Investigators at Second Military Medical University Report Findings in Liver Cancer (Practice guidelines for the pathological diagnosis of primary liver cancer: 2015 update)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "In 2010, a panel of Chinese pathologists reported the first expert consensus for the pathological diagnosis of primary liver cancers to address the many contradictions and inconsistencies in the pathological characteristics and diagnostic criteria for PLC. Since then considerable clinicopathological studies have been conducted globally, prompting us to update the practice guidelines for the pathological diagnosis of PLC."

The news reporters obtained a quote from the research from Second Military Medical University, "In April 18, 2014, a Guideline Committee consisting of 40 specialists from seven Chinese Societies (including Chinese Society of Liver Cancer, Chinese Anti-Cancer Association; Liver Cancer Study Group, Chinese Society of Hepatology, Chinese Medical Association; Chinese Society of Pathology, Chinese Anti-Cancer Association; Digestive Disease Group, Chinese Society of Pathology, Chinese Medical Association; Chinese Society of Surgery, Chinese Medical Association; Chinese Society of Clinical Oncology, Chinese Anti-Cancer Association; Pathological Group of Hepatobiliary Tumor and Liver Transplantation, Chinese Society of Pathology, Chinese Medical Association) was created for the formulation of the first guidelines for the standardization of the pathological diagnosis of PLC, mainly focusing on the following topics: gross specimen sampling, concepts and diagnostic criteria of small hepatocellular carcinoma (SHCC), microvascular invasion (MVI), satellite nodules, and immunohistochemical and molecular diagnosis. The present updated guidelines are reflective of current clinicopathological studies, and include a novel 7-point baseline sampling protocol, which stipulate that at least four tissue specimens should be sampled at the junction of the tumor and adjacent liver tissues in a 1:1 ratio at the 12, 3, 6 and 9 o'clock reference positions. For the purposes of molecular pathological examination, at least one specimen should be sampled at the intratumoral zone, but more specimens should be sampled for tumors harboring different textures or colors. Specimens should be sampled at both adjacent and distant peritumoral liver tissues or the tumor margin in order to observe MVI, satellite nodules and dysplastic foci/nodules distributed throughout the background liver tissues. Complete sampling of whole SHCC <= 3 cm should be performed to assess its biological behavior, and in clinical practice, therapeutic borders should be also preserved, even in SHCC. The diagnostic criteria of MVI and satellite nodules, immunohistochemical panels, as well as molecular diagnostic principles, such as clonal typing, for recurrent HCC and multinodule HCC were also proposed and recommended. The standardized process of pathological examination is aimed at ensuring the accuracy of pathological PLC diagnoses as well as providing a valuable frame of reference for the clinical assessment of tumor invasive potential, the risk of postoperative recurrence, long-term survival, and the development of individualized treatment regimens."

According to the news reporters, the research concluded: "The updated guidelines could ensure the accuracy of pathological diagnoses of PLC, and provide a valuable frame of reference for its clinical assessment."

Our news correspondents report that additional information may be obtained by contacting W.M. Cong, Second Military Med Univ, Eastern Hepatobiliary Surg Hosp, Dept. of Pathol, Shanghai 200433, People's Republic of China. Additional authors for this research
investigators at Seoul National University Describe Findings in Melanoma [Inhibition of tyrosinase activity and melanin production by the chalcone derivative 1-(2-cyclohexylmethoxy-6-hydroxy-phenyl)-3(4-hydroxymethyl-phenyl)-propenone]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Melanoma have been presented. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Abnormal accumulation of melanin pigments in the skin can lead to hyperpigmentation disorders and melanoma. Melanin biosynthesis is ultimately regulated by the rate-limiting enzyme tyrosinase."

The news correspondents obtained a quote from the research from Seoul National University, "In the present study, we synthesized chalcone derivatives and identified 1-(2-cyclohexylmethoxy-6-hydroxyphenyl)-3-(4-hydroxymethyl-phenyl)-propenone (chalcone-21) as an anti-melanogenic substance in B16F10 melanoma cells. Chalcone-21 strongly inhibited cellular melanin production and tyrosinase activity in B16F10 melanoma cells stimulated with α-melanocyte stimulating hormone (alpha-MSH) or protoporphyrin IX."

According to the news reporters, the research concluded: "In addition, the compound suppressed not only the expression of tyrosinase, tyrosinase-related protein-1 (TRP-1), TRP-2, and microphthalmia-associated transcription factor (MITF), but also the transcriptional activity of tyrosinase and MITF. Our results demonstrated chalcone-21 to be an effective depigmenting agent."

For more information on this research see: Inhibition of tyrosinase activity and melanin production by the chalcone derivative 1-(2-cyclohexylmethoxy-6-hydroxy-phenyl)-3(4-hydroxymethyl-phenyl)-propenone. Biochemical and Biophysical Research Communications, 2016;480(4):648-654. Heart Disorders and Diseases - Heart Attack

Investigators at Seoul National University Discuss Findings in Heart Attack (The effect of atmosphere temperature on out-of-hospital cardiac arrest outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Attack is now available. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "It is unclear whether the atmosphere temperature is associated with outcomes after out-of-hospital cardiac arrest (OHCA). This is a nationwide observational study using the national OHCA registry merged with a geographical and weather database."

Our news journalists obtained a quote from the research from Seoul National University, "Adult patients with a cardiac etiology that occurred from 2006 to 2013 were included, excluding patients with unknown outcome or unknown weather information. The main exposure was the hourly measured temperature matched to the OHCA event time. The covariates were age, gender, metropolis, place, and weather factors (wind speed and humidity). The primary outcome was good cerebral performance scale (CPC) 1 or 2. Patients were classified with three temperature groups by quartile range: Cold (< 4 degrees C), Intermediate (4-21 degrees C), and Hot (≥ 22 degrees C). We tested the associations between the atmosphere temperature (by 1 C and by temperature group) and outcomes using multivariable logistic regression analysis. Of 17,3051 OHCAs, a total of 115,578 cases were matched to weather database. A total of 78,717 OHCAs were analyzed. The proportion of good CPC 1 or 2 was 1.7% in the Cold group, 1.8% in the Intermediate group, and 2.3% in the Hot group. As the temperature at the event of OHCA increased by 1 degrees C, AORs (95% CIs) were 1.006 (1.002-1.009) for good CPC."

According to the news editors, the research concluded: "The AORs (95% CIs) for good CPC in Cold and Hot group comparing with Intermediate group for good CPC were 0.964 (0.845-1.100) and 1.246 (1.096-1.416), respectively."

Our news journalists report that additional information may be obtained by contacting E.J. Cho, Seoul National University, Coll Med, Seoul, South Korea. Additional authors for this research include S.D. Shin, S. Jeong, Y.H. Kwak and G.J. Suh.

Investigators at Seoul National University Hospital Report New Data on Colon Cancer (Clinical Implication of Anti-Angiogenic Effect of Regorafenib in Metastatic Colorectal Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Regorafenib induces distinct radiological changes that represent its anti-angiogenic effect. However, clinical implication of the changes is unclear."

Our news editors obtained a quote from the research from Seoul National University Hospital, "Tumor attenuation as measured by Hounsfield units (HU) in contrast-enhanced computed tomography (CT) and cavitary changes of lung metastases were analyzed in association with treatment outcome of metastatic colorectal cancer patients (N=80) treated with regorafenib in a prospective study. 141 lesions in 72 patients were analyzed with HU. After 2 cycles of regorafenib, 87.5% of patients showed decrease of HU (Median change -23.9%, range -61.5%-20.7%). Lesional attenuation change was modestly associated with metabolic changes of 18-fluoro-deoxyglucose positron emission tomography-CT (Pearson's r=0.37, p=0.002). Among 53 patients with lung metastases, 17 (32.1%) developed cavitary changes. There were no differences in disease control rate, progression-free survival, or overall survival according to the radiological changes. At the time of progressive disease (PD) according to RECIST 1.1, HU was lower than baseline in 86.0% (43/50) and cavitary change of lung metastasis persisted without refilling in 84.6% (11/13). Regorafenib showed prominent anti-angiogenic effect in colorectal cancer, but the changes were not associated with treatment outcome."

According to the news editors, the research concluded: "However, the anti-angiogenic effects persisted at the time of PD, which suggests that we may need to develop new treatment strategies."

For more information on this research see: Clinical Implication of Anti-Angiogenic Effect of Regorafenib in Metastatic Colorectal Cancer. Plos One, 2015;10(12):e0145004. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

The news editors report that additional information may be obtained by contacting Y. Lim, Dept. of Internal Medicine, Seoul National University Hospital, Seoul, South Korea. Investigators at Shaheed Beheshti University of Medical Sciences Release New Data on Type 2 Diabetes (Oxidative stress, type 2 diabetes and vitamin D: past, present and future)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting out of Tehran, Iran, by NewsRx editors, research stated, "Oxidative stress refers to an imbalance between potentially harmful free radicals and the body's mechanisms to efficiently detoxify them in favor of the free radicals. Consequently, excess free radicals can attack and damage a wide range of biomolecules including proteins, lipids and nucleic acids."

Our news journalists obtained a quote from the research from the Shaheed Beheshti University of Medical Sciences, "Antioxidant mechanisms of the body are under the influence of genetic and environmental (including dietary) factors. Diabetes is one of the most common metabolic disorders around the world. A huge body of evidence indicates a role for oxidative stress in development of many human diseases including diabetes. In this article, the latest information on the possible links of oxidative stress with diabetes development, control and complications as well as the newest results of antioxidant supplementation trials is reviewed. In addition, the possible role of vitamin D, as a newly recognized antioxidant in diabetes is discussed."

According to the news editors, the research concluded: "Finally, concluding remarks on pivotal issues and future studies are presented."

Our news journalists report that additional information may be obtained by contacting B. Nikooyeh, Laboratory of Nutrition Research, National Nutrition and Food Technology Research Institute (NNFTRI) and Faculty of Nutrition Science and Food Technology, Shahid Beheshti University of Medical Sciences, Tehran, Iran.

Investigators at Shandong Normal University Report Findings in Ischemia (Fluorescent Nanocomposite for Visualizing Cross-Talk between MicroRNA-21 and Hydrogen Peroxide in Ischemia-Reperfusion Injury in Live Cells and In Vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Ischemia. According to news reporting originating from Jinan, People's Republic of China, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) and reactive oxygen species (ROS) are concurrently implicated in heart ischemia-reperfusion (IR) injury. There may exist mutual cross-talk between miRNAs and ROS in cardiac IR injury process."

Financial supporters for this research include Ministry of Science and Technology of the People's Republic of China, National Natural Science Foundation of China, Natural Science Foundation of Shandong Province.

Our news editors obtained a quote from the research from Shandong Normal University, "In this study, we developed a novel crown-like silica@polydopamine-DNA-CeO2 nanocomposite by assembly of silica@polydopamine-DNA1 nanoparticles decorated with satellite CeO2-DNA2 nanoparticles for detecting and imaging of microRNA-21 (miR-21) and hydrogen peroxide (H2O2) in simulated IR injury in living cells and in vivo. The miRNA-21 was found to be regulated by H2O2 via PI3K/AKT signaling pathway for the first time in H9C2 cells in simulated ischemia-reperfusion injury. H2O2 and miRNA-21 are overproduced during mimicked heart ischemia-reperfusion injury, suggesting that they are closely related to reperfusion injury. All these results reveal that there is definite cross-talk between miR-21 and H2O2 in IR injury."

According to the news editors, the research concluded: "The current method can provide a promising strategy to further explore the interplaying roles between ROS and miRNAs in other pathological processes."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.analchem.6b03701. This DOI is a link to an online electronic document that is either free for sale.

Investigators at Shandong University Describe Findings in Ethanol
(Corosolic acid protects hepatocytes against ethanol-induced damage by modulating mitogen-activated protein kinases and activating autophagy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Ethanol are discussed in a new report. According to news reporting originating in Shandong, People's Republic of China, by NewsRx journalists, research stated, "The reactive oxygen species (ROS)/mitogen-activated protein kinase (MAPK) destroyed autophagy and the reactive oxygen species/mitogen-activated protein kinase (MAPK) pathway are considered closely related to ethanol-induced hepatocellular injury. Previous work indicated that corosolic acid, the natural extracts of leaves of the banaba tree, Lagerstroemia speciosa L., could protect the liver against ethanol-induced damage, but the underlying mechanism is unclear."

Financial support for this research came from National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Shandong University, "In the study we found that corosolic acid significantly inhibited ethanol induced apoptosis, increased level of tumor necrosis factor-alpha (TNF-alpha) and reactive oxygen species accumulation in vitro. Corosolic acid inhibited ethanol-activated p38 and c-Jun N-terminal kinase MAPK signaling in BRL-3A and HepG2 cells as well as in experimental rats. Corosolic acid restored the ethanol-suppressed expression of autophagy-related genes, including beclin-1 and the ratio of microtubule-associated protein light chain 3II/1 (LC3II/I) via AMP-activated protein kinase (AMPK) activation both in vitro and in vivo. In experimental rats, corosolic acid ameliorated the detrimental histopathological findings. Corosolic acid may protect the liver against ethanol-induced injury by modulation of MAPK signaling and autophagy activation."

According to the news reporters, the research concluded: "These findings suggested that corosolic acid might be a promising agent in treatment of alcoholic liver diseases."

For more information on this research see: Corosolic acid protects hepatocytes against ethanol-induced damage by modulating mitogen-activated protein kinases and activating autophagy. European Journal of Pharmacology, 2016;791():578-588. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Investigators at Shandong University Report Findings in Xenografts (Riccardin D-N induces lysosomal membrane permeabilization by inhibiting acid sphingomyelinase and interfering with sphingomyelin metabolism in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology - Xenografts. According to news originating from Jinan, People's Republic of China, by NewsRx correspondents, research stated, "Lysosomes are important targets for anticancer drug discovery. Our previous study showed that Riccardin D-N (RD-N), a natural macroyclic bisbibenzyl derivative produced by Mannich reaction, induced cell death by accumulating in lysosomes."

Funders for this research include National Natural Science Foundation of China, Shandong Scientific Technology Program.

Our news journalists obtained a quote from the research from Shandong University, "Experiments were performed on human lung squamous cell carcinoma tissue from left inferior lobar bronchus of patient xenografts and H460 cells. RD-N was administrated for 25 days. The specimens of xenografts in Balb/c athymic (nu+/nu+) male mice were removed for immunohistochemistry, subcellular fractionation, enzyme activities and Western blotting analysis. mRFP-GFP-LC3 reporter was used to examine autophagy in H460 cells. Sphingomyelin assay was evaluated by thin-layer chromatography and assay kit. Lysosomal membrane permeabilization (LMP) caused by acid sphingomyelinase (ASM) inhibition and subsequent changes of sphingomyelin (SM) metabolism selectively destabilized the cancer cell lysosomes in RD-N-treated H460 cells in vitro and tumor xenograft model in vivo. The destabilized lysosomes induced the release of cathepsins from the lysosomes into the cytosol and further triggered cell death. These results explain the underlying mechanism of RD-N induced LMP."

According to the news editors, the research concluded: "It can be concluded that a more lysosomotropic derivative was synthesized by introduction of an amine group, which could have more potential applications in cancer therapy."

The news correspondents report that additional information may be obtained from H.X. Lou, Shandong University, Dept. of Nat Prod Chem, Key Lab Chem Biol, MOE, Jinan.
Investigators at Shanghai Jiao-Tong University Report Findings in Cancer Risk (An updated dose-response meta-analysis of coffee consumption and liver cancer risk)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Cancer Risk have been presented. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Prospective cohort studies of the relationship between coffee consumption and liver cancer risk have drawn different conclusions. Therefore, a dose-response meta-analysis of prospective cohort studies was performed to disentangle this causal relationship."

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "Prospective cohort studies of the association between coffee consumption and liver cancer risk published prior to Jan 9, 2016 were identified by searching in the PubMed and EMBASE databases. Extracted data were analyzed using a random-effects model. Of the 2892 records identified using the search strategy, a total of twenty cohort studies from ten publications were included in the final meta-analysis. The pooled estimate of relative risk (RR) with 95% confidence interval (CI) for highest vs. non/occasional coffee drinkers was 0.55(0.44-0.67). No evidence of publication bias was observed (p for Egger's test = 0.229). Sensitivity analysis indicated the results were robust. Dose-response analysis revealed a significant linear dose-response relationship between coffee consumption and liver cancer risk (p = 0.36). Subgroup analyses stratified by pre-specified variables (gender, geographic region, and adjusted factors) indicated similar results within individual subgroups."

According to the news editors, the research concluded: "Our meta-analysis suggested that coffee consumption is inversely associated with liver cancer risk."

The news correspondents report that additional information may be obtained from Y.G. Wang, Shanghai Jiao Tong University, Sch Med, Shanghai Tongren Hosp, Dept. of Gastroenterol, Shanghai, People's Republic of China. Additional authors for this research include Q. Cao, P. Chen, S.G. Yang, M. Deng, Y.G. Wang and L.J. Li.

Investigators at Sharif University of Technology Have Reported New Data on Drug Delivery Systems (Exploring Cellular Interactions of Liposomes Using Protein Corona Fingerprints and Physicochemical Properties)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Drug Delivery Systems. According to news reporting from Tehran, Iran, by NewsRx journalists, research stated, "To control liposomes fate and transport upon contact with biofluids, it is essential to consider several parameters affecting the synthetic and biological identity of liposomes, as well as liposome-protein corona (PC) aspects. As a powerful tool in this data mining adventure, quantitative structure-activity relationship (QSAR) approach is used to correlate physicochemical properties of liposomes and their PC fingerprints to multiple quantified biological responses."

Financial support for this research came from Tehran University of Medical Sciences and Health Services.

The news correspondents obtained a quote from the research from the Sharif University of Technology, "In the present study, the relationship between cellular interactions of a set of structurally diverse liposomal formulations and their physicochemical and PC properties has been investigated via linear and nonlinear QSAR models. Significant parameters affecting cellular uptake and cell viability of liposomes in two important cancer cell lines (PC3 and HeLa) have been identified."

According to the news reporters, the research concluded: "The developed QSARs have the capacity to be implemented in advanced targeted delivery of liposomal drugs."

Our news journalists report that additional information may be obtained by contacting A. Bigdeli, Dept. of Chemistry, Sharif University of Technology, Tehran 1113658639, Iran. Additional authors for this research include S. Palchetti, D. Pozzi, M.R. Hormozi-Nezhad, F. Baldelli Bombelli, G. Caracciolo and M. Mahmoudi.

Peptide Proteins - Proinsulin

Investigators at Shiga University of Medical Sciences Discuss Findings in Proinsulin (MicroRNA148b-3p inhibits mTORC1-dependent apoptosis in diabetes by repressing TNFR2 in proximal tubular cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptide Proteins - Proinsulin.

According to news reporting originating from Shiga, Japan, by NewsRx correspondents, research stated, "Hypoxia causes proximal tubular cell damage in diabetes, even though proximal tubular cells have an adaptive system to combat hypoxia involving induction of hypoxia factor-1 (HIF-1) and inhibition of mechanistic target of rapamycin complex 1 (mTORC1). Here, we examined the interference effect of altered glucose and lipid metabolism on the hypoxia responses in proximal tubular cells."

Our news editors obtained a quote from the research from the Shiga University of Medical Sciences, "In culture, hypoxia alone induced HIF-1 and inhibited mTORC1, preventing death in proximal tubular cells. However, hypoxia with high glucose and palmitate increased mTORC1 activity and promoted apoptosis in proximal tubular cells, which was inhibited by pharmacological and genetic inactivation of mTORC1. Since inhibition of all mTORC1's physiological functions regulated by growth factors including insulin causes various adverse effects, we screened for a microRNA that can inhibit only pro-apoptotic effects of mTORC1 to discover a safe therapeutic target. This screen found microRNA-148b-3p was able to specifically inhibit mTORC1-dependent apoptosis in hypoxic proximal tubular cells exposed to high glucose and palmitate, without affecting insulin-dependent mTORC1 activation. Furthermore, tumor necrosis factor receptor (TNFR) 2 was the target of microRNA-148b-3p and its suppression inhibited apoptosis. Finally, enhanced apoptosis with TNFR2 overexpression was found in hypoxic and mTORC1-activated proximal tubular cells in diabetic rats. Thus, diabetes activated mTORC1 even in hypoxic proximal tubular cells, leading to apoptosis by reducing microRNA-148b-3p expression."

According to the news editors, the research concluded: "Modulating this pathogenic pathway may be a novel therapy for proximal tubular cell damage in diabetes."

The news editors report that additional information may be obtained by contacting S. Kume, Shiga University of Medical Sciences, Dept. of Med, Otsu, Shiga 5202192, Japan. Additional authors for this research include S. Kume, M. Chin-Kanasaki, H. Araki, S. Araki, J. Nakazawa, T. Sugaya, D. Koya, M. Haneda, H. Maegawa and T. Uzu.

Investigators at Sichuan University Release New Data on Type 2 Diabetes (Factors that Affect Pancreatic Islet Cell Autophagy in Adult Rats: Evaluation of a Calorie-Restricted Diet and a High-Fat Diet)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news reporting from Chengdu, People's Republic of China, by NewsRx journalists, research stated, "Aging may be a risk factor for type 2 diabetes in the elderly. Dietary intervention can affect glucose tolerance in adults, which may be due to body composition and islet cell autophagy."

The news correspondents obtained a quote from the research from Sichuan University, "The aim of this study was to determine the effects of various dietary interventions on islet cell autophagy. Pancreatic tissue and blood samples were collected from Sprague Dawley rats (14-16 months old, n=15 for each group) that received a normal diet (ND), a high-fat diet (HFD), or a calorie-restricted diet (CRD). The body weight (BW), visceral fat, serum lipid levels, fasting serum glucose, insulin levels, and b/a cell area were determined in 14-16-(0-w), 16-18-(8-w), and 18-20(16-w)-month-old rats. Pancreatic islet autophagy (LC3B and LAMP2), AP (Acid Phosphatase) and apoptosis (apoptosis index, AI (TUNEL assay) and cleaved caspase-3) were detected using immunohistochemistry, ELISA and western blot. At 16 weeks, the expressions of LC3B, LAMP2 and AP markedly increased in both the HFD (p <0.01) and CRD (p <0.05) groups; however, an increase in the AI (p <0.05), cleaved caspase-3 and Beclin1 expression and a decrease in the expressions of BCL2 and BCLXL (p <0.05) were observed in only the HFD group. FFA, triglyceride levels, HOMA-IR, insulin levels and glucagon levels were significantly increased in the HFD group but decreased in the CRD group at 16 weeks (p <0.05)."

According to the news reporters, the research concluded: "The degree of islet cell autophagy was potentially regulated by the levels of FFA and islet cell insulin and glucagon, which may have been due to the effects of Beclin1/BCL2."

For more information on this research see: Factors that Affect Pancreatic Islet Cell Autophagy in Adult Rats: Evaluation of a Calorie-Restricted Diet and a High-Fat Diet. Plos One, 2016;11(3):e0151104. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Investigators at Soochow University Report Findings in Peptide Hydrolases (Cathepsin L upregulation-induced EMT phenotype is associated with the acquisition of cisplatin or paclitaxel resistance in A549 cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Enzymes and Coenzymes - Peptide Hydrolases is the subject of a report. According to news reporting originating in Suzhou, People's Republic of China, by NewsRx journalists, research stated, "Cathepsin L (CTSL), a lysosomal acid cysteine protease, is known to play important roles in tumor metastasis and chemotherapy resistance. In this study we investigated the molecular mechanisms underlying the regulation of chemoresistance by CTSL in human lung cancer cells."

The news reporters obtained a quote from the research from Soochow University, "Human lung cancer A549 cells, A549/PTX (paclitaxel-resistant) cells and A549/DDP (cisplatin-resistant) cells were tested. The resistance to cisplatin or paclitaxel was detected using MTT and the colony-formation assays. Actin remodeling was observed with FITC-Phalloidin fluorescent staining or immunofluorescence. A wound-healing assay or Transwell assay was used to assess the migration or invasion ability. The expression of CTSL and epithelial and mesenchymal markers was analyzed with Western blotting and immunofluorescence. The expression of EMT-associated transcription factors was measured with Western blotting or q-PCR. BALB/c nude mice were implanted subcutaneously with A549 cells overexpressing CTSL, and the mice were administered paclitaxel (10, 15 mg/kg, ip) every 3 d for 5 times. Cisplatin or paclitaxel treatment (10-80 ng/mL) induced CTSL expression in A549 cells. CTSL levels were much higher in A549/PTX and A549/DDP cells than in A549 cells. Silencing of CTSL reversed the chemoresistance in A549/DDP and A549/TAX cells, whereas overexpression of CTSL attenuated the sensitivity of A549 cells to cisplatin or paclitaxel. Furthermore, A549/DDP and A549/TAX cells underwent morphological and cytoskeletal changes with increased cell invasion and migration abilities, accompanied by decreased expression of epithelial markers (E-cadherin and cytokeratin-18) and increased expression of mesenchymal markers (N-cadherin and vimentin), as well as upregulation of EMT-associated transcription factors Snail, Slug, ZEB1 and ZEB2. Silencing of CTSL reversed EMT in A549/DDP and A549/TAX cells; In contrast, overexpression of CTSL induced EMT in A549 cells. In xenograft nude mouse model, the mice implanted with A549 cells overexpressing CTSL exhibited significantly reduced sensitivity to paclitaxel treatment, and increased expression of EMT-associated proteins and transcription factors in tumor tissues. Cisplatin and paclitaxel resistance is associated with CTSL upregulation-induced EMT in A549 cells."

According to the news reporters, the research concluded: "Thus, CTSL-mediated EMT may be exploited as a target to enhance the efficacy of cisplatin or paclitaxel against lung cancer and other types of malignancies."

For more information on this research see: Cathepsin L upregulation-induced EMT phenotype is associated with the acquisition of cisplatin or paclitaxel resistance in A549 cells. *Acta Pharmacologica Sinica*. 2016;37(12):1606-1622. *Acta Pharmacologica Sinica* can be contacted at: Acta Pharmacologica Sinica, 294 Tai-Yuan Rd, Shanghai, 200031, Peoples R

Heart Disorders and Diseases - Atrial Fibrillation

Investigators at St. Louis College of Pharmacy Detail Findings in Atrial Fibrillation (Practical Considerations for the Use of Direct Oral Anticoagulants in Patients With Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting out of St. Louis, Missouri, by NewsRx editors, research stated, "Atrial fibrillation (AF) is a significant risk factor for stroke and peripheral thromboembolic events (TEs). Preventing blood clots in the heart to reduce stroke and TE risk is a key goal of AF therapy."

Our news journalists obtained a quote from the research from the St. Louis College of Pharmacy, "Traditional stroke risk assessment tools for patients with nonvalvular AF include the CHADS2 and CHA(2)DS(2)-VASc scores, while long-term outcome data with the newer direct oral anticoagulants (DOACs) are emerging. The goals of this review were to assess traditional therapies and existing treatment guidelines and to discuss key pharmacologic properties of the DOACS, noting how these may benefit at-risk patients with AF. This narrative review was developed on the basis of the authors' clinical knowledge, extensive reading of the literature, and broad pharmacy experience in the management of patients with AF. Limitations of oral vitamin K antagonists (VKAs) include slow onset of action, the need for regular monitoring of their anticoagulation effect, significant food and drug interactions, and unpredictable dose-response properties. Key clinical trial data led to the approvals of apixaban, dabigatran etexilate, edoxaban, and rivaroxaban in the United States to reduce the risk of stroke and systemic embolism in patients with nonvalvular AF. With predictable pharmacologic properties and limited drug and/or dietary interactions, the DOACs offer several benefits over traditional oral anticoagulation therapy with VKA. However, they have limitations, including the absence of immediate reversal agents and limited options for monitoring their anticoagulation effects in clinical practice."
According to the news editors, the research concluded: "As experience with the use of DOACs grows, optimized treatment regimens and improved patient care are expected."

Our news journalists report that additional information may be obtained by contacting Z. Stacy, St Louis Coll Pharm, St Louis, MO 63110, United States.

**Cardiovascular Diseases and Conditions - Aneurysm**

**Investigators at St. Michael's Hospital Report Findings in Aneurysm [The wire anchor loop traction (WALT) maneuver]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurysm. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "Crossing the neck of large complex intracranial aneurysms for the purposes of stent deployment can be challenging using standard over the wire techniques."

Our news editors obtained a quote from the research from St. Michael's Hospital, "We describe a novel yet simple technique for straightening out the loop formed within a large intracranial aneurysm, which is often required in order to cross the aneurysm neck into the distal branch. Both the microcatheter and microwire are initially introduced into the distal vasculature, followed by withdrawal of the microwire to a point parallel to the distal exiting branch."

According to the news editors, the research concluded: "The microcatheter and microwire are then gently withdrawn and a series of maneuvers to gradually reduce the loop is performed, obviating the need for distal purchase in the form of a stent, balloon, or coil, which have previously been described to maintain distal purchase."

The news editors report that additional information may be obtained by contacting T.R. Marotta, St. Michael's Hospital, Diagnost & Therapeut Neuroradiol, Toronto, ON M5B 1W8, Canada. Additional authors for this research include R.H. Sacho, F. Belzile and T.R. Marotta.
Investigators at Stanford University Detail Findings in Laboratory Research (Directed evolution using dCas9-targeted somatic hypermutation in mammalian cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Laboratory Research are presented in a new report. According to news reporting originating from Stanford, California, by NewsRx correspondents, research stated, "Engineering and study of protein function by directed evolution has been limited by the technical requirement to use global mutagenesis or introduce DNA libraries. Here, we develop CRISPR-X, a strategy to repurpose the somatic hypermutation machinery for protein engineering in situ."

Our news editors obtained a quote from the research from Stanford University, "Using catalytically inactive dCas9 to recruit variants of cytidine deaminase (AID) with MS2-modified sgRNAs, we can specifically mutagenize endogenous targets with limited off-target damage. This generates diverse libraries of localized point mutations and can target multiple genomic locations simultaneously. We mutagenize GFP and select for spectrum-shifted variants, including EGFP. Additionally, we mutate the target of the cancer therapeutic bortezomib, PSMB5, and identify known and novel mutations that confer bortezomib resistance. Finally, using a hyperactive AID variant, we mutagenize loci both upstream and downstream of transcriptional start sites."

According to the news editors, the research concluded: "These experiments illustrate a powerful approach to create complex libraries of genetic variants in native context, which is broadly applicable to investigate and improve protein function."

The news editors report that additional information may be obtained by contacting M.C. Bassik, Stanford Univ Chem Engn & Med Human Hlth ChEM H, Stanford, CA, United States. Additional authors for this research include L. Fresard, K. Han, C.H. Lee, A. Li, K.A. Cimprich, S.B. Montgomery and M.C. Bassik.

Investigators at Stanford University Discuss Findings in Connective Tissue Cells (Biochemically engineered stromal cell-derived factor 1-alpha analog increases perfusion in the ischemic hind limb)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Connective Tissue Cells. According to news reporting out of Stanford, California, by NewsRx editors, research stated, "Despite promising therapeutic innovation over the last decade, peripheral arterial disease remains a prevalent morbidity, as many patients are still challenged with peripheral ischemia. We hypothesized that delivery of engineered stromal cell-derived factor 1-alpha (ESA) in an ischemic hind limb will yield significant improvement in perfusion."

Our news journalists obtained a quote from the research from Stanford University, "Male rats underwent right femoral artery ligation, and animals were randomized to receive a 100 mu L injection of saline (n = 9) or 6 mu g/kg dosage of equal volume of ESA (n = 12) into the ipsilateral quadriceps muscle. Both groups of animals were also given an intraperitoneal injection of 40 mu g/kg of granulocyte macrophage colony-stimulating factor (GMCSF). Perfusion was quantified using a laser Doppler imaging device preoperatively, and on postoperative days 0, 7, and 14. Immunohistochemistry was performed to quantify angiogenesis on day 14, and an mRNA profile was evaluated for angiogenic and inflammatory markers. Compared with the saline/GMCSF group at day 14, the ESA/GMCSF-injected animals had greater reperfusion ratios (Saline/GMCSF, 0.600 +/- 0.140 vs ESA/GMCSF, 0.900 +/- 0.181; group effect P = .006; time effect P < .0001; group×time effect P < .0001), elevated capillary density (103; Saline/GMCSF, 6.40 +/- 2.01 vs ESA/GMCSF, 18.55 +/- 5.30; P < .01), and increased mRNA levels of vascular endothelial growth factor-A (Saline/GMCSF [n = 6], 0.298 +/- 0.205 vs ESA/GMCSF [n = 8], 0.456 +/- 0.139; P = .03)."

According to the news editors, the research concluded: "Delivery of ESA significantly improves perfusion in a rat model of peripheral arterial disease via improved neovasculogenesis, a finding which may prove beneficial in the treatment strategy for this debilitating disease."

Our news journalists report that additional information may be obtained by contacting J.B. Woo, Stanford University, Sch Med, Dept. of Cardiothorac Surg, Stanford, CA 94305, United States. Additional authors for this research include A.S. Fairman, J.E. Cohen, J.W. MacArthur, A.B. Goldstone, J.B. Woo, W. Hiesinger and Y.J. Woo.

Investigators at State University of Campinas Describe Findings in Chemotherapy (Medicinal herbs for cancer patients undergoing chemotherapy in a Brazilian hospital - An exploratory study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Chemotherapy have been published. According to news originating from Campinas, Brazil, by NewsRx correspondents, research stated, "Integrative Oncology when combined with conventional care can be effective and reduce adverse symptoms of cancer and its treatment. The purpose of this exploratory study was to explore whether individualised medicinal herbs given to cancer patients at a Brazilian hospital improved symptoms and wellbeing."

Our news journalists obtained a quote from the research from the State University of Campinas, "This exploratory study was carried out between May 2012 and January 2013. Data from nineteen patients who received medicinal herbs every 21 days for three months were compared before and after their treatment and also with 14 patients who did not receive medicinal herbs who acted as a comparison group. An adapted version of the MYMOP was used to identify patients' self-reported symptoms and perceptions of wellbeing. After completing the medicinal herbs' treatment with the intervention group, 10 patients reported feeling better (p value = 0.24) and nine felt worse. Of the comparison group eight patients reported feeling better (p value = 0.29), four felt worse, and two declared feeling no alterations. The Student T test was used to compare differences between the medicinal herbs' and comparison group. The results for the intervention group didn't achieve statistically significant changes (p value = 0.48), compared to the comparison group. The medicinal herb treatment delivered as part of the integrative care in oncology produced clinically significant effects for over half of the patients while undergoing conventional cancer treatment."

According to the news editors, the research concluded: "However, the wellbeing improvement was not statistically different from a group of cancer patients who did not receive herbs."

The news correspondents report that additional information may be obtained from P. Siegel, Campinas State University, Fac Med Sci, Dept. of Collect Hlth, BR-13083887 Campinas, SP, Brazil. Additional authors for this research include F.O. de Gaspi, V. Salerno, C.S.P. Lima, C. Stephan and N.F. de Barros.

Investigators at Sun Yat Sen University Discuss Findings in Peritonitis
(Risk Factors For Early-onset Peritonitis In Southern Chinese Peritoneal Dialysis Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Digestive System Diseases and Conditions - Peritonitis. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Early peritonitis was confirmed to be associated with a higher risk of early technique failure. However, literature concerning peritonitis within the first 3 months of peritoneal dialysis (PD) initiation is scarce."

Our news editors obtained a quote from the research from Sun Yat Sen University, "The present study was to investigate risk factors associated with early-onset peritonitis in PD patients. In this retrospective observational cohort study, all incident PD patients from January 1, 2006, to December 31, 2013, were recruited and followed up until December 31, 2014. According to time-to-first episode of peritonitis, patients were divided into early-onset (≤ 3 months) peritonitis and late-onset (> 3 months) peritonitis. Baseline demographic, clinical, and laboratory data, as well as episodes of peritonitis, were collected. Risk factors associated with early-onset peritonitis were evaluated using logistic regression model. Of 1,690 patients on PD, 503 (29.8%) developed at least 1 episode of peritonitis and 118 (7.0%) patients presented the first episodes of peritonitis within the first 3 months. A multivariate logistic analysis showed that higher body mass index (BMI) (odds ratio [OR] 1.08, 95% confidence interval [CI] 1.01 - 1.15, p = 0.034), hypoalbuminemia (OR 1.75, 95% CI 1.11 - 2.78, p = 0.017), and catheter exit-site infection (OR 4.14, 95% CI 2.45 - 7.00, p < 0.001) were risk factors independently associated with early-onset peritonitis. Compared to those with late-onset, patients with early-onset peritonitis had a higher overall peritonitis rate (0.76 vs 0.38 per patient-year, p < 0.001) and worse technique survival (p < 0.001), while patient survival did not differ significantly between the 2 groups during the long-term follow-up (p > 0.05)."

According to the news editors, the research concluded: "Higher BMI, hypoalbuminemia, and catheter exit-site infection were the risk factors associated with early-onset peritonitis in PD patients."

The news editors report that additional information may be obtained by contacting X. Yang, Sun Yat Sen UniversityAffiliated Hosp 1, Dept. of Nephrol, Guangzhou 510080, Guangdong, People's Republic of China. Additional authors for this research include R. Huang, C.Y. Yi, J. Wu, Q.Y. Guo, Q. Zhou, X.Q. Yu and X. Yang.

Oncology - Nasopharyngeal Carcinoma

Investigators at Sun Yat-sen University Cancer Center Have Reported New Data on Nasopharyngeal Carcinoma (Morphine, a potential antagonist of cisplatin cytotoxicity, inhibits cisplatin-induced apoptosis and suppression of tumor growth in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Nasopharyngeal Carcinoma have been published. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Morphine is an opioid analgesic drug often used for pain relief in cancer patients. However, there is growing evidence that morphine may modulate tumor growth, progression and metastasis."

Our news editors obtained a quote from the research from Sun Yat-sen University Cancer Center, "In this study, we evaluated whether morphine modulates cisplatin-induced apoptosis in human nasopharyngeal carcinoma CNE-2 cells and whether morphine affects the antitumor activity of cisplatin on tumor growth in human nasopharyngeal carcinoma CNE-2 xenografts in nude mice. We showed that a pretreatment with morphine (1 mg/ml) inhibited the sensitivity of CNE-2 cells to cisplatin by inhibiting cisplatin-induced CNE-2 cell apoptosis, decreasing caspase-3 activity and increasing the Bcl-2/Bax ratio. However, a high dose of morphine (1000 mg/ml) had the opposite effect. We also showed that at a low dose, morphine enhances chemoresistance in an in vivo nasopharyngeal carcinoma (NPC) model by inhibiting cisplatin-induced apoptosis and decreasing neovascularization."

According to the news editors, the research concluded: "Taken together, our results indicate that a low dose of morphine may lead to chemoresistance of cisplatin in NPC models in vitro and in vivo by inhibiting cisplatin-induced apoptosis and decreasing neovascularization."

For more information on this research see: Morphine, a potential antagonist of cisplatin cytotoxicity, inhibits cisplatin-induced apoptosis and suppression of tumor growth in nasopharyngeal carcinoma xenografts. Scientific Reports, 2016;6():18706. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Investigators at Sungkyunkwan University Detail Findings in Breast Cancer (Comparative analysis of BRCA1 and BRCA2 variants of uncertain significance in patients with breast cancer: a multifactorial probability-based model versus ACMG standards ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "To investigate variants of uncertain significance (VUS) in BRCA1 and BRCA2, we assessed the multifactorial posterior probability of VUS in BRCA1 and BRCA2 and compared these analyses with interpretations according to the recently released American College of Medical Genetics and Genomics (ACMG) standards and guidelines. The analysis involved 715 Korean patients with breast cancer."

Our news journalists obtained a quote from the research from Sungkyunkwan University, "The multifactorial probability of a VUS was analyzed using the prior probability and combined likelihoods of personal and family history, the pathologic profile of the breast cancer, and co-occurrence with pathogenic variants. Results were compared with those obtained according to the ACMG standards/guidelines. Sixteen VUS from 51 BRCA1 VUS carriers and 28 VUS from 62 BRCA2 VUS carriers were analyzed. There was a slight agreement between the two analyses, with a kappa value of 0.14 (95% confidence interval (CI) = -0.34 to 0.62) for the BRCA1 VUS and a kappa value of 0.17 (95% CI = -0.10 to 0.49) for the BRCA2 VUS. We propose that genetic counseling should be based on the concordant results between these two analyses."

According to the news editors, the research concluded: "When discrepancies are found, those variants are still considered VUS and careful counseling should be provided."

For more information on this research see: Comparative analysis of BRCA1 and BRCA2 variants of uncertain significance in patients with breast cancer: a multifactorial probability-based model versus ACMG standards and guidelines for interpreting sequence variants. Genetics in Medicine, 2016;18(12):1250-1257. Genetics in Medicine can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. Investigators at Sungkyunkwan University Report Findings in Ebstein Anomaly (Natural Course of Adult Ebstein Anomaly When Treated according to Current Recommendation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Ebstein Anomaly is now available. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The objectives of this study were to assess the clinical outcomes of adults with Ebstein Anomaly (EA) according to their treatment modalities. All adult EA patients diagnosed between October 1994 and October 2014 were retrospectively evaluated by medical record review."

Our news journalists obtained a quote from the research from Sungkyunkwan University, "Total 60 patients were categorized into 3 groups according to their treatment strategy, i.e. non-operative treatment (Group I, n = 23), immediate operative treatment (Group II, n = 27), and delayed operative treatment (Group III, n = 10). A composite of major adverse cardiac and cerebrovascular events (MACCE) and factors associated with MACCE were assessed in each treatment group. MACCE occurred in 13.0% patients in Group I, 55.6% patients in Group II and 50% in Group III (P = 0.006). Event free survivals at 5 years were 90% in Group I, 52.7% in Group II, 50.0% in Group III (P = 0.036). Post-operatively, most patients showed improvement on clinical symptoms. However, event free survival rate was lower in patients with operation compared to those with non-operative treatment (58.7% vs. 90.9%; P = 0.007). Major arrhythmic event occurred more frequently even after surgical ablation (50.0% vs. 20.0%; P = 0.034). Re-operation was more frequent in patients underwent delayed surgery compared to those with immediate surgery (50.0% vs. 18.5%; P = 0.001). Current guideline to decide patient's treatment strategy appeared to be appropriate in adult patients with EA. However, surgical ablation for arrhythmia was not enough so that concomitant medical treatment should be considered."

According to the news editors, the research concluded: "Therefore, attentive risk stratification and cautious decision of treatment strategy by experienced cardiac surgeon are believed to improve clinical outcome."

For more information on this research see: Natural Course of Adult Ebstein Anomaly When Treated according to Current Recommendation. Journal of Korean Medical Science, 2016;31(11):1749-1754. Journal of Korean Medical Science can be contacted at: Korean Acad Medical Sciences, 302 75 Dong Du Ichon, Dong Yongsan Ku, Seoul 140 031, South Korea.

The news correspondents report that additional information may be obtained from S.W. Park, Sungkyunkwan UniversitySch Med, Samsung Med Center, Heart Vasc Stroke Inst, Seoul, South Korea. **Pharmacotherapy**

**Investigators at Sungkyunkwan University School of Medicine Release New Data on Pharmacotherapy (Persistence and compliance with medication management in the treatment of overactive bladder)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacotherapy have been presented. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Overactive bladder (OAB) is a common and chronic condition that impacts patients' daily activities and quality of life. Pharmacotherapy for OAB is a mainstay of treatment."

The news correspondents obtained a quote from the research from the Sungkyunkwan University School of Medicine, "Antimuscarinics and b3-adrenoceptor agonists are the two major classes of oral pharmacotherapy and have similar efficacy for treating the symptoms of OAB. Owing to the chronic nature of OAB, long-term use of medication is essential for OAB symptom control and positive health outcomes. However, many patients elect to stop their medications during the treatment period. Unmet expectations of treatment and side effects seem to be the major factors for discontinuing OAB pharmacotherapy. Furthermore, the short-and long-term persistence and compliance with medication management are markedly worse in OAB than in other chronic medical conditions. Improvement in persistence and compliance with OAB pharmacotherapy is a hot topic in OAB treatment and should be an important goal in the treatment of OAB. Effective strategies should be identified to improve persistence and compliance."

According to the news reporters, the research concluded: "In this review, we outline what is known about persistence and compliance and the factors affecting persistence with pharmacotherapy in patients with OAB."

For more information on this research see: Persistence and compliance with medication management in the treatment of overactive bladder. *Investigative and Clinical Urology*, 2016;57(2):84-93.

**Cardiovascular Diseases and Conditions – Air…**

**Investigators at Swedish Neuroscience Institute Report Findings in Air Embolism (Venous air embolus during prone cervical spine fusion: case report)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Air Embolism have been published. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "Venous air embolism (VAE) is a known neurosurgical complication classically and most frequently occurring in patients undergoing posterior cranial fossa or cervical spine surgery in a sitting or semi-sitting position. The authors present a case of VAE that occurred during posterior cervical spine surgery in a patient in the prone position, a rare intraoperative complication."

Our news journalists obtained a quote from the research from Swedish Neuroscience Institute, "The patient was a 65-year-old man who was undergoing a C1-2 fusion for a nonunion of a Type II dens fracture and developed a VAE. While VAE in the prone position is uncommon, it is a neurosurgical complication that may have significant clinical implications both intraoperatively and postoperatively."

According to the news editors, the research concluded: "The aim of this review is 2-fold: 1) to improve the general knowledge of this complication among surgeons and anesthesiologists who may not otherwise suspect air embolism in patients positioned prone for posterior cervical spine operations, and 2) to formulate preventive measures as well as a plan for prompt diagnosis and treatment should this complication occur."

For more information on this research see: Venous air embolus during prone cervical spine fusion: case report. *Journal of Neurosurgery-Spine*, 2016;25(6):681-684. *Journal of Neurosurgery-Spine* can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

The news correspondents report that additional information may be obtained from M. Moisi, Swedish Med Center, Swedish Neurosci Inst, Dept. of Neurol Surg, Seattle, WA, United States. **Algorithms**

**Investigators at Taipei Veterans General Hospital Describe Findings in Algorithms (Diagnostic algorithm for detection of targetable driver mutations in lung adenocarcinomas: Comprehensive analyses of 205 cases with immunohistochemistry, ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Algorithms have been published. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Analysis of the targetable driver mutations is now recommended in all patients with advanced
lung adenocarcinoma. Molecular-based methods are usually adopted, however, along with the implementation of highly sensitive and/or mutation-specific antibodies, immunohistochemistry (IHC) has been considered an alternative method for identifying driver mutations in lung adenocarcinomas."

Our news editors obtained a quote from the research from Taipei Veterans General Hospital, "A total of 205 lung adenocarcinomas were examined for EGFR mutations and ALK and ROS1 rearrangements using real-time PCR, fluorescence in situ hybridization (FISH) and IHC in parallel. The performance of different commercially available IHC antibody clones toward targetable driver mutations was evaluated. The association between these driver mutations and clinicopathological characteristics was also analyzed. In 205 cases we studied, 58.5% were found to harbor EGFR mutations, 6.3% ALK rearrangements and 1.0% ROS1 rearrangements. Compared to molecular-based methods, IHC of EGFR mutations showed an excellent specificity but the sensitivity is suboptimal, while IHC of ALK and ROS1 rearrangements demonstrated high sensitivity and specificity. No significant difference regarding the performance of different antibody clones toward these driver mutations was observed, except that clone SP125 showed a higher sensitivity than 43B2 in the detection of p.L858R of EGFR. In circumstances such as poor quality of nucleic acids or low content of tumor cells, IHC of EGFR mutation-specific antibodies could be used as an alternative method. Patients negative for EGFR mutations are subjected to further analysis on ALK and ROS1 rearrangements using IHC methods."

According to the news editors, the research concluded: "Herein, we proposed a lung adenocarcinoma testing algorithm for the application of IHC in therapeutic diagnosis."

For more information on this research see: Diagnostic algorithm for detection of targetable driver mutations in lung adenocarcinomas: Comprehensive analyses of 205 cases with immunohistochemistry, real-time PCR and fluorescence in situ hybridization methods. **Health and Medicine - Spinal Research**

**Investigators at Tel Aviv Medical Center & School of Medicine Describe Findings in Spinal Research (Predictors for surgical complications of en bloc resections in the spine: review of 220 cases treated by the same team)**
According to news reporting originating in Tel Aviv, Israel, by NewsRx journalists, research stated, "Identify risk factors, enabling reduction of the rate of complications and improve outcome in en bloc resection surgeries. A retrospective study of prospective collected data of 1681 patients affected by spine tumors treated from 1990 to 2015 by the same team."

The news reporters obtained a quote from the research from the Tel Aviv Medical Center & School of Medicine, "A total of 220 en bloc resections that were performed on 216 patients during that period. Most of the tumors were primary-165 cases (43 benign and 122 malignant), metastases occurred in 55 cases. Median FU was 45 months (0-371). 153 complications were observed in 100 patients (46.2 %). 64 (30 %) suffered one complication, while the rest had two or more. There were 105 major and 48 minor complications. Seven patients (4.6 %) died as a result of complications. The combined approach, neoadjuvant chemotherapy and neoadjuvant radiotherapy were statistically significant independent risk factors for complications occurrence. 33 patients (15.2 %) suffered from local recurrence. Reoperations were mostly due to tumor recurrences, but also to hardware failures, wound dehiscence, hematomas and aortic dissection. The rate of complication is higher in multisegmental resections and when double combined approach is performed. Reoperations display greater morbidity owing to dissection through scar/fibrosis from previous operations and possibly from RT. Careful treatment planning and, in the event of uncertainty, referral to a specialty center must be stressed. The high risk of complications should not discourage surgeons from performing en bloc resection when needed."

According to the news reporters, the research concluded: "Most of the patients who sustain complications benefit from the better local control resulting from en bloc resection."

For more information on this research see: Predictors for surgical complications of en bloc resections in the spine: review of 220 cases treated by the same team. European Spine Journal, 2016;25(12):3932-3941. European Spine Journal can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Investigators at Tel Aviv University Describe Findings in Inflammatory Bowel Disease (Biosimilars in Inflammatory Bowel Disease: Facts and Fears of Extrapolation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Digestive System Diseases and Conditions - Inflammatory Bowel Disease is now available. According to news reporting originating in Tel Hashomer, Israel, by NewsRx journalists, research stated, "Biologic drugs such as infliximab and other anti-tumor necrosis factor monoclonal antibodies have transformed the treatment of immuno-mediated inflammatory conditions such as Crohn's disease and ulcerative colitis (collectively known as inflammatory bowel disease [IBD]). However, the complex manufacturing processes involved in producing these drugs mean their use in clinical practice is expensive."

The news reporters obtained a quote from the research from Tel Aviv University, "Recent or impending expiration of patents for several biologics has led to development of biosimilar versions of these drugs, with the aim of providing substantial cost savings and increased accessibility to treatment. Biosimilars undergo an expedited regulatory process. This involves proving structural, functional, and biological biosimilarity to the reference product (RP). It is also expected that clinical equivalency/comparability will be demonstrated in a clinical trial in one (or more) sensitive population. Once these requirements are fulfilled, extrapolation of biosimilar approval to other indications for which the RP is approved is permitted without the need for further clinical trials, as long as this is scientifically justifiable. However, such justification requires that the mechanism(s) of action of the RP in question should be similar across indications and also comparable between the RP and the biosimilar in the clinically tested population(s). Likewise, the pharmacokinetics, immunogenicity, and safety of the RP should be similar across indications and comparable between the RP and biosimilar in the clinically tested population(s). To date, most anti-tumor necrosis factor biosimilars have been tested in trials recruiting patients with rheumatoid arthritis. Concerns have been raised regarding extrapolation of clinical data obtained in rheumatologic populations to IBD indications."

According to the news reporters, the research concluded: "In this review, we discuss the issues surrounding indication extrapolation, with a focus on extrapolation to IBD."

For more information on this research see: Biosimilars in Inflammatory Bowel Disease: Facts and Fears of Extrapolation. *Clinical Gastroenterology and Hepatology*, 2016;14 (12):1685-1696. *Clinical Gastroenterology and Hepatology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Clinical Gastroenterology and Hepatology - www.journals.elsevier.com/clinical-gastroenterology-and-hepatology/)

Investigators at Tokyo Medical and Dental University Discuss Findings in Oral Squamous Cell Carcinoma (Exosomal microRNA miR-1246 induces cell motility and invasion through the regulation of DENND2D in oral squamous cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Oral Squamous Cell Carcinoma. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Metastasis is associated with poor prognosis in cancers. Exosomes, which are packed with RNA and proteins and are released in all biological fluids, are emerging as an important mediator of intercellular communication."

Our news journalists obtained a quote from the research from Tokyo Medical and Dental University, "However, the function of exosomes remains poorly understood in cancer metastasis. Here, we demonstrate that exosomes isolated by size-exclusion chromatography from a highly metastatic human oral cancer cell line, HOC313-LM, induced cell growth through the activation of ERK and AKT as well as promoted cell motility of the poorly metastatic cancer cell line HOC313-P. MicroRNA (miRNA) array analysis identified two oncogenic miRNAs, miR-342-3p and miR-1246, that were highly expressed in exosomes. These miRNAs were transferred to poorly metastatic cells by exosomes, which resulted in increased cell motility and invasive ability. Moreover, miR-1246 increased cell motility by directly targeting DENN/MADD Domain Containing 2D (DENND2D)."

According to the news editors, the research concluded: "Taken together, our findings support the metastatic role of exosomes and exosomal miRNAs, which highlights their potential for applications in miRNA-based therapeutics."

For more information on this research see: Exosomal microRNA miR-1246 induces cell motility and invasion through the regulation of DENND2D in oral squamous cell carcinoma. *Scientific Reports, 2016;6():1-11.* *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Investigators at Tokyo University of Science Report Findings in Ketoprofen Therapy (Dibucaine inhibits ketoprofen photodegradation via a mechanism different from that of antioxidants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Ketoprofen Therapy. According to news reporting originating in Chiba, Japan, by NewsRx journalists, research stated, "Ketoprofen is one of the non-steroidal anti-inflammatory drugs used for fomentation. It is associated with undesirable photosensitivity caused by UV irradiation."

The news reporters obtained a quote from the research from the Tokyo University of Science, "Moreover, it induces photodegradation, including decarboxylation, when exposed to UV irradiation. In this study, we attempted to identify compounds that can inhibit the photodegradation of ketoprofen. UV irradiation of ketoprofen follows first-order reaction kinetics and yields three photoproducts. Aqueous solutions containing ketoprofen generate free radicals when it was irradiated with UV. We considered that these free radicals react with ketoprofen. Antioxidants inhibit the photodegradation of ketoprofen. On the other hand, a local anesthetic, dibucaine hydrochloride, was also effective in inhibiting the photodegradation of ketoprofen. We evaluated the difference in the mechanism of inhibition between the antioxidants and the local anesthetic."

According to the news reporters, the research concluded: "Both antioxidants and dibucaine hydrochloride are effective inhibitors of the photodegradation of ketoprofen."

For more information on this research see: Dibucaine inhibits ketoprofen photodegradation via a mechanism different from that of antioxidants. Journal of Photochemistry and Photobiology A-Chemistry, 2017;333():208-212. Journal of Photochemistry and Photobiology A-Chemistry can be contacted at: Elsevier Science Sa, PO Box 564, 1001 Lausanne, Switzerland.

Investigators at Tottori University School of Medicine Release New Data on Cryptorchidism (Post-fertilization effect of bilateral primary testicular damage induced by unilateral cryptorchidism in the rat model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Urogenital Diseases and Conditions - Cryptorchidism. According to news reporting from Yonago, Japan, by NewsRx journalists, research stated, "Cryptorchidism, a common anomaly of the male genitalia, affects 2-4% of male infants. The post-fertilization effects of unilateral cryptorchidism model in the rat and the effects of antioxidant treatment were investigated."

Financial support for this research came from Japan Society for the Promotion of Science.

The news correspondents obtained a quote from the research from the Tottori University School of Medicine, "Six-week-old male Wistar rats were randomly separated into four groups. Unilateral cryptorchidism was induced in the right testis of three groups. One group was treated with saline intraperitoneally (i.p.) (Crypto), one group was treated with taurine (500 mg/kg, i.p.; Tau), and another group was treated with sivelestat (15 mg/kg i.p.; Siv). The control group was treated with saline i.p. The treatment was daily for 8 weeks. Five days before sacrifice, mating studies were performed. Body, testicular, and epididymal weights were recorded. Malondialdehyde (MDA) levels in the seminal vesicular fluid (SVF) were measured. Testicular levels of MDA and 8-hydroxy-2'-deoxyguanosine (8-OHdG) were determined bilaterally. TUNEL assay was used to examine DNA fragmentation bilaterally. Histological examination and the Johnsen score were used to evaluate morphological testicular alterations. The Crypto group demonstrated significantly lower right testicular and epididymal weights, significantly increased SVF-MDA levels, testicular MDA and 8-OHdG levels, and the apoptotic score bilaterally compared to the controls. Furthermore, histological evaluation revealed significantly reduced spermatogenesis and mild injury to the cryptorchid testes compared to the control. Treatment with both taurine and sivelestat significantly reduced SVF-MDA levels, testicular MDA, 8-OHdG, and apoptosis bilaterally compared to the Crypto group. Antioxidant treatment was unable to ameliorate spermatogenesis. Newborns delivered by females that mated with Crypto-males had significantly lower body weight compared with the respective animals from the control, Tau and Siv groups. The present study demonstrated that unilateral cryptorchidism-induced testicular damage can significantly affect the contralateral testis as well having further deleterious post-fertilization effect on the development of newborns."

According to the news reporters, the research concluded: "Treatment with antioxidants can partially improve the testicular damage bilaterally with beneficial effects for the newborns."

For more information on this research see: Post-fertilization effect of bilateral primary testicular damage induced by unilateral cryptorchidism in the rat model. Andrology, 2016;4(2):297-305.

Clinical Research - Clinical Research in Anesthesia

Investigators at Trinity College Detail Findings in Clinical Research in Anesthesia (The preoperative use of field tests of exercise tolerance to predict postoperative outcome in intra-abdominal surgery: a systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Clinical Research - Clinical Research in Anesthesia are presented in a new report. According to news originating from Dublin, Ireland, by NewsRx correspondents, research stated, "To assess the ability of field tests of exercise tolerance, such as the 6-minute walk test (6MWT) and incremental shuttle walk test (ISWT), to predict postoperative outcome following intra-abdominal surgery. A systematic review."

Our news journalists obtained a quote from the research from Trinity College, "A hospital-affiliated university. The following databases were searched: AMED, CINAHL, EMBASE, PEDro, PubMed/MEDLINE, and The Cochrane Library. Six full-text articles were included. Data extraction included author, population demographics, surgery type, postoperative outcome measure, and field test results. The risk of bias was performed using the Quality in Prognosis Studies tool. Surgical procedures reviewed were colorectal (n = 3), upper gastrointestinal (n = 1), and intra-abdominal surgery (n = 2). Field tests of exercise tolerance showed little ability to predict postoperative mortality; however, the overall rate of mortality was low. Patients achieving lower distances on the ISWT tended to have longer hospital stays and an increased risk of overall complications. The 6MWT does not appear able to predict postoperative cardiac or pulmonary complications; however, it may be suitable to predict general complications. Field tests may be able to predict postoperative outcome; however, further validation is needed. The ISWT appears to be the superior field test."

According to the news editors, the research concluded: "The 6MWT and stair climb test require further validation to assess their predictive ability."

The news correspondents report that additional information may be obtained from J. Moran, Trinity College Dublin, Trinity Center Hlth Sci, Sch Med, Discipline Physiotherapy, Dublin, Ireland. Additional authors for this research include F. Wilson, E. Guinan, P. McCormick, J. Hussey and J. Moriarty.

**Heart Disorders and Diseases - Dilated**

**Investigators at University Children's Hospital Report Findings in Dilated Cardiomyopathy [Pitfalls in Echocardiography: Coarctation of the Aorta Presenting as Dilated Cardiomyopathy (DCM)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Dilated Cardiomyopathy is now available. According to news reporting originating from Tubingen, Germany, by NewsRx correspondents, research stated, "The morphologic spectrum of aortic coarctation extends from discrete isthmic obstruction to tubular hypoplasia of the entire aortic arch. Neonates with coarctation frequently present with congestive heart failure and critically reduced perfusion of the descending aorta following ductal closure."

Our news editors obtained a quote from the research from University Children's Hospital, "During the recent years we observed several infants with coarctation who presented beyond the neonatal period with dilated cardiomyopathy (DCM). We reviewed our patients with coarctation to determine whether this presentation represents an exception or is relevant for the differential diagnosis of children with DCM. From 1/2001 to 12/2013 74 babies with isolated coarctation were diagnosed in our institution. 50 patients presented in the neonatal period and 24 patients beyond the first month. 5/74 infants presented after the neonatal period with poorly contractile, dilated left ventricles. Echocardiographic detection of the coarctation was facilitated by application of the ductal view and by Doppler interrogation of the celiac artery revealing a significantly diminished systolic flow velocity. All patients underwent resection of the coarctation and end-to-end anastomosis of the aorta. Postoperative normalization of left ventricular function was observed within a median interval of 2 months. Coarctation of the aorta presenting as DCM accounted for 21 % of our infants with coarctation who presented beyond the neonatal period and 7 % of those in the first year of life. The stenosis was difficult to detect because of its distal location and normal configuration of the aortic arch."

According to the news editors, the research concluded: "Isthmic coarctation should be included in the differential diagnosis of infants with DCM and requires careful examination of the isthmic region in these children."

For more information on this research see: Pitfalls in Echocardiography: Coarctation of the Aorta Presenting as Dilated Cardiomyopathy (DCM). Ultraschall in Der Medizin, 2016;37(5):482-486. Ultraschall in Der Medizin can be contacted at: Georg Thieme Verlag Kg, Rudigerstr 14, D-70469 Stuttgart, Germany.

The news editors report that additional information may be obtained by contacting G. Wiegand, University Children's Hospital, Pediat Cardiol, D-72074 Tubingen, Germany. Additional authors for this research include C. Schlensak and M. Hofbeck.

Investigators at University College Release New Data on Cancer Research (Phase I study of KW-2478, a novel Hsp90 inhibitor, in patients with B-cell malignancies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Research. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "KW-2478 is a novel, non-ansamycin, non-purine heat-shock protein 90 (Hsp90) inhibitor. In this phase I, multicentre study, KW-2478 was administered intravenously over 1 h at doses ranging from 14 to 176 mg m(-2) once daily on days 1-5 of a 14-day cycle in a standard 3+3 design in 27 patients (22 with multiple myeloma and 5 with non-Hodgkin lymphoma)."

Our news journalists obtained a quote from the research from University College, "Patients enrolled had relapsed/refractory disease previously treated with &#10878;2 regimens. There were no dose-limiting toxicities, thus the maximum-tolerated dose was not reached. KW-2478 was well tolerated and did not manifest significant retinal or ocular toxicity. The most common treatment-related adverse events were diarrhoea (33.3%), fatigue (29.6%), headache (25.9%), hypertension (22.2%), nausea (14.8%), vomiting (7.4%), and dizziness (7.4%). Plasma concentrations peaked at the end of infusion and decayed in a biphasic manner with a terminal half-life of &sim;6 h. Target inhibition was inferred from the increase in Hsp70 levels in peripheral blood mononuclear cells at doses &#10878;71 mg m(-2). Twenty-four of 25 (96%) evaluable patients showed stable disease, with five being free of disease progression for &#10878;6 months."

According to the news editors, the research concluded: "Preliminary clinical response data were encouraging and warrant further investigation of KW-2478 in combination regimens for relapsed/refractory B-cell malignancies."

The news correspondents report that additional information may be obtained from K. Yong, UCL Cancer Institute, University College London, Huntley Street, London WC1E 6DD, UK. Additional authors for this research include J. Cavet, P. Johnson, G. Morgan, C. Williams, D. Nakashima, S. Akinaga, H. Oakervee and J. Cavenagh.

Investigators at University Health Network Describe Findings in Aneurysm (Intra-aneurysmal hemodynamics: evaluation of pCONus and pCANvas bifurcation aneurysm devices using DSA optical flow imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurysm. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "Implantation of self-expanding stents from the parent artery into the sac of a bifurcation aneurysm is regularly used to facilitate endovascular coil occlusion with the so-called waffle cone technique (WCT). Self-expanding aneurysm bridging stents like Solitaire AB, can be used; however, bifurcation devices like pCONus and pCANvas are especially designed for WCT."

Our news journalists obtained a quote from the research from University Health Network, "These devices provide additional support for coil implantation owing to intraluminal nylon fibers (pCONus) or membranes (pCANvas) covering the intracranial aneurysm neck. Assessment of the intra-aneurysmal hemodynamic impact of these three devices: a regular intracranial stent (Solitaire AB) and two bifurcation devices (pCONus and pCANvas). An in vitro experiment was set up using a silicone model of a basilar tip aneurysm filled with blood mimicking fluid under a pulsatile circulation. Solitaire AB, pCONus, and pCANvas were successively implanted in the model for hemodynamic evaluation. High frame rate DSA series were acquired under various conditions. Intra-aneurysmal flow changes, including mean aneurysm flow amplitude ratio, were subsequently assessed by the optical flow method, measuring the detector velocity field before and after device implantations. Results pCONus and Solitaire minimally reduced the intra-aneurysmal flow (R=0.96, p=0.17 and R=0.91, p=0.01, respectively), whereas pCANvas strongly diminished the intra-aneurysmal flow (R=0.41, p=5x10(-12)). Waffle cone deployment of stents and technique-specific devices had no undesirable effect on the intra-aneurysmal flow. In particular, no increased flow was redirected into the aneurysm sac."

According to the news editors, the research concluded: "The intraluminal membrane of the pCANvas strongly reduced the intra-aneurysmal flow, potentially preventing recanalization problems."

Our news journalists report that additional information may be obtained by contacting V.M. Pereira, Toronto Western Hosp, Univ Hlth Network, Div Neurosurg, Dept. of Surg, Toronto, ON M5T 2S8, Canada. Additional authors for this research include H. Henkes, P. Bouillot, O. Brina, L.A. Slater and V.M. Pereira.

Anaphylactic Shock

Investigators at University Hospital Describe Findings in Anaphylactic Shock (Intraoperative anaphylactic shock to nefopam)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Anaphylactic Shock. According to news reporting from Montpellier, France, by NewsRx journalists, research stated, "Diagnosis of IgE dependant intraoperative anaphylaxis is supported by increased serum tryptase levels at the time of reaction."

The news correspondents obtained a quote from the research from University Hospital, "Nefopam is a centrally acting non-opioid analgesic drug widely used for the relief of moderate to severe pain as an alternative to opioid analgesic drugs."

According to the news reporters, the research concluded: "We report a case of an intraoperative IgE-dependent anaphylactic shock to nefopam, diagnosed by skin prick testing."

For more information on this research see: Intraoperative anaphylactic shock to nefopam. Revue Francaise D Allergologie, 2016;56(6):490-491. Revue Francaise D Allergologie can be contacted at: Elsevier Masson, Via Paleocapa 7, 20121 Milano, Italy.

Cardiovascular Diseases and Conditions...

Investigators at University Hospital Discuss Findings in Thromboangiitis Obliterans [Efficacy of bosentan in patients with refractory thromboangiitis obliterans (Buerger disease) A case series and review of the literature]
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Thromboangiitis Obliterans. According to news originating from Barcelona, Spain, by NewsRx correspondents, research stated, "The cornerstone of therapy in thromboangiitis obliterans (TAO) is complete abstinence from tobacco. In addition to discontinuation of cigarette smoking, very few pharmacological and surgical options of controversial efficacy are available to date."

Our news journalists obtained a quote from the research from University Hospital, "New therapeutic options with greater efficacy are clearly needed to properly manage these patients. In this preliminary study, we assessed the effectiveness and safety of bosentan in a case series of 8 adults with TAO and severe ischemic ulceronecrotic lesions who were treated with bosentan after inadequate response to platelet inhibitors, vasodilators, and intravenous alprostadil. Additionally, we reviewed 18 well-documented patients with refractory TAO treated with bosentan, which was previously reported (PubMed 1965-2015). These 26 patients formed the basis of our present analysis. All were current smokers. The median duration of bosentan treatment (SD) was 4.5 +/- 4 months (range 3-16). Eleven patients (42%) were unable to completely abstain from smoking during their follow-up. With bosentan treatment, no new ischemic lesions were observed in the target extremities. A complete therapeutic response was achieved in 80% of patients, whereas a partial response was observed in 12%. Two patients (8%) ultimately required amputation despite treatment. After discontinuation of bosentan, patients were followed for a median of 20 +/- 14 months (range 3-60). Two patients whose trophic lesions had healed relapsed. When comparing patients who gave up smoking with those who were unable to completely abstain from smoking during follow-up, no significant differences were found in efficacy outcomes. Four patients (15%) developed adverse events, requiring bosentan discontinuation in 1 case."

According to the news editors, the research concluded: "These preliminary data suggest that bosentan may be considered a therapeutic option for treatment of cases of severe TAO refractory to conventional treatment, and merit further evaluation in larger controlled, randomized clinical studies."

For more information on this research see: Efficacy of bosentan in patients with refractory thromboangiitis obliterans (Buerger disease) A case series and review of the literature. Medicine, 2016;95(48):218-222. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

The news correspondents report that additional information may be obtained from J. Narvaez, Hosp Univ Bellvitge IDIBELL, Dept. of Rheumatol, Barcelona, Spain. Investigators at University Hospital Report Findings in Epilepsy (Low-grade epilepsy-associated neuroepithelial tumours - the 2016 WHO classification)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Epilepsy are discussed in a new report. According to news reporting from Erlangen, Germany, by NewsRx journalists, research stated, "Rapid developments in molecular genetic technology and research have swiftly advanced our understanding of neuro-oncology. As a consequence, the WHO invited their expert panels to revise the current classification system of brain tumours and to introduce, for the first time, a molecular genetic approach for selected tumour entities, thus setting a new gold standard in histopathology."

The news correspondents obtained a quote from the research from University Hospital, "The revised 5th edition of the 'blue book' was released in May 2016 and will have a major impact in stratifying diagnosis and treatment. However, low-grade neuroepithelial tumours that present with early-onset focal epilepsy and are mostly seen in children and young adults (previously designated as long-term epilepsy-associated neuroepithelial tumours, LEAT) lack such innovative clinicopathological and molecular genetic tools."

According to the news reporters, the research concluded: "The Neuropathology Task Force of the International League against Epilepsy will critically discuss this issue, and will offer perspectives on how to decipher and validate clinically meaningful LEAT entities using the current WHO approach that integrates clinicopathological and genetic classification systems."

Our news journalists report that additional information may be obtained by contacting I. Blumcke, University Hospital Erlangen, Dept. of Neuropathol, D-91054 Erlangen, Germany. Additional authors for this research include E. Aronica, A. Becker, D. Capper, R. Coras, M. Honavar, T.S. Jacques, K. Kobow, H. Miyata, A. Muhlebner, J. Pimentel, F. Soylemezoglu and M. Thom.

Autoimmune Diseases and Conditions - Multiple...

Investigators at University Hospital Report Findings in Multiple Sclerosis (Vestibular and ocular motor function prior to and after therapeutic apheresis with small plasmfilter in multiple sclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Multiple Sclerosis. According to news reporting originating from Sofia, Bulgaria, by NewsRx correspondents, research stated, "Some patients with multiple sclerosis (MS) are resistant to steroid therapy. In them an alternative therapy could be therapeutic apheresis (TA)."

Our news editors obtained a quote from the research from University Hospital, "A woman with relapsing-remitting cerebral MS with dizziness and imbalance, resistant to steroid therapy was treated with low volume plasmapheresis with saline substitution. The first four sessions were performed every other day, 5-th after 30 days, 6-th 3 months later, and 7-th 6 months later. During each session 1000-1500 ml plasma was substituted with saline solution only. Symptoms were reduced. Objective vestibular and ocular-motor tests prior to and after the TA demonstrated improved function."

According to the news editors, the research concluded: "Low volume plasmapheresis with saline substitution might be effective therapeutic option for steroid resistant MS. Objective methods of measuring vestibular and ocular-motor functions are useful in assessing MS treatment. J. Clin. Apheresis 31:470-472, 2016."

The news editors report that additional information may be obtained by contacting O.I. Kolev, Univ Hosp Neurol & Psychiat St Naum, Sofia 1113, Bulgaria.

Neuropathy

Investigators at University Hospital Report Findings in Neuropathy (HSMNR belongs to the most frequent types of hereditary neuropathy in the Czech Republic and is twice more frequent than HMSNL)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neuropathy. According to news
reporting out of Prague, Czech Republic, by NewsRx editors, research stated, "Hereditary motor and sensory neuropathy type Russe (HMSNR), also called CMT4G, is an autosomal recessive inherited peripheral neuropathy (IPN) caused by a founder mutation in the HK1 gene. HMSNR affects only patients with Roma origin, similar to the better known HMSN type Lom clarified earlier."

Our news journalists obtained a quote from the research from University Hospital, "By testing IPN patients with Roma origin, we realized that HMSNR affects surprisingly many patients in the Czech Republic. HMSNR is one of the most frequent types of IPN in this country and appears to be twice more frequent than HMSNl. Pronounced lower limb atrophies and severe deformities often lead to walking inability in even young patients, but hands are usually only mildly affected even after many years of disease duration."

According to the news editors, the research concluded: "The group of 20 patients with HMSNR presented here is the first report about the prevalence of HMSNR from central Europe."

For more information on this research see: HSMNR belongs to the most frequent types of hereditary neuropathy in the Czech Republic and is twice more frequent than HMSNL. Clinical Genetics, 2016;90(2):161-165. Clinical Genetics can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com/; Clinical Genetics - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1399-0004)

Our news journalists report that additional information may be obtained by contacting D.S. Brozkova, Motol Univ Hosp, Prague 15006, Czech Republic. Additional authors for this research include J. Haberlova, R. Mazanec, J. Lastuvkova and P. Seeman.

Keywords for this news article include: Prague, Czech Republic, Europe, Genetics, Genetics, Neuropathy, University Hospital.

Transplant Medicine - Heart Transplants
Investigators at University Hospital Report New Data on Heart Transplants (Design of the DRAGET Study: a multicentre controlled diagnostic study to assess the detection of acute rejection in patients with heart transplant by means of T2 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Heart Transplants. According to news originating from Strasbourg, France, by NewsRx correspondents, research stated, "Patients with heart transplant are screened for silent graft rejection by recurrent endomyocardial biopsies. MRI can detect the presence of oedema non-invasively by quantitatively measuring changes of the transverse relaxation time T2 in the myocardium."

Our news journalists obtained a quote from the research from University Hospital, "Several monocentric studies have shown that T2 quantification could help detect graft rejection in a less invasive way. DRAGET is a national multicentre diagnostic study designed to prove that T2 quantification by MRI can detect graft rejection. 190 patients from 10 centres will undergo T2 quantification and endomyocardial biopsy, within 24 h, 4 to 6 times during the first
year after transplantation. T2 will be computed by analysing a sequence of 10 images obtained from a short-axis slice. Specific phantoms will be used to calibrate the T2 quantification on each MR scanner to cope with the different equipment (different vendors, magnetic field strength, etc). Specific pads with known T2 will also be used during each examination and provide a quality check to cope with the different experimental conditions (temperature, etc). All MRI and biopsy data will be reinterpreted in our centre and reproducibility will be assessed. The primary outcome will be sensitivity and specificity of MRI. The secondary outcomes will be (1) prognostic values of T2, (2) reproducibility of each techniques, (3) number of adverse events during each procedures and (4) confidence of the physicians in T2. Ethics approval has been obtained. The new MRI method will be disseminated at a national level and its practical usefulness will be assessed in centres not familiar with MRI T2 quantification."

According to the news editors, the research concluded: "The ultimate aim of the DRAGET project is to replace a strategy based solely on biopsy with one based on a first-line MRI (with biopsy only when needed) for a more efficient and less invasive detection of rejection. ANSM 2014-A00848-39, NCT02261870."

For more information on this research see: Design of the DRAGET Study: a multicentre controlled diagnostic study to assess the detection of acute rejection in patients with heart transplant by means of T2 quantification with MRI in comparison to myocardial biopsies. *Bmj Open*, 2015;5(10):e008963. **Cytometry**

**Investigators at University Hospital Target Cytometry (Flow cytometry in hematological nonmalignant disorders)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cytometry have been presented. According to news originating from Nantes, France, by NewsRx correspondents, research stated, "Multiparameter flow cytometry (MFC) has become an integral part of the diagnosis and classification of hematological malignancies. However, several nonmalignant or premalignant disorders may benefit from this technology in hematology laboratories."

Our news journalists obtained a quote from the research from University Hospital, "This review provides information on the normal immunophenotypic characteristics of peripheral blood leukocyte subsets and their modifications in several clinical conditions. The
usefulness of MFC and the specific markers that can be investigated in hyperlymphocytosis, infection, hypereosinophilia, paroxysmal nocturnal hemoglobinuria, and large granular lymphocyte disorders is described."

According to the news editors, the research concluded: "Mention is also made of the developments of MFC for analyses of red blood cells or platelets."

The news correspondents report that additional information may be obtained from M.C. Bene, Hematology Biology, University Hospital of Nantes, Nantes, France. Additional authors for this research include Y. Le Bris, N. Robillard, S. Wuilleme, M. Fouassier and M. Eveillard.

---

**Oncology - Liver Cancer**

**Investigators at University Hospital Zero in on Liver Cancer (Radiofrequency ablation of hepatocellular carcinoma: Mono or multipolar?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news reporting from Angers, France, by NewsRx journalists, research stated, "Thermo-ablation by radiofrequency is recognized as a curative treatment for early-stage hepatocellular carcinoma. However, local recurrence may occur because of incomplete peripheral tumor destruction."

The news correspondents obtained a quote from the research from University Hospital, "Multipolar radiofrequency has been developed to increase the size of the maximal ablation zone. We aimed to compare the efficacy of monopolar and multipolar radiofrequency for the treatment of hepatocellular carcinoma and determine factors predicting failure. A total of 171 consecutive patients with 214 hepatocellular carcinomas were retrospectively included. One hundred fifty-eight tumors were treated with an expandable monopolar electrode and 56 with a multipolar technique using several linear bipolar electrodes. Imaging studies at 6 weeks after treatment, then every 3 months, assessed local effectiveness. Radiofrequency failure was defined as persistent residual tumor after two sessions (primary radiofrequency failure) or local tumor recurrence during follow-up. This study received institutional review board approval (number
2014/77). Imaging showed complete tumor ablation in 207 of 214 lesions after the first session of radiofrequency. After a second session, only two cases of residual viable tumor were observed. During follow-up, there were 46 local tumor recurrences. Thus, radiofrequency failure occurred in 48/214 (22.4%) cases. By multivariate analysis, technique (p <0.001) and tumor size (p=0.023) were independent predictors of radiofrequency failure. Failure rate was lower with the multipolar technique for tumors <25 mm (p=0.023) and for tumors between 25 and 45 mm (p=0.082). There was no difference for tumors (>=) 45 mm (p=0.552)."

According to the news reporters, the research concluded: "Compared to monopolar radiofrequency, multipolar radiofrequency improves tumor ablation with a subsequent lower rate of local tumor recurrence."

Our news journalists report that additional information may be obtained by contacting V. Cartier, Dept. of Radiology, University Hospital, Angers, France. Additional authors for this research include J. Boursier, J. Lebigot, F. Oberti, I. Fouchard-Hubert and C. Aube.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jgh.13179. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions -...

Investigators at University of Alabama Report New Data on Hypertension (Urinary sodium excretion predicts blood pressure response to spironolactone in patients with resistant hypertension independent of aldosterone status)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news reporting originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "Resistant hypertension (RHTN), blood pressure (BP) at least 140/90 mmHg despite using at least three different medications, including a diuretic, is associated with high dietary sodium and hyperaldosteronism. Mineralocorticoid receptor antagonists are recommended for treatment of RHTN, however, BP response to these agents varies widely."

Our news editors obtained a quote from the research from the University of Alabama, "In the current analysis, we assessed predictors of BP response to spironolactone in patients with RHTN. We retrospectively evaluated the BP response to adding spironolactone 12.5-25 mg to existing medications. A favorable BP response was defined as a reduction in SBP of at least 10 mmHg. Tested variables included baseline characteristics and biochemical parameters. A total of 79 patients with RHTN were included in the analysis. Evaluated patients..."
were more likely women (53.2%) and African-American (55.8%); were generally obese (76%) and were prescribed an average of four antihypertensive medications. Baseline SBP was 153.6 ± 22.3 mmHg; addition of spironolactone resulted in a mean reduction of 15.5 ± 20.7 mmHg. Patients with high urinary sodium excretion (≥200 mEq/24 h) had a significantly greater BP reduction compared with patients with normal excretion (<200 mEq/24 h) (p=0.008). Multivariable analysis identified 24 h urinary sodium excretion as a significant predictor of BP response (p=0.021) after controlling for potential confounders, including primary aldosteronism. The antihypertensive effect of spironolactone is positively related to urinary sodium excretion regardless of aldosterone status."

According to the news editors, the research concluded: "These findings suggest that mineralocorticoid receptor antagonists may be of preferential benefit in counteracting the BP effects of high dietary sodium."

For more information on this research see: Urinary sodium excretion predicts blood pressure response to spironolactone in patients with resistant hypertension independent of aldosterone status. Journal of Hypertension, 2016;34(5):1005-10. (Lippincott Williams and Wilkins - www.lww.com; Journal of Hypertension - journals.lww.com/jhypertension/pages/default.aspx)

The news editors report that additional information may be obtained by contacting L. Ghazi, aDept. of Medicine and Cardiovascular Disease, Vascular Biology and Hypertension Program bCenter for Clinical and Translational Science, University of Alabama at Birmingham, Birmingham, Alabama, United States. Additional authors for this research include T. Dudenbostel, C.P. Lin, S. Oparil and D.A Calhoun.

samples of grade 5 students (age 10-11 years) from 10 intervention schools in low-
socioeconomic neighbourhoods and 20 comparison schools in middle-socioeconomic
neighbourhoods. Multilevel models assessed differences in step-counts between intervention
and comparison groups over-time by weight (objectively measured) and socioeconomic status
subgroups. In 2009, children from intervention schools were less active on weekends relative to
comparison schools (9212 vs. 11186 steps/day p<0.01). Two years later, daily step-counts on
weekend days among children in low socioeconomic intervention schools increased such that
they approximated those of children from middle socioeconomic comparison schools (12148 vs.
12121 steps/day p=0.96). The relative difference in steps between intervention and comparison
schools on weekends reduced from -21.4% to 0.2% following the intervention. The
normalization of weekend step counts was similar for normal weight (-21.4% to +2.0%) and
overweight (-19.1 to +3.9%) children, and was balanced across socioeconomic subgroups.
These data suggest that school-based health promotion is effective for reducing inequities in
physical activity levels outside school hours."

According to the news editors, the research concluded: "Investments in school-based
health promotion lead to behavior modification beyond the school environment."

For more information on this research see: Does School-Based Health Promotion
Affect Physical Activity on Weekends? And, Does It Reach Those Students Most in Need of
Health Promotion? Plos One, 2015;10(10):e0137987. (Public Library of Science -

**Oncology - Prostate Cancer**

**Investigators at University of Arizona College of Medicine Report New Data on Prostate Cancer (Prostate Cancer-Associated Disseminated Intravascular Coagulation with Excessive Fibrinolysis Treated with Degarelix)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Prostate Cancer. According to news reporting originating from Tucson, Arizona, by NewsRx correspondents, research stated, "Disseminated intravascular coagulation (DIC) with excessive fibrinolysis (XFL) is a rare and acute life-threatening variant of DIC in patients with prostate cancer. Patients present with coagulopathy, hypofibrinogenemia, and systemic bleeding."

Our news editors obtained a quote from the research from the University of Arizona College of Medicine, "We describe a case of DIC XFL caused by prostate cancer (PC)
successfully treated with a single injection of degarelix, a gonadotropin-releasing hormone (GnRH) receptor antagonist. This led to prompt control of the patient's coagulopathy within ten days of treatment.

According to the news editors, the research concluded: "Our case highlights features of this rare and devastating hemorrhagic complication of PC along with a fast-acting and effective therapeutic drug option."

For more information on this research see: Prostate Cancer-Associated Disseminated Intravascular Coagulation with Excessive Fibrinolysis Treated with Degarelix. Case Reports In Oncological Medicine, 2015;2015():212543. (Hindawi Publishing - www.hindawi.com; Case Reports In Oncological Medicine - www.hindawi.com/crim/oncmed/) 

The news editors report that additional information may be obtained by contacting S.Y. Ong, University of Arizona College of Medicine, 1501 N Campbell Avenue, Tucson, AZ 85724, United States. was analyzed by immunohistochemistry. LincRNA-p21 was down-regulated in tumor tissue, but no association was observed with TP53 mutational status. High lincRNA-p21 levels were associated with poor CSS in all patients (p = 0.032). When patients were classified according to histological subtypes, the impact of lincRNA-p21 was confined to patients with adenocarcinoma in both time to relapse (p = 0.006) and CSS (p < 0.001). To explain the poor outcome of patients with high lincRNA-p21 expression, we studied the role of lincRNA-p21 in angiogenesis in vitro and observed a global downregulation in the expression of angiogenesis-related genes when lincRNAp21 was inhibited. Moreover, supernatants from lincRNAp21-inhibited cells were significantly less angiogenic and had lower levels of secreted vascular endothelial growth factor A than controls did. Finally, tumor samples with high lincRNA-p21 levels had higher microvascular density."

According to the news editors, the research concluded: "Our findings suggest that lincRNA-p21 affects outcome in patients with NSCLC adenocarcinoma through the regulation of angiogenesis."

The news editors report that additional information may be obtained by contacting A. Navarro, University of Barcelona, Mol Oncol & Embryol Lab, Human Anat Unit, Sch MedIDIBAPS, Barcelona, Spain. Additional authors for this research include A. Navarro, N. Vinolas, R.M. Marrades, J. Moises, A. Cordeiro, A. Saco, C. Munoz, D. Fuster, L. Molins, J. Ramirez and M. Monzo.

**Nutritional and Metabolic Diseases and Conditions**

**Investigators at University of Bielsko Biala Discuss Findings in Type 2 Diabetes (Independent Factors of Changes of Ankle-Brachial Index in Peripheral Arterial Occlusive Disease in Elderly Patients with or without Diabetes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting out of Bielsko Biala, Poland, by NewsRx editors, research stated, "Peripheral arterial disease (PAD) belongs to the commonly-occurring pathologies associated with elderly age. A simple tool for defining the severity of PAD is the ankle-brachial index (ABI)."

Our news journalists obtained a quote from the research from the University of Bielsko Biala, "The purpose of this research was to determine independent factors of changes of ABI in elderly patients with occlusive PAD disease (PAOD) with and without diabetes. The research was carried out on 49 elderly patients with PAOD, including 29 patients with type 2
diabetes, and 20 patients without diabetes. The concentration of interleukin-6 (IL-6), E-selectin, fibrinogen, and C-reactive protein (CRP) in the blood serum was marked. In all patients, the independent factors of changes of ABI were determined with the use of the multiple logistic regression analysis. Our results show that in the group of patients with PAOD suffering from diabetes, it was demonstrated that the ABI was related to age, the duration of the symptoms of PAD, body mass index (BMI), low-density lipoprotein cholesterol, fibrinogen, and sex (determination coefficient R-2 = 0.699). In patients with PAOD without diabetes, the ABI was related to age, the duration of the symptoms of PAD, the levels of CRP, E-selectin, high-density lipoprotein cholesterol, and the glomerular filtration rate (determination coefficient R-2 = 0.844)."

According to the news editors, the research concluded: "We conclude that in elderly patients with PAOD with and without diabetes, the participation of independent factors related to the ABI is diversified; in patients with diabetes, the concentration of IL-6 and fibrinogen is lower, and the concentration of E-selectin is higher than in patients without diabetes."

For more information on this research see: Independent Factors of Changes of Ankle-Brachial Index in Peripheral Arterial Occlusive Disease in Elderly Patients with or without Diabetes. International Journal of Environmental Research and Public Health, 2016;13(11):935-945. Health and Medicine

Investigators at University of Birmingham Report Findings in Health and Medicine [Nominal ISOMERs (Incorrect Spellings Of Medicines Eluding Researchers)-variants in the spellings of drug names in PubMed: a database review]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Health and Medicine is now available. According to news reporting out of Birmingham, United Kingdom, by NewsRx editors, research stated, "To examine how misspellings of drug names could impede searches for published literature. Database review. DATA PubMed. REVIEW The study included 30 drug names that are
commonly misspelt on prescription charts in hospitals in Birmingham, UK (test set), and 30 control names randomly chosen from a hospital formulary (control set)."

Our news journalists obtained a quote from the research from the University of Birmingham, "The following definitions were used: standard names—the international nonproprietary names, variant names—deviations in spelling from standard names that are not themselves standard names in English language nomenclature, and hidden reference variants—variant spellings that identified publications in textword (tw) searches of PubMed or other databases, and which were not identified by textword searches for the standard names. Variant names were generated from standard names by applying letter substitutions, omissions, additions, transpositions, duplications, deduplications, and combinations of these. Searches were carried out in PubMed (30 June 2016) for 'standard name[tw]' and 'variant name[tw] NOT standard name[tw].' The 30 standard names of drugs in the test set gave 325,979 hits in total, and 160 hidden reference variants gave 3,872 hits (1.17%). The standard names of the control set gave 470,064 hits, and 79 hidden reference variants gave 766 hits (0.16%). Letter substitutions (particularly i to y and vice versa) and omissions together accounted for 2,924 (74%) of the variants. Amitriptyline (8,530 hits) yielded 18 hidden reference variants (179 (2.1%) hits). Names ending in 'in,' 'ine,' or 'micin' were commonly misspelt. Failing to search for hidden reference variants of 'gentamicin,' 'amitriptyline,' 'mirtazapine,' and 'trazodone' would miss at least 19 systematic reviews. A hidden reference variant related to Christmas, 'No-el', was rare; variants of 'X-miss' were rarer."

According to the news editors, the research concluded: "When performing searches, researchers should include misspellings of drug names among their search terms."

Our news journalists report that additional information may be obtained by contacting R.E. Ferner, University of Birmingham, Inst Clin Sci, Birmingham, W Midlands, United Kingdom.

Keywords for this news article include: Birmingham, United Kingdom, Europe, Health and Medicine, Article Review, Drugs and Therapies, University of Birmingham.

Hormones

Investigators at University of Calgary Report Findings in Hormones (Two light-activated neuroendocrine circuits arising in the eye trigger physiological and morphological pigmentation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hormones. According to news reporting out of Calgary, Canada, by NewsRx editors, research stated, 'Two biological processes regulate light-induced skin colour change. A fast physiological pigmentation change' (i.e. circadian variations or camouflage) involves alterations in the distribution of pigment containing granules in the cytoplasm of chromatophores, while a slower morphological pigmentation change' (i.e.
seasonal variations) entails changes in the number of pigment cells or pigment type."

Financial support for this research came from Natural Sciences and Engineering Research Council of Canada.

Our news journalists obtained a quote from the research from the University of Calgary, "Although linked processes, the neuroendocrine coordination triggering each response remains largely obscure. By evaluating both events in Xenopus laevis embryos, we show that morphological pigmentation initiates by inhibiting the activity of the classical retinal ganglion cells. Morphological pigmentation is always accompanied by physiological pigmentation, and a melatonin receptor antagonist prevents both responses. Physiological pigmentation also initiates in the eye, but with repression of melanopsin-expressing retinal ganglion cell activity that leads to secretion of alpha-melanocyte-stimulating hormone (-MSH)."

According to the news editors, the research concluded: "Our findings suggest a model in which eye photoperception links physiological and morphological pigmentation by altering -MSH and melatonin production, respectively."

Our news journalists report that additional information may be obtained by contacting S. McFarlane, University of Calgary, Alberta Childrens Hosp, Res Inst, Hotchkiss Brain InstDept Cell Biol & Anat, Calgary, AB, Canada. Additional authors for this research include C.L. Hehr, H. Munn and S. McFarlane.

