 tyrosine kinase inhibitors in vitro. A combination of crizotinib and dasatinib emerged as the most cytotoxic across established and primary human GBM cell lines. The combination treatment induced apoptotic cell death and polyploidy. Furthermore, the combination treatment led to the altered expression and localization of several tyrosine kinase receptors such as Met and EGFR and downstream effectors as such as SRC. Furthermore, the combination treatment reduced the migration and invasion of GBM cells and prevented endothelial cell tube formation in vitro. Overall, our study demonstrated the broad specificity of a combination of crizotinib and dasatinib across multiple GBM cell lines."

According to the news reporters, the research concluded: "These findings provide insight into the development of alternative therapy for the treatment of GBM."

For more information on this research see: A combination of tyrosine kinase inhibitors, crizotinib and dasatinib for the treatment of glioblastoma multiforme. *Oncotarget*, 2015;6(35):37948-64.

Oncology - Glioblastomas

New Glioblastomas Study Findings Have Been Reported by Researchers at New York Medical College (ATP-site binding inhibitor effectively targets mTORC1 and mTORC2 complexes in glioblastoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Glioblastomas is the subject of a report. According to news reporting from Valhalla, New York, by NewsRx journalists, research stated, "The PI3K-AKT-mTOR signaling axis is central to the transformed phenotype of glioblastoma (GBM) cells, due to frequent loss of tumor suppressor PTEN (phosphatase and tensin homolog deleted on chromosome 10). The mechanistic target of rapamycin (mTOR) kinase is present in two cellular multi-protein complexes, mTORC1 and mTORC2, which have distinct subunit composition, substrates and mechanisms of action."

The news correspondents obtained a quote from the research from New York Medical College, "Targeting the mTOR protein is a promising strategy for GBM therapy. However, neither of these complexes is fully inhibited by the allosteric inhibitor of mTOR, rapamycin or its analogs. Herein, we provide evidence that the combined inhibition of mTORC1/2, using the ATP-competitive binding inhibitor PP242, would effectively suppress GBM growth and dissemination as compared to an allosteric binding inhibitor of mTOR. GBM cells treated with PP242 demonstrated significantly decreased activation of mTORC1 and mTORC2, as shown by reduced phosphorylation of their substrate levels, p70 S6K(Thr389) and AKT(Ser473), respectively, in a dose-dependent manner. Furthermore, insulin induced activation of these kinases was abrogated by pretreatment with PP242 as compared with rapamycin. Unlike rapamycin, PP242 modestly activates extracellular regulated kinase (ERK1/2), as shown by expression of pERK(Thr202/Tyr204). Cell proliferation and S-phase entry of GBM cells was significantly suppressed by PP242, which was more pronounced compared to rapamycin treatment. Lastly, PP242 significantly suppressed the migration of GBM cells, which was associated with a change in cellular behavior rather than cytoskeleton loss."

According to the news reporters, the research concluded: "These results underscore the potential therapeutic use of the PP242, a novel ATP-competitive binding inhibitor of mTORC1/2 kinase, in suppression of GBM growth and dissemination."

For more information on this research see: ATP-site binding inhibitor effectively

**Oncology - Glioblastomas**

**New Glioblastomas Study Results Reported from Hoag Memorial Hospital (Upfront boost Gamma Knife "leading-edge" radiosurgery to FLAIR MRI-defined tumor migration pathways in 174 patients with glioblastoma multiforme: a 15-year assessment of a ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Glioblastomas. According to news reporting originating in Newport Beach, California, by NewsRx journalists, research stated, "Glioblastoma multiforme (GBM) is composed of cells that migrate through the brain along predictable white matter pathways. Targeting white matter pathways adjacent to, and leading away from, the original contrast-enhancing tumor site (termed leading-edge radiosurgery [LERS]) with single-fraction stereotactic radiosurgery as a boost to standard therapy could limit the spread of glioma cells and improve clinical outcomes."

The news reporters obtained a quote from the research from Hoag Memorial Hospital, "Between December 2000 and May 2016, after an initial diagnosis of GBM and prior to or during standard radiation therapy and carmustine or temozolomide chemotherapy, 174 patients treated with radiosurgery to the leading edge (LE) of tumor cell migration were reviewed. The LE was defined as a region outside the contrast-enhancing tumor nidus, defined by FLAIR MRI. The median age of patients was 59 years (range 22-87 years). Patients underwent LERS a median of 18 days from original diagnosis. The median target volume of 48.5 cm(3) (range 2.5-220.0 cm(3)) of LE tissue was targeted using a median dose of 8 Gy (range 6-14 Gy) at the 50% isodose line. The median overall survival was 23 months (mean 43 months) from diagnosis. The 2-, 3-, 5-, 7-, and 10-year actual overall survival rates after LERS were 39%, 26%, 16%, 10%, and 4%, respectively. Nine percent of patients developed treatment-related imaging-documented changes due to LERS. Nineteen percent of patients were hospitalized for management of edema, 22% for resection of a tumor cyst or new tumor bulk, and 2% for shunting to treat hydrocephalus throughout the course of their disease. Of the patients still alive, Karnofsky Performance Scale scores remained stable in 90% of patients and decreased by 1-3 grades in 10% due to symptomatic treatment-related imaging changes. LERS is a safe and effective upfront adjunctive therapy for patients with newly diagnosed GBM. Limitations of this study include a single-center experience and single-institution determination..."
of the LE tumor target. Use of a leading-edge calculation algorithm will be described to achieve a consistent approach to defining the LE target for general use."

According to the news reporters, the research concluded: "A multicenter trial will further elucidate its value in the treatment of GBM."

Oncology - Glioblastomas

New Glioblastomas Study Results from Xinjiang Medical University Described (MicroRNA-106a-5p facilitates human glioblastoma cell proliferation and invasion by targeting adenomatosis polyposis coli protein)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Glioblastomas have been presented. According to news reporting originating from Xinjiang, People's Republic of China, by NewsRx correspondents, research stated, "The invasive behavior of glioblastoma multiforme (GBM) cells is an important reason for its poor prognosis. Tumor cells acquire an ability to digest the extracellular matrix and infiltrate the adjacent normal tissue during invasion."

Our news editors obtained a quote from the research from Xinjiang Medical University, "Restraining GBM invasion by changing effector molecules can significantly improve the patient's prognosis. MiRNAs are involved in multiple biological functions via suppressing target genes. In this study, we found that miR-106a-5p expression was high in GBM tissues and cells. The data showed an inverse correlation in GBM tissues between the levels of miR-106a-5p and adenomatosis polyposis coli (APC) mRNAs. Additionally, ectopic expression of miR-106a-5p facilitated the invasion of GBM cells whereas inhibition of miR-106a-5p expression weakened the invasive ability. Numerous transcription factors are downstream effectors of the Wnt/beta-catenin pathway. Target prediction databases and luciferase data showed that APC is a new direct target of miR-106a-5p. Importantly, westernblot assays demonstrated that miR-106a-5p can reduce APC protein level and enhance target proteins of Wnt/beta-catenin pathway. Thus, we hypothesize that miR-106a-5p directly targets APC, resulting in the activation of Wnt/beta-catenin pathway."
According to the news editors, the research concluded: "Our results suggest that miR-106a-5p is involved in the invasive behavior of GBM cells and by targeting APC and activating Wnt/beta-catenin pathway, it provides a theoretical basis for developing potential clinical strategies."

For more information on this research see: MicroRNA-106a-5p facilitates human glioblastoma cell proliferation and invasion by targeting adenomatosis polyposis coli protein. *Biochemical and Biophysical Research Communications*, 2016;481(3-4):245-250. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Oncology - Gliomas**

**New Gliomas Data Have Been Reported by Researchers at Department of Neurosurgery (Nimotuzumab enhances temozolomide-induced growth suppression of glioma cells expressing mutant EGFR in vivo)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Gliomas are presented in a new report. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "A mutant form of epidermal growth factor receptor (EGFR), EGFRvIII, is common in glioblastoma (GBM) and confers enhanced tumorigenic activity and drug resistance. Nimotuzumab, an anti-EGFR antibody, has shown preclinical and clinical activity to GBM, but its specific activity against EGFRvIII has not been fully investigated."

Funders for this research include Ministry of Education, Culture, Sports, Science, and Technology, Faculty of Medicine, Kyorin University, Daiichi-Sankyo, Chugai Pharmaceutical Co., Ltd.

Our news editors obtained a quote from the research from the Department of Neurosurgery, "Human glioma U87MG or LNZ308 cells overexpressing either wild-type (wt) EGFR or EGFRvIII were treated with nimotuzumab, temozolomide, or both. Expression and phosphorylation status of molecules were determined by Western blot analysis. Methylation status of promoter region of O(6) -methylguanine-DNA methyltransferase (MGMT) was detected by methylation-specific PCR. Antitumor activity was tested using nude mice bearing either subcutaneous or intracerebral xenografts along with analyses of EGFR phosphorylation..."
status, proliferation, apoptosis, and vessel density. Nimotuzumab treatment resulted in reduction of EGFRvIII tyrosine phosphorylation with a decrease in Akt phosphorylation that was greater than that of wtEGFR. Correspondingly, antitumor effects, growth suppression and survival elongation, were more significant in mice bearing either subcutaneous or intracerebral tumor expressing EGFRvIII than in those expressing wtEGFR. These effects were markedly increased when temozolomide was combined with nimotuzumab. The post-treatment recurrent brain tumors exhibited a decrease in expression of the mismatch repair (MMR) proteins, MSH6 and MLH1, but their methylated MGMT status did not change. Nimotuzumab has in vivo antitumor activity against GBM, especially those expressing EGFRvIII, when combined with temozolomide.

According to the news editors, the research concluded: "This could provide a basis for preselection of patients with GBM by EGFR status who might benefit from the nimotuzumab and temozolomide combination therapy."

The news editors report that additional information may be obtained by contacting Y. Nitta, Dept. of Neurosurgery, Kugayama Hospital, 2-14-20 Kitakarasuyama, Setagaya, Tokyo, 157-0061, Japan. Additional authors for this research include S. Shimizu, Y. Shishido-Hara, K. Suzuki, Y. Shiokawa and M. Nagane.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cam4.614. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Gliomas

New Gliomas Findings from University of Wisconsin Described (Effect of D609 on the expression of GADD45 beta protein: Potential inhibitory role in the growth of glioblastoma cancer stem like cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gliomas. According to news reporting originating from Madison, Wisconsin, by NewsRx correspondents, research stated, "GADD45 beta (Growth Arrest and DNA Damage inducible protein) is a stress activated protein which plays an important role in regulating apoptosis, proliferation, DNA repair and potentially may have a role in cancer. In this study we examined the role of anti-oxidative stress on the expression of GADD45 beta in glioma stem-like cells (GSC)."

Our news editors obtained a quote from the research from the University of Wisconsin, "We show that patient derived GSCs have high survival in the absence of exogenous
growth factors. Addition of D609 (Tricyclodecan-9-yl-xanthogenate), a known anti-oxidative compound, to GSCs reduced the cellular ATP content with significant effects observed when GSCs were cultured in growth factor free medium. D609 exposure also resulted in a decrease in the protein and an increase in mRNA of GADD45 beta with a concomitant decline in the survival of cells. However, under similar conditions the phosphorylation of p38 MAP kinase (stress activated MAP kinase), a downstream target of GADD45 beta, was significantly enhanced in response to D609. Therefore it appears that GADD45 beta might play a role in glioma stem cell survival and that p38 MAP kinase may not be directly activated by GADD45 beta."

According to the news editors, the research concluded: "Together these observations suggest that anti-oxidative compounds like D609 can target GADD45 beta which may be one strategy to curtail the growth of glioma stem like cells."

The news editors report that additional information may be obtained by contacting H.S.G. Kalluri, University of Wisconsin, Dept. of Neuril Surg, Madison, WI 53792, United States. Additional authors for this research include J.S. Kuo and R.J. Dempsey.

Keywords for this news article include: Madison, Wisconsin, United States, North and Central America, Enzymes and Coenzymes, Glioblastomas, Oncology, Genetics, Gliomas, Kinase, Cancer, University of Wisconsin.

Oncology - Gliomas

New Gliomas Study Findings Have Been Reported by Researchers at Si Chuan University (Biomarkers related with seizure risk in glioma patients: A systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gliomas. According to news originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "Increasing evidence indicates that genetic biomarkers play important roles in the development of glioma-associated seizures. Thus, we performed a systematic review to summarise biomarkers that are associated with seizures in glioma patients."

Our news journalists obtained a quote from the research from Si Chuan University, "An electronic literature search of public databases (PubMed, Embase and Medline) was performed using the keywords glioma, seizure and epilepsy. A total of 26 eligible studies with 2224 cases were included in this systematic review of publications to 20 June, 2016. Genetic biomarkers such as isocitrate dehydrogenase 1 (IDH1) mutations, low expression of excitatory amino acid transporter 2 (EAAT2), high xCT expression, overexpression of adenosine kinase (ADK) and low expression of very large G-protein-coupled receptor-1 (VLGR1) are primarily involved in synaptic transmission, whereas BRAF mutations, epidermal growth factor receptor
EGFR amplification, miR-196b expression and low ki-67 expression are associated with regulation of cell proliferation. However, there is limited evidence regarding the roles of RAD50 interactor I (RINT1) and olig2 in epileptogenesis among glioma patients. Glioma-related seizure was related to the dysfunction of tumor microenvironment.

According to the news editors, the research concluded: "Our findings may provide new mechanistic insights into targeted therapy for glioma-related seizures and may result in the development of multi-target therapies."

For more information on this research see: Biomarkers related with seizure risk in glioma patients: A systematic review. Clinical Neurology and Neurosurgery, 2016;151():113-119. Clinical Neurology and Neurosurgery can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Oncology - Gliomas

New Gliomas Study Findings Recently Were Reported by M.S. Eljamel and Co-Researchers (The effectiveness and cost-effectiveness of intraoperative imaging in high-grade glioma resection; a comparative review of intraoperative ALA, fluorescein, ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gliomas have been published. According to news reporting originating in Midlothian, United Kingdom, by NewsRx journalists, research stated, "Surgical resection of high-grade gliomas (HGG) is standard therapy because it imparts significant progression free (PFS) and overall survival (OS). However, HGG-tumor margins are indistinguishable from normal brain during surgery."

The news reporters obtained a quote from the research, "Hence intraoperative technology such as fluorescence (ALA, fluorescein) and intraoperative ultrasound (IoUS) and MRI (IoMRI) has been deployed. This study compares the effectiveness and cost-effectiveness of these technologies. Critical literature review and meta-analyses, using MEDLINE/PubMed service. The list of references in each article was double-checked for any missing references. We included all studies that reported the use of ALA, fluorescein (FLCN), IoUS or IoMRI to guide HGG-surgery. The meta-analyses were conducted according to statistical heterogeneity between studies. If there was no heterogeneity, fixed effects model was used; otherwise, a random effects
A statistical model was used. Statistical heterogeneity was explored by chi(2) and inconsistency (I-2) statistics. To assess cost-effectiveness, we calculated the incremental cost per quality-adjusted life-year (QALY). Gross total resection (GTR) after ALA, FLCN, IoUS and IoMRI was 69.1%, 84.4%, 73.4% and 70% respectively. The differences were not statistically significant. All four techniques led to significant prolongation of PFS and tended to prolong OS. However none of these technologies led to significant prolongation of OS compared to controls. The cost/QALY was $16,218, $3181, $6049 and $32,954 for ALA, FLCN, IoUS and IoMRI respectively. ALA, FLCN, IoUS and IoMRI significantly improve GTR and PFS of HGG.

According to the news reporters, the research concluded: "Their incremental cost was below the threshold for cost-effectiveness of HGG-therapy, denoting that each intraoperative technology was cost-effective on its own."

For more information on this research see: The effectiveness and cost-effectiveness of intraoperative imaging in high-grade glioma resection; a comparative review of intraoperative ALA, fluorescein, ultrasound and MRI. *Photodiagnosis and Photodynamic Therapy*, 2016;16 ():35-43. *Photodiagnosis and Photodynamic Therapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Oncology - Gliomas**

**New Gliomas Study Results from Northwestern University Feinberg School of Medicine Described (Controlled Payload Release by Magnetic Field Triggered Neural Stem Cell Destruction for Malignant Glioma Treatment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gliomas have been presented. According to news reporting originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Stem cells have recently garnered attention as drug and particle carriers to sites of tumors, due to their natural ability to track to the site of interest. Specifically, neural stem cells (NSCs) have demonstrated to be a promising candidate for delivering therapeutics to malignant glioma, a primary brain tumor that is not curable by current treatments, and inevitably fatal."

Our news editors obtained a quote from the research from the Northwestern University Feinberg School of Medicine, "In this article, we demonstrate that NSCs are able to internalize 2 mm magnetic discs (SD), without affecting the health of the cells. The SD can then
be remotely triggered in an applied 1 T rotating magnetic field to deliver a payload. Furthermore, we use this NSC-SD delivery system to deliver the SD themselves as a therapeutic agent to mechanically destroy glioma cells. NSCs were incubated with the SD overnight before treatment with a 1T rotating magnetic field to trigger the SD release. The potential timed release effects of the magnetic particles were tested with migration assays, confocal microscopy and immunohistochemistry for apoptosis. After the magnetic field triggered SD release, glioma cells were added and allowed to internalize the particles. Once internalized, another dose of the magnetic field treatment was administered to trigger mechanically induced apoptotic cell death of the glioma cells by the rotating SD."

According to the news editors, the research concluded: "We are able to determine that NSC-SD and magnetic field treatment can achieve over 50% glioma cell death when loaded at 50 SD/cell, making this a promising therapeutic for the treatment of glioma."

For more information on this research see: Controlled Payload Release by Magnetic Field Triggered Neural Stem Cell Destruction for Malignant Glioma Treatment. *Plos One*, 2016;11(1):e0145129. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

**Oncology - Gliomas**

**New Gliomas Study Results from Uppsala University Described (Heparanase Promotes Glioma Progression and Is Inversely Correlated with Patient Survival)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Gliomas are presented in a new report. According to news reporting originating from Uppsala, Sweden, by NewsRx correspondents, research stated, "Malignant glioma continues to be fatal, despite improved insight into its underlying molecular mechanisms. The most malignant form, glioblastoma (GBM), is characterized by aberrant activation of receptor tyrosine kinases (RTK) and infiltrative growth."

Our news editors obtained a quote from the research from Uppsala University, "Heparan sulfate proteoglycans (HSPG), integral components of the extracellular matrix of brain tumors, can regulate activation of many RTK pathways. This prompted us to investigate heparanase (HPSE), which cleaves HSPGs, for its role in glioma. This hypothesis was evaluated using tissue microarrays, GBM cells derived from patients, murine in vitro and in vivo models of glioma, and public databases. Downregulation of HPSE attenuated glioma cell proliferation, whereas addition of HPSE stimulated growth and activated ERK and AKT signaling. Using
HPSE transgenic and knockout mice, it was demonstrated that tumor development in vivo was positively correlated to HPSE levels in the brain. HPSE also modified the tumor microenvironment, influencing reactive astrocytes, microglia/monocytes, and tumor angiogenesis. Furthermore, inhibition of HPSE reduces tumor cell numbers, both in vitro and in vivo. HPSE was highly expressed in human glioma and GBM cell lines, compared with normal brain tissue. Indeed, a correlation was observed between high levels of HPSE and shorter survival of patients with high-grade glioma.

According to the news editors, the research concluded: "These data provide proof-of-concept for anti-HPSE treatment of malignant glioma, as well as novel insights for the development of HPSE as a therapeutic target."

New Glucose Intolerance Findings from New York University Described (One-hour post-load plasma glucose level during the OGTT predicts dysglycemia Observations from the 24 year follow-up of the Israel Study of Glucose Intolerance, Obesity and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Glucose Intolerance. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "The present study assessed the longitudinal association of an elevated 1-h plasma glucose [1-h-PG >8.6 mmol/l (155 mg/dl)] with and without impaired glucose tolerance [IGT; 2-h-PG 7.8-11.0 mmol/l (140-199 mg/dl)] with cumulative incident of diabetes and prediabetes over 24 years in a non-diabetic cohort. From 1979 to 1984, 1970 non-diabetic men and women completed an oral glucose tolerance test (OGTT), physical and biochemical measurements as well as a questionnaire related to lifestyle and medical background."

The news reporters obtained a quote from the research from New York University,
"During the years 2000-2004, 853 survivors of the original cohort were interviewed and re-examined for glycemic progression. Individuals with 1-h-PG >8.6 mmol/l (155 mg/dl) but with 2-h-PG <7.8 mmol/l (140 mg/dl) had a significantly elevated risk, compared to those with both 1-h-PG 68.6 mmol/l (155 mg/dl) and 2-h-PG <7.8 mmol/l (140 mg/dl), for both diabetes [OR: 4.35 (95% CI: 2.50-7.73)] and prediabetes outcomes [OR: 1.87 (95% CI 1.09-3.26)], adjusted for sex and age, smoking, body mass index, blood pressure, fasting blood glucose and insulin. The risk for diabetes associated with a 1-h level >8.6 mmol/l (155 mg/dl) is increased and further worsened in the presence of IGT."

According to the news reporters, the research concluded: "Identifying individuals at risk with a 1-h-PG glucose level during an OGTT is recommended."

For more information on this research see: One-hour post-load plasma glucose level during the OGTT predicts dysglycemia Observations from the 24 year follow-up of the Israel Study of Glucose Intolerance, Obesity and Hypertension. Diabetes Research and Clinical Practice, 2016;120():221-228. Membrane Proteins - Glutamate Receptors

New Glutamate Receptors Study Findings Recently Were Reported by C. Citti and Co-Researchers [7-Chloro-5-(furan-3-yl)-3-methyl-4H-benzo[e][1,2,4]thiadiazine 1,1-Dioxide as Positive AllostERIC Modulator of ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Membrane Proteins - Glutamate Receptors. According to news reporting originating from Lecce, Italy, by NewsRx correspondents, research stated, "5-Arylbenzothiadiazine type compounds acting as positive allosteric modulators of α-amino-3-hydroxy-5-methyl-4-isoaxolepropionic acid receptor (AMPA-PAMs) have received particular attention in the past decade for their nootropic activity and lack of the excitotoxic side effects of direct agonists. Recently, our research group has published the synthesis and biological activity of 7-chloro-5-(furanyl)-3-methyl-3,4-dihydro-2H-1,2,4-benzothiadiazine 1,1-dioxide (1), one of the most active benzothiadiazine-derived AMPA-PAMs in vitro to date."

Our news editors obtained a quote from the research, "However, 1 exists as two stereolabile enantiomers, which rapidly racemize in physiological conditions, and only one
isomer is responsible for the pharmacological activity. In the present work, experiments carried out with rat liver microsomes show that 1 is converted by hepatic cytochrome P450 to the corresponding unsaturated derivative 2 and to the corresponding pharmacologically inactive benzenesulfonamide 3. Surprisingly, patch-clamp experiments reveal that 2 displays an activity comparable to that of the parent compound. Molecular modeling studies were performed to rationalize these results. Furthermore, mice cerebral microdialysis studies suggest that 2 is able to cross the blood-brain barrier and increases acetylcholine and serotonin levels in the hippocampus.

According to the news editors, the research concluded: "The experimental data disclose that the achiral hepatic metabolite 2 possesses the same pharmacological activity of its parent compound 1 but with an enhanced chemical and stereochemical stability, as well as an improved pharmacokinetic profile compared with 1."

For more information on this research see: 7-Chloro-5-(furan-3-yl)-3-methyl-4H-benzo[e][1,2,4]thiadiazine 1,1-Dioxide as Positive Allosteric Modulator of a-Amino-3-hydroxy-5-methyl-4-isoxazolepropionic Acid (AMPA) Receptor. The End of the Unsaturated-Inactive Paradigm? Acs Chemical Neuroscience, 2015;7(2):149-60. (American Chemical Society - www.acs.org; Acs Chemical Neuroscience - www.pubs.acs.org/journal/acncdm)

The news editors report that additional information may be obtained by contacting C. Glycyrrhetinic Acid

New Glycyrrhetinic Acid Study Results Reported from Kuwait University (Carbenoxolone exposure during late gestation in rats alters placental expressions of p53 and estrogen receptors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Glycyrrhetinic Acid have been published. According to news originating from Safat, Kuwait, by NewsRx correspondents, research stated, "Gestational carbenoxolone exposure inhibits placental 11 beta-hydroxysteroid dehydrogenase (11 beta-HSD), the physiological barrier for glucocorticoids, which increases fetal exposure to glucocorticoids and induces intrauterine growth restriction (IUGR). We hypothesized that carbenoxolone exposure influences the expression of placental estrogen receptors-alpha and beta (ER alpha & ER beta) and p53 leading to inhibited fetal and placental growth."

Financial support for this research came from Kuwait University.

Our news journalists obtained a quote from the research from Kuwait University, "Pregnant Sprague-Dawley rats were injected twice daily with either carbenoxolone (10 mg/kg;
s.c.) or vehicle (control group) from gestational days (dg) 12 onwards. Maternal blood and placentas were collected on 16 dg, 19 dg and 21 dg. The expression of ER alpha, ER beta and p53 were studied in placental basal and labyrinth zones by RT-PCR, Western blotting and immunohistochemistry. Carbenoxolone did not affect placental and fetal body weights, but ELISA showed decreased estradiol levels on 19 dg and 21 dg, and increased maternal luteinizing hormone levels on all dg. The follicle stimulating hormone levels decreased on 16 dg and 19 dg, and increased on 21 dg. Carbenoxolone decreased ER alpha mRNA levels on 16 dg in both zones and its protein level on 19 dg in the labyrinth zone. However, carbenoxolone increased ER beta mRNA levels on 19 dg and 21 dg and protein levels on 16 dg and 19 dg in the labyrinth zone. The p53 mRNA levels increased on all dg, but its protein levels increased on 21 dg in both zones.

According to the news editors, the research concluded: "Carbenoxolone exposure changes placental p53, ER alpha, ER beta expression in favor of cell death but these changes do not induce IUGR in rats."

The news correspondents report that additional information may be obtained from M.D. Al-Bader, Kuwait University, Fac Med, Dept. of Physiol, Safat 13110, Kuwait. Additional authors for this research include S.A. Jasem and N. Kilarkaje.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejphar.2016.09.035. This DOI is a link to an online electronic document that is either free or for purchase.

**Immune System Diseases and Conditions - Graft-Versus-Host Disease Study Results from University of Freiburg Described (Pathogenesis of acute graft-versus-host disease: from intestinal microbiota alterations to donor T cell activation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immune System Diseases and Conditions - Graft-Versus-Host Disease have been presented. According to news reporting from Freiburg, Germany, by NewsRx journalists, research stated, "Acute graft-versus-host disease (aGVHD) is a major life-threatening complication of allogeneic haematopoietic cell transplantation (allo-HCT). Here we discuss the aGVHD pathophysiology initiated by multiple signals that cause alloreactive T-cell activation."

Funders for this research include Deutsche Forschungsgemeinschaft, European
The news correspondents obtained a quote from the research from the University of Freiburg, "The outcome of such donor T-cell activation is influenced by T-cell receptor-signal strength, anatomical location, co-stimulatory/co-inhibitory signals and differentiation stage (naive, effector/memory) of T-cells. Additionally, cross-priming of T cells to antigens expressed by pathogens can contribute to aGVHD-mediated tissue injury. In addition to the properties of donor T-cell activation, highly specialized tissue resident cell types, such as innate lymphoid cells, antigen-presenting cells, immune regulatory cells and various intestinal cell populations are critically involved in aGVHD pathogenesis. The role of the thymus and secondary lymphoid tissue injury, non-haematopoietic cells, intestinal microflora, cytokines, chemokines, microRNAs, metabolites and kinases in aGVHD pathophysiology will be highlighted."

According to the news reporters, the research concluded: "Acute GVHD pathogenic mechanisms will be connected to novel therapeutic approaches under development for, and tested in, the clinic."

Our news journalists report that additional information may be obtained by contacting R. Zeiser, University of Freiburg, Dept. of Haematol Oncol & Stem Cell Transplantat, Medical Center, D-79106 Freiburg, Germany. Additional authors for this research include G. Socie and B.R. Blazar.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bjh.14295. This DOI is a link to an online electronic document that is either free or for purchase.

Granulocytes

New Granulocytes Findings from Institute of Pediatrics Reported (T Cell Independent Mechanisms Associated with Neutrophil Extracellular Trap Formation and Selective Autophagy in IL-17A Mediated Epidermal Hyperplasia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Granulocytes. According to news reporting originating from Sacramento, California, by NewsRx correspondents, research stated, "IL-17A has been strongly associated with epidermal hyperplasia in many cutaneous disorders. However, because IL-17A is mainly produced by alpha beta and gamma delta T cells in response to IL-23, the role of T cells and IL-23 has overshadowed any IL-17A-independent actions."

Our news editors obtained a quote from the research from the Institute of Pediatrics,
In this article, we report that IL-17A gene transfer induces epidermal hyperplasia in Il23r(-/-) Rag1(-/-) and Tcr delta-deficient mice, which can be prevented by neutrophil depletion. Moreover, adoptive transfer of CD11b(+)Gr-1(hi) cells, after IL-17A gene transfer, was sufficient to phenocopy the disease. We further show that the IL-17A-induced pathology was prevented in transgenic mice with impaired neutrophil extracellular trap formation and/or neutrophils with conditional deletion of the master regulator of selective autophagy, Wdfy3.

According to the news editors, the research concluded: "Our data demonstrate a novel T cell-independent mechanism that is associated with neutrophil extracellular trap formation and selective autophagy in IL-17A-mediated epidermal hyperplasia."

For more information on this research see: T Cell Independent Mechanisms Associated with Neutrophil Extracellular Trap Formation and Selective Autophagy in IL-17A Mediated Epidermal Hyperplasia. *Journal of Immunology*, 2016;197(11):4403-4412. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. **Immunology - Granulocytes**

**New Granulocytes Findings from Johannes Gutenberg-University Reported [Genetics and pathophysiology of granulomatosis with polyangiitis (GPA) and its main autoantigen proteinase 3]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immunology - Granulocytes is the subject of a report. According to news originating from Mainz, Germany, by NewsRx correspondents, research stated, "Granulomatosis with polyangiitis (GPA) is a severe autoimmune disease and one of the small vessel antineutrophil cytoplasmic antibody (ANCA)-associated vasculitides. Although its etiology and pathophysiology are still widely unknown, it is accepted that infections, environmental factors, epigenetic modifications, and a genetic predisposition provide the basis for this systemic disorder."

Our news journalists obtained a quote from the research from Johannes Gutenberg-University, "GPA typically evolves into two phases: an initial phase characterized by ear, nose and throat (ENT) manifestations, such as chronic sinusitis and otitis, ulceration of the oral cavity and pharynx, as well as pulmonary nodules and a severe generalized phase, defined by the occurrence of rapidly progressive glomerulonephritis, pulmonary hemorrhage, and arthritis. ANCA, directed against the neutrophilic enzymes proteinase 3 and myeloperoxidase, are present in up to 90% of the affected patients in the systemic phase. As the humoral immunity is predominantly directed against neutrophilic antigens, it is apparent that neutrophils play a
critical role in GPA both as target and effector cells. Although GPA pathogenesis is not well known, some susceptibility genes and loci have been identified by candidate gene approaches, genome-wide association studies, and meta-analyses, as well as familial association studies. Such genes are CTLA4, PTPN22, COL11A2, SERPINA1, and the MHC class II gene cluster. This review highlights the clinical, pathophysiological, and genetic background of GPA and aims to give an overview of recent efforts to identify GPA susceptibility genes."

According to the news editors, the research concluded: "We point out the genetic basis of the main autoantigen PR3 and why it is so difficult to establish a murine GPA model."

The news correspondents report that additional information may be obtained from M. Relle, Johannes Gutenberg Univ Mainz, University Medical Center, Div Rheumatol & Clin Immunol, Dept. of Internal Med, Mainz, Germany. Additional authors for this research include B. Fohr, F. Fasola and A. Schwarting.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mcp.2016.08.009. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Mainz, Germany, Europe, Proteinase, Article Review, Hemic and Immune Systems, Enzymes and Coenzymes, Autoantigens, Granulocytes, Neutrophils, Immunology, Phagocytes, Antigens, Genetics, Johannes Gutenberg-University.

**Immunology - Granulocytes**

**New Granulocytes Study Findings Have Been Reported by Investigators at Inner Mongolia Medical College (Macrophage migration inhibitory factor contributes to anti-neutrophil cytoplasmic antibody-induced neutrophils activation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Granulocytes. According to news reporting from Hohhot, People's Republic of China, by NewsRx journalists, research stated, "Macrophage migration inhibitory factor (MIF) is an inflammatory mediator released by macrophages that is central to the innate immune system, with an upstream role in the inflammatory cascade. MIF is one of the most important pathogenic factors in the development of the autoimmune diseases."

Financial support for this research came from National Natural Science Fund.

The news correspondents obtained a quote from the research from Inner Mongolia Medical College, "In the current study, we investigated the role of MIF in anti-neutrophil cytoplasmic antibody (ANCA)-induced neutrophil activation. Plasma levels of MIF from 31 patients with active ANCA-associated vasculitis (AAV) were analyzed by ELISA. The various
effects of MIF in ANCA-induced neutrophil respiratory burst and degranulation were measured. Plasma levels of circulating MIF were significantly higher in AAV patients with active disease compared with those in remission and healthy controls. Compared with MIF-primed neutrophils, the MFI value increased significantly in MIF-primed neutrophils further activated with MPO-ANCA-positive IgG or PR3-ANCA-positive IgG (270.8 +/- 9.7 vs. 421.5 +/- 9.7, P< 0.001; 270.8 +/- 9.7 vs. 414.1 +/- 15.6, P< 0.001, respectively). Compared with MIF-primed neutrophils, the lactoferrin concentration increased significantly in the supernatant of MIF-primed neutrophils further activated by MPO-ANCA-positive IgG (567.8 +/- 61.2 ng/ml vs. 1677.0 +/- 42.5 ng/ml, P< 0.001) or PR3-ANCA-positive IgG (567.8 +/- 61.2 ng/ml vs. 1546.0 +/- 116.2 ng/ml, P< 0.001), respectively. Interleukin-8 (IL-8), IL-6 and IL-23 were involved in ANCA-induced activation of MIF-primed neutrophils. MIF primes neutrophils by increasing ANCA antigen translocation."

According to the news reporters, the research concluded: "The primed neutrophils can be further induced by ANCA, resulting in respiratory burst and degranulation." For more information on this research see: "Macrophage migration inhibitory factor contributes to anti-neutrophil cytoplasmic antibody-induced neutrophils activation. Human Immunology, 2016;77(12):1209-1214. Human Immunology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Human Immunology - www.journals.elsevier.com/human-immunology/)

Our news journalists report that additional information may be obtained by contacting J. Hao, Inner Mongolia Med College, Affiliated Hosp, Dept. of Med, Div Renal, Hohhot 010050, Inner Mongolia, People's Republic of China. Additional authors for this research include T.G. Lv, C. Wang, L.P. Xu and J.R. Zhao.

Guanidines

New Guanidines Study Results Reported from Mansoura University (Agmatine protects rat liver from nicotine-induced hepatic damage via antioxidative, antiapoptotic, and antifibrotic pathways)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Guanidines have been published. According to news reporting originating from Mansoura, Egypt, by NewsRx correspondents, research stated, "Tobacco smoking with its various forms is a global problem with proved hazardous effects to human health. The present work was planned to study the defending role of agmatine (AGM) on hepatic oxidative stress and damage induced by nicotine in rats."
Our news editors obtained a quote from the research from Mansoura University, "Thirty-two rats divided into four groups were employed: control group, nicotine-only group, AGM group, and AGM-nicotine group. Measurements of serum hepatic biochemical markers, lipid profile, and vascular cell adhesion molecule-1 were done. In addition, malondialdehyde (MDA), superoxide dismutase (SOD), glutathione (GSH) activity, and nitrate/nitrite (NOx) levels were estimated in the liver homogenates. Immunohistochemistry for Bax and transforming growth factor beta (TGF-beta 1) and histopathology of the liver were also included. Data of the study demonstrated that nicotine administration exhibited marked liver deterioration, an increase in liver enzymes, changes in lipid profile, and an elevation in MDA with a decline in levels of SOD, GSH, and NOx (nitrate/nitrite). Also, levels of proapoptotic Bax and profibrotic TGF-beta 1 showed marked elevation in the liver. AGM treatment to rats in nicotine-only group ameliorated all the previous changes."

According to the news editors, the research concluded: "These findings indicate that AGM could successfully overcome the nicotine-evoked hepatic oxidative stress and tissue injury, apoptosis, and fibrosis."

For more information on this research see: Agmatine protects rat liver from nicotine-induced hepatic damage via antioxidative, antiapoptotic, and antifibrotic pathways. *Naunyn-Schmiedebergs Archives of Pharmacology*, 2016;389(12):1341-1351. *Naunyn-Schmiedebergs Archives of Pharmacology* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
TCGA. In the validation cohort, the majority of patients had stage III/IV disease (208/265, 78.4%). CD47 expression was seen in 210/265 (79.2%). Patients were categorized into CD47hi (129/265; 48.7%) versus CD47lo (136/265; 51.3%). Patients with CD47lo tumors were more likely to have a complete response to adjuvant therapy than CD47hi (65% vs 50%, p = 0.026). Although there was a trend towards an increase in median OS (37.64 vs 45.26 months, p = 0.92) in the CD47lo group compared with CD47hi, the difference was not significant. CD47 is expressed at high frequency in EOC. Patients with CD47lo EOC had a better treatment response to standard therapy, and trended towards improved OS. This demonstrates that while CD47 may be an immunologic shield that may be considered for targeted therapies, it is likely that it operates in concert with other mechanisms of immune evasion.

According to the news editors, the research concluded: "Future studies to evaluate CD47 expression with other known mechanisms of immune escape in the tumor microenvironment may help further define its role."

For more information on this research see: The CD47 "don't eat me signal" is highly expressed in human ovarian cancer. Gynecologic Oncology, 2016;143(2):393-397. Immune System Diseases and Conditions - HIV/AIDS

New HIV/AIDS Data Have Been Reported by Researchers at Fudan University (Specific Reactivation of Latent HIV-1 by dCas9-SunTag-VP64-mediated Guide RNA Targeting the HIV-1 Promoter)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immune System Diseases and Conditions - HIV/AIDS have been presented. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "HIV-1 escapes antiretroviral agents by integrating into the host DNA and forming a latent transcriptionally silent HIV-1 provirus. Transcriptional activation is prerequisite for reactivation and the eradication of latent HIV-1 proviruses. dCas9-SunTag-VP64 transcriptional system has been reported that it can robustly activate the expression of an endogenous gene using a single guide RNA (sgRNA)."

The news correspondents obtained a quote from the research from Fudan University, "Here, we systematically investigated the potential of dCas9-SunTag-VP64 with the designed sgRNAs for reactivating latent HIV-1. We found dCas9-SunTag-VP64 with sgRNA 4 or sgRNA 5 targeted from -164 to -146 or -124 to -106 bp upstream of the transcription start sites of HIV-1 could induce high expression of luciferase reporter gene after screening of sgRNAs..."
targeting different regions of the HIV-1 promoter. Further, we confirmed that dCas9-SunTag-VP64 with sgRNA 4 or sgRNA 5 can effectively reactivate latent HIV-1 transcription in several latently infected human T-cell lines. Moreover, we confirmed that the reactivation of latent HIV-1 by dCas9-SunTag-VP64 with the designed sgRNA occurred through specific binding to the HIV-1 LTR promoter without genotoxicity and global T-cell activation.

According to the news reporters, the research concluded: "Taken together, our data demonstrated dCas9-SunTag-VP64 system can effectively and specifically reactivate latent HIV-1 transcription, suggesting that this strategy could offer a novel approach to anti-HIV-1 latency."

For more information on this research see: Specific Reactivation of Latent HIV-1 by dCas9-SunTag-VP64-mediated Guide RNA Targeting the HIV-1 Promoter. Molecular Therapy, 2016;24(3):508-21. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

**Immune System Diseases and Conditions - HIV/AIDS**

**New HIV/AIDS Findings Has Been Reported by H. Huerga et al (Who Needs to Be Targeted for HIV Testing and Treatment in KwaZulu-Natal? Results From a Population-Based Survey)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - HIV/AIDS are presented in a new report. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "Identifying gaps in HIV testing and treatment is essential to design specific strategies targeting those not accessing HIV services. We assessed the prevalence and factors associated with being HIV untested, unaware, untreated, and virally unsuppressed in KwaZulu-Natal, South Africa."

Our news editors obtained a quote from the research, "Cross-sectional population-based survey. People aged 15-59 years were eligible. Interviews, HIV testing, and blood collection for antiretroviral drug presence test, CD4, and viral load were done at the participants' home. Of the 5649 individuals included, 81.4% (95% CI: 79.8 to 82.9) had previously been tested. HIV prevalence was 25.2%. HIV-positivity awareness rate was 75.2%
(95% CI: 72.9 to 77.4). Of all unaware, 73.3% of people were aged, 35 years and 68.7% were women. Antiretroviral therapy coverage was 75.0% (95% CI: 72.0 to 77.8) among those eligible for treatment (CD4 < 350, PMTCT-B) and 53.1% (95% CI: 50.4 to 55.7) among all HIV-positive individuals. Viral load was <1000 copies per milliliter in 57.1% of all HIV-positive individuals. Although 66.3% and 71.7% of people with viral load >= 1000 copies per milliliter were people aged, 35 years and women respectively, men had 4.4, 1.8, 1.6, and 1.7 times the odds of being untested, unaware, untreated, and virally unsuppressed. In addition, people with more than 1 sexual partner had 1.3, 2.2, and 1.9 times the odds of being untested, unaware, and untreated. The majority of HIV-positive people unaware of their status, untreated, and virally unsuppressed were individuals aged <35 years and women. However, men were disproportionately untested, unaware HIV positivity, untreated, and virally unsuppressed."

According to the news editors, the research concluded: "In this context, HIV testing and treatment should be prioritized to target young people and women, whereas novel strategies are necessary to reach men."

The news editors report that additional information may be obtained by contacting H. Huerga, Epicentre, Paris, France. Additional authors for this research include G. Van Cutsem, J. Ben Farhat, M. Reid, M. Bouhenia, D. Maman, L. Wiesner, J.F. Etard and T. Ellman.

Immune System Diseases and Conditions - HIV/AIDS

New HIV/AIDS Findings Has Been Reported by Investigators at Medical College of Wisconsin (Partnership-Level Analysis of African American Women's Risky Sexual Behavior in Main and Non-Main Partnerships)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immune System Diseases and Conditions - HIV/AIDS is now available. According to news reporting out of Milwaukee, Wisconsin, by NewsRx editors, research stated, "The majority of research on risky sexual behavior in African American women has examined global associations between individual-level predictors and behavior. However, this method obscures the potentially significant impact of the specific relationship or relationship partner on risky sexual behavior."

Our news journalists obtained a quote from the research from the Medical College of Wisconsin, "To address this gap, we conducted partnership-level analysis of risky sexual behavior among 718 African American women recruited from HIV counseling, testing, and referral sites in four states. Using mixed model regressions, we tested relationships between..."
condomless vaginal intercourse with men and variables drawn from the Theory of Planned Behavior, Theory of Gender and Power, and previous research specifically on sexual risks among African American women."

According to the news editors, the research concluded: "Significant associations with risky sexual behavior indicate the need for continued emphasis on condom attitudes, condom negotiation behaviors, and overcoming partner resistance to condoms within both main and non-main partnerships when implementing interventions designed to address HIV and sexually transmitted infection risks among African American women."

For more information on this research see: Partnership-Level Analysis of African American Women's Risky Sexual Behavior in Main and Non-Main Partnerships. *AIDS and Behavior*, 2016;20(12):2893-2903. *AIDS and Behavior* can be contacted at: Springer, Plenum Publishers, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; AIDS and Behavior - www.springerlink.com/content/1090-7165/)

**Immune System Diseases and Conditions - HIV/AIDS**

**New HIV/AIDS Findings Reported from Kyoto University (Core Binding Factor beta Protects HIV, Type 1 Accessory Protein Viral Infectivity Factor from MDM2-mediated Degradation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immune System Diseases and Conditions - HIV/AIDS. According to news originating from Kyoto, Japan, by NewsRx correspondents, research stated, "HIV, type 1 overcomes host restriction factor apolipoprotein B mRNA-editing enzyme catalytic polypeptide-like 3 (APO-BEC3) proteins by organizing an E3 ubiquitin ligase complex together with viral infectivity factor (Vif) and a host transcription cofactor core binding factor beta (CBF beta). CBF beta is essential for Vif to counteract APOBEC3 by enabling the recruitment of cullin 5 to the complex and increasing the steady-state level of Vif protein; however, the mechanisms by which CBF beta up-regulates Vif protein remains unclear."

Our news journalists obtained a quote from the research from Kyoto University, "Because we have reported previously that mouse double minute 2 homolog (MDM2) is an E3 ligase for Vif, we hypothesized that CBF beta might protect Vif from MDM2-mediated degradation. Co-immunoprecipitation analyses showed that Vif mutants that do not bind to CBF beta preferentially interact with MDM2 and that overexpression of CBF beta disrupts the interaction between MDM2 and Vif. Knockdown of CBF beta reduced the steady-state level of Vif in MDM2-proficient cells but not in MDM2-null cells. Cycloheximide chase analyses
revealed that Vif E88A/W89A, which does not interact with CBF beta, degraded faster than wild-type Vif in MDM2-proficient cells but not in MDM2-null cells, suggesting that Vif stabilization by CBF beta is mainly caused by impairing MDM2-mediated degradation. We identified Vif R93E as a Vif variant that does not bind to MDM2, and the virus with this substitution mutation was more resistant to APOBEC3G than the parental virus. Combinatory substitution of Vif residues required for CBF beta binding and MDM2 binding showed full recovery of Vif steady-state levels, supporting our hypothesis."

According to the news editors, the research concluded: "Our data provide new insights into the mechanism of Vif augmentation by CBF beta."

For more information on this research see: Core Binding Factor beta Protects HIV, Type 1 Accessory Protein Viral Infectivity Factor from MDM2-mediated Degradation. *Journal of Biological Chemistry*, 2016;291(48):24892-24899. *Journal of Biological Chemistry* can be contacted at: Amer Soc Biochemistry Molecular Biology Inc, 9650 Rockville Pike, Bethesda, MD 20814-3996, USA. Immune System Diseases and Conditions - HIV/AIDS

**New HIV/AIDS Findings Reported from S.T. Xu and Co-Authors (cGAS-Mediated Innate Immunity Spreads Intercellularly through HIV-1 Env-Induced Membrane Fusion Sites)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immune System Diseases and Conditions - HIV/AIDS. According to news originating from Hannover, Germany, by NewsRx correspondents, research stated, "Upon sensing cytoplasmic retroviral DNA in infected cells, cyclic GMP-AMP (cGAMP) synthase (cGAS) produces the cyclic dinucleotide cGAMP, which activates STING to trigger a type I interferon (IFN) response. We find that membrane fusion-inducing contact between donor cells expressing the HIV envelope (Env) and primary macrophages endogenously expressing the HIV receptor CD4 and coreceptor enable intercellular transfer of cGAMP."

Our news journalists obtained a quote from the research, "This cGAMP exchange results in STING-dependent antiviral IFN responses in target macrophages and protection from HIV infection. Furthermore, under conditions allowing cell-to-cell transmission of HIV-1, infected primary T cells, but not cell-free virions, deliver cGAMP to autologous macrophages through HIV-1 Env and CD4/coreceptor-mediated membrane fusion sites and induce a STING-
dependent, but cGAS-independent, IFN response in target cells."

According to the news editors, the research concluded: "Collectively, these findings identify an infection-specific mode of horizontal transfer of cGAMP between primary immune cells that may boost antiviral responses, particularly in infected tissues in which cell-to-cell transmission of virions exceeds cell-free infection."

For more information on this research see: cGAS-Mediated Innate Immunity Spreads Intercellularly through HIV-1 Env-Induced Membrane Fusion Sites. Cell Host & Microbe, 2016;20(4):443-457. Cell Host & Microbe can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell Host & Microbe - www.journals.elsevier.com/cell-host-and-microbe/)

The news correspondents report that additional information may be obtained from C. Goffinet, Center Expt & Clin Infect Res, TWINCORE, Inst Expt Virol, D-30625 Hannover, Germany. Additional authors for this research include A. Ducroux, A. Ponnurangam, G. Vieyres, S. Franz, M. Musken, T. Zillinger, A. Malassa, E. Ewald, V. Hornung, W. Barchet, S. Haussler, T. Pietschmann and C. Goffinet.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.chom.2016.09.003. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Hannover, Germany, Europe, Viral Sexually Transmitted Diseases and Conditions, Immune System Diseases and Conditions, Mononuclear Phagocyte System, Connective Tissue Cells, Primate Lentiviruses, Vertebrate Viruses, HIV Infections, Myeloid Cells, Retroviridae, Macrophages, RNA Viruses, Immunology, Phagocytes, Genetics, HIV/AIDS, HIV-1.

Our news editors obtained a quote from the research from the Johns Hopkins University Bloomberg School of Public Health, "We enrolled men and women with a current or prior history of injection drug use in this cross-sectional sub-study within the AIDS Linked to the Intravenous Experience (ALIVE) cohort. We tested oral rinse samples for 37 types of HPV DNA and collected self-reported risk factor information. We compared oral HPV prevalence across categories using chi-squared statistics and multivariable logistic regression. Among 199 subjects, 32% were HIV-positive (median CD4 count 384 cells/mL), 90% were Black, 56% had
less than a high school education, 17% had recently used injection drugs, and the median age was 54 years. Most had performed oral sex (82%) but had fewer than 5 lifetime partners (58%). The prevalence of any oral HPV was 29%, and of any oncogenic oral HPV was 13%. Oral HPV prevalence was high among both heterosexual men (30%) and women (20%). After adjustment, odds of oral HPV were increased among HIV-positive individuals with a low CD4 count (<350 cells/ml, aOR=2.7, 95%CI=1.2-6.4, vs. HIV-negative individuals), but not among HIV-positive individuals with a higher CD4 cell count. Odds were also elevated for those who had recently performed oral sex on a woman (aOR=2.2, 95%CI=1.01-4.6) and, even after this adjustment, among bisexual/lesbian females (aOR=5.6, 95%CI=1.4-23, vs. heterosexual females). Oral HPV prevalence was not associated with vaginal sex, performing oral sex on a man, or recent drug use. Recent drug use was not associated with oral HPV prevalence in our study."

According to the news editors, the research concluded: "However, despite modest numbers of sexual partners, the prevalence of oral HPV among this largely Black population with lower socioeconomic status was high."

The news editors report that additional information may be obtained by contacting H.A. Robbins, Dept. of Epidemiology, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States. Additional authors for this research include C.E. Fennell, M. Gillison, W. Xiao, Y. Guo, A. Wentz, G.D. Kirk, S.H. Mehta and G. D'Souza.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
The news reporters obtained a quote from the research from the University of Antioquia, "Here, we assessed the role of single-stranded RNA40 (ssRNA40) derived from HIV-1 in neutrophil activation. We observed functional activation of neutrophils in response to HIV-1-derived ssRNA40 based on the expression of TLR7/8, RIG-I, and MDA5, induction of cytokines (IL-6 and TNF-alpha), and the production of reactive oxygen species (ROS). Additionally, ssRNA40 promoted the expression of CD62L and TNF-alpha and the production of ROS in the presence of the TLR2 agonist Pam(2)CSK(4). ssRNA40 together with R848 (a TLR7/8 agonist) increased CD11b expression but decreased CD62L expression. Furthermore, decreased IL-6 expression was observed in the presence of the TLR4 agonist LPS. Finally, we found that ssRNA40 promotes RIG-I and MDA5 expression in the presence of the TLR2, TLR4 and TLR7/8 agonists."

According to the news reporters, the research concluded: "This study demonstrates a functional response of TLRs in neutrophils challenged with ssRNA40, suggesting that TLRs could be involved in the innate immune response observed during HIV infection, which might be mediated by its genome."

For more information on this research see: HIV-1-derived single-stranded RNA acts as activator of human neutrophils. *Immunologic Research*. 2016;64(5-6):1185-1194. *Immunologic Research* can be contacted at: Humana Press Inc, 999 Riverview Drive Suite 208, Totowa, NJ 07512, USA. **Immune System Diseases and Conditions - HIV/AIDS**

**New HIV/AIDS Study Findings Have Been Reported from University Hospital (NS5A Resistance: Clinical Implications and Treatment Possibilities)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - HIV/AIDS have been published. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "Treatments with interferon-free direct-acting antiviral agents have high efficacy, with sustained virological response rates of more than 90%. Nevertheless, they fail to eliminate the infection in 1-7% of patients."
The news reporters obtained a quote from the research from University Hospital, "The majority of virological failures are due to relapse following treatment discontinuation, while virological rebound during therapy is rare. Although not the only factor, the presence of resistance-associated variants is one of the major causes for said failure. Resistance-associated variants affect the sequence involved in protein synthesis on which different direct-acting antiviral agents act (NS3/4A, NS5A, NS5B). Of all these variants, the ones with the greatest impact are resistance-associated variants that affect the NS5A region due to their long-term persistence."

According to the news reporters, the research concluded: "In this article we will describe the most significant NS5A resistance-associated variants, the clinical relevance of their detection both before and after treatment, their persistence over time, and lastly, we will devote particular attention to discussing what approach to adopt when dealing with treatment failure to an antiviral regimen that includes NS5A inhibitors."

Our news correspondents report that additional information may be obtained by contacting J.L. Calleja, Gastroenterology and Hepatology Department, Puerta de Hierro University Hospital, Majadahonda, Madrid, Spain. Additional authors for this research include S. Llerena, C. Perello and J. Crespo.

Keywords for this news article include: Spain, Madrid, Europe, HIV/AIDS, Article Review, Immune System Diseases and Conditions.

Immune System Diseases and Conditions - HIV/AIDS

New HIV/AIDS Study Findings Reported from University of California (CRISPR-mediated Activation of Latent HIV-1 Expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - HIV/AIDS are presented in a new report. According to news reporting from Berkeley, California, by NewsRx journalists, research stated, "Complete eradication of HIV-1 infection is impeded by the existence of cells that harbor chromosomally integrated but transcriptionally inactive provirus. These cells can persist for years without producing viral progeny, rendering them refractory to immune surveillance and antiretroviral therapy and providing a permanent reservoir for the stochastic reactivation and reseeding of HIV-1."

The news correspondents obtained a quote from the research from the University of California, "Strategies for purging this latent reservoir are thus needed to eradicate infection. Here, we show that engineered transcriptional activation systems based on CRISPR/Cas9 can be harnessed to activate viral gene expression in cell line models of HIV-1 latency. We further demonstrate that complementing Cas9 activators with latency-reversing compounds can enhance latent HIV-1 transcription and that epigenome modulation using CRISPR-based acetyltransferases can also promote viral gene activation."

According to the news reporters, the research concluded: "Collectively, these results demonstrate that CRISPR systems are potentially effective tools for inducing latent HIV-1 expression and that their use, in combination with antiretroviral therapy, could lead to improved
therapies for HIV-1 infection."

For more information on this research see: CRISPR-mediated Activation of Latent HIV-1 Expression. *Molecular Therapy*, 2015;24(3):499-507. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

Our news journalists report that additional information may be obtained by contacting P. Limsirichai, Dept. of Plant and Microbial Biology, University of California, Berkeley, Berkeley, California, United States. Additional authors for this research include T. Gaj and D.V Schaffer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/mt.2015.213. This DOI is a link to an online electronic document that is either free or for purchase.

**Immune System Diseases and Conditions - HIV/AIDS**

**New HIV/AIDS Study Findings Reported from University of Molise (High prevalence of human papillomavirus type 58 in HIV infected men who have sex with men: A preliminary report in Central Italy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immune System Diseases and Conditions - HIV/AIDS are discussed in a new report. According to news originating from Campobasso, Italy, by NewsRx correspondents, research stated, "Human papillomavirus (HPV) infection and type-specific prevalence at anal, oral, coronal sulcus, and urethral mucosa in fifty HIV positive men having sex with men (MSM) were evaluated; patients were enrolled in a non-metropolitan area of Central Italy. Clinical and socio-demographic information, drug, and sexual behaviors were obtained for each participant."

Our news journalists obtained a quote from the research from the University of Molise, "HPV was detected by PCR from an overall of 200 specimens, and genotyping was performed by both Restriction Fragment Length Polymorphism analysis and sequencing. HPV DNA was found in 60.0% (n=30) of HIV positive MSM, and prevalence was higher at anal canal (n=28, 56.0%) compared to all the other anatomical sites (ch(2) test p<0.01) of coronal sulcus (n=11, 22.0%), oral (n=8, 16.0%), and urethral mucosa (n=5, 10.0%). We found 63.3% (n=19) of MSM with at least one high-risk genotype, and HPV-58 was more frequently detected (n=9, 47.4%) respect to HPV-16 (n=6, 31.6%). This is the first report on HPV detected at four anatomical sites involved in sexual practices in HIV positive MSM. We found an unusual distribution of oncogenic genotypes with an exceeding prevalence of HPV-58 respect to HPV-16."

According to the news editors, the research concluded: "Hence, the recently licensed nonavalent vaccine should be suitable to prevent a larger number of infections caused by potentially emerging high-risk genotypes."

For more information on this research see: High prevalence of human papillomavirus
type 58 in HIV infected men who have sex with men: A preliminary report in Central Italy. 

The news correspondents report that additional information may be obtained from M.L. Sammarco, Chair of Hygiene, Dept. of Medicine and Health Sciences, University of Molise, Campobasso, Italy. Additional authors for this research include C. Ucciferri, M. Tamburro, K. Falasca, G. Ripabelli and J. Vecchiet.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/jmv.24406. This DOI is a link to an online electronic document that is either free or for purchase.

**Gram-Negative Bacteria - Haemophilus influenzae**

**New Haemophilus influenzae Findings from Center for Disease Control and Prevention Reported (Comparative Genomic Analysis of Haemophilus haemolyticus and Nontypeable Haemophilus influenzae and a New Testing Scheme for Their Discrimination)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Haemophilus influenzae. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "Haemophilus haemolyticus has been recently discovered to have the potential to cause invasive disease. It is closely related to nontypeable Haemophilus influenzae (NT H. influenzae). NT H. influenzae and H. haemolyticus are often misidentified because none of the existing tests targeting the known phenotypes of H. haemolyticus are able to specifically identify H. haemolyticus."

The news correspondents obtained a quote from the research from Center for Disease Control and Prevention, "Through comparative genomic analysis of H. haemolyticus and NT H. influenzae, we identified genes unique to H. haemolyticus that can be used as targets for the identification of H. haemolyticus. A real-time PCR targeting purT (encoding phosphoribosylglycinamidine formyltransferase 2 in the purine synthesis pathway) was developed and evaluated. The lower limit of detection was 40 genomes/PCR; the sensitivity and specificity in detecting H. haemolyticus were 98.9% and 97%, respectively. To improve the discrimination of H. haemolyticus and NT H. influenzae, a testing scheme combining two targets (H. haemolyticus purT and H. influenzae hpd, encoding protein D lipoprotein) was also evaluated and showed 96.7% sensitivity and 98.2% specificity for the identification of H. haemolyticus and 92.8% sensitivity and 100% specificity for the identification of H. influenzae, respectively."

According to the news reporters, the research concluded: "The dual-target testing scheme can be used for the diagnosis and surveillance of infection and disease caused by H. haemolyticus and NT H. influenzae."
For more information on this research, see: Comparative Genomic Analysis of Haemophilus haemolyticus and Nontypeable Haemophilus influenzae and a New Testing Scheme for Their Discrimination. *Journal of Clinical Microbiology*, 2016;54(12):3010-3017. *Journal of Clinical Microbiology* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

**Hantavirus**

**New Hantavirus Findings from University of Health Sciences Described**

(Targeting a Novel RNA-Protein Interaction for Therapeutic Intervention of Hantavirus Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hantavirus have been published. According to news reporting from Pomona, California, by NewsRx journalists, research stated, "An evolutionarily conserved sequence at the 5' terminus of hantaviral genomic RNA plays an important role in viral transcription initiation and packaging of the viral genome into viral nucleocapsids. Interaction of viral nucleocapsid protein (N) with this conserved sequence facilitates mRNA translation by a unique N-mediated translation strategy."

Financial support for this research came from National Institutes of Health.

The news correspondents obtained a quote from the research from the University of Health Sciences, "Whereas this evolutionarily conserved sequence facilitates virus replication with the assistance of N in eukaryotic hosts having multifaceted antiviral defense, we demonstrate its interaction with N presents a novel target for therapeutic intervention of hantavirus disease. Using a high throughput screening approach, we identified three lead inhibitors that bind and induce structural perturbations in N. The inhibitors interrupt N-RNA interaction and abrogate both viral genomic RNA synthesis and N-mediated translation strategy without affecting the canonical translation machinery of the host cell. The inhibitors are well tolerated by cells and inhibit hantavirus replication with the same potency as ribavarin, a commercially available antiviral."

According to the news reporters, the research concluded: "We report the identification of a unique chemical scaffold that disrupts a critical RNA-protein interaction in
hantaviruses and holds promise for the development of the first anti-hantaviral therapeutic with broad spectrum antiviral activity."

Our news journalists report that additional information may be obtained by contacting M.A. Mir, Western Univ Hlth Sci, Coll Vet Med, Pomona, CA 91766, United States. Additional authors for this research include S.S. Ganaie, A. Roy, S. Jeeva and M.A. Mir.

**Oncology - Head and Neck Cancer**

**New Head and Neck Cancer Study Findings Have Been Reported by Investigators at University of Malaya (HOPX functions as a tumour suppressor in head and neck cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Head and Neck Cancer are presented in a new report. According to news reporting originating from Kuala Lumpur, Malaysia, by NewsRx correspondents, research stated, "Head and neck squamous cell carcinoma (HNSCC) is a generalized term that encompasses a diverse group of cancers that includes tumours of the oral cavity (OSCC), oropharynx (OPSCC) and nasopharynx (NPC). Genetic alterations that are common to all HNSCC types are likely to be important for squamous carcinogenesis."

Our news editors obtained a quote from the research from the University of Malaya, "In this study, we have investigated the role of the homeodomain-only homeobox gene, HOPX, in the pathogenesis of HNSCC. We show that HOPX mRNA levels are reduced in OSCC and NPC cell lines and tissues and there is a general reduction of HOPX protein expression in these tumours and OPSCCs. HOPX promoter methylation was observed in a subset of HNSCCs and was associated with a worse overall survival in HPV negative tumours. RNAseq analysis of OSCC cells transfected with HOPX revealed a widespread deregulation of the transcription of genes related to epithelial homeostasis and ectopic over-expression of HOPX in OSCC and NPC cells inhibited cell proliferation, plating efficiency and migration, and enhanced sensitivity to UVA-induced apoptosis."

According to the news editors, the research concluded: "Our results demonstrate that HOPX functions as a tumour suppressor in HNSCC and suggest a central role for HOPX in suppressing epithelial carcinogenesis."

For more information on this research see: HOPX functions as a tumour suppressor

**Oncology - Head and Neck Cancer**

**New Head and Neck Cancer Study Findings Recently Were Reported by Researchers at Research Institute (Treatment delays, race, and outcomes in head and neck cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Head and Neck Cancer are discussed in a new report. According to news reporting originating in Tampa, Florida, by NewsRx journalists, research stated, "Patient race has been shown to predict for differences in outcomes and has been attributed to socioeconomic factors such as social support and access to healthcare. In head and neck cancer (HNC), a disease without recommended screening, we sought to investigate the association between race, treatment delays and outcome."

The news reporters obtained a quote from the research from Research Institute, "Records of 1802 patients with non-metastatic squamous cell HNC treated between 1998 and 2013 were retrospectively assessed from an institutional database. Patient demographics, tumor and treatment characteristics, and patient outcomes were abstracted from the chart. Differences between groups were assessed via logistic regression multivariate analysis (MVA). Outcomes including locoregional control (LRC) and overall survival (OS) were then estimated via Kaplan-Meier and Cox-regression MVA. Median follow up was 34 months. Patient races included white (n = 1671, 93%), black (n = 80, 4%), Asian (n = 18, 1%), and other (n = 33, 2%). On logistic regression MVA, Black patients were less likely to be married (39% vs. 63%; OR 0.595% CI 0.30-0.83, p = 0.007) or be currently employed (43% vs. 61%; OR 0.44 95% CI 0.26-0.74, p = 0.002) when compared to non-blacks. Black patients were also younger (54 vs. 59 years, p = 0.001), more likely to present with advanced tumor stage (T4: 48% vs. 25%), and more often had > 45 days elapsed from diagnosis to treatment initiation (DTI) (61% vs. 49%, p = 0.028). Delays in treatment, such as delayed diagnosis (advanced disease presentation) and delays in DTI > 45 days were also associated with marital and employment status. Black patients were associated with a lower 3-year LRC rate (65% vs. 81%, p < 0.001) and OS rate (43% vs. 69%, p < 0.001), compared to non-black patients. Patients with > 45 days DTI had a detriment in 3-year LRC (77% vs. 83%, p = 0.002) and OS (66% vs. 69%, p = 0.009). On Cox MVA, black race was independently prognostic for worse LRC (HR 1.62 95% CI 1.04-2.51, p = 0.033) and OS (HR 1.55 95% CI 1.15-2.08, p = 0.004) vs. non-blacks. Black race is independently prognostic for LRC and OS. Delays in HNC treatment, such as more advanced
tumor stage presentation and delays in treatment initiation, may be attributed to socioeconomic factors such as employment status and social support."

According to the news reporters, the research concluded: "Efforts to accommodate these factors may expedite treatment, in hopes of improving the race related outcome disparity in HNC."

For more information on this research see: Treatment delays, race, and outcomes in head and neck cancer. *Cancer Epidemiology*, 2016;45():18-25. *Cancer Epidemiology* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. **Oncology - Head and Neck Cancer**

**New Head and Neck Cancer Study Findings Recently Were Reported by Researchers at University of Colorado (Enhancing radiosensitization in EphB4 receptor-expressing Head and Neck Squamous Cell Carcinomas)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Head and Neck Cancer have been published. According to news reporting from Aurora, Colorado, by NewsRx journalists, research stated, "Members of the Eph family of receptor tyrosine kinases have been implicated in a wide array of human cancers. The EphB4 receptor is ubiquitously expressed in head and neck squamous cell carcinoma (HNSCC) and has been shown to impart tumorigenic and invasive characteristics to these cancers."

The news correspondents obtained a quote from the research from the University of Colorado, "In this study, we investigated whether EphB4 receptor targeting can enhance the radiosensitization of HNSCC. Our data show that EphB4 is expressed at high to moderate levels in HNSCC cell lines and patient-derived xenograft (PDX) tumors. We observed decreased survival fractions in HNSCC cells following EphB4 knockdown in clonogenic assays. An enhanced G2 cell cycle arrest with activation of DNA damage response pathway and increased apoptosis was evident in HNSCC cells following combined EphB4 downregulation and radiation compared to EphB4 knockdown and radiation alone. Data using HNSCC PDX models showed significant reduction in tumor volume and enhanced delay in tumor regrowth following
sEphB4-HSA administration with radiation compared to single agent treatment. sEphB4-HSA is a protein known to block the interaction between the EphB4 receptor and its ephrin-B2 ligand."

According to the news reporters, the research concluded: "Overall, our findings emphasize the therapeutic relevance of EphB4 targeting as a radiosensitizer that can be exploited for the treatment of human head and neck carcinomas."

For more information on this research see: Enhancing radiosensitization in EphB4 receptor-expressing Head and Neck Squamous Cell Carcinomas. Scientific Reports, 2016;6():1-13. Surgery - Head and Neck Surgery

New Head and Neck Surgery Findings Has Been Reported by Investigators at Laval University (Decreasing loco-regional recurrence for oral cavity cancer with total Mohs margins technique)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Surgery - Head and Neck Surgery. According to news reporting originating in Quebec City, Canada, by NewsRx journalists, research stated, "The conventional technique for cancer resection margin analysis studies only 0.1% of the surgical margins. Complete frozen section margins - also known as Mohs margins - allows for analysis of 100% of the surgical margins."

The news reporters obtained a quote from the research from Laval University, "The objective of our study is to compare oral cavity cancer loco-regional recurrence rates when treated by total frozen sections technique (Total Mohs margins) versus conventional margins. We conducted a multicenter retrospective cohort chart review. Loco-regional oral cancer recurrence rates were compared between patients treated with total Mohs margins (2007-2013) and patients treated with conventional margins techniques (2002-2007). After applying inclusion criteria, a total of 60 patients treated by total Mohs margins and 57 patients with conventional margins were identified. Patients had similar baseline cancer stages, pathological types, past head and neck cancers and comorbidities (all p> 0.05). One-year recurrence rate was lower (10.0% vs 21.1%, p = 0.019) in favor of Mohs total margins and stayed significantly lower at 5 years of follow-up. When adjusted for T grade with N0 disease, Mohs technique was still beneficial in loco-regional recurrence for Tis-T4N0 up to 2 years (10.5% vs 25.7%, z-score 1.849, p = 0.032). The Number Needed to Treat at 2 years of follow-up for this subgroup of
patients (Tis-T4N0) is 6.6. Margins had to be retaken more often intra-operatively in Mohs technique (68.3% vs 12.3%, p< 0.0001), mainly for positive deep margins (48.6% of all margins, p = 0.028). Duration of surgery was not increased with Mohs vs conventional technique (380 min vs 475 min respectively, p = 0.025). Mohs total margins may result in a significant reduction in cancer recurrence rate at 5 years compare to conventional surgery."

According to the news reporters, the research concluded: "Moreover, duration of surgery was not increased when using Mohs technique when judiciously performed."

Our news correspondents report that additional information may be obtained by contacting N. Audet, Laval University, Hopital Enfant Jesus, CHU Quebec, Dept. of Otolaryngol Head & Neck Surg, Quebec City, PQ G1J 1Z4, Canada. Additional authors for this research include P. Gauthier and N. Audet.

Keywords for this news article include: Quebec City, Quebec, Canada, North and Central America, Head and Neck Surgery, Oncology, Surgery, Cancer, Laval University.

**Health and Medicine - Health and Society**

**New Health and Society Study Results from IMS Health Described (Orphan Drug Expenditures In The United States: A Historical And Prospective Analysis, 2007-18)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Health and Society. According to news reporting originating in Fairfax, Virginia, by NewsRx journalists, research stated, "The Orphan Drug Act of 1983 established incentives for the development of drugs that treat rare, or orphan, diseases. We used the IMS Health MIDAS database of audited biopharmaceutical sales to measure US annual spending on orphan drugs in the period 2007-13, and we estimated spending on the drugs for the period 2014-18."

The news reporters obtained a quote from the research from IMS Health, "We identified 356 brand-name orphan drugs that were approved by the Food and Drug Administration in the period 1983-2013. While we included orphan drugs with both orphan and other indications, we adjusted spending to include only spending for orphan indications. In 2014 dollars, expenditures on orphan drugs totaled $15 billion in 2007 and $30 billion in 2013-representing 4.8 percent and 8.9 percent of total pharmaceutical expenditures, respectively. Our future trend analysis for the period 2014-18 suggests a slowing in the growth of orphan drug expenditures. The overall impact of orphan drugs on payers' drug budgets is relatively small, and spending on orphan drugs as a percentage of total pharmaceutical expenditures has remained fairly stable."

According to the news reporters, the research concluded: "Concerns that growth in orphan drug expenditures may lead to unsustainable drug expenditures do not appear to be justified."

For more information on this research see: Orphan Drug Expenditures In The United
New Health-System Pharmacy Findings from Medical University of South Carolina Described (Pharmacy residency training measured through a standardized knowledge test)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Health-System Pharmacy is now available. According to news reporting out of Charleston, South Carolina, by NewsRx editors, research stated, "The use of a standardized knowledge test to assess postgraduate year 1 (PGY1) pharmacy residency training was evaluated. This was a retrospective review of a prospectively administered exam."

Our news journalists obtained a quote from the research from the Medical University of South Carolina, "A bank of questions was developed by preceptors from each of the core rotation disciplines: general medicine (including ambulatory care and oncology), pediatrics, critical care (including transplantation), drug information, operations, practice management, and psychiatry. Board-certified pharmacy specialists at our institution were asked to submit 5-10 questions with answers that would likely be encountered by residents during rotation in their specific specialty area. The exam was administered at the beginning and the end of the resident's PGY1 year. A total of 49 PGY1 residents completed the examination during the first and last months of their residency training. Residents' overall scores improved 5-10% annually from baseline to completion of their residency. The mean overall exam score significantly improved from baseline after completion of a PGY1 residency at our institution for all four class years. All four residency classes demonstrated an increase from baseline scores in most core disciplines with the exception of practice management, which decreased every year of the examination."

According to the news editors, the research concluded: "Scores on a standardized exam developed to assess the baseline knowledge of incoming PGY1 residents and the effect of one year of residency training improved in the majority of practice areas at the end of the year compared to scores at the beginning of the year."

For more information on this research see: Pharmacy residency training measured through a standardized knowledge test. American Journal of Health-System Pharmacy, 2016;73 (24):2095-2098. American Journal of Health-System Pharmacy can be contacted at: Amer Soc Health-System Pharmacists, 7727 Wisconsin Ave, Bethesda, MD 20814, USA.
Our news journalists report that additional information may be obtained by contacting A.N. Thompson, Medical University of South Carolina, Coll Pharm, Dept. of Clin Pharm & Outcome Sci, Charleston, SC 29425, United States. Additional authors for this research include B.P. McKinzie, J.S. Haney, J.M. Nappi and N. Pilch.

Heart Disorders and Diseases - Heart Attack

New Heart Attack Findings Has Been Reported by M. Cardona-Morrell et al (Pre-existing risk factors for in-hospital death among older patients could be used to initiate end-of-life discussions rather than Rapid Response System calls: A ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Attack. According to news originating from Sydney, Australia, by NewsRx correspondents, research stated, "To investigate associations between clinical parameters beyond the evident physiological deterioration and limitations of medical treatment with in-hospital death for patients receiving Rapid Response System (RRS) attendances. Retrospective case-control analysis of clinical parameters for 328 patients aged 60 years and above at their last RRS call during admission to a single teaching hospital in the 2012-2013 calendar years."

Our news journalists obtained a quote from the research, "Generalised estimating equation modelling was used to compare the deceased with a randomly selected sample of those who had RRS calls and survived admission (controls), matched by age group, sex, and hospital ward. In addition to a pre-existing order for limitation of treatment or cardiac arrest (OR 6.92; 95% CI 4.61-10.27), nursing home residence, proteinuria, advanced malignancy, acute myocardial infarction, chronic kidney disease, cognitive impairment and frailty were associated with high risk of death. After adjusting for all the clinical indicators investigated, the strongest risk factors for in-hospital death for patients with a RRS call were advanced malignancy (OR 3.95; 95% CI 2.16-7.21) and new myocardial infarction (OR 2.79; 95% CI 1.86-4.20). Patients with cognitive impairment, frailty indicator or chronic kidney disease were twice as likely to die as patients without those risk factors. In a sample of older deteriorated patients requiring a RRS attendance, multiple indicators of chronic illness, cognitive impairment and frailty were significantly associated with high risk of death."

According to the news editors, the research concluded: "These clinical features beyond the evident orders for limitation of medical treatment should signal the need for clinicians to initiate end-of-life discussions that may prevent futile interventions."

For more information on this research see: Pre-existing risk factors for in-hospital death among older patients could be used to initiate end-of-life discussions rather than Rapid Response System calls: A case-control study. Resuscitation, 2016;109():76-80. Resuscitation
New Heart Attack Findings Has Been Reported by Researchers at Department of Emergency Medicine (Prevalence of emergency medical service utilisation in patients with out-of-hospital cardiac arrest in Thailand)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting originating in Bangkok, Thailand, by NewsRx journalists, research stated, "Most patients with out-of-hospital cardiac arrest (OHCA) have grave outcomes. The efficacy of emergency medical services (EMS) may affect outcomes."

The news reporters obtained a quote from the research from the Department of Emergency Medicine, "However, no data exists in Thailand. To ascertain the prevalence of EMS utilisation in patients with OHCA transferred to Siriraj Hospital and also to elucidate the rates of return of spontaneous circulation (ROSC), hospital admission and survival to hospital discharge. This prospective cohort study was conducted in patients with OHCA at a university hospital in Bangkok, Thailand from May 2011 to February 2013. The data was gathered by interviewing bystanders. Data about the mode of transportation, reasons for EMS usage, response time, ROSC and 30-day mortality were collected. Patients with rigour mortis or livor mortis were excluded. The factors affecting ROSC and survival rate were determined by univariate analysis. One hundred and fifty-two patients were included. The prevalence of EMS usage was 14.5% (95% CI 9.3 to 21.0). The most common cause of non-usage of EMS was not knowing or forgetting an EMS number (49.2%). The proportion of bystanders having known an EMS number and using EMS was 34%. The ROSC and 30-day survival rates were 53.3% and 10.5%, respectively. Non-cardiac causes and witnessed arrests were associated with ROSC (p <0.05). The prevalence of EMS utilisation in OHCA at Siriraj Hospital was very low. This may affect the outcomes of patients with OHCA."

According to the news reporters, the research concluded: "Improving the EMS system by publicity to increase public awareness and providing life-support education nationwide may improve outcomes of patients with OHCA in Thailand."

Our news correspondents report that additional information may be obtained by contacting A. Monsomboon, Dept. of Emergency Medicine, Siriraj Hospital, Bangkok, Thailand. Additional authors for this research include P. Chantawatsharakorn, S. Sukuriyayothin, K. Keorochana, A. Mukda, N. Prapruetkit, U. Surabenjawong, T. Nakornchai and T. Chakorn.

**Heart Disorders and Diseases - Heart Attack**

**New Heart Attack Findings from Federal University Outlined (Effects of thyroid hormones on aortic tissue after myocardial infarction in rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Attack. According to news reporting originating from Porto Alegre, Brazil, by NewsRx correspondents, research stated, "Studies have shown a cardioprotective role of thyroid hormones (THs) in cardiac remodeling after acute myocardial infarction (MI). However, there is no data in the literature examining the influence of TH administration on the aortic tissue in an animal model of MI."

Our news editors obtained a quote from the research from Federal University, "This study aimed to evaluate the effects of thyroid hormones on the aorta after MI. Male Wistar rats were divided into a sham group (SHAM), infarcted group (AMI), sham+TH (SHAMT) and AMI+TH (AMIT). After MI, the animals received T3 and T4 (2 and 8 μg/100 g/day, respectively) by oral gavage for 12 days. Later, the animals underwent echocardiography and euthanasia and the aorta was collected for molecular and biochemical analysis. T3 and T4 administration increased the expression of the pro-angiogenic proteins vascular endothelial growth factor (VEGF) and hypoxia inducible factor 1 alpha (HIF-1 alpha) in the aorta of AMIT rats when compared with AMI. With respect to TH receptors, AMI rats presented a decrease in TR beta levels, which was prevented by the hormonal administration. In AMIT rats, both TR alpha and TR beta levels were increased when compared with the AMI group. Reactive oxygen species levels and NADPH oxidase activity were decreased in both treated groups when compared with the non-treated animals. TH administration after MI may improve angiogenic signaling in the aorta as well as the responsiveness of this vessel to T3 and T4."

According to the news editors, the research concluded: "These positive effects in the aorta may result in additional protection for the cardiovascular system in the context of cardiac ischaemic injury."

For more information on this research see: Effects of thyroid hormones on aortic tissue after myocardial infarction in rats. *European Journal of Pharmacology*, 2016;791():788-
793. *European Journal of Pharmacology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; European Journal of Pharmacology - www.journals.elsevier.com/european-journal-of-pharmacology/)

**Heart Disorders and Diseases - Heart Attack**

**New Heart Attack Findings from Kanazawa University Hospital Described (Age-specific differences in prognostic significance of rhythm conversion from initial non-shockable to shockable rhythm and subsequent shock delivery in out-of-hospital ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting out of Ishikawa, Japan, by NewsRx editors, research stated, "Early rhythm conversion from an initial non-shockable to a shockable rhythm and subsequent shock delivery in patients with out-of-hospital cardiac arrest (OHCA) has been associated with favourable neurological outcome (Cerebral Performance Category score 1 or 2; CPC 1-2). We hypothesized that the prognostic significance of rhythm conversion and subsequent shock delivery differs by age and time from initiation of cardiopulmonary resuscitation (CPR) by emergency medical service (EMS) providers to first defibrillation (shock delivery time)."

Our news journalists obtained a quote from the research from Kanazawa University Hospital, "We analysed 430,443 OHCA patients with an initial non-shockable rhythm using a prospective Japanese Utstein-style database from 2011 to 2014. The primary endpoint was 1-month CPC 1-2. Multivariate logistic regression revealed that rhythm conversion and subsequent shock delivery is positively associated with 1-month CPC 1-2: the adjusted odds ratio was 6.09 (95% confidence interval: 3.65-9.75) for shock delivery time <10 min and 3.34 (2.58-4.27) for 10-19 min in patients aged 18-64 years, and 3.16 (1.45-6.09) for <10 min and 2.17 (1.51-3.03) for 10-19 min in patients aged 65-74 years. However, it is negatively associated with 1-month CPC 1-2 for shock delivery time of 20-59 min in patients aged 75-84 years (0.55; 0.27-0.98) and >85 years (0.17; 0.03-0.53)."

According to the news editors, the research concluded: "Early rhythm conversion from an initial non-shockable to a shockable rhythm and subsequent shock delivery is associated
with increased odds of 1-month CPC 1-2 in OHCA patients aged 18-74 years but not in those aged >= 75 years."

**Heart Disorders and Diseases - Heart Attack**

**New Heart Attack Findings from P.C. Sherrell and Co-Authors Described (Cardiac and stem cell-cocooned hybrid microspheres: A multi factorial design approach)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting originating in Linkoping, Sweden, by NewsRx journalists, research stated, "Cell therapy is a promising approach for the treatment of patients suffering from myocardial infarction. Most recent therapies involve direct injection of cells into the damaged heart tissue to induce regeneration and help restore its functions, however, anoikis and the harsh environment at the sight of injection limit the therapeutic efficacy of current techniques."

Funders for this research include European Research Agency, Landstinget i Ostergotland-2013, Linkoping University-2014.

The news reporters obtained a quote from the research, "Biopolymeric microspheres such as alginate have been widely used for cells encapsulation and delivery for cell therapy applications. However, majority of these techniques are not standardized that is a big challenge for translation into clinically-relevant treatment options. In addition, purely-alginate base microspheres are limited by poor biodegradability and lack of strong interaction between the encapsulated cells and their surrounding alginate matrix. In this work, we have shown that the addition of type I collagen into alginate microspheres, systematically optimized by a multivariate experimental design, improves the biocompatibility of the microspheres towards induced pluripotent stem cells (iPSC), cardiomyocytes, and blood outgrowth endothelial cells (BOEC), whilst improving diffusion between outside environment and the inner sphere. The addition of collagen allows for multiple routes for sphere degradation leading to potentially
greater control over cell release once delivered."

According to the news reporters, the research concluded: "Mathematical models were developed and utilized to effectively evaluate and predict the influence of various factors such as polymer ratios, micronization air flow rate, and air-gap distance on spheres size and shape, which play a key role in cell viability, degradation rate of microspheres, as well as controlled production of the cell cocoons toward clinically-relevant cell therapies for treatment of myocardial infarction."

For more information on this research see: Cardiac and stem cell-cocooned hybrid microspheres: A multi factorial design approach. *Sensors and Actuators B-Chemical*, 2016;236 ():480-489. *Sensors and Actuators B-Chemical* can be contacted at: Elsevier Science Sa, PO Box 564, 1001 Lausanne, Switzerland.

**Heart Disorders and Diseases - Heart Attack**

**New Heart Attack Findings from University of Lille Described (Can we identify termination of resuscitation criteria in cardiac arrest due to drowning: results from the French national out-of-hospital cardiac arrest registry)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Attack. According to news reporting originating from Loos, France, by NewsRx correspondents, research stated, "Aims and objectivesThe aim of this study was to describe the cohort of persons having experiences fatal and non-fatal drowning events, registered in the French cardiac arrest registry and to identify termination of resuscitation criteria. MethodsWe performed a prospective multicenter study based on data from French cardiac arrest registry database."

Our news editors obtained a quote from the research from the University of Lille, "All patients with cardiac arrest after drowning (CAD) recorded between July 2011 and November 2014 were included. The population description was carried out by medians [interquartile ranges (IQR)] or frequencies. The characteristics were compared in terms of the primary endpoint (alive vs dead at hospital admission) using chi-square or Fisher's exact and the Mann-Whitney U test. The predictive model was carried out using the multivariate logistic regression. ResultsThe analysis included 234 CAD. The majority of patients were adults (83.6%) and males (64.5%). Most of the submersions occurred out of home (75.6%). We recorded 66.7% of incidents in fresh water. About a third of CAD was witnessed of which
33.8% had an immediate basic life support. Most of CAD patients received an advanced cardiac life support (87.2%). The median Mobile Medical Team response time was 22 [15-30] minutes. At hospital, 40.6% of patients were alive. Twenty one patients (9.0%) were discharged alive. Among them, 17 had a good neurological outcome. Faster interventions generally resulted in higher survival chances (Mobile Medical Team response time OR: 0.960[0.925; 0.996]; P=0.031; no flow duration OR: 0.535[0.313; 0.913]; P=0.022) if associated with ventilation (OR: 6.742[2.043; 22.250]; P=0.002). Age (OR: 0.971[0.955; 0.988]; P=0.001) and location outside (OR: 0.203[0.064; 0.625]; P=0.007) are the other criteria of our model. Conclusions The model is helpful to highlight explanatory variables concerning CAD patients' outcome. The next step is the validation of these five factors by a larger study.

According to the news editors, the research concluded: "Prevention and public training to lifesaving behaviours must be considered as priorities in French public health programmes."

The news editors report that additional information may be obtained by contacting H. Hubert, ILIS Univ Lille, Dept. of Public Hlth, EA 2694, Loos, France. Additional authors for this research include J. Escutnaire, P. Michelet, E. Babykina, C. El Khoury, K. Tazarourte, C. Vilhelm, L. El Hiki, B. Guinhouya and P.Y. Gueugniaud.

---

**New Heart Attack Study Findings Have Been Reported by Investigators at Oslo University Hospital (Factors impacting upon timely and adequate allocation of prehospital medical assistance and resources to cardiac arrest patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news originating from Oslo, Norway, by NewsRx correspondents, research stated, "Explore, understand and address issues that impact upon timely and adequate allocation of prehospital medical assistance and resources to out-of-hospital cardiac arrest (OHCA) patients. Mixed-methods design obtaining data for one year in three emergency medical communication centres (EMCC); Oslo-Akershus (OA), Vestfold-Telemark (VT) and Ostfold (O)."

Financial support for this research came from University of Oslo.

Our news journalists obtained a quote from the research from Oslo University Hospital, "Data collection included quantitative data from analysis of dispatch logs, ambulance
records and audio files. Qualitative data were collected through in-depth interviews and non-participant observations. OA-, VT-and O-EMCC responded to 1095 OHCAs and 579 of these calls were included for further analysis (333, 143 and 103, respectively). There were significant site differences in their recognition of OHCA (89, 94 and 78%, respectively, p < 0.001), provision of CPR instructions (83, 83 and 61%, respectively, p < 0.001), time from call answered to initial CPR instructions (1.4 min (1.2, 1.6), 1.1 min (0.9, 1.2) and 1.3 (1.2, 1.7) respectively, p = 0.002). The most frequent reason for delayed or failed recognition of OHCA was misinterpretation of agonal breathing. Interviews and observations revealed individual differences in protocol use, interrogation strategy and assessment of breathing. Use of protocol was only part of decision making, dispatchers trusted their own clinical experience and intuition, and used assumptions about the patient and the situation as part of decision making. Agonal breathing continues to be the main barrier to recognition of cardiac arrest.”

According to the news editors, the research concluded: "Individual differences among dispatchers' strategies can directly impact on performance, mainly due to the wide definition of cardiac arrest and lack of uniform tools for assessment of breathing.”

For more information on this research see: Factors impacting upon timely and adequate allocation of prehospital medical assistance and resources to cardiac arrest patients. Resuscitation, 2016;109():56-63. Resuscitation can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. database were analyzed."

The news correspondents obtained a quote from the research from American University, "Patients aged (>=)18 years undergoing unilateral primary TKA were included. We divided the patients into 4 groups: no anemia, any anemia, mild anemia, and moderate-severe anemia. Associations between anemia and different characteristics as well as cardiac outcomes and death were studied, after adjusting for all potential confounders. In the nonanemic group, the occurrence of myocardial infarction, cardiac arrest, and death were 61 of 34,661 (0.18%), 23 of 34,661 (0.07%), and 30 of 34,661 (0.09%), respectively. The numbers in the anemia group were 23 of 6673 (0.34%), 9 of 6673 (0.13%), and 14 of 6673 (0.21%). These were not statistically different. The anemic group had higher odds for respiratory and renal morbidities and for receiving transfusions. We found no association between preoperative anemia or its severity and myocardial infarction, cardiac arrest, or death up to 30 days postoperatively. This could potentially lower the bar for safe preoperative hematocrit levels for elective TKA, theoretically increasing the percentage of anemic patients undergoing the procedure."

According to the news reporters, the research concluded: "This, however, is at the expense of potential respiratory and renal insults."

For more information on this research see: The Association of Anemia and Its Severity with Cardiac Outcomes and Mortality After Total Knee Arthroplasty in Noncardiac Patients. The Journal of Arthroplasty, 2015;31(4):766-70.

Heart Disorders and Diseases - Heart Attack

New Heart Attack Study Findings Have Been Reported by Researchers at University Hospital (External validity of a contemporaneous primary percutaneous coronary intervention trial in patients with acute ST-elevation myocardial infarction: ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting originating in Bern, Switzerland, by NewsRx journalists, research stated, "Randomised controlled trials (RCTs) represent the most robust source of evidence-based medicine. However, the generalisability of RCTs is limited by the inclusion of selected populations."
The news reporters obtained a quote from the research from University Hospital, "We sought to assess the external validity of a contemporary trial including patients with ST-elevation myocardial infarction (STEMI) undergoing primary percutaneous coronary intervention (PPCI). Patients presenting to Bern University Hospital during the inclusion period of the COMFORTABLE AMI trial were divided into three groups: RCT participants (41%), eligible not included (17.5%), and excluded patients (41.5%). Major adverse cardiac events (MACE) were defined as one-year death and myocardial infarction. RCT participants compared with RCT-eligible patients had comparable baseline characteristics and outcomes; however, excluded patients differed in risk and had higher rates of MACE (HR 3.63, 95% CI: 2.03-6.48, p <0.001), death (HR 6.23, 95% CI: 2.93-13.24, p<0.001) and definite/probable stent thrombosis (HR 3.63, 95% CI: 1.79-7.36, p<0.001). Inability to provide consent was the most frequent exclusion criterion and was independently associated with an increased risk for MACE (HR 6.85, 95% CI: 3.97-11.81, p<0.001). In this single-centre investigation, results from the COMFORTABLE AMI trial appeared applicable to a broad representation of RCT-eligible patients."

According to the news reporters, the research concluded: "However, patients excluded from the trial represented a higher-risk population with impaired clinical outcomes and a lower adherence to cardiovascular medication."

Our news correspondents report that additional information may be obtained by contacting L. Raber, University Hospital Bern, Dept. of Cardiol, CH-3010 Bern, Switzerland. Additional authors for this research include S. Hadorn, T. Zanchin, K. Yamaji, A. Moschovitis, T. Pilgrim, S. Stortecky, P. Juni, D. Heg, S. Windecker and L. Raber.

Heart Disorders and Diseases - Heart Attack

New Heart Attack Study Findings Recently Were Reported by Researchers at Tel Aviv Sourasky Medical Center (Differential Effects of Colchicine on Cardiac Cell Viability in an in vitro Model Simulating Myocardial Infarction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Attack are discussed in a new report. According to news reporting from Tel Aviv, Israel, by NewsRx journalists, research stated, "We aimed to examine the effects of colchicine, currently in clinical
trials for acute myocardial infarction (AMI), on the viability of cardiac cells using a cell line model of AMI. HL-1, a murine cardiomyocyte cell line, and H9C2, a rat cardiomyoblast cell line, were incubated with TNFa or sera derived from rats that underwent AMI or sham operation followed by addition of colchicine."

The news correspondents obtained a quote from the research from Tel Aviv Sourasky Medical Center, "In another experiment, HL-1/H9C2 cells were exposed to anoxia with or without subsequent addition of colchicine. Cell morphology and viability were assessed by light microscopy, flow cytometry and Western blot analyses for apoptotic markers. Cellular viability was similar in both sera; however, exposing both cell lines to anoxia reduced their viability. Adding colchicine to anoxic H9C2, but not to anoxic HL-1, further increased their mortality, at least in part via enhanced apoptosis. Under any condition, colchicine induced detachment of H9C2 cells from their culture plates. This phenomenon did not apply to HL-1 cells. Colchicine enhanced cardiomyoblast mortality under in vitro conditions mimicking AMI and reduced their adherence capability. HL-1 was not affected by colchicine; nevertheless, no salvage effect was observed."

According to the news reporters, the research concluded: "We thus conclude that colchicine may not inhibit myocardial apoptosis following AMI."

Our news journalists report that additional information may be obtained by contacting G. Margolis, Dept. of Internal Medicine H, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel. Additional authors for this research include E. Hertzberg-Bigelman, R. Levy, J. Ben-Shoshan, G. Keren and M. Entin-Meer.

Heart Disorders and Diseases - Heart Attack

New Heart Attack Study Findings Reported from University of Alberta
(Complete vs Culprit-Only Percutaneous Coronary Intervention in STEMI With Multivessel Disease: A Meta-analysis and Trial Sequential Analysis of Randomized Trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Attack have been presented. According to news originating from Edmonton, Canada, by NewsRx correspondents,
research stated, "Patients with ST-elevation myocardial infarction (STEMI) and multivessel disease (MVD) most commonly are treated with culprit-only percutaneous coronary intervention (PCI). However, this has been recently challenged, suggesting benefit with complete revascularization (CR)."

Our news journalists obtained a quote from the research from the University of Alberta, "Still, these latest findings are largely based on clinical trials powered for composite outcomes that frequently include 'softer' end points. We performed a meta-analysis comparing routine culprit-only PCI vs CR in STEMI, with an emphasis on 'hard' clinical end points. MEDLINE, EMBASE, ISI Web of Science, and CENTRAL were searched from 1996-May 2015. Studies included patients with STEMI and MVD who received primary PCI. The primary end point was long-term death/myocardial infarction (MI). Data were combined using a fixed-effects model. Seven randomized trials (2004 patients: 1065 CR and 939 culprit-only PCI procedures) were included. Compared with culprit-only PCI, CR reduced the composite of death/MI (odds ratio [OR], 0.71; 95% confidence interval [CI], 0.52-0.96) but not death (OR, 0.78; 95% CI, 0.53-1.15) or recurrent MI (OR, 0.85; 95% CI, 0.58-1.24) alone. If CR was performed during the index catheterization, a reduction in death/MI was observed (death/MI: OR, 0.41; 95% CI, 0.25-0.65; death: OR, 0.59; 95% CI, 0.34-1.00; recurrent MI: OR, 0.35; 95% CI, 0.18-0.69). If staged, no benefits were noted (death/MI: OR, 0.99; 95% CI, 0.67-1.45; death: OR, 0.95; 95% CI, 0.56-1.61; recurrent MI: OR, 1.02; 95% CI, 0.61-1.70). However, when trial sequential analysis was performed for the overall population, the cumulative z-curve did not cross the monitoring boundary, suggesting a lack of evidence for reducing death/MI with CR (similar for index catheterization). In STEMI with MVD, there is insufficient evidence to support a reduction in death/MI with CR."

According to the news editors, the research concluded: "Our results reinforce the need for larger clinical trials powered for robust clinical end points."

The news correspondents report that additional information may be obtained from K.R. Bainey, University of Alberta, Mazankowski Alberta Heart Inst, Edmonton, AB, Canada. Additional authors for this research include R.C. Welsh, B. Toklu and S. Bangalore.

Heart Disorders and Diseases - Heart Attack

New Heart Attack Study Findings Reported from Yokohama City University (Pharmacodynamic Assessment of Platelet Reactivity After a Loading Dose of Prasugrel or Clopidogrel in Patients With ST-Segment Elevation Myocardial Infarction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Attack are discussed in a new report. According to news originating from Kanagawa, Japan, by NewsRx correspondents, research stated, "Few studies have compared the platelet reactivity of prasugrel and clopidogrel in the acute phase of ST-segment elevation myocardial infarction (STEMI). Primary percutaneous coronary intervention (PCI) was performed in 78 patients with STEMI within 12 h of onset."

Our news journalists obtained a quote from the research from Yokohama City University, "Patients were randomly assigned to receive a Japanese standard loading dose of prasugrel 20 mg or clopidogrel 300 mg. Platelet reactivity was serially assessed using the VerifyNow-P2Y12 assay, the results of which were expressed as P2Y12-reaction-units (PRU). PRU values were significantly lower in the prasugrel group (n=38) than in the clopidogrel group (n=40) at 3 h, 24 h, and 14 days after loading (191+/−101 vs. 271+/−50, 147+/−80 vs. 261+/−57, and 171+/−67 vs. 221+/−70, respectively, P<0.05), although the PRU levels at baseline (231+/−57 vs. 237+/−58, P=0.65) and 1 h after loading (282+/−65 vs. 291+/−62, P=0.54) were similar. As compared with the baseline values, the PRU levels at 1, 3 and 24 h after clopidogrel loading were significantly higher (respectively, P<0.05), whereas only the PRU at 1 h after prasugrel was elevated (P <0.001)."

According to the news editors, the research concluded: "In Japanese patients with STEMI who undergo primary PCI, prasugrel provides stronger platelet inhibition than clopidogrel from 3 h after loading, whereas platelet reactivity remained elevated within 24 h after clopidogrel loading."

The news correspondents report that additional information may be obtained from K. Tsukahara, Yokohama City University, Medical Center, Div Cardiol, Yokohama, Kanagawa, Japan. Additional authors for this research include K. Tsukahara, Y. Minamimoto, Y. Kimura, Y. Matsuzawa, N. Maejima, N. Iwahashi, K. Hibi, M. Kosuge, T. Ebina and K. Kimura.

New Heart Disease Data Have Been Reported by Investigators at Harvard School of Medicine (Parity, coronary heart disease and mortality in the old order Amish)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Disease is the subject of a report. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Prior data on the association between parity and mortality are limited by the presence of sociodemographic confounders including cultural norms of parity. Our objective was to determine the association between parity and mortality in the Amish, a socioeconomically homogenous group with large numbers of children per family."

The news reporters obtained a quote from the research from the Harvard School of Medicine, "We conducted a population-based cohort study among 518 Old Order Amish women enrolled in a cardiovascular awareness program. The mean length of follow-up for mortality was 13.52 years. We determined the adjusted associations between parity and obesity, prevalent coronary heart disease and mortality. The mean number of total births per woman was 6.7 +/- 3.6 with a mode of 8. No significant association was observed between parity and all-cause mortality when adjusted for age (HR 1.00 per additional birth; 95% CI 0.96-1.05; p = 0.85) or in multivariate analysis (HR 1.00, 95% CI 0.95-1.05; p = 0.95). There was also no association of parity in age- or multivariable adjusted models with prevalent diabetes, hypertension or coronary heart disease. Despite the lack of effect of parity on mortality, a significant association of ten or more births was observed with higher body mass index (BMI) compared to the referent group of 8-9 total births. In a highly homogeneous population with high rates of parity, no association between overall mortality and parity was observed."

According to the news reporters, the research concluded: "Ten or more births were significantly associated with a higher BMI but not with overall mortality."

For more information on this research see: Parity, coronary heart disease and mortality in the old order Amish. Atherosclerosis, 2016;254():14-19. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Our news correspondents report that additional information may be obtained by contacting F.K. Welty, Harvard Med Sch, Beth Israel Deaconess Med Center, Dept. of Med, Div Cardiovasc, Boston, MA, United States. Additional authors for this research include J. Giuseffi, M.D. Avila, N. New Heart Disease Data Have Been Reported by Researchers at Baptist Hospital of Miami [CAD-RADS (TM): Coronary Artery Disease - Reporting and Data System]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Disease. According to news reporting originating in Miami, Florida, by NewsRx journalists, research stated, "The intent of CAD-RADS Coronary Artery Disease Reporting and Data System is to create a standardized method to communicate findings of coronary CT angiography (coronary CTA) in order to facilitate decision-making regarding further patient management. The suggested CAD-RADS classification is applied on a per-patient basis and represents the highest-grade coronary artery lesion documented by coronary CTA."

The news reporters obtained a quote from the research from the Baptist Hospital of Miami, "It ranges from CAD-RADS 0 (Zero) for the complete absence of stenosis and plaque to CAD-RADS 5 for the presence of at least one totally occluded coronary artery and should always be interpreted in conjunction with the impression found in the report. Specific recommendations are provided for further management of patients with stable or acute chest pain based on the CAD-RADS classification. The main goal of CAD-RADS is to standardize reporting of coronary CTA results and to facilitate communication of test results to referring physicians along with suggestions for subsequent patient management."

According to the news reporters, the research concluded: "In addition, CAD-RADS will provide a framework of standardization that may benefit education, research, peer-review and quality assurance with the potential to ultimately result in improved quality of care."

New Heart Disease Data Have Been Reported by Researchers at Tarbiat Modares University [Automated diagnosis of coronary artery disease (CAD) patients using optimized SVM]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Disease. According to news reporting out of Tehran, Iran, by NewsRx editors, research stated, "Currently Coronary Artery Disease (CAD) is one of the most prevalent diseases, and also can lead to death, disability and economic loss in patients who suffer from cardiovascular disease. Diagnostic procedures of this disease by medical teams are typically invasive, although they do not satisfy the required accuracy."

Our news journalists obtained a quote from the research from Tarbiat Modares University, "In this study, we have proposed a methodology for the automatic diagnosis of normal and Coronary Artery Disease conditions using Heart Rate Variability (HRV) signal extracted from electrocardiogram (ECG). The features are extracted from HRV signal in time, frequency and nonlinear domains. The Principal Component Analysis (PCA) is applied to reduce the dimension of the extracted features in order to reduce computational complexity and to reveal the hidden information underlain in the data. Finally, Support Vector Machine (SVM) classifier has been utilized to classify two classes of data using the extracted distinguishing features. In this paper, parameters of the SVM have been optimized in order to improve the accuracy. Provided reports in this paper indicate that the detection of CAD class from normal class using the proposed algorithm was performed with accuracy of 99.2%, sensitivity of 98.43%, and specificity of 100%.

According to the news editors, the research concluded: "This study has shown that methods which are based on the feature extraction of the biomedical signals are an appropriate approach to predict the health situation of the patients."

For more information on this research see: Automated diagnosis of coronary artery disease (CAD) patients using optimized SVM. *Computer Methods and Programs in Biomedicine*, 2017;138():117-126. *Computer Methods and Programs in Biomedicine* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Heart Disorders and Diseases - Heart Disease

New Heart Disease Findings Has Been Reported by Investigators at Medical University of South Carolina (Prognostic implications of coronary CT angiography-derived quantitative markers for the prediction of major adverse cardiac events)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Disease. According to news reporting out of Charleston, South Carolina, by NewsRx editors, research stated, "To evaluate quantitative markers derived from coronary CT angiography (coronary CTA) for the prediction of major adverse cardiac events (MACE). Pooled data from two centers in the US and Europe were retrospectively analyzed."

Our news journalists obtained a quote from the research from the Medical University of South Carolina, "Forty-six patients (65.5 +/- 8.1 years, 62% male) with suspected coronary artery disease (CAD) who had undergone dual-source CCTA and had experienced MACE within 12 months were included and compared to a Framingham risk score matched cohort (n = 46) without MACE. Various quantitative markers derived from coronary CTA were compared between both groups: Total plaque volume (TPV), calcified and non-calcified plaque volumes (CPV and NCPV), plaque burden (%), remodeling index, lesion length, presence of Napkin-ring sign, segment involvement score (SIS), and segment stenosis score (SSS). Discriminatory power of these markers for predicting MACE was assessed. Patients with MACE had significantly more obstructive CAD with higher plaque burden, SSS, and SIS (all p< 0.05) compared to controls. MACE-related lesions showed higher median TPV (122.6 mm(3) vs. 76.3 mm(3)), NCPV (67.3 mm(3) vs. 56.1 mm(3)), plaque burden (66.3% vs. 44.9%), greater lesion length (23.1 mm vs. 19.2 mm), and higher prevalence of Napkin-ring sign (63% vs. 32%) (all p< 0.05). On multivariable analysis, odds ratios (OR) for MACE on a per-patient level were 1.07 for plaque burden (p = 0.0002) and 1.13 for SSS (p = 0.049). On a per-lesion basis OR for lesion length was 1.05 (p = 0.042), 1.03 for plaque burden (p = 0.018), 1.28 for remodeling index (p = 0.026), and 1.68 for the Napkin-ring sign (p = 0.031). At receiver operating characteristics analysis a combination of markers (Framingham risk score + Napkin-ring sign + lesion length + remodeling index) showed the highest predictive value for MACE (AUC 0.92, p = 0.013). Coronary CTA-derived markers portend predictive value for MACE on a per-patient (plaque burden and SSS) and per-lesion level (lesion length, plaque burden, remodeling index, and Napkin-ring sign)."

According to the news editors, the research concluded: "A combination of markers added to the Framingham risk score has the highest predictive power."

Our news journalists report that additional information may be obtained by contacting U.J. Schoepf, Medical University of South Carolina, Dept. of Medicine, Div Cardiol, Charleston, SC, United States. Additional authors for this research include F. Plank, C.N. De
New Heart Disease Findings Reported from McGill University (Sex Differences in Clinical Outcomes After Premature Acute Coronary Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Disease. According to news reporting originating from Montreal, Canada, by NewsRx correspondents, research stated, "Over past decades, the incidence of acute coronary syndrome (ACS) has increased in young women, and greater mortality rates after discharge were observed among young women vs men. We revisited this issue with contemporary data from the Gender and Sex Determinants of Cardiovascular Disease: From Bench to Beyond Premature Acute Coronary Syndrome (GENESIS-PRAXY), a multicentre prospective cohort study."

Our news editors obtained a quote from the research from McGill University, "One thousand two hundred thirteen patients were enrolled in GENESIS-PRAXY from 26 centres across Canada, the United States, and Switzerland between January 2009 and April 2013. We assessed major adverse cardiac events (MACE) and mortality over 12 months after ACS. The role of sex as a predictor of outcomes was determined with Cox proportional hazard regression analysis. We included 1163 patients with complete data. The occurrence of MACE was 9% and 8% in women and men, respectively (P = 0.75), and 1% of women and men died during follow-up. In adjusted models, there was no sex difference in the risk of MACE or mortality. The proportion of patients with all-cause rehospitalization was higher in women (13%) compared with men (9%; P = 0.006), but cardiac rehospitalization rates were similar in both sexes regardless of ACS type. Among first rehospitalizations, the majority was classified as cardiac related (69%), with chest pain or angina (28%) and myocardial infarction (19%) reported as the most common reasons for first rehospitalization. Women were more likely than men to be rehospitalized for all causes but not for a cardiac cause."

According to the news editors, the research concluded: "In contrast to earlier studies, men and women had similar mortality and MACE outcomes at 1 year."

The news editors report that additional information may be obtained by contacting L. Pilote, McGill University, Center Hlth, Div Clin Epidemiol, Res Inst, Montreal, PQ, Canada. Additional authors for this research include J. Choi, N. Winters, M.J. Eisenberg, S.L. Bacon, J. Cox, S.S. Daskalopoulou, K.L. Lavoie, I. Karp, A. Shimony, D. So, G. Thanassoulis and L. Pilote.

Heart Disorders and Diseases - Heart Disease

New Heart Disease Findings from Chonnam National University School of Medicine Described (Associations between Serotonergic Genes and Escitalopram Treatment Responses in Patients with Depressive Disorder and Acute Coronary Syndrome: The ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Disease. According to news reporting originating from Gwangju, South Korea, by NewsRx correspondents, research stated, "Genes related to serotonin are associated with responses to treatment for depression. We examined associations between the serotonin transporter (5-HTT) and serotonin 2a receptor (5-HTR2a) genes and responses to treatment for depressive disorders in acute coronary syndrome (ACS)."

Our news editors obtained a quote from the research from the Chonnam National University School of Medicine, "A total of 255 patients who met the DSM-IV major or minor depressive disorder and recently developed ACS were randomly assigned to the escitalopram (n=127) or placebo (n=128) group in this 24-week double-blind trial (ClinicalTrial.gov identifier: NCT00419471). Remission was defined as a Hamilton Rating Scale for Depression (HAMD) score (<=)7. Assays were performed for the 5-HTTLPR, STin2 VNTR, 5-HTR2a 102T/C, and 5-HTR2a 1438A/G genotypes. Escitalopram was superior to placebo for treating depressive disorder with ACS but there were no significant associations between serotonergic genes and treatment responses even when considering ACS severity."

According to the news editors, the research concluded: "The effect of escitalopram was independent of 5-HTT and 5-HTR2a polymorphisms."

For more information on this research see: Associations between Serotonergic Genes and Escitalopram Treatment Responses in Patients with Depressive Disorder and Acute Coronary Syndrome: The EsDEPACS Study. Psychiatry Investigation, 2015;13(1):157-60.

The news editors report that additional information may be obtained by contacting H.J. Kang, Dept. of Psychiatry, Chonnam National University Medical School, Gwangju, South Korea. Additional authors for this research include K.Y. Bae, S.W. Kim, I.S. Shin, Y.J. Hong, Y. Ahn, M.H. Jeong, S.W. Park, Y.H. Kim, J.S. Yoon and J.M Kim.

New Heart Disease Study Findings Recently Were Reported by Researchers at Seoul National University (Limiting scan range of cardiac CT and the chance of missed acute aortic syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Disease are presented in a new report. According to news originating from Gyeonggi Do, South Korea, by NewsRx correspondents, research stated, "Recently, dedicated cardiac computed tomography (CT) has been performed to rule out acute coronary syndrome in patients with chest pain equivalents. However, acute aortic syndrome (AAS) could mimic acute coronary syndrome."

Our news journalists obtained a quote from the research from Seoul National University, "We investigated the reliability of CT with a limited scan range for the detection of AAS. Patients older than 18 years with a diagnosis of AAS were included for a 10-year period. We reviewed all patients’ electronic medical record and cardiac CT scan images. The AAS lesions outside of the upper or lower margin of the cardiac CT scan range were measured. Other abnormalities defined as indirect evidence of AAS such as pericardial effusion were also collected. Of a total of 309 cases, 6 (1.9%; 95% confidence interval, 0.71-4.17) patients had aortic lesions outside of the cardiac CT scan range. One patient had an aortic lesion above the cardiac CT scan range, and 5 patients had aortic lesions below the cardiac CT scan range. Aortic lesions outside of the cardiac CT scan range were not rare."

According to the news editors, the research concluded: "Therefore, using a cardiac CT might not guarantee ruling out AAS completely."

The news correspondents report that additional information may be obtained from K. Kim, Seoul National University, Bundang Hosp, Dept. of Emergency Med, Seongnam Si 463707, Gyeonggi Do, South Korea. Additional authors for this research include J. Kim and K. Kim.

New Heart Failure Findings Has Been Reported by Investigators at Gilead Sciences Inc. (Targeting LOXL2 for cardiac interstitial fibrosis and heart failure treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Failure have been presented. According to news originating from Foster City, California, by NewsRx correspondents, research stated, "Interstitial fibrosis plays a key role in the development and progression of heart failure. Here, we show that an enzyme that crosslinks collagen-Lysyl oxidase-like 2 (Loxl2)-is essential for interstitial fibrosis and mechanical dysfunction of pathologically stressed hearts."

Our news journalists obtained a quote from the research from Gilead Sciences Inc., "In mice, cardiac stress activates fibroblasts to express and secrete Loxl2 into the interstitium, triggering fibrosis, systolic and diastolic dysfunction of stressed hearts. Antibody-mediated inhibition or genetic disruption of Loxl2 greatly reduces stress-induced cardiac fibrosis and chamber dilatation, improving systolic and diastolic functions. Loxl2 stimulates cardiac fibroblasts through PI3K/AKT to produce TGF-beta 2, promoting fibroblast-to-myofibroblast transformation; Loxl2 also acts downstream of TGF-beta 2 to stimulate myofibroblast migration. In diseased human hearts, LOXL2 is upregulated in cardiac interstitium; its levels correlate with collagen crosslinking and cardiac dysfunction."

According to the news editors, the research concluded: "LOXL2 is also elevated in the serum of heart failure (HF) patients, correlating with other HF biomarkers, suggesting a conserved LOXL2-mediated mechanism of human HF."

Keywords for this news article include: Foster City, California, United States, North and Central America, Cardiovascular Diseases and Conditions, Heart Disorders and Diseases, Heart Failure, Heart Disease, Cardiology, Genetics, Gilead Sciences Inc.

Heart Disorders and Diseases - Heart Failure

New Heart Failure Findings Has Been Reported by Investigators at Kumamoto University (Late gadolinium enhancement on cardiac magnetic resonance predicts coronary vasomotor abnormality and myocardial lactate production in patients with chronic heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Failure. According to news originating from Kumamoto, Japan, by NewsRx correspondents, research stated, "Myocardial fibrosis and microvascular dysfunction are key determinants of outcome in heart failure (HF); we examined their relationship in patients with HF. Our study included 61 consecutive patients with HF but without coronary stenosis."

Financial supporters for this research include Boehringer Ingelheim Japan, Bristol-Myers Squibb Company, Mitsubishi Tanabe Pharma.

Our news journalists obtained a quote from the research from Kumamoto University, "All underwent gadolinium-enhanced cardiac magnetic resonance to evaluate late gadolinium enhancement (LGE) and an acetylcholine (ACh) provocation test to evaluate microvascular dysfunction. During the ACh provocation test, we sampled blood simultaneously from the coronary sinus and aortic root to compare lactate concentrations. We quantified coronary blood flow volume using an intracoronary Doppler-tipped guidewire. We detected LGE in 34 patients (LGE-positive); 27 were LGE-negative. Coronary blood flow volume increased significantly after the ACh provocation test only in LGE-negative patients (before vs. after ACh, 47.5 +/- A 36.8 vs. 69.2 +/- A 48.0 ml/min, respectively; p = 0.004). The myocardial lactate extraction ratio (LER) significantly decreased after the ACh test in both groups (LGE-negative, p = 0.001; LGE-positive, p< 0.001), significantly more so in the LGE-positive group (p = 0.017). Multivariate logistic regression analysis showed that a post-ACh LER < 0 (indicating myocardial lactate production) was a significant predictor of LGE-positivity (odds ratio 4.54; 95 % confidence interval 1.38-14.93; p = 0.013). In the LGE-positive group, an LGE volume greater than the median significantly predicted a post-ACh LER of < 0 (p = 0.042; odds ratio 6.02; 95 % confidence interval 1.07-33.86). ACh-provoked coronary vasomotor abnormality is closely correlated with myocardial fibrosis in patients with HF but without organic coronary stenosis."

According to the news editors, the research concluded: "Coronary vasomotor abnormalities in fibrotic myocardium may worsen HF."

For more information on this research see: Late gadolinium enhancement on cardiac magnetic resonance predicts coronary vasomotor abnormality and myocardial lactate production in patients with chronic heart failure. *Heart and Vessels*, 2016;31(12):1969-1979. *Heart and Vessels* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. New Heart Failure Findings Has Been Reported by Investigators at Ruhr University (Calcitropic and phosphaturic hormones in heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Failure. According to news reporting from Bad Oeynhausen, Germany, by NewsRx journalists, research stated, "Despite adherence to evidence-based guidelines, heart failure [HF] still results in 5-year mortality rates of 50%, indicating a need to implement additional preventive/intervention strategies. This review summarizes data on alterations in the calcitropic and phosphaturic hormones 1,25-dihydroxyvitamin D [1,25(OH)(2)D] and fibroblast growth factors-23 [FGF-23] in HF and discusses non-pharmacological measures for targeting these hormones."

The news correspondents obtained a quote from the research from Ruhr University, "Data synthesis: The role of 1,25(OH) 2D in the regulation of calcium and phosphate homeostasis is central. 1,25(OH) 2D also plays a pivotal role in cardiac function, but is downregulated by FGF-23. There is accumulating evidence from epidemiological data that HF is associated with decreased circulating 1,25(OH) 2D and elevated FGF-23 levels. In patients with failing hearts, very low 1,25(OH) 2D and extremely high FGF-23 levels have been reported. Experimental data support the assumption that vitamin D deficiency and high serum phosphate/FGF-23 levels increase the risk of HF. This review provides a hypothesis of how vitamin D deficiency, high calcium/phosphorus intake, physical inactivity, and age-related renal impairment may all contribute to HF by adversely affecting calcium-and phosphate-regulating hormones. Several case series in infants and a meta-analysis of randomized controlled trials in adults have already reported successful treatment of or a significant risk reduction in HF by vitamin D supplements. The association of calcium/phosphorus intake, physical activity, or renal function with calcitropic/phosphaturic hormones and HF is however less well documented."

According to the news reporters, the research concluded: "More attention should be paid in future to the association of circulating 1,25(OH) 2D and FGF-23 levels with HF and to (non-pharmacological) measures for targeting these calcitropic/phosphaturic hormones."

Our news journalists report that additional information may be obtained by contacting A. Zittermann, Ruhr University of Bochum, Clin Thorac & Cardiovasc Surg, Heart & Diabet Center North Rhine Westphalia, D-32545 Bad Oeynhausen, Germany.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.numecd.2016.06.007. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Heart Failure

New Heart Failure Findings Reported from Hasselt University (Mode of Death in Octogenarians Treated With Cardiac Resynchronization Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Failure. According to news reporting out of Diepenbeek, Belgium, by NewsRx editors, research stated, "Cardiac resynchronization therapy (CRT) improves morbidity and mortality in heart failure with reduced ejection fraction (HFrEF) and electrical dyssynchrony. CRT patients in clinical practice are older compared with clinical trials."

Our news journalists obtained a quote from the research from Hasselt University, "To investigate clinical response, reverse remodeling, outcome, and mode of death in octogenarians receiving CRT. Baseline characteristics, change in New York Heart Association (NYHA) functional class, reverse ventricular remodeling, heart failure readmissions, all-cause mortality, and mode of death were evaluated in CRT patients with comparison between octogenarians and nonoctogenarians. In addition, annual mortality rates of octogenarians undergoing CRT were compared with age-matched control subjects from the general population with the use of national actuarial tables. A total of 686 patients, including 178 octogenarians (26%), were followed for 38 +/- 22 months. Octogenarians exhibited a similar change in NYHA functional class (P = .640), left ventricular ejection fraction increase (P = .796), and decrease in end-diastolic (P = .441) and end-systolic (P = .312) diameter compared with their younger counterparts undergoing CRT. Octogenarians had a higher all-cause mortality risk (P < .001), but heart failure readmission risk did not differ (hazard ratio 0.916, 95% confidence interval 0.638-1.313; P = .632). A higher proportion of noncardiac deaths was observed in octogenarians (74%) versus younger patients (50%; P = .022), with worsening heart failure rather than malignant tachyarrhythmia being the main cardiac cause of death. Compared with an age-matched sample from the general population, octogenarians receiving CRT had an equivalent annual mortality rate (log-rank test: P = .444)."

According to the news editors, the research concluded: "Octogenarians retain the ability to mount a significant symptomatic and ventricular remodeling response after CRT, resulting in survival similar to the general age-matched population."

For more information on this research see: Mode of Death in Octogenarians Treated With Cardiac Resynchronization Therapy. *Journal of Cardiac Failure*, 2016;22Q(12):970-977. *Journal of Cardiac Failure* can be contacted at: Churchill Livingstone Inc Medical Publishers, Curtis Center, Independence Square West, Philadelphia, PA 19106-3399, USA. Our news journalists report that additional information may be obtained by
New Heart Failure Findings from Brigham and Women's Hospital Reported (Long-Term Arrhythmic and Nonarrhythmic Outcomes of Lamin A/C Mutation Carriers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Failure is the subject of a report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Mutations in LMNA are variably expressed and may cause cardiomyopathy, atrioventricular block (AVB), or atrial arrhythmias (AAs) and ventricular arrhythmias (VA). Detailed natural history studies of LMNA-associated arrhythmic and nonarrhythmic outcomes are limited, and the prognostic significance of the index cardiac phenotype remains uncertain."

Our news journalists obtained a quote from the research from Brigham and Women's Hospital, "This study sought to describe the arrhythmic and nonarrhythmic outcomes of LMNA mutation carriers and to assess the prognostic significance of the index cardiac phenotype. The incidence of AVB, AA, sustained VA, left ventricular systolic dysfunction (LVD) (- left ventricular ejection fraction <= 50%), and end-stage heart failure (HF) was retrospectively determined in 122 consecutive LMNA mutation carriers followed at 5 referral centers for a median of 7 years from first clinical contact. Predictors of VA and end-stage HF or death were determined. The prevalence of clinical manifestations increased broadly from index evaluation to median follow-up: AVB, 46% to 57%; AA, 39% to 63%; VA, 16% to 34%; and LVD, 44% to 57%. Implantable cardioverter-defibrillators were placed in 59% of patients for new LVD or AVB. End-stage HF developed in 19% of patients, and 13% died. In patients without LVD at presentation, 24% developed new LVD, and 7% developed end-stage HF. Male sex (p - 0.01), non-missense mutations (p = 0.03), and LVD at index evaluation (p = 0.004) were associated with development of VA, whereas LVD was associated with end-stage HF or death (p < 0.001). Mode of presentation (with isolated or combination of clinical features) did not predict sustained VA or end-stage HF or death. LMNA-related heart disease was associated with a high incidence of phenotypic progression and adverse arrhythmic and nonarrhythmic events over long-term follow-up. The index cardiac phenotype did not predict adverse events."

According to the news editors, the research concluded: "Genetic diagnosis and subsequent follow-up, including anticipatory planning for therapies to prevent sudden death and manage HF, is warranted."

For more information on this research see: Long-Term Arrhythmic and

**Heart Disorders and Diseases - Heart Failure**

**New Heart Failure Findings from Institute for Health Outlined (Use of Coronary Ultrasound Imaging to Evaluate Ventricular Function in Adult Zebrafish)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Failure are discussed in a new report. According to news reporting out of Strassen, Luxembourg, by NewsRx editors, research stated, "So far, imaging of the adult zebrafish heart and assessment of heart failure in adult zebrafish have been very limited. Here, we describe a new method for in vivo imaging of the hypertrabeculated heart of the adult zebrafish using miniaturized cardiac ultrasound catheters obtained from the cardiac catheterization laboratory."

Our news journalists obtained a quote from the research from Institute for Health, "This method allows the observation of the ventricle of zebrafish and the assessment of ventricular diameters during diastole and systole, as well as heart rate and fractional shortening. Significant changes in these parameters were detected through the use of an adult zebrafish heart failure model induced by chronic anemia."

According to the news editors, the research concluded: "This imaging technique opens the door to detailed in vivo analysis of the adult heart failure phenotype in zebrafish."

For more information on this research see: Use of Coronary Ultrasound Imaging to Evaluate Ventricular Function in Adult Zebrafish. *Zebrafish*, 2016;13(6):477-480. *Zebrafish* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. (Mary Ann Liebert, Inc. - www.liebertpub.com; Zebrafish - www.liebertpub.com/overview/zebrafish/122/)

Our news journalists report that additional information may be obtained by contacting I. Emens, Luxembourg Inst Hlth, Cardiovasc Res Unit, L-1445 Strassen, Luxembourg. Additional authors for this research include A.I. Lumley, Y. Devaux and D.R. Wagner.

New Heart Failure Findings from P.M. Brown and Colleagues Discussed (Composite End Points in Acute Heart Failure Research: Data Simulations Illustrate the Limitations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Failure. According to news reporting from Edmonton, Canada, by NewsRx journalists, research stated, "Composite end points are frequently used in clinical trials of investigational treatments for acute heart failure, eg, to boost statistical power and reduce the overall sample size. By incorporating multiple and varying types of clinical outcomes they provide a test for the overall efficacy of the treatment."

The news correspondents obtained a quote from the research, "Our objective is to compare the performance of popular composite end points in terms of statistical power and describe the uncertainty in these power estimates and issues concerning implementation. We consider several composites that incorporate outcomes of varying types (eg, time to event, categorical, and continuous). Data are simulated for 5 outcomes, and the composites are derived and compared. Power is evaluated graphically while varying the size of the treatment effects, thus describing the sensitivity of power to varying circumstances and eventualities such as opposing effects. The average z score offered the most power, although caution should be exercised when opposing effects are anticipated. Results emphasize the importance of an a priori assessment of power and scientific basis for construction, including the weighting of individual outcomes deduced from data simulations. The interpretation of a composite should be made alongside results from the individual components."

According to the news reporters, the research concluded: "The average z score offers the most power, but this should be considered in the research context and is not without its limitations."

Our news journalists report that additional information may be obtained by contacting J.A. Ezekowitz, Canadian VIGOUR Center, Edmonton, AB, Canada. Additional authors for this research include K.J. Anstrom, M. Felker and J.A. Ezekowitz.

New Heart Failure Findings from University of Ottawa Described
(Charactersitics and outcomes for acute heart failure in elderly patients presenting to the ED)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Failure have been presented. According to news reporting originating from Ottawa, Canada, by NewsRx correspondents, research stated, "The first aim of this study was to investigate the characteristics for elderly patients with acute heart failure presenting to the emergency department (ED). The second aim was to determine the characteristics of these elderly patients associated with serious adverse events."

Our news editors obtained a quote from the research from the University of Ottawa, "The population was divided into 2 age groups, <80 and >= 80 years. The primary outcome was the occurrence of a serious adverse event, defined as either death from any cause within 30 days of the index ED visit or any of the following events within 14 days of the index ED visit: admission to a monitored unit, intubation, need for noninvasive ventilation, myocardial infarction, major procedure, or, for patients who were discharged after the initial visit, return to the ED resulting in admission to hospital. This prospective cohort study included 1658 visits. Older patients had a lower heart rate and higher diastolic blood pressure. The older patients were more likely to experience hospital admission (56% vs 46%, P< .001). For patients 80 years or older, 109 (14%) experienced a serious adverse event. In this >= 80-year group, history of heart failure, current medication with antiarrhythmic, acute infarction on the arrival electrocardiography, chest x-ray with pleural effusion, and urea greater than 12 mmol/L were independently associated with short-term serious adverse events. Elderly patients with heart failure are a high-risk group."

According to the news editors, the research concluded: "Careful assessment of these factors could help physicians identify those patients most at risk for adverse outcomes and, therefore, most in need of hospital admission."

The news editors report that additional information may be obtained by contacting P.G. Claret, University of Ottawa, Ottawa Hospital, Res Inst, Ottawa, ON, Canada. Additional authors for this research include I.G. Stiell, J.W. Yan, C.M. Clement, B.H. Rowe, L.A. Calder and J.J. Perry.

New Heart Failure Findings from University of Pennsylvania Discussed
(A qualitative secondary data analysis of intentional and unintentional medication nonadherence in adults with chronic heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "To explore factors contributing to intentional and unintentional medication nonadherence in adults with chronic heart failure (HF). Medication nonadherence is prevalent in HF but the factors contributing to it are not well understood."

Financial supporters for this research include SIGMA Theta Tau International Honor Society of Nursing, NIOSH Education and Research Center for Occupational Safety and Health, Kynett Foundation, the University of Pennsylvania Institute on Aging, New York University Provost University Challenge Research Fund.

The news correspondents obtained a quote from the research from the University of Pennsylvania, "This secondary data analysis of qualitative data explored narrative accounts about medication adherence from four previous studies (N = 112). The Necessity Concerns Framework derived from the Common Sense Model (CSM) of Self-Regulation guided the interpretation of themes. In this diverse sample (39% Black, 6% Hispanic, 63% male; mean age 59 15 years), 90% reported at least intermittent nonadherence. For many (60%), missing medication was unintentional but 27% reported intentional nonadherence. Four interconnected patterns of behavior emerged: 1) rarely non adherent, 2) frequently nonadherent, 3) intentionally nonadherent, and 4) reformed nonadherent. Misperceptions about HF, beliefs, concerns, and contextual factors contributed to both intentional and unintentional nonadherence."

According to the news reporters, the research concluded: "Medication nonadherence is prevalent in HF and influenced by modifiable factors."

Our news journalists report that additional information may be obtained by contacting B. Riegel, University of Pennsylvania, Sch Nursing, Philadelphia, PA 19104, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.hrtlng.2016.08.003. This DOI is a link to an online electronic document that is either free or for purchase.

New Heart Failure Study Findings Reported from Emory University [An evidence-based review of recent advances in therapy for heart failure with reduced ejection fraction (HFrEF)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Failure is the subject of a report. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "An estimated 5.1 million Americans have chronic heart failure and this is expected to increase 25% by 2030."

The news correspondents obtained a quote from the research from Emory University, "Heart failure is a clinical syndrome that evolves from either functional or structural changes to the ventricles that lead to filling or ejection abnormalities. Thus far, pharmacotherapy has been show to be beneficial in patients only with reduced ejection fraction; however, new therapies have been developed in hopes of reducing the burden of heart failure."

According to the news reporters, the research concluded: "In this review, we will discuss current pharmacotherapies recommended in American College of Cardiology/American Heart Association guidelines, the evidence behind these recommendations as well as new and emerging therapies that have been developed."

Our news journalists report that additional information may be obtained by contacting L. Raj, Emory University, Sch Med, Dept. of Med, Atlanta, GA 30303, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1136/postgradmedj-2016-134378. This DOI is a link to an online electronic document that is either free or for purchase.

New Heart Failure Study Results from University of Pennsylvania Hospital Described [Pulsatile Load Components, Resistive Load and Incident Heart Failure: The Multi-Ethnic Study of Atherosclerosis (MESA)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Left ventricular (LV) afterload is composed of systemic vascular resistance (SVR) and components of pulsatile load, including total arterial compliance (TAC), and reflection magnitude (RM). RM, which affects the LV systolic loading sequence, has been shown to strongly predict HF."

The news correspondents obtained a quote from the research from the University of Pennsylvania Hospital, "Effective arterial elastance (E-a) is a commonly used parameter initially proposed to be a lumped index of resistive and pulsatile afterload. We sought to assess how various LV afterload parameters predict heart failure (HF) risk and whether RM predicts HF independently from subclinical atherosclerosis. We studied 4345 MESA participants who underwent radial arterial tonometry and cardiac output (CO) measurements with the use of cardiac MRI. RM was computed as the ratio of the backward (P-b) to forward (P-f) waves. TAC was approximated as the ratio of stroke volume (SV) to central pulse pressure. SVR was computed as mean pressure/CO. E-a was computed as central end-systolic pressure/SV. During 10.3 years of follow-up, 91 definite HF events occurred. SVR (P = .74), TAC (P = .81), and E-a (P = .81) were not predictive of HF risk. RM was associated with increased HF risk, even after adjustment for other parameters of arterial load, various confounders, and markers of subclinical atherosclerosis (standardized hazard ratio [HR] 1.49, 95% confidence interval [CI] 1.18-1.88; P = .001). Pb was also associated with an increased risk of HF after adjustment for P-f (standardized HR 1.43, 95% CI 1.17-1.75; P = .001). RM is an important independent predictor of HF risk, whereas TAC, SVR, and E-a are not."

According to the news reporters, the research concluded: "Our findings support the importance of the systolic LV loading sequence on HF risk, independently from subclinical atherosclerosis."

Our news journalists report that additional information may be obtained by contacting P. Zamani, University of Pennsylvania Hospital, Div Cardiovasc Med, Perelman Sch Med, Philadelphia, PA 19104, United States. Additional authors for this research include S.M. Lilly, P. Segers, D.R. Jacobs, D.A. Bluemke, D.A. Duprez and J.A. Chirinos.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cardfail.2016.04.011. This DOI is a link to an online electronic document that is either free or for purchase.

New Heart Surgery Findings from University of Michigan Described (Delayed Sternal Closure in Infant Heart Surgery-The Importance of Where and When: An Analysis of the STS Congenital Heart Surgery Database)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Surgery - Heart Surgery is now available. According to news reporting out of Ann Arbor, Michigan, by NewsRx editors, research stated, "Delayed sternal closure (DSC) is commonly used to optimize hemodynamic stability after neonatal and infant heart surgery. We hypothesized that duration of sternum left open (SLO) was associated with rate of infection complications, and that location of sternal closure may mitigate infection risk."

Our news journalists obtained a quote from the research from the University of Michigan, "Infants (age <= 365 days) undergoing index operations with cardiopulmonary bypass and DSC at STS Congenital Heart Surgery Database centers (from 2007 to 2013) with adequate data quality were included. Primary outcome was occurrence of infection complication, defined as one or more of the following: endocarditis, pneumonia, wound infection, wound dehiscence, sepsis, or mediastinitis. Multivariable regression models were fit to assess association of infection complication with: duration of SLO (days), location of DSC procedure (operating room versus elsewhere), and patient and procedural factors. Of 6,127 index operations with SLO at 100 centers, median age and weight were 8 days (IQR, 5-24) and 3.3 kg (IQR, 2.9-3.8); 66% of operations were STAT morbidity category 4 or 5. At least one infection complication occurred in 18.7%, compared with 6.6% among potentially eligible neonates and infants without SLO. Duration of SLO (median, 3 days; IQR, 2-5) was associated with an increased rate of infection complications (p < 0.001). Location of DSC procedure was operating room (16%), intensive care unit (67%), or other (17%). Location of DSC was not associated with rate of infection complications (p = 0.45). Rate of occurrence of infectious complications is high among infants with sternum left open following cardiac surgery."

According to the news editors, the research concluded: "Longer duration of SLO is associated with increased infection complications."

Our news journalists report that additional information may be obtained by contacting K. Nelson-McMillan, CS Mott Childrens Hosp, Univ Michigan Heart Center, Dept. of Pediat, Div Pediat Cardiol, Ann Arbor, MI, United States. Additional authors for this research

**Transplant Medicine - Heart Transplants**

**New Heart Transplants Study Findings Reported from Vanderbilt University (Duration of Left Ventricular Assist Device Support Does Not Impact Survival After US Heart Transplantation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Transplant Medicine - Heart Transplants is the subject of a report. According to news reporting originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "The aim of this study was to determine whether the duration of left ventricular device support (LVAD) influenced outcomes after orthotopic heart transplantation in a modern, bridge to transplant national cohort. The United Network for Organ Sharing database, which has recently made pretransplant LVAD duration available, was queried for all adult bridge to transplant patients between January 2011 and December 2012."

Our news editors obtained a quote from the research from Vanderbilt University, "Three LVAD duration cohorts were generated, as follows: short (less than 90 days), intermediate (90 to 365 days), and prolonged (more than 365 days). Recipient, donor, and transplant-specific characteristics were compared among the duration cohorts. Unadjusted short-term and long-term survivals were estimated with the Kaplan-Meier method. Risk-adjusted models were also constructed to determine the independent impact of device duration on mortality. Of the 1,332 patients who met criteria for inclusion, 9.8% (n = 130), 54.7% (n = 729), and 35.5% (n = 473) were classified as short, intermediate, and prolonged, respectively. Although the performance status across each cohort was similar at listing (p = 0.38), more patients in the intermediate and prolonged cohorts were considered functionally independent before orthotopic heart transplantation (32% and 37%, respectively, versus 18%; p< 0.001). Additionally, despite worse baseline renal function in the intermediate and prolonged cohorts relative to the short cohort (glomerular filtration rate, 57 and 57 versus 69, p< 0.001), there was no difference in the incidence of new onset posttransplant renal failure (7% versus 10%, 9%, p = 0.41). There was also no difference in 30-day survival (98%, 96%, 95%, p = 0.51), 6-month survival (93%, 92%, 92%, p = 0.93), or 1-year survival (91%, 89%, 89%, p = 0.78) across the cohorts. After risk adjustment, duration did not independently predict mortality at any timepoint. In the largest, non-industry sponsored study of a modern bridge to transplant cohort, we demonstrated that duration of LVAD support before orthotopic heart transplantation does not influence posttransplant morbidity or mortality."

According to the news editors, the research concluded: "In subanalysis, support for 90 days or more is associated with improvements in pretransplant functional performance."

The news editors report that additional information may be obtained by contacting A.S. Shah, Vanderbilt University, Center Med, Dept. of Cardiac Surg, Nashville, TN 37232, United States. Additional authors for this research include J.T. Magruder, T.C. Crawford, C.D. Fraser, W.G. Plum, C.M. Sciortino, R.S. Higgins, G.J.R. Whitman and A.S. Shah.

Heart Valves

**New Heart Valves Study Findings Reported from St. Marianna University**

*Influence of aortic valve leaflet calcification on dynamic aortic valve motion assessed by cardiac computed tomography*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Valves. According to news reporting originating from Kanagawa, Japan, by NewsRx correspondents, research stated, "Computed tomography is the best noninvasive imaging modality for evaluating valve leaflet calcification. To evaluate the association of aortic valve leaflet calcification with instantaneous valve opening and closing using dynamic multidetector computed tomography (MDCT)."

Our news editors obtained a quote from the research from St. Marianna University, "We retrospectively evaluated 58 consecutive patients who underwent dynamic MDCT imaging. Aortic valve calcification (AVC) was quantified using the Agatston method. The aortic valve area (AVA) tracking curves were derived by planimetry during the cardiac cycle using all 20 phases (5% reconstruction). da/dt in cm(2)/s was calculated as the rate of change of AVA during opening (positive) or closing (negative). Patients were divided into 3 three groups according to Agatston score quartile: no AVC (Q2, Score 0, n = 18), mild AVC (Q3, Score 1-225, n = 24), and severe AVC (Q4 Score >2254, n = 14). In multivariable linear regression, compared to the non AVC group, the mild and severe AVC groups had lower maximum AVA (by -1.71 cm(2) and -2.25 cm(2), respectively), lower peak positive da/dt (by -21.88 cm(2)/s and -26.65 cm(2)/s, respectively), and higher peak negative da/dt (by 13.78 cm(2)/s and 18.11 cm(2)/s, respectively) (p < 0.05 for all comparisons). AVA and its opening and closing were influenced by leaflet calcification."

According to the news editors, the research concluded: "The present study demonstrates the ability of dynamic MDCT imaging to assess quantitative aortic valve motion in a clinical setting."

The news editors report that additional information may be obtained by contacting Y.J. Akashi, St. Marianna University, Sch Med, Dept. of Internal Med, Div Cardiol, Kawasaki, Kanagawa, Japan. Additional authors for this research include K. Yoneyama, M. Izumo, K. Suzuki, Y. Ogawa, K. Chikaraishi, Y. Ogawa, Y. Kobayashi, T. Furukawa, Y. Tanabe and Y.J. Akashi.

**Gram-Negative Bacteria - Helicobacter pylori**

**New Helicobacter pylori Findings from Autonomous University Discussed (Regression of gastric intestinal metaplasia after the eradication of Helicobacter pylori infection in a hospital in Mexico)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Helicobacter pylori have been published. According to news reporting from Culiacan, Mexico, by NewsRx journalists, research stated, "Intestinal metaplasia is a precursor lesion of gastric cancer. Infection by Helicobacter pylori is the principal cause of metaplasia."

The news correspondents obtained a quote from the research from Autonomous University, "While evidence of the regression of metaplasia after treatment to eradicate this infection has been demonstrated, controversy remains with regard to this subject. The objective of this study was to determine the frequency of the regression of gastric intestinal metaplasia one year after the eradication of Helicobacter pylori. A prospective longitudinal designed study was carried out. The population studied in this research consisted of patients attending the Endoscopy Unit to undergo an upper endoscopy, in whom various symptoms indicated intestinal metaplasia associated with Helicobacter pylori, and who received standard empiric triple therapy to eradicate the bacteria. An upper endoscopy was performed in which four gastric biopsy samples were taken (two from the antrum and two from the body) before and after the eradicating treatment, with the endoscopic and histological findings studied after one year of monitoring. The statistical analysis was conducted using the Fisher's exact test and the McNemar's test. Forty-six patients were studied, of whom 20 (43.5%) were men and 26 (56.5%) were women, with an average age of 58.9 (DE 11.2). Intestinal metaplasia was found in 46 (100%) patients before treatment and in 21 (45.7%) patients post-eradication. Complete intestinal metaplasia (type I) was found in 35 patients (76.1%) before treatment and in 11 (23.9%) patients post-eradication (p = 0.000), while incomplete intestinal metaplasia (type II) was found in 10 (21.7%) patients before treatment and in 10 (21.7%) patients post-eradication. Non-atrophic chronic gastritis was found in 35 (76.1%) patients before treatment and in 32 (69.6%) patients post-eradication. In this study, gastric intestinal metaplasia associated with
Helicobacter pylori infection showed a regression of 54.3% one year after the eradication of this microorganism."

According to the news reporters, the research concluded: "This treatment could modify the natural history of the development of gastric cancer."

For more information on this research see: Regression of gastric intestinal metaplasia after the eradication of Helicobacter pylori infection in a hospital in Mexico. Revista Espanola De Enfermedades Digestivas, 2016;108(12):770-775. Revista Espanola De Enfermedades Digestivas can be contacted at: Aran Ediciones, S A, Castello, 128, 1O, 28006 Madrid, Spain.

Our news journalists report that additional information may be obtained by contacting J.A. Sanchez-Cuen, Univ Autonoma Sinaloa, Sch Med, Dept. of Postgraduate Studies, Culiacan, Sinaloa, Mexico. Additional authors for this research include A.B. Irineo-Cabrales, G. Bernal-Magana and F.D. Peraza-Garay.

Gram-Negative Bacteria - Helicobacter pylori

New Helicobacter pylori Findings from Shahrekord University of Medical Sciences Described (Clinical relevance of Helicobacter pylori virulence factors in Iranian patients with gastrointestinal diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Helicobacter pylori is now available. According to news reporting from Shahrekord, Iran, by NewsRx journalists, research stated, "Helicobacter pylori (H. pylori) usually colonizes the gastric mucosa of more than 50% of the human population, causing an infection that may appear in early childhood and can persist for life. H. pylori is suggested as the main cause of peptic ulcer and chronic gastritis. It is also associated with gastric cancer."

The news correspondents obtained a quote from the research from the Shahrekord University of Medical Sciences, "Its severity and symptoms depend on environmental factors, host susceptibility and bacterial components, which allow H. pylori to switch between commensalism and pathogenicity. H. pylori is genetically highly variable, and the variability which affects H. pylori virulence factors might be useful in identifying the strains with different degrees of pathogenicity. The geographic distribution of distinct H. pylori genotypes is largely unknown and should be established. The prevalence of more pathogenic genotypes in certain areas may have important epidemiological consequences. It also might be associated with the severity of H. pylori related diseases in such regions. Given that Iran is located in the Middle East and Asian populations have revealed high levels of gastric cancer, it is of clinical interest to clarify the potential of H. pylori virulence markers in predicting the associated clinical outcomes."

According to the news reporters, the research concluded: "In this review, clinical relevance of adhesion molecules and significant virulence factors of H. pylori in Iranian patients with gastrointestinal diseases are discussed in comparison to other countries."

Our news journalists report that additional information may be obtained by contacting H. Shirzad, Shahrekord Univ Med Sci, Cellular & Mol Res Center, Shahrekord, Iran. Additional authors for this research include F. Azadegan-Dehkordi, M. Rafieian-Kopaei, G. Rahimian, M. Asadi-Samani and H. Shirzad.

**Health and Medicine - Hematology Research**

**New Hematology Research Findings from Leiden University Reported** *(Red cell alloimmunisation in patients with different types of infections)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Hematology Research have been published. According to news reporting originating in Leiden, Netherlands, by NewsRx journalists, research stated, "Red cell alloantigen exposure can cause alloantibody-associated morbidity. Murine models have suggested that inflammation modulates red cell alloimmunisation."

The news reporters obtained a quote from the research from Leiden University, "This study quantifies alloimmunisation risks during infectious episodes in humans. We performed a multicentre case-control study within a source population of patients receiving their first and subsequent red cell transfusions during an 8-year follow-up period. Patients developing a first transfusion-induced red cell alloantibody (N=505) were each compared with two similarly exposed, but non-alloimmunised controls (N=1010) during a 5-week alloimmunisation risk period using multivariate logistic regression analysis. Transfusions during severe' bacterial (tissue-invasive) infections were associated with increased risks of alloantibody development [adjusted relative risk (RR) 1<bold > <i> </i>34, 95% confidence interval (95% CI) 0<bold > <i> </i>97-1<bold > <i> </i>85], especially when these infections were accompanied with long-standing fever (RR 3<bold > <i> </i>06, 95% CI 1<bold > <i> </i>57-5<bold > <i> </i>96). Disseminated viral disorders demonstrated a trend towards increased risks (RR2<bold > <i> </i>41, 95% CI 0<bold > <i> </i>89-6<bold > <i> </i>53), in apparent contrast to a possible protection associated with Gram-negative bacteraemia (RR 0<bold > <i> </i>58, 95% CI 0<bold > <i> </i>13-1<bold > <i> </i>14). Simple' bacterial infections, Gram-positive bacteraemia, fungal infections, maximum C-reactive protein values and leucocytosis were not associated with red cell alloimmunisation. These findings are consistent with murine models."
According to the news reporters, the research concluded: "Confirmatory research is needed before patients likely to develop alloantibodies may be identified based on their infectious conditions at time of transfusion."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bjh.14307. This DOI is a link to an online electronic document that is either free or for purchase.

**Hematopoiesis**

**New Hematopoiesis Study Findings Have Been Reported from M. Letourneau et al (Drosophila hematopoiesis under normal conditions and in response to immune stress)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hematopoiesis are presented in a new report. According to news reporting from Toulouse, France, by NewsRx journalists, research stated, "The emergence of hematopoietic progenitors and their differentiation into various highly specialized blood cell types constitute a finely tuned process. Unveiling the genetic cascades that control blood cell progenitor fate and understanding how they are modulated in response to environmental changes are two major challenges in the field of hematopoiesis."

Funders for this research include Centre National de la Recherche Scientifique, University Toulouse III, Agence Nationale de la Recherche, Association pour la Recherche sur le Cancer, Indo-French Centre for the Promotion of Advanced Research.

The news correspondents obtained a quote from the research, "In the last 20 years, many studies have established important functional analogies between blood cell development in vertebrates and in the fruit fly, Drosophila melanogaster. Thereby, Drosophila has emerged as a powerful genetic model for studying mechanisms that control hematopoiesis during normal development or in pathological situations. Moreover, recent advances in Drosophila have highlighted how intricate cell communication networks and microenvironmental cues regulate blood cell homeostasis. They have also revealed the striking plasticity of Drosophila mature blood cells and the presence of different sites of hematopoiesis in the larva."

According to the news reporters, the research concluded: "This review provides an overview of Drosophila hematopoiesis during development and summarizes our current
knowledge on the molecular processes controlling larval hematopoiesis, both under normal conditions and in response to an immune challenge, such as wasp parasitism."

Our news journalists report that additional information may be obtained by contacting L. Waltzer, Center Biol Integrat, F-31062 Toulouse 9, France. Additional authors for this research include F. Lapraz, A. Sharma, N. Vanzo, L. Waltzer and M. Crozatier.

**Stem Cell Research - Hematopoietic Stem Cells**

**New Hematopoietic Stem Cells Study Findings Recently Were Reported by Researchers at University Hospital (A case of maternal-foetal chimerism identified during routine histocompatibility testing for hematopoietic stem cell transplantation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stem Cell Research - Hematopoietic Stem Cells. According to news reporting out of Zagreb, Croatia, by NewsRx editors, research stated, "This report describes a case of maternal-foetal chimerism identified in a boy diagnosed with SCID, who underwent HLA testing in preparation for HSCT. The first analysis was carried out on DNA from peripheral blood and included HLA-A, HLA-B, HLA-DRB1 typing using PCR-SSO."

Our news journalists obtained a quote from the research from University Hospital, "The patient's HLA-B typing results were noninterpretable. All samples were re-typed for HLA-B using PCR-SSP, again resulting in noninterpretable typing of patient's HLA-B. In both cases, several weak positive probes/reactions interfered with the interpretation when using commercial software. Next round of HLA typing, using PCR-SSP and PCR-SSO methods, included the patient's bone marrow sample and HLA-C locus, but interpretation was again not possible. The PCR-STR analysis performed on both peripheral blood and bone marrow samples revealed seven STRs for which two maternal and one paternal allele were detected. Retrospective manual interpretation of HLA-B and HLA-C typing revealed that weak positive reactions were indeed owed to paternal HLA-B and HLA-C alleles and that the patient had both maternal and one paternal allele. Retyping of HLA-B and HLA-C loci and STR analysis on the patient's buccal cells sample revealed the expected one maternal/one paternal allele pattern."

According to the news editors, the research concluded: "In summary, the combination of several different typing methods and manual interpretation were necessary to obtain the patient's HLA typing results."

For more information on this research see: A case of maternal-foetal chimerism

New Hematopoietic Stem Cells Study Findings Recently Were Reported by Researchers at University of Wisconsin (Generating human hematopoietic stem cells in vitro - exploring endothelial to hematopoietic transition as a portal for stemness ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Stem Cell Research - Hematopoietic Stem Cells. According to news reporting out of Madison, Wisconsin, by NewsRx editors, the research stated, "Advances in cellular reprogramming technologies have created alternative platforms for the production of blood cells, either through inducing pluripotency in somatic cells or by way of direct conversion of nonhematopoietic cells into blood cells. However, de novo generation of hematopoietic stem cells (HSCs) with robust and sustained multilineage engraftment potential remains a significant challenge."

Our news journalists obtained a quote from the research from the University of Wisconsin, "Hemogenic endothelium (HE) has been recognized as a unique transitional stage of blood development from mesoderm at which HSCs arise in certain embryonic locations. The major aim of this review is to summarize historical perspectives and recent advances in the investigation of endothelial to hematopoietic transition (EHT) and HSC formation in the context of aiding in vitro approaches to instruct HSC fate from human pluripotent stem cells. In addition, direct conversion of somatic cells to blood and HSCs and progression of this conversion through HE stage are discussed."

According to the news editors, the research concluded: "A thorough understanding of the intrinsic and microenvironmental regulators of EHT that lead to the acquisition of self-renewal potential by emerging blood cells is essential to advance the technologies for HSC production and expansion."

For more information on this research see: Generating human hematopoietic stem cells in vitro - exploring endothelial to hematopoietic transition as a portal for stemness

**Hematopoietic**

**New Hematopoietic Study Findings Have Been Reported by A. Cico and Colleagues (Enhancers and their dynamics during hematopoietic differentiation and emerging strategies for therapeutic action)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematopoietic have been published. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "Cellular differentiation requires precisely regulated tissue-specific and developmental stage-specific gene expression patterns."

Funders for this research include Atip-Avenir Program, Plan Cancer, Schlumberger Foundation for Education and Research (FSER), Labex, CEA Irtelis Ph.D. Fellowship.

The news reporters obtained a quote from the research, "Numerous studies have highlighted the predictive power of enhancers on lineage-specific gene expression programs and have started to unravel their mechanisms of action. We review here the dynamics of the enhancer landscape during hematopoietic differentiation and how enhancers function in the context of the 3D organization of the genome."

According to the news reporters, the research concluded: "We further discuss the involvement of aberrant enhancer activity in human diseases and emerging strategies aiming at controlling enhancer activity and chromosome topology for therapeutic purposes."

Our news correspondents report that additional information may be obtained by contacting E. Soler, Lab Excellence GR Ex, Paris, France. Additional authors for this research include C. Andrieu-Soler and E. Soler.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/1873-3468.12424. This DOI is a link to an online electronic document that is either free or for purchase.

Biological Factors - Heme

New Heme Study Findings Have Been Reported by Y.K. Ye and Colleagues (Electrochemical gene sensor based on a glassy carbon electrode modified with hemin-functionalized reduced graphene oxide and gold nanoparticle-immobilized probe DNA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Biological Factors - Heme. According to news reporting from Hefei, People's Republic of China, by NewsRx journalists, research stated, "The authors describe an electrochemical DNA biosensor based on a glassy carbon electrode modified with gold nanoparticles (AuNPs) and reduced graphene oxide that was functionalized with hemin (hemin-rGO). Capture DNA (a 21-mer) is immobilized on the AuNPs via gold-thiol chemistry."

Funders for this research include National Natural Science Foundation of China, Natural Science Foundation of Anhui Province, Science and Technology Program of Guangzhou, China, Fundamental Research Funds for the Central Universities.

The news correspondents obtained a quote from the research, "The detection scheme relies on the measurement of the differential pulse voltammetric current change of the oxidation-reduction reaction of hemin before and after DNA hybridization has occurred. The decrease in the voltammetric currents of iron (III) (best measured at -0.3 V vs. Ag/AgCl) is linearly related to the concentration of complementary DNA. The calibration plot covers the 1.0 aM to 0.1 pM concentration range, and the detection limit is as low as 0.14 aM (at a signal-to-noise ratio of 3)."

According to the news reporters, the research concluded: "The biosensor was successfully applied to the direct determination of complementary DNA in self-prepared samples by using the standard addition method."

For more information on this research see: Electrochemical gene sensor based on a glassy carbon electrode modified with hemin-functionalized reduced graphene oxide and gold nanoparticle-immobilized probe DNA. Microchimica Acta, 2017;184(1):245-252. Microchimica Acta can be contacted at: Springer Wien, Sachsenplatz 4-6, PO Box 89, A-1201 Wien, Austria. (Springer - www.springer.com; Microchimica Acta - www.springerlink.com/content/0026-3672/)

New HemeProteins Findings from Showa Pharmaceutical University Reported (Identification of putative substrates for cynomolgus monkey cytochrome P450 2C8 by substrate depletion assays with 22 human P450 substrates and inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Proteins - HemeProteins are discussed in a new report. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Cynomolgus monkeys are widely used in drug developmental stages as non-human primate models. Previous studies used 89 compounds to investigate species differences associated with cytochrome P450 (P450 or CYP) function that reported monkey specific CYP2C76 cleared 19 chemicals, and homologous CYP2C9 and CYP2C19 metabolized 17 and 30 human CYP2C9 and/or CYP2C19 substrates/inhibitors, respectively."

Our news journalists obtained a quote from the research from Showa Pharmaceutical University, "In the present study, 22 compounds selected from viewpoints of global drug interaction guidances and guidelines were further evaluated to seek potential substrates for monkey CYP2C8, which is highly homologous to human CYP2C8 (92%). Amodiaquine, montelukast, quercetin and rosiglitazone, known as substrates or competitive inhibitors of human CYP2C8, were metabolically depleted by recombinant monkey CYP2C8 at relatively high rates."

According to the news editors, the research concluded: "Taken together with our reported findings of the slow eliminations of amodiaquine and montelukast by monkey CYP2C9, CYP2C19 and CYP2C76, the present results suggest that these at least four chemicals may be good marker substrates for monkey CYP2C8."

The news correspondents report that additional information may be obtained from H. Yamazaki, Showa Pharmaceutical University, Machida, Tokyo 1948543, Japan. Additional authors for this research include N. Murayama, M. Satsukawa, S. Uehara, M. Shimizu, K. Iwasaki, S. Iwano, Y. Uno and H. Yamazaki.

Keywords for this news article include: Tokyo, Japan, Asia, Chemicals, Drugs and Therapies, HemeProteins, Cytochromes, Proteins, Showa Pharmaceutical University.
New Hemophilia A Findings Reported from University of Caen
(Influence of factor VIII level and its inhibitor titer on the therapeutic response to corticosteroids alone in the management of acquired hemophilia A retrospective single-center study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematologic Diseases and Conditions - Hemophilia A have been published. According to news reporting from Caen, France, by NewsRx journalists, research stated, "The treatment of acquired hemophilia (AH) involves discussing whether corticosteroids should be administered alone or combined with immunosuppressant drugs, which increase the risk of infection especially in elderly patients and/or those with autoimmunity or neoplastic diseases, who represent the target population of the disease. Prognostic factors highlighting adequate responses to corticosteroids alone must be identified for satisfactory clinical response and lower infectious risk. We aimed to evaluating the efficacy of corticosteroids alone in the management of AH depending on factor VIII (FVIII, \( \geq \) or \(< 1\) IU/dL) levels and/or inhibitor (INH, \( \leq \) or \(> 20\) Bethesda units per milliliter [BU/mL]) titer."

The news correspondents obtained a quote from the research from the University of Caen, "We conducted a retrospective single-center study including 24 patients treated for AH with corticosteroids alone. Time to achieve partial remission (PR: absence of hemorrhage and FVIII >50IU/dL) was significantly shorter in the FVIII ≥ 1 IU/dL group than in the FVIII < 1 IU/dL group (20 [10-55] vs 39 [20-207] days, P=0.044) and in the INH ≤ 20 BU/mL and FVIII ≥ 1 IU/dL group than in the FVIII < 1 IU/dL and/or INH > 20 BU/mL group (15[11-35] vs 41 [20-207] days, P=0.003). In both subgroups, time to achieve complete remission (CR: negative INH and corticosteroids below 10 mg/d) was also significantly shorter than that observed in the opposite subgroups. INH titer, considered alone, did not affect the length of time to onset of PR or CR. CR and PR rates did not differ significantly depending on these variables."

According to the news reporters, the research concluded: "Our study suggests that in AH, patients with FVIII levels \( \geq \) 1 IU/dL considered alone or combined with INH titer \( \leq \) 20 BU/mL could be treated by corticosteroids alone, given that this subgroup of patients displayed faster therapeutic responses to this strategy."

For more information on this research see: Influence of factor VIII level and its inhibitor titer on the therapeutic response to corticosteroids alone in the management of acquired hemophilia A retrospective single-center study. Medicine, 2016;95(48):44-49. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Our news journalists report that additional information may be obtained by contacting M. Vautier, Center Hosp Univ Caen, Dept. of Internal Med, Caen, France. New Hemorrhagic Shock Data Have Been Reported by Investigators at Academy of Military Medical Sciences (Carboxyfullerene nanoparticles alleviate acute hepatic injury in severe hemorrhagic shock)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hemorrhagic Shock is now available. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Hemorrhagic shock/resuscitation involves overwhelming reactive oxygen species (ROS) that cause oxidative stress, inflammation, and subsequent tissue injury. We investigated the effects of the potent antioxidant carboxyfullerene (C-3) on acute liver injury during hemorrhage shock/resuscitation."

Financial supporters for this research include National Natural Science Foundation of China, Youth Science Fund of AMMS.

Our news journalists obtained a quote from the research from the Academy of Military Medical Sciences, "C-3 infusion reduced the alanine aminotransferase (ALT) activity, methemoglobin content, malondialdehyde content, myeloperoxidase activity and expression levels of tumor necrosis factor-alpha and interleukin-6; it increased superoxide dismutase activity in the liver. The histologic injury score and apoptotic index were also markedly decreased after C-3 treatment compared with the vehicle group. Additionally, C-3-treated rats showed a significant decrease in nuclear factor-kappa B DNA binding capacity, which was preceded by reduced phosphorylation of the nuclear factor kappa B (NF-kappa B) p65 subunit in the liver. C-3 nanoparticles ameliorate oxidative stress, the inflammatory response, and subsequent acute liver injury after hemorrhagic shock/resuscitation. These protective effects appear to be mediated through the inhibition of the nuclear factor-kappa B pathway."

According to the news editors, the research concluded: "C-3 treatment may be a promising strategy to improve tissue injury in hemorrhagic shock/resuscitation."

For more information on this research see: Carboxyfullerene nanoparticles alleviate acute hepatic injury in severe hemorrhagic shock. *Biomaterials*, 2017;112():72-81. *Biomaterials* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Biomaterials - www.journals.elsevier.com/biomaterials/)

Liver Diseases and Conditions - Hepatitis B Virus

New Hepatitis B Virus Findings from Hokkaido University Described
(Hepatitis B virus X protein impairs alpha-interferon signaling via up-regulation of suppressor of cytokine signaling 3 and protein phosphatase 2A)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Hepatitis B Virus are presented in a new report. According to news reporting out of Hokkaido, Japan, by NewsRx editors, research stated, "Hepatitis B Virus (HBV) causes liver cirrhosis and hepatocellular carcinoma. Standard therapy includes treatment with interferon (IFN); however, its efficacy is limited."

Our news journalists obtained a quote from the research from Hokkaido University, "HBV has been reported to impair IFN signaling; however, the mechanism is unclear. Here, the relationship between HBV X protein (HBx) and IFN signaling was investigated by establishing HepG2 cells, stably expressing HBx (HepG2/HBx) via retrovirus-mediated gene transfer. Subsequently, IFN negative-regulator expression and its mechanism were studied. HepG2/HBx cells showed reduced expression of IFN-stimulated genes and expressed higher levels of suppressor of cytokine signaling 3 (SOCS3) and protein phosphatase 2A (PP2A) suppressor compared with control cells. Knockdown of SOCS3 and PP2A restored IFN sensitivity. Moreover, HepG2/HBx cells showed higher phosphorylation levels of signal transducers and activators of transcription 3 and endoplasmic reticulum stress, which are inducers of SOCS3 and PP2A, respectively. Additionally, HBx-knockdown restored IFN sensitivity in HepG2.215.7 cells. It was also confirmed that SOCS3 and PP2A expression levels were up-regulated in the liver of patients with HBV infection."

According to the news editors, the research concluded: "The results of this study demonstrated that HBx impairs IFN signaling via increased expression of SOCS3 and PP2A, a novel mechanistic insight, providing a potential therapeutic target to enhance the efficiency of IFN therapy. J. Med. Virol. 89:267-275, 2017."

New Hepatitis B Virus Study Findings Have Been Reported by Researchers at University Hospital (The transcription factor c-JUN/AP-1 promotes HBV-related liver tumorigenesis in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Hepatitis B Virus are presented in a new report. According to news originating from Freiburg, Germany, by NewsRx correspondents, research stated, "Hepatocellular carcinoma (HCC) develops as a consequence of chronic inflammatory liver diseases such as chronic hepatitis B virus (HBV) infection. The transcription factor c-Jun/activator protein 1 (AP-1) is strongly expressed in response to inflammatory stimuli, promotes hepatocyte survival during acute hepatitis and acts as an oncogene during chemically induced liver carcinogenesis in mice."

Our news journalists obtained a quote from the research from University Hospital, "Here, we therefore aimed to characterize the functions of c-Jun during HBV-related liver tumorigenesis. To this end, transgenic mice expressing all HBV envelope proteins (HBV(+)), an established model of HBV-related HCC, were crossed with knockout mice lacking c-Jun specifically in hepatocytes and tumorigenesis was analyzed. Hepatic expression of c-Jun was strongly induced at several time points during tumorigenesis in HBV(+) mice, whereas expression of other AP-1 components remained unchanged. Importantly, formation of premalignant foci and tumors was strongly reduced in HBV(+) mice lacking c-Jun. This phenotype correlated with impaired hepatocyte proliferation and increased expression of the cell cycle inhibitor p21, whereas hepatocyte survival was not affected. Progression and prognosis of HBV-related HCC correlates with the expression of the cytokine osteopontin (Opn), an established AP-1 target gene. Opn expression was strongly reduced in HBV(+) livers and primary mouse hepatocytes lacking c-Jun, demonstrating that c-Jun regulates hepatic Opn expression in a cell-autonomous manner. These findings indicate that c-Jun has important functions during HBV-associated tumorigenesis by promoting hepatocyte proliferation as well as progression of dysplasia."

According to the news editors, the research concluded: "Therefore, targeting c-Jun may be a useful strategy to prevent hepatitis-associated tumorigenesis."

For more information on this research see: The transcription factor c-JUN/AP-1 promotes HBV-related liver tumorigenesis in mice. Cell Death and Differentiation, 2015;23 (4):576-82. (Nature Publishing Group - www.nature.com/; Cell Death and Differentiation - www.nature.com/cdd/)

The news correspondents report that additional information may be obtained from C. Trierweiler, Dept. of Medicine II, University Hospital Freiburg, Hugstetter Strasse 55, D-79106 Freiburg, Germany. Additional authors for this research include B. Hockenjos, K. Zatloukal, R. Thimme, H.E. Blum, E.F. Wagner and P. Hasselblatt.

The direct object identifier (DOI) for that additional information is:
New Hepatitis B Virus Study Findings Recently Were Reported by Researchers at French National Institute of Health and Medical Research (INSERM) (Intensification with pegylated interferon during treatment with tenofovir in HIV-hepatitis B virus ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Hepatitis B Virus are presented in a new report. According to news originating from Paris, France, by NewsRx correspondents, research stated, "In hepatitis B e antigen (HBeAg) positive patients with hepatitis B virus (HBV) mono-infection, intensification of nucleos(t)ide analogue treatment with pegylated interferon (PegIFN) could help induce higher HBeAg seroclearance rates. Our aim was to determine the long-term effect of adding PegIFN to tenofovir (TDF)-containing antiretroviral therapy on seroclearance in HBeAg-positive patients co-infected with the human immunodeficiency virus (HIV) and HBV."

Financial supporters for this research include Institut de Medecine et d'Epidemiologie Appliquee, Agence Nationale de Recherches sur le Sida et les Hepatites Virales, Gilead Sciences.

Our news journalists obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "In this prospective matched cohort study, 46 patients with 1-year PegIFN intensification during TDF-containing antiretroviral therapy (TDF+PegIFN) were matched 1:1 to controls undergoing TDF without PegIFN (TDF) using a time-dependent propensity score based on age, CD4+ count and liver cirrhosis status. Kinetics of HBeAg quantification (qHBeAg) and hepatitis B surface antigen quantification (qHBsAg) were estimated using mixed-effect linear regression and time to HBeAg seroclearance or HBsAg seroclearance was modelled using proportional hazards regression. At baseline, previous TDF exposure was a median 39.8 months (IQR=21.4-59.4) and median qHBeAg and qHBsAg levels were 6.9PEIU/mL and 3.72 log(10)IU/mL, respectively (P >.5 between groups). Median follow-up was 33.4 months (IQR=19.0-36.3). During intensification, faster average declines of qHBeAg (-0.066 vs -0.027PEIU/mL/month, P=.001) and qHBsAg (-0.049 vs -0.026 log(10) IU/mL/month, P=.09) were observed in patients undergoing TDF+PegIFN vs TDF, respectively. After intensification, qHBeAg and qHBsAg decline was no different between groups (P=.7 and P=.9, respectively). Overall, no differences were observed in HBeAg seroclearance (TDF+PegIFN=13.2 vs TDF=12.6/100 personyears, P=.5) or HBsAg seroclearance rates (TDF+PegIFN=1.8 vs TDF=1.3/100 personyears, P=.7)."

According to the news editors, the research concluded: "PegIFN intensification in HBeAg-positive co-infected patients did not lead to increased rates of HBeAg or HBsAg..."
clearance, despite faster declines of antigen levels while on PegIFN."

The news correspondents report that additional information may be obtained from A. Boyd, INSERM, UMR_ S1136, Inst Pierre Louis Epidemiol & Sante Public, Paris, France. **Liver Diseases and Conditions - Hepatitis C Virus**

**New Hepatitis C Virus Study Findings Have Been Reported by Researchers at Research Foundation (Serum-derived hepatitis C virus 1a infection of human astrocyte cell line SVG)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Hepatitis C Virus have been presented. According to news reporting from Chennai, India, by NewsRx journalists, research stated, "Neuroinvasion of hepatitis C virus (HCV) is evidenced by recent clinical studies. In this study, serum-derived HCV infection of astrocytes was analysed."

Funders for this research include Department of Biotechnology, Govt. of India, INSPIRE Fellowship programme, Department of Science and Technology, Govt. of India.

The news correspondents obtained a quote from the research from Research Foundation, "Astrocytes were infected with HCV-positive serum, and viral replication was assessed on different days postinfection. RT-PCR was positive for HCV-negative strand on 5th and 7th day postinfection in the HCV-positive serum-infected astrocytes. Real-time RNA count in the cell culture supernatant was steadily increasing from day 3 to day 7. To reconfirm the viral replication, astrocytes were treated with an antiviral before the serum infection, and the
antiviral treatment significantly reduced the viral RNA count. Further, the virus-infected cells
stained positive for the presence of viral core protein. Electron microscopy revealed the
presence of HCV-like particles in the astrocyte cell culture supernatant."

According to the news reporters, the research concluded: "Serum-derived HCV
replicates in human astrocyte cell line SVG."

For more information on this research see: Serum-derived hepatitis C virus 1a

Liver Diseases and Conditions - Hepatitis C Virus

New Hepatitis C Virus Study Findings Recently Were Reported by
Researchers at Dalian Medical University (Sofosbuvir and ribavirin in
acute hepatitis C-infected patient with decompensated cirrhosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Fresh data on Liver Diseases and Conditions - Hepatitis C Virus are
presented in a new report. According to news originating from Dalian, People's Republic of
China, by NewsRx correspondents, research stated, "The treatment of chronic hepatitis C virus
infection has been revolutionized by the advent of direct-acting antiviral agents. However,
evidence of its effects on patients with acute hepatitis C (AHC) virus infection is limited."

Our news journalists obtained a quote from the research from Dalian Medical
University, "Case summary: We report the case of a patient with decompensated cirrhosis
induced by autoimmune liver disease, whose condition rapidly deteriorated following AHC
virus infection. The patient received sofosbuvir and ribavirin combination treatment for 12
weeks. Serum hepatitis C virus RNA remained undetectable 36 weeks after discontinuing
sofosbuvir and ribavirin."

According to the news editors, the research concluded: "Our findings support the use
of sofosbuvir and ribavirin as a treatment in AHC patients with decompensated cirrhosis."

For more information on this research see: Sofosbuvir and ribavirin in acute

Liver Diseases and Conditions - Hepatitis

New Hepatitis Findings from Boston University Reported (Extranodal Marginal Zone Endobronchial Lymphoma Associated With Hepatitis C)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Hepatitis is now available. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "We describe two patients with hepatitis C and a diagnosis of pulmonary extranodal marginal zone B cell lymphoma."

Our news editors obtained a quote from the research from Boston University, "Both patients demonstrated a chronic nonproductive cough without hemoptysis. Diagnosis was obtained after a computed tomographic chest scan and flexible bronchoscopic biopsy."

According to the news editors, the research concluded: "We discuss the staging and prognosis of this disease, its correlation with hepatitis C, and potential benefits of treating the associated hepatitis C."

The news editors report that additional information may be obtained by contacting N. Bhatt, Boston University, Center Pulm, Boston, MA 02215, United States. Additional authors for this research include M. Sloan, C.J. O'Hara, R. Oommen, K. Steiling and V.R. Litle.

New Hepatology Research Study Findings Recently Were Reported by Researchers at Saarland University Hospital [The common PNPLA3 variant p.I148M is associated with liver fat contents as quantified by controlled attenuation parameter (CAP)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gastroenterology - Hepatology Research. According to news reporting originating from Homburg, Germany, by NewsRx correspondents, research stated, "Non-alcoholic fatty liver disease (NAFLD) is becoming the most prevalent liver disorder. The PNPLA3 (adiponutrin) variant p.I148M has been identified as common genetic modifier of NAFLD."

Our news editors obtained a quote from the research from Saarland University Hospital, "Our aim was to assess the relationships between genetic risk and non-invasively measured liver fat content. Hepatic steatosis was quantified by transient elastography, using the controlled attenuation parameter (CAP) in 174 patients with chronic liver diseases (50% women, age 18-77 years). In addition, a cohort of 174 gender-matched healthy controls (50% women, age 32-77 years) was recruited. The PNPLA3 mutation as well as the novel NAFLD-predisposing genetic variant (TM6SF2 p.E167K) were genotyped with allele-specific probes. The PNPLA3 genotype correlated significantly (p=0.001) with hepatic CAP measurements. The p.148M risk allele increased the odds of developing liver steatosis (OR=2.39, p=0.023). In multivariate models, BMI and PNPLA3 mutation were both independently associated with CAP values (p <0.001 and p=0.007, respectively). Carriers of the TM6SF2 risk allele presented with increased aminotransferase activities (ALT: p=0.007, AST: p=0.004), but the presence of this variant did not affect CAP values. The PNPLA3 p.I148M variant represents the most important prosteatotic genetic risk factor."

According to the news editors, the research concluded: "NAFLD carriers of this variant should be followed up carefully, with elastography and CAP being ideally suited for this purpose."

The news editors report that additional information may be obtained by contacting A. Arslanow, Dept. of Medicine II, Saarland University Medical Center, Homburg, Germany. Additional authors for this research include C.S. Stokes, S.N. Weber, F. Grunhage, F. Lammert and M. Krawczyk.

New Hereditary Hemorrhagic Telangiectasia Findings from Department of Radiology Discussed (Natural history of brain capillary vascular malformations in hereditary hemorrhagic telangiectasia patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Hereditary Hemorrhagic Telangiectasia. According to news originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Brain capillary vascular malformations (CVMs) are known to occur with relatively high frequency in hereditary hemorrhagic telangiectasia (HHT) patients. These lesions are thought to have a benign natural history but this has not been systematically studied."

Our news journalists obtained a quote from the research from the Department of Radiology, "The purpose of our study was to examine the natural history of CVMs in a consecutive series of HHT patients. Consecutive patients with untreated CVMs receiving serial imaging were included. Baseline data including demographics, HHT gene mutations, and Curacao diagnostic criteria were collected. The primary outcome was rupture on follow-up. A secondary outcome was new focal neurological deficit or seizure related to the lesion. 22 patients with 42 CVMs were included. Mean age was 45.9±16.9 years. 18 patients (81.8%) were women and 4 (18.2%) were men. 19 patients (86.4%) had definite HHT and 3 patients (13.6%) had probable HHT. Mean follow-up was 4.6±3.7 years. There were a total of 100.2 patient years of follow-up and 222.5 lesion years. No lesions ruptured on follow-up and no patient had focal neurological deficits or seizures related to the lesions. Our study found that CVMs in HHT patients have a benign natural history as no patients had hemorrhage or other symptoms related to these lesions."

According to the news editors, the research concluded: "These findings should be confirmed in additional multicenter longitudinal studies."

The news correspondents report that additional information may be obtained from W. Brinjikji, Dept. of Radiology, Mayo Clinic, Rochester, Minnesota, United States. Additional authors for this research include V.N. Iyer, G. Lanzino, K.R. Thielen and C.P Wood.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1136/neurintsurg-2015-012252. This DOI is a link to an online electronic document that is either free or for purchase.

New Hereditary Nonpolyposis Colorectal Cancer Study Findings Have Been Reported from University Medical Center (Cost-effectiveness of routine screening for Lynch syndrome in endometrial cancer patients up to 70 years of age)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Hereditary Nonpolyposis Colorectal Cancer is now available. According to news reporting out of Rotterdam, Netherlands, by NewsRx editors, research stated, "To assess cost-effectiveness of routine screening for Lynch Syndrome (IS) in endometrial cancer (EC) patients years of age. Consecutive EC patients <= 70 years of age were screened for LS by analysis of microsatellite instability, immunohistochemistry and MLH1 hypermethylation."

Our news journalists obtained a quote from the research from University Medical Center, "Costs and health benefit in life years gained (LYG) included surveillance for LS carriers among EC patients and relatives. We calculated incremental cost-effectiveness ratios (ICERs) comparing LS screening among EC patients <= 70 years with <= 50 years and the revised Bethesda guidelines. Screening for LS in 179 EC patients identified 7 LS carriers; 1 was <= 50 and 6 were 51-70 years. Per age category 18 and 9 relatives were identified as LS carrier. Screening resulted in 74.7 LYG (45.4 and 29.3 LYG per age category). The ICER for LS screening in EC patients <= 70 compared with <= 50 years was (sic)5,252/LYG. The revised Bethesda guidelines missed 4/7 (57%) LS carriers among EC patients. The ICER for LS screening in EC patients <= 70 years of age compared with the revised Bethesda guidelines was (sic)6,668/LYG. Both ICERs remained <(sic)16,000/LYG in sensitivity analyses."

According to the news editors, the research concluded: "Routine LS screening in EC patients years is a cost-effective strategy, allowing colorectal cancer prevention in EC patients and their relatives."

New Histology Study Findings Reported from University of California (Molecular inimitability amongst tumors: implications for precision cancer medicine in the age of personalized oncology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Histology. According to news originating from La Jolla, California, by NewsRx correspondents, research stated, "Tumor sequencing has revolutionized oncology, allowing for detailed interrogation of the molecular underpinnings of cancer at an individual level. With this additional insight, it is increasingly apparent that not only do tumors vary within a sample (tumor heterogeneity), but also that each patient's individual tumor is a constellation of unique molecular aberrations that will require an equally unique personalized therapeutic regimen."

Our news journalists obtained a quote from the research from the University of California, "We report here the results of 439 patients who underwent Clinical Laboratory Improvement Amendment (CLIA)-certified next generation sequencing (NGS) across histologies. Among these patients, 98.4% had a unique molecular profile, and aside from three primary brain tumor patients with a single genetic lesion (IDH1 R132H), no two patients within a given histology were molecularly identical. Additionally, two sets of patients had identical profiles consisting of two mutations in common and no other anomalies. However, these profiles did not segregate by histology (lung adenocarcinoma-appendiceal cancer (KRAS G12D and GNAS R201C), and lung adenocarcinoma-liposarcoma (CDK4 and MDM2 amplification pairs))."

According to the news editors, the research concluded: "These findings suggest that most advanced tumors are molecular singletons within and between histologies, and that tumors that differ in histology may still nonetheless exhibit identical molecular portraits, albeit rarely."

The news correspondents report that additional information may be obtained from S.P. Patel, Center for Personalized Cancer Therapy and Division of Hematology and Oncology, University of California San Diego Moores Cancer Center, La Jolla, CA, United States. Additional authors for this research include M. Schwaederle, G.A. Daniels, P.T. Fanta, R.B. Schwab, K.A. Shimabukuro, S. Kesari, D.E. Piccioni, L.A. Bazhenova, T.L. Helsten, S.M. Lippman, B.A. Parker and R. Kurzrock.

New Hormones Study Results from Karolinska Institute Described (Hippocampal Transcriptome Profile of Persistent Memory Rescue in a Mouse Model of THRA1 Mutation-Mediated Resistance to Thyroid Hormone)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hormones have been published. According to news reporting from Stockholm, Sweden, by NewsRx journalists, research stated, "Hypothyroidism due to THRA1 (gene coding for thyroid hormone receptor a1) mutation-mediated Resistance to Thyroid Hormone (RTH) has been recently reported in human and is associated with memory deficits similar to those found in a mouse model for Thra1 mutation mediated RTH (Thra1(+/m) mice). Here, we show that a short-term treatment of Thra1(+/m) mice with GABAA receptor antagonist pentylenetetrazol (PTZ) completely and durably rescues their memory performance."

The news correspondents obtained a quote from the research from Karolinska Institute, "In the CA1 region of the hippocampus, improvement of memory is associated with increased in long-term potentiation (LTP) and an augmentation of density of dendritic spines (DDS) onto the apical dendrites of pyramidal cells reflecting an increase in the local excitatory drive. Unbiased gene profiling analysis of hippocampi of treated Thra1(+/+) and Thra1(+/m) mice were performed two weeks and three months post treatment and identified co-expression modules that include differentially expressed genes related with and predicting higher memory, LTP and DDS in the hippocampi of PTZ-treated animals."

According to the news reporters, the research concluded: "We observed that PTZ treatment changed similar sets of genes in both Thra1(+/+) and Thra1(+/m) mice, which are known to be involved in memory consolidation and neurotransmission dynamics and could participate in the persistent effects of PTZ on memory recovery."

For more information on this research see: Hippocampal Transcriptome Profile of Persistent Memory Rescue in a Mouse Model of THRA1 Mutation-Mediated Resistance to Thyroid Hormone, Scientific Reports, 2016;6():18617. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting Y. Wang, Dept. of Neuroscience, Karolinska Institutet, 171 77 Stockholm, Sweden. Additional authors for this research include A. Fisahn, I. Sinha, D.P. Nguyen, U. Sterzenbach, F. Lallemend and S. Hadjab.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/srep18617. This DOI is a link to an online electronic document that is either free or for purchase.

New Human Genetics Findings Reported from C. Beeroud and Co-Authors (BRCA Share: A Collection of Clinical BRCA Gene Variants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Genetics - Human Genetics have been presented. According to news reporting from San Juan Capistrano, California, by NewsRx journalists, research stated, "As next-generation sequencing increases access to human genetic variation, the challenge of determining clinical significance of variants becomes ever more acute. Germline variants in the BRCA1 and BRCA2 genes can confer substantial lifetime risk of breast and ovarian cancer."

The news correspondents obtained a quote from the research, "Assessment of variant pathogenicity is a vital part of clinical genetic testing for these genes. A database of clinical observations of BRCA variants is a critical resource in that process. This article describes BRCA ShareTM, a database created by a unique international alliance of academic centers and commercial testing laboratories. By integrating the content of the Universal Mutation Database generated by the French Unicancer Genetic Group with the testing results of two large commercial laboratories, Quest Diagnostics and Laboratory Corporation of America (LabCorp), BRCA ShareTM has assembled one of the largest publicly accessible collections of BRCA variants currently available. Although access is available to academic researchers without charge, commercial participants in the project are required to pay a support fee and contribute their data. The fees fund the ongoing curation effort, as well as planned experiments to functionally characterize variants of uncertain significance."