Oncology - Non-Small Cell Lung Cancer

Investigators at University of California Davis School of Medicine Discuss Findings in Non-Small Cell Lung Cancer (Surgical Management of Advanced Non-Small Cell Lung Cancer Is Decreasing But Is Associated With Improved Survival)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Non-Small Cell Lung Cancer have been presented. According to news originating from Davis, California, by NewsRx correspondents, research stated, "For patients with advanced stage non-small cell lung cancer (NSCLC), chemotherapy and chemoradiation are the principal treatment modalities, and the role of surgical resection remains unclear. Our objective was to evaluate current trends and oncologic outcomes for advanced stage NSCLC."
Financial supporters for this research include National Center for Advancing Translational Sciences, National Institutes of Health.

Our news journalists obtained a quote from the research from the University of California Davis School of Medicine, "We hypothesized that surgery is associated with increased survival and may be an underutilized treatment modality. The California Cancer Registry was queried from 2004 to 2012 for cases of stage IIIA, IIIB, and IV NSCLC, and we identified 34,016 cases. Patients were categorized by treatment group, and linear regression was used to calculate trends in treatment and predictors of treatment group. Kaplan-Meier and Cox regression modeling were used to determine the influence of treatment group on overall survival. Twenty-seven percent of patients (9,223 of 34,016) received no treatment. For the entire cohort, treatment with chemotherapy alone increased (p < 0.001), but treatment with radiotherapy alone, surgery alone, or in any combination decreased (p = 0.011, p< 0.001, p = 0.021, p = 0.007, and p = 0.094). Treatment group, age, sex, race, socioeconomic status, stage, histology, and tumor size were all significant predictors of overall survival. Overall survival was significantly longer for patients who had surgery as part of their treatment regimen (p < 0.001). For patients with advanced stage NSCLC, the use of multimodality regimens that include surgery are decreasing despite longer overall survival."

According to the news editors, the research concluded: "Future studies are needed to identify the demographics and clinical characteristics of patients with advanced stage NSCLC who may benefit from surgery."

The news report states that additional information may be obtained from E.A. David, UC Davis Sch Med, Dept. of Public Hlth Sci, Davis, CA, United States. Additional authors for this research include R.J. Canter, Y.J. Chen, D.T. Cooke and R.D. Cress. Immune System Diseases and Conditions - HIV/AIDS

Investigators at University of California Describe Findings in HIV/AIDS (HIV Transmission Risk Behavior in a Cohort of HIV-Infected Treatment-Na<ve Men and Women in the United States)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - HIV/AIDS have been published. According to news reporting originating from Los Angeles,
California, by NewsRx correspondents, research stated, "Antiretroviral therapy (ART) can minimize HIV transmission. Prevention benefits may be compromised by barriers to virologic suppression, and by increased condomless sex among those initiating ART."

Our news editors obtained a quote from the research from the University of California, "We evaluated condomless sex in a cohort of HIV-infected US individuals poised to initiate ART in a clinical trial. We assessed partner and sex act type, condom use, and perception of infectiousness. Six percent of participants reported as not infectious; men who have sex with men were more likely to perceive high infectivity. Prevalence of condomless sex was 44%; 74% of those also reported homosexual acquisition of HIV. Predictors of increased risk of condomless sex included greater numbers of lifetime partners, recent stimulant drug use and an HIV-positive or unknown serostatus partner. In the context of serodifferent partners, lower perception of infectiousness was also associated with a higher risk of condomless sex."

According to the news editors, the research concluded: "Results highlight opportunities for prevention education for HIV infected individuals at ART initiation."

For more information on this research see: HIV Transmission Risk Behavior in a Cohort of HIV-Infected Treatment-Na < ve Men and Women in the United States. AIDS and Behavior, 2016;20(12):2983-2995. Pediatrics - Adolescent Medicine

Investigators at University of California Report Findings in Adolescent Medicine (Teen Preferences for Clinic-Based Behavior Screens: Who, Where, When, and How?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Pediatrics - Adolescent Medicine are discussed in a new report. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "Previous research examining computer-based adolescent risk behavior screening was done before widespread adoption of smartphones and merits updating. This is a cross-sectional survey among 115 adolescents seeking primary care age 12-18 years."

Our news editors obtained a quote from the research from the University of California, "It is a diverse sample with 59% female, 51% white, 18% African-American, and 27% Latino. Respondents were asked level of comfort and honesty (1 - strongly disagree, 5 - strongly agree) when answering health behavior questions by paper, interview, or electronic device. Differences in the level of agreement were tested using a Wilcoxon signed rank test. 
Adolescents reported a higher level of comfort and honesty for screening conducted via electronic device versus paper (90% vs. 57%, p< .001; 89% vs. 61%, p<.001). Sixty-two percent adolescents prefer waiting room electronic screening versus at home (4.7%) or by provider in the examination room (11.2%).

According to the news editors, the research concluded: "Electronic same-day risk behavior screening is the preferred method for adolescents and should be incorporated into preventive services."

The news editors report that additional information may be obtained by contacting C.B. Jasik, University of California, Dept. of Pediat, Div Adolescent & Young Adult Med, San Francisco, CA, United States. Additional authors for this research include M. Berna, M. Martin and E.M. Ozer.

Diseases and Conditions - Basilar Aneurysm

Investigators at University of California Report Findings in Basilar Aneurysm (Treatment of wide-necked basilar tip aneurysm not amenable to Y-stenting using the PulseRider device)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Diseases and Conditions - Basilar Aneurysm is now available. According to news reporting from Los Angeles, California, by NewsRx journalists, research stated, "Endovascular treatment of broad-necked bifurcation aneurysms remains challenging."

The news correspondents obtained a quote from the research from the University of California, "Stent-assisted coiling has been successful but requires catheterization of the branches off the parent vessel. We present the case of a patient who failed primary and stent-assisted coiling of a large basilar tip aneurysm because the morphology of the aneurysm precluded successful distal catheterization of the posterior cerebral artery (PCA) branches."

According to the news reporters, the research concluded: "Using the PulseRider device, which does not require catheterization of bifurcation branches, we were able to treat the aneurysm successfully."

Investigators at University of California Report Findings in Human Genetics (Colocalization of GWAS and eQTL Signals Detects Target Genes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Genetics - Human Genetics have been presented. According to news reporting from Los Angeles, California, by NewsRx journalists, research stated, "The vast majority of genome-wide association study (GWAS) risk loci fall in non-coding regions of the genome. One possible hypothesis is that these GWAS risk loci alter the individual's disease risk through their effect on gene expression in different tissues."

Funders for this research include National Science Foundation, NIH, NIH Big Data to Knowledge, Novo Nordisk, University Of Oxford, Broad Institute, National Institute of Neurological Disorders and Stroke Informatics Center for Neurogenetics and Neurogenomics.

The news correspondents obtained a quote from the research from the University of California, "In order to understand the mechanisms driving a GWAS risk locus, it is helpful to determine which gene is affected in specific tissue types. For example, the relevant gene and tissue could play a role in the disease mechanism if the same variant responsible for a GWAS locus also affects gene expression. Identifying whether or not the same variant is causal in both GWASs and expression quantitative trait locus (eQTL) studies is challenging because of the uncertainty induced by linkage disequilibrium and the fact that some loci harbor multiple causal variants. However, current methods that address this problem assume that each locus contains a single causal variant. In this paper, we present eCAVIAR, a probabilistic method that has several key advantages over existing methods. First, our method can account for more than one causal variant in any given locus. Second, it can leverage summary statistics without accessing the individual genotype data. We use both simulated and real datasets to demonstrate the utility of our method."

According to the news reporters, the research concluded: "Using publicly available eQTL data on 45 different tissues, we demonstrate that eCAVIAR can prioritize likely relevant tissues and target genes for a set of glucose-and insulin-related trait loci."

For more information on this research see: Colocalization of GWAS and eQTL Signals Detects Target Genes. American Journal of Human Genetics, 2016;99(6):1245-1260. American Journal of Human Genetics can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; American Journal of
Human Genetics - www.journals.elsevier.com/american-journal-of-human-genetics/

Our news journalists report that additional information may be obtained by contacting E. Eskin, University of California, Dept. of Human Genet, Los Angeles, CA 90095, United States. Additional authors for this research include M. van de Bunt, A.V. Segre, X. Li, J.W.J. Joo, M. Bilow, J.H. Sul, S. Sankararaman, B. Pasaniuc and E. Eskin.

Skin Diseases

Investigators at University of California Report Findings in Skin Diseases (Therapeutic RNAi robed with ionic liquid moieties as a simple, scalable prodrug platform for treating skin disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases are presented in a new report. According to news originating from Santa Barbara, California, by NewsRx correspondents, research stated, "The high prevalence of skin diseases and their visible symptoms result in major physical, emotional, and economic burden for which few solutions exist. To address this unmet medical need, topical delivery of RNAi such as siRNA holds many advantages including direct access to the diseased site, potent knockdown of disease symptoms, and limited off-target effects."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from the University of California, "Unfortunately, delivering drugs into skin is extremely difficult. To address these concerns, we present RNAi robed with ionic liquid moieties. Specifically, we show that robed-siRNAs can be synthesized by a simple two-step process from bulk materials. Robing affords tuneability of properties necessary for dermal drug delivery including octanol-water partitioning, skin transport, and cell internalization. The efficacy and safety of robed-siRNA for treating skin disease was confirmed by its ability to limit breakdown of elastin, a major cause of premature aging, following UVB exposure to human reconstructed skin tissue."

According to the news editors, the research concluded: "Together, the data strongly support that therapeutic RNAi robed with ionic liquid moieties are a simple, scalable prodrug platform for treating skin disease."

For more information on this research see: Therapeutic RNAi robed with ionic liquid moieties as a simple, scalable prodrug platform for treating skin disease. Journal of Controlled Release, 2016;242():80-88. Journal of Controlled Release can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Controlled Release - www.journals.elsevier.com/journal-of-controlled-release/)

The news correspondents report that additional information may be obtained from S. Mitragotri, University of California, Dept. of Chem Engn, Santa Barbara, CA 93106, United States.
Investigators at University of Chicago Detail Findings in Blood Transfusion (Endothelin Receptor A Antagonism Prevents Damage to Glycogen-Rich Placental Cells Following Uterine Ischemia-Reperfusion in the Rat)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transfusion Medicine - Blood Transfusion have been published. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "Fetal growth restriction (FGR) is a common cause of perinatal morbidity and mortality. Suboptimal uteroplacental perfusion is the most commonly identified cause of FGR, and ischemic lesions are often observed in placentas from pregnancies complicated by FGR."

Our news journalists obtained a quote from the research from the University of Chicago, "Ischemia followed by reperfusion is a strong stimulus to the production of the vasoconstrictor endothelin 1 (ET-1) which has been implicated in several models of FGR. We sought to investigate oxidative stress and placental morphology in a rat model of ischemia-reperfusion (I/R)-induced FGR and to evaluate the role of ET-1 in the observed pathology. Unilateral uterine I/R (30 min) was conducted, with and without simultaneous ET-1 receptor A (ETA) antagonism, on pregnant rats at gestation day 17. Placental tissues collected 24 hours later were evaluated immunohistochemically for oxidative damage. Tissue pathology was studied using quantitative morphometry. Glycogen-rich cellular areas in the placental junctional zone exhibited only 50% intact cells (P < .001) in both uterine horns following unilateral I/R, compared to controls. ETA antagonism prevented damage to the glycogen-rich cellular areas. Oxidative damage in response to I/R was prominent in the labyrinthine layer in both uterine horns and was not affected by ETA antagonism. We conclude that glycogen-rich cellular areas of the placental junctional zone are particularly vulnerable to damage from uterine I/R in the rat. Nucleic acid oxidative damage in the labyrinth is a prominent effect of uterine I/R."

According to the news editors, the research concluded: "ETA antagonism protects placental cellular integrity during I/R challenge but does not prevent nucleic acid oxidative damage."

For more information on this research see: Endothelin Receptor A Antagonism Prevents Damage to Glycogen-Rich Placental Cells Following Uterine Ischemia-Reperfusion in the Rat. Reproductive Sciences, 2016;23(11):1518-1525. Reproductive Sciences can be contacted at: Sage Publications Inc, 2455 Teller Rd, Thousand Oaks, CA 91320, USA. **Oncology - Colon Cancer**

**Investigators at University of Chicago Release New Data on Colon Cancer (TET-catalyzed 5-hydroxymethylcytosine regulates gene expression in differentiating colonocytes and colon cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "The formation of differentiated cell types from pluripotent progenitors involves epigenetic regulation of gene expression. DNA hydroxymethylation results from the enzymatic oxidation of 5-methylcytosine (5-mC) to 5-hydroxymethylcytosine (5-hmC) by the ten-eleven translocation (TET) 5-mC dioxygenase enzymes."

Our news journalists obtained a quote from the research from the University of Chicago, "Previous work has mapped changes in 5-mC during differentiation of intestinal stem cells. However, whether or not 5-hmC regulates colonocyte differentiation is unknown. Here we show that 5-hmC regulates gene expression during colonocyte differentiation and controls gene expression in human colon cancers. Genome-wide profiling of 5-hmC during in vitro colonic differentiation demonstrated that 5-hmC is gained at highly expressed and induced genes and is associated with intestinal transcription factor binding sites, including those for HNF4A and CDX2. TET1 induction occurred during differentiation, and TET1 knockdown altered gene expression and inhibited barrier formation of colonocytes. We find that the 5-hmC distribution in primary human colonocytes parallels the distribution found in differentiated cells in vitro, and that gene-specific 5-hmC changes in human colon cancers are directly correlated with changes in gene expression."

According to the news editors, the research concluded: "Our results support a model in which 5-hmC regulates differentiation of adult human intestine and 5-hmC alterations contribute to the disrupted gene expression in colon cancer."

For more information on this research see: TET-catalyzed 5-hydroxymethylcytosine regulates gene expression in differentiating colonocytes and colon cancer. *Scientific Reports*, 2015;5():17568. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Drugs and Therapies - Central Nervous System Agents**

**Investigators at University of Coimbra Report Findings in Central Nervous System Agents (A Rapid and Sensitive HPLC-DAD Assay to Quantify Lamotrigine, Phenytoin and Its Main Metabolite in Samples of Cultured HepaRG Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Central Nervous System Agents have been published. According to news originating from Coimbra, Portugal, by NewsRx correspondents, research stated, "A sensitive and fast high-performance liquid chromatography-diode-array detection assay was developed and validated for the simultaneous quantification of 5-(4-hydroxyphenyl)-5-phenylhydantoin (HPPH), phenytoin (PHT) and lamotrigine (LTG) in samples of cultured HepaRG cells. Chromatographic separation of analytes and internal standard (IS) was achieved in similar to 15 min on a C18-column, at 35 degrees C, using acetonitrile (6%), methanol (25%) and a mixture (69%) of water-triethylamine (99.7: 0.3, v/v; pH 6.0), pumped at 1 mL/min."

Our news journalists obtained a quote from the research from the University of Coimbra, "The analytes and IS were detected at 215 or 235 nm. Calibration curves were linear with regression coefficients >0.994 over the concentration ranges of 0.1-15 µg/mL for HPPH; 0.15-30 µg/mL for PHT and 0.2-20 µg/mL for LTG. The method showed to be accurate (bias value of +/- 10.5 or +/- 17.6% in the lower limit of quantification, LLOQ) and precise (coefficient variation <= 8.1 or <= 15.4% in the LLOQ), and the absolute recovery of the analytes ranged from 62.5 to 96.9%.

According to the news editors, the research concluded: "HepaRG cells have emerged as a very promising in vitro model to evaluate metabolic, drug interaction and/or pharmacokinetic studies, and this methodology will be suitable to support subsequent studies involving the antiepileptic drugs PHT and LTG."

The news correspondents report that additional information may be obtained from G. Alves, University of Coimbra, CNC Center Neurosci & Cell Biol, P-3004517 Coimbra, Portugal. Additional authors for this research include M. Rodrigues, A. Falcao and G. Alves.

**Nutritional and Metabolic Diseases and Conditions -…**

**Investigators at University of Colorado Detail Findings in Obesity (Characterization of Childhood Obesity and Behavioral Factors)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating in Aurora, Colorado, by NewsRx journalists, research stated, "Childhood obesity is a major public health threat in the United States. Recent data indicate that 34.2% of children ages 6 to 11 years are overweight or obese."

The news reporters obtained a quote from the research from the University of Colorado, "The purpose of this study is to describe childhood obesity levels and identify risk behaviors in two school-based health centers in Michigan, one urban and one rural. This study is a secondary data analysis from a multicenter comparative effectiveness trial. Multiple logistic regression was used to examine behavioral factors associated with overweight/obesity in children. In this sample (n = 105), 41.9% were obese and 16.2% were overweight. The duration of sleep per night (p = .04) and the frequency of eating breakfast (p = .04) were significant predictors of being overweight/obese. Health care providers in school-based health centers must be comfortable assessing, preventing, and treating childhood obesity in this high-risk group of patients."

According to the news reporters, the research concluded: "Interventions should encourage children to eat breakfast daily and to get adequate sleep."

Our news correspondents report that additional information may be obtained by contacting B. Gance-Cleveland, University of Colorado, Coll Nursing, Aurora, CO, United States. Additional authors for this research include H. Aldrich, T.J. Callahan, E.E. Matthews and B. Gance-Cleveland.

Oncology - Bladder Cancer

Investigators at University of Connecticut Report Findings in Bladder Cancer (AMPK alpha 2 Regulates Bladder Cancer Growth through SKP2-Mediated Degradation of p27)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Bladder Cancer. According to news reporting from Farmington, Connecticut, by NewsRx journalists, research stated, "AMP-activated protein kinase (AMPK) is the central metabolic regulator of the cell and controls energy consumption based upon nutrient availability. Due to its role in energy regulation, AMPK has been implicated as a barrier for cancer progression and is suppressed in multiple cancers."

The news correspondents obtained a quote from the research from the University of Connecticut, "To examine whether AMPK regulates bladder cancer cell growth, HTB2 and HT1376 bladder cells were treated with an AMPK activator, 5-aminoimidazole-4-carboxamide ribonucleotide (AICAR). AICAR treatment reduced proliferation and induced the expression of p27(Kip1) (CDKN1B), which was mediated through an mTOR-dependent mechanism. Interestingly, AMPK alpha 2 knockdown resulted in reduced p27 levels, whereas AMPK alpha 1 suppression did not. To further determine the exact mechanism by which AMPK alpha 2 regulates p27, HTB2 and HT1376 cells were transduced with an shRNA targeting AMPK alpha 2. Stable knockdown of AMPK alpha 2 resulted in increased proliferation and decreased p27 protein. The reduced p27 protein was determined to be dependent upon SKP2. Additionally, loss of AMPK alpha 2 in a xenograft and a chemical carcinogen model of bladder cancer resulted in larger tumors with less p27 protein and high SKP2 levels."

According to the news reporters, the research concluded: "Consistent with the regulation observed in the bladder cancer model systems, a comprehensive survey of human primary bladder cancer clinical specimens revealed low levels of AMPK alpha 2 and p27 and high levels of SKP2."

For more information on this research see: AMPK alpha 2 Regulates Bladder Cancer Growth through SKP2-Mediated Degradation of p27. Molecular Cancer Research, 2016;14(12):1182-1194. Molecular Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Investigators at University of Copenhagen Describe Findings in Atherosclerosis (Marker of Endothelial Dysfunction Asymmetric Dimethylarginine Is Elevated in HIV Infection but Not Associated With Subclinical Atherosclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting out of Copenhagen, Denmark, by NewsRx editors, research stated, "Cardiovascular disease contributes to excess morbidity and mortality in HIV infection, and endothelial dysfunction may contribute to this pattern. We aimed to determine the endothelial function in treated and untreated HIV-infected individuals and investigate potential associations with viral replication, immune activation, coagulation, platelet function, and subclinical atherosclerosis."

Our news journalists obtained a quote from the research from the University of Copenhagen, "Asymmetric dimethylarginine (ADMA, marker of endothelial dysfunction) and soluble CD14 (sCD14, marker of monocyte activation) were measured in plasma from two previously established cross-sectional cohorts: cohort A including 50 untreated and 50 antiretroviral therapy (ART)-treated HIV-infected individuals with previously assessed coagulation and platelet function and cohort B including 105 HIV-infected individuals on ART and 105 uninfected controls with previously assessed coronary artery calcium score, myocardial perfusion defects, and carotid intima-media thickness. Concentrations of ADMA were higher in HIV-infected individuals compared with uninfected controls, and higher ADMA was found in ART-treated compared with untreated HIV-infected individuals. ADMA was associated with viral load, sCD14, D-dimer, and low CD4(+) T-cell count in untreated HIV infection. Only viral load remained significant in multivariate analyses. In ART-treated HIV-infected individuals, ADMA was not associated with coronary artery calcium score, myocardial perfusion defects, or intima-media thickness. Evidence of endothelial dysfunction was found in HIV infection and in untreated compared with treated HIV infection. In untreated HIV infection, the main driver of endothelial dysfunction was viral replication. Importantly, in treated HIV infection, ADMA was not associated with subclinical atherosclerosis."

According to the news editors, the research concluded: "Thus, our data question the potential of ADMA as a useful biomarker of early atherosclerosis in treated HIV infection."

Investigators at University of Copenhagen Discuss Findings in Staphylococcus aureus (The Lantibiotic NAI-107 Efficiently Rescues Drosophila melanogaster from Infection with Methicillin-Resistant Staphylococcus aureus USA300)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Positive Bacteria - Staphylococcus aureus is now available. According to news originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "We used the fruit fly Drosophila melanogaster as a cost-effective in vivo model to evaluate the efficacy of novel antibacterial peptides and peptoids for treatment of methicillin-resistant Staphylococcus aureus (MRSA) infections. A panel of peptides with known antibacterial activity in vitro and/or in vivo was tested in Drosophila."

Financial support for this research came from Det Frie Forskningsrad (DFF).

Our news journalists obtained a quote from the research from the University of Copenhagen, "Although most peptides and peptoids that were effective in vitro failed to rescue lethal effects of S. aureus infections in vivo, we found that two lantibiotics, nisin and NAI-107, rescued adult flies from fatal infections. Furthermore, NAI-107 rescued mortality of infection with the MRSA strain USA300 with an efficacy equivalent to that of vancomycin, a widely applied antibiotic for the treatment of serious MRSA infections."

According to the news editors, the research concluded: "These results establish Drosophila as a useful model for in vivo drug evaluation of antibacterial peptides."

For more information on this research see: The Lantibiotic NAI-107 Efficiently Rescues Drosophila melanogaster from Infection with Methicillin-Resistant Staphylococcus aureus USA300. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5427-5436. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Investigators at University of Copenhagen Have Reported New Data on Multiple Sclerosis (Exploring potential mechanisms of action of natalizumab in secondary progressive multiple sclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Autoimmune Diseases and Conditions - Multiple Sclerosis is the subject of a report. According to news reporting originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "Multiple sclerosis (MS) is a common and chronic central nervous system (CNS) demyelinating disease and a leading cause of permanent disability. Patients most often present with a relapsing-remitting disease course, typically progressing over time to a phase of relentless advancement in secondary progressive MS (SPMS), for which approved disease-modifying therapies are limited."

Our news editors obtained a quote from the research from the University of Copenhagen, "In this review, we summarize the pathophysiological mechanisms involved in the development of SPMS and the rationale and clinical potential for natalizumab, which is currently approved for the treatment of relapsing forms of MS, to exert beneficial effects in reducing disease progression unrelated to relapses in SPMS. In both forms of MS, active brain-tissue injury is associated with inflammation; but in SPMS, the inflammatory response occurs at least partly behind the blood-brain barrier and is followed by a cascade of events, including persistent microglial activation that may lead to chronic demyelination and neurodegeneration associated with irreversible disability. In patients with relapsing forms of MS, natalizumab therapy is known to significantly reduce intrathecal inflammatory responses which results in reductions in brain lesions and brain atrophy as well as beneficial effects on clinical measures, such as reduced frequency and severity of relapse and reduced accumulation of disability. Natalizumab treatment also reduces levels of cerebrospinal fluid chemokines and other biomarkers of intrathecal inflammation, axonal damage and demyelination, and has demonstrated the ability to reduce innate immune activation and intrathecal immunoglobulin synthesis in patients with MS."

According to the news editors, the research concluded: "The efficacy of natalizumab therapy in SPMS is currently being investigated in a randomized, double-blind, placebo-controlled trial."

For more information on this research see: Exploring potential mechanisms of action of natalizumab in secondary progressive multiple sclerosis. Therapeutic Advances In Neurological Disorders, 2016;9(1):31-43. The news editors report that additional information may be obtained by contacting F. Sellebjarjeg, Danish Multiple Sclerosis Center, Rigshospitalet, University of Copenhagen, Copenhagen, Denmark. Additional authors for this research include D. Cadavid, D. Steiner,
Investigators at University of Florence Report Findings in Rheumatoid Arthritis (Acute effect of Capparis spinosa root extracts on rat articular pain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Autoimmune Diseases and Conditions - Rheumatoid Arthritis have been published. According to news reporting out of Florence, Italy, by NewsRx editors, research stated, "Ethnopharmacological relevance: Capparis spinosa L. originates from dry regions of Asia and Mediterranean basin. In traditional medicine of these areas, infusions from caper root are considered to be beneficial for the treatment of rheumatism, gout and against abdominal pains."

Financial supporters for this research include Italian Ministry of Instruction, University and Research, University of Florence.

Our news journalists obtained a quote from the research from the University of Florence, "Aim of the study: To evaluate the pain relieving properties of a Syrian cultivar of Capparis spinosa roots in rat models of osteoarthritis and rheumatoid arthritis. Decoction (DEC) and hydroalcoholic extract (EtH2O) were obtained from powdered roots; the latter was further separated in CH2Cl2 and aqueous (H2O-Res) fractions. The extracts were characterized in terms of spermidine alkaloids by HPLC/DAD/MS and stachydrine by NMR. Different amount of free and glycosilated forms of capparispine and analogues (from 0.5% w/w for DEC up to 7.6% w/w for CH2Cl2 fraction) were detected. Rat models of rheumatoid arthritis and osteoarthritis were induced by the intra-articular administration of Complete Freund's Adjuvant (CFA) or monosodium iodoacetate (MIA), respectively. Fourteenth days after CFA or MIA injection, the different preparations of Capparis spinosa (3, 30, 100 and 300 mg kg(-1)) were acutely administered p.o.. Powdered roots (300 mg kg(-1)), DEC (100 mg kg(-1)), and EtH2O (300 mg kg(-1)) significantly reduced hypersensitivity to mechanical noxious stimuli as well as spontaneous pain evaluated as hind limb bearing alterations in both models. The CH2Cl2 and the H2O-Res (30 mg kg(-1)) were the most potent in reverting pain threshold alterations despite the different content of free alkaloids. Capparis spinosa extracts relieved pain related to rheumatoid arthritis and osteoarthritis after single administration."

According to the news editors, the research concluded: "A synergistic effect due to a
specific 'phytochemical mixture' is suggested."

Our news journalists report that additional information may be obtained by contacting L.D. Mannelli, University of Florence, Dept. of Neurosci Psychol Drug Res & Child Hlth, NEUROFARBA, Pharmacol & Toxicol Sect, Florence, Italy. Additional authors for this research include L. Michell, L.D. Mannelli, B. Tenci, M. Innocenti, M. Khatib, N. Mulinacci and C. Ghelardini.

**Biotechnology - Molecular Therapeutics**

**Investigators at University of Groningen Release New Data on Molecular Therapeutics (Re-expression of Selected Epigenetically Silenced Candidate Tumor Suppressor Genes in Cervical Cancer by TET2-directed Demethylation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Biotechnology - Molecular Therapeutics are presented in a new report. According to news reporting from Groningen, Netherlands, by NewsRx journalists, research stated, "DNA hypermethylation is extensively explored as therapeutic target for gene expression modulation in cancer. Here, we re-activated hypermethylated candidate tumor suppressor genes (TSGs) (C13ORF18, CCNA1, TFPI2, and Maspin) by TET2-induced demethylation in cervical cancer cell lines."

The news correspondents obtained a quote from the research from the University of Groningen, "To redirect TET2 to hypermethylated TSGs, we engineered zinc finger proteins (ZFPs), which were first fused to the transcriptional activator VP64 to validate effective gene re-expression and confirm TSG function. ChIP-Seq not only revealed enriched binding of ZFPs to their intended sequence, but also considerable off-target binding, especially at promoter regions. Nevertheless, results obtained by targeted re-expression using ZFP-VP64 constructs were in line with cDNA overexpression; both revealed strong growth inhibition for C13ORF18 and TFPI2, but not for CCNA1 and Maspin. To explore effectiveness of locus-targeted demethylation, ZFP-TET2 fusions were constructed which efficiently demethylated genes with subsequent gene re-activation. Moreover, targeting TET2 to TFPI2 and C13ORF18, but not CCNA1, significantly decreased cell growth, viability, and colony formation in cervical cancer cells compared to a catalytically inactive mutant of TET2."
According to the news reporters, the research concluded: "These data underline that effective re-activation of hypermethylated genes can be achieved through targeted DNA demethylation by TET2, which can assist in realizing sustained re-expression of genes of interest."

For more information on this research see: Re-expression of Selected Epigenetically Silenced Candidate Tumor Suppressor Genes in Cervical Cancer by TET2-directed Demethylation. *Molecular Therapy*, 2015;24(3):536-47. **Transplant Medicine - Liver Transplants**

**Investigators at University of Hong Kong Release New Data on Liver Transps (Circulating Fibroblast Growth Factor 21 Is A Sensitive Biomarker for Severe Ischemia/reperfusion Injury in Patients with Liver Transplantation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Transplant Medicine - Liver Transplants are presented in a new report. According to news originating from Hong Kong, People's Republic of China, by NewsRx correspondents, research stated, "Hepatic ischemia/reperfusion (I/R) injury is a major cause of morbidity and mortality after liver surgery. Therefore, it is important to identify reliable biomarkers to assist early diagnosis of hepatic I/R injury."

Our news journalists obtained a quote from the research from the University of Hong Kong, "This study aimed to investigate the potential of serum levels of fibroblast growth factor 21 (FGF21) as a biomarker for hepatic I/R injury in patients with liver transplantation. Two independent cohorts of liver transplantation patients were recruited for determination of serum levels of FGF21, ALT, and AST. The results demonstrated that serum FGF21 at 2 hours post-reperfusion in cohort-1 exhibited an approximately 20-fold elevation relative to those in healthy subjects. In blood samples dynamically collected in cohort-2, a dramatic increase in serum FGF21 levels (~25-fold) was observed at two hours after surgery, whereas the peak levels of serum ALT and AST were detected only after 24 hours. Temporal correlation analysis demonstrated a significant association of peak serum levels of FGF21 at 2 hours with the magnitude of the increase in both serum ALT and AST levels at 24 hours post transplantation."

According to the news editors, the research concluded: "Serum FGF21 may represent a sensitive and specific prognostic biomarker for early detection of I/R injury in patients with
liver transplantation."

For more information on this research see: Circulating Fibroblast Growth Factor 21 Is A Sensitive Biomarker for Severe Ischemia/reperfusion Injury in Patients with Liver Transplantation. *Scientific Reports*, 2016;6():19776. **Drugs and Therapies - Central Nervous System Agents**

**Investigators at University of Illinois Detail Findings in Central Nervous System Agents (Exploring Hallucinogen Pharmacology and Psychedelic Medicine with Zebrafish Models)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Central Nervous System Agents are presented in a new report. According to news reporting originating in Chicago, Illinois, by NewsRx journalists, research stated, "After decades of sociopolitical obstacles, the field of psychiatry is experiencing a revived interest in the use of hallucinogenic agents to treat brain disorders. Along with the use of ketamine for depression, recent pilot studies have highlighted the efficacy of classic serotonergic hallucinogens, such as lysergic acid diethylamide and psilocybin, in treating addiction, post-traumatic stress disorder, and anxiety."

The news reporters obtained a quote from the research from the University of Illinois, "However, many basic pharmacological and toxicological questions remain unanswered with regard to these compounds. In this study, we discuss psychedelic medicine as well as the behavioral and toxicological effects of hallucinogenic drugs in zebrafish. We emphasize this aquatic organism as a model ideally suited to assess both the potential toxic and therapeutic effects of major known classes of hallucinogenic compounds. In addition, novel drugs with hallucinogenic properties can be efficiently screened using zebrafish models."

According to the news reporters, the research concluded: "Well-designed preclinical studies utilizing zebrafish can contribute to the reemerging treatment paradigm of psychedelic medicine, leading to new avenues of clinical exploration for psychiatric disorders."

For more information on this research see: Exploring Hallucinogen Pharmacology and Psychedelic Medicine with Zebrafish Models. *Zebrafish*, 2016;13(5):379-390,112. *Zebrafish* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Dicarboxylic Acids

Investigators at University of Illinois Have Reported New Data on Dicarboxylic Acids (Fumarate-Mediated Persistence of Escherichia coli against Antibiotics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Dicarboxylic Acids are presented in a new report. According to news reporting from Urbana, Illinois, by NewsRx journalists, research stated, "Bacterialpersisters are a small fraction of quiescent cells that survive in the presence of lethal concentrations of antibiotics. They can regrow to give rise to a new population that has the same vulnerability to the antibiotics as did the parental population."

Financial support for this research came from National Research Foundation of Korea (NRF).

The news correspondents obtained a quote from the research from the University of Illinois, "Although formation of bacterial persisters in the presence of various antibiotics has been documented, the molecular mechanisms by which these persisters tolerate the antibiotics are still controversial. We found that amplification of the fumarate reductase operon (FRD) in*Escherichia coli*led to a higher frequency of persister formation. The persister frequency of*E. coli*was increased when the cells contained elevated levels of intracellular fumarate. Genetic perturbations of the electron transport chain (ETC), a metabolite supplementation assay, and even the toxin-antitoxin-related*hipA*mutation indicated that surplus fumarate markedly elevated the*E. coli*persister frequency. An*E. coli*strain lacking succinate dehydrogenase (SDH), thereby showing a lower intracellular fumarate concentration, was killed ∼1,000-fold more effectively than the wild-type strain in the stationary phase."

According to the news reporters, the research concluded: "It appears thatSDHandFRDrepresent a paired system that gives rise to and maintains*E. coli*persisters by producing and utilizing fumarate, respectively."

For more information on this research see: Fumarate-Mediated Persistence of Escherichia coli against Antibiotics. *Antimicrobial Agents and Chemotherapy*, 2016;60(4):2232-40. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Ischemia

Investigators at University of Ioannina Report New Data on Ischemia (The diagnostic yield of transesophageal echocardiography in patients with cryptogenic cerebral ischaemia: a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Ischemia have been published. According to news reporting out of Ioannina, Greece, by NewsRx editors, research stated, "The diagnostic utility of transesophageal echocardiography (TEE) in patients with cryptogenic ischaemic stroke (IS) or transient ischaemic attack (TIA) remains controversial. A systematic review and meta-analysis was performed according to PRISMA guidelines to estimate the pooled prevalence of potential cardioembolic causes detected by TEE in prospective observational studies of cryptogenic IS/TIA."

Financial supporters for this research include European Regional Development Fund - Project St Anne's University Hospital, Brno - International Clinical Research Center (FNUSA-ICRC).

Our news journalists obtained a quote from the research from the University of Ioannina, "Cardiac conditions causally associated with cerebral ischaemia were considered to be intramural thrombi and intracardiac tumors according to ASCO phenotyping of IS. Thirty-five eligible studies, comprising 5772 patients (mean age 53.6 years, 56.9% men) were identified. The most common TEE finding was ascending aorta and/or aortic arch atheroma [51.2% (27.4%-74.5%)], followed by patent foramen ovale (PFO) [43.2% (36.3%-50.4%)]. Complex aortic plaques and large PFOs were reported in 14% (10.2%-18.9%) and 19.5% (16.6%-22.8%) of TEE evaluations. The prevalence of atrial septal aneurysm was 12.3% (7.9%-18.7%) and was significantly higher in conjunction with PFO presence (risk ratio 2.04, 95% confidence interval 1.63-2.54, p<0.001). The prevalence of left atrial thrombus [3.0% (1.1%-8.3%)] and spontaneous echo contrast [3.8% (2.3%-6.2%)] was low. The prevalence of intracardiac tumors was extremely uncommon [0.2% (0%-0.7%)]. Significant heterogeneity was identified (I(2) > 60%) in the majority of analyses. Heterogeneity was not affected by cryptogenic stroke definition (TOAST versus alternative criteria). After dichotomizing available studies using a cut-off of 50 years, PFO was significantly (p=0.001) more prevalent in younger than in older patients. Routine TEE in patients with cryptogenic IS/TIA commonly identifies abnormal findings."

According to the news editors, the research concluded: "However, the prevalence of cardiac conditions considered to be causally associated with cerebral ischaemia (intracardiac
thrombi and tumors) is low."

Our news journalists report that additional information may be obtained by contacting A.H. Katsanos, Dept. of Neurology, School of Medicine, University of Ioannina, Ioannina, Greece. Additional authors for this research include S. Giannopoulos, A. Frogoudaki, A.R. Vrettou, I. Ikonomidis, I. Paraskevaidis, C. Zompola, K. Vadikolias, E. Boviatsis, J. Parissis, K. Voumvourakis, A.P. Kyritsis and G. Tsivgoulis.

Central Nervous System Diseases and Conditions –…

Investigators at University of Malaya Detail Findings in Cerebral Infarction (Cerebral infarction pattern in tuberculous meningitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Central Nervous System Diseases and Conditions - Cerebral Infarction is the subject of a report. According to news originating from Kuala Lumpur, Malaysia, by NewsRx correspondents, research stated, "Tuberculous meningitis (TBM) causes significant morbidity and mortality. The primary objective was to re-examine the concept of 'TB zone' and 'ischaemic zone' in cerebral infarction in patients with tuberculous meningitis."

Our news journalists obtained a quote from the research from the University of Malaya, "The secondary objective was to evaluate cerebral infarction, vasculitis and vasospasm in tuberculous meningitis infections. Between 2009 and 2014, TBM patients were recruited. Neuroimaging was performed and findings of cerebral infarction, vasculitis and vasospasm were recorded. Infarcts were classified based on arterial supply and Hsiej's classification. Fifty-one TBM patients were recruited of whom 34 patients (67%) had cerebral infarction. Based on Hsiej's classification, 20 patients (59%) had infarcts in both 'TB zone' and 'ischaemic zones'. 12 patients (35%) had infarcts in 'ischaemic zone' and two (6%) patients had infarcts in 'TB zone'. In terms of vascular supply, almost all patients (35/36) had infarcts involving perforators and cortical branches. 25 patients (73%) and 14 patients (41%) had infarcts supplied by lateral lenticulostrate and medial lenticulostrate arteries respectively. 15 patients (37%) had vasculitis. Vasospasm was present in six patients (15%). 29 patients (85%) with cerebral infarction also had leptomeningeal enhancement (p = 0.002)."

According to the news editors, the research concluded: "In summary, infarcts involved mainly perforators and cortical branches, rather than 'TB zone' versus 'ischaemic zone.'"

For more information on this research see: Cerebral infarction pattern in tuberculous

**Mycobacterium Infections - Tuberculosis**

**Investigators at University of Manitoba Describe Findings in Tuberculosis [IFN-gamma promoter polymorphisms do not affect QuantiFERON((R)) TB Gold In-Tube test results in a Canadian population]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news reporting originating from Winnipeg, Canada, by NewsRx correspondents, research stated, "Several studies have shown polymorphisms within the interferon-gamma (IFN-gamma) promoter influence cytokine expression. The interferon-gamma release assay (IGRA) relies on the ability to produce IFNy in response to tuberculosis (TB) specific antigens."

Our news editors obtained a quote from the research from the University of Manitoba, "This study determined the relationship between the IFN-gamma+874 A/T promoter polymorphism and the performance of the QuantiFERON-TB Gold In-Tube (QFT-GIT) test in an ethnically diverse Canadian population. A total of 190 participants were categorised into three groups based on history of and exposure to TB: active TB (n = 55), TB exposed (n = 55) and presumably TB unexposed controls (n = 80). All participants underwent QFT-GIT testing, and DNA was extracted from whole blood and probed for polymorphism at position+874 (T/A) of intron 1 of IFN-gamma. Statistical relationships between the QFT-GIT results, polymorphisms and demographic data were evaluated. IFN-gamma+874 genotype frequencies among the entire study population (n= 190) were A/A (45.8%), T/A (39.5%), and T/T (14.7%). Among the three study groups, there was no correlation between QFT-GIT results and the IFN-gamma+874 A/T genotype, and no correlation of genotype with IFN-gamma production in response to either Mycobacterium tuberculosis antigens or mitogenic stimulation."

According to the news editors, the research concluded: "Our results indicate that the IFN-gamma+874 promoter polymorphism does not influence QFT-GIT performance in this study population."

For more information on this research see: IFN-gamma promoter polymorphisms do

**Mycobacterium Infections - Tuberculosis**

**Investigators at University of Massachusetts Report Findings in Tuberculosis (Structural and Genetic Analyses of the Mycobacterium tuberculosis Protein Kinase B Sensor Domain Identify a Potential Ligand-binding Site)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mycobacterium Infections - Tuberculosis is the subject of a report. According to news reporting from Worcester, Massachusetts, by NewsRx journalists, research stated, "Monitoring the environment with serine/threonine protein kinases is critical for growth and survival of Mycobacterium tuberculosis, a devastating human pathogen. Protein kinase B (PknB) is a transmembrane serine/threonine protein kinase that acts as an essential regulator of mycobacterial growth and division."

The news correspondents obtained a quote from the research from the University of Massachusetts, "The PknB extracellular domain (ECD) consists of four repeats homologous to penicillin-binding protein and serine/threonine kinase associated (PASTA) domains, and binds fragments of peptidoglycan. These properties suggest that PknB activity is modulated by ECD binding to peptidoglycan substructures, however, the molecular mechanisms underpinning PknB regulation remain unclear. In this study, we report structural and genetic characterization of the PknB ECD. We determined the crystal structures of overlapping ECD fragments at near atomic resolution, built a model of the full ECD, and discovered a region on the C-terminal PASTA domain that has the properties of a ligand-binding site. Hydrophobic interaction between this surface and a bound molecule of citrate was observed in a crystal structure. Our genetic analyses in M. tuberculosis showed that nonfunctional alleles were produced either by deletion of any of single PASTA domain or by mutation of individual conserved residues lining the putative ligand-binding surface of the C-terminal PASTA repeat."

According to the news reporters, the research concluded: "These results define two distinct structural features necessary for PknB signal transduction, a fully extended ECD and a conserved, membrane-distal putative ligand-binding site."

For more information on this research see: Structural and Genetic Analyses of the Mycobacterium tuberculosis Protein Kinase B Sensor Domain Identify a Potential Ligand-binding Site. *Journal of Biological Chemistry*, 2016;291(44):22961-22969. *Journal of*

**Musculoskeletal Diseases and Conditions - Muscular...**

**Investigators at University of Massachusetts School of Medicine Have Reported New Data on Muscular Dystrophy (CRISPR/dCas9-mediated Transcriptional Inhibition Ameliorates the Epigenetic Dysregulation at D4Z4 and Represses DUX4-fl in FSH ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Musculoskeletal Diseases and Conditions - Muscular Dystrophy. According to news reporting originating in Worcester, Massachusetts, by NewsRx journalists, research stated, "Facioscapulohumeral muscular dystrophy (FSHD) is one of the most prevalent myopathies, affecting males and females of all ages. Both forms of the disease are linked by epigenetic derepression of the D4Z4 macrosatellite repeat array at chromosome 4q35, leading to aberrant expression of D4Z4-encoded RNAs in skeletal muscle."

The news reporters obtained a quote from the research from the University of Massachusetts School of Medicine, "Production of full-length DUX4 (DUX4-fl) mRNA from the derepressed D4Z4 array results in misexpression of DUX4-FL protein and its transcriptional targets, and apoptosis, ultimately leading to accumulated muscle pathology. Returning the chromatin at the FSHD locus to its nonpathogenic, epigenetically repressed state would simultaneously affect all D4Z4 RNAs, inhibiting downstream pathogenic pathways, and is thus an attractive therapeutic strategy. Advances in CRISPR/Cas9-based genome editing make it possible to target epigenetic modifiers to an endogenous disease locus, although reports to date have focused on more typical genomic regions. Here, we demonstrate that a CRISPR/dCas9 transcriptional inhibitor can be specifically targeted to the highly repetitive FSHD macrosatellite array and alter the chromatin to repress expression of DUX4-fl in primary FSHD myocytes."

According to the news reporters, the research concluded: "These results implicate the promoter and exon 1 of DUX4 as potential therapeutic targets and demonstrate the utility of CRISPR technology for correction of the epigenetic dysregulation in FSHD."

**Blood Pressure**

**Investigators at University of Melbourne Zero in on Blood Pressure (Nocturnal indicators of increased cardiovascular risk in depressed adolescent girls)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Blood Pressure. According to news reporting originating in Melbourne, Australia, by NewsRx journalists, research stated, "Depression is an independent risk factor for cardiovascular disease in adults, and recent literature suggests preclinical signs of cardiovascular risk are also present in depressed adolescents. No study has examined the effect of clinical depression on cardiovascular factors during sleep."

Financial support for this research came from Melbourne School of Psychological Sciences PhD Student Research Funding Scheme.

The news reporters obtained a quote from the research from the University of Melbourne, "This study examined the relationship between clinical depression and nocturnal indicators of cardiovascular risk in depressed adolescent girls from the general community (13-18 years old; 11 clinically depressed, eight healthy control). Continuous beat-to-beat finger arterial blood pressure and heart rate were monitored via Portapres and electrocardiogram, respectively. Cardiovascular data were averaged over each hour for the first 6 h of sleep, as well as in 2-min epochs of stable sleep that were then averaged within sleep stages. Data were also averaged across 2-min epochs of pre-sleep wakefulness and the first 5 min of continuous non-rapid eye movement sleep to investigate the blood pressure dipping response over the sleep-onset period. Compared with controls, depressed adolescents displayed a similar but significantly elevated blood pressure profile across sleep. Depressed adolescents had significantly higher systolic and diastolic blood pressure and mean arterial pressures across the entire night (p <0.01), as well as during all sleep stages (p <0.001). Depressed adolescents also had higher blood pressure across the sleep-onset period, but the groups did not differ in the rate
of decline across the period."

According to the news reporters, the research concluded: "Higher blood pressure during sleep in depressed adolescent females suggests that depression has a significant association with cardiovascular functioning during sleep in adolescent females, which may increase risk for future cardiovascular pathology."

Our news correspondents report that additional information may be obtained by contacting J.M. Waloszek, Melbourne School of Psychological Sciences, The University of Melbourne, Melbourne, Vic, Australia. Additional authors for this research include M.J. Woods, M.L. Byrne, C.L. Nicholas, B. Bei, G. Murray, M. Raniti, N.B. Allen and J. Trinder.

Oncology - Colon Cancer

**Investigators at University of Michigan Detail Findings in Colon Cancer (Genetic predisposition to colorectal cancer: Implications for treatment and prevention)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "Colorectal cancer (CRC) is the third most common cancer diagnosed in men and women and approximately 5% of cases are associated with identifiable germline mutations associated with hereditary cancer syndromes. Lifetime risks for CRC can approach 50%-80% for mutation carriers in the absence of endoscopic and/or surgical intervention, and early identification of at-risk individuals can guide clinical interventions for cancer prevention and treatment."

Our news journalists obtained a quote from the research from the University of Michigan, "Personal and family history and molecular phenotype of CRC tumors are used in determining which patients should be referred for clinical genetic evaluation. Outcomes of genetic testing performed using next-generation sequencing (NGS) multigene panels suggest there can be significant overlap in clinical features among the various hereditary cancer syndromes."

According to the news editors, the research concluded: "This review summarizes new developments in diagnosis and management of patients with genetic predisposition to CRC."

For more information on this research see: Genetic predisposition to colorectal cancer: Implications for treatment and prevention. *Seminars in Oncology*, 2016;43(5):536-542.
Investigators at University of Michigan Report Findings in Naphthaleneacetic Acids (Mimicking natural systems: Changes in behavior as a result of dynamic exposure to naproxen)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Naphthaleneacetic Acids have been published. According to news reporting from Pellston, Michigan, by NewsRx journalists, research stated, "Animals living in aquatic habitats regularly encounter anthropogenic chemical pollution. Typically, the toxicity of a chemical toxicant is determined by the median lethal concentration (LC50) through a static exposure test."

The news correspondents obtained a quote from the research from the University of Michigan, "However, LC50 values and static tests do not provide an accurate representation of exposure to pollutants within natural stream systems. In their native habitats, animals experience exposure as a fluctuating concentration due to turbulent mixing, temporal variations of contamination (seasonal inputs), and contaminant input type (point vs. non-point). Research has shown that turbulent environments produce exposures with a high degree of fluctuation in frequency, duration, and intensity. In order to more effectively evaluate the effects of pollutants, we created a dynamic exposure paradigm, utilizing both flow and substrate within a small mesocosm. A commonly used pharmaceutical, naproxen, was used as the toxicant and female crayfish (Orconectes virilis) as the target organism to investigate changes in fighting behavior as a result of dynamic exposure. Crayfish underwent either a 23 h long static or a dynamic exposure to naproxen. Following exposure, the target crayfish and an unexposed size matched opponent underwent a 15 min fight trial. These fight trials were recorded and later analyzed using a standard ethogram. Results indicate that exposure to sublethal concentrations of naproxen, in both static and flowing conditions, negatively impact aggressive behavior. Results also indicate that a dynamic exposure paradigm has a greater negative impact on behavior than a static exposure. Turbulence and habitat structure play important roles in shaping chemical exposure. Future research should incorporate features of dynamic chemical exposure in order to form a more comprehensive image of chemical exposure and predict the resulting sublethal effects from exposure. Possible techniques for assessment include utilizing flow through experimental set-ups in tandem with behavioral or physiological endpoints as opposed to acute..."
toxicity."

According to the news reporters, the research concluded: "Other possibilities of assessment could involve utilizing fine-scale chemical measurements of pollutants to determine the actual concentrations animals encounter during an exposure event."

For more information on this research see: Mimicking natural systems: Changes in behavior as a result of dynamic exposure to naproxen. Ecotoxicology and Environmental Safety, 2017;135():347-357. **Lung Diseases and Conditions - Asthma**

**Investigators at University of Milan Discuss Findings in Asthma (The lag-time approach improved drug-outcome association estimates in presence of protopathic bias)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Asthma. According to news originating from Milan, Italy, by NewsRx correspondents, research stated, "Protopathic bias is a systematic error which occurs when measured exposure status may be affected by the latent onset of the target outcome. In this article, we aimed to discuss the benefits and drawbacks of the lag-time approach to address this type of bias."

Our news journalists obtained a quote from the research from the University of Milan, "The lag-time approach consists in excluding from exposure assessment the period immediately preceding the outcome detection date. With the help of simple causal diagrams, we illustrate the rationale and limitations of such strategy. The lag time approach was illustrated in a case-crossover study, based on the health care utilization databases of the Italian Lombardy Region, on the real-world effectiveness of some respiratory drugs (exposure) in preventing asthma exacerbations (outcome). A total of 7,300 of patients who were admitted to an emergency department (ED) for asthma during 2010-2012 (cases) were included. Use (vs. nonuse) of short-acting beta-agonists (SABAs, an asthma reliever medication) during the 90 days before the ED admission date was associated with an increased risk of the outcome [odds ratio (OR): 1.95; 95% confidence interval (CI): 1.72, 2.22]. This paradoxical finding may be explained by protopathic bias, as SABA use prior the ED admission may be affected by preceding respiratory distress. Indeed, when a 120-day period preceding the ED admission was ignored from drug exposure assessment (lag time), SABAs were found to be associated with a...
reduced risk of the outcome (OR: 0.81; 95% CI: 0.84, 0.92), as expected."

According to the news editors, the research concluded: "The lag-time approach can be a useful strategy to circumvent protopathic bias in observational studies."

The news correspondents report that additional information may be obtained from G. Corrao, Univ Milano Bicocca, Unit Biostat Epidemiol & Public Hlth, Dept. of Stat & Quantitat Methods, I-20126 Milan, Italy.

**Medicare and Medicaid**

**Investigators at University of Mississippi Describe Findings in Medicare and Medicaid (Comparison of Pharmacist and Physician Managed Annual Medicare Wellness Services)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Medicare and Medicaid. According to news reporting originating in Jackson, Mississippi, by NewsRx journalists, research stated, "Medicare Annual Wellness Visits (AWV) are a benefit provided for Medicare beneficiaries to increase focus on wellness and preventive measures. Pharmacists can conduct AWVs, which offers a potential avenue for outpatient revenue generation."

The news reporters obtained a quote from the research from the University of Mississippi, "PROGRAM DESCRIPTION: To compare a composite of interventions and screenings and revenue generated by a pharmacist with those made by a physician during a subsequent AWV. A report generated through the electronic health record was used to determine AWVs conducted by a pharmacist or 3 participating physicians from December 2013 to March 2016, including revenue generated. Through electronic chart review, documentation was accessed to quantify and categorize the number and types of referrals, health advice, laboratory tests, procedures, vaccinations, and screenings that were recommended during each patient's AWV. OBSERVATIONS: The pharmacist performed 19 subsequent visits, and the 3 physicians performed 89 subsequent visits. Overall, the composite of interventions and screenings was significantly higher in the pharmacist group than the physician group (P=0.03). More interventions were made in the areas of health advice (P=0.020), vaccine recommendations (P=0.009), and screenings in the pharmacist group (P <0.001). The physicians ordered significantly more laboratory tests per visit (P <0.001). The pharmacist was reimbursed on average $105 per visit versus $99 per visit for the physicians."

According to the news reporters, the research concluded: "Pharmacist-provided
AWVs are at least comparable to those provided by physicians and offer an additional access point for valuable services for Medicare beneficiaries."

For more information on this research see: Comparison of Pharmacist and Physician Managed Annual Medicare Wellness Services. *Journal of Managed Care & Specialty Pharmacy*, 2016;22(12):1412-1416. *Journal of Managed Care & Specialty Pharmacy* can be contacted at: Acad Managed Care Pharmacy, 100 N Pitt St, 400, Alexandria, VA 22314-3134, USA.

**Heart Disorders and Diseases - Heart Failure**

**Investigators at University of Mississippi Report Findings in Heart Failure (Presence and Implication of Temporal Nonuniformity of Early Diastolic Left Ventricular Wall Expansion in Patients With Heart Failure)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Failure are discussed in a new report. According to news originating from Jackson, Mississippi, by NewsRx correspondents, research stated, "Early-diastolic left ventricular (LV) longitudinal expansion is delayed with diastolic dysfunction. We hypothesized that, in patients with heart failure (HF), regardless of LV ejection fraction (EF), there is diastolic temporal nonuniformity with a delay of longitudinal relative to circumferential expansion."

Our news journalists obtained a quote from the research from the University of Mississippi, "Echocardiography was performed in 143 HF patients-50 with preserved EF (HFpEF) and 93 with reduced EF (HFrEF)-as well as 31 normal control subjects. The delay of early-diastolic mitral annular velocity from the mitral Doppler E (TE-e ') was measured as a parameter of the longitudinal expansion delay. The delay of the longitudinal early-diastolic global strain rate (SRE) relative to circumferential SRE (Delay(C-L)) was calculated as a parameter of temporal nonuniformity. Intra-LV pressure difference (IVPD) was estimated with the use of color M-mode Doppler data as a parameter of LV diastolic suction. Although normal control subjects had symmetric LV expansion in early diastole, TE-e ' and Delay(C-L) were significantly prolonged in HF regardless of EF (P <.01 vs control for all). Multivariate analysis revealed that Delay(C-L) was the independent determinant of IVPD among the parameters of LV geometry and contraction (beta = -.21; P< .05)."

According to the news editors, the research concluded: "An abnormal temporal nonuniformity of early-diastolic expansion is present in HF regardless of EF, which was
associated with reduced LV suction."

For more information on this research see: Presence and Implication of Temporal Nonuniformity of Early Diastolic Left Ventricular Wall Expansion in Patients With Heart Failure. *Journal of Cardiac Failure*, 2016;22Q(12):945-953. *Journal of Cardiac Failure* can be contacted at: Churchill Livingstone Inc Medical Publishers, Curtis Center, Independence Square West, Philadelphia, PA 19106-3399, USA. **Nephrology**

**Investigators at University of Montreal Describe Findings in Nephrology**  
**Acute kidney injury induces hallmarks of polycystic kidney disease**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nephrology have been published. According to news reporting from Montreal, Canada, by NewsRx journalists, research stated, "Acute kidney injury (AKI) and autosomal dominant polycystic kidney disease (ADPKD) are considered separate entities that both frequently cause renal failure. Since ADPKD appears to depend on a polycystin-1 (Pc1) or Pc2 dosage mechanism, we investigated whether slow progression of cystogenesis in two Pkd1 transgenic mouse models can be accelerated with moderate ischemia-reperfusion injury (IRI)."

The news correspondents obtained a quote from the research from the University of Montreal, "Transient unilateral left ischemic kidneys in both nontransgenic and transgenic mice reproducibly develop tubular dilatations, cysts, and typical PKD cellular defects within 3 mo post-IRI. Similar onset and severity of IRI induced-cystogenesis independently of genotype revealed that IRI is sufficient to promote renal cyst formation; however, this response was not further amplified by the transgene in Pkd1 mouse models. The IRI nontransgenic and transgenic kidneys showed from 16 days post-IRI strikingly increased and sustained Pkd1/Pc1 (>3-fold) and Pc2 (>8-fold) expression that can individually be cystogenic in mice. In parallel, long-term and important stimulation of hypoxia-inducible factor 1 alpha expression was induced as in polycystic kidney disease. While mammalian target of rapamycin signaling is activated, stimulation of the Wnt pathway, with markedly increased active beta-catenin and c-Myc expression in IRI renal epithelium, uncovered a similar regulatory cystogenic response shared by IRI and ADPKD."

According to the news reporters, the research concluded: "Our study demonstrates that long-term AKI induces cystogenesis and cross talk with ADPKD Pc1/Pc2 pathogenic
signaling."

Our news journalists report that additional information may be obtained by contacting M. Trudel, University of Montreal, Fac Med, Inst Rech Clin Montreal, Mol Genet & Dev, Montreal, PQ H2W 1R7, Canada.

Chemistry - Biochemistry

**Investigators at University of Nice Hospital Center Detail Findings in Biochemistry (How does metabolism affect cell death in cancer?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Chemistry - Biochemistry. According to news reporting originating in Nice, France, by NewsRx journalists, research stated, "In cancer research, identifying a specificity of tumor cells compared with 'normal' proliferating cells for targeted therapy is often considered the Holy Grail for researchers and clinicians. Although diverse in origin, most cancer cells share characteristics including the ability to escape cell death mechanisms and the utilization of different methods of energy production."

Financial supporters for this research include Fondation ARC pour la Recherche sur le Cancer, Agence Nationale de la Recherche.

The news reporters obtained a quote from the research from the University of Nice Hospital Center, "In the current paradigm, aerobic glycolysis is considered the central metabolic characteristic of cancer cells (Warburg effect). However, recent data indicate that cancer cells also show significant changes in other metabolic pathways. Indeed, it was recently suggested that Kreb's cycle, pentose phosphate pathway intermediates, and essential and nonessential amino acids have key roles. Renewed interest in the fact that cancer cells have to reprogram their metabolism in order to proliferate or resist treatment must take into consideration the ability of tumor cells to adapt their metabolism to the local microenvironment (low oxygen, low nutrients). This variety of metabolic sources might be either a strength, resulting in infinite possibilities for adaptation and increased ability to resist chemotherapy-induced death, or a weakness that could be targeted to kill cancer cells."

According to the news reporters, the research concluded: "Here, we discuss recent insights showing how energetic metabolism may regulate cell death and how this might be relevant for cancer treatment."

Our news correspondents report that additional information may be obtained by contacting J.E. Ricci, University of Nice Hospital Center, Dept. of Anesthesie Reanimat, Nice,
France.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/febs.13570. This DOI is a link to an online electronic document that is either free or for purchase.

Clinical Research - Clinical Trials and Studies

Investigators at University of Otago Describe Findings in Clinical Trials and Studies (Combination Nicotine Metered Dose Inhaler and Nicotine Patch for Smoking Cessation: A Randomized Controlled Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Clinical Research - Clinical Trials and Studies have been presented. According to news reporting from Wellington, New Zealand, by NewsRx journalists, research stated, "In order to replicate the rewarding effects of smoking, nicotine replacement therapies must deliver nicotine via the pulmonary route. We aimed to measure the efficacy of a simple pressurized metered dose inhaler containing nicotine combined with a nicotine patch for smoking cessation."

The news correspondents obtained a quote from the research from the University of Otago, "Double-blind randomized placebo-controlled, parallel group trial conducted at the University of Otago, Wellington, New Zealand. Five-hundred two adults (a parts per thousand yen18 years) who smoked at least nine cigarettes per day, with a Fagerstrom Test for Nicotine Dependence a parts per thousand yen3 who wanted to quit, were randomized (1:1). active nicotine pressurized metered dose inhaler (pMDI) plus active nicotine patch, versus placebo pMDI plus active nicotine patch. Subjects were instructed to use the aerosols for 6 months when they felt an urge to smoke and the patches daily for 5 months, reduce their smoking and quit by the end of the fourth week. Subjects were followed for 7 months. The primary outcome was prolonged 6 month not smoked on 7 consecutive days, analyzed by intention-to-treat. For the primary outcome, 78/246 (31.71%) in the active group versus 46/256 (17.97%) in the control group were abstinent (odds ratio 2.12, 95% confidence interval 1.40 to 3.23). Adverse events were reported by 245/246 (99.6%) and 247/256 (96.5%) subjects in the active and control groups, respectively. Mild coughing which decreased with regular use was common with the nicotine aerosols. Inhaled nicotine from a metered dose inhaler combined with a nicotine patch substantially improves abstinence for 6 months amongst adult nicotine dependant smokers wanting to quit. In 2012, we published a systematic review of the use nicotine by inhalation in this journal. At that time we were unable to find any studies that had measured the effects of nicotine delivery by pMDI on smoking cessation, and we are not aware of any since 2012. Our study is the first to look at nicotine by pMDI in smoking cessation."

According to the news reporters, the research concluded: "The present trial demonstrates that a simple nonproprietary nicotine inhaler, using relatively inexpensive standard technology, increases smoking cessation rates over and above nicotine patch therapy, and could usefully enhance nicotine replacement in smoking cessation treatment."

For more information on this research see: Combination Nicotine Metered Dose

**Adipogenesis**

**Investigators at University of Ottawa Detail Findings in Adipogenesis**

*(The Anti-Adipogenic Effect of Peripheral Blood Mononuclear Cells is Absent with PCSK9 Loss-of-Function Variants)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Adipogenesis. According to news originating from Ottawa, Canada, by NewsRx correspondents, research stated, "To determine the effect of (1) an oral fat load and (2) pro-protein convertase subtilisin/ kexin type (PCSK) 9 loss-of-function (LOF) variant status on the ability of peripheral blood mononuclear cells (PBMC) to inhibit human adipogenesis. PBMC from subjects with one or more PCSK9 LOF variants versus non-variant controls were compared in the fasting state and after an oral fat load."

Our news journalists obtained a quote from the research from the University of Ottawa, "Fasting triglyceride (TG) levels were lower in the LOF variant versus non-variant group but rose to the same level after the oral fat load. Conditioned medium from PBMC was obtained in fasting (PBMC-CM-F) and 4-h postprandial (PBMC-CM-PP) states. PBMC-CM-PP from non-variant controls inhibited adipogenesis of human preadipocytes more than did PBMC-CM-F. In contrast, PBMC-CM-F or -PP from PCSK9 LOF variant subjects had no effect on adipogenesis. After the oral fat load, PBMC from PCSK9 LOF variant subjects showed significant increases in mRNA levels of interleukin-1 beta, tumor necrosis factor-alpha, sterol regulatory element binding protein-1c, CD36, and monocyte chemoattractant protein-1 (MCP-1), only MCP-1 mRNA levels increased in PBMC from non-variant controls."

According to the news editors, the research concluded: "The absence of anti-adipogenic action of PBMC from PCSK9 LOF variant subjects points to a novel role for PCSK9 in PBMC-adipose cell interactions."

The news correspondents report that additional information may be obtained from A.
Investigators at University of Pardubice Report Findings in Separation Science (Determination of selected fatty acids in dried sweat spot using gas chromatography with flame ionization detection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science - Separation Science. According to news reporting from Pardubice, Czech Republic, by NewsRx journalists, research stated, "A method is described for the determination of fatty acids in dried sweat spot and plasma samples using gas chromatography with flame ionization detection. Plasma and dried sweat spot samples were obtained from a group of blood donors."

The news correspondents obtained a quote from the research from the University of Pardubice, "The sweat was collected from each volunteer during exercise. Sweat was spotted onto collection paper containing butylated hydroxytoluene. Fatty acids were derivatized with acetyl chloride in methanol to form methyl esters of fatty acids. The fatty acids in dried sweat spot samples treated with butylated hydroxytoluene and stored at -20 degrees C were stable for 3 months. Our results indicate that sweat contains, among fatty acids with short chain, also fatty acids with long chain and unsaturated fatty acids."

According to the news reporters, the research concluded: "Linear relationships between percentage content of selected fatty acids in dried sweat spot and plasma were observed."

Our news journalists report that additional information may be obtained by contacting R. Kandar, Univ Pardubice, Fac Chem Technol, Dept. of Biol & Biochem Sci, Pardubice, Czech Republic. Additional authors for this research include P. Drabkova, L. Andrlova, A. Kostelnik and A. Cegan.

Keywords for this news article include: Pardubice, Czech Republic, Europe, Separation Science, Science, University of Pardubice.

Gram-Negative Bacteria - *Pseudomonas aeruginosa*

Investigators at University of Paris-Sud Report Findings in *Pseudomonas aeruginosa* (Actin activates *Pseudomonas aeruginosa* ExoY nucleotidyl cyclase toxin and ExoY-like effector domains from MARTX toxins)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - *Pseudomonas aeruginosa* are discussed in a new report. According to news reporting from Gif sur Yvette, France, by NewsRx journalists, research stated, "The nucleotidyl cyclase toxin ExoY is one of the virulence factors injected by the *Pseudomonas aeruginosa* type III secretion system into host cells. Inside cells, it is activated by an unknown eukaryotic cofactor to synthesize various cyclic nucleotide monophosphates."

The news correspondents obtained a quote from the research from the University of Paris-Sud, "ExoY-like adenylate cyclases are also found in Multifunctional-Autoprocessing Repeats-in-ToXin (MARTX) toxins produced by various Gram-negative pathogens. Here we demonstrate that filamentous actin (F-actin) is the hitherto unknown cofactor of ExoY. Association with F-actin stimulates ExoY activity more than 10,000 fold in vitro and results in stabilization of actin filaments. ExoY is recruited to actin filaments in transfected cells and alters F-actin turnover. Actin also activates an ExoY-like adenylate cyclase MARTX effector domain from *Vibrio nigripulchritudo*. Finally, using a yeast genetic screen, we identify actin mutants that no longer activate ExoY."

According to the news reporters, the research concluded: "Our results thus reveal a new sub-group within the class II adenylyl cyclase family, namely actin-activated nucleotidyl cyclase (AA-NC) toxins."

Keywords for this news article include: Gif sur Yvette, France, Europe, Gram-Negative Aerobic Rods and Cocci, Gram-Negative Aerobic Bacteria, Gram-Negative Bacteria, *Pseudomonas aeruginosa*, Enzymes and Coenzymes, Gammaproteobacteria, Pseudomonadaceae, Proteobacteria, Genetics, Cyclase, University of Paris-Sud.

Investigators at University of Pittsburgh Medical Center Report New Data on Lymphoma (Flow Cytometric Evaluation of Double/Triple Hit Lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lymphoma. According to news originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "Double' or 'triple' hit lymphomas (D/THL) with recurrent translocations involving MYC/8q24 and BCL2/18q21 and/or BCL6/3q27 are characterized by a poor prognosis, but their identification is hampered by the clinicopathologic overlap with other disease categories. Cases with circulating blastic-appearing cells may initially cause concern for lymphoblastic leukemia a diagnostic dilemma, which has not been well studied."

Our news journalists obtained a quote from the research from the University of Pittsburgh Medical Center, "There is only limited literature regarding the flow cytometric (FC) D/THL phenotype and its clinical correlates. The FC features of 20 D/THL (11 BCL2(+)/MYC (+), 5 BCL6(+)/MYC(+), 4 BCL2(+)/BCL6(+)/MYC(+)) were evaluated, compared to 20 B-lymphoblastic leukemias (B-LBL), and correlated with overall survival. Most (89%, 17/19) D/THL were CD10(+), 47% (9/19) lacked surface light chain, and a significant subset underexpressed CD45 (47%, 9/19), CD20 (42% 8/19), and/or CD19 (39%, 7/18), which did not vary by genetic subgroup. Compared to B-LBL, D/THL less frequently underexpressed CD45 (p=0.0001) and CD20 (p=0.0004). Lower levels of BCL2 expression were noted in the BCL6 (+)/MYC(+) and BCL2(+)/BCL6(+)/MYC(+) subgroups versus BCL2(+)/MYC(+) cases (p=0.0014). Of the flow cytometric parameters assessed, dim CD45 expression correlated with inferior survival (p=0.01)."

According to the news editors, the research concluded: "Although there is some overlap with B-LBL, D/THL demonstrates a characteristic immunophenotype which may have prognostic significance and warrants further investigation."

For more information on this research see: Flow Cytometric Evaluation of Double/Triple Hit Lymphoma. Oncology Research, 2016;23(3):137-46.

The news correspondents report that additional information may be obtained from C.G. Roth, Dept. of Pathology, Division of Hematopathology, University of Pittsburgh Medical Center, Pittsburgh, PA, United States. Additional authors for this research include A. Gillespie-Twardy, S. Investigators at University of Queensland Report Findings in Obesity and Diabetes (Epicardial Adipose Tissue Volume and Left Ventricular Myocardial Function Using 3-Dimensional Speckle Tracking Echocardiography)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity and Diabetes. According to news reporting from Brisbane, Australia, by NewsRx journalists, research stated, "Although epicardial adipose tissue (EAT) volume is associated with increased incidence of coronary artery disease (CAD), its role in myocardial systolic dysfunction is unclear. The present study aimed to identify independent determinants of EAT volume in patients without obstructive CAD, and to evaluate the association between EAT volume (vs other measures of obesity) and myocardial systolic strain analysis."

The news correspondents obtained a quote from the research from the University of Queensland, "We prospectively recruited 130 patients without obstructive CAD on contrast-enhanced cardiac computed tomography imaging and normal left ventricular ejection fraction on 3-dimensional (3D) echocardiography. EAT volume was quantified from cardiac computed tomography imaging, and 3D multidirectional (longitudinal, circumferential, radial, and area) strain were measured. The mean EAT volume was 97.5 +/- 43.7 cm(3). In multivariable analysis, measures of obesity (body mass index [P = 0.007] and waist/hip ratio [P = 0.001]) were independently associated with larger EAT volume. EAT volume was correlated with 3D global longitudinal (r = 0.601; P< 0.001), circumferential (r = 0.375; P< 0.001), radial (r = -0.546; P< 0.001), and area (r = 0.558; P< 0.001) strain. In multivariable analyses, epicardial fat volume was the strongest predictor of 3D global longitudinal (standardized beta = 0.512; P< 0.001), circumferential (standardized beta = 0.242; P = 0.006), radial (standardized beta = -0.422; P< 0.001), and area (standardized beta = 0.428; P< 0.001) strain. In contrast, other measures of obesity including body mass index and waist/hip ratio were not independent determinants of 3D multidirectional global strain (all P> 0.05)."

According to the news reporters, the research concluded: "EAT volume is independently associated with impaired myocardial systolic function despite preserved 3D left ventricular ejection fraction and absence of obstructive CAD, and might play a significant role in the pathophysiology of diabetic, obesity, and metabolic heart disease."

Our news journalists report that additional information may be obtained by contacting A.C.T. Ng, University of Queensland, Princess Alexandra Hospital, Dept. of Cardiol, Brisbane, Qld 4102, Australia. Additional authors for this research include S.Y. Goo, N. Roche, R.J. van der Geest and W.Y.S. Wang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cjca.2016.06.009. This DOI is a link to an online electronic document that is either free or for purchase.
Investigators at University of Regensburg Detail Findings in Colon Cancer (Physical Activity and Risk of Colon Cancer in Diabetic and Nondiabetic US Adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting originating from Regensburg, Germany, by NewsRx correspondents, research stated, "To determine whether moderate to vigorous physical activity is associated with a decreased risk of colon cancer in diabetic patients. We evaluated the association between physical activity and colon cancer in 25,753 patients with a self-reported history of diabetes and in 274,965 nondiabetic individuals from the National Institutes of Health-AARP Diet and Health Study who were aged 50 to 71 years in 1995-1996."

Our news editors obtained a quote from the research from the University of Regensburg, "Moderate to vigorous physical activity was assessed at baseline using a self-administered questionnaire. Follow-up for colon cancer incidence extended to December 31, 2011. During 13.0 years of follow-up, 480 diabetic patients and 4151 nondiabetic individuals had development of colon cancer. Among diabetic patients, compared with never/rarely engaging in physical activity, more than 7 h/wk of physical activity exhibited a reduced risk of colon cancer in the age-and sex-adjusted model (hazard ratio [HR], 0.74; 95% CI, 0.56-0.996; P = .16 for trend). This association was attenuated and no longer statistically significant after additional control for other covariates (HR, 0.78; 95% CI, 0.58-1.05; P = .29 for trend). By comparison, physical activity was inversely related to colon cancer risk in nondiabetic individuals (multivariate-adjusted HR, 0.81; 95% CI, 0.73-0.89; P< .001 for trend). In this investigation of the relationship between physical activity and colon cancer in diabetic patients, we found a statistically significant inverse relationship in the age-and sex-adjusted model, which was no longer statistically significant in the multivariate-adjusted model. A reduced risk was noted among nondiabetic individuals, irrespective of other covariates."

According to the news editors, the research concluded: "Future studies with a larger number of participants are required to explore whether physical activity beneficially affects colon cancer risk among diabetic patients."

The news editors report that additional information may be obtained by contacting D. Schmid, University of Regensburg, Dept. of Epidemiol & Prevent Med, D-93053 Regensburg, Germany. Additional authors for this research include G. Behrens, C.E. Matthews and M.F.
Investigators at University of Rochester School of Medicine and Dentistry Release New Data on Dilated Cardiomyopathy (Cardiac Gab1 deletion leads to dilated cardiomyopathy associated with mitochondrial damage and cardiomyocyte apoptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Dilated Cardiomyopathy. According to news reporting out of Rochester, New York, by NewsRx editors, research stated, "A vital step in the development of heart failure is the transition from compensatory cardiac hypertrophy to decompensated dilated cardiomyopathy (DCM) during cardiac remodeling under mechanical or pathological stress. However, the molecular mechanisms underlying the development of DCM and heart failure remain incompletely understood."

Our news journalists obtained a quote from the research from the University of Rochester School of Medicine and Dentistry, "In the present study, we investigate whether Gab1, a scaffolding adaptor protein, protects against hemodynamic stress-induced DCM and heat failure. We first observed that the protein levels of Gab1 were markedly reduced in hearts from human patients with DCM and from mice with experimental viral myocarditis in which DCM developed. Next, we generated cardiac-specific Gab1 knockout mice (Gab1-cKO) and found that Gab-cKO mice developed DCM in hemodynamic stress-dependent and age-dependent manners. Under transverse aorta constriction (TAC), Gab1-cKO mice rapidly developed decompensated DCM and heart failure, whereas Gab1 wild-type littermates exhibited adaptive left ventricular hypertrophy without changes in cardiac function. Mechanistically, we showed that Gab1-cKO mouse hearts displayed severe mitochondrial damages and increased cardiomyocyte apoptosis. Loss of cardiac Gab1 in mice impaired Gab1 downstream MAPK signaling pathways in the heart under TAC. Gene profiles further revealed that ablation of Gab1 in heart disrupts the balance of anti-and pro-apoptotic genes in cardiomyocytes. These results demonstrate that cardiomyocyte Gab1 is a critical regulator of the compensatory cardiac response to aging and hemodynamic stress."

According to the news editors, the research concluded: "These findings may provide new mechanistic insights and potential therapeutic target for DCM and heart failure."

For more information on this research see: Cardiac Gab1 deletion leads to dilated cardiomyopathy associated with mitochondrial damage and cardiomyocyte apoptosis. Cell Death and Differentiation, 2015;23(4):695-706. (Nature Publishing Group - www.nature.com/cdd/)

Biotechnology - Genomics

Investigators at University of Sao Paulo Describe Findings in Genomics (Methylation status of homeobox genes in common human cancers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biotechnology - Genomics. According to news reporting originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "Approximately 300 homeobox loci were identified in the euchromatic regions of the human genome, of which 235 are probable functional genes and 65 are likely pseudogenes. Many of these genes play important roles in embryonic development and cell differentiation."

Financial support for this research came from FAPESP.

Our news editors obtained a quote from the research from the University of Sao Paulo, "Dysregulation of homeobox gene expression is a frequent occurrence in cancer. Accumulating evidence suggests that as genetics disorders, epigenetic modifications alter the expression of oncogenes and tumor suppressor genes driving tumorigenesis and perhaps play a more central role in the evolution and progression of this disease."

According to the news editors, the research concluded: "Here, we described the current knowledge regarding homeobox gene DNA methylation in human cancer and describe its relevance in the diagnosis, therapeutic response and prognosis of different types of human cancers."

The news editors report that additional information may be obtained by contacting F.D. Nunes, University of Sao Paulo, Sch Dental, Dept. of Oral Pathol, Sao Paulo, Brazil. Additional authors for this research include C.M. Esteves, F.C.A. Xavier and F.D. Nunes.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ygeno.2016.11.001. This DOI is a link to an online electronic document that is either free or for purchase.
Investigators at University of Sydney Describe Findings in Estradiol Congeners (Progressive Temporal Change in Serum SHBG, But Not in Serum Testosterone or Estradiol, Is Associated With Bone Loss and Incident Fractures in Older Men: The Concord ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hormones - Estradiol Congeners are presented in a new report. According to news reporting from Sydney, Australia, by NewsRx journalists, research stated, "This study aimed to examine progressive temporal relationships between changes in major reproductive hormones across three waves of a cohort study of older men and (1) changes in bone mineral density (BMD) and (2) incident fractures (any, hip or non-vertebral) over an average of 6 years of follow-up. The CHAMP cohort of men aged 70 years and older were assessed at baseline (2005 to 2007, n=1705), 2-year follow-up (n=1367), and 5-year follow-up (n=958)."

The news correspondents obtained a quote from the research from the University of Sydney, "Serum testosterone (T), dihydrotestosterone (DHT), estradiol (E2), and estrone (E1) (by liquid chromatography-tandem mass spectrometry [LC-MS/MS]), and sex hormone-binding globulin (SHBG), luteinizing hormone (LH), and follicle-stimulating hormone (FSH) (by immunoassay) were measured at all time-points, whereas free testosterone (cFT) was calculated using a well-validated formula. Hip BMD was measured by dual-energy X-ray absorptiometry (DXA) at all three time-points, and fracture data were verified radiographically. Statistical modeling was done using general estimating equations (GEEs). For total hip BMD, univariable analyses revealed inverse associations with temporal changes in serum SHBG, FSH, and LH and positive associations for serum E1 and cFT across the three time-points. In models adjusted for multiple covariables, serum SHBG (=0.029), FSH (=0.065), LH (=0.049), E1 (=0.019), and cFT (=0.033) remained significantly associated with hip BMD. However for femoral neck BMD, only FSH (=0.048) and LH (=0.036) remained associated in multivariable-adjusted models. Temporal change in serum SHBG, but not T, E2, or other hormonal variables, was significantly associated with any, nonvertebral or hip fracture incidence in univariable analyses. In multivariable-adjusted models, temporal increase in serum SHBG over time remained associated with any fracture (=0.060) and hip fracture (=0.041) incidence, but not nonvertebral fracture incidence. These data indicate that a progressive increase in circulating SHBG over time predicts bone loss and fracture risk in older men."

According to the news reporters, the research concluded: "Further studies are warranted to further characterize changes in circulating SHBG as a mechanism and/or biomarker of bone health during male ageing."

For more information on this research see: Progressive Temporal Change in Serum SHBG, But Not in Serum Testosterone or Estradiol, Is Associated With Bone Loss and Incident Fractures in Older Men: The Concord Health and Ageing in Men Project. Journal of Bone and...
Investigators at University of Texas Medical Branch Detail Findings in Granulocytes (Cytokine-Induced Glucocorticoid Resistance from Eosinophil Activation: Protein Phosphatase 5 Modulation of Glucocorticoid Receptor Phosphorylation and Signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immunology - Granulocytes are presented in a new report. According to news reporting from Galveston, Texas, by NewsRx journalists, research stated, "The mechanisms contributing to persistent eosinophil activation and poor eosinopenic response to glucocorticoids in severe asthma are poorly defined. We examined the effect of cytokines typically overexpressed in the asthmatic airways on glucocorticoid signaling in in vitro activated eosinophils."

The news correspondents obtained a quote from the research from the University of Texas Medical Branch, "An annexin V assay used to measure eosinophil apoptosis showed that cytokine combinations of IL-2 plus IL-4 as well as TNF-alpha plus IFN-gamma, or IL-3, GM-CSF, and IL-5 alone significantly diminished the proapoptotic response to dexamethasone. We found that IL-2 plus IL-4 resulted in impaired phosphorylation and function of the nuclear glucocorticoid receptor (GCR). Proteomic analysis of steroid sensitive and resistant eosinophils identified several differentially expressed proteins, namely protein phosphatase 5 (PP5), formyl peptide receptor 2, and annexin 1. Furthermore, increased phosphatase activity of PP5 correlated with impaired phosphorylation of the GCR. Importantly, suppression of PP5 expression with small interfering RNA restored proper phosphorylation and the proapoptotic function of the GCR. We also examined the effect of lipoxin A4 on PP5 activation by IL-2 plus IL-4. Similar to PP5 small interfering RNA inhibition, pretreatment of eosinophils with lipoxin A4 restored GCR phosphorylation and the proapoptotic function of GCs."

According to the news reporters, the research concluded: "Taken together, our results showed 1) a critical role for PP5 in cytokine-induced resistance to GC-mediated eosinophil death, 2) supported the dependence of GCR phosphorylation on PP5 activity, and 3) revealed that PP5 is a target of the lipoxin A4-induced pathway countering cytokine-induced resistance to GCs in eosinophils."

For more information on this research see: Cytokine-Induced Glucocorticoid
Resistance from Eosinophil Activation: Protein Phosphatase 5 Modulation of Glucocorticoid Receptor Phosphorylation and Signaling. *Journal of Immunology*, 2016;197(10):3782-3791. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. **Oncology - Breast Cancer**

**Investigators at University of Texas Report Findings in Breast Cancer (Interventions to Manage Uncertainty and Fear of Recurrence in Female Breast Cancer Survivors: A Review of the Literature)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Fear of cancer recurrence (FCR) is one of the largest unmet needs in the breast cancer survivor population. This review addresses this unmet need with the question: What available interventions manage uncertainty and FCR in female breast cancer survivors? Objectives: The purpose of this article is to better understand potential interventions to manage FCR when caring for breast cancer survivors."

Our news editors obtained a quote from the research from the University of Texas, "Databases used were PubMed, CINAHL®, Google Scholar, EMBASE, and Scopus. Articles published in English from 2009-2014 with female breast cancer survivors and interventions that address FCR as an endpoint or outcome measure or objectively illustrate an improvement in FCR were included. One hundred ninety-eight articles were initially identified in this literature review search. Upon detailed review of content for relevance, seven articles met criteria to be included in this review. This literature review provided current evidence of published interventions to manage uncertainty in the female breast cancer survivor population, as well as future research recommendations."

According to the news editors, the research concluded: "Interventions surrounding being mindful, managing uncertainty, having more effective patient-provider communication, and handling stress through counseling are options for managing FCR."

For more information on this research see: Interventions to Manage Uncertainty and

**Oncology - Glioblastomas**

**Investigators at University of Texas Report Findings in Glioblastomas (The Cytoskeletal Adapter Protein Spinophilin Regulates Invadopodia Dynamics and Tumor Cell Invasion in Glioblastoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Glioblastomas have been published. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "Glioblastoma is a primary brain cancer that is resistant to all treatment modalities. This resistance is due, in large part, to invasive cancer cells that disperse from the main tumor site, escape surgical resection, and contribute to recurrent secondary lesions."

Our news journalists obtained a quote from the research from the University of Texas, "The adhesion and signaling mechanisms that drive glioblastoma cell invasion remain enigmatic, and as a result there are no effective anti-invasive clinical therapies. Here we have characterized a novel adhesion and signaling pathway comprised of the integrin alpha v beta 8 and its intracellular binding partner, Spinophilin (Spn), which regulates glioblastoma cell invasion in the brain microenvironment. We show for the first time that Spn binds directly to the cytoplasmic domain of beta 8 integrin in glioblastoma cells. Genetically targeting Spn leads to enhanced invasive cell growth in preclinical models of glioblastoma. Spn regulates glioblastoma cell invasion by modulating the formation and dissolution of invadopodia. Spn-regulated invadopodia dynamics are dependent, in part, on proper spatiotemporal activation of the Rac1 GTPase. Glioblastoma cells that lack Spn showed diminished Rac1 activities, increased numbers of invadopodia, and enhanced extracellular matrix degradation. Collectively, these data identify Spn as a critical adhesion and signaling protein that is essential for modulating glioblastoma cell invasion in the brain microenvironment."

According to the news editors, the research concluded: "Tumor cell invasion is a major clinical obstacle in glioblastoma and this study identifies a new signaling pathway regulated by Spinophilin in invasive glioblastoma."

The news correspondents report that additional information may be obtained from J.H. McCarty, Univ Texas MD Anderson Canc Center, Houston, TX 77030, United States. Additional authors for this research include N.G. Avci, P.A. Guerrero, L.K. Tang, J. Popp, J.E. Morales, Z.H. Chen, A. Carnero, F.F. Lang, B.A. Ballif, G.M. Rivera and J.H. McCarty.

**Hearing Diseases and Conditions - Tinnitus**

**Investigators at University of Texas Report Findings in Tinnitus (Acute high-intensity noise induces rapid Arc protein expression but fails to rapidly change GAD expression in amygdala and hippocampus of rats: Effects of treatment with ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hearing Diseases and Conditions - Tinnitus have been published. According to news reporting out of Richardson, Texas, by NewsRx editors, research stated, "Tinnitus is a devastating auditory disorder impacting a growing number of people each year. The aims of the current experiment were to assess neuronal mechanisms involved in the initial plasticity after traumatic noise exposure that could contribute to the emergence of tinnitus and to test a potential pharmacological treatment to alter this early neural plasticity."

Financial support for this research came from American Tinnitus Association.

Our news journalists obtained a quote from the research from the University of Texas, "Specifically, this study addressed rapid effects of acute noise trauma on amygdalo-hippocampal circuitry, characterizing biomarkers of both excitation and inhibition in these limbic regions, and compared them to expression of these same markers in primary auditory cortex shortly after acute noise trauma. To assess excitatory plasticity, activity-regulated cytoskeleton-associated (Arc) protein expression was evaluated in male rats 45 min after bilateral exposure to acute high-intensity noise (16 kHz, 115 dB SPL, for 1 h), sufficient to cause acute cochlear trauma, a common cause of tinnitus in humans and previously shown sufficient to induce tinnitus in rat models of this auditory neuropathology. Western blot analyses confirmed that up regulation of amygdalo-hippocampal Arc expression occurred rapidly post-noise trauma, corroborating several lines of evidence from our own and other laboratories indicating that limbic brain structures, i.e. outside of the classical auditory pathways, exhibit plasticity early in the initiation of tinnitus. Western blot analyses revealed no noise-induced changes in amygdalo-hippocampal expression of glutamate decarboxylase (GAD), the biosynthetic enzyme required for GABAergic inhibition. No changes in either Arc or GAD protein expression were observed in primary auditory cortex in this immediate post-noise exposure period, confirming other reports that auditory cortical plasticity may not occur until
later in the development of tinnitus. As a further control, our experiments compared Arc protein expression between groups exposed to the quiet background of a sound-proof chamber to those exposed not only to the traumatic noise described above, but also to an intermediate, non-traumatic noise level (70 dB SPL) for the same duration in each of these three brain regions. We found that non-traumatic noise did not up-regulate Arc protein expression in these brain regions. To see if changes in Arc expression due to acute traumatic noise exposure were stress-related, we compared circulating serum corticosterone in controls and rats exposed to traumatic noise at the time when changes in Arc were observed, and found no significant differences in this stress hormone in our experimental conditions. Finally, the ability of D-cycloserine (DCS; an NMDA-receptor NR1 partial agonist) to reduce or prevent the noise trauma-related plastic changes in the biomarker, Arc, was tested."

According to the news editors, the research concluded: "D-cycloserine prevented traumatic noise-induced up regulation of Arc protein expression in amygdala but not in hippocampus, suggesting that DCS alone is not fully effective in eliminating regionally-specific early plastic changes after traumatic noise exposure."

For more information on this research see: Acute high-intensity noise induces rapid Arc protein expression but fails to rapidly change GAD expression in amygdala and hippocampus of rats: Effects of treatment with D-cycloserine. "GIDEON (Global Investigation of therapeutic DEcisions in hepatocellular carcinoma and Of its treatment with sorafeNib) is a prospective, observational registry study evaluating the safety of sorafenib and treatment practices in hepatocellular carcinoma patients. This large global database allowed for assessment of the use and tolerability of sorafenib in patients with liver dysfunction."

The news correspondents obtained a quote from the research from the University of Texas Southwestern, "Baseline characteristics and medical/treatment history were collected in patients for whom a decision to treat with sorafenib had been made. Adverse event, dosing, and outcomes data were collected during follow-up. In the overall safety population (n = 3202), 1968 patients (61%) had Child-Pugh A status and 666 (21%) had Child-Pugh B. The majority of Child-Pugh A (72%) and Child-Pugh B (70%) patients received an initial sorafenib dose of 800 mg, consistent with the label, and dose reduction rates were 40% and 29%, respectively. The type and incidence of adverse events were generally consistent across Child-Pugh subgroups. The incidence of drug-related adverse events leading to discontinuation was similar between Child-Pugh A and Child-Pugh B patients (17% and 21%). In the intent-to-treat population (n = 3213), median overall survival (months [95% confidence interval]) was longer in Child-Pugh A patients (13.6 [12.8-14.7]) compared with Child-Pugh B patients (5.2 [4.6-6.3]). In clinical practice, the safety profile of sorafenib appeared to be consistent across Child-Pugh A and Child-Pugh B patients. Findings suggest sorafenib may be safely used in some Child-Pugh B patients and indicate the importance of careful patient evaluation when making treatment decisions. Lay summary: The GIDEON (Global Investigation of therapeutic DEcisions in hepatocellular carcinoma and Of its treatment with sorafeNib) study is a large prospective registry of patients with liver cancer who were treated with sorafenib. The aims were to evaluate the safety and tolerability of sorafenib among those in which the liver was not functioning properly."

According to the news reporters, the research concluded: "The study showed that the safety profile of sorafenib was consistent across patients with preserved liver function and those in which the liver was not functioning properly, and therefore, suggesting that sorafenib may be a valid treatment for some patients with liver impairment."

Our news journalists report that additional information may be obtained by contacting J.A. Investigators at University of Texas Southwestern Medical Center Discuss Findings in Liver Cancer (Predictors of adequate ultrasound quality for hepatocellular carcinoma surveillance in patients with cirrhosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news reporting originating in Dallas, Texas, by NewsRx journalists, research stated, "Abdominal ultrasound fails to detect over one-fourth of hepatocellular carcinoma (HCC) at an early stage in patients with cirrhosis. Identifying patients in whom ultrasound is of inadequate quality can inform interventions to improve surveillance effectiveness."

Funders for this research include Agency for Healthcare Research and Quality, Cancer Prevention and Research Institute of Texas.

The news reporters obtained a quote from the research from the University of Texas Southwestern Medical Center, "To evaluate and identify predictors of ultrasound quality in patients with cirrhosis. We performed a retrospective cohort study among patients who underwent ultrasound examination for a cirrhosis-related indication between April 2015 and October 2015. Three fellowship-trained abdominal radiologists collectively reviewed all ultrasound exams and categorised exam quality as definitely adequate, likely adequate, likely inadequate and definitely inadequate to exclude liver lesions. We performed multivariable logistic regression to determine characteristics associated with inadequate ultrasound quality. Among 941 patients, 191 (20.3%) ultrasounds were inadequate for excluding HCC-134 definitely inadequate and 57 likely inadequate. In multivariable analysis, inadequate quality was associated with male gender (OR 1.68, 95% CI 1.14-2.48), body mass index category (OR 1.67, 95% CI 1.45-1.93), Child-Pugh B or C cirrhosis (OR 1.93, 95% CI 1.32-2.81), alcohol-related cirrhosis (OR 2.11, 95% CI 1.33-3.37), NASH cirrhosis (OR 2.87, 95% CI 1.71-4.80), and in-patient status (OR 1.55, 95% CI 1.01-2.37). Ultrasounds were inadequate in over one-third of patients with Child-Pugh C cirrhosis, BMI >35, or NASH cirrhosis. One in five ultrasounds in patients with cirrhosis are inadequate for exclusion of HCC, which can contribute to surveillance failure."

According to the news reporters, the research concluded: "Alternative surveillance modalities are needed in subgroups prone to inadequate ultrasounds including obese patients, those with Child Pugh B or C cirrhosis, and those with alcohol-or NASH-related cirrhosis."

Our news correspondents report that additional information may be obtained by contacting A.G. Singal, UT Southwestern Med Center, Harold C Simmons Canc Center, Dallas, TX, United States. Additional authors for this research include D.T. Fetzer, T. Yokoo, J.A.
Investigators at University of Tubingen Report Findings in Heparin Therapy (Design of intelligent chitosan/heparin hollow microcapsules for drug delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Heparin Therapy. According to news reporting out of Reutlingen, Germany, by NewsRx editors, research stated, "In this study, a novel strategy has been developed for the assembly of polyelectrolyte multilayer (PEM) on CaCO3 templates in acidic pH solutions, where consecutive polyelectrolyte layers (heparin/poly(allylamine hydrochloride) or heparin/chitosan) were deposited on PEM hollow microcapsules established previously on CaCO3 templates. The PEM build-up, hollow capsule characterization and successful encapsulation of fluorescein 5(6)-isothiocyanate (FITC)-Dextran by coprecipitation with CaCO3 are demonstrated."

Our news journalists obtained a quote from the research from the University of Tubingen, "Improvement by the removal of CaCO3 core was achieved while the depositions. In the course of the release profile, high retardation for encapsulated FITC-Dextran was observed."

According to the news editors, the research concluded: "The combined shell capsules system is a significant trait that has potential use in tailoring functional layer-by-layer capsules as intelligent drug delivery vehicles where the preliminary in vitro tests showed the responsiveness on the enzymes."

Our news journalists report that additional information may be obtained by contacting X. Xiong, University of Tubingen, NMI Nat & Med Sci Inst, Reutlingen, Germany. Additional authors for this research include X. Xiong, Q.G. Zou, P.K. Ouyang, C. Burkhardt and R. Krastev.

Keywords for this news article include: Reutlingen, Germany, Europe, Drug Delivery Systems, Drugs and Therapies, Heparin Therapy, University of Tubingen.
Investigators at University of Turin Release New Data on Prostate Cancer (Retrospective study testing next generation sequencing of selected cancer-associated genes in resected prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to news reporting out of Orbassano, Italy, by NewsRx editors, research stated, "Prostate cancer (PCa) has a highly heterogeneous outcome. Beyond Gleason Score, Prostate Serum Antigen and tumor stage, nowadays there are no biological prognostic factors to discriminate between indolent and aggressive tumors. The most common known genomic alterations are the TMPRSS-ETS translocation and mutations in the PI3K, MAPK pathways and in p53, RB and c-MYC genes. The aim of this retrospective study was to identify by next generation sequencing the most frequent genetic variations (GVs) in localized and locally advanced PCa underwent prostatectomy and to investigate their correlation with clinical-pathological variables and disease progression."

Our news journalists obtained a quote from the research from the University of Turin, "Identified non-synonymous GVs included TP53 p.P72R (78% of tumors), two CSFR1 SNPs, rs2066934 and rs2066933 (70%), KDR p.Q472H (67%), KIT p.M541L (28%), PIK3CA p.I391M (19%), MET p.V378I (10%) and FGFR3 p.F384L/p.F386L (8%). TP53 p.P72R, MET p.V378I and CSFR1 SNPs were significantly associated with the HI risk group, TP53 and MET variations with T (>=)T2c. FGFR3 p.F384L/p.F386L was correlated with T (<)T2b. MET p.V378I mutation, detected in 20% of HI risk patients, was associated with early biochemical recurrence. Nucleic acids were obtained from tissue samples of 30 high (HI) and 30 low-intermediate (LM) risk patients, according to D'Amico criteria. Genomic DNA was explored with the Ion_AmpliSeq_Cancer_Hotspot_Panel_v.2 including 50 cancer-associated genes. GVs with allelic frequency (AF) (>)=10%, affecting protein function or previously associated with cancer, were correlated with clinical-pathological variables."

According to the news editors, the research concluded: "Our results confirm a complex mutational profile in PCa, supporting the involvement of TP53, MET, FGFR3, CSF1R GVs in tumor progression and aggressiveness."

For more information on this research see: Retrospective study testing next generation sequencing of selected cancer-associated genes in resected prostate cancer. Oncotarget, 2016;7(12):14394-404.

Our news journalists report that additional information may be obtained by contacting M. Lo Iacono, University of Turin, Dept. of Oncology, Orbassano, Italy. Investigators at University of Washington Have Reported New Data on Regenerative Medicine (Silent IL2RG Gene Editing in Human Pluripotent Stem Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Biomedical Engineering - Regenerative Medicine is now available. According to news reporting originating from Seattle, Washington, by NewsRx correspondents, research stated, "Many applications of pluripotent stem cells (PSCs) require efficient editing of silent chromosomal genes. Here, we show that a major limitation in isolating edited clones is silencing of the selectable marker cassette after homologous recombination and that this can be overcome by using a ubiquitous chromatin opening element (UCOE) promoter-driven transgene."

Our news editors obtained a quote from the research from the University of Washington, "We use this strategy to edit the silent IL2RG locus in human PSCs with a recombinant adeno-associated virus (rAAV)-targeting vector in the absence of potentially genotoxic, site-specific nucleases and show that IL2RG is required for natural killer and T-cell differentiation of human PSCs. Insertion of an active UCOE promoter into a silent locus altered the histone modification and cytosine methylation pattern of surrounding chromatin, but these changes resolved when the UCOE promoter was removed."

According to the news editors, the research concluded: "This same approach could be used to correct IL2RG mutations in X-linked severe combined immunodeficiency patient-derived induced PSCs (iPSCs), to prevent graft versus host disease in regenerative medicine applications, or to edit other silent genes."

For more information on this research see: Silent IL2RG Gene Editing in Human Pluripotent Stem Cells. Molecular Therapy, 2015;24(3):582-91. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

Health and Medicine - Addiction Research

Investigators at University of Wisconsin School of Medicine and Public Health Release New Data on Addiction Research (Identifying effective intervention components for smoking cessation: a factorial screening experiment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Health and Medicine - Addiction Research are discussed in a new report. According to news reporting originating from Madison, Wisconsin, by NewsRx correspondents, research stated, "To identify promising intervention components intended to help smokers to attain and maintain abstinence in their quit smoking attempts. A fully crossed, six-factor randomized fractional factorial experiment."

Our news editors obtained a quote from the research from the University of Wisconsin School of Medicine and Public Health, "Eleven primary care clinics in southern Wisconsin, USA. A total of 637 adult smokers (55% women, 88% white) motivated to quit smoking who visited primary care clinics. Six intervention components designed to prepare smokers to quit, and achieve and maintain abstinence (i.e. for the preparation, cessation and maintenance phases of smoking treatment): (1) preparation nicotine patch versus none; (2) preparation nicotine gum versus none; (3) preparation counseling versus none; (4) intensive cessation in-person counseling versus minimal; (5) intensive cessation telephone counseling versus minimal; and (6) 16 versus 8 weeks of combination nicotine replacement therapy (nicotine patch + nicotine gum). Seven-day self-reported point-prevalence abstinence at 16 weeks. Preparation counseling significantly improved week 16 abstinence rates (p=.04), while both forms of preparation nicotine replacement therapy interacted synergistically with intensive cessation in-person counseling (p <0.05). Conversely, intensive cessation phone counseling and intensive cessation in-person counseling interacted antagonistically (p <0.05)-these components produced higher abstinence rates by themselves than in combination."

According to the news editors, the research concluded: "Preparation counseling and the combination of intensive cessation in-person counseling with preparation nicotine gum or patch are promising intervention components for smoking and should be evaluated as an integrated treatment package."

The news editors report that additional information may be obtained by contacting M.E. Piper, Center for Tobacco Research and Intervention, University of Wisconsin School of Medicine and Public Health, Madison, WI, United States. Additional authors for this research include M.C. Fiore, S.S. Smith, D. Fraser, D.M. Bolt, L.M. Collins, R. Mermelstein, T.R. Schlam, J.W. Cook, D.E. Jorenby, W.Y. Loh and T.B Baker.

Cardiovascular Diseases and Conditions -…

Investigators at University of Yaounde Discuss Findings in Hypertension (Distribution and patterning of noncommunicable disease risk factors in indigenous Mbororo and non-autochthonous populations in Cameroon: cross sectional study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hypertension. According to news reporting from Yaounde, Cameroon, by NewsRx journalists, research stated, "Data on Non-Communicable Diseases (NCDs) among indigenous populations are needed for interventions to improve health care. We conducted a survey in 2013 among rural indigenous Mbororo, Fulbe and other ethnic groups to determine the distribution of risk factors of NCDs in Cameroon."

The news correspondents obtained a quote from the research from the University of Yaounde, "We selected seven targets of NCD risk factors: tobacco use, alcohol use, diet (salt/sugar intake, vegetable/fruit consumption), raised blood pressure, raised blood glucose, physical inactivity and weight measures. The WHO STEPwise approach was used to collect data from 1921 consenting participants aged >= 20 years. Prevalence of NCD risk factors was summarised by descriptive statistics. Underweight was widespread, Mbororo (50.8%) and Fulbe (37.2%). Increase in prevalence of six risk factors was observed among the Fulbe when compared to Mbororo. Participants aged 20-39 years had low levels of physical activity, poor diet and higher levels of alcohol consumption (except Mbororo) and those aged >= 40 years had higher prevalence of diabetes, hypertension, current smoking and overweight/obesity. Men and women differed in current smoking, occasional/daily alcohol consumption, pre-hypertension and hypertension, continuous walking for at least ten minutes, and weight measures for Fulbe and Mbororo, p< 0.05. Distribution of NCD risk factors was high among settled Fulani (Fulbe) when compared to indigenous nomadic Fulani (Mbororo). Change from nomadic to settled life might be accompanied by higher prevalence of NCDs."

According to the news reporters, the research concluded: "This data should be used to develop intervention programmes to curb the rising burden of NCDs in rural indigenous and non-indigenous populations."

Our news journalists report that additional information may be obtained by contacting N.C. Kufe, Univ Yaounde I, Fac Med & Biomed Sci, Dept. of Med & Special, Hlth Populat Transit HoPiT Res Grp, Yaounde, Cameroon. Additional authors for this research include G. Ngufor, G. Mbeh and J.C. Mbanya.
Investigators at Veterans Affairs Medical Center Describe Findings in Pneumonia (Evaluation of a protocol to optimize duration of pneumonia therapy at hospital discharge)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Pneumonia. According to news originating from Boise, Idaho, by NewsRx correspondents, research stated, "A protocol to optimize the duration of antimicrobial therapy (DAT) for uncomplicated pneumonia at hospital discharge was evaluated. This retrospective quasiexperimental study was conducted at Boise Veterans Affairs Medical Center from March 2013 through June 2015."

Our news journalists obtained a quote from the research from Veterans Affairs Medical Center, "Patients were included in the study if they were diagnosed with pneumonia, were hospitalized for more than 24 hours, received antimicrobial treatment within 48 hours of admission, and survived until hospital discharge. The intervention included development of a pneumonia DAT triage algorithm, a process for assessment of the appropriate DAT by pharmacists, and recommendations to providers to limit excessive discharge DATs prescribed. Interrupted time series analysis was performed to determine the mean monthly DAT per patient and the 30-day readmission rate. Of the 707 patients discharged with a diagnosis of pneumonia, 560 met the criteria for study inclusion (366 in the preimplementation group and 194 in the postimplementation group). Change in slope of monthly mean DAT per patient postimplementation was significantly reduced (p = 0.03) from the preimplementation slope (p = 0.95), indicating an association between the intervention and mean DAT per patient. The intervention was not associated with the 30-day readmission rate. The mean S.D. DAT decreased from 9.5 +/- 2.4 days preimplementation to 8.2 +/- 2.9 days postimplementation, primarily due to the reduction of outpatient DAT from 5.2 +/- 3.0 days preimplementation to 4.2 +/- 3.0 days postimplementation."

According to the news editors, the research concluded: "A pharmacy-based triage algorithm helped to reduce excessive DATs for patients with pneumonia at hospital discharge without negatively affecting 30-day readmission rates."

For more information on this research see: Evaluation of a protocol to optimize duration of pneumonia therapy at hospital discharge. American Journal of Health-System Pharmacy, 2016;73(24):2043-2054. American Journal of Health-System Pharmacy can be contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD 20814, USA.

The news correspondents report that additional information may be obtained from K. Madaras-Kelly, Vet Affairs Med Center, Boise, ID 83702, United States. Additional authors for this research include K. Crane, M. Wilkin, J. Bohan, R. Remington and K. Madaras-Kelly. The direct object identifier (DOI) for that additional information is:
Investigators at Wake Forest University Discuss Findings in Central Nervous System Depressants ($1.8 Million and counting: how volatile agent education has decreased our spending $1000 per day)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Central Nervous System Depressants are discussed in a new report. According to news originating from Winston Salem, North Carolina, by NewsRx correspondents, research stated, "Study Objective: Volatile anesthetic agents comprise a substantial portion of every hospital's pharmacy budget. Challenged with an initiative to lower anesthetic drug expenditures, we developed an education based intervention focused on reducing volatile anesthetic costs while preserving access to all available volatile anesthetics."

Our news journalists obtained a quote from the research from Wake Forest University, "When postintervention evaluation demonstrated a dramatic year-over-year reduction in volatile agent acquisition costs, we undertook a retrospective analysis of volatile anesthetic purchasing data using time series analysis to determine the impact of our educational initiative. We obtained detailed volatile anesthetic purchasing data from the Central Supply of Wake Forest Baptist Health from 2007 to 2014 and integrated these data with the time course of our educational intervention. Aggregate volatile anesthetic purchasing data were analyzed for 7 consecutive fiscal years. The educational initiative emphasized tissue partition coefficients of volatile anesthetics in adipose tissue and muscle and their impact on case management. We used an interrupted time series analysis of monthly cost per unit data using autoregressive integrated moving average modeling, with the monthly cost per unit being the amount spent per bottle of anesthetic agent per month. The cost per unit decreased significantly after the intervention (t = -6.73, P< .001). The autoregressive integrated moving average model predicted that the average cost per unit decreased $48 after the intervention, with 95% confidence interval of $34 to $62. As evident from the data, the purchasing of desflurane and sevoflurane decreased, whereas that of isoflurane increased. An educational initiative focused solely on the selection of volatile anesthetic agent per case significantly reduced volatile anesthetic expense at a tertiary medical center. This approach appears promising for application in other hospitals in the rapidly evolving, value-added health care environment."

According to the news editors, the research concluded: "We were able to accomplish this with instruction on tissue partition coefficients and each agent's individual cost per MAC-hour delivered."

For more information on this research see: $1.8 Million and counting: how volatile agent education has decreased our spending $1000 per day. *Journal of Clinical Anesthesia*, 2016;35():253-258. *Journal of Clinical Anesthesia* can be contacted at: Elsevier Science Inc,
Women's Health - Obstetrics and Gynecology

Investigators at Washington University Report Findings in Obstetrics and Gynecology (Adult Comorbidity Evaluation 27 score as a predictor of survival in endometrial cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Women's Health - Obstetrics and Gynecology have been published. According to news reporting from St. Louis, Missouri, by NewsRx journalists, research stated, "The incidence of endometrial cancer increases with age and is associated with medical comorbidities such as obesity and diabetes. Although a few cohort studies of <500 patients showed an association between comorbidity and survival in patients with endometrial cancer, the degree of association must be better described."

The news correspondents obtained a quote from the research from Washington University, "The Adult Comorbidity Evaluation 27 is a validated comorbidity instrument that provides a score of 0-3 based on the number of and severity of medical comorbidities. This study was performed to explore the association between medical comorbidities and survival of patients with endometrial cancer. Patients who were diagnosed with endometrial cancer from 2000-2012 were identified from the prospectively maintained Siteman Cancer Center tumor registry. Patients who underwent primary surgical treatment for endometrioid, serous, and clear cell endometrial carcinoma were included. Patients who primarily were treated with radiation, chemotherapy, or hormone therapy were excluded. Patients with uterine sarcomas or neuroendocrine tumors were excluded. Patients with missing Adult Comorbidity Evaluation 27 scores were also excluded from analysis. Information that included patient demographics, Adult Comorbidity Evaluation 27 score, tumor characteristics, adjuvant treatment, and survival data were extracted from the database. The association of Adult Comorbidity Evaluation 27 and overall and recurrence-free survival was explored in a multivariable Cox regression analysis after being controlled for variables that have been found to be associated significantly with survival in univariable analysis. A total of 2073 patients with a median age of 61 years (range, 20-94 years) at diagnosis were identified. The Adult Comorbidity Evaluation 27 score was 0, 1, 2, and 3 in 22%, 38%, 28%, and 12% of patients, respectively. Stage distribution was I (73%), II (5%), III (15%), and IV (7%), and grade distribution was 1 (52%), 2 (23%), and 3 (25%). Most
patients had endometrioid histologic condition (87%) followed by serous (11%) and clear cell (3%) endometrial carcinoma. The median overall survival time for the entire cohort was 54 months (95% confidence interval, 3-154 months), and the median recurrence-free survival was 50 months (95% confidence interval, 2-154 months). On univariable analysis, age, race, marital status, stage, grade, histologic condition, and treatment type were associated significantly with overall survival and recurrence-free survival. After adjustment for these covariates, patients with an Adult Comorbidity Evaluation 27 score of 2 had a 52% higher risk of death (95% confidence interval, 1.16-2.00); patients with an Adult Comorbidity Evaluation 27 score of 3 had a 2.35-fold increased risk of death (95% confidence interval, 1.73-3.21) compared with patients with an Adult Comorbidity Evaluation 27 score of 0. Similarly, patients with an Adult Comorbidity Evaluation 27 score of 2 had a 38% higher risk of recurrence (95% confidence interval, 1.07-1.78); patients with Adult Comorbidity Evaluation 27 score of 3 had a 2.05-fold increased risk of recurrence (95% confidence interval, 1.53-2.75) compared with patients with an Adult Comorbidity Evaluation 27 score of 0. We found no interaction between Adult Comorbidity Evaluation 27 score and age, stage, or treatment type.

According to the news reporters, the research concluded: "Our findings demonstrate the importance of comorbidities in the estimation of the prognosis of patients with endometrial cancer, even after adjustment for age and known tumor-specific prognostic factors such as stage, grade, histologic condition, and adjuvant treatment."

Our news journalists report that additional information may be obtained by contacting P.S. Binder, Washington University, Sch Med, Dept. of Obstet & Gynecol, Div Gynecol Oncol, St Louis, MO 63110, United States. Additional authors for this research include J.F. Peipert, D. Kallogjeri, R.A. Epidemiology

Investigators at Wayne State University Discuss Findings in Epidemiology (High-throughput allele-specific expression across 250 environmental conditions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Epidemiology. According to news reporting from Detroit, Michigan, by NewsRx journalists, research stated, "Gene-by-environment (GxE) interactions determine common disease risk factors and biomedically relevant complex traits. However, quantifying how the environment modulates genetic effects
on human quantitative phenotypes presents unique challenges."

Funders for this research include National Institute of General Medical Sciences, American Heart Association.

The news correspondents obtained a quote from the research from Wayne State University, "Environmental covariates are complex and difficult to measure and control at the organismal level, as found in GWAS and epidemiological studies. An alternative approach focuses on the cellular environment using in vitro treatments as a proxy for the organismal environment. These cellular environments simplify the organism-level environmental exposures to provide a tractable influence on subcellular phenotypes, such as gene expression. Expression quantitative trait loci (eQTL) mapping studies identified GxE interactions in response to drug treatment and pathogen exposure. However, eQTL mapping approaches are infeasible for large-scale analysis of multiple cellular environments. Recently, allele-specific expression (ASE) analysis emerged as a powerful tool to identify GxE interactions in gene expression patterns by exploiting naturally occurring environmental exposures. Here we characterized genetic effects on the transcriptional response to 50 treatments in five cell types. We discovered 1455 genes with ASE (FDR <10%) and 215 genes with GxE interactions. We demonstrated a major role for GxE interactions in complex traits. Genes with a transcriptional response to environmental perturbations showed sevenfold higher odds of being found in GWAS. Additionally, 105 genes that indicated GxE interactions (49%) were identified by GWAS as associated with complex traits. Examples include GIPR caffeine interaction and obesity and include LAMP3-selenium interaction and Parkinson disease."

According to the news reporters, the research concluded: "Our results demonstrate that comprehensive catalogs of GxE interactions are indispensable to thoroughly annotate genes and bridge epidemiological and genome-wide association studies."

Our news journalists report that additional information may be obtained by contacting R. Pique-Regi, Wayne State University, Dept. of Obstet & Gynecol, Detroit, MI 48201, United States. Additional authors for this research include A.L. Richards, D. Kurtz, C.A. Kalita, G.O. Davis, C.T. Harvey, A. Alazizi, D. Watza, Y. Sorokin, N. Hauff, X. Zhou, X.Q. Wen, R. Pique-Regi and F. Luca.

**Heart Disorders and Diseases - Heart Failure**

**Investigators at Wayne State University Report Findings in Heart Failure (Results of a Hospital-Based Palliative Care Intervention for Patients With an Acute Exacerbation of Chronic Heart Failure)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Failure is the subject of a report. According to news reporting out of Detroit, Michigan, by NewsRx editors, research stated, "Palliative interventions are an important part of advanced heart failure (HF) care. However, these interventions are historically underutilized, particularly by African Americans."

Our news journalists obtained a quote from the research from Wayne State University, "We performed a prospective randomized intervention trial in patients with advanced HF who were hospitalized for acute decompensation at 3 urban hospitals, comparing the effect of palliative care consultation (PCC) with that of usual care. The primary end point was the proportion choosing comfort-oriented care (hospice and/or 'do not resuscitate' [DNR] order) 3-6 months after randomization. A total of 85 patients (mean age 68 years, 91.8% African American) were enrolled over a 2-year period. Four of the 43 patients (9.3%) randomized to the PCC group chose comfort-oriented care versus 0 of the 42 control group members (risk difference = 9.3%; 95% confidence interval = -11.8% to 30.0%). In this predominantly African-American cohort of hospitalized patients with advanced HF, PCC did not lead to a greater likelihood of comfort care election compared with usual care."

According to the news editors, the research concluded: "More robust palliative interventions should be developed to meet the needs of diverse groups of patients with HF."

For more information on this research see: Results of a Hospital-Based Palliative Care Intervention for Patients With an Acute Exacerbation of Chronic Heart Failure. *Journal of Cardiac Failure*, 2016;22Q(12):1033-1036. *Journal of Cardiac Failure* can be contacted at: Churchill Livingstone Inc Medical Publishers, Curtis Center, Independence Square West, Philadelphia, PA 19106-3399, USA. **Immune System Diseases and Conditions - HIV/AIDS**

**Investigators at Weizmann Institute of Science Detail Findings in HIV/AIDS [Heat Shock Protein 90 Facilitates Latent HIV Reactivation through Maintaining the Function of Positive Transcriptional Elongation Factor b (p-TEFb) under Proteasome ...]**
Research findings on Immune System Diseases and Conditions - HIV/AIDS are discussed in a new report. According to news originating from Rehovot, Israel, by NewsRx correspondents, research stated, "The persistence of HIV in resting memory CD4(+) T cells at a latent state is considered as the major barrier on the path to achieve a cure for HIV. Proteasome inhibitors (PIs) were previously reported as latency reversing agents (LRAs) but the mechanism underlying this function is yet unclear."

Financial supporters for this research include National Natural Science Foundation of China, National S&T Key Foundation, Natural Science Foundation of Guangdong Province.

Our news journalists obtained a quote from the research from the Weizmann Institute of Science, "Here we demonstrate that PIs reactivate latent HIV ex vivo without global T cell activation, and may facilitate host innate immune responses. Mechanistically, latent HIV reactivation induced by PIs is mediated by heat shock factor 1 (HSF1) via the recruitment of the heat shock protein (HSP) 90-positive transcriptional elongation factor b (p-TEFb) complex. Specifically, HSP90 downstream HSF1 gives positive feedback to the reactivation process through binding to cyclin-dependent kinase 9 (CDK9) and preventing it from undergoing degradation by the proteasome. Overall, these findings suggest proteasome inhibitors as potential latency reversing agents."

According to the news editors, the research concluded: "In addition, HSF1/HSP90 involved in HIV transcription elongation, may serve as therapeutic targets in HIV eradication."

The news correspondents report that additional information may be obtained from Y. Shai, Weizmann Inst Sci, Dept. of Biochem, IL-76100 Rehovot, Israel. Additional authors for this research include W. Zhao, C.Y. Wang, J. Lin, X.Y. Zeng, R.X. Ren, K. Wang, T.R. Xun, Y. Shai and S.W. Liu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.743906. This DOI is a link to an online electronic document that is either free or for purchase.

Adenocarcinomas

Investigators at West China Hospital Target Adenocarcinomas
(Diagnostic value of thyroid transcription factor-1 for pleural or other serous metastases of pulmonary adenocarcinoma: a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Adenocarcinomas have been published. According to news originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "The role of thyroid transcription factor 1 (TTF-1) in the diagnosis of metastatic pulmonary adenocarcinomas in pleural, pericardial, and peritoneal effusions has not been defined. This study aimed to assess the overall diagnostic accuracy of TTF-1 for metastatic pulmonary adenocarcinomas in pleural or other effusions."

Our news journalists obtained a quote from the research from West China Hospital, "Literature search was conducted in PubMed, EMBASE, and other databases to find eligible publications. Quality was assessed according to standardized QUADAS-2 criteria. Sensitivity, specificity, positive/negative likelihood ratio (PLR/NLR), and diagnostic odds ratio (DOR) were pooled. Summary receiver operating characteristic (SROC) curves were used to assess overall performance of the TTF-1 assay. A systematic search revealed 20 studies comprising a total of 1,213 subjects in this meta-analysis. The summary estimates were listed as follows: sensitivity, 0.74 (95% CI: 0.69-0.79); specificity, 0.99 (95% CI: 0.97-1.00); PLR, 78.16 (95% CI: 27.15-225.05); NLR, 0.26 (95% CI: 0.22-0.32); and diagnostic odds ratio, 297.75 (95% CI: 104.16-851.19). Estimated positive and negative post-probability values for metastatic pulmonary adenocarcinomas prevalence of 20% were 95% and 6%, respectively. The area under the SROC curve was 0.96. TTF-1 shows significant potential as a diagnostic marker to differentiate metastatic pulmonary from non-pulmonary adenocarcinomas in pleural or other effusions."

According to the news editors, the research concluded: "These results justify larger, more rigorous studies to confirm such a diagnostic role."

For more information on this research see: Diagnostic value of thyroid transcription factor-1 for pleural or other serous metastases of pulmonary adenocarcinoma: a meta-analysis. Scientific Reports, 2016;6():19785. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Investigators at Xiamen University Zero in on Iron-Binding Proteins (Biomineralization-Inspired Synthesis of Copper Sulfide-Ferritin Nanocages as Cancer Theranostics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Carrier Proteins - Iron-Binding Proteins have been published. According to news reporting out of Xiamen, People's Republic of China, by NewsRx editors, research stated, "It is essential to control the size and morphology of nanoparticles strictly in nanomedicine. Protein cages offer significant potential for templated synthesis of inorganic nanoparticles."

Funders for this research include Program for New Century Excellent Talents in University, Ministry of Education of the People's Republic of China, Ministry of Science and Technology of the People's Republic of China, National Institute of Biomedical Imaging and Bioengineering, China Scholarship Council, National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Xiamen University, "In this study, we successfully synthesized ultrasmall copper sulfide (CuS) nanoparticles inside the cavity of ferritin (Fn) nanocages by a biomimetic synthesis method. The uniform CuS-Fn nanocages (CuS-Fn NCs) showed strong near-infrared absorbance and high photothermal conversion efficiency. In quantitative ratiometric photoacoustic imaging (PAI), the CuS-Fn NCs exhibited superior photoacoustic tomography improvements for real-time in vivo PAI of entire tumors. With the incorporation of radionuclide (64)Cu, (64)CuS-Fn NCs also served as an excellent PET imaging agent with higher tumor accumulation compared to free copper. Following the guidance of PAI and PET, CuS-Fn NCs were applied in photothermal therapy to achieve superior cancer therapeutic efficiency with good biocompatibility both in vitro and in vivo."

According to the news editors, the research concluded: "The results demonstrate that the bioinspired multifunctional CuS-Fn NCs have potential as clinically translatable cancer theranostics and could provide a noninvasive, highly sensitive, and quantitative in vivo guiding method for cancer photothermal therapies in experimental and clinical settings."

For more information on this research see: Biomineralization-Inspired Synthesis of Copper Sulfide-Ferritin Nanocages as Cancer Theranostics. Acs Nano, 2016;10(3):3453-60. (American Chemical Society - www.acs.org; Acs Nano - www.pubs.acs.org/journal/ancac3)

Investigators at Yale University Report Findings in One-Carbon Group Transferases (Methyltransferase-like protein 16 binds the 3′-terminal triple helix of MALAT1 long noncoding RNA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Enzymes and Coenzymes - One-Carbon Group Transferases are presented in a new report. According to news reporting out of New Haven, Connecticut, by NewsRx editors, research stated, "Metastasis-associated lung adenocarcinoma transcript 1 (MALAT1), a cancer-promoting long noncoding RNA, accumulates in cells by using a 3′-triple-helical RNA stability element for nuclear expression (ENE). The ENE, a stem-loop structure containing a U-rich internal loop, interacts with a downstream A-rich tract (ENE+A) to form a blunt-ended triple helix composed of nine U.A-U triples interrupted by a C.G-C triple and C-G doublet."

Our news journalists obtained a quote from the research from Yale University, "This unique structure prompted us to explore the possibility of protein binding. Native gel-shift assays revealed a shift in radiolabeled MALAT1 ENE+A RNA upon addition of HEK293T cell lysate. Competitive gel-shift assays suggested that protein binding depends not only on the triple-helical structure but also its nucleotide composition. Selection from the lysate using a biotinylated-RNA probe followed by mass spectrometry identified methyltransferase-like protein 16 (METTL16), a putative RNA methyltransferase, as an interacting protein of the MALAT1 ENE+A. Gel-shift assays confirmed the METTL16-MALAT1 ENE+A interaction in vitro: Binding was observed with recombinant METTL16, but diminished in lysate depleted of METTL16, and a supershift was detected after adding anti-METTL16 antibody. Importantly, RNA immunoprecipitation after in vivo UV cross-linking and an in situ proximity ligation assay for RNA-protein interactions confirmed an association between METTL16 and MALAT1 in cells. METTL16 is an abundant (similar to 5 x 10(5) molecules per cell) nuclear protein in HeLa cells."

According to the news editors, the research concluded: "Its identification as a triple-stranded RNA binding protein supports the formation of RNA triple helices inside cells and suggests the existence of a class of triple-stranded RNA binding proteins, which may enable the discovery of additional cellular RNA triple helices."

Our news journalists report that additional information may be obtained by contacting J.A. Brown, Yale University, Sch Med, Howard Hughes Med Inst, Dept. of Mol Biophys & Biochem, New Haven, CT 06536, United States. Additional authors for this research include C.G. Kinzig, S.J. DeGregorio and J.A. Steitz.

Investigators at Yang Ming National University Describe Findings in Basic-Leucine Zipper Transcription Factors (The SHP2-ERK2 signaling pathway regulates branched I antigen formation by controlling the binding of CCAAT/enhancer binding protein ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Proteins - Basic-Leucine Zipper Transcription Factors. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Phosphorylation status of the transcription factor CCAAT/enhancer binding protein alpha (C/EBP alpha) has been demonstrated in a human hematopoietic cell model to regulate the formation of branched I antigen by affecting its binding affinity to the promoter region of the IGnTC gene during erythroid and granulocytic differentiation. The K-562 cell line was induced to differentiate into red blood cells (RBCs) or granulocytes by sodium butyrate or retinoic acid, respectively, to study the involvement of three MAP kinase pathways in I antigen synthesis."

Our news editors obtained a quote from the research from Yang Ming National University, "The regulatory effects of the extracellular signal-regulated kinase (ERK) 2-Src homology region 2 domain-containing phosphatase 2 (SHP2) pathway on phosphorylation status and binding affinities of C/EBP alpha as well as the subsequent activation of IGnTC and synthesis of surface I formation were studied in wild-type K-562 cells and in mutant cells that overexpress ERK2 and SHP2. We found that SHP2-ERK2 signaling regulates the phosphorylation status of C/EBP alpha to alter its binding affinity onto the IGnTC promoter region, thereby activating the synthesis of cell surface I antigen formation during erythropoiesis. SHP2-ERK2 signaling acts upstream of C/EBP alpha as a regulator of cell surface I antigen synthesis."

According to the news editors, the research concluded: "Such regulation is specific for RBC but not for granulocyte differentiation."

The news editors report that additional information may be obtained by contacting Y.C. Twu, Yang Ming National University, Dept. of Biotechnol & Lab Sci Med, Taipei 11211, Taiwan. Additional authors for this research include Y.H. Lee, F.L. Chang, H. Ho, C.H. Huang and Y.C. Twu.

Keywords for this news article include: Taipei, Taiwan, Asia, Basic-Leucine Zipper Transcription Factors, CCAAT-Enhancer-Binding Protein-alpha, CCAAT-Enhancer-Binding Proteins, Enzymes and Coenzymes, DNA-Binding Proteins, Nuclear Proteins, Genetics, Kinase, Yang Ming National University.
Investigators at Yang Ming National University Detail Findings in Cardiology (Asymmetric dimethylarginine predicts the risk of contrast-induced acute kidney injury in patients undergoing cardiac catheterization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Decreased nitric oxide (NO) bioavailability and increased oxidative stress may be involved in the pathogenesis of contrast-induced acute kidney injury (CI-AKI). The relationship between asymmetric dimethylarginine (ADMA), an endogenous NO synthase inhibitor, and CI-AKI is unknown."

Our news editors obtained a quote from the research from Yang Ming National University, "We measured plasma ADMA levels in 664 consecutive subjects undergoing cardiac catheterization. Mehran score for predicting the risk of CI-AKI was calculated. After cardiac catheterization, 78 (11.7%) patients experienced CI-AKI (defined as increase of serum creatinine levels of >= 0.3 mg/dl or a 25% increase from baseline value at 48 h after the procedure). The plasma ADMA levels of patients with CI-AKI were significantly higher than those of patients without CI-AKI (0.50 +/- 0.09 μmol/l versus 0.46 +/- 0.10 μmol/l, p< 0.001). The c-statistics of plasma ADMA level and Mehran score for the occurrence of CI-AKI were 0.639 (95% CI: 0.601-0.676, p< 0.001) and 0.615 (95% CI: 0.577-0.652, p = 0.001), respectively. By using a cutpoint of plasma ADMA level of 0.42 μmol/l, the analysis would yield 85.9% sensitivity, 37.0% specificity. Adding the plasma ADMA level to the Mehran score system marginally increases the c-statistic from 0.615 to 0.643 (p = 0.03). Furthermore, in patients developing CI-AKI, those with plasma ADMA levels > 0.42 μmol/l (14 events in 52 patients) tended to have a higher 1-year major adverse event rate than those with plasma ADMA level <= 0.42 μmol/l (2 events in 26 patients) (p = 0.055)."

According to the news editors, the research concluded: "In patients undergoing cardiac catheterization, ADMA might be a novel risk factor of CI-AKI."

Clinical Research - Clinical Trials and Studies

Investigators at Yonsei University Discuss Findings in Clinical Trials and Studies (A retrospective observational study on the treatment outcomes of 26 patients with spinal cord astrocytoma including two cases of malignant transformation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Clinical Research - Clinical Trials and Studies have been presented. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "To determine the biologic behavior and prognostic factors of spinal cord astrocytoma, we reviewed surgical and clinical outcomes. Due to the rarity of spinal cord astrocytoma, there is a lack of research regarding this type of tumor and malignant transformation."

The news correspondents obtained a quote from the research from Yonsei University, "We retrospectively reviewed the data from all patients on whom we performed spinal cord tumor removal between 1983 and 2014. Twenty-six patients were pathologically confirmed to have spinal cord astrocytoma or glioblastoma. Surgical extent and disease progression were confirmed by the surgeon based on operative findings, postoperative MRI, and outpatient department (OPD) follow-up. Pain or neurological deficit was the chief complaint for all patients. With MRI studies, there is a tendency for high-grade astrocytomas to show as enhanced and heterogeneous images. Two of the low-grade astrocytomas showed malignant transformation over the course of 4 and 11 months, respectively. The overall survival (OS) for low-grade astrocytoma was 28-480 months (mean 156.38 months); the OS for high-grade astrocytoma was 1-36 months (mean 12.00 months). Two of 12 low-grade cases showed malignant transformations at 4 and 11 months, respectively, based on pathological confirmation. With spinal cord astrocytomas, enhanced MRI results appeared similar to those of a malignant lesion. We suggest close observation and image correlation of low-grade astrocytomas, even when pathologically confirmed as low-grade."

According to the news reporters, the research concluded: "In this review, we found that histologic grade is the most important prognostic factor, although it is not always concordant with biologic behaviors."

For more information on this research see: A retrospective observational study on the treatment outcomes of 26 patients with spinal cord astrocytoma including two cases of malignant transformation. European Spine Journal, 2016;25(12):4067-4079. European Spine Journal can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Investigators at Zhejiang Chinese Medical University Detail Findings in Type 2 Diabetes (Urinary Metabolomic Profiling in Zucker Diabetic Fatty Rats with Type 2 Diabetes Mellitus Treated with Glimepiride, Metformin, and Their Combination)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is the subject of a report. According to news reporting originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Type 2 diabetes mellitus (T2DM) is a high incidence metabolic disease. Glimepiride, metformin, and their combination are the most commonly used therapeutics for T2DM in the clinic, but little is known about the metabolic responses of these therapies."

Our news editors obtained a quote from the research from Zhejiang Chinese Medical University, "In this study, ultrahigh-pressure liquid chromatography/electrospray ionization quadrupole time-of-flight mass spectrometry (UHPLC/ESI-QTOF-MS)-based metabolomics was applied to detect changes in the urinary metabolomic profile of Zucker diabetic fatty (ZDF) rats in response to these treatments. Additionally, standard biochemical parameters (e.g., fasting plasma glucose, glycosylated hemoglobin, oral glucose tolerance, urinary glucose, triglyceride, total cholesterol, and insulin) and liver histopathology were monitored and observed. Six metabolites, including 3-galactosyl lactose, citric acid, sphingosine, phytosphingosine, ribothymidine, and succinoadenosine, were found significantly reverted to the normal level after these therapies."

According to the news editors, the research concluded: "The present study is the first to present citric acid and sphinganine as the potential markers of T2DM, which could be used as indicators to observe the anti-diabetic effects of glimepiride, metformin, and their combination treatments."

For more information on this research see: Urinary Metabolomic Profiling in Zucker Diabetic Fatty Rats with Type 2 Diabetes Mellitus Treated with Glimepiride, Metformin, and Their Combination. *Molecules*, 2016;21(11):447-458. *Molecules* can be contacted at: MdpiaG, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. Investigators from Aarhus University Have Reported New Data on Neurodegenerative Diseases and Conditions (Current status of treating neurodegenerative disease with induced pluripotent stem cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions have been published. According to news originating from Tjele, Denmark, by NewsRx correspondents, research stated, "Degenerative diseases of the brain have proven challenging to treat, let alone cure. One of the treatment options is the use of stem cell therapy, which has been under investigation for several years."

Our news journalists obtained a quote from the research from Aarhus University, "However, treatment with stem cells comes with a number of drawbacks, for instance the source of these cells. Currently, a number of options are tested to produce stem cells, although the main issues of quantity and ethics remain for most of them. Over recent years, the potential of induced pluripotent stem cells (iPSCs) has been widely investigated and these cells seem promising for production of numerous different tissues both in vitro and in vivo. One of the major advantages of iPSCs is that they can be made autologous and can provide a sufficient quantity of cells by culturing, making the use of other stem cell sources unnecessary. As the first descriptions of iPSC production with the transcription factors Sox2, Klf4, Oct4 and C-Myc, called the Yamanaka factors, a variety of methods has been developed to convert somatic cells from all germ layers to pluripotent stem cells. Improvement of these methods is necessary to increase the efficiency of reprogramming, the quality of pluripotency and the safety of these cells before use in human trials."

According to the news editors, the research concluded: "This review focusses on the current accomplishments and remaining challenges in the production and use of iPSCs for treatment of neurodegenerative diseases of the brain such as Alzheimer's disease and Parkinson's disease."

The news correspondents report that additional information may be obtained from A.E. Pen, Aarhus University, Dept. of Mol Biol & Genet, DK-8830 Tjele, Denmark.

Oncology - Pancreatic Cancer

Investigators from Academy of Military Medical Sciences Release New Data on Pancreatic Cancer (Numb/Notch signaling pathway modulation enhances human pancreatic cancer cell radiosensitivity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Pancreatic Cancer are discussed in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "The present study aims to evaluate whether repression of the Numb/Notch signaling pathway affects the radiosensitivity of human pancreatic cancer cell lines. Different doses of X-rays (0, 2, 3, 4, and 5 Gy) were applied to the PANC-1, SW1990, and MIA PaCa-2 human pancreatic cancer cell lines, and the Numb/Notch pathway inhibitor DAPT was added at different doses (0, 1, 3, and 5 mu mol/l)."

Financial support for this research came from Beijing Municipal Science and Technology Commission.

The news correspondents obtained a quote from the research from the Academy of Military Medical Sciences, "MTT assay, colony formation assay, flow cytometry, scratch assay, and Transwell experiments were performed, and qRT-PCR and Western blot were conducted for the detection of Numb expression. Tumorigenicity assay in nude mice was carried out to verify the influence of blocker of the Numb/Notch signaling pathway on the radiosensitivity of xenograft tumors. The MTT assay, colony formation assay and flow cytometry experiments revealed that proliferation decreased as radiation dose increased. The viability of PANC-1 cells at 5 Gy, SW 1990 cells at 4 Gy and 5 Gy, and MIA PaCa-2 cells at 2-5 Gy was significantly lower than that of non-irradiated cells (all P< 0.05). The migration and invasion assays indicated that the PANC-1 cell line was least radiosensitive, while the MIA PaCa-2 cell line was the most radiosensitive. Numb expression significantly increased with increasing radiation dose, whereas the expression of Hes1, Notch1, and Hes5 significantly decreased compared to non-irradiated cells (P < 0.05). Compared to untreated control cells, DAPT dose dependently increased Numb expression and inhibited Notch1, Hes1, and Hes5 expressions at 2 Gy (P < 0.05). Subcutaneous tumorigenicity assay in nude mice demonstrated that DAPT increased the radiosensitivity of PANC-1, SW 1990, and MIA PaCa-2 cells."

According to the news reporters, the research concluded: "These findings suggest that Numb/Notch signaling in pancreatic cancer cells is associated with X-ray radiation and that inhibition of the Numb/Notch signaling pathway can enhance radiosensitivity, suggesting that inhibition of the Numb/Notch signaling pathway may serve as a potential target for clinical improvement of the radiosensitivity of pancreatic cancer."

Personalized Medicine

Investigators from Aetna Release New Data on Personalized Medicine (Payer view of personalized medicine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Personalized Medicine. According to news reporting out of Hartford, Connecticut, by NewsRx editors, the research stated, "The process and methods used by payers when evaluating coverage of personalized medicine testing are described. Personalized medicine encompasses a number of diagnostic tools that measure drug metabolism, genetic risk for disease development, and tumor type or markers that can guide oncology treatments."

Our news journalists obtained a quote from the research from Aetna, "However, whole genome testing, tumor marker testing, and testing for drug metabolism are additional costs to the healthcare system. In order to justify these costs, payers and health technology assessment bodies must evaluate the individual tests or groups of tests on their own merits. In order for a test to be covered by payers, test developers must demonstrate clinical utility as measured by improved outcomes or well-informed decision-making. In the United States, payers generally focus on clinical benefit to individual patients and benefits to the healthcare system. Clinical benefits include improved outcomes. Benefits to the healthcare system are generally considered to be cost offsets, which may be due to reductions in the use of unnecessary interventions or to more efficient use of resources. Provider organizations have been assuming more responsibility and liability for healthcare costs through various risk arrangements, including accountable care organizations and patient-centered medical homes. Diagnostic tests that increase efficiency, reduce unnecessary interventions, and improve outcomes will be chosen by specialists in provider organizations."

According to the news editors, the research concluded: "For personalized medicine approaches to be adopted and covered by health plans, the methods must be shown to be analytically and clinically valid and provide clinical utility at a reasonable level of cost-effectiveness to payers."

For more information on this research see: Payer view of personalized medicine. American Journal of Health-System Pharmacy, 2016;73(23):2007-2012. American Journal of Health-System Pharmacy can be contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD 20814, USA.

Lipoproteins

Investigators from Aix-Marseille University Zero in on Lipoproteins (A Combination of Single-Nucleotide Polymorphisms Is Associated with Interindividual Variability in Cholecalciferol Bioavailability in Healthy Men)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lipoproteins is now available. According to news reporting originating in Marseille, France, by NewsRx journalists, research stated, "Most people require dietary vitamin D to achieve the recommended concentration of 25-hydroxyvitamin D [25(OH)D] in the blood. However, the response to vitamin D supplementation is highly variable among individuals."

The news reporters obtained a quote from the research from Aix-Marseille University, "We assessed whether the variability in cholecalciferol bioavailability was associated with single-nucleotide polymorphisms (SNPs) in candidate genes. In a single-group design, 39 healthy adult men with a mean +/- SD age of 33 +/- 2 y and mean +/- SD body mass index lid kg/m(2)) of 22.9 +/- 0.3 were genotyped with the use of whole-genome microarrays. After an overnight fast, plasma 25(OH)D status was measured, and the subjects then consumed a meal that provided 5 mg cholecalciferol as a supplement. Plasma chylomicron cholecalciferol concentration was measured over 8 h, and cholecalciferol response was assessed by calculating the postprandial area under the curve. Partial least squares regression was used to test the association of SNPs in or near candidate genes (61 genes representing 3791 SNPs) with the postprandial cholecalciferol response. The postprandial chylomicron cholecalciferol concentration peaked at 5.4 h. The cholecalciferol response was extremely variable among individuals (CV: 47%). It correlated with the chylomicron triglyceride (TG) response (r = 0.60; P< 0.001) but not with the fasting plasma 25(OH)D concentration (r = 0.04; P = 0.83). A significant (P = 1.32 x 10(-4)) partial least squares regression model that included 17 SNPs in 13 genes (including 5 that have been associated with chylomicron TG response) was associated with the variance in the cholecalciferol response. In healthy men, there is a high interindividual variability in cholecalciferol bioavailability that is associated with a combination of SNPs located in or near genes involved in both vitamin D and lipid metabolism."

According to the news reporters, the research concluded: "This trial was registered at clinicaltrials.gov as NCT02100774."

Blood Diseases and Conditions - Sepsis

Investigators from Alice Springs Hospital Report New Data on Sepsis (Total and unbound ceftriaxone pharmacokinetics in critically ill Australian Indigenous patients with severe sepsis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Diseases and Conditions - Sepsis have been published. According to news reporting originating in Alice Springs, Australia, by NewsRx journalists, research stated, "In the absence of specific data to guide optimal dosing, this study aimed to describe the pharmacokinetics of ceftriaxone in severely septic Australian Indigenous patients and to assess achievement of the pharmacodynamic target of the regimens prescribed. A pharmacokinetic study was conducted in a remote hospital intensive care unit in patients receiving ceftriaxone dosing of 1 g every 12 h (q12h)."

Funders for this research include National Health and Medical Research Council of Australia, Australian Academy of Science's, Alice Springs Specialists' Private Practice Trust Fund, Australian National Health and Medical Research Council Fellowship, Australian National Health and Medical Research Council for Centre of Research Excellence.

The news reporters obtained a quote from the research from Alice Springs Hospital, "Serial blood and urine samples were collected over one dosing interval on two consecutive days. Samples were assayed using a validated chromatography method for total and unbound concentrations. Concentration-time data collected were analysed with a non-compartmental approach. A total of 100 plasma samples were collected from five subjects. Ceftriaxone clearance, volume of distribution at steady-state, elimination half-life and elimination rate constant estimates were 0.9 (0.6-1.5) L/h, 11.2 (7.6-13.4) L, 9.5 (3.2-10.2) h and 0.07 (0.07-0.21) h(-1), respectively. The unbound fraction of ceftriaxone ranged between 14% and 43%, with a higher unbound fraction present at higher total concentrations. The unbound concentrations at 720 min from the initiation of infusion for the first and second dosing intervals were 7.2 (4.8-10.7) mg/L and 7.8 (4.7-12.1) mg/L respectively, which exceeds the minimum inhibitory concentration of all typical target pathogens."

According to the news reporters, the research concluded: "The regimen of ceftriaxone 1 g q12h is adequate for critically ill Australian Indigenous patients with severe
sepsis caused by non-resistant pathogens."

Our news correspondents report that additional information may be obtained by contacting D. Tsai, Alice Springs Hosp, Dept. of Pharm, Alice Springs, NT, Australia. **Oncology - Colon Cancer**

**Investigators from Annamalai University Zero in on Colon Cancer**

*(Biochemical and molecular mechanisms underlying the chemopreventive efficacy of rosmarinic acid in a rat colon cancer)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Colon Cancer is the subject of a report. According to news reporting from Tamil Nadu, India, by NewsRx journalists, research stated, "To shed light on colon cancer chemoprevention, natural phytochemicals attract researchers by virtue of their beneficial biological effects. The chemopreventive potential of rosmarinic acid (RA) was tested by using the colon carcinogen, 1,2-dimethylhydrazine (DMH) by evaluating the Aberrant crypt foci (ACF), tumour incidence, lipid peroxidative byproducts, phase I & II drug metabolizing enzymes, cell proliferative and apoptotic proteins."

The news correspondents obtained a quote from the research from Annamalai University, "Rats were divided into six groups and received modified pellet diet. Group 1 served as control rats, group 2 rats received RA (5 mg/kg b.w. p.o.), rats in groups 3-6 received DMH (20 mg/kg b.w., s.c.) for the first fifteen weeks. In addition to DMH, groups 4-6 received RA at the dose of 5 mg/kg b.w. during initiation, post initiation stages and also for the entire study period. DMH treated rats showed an increase in the development of ACF, tumour formation and multiplicity and decrease in lipid peroxidative byproducts. Moreover, it modulates xenobiotic enzymes and reduces the expressions of proapoptotic proteins; increases expressions of anti apoptotic proteins at the end of the study."

According to the news reporters, the research concluded: "Supplementation with RA to carcinogen treated rats protected them from the above deleterious effects caused by DMH and
thus RA may be used as a potent chemopreventive agent."

Our news journalists report that additional information may be obtained by contacting N. Namasivayam, Annamalai Univ, Fac Sci, Dept. of Biochem & Biotechnol, Annamalainagar 608002, Tamil Nadu, India. Additional authors for this research include S. Gunasekaran and N. Namasivayam.

**Cystic Fibrosis**

**Investigators from Autonomous University Release New Data on Cystic Fibrosis (The+1858 C/T Polymorphism in the PTPN22 Gene Is Associated with Cystic Fibrosis Patients in Northeast Mexico)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cystic Fibrosis are presented in a new report. According to news reporting originating in Nuevo Leon, Mexico, by NewsRx journalists, research stated, "Cystic fibrosis (CF) is the most common autosomal recessive disease in the Caucasian population, but it has also been widely diagnosed in the Mexican population. Production of viscous secretions affects the secretory epithelia and the respiratory condition usually leads to death."

The news reporters obtained a quote from the research from Autonomous University, "The relationship between the CFTR genotype and the disease phenotype is not well understood. Other risk factors such as genetic and autoimmune influence the development of this disease. We analyzed the PTPN22 R620W polymorphism (+1858 C/T, rs2476601) in 78 DNA samples from CF patients and 232 healthy controls from northeast Mexico using the polymerase chain reaction-restriction fragment length (PCR-RFLP) method. The C allele and the CC genotype were the most frequently detected in controls (CC genotype 96.12%; C allele 98.06%) compared with CF patients (CC genotype 88.46%, C allele 93.59%). A statistically significant association for the CT + TT genotypes (p = 0.012, OR = 3.232) as well as for the mutant T allele (p = 0.005, OR = 3.463) was found when comparing CF patients with controls. A significant association was found between the rs2476601 polymorphism of the PTPN22 gene and CF in Mexican patients."

According to the news reporters, the research concluded: "Further studies are necessary to understand the influence of this variant on lung neutrophil function and disease development."
For more information on this research see: The+1858 C/T Polymorphism in the PTPN22 Gene Is Associated with Cystic Fibrosis Patients in Northeast Mexico. *Archives of Medical Research*, 2016;47(5):403-406. *Archives of Medical Research* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Heart Disorders and Diseases - Heart Disease**

**Investigators from Baylor University Zero in on Heart Disease (Causes of Death and Heart Weights in Adults at Necropsy in a Tertiary Texas Hospital, 2013-2015)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Disease have been published. According to news originating from Dallas, Texas, by NewsRx correspondents, research stated, "The causes of death and heart weights at death appear to be quite different in the USA today than in the first few decades of the last century. We determined the causes of death and heart weights at necropsy in 231 adults and compared the heart weights to those reported in several studies in the first half of the 20th century. Of the 231."

Our news journalists obtained a quote from the research from Baylor University, "91 (39%) died of a cardiovascular (CV) condition, and 140 (61%), of a non-CV condition. Of the 91 fatal CV disease cases, 48 had fatal coronary artery disease (CAD); of the remaining 183 cases without fatal CAD, 25 had narrowing >75% of 1 or more major epicardial coronary arteries. Thus, 73 of the 231 (32%) patients at necropsy had severe CAD. Comparison between the fatal CV and fatal non-CV cases disclosed variable age (mean 64 years vs mean 57 years) and heart weight (529 g vs 449 g) to be significantly different. Heart weight was found to be the only significantly variable between men and women. Comparison of the heart weights in this study to those recorded as 'normal' hearts 75 to 115 years earlier showed that today's 'average' heart is much larger than those reported earlier. In contrast to the earlier studies, heart weight presently appears to increase with age and with an increase in body mass index. early studies in heart weight did not take into account today's longer survival and therefore a high prevalence of systemic hypertension, diabetes mellitus, obesity (and cardiac adiposity), and the presence of atherosclerotic CAD."

According to the news editors, the research concluded: "Additionally, the cause of death (CV vs non-CV) was rarely considered in the early studies of heart weight."

For more information on this research see: Causes of Death and Heart Weights in

The news correspondents report that additional information may be obtained from W.C. Roberts, Baylor Univ, Medical Center, Dept. of Internal Med, Dallas, TX 75246, United States. Additional authors for this research include V.S. Won, A. Vasudevan and J.M. Guileyardo.

**Chromaffin Cells**

**Investigators from Beijing Institute of Radiation Medicine Zero in on Chromaffin Cells (Ferulic acid prevents LPS-induced up-regulation of PDE4B and stimulates the cAMP/CREB signaling pathway in PC12 cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Chromaffin Cells is now available. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Phosphodiesterase 4 (PDE4) isozymes are involved in different functions, depending on their patterns of distribution in the brain. The PDE4 subtypes are distributed in different inflammatory cells, and appear to be important regulators of inflammatory processes."

Our news journalists obtained a quote from the research from the Beijing Institute of Radiation Medicine, "In this study we examined the effects of ferulic acid (FA), a plant component with strong anti-oxidant and anti-inflammatory activities, on lipopolysaccharide (LPS)-induced up-regulation of phosphodiesterase 4B (PDE4B) in PC12 cells, which in turn regulated cellular cAMP levels and the cAMP/cAMP response element binding protein (CREB) pathway in the cells. PC12 cells were treated with LPS (1 mu g/mL) for 8 h, and the changes of F-actin were detected using laser scanning confocal microscopy. The levels of pro-inflammatory cytokines were measured suing ELISA kits, and PDE4B-specific enzymatic activity was assessed with a PDE4B assay kit. The mRNA levels of PDE4B were analyzed with Q-PCR, and the protein levels of CREB and phosphorylated CREB (pCREB) were determined using immunoblotting. Furthermore, molecular docking was used to identify the interaction between PDE4B2 and FA. Treatment of PC12 cells with LPS induced thick bundles of actin filaments appearing in the F-actin cytoskeleton, which were ameliorated by pretreatment with FA (10-40 mu mol/L) or with a PDE4B inhibitor rolipram (30 mu mol/L). Pretreatment with FA dose-dependently inhibited the LPS-induced production of TNF-alpha and IL-1 beta in PC12 cells. Furthermore, pretreatment with FA dose-dependently attenuated the LPS-induced up-regulation of PDE4 activity in PC12 cells. Moreover, pretreatment with FA decreased LPS-induced up-regulation of the PDE4B mRNA, and reversed LPS-induced down-regulation of CREB and
pCREB in PC12 cells. The molecular docking results revealed electrostatic and hydrophobic interactions between FA and PDE4B2. The beneficial effects of FA in PC12 cells might be conferred through inhibition of LPS-induced up-regulation of PDE4B and stimulation of cAMP/CREB signaling pathway."

According to the news editors, the research concluded: "Therefore, FA may be a potential therapeutic intervention for the treatment of neuroinflammatory diseases such as AD."

The news correspondents report that additional information may be obtained from Y. Gao, Beijing Inst Radiat Med, Beijing 100850, People's Republic of China. Additional authors for this research include Q. Hong, H.L. Tan, C.R. Xiao and Y. Gao.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/aps.2016.88. This DOI is a link to an online electronic document that is either free or for purchase.

Proteins - Carrier Proteins

Investigators from Beijing Normal University Report New Data on Carrier Proteins (Autotaxin Expression Is Regulated at the Post-transcriptional Level by the RNA-binding Proteins HuR and AUF1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Proteins - Carrier Proteins have been presented. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Autotaxin (ATX) is a key enzyme that converts lysophosphatidylcholine (LPC) into lysophosphatidic acid (LPA), a lysophospholipid mediator that regulates cellular activities through its specific G protein-coupled receptors. The ATX-LPA axis plays an important role in various physiological and pathological processes, especially in inflammation and cancer development."

Financial supporters for this research include National Natural Science Foundation of China, Beijing Normal University, Ministry of Education of the People's Republic of China.

The news reporters obtained a quote from the research from Beijing Normal University, "Although the transcriptional regulation of ATX has been widely studied, the post-transcriptional regulation of ATX is largely unknown. In this study, we identified conserved adenylate-uridylate (AU)-rich elements in the ATX mRNA 3'-untranslated region (3'UTR). The RNA-binding proteins HuR and AUF1 directly bound to the ATX mRNA 3'UTR and had antagonistic functions in ATX expression. HuR enhanced ATX expression by increasing ATX mRNA stability, whereas AUF1 suppressed ATX expression by promoting ATX mRNA decay."
HuR and AUF1 were involved in ATX regulation in Colo320 human colon cancer cells and the LPS-stimulated human monocyctic THP-1 cells. HuR knockdown suppressed ATX expression in B16 mouse melanoma cells, leading to inhibition of cell migration. This effect was reversed by AUF1 knockdown to recover ATX expression or by the addition of LPA. These results suggest that the post-transcriptional regulation of ATX expression by HuR and AUF1 modulates cancer cell migration.

According to the news reporters, the research concluded: "In summary, we identified HuR and AUF1 as novel post-transcriptional regulators of ATX expression, thereby elucidating a novel mechanism regulating the ATX-LPA axis."

Our news correspondents report that additional information may be obtained by contacting X.T. Zhang, Beijing Normal University, Coll Life Sci, Inst Cell Biol, Key Lab Cell Proliferat & Regulat BiolMinist Edu, Beijing 100875, People's Republic of China. Ischemia

**Investigators from Boston University Have Reported New Data on Ischemia (Recurrent Lower-Extremity Compartment Syndrome after Four-Compartment Fasciotomy Secondary to Acute Limb Ischemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Ischemia have been presented. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Lower-extremity compartment syndrome is a limb-threatening event necessitating emergent treatment using fasciotomy. Recurrent compartment syndrome is rare and has only been reported after trauma and in conjunction with underlying connective tissue disorders."

The news reporters obtained a quote from the research from Boston University, "In this report, we present a case of recurrent lower-extremity compartment syndrome caused by ischemia-reperfusion injury, in a patient previously treated with adequate 4-compartment fasciotomies. As such, this is the first reported case of recurrent compartment syndrome in the setting of ischemia-reperfusion injury that required treatment with 4-compartment fasciotomies on both occasions."

According to the news reporters, the research concluded: "This case demonstrates
that fasciotomy is not protective against the development of recurrent compartment syndrome due to ischemia-reperfusion injury and that patients at high risk require monitoring."

Our news correspondents report that additional information may be obtained by contacting J.J. Siracuse, Boston University, Sch Med, Boston Med Center, Div Vasc & Endovasc Surg, Boston, MA 02118, United States. Additional authors for this research include A. Farber, J.A. Kalish and J.J. Siracuse.

**Proteins - DNA-Binding Proteins**

**Investigators from Boston University Zero in on DNA-Binding Proteins (MEK and TAK1 Regulate Apoptosis in Colon Cancer Cells with KRAS-Dependent Activation of Proinflammatory Signaling)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Proteins - DNA-Binding Proteins have been presented. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "MEK inhibitors have limited efficacy in treating RAS-RAF-MEK pathway-dependent cancers due to feedback pathway compensation and dose-limiting toxicities. Combining MEK inhibitors with other targeted agents may enhance efficacy."

Our news journalists obtained a quote from the research from Boston University, "Here, codependencies of MEK, TAK1, and KRAS in colon cancer were investigated. Combined inhibition of MEK and TAK1 potentiates apoptosis in KRAS-dependent cells. Pharmacologic studies and cell-cycle analyses on a large panel of colon cancer cell lines demonstrate that MEK/TAK1 inhibition induces cell death, as assessed by sub-G1 accumulation, in a distinct subset of cell lines. Furthermore, TAK1 inhibition causes G2-M cell cycle blockade and polyploidy in many of the cell lines. MEK plus TAK1 inhibition causes reduced G2-M/polyploid cell numbers and additive cytotoxic effects in KRAS/TAK1-dependent cell lines as well as a subset of BRAF-mutant cells. Mechanistically, sensitivity to MEK/TAK1 inhibition can be conferred by KRAS and BMP receptor activation, which promote expression of NF-kappa B-dependent proinflammatory cytokines, driving tumor cell survival and proliferation. MEK/TAK1 inhibition causes reduced mTOR, Wnt, and NF-kappa B signaling in TAK1/MEK-dependent cell lines concomitant with apoptosis. A Wnt/ NF-kappa B transcriptional signature was derived that stratifies primary tumors into three major subtypes: Wnt-high/NF-kappa B-low, Wnt-low/NF-kappa B-high and Wnt-high/NF-kappa B-high, designated W, N, and WN, respectively. These subtypes have distinct characteristics, including
enrichment for BRAF mutations with serrated carcinoma histology in the N subtype. Both N and
WN subtypes bear molecular hallmarks of MEK and TAK1 dependency seen in cell lines."

According to the news editors, the research concluded: "Therefore, N and WN subtype signatures could be utilized to identify tumors that are most sensitive to anti-
MEK/TAK1 therapeutics."

For more information on this research see: MEK and TAK1 Regulate Apoptosis in
Colon Cancer Cells with KRAS-Dependent Activation of Proinflammatory Signaling. Molecular Cancer Research, 2016;14(12):1204-1216. RNA Viruses - Respiratory Syncytial Viruses

Investigators from Brigham and Women's Hospital Target Respiratory Syncytial Viruses (Pharmacist-driven respiratory syncytial virus prophylaxis stewardship service in a neonatal intensive care unit)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on RNA Viruses - Respiratory Syncytial Viruses have been published. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "The development and implementation of a pharmacist-driven respiratory syncytial virus (RSV) prophylaxis stewardship program in a neonatal intensive care unit (NICU) are described. An RSV prophylaxis stewardship service was created in the NICU at Brigham and Women's Hospital to align with the newly updated 2014 American Academy of Pediatrics (AAP) recommendations for palivizumab."

The news reporters obtained a quote from the research from Brigham and Women's Hospital, "The service comprised two NICU clinical pharmacists with oversight from the NICU medical director and the chair of the NICU infection control committee. Supervising physicians provided oversight for the identification of qualified patients on a weekly basis and assisted in the evaluation of controversial cases. The goals of the RSV prophylaxis stewardship service were to identify qualifying infants, improve adherence to the current AAP recommendations, educate staff and families on the recently updated MP recommendations, streamline communication between providers regarding qualifying infants, and prepare and deliver palivizumab for administration in an organized and cost-effective manner. Twice-weekly 'RSV
prophylaxis days' were designated, with a set administration time on each day. Workflow was successfully streamlined between members of the healthcare team, including NICU pharmacists, prescribers, off-shift pharmacists, and nurses."

According to the news reporters, the research concluded: "Pharmacists involved in a multidisciplinary RSV prophylaxis stewardship service successfully identified qualifying patients for RSV prophylaxis while adhering to the latest MP recommendations, educated staff and families regarding RSV, streamlined communication among healthcare providers, and ensured preparation of palivizumab in an organized and cost-effective manner."

For more information on this research see: Pharmacist-driven respiratory syncytial virus prophylaxis stewardship service in a neonatal intensive care unit. *American Journal of Health-System Pharmacy*, 2016;73(24):2089-2094. *American Journal of Health-System Pharmacy* can be contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD 20814, USA.

*Health and Medicine - Emergency Medicine*

**Investigators from Brigham and Women's Hospital Zero in on Emergency Medicine (An ED pilot intervention to facilitate outpatient acute care for cancer patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Health and Medicine - Emergency Medicine. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Unplanned hospitalizations are common in patients with cancer, and most hospitalizations originate in the emergency department (ED). We implemented an ED-based pilot intervention designed to reduce hospitalizations among patients with solid tumors."

The news reporters obtained a quote from the research from Brigham and Women's Hospital, "The intervention, piloted at a single academic medical center, involved a medical oncologist embedded in the ED during evening hours. We used a quasiexperimental preimplementation/postimplementation study design to evaluate the proportion of ED visits that resulted in inpatient hospital admission, before and after pilot implementation. General estimating equations were used to evaluate the association between the intervention and hospital admission. There were 390 ED visits by eligible cancer patients in the preintervention period and 418 visits in the intervention period. During the intervention period, 158 (38%) of 418 ED
visits were identified by the embedded oncologist during the evening intervention shift. The proportion of ED visits leading to hospitalization was 70% vs 69% in the preintervention and intervention periods (odds ratio, 0.93 [95% confidence interval, 0.69-1.24]; P=.62). There were no differences between periods in ED length of stay or subsequent use of acute care. Among patients with initial ED presentation during the operating hours of the intervention, the proportion of ED visits leading to hospitalization was 77% vs 67% in the preintervention and intervention periods (odds ratio, 0.62 [0.36-1.08]; P=.08). Embedding an oncologist in the ED of an academic medical center did not significantly reduce hospital admissions."

According to the news reporters, the research concluded: "Novel approaches are needed to strengthen outpatient acute care for patients with cancer."

Our news correspondents report that additional information may be obtained by contacting G.A. Brooks, Brigham & Women's Hospital, Dept. of Med, Boston, MA 02115, United States. Additional authors for this research include E.J. Chen, M.A. Murakami, M. Giannakis, C.W. Baugh and D. Schrag.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajem.2016.06.076. This DOI is a link to an online electronic document that is either free or for purchase.

**Heart Disorders and Diseases - Heart Disease**

**Investigators from Brigham and Women's Hospital Zero in on Heart Disease (Long-term outcomes after catheter ablation of ventricular tachycardia in patients with and without structural heart disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Disease. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Long-term outcomes after ventricular tachycardia (VT) ablation are sparsely described. The purpose of this study was to describe long-term prognosis after VT ablation in patients with no structural heart disease (no SHD), ischemic cardiomyopathy (ICM), and nonischemic cardiomyopathy (NICM)."

Our news journalists obtained a quote from the research from Brigham and Women's Hospital, "Consecutive patients (N = 695: no SHD, 98; ICM, 358; NICM, 239) ablated for sustained VT were followed for a median of 6 years. Acute procedural parameters (complete success [noninducibility of any VT]) and outcomes after multiple procedures were reported. Compared with patients with no SHD or NICM, patients with ICM were the oldest, were more
likely to be men, lowest left ventricular ejection fraction, highest drug failures, VT storms, and number of inducible VTs. Complete procedure success was highest in patients with no SHD than in patients with ICM and those with NICM (79%, 56%, 60%, respectively; P< .001). At 6 years, ventricular arrhythmia (VA)-free survival was highest in patients with no SHD (77%) than in patients with ICM (54%) and those with NICM (38%) (P < .001), and overall survival was lowest in patients with ICM (48%), followed by patients with NICM (74%) and patients with no SHD (100%) (P < .001). Age, left ventricular ejection fraction, presence of SHD, acute procedural success (noninducibility of any VT), major complications, need for nonradiofrequency ablation modalities, and VA recurrence were independently associated with all-cause mortality. Long-term follow-up after VT ablation shows excellent prognosis in the absence of SHD, highest VA recurrence, and transplantation in patients with NICM and highest mortality in patients with ICM."

According to the news editors, the research concluded: "The extremely low mortality for those without SHD suggests that VT in this population is rarely an initial presentation of a myopathic process."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.hrthm.2016.07.001. This DOI is a link to an online electronic document that is either free or for purchase.

Hormones

Investigators from Brown University Release New Data on Hormones (The metabolic sensor Sirt1 and the hypothalamus: Interplay between peptide hormones and pro-hormone convertases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hormones. According to news originating from Providence, Rhode Island, by NewsRx editors, the research stated, "The last decade had witnessed a tremendous progress in our understanding of the causes of metabolic diseases including obesity. Among the contributing factors regulating energy balance are
nutrient sensors such as sirtuins."

Financial support for this research came from National Institute of Diabetes and Digestive and Kidney Diseases.

Our news journalists obtained a quote from the research from Brown University, "Sirtuinl (Sirt1), a NAD+ dependent deacetylase is affected by diet, environmental stress, and also plays a critical role in metabolic health by deacetylating proteins in many tissues, including liver, muscle, adipose tissue, heart, endothelium, and in the complexity of the hypothalamus. Because of its dependence on NAD+, Sirtl also functions as a nutrient/redox sensor, and new novel data show a function of this enzyme in the maturation of hypothalamic peptide hormones controlling energy balance either through regulation of specific nuclear transcription factors or by regulating specific pro hormone convertases (PCs) involved in the post-translational processing of pro-hormones. The post translational processing mechanism of pro-hormones is critical in the pathogenesis of obesity as recently shown that metabolic and physiological triggers affect the biosynthesis and processing of many peptides hormones. Specific regulation of pro-hormone processing is likely another key step where final amounts of bioactive peptides can be tightly regulated. Different factors stimulate or inhibit pro hormones biosynthesis in concert with an increase in the PCs involved in the maturation of bioactive hormones. Adding more complexity to the system, the new studies describe here suggest that Sirtl could also regulate the fate of peptide hormone biosynthesis. The present review summarizes the recent progress in hypothalamic SIRT1 research with a particular emphasis on the tissue-specific control of neuropeptide hormone maturation. The series of studies done in mouse and rat models strongly advocate for the first time that a deacetylating enzyme could be a regulator in the maturation of peptide hormones and their processing enzymes. These discoveries are the culmination of the first in-depth understanding of the metabolic role of Sirtl in the brain."

According to the news editors, the research concluded: "It suggests that Sirt1 behaves differently in the brain than in organs such as the liver and pancreas, where the enzyme has been more commonly studied."

The news correspondents report that additional information may be obtained from E.A. Nillni, Brown University, Warren Alpert Med Sch, Dept. of Mol Biol Cell Biol & Biochem, Providence, RI 02912, United States.

 Investigators from Cancer Research Institute Have Reported New Data on Breast Cancer (Global and gene specific DNA methylation in breast cancer cells was not affected during epithelial-to-mesenchymal transition in vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting from Bratislava, Slovakia, by NewsRx journalists, research stated, "Epithelial-to-mesenchymal transition (EMT) significantly affects the risk of metastasising in breast cancer. Plasticity and reversibility of EMT suggest that epigenetic mechanisms could be the key drivers of these processes, but little is known about the dynamics of EMT-related epigenetic alterations."

The news correspondents obtained a quote from the research from Cancer Research Institute, "We hypothesised that EMT, mediated by autocrine and paracrine signals, will be accompanied by changes in DNA methylation profiles. Therefore, conditioned medium from adipose tissue derived mesenchymal stromal cells was used for induction of EMT in human breast cancer SK-BR-3 cell line. EMT-related morphological alterations and changes in gene expression of EMT-associated markers were assessed. To reverse EMT, 20 nm size gold nanoparticles (AuNPs) synthesized by the citrate reduction method were applied. Finally, DNA methylation of LINE-1 sequences and promoter methylation of TIMP3, ADAM23 and BRMS1 genes were quantitatively evaluated by pyrosequencing. Despite the presence of EMT-associated morphological and gene expression changes in tumour cells, EMT induced by adipose tissue-derived mesenchymal stromal cells had almost no effect on LINE-1 and gene-specific DNA methylation patterns of TIMP3, ADAM23 and BRMS1 genes. Although treatment for 24, 48 or 72 hours with 20 nm AuNPs at a concentration of 3 g/ml slightly decreased gene expression of EMT-associated markers in SK-BR-3 cells, it did not alter global or gene-specific DNA methylation. Our results suggest that changes in DNA methylation are not detectable in vitro in early phases of EMT. Previously published positive findings could represent rather the sustained presence of potent EMT inducing signals or the synergistic effect of various epigenetic mechanisms."

According to the news reporters, the research concluded: "Treatment with AuNPs slightly attenuated EMT, and their therapeutic potential needs to be further investigated."

For more information on this research see: Global and gene specific DNA methylation in breast cancer cells was not affected during epithelial-to-mesenchymal transition in vitro. Neoplasma, 2016;63(6):901-910. Neoplasma can be contacted at: Apress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

Investigators from Capital Medical University Target Alzheimer Disease (Treatment of epilepsy for people with Alzheimer's disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Alzheimer Disease have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Any type of seizure can be observed in Alzheimer's disease (AD). Antiepileptic drugs seem to prevent the recurrence of epileptic seizures in most people with AD."

The news reporters obtained a quote from the research from Capital Medical University, "There are pharmacological and non-pharmacological treatments for epilepsy in people with AD. There are no current systematic reviews to evaluate the efficacy and tolerability of the treatment. This review aims to review those different modalities. To assess the efficacy and tolerability of the treatment of epilepsy for people with Alzheimer's disease (AD) (including sporadic AD and dominantly inherited AD). Search methods We searched the Cochrane Epilepsy Group Specialized Register (1 February 2016), the Cochrane Central Register of Controlled Trials (1 February 2016), MEDLINE (Ovid, 1 February 2016) and ClinicalTrials.gov (1 February 2016). In an effort to identify further published, unpublished and ongoing trials, we searched ongoing trials' registers, reference lists and relevant conference proceedings, and contacted authors and pharmaceutical companies. Selection criteria We included randomised and quasi-randomised controlled trials investigating treatment for epilepsy in people with AD, with the outcomes of proportion of seizure freedom or experiencing adverse events. Data collection and analysis Two review authors independently screened the titles and abstracts of identified records, selected studies for inclusion, extracted data, cross-checked the data for accuracy and assessed themethodological quality. We performed nometa-analyses due to the limited available data. We included one randomised controlled trial with 95 participants. Concerning the proportion of participants with seizure freedom, no significant differences were found in levetiracetam (LEV) versus lamotrigine (LTG) (risk ratio (RR) 1.20, 95% confidence interval (CI) 0.53 to 2.71), in levetiracetam versus phenobarbital (PB) (RR 1.01, 95% CI 0.47 to 2.19), or in LTG versus PB (RR 0.84, 95% CI 0.35 to 2.02). It seemed that LEV could improve cognition and LTG could relieve depression; while PB and LTG could worsen cognition, and LEV and PB could worsen mood. We judged the quality of the evidence to be very low. Authors' conclusions This review does not provide sufficient evidence to support LEV, PB and LTG for the treatment of epilepsy in people with AD. Regarding the efficacy and tolerability, no significant differences were found between LEV, PB and LTG."

According to the news reporters, the research concluded: "In the future, large randomised, doubleblind, controlled, parallel-group clinical trials are required to determine the efficacy and tolerability of treatment for epilepsy in people with AD."

For more information on this research see: Treatment of epilepsy for people with Alzheimer's disease. Cochrane Database of Systematic Reviews, 2016;(11):2237-2268. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St,
Investigators from Captain James A. Lovell Federal Health Care Center Have Reported New Data on Ventricular Fibrillation (Adverse postresuscitation myocardial effects elicited by buffer-induced alkalemia ameliorated by NHE-1 inhibition in a rat ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Ventricular Fibrillation. According to news reporting originating in North Chicago, Illinois, by NewsRx journalists, research stated, "Major myocardial abnormalities occur during cardiac arrest and resuscitation including intracellular acidosis-partly caused by CO2 accumulation-and activation of the Na+-H+ exchanger isoform-1 (NHE-1). We hypothesized that a favorable interaction may result from NHE-1 inhibition during cardiac resuscitation followed by administration of a CO2-consuming buffer upon return of spontaneous circulation (ROSC)."

Funders for this research include Friends Medical Research Institute, Veterans Administration, The UCLA Academic Senate, A gift by Ms. Monica Ply, Discretionary Fund from Department of Medicine.

The news reporters obtained a quote from the research from Captain James A. Lovell Federal Health Care Center, "Ventricular fibrillation was electrically induced in 24 male rats and left untreated for 8 min followed by defibrillation after 8 min of cardiopulmonary resuscitation (CPR). Rats were randomized 1:1:1 to the NHE-1 inhibitor zoniporide or vehicle during CPR and disodium carbonate/ sodium bicarbonate buffer or normal saline (30 ml/ kg) after ROSC. Survival at 240 min declined from 100% with Zoniporide/ Saline to 50% with Zoniporide/ Buffer and 25% with Vehicle/ Buffer (P = 0.004), explained by worsening postresuscitation myocardial dysfunction. Marked alkalemia occurred after buffer administration along with lactatemia that was maximal after Vehicle/ Buffer, attenuated by Zoniporide/ Buffer, and minimal with Zoniporide/ Saline [ 13.3 +/- 4.8 (SD), 9.2 +/- 4.6, and 2.7 +/- 1.0 mmol/ l; P<= 0.001]. We attributed the intense postresuscitation lactatemia to enhanced glycolysis consequent to severe buffer-induced alkalemia transmitted intracellularly by an active NHE-1. We attributed the worsened postresuscitation myocardial dysfunction also to severe alkalemia intensifying Na+ entry via NHE-1 with consequent Ca2+ overload injuring mitochondria, evidenced by increased plasma cytochrome c. Both buffer-induced effects were ameliorated by zoniporide. Accordingly, buffer-induced alkalemia after ROSC worsened myocardial function and survival,
likely through enhancing NHE-1 activity."

According to the news reporters, the research concluded: "Zoniporide attenuated these effects and uncovered a complex postresuscitation acid-base physiology whereby blood pH drives NHE-1 activity and compromises mitochondrial function and integrity along with myocardial function and survival."

For more information on this research see: Adverse postresuscitation myocardial effects elicited by buffer-induced alkalemia ameliorated by NHE-1 inhibition in a rat model of ventricular fibrillation. *Journal of Applied Physiology*, 2016;121(5):1160-1168. *Journal of Applied Physiology* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Our news correspondents report that additional information may be obtained by contacting R.J. Gazmuri, Captain James A Lovell Fed Hlth Care Center, Sect Crit Care Med, North Chicago, IL, United States. Additional authors for this research include J. Radhakrishnan, T.G. Mason, J.A. Kraut and R.J. Gazmuri.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1152/japplphysiol.00336.2016. This DOI is a link to an online electronic document that is either free or for purchase.

**Lung Diseases and Conditions - Asbestosis**

**Investigators from Cardno ChemRisk Release New Data on Asbestosis (Anthophyllite asbestos: state of the science review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lung Diseases and Conditions - Asbestosis. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated, "Anthophyllite is an amphibole form of asbestos historically used in only a limited number of products. No published resource currently exists that offers a complete overview of anthophyllite toxicity or of its effects on exposed human populations."

The news reporters obtained a quote from the research from Cardno ChemRisk, "We performed a review focusing on how anthophyllite toxicity was understood over time by conducting a comprehensive search of publicly available documents that discussed the use, mining, properties, toxicity, exposure and potential health effects of anthophyllite. Over 200 documents were identified; 114 contained relevant and useful information which we present chronologically in this assessment. Our analysis confirms that anthophyllite toxicity has not been well studied compared to other asbestos types. We found that toxicology studies in animals from the 1970s onward have indicated that, at sufficient doses, anthophyllite can cause asbestosis, lung cancer and mesothelioma. Studies of Finnish anthophyllite miners, conducted in the 1970s, found an increased incidence of asbestosis and lung cancer, but not mesothelioma. Not until the mid-1990s was an epidemiological link with mesothelioma in humans observed. Its presence in talc has been of recent significance in relation to potential asbestos exposure through the use of talc-containing products. Characterizing the health risks of anthophyllite is
difficult, and distinguishing between its asbestiform and non-asbestiform mineral form is essential from both a toxicological and regulatory perspective. Anthophyllite toxicity has generally been assumed to be similar to other amphiboles from a regulatory standpoint, but some notable exceptions exist."

According to the news reporters, the research concluded: "In order to reach a more clear understanding of anthophyllite toxicity, significant additional study is needed."

Our news correspondents report that additional information may be obtained by contacting S.H. Gaffney, Cardno ChemRisk, San Francisco, CA 94105, United States. Additional authors for this research include M. Grespin, L. Garnick, D.A. Drechsel, R. Hazan, D.J. Paustenbach and B.D. Simmons.

Chalcones

Investigators from Central Drug Research Institute Release New Data on Chalcones (Development of Leishmania donovani stably expressing DsRed for flow cytometry-based drug screening using chalcone thiazolyl-hydrazone as a new antileishmanial ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Chalcones have been presented. According to news reporting from Uttar Pradesh, India, by NewsRx journalists, research stated, "Green fluorescent protein produces significant fluorescence and is extremely stable, however its excitation maximum is close to the ultraviolet range and thus can damage living cells. Hence, Leishmania donovani stably expressing DsRed were developed and their suitability for flow cytometry-based antileishmanial screening was assessed by evaluating the efficacies of standard drugs as well as newly synthesised chalcone thiazolyl-hydrazone compounds."

Funders for this research include Central Drug Research Institute of the Council of Scientific and Industrial Research, CSIR, the Indian Council of Medical Research (ICMR), University Grants Commission (UGC).

The news correspondents obtained a quote from the research from Central Drug Research Institute, "The DsRed gene was successfully integrated at the 18S rRNA locus of L. donovani and transfectants (LdDsRed) were selected using hygromycin B. Enhanced expression of DsRed and a high level of infectivity to J774A.1 macrophages were achieved, which was confirmed by fluorescence microscopy and flow cytometry. Furthermore, these LdDsRed transfectants were utilised for development of an in vitro screening assay using the standard
antileishmanial drugs miltefosine, amphotericin B, pentamidine and paromomycin. The response of transfectants to standard drugs correlated well with previous reports. Subsequently, the suitability of this system was further assessed by screening a series of 18 newly synthesised chalcone thiazolyl-hydrazone compounds in vitro for their antileishmanial activity, wherein 8 compounds showed moderate antileishmanial activity. The most active compound 5g, with ca. 73% splenic parasite reduction, exerted its activity via generating nitric oxide and reactive oxygen species and inducing apoptosis in LdDsRed-infected macrophages. Thus, these observations established the applicability of LdDsRed transfectants for flowcytometry-based antileishmanial screening.

According to the news reporters, the research concluded: "Further efforts aimed at establishing a high-throughput screening assay and determining the in vivo screening of potential antileishmanial leads are required."

(NPs) induced by coordination bond."

Funders for this research include National Natural Science Foundation of China, Natural Science Foundation of Jiangsu Province, Priority Academic Program Development of Jiangsu Higher Education Institutions, National High Technology Research and Development Program of China.

The news reporters obtained a quote from the research from China Pharmaceutical University, "Tf-inspired NPs were prepared via environment-friendly method, and well redispersed in saline after lyophilization. When internalized into tumor cells by SPARC (secreted protein acidic and rich in cysteine) mediated endocytosis, Tf-inspired NPs bypassed and decreased the P-glycoprotein-mediated drug efflux and led to more effective treatment of multidrug-resistant breast cancer compared with free drugs both in vitro and in vivo due to the enhanced cellular uptake and rapid pH-responsive drug release. Moreover, Tf-inspired NPs exhibited good biocompatibility and low systemic toxicity."

According to the news reporters, the research concluded: "Thus, our results demonstrate that Tf-inspired NPs based on coordination bond represent as a smart drug delivery strategy to combat multidrug-resistant cancer and have great potential for clinical applications in cancer therapy."

For more information on this research see: Transferrin-inspired vehicles based on pH-responsive coordination bond to combat multidrug-resistant breast cancer. Biomaterials, 2017;113():266-278. **Enzymes and Coenzymes - Cholinesterases**

**Investigators from Chinese Academy of Sciences Release New Data on Cholinesterases (New perspectives for multi-level regulations of neuronal acetylcholinesterase by dioxins)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Enzymes and Coenzymes - Cholinesterases are discussed in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Acetylcholinesterase (AChE; EC 3.1.1.7) is a
vital functional enzyme in cholinergic neurotransmission which can rapidly hydrolyze neurotransmitter, acetylcholine, in the central and peripheral nervous systems. Emerging evidence showed that in addition to classical environmental AChE inhibitors, e.g. organophosphate and carbamate pesticides, dioxins are a new type of xenobiotic causing impairment of AChE.”

Financial supporters for this research include National Natural Science Foundation of China, Chinese Academy of Sciences.

The news correspondents obtained a quote from the research from the Chinese Academy of Sciences, "Dioxin can transcriptionally or post-transcriptionally suppress AChE expression in human neuroblastoma cells or mouse immune cells via the aryl hydrocarbon receptor (AhR) pathway, respectively. Dioxins can affect gene expression through other mechanisms, such as cross-talk with other signaling cascades and epigenetic modulations. Therefore, in this review, by summarizing the known mechanisms of AChE regulation and dioxin-induced gene alteration, potential signaling cascades and epigenetic mechanisms are proposed for dioxin-mediated AChE regulation. Mitogen activated protein (MAP) kinase, 30, 50-cyclic adenosine monophosphate (cAMP) and calcium-related singaling pathways, as well as potential epigenetic mechanisms, such as DNA methylation, and post-transcriptional regulation via microRNAs, including hsa-miR-132, hsa-miR-212 and hsa-miR-25-3p are discussed here."

According to the news reporters, the research concluded: "These proposed mechanisms may be invaluable not only to promote comprehensive understanding of the action mechanisms for dioxin, but to illustrate the molecular basis of dioxin-induced health impacts."

Investigators from Chinese Academy of Sciences Zero in on HIV/AIDS
[HIV-1 gp120 Glycoprotein Interacting with Dendritic Cell-specific Intercellular Adhesion Molecule 3-grabbing Non-integrin (DC-SIGN) Down-Regulates Tight Junction Proteins to ...]
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Approximately 70% of HIV-1 infected patients acquire ocular opportunistic infections and manifest eye disorders during the course of their illness. The mechanisms by which pathogens invade the ocular site, however, are unclear."

Our news journalists obtained a quote from the research from the Chinese Academy of Sciences, "Under normal circumstances, vascular endothelium and retinal pigment epithelium (RPE), which possess a well developed tight junction complex, form the blood-retinal barrier (BRB) to prevent pathogen invasion. We hypothesize that disruption of the BRB allows pathogen entry into ocular sites. The hypothesis was tested using in vitro models. We discovered that human RPE cells could bind to either HIV-1 gp120 glycoproteins or HIV-1 viral particles. Furthermore, the binding was mediated by dendritic cell-specific intercellular adhesion molecule 3-grabbing non-integrin (DC-SIGN) expressed on RPE cells. Upon gp120 binding to DC-SIGN, cellular NF-kappa B signaling was triggered, leading to the induction of matrix metalloproteinases, which subsequently degraded tight junction proteins and disrupted the BRB integrity. DC-SIGN knockdown or prior blocking with a specific antibody abolished gp120-induced matrix metalloproteinase expression and reduced the degradation of tight junction proteins."

According to the news editors, the research concluded: "This study elucidates a novel mechanism by which HIV, type 1 invades ocular tissues and provides additional insights into the translocation or invasion process of ocular complication-associated pathogens."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.744615. This DOI is a link to an online electronic document that is either free or for purchase.

Investigators from Chinese University of Hong Kong Have Reported New Data on Sepsis (Regulation of Circulating Hematopoietic Stem/Progenitor Cells in Preterm Infants with Septicemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Blood Diseases and Conditions - Sepsis have been presented. According to news reporting out of Hong Kong, People's Republic of China, by NewsRx editors, research stated, "Preterm infants are at high risk of developing severe sepsis. Circulating hematopoietic stem and progenitor cells (HSPCs; CD45 (+) CD34 (+)) have been suggested to play a vital role in the host immunological defense against invading pathogens."

Our news journalists obtained a quote from the research from the Chinese University of Hong Kong, "The objectives were to investigate the regulation of circulating HSPCs in preterm infants during infection episodes, and to assess the relationship of CD45 (+) CD34 (+) cells with immunological mediators and differential leukocyte populations. First, we conducted a cross-sectional case-control study comparing these parameters among infected infants (n = 23), gestational and postnatal age-matched noninfected infants (n = 46), and "healthy" control (CTL) infants (n = 12). Second, we investigated the longitudinal change of CD45 (+) CD34 (+) cell concentrations in infected infants before, during, and after an infection episode, and compared them with the other two groups. Our cross-sectional results showed that CD45 (+) CD34 (+) cell count and percentage were significantly reduced in infected infants during systemic infection, compared with the noninfected or CTL infants. There were significant positive correlation between levels of CD45 (+) CD34 (+) cells and lymphocytes or monocytes, and significant negative correlation between CD45 (+) CD34 (+) cells and neutrophils or interleukin (IL)6 in infected infants. Longitudinal analysis showed that changes of CD45 (+) CD34 (+) cells at the onset of sepsis relative to levels 1 week prior and 1 week postsepsis in infected infants were significantly different from those changes in the corresponding time points for the other two groups."

According to the news editors, the research concluded: "Our findings suggested that circulating HSPCs were dynamically regulated during septicemia and could play an important role in the defense mechanism, plausibly contributing to replenishment of leukocytes during sepsis in preterm infants."

For more information on this research see: Regulation of Circulating Hematopoietic Stem/Progenitor Cells in Preterm Infants with Septicemia. *Stem Cells and Development*, 2016;25(23):1780-1787. *Stem Cells and Development* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Investigators from Chinese University of Hong Kong Release New Data on Cervical Cancer (Examining the Cervical Screening Behaviour of Women Aged 50 or above and Its Predicting Factors: A Population-Based Survey)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cervical Cancer have been published. According to news reporting out of Hong Kong, People's Republic of China, by NewsRx editors, research stated, "Under-screening may increase the risk of cervical cancer in middle-aged women. This study aimed to investigate cervical cancer screening behaviour and its predictors among women aged 50 years or above."