According to the news reporters, the research concluded: "BRCA ShareTM databases can therefore be considered as models of successful data sharing between private companies and the academic world."

Our news journalists report that additional information may be obtained by contacting C.M. Strom, Quest Diagnost, San Juan Capistrano, CA 92675, United States. Additional authors for this research include S.I. Letovsky, C.D. Braastad, S.M. Caputo, O. Beaudoux, Y.J. Bignon, B.B.D. Paillerets, M. Bronner, C.M. Buell, G.E. Colloid-Beeroud, F. Coulet, N. Derive, C. Divincenzo, C.D. Elzinga, C. Garrec, C. Houdayer, I. Karbassi and Liza.

New Human Genetics Findings Reported from Korea National Institute of Health (Application of whole-exome sequencing for detecting copy number variants in CMT1A/HNPP)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics - Human Genetics. According to news reporting from Cheongju, South Korea, by NewsRx journalists, research stated, "Large insertions and deletions (indels), including copy number variations (CNVs), are commonly seen in many diseases. Standard approaches for indel detection rely on well-established methods such as qPCR or short tandem repeat (STR) markers."

The news correspondents obtained a quote from the research from the Korea National Institute of Health, "Recently, a number of tools for CNV detection based on next-generation sequencing (NGS) data have also been developed; however, use of these methods is limited. Here, we used whole-exome sequencing (WES) in patients previously diagnosed with CMT1A or HNPP using STR markers to evaluate the ability of WES to improve the clinical diagnosis. Patients were evaluated utilizing three CNV detection tools including CONIFER, ExomeCNV and CEQer, and array comparative genomic hybridization (aCGH). We identified a breakpoint region at 17p11.2-p12 in patients with CMT1A and HNPP. CNV detection levels were similar in both 6 Gb (mean read depth= 80x) and 17 Gb (mean read depth= 190x) data. Taken together, these data suggest that 6 Gb WES data are sufficient to reveal the genetic causes of various diseases and can be used to estimate single mutations, indels, and CNVs simultaneously."

According to the news reporters, the research concluded: "Furthermore, our data strongly indicate that CNV detection by NGS is a rapid and cost-effective method for clinical diagnosis of genetically heterogeneous disorders such as CMT neuropathy."

Our news journalists report that additional information may be obtained by contacting S.K. Koo, Korea Natl Inst Hlth, Center Biomed Sci, Div Intractable Dis, Cheongju 363951, Chungcheongbuk, South Korea. Additional authors for this research include M.H. Park, H.M. Woo, M.H. Han, B.Y. Kim, B.O. Choi, K.W. Chung and S.K. Koo.

New Human Herpesvirus 8 Findings from Hannover School of Medicine Outlined (The KSHV RNA regulator ORF57: target specificity and its role in the viral life cycle)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Human Herpesvirus Diseases and Conditions - Human Herpesvirus 8. According to news reporting out of Hannover, Germany, by NewsRx editors, research stated, "Kaposi's sarcoma-associated herpesvirus (KSHV) encodes ORF57, which enhances the expression of intron-less KSHV genes on multiple post-transcriptional levels mainly affecting RNA stability and export to the cytoplasm. Yet, it remains elusive how ORF57 recognizes viral RNAs and discriminates them from cellular messenger RNAs (mRNAs)."

Our news journalists obtained a quote from the research from the Hannover School of Medicine, "Although one common binding motif on three separate KSHV RNAs has been described, most other lytic genes lack this sequence element. In this article we will review the sequence requirements for ORF57 to enhance RNA expression and discuss a model how ORF57 achieves specificity for viral RNAs."

According to the news editors, the research concluded: "Finally, the role of ORF57 is integrated into the viral life cycle as a complex interplay with other viral and host factors and with implications for cellular gene expression."

For more information on this research see: The KSHV RNA regulator ORF57: target specificity and its role in the viral life cycle. Wiley Interdisciplinary Reviews Rna, 2016;7 (2):173-85.

Our news journalists report that additional information may be obtained by contacting C. Vogt, Institute for Virology, Hannover Medical School, Hannover, Germany.

New Human Immunodeficiency Virus Study Findings Recently Were Reported by Researchers at Blood Systems Research Institute [Self-reported historic human immunodeficiency virus (HIV) testing in a Brazilian blood donor HIV case-control study]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Human Immunodeficiency Virus is now available. According to news reporting originating from San Francisco, California, by NewsRx
correspondents, research stated, "There has been increased worldwide emphasis on the many benefits of human immunodeficiency virus (HIV) serostatus awareness for both infection prevention and improved treatment outcomes. Previous studies indicate that donors may use blood donation to be tested; the objectives of this analysis were to assess, among donors with previously undisclosed risk behavior in the 12 months before donation, the frequency of those who have previously been tested for HIV and the demographic and behavioral factors associated with such testing."

Our news editors obtained a quote from the research from Blood Systems Research Institute, "In this secondary analysis from an HIV case-control study of blood donors in Brazil, we analyzed the response to the question, 'Other than blood donation, have you ever been tested for HIV?' Demographic and disclosed risk behaviors associated with previous testing were determined. The study included 341 HIV-positive cases and 791 HIV-negative controls (1:2 case/control ratio). Overall, 31% of blood donors (40% of cases and 26% of controls) reported having been tested for HIV outside of blood donation. History of HIV testing varied according to sex, HIV status, and reported sexual risk behavior. Although it is encouraging that previous testing was more frequent in donors with acknowledged sexual risk behavior in Brazil, 60% still had not been tested for HIV outside of the blood donation setting."

According to the news editors, the research concluded: "Educating donors on the importance of not using blood centers as a means to get tested for HIV in Brazil, especially if they engage in higher risk behaviors, and seeking alternate testing venues instead could improve the safety of donated blood."

**Immunology - Human Immunology**

**New Human Immunology Study Findings Reported from Laboratory for Immunology (Next-Generation Sequencing of the HLA locus: Methods and impacts on HLA typing, population genetics and disease association studies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Human Immunology.
According to news reporting from Strasbourg, France, by NewsRx journalists, research stated, "The human Major Histocompatibility Complex, known as the 'Human Leukocyte Antigen (HLA)', could be defined as a 'super locus' (historically called 'supergene') governing the adaptive immune system in vertebrates. It also harbors genes involved in innate immunity."

The news correspondents obtained a quote from the research from Laboratory for Immunology, "HLA is the most gene-dense, polymorphic and disease-associated region of the human genome. It is of critical medical relevance given its involvement in the fate of the transplanted organs/tissues and its association with more than 100 diseases. However, despite these important roles, comprehensive sequence analysis of the 4 megabase HLA locus has been limited due to technological challenges. Thanks to recent improvements in Next Generation Sequencing (NGS) technologies however, one is now able to handle the peculiarities of the MHC notably the tight linkage disequilibrium between genes as well as their high degree of polymorphism (and hence heterozygosity). Increased read lengths, throughput, accuracy, as well as development of new bioinformatics tools now enable to efficiently generate complete and accurate full-length HLA haplotypes without phase ambiguities. The present report reviews current NGS approaches to capture, sequence and analyze HLA genes and loci."

According to the news reporters, the research concluded: "The impact of these new methodologies on various applications including HLA typing, population genetics and disease association studies are discussed."

For more information on this research see: Next-Generation Sequencing of the HLA locus: Methods and impacts on HLA typing, population genetics and disease association studies. Human Immunology, 2016;77(11):1016-1023. Human Immunology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Drugs and Therapies - Human Serum Albumin Therapy

New Human Serum Albumin Therapy Findings from Tarbiat Modares University Described (Inhibition of lysozyme fibrillation by human serum albumin nanoparticles: Possible mechanism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Human Serum Albumin Therapy. According to news reporting originating in Tehran, Iran, by NewsRx journalists, research stated, "Amyloid fibrillation is a prevalent phenomenon in different proteins and peptides, which results in a variety of disorders. Over the last decade,
implementation of nanoparticles (NPs), with or without drugs, is considered as a promising approach to protect against the aggregation process of amyloid proteins."

Financial support for this research came from Tarbiat Modares University and National Institute of Genetic Engineering and Biotechnology.

The news reporters obtained a quote from the research from Tarbiat Modares University, "In this study, we investigated the effect of human serum albumin NPs (HSA NPs) on the fibrillation of Hen Egg White Lysozyme (HEWL). The results showed that HSA NPs decrease the fibrillation of HEWL in a size dependent manner. Surprisingly, despite their inhibitory effects on the formation of long fibrils, our studies revealed that the NPs do not preserve the stability of the protein's structure in denaturing conditions. In fact, different structural analysis methods revealed that in the presence of the NPs, the protein's tendency to expose hydrophobic patches increased. Therefore, it seems that HSA NPs are responsible for decrease in HEWL fibrillation by reducing its concentration and blocking hot spot regions for self-assembly via moderate interaction."

According to the news reporters, the research concluded: "Collectively, our results shed light on the impact of HSA NPs on HEWL fibrillation and open new challenges on the implications of these NPs for drug delivery purposes or direct use as therapeutic agents."

Our news correspondents report that additional information may be obtained by contacting S.A. Shojaosadati, Tarbiat Modares Univ, Dept. of Chem Engn, Tehran 14115111, Iran. Additional authors for this research include H. Mohammad-Beigi, F. Aliakbari, A.T. Marvian, S.A. Shojaosadati and D. Morshed.

disease by regulating cell proliferation and differentiation. Transcriptional activity, whether by bHLH homo- or heterodimerization, is dependent on protein protein and protein DNA interactions mediated by a-helices."

The news reporters obtained a quote from the research from Dana-Farber Cancer Institute, "Thus, alpha-helical decoys have been proposed as potential targeted therapies for pathologic bHLH transcription. Here, we developed a library of stabilized alpha-helices of OLIG2 (SAH-OLIG2) to test the capacity of hydrocarbon-stapled peptides to disrupt OLIG2 homodimerization, which drives the development and chemoresistance of glioblastoma multiforme, one of the deadliest forms of human brain cancer. Although stapling successfully reinforced the alpha-helical structure of bHLH constructs of varying length, sequence-specific dissociation of OLIG2 dimers from DNA was not achieved. Re-evaluation of the binding determinants for OLIG2 self-association and stability revealed an unanticipated role of the C-terminal domain."

According to the news reporters, the research concluded: "These data highlight potential pitfalls in peptide-based targeting of bHLH transcription factors given the liabilities of their positively charged amino acid sequences and multifactorial binding determinants."

For more information on this research see: Challenges in Targeting a Basic Helix-Loop-Helix Transcription Factor with Hydrocarbon-Stapled Peptides. ACS Chemical Biology, 2016;11(11):3146-3153. ACS Chemical Biology can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; ACS Chemical Biology - www.pubs.acs.org/journal/acbcct)

Hydrochloric Acid

New Hydrochloric Acid Study Findings Have Been Reported by Researchers at University of Tennessee (Safety Of Continuous Peripheral Infusion Of 3% Sodium Chloride Solution In Neurocritical Care Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hydrochloric Acid have been presented. According to news originating from Memphis, Tennessee, by NewsRx correspondents, research stated, "Numerous drug information resources recommend that continuous intravenous 3% sodium chloride solution be administered via a central catheter. To evaluate the incidence of infusion-related reactions and electrolyte abnormalities in neurocritical care patients treated with continuous intravenous infusion of 3% sodium chloride solution via a peripheral catheter."

Our news journalists obtained a quote from the research from the University of Tennessee, "Data on patients treated with continuous intravenous infusion of 3% sodium
chloride solution at 2 academic medical centers were evaluated retrospectively to determine the administration site. Electronic notes on catheter status were reviewed to determine the occurrence of infusion-related reactions. Prespecified thresholds were used to assess electrolyte abnormalities. Of 213 patients who had peripheral continuous intravenous infusions of 3% sodium chloride solution, 15 (7%) had infusion-related reactions. Administration was changed to a central catheter in 56 patients (26.3%), but only 5 changes were due to an infusion-related reaction. Most (157 patients, 73.7%) received their entire treatment peripherally, for a median duration of 44 hours, 3 minutes. The most common electrolyte abnormalities were hyperchloremia in 49.3% and hypokalemia in 46.9% of patients. Current recommendations that a central catheter is required for continuous intravenous infusion of 3% sodium chloride solution should be reevaluated. Only a few patients who had peripheral infusions had infusion-related reactions.

According to the news editors, the research concluded: "Electrolyte abnormalities occurred frequently with peripheral infusion, but the clinical importance of the abnormalities remains unclear."

For more information on this research see: Safety Of Continuous Peripheral Infusion Of 3% Sodium Chloride Solution In Neurocritical Care Patients. *American Journal of Critical Care*, 2017;26(1):37-42. *American Journal of Critical Care* can be contacted at: Amer Assoc Critical Care Nurses, 101 Columbia, Aliso Viejo, CA 92656, USA.

The news correspondents report that additional information may be obtained from G.M. Jones, University of Tennessee, Hlth Sci Center, Clin Pharm Neurol & Neurosurg, Memphis, TN 38104, United States. Additional authors for this research include L. Bode, H. Riha and M.J. Erdman.

**Nutritional and Metabolic Diseases and Conditions - ...**

**New Hypercholesterolemia Study Findings Have Been Reported by Investigators at Federal University (The effects of rosuvastatin on lipid-lowering, inflammatory, antioxidant and fibrinolytics blood biomarkers are influenced by Val16Ala superoxide ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Hypercholesterolemia. According to news reporting from Santa Maria, Brazil, by NewsRx journalists, research stated, "Rosuvastatin is a cholesterol-lowering drug that also attenuates the inflammatory process and oxidative stress via the reduction of superoxide anion production. Superoxide anions are metabolized by manganese-dependent superoxide dismutase (MnSOD or SOD2) in the mitochondria."

The news correspondents obtained a quote from the research from Federal University, "In humans, there is a gene polymorphism where a change of alanine (Ala) to valine
(Val) occurs at the 16th amino acid (Ala16Val-SOD2). The VV genotype has been associated with the risk of developing several metabolic diseases, such as hypercholesterolemia. Thus, to further explore this phenomenon, this study investigated the influence of the Val16AlaSOD2 polymorphism on the lipid profile and inflammatory and fibrinolytic biomarkers of 122 hypercholesterolemic patients undergoing the first pharmacological cholesterol-lowering therapy who were treated with 20 mg rosuvastatin for 120 days. The findings indicate that the VV patients who present a low-efficiency SOD2 enzyme exhibit an attenuated response to rosuvastatin compared with the A-allele patients. The effect of rosuvastatin on inflammatory and fibrinolytic biomarkers was also less intense in the VV patients.

According to the news reporters, the research concluded: "These results suggest some pharmacogenetic effects of Val16Ala-SOD2 in hypercholesterolemia treatment."

For more information on this research see: The effects of rosuvastatin on lipid-lowering, inflammatory, antioxidant and fibrinolytics blood biomarkers are influenced by Val16Ala superoxide dismutase manganese-dependent gene polymorphism. Pharmacogenomics Journal, 2016;16(6):501-506. Pharmacogenomics Journal can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **Hyperoxia**

**New Hyperoxia Study Findings Have Been Reported from Medical University (Cyclic and constant hyperoxia cause inflammation, apoptosis and cell death in human umbilical vein endothelial cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hyperoxia are presented in a new report. According to news reporting out of Vienna, Austria, by NewsRx editors, research stated, "Perioperative high-dose oxygen (O2) exposure can cause hyperoxia. While the effect of constant hyperoxia on the vascular endothelium has been investigated to some extent, the impact of cyclic hyperoxia largely remains unknown."
Financial support for this research came from Mayor of the City of Vienna, Austria.

Our news journalists obtained a quote from the research from Medical University. "We hypothesized that cyclic hyperoxia would induce more injury than constant hyperoxia to human umbilical vein endothelial cells (HUVECs). HUVECs were exposed to cyclic hyperoxia (5-95% O2) or constant hyperoxia (95% O2), normoxia (21% O2), and hypoxia (5% O2). Cell growth, viability (Annexin V/propidium iodide and 3-(4,5-dimethythiazol-2-yl)-2,5-diphenyl tetrazolium bromide, MTT) lactate dehydrogenase (LDH), release, cytokine (interleukin, IL and macrophage migration inhibitory factor, MIF) release, total antioxidant capacity (TAC), and superoxide dismutase activity (SOD) of cell lysate were assessed at baseline and 8, 24, and 72 h. A signal transduction pathway finder array for gene expression analysis was performed after 8 h. Constant and cyclic hyperoxia-induced gradually detrimental effects on HUVECs. After 72 h, constant or cyclic hyperoxia exposure induced change in cytotoxic (LDH +12%, p=0.026; apoptosis +121/61%, p<0.01; alive cells -15%, p<0.01; MTT -16/15%, p<0.01), inflammatory (IL-6 +142/190%, p<0.01; IL-8 +72/43%, p<0.01; MIF +147/93%, p<0.01), or redox-sensitive (SOD +278%, TAC-25% p<0.01) markers. Gene expression analysis revealed that constant and cyclic hyperoxia exposure differently activates oxidative stress, nuclear factor kappa B, Notch, and peroxisome proliferator-activated receptor pathways. Extreme hyperoxia exposure induces inflammation, apoptosis and cell death in HUVECs."

According to the news editors, the research concluded: "Although our findings cannot be transferred to clinical settings, results suggest that hyperoxia exposure may cause vascular injury that could play a role in determining perioperative outcome."

Our news journalists report that additional information may be obtained by contacting J. Wu, Dept. of Anaesthesia, General Intensive Care and Pain Management, Medical University of Vienna, Vienna, Austria. Additional authors for this research include C. Hafner, J.P. Schramel, C. Kaun, K.A. Krychtiiuk, J. Wojta, S. Boehme, R. Ullrich, E.V. Tretter, K. Markstaller and K.U Klein.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/aas.12646. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Diseases and Conditions**

**New Hypertension Data Have Been Reported by Researchers at North West University (A call to action and a lifecourse strategy to address the global burden of raised blood pressure on current and future generations: the Lancet Commission on ...)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Hypertension are discussed in a new report. According to news reporting from Potchefstroom, South Africa, by NewsRx journalists, research stated, "Elevated blood pressure is the strongest modifiable risk factor for cardiovascular disease worldwide. Despite extensive knowledge about ways to prevent as well as to treat hypertension, the global incidence and prevalence of hypertension and, more importantly, its cardiovascular complications are not reduced-partly because of inadequacies in prevention, diagnosis, and control of the disorder in an ageing world."

The news correspondents obtained a quote from the research from North West University, "The aim of the Lancet Commission on hypertension is to identify key actions to improve the management of blood pressure both at the population and the individual level, and to generate a campaign to adopt the suggested actions at national levels to reduce the impact of elevated blood pressure globally. The first task of the Commission is this report, which briefly reviews the available evidence for prevention, identification, and treatment of elevated blood pressure, hypertension, and its cardiovascular complications. The report focuses on how as-yet unsolved issues might be tackled using approaches with population-wide impact and new methods for patient evaluation and education in the broadest sense (some of which are not always strictly evidence based) to manage blood pressure worldwide. The report is built around the concept of lifetime risk applicable to the entire population from conception. Development of subclinical and sometimes clinical cardiovascular disease results from lifetime exposure to cardiovascular risk factors combined with the susceptibility of individuals to the harmful consequences of these risk factors. The Commission recognises the importance of other cardiovascular risk factors—e.g., smoking, obesity, dyslipidaemia, and diabetes mellitus—on antihypertensive treatment. However, as a Commission on hypertension, this report focuses mainly on issues and actions related to elevated blood pressure. Previous action plans for improving management of elevated blood pressure and hypertension have not yet provided adequate results. Therefore, the Commission has identified ten essential and achievable goals and ten accompanying, mutually additive, and synergistic key actions that—if implemented effectively and broadly—will make substantial contributions to the management of blood pressure globally."

According to the news reporters, the research concluded: "The Commission deliberately has not listed these complementary key actions by priority because the balance between strength of evidence, feasibility, and potential benefit could differ by country."

For more information on this research see: A call to action and a lifecourse strategy to address the global burden of raised blood pressure on current and future generations: the Lancet Commission on hypertension. Lancet, 2016;388(10060):2665-2712. Lancet can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Cardiovascular Diseases and Conditions -…

New Hypertension Findings from Tel Aviv University Described (Combination Therapy for Pulmonary Arterial Hypertension: A Systematic Review and Meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating from Tel Aviv, Israel, by NewsRx correspondents, research stated, "Combination therapy (CT) for patients with pulmonary arterial hypertension (PAH) has been recommended for many years, despite weak evidence of efficacy over monotherapy (MT). A previous meta-analysis comparing CT vs MT with pulmonary vasodilators failed to demonstrate a clear reduction in clinical worsening events."

Our news editors obtained a quote from the research from Tel Aviv University, "We searched for relevant articles in PubMed, EMBASE, the Cochrane Database, and clinicaltrials.gov; we also manually searched review articles and conference abstracts from 1980-December 2015. Target articles were double-blinded studies of 2 or more pulmonary vasodilators given in combination vs monotherapy for treatment of patients with PAH. The principal outcome of interest was 'combined clinical worsening' (CCW) events (including but not limited to death or hospitalization). Data on physiological outcomes were also explored. Meta-analysis was performed using the DerSimonian and Laird random-effects model. We extracted data from 18 randomized controlled trials (RCTs) (N = 4162). CT was associated with a significant 38% reduction of risk of CCW (15 RCTs: n = 3906; risk ratio [RR], 0.62; 95% confidence interval [CI], 0.50-0.77). This reduction in risk was driven by a reduction in nonfatal end points (12 RCTs: n = 2611; RR, 0.56; 95% CI, 0.40-0.78) and not by a reduction of mortality (12 RCTs: n = 2717; RR, 0.79; 95% CI, 0.53-1.17). CT was also associated with improvement in 6-minute walking distance (10 RCTs: n = 1553; weighted mean difference [WMD], +23.0 m; 95% CI, 15.9-30.1), improved functional class (9 RCTs: n = 1737; RR, 1.26; 95% CI, 1.05-1.51), and beneficial effects on pulmonary hemodynamics such as cardiac index (WMD, +0.35 L/min/m; 95% CI, 0.14-0.56)."

According to the news editors, the research concluded: "In this highly comprehensive meta-analysis, CT reduces the risk of CCW events in patients with PAH and brings physiological improvement."

The news editors report that additional information may be obtained by contacting B.D. Fox, Tel Aviv University, Fac Med, Tel Aviv, Israel. Additional authors for this research
include O. Shtraichman, D. Langleben, A. Shimony and M.R. Kramer.

Cardiovascular Diseases and Conditions -...

New Hypertension Findings from Veterans Affairs Medical Center Described (Screening and brief intervention for unhealthy substance use in patients with chronic medical conditions: a systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating from Menlo Park, California, by NewsRx correspondents, research stated, "Aims and objectives. This systematic review describes studies evaluating screening tools and brief interventions for addressing unhealthy substance use in primary care patients with hypertension, diabetes or depression."

Financial support for this research came from Department of Veterans Affairs (VA) Office of Research and Development.

Our news editors obtained a quote from the research from Veterans Affairs Medical Center, "Primary care is the main entry point to the health care system for most patients with comorbid unhealthy substance use and chronic medical conditions. Although of great public health importance, systematic reviews of screening tools and brief interventions for unhealthy substance use in this population that are also feasible for use in primary care have not been conducted. Systematic review. We systematically review the research literature on evidence-based tools for screening for unhealthy substance use in primary care patients with depression, diabetes and hypertension, and utilising brief interventions with this population. Despite recommendations to screen for and intervene with unhealthy substance use in primary care patients with chronic medical conditions, the review found little indication of routine use of these practices. Limited evidence suggested the Alcohol Use Disorders Identification Test and Alcohol Use Disorders Identification Test-C screeners had adequate psychometric characteristics in patients with the selected chronic medical conditions. Screening scores indicating more severe alcohol use were associated with health-risk behaviours and poorer health outcomes, adding to the potential usefulness of screening for unhealthy alcohol use in this population. Studies support brief interventions' effectiveness with patients treated for hypertension or depression who hazardously use alcohol or cannabis, for both substance use and chronic medical condition outcomes. Relevance to clinical practice. Although small, the international evidence base suggests that screening with the Alcohol Use Disorders Identification Test or Alcohol Use Disorders Identification Test-C and brief interventions for primary care patients with chronic medical conditions, delivered by nurses or other providers, are effective for identifying unhealthy substance use and associated with healthy behaviours and improved outcomes."
According to the news editors, the research concluded: "Lacking are studies screening for illicit drug use, and using single-item screening tools, which could be especially helpful for frontline primary care providers including nurses."

The news editors report that additional information may be obtained by contacting C. Timko, Vet Affairs Palo Alto Hlth Care Syst, Center Innovat Implementat, Menlo Park, CA 94025, United States. Additional authors for this research include C. Kong, L. Vittorio and M.A. Cucciare.

Cardiovascular Diseases and Conditions -...

**New Hypertension Study Findings Have Been Reported by F. Crovetto and Co-Researchers (First-trimester screening with specific algorithms for early- and late-onset fetal growth restriction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating from Barcelona, Spain, by NewsRx correspondents, research stated, "To develop optimal first-trimester algorithms for the prediction of early and late fetal growth restriction (FGR). This was a prospective cohort study of singleton pregnancies undergoing first-trimester screening."

Our news editors obtained a quote from the research, "FGR was defined as an ultrasound estimated fetal weight <10th percentile plus Doppler abnormalities or a birth weight <3rd percentile. Logistic regression-based predictive models were developed for predicting early and late FGR (cut-off: delivery at 34 weeks). The model included the a-priori risk (maternal characteristics), mean arterial pressure (MAP), uterine artery pulsatility index (UtA-PI), placental growth factor (PIGF) and soluble fms-like tyrosine kinase-1 (sFlt-1). Of the 9150 pregnancies included, 462 (5%) fetuses were growth restricted: 59 (0.6%) early and 403 (4.4%) late. Significant contributions to the prediction of early FGR were provided by black ethnicity, chronic hypertension, previous FGR, MAP, UtA-PI, PIGF and sFlt-1. The model achieved an overall detection rate (DR) of 86.4% for a 10% false-positive rate (area under the receiver-operating characteristics curve (AUC): 0.93 (95% CI, 0.87-0.98)). The DR was 94.7% for FGR with pre-eclampsia (PE) (64% of cases) and 71.4% for FGR without PE (36% of cases). For late FGR, significant contributions were provided by chronic hypertension, autoimmune disease,
previous FGR, smoking status, nulliparity, MAP, UtA-PI, PIGF and sFlt-1. The model achieved a DR of 65.8% for a 10% false-positive rate (AUC: 0.76 (95% CI, 0.73-0.80)). The DR was 70.2% for FGR with PE (12% of cases) and 63.5% for FGR without PE (88% of cases)."

According to the news editors, the research concluded: "The optimal screening algorithm was different for early vs late FGR, supporting the concept that screening for FGR is better performed separately for the two clinical forms."

The news editors report that additional information may be obtained by contacting F. Figueras, Center Biomed Res Rare Dis CIBER ER, Barcelona, Spain. Additional authors for this research include S. Triunfo, F. Crispi, V. Rodriguez-Sureda, E. Roma, C. Dominguez, E. Gratacos and F. Figueras.

Keywords for this news article include: Barcelona, Spain, Europe, Cardiovascular Diseases and Conditions, Algorithms, Diagnostics and Screening, Hypertension.

Cardiovascular Diseases and Conditions -...

New Hypertension Study Findings Have Been Reported by Investigators at Mayo Clinic (Emerging concepts for patients with treatment-resistant hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Hypertension are discussed in a new report. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "Treatment-resistant hypertension (TRH) is defined as elevated blood pressure despite treatment with three properly dosed antihypertensive drugs, and is associated with adverse cardiovascular and renal outcomes and increased mortality. Treatment of patients with TRH focuses on maximizing the doses of antihypertensive drugs and adding drugs with complementary mechanisms of action, including a combination of angiotensin-converting enzyme inhibitors or angiotensin-receptor blockers, calcium channel blockers, and thiazide-like diuretics."

Financial support for this research came from NIH.

The news correspondents obtained a quote from the research from Mayo Clinic, "Randomized clinical trials have demonstrated the efficacy of the mineralocorticoid receptor antagonist spironolactone as a fourth-line therapy for patients with TRH. Other pharmacologic considerations include adding alpha-blockers, combined alpha-beta-blockers, centrally acting alpha-agonists, or direct vasodilators. However, a small, but important subset of patients remain hypertensive despite combination regimens with multiple antihypertensive drugs, underscoring the need for novel blood pressure-lowering therapies. Over recent years, alternative approaches for treating TRH have emerged, including agonists of natriuretic peptides, endothelin-receptor antagonists, and additional vasoactive drugs. Lastly, device-based interventions, such as renal
denervation or carotid baroreflex activation, may supplement drug therapy for these patients."

According to the news reporters, the research concluded: "This review summarizes current knowledge on the management of TRH, with focus on novel therapeutic strategies designed to achieve optimal blood pressure control."

Our news journalists report that additional information may be obtained by contacting L.O. Lerman, Mayo Clinic, Div Nephrol & Hypertens, Rochester, MN 55905, United States. Additional authors for this research include S.C. Textor and L.O. Lerman.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.tcm.2016.05.004. This DOI is a link to an online electronic document that is either free or for purchase.

**New Hypertension Study Findings Have Been Reported by Investigators at Ohio State University (Ascorbic Acid Protects against Hypertension through Downregulation of ACE1 Gene Expression Mediated by Histone Deacetylation in Prenatal ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Hypertension is the subject of a report. According to news reporting originating from Columbus, Ohio, by NewsRx correspondents, research stated, "Hypertension is a major risk factor for cardiovascular and cerebrovascular disease. Prenatal exposure to lipopolysaccharide (LPS) leads to hypertension in a rat offspring."

Our news editors obtained a quote from the research from Ohio State University, "However, the mechanism is still unclear. This study unraveled epigenetic mechanism for this and explored the protective effects of ascorbic acid against hypertension on prenatal inflammation-induced offspring. Prenatal LPS exposure resulted in an increase of intrarenal oxidative stress and enhanced angiotensin-converting enzyme 1 (ACE1) gene expression at the mRNA and protein levels in 6-and 12-week-old offspring, correlating with the augmentation of histone H3 acetylation (H3AC) on the ACE1 promoter. However, the prenatal ascorbic acid treatment decreased the LPS-induced expression of ACE1, protected against intrarenal oxidative stress, and reversed the altered histone modification on the ACE1 promoter, showing the protective effect in offspring of prenatal LPS stimulation. Our study demonstrates that ascorbic acid is able to prevent hypertension in offspring from prenatal inflammation exposure."

According to the news editors, the research concluded: "Thus, ascorbic acid can be a
new approach towards the prevention of fetal programming hypertension."

For more information on this research see: Ascorbic Acid Protects against Hypertension through Downregulation of ACE1 Gene Expression Mediated by Histone Deacetylation in Prenatal Inflammation-Induced Offspring. *Scientific Reports*, 2016;6():11-20. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**New Hypertension Study Findings Reported from M. Nemezcz and Co-Authors (Role of MicroRNA in Endothelial Dysfunction and Hypertension)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Hypertension are discussed in a new report. According to news originating from Bucharest, Romania, by NewsRx correspondents, research stated, "Purpose of Review Hypertension is either a cause or a consequence of the endothelial dysfunction and a major risk factor for cardiovascular disease (CVD). In vitro and in vivo studies established that microRNAs (miRNAs) are decisive for endothelial cell gene expression and function in various pathological conditions associated with CVD."

Our news journalists obtained a quote from the research, "This review provides an overview of the miRNA role in controlling the key connections between endothelial dysfunction and hypertension. Herein we summarize the present understanding of mechanisms underlying hypertension and its associated endothelial dysfunction as well as the miRNA role in endothelial cells with accent on the modulation of renin-angiotensin-aldosterone-system, nitric oxide, oxidative stress and on the control of vascular inflammation and angiogenesis in relation to endothelial dysfunction in hypertension. In particular, latest insights in the identification of endothelial-specific microRNAs and their targets are added to the understanding of miRNA significance in hypertension."

According to the news editors, the research concluded: "This comprehensive knowledge of the role of miRNAs in endothelial dysfunction and hypertension and of molecular mechanisms proposed for miRNA actions may offer novel diagnostic biomarkers and therapeutic targets for controlling hypertension-associated endothelial dysfunction and other cardiovascular complications."

For more information on this research see: Role of MicroRNA in Endothelial

The news correspondents report that additional information may be obtained from G. Tanko, Nicolae Simionescu Romanian Academy, Inst Cellular Biol & Pathol, Dept. of Pathophysiol & Pharmacol, Bucharest 050568, Romania. Additional authors for this research include N. Alexandru, G. **New Hypertension Study Results Reported from University of Science Malaysia [Efficacy of Losartan in the management of Post-Dialysis Euvolemic Hypertension (HELD-Trial): A Single-Blind Randomized Control Trial]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Hypertension are presented in a new report. According to news originating from Kelantan, Malaysia, by NewsRx correspondents, research stated, "To assess the effectiveness of losartan 50 mg on post dialysis euvolemic hypertensive patients against standard antihypertensive pharmacotherapy. A multicentre, prospective, randomized, single-blind trial was conducted to assess the effect of losartan 50 mg every other day (EOD), once a morning (OM) among post-dialysis euvolemic hypertensive patients."

Our news journalists obtained a quote from the research from the University of Science Malaysia, "Covariate-adaptive randomization was used to allocate participants to a standard or treatment arm, and they were followed up for eight weeks. Pre-, intra-and post-dialysis session blood pressure (BP) measurements were recorded along with any adverse events. A total of 88 patients were randomized into standard (n = 44) and treatment arms (n = 44) and were followed for a period of 8 weeks. In the standard group, the mean post-dialysis blood pressure dropped by 0.3 mmHg by the end of the 8th week. However the treatment arm reported a drop of 2.4 mmHg of BP drop during the 8-week trial period. Analysis suggests that there was a significant difference in blood pressure readings at the end of 8 weeks among patients treated with losartan (P < 0.001). However, no such statistical association was observed in the standard arm (P 0.75)."

According to the news editors, the research concluded: "A slow, steady significant decline in post-dialysis BP was observed among euvolemic hypertensive patients that were treated with losartan 50 mg."

New Hypertension Study Results from Soochow University Described

(High sucrose intake during gestation increases angiotensin II type 1 receptor-mediated vascular contractility associated with epigenetic alterations in aged offspring rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news reporting from Suzhou, People's Republic of China, by NewsRx journalists, research stated, "Accruing evidence have confirmed that the fetal programming in response to adverse environmental in utero factors plays essential roles in the pathogenesis of hypertension in later life. High sugar intake has been accepted worldwide in everyday life diet and becomes the critical public health issue."

The news correspondents obtained a quote from the research from Soochow University, "Our previous studies indicated that intake of high sucrose (HS) during pregnancy could change the vascular reactivity and dipsogenic behavior closely associated with abnormal renin-angiotensin system (RAS), to increase the risk of hypertension in adult offspring. In the present study, we tested the hypothesis that maternal HS intake in pregnancy may further deteriorate the Ang II-induced cardiovascular responses in the aged offspring. HS intake was provided to pregnant rats throughout the gestation. Blood pressure (BP) in conscious state and vascular contractility in vitro were measured in 22-month-old aged offspring rats. In addition, mRNA and protein expressions and epigenetic changes of Ang II type 1 receptor (AT(1)R) gene in blood vessels were determined with the methods of real-time RT-PCR, Western blotting, and Chromatin Immunoprecipitation Assay (CHIP). in the aged offspring, maternal HS intake during gestation would cause the elevation of basal BP which could be diminished by losartan. Although the circulatory Ang II was not changed, levels of local Ang II were significantly increased in blood vessels. In addition, prenatal HS exposure would significantly enhance the ATI R-mediated vasoconstriction in both aorta and mesenteric arteries of the aged offspring. Moreover, in the aged offspring of prenatal HS exposure, mRNA and protein expressions of AT (1)R gene in both large and small blood vessels were significantly increased, which should be closely associated with the changes of epigenetic mechanisms such as histone modifications."

According to the news reporters, the research concluded: "Collectively, we proposed that maternal HS intake during gestation would cause abnormal BP responses mediated via the
enhancement of vascular RAS, together with the increased expression of AT(1)R gene related to the its epigenetic changes, which would actually lead to the overt phenotype of hypertension in the aged offspring."

For more information on this research see: High sucrose intake during gestation increases angiotensin II type 1 receptor-mediated vascular contractility associated with epigenetic alterations in aged offspring rats. Peptides, 2016;86():133-144. Peptides can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Peptides - www.journals.elsevier.com/peptides/)

**New Hypoalbuminemia Findings from Boston University Reported (Effect of severe hypoalbuminemia on toxicity of high-dose melphalan and autologous stem cell transplantation in patients with AL amyloidosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematologic Diseases and Conditions - Hypoalbuminemia is now available. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "High-dose melphalan with stem cell transplantation (HDM/SCT) extends survival and induces hematologic and clinical responses in patients with light chain (AL) amyloidosis. Eighty percent of melphalan is bound to plasma proteins (60% albumin-bound)."

The news correspondents obtained a quote from the research from Boston University, "We hypothesized that patients with profound hypoalbuminemia have a greater free melphalan fraction and more toxicity. Patients with AL amyloidosis treated with HDM/SCT between 2011 and 2014 with severe hypoalbuminemia (SH), defined as serum albumin <= 2 g/dL were studied retrospectively. Sixteen patients with SH were identified. Forty-one patients without severe hypoalbuminemia (WSH) treated between 2011 and 2012 served as control. The incidence of acute renal failure requiring hemodialysis was 25% among patients with SH, compared with 5% among patients WSH (P= 0.05). Not all patients who needed dialysis required it long term; 6.25% for SH and 2.44% for WSH (P= 0.49). The rates of grade 3 or 4 febrile neutropenia and gastrointestinal toxicities were not significantly different between the
groups. Engraftment kinetics were similar for both groups. Grade 4 renal toxicity and grade 3 lightheadedness were more frequent in patients with SH undergoing HDM/SCT for AL amyloidosis.

According to the news reporters, the research concluded: "Further studies into the mechanism of increased renal toxicity in patients with SH are warranted."

For more information on this research see: Effect of severe hypoalbuminemia on toxicity of high-dose melphalan and autologous stem cell transplantation in patients with AL amyloidosis. *Bone Marrow Transplantation*, 2016;51(10):1318-1322. *Bone Marrow Transplantation* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Cardiovascular Diseases and Conditions - Hypotension

New Hypotension Study Findings Have Been Reported by Researchers at Federal University (Cardiovascular Effects of the Essential Oil of Croton argyrophylloides in Normotensive Rats: Role of the Autonomic Nervous System)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypotension have been published. According to news reporting originating in Fortaleza, Brazil, by NewsRx journalists, research stated, "Cardiovascular effects of the essential oil of Croton argyrophylloides Muell. Arg. (EOCA) were investigated in normotensive rats. In saline-pretreated anesthetized or conscious rats, intravenous (i.v.) injection of the EOCA induced dose-dependent hypotension."

Funders for this research include Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, UFPE.

The news reporters obtained a quote from the research from Federal University. "Dose-dependent tachycardia was observed only in conscious rats. In anesthetized rats, cervical bivagotomy failed to enhance EOCA-induced hypotension but unmasked significant bradycardia. In conscious rats, i.v. pretreatment with methylatropine, but not with atenolol or L-NAME, reduced both hypotensive and tachycardiac responses to EOCA. However, hexamethonium pretreatment reverted the EOCA-induced tachycardia into significant bradycardia without affecting the hypotension. In aortic ring preparations precontracted with phenylephrine, EOCA induced a concentration-dependent relaxation that was significantly reduced by vascular endothelium removal and pretreatment with atropine, indomethacin, or glibenclamide but remained unaffected by pretreatment with L-NAME or TEA. It is concluded
that i.v. treatment with EOAC decreased blood pressure probably through an active vascular relaxation rather than withdrawal of sympathetic tone. Muscarinic receptor stimulation, liberation of the endothelium-derived prostacyclin, and opening KATP channels are partially involved in the aortic relaxation induced by EOCA and in turn in the mediation of EOCA-induced hypotension.

According to the news reporters, the research concluded: "EOCA-induced tachycardia in conscious rats appears to be mediated reflexly through inhibition of vagal drive to the heart."

For more information on this research see: Cardiovascular Effects of the Essential Oil of Croton argyrophylloides in Normotensive Rats: Role of the Autonomic Nervous System. Evidence-Based Complementary and Alternative Medicine, 2016;(1):1-9. Cardiovascular Diseases and Conditions - Hypotension

New Hypotension Study Findings Recently Were Reported by Researchers at Xi'an Jiao Tong University [Vasodilation and hypotension of a novel 3-benzylquinazolin-4(3H)-one derivative via the inhibition of calcium flux]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Hypotension are presented in a new report. According to news reporting from Shaanxi, People's Republic of China, by NewsRx journalists, research stated, "A novel 3-benzylquinazolin-4(3H)-one derivative Z32, namely 6,7-dimethoxy-3-(3-chloro-4-(4-fluorobenzyloxy)benzyl)quinazolin-4(3H)-one was synthesized. The vasorelaxant and antihypertensive effects of Z32 and its underlying mechanisms were investigated."

The news correspondents obtained a quote from the research from Xi'an Jiao Tong University, "The following methods were used. The isometric tension of artery ring segments was recorded using an in vitro myography system. Changes in the calcium influx in mesenteric arteries were surveyed using a real-time confocal microscopy. The arterial pressure of spontaneously hypertensive rats was measured in vivo using a non-invasive tail cuff blood
pressure system. The results showed that Z32 can relax rat mesenteric arteries pre-constricted by KCl or phenylephrine in a concentration-dependent manner. The vasorelaxant effects were not affected by the removal of the endothelium, blockade of potassium channels by tetraethylammonium chloride, or inhibition of either guanylate cyclase by ODQ, nitric oxide synthase by L-NAME, or cyclooxygenase by indomethacin. In Ca2+-free conditions, Z32 did not affect the constriction evoked by caffeine, however, significantly reduced the constrictions induced (1) by phenylephrine, (2) by CaCl2 in either phenylephrine (in the presence of verapamil) or KCl stimulated arteries, (3) by extracellular Ca2+ restoration in thapsigargin-treated mesenteric arteries, and (4) by the activator of protein kinase C phorbol-12, 13-dibutyrate, and the inhibitor of protein tyrosine phosphatase sodium orthovanadate. Further, Z32 decreased the systolic and diastolic arterial pressure of spontaneously hypertensive rats in a dose-dependent manner."

According to the news reporters, the research concluded: "Z32 lowers the arterial pressure and induces vasorelaxation through the inhibition of calcium flux, probably via a protein tyrosine phosphorylation-dependent way."

For more information on this research see: Vasodilation and hypotension of a novel 3-benzylquinazolin-4(3H)-one derivative via the inhibition of calcium flux. European Journal of Pharmacology, 2016;791():741-750. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Surgery - Hysterectomy

New Hysterectomy Findings from Southeast University Described (Effects of propofol and sevoflurane on perioperative immune response in patients undergoing laparoscopic radical hysterectomy for cervical cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Surgery - Hysterectomy. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "The aim of this study is to compare the effects of propofol and sevoflurane anesthesia on perioperative immune response in patients undergoing laparoscopic radical hysterectomy for cervical cancer. Sixty patients with cervical cancer scheduled for elective laparoscopic radical hysterectomy under general anesthesia were randomized into 2 groups."

Our news journalists obtained a quote from the research from Southeast University, "TIVA group received propofol induction and maintenance and SEVO group received sevoflurane induction and maintenance. Blood samples were collected at 30 min before
induction (T-0); the end of the operation (T-1); and 24h (T-2), 48h (T-3), and 72h (T-4) after operation. The T lymphocyte subsets (including CD3+ cells, CD4+ cells, and CD8+ cells) and CD4+/CD8+ ratio, natural killer (NK) cells, and B lymphocytes were analyzed by flow cytometry. After surgery, all immunological indicators except CD8+ cells were significantly decreased in both groups compared to basal levels in T0, and the counts of CD3+ cells, CD4+ cells, NK cells, and the CD4+/CD8+ ratios were significantly lower in the SEVO groups than that in the TIVA group. However, the numbers of B cells were comparable at all the time points between 2 groups. Laparoscopic radical hysterectomy for cervical cancer is associated with postoperative lymphopenia."

According to the news editors, the research concluded: "In terms of protecting circulating lymphocytes, propofol is superior to sevoflurane."

For more information on this research see: Effects of propofol and sevoflurane on perioperative immune response in patients undergoing laparoscopic radical hysterectomy for cervical cancer. Medicine, 2016;95(49):186-191. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/

Immunology - Immunoglobulins

New Immunoglobulins Findings from University of Texas Health Science Center Reported (Pharmacological concentrations of recombinant factor VIIa restore hemostasis independent of tissue factor in antibody-induced hemophilia mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - Immunoglobulins have been presented. According to news originating from Tyler, Texas, by NewsRx correspondents, research stated, "ESSENTIALS: The role of tissue factor (TF) in recombinant factor VIIa (rFVIIa) therapy in hemophilia is unclear. An acquired mouse hemophilia model with very low or normal levels of human TF was used in the study. rFVIIa is equally effective in correcting the bleeding in mice expressing low or normal levels of TF."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from the University of Texas Health Science Center, "Pharmacological doses of rFVIIa restore hemostasis in hemophilia independent of TF. Recombinant factor VIIa (rFVIIa) has been used widely for treating hemophilia patients with inhibitory autoantibodies against factor VIII or IX. Its mechanism of action is not entirely known. A majority of in vitro studies suggested that pharmacological concentrations of rFVIIa restore hemostasis in hemophilia in a phospholipid-
dependent manner, independent of tissue factor (TF). However, a few studies suggested that a TF-dependent mechanism has a primary role in correction of bleeding by rFVIIa in hemophilia patients. Here, we investigated the potential contribution of TF in rFVIIa-induced hemostasis in hemophilia employing a model system of FVIII antibody-induced hemophilia in TF transgenic mice. Mice expressing low levels of human TF (LTF mice), mice expressing relatively high levels of human TF (HTF mice) and wild-type mice (WT mice) had neutralizing anti-FVIII antibodies administered in order to induce hemophilia in these mice. The mice were then treated with varying concentrations of rFVIIa. rFVIIa-induced hemostasis was evaluated with the saphenous vein bleeding model. Administration of FVIII inhibitory antibodies induced the hemophilic bleeding phenotype in all three genotypes. rFVIIa administration rescued the bleeding phenotype in all three genotypes. No significant differences were observed in rFVIIa-induced correction of bleeding between LTF and HTF mice that had FVIII antibodies administered.

According to the news editors, the research concluded: "Our results provide strong evidence supporting the suggestion that the hemostatic effect of pharmacological doses of rFVIIa stems from a TF-independent mechanism."

The news correspondents report that additional information may be obtained from S. Keshava, Dept. of Cellular and Molecular Biology, The University of Texas Health Science Center at Tyler, Tyler, TX, United States. Additional authors for this research include J. Sundaram, A. Rajulapati, U.R. Pendurthi and L.V Rao.

Immunology - Immunoglobulins

New Immunoglobulins Study Findings Have Been Reported by Investigators at Aichi Medical University (De Novo Anti-HLA DSA Characteristics and Subclinical Antibody-Mediated Kidney Allograft Injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immunology - Immunoglobulins is now available. According to news originating from Aichi, Japan, by NewsRx correspondents, research stated, "It is unclear whether all donor-specific antibodies (DSA) can cause chronic antibody-mediated rejection (AMR). Subclinical stage before manifestation of renal dysfunction may be a critical
period for reversing AMR."

Our news journalists obtained a quote from the research from Aichi Medical University, "The aim of our study was to identify factors related to the development of subclinical AMR and to clarify the characteristics of de novo DSA. Eight hundred ninety-nine renal transplants were screened for HLA antibody. De novo DSA were detected in 95 patients. Forty-three patients without renal dysfunction who underwent renal biopsies were enrolled in this study. Eighteen patients (41.9%) were diagnosed with biopsy-proven subclinical AMR and treated with plasmapheresis and rituximab-based therapy, whereas 25 showed no findings of AMR. Significant subclinical AMR-related factors were younger recipients, history of acute T cell-mediated rejection and DSA class II, especially DR-associated DSA. Mean fluorescence intensity (MFI) values of DR-DSA were significantly higher, whereas DQ-DSA was not different between subclinical AMR and no AMR. The MFI (>50%), DSA-MFI values greater than 3000, and Clq binding DSA were also significant subclinical AMR-related factors (P < 0.05). Among 18 patients treated for subclinical AMR, 8 patients (44.4%) obtained over 50% reduction of DSA-MFI and/or improvement or no deterioration of pathological findings. In contrast, 25 patients without subclinical AMR did not show renal dysfunction clinically. Moreover, all of the 8 patients with rebiopsy after 2 years continued to demonstrate no AMR. About 40% of patients with de novo DSA demonstrated biopsy-proven subclinical AMR, leading to progressive graft injury."

According to the news editors, the research concluded: "To validate the intervention and treatment for de novo DSA-positive patients without renal dysfunction, further study is necessary."

For more information on this research see: De Novo Anti-HLA DSA Characteristics and Subclinical Antibody-Mediated Kidney Allograft Injury. Transplantation, 2016;100 (10):2194-2202. Transplantation can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Immunology - Immunoglobulins**

**New Immunoglobulins Study Findings Have Been Reported by Investigators at University of Pittsburgh [A depleting antibody toward sca-1 mitigates a surge of CD34(+)c-kit(+) progenitors and reduces vascular restenosis in a murine vascular injury ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immunology - Immunoglobulins is now available. According to news reporting originating in Pittsburgh, Pennsylvania, by NewsRx journalists,
research stated, "Vascular restenosis remains a major obstacle to long-term success after vascular intervention. Circulating progenitor cells have been implicated in restenosis, and yet it has remained unclear if these cells, particularly nonendothelial progenitors, have an active role in this pathologic process."

The news reporters obtained a quote from the research from the University of Pittsburgh, "We hypothesized that circulating CD34(+) / c-kit(+) progenitors would increase after vascular injury, mirrored by changes in the injury signal, stromal cell-derived factor 1 alpha (sdf1 alpha). We further postulated that an antibody-based depletion would mitigate progenitor surge and, in turn, reduce restenosis in a murine model. C57BL6 mice underwent wire injury of the femoral artery and were compared with mice with sham surgery and vessel ligation by flow cytometry as well as by sdf1 alpha enzyme-linked immunosorbent assay of peripheral blood. Next, injured C57BL6 mice treated with a depleting antibody toward the progenitor marker sca-1 or with an isotype control were compared in terms of sdf1 alpha as well as enumeration of progenitors. At 28 days, restenosis was quantified between sca-1- and isotype-treated animals. Wire injury generated an increase in sdf1 alpha as well as a surge of CD34(+) / c-kit(+) progenitors relative to nonsurgical controls (P = .005). Treatment with sca-1 antibody ablated the peripheral surge compared with isotype-treated, injured animals (P = .02), and sca progenitor depletion reduced the 28-day intima to media ratio in a statistically significant fashion compared with either nontreated (P = .04) or isotype-treated (P = .036) animals. Our study has demonstrated that sca-1 antibody reduces both progenitor surge and vascular restenosis after endoluminal vascular injury in a murine model."

According to the news reporters, the research concluded: "This suggests that circulating progenitors play an active role in restenotic disease."

Our news correspondents report that additional information may be obtained by contacting B.W. Tillman, University of Pittsburgh, McGowan Inst Regenerat Med, Pittsburgh, PA 15232, United States. Additional authors for this research include J. Kelly, T.D. Richards, A.F. Chen, A.D. Donnenberg, V.S. Donnenberg and E. Tzeng.

**Immunology - Immunoglobulins**

**New Immunoglobulins Study Findings Reported from S. Ducreux and Co-Authors (Monitoring efficiency of humoral rejection episode therapy in liver transplantation: any role for complement binding Luminex Single Antigen assays?)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immunology - Immunoglobulins. According to news reporting originating from Lyon, France, by NewsRx correspondents, research stated, "Humoral rejection and its relationship with anti HLA antibodies have been extensively studied in organ transplantation with the exception of liver transplantation (LT). Recently, association between donor specific anti HLA antibodies (DSA) and increased risk of rejection and graft loss has been suggested in LT."

Our news editors obtained a quote from the research, "When such antibodies appear, adequate treatment and monitoring are needed to avoid or delay allograft loss. We report here three cases of probable antibody-mediated rejection developed after pregnancy in liver transplanted women. Sera at the time of rejection and during follow-up have been retrospectively tested for the ability of DSA to bind complement components. These cases display different outcomes depending on the complement binding DSA capacity and titers after treatment of the rejection episodes."

According to the news editors, the research concluded: "Thus, they highlight the potential interest of complement binding Luminex Single Antigen assays to monitor the efficiency of anti-rejection therapy."

For more information on this research see: Monitoring efficiency of humoral rejection episode therapy in liver transplantation: any role for complement binding Luminex Single Antigen assays? Transplant Immunology, 2016;35():23-8. (Elsevier - www.elsevier.com; Transplant Immunology - www.journals.elsevier.com/transplant-immunology/)

Immunology

New Immunology Findings from University of Sydney Described [The Analysis of CD83 Expression on Human Immune Cells Identifies a Unique CD83(+)‐Activated T Cell Population]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immunology are discussed in a new report. According to news reporting out of Sydney, Australia, by NewsRx editors, research stated, "CD83 is a member of the Ig gene superfamily, first identified in activated lymphocytes. Since then, CD83 has become an important marker for defining activated human dendritic cells (DC)."

Our news journalists obtained a quote from the research from the University of Sydney, "Several potential CD83 mRNA isoforms have been described, including a soluble form detected in human serum, which may have an immunosuppressive function. To further
understand the biology of CD83, we examined its expression in different human immune cell types before and after activation using a panel of mouse and human anti-human CD83 mAb. The mouse anti-human CD83 mAbs, HB15a and HB15e, and the human anti-human CD83 mAb, 3C12C, were selected to examine cytoplasmic and surface CD83 expression, based on their different binding characteristics. Glycosylation of CD83, the CD83 mRNA isoforms, and soluble CD83 released differed among blood DC, monocytes, and monocyte-derived DC, and other immune cell types. A small T cell population expressing surface CD83 was identified upon T cell stimulation and during allogeneic MLR. This subpopulation appeared specifically during viral Ag challenge. We did not observe human CD83 on unstimulated human natural regulatory T cells (Treg), in contrast to reports describing expression of CD83 on mouse Treg. CD83 expression was increased on CD4(+), CD8(+) T, and Treg cells in association with clinical acute graft-versus-host disease in allogeneic hematopoietic cell transplant recipients."

According to the news editors, the research concluded: "The differential expression and function of CD83 on human immune cells reveal potential new roles for this molecule as a target of therapeutic manipulation in transplantation, inflammation, and autoimmune diseases."

For more information on this research see: The Analysis of CD83 Expression on Human Immune Cells Identifies a Unique CD83(+) Activated T Cell Population. *Journal of Immunology*, 2016;197(12):4613-4625. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. **Drugs and Therapies - Immunosuppressive Agents**

**New Immunosuppressive Agents Findings Reported from Department of Surgery (Unusual case of tacrolimus vascular toxicity after deceased donor renal transplantation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Immunosuppressive Agents have been published. According to news reporting out of Tottori, Japan, by NewsRx editors, research stated, "We report a case of tacrolimus vascular toxicity found on a protocol biopsy shortly after a deceased donor renal transplantation. The patient was immunologically high-risk and acute antibody-mediated rejection during post-transplant dialysis phase was suspected on the protocol biopsy."

Our news journalists obtained a quote from the research from the Department of Surgery, "Although the patient was stable after treatment of rejection, a further examination showed a very rare but specific side-effect of tacrolimus. It is sometimes difficult to make a differential diagnosis during postoperative dialysis period among AMR, primary non-
functioning, drug toxicity, infection or just prolonged recovery from the damage of a long
agonal phase on the non-heart beating donor."

According to the news editors, the research concluded: "Although the possibilities of
coexistence of rejection or other causes such as infection have not been completely excluded, it
is important to be aware of this unusual side effect of tacrolimus."

For more information on this research see: Unusual case of tacrolimus vascular
can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-

Drugs and Therapies - Immunosuppressive Agents

New Immunosuppressive Agents Findings from University of
Montpellier Described (Evaluation of the New Siemens Tacrolimus
Assay on the Dimension EXL Integrated Chemistry System Analyzer:
Comparison With an Ultra-Performance Liquid ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators discuss new findings in Drugs and Therapies -
Immunosuppressive Agents. According to news reporting originating from Montpellier, France,
by NewsRx correspondents, research stated, "Many patients are maintained at the lower end of
the tacrolimus (TAC) reference range (3-7 ng/mL), requiring the use of analytical methods
displaying a very low limit of quantification for their follow-up. Therefore, the new Dimension
TAC, based on affinity chrome-mediated immunoassay technology, was evaluated on the
Dimension EXL Integrated Chemistry System (Siemens Healthcare Diagnostics Inc)."

Our news editors obtained a quote from the research from the University of
Montpellier, "The aims of this study were (1) to evaluate the analytical performances with
special emphasis on sensibility at low levels of TAC, (2) to compare the results with an ultra-
performance liquid chromatography-tandem mass spectrometry (UPLC/MS/MS) method.
Analytical performance (imprecision, linearity, limit of detection, and limit of quantification)
was evaluated. Comparison to UPLC/MS/MS was performed on 106 whole blood samples from
88 transplant recipients using regression analysis and Bland-Altman plot analysis. Repeatability
and within-laboratory coefficients of variation were <6% at mean TAC control levels of 3.7,
11.7, and 19.2 ng/mL. Linearity was confirmed between 1.0 and 22 ng/mL. Passing-Bablok
regression analysis of Siemens TAC assay in comparison with UPLC/MS/MS values displayed
a slope of 1.09 and an intercept of -0.42. Using Bland-Altman analysis, the mean bias was 0.27
ng/mL with 1.96 SD limits of -2.14 and 2.67 ng/mL."
According to the news editors, the research concluded: "The new Dimension TAC immunoassay on the EXL analyzer demonstrated reliable and reproducible performances allowing routine monitoring in transplant patients, even at TAC concentrations at the lower end of the therapeutic range."

The news editors report that additional information may be obtained by contacting J.P. Cristol, University of Montpellier, CHRU Montpellier, PhyMedExp, Lab BiochimINSERMU1046CNRSUMR 9214, F-34295 Montpellier 5, France. Additional authors for this research include T. Sutra, S. Badiou, N. Kuster, A.M. Dupuy, G. Mourad, G.P. Pageaux, M. Le Quintrec and J.P. Cristol.

**Drugs and Therapies - Immunotherapy**

**New Immunotherapy Study Findings Recently Were Reported by Researchers at Shiraz University of Medical Sciences [Monitoring of CD8(+) T-cell Activity in mTOR Inhibitor-treated Cancer Patients for Successful Immunotherapy]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Immunotherapy. According to news reporting originating from Shiraz, Iran, by NewsRx correspondents, research stated, "Mammalian target of rapamycin (mTOR) inhibitors are strong anti-tumor drugs; however, they have adverse immunosuppressive side effects in some cancer patients. Animal studies have provided evidence that mTOR inhibitors improved tumor-specific T-cells adoptive transfer in which the quality of CD8+ T-cells is a major factor for predicting success."

Our news editors obtained a quote from the research from the Shiraz University of Medical Sciences, "Interestingly, mTOR inhibitors are capable of stimulating cytotoxic CD8+ T-cell if their dose/duration is adjusted. Rapamycin-induced CD8+ T-cells have also been associated with tumor immunity in animal models. We hypothesize that mTOR inhibitors can be a potential tool toward successful immunotherapy in cancer patients. CD8+ T-cell activity should be monitored before and after treatment to identify patients with improved CD8+ T-cells who might further benefit from expanding these cells and autologous lymphocyte therapy. Patients with a suppressed CD8+ T-cell activity may require individual adjustment of the drug dose in order to convert harmful immunosuppressive side effects of mTOR inhibitors into helpful immunostimulatory activities."

According to the news editors, the research concluded: "Further investigations and
clinical trials are required to prove the utility of CD8+ T-cell monitoring for successful immunotherapy in mTOR inhibitor-treated cancer patients."

For more information on this research see: Monitoring of CD8(+) T-cell Activity in mTOR Inhibitor-treated Cancer Patients for Successful Immunotherapy. *Archives of Medical Research*, 2016;47(5):401-402. *Archives of Medical Research* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Drugs and Therapies - Immunotherapy**

**New Immunotherapy Study Results Reported from Dana-Farber Cancer Institute (Genomic Approaches to Understanding Response and Resistance to Immunotherapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Immunotherapy have been presented. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Immunotherapy has led to a paradigm shift in the treatment of some malignancies, providing long-term, durable responses for patients with advanced cancers. However, such therapy has benefited only a subset of patients, with some patients failing to respond to treatment at all and others achieving a limited response followed by tumor progression."

Our news journalists obtained a quote from the research from Dana-Farber Cancer Institute, "Understanding factors contributing to an effective response and further elucidating mechanisms of resistance will be crucial as these therapies are applied more broadly. Genomics-based approaches have significantly advanced the study of response and resistance to immunotherapy in general, and to immune checkpoint blockade more specifically. Here, we review how genomic and transcriptomic approaches have identified both somatic and germline positive correlates of response, including high mutational/neoantigen load and low intratumoral heterogeneity, among others. The genomic analysis of resistant tumors has additionally identified crucial factors involved in resistance to immune checkpoint blockade, including loss of PTEN and upregulation of other immune checkpoints."

According to the news editors, the research concluded: "Overall, the continued use of genomic techniques at the point of care, combined with appropriate functional studies, would ideally lead to a better understanding of why certain patients respond to immune-based therapies, allowing clinicians to identify the subset of patients likely to benefit from such therapy, and potentially providing insight into how other therapies may be added in combination..."
to increase the number of patients who may benefit from immunotherapy."

For more information on this research see: Genomic Approaches to Understanding Response and Resistance to Immunotherapy. *Clinical Cancer Research*, 2016;22(23):5642-5650. *Clinical Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. **Drugs and Therapies - Indomethacin Therapy**

**New Indomethacin Therapy Study Findings Have Been Reported by Investigators at University of Barcelona (Oil-in-water nanoemulsions are suitable for carrying hydrophobic compounds: Indomethacin as a model of anti-inflammatory drug)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Indomethacin Therapy. According to news originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Oil-in-water nanoemulsions are increasingly being used as delivery systems for encapsulating lipophilic components in functional food, personal care and pharmaceutical products. In the current study, we developed a multimodal platform to carry hydrophobic indomethacin or magnetic nanoparticles, or both."

Financial support for this research came from Spanish Ministerio de Economia y Competitividad (MINECO).

Our news journalists obtained a quote from the research from the University of Barcelona, "As a consequence, this platform has great potential for therapeutic or imaging purposes. By optimizing the system composition and homogenization conditions, a nanoemulsion with a mean droplet diameter of about 200 nm and a low polydispersity index (< 0.2) was formed. The plain nanoemulsion was shown to be innocuous in cellular studies and did not present acute toxicity (observed in a rat model)."

According to the news editors, the research concluded: "More interesting was the finding that nanoemulsions loaded with indomethacin presented a significantly different anti-inflammatory than the free drug."

For more information on this research see: Oil-in-water nanoemulsions are suitable for carrying hydrophobic compounds: Indomethacin as a model of anti-inflammatory drug.
New Indomethacin Therapy Study Findings Have Been Reported by Investigators at Vanderbilt University (Antitumor Activity of Cytotoxic Cyclooxygenase-2 Inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Indomethacin Therapy. According to news reporting originating in Nashville, Tennessee, by NewsRx journalists, research stated, "Targeted delivery of chemotherapeutic agents to tumors has been explored as a means to increase the selectivity and potency of cytotoxicity. Most efforts in this area have exploited the molecular recognition of proteins highly expressed on the surface of cancer cells followed by internalization."

Financial support for this research came from National Cancer Institute.

The news reporters obtained a quote from the research from Vanderbilt University, "A related approach that has received less attention is the targeting of intracellular proteins by ligands conjugated to anticancer drugs. An attractive target for this approach is the enzyme cyclooxygenase-2 (COX-2), which is highly expressed in a range of malignant tumors. Herein, we describe the synthesis and evaluation of a series of chemotherapeutic agents targeted to COX-2 by conjugation to indomethacin. Detailed characterization of compound 12, a conjugate of indomethacin with podophyllotoxin, revealed highly potent and selective COX-2 inhibition in vitro and in intact cells. Kinetics and X-ray crystallographic studies demonstrated that compound 12 is a slow, tight-binding inhibitor that likely binds to COX-2's allosteric site with its indomethacin moiety in a conformation similar to that of indomethacin. Compound 12 exhibited cytotoxicity in cell culture similar to that of podophyllotoxin with no evidence of COX-2-dependent selectivity. However, in vivo, compound 12 accumulated selectively in and more effectively inhibited the growth of a COX-2-expressing xenograft compared to a xenograft that did not express COX-2."

According to the news reporters, the research concluded: "Compound 12, which we have named chemocoxib A, provides proof-of-concept for the in vivo targeting of
chemotherapeutic agents to COX-2 but suggests that COX-2-dependent selectivity may not be evident in cell culture-based assays.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acschembio.6b00560. This DOI is a link to an online electronic document that is either free or for purchase.

**Inflammation**

**New Inflammation Findings from G.J. Szebeni and Colleagues Discussed (Pro-Tumoral Inflammatory Myeloid Cells as Emerging Therapeutic Targets)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Inflammation have been presented. According to news reporting originating from Budapest, Hungary, by NewsRx correspondents, research stated, "Since the observation of Virchow, it has long been known that the tumor microenvironment constitutes the soil for the infiltration of inflammatory cells and for the release of inflammatory mediators. Under certain circumstances, inflammation remains unresolved and promotes cancer development."

Our news editors obtained a quote from the research, "Here, we review some of these indisputable experimental and clinical evidences of cancer related smouldering inflammation. The most common myeloid infiltrate in solid tumors is composed of myeloid-derived suppressor cells (MDSCs) and tumor-associated macrophages (TAMs). These cells promote tumor growth by several mechanisms, including their inherent immunosuppressive activity, promotion of neoangiogenesis, mediation of epithelial-mesenchymal transition and alteration of cellular metabolism. The pro-tumoral functions of TAMs and MDSCs are further enhanced by their cross-talk offering a myriad of potential anti-cancer therapeutic targets. We highlight these main pro-tumoral mechanisms of myeloid cells and give a general overview of their phenotypical and functional diversity, offering examples of possible therapeutic targets. Pharmacological targeting of inflammatory cells and molecular mediators may result in therapies improving patient condition and prognosis."
According to the news editors, the research concluded: "Here, we review experimental and clinical findings on cancer-related inflammation with a major focus on creating an inventory of current small molecule-based therapeutic interventions targeting cancer-related inflammatory cells: TAMs and MDSCs."

For more information on this research see: Pro-Tumoral Inflammatory Myeloid Cells as Emerging Therapeutic Targets. *International Journal of Molecular Sciences, 2016;17* (11):2753-2780. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news editors report that additional information may be obtained by contacting G.J. Szebeni, Synaptogenex Ltd, H-1037 Budapest, Hungary. Additional authors for this research include C. Vizier, L.I. Nagy, K. Kitajka and L.G. Puskas.

**Inflammation**

**New Inflammation Findings from German Cancer Research Center Described (Natural killer cell memory in infection, inflammation and cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Inflammation have been presented. According to news reporting out of Heidelberg, Germany, by NewsRx editors, research stated, "Immunological memory can be defined as a quantitatively and qualitatively enhanced immune response upon rechallenge. For natural killer (NK) cells, two main types of memory exist."

Our news journalists obtained a quote from the research from German Cancer Research Center, "First, similarly to T cells and B cells, NK cells can exert immunological memory after encounters with stimuli such as haptons or viruses, resulting in the generation of antigen-specific memory NK cells. Second, NK cells can remember inflammatory cytokine milieus that imprint long-lasting non-antigen-specific NK cell effector function."

According to the news editors, the research concluded: "The basic concepts derived from studying NK cell memory provide new insights about innate immunity and could lead to novel strategies to improve treatments for infectious diseases and cancer."

For more information on this research see: Natural killer cell memory in infection, inflammation and cancer. *Nature Reviews Immunology, 2016;16*(2):112-23. (Nature Publishing Group - www.nature.com/nri/)

Our news journalists report that additional information may be obtained by contacting A. Cerwenka, Innate Immunity Group, German Cancer Research Center, D080, 69120 Heidelberg, Germany.

New Inflammation Findings from National Center for Scientific Research (CNRS) Discussed (Pan PPAR agonist IVA337 is effective in prevention and treatment of experimental skin fibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Inflammation have been presented. According to news reporting out of Paris, France, by NewsRx editors, research stated, "The pathogenesis of systemic sclerosis (SSc) involves a distinctive triad of autoimmune, vascular and inflammatory alterations resulting in fibrosis. Evidence suggests that peroxisome proliferator-activated receptors (PPARs) play an important role in SSc-related fibrosis and their agonists may become effective therapeutic targets."

Our news journalists obtained a quote from the research from National Center for Scientific Research (CNRS), "To determine the expression of PPARs in human fibrotic skin and investigate the effects of IVA337, a pan PPAR agonist, in vitro and in vivo models of fibrosis. The antifibrotic effects of IVA337 were studied using a bleomycin-induced mouse model of dermal fibrosis. The in vivo effect of IVA337 on wound closure and inflammation were studied using an excisional model of wound healing. Low levels of PPAR alpha and PPAR gamma were detected in the skin of patients with SSc compared with controls. In mice, IVA337 was associated with decreased extracellular matrix (ECM) deposition and reduced expression of phosphorylated SMAD2/3-intracellular effector of transforming growth factor (TGF)-beta 1. Although the antifibrotic effect of pan PPAR was similar to that of PPAR gamma agonist alone, a significant downregulation of several markers of inflammation was associated with IVA337. Despite its anti-inflammatory and antifibrotic properties, IVA337 did not interfere with wound closure. In vitro effects of IVA337 included attenuation of transcription of ECM genes and alteration of canonical and non-canonical TGF-beta signalling pathways."

According to the news editors, the research concluded: "These findings indicate that simultaneous activation of all three PPAR isoforms exerts a dampening effect on inflammation and fibrosis, making IVA337 a potentially effective therapeutic candidate in the treatment of fibrotic diseases including SSc."

Our news journalists report that additional information may be obtained by contacting N. Ruzehaji, CNRS, UMR8104, Paris, France. Additional authors for this research include C. Frantz, M. Ponsoye, J. Avouac, S. Pezet, T. Guilbert, J.M. Luccarini, P. Broqua, J.L. Junien and Y. Allanore.

New Inflammation Findings from Y.J. Lee and Co-Authors Described (Acquired Bilateral Dyspigmentation on Face and Neck: Clinically Appropriate Approaches)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Inflammation. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "Facial dyspigmentation in Asian women often poses diagnostic and therapeutic challenges. Recently, a distinctive bilateral hyperpigmentation of face and neck has occasionally been observed."

The news reporters obtained a quote from the research, "This study was performed to investigate the clinico-pathological features of this dyspigmentation as well as proper treatment approaches. We retrospectively investigated the medical records including photographs, routine laboratory tests, histopathologic studies of both lesional and peri-lesional normal skin and patch test of thirty-one patients presented acquired bizarre hyperpigmentation on face and neck. The mean age of patients was 52.3 years and the mean duration of dyspigmentation was 24.2 months. In histologic evaluations of lesional skin, a significantly increased liquefactive degeneration of basal layer, pigmentary incontinence and lymphocytic infiltration were noted, whereas epidermal melanin or solar elastosis showed no statistical differences. Among 19 patients managed with a step-by-step approach, seven improved with using only topical anti-inflammatory agents and moisturizer, and 12 patients gained clinical benefit after laser therapy without clinical aggravation. Both clinical and histopathologic findings of the cases suggest a distinctive acquired hyperpigmentary disorder related with subclinical inflammation."

According to the news reporters, the research concluded: "Proper step-by-step evaluation and management of underlying subclinical inflammation would provide clinical benefit."

For more information on this research see: Acquired Bilateral Dyspigmentation on Face and Neck: Clinically Appropriate Approaches. Journal of Korean Medical Science, 2016;31(12):2042-2050. Journal of Korean Medical Science can be contacted at: Korean Acad Medical Sciences, 302 75 Dong Du Ichon, Dong Yongsan Ku, Seoul 140 031, South Korea.

Our news correspondents report that additional information may be obtained by contacting J.H. Lee, Sungkyunkwan University Dept. of Med Device Management & Res, SAIHST, Seoul, South Korea. Additional authors for this research include J.H. Park, D.Y. Lee and J.H. Lee.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3346/jkms.2016.31.12.2042. This DOI is a link to an online electronic document that is either free or for purchase.

New Inflammatory Bowel Disease Findings from Mercy Hospital
Reported (Identification of Factors Impacting Recurrent Clostridium difficile Infection and Development of a Risk Evaluation Tool)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Inflammatory Bowel Disease. According to news reporting from St. Louis, Missouri, by NewsRx journalists, research stated, "Recurrent Clostridium difficile infection (RCDI) is a growing concern, yet limited data exists to clarify which patients are at highest risk. Identification of these patients may better inform decisions of those who may benefit from prophylactic intervention."

The news correspondents obtained a quote from the research from Mercy Hospital, "The purpose of this study was to determine which factors are associated with the recurrence of Clostridium difficile infection (CDI) and to develop a risk stratification tool. Patients readmitted within 10 weeks of positive C. difficile polymerase chain reaction (PCR) with symptoms were included in this retrospective case control study. The primary outcome was analyzed via univariate regression analyses of the independent factors including age, gender, number of CDI episodes, administration of acid blocking agents, antibiotics or chemotherapy, Charlson Comorbidity Index, gastrointestinal conditions, and exposure to healthcare facilities. Recurrent CDI was identified in 44 of 220 included patients. In the univariate analysis, factors associated with development of RCDI included antibiotic exposure (OR 2.51, 95% CI 1.14-5.54; p 0.02) and inflammatory bowel disease (OR 5.77, 95% CI 1.24-26.79; p 0.03). An evaluation tool was created from a well-fit model. Additional factors included in the tool were chosen based on evaluation of findings from existing literature. Antibiotic therapy and inflammatory bowel disease were found to be associated with RCDI. Although a statistically significant association with RCDI was not found for other factors, this is likely related to small sample size."

According to the news reporters, the research concluded: "The creation of an evaluation tool using specific patient factors can help determine the risk of RCDI, while future studies may validate this tool."

Our news journalists report that additional information may be obtained by contacting E.K. Hennessey, Mercy Hosp St Louis, St Louis, MO, United States. Additional authors for this research include E.K. Hennessey, A.M. Bryant, J.A. Khoury and A.J. Crannage.

**RNA Viruses - Influenza A Virus**

**New Influenza A Virus Findings Has Been Reported by Researchers at University of Melbourne (Apocynin and ebselen reduce influenza A virus-induced lung inflammation in cigarette smoke-exposed mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on RNA Viruses - Influenza A Virus.

According to news reporting originating in Victoria, Australia, by NewsRx journalists, research stated, "Influenza A virus (IAV) infections are a common cause of acute exacerbations of chronic obstructive pulmonary disease (AECOPD). Oxidative stress is increased in COPD, IAV-induced lung inflammation and AECOPD."

The news reporters obtained a quote from the research from the University of Melbourne, "Therefore, we investigated whether targeting oxidative stress with the Nox2 oxidase inhibitors and ROS scavengers, apocynin and ebselen could ameliorate lung inflammation in a mouse model of AECOPD. Male BALB/c mice were exposed to cigarette smoke (CS) generated from 9 cigarettes per day for 4 days. On day 5, mice were infected with 1 ? 10^{4.5} PFUs of the IAV Mem71 (H3N1). BALF inflammation, viral titers, superoxide production and whole lung cytokine, chemokine and protease mRNA expression were assessed 3 and 7 days post infection. IAV infection resulted in a greater increase in BALF inflammation in mice that had been exposed to CS compared to non-smoking mice. This increase in BALF inflammation in CS-exposed mice caused by IAV infection was associated with elevated gene expression of pro-inflammatory cytokines, chemokines and proteases, compared to CS alone mice. Apocynin and ebselen significantly reduced the exacerbated BALF inflammation and pro-inflammatory cytokine, chemokine and protease expression caused by IAV infection in CS mice."

According to the news reporters, the research concluded: "Targeting oxidative stress using apocynin and ebselen reduces IAV-induced lung inflammation in CS-exposed mice and may be therapeutically exploited to alleviate AECOPD."

For more information on this research see: Apocynin and ebselen reduce influenza A virus-induced lung inflammation in cigarette smoke-exposed mice. *Scientific Reports*, 2016;6 ():20983. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

RNA Viruses - Influenza A Virus Subtype H1N1

New Influenza A Virus Subtype H1N1 Study Findings Have Been Reported from Howard Hughes Medical Institute (Influenza immunization elicits antibodies specific for an egg-adapted vaccine strain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in RNA Viruses - Influenza A Virus Subtype H1N1. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "For broad protection against infection by viruses such as influenza or HIV, vaccines should elicit antibodies that bind conserved viral epitopes, such as the receptor-binding site (RBS). RBS-directed antibodies have been described for both HIV1-3 and influenza virus(4-8), and the design of immunogens to elicit them is a goal of vaccine research in both fields."

Our news journalists obtained a quote from the research from Howard Hughes Medical Institute, "Residues in the RBS of influenza virus hemagglutinin (HA) determine a preference for the avian or human receptor, alpha-2,3-linked sialic acid and alpha-2,6-linked sialic acid, respectively(9,10). Transmission of an avian-origin virus between humans generally requires one or more mutations in the sequences encoding the influenza virus RBS to change the preferred receptor from avian to human(9,11,12), but passage of a human-derived vaccine candidate in chicken eggs can select for reversion to avian receptor preference(13-15). For example, the X-181 strain of the 2009 new pandemic H1N1 influenza virus, derived from the A/California/07/2009 isolate and used in essentially all vaccines since 2009, has arginine at position 226, a residue known to confer preference for an alpha-2,3 linkage in H1 subtype viruses(13,14); the wild-type A/California/07/2009 isolate, like most circulating human H1N1 viruses, has glutamine at position 226. We describe, from three different individuals, RBS-directed antibodies that recognize the avian-adapted H1 strain in current influenza vaccines but not the circulating new pandemic 2009 virus; Arg226 in the vaccine-strain RBS accounts for the restriction. The polyclonal sera of the three donors also reflect this preference."

According to the news editors, the research concluded: "Therefore, when vaccines produced from strains that are never passaged in avian cells become widely available, they may prove more capable of eliciting RBS-directed, broadly neutralizing antibodies than those produced from egg-adapted viruses, extending the established benefits of current seasonal influenza immunizations."

**Immunology - Innate Immunity**

**New Innate Immunity Data Have Been Reported by Researchers at Medical University [Paul Ehrlich (1854-1915) and His Contributions to the Foundation and Birth of Translational Medicine]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immunology - Innate Immunity are presented in a new report. According to news originating from Vienna, Austria, by NewsRx correspondents, research stated, "Translational research and precision medicine are based on a profound knowledge of cellular and molecular mechanisms contributing to various physiologic processes and pathologic reactions in diverse organs. Whereas specific molecular interactions and mechanisms have been identified during the past 5 decades, the underlying principles were defined much earlier and originate from to the seminal observations made by outstanding researchers between 1850 and 1915."

Our news journalists obtained a quote from the research from Medical University, "One of the most outstanding exponents of these scientists is Paul Ehrlich. His work resulted not only in the foundation and birth of modern hematolgy and immunology, but also led to the development of chemotherapy and specific targeted treatment concepts. In 2015, the Medical University of Vienna organized a memorial meeting, with the aim of honoring Paul Ehrlich's contributions to science, and to commemorate the 100th anniversary of his death."

According to the news editors, the research concluded: "The authors of the current review served as faculty members and dedicate this paper to Paul Ehrlich and his remarkable contributions to medicine."

The news correspondents report that additional information may be obtained from P. Valent, Dept. of Medicine I, Division of Hematology and Hemostaseology, Medical University of Vienna, Vienna, Austria. Additional authors for this research include B. Groner, U. Schumacher, G. Superti-Furga, M. Busslingger, R. Kralovics, C. Zielinski, J.M. Penninger, D. Kerjaschki, G. Stingl, J.S. Sinolen, R. Valenta, H. Lassmann, H. Kovar, U. Jager, G. Kornek, M. Muller and So.

New Integrative Medicine Findings from D. Damaske and Co-Authors Described (The beliefs and attitudes of chiropractors and their patients utilising an open practice environment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Health and Medicine - Integrative Medicine have been presented. According to news reporting originating from Bergamo, Italy, by NewsRx correspondents, research stated, "Although chiropractic care is known to be provided in different types of environments, patient satisfaction on the use of an open plan/multi bedded environment is unknown. The aim of this study was to examine chiropractic patients' beliefs, experiences and satisfaction with chiropractic care in an open environment and to test the hypothesis that a patient's privacy and dignity may be preserved in open adjusting environments."

Our news editors obtained a quote from the research, "A convenience sample of twenty-seven European chiropractors from 8 European countries was obtained through 2 national association e-mail lists and verbal request at 2 continuing education seminars. They and their patients were asked to complete a Global Wellness and Likert-type survey for the purpose of this study. One thousand, one hundred and nine patients who received chiropractic care in an open environment participated in this study. They reported to be very highly satisfied with the care they were receiving (average rating = 8.98/10) and expressed significantly improved survey responses in regard to their self-rated Global Wellness at the time of evaluation compared to baseline measures. In terms of their attitudes, beliefs and experiences in this model of chiropractic care, participants indicated positive experiences in that they were comfortable receiving care in such an environment, their dignity was respected, their privacy maintained and they were cared for in a professional manner. The findings presented here provide valuable insight into patients' perspectives in receiving care in an open adjusting environment. Our results demonstrate that the open adjusting environment is an effective practice model for maintaining a patient's dignity and privacy while providing a high level of patient satisfaction."

According to the news editors, the research concluded: "Open room care may need to be included in future decisions regarding best practice configuration for chiropractic care facilities."

The news editors report that additional information may be obtained by contacting D. Damaske, Multispecialist Hosp Humanitas Gavazzeni, Bergamo, Italy. Additional authors for this research include P. McCrossin, F. Santoro and J. Alcantara.

New Interleukin Receptors Study Results from Ajou University Described (Recent Progress in the Molecular Recognition and Therapeutic Importance of Interleukin-1 Receptor-Associated Kinase 4)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Interleukin Receptors. According to news originating from Suwon, South Korea, by NewsRx correspondents, research stated, "Toll-like receptors (TLRs) are the most upstream pattern recognition receptors in the cell, which detect pathogen associated molecular patterns and initiate signal transduction, culminating in the transcription of pro-inflammatory cytokines and antiviral interferon. Interleukin-1 receptor-associated kinase 4 (IRAK4) is a key mediator in TLR (except for TLR3) and interleukin-1 receptor signaling pathways."

Our news journalists obtained a quote from the research from Ajou University, "The loss of kinase function of IRAK4 is associated with increased susceptibility to various pathogens, while its over-activation causes autoimmune diseases such as rheumatoid arthritis, systemic lupus erythematosus, and cancer. The therapeutic importance of this master kinase has been advocated by a number of recent preclinical studies, where potent inhibitors have been administered to improve various TLR-mediated pathologies. Increasing studies of X-ray crystallographic structures with bound inhibitors have improved our knowledge on the molecular recognition of ligands by IRAK4, which will be crucial for the development of new inhibitors with improved potencies."

According to the news editors, the research concluded: "In this review, we briefly discuss the structural aspect of ligand recognition by IRAK4 and highlight its therapeutic importance in the context of TLR-associated unmet medical needs."

For more information on this research see: Recent Progress in the Molecular Recognition and Therapeutic Importance of Interleukin-1 Receptor-Associated Kinase 4. Molecules, 2016;21(11):1645-1659. Molecules can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. (Springer - www.springer.com; Molecules - www.springerlink.com/content/1420-3049/)

The news correspondents report that additional information may be obtained from M.C. Patra, Ajou University, Dept. of Mol Sci & Technol, Suwon 443749, South Korea.

Intermediate Filament Proteins

New Intermediate Filament Proteins Findings Has Been Reported by Investigators at Veterans Affairs Medical Center (Disruption of desmin-mitochondrial architecture in patients with regurgitant mitral valves and preserved ventricular function)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Intermediate Filament Proteins are presented in a new report. According to news reporting originating in Birmingham, Alabama, by NewsRx journalists, research stated, "Recent studies have demonstrated improved outcomes in patients receiving early surgery for degenerative mitral regurgitation (MR) rather than adhering to conventional guidelines for surgical intervention. However, studies providing a mechanistic basis for these findings are limited."

The news reporters obtained a quote from the research from Veterans Affairs Medical Center, "Left ventricular (LV) myocardium from 22 patients undergoing mitral valve repair for American Heart Association class I indications was evaluated for desmin, the voltage-dependent anion channel, alpha-B-crystallin, and alpha, beta-unsaturated aldehyde 4-hydroxynonenal by fluorescence microscopy. The same was evaluated in 6 normal control LV autopsy specimens. Cardiomyocyte ultrastructure was examined by transmission electron microscopy. Magnetic resonance imaging with tissue tagging was performed in 55 normal subjects and 22 MR patients before and 6 months after mitral valve repair. LV end-diastolic volume was 1.5-fold (P<.0001) higher and LV mass-to-volume ratio was lower in MR (P=.004) hearts versus normal hearts and showed improvement 6 months after mitral valve surgery. However, LV ejection fraction decreased from 65% +/- 7% to 52% +/- 9% (P=.0001) and LV circumferential (P<.0001) and longitudinal strain decreased significantly below normal values (P<.002) after surgery. Hearts with MR had a 53% decrease in desmin (P<.0001) and a 2.6-fold increase in desmin aggregates (P<.0001) versus normal, along with substantial, intense perinuclear staining of alpha, beta-unsaturated aldehyde 4-hydroxynonenal in areas of mitochondrial breakdown and clustering. Transmission electron microscopy demonstrated numerous electron-dense deposits, myofibrillar loss, Z-disc abnormalities, and extensive granulofilamentous debris identified as desmin-positive by immunogold transmission electron microscopy."

According to the news reporters, the research concluded: "Despite well-preserved preoperative LV ejection fraction, severe oxidative stress and disruption of cardiomyocyte desmin-mitochondrial sarcomeric architecture may explain postoperative LV functional decline and further supports the move toward earlier surgical intervention."

Our news correspondents report that additional information may be obtained by
Lung Diseases and Conditions - Interstitial Lung...

**New Interstitial Lung Disease Study Results from Fukushima Medical University Described (Clinicopathological analysis of mechanic's hand associated with dermatomyositis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Interstitial Lung Disease. According to news reporting from Fukushima, Japan, by NewsRx journalists, research stated, "Mechanic's hand is often seen in the fingers of patients with dermatomyositis and is frequently associated with anti-aminoacyl-transfer RNA synthetase autoantibodies and interstitial lung disease. We analysed the clinical symptoms of 50 patients with dermatomyositis who had visited our department, 26 of whom also had mechanic's hand."

The news correspondents obtained a quote from the research from Fukushima Medical University, "A histological examination was carried out in 16 of the 26 cases, which revealed hyperkeratosis in all cases and colloid bodies in the epidermis in 15 cases. The number of cases of interstitial lung disease in patients with mechanic's hand (22/26, 85%) was significantly higher than that in those without mechanic's hand (12/24, 50%) (P < 0.05)."

According to the news reporters, the research concluded: "Mechanic's hand is an important skin lesion of dermatomyositis, and increases the likelihood of interstitial lung disease."

Our news journalists report that additional information may be obtained by contacting T. Mori, Fukushima Med Univ, Dept. of Dermatol, Fukushima 9601295, Japan. Additional authors for this research include T. Ohashi, Y. Kato, M. Ohtsuka and T. Yamamoto.

Central Nervous System Diseases and Conditions - …

New Intracranial Aneurysm Findings Has Been Reported by Investigators at Zhengzhou University (Safety and efficacy of a new prophylactic tirofiban protocol without oral intraoperative antiplatelet therapy for endovascular treatment of ruptured ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Central Nervous System Diseases and Conditions - Intracranial Aneurysm is the subject of a report. According to news reporting out of Zhengzhou, People's Republic of China, by NewsRx editors, research stated, "Coil embolization of intracranial aneurysms is being increasingly used; however, thromboembolic events have become a major periprocedural complication. To determine the safety and efficacy of prophylactic tirofiban in patients with ruptured intracranial aneurysms."

Our news journalists obtained a quote from the research from Zhengzhou University, "Tirofiban was administered as an intravenous bolus (8.0 µg/kg over 3 min) followed by a maintenance infusion (0.10 µg/kg/min) before stent deployment or after completion of single coiling. Dual oral antiplatelet therapy (loading doses) was overlapped with half the tirofiban dose 2 h before cessation of the tirofiban infusion. Cases of intracranial hemorrhage or thromboembolism were recorded. Tirofiban was prophylactically used in 221 patients, including 175 (79.19%) who underwent stent-assisted coiling and 46 (20.81%) who underwent single coiling, all in the setting of aneurysmal subarachnoid hemorrhage. Six (2.71%) cases of intracranial hemorrhage occurred, including four (1.81%) tirofiban-related cases and two (0.90%) antiplatelet therapy related cases. There were two (0.90%) cases of fatal hemorrhage, one related to tirofiban and the other related to dual antiplatelet therapy. Thromboembolic events occurred in seven (3.17%) patients (6 stent-assisted embolization, 1 single coiling), of which one (0.45%) event occurred during stenting and six (2.72%) occurred during intravenous tirofiban maintenance. No thromboembolic events related to dual antiplatelet therapy were found."

According to the news editors, the research concluded: "Tirofiban bolus over 3 min followed by maintenance infusion appears to be a safe and efficient prophylactic protocol for the endovascular treatment of ruptured intracranial aneurysms and may be an alternative to intraoperative oral antiplatelet therapy, especially in the case of stent-assisted embolization."

Our news journalists report that additional information may be obtained by contacting T.X. Li, Zhengzhou Univ, Henan Prov Peoples Hosp, Dept. of Intervent Therapy
New Intracranial Aneurysm Study Findings Reported from Stanford University Hospital (Detection and characterization of intracranial aneurysms: a 10-year multidetector CT angiography experience in a large center)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Intracranial Aneurysm have been published. According to news reporting out of Stanford, California, by NewsRx editors, research stated, "CT angiography (CTA) is increasingly used for the detection, characterization, and follow-up of intracranial aneurysms. A lower threshold to request a CT angiogram may render a patient population that differs from previous studies primarily evaluated with conventional angiography."