Our news journalists obtained a quote from the research from the Chinese University of Hong Kong, "A population-based sample of 959 women was recruited by telephone from domestic households in Hong Kong, using random methods, and a structured questionnaire developed to survey participants. Multivariable logistic regressions were performed to examine the factors independently associated with cervical screening behaviour. Nearly half the sample (48%) had never had a cervical smear test. Multivariable analyses showed that age, educational level, marital status, family history of cancer, smoking status, use of complementary therapy, recommendation from health professionals, and believing that regular visits to a doctor or a Chinese herbalist were good for their health were predictors of cervical screening behaviour. Misconceptions concerned with menopause may reduce women's perceived susceptibility to cervical cancer, especially if they are 50 or above, and exert a negative effect on their screening behaviour."

According to the news editors, the research concluded: "Healthcare professionals should actively approach these high-risk groups-older unmarried women, smokers, those less educated and who are generally not much concerned with their health."

For more information on this research see: Examining the Cervical Screening Behaviour of Women Aged 50 or above and Its Predicting Factors: A Population-Based Survey. *International Journal of Environmental Research and Public Health*, 2016;13(12):340-354. *International Journal of Environmental Research and Public Health* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Chalcogens

Investigators from Chosun University Zero in on Chalcogens [Isorhamnetin Inhibits Reactive Oxygen Species-Dependent Hypoxia Inducible Factor (HIF)1 alpha a Accumulation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Chalcogens have been presented. According to news reporting out of Gwangju, South Korea, by NewsRx editors, research stated, "Isorhamnetin is a flavonoid metabolite of quercetin and isolated from water dropwort (Oenanthe javanica, Umbelliferae). It has been reported that isorhamnetin exerts beneficial effects including antioxidant, anti-inflammatory, and anti-proliferative activities."

Our news journalists obtained a quote from the research from Chosun University, "The present study investigated whether the antioxidant activity of isorhamnetin is correlated with its anti-cancer effects on colorectal cancer cells. Isorhamnetin significantly repressed cobalt chloride (CoCl2) - or hypoxia-induced hypoxia inducible factor-1 alpha (HIF-1 alpha) accumulation in HCT116 and 11T29 cells. When compared with quercetin, isorhamnetin showed potent inhibition of HIF-1 alpha. Moreover, it inhibited CoCl2-induced activity of hypoxia response element reporter gene and HIF-1 alpha-dependent transcription of genes such as glucose transporter 1, lactate dehydrogenase A, carbonic anhydrase-IX, and pyruvate dehydrogenase kinase 1. Isorhamnetin also blocked hydrogen peroxide (H2O2) induced HIF-1 alpha accumulation. The antioxidant effects of isorhamnetin were confirmed by observation of CoCl2- or H2O2-induced reactive oxygen species (ROS) production. Consistently, overexpressed HIF-1 alpha was decreased by isorhamnetin or N-acetyl-L-cysteine in HEK293 cells. In vitro migration and invasion assay further confirmed the inhibitory effects of isorhamnetin on cancer cells."

According to the news editors, the research concluded: "Collectively, these results demonstrate that isorhamnetin inhibits ROS-mediated HIF-1 alpha accumulation, which contributes to its anti-metastatic efficacy."

Our news journalists report that additional information may be obtained by contacting S.M. Shin, Chosun Univ, Coll Pharm, Gwangju 501759, South Korea. Additional authors for this research include K. Seo, S.H. Kim and S.M. Shin.

Lipopolysaccharides

Investigators from Chung Ang University Target Lipopolysaccharides (Apocynin inhibits Toll-like receptor-4-mediated activation of NF-kappa B by suppressing the Akt and mTOR pathways)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lipopolysaccharides are presented in a new report. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Microbial product lipopolysaccharide has been shown to be involved in the pathogenesis of inflammatory skin diseases. Apocynin has demonstrated to have an anti-inflammatory effect."

The news correspondents obtained a quote from the research from Chung Ang University, "However, the effect of apocynin on the Toll-like receptor-4-dependent activation of Akt, mammalian target of rapamycin (mTOR), and nuclear factor (NF)-kappa B pathway, which is involved in productions of inflammatory mediators in keratinocytes, has not been studied. Using human keratinocytes, we investigated the effect of apocynin on the inflammatory mediator production in relation to the Toll-like receptor-4-mediated-Akt/mTOR and NF-kappa B pathways, which regulates the transcription genes involved in immune and inflammatory responses. Apocynin, Akt inhibitor SH-5, Bay 11-7085 and N-acetylcysteine each attenuated the lipopolysaccharide-induced production of cytokines, PGE(2), and chemokines, changes in the levels of Toll-like receptor-4, p-Akt, mTOR, and NF-kappa B, and production of reactive oxygen species in keratinocytes. The results show that apocynin appears to attenuate the lipopolysaccharide-stimulated production of inflammatory mediators in keratinocytes by suppressing the Toll-like receptor-4-mediated activation of the Akt, mTOR, and NF-kappa B pathways. The effect of apocynin appears to be attributed to its inhibitory effect on the production of reactive oxygen species."

According to the news reporters, the research concluded: "Apocynin appears to attenuate the microbial product-mediated inflammatory skin diseases."

For more information on this research see: Apocynin inhibits Toll-like receptor-4-mediated activation of NF-kappa B by suppressing the Akt and mTOR pathways. Naunyn-Schmiedebergs Archives of Pharmacology, 2016;389(12):1267-1277. Naunyn-Schmiedebergs Archives of Pharmacology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

**Investigators from City of Hope National Medical Center Report New Data on T-Cell Lymphoma [Long-term follow-up and management of small and medium-sized CD4(+) T cell lymphoma and CD8(+) lymphoid proliferations of acral sites: a multicenter ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - T-Cell Lymphoma is the subject of a report. According to news reporting originating from Duarte, California, by NewsRx correspondents, research stated, "Primary cutaneous CD4(+) small-medium pleomorphic T cell lymphoma (SMPTCL) is a low-grade cutaneous T cell lymphoma. Its clinical and histopathologic features are comparable with those of CD8(+) lymphoid proliferations (LPs) of the ear and acral sites."

Our news editors obtained a quote from the research from the City of Hope National Medical Center, "We performed a retrospective analysis of patients with CD4(+) SMPTCL or CD8(+) LP to elucidate the clinical course, prognosis, and outcomes. Demographic, clinical, and treatment data were reviewed. Histopathologic data based on architectural, cytomorphologic, and immunohistochemical features were assessed. Immunohistochemical staining for T and B cell markers was evaluated. A total of 25 patients including 22 with CD4(+) SMPTCL and three with CD8(+) LP were identified. All patients presented with a single lesion, predominantly on the head, neck, or upper trunk (84%). No patients showed extracutaneous disease at any evaluation. The most common histopathologic changes showed a dense nodular infiltrate of small cells with hyperchromatic nuclei without significant follicular or adnexal involvement. Patients were treated with excision (48%), local radiation (28%), or topical or intralesional steroids (24%). All patients achieved complete resolution of disease. Five patients demonstrated cutaneous relapse at new sites. The CD4(+) SMPTCL/CD8(+) LP subgroup usually presents with solitary lesions and demonstrates an indolent clinical course. Typical presentation, classic histopathology, widespread expression of follicular T helper cell markers, and loss of a T cell antigen are diagnostic features of CD4(+) SMPTCL, whereas monomorphous CD8(+) infiltrate without follicular T helper cell markers is consistent with CD8(+) LP."

According to the news editors, the research concluded: "Local skin-directed therapy is appropriate in these patients."

The news editors report that additional information may be obtained by contacting C. Querfeld, City Hope Natl Med Center, Center Comprehens Canc, Dept. of Pathol, Duarte, CA 91010, United States. Additional authors for this research include S. Jawed, P.L. Myskowski, S. Horwitz, A.S. Lucas, A. Moskowitz, M. Pulitzer, J. Zain, S.T. Rosen and C. Querfeld.

Investigators from Cleveland Clinic Release New Data on Hypertension (Impact of Sleep-Disordered Breathing Treatment on Patient Reported Outcomes in a Clinic-Based Cohort of Hypertensive Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Hypertension is now available. According to news reporting out of Cleveland, Ohio, by NewsRx editors, research stated, "We hypothesized that patient reported outcomes (PROs) improve with positive airway pressure (PAP) in patients with sleep-disordered breathing (SDB) and hypertension (HTN). Questionnaire-based PROs (sleepiness [Epworth Sleepiness Scale, (ESS)], depression [Patient Health Questionnaire-9 (PHQ-9)], and fatigue [Fatigue Severity Scale (FSS)]) were retrospectively examined in patients with SDB and HTN at baseline and within a year following PAP initiation."

Our news journalists obtained a quote from the research from Cleveland Clinic, "PRO changes were estimated using multivariable linear mixed-effect models adjusted for baseline age, sex, race, body mass index, resistant hypertension (RHTN) status, cardiac and diabetes history, and correlation between repeated measurements. Age and race by PAP interaction terms (mean change, 95% CI) were examined. 894 patients with HTN and SDB were examined. 130 (15%) had baseline RHTN (age 58 +/- 12 y, 52.9 % male, BMI 36.2 +/- 9.1 kg/m (2)). In multivariable models, a significant improvement in sleepiness ESS (-2.09, 95% CI: -2.37, -1.82), PHQ-9 (-1.91, 95% CI: -2.25, -1.56), and FSS scores (-4.06 95% CI: -4.89, -3.22) was observed. A significant race by PAP effect interaction was observed (p < 0.0001 for all PROs); Caucasians had greater improvements than non-Caucasians. The interaction term of effect of PAP and age was significant for ESS (p = 0.04) and PHQ-9 (p = 0.0003), indicating greater improvement in younger patients."

According to the news editors, the research concluded: "Consistent improvement of broad PRO domains in response to PAP in SDB was observed in this clinic-based hypertensive cohort; Caucasians and younger patients derived greater benefit."

For more information on this research see: Impact of Sleep-Disordered Breathing Treatment on Patient Reported Outcomes in a Clinic-Based Cohort of Hypertensive Patients. Journal of Clinical Sleep Medicine, 2016;12(10):1357-1364. Journal of Clinical Sleep Medicine can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

Our news journalists report that additional information may be obtained by contacting H.K. Walia, Cleveland Clinic, Neurol Inst, Sleep Disorders Center, Cleveland, OH 44106, United States. Investigators from Columbia University Have Reported New Data on Thrombosis (Impact of time to treatment on the effects of bivalirudin vs. glycoprotein Ilb/IIa inhibitors and heparin in patients undergoing primary percutaneous coronary ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Thrombosis is the subject of a report. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "In the HORIZONS-AMI trial, bivalirudin compared to unfractionated heparin (UFH) plus a glycoprotein Ilb/IIa inhibitor (GPI) improved net clinical outcomes in patients undergoing primary percutaneous coronary intervention (PCI) at the cost of an increased rate of acute stent thrombosis. We sought to examine whether these effects are dependent on time to treatment."

Our news journalists obtained a quote from the research from Columbia University, "The interaction between anticoagulation regimen and symptom onset to first balloon inflation time (SBT) on the 30-day and three-year rates of major adverse cardiac events (MACE) was examined in 3,199 randomised patients according to SBT <3 hours versus >3 hours. Among patients with an SBT <3 hours, bivalirudin resulted in higher 30-day rates of MACE compared to UFH plus a GPI. Nonsignificant differences were observed in patients with an SBT >3 hours. Similar results were found for MACE at three years and stent thrombosis and reinfarction at 30 days and three years. By multivariable analysis, bivalirudin was an independent predictor of MACE at 30 days and three years in patients with an SBT <3 hours, but not in patients with SBT >3 hours."

According to the news editors, the research concluded: "Bivalirudin compared to UFH plus a GPI is associated with an increased rate of stent thrombosis and MACE in patients with short SBTs, but not in those with longer SBTs."

For more information on this research see: Impact of time to treatment on the effects of bivalirudin vs. glycoprotein Ilb/IIa inhibitors and heparin in patients undergoing primary percutaneous coronary intervention: insights from the HORIZONS-AN trial. Eurointervention, 2016;12(9):1144-1153. Eurointervention can be contacted at: Europa Edition, 19 Allees Jean Jaures B P 61508, Toulouse Cedex 6, 31015, France.

Investigators from Comenius University Report New Data on Cardiovascular Research (Effects of Necrostatin-1, an Inhibitor of Necroptosis, and its Inactive Analogue Nec-1i on Basal Cardiovascular Function)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Research are discussed in a new report. According to news reporting originating from Bratislava, Slovakia, by NewsRx correspondents, research stated, "Inhibition of receptor-interacting serine/threonine-protein kinase 1 (RIP1) by necrostatin-1 (Nec-1) alleviates cardiac injury due to prevention of necroptotic cell death. Its inactive analogue necrostatin-1i (Nec-1i), lacking RIP1 activity, serves as a suitable control."

Our news editors obtained a quote from the research from Comenius University, "It is unknown if these agents influence the heart function in the absence of damaging stimuli. For this purpose, we measured intraarterial blood pressure (systolic - sBP and diastolic - dBP) and ECG parameters after a bolus administration of Nec-1 and Nec-1i in rats during 30 min. Nec-1, unlike Nec-1i, increased sBP and dBP, as well as heart rate reaching the peak at 20 min. The P wave duration tended to be decreased and the duration of the PR interval was shortened by Nec-1 indicating faster conduction of the impulses through atria to the ventricles. The drugs did not influence the QTc interval duration and no episode of ventricular arrhythmia was observed. In summary, Nec-1 temporarily modulates blood pressure and electrical function of the healthy heart."

According to the news editors, the research concluded: "These effects of Nec-1 are likely due to its off-target action or RIP1 has an important role in the regulation of cardiovascular function independently of its action on the necroptotic pathway."

For more information on this research see: Effects of Necrostatin-1, an Inhibitor of Necroptosis, and its Inactive Analogue Nec-1i on Basal Cardiovascular Function. Physiological Research, 2016;65(5):861-865. Physiological Research can be contacted at: Acad Sciences Czech Republic, Inst Physiology, Videnska 1083, Prague 4 142 20, Czech Republic.

Investigators from Council of Scientific and Industrial Research (CSIR) Release New Data on Microtubule Proteins [Synthesis of 3,5-dihydroxy-7,8-dimethoxy-2-(4-methoxyphenyl) benzopyran-4-one derivatives as anticancer agents]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Microtubule Proteins is now available. According to news originating from Uttar Pradesh, India, by NewsRx correspondents, research stated, "Different alkyl amide (15a-I) and alkyl amine (16a-e) derivatives of 7,8-dimethoxy-3-hydroxy-2-(4-methoxyphenyl)benzopyran-4-one were synthesized and evaluated for their anticancer activity against five different cancer cell lines using SRB assay."

Our news journalists obtained a quote from the research from the Council of Scientific and Industrial Research (CSIR), "Compounds 15e, 15i, 15j and 16a-e showed significant anticancer activity within the range of IC50 2.58-34.86 muM. The most promising molecule, 16c, was further analyzed for its effect on cell cycle and apoptosis of estrogen receptor positive cancer cells (MCF-7 cells) which showed that 16c triggered apoptosis in MCF-7 cells and arrested cells population at sub-G(0) (apoptotic) and G(2)M phase."

According to the news editors, the research concluded: "In tubulin polymerization assay, 16c interfered with kinetics of tubulin polymerization."

The news correspondents report that additional information may be obtained from A. Gupta, CSIR, Cent Inst Med & Aromat Plants, Dept. of Med Chem, Lucknow 226015, Uttar Pradesh, India. Drugs and Therapies - Antibiotics

Investigators from Curtin University Target Antibiotics (Exploiting Interkingdom Interactions for Development of Small-Molecule Inhibitors of Candida albicans Biofilm Formation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a
new report. According to news reporting originating from Perth, Australia, by NewsRx correspondents, research stated, "A rapid decline in the development of new antimicrobial therapeutics has coincided with the emergence of new and more aggressive multidrug-resistant pathogens. Pathogens are protected from antibiotic activity by their ability to enter an aggregative biofilm state."

Funders for this research include Science Foundation Ireland (SFI), European Commission (EC), Health Research Board (HRB), Teagasc, Department of Agriculture, Food and the Marine, Irish Research Council for Science, Engineering and Technology (IRCSET), Marine Institute (Foras Na Mara).

Our news editors obtained a quote from the research from Curtin University, "Therefore, disrupting this process in pathogens is a key strategy for the development of next-generation antimicrobials. Here, we present a suite of compounds, based on the Pseudomonas aeruginosa 2-heptyl-4(1H)-quinolone (HHQ) core quinolone interkingdom signal structure, that exhibit noncytotoxic antibiofilm activity toward the fungal pathogen Candida albicans. In addition to providing new insights into what is a clinically important bacterium-fungus interaction, the capacity to modularize the functionality of the quinolone signals is an important advance in harnessing the therapeutic potential of signaling molecules in general."

According to the news editors, the research concluded: "This provides a platform for the development of potent next-generation small-molecule therapeutics targeting clinically relevant fungal pathogens."

For more information on this research see: Exploiting Interkingdom Interactions for Development of Small-Molecule Inhibitors of Candida albicans Biofilm Formation. Antimicrobial Agents and Chemotherapy, 2016;60(10):5894-5905. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. correspondents, research stated, "The clinical management of heart rhythm disorders still constitutes a major challenge. The development of alternatives to current approaches is of significant interest in order to establish more effective therapies that increase quality of life and reduce symptoms and hospitalizations."

Our news editors obtained a quote from the research from DZHK German Center for Cardiovascular Research, "Over the past two decades the mechanistic understanding of pathophysiological pathways underlying cardiac arrhythmias has advanced profoundly, opening up novel avenues for mechanism-based therapeutic approaches. In particular, gene therapy offers greater selectivity than small molecule-based or interventional treatment. The gene of interest is packaged into viral or non-viral carriers and delivered to the target area via direct injection or using catheter-based techniques, providing the advantage of site-restricted action in contrast to systemic application of drugs."

According to the news editors, the research concluded: "This work summarizes the current knowledge on mechanistic background, application strategies, and preclinical outcome of antiarrhythmic gene therapy for atrial fibrillation, ventricular tachycardia, and modulation of sinus node function."

The news editors report that additional information may be obtained by contacting D. Thomas, DZHK German Center Cardiovasc Res, Partner Site Heidelberg Mannheim, D-69120 Heidelberg, Germany. Additional authors for this research include P.A. Schweizer, H.A. Katus and D. Thomas.

Gram-Negative Bacteria - Helicobacter pylori

Investigators from DZIF German Center for Infection Research Target Helicobacter pylori (Systematic site-directed mutagenesis of the Helicobacter pylori CagL protein of the Cag type IV secretion system identifies novel functional domains)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Helicobacter pylori is now available. According to news reporting originating in Hannover, Germany, by NewsRx journalists, research stated, "The Cag Type IV secretion system, which contributes to inflammation and cancerogenesis during chronic infection, is one of the major virulence factors of the bacterial gastric pathogen Helicobacter pylori. We have generated and characterized a series of non-marked site-directed chromosomal mutants in H. pylori to define domains of unknown function of the essential tip protein CagL of the Cag secretion system."
The news reporters obtained a quote from the research from DZIF German Center for Infection Research, "Characterizing the CagL mutants, we determined that their function to activate cells and transport the effector CagA was reduced to different extents. We identified three novel regions of the CagL protein, involved in its structural integrity, its possible interaction with the CagPAIT4SS pilus protein CagI, and in its binding to integrins and other host cell ligands. In particular two novel variable CagL motifs were involved in integrin binding, TSPSA, and TASLI, which is located opposite of its integrin binding motif RGD. We thereby defined functionally important subdomains within the CagL structure, which can be used to clarify CagL contributions in the context of other CagPAI proteins or for inhibition of the CagT4SS."

According to the news reporters, the research concluded: "This structure-function correlation of CagL domains can also be instructive for the functional characterization of other potential VirB5 orthologs whose structure is not yet known."

Our news correspondents report that additional information may be obtained by contacting C. Josenhans, DZIF German Center Infect Res, Partner Site Hannover Braunschweig, D-30625 Hannover, Germany. Additional authors for this research include P. Olbermann, S.H. Bats, W. Fischer and C. Josenhans.

Keywords for this news article include: Hannover, Germany, Europe, Parasitic Diseases and Conditions, Gram-Negative Bacteria, Epsilonproteobacteria, Helicobacter pylori, Proteobacteria, Mutagenesis, Genetics, DZIF German Center for Infection Research.

Gender and Health

**Investigators from Department of Nuclear Medicine Have Reported New Data on Gender and Health (Impact of Gender on the Prognostic Value of Coronary Artery Calcium in Symptomatic Patients With Normal Single-Photon Emission Computed Tomography ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gender and Health are discussed in a new report. According to news originating from Zwolle, Netherlands, by NewsRx correspondents, research stated, "The coronary artery calcium (CAC) score provides independent prognostic value on top of single-photon emission computed tomography (SPECT) myocardial perfusion imaging (MPI). We sought to determine whether the prognostic value of the CAC score in patients with normal SPECT MPI is gender specific."

Our news journalists obtained a quote from the research from the Department of Nuclear Medicine, "We studied 3,705 consecutive symptomatic patients without a history of coronary artery disease with normal SPECT MPI. All patients underwent concomitant CAC scoring, which was categorized as CAC score 0, 1 to 99, 100 to 399, 400 to 999, or >= 1,000. Major adverse cardiac events were defined as revascularization, nonfatal myocardial infarction,
or all-cause mortality. The median CAC score was 9 in women (interquartile range 0 to 113) and 47 in men (interquartile range 1 to 307, p<0.001). The annual event rate was lower in women than in men (1.6% and 2.7%, respectively, p<0.001). When stratified by CAC score, annual event rates were similar (for women and men, respectively: CAC score 0, 0.6% and 0.5%, p = 0.95; CAC score 1 to 99, 0.9% and 1.2%, p = 0.45; CAC score 100 to 399, 2.7% and 3.8%, p = 0.23; CAC score 400 to 999, 3.8% and 5.3%, p = 0.34; CAC score >= 1,000, 8.4% and 8.7%, p = 0.99). The CAC score was an independent predictor of major adverse cardiac events in both genders (CAC score >= 1,000: hazard ratio for women 8.5, 95% confidence interval 4.0 to 18.1; hazard ratio for men 14.8, 95% confidence interval 5.3 to 41.1)."

According to the news editors, the research concluded: "Risk for events is similar for both genders when stratified by CAC score, wherein a high CAC score carries a high risk for events despite normal SPECT MPI. Our findings do not reveal a gender-specific prognostic value of the CAC score."

The news correspondents report that additional information may be obtained from E.M. Engbers, Isala, Dept. of Nucl Med, Zwolle, Netherlands. Additional authors for this research include J.R. Timmer, J.P. Ottervanger, M. Mouden, S. Knollema and P.L. Jager.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.amjcard.2016.08.037. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Neuroblastomas**

**Investigators from Department of Pediatrics Target Neuroblastomas (MicroRNA-21 promotes the proliferation and invasion of neuroblastoma cells through targeting CHIA)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Neuroblastomas are discussed in a new report. According to news reporting from Kaifeng, People's Republic of China, by NewsRx journalists, research stated, "Neuroblastoma (NB) is one of the most common solid tumors in infants and children. Numerous reports demonstrated that microRNAs (miRNAs) play important roles in the carcinogenesis of neuroblastoma. miR-21 functions as a tumor oncogene in some malignancies."

The news correspondents obtained a quote from the research from the Department of Pediatrics, "However, its role in NB remains poorly understood. miR-21 expression was
quantified in NB tissues and matched adjacent non-tumor tissues using quantitative real-time PCR (RT-PCR). Cell proliferation, migration, and invasion were measured following overexpression of miR-21 expression by miR-21 mimics. miR-21 targets were scanned using target prediction programs. Following the overexpression of miR-21, target gene expression was detected by western blotting. In addition, cell proliferation, migration, and invasion were measured following inhibition of CHL1 expression by siRNA. In the present study, our results showed that miR-21 was increased in NB tissues compared with matched adjacent non-tumor tissues. Forced overexpression of miR-21 significantly increased NB cell proliferation, migration, and invasion. Close homolog of LI (CHL1) was found to be a target of miR-21. Furthermore, downregulation of CHL1 by siRNA performed similar effects with overexpression of miR-21 in NB cells.

According to the news reporters, the research concluded: "We suggested that miR-21 promoted neuroblastoma cell growth and motility partially by targeting CHL1, indicating the potential utility of miR-21 inhibition as a novel therapeutic strategy against neuroblastoma."

For more information on this research see: MicroRNA-21 promotes the proliferation and invasion of neuroblastoma cells through targeting CHIA. Minerva Medica, 2016;107 (5):287-293. Minerva Medica can be contacted at: Edizioni Minerva Medica, Corso Bramante 83-85 Int Journals Dept., 10126 Turin, Italy.

Our news journalists report that additional information may be obtained by contacting Y. Li, HeNan Univ, Huaihe Hosp, Dept. of Pediat, Kaifeng 475000, Henan Province, People's Republic of China. Additional authors for this research include Y.M. Shang and Q.W. Wang.

Keywords for this news article include: Kaifeng, People's Republic of China, Asia, Cell Proliferation, Neuroblastomas, Hematology, Oncology, Genetics, Department of Pediatrics.

Nutritional and Metabolic Diseases and Conditions -- Investigators from Dokkyo Medical University Zero in on Protein Deficiency (StarD7 Protein Deficiency Adversely Affects the Phosphatidylcholine Composition, Respiratory Activity, and Cristae Structure of Mitochondria)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Protein Deficiency. According to news reporting out of Tochigi, Japan, by NewsRx editors, research stated, "Phosphatidylcholine (PC) is a major phospholipid of mitochondria, comprising 40-50% of both the outer and the inner membranes. However, PC must be imported from its production organelles because mitochondria lack the enzymes essential for PC biosynthesis."

Our news journalists obtained a quote from the research from Dokkyo Medical University, "In a previous study, we found that StarD7 mediates the intracellular transfer of PC to mitochondria. Therefore, in this study, we analyzed the contribution of StarD7 to the maintenance of mitochondrial phospholipid content and function using siRNA-mediated knockdown and knock-out (KO) of the StarD7 gene in HEPA-1 cells. Real time analysis of
respiratory activity demonstrated that the oxygen consumption rate and activity of mitochondrial complexes were impaired in StarD7-KD cells. To confirm these results, we established StarD7-KO HEPA-1 cells by double nicking using CRISPR/Cas9n. As expected, StarD7-KD and -KO cells showed a significant reduction in mitochondrial PC content. The ATP level and growth rate of KO cells were notably lower compared with wild-type cells when cultured in glucose-free galactose-containing medium to force cells to rely on mitochondrial ATP production. In KO cells, the level of the MTCO1 protein, a primary subunit of complex IV, was reduced without a concomitant decrease in its mRNA, but the level was restored when StarD7-I was overexpressed. StarD7-KO cells showed impaired formation of the mitochondrial supercomplexes and exhibited a disorganized cristae structure, with no changes in optic atrophy 1 protein.

According to the news editors, the research concluded: "These findings indicate that StarD7 plays important roles in maintaining the proper composition of mitochondrial phospholipids as well as mitochondrial function and morphogenesis."

Our news journalists report that additional information may be obtained by contacting H. Sugimoto, Dokkyo Med Univ, Sch Med, Dept. of Biochem, Mibu, Tochigi, Japan. Additional authors for this research include H. Ando, P.X. Zhang, L. Vergnes, C. Aoyama, M. Itoh, K. Reue and H. Sugimoto.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.736793. This DOI is a link to an online electronic document that is either free or for purchase.

Patient Care

**Investigators from Duke University Target Patient Care (Impact of remote monitoring on clinical events and associated health care utilization: A nationwide assessment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Patient Care are discussed in a new report. According to news reporting out of Durham, North Carolina, by NewsRx editors, research stated, "Remote monitoring (RM) of cardiac implantable electronic devices (CIEDs) improves patient survival. However, whether RM reduces health care utilization is unknown."

Our news journalists obtained a quote from the research from Duke University, "The
The purpose of this study was to determine whether RM was associated with reduced hospitalization and costs in clinical practice. We conducted a nationwide cohort study using the Truven Health Analytics MarketScan database. Patients implanted with a CIED between March 31, 2009, and April 1, 2012, were included. All-cause hospitalization events were compared between those using RM and those not using RM by using Cox proportional hazards methods with Andersen-Gill extension and propensity scoring. We also compared health care costs (payments >30 days after CIED implantation). Overall, there were 92,566 patients (mean age 72 +/- 13 years; 58,140 [63%] men) with a mean follow-up of 19 +/- 12 months, including 54,520 (59%) pacemaker, 27,816 (30%) implantable cardioverter-defibrillator, and 10,230 (11%) cardiac resynchronization therapy patients. Only 37% of patients (34,259) used RM. Patients with RM had Charlson Comorbidity Index values similar to those not using RM but had lower adjusted risk of all-cause hospitalization (adjusted hazard ratio 0.82; 95% confidence interval 0.80-0.84; P< .001) and shorter mean length of hospitalization (5.3 days vs 8.1 days; P< .001) during follow-up. RM was associated with a 30% reduction in hospitalization costs ($8720 mean cost per patient-year vs $12,423 mean cost per patient-year). For every 100,000 patient-years of follow-up, RM was associated with 9810 fewer hospitalizations, 119,000 fewer days in hospital, and $370,270,000 lower hospital payments. RM is associated with reductions in hospitalization and health care utilization."

According to the news editors, the research concluded: "Since only about a third of patients with CIEDs routinely use RM, this represents a major opportunity for quality improvement."

Our news journalists report that additional information may be obtained by contacting J.P. Piccini, Duke University, Medical Center, Durham, NC, United States. Additional authors for this research include S. Mittal, J. Snell, J.B. Prillinger, N. Dalal and N. Varma.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.hrthm.2016.08.024. This DOI is a link to an online electronic document that is either free or for purchase.

Clinical Trials and Studies - Pre-Trial Research

Investigators from Emory University Zero in on Pre-Trial Research (The CRF System as a Therapeutic Target for Neuropsychiatric Disorders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Trials and Studies - Pre-Trial Research are discussed in a new report. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "The major neuropsychiatric disorders are devastating illnesses that are only modestly responsive to treatment. Improving the treatment of these conditions will
require innovative new strategies that depart from previously focused-on pharmacological mechanisms."

The news correspondents obtained a quote from the research from Emory University, "Considerable preclinical and clinical data indicate corticotropin-releasing factor (CRF) signaling as a target for new psychotropic drug development. Here we review alterations in the CRF system reported in several psychiatric conditions. We also examine the preclinical work that has dissected the distinctive roles of CRF receptors in specific circuits relevant to these disorders. We further describe the clinical trials of CRF1 receptor antagonists that have been conducted."

According to the news reporters, the research concluded: "Although these clinical trials have thus far met with limited therapeutic success, the unfolding complexity of the CRF system promises many future directions for studying its role in the etiology and treatment of neuropsychiatric conditions."

Our news journalists report that additional information may be obtained by contacting J. Sanders, Emory University, Dept. of Psychiat & Behav Sci, Atlanta, GA 30322, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.tips.2016.09.004. This DOI is a link to an online electronic document that is either free or for purchase.

---

**Oncology - Pancreatic Cancer**

**Investigators from Erasme University Target Pancreatic Cancer (Intraperitoneal mesh prosthesis metastasis from pancreatic cancer, after laparoscopic hernia repair)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news reporting out of Brussels, Belgium, by NewsRx editors, research stated, "There are very few case reports of metastasis on a mesh prosthesis following laparoscopic hernia repair in the literature and its incidence is completely unknown. Case report A 76-year-old male patient presented in December 2013 with a suspicious malignant lesion of the pancreatic tail on the MRI."

Our news journalists obtained a quote from the research from Erasme University, "He was also complaining of a painful mass in the right para-rectal area. An exploratory laparoscopy performed in December 2013 revealed microscopic whitish peritoneal implants in the left hypochondrium and a massive metastasis involving a mesh prosthesis placed e years
before in the right para-rectal area. The pathology report of biopsies of the mesh confirmed a metastasis compatible with a pancreatic tumor. Possible modes of metastasis and limited published data to date on mesh prosthesis metastasis are presented. This situation can be assimilated to port-site metastasis after laparoscopy."

According to the news editors, the research concluded: "A mesh prosthesis metastasis after laparoscopic hernia repair is very rare."

Our news journalists report that additional information may be obtained by contacting V. Simonelli, Erasmus University, Medicosurg Dept. of Gastroenterol, B-1070 Brussels, Belgium. Additional authors for this research include C. Boven, P. Loi, I. El Nakadi and J. Closett.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1080/00015458.2016.1139831. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Brussels, Belgium, Europe, Pancreatic Neoplasms, Pancreatic Cancer, Gastroenterology, Medical Devices, Prosthetics, Oncology, Pancreas, Hernias, Erasme University.

**Cardiovascular Diseases**

**Investigators from Erasmus University Release New Data on Cardiovascular Diseases (Von Willebrand Factor, ADAMTS13, and the Risk of Mortality The Rotterdam Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases have been published. According to news reporting from Rotterdam, Netherlands, by NewsRx journalists, research stated, "Von Willebrand Factor (VWF) is a plasma protein that plays a major role in platelet adhesion and aggregation. Large VWF multimers are cleaved into smaller, less coagulant forms by the metalloprotease ADAMTS13 (A Disintegrin And Metalloprotease with ThromboSpondin motif repeats 13)."

The news correspondents obtained a quote from the research from Erasmus University, "Previous studies have shown that high VWF and low ADAMTS13 levels are associated with cardiovascular disease, but whether these factors are associated with mortality is unclear. Our aim is to establish the association between VWF antigen (VWF: Ag) levels, ADAMTS13 activity, and mortality. Approach and Results-We included 6130 participants of the Rotterdam study, a population-based cohort study among individuals aged >= 55 years. We determined the association between ADAMTS13 activity, VWF: Ag levels, and all-cause and cardiovascular mortality by Cox proportional hazard regression analysis. During a median follow-up time of 11.3 years and a total of 90 635 person years, 1868 of the 6130 individuals died (30.5%), of whom 442 (23.7%) died because of cardiovascular disease. In individuals with low ADAMTS13 activity, the risk of cardiovascular mortality (hazard ratio, 1.46; 95%
confidence interval, 1.09-1.96) was higher than that in individuals with high ADAMTS13 activity. The risk of cardiovascular mortality (hazard ratio, 1.29; 95% confidence interval 0.98-1.70) was higher in individuals with the highest VWF: Ag levels than in those with the lowest levels. In individuals with both low ADAMTS13 activity and high VWF: Ag levels, the risk of cardiovascular mortality was even higher (hazard ratio, 1.73 95% confidence interval, 1.28-2.35)."

According to the news reporters, the research concluded: "In this large prospective cohort study, ADAMTS13 activity and VWF: Ag levels are both associated with an increased risk of all-cause and cardiovascular mortality."

For more information on this research see: Von Willebrand Factor, ADAMTS13, and the Risk of Mortality The Rotterdam Study. Arteriosclerosis Thrombosis and Vascular Biology, 2016;36(12):2446-2451. Arteriosclerosis Thrombosis and Vascular Biology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Oncology - Cancer Risk

Investigators from Erasmus University Target Cancer Risk (Value of cyclin A immunohistochemistry for cancer risk stratification in Barrett esophagus surveillance A multicenter case-control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Risk have been published. According to news reporting originating in Rotterdam, Netherlands, by NewsRx journalists, research stated, "The value of endoscopic Barrett esophagus (BE) surveillance based on histological diagnosis of low-grade dysplasia (LGD) remains debated given the lack of adequate risk stratification. The aim of this study was to evaluate the predictive value of cyclin A expression and to combine these results with our previously reported immunohistochemical p53, AMACR, and SOX2 data, to identify a panel of biomarkers predicting neoplastic progression in BE."

The news reporters obtained a quote from the research from Erasmus University, "We conducted a case-control study within a prospective cohort of 720 BE patients. BE patients who progressed to high-grade dysplasia (HGD, n=37) or esophageal adenocarcinoma (EAC, n=13), defined as neoplastic progression, were classified as cases and patients without neoplastic progression were classified as controls (n=575). Cyclin A expression was determined by immunohistochemistry in all 625 patients; these results were combined with the histological diagnosis and our previous p53, AMACR, and SOX2 data in loglinear regression models.
Differences in discriminatory ability were quantified as changes in area under the ROC curve (AUC) for predicting neoplastic progression. Cyclin A surface positivity significantly increased throughout the metaplasia-dysplasia-carcinoma sequences and was seen in 10% (107/1050) of biopsy series without dysplasia, 33% (109/335) in LGD, and 69% (34/50) in HGD/EAC. Positive cyclin A expression was associated with an increased risk of neoplastic progression (adjusted relative risk (RRa) 2.4; 95% CI: 1.7-3.4). Increases in AUC were substantial for P53 (+0.05), smaller for SOX2 (+0.014), minor for cyclin A (+0.003), and none for AMARC (0.00). Cyclin A immunopositivity was associated with an increased progression risk in BE patients. However, compared to p53 and SOX2, the incremental value of cyclin A was limited.

According to the news reporters, the research concluded: "The use of biomarkers has the potential to significantly improve risk stratification in BE."

For more information on this research see: Value of cyclin A immunohistochemistry for cancer risk stratification in Barrett esophagus surveillance A multicenter case-control study. Medicine, 2016;95(47):166-172. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Oncology - Carcinomas
Investigators from Erasmus University Target Carcinomas (Survival in Patients With Primary Metastatic Renal Cell Carcinoma Treated With Sunitinib With or Without Previous Cytoreductive Nephrectomy: Results From a Population-based Registry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Carcinomas. According to news reporting out of Rotterdam, Netherlands, by NewsRx editors, research stated, "To evaluate the effect of cytoreductive nephrectomy (CN) on overall survival (OS) in primary metastatic renal cell carcinoma (mRCC) patients treated with first-line sunitinib. Patients with primary mRCC treated with first-line sunitinib were selected from a Dutch population-based registry."

Our news journalists obtained a quote from the research from Erasmus University, "A propensity score was calculated reflecting the probability of a patient undergoing CN prior to sunitinib using a set of known covariates, such as the Memorial Sloan Kettering Cancer Center and International mRCC Database Consortium risk factors. After propensity score matching,
differences in OS were analyzed using the Kaplan-Meier method and a multivariable Cox proportional hazards model was used to evaluate the effect of CN on OS. A total of 227 patients met the selection criteria; 74 patients (33%) underwent CN prior to sunitinib. In the matched population, the median OS of patients who underwent CN was 17.9 months compared to 8.8 months for patients treated with sunitinib only. Multivariable analysis showed that CN was an independent predictor of OS (hazard ratio 0.61, 95% confidence interval: 0.41-0.92). A subgroup analysis of patients with a time to targeted therapy of <1 year showed a median OS of 12.7 months for patients treated with CN compared to 8.0 months for patients treated with sunitinib only. The corresponding hazard ratio was 0.67 (95% confidence interval: 0.46-0.98). This study suggests that CN may be effective. However, the benefit was modest when correcting for time from diagnosis to sunitinib."

According to the news editors, the research concluded: "One important limitation is the use of a registry (with retrospectively collected data), which made it impossible to correct for unmeasured characteristics that could be associated with treatment choices or survival."

For more information on this research see: Survival in Patients With Primary Metastatic Renal Cell Carcinoma Treated With Sunitinib With or Without Previous Cytoreductive Nephrectomy: Results From a Population-based Registry. *Urology*, 2016;95 ():121-127. *Urology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Vitreomacular traction, including full-thickness macular hole (FTMH). Phase 3b, randomized, sham-controlled, double-masked, multicenter clinical trial."

Our news journalists obtained a quote from the research from Eye Institute, "Sample size was 220 subjects (146 ocriplasmin, 74 sham) randomized in a 2:1 ratio to receive intravitreal ocriplasmin 0.125 mg or sham injection. The trial involved 12 visits over 24-months. Inclusion criteria included presence of VMA and best-corrected visual acuity (BCVA) of 20/32 or worse in the study eye. Exclusion criteria included FTMH > 400 μm, presence of epiretinal membrane (ERM), and aphakia in the study eye. The primary efficacy end point was the proportion of subjects with pharmacologic VMA resolution at day 28. Secondary efficacy end points were assessed at month 24 and included proportion of subjects with BCVA gain from baseline, nonsurgical FTMH closure, vitrectomy, and Visual Function Questionnaire 25 (VFQ-25) outcomes. The OASIS trial met its primary end point with pharmacologic VMA resolution at day 28 being significantly higher in the ocriplasmin group (41.7%) compared with the sham group (6.2%). The treatment effect was maintained until study end. In the ocriplasmin group, pharmacologic VMA resolution at day 28 was higher in subgroups with the following baseline characteristics compared with the complementary subgroups without them: presence of focal VMA, presence of FTMH, absence of ERM, and phakic lens status. In the ocriplasmin group, 50.5% of subjects had a>= 2-line improvement in BCVA from baseline compared with 39.1% of subjects in the sham group. The nonsurgical FTMH closure rate was 30.0% for the ocriplasmin group compared with 15.4% for the sham group. All other secondary end points also favored ocriplasmin over sham. Regarding safety, most adverse events were mild to moderate, had a short onset time, and were transient, with no new safety signals identified."

According to the news editors, the research concluded: "The OASIS trial demonstrates the long-term efficacy and safety of ocriplasmin, providing improved resolution of symptomatic VMA compared with previous phase 3 trials with no additional safety signals identified."

Our news journalists report that additional information may be obtained by contacting P.U. Dugel, Univ Southern Calif, Keck Sch Med, USC Roski Eye Inst, Los Angeles, CA, United States. Additional authors for this research include M. Tolentino, L. Feiner, P. Kozma and A. Leroy.

Researchers from FIOCRUZ Target Atherosclerosis (Chronic LPSF/GQ-02 treatment attenuates inflammation and atherosclerosis development in LDLr−/− mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news reporting from Recife, Brazil, by NewsRx journalists, research stated, "Atherosclerosis is a complex disorder with a multifactorial pathogenesis. We previously indicated that the new TZD LPSF/GQ-02 inhibits hepatic steatosis and inflammation, which are reported as risk factors for atherosclerosis development."

The news correspondents obtained a quote from the research from FIOCRUZ, "Here, we explored the effects of LPSF/GQ-02 on atherosclerosis in LDLr−/− mice comparing two treatment periods. LDLr−/− mice were fed a high-fat diet for 10 and 12 weeks and received oral treatment with LPSF/GQ-02 (30 mg/kg/day) or pioglitazone (20 mg/kg/day) for 15 and 30 days, respectively. Both treatment protocols with LPSF/GQ-02 resulted in lower collagen density in the atherosclerotic lesions. In addition, the treatment for 15 days also decreased mRNA levels of CD40, MCP-1, ABCG1 and upregulated PPAR alpha, whereas the 30-days treatment reduced the protein levels of LOX-1, p-I kappa B alpha and p-NF kappa B. This study provides evidence that LPSF/GQ-02 affects the composition and growth of atherosclerotic lesions in LDLr−/− mice."

According to the news reporters, the research concluded: "Moreover, our data also support previous findings showing anti-inflammatory properties of LPSF/GQ-02 and reinforce the therapeutic potential of this TZD for treating atherosclerosis and inflammation-related disorders."

For more information on this research see: Chronic LPSF/GQ-02 treatment attenuates inflammation and atherosclerosis development in LDLr−/− mice. European Journal of Pharmacology, 2016;791():622-631. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Investigators from Federal University Target Chemistry (Analysis of tricyclic antidepressants in human plasma using online restricted access molecularly imprinted solid phase extraction followed by direct mass spectrometry ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Chemistry is now available. According to news reporting from Alfenas, Brazil, by NewsRx journalists, research stated, "The use of a new class of hybrid materials, called restricted access molecularly imprinted polymers (RAMIPs) seems to present a good strategy for the sample preparation of complex matrices, since these materials combine good protein elimination capacity with high degree selectivity. Mass spectrometers (MS) have been successfully used for polar drug identification and quantification."

The news correspondents obtained a quote from the research from Federal University, "In order to combine the advantages of both RAMIPs and mass spectrometry, we proposed a study that joins these properties in a single system, where we could analyse tricyclic antidepressants from human plasma, without offline extraction or chromatographic separation. A RAMIP for amitriptyline was synthesised by the bulk method, using methacrylic acid as a functional monomer and glycidilmethacrylate as a hydrophilic co-monomer. Then, epoxide ring openings were made and the polymer was covered with bovine serum albumin (BSA). A column filled with RAMIP-BSA was coupled to a MS/MS instrument in an online configuration, using water as loading and reconditioning mobile phase and a 0.01% acetic acid aqueous solution: acetonitrile at 30:70 as elution mobile phase. The system was used for on-line extraction and simultaneous quantification of nortriptyline, desipramine, amitriptyline, imipramine, clomipramine and clomipramine-d3 (IS) (from 15.0 to 500.014 μg L-1) from plasma samples. The correlation coefficient was higher than 0.99 for all analytes. The CV (coefficient of variation) values ranged from 1.34% to 19.13% for intra assay precision and 1.32-19.77% for inter assay precision."

According to the news reporters, the research concluded: "The E% (relative error) values ranged from -19.15% to 19.51% for intra assay accuracy and from -9.04% to 16.22% for inter assay accuracy."

For more information on this research see: Analysis of tricyclic antidepressants in human plasma using online restricted access molecularly imprinted solid phase extraction followed by direct mass spectrometry identification/quantification. *Talanta*, 2017;163():8-16. *Talanta* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Investigators from Foothills Medical Center Zero in on Clinical Trials and Studies [Infarct in a New Territory After Treatment Administration in the ESCAPE Randomized Controlled Trial (Endovascular Treatment for Small Core and Anterior ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news originating from Calgary, Canada, by NewsRx correspondents, research stated, "Infarct in a new previously unaffected territory (INT) is a potential complication of endovascular treatment. We applied a recently proposed methodology to identify and classify INTs in the ESCAPE randomized controlled trial (Endovascular Treatment for Small Core and Anterior Circulation Proximal Occlusion With Emphasis on Minimizing CT to Recanalization Times)."

Our news journalists obtained a quote from the research from Foothills Medical Center, "The core laboratory identified INTs on 24-hour follow-up imaging, blinded to treatment allocation, after assessing all baseline imaging. INTs were classified into 3 types (I-III) and 2 subtypes (A/ B) based on size and if catheter manipulation was likely performed across the vessel territory ostium. Logistic regression was used to understand the effect of multiple a priori identified variables on INT occurrence. Ordinal logistic regression was used to analyze the effect of INTs on modified Rankin Scale shift at 90 days. From 308 patients included, 14 INTs (4.5% overall; 2.8% on follow-up noncontrast computed tomography, 11.7% on follow-up magnetic resonance imaging) were identified (5.0% in endovascular treatment arm versus 4.0% in control arm [P= 0.7]). The use of intravenous alteplase was associated with a 68% reduction in the odds of INT occurrence (3.0% with versus 9.1% without; odds ratio, 0.32; 95% confidence interval, 0.11-0.96; adjusted for age, sex, and treatment type). No other variables were associated with INTs. INT occurrence was associated with reduced probability of good clinical outcome (common odds ratio, 0.25; 95% confidence interval, 0.09-0.74; adjusted for age, type of treatment, and follow-up scan). INTs are uncommon, detected more frequently on follow-up magnetic resonance imaging, and affect clinical outcome."

According to the news editors, the research concluded: "In experienced centers, endovascular treatment is likely not causal, whereas intravenous alteplase may be therapeutic."

For more information on this research see: Infarct in a New Territory After Treatment Administration in the ESCAPE Randomized Controlled Trial (Endovascular Treatment for Small Core and Anterior Circulation Proximal Occlusion With Emphasis on Minimizing CT to Recanalization Times). Investigators from Fourth Military Medical University Have Reported New Data on Melanoma (Expression of MicroRNA-301a and its Functional Roles in Malignant Melanoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Melanoma. According to news reporting out of Shaanxi, People's Republic of China, by NewsRx editors, research stated, "Although microRNA-301a has been reported to function as an oncogene in many human cancers, the roles of miR-301a in malignant melanoma (MM) is unclear. The present study aims to investigate the functional roles of miR-301a in MM and its possible molecular mechanisms."

Our news journalists obtained a quote from the research from Fourth Military Medical University, "Quantitative real-time PCR (qRT-PCR) assay was performed to detect the expression of miR-301a in MM tissues, and analyze its correlation with metastasis and prognosis of MM patients. In vitro, miR-301a was ectopically expressed using overexpression and knock-down strategies, and the effects of miR-301a expression on growth, apoptosis, migration, invasion and chemosensitivity of MM cells were further investigated. Furthermore, the potential and functional target gene was identified by luciferase reporter, qRT-PCR, Western blot assays. We showed that the expression of miR-301a was significantly upregulated in MM tissues, and upregulation of miR-301a correlated with metastasis and poor prognosis of MM patients. Transfection of miR-301a/inhibitor significantly inhibited growth, colony formation, migration, invasion and enhanced apoptosis and chemosensitivity in MM cells, while transfection of miR-301a/mimic could induce the inverse effects on phenotypes of MM cells. Luciferase reporter, qRT-PCR and Western blot assays showed that phosphatase and tensin homolog (PTEN) was a direct and functional target of miR-301a. It was also observed that the Aid and FAK signaling pathways were involved in miR-301/PTEN-promoting MM progression."

According to the news editors, the research concluded: "Taken together, our study suggests that miR-301a may be used as a potential therapeutic target in the treatment of human MM."

Our news journalists report that additional information may be obtained by contacting X.Y. Li, Fourth Military Medical University, Tangdu Hosp, Dept. of Plast Surg, Xian 710038, Shaanxi, People's Republic of China. Additional authors for this research include Y.J. Li, X.X. Lv, J.Q. Li, X.L. Wang, Z.J. Lei and X.Y. Li.

Oncology - Lymphoma
Investigators from Fred Hutchinson Cancer Research Center Report New Data on Lymphoma (Quality of life results from a phase 3 study of brentuximab vedotin consolidation following autologous haematopoietic stem cell transplant for persons with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Lymphoma have been presented. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "Brentuximab vedotin (BV) significantly improved progression-free survival in a phase 3 study in patients with relapsed or refractory Hodgkin lymphoma (RR-HL) post-autologous-haematopoietic stem cell transplant (auto-HSCT); we report the impact of BV on quality of life (QOL) from this trial. The European Quality of Life five dimensions questionnaire was administered at the beginning of each cycle, end of treatment, and every 3 months during follow-up; index value scores were calculated using the time trade-off (TTO) method for UK-weighted value sets."

Our news journalists obtained a quote from the research from Fred Hutchinson Cancer Research Center, "Questionnaire adherence during the trial was 87.5% (N=329). In an intent-to-treat analysis, compared with placebo, TTO scores in the BV arm did not exceed the minimally important difference (MID) of 0.08 except at month 15 (-0.084; 95% confidence interval, -0.143 to -0.025). On-treatment index scores were similar between arms and did not reach the MID at any time point; mixed-effect modelling showed that BV treatment effect was not significant (P=0.2127). BV-associated peripheral neuropathy did not meaningfully impact QOL. Utility scores for patients who progressed declined compared with those who did not; TTO scores between these patients exceeded the MID beginning at month 15."

According to the news editors, the research concluded: "QOL decreased modestly with BV consolidation treatment in patients with RR-HL at high risk of relapse after auto-HSCT."

The news correspondents report that additional information may be obtained from S.D. Ramsey, Fred Hutchinson Canc Res Center, Hutchinson Inst Canc Outcomes Res, Seattle, WA 98104, United States. Additional authors for this research include A. Nademanee, T.
Investigators from Free University Have Reported New Data on Epilepsy [Altered GABA(A) receptor density and unaltered blood-brain barrier [C-11]flumazenil transport in drug-resistant epilepsy patients with mesial temporal sclerosis]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Studies in rodents suggest that flumazenil is a P-glycoprotein substrate at the blood-brain barrier. This study aimed to assess whether [C-11] flumazenil is a P-glycoprotein substrate in humans and to what extent increased P-glycoprotein function in epilepsy may confound interpretation of clinical [C-11]flumazenil studies used to assess gamma-aminobutyric acid A receptors."

Our news editors obtained a quote from the research from Free University, "Nine drug-resistant patients with epilepsy and mesial temporal sclerosis were scanned twice using [C-11]flumazenil before and after partial P-glycoprotein blockade with tariquidar. Volume of distribution, nondisplaceable binding potential, and the ratio of rate constants of [C-11] flumazenil transport across the blood-brain barrier (K-1/k(2)) were derived for whole brain and several regions. All parameters were compared between pre- and post-tariquidar scans. Regional results were compared between mesial temporal sclerosis and contralateral sides. Tariquidar significantly increased global K-1/k(2) (+23%) and volume of distribution (+10%), but not nondisplaceable binding potential. At the mesial temporal sclerosis side volume of distribution and nondisplaceable binding potential were lower in hippocampus (both similar to -19%) and amygdala (both similar to -16%), but K-1/k(2) did not differ, suggesting that only regional gamma-aminobutyric acid A receptor density is altered in epilepsy."

According to the news editors, the research concluded: "Although [C-11]flumazenil appears to be a (weak) P-glycoprotein substrate in humans, this does not seem to affect its role as a tracer for assessing gamma-aminobutyric acid A receptor density."

Investigators from Free University Target Cytomegalovirus (Primary maternal cytomegalovirus infections: accuracy of fetal ultrasound for predicting sequelae in offspring)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Herpesvirus Diseases and Conditions - Cytomegalovirus are discussed in a new report. According to news originating from Brussels, Belgium, by NewsRx correspondents, research stated, "Cytomegalovirus infection is the most common perinatal viral infection that can lead to severe long-term medical conditions. Antenatal identification of maternal cytomegalovirus infections with proven fetal transmission and potential postnatal clinical sequelae remains a major challenge in perinatology."

Our news journalists obtained a quote from the research from Free University, "There is a need to improve the prenatal counseling offered to patients and guide future clinical management decisions in cases of proven primary cytomegalovirus infection. We sought to evaluate the accuracy of fetal ultrasound for predicting sequelae in fetuses infected with congenital cytomegalovirus after maternal primary infection. We conducted a prospective observational study from 1996 through 2012 in pregnant women with serological evidence of primary cytomegalovirus infection and proven vertical transmission to the fetus, based on viral load in the amniotic fluid. Fetal ultrasound was performed in all patients. Pregnancy termination was presented as an option for infected fetuses. Hearing and neurological clinical assessments were performed for all neonates with cytomegalovirus-positive urine samples. A total of 67 patients (69 fetuses) with proven vertical transmission were included in this study, including 64 singleton and 3 twin pregnancies. Eight fetuses were lost to follow-up. Of the remaining 61 fetuses, termination of the pregnancy was performed for 26, including 11 with fetal ultrasound anomalies. Autopsy provided histological evidence of fetal cytomegalovirus infection in all cases. In the 15 terminated fetuses without ultrasound anomalies, histological evidence of damage caused by fetal infection was detected in 13 cases. Among the 35 live-born infants, 12 had fetal ultrasound anomalies suggestive of congenital infection. Of these 12 infants, 6 had..."
normal clinical evaluations, whereas 6 presented with either hearing and/or neurological anomalies, classified as severe in 4 cases. Among the 23 live-born infants with normal prenatal ultrasound, 5 developed hearing impairments and 1 showed mild neurological developmental delay. Fetal ultrasound anomalies were detected in 37.7% of pregnant women with primary cytomegalovirus infection acquired in early pregnancy and proven fetal infection, and were confirmed by autopsy or postnatal clinical evaluation in 73.9%.

According to the news editors, the research concluded: "Autopsy or postnatal clinical evaluation also detected cytomegalovirus-related anomalies in 55% of infants with normal fetal ultrasound evaluations."

The news correspondents report that additional information may be obtained from L. Gucciardo, Vrije Univ Brussel, Univ Ziekenhuis Brussel, Dept. of Obstet & Prenatal Med, Brussels, Belgium. Additional authors for this research include A. Vorsselmans, E. Done, K. Van Berkel, G. Faron, I. Foulon, A. Naessens, A. Jansen, W. Foulon and L. Gucciardo.

Heart Disorders and Diseases - Andersen-Tawil...

Investigators from Fudan University Target Andersen-Tawil Syndrome (Clinical Features And Long Exercise Test In Chinese Patients With Andersen-tawil Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Andersen-Tawil Syndrome have been presented. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Andersen-Tawil syndrome (ATS) is a rare multisystem channelopathy characterized by periodic paralysis, ventricular arrhythmias, and developmental dysmorphology. There are few reports concerning ATS in the Chinese population."

Our news journalists obtained a quote from the research from Fudan University, "We analyzed clinical features and evaluated the long exercise test as a tool for diagnosis of periodic paralysis in ATS. Direct sequencing of KCNJ2 was performed in 12 subjects from mainland China with suspected ATS. Clinical features, therapeutic responses, and long exercise tests (LET) were retrospectively analyzed. Twelve patients were genetically confirmed to have ATS. A small mandible and clinodactyly were demonstrated in all patients. Premature ventricular contractions were the most prevalent form of cardiac arrhythmia. The LET revealed an early amplitude decrement. Chinese ATS patients shared some common clinical features with reported subjects in other countries."
According to the news editors, the research concluded: "An early amplitude decrement in LET may be useful for diagnosis of ATS."

The news correspondents report that additional information may be obtained from K. Qiao, Fudan University, Huashan Hosp, Inst Neurol, Dept. of Clin Electrophysioli, Shanghai 200040, People's Republic of China. Additional authors for this research include S.S. Luo, X. Cheng, D.Y. Yue, W.H. Zhu, J. Lin, J. Huang, J.H. Lu, C.B. Zhao and K. Qiao.

Keywords for this news article include: Shanghai, People's Republic of China, Asia, Heart Disorders and Diseases, Andersen-Tawil Syndrome, Cardiology, Neurology, Genetics, Fudan University.

**Oncology - Colon Cancer**

**Investigators from Fudan University Zero in on Colon Cancer (Cullin 3 targets methionine adenosyltransferase II alpha for ubiquitylation-mediated degradation and regulates colorectal cancer cell proliferation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Cullin 3 (CUL3) serves as a scaffold protein and assembles a large number of ubiquitin ligase complexes. It is involved in multiple cellular processes and plays a potential role in tumor development and progression."

Our news editors obtained a quote from the research from Fudan University, "In this study, we demonstrate that CUL3 targets methionine adenosyltransferase II alpha (MAT II alpha) and promotes its proteasomal degradation through the ubiquitylation-mediated pathway. MAT II alpha is a key enzyme in methionine metabolism and is associated with uncontrolled cell proliferation in cancer. We presently found that CUL3 down-regulation could rescue folate deprivation-induced MAT II alpha exhaustion and growth arrest in colorectal cancer (CRC) cells. Further results from human CRC samples display an inverse correlation between CUL3 and MAT II alpha protein levels."

According to the news editors, the research concluded: "Our observations reveal a novel role of CUL3 in regulating cell proliferation by controlling the stability of MAT II alpha."

The news editors report that additional information may be obtained by contacting Y.Y. Xu, Fudan University, Inst Biomed Sci, Canc Metab Lab, Shanghai 200032, People's

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news reporting originating from Fujian, People's Republic of China, by NewsRx correspondents, research stated, "Aberrant expression of lncRNA has been suggested to have an association with tumorigenesis. Our study was designed to reveal the underlying connection between lncRNA SNHG1 and hepatocellular carcinoma (HCC) pathogenesis."

Our news editors obtained a quote from the research from Fujian Medical University, "A total of 122 pairs of HCC tissues (case group) and matched adjacent non-tumor liver tissues (control group) were collected for this study. RT-PCR and in situ hybridization were conducted to investigate differences in IncRNA SNHG1 expression between the case and control group. The expression levels of IncRNA SNHG1 and miR-195 in HepG2 cells transfected with SNHG1-mimic and SNHG1-inhibitor were measured by RT-PCR. The proliferation, invasion, and migration status of HepG2 cells after transfection were assessed through MTT assay, wound healing assay, and Transwell assay, respectively. Whether miR-195 is a direct downstream target of IncRNA SNHG1 was verified by both bioinformatics target gene prediction and dual-luciferase report assay. The expression level of IncRNA SNHG1 was remarkably upregulated in HCC tissues and cell lines compared with normal tissues and cell lines. High expression of IncRNA SNHG1 contributed to the downregulation of miR-195 in HepG2 cells. Also, IncRNA SNHG1 exacerbated HCC cell proliferation, invasion, and migration in vitro through the inhibition of miR-195. This suggests that miR-195 is a direct downstream target of IncRNA SNHG1."

According to the news editors, the research concluded: "LncRNA SNHG1 may contribute to the aggravation of HCC through the inhibition of miR-195."

For more information on this research see: Expression of Long Non-Coding RNA (IncRNA) Small Nucleolar RNA Host Gene 1 (SNHG1) Exacerbates Hepatocellular Carcinoma Through Suppressing miR-195. Medical Science Monitor, 2016;22():4820-4829. Medical Science Monitor can be contacted at: Int Scientific Literature, Inc, 361 Forest Lane, Smithtown, NY 11787, USA.

The news editors report that additional information may be obtained by contacting H. Zhang, Fujian Med Univ, Teaching Hosp, Fujian Prov Canc Hosp, Dept. of Abdominal Surg, Fuzhou, Fujian, People's Republic of China. Additional authors for this research include D.
Investigators from Fukushima Medical University Zero in on Heart Failure (Associations With Eicosapentaenoic Acid to Arachidonic Acid Ratio and Mortality in Hospitalized Heart Failure Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Failure is now available. According to news originating from Fukushima, Japan, by NewsRx correspondents, research stated, "Intake of n-3 polyunsaturated fatty acids (n-3 PUFAs) lowers the risk of atherosclerotic cardiovascular events, particularly ischemic heart disease. In addition, the ratio of eicosapentaenoic acid (EPA; n-3 PUFA) to arachidonic acid (AA; n-6 PUFA) has recently been recognized as a risk marker of cardiovascular disease."

Our news journalists obtained a quote from the research from Fukushima Medical University, "In contrast, the prognostic impact of the EPA/AA ratio on patients with heart failure (HF) remains unclear. A total of 577 consecutive patients admitted for HF were divided into 2 groups based on median of the EPA/AA ratio: low EPA/AA (EPA/AA <0.32 mg/dl, n = 291) and high EPA/AA (EPA/AA >= 0.32, n = 286) groups. We compared laboratory data and echocardiographic findings and followed cardiac mortality. Although body mass index, blood pressure, B-type natriuretic peptide, hemoglobin, estimated glomerular filtration rate, total protein, albumin, sodium, C-reactive protein, and left ventricular ejection fraction did not differ between the 2 groups, cardiac mortality was significantly higher in the low EPA/AA group than in the high EPA/AA group (12.7 vs 5.9%, log-rank P = .004). Multivariate Cox proportional hazard analysis revealed that the EPA/AA ratio was an independent predictor of cardiac mortality (hazard ratio 0.677, 95% confidence interval 0.453-0.983, P = .041) in patients with HF."

According to the news editors, the research concluded: "The EPA/AA ratio was an independent predictor of cardiac mortality in patients with HF; therefore, the prognosis of patients with HF may be improved by taking appropriate management to control the EPA/AA balance."

For more information on this research see: Associations With Eicosapentaenoic Acid to Arachidonic Acid Ratio and Mortality in Hospitalized Heart Failure Patients. *Journal of Cardiac Failure*, 2016;22Q(12):962-969. *Journal of Cardiac Failure* can be contacted at: Churchill Livingstone Inc Medical Publishers, Curtis Center, Independence Square West, Philadelphia, PA 19106-3399, USA. Investigators from Geisinger Health System Report New Data on Obesity (Depression, its Comorbidities and Treatment, and Childhood Body Mass Index Trajectories)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting from Danville, Pennsylvania, by NewsRx journalists, research stated, "No prior studies have evaluated depression diagnoses and cumulative antidepressant use in relation to longitudinal body mass index (BMI) trajectories in a population-representative sample. Electronic health record data from 105,163 children ages 8 to 18 years with 314,648 BMI values were used."

The news correspondents obtained a quote from the research from Geisinger Health System, "Depression diagnoses were evaluated as ever versus never, cumulative number of encounters with diagnoses, and total duration of diagnoses. Antidepressants were evaluated as months of use. Associations were evaluated with diagnoses alone, antidepressants alone, and then together, adjusting for covariates. A total of 6,172 (5.9%) and 10,628 (10.1%) children had a diagnosis of depression or received antidepressant treatment, respectively. At all ages, children receiving Medical Assistance (30.9%) were more likely to be treated with antidepressants. Depression diagnosis and antidepressant use were each independently and positively associated with BMI trajectories; associations were stronger with longer durations of diagnosis and treatment. Among children who received 12 or more months of antidepressants (vs. none), the mean (95% CI) weight gain at 18 years associated with antidepressant use (all classes) was 2.10 (1.76-2.45) kg."

According to the news reporters, the research concluded: "Depression and antidepressant use were both independently associated with increasing BMIs over time, suggesting an important unintended consequence of healthcare to the obesity epidemic."

For more information on this research see: Depression, its Comorbidities and Treatment, and Childhood Body Mass Index Trajectories. Obesity, 2016;24(12):2585-2592. Obesity can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

Investigators from General Hospital Have Reported New Data on Cell Proliferation (Inhibitor of DNA-binding 1 promotes endothelial progenitor cell proliferation and migration by suppressing E2-2 through the helix-loop-helix domain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cell Proliferation are discussed in a new report. According to news originating from Kunming, People's Republic of China, by NewsRx correspondents, research stated, "Vascular endothelial damage is the major contributing factor to cardiovascular diseases. Recently, the therapeutic significance of endothelial progenitor cells (EPCs) has drawn increasing attention due to their roles in re-endothelialization following injury."

Our news journalists obtained a quote from the research from General Hospital, "The inhibitor of DNA-binding 1 (ID1) has been proven to promote EPC proliferation and migration, suggesting a critical function of ID1 in re-endothelialization. However, the underlying mechanisms remain undefined. In this study, ID1 was found to interact with E2-2 using immunoprecipitation analysis. Moreover, ID1 overexpression suppressed E2-2 expression and luciferase reporter activity; however, these effects were not observed in cells transfected with ID1 lacking the helix-loop-helix (HLH) domain (ID1HLH). Further functional analysis corroborated that the upregulation of E2-2 markedly attenuated the ID1-mediated increase in EPC proliferation and migration. Furthermore, the HLH domain plays an important role in ID1-induced EPC proliferation and migration, as its deletion suppressed the positive regulatory effects of ID1 on EPC proliferation and migration. Taken together, the findings of our study confirm that ID1 promotes EPC proliferation and migration by suppressing E2-2 through the HLH domain in ID1."

According to the news editors, the research concluded: "Therefore, ID1 may represent a potential therapeutic target for EPC-mediated re-endothelialization following vascular injury."

For more information on this research see: Inhibitor of DNA-binding 1 promotes endothelial progenitor cell proliferation and migration by suppressing E2-2 through the helix-loop-helix domain. *International Journal of Molecular Medicine*, 2016;38(5):1549-1557. *International Journal of Molecular Medicine* can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

The news correspondents report that additional information may be obtained from H. Wang, Kunming Gen Hosp Chengdu Military Command, Dept. of Geriatr, Kunming 650032, Yunnan, People's Republic of China. Additional authors for this research include Y. Liang, C.P. Yin, X.L. Liu, Y. Su, L. Zhang and H. Wang.
Investigators from Ghent University Report New Data on Familial Mediterranean Fever (Familial Mediterranean fever mutations lift the obligatory requirement for microtubules in Pyrin inflammasome activation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autoinflammatory Diseases and Conditions - Familial Mediterranean Fever have been presented. According to news originating from Ghent, Belgium, by NewsRx correspondents, research stated, "Familial Mediterranean fever (FMF) is the most common monogenic autoinflammatory disease worldwide. It is caused by mutations in the inflammasome adaptor Pyrin, but how FMF mutations alter signaling in FMF patients is unknown."

Financial support for this research came from EC | European Research Council (ERC).

Our news journalists obtained a quote from the research from Ghent University, "Herein, we establish Clostridium difficile and its enterotoxin A (TcdA) as Pyrin-activating agents and show that wild-type and FMF Pyrin are differentially controlled by microtubules. Diverse microtubule assembly inhibitors prevented Pyrin-mediated caspase-1 activation and secretion of IL-1 beta and IL-18 from mouse macrophages and human peripheral blood mononuclear cells (PBMCs). Remarkably, Pyrin inflammasome activation persisted upon microtubule disassembly in PBMCs of FMF patients but not in cells of patients afflicted with other autoinflammatory diseases. We further demonstrate that microtubules control Pyrin activation downstream of Pyrin dephosphorylation and that FMF mutations enable microtubule-independent assembly of apoptosis-associated speck-like protein containing a caspase recruitment domain (ASC) micrometer-sized perinuclear structures (specks)."

According to the news editors, the research concluded: "The discovery that Pyrin mutations remove the obligatory requirement for microtubules in inflammasome activation provides a conceptual framework for understanding FMF and enables immunological screening of FMF mutations."

The news correspondents report that additional information may be obtained from M. Lamkanfi, University of Ghent, Dept. of Internal Med, B-9000 Ghent, Belgium. Additional authors for this research include P.H.V. Saavedra, N.M. de Vasconcelos, N. Van Opdenbosch,
Investigators from Gifu University Zero in on Bladder Cancer (A Novel Role of Dickkopf-Related Protein 3 in Macropinocytosis in Human Bladder Cancer T24 Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Bladder Cancer have been published. According to news originating from Gifu, Japan, by NewsRx correspondents, research stated, "Dickkopf-related protein 3 (Dkk-3) is a potential tumor suppressor reported in various cancer entities. However, we found that Dkk-3 was exceptionally upregulated in bladder cancer T24 cells."

Our news journalists obtained a quote from the research from Gifu University, "To validate the biological role of Dkk-3 other than a tumor suppressor, we examined the function of Dkk-3 in T24 cells. Gene silencing of Dkk-3 inhibited cell growth through inducing G(0)/G(1) cell-cycle arrest. Furthermore, Dkk-3 knock-down caused macropinocytosis accompanied by autophagy, which were canceled in part by their inhibitors 5-(N-ethyl-N-isopropyl) amiloride (EIPA) and 3-methyladenine (3-MA). The macropinocytosis was induced by the Dkk-3 knock-down when there were sufficient extracellular nutrients. On the other hand, when the nutritional condition was poor, the autophagy was mainly induced by the Dkk-3 knock-down."

According to the news editors, the research concluded: "These data indicated that Dkk-3 has a role in modulating macropinocytotic and autophagic pathways, a distinct function other than a Wnt antagonist."

For more information on this research see: A Novel Role of Dickkopf-Related Protein 3 in Macropinocytosis in Human Bladder Cancer T24 Cells. International Journal of Molecular Sciences, 2016;17(11):1300-1313. International Journal of Molecular Sciences can be contacted at: Mdpí Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news correspondents report that additional information may be obtained from N. Tsujimura, Gifu University, United Grad Sch Drug Discovery & Med Informat Sci, Gifu, Gifu 5011194, Japan. Additional authors for this research include N.O. Yamada, Y. Kuranaga, M. Kumazaki, H. Shinohara, K. Taniguchi and Y. Akao.

Investigators from Gil Medical Center Report New Data on Nanotechnology (Recent insights into the development of nanotechnology to detect circulating tumor cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nanotechnology are presented in a new report. According to news reporting originating in Inchon, South Korea, by NewsRx journalists, research stated, "Circulating tumor cells (CTCs) produced from primary tumors act as seeds for metastasis, leading to the majority of cancer-related deaths. Currently, in cancer research, these cells have attracted much attention in studying the process of metastasis."

Financial support for this research came from National Research Foundation.

The news reporters obtained a quote from the research from Gil Medical Center, "Various studies in the past decade have enlightened the role of CFCs as potential biomarkers in cancer diagnosis and prognosis. As a result, the analysis of CTCs could act as a substitute for characterizing the nature of primary tumors and provide unique insights into the metastatic process. The detection of CTCs in the blood samples of a cancer patient is technically challenging because of the extremely low abundance of CTCs among a large number of other blood cells. Therefore, novel methods for the detection of CFCs are highly recommended."

According to the news reporters, the research concluded: "In this feature article, we discuss the recent progress in nanotechnology for the detection of CTCs along with perspectives on future opportunities."

Our news correspondents report that additional information may be obtained by contacting S. Kim, Gil Med Center, Grad Gachon Med Res Inst, Inchon 405760, South Korea.

Investigators from Guangxi Medical University Have Reported New Data on Diclofenac Therapy (Protection from diclofenac-induced liver injury by Yulangsan polysaccharide in a mouse model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Diclofenac Therapy have been published. According to news reporting originating from Nanning, People's Republic of
China, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: Millettia pulchra Kurz var-laxior (Dunn) Z. Wei, a wild-growing plant of the family Fabaceae is known to possess multifarious medicinal properties. Yulangsan polysaccharide (YLSPS) is a chief ingredient of its root, which has been used in Chinese traditional medicine with a long history for remedy of acute or chronic hepatitis and jaundice."

Funders for this research include Natural Science Foundation of China, Fok Ying-Tong Education Foundation of China, Guangxi Natural Science Foundation, Science and Technology Research Projects of Guangxi, Science and Technology foundation.

Our news editors obtained a quote from the research from Guangxi Medical University, "Aim of the study: To investigate the ability of the YLSPS to protect against diclofenac-induced hepatotoxicity in mice. Mice were orally treated with YLSPS daily 1 h after the injection of diclofenac for 2 weeks. Dimethyl diphenyl dicarboxylate was used as a reference drug. YLSPS effectively reduced the elevated levels of serum alanine aminotransferase, aspartate aminotransferase, and alkaline phosphatase and enhanced the reduction of superoxide dismutase, catalase, and glutathione peroxidase activities in the liver. Moreover, the content of malondialdehyde was reduced by treatment with YLSPS, and histological findings also confirmed the anti-hepatotoxic activity. In addition, YLSPS significantly inhibited proinflammatory mediators, such as tumor necrosis factor-alpha and interleukin 1 beta. YLSPS also enhanced mitochondrial antioxidants and inhibited cell death by preventing the down-regulation of Bcl-2 and the up-regulation and release of Bax along with caspase 9 and 3 activity; thus, these findings confirm the involvement of mitochondria in diclofenac-induced apoptosis."

According to the news editors, the research concluded: "The results indicate that protective effects of YLSPS against diclofenac-induced acute hepatic injury may rely on its effect on reducing oxidative stress, suppressing inflammatory responses, and improving drug-metabolizing enzyme activity in the liver."

The news editors report that additional information may be obtained by contacting R.B. Huang, Guangxi Med Univ, Dept. of Pharmacol, Nanning 530021, People's Republic of China. Investigators from Hamamatsu University Release New Data on Chronic Kidney Disease (Impaired endogenous nighttime melatonin secretion relates to intrarenal renin-angiotensin system activation and renal damage in patients with chronic kidney disease...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Kidney Diseases and Conditions - Chronic Kidney Disease. According to news originating from Hamamatsu, Japan, by NewsRx correspondents, research stated, "Activation of the intrarenal renin-angiotensin system (RAS) plays a critical role in the pathophysiology of chronic kidney disease (CKD) and hypertension. The circadian rhythm of intrarenal RAS activation leads to renal damage and hypertension, which are associated with diurnal blood pressure (BP) variation."

Our news journalists obtained a quote from the research from Hamamatsu University, "The activation of intrarenal RAS following reactive oxygen species (ROS) activation, sympathetic hyperactivity and nitric oxide (NO) inhibition leads to the development of renal damage. Melatonin is a hormone regulating the circadian rhythm, and has multiple functions such as anti-oxidant and anti-adrenergic effects and enhancement of NO bioavailability. Nocturnal melatonin concentrations are lower in CKD patients. However, it is not known if impaired endogenous melatonin secretion is related to BP, intrarenal RAS, or renal damage in CKD patients. We recruited 53 CKD patients and conducted 24-h ambulatory BP monitoring. urine was collected during the daytime and nighttime. We investigated the relationship among the melatonin metabolite urinary 6-sulphatoxymelatonin (U-aMT6s), BP, renal function, urinary angiotensinogen (U-AGT), and urinary albumin (U-Alb). Patients' U-aMT6s levels were significantly and negatively correlated with clinical parameters such as renal function, systolic BP, U-AGT, and U-Alb, during both day and night. Multiple regression analyses for U-aMT6s levels were performed using age, gender, renal function, and each parameter (BPs, U-AGT or U-Alb), at daytime and nighttime. U-aMT6s levels were significantly associated with U-AGT (beta = -0.31, p = 0.044) and U-Alb (beta = -0.25, p = 0.025) only at night."

According to the news editors, the research concluded: "Impaired nighttime melatonin secretion may be associated with nighttime intrarenal RAS activation and renal damage in CKD patients."

For more information on this research see: Impaired endogenous nighttime melatonin secretion relates to intrarenal renin-angiotensin system activation and renal damage in patients with chronic kidney disease. Clinical and Experimental Nephrology, 2016;20(6):878-884. Clinical and Experimental Nephrology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Investigators from Harvard School of Medicine Release New Data on Atherosclerosis (Heterogeneity of Coronary Plaque Morphology and Natural History: Current Understanding and Clinical Significance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Atherosclerosis have been presented. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Purpose of Review Despite the important progress in identifying high-risk atherosclerotic plaques, many key elements are elusive. Advanced imaging modalities provide valuable information about the anatomic and functional plaque characteristics and underscore the presence of multiple plaque morphologies."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "However, how the heterogeneity of atherosclerotic plaque can alter our current understanding of coronary artery disease is not fully understood. Along the length of an individual plaque, the morphology patterns display marked heterogeneity. Contrary to previous beliefs, plaque morphology is also highly dynamic over time, with the vast majority of high-risk plaques becoming quiescent and mild plaques becoming severely obstructive in a short period of time. Endothelial shear stress, a local hemodynamic factor known for its critical effects in plaque initiation and progression, also displays longitudinal heterogeneity contributing to the arterial wall response in all time points. Risk stratification of plaques based on the morphological characteristics at one region of the plaque, usually the minimal lumen diameter, and at one point in time may be misleading."

According to the news editors, the research concluded: "The evaluation of both morphological and hemodynamic characteristics along the length of a plaque will improve the risk assessment of individual plaques."

For more information on this research see: Heterogeneity of Coronary Plaque Morphology and Natural History: Current Understanding and Clinical Significance. Current Atherosclerosis Reports, 2016;18(12):97-105. Current Atherosclerosis Reports can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. (Springer - www.springer.com; Current Atherosclerosis Reports - www.springerlink.com/content/1523-3804/)

Investigators from Hebrew University Report New Data on Thyroid Cancer (Unemployment Risk and Decreased Income Two and Four Years After Thyroid Cancer Diagnosis: A Population-Based Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Thyroid Cancer is the subject of a report. According to news originating from Jerusalem, Israel, by NewsRx correspondents, research stated, "Thyroid cancer (TC) often occurs in relatively young patients and has a high cure rate. However, decreased psychological and physical well-being may reduce the work capability of patients with TC."

Our news journalists obtained a quote from the research from Hebrew University, "This study aimed to compare the risk for unemployment and decreased income in TC survivors with a matched non-cancer group at two and four years after diagnosis. The study also aimed to predict unemployment and income changes at two and four years after diagnosis. A historical prospective study design was used, with cohort inception and baseline measurements drawn from the Israeli Central Bureau of Statistics 1995 National Census, with follow-up until 2011. Cancer incidence was obtained from the Israel Cancer Registry, and employment status from the Tax Authority. A matched group was sampled from the census population. Binary logistic regression analyses were used to assess odds ratios (OR) for the study outcomes, controlled for age, sex, ethnicity, education years, socioeconomic position, and employment status at two years before diagnosis. In total, 417 cases of TC and 1277 non-cancer matched subjects were included in the study. People who died during the study period were excluded. The mean age at the time of cancer diagnosis was 43.5 years in the TC group and 43.8 years in the control group (p = 0.6). After adjusting for potential confounders, a positive association was found between TC and risk of unemployment two years after diagnosis (OR = 1.46 [confidence interval (CI) 1.09-1.95]), and decreased income two years after diagnosis (OR = 1.61 [CI 1.23-2.01]) and four years after diagnosis (OR = 1.63 [CI 1.25-2.13]). The association between TC and unemployment at four years after diagnosis weakened and lost significance (OR = 1.30 [CI 0.98-1.72]). TC survivorship was associated with unemployment at two years and decreased income at two and four years after diagnosis. Decreased income may be a marker for a shift to part-time work rather than a return to full-time work."

According to the news editors, the research concluded: "The findings suggest that interventions to enhance the return to full-time work are needed in this population."

For more information on this research see: Unemployment Risk and Decreased Income Two and Four Years After Thyroid Cancer Diagnosis: A Population-Based Study. Thyroid, 2016;26(9):1251-1258. Thyroid can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Cardiovascular Diseases and Conditions - Thrombosis

Investigators from Hospital Clinic Report New Data on Thrombosis (Surgical Complications in En Bloc Renal Transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Thrombosis. According to news reporting from Madrid, Spain, by NewsRx journalists, research stated, "En bloc pediatric transplantation (EBPT) began with the aim of increasing the donor pool due to the existing high demand for donors. At its inception, it was considered a type of suboptimal transplantation due to its association with a high incidence of vascular, urologic, and immunologic complications."

The news correspondents obtained a quote from the research from Hospital Clinic, "The main objective of this study was to update information on EBPT with the largest case series that exists on a worldwide scale. In a retrospective study, the results obtained from brain-dead donors (BDDs; n = 770) were compared to those of EBPT (n = 100) from January 1990 to December 2012. The median of follow-up was 12.8 years (interquartile range 8.1 to 17.2). The variables collected for analysis were demographic factors (age and sex of recipients, age and weight of donors), renal function, graft survival, recipient survival, surgical complications (thrombosis, lymphocele, urologic complications, and renal artery stenosis and need for revascularization with angioplasty and/or stents). Subsequently in a second analysis, we studied the association between graft survival, thrombosis, angioplasty, stents, and appearance of lymphoceles with the different factors that were considered to be related in accordance with published literature and our own experience. Graft loss due to surgical complications was more frequent in EBPT than in BDD (15% vs 2.2 % in BDD; P< .001), and interstitial fibrosis and tubular atrophy were more frequent in BDD (13% vs 2%; P< .001)."

According to the news reporters, the research concluded: "EBPT offers a good survival rate after overcoming the possible surgical complications that may arise."

Our news journalists report that additional information may be obtained by contacting M. Diaz, Hosp Clin San Carlos, Dept. of Nephrol, Madrid, Spain. Additional authors for this research include N.C. Romero, I. Perez-Flores, M.C. Arevalo, B.R. Cubillo, A. Shabaka, V.L. de la Manzanara, A.G. Vegas, J.B. Izquierdo and A.I. Sanchez-Fructuoso.

Investigators from Huazhong University of Science and Technology Zero in on Immunoglobulins (SPECT and fluorescence imaging of vulnerable atherosclerotic plaque with a vascular cell adhesion molecule 1 single-chain antibody fragment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immunology - Immunoglobulins is the subject of a report. According to news reporting originating in Wuhan, People's Republic of China, by NewsRx journalists, research stated, "Early detection and evaluation of vulnerable atherosclerotic plaque are important for risk stratification and timely intervention, and vascular cell adhesion molecule 1 (VCAM1) assists in adhesion and recruitment of inflammatory cells to vulnerable lesions. We labeled a single-chain variable fragment (scFv) of VCAM1 with (99)mtechnetium ((99)mTc) and fluorescent markers to investigate its potential utility in detecting vulnerable plaques in animal models of atherosclerosis."

The news reporters obtained a quote from the research from the Huazhong University of Science and Technology, "We labeled VCAM1 scFv with (99)mTc and cyanine5 (CY5) and evaluated the probes on apolipoprotein E gene-deficient mice and New Zealand White rabbits with induced atherosclerosis. Histopathology and Western blot examinations confirmed atherosclerotic plaque and VCAM1 expression in the aortas. In vivo biodistribution of (99)mTc-scFv-VCAM1 was studied. Abdominal organs of mice were removed after CY5-scFv-VCAM1 administration for aortic fluorescence imaging. Rabbits SPECT imaging of (99)mTc-scFv-VCAM1 was performed and autoradiography (ARG) of the aortas was checked to confirm the tracer uptake. The radiochemical purity of (99)mTc-scFv-VCAM1 was 98.72 +/- 1.04% (n = 5) and its specific activity was 7.8 MBq/mug. Biodistribution study indicated predominant probe clearance by kidneys. In fluorescence imaging, stronger signal from CY5-scFv-VCAM1 in the aorta was observed in atherosclerotic mice than that in controls. SPECT imaging with (99)mTc-scFv-VCAM1 showed tracer uptake in the abdominal aorta and the aortic arch of atherosclerotic animals. ARG confirmed tracer uptake in the aortas of atherosclerotic rabbits, with higher uptake ratios of aortic arch/descending aorta in experimental animals (4.45 +/- 0.63, n = 5) than controls (1.12 +/- 0.15, n = 5; p< 0.05)."

According to the news reporters, the research concluded: "SPECT and fluorescence imaging results showed the feasibility and effectiveness of detecting vulnerable plaque with scFv of VCAM1, indicating its potential for early diagnosis and evaluation of atherosclerosis."

For more information on this research see: SPECT and fluorescence imaging of vulnerable atherosclerotic plaque with a vascular cell adhesion molecule 1 single-chain antibody fragment. Atherosclerosis, 2016;254():263-270. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Our news editors obtained a quote from the research from Imperial College, "Intravital imaging reveals that vessel growth in murine long bone involves the extension and anastomotic fusion of endothelial buds. Impaired blood flow leads to defective angiogenesis and osteogenesis, and downregulation of Notch signalling in endothelial cells. In aged mice, skeletal blood flow and endothelial Notch activity are also reduced leading to decreased angiogenesis and osteogenesis, which is reverted by genetic reactivation of Notch. Blood flow and angiogenesis in aged mice are also enhanced on administration of bisphosphonate, a class of drugs frequently used for the treatment of osteoporosis."

According to the news editors, the research concluded: "We propose that blood flow and endothelial Notch signalling are key factors controlling ageing processes in the skeletal system."

Biological Factors - Biological Toxins

Investigators from Institute of Applied Ecology Report New Data on Biological Toxins (Up-regulation of granzyme B and perforin by staphylococcal enterotoxin C2 mutant induces enhanced cytotoxicity in Hepal-6 cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biological Factors - Biological Toxins. According to news reporting from Liaoning, People's Republic of China, by NewsRx journalists, research stated, "Staphylococcal enterotoxin C2 (SEC2), a member of bacterial superantigen, is one of the most potent known activators of T lymphocytes. With this property, SEC2 has already been used in clinic as a tumor immunotherapy agent in China."

The news correspondents obtained a quote from the research from the Institute of Applied Ecology, "To increase the antitumor activity, a SEC2 mutant named ST-4 (GINTG102-106WWH) with amino acid substitutions in T cell receptor (TCR)-binding domain was generated by site-directed mutagenesis, and the molecular mechanism of the enhanced antitumor activity was investigated. ST-4 could activate much more v beta 8.2 and 83 T cells and NK cells compared with SEC2, and exhibited significantly enhanced immunocyte stimulation and antitumor activity in vitro. The synthetic peptide sequencing the residues of mutant TCR-binding domain could competitively inhibit the immunocyte stimulation activity of ST-4. Most importantly, ST-4 up-regulated granzyme B and perforin at both mRNA and protein levels. We also found that expression of proapoptotic proteins cytochrome c, BAX and activation of caspase-3, 9 was up-regulated, and antiapoptotic protein Bcl-xL was down-regulated in the treatment with either ST-4 or SEC2. When granzyme B inhibitor or perforin inhibitor is presented, tumor cell viability was significantly rescued. Taken together, we demonstrate that increased ST-4-TCR recognition contributed to massive T cells and NK cells activation. These activated cells released up-regulated granzyme B and perforin, which induced the enhanced tumor cells apoptosis by mitochondrial apoptotic pathway, and ultimately led to enhanced tumor cell growth inhibition."

According to the news reporters, the research concluded: "ST-4 may be a promising candidate for antitumor clinic usage in future."

Our news journalists report that additional information may be obtained by

Investigators from Institute of Cytology Have Reported New Data on Genetics (p53 Proteoforms and Intrinsic Disorder: An Illustration of the Protein Structure-Function Continuum Concept)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics. According to news reporting originating from St. Petersburg, Russia, by NewsRx editors, the research stated, "Although it is one of the most studied proteins, p53 continues to be an enigma. This protein has numerous biological functions, possesses intrinsically disordered regions crucial for its functionality, can form both homo-tetramers and isoform-based hetero-tetramers, and is able to interact with many binding partners."

Our news editors obtained a quote from the research from the Institute of Cytology, "It contains numerous posttranslational modifications, has several isoforms generated by alternative splicing, alternative promoter usage or alternative initiation of translation, and is commonly mutated in different cancers. Therefore, p53 serves as an important illustration of the protein structure-function continuum concept, where the generation of multiple proteoforms by various mechanisms defines the ability of this protein to have a multitude of structurally and functionally different states."

According to the news editors, the research concluded: "Considering p53 in the light of a proteoform-based structure-function continuum represents a non-canonical and conceptually new contemplation of structure, regulation, and functionality of this important protein."

For more information on this research see: p53 Proteoforms and Intrinsic Disorder: An Illustration of the Protein Structure-Function Continuum Concept. International Journal of Molecular Sciences, 2016;17(11):1676-1712. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Oncology - Brain Cancer

Investigators from Institute of Science Release New Data on Brain Cancer (OCT4 spliced variants are highly expressed in brain cancer tissues and inhibition of OCT4B1 causes G2/M arrest in brain cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Brain Cancer. According to news reporting originating from Kerman, Iran, by NewsRx correspondents, research stated, "The new claim about the origin of cancer known as Cancer Stem Cell theory states that a somatic differentiated cell can dedifferentiated or reprogrammed for regaining the cancer cell features. It has been recently shown that expression of stemness factors such as Oct4, Sox2, Nanog and Klf4, in a variety of somatic cancers can leads to development of tumorogenesis."

Our news editors obtained a quote from the research from the Institute of Science, "Here, the expression of Oct4 variants were evaluated in brain tumor tissues by quantitative RT-PCR and immunohistochemical (IHC) analysis. In next phase of our study, the expression of Oct4B1 was knock-down in brain cancer cell lines and its effect on cell cycle was assessed. Finally, in order to get insights into sequence-structure-function relationships of Oct4 isoforms, their sequences were analysed using bioinformatic tools. Our data revealed that all three variants of Oct4 are expressed in different types of brain cancer. The expression level of Oct4B1, in contrast to Oct4B, was much higher in high-grade brain tumors compared with low-grade ones. In line with qPCR, the expression of Oct4A and B isoforms was confirmed with IHC in different types of brain tumors. Moreover, as a result of the suppression of Oct4B1 expression, the brain cancer cells were arrested in G2/M phase of cell cycle. Bioinformatics data indicated that the predicted Oct4B1 protein have DNA binding properties."

According to the news editors, the research concluded: "All together, our findings suggest that Oct4B1 has a potential role in tumorigenesis of brain cancer and can be considered as a new tumor marker with potential value in diagnosis and treatment of brain cancer."

For more information on this research see: OCT4 spliced variants are highly expressed in brain cancer tissues and inhibition of OCT4B1 causes G2/M arrest in brain cancer cells. **Amino Acids**

**Investigators from Institute of Science and Technology Austria Report New Data on Amino Acids (Impaired Amino Acid Transport at the Blood Brain Barrier Is a Cause of Autism Spectrum Disorder)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Amino Acids. According to news reporting from Klosterneuburg, Austria, by NewsRx journalists, research stated, "Autism spectrum disorders (ASD) are a group of genetic disorders often overlapping with other neurological conditions. We previously described abnormalities in the branched-chain amino acid (BCAA) catabolic pathway as a cause of ASD."

Funders for this research include CIDR, Broad Institute Center for Mendelian Disorders, Yale Center for Mendelian Disorders, Gregory M. Kiez and Mehmet Kutman Foundation, Italian Ministry of Instruction University and Research, NIH, NICHD, SFARI, FWF.

The news correspondents obtained a quote from the research from the Institute of Science and Technology Austria, "Here, we show that the solute carrier transporter 7a5 (SLC7A5), a large neutral amino acid transporter localized at the bloodbrainbarrier (BBB), has an essential role in maintaining normal levels of brain BCAAs. In mice, deletion of Slc7a5 from the endothelial cells of theBBBleads to atypical brain amino acid profile, abnormal mRNA translation, and severe neurological abnormalities. Furthermore, we identified several patients with autistic traits and motor delay carrying deleterious homozygous mutations in the SLC7A5 gene. Finally, we demonstrate that BCAA intracerebroventricular administration ameliorates abnormal behaviors in adult mutant mice."

According to the news reporters, the research concluded: "Our data elucidate a neurological syndrome defined by SLC7A5 mutations and support an essential role for the BCAA in human brain function."

For more information on this research see: Impaired Amino Acid Transport at the Blood Brain Barrier Is a Cause of Autism Spectrum Disorder. *Cell*, 2016;167(6):1481-1494.88-105. *Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. Investigators from Instituto de Salud Carlos III Release New Data on Respiratory Syncytial Viruses (Trivalency of a Nanobody Specific for the Human Respiratory Syncytial Virus Fusion Glycoprotein Drastically Enhances Virus Neutralization and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on RNA Viruses - Respiratory Syncytial Viruses. According to news reporting from Madrid, Spain, by NewsRx journalists, research stated, "ALX-0171 is a trivalent Nanobody derived from monovalent Nb017 that binds to antigenic site II of the human respiratory syncytial virus (hRSV) fusion (F) glycoprotein."

Funders for this research include Ministerio de Economia y Competitividad (MINECO), Agentschap voor Innovatie door Wetenschap en Techniek (IWT).

The news correspondents obtained a quote from the research from Instituto de Salud Carlos III, "ALX-0171 is about 6,000 to 10,000 times more potent than Nb017 in neutralization tests with strains of hRSV antigenic groups A and B. To explore the effect of this enhanced neutralization on escape mutant selection, viruses resistant to either ALX-0171 or Nb017 were isolated after serial passage of the hRSV Long strain in the presence of suboptimal concentrations of the respective Nanobodies. Resistant viruses emerged notably faster with Nb017 than with ALX-0171 and in both cases contained amino acid changes in antigenic site II of hRSV F. Detailed binding and neutralization analyses of these escape mutants as well as previously described mutants resistant to certain monoclonal antibodies (MAbs) offered a comprehensive description of site II mutations which are relevant for neutralization by MAbs and Nanobodies."

According to the news reporters, the research concluded: "Notably, ALX-0171 showed a sizeable neutralization potency with most escape mutants, even with some of those selected with the Nanobody, and these findings make ALX-0171 an attractive antiviral for treatment of hRSV infections."

For more information on this research see: Trivalency of a Nanobody Specific for the Human Respiratory Syncytial Virus Fusion Glycoprotein Drastically Enhances Virus Neutralization and Impacts Escape Mutant Selection. *Antimicrobial Agents and Chemotherapy*, 2016;60(11):6498-6509. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Zero in on Heart Failure (Combined use of renin-angiotensin-
aldosterone system-acting agents: a cross-sectional study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting out of Cluj Napoca, Romania, by NewsRx editors, research stated, "Due to recent EU warnings and restrictions on the combined use of renin-angiotensin-aldosterone system (RAAS)-acting agents, and the seriousness of the associated harm, we analyzed the prescription of angiotensin-converting enzyme inhibitors (ACEIs) and angiotensin receptor blockers (ARBs) as dual therapy or associated with spironolactone. An administrative claims database of a regional hospital in Romania."

Financial support for this research came from European Social Fund.

Our news journalists obtained a quote from the research from the Iuliu Hatieganu University of Medicine and Pharmacy, "We retrospectively included all adult patients hospitalized during 18 months in 2013-2014, discharged with a prescription of a RAAS-acting agent. Counts of ACEIs and ARBs co-prescription, of ACEIs or ARBs combined with spironolactone, co-morbidities, co-medication, creatinine, and electrolytes assessment and values. Out of 1697 patients with a prescription of a RAAS-acting agent, 24 (1.4%) were co-prescribed ACEIs and ARBs, and 416 (24.5%) ACEIs or ARBs with spironolactone. Patients prescribed dual ACEI/ARB therapy and the ones with ACEI or ARB-spironolactone combination had significantly higher prevalence of increased creatinine level before discharge, compared to the ACEI and ARB monotherapy groups (48 and 31% compared to 17 and 27%). Subjects with diabetes, heart failure, ischaemic heart disease, or urea ae >40 mg/dL had higher odds of having ACEI or ARB-spironolactone combination compared to monotherapy, while hypertension and renal disease subjects had lower odds. Similar findings were comparing dual ACEI/ARB therapy to monotherapy except heart failure (not statistically significant). Overall, the prevalence of use of dual therapy was low."

According to the news editors, the research concluded: "The combined use of RAAS-acting agents was higher in patients with known risk factors for further renal function deterioration, compared to the ones without."

Our news journalists report that additional information may be obtained by contacting D. Leucuta, Iuliu Hatieganu University of Medicine & Pharmacy, Dept. of Biostat & Med Informat, Cluj Napoca 400349, Romania. Additional authors for this research include D. Leucuta, C. Bucsra, C. Mogosan and D. Dumitrascu.

Investigators from Iwate Medical University Release New Data on Ameloblasts (The Semaphorin 4D-RhoA-Akt Signal Cascade Regulates Enamel Matrix Secretion in Coordination With Cell Polarization During Ameloblast Differentiation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Ameloblasts have been presented. According to news originating from Iwate, Japan, by NewsRx correspondents, research stated, "During tooth development, oral epithelial cells differentiate into ameloblasts in order to form the most mineralized tissue in the vertebrate body: enamel. During this process, ameloblasts directionally secrete enamel matrix proteins and morphologically change from low columnar cells to polarized tall columnar cells, both of which are essential for the proper formation of enamel."

Our news journalists obtained a quote from the research from Iwate Medical University, "In this study, we elucidated the molecular mechanism that integrates ameloblast function and morphology. Immunohistochemistry revealed that the restricted expression of semaphorin 4D (Sema4D) and RhoA activation status are closely associated with ameloblast differentiation in mouse incisors. In addition, in vitro gain-of-function and loss-of-function experiments demonstrated that Sema4D acts upstream of RhoA to regulate cell polarity and amelogenin expression via the Plexin B1/Leukemia-associated RhoGEF (LARG) complex during ameloblast differentiation. Experiments in transgenic mice demonstrated that expression of a dominant-negative form of RhoA in dental epithelium hindered ameloblast differentiation and subsequent enamel formation, as well as perturbing the establishment of polarized cell morphology and vectorial amelogenin expression. Finally, we showed that spatially restricted Akt mediates between Sema4D-RhoA signaling and these downstream cellular events."

According to the news editors, the research concluded: "Collectively, our results reveal a novel signaling network, the Sema4D-RhoA-Akt signal cascade, that coordinates cellular function and morphology and highlights the importance of specific spatiotemporally restricted components of a signaling pathway in the regulation of ameloblast differentiation."

The news correspondents report that additional information may be obtained from H. Harada, Iwate Medical University, Dept. of Anat, Div Dev Biol & Regenerat Med, Yahaba, Iwate 0283694, Japan. Additional authors for this research include H. Ida-Yonemochi, N. Fujiwara and H. Harada.

Cardiovascular Diseases and Conditions - Aneurysm

Investigators from Jefferson Hospital for Neuroscience Report New Data on Aneurysm (Clipping of previously coiled cerebral aneurysms: efficacy, safety, and predictors in a cohort of 111 patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Aneurysm are presented in a new report. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "With the increasing number of aneurysms treated with endovascular coiling, more recurrences are being encountered. The aim of this study was to evaluate the efficacy and safety of microsurgical clipping in the treatment of recurrent, previously coiled cerebral aneurysms and to identify risk factors that can affect the outcomes of this procedure."

Our news editors obtained a quote from the research from Jefferson Hospital for Neuroscience, "One hundred eleven patients with recurrent aneurysms whose lesions were managed by surgical clipping between January 2002 and October 2014 were identified. The rates of aneurysm occlusion, retreatment, complications, and good clinical outcome were retrospectively determined. Univariate and multivariate logistic regressions were performed to identify factors associated with these outcomes. The mean patient age was 50.5 years, the mean aneurysm size was 7 mm, and 97.3% of aneurysms were located in the anterior circulation. The mean follow-up was 22 months. Complete aneurysm occlusion, as assessed by intraoperative angiography, was achieved in 97.3% of aneurysms (108 of 111 patients). Among patients, 1.8% (2 of 111 patients) had a recurrence after clipping. Retreatment was required in 4.5% of patients (5 of 111) after clipping. Major complications were observed in 8% of patients and mortality in 2.7%. Ninety percent of patients had a good clinical outcome. Aneurysm size (OR 1.4, 95% CI 1.08-1.7; p = 0.009) and location in the posterior circulation were significantly associated with higher complications. All 3 patients who had coil extraction experienced a postoperative stroke. Aneurysm size (OR 1.2, 95% CI 1.02-1.45; p = 0.025) and higher number of interventions prior to clipping (OR 5.3, 95% CI 1.3-21.4; p = 0.019) were significant predictors of poor outcome. An aneurysm size > 7 mm was a significant predictor of incomplete obliteration and retreatment (p = 0.018). Surgical clipping is safe and effective in treating recurrent, previously coiled cerebral aneurysms."

According to the news editors, the research concluded: "Aneurysm size, location, and number of previous coiling procedures are important factors to consider in the management of
these aneurysms."

For more information on this research see: Clipping of previously coiled cerebral aneurysms: efficacy, safety, and predictors in a cohort of 111 patients. *Journal of Neurosurgery*, 2016;125(6):1337-1343. *Journal of Neurosurgery* can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

**Immune System Diseases and Conditions - HIV/AIDS**

**Investigators from Jilin University Have Reported New Data on HIV/AIDS (Transmission of Multiple HIV-1 Subtype C Transmitted/founder Viruses into the Same Recipients Was not Determined by Modest Phenotypic Differences)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "A severe bottleneck exists during HIV-1 mucosal transmission. However, viral properties that determine HIV-1 transmissibility are not fully elucidated."

Our news journalists obtained a quote from the research from Jilin University, "We identified multiple transmitted/founder (T/F) viruses in six HIV-1-infected subjects by analyzing whole genome sequences. Comparison of biological phenotypes of different T/F viruses from the same individual allowed us to more precisely identify critical determinants for viral transmissibility since they were transmitted under similar conditions. All T/F viruses used coreceptor CCR5, while no T/F viruses used CXCR4 or GPR15. However, the efficiency for different T/F viruses from the same individual to use CCR5 was significantly variable, and the differences were even more significant for usage of coreceptors FPRL1, CCR3 and APJ. Resistance to IFN-alpha was also different between T/F viruses in 2 of 3 individuals. The relative fitness between T/F viruses from the same subject was highly variable (2-6%). Importantly, the levels of coreceptor usage efficiency, resistance to IFN-alpha and viral fitness were not associated with proportions of T/F viruses in each individual during acute infection."

According to the news editors, the research concluded: "Our results show that the modest but significant differences in coreceptor usage efficiency, IFN-alpha sensitivity and viral fitness each alone may not play a critical role in HIV-1 transmission."

For more information on this research see: Transmission of Multiple HIV-1 Subtype

The news correspondents report that additional information may be obtained from F. Gao, Jilin University, Sch Life Sci, Natl Engr Lab AIDS Vaccine, Changchun 130012, People's Republic of China. **Heart Disorders and Diseases - Acute Coronary…**

**Investigators from Jilin University Target Acute Coronary Syndrome (Negative Association of Circulating MicroRNA-126 with High-sensitive C-reactive Protein and Vascular Cell Adhesion Molecule-1 in Patients with Coronary Artery Disease Following …)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in heart disorders and diseases - acute coronary syndrome. According to news reporting from Changchun, People's Republic of China, by NewsRx journalists, research stated, "Percutaneous coronary intervention (PCI) causes endothelial damage, resulting in an inflammatory response with elevation of markers such as high-sensitive C-reactive protein (hs-CRP) and vascular cell adhesion molecule-1 (VCAM-1), which are associated with restenosis after PCI. Evidence suggests that microRNA-126 (miR-126) plays an important role in vascular inflammation, but its correlation with PCI-mediated inflammation has not been investigated."

The news correspondents obtained a quote from the research from Jilin University, "In this study, we investigated the effect of PCI on circulating miR-126 and inflammation markers such as hs-CRP and VCAM-1. We enrolled 130 patients with coronary artery disease (CAD) in the Second Hospital of Jilin University from October 2015 to December 2015. Among them, 82 patients with CAD, defined as at least one major epicardial vessel with > 70% stenosis who planned to undergo PCI, were divided into acute coronary syndrome (ACS) group (46 patients) and stable angina (SA) group (36 patients). Forty-eight patients confirmed by coronary angiography without PCI were used as controls. The plasmas of all patients were collected prior to PCI and at 30 min, 24 h, and 72 h after PCI. The plasma VCAM-1 and hs-CRP were detected by enzyme-linked immunosorbent assay, and the miR-126 was evaluated by quantitative reverse transcription-polymerase chain reaction. Plasma concentrations of hs-CRP and VCAM-1 in patients with either ACS (n = 46) or SA (n = 36) were significantly higher than in controls (n = 48) (P < 0.01) prior to PCI, and increased further at 24 h and 72 h after PCI, compared with prior PCI. Moreover, VCAM-1 was positively correlated with balloon time and pressure. In contrast, the plasma concentration of miR-126 was significantly lower in patients with CAD than in controls, and further decreased with time post-PCI. A negative correlation was observed
between miR-126 and hs-CRP and VCAM-1 at 72 h after PCI."

According to the news reporters, the research concluded: "There was a negative correlation of miR-126 with the PCI-induced markers of inflammation such as hs-CRP and VCAM-1."

Our news journalists report that additional information may be obtained by contacting B. Liu, Jilin University, Hosp 2, Dept. of Cardiol, Changchun 130041, Jilin, People's Republic of China. Additional authors for this research include Y.Y. Yan, Z.Y. Guo, Y.J. Jiang, L.L. Liu and B. Liu.

### Parkinson's Disease

**Investigators from Jinzhou Medical University Report New Data on Parkinson's Disease (Involvement of microRNA-135a-5p in the Protective Effects of Hydrogen Sulfide Against Parkinson's Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Parkinson's disease. According to news reporting originating in Jinzhou, People's Republic of China, by NewsRx journalists, research stated, "Development of effective therapeutic drugs for Parkinson's disease is in great need. During the progression of Parkinson's disease, Rho-associated protein kinase 2 (ROCK2) is activated to promote neurodegeneration."

The news reporters obtained a quote from the research from Jinzhou Medical University, "Hydrogen sulfide (H2S) has a neuroprotective effect during the neural injury of Parkinson's disease. However, the mechanisms that underlie the effects of ROCK2 and H2S remain ill-defined. In the current study, we addressed these questions Methods: We used a 1-methyl-4-phenyl-1,2,3,6 tetrahydropyridine (MPTP)-induced mouse subacute model of Parkinson's disease to study the effects of H2S on astrocytic activation in the mouse striatum, on
the levels of tyrosine-hydroxylase (TH)-positive neuron loss, on the apomorphine-induced rotational behavior of the mice, and on the changes in ROCK2 and miR-135a-5p expression. Plasmid transfection was applied to modify miR-135a-5p levels in a neuronal cell line HCN-1A. Bioinformatics analysis was performed to predict the relationship between ROCK2 and miR-135a-5p in neuronal cells, and then was confirmed by luciferase reporter assay. H2S alleviated MPTP-induced astrocytic activation in the mouse striatum, alleviated the increases in TH-positive neuron loss, and improved the apomorphine-induced rotational behavior of the mice. H2S significantly attenuated the increases in ROCK2 and the decreases in miR-135a-5p by MPTP. MiR-135a-5p targeted the 3-UTR of ROCK2 mRNA to inhibit its translation in neuronal cells."

According to the news reporters, the research concluded: "MiR-135a-5p-regulated ROCK2 may play a role in the protective effects of hydrogen sulfide against Parkinson's disease."

Our news correspondents report that additional information may be obtained by contacting Q.S. Yang, Jinzhou Med Univ, Dept. of Radiat Oncol, Affiliated Hosp 1, Jinzhou 121001, People's Republic of China. Additional authors for this research include S.T. Liao, H.Y. Quan, Y.H. Lin, J. failure. As sleep disordered breathing may predispose to elevations in pulmonary vascular resistance and associated negative effects on right ventricular function, we sought to assess this in patients with underlying congenital heart disease."

Our news journalists obtained a quote from the research from John Hunter Hospital, "We performed a pilot study to evaluate the incidence of sleep-disordered breathing in a patient population with a history of long standing pulmonary valve incompetence in patients with congenital heart disease using overnight oximetry. Patients with a background of tetralogy of Fallot repair or residual pulmonary incompetence following previous pulmonary valve intervention for congenital pulmonary stenosis were included. Twenty-two patients underwent overnight oximetry. The mean age of the cohort was 34.3 +/- 15.2 years with no patients observed to have severe underlying pulmonary hypertension. Abnormal overnight oximetry was seen in 13/22 patients (59.1%) with 2/22 (9.1%) patients considered to have severe abnormalities. An important proportion of patients with a background of pulmonary incompetence complicating congenital heart disease are prone to the development of sleep-disordered breathing as assessed by overnight oximetry."

According to the news editors, the research concluded: "Further study into the prevalence and mechanisms of sleep-disordered breathing in a larger cohort are warranted."

For more information on this research see: Sleep-Disordered Breathing in Patients with Pulmonary Valve Incompetence Complicating Congenital Heart Disease. Congenital Heart Disease, 2016;11(6):678-682. Congenital Heart Disease can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Oncology - Lung Cancer

Investigators from Kanagawa Cancer Center Release New Data on Lung Cancer (Prognostic Role of Subtype Classification in Small-Sized Pathologic N0 Invasive Lung Adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lung Cancer. According to news reporting out of Kanagawa, Japan, by NewsRx editors, research stated, "The prognosis of patients with small, node-negative lung cancers, which the current indication for adjuvant chemotherapy never includes, is sometimes poor despite complete tumor resection. The present study aimed to identify independent prognostic factors and to clarify possible candidates for adjuvant chemotherapy among patients with small, node-negative invasive adenocarcinoma."

Our news journalists obtained a quote from the research from Kanagawa Cancer Center, "This study involved 153 patients with completely resected small (<= 20 mm)
pathologic N0 invasive adenocarcinomas. Invasive adenocarcinoma was classified as lepidic predominant (LPA), papillary or acinar predominant (PA), or solid or micropapillary predominant (SM), according to the International Association for the Study of Lung Cancer, American Thoracic Society, and European Respiratory Society classification. Overall survival and recurrence-free survival were estimated from Kaplan-Meier curves. Prognostic factors for recurrence-free survival were determined using univariate and multivariate Cox proportional hazards models. Three-year overall survival and recurrence-free survival rates were 98% and 98%, 97% and 88%, and 85% and 64% for LPA, PA, and SM tumors, respectively. Prognosis was the worst for patients with SM tumors (overall survival LPA versus PA, $p = 0.099$; LPA versus SM, $p < 0.001$; and PA versus SM, $p = 0.032$; recurrence-free survival LPA versus PA, $p = 0.014$; LPA versus SM, $p < 0.001$; and PA versus SM, $p < 0.001$). Subtype was a significantly independent prognostic factor for recurrence-free survival in multivariate analysis (SM versus LPA hazard ratio 22, 95% confidence interval: 2.5 to 190, $p = 0.0054$).

According to the news editors, the research concluded: "Patients with small (<= 20 mm) pathologic N0 solid or micropapillary predominant invasive adenocarcinoma might be possible candidates for adjuvant chemotherapy."

Our news journalists report that additional information may be obtained by contacting T. Yoshiya, Kanagawa Canc Center, Dept. of Thorac Oncol, Yokohama, Kanagawa, Japan. Additional authors for this research include T. Mimae, Y. Tsutani, N. Tsubokawa, S. Sasada, Y. Miyata, K. Kushitani, Y. Takeshima, S. Murakami, H. Ito, H. Nakayama and M. Okada.

**Blood Pressure**

**Investigators from Karolinska Institute Release New Data on Blood Pressure (Effects of antiseptic mouthwash on resting metabolic rate: A randomized, double-blind, crossover study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Blood Pressure. According to news reporting from Stockholm, Sweden, by NewsRx journalists, research stated, "The nitrate-nitrite-nitric oxide pathway has emerged as a significant source of nitric oxide (NO) bioactivity. Dietary intake of inorganic nitrate has a number of cardiovascular effects as well as a decrease in oxygen cost during exercise and a reduction in resting metabolic rate (RMR)."

The news correspondents obtained a quote from the research from Karolinska Institute, "Oral bacteria have a key role in bioactivation of inorganic nitrate since they catalyse
the conversion of salivary nitrate to the more reactive nitrite anion. Recent studies demonstrate that blood pressure increases with the use of an antiseptic mouthwash, indicating that endogenous, NO-synthase derived nitrate is recycled into nitrite and NO, sufficiently to modulate cardiovascular function. Here we tested if also RMR would be affected by an antiseptic mouthwash. Seventeen healthy normotensive female subjects (23 +/- 4 y) participated in this randomized, double blinded, crossover study. During two 3-day periods separated by 28 days the subjects consumed a diet low in nitrate combined with rinsing their mouth three times daily with a chlorhexidine-containing mouthwash (mouthwash) or placebo mouthwash (placebo) with similar taste but no antiseptic properties. Resting metabolic rate (RMR) was measured by indirect calorimetry and 24 h ambulatory blood pressure recordings were obtained after each intervention together with blood, saliva and urine samples. Treatment with chlorhexidine-containing mouthwash effectively reduced oral conversion of nitrate to nitrite but had no effect on plasma levels of these anions or plasma cGMP. RMR and 24 h ambulatory blood pressure were unaffected by the intervention."

According to the news reporters, the research concluded: "We conclude that in young healthy females an antiseptic mouthwash was effective in disrupting oral bacterial nitrate conversion to nitrite, but this was not associated with changes in plasma nitrite, RMR or blood pressure."

For more information on this research see: Effects of antiseptic mouthwash on resting metabolic rate: A randomized, double-blind, crossover study. Nitric Oxide-Biology and Chemistry, 2016;61():38-44. Nitric Oxide-Biology and Chemistry can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA.

**Cardiovascular Diseases and Conditions - Carotid...**

**Investigators from Keimyung University Zero in on Carotid Stenosis (A lotus root-like appearance in carotid stenosis on optical coherence tomographye)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Carotid Stenosis. According to news reporting from Daegu, South Korea, by NewsRx journalists, research stated, "An 82-year-old man visited the outpatient clinic of our stroke centre because of dizziness. He had a previous history of stroke without definite sequelae."

The news correspondents obtained a quote from the research from Keimyung
University, "Severe stenosis in the left proximal internal carotid artery (ICA) was seen on Doppler sonography. Conventional angiography revealed focal severe stenosis with 'string sign' in the left proximal ICA and delayed distal runoff. Optical coherence tomography showed multiple channels surrounding a narrowed central lumen (lotus root-like appearance). Carotid stent placement with a protection device was done without complications."

According to the news reporters, the research concluded: "The patient was discharged in good condition 5 days after the procedure."

Our news journalists report that additional information may be obtained by contacting C.H. Kim, Keimyung University, Dept. of Neurosurg, Sch Med, Daegu, South Korea. Additional authors for this research include H.J. Yoon, J.H. Hong, C.H. Kim, S.I. Sohn and C.Y. Lee.

**Inflammation**

**Investigators from Keio University Target Inflammation (Innate lymphoid cells in allergic and nonallergic inflammation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Inflammation are presented in a new report. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "In the last decade, the full picture of the role of innate lymphoid cells (ILCs) has been gradually revealed. ILCs are classified into 3 groups based on their transcription factors and cytokine production patterns, which mirror helper T-cell subsets."

Our news journalists obtained a quote from the research from Keio University, "Unlike T cells and B cells, ILCs do not have antigen receptors. They promptly respond to multiple tissue-derived factors, such as cytokines and alarmins, and produce multiple proinflammatory and immunoregulatory cytokines. It has been reported that ILC-derived cytokines are important for the induction and regulation of inflammation. Accumulating evidence suggests that ILCs play substantial roles in protection against infection and the pathogenesis of inflammatory diseases, such as allergic diseases and autoimmune diseases. Different ILC subsets localize in distinct tissue/organ niches and receive tissue-derived signals on different types of inflammation, which allows them to acquire diverse phenotypes with specialized effector capacities."

According to the news editors, the research concluded: "In this review we highlight the roles of ILCs in a variety of organs, such as the airway, skin, and gastrointestinal tract, in the
context of allergic and nonallergic inflammation."

For more information on this research see: Innate lymphoid cells in allergic and nonallergic inflammation. *Journal of Allergy and Clinical Immunology*, 2016;138(5):1253-1264. *Journal of Allergy and Clinical Immunology* can be contacted at: Mosby-Elsevier, 360 Park Avenue South, New York, NY 10010-1710, USA. **Cardiovascular Diseases and Conditions - Venous...**

**Investigators from King’s College Hospital Have Reported New Data on Venous Thromboembolism (Maternal and pregnancy characteristics affect plasma fibrin monomer complexes and D-dimer reference ranges for venous thromboembolism in pregnancy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Venous Thromboembolism are presented in a new report. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "D-dimers have a high negative predictive value for excluding venous thromboembolism outside of pregnancy but the use in pregnancy remains controversial. A higher cut-off value has been proposed in pregnancy due to a continuous increase across gestation."

The news reporters obtained a quote from the research from King’s College Hospital, "Fibrin monomer complexes have been considered as an alternative diagnostic tool for exclusion of venous thromboembolism in pregnancy due to their different behavior. We sought to establish normal values of fibrin monomer complexes and D-dimer as a diagnostic tool for the exclusion of venous thromboembolism in pregnancy and examine the effect of maternal and obstetric factors on these markers. Plasma D-dimer and fibrin monomer complexes were measured by quantitative immunoturbidimetry in 2870 women with singleton pregnancies attending their routine first-trimester hospital visit in a prospective screening study for adverse obstetric outcome. Multiple regression analysis was used to determine maternal characteristics and obstetric factors affecting the plasma concentrations and converting these into multiple of the median values after adjusting for significant maternal and obstetric characteristics. Plasma fibrin monomer complexes increased with maternal weight and were lower in women with a history of cocaine abuse and chronic hypertension. D-dimers increased with gestational age and maternal weight and were higher in sickle cell carriers and in women of African and South Asian racial origin compared to Caucasians. Fibrin monomer complexes and D-dimers are
affected by maternal and obstetric characteristics rather than only gestational age."

According to the news reporters, the research concluded: "The utility of these fibrin-linked markers as a tool for exclusion of venous thromboembolism in pregnancy might be improved by adjusting for patient-specific characteristics."

Our news correspondents report that additional information may be obtained by contacting R. Arya, Kings Coll Hosp Fdn Trust, Kings Thrombosis Center, Dept. of Med Hematol, London, United Kingdom. Additional authors for this research include R. Arya, A.B. Peixoto, R. Akolekar, I. Staboulidou and K.H. Nicolaides.

**Digestive System Diseases and Conditions** –

**Investigators from King's College Target Sclerosing Cholangitis [Mutations in DCDC2 (doublecortin domain containing protein 2) in neonatal sclerosing cholangitis]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Digestive System Diseases and Conditions - Sclerosing Cholangitis have been presented. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Neonatal sclerosing cholangitis (NSC) is a severe neonatal-onset cholangiopathy commonly leading to liver transplantation (LT) for end-stage liver disease in childhood. Liver biopsy findings histopathologically resemble those in biliary atresia (BA); however, in NSC extrahepatic bile ducts are patent, whilst in BA their lumina are obliterated."

Our news journalists obtained a quote from the research from King's College, "NSC is commonly seen in consanguineous kindreds, suggesting autosomal recessive inheritance. From 29 NSC patients (24 families) identified, DNA was available in 24 (21 families). Thirteen (7 male) patients (12 families) of consanguineous parentage were selected for whole exome sequencing. Sequence variants were filtered for homozygosity, pathogenicity, minor allele frequency, quality score, and encoded protein expression pattern. Four of 13 patients were homozygous and two were compound heterozygous for mutations in the doublecortin domain containing 2 gene (DCDC2), which encodes DCDC2 protein and is expressed in cholangiocyte cilia. Another 11 patients were sequenced: one (with one sibling pair) was compound heterozygous for DCDC2 mutations. All mutations were protein truncating. In available liver tissue from patients with DCDC2 mutations, immunostaining for human DCDC2 and the ciliary
protein acetylated alpha-tubulin (ACALT) showed no expression (n = 6) and transmission
electron microscopy found that cholangiocytes lacked primary cilia (n = 5). DCDC2 and
ACALT were expressed in NSC patients without DCDC2 mutations (n = 22). Of the patients
carrying DCDC2 mutations, one died awaiting LT; five came to LT, of whom one died 2 years
later. The other 4 are well. Among 24 NSC patients with available DNA, 7 had mutations in
DCDC2 (6 of 19 families). NSC patients in substantial proportion harbour mutations in
DCDC2. Their disease represents a novel liver-based ciliopathy. Lay summary: Neonatal
sclerosing cholangitis (NSC) is a rare genetic form of liver disease presenting in infancy.
Through next generation sequencing we identified mutations in the gene encoding for
doublecortin domain containing 2 (DCDC2) protein in a group of NSC children. DCDC2 is a
signalling and structural protein found in primary cilia of cholangiocytes."

According to the news editors, the research concluded: "Cholangiocytes are the cells
forming the biliary system which is the draining system of the liver."

For more information on this research see: Mutations in DCDC2 (doublecortin
domain containing protein 2) in neonatal sclerosing cholangitis. Journal of Hepatology,
Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of
Hepatology - www.journals.elsevier.com/journal-of-hepatology/)

Drugs and Therapies - Indomethacin Therapy

Investigators from Kobe Pharmaceutical University Report New Data on
Indomethacin Therapy (Down-regulation of hepatic CYP3A1 expression
in a rat model of indomethacin-induced small intestinal ulcers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Current study results on Drugs and Therapies - Indomethacin Therapy have
been published. According to news reporting from Hyogo, Japan, by NewsRx journalists,
research stated, "The liver and the small intestine are closely related in the processes of drug
absorption, metabolism and excretion via the enterohepatic circulation. Small intestinal ulcers
are a serious adverse effect commonly occurring in patients taking nonsteroidal anti-
inflammatory drugs."

The news correspondents obtained a quote from the research from Kobe
However, the influence of small intestinal ulcers on drug metabolism has not been established. This study examined the expression changes of cytochrome P450 (CYP) in the liver using an indomethacin-induced small intestinal ulcer rat model and in cultured cells. After the administration of indomethacin to rats, ulcers were observed in the small intestine and expression of CYP3A1, the major isoform of hepatic CYP, was significantly down-regulated in the liver, accompanied by increased expression of inducible nitric oxide synthase, tumor necrosis factor, interleukin (IL)-1 and IL-6, in the small intestine and the liver. The indomethacin-induced small intestinal ulceration, the increase in inflammatory mediators in the small intestine and the liver, and the down-regulation of CYP3A1 expression in the liver were inhibited by co-administration of ampicillin, an antibacterial agent. In the human hepatic HepG2 cell line, IL-1, IL-6 and NOC-18, an NO donor, caused down-regulation of CYP3A4, the major isoform of human CYP3A.

According to the news reporters, the research concluded: "Thus, this study suggests that after indomethacin treatment small intestinal ulcers cause the down-regulation of CYP3A1 in the rat liver through an increase in ulcer-derived inflammatory mediators."

Our news journalists report that additional information may be obtained by contacting S. Kawauchi, Kobe Pharmaceutical Univ, Educ Center Clin Pharm, Higashinada Ku, Kobe, Hyogo 6588558, Japan. Additional authors for this research include T. Nakamura, S. Horibe, T. Tanahashi, S. Mizuno, T. Hamaguchi and Y. Rikitake.

**Intercellular Signaling Peptides and Proteins**

**Investigators from Konkuk University Report New Data on Cytokines [Intracellular interleukin (IL)-1 family cytokine processing enzyme]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Intercellular Signaling Peptides and Proteins - Cytokines is the subject of a report. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "The interleukin (IL)-1 family is the largest family of interleukins. Eleven members of the IL-1 family of ligands are intracellular molecules, except a single isoform of an IL-1 receptor antagonist (IL-1Ra; also known as IL-1RN), which contains a signal peptide at the N-terminus for effective secretion."

Financial support for this research came from Konkuk University.

The news reporters obtained a quote from the research from Konkuk University, "The inflammasome is a complex of intracellular molecules that is responsible for the processing of IL-1 beta and IL-18, whereas the remaining IL-1 family members, including IL-1 alpha, are processed in an inflammasome caspase-1-independent pathway. Among the eleven members of the IL-1 family ligands, precursor IL-1 alpha, IL-1 beta, and IL-33 have
comparatively long pro-peptides of approximately 110 amino acid residues at the N-terminus. However, the other IL-1 members, except for IL-37 (also known as IL-1F7), have relatively short propeptides with fewer than 40 amino acid residues at the N-terminus. Most cytokines, including interferons and interleukins, possess a hydrophobic signal sequence for secretion. Therefore, soluble cytokines readily act on cell surface receptors immediately after their release from cells. Unlike other cytokine families, IL-1 family ligands exhibit two-step regulation: transcriptional induction at the mRNA level and post-translational modification at the protein level because of the lack of a hydrophobic signal sequence at the N-terminus. Various processing enzymes involved in the activation of intracellular IL-1 family cytokines likely provide effective immune regulation to protect the host from infections.

According to the news reporters, the research concluded: "In this review, we describe all eleven IL-1 family ligand processing enzymes, mature ligand functions, and mode of receptor conformation."

For more information on this research see: Intracellular interleukin (IL)-1 family cytokine processing enzyme. Archives of Pharmacal Research, 2016;39(11):1556-1564. Gram-Positive Bacteria - Streptococcus pneumoniae

Investigators from Kyungpook National University Release New Data on Streptococcus pneumoniae (Antimicrobial Activity of Zabofloxacin against Clinically Isolated Streptococcus pneumoniae)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Positive Bacteria - Streptococcus pneumoniae are discussed in a new report. According to news reporting originating in Daegu, South Korea, by NewsRx journalists, research stated, "Zabofloxacin is a novel fluoroquinolone agent that has potent activity against gram-positive pathogens."

The news reporters obtained a quote from the research from Kyungpook National University, "In this study, we confirmed that zabofloxacin showed the most potent in vitro and in vivo activities against drug-resistant Streptococcus pneumoniae. Among the fluoroquinolone compounds, zabofloxacin showed the most potent in vitro activity against clinical isolates of penicillin-sensitive S. pneumoniae (minimum inhibitory concentration, MIC90: 0.03 mg/L) and penicillin-resistant S. pneumoniae (MIC90: 0.03 mg/L). Against quinolone-resistant S. pneumoniae, zabofloxacin (MIC90: 1 mg/L) was more active than ciprofloxacin, sparofloxacin,
and moxifloxacin; however, its activity was the same as that of gemifloxacin."

According to the news reporters, the research concluded: "The in vivo activity of zabofloxacin was most potent among the quinolone compounds tested against the systemic infection and respiratory tract infection models in mice."

For more information on this research see: Antimicrobial Activity of Zabofloxacin against Clinically Isolated Streptococcus pneumoniae. *Molecules*, 2016;21(11):2114-2121. *Molecules* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. **Erythrocytosis**

**Investigators from Laval University Have Reported New Data on Erythrocytosis (Hypercapnic ventilatory response is decreased in a mouse model of excessive erythrocytosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Erythrocytosis have been published. According to news reporting from Quebec City, Canada, by NewsRx journalists, research stated, "The impact of cerebral erythropoietin (Epo) in the regulation of the hypercapnic ventilatory response (HcVR) is controversial. While we reported that cerebral Epo does not affect the central chemosensitivity in C57Bl/6 mice receiving an intracisternal injection of sEpoR (the endogenous antagonist of Epo), a recent study in transgenic mice with constitutive high levels of human Epo in brain and circulation (Tg6) and in brain only (Tg21), showed that Epo blunts the HcVR, maybe by interacting with central and peripheral chemoreceptors."

Financial supporters for this research include Gouvernement du Canada | Canadian Institutes of Health Research (Instituts de recherche en sante du Canada), Fonds de Recherche du Quebec Nature et Technologies (Quebec Fund for Research in Nature and Technology).

The news correspondents obtained a quote from the research from Laval University, "High Epo serum levels in Tg6 mice lead to excessive erythrocytosis (hematocrit similar to 80-90%), the main symptom of chronic mountain sickness (CMS). These latter results support the hypothesis that reduced central chemosensitivity accounts for the hypoventilation observed in CMS patients. To solve this intriguing divergence, we reevaluate HcVR in Tg6 and Tg21 mouse lines, by assessing the metabolic rate [O consumption (V.) and CO production (V.)], a key factor modulating ventilation, the effect of which was not considered in the previous study. Our results showed that the decreased HcVR observed in Tg6 mice (similar to 70% reduction; < 0.01) was due to a significant decrease in the metabolism (similar to 40%; < 0.0001) rather than Epo's effect on CO chemosensitivity. Additional analysis in Tg21 mice did not reveal differences of
HcVR or metabolism. We concluded that cerebral Epo does not modulate the central chemosensitivity system, and that a metabolic effect upon CO inhalation is responsible for decreased HcVR observed in Tg6 animals."

According to the news reporters, the research concluded: "As CMS patients also show decreased HcVR, our findings might help to better understand respiratory disorders at high altitude."

For more information on this research see: Hypercapnic ventilatory response is decreased in a mouse model of excessive erythrocytosis. American Journal of Physiology-Regulatory Integrative and Comparative Physiology, 2016;311(5):R940-R947. Oncology - Acute Lymphoblastic Leukemia

Investigators from Ludwig-Maximilians-University Target Acute Lymphoblastic Leukemia (Characterization of Rare, Dormant, and Therapy-Resistant Cells in Acute Lymphoblastic Leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Acute Lymphoblastic Leukemia is now available. According to news reporting from Munich, Germany, by NewsRx journalists, research stated, "Tumor relapse is associated with dismal prognosis, but responsible biological principles remain incompletely understood. To isolate and characterize relapse-inducing cells, we used genetic engineering and proliferation-sensitive dyes in patient-derived xenografts of acute lymphoblastic leukemia (ALL)."

Funders for this research include ERC, Deutsche Jose Carreras Leukamie-Stiftung, Collaborative Research Centers 684, German Consortium for Translational Cancer Research, Bettina Brau-Stiftung, Dr. Helmut Legerlotz Stiftung, Collaborative Research Center 1243, German Federal Ministry of Education and Research, German Research Foundation.

The news correspondents obtained a quote from the research from Ludwig-Maximilians-University, "We identified a rare subpopulation that resembled relapse-inducing cells with combined properties of long-term dormancy, treatment resistance, and stemness. Single-cell and bulk expression profiling revealed their similarity to primary ALL cells isolated from pediatric and adult patients at minimal residual disease (MRD). Therapeutically adverse characteristics were reversible, as resistant, dormant cells became sensitive to treatment and started proliferating when dissociated from the in vivo environment."
According to the news reporters, the research concluded: "Our data suggest that ALL patients might profit from therapeutic strategies that release MRD cells from the niche."

For more information on this research see: Characterization of Rare, Dormant, and Therapy-Resistant Cells in Acute Lymphoblastic Leukemia. Cancer Cell, 2016;30(6):849-862. Cancer Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cancer Cell - www.journals.elsevier.com/cancer-cell/)

Inflammation

Investigators from Manchester Metropolitan University Release New Data on Inflammation (PI16 is a shear stress and inflammation-regulated inhibitor of MMP2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Inflammation have been published. According to news reporting originating in Manchester, United Kingdom, by NewsRx journalists, research stated, "Raised endothelial shear stress is protective against atherosclerosis but such protection may be lost at sites of inflammation. We found that four splice variants of the peptidase inhibitor 16 (PI16) mRNA are among the most highly shear stress regulated transcripts in human coronary artery endothelial cells (HCAECs), in vitro but that expression is reduced by inflammatory mediators TNF alpha and IL-1 beta."

The news reporters obtained a quote from the research from Manchester Metropolitan University, "Immunohistochemistry demonstrated that PI16 is expressed in human coronary endothelium and in a subset of neointimal cells and medial smooth muscle cells. Adenovirus-mediated PI16 overexpression inhibits HCAEC migration and secreted matrix metalloproteinase (MMP) activity. Moreover, PI16 inhibits MMP2 in part by binding an exposed peptide loop above the active site."

According to the news reporters, the research concluded: "Our results imply that, at high endothelial shear stress, PI16 contributes to inhibition of protease activity; protection that can be reversed during inflammation."

For more information on this research see: PI16 is a shear stress and inflammation-regulated inhibitor of MMP2. Scientific Reports, 2016;6():1-11. Scientific Reports can be
Investigators from Mansoura University Have Reported New Data on Giant Cell Granuloma (Efficacy of Ethanolamine Oleate Sclerotherapy in Treatment of Peripheral Giant Cell Granuloma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Jaw Diseases and Conditions - Giant Cell Granuloma is the subject of a report. According to news reporting originating from Mansoura, Egypt, by NewsRx editors, the research stated, "The aim of this study was to evaluate the efficacy of ethanolamine oleate (EO) sclerotherapy in the treatment of peripheral giant cell granuloma. This study included 24 patients presenting with PGCGs greater than 2 cm in diameter."

Our news editors obtained a quote from the research from Mansoura University, "Definitive diagnosis was confirmed after histopathologic examination of incisional biopsy specimens. EO sclerotherapy at a concentration of 2.5% was injected into each lesion once a week. Repeated injections were performed if needed. The treatment response was recorded as complete remission, moderate response, or no change. This study involved 11 male and 13 female patients, ranging in age from 9 to 70 years; the average age was 45.3 years. The mandible (75%) was involved more than the maxilla. PGCGs occurred posteriorly (62.5%) more than anteriorly. The number of injection sessions was 57, with an average of 2.4 sessions per lesion. Clinical improvement was seen in 23 patients: complete remission in 20 (83.3%) and moderate improvement in 3 (12.5%). No clinical improvement occurred in 1 patient (4.2%). EO injection offers an alternative to conventional methods for the treatment of PGCG." According to the news editors, the research concluded: "The technique is straightforward, safe, and cost-effective with a high success rate."

The news editors report that additional information may be obtained by contacting W.S. Ahmed, Mansoura University, Fac Dental, Dept. of Oral & Maxillofacial Surg, Mansoura, Egypt.

The direct object identifier (DOI) for that additional information is:
Investigators from Marmara University Target Atrial Fibrillation (Effect of intravenous zoledronic acid infusion on electrocardiographic parameters in patients with osteoporosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting originating in Istanbul, Turkey, by NewsRx journalists, research stated, "We evaluated the effects of zoledronic acid (ZA) therapy on electrocardiographic (ECG) parameters for the first time in the literature. Measurements were performed on ECGs obtained before and after ZA infusion on the same day as well as 1 month after the infusion."

The news reporters obtained a quote from the research from Marmara University, "ZA infusion did not have any short- or long-term effect on any parameter that might be associated with the tendency for atrial fibrillation or ventricular arrhythmias. The aim of the present study was to evaluate the early and late effects of ZA therapy on ECG parameters which might be associated with the tendency for atrial and ventricular arrhythmias. Consecutive patients with osteoporosis who were admitted to our clinic between December 2013 and December 2014 and who were scheduled to receive ZA infusion constituted our study population. Twelve-lead surface ECGs were obtained from all patients before and after ZA infusion on the same day as well as 1 month after the infusion. All ECG parameters were measured and compared with each other for each patient. Data of 100 patients were used in the analysis (9 male; 70.5 +/- 11.6 years of age). There were no significant differences between repeated measurements regarding pmax, pmin, and p dispersion values. QT max and QT min values were significantly increased after infusion; however, there were no significant changes in QT dispersion, Tp-e interval, and Tp-e dispersion values. ZA infusion did not affect P wave dispersion both at the immediate post-infusion period and 1 month after infusion. QT values were significantly increased early after ZA infusion; however, there were no significant differences in parameters reflecting disparity of ventricular recovery times and transmural dispersion of ventricular repolarization."

According to the news reporters, the research concluded: "Based on these observations, it may be suggested that ZA infusion did not have any short- or long-term effect on any parameter that might be associated with the tendency for atrial fibrillation or ventricular arrhythmias."

For more information on this research see: Effect of intravenous zoledronic acid infusion on electrocardiographic parameters in patients with osteoporosis. Osteoporosis International, 2016;27(12):3543-3547. Osteoporosis International can be contacted at:
Investigators from Max-Planck-Institute for Biophysics [Zero in on Molecular and Cellular Biology (Molecular Architecture of SF3b and Structural Consequences of Its Cancer-Related Mutations)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Life Science Research - Molecular and Cellular Biology is now available. According to news originating from Gottingen, Germany, by NewsRx correspondents, research stated, "SF3b is a heptameric protein complex of the U2 small nuclear ribonucleoprotein (snRNP) that is essential for pre-mRNA splicing. Mutations in the largest SF3b subunit, SF3B1/SF3b155, are linked to cancer and lead to alternative branch site (BS) selection."

Our news journalists obtained a quote from the research from Max-Planck-Institute for Biophysics, "Here we report the crystal structure of a human SF3b core complex, revealing how the distinctive conformation of SF3b155's HEAT domain is maintained by multiple contacts with SF3b130, SF3b10, and SF3b14b. Protein-protein crosslinking enabled the localization of the BS-binding proteins p14 and U2AF65 within SF3b155's HEAT-repeat superhelix, which together with SF3b14b forms a composite RNA-binding platform. SF3b155 residues, the mutation of which leads to cancer, contribute to the tertiary structure of the HEAT superhelix and its surface properties in the proximity of p14 and U2AF65."

According to the news editors, the research concluded: "The molecular architecture of SF3b reveals the spatial organization of cancer-related SF3b155 mutations and advances our understanding of their effects on SF3b structure and function."

For more information on this research see: Molecular Architecture of SF3b and Structural Consequences of Its Cancer-Related Mutations. Molecular Cell, 2016;64(2):307-319. Molecular Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Molecular Cell - www.journals.elsevier.com/molecular-cell/)

Investigators from Mayo Clinic Report New Data on Congenital Heart Disease (Postcardiotomy ECMO Support after High-risk Operations in Adult Congenital Heart Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Congenital Diseases and Conditions - Congenital Heart Disease. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Cardiac operations in high-risk adult congenital heart disease (ACHD) patients may require mechanical circulatory support (MCS), such as extracorporeal membrane oxygenation (ECMO) or intraaortic balloon pump (IABP), to allow the cardiopulmonary system to recover. We reviewed records for all ACHD patients who required MCS following cardiotomy at our institution from 1/2001 to 12/2013."

Our news editors obtained a quote from the research from Mayo Clinic, "During the study period, 2264 (mean age 39.1 years, females similar to 54.1%) operations were performed in ACHD patients of whom 24 (1.1%) required postoperative MCS (14 males; median age 41 years, range 22-75). Preoperatively the 24 patients had a mean systemic ventricular ejection fraction of 47% (range 10-66%); 72% of these patients were in NYHA class III/IV heart failure. The common underlying diagnoses included pulmonary atresia with intact ventricular septum (20%), tetralogy of Fallot (16%), Ebstein anomaly (12%), cc-TGA (12%), septal defects (12%), and others (28%). Operations performed were valvular operations with/without maze (58.2%), Fontan conversion (21%), coronary bypass grafting with valvular operations (12.5%), and heart transplant (8.3%). Indications for MCS were left-sided (systemic) heart failure (32%), right-sided (subpulmonary) heart failure (24%), biventricular heart failure (36%), persistent arrhythmia (4%), and hypoxemia (4%). Forty-two percent were placed on ECMO only; in the second group, IABP was attempted and subsequently followed by ECMO initiation. The mean duration of MCS was 8.4 days (range 0.8-35.4). Common morbidities included coagulopathy (60%), renal failure (56%), and arrhythmia (48%). Overall, 46% of patients survived to hospital discharge. Deaths were due to either multi organ failure or the underlying cardiac disease; sepsis was the primary cause of death in one patient. Median follow-up for survivors was 41 months (maximum 106 months), NYHA functional class was I/II in all 8 late survivors. Following complex operations in high-risk ACHD patients, MCS may be required."

According to the news editors, the research concluded: "Despite significant morbidity, nearly half of patients survive to hospital discharge."
For more information on this research see: Postcardiotomy ECMO Support after High-risk Operations in Adult Congenital Heart Disease. Congenital Heart Disease, 2016;11(6):751-755. Congenital Heart Disease can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Nervous System Diseases and Conditions -...

Investigators from Mayo Clinic Report New Data on Neurofibromatosis Type 2 (Gamma Knife radiosurgery for neurofibromatosis type 2-associated meningiomas: a 22-year patient series)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nervous System Diseases and Conditions - Neurofibromatosis Type 2 have been presented. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "Neurofibromatosis type 2 (NF2) is a debilitating genetic condition with potential development of multiple meningiomas. We report our experience treating a series of NF2-associated intracranial meningiomas with Gamma Knife radiosurgery (GKRS)."

Our news journalists obtained a quote from the research from Mayo Clinic, "Between 1992 and 2013, 15 consecutive patients (age 20-54 years) with 62 intracranial meningiomas were treated with single-fraction GKRS. Fifty-five percent of tumors involved the convexity or parasagittal/falx. The median prescription dose was 16 Gy (range 13-20 Gy). The median tumor diameter was 2.1 cm (range 0.7-4.5 cm). The median radiographic and clinical follow-up periods were 103 and 111 months, respectively. The 5-year and 10-year local controls were both 96 %. The disease specific survival was 93 % at 5 years and 68 % at 10 years. Fifty-three percent of patients had multiple meningiomas and received multiple GKRS treatments (range 1-7) for new or enlarging intracranial meningiomas. 11 (73 %) patients were alive at last follow-up, with 60 (97 %) tumors controlled (smaller or unchanged in size). There were 2 in-field failures, one at 1 year and the other at 3.5 years. There were no marginal failures. Major Complications after GKRS included: 1 case of radiation necrosis, 1 case of post treatment edema, and 1 case of a presumed radiation induced cavernous malformation 5 years after GKRS. GK is an effective treatment for enlarging NF2-associated meningiomas."

According to the news editors, the research concluded: "No cases of malignant transformation or secondary malignancies were seen during the follow-up period."

For more information on this research see: Gamma Knife radiosurgery for neurofibromatosis type 2-associated meningiomas: a 22-year patient series. Journal of Neuro-
Investigators from Mayo Clinic Target Osteomyelitis (Mycoplasma hominis vertebral spine infection: Case report and a review of infections of bone and joints)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Musculoskeletal Diseases and Conditions - Osteomyelitis are presented in a new report. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Mycoplasma hominis (M. hominis) is a common commensal that colonizes the human urogenital tract, wherein it is also known to cause genito-urinary infections. It has rarely been reported to cause spinal infections."

Our news editors obtained a quote from the research from Mayo Clinic, "Case description: We describe the case of a 53-year old diabetic woman who developed spontaneous, culture-negative L3-4 osteomyelitis that progressed clinically and radiographically despite debridement, stabilization, and empiric broad-spectrum antimicrobial therapy. After her third debridement procedure, cultures of the multiple intraoperative specimens yielded M. hominis. Literature review: A PubMed search identified a total of 4 reports of M. hominis causing spinal osteomyelitis and 22 other cases involving bones and joints. Clinical relevance: M. hominis is a rare cause of bone and joint infections. Because of low clinical suspicion for this pathogen, combined with its fastidious nature and the difficult growth characteristics of this organism, M. hominis infections may be unrecognized and untreated, resulting in high morbidity. In addition to bacterial culture, molecular tests are available to detect M. hominis in clinical samples."

According to the news editors, the research concluded: "This case report and review of the literature suggest that, in some cases of purulent culture-negative osteomyelitis, especially if not responding to standard empiric antibacterial therapy, M. hominis should be considered as
a potential pathogen."

For more information on this research see: Mycoplasma hominis vertebral spine infection: Case report and a review of infections of bone and joints. *Journal of Infection and Chemotherapy*, 2016;22(11):755-758. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Springer - www.springer.com; Journal of Infection and Chemotherapy - www.springerlink.com/content/1341-321x/)

The news editors report that additional information may be obtained by contacting H.L. Tyner, Mayo Clinic, Div Infect Dis, Dept. of Med, Rochester, MN, United States. Additional authors for this research include A. Virk, A. Nassr and R. Razonable.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jiac.2016.04.008. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Prostate Cancer**

**Investigators from Mayo Clinic Zero in on Prostate Cancer [Evaluation of polymer shielding for adenovirus serotype 6 (Ad6) for systemic virotherapy against human prostate cancers]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Oncolytic viruses hold promise as 'self-amplifying' cancer therapies wherein a virally killed cell can produce thousands of new viral 'drugs' that can kill more cancer cells. Adenoviruses (Ads) are one family of oncolytic viruses."

Our news editors obtained a quote from the research from Mayo Clinic, "Most human studies have used human Ad serotype 5 (Ad5). Unfortunately, most patients are already immune to Ad5 increasing the likelihood that the agent will be neutralized if used as a cancer therapy. In this work, lower seroprevalence Ad6 was tested as a systemic therapy for prostate cancer. Ad5 and Ad6 were injected intravenously a single time in nude mice bearing human prostate tumors, and toxicity and efficacy were assessed. Ad6 was chemically shielded with polyethylene glycol (PEG) to test if this would further improve its pharmacology. Ad6 produced 30-fold lower liver damage and less toxicity than Ad5. Ad6 significantly repressed the growth of androgen-resistant human DU145 prostate tumors and androgen-sensitive LNCaP tumors after single intravenous injection. PEGylation did not change virus distribution, but blunted liver damage and cytokine production by Ad6. PEGylated Ad6 eradicated LNCaP tumors and maintained body mass, but lost potency against the more challenging DU145 tumors. These and other data suggest that low seroprevalent Ad6 has better efficacy and safety than the benchmark oncolytic virus Ad5 for systemic therapy of prostate cancer."

According to the news editors, the research concluded: "These data also indicate that
PEGylation may improve Ad6 safety, but that this shielding may reduce oncolytic efficacy after intravenous treatment."

For more information on this research see: Evaluation of polymer shielding for adenovirus serotype 6 (Ad6) for systemic virotherapy against human prostate cancers. *Molecular Therapy-Oncolytics*, 2016;3():1-9. *Molecular Therapy-Oncolytics* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

The news editors report that additional information may be obtained by contacting M.A. Barry, Mayo Clinic, Dept. of Mol Med, Rochester, MN 55902, United States. Additional authors for this research include G.J. Heller, M.E. Barry, C.M. Crosby, M.A. Turner and M.A. Barry.

Keywords for this news article include: Rochester, Minnesota, United States, North and Central America, Oncolytic Viruses, Epidemiology, Prostatic Neoplasms, Prostate Cancer, Oncology, Therapy, Mayo Clinic.

Heart Disorders and Diseases - Heart Disease

**Investigators from McMaster University Zero in on Heart Disease (Impact of a Genetic Risk Score on Myocardial Infarction Risk Across Different Ethnic Populations)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Disease are presented in a new report. According to news reporting originating in Hamilton, Canada, by NewsRx journalists, research stated, "Myocardial infarction (MI) risk varies by ethnicity, although the influence of genetic factors remains unclear. Using a genetic risk score (GRS), we examined the association between 25 coronary artery disease (CAD)-related single nucleotide polymorphisms and MI across 6 ethnic groups."

The news reporters obtained a quote from the research from McMaster University, "We studied 8556 participants in the INTERHEART case-control study from 6 ethnic groups: Europeans, South Asians, Southeast Asians, Arabs, Latin Americans, and Africans. Associations between the GRS and MI were tested in each group by logistic regression and overall by meta-analysis. Overall, the GRS increased the odds of MI by 1.07 (95% confidence interval [CI], 1.04-1.09) per risk allele in the unadjusted model, with little change (odds ratio, 1.06; 95% CI, 1.04-1.09) after adjusting for demographic and modifiable factors. In Europeans, South Asians, Southeast Asians, and Arabs, the GRS was significantly associated with MI, with minimal heterogeneity observed. In these groups, a score > 23 risk alleles (highest 4 quintiles) was associated with only a 5% difference in population attributable risk (PAR) (36% to 41%) for MI. The GRS was not significant in Latin Americans or Africans. In the overall cohort, modest changes, beyond clinical factors, in PAR (88% to 91%), concordance statistic (0.73 to 0.74), and continuous net reclassification improvement (12%) were observed with the GRS. A CAD GRS is associated with MI across a multiethnic cohort, with significant and consistent effects across 4 distinct ethnicities."

According to the news reporters, the research concluded: "However, it only modestly improves MI risk prediction beyond clinical factors."

For more information on this research see: Impact of a Genetic Risk Score on

Our news correspondents report that additional information may be obtained by contacting P.G. Joseph, McMaster University, Population Health Res Inst, Hamilton, ON, Canada. Additional authors for this research include G. Pare, S. Asma, J.C. Engert, S. Yusuf and S.S. Anand.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cjca.2016.05.014. This DOI is a link to an online electronic document that is either free or for purchase.

**Papillomas**

**Investigators from Medical College of Wisconsin Target Papillomas (Black Raspberries Demethylate Sfrp4, a WNT Pathway Antagonist, in Rat Esophageal Squamous Cell Papilloma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Papillomas. According to news reporting out of Milwaukee, Wisconsin, by NewsRx editors, research stated, "Aberrant methylation of DNA is a common event in the development of cancers, including squamous cell carcinoma (SCC) of the human esophagus. In the present study, we determined: (a) whether aberrant DNA methylation also occurs in the development of N-nitrosomethylbenzylamine (NMBA)-induced tumorigenesis in the rat esophagus, a model of human esophageal SCC; and (b) if so, whether dietary black raspberries (BRBs) are capable of preventing this aberrant DNA methylation."

Our news journalists obtained a quote from the research from the Medical College of Wisconsin, "A diet containing 5% BRBs inhibited the development of NMBA-induced tumors in the rat esophagus. This inhibition was associated with reduced mRNA levels of the DNA methyltransferases, Dnmt1 and Dnmt3b, in both dysplastic lesions and in papillomas of the esophagus. In addition, promoter methylation of Sfrp4, a WNT pathway antagonist, was significantly reduced by the berry diet, and this was associated with decreased nuclear localization of beta-CATENIN and reduced expression of c-MYC protein in NMBA-treated esophagi. Decreased promoter methylation of Sfrp4 correlated with decreased expression of Dmnt3b and, ultimately, with increased Sfrp4 mRNA expression."

According to the news editors, the research concluded: "This suggests that epigenetic alterations in NMBA-induced rat esophageal tumorigenesis recapitulate epigenetic events in human esophageal SCC, and that BRBs could be useful in preventing the aberrant DNA methylation involved in the development of human esophageal SCC."

For more information on this research see: Black Raspberries Demethylate Sfrp4, a
Our news journalists report that additional information may be obtained by contacting Y.W. Huang, Medical College of Wisconsin, Dept. of Obstet & Gynecol, Milwaukee, WI 53226, United States. Additional authors for this research include F. Gu, A. Dombkowski, L.S. Wang and G.D. Stoner.

Investigators from Medical Research Institute Report New Data on Mesenchymal Stem Cells (Tyrosine kinase receptor c-ros-oncogene 1 mediates TWIST-1 regulation of human mesenchymal stem cell lineage commitment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Stem Cell Research - Mesenchymal Stem Cells. According to news reporting from Adelaide, Australia, by NewsRx journalists, research stated, "The TWIST-1 gene encodes a basic helix-loop-helix (bHLH) transcription factor important in mediating skeletal and head mesodermal tissue development. Bone marrow-derived mesenchymal stem/stromal cells (BMSC), express high levels of TWIST-1, which is down regulated during ex vivo expansion."

Financial support for this research came from National Health and Medical Research Council.

The news correspondents obtained a quote from the research from Medical Research Institute, "Cultured BMSC over-expressing TWIST-1 display decreased capacity for osteogenic differentiation and an enhanced capacity to undergo adipogenesis, suggesting that TWIST-1 is a mediator of lineage commitment. However, little is known regarding the mechanism(s) by which TWIST-1 mediates cell fate determination. In this study, microarray analysis was used to identify a novel downstream TWIST-1 target, tyrosine kinase receptor c-ros-oncogene 1 (C-ROS-1), which was down regulated in TWIST-1 over-expressing BMSC. Chromatin immunoprecipitation analysis showed that TWIST-1 directly bound to two E-box binding sites on the proximal C-ROS-1 promoter. Knock-down of C-ROS-1 in human BMSC and cranial bone cells resulted in a decreased capacity for osteogenic differentiation in vitro. Conversely, suppression of C-ROS-1 in BMSC resulted in an enhanced capacity to undergo adipogenesis. Furthermore, reduced C-ROS-1 levels led to activation of different components of the PI3K/AKT/mTORC1 signalling pathway during osteogenic and adipogenic differentiation."

According to the news reporters, the research concluded: "Collectively, these data suggest that C-ROS-1 is involved in BMSC fate switching between osteogenesis and adipogenesis, mediated via PI3K/AKT/mTORC1 signalling."
For more information on this research see: Tyrosine kinase receptor c-ros-oncogene 1 mediates TWIST-1 regulation of human mesenchymal stem cell lineage commitment. *Bone*, 2017;94():98-107. *Bone* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Gram-Positive Bacteria - Staphylococcus aureus**

**Investigators from Medicines Co. Have Reported New Data on Staphylococcus aureus (Pooled analysis of single-dose oritavancin in the treatment of acute bacterial skin and skin-structure infections caused by Gram-positive pathogens, including a ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Positive Bacteria - Staphylococcus aureus have been published. According to news originating from St. Laurent, Canada, by NewsRx correspondents, research stated, "Oritavancin is a lipoglycopeptide antibiotic with bactericidal activity against Gram-positive pathogens, including methicillin-resistant Staphylococcus aureus (MRSA). The phase 3 studies SOLO I and SOLO II demonstrated comparable efficacy and safety of a single dose of oritavancin compared with 7-10 days of twicedaily vancomycin in adults with acute bacterial skin and skin-structure infections (ABSSSIs)."

Financial support for this research came from The Medicines Company.

Our news journalists obtained a quote from the research from Medicines Co., "The present analysis assessed clinical responses by pathogen at 48-72 h and at study days 14-24 in SOLO patients within the pooled data set. Of the 1959 patients in the pooled SOLO studies, 1067 had at least one baseline Gram-positive pathogen and 405 had MRSA. Clinical response rates were similar for oritavancin and vancomycin-treated patients by pathogen, including Staphylococcus aureus with or without the Panton-Valentine leukocidin (pvl) gene and from different clonal complexes, and were similar for pathogens within each treatment group. Oritavancin exhibited potent in vitro activity against all baseline pathogens, with MIC90 values (minimum inhibitory concentration required to inhibit 90% of the isolates) of 0.12 μg/mL for Staphylococcus aureus, 0.25 μg/mL for Streptococcus pyogenes and 0.06 μg/mL for Enterococcus faecalis."

According to the news editors, the research concluded: "Whereas both oritavancin
and vancomycin achieved similarly high rates of clinical response by pathogen, including methicillin-susceptible and-resistant Staphylococcus aureus, oritavancin provides a singledose alternative to 7-10 days of twice-daily vancomycin to treat ABSSSIs."

The news correspondents report that additional information may be obtained from G. Moeck, Medicines Co, St Laurent, PQ H4S 2A1, Canada. Additional authors for this research include F.F. Arhin, M.A. Wikler, D.F. Sahm, B.N. Kreiswirth, J.R. Mediavilla, S. Good, C. Fiset, H. Jiang, G. Moeck, H. Kabler, S. Green and W. O'Riordan.

**Neuropathy**

**Investigators from Miguel Hernandez University Report New Data on Neuropathy (Roles of NTE protein and encoding gene in development and neurodevelopmental toxicity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neuropathy. According to news originating from Elche, Spain, by NewsRx correspondents, research stated, "Neuropathy Target Esterase (NTE) is a membrane protein codified by gene PNPLA6. NTE was initially discovered as a target of the so-called organophosphorus-induced delayed polyneuropathy triggered by the inhibition of the NTE-associated esterase center by neuropathic organophosphorus compounds (OPs)."

Our news journalists obtained a quote from the research from Miguel Hernandez University, "The physiological role of NTE might be related to membrane lipid homeostasis and seems to be involved in adult organisms in maintaining nervous system integrity. However, NTE is also involved in cell differentiation and embryonic development. NTE is expressed in embryonic and adult stem cells, and the silencing of Pnpla6 by interference RNA in D3 mouse cells causes significant alterations in several genetic pathways related to respiratory tube and
nervous system formation, and in vasculogenesis and angiogenesis. The silencing of gene PNPLA6 in human NT2 cells at the beginning of neurodifferentiation causes severe phenotypic alterations in neuron-like differentiated cells; e.g. reduced electrical activity and the virtual disappearance of markers of neural tissue, synapsis and glia. These phenotypic effects were not reproduced when NTE esterase activity was inhibited by neuropathic OP mipafox instead of being silenced at the genetic level. Neuropathic OP chlorpyrifos seems able to induce neurodevelopmental alterations in animals. However, the effects of chlorpyrifos in the expression of biomarker genes of differentiation in D3 cells differ considerably from the effects induced by Pnpla6 silencing.

According to the news editors, the research concluded: "Available information suggests that PNPLA6 and/or the NTE protein play a role in early neurodifferentiation stages, although this role is not dependent upon the esterase NTE center. Therefore, impairments caused by OPs, such as chlorpyrifos, on neurodevelopment are not due to inhibition of NTE esterase enzymatic activity."

For more information on this research see: Roles of NTE protein and encoding gene in development and neurodevelopmental toxicity. Chemico-Biological Interactions, 2016;259 ():352-357. Drugs and Therapies - Antibiotics

Investigators from Monash University Target Antibiotics (Pharmacokinetics/pharmacodynamics of colistin and polymyxin B: are we there yet?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antibiotics. According to news originating from Melbourne, Australia, by NewsRx correspondents, research stated, "The polymyxin antibiotics [colistin and polymyxin B (PMB)] are increasingly used as a last-line option for the treatment of infections caused by extensively drug-resistant Gram-negative bacteria. Despite having similar structures and antibacterial activity in vitro, the two clinically available polymyxins have very different pharmacological properties, as colistin (polymyxin E) is intravenously administered to patients in the form of an inactive prodrug colistin methanesulphonate (sodium)."
Our news journalists obtained a quote from the research from Monash University, "This review will discuss recent progress in the pharmacokinetics/pharmacodynamics and toxicity of colistin and PMB, the factors that affect their pharmacological profiles, and the challenges for the effective use of both polymyxins. Strategies are proposed for optimising their clinical utility based upon the recent pharmacological studies in vitro, in animals and patients. In the 'Bad Bugs, No Drugs' era, polymyxins are a critically important component of the antibiotic armamentarium against difficult-to-treat Gram-negative 'superbugs'."

According to the news editors, the research concluded: "Rational approaches to the use of polymyxins must be pursued to increase their effectiveness and to minimise resistance and toxicity."

The news correspondents report that additional information may be obtained from J. Li, Monash University, Monash Inst Pharmaceut Sci, Drug Delivery Disposit & Dynam, Melbourne, Vic, Australia. Additional authors for this research include T. Velkov, R.L. Nation, A. Forrest, B.T. Tsuji, P.J. Bergen and J. Li.

Drugs and Therapies - Toxicology and Pharmacology

Investigators from Monsanto Zero in on Toxicology and Pharmacology (Ecological risk assessment for DvSnf7 RNA: A plant-incorporated protectant with targeted activity against western corn rootworm)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Toxicology and Pharmacology are discussed in a new report. According to news originating from Creve Coeur, Missouri, by NewsRx correspondents, research stated, "MON 87411 maize, which expresses DvSnf7 RNA, was developed to provide an additional mode of action to confer protection against corn rootworm (Diabrotica spp.). A critical step in the registration of a genetically engineered crop with an insecticidal trait is performing an ecological risk assessment to evaluate the potential for adverse ecological effects."

 Financial supporters for this research include Monsanto Company, California Agricultural Research Inc.
Our news journalists obtained a quote from the research from Monsanto, "For MON 87411, an assessment plan was developed that met specific protection goals by characterizing the routes and levels of exposure, and testing representative functional taxa that would be directly or indirectly exposed in the environment. The potential for toxicity of DvSnf7 RNA was evaluated with a harmonized battery of non-target organisms (NTOs) that included invertebrate predators, parasitoids, pollinators, soil biota as well as aquatic and terrestrial vertebrate species. Laboratory tests evaluated ecologically relevant endpoints such as survival, growth, development, and reproduction and were of sufficient duration to assess the potential for adverse effects. No adverse effects were observed with any species tested at, or above, the maximum expected environmental concentration (MEEC). All margins of exposure for NTOs were >10-fold the MEEC."

According to the news editors, the research concluded: "Therefore, it is reasonable to conclude that exposure to DvSnf7 RNA, both directly and indirectly, is safe for NTOs at the expected field exposure levels."

For more information on this research see: Ecological risk assessment for DvSnf7 RNA: A plant-incorporated protectant with targeted activity against western corn rootworm. Regulatory Toxicology and Pharmacology, 2016;81():77-88. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Liver Diseases and Conditions - Hepatitis B Virus

Investigators from Nagoya City University Target Hepatitis B Virus
[Molecular epidemiology of co-infection with hepatitis B virus and human immunodeficiency virus (HIV) among adult patients in Harare, Zimbabwe]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Liver Diseases and Conditions - Hepatitis B Virus is the subject of a report. According to news originating from Nagoya, Japan, by NewsRx correspondents, research stated, "Core promoter/precore (BCP/PC) and S regions of HBV, as well The objective of this study was to determine the prevalence of co-infection with hepatitis B virus (HBV) and human immunodeficiency virus (HIV) and the genetic characteristics of both viruses among pre-HIV-treatment patients in Harare, Zimbabwe. This cross-sectional survey
involved 176 remnant plasma samples collected from consenting HIV patients (median age 35 [18-74]) between June and September 2014."

Our news journalists obtained a quote from the research from Nagoya City University, "HBV seromarkers were determined by high-sensitivity chemiluminescence assays. Molecular evolutionary analyses were conducted on the basalt as part of the HIV pol region. Of the 176 participants (65.7% female), 19 (10.8%) were positive for HBsAg (median 0.033IU/ml [IQR 0.01-415]. The HBsAg incidence was higher in men than women (P=0.009). HBsAg-positive subjects had lower median CD4 counts (P=0.016). HBV DNA was detectable in 12 HBsAg-positive samples (median 3.36 log cp/ml (2.86-4.51), seven being amplified and sequenced. All isolates were subgenotype A1 without HBV drug resistance mutations but each had at least one BCP/PC mutation. PreS deletion mutants and small S antigen variants M133I/T and D144G were identified. Of the 164 HIV isolates successfully genotyped, 163 (99.4%) were HIV-1 subtype C and only one was HIV-1 subtype F1. Sixteen (9.8%) had at least one drug resistance mutation, predominantly non-nucleoside reverse transcriptase inhibitor-related mutations, observed mostly among female participants."

According to the news editors, the research concluded: "This study shows that co-infection with HBV is present among HIV patients enrolling into HIV care in Zimbabwe, suggesting that HBV screening and monitoring programmes be strengthened in this context. J. Med. Virol. 89:257-266, 2017."

The news correspondents report that additional information may be obtained from Y. Tanaka, Nagoya City University, Grad Sch Med Sci, Liver Unit, Nagoya, Aichi, Japan. Additional authors for this research include S. Iijima, N. Chin’ombe, S. Mtapuri-Zinyowera, S. Murakami, M. Isogawa, A. Hachiya, Y. Iwatani and Y. Tanaka.

Molecular Nutrition

Investigators from National Heart Lung and Blood Institute Have Reported New Data on Molecular Nutrition (Long-chain monounsaturated fatty acid-rich fish oil attenuates the development of atherosclerosis in mouse models)
Researchers detail new data in Molecular Nutrition. According to news reporting from Bethesda, Maryland, by NewsRx journalists, research stated, "Scope: Fish oil-derived long-chain monounsaturated fatty acids (LCMUFA) containing chain lengths longer than 18 were previously shown to improve cardiovascular disease risk factors in mice. However, it is not known if LCMUFA also exerts anti-atherogenic effects."

Financial support for this research came from National Institutes of Health.

The news correspondents obtained a quote from the research from National Heart Lung and Blood Institute, "The main objective of the present study was to investigate the effect of LCMUFA on the development of atherosclerosis in mouse models. LDLR-KO mice were fed Western diet supplemented with 2% (w/w) of either LCMUFA concentrate, olive oil, or not (control) for 12 wk. LCMUFA, but not olive oil, significantly suppressed the development of atherosclerotic lesions and several plasma inflammatory cytokine levels, although there were no major differences in plasma lipids between the three groups. At higher doses 5% (w/w) LCMUFA supplementation was observed to reduce pro-atherogenic plasma lipoproteins and to also reduce atherosclerosis in ApoE-KO mice fed a Western diet. RNA sequencing and subsequent qPCR analyses revealed that LCMUFA upregulated PPAR signaling pathways in liver. In cell culture studies, apoB-depleted plasma from LDLR-K mice fed LCMUFA showed greater cholesterol efflux from macrophage-like THP-1 cells and ABCA1-overexpressing BHK cells."

According to the news reporters, the research concluded: "Our research showed for the first time that LCMUFA consumption protects against diet-induced atherosclerosis, possibly by upregulating the PPAR signaling pathway."

Subcellular Fractions

Investigators from National Heart Lung and Blood Institute Zero in on Subcellular Fractions (TP53 mutation, mitochondria and cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Subcellular Fractions are presented in a new report. According to news reporting originating in Bethesda, Maryland, by NewsRx journalists, research stated, "Under normal conditions, basal levels of wild-type p53 promote mitochondrial function through multiple mechanisms. Remarkably, some missense mutations of p53, in contrast to the null state, can result in the retention of its metabolic activities."

Funders for this research include National Heart, Lung and Blood Institute (NHLBI), NIH.

The news reporters obtained a quote from the research from National Heart Lung and Blood Institute, "These effects are particularly prominent in the mitochondria and demonstrate a functional role for mutant p53 in cancer metabolism. This review summarizes accumulating data on the mechanisms by which p53 missense mutations can regulate mitochondrial metabolism and promote the viability and survival of both normal and cancer cells, thus acting as a double edged sword for the host."

According to the news reporters, the research concluded: "Greater understanding of these mechanisms may provide insights for developing new treatment or preventive strategies against cancer."

Our news correspondents report that additional information may be obtained by contacting P.M. Hwang, National Heart Lung & Blood Institute, Center Mol Med, National Institutes of Health, Bethesda, MD 20892, United States. Additional authors for this research include P.Y. Wang and P.M. Hwang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.gde.2016.02.007. This DOI is a link to an online electronic document that is either free or for purchase.

Investigators from National Institute for Health Research Zero in on Type 2 Diabetes (Systematic Functional Characterization of Candidate Causal Genes for Type 2 Diabetes Risk Variants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting out of Oxford, United Kingdom, by NewsRx editors, research stated, "Most genetic association signals for type 2 diabetes risk are located in noncoding regions of the genome, hindering translation into molecular mechanisms. Physiological studies have shown a majority of disease-associated variants to exert their effects through pancreatic islet dysfunction."

Funders for this research include Wellcome Trust, Novo Nordisk.

Our news journalists obtained a quote from the research from National Institute for Health Research, "Systematically characterizing the role of regional transcripts in beta-cell function could identify the underlying disease-causing genes, but large-scale studies in human cellular models have previously been impractical. We developed a robust and scalable strategy based on arrayed gene silencing in the human beta-cell line EndoC-beta H1. In a screen of 300 positional candidates selected from 75 type 2 diabetes regions, each gene was assayed for effects on multiple disease-relevant phenotypes, including insulin secretion and cellular proliferation. We identified a total of 45 genes involved in beta-cell function, pointing to possible causal mechanisms at 37 disease associated loci. The results showed a strong enrichment for genes implicated in monogenic diabetes. Selected effects were validated in a follow-up study, including several genes (ARL15, ZM1Z1, and THADA) with previously unknown or poorly described roles in beta-cell biology."

According to the news editors, the research concluded: "We have demonstrated the feasibility of systematic functional screening in a human beta-cell model and successfully prioritized plausible disease-causing genes at more than half of the regions investigated."

Our news journalists report that additional information may be obtained by contacting A.L. Gloyn, Churchill Hospital, Natl Inst Hlth Res, Oxford Biomed Res Center, Oxford, United Kingdom. Additional authors for this research include A. Ceroni, M. Van De Bunt, C. Burrows, A. Barrett, R. Scharfmann, D. Ebner, M.I. McCarthy and A.L. Gloyn.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2337/db16-0361. This DOI is a link to an online electronic document that is either free or for purchase.

Leukocyte Diseases and Conditions - Eosinophilia

Investigators from National Research Institute Release New Data on Eosinophilia (Platelets constitutively express IL-33 protein and modulate eosinophilic airway inflammation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Leukocyte Diseases and Conditions - Eosinophilia have been published. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Although platelets play a key role in allergic inflammation in addition to their well-established role in hemostasis, the precise mechanisms of how platelets modulate allergic inflammation are not fully understood. IL-33 is an essential regulator of innate immune responses and allergic inflammation."

Our news journalists obtained a quote from the research from National Research Institute, "We sought to determine the expression of IL-33 protein by platelets and its functional significance in airway inflammation. IL-33 protein in human platelets, the human megakaryocyte cell line MEG-01, and bone marrow-derived mouse megakaryocytes was detected by using Western blot analysis and fluorescent immunostaining. We examined the functional relevance of IL-33 protein in platelets by comparing platelet-intact and platelet-depleted groups in a murine model of IL-33-dependent airway eosinophilia elicited by intranasal administration of papain. We further compared the additive effect of administration of platelets derived from wild-type versus IL-33-deficient mice on the papain-induced eosinophilia. Platelets and their progenitor cells, megakaryocytes, constitutively expressed IL-33 protein (31 kDa). Papain-induced IL-33-dependent airway eosinophilia in mice was significantly attenuated by platelet depletion. Conversely, concomitant administration of platelets derived from wild-type mice but not IL-33-deficient mice enhanced the papain-induced airway eosinophilia. Our novel findings suggest that platelets might be important cellular sources of IL-33 protein in vivo and that platelet-derived IL-33 might play a role in airway inflammation."

According to the news editors, the research concluded: "Therefore platelets might become an attractive novel therapeutic target for asthma and probably allergic inflammation."

For more information on this research see: Platelets constitutively express IL-33 protein and modulate eosinophilic airway inflammation. Journal of Allergy and Clinical Immunology, 2016;138(5):1395-1403,717-722. **Drugs and Therapies - Chemotherapy**

**Investigators from National Tsing Hua University Release New Data on Chemotherapy (Tumor Microenvironment-Responsive Nanoparticle Delivery of Chemotherapy for Enhanced Selective Cellular Uptake and Transportation within Tumor)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Chemotherapy. According to news originating from Hsinchu, Taiwan, by NewsRx correspondents, research stated, "A novel drug delivery strategy featured with enhanced uptake of nanoparticles (NPs) by targeted tumor cells and subsequent intratumoral cellular hitchhiking of chemotherapy to deep tumor regions was described. The NP delivery system was obtained from assembly of poly(lactic acid co-glycolic acid)-grafted hyaluronic acid (HA-g-PLGA) together with an anticancer drug, SN38, in aqueous phase, followed by implementing the NP surface with a layer of methoxypoly(ethylene glycol)-b-poly(histamine methacrylamide) (mPEG-b-PHMA) via hydrophobic association to improve the colloidal stability both in vitro and in vivo."

Funders for this research include National Tsing Hua University, National Taiwan University Hospital, Ministry of Science and Technology, Taiwan.

Our news journalists obtained a quote from the research from National Tsing Hua University, "Upon arrival of these PEGylated NPs at the acidic tumor site through the EPR effect, mPEG-b-PHMA became detached from the NP surface by the charge transition of the PHMA blocks from neutral (hydrophobic) to positively charged (hydrophilic) state via acid-induced protonation of their imidazole groups in tumor microenvironment. The exposure of HA shell on the naked NP thus resulted in enhanced uptake of NPs by CD44-expressed tumor cells, including cancer cells and tumor-associated macrophages (TAMs)."

According to the news editors, the research concluded: "Along with the TAMs being further chemotactically recruited by hypoxia cells, the engulfed nanotherapeutics was thus transported into the avascular area in which the anticancer action of chemotherapy occurred by virtue of the drug release alongside PLGA degradation, similar to those arising in other tumor nonhypoxia regions."

For more information on this research see: Tumor Microenvironment-Responsive Nanoparticle Delivery of Chemotherapy for Enhanced Selective Cellular Uptake and Transportation within Tumor. *Biomacromolecules*, 2016;17(12):3883-3892. *Biomacromolecules* can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; Biomacromolecules - www.pubs.acs.org/journal/bomaf6)

The news correspondents report that additional information may be obtained from H.C. Chiu, Natl Tsing Hua Univ, Dept. of Biomed Engn & Environm Sci, Hsinchu 300, Taiwan. Additional authors for this research include S.H. Chen, W.H. Chiang, C.W. Huang, C.L. Lo, C.S. Chern and H.C. Chiu.

Investigators from Netherlands Cancer Institute Release New Data on Small Cell Lung Cancer (Ped- and postoperative management of stage I-III Non Small Cell Lung Cancer: Which quality of care indicators are evidence-based?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Small Cell Lung Cancer is now available. According to news originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Quality of care (QoC) has a central role in our health care system. The aim of this review is to present a set of evidence-based quality indicators for the surgical treatment and postoperative management of lung cancer."

Our news journalists obtained a quote from the research from Netherlands Cancer Institute, "A search was performed through PubMed, Embase and the Cochrane library database, including English literature, published between 1980 and 2012. Search terms regarding 'lung neoplasms', 'surgical treatment' and 'quality of care' were used. Potential QoC indicators were divided into structure, process or outcome measures and a final selection was made based upon the level of evidence. High hospital volume and surgery performed by a thoracic surgeon, were identified as important structure indicators. Sleeve resection instead of pneumonectomy and the importance of treatment within a clinical care path setting were identified as evidence-based process indicators. A symptom-based follow-up regime was identified as a new QoC indicator."

According to the news editors, the research concluded: "These indicators can be used for registration, benchmarking and ultimately quality improvement in lung cancer surgery."

The news correspondents report that additional information may be obtained from R.C. Numan, Antoni van Leeuwenhoek Hosp, Netherlands Canc Inst, Dept. of Surg Oncol, NL-1066 CX Amsterdam, Netherlands. Additional authors for this research include M. ten Berge, J.A. Burgers, H.M. Klomp, J.W. van Sandick, P. Baas and M.W. Wouters.

Keywords for this news article include: Amsterdam, Netherlands, Europe, Surgery, Article Review, Small Cell Lung Cancer, Quality of Care, Lung Neoplasms, Oncology, Netherlands Cancer Institute.

Investigators from Odense University Hospital Zero in on Central Nervous System Agents (2016 updated MASCC/ESMO consensus recommendations: prevention of radiotherapy-induced nausea and vomiting)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Central Nervous System Agents have been presented. According to news originating from Odense, Denmark, by NewsRx correspondents, research stated, "Radiotherapy-induced nausea and vomiting (RINV) are distressing symptoms. Evidence-based guidelines should facilitate the prescription of the best possible antiemetic prophylaxis."

Our news journalists obtained a quote from the research from Odense University Hospital, "As part of the MASCC/ESMO Antiemetic Guidelines Update 2016, a thorough review of the literature concerning RINV since the 2009 update was required. A systematic review of the literature including data published from June 2009 to May 2015 was performed. Committee VII (RINV) under the MASCC/ESMO Antiemetic Guidelines Update Committee assessed the literature. The searches yielded 926 records, 906 records were excluded, leaving 20 records for full text assessment, and 18 publications were finally included. The only fully published randomized studies in prevention of RINV were two negative studies in acupuncture and green tea, respectively. No data to support new recommendations for antiemetic prophylaxis in RINV was available. However, based on expert opinions, the committee agreed on changes in emetic risk level for certain sites of irradiation. The serotonin receptor antagonists are still the cornerstone in antiemetic prophylaxis of nausea and vomiting induced by high and moderate emetic risk radiotherapy. The studies available since the last update did not change recommendations for antiemetic prophylaxis. The emetogenicity of craniospinal radiotherapy was reclassified from low to moderate emetic level along with some other minor changes."

According to the news editors, the research concluded: "In the future, RINV prophylaxis in single fraction, multiple fraction, and in concomitant chemo-radiotherapy still need to be explored with regard to the different classes and combinations of antiemetic drugs."

For more information on this research see: 2016 updated MASCC/ESMO consensus recommendations: prevention of radiotherapy-induced nausea and vomiting. Supportive Care in Cancer, 2017;25(1):309-316. Investigators from Ohio State University Report New Data on Magnetic Resonance (DEMARCATE: Density-based magnetic resonance image clustering for assessing tumor heterogeneity in cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Magnetic Resonance are discussed in a new report. According to news reporting out of Columbus, Ohio, by NewsRx editors, research stated, "Tumor heterogeneity is a crucial area of cancer research where in inter-and intra-tumor differences are investigated to assess and monitor disease development and progression, especially in cancer. The proliferation of imaging and linked genomic data has enabled us to evaluate tumor heterogeneity on multiple levels."

Funders for this research include NIH, University of Texas MD Anderson Cancer Center Support Grant (CCSG).

Our news journalists obtained a quote from the research from Ohio State University, "In this work, we examine magnetic resonance imaging (MRI) in patients with brain cancer to assess image-based tumor heterogeneity. Standard approaches to this problem use scalar summary measures (e.g., intensity-based histogram statistics) that do not adequately capture the complete and finer scale information in the voxel-level data. In this paper, we introduce a novel technique, DEMARCATE (DEnsity-based MAgnetic Resona nce image Clustering for Assessing Tumor hEtero-geneity) to explore the entire tumor heterogeneity density profiles (THDPs) obtained from the full tumor voxel space. THDPs are smoothed representations of the probability density function of the tumor images. We develop tools for analyzing such objects under the Fisher-Rao Riemannian framework that allows us to construct metrics for THDP comparisons across patients, which can be used in conjunction with standard clustering approaches. Our analyses of The Cancer Genome Atlas (TCGA) based Glioblastoma dataset reveal two significant clusters of patients with marked differences in tumor morphology, genomic characteristics and prognostic clinical outcomes."

According to the news editors, the research concluded: "In addition, we see enrichment of image-based clusters with known molecular subtypes of glioblastoma multiforme, which further validates our representation of tumor heterogeneity and subsequent clustering techniques."

Our news journalists report that additional information may be obtained by contacting A. Saha, Ohio State University, Dept. of Stat, Columbus, OH 43210, United States. Additional authors for this research include S. Banerjee, S. Kurtek, S. Narang, J. Lee, G. Rao, J. Martinez, K. Bharath, A.U.K. Rao and V. Baladandayuthapani.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.nicl.2016.05.012. This DOI is a link to an online electronic document that is either free or for purchase.

Investigators from Osaka University Target Clinical Trials and Studies (Intravenous Vitamin B6 Increases Resistance to Erythropoiesis-Stimulating Agents in Hemodialysis Patients: A Randomized Controlled Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Clinical Research - Clinical Trials and Studies is the subject of a report. According to news reporting from Osaka, Japan, by NewsRx journalists, research stated, "Vitamin B6 deficiency is common in hemodialysis patients and may contribute to anemia and abnormal bone metabolism in this population. 6-month, open-label, randomized controlled parallel-group study in hemodialysis centers."

The news correspondents obtained a quote from the research from Osaka University, "Fifty-six maintenance hemodialysis patients with relatively high resistance to erythropoiesis-stimulating agents (ESA). Intravenous vitamin B6 (60 mg of intravenous pyridoxal 5'-phosphate after each thrice-weekly hemodialysis session). The primary and secondary outcomes were changes over time in ESA resistance index and bone turnover markers, respectively. The prevalence of vitamin B6 deficiency was 40% overall. Compared with the control group, the B6 group showed an upward change in ESA resistance index over time (P-interaction = .038). At week 13 (a priori-defined time point), pyridoxal 5'-phosphate administration was associated with higher ESA resistance index by 0.97 (95% confidence interval, 0.02-1.92) x 10(-2) mg/dL.hemoglobin after baseline adjustment, which was not modified by baseline vitamin B6 status. There was a trend toward increase in serum erythropoietin concentrations in the B6 group after adjustment for baseline values, hemoglobin, and weekly ESA dose (P-interaction = .06). The downward changes of bone-specific alkaline phosphatase and tartrate-resistant acid phosphatase 5b in the B6 group relative to the control group were pronounced in patients without vitamin B6 deficiency (P-interaction < .001 and .017, respectively), despite nonsignificant between-group difference in 1-84 parathyroid hormone."

According to the news reporters, the research concluded: "Thrice-weekly intravenous vitamin B6 (60 mg pyridoxal 5'-phosphate hydrate) worsens the response to ESA and may blunt the response of bone to parathyroid hormone in hemodialysis patients."

Our news journalists report that additional information may be obtained by contacting T. Hamano, Osaka University, Grad Sch Med, Dept. of Comprehens Kidney Dis Res, Suita, Osaka 5650871, Japan. Additional authors for this research include S. Mikami, T. Hamano, Y. Obi, H. Tanaka, A. Shimomura, H. Rakugi, T. Inoue and Y. Isaka.

The direct object identifier (DOI) for that additional information is:
Investigators from Paris Diderot University Zero in on Dimethylamines (Mechanisms of tramadol-related neurotoxicity in the rat: Does diazepam/tramadol combination play a worsening role in overdose?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Dimethylamines have been published. According to news reporting from Paris, France, by NewsRx journalists, research stated, "Poisoning with opioid analgesics including tramadol represents a challenge. Tramadol may induce respiratory depression, seizures and serotonin syndrome, possibly worsened when in combination to benzodiazepines."

Financial support for this research came from INSERM.

The news correspondents obtained a quote from the research from Paris Diderot University, "Our objectives were to investigate tramadol-related neurotoxicity, consequences of diazepam/tramadol combination, and mechanisms of drug-drug interactions in rats. Median lethal-doses were determined using Dixon Bruce's up-and-down method. Sedation, seizures, electroencephalography and plethysmography parameters were studied. Concentrations of tramadol and its metabolites were measured using liquid-chromatography high-resolution-mass-spectrometry. Plasma, platelet and brain monoamines were measured using liquid-chromatography coupled to fluorimetry. Median lethal-doses of tramadol and diazepam/tramadol combination did not significantly differ, although time-to-death was longer with combination (P = 0.04). Tramadol induced dose-dependent sedation (P < 0.05), early-onset seizures (P < 0.001) and increase in inspiratory (P < 0.01) and expiratory times (P < 0.05). The diazepam/tramadol combination abolished seizures but significantly enhanced sedation (P < 0.01) and respiratory depression (P < 0.05) by reducing tidal volume (P < 0.05) in addition to tramadol-related increase in respiratory times, suggesting a pharmacodynamic mechanism of interaction. Plasma M1 and M5 metabolites were mildly increased, contributing additionally to tramadol-related respiratory depression. Tramadol-induced early-onset increase in brain concentrations of serotonin and norepinephrine was not significantly altered by the diazepam/tramadol combination. Interestingly neither pretreatment with cyproheptadine (a serotonin-receptor antagonist) nor a benserazide/5-hydroxytryptophane combination (enhancing brain serotonin) reduced tramadol-induced seizures. Our study shows that diazepam/tramadol combination does not worsen tramadol-induced fatality risk but alters its toxicity pattern with enhanced respiratory depression but abolished seizures. Drug-drug interaction is mainly pharmacodynamic but increased plasma M1 and M5 metabolites may also contribute to enhancing respiratory depression."

According to the news reporters, the research concluded: "Tramadol-induced seizures are independent of brain serotonin."