Our news journalists obtained a quote from the research from Stanford University Hospital, "Our objective was to broaden our knowledge of the factors associated with aneurysm rupture and patient mortality in this population. All CTA studies performed over a 10-year period at a large neurovascular referral center were reviewed for the presence of an intracranial aneurysm. Patient demographics, mortality, CTA indication, aneurysm location, size, and rupture status were recorded. Results 2927 patients with aneurysms were identified among 29 003 CTAs. 17% of the aneurysms were ruptured at the time of imaging, 24% of aneurysms were incidentally identified, and multiple aneurysms were identified in 34% of patients. Aneurysms most commonly arose from the supraclinoid internal carotid artery (22%), the middle cerebral artery (18%), and the anterior communicating artery (13%). Male sex, age <50 years, aneurysms >6 mm, and aneurysms arising from the anterior communicating artery, posterior communicating artery, or the posterior circulation were independent predictors of aneurysm rupture. Independent mortality predictors included male sex, posterior circulation aneurysms, intraventricular hemorrhage, and intraparenchymal hemorrhage."

According to the news editors, the research concluded: "These results indicate that aneurysms detected on CTA that arise from the anterior communicating artery, posterior communicating artery, or the posterior circulation, measure >6 mm in size, occur in men, and in
patients aged <50 years are associated with rupture."

**New Intracranial Hypertension Study Findings Reported from Ohio State University [Idiopathic Intracranial Hypertension (Pseudotumor Cerebri)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Intracranial Hypertension. According to news reporting from Columbus, Ohio, by NewsRx editors, the research stated, "Idiopathic intracranial hypertension has been recognized in the literature for over 100 years. It is a disease of elevated intracranial pressure without evidence of a space-occupying lesion found most often in obese women of childbearing age."

The news correspondents obtained a quote from the research from Ohio State University, "The signs and symptoms have been well described; however, the etiology is yet unknown. Medical and surgical treatment is aimed at the preservation of vision and improvement in symptoms. The medical literature is replete with articles addressing the epidemiology, pathophysiology, clinical and imaging features, and treatment. There are limited nursing reports (Lehman, 2003; McDonald, 1984; Revta, 1977)."

According to the news reporters, the research concluded: "The objective of this manuscript is to provide an overview for the neuroscience nurse of the clinical features, diagnostic work-up, and therapeutic options available for patients with idiopathic intracranial hypertension."

For more information on this research see: Idiopathic Intracranial Hypertension (Pseudotumor Cerebri). *Journal of Neuroscience Nursing*, 2016;48(6):303-310. *Journal of Neuroscience Nursing* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq,

Membrane Proteins - Ion Channels

New Ion Channels Data Have Been Reported by Researchers at University of Turku (L-type calcium channels regulate filopodia stability and cancer cell invasion downstream of integrin signalling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Membrane Proteins - Ion Channels have been presented. According to news reporting originating from Turku, Finland, by NewsRx correspondents, research stated, "Mounting in vitro, in vivo and clinical evidence suggest an important role for filopodia in driving cancer cell invasion. Using a high-throughput microscopic-based drug screen, we identify FDA-approved calcium channel blockers (CCBs) as potent inhibitors of filopodia formation in cancer cells."

Our news editors obtained a quote from the research from the University of Turku, "Unexpectedly, we discover that L-type calcium channels are functional and frequently expressed in cancer cells suggesting a previously unappreciated role for these channels during tumorigenesis. We further demonstrate that, at filopodia, L-type calcium channels are activated by integrin inside-out signalling, integrin activation and Src. Moreover, L-type calcium channels promote filopodia stability and maturation into talin-rich adhesions through the spatially restricted regulation of calcium entry and subsequent activation of the protease calpain-1."

According to the news editors, the research concluded: "Altogether we uncover a novel and clinically relevant signalling pathway that regulates filopodia formation in cancer cells and propose that cycles of filopodia stabilization, followed by maturation into focal adhesions, directs cancer cell migration and invasion."

The news editors report that additional information may be obtained by contacting G. Jacquemet, University of Turku, Turku Center Biotechnol, FIN-20520 Turku, Finland. Additional authors for this research include H. Baghirov, M. Georgiadou, H. Sihto, E. Peuhu, P. Cettour-Janet, T. He, M. Perala, P. Kronqvist, H. Joensuu and J. Ivaska.

New Iron Deficiency Study Results from University of the Free State Described (Iron status determination in pregnancy using the Thomas plot)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Iron Deficiency are discussed in a new report. According to news reporting out of Bloemfontein, South Africa, by NewsRx editors, research stated, "Physiological changes during pregnancy affect routine tests for iron deficiency. The reticulocyte haemoglobin equivalent (RET-He) and serum-soluble transferrin receptor (sTfR) assay are newer diagnostic parameters for the detection of iron deficiency, combined in the Thomas diagnostic plot."

Financial support for this research came from NHLS Research Trust.

Our news journalists obtained a quote from the research from the University of the Free State, "We used this plot to determine the iron status of pregnant women presenting for their first visit to an antenatal clinic in Bloemfontein, South Africa. Routine laboratory tests (serum ferritin, full blood count and C-reactive protein) and RET-He and sTfR were performed. The iron status was determined using the Thomas plot. For this study, 103 pregnant women were recruited. According to the Thomas plot, 72.8% of the participants had normal iron stores and erythropoiesis. Iron-deficient erythropoiesis was detected in 12.6%. A third of participants were anaemic. Serum ferritin showed excellent sensitivity but poor specificity for detecting depleted iron stores. HIV status had no influence on the iron status of the participants. Our findings reiterate that causes other than iron deficiency should be considered in anaemic individuals. When compared with the Thomas plot, a low serum ferritin is a sensitive but nonspecific indicator of iron deficiency."

According to the news editors, the research concluded: "The Thomas plot may provide useful information to identify pregnant individuals in whom haematologic parameters indicate limited iron availability for erythropoiesis."

Our news journalists report that additional information may be obtained by contacting R. Weyers, Dept. of Haematology and Cell Biology, Faculty of Health Sciences, University of the Free State and National Health Laboratory Service (NHLS), Bloemfontein, South Africa. Additional authors for this research include M.J. Coetzee and M. Nel.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ijlh.12448. This DOI is a link to an online electronic document that is either free or for purchase.

New Iron-Binding Proteins Study Findings Recently Were Reported by Researchers at University of Pennsylvania (Vascular Accessibility of Endothelial Targeted Ferritin Nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Carrier Proteins - Iron-Binding Proteins are presented in a new report. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "Targeting nanocarriers to the endothelium, using affinity ligands to cell adhesion molecules such as ICAM-1 and PECAM-1, holds promise to improve the pharmacotherapy of many disease conditions. This approach capitalizes on the observation that antibody-targeted carriers of 100 nm and above accumulate in the pulmonary vasculature more effectively than free antibodies."

Financial support for this research came from National Heart, Lung, and Blood Institute.

Our news journalists obtained a quote from the research from the University of Pennsylvania, "Targeting of prospective nanocarriers in the 10-50 nm range, however, has not been studied. To address this intriguing issue, we conjugated monoclonal antibodies (Ab) to ICAM-1 and PECAM-1 or their single chain antigen-binding fragments (scFv) to ferritin nanoparticles (FNPs, size 12 nm), thereby producing Ab/FNPs and scFv/FNPs. Targeted FNPs retained their typical symmetric core-shell structure with sizes of 20-25 nm and ∼4-5 Ab (or ∼7-9 scFv) per particle. Ab/FNPs and scFv/FNPs, but not control IgG/FNPs, bound specifically to cells expressing target molecules and accumulated in the lungs after intravenous injection, with pulmonary targeting an order of magnitude higher than free Ab. Most intriguing, the targeting of Ab/FNPs to ICAM-1, but not PECAM-1, surpassed that of larger Ab/carriers targeted by the same ligand."

According to the news editors, the research concluded: "These results indicate that (i) FNPs may provide a platform for targeting endothelial adhesion molecules with carriers in the 20 nm size range, which has not been previously reported; and (ii) ICAM-1 and PECAM-1 (known to localize in different domains of endothelial plasmalemma) differ in their accessibility to circulating objects of this size, common for blood components and nanocarriers."

Our news journalists report that additional information may be obtained by contacting E. Arguiri, Division of Pulmonary, Allergy and Critical Care Medicine, Dept. of Medicine, University of Pennsylvania, Hospital of the University of Pennsylvania, 835W Gates Building, 3600 Spruce Street, Philadelphia, Pennsylvania 19104, United States. Additional
New Iron-Deficiency Anemia Findings from Pamukkale University Reported (Response to parenteral iron therapy distinguish unexplained refractory iron deficiency anemia from iron-refractory iron deficiency anemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Iron-Deficiency Anemia have been published. According to news originating from Denizli, Turkey, by NewsRx correspondents, research stated, "We evaluated that response to parenteral iron therapy could be helpful in distinguishing the types of iron deficiency anemia. This study analyzed responses to IV iron sucrose therapy of 15 children with unexplained refractory iron deficiency anemia (URIDA)."

Our news journalists obtained a quote from the research from Pamukkale University, "We compared the results at diagnosis, 6 weeks and 6 months after the therapy. Results were compared with responses of 11 patients' results with iron-refractory iron deficiency anemia (IRIDA) from our previous study. Six weeks after the start of treatment, ferritin, MCV, MCH and Hb values were in normal range in 10 patients. The increase in Hb, MCH, MCV, and ferritin values ranged 2.6-3.5 g/dL, 1.7-4.2 pg, 2-9 fL, and 13-25 ng/mL, respectively. In five patients, Hb, MCH, and MCV mean (range) values [11.2 g/dL (11-12.2), 24.5 pg (24-25.6), and 67 fL (65-70)] were nearly normal but ferritin mean (range) values [9.8 ng/mL (8-11)] were below normal. Six weeks after the start of treatment, Hb, MCH, MCV and ferritin values of patients with IRIDA were increased. The increase in Hb, MCH, MCV, and ferritin values ranged 0.8-2.7 g/dL, 1.7-4.2 pg, 2-9 fL, and 13-25 ng/mL, respectively. IRIDA is only partially responsive to parenteral iron supplementation."

According to the news editors, the research concluded: "This study demonstrated that the response to intravenous iron therapy for the URIDA cases improved blood parameters more effectively than hereditary IRIDA. Response to parenteral iron therapy would be helpful to distinguish unexplained refractory IDA from hereditary IRIDA for clinicians who do not have access to hepcidin or TMPRS6 mutation analysis."

For more information on this research see: Response to parenteral iron therapy distinguish unexplained refractory iron deficiency anemia from iron-refractory iron deficiency anemia. International Journal of Laboratory Hematology, 2016;38(2):167-71. International Journal of Laboratory Hematology can be contacted at: Blackwell Publishing Inc, 350 Main St, Malden, MA 02148, USA. Ischemia

New Ischemia Findings from Royal Melbourne Institute of Technology University Reported (Highly Sensitive Detection of Minimal Cardiac Ischemia using Positron Emission Tomography Imaging of Activated Platelets)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Ischemia. According to news reporting originating from Melbourne, Australia, by NewsRx correspondents, research stated, "A reliable method for the diagnosis of minimal cardiac ischemia would meet a strong demand for the sensitive diagnosis of coronary artery disease in cardiac stress testing and risk stratification in patients with chest pain but unremarkable ECGs and biomarkers. We hypothesized that platelets accumulate early on in ischemic myocardium and a newly developed technology of non-invasive molecular PET imaging of activated platelets can thus detect minimal degrees of myocardial ischemia."

Our news editors obtained a quote from the research from the Royal Melbourne Institute of Technology University, "To induce different degrees of minimal cardiac ischemia, the left anterior descending artery (LAD) was ligated for 10, 20 or 60 min. Mice were injected with a newly generated scFv(anti-GPIIb/IIIa)-(64)CuMeCOSar radiotracer, composed of a single-chain antibody that only binds to activated integrin GPIIb/IIIa (alpha(IIb)beta(III)) and thus to activated platelets, and a sarcophagine cage MeCOSar complexing the long half-life PET tracer copper-64. A single PET/CT scan was performed. Evans Blue/TTC staining to detect necrosis as well as classical serological biomarkers like Troponin I and heart-type fatty acid-binding protein (H-FABP) were negative, whereas PET imaging of activated platelets was able to detect small degrees of ischemia."

According to the news editors, the research concluded: "Taken together, molecular PET imaging of activated platelets represents a unique and highly sensitive method to detect minimal cardiac ischemia."

For more information on this research see: Highly Sensitive Detection of Minimal Cardiac Ischemia using Positron Emission Tomography Imaging of Activated Platelets.

Ischemia

New Ischemia Study Findings Have Been Reported by Investigators at Kyushu University (Protective Effects of Imatinib on Ischemia/Reperfusion Injury in Rat Lung)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Ischemia are discussed in a new report. According to news reporting originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "Ischemia/reperfusion injury (IRI) remains a significant complication after lung transplantation. Endothelial damage and inflammation contribute to its development."

Our news editors obtained a quote from the research from Kyushu University, "Imatinib has been reported to regulate vascular permeability by maintaining endothelial junctions and showing antiinflammatory effects through inhibition of the Abl kinases. We hypothesized that imatinib could have a protective effect against IRI. Male Lewis rats were heparinized and underwent left thoracotomy, and the left hilum was clamped for 90 minutes followed by reperfusion for 120 minutes. Imatinib mesylate (50 mg/kg) and a solvent were administered intraperitoneally 20 minutes before ischemia in the imatinib group and the vehicle group, respectively (n = 7 in each group). After reperfusion, lung function, lung wet to dry weight (W/D) ratio, and histologic findings were obtained. The expression of vascular endothelial cadherin (VEC), the phosphorylation level of CrkL (pCrkL) (an exclusive target of Abl kinases), and the cytokine level were evaluated using lung tissue lysate. The imatinib concentrations of plasma and lungs after reperfusion were measured in this hilar clamp model (n = 7). In the imatinib group, lung function was improved with a lower W/D ratio. Perivascular edema and neutrophil infiltration were ameliorated. The imatinib group demonstrated maintained expression of VEC, inhibition of pCrkL, and a significantly higher level of interleukin (IL)-10. The imatinib concentration in both lungs showed a strong correlation with plasma concentration. In a rat IRI model, imatinib attenuated lung injury by an antipermeability and antiinflammatory effect."

According to the news editors, the research concluded: "The delivery and function of imatinib in the lung was also confirmed in this model."

Ischemia

New Ischemia Study Findings Have Been Reported by Investigators at University Medical Center, Hamburg Eppendorf (Lymphocyte-specific deletion of IKK2 or NEMO mediates an increase in intrarenal Th17 cells and accelerates renal damage in an ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Ischemia. According to news reporting out of Hamburg, Germany, by NewsRx editors, research stated, "Acute kidney injury (AKI) is associated with poor patient outcome and a global burden for end-stage renal disease. Ischemia-reperfusion injury (IRI) is one of the major causes of AKI, and experimental work has revealed many details of the inflammatory response in the kidney, such as activation of the NF-kappa B pathway."

Our news journalists obtained a quote from the research from University Medical Center, Hamburg Eppendorf, "Here, we investigated whether deletion of the NF-kappa B kinases IKK2 or NEMO in lymphocytes or systemic inhibition of IKK2 would cause different kidney inflammatory responses after IRI induction. Serum creatinine, blood urea nitrogen (BUN) level, and renal tubular injury score were significantly increased in CD4(cre)IKK2(f/f) (CD4xIKK2(Delta)) and CD4(cre)NEMO(f/f) (CD4xNEMO(Delta)) mice compared with CD4cre mice after IRI induction. The frequency of Th17 cells infiltrating the kidneys of CD4xIKK2(Delta) or CD4xNEMO(Delta) mice was also significantly increased at all time points. CCL20, an important chemokine in Th17 cell recruitment, was significantly increased at early time points after the induction of IRI. IL-1 beta, TNF-alpha, and CCL2 were also significantly increased in different patterns. A specific IKK2 inhibitor, KINK-1, reduced BUN and serum creatinine compared with nontreated mice after IRI induction, but the frequency of kidney Th17 cells was also significantly increased."

According to the news editors, the research concluded: "Although systemic IKK2 inhibition improved kidney function, lymphocyte-specific deletion of IKK2 or NEMO aggravated kidney injury after IRI, and, in both conditions, the percentage of Th17 cells was increased. Our findings demonstrate the critical role of the NF-kappa B pathway in Th17 activation, which advises caution when using systemic IKK2 inhibitors in patients with kidney
injury, since they might impair the T cell response and aggravate renal disease."

For more information on this research see: Lymphocyte-specific deletion of IKK2 or NEMO mediates an increase in intrarenal Th17 cells and accelerates renal damage in an ischemia-reperfusion injury mouse model. *American Journal of Physiology-Renal Physiology*, 2016;311(5):F1005-F1014. *American Journal of Physiology-Renal Physiology* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

**Oncology - Kidney Cancer**

**New Kidney Cancer Data Have Been Reported by Investigators at Cancer Hospital (Newly-presented potential targeted drugs in the treatment of renal cell cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Kidney Cancer. According to news reporting out of Nanchang, People's Republic of China, by NewsRx editors, research stated, "Renal cell carcinoma (RCC) is the most frequent form of renal cancer, and is associated with a high frequency of metastasis. While, there is few therapeutic methods can substantially prolong survival."

Our news journalists obtained a quote from the research from Cancer Hospital, "Superior to cytokine therapy with IL-2 and/or IFN-alpha, several newer targeted treatments are available for the treatment of patients with advanced conventional (clear cell) renal cell carcinoma (RCC), which received improved outcomes. These newer targeted treatments include the multi-targeted tyrosine kinase inhibitors (TKIs, sorafenib, sunitinib, pazopanib, and axitinib), the humanised antivascular endothelial growth factor (VEGF) monoclonal antibody [bevacizumab combined with interferon (IFN)-alpha], and mTOR (mammalian target of rapamycin) complex 1 kinase inhibitors (everolimus and temsirolimus). However, these targeted drugs are still associated with limited efficacy and high toxicity, so there is still a strong need for further discovery of new targeted drugs."

According to the news editors, the research concluded: "In the present manuscript, we summarize newly-presented potential targeted drugs for RCC, classified by drug characteristic, small molecule, small molecule combination, monoclonal antibody, polysaccharides, organometals and peptides."

For more information on this research see: Newly-presented potential targeted drugs in the treatment of renal cell cancer. *Open Life Sciences*, 2016;11(1):122-129. *Open Life*
New Kidney Transplants Data Have Been Reported by A.S. Benjumea and Co-Authors (Hepatitis C Virus in Kidney Transplant Recipients: A Problem on the Path to Eradication)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Kidney Transplants is now available. According to news reporting from Seville, Spain, by NewsRx journalists, research stated, "Hepatitis C virus (HCV) still has significant prevalence in kidney transplant (KT) recipients and is related to poor recipient and graft survival. New direct-acting antivirals (DAA) are leading to a radical change in the problem."

The news correspondents obtained a quote from the research, "We studied HCV prevalence at the time of transplantation and in follow-up patients, the way cases are handled, and the results of DAA. A total of 2,001 KT had been performed in our center since 1978. Pre- or post-transplantation HCV serology was present in 1,880 cases and was positive in 13.4%. A total of 1,195 transplant recipients were still being monitored by us, with only 60 (5%) HCV+ and 45 (3.6%) RNA+ cases. Of these 45 HCV+/RNA+, 25 had been or were being treated, 7 were about to begin treatment, 1 was awaiting new DAA treatment owing to low glomerular filtration rate (GFR), 3 were being evaluated, 2 had been excluded owing to high comorbidity, 2 refused to be treated, 2 needed to return to hemodialysis, and 1 was lost to follow-up. Except 1 case where Viekira Pak was used because of low GFR, all cases included sofosbuvir as the main drug associated with either ledipasvir (70%) or daclatasvir (25%). Ribavirin was added as coadjuvant in 35% of cases. Twenty-one patients had completed treatment (84%). Two patients had to interrupt DAA therapy (8%), one because of hepatotoxicity and the other as a result of a liver transplantation. In every case, the graft maintained function and negativization of viral replication occurred. Side effects have been low, anemia related to ribavirin being the main one. Just one case needed to be interrupted at the 7th week of DAA therapy due to hepatotoxicity."

According to the news reporters, the research concluded: "It has frequently been necessary to adjust immunosuppression treatment with the use of higher doses of tacrolimus."

New Kidney Transplants Findings Has Been Reported by E. Luna et al

[Effect of Cytomegalovirus Infection on Survival of Older Kidney Transplant Patients (D plus /R plus ): Impact of Valganciclovir Prophylaxis Versus Preemptive Therapy]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Kidney Transplants have been published. According to news reporting originating in Badajoz, Spain, by NewsRx journalists, research stated, "Kidney transplant patients with D+/R+ serology can be treated with either prophylaxis or preemptive valganciclovir. The older transplant population suffers severe immunosenescence, especially patients with latent cytomegalovirus (CMV) infection (R+)."

The news reporters obtained a quote from the research, "They are more likely to develop indirect CMV effects. Likewise, many patients have significant cardiovascular comorbidity, which makes them more sensitive to these indirect effects. The aim of this study was to evaluate the incidence of CMV viremia and indirect effects on survival, comparing prophylaxis (V) against preemptive (P) valganciclovir in an older kidney transplant population. We analyzed the data of 233 recipients from 2002 (age, >55 years; D+/R+) with >= 6 months of follow-up. The patients were divided into 2 groups: 167 (71.7%) in the V group and 66 (28.3%) in the P group. The incidence of CMV infection in the P group was 32% versus 6% in V group. Patients with CMV viremia showed worse survival values than patients without viremia (log rank P = .031). Five-year survivals were 74% vs 88%, respectively. Cox regression showed that the adjusted effect of CMV infection on overall survival was a significant risk (hazard ratio [HR], 2.07; 95% CI, 1.003-4.29). Patients with CMV viremia showed worse cardiovascular survival than patients without viremia, with 5-year survivals of 79% vs 94%. Cox regression showed that the adjusted effect of CMV infection was a significant risk (HR, 2.62). CMV infection has a detrimental effect on the survival of older patients."

According to the news reporters, the research concluded: "Valganciclovir prophylaxis induces a protective effect against CMV infection and could improve survival of older patients with cardiovascular comorbidities."

Our news correspondents report that additional information may be obtained by contacting E. Luna, Infanta Cristina Hosp, Nephrol & Kidney Transplantat Department, Badajoz 06011, Spain. Additional authors for this research include F. Caravaca, F. Ferreira, N. Fernandez, P. Martin, M.L. Vargas, M.L. Vargas, J.S. de Santamaria, G.G. Pino, L. Azevedo and A.M. Sanz.

**Transplant Medicine - Kidney Transplants**

**New Kidney Transplants Findings Has Been Reported by Investigators at Yonsei University (Low-dose mycophenolate mofetil in tablet form or capsule form combined with tacrolimus in the early period after kidney transplantation: a prospective ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Kidney Transplants is now available. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The tablet form (500 mg) of mycophenolate mofetil (MMF) provides more convenience of taking drugs and cost-effectiveness than the capsule form (250 mg). We examined the efficacy and safety of MMF in its different forms combined with tacrolimus in kidney transplant recipients."

Our news journalists obtained a quote from the research from Yonsei University, "This multicenter, 26-week, randomized trial was performed to compare the efficacy and safety of the tablet form of MMF versus the capsule form of MMF in 156 kidney transplant recipients. Allograft function, the incidence of efficacy failure (biopsy-proven acute rejection (BPAR), death, graft loss, or loss to follow-up), and adverse events were compared. The mean dose (mg/day) of MMF at 26 weeks was comparable: 1,052.6 +/- 194.2 in the tablet group vs. 1,155.6 +/- 298.1 in the capsule group (p = 0.063). Trough levels of tacrolimus at 26 weeks were comparable. The mean estimated glomerular filtration rate of the tablet group at 26 weeks post-transplant was not inferior to that of the capsule group. The incidence of efficacy failure was similar in the two groups: tablet group, 5.2% and capsule group, 7.7% (difference -2.5%; 95% confidence interval -5.22 - 10.21%). The incidence of BPAR until 26 weeks post-transplant in the tablet group was 3.9%, compared to 7.7% in the capsule group (p = 0.346). There was no significant difference in the incidence of discontinuations and serious adverse events between the groups."
According to the news editors, the research concluded: "Low-dose MMF in tablet form combined with tacrolimus can be considered as an efficacious and safe immunosuppressive regimen in the early period after kidney transplantation."

For more information on this research see: Low-dose mycophenolate mofetil in tablet form or capsule form combined with tacrolimus in the early period after kidney transplantation: a prospective randomized trial. *Clinical Nephrology*, 2016;86(6):319-327. *Clinical Nephrology* can be contacted at: Dustri-Verlag Dr Karl Feistle, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

**Transplant Medicine - Kidney Transplants**

**New Kidney Transplants Findings Reported from Roma Tor Vergata University (Everolimus and Advagraf Ab Initio in Combined Liver and Kidney Transplant With Donor-Specific Antibodies: A Case Report)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Kidney Transplants have been published. According to news reporting out of Rome, Italy, by NewsRx editors, research stated, "Although donor-specific antibodies are regarded as a contraindication for kidney transplantation, the data available for combined liver and kidney transplantation (cLKTx) are scarce, and there is no established therapeutic approach for this category of transplant recipients. De novo use of everolimus and a reduced dose of calcineurin inhibitor reportedly provides excellent kidney function compared with a standard regimen containing a calcineurin inhibitor."

Our news journalists obtained a quote from the research from Roma Tor Vergata University, "This strategy, however, has been applied in only some recipient categories. Here we report a case of a highly sensitized male patient who underwent a cLKTx and received everolimus with low-dose tacrolimus (once-daily prolonged-release formulation) as ab initio immunosuppressive treatment. The pretransplant panel-reactive antibody estimate was 97%, and multiple anti-HLA antibodies were detected at the time of transplantation."

According to the news editors, the research concluded: "Thus far, patient and allograft survival have reached 2 years, with the recipient remaining on a regimen of immunosuppression with everolimus and low-dose tacrolimus, with no episodes of rejection."

Our news journalists report that additional information may be obtained by contacting L. Tariciotti, Roma Tor Vergata University, Policlinico Tor Vergata, Liver & Kidney Transplant Center, Rome, Italy. Additional authors for this research include T.M. Manzia, D. Sforza, A. Anselmo and G. Tisone.

Keywords for this news article include: Rome, Italy, Europe, Tyrosine Kinase Inhibitors, Immunosuppressive Agents, MTOR Kinase Inhibitors, Drugs and Therapies, Transplant Medicine, Kidney Transplants, Organ Transplants, Immunoglobulins, Antineoplastics, MTOR Inhibitors, Transplantation, Blood Proteins, Biomedicine, Immunology, Antibodies, Everolimus, Surgery, Roma Tor Vergata University.

Transplant Medicine - Kidney Transplants

New Kidney Transplants Findings from Institute for Cancer Research and Treatment (IRCCS) Described (Mesenchymal stromal cells in renal transplantation: opportunities and challenges)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Transplant Medicine - Kidney Transplants is the subject of a report. According to news reporting originating from Bergamo, Italy, by NewsRx correspondents, research stated, "Lifelong immunosuppressive therapy is essential to prevent allograft rejection in transplant recipients. Long-term, nonspecific immunosuppression can, however, result in life-threatening complications and fail to prevent chronic graft rejection."

Our news editors obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Bone marrow (BM)-derived multipotent mesenchymal stromal cells (MSCs) have emerged as a potential candidate for cell-based therapy to modulate the immune response in organ transplantation. These cells can repair tissue after injury and downregulate many of the effector functions of immune cells that participate in the alloimmune response, converting them into regulatory cells. The findings of preclinical and initial clinical studies support the potential tolerance-inducing effects of MSCs and highlight the unanticipated complexity of MSC therapy in kidney transplantation. In animal models of transplantation MSCs promote donor-specific tolerance through the generation of regulatory T cells and antigen-presenting cells. In some settings, however, MSCs can acquire proinflammatory properties and contribute to allograft dysfunction. The available data from small clinical studies suggest that cell infusion is safe and well tolerated by kidney transplant recipients. Ongoing and future trials will provide evidence regarding the long-term safety of MSC therapy and determine the optimum cell source (either autologous or allogeneic) and infusion protocol to achieve operational tolerance in kidney transplant recipients."

According to the news editors, the research concluded: "These studies will also provide additional evidence regarding the risks and benefits of MSC infusion and will hopefully offer definitive answers to the important questions of when, where, how many and which types of MSCs should be infused to fully exploit their immunomodulatory, pro-tolerogenic and tissue-repairing properties."

For more information on this research see: Mesenchymal stromal cells in renal

The news editors report that additional information may be obtained by contacting F. Casiraghi, IRCCS - Istituto di Ricerche Farmacologiche Mario Negri, Transplant Research Center Chiara Cucchi de Alessandri e Gilberto Crespi, Via GB Camozzi 3, 24020 Ranica, Bergamo, Italy. Transplant Medicine - Kidney Transplants

**New Kidney Transplants Study Findings Have Been Reported by Investigators at Department of Nephrology (Hepatitis C Treatment With Direct-Acting Antivirals in Kidney Transplant: Preliminary Results From a Multicenter Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Transplant Medicine - Kidney Transplants. According to news reporting from Seville, Spain, by NewsRx journalists, research stated, "Hepatitis C (HC) is a very relevant negative prognosis factor for graft and transplant recipient survival. New direct-acting antivirals (DAAs) allow us to solve this problem in an effective way."

The news correspondents obtained a quote from the research from the Department of Nephrology, "It is crucial to understand their real impact in our daily practice. We analyzed treatment results with DAA, free of interferon, in kidney transplant recipients (KTRs) from 15 Spanish hospitals (Grupo Espanol de Actualizacion en Trasplante), regarding effectiveness, tolerance, and impact on immunosuppression, renal function-proteinuria, and diabetes. One hundred nineteen KTRs were included (9 combined liver-kidney transplants). The main DAA used was sofosbuvir (91%) combined with ledipasvir (55%), simeprevir (14%), or daclatasvir (13%); in 9 cases (7%), a paritaprevir-ritonavir-ombitasvir-dasabuvir combination (3D) was used; Ribavirin was used as a coadjuvant in 18%. Side effects were limited (23.5%) and without relevance in general, except in 7 patients for whom we needed to interrupt the treatment due to neurotoxicity (1) caused by drug interaction (3D and tacrolimus) or anemia (3) by Ribavirin or others. Ninety-four patients had completed the treatment when data were analyzed: virological response was seen in 97.8% % of cases. Liver function analysis improved: 84% normal versus 21% before starting the treatment (P < .001). Renal function and proteinuria did not change. Tacrolimus level at the end of DAA-treatment was significantly lower with respect to the beginning (5.8 +/- 2.1 ng/mL vs. 7.4 +/- 1.8 ng/mL, P = .03), despite a slight increase in the dose (2.6 mg/d vs. 2.3 mg/d, P = .17). DAA are highly effective in the treatment of hepatitis C in
KTRs with good tolerance in general, making it possible to solve the problem and have a good chance to improve the prognosis in our transplantation patients."

According to the news reporters, the research concluded: "The use of these therapies in KTRs requires special control and coordination with digestive professionals, especially if 3D or Ribavirin is used."

Our news journalists report that additional information may be obtained by contacting C. Gonzalez-Corvillo, Hosp Virgen Del Rocío, Dept. of Nephrol, Seville, Spain. Additional authors for this research include C. Gonzalez-Corvillo, M. Perello, S. Zarraga, C. Jimenez-Martín, L.R. Lauzurica, A. Alonso, A. Franco, D. Hernandez-Marrero and A. Sanchez-Fructuoso.

**Transplant Medicine - Kidney Transplants**

**New Kidney Transplants Study Results from University Medical Center Described (A high intrapatient variability in tacrolimus exposure is associated with poor long-term outcome of kidney transplantation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Transplant Medicine - Kidney Transplants are discussed in a new report. According to news originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "Tacrolimus is a critical dose drug with a considerable intrapatient variability (IPV) in its pharmacokinetics. We investigated whether a high IPV in tacrolimus exposure is associated with adverse long-term renal transplantation outcomes."

Financial support for this research came from Chiesi Farmaceutici.

Our news journalists obtained a quote from the research from University Medical Center, "Tacrolimus IPV was calculated from predose concentrations measured between 6 and 12 months post-transplantation of 808 renal transplant recipients (RTRs) transplanted between 2000 and 2010. One hundred and eighty-eight (23.3%) patients reached the composite end point consisting of graft loss, late biopsy-proven rejection, transplant glomerulopathy, or doubling of serum creatinine concentration between month 12 and the last follow-up. The cumulative incidence of the composite end point was significantly higher in patients with high IPV than in patients with low IPV (hazard ratio: 1.41, 95% CI: 1.06-1.89; P = 0.019). After the adjustment for several factors, the higher incidence of the composite end point for RTRs with a high IPV remained statistically significant (hazard ratio: 1.42, 95% CI: 1.06-1.90; P = 0.019). Younger recipient age at transplantation, previous transplantation, worse graft function (at month 6 post-transplantation), and low mean tacrolimus concentration at 1 year post-transplantation were additional predictors for worse long-term transplant outcome."

According to the news editors, the research concluded: "A high tacrolimus IPV is an
independent risk factor for adverse kidney transplant outcomes that can be used as an easy monitoring tool to help identify high-risk RTRs."

The news correspondents report that additional information may be obtained from N. Shuker, University Medical Center, Dept. of Hosp Pharm, Erasmus MC, Rotterdam, Netherlands. Additional authors for this research include L. Shuker, J. van Rosmalen, J.I. Roodnat, L.C.P. Borra, W. Weimar, D.A. Hesselink and T. van Gelder.

Gram-Negative Bacteria - Klebsiella

New Klebsiella Data Have Been Reported by Investigators at Federal University (Outbreaks of colistin-resistant and colistin-susceptible KPC-producing Klebsiella pneumoniae in a Brazilian intensive care unit)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Klebsiella have been published. According to news reporting originating in Uberlandia, Brazil, by NewsRx journalists, research stated, "Carbapenem-resistant Enterobacteriaceae (CRE), especially those that produce Klebsiella pneumoniae carbapenemase (KPC) and are associated with colistin resistance, pose a severe health threat due to the limited treatment options. To describe two outbreaks of KPC-producing K. pneumoniae in an adult intensive care unit (AICU) in Brazil."

The news reporters obtained a quote from the research from Federal University. "In May 2015, 14 patients had colistin-susceptible KPC-producing strains (ColS-KPC), and in July 2015, nine patients had colistin-resistant KPC-producing strains (ColR-KPC). Between September 2014 and August 2015, we performed surveillance at a university hospital and all CRE were tested for blaKPC genes. Clonality was investigated by pulsed-field gel electrophoresis. Resistance to colistin was confirmed by broth microdilution method. Consumption of carbapenems and colistin was expressed as defined daily doses. In all, 111 patients with CRE were identified during the surveillance period; K. pneumoniae was the major isolate (77.13%). The two outbreaks were identified when infection rates (KPC per 1000 patient-days) exceeded the background level. Rates of carbapenem and colistin consumption were high. Control measures (bedside alcohol gel, contact precautions, regular rectal swabs) did not curtail the outbreaks. Mortality rates were 42.9% and 44.4% for ColS-KPC- and ColR-KPC-
infected patients, respectively. After the death of four infected patients with CoIR-KPC, the unit was closed to new admissions. Our experience demonstrates the serious risks presented by KPC, and especially CoIR-KPC, in Brazilian AICUs."

According to the news reporters, the research concluded: "Selective pressure from excessive antibiotic use and transmission on healthcare workers' hands were likely the major factors in transmission."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jhin.2016.08.019. This DOI is a link to an online electronic document that is either free or for purchase.

Gram-Negative Bacteria - Klebsiella

New Klebsiella Study Findings Recently Were Reported by Researchers at Oswaldo Cruz Institute (mgrB Mutations Mediating Polymyxin B Resistance in Klebsiella pneumoniae Isolates from Rectal Surveillance Swabs in Brazil)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Gram-Negative Bacteria - Klebsiella is the subject of a report. According to news reporting originating in Rio de Janeiro, Brazil, by NewsRx journalists, research stated, "We aimed to investigate polymyxin B (PMB) resistance and its molecular mechanisms in 126 Klebsiella pneumoniae isolates from rectal swabs in Brazil."

Financial supporters for this research include MCTI | Conselho Nacional de Desenvolvimento Cientifico e Tecnologico (CNPq), PAPES/Oswaldo Cruz Institute (IOC-FIOCRUZ), Fundacao Carlos Chagas Filho de Amparo a Pesquisa do Estado do Rio de Janeiro (FAPERJ).

The news reporters obtained a quote from the research from Oswaldo Cruz Institute, "Ten isolates exhibited PMB resistance with interruption of mgrB gene by insertion sequences or missense mutations. Most of the PMB-resistant isolates harbored bla(KPC-2) (n = 8) and
belonged to clonal complex 258 (CC258) (n = 7)."

According to the news reporters, the research concluded: "These results highlight the importance of monitoring the spread of polymyxin-resistant bacteria in hospitals, since few options remain to treat multidrug-resistant isolates."

For more information on this research see: mgrB Mutations Mediating Polymyxin B Resistance in Klebsiella pneumoniae Isolates from Rectal Surveillance Swabs in Brazil. Antimicrobial Agents and Chemotherapy, 2016;60(11):6969-6972. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting M.D. Asensi, Fiocruz MS, Inst Oswaldo Cruz, Lab Pesquisa Infeccao Hosp LAPIH, Rio De Janeiro, Brazil. Additional authors for this research include P.S. Pereira, M.D. Asensi and A.P.D. Carvalho-Assef.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AAC.01456-16. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Laryngeal Cancer

New Laryngeal Cancer Study Findings Have Been Reported by Investigators at University of California (Prognostic significance of p16 in squamous cell carcinoma of the larynx and hypopharynx)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Laryngeal Cancer have been presented. According to news reporting originating from Los Angeles, California, by NewsRx correspondents, research stated, "To evaluate the prognostic significance of p16 expression among patients with squamous cell carcinoma of the larynx (LSCC) and hypopharynx (HSCC). The medical records of all patients with locally advanced, non-metastatic LSCC/ HSCC were reviewed. p16(INK4A) (p16) protein expression was evaluated on pathological specimens by immunohistochemistry (IHC), and the Kaplan Meier method was used to estimate overall survival (OS) and locoregional control (LRC)."

Our news editors obtained a quote from the research from the University of California, "In select cases, p16 expression was correlated to high-risk and low-risk HPV genotypes using in situ hybridization (ISH). Thirty-one patients (23 LSCC; 8 HSCC) were identified. Seventeen (54.8%) patients were p16 negative; 14 (45.2%) were p16-positive. The primary treatment modality was radiation therapy for 22 (71.0%) patients and surgery for 9 (29.0%). Nineteen (61.3%) patients were evaluated for high-risk HPV and low-risk HPV genotypes by IHC, of whom 2 (10.5%) patients were positive for high-risk HPV and 1 (5.3%)
was positive for low-risk HPV. For high risk HPV, the positive predictive value (PPV), sensitivity, and specificity of p16 was 20.0%, 100%, and 52.9%. There was no significant difference in the 2-year actuarial rates of OS (91% vs. 64%, p = 0.34) or LRC (51% vs. 46%, p = 0.69) between the p16-positive and p-16 negative patients. In this small cohort of 31 LSCC and HSCC patients, p16 was not a significant predictive of either LRC or OS.

According to the news editors, the research concluded: "Furthermore, p16 was poorly correlated with HPV genotyping as identified by ISH."

The news editors report that additional information may be obtained by contacting A.M. Chen, University of California, David Geffen Sch Med, Dept. of Radiat Oncol, Los Angeles, CA 90024, United States. Additional authors for this research include P.C. Wang, R. Chin, M.S. John, E. Abemayor, S. Bhuta and A.M. Chen.

Heart Disorders and Diseases - Left Ventricular...  

New Left Ventricular Dysfunction Findings from Rovigo General Hospital Described (ECG parameters predict left ventricular conduction delay in patients with left ventricular dysfunction)  

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Left Ventricular Dysfunction have been published. According to news reporting originating from Rovigo, Italy, by NewsRx correspondents, research stated, "Estimating left ventricular electrical delay (Q-LV) from a 12-lead ECG may be important in evaluating cardiac resynchronization therapy (CRT). The purpose of this study was to assess the impact of Q-LV interval on ECG configuration."

Our news editors obtained a quote from the research from Rovigo General Hospital, "One hundred ninety-two consecutive patients undergoing CRT implantation were divided electrocardiographically into 3 groups: left bundle branch block (LBBB), right bundle branch block (RBBB), and nonspecific intraventricular conduction delay (IVCD). The IVCD group was further subdivided into 81 patients with left (L)-IVCD and 15 patients with right ®-IVCD (resembling RBBB, but without S wave in leads I and aVL). The Q-LV interval in the different groups and the relationship between ECG parameters and the maximum Q-LV interval were analyzed. Patients with LBBB presented a long Q-LV interval (147.7 +/- 14.6 ms, all exceeding cutoff value of 110 ms), whereas RBBB patients presented a very short Q-LV interval (75.2 +/-
Patients with an IVCD displayed a wide range of Q-LV intervals. In L-IVCD, mid-QRS notching/slurring showed the strongest correlation with a longer Q-LV interval, followed, in decreasing order, by QRS duration >150 ms and intrinsicoid deflection >60 ms. Isolated mid-QRS notching/slurring predicted Q-LV interval >110 ms in 68% of patients. The R-IVCD group presented an unexpectedly longer Q-LV interval (127.0 +/- 12.5 ms; 13/15 patients had Q-LV >110 ms). Patients with LBBB have a very prolonged Q-LV interval. Mid-QRS notching in lateral leads strongly predicts a longer Q-LV interval in L-IVCD patients.

According to the news editors, the research concluded: "Patients with R-IVCD constitute a subgroup of patients with a long Q-LV interval."

For more information on this research see: ECG parameters predict left ventricular conduction delay in patients with left ventricular dysfunction. *Heart Rhythm*, 2016;13 (12):2289-2296. *Heart Rhythm* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Heart Rhythm - www.journals.elsevier.com/heart-rhythm/)

The news editors report that additional information may be obtained by contacting G. Pastore, Rovigo Gen Hosp, Dept. of Cardiol, Rovigo, Italy. Additional authors for this research include M. Maines, L. Marcantoni, F. Zanon, F. Noventa, G. Corbucci, E. Baracca, S. Aggio, C. Picariello, D. Lanza, G. Rigatelli, M. Carraro, L. Roncon and S.S. Barold.

**Leiomyosarcomas**

**Leiomyosarcomas Findings from University of Texas Discussed**

(Survival of patients with metastatic leiomyosarcoma: the MD Anderson Clinical Center for targeted therapy experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Leiomyosarcomas. According to news reporting originating in Houston, Texas, by Newsrx journalists, research stated, "Advanced stage leiomyosarcoma (LMS) is incurable with current systemic antitumor therapies. Therefore, there is clinical interest in exploring novel therapeutic regimens to treat LMS."

Financial support for this research came from National Natural Science Foundation of China.

The news reporters obtained a quote from the research from the University of Texas, "We reviewed the medical records of 75 consecutive patients with histologically confirmed metastatic LMS, who had been referred to the Clinical Center for Targeted Therapy at MD Anderson Cancer Center. To lay the foundation for potential phase I trials for the treatment of advanced LMS, we analyzed tumor response and survival outcome data. The frequent hotspot gene aberrations that we observed were the TP53 mutation (65%) and RB1 loss/mutation (45%)
detected by Sequenom or next-generation sequencing. Among patients treated with gene aberration-related phase I trial therapy, the median progression-free survival was 5.8 months and the median overall survival was 15.9 months, significantly better than in patients without therapy (1.9 months, $P = 0.001$; and 8.7 months, $P = 0.013$, respectively). Independent risk factors that predicted shorter overall survival included hemoglobin <10 g/dL, body mass index < 30 kg/m(2), serum albumin < 3.5 g/dL, and neutrophil above upper limit of normal. The median survivals were 19.9, 7.6, and 0.9 months for patients with 0, 1 or 2, and $\geq$ 3 of the above risk factors, respectively ($P < 0.001$). A prognostic scoring system that included four independent risk factors might predict survival in patients with metastatic LMS who were treated in a phase I trial."

According to the news reporters, the research concluded: "Gene aberration-related therapies led to significantly better clinical benefits, supporting that further exploration with novel mechanism-driven therapeutic regimens is warranted."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cam4.956. This DOI is a link to an online electronic document that is either free or for purchase.

**Leptospira**

**New Leptospira Study Results Reported from S.M. Faisal et al**

**[Leptospira surface adhesin (Lsa21) induces Toll like receptor 2 and 4 mediated inflammatory responses in macrophages]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Leptospira. According to news originating from Andhra Pradesh, India, by NewsRx correspondents, research stated, "Leptospirosis is zoonotic and emerging infectious disease of global importance. Little is understood about Leptospira pathogenesis and host immune response."

Our news journalists obtained a quote from the research, "In the present work we have investigated how Leptospira modulates the host innate immune response mediated by Toll-like receptors (TLRs) via surface exposed proteins. We screened Leptospira outer
membrane/surface proteins for their ability to activate/inhibit TLR2/4 signaling in HEK293 cell lines. Of these the 21 kDa Leptospira surface adhesin, Lsa21 had strong TLR2 and TLR4 activity leading to production of proinflammatory cytokines and expression of costimulatory molecules in mouse macrophages. This activity of Lsa21 on innate response was dependent on activation of mitogen activated protein kinases (MAPKs) via stimulating the rapid phosphorylation of p38, JNK and activation of transcription factor NF-kappa B. Additionally, neutralizing antibodies against TLR2 and TLR4 significantly inhibited cytokine secretion and attenuated Lsa21 induced phosphorylation of p38 and JNK. Furthermore, Lsa21 induced cytokine levels were significantly lower in TLR2(-/-) and TLR4(-/-) than in wild type mouse macrophage cell lines. Confocal microscopy and molecular docking confirmed that Lsa21 interacted with both TLR2 and TLR4."

According to the news editors, the research concluded: "These results indicate that Lsa21 is a potent TLR2 and TLR4 agonist that induces strong innate response and may play important role in Leptospira pathogenesis."

For more information on this research see: Leptospira surface adhesin (Lsa21) induces Toll like receptor 2 and 4 mediated inflammatory responses in macrophages. Scientific Reports, 2016;6():1-14. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Drugs and Therapies - Lercanidipine Therapy

New Lercanidipine Therapy Data Have Been Reported by Investigators at China Pharmaceutical University (Simultaneous Determination of a Fixed-Dose Combination of Lercanidipine and Valsartan in Human Plasma by LC-MS-MS: Application to a ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Lercanidipine Therapy. According to news originating from Nanjing, People's Republic of China, by NewsRx correspondents, research stated, "A simple, sensitive and reproducible liquid chromatography-electrospray ionization-tandem mass spectrometry (LC-MS-MS) method was developed and validated for the first time for simultaneous quantification of lercanidipine and valsartan in human plasma. The analytes were extracted by simple protein precipitation with acetonitrile and separated on a Hanbon Hedera ODS-2 C-18 (150 mmx 2.1 mm, 5 mu m) column."

Our news journalists obtained a quote from the research from China Pharmaceutical
University, "The mobile phase was composed of a mixture (53: 47, v/v) of acetonitrile and 10 mmol/L ammonium acetate containing 0.5% formic acid. The analytes were ionized by positive electrospray ion and detected in the multi-reaction monitoring mode with m/z 612.1 -> 280.2 for lercanidipine, m/z 436.0 -> 235.1 for valsartan and m/z 285.1 -> 193.1 for diazepam, the internal standard. The calibration curves obtained were linear over the concentration range of 0.01504-10.07 ng/mL for lercanidipine and 5.025-6,030 ng/mL for valsartan. The results of the intra-and inter-day precision studies were within the acceptance range. The recoveries of the analytes were in the range of 98-103%.

According to the news editors, the research concluded: "This method was successfully applied to the pharmacokinetic study of a novel fixed-dose combination of lercanidipine and valsartan formulation after an oral administration to healthy Chinese subjects."

For more information on this research see: Simultaneous Determination of a Fixed-Dose Combination of Lercanidipine and Valsartan in Human Plasma by LC-MS-MS: Application to a Pharmacokinetic Study. *Journal of Chromatographic Science, 2016;54* (9):1553-1559.

The news correspondents report that additional information may be obtained from L. Ding, China Pharmaceutical University, Dept. of Pharmaceut Anal, Nanjing 210009, People's Republic of China. Additional authors for this research include J.E. Agbokponto, R. Zhang, Q. Li and L. Ding.

**Neurodegenerative Diseases and Conditions - Lewy...**

**New Lewy Body Disease Data Have Been Reported by G. Perini and Co-Authors (Misidentification Delusions Prevalence in Different Types of Dementia and Validation of a Structured Questionnaire)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurodegenerative Diseases and Conditions - Lewy Body Disease are presented in a new report. According to news originating from Milan, Italy, by NewsRx correspondents, research stated, "Misidentification delusions (MDs) are considered relatively rare psychopathologic phenomena that may occur within the context of psychiatric or neurological conditions. The purpose of this study was to assess the prevalence of MD in different types of dementia, correlate the presence of MD with demographic and clinical variables, and validate a specific questionnaire."

Our news journalists obtained a quote from the research, "We examined 146 subjects with Alzheimer disease, 21 with Lewy body dementia, 6 with frontotemporal dementia, and 13 with vascular dementia (subcortical type), who were consecutively enrolled in the study from 2 Memory Clinics. Patients had a mean age of 78.7 +/- 6.4 years and an Mini-Mental State Examination average score of 16.9 +/- 6.1. The Neuropsychiatric Inventory delusion subscale
and a new Misidentification Delusion Questionnaire aimed at specific assessment of 11 delusional misidentification syndromes were administered to the caregivers. On the basis of the Neuropsychiatric Inventory, MDs were present in 33.3% of the subjects, whereas according to the Misidentification Delusion Questionnaire they were present in 36.0% of the subjects. Specifically, 34.2% of Alzheimer disease, 52.4% of Lewy body dementia, and 46.1% of vascular dementia patients experienced at least 1 MD. None of the patients with frontotemporal dementia developed MD. The most frequent MD was house misidentification, followed by splitting of people and reduplicative paramnesia.

According to the news editors, the research concluded: "Our self-administered questionnaire proved to be an accurate and specific tool for the detection of MD."

For more information on this research see: Misidentification Delusions Prevalence in Different Types of Dementia and Validation of a Structured Questionnaire. Alzheimer Disease & Associated Disorders, 2016;30(4):331-337. Alzheimer Disease & Associated Disorders can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Life Science Research

New Life Science Research Findings Has Been Reported by Researchers at Federal University (Monoconjugation of Human Amylin with Methylpolyethylene glycol)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Life Science Research is the subject of a report. According to news reporting originating in Rio de Janeiro, Brazil, by NewsRx journalists, research stated, "Amylin is a pancreatic hormone cosecreted with insulin that exerts unique roles in metabolism and glucose homeostasis. The therapeutic restoration of postprandial and basal amylin levels is highly desirable in diabetes mellitus."

The news reporters obtained a quote from the research from Federal University, "Protein conjugation with the biocompatible polymer polyethylene glycol (PEG) has been shown to extend the biological effects of biopharmaceuticals. We have designed a PEGylated human amylin by using the aminoreactive compound methoxylpolyethylene glycol succinimidyl carbonate (mPEGsc). The synthesis in organic solvent resulted in high yields of monoPEGylated human amylin, which showed large stability against aggregation, an 8 times increase in half-life in vivo compared to the non-conjugated amylin, and pharmacological activity as shown by
modulation of cAMP production in MCF-7 cell line, decrease in glucagon and modulation of
glycemia following subcutaneous administration in mice."

According to the news reporters, the research concluded: "Altogether these data
reveal the potential use of PEGylated human amylin for the restoration of fasting amylin levels."

For more information on this research see: Monoconjugation of Human Amylin with
Methylpolyethyleneglycol. Plos One, 2015;10(10):e0138803. (Public Library of Science -

**New Lipid Metabolism Disorders Findings from University of Manitoba Discussed (HNF-4 alpha regulated miR-122 contributes to development of gluconeogenesis and lipid metabolism disorders in Type 2 diabetic mice and in palmitate-treated HepG2 ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness &
Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and
Conditions - Lipid Metabolism Disorders. According to news reporting out of Winnipeg,
Canada, by NewsRx editors, research stated, "Hepatocyte Nuclear Factor-4 alpha (HNF-4 alpha)
is a key nuclear receptor protein required for liver development. miR-122 is a predominant
microRNA expressed in liver and is involved in the regulation of cholesterol and fatty acid
metabolism. HNF-4 alpha is know to regulate expression of miR-122 in liver."

Our news journalists obtained a quote from the research from the University of
Manitoba, "We examined how HNF-4 alpha regulated gluconeogenesis and lipid metabolism
through miR-122 in vivo and in vitro. Expression of miR-122, HNF-4 alpha,
phosphoeneolpyruvate carboxykinase (PEPCK), glucose-6-phosphatase (G6Pase), sterol response
elementary binding protein-1 (SREBP-1), fatty acid synthase-1 (FAS-1), carnitine
palmitoyltransferase-1 (CPT-1) and acetyl Coenzyme A carboxylase alpha (ACCoC) were
determined in livers of Type 2 diabetic mice and in insulin resistant palmitate-treated HepG2
cells. CPT-1 and phosphorylated ACCoC expression were significantly decreased in livers of
Type 2 diabetic mice and in palmitate-treated HepG2 cells compared to controls. In contrast,
expression of miR-122, HNF-4 alpha, PEPCK, G6Pase, SREBP-1, FAS-1 and ACCoC were
significantly elevated in liver of Type 2 diabetic mice and in palmitate-treated HepG2 cells
compared to controls. Expression of HNF-4 alpha increased whereas siRNA knockdown of
HNF-4 alpha decreased miR-122 levels in HepG2 cells compared to controls. In addition,
extension of HNF-4 alpha in HepG2 cells increased PEPCK, G6Pase, SREBP-1, FAS-1,
ACCoc mRNA and protein expression and decreased CPT-1 and p-ACCoc mRNA and protein expression compared to controls. Addition of miR-122 inhibitors attenuated the HNF-4 alpha mediated effect on expression of these gluconeogenic and lipid metabolism proteins."

According to the news editors, the research concluded: "The results indicate that HNF-4 alpha regulated miR-122 contributes to development of the gluconeogenic and lipid metabolism alterations observed in Type 2 diabetic mice and in palmitate-treated HepG2 cells."

For more information on this research see: HNF-4 alpha regulated miR-122 contributes to development of gluconeogenesis and lipid metabolism disorders in Type 2 diabetic mice and in palmitate-treated HepG2 cells. European Journal of Pharmacology, 2016;791():254-263. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; European Journal of Pharmacology - www.journals.elsevier.com/european-journal-of-pharmacology/)

Lipid Research

New Lipid Research Study Findings Have Been Reported by Investigators at Linkoping University (Alterations in high-density lipoprotein proteome and function associated with persistent organic pollutants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lipid Research. According to news reporting out of Linkoping, Sweden, by NewsRx editors, research stated, "There is a growing body of evidence that persistent organic pollutants (POPs) may increase the risk for cardiovascular disease (CVD), but the mechanisms remain unclear. High-density lipoprotein (HDL) acts protective against CVD by different processes, and we have earlier found that HDL from subjects with CVD contains higher levels of POPs than healthy controls."

Financial support for this research came from Research Council of Southeast Sweden.

Our news journalists obtained a quote from the research from Linkoping University, "In the present study, we have expanded analyses on the same individuals living in a contaminated community and investigated the relationship between the HDL POP levels and protein composition/ function. HDL from 17 subjects was isolated by ultracentrifugation. HDL protein composition, using nanoliquid chromatography tandemmass spectrometry, and antioxidant activity were analyzed. The associations of 16 POPs, including polychlorinated biphenyls (PCBs) and organochlorine pesticides, with HDL proteins/functions were investigated by partial least square and multiple linear regression analysis. Proteomic analyses identified 118
HDL proteins, of which ten were significantly (p < 0.05) and positively associated with the combined level of POPs or with highly chlorinated PCB congeners. Among these, cholesteryl ester transfer protein and phospholipid transfer protein, as well as the inflammatory marker serum amyloid A, were found. The serum paraoxonase/arylesterase 1 activity was inversely associated with POPs. Pathway analysis demonstrated that up-regulated proteins were associated with biological processes involving lipoprotein metabolism, while down-regulated proteins were associated with processes such as negative regulation of proteinases, acute phase response, platelet degranulation, and complement activation. These results indicate an association between POP levels, especially highly chlorinated PCBs, and HDL protein alterations that may result in a less functional particle. Further studies are needed to determine causality and the importance of other environmental factors."

According to the news editors, the research concluded: "Nevertheless, this study provides a first insight into a possible link between exposure to POPs and risk of CVD."

Our news journalists report that additional information may be obtained by contacting S.A. Ljunggren, Linkoping University, Dept. of Clin & Expt Med, Occupat & Environm Med Center, Linkoping, Sweden. Additional authors for this research include I. Helmfrid, U. Norinder, M. Fredriksson, G. Wingren, H. Karlsson and M. Lindahl.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.envint.2016.11.008. This DOI is a link to an online electronic document that is either free or for purchase.

**Lipid Research**

**New Lipid Research Study Findings Have Been Reported by Researchers at Quebec Heart and Lung Institute (Coronary atheroma progression rates in men and women following high-intensity statin therapy: A pooled analysis of REVERSAL, ASTEROID and ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lipid Research have been presented. According to news reporting originating from Quebec City, Canada, by NewsRx correspondents, research stated, "High-intensity statin therapy (HIST) reduces cardiovascular events, however, sex-related differences in treatment effects are not well characterized. A patient-level post hoc pooled analysis of 3 randomized trials utilizing serial coronary intravascular ultrasound was undertaken, testing the anti-atherosclerotic effects of HIST in coronary disease patients."

Our news editors obtained a quote from the research from Quebec Heart and Lung
Institute, "Sex-related differences in changes (Delta) in coronary percent atheroma volume (PAV) were ascertained following 18-24 months of HIST (atorvastatin 80 mg or rosuvastatin 40 mg daily), and further characterized according to on-treatment lipid and lipoprotein levels. In women (n = 451) compared with men (n = 1190), on-treatment levels of LDL-C (68 +/- 24 vs. 67 +/- 22 mg/dl, p = 0.62) and apoB (77 +/- 23 vs. 76 +/- 20 mg/dl, p = 0.51) were similar; levels of HDL-C (53 +/- 12 vs. 47 +/- 11 mg/dl, p< 0.001), apoA1 (154 +/- 26 vs. 140 +/- 24 mg/dl, p< 0.001), triglycerides [122 (95, 158) vs. 114 (89, 154) mg/dl, p = 0.012] and CRP [1.7 (0.9, 3.8) vs. 1.1 (0.6, 2.7) mg/l, p< 0.001] were higher; while the total cholesterol/HDL-C (TC/HDL-C) ratio was lower (2.9 +/- 0.8 vs. 3.1 +/- 0.8, p< 0.001). Compared with men, women harbored significantly lower baseline PAV (34.8 +/- 8.7 vs. 38.3 +/- 8.8%, p< 0.001), yet demonstrated significantly greater PAV regression (Delta PAV -1.07 +/- 0.26 vs. -0.66 +/- 0.23%, p = 0.02). When achieved on-treatment levels of LDL-C were <64 mg/dl, apoB <73 mg/dl, non-HDL-C < 88.8 mg/dl, and TC/HDL-C < 2.99, women demonstrated significantly greater PAV regression than men. Multivariable analysis revealed female sex to independently associate with PAV regression (coefficient -0.66, p = 0.02).

According to the news editors, the research concluded: "Women demonstrate greater degrees of coronary plaque regression compared with men following long-term HIST, especially in the setting of lower achieved atherogenic lipoprotein levels."

For more information on this research see: Coronary atheroma progression rates in men and women following high-intensity statin therapy: A pooled analysis of REVERSAL, ASTEROID and SATURN. The news correspondents obtained a quote from the research from Veterans Affairs Medical Center, "It is been difficult to verify this in population studies because of confounding factors. Nonetheless, meta-analysis of controlled studies documents a cholesterol-raising action of dietary cholesterol. Most of this effect occurs in low-density lipoproteins (LDLs), but the cholesterol content of other lipoproteins can be increased as well. Moreover, population studies strongly suggest that dietary cholesterol is atherogenic beyond any rise in LDL concentrations. It must be emphasized that dietary cholesterol is only one of several dietary factors influencing serum cholesterol levels. Others include saturated fatty acids, trans fatty acids, soluble fiber, and total caloric intake. To achieve substantial serum cholesterol lowering, favorable changes in all of these factors must be combined. To maximize cardiovascular risk reduction, a lifetime of a healthy diet is needed. Reduced cholesterol intake is only one of several factors required to achieve such a diet. In addition, reduction of cholesterol absorption can enhance serum cholesterol lowering. This can be attained by the addition of plant sterols or plant stanols to the diet or by use of ezetimibe, a cholesterol absorption blocker."

According to the news reporters, the research concluded: "By combining dietary cholesterol reduction with other cholesterol-lowering modalities, it should be possible to substantially reduce atherosclerosis throughout life short of using cholesterol-lowering drugs that act systemically."

For more information on this research see: Does Dietary Cholesterol Matter? *Current Atherosclerosis Reports*, 2016;18(11):48-54. *Current Atherosclerosis Reports* can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. **Nutritional and Metabolic Diseases and Conditions -**

**New Lipodystrophy Findings from University of Leipzig Discussed (Progranulin is increased in human and murine lipodystrophy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Lipodystrophy have been presented. According to news reporting originating from Leipzig, Germany, by NewsRx correspondents, research stated, "Lipodystrophies (LD) are genetic or acquired disorders sharing the symptom of partial or complete adipose tissue deficiency and a dysregulation of adipokines including leptin and adiponectin. Progranulin, an adipokine with proinflammatory and insulin resistance-inducing characteristics, has not been investigated in LD so far."

Our news editors obtained a quote from the research from the University of Leipzig, "Circulating progranulin was determined in LD patients (N = 37) and in age-, gender-, and body mass index-matched healthy control subjects (N = 37). Additionally, we investigated progranulin expression in an LD mouse model as compared to wild-type mice. Moreover, we
elucidated circulating progranulin before and during metreleptin supplementation in 10 patients with LD. Median [interquartile range] circulating progranulin was increased in patients with LD (82.9 [25.9] µg/l) as compared to controls (73.6 [22.8] µg/l) (p = 0.005). C-reactive protein (CRP) remained an independent and positive predictor of progranulin in multivariate analysis. Progranulin mRNA was significantly upregulated in all adipose tissue depots, i.e. visceral, subcutaneous, and brown adipose tissue, and in muscle of LD animals versus wild-type mice. Progranulin levels did not significantly change during metreleptin supplementation. Progranulin serum concentration is increased in patients with LD, and shows an independent and positive correlation with CRP."

According to the news editors, the research concluded: "Different adipose tissue depots and muscle might be potential origins of elevated progranulin."

For more information on this research see: Progranulin is increased in human and murine lipodystrophy. *Diabetes Research and Clinical Practice*, 2016;120():1-7. *Diabetes Research and Clinical Practice* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Oncology - Liposarcomas**

**New Liposarcomas Study Findings Reported from General Hospital (Liposarcoma scroti: a rare paratesticular tumor)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liposarcomas. According to news reporting originating from Turnhout, Belgium, by NewsRx correspondents, research stated, "Paratesticular liposarcoma is a rare condition characterized by a growing, painless inguinal, or scrotal mass. To our knowledge, less than 200 cases worldwide are reported thus far."

Our news editors obtained a quote from the research from General Hospital, "It is characterized by slow growth and can reach large dimensions at diagnosis. Paratesticular well-differentiated liposarcoma has a prolonged clinical course with recurrences in more than half the cases, sometimes late. Regardless of tumor size, radical orchidectomy with free surgical margins is recommended in order to avoid recurrence. When there is tumor recurrence, reoperation is the treatment of choice because radio-and chemotherapy have yet to be well established in these cases. There is a low risk of metastasis. Overall prognosis is good. Adjuvant therapies,
represented by radio-and chemotherapy, have a controversial role in the literature due to the rarity of the disease."

According to the news editors, the research concluded: "In this article, we present a review of the literature and case discussion of paratesticular liposarcoma with focus on diagnosis, treatment and follow-up."

The news editors report that additional information may be obtained by contacting C. Schoonjans, Gen Hosp Turnhout, Dept. of Gen Surg, Turnhout, Belgium. Additional authors for this research include D. Servaes and M. Bronckaers.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1080/00015458.2016.1139939. This DOI is a link to an online electronic document that is either free or for purchase.

Biotechnology - Liposomes

**New Liposomes Study Findings Reported from Nagoya University (Septin Interferes with the Temperature-Dependent Domain Formation and Disappearance of Lipid Bilayer Membranes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Biotechnology - Liposomes is now available. According to news reporting originating in Nagoya, Japan, by NewsRx journalists, research stated, "Domain formation or compartmentalization in a lipid bilayer membrane has been thought to take place dynamically in cell membranes and play important roles in the spatiotemporal regulation of their physiological functions. In addition, the membrane skeleton, which is a protein assembly beneath the cell membrane, also regulates the properties as well as the morphology of membranes because of its role as a diffusion barrier against constitutive molecules of the membrane or as a scaffold for physiological reactions."

Financial supporters for this research include Ministry of Education, Culture, Sports, Science, and Technology, Japan Society for the Promotion of Science.

The news reporters obtained a quote from the research from Nagoya University, "Therefore, it is important to study the relationship between lipid bilayer membranes and proteins that form the membrane skeleton. Among cytoskeletal systems, septin is unique because it forms arrays on liposomes that contain phosphoinositides, and this property is thought to contribute to the formation of the annulus in sperm flagellum. In this study, a supported lipid bilayer (SLB) was used to investigate the effect of septin on lipid bilayers because SLBs rather than liposomes are suitable for observation of the membrane domains formed. We found that SLBs containing phosphatidylinositol (PI) reversibly form domains by decreasing the temperature and that septin affects both the formation and the disappearance of the cooling-induced domain. Septin inhibits the growth of cooling-induced domains during decreases in temperature and inhibits the dispersion and the disappearance of those domains during increases..."
According to the news reporters, the research concluded: "These results indicate that septin complexes, i.e., filaments or oligomers assembling on the surface of lipid bilayer membranes, can regulate the dynamics of domain formation via their behavior as an anchor for PI molecules."

Our news correspondents report that additional information may be obtained by contacting K. Takiguchi, Nagoya University, Struct Biol Res Center, Nagoya, Aichi 4648601, Japan. Additional authors for this research include T. Isogai, R. Tero, Y. Tanaka-Takiguchi, T. Ujihara, M. Kinoshita and K. Takiguchi.

**Oncology - Liver Cancer**

**New Liver Cancer Data Have Been Reported by Investigators at Henan University (MicroRNA-27b exerts an oncogenic function by targeting Fbxw7 in human hepatocellular carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news originating from Kaifeng, People's Republic of China, by NewsRx correspondents, research stated, "Aberrant expression of microRNAs (miRNAs) plays fundamental effect on the pathogenesis of hepatocellular carcinoma (HCC). MiR-27b was previously found to play important roles in human cancers."

Our news journalists obtained a quote from the research from Henan University, "However, its expression status, clinical significance, and biological functions in HCC remain largely unclear. The expression status of miR-27b in HCC specimens and cells were determined with qRT-PCR. MTT, 5-bromodeoxyuridine (BrdU) proliferation assays, and flow cytometry analysis were carried out to assay proliferation, cell cycle, and apoptosis. A subcutaneous model was used to evaluated the HCC tumor growth in vivo. The putative target gene of miR-27b was disclosed by TargetScan and a luciferase reporter assay. The levels of miR-27b were overexpressed in HCC. Overexpression of miR-27b was correlated with adverse prognostic features and reduced survival rate. Inhibition of miR-27b in SMMC-7721 cells remarkably suppressed proliferative ability and cell-cycle progression while enhanced apoptosis. In contrast, miR-27b overexpression resulted in prominent increased proliferation and process of cell cycle and reduced apoptosis of Hep3B cells. In vivo studies showed that knockdown of miR-27b inhibited the in vivo growth of SMMC-7721 cells in mouse xenograft model. Furthermore, we
confirmed that Fbxw7 was directly regulated by miR-27b and mediated the roles of miR-27b in HCC.

According to the news editors, the research concluded: "We suggest that miR-27b serves as an oncogenic miRNA in HCC by modulating proliferation, cell-cycle progression, and apoptosis, and its oncogenic effect is mediated by its downstream target gene, Fbxw7."

For more information on this research see: MicroRNA-27b exerts an oncogenic function by targeting Fbxw7 in human hepatocellular carcinoma. Tumor Biology, 2016;37 (11):15325-15332. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

The news correspondents report that additional information may be obtained from Q.X. Ge, Henan Univ, Huaihe Hosp, Dept. of Gastroenterol, Kaifeng 475000, Henan Province, People's Republic of China. Additional authors for this research include J.P. Sun, H.T. Hou, K. Li, X. Liu and Q.X. Ge.

Oncology - Liver Cancer

New Liver Cancer Data Have Been Reported by Researchers at Xi'an Jiaotong University (MicroRNA-519a promotes tumor growth by targeting PTEN/PI3K/AKT signaling in hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news reporting out of Shaanxi, People's Republic of China, by NewsRx editors, research stated, "MicroRNAs (miRNAs) have been found to play fundamental roles in the pathogenesis of hepatocellular carcinoma (HCC). Previous miRNA array data showed that miR-519a was upregulated in HCC tissues compared to adjacent non-tumor tissues."

Our news journalists obtained a quote from the research from Xi'an Jiaotong University, "However, the functional role of miR-519a in HCC remains unexplored. In this study, we demonstrated that the expression of miR-519a was elevated in both HCC tissues and cell lines. Clinical association analysis revealed that high expression of miR-519a was correlated with adverse clinicopathological characteristics including large tumor size, high Edmondson-Steiner grading, advanced tumor-node-metastasis (TNM) tumor stage and venous infiltration. Furthermore, high expression of miR-519a conferred a reduced 5-year overall survival and disease-free survival of HCC patients. Moreover, we disclosed that miR-519a overexpression promoted, but miR-519a silencing reduced, HCC cell proliferation and cell cycle progression in vitro. Notably, we identified phosphatase and tensin homolog (PTEN) as a direct downstream target and functional mediator of miR-519a in HCC cells. Mechanistically, phosphatidylinositol-3-OH kinase (PI3K)/AKT pathway, downstream of PTEN, is essential for the functional roles of miR-519a in HCC cells."
According to the news editors, the research concluded: "Our results indicate that miR-519a promotes tumor growth of HCC by targeting PTEN-mediated PI3K/AKT pathway, and potentially serves as a novel prognostic biomarker and therapeutic target for HCC."

Our news journalists report that additional information may be obtained by contacting K. Tu, Dept. of Hepatobiliary Surgery, the First Affiliated Hospital of Xi’an Jiaotong University, Xi’an, Shaanxi 710061, People’s Republic of China. Additional authors for this research include Z. Liu, B. Yao, S. Han and W. Yang.

Oncology - Liver Cancer

New Liver Cancer Findings Has Been Reported by Investigators at Pusan National University (Development and Applicability of the A-P 200 Criteria for Liver Transplantation for Hepatocellular Carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Liver Cancer is the subject of a report. According to news reporting out of Yangsan, South Korea, by NewsRx editors, research stated, "The Milan criteria are widely accepted for indicating liver transplantation in patients with hepatocellular carcinoma (HCC). However, a 7% to 20% possibility of HCC recurrence remains, even among patients who fulfill the Milan criteria."

Our news journalists obtained a quote from the research from Pusan National University, "We retrospectively reviewed 88 patients with HCC who underwent liver transplantation at Pusan National University Yangsan Hospital between May 2010 and December 2014. The risk factors for HCC recurrence were analyzed, and the overall survival and disease-free survival rates were calculated based on each risk factor. Seventeen patients (19.3%) experienced HCC recurrence. Multivariate analyses revealed that the independent risk factors for HCC recurrence were protein induced by vitamin K absence or antagonist II (PIVKA-II) levels of >200 mAU/mL, levels of >200 for alpha-fetoprotein (ng/mL) or PIVKA-II (mAU/mL), and microvascular invasion. Therefore, we defined the A-P 200 criteria as simultaneously exhibiting alpha-fetoprotein levels of <= 200 ng/mL and PIVKA-II levels of <= 200 mAU/mL. The 3-year overall survival rates among patients who fulfilled or exceeded the A-P 200 criteria were 89.2% and 80.0%, respectively (P = .79). The 3-year disease-free survival rates among patients who fulfilled or exceeded the A-P 200 criteria were 89.9% and 43.1%, respectively (P < .001). We also applied the A-P 200 criteria to patient data from another major center and observed similar results."

According to the news editors, the research concluded: "These findings confirm that the A-P 200 criteria can be used to predict recurrence after liver transplantation among patients
with HCC."

Our news journalists report that additional information may be obtained by contacting K. Yang, Pusan National University, yangsan Hosp, Res Inst Convergence Biomed Sci & Technol, Yangsan, South Korea. Additional authors for this research include T.B. Lee, B.H. Choi, Y.M. Park, J.H. Ryu, D.J. Joo and C.W. Chu.

**Oncology - Liver Cancer**

**New Liver Cancer Findings from University of Bologna Described (Length time bias in surveillance for hepatocellular carcinoma and how to avoid it)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting out of Bologna, Italy, by NewsRx editors, research stated, "Length time bias is a selection bias which can lead to an overestimation of survival of screening-detected cases caused by the relative excess of slower-growing tumors detected with respect to symptomatic cases. This leads to the incorrect perception that screening improves outcomes when it only selects tumors with a favorable biology."

Our news journalists obtained a quote from the research from the University of Bologna, "Data regarding this bias in surveillance for hepatocellular carcinoma (HCC) have never been provided. A semi-Markov model was developed to investigate this issue. An exponential tumor growth was applied. During its growth, tumor diagnosis 'at surveillance appointments' was made when tumor attained a size equal to or above the size of tumors diagnosed in surveilled patients obtained from pertinent published reports, or 'in-between appointments' (due to the development of symptoms) if tumor size attained the size of symptomatic diagnosis, derived from published reports; otherwise the tumor continued to grow until the time horizon had been reached. Tumor doubling time (DT) values were recorded according to the method of diagnosis. In a theoretical cohort of 1000 patients submitted to semiannual surveillance, 72.5% will be diagnosed at a surveillance appointment and 18% because of symptom development, although under surveillance. Patients diagnosed with HCC at a surveillance appointment had a median tumor DT of 100 days (interquartile range, 68-143
days), whereas those diagnosed because of symptoms had a median DT of 42 days (interquartile range, 29-58 days) although under surveillance."

According to the news editors, the research concluded: "The surveillance propensity to detect slower-growth tumors is relevant, and practical suggestions to minimize this bias in longitudinal studies are provided."

For more information on this research see: Length time bias in surveillance for hepatocellular carcinoma and how to avoid it. Hepatology Research, 2016;46(12):1275-1280. Hepatology Research can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Elsevier - www.elsevier.com; Hepatology Research - www.journals.elsevier.com/hepatology-research/)

Our news journalists report that additional information may be obtained by contacting A. Cucchetti, University of Bologna, Dept. of Med & Surg Sci, S Orsola Malpighi Hosp, Alma Mater Studiorum, Bologna, Italy. Additional authors for this research include F. Garuti, A.D. Pinna and F. Trevisani.

Keywords for this news article include: Bologna, Italy, Europe, Oncology, Diagnostics and Screening, Epidemiology, Liver Cancer, Carcinomas, University of Bologna.

Our news editors report that additional information may be obtained by contacting: 443 patients with HCV-related cirrhosis and Barcelona Clinic Liver Cancer Stage A/0 HCC who had a complete radiological response after curative resection or ablation. Active HCV infection was present in 328, selected from the Italian Liver Cancer group cohort; 58 patients had SVR achieved by IFN-free regimens after HCC cure, and 57 patients had SVR achieved by IFN-based regimens after HCC cure. Individual data of patients in the last two groups were extracted from available publications. TTR by Kaplan-Meier curve was significantly lower in patients with active HCV infection compared with those with SVR both by IFN-free (P = 0.02) and by IFN-based (P < 0.001) treatments. TTR was similar in patients with SVR by IFN-free or by IFN-based (P = 0.49) strategies."

According to the news editors, the research concluded: "In HCV-infected, successfully treated patients with early HCC, SVR obtained by IFN-based or IFN-free regimens significantly reduce tumour recurrence without differences related to the anti-viral strategy
used."

The news editors report that additional information may be obtained by contacting C. Camma, University of Palermo, Sect Gastroenterol, Palermo, Italy. Additional authors for this research include G. Cabibbo, M. Barbara, S. Attardo, L. Bucci, F. Farinati, E.G. Giannini, F. Tovoli, F. Ciccarese, G.L. Rapaccini, M. Di Marco, E. Caturelli, M. Zoli, F. Borzio, R. Sacco, R. Virdone, F. Marra, M. **Oncology - Liver Cancer**

**New Liver Cancer Study Findings Have Been Reported by Researchers at University of Illinois (Carotenoid Nanovector for Efficient Therapeutic Gene Knockdown of Transcription Factor FOXC1 in Liver Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news originating from Urbana, Illinois, by NewsRx correspondents, research stated, "Transcription factor FOXC1 has been implicated to play a critical role in hepatocellular carcinoma (HCC) progression, but targeting FOXC1 for therapeutic benefit remains a challenge owing to its location inside the cell nucleus. Herein we report successful therapeutic gene knockdown of transcription factor FOXC1 in liver cancer cells through efficient delivery of siFOXC1 using novel carotenoid functionalized dendritic nanoparticles (CDN)."

Financial supporters for this research include University of Illinois at Urbana-Champaign, Warren H. and Clara Cole Society.

Our news journalists obtained a quote from the research from the University of Illinois, "This delivery system also displayed a markedly reduced toxicity profile compared to a standard siRNA transfection agent. We were able to achieve ∼90% FOXC1 knockdown using the CDN-siFOXC1 complex."

According to the news editors, the research concluded: "Additionally, it was found to have ∼18% greater delivery efficiency compared to treatments with particles which have no carotenoid tagging, thereby emphasizing the role of carotenoid mediated cell internalization in the efficient delivery of CDN-siFOXC1 complex in liver cancer cells."

For more information on this research see: Carotenoid Nanovector for Efficient Therapeutic Gene Knockdown of Transcription Factor FOXC1 in Liver Cancer. *Bioconjugate
Oncology - Liver Cancer

New Liver Cancer Study Findings Have Been Reported by Researchers at Xiamen University (The preventative effect of Akt knockout on liver cancer through modulating NF-kB-regulated inflammation and Bad-related apoptosis signaling pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Liver Cancer. According to news reporting originating in Fujian, People's Republic of China, by NewsRx journalists, research stated, "Primary liver cancer is globally the sixth most frequent cancer, and the second leading cause of cancer death and its incidence is increasing in many countries, thus, becoming serious threat to human health. Substantial research has focused on the treatment and prevention of liver cancer."

The news reporters obtained a quote from the research from Xiamen University, "However, the underlying molecular mechanism of liver cancer are still not fully understood, and therefore development of treatments are delayed. Akt has been suggested to play an essential role in the progression of inflammation response and apoptosis. Hence, in the present study, Akt knockout mice and cell lines were used as a model to investigate the molecular mechanism of Akt-associated inflammatory and apoptotic signaling pathway with NF-kB and Bad in the progression of liver cancer. Western blotting, quantitative RT-PCR (qRT-PCR), immunohistochemistry, ELISA and flow cytometric analysis were used to determine the key signaling pathway in the development of liver cancer. The results indicated that, compared to the normal liver cells, the expression of Akt was significantly higher in liver cancer cell lines. In addition, Akt-knockout liver cancer cells showed lower Akt expression. we also, found that Akt-knockout cancer cell lines modulated inflammation response and apoptosis via inhibiting NF-kB expression and suppressing apoptotic activation. Our results indicated that the downstream signals, including cytokines regulated by NF-kB signaling pathway and caspase-3-activated apoptosis affected by Bad were downregulated for knockout of Akt. These findings demonstrated that Akt is related to NF-kB and Bad signaling pathway possibly playing a direct..."
According to the news reporters, the research concluded: "Thus, Akt might be an important and potential treatment choice for the clinical diagnosis and treatment in the future."

For more information on this research see: The preventative effect of Akt knockout on liver cancer through modulating NF-kB-regulated inflammation and Bad-related apoptosis signaling pathway. *International Journal of Oncology*, 2016;48(4):1467-76.

Our news correspondents report that additional information may be obtained by contacting B. Hu, Dept. of Laboratory Medicine, The First Affiliated Hospital of Xiamen University, Xiamen, Fujian 361003, People's Republic of China. Additional authors for this research include M. Sun, J. Oncology - Liver Cancer

New Liver Cancer Study Findings Recently Were Reported by Researchers at Department of Radiology (Hepatocellular carcinoma: modern image-guided therapies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting from Leeds, United Kingdom, by NewsRx journalists, research stated, "The most common primary malignancy of the liver and the third leading cause of cancer mortality worldwide is hepatocellular carcinoma (HCC), which presents a major global health problem due to its increasing incidence. Most cases of HCC are secondary to either infection (hepatitis B or C) or cirrhosis (alcohol being the most common cause)."

The news correspondents obtained a quote from the research from the Department of Radiology, "Clinical presentation is variable and the tumor can be an incidental finding. Treatment options for HCC and prognosis are dependent on many factors but most importantly tumor size and staging. The last two decades have revolutionised the treatment of HCC using image-guided techniques. The concepts of imaging and image-guided techniques are still young and not well described in standard textbooks and hence an up to date review article is essential. The clinical subspecialties may lack familiarity with image-guided techniques but are responsible for management of these patients before and after the treatment by interventional radiologists. This article reviews current image-guided techniques, evidence and outcomes and provides educational highlights and question and answers."

According to the news reporters, the research concluded: "The article provides an overview in a simple understandable manner to enable readers from various levels of practice and training to benefit from and apply in their practice."

For more information on this research see: Hepatocellular carcinoma: modern image-guided therapies. *Postgraduate Medical Journal*, 2016;92(1085):165-71. (BMJ Publishing Group - group.bmj.com; Postgraduate Medical Journal - pmj.bmj.com/)

Oncology - Liver Cancer

New Liver Cancer Study Findings Reported from Kirby Institute [Trends in hepatocellular carcinoma among people with HBV or HCV notification in Australia (2000-2014)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Liver Cancer have been presented. According to news reporting originating from Sydney, Australia, by NewsRx correspondents, research stated, "This study evaluates trends in hepatocellular carcinoma (HCC) among people with hepatitis B virus (HBV) or hepatitis C virus (HCV) infection in New South Wales (NSW), Australia between 2000 and 2014. Data on HBV and HCV notifications between January 1993 and December 2012 were linked to the NSW Admitted Patients Data Collection database between July 2000 and June 2014 and NSW Registry of Births Deaths and Marriages."

Our news editors obtained a quote from the research from Kirby Institute, "The burden, crude and age-standardised incidence of HCC based on first hospitalization were calculated. In NSW between 2000-2014, there were 54,399, 93,099 and 3,809 individuals notified with HBV, HCV and HBV/HCV coinfection respectively. There were 725 (1.3%) with HCC among those with HBV notification as compared to 1,309 with HCC (1.4%) in those with HCV notification. The population-level burden of new HCC cases per year has stabilised in the HBV cohort (53 in 2001 and 44 in 2013), but increased markedly in the HCV cohort (49 in 2001 to 151 in 2013). The age-standardised incidence rates of HCC (per 1,000 person-years) declined from 2.3 (95% confidence interval (CI) 1.4, 3.1) in 2001 to 0.9 (95% CI 0.6, 1.2) in 2012 among those with HBV and remained stable between 2001 (1.4; 95% CI 0.8, 1.9) and 2012 (1.5; 95% CI 1.2, 1.7) in those with HCV. Main factors associated with HCC in those with HBV included later study period (2005-2009; 2010-2014) (hazard ratio (HR)=0.54, 95% CI 0.42, 0.70), male gender (HR=4.50, 95% CI 3.6, 5.6), Asia-Pacific country of birth (HR=3.84, 95% CI 2.58, 5.71) and alcohol dependency (HR=2.84, 95% CI 1.95, 4.13). Main factors associated with HCC in those with HCV included male gender (HR=2.56, 95% CI 2.20, 2.98), rural place of residence (HR=0.73, 95% CI 0.62, 0.86), Asia-Pacific country of birth (HR=2.37, 95% CI 1.99, 2.82) and alcohol dependency (HR=3.90, 95% CI 3.39, 4.49). Individual-level risk of HBV-related HCC has declined, suggesting an impact of more effective antiviral therapy from mid-2000s. In contrast, the interferon-containing HCV treatment era had no impact on individual-level HCV-related HCC risk and has seen escalating population-level HCC burden. Lay summary: Individual-level risk of HBV-related HCC has declined, suggesting an impact of more effective antiviral therapy from mid-2000s."

According to the news editors, the research concluded: "In contrast, the interferon-
containing HCV treatment era had no impact on individual-level HCV-related HCC risk and has seen escalating population-level HCC burden."

The news editors report that additional information may be obtained by contacting R. Waziry, UNSW Australia, Kirby Inst, Sydney, NSW, Australia. Additional authors for this research include J. Grebely, J. Amin, M. Alavi, B. Hajarizadeh, J. George, G.V. Matthews, M. Law and G.J. Dore.

**Oncology - Liver Cancer**

**New Liver Cancer Study Results Reported from National Research Center (Relationship Between Serum microRNA155 and Telomerase Expression in Hepatocellular Carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Liver Cancer is now available. According to news reporting originating in Cairo, Egypt, by NewsRx journalists, research stated, "Activation of telomerase reverse transcriptase (hTERT) has a role in liver carcinogenesis where telomerase is normally suppressed in most human somatic tissues after birth. In the current study we aimed to detect the significance of hTERT mRNA in early detection of hepatocellular carcinoma (HCC) and to determine the relationship between serum microRNA155 and telomerase expression."

The news reporters obtained a quote from the research from National Research Center, "Serum and liver tissue samples were collected from 40 patients (17 samples from patients with liver cirrhosis and 23 samples from patients with HCC) and 12 blood samples from healthy subjects were collected. Serum miRNA155 levels and blood and tissue hTERT mRNA were detected by real-time quantitative reverse-transcriptase PCR (RT-qPCR) among liver cirrhosis and HCC patients. Moreover, miR-155, blood and tissue hTERT levels were analyzed in relation to clinical and pathological features. Calculated expression of miRNA155 revealed that relative quantity (RQ) miR 155 was overexpressed in sera of HCC patients when compared to patients with liver cirrhosis and controls (p < 0.0001). The median values of serum telomerase were significantly increased among HCC patients than in patients with liver cirrhosis and controls (p = 0.04). Moreover, tissue expression of telomerase was significantly higher in malignant tissue more than adjacent nonmalignant tissue among HCC patients (p = 0.02). It was also found that tissue expression of telomerase was significantly decreased in tissue of liver cirrhosis patients (p = 0.03). Interestingly, we found that blood telomerase was directly
The study found that low expression of DCXR protein indicates a poor prognosis for hepatocellular carcinoma patients. Researchers from Second Military Medical University, Shanghai, People's Republic of China, investigated the prognostic value of dicarbonyl/L-xylulose reductase (DCXR) in human hepatocellular carcinoma (HCC). They used immunohistochemistry and tissue microarrays to evaluate DCXR protein expression levels. The results showed that DCXR proteins were significantly lower in HCC tumor tissues compared to peritumoral non-cancer tissues. The study concluded that low expression of DCXR is associated with a worse prognosis for HCC patients.
shorter time to recurrence (TTR) in both the training and validation set were found to be associated with lower expression levels of DCXR. In the training set, the expression level of DCXR in HCC was an independent prognostic factor for OS according to univariate and multivariate analyses."

According to the news reporters, the research concluded: "DCXR expression is an independent prognostic factor for OS and TTR of post-operative HCC patients, and low expression levels of DCXR in HCC may indicate poor outcome of HCC patients after surgical resection."

For more information on this research see: Low expression of DCXR protein indicates a poor prognosis for hepatocellular carcinoma patients. Tumor Biology, 2016;37 (11):15079-15085. Liver Diseases and Conditions - Liver Fibrosis

New Liver Fibrosis Study Findings Have Been Reported by G. Bain and Colleagues (Selective Inhibition of Autotaxin Is Efficacious in Mouse Models of Liver Fibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Liver Fibrosis is now available. According to news reporting originating from San Diego, California, by NewsRx correspondents, research stated, "Autotaxin (ATX) is a secreted glycoprotein that converts lysophosphatidylcholine (LPC) to the bioactive phospholipid lysophosphatidic acid (LPA) and is the major enzyme generating circulating LPA. Inhibition of LPA signaling has profound antifibrotic effects in multiple organ systems, including lung, kidney, skin, and peritoneum."

Our news editors obtained a quote from the research, "However, other LPA-generating pathways exist, and the role of ATX in localized tissue LPA production and fibrosis remains unclear and controversial. In this study, we describe the preclinical pharmacologic, pharmacokinetic, and pharmacodynamic properties of a novel small-molecule ATX inhibitor, PAT-505 [3-([6-chloro-2-cyclopropyl-1-(1-ethyl-1H-pyrazol-4-yl)-7-fluoro-1H-indol-3-yl) thio]-2-fluorobenzoic acid sodium salt]. PAT-505 is a potent, selective, noncompetitive inhibitor that displays significant inhibition of ATX activity in plasma and liver tissue after oral administration. When dosed therapeutically in a Stelic Mouse Animal Model of nonalcoholic
steatohepatitis (NASH), PAT-505 treatment resulted in a small but significant improvement in fibrosis with only minor improvements in hepatocellular ballooning and hepatic inflammation. In a choline-deficient, high-fat diet model of NASH, therapeutic treatment with PAT-505 robustly reduced liver fibrosis with no significant effect on steatosis, hepatocellular ballooning, or inflammation."

According to the news editors, the research concluded: "These data demonstrate that inhibiting autotaxin is antifibrotic and may represent a novel therapeutic approach for the treatment of multiple fibrotic liver diseases, including NASH."

Keywords for this news article include: San Diego, California, United States, North and Central America, Liver Diseases and Conditions, Gastroenterology, Liver Cirrhosis, Liver Fibrosis, Inflammation.

Liver Diseases and Conditions - Liver Fibrosis

**New Liver Fibrosis Study Findings Have Been Reported by Researchers at Theodor Bilharz Research Institute (Wharton's jelly-derived mesenchymal stem cells combined with praziquantel as a potential therapy for Schistosoma mansoni-induced liver ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Liver Fibrosis. According to news reporting from Giza, Egypt, by NewsRx journalists, research stated, "Liver fibrosis is one of the most serious consequences of *S. mansoni* infection. The aim of the present study was to investigate the potential anti-fibrotic effect of human Wharton's jelly-derived mesenchymal stem cells (WJMSCs) combined with praziquantel (PZQ) in *S. mansoni*-infected mice. *S. mansoni*-infected mice received early (8(th) week post infection) and late (16(th) week post infection) treatment with WJMSCs, alone and combined with oral PZQ."

The news correspondents obtained a quote from the research from Theodor Bilharz Research Institute, "At the 10(th) month post infection, livers were collected for subsequent flow cytometric, histopathological, morphometric, immunohistochemical, gene expression, and gelatin zymographic studies. After transplantation, WJMSCs differentiated into functioning liver-like cells as evidenced by their ability to express human hepatocyte-specific markers. Regression of *S. mansoni*-induced liver fibrosis was also observed in transplanted groups, as evidenced by histopathological, morphometric, and gelatin zymographic results besides decreased expression of three essential contributors to liver fibrosis in this particular model;
alpha smooth muscle actin, collagen-I, and interleukin-13. PZQ additionally enhanced the beneficial effects observed in WJMSCs-treated groups."

According to the news reporters, the research concluded: "Our results suggest that combining WJMSCs to PZQ caused better enhancement in S. mansoni-induced liver fibrosis, compared to using each alone."

For more information on this research see: Wharton's jelly-derived mesenchymal stem cells combined with praziquantel as a potential therapy for Schistosoma mansoni-induced liver fibrosis. Scientific Reports, 2016;6():21005. (Nature Publishing Group - www.nature.com/srep/)

**Oncology - Lung Cancer**

**New Lung Cancer Data Have Been Reported by Investigators at Oregon Health and Science University (The Roles of Dyadic Appraisal and Coping in Couples With Lung Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting out of Portland, Oregon, by NewsRx editors, research stated, "Given the high symptom burden and low survivability of lung cancer, patients and their spouses have been found to experience poor mental health. The current study examined the roles of dyadic appraisal and dyadic coping on the mental health of 78 couples living with non-small cell lung cancer."

Our news journalists obtained a quote from the research from Oregon Health and Science University, "Multilevel modeling revealed that spouses, on average, reported significantly worse mental health than patients. Dyadic appraisal and dyadic coping played important roles in predicting mental health, controlling for known developmental and contextual covariates. Dyadic appraisal of the patient's pain and fatigue was significantly associated with spouse mental health, albeit in opposite directions. Dyadic coping significantly predicted patient mental health. The study underlines the need to incorporate routine screening of both patient and spouse mental health, and highlights the complex role of appraisal within the couple in a life-threatening context. Viewing the couple as a unit, rather than separate individuals, raises important awareness about the role of disparate illness appraisals and coping strategies within the dyad on the health of both members."

According to the news editors, the research concluded: "Nurses are particularly well situated to engage in a collaborative family-focused approach to the couple with cancer that promotes communication and health."

New Lung Cancer Data Have Been Reported by Researchers at Chinese Peoples' Liberation Army General Hospital (Ratio of lymph node to primary tumor SUVmax multiplied by maximal tumor diameter on positron emission tomography/integrated computed ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lung Cancer. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Positron emission tomography/integrated computed tomography (PET/CT) provides the most accurate imaging modality for preoperative lung cancer staging. However, the diagnostic accuracy of maximum standardized uptake value (SUVmax) for mediastinal (N2) lymph nodes (LN) is unclear."

Our news editors obtained a quote from the research from Chinese Peoples' Liberation Army General Hospital, "We compared SUVmax, the ratio of LN to primary tumor SUVmax (SUVn/t), and SUVn/t multiplied by maximal tumor diameter (SUVindex) in terms of their abilities to predict mediastinal LN malignancy. We retrospectively analyzed 170 mediastinal LN stations from 73 consecutive patients who underwent systemic LN resection and PET/CT within 27 days. The SUVmax of the primary tumors was >2.0 and the SUVmax of the mediastinal LN stations ranged from 2.0 to 7.0 on PET/CT. Receiver-operating characteristic curves (ROCs) of SUVmax, SUVn/t, and SUVindex were calculated separately and the areas under the curves (AUCs) were used to assess the abilities of the parameters to predict LN malignancy. The optimal cutoff values were calculated from each ROC curve and the diagnostic abilities were also compared. The diagnostic accuracies of the 3 methods were also assessed separately in smoking and nonsmoking patients. Twenty-eight LN stations were malignancy-positive and the remaining 142 were malignancy-negative. The AUCs for SUVindex, SUVn/t, and SUVmax were 0.709, 0.590, and 0.673, respectively, and the optimal cutoff values for SUVindex, SUVn/t, and SUVmax were 1.11, 0.34, and 3.6, respectively. The differences between SUVindex and SUVn/t were significant, but there was no significant difference between SUVindex and SUVmax. There were no significant differences between smokers and nonsmokers in the AUCs for any of the methods for predicting LN malignancy (P values >
0.05)."

According to the news editors, the research concluded: "SUVindex may be a predictor of mediastinal LN malignancy in lung cancer patients."

For more information on this research see: Ratio of lymph node to primary tumor SUVmax multiplied by maximal tumor diameter on positron emission tomography/integrated computed tomography may be a predictor of mediastinal lymph node malignancy in lung cancer. *Medicine, 2016;95(46):426-432.* *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

The news editors report that additional information may be obtained by contacting X.Y. Chu, Chinese Peoples' Liberation Army PLA Gen Hosp, Dept. of Thorac Surg, Beijing, People's Republic of China. Additional authors for this research include Y.H. Tang, Z.Q. Xue, P. Yang, K.F. Ma, G.Y. Ma and X.Y. Chu.

**Oncology - Lung Cancer**

**New Lung Cancer Study Findings Have Been Reported by Investigators at University of Louisville (Normalization of Exhaled Carbonyl Compounds After Lung Cancer Resection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting originating in Louisville, Kentucky, by NewsRx journalists, research stated, "Quantitative analysis of specific exhaled carbonyl compounds (ECCs) has shown promise for the detection of lung cancer. The purpose of this study is to demonstrate the normalization of ECCs in patients after lung cancer resection."

The news reporters obtained a quote from the research from the University of Louisville, "Patients from a single center gave consent and were enrolled in the study from 2011 onward. Breath analysis was performed on lung cancer patients before and after surgical resection of their tumors. One liter of breath from a single exhalation was collected and evacuated over a silicon microchip. Carbonyls were captured by oximation reaction and analyzed by mass spectrometry. Concentrations of four cancer-specific ECCs were measured and compared by using the Wilcoxon test. A given cancer marker was considered elevated at 1.5 or more standard deviations greater than the mean of the control population. There were 34 cancer patients with paired samples and 187 control subjects. The median values after resection were significantly lower for all four ECCs and were equivalent to the control patient values for three of the four ECCs. The analysis of ECCs demonstrates reduction to the level of control patients after surgical resection for lung cancer. This technology has the potential to be a useful tool to detect disease after lung cancer resection."

According to the news reporters, the research concluded: "Continued follow-up will determine whether subsequent elevation of ECCs is indicative of recurrent disease."

Our news correspondents report that additional information may be obtained by contacting V. van Berkel, University of Louisville, Dept. of Chem Engn, Louisville, KY 40292, United States. Additional authors for this research include M.C. Black, M. Bousamra, J.R. Trivedi, M. Li, X.A. Fu and V. van Berkel.

**Oncology - Lung Cancer**

**New Lung Cancer Study Findings Have Been Reported by Investigators at University of North Carolina (Lysyl Hydroxylase 2 Is Secreted by Tumor Cells and Can Modify Collagen in the Extracellular Space)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lung Cancer. According to news reporting from Chapel Hill, North Carolina, by NewsRx journalists, research stated, "Lysyl hydroxylase 2 (LH2) catalyzes the hydroxylation of lysine residues in the telopeptides of fibrillar collagens, which leads to the formation of stable collagen cross-links. Recently we reported that LH2 enhances the metastatic propensity of lung cancer by increasing the amount of stable hydroxylysine aldehyde-derived collagen cross-links (HLCCs), which generate a stiffer tumor stroma (Chen, Y., et al. (2015) J. Clin. Invest. 125, 1147-1162)."

Funders for this research include National Cancer Institute, National Institute of Arthritis and Musculoskeletal and Skin Diseases.

The news correspondents obtained a quote from the research from the University of North Carolina, "It is generally accepted that LH2 modifies procollagen alpha chains on the endoplasmic reticulum before the formation of triple helical procollagen molecules. Herein, we report that LH2 is also secreted and modifies collagen in the extracellular space. Analyses of lung cancer cell lines demonstrated that LH2 is present in the cell lysates and the conditioned media in a dimeric, active form in both compartments. LH2 co-localized with collagen fibrils in the extracellular space in human lung cancer specimens and in orthotopic lung tumors generated by injection of a LH2-expressing human lung cancer cell line into nude mice. LH2 depletion in MC3T3 osteoblastic cells impaired the formation of HLCCs, resulting in an increase in the unmodified lysine aldehyde-derived collagen cross-link (LCC), and the addition of recombinant LH2 to the media of LH2-deficient MC3T3 cells was sufficient to rescue HLCC formation in the extracellular matrix."

According to the news reporters, the research concluded: "The finding that LH2
modifies collagen in the extracellular space challenges the current view that LH2 functions solely on the endoplasmic reticulum and could also have important implications for cancer biology."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.759803. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Lung Cancer

New Lung Cancer Study Findings Have Been Reported by Researchers at CHA University (Genomic profiling of lung adenocarcinoma patients reveals therapeutic targets and confers clinical benefit when standard molecular testing is negative)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Lung Cancer is the subject of a report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Identification of clinically relevant oncogenic drivers in advanced cancer is critical in selecting appropriate targeted therapy. Using next-generation sequencing (NGS)-based clinical cancer gene assay, we performed comprehensive genomic profiling (CGP) of advanced cases of lung adenocarcinoma."

Our news editors obtained a quote from the research from CHA University, "Formalin-fixed paraffin-embedded tumors from 51 lung adenocarcinoma patients whose tumors previously tested negative for EGFR/KRAS/ALK by conventional methods were collected, and CGP was performed via hybridization capture of 4,557 exons from 287 cancer-related genes and 47 introns from 19 genes frequently rearranged in cancer. Genomic profiles of all 51 cases were obtained, with a median coverage of 564x and a total of 190 individual genomic alterations (GAs). GAs per specimen was a mean of 3.7 (range 0-10). Cancer genomes are characterized by 50% (80/190) non-synonymous base substitutions, 15% (29/190) insertions or deletion, and 3% (5/190) splice site mutation. TP53 mutation was the most common GAs
(15%, n=29/190), followed by CDKN2A homozygous loss (5%, n=10/190), KRAS mutation (4%, n=8/190), EGFR mutation (4%, n=8/190) and MDM2 amplification (2%, n=5/190). As per NCCN guidelines, targetable GAs were identified in 16 patients (31%) (BRaf mutation [n=1], EGFR mutation [n=8], ERBB2 mutation [n=4], MET amplification [n=1], KIF5B-RET rearrangement [n=2], CCDC6-RET rearrangement [n=1], CD74-ROS1 rearrangement [n=1], EZR-ROS1 rearrangement [n=5], and SLC34A2-ROS1 rearrangement [n=1]). Fifty eight percent of patients wild type by standard testing for EGFR/KRAS/ALK have GAs identifiable by CGP that suggest benefit from target therapy."

According to the news editors, the research concluded: "CGP used when standard molecular testing for NSCLC is negative can reveal additional avenues of benefit from targeted therapy."

For more information on this research see: Genomic profiling of lung adenocarcinoma patients reveals therapeutic targets and confers clinical benefit when standard molecular testing is negative. Oncotarget, 2016;7(17):24172-8.

Oncology - Lung Cancer

New Lung Cancer Study Findings Have Been Reported from International Agency for Research on Cancer (Descriptive epidemiology of lung cancer and current status of tobacco control measures in Central and South America)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lung Cancer. According to news reporting from Lyon, France, by NewsRx journalists, research stated, "Rationale and objective: Lung cancer is the most commonly diagnosed cancer and the leading cause of cancer death in the world. In Central and South America lung cancer is now one of most frequent cancers and the leading cause of cancer-related death in both sexes."

The news correspondents obtained a quote from the research from International Agency for Research on Cancer, "We describe patterns and trends in lung cancer incidence and mortality in Central and South America and give a brief overview of the current status of tobacco control measures based on the most recent MPOWER report. We obtained regional and national-level incidence data from 48 population-based cancer registries in 13 countries and cancer deaths from the WHO mortality database for 18 countries. We estimated world population age-standardized incidence and mortality rates per 100,000 person-years. Incidence of lung cancer by histological subtype were only available from high-quality population-based..."
cancer registries for the period 2003-2007. The highest incidence and mortality rates in the region were seen among males in Argentina, Cuba, Chile and Uruguay. Adenocarcinoma was the most frequent histological type overall, though squamous carcinoma was more frequent in Antofagasta-Chile and Villa Clara-Cuba. Smoke-free policies and warnings are widely implemented tobacco control measures; cessation is offered but the costs are not covered by health systems in the majority of countries.

According to the news reporters, the research concluded: "The high burden of lung cancer in the region highlights the need to improve long term information and strengthen current tobacco control policies including aggressive taxing measures and supporting smoking cessation in order to achieve the targeted reductions in smoking prevalence."

Our news journalists report that additional information may be obtained by contacting M. Pineros, Int Agcy Res Canc, Sect Canc Surveillance, F-69008 Lyon, France. Additional authors for this research include M.S. Sierra and D. Forman.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.canep.2016.03.002. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Lung Cancer

New Lung Cancer Study Findings Recently Were Reported by Researchers at Cochin Hospital (Intratumoral Immune Cell Densities Are Associated with Lung Adenocarcinoma Gene Alterations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lung Cancer. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "Tumor-infiltrating immune cells affect lung cancer outcome. However, the factors that influence the composition and function of the tumor immune environment remain poorly defined and need investigation, particularly in the era of immunotherapy."

Our news editors obtained a quote from the research from Cochin Hospital. "To determine whether the tumoral immune environment is related to lung adenocarcinoma mutations. This retrospective cohort included 316 consecutive patients with lung adenocarcinoma (225 men; 258 smokers) studied from 2001 to 2005 in a single center. We investigated the association of densities of intratumoral mature dendritic cells (mDCs), CD8(+) T cells, neutrophils, and macrophages with clinical and pathological variables and tumor cell mutation profiles obtained by next-generation sequencing. In 282 tumors, we found 460 mutations, mainly in TP53 (59%), KRAS (40%), STK11 (24%), and EGFR (14%). Intratumoral
CD8(+) T-cell density was high in smokers (P = 0.02) and TP53-mutated tumors (P = 0.02) and low in BRAF-mutated tumors (P = 0.005). Intratumoral mDC density was high with low pathological tumor stage (P = 0.01) and low with STK11 mutation (P = 0.004). Intratumoral neutrophil density was high and low with BRAF mutation (P = 0.04) and EGFR mutation (P = 0.02), respectively. Intratumoral macrophage density was low with EGFR mutation (P = 0.01). Intratumoral CD8(+) T-cell and mDC densities remained strong independent markers of overall survival (P = 0.001 and P = 0.02, respectively).

According to the news editors, the research concluded: "Intratumoral immune cell densities (mDCs, CD8+ T cells, neutrophils, macrophages) were significantly associated with molecular alterations in adenocarcinoma underlying the interactions between cancer cells and their microenvironment."

The news editors report that additional information may be obtained by contacting D. Damotte, Hopital Cochin, Serv Pathol, Paris, France. Additional authors for this research include M. Alifano, N. Pecuchet, J. Biton, E. Becht, J. Goc, C. Germain, H. Ouakrim, J.F. Regnard, I. Cremer, P. Laurent-Puig, M.C. Dieu-Nosjean, H. Blons and D. Damotte.

**Oncology - Lung Cancer**

**New Lung Cancer Study Findings Recently Were Reported by Researchers at George Mason University** (Functional signaling pathway analysis of lung adenocarcinomas identifies novel therapeutic targets for KRAS mutant tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news reporting from Manassas, Virginia, by NewsRx journalists, research stated, "Little is known about the complex signaling architecture of KRAS and the interconnected RAS-driven protein-protein interactions, especially as it occurs in human clinical specimens. This study explored the activated and interconnected signaling network of KRAS mutant lung adenocarcinomas (AD) to identify novel therapeutic targets. Thirty-four KRAS mutant (MT) and twenty-four KRAS wild-type (WT) frozen biospecimens were obtained from surgically treated lung ADs."

The news correspondents obtained a quote from the research from George Mason University, "Samples were subjected to Laser Capture Microdissection and Reverse Phase Protein Microarray analysis to explore the expression/activation levels of 150 signaling proteins along with co-activation concordance mapping. An independent set of 90 non-small cell lung
cancers (NSCLC) was used to validate selected findings by immunohistochemistry (IHC). Compared to KRAS WT tumors, the signaling architecture of KRAS MT ADs revealed significant interactions between KRAS downstream substrates, the AKT/mTOR pathway, and a number of Receptor Tyrosine Kinases (RTK). Approximately one-third of the KRAS MT tumors had ERK activation greater than the WT counterpart (p <0.01). Notably 18% of the KRAS MT tumors had elevated activation of the Estrogen Receptor alpha (ER-a) (p=0.02). This finding was verified in an independent population by IHC (p=0.03). KRAS MT lung ADs appear to have a more intricate RAS linked signaling network than WT tumors with linkage to many RTKs and to the AKT-mTOR pathway. Combination therapy targeting different nodes of this network may be necessary to treat this group of patients.

According to the news reporters, the research concluded: "In addition, for patients with KRAS MT tumors and activation of the ER-a, anti-estrogen therapy may have important clinical implications."

According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "Oncogenic activation of protein kinase BRAF drives tumor growth by promoting mitogen-activated protein kinase (MAPK) pathway signaling. Because oncogenic mutations in BRAF occur in similar to 2-7% of lung adenocarcinoma (LA), BRAF-mutant LA is the most frequent cause of BRAF-mutant cancer mortality worldwide."

Our news editors obtained a quote from the research from the University of California, "Whereas most tumor types harbor predominantly the BRAF(V600E)-mutant allele, the spectrum of BRAF mutations in LA includes BRAF(V600E) (similar to 60% of cases) and non-V600E mutant alleles (similar to 40% of cases) such as BRAF(G469A) and BRAF (G466V). The presence of BRAFV600E in LA has prompted clinical trials testing selective
BRAF inhibitors such as vemurafenib in BRAF(V600E)-mutant patients. Despite promising clinical efficacy, both innate and acquired resistance often result from reactivation of MAPK pathway signaling, thus limiting durable responses to the current BRAF inhibitors. Further, the optimal therapeutic strategy to block non-V600E BRAF-mutant LA remains unclear. Here, we report the efficacy of the Raf proto-oncogene serine/threonine protein kinase (RAF) inhibitor, PLX8394, that evades MAPK pathway reactivation in BRAF-mutant LA models. We show that PLX8394 treatment is effective in both BRAF(V600E) and certain non-V600 LA models, in vitro and in vivo. PLX8394 was effective against treatment-naive BRAF-mutant LAs and those with acquired vemurafenib resistance caused by an alternatively spliced, truncated BRAF (V600E) that promotes vemurafenib-insensitive MAPK pathway signaling. We further show that acquired PLX8394 resistance occurs via EGFR-mediated RAS-mTOR signaling and is prevented by upfront combination therapy with PLX8394 and either an EGFR or mTOR inhibitor."

According to the news editors, the research concluded: "Our study provides a biological rationale and potential polytherapy strategy to aid the deployment of PLX8394 in lung cancer patients."

The news editors report that additional information may be obtained by contacting T.G. Bivona, University of California, Dept. of Cellular & Mol Pharmacol, San Francisco, CA 94158, United States. Additional authors for this research include L. Lin, V. Olivas, E. Chan, E. Markegard, A. Rymar, D. Neel, X. Chen, G. Hemmati, G. Bollag and T.G. Bivona.

**Oncology - Lung Cancer**

**New Lung Cancer Study Results from P.N. Lee et al Described (The effect of time changes in diagnosing lung cancer type on its recorded distribution, with particular reference to adenocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lung Cancer. According to news reporting out of Surrey, United Kingdom, by NewsRx editors, research stated, "Among lung cancers, a substantial shift over time has occurred in the recorded frequency of adenocarcinoma (AdC) relative to that of squamous cell carcinoma (SqCC). This is evident in many countries, and also in those who have never smoked."
Financial supporters for this research include British American Tobacco (Investments) Limited, Altria Client Services.

Our news journalists obtained a quote from the research, "We attempted to address the extent to which this increase is real, or an artefact of changing diagnostic practices. We reviewed studies re-evaluating diagnoses using more up-to-date criteria, and studies applying standard criteria to cases collected over a long period. We also describe changes to classifications, and factors affecting diagnostic accuracy and consistency. While the four main types have long remained essentially unchanged, successive WHO classifications differ in how tumours are ascribed to these types. Despite refinement of classifications and technological advances, the decision is ultimately the pathologist's. In 11 studies, 189/1212(15.6%) originally diagnosed AdCs were reclassified as non-AdC on review, whereas 541/1564(34.6%) of non-AdCs were reclassified as AdC, increasing AdCs by 30%. Studies examining trends in the proportion of AdC were conflicting; three showing a declining trend, seven no trend, and six some increase. Some studies find lepidic (bronchioloalveolar) carcinoma, but not other AdC sub-types, increased."

According to the news editors, the research concluded: "The rising AdC/SqCC ratio results at least partly from diagnostic changes."

For more information on this research see: The effect of time changes in diagnosing lung cancer type on its recorded distribution, with particular reference to adenocarcinoma. Regulatory Toxicology and Pharmacology, 2016;81():322-333. Oncology - Lung Cancer

New Lung Cancer Study Results from Peking University Cancer Hospital and Institute Described (Quantification of mutant alleles in circulating tumor DNA can predict survival in lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "We aimed to investigate the feasibility of droplet digital PCR (ddPCR) for the quantitative and dynamic detection of EGFR mutations and next generation sequencing (NGS) for screening EGFR-tyrosine kinase inhibitors (EGFR-TKIs) resistance-relevant mutations in circulating tumor DNA (ctDNA) from advanced lung adenocarcinoma (ADC) patients. Detection limit of EGFR mutation in ctDNA by ddPCR was 0.04%."
The news reporters obtained a quote from the research from Peking University Cancer Hospital and Institute, "Taking the EGFR mutation in tumor tissue as the golden standard, the concordance of EGFR mutations detected in ctDNA was 74% (54/73). Patients with EGFR mutation in ctDNA (n=54) superior progression-free survival (PFS, median, 12.6 vs. 6.7 months, p<0.001) and overall survival (OS, median, 35.6 vs. 23.8 months, p=0.028) compared to those with EGFR wild type in ctDNA (n=19). Patients with high EGFR-mutated abundance in ctDNA (>5.15%) showed better PFS compared to those with low EGFR mutated abundance (<= 5.15%) (PFS, median, 15.4 vs. 11.1 months, p=0.021). NGS results showed that 66.6% (8/12) total mutational copy number were elevated and 76.5% (26/34) mutual mutation frequency increased after disease progression. Seventy-three advanced ADC patients with tumor tissues carrying EGFR mutations and their matched pre-and post-EGFR-TKIs plasma samples were enrolled in this study. Absolute quantities of plasma EGFR mutant and wild-type alleles were measured by ddPCR. Multi-genes testing was performed using NGS in 12 patients. Dynamic and quantitative analysis of EGFR mutation in ctDNA could guide personalized therapy for advanced ADC."

According to the news reporters, the research concluded: "NGS shows good performance in multiple genes testing especially novel and uncommon genes."

Our news correspondents report that additional information may be obtained by contacting X. Yang, Dept. of Thoracic Medical Oncology, Key Laboratory of Carcinogenesis and Translational Research (Ministry of Education), Peking University Cancer Hospital and Institute, Beijing, People's Republic of China. Additional authors for this research include M. Zhuo, X. Ye, H. Bai, Z. Wang, Y. Sun, J. Zhao, T. An, J. Duan, M. Wu and J. Wang.

Lung Diseases

New Lung Diseases Findings from Yonsei University Described (Implication of vitamin D-associated factors in patients with non tuberculous mycobacterial lung disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Little information is available regarding vitamin D-associated factors in patients with non tuberculous mycobacteria (NTM) lung disease. To determine the association between vitamin D-related factors and susceptibility to NTM lung disease."

Our news editors obtained a quote from the research from Yonsei University, "The relative gene expression levels of cathelicidin (CAMP), defensin (DEFB4), vitamin D receptor (VDR) and 1 alpha-hydroxylase (CYP27B1), as well as the serum levels of 25-hydroxyvitamin
D (25[OH]D), cathelicidin (LL-37), defensin (hBD-2) and vitamin D binding protein (DBP) from 82 patients with NTM lung disease and 28 control subjects were analysed. Gene expression of CAMP and DEFB4 was significantly higher, and gene expression of VDR and CYP27B1 was significantly lower, in NTM patients than controls. Serum LL-37 and hBD-2 levels were not significantly different between NTM patients and controls; however, the serum DBP level was higher in NTM patients than controls. The serum vitamin D status of patients did not correlate with serum LL-37, hBD-2, or DBP concentration or gene expression of CAMP, DEFB4, VDR or CYP27B1.

According to the news editors, the research concluded: "A higher level of gene expression for antimicrobial peptide is more likely to be associated with NTM lung disease than serum vitamin D status."

Keywords for this news article include: Seoul, South Korea, Asia, Respiratory Tract Diseases and Conditions, Lung Diseases and Conditions, Genetics, Yonsei University.

Lung Diseases

New Lung Diseases Study Findings Have Been Reported by Investigators at Harvard School of Medicine (Soluble epoxide hydrolase deficiency or inhibition enhances murine hypoxic pulmonary vasoconstriction after lipopolysaccharide challenge)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases are discussed in a new report. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Hypoxic pulmonary vasoconstriction (HPV) is the response of the pulmonary vasculature to low levels of alveolar oxygen. HPV improves systemic arterial oxygenation by matching pulmonary perfusion to ventilation during alveolar hypoxia and is impaired in lung diseases such as the acute respiratory distress syndrome (ARDS) and in experimental models of endotoxemia."

Financial supporters for this research include Deutsche Forschungsgemeinschaft (DFG), HHS | NIH | National Heart, Lung, and Blood Institute (NHBLI), HHS | National Institutes of Health (NIH).

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Epoxyeicosatrienoic acids (EETs) are pulmonary vasoconstrictors, which are metabolized to less vasoactive dihydroxyeicosatrienoic acids (DHETs) by soluble epoxide hydrolase (sEH). We hypothesized that pharmacological inhibition or a congenital deficiency of
sEH in mice would reduce the metabolism of EETs and enhance HPV in mice after challenge with lipopolysaccharide (LPS). HPV was assessed 22 h after intravenous injection of LPS by measuring the percentage increase in the pulmonary vascular resistance of the left lung induced by left mainstem bronchial occlusion (LMBO). After LPS challenge, HPV was impaired in sEH (+/+), but not in sEH(-/-) mice or in sEH(+/+) mice treated acutely with a sEH inhibitor. Deficiency or pharmacological inhibition of sEH protected mice from the LPS-induced decrease in systemic arterial oxygen concentration (PaO2) during LMBO. In the lungs of sEH(-/-) mice, the LPS-induced increase in DHETs and cytokines was attenuated. Deficiency or pharmacological inhibition of sEH protects mice from LPS-induced impairment of HPV and improves the PaO2 after LMBO. After LPS challenge, lung EET degradation and cytokine expression were reduced in sEH(-/-) mice.

According to the news editors, the research concluded: "Inhibition of sEH might prove to be an effective treatment for ventilation-perfusion mismatch in lung diseases such as ARDS."

For more information on this research see: Soluble epoxide hydrolase deficiency or inhibition enhances murine hypoxic pulmonary vasoconstriction after lipopolysaccharide challenge. American Journal of Physiology-Lung Cellular and Molecular Physiology, 2016;311 (6):L1213-L1221. American Journal of Physiology-Lung Cellular and Molecular Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Our news journalists report that additional information may be obtained by contacting W.M. Zapol, Harvard Med Sch, Boston, MA 02114, United States. Additional authors for this research include A. Beloiartsev, M.D. Buswell, D. Panigrahy, R. Malhotra, E.S. Buys, P. Radermacher, F. Ichinose, D.B. Bloch and W.M. Zapol.

Lung Diseases

New Lung Diseases Study Findings Have Been Reported by Investigators at Shaheed Beheshti University of Medical Sciences (The roles of miRNAs as potential biomarkers in lung diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases is now available. According to news reporting out of Tehran, Iran, by NewsRx editors, research stated, "MicroRNAs (miRNAs) are small non-coding RNAs which can act as master regulators of gene expression, modulate almost all biological process and are essential for maintaining cellular homeostasis. Dysregulation of miRNA expression has been associated with aberrant gene expression and may lead to pathological conditions."
Financial supporters for this research include MRC, Wellcome Trust, Royal Brompton NHS Foundation Trust, Imperial College London.

Our news journalists obtained a quote from the research from the Shaheed Beheshti University of Medical Sciences, "Evidence suggests that miRNA expression profiles are altered between health and disease and as such may be considered as biomarkers of disease. Evidence is increasing that miRNAs are particularly important in lung homeostasis and development and have been demonstrated to be the involved in many pulmonary diseases such as asthma, COPD, sarcoidosis, lung cancer and other smoking related diseases. Better understanding of the function of miRNA and the mechanisms underlying their action in the lung, would help to improve current diagnosis and therapeutics strategies in pulmonary diseases. Recently, some miRNA-based drugs have been introduced as possible therapeutic agents."

According to the news editors, the research concluded: "In this review we aim to summarize the recent findings regarding the role of miRNAs in the airways and lung and emphasise their potential therapeutic roles in pulmonary diseases."

For more information on this research see: The roles of miRNAs as potential biomarkers in lung diseases. European Journal of Pharmacology, 2016;791():395-404. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; European Journal of Pharmacology - www.journals.elsevier.com/european-journal-of-pharmacology/)

Our news journalists report that additional information may be obtained by contacting E. Mortaz, Shahid Beheshti Univ Med Sci, Clin TB & Epidemiol Res Center, Natl Res & Inst TB & Lung Dis, Tehran, Iran. Additional authors for this research include I.M. Adcock, J. Garssen, E. Mortaz, M. Varahram, M. Mirsaeidi and A. Velayati.

**Lung Diseases**

**New Lung Diseases Study Findings Have Been Reported by Investigators at Sungkyunkwan University (Peak Plasma Concentration of Azithromycin and Treatment Responses in Mycobacterium avium Complex Lung Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Macrolides, such as azithromycin (AZM) and clarithromycin, are the cornerstones of treatment for Mycobacterium avium complex lung disease (MAC-LD). Current guidelines recommend daily therapy with AZM for cavitary MAC-LD and intermittent therapy for noncavitary MAC-LD, but the effectiveness of these regimens has not been thoroughly investigated."

Financial supporters for this research include National Research Foundation of Korea
The news correspondents obtained a quote from the research from Sungkyunkwan University, "This study evaluated associations between microbiological response and estimated peak plasma concentrations (C-max) of AZM. The AZM C-max was measured in patients receiving daily therapy (250 mg of AZM daily, n = 77) or intermittent therapy (500 mg of AZM three times weekly, n = 89) for MAC-LD and daily therapy for Mycobacterium abscessus complex LD (MABC-LD) (250 mg of AZM daily, n = 55). The AZM C-max was lower with the daily regimen for MAC-LD (median, 0.24 μg/ml) than with the intermittent regimen for MAC-LD (median, 0.65 μg/ml; P< 0.001) or daily therapy for MABC-LD (median, 0.53 μg/ml; P< 0.001). After adjusting for confounding factors, AZM C(max)was independently associated with favorable microbiological responses in MAC-LD patients receiving a daily regimen (adjusted odds ratio [aOR], 1.58; 95% confidence interval [CI], 1.01 to 2.48; P = 0.044) but not an intermittent regimen (aOR, 0.85; 95% CI, 0.58 to 1.23, P = 0.379). With the daily AZM-based multidrug regimen for MAC-LD, a low AZM C-max was common, whereas a higher AZM C-max was associated with favorable microbiologic responses. The results also suggested that the addition of rifampin may lower AZM C-max."

According to the news reporters, the research concluded: "When a daily AZM-based multidrug regimen is used for treating severe MAC-LD, such as cavitary disease, the currently recommended AZM dose might be suboptimal."

For more information on this research see: Peak Plasma Concentration of Azithromycin and Treatment Responses in Mycobacterium avium Complex Lung Disease. Antimicrobial Agents and Chemotherapy, 2016;60(10):6076-6083. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Autoimmune Diseases and Conditions - Lupus

New Lupus Findings from Central Hospital Reported (Expression of BAFF and BR3 in patients with systemic lupus erythematosus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autoimmune Diseases and Conditions - Lupus have been
presented. According to news reporting originating in Tianjin, People's Republic of China, by NewsRx journalists, research stated, "The objective of this study was to examine the relationship between the expression of B cell activating factor (BAFF) and BAFF receptor in patients with disease activity of systemic lupus erythematosus (SLE). Real-time RT-PCR was used to examine BAFF mRNA expression in peripheral blood monocytes of active and stable SLE patients and healthy controls."

The news reporters obtained a quote from the research from Central Hospital, "The percentage of BAFF receptor 3 (BR3) on B lymphocytes was measured by flow cytometry. Soluble BAFF levels in serum were assayed by ELISA. Microalbumin levels were assayed by an automatic immune analysis machine. BAFF mRNA and soluble BAFF levels were highest in the active SLE group, followed by the stable SLE group, and controls (p <0.01). The percentage of BR3 on B lymphocytes was downregulated in the active SLE group compared with the stable SLE group and controls (p <0.01). BAFF mRNA levels and soluble BAFF levels were higher in patients who were positive for proteinuria than in those who were negative (p <0.01). The percentage of BR3 on B lymphocytes was lower in patients who were positive for proteinuria than in those who were negative (p <0.01). The BAFF/BR3 axis may be over-activated in SLE patients."

According to the news reporters, the research concluded: "BAFF and BR3 levels may be useful parameters for evaluating treatment."

For more information on this research see: Expression of BAFF and BR3 in patients with systemic lupus erythematosus. Brazilian Journal of Medical and Biological Research, 2016;49(3):.

Our news correspondents report that additional information may be obtained by contacting J.H. Duan, Tianjin First Central Hospital, Tianjin, People's Republic of China. Additional authors for this research include Y. Jiang, H. Mu and Z.Q Tang.

Autoimmune Diseases and Conditions - Lupus

New Lupus Study Findings Have Been Reported by Researchers at King's College (Urinary congophilia in women with hypertensive disorders of pregnancy and preexisting proteinuria or hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Autoimmune Diseases and Conditions - Lupus is the subject of a report. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "Congophilia indicates the presence of amyloid protein, which is an aggregate of misfolded proteins, that is implicated in the pathophysiologic condition of preeclampsia. Recently, urinary congophilia has been proposed as a test for the diagnosis and prediction of preeclampsia."
Our news journalists obtained a quote from the research from King's College, "The purpose of this study was to determine whether urine congophilia is present in a cohort of women with preeclampsia and in pregnant and nonpregnant women with renal disease. With the use of a preeclampsia, chronic hypertension, renal disease, and systemic lupus erythematosus cohort, we analyzed urine samples from healthy pregnant control subjects (n = 31) and pregnant women with preeclampsia (n = 23), gestational hypertension (n = 10), chronic hypertension (n = 14), chronic kidney disease; n = 28), chronic kidney disease with superimposed preeclampsia (n = 5), and chronic hypertension and superimposed preeclampsia (n = 12). Samples from nonpregnant control subjects (n = 10) and nonpregnant women with either systemic lupus erythematosus with (n = 25) and without (n = 14) lupus nephritis were analyzed. For each sample, protein concentration was standardized before it was mixed with Congo Red, spotted to nitrocellulose membrane, and rinsed with methanol. The optical density of the residual Congo Red stain was determined; Congo red stain retention was calculated, and groups were compared with the use of the Mann-Whitney test or Kruskal-Wallis analysis of Variance test, as appropriate. Congophilia was increased in urine from women with preeclampsia (median Congo red stain retention, 47%; interquartile range, 22-68%) compared with healthy pregnant control subjects (Congo red stain retention: 16%; interquartile range, 13-21%; P = .002), women with gestational hypertension (Congo red stain retention, 20%; interquartile range, 13-27%; P = .008), or women with chronic hypertension Congo red stain retention, 17%; interquartile range, 12-28%; P = .01). There were no differences in Congo red retention between pregnant women with chronic hypertension and normal pregnant control subjects (Congo red stain retention, 17% [ interquartile range, 12-28%] vs 16% [interquartile range, 13-21%], respectively; P = .72).

Congophilia was present in pregnant women with chronic kidney disease (Congo red stain retention, 32%; interquartile range, 14-57%), being similar to values found in women with preeclampsia (P = .22) and for women with chronic kidney disease and superimposed preeclampsia (Congo red stain retention, 57%; [interquartile range, 29-71%; P = .18). Nonpregnant women with lupus nephritis had higher congophilia levels compared with nonpregnant female control subjects (Congo red stain retention, 38% [interquartile range, 17-73%] vs 9% [7-11%], respectively; P< .001) and nonpregnant women with systemic lupus erythematosus without nephritis (Congo red stain retention, 38% [interquartile range, 17-73%] vs 13% [interquartile range, 11-17%], respectively; P = .001). A significant positive correlation was observed between congophilia and protein: creatinine ratio (Spearman rank correlations, 0.702; 95% confidence interval, 0.618-0.770; P< .001). This study confirms that women with preeclampsia and chronic kidney disease without preeclampsia have elevated urine congophilia levels compared with healthy pregnant women. Nonpregnant women with lupus nephritis also have elevated urine congophilia levels compared with healthy control subjects."

According to the news editors, the research concluded: "An elevated Congo Red stain retention may not be able to differentiate between these conditions; further research is required to explore the use of congophilia in clinical practice."

The news correspondents report that additional information may be obtained from F.P. McCarthy, Kings Coll London, St. Thomas Hospital, Womens Hlth Academy Center, London, United Kingdom. Additional authors for this research include A. Adetoba, C. Gill, K. Bramham, M. Bertolaccini, G.J. Burton, G. Girardi, P.T. Seed, L. Poston and L.C. Chappell.
New Luteinizing Hormone Findings from National Research Institute of Aquaculture Discussed (Development of a homologous radioimmunoassay for red seabream follicle stimulating hormone and regulation of gonadotropins by GnRH in red seabream, ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptide Proteins - Luteinizing Hormone. According to news reporting originating from Oita, Japan, by NewsRx correspondents, research stated, "Using a recombinant chimeric single-chain follicle stimulating hormone (FSH), we established a radioimmunoassay (RIA) for red seabream (Pagrus major) FSH (pmFSH) which became a powerful tool for studying reproductive physiology. We studied the profiles in plasma and pituitary concentrations of FSH and luteinizing hormone (LH) during sexual maturation."

Financial support for this research came from JSPS KAKENHI.

Our news editors obtained a quote from the research from the National Research Institute of Aquaculture, "A pre-established RIA for red seabream LH was used for the LH measurements. The regulation of FSH and LH secretion from the pituitary was investigated using a gonadotropin-releasing hormone analog (GnRHa) in vivo and in vitro. Marked differences in plasma and pituitary FSH levels were observed between males and females; pituitary FSH content in males was much higher than that in females during all seasons, and plasma FSH levels in males were high during the spawning season, whereas those in females were unchanged. In contrast, plasma and pituitary levels of LH were elevated before and during the spawning season in males and females. Injecting or implanting (cholesterol pellet) a GnRHa into adult and juvenile red seabream resulted in significant increases in plasma LH concentrations; however, no significant change was observed in plasma FSH. Moreover, GnRHa stimulated only LH secretion in an in vitro experiment using dispersed pituitary cells. The discrete FSH and LH secretion profiles revealed suggest differential roles for the two gonadotropins during red seabream gametogenesis."

According to the news editors, the research concluded: "In addition, the marked difference in pituitary FSH levels in males and females suggests the relative significance of FSH in male reproduction."

For more information on this research see: Development of a homologous radioimmunoassay for red seabream follicle stimulating hormone and regulation of gonadotropins by GnRH in red seabream, Pagrus major. New Lymphocytes Study Findings Recently Were Reported by Researchers at University Hospital (Moving Immune Checkpoint Blockade in Thoracic Tumors beyond NSCLC)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Lymphocytes. According to news reporting from Parma, Italy, by NewsRx journalists, research stated, "SCLC and malignant pleural mesothelioma (MPM) are historically characterized by a disappointing lack of significant therapeutic breakthroughs for novel agents, and both malignancies represent true unmet medical needs. Given the promising results of anti-cytotoxic T-lymphocyte associated protein-4 and anti-programmed cell death-1/programmed death ligand-1 antibodies in the treatment of advanced NSCLCs, these immune checkpoint inhibitors are now also under investigation in SCLC and MPM, as well as in thymic epithelial tumors (TETs)."

The news correspondents obtained a quote from the research from University Hospital, "Here, we review the biological and clinical rationale for immune checkpoint inhibition in SCLC, MPM, and TETs and present preliminary clinical results with available antibodies. Immunotherapeutic perspectives for these malignancies in terms of novel agents currently under evaluation or anticipated in the near future are also discussed. Current immune checkpoint blockers targeting cytotoxic T-lymphocyte associated protein-4 and the programmed cell death-1/programmed death ligand-1 axis, administered alone or in combination and as multi modality treatment, are likely to be a valuable addition to the therapeutic array for managing SCLC and MPM; studies in TETs, which are currently in their infancy, are merited."

According to the news reporters, the research concluded: "Close attention to potential toxicities will be important to the success of such strategies in these settings."

Our news journalists report that additional information may be obtained by contacting F. Facchinetti, University Hospital Parma, Medical Oncol Unit, Parma, Italy. Additional authors for this research include A. Marabelle, G. Rossi, J.C. Soria, B. Besse and M. Tiseo.

Immunology - Lymphoid Tissue

New Lymphoid Tissue Findings from Medical University Outlined
(Vulvar cancer: initial management and systematic review of literature on currently applied treatment approaches)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immunology - Lymphoid Tissue are discussed in a new report. According to news reporting from Gdansk, Poland, by NewsRx editors, the research stated, "This review provides guidelines and aims to estimate utilisation rates of treatment modalities applied in vulvar cancer. Current standards of treatment are as follows: wide local excision instead of radical vulvectomy in the case of small tumour (T < 2 cm), no lymph node dissection in the case of a microinvasive tumour (invasion < 1 mm), unilateral lymph node dissection in the case of a lateral tumour and inguinal-femoral lymphadenectomy by separate incisions instead of en bloc inguinal-femoral lymph node excision."

The news correspondents obtained a quote from the research from Medical University, "Implementation of sentinel lymph node biopsy in patients with tumours not exceeding 4 cm is safe and efficiently eliminates redundant groin dissections. Pre-operative treatment with chemoradiotherapy reduces tumour size and improves surgical excision of inoperable primary tumours or fixed lymph nodes, but side effects are considerable. Literature search performed using PubMed database (from: 1 June 2005 to 1 June 2015) with the terms 'consecutive', 'vulvar cancer', 'treatment' identified seven full-text manuscripts, including data on 1114 patients. Utilisation rates of neoadjuvant radiochemotherapy, chemotherapy alone, surgery, adjuvant radiotherapy and adjuvant radiochemotherapy were 5.9%, 0.3%, 89.3%, 22.6% and 0.2% respectively."

According to the news reporters, the research concluded: "An evidence-based estimation of appropriate rates of surgery, radiotherapy and chemotherapy for vulvar cancer is needed to compare management reflecting guidelines with presented here real frequency of applied modalities."

Our news journalists report that additional information may be obtained by contacting J.J. Sznurkowski, Medical University Lublin, Dept. of Surg Oncol, Gdansk, Poland.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ecc.12455. This DOI is a link to an online electronic document that is either free or for purchase.

**Immunology - Lymphoid Tissue**

**New Lymphoid Tissue Findings from School of Medicine Described (Pelvic Lymph Node Dissection in Patients Treated for Testis Cancer: The Memorial Sloan Kettering Cancer Center Experience)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunology - Lymphoid Tissue. According to news reporting originating in Springfield, Illinois, by NewsRx journalists, research stated, "To describe the pathologic findings and clinical outcome data for patients undergoing pelvic lymph node dissection (PLND) in the course of management of testicular germ cell tumors at Memorial Sloan Kettering Cancer Center (MSKCC). Following institutional review board approval, data on 2186 patients who underwent retroperitoneal lymph node dissection (RPLND) at MSKCC between 1989 and 2011 were retrospectively reviewed."

The news reporters obtained a quote from the research from the School of Medicine, "Of these 2186 patients, we analyzed data for 44 patients (2%) who underwent PLND at the time of RPLND. PLND was performed in 14/44 (31%) patients at time of primary RPLND (P-RPLND), and in 21/44(48%) patients at time of postchemotherapy RPLND (PC-RPLND), usually for suspicious radiologic or intraoperative findings, whereas 9/44 (21%) underwent PLND for treatment of relapse. Positive pelvic findings on imaging included pelvic disease <= 5 cm in 17/44 (39%) patients and >5 cm in 11/44 (25%) patients (median size = 4 cm). At the time of PC-RPLND, alphafetoprotein and beta human chorionic gonadotropin were elevated in 6/21 (29%) and 4/21 (19%) patients, respectively. Histology revealed teratoma in 15/44 (34%) and viable tumor in 5/44 (11%) patients. At a median follow-up of 46 months, 40/44 (91%) patients were living without disease, 3/44 (7%) were living with disease (1 after PC-RPLND and 2 after relapse), and 1/44 (2%) died of other causes."

According to the news reporters, the research concluded: "PLND was performed infrequently in our series of patients who underwent RPLND for testis cancer."

Our news correspondents report that additional information may be obtained by contacting S.R. Alanee, Southern Illinois Univ, Sch Med, Dept. of Surg, Div Urol, Springfield,
Oncology - Lymphoma

New Lymphoma Findings from University of Rochester Described [ACR Appropriateness Criteria (R) Hodgkin Lymphoma-Favorable Prognosis Stage I and II]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lymphoma. According to news reporting from Rochester, New York, by NewsRx journalists, research stated, "This topic addresses the treatment of newly diagnosed patients with favorable prognosis stage I and II Hodgkin lymphoma. In most cases, combined modality therapy (chemotherapy followed by involved site radiation therapy) constitutes the current standard of care."

The news correspondents obtained a quote from the research from the University of Rochester, "The American College of Radiology Appropriateness Criteria are evidence-based guidelines for specific clinical conditions that are reviewed annually by a multidisciplinary expert panel. The guideline development and revision include an extensive analysis of current medical literature from peer-reviewed journals and the application of well-established methodologies (RAND/UCLA Appropriateness Method and Grading of Recommendations Assessment, Development, and Evaluation or GRADE) to rate the appropriateness of imaging and treatment procedures for specific clinical scenarios. In those instances where evidence is lacking or equivocal, expert opinion may supplement the available evidence to recommend imaging or treatment. By combining the most recent medical literature and expert opinion, this revised guideline can aid clinicians in the appropriate use of combined modality therapy for favorable prognosis stage I and II Hodgkin lymphoma."

According to the news reporters, the research concluded: "Increasing information about the late effects of treatment has led to attempts to decrease toxicity by using less chemotherapy (decreased duration and/or intensity or different agents) and less radiation therapy (reduced volume and/or dose) while maintaining excellent efficacy."

For more information on this research see: ACR Appropriateness Criteria® Hodgkin Lymphoma-Favorable Prognosis Stage I and II. American Journal of Clinical Oncology-Cancer Clinical Trials, 2016;39(6):535-544. American Journal of Clinical Oncology-Cancer Clinical Trials can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Our news journalists report that additional information may be obtained by contacting S. Dhakal, University of Rochester, Medical Center, Rochester, NY 14627, United States. Additional authors for this research include R. Advani, L.K. Ballas, B.S. Dabaja, C.R.

Machine Learning

New Machine Learning Findings from University of California Outlined (Molecular Properties of Drugs Interacting with SLC22 Transporters OAT1, OAT3, OCT1, and OCT2: A Machine-Learning Approaches)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Machine Learning. According to news originating from La Jolla, California, by NewsRx correspondents, research stated, "Statistical analysis was performed on physicochemical descriptors of similar to 250 drugs known to interact with one or more SLC22 'drug' transporters (i.e., SLC22A6 or OAT1, SLC22A8 or OAT3, SLC22A1 or OCT1, and SLC22A2 or OCT2), followed by application of machine-learning methods and wet laboratory testing of novel predictions. In addition to molecular charge, organic anion transporters (OATs) were found to prefer interacting with planar structures, whereas organic cation transporters (OCTs) interact with more three-dimensional structures (i.e., greater SP3 character)."

Our news journalists obtained a quote from the research from the University of California, "Moreover, compared with OAT1 ligands, OAT3 ligands possess more acyclic tetravalent bonds and have a more zwitterionic/cationic character. In contrast, OCT1 and OCT2 ligands were not clearly distinguishable form one another by the methods employed. Multiple pharmacophore models were generated on the basis of the drugs and, consistent with the machine-learning analyses, one unique pharmacophore created from ligands of OAT3 possessed cationic properties similar to OCT ligands; this was confirmed by quantitative atomic property field analysis. Virtual screening with this pharmacophore, followed by transport assays, identified several cationic drugs that selectively interact with OAT3 but not OAT1. Although the present analysis may be somewhat limited by the need to rely largely on inhibition data for modeling, wet laboratory/in vitro transport studies, as well as analysis of drug/metabolite handling in Oat and Oct knockout animals, support the general validity of the approach-which can also be applied to other SLC and ATP binding cassette drug transporters. This may make it possible to predict the molecular properties of a drug or metabolite necessary for interaction with the transporter(s), thereby enabling better prediction of drug-drug interactions and drug-metabolite interactions."

According to the news editors, the research concluded: "Furthermore, understanding the overlapping specificities of OATs and OCTs in the context of dynamic transporter tissue expression patterns should help predict net flux in a particular tissue of anionic, cationic, and zwitterionic molecules in normal and pathophysiological states."

Mosquito-Borne Diseases - Malaria

New Malaria Study Findings Have Been Reported from J.I. Nankabirwa et al (Intermittent Preventive Treatment with Dihydroartemisinin-Piperaquine in Ugandan Schoolchildren Selects for Plasmodium falciparum Transporter Polymorphisms That Modify ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mosquito-Borne Diseases - Malaria. According to news reporting originating in Kampala, Uganda, by NewsRx journalists, research stated, "Dihydroartemisinin-piperaquine (DP) offers prolonged protection against malaria, but its impact on Plasmodium falciparum drug sensitivity is uncertain. In a trial of intermittent preventive treatment in schoolchildren in Tororo, Uganda, in 2011 to 2012, monthly DP for 1 year decreased the incidence of malaria by 96% compared to placebo; DP once per school term offered protection primarily during the first month after therapy."

The news reporters obtained a quote from the research, "To assess the impact of DP on selection of drug resistance, we compared the prevalence of key polymorphisms in isolates that emerged at different intervals after treatment with DP. Blood obtained monthly and at each episode of fever was assessed for P. falciparum parasitemia by microscopy. Samples from 160 symptomatic and 650 asymptomatic episodes of parasitemia were assessed at 4 loci (N86Y, Y184F, and D1246Y in pfmdr1 and K76T in pfcrt) that modulate sensitivity to aminoquinoline antimalarials, utilizing a ligase detection reaction-fluorescent microsphere assay. For pfmdr1 N86Y and pfcrt K76T, but not the other studied polymorphisms, the prevalences of mutant genotypes were significantly greater in children who had received DP within the past 30 days than in those not treated within 60 days (86Y, 18.0% versus 8.3% [P = 0.03]; 76T, 96.0% versus 86.1% [P = 0.05]), suggesting selective pressure of DP. Full sequencing of pfcrt in a subset of samples did not identify additional polymorphisms selected by DP."

According to the news reporters, the research concluded: "In summary, parasites that emerged soon after treatment with DP were more likely than parasites not under drug pressure to harbor pfmdr1 and pfcrt polymorphisms associated with decreased sensitivity to aminoquinoline antimalarials."

For more information on this research see: Intermittent Preventive Treatment with Dihydroartemisinin-Piperaquine in Ugandan Schoolchildren Selects for Plasmodium falciparum Transporter Polymorphisms That Modify Drug Sensitivity. Antimicrobial Agents and

**Mosquito-Borne Diseases - Malaria**

**New Malaria Study Findings Recently Were Reported by Researchers at Clemson University (Identification of Novel Plasmodium falciparum Hexokinase Inhibitors with Antiparasitic Activity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mosquito-Borne Diseases - Malaria. According to news reporting originating in Clemson, South Carolina, by NewsRx journalists, research stated, "Plasmodium falciparum, the deadliest species of malaria parasites, is dependent on glycolysis for the generation of ATP during the pathogenic red blood cell stage. Hexokinase (HK) catalyzes the first step in glycolysis, transferring the gamma-phosphoryl group of ATP to glucose to yield glucose-6-phosphate."

Financial support for this research came from HHS | National Institutes of Health (NIH).

The news reporters obtained a quote from the research from Clemson University, "Here, we describe the validation of a high-throughput assay for screening small-molecule collections to identify inhibitors of the P. falciparum HK (PfHK). The assay, which employed an ADP-Glo reporter system in a 1,536-well-plate format, was robust with a signal-to-background ratio of 3.4 +/- 1.2, a coefficient of variation of 6.8% +/- 2.9%, and a Z'-factor of 0.75 +/- 0.08. Using this assay, we screened 57,654 molecules from multiple small-molecule collections. Confirmed hits were resolved into four clusters on the basis of structural relatedness. Multiple singleton hits were also identified. The most potent inhibitors had 50% inhibitory concentrations as low as similar to 1 mu M, and several were found to have low-micromolar 50% effective concentrations against asexual intraerythrocytic-stage P. falciparum parasites. These molecules additionally demonstrated limited toxicity against a panel of mammalian cells."

According to the news reporters, the research concluded: "The identification of PfHK inhibitors with antiparasitic activity using this validated screening assay is encouraging, as it justifies additional HTS campaigns with more structurally amenable libraries for the identification of potential leads for future therapeutic development."
For more information on this research see: Identification of Novel Plasmodium falciparum Hexokinase Inhibitors with Antiparasitic Activity. *Antimicrobial Agents and Chemotherapy*, 2016;60(10):6023-6033. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

**Mosquito-Borne Diseases - Malaria**

**New Malaria Study Results Reported from GlaxoSmithKline**

**Development of a Novel High-Density [H-3] Hypoxanthine Scintillation Proximity Assay To Assess Plasmodium falciparum Growth**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mosquito-Borne Diseases - Malaria. According to news reporting originating in Tres Cantos, Spain, by NewsRx journalists, research stated, "The discovery and development of new antimalarial drugs are becoming imperative because of the spread of resistance to current clinical treatments. The lack of robustly validated antimalarial targets and the difficulties with the building in of whole-cell activity in screening hits are hampering target-based approaches."

The news reporters obtained a quote from the research from GlaxoSmithKline, "However, phenotypic screens of structurally diverse molecule libraries are offering new opportunities for the identification of novel antimalarials. Several methodologies can be used to determine the whole-cell in vitro potencies of antimalarial hits. The [H-3] hypoxanthine incorporation assay is considered the 'gold standard' assay for measurement of the activity of antimalarial compounds against intraerythrocytic forms of Plasmodium falciparum. However, the method has important limitations, as the assay is not amenable for high-throughput screening since it remains associated with the 96-well plate format. We have overcome this drawback by adapting the [3H] hypoxanthine incorporation method to a 384-well high-density format by coupling a homogeneous scintillation proximity assay (SPA) and thus eliminating the limiting filtration step. This SPA has been validated using a diverse set of 1,000 molecules, including both a representative set from the Tres Cantos Antimalarial Set (TCAMS) of compounds and molecules inactive against whole cells. The results were compared with those from the P. falciparum lactate dehydrogenase whole-cell assay, another method that is well established as a
surrogate for parasite growth and is amenable for high-throughput screening."

According to the news reporters, the research concluded: "The results obtained demonstrate that the SPA-based [H-3] hypoxanthine incorporation assay is a suitable design that is adaptable to high-throughput antimalarial drug screening and that maintains the features, robustness, and reliability of the standard filtration hypoxanthine incorporation method."

Our news correspondents report that additional information may be obtained by contacting C. de Cozar, GlaxoSmithKline, DDW, Tres Cantos, Spain. Additional authors for this research include I. Caballero, G. Colmenarejo, L.M. Sanz, E. Alvarez-Ruiz, F.J. Gamo and C. Cid.

Mosquito-Borne Diseases - Malaria

New Malaria Study Results from M.W. Vos et al Described (A semi-automated luminescence based standard membrane feeding assay identifies novel small molecules that inhibit transmission of malaria parasites by mosquitoes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mosquito-Borne Diseases - Malaria. According to news reporting originating in Nijmegen, Netherlands, by NewsRx journalists, research stated, "Current first-line treatments for uncomplicated falciparum malaria rapidly clear the asexual stages of the parasite, but do not fully prevent parasite transmission by mosquitoes. The standard membrane feeding assay (SMFA) is the biological gold standard assessment of transmission reducing activity (TRA), but its throughput is limited by the need to determine mosquito infection status by dissection and microscopy."

The news reporters obtained a quote from the research, "Here we present a novel dissection-free luminescence based SMFA format using a transgenic Plasmodium falciparum reporter parasite without resistance to known antimalarials and therefore unrestricted in its utility in compound screening. Analyses of sixty-five compounds from the Medicines for Malaria Venture validation and malaria boxes identified 37 compounds with high levels of TRA (>80%); different assay modes allowed discrimination between gametocytocidal and downstream modes of action. Comparison of SMFA data to published assay formats for predicting parasite infectivity indicated that individual in vitro screens show substantial numbers of false negatives. These results highlight the importance of the SMFA in the screening pipeline for transmission reducing compounds and present a rapid and objective method."

According to the news reporters, the research concluded: "In addition we present
sixteen diverse chemical scaffolds from the malaria box that may serve as a starting point for further discovery and development of malaria transmission blocking drugs."

For more information on this research see: A semi-automated luminescence based standard membrane feeding assay identifies novel small molecules that inhibit transmission of malaria parasites by mosquitoes. *Scientific Reports*, 2015;5():18704. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Oncology - Malignant Mesothelioma**

**New Malignant Mesothelioma Data Have Been Reported by Investigators at Seoul National University (Hypomethylation reduced the aggressive potential of human malignant mesothelioma cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Malignant Mesothelioma have been published. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Epigenetic modifications have been implicated in the development of therapeutic resistance responsible for the poor prognosis of human malignant mesothelioma (HMM). To find a potential way to overcome this therapeutic resistance, this study investigated the anticancer effects of a DNA demethylating agent, 5-Aza-2'-Deoxycytidine (5-aza-dC), on HMM cells."

Our news journalists obtained a quote from the research from Seoul National University, "The 5-aza-dC exhibited minimal detrimental effects on cell survival. However, treatment with 5-aza-dC significantly altered the, biological characteristics associated with malignancy, such as cell migration and cell interaction, colony-forming capacity, and invasiveness. Moreover, it significantly reduced the fraction of side population (SP) cells, which are reportedly enriched for more aggressive cells. Large-scale methylation analysis based on methylated DNA immunoprecipitation revealed a more than two fold increase in the methylation level of major tumor suppressor genes in the SP fraction. The data indicated that SP cells might acquire malignancy by hypermethylation of tumor suppressor genes. Treatment with 5-aza-dC could attack more malignant cells through the modification of their methylation status. The results indicate that the modulation of DNA methylation might be a valuable strategy to overcome the therapeutic resistance of HMM."

According to the news editors, the research concluded: "Moreover, ensuing changes in the biological characteristics provide a basis for further analysis of the role of methylation in
DNA Viruses - Mastadenovirus

New Mastadenovirus Study Results Reported from University of Manitoba (The interaction of adenovirus E1A with the mammalian protein Ku70/XRCC6)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on DNA Viruses - Mastadenovirus have been presented. According to news originating from Winnipeg, Canada, by NewsRx correspondents, research stated, "Human adenovirus infects terminally differentiated cells and to replicate it must induce S-phase. The chief architects that drive adenovirus-infected cells into S-phase are the E1A proteins, with 5 different isoforms expressed during infection."

Financial supporters for this research include Natural Sciences and Engineering Research Council, Research Manitoba (MHRC Establishment Grant).

Our news journalists obtained a quote from the research from the University of Manitoba, "E1A remodels the infected cell by associating with cellular factors and modulating their activity. The C-terminus of E1A is known to bind to only a handful of proteins. We have identified a novel E1A C-terminus binding protein, Ku70 (XRCC6), which was found to bind directly within the CR4 of E1A from human adenovirus type 5. Depletion of Ku70 reduced virus growth, possibly by activating the DNA damage response pathway. Ku70 was found to localize to viral replication centers and associate with the viral genome. Ku70 was also recruited to cellular cell cycle regulated promoters following viral infection."

According to the news editors, the research concluded: "Our study has identified, for the first time, Ku70 as a novel E1A-binding protein which affects virus life cycle."

For more information on this research see: The interaction of adenovirus E1A with the mammalian protein Ku70/XRCC6. Virology, 2017;500():11-21. Virology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Virology - www.journals.elsevier.com/virology/)

The news correspondents report that additional information may be obtained from P.
New Measles Findings Reported from Paul Ehrlich Institute (Enhanced lysis by bispecific oncolytic measles viruses simultaneously using HER2/neu or EpCAM as target receptors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Infectious Diseases and Conditions - Measles are discussed in a new report. According to news reporting from Langen, Germany, by NewsRx journalists, research stated, "To target oncolytic measles viruses (MV) to tumors, we exploit the binding specificity of designed ankyrin repeat proteins (DARPins). These DARPin-MVs have high tumor selectivity while maintaining excellent oncolytic potency."

The news correspondents obtained a quote from the research from Paul Ehrlich Institute, "Stability, small size, and efficacy of DARPin allowed the generation of MVs simultaneously targeted to tumor marker HER2/neu and cancer stem cell (CSC) marker EpCAM. For optimization, the linker connecting both DARPin was varied in flexibility and length. Flexibility had no impact on fusion helper activity whereas length had. MVs with bispecific MV-H are genetically stable and revealed the desired double-target specificity. In vitro, the cytolysis activity of bispecific MVs was superior or comparable to mono-targeted viruses depending on the target cells. In vivo, therapeutic efficacy of the bispecific viruses was validated in an orthotopic ovarian carcinoma model revealing an effective reduction of tumor mass. Finally, the power of bispecific targeting was demonstrated on cocultures of different tumor cells thereby mimicking tumor heterogeneity in vitro, more closely reflecting real tumors. Here, bispecific excelled monospecific viruses in efficacy."

According to the news reporters, the research concluded: "DARPin-based targeting domains thus allow the generation of efficacious oncolytic viruses with double specificity, with the potential to handle intratumoral variation of antigen expression and to simultaneously target CSCs and the bulk tumor mass."

For more information on this research see: Enhanced lysis by bispecific oncolytic measles viruses simultaneously using HER2/neu or EpCAM as target receptors. *Molecular Therapy-Oncolytics*, 2016;3():1-13. *Molecular Therapy-Oncolytics* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

Our news journalists report that additional information may be obtained by contacting M.D. Muhlebach, Paul Ehrlich Inst, Oncolyt Measles Viruses & Vaccine Vectors, Langen, Germany. Additional authors for this research include L. Gottschlich, D. Riehl, T.

Keywords for this news article include: Langen, Germany, Europe, Infectious Diseases and Conditions, Paramyxoviridae Infections, Morbillivirus Infections, Mononegavirales, Paramyxovirinae, Measles Virus, RNA Viruses, Virology, Genetics, Viral, Paul Ehrlich Institute.

Genetics - Medical Genetics

New Medical Genetics Findings from School of Psychiatry Described (Sleep disturbance in Mowat-Wilson syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Genetics - Medical Genetics have been presented. According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "Mowat-Wilson syndrome (MWS) is a multiple congenital anomaly syndrome caused by a heterozygous mutation or deletion of the ZEB2 gene. It is characterized by a distinctive facial appearance in association with intellectual disability (ID) and variable other features including agenesis of the corpus callosum, seizures, congenital heart defects, microcephaly, short stature, hypotonia, and Hirschsprung disease."

Financial supporters for this research include University of New South Wales, Sydney Children's Hospital Foundation.

The news reporters obtained a quote from the research from the School of Psychiatry, "The current study investigated sleep disturbance in people with MWS. In a series of unstructured interviews focused on development and behaviors in MWS, family members frequently reported sleep disturbance, particularly early-morning waking and frequent night waking. The Sleep Disturbance Scale for Children (SDSC) was therefore administered to a sample of 35 individuals with MWS, along with the Developmental Behaviour Checklist (DBC) to measure behavioral and emotional disturbance. A high level of sleep disturbance was found in the MWS sample, with 53% scoring in the borderline range and 44% in the clinical disorder range for at least one subscale of the SDSC. Scores were highest for the Sleep-wake transition disorders subscale, with 91% of participants reaching at least the borderline disorder range. A significant positive association was found between total scores on the SDSC and the DBC Total Behaviour Problem Score."

According to the news reporters, the research concluded: "These results suggest that sleep disorders should be screened for in people with MWS, and where appropriate, referrals to sleep specialists made for management of sleep problems."

Our news correspondents report that additional information may be obtained by contacting E. Evans, Dept. of Developmental Disability Neuropsychiatry, School of Psychiatry, UNSW Australia, Sydney, New South Wales, Australia. Additional authors for this research include D. Mowat, M. Wilson and S. Einfeld.

Genetics - Medical Genetics

New Medical Genetics Study Findings Reported from Technion-Israel Institute of Technology (Is One Diagnosis the Whole Story? Patients with Double Diagnoses)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Genetics - Medical Genetics. According to news originating from Haifa, Israel, by NewsRx correspondents, research stated, "One of the goals of evaluating a patient in the genetics clinic is to find the diagnosis that would explain his or her clinical presentation. Sometimes the patient's diagnosis remains undefined or does not explain all of the clinical findings."

Our news journalists obtained a quote from the research from the Technion-Israel Institute of Technology, "As clinicians are often guided by a 'single disorder' paradigm, diagnosing multiple genetic conditions in the same patient requires a heightened sense of awareness. Over the last few years, we evaluated several patients (n = 14) who were found to have more than one genetic diagnosis. In this paper, we will describe their natural history and diagnoses, and draw on the lessons learned from this phenomenon, which we expect to grow in this era of next-generation diagnostic technologies. To our knowledge, this is by far the largest series of patients with double diagnoses."

According to the news editors, the research concluded: "Based on our findings, we strongly recommend that physicians question every diagnosis to determine whether it indeed explains all of the patients' symptoms, and consider whether they should continue the diagnostic evaluation to look for a more accurate and complete set of diagnoses."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/ajmg.a.37799. This DOI is a link to an online electronic document that is either free or for purchase.

New Medicinal Chemistry Findings Has Been Reported by Investigators at Shanghai Jiao-Tong University (Screening and biological evaluation of a novel STAT3 signaling pathway inhibitor against cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Health and Medicine - Medicinal Chemistry have been presented. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "It is now established that the specificity in signaling of signal transducer and activator of transcription 3 (STAT3) is mediated by the SH2 domain of STAT3, which mediates its interaction with the phosphopeptide docking sites displayed by receptors and JAKs, dimerization and subsequent DNA binding. Thus, we aimed to identify and design a class of strong potential small molecular inhibitors of STAT3 for the discovery and development of novel anticancer agents."

Financial supporters for this research include National Basic Research Program of China, National Natural Science Foundation of China.

Our news editors obtained a quote from the research from Shanghai Jiao-Tong University, "Several classes of small molecules have been identified as STAT3 inhibitors after structure-based screening of the STAT3 SH2 domain. Next, we detected the activity of these inhibitors using fluorescence polarization (FP) and identified the growth inhibition of DU145 and MDA-MB-468 cells using the CCK-8 assay. Consequently, B9 inhibits the proliferation of tumor cells harboring abnormal activation of STAT3, such as, MDA-MB-468, MDA-MB-231 and DU145. However, there is little inhibition of MCF-7 cells. In addition, The K-d of B9 to STAT3 (1634S/Q635G) is 22.75 μM compared to 4.59 μM for WT as analyzed by SPR. The phosphorylation of STAT3 in MDA-MB-468 cells was obviously decreased after treatment with B9 at the preconceived concentration of 30 μM, as detected using immunoblotting. Here, we evaluated the effect of B9 on the migration of MDA-MB-468 cells."

According to the news editors, the research concluded: "Taken together, our results indicate a novel small molecule that decreases STAT3 activation and function of the STAT3 signaling pathway, thereby inducing an antitumor response in human breast cancer cells harboring constitutively active STAT3."

The news editors report that additional information may be obtained by contacting J. Zhang, Shanghai Jiao Tong University, Sch Med, Dept. of Pathophysiol, Key Lab Cell Differentiat & ApoptosisChinese Min, Shanghai 200025, People's Republic of China. Health and Medicine - Medicinal Chemistry

New Medicinal Chemistry Findings from University of Birmingham Outlined (Nucleoside Phosphate and Phosphonate Prodrug Clinical Candidates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Health and Medicine - Medicinal Chemistry have been presented. According to news reporting out of Birmingham, United Kingdom, by NewsRx editors, research stated, "Nucleoside monophosphates and monophosphonates have been known for a long time to exert favorable pharmacological effects upon intracellular delivery. However, their development as drug molecules has been hindered by the inherent poor druglike properties of the monophosphate and monophosphonate groups."

Our news journalists obtained a quote from the research from the University of Birmingham, "These include inefficient cellular uptake and poor in vivo stability, with this latter drawback being most relevant to monophosphates than monophosphonates. To address these limitations, numerous monophosphate and monophosphonate prodrug strategies have been developed and applied in the discovery of nucleoside monophosphate and monophosphonate prodrugs that can treat viral infections and cancer. The approval of sofosbuvir, a nucleoside monophosphate prodrug, highlighted the success to be had by employing these prodrug technologies in the discovery of nucleotide therapeutics."

According to the news editors, the research concluded: "In this Miniperspective, we discuss the different key monophosphate and monophosphonate nucleoside prodrugs that entered clinical development, some of which may in the future be approved to treat various human diseases."

For more information on this research see: Nucleoside Phosphate and Phosphonate Prodrug Clinical Candidates. Journal of Medicinal Chemistry, 2016;59(23):10400-10410.

Journal of Medicinal Chemistry can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; Journal of Medicinal Chemistry - www.pubs.acs.org/journal/jmchem)

Our news journalists report that additional information may be obtained by contacting Y. Mehellou, University of Birmingham, Coll Engn & Phys Sci, Sch Chem, Birmingham B15 2TT, W Midlands, United Kingdom. Additional authors for this research include H. Kadri, A. Miccoli and Y. Mehellou.

New Medicinal Chemistry Study Findings Have Been Reported by Investigators at Academy of Sciences (Synthesis and biological evaluation of novel 2-imino-4-thiazolidinone derivatives as potent anti-cancer agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Health and Medicine - Medicinal Chemistry are presented in a new report. According to news reporting originating from Tamil Nadu, India, by NewsRx correspondents, research stated, "A new series of 2-imino-4-thiazolidinone derivatives (7a-7t) has been synthesised and screened for their cytotoxicity against three cancer cell lines (B16F10, A549, PANC-1) and normal cell line (CHO). Among the compounds tested, compounds 7k, 7m, 7n showed potent cytotoxicity against B16F10 cell line with IC50 between 3.4 and 7 μM. Interestingly these three compounds are non toxic to non cancerous CHO cells and induced apoptosis in B16F10 cells observed by DNA damage analysis through PI/Hoechst double staining method."

Financial supporters for this research include CSIR, Department of Science & Technology, Government of India, DST.

Our news editors obtained a quote from the research from the Academy of Sciences, "Compounds 7k and 7n induced G0/G1 cell cycle arrest while compound 7m induced G2/M cell cycle arrest in B16F10 cells which confirms that these compounds have role in cancer cell cycle regulation. Additionally, compound 7m showed generation of intracellular reactive oxygen species (ROS) in B16F10 cells that may contribute in the cell cycle arrest whereas compounds 7k and 7n show anti-cancer activity through independent of ROS formation. Induction of apoptosis, cell cycle arrest in B16F10 cells are found to be the anti-cancer mechanism of these three compounds."

According to the news editors, the research concluded: "The results all together demonstrate the potent cytotoxic nature of these compounds in cancer cells could be considered as new class of chemotherapeutic agents in near future."

The news editors report that additional information may be obtained by contacting R.M. Kumbhare, Academy Sci & Innovat Res, Madras 600113, Tamil Nadu, India. Additional authors for this research include R. Kotcherlakota, T.L. Dadmal, V.S. Bollu, R.M. Kumbhare and C.R. Patra.

**Oncology - Melanoma**

**New Melanoma Data Have Been Reported by Researchers at University of Sao Paulo (Genotyping and differential expression analysis of inflammasome genes in sporadic malignant melanoma reveal novel contribution of CARD8, IL1B and IL18 in melanoma ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Melanoma have been presented. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "Sporadic melanoma malignancy is correlated with constitutive secretion of IL-1 beta in transformed melanocytes suggesting the involvement of inflammasome in melanoma. Common variants in inflammasome genes are known to affect IL-1 beta expression."

Funders for this research include Sao Paulo Research Foundation, CNPq.

Our news journalists obtained a quote from the research from the University of Sao Paulo, "To investigate the contribution of inflammasome genetics in melanoma development and progression and to identify a potential prognostic marker, the distribution of selected inflammasome SNPs was analysed in a Brazilian case/control cohort of sporadic malignant melanoma (SMM) and then the expression of inflammasome components was evaluated in melanoma biopsies. Allele and gene-specific Taqman assays were implied for genotyping of case/control DNA samples and for relative expression analysis in skin biopsies respectively. CARD8 rs6509365 was found to be significantly more common in healthy volunteers than in SMM patients suggesting a protection effect of this variant towards melanoma development. Accordingly, CARD8 expression was found to be reduced in nevus compared to melanoma biopsies. Upon stratification, NLRP1 rs11651270 and CARD8 rs2043211 were found associated with nodular melanoma; IL1B rs1143643 to a lower value of Breslow index; IL18 rs5744256 to melanoma development in sun sensitive individuals. As expected, IL1B expression was up-regulated in tumour biopsies especially in metastatic samples, whereas IL18 was down-regulated compared to nevus."

According to the news editors, the research concluded: "Our results demonstrated for the first time the contribution of inflammasome genes CARD8, IL1B and IL18 in SMM."

The news correspondents report that additional information may be obtained from W.C. da Silva, University of Sao Paulo, Fac Med, Dept. of Dermatol, Lab Med Invest Dermatol & Immunodeficiencies LIM 5, BR-05403000 Sao Paulo, SP, Brazil. Additional authors for this research include T.M. Oshiro, D.C. de Sa, D. Franco, C.F. Neto and A. Pontillo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cancergen.2016.09.004. This DOI is a link to an online electronic document that is either free or for purchase.
New Melanoma Findings Reported from Tufts University (Brachytherapy vs. external beam radiotherapy for choroidal melanoma: Survival and patterns-of-care analyses)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Melanoma have been published. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "No modern randomized trials exist comparing external beam radiotherapy (EBRT) and plaque brachytherapy (BT) for choroidal melanoma, and the optimal treatment modality is currently unknown. This study compares the patterns of care and efficacy of EBRT vs. BT based on data in the Surveillance, Epidemiology, and End Results database."

The news correspondents obtained a quote from the research from Tufts University, "The Surveillance, Epidemiology, and End Results database was queried for patients aged 20-79 diagnosed with choroidal melanoma from 2004 to 2011, treated with EBRT or BT; included patients were clinically T1-T4, NO, and MO. Overall survival and cause-specific survival curves were calculated by the Kaplan-Meier method. Univariate and multi-variate analyses were performed in the survival and patterns-of-care analyses. A total of 1004 cases (380 EBRT and 624 BT) were included in the survival analysis. There was no difference in the 5-year overall survival (83.3% EBRT vs. 82.5% BT, p = 0.69) and 5 year cause-specific survival (88.3% EBRT vs. 88.3% BT, p = 0.92). In the survival analysis, older age and advanced tumor stage were predictors of increased risk of death. In the patterns-of-care analysis, later year of diagnosis and smaller tumor stage were predictors of BT use. Advanced tumor stage and older age seem to be independent predictors for risk of death from choroidal melanoma. The use of BT favors smaller tumors and later year of diagnosis."

According to the news reporters, the research concluded: "There is no difference in survival between those treated with EBRT or BT, and the utilization of BT is increasing."

Our news journalists report that additional information may be obtained by contacting J.E. Mignano, Tufts University, Sch Med, Tufts Med Center, Dept. of Radiat Oncol, Boston, MA 02111, United States. Additional authors for this research include N.L. Gagne, C.S. Melhus and J.E. Mignano.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.brachy.2015.12.001. This DOI is a link to an online electronic document that is either free or for purchase.

New Melanoma Study Findings Reported from University of Chicago
(Density of immunogenic antigens does not explain the presence or absence of the T-cell-inflamed tumor microenvironment in melanoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Melanoma are discussed in a new report. According to news reporting from Chicago, Illinois, by NewsRx journalists, research stated, "Melanoma metastases can be categorized by gene expression for the presence of a T-cell-inflamed tumor microenvironment, which correlates with clinical efficacy of immunotherapies. T cells frequently recognize mutational antigens corresponding to nonsynonymous somatic mutations (NSSMs), and in some cases shared differentiation or cancer-testis antigens."

The news correspondents obtained a quote from the research from the University of Chicago, "Therapies are being pursued to trigger immune infiltration into non-T-cell-inflamed tumors in the hope of rendering them immunotherapy responsive. However, whether those tumors express antigens capable of T-cell recognition has not been explored. To address this question, 266 melanomas from The Cancer Genome Atlas (TCGA) were categorized by the presence or absence of a T-cell-inflamed gene signature. These two subsets were interrogated for cancer-testis, differentiation, and somatic mutational antigens. No statistically significant differences were observed, including density of NSSMs. Focusing on hypothetical HLA-A2(+) binding scores, 707 peptides were synthesized, corresponding to all identified candidate neoepitopes. No differences were observed in measured HLA-A2 binding between inflamed and noninflamed cohorts. Twenty peptides were randomly selected from each cohort to evaluate priming and recognition by human CD8(+) T cells in vitro with 25% of peptides confirmed to be immunogenic in both. A similar gene expression profile applied to all solid tumors of TCGA revealed no association between T-cell signature and NSSMs. Our results indicate that lack of spontaneous immune infiltration in solid tumors is unlikely due to lack of antigens."

According to the news reporters, the research concluded: "Strategies that improve T-cell infiltration into tumors may therefore be able to facilitate clinical response to immunotherapy once antigens become recognized."

Our news journalists report that additional information may be obtained by contacting T.F. Gajewski, University Chicago, Human Immune Monitoring Facil, Chicago, IL 60637, United States. Additional authors for this research include J.J. Luke, R. Bao, Y.Y. Zha, K.M. Hernandez, Y. Li, A.P. Gajewski, J. Andrade and T.F. Gajewski.

Oncology - Melanoma

**New Melanoma Study Results from University Hospital Described (Noncutaneous Melanomas: A Single-Center Analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Melanoma. According to news reporting out of Zurich, Switzerland, by NewsRx editors, research stated, "The optimal treatment algorithm for noncutaneous melanomas must yet be established. To compare systemic treatment-relevant mutational status, metastatic pattern and response to systemic treatment in noncutaneous melanoma."

Our news journalists obtained a quote from the research from University Hospital, "Retrospective single-center study analyzing 64 noncutaneous melanoma patients treated between January 2006 and September 2013. c-KIT mutations were found exclusively in vulvovaginal melanoma (4/7). Overall status for NRAS and BRAF mutations was low (1/7 and 0/21 detected mutations, respectively). Seven out of 7 vulvovaginal and 6/13 sinonasal melanomas first metastasized to lymph nodes, whereas 18/22 ocular melanomas first metastasized to the liver. Response to systemic treatment in vulvovaginal melanomas was best for imatinib with a disease control rate of 3/3 and overall for ipilimumab with a disease control rate of 3/10. Sorafenib was associated with adverse drug reactions (6/13) and poor results. Noncutaneous melanomas show few tumor-signaling pathway mutations and distinct metastasization patterns."

According to the news editors, the research concluded: "Immunotherapy induces response rates in mucosal melanoma similar to those in cutaneous melanoma."

Our news journalists report that additional information may be obtained by contacting V. Del Prete, Dept. of Dermatology, University Hospital of Zurich, Zurich, Switzerland. Additional authors for this research include K. Chaloupka, D. Holzmann, D. Fink, M. Levesque, R. Dummer and S.M Goldinger.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000441444. This DOI is a link to an online electronic document that is either free or for purchase.

Membrane Proteins - Membrane Glycoproteins

New Membrane Glycoproteins Study Findings Have Been Reported by Investigators at University of Melbourne [Novel mechanism of modulation at a ligand-gated ion channel; action of 5-Cl-indole at the 5-HT(3)A receptor]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Membrane Proteins - Membrane Glycoproteins is the subject of a report. According to news reporting from Parkville, Australia, by NewsRx journalists, research stated, "Background and PurposeThe 5-HT3 receptor is a prototypical member of the Cys-loop ligand-gated ion channel (LGIC) superfamily and an established therapeutic target. In addition to activation via the orthosteric site, receptor function can be modulated by allosteric ligands."

The news correspondents obtained a quote from the research from the University of Melbourne, "We have investigated the pharmacological action of Cl-indole upon the 5-HT(3)A receptor and identified that this positive allosteric modulator possesses a novel mechanism of action for LGICs. Experimental ApproachThe impact of Cl-indole upon the 5-HT3 receptor was assessed using single cell electrophysiological recordings and [H-3]-granisetron binding in HEK293 cells stably expressing the 5-HT3 receptor. Key ResultsCl-indole failed to evoke 5-HT (3)A receptor-mediated responses (up to 30M) or display affinity for the [H-3]-granisetron binding site. However, in the presence of Cl-indole, termination of 5-HT application revealed tail currents mediated via the 5-HT(3)A receptor that were independent of the preceding 5-HT concentration but were antagonized by the 5-HT3 receptor antagonist, ondansetron. These tail currents were absent in the 5-HT(3)AB receptor. Furthermore, the presence of 5-HT revealed a concentration-dependent increase in the affinity of Cl-indole for the orthosteric binding site of the human 5-HT(3)A receptor. Conclusions and ImplicationsCl-indole acts as both an orthosteric agonist and an allosteric modulator, but the presence of an orthosteric agonist (e.g. 5-HT) is a prerequisite to reveal both actions. Precedent for ago-allosteric action is available, yet the essential additional presence of an orthosteric agonist is now reported for the first time."

According to the news reporters, the research concluded: "This widening of the pharmacological mechanisms to modulate LGICs may offer further therapeutic opportunities."

Our news journalists report that additional information may be obtained by contacting N.M. Barnes, University of Melbourne, Sch Biomed Sci, Dept. of Pharmacol & Therapeut, Fac Med Dental & Hlth Sci, Parkville, Vic, Australia. Additional authors for this research include G. Grafton, A. Roberts, S. Larkin, N. O'Neill, J. Palandri, R. Otvos, A.J. Cooper, C. Ulens and N.M. Barnes.

Keywords for this news article include: Parkville, Australia, Australia and New Zealand, Serotonin-Type 3 Receptor Antagonists, Membrane Transport Proteins, Membrane Glycoproteins, Membrane Proteins, Carrier Proteins, Pharmacology, Ion Channels, Therapy, 5-HT3, University of Melbourne.
Proteins - Membrane Proteins

New Membrane Proteins Findings from University of California Described (Modeling Membrane Protein-Ligand Binding Interactions: The Human Purinergic Platelet Receptor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Membrane Proteins. According to news reporting out of Irvine, California, by NewsRx editors, research stated, "Membrane proteins, due to their roles as cell receptors and signaling mediators, make prime candidates for drug targets. The computational analysis of protein ligand binding affinities has been widely employed as a tool in rational drug design efforts."

Our news journalists obtained a quote from the research from the University of California, "Although efficient implicit solvent-based methods for modeling globular protein-ligand binding have been around for many years, the extension of such methods to membrane protein-ligand binding is still in its infancy. In this study, we extended the widely used Amber/MMPBSA method to model membrane protein-ligand systems, and we used it to analyze protein-ligand binding for the human purinergic platelet receptor (P2Y(12)R), a prominent drug target in the inhibition of platelet aggregation for the prevention of myocardial infarction and stroke. The binding affinities, computed by the Amber/MMPBSA method using standard parameters, correlate well with experiment. A detailed investigation of these parameters was conducted to assess their impact on the accuracy of the method. These analyses show the importance of properly treating the nonpolar solvation interactions and the electrostatic polarization in the binding of nucleotide agonists and non nucleotide antagonists to P2Y(12)R On the basis of the crystal structures and the experimental conditions in the binding assay, we further hypothesized that the nucleotide agonists lose their bound magnesium ion upon binding to P2Y(12)R, and our computational study supports this hypothesis."

According to the news editors, the research concluded: "Ultimately, this work illustrates the value of computational analysis in the interpretation of experimental binding reactions."

Our news journalists report that additional information may be obtained by contacting R. Luo, University of California, Dept. of Chem Engn & Mat Sci, Irvine, CA 92697, United States. Additional authors for this research include W.M. Botello-Smith, A. Follmer, L. Xiao, E. Lambros and R. Luo.

New Meningeal Neoplasms Findings from King's College Hospital Discussed (Comparative gene expression profiling of ADAMs, MMPs, TIMPs, EMMPRIN, EGF-R and VEGFA in low grade meningioma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Meningeal Neoplasms. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "MMPs (matrix metalloproteinases), ADAMs (a disintegrin and metalloproteinase) and TIMPs (tissue inhibitors of metalloproteinases) are implicated in invasion and angiogenesis: both are tissue remodelling processes involving regulated proteolysis of the extracellular matrix, growth factors and their receptors. The expression of these three groups and their correlations with clinical behaviour has been reported in gliomas but a similar comprehensive study in meningiomas is lacking."

Our news editors obtained a quote from the research from King's College Hospital, "In this study, we aimed to evaluate the patterns of expression of 23 MMPs, 4 TIMPs, 8 ADAMs, selective growth factors and their receptors in 17 benign meningiomas using a quantitative real-time polymerase chain reaction (qPCR). Results indicated very high gene expression of 13 proteases, inhibitors and growth factors studied: MMP2 and MMP14, TIMP-1, -2 and -3, ADAM9, 10, 12, 15 and 17, EGF-R, EMMPRIN and VEGF-A, in almost every meningioma. Expression pattern analysis showed several positive correlations between MMPs, ADAMs, TIMPs and growth factors. Furthermore, our findings suggest that expression of MMP14, ADAM9, 10, 12, 15 and 17, TIMP-2, EGF-R and EMMPRIN reflects histological subtype of meningioma such that fibroblastic subtype had the highest mRNA expression, transitional subtype was intermediate and meningothelial type had the lowest expression."

According to the news editors, the research concluded: "This is the first comprehensive study characterizing gene expression of 8 ADAMs in meningiomas. These neoplasms, although by histological definition benign, have invasive potential. Taken together, the selected elevated gene expression pattern may serve to identify targets for therapeutic intervention or indicators of biological progression and recurrence."

For more information on this research see: Comparative gene expression profiling of ADAMs, MMPs, TIMPs, EMMPRIN, EGF-R and VEGFA in low grade meningioma. Central Nervous System Diseases and Conditions –…

New Meningeal Neoplasms Study Findings Have Been Reported from University of California (Expression and prognostic impact of immune modulatory molecule PD-L1 in meningioma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Meningeal Neoplasms have been published. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated, "While immunotherapy may offer promising new approaches for high grade meningiomas, little is currently known of the immune landscape in meningiomas. We sought to characterize the immune microenvironment and a potentially targetable antigen mesothelin across WHO grade I-III cases of meningiomas, and how infiltrating immune populations relate to patient outcomes."

Financial support for this research came from Neurosurgery Research and Education Foundation.

The news reporters obtained a quote from the research from the University of California, "Immunohistochemistry was performed on tissue microarrays constructed from 96 meningioma cases. The cohort included 16 WHO grade I, 62 WHO grade II, and 18 WHO grade III tumors. Immunohistochemistry was performed using antibodies against CD3, CD8, CD20, CD68, PD-L1, and mesothelin. Dual staining using anti-PD-L1 and anti-CD68 antibodies was performed, and automated cell detection and positive staining detection algorithms were utilized. Greater degree of PD-L1 expression was found in higher grade tumors. More specifically, higher grade tumors contained increased numbers of intratumoral CD68-, PD-L1+ cells (p = 0.022), but did not contain higher numbers of infiltrating CD68+, PD-L1+ cells (p = 0.30). Higher PD-L1+/CD68- expression was independently predictive of worse overall survival in our cohort when accounting for grade, performance status, extent of resection, and recurrence history (p = 0.014). Higher expression of PD-L1+/CD68- was also present in tumors that had undergone prior radiotherapy (p = 0.024). Approximately quarter of meningiomas overexpressed mesothelin to levels equivalent to those found in pancreatic carcinomas and malignant mesotheliomas. The association with poor survival outcomes in our study suggests that PD-L1 may play a significant biologic role in the aggressive phenotype of higher grade meningiomas."

According to the news reporters, the research concluded: "Thus, immunotherapeutic strategies such as checkpoint inhibition may have clinical utility in PD-L1 overexpressing meningiomas."

For more information on this research see: Expression and prognostic impact of immune modulatory molecule PD-L1 in meningioma. *Journal of Neuro-Oncology*, 2016;130 (3):543-552. *Journal of Neuro-Oncology* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Mental Health

New Mental Health Study Findings Recently Were Reported by Researchers at College of Nursing (Interventions to encourage uptake of cancer screening for people with severe mental illness)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mental Health are presented in a new report. According to news reporting from Brentford, United Kingdom, by NewsRx journalists, research stated, "Adults with severe mental illness (i.e. schizophrenia or other related psychotic disorders and bipolar disorder) can be at greater risk of cancer than those without severe mental illness (SMI). Early detection of cancer through screening is effective in improving patient outcomes including death."