Our news journalists report that additional information may be obtained by contacting C. Lagard, Paris Diderot Univ, UMR S 1144, Paris, France. Additional authors for this research include L. Chevillard, I. Malissin, P. Risede, J. Callebert, L. Labat, J.M. Launay, J.L. Laplanche and B. Megarbane.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.taap.2016.09.013. This DOI is a link to an online electronic document that is either free or for purchase.

**Enzymes and Coenzymes**

**Investigators from Pasteur Institute Release New Data on Enzymes and Coenzymes (Crystal Structure of the Metallo-beta-Lactamase GOB in the Periplasmic Dizinc Form Reveals an Unusual Metal Site)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Enzymes and Coenzymes. According to news reporting from Paris, France, by NewsRx journalists, research stated, "Metallo-beta-lactamases (MBLs) are broad-spectrum, Zn(II)-dependent lactamases able to confer resistance to virtually every beta-lactam antibiotic currently available. The large diversity of active-site structures and metal content among MBLs from different sources has limited the design of a pan-MBL inhibitor."

The news correspondents obtained a quote from the research from Pasteur Institute, "GOB-18 is a divergent MBL from subclass B3 that is expressed by the opportunist Gram-negative pathogen Elizabethkingia meningoseptica. This MBL is atypical, since several residues conserved in B3 enzymes (such as a metal ligand His) are substituted in GOB enzymes. Here, we report the crystal structure of the periplasmic di-Zn(II) form of GOB-18. This enzyme displays a unique active-site structure, with residue Gln116 coordinating the Zn1 ion through its terminal amide moiety, replacing a ubiquitous His residue. This situation contrasts with that of B2 MBLs, where an equivalent His116Asn substitution leads to a di-Zn(II) inactive species. Instead, both the mono- and di-Zn(II) forms of GOB-18 are active against penicillins, cephalosporins, and carbapenems. In silico docking and molecular dynamics simulations indicate that residue Met221 is not involved in substrate binding, in contrast to Ser221, which otherwise is conserved in most B3 enzymes. These distinctive features are conserved in recently
reported GOB orthologues in environmental bacteria."

According to the news reporters, the research concluded: "These findings provide valuable information for inhibitor design and also posit that GOB enzymes have alternative functions."

For more information on this research see: Crystal Structure of the Metallo-beta-Lactamase GOB in the Periplasmic Dizinc Form Reveals an Unusual Metal Site. *Antimicrobial Agents and Chemotherapy*, 2016;60(10):6013-6022. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Heart Disorders and Diseases - Left Ventricular...**

**Investigators from Peking University Release New Data on Left Ventricular Hypertrophy (A novel hydrodynamic approach of drag-reducing polymers to improve left ventricular hypertrophy and aortic remodeling in spontaneously hypertensive rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Left Ventricular Hypertrophy are discussed in a new report. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Drag-reducing polymers (DRPs), when added in minute concentrations, have been shown to decrease peripheral vascular resistance. In this study, the effect of DRPs on the hypertension-induced left ventricular hypertrophy and aortic remodeling was evaluated in spontaneously hypertensive rats (SHR)."

The news reporters obtained a quote from the research from Peking University, "Male SHR and age-matched Wistar rats were divided into four groups and received intravenous injection of normal saline (NS) or DRPs. Body weight (BW), heart rate (HR) and systolic blood pressure (SBP) were measured. Echocardiography was used to evaluate the changes in left ventricle (LV) function and global wall motion. The LV and aorta were stained by hematoxylin and eosin. Cell size of cardiomyocytes and aortic medial thickness were evaluated for each section. The expression of endothelin-1 (ET-1) of LV and aorta was examined by quantitative reverse transcription polymerase chain reaction (qRT-PCR) and immunohistochemistry. There was no significant difference in the increase of SBP among SHR+ NS, SHR+ 10DRP and SHR+ 20DRP groups. SHR+ NS group had markedly smaller left ventricular end-systolic diameter and left ventricular end-diastolic diameter but bigger anterior and posterior systolic wall thicknesses, while there was no significant difference in fractional shortening and ejection fraction. The cross-sectional areas (CSAs) of cardiomyocytes and the medial thickness of the aorta in SHR+ 10 (ppm) DRP and SHR+ 20 (ppm) DRP groups were significantly reduced compared with
SHR+ NS group. The expression of ET-1 in SHR+ 10DRP and SHR+ 20DRP groups was significantly attenuated. These results suggest that chronic treatment with DRPs can protect against left ventricular hypertrophy and aortic remodeling.

According to the news reporters, the research concluded: "DRPs may offer a new approach to the treatment of left ventricular hypertrophy and aortic remodeling caused by hypertension."

Investigators from Peking University Report New Data on Tricho-Dento-Osseous Syndrome (Senescence: novel insight into DLX3 mutations leading to enhanced bone formation in Tricho-Dento-Osseous syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Diseases and Conditions - Tricho-Dento-Osseous Syndrome is the subject of a report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The homeodomain transcription factor distal-less homeobox 3 gene (DLX3) is required for hair, tooth and skeletal development. DLX3 mutations have been found to be responsible for Tricho-Dento-Osseous (TDO) syndrome, characterized by kinky hair, thin-pitted enamel and increased bone density."

Our news journalists obtained a quote from the research from Peking University, "Here we show that the DLX3 mutation (c.533 A>G; Q178R) attenuates osteogenic potential and senescence of bone mesenchymal stem cells (BMCs) isolated from a TDO patient, providing a molecular explanation for abnormal increased bone density. Both DLX3 mutations (c.533 A>G and c.571_574delGGGG) delayed cellular senescence when they were introduced into pre-osteoblastic cells MC3T3-E1. Furthermore, the attenuated skeletal aging and bone loss in DLX3 (Q178R) transgenic mice not only reconfirmed that DLX3 mutation (Q178R) delayed..."
cellular senescence, but also prevented aging-mediated bone loss. Taken together, these results indicate that DLX3 mutations act as a loss of function in senescence. The delayed senescence of BMSCs leads to increased bone formation by compensating decreased osteogenic potentials with more generations and extended functional lifespan."

According to the news editors, the research concluded: "Our findings in the rare human genetic disease unravel a novel mechanism of DLX3 involving the senescence regulation of bone formation."

For more information on this research see: Senescence: novel insight into DLX3 mutations leading to enhanced bone formation in Tricho-Dento-Osseous syndrome. Scientific Reports, 2016;6():1-13. **Oncology - Rectal Cancer**

**Investigators from People's Hospital Release New Data on Rectal Cancer (Relationship between serum uric acid and metastatic and nonmetastatic rectal cancer patients with undergoing no chemotherapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Rectal Cancer. According to news reporting originating in Yichang, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to investigate the role of uric acid (UA) in assessing rectal cancer metastasis. There were 475 newly diagnosed patients with complete data in our study, a total of 475 cases were reviewed, and divided into patients with metastasis and without metastasis."

The news reporters obtained a quote from the research from People's Hospital, "There were several statistical differences in age, tumor diameter, carcino-embryonic antigen (CEA), and C-reactive protein (CRP) between the 2 groups. Importantly, serum concentrations of UA in patients with lymphatic metastasis were found to be increased compared with patients without lymphatic metastasis (270.9+/−52.99 vs 215.8+/−43.55; P<0.001). There were positive correlations of serum UA with creatinine (Cr), CRP, and CEA (r=0.281, P=0.023; r=0.312, P=0.001; r=0.294, P=0.017) in rectal cancer patients with metastasis. Multivariate analysis model revealed that elevated serum levels of UA were significant prognostic marker for lymphatic metastasis in patients with rectal cancer, independently of CRP, CEA, and tumor diameter (odds ratio 1.035, 95% CI 1.013-1.057, P=0.002). In receiver-operating characteristic curve analysis, the area under the curve of serum UA in assessing metastatic rectal cancer patients was 0.803,
with sensitivity of 0.864 and specificity of 0.739."

According to the news reporters, the research concluded: "Our results suggest that serum UA may be a novel marker in assessing tumor metastasis in patients with rectal cancer."

For more information on this research see: Relationship between serum uric acid and metastatic and nonmetastatic rectal cancer patients with undergoing no chemotherapy. *Medicine*, 2016;95(47):248-251. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Oncology - Lung Cancer**

**Investigators from People's Hospital Report New Data on Lung Cancer (Fibroblast Growth Factor Receptor 1 Gene Amplification in Nonsmall Cell Lung Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Lung Cancer have been presented. According to news originating from Shandong, People's Republic of China, by NewsRx correspondents, research stated, "To review the prevalence and prognostic significance of fibroblast growth factor receptor 1 (FGFR1) amplification and to establish an association between FGFR1 amplification and the clinical characteristics of nonsmall cell lung cancer (NSCLC). We searched PubMed for English-language studies published between January 2010 and May 2016."

Our news journalists obtained a quote from the research from People's Hospital, "We included all relevant articles, with no limitation of study design. FGFR1 amplification was reported in 8.7-20.0% of NSCLC cases and was significantly more frequent in squamous cell carcinomas (SCCs) (9.7-28.3%) than in adenocarcinomas (ADCs) (0-15.0%). The rates of FGFR1 amplification were as follows: males, 13.9-22.1%; females, 0-20.1%; Stage I NSCLC, 9.3-24.1%; Stage II NSCLC, 12.9-25.0%; Stage III NSCLC, 8.2-19.5%; Stage IV NSCLC, 0-12.5%; current smokers, 13.3-29.0%; former smokers, 2.5-23.0%; and nonsmokers, 0-22.2%. Overall survival was 43.9-70.8 months in patients with FGFR1 amplification and 42.4-115.0 months in patients with no FGFR1 amplification; disease-free survival was 22.5-58.5 months and 52.4-94.6 months, respectively. FGFR1 amplification is more frequent in SCCs than in ADCs."

According to the news editors, the research concluded: "The association between FGFR1 amplification and clinical characteristics (gender, smoking status, and disease stage) and the prognostic significance of FGFR1 amplification in NSCLC remain controversial."

For more information on this research see: Fibroblast Growth Factor Receptor 1 Gene Amplification in Nonsmall Cell Lung Cancer. *Chinese Medical Journal*, 2016;129
Investigators from Pontifical Catholic University Release New Data on Lung Diseases (Modulatory potential of resveratrol during lung inflammatory disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases have been published. According to news reporting originating from Porto Alegre, Brazil, by NewsRx correspondents, research stated, "Neutrophils are the first cells to achieve the sites of infection or inflammation in the lungs. The massive accumulation of these cells is associated with acute and chronic lung injury."

Financial support for this research came from CAPES.

Our news editors obtained a quote from the research from Pontifical Catholic University, "Therefore, they have been implicated in the pathogenesis of many lung diseases through the release of reactive oxygen intermediates, proteolytic enzymes and Neutrophil Extracellular Traps (NETs). The excessive and continuous release of NETs, fibers composed by decondensed chromatin coated with neutrophil proteins, are associated to the impairment of lung function in different pathological settings. Flavonoids inhibit the respiratory burst of neutrophils in mammals. However, one of these flavonoids, resveratrol has a particular chemical property. It reduce Cu(II) to Cu(I) form with concomitant formation of reactive oxygen species, which can produce DNA breakage as reported in several in vitro models. We hypothesize that direct resveratrol administration in lungs can cleave DNA in NETs, improving lung function during acute airway infections or chronic inflammatory lung diseases. If the hypothesis is correct, the control of NET formation can be used to reduce the inflammatory environment in lung after neutrophil stimuli. Additionally, the production of proinflammatory cytokines by neutrophils could be also diminished by resveratrol administration."

According to the news editors, the research concluded: "In this sense, this flavonoid provides a multifaceted opportunity for treatment of lung diseases with strong or chronic neutrophil activation."

The news editors report that additional information may be obtained by contacting J.E. Vargas, Pontifical Catholic Univ Rio Grande Sul PUCRS, Center INFANT, Porto Alegre, RS, Brazil. Additional authors for this research include A.A. Souto, P.M.C. Pitrez, R.T. Stein and B.N. Porto.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mehy.2016.09.023. This DOI is a link to an online electronic document that is either free or for purchase.

**Heart Disorders and Diseases - Atrial Fibrillation**

**Investigators from Pontifical Catholic University Target Atrial Fibrillation (Overcoming global challenges in stroke prophylaxis in atrial fibrillation: The role of non-vitamin K antagonist oral anticoagulants)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting originating from Porto Alegre, Brazil, by NewsRx correspondents, research stated, "Atrial fibrillation is the world's most common sustained cardiac arrhythmia and is associated with a significantly increased risk of stroke. The global burden of atrial fibrillation is rising, commensurate with the ageing population."

Our news editors obtained a quote from the research from Pontifical Catholic University, "Well-controlled vitamin K antagonist-based anticoagulation has been shown to reduce the risk of stroke secondary to atrial fibrillation by two-thirds. However, patients with atrial fibrillation have frequently been denied anticoagulation because of a variety of perceived risks related to bleeding, falls, chronological age, and poor compliance. Even when vitamin K antagonists are used, maximum benefit and safety are only delivered when high quality control of therapy (TTR >70%) is achieved, which has proven remarkably difficult in many health-care systems and amongst many patient groups. The non-vitamin K antagonist oral anticoagulants (NOACs) offer solutions to many of the challenges of achieving widespread, safe, and effective anticoagulation for stroke prophylaxis in atrial fibrillation, yet their uptake into routine clinical practice remains variable."

According to the news editors, the research concluded: "The evidence supporting their more widespread use to overcome the challenges of stroke prophylaxis for atrial fibrillation is reviewed in this article."

For more information on this research see: Overcoming global challenges in stroke
Investigators from Postgraduate Institute of Medical Education and Research Report New Data on Lung Cancer (Endosonography Versus Mediastinoscopy in Mediastinal Staging of Lung Cancer: Systematic Review and Meta-Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lung Cancer. According to news originating from Chandigarh, India, by NewsRx correspondents, research stated, "Whether endosonography can replace mediastinoscopy as the initial procedure for mediastinal staging of non-small cell lung cancer remains controversial. Herein, we perform a systematic review of randomized controlled trials and observational studies (both procedures performed in same subjects) comparing the two procedures."

Our news journalists obtained a quote from the research from the Postgraduate Institute of Medical Education and Research, "Nine studies (960 subjects) were identified. The pooled risk-difference of the sensitivity of endosonography versus mediastinoscopy in observational studies and randomized controlled trials was 0.11 (95% confidence interval, -0.07 to 0.29) and 0.11 (95% confidence interval, -0.03 to 0.25), respectively suggesting equivalence of the two procedures. The complication rate was significantly lower with endosonographic procedures."

According to the news editors, the research concluded: "Endoscopic ultrasound-guided fine needle aspiration/endobronchial ultrasound-guided transbronchial needle aspiration was found to have similar yield but lower complication rate compared to mediastinoscopy in the initial mediastinal staging of non-small cell lung cancer."

Investigators from Purdue University Have Reported New Data on Crystal Research (A Comparison of the Crystallization Inhibition Properties of Bile Salts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Crystal Research are presented in a new report. According to news originating from West Lafayette, Indiana, by NewsRx correspondents, research stated, "Bile salts are natural surfactants present in the human gastrointestinal tract. Therefore, it is essential to consider their effect on the dissolution and crystallization tendency of oral drug formulations."

Financial supporters for this research include Division of Chemistry, American Association of Pharmaceutical Scientists, Division of Materials Research, Merck and Co., Inc.

Our news journalists obtained a quote from the research from Purdue University, "Although a recent study showed that sodium taurocholate delayed nucleation for 11 structurally diverse compounds, there is limited information about the crystallization inhibition properties of other bile salts and whether they are interchangeable in this context. In this study, we evaluated the ability of 13 bile salts to maintain supersaturated aqueous solutions of three compounds: celecoxib, nevirapine, and fibanserin. Most bile salts extended nucleation induction times. However, their inhibitory effects varied depending on the structure and concentration of the bile salt and the drug. The R5 group and hydrophobicity of the bile salt appeared to be essential. Molecular dynamics simulations indicated that van der Waals and hydrogen bonding interactions occurred between nevirapine and bile salts, with variations in different systems."

According to the news editors, the research concluded: "These results are important to better understand the crystallization tendency of orally delivered poorly water-soluble compounds in vivo."

For more information on this research see: A Comparison of the Crystallization Inhibition Properties of Bile Salts. Crystal Growth & Design, 2016;16(12):7286-7300. Crystal Growth & Design can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; Crystal Growth & Design -

Parkinson's Disease

Investigators from Queensland University of Technology Release New Data on Parkinson's Disease [Occupancy of pramipexole (Sifrol) at cerebral dopamine D2/3 receptors in Parkinson's disease patients]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Parkinson's disease have been published. According to news reporting out of Brisbane, Australia, by NewsRx editors, research stated, "Whereas positron emission tomography (PET) with the antagonist ligand [F-18] fallypride reveals the composite of dopamine D2 and D3 receptors in brain, treatment of Parkinson's disease (PD) patients with the D3-prefering agonist pramipexole should result in preferential occupancy in the nucleus accumbens, where the D3-subtype is most abundant. To test this prediction we obtained pairs of [18F] fallypride PET recordings in a group of nine PD patients, first in a condition of treatment as usual with pramipexole (ON-Sifrol; 3 x 0.7 mg p.d.), and again at a later date, after withholding pramipexole 48-72 h (OFF-Sifrol); in that condition the serumpramipexole concentration had declined by 90% and prolactin levels had increased four-fold, in conjunction with a small but significant worsening of PD motor symptoms."

Our news journalists obtained a quote from the research from the Queensland University of Technology, "Exploratory comparison with historical control material showed 14% higher dopamine D2/3 availability in the more-affected putamen of patients OFF medication. On-Sifrol there was significant (p. 0.01) occupancy at [F-18] fallypride binding sites in globus pallidus (8%) thalamus (9%) and substantia nigra (19%), as well as marginally significant occupancy in frontal and temporal cortex of patients."

According to the news editors, the research concluded: "Contrary to expectation, comparison of ON-and OFF-Sifrol results did not reveal any discernible occupancy in nucleus accumbens, or elsewhere in the extended striatum; present methods should be sensitive to a 10% change in dopamine D2/3 receptor availability in striatum; the significant findings elsewhere in the basal ganglia and in cerebral cortex are consistent with a predominance of D3 receptors in those structures, especially in substantia nigra, and imply that therapeutic effects of pramipexole may be obtained at sites outside the extended striatum."

For more information on this research see: Occupancy of pramipexole (Sifrol) at cerebral dopamine D2/3 receptors in Parkinson's disease patients. NeuroImage-Clinical, 2016;12():41-46. NeuroImage-Clinical can be contacted at: Elsevier Sci Ltd, The Boulevard,
Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England.

Genetics - Assisted Reproduction and Genetics

Investigators from Radboud University Release New Data on Assisted Reproduction and Genetics (Clinically applied procedures for human ovarian tissue cryopreservation result in different levels of efficacy and efficiency)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Genetics - Assisted Reproduction and Genetics are discussed in a new report. According to news reporting originating in Nijmegen, Netherlands, by NewsRx journalists, research stated, "Different protocols are being used worldwide for the cryopreservation of human ovarian tissue for fertility preservation purposes. The efficiency and efficacy of the majority of these protocols has not been extensively evaluated, possibly resulting in sub-optimally cryopreserved ovarian tissue."

Funders for this research include Radboud Institute for Health Sciences, Stichting Kinderen Kankervrij, Merck Serono.

The news reporters obtained a quote from the research from Radboud University, "To address the impact of this issue, we assessed the effects of two clinically successful human ovarian tissue slow-freezing cryopreservation procedures on the quality of the cryopreserved tissue. To differentiate between cryopreservation (C) versus thawing (T) related effects, four combinations of these two (A and B) very different cryopreservation/thawing protocols (A(C)A (T), A(C)B(T), B(C)A(T), BCBT) were studied. Before and after cryopreservation and thawing, the percentage of living and morphologically normal follicles, as well as the overall tissue viability, was assessed. Our experiments revealed that the choice of the cryopreservation protocol noticeably affected the overall tissue viability and percentage of living follicles, with a higher viability after protocol B-C when compared to A(C)."

According to the news reporters, the research concluded: "No statistically significant
differences in tissue viability were observed between the two thawing protocols, but thawing protocol B-T required considerably more human effort and materials than thawing protocol A (T)."

Our news correspondents report that additional information may be obtained by contacting R. Peek, Radboud University, Dept. of Obstet & Gynecol, NL-6500 HB Nijmegen, Netherlands. Additional authors for this research include J.R. Westphal, C.C.M. Beerendonk, R.L.M. Bekkers, P.L.M. Zusterzeel, J.C.M. Hendriks, D.D.M. Braat and R. Peek.

Eye Diseases and Conditions - Choroidal...

**Investigators from Rambam Medical Center Have Reported New Data on Choroidal Neovascularization [A SEMA3E mutant resistant to cleavage by furins (UNCL-SEMA3E) inhibits choroidal neovascularization]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Eye Diseases and Conditions - Choroidal Neovascularization is now available. According to news reporting out of Haifa, Israel, by NewsRx editors, research stated, "Abnormal subretinal choroidal neovascularization (CNV) is a major cause of blindness in exudative age related macular degeneration (AMD). Current anti-angiogenic treatments by VEGF sequestering agents have been successful, but a significant proportion of patients do not respond well to these treatments, and the response of others diminishes over time, suggesting that additional anti-angiogenic agents that function by separate mechanisms may be of use to such patients."

Financial supporters for this research include Israel Binational Science Foundation (BSF), Israel Ministry of Commerce, Israel Science Foundation, Rappaport Family Institute for Research in the Medical Sciences.

Our news journalists obtained a quote from the research from Rambam Medical Center, "We have previously found that a point mutated form of semaphorin-3E resistant to cleavage by furin like pro-protein convertases (UNCL-Sema3E) displays potent anti-angiogenic properties. We therefore determined if UNCL-Sema3E has potential as an inhibitor of CNV formation. We chose to study UNCL-Sema3E rather than wild type sema3E because unlike full length sema3E, the major p61-Sema3E peptide that is produced by cleavage of sema3E with furin like pro-protein convertases activates signal transduction mediated by the ErbB2 receptor and can promote tumor metastasis in addition to its anti-angiogenic activity. UNCL-Sema3E
inhibited efficiently vascular endothelial growth factor-A (VEGF), platelet derived growth 
factor (PDGF) and basic fibroblast growth factor (bFGF) signaling in human umbilical vein 
derived endothelial cells (HUVEC) and to a lesser extent hepatocyte growth factor (HGF) signal 
transduction. CNV that was induced in the eyes of C57 black mice by laser photocoagulation 
was inhibited by 65% (P < 0.01) following a single bolus intra-vitreal injection of 5 mu g 
UNCL-Sema3E. This inhibitory effect was similar to the inhibition produced by a single bolus 
 intra-vitreal injection of 5 mu g aflibercept. A similar inhibition of CNV was observed 
following the injection of UNCL-Sema3E into the eyes of Long-Evans rats. However, a higher 
dose of UNCL-Sema3E (125 mu g), partially due to the larger volume of the vitreous cavity of 
rats, was required to achieve maximal inhibition of CNV. Injection of UNCL-Sema3E into eyes 
of healthy mice did not have any adverse effect on retinal function as assessed by optic kinetic 
reflex (OKR) or by electoretinogram (ERG) assays nor did UNCL-Sema3E injection affect the 
structure of the retina as determined using histology.

According to the news editors, the research concluded: "To conclude, our results 
suggest that UNCL-Sema3E may be useful for the treatment of exudative AMD, which does not 
respond well to conventional anti-VEGF therapy."

For more information on this research see: A SEMA3E mutant resistant to cleavage 
by furins (UNCL-SEMA3E) inhibits choroidal neovascularization. Experimental Eye Research, 
2016;153():186-194. Experimental Eye Research can be contacted at: Academic Press Ltd-
Elsevier Science Ltd, 24-28 Oval Rd, London NW1 7DX, England. (Elsevier -

Atrial Fibrillation

Investigators from Research Hospital Report New Data on Atrial 
Fibrillation (Unanswered Questions in Complex Fractionated Atrial 
Electrogram Ablation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness 
& Wellness Week -- Investigators publish new report on Atrial Fibrillation. According to news 
reporting originating from Kocaeli, Turkey, by NewsRx correspondents, research stated, 
"Pulmonary vein isolation has been accepted as potential target for ablation of paroxysmal atrial
fibrillation (AF) given that the pulmonary veins are the main source of AF triggers. However, ablation strategies for persistent AF are less well defined."

Our news editors obtained a quote from the research from Research Hospital, "Mapping and ablation of complex fractionated atrial electrograms (CFAEs) is one strategy that has been proposed as a strategy for substrate modification although there is no consensus on their definition and procedural end points. Results of clinical studies have been conflicting."

According to the news editors, the research concluded: "In this review, we aimed to discuss yesterday, today, and tomorrow of CFAEs ablation in persistent AF ablation."

For more information on this research see: Unanswered Questions in Complex Fractionated Atrial Electrogram Ablation. PACE-Pacing and Clinical Electrophysiology, 2016;39(11):1269-1278. PACE-Pacing and Clinical Electrophysiology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news editors report that additional information may be obtained by contacting T. Aksu, Kocaeli Derince Educ & Res Hosp, Dept. of Cardiol, Kocaeli, Turkey. Additional authors for this research include T.E. Guler, K. Yalin and A. Oto.

Investigations from Royal Devon and Exeter NHS Foundation Trust Have Reported New Data on Charcot-Marie-Tooth Disease (Novel homozygous missense mutation in GAN associated with Charcot-Marie-Tooth disease type 2 in a large consanguineous family ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nervous System Diseases and Conditions - Charcot-Marie-Tooth Disease are discussed in a new report. According to news reporting out of Exeter, United Kingdom, by NewsRx editors, research stated, "CMT-2 is a clinically and genetically heterogeneous group of peripheral axonal neuropathies characterized by slowly progressive weakness and atrophy of distal limb muscles resulting from length-dependent motor and sensory neurodegeneration. Classical giant axonal neuropathy (GAN) is an autosomal recessively inherited progressive neurodegenerative disorder of the peripheral and central nervous systems, typically diagnosed in early childhood and resulting in death by the end of the third decade."

Our news journalists obtained a quote from the research from Royal Devon and Exeter NHS Foundation Trust, "Distinctive phenotypic features are the presence of 'kinky' hair and long eyelashes. The genetic basis of the disease has been well established, with over 40 associated mutations identified in the gene GAN, encoding the BTB-KELCH protein gigaxonin, involved in intermediate filament regulation. An Illumina Human CytoSNP-12 array followed by whole exome sequence analysis was used to identify the disease associated gene mutation in a large consanguineous family diagnosed with Charcot-Marie-Tooth disease type 2 (CMT-2) from which all but one affected member had straight hair. Here we report the identification of a novel GAN missense mutation underlying the CMT-2 phenotype observed in this family. Although milder forms of GAN, with and without the presence of kinky hair have been reported previously, a phenotype distinct from that was investigated in this study. All family members
lacked common features of GAN, including ataxia, nystagmus, intellectual disability, seizures, and central nervous system involvement."

According to the news editors, the research concluded: "Our findings broaden the spectrum of phenotypes associated with GAN mutations and emphasize a need to proceed with caution when providing families with diagnostic or prognostic information based on either clinical or genetic findings alone."

For more information on this research see: Novel homozygous missense mutation in GAN associated with Charcot-Marie-Tooth disease type 2 in a large consanguineous family from Israel. BMC Medical Genetics, 2016;17():1-7. BMC Medical Genetics can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. **Biomedical Engineering - Tissue Engineering**

**Investigators from Royal University Hospital Report New Data on Tissue Engineering (Regulation of sequential release of growth factors using bilayer polymeric nanoparticles for cardiac tissue engineering)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biomedical Engineering - Tissue Engineering is the subject of a report. According to news originating from Saskatoon, Canada, by NewsRx correspondents, research stated, "Cardiac tissue engineering aims to develop engineered constructs for myocardial infarction repair, where a challenge is the control of growth factor (GF) sequential release. Herein, bilayer polymeric nanoparticles composed of a GF-encapsulating core surrounded by rate-regulating shell were developed for sequential GF release."

Our news journalists obtained a quote from the research from Royal University Hospital, "Single and bilayer polymeric nanoparticles were fabricated, characterized and biologically assessed. A novel 'Geno-Neural model' was developed and validated for rate-programming of the nanoparticles. The bilayer nanoparticles featured low burst effect and time-delayed release, and allowed for sequential release of PDGF following co-release of VEGF and bFGF, which promoted angiogenesis."
According to the news editors, the research concluded: "The nanoparticulate delivery system, along with the Geno-Neural model, offers great potential for spatiotemporal control of GF release for cardiovascular regenerative medicine."

The news correspondents report that additional information may be obtained from M. Izadifar, Royal Univ Hosp, Saskatchewan Cerebrovasc Center, Saskatoon, SK, Canada. Additional authors for this research include M.E. Kelly and X.B. Chen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2217/nnm-2016-0220. This DOI is a link to an online electronic document that is either free or for purchase.

**Hematology - Plasma**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematology - Plasma is now available. According to news reporting out of Chicago, Illinois, by NewsRx editors, the research stated, "Therapeutic plasma exchange has long been utilized to manage a variety of immune-mediated diseases. The underlying principle is the removal of a circulating pathogenic substance from the plasma and substitution with a replacement fluid."

Our news journalists obtained a quote from the research from Rush University, "Different methodologies of plasma separation include the use of centrifuge, which relies on the variation in the specific gravity of blood components, and membrane-based separation, which relies on particle size. With advancements in technology and clinical insight into disease pathophysiology, membrane technology has become more biocompatible, safer, and more adaptable to conventional hemodialysis and hemofiltration machines. As such, nephrologists, who are familiar with management of extracorporeal blood purification systems, are increasingly involved with membrane-based plasma separation."

According to the news editors, the research concluded: "This review aims to highlight the technical aspects of membrane-based separation, review the prescription for therapy, and draw comparisons with the centrifuge-based technique when applicable."

Investigators from Sapienza-University Zero in on Chronic Venous Disease (Ultrasonography of Skin Changes in Legs with Chronic Venous Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Chronic Venous Disease. According to news reporting originating in Rome, Italy, by NewsRx editors, the research stated, "In daily practice, ultrasonography (US) is used only to designate the location and pattern of venous lesions. Skin US is not performed between routine venous investigations."

The news reporters obtained a quote from the research from Sapienza-University, "Skin morphology is evaluated by the same probes used for routine Duplex evaluation of superficial veins. US findings from evident skin lesions are comparatively evaluated with those from the surrounding apparently normal skin and from the contralateral leg. Inflammation and dermal edema can be found in the apparently normal skin of C2 legs. Swollen legs show thickening of-the subcutaneous layer as a result of diffuse soaking or anechoic cavities, with or without dermal edema. Chronic hypodermitis is characterized by inflammatory edema in initial phases, and by liposclerosis in advanced cases. Recrudescence of inflammation provokes focal rarefactions of the subcutaneous layer, possibly related to ulcer opening. In legs with venous disorders, sonography refines clinical evaluation of the skin and may reveal changes not highlighted by inspection. Some of these changes could require further investigation because they have not yet been explained or described."

According to the news reporters, the research concluded: "Skin sonography should improve knowledge of the natural history of skin changes, as well as contribute to a better grading of venous diseases severity In particular, US evidence of cutaneous and subcutaneous changes in C2 legs should be considered to stratify the treatment in C2 legs, by identifying those in which varicose veins are not simply a cosmetic problem."

Human Herpesvirus Diseases and Conditions –…

Investigators from Sapporo Medical University Release New Data on Epstein-Barr Virus (Virus reactivations after autologous hematopoietic stem cell transplantation detected by multiplex PCR assay)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Human Herpesvirus Diseases and Conditions - Epstein-Barr Virus are discussed in a new report. According to news reporting originating from Hokkaido, Japan, by NewsRx correspondents, research stated, "Several studies have indicated that viral reactivations following allogeneic hematopoietic stem cell transplantation (allo-HSCT) are frequent, but viral reactivations after autologous HSCT (auto-HSCT) have not been investigated in detail. We performed multiplex polymerase chain reaction (PCR) assay to examine multiple viral reactivations simultaneously in 24 patients undergoing auto-HSCT between September 2010 and December 2012."

Our news editors obtained a quote from the research from Sapporo Medical University, "Weekly whole blood samples were collected from pre- to 42 days post-HSCT, and tested for the following 13 viruses; herpes simplex virus 1 (HSV-1), HSV-2, varicella-zoster virus (VZV), Epstein-Barr virus (EBV), cytomegalovirus (CMV), human herpesvirus 6 (HHV-6), HHV-7, HHV-8, adeno virus (ADV), BK virus (BKV), JC virus (JCV), parvovirus B19 (B19V), and hepatitis B virus (HBV). Fifteen (63%) patients had at least one type of viral reactivation. HHV6 (n=10; 41.7%) was most frequently detected followed by EBV (n=7; 29.2%). HHV-6 peaked on day 21 after HSCT and promptly declined. In addition, HBV, CMV, HHV7, and B19V were each detected in one patient. HHV6 reactivation was detected in almost half the auto-HSCT patients, which was similar to the incidence in allo-HSCT patients. The incidence of EBV was unexpectedly high. Viral infections in patients undergoing auto-HSCT were higher than previously reported in other studies."

According to the news editors, the research concluded: "Although there were no particular complications of viral infection, we should pay attention to possible viral reactivations in auto-HSCT patients. J. Med. Virol. 89:358-362, 2017."

For more information on this research see: Virus reactivations after autologous hematopoietic stem cell transplantation detected by multiplex PCR assay. *Journal of Medical Virology*, 2017;89(2):358-362. *Journal of Medical Virology* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell -
Investigators from School of Life Science Release New Data on Prostate Cancer (Ailanthone targets p23 to overcome MDV3100 resistance in castration-resistant prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Androgen receptor (AR) antagonist MDV3100 is the first therapeutic approach in treating castration-resistant prostate cancer (CRPC), but tumours frequently become drug resistant via multiple mechanisms including AR amplification and mutation. Here we identify the small molecule Ailanthone (AIL) as a potent inhibitor of both full-length AR (AR-FL) and constitutively active truncated AR splice variants (AR-Vs)."

Our news journalists obtained a quote from the research from the School of Life Science, "AIL binds to the co-chaperone protein p23 and prevents AR's interaction with HSP90, thus resulting in the disruption of the AR-chaperone complex followed by ubiquitin/proteasome-mediated degradation of AR as well as other p23 clients including AKT and Cdk4, and downregulates AR and its target genes in PCa cell lines and orthotopic animal tumours. In addition, AIL blocks tumour growth and metastasis of CRPC. Finally, AIL possesses favourable drug-like properties such as good bioavailability, high solubility, lack of CYP inhibition and low hepatotoxicity."

According to the news editors, the research concluded: "In general, AIL is a potential candidate for the treatment of CRPC."

The news correspondents report that additional information may be obtained from X. Wang, East China Normal Univ, Sch Life Sci, Shanghai 200241, People's Republic of China.
Investigators from School of Medicine Zero in on Crohn's Disease (A Frameshift in CSF2RB Predominant Among Ashkenazi Jews Increases Risk for Crohn's Disease and Reduces Monocyte Signaling via GM-CSF)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Digestive System Diseases and Conditions - Crohn's Disease is now available. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Crohn's disease (CD) has the highest prevalence in Ashkenazi Jewish populations. We sought to identify rare, CD-associated frameshift variants of high functional and statistical effects."

The news correspondents obtained a quote from the research from the School of Medicine, "We performed exome sequencing and array-based genotype analyses of 1477 Ashkenazi Jewish individuals with CD and 2614 Ashkenazi Jewish individuals without CD (controls). To validate our findings, we performed genotype analyses of an additional 1515 CD cases and 7052 controls for frameshift mutations in the colony-stimulating factor 2-receptor b common subunit gene (CSF2RB). Intestinal tissues and blood samples were collected from patients with CD; lamina propria leukocytes were isolated and expression of CSF2RB and granulocyte-macrophage colony-stimulating factor-responsive cells were defined by adnomatous polyposis coli (APC) time-of-flight mass cytometry (CyTOF analysis). Variants of CSF2RB were transfected into HEK293 cells and the expression and functions of gene products were compared. In the discovery cohort, we associated CD with a frameshift mutation in CSF2RB (P = 8.52 x 10(-4)); the finding was validated in the replication cohort (combined P = 3.42 x 10(-6)). Incubation of intestinal lamina propria leukocytes with granulocyte-macrophage colony-stimulating factor resulted in high levels of phosphorylation of signal transducer and activator of transcription (STAT5) and lesser increases in phosphorylation of extracellular signal-regulated kinase and AK straining transforming (AKT). Cells co-transfected with full-length and mutant forms of CSF2RB had reduced pSTAT5 after stimulation with granulocyte-macrophage colony-stimulating factor, compared with cells transfected with control CSF2RB, indicating a dominant-negative effect of the mutant gene. Monocytes from patients with CD who were heterozygous for the frameshift mutation (6% of CD cases analyzed) had reduced responses to granulocyte-macrophage colony-stimulating factor and markedly decreased activity of aldehyde dehydrogenase; activity of this enzyme has been associated with immune tolerance. In a genetic analysis of Ashkenazi Jewish individuals, we associated CD with a frameshift mutation in CSF2RB."

According to the news reporters, the research concluded: "Intestinal monocytes from carriers of this mutation had reduced responses to granulocyte-macrophage colony-stimulating factor, providing an additional mechanism for alterations to the innate immune response in individuals with CD."

For more information on this research see: A Frameshift in CSF2RB Predominant

**Drugs and Therapies - Pharmaceutical Research**

**Investigators from School of Pharmacy Report New Data on Pharmaceutical Research (Nanomedicines for advanced cancer treatments: Transitioning towards responsive systems)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmaceutical Research. According to news reporting originating in Dublin, Ireland, by NewsRx journalists, research stated, "The development of nanomedicines for the treatment of cancer focuses on the local targeted delivery of chemotherapeutic drugs to enhance drug efficacy and reduce adverse effects. The nanomedicines which are currently approved for clinical use are mainly successful in terms of improved bioavailability and tolerability but do not necessarily increase drug performance."

Funders for this research include RCSI Seed funding Scheme, Science Foundation Ireland (SFI).

The news reporters obtained a quote from the research from the School of Pharmacy, "Therefore, there is a need for improved drug carrier systems which are able to deliver high doses of anti-cancer drugs to the tumor. Stimuli responsive carriers are promising candidates since drug release can be triggered locally in the tumor via internal (i.e. pH, redox potential, metabolite or enzyme concentration) or external (i.e. heat, ultrasound, light, magnetic field)"
stimuli. This review summarizes the recent progress in the transition towards stimuli responsive nanomedicines (i.e. liposomes, polymeric micelles, nanogels and mesoporous silica nanoparticles) and other therapy modalities that are currently developed in the fight against cancer like the application of ultrasound, tumor normalization and phototherapy."

According to the news reporters, the research concluded: "Furthermore, the potential role of image guided drug delivery in the development of new nanomedicines and its clinical application is discussed."

Our news correspondents report that additional information may be obtained by contacting E. Ruiz-Hernandez, RCSI, Sch Pharm, Dublin 2, Ireland. Additional authors for this research include B.P. Murphy, T. Eufrasio-da-Silva, D.P. O'Reilly, T. Vermonden, W.E. Hennink, G.P. Duffy and E. Ruiz-Hernandez.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.013. This DOI is a link to an online electronic document that is either free or for purchase.

Investigators from School of Public Health Target Heme (A novel label-free and signal-on electrochemical aptasensor based on the autonomous assembly of hemin/G-quadruplex and direct electron transfer of hemin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biological Factors - Heme have been presented. According to news reporting originating from Xuzhou, People's Republic of China, by NewsRx correspondents, research stated, "In this study, we developed a signal-on and label-free aptasensor based on the direct electron transfer of hemin and signal amplification by target-catalyzed hairpin assembly followed by a hybridization chain reaction (HCR). Upon the addition of a target protein, it facilitates the opening of the hairpin structure of A1 and thus accelerates the hybridization between A1 and A2; the target protein was displaced from hairpin A1 with hairpin A2 through a process similar to DNA branch migration."

Funders for this research include National Natural Science Foundation of China, Excellent Talents of Xuzhou Medical College, State Key Laboratory of Analytical Chemical for Life Science, Most Foundation of Jiangxi Province.

Our news editors obtained a quote from the research from the School of Public Health, "The released target participates in the next hybridization process with A1. Finally, each target passes through many cycles, confining numerous A1 close to the gold electrode.
Subsequently, the single-strand fragment on the electrode surface initiated HCR, resulting in the hybridization reaction to form double-strand DNA concatemers on the electrode surface. Consequently, hemin stacked into the G-quadruplex-forming region, and the hemin/G-quadruplex was formed, generating an amplified electrochemical signal by differential pulse voltammetry. In our sensing approach, the introduction of HCR significantly enhanced the signal of the sensor response."

According to the news editors, the research concluded: "Moreover, the approach is free of any label conjugation step for signal amplification and simple and thus has great potential for the development of robust aptasensors."

For more information on this research see: A novel label-free and signal-on electrochemical aptasensor based on the autonomous assembly of hemin/G-quadruplex and direct electron transfer of hemin. *Sensors and Actuators B-Chemical*, 2017;238():434-440. *Sensors and Actuators B-Chemical* can be contacted at: Elsevier Science Sa, PO Box 564, 1001 Lausanne, Switzerland.

The news editors report that additional information may be obtained by contacting Y.H. Li, Xuzhou Med Univ, Sch Public Hlth, Xuzhou 221004, People's Republic of China. Additional authors for this research include Y. Qian, Y. Zhang, S.Y. Meng, S.Y. Wang, Y.H. Li and F.L. Gao.

**Drug Development**

**Investigators from Shaheed Beheshti University of Medical Sciences Target Drug Development (PH-sensitive bionanocomposite hydrogel beads based on carboxymethyl cellulose/ZnO nanoparticle as drug carrier)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drug Development have been presented. According to news originating from Tehran, Iran, by NewsRx correspondents, research stated, "The present work explains the preparation of new pH-sensitive bionanocomposite beads based on carboxymethyl cellulose (CMC) and ZnO nanoparticles for use as controlled release drug delivery systems. Fe3+ ion as physical crosslinking agent was used to prepare ionic cross-linked bionanocomposite hydrogel beads."

Our news journalists obtained a quote from the research from the Shaheed Beheshti University of Medical Sciences, "Propranolol hydrochloride (PPN) has been chosen as a model drug. Characterization of the pH-sensitive bionanocomposite beads resulting from incorporation of different content of ZnO nanoparticles into CMC matrix was carried out using different experimental techniques: XRD, FT-IR, TGA, SEM and EDX. Propranolol incorporation efficiency in beads was determined by UV vis spectroscopy and was found to be high."
Moreover, the swelling and drug release properties of the bionanocomposite hydrogels were investigated. The prepared bionanocomposite beads showed a pH sensitive swelling behavior with maximum water absorbing at pH 7.4. Also, it was found that the swelling ratio of ZnO/CMC hydrogels in different aqueous solutions was rather higher in comparison with its neat hydrogel. In vitro drug release test was carried out to prove the effectiveness of this novel type of bionanocomposite hydrogel beads as a controlled drug delivery system."

According to the news editors, the research concluded: "A more sustained and controlled drug releases were observed for ZnONPs containing NaCMC beads, which increased by the increase in ZnONPs content."

For more information on this research see: PH-sensitive bionanocomposite hydrogel beads based on carboxymethyl cellulose/ZnO nanoparticle as drug carrier. _International Journal of Biological Macromolecules_, 2016;93():1317-1327. _International Journal of Biological Macromolecules_ can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Investigators from Shandong University Have Reported New Data on Halomonas [Alkaline Response of a Halotolerant Alkaliphilic Halomonas Strain and Functional Diversity of Its Na+ (K+)/H+ Antiporters]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Halomonas is now available. According to news reporting from Jinan, People's Republic of China, by NewsRx journalists, research stated, "Halomonas sp. Y2 is a halotolerant alkaliphilic strain from Na+-rich pulp mill wastewater with high alkalinity (pH > 11.0)."

The news correspondents obtained a quote from the research from Shandong University, "Transcriptome analysis of this isolate revealed this strain may use various transport systems for pH homeostasis. In particular, the genes encoding four putative Na+/H+ antiporters were differentially expressed upon acidic or alkaline conditions. Further evidence, from heterologous expression and mutant studies, suggested that Halomonas sp. Y2 employs its
Na+/H+ antiporters in a labor division way to deal with saline and alkaline environments. Ha-NhaD2 displayed robust Na+(Li+) resistance and high transport activities in Escherichia coli; a Delta Ha-nhaD2 mutant exhibited growth inhibition at high Na+(Li+) concentrations at pH values of 6.2, 8.0, and 10.0, suggesting its physiological role in osmotic homeostasis. In contrast, Ha-NhaD1 showed much weaker activities in ion exporting and pH homeostasis. Ha-Mrp displayed a combination of properties similar to those of Mrp transporters from some Bacillus alkaliphiles and neutrophiles. This conferred obvious Na+(Li+, K+) resistance in E. coli-deficient strains, as those ion transport spectra of some neutrophil Mrp antiporters. Conversely, similar to the Bacillus alkaliphiles, Ha-Mrp showed central roles in the pH homeostasis of Halomonas sp. Y2. An Ha-mrp-disrupted mutant was seriously inhibited by high concentrations of Na+(Li+, K+) but only under alkaline conditions."

According to the news reporters, the research concluded: "Ha-NhaP was determined to be a K+/H+ antiporter and shown to confer strong K+ resistance both at acidic and alkaline stresses."

Our news journalists report that additional information may be obtained by contacting C.Y. Yang, Shandong University, State Key Lab Microbial Technol, Jinan 250100, People's Republic of China. Additional authors for this research include Y.W. Meng, Y.B. Cui, C.F. Li, F. Tao, H.J. Yin, C.Y. Yang and P. Xu.

Keywords for this news article include: Jinan, People's Republic of China, Asia, Gram-Negative Aerobic Rods and Cocci, Gram-Negative Bacteria, Gammaproteobacteria, Halomonadaceae, Proteobacteria, Halomonas, Genetics, Shandong University.

Proteins - Nerve Tissue Proteins

Investigators from Shandong University Target Nerve Tissue Proteins (Gamma-synuclein binds to AKT and promotes cancer cell survival and proliferation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Proteins - Nerve Tissue Proteins is the subject of a report. According to news reporting originating from Jinan, People's Republic of China, by NewsRx correspondents, research stated, "Hyperactivation of AKT plays a critical role in the survival and proliferation of cancer cells. However, the molecular mechanisms underlying AKT activation remain elusive."

Our news editors obtained a quote from the research from Shandong University, "Here, we tested the effect of gamma-synuclein, a member of the synuclein family of proteins, on the activation of AKT. We show that the expression level of gamma-synuclein is increased in non-small cell lung cancer (NSCLC) tissues. gamma-Synuclein binds to the protein kinase domain of AKT and promotes its phosphorylation. Overexpression of gamma-synuclein in H157
cells enhances cell proliferation and protects the cells from staurosporine-induced cytotoxicity. Knockdown of gamma-synuclein attenuates AKT activation and cell proliferation induced by epidermal growth factor. The effect of gamma-synuclein is abolished when AKT is depleted."

According to the news editors, the research concluded: "Thus, gamma-synuclein promotes cell survival and proliferation via activating AKT and may play a causal role in the pathogenesis of NSCLC."

For more information on this research see: Gamma-synuclein binds to AKT and promotes cancer cell survival and proliferation. Tumor Biology, 2016;37(11):14999-15005. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

The news editors report that additional information may be obtained by contacting Y.R. Ju, Shandong University, Shandong Prov Hosp, Dept. of Resp, Jinan 250021, People's Republic of China. Additional authors for this research include J.Y. Niu, E.L. Sun, X.D. Rong, X.X. Zhang and Y.R. Ju.

Heart Disorders and Diseases - Heart Failure

Investigators from Shanghai Jiao-Tong University Report New Data on Heart Failure (IL-34 is associated with the presence and severity of renal dysfunction and coronary artery disease in patients with heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Failure. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Pro-inflammatory mediators are identified in patients with heart failure (HF), some of which may be used as biomarkers with diagnostic or prognostic value. As an additional ligand of Colony Stimulating Factor-1 Receptor (CSF-1R), interleukin-34 (IL-34) has been identified as a pro-inflammatory cytokine participating in chronic heart failure (CHF)."

The news reporters obtained a quote from the research from Shanghai Jiao-Tong University, "However, the potential impact of IL-34 in CHF complications remains unknown. In order to determine the clinical significance of serum IL-34 in CHF patients, especially those with kidney dysfunction and coronary artery disease (CAD) comorbid conditions, serum IL-34 was measured in 510 consecutive patients with CHF in a cross-sectional study. The present study demonstrated that higher serum IL-34 levels were associated with poorer renal function and more severe anemia in patients with CHF. After adjusting for age, gender, conventional risk factors, and other significant covariates, IL-34 positively correlated with the presence and
severity of renal dysfunction (as measured by eGFR and cystatin C) on multivariable linear and logistic regression analysis. IL-34 was also demonstrated to be an independent risk factor for CAD among HF patients."

According to the news reporters, the research concluded: "Elevated serum IL-34 levels were demonstrated to be independently associated with renal insufficiency and CAD in patients with CHF, regardless of the systolic function."

For more information on this research see: IL-34 is associated with the presence and severity of renal dysfunction and coronary artery disease in patients with heart failure. *Scientific Reports*, 2016;6():9-16. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **Oncology - Bone Cancer**

**Investigators from Shanghai Jiao-Tong University Target Bone Cancer (Osteotropic peptide-mediated bone targeting for photothermal treatment of bone tumors)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Bone Cancer. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The treatment of bone tumors is a challenging problem due to the inefficient delivery of therapeutics to bone and the bone microenvironment-associated tumor resistance to chemo- and radiotherapy. Here, we developed a bone-targeted nanoparticle, aspartate octapeptide-modified dendritic platinum-copper alloy nanoparticle (Asp-DPCN), for photothermal therapy (PTT) of bone tumors."

Funders for this research include National Key Research and Development Program of China, National Natural Science Foundation of China, Basic Research Program of Science and Technology Commission of Shanghai Municipality, Fok Ying Tong Education Foundation, Shanghai Pujiang Program.

Our news editors obtained a quote from the research from Shanghai Jiao-Tong University, "Asp-DPCN showed much higher affinity toward hydroxyapatite and bone fragments than the non-targeted DPCN in vitro. Furthermore, Asp-DPCN accumulated more efficiently around bone tumors in vivo, and resulted in a higher temperature in bone tumors during PIT. Finally, Asp-DPCN-mediated nu not only efficiently depressed the tumor growth but also significantly reduced the osteoclastic bone destruction."
According to the news editors, the research concluded: "Our study developed a promising therapeutic approach for the treatment of bone tumors."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.biomaterials.2016.11.010. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Breast Cancer**

**Investigators from Shantou University Have Reported New Data on Breast Cancer (Evaluating Breast Cancer Risk under Exposure to Environmental Estrogen-Like Chemicals)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Breast cancer is the most prevalent cancer among women in the world, with a notable increasing prevalence in recent decades. Many environmental compounds with estrogenic activity, called environmental estrogens (EEs), which are especially persistent organic pollutants, may play important roles in the occurrence and development of breast cancer and even treatment and prognosis."

The news reporters obtained a quote from the research from Shantou University, "EE compounds, including bisphenol A, nonylphenol, phthalates, perfluorooctane sulfonate, polybrominated diphenyl ethers, dioxins, and polychlorinated biphenyls, result from industrial manufacturing and exist ubiquitously in the human environment. With the aggravation of environmental pollution, these compounds are residual in all kinds of environmental matrices - especially in industrialized countries. Humans are frequently exposed to them through various pathways, including body contact, inhalation, diet, household products, dust, and cosmetics. They have been detected in many types of human specimens. Their persistence in environmental matrices and humans has aroused global attention because of their effect on public health, especially the occurrence of breast cancer."

According to the news reporters, the research concluded: "In this review, we focus on recent research of these seven familiar EEs in industrial pollutants to provide insight into the
evidence for risk of breast cancer with exposure to environmental estrogen-like chemicals and to provide clues for prevention and control of breast cancer."

Our news correspondents report that additional information may be obtained by contacting K.S. Wu, Shantou University, Coll Med, Dept. of Prevent Med, Shantou 515041, Guangdong, People's Republic of China. Additional authors for this research include X.L. Wang and K.S. Wu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.15244/pjoes/64282. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Cancer Risk

Investigators from Shenzhen University Report New Data on Cancer Risk (Quantitative assessment of human health risk posed by polycyclic aromatic hydrocarbons in urban road dust)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Cancer Risk are presented in a new report. According to news originating from Shenzhen, People's Republic of China, by NewsRx correspondents, research stated, "Among the numerous pollutants present in urban road dust, polycyclic aromatic hydrocarbons (PAHs) are among the most toxic chemical pollutants and can pose cancer risk to humans. The primary aim of the study was to develop a quantitative model to assess the cancer risk from PAHs in urban road dust based on traffic and land use factors and thereby to characterise the risk posed by PAHs in fine (<150 mu m) and coarse (>150 mu m) particles."

Our news journalists obtained a quote from the research from Shenzhen University, "The risk posed by PAHs was quantified as incremental lifetime cancer risk (ILCR), which was modelled as a function of traffic volume and percentages of different urban land uses. The study outcomes highlighted the fact that cancer risk from PAHs in urban road dust is primarily influenced by PAHs associated with fine solids. Heavy PAHs with 5 to 6 benzene rings, especially dibenzo[a,h]anthracene (D[a]A) and benzo[a] pyrene (B[a]P) in the mixture contribute most to the risk." According to the news editors, the research concluded: "The quantitative model developed based on traffic and land use factors will contribute to informed decision making in relation to the management of risk posed by PAHs in urban road dust."

For more information on this research see: Quantitative assessment of human health risk posed by polycyclic aromatic hydrocarbons in urban road dust. Science of the Total
Investigators from Simon Fraser University Have Reported New Data on Nanoparticles (NanoHDA: A nanoparticle-assisted isothermal amplification technique for genotyping assays)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nanotechnology - Nanoparticles are presented in a new report. According to news reporting from Burnaby, Canada, by NewsRx journalists, research stated, "Isothermal methods, such as helicase-dependent amplification (HDA), have an advantage over polymerase chain reaction for DNA amplification owing to their ease of operation. Here, we developed a new HDA method that is nanoparticle-assisted, termed nanoHDA."

The news correspondents obtained a quote from the research from Simon Fraser University, "This method uses gold nanoparticles (AuNPs) to improve the sensitivity and specificity of the isothermal method. In HDA, the denaturation of DNA templates is mediated by helicases, but this method is limited by the low denaturation efficiency of helicases. In this report, AuNPs with preferential affinity for single-stranded DNA (ssDNA) were utilized to improve the denaturation efficiency of helicases. The same affinity property of nanoparticles can also enhance specificity by suppressing primer-dimer formation."

According to the news reporters, the research concluded: "This nanoHDA method was employed to genotype the KRAS gene in genomic DNA samples from colorectal cancer patients, as achieved by the hybridization of nanoHDA amplicons using the NanoBioArray chip."

Our news journalists report that additional information may be obtained by contacting P.C.H. Li, Simon Fraser University, Dept. of Chem, Burnaby, BC V5A 1S6, Canada.
Investigators from Singapore National University Report New Data on Ethnopharmacology (Investigation of uterotonic properties of Ananas comosus extracts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Ethnopharmacology are presented in a new report. According to news originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: In folklore medicine Ananas comosus (pineapple) is reputed to act as an abortifacient and in expectant women as a means of inducing labor. Several reports have claimed abortifacient property of A. comosus fruit (ripe or unripe)."

Our news journalists obtained a quote from the research from Singapore National University, "Ripe fruit has been used orally as traditional medicine in inducing abortion in Kerala state of India while the juice of unripe fruit was used for abortion in Bangladesh. However, scientific evidence supporting the efficacy of pineapple extracts in inducing uterine contractions is clearly lacking. Aim of the study: This study investigated the pharmacological effects of different fractions of pineapple extract with a range of maturities to identify the most potent uterotonic fraction. The ethanolic crude extracts of pineapple (edible part) were prepared and fractionated through a series of liquid-liquid partitions. Fractions were separately tested on isolated uterine muscle from pregnant SD rats and human pregnant myometrium, which were cut into strips along the longitudinal axis of uterus. The strips were mounted vertically in organ baths (37 degrees C) and exposed to cumulative addition of fractions (0.1-10 mg ml(-1)), serotonin (0.05-5 mu M) and different inhibitors to delineate the mechanism of action of the active ingredients of the extract. Aqueous fraction (F4) possesses uterine stimulant property which was blocked by verapamil but unaffected by indomethacin, prazosin and atosiban. Notably, ketanserin (10 mu M) diminished the maximal contractile response induced by both F4 and 5HT by 74.3% and 92.1% respectively."

According to the news editors, the research concluded: "These results may indicate the presence of 5HT or 5HT-like compound(s) and serotonergic pathways may contribute to the uterotonic activity of pineapple extract."

The news correspondents report that additional information may be obtained from P.G. Adaikan, Singapore National University, Yong Loo Lin Sch Med, Dept. of Obstet & Gynaecol, Singapore 119228, Singapore. Additional authors for this research include P.G. Adaikan, L.C. Lau, B. Bin Said, Y.H. Gong, H.M. Tan and M. Choolani.

Heart Disorders and Diseases - Heart Failure

Investigators from Sophiahemmet University Have Reported New Data on Heart Failure (y Patterns and the mediating role of avoidant coping style and illness perception on anxiety and depression in patients with chronic heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting originating in Stockholm, Sweden, by NewsRx journalists, research stated, "Emotional distress in patients with chronic heart failure (CHF) predicts mortality, hospital readmission and quality of life. The patient's avoidant coping style and beliefs about the disease have been linked to emotional distress in CHF."

The news reporters obtained a quote from the research from Sophiahemmet University, "However, the pattern and transmitting effects of these variables are indefinite. This study aimed to examine the links between and the potential mediating role of illness perceptions and avoidant coping style on depression and anxiety in patients with CHF. Self-assessment data from 103 patients with CHF were subjected to path analysis in two hypothesised models. The outcome measures were coping styles, illness perception, anxiety and depression. Avoidant coping had a direct adverse effect on anxiety and depression. The perception of symptom burden and personal control, significantly mediated the effect between avoidant coping and anxiety and depression."

According to the news reporters, the research concluded: "Avoidant coping style appears to influence not only emotional distress, but also a malignant symptom perception and low sense of control over the illness."

Our news correspondents report that additional information may be obtained by contacting C.N. Bose, Sophiahemmet Univ, Stockholm, Sweden. Additional authors for this research include M.L. Elfstrom, G. Bjorling, H. Persson and F. Saboonchi.

Lung Diseases and Conditions - Asthma

Investigators from Southeast University Have Reported New Data on Asthma (Atopy and Specific Cancer Sites: a Review of Epidemiological Studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Asthma are discussed in a new report. According to news originating from Yancheng, People's Republic of China, by NewsRx correspondents, research stated, "Mounting evidence appears to link asthma and atopy to cancer susceptibility. This review presents and discusses published epidemiological studies on the association between site-specific cancers and atopy."

Financial support for this research came from National Sciences Foundation of China.

Our news journalists obtained a quote from the research from Southeast University, "PubMed was searched electronically for publications between 1995 and 2015, and cited references were researched manually. Quantitative studies relating to atopy, allergy, or asthma and cancer were identified and tabulated. Despite many exposure-related limitations, patterns in the studies were observed. Asthma, specifically, has been observed to be a risk factor for lung cancer. A protective effect of atopic diseases against pancreatic cancer has been shown consistently in case-control studies but not in cohort studies. Allergy of any type appears to be protective against glioma and adult acute lymphoblastic leukemia. Most studies on atopic diseases and non-Hodgkin lymphoma or colorectal cancer reported an inverse association. The other sites identified had varying and non-significant outcomes."

According to the news editors, the research concluded: "Further research should be dedicated to carefully defined exposure assessments of 'atopy' as well as the biological plausibility in the association between atopic diseases and cancer."

For more information on this research see: Atopy and Specific Cancer Sites: a Review of Epidemiological Studies. Clinical Reviews in Allergy & Immunology, 2016;51(3):338-352. Clinical Reviews in Allergy & Immunology can be contacted at: Humana Press Inc, 999 Riverview Drive Suite 208, Totowa, NJ 07512, USA.

Investigators from St. Louis University Zero in on Head and Neck Cancer (Palliative Care Considerations for Patients With Head and Neck Cancer With Children at Home)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Head and Neck Cancer have been presented. According to news reporting from St. Louis, Missouri, by NewsRx journalists, research stated, "Adult patients diagnosed with head and neck cancer (HNC) who may have contact with children in the home setting are at risk of experiencing distress because of embarrassing and challenging oral symptoms often associated with an HNC diagnosis and the side effects of required treatments. This article features a case study involving a patient diagnosed with HNC and details how oncology nurses can provide patients with HNC and their caregivers with resources and support."

The news correspondents obtained a quote from the research from St. Louis University, "At a Glance Patients with HNC often experience pain and embarrassment because of oral and body image side effects during and after radiation treatments. Homecare management stress is commonly reported by caregivers of patients with HNC."

According to the news reporters, the research concluded: "Oncology nurses are particularly well positioned to offer psychosocial-focused palliative care support to patients with HNC and their caregivers during radiation treatments."

For more information on this research see: Palliative Care Considerations for Patients With Head and Neck Cancer With Children at Home. Clinical Journal of Oncology Nursing, 2016;20(6):585-587. Clinical Journal of Oncology Nursing can be contacted at: Oncology Nursing Soc, 125 Enterprise Dr, Pittsburgh, PA 15275, USA.

Investigators from Sun Yat Sen University Report New Data on Clinical Trials and Studies (Sequential four-drug chemotherapy and intensity-modulated radiotherapy for larynx preservation in resectable advanced larynx and hypopharynx cancer: A ...

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Clinical Research - Clinical Trials and Studies are presented in a new report. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "The value of additional use of cetuximab with the classical cisplatin, docetaxel and 5-fluorouracil regimen in larynx preservation remains unknown. This study was designed to resolve this issue and appraise its toxicity."

Our news journalists obtained a quote from the research from Sun Yat Sen University, "Thirteen untreated patients with stage III-IV larynx or hypopharynx squamous cell carcinoma were recruited and received two cycles of C + TPF regimen (cetuximab plus docetaxel, cisplatin and 5-fluorouracil), followed by one more cycle of C + TPF and intensity-modulated radiotherapy (70 Gy). Primary endpoint was larynx preservation (LP) rate at 3 months. Secondary endpoints were larynx function preservation (LFP) and overall survival (OS) at 12, 36 and 60 months. With a two-cycle induction treatment of C + TPF protocol, four (31%) and nine (69%) patients achieved complete and partial response, respectively. The top three toxicities were dermatitis (9 cases), nausea/vomiting (6 cases), and anemia (4 cases). After the full-course treatment, 12 out of 13 patients (92.3%) obtained LP at 3 months. This strategy demonstrated relatively high LFP rates of 92.3%, 69.2% and 54.5% and satisfactory OS rates of 100%, 84.6% and 54.5% at 12, 36 and 60 months, respectively."

According to the news editors, the research concluded: "These preliminary results suggest induction treatment with C + TPF regimens, followed by intensity-modulated radiotherapy is well-tolerated, which warrants further evaluation."

The news correspondents report that additional information may be obtained from A.K. Yang, Sun Yat Sen UniversityCenter Canc, Dept. of Head & Neck, State Key Lab Oncol South ChinaCollaborat Innova, Guangzhou, Guangdong, People's Republic of China. Additional authors for this research include C.Y. He, T. Tang, W.C. Chen, Z.Q. Li, Y. Chen and A.K. Yang.

Oncology - Colon Cancer

Investigators from Taipei Medical University Release New Data on Colon Cancer (Down-regulation of let-7a-5p predicts lymph node metastasis and prognosis in colorectal cancer: Implications for chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Colorectal cancer (CRC) guidelines recommend adjuvant chemotherapy according to the level of lymph node metastasis. Let-7a-5p is a microRNA, which inhibits migration, invasion, as well as the epithelial-mesenchymal transition by targeting HMGA2."

Financial supporters for this research include National Science Council, Health and welfare surcharge of tobacco products, Ministry of Health and Welfare.

Our news journalists obtained a quote from the research from Taipei Medical University, "The aim of this study was to investigate the role of let 7a-5p in the clinical impact of CRC. In this study, one hundred and ninety-two CRC patients were enrolled. The expression of let-7a-5p and HMGA2 in serum and tumour tissues were analysed by real-time PCR and immunohistochemistry. Kaplan-Meier analysis was used to analyse primary outcomes, including the survival and tumour recurrence. The expression of let-7a-5p in tumour tissues was significantly negative correlated with the tumour size, stage and lymph node metastasis in CRC patients (p = 0.024 for tumour size, p< 0.0001 for stage and p< 0.0001 for lymph node metastasis). There was a negative correlation between the levels of let-7a-5p and the HMGA2 protein (p < 0.0001). The overall survival (OS) and disease-free survival (DFS) rates of patients with let-7a-5p low/HMGA2 high were poorer than those with let-7a-5p high/HMGA2 high, let-7a-5p high/HMGA2 low and let-7a-5p low/HMGA2 low. In addition, the expression levels of let-7a-5p in sera were positively correlated with let 7a-5p in the tumour tissues of the CRC patients. The expression levels of let-7a-5p in sera also could be used as a biomarker to predict clinical outcome. We suggest that down-regulation of let-7a-5p in sera and tumour tissues of CRC patients could be used to predict lymph node metastasis and the disease prognosis."

According to the news editors, the research concluded: "These results could be implicated for chemotherapy suggestion."

The news correspondents report that additional information may be obtained from Y.W. Cheng, Taipei Medical University, Taipei Med Univ Hosp, Center Canc, Taipei, Taiwan. Additional authors for this research include C.C. Huang, K.T. Yeh, T.W. Ke, P.L. Wei, J.R. Yang and Y.W. Cheng.

The direct object identifier (DOI) for that additional information is:
Investigators from Tel Aviv University Have Reported New Data on Nephrology (Can Unenhanced CT Findings Predict Interventional Versus Conservative Treatment in Acute Renal Colic?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nephrology is the subject of a report. According to news originating from Tel Aviv, Israel, by NewsRx correspondents, research stated, "The purpose of this study was to determine the value of clinical parameters and radiologic findings on unenhanced CT to the choice between interventional and conservative management for patients with acute renal colic. Unenhanced CT records of 183 consecutive patients with acute renal colic were retrospectively reviewed."

Our news journalists obtained a quote from the research from Tel Aviv University, "Urolithiasis was confirmed at both unenhanced CT and clinical follow-up findings of 80 patients (study group). Clinical parameters (signs of infection and renal indexes) and unenhanced CT findings (tissue rim sign, hydronephrosis, perinephric and periureteral edema, ureteral dilatation, renal attenuation, and stone characteristics) were graded and correlated with the choice of clinical management. ROC analysis was constructed for the most statistically significant parameters. Forty-two patients (52%) were treated conservatively and 38 (48%) underwent interventional treatments. The relationship between shivering, fever, and leukocytosis and interventional treatment had low sensitivity (29%, 26%, and 16%, respectively) but very high specificity (98%, 95%, and 98%, respectively) (p < 0.05). Stone size and density were statistically significantly different between patients treated conservatively and those treated interventionaly (size, 4.6 vs 6.7 mm; density, 730 vs 910 HU; p< 0.01). Stones larger than 6.5 mm with an attenuation value greater than 1100 HU and that were proximally located were more likely to be treated interventionaly. Larger stone size, higher density, proximal location, and complaints of shivering, fever, and leukocytosis are the most important parameters for predicting invasive management of acute renal colic."

According to the news editors, the research concluded: "Other clinical and radiologic information may be useful as supportive findings but do not predict the choice of patient management."

For more information on this research see: Can Unenhanced CT Findings Predict Interventional Versus Conservative Treatment in Acute Renal Colic? American Journal of Roentgenology, 2016;207(5):1016-1021. American Journal of Roentgenology can be contacted at: Amer Roentgen Ray Soc, 1891 Preston White Dr, Subscription Fulfillment, Reston, VA 22091, USA.

The news correspondents report that additional information may be obtained from O.
Investigators from Third Military Medical University Target Respiratory Tract (Deficiency of LIGHT signaling pathway exacerbates Chlamydia psittaci respiratory tract infection in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Respiratory Tract. According to news reporting from Chongqing, People's Republic of China, by NewsRx journalists, research stated, "LIGHT, a costimulatory member of the immunoglobulin superfamily (Ig SF), can greatly impact T cell activation. The role of the LIGHT signaling pathway in chlamydial infection was evaluated in mice following respiratory tract infection with Chlamydia psittaci."

Financial supporters for this research include National Natural Science Foundation of China, Natural Science Foundation of Hunan Province.

The news correspondents obtained a quote from the research from Third Military Medical University, "Compared with wild type (WT) mice, LIGHT knockout (KO) mice showed significant reduction of body weight, much lower survival rate, higher bacterial burden, prolonged infection time courses and more severe pathological changes in lung tissue. The mRNA levels of IFN-gamma, TNF-alpha, IL-17 and IL-12 in the lung tissue of LIGHT KO mice were significantly lower than those in WT mice. While there was no obvious difference in the percentages of CD4(+) and CD8(+) T cells in the spleens of the two groups of mice, there was a markedly elevated percentage of CD4+ CD25(+) FoxP3(+) Treg cells in LIGHT KO mice."

According to the news reporters, the research concluded: "Together, these results demonstrate that the LIGHT signaling pathway is not only required for inflammatory cytokine production as part of the host response to chlamydial infection, but also influences the differentiation of CD4(+) CD25(+) FoxP3(+) Treg cells, both of which may be essential for control of C. psittaci respiratory tract infection."

Our news journalists report that additional information may be obtained by contacting G.L. Xu, Third Military Medical University, Inst Immunol, Chongqing 400038, People's Republic of China. Additional authors for this research include S.H. Chen, S. Xu, Y.B.
Investigators from Thomas Jefferson University Target Thrombocytopenia [TULA-2 (T-Cell Ubiquitin Ligand-2) Inhibits the Platelet Fc Receptor for IgG IIA (Fc gamma RIIA) Signaling Pathway and Heparin-Induced Thrombocytopenia in Mice]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematologic Diseases and Conditions - Thrombocytopenia is now available. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "The objective of this study is to investigate the role of T-cell ubiquitin ligand-2 (TULA-2) in the platelet Fc receptor for IgG IIA (Fc gamma RIIA) pathway and in the pathogenesis of heparin-induced thrombocytopenia (HIT). Approach and Results-HIT is a life-threatening thrombotic disease in which IgG antibodies against the heparin-platelet factor 4 complex activate platelets via Fc gamma RIIA."

Our news editors obtained a quote from the research from Thomas Jefferson University, "We reported previously differential expression of TULA-2 in human population was linked to Fc gamma RIIA responsiveness. In this study, we investigated the role of TULA-2, a protein phosphatase, in the Fc gamma RIIA pathway and HIT pathogenesis by crossing TULA-2(-/-) mice with transgenic Fc gamma RIIA(+/+) mice. Ablation of TULA-2 resulted in hyperphosphorylation of spleen tyrosine kinase, linker for the activation of T cells, and phospholipase C gamma 2 in platelets via Fc gamma RIIA activation. Platelet integrin activation, granule secretion, phosphatidylserine exposure, and aggregation were also enhanced in TULA-2(-/-) murine platelets. Compared with wild-type mice, TULA-2(-/-) mice showed aggravated antibody-mediated thrombocytopenia, augmented thrombin generation, and shortened tail bleeding time. In contrast, there was no significant difference between TULA-2(-/-) and TULA-2(+/+) platelets in platelet spreading and clot retraction. Of note, heterozygous TULA-2(+/+) mice, whose platelets contained 50% as much protein as the TULA-2(+/+) platelets, showed significantly increased platelet reactivity and more severe thrombocytopenia in vivo compared with TULA-2(+/+) mice. Together, the data demonstrate that not only the absence of TULA-2 but also the relative level of TULA-2 expression modulates Fc gamma RIIA-mediated platelet reactivity and HIT in vivo."

According to the news editors, the research concluded: "TULA-2 expression could be a valuable marker for HIT and inhibiting TULA-2 may serve as a potential therapy to reverse the bleeding adverse effect of anticoagulants."
For more information on this research see: TULA-2 (T-Cell Ubiquitin Ligand-2) Inhibits the Platelet Fc Receptor for IgG IIA (Fc gamma RIIA) Signaling Pathway and Heparin-Induced Thrombocytopenia in Mice. *Arteriosclerosis Thrombosis and Vascular Biology*, 2016;36(12):2315-2323. *Arteriosclerosis Thrombosis and Vascular Biology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

The news editors report that additional information may be obtained by contacting S.E. McKenzie, Thomas Jefferson University, Cardeza Fdn Hematol Res, Dept. of Med, Philadelphia, PA 19107, United States. Additional authors for this research include S. Abraham, S. Renna, L.C. Edelstein, C.A. Dangelmaier, A.Y. Tsygankov, S.P. Kunapuli, P.F. Bray and S.E. McKenzie.

**Nutritional and Metabolic Diseases and Conditions**

**Investigators from Tokyo Medical and Dental University Zero in on Obesity (Reduced Morning Cortisol Concentration in Saliva Was Associated with Obesity: Evidence from Community-Dwelling Adults in Papua New Guinea)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Obesity are discussed in a new report. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "This study investigated morning salivary cortisol concentration in relation to total body fat composition among community-dwelling Papua New Guinean adults. In addition to demographic and anthropometric measurements, saliva was collected in a single morning from 478 residents in Eastern Highlands Province and Madang Province." Our news editors obtained a quote from the research from Tokyo Medical and Dental University, "After adjusting for age, region, and occupation, the morning salivary cortisol concentration was significantly negatively correlated with body mass index among men (B = -0.01, P< 0.05) and women (B = -0.013, P< 0.05), and waist circumference (B = -0.007, P< 0.05), waist-to-hip-ratio (B = -1.214, P< 0.05), and subscapular-to-triceps skinfold-thickness ratio (B = -0.045, P< 0.05) among men. Men with total or abdominal body fat mass known for elevated risk of non-communicable diseases displayed lower cortisol compared to men without such risk."

According to the news editors, the research concluded: "Papua New Guinean adults with increased accumulation of body fat showed reduced cortisol concentration in morning saliva."

For more information on this research see: Reduced Morning Cortisol Concentration in Saliva Was Associated with Obesity: Evidence from Community-Dwelling Adults in Papua New Guinea.
Investigators from Tufts Medical Center Zero in on Bacteroides (In Vitro Evaluation of the Activity of Imipenem-Relebactam against 451 Recent Clinical Isolates of Bacteroides Group and Related Species)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Bacteroides. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "We evaluated the in vitro activity of imipenem-relebactam (imipenem-MK7655) against 451 recent clinical isolates within the Bacteroides group and related species.

The news correspondents obtained a quote from the research from Tufts Medical Center, "Relebactam did not enhance or inhibit the activity of imipenem against Bacteroides fragilis or other Bacteroides species. No synergistic or antagonistic effect was observed."

According to the news reporters, the research concluded: "The MICs of imipenem-relebactam were equal to or within one dilution of the MICs of these isolates to imipenem."

For more information on this research see: In Vitro Evaluation of the Activity of Imipenem-Relebactam against 451 Recent Clinical Isolates of Bacteroides Group and Related Species. Antimicrobial Agents and Chemotherapy, 2016;60(10):6393-6397. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Investigators from Tulane University Report New Data on Prostate Cancer (Emerging data on androgen receptor splice variants in prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting out of New Orleans, Louisiana, by NewsRx editors, research stated, "Androgen receptor splice variants are alternatively spliced variants of androgen receptor, which are C-terminally truncated and lack the canonical ligand-binding domain. Accumulating evidence has indicated a significant role of androgen receptor splice variants in mediating resistance of castration-resistant prostate cancer to current therapies and in predicting therapeutic responses."

Our news journalists obtained a quote from the research from Tulane University, "As such, there is an urgent need to target androgen receptor splicing variants for more effective treatment of castration-resistant prostate cancer. Identification of precise and critical targeting points to deactivate androgen receptor splicing variants relies on a deep understanding of how they are generated and the mechanisms of their action."

According to the news editors, the research concluded: "In this review, we will focus on the emerging data on their generation, clinical significance and mechanisms of action as well as the therapeutic influence of these findings."

For more information on this research see: Emerging data on androgen receptor splice variants in prostate cancer. Endocrine-Related Cancer, 2016;23(12):T199-T210. Endocrine-Related Cancer can be contacted at: Bioscientifica Ltd, Euro House, 22 Apex Court Woodlands, Bradley Stoke, Bristol BS32 4JT, England.

Our news journalists report that additional information may be obtained by contacting Y. Dong, Tulane University, Sch Med, Dept. of Struct & Cellular Biol, Tulane Canc Center, New Orleans, LA 70112, United States. Additional authors for this research include Y. Zhan and Y. Dong.

Investigators from United Hospitals Target Tuberculosis and Lung Disease [Pyrazinamide susceptibility testing: proposed new standard with the BAGTEC(TM) MGIT(TM) 960 system]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Tuberculosis and Lung Disease have been published. According to news reporting out of Ancona, Italy, by NewsRx editors, research stated, "The susceptibility of 253 Mycobacterium tuberculosis complex isolates to pyrazinamide (PZA) was assessed using the BACTEC™ MGIT™ 960 (M960) system. Resistant strains underwent paired repeat testing using 1) a critical concentration of 200 µg/mL (PZA-200), and 2) a reduced inoculum of 0.25 ml." Our news journalists obtained a quote from the research from United Hospitals, "They were also examined using the BACTEC 460 (B460) reference method and investigated for pncA mutations. On M960, 37 isolates were resistant. In the PZA-200 assay, 20 of these were resistant and 17 susceptible, while 18 were resistant and 19 susceptible with reduced inoculum."

According to the news editors, the research concluded: "The B460 assay and pncA sequencing confirmed results with reduced inoculum."

For more information on this research see: Pyrazinamide susceptibility testing: proposed new standard with the BAGTEC™ MGIT™ 960 system. International Journal of Tuberculosis and Lung Disease, 2016;20(12):1677-1680. Drugs and Therapies - Pharmaceutical Design

Investigators from University College Target Pharmaceutical Design (ABC Transporters and Drug Resistance in Patients with Epilepsy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Pharmaceutical Design have been presented. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Resistance to antiepileptic drugs (AED) remains a major problem in clinical epileptology. This pharmacoresistance is independent of the choice of AEDs."

The news correspondents obtained a quote from the research from University College, "Different hypotheses have been proposed to explain the neurobiological basis for pharmacoresistance in epilepsy. The transporter hypothesis is the mostly investigated theory.
Hereby, overexpression of multidrug efflux transporters, such as P-glycoprotein (Pgp), at the blood-brain-barrier (BBB) is thought to be involved in pharmacoresistance in epilepsy by extruding AEDs from their target site. Accumulating evidence supports an overexpression of Pgp in pharmacoresistant epilepsy. Molecular Imaging studies provide unique opportunities for the in-vivo study of the transporter hypothesis in the central nervous system (CNS). Several studies demonstrated that positron emission tomography (PET) with [C-11]-radiolabeled Pgp substrates is a promising tool for in vivo investigation of Pgp function at the rat, monkey and human BBB.

According to the news reporters, the research concluded: "Quantification of Pgp over activity in epilepsy patients by in vivo imaging could be highly useful because altered treatment strategies or novel AED could then be applied."

Our news journalists report that additional information may be obtained by contacting M. Koepp, UCL, Neurol Inst, Dept. of Clin & Expt Epilepsy, London, United Kingdom.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2174/1381612822666160810150416. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Chemotherapy**

**Investigators from University Hospital Zero in on Chemotherapy (Preoperative predictors of delay in initiation of adjuvant chemotherapy in patients undergoing primary debulking surgery for ovarian cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Chemotherapy are discussed in a new report. According to news originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "The objective of this study was to identify preoperative characteristics of patients that experience a delay in initiation of adjuvant chemotherapy after primary debulking surgery for ovarian cancer. We performed a retrospective review of patients with Stage II to IV high-grade epithelial ovarian, tubal, and peritoneal carcinoma who underwent primary debulking surgery followed by adjuvant chemotherapy from 2005 to 2013."

Our news journalists obtained a quote from the research from University Hospital, "Patients were divided into 2 groups: Control (those who received their first cycle of chemotherapy within 6 weeks of debulking surgery) vs. chemotherapy delay (those who received their first cycle of chemotherapy at an interval >6 weeks from primary debulking surgery). Relevant clinical variables and survival outcomes were compared between the 2
groups using standard statistical methods. A total of 221 patients were included in the analyses, with 169 (76.5%) in the control group and 52 (23.5%) in the chemo delay group. On multi-variate analysis, risk factors that were significantly associated with a delay in initiation of chemotherapy included: age >65, albumin <3.5, and high age-adjusted Charlson Comorbidity Index score. Delay in chemotherapy initiation was associated with a shorter progression-free (p = 0.014) but not overall survival (p = 0.19). Delay in initiation of chemotherapy affected 23.5% of patients in our study population. Easily identifiable risk factors for chemotherapy delay exist that can help us pre-operatively identify patients for which neoadjuvant chemotherapy may be a better treatment option."

According to the news editors, the research concluded: "Further study into prospective modeling with these identified risk factors is warranted."

The news correspondents report that additional information may be obtained from S. Singh, Univ Hosp Case Med Center, Div Gynecol Oncol, Cleveland, OH, United States. Additional authors for this research include M. Guetzko and K. Resnick.

**Hematopoietic**

**Investigators from University Medical Center Have Reported New Data on Hematopoietic (Bcl-2 proteins in development, health, and disease of the hematopoietic system)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hematopoietic are presented in a new report. According to news reporting from Freiburg, Germany, by NewsRx journalists, research stated, "Members of the Bcl-2 protein family regulate cell fate decisions following a variety of developmental cues or stress signals, with the outcomes of cell death or survival, thus shaping multiple mammalian tissues."

Funders for this research include European Research Council, Wilhelm Sander foundation, Austrian Science Fund, Deutsche Forschungsgemeinschaft.

The news correspondents obtained a quote from the research from University Medical Center, "This review describes in detail how anti-and proapoptotic Bcl-2 proteins contribute to the development and functioning of the fetal and adult hematopoietic systems and how they influence the generation and maintenance of different hematopoietic lineages. An overview on how stress signals such as genotoxic stress or inflammation can compromise blood cell production, partially by engaging the intrinsic apoptosis pathway, is presented."

According to the news reporters, the research concluded: "Finally, the review describes how Bcl-2 protein deregulation-either leading to increased apoptosis resistance or excessive cell death-contributes to many hematological disorders, with specific focus on rare disorders of hematopoeisis and how this knowledge may be used therapeutically."

Our news journalists report that additional information may be obtained by

Drugs and Therapies - Antibiotics

Investigators from University Medical Center, Hamburg Eppendorf Report New Data on Antibiotics (Tedizolid susceptibility in linezolid- and vancomycin-resistant Enterococcus faecium isolates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antibiotics. According to news reporting out of Hamburg, Germany, by NewsRx editors, research stated, "Vancomycin-resistant enterococci (VRE) are of ever-increasing importance, most notably in high-risk patient populations. Therapy options are often limited for these isolates, and apart from tigecycline and daptomycin, oxazolidinone linezolid is frequently administered."

Our news journalists obtained a quote from the research from University Medical Center, Hamburg Eppendorf, "The broad usage of linezolid, however, has driven the emergence of linezolid-resistant VRE strains (LR-VRE), further shortening therapeutic options. Second-generation oxazolidinone tedizolid has the advantage of being active against a specific subset of LR-VRE, i.e. isolates expressing the plasmid-encoded chloramphenicol-florfenicol resistance (cfr) gene. Here we tested tedizolid activity in a collection of 30 LR Enterococcus faecium VRE (MIC range 32-256 mg/l) isolated between 2012 and 2015 from clinical and screening specimens. By pulsed field gel electrophoresis (PFGE) isolates were assigned to 16 clonal lineages. In three cases, linezolid-susceptible progenitor isolates of LR-VRE were isolated, thus demonstrating the de-novo emergence of the linezolid-resistant phenotype. PCR did not detect cfr, cfr(B) or novel oxazolidinone resistance gene oprA in LR-VRE. All isolates, however, carried mutations within the 23S rDNA. Compared to linezolid, tedizolid MICs were lower in all isolates (MIC range 2-32 mg/l), but remained above the FDA tedizolid breakpoint for E. faecalis at 0.5 mg/l."

According to the news editors, the research concluded: "Thus, related to the predominant resistance mechanism, tedizolid is of limited value for treatment of most LR-VRE and represents a therapeutic option only for a limited subset of isolates."

For more information on this research see: Tedizolid susceptibility in linezolid- and vancomycin-resistant Enterococcus faecium isolates. Investigators from University Nova of Lisboa Release New Data on Insulin Resistance (Functional abolition of carotid body activity restores insulin action and glucose homeostasis in rats: key roles for visceral adipose tissue and the liver)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Endocrine System Diseases and Conditions - Insulin Resistance. According to news reporting originating from Lisbon, Portugal, by NewsRx correspondents, research stated, "We recently described that carotid body (CB) over-activation is involved in the aetiology of insulin resistance and arterial hypertension in animal models of the metabolic syndrome. Additionally, we have demonstrated that CB activity is increased in animal models of insulin resistance, and that carotid sinus nerve (CSN) resection prevents the development of insulin resistance and arterial hypertension induced by high-energy diets."

Financial supporters for this research include MINECO/FEDER, UE, Institute of Health Carlos III (Spain), Portuguese Foundation for Science and Technology.

Our news editors obtained a quote from the research from the University Nova of Lisboa, "Here, we tested whether the functional abolition of CB by CSN transection would reverse pre-established insulin resistance, dyslipidaemia, obesity, autonomic dysfunction and hypertension in animal models of the metabolic syndrome. The effect of CSN resection on insulin signalling pathways and tissue-specific glucose uptake was evaluated in skeletal muscle, adipose tissue and liver. Experiments were performed in male Wistar rats submitted to two high-energy diets: a high-fat diet, representing a model of insulin resistance, hypertension and obesity, and a high-sucrose diet, representing a lean model of insulin resistance and hypertension. Half of each group was submitted to chronic bilateral resection of the CSN. Age-matched control rats were also used. CSN resection normalised systemic sympathetic nervous system activity and reversed weight gain induced by high-energy diets. It also normalised plasma glucose and insulin levels, insulin sensitivity lipid profile, arterial pressure and endothelial function by improving glucose uptake by the liver and perienteric adipose tissue."

According to the news editors, the research concluded: "We concluded that
functional abolition of CB activity restores insulin sensitivity and glucose homeostasis by positively affecting insulin signalling pathways in visceral adipose tissue and liver.

For more information on this research see: Functional abolition of carotid body activity restores insulin action and glucose homeostasis in rats: key roles for visceral adipose tissue and the liver. *Diabetologia*, 2017;60(1):158-168. *Diabetologia* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Diabetologia - www.springerlink.com/content/0012-186x/)

Eye Diseases and Conditions - Retinitis Pigmentosa

**Investigators from University of Adelaide Report New Data on Retinitis Pigmentosa (A review of the mechanisms of cone degeneration in retinitis pigmentosa)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Eye Diseases and Conditions - Retinitis Pigmentosa have been published. According to news reporting out of Adelaide, Australia, by NewsRx editors, research stated, "Retinitis pigmentosa (RP) is an inherited condition that features degeneration of rod and cone photoreceptors. In all forms of RP, the genetic mutation is expressed exclusively in rods; however, cones die too."

Our news journalists obtained a quote from the research from the University of Adelaide, "The secondary death of cones in RP remains somewhat mysterious. A better understanding of the mechanisms that cause cone degeneration in RP could lead to novel treatments that preserve cones. There are a number of prevailing theories that attempt to explain cone degeneration in RP. One concept is that cone survival is dependent on trophic factors produced by rods. Another hypothesis is that cones suffer from a nutrient shortage after rods have been lost. Additionally, oxidative stress and pro-inflammatory microglial activation have also been suggested to play a role in cone death."

According to the news editors, the research concluded: "The present review evaluates the evidence supporting these theories and provides an update on the mechanisms of cone degeneration in RP."

For more information on this research see: A review of the mechanisms of cone degeneration in retinitis pigmentosa.
Investigators from University of Athens Zero in on Acinetobacter baumannii (In Vitro Bactericidal Activity of Trimethoprim-Sulfamethoxazole Alone and in Combination with Colistin against Carbapenem-Resistant Acinetobacter baumannii Clinical ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Negative Bacteria - Acinetobacter baumannii. According to news reporting originating from Athens, Greece, by NewsRx correspondents, research stated, "Trimethoprim-sulfamethoxazole alone and combined with colistin was tested in vitro against six carbapenem-resistant Acinetobacter baumannii (CRAB) clinical strains."

Our news editors obtained a quote from the research from the University of Athens, "After 24 h, at achievable serum concentrations, trimethoprim-sulfamethoxazole effectively killed all strains, while colistin killed only one strain."

According to the news editors, the research concluded: "Trimethoprim-sulfamethoxazole plus colistin rapidly killed all strains after 6 h and for up to 24 h. Trimethoprim-sulfamethoxazole, one of the few remaining antimicrobials that still has a degree of activity, particularly combined with colistin, might represent an effective therapy for severe CRAB infections."

For more information on this research see: In Vitro Bactericidal Activity of Trimethoprim-Sulfamethoxazole Alone and in Combination with Colistin against Carbapenem-Resistant Acinetobacter baumannii Clinical Isolates. Antimicrobial Agents and Chemotherapy, 2016;60(11):6903-6906. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news editors report that additional information may be obtained by contacting S. Pournaras, University of Athens, Sch Med, Dept. of Microbiol, Athens, Greece.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AAC.01082-16. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Brain Cancer
Investigators from University of Bordeaux Have Reported New Data on Brain Cancer (In Vivo Follow-up of Brain Tumor Growth via Bioluminescence Imaging and Fluorescence Tomography)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Brain Cancer are discussed in a new report. According to news reporting originating in Bordeaux, France, by NewsRx journalists, research stated, "Reporter gene-based strategies are widely used in experimental oncology. Bioluminescence imaging (BLI) using the firefly luciferase (Fluc) as a reporter gene and D-luciferin as a substrate is currently the most widely employed technique."

The news reporters obtained a quote from the research from the University of Bordeaux, "The present paper compares the performances of BLI imaging with fluorescence imaging using the near infrared fluorescent protein (iRFP) to monitor brain tumor growth in mice. Fluorescence imaging includes fluorescence reflectance imaging (FRI), fluorescence diffuse (optical) tomography (fDOT), and fluorescence molecular Imaging (FMT ®). A U87 cell line was genetically modified for constitutive expression of both the encoding Fluc and iRFP reporter genes and assayed for cell, subcutaneous tumor and brain tumor imaging. On cultured cells, BLI was more sensitive than FRI; in vivo, tumors were first detected by BLI."

According to the news reporters, the research concluded: "Fluorescence of iRFP provided convenient tools such as flux cytometry, direct detection of the fluorescent protein on histological slices, and fluorescent tomography that allowed for 3D localization and absolute quantification of the fluorescent signal in brain tumors."

For more information on this research see: In Vivo Follow-up of Brain Tumor Growth via Bioluminescence Imaging and Fluorescence Tomography. International Journal of Molecular Sciences, 2016;17(11):845-854. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Our news correspondents report that additional information may be obtained by contacting C. Genevois, Univ Bordeaux, Mol Imaging & Innovat Therapy Oncol IMOTION, EA 7435, F-33076 Bordeaux, France. Additional authors for this research include H. Loiseau and F. Couillaud.
Investigators from University of Bristol Zero in on Blood Pressure (Quantifying sympathetic neuro-haemodynamic transduction at rest in humans: insights into sex, ageing and blood pressure control)

2017 JAN 14 (NewsRx) -- New research on Blood Pressure is the subject of a report. According to news reporting from Bristol, United Kingdom, by NewsRx journalists, research stated, "Sex and age differences in the sympathetic control of resting blood pressure (BP) may be due to differences in the transduction of sympathetic nerve activity (SNA) into vascular tone. Current methods for dynamically quantifying transduction focus on the relationship between SNA and vasoconstriction during a pressor stimulus, which increases BP and may be contra-indicated in patients."