The news correspondents obtained a quote from the research from the College of Nursing, "However, people with SMI are less likely than others to take up available cancer screening. To determine the effectiveness of interventions targeted at adults with SMI, or their carers or health professionals, and aimed at increasing the uptake of cancer screening tests for which the adults with SMI are eligible. Search methods We searched the Cochrane Schizophrenia Group’s Trials Register (October 25, 2012; December 19, 2014; April 07, 2015; July 04, 2016). Selection criteria All randomised controlled trials (RCTs) of interventions, targeted towards adults with SMI or their carers or health professionals, to encourage uptake of cancer screening tests for which the adults with SMI were eligible. Data collection and analysis Two review authors independently screened titles and abstracts and assessed these against the inclusion criteria. We did not find any trials that met the inclusion criteria. Authors' conclusions A comprehensive search showed that currently there is no RCT evidence for any method of encouraging cancer screening uptake in people with SMI. No specific approach can therefore be recommended."

According to the news reporters, the research concluded: "High-quality, large-scale RCTs are needed urgently to help address the disparity between people with SMI and others in cancer screening uptake."

For more information on this research see: Interventions to encourage uptake of cancer screening for people with severe mental illness. Cochrane Database of Systematic Reviews, 2016;(9):2795-2812. Stem Cell Research - Mesenchymal Stem Cells

New Mesenchymal Stem Cells Study Findings Have Been Reported by Investigators at Biotechnology Research Institute (Human umbilical cord-derived mesenchymal stem cells in acute liver injury: Hepatoprotective efficacy, subchronic toxicity, ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Stem Cell Research - Mesenchymal Stem Cells have been published. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Umbilical cord-derived mesenchymal stem cells (UC-MSCs) therapy might be an alternative to liver transplantation for acute or chronic liver injury. The aim of this study was to evaluate the efficacy of human UC-MSCs on carbon tetrachloride (CCl4)-induced acute liver injury."

Funders for this research include Industrial Core Technology Development Program, Ministry of Knowledge Economy, Republic of Korea.

Our news journalists obtained a quote from the research from Biotechnology Research Institute, "In addition, its toxicity, tumorigenicity, and biodistribution were determined. Significant hepatoprotective effects of hUC-MSCs with decreased levels of hepatocellular necrosis and lobular neutrophilic infiltration were found. Regarding the safety of hUC-MSCs, no serious hUC-MSCs-related changes (body weight, food/water consumption, clinical symptom, urinalysis, hematology, clinical chemistry, organ weight, and histopathology) were observed in a 13-week subchronic toxicity study. In a 26-week tumorigenicity study, no mice developed tumor related to hUC-MSCs transplantation up to 1 x 10(8) cells/kg. In particular, human mitochondrial sequence detection revealed that most hUC-MSCs were cleared from the major organs of the mice at 13 weeks after transplantation. There was no systemic toxicity or neoplastic finding either."

According to the news editors, the research concluded: "Taken together, these results suggested that hUC-MSCs have great potential for future clinical treatment of acute liver disease."

For more information on this research see: Human umbilical cord-derived mesenchymal stem cells in acute liver injury: Hepatoprotective efficacy, subchronic toxicity, tumorigenicity, and biodistribution. Regulatory Toxicology and Pharmacology, 2016;81():437-447. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Regulatory Toxicology and Pharmacology - www.journals.elsevier.com/regulatory-toxicology-and-pharmacology/)

Stem Cell Research - Mesenchymal Stem Cells

New Mesenchymal Stem Cells Study Results from C. Pontikoglou et al Described (CD200 expression in human cultured bone marrow mesenchymal stem cells is induced by pro-osteogenic and pro-inflammatory cues)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stem Cell Research - Mesenchymal Stem Cells. According to news reporting originating from Tours, France, by NewsRx correspondents, research stated, "Similar to other adult tissue stem/progenitor cells, bone marrow mesenchymal stem/stromal cells (BM MSCs) exhibit heterogeneity at the phenotypic level and in terms of proliferation and differentiation potential. In this study such a heterogeneity was reflected by the CD200 protein."

Financial supporters for this research include Seventh Framework Programme, REBORNE.

Our news editors obtained a quote from the research, "We thus characterized CD200 (pos) cells sorted from whole BM MSC cultures and we investigated the molecular mechanisms regulating CD200 expression. After sorting, measurement of lineage markers showed that the osteoblastic genes RUNX2 and DLX5 were up-regulated in CD200(pos) cells compared to CD200(neg) fraction. At the functional level, CD200(pos) cells were prone to mineralize the extra-cellular matrix in vitro after sole addition of phosphates. In addition, osteogenic cues generated by bone morphogenetic protein 4 (BMP4) or BMP7 strongly induced CD200 expression. These data suggest that CD200 expression is related to commitment/differentiation towards the osteoblastic lineage. Immunohistochemistry of trephine bone marrow biopsies further corroborates the osteoblastic fate of CD200(pos) cells. However, when dexamethasone was used to direct osteogenic differentiation in vitro, CD200 was consistently down-regulated. As dexamethasone has anti-inflammatory properties, we assessed the effects of different immunological stimuli on CD200 expression. The pro-inflammatory cytokines interleukin-1b and tumor necrosis factor-a increased CD200 membrane expression but down-regulated osteoblastic gene expression suggesting an additional regulatory pathway of CD200 expression. Surprisingly, whatever the context, i.e. pro-inflammatory or pro-osteogenic, CD200 expression was down-regulated when nuclear-factor (NF)-kB was inhibited by chemical or adenoviral agents."

According to the news editors, the research concluded: "CD200 expression by cultured BM MSCs can be induced by both osteogenic and pro-inflammatory cytokines through the same pathway: NF-kB."

For more information on this research see: CD200 expression in human cultured bone marrow mesenchymal stem cells is induced by pro-osteogenic and pro-inflammatory cues. *Journal of Cellular and Molecular Medicine*, 2016;20(4):655-65. *Journal of Cellular and
New Metabolic Diseases Findings from Salk Institute for Biological Studies Outlined (Circadian physiology of metabolism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Metabolic Diseases are presented in a new report. According to news reporting out of La Jolla, California, by NewsRx editors, the research stated, "A majority of mammalian genes exhibit daily fluctuations in expression levels, making circadian expression rhythms the largest known regulatory network in normal physiology. Cell-autonomous circadian clocks interact with daily light-dark and feeding-fasting cycles to generate approximately 24-hour oscillations in the function of thousands of genes."

Our news journalists obtained a quote from the research from Salk Institute for Biological Studies, "Circadian expression of secreted molecules and signaling components transmits timing information between cells and tissues. Such intra- and intercellular daily rhythms optimize physiology both by managing energy use and by temporally segregating incompatible processes. Experimental animal models and epidemiological data indicate that chronic circadian rhythm disruption increases the risk of metabolic diseases. Conversely, time-restricted feeding, which imposes daily cycles of feeding and fasting without caloric reduction, sustains robust diurnal rhythms and can alleviate metabolic diseases."

According to the news editors, the research concluded: "These findings highlight an integrative role of circadian rhythms in physiology and offer a new perspective for treating chronic diseases in which metabolic disruption is a hallmark."

For more information on this research see: Circadian physiology of metabolism. Science, 2016;354(6315):1008-1015. Science can be contacted at: Amer Assoc Advancement Science, 1200 New York Ave, NW, Washington, DC 20005, USA. (Springer - www.springer.com; Science - www.springerlink.com/content/0926-7220/)

New Metabolic Syndrome Study Findings Have Been Reported by Investigators at Weill Cornell Medical College (The Metabolic Role of the Microbiome: Implications for NAFLD and the Metabolic Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Metabolic Syndrome are presented in a new report. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Nonalcoholic fatty liver disease (NAFLD) has rapidly emerged as one of the most prevalent liver diseases worldwide and is set to achieve virtually epidemic proportions if current trends in obesity continue."

The news correspondents obtained a quote from the research from Weill Cornell Medical College, "A considerable volume of data from animal experiments has revealed the magnitude of the metabolic contribution of the gut microbiome and how a disordered microbial population could contribute to the development of obesity and its complications, including NAFLD. Although considerable progress has been made in developing a role for the microbiome in NAFLD and nonalcoholic steatosis (NASH), there are still many issues to be resolved, including the nature and location of the altered microbiome (i.e., small intestine or colon, or both); the specificity of deficits in intestinal integrity to NAFLD/NASH versus liver disease in general; the metabolic pathways, in man, that are key to the influence of the microbiome; and finally, the therapeutic interventions that are likely to be of benefit to our patients."

According to the news reporters, the research concluded: "As always, the situation in man is somewhat more complex than in animal models, but the role of the microbiota and of interventions that modulate the microbiome, though not yet ready for clinical practice, continue to be fertile areas for basic and clinical research."

For more information on this research see: The Metabolic Role of the Microbiome: Implications for NAFLD and the Metabolic Syndrome. *Seminars in Liver Disease*, 2016;36 (4):312-316. *Seminars in Liver Disease* can be contacted at: Thieme Medical Publ Inc, 333 Seventh Ave, New York, NY 10001, USA. New Metencephalon Study Results Reported from University of Salerno
(Synthesis and pharmacological evaluation of functionalized isoindolinones on GABA-activated chloride currents in rat cerebellum granule cells in culture)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System - Metencephalon have been presented. According to news reporting originating from Fisciano, Italy, by NewsRx correspondents, research stated, "A focused N-substituted 3-(2-piperazin-1-yl)-2-oxoethyl)-2-(pyridin-2-yl)isoindolin-1-ones small library was synthesized for modulation of GABA-A receptor function and compared to Zopiclone for the ability to increase GABA-activated chloride currents. All compounds were tested for their effects on GABA-activated chloride currents in rat cerebellar granule cells by use of the whole-cell patch clamp technique."

Our news editors obtained a quote from the research from the University of Salerno, "Electrophysiological studies on cultured cerebellar granule cells revealed 3-[2-(4-methylpiperazin-1-yl)-2-oxoethyl]-2-(5-nitropyridin-2-yl)isoindolin-1-one (Id) as a partial agonist displaying 34% increase of the 10 JIM GABA evoked peak chloride currents, antagonized by flumazenil. Moreover, a second group of compounds, with bulky functional groups at N-4 position of piperazine, have shown inverse agonist effects."

According to the news editors, the research concluded: "The simple synthetic procedure and the possibility of modulating the efficacy of this class of ligands through additional structural modifications pave the way for further development of new molecules as a novel class of compounds able to interfere with benzodiazepine receptors."

The news editors report that additional information may be obtained by contacting A. Massa, University of Salerno, Dept. of Biol & Chem, I-84084 Fisciano, SA, Italy. Additional authors for this research include É. Gatta, C. Petronzi, A. Cupello, P. De Caprariis, M. Robello, A. Massa and R. Filosa.

New Microbiology Study Findings Recently Were Reported by Researchers at University of Santiago (Characterization of the microbiota associated to Pecten maximus gonads using 454-pyrosequencing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Life Science Research - Microbiology are presented in a new report. According to news originating from Santiago de Compostela, Spain, by NewsRx correspondents, research stated, "A next-generation sequencing (NGS) approach was used to study the microbiota associated to Pecten maximus broodstock, applying pyrosequencing of PCR-amplified V1-V4 16S rRNA gene regions. We analysed the resident bacterial communities in female and male scallop gonads before and after spawning."

Our news journalists obtained a quote from the research from the University of Santiago, "DNA samples were amplified and quality-filtered reads were assigned to family and genus taxonomic levels using the Ribosomal Database Project classifier. A total of 18,520 sequences were detected, belonging to 13 phyla, including Proteobacteria (55%), Bacteroidetes (11.7%), Firmicutes (3%), Actinobacteria (2%) and Spirochaetes (1.2%), and 110 genera. The major fraction of the sequences detected corresponded to Proteobacteria, Beta-and Gammaproteobacteria being the most abundant classes. The microbiota of P. maximus gonad harbour a wide diversity, however differences on male and female samples were observed, where female gonad samples show a larger number of genera and families. The dominant bacterial genera appeared to be Delftia, Acinetobacter, Hydrotalea, Aquabacterium, Bacillus, Sediminibacterium, Sphingomonas, and Pseudomonas that were present among the four analysed samples."

According to the news editors, the research concluded: "This next generation sequencing technique, applied for the first time in P. maximus (great scallop) gonads was useful for the study of the bacterial communities in this mollusc, unravelling the great bacterial diversity in its microbiota."

For more information on this research see: Characterization of the microbiota associated to Pecten maximus gonads using 454-pyrosequencing. International Microbiology, 2016;19(2):93-99. International Microbiology can be contacted at: Inst Estudis Catalans, Carrer Del Carme, 47, Barcelona, 08001, Spain. New Middle Cerebral Artery Infarction Data Have Been Reported by Investigators at Mashhad University of Medical Sciences (Aqueous and Ethanolic Extracts of Boswellia serrata Protect Against Focal Cerebral Ischemia and Reperfusion Injury in Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Central Nervous System Diseases and Conditions - Middle Cerebral Artery Infarction is the subject of a report. According to news reporting originating from Mashhad, Iran, by NewsRx correspondents, research stated, "Oxidative stress and cell apoptosis play major roles in neuronal injury after ischemia-reperfusion (I-R) injury. Boswellia serrata is a medicinal plant with antioxidant properties."

Our news editors obtained a quote from the research from the Mashhad University of Medical Sciences, "Acetyl-11-keto-beta-boswelic acid (AKBA) is an active triterpenoid compound from B. serrate. In the current study, the neuroprotective effects of aqueous and ethanolic extracts of B. serrata (named ABS and EBS, respectively) and AKBA were investigated against middle cerebral artery occlusion-induced cerebral I-R injury in rats. ABS and EBS with doses of 125, 250 and 500 and AKBA with a dose of 50 mg/kg were administered (intraperitoneally) just after middle cerebral artery occlusion induction for 30 min and reperfusion for 24 h. HPLC analysis suggested that ABS and EBS had AKBA of 8.8% and 9.5% (w/w), respectively. B. serrata and AKBA significantly improved neurological deficit and reduced brain infarction, neuronal cell loss and apoptosis and also attenuated lipid peroxidation while increasing glutathione content and superoxide dismutase activity in the cerebral cortex following a stroke. Apoptosis suppression was found to be mediated through regulating caspase-3 and bax/bcl-2 expressions."

According to the news editors, the research concluded: "Our results demonstrated that B. serrata and AKBA attenuate oxidative damage and inhibit cell apoptosis, subsequently protecting cerebral I-R injury in rats."

The news editors report that additional information may be obtained by contacting H.R. Sadeghnia, Mashhad Univ Med Sci, Neurocognit Res Center, Fac Med, Mashhad, Iran. Additional authors for this research include H. Hosseinzadeh, A.E. Bideskan and H.R. Sadeghnia.

New Mitotic Inhibitors Study Results Reported from University of Tehran (Specific targeting delivery to MUC1 overexpressing tumors by albumin-chitosan nanoparticles conjugated to DNA aptamer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Mitotic Inhibitors have been published. According to news reporting originating in Tehran, Iran, by NewsRx journalists, research stated, "Chitosan-coated human serum albumin nanoparticles were functionalized by MUC1 aptamer to obtain a selective drug carrier toward cancers overexpressing MUC1. The negative charges of albumin nanoparticles were shifted to positive charges by surface modification with chitosan, and MUC1 was conjugated through an acrylate spacer."

Financial support for this research came from Nanotechnology Research Center of Tehran University of Medical Sciences.

The news reporters obtained a quote from the research from the University of Tehran, "The cytotoxicity of targeted nanoparticles was significantly more than non-aptamer nanoparticles, and also the chitosan-coated nanoparticles had more cytotoxic effects than the negatively charged albumin nanoparticles. The IC50 of targeted nanoparticles was 28 and 26% of free paclitaxel in MCF7 and T47D cells at 48 h, respectively. Confocal laser scanning electron microscopy showed that aptamer conjugation and positive charge increase the cellular uptake. 66% of paclitaxel was released within 32 h, but 100% of drug was released at pH = 5.5 (similar cancer cells)."

According to the news reporters, the research concluded: "The paclitaxel plasma amount was at a good level of 17.6% at 2 h for increasing the chance of cellular uptake."

Our news correspondents report that additional information may be obtained by contacting R. Dinarvand, Univ Tehran Med Sci, Dept. of Pharmaceut, Fac Pharm, Tehran, Iran. Additional authors for this research include A. Mohammadi, F. Atyabi, S.M. Nabavi, S.M. Ebrahimi, E. Shahmoradi, B.S. Varnamkhiati, M.H. Ghahremani and R. Dinarvand.

New Molecular Biology Findings Reported from Fujian Agriculture and Forestry University [Cytotoxic, Antitumor and Immunomodulatory Effects of the Water-Soluble Polysaccharides from Lotus (Nelumbo nucifera Gaertn.) Seeds]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Molecular Biology have been published. According to news reporting out of Fuzhou, People's Republic of China, by NewsRx editors, research stated, "Lotus is an edible and medicinal plant, and the extracts from its different parts exhibit various bioactivities. In the present study, the hot water-soluble polysaccharides from lotus seeds (LSPS) were evaluated for their cancer cell cytotoxicity, immunomodulatory and antitumor activities."

Our news journalists obtained a quote from the research from Fujian Agriculture and Forestry University, "LSPS showed significant inhibitory effects on the mouse gastric cancer MFC cells, human liver cancer HuH-7 cells and mouse hepatocarcinoma H22 cells. The animal studies showed that LSPS inhibited tumor growth in H22 tumor-bearing mice with the highest inhibition rate of 45.36%, which is comparable to that induced by cyclophosphamide (30 mg/kg) treatment (50.79%). The concentrations of white blood cells were significantly reduced in cyclophosphamide-treated groups (p < 0.01), while LSPS showed much fewer side effects according to the hematology analysis. LSPS improved the immune response in H22 tumor-bearing mice by enhancing the spleen and thymus indexes, and increasing the levels of serum cytokines including tumor necrosis factor-ff and interleukin-2. Moreover, LSPS also showed in vivo antioxidant activity by increasing superoxide dismutase activity, thus reducing the malondialdehyde level in the liver tissue."

According to the news editors, the research concluded: "These results suggested that LSPS can be used as an antitumor and immunomodulatory agent."

For more information on this research see: Cytotoxic, Antitumor and Immunomodulatory Effects of the Water-Soluble Polysaccharides from Lotus (Nelumbo nucifera Gaertn.) Seeds. *Molecules*, 2016;21(11):689-699. *Molecules* can be contacted at: Mdpj Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. New Molecular Cancer and Carcinogenesis Data Have Been Reported by Researchers at Kinki University (Significance of FGF9 gene in resistance to anti-EGFR therapies targeting colorectal cancer: A subset of colorectal cancer patients with FGF9 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Molecular Cancer and Carcinogenesis. According to news originating from Osaka, Japan, by NewsRx correspondents, research stated, "Although fibroblast growth factor (FGF) signals are strongly associated with malignancy, limited information is available regarding the role of the FGF9 signal in colorectal cancer (CRC). In this study, we investigated the frequency of FGF9 amplification in CRC clinical specimens and the association between the FGF9 gene and resistance to anti-EGFR therapies."

Our news journalists obtained a quote from the research from Kinki University, "In clinical samples, an FGF9 copy number gain of 5 copies was observed at a frequency of 8/145 (5.5%) and tended to be related to wild-type KRAS (7/96, 7.3%). Furthermore, FGF9 amplification was not observed in any of the samples from the 15 responders to anti-EGFR therapies but was observed in one sample from the seven non-responders with wild-type KRAS, and two samples from non-responders also had high FGF9 mRNA expression levels. FGF9 amplification was validated using a fluorescence in situ hybridization (FISH) analysis, and FGF9-amplified sections showed readily detectable signals originating from FGF9 protein when examined using immunohistochemistry. In both the in vitro and in vivo experiments using FGF9-overexpressing CRC cell lines, FGF9 overexpression induced strong resistance to anti-EGFR therapies via the enforced FGFR signal, and this resistance was cancelled by the application of an FGFR inhibitor. Considering these results, the FGF9 gene may play an important role in resistance to anti-EGFR therapies in patients with CRC, and such resistance might be overcome by combined treatment with an anti-FGFR inhibitor."

According to the news editors, the research concluded: "These findings strongly encourage the development of FGFR-targeted therapy for CRC patients with FGF9 gene upregulation."

New Molecular Chaperones Study Findings Reported from J. Lee and Co-Authors (Heat Shock Protein 90 Regulates Subcellular Localization of Smads in Mv1Lu Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Proteins - Molecular Chaperones are discussed in a new report. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Heat shock protein 90 (HSP90) regulates the stability of various proteins and plays an essential role in cellular homeostasis. Many client proteins of HSP90 are involved in cell growth, survival, and migration; processes that are generally accepted as participants in tumorigenesis."

Funders for this research include Nuclear Research & Development Program, Ministry of Science, ICT and Future Planning (MSIP).

Our news journalists obtained a quote from the research, "HSP90 is also up-regulated in certain tumors. Indeed, the inhibition of HSP90 is known to be effective in cancer treatment. Recently, studies showed that HSP90 regulates transforming growth factor b1 (TGF-b1)-induced transcription by increasing the stability of the TGF-b receptor. TGF-b signaling also has been implicated in cancer, suggesting the possibility that TGF-b1 and HSP90 function cooperatively during the cancer cell progression. Here in this paper, we investigated the role of HSP90 in TGF-b1-stimulated Mv1Lu cells. Treatment of Mv1Lu cells with the HSP90 inhibitor, 17-allylamino-demethoxy-geldanamycin (17AAG), or transfection with truncated HSP90 (DHSP90) significantly reduced TGF-b1-induced cell migration. Pretreatment with 17AAG or transfection with DHSP90 also reduced the levels of phosphorylated Smad2 and Smad3. In addition, the HSP90 inhibition interfered the nuclear localization of Smads induced by constitutively active Smad2 (S2EE) or Smad3 (S3EE). We also found that the HSP90 inhibition decreased the protein level of importin-b1 which is known to regulate R-Smad nuclear translocation. These data clearly demonstrate a novel function of HSP90; HSP90 modulates TGF-b signaling by regulating Smads localization. Overall, our data could provide a detailed mechanism linking HSP90 and TGF-b signaling."

According to the news editors, the research concluded: "The extension of our understanding of HSP90 would offer a better strategy for treating cancer."

Our news journalists report that additional information may be obtained by contacting J. Lee, Division of Radiation Effects, Korea Institute of Radiation and Medical Sciences, Seoul, South Korea. Additional authors for this research include Y.S. An, M.R. Kim, Y.A. Kim, J.K. Lee, C.S. Hwang, E. Chung, I.C. Park and J.Y Yi.

New Molecular Genetics Findings from Gazi University Described
(Molecular analysis of the AGXT gene in patients suspected with hyperoxaluria type 1 and three novel mutations from Turkey)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Life Science Research - Molecular Genetics are discussed in a new report. According to news originating from Ankara, Turkey, by NewsRx correspondents, research stated, "Primary hyperoxaluria type 1 (PH1) is a rare, autosomal recessive disease, caused by the defect of AGXT gene encoding hepatic peroxisomal alanine glyoxylateaminotransferase (AGT). This enzyme is responsible for the conversion of glyoxylate to glycine."

Our news journalists obtained a quote from the research from Gazi University, "The diagnosis of PH1 should be suspected in infants and children with nephrocalcinosis or nephrolithiasis. Early diagnosis and treatment is crucial in preventing disease progression to end stage kidney disease (ESKD). In this study, AGXT gene sequence analyses were performed in 82 patients who were clinically suspected (hyperoxaluria and nephrolithiasis or nephrocalcinosis with or without renal impairment) to have PH1. Disease causing mutations have been found in fifteen patients from thirteen families (18%). Novel mutations have been found (c.458T > A (p.L153X), c.733_734delAA (p.Lys245Valfs*11), c.52 C> T (p.L18F)) in three of 13 families. There were 3-year lag time between initial symptoms and the time of PH1 is suspected; additionally, 5.5-year lag time between initial symptoms and definitive diagnosis. Consanguinity was detected in 77% of the patients with mutation. After genetic diagnosis, one patient received combined kidney and liver transplantation. AGXT gene sequencing is now the choice of diagnosis of PH1 due to its non-invasive nature compared to liver enzyme assay."

According to the news editors, the research concluded: "Early diagnosis and accurate treatment in PH1 is important for better patient outcomes."

For more information on this research see: Molecular analysis of the AGXT gene in patients suspected with hyperoxaluria type 1 and three novel mutations from Turkey. Molecular Genetics and Metabolism, 2016;119(4):311-316. Molecular Genetics and Metabolism can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Molecular Genetics and Metabolism - www.journals.elsevier.com/molecular-genetics-and-metabolism/)

The news correspondents report that additional information may be obtained from E. Isiyel, Gazi University, Fac Med, Dept. of Pediat Nephrol, Ankara, Turkey. Additional authors for this research include S.A.B. Ezgu, S. Caliskan, S. Akman, I. Akil, Y. Tabel, N. Akinci, E.B. Ozdogan, A. Ozel, F.K. Eroglu and F.S. Ezgu.

New Molecular Pharmaceutics Data Have Been Reported by Researchers at Guangzhou University (Improving Therapeutic Potential of Farnesylthiosalicylic Acid: Tumor Specific Delivery via Conjugation with Heptamethine Cyanine Dye)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology - Molecular Pharmaceutics. According to news reporting originating from Guangzhou, People's Republic of China, by NewsRx correspondents, research stated, "The RAS and mTOR inhibitor S-trans-trans-farnesylthiosalicylic acid (FTS) is a promising anticancer agent with moderate potency, currently undergoing clinical trials as a chemotherapeutic agent. FTS has displayed its potential against a variety of cancers including endocrine resistant breast cancer."

Our news editors obtained a quote from the research from Guangzhou University, "However, the poor pharmacokinetics profile attributed to its high hydrophobicity is a major hindrance for its continued advancement in clinic. One of the ways to improve its therapeutic potential would be to enhance its bioavailability to cancer tissue by developing a method for targeted delivery. In the current study, FTS was conjugated with the cancer-targeting heptamethine cyanine dye 5 to form the FTS-dye conjugate 11. The efficiency of tumor targeting properties of conjugate 11 against cancer cell growth and mTOR inhibition was evaluated in vitro in comparison with parent FTS. Cancer targeting of 11 in a live mouse model of MCF7 xenografts was demonstrated with noninvasive, near-infrared fluorescence (NIRF) imaging. The results from our studies clearly suggest that the bioavailability of FTS is indeed improved as indicated by log P values and cancer cell uptake. The FTS-dye conjugate 11 displayed higher potency (IC=16.8 ? 0.5 mM) than parent FTS (IC=&sim;51.3 ? 1.8 mM) and inhibited mTOR activity in the cancer cells at a lower concentration (12.5 mM). The conjugate 11 was shown to be specifically accumulated in tumors as observed by in vivo NIRF imaging, organ distribution, and ex vivo tumor histology along with cellular level confocal microscopy."

According to the news editors, the research concluded: "The conjugation of FTS with cancer-targeting heptamethine cyanine dye improved its pharmacological profile."

For more information on this research see: Improving Therapeutic Potential of Farnesylthiosalicylic Acid: Tumor Specific Delivery via Conjugation with Heptamethine Cyanine Dye. Molecular Pharmaceutics, 2016;(). (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

Biotechnology - Molecular Therapeutics

New Molecular Therapeutics Findings from I. Petta and Co-Researchers Described (Modulation of Protein-Protein Interactions for the Development of Novel Therapeutics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology - Molecular Therapeutics. According to news reporting from Ghent, Belgium, by NewsRx journalists, research stated, "Protein-protein interactions (PPIs) underlie most biological processes. An increasing interest to investigate the unexplored potential of PPIs in drug discovery is driven by the need to find novel therapeutic targets for a whole range of diseases with a high unmet medical need."

The news correspondents obtained a quote from the research, "To date, PPI inhibition with small molecules is the mechanism that has most often been explored, resulting in significant progress towards drug development. However, also PPI stabilization is gradually gaining ground. In this review, we provide a focused overview of a number of PPIs that control critical regulatory pathways and constitute targets for the design of novel therapeutics. We discuss PPI-modulating small molecules that are already pursued in clinical trials."

According to the news reporters, the research concluded: "In addition, we review a number of PPIs that are still under preclinical investigation but for which preliminary data support their use as therapeutic targets."

For more information on this research see: Modulation of Protein-Protein Interactions for the Development of Novel Therapeutics. *Molecular Therapy*, 2015;24(4):707-18. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

Our news journalists report that additional information may be obtained by contacting I. Petta, Receptor Research Laboratories, Cytokine Receptor Lab (CRL), VIB Dept. of Medical Protein Research, Ghent, Belgium. Additional authors for this research include S. Lievens, C. Libert, J. Tavernier and K. De Bosscher.

Biotechnology - Molecular Therapeutics

New Molecular Therapeutics Findings from University of Minnesota Described (Evaluation of TCR Gene Editing Achieved by TALENs, CRISPR/Cas9, and megaTAL Nucleases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biotechnology - Molecular Therapeutics have been
presented. According to news reporting originating in Minneapolis, Minnesota, by NewsRx journalists, research stated, "Present adoptive immunotherapy strategies are based on the re-targeting of autologous T-cells to recognize tumor antigens. As T-cell properties may vary significantly between patients, this approach can result in significant variability in cell potency that may affect therapeutic outcome."

The news reporters obtained a quote from the research from the University of Minnesota. "More consistent results could be achieved by generating allogeneic cells from healthy donors. An impediment to such an approach is the endogenous T-cell receptors present on T-cells, which have the potential to direct dangerous off-tumor antithost reactivity. To address these limitations, we assessed the ability of three different TCR-a-targeted nucleases to disrupt T-cell receptor expression in primary human T-cells. We optimized the conditions for the delivery of each reagent and assessed off-target cleavage."

According to the news reporters, the research concluded: "The megaTAL and CRISPR/Cas9 reagents exhibited the highest disruption efficiency combined with low levels of toxicity and off-target cleavage, and we used them for a translatable manufacturing process to produce safe cellular substrates for next-generation immunotherapies."

For more information on this research see: Evaluation of TCR Gene Editing Achieved by TALENs, CRISPR/Cas9, and megaTAL Nucleases. Molecular Therapy, 2015;24 (3):570-81. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

Life Science Research - Molecular and Cellular Biology

New Molecular and Cellular Biology Data Have Been Reported by A. Gubern and Co-Authors (The N-Terminal Phosphorylation of RB by p38 Bypasses Its Inactivation by CDKs and Prevents Proliferation in Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Life Science Research - Molecular and Cellular Biology. According to news reporting from Barcelona, Spain, by NewsRx journalists, research stated, "Control of the G1/S phase transition by the Retinoblastoma (RB) tumor suppressor is critical for the proliferation of normal cells in tissues, and its inactivation is one of the most fundamental events leading to cancer. Cyclin-dependent kinase (CDK) phosphorylation
inactivates RB to promote cell cycle-regulated gene expression."

The news correspondents obtained a quote from the research, "Here we show that, upon stress, the p38 stress-activated protein kinase (SAPK) maximizes cell survival by downregulating E2F gene expression through the targeting of RB. RB undergoes selective phosphorylation by p38 in its N terminus; these phosphorylations render RB insensitive to the inactivation by CDKs. p38 phosphorylation of RB increases its affinity toward the E2F transcription factor, represses gene expression, and delays cell-cycle progression."

According to the news reporters, the research concluded: "Remarkably, introduction of a RB phosphomimetic mutant in cancer cells reduces colony formation and decreases their proliferative and tumorigenic potential in mice."

Our news journalists report that additional information may be obtained by contacting E. de Nadal, UPF, Dept. of Ciencies Expt & Salut, Cell Signaling Res Grp, Barcelona 08003, Spain. Additional authors for this research include M. Joaquin, M. Marques, P. Maseres, J. Garcia-Garcia, R. Amat, D. Gonzalez-Nunez, B. Oliva, F.X. Real, E. de Nadal and F. Posas.

**Drugs and Therapies - Monoclonal Antibodies**

**New Monoclonal Antibodies Data Have Been Reported by Investigators at University of Verona (Teriparatide and denosumab combination therapy and skeletal metabolism)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Monoclonal Antibodies are discussed in a new report. According to news reporting originating from Verona, Italy, by NewsRx correspondents, research stated, "Several therapies are available for osteoporosis. Understanding the bone turnover changes and their mutual relationship gives an overall view and might lead to a target therapy. Introduction The aim of this study is to compare the changes in bone turnover markers in patients treated with either denosumab alone, teriparatide (TPTD) alone, or in a third therapeutic scheme, when TPTD was added to patients previously treated with denosumab."

Our news editors obtained a quote from the research from the University of Verona, "Fifty-nine women over 65 years old with severe postmenopausal osteoporosis (evidence of at least two moderate-severe vertebral fractures) were enrolled in the study. Serum samples were
collected every 3 months. They were assayed for intact N-propeptide of type I collagen (P1NP), C-terminal telopeptide of type I collagen (CTX), intact parathyroid hormone (PTH), 25 hydroxyvitamin D (25 OHD), Sclerostin (SOST), and Dickkopf-related protein 1 (DKK1). Bone mass density was assessed by dual-energy X-ray absorptiometry at the lumbar spine and at the total hip. In the groups treated only with TPTD or with denosumab, bone turnover markers increased and decreased, respectively. In TPTD group, a later significant increase in DKK1 was observed, while in denosumab group, a progressive increase in SOST was associated with a progressive significant decrease in DKK1. In the group treated first with denosumab and in which TPTD was added 3 months later, both CTX and P1NP increased 3 months after the beginning of TPTD. The strong effect of denosumab on bone turnover seems to be reversed by TPTD treatment. In this study, we showed that TPTD is able to express its biological activity even when bone turnover is fully suppressed by denosumab treatment.

According to the news editors, the research concluded: "The combination therapy is associated with significant increases in both DKK1 and SOST."

For more information on this research see: Teriparatide and denosumab combination therapy and skeletal metabolism. Osteoporosis International, 2016;27(11):3301-3307. Immunology - Mononuclear Phagocyte System

New Mononuclear Phagocyte System Study Findings Have Been Reported by Researchers at University of Kansas Medical Center (Serine 574 phosphorylation alters transcriptional programming of FOXO3 by selectively enhancing apoptotic gene expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Mononuclear Phagocyte System. According to news reporting from Kansas City, Kansas, by NewsRx journalists, research stated, "Forkhead box O3 (FOXO3) is a multispecific transcription factor that is responsible for multiple and conflicting transcriptional programs such as cell survival and apoptosis. The protein is heavily post-translationally modified and there is considerable evidence that post-transcriptional modifications (PTMs) regulate protein stability and nuclear-
The news correspondents obtained a quote from the research from the University of Kansas Medical Center, "Much less is known about how FOXO3 PTMs determine the specificity of its transcriptional program. In this study we demonstrate that exposure of hepatocytes to ethanol or exposure of macrophages to lipopolysaccharide (LPS) induces the c-Jun N-terminal kinase (JNK)-dependent phosphorylation of FOXO3 at serine-574. Chromatin immunoprecipitation (ChIP), mRNA and protein measurements demonstrate that p-574-FOXO3 selectively binds to promoters of pro-apoptotic genes but not to other well-described FOXO3 targets. Both unphosphorylated and p-574-FOXO3 bound to the B-cell lymphoma 2 (Bcl-2) promoter, but the unphosphorylated form was a transcriptional activator, whereas p-574-FOXO3 was a transcriptional repressor. The combination of increased TRAIL (TNF-related apoptosis-inducing ligand) and decreased Bcl-2 was both necessary and sufficient to induce apoptosis. LPS treatment of a human monocyte cell line (THP-1) induced FOXO3 S-574 phosphorylation and apoptosis. LPS-induced apoptosis was prevented by knockdown of FOXO3. It was restored by overexpressing wild-type FOXO3 but not by overexpressing a nonphosphorylatable S-574A FOXO3. Expression of an S-574D phosphomimetic form of FOXO3 induced apoptosis even in the absence of LPS. A similar result was obtained with mouse peritoneal macrophages where LPS treatment increased TRAIL, decreased Bcl-2 and induced apoptosis in wild-type but not FOXO3(-/-) cells."

According to the news reporters, the research concluded: "This work thus demonstrates that S-574 phosphorylation generates a specifically apoptotic form of FOXO3 with decreased transcriptional activity for other well-described FOXO3 functions."

For more information on this research see: Serine 574 phosphorylation alters transcriptional programming of FOXO3 by selectively enhancing apoptotic gene expression. Cell Death and Differentiation, 2015;23(4):583-95. (Nature Publishing Group - www.nature.com/cdd/)

Motor Neuron Disease have been published. According to news reporting from Daejeon, South Korea, by NewsRx journalists, research stated, "Although the ubiquitin proteasome system is believed to play an important role in the pathogenesis of familial amyotrophic lateral sclerosis (FALS), caused by mutations in Cu/Zn-superoxide dismutase 1 (SOD1), the mechanism of how mutant SOD1 protein is regulated in cells is still poorly understood."

Funders for this research include Korea Research Institute of Bioscience and Biotechnology, National Research Foundation of Korea, National Research Council of Science and Technology.

The news correspondents obtained a quote from the research from the University of Science and Technology, "Here we have demonstrated that cellular inhibitor of apoptosis proteins (cIAPs) are specifically associated with FALS-linked mutant SOD1 (mSOD1) and that this interaction promotes the ubiquitin-dependent proteasomal degradation of mutant SOD1. By utilizing cumate inducible SOD1 cells, we also showed that knock-down or pharmacologic depletion of cIAPs leads to H2O2 induced cytotoxicity in mSOD1 expressing cells."

According to the news reporters, the research concluded: "Altogether, our results reveal a novel role of cIAPs in FALS-associated mutant SOD1 regulation."

For more information on this research see: cIAPs promote the proteasomal degradation of mutant SOD1 linked to familial amyotrophic lateral sclerosis. *Biochemical and Biophysical Research Communications*, 2016;480(3):422-428. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **New Moyamoya Disease Study Results Reported from Keio University (Homzygosity for Moyamoya Disease Risk Allele Leads to Moyamoya Disease with Extracranial Systemic and Pulmonary Vasculopathy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Moyamoya Disease are discussed in a new report. According to news reporting originating in
Tokyo, Japan, by NewsRx journalists, research stated, "Moyamoya disease is characterized by diffuse distal intracranial stenosis. Recently, RNF213 has been identified as a susceptibility gene in the development of this condition."

Financial supporters for this research include Ministry of Health, Labour and Welfare, Japan Agency for Medical Research and Development, Kawano Masanori Memorial Public Interest Incorporated Foundation, Keio University Research Grants, Japan Foundation for Pediatric Research, Japan Society for the Promotion of Science.

The news reporters obtained a quote from the research from Keio University, "Pulmonary hypertension is a rare progressive vasculopathy with an unknown etiology. The co-occurrence of pulmonary hypertension and Moyamoya disease has been described in four patients; however, whether this co-occurrence represents a chance association or a common vascular pathology has remained unknown. Here, we report two unrelated male patients who presented during their childhood with dyspnea on exertion. Systemic vascular imaging studies revealed the presence of pulmonary hypertension and Moyamoya disease in both patients. Medical exome sequencing revealed that both patients had a homozygous mutation for p.Arg4810Lys in RNF213. We suggest that homozygosity in RNF213 may lead to a novel entity involving the brain and lung. Interestingly, when present in a heterozygous state, this mutation causes a classic cerebral vascular disease, Moyamoya disease. In the homozygous state, the exact same mutation led to Moyamoya disease with extracranial systemic vasculopathy in at least two patients."

According to the news reporters, the research concluded: "From a clinical standpoint, cerebrovascular or pulmonary vascular investigations may be warranted in patients with pulmonary hypertension or Moyamoya disease, respectively."

Our news correspondents report that additional information may be obtained by contacting K. Kosaki, Keio University, Sch Med, Center Med Genet, Tokyo, Japan. Additional authors for this research include T. Takenouchi and K. Kosaki.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/ajmg.a.37829. This DOI is a link to an online electronic document that is either free or for purchase.

New Multiple Myeloma Findings Has Been Reported by Investigators at University of Belgrade (Prognostic Significance of Cereblon Expression in Patients With Multiple Myeloma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Multiple Myeloma. According to news reporting out of Belgrade, Serbia, by NewsRx editors, research stated, "Within a personalized treatment approach in multiple myeloma (MM), the prognostic significance of cereblon (CRBN) expression was analyzed in 92 newly diagnosed patients. In patients treated with thalidomide-based combinations, CRBN expression significantly affected the treatment response (P = .028) and progression free survival (P = .017)."

Our news journalists obtained a quote from the research from the University of Belgrade, "With implications for the treatment outcome, measurement of CRBN expression might represent an additional prognostic tool in a personalized treatment approach. To personalize the treatment approach for patients with multiple myeloma (MM), molecular markers such as cereblon (CRBN) are currently the focus of investigation. The aim of the present study was to test the prognostic significance of CRBN expression in MM patients ineligible for autologous stem cell transplantation (ASCT). The data from 92 previously untreated patients were analyzed. The distribution according to the International Staging System score was 26.1%, 30.4%, and 43.5% with a score of 1, 2, and 3, respectively. Thalidomide- and bortezomib-based combinations were used in 83.7% and 16.3% of the patients, respectively. A treatment response (complete remission, very good partial remission, partial remission) was achieved in 83.7% of the patients and correlated with high CRBN expression (P = .006), mainly in the patients treated with thalidomide (P = .028). Low CRBN expression affected progression-free survival (PFS; P = .017) but not overall survival (OS) in patients treated with thalidomide and had no influence on OS in the bortezomib group. In the Cox regression model, low CRBN expression was the most important prognostic parameter that influenced PFS in the thalidomide-treated patients (P = .012). CRBN expression is of prognostic value in MM patients ineligible for ASCT treated with thalidomide as an immunomodulatory drug."

According to the news editors, the research concluded: "With low expression indicating a possible suboptimal treatment outcome, measurement of CRBN expression might serve as additional prognostic tool in the personalized treatment approach."

Oncology - Multiple Myeloma

New Multiple Myeloma Findings from Celgene Outlined (A Dual Color Immunohistochemistry Assay for Measurement of Cereblon in Multiple Myeloma Patient Samples)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Multiple Myeloma have been published. According to news originating from San Diego, California, by NewsRx correspondents, research stated, "Clinical interest in the measurement of Cereblon (CRBN), the primary target of the IMiDs immunomodulatory drugs lenalidomide and pomalidomide, has been fueled by its essential requirement for antitumor or immunomodulatory activity of both drugs in multiple myeloma (MM). However, limited analyses of clinical samples for CRBN gene expression or protein levels have utilized unvalidated reagents and assays, raising uncertainty about the interpretation of these results."

Our news journalists obtained a quote from the research from Celgene, "We previously described a highly specific rabbit monoclonal antibody CRBN65 against 65-76 AA of human Cereblon. Here we describe a validated dual color bright-field Cereblon/CD138 immunohistochemical (IHC) assay utilizing CRBN65 and a commercial mouse monoclonal CD138 antibody. Sensitivity and specificity of the assay was determined and assay precision was shown for both cytoplasmic and nuclear Cereblon in MM bone marrow samples with coefficient of variation values of 5% and 2%, respectively. The dual IHC assay was effective for detecting a continuous range of Cereblon levels in 22 MM patient bone marrow core biopsies and aspirate clots, as shown by average cytoplasmic H-scores ranging from 63 to 267 and nuclear H-scores ranging from 17 to 250. Interpathologist comparison of MM sample H-scores by 3 pathologists demonstrated good concordance (R-2=0.73)."

According to the news editors, the research concluded: "This dual assay demonstrated superior Cereblon IHC measurement in MM samples compared with the single IHC assay using a published commercial rabbit polyclonal Cereblon antibody and could be used to explore the potential utility of Cereblon as a biomarker in the clinic."

For more information on this research see: A Dual Color Immunohistochemistry Assay for Measurement of Cereblon in Multiple Myeloma Patient Samples. Applied Immunohistochemistry & Molecular Morphology, 2016;24(10):695-702. Applied Immunohistochemistry & Molecular Morphology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Oncology - Multiple Myeloma**

**New Multiple Myeloma Findings from Southern Medical University Described (Characterization of gamma delta regulatory T cells from peripheral blood in patients with multiple myeloma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Multiple Myeloma are presented in a new report. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Gamma delta regulatory T cells are able to inhibit the activation and function of T cells involved in antigen-specific immune responses. This study aimed to investigate the potential role of gamma delta regulatory T cells in inhibiting anti-tumor immune responses in patients diagnosed as multiple myeloma (MM)."

Our news journalists obtained a quote from the research from Southern Medical University, "We measured the levels of gamma delta T cells, the distribution and clonally amplified TCR V gamma and V delta T cells in peripheral blood of healthy donors, patients recently diagnosed with MM, and MM patients in remission cohorts. In addition, we evaluated the ability of gamma delta regulatory T cells to inhibit the proliferation of CD4-FCD25- T cells and detected the expression of immunoregulatory-associated molecules. We found that the levels of gamma delta regulatory T cells from the peripheral blood in patients of MM were significantly higher than those in healthy donors. Comparison of gamma delta T regulatory cells function in MM and healthy donors showed similarly inhibitory effects on the proliferation of T cells. Additionally, TLR8 expression level increased significantly in MM patients compared to healthy donors, while the expression levels of Foxp3, CD25, CTLA4, GITR, GATA3 and Tbet in MM patients and healthy donors showed no significant difference."

According to the news editors, the research concluded: "Taken together, our study reveals the potential role of gamma delta regulatory T cells in inhibiting anti-tumor immune responses in MM patients."

For more information on this research see: Characterization of gamma delta regulatory T cells from peripheral blood in patients with multiple myeloma. *Biochemical and Biophysical Research Communications*, 2016;480(4):594-601. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Oncology - Multiple Myeloma**

**New Multiple Myeloma Study Findings Have Been Reported by Investigators at University College (17P deleted multiple myeloma presenting with intracranial disease: durable remission after tailored management)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Multiple Myeloma. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "In multiple myeloma (MM), del(17p) is associated with a poor outcome if present in greater than half the tumour cells. Similarly, intracranial involvement, often seen in the context of advanced disease, also heralds short survival."

The news reporters obtained a quote from the research from University College, "We present a rare case of MM presenting with intracranial disease and carrying del(17p) in 100% of tumour cells. This patient was successfully treated with combination chemotherapy employing central nervous system directed agents and bortezomib, followed by autologous stem cell transplant and consolidation with radiotherapy, bortezomib and thalidomide."

According to the news reporters, the research concluded: "We also present the outcomes of our single-centre experience of MM patients presenting with del(17p) disease."

Our news correspondents report that additional information may be obtained by contacting J. Lee, Univ Coll London NHS Fdn Trust, Clin Haematol, London, United Kingdom. Additional authors for this research include D. Smith, N. Rabin, J. Tobias and K. Yong.

New Multiple Myeloma Study Findings Have Been Reported by J.K. Zhang and Colleagues (Design, synthesis and biological evaluation of novel non-covalent piperidine-containing peptidyl proteasome inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Multiple Myeloma have been published. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "A series of novel non-covalent piperidine-containing dipeptidyl derivatives were designed, synthesized and evaluated as proteasome inhibitors. All target compounds were tested for their proteasome chymotrypsin-like inhibitory activities, and selected derivatives were evaluated for the anti-proliferation activities against two multiple myeloma (MM) cell lines RPMI 8226 and MM-1S."

Financial supporters for this research include Hangzhou Science and Technology Committee, National Natural Science Foundation of China.

The news reporters obtained a quote from the research, "Among all of these compounds, eight exhibited significant proteasome inhibitory activities with IC50 less than 20 nM, and four are more potent than the positive control Carfilzomib. Compound 28 displayed the most potent proteasome inhibitory activity (IC50: 1.4 +/- 0.1 nM) and cytotoxicities with IC50 values at 13.9 +/- 1.8 nM and 9.5 +/- 0.5 nM against RPMI 8226 and MM-1S, respectively. Additionally, the ex vivo blood cell proteasome inhibitory activities of compounds 24 and 27-29 demonstrated that the enzymatic metabolism in the whole blood could be well tolerated."

According to the news reporters, the research concluded: "All these experiments confirmed that the piperidine-containing non-covalent proteasome inhibitors are potential leads for exploring new anti-cancer drugs."

Our news correspondents report that additional information may be obtained by contacting R.X. Zhuang, Hangzhou Xixi Hosp, Dept. of Pharmaceut Preparat, Hangzhou 310023, Zhejiang, People's Republic of China. Additional authors for this research include L.X. Gao, J.J. Xi, L. Sheng, Y.M. Zhao, L. Xu, Y.D. Shao, S.R. Liu, R.X. Zhuang, Y.B. Zhou and J. Li.

New Multiple Myeloma Study Findings Have Been Reported by Researchers at Division of Genetics and Cell Biology (Assessing Heterogeneity of Osteolytic Lesions in Multiple Myeloma by H-1 HR-MAS NMR Metabolomics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Multiple Myeloma. According to news reporting out of Milan, Italy, by NewsRx editors, research stated, "Multiple myeloma (MM) is a malignancy of plasma cells characterized by multifocal osteolytic bone lesions. Macroscopic and genetic heterogeneity has been documented within MM lesions."

Our news journalists obtained a quote from the research from the Division of Genetics and Cell Biology, "Understanding the bases of such heterogeneity may unveil relevant features of MM pathobiology. To this aim, we deployed unbiased H-1 high-resolution magic-angle spinning (HR-MAS) nuclear magnetic resonance (NMR) metabolomics to analyze multiple biopsy specimens of osteolytic lesions from one case of pathological fracture caused by MM. Multivariate analyses on normalized metabolite peak integrals allowed clusterization of samples in accordance with a posteriori histological findings. We investigated the relationship between morphological and NMR features by merging morphological data and metabolite profiling into a single correlation matrix. Data-merging addressed tissue heterogeneity, and greatly facilitated the mapping of lesions and nearby healthy tissues."

According to the news editors, the research concluded: "Our proof-of-principle study reveals integrated metabolomics and histomorphology as a promising approach for the targeted study of osteolytic lesions."

For more information on this research see: Assessing Heterogeneity of Osteolytic Lesions in Multiple Myeloma by H-1 HR-MAS NMR Metabolomics. *International Journal of Molecular Sciences*, 2016;17(11):830-844. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Our news journalists report that additional information may be obtained by contacting L. Tavel, Ist Sci San Raffaele, Div Genet & Cell Biol, Biomol NMR Unit, I-20132 Milan, Italy. New Multiple Myeloma Study Findings Reported from Mayo Clinic
(Myelomatous Involvement of the Central Nervous System)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Multiple Myeloma. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Myelomatous involvement of the central nervous system (CNS) is an uncommon complication that portends a poor prognosis in patients with multiple myeloma (MM). Limited data exist regarding the optimal management of CNS MM."

Our news editors obtained a quote from the research from Mayo Clinic, "In the present case-control study, we examined the clinical presentation, diagnosis, treatment, and outcomes of CNS MM patients compared with a control group of MM patients without CNS involvement, matched by date of diagnosis and gender. Limited data exist with respect to the outcome and optimal treatment of patients with myelomatous involvement of the central nervous system (CNS). Of 4060 patients with multiple myeloma (MM), evaluated at Mayo Clinic from 1998 to 2014, 29 (0.7%) had identifiable CNS involvement, established by the presence of atypical plasma cells in the cerebrospinal fluid (CSF) and/or identification of intraparenchymal or meningeal involvement on magnetic resonance imaging (MRI). A cohort of 87 MM patients without CNS disease served as the control group (1:3), matched by diagnosis date and gender. Plasma cells were detected in the CSF in 87% and MRI findings consistent with CNS involvement were noted in 82% of the patients. A bone marrow plasma cell labeling index of >= 3%, the presence of disease at other extramedullary sites, or peripheral blood plasma cells of > 800 per 150,000 events were associated with an odds ratio of 7.1, 10.3, and 14, respectively, for the risk of CNS involvement. Overall survival (OS) from the diagnosis of MM was significantly shorter in the CNS-MM group (median 40 months; 95% confidence interval [CI], 24-56 months) than in the control group (median, 93 months; 95% CI, 67-129 months). OS was 3.4 months from the detection of CNS disease. Patients who underwent autologous stem cell transplantation after CNS involvement (n = 7) had a median OS of 19 months (95% CI, 10-67 months) from the detection of CNS involvement. Myelomatous involvement of the CNS is a rare complication that portends a poor survival."

According to the news editors, the research concluded: "Current therapeutic approaches appear to be largely ineffective for this subset of patients with MM."

For more information on this research see: Myelomatous Involvement of the Central Nervous System. Clinical Lymphoma Myeloma & Leukemia, 2016;16(11):644-654. Clinical Lymphoma Myeloma & Leukemia can be contacted at: Cig Media Group, Lp, 3500 Maple Avenue, Ste 750, Dallas, TX 75219-3931, USA.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.clml.2016.08.010. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Multiple Myeloma

New Multiple Myeloma Study Findings Reported from Tongji University (Pterostilbene Inhibits Human Multiple Myeloma Cells via ERK1/2 and JNK Pathway In Vitro and In Vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Multiple Myeloma are presented in a new report. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Multiple myeloma (MM) is the second most common malignancy in the hematologic system, which is characterized by accumulation of plasma cells in bone marrow. Pterostilbene (PTE) is a natural dimethylated analog of resveratrol, which has antioxidant, anti-inflammatory and anti-tumor properties."

The news reporters obtained a quote from the research from Tongji University, "In the present study, we examined the anti-tumor effect of PTE on MM cell lines both in vitro and in vivo using the cell counting kit (CCK)-8, apoptosis assays, cell cycle analysis, reactive oxygen species (ROS) generation, JC-1 mitochondrial membrane potential assay, Western blotting and tumor xenograft models. The results demonstrated that PTE induces apoptosis in the H929 cell line and causes cell cycle arrest at G0/G1 phase by enhancing ROS generation and reducing mitochondrial membrane potential. The anti-tumor effect of PTE may be caused by the activation of the extracellular regulated protein kinases (ERK) 1/2 and c-Jun N-terminal kinase (JNK) signaling pathways. Additionally, mice treated with PTE by intraperitoneal injection demonstrated reduced tumor volume."

According to the news reporters, the research concluded: "Taken together, the results of this study indicate that the anti-tumor effect of PTE on MM cells may provide a new therapeutic option for MM patients."

For more information on this research see: Pterostilbene Inhibits Human Multiple Myeloma Cells via ERK1/2 and JNK Pathway In Vitro and In Vivo. International Journal of Molecular Sciences, 2016;17(11):2318-2330. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Autoimmune Diseases and Conditions - Multiple...

New Multiple Sclerosis Findings from Harvard School of Medicine Discussed (Environmental control of autoimmune inflammation in the central nervous system)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Autoimmune Diseases and Conditions - Multiple Sclerosis are discussed in a new report. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Multiple sclerosis (MS) is a chronic autoimmune inflammatory demyelinating disorder of the central nervous system (CNS), which causes severe disability and requires extensive medical attention and treatment. While the infiltration of pathogenic immune cells into the CNS leads to the formation of inflammatory lesions in its initial relapsing-remitting stage, late stages of MS are characterized by progressive neuronal loss and demyelination even without continued interaction with the peripheral immune compartment."

Financial supporters for this research include National Institutes of Health, National Multiple Sclerosis Society, International Progressive MS Alliance, American Cancer Society, Mallinckrodt Pharmaceuticals and Deutsche Forschungsgemeinschaft (DFG).

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "Several genetic and environmental factors modulate and influence these processes on multiple levels. Genetic variants confer a predisposition for the development of MS, but are not accessible to therapeutic intervention as of today. However, migration studies suggest that environmental factors influence disease development, activity and progression."

According to the news reporters, the research concluded: "This article reviews mechanisms of disease pathogenesis in MS and their modulation by environmental factors such as geographical localization, the gut microbiome and the diet."

For more information on this research see: Environmental control of autoimmune inflammation in the central nervous system. Current Opinion in Immunology, 2016;43():46-53. Current Opinion in Immunology can be contacted at: Current Biology Ltd, 84 Theobalds Rd, London WC1X 8RR, England. (Elsevier - www elsevier com; Current Opinion in Immunology - www journals elsevier com/current-opinion-in-immunology/)

Our news journalists report that additional information may be obtained by contacting F.J. Quintana, Harvard Med Sch, Brigham & Women's Hospital, Ann Romney Center Neurol Dis, Boston, MA 02115, United States.

New Multiple Sclerosis Study Findings Reported from University of Rijeka (Angiotensin-converting enzyme insertion/deletion gene polymorphism in multiple sclerosis: a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Autoimmune Diseases and Conditions - Multiple Sclerosis is the subject of a report. According to news reporting from Rijeka, Croatia, by NewsRx journalists, research stated, "The activity of angiotensin-converting enzyme (ACE) has been increased in the blood and cerebrospinal fluid of multiple sclerosis (MS) patients. In addition, there has been suppression of disease development in experimental autoimmune encephalomyelitis after blockade of ACE."

Financial support for this research came from University of Rijeka, Croatia.

The news correspondents obtained a quote from the research from the University of Rijeka, "These findings suggest that ACE may play a role in the MS pathogenesis. Since the previous studies investigating the association between the insertion/deletion (I/D) polymorphism in intron 16 of the ACE gene and MS reported contradictory results, we performed a meta-analysis of four studies conducted in European populations of Slavic origin (1062 patients and 1067 controls) using the Comprehensive Meta-analysis 3.0 software. The results demonstrated that the ACE I/D polymorphism had no statistically significant association with an increased MS risk (all p > 0.05) under all genetic comparison models: (1) allelic (D vs. I), (2) recessive (DD vs. ID + II), (3) dominant (DD + ID vs. II), and (4) additive (DD vs. ID vs. II). This meta-analysis indicates that the ACE I/D polymorphism is not associated with susceptibility to MS in Europeans of Slavic origin."

According to the news reporters, the research concluded: "Further studies with larger sample sizes from genetically different populations are warranted."

Our news journalists report that additional information may be obtained by contacting S. Ristic, University of Rijeka, Sch Med, Dept. of Biol & Med Genet, Rijeka 51000, Croatia. Additional authors for this research include N.S. Cizmarevic, J. Sepcic, M. Kapovic and B. Peterlin.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s10072-016-2698-3. This DOI is a link to an online electronic document that is either free or for purchase.

Autoimmune Diseases and Conditions - Multiple...

New Multiple Sclerosis Study Results from NeuroCure Clinical Research Center Described (Analysis of Lymphocytic DNA Damage in Early Multiple Sclerosis by Automated Gamma-H2AX and 53BP1 Foci Detection: A Case Control Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Multiple Sclerosis. According to news originating from Berlin, Germany, by NewsRx correspondents, research stated, "In response to DNA double-strand breaks, the histone protein H2AX becomes phosphorylated at its C-terminal serine 139 residue, referred to as g-H2AX. Formation of g-H2AX foci is associated with recruitment of p53-binding protein 1 (53BP1), a regulator of the cellular response to DNA double-strand breaks. g-H2AX expression in peripheral blood mononuclear cells (PBMCs) was recently proposed as a diagnostic and disease activity marker for multiple sclerosis (MS)."

Our news journalists obtained a quote from the research from NeuroCure Clinical Research Center, "To evaluate the significance of g-H2AX and 53BP1 foci in PBMCs as diagnostic and disease activity markers in patients with clinically isolated syndrome (CIS) and early relapsing-remitting MS (RRMS) using automated g-H2AX and 53BP1 foci detection. Immunocytochemistry was performed on freshly isolated PBMCs of patients with CIS/early RRMS (n=25) and healthy controls (n=27) with g-H2AX and 53BP1 specific antibodies. Nuclear g-H2AX and 53BP1 foci were determined using a fully automated reading system, assessing the numbers of g-H2AX and 53BP1 foci per total number of cells and the percentage of cells with foci. Patients underwent contrast enhanced 3 Tesla magnetic resonance imaging (MRI) and clinical examination including expanded disability status scale (EDSS) score. g-H2AX and 53BP1 were also compared in previously frozen PBMCs of each 10 CIS/early RRMS patients with and without contrast enhancing lesions (CEL) and 10 healthy controls. The median (range) number of g-H2AX (0.04 [0-0.5]) and 53BP1 (0.005 [0-0.2]) foci per cell in freshly isolated PBMCs across all study participants was low and similar to previously reported values of healthy individuals. For both, g-H2AX and 53BP1, the cellular focus number as well as the percentage of positive cells did not differ between patients with CIS/RRMS and healthy controls. g-H2AX and 53BP1 levels neither correlated with number nor volume of T2-weighted lesions on MRI, nor with the EDSS. Although g-H2AX, but not 53BP1, levels were higher in previously frozen PBMCs of patients with than without CEL, g-H2AX values of both groups overlapped and g-H2AX did not correlate with the number or volume of CEL. g-H2AX and 53BP1 foci do not seem to be promising diagnostic or disease activity biomarkers in patients with early MS."

According to the news editors, the research concluded: "Lymphocytic DNA double-strand breaks are unlikely to play a major role in the pathophysiology of MS."

The news correspondents report that additional information may be obtained from L. Rasche, NeuroCure Clinical Research Center, Charite - Universitätsmedizin Berlin, Berlin, Germany. Additional authors for this research include L. Heiserich, J.R. Behrens, K. Lenz, C.
New Muscular Atrophy Findings from Cleveland Clinic Outlined
(Sarcopenia from mechanism to diagnosis and treatment in liver disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Musculoskeletal Diseases and Conditions - Muscular Atrophy. According to news originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Sarcopenia or loss of skeletal muscle mass is the major component of malnutrition and is a frequent complication in cirrhosis that adversely affects clinical outcomes. These include survival, quality of life, development of other complications and post liver transplantation survival."

Our news journalists obtained a quote from the research from Cleveland Clinic, "Radiological image analysis is currently utilized to diagnose sarcopenia in cirrhosis. Nutrient supplementation and physical activity are used to counter sarcopenia but have not been consistently effective because the underlying molecular and metabolic abnormalities persist or are not influenced by these treatments. Even though alterations in food intake, hypermetabolism, alterations in amino acid profiles, endotoxemia, accelerated starvation and decreased mobility may all contribute to sarcopenia in cirrhosis, hyperammonemia has recently gained attention as a possible mediator of the liver-muscle axis. Increased muscle ammonia causes: cataplerosis of o-t-ketoglutarate, increased transport of leucine in exchange for glutamine, impaired signaling by leucine, increased expression of myostatin (a transforming growth factor beta superfamily member) and an increased phosphorylation of eukaryotic initiation factor 2a. In addition, mitochondrial dysfunction, increased reactive oxygen species that decrease protein synthesis and increased autophagy mediated proteolysis, also play a role. These molecular and metabolic alterations may contribute to the anabolic resistance and inadequate response to nutrient supplementation in cirrhosis. Central and skeletal muscle fatigue contributes to impaired exercise capacity and responses. Use of proteins with low ammoniagenic potential, leucine enriched amino acid supplementation, long-term ammonia lowering strategies and a combination of resistance and endurance exercise to increase muscle mass and function may target the molecular abnormalities in the muscle."

According to the news editors, the research concluded: "Strategies targeting endotoxemia and the gut microbiome need further evaluation."

**Autoimmune Diseases and Conditions - Myasthenia...**

**New Myasthenia Gravis Findings from University of Athens School of Medicine Reported (Future perspectives in target-specific immunotherapies of myasthenia gravis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Myasthenia Gravis. According to news reporting originating in Philadelphia, Pennsylvania, by NewsRx editors, the research stated, "Myasthenia gravis (MG) is an autoimmune disease caused by complement-fixing antibodies against acetylcholine receptors (AChR); antigen-specific CD4+ T cells, regulatory T cells (Tregs) and T helper (Th) 17+ cells are essential in antibody production. Target-specific therapeutic interventions should therefore be directed against antibodies, B cells, complement and molecules associated with T cell signaling."

The news reporters obtained a quote from the research from the University of Athens School of Medicine, "Even though the progress in the immunopathogenesis of the disease probably exceeds any other autoimmune disorder, MG is still treated with traditional drugs or procedures that exert a non-antigen specific immunosuppression or immunomodulation. Novel biological agents currently on the market, directed against the following molecular pathways, are relevant and specific therapeutic targets that can be tested in MG: (a) T cell intracellular signaling molecules, such as anti-CD52, anti-interleukin (IL) 2 receptors, anti-costimulatory molecules, and anti-Janus tyrosine kinases (JAK1, JAK3) that block the intracellular cascade associated with T-cell activation; (b) B cells and their trophic factors, directed against key B-cell molecules; © complement C3 or C5, intercepting the destructive effect of complement-fixing antibodies; (d) cytokines and cytokine receptors, such as those targeting IL-6 which promotes antibody production and IL-17, or the p40 subunit of IL-12/IL-23 that affect regulatory T cells; and (e) T and B cell transmigration molecules associated with lymphocyte egress from the lymphoid organs. All drugs against these molecular pathways require testing in controlled trials,
although some have already been tried in small case series."

According to the news reporters, the research concluded: "Construction of recombinant AChR antibodies that block binding of the pathogenic antibodies, thereby eliminating complement and antibody-dependent-cell-mediated cytotoxicity, are additional novel molecular tools that require exploration in experimental MG."

For more information on this research see: Future perspectives in target-specific immunotherapies of myasthenia gravis. *Therapeutic Advances In Neurological Disorders*, 2015;8(6):316-27. *Therapeutic Advances In Neurological Disorders* can be contacted at: SAGE Publications, USA, 2455 Teller Road, Thousand Oaks, CA 91320, USA. **Myeloid Cells**

**New Myeloid Cells Findings from Chinese Academy of Sciences Described [Crucial Role of P2X(7) Receptor in Regulating Exocytosis of Single-Walled Carbon Nanotubes in Macrophages]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Myeloid Cells have been presented. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Exocytosis of single-walled carbon nanotubes (SWCNTs) determines therapeutic efficiency and toxicity of nanoproducts but its underlying mechanism remains elusive. In this study, it is found that the exocytosis mechanism of SWCNTs is mediated mainly through the activation of P2X(7) receptor (P2X(7)R), an ATP-gated membrane receptor highly expressed in macrophages."

Our news journalists obtained a quote from the research from the Chinese Academy of Sciences, "Inhibition of P2X(7)R signaling by either a specific inhibitor (oxidized ATP) or small interfering RNA targeting P2X(7)R largely prevents the exocytosis of SWCNTs from Raw264.7 cells, resulting in significant accumulation of SWCNTs within cells. In contrast, activation of P2X(7)R with ATP promotes exocytosis of SWCNTs. Specifically, it is elucidated that internalized SWCNTs are accumulated in lysosomes and induce transitional release of ATP into extracellular space, which further activates P2X(7)R, leading to the influx of calcium ions,
phosphorylation of protein kinase C, ERK1/2, p38, and JNK, as well as alkalization of lysosomes. SWCNTs exposure also induces microtubules reorganization that facilitates the secretion of SWCNTs-containing lysosomes. It is also found that P2X(7)R simultaneously mediates secretion of IL-1 beta from Raw264.7 cells during the process of SWCNTs exocytosis. The combined data reveals that P2X(7)R-mediated pathway is the predominant molecular mechanism for exocytosis of SWCNTs in Raw264.7 cells. 

According to the news editors, the research concluded: "Moreover, SWCNT-induced inflammation is closely coupled with the exocytosis of SWCNTs through P2X(7)R."

Our news journalists report that additional information may be obtained by contacting B. Wan, Univ Chinese Academy Sci, Beijing 100049, People's Republic of China. Additional authors for this research include B. Wan, Y. Yang, X.M. Ren, L.H. Guo and H. Zhang.

Oncology - Myeloid Leukemia

New Myeloid Leukemia Findings from University of Munster Reported (Myeloid leukemia with transdifferentiation plasticity developing from T-cell progenitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Myeloid Leukemia have been published. According to news reporting out of Munster, Germany, by NewsRx editors, research stated, "Unfavorable patient survival coincides with lineage plasticity observed in human acute leukemias. These cases are assumed to arise from hematopoietic stem cells, which have stable multipotent differentiation potential."

Our news journalists obtained a quote from the research from the University of Munster, "However, here we report that plasticity in leukemia can result from instable lineage identity states inherited from differentiating progenitor cells. Using mice with enhanced c-Myc expression, we show, at the single-cell level, that T-lymphoid progenitors retain broad malignant lineage potential with a high capacity to differentiate into myeloid leukemia. These T-cell-derived myeloid blasts retain expression of a defined set of T-cell transcription factors, creating a lymphoid epigenetic memory that confers growth and propagates myeloid/T-lymphoid plasticity. Based on these characteristics, we identified a correlating human leukemia cohort and revealed targeting of Jak2/Stat3 signaling as a therapeutic possibility. Collectively, our study suggests the thymus as a source for myeloid leukemia and proposes leukemic plasticity as a
driving mechanism."

According to the news editors, the research concluded: "Moreover, our results reveal a pathway-directed therapy option against thymus-derived myeloid leukemogenesis and propose a model in which dynamic progenitor differentiation states shape unique neoplastic identities and therapy responses."

Our news journalists report that additional information may be obtained by contacting F. Rosenbauer, University of Munster, Inst Mol Tumor Biol, Munster, Germany. Additional authors for this research include M. Czeh, J. Fischer, C. Walter, S. Ghani, M. Zepper, K. Agelopoulos, S. Lettermann, M.L. Gebhardt, N. Mah, A. Weilemann, M. Grau, V. Groning, T. **Heart Disorders and Diseases - Myocardial Ischemia**

**New Myocardial Ischemia Findings from Ehime University Described (Optimal Scan Time for Single-Phase Myocardial Computed Tomography Perfusion to Detect Myocardial Ischemia - Derivation Cohort From Dynamic Myocardial Computed Tomography Perfusion)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Myocardial Ischemia are presented in a new report. According to news originating from Toon, Japan, by NewsRx correspondents, research stated, "Single-phase myocardial computed tomography perfusion (CTP) is useful for detecting myocardial ischemia, but determining the optimal scan time is difficult. The present study evaluated this by analyzing dynamic CTP data."

Our news journalists obtained a quote from the research from Ehime University, "We retrospectively selected 32 patients, all of whom had undergone stress dynamic CTP and magnetic resonance myocardial perfusion imaging (MR-MPI). Myocardial ischemia was assessed by MR-MPI using the 16-segment model. Whole-heart dynamic CTP data were acquired for 30 consecutive heartbeats without spatial or temporal gaps using a wide-detector CT, and redistributed into 11 series of single-phase CTP acquired from -2 s to 8 s from the time of maximal enhancement (Tmax) in the ascending aorta. Single-phase CTP images were visually assessed at the segment level, and diagnostic performance of single-phase CTP images for detecting myocardial ischemia was compared with dynamic CTP. Of 512 segments, 177 segments (35%) were diagnosed as ischemic by MR-MPI. The diagnostic accuracy of single-phase CTP acquired at 2-6 s from Tmax in the ascending aorta (median 86%, range 84-87%) was comparable to that of dynamic CTP."

According to the news editors, the research concluded: "The optimal scan time for detecting myocardial ischemia with single-phase CTP was at 2-6 s from Tmax in the ascending..."
aorta."

The news correspondents report that additional information may be obtained from Y. Tanabe, Ehime University, Grad Sch Med, Dept. of Radiol, Shitsukawa, Toon 7910295, Japan. Additional authors for this research include T. Kido, A. Kurata, T. Uetani, N. Fukuyama, T. Yokoi, H. Nishiyama, T. Kido, M. Miyagawa and T. Mochizuki.

**Nanotechnology - Nanomaterials**

**New Nanomaterials Study Findings Recently Were Reported by Researchers at Research Institute (Effects of dose volume and delivery device on bronchoalveolar lavage parameters of intratracheally administered nano-sized TiO2 in rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nanotechnology - Nanomaterials have been published. According to news reporting from Oita, Japan, by NewsRx journalists, research stated, "The intratracheal (IT) test is useful for screening the pulmonary toxicity of inhaled materials, including nanomaterials. However, a standard procedure has not yet been authorized internationally, and the effects of different test parameters are unknown."

Financial support for this research came from Ministry of Economy, Trade and Industry.

The news correspondents obtained a quote from the research from Research Institute, "To determine appropriate experimental conditions for the IT test, we intratracheally administered nano-sized TiO2 to male F344 rats at 3.0 mg/kg body weight by using two delivery devices (gavage needle or microaerosolizer) and dose volumes of 0.5-3.0 mL/kg (gavage needle) or 0.5-2.0 mL/kg (microaerosolizer). We evaluated the pulmonary deposition and interlobar distribution of TiO2 at both 30 min and 3 days after administration. In addition, the inflammatory components in bronchoalveolar lavage (BAL) fluid were measured 3 days after administration of TiO2. At dose volumes of 0.5-2.0 mL/kg, the BAL values were comparable regardless of the device used. In addition, pulmonary TiO2 burden and lobar concentration patterns were equivalent at all combinations of dose volume and delivery device."

According to the news reporters, the research concluded: "The acute pulmonary toxicity of nanomaterials can be assessed effectively by using an IT test in which the test agent is provided to rats at a dose volume of 0.5-2.0 mL/kg with either a gavage needle or microaerosolizer."
For more information on this research see: Effects of dose volume and delivery device on bronchoalveolar lavage parameters of intratracheally administered nano-sized TiO2 in rats. Regulatory Toxicology and Pharmacology, 2016;81():233-241. New Nanoparticles Findings from Academy of Sciences Described
(Amplified Fluorescence from Polyfluorene Nanoparticles with Dual State Emission and Aggregation Caused Red Shifted Emission for Live Cell Imaging and Cancer Theranostics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nanotechnology - Nanoparticles. According to news reporting out of Tamil Nadu, India, by NewsRx editors, research stated, "A newly synthesized polyfluorene derivative with pendant di(2-picoly)amine (PF-DPA) shows dual state emission and aggregation caused red shifted emission that was utilized for cell imaging and cancer theranostics. PF-DPA was nontoxic to normal cells but showed cytotoxicity against cancer cells, suggesting its utility for cancer therapy."

Funders for this research include Council of Scientific and Industrial Research, Science and Engineering Research Board, Department of Electronics and Information Technology, Ministry of Communications and Information Technology, Max-Planck-Gesellschaft.

Our news journalists obtained a quote from the research from the Academy of Sciences, "PF-DPA exhibits a large and unique red shifted emission at 556 nm at higher water ratio of THF:H2O (10:90) due to the formation of polymer nanoparticles or PDots spontaneously by intra- and intermolecular self-assembly induced aggregation. Dual state emission and aggregation caused red shifted emission (>100 nm) in PF-DPA homopolymer nanoparticles is very unique and attributed to the combined effect of intramolecular planarization and J-type aggregate formation in the PDots (25 +/- 5 nm)."

According to the news editors, the research concluded: "The PF-DPA PDots exhibit bright green and orange fluorescence with exceptional live cell imaging properties and potential applications in cancer theranostics due to their selective cytotoxic nature toward cancer cells."

For more information on this research see: Amplified Fluorescence from

Our news journalists report that additional information may be obtained by contacting C.R. Patra, Academy Sci & Innovat Res AcSIR, Madras 600113, Tamil Nadu, India. Additional authors for this research include S. Mukherjee, C.R. Patra and P.K. Iyer.

**Nanotechnology - Nanoparticles**

**New Nanoparticles Findings from Swinburne University of Technology Described (Microwave-assisted formulation of solid lipid nanoparticles loaded with non-steroidal anti-inflammatory drugs)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nanotechnology - Nanoparticles have been presented. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "Stearic acid-based solid lipid nanoparticles (SLNs) were prepared using the microwave assisted one-pot microemulsions procedure pioneered by our group. In this study, non-steroidal anti-inflammatory drugs (NSAIDs) including indomethacin, ketoprofen and nimesulide were selected as ideal 'test' drugs, based on their poor water solubility."

The news correspondents obtained a quote from the research from the Swinburne University of Technology, "The model drugs were incorporated within the SLNs by the microwave-assisted procedure at the time of SLN production. The microwave-produced drug-loaded SLNs were evaluated in terms of their physicochemical characteristics, drug release behavior and their uptake into against A549 cell line (human lung epithelial cells). The microwave-produced drug-loaded SLNs had a small particle size distribution, negative zeta potential and high encapsulation efficiency. The drug release studies were consistent with a core-shell structure of SLNs (probably a drug-loaded shell) which results in biphasic drug release from the SLNs. The drug release kinetics suggested a good fit of the release data to the Makoid-Banakar model and was governed by Fickian diffusion. The drug-loaded SLNs showed concentration-dependent cytotoxicity and reduced IL-6 and IL-8 secretion in lipopolysaccharide-induced cells."

According to the news reporters, the research concluded: "All of the above findings suggest that the microwave-produced SLNs could be promising drug carriers of NSAIDs and will further facilitate their development for topical, oral and/or nasal administration."

For more information on this research see: Microwave-assisted formulation of solid

Our news journalists report that additional information may be obtained by contacting R.M. Shah, Swinburne Univ Technol, Dept. of Chem & Biotechnol, Fac Sci Engn & Technol, Melbourne, Vic 3122, Australia. Additional authors for this research include D.S. Eldridge, E.A. Palombo and I.H. Harding.

New Nanotechnology Study Findings Reported from State Key Laboratory of Environmental Chemistry and Ecotoxicology [Improved In Vitro and In Vivo Biocompatibility of Graphene Oxide through Surface Modification: Poly(Acrylic ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nanotechnology. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "The unique physicochemical properties of two-dimensional (2D) graphene oxide (GO) could greatly benefit the biomedical field; however, recent research demonstrated that GO could induce in vitro and in vivo toxicity. We determined the mechanism of GO induced toxicity, and our in vitro experiments revealed that pristine GO could impair cell membrane integrity and functions including regulation of membrane-and cytoskeleton-associated genes, membrane permeability, fluidity and ion channels."

Financial supporters for this research include Ministry of Science and Technology of the People's Republic of China, National Natural Science Foundation of China, Chinese Academy of Sciences.

The news reporters obtained a quote from the research from the State Key Laboratory of Environmental Chemistry and Ecotoxicology, "Furthermore, GO induced platelet depletion, pro-inflammatory response and pathological changes of lung and liver in mice. To improve the biocompatibility of pristine GO, we prepared a series of GO derivatives including aminated GO (GO-NH2), poly(acrylamide)-functionalized GO (GO-PAM), poly(acrylic acid)-functionalized GO (GO-PAA) and poly(ethylene glycol)-functionalized GO (GO-PEG), and compared their toxicity with pristine GO in vitro and in vivo. Among these GO derivatives, GO-PEG and GO-PAA induced less toxicity than pristine GO, and GO-PAA was the most biocompatible one in vitro and in vivo. The differences in biocompatibility were due to the differential compositions of protein corona, especially immunoglobulin G (IgG), formed on their surfaces that determine
their cell membrane interaction and cellular uptake, the extent of platelet depletion in blood, thrombus formation under short-term exposure and the pro-inflammatory effects under long-term exposure."

According to the news reporters, the research concluded: "Overall, our combined data delineated the key molecular mechanisms underlying the in vivo and in vitro biological behaviors and toxicity of pristine GO, and identified a safer GO derivative that could be used for future applications."

For more information on this research see: Improved In Vitro and In Vivo Biocompatibility of Graphene Oxide through Surface Modification: Poly(Acrylic Acid)-Functionalization is Superior to PEGylation. *Acs Nano*, 2016;10(3):3267-81. **Neovascularization**

**New Neovascularization Findings from Department of Ophthalmology Discussed (Lack of netrin-4 modulates pathologic neovascularization in the eye)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neovascularization have been published. According to news reporting originating from Berlin, Germany, by NewsRx correspondents, research stated, "Netrins are a family of matrix-binding proteins that function as guidance signals. Netrin-4 displays pathologic roles in tumorigenesis and neovascularization."

Our news editors obtained a quote from the research from the Department of Ophthalmology, "To answer the question whether netrin-4 acts either pro-or anti-angiogenic, angiogenesis in the retina was assessed in Ntn-4(-/-) mice with oxygen-induced retinopathy (OIR) and laser-induced choroidal neovascularization (CNV), mimicking hypoxia-mediated neovascularization and inflammatory mediated angiogenesis. The basement membrane protein netrin-4 was found to be localised to mature retinal blood vessels. Netrin-4, but not netrin-1 mRNA expression, increased in response to relative hypoxia and recovered to normal levels at the end of blood vessel formation. No changes in the retina were found in normoxic Ntn-4(-/-) mice. In OIR, Ntn-4(-/-) mice initially displayed larger avascular areas which recovered faster to revascularization. Ganzfeld electroretinography showed faster recovery of retinal function in Ntn-4(-/-) mice. Expression of netrin receptors, Unc5H2 (Unc-5 homolog B, C. elegans) and DCC (deleted in colorectal carcinoma), was found in Müller cells and astrocytes. Laser-induced
neovascularization in Nnt-4(-/-) mice did not differ to that in the controls."

According to the news editors, the research concluded: "Our results indicate a role for netrin-4 as an angiogenesis modulating factor in O2-dependent vascular homeostasis while being less important during normal retinal developmental angiogenesis or during inflammatory neovascularization."

For more information on this research see: Lack of netrin-4 modulates pathologic neovascularization in the eye. Scientific Reports, 2016;6():18828. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting N. Kociok, Dept. of Ophthalmology, Charite Universitatsmedizin, Berlin, Germany. Nephrology

New Nephrology Study Findings Have Been Reported by Investigators at University of Crete (Micro-RNA analysis of renal biopsies in human lupus nephritis demonstrates up-regulated miR-422a driving reduction of kallikrein-related peptidase 4)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nephrology are presented in a new report. According to news reporting from Iraklion, Greece, by NewsRx journalists, research stated, "Aberrancies in gene expression in immune effector cells and in end-organs are implicated in lupus pathogenesis. To gain insights into the mechanisms of tissue injury, we profiled the expression of micro-RNAs in inflammatory kidney lesions of human lupus nephritis (LN)."

Financial supporters for this research include Greek General Secretariat of, Research and Technology, European Social Fund (ESF) and National Resources.

The news correspondents obtained a quote from the research from the University of Crete, "Kidney specimens were from patients with active proliferative, membranous or mixed LN and unaffected control tissue. Micro-RNAs were quantified by TaqMan Low Density Arrays. Bioinformatics was employed to predict gene targets, gene networks and perturbed signaling pathways. Results were validated by transfection studies (luciferase assay, real-time PCR) and in murine LN. Protein expression was determined by immunoblotting and immunohistochemistry. Twenty-four micro-RNAs were dysregulated (9 up-regulated, 15 down-regulated) in human LN compared with control renal tissue. Their predicted gene targets participated in pathways associated with TGF-beta, kinases, NF-kappa B, HNF4A, Wnt/beta-catenin, STAT3 and IL-4. miR-422a showed the highest upregulation (17-fold) in active LN and correlated with fibrinoid necrosis lesions (beta = 0.63, P = 0.002). In transfection studies, miR-
422a was found to directly target kallikrein-related peptidase 4 (KLK4) mRNA. Concordantly, KLK4 mRNA was significantly reduced in the kidneys of human and murine LN and correlated inversely with miR-422a levels. Immunohistochemistry confirmed reduced KLK4 protein expression in renal mesangial and tubular epithelial cells in human and murine LN.

According to the news reporters, the research concluded: "KLK4, a serine esterase with putative renoprotective properties, is down-regulated by miR-422a in LN kidney suggesting that, in addition to immune activation, local factors may be implicated in the disease."

Our news journalists report that additional information may be obtained by contacting G.K. Bertsias, University of Crete, Rheumatol Clin Immunol & Allergy, Sch Med, Iraklion, Greece. Additional authors for this research include A. Banos, E. Stagakis, K. Loupasakis, E. Drakos, V. Sinatkas, A. Zampoulaki, A. Papagianni, D. Iliopoulos, D.T. Boumpas and G.K. Bertsias.

**Nephrology**

**New Nephrology Study Findings Have Been Reported by Investigators at University of Palermo (Association Between Uric Acid and Renal Hemodynamics: Pathophysiological Implications for Renal Damage in Hypertensive Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nephrology is now available. According to news reporting originating from Palermo, Italy, by NewsRx correspondents, research stated, "The role of vascular renal changes in mediating the association between serum uric acid (SUA) and renal damage is unclear. The purposes of this study were to investigate the relationship between SUA and renal resistive index (RRI), assessed by duplex Doppler ultrasonography, and to assess whether hemodynamic renal changes may explain the association between SUA and renal damage in hypertensive patients."

Our news editors obtained a quote from the research from the University of Palermo, "A total of 530 hypertensive patients with and without chronic kidney disease were enrolled and divided into SUA tertiles based on sex-specific cutoff values. RRI and albuminuria were greater
and glomerular filtration rate (GFR) was lower in the uppermost SUA tertile patients when compared with those in the lowest tertiles (all P<.001). Moreover, SUA strongly correlated with RRI (P < .001) in all patients.

According to the news editors, the research concluded: "However, RRI did not seem to explain the relationship between SUA and renal damage, and GFR significantly related with SUA in the overall population (P < .001) even after adjustment for RRI."

The news editors report that additional information may be obtained by contacting G. Geraci, University of Palermo, Dipartimento Biomed Med Interna & Specialist DIBI, Unit Nephrol & Hypertens, European Soc Hypertens Excellence Center, Palermo, Italy. Additional authors for this research include G. Mule, M. Mogavero, C. Geraci, E. Nardi and S. Cottone.

**Nephrology**

**New Nephrology Study Findings Have Been Reported by Researchers at Medical University (Renal microRNA- and RNA-profiles in progressive chronic kidney disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nephrology have been presented. According to news originating from Innsbruck, Austria, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) contribute to chronic kidney disease (CKD) progression via regulating mRNAs involved in renal homeostasis. However, their association with clinical outcome remains poorly understood."

Financial support for this research came from Seventh Framework Programme.

Our news journalists obtained a quote from the research from Medical University, "We performed miRNA and mRNA expression profiling on renal biopsy sections by qPCR (miRNA) and microarrays (mRNA) in a discovery (n=43) and in a validation (n=29) cohort. miRNAs differentiating stable and progressive cases were inversely correlated with putative target mRNAs, which were further characterized by pathway analysis using KEGG pathways. miR-30d, miR-140-3p, miR-532-3p, miR-194, miR-190, miR-204 and miR-206 were downregulated in progressive cases. These seven miRNAs correlated with upregulated 29 target mRNAs involved in inflammatory response, cell-cell interaction, apoptosis and intra-cellular signalling. In particular, miR-206 and miR-532-3p were associated with distinct biological processes via the expression of their target mRNAs: Reduced expression of miR-206 in
progressive disease correlated with the upregulation of target mRNAs participating in inflammatory pathways (CCL19, CXCL1, IFNAR2, NCK2, PTK2B, PTPRC, RASGRP1 and TNFRSF25). Progressive cases also showed a lower expression of miR-532-3p and an increased expression of target transcripts involved in apoptosis pathways (MAP3K14, TNFRSF10B/TRAIL-R2, TRADD and TRAF2). In the validation cohort, we confirmed the decreased expression of miR-206 and miR-532-3p, and the inverse correlation of these miRNAs with the expression of nine of the 12 target genes. The levels of the identified miRNAs and the target mRNAs correlated with clinical parameters and histological damage indices."

According to the news editors, the research concluded: "These results suggest the involvement of specific miRNAs and mRNAs in biological pathways associated with the progression of CKD."

The news correspondents report that additional information may be obtained from M. Rudnicki, Dept. of Internal Medicine IV - Nephrology and Hypertension, Medical University Innsbruck, Innsbruck, Austria. Additional authors for this research include P. Perco, B. D Haene, J. Leierer, A. Heinzel, I. Muhlberger, N. Schweibert, J. Sunzenauer, H. Regele, A. Kronbichler, P. Mestdagh, J. Vandesompele, B. Mayer and G. Mayer.

Nephropathy

New Nephropathy Study Findings Have Been Reported from Jilin University [Increased ratio of ICOS(+) /PD-1(+) follicular helper T cells positively correlates with the development of human idiopathic membranous nephropathy]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nephropathy are discussed in a new report. According to news originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "To identify the frequencies of different subsets of peripheral blood follicular helper T (Tfh) cells in human idiopathic membranous nephropathy (IMN), 39 patients with new onset IMN and 18 age-and gender-matched healthy controls (HC) were enrolled for this study. The frequency of Tfh cells in venous blood were measured by flow cytometry, while concentration of serum IL-21 was detected by enzyme-linked immunosorbent assay."

Financial supporters for this research include National Natural Science Foundation of China, Bethune B plan of Jilin University, Special Research Foundation of Jilin University. Our news journalists obtained a quote from the research from Jilin University,
"Correlation between the clinical features of IMN and Tfh cells was assessed by Spearman's rank correlation test. Overall, the frequencies of total, ICOS(+) and PD-1(+) Tfh cells were increased in IMN patients, while the ratio of ICOS(+)/PD-1(+) Tfh cells positively correlated with IMN progression. However, the elevated serum IL-21 level in three subgroups of IMN patients, stratified based on 24-h urine protein levels, was not statistically significant compared to HC. Nonetheless, intracellular IL-21 in Tfh cells was generally increased in all IMN patients, and closely correlated with IMN development. Finally, the frequency of IL-21(+) Tfh cells and the ratio of ICOS(+) /PD-1(+) Tfh cells were positively correlated with the estimated 24-h urine protein of IMN patients. The data indicated that Tfh cells contribute to the pathogenicity of IMN."

According to the news editors, the research concluded: "The ratio of ICOS(+) /PD-1(+) Tfh cells and the frequency of IL-21(+) Tfh cells may be indicators for evaluating the IMN development."

The news correspondents report that additional information may be obtained from X. Shi, Genetic Diagnosis Centre, Central Laboratory, Ministry of Education, First Hospital, Jilin University, Changchun, People's Republic of China. Additional authors for this research include Z. Qu, L. Zhang, N. Zhang, Y. Liu, M. Li, J. Qian and Y. Jiang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1440-1681.12555. This DOI is a link to an online electronic document that is either free or for purchase.

**Proteins - Nerve Tissue Proteins**

**New Nerve Tissue Proteins Findings from University of Padua Discussed (Alpha-synuclein at the intracellular and the extracellular side: functional and dysfunctional implications)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Proteins - Nerve Tissue Proteins is the subject of a report. According to news reporting originating in Padua, Italy, by NewsRx journalists, research stated, "Alpha-synuclein (alpha-syn) is an abundant neuronal protein whose physiological function, even if still not completely understood, has been consistently related to synaptic function and vesicle trafficking. A group of disorders known as synucleinopathies, among which Parkinson's disease (PD), is deeply associated with the mis-folding and aggregation of alpha-syn, which can give rise to proteinaceous inclusion known as Lewy bodies (LB)."

The news reporters obtained a quote from the research from the University of Padua, "Proteostasis stress is a relevant aspect in these diseases and, currently, the presence of oligomeric alpha-syn species rather than insoluble aggregated forms, appeared to be associated
with cytotoxicity. Many observations suggest that alpha-syn is responsible for neurodegeneration by interfering with multiple signaling pathways. alpha-syn protein can directly form plasma membrane channels or modify with their activity, thus altering membrane permeability to ions, abnormally associate with mitochondria and cause mitochondrial dysfunction (i.e. mitochondrial depolarization, Ca2+ dys-homeostasis, cytochrome c release) and interfere with autophagy regulation. The picture is further complicated by the fact that single point mutations, duplications and triplication in alpha-syn gene are linked to autosomal dominant forms of PD."

According to the news reporters, the research concluded: "In this review we discuss the multi-faced aspect of alpha-syn biology and address the main hypothesis at the basis of its involvement in neuronal degeneration."

For more information on this research see: Alpha-synuclein at the intracellular and the extracellular side: functional and dysfunctional implications. Biological Chemistry, 2017;398(1):77-100. Biological Chemistry can be contacted at: Walter De Gruyter Gmbh, Genthiner Strasse 13, D-10785 Berlin, Germany.

Our news correspondents report that additional information may be obtained by contacting M. Brini, University of Padua, Dept. of Biol, I-35131 Padua, Italy. Additional authors for this research include T. Cali, I. Szabo and M. Brini.

Keywords for this news article include: Padua, Italy, Europe, Proteins, Article Review, Nerve Tissue Proteins, alpha-Synuclein, Synucleins, Genetics, University of Padua.

Oncology - Neuroblastomas

New Neuroblastomas Findings from Fudan University Discussed (Wip1 inhibitor GSK2830371 inhibits neuroblastoma growth by inducing Chk2/p53-mediated apoptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Neuroblastomas. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Neuroblastoma (NB) is the most common extracranial tumor in children. Unlike in most adult tumors, tumor suppressor protein 53 (p53) mutations occur with a relatively low frequency in NB and the downstream function of p53 is intact in NB cell lines."

Our news journalists obtained a quote from the research from Fudan University, "Wip1 is a negative regulator of p53 and hindrance of Wip1 activity by novel inhibitor GSK2830371 is a potential strategy to activate p53's tumor suppressing function in NB. Yet, the in vivo efficacy and the possible mechanisms of GSK2830371 in NB have not yet been elucidated. Here we report that novel Wip1 inhibitor GSK2830371 induced Chk2/p53-mediated apoptosis in NB cells in a p53-dependent manner. In addition, GSK2830371 suppressed the colony-formation potential of p53 wild-type NB cell lines. Furthermore, GSK2830371 enhanced doxorubicin-(Dox) and etoposide-(VP-16) induced cytotoxicity in a subset of NB cell lines, including the chemoresistant LA-N-6 cell line. More importantly, GSK2830371 significantly inhibited tumor growth in an orthotopic xenograft NB mouse model by inducing Chk2/p53-mediated apoptosis in vivo."
According to the news editors, the research concluded: "Taken together, this study suggests that GSK2830371 induces Chk2/p53-mediated apoptosis both in vitro and in vivo in a p53 dependent manner."

Keywords for this news article include: Shanghai, People's Republic of China, Asia, Neuroblastomas, Hematology, Cell Line, Apoptosis, Genetics, p53 Gene, Oncology, Fudan University.

**Oncology - Neuroblastomas**

**New Neuroblastomas Study Results Reported from University of Rome (Neuroblastoma: oncogenic mechanisms and therapeutic exploitation of necroptosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Neuroblastomas have been presented.

According to news reporting out of Rome, Italy, by NewsRx editors, research stated, "Neuroblastoma (NB) is the most common extracranial childhood tumor classified in five stages (1, 2, 3, 4 and 4S), two of which (3 and 4) identify chemotherapy-resistant, highly aggressive disease. High-risk NB frequently displays MYCN amplification, mutations in ALK and ATRX, and genomic rearrangements in TERT genes."

Our news journalists obtained a quote from the research from the University of Rome, "These NB subtypes are also characterized by reduced susceptibility to programmed cell death induced by chemotherapeutic drugs. The latter feature is a major cause of failure in the treatment of advanced NB patients. Thus, proper reactivation of apoptosis or of other types of programmed cell death pathways in response to treatment is relevant for the clinical management of aggressive forms of NB. In this short review, we will discuss the most relevant genomic rearrangements that define high-risk NB and the role that destabilization of p53 and p73 can have in NB aggressiveness. In addition, we will propose a strategy to stabilize p53 and p73 by using specific inhibitors of their ubiquitin-dependent degradation."

According to the news editors, the research concluded: "Finally, we will introduce necroptosis as an alternative strategy to kill NB cells and increase tumor immunogenicity."

Our news journalists report that additional information may be obtained by
contacting S. Nicolai, Dept. of Experimental Medicine and Surgery, University of Rome Tor Vergata, Via Montpellier I, Rome 00133, Italy. Additional authors for this research include M. Pieraccioli, A. Peschiaroli, G. Melino and G. Raschella.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/cddis.2015.354. This DOI is a link to an online electronic document that is either free or for purchase.

Neurodegenerative Diseases

New Neurodegenerative Diseases and Conditions Findings Has Been Reported by Researchers at Neuroscience Institute (Neurosteroidogenesis Today: Novel Targets for Neuroactive Steroid Synthesis and Action and Their Relevance for Translational ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurodegenerative Diseases and Conditions are presented in a new report. According to news originating from Cagliari, Italy, by NewsRx correspondents, research stated, "Neuroactive steroids are endogenous neuromodulators synthesised in the brain that rapidly alter neuronal excitability by binding to membrane receptors, in addition to the regulation of gene expression via intracellular steroid receptors. Neuroactive steroids induce potent anxiolytic, antidepressant, anticonvulsant, sedative, analgesic and amnesic effects, mainly through interaction with the GABAA receptor."

Funders for this research include National Institutes of Health, JSPS KAKENHI, National Institute of Mental Health, National Institute of General Medical Sciences, New York State Office for People With Developmental Disabilities, Bowles Center for Alcohol Studies, Fondazione Cavalieri Ottolenghi, Fondazione Cariplo.

Our news journalists obtained a quote from the research from Neuroscience Institute, "They also exert neuroprotective, neurotrophic and antiapoptotic effects in several animal models of neurodegenerative diseases. Neuroactive steroids regulate many physiological functions, such as the stress response, puberty, the ovarian cycle, pregnancy and reward. Their levels are altered in several neuropsychiatric and neurological diseases and both preclinical and clinical studies emphasise a therapeutic potential of neuroactive steroids for these diseases, whereby symptomatology ameliorates upon restoration of neuroactive steroid concentrations. However, direct administration of neuroactive steroids has several challenges, including pharmacokinetics, low bioavailability, addiction potential, safety and tolerability, which limit its therapeutic use. Therefore, modulation of neurosteroidogenesis to restore the altered endogenous neuroactive steroid tone may represent a better therapeutic approach. This review summarises recent approaches that target the neuroactive steroid biosynthetic pathway at different levels aiming to promote neurosteroidogenesis. These include modulation of neurosteroidogenesis through ligands of the translocator protein 18 kDa and the pregnane xenobiotic receptor, as well as targeting of specific neurosteroidogenic enzymes such as 17b-hydroxysteroid dehydrogenase type 10 or P450 side chain cleavage."

According to the news editors, the research concluded: "Enhanced
neurosteroidogenesis through these targets may be beneficial not only for neurodegenerative
diseases, such as Alzheimer's disease and age-related dementia, but also for neuropsychiatric
diseases, including alcohol use disorders.

For more information on this research see: Neurosteroidogenesis Today: Novel
Targets for Neuroactive Steroid Synthesis and Action and Their Relevance for Translational
ISSN)1365-2826)

The news correspondents report that additional information may be obtained from P.
Porcu, Neuroscience Institute, National Research Council of Italy (CNR), Cagliari, Italy.

Oncology - Neuroectodermal Tumors

New Neuroectodermal Tumors Findings from University of Texas
Outlined (Activity of c-Met/ALK Inhibitor Crizilinib and Multi-Kinase
VEGF Inhibitor Pazopanib in Metastatic Gastrointestinal
Neuroectodermal Tumor Harboring EINSR1-CREB1 Fusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators discuss new findings in Oncology - Neuroectodermal
Tumors. According to news originating from Houston, Texas, by NewsRx correspondents,
research stated, "Malignant gastrointestinal neuroectodermal tumor (GNET) is an aggressive
rare tumor, primarily occurring in young adults with frequent local-regional metastases and
recurrence after local control. The tumor is characterized by the presence of EWSR1-ATFI or
EWSR1-CREB1 and immunohistochemical positivity for S-100 protein without melanocytic
marker positivity."

Our news journalists obtained a quote from the research from the University of
Texas, "Due to poor responses to standard sarcoma regimens, GNET has a poor prognosis, and
development of effective systemic therapy is desperately needed to treat these patients. Herein,
we present a patient with a small bowel GNET who experienced recurrent hepatic and skeletal
metastases after a primary resection. Comprehensive genomic profiling (CGP) in the course of
clinical care with DNA and RNA sequencing demonstrated the presence of an exon 7 to exon 6
EWSR1-CREB1 fusion in the context of a diploid genome with no other genomic alterations. In
a clinical trial, the patient received a combination of 250 mg crizotinib with 600 mg pazopanib
quaque die and achieved partial response and durable clinical benefit for over 2.8 years, and
with minimal toxicity from therapy."

According to the news editors, the research concluded: "Using a CGP database of
over 50,000 samples, we identified 11 additional cases that harbor EWSR1-CREB1 and report
clinicopathologic characteristics, as these patients may also benefit from such a regimen."

For more information on this research see: Activity of c-Met/ALK Inhibitor Crizilinib and Multi-Kinase VEGF Inhibitor Pazopanib in Metastatic Gastrointestinal Neuroectodermal Tumor Harboring EINSR1-CREB1 Fusion. Oncology - Neuroendocrine Cancer

New Neuroendocrine Cancer Data Have Been Reported by Researchers at Chiba University (Expression of Sex Determining Region Y-Box 2 and Pancreatic and Duodenal Homeobox 1 in Pancreatic Neuroendocrine Tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Neuroendocrine Cancer. According to news reporting from Chiba, Japan, by NewsRx journalists, research stated, "The World Health Organization 2010 classification divides pancreatic neuroendocrine tumors (p-NETs) entity to well-differentiated neuroendocrine tumors (NET) and poorly differentiated neuroendocrine carcinomas (NEC) by Ki-67 index. The aim of this study is elucidate the pathophysiology and tumor biology of p-NETs."

The news correspondents obtained a quote from the research from Chiba University, "We assessed the expression of transcription factors sex determining region Y-box 2 (SOX2) and pancreatic and duodenal homeobox 1 (Pdx1) essential for the normal fetal development of pancreatic neuroendocrine cells in 46 surgically resected p-NETs by immunohistochemistry. The relationship of expression levels of these factors and clinicopathological factors were analyzed. SOX2 was positive in 6 p-NETs (13.0%). Five of 7 NEC patients showed positive for SOX2. SOX2 was highly (sensitivity 71%) and specifically (specificity 97%) expressed in NEC. Patients with SOX2 positive p-NET showed the significantly shorter disease-free and overall survival than patients with SOX2 negative p-NET. High Pdx1 expression was seen in 25 p-NET patients (54.3%). None of the NEC patients showed high Pdx1 expression. There was a significant reverse correlation between SOX2 and Pdx1 expression. The expression patterns of SOX2 and Pdx1 highly correlated with prognosis of p-NETs."
According to the news reporters, the research concluded: "These expression patterns may represent the biological and pathophysiological difference of p-NETs and indicate the origin of tumor."

For more information on this research see: Expression of Sex Determining Region Y-Box 2 and Pancreatic and Duodenal Homeobox 1 in Pancreatic Neuroendocrine Tumors. *Pancreas*, 2016;45(4):522-7. (Lippincott Williams and Wilkins - www.lww.com; Pancreas - journals.lww.com/pancreasjournal/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting T. Akiyama, From the Dept. of General Surgery, Graduate School of Medicine, Chiba University, Chiba City, Chiba, Japan. Additional authors for this research include T. Shida, H. Yoshitomi, S. Takano, S. Kagawa, H. Shimizu, M. Ohtsuka, A. Kato, K. Furukawa and M. Miyazaki.

---

**Oncology - Neuroendocrine Cancer**

**New Neuroendocrine Cancer Findings from Uppsala University Outlined (Somatostatin analogues in acromegaly and gastroenteropancreatic neuroendocrine tumours: past, present and future)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Neuroendocrine Cancer have been published. According to news originating from Uppsala, Sweden, by NewsRx correspondents, research stated, "Acromegaly is a hormonal disorder that arises when the pituitary gland secretes excess growth hormone (GH), which in turn stimulates a concomitant increase in serum insulin-like growth factor 1 (IGF-1) levels. Gastroenteropancreatic neuroendocrine tumours (GEP-NET) constitute a heterogeneous group of tumours that can secrete serotonin and a variety of peptide hormones that may cause characteristic symptoms known as carcinoid syndrome or other symptoms and hormonal hypersecretion syndromes depending on the tumour's site of origin."

Our news journalists obtained a quote from the research from Uppsala University, "Current medical therapy for the treatment of acromegaly and GEP-NET involves the administration of somatostatin analogues that effectively suppress excess hormone secretion. After its discovery in 1979, octreotide became the first synthetic biologically stable somatostatin analogue with a short-acting formulation of octreotide introduced into clinical practice in the late 1980s. Lanreotide, another somatostatin analogue, became available in the mid-1990s initially as a prolonged-release formulation administered every 10 or 14 days. Long-acting release formulations of both octreotide (Sandostatin LAR and Novartis) and lanreotide (Somatuline Autogel, Ipsen), based on microparticle and nanoparticle drug-delivery technologies, respectively, were later developed, which allowed for once-monthly administration and improved convenience. First-generation somatostatin analogues remain one of the cornerstones of medical therapy in the management of pituitary and GEP-NET hormone
hypersecretion, with octreotide having the longest established efficacy and safety profile of the somatostatin analogue class. More recently, pasireotide (Signifor), a next-generation multireceptor-targeted somatostatin analogue, has emerged as an alternative therapeutic option for the treatment of acromegaly."

According to the news editors, the research concluded: "This review summarizes the development and clinical success of somatostatin analogues."

For more information on this research see: Somatostatin analogues in acromegaly and gastroenteropancreatic neuroendocrine tumours: past, present and future. *Endocrine-Related Cancer*, 2016;23(12):R551-R566. *Endocrine-Related Cancer* can be contacted at: Bioscientifica Ltd, Euro House, 22 Apex Court Woodlands, Bradley Stoke, Bristol BS32 4JT, England.

**Nervous System Research - Neuroendocrinology**

**New Neuroendocrinology Findings from University of Regensburg Reported (The neural basis of sex differences in sexual behavior: A quantitative meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nervous System Research - Neuroendocrinology. According to news reporting out of Regensburg, Germany, by NewsRx editors, research stated, "Sexuality as to its etymology presupposes the duality of sexes. Using quantitative neuroimaging meta analyses, we demonstrate robust sex differences in the neural processing of sexual stimuli in thalamus, hypothalamus, and basal ganglia."

Funders for this research include Deutsche Forschungsgemeinschaft, National Institute of Mental Health, Helmholtz Portfolio Theme, European Union Seventh Framework Programme, Human Brain Project, German National Merit Foundation.

Our news journalists obtained a quote from the research from the University of Regensburg, "In a narrative review, we show how these relate to the well-established sex differences on the behavioral level. More specifically, we describe the neural bases of known poor agreement between self-reported and genital measures of female sexual arousal, of
previously proposed male proneness to affective sexual conditioning, as well as hints of unconscious activation of bonding mechanisms during sexual stimulation in women."

According to the news editors, the research concluded: "In summary, our meta-analytic review demonstrates that neurofunctional sex differences during sexual stimulation can account for well-established sex differences in sexual behavior."

Our news journalists report that additional information may be obtained by contacting T.B. Poeppl, University of Regensburg, Dept. of Psychiat & Psychotherapy, D-93053 Regensburg, Germany. Additional authors for this research include B. Langguth, R. Rupprecht, A. Safron, D. Bzdok, A.R. Laird and S.B. Eickhoff.

Neuroimaging

New Neuroimaging Study Findings Have Been Reported by Investigators at National Hospital (Megalencephaly, polymicrogyria and ribbon-like band heterotopia: A new cortical malformation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neuroimaging have been published. According to news reporting out of Niigata, Japan, by NewsRx editors, research stated, "Megalencephalic polymicrogyria syndromes include megalencephaly-capillary malformation and megalencephaly-polymicrogyria-polydactyly-hydrocephalus. Recent genetic studies have identified that genes in the PI3K-AKT pathway are involved in the pathogenesis of these disorders."

Our news journalists obtained a quote from the research from National Hospital, "Herein, we report a patient who presented with developmental delay, epilepsy and peculiar neuroimaging findings of megalencephaly, polymicrogyria, and symmetrical band heterotopia in the periventricular region. The heterotopias exhibited inhomogeneous signals with undulatory mixtures of gray and white matter, resembling ribbon-like heterotopia, with a predominance in the temporal to occipital regions. These neuroradiological findings were not consistent with those in known megalencephalic polymicrogyria syndromes. No genetic abnormality was identified through whole-exome sequencing."

According to the news editors, the research concluded: "The neuroimaging findings of this patient may represent a novel cortical malformation involving megalencephaly with polymicrogyria and ribbon-like band heterotopia."

For more information on this research see: Megalencephaly, polymicrogyria and

Our news journalists report that additional information may be obtained by contacting Y. Kobayashi, Nishi Niigata Chuo Natl Hosp, Dept. of Child Neurol, Niigata, Japan. **Surgery - Neurointerventional Surgery**

**New Neurointerventional Surgery Study Findings Have Been Reported by L.B.C. Brasiliense and Co-Researchers (Silent ischemic events after Pipeline embolization device: a prospective evaluation with MR diffusion-weighted imaging)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Surgery - Neurointerventional Surgery have been presented. According to news reporting out of Jacksonville, Florida, by NewsRx editors, research stated, "The development of ischemic events is relatively common after endovascular interventions, and flow diverters may pose a particular threat owing to their increased technical complexity and high metal content. To investigate the incidence and potential risk factors for thromboembolic lesions after treatment with a Pipeline embolization device (PED)."

Our news journalists obtained a quote from the research, "This prospective study included a total of 59 patients electively treated with a PED over 12 months. Postprocedural diffusion-weighted imaging sequences of the brain were obtained 24 h after interventions to detect ischemic lesions. Demographic data, aneurysm characteristics, antiplatelet management, and perioperative data were correlated with the rate of ischemic events. The incidence of silent ischemic events after use of a PED was 62.7% (37 patients) and neurological symptoms occurred in 8.1% of affected patients. Development of ischemic events was significantly associated with older patients (>= 60 years; p=0.038). Routine use of platelet function assays and newer P2Y12 receptor inhibitors (ticagrelor) were not associated with fewer thromboembolic events. Thromboembolic events are relatively common after treatment with a PED with an incidence comparable to stent-assisted and conventional coiling but the risk of neurological morbidity from ischemic burden is low."

According to the news editors, the research concluded: "Older patients are at particularly increased risk of thromboembolic events."

New Neuromuscular Diseases Study Results Reported from C.D. Kassardjian et al (The Utility Of Genetic Testing In Neuromuscular Disease: A Consensus Statement From The Aanem On The Clinical Utility Of Genetic Testing In Diagnosis Of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neuromuscular Diseases. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "The aim of this consensus statement is to provide a recommendation from AANEM experts on the clinical utility of genetic testing. It is not meant to recommend or endorse any specific genetic testing methodology or algorithm."

Our news journalists obtained a quote from the research, "The AANEM Professional Practice Committee reached a consensus based on expert opinion on the utility of genetic testing in neuromuscular diseases and made recommendations on factors that physicians and patients should consider when deciding whether to proceed with such testing. Despite the costs of genetic testing, these tests can be both valuable and beneficial in the diagnosis and treatment of neuromuscular diseases in many situations. The AANEM believes that performing genetic testing to arrive at a specific molecular diagnosis is a critical step in providing high-quality care to neuromuscular patients."

According to the news editors, the research concluded: "The cost of testing should not be a deterrent, as there are important clinical, safety, psychosocial, and research benefits."

Our news journalists report that additional information may be obtained by contacting C.D. Kassardjian, Care Off Suk M, Amer Assoc Neuromuscular & Electrodiagnost
Autoimmune Diseases and Conditions -...

New Neuromyelitis Optica Study Findings Reported from Central South University [CD14(+) CD16(++) monocytes are increased in patients with NMO and are selectively suppressed by glucocorticoids therapy]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Autoimmune Diseases and Conditions - Neuromyelitis Optica are discussed in a new report. According to news reporting originating in Changsha, People's Republic of China, by NewsRx journalists, research stated, "The pathophysiologic significance of the CD16(+) monocyte subset has been demonstrated by its expansion in various autoimmune disorders. To date, the characteristics and roles of monocyte subpopulations in patients with neuromyelitis optica (NMO) have been poorly defined."

The news reporters obtained a quote from the research from Central South University, "We measured the percentages of the monocyte subsets in the peripheral blood, the levels of IL-1 beta and TNF-alpha mRNA in monocyte subsets and the concentrations of IL-1 beta and TNF-alpha in plasma and CSF from NMO patients. Our results showed that nonclassical monocytes were up-regulated in NMO patients and significantly elevated and TNF-a expression was detected in it."

According to the news reporters, the research concluded: "In addition the increased nonclassical monocytes could be selectively suppressed by GC in patients with NMO."

For more information on this research see: CD14(+) CD16(++) monocytes are increased in patients with NMO and are selectively suppressed by glucocorticoids therapy. *Journal of Neuroimmunology*, 2016;300():1-8. *Journal of Neuroimmunology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Neuroimmunology - www.journals.elsevier.com/journal-of-neuroimmunology/)

Neurons

New Neurons Data Have Been Reported by Investigators at Israel Naval Medical Institute (Evidence for the infiltration of gas bubbles into the arterial circulation and neuronal injury following "yo-yo" dives in pigs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neurons. According to news originating from Haifa, Israel, by NewsRx correspondents, research stated, "Yo-yo' diving may place divers at a greater risk of neurologic decompression illness (DCI). Using a rat model, we previously demonstrated that 'yo-yo' diving has a protective effect against DCI."

Our news journalists obtained a quote from the research from Israel Naval Medical Institute, "In the current study, we evaluated the risk of neurologic DCI following 'yo-yo' dives in a pig model. Pigs were divided into four groups. The Control group (group A) made a square dive, without excursions to the surface ('peeps'). Group B performed two 'peeps,' group C performed four 'peeps,' and group D did not dive at all. All dives were conducted on air to 5 atm absolute, for 30-min bottom time. Echocardiography was performed to detect cardiac gas bubbles before the dive, immediately after, and at 90-min postdive. Motor performance was observed during the 5-h postdive period. Symptoms increased dramatically following a dive with four 'peeps.' Gas bubbles were detected in the right ventricle of all animals except for the sham group and in the left ventricle only after the four-peep dive. Neuronal cell injury was found in the spinal cord in each of the three experimental groups, tending to decrease with an increase in the number of 'peeps.' A four-peep 'yo-yo' dive significantly increased the risk of neurologic DCI in pigs."

According to the news editors, the research concluded: "Following a four-peep dive, we detected a higher incidence of bubbles in the left ventricle, supporting the common concern regarding an increased risk of neurologic DCI, albeit there was no direct correlation with the frequency of 'red neurons' in the spinal cord."

The news correspondents report that additional information may be obtained from Y. Arieli, Israel Def Forces Med Corps, Israel Naval Med Inst, Haifa, Israel. Additional authors for this research include Y. Yanir, M. Mullokandov, B. Aviner and Y. Arieli.

Keywords for this news article include: Haifa, Israel, Asia, Neurons, Cells, Israel Naval Medical Institute.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neuroscience - Neurophysiology. According to news reporting from Nashville, Tennessee, by NewsRx journalists, research stated, "Evidence accumulating over the past 15 years soundly refutes the dogma that the Drosophila nervous system is hardwired. The preponderance of studies reveals activity-dependent neural circuit refinement driving optimization of behavioral outputs."

Financial support for this research came from HHS | NIH | National Institute of Mental Health (NIMH).

The news correspondents obtained a quote from the research from Vanderbilt University, "We describe developmental, sensory input-dependent plasticity in the brain olfactory antennal lobe, which we term long-term central adaption (LTCA). LTCA is evoked by prolonged exposure to an odorant during the first week of posteclosion life, resulting in a persistently decreased response to aversive odors and an enhanced response to attractive odors. This limited window of early-use, experience-dependent plasticity represents a critical period of olfactory circuit refinement tuned by initial sensory input. Consequent behavioral adaptations have been associated with changes in the output of olfactory projection neurons to higher brain centers. Recent studies have indicated a central role for local interneuron signaling in LTCA presentation. Genetic and molecular analyses have implicated the mRNA-binding fragile X mental retardation protein and ataxin-2 regulators, Notch trans-synaptic signaling, and cAMP signal transduction as core regulatory steps driving LTCA."

According to the news reporters, the research concluded: "In this article, we discuss the structural, functional, and behavioral changes associated with LTCA and review our current understanding of the molecular pathways underlying these developmental, experience-dependent changes in the olfactory circuitry."

For more information on this research see: Developmental experience-dependent plasticity in the first synapse of the Drosophila olfactory circuit. Journal of Neurophysiology, 2016;116(6):2730-2738. Journal of Neurophysiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Our news journalists report that additional information may be obtained by contacting K. Broadie, Vanderbilt University, Dept. of Biol Sci, Nashville, TN 37235, United States.

Neutral Amino Acids

New Neutral Amino Acids Findings from University of Texas Discussed (Targeting Stromal Glutamine Synthetase in Tumors Disrupts Tumor Microenvironment-Regulated Cancer Cell Growth)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neutral Amino Acids. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Reactive stromal cells are an integral part of tumor microenvironment (TME) and interact with cancer cells to regulate their growth. Although targeting stromal cells could be a viable therapy to regulate the communication between TME and cancer cells, identification of stromal targets that make cancer cells vulnerable has remained challenging and elusive."

Financial supporters for this research include St. Louis Ovarian Cancer Awareness Research Grant, NIH.

The news correspondents obtained a quote from the research from the University of Texas, "Here, we identify a previously unrecognized mechanism whereby metabolism of reactive stromal cells is reprogrammed through an upregulated glutamine anabolic pathway. This dysfunctional stromal metabolism confers atypical metabolic flexibility and adaptive mechanisms in stromal cells, allowing them to harness carbon and nitrogen from noncanonical sources to synthesize glutamine in nutrient-deprived conditions existing in TME. Using an orthotopic mouse model for ovarian carcinoma, we find that co-targeting glutamine synthetase in stroma and glutaminase in cancer cells reduces tumor weight, nodules, and metastasis."

According to the news reporters, the research concluded: "We present a synthetic lethal approach to target tumor stroma and cancer cells simultaneously for desirable therapeutic outcomes."

For more information on this research see: Targeting Stromal Glutamine Synthetase in Tumors Disrupts Tumor Microenvironment-Regulated Cancer Cell Growth. *Cell Metabolism*, 2016;24(5):685-700. *Cell Metabolism* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. Leukocyte Diseases and Conditions - Neutropenia

**New Neutropenia Findings from M. Aapro and Colleagues Discussed**

[Predictive modeling of the outcomes of chemotherapy-induced (febrile) neutropenia prophylaxis with biosimilar filgrastim (MONITOR-GCSF]
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Leukocyte Diseases and Conditions - Neutropenia have been published. According to news reporting from Genolier, Switzerland, by NewsRx journalists, research stated. "Risk models of chemotherapy-induced (CIN) and febrile neutropenia (FN) have to date focused on determinants measured at the start of chemotherapy. We extended this static approach with a dynamic approach of CIN/FN risk modeling at the start of each cycle."

Financial support for this research came from Hexal AG/Sandoz International GmbH.

The news correspondents obtained a quote from the research, "We applied predictive modeling using multivariate logistic regression to identify determinants of CIN/FN episodes and related hospitalizations and chemotherapy disturbances (CIN/FN consequences) in analyses at the patient ('ever' during the whole period of chemotherapy) and cycle-level (during a given chemotherapy cycle). Statistical dependence of cycle data being 'nested' under patients was managed using generalized estimation equations. Predictive performance of each model was evaluated using bootstrapped concordance statistics. Static patient-level risk models of 'ever' experiencing CIN/FN adverse events and consequences during a planned chemotherapy regimen included predictors related to history, risk factors, and prophylaxis initiation and intensity. Dynamic cycle-level risk models of experiencing CIN/FN adverse events and consequences in an upcoming cycle included predictors related to history, risk factors, and prophylaxis initiation and intensity; as well as prophylaxis duration, CIN/FN in prior cycle, and treatment center characteristics. These 'real-world evidence' models provide clinicians with the ability to anticipate CIN/FN adverse events and their consequences at the start of a chemotherapy line (static models); and, innovatively, to assess risk of CIN/FN adverse events and their consequences at the start of each cycle (dynamic models). This enables individualized patient treatment and is consistent with the EORTC recommendation to re-appraise CIN/FN risk at the start of each cycle. Prophylaxis intensity (under-, correctly-, or over-prophylacted relative to current EORTC guidelines) is a major determinant. Under-prophylaxis is clinically unsafe."

According to the news reporters, the research concluded: "Over-prophylaxis of patients administered chemotherapy with intermediate or low myelotoxicity levels may be beneficial, both in patients with and without risk factors, and must be validated in future studies."

Our news journalists report that additional information may be obtained by contacting M. Aapro, Clin Genolier, Inst Multidisciplinaire Oncol, CH-1272 Genolier, Switzerland. Additional authors for this research include H. Ludwig, C. Bokemeyer, P. Gascon, M. Boccadoro, K. Denhaerynck, A. Krendyukov, M. Gorray, K. Macdonald and I. Abraham.

Nitrosourea Compounds

New Nitrosourea Compounds Findings from H. Fisli and Co-Researchers Reported (Spectrofluorimetric determination of the antineoplastic agent lomustine based on the sensitizing effect of b-cyclodextrin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nitrosourea Compounds are presented in a new report. According to news originating from Guelma, Algeria, by NewsRx correspondents, research stated, "The effects of solvent dipolarity/polarizability and solvent-solute hydrogen bonding on the photophysical properties of the antineoplastic drug lomustine were analysed by means of the linear solvation energy relationship (LSER) concept proposed by Kamlet and Taft. The LSER method enabled the overall solvent effects to be quantitatively estimated and separated into specific and non-specific contributions."

Our news journalists obtained a quote from the research, "The molecular encapsulation of lomustine by b-cyclodextrin (b-CD) has been studied using fluorescence spectroscopy. The results are discussed in terms of the binding parameter and the effect of the solvent used. It was concluded that b-CD forms a 1:1 inclusional complex with lomustine in acetonitrile solution and its association constant was calculated to be 500 M(-1). In addition, and for the first time, a simple, rapid and high sensitive fluorimetric method for the determination of lomustine was developed based upon the enhancement effect produced through complex formation with b-CD. The new approach for the quantification of lomustine in the presence of b-CD was described in aqueous and organic solutions."

According to the news editors, the research concluded: "Better limits of detection (0.31 ?g ml(-1)) and quantification (1.05 ?g ml(-1)) were obtained in aqueous solution with respect to those obtained in organic solvent."

The news correspondents report that additional information may be obtained from H. Fisli, Laboratoire de Chimie Appliquee (LCA), Universite 8 mai 1945, Guelma, Algeria. Additional authors for this research include N. Bensouilah and M. Abdaoui.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/bio.3045. This DOI is a link to an online electronic document that is either free or for purchase.

New Non-Hodgkin Lymphoma Study Findings Reported from Ulsan University Hospital (Biweekly dose-dense gemcitabine-oxaliplatin and dexamethasone for relapsed/refractory aggressive non-Hodgkin lymphoma: A multicenter, single-arm, phase II trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Non-Hodgkin Lymphoma is the subject of a report. According to news reporting originating from Ulsan, South Korea, by NewsRx correspondents, research stated, "We performed a phase II study to evaluate the efficacy of combination chemotherapy consisting of gemcitabine, dexamethasone and oxaliplatin (GemDOx) as a biweekly regimen and salvage therapy in patients with relapsed or refractory aggressive non-Hodgkin lymphoma (NHL).Gemcitabine (1000 mg/m(2) ) and oxaliplatin (85 mg/m(2) ) were administered intravenously on days 1 and 15, and dexamethasone (40 mg) was administered orally on days 1-4."

Financial support for this research came from Ministry of Education, Science and Technology.

Our news editors obtained a quote from the research from Ulsan University Hospital, "Twenty-nine patients were enrolled, and most patients had diffuse large B-cell lymphoma (n=18). The median age of the patients and median prior number of chemotherapy cycles were 53 (range, 26-74) years and 1 (range, 1-4) cycle, respectively. Only 17 (58.6%) and 9 (31.0%) patients completed two or more and four or more cycles, respectively, and the median number of received cycles was two (range, 1-8). Overall response rates were 27.6% (complete response in 13.8%) among intent-to-treat patients and 47.1% (complete response in 23.5%) among patients who had received at least two GemDOx cycles. Median progression-free survival and median overall survival were 3.9 and 20.5 months, respectively. The most-frequent grade 3 or 4 toxicity was neutropenia (22.9%), and no grade 3 or 4 peripheral neurotoxicity was noted."

According to the news editors, the research concluded: "GemDOx chemotherapy, therefore, showed modest activity against relapsed or refractory aggressive NHL, although toxicities were acceptable."

The news editors report that additional information may be obtained by contacting J.C. Jo, Dept. of Hematology and Oncology, Ulsan University Hospital, University of Ulsan College of Medicine, Ulsan, South Korea. Additional authors for this research include J.H. Baek, J.H. Lee, Y.D. Joo, S.H. Bae, J.L. Lee, J.H. Lee, D.Y. Kim, W.S. Lee, H.M. Ryoo, Y. Choi, H. Kim and K.H. Lee.

Oncology - Non-Small Cell Lung Cancer

New Non-Small Cell Lung Cancer Data Have Been Reported by I. Sullivan and Co-Authors (ALK inhibitors in non-small cell lung cancer: the latest evidence and developments)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Non-Small Cell Lung Cancer. According to news reporting from Villejuif, France, by NewsRx journalists, research stated, "The treatment of patients with advanced non-small cell lung cancer (NSCLC) harbouring chromosomal rearrangements of ALK (anaplastic lymphoma kinase) was revolutionized by crizotinib, a small molecule inhibitor of ALK, ROS1 and MET. Unfortunately, the disease progressed within the first 12 months in most of the patients because of the development of crizotinib resistance in the majority of patients and the emergence of acquired resistance mutations in most of them."

The news correspondents obtained a quote from the research, "Many of them had been reported even before its approval leading to the rapid development of second-generation ALK inhibitors for crizotinib-resistant NSCLC. In the last few years, novel potent ALK inhibitors with promising results and a good toxicity profile have become available: ceritinib (LDK378), alectinib (RG7853/AF-802/RO5424802/CH5424802), brigatinib (AP26113), entrectinib (RXDX-101, NMS-E628), PF-06463922, ASP3026, TSR-011, X-376/X-396 and CEP-28122/CEP-37440. Moreover, HSP90 (90 kDa heat shock protein) inhibitors have demonstrated clinical activity in patients with ALK+ NSCLC."

According to the news reporters, the research concluded: "This review focuses on the molecular and clinical properties of this new generation of ALK inhibitors under development in the clinic."

For more information on this research see: ALK inhibitors in non-small cell lung cancer: the latest evidence and developments. Therapeutic Advances in Medical Oncology, 2016;8(1):32-47. (Sage Publications - www.sagepub.com; Therapeutic Advances In Medical Oncology - tam.sagepub.com)

Our news journalists report that additional information may be obtained by contacting I. Sullivan, Gustave Roussy - Medical Oncology, Villejuif, France.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/1758834015617355. This DOI is a link to an online electronic document that is either free or for purchase.

New Non-Small Cell Lung Cancer Data Have Been Reported by Researchers at University of Texas (Auranofin-mediated inhibition of PI3K/AKT/mTOR axis and anticancer activity in non-small cell lung cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Non-Small Cell Lung Cancer are presented in a new report. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Auranofin, a gold complex that has been used to treat rheumatoid arthritis in clinics and has documented pharmacokinetic and safety profiles in humans, has recently been investigated for its anticancer activity in leukemia and some solid cancers. However, auranofin's single agent activity in lung cancer is not well characterized."

The news correspondents obtained a quote from the research from the University of Texas, "To determine whether auranofin has single agent activity in lung cancer, we evaluated auranofin's activity in a panel of 10 non-small cell lung cancer (NSCLC) cell lines. Cell viability analysis revealed that auranofin induced growth inhibition in a subset of NSCLC cell lines with a half maximal inhibitory concentration (IC[50]) below 1.0 mM. Treatment with auranofin elicited apoptosis and necroptosis in auranofin-sensitive cell lines. Moreover, the susceptibility of NSCLC cells to auranofin was inversely correlated with TXNRD1 expression in the cells. Transient transfection of the TXNRD1-expressing plasmid in auranofin-sensitive Calu3 cells resulted in partial resistance, indicating that high TXNRD level is one of causal factors for resistance to auranofin. Further mechanistic characterization with proteomic analysis revealed that auranofin inhibits expression and/or phosphorylation of multiple key nodes in the PI3K/AKT/mTOR pathway, including S6, 4EBP1, Rictor, p70S6K, mTOR, TSC2, AKT and GSK3. Ectopic expression of TXNRD1 partially reversed auranofin-mediated PI3K/AKT/mTOR inhibition, suggesting that TXNRD1 may participate in the regulation of PI3K/AKT/mTOR pathway. Administration of auranofin to mice with xenograft tumors derived from NSCLC cells significantly suppressed tumor growth without inducing obvious toxic effects."

According to the news reporters, the research concluded: "Our results demonstrated feasibility of repurposing auranofin for treatment of lung cancer."

Our news journalists report that additional information may be obtained by contacting H. Li, Dept. of Thoracic and Cardiovascular Surgery, University of Texas MD Anderson Cancer Center, Houston, Texas, United States. Additional authors for this research include J. Hu, S. Wu, L. Wang, X. Cao, X. Zhang, B. Dai, M. Cao, R. Shao, R. Zhang, M. Majidi, L. Ji, J.V. Heymach, M. Wang, S. Pan, J. Minna, R.J. Mehran, S.G. Swisher, J.A. Roth and B. Fang.

**Oncology - Non-Small Cell Lung Cancer**

**New Non-Small Cell Lung Cancer Findings from Arnau de Vilanova University Hospital Described (Eventual role of EGFR-tyrosine kinase inhibitors in early-stage non-small-cell lung cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Non-Small Cell Lung Cancer. According to news reporting originating from Lleida, Spain, by NewsRx correspondents, research stated, "Nonadvanced non-small-cell lung cancer (NSCLC) has a poor long-term survival from surgery or definitive radiation that is minimally improved with induction/adjuvant conventional chemotherapy. EGFR-tyrosine kinase inhibitors (TKIs), which provide a significant benefit for molecularly selected EGFR-mutant patients with advanced NSCLC, have been infrequently explored in nonadvanced NSCLC to date."

Our news editors obtained a quote from the research from Arnau de Vilanova University Hospital, "Current published studies reported no significant benefit from adding EGFR-TKI to the induction/adjuvant setting. However, many of them present eventual biases such as unpowered statistics, lack of molecular selection, recruitment of low-risk NSCLC, low sample size or unsuitable control arms. strengths and deficiencies of completed and ongoing trials were fully discussed."

According to the news editors, the research concluded: "Similarly, the selection of patients and control arms, the duration and risks of EGFR-TKI therapies in early-stage NSCLC, the evaluation of response and the diagnosis of EGFR status were considered and analyzed."

The news editors report that additional information may be obtained by contacting D. Marquez-Medina, Medical Oncology Department, Arnau de Vilanova University Hospital, Lleida, Spain.

Oncology - Non-Small Cell Lung Cancer

New Non-Small Cell Lung Cancer Findings from Kyung Hee University Described (Decursin enhances TRAIL-induced apoptosis through oxidative stress mediated-endoplasmic reticulum stress signalling in non-small cell lung cancers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The TNF-related apoptosis-inducing ligand (TRAIL) is a promising anticancer agent due to its remarkable ability to selectively kill tumor cells. However, because most tumours exhibit resistance to TRAIL-induced apoptosis, the development of combination therapies to overcome resistance to TRAIL is required for effective cancer therapy."

Financial support for this research came from Korea Government (MEST).

Our news editors obtained a quote from the research from Kyung Hee University, "Cell viability and possible synergy between the plant pyranocoumarin decursin and TRAIL was measured by MTT assay and calceusyn software. Reactive oxygen species (ROS) and apoptosis were measured using dichlorodihydrofluorescein and annexin/propidium iodide in cell flow cytometry. Changes in protein levels were assessed with Western blotting. Combining decursin and TRAIL markedly decreased cell viability and increased apoptosis in TRAIL-resistant non-small-cell lung cancer (NSCLC) cell lines. Decursin induced expression of the death receptor 5 (DR5). Inhibition of DR5 attenuated apoptotic cell death in decursin + TRAIL treated NSCLC cell lines. Interestingly, induction of DR5 and CCAAT/enhancer-binding protein homologues protein by decursin was mediated through selective induction of the pancreatic endoplasmic reticulum kinase (PERK)/activating transcription factor 4 (ATF4) branch of the endoplasmic reticulum stress response pathway. Furthermore, enhancement of PERK/ATF4 signalling by decursin was mediated by ROS generation in NSCLC cell lines, but not in normal human lung cells. Decursin also markedly down-regulated expression of survivin and Bcl-xL in TRAIL-resistant NSCLC cells."

According to the news editors, the research concluded: "ROS generation by decursin selectively activated the PERK/ATF4 axis of the endoplasmic reticulum stress signalling pathway, leading to enhanced TRAIL sensitivity in TRAIL-resistant NSCLC cell lines, partly via up-regulation of DR5."

The news editors report that additional information may be obtained by contacting J. Kim, College of Korean Medicine, Kyung Hee University, Seoul, South Korea. Additional authors for this research include M. Yun, E.O. Kim, D.B. Jung, G. Won, B. Kim, J.H. Jung and S.H Kim.

**Oncology - Non-Small Cell Lung Cancer**

**New Non-Small Cell Lung Cancer Findings from Kyushu University Described (Clinical implications of sarcopenia in patients undergoing complete resection for early non-small cell lung cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Non-Small Cell Lung Cancer are discussed in a new report. According to news reporting originating in Fukuoka, Japan, by NewsRx journalists, research stated, "Sarcopenia is characterized by progressive and generalized loss of skeletal muscle mass and strength. We aimed to investigate sarcopenia in patients with stage I non-small cell lung cancer (NSCLC) who underwent complete resection, and the relationship of sarcopenia with clinicopathological factors."

The news reporters obtained a quote from the research from Kyushu University, "All consecutive patients who underwent lung resection between January 2005 and December 2008 were enrolled in this retrospective study. Eligible patients were assigned to one of 2 groups according to the presence or absence of sarcopenia, as assessed by the sum of cross-sectional areas of skeletal muscles in the region of the third lumbar vertebra (L3) on preoperative computed tomography (CT). Sixteen of 52 male (30.8%) and 22 of 38 female (57.9%) patients were identified with sarcopenia (p = 0.01). Patients with sarcopenia were more likely to have a low body mass index (BMI) (p <0.0001). Kaplan-Meier analysis showed that patients with sarcopenia had a significantly worse outcome than patients without sarcopenia (5-year-survival: 72.8% vs 85.8%, respectively, p = 0.028). Multivariate analysis found that sarcopenia was a significant independent prognostic factor (hazard ratio: 7.09, p = 0.0008)."

According to the news reporters, the research concluded: "Sarcopenia identified on a cross-sectional CT image of the L3 level was associated with poor outcome with completely resected early-stage NSCLC."

Our news correspondents report that additional information may be obtained by contacting T. Okamoto, Kyushu University, Grad Sch Med Sci, Dept. of Surg & Sci, Fukuoka 812, Japan. Additional authors for this research include T. Okamoto, T. Fujishita, M. Katsura, T. Akamine, S. Takamori, Y. Morodomi, T. Tagawa, F. Shoji and Y. Maehara.

New Non-Small Cell Lung Cancer Findings from School of Life Science and Technology Described (MARVELD1 Modulates Cell Surface Morphology and Suppresses Epithelial-Mesenchymal Transition in Non-Small Cell Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news reporting originating in Harbin, People's Republic of China, by NewsRx journalists, research stated, "Integrins have been known to play pivotal roles in malignant progression and epithelial-mesenchymal transition (EMT) of non-small cell lung cancer (NSCLC). We previously demonstrated that MARVELD1, a potential tumor suppressor, is epigenetically silenced in multiple cancer cells."

The news reporters obtained a quote from the research from the School of Life Science and Technology, "In this study, we found MARVELD1 silencing altered cell surface ultrastructure of NSCLC cells and inhibited the formation of punctate integrin beta 1/beta 4 cluster in microvillus, whereas MARVELD1 overexpression suppressed TGF-beta 1-induced EMT. Remarkably, the balance of integrin beta 1 and beta 4 was modulated by MARVELD1. MARVELD1 silencing led to imbalance of integrin beta 1/beta 4 and significantly reduced microvillus length, furthermore affected the localization of beta 1/beta 4 at microvilli tips. TGF-beta 1-induced EMT was promoted by MARVELD1 silencing, while rebalance of integrin beta 1/beta 4 partly rescued the epithelial phenotype of MARVELD1-silenced cells."

According to the news reporters, the research concluded: "Mechanistically, we demonstrate that MARVELD1-mediated balance of integrin beta 1 and beta 4 regulates cell surface ultrastructure and EMT phenotype of NSCLC cells, suggesting MARVELD1 has a potential to be developed as a therapeutic target for NSCLC."

Our news correspondents report that additional information may be obtained by contacting Y. Li, Harbin Inst Technol, Sch Life Sci & Technol, Harbin, People's Republic of China. Additional authors for this research include M. Shi, S.S. Liu, Y.Q. Li, K.X. Guo, Y.P. Ci, W.Z. Liu and Y. Li.

New Non-Small Cell Lung Cancer Findings from University of Palermo Reported (Exosomes isolation and characterization in serum is feasible in non-small cell lung cancer patients: critical analysis of evidence and potential role in clinical ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news originating from Palermo, Italy, by NewsRx correspondents, research stated, "Exosomes are nano-sized vesicles of endolysosomal origin, released by several cytotypes in physiological and pathological conditions. Tumor derived exosomes, interacting with other cells of the tumor microenvironment, modulate tumor progression, angiogenic switch, metastasis, and immune escape."

Our news journalists obtained a quote from the research from the University of Palermo, "Recently, extracellular vesicles were proposed as excellent biomarkers for disease monitoring and prognosis in cancer patients. Non-small cell lung cancer (NSCLC) has a poor 5-year survival rate due to the delay in the detection of the disease. The majority of patients are diagnosed in an advanced disease stage. Exosomes might be promising beneficial tools as biomarker candidates in the scenario of NSCLC, since they contain both, proteins and miRNAs. The clinical case reported in this manuscript is a proof of concept revealing that NSCLC exosomes and sorted miRNAs might constitute, in a near future, novel biomarkers."

According to the news editors, the research concluded: "This review summarizes the role of exosomes in NSCLC, focusing on the importance of exosomal microRNAs in lung cancer diagnosis and prognosis."

The news correspondents report that additional information may be obtained from S. Taverna, Dept. of Biopathology and Medical Biotechnology, Section of Biology and Genetics, University of Palermo, Palermo, Italy. Additional authors for this research include M. Giallombardo, I. Gil-Bazo, A.P. Carreca, M. Castiglia, J. Chacartegui, A. Araujo, R. Alessandro, P. Pauwels, M. Peeters and C. Rolfo.

New Non-Small Cell Lung Cancer Study Findings Have Been Reported by Investigators at Huazhong University of Science and Technology (HMGB1 induces human non-small cell lung cancer cell motility by activating integrin alpha v beta 3/FAK through ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Non-Small Cell Lung Cancer is the subject of a report. According to news reporting from Hubei, People's Republic of China, by NewsRx journalists, research stated, "High mobility group box 1 (HMGB1) is a ubiquitous nuclear protein with multi-functions and plays an important role in tumorigenesis and metastasis in various human cancers. In the present study, we found that HMGB1 induced migration of human non-small cell lung cancer (NSCLC) cells by up-regulating integrin alpha v beta 3 expression."

The news correspondents obtained a quote from the research from the Huazhong University of Science and Technology, "Further investigation evidenced that HMGB1 activated Toll-like receptor 4 (TLR4) and NF-kappa B, which was responsible for alpha v beta 3 up-regulation. Furthermore, HMGB1-induced integrin alpha v beta 3 expression led to focal adhesion kinase (FAK) phosphorylation and increased paxillin and talin mRNA expression. Knockdown HMGB1 inhibited xenograft tumor metastasis in athymic mice."

According to the news reporters, the research concluded: "Taken together, our findings suggested that HMGB1 enhances tumor cell migration ability by activating alpha v beta 3/FAK through TLR4/NF-kappa B signaling, leading to metastasis of NSCLC."

Our news journalists report that additional information may be obtained by contacting J.H. Zhu, Huazhong University of Science & Technology, Tongji Med College, Wuhan Hosp 1, Clin Immunol Lab, Wuhan 430022, Hubei, People's Republic of China. Additional authors for this research include J. Luo, Y.C. Li, M. Jia, Y.Q. Wang, Y. Huang and S.H. Ke.

New Non-Small Cell Lung Cancer Study Findings Have Been Reported by Investigators at Oslo University Hospital (Estrogen receptor expression and gene promoter methylation in non-small cell lung cancer - a short report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Non-Small Cell Lung Cancer are discussed in a new report. According to news reporting out of Oslo, Norway, by NewsRx editors, research stated, "In the past, anomalous estrogen receptor (ER) regulation has been associated with various lung pathologies, but so far its involvement in lung cancer initiation and/or progression has remained unclear. Here, we aimed at assessing in vivo and in vitro ER expression and its possible epigenetic regulation in non-small cell lung cancer (NSCLC) samples and their corresponding normal tissues and cells."

Financial support for this research came from Kreftforeningen.

Our news journalists obtained a quote from the research from Oslo University Hospital, "ER alpha and ER beta gene expression levels were assessed using real time quantitative PCR (RT-qPCR), whereas ER alpha and ER beta gene promoter methylation levels were assessed using DNA bisulfite conversion followed by pyrosequencing. We included NSCLC (n = 87) and adjacent histologically normal lung tissue samples from lung cancer patients (n = 184), primary normal bronchial epithelial-derived cell cultures (n = 11), immortalized bronchial epithelial-derived cell lines (n = 3) and NSCLC derived cell lines (n = 9). Using RT-qPCR we found significantly lower ER alpha and ER beta expression levels in the NSCLC tissue samples compared to their normal adjacent tissue samples. These lower ER expression levels were confirmed in vitro using primary normal bronchial epithelial-derived cell cultures, immortalized bronchial epithelial-derived cell lines and NSCLC-derived cell lines. By using this latter panel of cells, we found that ER gene promoter hypermethylation was associated with decreased ER expression. In addition we found that in tumor and normal lung tissues, smoking was associated with decreased ER expression and that normal lung tissues with a low ER beta expression level exhibited increased smoking-related DNA adducts."

According to the news editors, the research concluded: "Taken together, our results indicate that decreased ER expression mediated by DNA methylation may play a role in NSCLC development."

Our news journalists report that additional information may be obtained by contacting X. Tekpli, Oslo Univ Hosp, Inst Canc Res, Dept. of Genet, Oslo, Norway. Additional authors for this research include V. Skaug, R. Baera, D.H. Phillips, A. Haugen and S. Mollerup.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13402-016-0295-3. This DOI is a link to an online electronic document that is either free or for purchase.

New Non-Small Cell Lung Cancer Study Findings Recently Were Reported by Researchers at China Medical University and Hospital (Overexpression of CASS4 promotes invasion in non-small cell lung cancer by activating the AKT signaling pathway and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news originating from Shenyang, People's Republic of China, by NewsRx correspondents, research stated, "The role of Crk-associated substrate (CAS) family members in regulating invasion and metastasis has been described in several cancers. As the fourth member of the CAS family, CASS4 is also related with positive lymph node metastasis and poor prognosis in lung cancer."

Funders for this research include National Natural Science Foundation of China, Natural Science Foundation of Liaoning Province, Research Foundation for the Doctoral Program.

Our news journalists obtained a quote from the research from China Medical University and Hospital, "However, the underlying mechanisms and downstream effectors of CASS4 in the development and progression of non-small cell lung cancer (NSCLC) remain unclear. In this study, CASS4 overexpression inhibited E-cadherin expression and enhanced invasion in NSCLC cell line transfected with CASS4 plasmid, while CASS4 depletion upregulated E-cadherin expression and inhibited invasion in NSCLC cell line transfected with CASS4 siRNA. The effect of CASS4 overexpression in facilitating invasion of NSCLC cells was reversed by restoring E-cadherin expression, which indicates that CASS4 may promote invasion by inhibiting E-cadherin expression. Subsequent immunohistochemistry results confirmed that CASS4 overexpression correlated with loss of E-cadherin expression. We next investigated the phosphorylation levels of focal adhesion kinase (FAK), p38, extracellular signal-related kinase (ERK), and AKT after CASS4 plasmid or CASS4 siRNA transfection. CASS4 facilitated AKT (Ser473) phosphorylation. Treatment with an AKT phosphorylation inhibitor reversed the increased invasive capacity and downregulation of E-cadherin protein induced by CASS4 overexpression."

According to the news editors, the research concluded: "Taken together, the present results indicate that CASS4 may promote NSCLC invasion by activating the AKT signaling pathway, thereby inhibiting E-cadherin expression."

For more information on this research see: Overexpression of CASS4 promotes invasion in non-small cell lung cancer by activating the AKT signaling pathway and inhibiting E-cadherin expression. Oncology - Non-Small Cell Lung Cancer

New Non-Small Cell Lung Cancer Study Findings Recently Were Reported by Researchers at Faculty of Medicine (MEK inhibitors against MET-amplified non-small cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Non-Small Cell Lung Cancer have been presented. According to news reporting originating from Osaka, Japan, by NewsRx correspondents, research stated, "Several receptor tyrosine kinases (RTKs) including EGFR, ALK, and MET have been identified as therapeutic targets in non-small cell lung cancer (NSCLC). Among the downstream pathways of RTKs, the MAPK pathway is particularly important for cancer cell proliferation, differentiation, and survival."

Our news editors obtained a quote from the research from the Faculty of Medicine, "In this study, the effects of MEK inhibitors (trametinib and PD0325901) in several NSCLC cell lines with driver gene alterations, especially RTK genes, were tested in vitro using an MTT assay, and a wide range of sensitivities was found. In particular, all the EGFR-mutated cell lines were resistant to MEK inhibitors, whereas all the MET-amplified cell lines were sensitive. A bioinformatics technique and western blot analyses showed that the PI3K/AKT pathway is more activated in EGFRmutated NSCLC than in MET-amplified NSCLC, and a PI3K inhibitor enhanced the sensitivity to trametinib in the EGFR-mutated cell lines, suggesting that this pathway is associated with resistance to MEK inhibitors. Although the HCC827 cell line (EGFR mutation) was resistant to MEK inhibitors, the HCC827CNXR cell line, whose driver gene shifts from EGFR to MET, exhibited enhanced sensitivity to MEK inhibitors, indicating the biological importance of the MAPK pathway for MET-amplified NSCLC. Furthermore, a synergistic effect of crizotinib (a MET inhibitor) and trametinib was observed in MET-amplified NCLC cell lines."

According to the news editors, the research concluded: "Our findings indicate that the MAPK pathway is biologically important for MET-amplified NSCLC and strongly encourage the development of combination therapy with a MET inhibitor and a MEK inhibitor against MET-amplified NSCLC."

**Oncology - Non-Small Cell Lung Cancer**

**New Non-Small Cell Lung Cancer Study Findings Recently Were Reported by Researchers at Jiangsu University (The functional status of DNA repair pathways determines the sensitization effect to cisplatin in non-small cell lung cancer cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news reporting out of Zhenjiang, People's Republic of China, by NewsRx editors, research stated, "Cisplatin can cause a variety of DNA crosslink lesions including intra-strand and inter-strand crosslinks (ICLs), which are associated with the sensitivity of cancer cells to cisplatin. Here, we aimed to assess the contribution of the Fanconi anemia (FA), homologous recombination (HR) and nucleotide excision repair (NER) pathways to cisplatin resistance in non-small cell lung cancer (NSCLC)-derived cells."

Our news journalists obtained a quote from the research from Jiangsu University, "The expression of FA, HR and NER pathway-associated genes was assessed by RT-qPCR and Western blotting. siRNAs were used to knock down the expression of these genes. CCK-8 and flow cytometry assays were used to assess the viability and apoptotic rate of NSCLC-derived cells, respectively. Immunofluorescence and alkaline comet assays were used to assess the repair of ICLs. We found that acquired cisplatin-resistant NSCLC-derived A549/DR cells exhibited markedly enhanced FA and HR repair pathway capacities compared to its parental A549 cells and another independent NSCLC-derived cell line, Calu-1, which possesses a moderate innate resistance to cisplatin. siRNA-mediated silencing of the FA-associated genes FANCL and RAD18 and the HR-associated genes BRCA1 and BRCA2 significantly potentiated the sensitivity of A549/DR cells to cisplatin compared to A549 and Calu-1 cells, suggesting that the acquired cisplatin resistance in A549/DR cells may be attributed to enhanced FA and HR pathway capacities responsible for ICL repair. Although we found that expression knockdown of the NER-associated genes XPA and ERCC1 sensitized the three NSCLC-derived cell lines to cisplatin, the sensitization effect was more significant in Calu-1 cells than in A549 and A549/DR cells, implying that the innate cisplatin resistance in Calu-1 cells may result from an increased NER activity. Our results indicate that the functional status of DNA repair pathways determine the sensitivity of NSCLC cells to cisplatin."

According to the news editors, the research concluded: "Direct targeting of the pathway that is involved in cisplatin resistance may be an effective strategy to surmount cisplatin resistance in NSCLC."

For more information on this research see: The functional status of DNA repair...

**Oncology - Non-Small Cell Lung Cancer**

**New Non-Small Cell Lung Cancer Study Results Reported from Department of Surgery (Clinical Staging of Stage I Non-Small Cell Lung Cancer in the Netherlands-Need for Improvement in an Era With Expanding Nonsurgical Treatment Options: Data From ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Non-Small Cell Lung Cancer is the subject of a report. According to news reporting from Alkmaar, Netherlands, by NewsRx journalists, research stated, "The clinical stage of non-small cell lung cancer (NSCLC) determines the initial treatment, whereas the pathologic stage best determines prognosis and the need for adjuvant treatment. In an era in which stereotactice ablative radiotherapy (SABR) has become an alternative modality to surgical intervention, clinical staging is even more important, because pathologic staging is omitted in the case of SABR."

The news correspondents obtained a quote from the research from the Department of Surgery, "The objective of this study was to determine the concordance between clinical and pathologic stage in routine clinical practice for patients with early-stage NSCLC. Prospective data were derived from the Dutch Lung Surgery Audit (DLSA) in 2013 and 2014. Patients with clinical stage I NSCLC who underwent surgical resection and had a positron emission tomographycomputed tomography (PET-CT) scan in their clinical workup were selected. Clinical and pathologic TNM (cTNM and pTNM) stages were compared. From a total of 1,790 patients with clinical stage I, 1,555 (87%) patients were included in this analysis. Concordance between cTNM and pTNM was 59.9%. Of the patients with clinical stage I, 22.6% were upstaged to pathologic stage II or higher. In total, 14.9% of all patients with clinical stage I had nodal metastases, and 5.5% of all patients had unforeseen N2 disease. In patients with clinical stage T2a tumors, 21.3% had nodal metastases, 14.5% being N1 and 6.7% being N2 disease. Concordance between clinical and pathologic stage is 59.9%. In patients with clinical stage I NSCLC, 22.6% were upstaged to pathologic stage II or higher, which is an indication for..."
adjuvant chemotherapy."

According to the news reporters, the research concluded: "Improvement in accuracy of staging is thus needed, particularly for these patients."

Our news journalists report that additional information may be obtained by contacting D.J. Heineman, Medical Center Alkmaar, Dept. of Surg, NL-1815 JD Alkmaar, Netherlands. Additional authors for this research include M.G. ten Berge, J.M. Daniels, M.I. Versteegh, P.J. Marang-van de Mheen, M.W. Wouters and W.H. Schreurs.

**Oncology - Non-Small Cell Lung Cancer**

**New Non-Small Cell Lung Cancer Study Results from Shanghai Jiao-Tong University Described (Nrf2 but not autophagy inhibition is associated with the survival of wild-type epidermal growth factor receptor non-small cell lung cancer cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Non-Small Cell Lung Cancer. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Non-small cell lung cancer (NSCLC) is one of the most common malignancies in the world. Icotinib and Gefitinib are two epidermal growth factor receptor (EGFR) tyrosine kinase inhibitors (TKIs) that have been used to treat NSCLC."

Funders for this research include National Natural Science Foundation of China, Shanghai Committee of Science and Technology, China, NIAAA, National Center for Research Resources, National Institute of General Medical Sciences, NIH.

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "While it is well known that mutations of EGFR can affect the sensitivity of NSCLC to the EGFR-TKI, other mechanisms may also be adopted by lung cancer cells to develop resistance to EGFR-TKI treatment. Cancer cells can use multiple adaptive mechanisms such as activation of autophagy and Nrf2 to protect against various stresses and chemotherapeutic drugs. Whether autophagy or Nrf2 activation contributes to the resistance of NSCLC to EGFR-TKI treatment in wild-type EGFR NSCLC cells remains elusive. In the present study, we confirmed that Icotinib and Gefitinib induced apoptosis in EGFR mutant HCC827 but not in EGFR wild-type A549 NSCLC cells. Icotinib and Gefitinib did not induce autophagic flux or inhibit mTOR in A549 cells. Moreover, suppression of autophagy by chloroquine, a lysosomal inhibitor, did not affect Icotinib- or Gefitinib-induced cell death in A549 cells. In contrast, Brusatol, an Nrf2 inhibitor, significantly suppressed the cell survival of A549 cells. However, Brusatol did not
further sensitize A549 cells to EGFR TKI-induced cell death."

According to the news editors, the research concluded: "Results from this study suggest that inhibition of Nrf2 can decrease cell vitality of EGFR wild-type A549 cells independent of autophagy."

For more information on this research see: Nrf2 but not autophagy inhibition is associated with the survival of wild-type epidermal growth factor receptor non-small cell lung cancer cells. Toxicology and Applied Pharmacology, 2016;310():140-149. Nosocomial Infections

New Nosocomial Infections Study Findings Reported from Shanghai Jiao-Tong University (Systematic Mutational Analysis of Histidine Kinase Genes in the Nosocomial Pathogen Stenotrophomonas maltophilia Identifies BfmAK System Control of Biofilm ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nosocomial Infections. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "The Gram-negative bacterium Stenotrophomonas maltophilia lives in diverse ecological niches. As a result of its formidable capabilities of forming biofilm and its resistance to multiple antibiotic agents, the bacterium is also a nosocomial pathogen of serious threat to the health of patients whose immune systems are suppressed or compromised."

Financial supporters for this research include National Natural Science Foundation of China (NSFC), Chinese Academy of Sciences (CAS).

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University. "Besides the histidine kinase RpfC, the two-component signal transduction system (TCS), which is the canonical regulatory machinery used by most bacterial pathogens, has never been experimentally investigated in S. maltophilia Here, we annotated 62 putative histidine kinase genes in the S. maltophilia genome and successfully obtained 51 mutants by systematical insertional inactivation. Phenotypic characterization identified a series of mutants with
deficiencies in bacterial growth, swimming motility, and biofilm development. A TCS, named here BfmA-BfmK (Smlt4209-Smlt4208), was genetically confirmed to regulate biofilm formation in *S. maltophilia*. Together with interacting partner prediction and chromatin immunoprecipitation screens, six candidate promoter regions bound by BfmA in vivo were identified. We demonstrated that, among them, BfmA acts as a transcription factor that binds directly to the promoter regions of bfmA-bfmK and Smlt0800(acoT), a gene encoding an acyl coenzyme A thioesterase that is associated with biofilm development, and positively controls their transcription.

According to the news editors, the research concluded: "Genome-scale mutational analyses of histidine kinase genes and functional dissection of BfmK-BfmA regulation in biofilm provide genetic information to support more in-depth studies on cellular signaling in *S. maltophilia*, in the context of developing novel approaches to fight this important bacterial pathogen."

Our news journalists report that additional information may be obtained by contacting Z. Liu, School of Pharmacy, Shanghai Jiao Tong University, Shanghai, People's Republic of China. Additional authors for this research include F.F. Wang, B.Z. Ren, W. Liu, Z. Liu and W. Qian.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AEM.03951-15. This DOI is a link to an online electronic document that is either free or for purchase.

**Nuclear Magnetic Resonance**

**New Nuclear Magnetic Resonance Study Results Reported from Chiba University (Application of Solid-State NMR Relaxometry for Characterization and Formulation Optimization of Grinding-Induced Drug Nanoparticle)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nuclear Magnetic Resonance. According to news reporting originating from Chiba, Japan, by NewsRx correspondents, research stated, "The formation mechanism of drug nanoparticles was investigated using solid-state nuclear magnetic resonance (NMR) techniques for the efficient discovery of an optimized nanoparticle formulation. The cogrinding of nifedipine (NIF) with polymers, including hydroxypropyl methylcellulose (HPMC) and polyvinylpyrrolidone (PVP), and sodium dodecyl
sulfate (SDS) was performed to prepare the NIF nanoparticle formulations.

Financial supporters for this research include Japan Society for the Promotion of Science, Uehara Memorial Foundation, Japan Agency for Medical Research and Development, Hosokawa Powder Technology Foundation.

Our news editors obtained a quote from the research from Chiba University, "Then, solid-state NMR relaxometry was used for the nanometer-order characterization of NIF in the polymer matrix. Solid-state NMR measurements revealed that the crystal size of NIF was reduced to several tens of nanometers with amorphization of NIF by cogrinding with HPMC and SDS for 100 min. Similarly, the size of the NIF crystal was reduced to less than 90 nm in the 40 min ground mixture of NIF/PVP/SDS. Furthermore, 100 min grinding of NIF/PVP/SDS induced amorphization of almost all the NIF crystals followed by nanosizing. The hydrogen bond between NIF and PVP led to the efficient amorphization of NIF in the NIF/PVP/SDS system compared with NIF/HPMC/SDS system. The efficient nanosizing of the NIF crystal in the solid state, revealed by the solid-state NMR relaxation time measurements, enabled the formation of large amounts of NIF nanoparticles in water followed by the polymer dissolution. In contrast, excess amorphization of the NIF crystals failed to efficiently prepare the NIF nanoparticles. The solid-state characterization of the crystalline NIF revealed good correlation with the NIF nanoparticles formation during aqueous dispersion."

According to the news editors, the research concluded: "Furthermore, the solid-state NMR measurements including relaxometry successfully elucidated the nanometer-order dispersion state of NIF in polymer matrix, leading to the discovery of optimized conditions for the preparation of suitable drug nanoparticles."

The news editors report that additional information may be obtained by contacting K. Ueda, Graduate School of Pharmaceutical Sciences, Chiba University, 1-8-1 Inohana, Chuo-ku, Chiba 260-8675, Japan. Additional authors for this research include K. Higashi and K. Moribe.

**Proteins - Nucleoproteins**

**New Nucleoproteins Findings from Fudan University Described**

(Distinct roles of the histone chaperones NAP1 and NRP and the chromatin-remodeling factor INO80 in somatic homologous recombination in Arabidopsis thaliana)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Proteins - Nucleoproteins have been presented. According
to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Homologous recombination (HR) of nuclear DNA occurs within the context of a highly complex chromatin structure. Despite extensive studies of HR in diverse organisms, mechanisms regulating HR within the chromatin context remain poorly elucidated."

Funders for this research include National Basic Research Program of China, Agence Nationale de la Recherche.

Our news journalists obtained a quote from the research from Fudan University, "Here we investigate the role and interplay of the histone chaperones NUCLEOSOME ASSEMBLY PROTEIN1 (NAP1) and NAP1-RELATED PROTEIN (NRP) and the ATP-dependent chromatin-remodeling factor INOSITOL AUXOTROPHY80 (INO80) in regulating somatic HR in Arabidopsis thaliana. We show that simultaneous knockout of the four AtNAP1 genes and the two NRP genes in the sextuple mutant m123456-1 barely affects normal plant growth and development. Interestingly, compared with the respective AtNAP1 (m123-1 and m1234-1) or NRP (m56-1) loss-of-function mutants, the sextuple mutant m123456-1 displays an enhanced plant hypersensitivity to UV or bleomycin treatments. Using HR reporter constructs, we show that AtNAP1 and NRP act in parallel to synergistically promote somatic HR. Distinctively, the AtINO80 loss-of-function mutation (atino80-5) is epistatic to m56-1 in plant phenotype and telomere length but hypostatic to m56-1 in HR determinacy. Further analyses show that expression of HR machinery genes and phosphorylation of H2A.X (-H2A.X) are not impaired in the mutants."

According to the news editors, the research concluded: "Collectively, our study indicates that NRP and AtNAP1 synergistically promote HR upstream of AtINO80-mediated chromatin remodeling after the formation of -H2A.X foci during DNA damage repair."

Our news journalists report that additional information may be obtained by contacting A.W. Dong, Fudan University, Int Associated Lab CNRS Fudan HUNAU Plant Epigeno, State Key Lab Genet EngnSch Life SciInst Plant, Dept. of BiochemCollaborat Innovat Center Genet & Dev., Shanghai 20043, People's Republic of China. Additional authors for this research include J. Gao, J. Ma, L. Cao, C. Zhang, Y. Zhu, A.W. Dong and W.H. Shen.

New Obesity Data Have Been Reported by Investigators at University of Mississippi (Nitric oxide synthase-mediated blood pressure regulation in obese melanocortin-4 receptor-deficient pregnant rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Obesity is now available. According to news reporting from Jackson, Mississippi, by NewsRx journalists, research stated, "Although obesity increases the risk for hypertension in pregnancy, the mechanisms responsible are unknown. Increased nitric oxide (NO) production results in vasodilation and reduced blood pressure during normal pregnancy in lean rats; however, the role of NO is less clear during obese pregnancies."

Funders for this research include HHS | NIH | National Heart, Lung, and Blood Institute (NHBLI), HHS | NIH | National Institute of General Medical Sciences (NIGMS), HHS | NIH | National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK).

The news correspondents obtained a quote from the research from the University of Mississippi, "We examined the impact of obesity on NO synthase (NOS)-mediated regulation of blood pressure during pregnancy by testing the hypothesis that NOS activity, expression, and regulation of vascular tone and blood pressure are reduced in obese pregnant rats. At gestational day 19, melanocortin-4 receptor (MC4R)-deficient obese rats (MC4R) had greater body weight and fat mass with elevated blood pressure and circulating sFlt-1 levels compared with MC4R pregnant rats. MC4R pregnant rats also had less circulating cGMP levels and reduced total NOS enzymatic activity and expression in mesenteric arteries. Despite decreased biochemical measures of NO/NOS in MC4R rats, NOS inhibition enhanced vasoconstriction only in mesenteric arteries from MC4R rats, suggesting greater NOS-mediated tone. To examine the role of NOS on blood pressure regulation in obese pregnant rats, MC4R and MC4R pregnant rats were administered the nonselective NOS inhibitor N-G-nitro-L-arginine methyl ester ((L)-NAME, 100 mg/l) from gestational day 14 to 19 in drinking water. The degree by which (L)-NAME raised blood pressure was similar between obese and lean pregnant rats."

According to the news reporters, the research concluded: "Although MC4R obese pregnant rats had elevated blood pressure associated with reduced total NOS activity and expression, they had enhanced NOS-mediated attenuation of vasoconstriction, with no evidence of alterations in NOS-mediated regulation of blood pressure."

Our news journalists report that additional information may be obtained by contacting F.T. Spradley, University of Mississippi, Medical Center, Womens Hlth Res Center, Jackson, MS 39216, United States. Additional authors for this research include J.M. Sasser, J.B. Musall, J.C. Sullivan and J.P. Granger.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1152/ajpregu.00285.2016. This DOI is a link to an online electronic document that is either free or for purchase.

New Obesity Findings Has Been Reported by Investigators at Biomedical Research Institute (Prenatal nutrition and the risk of adult obesity: Long-term effects of nutrition on epigenetic mechanisms regulating gene expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Solid epidemiological evidence indicates that part of the risk of obesity in adulthood could be programmed during prenatal development by the quality of maternal nutrition. Nevertheless, the molecular mechanisms involved are mostly unknown, which hinders our capacity to develop effective intervention policies."

Our news journalists obtained a quote from the research from Biomedical Research Institute, "Here, we discuss the hypothesis that mechanisms underlying prenatal programming of adult risk are epigenetic and sensitive to environmental cues such as nutrition. While the information encoded in DNA is essentially stable, regulatory epigenetic mechanisms include reversible, covalent modifications of DNA and chromatin, such as methylation, acetylation etc. It is known that dietary availability of methyl donors has an impact on the patterns of gene expression by affecting DNA methylation at regulatory regions, a likely basis for reprogramming developmental plasticity. The Agouti and Axin-Psed genes, as well as the embryonic growth factor IGF2/H19 locus are examples of diet-induced modulation of phenotypic traits by affecting methylation of gene-regulatory regions. Recent work has evidenced an unsuspected role for chromatin as metabolic sensor. Chromatin is susceptible to a number of post-translational modifications that modulate gene expression, among them the GlcNAcylation of histone proteins and other epigenetic regulators. Intracellular levels of the precursor molecule UDP-GlcNAc, and hence the degree of global chromatin GlcNAcylation, depend on the energetic state of the cell, making GlcNAcylation a functional link between nutrition and regulation of gene expression."

According to the news editors, the research concluded: "Dietary interference with these regulatory mechanisms could effectively counteract the early-life programming of adult risk."

The news correspondents report that additional information may be obtained from E. Navarro, Bellvitge Biomed Res Inst IDIBELL, Mol Oncol Lab, Barcelona 08908, Spain. Additional authors for this research include A.N. Funtikova, M. Fito and H. Schröder.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jnutbio.2016.03.012. This DOI is a link to an online electronic document that is either free or for purchase.

**New Obesity Findings Has Been Reported by Investigators at Kuwait Institute for Scientific Research (Total Energy Expenditure in Obese Kuwaiti Primary School Children Assessed by the Doubly-Labeled Water Technique)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Obesity is the subject of a report. According to news originating from Safat, Kuwait, by NewsRx correspondents, research stated, "The aim of this pilot study was to assess body composition and total energy expenditure (TEE) in 35 obese 7-9 years old Kuwaiti children (18 girls and 17 boys). Total body water (TBW) and TEE were assessed by doubly-labeled water technique."

Our news journalists obtained a quote from the research from Kuwait Institute for Scientific Research, "TBW was derived from the intercept of the elimination rate of deuterium and TEE from the difference in elimination rates of O-18 and deuterium. TBW was used to estimate fat-free mass (FFM), using hydration factors for different ages and gender. Fat mass (FM) was calculated as the difference between body weight and FFM. Body weight was not statistically different but TBW was significantly higher (p = 0.018) in boys (44.9% +/- 3.3%) than girls (42.4% +/- 3.0%), while girls had significantly higher estimated FM (45.2 +/- 3.9 weight % versus 41.6% +/- 4.3%; p = 0.014). TEE was significantly higher in boys (2395 +/- 349 kcal/day) compared with girls (1978 +/- 169 kcal/day); p = 0.001. Estimated physical activity level (PAL) was significantly higher in boys; 1.61 +/- 0.167 versus 1.51 +/- 0.870; p = 0.034."

According to the news editors, the research concluded: "Our results provide the first dataset of TEE in 7-9 years old obese Kuwaiti children and highlight important gender differences to be considered during the development of school based interventions targeted to combat childhood obesity."

New Obesity Findings from Centers for Disease Control and Prevention Discussed (The role of obesity in the relation between total water intake and urine osmolality in US adults, 2009-2012)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating from Hyattsville, Maryland, by NewsRx correspondents, research stated, "Adequate water intake is critical to physiologic and cognitive functioning. Although water requirements increase with body size, it remains unclear whether weight status modifies the relation between water intake and hydration status."

Our news editors obtained a quote from the research from Centers for Disease Control and Prevention, "We examined how the association between water intake and urine osmolality, which is a hydration biomarker, varied by weight status. NHANES cross-sectional data (2009-2012) were analyzed in 9601 nonpregnant adults aged >= 20 y who did not have kidney failure. Weight status was categorized with the use of body mass index on the basis of measured height and weight (underweight or normal weight, overweight, and obesity). Urine osmolality was determined with the use of freezing-point depression osmometry. Hyphydration was classified according to the following age dependent formula: >= 831 mOsm/kg - [3.4 X (age - 20 y)]. Total water intake was determined with the use of a 24-h dietary recall and was dichotomized as adequate or low on the basis of the Institute of Medicine's adequate intake recommendations for men and women (men: >= 3.7 or <3.7 L; nonlactating women: >= 2.7 or <2.7 L; lactating women: >= 3.8 or <3.8 L for adequate or low intakes, respectively). We tested interactions and conducted linear and log-binomial regressions. Total water intake (P = 0.002), urine osmolality (P < 0.001), and hypohydration prevalence (P < 0.001) all increased with higher weight status. Interactions between weight status and water intake status were significant in linear (P = 0.005) and log-binomial (P = 0.015) models, which were then stratified. The prevalence ratio of hypohydration between subjects with adequate water intake and those with low water intake was 0.56 (95% CI: 0.43, 0.73) in adults who were underweight or normal weight, 0.67 (95% CI: 0.57, 0.79) in adults who were overweight, and 0.78 (95% CI: 0.70, 0.88) in adults who were obese."

According to the news editors, the research concluded: "On a population level, obesity modifies the association between water intake and hydration status."

For more information on this research see: The role of obesity in the relation

The news editors report that additional information may be obtained by contacting A.Y. Rosinger, CDC, Div Hlth & Nutr Examinat Surveys, Natl Center Hlth Stat, Hyattsville, MD, United States. Additional authors for this research include H.G. Lawman, L.J. Akinbami and C.L. Ogden.

**Nutritional and Metabolic Diseases and Conditions -…**

**New Obesity Findings from Monash University Described (Circadian regulation of lipid metabolism)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting from Melbourne, Australia, by NewsRx editors, the research stated, "The circadian system temporally coordinates daily rhythms in feeding behaviour and energy metabolism. The objective of the present paper is to review the mechanisms that underlie circadian regulation of lipid metabolic pathways."

The news correspondents obtained a quote from the research from Monash University, "Circadian rhythms in behaviour and physiology are generated by master clock neurons in the suprachiasmatic nucleus (SCN). The SCN and its efferent targets in the hypothalamus integrate light and feeding signals to entrain behavioural rhythms as well as clock cells located in peripheral tissues, including the liver, adipose tissue and muscle. Circadian rhythms in gene expression are regulated at the cellular level by a molecular clock comprising a core set of clock genes/proteins. In peripheral tissues, hundreds of genes involved in lipid biosynthesis and fatty acid oxidation are rhythmically activated and repressed by clock proteins, hence providing a direct mechanism for circadian regulation of lipids. Disruption of clock gene function results in abnormal metabolic phenotypes and impaired lipid absorption, demonstrating that the circadian system is essential for normal energy metabolism. The composition and timing of meals influence diurnal regulation of metabolic pathways, with food intake during the usual rest phase associated with dysregulation of lipid metabolism. Recent studies using metabolomics and lipidomics platforms have shown that hundreds of lipid species are circadian-regulated in human plasma, including but not limited to fatty acids, TAG, glycerophospholipids, sterol lipids and sphingolipids."

According to the news reporters, the research concluded: "In future work, these lipid profiling approaches can be used to understand better the interaction between diet, mealtimes and circadian rhythms on lipid metabolism and risk for obesity and metabolic diseases."

For more information on this research see: Circadian regulation of lipid metabolism.
New Obesity Findings from Rutgers State University Outlined (High phenolics Rutgers Scarlet Lettuce improves glucose metabolism in high fat diet-induced obese mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news originating from New Brunswick, New Jersey, by NewsRx correspondents, research stated, "Scope: The ability of high phenolic Rutgers Scarlet Lettuce (RSL) to attenuate metabolic syndrome and gut dysbiosis was studied in very high fat diet (VHFD)-fed mice. Phenolic absorption was assessed in vivo and in a gastrointestinal tract model."

Funders for this research include National Center for Complementary and Alternative Medicine, Office of Dietary Supplements, National Institute of General Medical Sciences.

Our news journalists obtained a quote from the research from Rutgers State University, "Mice were fed VHFD, VHFD supplemented with RSL (RSL-VHFD) or store-purchased green lettuce (GL-VHFD), or low-fat diet (LFD) for 13 weeks. Compared to VHFD or GL-VHFD-fed groups, RSL-VHFD group showed significantly improved oral glucose tolerance (p <0.05). Comparison of VHFD, RSL-VHFD, and GL-VHFD groups revealed no significant differences with respect to insulin tolerance, hepatic lipids, body weight gain, fat mass, plasma glucose, triglycerides, free fatty acid, and lipopolysaccharide levels, as well as relative abundances of major bacterial phyla from 16S rDNA amplicon data sequences (from fecal and cecal samples). However, RSL and GL-supplementation increased abundance of several taxa involved in plant polysaccharide degradation/fermentation. RSL phenolics chlorogenic acid, quercetin-3-glucoside, and quercetin-malonyl-glucoside were bioaccessible in the TIM-1 digestion model, but had relatively low recovery. RSL phenolics contributed to attenuation of post-prandial hyperglycemia."

According to the news editors, the research concluded: "Changes in gut microbiota were likely due to microbiota accessible carbohydrates in RSL and GL rather than RSL phenolics, which may be metabolized, absorbed, or degraded before reaching the colon."

The news correspondents report that additional information may be obtained from I. Raskin, Rutgers State University, Dept. of Plant Biol, New Brunswick, NJ 08901, United States. Additional authors for this research include D.E. Roopchand, A. Poulev, P. Kuhn, I. Armas, W.D. Johnson, A. Oren, D. Ribnicky, E. Zelzion, D. Bhattacharya and I. Raskin.

Nutritional and Metabolic Diseases and Conditions -...

New Obesity Findings from University of Chicago Described
(Relationship Between Obesity, Hypertension, and Aldosterone Production in Postmenopausal African American Women: A Pilot Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating in Chicago, Illinois, by NewsRx journalists, research stated, "Increased abdominal obesity is associated with increased cardiovascular risk, especially in African American women. The adipocyte is documented to produce a number of inflammatory factors including the hormone aldosterone."

The news reporters obtained a quote from the research from the University of Chicago, "There are very few data documenting aldosterone production from adipocytes of postmenopausal women as well as data demonstrating the effects of angiotensin receptor blockade (ARB) on its production in predominately African American women. The authors hypothesize that increased central adipocyte mass in obese postmenopausal women contributes to increased production of aldosterone that is suppressed with the ARB azilsartan medoxomil. The authors tested this hypothesis in a double-blind, placebo-controlled pilot study of 34 hypertensive postmenopausal women (mean age 57.5 +/- 7.5 years), 91% of whom were African American. Patients had a mean 24-hour ambulatory systolic blood pressure of 127 +/- 13 mm Hg off any blocker of the renin-angiotensin system but while taking other antihypertensive medications. The authors further validated aldosterone production in a nested cohort of women using fat cells from a fat pad biopsy. Azilsartan reduced 24-hour urinary aldosterone by 47.3% from baseline (P=.03), with between-groups differences in urine aldosterone of -5.3 +/- 52.3% placebo vs -47.3 +/- 32.9% azilsartan (P=.07) at 6 months. An adrenal cell line treated with adipocyte-conditioned media from subcutaneous abdominal adipocytes of postmenopausal women (n=3) showed an increase in aldosterone production blocked by an ARB (1948 +/- 1297 pg/mL fat alone vs 894 +/- 438 pg/mL fat + ARB; P=.022). The authors conclude that
aldosterone is produced from subcutaneous adipocytes of obese postmenopausal women."

According to the news reporters, the research concluded: "Moreover, use of an ARB significantly reduces aldosterone production within 6 months of use in these women as well as in cells exposed to their adipocytes."

Our news correspondents report that additional information may be obtained by contacting G.L. Bakris, Univ Chicago Med, Sect Endocrinol Diabet & Metab, ASH Comprehens Hypertens Center, Dept. of Med, Chicago, IL 60637, United States. Additional authors for this research include C. Majewski, C.H. Liao and G.L. Bakris.

Nutritional and Metabolic Diseases and Conditions -

New Obesity Findings from University of Minnesota Outlined (Meal Replacements Followed by Topiramate for the Treatment of Adolescent Severe Obesity: A Pilot Randomized Controlled Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news originating from Minneapolis, Minnesota, by NewsRx correspondents, research stated, "To assess the safety and efficacy of short-term meal replacement therapy followed by topiramate for body mass index (BMI) reduction in adolescents with severe obesity. Adolescents (ages 12-18 years) with severe obesity (BMI >= 1.2 times the 95th percentile or BMI >= 35 kg/m(2)) were recruited for this double-blind, randomized, placebo-controlled trial."

Our news journalists obtained a quote from the research from the University of Minnesota, "Participants completed 4 weeks of meal replacement therapy followed by randomization (1: 1) to either 24 weeks of topiramate 75 mg/day or placebo. Mean changes were compared between groups. Thirty adolescents (mean age 15.2 +/- 1.7 years, mean BMI 40.3 +/- 4.6 kg/m(2)) completed the meal replacement phase and were randomized; 21 completed the study. The difference in mean percent change in BMI between the topiramate and placebo groups was not significant (-1.9%; 95% CI: -5.2% to +1.5%; P = 0.291). Significant
improvements in visceral fat and very-low-density lipoprotein cholesterol were observed in the topiramate compared with the placebo group. There were no concerning changes in neurocognitive function or bone health."

According to the news editors, the research concluded: "In this pilot study, 4 weeks of meal replacement therapy followed by 24 weeks of low-dose topiramate compared with meal replacement therapy alone did not result in significant BMI reduction for adolescents with severe obesity."

For more information on this research see: Meal Replacements Followed by Topiramate for the Treatment of Adolescent Severe Obesity: A Pilot Randomized Controlled Trial. Obesity, 2016;24(12):2553-2561. Obesity can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

Nutritional and Metabolic Diseases and Conditions …

New Obesity Study Findings Have Been Reported by Researchers at Auckland University of Technology (Family-Centered Brief Intervention for Reducing Obesity and Cardiovascular Disease Risk: A Randomized Controlled Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Obesity are discussed in a new report. According to news reporting from Auckland, New Zealand, by NewsRx journalists, research stated, "To assess the effects of a family-centered, physical activity and nutrition 'brief' intervention (time-limited contact) on body weight and related health outcomes in primary health care patients with an elevated 5-year cardiovascular disease (CVD) risk. This study implemented a cluster randomized controlled trial design with two treatment conditions: a CVD risk assessment and one-time consultation ('usual care' control) and a CVD risk assessment and up to five home sessions that aimed to reduce obesity by encouraging physical activity and healthy eating (intervention)."

The news correspondents obtained a quote from the research from the Auckland University of Technology, "Three hundred and twenty patients aged 35 to 65 years from 16 primary health care clinics in Auckland, New Zealand, participated in the study. Intervention effects on BMI, waist circumference, blood pressure, blood cholesterol, triglycerides, 5-year
CVD risk, physical activity, and dietary patterns were assessed using generalized linear mixed models. When compared with the control group, the intervention resulted in a significant but relatively modest decrease in BMI between baseline and the 12-month follow-up (-0.633 kg m\(^{-2}\), P-adj = 0.048). Significant decreases were also observed for total cholesterol at 4 and 12 months, the total cholesterol to high-density lipoprotein cholesterol ratio at 4 months, 5-year CVD risk at 4 months, and fast food consumption at 12 months."

According to the news reporters, the research concluded: "Our findings show that a family-centered brief intervention targeting physical activity and nutrition can generate slightly better obesity-related health outcomes than usual care alone."

For more information on this research see: **Family-Centered Brief Intervention for Reducing Obesity and Cardiovascular Disease Risk: A Randomized Controlled Trial.** *Obesity*, 2016;24(11):2311-2318. *Obesity* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. **Nutritional and Metabolic Diseases and Conditions**…

**New Obesity Study Findings Have Been Reported from Department of Pediatrics (Setting Adolescents Up for Success: Promoting a Policy to Delay High School Start Times)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "A unique biological shift in sleep cycles occurs during adolescence causing later sleep and wake times. This shift is not matched by a concurrent modification in school start times, resulting in sleep curtailment for a large majority of adolescents."

Financial support for this research came from Leadership Education in Adolescent Health training grant.

Our news editors obtained a quote from the research from the Department of Pediatrics, "Chronic inadequate sleep is associated with poor academic performance including executive function impairments, mood, and behavioral issues, as well as adverse health outcomes such as an increased risk of obesity, hypertension, and cardiovascular disease. In order to address sleep deficits and the potential negative outcomes associated with chronic sleep deprivation, the American Academy of Pediatrics (AAP) and US Centers for Disease Control...
and Prevention (CDC) support delaying school start times for middle and high school students. We summarize current evidence, explicate the need for policy change, and urge school districts to put adolescent students' health as top priority and implement school start times consistent with their developmental needs. Whereas substantial evidence illustrating adverse consequences of inadequate sleep on psychological and physical health, and recommendations exist to adapt daytime school schedules to match sleep needs have been released, actual implementation of these recommendations have been limited."

According to the news editors, the research concluded: "This is a call to action for the implementation of AAP/CDC recommendations across the state and nation."

The news editors report that additional information may be obtained by contacting M. Barnes, UAB, Dept. of Pediat, Div Gen Pediat & Adolescent Med, Birmingham, AL 35233, United States. Additional authors for this research include K. Davis, M. Mancini, J. Ruffin, T. Simpson and K. Casazza.

**Nutritional and Metabolic Diseases and Conditions** -

**New Obesity Study Results from University of Arkansas Described**

*(Obese Mice Fed a Diet Supplemented with Enzyme-Treated Wheat Bran Display Marked Shifts in the Liver Metabolome Concurrent with Altered Gut Bacteria)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting from Little Rock, Arkansas, by NewsRx journalists, research stated, "Enzyme-treated wheat bran (ETWB) contains a fermentable dietary fiber previously shown to decrease liver triglycerides (TGs) and modify the gut microbiome in mice. It is not clear which mechanisms explain how ETWB feeding affects hepatic metabolism, but factors (i.e., xenometabolites) associated with specific microbes may be involved."