The news correspondents obtained a quote from the research from the University of Bristol, "We describe a simple analytical method for quantifying transduction under resting conditions. We performed linear regression analysis of binned muscle SNA burst areas against diastolic BP (DBP). We assessed whether the slope of this relationship reflects the transduction of SNA into DBP. To evaluate this, we investigated whether this measure captures differences in transduction in different populations. Specifically, we (1) quantified transduction in young men (YM), young women (YW), older men (OM) and postmenopausal women (PMW); and (2) measured changes in transduction during beta-blockade using propranolol in YW, YM and PMW. YM had a greater transduction vs. OM (0.10 +/- 0.01 mmHg(%s)(-1), n = 23 vs. 0.06 +/- 0.01 mmHg (% s)(-1), n = 18; P = 0.003). Transduction was lowest in YW (0.02 +/- 0.01 mmHg (% s)(-1), n = 23) and increased during beta-blockade (0.11 +/- 0.01 mmHg(% s)(-1); P<0.001). Transduction in PMW (0.07 +/- 0.01 mmHg(% s)(-1), n = 23) was greater compared to YW (P = 0.001), and was not altered during beta-blockade (0.06 +/- 0.01 mmHg (%s)(-1); P = 0.98). Importantly, transduction increased in women with age, but decreased in men. Transduction in women intersected that in men at 55 +/- 1.5 years. This measure of transduction captures age- and sex-differences in the sympathetic regulation of DBP and may be valuable in quantifying transduction in disease."

According to the news reporters, the research concluded: "In particular, this measure may help target treatment strategies in specific hypertensive subpopulations."

Therapeutics

Investigators from University of British Columbia Report New Data on Therapeutics (Effective Translation of Research to Practice: Hospital-Based Rehabilitation Program Improves Health-Related Physical Fitness and Quality of Life of Cancer ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Therapeutics are presented in a new report. According to news reporting originating in Vancouver, Canada, by NewsRx journalists, research stated, "Although exercise has been widely established as an efficacious rehabilitative therapy for cancer survivors in rigorously designed research studies, demonstration of translation of this research into clinical oncology practice is needed. The purpose of this study was to evaluate the effectiveness of a real-world cancer rehabilitation program implemented within a healthcare setting."

The news reporters obtained a quote from the research from the University of British Columbia, "This study involved 299 adult cancer survivors enrolled in a hospital-based, supervised, individualized, cancer rehabilitation program. A retrospective review of the 132 participants who completed the follow-up assessment was performed. Sixty-minute sessions consisting of aerobic, resistance, flexibility, and relaxation exercises were performed twice weekly. Questionnaires and fitness assessments were administered at enrollment and after 24 sessions by exercise physiologists. Change in a number of health-related physical fitness and patient-reported outcomes and the influence of baseline characteristics on program outcomes were assessed. There were no baseline differences between those who completed the follow-up assessment and those who withdrew. Statistically and/or clinically meaningful improvements occurred in functional capacity, blood pressure, muscular endurance, flexibility, health-related quality of life, and fatigue, but not in body composition. Age, marital status, radiation treatment status, exercise frequency before diagnosis, smoking status, and alcohol consumption frequency influenced functional capacity and/or quality-of-life changes."

According to the news reporters, the research concluded: "Adoption of cancer rehabilitation as a standard part of oncology care may improve cancer survivors' health and well-being."

For more information on this research see: Effective Translation of Research to Practice: Hospital-Based Rehabilitation Program Improves Health-Related Physical Fitness and Quality of Life of Cancer Survivors. Journal of the National Comprehensive Cancer Network, 2016;14(12):1555-1562. Journal of the National Comprehensive Cancer Network can be contacted at: Harborside Press, 37 Main St, Cold Spring Harbor, NY 11724, USA.

Our news correspondents report that additional information may be obtained by contacting K.L. Campbell, University of British Columbia, Vancouver, BC, Canada. Additional authors for this research include R.J. Klika, T. Ballard, P. Downey and K.L. Campbell.

Investigators from University of Cairo Zero in on Pharmacokinetics (UPLC-MS-MS Method for the Determination of Vilazodone in Human Plasma: Application to a Pharmacokinetic Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Pharmacokinetics. According to news reporting out of Cairo, Egypt, by NewsRx editors, research stated, "A sensitive, rapid and simple liquid chromatographic-electrospray ionization tandem mass spectrometric (LC-ESI-MS-MS) method was developed for the quantitative determination of vilazodone in human plasma and for the study of the pharmacokinetic behavior of vilazodone in healthy Egyptian volunteers. With escitalopram as internal standard (IS), liquid-liquid extraction was used for the purification and preconcentration of analytes from human plasma matrix using diethyl ether."

Our news journalists obtained a quote from the research from the University of Cairo, "The separation was performed on an Acquity UPLC BEH shield RP C18 column (1.7 мм, 2.1 x 150 mm). Isocratic elution was applied using methanol-0.2% formic acid (90: 10, v/v). Detection was performed on a triple-quadrupole tandem mass spectrometer with multiple reaction monitoring mode via an electrospray ionization source at m/z 442.21 -> 155.23 for vilazodone and m/z 325.14 -> 109.2 for escitalopram. Linear calibration curves were obtained over the range of 1-200 ng/mL with the lower limit of quantification at 1 ng/mL. The intra-and inter-day precision showed relative standard deviation <= 3.3%. The total run time was 1.5 min."

According to the news editors, the research concluded: "This method was successfully applied for clinical pharmacokinetic investigation, and a preliminary metabolic study was also carried out."

Our news journalists report that additional information may be obtained by contacting M. Fouad, Cairo University, Fac Pharm, Pharmaceut Chem Department, Cairo 11562, Egypt. Additional authors for this research include H. Hashem, M. Fouad and S. Tarek.

Keywords for this news article include: Cairo, Egypt, Africa, Pharmacokinetics, Pharmaceuticals, University of Cairo.

Investigators from University of California Have Reported New Data on Molecular Biology (GOLPH3 drives cell migration by promoting Golgi reorientation and directional trafficking to the leading edge)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Molecular Biology have been published. According to news reporting out of La Jolla, California, by NewsRx editors, research stated, "The mechanism of directional cell migration remains an important problem, with relevance to cancer invasion and metastasis. GOLPH3 is a common oncogenic driver of human cancers, and is the first oncogene that functions at the Golgi in trafficking to the plasma membrane."

Our news journalists obtained a quote from the research from the University of California, "Overexpression of GOLPH3 is reported to drive enhanced cell migration. Here we show that the phosphatidylinositol-4-phosphate/GOLPH3/myosin 18A/F-actin pathway that is critical for Golgi-to-plasma membrane trafficking is necessary and limiting for directional cell migration. By linking the Golgi to the actin cytoskeleton, GOLPH3 promotes reorientation of the Golgi toward the leading edge. GOLPH3 also promotes reorientation of lysosomes (but not other organelles) toward the leading edge. However, lysosome function is dispensable for migration and the GOLPH3 dependence of lysosome movement is indirect, via GOLPH3's effect on the Golgi. By driving reorientation of the Golgi to the leading edge and driving forward trafficking, particularly to the leading edge, overexpression of GOLPH3 drives trafficking to the leading edge of the cell, which is functionally important for directional cell migration."

According to the news editors, the research concluded: "Our identification of a novel pathway for Golgi reorientation controlled by GOLPH3 provides new insight into the mechanism of directional cell migration with important implications for understanding GOLPH3's role in cancer."

For more information on this research see: GOLPH3 drives cell migration by promoting Golgi reorientation and directional trafficking to the leading edge. Molecular Biology of the Cell, 2016;27(24):3828-3840. Molecular Biology of the Cell can be contacted at: Amer Soc Cell Biology, 8120 Woodmont Ave, Ste 750, Bethesda, MD 20814-2755, USA.

Our news journalists report that additional information may be obtained by contacting S.J. Field, University of California, Dept. of Med, Div Endocrinol & Metab, La Jolla, CA 92093, United States. Investigators from University of California Release New Data on Hypoventilation (Treatment of ethanol poisoning and associated hypoventilation with doxapram)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Respiratory Tract Diseases and Conditions - Hypoventilation is the subject of a report. According to news reporting originating from Sacramento, California, by NewsRx correspondents, research stated, "Ethanol poisoning often results in profound coma with hypoventilation lasting several hours. Doxapram, a central nervous system respiratory stimulant, was used to safely counter the effects of ethanol, avoid need for intubation, and prevent unnecessary admission to the intensive care unit."

Our news editors obtained a quote from the research from the University of California, "We report a case of ethanol poisoning in a 48-year-old man who presented to the emergency department with altered mental status, hypoventilation, and hypoxemia. Intravenous doxapram was administered, and within seconds, his ventilatory status returned to normal. His altered mental status also improved to the point at which he became alert and conversant. Further dosing of doxapram was not required. Doxapram, an old and rarely used drug in the emergency department, is an analeptic that is advantageous in the treatment of hypoventilation from sedative overdose for which there is no specific antidote."

According to the news editors, the research concluded: "For appropriate cases of ethanol poisoning with hypoventilation, emergency physicians should consider doxapram before proceeding to intubation."

The news editors report that additional information may be obtained by contacting J.R. Richards, University of California, Medical Center, Dept. of Emergency Med, Sacramento, CA 95817, United States. Additional authors for this research include E.G. Laurin, S.W. Bretz, B.R. Traylor and E.A. Panacek.

Investigators from University of California Target Glioblastomas (Tissue mechanics promote IDH1-dependent HIF1 alpha-tenascin C feedback to regulate glioblastoma aggression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Glioblastomas is now available. According to news originating from San Francisco, California, by NewsRx correspondents, research stated, "Increased overall survival for patients with glioma brain tumours is associated with mutations in the metabolic regulator isocitrate dehydrogenase 1 (IDH1). Gliomas develop within a mechanically challenged microenvironment that is characterized by a dense extracellular matrix (ECM) that compromises vascular integrity to induce hypoxia and activate HIF1 alpha."

Our news journalists obtained a quote from the research from the University of California, "We found that glioma aggression and patient prognosis correlate with HIF1 alpha levels and the stiffness of a tenascin C (TNC)-enriched ECM. Gain-and loss-of-function xenograft manipulations demonstrated that a mutant IDH1 restricts glioma aggression by reducing HIF1 alpha-dependent TNC expression to decrease ECM stiffness and mechanosignalling. Recurrent IDH1-mutant patient gliomas had a stiffer TNC-enriched ECM that our studies attributed to reduced miR-203 suppression of HIF1 alpha and TNC mediated via a tension-dependent positive feedback loop."

According to the news editors, the research concluded: "Thus, our work suggests that elevated ECM stiffness can independently foster glioblastoma aggression and contribute to glioblastoma recurrence via bypassing the protective activity of IDH1 mutational status."

The news correspondents report that additional information may be obtained from V.M. Weaver, University of California, UCSF Helen Diller Comprehens Canc Center, San Francisco, CA 94143, United States. Additional authors for this research include J.K. Mouw, J.M. Barnes, M.W. Pickup, J.N. Lakins, Y. Kim, K. Lobo, A.I. Persson, G.F. Reis, T.R. McKnight, E.C. Holland, J.J. Phillips and V.M. Weaver.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Oxaprozin Therapy is the subject of a report. According to news reporting originating in Florence, Italy, by NewsRx journalists, research stated, "The combined strategy of drug-cyclodextrin (CD) complexation and complex loading into nanocarriers (deformable liposomes or nanostructured lipid carriers (NLC)), was exploited to develop effective topical formulations for oxaprozin transdermal administration. Oxaprozin was loaded as ternary complex with randomly-methylated-beta CD and arginine, selected as the best system in improving drug solubility."

The news reporters obtained a quote from the research from the University of Florence, "The colloidal dispersions, characterized for particle size, zeta-potential and entrapment efficiency, were investigated for drug permeation properties in comparison with a plain drug aqueous suspension, a ternary complex aqueous solution and a plain drug liposomal or NLC dispersion. Experiments with artificial membranes showed that the joined use of CD and both liposomes or NLC enabled a marked increase of the drug permeability (16 and 8 times, respectively) and was significantly more effective (P < 0.05) than the drug as ternary complex (3.2 times increase), and the corresponding liposomal or NLC dispersion of plain drug (5.6 and 4.3 times increase, respectively)."

According to the news reporters, the research concluded: "Experiments with excised human skin confirmed the significantly (P < 0.05) better performance of deformable liposomes than NLC in promoting drug permeation; moreover, they evidenced a more marked permeability increase compared to the plain drug (24 and 12 fold, respectively), attributed to a possible enhancer effect of the nanocarriers components and/or of the randomly-methylated-beta CD."

Our news correspondents report that additional information may be obtained by contacting P. Mura, University of Florence, Sch Human Hlth Sci, Dept. of Chem, I-50019 Florence, Italy. Additional authors for this research include M. Cirri, F. Maestrelli and P. Mura. **Blood Pressure**

**Investigators from University of Glasgow Report New Data on Blood Pressure (Relationship Between Blood Pressure Values, Depressive Symptoms, and Cardiovascular Outcomes in Patients With Cardiometabolic Disease)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Pressure have been published. According to news reporting originating in Glasgow, United Kingdom, by NewsRx journalists, research stated, "The authors studied the joint effect of blood pressure (BP) and depression on the risk of major adverse cardiovascular outcome in patients with existing cardiometabolic disease. A cohort of 35,537 patients with coronary heart disease, diabetes, or stroke underwent depression screening and BP measurement recorded concurrently."

Financial support for this research came from Chief Scientist Office.

The news reporters obtained a quote from the research from the University of Glasgow, "The authors used Cox’s proportional hazards to calculate risk of major adverse cardiovascular event (MACE; myocardial infarction/heart failure/stroke or cardiovascular death) over 4 years associated with baseline BP and depression. A total of 11% (3939) had experienced a MACE within 4 years. Patients with very high systolic BP (160-240 mm Hg; hazard ratio, 1.28) and depression (hazard ratio, 1.22) at baseline had significantly higher adjusted risk. Depression had a significant interaction with systolic BP in risk prediction (P=.03). Patients with a combination of high systolic BP and depression at baseline had 83% higher adjusted risk of MACE, as compared with patients with reference systolic BP without depression."

According to the news reporters, the research concluded: "Patients with cardiometabolic disease and comorbid depression may benefit from closer monitoring of systolic BP."

Our news correspondents report that additional information may be obtained by contacting F.S. Mair, University of Glasgow, Inst Hlth & Wellbeing, Gen Practice & Primary Care, Coll Med Vet & Life Sci, Glasgow, Lanark, United Kingdom. Additional authors for this research include J. 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Amphetamines. According to news reporting originating in Champaign, Illinois, by NewsRx journalists, research stated, "Non-medical use of amphetamine (AMPH) among adolescents is prevalent, which is problematic given the potential consequences of developmental drug exposure on brain function and behavior. Previously we found in adult male rats that AMPH exposure starting before puberty induces a persistent decrease in dopamine D-1 receptor (D1R) function in the medial prefrontal cortex (mPFC)."

The news reporters obtained a quote from the research from the University of Illinois, "Here we investigated if this dysfunction was associated with changes in D1R expression in the mPFC and nucleus accumbens (NAc). We also determined if starting drug exposure well before or near the onset of puberty would influence AMPH-induced changes in D1R expression and behavior. Male and female Sprague-Dawley rats were treated once every other day (10 injections total) with saline or 3 mg/kg AMPH (i.p.) from either postnatal day (P) 27 to 45 (pre puberty groups; Pre-P) or P37 to 55 (peri-puberty groups; Peri-P). After 1, 7 and 21 days of withdrawal, sucrose preference tests were performed to assess anhedonia. Exploratory behavior was studied in an open-field arena and on an elevated plus maze (EPM). Rats were then sacrificed for Western blot analysis of D1R expression. We found that AMPH withdrawal induced decreases in sucrose preference that persisted in rats with Peri-P onset treatment. Pre-P onset AMPH exposure led to increased open-arm exploration in the EPM test, as well as a decreased D1R level in the mPFC but not NAc."

According to the news reporters, the research concluded: "Our results demonstrated that AMPH exposure starting at different developmental stages resulted in distinct neurobehavioral abnormalities, suggesting an important role of exposure timing in drug-induced plasticity."

For more information on this research see: Timing Of Amphetamine Exposure In Relation To Puberty Onset Determines Its Effects On Anhedonia, Exploratory Behavior, And Dopamine D-1 Receptor Expression In Young Adulthood. Neuroscience, 2016;339():72-84. Neuroscience can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. Investigators from University of Iowa Have Reported New Data on Cancer Genetics (The NAB2-STAT6 gene fusion in solitary fibrous tumor can be reliably detected by anchored multiplexed PCR for targeted next-generation sequencing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Genetics have been published. According to news reporting from Iowa City, Iowa, by NewsRx journalists, research stated, "Solitary fibrous tumor (SFT) is a mesenchymal tumor of fibroblastic origin, which can affect any region of the body. 10-15% of SFTs metastasize and metastatic tumors are uniformly lethal with no effective therapies. The behavior of SFT is difficult to predict based on morphology."

The news correspondents obtained a quote from the research from the University of Iowa, "Recently, an intrachromosomal gene fusion between NAB2 and STAT6 was identified as the defining driving genetic event of SFT and different fusion types correlated with tumor histology and behavior. Due to the proximity of NAB2 and STAT6 on chromosome 12, this fusion may be missed by fluorescence in-situ hybridization. We evaluated 12 SFTs from 10 patients. All tumors showed strong nuclear staining for STAT6 by immunohistochemistry (IHC). The same formalin-fixed, paraffin embedded blocks for IHC were used for gene fusion detection by a next-generation sequencing (NGS)-based assay. Targeted RNA fusion sequencing for gene fusions was performed using the Universal RNA Fusion Detection Kit, the Archer™ FusionPlex™ Sarcoma Panel and the Ion Torrent PGM, and data were analyzed using the Archer Analysis Pipeline 3.3. All tumors were positive for NAB2-STAT6 fusion. Six types of fusions were detected: NAB2ex4-STAT6ex2, NAB2ex2-STAT6ex5, NAB2ex6-STAT6ex16, NAB2ex6-STAT6ex17, NAB2ex3-STAT6ex18 and NAB2intron6-STAT6Ex17. The NGS findings were confirmed by RT-PCR followed by Sanger sequencing. No STAT6 fusion was detected in selected morphologic mimics of SFT."

According to the news reporters, the research concluded: "The assay also allows for detection of novel fusions and can detect NAB2-STAT6 fusions at a single-base resolution."

For more information on this research see: Cancer Genetics, 2016;209(7-8):303-312. Cancer Genetics can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Cancer Genetics - www.journals.elsevier.com/cancer-genetics/)

**Drugs and Therapies - Cancer Therapy**

**Investigators from University of Jinan Report New Data on Cancer Therapy (Polyethylenimine-functionalized silver nanoparticle-based co-delivery of paclitaxel to induce HepG2 cell apoptosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Cancer Therapy. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Hepatocarcinoma is the third leading cause of cancer-related deaths around the world. Recently, a novel emerging nanosystem as anticancer therapeutic agents with intrinsic therapeutic properties has been widely used in various medical applications."

Our news journalists obtained a quote from the research from the University of Jinan, "In this study, surface decoration of functionalized silver nanoparticles (AgNPs) by polyethylenimine (PEI) and paclitaxel (PTX) was synthesized. The purpose of this study was to evaluate the effect of Ag@PEI@PTX on cytotoxic and anticancer mechanism on HepG2 cells. The transmission electron microscope image and 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide assay showed that Ag@PEI@PTX had satisfactory size distribution and high stability and selectivity between cancer and normal cells. Ag@PEI@PTX-induced HepG2 cell apoptosis was confirmed by accumulation of the sub-G1 cells population, translocation of phosphatidylserine, depletion of mitochondrial membrane potential, DNA fragmentation, caspase-3 activation, and poly(ADP-ribose) polymerase cleavage. Furthermore, Ag@PEI@PTX enhanced cytotoxic effects on HepG2 cells and triggered intracellular reactive oxygen species; the signaling pathways of AKT, p53, and MAPK were activated to advance cell apoptosis."

According to the news editors, the research concluded: "The results reveal that Ag@PEI@PTX may provide useful information on Ag@PEI@PTX-induced HepG2 cell apoptosis and as appropriate candidate for chemotherapy of cancer."

Our news journalists report that additional information may be obtained by contacting T.F. Chen, Jinan Univ, Dept. of Chem, Guangzhou 510632, Guangdong, People's Republic of China. Additional authors for this research include M. Guo, Z.F. Lin, M.Q. Zhao, M.S. Xiao, C.B. Wang, T.T. Xu, T.F. Chen and B. Zhu.

Investigators from University of Lille Report New Data on Kidney Transplants (Long-term outcome after early cyclosporine withdrawal in kidney transplantation: ten years after)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Transplant Medicine - Kidney Transplants are discussed in a new report. According to news reporting from Lille, France, by NewsRx journalists, research stated, "Despite long-term side effects, calcineurin inhibitors (CNI) remain a cornerstone of immunosuppression in renal transplantation. Few trials assessed the long-term outcome after early CNI withdrawal."

The news correspondents obtained a quote from the research from the University of Lille, "This intention-to-treat study assessed the 10-year outcome of 108 patients randomly converted from a cyclosporine (CsA)-mycophenolate mofetil (MMF)-prednisone regimen to a dual therapy (CsA-prednisone or MMF-prednisone) at 3 months postgraft. At 10 years, 3.7% in the CsA group and 35.2% in the MMF group remained on the protocol regimen (P <.001). eGFR was higher in the MMF group (64.4 +/- 21 vs 49.7 +/- 14.7 mL/min/1.73 m(2), P<.001), although acute rejection (12 vs 4 in the CsA group, P=.03) and Class II DSA incidences were increased. CNI-related toxicity (P=.019) and moderate-to-severe IF/TA (P=.004) were increased in the CsA group. Ten-year graft and patient survivals were not different. In multivariate analysis, acute rejection remained the strongest predictor of graft loss (HR=11.64, 95% CI [5.05-26.79], P<.0001). MMF withdrawal largely failed due to CNI toxicity, while CsA withdrawal led to increased graft failure due to uncontrolled acute rejection without increasing graft survival."

According to the news reporters, the research concluded: "From this study, it remains unclear which patients could benefit from limiting CNI exposure."

Our news journalists report that additional information may be obtained by contacting N. Tabibzadeh, University of Lille, UMR 995, F-59000 Lille, France. Additional authors for this research include F. Glowacki, M. Frimat, V. Elsermans, F. Provot, A. Lionet, V. Gnemmi, A. Hertig, C. Noel and M. Hazzan.

Investigators from University of Lisbon Target Immunoglobulins
(Integration of cell harvest with affinity-enhanced purification of monoclonal antibodies using aqueous two-phase systems with a dual tag ligand)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immunology - Immunoglobulins are presented in a new report. According to news reporting out of Lisbon, Portugal, by NewsRx editors, research stated, "Monoclonal antibodies (mAbs) are currently the most important class of recombinant protein therapeutics in the biotechnological and biopharmaceutical industry with more than 250 therapeutic mAbs currently undergoing clinical trials. High titer producing cultures and complex mixtures containing high cell densities, together with an increasing growing demand for highly pure mAbs is making recovery and purification processes hot targets for improvement and opens important technological challenges in mAbs manufacturing platforms."

Funders for this research include European Union 7th framework program, Fundacao para a Ciencia e Tecnologia.

Our news journalists obtained a quote from the research from the University of Lisbon, "This work explores the use of an affinity dual ligand based on a choline binding polypeptide tag (C-LytA) fused to the synthetic antibody binding Z domain (LYTAG-Z) in aqueous two-phase systems (ATPS) composed of phase forming polymers able to bind to the choline binding site of C-LytA (polyethylene glycol -PEG- and thermosensitive polymers -EOPO) for mAbs selective extraction. Integration of harvesting and ATPS affinity extraction steps were evaluated with ATPS proving to be an alternative strategy for integrating the clarification and the primary recovery of mAbs."

According to the news editors, the research concluded: "An extraction yield of 89% and a clarification higher than 95% were achieved using a system composed of 7% PEG 3350 and 6% dextran 500,000."

For more information on this research see: Integration of cell harvest with affinity-enhanced purification of monoclonal antibodies using aqueous two-phase systems with a dual tag ligand. Separation and Purification Technology, 2017;173():129-134. Separation and Purification Technology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Separation and Purification Technology - www.journals.elsevier.com/separation-and-purification-technology/)

Our news journalists report that additional information may be obtained by contacting A.M. Azevedo, University of Lisbon, Inst Super Tecn, IBB, Dept. of Bioengn, P-1049001 Lisbon, Portugal. Investigators from University of Louisiana Have Reported New Data on Breast Cancer (Role of Rac1/WAVE2 Signaling in Mediating the Inhibitory Effects of gamma-Tocotrienol on Mammary Cancer Cell Migration and Invasion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Monroe, Louisiana, by NewsRx correspondents, research stated, "The majority of breast cancer deaths result from the progression of this disease to a metastatic phenotype. Rac1 and Cdc42 are Rho family members that together with their downstream effectors, Wiskott Aldrich Syndrome protein-family verprolin-homologous protein 2 (WAVE2) and Arp2/3, play an important role in cytoskeletal reorganization and the formation of membrane protrusions that promote cancer cell migration and invasion. gamma-Tocotrienol, is a natural isoform within the vitamin E family of compounds that inhibits breast cancer cell growth and progression by suppressing various signaling pathways involved in mitogenic signaling and metastatic progression."

Our news journalists obtained a quote from the research from the University of Louisiana, "Studies were conducted to examine the effects of gamma-tocotrienol on Rac1/WAVE2 signaling dependent migration and invasion in highly metastatic mouse +SA and human MDA-MB-231 mammary cancer cells. Exposure to gamma-tocotrienol resulted in a dose-responsive decrease in Rac1/WAVE2 signaling as characterized by a suppression in the levels of Rac1/Cdc42, phospho-Rac1/Cdc42, WAVE2, Arp2, and Arp3 expression. Additional studies also demonstrated that similar treatment with gamma-tocotrienol resulted in a significant reduction in tumor cell migration and invasion."

According to the news editors, the research concluded: "Taken together, these findings indicate that gamma-tocotrienol treatment effectively inhibits Rac1/WAVE2 signaling and reduces metastatic phenotypic expression in mammary cancer cells, suggesting that gamma-tocotrienol may provide some benefit as a novel therapeutic approach in the treatment of metastatic breast cancer."

The news correspondents report that additional information may be obtained from P.W. Sylvester, Univ Louisiana Monroe, Sch Pharm, Monroe, LA 71209, United States. Additional authors for this research include V. Dronamraju and P.W. Sylvester.

Investigators from University of Louisville Target Gynecologic Cancer
(Optimal epidural analgesia for patients diagnosed as having gynecologic cancer undergoing interstitial brachytherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Gynecologic Cancer is now available. According to news reporting out of Louisville, Kentucky, by NewsRx editors, research stated, "To determine the optimal epidural analgesia for patients receiving interstitial brachytherapy (ISBT) for gynecologic cancers. Retrospective analysis. Operating room and hospital ward."

Our news journalists obtained a quote from the research from the University of Louisville, "Seventy-three patients diagnosed as having gynecologic cancer and undergoing ISBT. Twelve patients received ropivacaine alone, 14 patients received ropivacaine with fentanyl, and 45 patients received ropivacaine with hydromorphone by epidural infusion. Numeric Rating Scale pain scores, amounts of nonnarcotic and narcotic pain medications used in intravenous morphine equivalents (IVMEs), and amount of antiemetic or antipruritic medications used. Patients receiving ropivacaine alone had higher pain scores the morning of day 2 (4.2 vs 1.71 vs 0.6, P = .001), the afternoon of day 2 (4.9 vs 2.5 vs 1.7, P = .005), and the night of day 2 (2.4 vs 2.0 vs 0.6, P< .001). Patients receiving opioids in their epidural had lower pain scores on the night of placement (P = .050), the morning of day 2 (P < .001), the afternoon of day 2 (P = .002), and the night of day 2 (P < .001). Patients receiving ropivacaine alone used more oral narcotics than did those receiving ropivacaine with fentanyl or ropivacaine with hydromorphone on day 3 (5.9 vs 3.8 vs 2.8 mg IVME) and received more intravenous opioids day 1 (5.8 vs 0.0 vs 0.7 mg IVME, P = .004) and day 2 (20.6 vs 4.8 vs 1.0 mg IVME, P = .042). There were no differences in antiemetic or diphenhydramine usage at any time point. No epidural complications occurred. For patients receiving ISBT for gynecologic cancer, epidural analgesia provides safe and effective pain control."

According to the news editors, the research concluded: "Combined modality epidural analgesia improves pain control and lessens oral and intravenous opioid requirements without increased risk of adverse effects compared with epidural analgesia with local anesthetic alone."

Our news journalists report that additional information may be obtained by contacting A.K. Amsbaugh, University of Louisville, Dept. of Anesthesia & Perioperat Med, Louisville, KY 40202, United States. Additional authors for this research include M.J. Amsbaugh, M.N. El-Ghamry and B.M. Derhake.

Drug Resistance

Investigators from University of Malaga Report New Data on Drug Resistance (Molecular Docking Optimization in the Context of Multi-Drug Resistant and Sensitive EGFR Mutants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drug Resistance. According to news reporting from Malaga, Spain, by NewsRx journalists, research stated, "The human Epidermal Growth Factor (EGFR) plays an important role in signaling pathways, such as cell proliferation and migration. Mutations like G719S, L858R, T790M, G719S/T790M or T790M/L858R can alter its conformation, and, therefore, drug responses from lung cancer patients."

The news correspondents obtained a quote from the research from the University of Malaga, "In this context, candidate drugs are being tested and in silico studies are necessary to know how these mutations affect the ligand binding site. This problem can be tackled by using a multi-objective approach applied to the molecular docking problem. According to the literature, few studies are related to the application of multi-objective approaches by minimizing two or more objectives in drug discovery. In this study, we have used four algorithms (NSGA-II, GDE3, SMPSO and MOEA/D) to minimize two objectives: the ligand-receptor intermolecular energy and the RMSD score. We have prepared a set of instances that includes the wild-type EGFR kinase domain and the same receptor with somatic mutations, and then we assessed the performance of the algorithms by applying a quality indicator to evaluate the convergence and diversity of the reference fronts. The MOEA/D algorithm yields the best solutions to these docking problems."

According to the news reporters, the research concluded: "The obtained solutions were analyzed, showing promising results to predict candidate EGFR inhibitors by using this multi-objective approach."

For more information on this research see: Molecular Docking Optimization in the Context of Multi-Drug Resistant and Sensitive EGFR Mutants. Molecules. 2016;21(11):2311-2324. Molecules can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. (Springer - www.springer.com; Molecules - www.springerlink.com/content/1420-3049/)

Investigators from University of Manchester Release New Data on Cardiovascular Research (Knowledge gaps in the management of familial hypercholesterolaemia. A UK based survey)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Research is the subject of a report. According to news reporting from Manchester, United Kingdom, by NewsRx journalists, research stated, "Untreated individuals with familial hypercholesterolaemia (FH) are at increased risk of developing premature cardiovascular disease (CVD). Early diagnosis and treatment can result in a normal life expectancy."

Funders for this research include National Institute for Health Research, Central Manchester University Hospitals NHS Foundation Trust, Greater Manchester Comprehensive Local Research Network and Lipid Disease Fund.

The news correspondents obtained a quote from the research from the University of Manchester, "A recent survey commissioned by the European Atherosclerosis Society (EAS) reported a lack of awareness of FH in the general population. We conducted a survey to assess knowledge among healthcare professionals involved in the assessment and management of cardiovascular risk and disease in the United Kingdom. A survey designed to assess knowledge of diagnostic criteria, risk assessment, the role of cascade screening, and management options for patients with FH was distributed to 1000 healthcare professionals (response rate 44.3%). The same survey was redistributed following attendance at an educational session on FH. 151 respondents (40.5%) reported having patients under their care who would meet the diagnostic criteria for FH, but just 61.4% recognized that cardiovascular risk estimation tools cannot be applied in FH, and only 22.3% understood the relative risk of premature CVD compared to the general population. Similarly, just 65.9% were aware of recommendations regarding cascade screening. The prevalence and associated risk of FH continue to be underestimated, and knowledge of diagnostic criteria and treatment options is suboptimal. These results support the recent Consensus Statement of the EAS and production of quality standards by the National Institute for Health and Care Excellence."

According to the news reporters, the research concluded: "Further work is required to formulate interventions to improve FH awareness and knowledge, and to determine the effect these interventions have on patient outcomes."

For more information on this research see: Knowledge gaps in the management of familial hypercholesterolaemia. A UK based survey. Atherosclerosis, 2016;252():161-165. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Investigators from University of Manitoba Release New Data on Escherichia coli (Bacteria in drinking water sources of a First Nation reserve in Canada)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Escherichia coli. According to news reporting out of Winnipeg, Canada, by NewsRx editors, research stated, "Approximately 20% of the 600 First Nations reserves across Canada are under a drinking water advisory, often due to unacceptable levels of bacteria. In this study, we detected fecal bacteria at an alarmingly high frequency in drinking water sources in a fly-in First Nations community, most notably in buckets/drums of homes without running water where Escherichia coli levels ranged from 20 to 62,000 CFU/100 mL."

Financial support for this research came from Natural Sciences and Engineering Research Council of Canada.

Our news journalists obtained a quote from the research from the University of Manitoba, "The water leaving the water treatment plant was free of E. coli and its free residual chlorine concentration (0.67 mg/L) was within the range typically observed for treated water in Canada. Water samples from taps in homes served by cisterns, and those sampled from the water truck and community standpipe, always showed unacceptable levels of E. coli (1 to 2100 CFU/100mL) and free residual chlorine concentrations below the 0.2 mg/L required to prevent bacterial regrowth. Samples from taps in homes served by piped water had lower levels of E. coli (0 to 2 CFU/100 mL). DNA-and RNA-based 16S rRNA Illumina sequencing demonstrated that piped and cisterns water distribution systems showed an abundance of viable cells of Alphaproteobacteria indicative of biofilm formation in pipes and cisterns. The alpha diversity, based on observed OTUs and three other indices, was lowest in water truck samples that supplied water to the cistern and the low free residual chlorine concentration (0.07 mg/L) and predominance of Betaproteobacteria (63% of viable cells) that were immediately detected after the truck had filled up at the water treatment plant was indicative of contamination by particulate matter. Given these findings, First Nation residents living without running water and relying on inadequate water distribution systems are at higher risk of contracting water-born illnesses."

According to the news editors, the research concluded: "We urge all governments in Canada to expand their investments in supporting and sustaining water as a human right in Canada's First Nations communities."

For more information on this research see: Bacteria in drinking water sources of a First Nation reserve in Canada. Science of the Total Environment, 2017;575():813-819. Science of the Total Environment can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Science of the Total Environment - www.journals.elsevier.com/science-of-the-total-environment/)

**Biological Factors - Eicosanoids**

**Investigators from University of Maryland Target Eicosanoids**

*(Prostaglandin E Receptor EP4 expression, survival and pattern of recurrence in locally advanced NSCLC)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biological Factors - Eicosanoids. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Elevated COX-2 expression has been correlated with inferior outcome in NSCLC. COX-2 catalyzes the transformation of arachidonate to PGE(2)."

Financial support for this research came from P.J. Aldridge Foundation.

Our news journalists obtained a quote from the research from the University of Maryland, "We and others have demonstrated that PGE(2) induces proliferation and metastatic spread and immunosuppression through the G protein-coupled EP4 receptor. We hypothesized that EP4 expression on malignant cells would correlate with outcome and patterns of relapse after treatment of LANSCLC stage IIIA (7th edition, N2+). Tissue specimens from 41 pts treated for LANSC at UMGCC were obtained. A tissue microarray was prepared and examined for EP4 expression. Intensity of staining was scored semi-quantitatively as 0-4 in both the nuclear and cytoplasmic compartments by a pathologist blinded to the clinical data. EP4 nuclear staining 0-1 vs. 2+ was associated with overall survival, (OS) (44.3 vs. 18 mo; HR = 0.41, p = 0.024) and numerically superior progression free survival (PFS) (16.4 vs. 10.2 mo, p =0.16). EP4 cytoplasmic staining did not correlate with OS (0-1 vs. 2+, 23.8 vs. 28.8 mo; HR = 1.2, p= 0.81). Relapse pattern (no relapse or local vs. systemic) did not correlate with EP nuclear staining (p = 1.0, X-2). This is the first clinical study of EP4 expression in lung cancer. There was a significant correlation between OS and nuclear EP4 expression, indicating that this is a potential therapeutic target."

According to the news editors, the research concluded: "Studies with AT-007, a specific inhibitor of EP4, are planned to commence this year."

Investigators from University of Massachusetts Release New Data on Clinical Transplants (Functional status predicts postoperative mortality after liver transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Clinical Transplants have been published. According to news reporting from Worcester, Massachusetts, by NewsRx journalists, research stated, "Frail patients are more vulnerable to perioperative stressors of liver transplantation (LT). Program Specific Reports, used in transplant center auditing, risk-adjust for frailty using the Karnofsky Performance Status (KPS) scale."

Financial support for this research came from University of Massachusetts Medical School.

The news correspondents obtained a quote from the research from the University of Massachusetts, "We evaluate the extent to which functional impairment/disability is associated with increased risk of postoperative death. We included 24 505 first-time LT recipients from the Scientific Registry of Transplant Recipients (2006-2011). We categorized patients as Severe, Moderate, or Normal function/disability using the KPS scale and evaluated risk of 30-and 90-day mortality. Analyses took potential center-specific differences in KPS measurement protocols into account using hierarchal logistic modeling. Over one-quarter of our population was Severely impaired/disabled, and 30.5% had no functional limitations. Severely and Moderately impaired/disabled patients had 2.56 (95% CI 1.91-3.44) and 1.40 (95% CI 1.10-1.78) times the odds of 30-day mortality, respectively, after adjusting for key recipient and donor factors. Estimates remained consistent regardless of Model for End-Stage Liver Disease score, medical condition, or clustering analyses by center. Technical/operative complications and multiorgan failure/hemorrhage were more common causes of death among more Severely disabled patients than in higher functioning groups."

According to the news reporters, the research concluded: "Pre-transplant functional status, assessed using the KPS scale, is a reliable predictor of post-LT mortality in the United States."

**Drugs and Therapies - Platelet Aggregation Inhibitors**

**Investigators from University of Michigan Target Platelet Aggregation Inhibitors (Significant Improvement of Antithrombotic Responses to Clopidogrel by Use of a Novel Conjugate as Revealed in an Arterial Model of Thrombosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Platelet Aggregation Inhibitors are presented in a new report. According to news reporting out of Ann Arbor, Michigan, by NewsRx editors, research stated, "Clopidogrel is a prodrg that requires bioactivation by cytochrome P450 (P450) enzymes to a pharmacologically active metabolite for antiplatelet action. The clinical limitations of clopidogrel are in large part due to its poor pharmacokinetics resulting from inefficient bioactivation by P450s."

Our news journalists obtained a quote from the research from the University of Michigan, "In this study, we determined the pharmacokinetics and pharmacodynamics of a novel conjugate of clopidogrel, referred to as ClopNPT, in animal models and we evaluated its potential to overcome the limitations of clopidogrel. Results from pharmacokinetic (PK) studies showed that ClopNPT released the active metabolite with a time to maximal plasma concentration of < 5 minutes in C57BL/6 mice after either oral or intravenous administration, and plasma concentrations of the active metabolite reached C-max values of 1242 and 1100 ng/ml after a 10-mg/kg oral dose and a 5-mg/kg intravenous dose, respectively. Furthermore, ClopNPT was highly effective in preventing arterial thrombosis in rabbits and mice after vascular injuries. Formation of occlusive thrombi was prevented by ClopNPT at the 1-mg/kg dose with no significant increase in tongue bleeding time, whereas clopidogrel was ineffective at the same dose."

According to the news editors, the research concluded: "These results suggest that ClopNPT has favorable PK/pharmacodynamic properties that can potentially overcome the attenuated PK properties of clopidogrel and thus significantly improve the efficacy of antiplatelet therapy."

For more information on this research see: Significant Improvement of

Our news journalists report that additional information may be obtained by contacting H.M. Zhang, University of Michigan, Sch Med, Dept. of Pharm, Ann Arbor, MI 48109, United States. **Gram-Negative Bacteria - Brachyspira**

**Investigators from University of Minnesota Report New Data on Brachyspira (Characterization and Recognition of Brachyspira hampsonii sp nov., a Novel Intestinal Spirochete That Is Pathogenic to Pigs)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Brachyspira are discussed in a new report. According to news reporting out of St. Paul, Minnesota, by NewsRx editors, research stated, "Swine dysentery (SD) is a mucos hemorrhagic colitis of swine classically caused by infection with the intestinal spirochete Brachyspira hyodysenteriae. Since around 2007, cases of SD have occurred in North America associated with a different strongly beta-hemolytic spirochete that has been molecularly and phenotypically characterized and provisionally named 'Brachyspira hampsonii.' Despite increasing international interest, B. hampsonii is currently not recognized as a valid species."

Our news journalists obtained a quote from the research from the University of Minnesota, "To support its recognition, we sequenced the genomes of strains NSH-16(T), NSH-24, and P280/1, representing B. hampsonii genetic groups I, II, and III, respectively, and compared them with genomes of other valid Brachyspira species. The draft genome of strain NSH-16T has a DNA G+C content of 27.4% and an approximate size of 3.2 Mb. Genomic indices, including digital DNA-DNA hybridization (dDDH), average nucleotide identity (ANI), and average amino acid identity (AAI), clearly differentiated B. hampsonii from other recognized Brachyspira species. Although discriminated genotypically, the three genetic groups are phenotypically similar. By electron microscopy, cells of different strains of B. hampsonii measure 5 to 10 μm by 0.28 to 0.34 μm, with one or two flat curves, and have 10 to 14 periplasmic flagella inserted at each cell end. Using a comprehensive evaluation of genotypic (gene comparisons and multilocus sequence typing and analysis), genomic (dDDH, ANI, and AAI) and phenotypic (hemolysis, biochemical profiles, protein spectra, antibiogram, and pathogenicity) properties, we classify Brachyspira hampsonii sp. nov. as a unique species with genetically diverse yet phenotypically similar genovars (I, II, and III)."

According to the news editors, the research concluded: "We designate the type strain
NSH-16 (= ATCC BAA-2463 = NCTC 13792)."

For more information on this research see: Characterization and Recognition of Brachyspira hampsonii sp nov., a Novel Intestinal Spirochete That Is Pathogenic to Pigs. Journal of Clinical Microbiology, 2016;54(12):2942-2949. Journal of Clinical Microbiology can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

Our news journalists report that additional information may be obtained by contacting C.J. Gebhart, University of Minnesota, Coll Vet Med, Vet Diagnost Lab, St Paul, MN 55108, United States. Additional authors for this research include N.D. Phillips, T. La, D.J. Hampson and C.J. Gebhart.

Keywords for this news article include: St. Paul, Minnesota, United States, North and Central America, Gram-Negative Anaerobic Bacteria, Gram-Negative Bacteria, Brachyspira, Genetics, University of Minnesota.

Nutritional and Metabolic Diseases and Conditions - …

Investigators from University of Mississippi Target Hyperglycemia (Early development of podocyte injury independently of hyperglycemia and elevations in arterial pressure in nondiabetic obese Dahl SS leptin receptor mutant rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Hyperglycemia. According to news reporting out of Jackson, Mississippi, by NewsRx editors, research stated, "The current study examined the effect of obesity on the development of renal injury within the genetic background of the Dahl salt-sensitive rat with a dysfunctional leptin receptor derived from zinc-finger nucleases (SS(LepR)mutant strain). At 6 wk of age, body weight was 35% higher in the SS(LepR)mutant strain compared with SSWT rats and remained elevated throughout the entire study."

Our news journalists obtained a quote from the research from the University of Mississippi, "The SS(LepR)mutant strain exhibited impaired glucose tolerance and increased plasma insulin levels at 6 wk of age, suggesting insulin resistance while SSWT rats did not. However, blood glucose levels were normal throughout the course of the study. Systolic arterial pressure (SAP) was similar between the two strains from 6 to 10 wk of age. However, by 18 wk of age, the development of hypertension was more severe in the SS(LepR)mutant strain compared with SSWT rats (201 +/- 10 vs. 155 +/- 3 mmHg, respectively). Interestingly, proteinuria was substantially higher at 6 wk of age in the SS(LepR)mutant strain vs. SSWT rats (241 +/- 27 vs. 24 +/- 2 mg/day, respectively) and remained elevated until the end of the study. The kidneys from the SS(LepR)mutant strain displayed significant glomerular injury, including podocyte foot process effacement and lipid droplets compared with SSWT rats as early as 6 wk of age. By 18 wk of age, plasma creatinine levels were twofold higher in the SS(LepR)mutant strain vs. SSWT rats, suggesting the presence of chronic kidney disease (CKD)."

According to the news editors, the research concluded: "Overall, these results indicate that the SS(LepR)mutant strain develops podocyte injury and proteinuria independently of hyperglycemia and elevated arterial pressure that later progresses to CKD."

Our news journalists report that additional information may be obtained by contacting J.M. Williams, University of Mississippi, Medical Center, Dept. of Pharmacol & Toxicol, Jackson, MS 39272, United States. Additional authors for this research include L. Taylor, A.C. Johnson, S.P. Didion, A.M. Geurts, M.R. Garrett and J.M. Williams.

**Cardiovascular Diseases and Conditions -…**

**Investigators from University of Mississippi Target Hypertension (Associations Between Inflammation and Physical Function in African Americans and European Americans with Prevalent Cardiovascular Risk Factors)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Hypertension. According to news originating from Jackson, Mississippi, by NewsRx correspondents, research stated, "To examine associations between inflammation and physical function and potential mediation by white matter hyperintensities (WMHs) in African Americans (AAs) and European Americans (EAs). Cross-sectional analysis using linear and logistic models with generalized estimating equations to account for family clustering, reporting results as regression coefficients (beta) and odds ratios (ORs) adjusted for education, alcohol, exercise, body mass index, hypertension, diabetes mellitus, heart disease, cognition, ankle-brachial index, race (site), and supported interactions."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from the University of Mississippi, "Genetic Epidemiology Network of Arteriopathy-Genetics of Microangiopathic Brain Injury Study cohort. AA and EA sibships with two or more siblings with hypertension before age 60 (N = 1,960; 65% female, 51% AA, aged 26-91, 50% obese, 72% hypertensive). Inflammation (C-reactive protein (CRP), interleukin-6 (IL6), soluble tumor necrosis factor receptors (sTNFRs) 1 and 2, WMH volume (cm(3)) according to magnetic resonance imaging), walking speed (cm/s) over 25 feet, and mobility difficulty (any self-reported difficulty walking half a mile). In separate models, inflammatory markers were associated with walking speed (sTNFR1: beta = -2.74, P< .001; sTNFR2: beta = -1.23, P = .03; CRP: beta = -1.95, P = .001; IL6: beta = -1.24, P = .03) and mobility difficulty (sTNFR1: OR = 1.36, P = .001; sTNFR2: OR = 1.25, P = .005; CRP: OR = 1.22, P = .005; IL6: OR = 1.18, P = .02); the association between WMH volume and sTNFR1 in AA (beta = 0.07, P = .06) did not reach typical statistical
thresholds. WMH volume was associated with walking speed in AA (beta = -3.17, P = .02) but not with mobility difficulty (OR = 1.10, P = .54). Adjusting for WMH did not change associations. In young, middle-aged, and older adults with prevalent cardiovascular risk factors, multiple inflammatory biomarkers were associated with slower walking speed independent of microvascular disease in the brain. There was little evidence of mediation by brain WMH volume.

According to the news editors, the research concluded: "Inflammation may contribute to physical function impairments through pathways other than brain microvascular disease, particularly in AAs."

The news correspondents report that additional information may be obtained from B.G. Windham, University of Mississippi, Medical Center, Dept. of Med, Div Geriatr, Jackson, MS 39216, United States. Additional authors for this research include S.R. Wilkening, S.T. Lirette, I.J. Kullo, S.T. Turner, M.E. Griswold and T.H. Mosley.

**Heart Disorders and Diseases - Cardiomyopathies**

**Investigators from University of Murcia Zero in on Cardiomyopathies (Unclassifiable arrhythmic cardiomyopathy associated with Emery-Dreifuss caused by a mutation in FHL1)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Cardiomyopathies are presented in a new report. According to news originating from Murcia, Spain, by NewsRx correspondents, research stated, "Emery-Dreifuss muscular dystrophy (EDMD) is a heterogeneous genetic disorder characterized by peripheral muscular weakness often associated with dilated cardiomyopathy. We characterize clinically a large family with a mutation in FHL1 gene (p.Cys255Ser)."

Our news journalists obtained a quote from the research from the University of Murcia, "Penetrance was 44%, 100% for males and 18% for females. The heart was the main organ involved. Affected adult males had mild hypertrophy, systolic dysfunction and restriction with non-dilated ventricles. Carriers had significant QTc prolongation. The proband presented with resuscitated cardiac arrest. There were two transplants. Pathological study of explanted..."
heart showed fibrofatty replacement and scarring consistent with arrhythmogenic cardiomyopathy and prominent left ventricular trabeculations. Myopathic involvement was evident in all males. Females had no significant neuromuscular disease. Mutations in FHL1 cause unclassifiable cardiomyopathy with coexisting EDMD. Prognosis is poor and systolic impairment and arrhythmias are frequent.

According to the news editors, the research concluded: "Thrombopenia and raised creatine phosphokinase should raise suspicion of an FHL-1 disorder in X-linked cardiomyopathy."

The news correspondents report that additional information may be obtained from M. Sabater-Molina, University of Murcia, Dept. of Internal Med, Murcia, Spain. Additional authors for this research include M. Navarro, F. Martinez, L. Albert, L. Polo, J. Guardiola, E. Garcia-Molina, C. Munoz-Esparza, J.M. Lopez-Ayala, M. Sabater-Molina and J.R. Gimeno.

Keywords for this news article include: Murcia, Spain, Europe, Heart Disorders and Diseases, Genetics, Cardiovascular Diseases and Conditions, Cardiomyopathies, Heart Disease, University of Murcia.

Investigators from University of Nebraska Target Medical Genetics (The First Patient with Tandem Duplication of 6q14q16: Molecular and Phenotypic Characterization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Genetics - Medical Genetics. According to news originating from Omaha, Nebraska, by NewsRx correspondents, research stated, "Duplications of the long arm of chromosome 6 have been previously reported in a limited number of patients; however, most reported duplications encompass regions of chromosome 6 distal to band q21. Duplications restricted to the proximal portion of 6q are rare."

Our news journalists obtained a quote from the research from the University of Nebraska, "We report an 8-year-old male with a 16.4 megabase (Mb) tandem duplication of chromosome 6q14.1q16.1 (chr6: 7895019195395865; hg19) who exhibited dysmorphic facial features, seizures, global developmental delay, intellectual disability, autism spectrum disorder, sensorineural hearing loss, and immune deficiency. This patient refines and potentially expands the current, poorly-characterized phenotype associated with duplication of this proximal 6q region."

According to the news editors, the research concluded: "We recommend a low threshold for a hearing evaluation beyond newborn screening and for pursuing an immune work-up in patients with similar 6q duplications."

For more information on this research see: The First Patient with Tandem Duplication of 6q14q16: Molecular and Phenotypic Characterization. American Journal of
Investigators from University of North Carolina Target Wellness
(Strength and Comprehensiveness of School Wellness Policies in
Southeastern US School Districts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators discuss new findings in Wellness. According to news
reporting out of Chapel Hill, North Carolina, by NewsRx editors, research stated, "In 2004,
Congress passed legislation mandating that all public school districts participating in federal
school meal programs develop a school wellness policy (SWP) to direct efforts related to
nutrition and physical activity. We examined the extent to which SWPs varied in
comprehensiveness and strength in a representative sample of school districts in the
southeastern United States, the area of the country with the highest rates of childhood obesity."

Funders for this research include Pacific Institute for Research and Evaluation,
Eunice Kennedy Shriver National Institute of Child Health & Human Development of the
National Institutes of Health.

Our news journalists obtained a quote from the research from the University of North
Carolina, "Policies were assessed using an established 96-item coding tool by 2 raters to
ascertain the comprehensiveness and strength of the policies as a whole, and across distinct
subsections specified by federal legislation. In addition, variability in SWP comprehensiveness
and strength was assessed based on district sociodemographic characteristics. Overall, SWPs in
the southeastern states are weakly written, fragmented, and lack requirements necessary for
healthy school environments. District size, which was the only sociodemographic factor related
to policy characteristics, yielded an inverse association."

According to the news editors, the research concluded: "To encourage continued
promotion of healthy school environments, school districts will require technical support to
improve the quality of their school wellness policies."

For more information on this research see: Strength and Comprehensiveness of
2016;86(9):631-637. *Journal of School Health* can be contacted at: Wiley-Blackwell, 111...
Investigators from University of Oslo Have Reported New Data on Cardiology (The correlation between pulsatile intracranial pressure and indices of intracranial pressure-volume reserve capacity: results from ventricular infusion testing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news originating from Oslo, Norway, by NewsRx editors, the research stated, "The objective of this study was to examine how pulsatile and static intracranial pressure (ICP) scores correlate with indices of intracranial pressure-volume reserve capacity, i.e., intracranial elastance (ICE) and intracranial compliance (ICC), as determined during ventricular infusion testing. All patients undergoing ventricular infusion testing and overnight ICP monitoring during the 6-year period from 2007 to 2012 were included in the study."

Our news journalists obtained a quote from the research from the University of Oslo, "Clinical data were retrieved from a quality registry, and the ventricular infusion pressure data and ICP scores were retrieved from a pressure database. The ICE and ICC (= 1/ICE) were computed during the infusion phase of the infusion test. During the period from 2007 to 2012, 82 patients with possible treatment-dependent hydrocephalus underwent ventricular infusion testing within the department of neurosurgery. The infusion tests revealed a highly significant positive correlation between ICE and the pulsatile ICP scores mean wave amplitude (MWA) and rise-time coefficient (RTC), and the static ICP score mean ICP. The ICE was negatively associated with linear measures of ventricular size. The overnight ICP recordings revealed significantly increased MWA (> 4 mm Hg) and RTC (> 20 mm Hg/sec) values in patients with impaired ICC (< 0.5 ml/mm Hg). In this study cohort, there was a significant positive correlation between pulsatile ICP and ICE measured during ventricular infusion testing. In patients with impaired ICC during infusion testing (ICC < 0.5 ml/mm Hg), overnight ICP recordings showed increased pulsatile ICP (MWA > 4 mm Hg, RTC > 20 mm Hg/sec), but not increased mean ICP (< 10-15 mm Hg)."

According to the news editors, the research concluded: "The present data support the assumption that pulsatile ICP (MWA and RTC) may serve as substitute markers of pressure-volume reserve capacity, i.e., ICE and ICC."
For more information on this research see: The correlation between pulsatile intracranial pressure and indices of intracranial pressure-volume reserve capacity: results from ventricular infusion testing. *Journal of Neurosurgery*, 2016;125(6):1493-1503. *Journal of Neurosurgery* can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

The news correspondents report that additional information may be obtained from P.K. Eide, University of Oslo, Fac Med, N-0316 Oslo, Norway.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3171/2015.11.JNS151529. This DOI is a link to an online electronic document that is either free or for purchase.

**Nutritional and Metabolic Diseases and Conditions**

**Investigators from University of Oxford Have Reported New Data on Type 2 Diabetes (Assessment of Metformin-Induced Changes in Cardiac and Hepatic Redox State Using Hyperpolarized [1-C-13]Pyruvate)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "Metformin improves cardiovascular outcomes in type 2 diabetes, but its exact mechanisms of action remain controversial. We used hyperpolarized [1-C-13]pyruvate magnetic resonance spectroscopy to determine the effects of metformin treatment on heart and liver pyruvate metabolism in rats in vivo."

Our news journalists obtained a quote from the research from the University of Oxford, "Both oral treatment for 4 weeks and a single intravenous metformin infusion significantly increased the cardiac [1-C-13]lactate:[1-C-13]pyruvate ratio but had no effect on the [1-C-13]bicarbonate + (CO2)-C-13:[1-C-13]pyruvate ratio, an index of pyruvate dehydrogenase flux. These changes were paralleled by a significant increase in the heart and liver cytosolic redox state, estimated from the [lactate]:[pyruvate] ratio but not the whole-cell [NAD(+)][NADH] ratio. Hyperpolarized MRI localized the increase in cardiac lactate to the left ventricular myocardium, implying a direct myocardial effect, though metformin had no effect on systolic or diastolic cardiac function."

According to the news editors, the research concluded: "These findings demonstrate the ability of hyperpolarized pyruvate magnetic resonance spectroscopy to detect metformin-induced changes in cytosolic redox biology, suggest that metformin has a previously unrecognized effect on cardiac redox state, and help to refine the design of impending hyperpolarized magnetic resonance studies in humans."

Membrane Proteins - Toll Like Receptors

Investigators from University of Oxford Zero in on Toll Like Receptors (TLR Adaptor Protein MYD88 Mediates Sensitivity to HDAC Inhibitors via a Cytokine-Dependent Mechanism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Membrane Proteins - Toll Like Receptors have been published. According to news reporting from Oxford, United Kingdom, by NewsRx journalists, research stated, "Histone deacetylase (HDAC) inhibitors have proven useful therapeutic agents for certain hematologic cancers. However, HDAC inhibition causes diverse cellular outcomes, and identification of cancer-relevant pathways within these outcomes remains unresolved."

The news correspondents obtained a quote from the research from the University of Oxford, "In this study, we utilized an unbiased loss-of-function screen and identified the Toll-like receptor (TLR) adaptor protein MYD88 as a key regulator of the antiproliferative effects of HDAC inhibition. High expression of MYD88 exhibited increased sensitivity to HDAC inhibitors; conversely, low expression coincided with reduced sensitivity. MYD88-dependent TLR signaling controlled cytokine levels, which then acted via an extracellular mechanism to maintain cell proliferation and sensitize cells to HDAC inhibition. MYD88 activity was directly regulated through lysine acetylation and was deacetylated by HDAC6. MYD88 was a component of a wider acetylation signature in the ABC subgroup of diffuse large B-cell lymphoma, and one of the most frequent mutations in MYD88, L265P, conferred increased cell sensitivity to HDAC inhibitors. Our study defines acetylation of MYD88, which, by regulating TLR-dependent signaling to cytokine genes, influences the antiproliferative effects of HDAC inhibitors."

According to the news reporters, the research concluded: "Our results provide a possible explanation for the sensitivity of malignancies of hematologic origin to HDAC inhibitor-based therapy."

For more information on this research see: TLR Adaptor Protein MYD88 Mediates Sensitivity to HDAC Inhibitors via a Cytokine-Dependent Mechanism. Cancer Research, 2016;76(23):6975-6987. Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Investigators from University of Pennsylvania Release New Data on Beckwith-Wiedemann Syndrome (Tumor Screening in Beckwith-Wiedemann Syndrome-To Screen or Not to Screen?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetic Diseases and Conditions - Beckwith-Wiedemann Syndrome. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Beckwith-Wiedemann syndrome (BWS) is the most common imprinting disorder and consequently, one of the most common cancer predisposition disorders. Over the past 20 years, our understanding of the genetics and epigenetics leading to BWS has evolved and genotype/phenotype correlations have become readily apparent."

Our news editors obtained a quote from the research from the University of Pennsylvania, "Clinical management of these patients is focused on omphaloceles, hypoglycemia, macroglossia, hemihypertrophy, and tumor screening. Until recently, the need for tumor screening has been thought to be largely uniform across all genetic and epigenetic causes of BWS. As tumor risk correlates with genetic and epigenetic causes of BWS, several groups have proposed alterations to tumor screening protocols based on the etiology of BWS. However, there are many challenges inherent in adapting screening protocols."

According to the news editors, the research concluded: "Such protocols must accommodate not only the risk based on genetic and epigenetic causes but also the medical cost-benefit of screening, the psychological impact on families, and the social-legal implications of missing a treatable tumor."

The news editors report that additional information may be obtained by contacting J.M. Kalish, University of Pennsylvania, Dept. of Pediat, Perelman Sch Med, Philadelphia, PA 19104, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/ajmg.a.37881. This DOI is a link to an online electronic document that
Investigators from University of Pittsburgh Release New Data on Pulmonary Fibrosis (Expression of RXFP1 Is Decreased in Idiopathic Pulmonary Fibrosis Implications for Relaxin-based Therapies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Pulmonary Fibrosis is now available. According to news reporting from Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "Relaxin is a hormone that has been considered as a potential therapy for patients with fibrotic diseases. To gauge the potential efficacy of relaxin-based therapies in idiopathic pulmonary fibrosis (IPF), we studied gene expression for relaxin/insulin-like family peptide receptor 1 (RXFP1) in IPF lungs and controls."

The news correspondents obtained a quote from the research from the University of Pittsburgh, "We analyzed gene expression data obtained from the Lung Tissue Research Consortium and correlated RXFP1 gene expression data with cross-sectional clinical and demographic data. We also employed ex vivo donor and IPF lung fibroblasts to test RXFP1 expression in vitro. We tested CGEN25009, a relaxin-like peptide, in lung fibroblasts and in bleomycin injury. We found that RXFP1 is significantly decreased in IPF. In patients with IPF, the magnitude of RXFP1 gene expression correlated directly with diffusing capacity of the lung for carbon monoxide (P < 0.0001). Significantly less RXFP1 was detected in vitro in IPF fibroblasts than in donor controls. Transforming growth factor-beta decreased RXFP1 in both donor and IPF lung fibroblasts. CGEN25009 was effective at decreasing bleomycin-induced, acid-soluble collagen deposition in vivo. The relaxin-like actions of CGEN25009 were abrogated by RXFP1 silencing in vitro, and, in comparison with donor lung fibroblasts, IPF lung fibroblasts exhibited decreased sensitivity to the relaxin-like effects of CGEN25009. IPF is characterized by the loss of RXFP1 expression. RXFP1 expression is directly associated with pulmonary function in patients with IPF. The relaxin-like effects of CGEN25009 in vitro are dependent on expression of RXFP1."

According to the news reporters, the research concluded: "Our data suggest that patients with IPF with the highest RXFP1 expression would be predicted to be most sensitive to relaxin-based therapies."

Our news journalists report that additional information may be obtained by contacting D.J. Kass, University of Pittsburgh, Div Pulm Allergy & Crit Care Med, Pittsburgh,
Heart Disorders and Diseases - Heart Attack

Investigators from University of Pittsburgh Target Heart Attack (Long-term survival benefit from treatment at a specialty center after cardiac arrest)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Attack. According to news originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "The Institute of Medicine and American Heart Association have called for tiered accreditation standards and regionalization of post-cardiac arrest care, but there is little data to support that regionalization has a durable effect on patient outcomes. We tested the effect of treatment at a high-volume center on long-term outcome after sudden cardiac arrest (SCA)."

Our news journalists obtained a quote from the research from the University of Pittsburgh, "We included patients hospitalized at one of 7 medical centers in Southwestern Pennsylvania after SCA from 2005 to 2013. Centers were one regional referral center with an organized systems for post-SCA care, two moderate volume tertiary care centers and 4 low-volume centers. We abstracted clinical characteristics and outcomes at hospital discharge, and for survivors to discharge we queried the National Death Index for long-term survival data. We used Cox regression to determine the unadjusted associations of baseline predictors and survival, and built an adjusted model controlling for baseline predictors. Overall, 987 patients survived to discharge. During 2196 person-years of follow-up, median survival was 5.3 years and there were 396 deaths. In unadjusted analysis, treating center, age, arrest location, Charlson Comorbidity Index, initial rhythm, cardiac catheterization, defibrillator placement, discharge disposition, and neurological status at discharge were associated with long-term outcome. In adjusted analysis, treatment at the high-volume cardiac arrest center was associated with improved survival compared to treatment at other centers (hazards ratio 1.49, 95% confidence interval 1.19-1.86)."

According to the news editors, the research concluded: "Treatment at a high-volume cardiac arrest center with organized systems for post-arrest care is associated with a substantial long-term survival benefit after hospital discharge."

For more information on this research see: Long-term survival benefit from treatment at a specialty center after cardiac arrest. Resuscitation, 2016;108():48-53. Respiratory Tract Diseases and Conditions

Investigators from University of Sao Paulo Zero in on Respiratory Tract Diseases and Conditions (Effects of Particulate Matter and Its Chemical Constituents on Elderly Hospital Admissions Due to Circulatory and Respiratory Diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Respiratory Tract Diseases and Conditions. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "Various fractions of particulate matter have been associated with increased mortality and morbidity. The purpose of our study is to analyze the associations between concentrations of PM2.5, PM2.5-10, PM10 and their chemical constituents (soluble ions) with hospital admissions due to circulatory and respiratory diseases among the elderly in a medium-sized city in Brazil."

Our news journalists obtained a quote from the research from the University of Sao Paulo, "A time series study was conducted using Poisson regression with generalized additive models adjusted for confounders. Statistically significant associations were identified between PM10 and PM2.5-10 and respiratory diseases. Risks of hospitalization increased by 23.5% (95% CI: 13.5; 34.3) and 12.8% (95% CI: 6.0; 20.0) per 10 μg/m(3) of PM2.5-10 and PM10, respectively. PM2.5 exhibited a significant association with circulatory system diseases, with the risk of hospitalization increasing by 19.6% (95% CI: 6.4; 34.6) per 10 μg/m(3). Regarding the chemical species; SO42-, NO3-, NH4+ and K+ exhibited specific patterns of risk, relative to the investigated outcomes. Overall, SO42- in PM2.5-10 and K+ in PM2.5 were associated with increased risk of hospital admissions due to both types of diseases. The results agree with evidence indicating that the risks for different health outcomes vary in relation to the fractions and chemical composition of PM10."

According to the news editors, the research concluded: "Thus, PM10 speciation studies may contribute to the establishment of more selective pollution control policies."

For more information on this research see: Effects of Particulate Matter and Its Chemical Constituents on Elderly Hospital Admissions Due to Circulatory and Respiratory Diseases. *International Journal of Environmental Research and Public Health*, 2016;13 (10):213-223. *International Journal of Environmental Research and Public Health* can be
Investigators from University of South Carolina Zero in on Escherichia coli (The Escherichia coli BoLA Protein IbaG Forms a Histidine-Ligated [2Fe-2S]-Bridged Complex with Grx4)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Escherichia coli. According to news originating from Columbia, South Carolina, by NewsRx correspondents, research stated, "Two ubiquitous protein families have emerged as key players in iron metabolism, the CGFS-type monothiol glutaredoxins (Grxs) and the BoLA proteins. Monothiol Grxs and BoLA proteins form heterocomplexes that have been implicated in Fe-S cluster assembly and trafficking."

Financial support for this research came from National Institute of General Medical Sciences.

Our news journalists obtained a quote from the research from the University of South Carolina, "The Escherichia coli genome encodes members of both of these proteins families, namely, the monothiol glutaredoxin Grx4 and two BoLA family proteins, BoLA and IbaG. Previous work has demonstrated that E. coli Grx4 and BoLA interact as both apo and [2Fe-2S] bridged heterodimers that are spectroscopically distinct from [2Fe-2S]-bridged Grx4 homodimers. However, the physical and functional interactions between Grx4 and IbaG are uncharacterized. Here we show that co-expression of Grx4 with IbaG yields a [2Fe-2S]-bridged Grx4 IbaG heterodimer. In vitro interaction studies indicate that IbaG binds the [2Fe-2S] Grx4 homodimer to form apo Grx4 IbaG heterodimer as well as the [2Fe-2S] Grx4 IbaG heterodimer, altering the cluster stability and coordination environment. Additionally, spectroscopic and mutagenesis studies provide evidence that IbaG ligates the Fe-S cluster via the conserved histidine that is present in all BoLA proteins and by a second conserved histidine that is present in the H/C loop of two of the four classes of BoLA proteins."

According to the news editors, the research concluded: "These results suggest that IbaG may function in Fe-S cluster assembly and trafficking in E. coli as demonstrated for other BoLA homologues that interact with monothiol Grxs."

The news correspondents report that additional information may be obtained from
Investigators from University of Szeged Target Left Ventricular Hypertrophy (Identification of Two Novel LAMP2 Gene Mutations in Danon Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Left Ventricular Hypertrophy have been presented. According to news reporting from Szeged, Hungary, by NewsRx journalists, research stated, "Danon disease is a rare X-linked inherited disorder characterized by massive left ventricular hypertrophy, skeletal muscle dystrophy, and mental retardation. The disease is caused by mutations in the LAMP2 gene encoding for lysosome-associated membrane protein-2."

The news correspondents obtained a quote from the research from the University of Szeged, "Two young male patients with hypertrophic cardiomyopathy, characterized by marked, concentric left ventricular hypertrophy, elevated levels of creatine kinase, and manifest limb-girdle muscular dystrophy in 1 case, were investigated. Genetic screening included direct sequencing of the whole coding sequence of the LAMP2 gene. Genetic analysis identified 2 novel LAMP2 gene mutations. In Family A, a G-A transition (c. 962G > A) leading to a nonsense mutation at codon 321 (p. Trp321Ter), and in Family B, a one-nucleotide insertion (c. 973insC) leading to a full frame-shift (p. Pro324+24X) was detected in exon 8 of the LAMP2 gene. Family screening identified 8 mutation carriers, with 4 nonpenetrant cases and 3 additional, probably affected family members without DNA diagnosis. The cardiac phenotype was hypertrophic cardiomyopathy in all cases, including female mutation carriers. Five disease-related deaths occurred in the families, at an average age of 33 +/- 16 years, which was clearly lower in male than in female patients (28 +/- 7 vs 42 +/- 25 years). A high prevalence of arrhythmias or conduction abnormalities was also observed."

According to the news reporters, the research concluded: "The reported 2 novel LAMP2 gene mutation carrier families, one of them being one of the largest reported to date, highlight the malignant clinical course of Danon disease, characterized by a high rate of disease-related death at an early age and a high prevalence of arrhythmias or conduction abnormalities."

For more information on this research see: Identification of Two Novel LAMP2 Gene Mutations in Danon Disease. Canadian Journal of Cardiology, 2016;32(11):156-163. Canadian Journal of Cardiology can be contacted at: Elsevier Science Inc, 360 Park Ave
Drugs and Therapies - Chemotherapy

**Investigators from University of Texas Medical Branch Target Chemotherapy (The DNA Polymerase Gamma R953C Mutant Is Associated with Antiretroviral Therapy-Induced Mitochondrial Toxicity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Chemotherapy. According to news reporting originating in Galveston, Texas, by NewsRx journalists, research stated, "We found a heterozygous C2857T mutation (R953C) in polymerase gamma (Pol-gamma) in an HIV-infected patient with mitochondrial toxicity."

Funders for this research include HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID), HHS | NIH | National Institute of General Medical Sciences (NIGMS).

The news reporters obtained a quote from the research from the University of Texas Medical Branch, "The R953C Pol-gamma mutant binding affinity for dCTP is 8-fold less than that of the wild type. The R953C mutant shows a 4-fold decrease in discrimination of analog nucleotides relative to the wild type."

According to the news reporters, the research concluded: "R953 is located on the 'O-helix' that forms the substrate deoxynucleoside triphosphate (dNTP) binding site; the interactions of R953 with E1056 and Y986 may stabilize the O-helix and affect polymerase activity."

For more information on this research see: The DNA Polymerase Gamma R953C Mutant Is Associated with Antiretroviral Therapy-Induced Mitochondrial Toxicity. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5608-5611. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Investigators from University of Texas Target Small Cell Lung Cancer (Hsp90 Inhibitor Ganetespib Sensitizes Non-Small Cell Lung Cancer to Radiation but Has Variable Effects with Chemoradiation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Small Cell Lung Cancer. According to news reporting out of Houston, Texas, by NewsRx editors, research stated, "HSP90 inhibition is well known to sensitize cancer cells to radiation. However, it is currently unknown whether additional radiosensitization could occur in the more clinically relevant setting of chemoradiation (CRT)."

Our news journalists obtained a quote from the research from the University of Texas, "We used the potent HSP90 inhibitor ganetespib to determine whether it can enhance CRT effects in NSCLC. We first performed in vitro experiments in various NSCLC cell lines combining radiation with or without ganetespib. Some of these experiments included clonogenic survival assay, DNA damage repair, and cell-cycle analysis, and reverse-phase protein array. We then determined whether chemotherapy affected ganetespib radiosensitization by adding carboplatin-paclitaxel to some of the in vitro and in vivo xenograft experiments. Ganetespib significantly reduced radiation clonogenic survival in a number of lung cancer cell lines, and attenuated DNA damage repair with irradiation. Radiation caused G2-M arrest that was greatly accentuated by ganetespib. Ganetespib with radiation also dose-dependently upregulated p21 and downregulated pRb levels that were not apparent with either drug or radiation alone. However, when carboplatin-paclitaxel was added, ganetespib was only able to radiosensitize some cell lines but not others. This variable in vitro CRT effect was confirmed in vivo using xenograft models. Ganetespib was able to potently sensitize a number of NSCLC cell lines to radiation but has variable effects when added to platinum-based doublet CRT."

According to the news editors, the research concluded: "For optimal clinical translation, our data emphasize the importance of preclinical testing of drugs in the context of clinically relevant therapy combinations."

For more information on this research see: Hsp90 Inhibitor Ganetespib Sensitizes Non-Small Cell Lung Cancer to Radiation but Has Variable Effects with Chemoradiation. *Clinical Cancer Research*, 2016;22(23):5876-5886. *Clinical Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Our news journalists report that additional information may be obtained by contacting S.H. Lin, Univ Texas MD Anderson Canc Center, Dept. of Radiat Oncol, Houston, TX, United States. Additional authors for this research include H. Liu, L.X. Diao, A. Potter, J.H.
Investigators from University of Toledo Target Vesicular Transport Proteins (Differential roles of caveolin-1 in ouabain-induced Na+/K+-ATPase cardiac signaling and contractility)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Membrane Proteins - Vesicular Transport Proteins are presented in a new report. According to news reporting originating from Toledo, Ohio, by NewsRx correspondents, research stated, "Binding of ouabain to cardiac Na+/K+-ATPase initiates cell signaling and causes contractility in cardiomyocytes. It is widely accepted that caveolins, structural proteins of caveolae, have been implicated in signal transduction."

Our news editors obtained a quote from the research from the University of Toledo, "It is known that caveolae play a role in Na+/K+-ATPase functions. Regulation of caveolin-1 in ouabain-mediated cardiac signaling and contractility has never been reported. The aim of this study is to compare ouabain-induced cardiac signaling and contractility in wild-type (WT) and caveolin-1 knockout (cav-1 KO) mice. In contrast with WT cardiomyocytes, ouabain-induced signaling e.g., activation of phosphoinositide 3-kinase-alpha/Akt and extracellular signal-regulated kinases (ERK) 1/2, and hypertrophic growth were significantly reduced in cav-1 KO cardiomyocytes. Interactions of the Na+/K+-ATPase+1-subunit with caveolin-3 and the Na+/K+-ATPase alpha(1)-subunit with PI3K-alpha were also decreased in cav-1 KO cardiomyocytes. The results from cav-1 KO mouse embryonic fibroblasts also proved that cav-1 significantly attenuated ouabain-induced ERK1/2 activation without alteration in protein and cholesterol distribution in caveolae/lipid rafts. Intriguingly, the effect of ouabain induced positive inotropy in vivo (via transient infusion of ouabain, 0.48 nmol/g body wt) was not attenuated in cav-1 KO mice. Furthermore, ouabain (1-100 mu M) induced dose-dependent contractility in isolated working hearts from WT and cav-1 KO mice. The effects of ouabain on contractility between WT and cav-1 KO mice were not significantly different. These results demonstrated differential roles of cav-1 in the regulation of ouabain signaling and contractility."

According to the news editors, the research concluded: "Signaling by ouabain, in contrast to contractility, may be a redundant property of Na+/K+-ATPase."

For more information on this research see: Differential roles of caveolin-1 in ouabain-induced Na+/K+-ATPase cardiac signaling and contractility. *Physiological Genomics*, 2016;48(10):739-748. *Physiological Genomics* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Investigators from University of Toronto Report New Data on Biotherapies and Biologicals (Immune-Related Adverse Events Associated with Immune Checkpoint Inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Biotherapies and Biologicals are presented in a new report. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "Immune checkpoint inhibitors (ICIs), including antibodies targeting cytotoxic T-lymphocyte-associated antigen 4 (CTLA-4) and programmed cell death protein-1 (PD-1), have shown durable treatment responses in multiple tumor types by enhancing antitumor immunity."

Financial support for this research came from Ontario Institute for Cancer Research.

Our news journalists obtained a quote from the research from the University of Toronto, "However, removal of self-tolerance can induce autoimmunity and produce a unique immune-driven toxicity profile, termed immune-related adverse events (irAEs). As ICIs gain approval for a growing number of indications, it is imperative clinicians increase their knowledge of and ability to manage irAEs."

According to the news editors, the research concluded: "This review examines the etiology, presentation, kinetics, and treatment of irAEs and aims to provide practical guidance for clinicians."

The news correspondents report that additional information may be obtained from A.R. Hansen, University of Toronto, Dept. of Med, Toronto, ON, Canada.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s40259-016-0204-3. This DOI is a link to an online electronic document that is either free or for purchase.

Histology

Investigators from University of Ulsan Have Reported New Data on Histology (Plaque structural stress assessed by virtual histology-intravascular ultrasound predicts dynamic changes in phenotype and composition of untreated coronary artery ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Histology. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "We aimed to determine whether finite element analysis (FEA)-derived plaque structural stress (PSS) analysis can predict serial changes in atheroma volume, type, and tissue composition within a fibroatheroma-containing target segment. Overall, 210 patients (210 untreated coronary artery lesions) underwent serial (baseline and 12-month follow-up) grayscale- and virtual histology (VH)-intravascular ultrasound (IVUS)."

The news reporters obtained a quote from the research from the University of Ulsan, "Baseline PSS was assessed at the minimal lumen and at the maximum necrotic core (NC) sites. Overall, there was a significant decrease in % NC volume. The highest PSS tertile was associated with a smaller on-statin reduction in % NC volume (-1.55 +/- 1.03% in the highest vs. -5.18 +/- 1.12% in the lowest tertile, p = 0.025). Of the 115 lesions with baseline VH-thin cap fibroatheroma (TCFA), 36 (31%) showed persistent VH-TCFA at follow-up. Five of the 95 lesions with baseline thick-cap fibroatheroma evolved into VH-TCFA. Independent predictors of VH-TCFA at follow-up (including persistent and new VH-TCFA) were diabetes mellitus (odds ratio [ OR] -3.87, 95% CI = 1.58-9.47), a large MLA (OR = 1.39, 95% CI = 1.10-1.75), a greater percent atheroma volume (OR = 1.12, 95% CI = 1.05-1.19), VH-TCFA at baseline (OR = 8.01, 95% CI = 2.73-23.50), and a higher superficial PSS at the maximum NC site (OR = 1.02, 95% CI = 1.00-1.03), (all p < 0.05). Independent determinants of the serial change in % NC volume were high-sensitive C-reactive protein (beta = -2.79, 95% CI = -5.31 to -0.27), baseline % NC volume (beta = -0.70, 95% CI = -0.84 to -0.56), and superficial PSS at the maximum NC site (beta = 0.05, 95% CI = 0.01-0.08), (all p < 0.05). An elevated PSS was more likely associated with an increase in atheroma volume, a smaller on-statin reduction in % NC volumes, and the presence of VH-TCFA at follow-up."

According to the news reporters, the research concluded: "Morphologic and hemodynamic assessment by utilizing VH-IVUS may help understand and predict atherosclerotic progression."

For more information on this research see: Plaque structural stress assessed by virtual histology-intravascular ultrasound predicts dynamic changes in phenotype and composition of untreated coronary artery lesions. Atherosclerosis, 2016;254():85-92. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Our news correspondents report that additional information may be obtained by contacting Y.H. Kim, University of Ulsan, Coll Med, Asan Med Center, Dept. of Cardiol, Seoul, South Korea. Additional authors for this research include H. Ha, J.G. Lee, S.B. Han, G.S. Mintz, J. Kweon, M. Chang, J.H. Roh, P.H. Lee, S.H. Yoon, J.M. Ahn, D.W. Park, S.W. Lee, C.W.
Investigators from University of Washington Release New Data on Adverse Drug Reactions (Use of hydroxyethyl starch in leukocytapheresis procedures does not increase renal toxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Adverse Drug Reactions have been published. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "Hydroxyethyl starch (HES) is reportedly associated with an increased risk of renal failure and death when used for fluid resuscitation in critically ill patients. HES can be used during therapeutic leukocytapheresis (TL) procedures to enhance cell separation."

Our news journalists obtained a quote from the research from the University of Washington, "The purpose of this study was to evaluate the occurrence of adverse events associated with HES during TL procedures. We performed a retrospective review of patients who underwent TL with and without HES in the period 2009 to 2013 at six academic medical institutions. A difference-in-difference regression analysis was used to estimate the mean change before and after TL in selected outcomes in the HES group relative to the average change in the non-HES group. Selected outcomes included serum creatinine, estimated glomerular filtration rate (eGFR), and white blood cell (WBC) count. A total of 195 patients who underwent 278 TL procedures were studied. We found no significant differences in serum creatinine levels and eGFR on Days 1 and 7 after TL procedure between patients who received and those who did not receive HES. The rate of adverse events and overall and early mortality were similar in both groups. Patients with acute myeloid leukemia who received HES had greater WBC reduction when HES was used. Additionally, patients who received HES had improvement in pulmonary leukostasis symptoms."

According to the news editors, the research concluded: "HES, used at low doses during TL procedures, was not associated with adverse events previously ascribed to its use as a volume expander."

The news correspondents report that additional information may be obtained from M.B. Pagano, University of Washington, Dept. of Lab Med, Seattle, WA 98195, United States. Additional authors for this research include C. Harmon, L. Cooling, L. Connelly-Smith, S.A.
Investigators from University of Washington Release New Data on Congenital Adrenal Hyperplasia (Disorders of Sexual Development in Adult Women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Congenital Diseases and Conditions - Congenital Adrenal Hyperplasia is now available. According to news reporting originating from Seattle, Washington, by NewsRx correspondents, research stated, "Disorders (differences) of sexual development encompass a variety of conditions with atypical development of chromosomal, gonadal, or anatomic sex. Three of the most common differences of sex development conditions include congenital adrenal hyperplasia, complete androgen insensitivity, and Turner syndrome."

Our news editors obtained a quote from the research from the University of Washington, "Obstetrician-gynecologists who care for affected individuals in their practice must be familiar with the genetic, endocrine, and anatomic considerations of the most common conditions to provide optimal care. As women with these conditions transition to adult care, the gynecologist needs to assess the patient's understanding and educate her regarding her diagnosis and ongoing medical care. All of these conditions may affect self-perception, mental health, fertility, sexual function, and bone and cardiovascular health. Women with congenital adrenal hyperplasia need lifelong endocrine management and require genetic counseling before pregnancy. Women with androgen insensitivity syndrome require counseling regarding gonadectomy and hormone replacement therapy and may require vaginal elongation for intercourse. Most women with Turner syndrome experience premature ovarian insufficiency and require long-term estrogen replacement. Women with Turner syndrome often have congenital anomalies and autoimmune disorders, which require regular monitoring and care during adulthood."

According to the news editors, the research concluded: "The purpose of this review is to provide the obstetrician-gynecologist who cares for adult women with the most common disorders (differences) of sexual development conditions an outline of the current recommendations for screening and ongoing health care with particular emphasis on the underlying genetics, management of subfertility, infertility and sexual concerns, approach to hypogonadism, and understanding of associated comorbidities."

Investigators from University of Washington Report New Data on HIV/AIDS (Changes in Condomless Sex and Serosorting Among Men Who Have Sex With Men After HIV Diagnosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immune System Diseases and Conditions - HIV/AIDS have been presented. According to news reporting from Seattle, Washington, by NewsRx journalists, research stated, "Among men who have sex with men (MSM) diagnosed with HIV, high-risk sexual behaviors may decline in the year after diagnosis. The sustainability of these changes is unknown."

The news correspondents obtained a quote from the research from the University of Washington, "We created a retrospective cohort (Seroconversion Cohort) of MSM attending an STD clinic in Seattle, Washington who tested HIV positive between 2001 and 2013 and had a negative HIV test,2 years before diagnosis. We randomly selected 1000 HIV-negative controls (men who always tested HIV negative) who were frequency-matched to the Seroconversion Cohort based on HIV diagnosis year. 12-month sexual behavior data were collected at each clinic visit. We examined condomless anal intercourse (CAI) with HIV-negative, HIV-positive, and HIV unknown-status partners before diagnosis and up to 4 years thereafter. Of the 26,144 clinic visits where MSM tested for HIV, there were 655 (2.5%) new HIV diagnoses. Of these, 186 (28%) men had previously tested HIV negative and were included in the Seroconversion Cohort. The proportion (of the 186) reporting CAI with HIV-negative partners declined from 73% at diagnosis to 12% after diagnosis (P <0.001), whereas CAI with HIV-positive partners increased (11%-67%; P<0.001). The proportion who serosorted (ie, CAI only with HIV-concordant partners) did not change before or after diagnosis (34%-40%; P = 0.65). These 3 behaviors remained stable for up to 4 years after diagnosis. Among HIV-negative controls, serosorting and CAI with HIV-positive and HIV-negative partners was constant. MSM substantially modify their sexual behavior after HIV diagnosis."

According to the news reporters, the research concluded: "These changes are sustained for several years and may reduce HIV transmission to HIV-uninfected men."

Our news journalists report that additional information may be obtained by contacting C.M. Khosropour, University of Washington, Dept. of Epidemiol, Seattle, WA 98195, United States. Additional authors for this research include J.C. Dombrowski, R.P. Kerani, D.A. Katz, L.A. Barbee and M.R. Golden.

Eye Diseases and Conditions - Retinal Vein Occlusion

Investigators from University of Western Australia Report New Data on Retinal Vein Occlusion (Visual Acuity Is Correlated with the Area of the Foveal Avascular Zone in Diabetic Retinopathy and Retinal Vein Occlusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Eye Diseases and Conditions - Retinal Vein Occlusion. According to news reporting originating in Perth, Australia, by NewsRx journalists, research stated, "To determine if the area of the foveal avascular zone (FAZ) is correlated with visual acuity (VA) in diabetic retinopathy (DR) and retinal vein occlusion (RVO). Cross-sectional study. Ninety-five eyes of 66 subjects with DR (65 eyes), branch retinal vein occlusion (19 eyes), and central retinal vein occlusion (11 eyes)."

The news reporters obtained a quote from the research from the University of Western Australia, "Structural optical coherence tomography (OCT; Spectralis, Heidelberg Engineering) and OCT angiography (OCTA; Avanti, Optovue RTVue XR) data from a single visit were analyzed. FAZ area, point thickness of central fovea, central 1-mm subfield thickness, the occurrence of intraretinal cysts, ellipsoid zone disruption, and disorganization of retinal inner layers (DRIL) length were measured. VA was also recorded. Correlations between FAZ area and VA were explored using regression models. Main outcome measure was VA. Mean age was 62.9 +/- 13.2 years. There was no difference in demographic and OCT-derived anatomic measurements between branch retinal vein occlusion and central retinal vein occlusion groups (all P>= 0.058); therefore, data from the 2 groups were pooled together to a single RVO group for further statistical comparisons. Univariate and multiple regression analysis showed that the area of the FAZ was significantly correlated with VA in DR and RVO (all P<= 0.003). The relationship between FAZ area and VA varied with age (P = 0.026) such that for a constant FAZ area, an increase in patient age was associated with poorer vision (rise in logarithm of the minimum angle of resolution visual acuity). Disruption of the ellipsoid zone was significantly correlated with VA in univariate and multiple regression analysis (both P< 0.001). Occurrence of intraretinal cysts, DRIL length, and lens status were significantly correlated with VA in the univariate regression analysis (P <= 0.018) but not the multiple regression analysis (P >= 0.210). Remaining variables evaluated in this study were not predictive of VA (all P>= 0.225). The area of the FAZ is significantly correlated with VA in DR and RVO and this relationship is modulated by patient age."

According to the news reporters, the research concluded: "Further study about FAZ
area and VA correlations during the natural course of retinal vascular diseases and following treatment is warranted."

Our news correspondents report that additional information may be obtained by contacting C. Balaratnasingam, University of Western Australia, Lions Eye Inst, Center Ophthalmol & Visual Sci, Perth, WA, Australia. Additional authors for this research include M. Inoue, S. Ahn, J. McCann, E. Dhrami-Gavazi, L.A. Yannuzzi and K.B. Freund.

Central Nervous System Diseases and Conditions -…

**Investigators from University of Wollongong Zero in on Epilepsy (Development and validation of a seizure initiated drug delivery system for the treatment of epilepsy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Epilepsy have been published. According to news reporting out of Wollongong, Australia, by NewsRx editors, research stated, "Delivery of small dosages of anti-epileptic drug (AED) directly into the brain from implantable degradable polymers has been reported to alleviate epilepsy activity in a GAERS animal model, however this system delivers a continuous dose of AED to the brain. We describe here the development of an active drug delivery system whereby AED delivery is initiated by the onset of an epileptic event and controlled by a custom hardware device."

Our news journalists obtained a quote from the research from the University of Wollongong, "The system is comprised of an electrocortigographic (ECoG) data receiver, computational hardware, and a drug delivery component. The system initiates the release of an AED from an electrically conductive polymer when a seizure biomarker is detected above a preset threshold. Evaluation of the system showed that it is possible to vary the quantity of drug released linearly by varying the amount of charge injected into the drug loaded electroactive polymer. In addition it is possible to induce drug release within 10 s of injecting the charge, highlighting the responsive nature of the system."
According to the news editors, the research concluded: "This work demonstrates a significant advance in the development of a device that combines the electronics capable of monitoring ECoG activity, detecting epileptic seizures and initiating drug delivery."

For more information on this research see: Development and validation of a seizure initiated drug delivery system for the treatment of epilepsy. Sensors and Actuators B-Chemical, 2016;236():732-740. Sensors and Actuators B-Chemical can be contacted at: Elsevier Science Sa, PO Box 564, 1001 Lausanne, Switzerland.

Our news journalists report that additional information may be obtained by contacting G.G. Wallace, University of Wollongong, ARC Center Excellence Electromat Sci, AIIM Facil, Wollongong, NSW 2522, Australia. Additional authors for this research include Z.L. Yue, S. Ahmadi, W. Ng, W.M. Grosse, M.J. Cook, G.G. Wallace and S.E. Moulton.

Autoimmune Diseases and Conditions - Multiple...

Investigators from University of Zurich Target Multiple Sclerosis (Cancer co-occurrence patterns in Parkinson's disease and multiple sclerosis-Do they mirror immune system imbalances?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Autoimmune Diseases and Conditions - Multiple Sclerosis. According to news reporting from Zurich, Switzerland, by NewsRx journalists, research stated, "To examine the site-specific cancer mortality among deaths registered with Parkinson's disease (PD) and multiple sclerosis (MS). We focused on the patterns related to the most frequent cancers."

The news correspondents obtained a quote from the research from the University of Zurich, "We analyzed Swiss mortality data over a 39-year period (1969-2007), using a statistical approach applicable to unique databases, i.e. when no linkage with morbidity databases or disease registries is possible. It was based on a case-control design with bootstrapping to derive standardized mortality ratios (SMR). The cases were defined by the cancer-PD or cancer-MS co-registrations, whereas the controls were drawn from the remaining records with cancer deaths (matching criteria: sex, age, language region of Switzerland, subperiods 1969-1981, 1982-1994, 1995-2007). For PD we found lower SMRs in lung and liver cancer and higher SMRs in melanoma/skin cancer, and in cancers of breast and prostate. As for MS, the SMR in lung cancer was lower than expected, whereas SMRs in colorectal, breast and bladder cancer were higher. A common pattern of associations can be observed in PD and MS, with a lower risk of lung cancer and higher risk of breast cancer than expected."

According to the news reporters, the research concluded: "Thus, PD and MS resemble other conditions with similar (schizophrenia) or reversed patterns (rheumatoid arthritis, immunosuppression after organ transplantation)."

Our news journalists report that additional information may be obtained by contacting V. Ajdacic-Gross, University of Zurich, Hosp Psychiat, Zurich, Switzerland. Additional authors for this research include S. Rodgers, A. Aleksandrowicz, M. Mutsch, N. Steinemann, V. Von Wyl, R. von Kanel and M. Boppa.