The news correspondents obtained a quote from the research from the University of Arkansas, "The objective of this study was to characterize ETWB-driven shifts in the cecal microbiome and to identify correlates between microbial changes and diet-related differences in liver metabolism in diet-induced obese mice that typically display steatosis. Five-week-old male C57BL/6J mice fed a 45%-lard based fat diet supplemented with ETWB (20% wt:wt) or rapidly
digestible starch (control) (n = 15/group) for 10 wk were characterized by using a multi-omics approach. Multivariate statistical analysis was used to identify variables that were strong discriminators between the ETWB and control groups. Body weight and liver TGs were decreased by ETWB feeding (by 10% and 25%, respectively; P< 0.001), and an index of liver reactive oxygen species was increased (by 29%, P< 0.01). The cecal microbiome showed an increase in Bacteroidetes (by 42%; P< 0.05) and a decrease in Firmicutes (by 16%; P< 0.05). Metabolites that were strong discriminators between the ETWB and control groups included decreased liver antioxidants (glutathione and a-tocopherol); decreased liver carbohydrate metabolites, including glucose; lower hepatic arachidonic acid; and increased liver and plasma I3-hydroxybutyrate. Liver transcriptomics revealed key metabolic pathways affected by ETWB, especially those related to lipid metabolism and some fed- or fasting-regulated genes. Together, these changes indicate that dietary fibers such as ETWB regulate hepatic metabolism concurrently with specific gut bacteria community shifts in C57BL/6J mice.

According to the news reporters, the research concluded: "It is proposed that these changes may elicit gut-derived signals that reach the liver via enterohepatic circulation, ultimately affecting host liver metabolism in a manner that mimics, in part, the fasting state."

Our news journalists report that additional information may be obtained by contacting S.H. Adams, University of Arkansas, Dept. of Pediat, Little Rock, AR 72205, United States. Additional authors for this research include B.D. Piccolo, M.L. Marco, E.B. Kim, M.L. Goodson, M.J. Keenan, T.N. Dunn, K.E.B. Knudsen, S.H. Adams and R.J. Martin.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3945/jn.116.238923. This DOI is a link to an online electronic document that is either free or for purchase.

**Obesity, Fitness and Wellness**

**New Obesity, Fitness and Wellness Findings from KACST Discussed (Revisiting the morbid genome of Mendelian disorders)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Obesity, Fitness and Wellness. According to news reporting originating in Riyadh, Saudi Arabia, by NewsRx journalists, research stated, "The pathogenicity of many Mendelian variants has been challenged by large-scale sequencing efforts. However, many rare and benign 'disease mutations' are difficult to analyze due to their rarity."

The news reporters obtained a quote from the research from KACST, "The Saudi Arabian variome is enriched for homozygosity due to inbreeding, a key advantage that can be
exploited for the critical examination of previously published variants. We collated all 'disease-related mutations' listed in the Human Gene Mutation Database (HGMD) and ClinVar, including 'variants of uncertain significance' (VOUS). We find that the use of public databases including 1000 Genomes, ExAC, and Kaviar can reclassify many of these variants as likely benign. Our Saudi Human Genome Program (SHGP) can reclassify many variants that are rare in public databases. Furthermore, SGPD allows us to observe many previously reported variants in the homozygous state and our extensive phenotyping of participants makes it possible to demonstrate the lack of phenotype for these variants, thus challenging their pathogenicity despite their rarity. We also find that 18 VOUS BRCA1 and BRCA2 variants that are listed in BRCA Exchange are present at least once in the homozygous state in patients who lack features of Fanconi anemia. Reassuringly, we could reciprocally demonstrate that none of those labeled as 'pathogenic' were observed in the homozygous state in individuals who lack Fanconi phenotype in our database.

According to the news reporters, the research concluded: "Our study shows the importance of revisiting disease-related databases using public resources as well as of population-specific resources to improve the specificity of the morbid genome of Mendelian diseases in humans."

For more information on this research see: Revisiting the morbid genome of Mendelian disorders. Genome Biology, 2016;17():1-7. Genome Biology can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. (BioMed Central - www.biomedcentral.com/; Genome Biology - genomebiology.com)

Our news correspondents report that additional information may be obtained by contacting M. Abouelhoda, KACST, Saudi Human Genome Program, Riyadh, Saudi Arabia. Additional authors for this research include T. Faquih, M. El-Kalioby and F.S. Alkuraya.

Respiratory Tract Diseases and Conditions -...

New Obstructive Sleep Apnea Findings Reported from Harvard School of Medicine (Effect of Body Mass Index on Left Ventricular Mass in Career Male Firefighters)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea is now available. According to news reporting from Cambridge, Massachusetts, by NewsRx journalists, research stated, "Left ventricular (LV) mass is a strong predictor of cardiovascular disease (CVD) events; increased LV mass is common among US firefighters and plays a major role in firefighter sudden cardiac death. We aim to identify significant predictors of LV mass among firefighters."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "Cross-sectional study of 400 career male firefighters selected by an enriched randomization strategy. Weighted analyses were performed based on the total number of risk factors per subject with inverse probability weighting. LV mass was assessed by echocardiography (ECHO), and cardiac magnetic resonance, and normalized (indexed) for
height. CVD risk parameters included vital signs at rest, body mass index (BMI) defined obesity, obstructive sleep apnea risk, low cardiorespiratory fitness, and physical activity. Linear regression models were performed. In multivariate analyses, BMI was the only consistent significant independent predictor of LV mass indexes (all, p<0.001). A 1-unit decrease in BMI was associated with 1-unit (g/m(1.7)) reduction of LV mass/height(1.7) after adjustment for age, obstructive sleep apnea risk, and cardiorespiratory fitness."

According to the news reporters, the research concluded: "After height-indexing ECHO-measured and cardiac magnetic resonance measured LV mass, BMI was found to be a major driver of LV mass among firefighters. Our findings taken together with previous research suggest that reducing obesity will improve CVD risk profiles and decrease on-duty CVD and sudden cardiac death events in the fire service. Our results may also support targeted noninvasive screening for LV hypertrophy with ECHO among obese firefighters."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.amjcard.2016.08.058. This DOI is a link to an online electronic document that is either free or for purchase.

New Obstructive Sleep Apnea Findings from Fujian Medical University Discussed (Assessment of Upper-Airway Configuration in Obstructive Sleep Apnea Syndrome With Computed Tomography Imaging During Muller Maneuver)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea have been presented. According to news originating from Fuzhou, People's Republic of China, by NewsRx correspondents, research stated, "The purpose of this observational study was to investigate the relationship between upper-airway configuration assessed by CT imaging during the Muller maneuver state and the severity of obstructive sleep
apnea syndrome (OSAS). A total of 358 snoring subjects who underwent standard polysomnography and upper-airway configuration by using CT imaging were enrolled. According to the apnea-hypopnea index (AHI), subjects were classified into 4 groups: snoring group (simple snoring), AHI < 5; mild OSAS, 5 <= AHI < 15; moderate OSAS, 15 <= AHI < 30; and severe OSAS, AHI >= 30.

Our news journalists obtained a quote from the research from Fujian Medical University. "We also divided the upper airway into 3 parts, named the nasopharynx, oropharynx, and hypopharynx, from the CT scan and evaluated the minimal cross-sectional area (mCSA) and the shape of each airway level and calculated upper-airway length and distance from mandibular plane to hyoid bone (MPH). Multivariate logistic stepwise regression analysis identified body mass index (BMI), mCSA of nasopharynx, upper-airway length, and MPH as risk factors for the severity of OSAS. When subdivided for BMI and sex, upper-airway length was a risk factor for OSAS in non-obese (BMI < 27 kg/m(2)) and male subjects, and MPH was a risk factor only in obese (BMI >= 27 kg/m(2)) subjects. Meanwhile, mCSA of nasopharynx was significantly associated with the severity of OSAS independent of BMI. Subjects with severe OSAS have more significant abnormalities of the upper airway. Obesity, mCSA of nasopharynx, upper-airway length, and MPH may contribute to the severity of OSAS."

According to the news editors, the research concluded: "Obesity and sex should be taken into account when evaluating the abnormalities of upper-airway anatomy in snorers and patients with OSAS."

For more information on this research see: Assessment of Upper-Airway Configuration in Obstructive Sleep Apnea Syndrome With Computed Tomography Imaging During Muller Maneuver. Respiratory Care, 2016;61(12):1651-1658. Respiratory Care can be contacted at: Daedalus Enterprises Inc, 9425 N Mac Arthur Blvd, Ste 100, Irving, TX 75063-4706, USA.

The news correspondents report that additional information may be obtained from Q.C. Lin, Fujian Med Univ, Fujian Prov Sleep Disordered Breathing Clin Center, Lab Resp Dis, Dept. of Resp Med Affiliated Hosp 1, Fuzhou, Fujian Province, People's Republic of China. New Obstructive Sleep Apnea Findings from Jilin University Described (Obstructive sleep apnea syndrome is a risk factor of hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea have been published. According to news reporting out of Changchun, People's Republic of China, by NewsRx editors, research stated, "Some studies investigated the association between obstructive sleep apnea syndrome (OSAS) and hypertension risk. However, the results remained inconclusive."

Our news journalists obtained a quote from the research from Jilin University, "Thus, we performed a meta-analysis to clarify the association of OSAS and hypertension risk. EVIDENCE ACQUISITION: Online electronic databases (PubMed and EMBASE) was searched. The strength of association between the OSAS and hypertension risk was assessed by calculating OR with 95% CI. EVIDENCE SYNTHESIS: A total of 6 articles with 20,637 patients on OSAS and hypertension risk met the study inclusion criteria, and were included in the meta-analysis. OSAS was associated with a significantly increased risk of hypertension (OR=1.41; 95%CI, 1.29-1.88; I²=20%). In the race subgroup analysis, Caucasians with OSAS had increased hypertension risk (OR=1.43; 95%CI, 1.29-1.59; I²=20%). In the subgroup analysis according to gender, male OSAS patients were significantly associated with risk of hypertension (OR=1.59; 95%CI, 1.16-2.17; I²=0%), while female OSAS patients were not significantly associated with risk of hypertension (OR=1.18; 95%CI, 0.80-1.73; I²=0%). All of the different severities of OSAS patients had an increased hypertension risk (mild: OR=1.26; 95%CI, 1.17-1.35; I²=45%; moderate: OR=1.50; 95%CI, 1.27-1.76; I²=46%; severe: OR=1.47; 95%CI, 1.33-1.64; I²=63%)."

According to the news editors, the research concluded: "This meta-analysis suggested that OSAS may be associated with hypertension risk."

For more information on this research see: Obstructive sleep apnea syndrome is a risk factor of hypertension. Minerva Medica. 2016;107(5):294-299. Minerva Medica can be contacted at: Edizioni Minerva Medica, Corso Bramante 83-85 Int Journals Dept., 10126 Turin, Italy.

Our news journalists report that additional information may be obtained by contacting B.S. Lin, Jilin University, China Japan Union Hosp, Dept. of Cardiac Surg, Changchun 130033, People's Republic of China. Additional authors for this research include J.H. Ma, W. Wang and B.S. Lin.

New Ocular Hypertension Study Findings Reported from University of Iowa (Glaucoma Risk Alleles in the Ocular Hypertension Treatment Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Eye Diseases and Conditions - Ocular Hypertension is now available. According to news reporting originating from Iowa City, Iowa, by NewsRx correspondents, research stated, "Primary open-angle glaucoma (POAG) is a major cause of blindness and visual disability. Several genetic risk factors for POAG and optic nerve features have been identified."

Our news editors obtained a quote from the research from the University of Iowa, "We measured the relative risk for glaucoma that these factors contribute to participants in the Ocular Hypertension Treatment Study (OHTS). Comparative series. One thousand fifty-seven of 1636 participants (65%) of the OHTS were enrolled in this genetics ancillary study. Samples of DNA were available from 1057 OHTS participants. Of these, 209 developed POAG (cases) and 848 did not develop glaucoma (controls) between 1994 and 2009. The frequencies of 13 risk alleles previously associated with POAG or with optic disc features in other cohorts were compared between POAG cases and controls in the OHTS cohort using analyses of variance. The 2 largest subgroups, non-Hispanic whites (n = 752; 70.7%) and blacks (n = 249, 23.7%), also were analyzed separately. The probability of glaucoma developing over the course of the OHTS was compared between participants stratified for transmembrane and coiled-coil domains 1 (TMCO1) risk alleles using Kaplan-Meier and Cox proportional hazards analyses. Association of POAG with known genetic factors. No association was detected between the known POAG risk alleles when the OHTS cohort was examined as a whole. However, in the subgroup of non-Hispanic whites, allele frequencies at the TMCO1 locus were statistically different between cases and controls (P = 0.00028). By 13 years, non-Hispanic white participants with TMCO1 risk alleles had a 12% higher cumulative frequency of glaucoma developing than participants with no TMCO1 risk alleles. Moreover, the Cox proportional hazard analysis demonstrated that TMCO1 alleles increased relative risk comparable with that of some previously analyzed clinical measures (i.e., intraocular pressure). The size of the OHTS cohort and its composition of 2 large racial subgroups may limit its power to detect some glaucoma risk factors."

According to the news editors, the research concluded: "However, TMCO1 genotype was found to increase the risk of glaucoma developing among non-Hispanic whites, the largest racial subgroup in the OHTS cohort, at a magnitude similar to clinical predictors of disease that long have been associated with glaucoma."

The news editors report that additional information may be obtained by contacting J.H. Fingert, University of Iowa, Stephen A Wynn Inst Vis Res, Iowa City, IA, United States. Additional authors for this research include B. Faga, L. Ortega, B.R. Roos, M.O. Gordon, M.A. Kass, K. Wang and J.H. Fingert.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ophtha.2016.08.036. This DOI is a link to an online electronic
New Oncology Findings from Sun Yat Sen University Described (FABP5 correlates with poor prognosis and promotes tumor cell growth and metastasis in cervical cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology have been presented. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Fatty acid-binding protein 5 (FABP5) was found in our previous study to be a potential biomarker for lymph node metastasis of cervical cancer. However, the roles of FABP5 in cervical cancer remain unclear."

Financial supporters for this research include The Sun Yat-sen University Clinical Research 5010 Program, The Guangdong Natural Science Fund, The Science and Technology Program of Guangzhou.

The news correspondents obtained a quote from the research from Sun Yat Sen University, "In the present study, FABP5 expression was found to be significantly upregulated in cervical cancer tissues, and high FABP5 expression was significantly correlated with lymph node metastasis, lymphovascular space invasion, the International Federation of Gynecology and Obstetrics (FIGO) stage, and tumor size. Moreover, FABP5 was an independent factor for poor prognosis in cervical cancer patients. Silencing of FABP5 inhibited cell proliferation, colony formation, cell migration, and invasion in vitro. Furthermore, FABP5 silencing significantly reduced tumor growth and lung metastases in a murine allograft model in vivo. In addition, FABP5 silencing decreased the expression of matrix metalloproteinase-2 (MMP-2) and matrix metalloproteinase-9 (MMP-9) in vitro and in vivo."

According to the news reporters, the research concluded: "Collectively, these findings indicated that FABP5 plays an important role in the carcinogenesis and metastasis of cervical cancer, and FABP5 may be a novel predictor for prognostic assessment of cervical cancer patients."

For more information on this research see: FABP5 correlates with poor prognosis and promotes tumor cell growth and metastasis in cervical cancer. Tumor Biology, 2016;37 (11):14873-14883. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13277-016-5350-1. This DOI is a link to an online electronic document that is either free or for purchase.

**Nursing - Oncology Nursing**

**New Oncology Nursing Data Have Been Reported by Investigators at University of Turku (Measuring trust in nurses - Psychometric properties of the Trust in Nurses Scale in four countries)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nursing - Oncology Nursing have been published. According to news originating from Turku, Finland, by NewsRx correspondents, research stated, "The purpose of this study was to examine psychometric properties of three translated versions of the Trust in Nurses Scale (TNS) and cancer patients' perceptions of trust in nurses in a sample of cancer patients from four European countries. A cross-sectional, cross-cultural, multi-site survey design was used."

Our news journalists obtained a quote from the research from the University of Turku, "The data were collected with the Trust in Nurses Scale from patients with different types of malignancies in 17 units within five clinical sites (n = 599) between 09/2012 and 06/2014. Data were analyzed using descriptive and inferential statistics, multivariate methods and psychometrics using exploratory factor analysis, Cronbach's alpha coefficients, item analysis and Rasch analysis. The psychometric properties of the data were consistent in all countries. Within the exploratory factor analysis the principal component analysis supported the one component structure (unidimensionality) of the TNS. The internal consistency reliability was acceptable. The Rasch analysis supported the unidimensionality of the TNS cross-culturally. All items of the TNS demonstrated acceptable goodness-of-fit to the Rasch model. Cancer patients trusted nurses to a great extent although between country differences were found."

According to the news editors, the research concluded: "The Trust in Nurses Scale proved to be a valid and reliable tool for measuring patients' trust in nurses in oncological settings in international contexts."

The news correspondents report that additional information may be obtained from M. Stolt, University of Turku, Dept. of Nursing Sci, Turku 20014, Finland. Additional authors for this research include A. Charalambous, L. Radwin, C. Adam, J. Katajisto, C. Lemonidou, E. Patiraki, K. Sjovall and R. Suhonen.
Keywords for this news article include: Turku, Finland, Europe, Oncology Nursing, Nursing, Oncology, Cancer, University of Turku.

Oncology

New Oncology Study Findings Have Been Reported by Researchers at Institute for Cancer Research and Treatment (IRCCS) (Toward the molecular dissection of peritoneal pseudomyxoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology is now available. According to news reporting originating from Milan, Italy, by NewsRx correspondents, research stated, "Outcome of pseudomyxoma peritonei (PMP) after cytoreductive surgery (CRS) and hyperthermic intraperitoneal chemotherapy (HIPEC) is heterogeneous even after adjusting for clinicopathological prognostic variables. The identification of additional prognostic or even predictive biomarkers is an unmet clinical need."

Our news editors obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Forty patients with mucinous appendiceal tumors and PMP were clinically eligible and had evaluable tumor samples obtained after CRS and HIPEC. We carried out next-generations sequencing (NGS) of 50 gene's hotspot regions contained in the Hotspot Cancer Panel v2 using the Ion Torrent Personal Genome Machine platform (Life Technologies). KRAS and GNAS mutations were found in 72% and 52%, and their allelic frequency was below 10% in 55% and 43% of samples, respectively. KRAS and GNAS mutations were associated with worse progression-free survival (PFS) at univariate analysis (P = 0.006 and 0.011, respectively). At multivariate analysis, only KRAS mutatrd with worse progression-free survival (PFS) at univariate analysis (P = 0.012); GNAS mutations were not-being significantly associated with other poor prognostic features such as incomplete cytoreduction or KRAS mutations. Validation of results was carried out in an independent bi-institutional cohort of 25 patients and the prognostic effect of KRAS mutations was again confirmed in the multivariate model (P = 0.029). NGS approach allowed the discovery of other potentially druggable mutations such as those in PI3K, AKT, LKB1, FGFR3 and PDGFRA."

According to the news editors, the research concluded: "Given the homogeneity of this series and the sensitivity of NGS in this low-cellularity tumor, we demonstrated for the first time a poor prognostic role of KRAS mutations."

The news editors report that additional information may be obtained by contacting F. Pietrantonio, Fdn IRCCS Ist Nazl Tumori, Dept. of Med Oncol, Milan, Italy. Additional authors for this research include F. Perrone, A. Mennitto, E.M. Gleeson, M. Milione, E. Tamborini, A. Busico, G. Settanni, R. Berenato, M. Caporale, F. Morano, I. Bossi, A. Pellegrinelli, M. Di Bartolomeo, F. de Braud, D. Baratti, W.B. Bowne and S Kusamura.

Oncology

New Oncology Study Findings Have Been Reported by Researchers at Warsaw University of Life Sciences (The biology of extracellular vesicles with focus on platelet microparticles and their role in cancer development and progression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology have been published. According to news reporting from Warsaw, Poland, by NewsRx journalists, research stated, "Extracellular vesicles (EVs) are a heterogeneous group of structures which can be classified into smaller in size and relatively homogenous exosomes (EXSMs)-spherical fragments of lipid bilayers from inner cell compartments-and bigger in size ectosomes (ECSMs)-a direct consequence of cell-membrane blebbing. EVs can be found in body fluids of healthy individuals."

Financial support for this research came from Narodowe Centrum Nauki.

The news correspondents obtained a quote from the research from the Warsaw University of Life Sciences, "Their number increases in cancer and other pathological conditions. EVs can originate from various cell types, including leukocytes, erythrocytes, thrombocytes, and neoplastic cells. Platelet microparticles (PMPs) are the most abundant population of EVs in blood. It is well documented that PMPs, being a crucial element of EVs signaling, are involved in tumor growth, metastasis, and angiogenesis and may participate in the development of multidrug resistance by tumor cells. The aim of this review is to present the role of PMPs in carcinogenesis."

According to the news reporters, the research concluded: "The biology and functions of PMPs with a particular emphasis on the most recent scientific reports on EV properties are also characterized."

For more information on this research see: The biology of extracellular vesicles with focus on platelet microparticles and their role in cancer development and progression. Tumor Biology, 2016;37(11):14391-14401. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. Oncology

New Oncology Study Findings Have Been Reported from University of Torino (Oncogenic kinase fusions: an evolving arena with innovative clinical opportunities)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology have been published. According to news reporting from Torino, Italy, by NewsRx journalists, research stated, "Cancer biology relies on intrinsic and extrinsic deregulated pathways, involving a plethora of intra-cellular and extra-cellular components. Tyrosine kinases are frequently deregulated genes, whose aberrant expression is often caused by major cytogenetic events (e.g. chromosomal translocations)."

The news corresponents obtained a quote from the research from the University of Torino, "The resulting tyrosine kinase fusions (TKFs) prompt the activation of oncogenic pathways, determining the biological and clinical features of the associated tumors. First reported half a century ago, oncogenic TKFs are now found in a large series of hematologic and solid tumors. The molecular basis of TKFs has been thoroughly investigated and tailored therapies against recurrent TKFs have recently been developed. This review illustrates the biology of oncogenic TKFs and their role in solid as well as hematological malignancies."

According to the news reporters, the research concluded: "We also address the therapeutic implications of TKFs and the many open issues concerning their clinical impact."

For more information on this research see: Oncogenic kinase fusions: an evolving arena with innovative clinical opportunities. Oncotarget, 2016;7(18):25064-86.

Our news journalists report that additional information may be obtained by contacting F. Tabbo, Dept. of Molecular Biotechnology and Health Science and Center for Experimental Research and Medical Studies (CeRMS), University of Torino, Torino, Italy. Oncology

New Oncology Study Findings Recently Were Reported by Researchers at University of Oxford (Notch signaling: its roles and therapeutic potential in hematological malignancies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology have been published. According to news reporting from Torino, Italy, by NewsRx journalists, research stated, "Cancer biology relies on intrinsic and extrinsic deregulated pathways, involving a plethora of intra-cellular and extra-cellular components. Tyrosine kinases are frequently deregulated genes, whose aberrant expression is often caused by major cytogenetic events (e.g. chromosomal translocations)."

The news corresponents obtained a quote from the research from the University of Torino, "The resulting tyrosine kinase fusions (TKFs) prompt the activation of oncogenic pathways, determining the biological and clinical features of the associated tumors. First reported half a century ago, oncogenic TKFs are now found in a large series of hematologic and solid tumors. The molecular basis of TKFs has been thoroughly investigated and tailored therapies against recurrent TKFs have recently been developed. This review illustrates the biology of oncogenic TKFs and their role in solid as well as hematological malignancies."

According to the news reporters, the research concluded: "We also address the therapeutic implications of TKFs and the many open issues concerning their clinical impact."

For more information on this research see: Oncogenic kinase fusions: an evolving arena with innovative clinical opportunities. Oncotarget, 2016;7(18):25064-86.

Our news journalists report that additional information may be obtained by contacting F. Tabbo, Dept. of Molecular Biotechnology and Health Science and Center for Experimental Research and Medical Studies (CeRMS), University of Torino, Torino, Italy. & Wellness Week -- New research on Oncology is the subject of a report. According to news reporting originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "Notch is a highly conserved signaling system that allows neighboring cells to communicate, thereby controlling their differentiation, proliferation and apoptosis, with the outcome of its activation being highly dependent on signal strength and cell type. As such, there is growing evidence that disturbances in physiological Notch signaling contribute to cancer development and growth through various mechanisms."

Our news editors obtained a quote from the research from the University of Oxford, "Notch was first reported to contribute to tumorigenesis in the early 90s, through identification of the involvement of the Notch1 gene in the chromosomal translocation t(7;9)(q34;q34.3), found in a small subset of T-cell acute lymphoblastic leukemia. Since then, Notch mutations and aberrant Notch signaling have been reported in numerous other precursor and mature hematological malignancies, of both myeloid and lymphoid origin, as well as many epithelial tumor types. Of note, Notch has been reported to have both oncogenic and tumor suppressor roles, dependent on the cancer cell type. In this review, we will first give a general description of the Notch signaling pathway, and its physiologic role in hematopoiesis. Next, we will review the role of aberrant Notch signaling in several hematological malignancies."

According to the news editors, the research concluded: "Finally, we will discuss current and potential future therapeutic approaches targeting this pathway."

The news editors report that additional information may be obtained by contacting Y. Gu, Dept. of Clinical Haematology, Oxford University Hospitals, Churchill Hospital, Oxford, UK. Additional authors for this research include M. Masiero and A.H Banham.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18632/oncotarget.7772. This DOI is a link to an online electronic document that is either free or for purchase.

Eye Diseases and Conditions - Open-Angle Glaucoma

New Open-Angle Glaucoma Findings from Brigham and Women's Hospital Outlined (Prospective Study of Oral Health and Risk of Primary Open-Angle Glaucoma in Men Data from the Health Professionals Follow-up Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Eye Diseases and Conditions - Open-Angle Glaucoma are discussed in a new report. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Tooth loss or periodontal disease is associated with systemic endothelial dysfunction, which has been implicated in primary open-angle glaucoma (POAG). The relationship between oral health and POAG has received limited attention."

The news reporters obtained a quote from the research from Brigham and Women's
Thus, we evaluated the association between oral health history and risk of POAG and POAG subtypes. Prospective cohort study. Health Professionals Follow-up Study participants (40,536 men) followed biennially from 1986 to 2012. At each 2-year risk period, eligible participants were aged 40+ years, were free of POAG, and reported eye examinations. By using validated questions, we updated participants' status on number of natural teeth, teeth lost, periodontal disease with bone loss, and root canal treatments. During follow-up, 485 incident cases of POAG were confirmed with medical records and classified into subtypes defined by intraocular pressure (IOP; $\geq$ or $<22$ mmHg) or visual field (VF) loss pattern at diagnosis (peripheral loss only or early paracentral loss). Multivariable relative risks (MVRRs) and 95% confidence intervals (CIs) were estimated. Number of natural teeth, periodontal disease, and root canal treatment were not associated with POAG. However, compared with no report of tooth loss, a report of losing teeth within the past 2 years was associated with a 1.45-fold increased risk of POAG (95% CI, 1.06-1.97); in particular, a report within the past 2 years of both losing teeth and having a prevalent diagnosis of periodontal disease was associated with a 1.85-fold increased risk of POAG (95% CI, 1.07-3.18). The associations with recent tooth loss were not significantly different for the POAG subtypes ($P$ for heterogeneity $\geq 0.36$), although associations were strongest in relation to the POAG subtypes with IOP $<22$ mmHg (MVRR, 1.93; 95% CI, 1.09-3.43) and early paracentral VF loss (MVRR, 2.27; 95% CI, 1.32-3.88). Although the number of natural teeth was not associated with risk of POAG, recent tooth loss was associated with an increased risk of POAG.

According to the news reporters, the research concluded: "Because these findings may be due to chance, they need confirmation in larger studies."

Our news correspondents report that additional information may be obtained by contacting J.H. Kang, Brigham & Women's Hospital, Dept. of Med, Channing Div Network Med, Boston, MA 02115, United States. Additional authors for this research include L. Hyman, J.L. Wiggs, B.A. Rosner, K. Joshipura, M. McEvoy, Z.E. McPherson, J. Danias and J.H. Kang.

Drugs and Therapies - Ophthalmic Glaucoma Agents

New Ophthalmic Glaucoma Agents Study Results Reported from King's College (Reversal of cardiac vagal effects of phystostigmine by adjunctive muscarinic blockade)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Ophthalmic Glaucoma Agents
are discussed in a new report. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Pre-treatment with reversible acetylcholinesterase (AChE) inhibitors is an effective strategy for reducing lethality following organophosphate nerve agent exposure. AChE inhibition may have unwanted cardiac side effects, which could be negated by adjunctive anti-cholinergic therapy."

Financial support for this research came from Defence Science and Technology Laboratory.

The news correspondents obtained a quote from the research from King's College, "The aims of the present study were to examine the concentration-dependent effects of physostigmine on cardiac responses to vagus nerve stimulation (VNS), to test whether adjunctive treatment with hyoscine can reverse these effects and to assess the functional interaction and electrophysiological consequences of a combined pretreatment. Studies were performed in an isolated innervated rabbit heart preparation. The reduction in heart rate with VNS was augmented by physostigmine (1-1000 nmol/L), in a concentration-dependent manner - with an EC50 of 19 nmol/L. Hyoscine was shown to be effective at blocking the cardiac responses to VNS with an IC50 of 11 nmol/L. With concomitant perfusion of physostigmine, the concentration response curve for hyoscine was shifted downward and to the right, increasing the concentration of hyoscine required to normalise (to control values) the effects of physostigmine on heart rate. At the lowest concentration of hyoscine examined (1 nmol/L) a modest potentiation of heart rate response to VNS (+15 +/- 3%) was observed. We found no evidence of cardiac dysfunction or severe electrophysiological abnormalities with either physostigmine or hyoscine alone, or as a combined drug-therapy. The main finding of this study is that hyoscine, at concentrations greater than 10(-8) M, is effective at reversing the functional effects of physostigmine on the heart."

According to the news reporters, the research concluded: "However, low-concentrations of hyoscine may augment cardiac parasympathetic control."

For more information on this research see: Reversal of cardiac vagal effects of physostigmine by adjunctive muscarinic blockade. Neurotoxicology, 2016;57():174-182. Neurotoxicology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Neurotoxicology - www.journals.elsevier.com/neurotoxicology/)

New Optic Neuritis Study Findings Have Been Reported from University of Buenos Aires (Neuroprotective effect of melatonin in experimental optic neuritis in rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Eye Diseases and Conditions - Optic Neuritis is now available. According to news reporting from Buenos Aires, Argentina, by NewsRx journalists, research stated, "Optic neuritis (ON) is an inflammatory, demyelinating, and neurodegenerative condition of the optic nerve, which might induce permanent vision loss. Currently, there are no effective therapies for this disorder."

Financial supporters for this research include Agencia Nacional de Promocion Cientifica y Tecnologica, Universidad de Buenos Aires, Consejo Nacional de Investigaciones Cientificas y Tecnicas.

The news correspondents obtained a quote from the research from the University of Buenos Aires, "We have developed an experimental model of primary ON in rats through a single microinjection of 4.5 mg of bacterial lipopolysaccharide (LPS) into the optic nerve. Since melatonin acts as a pleiotropic therapeutic agent in various neurodegenerative diseases, we analyzed the effect of melatonin on LPS-induced ON. For this purpose, LPS or vehicle were injected into the optic nerve from adult male Wistar rats. One group of animals received a subcutaneous pellet of 20 mg melatonin at 24 hr before vehicle or LPS injection, and another group was submitted to a sham procedure. Melatonin completely prevented the decrease in visual evoked potentials (VEPs), and pupil light reflex (PLR), and preserved anterograde transport of cholera toxin b-subunit from the retina to the superior colliculus. Moreover, melatonin prevented microglial reactivity (ED1-immunoreactivity, p<0.01), astrogliosis (glial fibrillary acid protein-immunostaining, p<0.05), demyelination (luxol fast blue staining, p<0.01), and axon (toluidine blue staining, p<0.01) and retinal ganglion cell (Brn3a-immunoreactivity, p<0.01) loss, induced by LPS. Melatonin completely prevented the increase in nitric oxide synthase 2, cyclooxygenase-2 levels (Western blot) and TNFa levels, and partly prevented lipid peroxidation induced by experimental ON. When the pellet of melatonin was implanted at 4 days postinjection of LPS, it completely reversed the decrease in VEPs and PLR."

According to the news reporters, the research concluded: "These data suggest that melatonin could be a promising candidate for ON treatment."

Our news journalists report that additional information may be obtained by contacting M.L. Aranda, Laboratory of Retinal Neurochemistry and Experimental Ophthalmology, Dept. of Human Biochemistry, School of Medicine, CEFyBO, University of Buenos Aires, CONICET, Buenos Aires, Argentina. New Oral Cancer Findings from National Yang Ming University Described (Automatic and objective oral cancer diagnosis by Raman spectroscopic detection of keratin with multivariate curve resolution analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Oral Cancer is now available. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "We have developed an automatic and objective method for detecting human oral squamous cell carcinoma (OSCC) tissues with Raman microspectroscopy. We measure 196 independent Raman spectra from 196 different points of one oral tissue sample and globally analyze these spectra using a Multivariate Curve Resolution (MCR) analysis."

Our news editors obtained a quote from the research from National Yang Ming University, "Discrimination of OSCC tissues is automatically and objectively made by spectral matching comparison of the MCR decomposed Raman spectra and the standard Raman spectrum of keratin, a well-established molecular marker of OSCC. We use a total of 24 tissue samples, 10 OSCC and 10 normal tissues from the same 10 patients, 3 OSCC and 1 normal tissues from different patients. Following the newly developed protocol presented here, we have been able to detect OSCC tissues with 77 to 92% sensitivity (depending on how to define positivity) and 100% specificity."

According to the news editors, the research concluded: "The present approach lends itself to a reliable clinical diagnosis of OSCC substantiated by the 'molecular fingerprint' of keratin."

For more information on this research see: Automatic and objective oral cancer diagnosis by Raman spectroscopic detection of keratin with multivariate curve resolution analysis. Scientific Reports, 2016;6():20097. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting P.H. Chen, Institute of Biophotonics, National Yang-Ming University, No 155, Sec 2, Li-nong Street, Taipei, Taiwan. Additional authors for this research include R. Shimada, S. Yabumoto, H. Okajima, M. Ando, C.T. Chang, L.T. Lee, Y.K. Wong, A. Chiou and H.O Hamaguchi.

Oncology - Oral Cancer

New Oral Cancer Study Findings Have Been Reported from China Medical University and Hospital (Tetrandrine induces programmed cell death in human oral cancer CAL 27 cells through the reactive oxygen species production and caspase-dependent ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Oral Cancer. According to news reporting out of Taichung, Taiwan, by NewsRx editors, research stated, "Tetrandrine, a bisbenzylisoquinoline alkaloid, is extracted from the root of the Chinese herb Radix Stephania tetrandra S Moore. This compound has antitumor activity in different cancer cell types."

Financial support for this research came from China Medical University, Taichung (Taiwan, R.O.C.).

Our news journalists obtained a quote from the research from China Medical University and Hospital, "In this study, the effects of tetrandrine on human oral cancer CAL 27 cells were examined. Results indicated that tetrandrine induced cytotoxic activity in CAL 27 cells. Effects were due to cell death by the induction of apoptosis and accompany with autophagy and these effects were concentration-and time-dependent manners. Tetrandrine induced apoptosis was accompanied by alterations in cell morphology, chromatin fragmentation, and caspase activation in CAL 27 cells. Tetrandrine treatment also induced intracellular accumulation of reactive oxygen species (ROS). The generation of ROS may play an important role in tetrandrine-induced apoptosis. Tetrandrine triggered LC3B expression and induced autophagy in CAL 27 cells. Tetrandrine induced apoptosis and autophagy were significantly attenuated by N-acetylcysteine pretreatment that supports the involvement of ROS production."

According to the news editors, the research concluded: "Tetrandrine induced cell death may act through caspase-dependent apoptosis with Beclin-1-induced autophagy in human oral cancer cells. ? 2016 Wiley Periodicals, Inc. Environ Toxicol 32:329-343."

Our news journalists report that additional information may be obtained by contacting J.C. Lien, Graduate Institute of Pharmaceutical Chemistry, China Medical University, Taichung, 404, Taiwan. **Oncology - Oral Cancer**

**New Oral Cancer Study Results Reported from Fukuoka Dental College (Factors affecting volume change of myocutaneous flaps in oral cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Oral Cancer have been published. According to news reporting out of Fukuoka, Japan, by NewsRx editors, research stated, "After oral cancer resection with flap reconstruction, the volume of the flap decreases over time. The purpose of this study was to estimate the volume change in myocutaneous flaps and to identify the clinical factors associated with this volume decrease."

Our news journalists obtained a quote from the research from Fukuoka Dental College, "Postoperative computed tomography scans and magnetic resonance images of 30 patients, obtained at 1, 6, and 12 months after oral cancer resection with myocutaneous flap reconstruction, were reviewed retrospectively. Changes in the volume of the flaps over time were assessed. The residual flap ratio was calculated using the flap volume at 1 month after reconstruction as the denominator. The residual ratios in relation to clinical factors were compared at 6 and 12 months using the Student t-test. Overall, the flap residual ratio was 78.1% (range 64.1-93.9%) at 6 months and 71.4% (range 48.8-87.2%) at 12 months. Hypertension, diabetes mellitus, and postoperative radiotherapy were significantly associated with volume changes at 6 months, and postoperative infection and decreased serum albumin levels were associated with volume changes at both 6 months (P = 0.015 and P = 0.001, respectively) and 12 months (P = 0.026 and P = 0.017, respectively)."

According to the news editors, the research concluded: "Flap reconstruction must be performed with postoperative flap atrophy in mind in order to preserve optimum speech and swallowing function."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijom.2016.04.014. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Oral Squamous Cell Carcinoma

New Oral Squamous Cell Carcinoma Findings from University of Coimbra Outlined (WT1, MSH6, GATA5 and PAX5 as epigenetic oral squamous cell carcinoma biomarkers - a short report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Oral Squamous Cell Carcinoma. According to news reporting originating in Coimbra, Portugal, by NewsRx journalists, research stated, "Oral squamous cell carcinoma (OSCC) is a frequently occurring aggressive malignancy with a heterogeneous clinical behavior. Based on the paucity of specific early diagnostic and prognostic biomarkers, which hampers the appropriate treatment and, ultimately the development of novel targeted therapies, we aimed at identifying such biomarkers through a genetic and epigenetic analysis of these tumors. 93 primary OSCCs were subjected to DNA copy number alteration (CNA) and methylation status analyses using methylation-specific multiplex ligation-dependent probe amplification (MS-MPLA)."

Financial support for this research came from Portuguese Foundation for Science and Technology.

The news reporters obtained a quote from the research from the University of Coimbra, "The genetic and epigenetic OSCC profiles obtained were associated with the patients' clinic-pathological features. We found that WT1 gene promoter methylation is a predictor of a better prognosis and that MSH6 and GATA5 gene promoter methylation serve as predictors of a worse prognosis. GATA5 gene promoter methylation was found to be significantly associated with a shorter survival rate. In addition, we found that PAX5 gene promoter methylation was significantly associated with tongue tumors. To the best of our knowledge, this is the first study that highlights this specific set of genes as epigenetic diagnostic and prognostic biomarkers in OSCC."

According to the news reporters, the research concluded: "Our data highlight the importance of epigenetically assessing OSCCs to identify key genes that may serve as diagnostic and prognostic biomarkers and, potentially, as candidate therapeutic targets."

For more information on this research see: WT1, MSH6, GATA5 and PAX5 as epigenetic oral squamous cell carcinoma biomarkers - a short report. *Cellular Oncology*, 2016;39(6):573-582. *Cellular Oncology* can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. **Oncology - Oral Squamous Cell Carcinoma**

**New Oral Squamous Cell Carcinoma Study Findings Recently Were Reported by Researchers at Shanghai Jiao-Tong University (High Vimentin Expression Associated with Lymph Node Metastasis and Predicated a Poor Prognosis in Oral Squamous Cell ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Oral Squamous Cell Carcinoma have been published. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Oral squamous cell carcinoma (OSCC) is a common public health problem worldwide with poor prognosis, which is largely due to lymph node metastasis and recurrence. Identification of specific molecular markers of OSCC with lymph node metastasis would be very important for early and specific diagnosis."

The news correspondents obtained a quote from the research from Shanghai Jiao-Tong University, "In this study, we screened for the potential prognosis markers via unbiased transcriptomic microarray analysis in paired two OSCC cell lines, a lymph node metastatic HN12 cell line and a low metastatic parental HN4 cell line. The results showed that vimentin, with 87-fold increase of expression, was on the top of all upregulated genes in metastatic HN12 cells compared to non-metastatic HN4 cells. Treatment of non-metastatic HN4 cells with TGF-beta 1 induced epithelial to mesenchymal transition (EMT), with increased vimentin expression as well as enhanced migration activity. Consistently, knockdown of vimentin via siRNA resulted in suppressed invasion and migration activities of HN12 cells, suggesting an essential role of vimentin in EMT-related functions of OSCC cells. Finally, immunohistochemical (IHC) staining analysis showed that high vimentin expression was strongly associated with high lymph node metastases (p < 0.05), and poor overall survival (p < 0.05) in OSCC patients."

According to the news reporters, the research concluded: "Thus, high vimentin expression is strongly associated with increased metastatic potential, and may serve as a prediction marker for poor prognosis in OSCC patients."

New Organelles Findings Reported from Rutgers State University
(Toxicity of ricin A chain is reduced in mammalian cells by inhibiting its interaction with the ribosome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Organelles is now available. According to news reporting originating from New Brunswick, New Jersey, by NewsRx correspondents, research stated, "Ricin is a potent ribotoxin that is considered a bioterror threat due to its ease of isolation and possibility of aerosolization. In yeast, mutation of arginine residues away from the active site results in a ricin toxin A chain (RTA) variant that is unable to bind the ribosome and exhibits reduced cytotoxicity."

Financial support for this research came from National Institutes of Health.

Our news editors obtained a quote from the research from Rutgers State University, "The goal of the present work was to determine if these residues contribute to ribosome binding and cytotoxicity of RTA in mammalian cells. The RTA mutant R193A/R235A did not interact with mammalian ribosomes, while a G212E variant with a point mutation near its active site bound ribosomes similarly to wild-type (WT) RTA. R193A/R235A retained full catalytic activity on naked RNA but had reduced activity on mammalian ribosomes. To determine the effect of this mutant in intact cells, pre-R193A/R235A containing a signal sequence directing it to the endoplasmic reticulum and mature R193A/R235A that directly targeted cytosolic ribosomes were each expressed. Depurination and protein synthesis inhibition were reduced by both pre- and mature R193A/R235A relative to WT. Protein synthesis inhibition was reduced to a greater extent by R193A/R235A than by G212E. Pre R193A/R235A caused a greater reduction in caspase activation and loss of mitochondria/membrane potential than G212E relative to WT RTA. These findings indicate that an RTA variant with reduced ribosome binding is less toxic than a variant with less catalytic activity but normal ribosome binding activity."

According to the news editors, the research concluded: "The toxin-ribosome interaction represents a novel target for the development of therapeutics to prevent or treat ricin intoxication."

For more information on this research see: Toxicity of ricin A chain is reduced in mammalian cells by inhibiting its interaction with the ribosome. *Toxicology and Applied Pharmacology*, 2016;310():120-128. *Toxicology and Applied Pharmacology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. New Osteogenesis Imperfecta Study Results Reported from McGill University (DNA sequence analysis in 598 individuals with a clinical diagnosis of osteogenesis imperfecta: diagnostic yield and mutation spectrum)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Musculoskeletal Diseases and Conditions - Osteogenesis Imperfecta is the subject of a report. According to news originating from Montreal, Canada, by NewsRx correspondents, research stated, "We detected disease-causing mutations in 585 of 598 individuals (98%) with typical features of osteogenesis imperfecta (OI). In mild OI, only collagen type I encoding genes were involved."

Financial supporters for this research include Shriners of North America, Fonds de Recherche du Quebec - Sante.

Our news journalists obtained a quote from the research from McGill University, "In moderate to severe OI, mutations in 12 different genes were found; 11% of these patients had mutations in recessive genes. OI is usually caused by mutations in COL1A1 or COL1A2, the genes encoding collagen type I alpha chains, but mutations in at least 16 other genes have also been associated with OI. It is presently unknown what proportion of individuals with clinical features of OI has a disease-causing mutation in one of these genes. DNA sequence analysis was performed on 598 individuals from 487 families who had a typical OI phenotype. OI type I was diagnosed in 43% of individuals, and 57% had moderate to severe OI, defined as OI types other than type I. Disease-causing variants were detected in 97% of individuals with OI type I and in 99% of patients with moderate to severe OI. All mutations found in OI type I were dominant and exclusively affected COL1A1 or COL1A2. In moderate to severe OI, dominant mutations were found in COL1A1/COL1A2 (77%), IFITM5 (9%), and P4HB (0.6%). Mutations in one of the recessive OI-associated gene were observed in 12% of individuals with moderate to severe OI. The genes most frequently involved in recessive OI were SERPINF1 (4.0% of individuals with moderate to severe OI) and CRTAP (2.9%). DNA sequence analysis of currently known OI-associated genes identifies disease-causing variants in almost all individuals with a typical OI phenotype."

According to the news editors, the research concluded: "About 20% of individuals with moderate to severe OI had mutations in genes other than COL1A1/COL1A2."

For more information on this research see: DNA sequence analysis in 598 individuals with a clinical diagnosis of osteogenesis imperfecta: diagnostic yield and mutation spectrum. *Osteoporosis International*, 2016;27(12):3607-3613. *Osteoporosis International* can be contacted at: Springer London Ltd, 236 Grays Inn Rd, 6TH Floor, London WC1X 8HL,
New Osteoporosis Findings from University of Putra Malaysia Described
(Piper sarmentosum Effects on 11 beta-Hydroxysteroid Dehydrogenase Type 1 Enzyme in Serum and Bone in Rat Model of Glucocorticoid-Induced Osteoporosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Musculoskeletal Diseases and Conditions - Osteoporosis have been presented. According to news originating from Selangor, Malaysia, by NewsRx correspondents, research stated, "Glucocorticoid-induced osteoporosis is one of the common causes of secondary osteoporosis. Piper sarmentosum (Ps) extract possesses antioxidant and anti-inflammatory activities."

Our news journalists obtained a quote from the research from the University of Putra Malaysia, "In this study, we determined the correlation between the effects of Ps leaf water extract with the regulation of 11 beta-hydroxysteroid dehydrogenase (HSD) type 1 enzyme activity in serum and bone of glucocorticoid-induced osteoporotic rats. Twenty-four Sprague-Dawley rats were grouped into following: G1: sham-operated group administered with intramuscular vehicle olive oil and vehicle normal saline orally; G2: adrenalectomized (adrx) control group given intramuscular dexamethasone (120 mu g/kg/day) and vehicle normal saline orally; G3: adrx group given intramuscular dexamethasone (120 mu g/kg/day) and water extract of Piper sarmentosum (125 mg/kg/day) orally. After two months, the femur and serum were taken for ELISA analysis. Ps leaf water extract significantly reduced the femur corticosterone concentration (p < 0.05)."

According to the news editors, the research concluded: "This suggests that Ps leaf water extract was able to prevent bone loss due to long-term glucocorticoid therapy by acting locally on the bone cells by increasing the dehydrogenase action of 11 beta-HSD type 1. Thus, Ps may have the potential to be used as an alternative medicine against osteoporosis and osteoporotic fracture in patients on long-term glucocorticoid treatment."

For more information on this research see: Piper sarmentosum Effects on 11 beta-Hydroxysteroid Dehydrogenase Type 1 Enzyme in Serum and Bone in Rat Model of Glucocorticoid-Induced Osteoporosis. Molecules, 2016;21(11):1565-1574. Molecules can be
New Osteosarcomas Findings from Inje University Discussed
[Noninvasive and Repetitive Measurement of Cellular Metabolite from Human Osteosarcoma Cells (MG-63) Using 3.0 Tesla Proton (H-1) MR Spectroscopy]

New Osteosarcomas Study Findings Have Been Reported by Investigators at Zhengzhou University (Upregulation of miR-192 inhibits cell growth and invasion and induces cell apoptosis by targeting TCF7 in human osteosarcoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Osteosarcomas. According to news reporting originating from Zhengzhou, People's Republic of China, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) can function as oncogenes or tumor suppressor genes and are involved in multiple processes in cancer development and progression. For example, miR-192 is dysregulated in multiple human cancers, including osteosarcoma (OS)."

Our news editors obtained a quote from the research from Zhengzhou University, "However, the pathophysiological role of miR-192 and its relevance to OS cell growth and invasion has not yet been clarified. This study aimed to investigate the expression of miR-192 in OS and elucidate the molecular mechanisms by which miR-192 acts as a tumor suppressor in this disease. The qRT-PCR data identified significant down-regulation of miR-192 in 20 OS tissue samples and two OS cell lines when compared with adjacent normal tissues and a human osteoblast cell line, respectively. Furthermore, Western blot analysis revealed overexpression of T cellspecific transcription factor (TCF) 7 protein in tumor tissues compared with matched adjacent normal tissues. Further in vitro studies demonstrated that enforced expression of miR-192 inhibited U2OS and MG63 cell proliferation, invasion, and migration and induced apoptosis. Finally, Western blot and Luciferase assays identified TCF7 as a target of miR192."

According to the news editors, the research concluded: "Collectively, these findings suggest an important role for miR-192 in regulating the proliferation, migration, invasion, and apoptosis of OS cells through the regulation of TCF7."

For more information on this research see: Upregulation of miR-192 inhibits cell growth and invasion and induces cell apoptosis by targeting TCF7 in human osteosarcoma. **Oncology - Osteosarcomas**

**New Osteosarcomas Study Findings Have Been Reported from Guangzhou University (Curcumin Promotes Osteosarcoma Cell Death by Activating miR-125a/ERR Signal Pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Osteosarcomas. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Curcumin has demonstrated valuable therapeutic potential against a variety of human cancers including osteosarcoma. However, the molecular mechanisms underlying its anti-tumor effect remain to be poorly understood."

The news correspondents obtained a quote from the research from Guangzhou University, "By RNA sequence profiling, we found that curcumin significantly down-regulates the expression of estrogen-related receptor alpha (ERR) in osteosarcoma cells. Overexpression of ERR diminished curcumin-activated apoptotic cell death and scavenged curcumin-induced reactive oxygen species (ROS), while ERR silencing sensitized osteosarcoma cells to curcumin, resulting in increased inhibition of cell proliferation. In addition, we found that curcumin suppressed the ERR gene expression through upregulation of miR-125a. Data from this study revealed a novel mechanism for curcumin-mediated apoptotic cell death, which involves tumor cell killing via activating miR-125a/ERR pathway."

According to the news reporters, the research concluded: "Our studies also provide further support for osteosarcoma therapy by targeting ERR alone or in combination with curcumin. J. Cell. Biochem. 118: 74-81, 2017."

Our news journalists report that additional information may be obtained by contacting W. He, Guangzhou Univ Chinese Med, Affiliated Hosp 1, Guangzhou 510405, Guangdong, People's Republic of China. Additional authors for this research include H.B. Wang, F. Yang, H.W. Chen, W. He and J.J. Wang.

New Pacemakers Study Findings Recently Were Reported by Researchers at Emory University (How to Implant a Leadless Pacemaker With a Tine-Based Fixation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Pacemakers. According to news reporting originating in Atlanta, Georgia, by NewsRx journalists, research stated, "Leadless Implant Procedure. Two major studies have shown that leadless pacemakers are safe and effective for patients requiring right ventricular rate responsive pacing therapy."

The news reporters obtained a quote from the research from Emory University, "This positive result recently led to FDA approval of one of the available leadless pacing devices. While this new technology is promising, it requires a different skill set for safe implantation."

According to the news reporters, the research concluded: "In this article, we review in detail the different steps required for implantation of tine-based leadless pacemakers while providing tips and tricks to minimize complications."

Our news correspondents report that additional information may be obtained by contacting M.F. El-Chami, Emory University, Sch Med, Div Cardiol, Sect Electrophysiol, Atlanta, GA 30322, United States. between patients without PPM (no-PPM), patients with PPM prior to TAVI (old-PPM) and
patients with PPM implanted after TAVI (new-PPM). Out of 1,062 patients included in the
pooled data set, 783 (73.7%) were in the no-PPM group, 164 (15.4%) in the new-PPM group
and 115 (10.8%) in the old-PPM group. All-cause and cardiovascular mortality at two years
were similar for patients with no-PPM and new-PPM (adjusted HR 1.11, 95% CI: 0.74-1.67; p=
0.62; and adjusted HR 1.16, 95% CI: 0.68-1.98; p=0.59). Conversely, old-PPM was associated
with increased risk of both all-cause and cardiovascular mortality vs. no-PPM. By multivariable
analysis new-PPM did not affect LVEFR, while old PPM did. We observed a multiplicative
interaction, between new-PPM and post-procedural aortic regurgitation >1+ on two-year
mortality and one-year LVEFR, with increased risk of death and impaired, LVEFR in patients
with new-PPM and post-procedural aortic regurgitation (PPAR) >= 1+ (both p(interaction)
<0.0001). In patients undergoing TAVI, the presence of a PPM at baseline yielded a negative
effect on long-term prognosis while new-PPM did not.

According to the news editors, the research concluded: "The combination of new-
PPM with PPAR adversely impacts on survival and LV function recovery."

For more information on this research see: Impact of permanent pacemaker on
mortality after transcatheter aortic valve implantation: the PRAGMATIC (Pooled Rotterdam-
Milan-Toulouse in Collaboration) Pacemaker substudy. Eurointervention, 2016;12(9):1185-
1193. Eurointervention can be contacted at: Europa Edition, 19 Allees Jean Jaures B P 61508,

New Pain Findings from School of Medicine Described (Propacetamol-
Induced Injection Pain Is Associated with Activation of Transient
Receptor Potential Vanilloid 1 Channels)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Neurologic Manifestations - Pain.
According to news originating from Hannover, Germany, by NewsRx correspondents, research
stated, "Propacetamol (PPCM) is a prodrug of paracetamol (PCM), which was generated to
increase water solubility of PCM for intravenous delivery. PPCM is rapidly hydrolyzed by
plasma esterases to PCM and diethylglycine and shares some structural and metabolic properties
with lidocaine."

Our news journalists obtained a quote from the research from the School of
Although PPCM is considered to be comparable to PCM regarding its analgesic properties, injection pain is a common side effect described for PPCM but not PCM. Injection pain is a frequent and unpleasant side effect of numerous drugs in clinical use, and previous reports have indicated that the ligand gated ion channels transient receptor potential ankyrin 1 (TRPA1) and transient receptor potential vanilloid 1 (TRPV1) can mediate this effect on sensory neurons. This study aimed to investigate molecular mechanisms by which PPCM, in contrast to PCM, causes injection pain. Therefore, human TRPV1 and TRPA1 receptors were expressed in human embryonic kidney 293 cells and investigated by means of whole-cell patch clamp and ratiometric calcium imaging. PPCM (but not PCM) activated TRPV1, sensitized heat-induced currents, and caused an increase in intracellular calcium. In TRPA1-expressing cells however, both PPCM and PCM evoked calcium responses but failed to induce inward currents. Intracutaneous injection of PPCM, but not of PCM, in human volunteers induced an intense and short-lasting pain and an increase in superficial blood flow, indicating activation of nociceptive C fibers and subsequent neuropeptide release.

According to the news editors, the research concluded: "Activation of human TRPV1 by PPCM seems to be a relevant mechanism for induction of pain upon intracutaneous injection and thus also for pain reported as an adverse side effect upon intravenous administration."

The news correspondents report that additional information may be obtained from M. Eberhardt, Hannover Med Sch, Dept. of Anaesthesiol & Intens Care Med, D-30625 Hannover, Germany. Additional authors for this research include E. Eberhardt, A. Leffler and M. Eberhardt.

this way, the aim of this study was to investigate the behavioral, biochemical and neurochemical effects of a p,p'-methoxyl-diphenyl diselenide (OMePhSe)(2) supplemented diet on pain-depression dyad induced by reserpine in rats. Adult Wistar rats were fed with 10 mg (MeOPhSe) (2) per kg of rat chow supplemented diet for 30 days. Pain-depression dyad was induced by daily subcutaneous reserpine injection (0.5 mg/kg for three consecutive days) from 22 to 24 day of (MeOPhSe)(2) supplementation. The results showed that the reserpine injected rats had behavior phenotypes typical of depression-pain dyad and the (MeOPhSe)(2)-supplemented diet protected against these modifications. Furthermore, the (MeOPhSe)(2) dietary supplementation was effective against the increase in the prefrontal cortical MDA levels caused by reserpine. (MeOPhSe)(2)-supplemented diet triggered a per se augmentation of Nrf-2 levels. The [H-3] serotonin uptake, [H-3] glutamate uptake and release and MAO activity were not altered in the prefrontal cortices of rats from any experimental group.

According to the news editors, the research concluded: "Therefore, the results indicate that protective effects of a (MeOPhSe)(2)-supplemented diet can be mediated, at least in part, by its antioxidant property."

For more information on this research see: Pain-depression dyad induced by reserpine is relieved by p,p'-methoxyl-diphenyl diselenide in rats. European Journal of Pharmacology, 2016;791():794-802. Oncology - Pancreatic Cancer

New Pancreatic Cancer Data Have Been Reported by Researchers at Osaka City University Graduate School of Medicine (Molecular targets for the treatment of pancreatic cancer: Clinical and experimental studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Pancreatic Cancer is now available. According to news reporting out of Osaka, Japan, by NewsRx editors, research stated, "Pancreatic cancer is the fourth most common cause of cancer deaths worldwide. Although recent therapeutic developments for patients with pancreatic cancer have provided survival benefits, the outcomes for patients with pancreatic cancer remain unsatisfactory."

Our news journalists obtained a quote from the research from the Osaka City University Graduate School of Medicine, "Molecularly targeted cancer therapy has advanced in the past decade with the use of a number of pathways as candidates of therapeutic targets. This
review summarizes the molecular features of this refractory disease while focusing on the recent clinical and experimental findings on pancreatic cancer."

According to the news editors, the research concluded: "It also discusses the data supporting current standard clinical outcomes, and offers conclusions that may improve the management of pancreatic cancer in the future."

Our news journalists report that additional information may be obtained by contacting T. Matsuoka, Tasuku Matsuoka, Masakazu Yashiro, Dept. of Surgical Oncology, Osaka City University Graduate School of Medicine, Osaka 545-8585, Japan.

Oncology - Pancreatic Cancer

New Pancreatic Cancer Findings Reported from Skane University Hospital (Immune checkpoint therapy for pancreatic cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Pancreatic Cancer have been presented. According to news reporting originating in Lund, Sweden, by NewsRx journalists, research stated, "Novel treatment modalities are necessary for pancreatic cancer. Immunotherapy with immune checkpoint inhibition has shown effect in other solid tumors, and could have a place in pancreatic cancer treatment."

The news reporters obtained a quote from the research from Skane University Hospital, "Most available clinical studies on immune checkpoint inhibitors for pancreatic cancer are not yet completed and are still recruiting patients. Among the completed trials, there have been findings of a preliminary nature such as delayed disease progression and enhanced overall survival after treatment with immune checkpoint inhibitors in mono- or combination therapy. However, due to small sample sizes, major results are not yet identifiable. The present article provides a clinical overview of immune checkpoint inhibition in pancreatic cancer. PubMed, ClinicalTrials.gov and American Society of Clinical Oncology's meeting abstracts were systematically searched for relevant clinical studies."

According to the news reporters, the research concluded: "Four articles, five abstracts and 25 clinical trials were identified and analyzed in detail."

Our news correspondents report that additional information may be obtained by contacting D. Ansari, Skane Univ Hosp, SE-22185 Lund, Sweden. Additional authors for this research include R. Andersson, M. Bauden, S. Hammes, S. Holdenrieder and D. Ansari.

**Oncology - Pancreatic Cancer**

**New Pancreatic Cancer Findings from National Taiwan University Described** (Association of radiotherapy with favorable prognosis in daily clinical practice for treatment of locally advanced and metastatic pancreatic cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Pancreatic Cancer is the subject of a report. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Radiotherapy (RT) with or without chemotherapy is currently used in definitive therapy for advanced pancreatic cancer. We sought to evaluate the prognostic significance, pattern of care, and use of RT in locally advanced and metastatic pancreatic cancer."

Our news editors obtained a quote from the research from National Taiwan University, "Between 2002 and 2011, patients with invasive pancreatic carcinoma and prior exposure to systemic chemotherapy were included. We used Cox regression model and propensity score matching for prognostic analyses and logistic regression for analyzing the factors impacting the use of RT. We identified 217 pancreatic cancer patients (74 with unresectable stage II or III and 143 with stage IV). Of all patients, 90.8% had adenocarcinoma, and only 19.2% (42/217) received RT with doses ranging from 50 to 55 Gy in 25 to 28 fractions using modern RT techniques. Logistic regression showed stage (P < 0.001) and initial CA 19-9 level (P = 0.026) were significantly predictive of the choice of RT as a first-line treatment, whereas the second-line use of RT was associated with the response to first-line chemotherapy and longer progression-free survival. Patients with RT had a better median survival than those without it (14.6 vs 8.1 months, P< 0.001). In the multivariate analysis and propensity score matching, RT remained a good prognostic factor for overall survival. The use of RT might be associated with a favorable clinical outcome in patients with locally advanced and metastatic pancreatic cancer."

According to the news editors, the research concluded: "Further exploration of RT as a first-line therapy or second-line therapy for locally advanced or even metastatic pancreatic cancer is warranted."

The news editors report that additional information may be obtained by contacting K.H. Yeh, National Taiwan University, Coll Med, Grad Inst Clin Med, Taipei, Taiwan. Additional authors for this research include J.C. Guo, K.H. Yeh, Y.W. Tien, A.L. Cheng and S.H. Kuo.

Oncology - Pancreatic Cancer

New Pancreatic Cancer Findings from University of Cambridge Described (GEMMs as preclinical models for testing pancreatic cancer therapies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Pancreatic Cancer have been presented. According to news originating from Cambridge, United Kingdom, by NewsRx correspondents, research stated, "Pancreatic ductal adenocarcinoma is the most common form of pancreatic tumour, with a very limited survival rate and currently no available disease-modifying treatments. Despite recent advances in the production of genetically engineered mouse models (GEMMs), the development of new therapies for pancreatic cancer is still hampered by a lack of reliable and predictive preclinical animal models for this disease."

Our news journalists obtained a quote from the research from the University of Cambridge, "Preclinical models are vitally important for assessing therapies in the first stages of the drug development pipeline, prior to their transition to the clinical arena. GEMMs carry mutations in genes that are associated with specific human diseases and they can thus accurately mimic the genetic, phenotypic and physiological aspects of human pathologies. Here, we discuss different GEMMs of human pancreatic cancer, with a focus on the Lox-Stop-Lox (LSL)-Kras (G12D); LSL-Trp53(R172H); Pdx1-cre (KPC) model, one of the most widely used preclinical models for this disease."

According to the news editors, the research concluded: "We describe its application in preclinical research, highlighting its advantages and disadvantages, its potential for predicting clinical outcomes in humans and the factors that can affect such outcomes, and, finally, future developments that could advance the discovery of new therapies for pancreatic cancer."

For more information on this research see: GEMMs as preclinical models for testing pancreatic cancer therapies. Disease Models & Mechanisms, 2015;8(10):1185-200.

New Pancreatic Cancer Study Findings Have Been Reported by Investigators at Kyushu University (CD146 Attenuation in Cancer-Associated Fibroblasts Promotes Pancreatic Cancer Progression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Pancreatic Cancer are discussed in a new report. According to news originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "Cancer-associated fibroblasts (CAFs) are heterogeneous cell populations that influence tumor initiation and progression. CD146 is a cell membrane protein whose expression has been implicated in multiple human cancers."

Our news journalists obtained a quote from the research from Kyushu University, "CD146 expression is also detected in pancreatic cancer stroma; however, the role it plays in this context remains unclear. This study aimed to clarify the function and significance of CD146 expression in pancreatic cancer. We performed immunohistochemical staining to investigate the prevalence of CD146 expression in stromal fibroblasts in pancreatic cancer. We also examined the influence of CD146 on CAF-mediated tumor invasion and migration and CAF activation using CD146 small interfering RNA or overexpression plasmids in primary cultures of CAFs derived from pancreatic cancer tissues. CD146 expression in CAFs was associated with high-grade pancreatic intraepithelial neoplasia and low histological grade invasive ductal carcinoma of the pancreas, while patients with low CD146 expression had a poorer prognosis. Blocking CD146 expression in CAFs significantly enhanced tumor cell migration and invasion in a co-culture system. CD146 knockdown also promoted CAF activation, possibly by inducing the production of pro-tumorigenic factors through modulation of NF-kappa B activity. Consistently, overexpression of CD146 in CAFs inhibited migration and invasion of co-cultured cancer cells. Finally, CD146 expression in CAFs was reduced by interaction with cancer cells."

According to the news editors, the research concluded: "Our findings suggest that decreased CD146 expression in CAFs promotes pancreatic cancer progression."

The news correspondents report that additional information may be obtained from K. Ohuchida, Kyushu University, Grad Sch Med Sci, Adv Med Initiat, Fukuoka, Japan. Additional authors for this research include K. Ohuchida, Y. Chijiiwa, M. Zhao, Y. Mizuuchi, L. Cui, K. Horioka, T. Ohtsuka, K. Mizumoto, Y. Oda, M. Hashizume, M. Nakamura and M. Tanaka.

New Pancreatic Cancer Study Findings Have Been Reported by Investigators at Shanghai Jiao-Tong University (Arginine Methylation of MDH1 by CARM1 Inhibits Glutamine Metabolism and Suppresses Pancreatic Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Pancreatic Cancer is now available. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Distinctive from their normal counterparts, cancer cells exhibit unique metabolic dependencies on glutamine to fuel anabolic processes. Specifically, pancreatic ductal adenocarcinoma (PDAC) cells rely on an unconventional metabolic pathway catalyzed by aspartate aminotransferase, malate dehydrogenase 1 (MDH1), and malic enzyme 1 to rewire glutamine metabolism and support nicotinamide adenine dinucleotide phosphate (NADPH) production."

Financial supporters for this research include MOST, Natural Science Foundation of China, “Chenguang Program” of Shanghai Education Development Foundation and Shanghai Municipal Education Commission.

The news reporters obtained a quote from the research from Shanghai Jiao-Tong University, "Here, we report that methylation on arginine 248 (R248) negatively regulates MDH1. Protein arginine methyltransferase 4 (PRMT4/CARM1) methylates and inhibits MDH1 by disrupting its dimerization. Knockdown of MDH1 represses mitochondria respiration and inhibits glutamine metabolism, which sensitizes PDAC cells to oxidative stress and suppresses cell proliferation. Meanwhile, re-expression of wild-type MDH1, but not its methylation-mimetic mutant, protects cells from oxidative injury and restores cell growth and clonogenic activity. Importantly, MDH1 is hypomethylated at R248 in clinical PDAC samples."

According to the news reporters, the research concluded: "Our study reveals that arginine methylation of MDH1 by CARM1 regulates cellular redox homeostasis and suppresses glutamine metabolism of pancreatic cancer."

For more information on this research see: Arginine Methylation of MDH1 by CARM1 Inhibits Glutamine Metabolism and Suppresses Pancreatic Cancer. Molecular Cell, 2016;64(4):673-687. Oncology - Pancreatic Cancer

New Pancreatic Cancer Study Findings Have Been Reported by Investigators at University of Witwatersrand (Anti-LRP/LR-specific antibody IgG1-iS18 impedes adhesion and invasion of pancreatic cancer and neuroblastoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news reporting out of Johannesburg, South Africa, by NewsRx editors, research stated, "Cancer has become a global burden due to its high incidence and mortality rates, with an estimated 14.1 million cancer cases reported worldwide in 2012 particularly as a result of metastasis. Metastasis involves two crucial steps: adhesion and invasion, and the non-integrin receptor; the 37-kDa/67-kDa laminin receptor precursor/high affinity laminin receptor (LRP/LR) has been shown to be overexpressed on the surface of tumorigenic cells, thus being implicated in the enhancement of these two crucial steps."

Our news journalists obtained a quote from the research from the University of Witwatersrand, "The current study investigated the role of LRP/LR on the aggressiveness of pancreatic cancer (AsPC-1) and neuroblastoma (IMR-32) cells with respect to their adhesive and invasive potential. AsPC-1 and IMR-32 cells were utilized as the experimental cell lines for the study. Cell surface LRP/LR levels were visualised and quantified on the experimental and control (MCF-7) cell lines via confocal microscopy and flow cytometry, respectively. Total LRP/LR levels in the cell lines were assessed by Western blotting and the adhesive and invasive potential of the above-mentioned cell lines was determined before and after supplementation with the anti-LRP/LR specific antibody IgG1-iS18. Statistical significance of the data was confirmed via the use of the two-tailed student’s t-test and Pearson's correlation coefficient. Flow cytometry revealed that AsPC-1 and IMR-32 cells displayed significantly higher cell surface LRP/LR levels in comparison to the MCF-7 control cell line. However, Western blotting and subsequent densitometric analysis revealed that all three tumorigenic cell lines displayed no significant difference in total LRP/LR levels. The treatment of AsPC-1 and IMR-32 cells with IgG1-iS18 caused a significant reduction in the adhesive and invasive potential of the cells to laminin-1 and through the ECM-like Matrigel™, respectively. Pearson's correlation coefficients indicated a high correlation, thus suggesting a directly proportional relationship between cell surface LRP/LR levels and the adhesive and invasive potential of AsPC-1 and IMR-32 cells."

According to the news editors, the research concluded: "These findings suggest that through the interference of the LRP/LR-laminin-1 interaction, the anti-LRP/LR specific antibody IgG1-iS18 may act as an alternative therapeutic tool for the treatment of metastatic pancreatic cancer and neuroblastoma."

Our news journalists report that additional information may be obtained by

Oncology - Pancreatic Cancer

New Pancreatic Cancer Study Findings Have Been Reported by T. Han and Colleagues (Long Non-Coding RNA: An Emerging Paradigm of Pancreatic Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Pancreatic Cancer. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Pancreatic cancer remains a worldwide issue and burden that is hard to resolve given its low resection rate and chemo-resistance. Early diagnosis and early treatment are critical for conquering pancreatic cancer."

Our news journalists obtained a quote from the research, "Therefore, new biomarkers for diagnosis and prognosis are urgently needed. Previously, researchers mainly focused on protein-coding genetic and epigenetic changes in many types of cancers, and regarded the non-coding part as waste. Recently, however, long non-coding RNA (lncRNA) has emerged as a major participant in carcinogenesis, as it regulates cell proliferation, migration, invasion, metastasis, chemo-resistance, etc. The underlying mechanisms are summarized as signaling, decoy, guide and scaffold, yet the specific regulation networks remain to be uncovered. Several studies have revealed that some lncRNAs are dysregulated in pancreatic cancer, participating in biological functions."

According to the news editors, the research concluded: "In this review, we will briefly outline the functional lncRNAs in pancreatic cancer, decipher possible mechanisms of lncRNAs, and further explore their significance in pancreatic cancer."

Our news journalists report that additional information may be obtained by contacting F. Jiao, Shanghai Key Lab Pancreat Dis, Shanghai 201620, People's Republic of China. Additional authors for this research include H. Hu, M. Zhuo, L. Wang, J.J. Cui, F. Jiao and L.W. Wang.

New Pancreatic Cancer Study Results Reported from Nagasaki University (No-touch isolation techniques for pancreatic cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news reporting from Nagasaki, Japan, by NewsRx journalists, research stated, "The rate of recurrence, including liver metastasis is high in pancreatic cancer, even when complete surgical resection is performed as a curative treatment. In patients with pancreatic cancer, the handling and grasping of the pancreas during surgery may increase the risk of liver metastasis, as squeezing may spread cancer cells via the portal vein."

The news correspondents obtained a quote from the research from Nagasaki University, "A no-touch isolation technique might prevent the spread of cancer cells via the hematogenous metastatic route in patients with pancreatic cancer. However, while no-touch isolation techniques are simple, feasible and, in theory, ideal procedures for the surgical treatment of pancreatic cancer, there have been no randomized controlled prospective studies to validate their advantages and their efficacy remains controversial."

According to the news reporters, the research concluded: "It is, therefore, worth investigating the use of no-touch isolation techniques in pancreatic cancer."

Our news journalists report that additional information may be obtained by contacting T. Kuroki, Nagasaki University, Grad Sch Biomed Sci, Dept. of Surg, Nagasaki 8528501, Japan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s00595-016-1317-5. This DOI is a link to an online electronic document that is either free or for purchase.

New Pancreatic Cancer Study Results from Turgut Ozal University Described (Investigation of the expression of RIF1 gene on head and neck, pancreatic and brain cancer and cancer stem cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Pancreatic Cancer is now available. According to news reporting originating in Ankara, Turkey, by NewsRx journalists, research stated, "Recent studies have shown that cancer stem cells are resistant to chemotherapy. The aim of this study was to compare RIF1 gene expression in head and neck, pancreatic cancer and glioma cell lines and the cancer stem cells isolated from these cell lines."

The news reporters obtained a quote from the research from Turgut Ozal University, "UT-SCC-74 from Turku University and UT-SCC-74B primary tumor metastasis and neck cancer cell lines, YKG-1 glioma cancer cell line from RIKEN, pancreatic cancer cell lines and ASPC-1 cells from ATCC were grown in cell culture. To isolate cancer stem cells, ALDH-1 for UT-SCC-74 and UT-SCC-74B cell line, CD-133 for YKG-1 cell line and CD-24 for ASPC-1 cell line, were used as markers of cancer stem cells. RNA isolation was performed for both cancer lines and cancer stem cells. RNAs were converted to cDNA. RIF1 gene expression was performed by qRT-PCR analysis. RIF1 gene expression was compared with cancer cell lines and cancer stem cells isolated from these cell lines. The possible effect of RIF1 gene was evaluated. In the pancreatic cells, RIF1 gene expression in the stem cell-positive cell line was 256 time that seen in the stem cell-negative cell line. Considering the importance of RIF1 in NHEJ and of NHEJ in pancreatic cancer, RIF1 may be one of the genes that plays an important role in the diagnoses and therapeutic treatment of pancreatic cancer."

According to the news reporters, the research concluded: "The results of head and neck and brain cancers are inconclusive and further studies are required to elucidate the connection between RIF1 gene and these other types of cancers."

For more information on this research see: Investigation of the expression of RIF1 gene on head and neck, pancreatic and brain cancer and cancer stem cells. *Clinical and Investigative Medicine*, 2016;39(6):S43-S47. *Clinical and Investigative Medicine* can be contacted at: Canadian Soc Clinical Investigation, Csci Head Office, 774 Echo Drive, Ottawa, On K1S 5N8, Canada.

New Papillomavirus Infections Findings from Beijing University Reported (Human papillomavirus infection mechanism and vaccine of vulva carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Tumor Virus Infections - Papillomavirus Infections have been published. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Vulvar carcinoma is a rare tumor occurring in female patients. Though more than 40% of vulva cancers are due to the infection of human papillomavirus (HPV), understanding of HPV and vulvar carcinoma is insufficient."

The news correspondents obtained a quote from the research from Beijing University, "HPV expression is regulated by cellular and viral transcription factors that bind to specific elements within the ligase chain reaction. These proteins bind with different affinity to host cell proteins and disrupt normal epithelial differentiation and apoptosis. Immunotherapy does not target tumors, but instead targets the host immune system. Active immunotherapy is tumor-targeting or immune-targeting monoclonal antibodies and vaccines. Nonspecific active immunotherapy is mainly cytokine therapy. In the treatment and prevention of HPV, the most popular research projects were regarding peptide, recombinant protein and DNA-based vaccines, recombinant virus and other targets in HPV infection."

According to the news reporters, the research concluded: "Since the cervix and vulva are both susceptible areas, these studies may be able to help reduce prevalence of vulvar precancerous lesions and prevent all cancers caused by HPV."

For more information on this research see: Human papillomavirus infection mechanism and vaccine of vulva carcinoma. *Open Life Sciences*, 2016;11(1):185-190. *Open Life Sciences* can be contacted at: De Gruyter Open Ltd, Bogumila Zuga 32A St, 01-811 Warsaw, Poland.

New Paralysis Findings Reported from Vanderbilt University (Nondepolarizing Neuromuscular Blocking Agents, Reversal, and Risk of Postoperative Pneumonia)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nervous System Diseases and Conditions - Paralysis is now available. According to news reporting from Nashville, Tennessee, by NewsRx journalists, research stated, "Residual postoperative paralysis from nondepolarizing neuromuscular blocking agents (NMBAs) is a known problem. This paralysis has been associated with impaired respiratory function, but the clinical significance remains unclear."

The news correspondents obtained a quote from the research from Vanderbilt University, "The aims of this analysis were two-fold: (1) to investigate if intermediate-acting NMBA use during surgery is associated with postoperative pneumonia and (2) to investigate if nonreversal of NMBAs is associated with postoperative pneumonia. Surgical cases (n = 13,100) from the Vanderbilt University Medical Center National Surgical Quality Improvement Program database who received general anesthesia were included. The authors compared 1,455 surgical cases who received an intermediate-acting nondepolarizing NMBA to 1,455 propensity score-matched cases who did not and 1,320 surgical cases who received an NMBA and reversal with neostigmine to 1,320 propensity score-matched cases who did not receive reversal. Postoperative pneumonia incidence rate ratios (IRRs) and bootstrapped 95% CIs were calculated. Patients receiving an NMBA had a higher absolute incidence rate of postoperative pneumonia (9.00 vs. 5.22 per 10,000 person-days at risk), and the IRR was statistically significant (1.79; 95% bootstrapped CI, 1.08 to 3.07). Among surgical cases who received an NMBA, cases who were not reversed were 2.26 times as likely to develop pneumonia after surgery compared to cases who received reversal with neostigmine (IRR, 2.26; 95% bootstrapped CI, 1.65 to 3.03). Intraoperative use of intermediate nondepolarizing NMBAs is associated with developing pneumonia after surgery."

According to the news reporters, the research concluded: "Among patients who receive these agents, nonreversal is associated with an increased risk of postoperative pneumonia."

For more information on this research see: Nondepolarizing Neuromuscular Blocking Agents, Reversal, and Risk of Postoperative Pneumonia. Anesthesiology, 2016;125(4):647-655. New Parkinson's Disease Findings Has Been Reported by Investigators at Qingdao University (Association of VEGF gene polymorphisms with sporadic Parkinson's disease in Chinese Han population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Parkinson's disease. According to news reporting originating in Shandong, People's Republic of China, by NewsRx journalists, research stated, "Recent evidence indicates that vascular endothelial growth factor (VEGF) is capable of protecting dopaminergic (DA) neurons. Parkinson's disease (PD) is a progressive neurodegenerative disease caused by the degeneration of nigrostriatal dopaminergic neurons."

The news reporters obtained a quote from the research from Qingdao University, "To evaluate the role of VEGF single nucleotide polymorphisms (SNPs) and haplotypes in PD, we performed a case-control study including 400 PD patients and 400 healthy-matched controls. Polymerase chain reaction-restriction fragment length polymorphism (PCR-RFLP) analysis and DNA sequencing were used to detect the rs699947, rs2010963 and rs3025039 polymorphisms of the VEGF gene in cases and controls. Our study revealed that T allelic frequency of rs3025039 polymorphism was significantly higher in PD subjects (OR 1.497, 95 % CI 1.099-2.040, P = 0.013) than that in controls. Significant association for rs3025039 could be found in additive model (TT vs. CT vs. CC: OR 1.489, 95 % CI 1.018-2.177, P = 0.040) and dominant model (TT + CT vs. CC: OR 1.538, 95 % CI 1.068-2.216, P = 0.021). Subgroup analyses performed by gender suggested that this association could be found in male, but not in female. Moreover, it also demonstrated a significant association in the subgroup of late-onset PD (LOPD). However, for rs699947 and rs2010963 polymorphisms, genotype or allele frequencies did not differ between groups. No significant association could be found between rs699947 and rs2010963 polymorphism and PD risk. None of the observed haplotypes showed significant association with PD."

According to the news reporters, the research concluded: "Therefore, these results suggested that the VEGF gene might be associated with risk of developing sporadic PD in Han Chinese and the rs3025039 polymorphism may be a risk factor for sporadic PD."

For more information on this research see: Association of VEGF gene polymorphisms with sporadic Parkinson's disease in Chinese Han population. Neurological Sciences, 2016;37(12):1923-1929. Neurological Sciences can be contacted at: Springer-Verlag Italia Srl, Via Decembrio, 28, Milan, 20137, Italy. (Springer - www.springer.com; Neurological Sciences - www.springerlink.com/content/1590-1874/)

Our news correspondents report that additional information may be obtained by contacting A.M. Xie, Qingdao Univ, Affiliated Hosp, Dept. of Neurol, Qingdao 266003, Shandong, People's Republic of China. Additional authors for this research include Y.Y. Zhang, X. Han, X.Y. Li, L. Xue and A.M. Xie.

Keywords for this news article include: Shandong, People's Republic of China, Asia, Neurodegenerative Diseases and Conditions, Risk and Prevention, Genetics, Central Nervous System Diseases and Conditions, Intercellular Signaling Peptides and Proteins, Basal Ganglia Diseases and Conditions, Vascular Endothelial Growth Factors, Receptor Protein-Tyrosine Kinases, Brain Diseases and Conditions, Growth Factor Receptors, Parkinsonian Disorders, Parkinson's Disease, Phosphotransferases, Angiogenic Proteins, Movement Disorders, Membrane Proteins, Protein Kinases, VEGF, Qingdao University.
New Parkinson's Disease Study Findings Have Been Reported by Researchers at National Center for Scientific Research (CNRS) (Bee Venom Alleviates Motor Deficits and Modulates the Transfer of Cortical Information through the Basal Ganglia in Rat ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Parkinson's disease. According to news reporting originating from Marseille, France, by NewsRx correspondents, research stated, "Recent evidence points to a neuroprotective action of bee venom on nigral dopamine neurons in animal models of Parkinson's disease (PD). Here we examined whether bee venom also displays a symptomatic action by acting on the pathological functioning of the basal ganglia in rat PD models."

Our news editors obtained a quote from the research from National Center for Scientific Research (CNRS), "Bee venom effects were assessed by combining motor behavior analyses and in vivo electrophysiological recordings in the substantia nigra pars reticulata (SNr, basal ganglia output structure) in pharmacological (neuroleptic treatment) and lesional (unilateral intranigral 6-hydroxydopamine injection) PD models. In the hemi-parkinsonian 6-hydroxydopamine lesion model, subchronic bee venom treatment significantly alleviates contralateral forelimb akinesia and apomorphine-induced rotations. Moreover, a single injection of bee venom reverses haloperidol-induced catalepsy, a pharmacological model reminiscent of parkinsonian akinetic deficit. This effect is mimicked by apamin, a blocker of small conductance Ca2+-activated K+ (SK) channels, and blocked by CyPPA, a positive modulator of these channels, suggesting the involvement of SK channels in the bee venom antiparkinsonian action. In vivo electrophysiological recordings in the substantia nigra pars reticulata (basal ganglia output structure) showed no significant effect of BV on the mean neuronal discharge frequency or pathological bursting activity. In contrast, analyses of the neuronal responses evoked by motor cortex stimulation show that bee venom reverses the 6-OHDA-and neuroleptic-induced biases in the influence exerted by the direct inhibitory and indirect excitatory striatonigral circuits."

According to the news editors, the research concluded: "These data provide the first evidence for a beneficial action of bee venom on the pathological functioning of the cortico-basal ganglia circuits underlying motor PD symptoms with potential relevance to the symptomatic treatment of this disease."

For more information on this research see: Bee Venom Alleviates Motor Deficits and Modulates the Transfer of Cortical Information through the Basal Ganglia in Rat Models of Parkinson's Disease. Plos One, 2015;10(11):e0142838. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

The news editors report that additional information may be obtained by contacting N. Maurice, Aix Marseille Universite, CNRS, IBDM UMR 7288, Marseille, France. Additional authors for this research include T. Deltheil, C. Melon, B. Degos, C. Mourre, M. Amalric and L. Kerkerian-Le Goff.

New Pediatrics Study Findings Recently Were Reported by C. Ingels and Co-Researchers (The pattern recognition molecule collectin-L1 in critically ill children)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Pediatrics are discussed in a new report. According to news reporting originating in Leuven, Belgium, by NewsRx journalists, research stated, "Critically ill children are prone to nosocomial infections, which may lead to adverse outcome. Low serum concentrations upon admission to the pediatric intensive care unit (PICU) of the mannan-binding lectin (MBL)-associated serine protease (MASP)-3 protein of the lectin pathway of complement activation have been associated with risk of infection and prolonged need for intensive care."

The news reporters obtained a quote from the research, "We hypothesized that also a low upon-admission concentration of collectin-L1 (CL-L1), a novel member of this pathway, is independently associated with these adverse outcomes. We quantified the serum concentrations of CL-L1 in 81 healthy children and in 700 critically ill children upon PICU admission. CL-L1 concentrations were significantly lower in the critically ill children as compared with the healthy children. However, corrected for baseline characteristics, risk factors and several lectin pathway proteins, a higher CL-L1 concentration upon PICU admission was independently associated with an increased risk of acquiring a new infection and with a prolonged time to PICU discharge. In contrast, a low MASP-3 concentration remained independently associated with these adverse outcomes."

According to the news reporters, the research concluded: "A high serum CL-L1 concentration in critically ill children upon PICU admission is associated with an increased risk of infection and prolonged need of intensive care, and counteracts the protective effect of having a high MASP-3 concentration."

For more information on this research see: The pattern recognition molecule collectin-L1 in critically ill children. Pediatric Research, 2016;80(2):237-243. Pediatric Research can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group - www.nature.com/; Pediatric Research - www.nature.com/pr/)

Inflammatory Diseases and Conditions - Pelvic...

New Pelvic Inflammatory Disease Study Findings Recently Were Reported by Researchers at University of Copenhagen (Increased risk of borderline ovarian tumors in women with a history of pelvic inflammatory disease: A nationwide population-based ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Inflammatory Diseases and Conditions - Pelvic Inflammatory Disease have been published. According to news reporting out of Copenhagen, Denmark, by NewsRx editors, research stated, "Some studies suggest that pelvic inflammatory disease (PID) is a potential risk factor for ovarian cancer. However, only few studies have investigated the association between PID and risk of borderline ovarian tumors."

Financial support for this research came from MERMAID.

Our news journalists obtained a quote from the research from the University of Copenhagen, "We conducted a population-based cohort study to investigate the association between PID and risk of borderline ovarian tumors. Using various nationwide Danish registries we identified all women in Denmark during 1978-2012, who were born during 1940-1970 (n = 1,318,925). Of these, 81,263 women were diagnosed with PID in the study period, and 2736 women had a borderline ovarian tumor (1290 serous and 1344 mucinous). Hazard ratios (HRs) and 95% confidence intervals (CIs) for the association between PID and risk of borderline tumors were estimated using Cox regression models with adjustment for potential confounders. A history of PID was associated with an increased risk of borderline ovarian tumors (HR = 1.39; 95% CI: 1.19-1.61). However, histotype-specific analyses revealed significant variation in risk as PID was only associated with an increased risk of serous borderline tumors (HR = 1.85; 95% CI: 1.52-224), but not with mucinous borderline tumors (HR = 1.06; 95% CI: 0.83-135). PID is associated with an increased risk of serous borderline tumors."

According to the news editors, the research concluded: "Further research on the potential underlying biological mechanisms and on the identification of the subset of women with PID who are at increased risk of serous borderline tumors is warranted."

For more information on this research see: Increased risk of borderline ovarian tumors in women with a history of pelvic inflammatory disease: A nationwide population-based cohort study. *Gynecologic Oncology*, 2016;143(2):346-351. *Gynecologic Oncology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Enzymes and Coenzymes - Peptide Hydrolases

New Peptide Hydrolases Study Findings Have Been Reported from University of Oxford (Metalloprotease SPRTN/DVC1 Orchestrates Replication-Coupled DNA-Protein Crosslink Repair)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - Peptide Hydrolases. According to news reporting originating in Oxford, United Kingdom, by NewsRx journalists, research stated, "The cytotoxicity of DNA-protein crosslinks (DPCs) is largely ascribed to their ability to block the progression of DNA replication. DPCs frequently occur in cells, either as a consequence of metabolism or exogenous agents, but the mechanism of DPC repair is not completely understood."

Funders for this research include Medical Research Council programme, The Wellcome Trust, ULTRA-DD.

The news reporters obtained a quote from the research from the University of Oxford, "Here, we characterize SPRTN as a specialized DNA-dependent and DNA replication-coupled metalloprotease for DPC repair. SPRTN cleaves various DNA binding substrates during S-phase progression and thus protects proliferative cells from DPC toxicity. Ruijs-Aalfs syndrome (RJALS) patient cells with monogenic and biallelic mutations in SPRTN are hypersensitive to DPC-inducing agents due to a defect in DNA replication fork progression and the inability to eliminate DPCs. We propose that SPRTN protease represents a specialized DNA replication-coupled DPC repair pathway essential for DNA replication progression and genome stability."

According to the news reporters, the research concluded: "Defective SPRTN-dependent clearance of DPCs is the molecular mechanism underlying RJALS, and DPCs are contributing to accelerated aging and cancer."

**New Peptides and Proteins Findings Has Been Reported by Investigators at Yeungnam University (Therapeutic importance of peptides from marine source: A mini review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Peptides and Proteins are presented in a new report. According to news originating from Gyongsan, South Korea, by NewsRx editors, the research stated, "In recent years, much attention has been paid on microbial peptides with biological activities and proteins derived from foods that might have beneficial effects for humans."

Our news journalists obtained a quote from the research from Yeungnam University, "Microbial peptides are small chain amino acid molecules with multitude of biological and therapeutic potential. Moreover, many studies have reported that marine bioactive peptides can be used as antihypertensive, antioxidative, anticoagulant, and antimicrobial components in functional foods or nutraceuticals and pharmaceuticals due to their therapeutic potential in the treatment or prevention of severe diseases."

According to the news editors, the research concluded: "This contribution presents an overview of the bioactive peptides derived from marine organisms and their biological activities with potential applications in different areas of food and medicine industries."

Peptides and Proteins

New Peptides and Proteins Findings from University of Oxford Discussed (Drosophila sensory cilia lacking MKS proteins exhibit striking defects in development but only subtle defects in adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Peptides and Proteins are discussed in a new report. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "Cilia are conserved organelles that have important motility, sensory and signalling roles. The transition zone (TZ) at the base of the cilium is crucial for cilia function, and defects in several TZ proteins are associated with human congenital ciliopathies such as nephronophthisis (NPHP) and Meckel-Gruber syndrome (MKS)."

Financial supporters for this research include Biotechnology and Biological Sciences Research Council, Wellcome Trust, Medical Research Council.