Hematology - Blood Coagulation Factors

Investigators from Vanderbilt University Have Reported New Data on Blood Coagulation Factors (Contributions of Protease-Activated Receptors PAR1 and PAR4 to Thrombin-Induced GPIIbIIIa Activation in Human Platelets)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematology - Blood Coagulation Factors is the subject of a report. According to news reporting out of Nashville, Tennessee, by NewsRx editors, research stated, "Human platelets display a unique dual receptor system for responding to its primary endogenous activator, alpha-thrombin. Because of the lack of efficacious antagonists, the field has relied on synthetic peptides and pepducins to describe protease-activated receptor PAR1 and PAR4 signaling."

Our news journalists obtained a quote from the research from Vanderbilt University, "The precise contributions of each receptor have not been established in the context of thrombin. We took advantage of newly discovered PAR antagonists to contrast the contribution of PAR1 and PAR4 to thrombin-mediated activation of the platelet fibrin receptor (GPIIbIIIa). PAR1 is required for platelet activation at low but not high concentrations of thrombin, and maximal platelet activation at high concentrations of thrombin requires PAR4. As the concentration of thrombin is increased, PAR1 signaling is quickly overcome by PAR4 signaling, leaving a narrow window of low thrombin concentrations that exclusively engage PAR1. PAR4 antagonism reduces the maximum thrombin response by over 50%. Thus, although the PAR1 response still active at higher concentrations of thrombin, this response is superseded by PAR4. Truncation of a known PAR4 antagonist and identification of the minimum pharmacophore converted the mechanism of inhibition from noncompetitive to competitive, such that the antagonist could be outcompeted by increasing doses of the ligand. Fragments retained efficacy against both soluble and tethered ligands with lower cLogP values and an increased free fraction.
in plasma."

According to the news editors, the research concluded: "These reversible, competitive compounds represent a route toward potentially safer PAR4 antagonists for clinical utility and the development of tools such as radioligands and positron emission tomography tracers that are not currently available to the field for this target."

For more information on this research see: Contributions of Protease-Activated Receptors PAR1 and PAR4 to Thrombin-Induced GPIIbIIIa Activation in Human Platelets. *Molecular Pharmacology*, 2017;91(1):39-47. *Molecular Pharmacology* can be contacted at: Amer Soc Pharmacology Experimental Therapeutics, 9650 Rockville Pike, Bethesda, MD 20814-3995, USA.

Our news journalists report that additional information may be obtained by contacting H.E. Hamm, Vanderbilt University, Medical Center, Dept. of Pharmacol, Nashville, TN 37232, United States. Additional authors for this research include K.J. Temple, J.G. Maeng, A.L. Blobaum, S.R. Stauffer, C.W. Lindsley and H.E. Hamm.

Keywords for this news article include: Nashville, Tennessee, United States, North and Central America, Blood Coagulation Factors, Enzymes and Coenzymes, Serine Endopeptidases, Transfusion Medicine, Peptide Hydrolases, Blood Transfusion, Hematology, Protease, Thrombin, Vanderbilt University.

**Cyclohexanes**

**Investigators from Virginia Commonwealth University Report New Data on Cyclohexanes (Effects of the noncompetitive N-methyl-D-aspartate receptor antagonists ketamine and MK-801 on pain-stimulated and pain-depressed behaviour in rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cyclohexanes are discussed in a new report. According to news reporting originating in Richmond, Virginia, by NewsRx journalists, research stated, "Pain is a significant public health concern, and current pharmacological treatments have problematic side effects and limited effectiveness. N-methyl-D-aspartate (NMDA) glutamate receptor antagonists have emerged as one class of candidate treatments for pain because of the significant contribution of glutamate signalling in nociceptive processing."

The news reporters obtained a quote from the research from Virginia Commonwealth University, "This study compared effects of the NMDA receptor antagonists ketamine and MK-801 in assays of pain-stimulated and pain-depressed behaviour in rats. The nonsteroidal anti-inflammatory drug ketoprofen was examined for comparison as a positive control. Intraperitoneal injection of dilute acid served as an acute visceral noxious stimulus to stimulate a stretching response or depress intracranial self-stimulation (ICSS) in male Sprague-Dawley rats. Ketamine (1.0-10.0 mg/kg) blocked acid-stimulated stretching but failed to block acid-induced depression of ICSS, whereas MK-801 (0.01-0.1 mg/kg) blocked both acid-stimulated stretching and acid-induced depression of ICSS. These doses of ketamine and MK-801 did not alter control ICSS in the absence of the noxious stimulus; however, higher doses of ketamine (10 mg/kg) and MK-801 (0.32 mg/kg) depressed all behaviour. Ketoprofen (1.0 mg/kg) blocked both acid-induced stimulation of stretching and depression of ICSS without altering control
ICSS. These results support further consideration of NMDA receptor antagonists as analgesics; however, some NMDA receptor antagonists are more efficacious at attenuating pain-depressed behaviours. What does this study add? NMDA receptor antagonists produce dissociable effects on pain-depressed behaviour.

According to the news reporters, the research concluded: "Provides evidence that pain-depressed behaviours should be considered and evaluated when determining the antinociceptive effects of NMDA receptor antagonists."

Our news correspondents report that additional information may be obtained by contacting T.M. Hillhouse, Virginia Commonwealth University, Dept. of Pharmacol & Toxicol, Richmond, VA 23284, United States.

**Oncology - Glioblastomas**

**Investigators from Wake Forest University Report New Data on Glioblastomas (Impact of timing of radiotherapy in patients with newly diagnosed glioblastoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Glioblastomas is the subject of a report. According to news reporting originating in Winston Salem, North Carolina, by NewsRx journalists, research stated, "To further evaluate if a delay in the start of radiation therapy (RT) affects patient outcomes for glioblastoma (GBM). From May 1999 to May 2010, a total of 161 patients underwent surgery followed by RT for GBM."

The news reporters obtained a quote from the research from Wake Forest University, "We assessed overall survival (OS) and progression free survival (PFS), stratified by extent of surgical resection. Included in the analysis were genomic predictors of progression. Median time from surgery to start of RT was 20 days for biopsy alone, 28 days for subtotal resection (STR) and 28 days for gross total resection (GTR). For all patients, a delay >28 days did not result in a difference in PFS when compared to no delay (6.7 vs. 6.9 months, p = 0.07). PFS was improved in biopsy or STR patients with a>28 day delay to start of RT (4.2 vs. 6.7 months, p = 0.006). OS was also improved in patients receiving biopsy or STR with a>28 day delay to start of RT (12.3 vs. 7.8 months, p = 0.005). Multivariable analysis (MVA) demonstrated an improvement in OS and PFS with time to RT >28 days for biopsy or STR patients (HR 0.52 p = 0.008 and HR 0.48 p = 0.02, respectively). In this retrospective review of GBM patients treated at a single institution, OS and PFS were not different between time to RT >28 days compared to <28 days."
According to the news reporters, the research concluded: "There was a modest improvement in both PFS and OS in patients who received biopsy or STR with time to RT >28 days."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.clineuro.2016.10.012. This DOI is a link to an online electronic document that is either free or for purchase.

**Lung Diseases and Conditions - Acute Lung Injury**

**Investigators from Wuhan University Release New Data on Acute Lung Injury (Liraglutide attenuates lipopolysaccharide-induced acute lung injury in mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Acute Lung Injury is the subject of a report. According to news reporting out of Hubei, People's Republic of China, by NewsRx editors, research stated, "Liraglutide, an effective drug for the treatment of diabetes, has been proven to demonstrate anti-inflammatory and immunomodulatory effects. Hence, this study explored the effects and mechanism of action of liraglutide on lipopolysaccharide (LPS)-induced acute lung injury (ALI) in mice."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Wuhan University, "Male BALB/c mice were pre-conditioned with liraglutide or saline prior to intraperitoneal LPS or saline administration. Histopathological examination of lung, the wet/dry (W/D)weight ratio, protein content, inflammatory cell numbers and pro-inflammatory cytokine levels in broncho-alveolar lavage fluid (BAL fluid) were conducted. The effects of liraglutide on the nucleotide-binding oligomerization domain-like receptor protein 3 (NLRP3) inflammasome signalling pathway were assessed by Western blot. Pre-treatment with liraglutide decreased the wet-to-dry weight ratio and protein concentrations in BAL fluid and neutrophil infiltration in the lung tissues. Liraglutide also significantly reduced the interleukin-1 beta and interleukin-18 levels in BAL fluid, as well as effectively inhibited the expression of NLRP3 inflammasome."
According to the news editors, the research concluded: "These results indicated that liraglutide pre-treatment attenuated LPS-induced ALI by inhibiting the NLRP3 inflammasome pathway."

Our news journalists report that additional information may be obtained by contacting Y.C. Xu, Wuhan University, Zhongnan Hosp, Dept. of Endocrinol, Wuhan 430071, Hubei, People's Republic of China. Additional authors for this research include Y. Zhang, J. Chen, X.M. Hu and Y.C. Xu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejphar.2016.10.016. This DOI is a link to an online electronic document that is either free or for purchase.

### Genetics

**Investigators from Xuzhou Medical College Release New Data on Genetics (MDM2 oligomers: antagonizers of the guardian of the genome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Genetics are presented in a new report. According to news reporting out of Xuzhou, People's Republic of China, by NewsRx editors, research stated, "Over two decades of MDM2 research has resulted in the accumulation of a wealth of knowledge of many aspects of MDM2 regulation and function, particularly with respect to its most prominent target, p53. For example, recent knock-in mouse studies have shown that MDM2 heterooligomer formation with its homolog, MDMX, is necessary and sufficient in utero to suppress p53 but is dispensable during adulthood."

Our news journalists obtained a quote from the research from Xuzhou Medical College, "However, despite crucial advances such as these, several aspects regarding basic in vivo functions of MDM2 remain unknown. In one such example, although abundant evidence suggests that MDM2 forms homooligomers and heterooligomers with MDMX, the function and regulation of these homo-and heterooligomers in vivo remain incompletely understood."

According to the news editors, the research concluded: "In this review, we discuss the current state of our knowledge of MDM2 oligomerization as well as current efforts to target the MDM2 oligomer as a broad therapeutic option for cancer treatment."

Investigators from Yale University School of Medicine Release New Data on DNA Research (A Mechanistic Model for Colibactin-Induced Genotoxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on DNA Research are discussed in a new report. According to news reporting originating in New Haven, Connecticut, by NewsRx journalists, research stated, "Precolibactins and colibactins represent a family of natural products that are encoded by the clb gene cluster and are produced by certain commensal, extraintestinal, and probiotic E. coli. clb(+) E. coli induce megalocytosis and DNA double-strand breaks in eukaryotic cells, but paradoxically, this gene cluster is found in the probiotic Nissle 1917. Evidence suggests precolibactins are converted to genotoxic colibactins by colibactin peptidase (ClbP)-mediated cleavage of an N-acyl-D-Asnside chain, and all isolation efforts have employed Delta clbP strains to facilitate accumulation of precolibactins."

Financial supporters for this research include Yale University, National Cancer Institute, National Institute of General Medical Sciences.

The news reporters obtained a quote from the research from the Yale University School of Medicine, "It was hypothesized that colibactins form unsaturated imines that alkylate DNA by cyclopropane ring opening (2 -> 3). However, as no colibactins have been isolated, this hypothesis has not been tested experimentally. Additionally, precolibactins A-C (7-9) contain a pyridone that cannot generate the unsaturated imines that form the basis of this hypothesis. To resolve this, we prepared 13 synthetic colibactin derivatives and evaluated their DNA binding and alkylation activity. We show that unsaturated imines, but not the corresponding pyridone derivatives, potently alkylate DNA. The imine, unsaturated lactam, and cyclopropane are essential for efficient DNA alkylation. A cationic residue enhances activity. These studies suggest that precolibactins containing a pyridone are not responsible for the genotoxicity of the clb cluster. Instead, we propose that these are off-pathway fermentation products produced by a facile double cyclodehydration route that manifests in the absence of viable ClbP."

According to the news reporters, the research concluded: "The results presented herein provide a foundation to begin to connect metabolite structure with the disparate phenotypes associated with clb(+) E. coli."

For more information on this research see: A Mechanistic Model for Colibactin-Induced Genotoxicity. Journal of the American Chemical Society, 2016;138(48):15563-15570.
Investigators from Yeungnam University Have Reported New Data on Lung Cancer (Non-invasive visualization of mast cell recruitment and its effects in lung cancer by optical reporter gene imaging and glucose metabolism monitoring)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news originating from Gyongsan, South Korea, by NewsRx correspondents, research stated, "The inability to monitor the in vivo dynamics of mast cells (MCs) limits the better understanding of its role in cancer progression. Here, we report on noninvasive imaging of MC migration to tumor lesions in mice and evaluation of the effects of migrated MCs on tumor progression through reporter gene-based in vivo optical imaging and glucose metabolism monitoring in cancer with F-18-fluorodeoxyglucose (F-18-FDG) in vitro and in vivo."

Our news journalists obtained a quote from the research from Yeungnam University, "Murine MCs (MC-9) and Lewis lung cancer cells (LLC) expressing an enhanced firefly luciferase (effluc) gene were established, termed MC-9/effluc and LLC/effluc, respectively. MC-9/effluc cell migration to LLC tumor lesions was initially detected within 1 h post-transfer and distinct bioluminescence imaging signals emitted from MC-9/effluc cells were observed at tumor sites until 96 h. In vivo optical imaging as well as a biodistribution study with F-18-FDG demonstrated more rapid tumor growth and upregulated glucose uptake potentially associated with MC migration to tumor lesions."

According to the news editors, the research concluded: "These results suggest that the combination of a reporter gene-based optical imaging approach and glucose metabolism status monitoring with F-18-FDG represents a promising tool to better understand the biological role of MCs in tumor microenvironments and to develop new therapeutic drugs to regulate their involvement in enhanced tumor growth."

Erythromycin

Investigators from Yokohama City University Report New Data on Erythromycin (Clarithromycin Suppresses Chloride Channel Accessory 1 and Inhibits Interleukin-13-Induced Goblet Cell Hyperplasia in Human Bronchial Epithelial Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Erythromycin have been presented. According to news originating from Kanagawa, Japan, by NewsRx correspondents, research stated, "Activation of the interleukin-13 (IL-13) receptor leads to signal transducer and activator of transcription 6 (STAT6) activation and subsequent induction of SAM pointed domain containing ETS transcription factor (SPDEF) and chloride channel accessory 1 (CLCA1), increasing secretion of the gel-forming mucin MUC5AC. Activation of the epidermal growth factor receptor (EGFR) also leads to MUC5AC production via extracellular signal-regulated kinase (ERK1/2)."

Financial support for this research came from Yokohama City University Research Fund.

Our news journalists obtained a quote from the research from Yokohama City University, "We examined the effect of clarithromycin IL-13 signaling leading to production. Normal human bronchial epithelial (NHBE) cells were grown for 14 days at an air-liquid interface (ALI) with IL-13 and/or clarithromycin. Histochemical analysis was performed using hematoxylin and eosin (HE) staining and MUC5AC immunostaining. MUC5AC, SPDEF, and CLCA1 mRNA expression were evaluated by real-time PCR. Western analysis was used to assess phosphorylation of STAT6 and ERK1/2. Clarithromycin decreased IL-13-induced goblet cell hyperplasia and MUC5AC mRNA expression in a dose-dependent manner. Clarithromycin decreased IL-13-stimulated SPDEF and CLCA1 mRNA expression in a dose-dependent manner, and at 32 mu g/ml CLCA1 was profoundly decreased (P < 0.001)."

According to the news editors, the research concluded: "Although clarithromycin had no effect on STAT6 phosphorylation induced by IL-13, it decreased constitutive phosphorylation of ERK1/2 (P < 0.05)."

For more information on this research see: Clarithromycin Suppresses Chloride Channel Accessory 1 and Inhibits Interleukin-13-Induced Goblet Cell Hyperplasia in Human Bronchial Epithelial Cells. Antimicrobial Agents and Chemotherapy, 2016;60(11):6585-6590.

Uterine Diseases and Conditions - Endometriosis

Iran University of Medical Sciences Details Findings in Endometriosis
(1,25-Dihydroxy Vitamin D3 Modulates Endometriosis-Related Features of Human Endometriotic Stromal Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Uterine Diseases and Conditions - Endometriosis is the subject of a report. According to news reporting originating from Tehran, Iran, by NewsRx correspondents, research stated, "We aimed to evaluate modulatory effects of vitamin D3 on endometriosis-related features of endometriotic stromal cells. The effect of vitamin D3 on adhesion, invasion, proliferation, apoptosis, cytokine production, and angiogenesis potential of the eutopic (EuESCs), ectopic (EESCs), and control (CESCs) stromal cells from 25 women with and 20 women without endometriosis was investigated."

Financial supporters for this research include Avicenna Research Institute, Mashhad University of Medical Sciences.

Our news editors obtained a quote from the research from the Iran University of Medical Sciences, "In all groups, vitamin D3 significantly increased cell adhesion (p=0.0013-0.042), while decreased invasion (p=0.026-0.031) and proliferation (p=0.0013-0.039) of EESCs and EuESCs. Such treatment also resulted in a significant decrease in IL-6 production by EESCs (p=0.039), but had no significant effect on the IL-8 production. This vitamin also caused significant decrease in Bcl-2 gene expression by EuESCs (p=0.04) and Bcl-xL by EESCs (p=0.044-0.009). In addition, vitamin D3 treatment reduced VEGF-A gene expression by EESCs (p=0.046-0.009)."

According to the news editors, the research concluded: "Based on substantial favourable in vitro effects of vitamin D3 in endometriosis-related features of human endometriotic stromal cells, further investigations on therapeutic potential of this hormone in endometriosis are warranted."

For more information on this research see: 1,25-Dihydroxy Vitamin D3 Modulates

**Hearing Diseases and Conditions - Hearing Loss**

**Iron deficiency anemia associated with hearing loss**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- In a study published online by JAMA Otolaryngology-Head & Neck Surgery, Kathleen M. Schieffer, B.S., of the Pennsylvania State University College of Medicine, Hershey, Pa., and colleagues examined the association between sensorineural hearing loss and conductive hearing loss and iron deficiency anemia in adults ages 21 to 90 years in the United States.

In 2014, approximately 15 percent of adults reported difficulty with hearing. Because iron deficiency anemia (IDA) is a common and easily correctable condition, further understanding of the association between IDA and all types of hearing loss may help to open new possibilities for early identification and appropriate treatment. For this study, using data obtained from deidentified electronic medical records from the Penn State Milton S. Hershey Medical Center in Hershey, Pa., iron deficiency anemia was determined by low hemoglobin and ferritin levels for age and sex in 305,339 adults ages 21 to 90 years; associations between hearing loss and IDA were evaluated.

Of the patients in the study population, 43 percent were men; average age was 50 years. There was a 1.6 percent prevalence of combined hearing loss (defined as any combination of conductive hearing loss [hearing loss due to problems with the bones of the middle ear], sensorineural hearing loss, deafness, and unspecified hearing loss) and 0.7 percent prevalence of IDA. Both sensorineural hearing loss (SNHL; when there is damage to the cochlea or to the nerve pathways from the inner ear to the brain) (present in 1.1 percent of individuals with IDA) and combined hearing loss (present in 3.4 percent) were significantly associated with IDA. Analysis confirmed increased odds of SNHL and combined hearing loss among adults with IDA.

"An association exists between IDA in adults and hearing loss. The next steps are to better understand this correlation and whether promptly diagnosing and treating IDA may
positively affect the overall health status of adults with hearing loss," the authors write.

Therapeutics

Isfahan University of Medical Sciences Describes Findings in Therapeutics (Spiritual Well-Being for Increasing Life Expectancy in Palliative Radiotherapy Patients: A Questionnaire-Based Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Therapeutics are presented in a new report. According to news reporting originating in Isfahan, Iran, by NewsRx journalists, research stated, "Spiritual well-being in patients with an advanced cancer has been found to positively correlate with subjective well-being, lower pain levels, hope and positive mood states, high self-esteem, social competence, purpose in life, and overall quality of life. In this regard, Quran recitation is stated to be an efficient way to increase patient spirituality and also to handle life's everyday challenges."

The news reporters obtained a quote from the research from the Isfahan University of Medical Sciences, "The aim of this study was to investigate the effects of listening, reading, and watching the text of the Holy Quran, called (in this study) Quran recitation, for increasing life expectancy (LE) in palliative radiotherapy patients admitted to Radiotherapy Department of Seyed alshohada Hospital, Isfahan, Iran. A questionnaire-based study was carried out on a total of 89 palliative radiotherapy patients between March 2012 and June 2012. Informed consent was obtained. The patients were requested to complete a standardized questionnaire which was designed based on the European Organization for Research and Treatment of Cancer C30 Scale Quality of Life Questionnaire (EORTC C30 Scale QLQ). A computer program (SPSS version 16.0, Chicago, IL, USA) was used, and data were analyzed by the Wilcoxon test and Spearman's rank correlation. All hypotheses were tested using a criterion level of p=0.05. There was a significant difference for frequency and duration of Quran recitation among patients, before and after the diagnosis of their cancer (p=0.03). Using the Spearman's rank correlation, it was found that there was a correlation between Quran recitation and subjective well-being (r=0.352, p <0.001). Moreover, there was a correlation between Quran recitation and increasing LE (r= 0.311, p<0.003). More than 60% of the patients stated that more frequent recitation would lead to more LE and/or greater reassurance. On the basis of the present work, listening, reading, and watching the text of the Holy Quran are useful for increasing LE in palliative radiotherapy patients admitted to Radiotherapy Department."

According to the news reporters, the research concluded: "In other words, a benefit of Quran recitation on outcome of radiotherapy for palliative radiotherapy patients was found."

Oncology - Colon Cancer

Jimenez Diaz Foundation Reports Findings in Colon Cancer (Prognostic role of tissue transglutaminase 2 in colon carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting out of Madrid, Spain, by NewsRx editors, research stated, "Tissue transglutaminase 2 (TG2) is involved in many biological processes, from wound healing to neurodegeneration. Recently, there has been an increasing interest in this enzyme as a potential prognostic marker or therapy target in human neoplasms."

Funders for this research include Juan de la Cierva programme, Comunidad de Madrid (ES).

Our news journalists obtained a quote from the research from Jimenez Diaz Foundation, "The aim of this study was to analyze expression of TG2 messenger RNA (mRNA) and protein in colon cancer samples and to evaluate the potential value of TG2 as prognostic marker. We investigated not only expression level but also location of the protein in a series of human tumors. In silico analysis using the GSE39582 dataset showed that TG2 mRNA expression is associated with earlier relapse. The results of qPCR in our cohort showed TG2 mRNA to be up-regulated in 25 out of 70 samples (34%). Kaplan-Meier plots and log-rank test showed that patients with high TG2 mRNA expression have significantly worse prognosis in terms of overall survival (OS) and a trend to earlier recurrence. Immunohistochemical staining of tumor sections for TG2 revealed stromal staining in 152 cases (88%) and epithelial cell staining in 105 cases (62%). In stage II patients, stromal expression showed a significant association with disease-free survival (DFS). In patients with metastatic disease, TG2 expression was also associated with poor prognosis. Cox multivariate analysis showed that TG2 expression in epithelial cells is significantly and independently associated with OS, together with node involvement and presence of metastasis. Stromal TG2 expression was associated with DFS."

According to the news editors, the research concluded: "In summary, in non-metastatic colorectal cancer patients, stromal TG2 expression is significantly associated with DFS and epithelial TG2 expression with OS, independently of node involvement and

**Organelles**

**Kagoshima University Reports Findings in Organelles (Lysozyme Mutants Accumulate in Cells while Associated at their N-terminal Alpha-domain with the Endoplasmic Reticulum Chaperone GRP78/BiP)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Organelles. According to news reporting out of Kagoshima, Japan, by NewsRx editors, research stated, "Amyloidogenic human lysozyme variants deposit in cells and cause systemic amyloidosis. We recently observed that such lysozymes accumulate in the endoplasmic reticulum (ER) with the ER chaperone GRP78/BiP, accompanying the ER stress response."

Our news journalists obtained a quote from the research from Kagoshima University, "Here we investigated the region of lysozyme that is critical to its association with GRP78/BiP. In addition to the above-mentioned variants of lysozyme, we constructed lysozyme truncation or substitution mutants. These were co-expressed with GRP78/BiP (tagged with FLAG) in cultured human embryonic kidney cells, which were analyzed by western blotting and immunocytochemistry using anti-lysozyme and anti-FLAG antibodies. The amyloidogenic variants were confirmed to be strongly associated with GRP78/BiP as revealed by the co-immunoprecipitation assay, whereas N-terminal mutants pruned of 1-41 or 1-51 residues were found not to be associated with the chaperone. Single amino acid substitutions for the leucine array along the a-helices in the N-terminal region resulted in wild-type lysozyme remaining attached to GRP78/BiP. These mutations also tended to show lowered secretion ability. We conclude that the N-terminal a-helices region of the lysozyme is pivotal for its strong adhesion to GRP78/BiP."

According to the news editors, the research concluded: "We suspect that wild-type lysozyme interacts with the GRP at this region as a step in the proper folding monitored by the ER chaperone."

For more information on this research see: Lysozyme Mutants Accumulate in Cells while Associated at their N-terminal Alpha-domain with the Endoplasmic Reticulum Chaperone GRP78/BiP.
Atrial Fibrillation

Kanazawa University Details Findings in Atrial Fibrillation (Short-term rapid atrial pacing alters the gene expression profile of rat liver: Cardiohepatic interaction in atrial fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Atrial Fibrillation are presented in a new report. According to news originating from Ishikawa, Japan, by NewsRx correspondents, research stated, "Atrial fibrillation (AF) activates the coagulation system, leading to hypercoagulation of the blood. The liver is a major source of prothrombotic molecules."

Our news journalists obtained a quote from the research from Kanazawa University, "This study aimed to clarify whether cardiohepatic interactions are involved in AF-related hypercoagulation. We compared gene expression profiles of human liver tissue between patients with AF and sinus rhythm. An AF model was created by rapid atrial pacing (RAP) at a frequency of 1200 beats/min in anesthetized 10-week-old Sprague-Dawley rats. Livers, atria, and peripheral blood cells were collected and analyzed after 12 hours of RAP. DNA microarray analysis revealed marked changes in the gene expression profile of human liver of patients with AF. The extrinsic prothrombin activation pathway showed the most prominent change in 354 BioCarta pathways. Twelve hours of RAP also markedly altered the gene expression profile of rat liver. RAP markedly augmented the hepatic messenger RNA expression of fibrinogen chains, prothrombin, coagulation factor X, and antithrombin III. The augmented fibrinogen production by RAP was accompanied by increased of interleukin 6 (IL-6) messenger RNA expression in peripheral blood cells, enhanced monocyte chemoattractant protein-1 expression in the liver, infiltrated duster of differentiation 11b-positive mononuclear cells in the liver, and enhanced signal transducer and activator of transcription 3 (STAT3) phosphorylation in the nuclei of hepatocytes. STAT3 phosphorylation and increased fibrinogen and coagulation factor X production by RAP were suppressed by pretreatment with IL-6 neutralizing antibody. Rapid atrial excitation mimicking paroxysmal AF remotely altered the hepatic gene expression of prothrombotic molecules."

According to the news editors, the research concluded: "Increased fibrinogen expression in the liver by RAP was mediated by activation of the IL-6/STAT3 signaling pathway in the peripheral blood and liver."
For more information on this research see: Short-term rapid atrial pacing alters the gene expression profile of rat liver: Cardiohepatic interaction in atrial fibrillation. *Heart Rhythm*, 2016;13(12):2368-2376. *Heart Rhythm* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Musculoskeletal Diseases and Conditions - Bone**

**Kanazawa University Reports Findings in Bone Resorption (The Transcriptional Modulator Interferon-Related Developmental Regulator 1 in Osteoblasts Suppresses Bone Formation and Promotes Bone Resorption)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Musculoskeletal Diseases and Conditions - Bone Resorption are presented in a new report. According to news reporting originating in Ishikawa, Japan, by NewsRx journalists, research stated, "Bone homeostasis is maintained by the synergistic actions of bone-resorbing osteoclasts and bone-forming osteoblasts. Although interferon-related developmental regulator 1 (Ifrd1) has been identified as a transcriptional coactivator/repressor in various cells, little attention has been paid to its role in osteoblastogenesis and bone homeostasis thus far."

Financial support for this research came from Ministry of Education, Culture, Sports, Science, and Technology.

The news reporters obtained a quote from the research from Kanazawa University, "Here, we show that Ifrd1 is a critical mediator of both the cell-autonomous regulation of osteoblastogenesis and osteoblast-dependent regulation of osteoclastogenesis. Osteoblast-specific deletion of murine Ifrd1 increased bone formation and decreased bone resorption, causing high bone mass. Ifrd1 deficiency enhanced osteoblast differentiation and maturation along with increased expression of Runx2 and osterix (Osx). Mechanistically, Ifrd1 deficiency increased the acetylation status of p65, a component of NF-kB, at residues K122 and K123 via the attenuation of the interaction between p65 and histone deacetylase (HDAC). This led to the nuclear export of p65 and a decrease in NF-kB-dependent Smad7 expression and the subsequent enhancement of Smad1/Smad5/Smad8-dependent transcription. Moreover, a high bone mass phenotype in the osteoblast-specific deletion of Ifrd1 was markedly rescued by the introduction
of one Osx-floxed allele but not of Runx2-floxed allele. Coculture experiments revealed that Ifrd1-deficient osteoblasts have a higher osteoprotegerin (OPG) expression and a lower ability to support osteoclastogenesis. Ifrd1 deficiency attenuated the interaction between b-catenin and HDAC, subsequently increasing the acetylation of b-catenin at K49, leading to its nuclear accumulation and the activation of the b-catenin-dependent transcription of OPG. Collectively, the expression of Ifrd1 in osteoblasts repressed osteoblastogenesis and activated osteoclastogenesis through modulating the NF-kB/Smad/Osx and b-catenin/OPG pathways, respectively."

According to the news reporters, the research concluded: "These findings suggest that Ifrd1 has a pivotal role in bone homeostasis through its expression in osteoblasts in vivo and represents a therapeutic target for bone diseases."

Our news correspondents report that additional information may be obtained by contacting T. Iezaki, Laboratory of Molecular Pharmacology, Division of Pharmaceutical Sciences, Kanazawa University Graduate School, Kanazawa, Ishikawa, Japan. Additional authors for this research include Y. Onishi, K. Ozaki, K. Fukasawa, Y. Takahata, Y. Nakamura, K. Fujikawa, T. Takarada, Y. Yoneda, Y. Yamashita, G. Shioi and E. Hinoi.

Photodynamics

Kaohsiung Medical University Reports Findings in Photodynamics (Plasmon-Enhanced Photodynamic Cancer Therapy by Upconversion Nanoparticles Conjugated with Au Nanorods)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Photodynamics is the subject of a report. According to news reporting from Kaohsiung, Taiwan, by NewsRx journalists, research stated, "Photodynamic therapy (PDT) based on photosensitizers (PSs) constructed with nanomaterials has been widely applied to treat cancer. This therapy is characterized by an improved PS accumulation in tumor regions."

Financial supporters for this research include Academia Sinica, Ministry of Science and Technology, Taiwan.

The news correspondents obtained a quote from the research from Kaohsiung Medical University, "However, challenges, such as short penetration depth of light and low
extinction coefficient of PSs, limit PDT applications. In this study, a nanocomposite consisting of NaYF4:Yb/Er upconversion nanoparticles (UCPs) conjugated with gold nanorods (Au NRs) was developed to improve the therapeutic efficiency of PDT. Methylene blue (MB) was embedded in a silica shell for plasmon-enhanced PDT. UCPs served as a light converter from near-infrared (NIR) to visible light to excite MB to generate reactive oxygen species (ROS). Au NRs could effectively enhance upconversion efficiency and ROS content through a localized surface plasmon resonance (SPR) effect. Silica shell thickness was adjusted to investigate the optimized MB loading amount, ROS production capability, and efficient distance for plasmon-enhanced ROS production. The mechanism of plasmon-enhanced PDT was verified by enhancing UC luminescence intensity through the plasmonic field and by increasing the light-harvesting capability and absorption cross section of the system. This process improved the ROS generation by comparing the exchange of Au NRs to Au nanoparticles with different SPR bands. NIR-triggered nanocomposites of UCP@SiO2:MB-NRs were significantly confirmed by improving ROS generation and further modifying folic acid (FA) to develop an active component targeting OE CM-1 oral cancer cells. Consequently, UCP@SiO2:MB-NRs-FA could highly produce ROS and undergo efficient PDT in vitro and in vivo. The mechanism of PDT treatment by UCP@SiO2:MB-NRs-FA was evaluated via the cell apoptosis pathway."

According to the news reporters, the research concluded: "The proposed process is a promising strategy to enhance ROS production through plasmonic field enhancement and thus achieve high PDT therapeutic efficacy."

Dominican Republic Ministry of Tourism

Kickstart your Healthy New Year's Resolutions on a Dominican Republic Fitness Getaway

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- - Dominican Republic's all-inclusive resorts and world-class, white-sand beaches beckon travelers from all over the globe for rest and relaxation. But with the new year calling - and new fitness resolutions for 2017 - travelers should consider jetting to Dominican Republic for a fitness or wellness getaway. From outdoor activities and wellness retreats to
luxurious hotel gyms, there are exercise options for every type of fitness getaway this winter.

"Dominican Republic's wide range of travel options and activities may surprise travelers. Our country is so versatile, not only are we the premier destination for beach vacations, but we have the natural playground and high-quality service perfect for a fitness trip," said Magaly Toribio, marketing advisor for the Dominican Republic Ministry of Tourism. "There are so many exciting attractions to explore, you will stay active no matter where your trip takes you."

Home to both the highest and lowest points above sea level in the Caribbean, the boundless array of outdoor activities will keep your muscles moving. For travelers looking for something less rigorous, yoga classes can be found in tucked-away bungalows. With so much to keep you moving on a wellness getaway in Dominican Republic, you can save the R&R for home.

Neurologic Manifestations - Pain
King's College Reports Findings in Pain (Role of extracellular calcitonin gene-related peptide in spinal cord mechanisms of cancer-induced bone pain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Neurologic Manifestations - Pain is now available. According to news reporting originating from Rome, Italy, by NewsRx correspondents, research stated, "Severe pain is a common and debilitating complication of metastatic bone cancer. Current analgesics provide insufficient pain relief and often lead to significant adverse effects."

Our news editors obtained a quote from the research from King's College, "In models of cancer-induced bone pain, pathological sprouting of sensory fibers at the tumor-bone interface occurs concomitantly with reactive astrocytosis in the dorsal horn of the spinal cord. We observed that calcitonin gene-related peptide (CGRP)-fiber sprouting in the bone was associated with an increase in CGRP content in sensory neuron cell bodies in the dorsal root ganglia (DRG) and increased basal and activity-evoked release of CGRP from their central terminals in the dorsal horn. Intrathecal administration of a peptide antagonist (a-CGRP8-37) attenuated referred allodynia in the hind paw ipsilateral to bone cancer. CGRP receptor components (CLR and RAMP1) were up-regulated in dorsal horn neurons and expressed by reactive astrocytes. In primary cultures of astrocytes, CGRP incubation led to a concentration-dependent increase of forskolin-induced cAMP production, which was attenuated by pretreatment with CGRP8-37. Furthermore, CGRP induced ATP release in astrocytes, which was inhibited by CGRP8-37. We suggest that the peripheral increase in CGRP content observed in cancer-induced bone pain is mirrored by a central increase in the extracellular levels of CGRP."

According to the news editors, the research concluded: "This increase in CGRP not only may facilitate glutamate-driven neuronal nociceptive signaling but also act on astrocytic CGRP receptors and lead to release of ATP."

For more information on this research see: Role of extracellular calcitonin gene-

The news editors report that additional information may be obtained by contacting R.R. Hansen, aWolfson Centre for Age-Related Diseases, King's College London, London, UK bCNR, National Research Council, Cell Biology and Neurobiology Institute, Rome, Italy cIRCCS Santa Lucia Foundation, Rome, Italy. **Digestive System Diseases and Conditions - Gastritis**

**Kitasato Institute Hospital Reports Findings in Gastritis (First-line eradication for Helicobacter pylori-positive gastritis by esomeprazole-based triple therapy is influenced by CYP2C19 genotype)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Gastritis have been published. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "To evaluate the effect of first line esomeprazole (EPZ)-based triple therapy on *Helicobacter pylori* (*H. pylori*) eradication. A total of 80 Japanese patients with gastritis who were diagnosed as positive for *H. pylori* infection by endoscopic biopsy-based or (13)C-urea breath tests were included in this study."

Our news journalists obtained a quote from the research from Kitasato Institute Hospital, "The average age of the patients was 57.2 years (male/female, 42/38). These patients were treated by first-line eradication therapy with EPZ 40 mg/d, amoxicillin 1500 mg/d, and clarithromycin 400 mg/d for 7 d. All drugs were given twice per day. Correlations between *H. pylori* eradication, CYP2C19 genotype, and serum pepsinogen (PG) level were analyzed. This study was registered with the UMIN Clinical Trials Registry (UMIN000009642). The *H. pylori* eradication rates by EPZ-based triple therapy evaluated by intention-to-treat and per protocol were 67.5% and 68.4%, respectively, which were similar to triple therapies with other first-generation proton pump inhibitors (PPIs). The eradication rates in three different CYP2C19 genotypes, described as extensive metabolizer (EM), intermediate metabolizer, and poor metabolizer, were 52.2%, 72.1%, and 84.6%, respectively. The *H. pylori* eradication rate was significantly lower in EM than non-EM (p <0.05). The serum PG I level and PG I/II ratio were significantly increased after eradication of *H. pylori* (p <0.01), suggesting that gastric atrophy was improved by *H. pylori* eradication. Thus, first-line eradication by EPZ-based triple therapy for patients with *H. pylori*-positive gastritis was influenced by CYP2C19 genotype, and the eradication rate was on the same level with other first-generation PPIs in the Japanese population."

According to the news editors, the research concluded: "The results from this study
suggest that there is no advantage to EPZ-based triple therapy on *H. pylori* eradication compared to other first-generation PPIs."

Our news journalists report that additional information may be obtained by contacting Y. Saito, Yoshimasa Saito, Hiroshi Serizawa, Yukako Kato, Masaru Nakano, Division of Gastroenterology, Kitasato Institute Hospital, Minato-ku, Tokyo 108-8641, Japan. Additional authors for this research include H. Serizawa, Y. Kato, M. Nakano, M. Nakamura, H. Saito, H. Suzuki and T. Kanai.

**Oncology - Breast Cancer**

**Kurdistan University of Medical Sciences Reports Findings in Breast Cancer (Association of XRCC1 Trp194 allele with risk of breast cancer, and Ki67 protein status in breast tumor tissues)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting originating from Sanandaj, Iran, by NewsRx correspondents, research stated, "To evaluate the role of this polymorphism as a risk factor for breast cancer in Kurdish patients and to investigate the possible association between Arg194Trp x-ray repair cross-complementing group 1 (XRCC1) gene polymorphisms with clinical and histopathological outcomes of patients with breast cancer. A total of 100 breast cancer patients and 200 cancer-free controls in Kurdish population of Kurdistan state admitted to Tohid Hospital, Sanandaj, Kurdistan, Iran between January 2012 and May 2015 were enrolled in this cross-sectional study."

Our news editors obtained a quote from the research from the Kurdistan University of Medical Sciences, "Tissue expression of estrogen receptor (ER), progesteron receptor (PR), human epidermal growth factor receptor 2 (Her2/neu), and Ki67 were evaluated by immunohistochemistry (IHC). The Arg194Trp genotypes were determined by polymerase chain reaction-restriction fragment length polymorphism method. Our data showed that the risk for breast cancer increased significantly among the Trp variant of XRCC1. Statistically significant association was found between codon 194 polymorphisms and tissue expression of Ki67. The Trp allele of codon 194 XRCC1 is a potential risk factor for breast cancer in Kurdish ethnicity."

According to the news editors, the research concluded: "Furthermore, effect of this
polymorphism on clinical and histological features of breast cancer was significant."

The news editors report that additional information may be obtained by contacting M. Abdi, Kurdistan Univ Med Sci, Fac Med, Dept. of Clin Biochem, Sanandaj, Iran. Additional authors for this research include B. Ghaderi, S. Amini, M. Abdi and D. Roshani.

Membrane Proteins - Antimicrobial Cationic Peptides

La Trobe University Reports Findings in Antimicrobial Cationic Peptides
[Human b-defensin 3 contains an oncolytic motif that binds PI(4,5)P2 to mediate tumour cell permeabilisation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Membrane Proteins - Antimicrobial Cationic Peptides. According to news reporting originating in Melbourne, Australia, by NewsRx journalists, research stated, "Cationic antimicrobial peptides (CAPs), including taxonomically diverse defensins, are innate defense molecules that display potent antimicrobial and immunomodulatory activities. Specific CAPs have also been shown to possess anticancer activities; however, their mechanisms of action are not well defined."

The news reporters obtained a quote from the research from La Trobe University, "Recently, the plant defensin NaD1 was shown to induce tumor cell lysis by directly binding to the plasma membrane phosphoinositide, phosphatidylinositol 4,5-bisphosphate (PI(4,5)P2). The NaD1-lipid interaction was structurally defined by X-ray crystallography, with the defensin forming a dimer that binds PI(4,5)P2 via its cationic b2-b3 loops in a 'cationic grip' conformation. In this study, we show that human b-defensin 3 (HBD-3) contains a homologous b2-b3 loop that binds phosphoinositides. The binding of HBD-3 to PI(4,5)P2 was shown to be critical for mediating cytolysis of tumor cells, suggesting a conserved mechanism of action for defensins across diverse species."

According to the news reporters, the research concluded: "These data not only identify an evolutionary conservation of CAP structure and function for lipid binding, but also suggest that PIP-binding CAPs could be exploited for novel multifunction therapeutics."

For more information on this research see: Human b-defensin 3 contains an oncolytic motif that binds PI(4,5)P2 to mediate tumour cell permeabilisation. Oncotarget, 2016;7 (2):2054-69.

Gram-Negative Bacteria - Klebsiella

Laboratory of Clinical Microbiology Reports Findings in Klebsiella (First clinical cases of NDM-1-producing Klebsiella pneumoniae from two hospitals in Bulgaria)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Klebsiella are discussed in a new report. According to news reporting originating in Sofia, Bulgaria, by NewsRx journalists, research stated, "We report the first confirmed cases of NDM-1-producing Klebsiella pneumoniae infections in two hospitals in Bulgaria. The isolates were diverse in terms of plasmid and co-resistance gene content. K. pneumoniae PR2682, causing sepsis in patient with polytrauma due to traffic accident, harbored bla(NDM-1), bla(CMY-4), bla(CTX-M-15), bla(SHV-1), bla(TEM-1b), qnrB, and aac(6')-Ib. bla(NDM-1) was transferable by conjugation and located on an IncA/C plasmid of 176-kb, which also carried bla(CMY-4), bla(CTX-M-15), bla(TEM-1b), and qnrB. K. pneumoniae PR2830, causing urinary tract infection in prostate cancer patient, harbored bla(NDM-1), bla(SHV-1), bla(TEM-1), and aac(6')-Ib. bla(NDM-1) was carried on an 86-kb IncA/C plasmid transferable by conjugation together with bla(TEM-1), and aac(6')-Ib."

The news reporters obtained a quote from the research from the Laboratory of Clinical Microbiology, "Multilocus sequence typing indicated that the two isolates belonged to sequence type ST11. The emergence of NDM-1-producing K. pneumoniae indicates that bla(NDM-1)-mediated resistance is already disseminated among Enterobacteriaceae in Bulgaria."

According to the news reporters, the research concluded: "Our results further confirm the role of the Balkans as a secondary reservoir where NDM-encoding genes originate."

Lancaster University Reports Findings in Behavioural Pharmacology
(How cognitive biases can distort environmental statistics: introducing the rough estimation task)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Behavioural Pharmacology have been presented. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "The purpose of this study was to develop a novel behavioural method to explore cognitive biases. The task, called the Rough Estimation Task, simply involves presenting participants with a list of words that can be in one of three categories: appetitive words (e.g. alcohol, food, etc.), neutral related words (e.g. musical instruments) and neutral unrelated words."

Our news editors obtained a quote from the research from Lancaster University, "Participants read the words and are then asked to state estimates for the percentage of words in each category. Individual differences in the propensity to overestimate the proportion of appetitive stimuli (alcohol-related or food-related words) in a word list were associated with behavioural measures (i.e. alcohol consumption, hazardous drinking, BMI, external eating and restrained eating, respectively), thereby providing evidence for the validity of the task. The task was also found to be associated with an eye-tracking attentional bias measure."

According to the news editors, the research concluded: "The Rough Estimation Task is motivated in relation to intuitions with regard to both the behaviour of interest and the theory of cognitive biases in substance use."

For more information on this research see: How cognitive biases can distort environmental statistics: introducing the rough estimation task. Behavioural Pharmacology, 2016;27(2-3 Spec I):165-72. (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology - journals.lww.com/behaviouralpharm/pages/default.aspx)

Leiden University Details Findings in Congenital Heart Defects (Head growth in fetuses with isolated congenital heart defects: lack of influence of aortic arch flow and ascending aorta oxygen saturation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Congenital Diseases and Conditions - Congenital Heart Defects are presented in a new report. According to news reporting originating from Leiden, Netherlands, by NewsRx correspondents, research stated, "Congenital heart defects (CHDs) are associated with a smaller fetal head circumference (HC) and neurodevelopmental delay. Recent studies suggest that altered intrauterine brain hemodynamics may explain these findings."

Our news editors obtained a quote from the research from Leiden University, "Our objectives were to evaluate the pattern of head growth in a large cohort of fetuses with various types of CHD, analyze these patterns according to the type of CHD and estimate the effect of cerebral hemodynamics with advancing gestation in the second and third trimesters. Singleton fetuses with an isolated CHD were selected from three fetal medicine units (n = 436). Cases with placental insufficiency or genetic syndromes were excluded. CHD types were clustered according to the flow and oxygen saturation in the aorta. Z-scores of biometric data were constructed using growth charts of a normal population. HCat different gestational ages was evaluated and univariate and multivariate mixed regression analyses were performed to examine the patterns of prenatal HC growth. Fetuses with severe and less severe types of CHD demonstrated statistically significant HC growth restriction with increasing gestational age (slope of -0.017/day); however, there was no statistically significant effect of fetal hemodynamics on HC growth. Fetuses with CHD but normal brain oxygenation and normal aortic flow showed a significant decrease in HC growth (slope of -0.024/day). Only fetuses with isolated tetralogy of Fallot demonstrated a smaller HC z-score at 20 weeks of gestation (-0.67 (95% CI, -1.16 to -0.18)). Despite the decline in head growth in fetuses with a prenatally detected isolated CHD, HC values were within the normal range, raising the question of its clinical significance. Furthermore, in contrast to other studies, this large cohort did not establish a significant correlation between aortic flow or oxygen saturation and HC growth."

According to the news editors, the research concluded: "Factors other than altered fetal cerebral hemodynamics may contribute to HC growth restriction with increasing gestational age, such as (epi) genetic or placental factors."

The news editors report that additional information may be obtained by contacting F.A.R. Jansen, Leiden University, Medical Center, Dept. of Obstet & Fetal Med, Leiden, Netherlands. Additional authors for this research include E.W. Van Zwet, M.E.B. Rijlaarsdam, E. Pajkrt, C.L. Van Velzen, H.R. Zuurveen, A. Kragt, C.L. Bax, S.A.B. Clur, J.M.M. Van Lith, N.A. Blom and M.C. Haak.

Lund University Details Findings in Type 2 Diabetes (HDAC7 is overexpressed in human diabetic islets and impairs insulin secretion in rat islets and clonal beta cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news originating from Malmo, Sweden, by NewsRx correspondents, research stated, "Pancreatic beta cell dysfunction is a prerequisite for the development of type 2 diabetes. Histone deacytilyases (HDACs) may affect pancreatic endocrine function and glucose homeostasis through alterations in gene regulation."

Financial supporters for this research include Wallenberg KAW, Swedish Research Council, Strategic Research Area grant.

Our news journalists obtained a quote from the research from Lund University, "Our aim was to investigate the role of HDAC7 in human and rat pancreatic islets and clonal INS-1 beta cells (INS-1 832/13). To explore the role of HDAC7 in pancreatic islets and clonal beta cells, we used RNA sequencing, mitochondrial functional analyses, microarray techniques, and HDAC inhibitors MC1568 and trichostatin A. Using RNA sequencing, we found increased HDAC7 expression in human pancreatic islets from type 2 diabetic compared with non-diabetic donors. HDAC7 expression correlated negatively with insulin secretion in human islets. To mimic the situation in type 2 diabetic islets, we overexpressed Hdad7 in rat islets and clonal beta cells. In both, Hdad7 overexpression resulted in impaired glucose-stimulated insulin secretion. Furthermore, it reduced insulin content, mitochondrial respiration and cellular ATP levels in clonal beta cells. Overexpression of Hdad7 also led to changes in the genome-wide gene expression pattern, including increased expression of Tcf7l2 and decreased expression of gene sets regulating DNA replication and repair as well as nucleotide metabolism. In accordance, Hdad7 overexpression reduced the number of beta cells owing to enhanced apoptosis. Finally, we found that inhibiting HDAC7 activity with pharmacological inhibitors or small interfering RNA-mediated knockdown restored glucose-stimulated insulin secretion in beta cells that were overexpressing Hdad7. Taken together, these results indicate that increased HDAC7 levels caused beta cell dysfunction and may thereby contribute to defects seen in type 2 diabetic islets."

According to the news editors, the research concluded: "Our study supports HDAC7 inhibitors as a therapeutic option for the treatment of type 2 diabetes."

For more information on this research see: HDAC7 is overexpressed in human diabetic islets and impairs insulin secretion in rat islets and clonal beta cells. *Diabetologia*, 2017;60(1):116-125. *Diabetologia* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Biomedical Engineering - Tissue Engineering

Magnetic stem cells for gene engineering

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Scientists from the Tomsk Polytechnic University's Laboratory of Novel Dosage are developing a technology to control mesenchymal stem cells of patients. The technology will allow treating cancer more effective. To fight cancer cells the scientists suggest using the patient's own magnet controlled cells. Native body cells won't be rejected by its immune system and can deliver medication directly into the center of the disease.

The development of magnetic cells is jointly carried out by Tomsk Polytechnic University (TPU) and colleagues from Pavlov State Medical University of St. Petersburg and Queen Mary University of London.

The novel technology implies that mesenchymal stem cells (MSCs) of the patient's body with the size of about 10 microns are internationalized with magnetic controlled microcapsules with drug inside. External trigging (magnet) targets cells to tumor; make microcontainers open and release encapsulated compound. Thus, drug is precisely delivered affecting cancer cells and without causing harm to health.

"Mesenchymal stem cells are inherently able to migrate toward tumors. They also can differentiate under control into mesodermal cell types of bone, fat, cartilage, muscle or connective tissue in vivo and in vitro. Therefore, MSCs are very attractive for researchers and practical physicians to apply them in substitute therapy, gene or cell engineering," says one of the development's co-authors Alexander Timin, JRF at the Novel Dosage Laboratory, RASA Center at TPU.

For the first time, the scientists have demonstrated the efficiency of internationalization of magnetic microcapsules by MSCs to functionalize cells and to design magnetic controlled cells and tissue engineering systems.

"It is interesting to note MSCs exhibit a high capability to internationalize (capture) microcapsules without significant toxicity compared to other cell lines described in the literature. As a result of magnetic capsules internalization by MSCs we create a new cell engineering platform which is responsive to external magnetic field to control cell migration. This way magnetization of MSCs enables magnetic sorting of cells and form a cell spheroid out of tens of thousands of MSCs. Also, the obtained results can be further used to create a next generation cell-modified platform for efficient targeted delivery ex vivo," the authors note.

The scientists have published their results in Advanced Healthcare Materials (IF 5.75).

**Massachusetts Institute of Technology Details Findings in Immunotherapy (Eradication of large established tumors in mice by combination immunotherapy that engages innate and adaptive immune responses)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Immunotherapy are discussed in a new report. According to news reporting out of Cambridge, Massachusetts, by NewsRx editors, research stated, "Checkpoint blockade with antibodies specific for cytotoxic T lymphocyte-associated protein (CTLA)-4 or programmed cell death 1 (PDCD1; also known as PD-1) elicits durable tumor regression in metastatic cancer, but these dramatic responses are confined to a minority of patients. This suboptimal outcome is probably due in part to the complex network of immunosuppressive pathways present in advanced tumors, which are unlikely to be overcome by intervention at a single signaling checkpoint."

Our news journalists obtained a quote from the research from the Massachusetts Institute of Technology, "Here we describe a combination immunotherapy that recruits a variety of innate and adaptive immune cells to eliminate large tumor burdens in syngeneic tumor models and a genetically engineered mouse model of melanoma; to our knowledge tumors of this size have not previously been curable by treatments relying on endogenous immunity. Maximal antitumor efficacy required four components: a tumor-antigen-targeting antibody, a recombinant interleukin-2 with an extended half-life, anti-PD-1 and a powerful T cell vaccine. Depletion experiments revealed that CD8(+) T cells, cross-presenting dendritic cells and several other innate immune cell subsets were required for tumor regression. Effective treatment induced infiltration of immune cells and production of inflammatory cytokines in the tumor, enhanced antibody-mediated tumor antigen uptake and promoted antigen spreading."

According to the news editors, the research concluded: "These results demonstrate the capacity of an elicited endogenous immune response to destroy large, established tumors and elucidate essential characteristics of combination immunotherapies that are capable of curing a majority of tumors in experimental settings typically viewed as intractable."

Oncology - Breast Cancer

Medical College Describes Findings in Breast Cancer (Study on knowledge, experiences and barriers to mammography among working women from Delhi)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting out of New Delhi, India, by NewsRx editors, the research stated, "Mammography is not a popular screening tool for detecting breast cancer in India although regular screening is associated with reduced mortality from breast cancer. The objective of this study is to find out knowledge, experiences and barriers to mammography among working women of Delhi."

Our news journalists obtained a quote from the research from Medical College, "Cross-sectional descriptive study was conducted from October 2012 to March 2013 among working women from Delhi, India. The study was conducted as a part of ongoing training workshops organized for women on early detection of breast cancer. Total of eight such programs were organized and were attended by a total of 439 women. Each participant got a self-administered questionnaire to fill. Data was entered in Microsoft Excel and analysis was done using Statistical product and service solutions (SPSS) version 21 (IBM). A total of 439 participants were included in the study. 230 (52.4%) of the women were more than 40 years of age. Only four participants (1%) had not heard about the term mammography before. Less than half (45.1%) of the participants knew correctly the purpose of a mammogram. Only 11.8% of the women knew correctly about the age of getting the first baseline mammogram. Knowledge of frequency of getting the mammogram was also low only 95 (21.6%) correctly knew about it. Only 59 (11.9%) correctly responded that one needs to go to an imaging facility located either in a hospital or elsewhere to get mammogram done. Main experience shared by the women regarding mammography was that 42 (95.45%) did not know anything about the procedure when they went for this investigation. Out of a total of 230 women over 40 years of age only 38 (16.5%) had ever got a mammogram carried out. There is a statistically significant association between education status and practice of mammography (p <0.05). There were 18 women with family history of breast cancer out, of which 10 (55.5%) had got mammography carried out. 192 out of 230 (83.5%) women over 40 years of age had never got a mammogram done. Main reason 74 (38.5%) cited for this was that they did not know/were not aware they were supposed to go for mammography."  

According to the news editors, the research concluded: "As knowledge and utilization of mammography is low among women, there is a need to have a multipronged strategy to inform women about mammography and bring about a behavioral change along with having a formal national level screening guidelines for breast cancer early detection."

For more information on this research see: Study on knowledge, experiences and barriers to mammography among working women from Delhi. Indian Journal of Cancer,

Pathology

Medical University Describes Findings in Pathology (Vitamin D in the skin physiology and pathology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Pathology is now available. According to news reporting out of Gdansk, Poland, by NewsRx editors, research stated, "Vitamin D plays important, pleiotropic role in the maintenance of global homeostasis. Its influence goes far beyond the regulation of calcium and phosphorus balance, as diverse activities of vitamin D and its natural metabolites assure proper functioning of major human organs, including skin."

Our news journalists obtained a quote from the research from Medical University, "Recently, we reviewed the current understanding of vitamin D impact on human health from historical perspective (Wierzbicka et al. (2014) The renaissance of vitamin D. Acta Biochim Pol 61: 679-686). This article focuses on its functions in the skin. The skin and its appendages, creates a platform connecting and protecting internal organs against, usually harmful, external environment. It uppermost layer -epidermis in order to maintain a protective barrier undergoes a constant exchange of cornified keratinocytes layer. Its disturbance leads to development of serious skin disorders including psoriasis, vitilig o, atopic dermatitis and skin cancer. All of those dermatopathologies have a huge impact on modern societies, affecting not only the physical, but also mental state of patients as well as their social status. Furthermore, multiple human systemic diseases (autoimmune, blood and digestive diseases) have skin manifestation, thus 'condition of the skin' often reflects the condition and pathological changes within the internal organs. In humans, the skin is the natural source of vitamin D, which is produced locally from 7-dehydrocholesterol in photoreaction induced by ultraviolet B (UVB) radiation from the sun. It is also well established, that the process of proliferation and differentiation of keratinocytes is tightly regulated by calcium and the active form of vitamin D (1,25(OH)2D3). Thus, the skin physiology is inseparably connected with vitamin D production and activity. Unfortunately, UVB, which is required for vitamin D production, is also known as the main cause of a skin cancer, including melanoma."

According to the news editors, the research concluded: "Here, we are going to review benefits of vitamin D and its analogues in the maintenance of epidermal barrier and its potential use in the treatment of common skin diseases."

For more information on this research see: Vitamin D in the skin physiology and

Medical University Details Findings in Melanoma [Parthenolide induces MITF-M downregulation and senescence in patient-derived MITF-M (high) melanoma cell populations]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Melanoma. According to news reporting originating in Lodz, Poland, by NewsRx journalists, research stated, "The activity of the M isoform of microphthalmia-associated transcription factor (MITF-M) has been attributed to regulation of differentiation, proliferation, survival and senescence of melanoma cells. MITF expression was shown to be antagonized by the activation of transcription factor NF-kB."

The news reporters obtained a quote from the research from Medical University, "Parthenolide, an inhibitor of NF-kB, has not been yet reported to affect MITF-M expression. Our results obtained in patient-derived melanoma cell populations indicate that parthenolide efficiently decreases the MITF-M level. This is neither dependent on p65/NF-kB signaling nor RAF/MEK/ERK pathway activity as inhibition of MEK by GSK1120212 (trametinib) and induction of ERK1/2 activity by parthenolide itself do not interfere with parthenolide-triggered depletion of MITF-M in both wild-type BRAF and BRAF(V600E) melanoma populations. Parthenolide activity is not prevented by inhibitors of caspases, proteasomal and lysosomal pathways. As parthenolide reduces MITF-M transcript level and HDAC1 protein level, parthenolide-activated depletion of MITF-M protein may be considered as a result of transcriptional regulation, however, the influence of parthenolide on other elements of a dynamic control over MITF-M cannot be ruled out. Parthenolide induces diverse effects in melanoma cells, from death to senescence. The mode of the response to parthenolide is bound to the molecular characteristics of melanoma cells, particularly to the basal MITF-M expression level but other cell-autonomous differences such as NF-kB activity and MCL-1 level might also contribute."

According to the news reporters, the research concluded: "Our data suggest that parthenolide can be developed as a drug used in combination therapy against melanoma when simultaneous inhibition of MITF-M, NF-kB and HDAC1 is needed."

For more information on this research see: Parthenolide induces MITF-M downregulation and senescence in patient-derived MITF-M(high) melanoma cell populations. Oncotarget, 2016;7(8):9026-40.

**Memorial Sloan-Kettering Cancer Center Reports Findings in Glossectomy (Health-Related Quality of Life following Reconstruction for Common Head and Neck Surgical Defects)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Surgery - Glossectomy. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Improved understanding and management of health-related quality of life represents one of the greatest unmet needs for patients with head and neck malignancies. The purpose of this study was to prospectively measure health-related quality of life associated with different anatomical (head and neck) surgical resections."

Our news editors obtained a quote from the research from Memorial Sloan-Kettering Cancer Center, "A prospective analysis of health-related quality of life was performed in patients undergoing surgical resection with flap reconstruction for stage II or III head and neck malignancies. Patients completed the European Organization for Research and Treatment of Cancer Core Quality-of-Life Questionnaire-30 and the European Organization for Research and Treatment of Cancer Head and Neck Cancer Module-35 preoperatively, and at set postoperative time points. Scores were compared with a paired t test. Seventy-five patients were analyzed. The proportion of the cohort not alive at 2 years was 53 percent. Physical, role, and social functioning scores at 3 months were significantly lower than preoperative values (p < 0.05). At 12 months postoperatively, none of the function or global quality-of-life scores differed from preoperative levels, whereas five of the symptom scales remained below baseline. At 1 year postoperatively, maxillectomy, partial glossectomy, and oral lining defects had better function and fewer symptoms than mandibulectomy, laryngectomy, and total glossectomy. From 6 to 12 months postoperatively, partial glossectomy and oral lining defects had greater global quality of life than laryngectomies (p < 0.05). Postoperative health-related quality of life is associated with the anatomical location of the head and neck surgical resection. Preoperative teaching should be targeted for common ablative defects, with postoperative expectations adjusted appropriately."

According to the news editors, the research concluded: "Because surgery negatively impacts health-related quality of life in the immediate postoperative period, the limited survivorship should be reviewed with patients."

For more information on this research see: Health-Related Quality of Life following Reconstruction for Common Head and Neck Surgical Defects. *Plastic and Reconstructive Surgery*, 2016;138(6):1312-1320. *Plastic and Reconstructive Surgery* can be contacted at:
Mylan N.V.

**Mylan Launches Generic Concerta(R) Tablets**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- - Mylan N.V. (NASDAQ, TASE: MYL), announced the U.S. launch of Methylphenidate Hydrochloride Extended-Release Tablets USP, 18 mg, 27 mg, 36 mg and 54 mg, a generic version of Janssen's Concerta® Tablets. Mylan received final approval from the U.S. Food and Drug Administration (FDA) for its Abbreviated New Drug Application (ANDA) for this product, which is indicated for the treatment of Attention Deficit Hyperactivity Disorder (ADHD). (1)

Mylan CEO Heather Bresch commented, "The launch of generic Concerta® Tablets demonstrates Mylan's leadership in complex development and manufacturing and in bringing to market a broad portfolio of high quality generics. This launch also further strengthens our robust portfolio of central nervous system medications, which is the largest in the U.S. with more than 100 products. We're excited about bringing another generic in this therapeutic area to market and expanding access to help patients."

Methylphenidate Hydrochloride Extended-Release Tablets USP, 18 mg, 27 mg, 36 mg and 54 mg, had U.S. sales of approximately $1.59 billion for the 12 months ending October 31, 2016, according to IMS Health.

Currently, Mylan has more than 240 ANDAs pending FDA approval representing approximately $95.6 billion in annual brand sales, according to IMS Health. Forty-one of these pending ANDAs are potential first-to-file opportunities, representing $32.5 billion in annual brand sales, for the 12 months ending June 30, 2016, according to IMS Health.

Mylan is a global pharmaceutical company committed to setting new standards in healthcare. Working together around the world to provide 7 billion people access to high quality medicine, we innovate to satisfy unmet needs; make reliability and service excellence a habit; do what's right, not what's easy; and impact the future through passionate global leadership. We offer a growing portfolio of more than 2,700 generic and branded pharmaceuticals, including antiretroviral therapies on which approximately 50% of people being treated for HIV/AIDS worldwide depend. We market our products in more than 165 countries and territories. Our global R&D and manufacturing platform includes more than 50 facilities, and we are one of the world's largest producers of active pharmaceutical ingredients. Every member of our more than 35,000-strong workforce is dedicated to creating better health for a better world, one person at a

(1) Methylphenidate HCl ER Tablets USP, 18 mg, 27 mg, 36 mg and 54 mg should be given cautiously to patients with a history of drug dependence or alcoholism. Chronic abusive use can lead to marked tolerance and psychological dependence with varying degrees of abnormal behavior.

**Drugs and Therapies - Biopharmaceuticals**

**NIPTE is Partner in Newly Announced National Biopharmaceutical Manufacturing Institute**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- The National Institute for Pharmaceutical Technology and Education, Inc. (NIPTE) is part of the newly created public-private partnership called National Institute for Innovation of Manufacturing Biopharmaceuticals (NIIMBL). Its formation was announced by U.S. Secretary of Commerce Penny Pritzker on December 16, 2016. NIIMBL is led by the University of Delaware and includes some 150 private companies, academic institutions, and non-profit organizations across the nation. It is supported by a $70 million grant from U.S. Department of Commerce and an initial investment of $129 million from participating organizations. Its goal is to accelerate biopharmaceutical manufacturing innovation and educate and train a world-leading biopharmaceutical manufacturing workforce, fundamentally advancing U.S. competitiveness in this industry.

The participating NIPTE team, currently comprised of six member institutions (Universities of Connecticut, Kentucky, Kansas, Texas, Iowa, and Wisconsin), is a Tier 1 partner in NIIMBL. It will hold a seat on the Institute's Governance Board and will play a major role in its initiatives primarily focusing on biopharmaceutical formulations and product development, and FDA regulatory science. The team will work in close collaboration with three other NIPTE member institutions, Purdue University, University of Maryland, and the University of Minnesota, which are Tier 1 partners alongside NIPTE.

"We are extremely pleased that advanced pharmaceutical manufacturing is now part of the Manufacturing USA network," said Dr. Vadim J. Gurvich, executive director of NIPTE and research associate professor at the University of Minnesota. "NIIMBL's leadership has put together a very impressive partnership that will make a significant impact on biopharmaceutical manufacturing in this nation. As a key member, we will contribute to both research and education. For example, our Center of Excellence in Pharmaceutical Formulations will be a natural partner in NIIMBL."

NIPTE is a 501©(3) non-profit academic organization with the mission to improve human health through multi-university collaborative research advancing quality, safety, affordability, and speed to market of medicines. It is comprised of 15 top schools of pharmacy, chemical and pharmaceutical engineering, and one medical school. Current members are Duquesne University, Illinois Institute of Technology, Long Island University, Purdue University, Rutgers University, University of Connecticut, University of Iowa, University of
Nanjing Medical University Reports Findings in Non-Small Cell Lung Cancer (Prognostic Significance of EZH2 Expression in Non-Small Cell Lung Cancer: A Meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Non-Small Cell Lung Cancer are presented in a new report. According to news originating from Wuxi, People's Republic of China, by NewsRx correspondents, research stated, "Various studies examined the relationship between EZH2 overexpression with the clinical outcome in patients with non-small cell lung cancer (NSCLC), but yielded inconsistent results. Electronic databases updated to Dec 2014 were searched to find relevant studies."

Our news journalists obtained a quote from the research from Nanjing Medical University, "A meta-analysis was conducted with eligible studies which quantitatively evaluated the relationship between EZH2 overexpression and survival of patients with NSCLC Survival data were aggregated and quantitatively analyzed. We performed a meta-analysis of 10 studies (n=1,695 patients) that evaluated the correlation between EZH2 overexpression and survival in patients with lung cancer. Combined hazard ratios suggested that EZH2 overexpression was associated with poor prognosis of overall survival (OS) (HR=1.68, 95% CI: 1.42-1.93) in patients with lung cancer. In the stratified analysis, significantly risks were found among Asians (HR=1.33, 95% CI: 1.62-1.70), lung adenocarcinoma patients (HR=1.75, 95% CI: 1.38-2.52, in stage I NSCLC patients (HR=2.51, 95% CI: 1.23-3.79), but not among Caucasians."

According to the news editors, the research concluded: "EZH2 overexpression indicates a poor prognosis for patients with NSCLC, this effect appears also significant when the analysis is restricted in Asian population, lung AC and stage I patients, but not among Caucasians."

For more information on this research see: Prognostic Significance of EZH2 Expression in Non-Small Cell Lung Cancer: A Meta-analysis. *Scientific Reports*, 2016;6 ():19239. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Oncology - Breast Cancer

National Cancer Center Reports Findings in Breast Cancer
(PI3K/Akt/mTOR inhibitors in breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting out of Singapore, Singapore, by NewsRx editors, research stated, "Activation of the phosphoinositide 3 kinase (PI3K)/Akt/mammalian target of rapamycin (mTOR) pathway is common in breast cancer. There is preclinical data to support inhibition of the pathway, and phase I to III trials involving inhibitors of the pathway have been or are being conducted in solid tumors and breast cancer."

Our news journalists obtained a quote from the research from National Cancer Center, "Everolimus, an mTOR inhibitor, is currently approved for the treatment of hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative breast cancer. In this review, we summarise the efficacy and toxicity findings from the randomised clinical trials, with simplified guidelines on the management of potential adverse effects. Education of healthcare professionals and patients is critical for safety and compliance. While there is some clinical evidence of activity of mTOR inhibition in HR-positive and HER2-positive breast cancers, the benefits may be more pronounced in selected subsets rather than in the overall population."

According to the news editors, the research concluded: "Further development of predictive biomarkers will be useful in the selection of patients who will benefit from inhibition of the PI3K/Akt/mTOR (PAM) pathway."

For more information on this research see: PI3K/Akt/mTOR inhibitors in breast cancer. Cancer Biology & Medicine, 2015;12(4):342-54.

Neurons

National Center for Nanoscience and Technology Details Findings in Neurons (An on-chip model for investigating the interaction between neurons and cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurons are presented in a new report. According to news
reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Emerging evidence suggests that there is extensive interaction between neurons and cancer cells. However, few model systems have been developed to investigate nerve-cancer cell interaction in vitro."

The news correspondents obtained a quote from the research from National Center for Nanoscience and Technology, "Herein, a high-throughput microfluidic compartmentalized chip is developed to examine the interaction between neurons and cancer cells. The nerve bundles appear to provide a biophysical support for cancer cells and guide their directional migration. The cancers that have high levels of perineural invasion in clinical observations exhibit greater migration along neurites in the on-chip model. The on-chip model allows the screening of compounds which inhibit cancer cell migration along neurites in vitro. The interruption of neurites, the pharmacological blockade of nerve-cancer signaling, effectively attenuates the migration of cancer cells along neurites."

According to the news reporters, the research concluded: "This on-chip model provides a useful platform to investigate the dynamic interaction between cancer cells and neurons and can dramatically broaden the chemical space in screening neuron-related drugs for cancers."

For more information on this research see: An on-chip model for investigating the interaction between neurons and cancer cells. Integrative Biology, 2016;8(3):359-67. (Royal Society of Chemistry - www.rsc.org; Integrative Biology - pubs.rsc.org/en/journals/journalissues/ib)

**Macrolides**

**National Institute of Allergy and Infectious Diseases (NIAID) Details Findings in Macrolides (The Role of Signaling via Aqueous Pore Formation in Resistance Responses to Amphotericin B)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Macrolides is now available. According to news reporting originating in Bethesda, Maryland, by NewsRx editors, the research stated, "Drug resistance studies have played an important role in the validation of antibiotic targets. In the case of the polyene antibiotic amphotericin B (AmB), such studies have demonstrated the essential role that depletion of ergosterol plays in the development of AmB-resistant (AmB-R) organisms."

The news reporters obtained a quote from the research from the National Institute of
Allergy and Infectious Diseases (NIAID), "However, AmB-R strains also occur in fungi and parasitic protozoa that maintain a normal level of ergosterol at the plasma membrane. Here, I review evidence that shows not only that there is increased protection against the deleterious consequences of AmB-induced ion leakage across the membrane in these resistant pathogens but also that a set of events are activated that block the cell signaling responses that trigger the oxidative damage produced by the antibiotic. Such signaling events appear to be the consequence of a membrane-thinning effect that is exerted upon lipid-anchored Ras proteins by the aqueous pores formed by AmB. A similar membrane disturbance effect may also explain the activity of AmB on mammalian cells containing Toll-like receptors."

According to the news reporters, the research concluded: "These resistance mechanisms expand our current understanding of the role that the formation of AmB aqueous pores plays in triggering signal transduction responses in both pathogens and host immune cells."

For more information on this research see: The Role of Signaling via Aqueous Pore Formation in Resistance Responses to Amphotericin B. Antimicrobial Agents and Chemotherapy, 2016;60(9):5122-5129. Cardiovascular Diseases and Conditions - ...

National University Hospital Details Findings in Atherosclerosis (Airflow obstruction, atherosclerosis and cardiovascular risk factors in the AGES Reykjavik study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting originating from Reykjavik, Iceland, by NewsRx correspondents, research stated, "Airflow limitation, i.e., reduced forced expiratory volume in 1-second (FEV1), is associated with increased prevalence of atherosclerosis, however, causal mechanisms remain elusive. The objective of the study was to determine if the association between airflow obstruction and markers of atherosclerosis is mediated by systemic inflammation."

Our news editors obtained a quote from the research from National University Hospital, "1154 subjects from the longitudinal AGES Reykjavik study were included.
Population characteristics, systemic inflammation markers from blood (white blood cell counts (WBC) and level of Creactive protein (CRP)) were compared between patients with and without airflow limitation defined by reduced FEV1 on spirometry. Atherosclerosis burden was quantified by measurements of coronary artery calcium, aortic arch and distal aortic calcification in addition to carotid intimal media thickness (CIMT). Subjects were split into four groups according to smoking status and whether airflow limitation was present. There was a higher overall burden of atherosclerosis in ever-smokers compared to neversmokers, and in individuals with airflow obstruction compared to individuals without airflow obstruction. After adjusting for population characteristics, Framingham cardiovascular risk factors and markers of systemic inflammation (WBC and CRP), there was a significantly increased aortic arch and distal aorta calcification and higher CIMT measurement in individuals with airflow obstruction compared to individuals without airflow obstruction. After adjusting for population characteristics, Framingham cardiovascular risk factors and markers of systemic inflammation (WBC and CRP), there was a significantly increased aortic arch and distal aorta calcification and higher CIMT measurement in individuals with airflow obstruction compared to individuals without airflow obstruction. Systemic inflammation (WBC and CRP) does not appear to mediate the association between airflow limitation and atherosclerosis."

According to the news editors, the research concluded: "Only airflow limitation and not systemic inflammation (WBC and CRP) appears to be an independent predictor of atherosclerosis."

For more information on this research see: Airflow obstruction, atherosclerosis and cardiovascular risk factors in the AGES Reykjavik study. *Atherosclerosis*, 2016;252():122-127. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Oncology - Breast Cancer**

**National University Reports Findings in Breast Cancer (Predicting general and cancer-related distress in women with newly diagnosed breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news originating from Galway, Ireland, by NewsRx correspondents, research stated,
"Psychological distress can impact medical outcomes such as recovery from surgery and experience of side effects during treatment. Identifying the factors that explain variability in distress would guide future interventions aimed at decreasing distress."

Our news journalists obtained a quote from the research from National University, "Two factors that have been implicated in distress are illness perceptions and coping, and are part of the Self-Regulatory Model of Illness Behaviour (SRM). The model suggests that coping mediates the relationship between illness perceptions and distress. Despite this; very little research has assessed this relationship with cancer-related distress, and none have examined women with screen-detected breast cancer. This study is the first to examine the relative contribution of illness perceptions and coping on general and cancer-related distress in women with screen-detected breast cancer. Women recently diagnosed with breast cancer (N = 94) who had yet to receive treatment completed measures of illness perceptions (Revised Illness Perception Questionnaire), cancer-specific coping (Mental Adjustment to Cancer Scale), general anxiety and depression (Hospital Anxiety and Depression scale), and cancer-related distress. Hierarchical regression analyses revealed that medical variables, illness perceptions and coping predicted 50% of the variance in depression, 42% in general anxiety, and 40% in cancer-related distress. Believing in more emotional causes to breast cancer (beta = .22, p = .021), more illness identity (beta = .25, p = .004), greater anxious preoccupation (beta = .23, p = .030), and less fighting spirit (beta = -.31, p = .001) predicted greater depression. Greater illness coherence predicted less cancer-related distress (beta = -.20, p = .043). Greater anxious preoccupation also led to greater general anxiety (beta = .44, p < .001) and cancer-related distress (beta = .37, p = .001). Mediation analyses revealed that holding greater beliefs in a chronic timeline, more severe consequences, greater illness identity and less illness coherence increases cancer-specific distress (ps < .001) only if women were also more anxiously preoccupied with their diagnosis."

According to the news editors, the research concluded: "Screening women for anxious preoccupation may help identify women with screen-detected breast cancer at risk of experiencing high levels of cancer-related distress; whilst illness perceptions and coping could be targeted for use in future interventions to reduce distress."

For more information on this research see: Predicting general and cancer-related distress in women with newly diagnosed breast cancer. BMC Cancer. 2016;16():17-25. BMC Cancer can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. (BioMed Central - www.biomedcentral.com; BMC Cancer - www.biomedcentral.com/bmccancer/)

The news correspondents report that additional information may be obtained from A. Gibbons, Natl Univ Ireland, Sch Psychol, Galway, Ireland. Additional authors for this research include A. Groarke and K. Sweeney.

National University of Singapore Reports Findings in Squamous Cell Carcinoma (Exome sequencing reveals recurrent REV3L mutations in cisplatin-resistant squamous cell carcinoma of head and neck)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Squamous Cell Carcinoma is the subject of a report. According to news reporting originating in Singapore, Singapore, by NewsRx journalists, research stated, "Dacomitinib, an irreversible pan-HER inhibitor, had shown modest clinical activity in squamous cell carcinoma of head and neck (SCCHN) patients. Therefore, validated predictive biomarkers are required to identify patients most likely to benefit from this therapeutic option."

The news reporters obtained a quote from the research from the National University of Singapore, "To characterize the genetic landscape of cisplatin-treated SCCHN genomes and identify potential predictive biomarkers for dacomitinib sensitivity, we performed whole exome sequencing on 18 cisplatin-resistant metastatic SCCHN tumors and their matched germline DNA. Platinum-based chemotherapy elevated the mutation rates of SCCHN compared to chemotherapy-naïve SCCHNs. Cisplatin-treated SCCHN genomes uniquely exhibited a novel mutational signature characterized by C:G to A:T transversions at CCR sequence contexts that may have arisen due to error-prone translesional synthesis. Somatic mutations in REV3L, the gene encoding the catalytic subunit of DNA polymerase z involved in translesional synthesis, are significantly enriched in a subset of patients who derived extended clinical benefit to dacomitinib (p=0.04). Functional assays showed that loss-of-function of REV3L dramatically enhanced the sensitivity of SCCHN cells to dacomitinib by the loss of both translesion synthesis and homologous recombination pathways."

According to the news reporters, the research concluded: "Our data suggest that the 'platinum' mutational signature and inactivation of REV3L may inform treatment options in patients of recurrent SCCHN."

For more information on this research see: Exome sequencing reveals recurrent REV3L mutations in cisplatin-resistant squamous cell carcinoma of head and neck. Scientific Reports, 2016;6():19552. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/srep19552. This DOI is a link to an online electronic document that is either free or for purchase.

Our reports deliver fact-based news of research and discoveries from around the
Naturally occurring mechanism of cancer drug-resistance may itself be a treatment target

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- The use of proteasome inhibitors to treat cancer has been greatly limited by the ability of cancer cells to develop resistance to these drugs. But Whitehead Institute researchers have found a mechanism underlying this resistance—a mechanism that naturally occurs in many diverse cancer types and that may expose vulnerabilities to drugs that spur the natural cell-death process.

This finding—which also identifies a biomarker that can be used to gain a deeper understanding of the proteasome inhibitor-resistant state—is reported in the Proceedings of the National Academy of Sciences (PNAS) in an article entitled, Suppression of 19S proteasome subunits marks emergence of an altered cell state in diverse cancers.

Proteasomes are large protein complexes that mediate protein degradation and play a crucial role in maintaining protein equilibrium within the cell. When cells become cancerous, tremendous stresses are placed on the cellular machinery responsible for maintaining protein equilibrium—and that machinery is the target of anti-cancer drugs called proteasome inhibitors. Although proteasome inhibitors are very efficient in selective killing of cancer tumor cells grown in a dish (in-vitro), their success in the clinic has largely been undermined by the development of resistance—mechanisms of which are poorly understood.

"However, recently, we discovered a counterintuitive mechanism by which cells can acquire resistance to proteasome inhibitors in vitro," explains Peter Tsvetkov, lead author of the PNAS article and a post-doctoral researcher at Whitehead Institute. "Now, in this report, we show that this mechanism is at work in many human cancers. Moreover, we have determined that the mechanism is symptomatic of a broadly altered state in the cell, with a unique gene signature and newly exposed vulnerabilities that can be targeted with existing drugs." Notably, the mechanism was clearly associated with poor outcome in patients with the blood cancer myeloma, where proteasome inhibitors are a mainstay of treatment.

Analyzing data from thousands of cancer lines and tumors, the researchers found that those demonstrating resistance to proteasome inhibitor drugs were marked by suppressed expression of one or more of the cells' proteasome cap subunits (which are a subsets of the larger proteasome). Suppressing the expression of even one of the many subunits making up the cap will impair the assembly of the whole cap, resulting in a proteasome-inhibitor resistant state. "This fact reinforces just how complex the mechanisms of resistance to chemotherapy can be," says Luke Whitesell, a senior author of the PNAS paper and senior scientist at Whitehead Institute.

Nevertheless, this new report reveals a strategy to address such resistance which may have broad utility. The researchers found that, beyond conferring resistance to proteasome inhibitors, the suppressed expression of proteasome subunits reflects a broad remodeling of the cell's gene signature. Furthermore, this can also serve as a biomarker to stratify patients for treatment. "That signature marks a heritably altered and therapeutically relevant state in diverse cancers—a state that may expose vulnerability to specific drugs that are already in use in the clinic," Tsvetkov observes. "Cancers can achieve this resistance by multiple mechanisms, genetic or epigenetic. But these findings point us to new strategies and novel compounds that
can be developed as treatments that will be more effective for an array of cancer types because they are less susceptible to the emergence of resistance."

**Research and Markets**

**Neurovascular Devices Market 2013 - 2024 - Research and Markets**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research and Markets has announced the addition of the "Neurovascular Devices Market Analysis By Device Type, By Therapeutic Applications And Segment Forecasts, 2013 - 2024" report to their offering.

The global neurovascular device market was valued at USD 1.62 billion in the year 2015 and is expected to reach a value of USD 2.92 billion by 2024, growing at a CAGR of 6.5%.

Key factors driving the market growth include increase in patients suffering from cerebral vascular disorders mandating assistance of neurovascular devices such as cerebral embolization and aneurysm coils, implementation of advanced technological platforms in this field, and the favorable reimbursement policies across established markets such as the U.S., Canada, U.K., Germany, and Japan.

The market is segmented on the basis of device type and respective therapeutic applications. The embolization coils are widely employed in the treatments of strokes and cerebral aneurysms. They are responsible for majority of market share in the device type segment. According to World Health Organization (WHO), strokes are the leading cause of disability and third cause of death across the world. Stroke therapeutic application segment accounts for the largest market as compared to others. In addition, according to the American Heart Association, nearly 5% of the population is currently suffering from the cerebral aneurysms. Aneurysms can cause moderate to severe brain damage depending upon the condition. Therefore, their treatment is contributing to the increased demand of these platforms.

The embolization and aneurysms coiling devices are minimally invasive and are employed in effectively treating the aneurysms. Several diseases can be treated with the help of a single coil however; the unusual cerebral aneurysms require several expensive coils. Due to the efficacy, the volume for these procedures has increased over the years. This trend will continue over the forecast period, thereby rendering the leading position for this segment in terms of revenue share. The stenting systems possess the potential to address complex natured aneurysms, which were untreatable in the past. Hence, the cerebral angioplasty and stenting systems will exhibit an impressive growth pattern during the forecast period.

Moreover, Stryker Corporation is a key leader in the neurovascular device market, owing to the strategic acquisition of complete neurovascular portfolio of Boston Scientific Corporation in the year 2010. The other notable players in this industry include Abbott Laboratories, W.L. Gore & Associates, Inc., Micrport Scientific Corporation, and Terumo Corporation.

Key Topics Covered: 1 Methodology & Scope
2 Executive Summary
New Abdominal Aortic Aneurysm Data Have Been Reported by Researchers at Academic Medical Center (Biomechanical Imaging Markers as Predictors of Abdominal Aortic Aneurysm Growth or Rupture: A Systematic Review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm is the subject of a report. According to news reporting originating in Amsterdam, Netherlands, by NewsRx journalists, research stated, "Biomechanical characteristics, such as wall stress, are important in the pathogenesis of abdominal aortic aneurysms (MA) and can be visualised and quantified using imaging techniques. This systematic review aims to present an overview of all biomechanical imaging markers that have been studied in relation to AAA growth and rupture."

The news reporters obtained a quote from the research from Academic Medical Center, "This systematic review followed the PRISMA guidelines. A search in Medline, Embase, and the Cochrane Library identified 1503 potentially relevant articles. Studies were included if they assessed biomechanical imaging markers and their potential association with growth or rupture. Twenty-seven articles comprising 1730 patients met the inclusion criteria. Eighteen studies performed wall stress analysis using finite element analysis (FEA), 13 of which used peak wall stress (PWS) to quantify wall stress. Ten of 13 case control FEA studies reported a significantly higher PWS for symptomatic or ruptured AAs than for intact AAs. However, in some studies there was confounding bias because of baseline differences in aneurysm diameter between groups. Clinical heterogeneity in methodology obstructed a meaningful meta analysis of PWS. Three of five FEA studies reported a significant positive association between several wall stress markers, such as PWS and 99th percentile stress, and growth. One study reported a significant negative association and one other study reported no significant association. Studies assessing wall compliance, the augmentation index and wall stress analysis using Laplace's law, computational fluid dynamics and fluid structure interaction were also
included in this systematic review. Although PWS is significantly higher in symptomatic or ruptured AAAs in most FEA studies, confounding bias, clinical heterogeneity, and lack of standardisation limit the interpretation and generalisability of the results."

According to the news reporters, the research concluded: "Also, there is conflicting evidence on whether increased wall stress is associated with growth."

Our news correspondents report that additional information may be obtained by contacting R. Balm, Academy Med Center, Dept. of Surg, NL-1105 AZ Amsterdam, Netherlands. Abdominal Aortic Aneurysm

New Abdominal Aortic Aneurysm Findings from Shandong University Described (Silencing of hypoxia inducible factor-1 alpha gene attenuated angiotensin II-induced abdominal aortic aneurysm in apolipoprotein E-deficient mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Abdominal Aortic Aneurysm have been presented. According to news reporting originating from Jinan, People's Republic of China, by NewsRx correspondents, research stated, "We aimed to determine the effect of HIF-1 alpha, the main regulatory subunit of the hypoxia inducible factor 1 (HIF-1), on the development of the abdominal aortic aneurysm (AAA). AAA was induced in ApoE(-/-) mice by angiotensin. (AngII) infusion."

Our news editors obtained a quote from the research from Shandong University, "In vivo silencing of HIF-1 alpha was achieved by transfection of lentivirus expressing HIF-1 alpha shRNA. Time course analysis of the Ang. infusion model revealed that HIF-1 alpha was persistently upregulated during a 28-day period of AAA development. Silencing of the HIF-1 alpha gene reduced the aneurysm size (2.84 +/- 1.96 mm vs. 1.41 +/- 0.85 mm respectively at day 28, p = 0.0002). Silencing of HIF-1 alpha also alleviated infiltration of macrophages (38.8 +/- 14.7 vs. 11.4 +/- 4.4 macrophages/0.1 mm(2), p = 0.0006) and neovascularity (5.56 +/- 2.14
vs. 1.27 +/- 1.05 microvessels/0.1 mm(2), p = 0.0008) in the Ang. infusion model, at day 28. The activity of MMP-2 and MMP-9 was also decreased by knockdown of HIF-1 alpha. The early increased expression of pro-inflammatory factors, angiogenic factors, and MMPs during AAA induction was alleviated by HIF-1 alpha silencing."

According to the news editors, the research concluded: "Activation of HIF-1 signaling pathway participates in the Ang II-induced AAA formation in mice."

The news editors report that additional information may be obtained by contacting X. Jin, Shandong University, Shandong Prov Hosp, Dept. of Vasc Surg, Jinan 250012, People's Republic of China. Additional authors for this research include L. Shen, G. Li, H. Yuan, X. Jin and X.J. Wu.

Keywords for this news article include: Jinan, People's Republic of China, Asia, Basic Helix-Loop-Helix Transcription Factors, Cardiovascular Diseases and Conditions, Vascular Diseases and Conditions, Aortic Diseases and Conditions, Mononuclear Phagocyte System, Hypoxia-Inducible Factor 1, Abdominal Aortic Aneurysm, Nerve Tissue Proteins, Proteins, Genetics, Biological Factors, Peptide Proteins, Peptide Hormones, Apolipoproteins, Angiotensin II, Oligopeptides, Neuropeptides, Lipoproteins, Angiotensins, Apoproteins, Macrophages, Immunology, Phagocytes, Cardiology, Autacoids, Peptides, Shandong University.

**New Abdominal Aortic Aneurysm Study Findings Recently Were Reported by Researchers at Odense University Hospital (Animal Models Used to Explore Abdominal Aortic Aneurysms: A Systematic Review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm are presented in a new report. According to news reporting originating from Odense, Denmark, by NewsRx correspondents, research stated, "Experimental animal models have been used to investigate the formation, development, and progression of abdominal aortic aneurysms (AAAs) for decades. New models are constantly being developed to imitate the mechanisms of human AAAs and to identify treatments that are less risky than those used today."

Our news editors obtained a quote from the research from Odense University Hospital, "However, to the authors' knowledge, there is no model identical to the human AAA. The objective of this systematic review was to assess the different types of animal models used to investigate the development, progression, and treatment of AAA and to highlight their advantages and limitations. A search protocol was used to perform a systematic literature search of PubMed and Embase. A total of 2,830 records were identified. After selection of the relevant articles, 564 papers on animal AAA models were included. The most common models in
rodents, including elastase, calcium chloride, angiotensin II, xenograft, and transgenic models, and the most common models in non-rodents, including chemically induced, graft models, and patch models, all have limitations with regard to the pathological interpretation of human AAA."

According to the news editors, the research concluded: "Although findings from animal models of AAAs cannot be directly translated to human AAAs, the identification and awareness of animal models of AAA will provide knowledge for further investigation and insight into human AAA disease."

The news editors report that additional information may be obtained by contacting J.L. Poulsen, Odense Univ Hosp, Dept. of Cardiothorac & Vasc Surg T, DK-5000 Odense C, Denmark. Additional authors for this research include J. Stubbe and J.S. Lindholt.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejvs.2016.07.004. This DOI is a link to an online electronic document that is either free or for purchase.

**Nutritional and Metabolic Diseases and Conditions**

**New Acidosis Findings Reported from Hospices civils de Lyon**

(Hyperchloremic metabolic acidosis following plasma exchange during myasthenia gravis crisis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Acidosis is now available. According to news reporting originating from Lyon, France, by NewsRx correspondents, research stated, "Therapeutic plasma exchanges are increasingly used, notably during myasthenia gravis crisis. Repeated exchanges may induce severe adverse events."

Our news editors obtained a quote from the research from Hospices civils de Lyon, "We reported a case of symptomatic hyperchloremic metabolic acidosis following a therapeutic plasma exchange. Analysis of 4% albumin substitution solution revealed a chloride concentration of 145 mmol/L, which could explain this acidosis. Infusion of high volume of 4% albumin during plasma exchanges may produce hyperchloremic metabolic acidosis."

According to the news editors, the research concluded: "Special attention should be paid when repeated plasma exchanges are performed. J. Clin. Apheresis 31:479-480, 2016."

For more information on this research see: Hyperchloremic metabolic acidosis following plasma exchange during myasthenia gravis crisis. Journal of Clinical Apheresis,
New Acinetobacter baumannii Study Findings Have Been Reported from University of Pittsburgh (Comparison of Minocycline Susceptibility Testing Methods for Carbapenem-Resistant Acinetobacter baumannii)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Acinetobacter baumannii. According to news originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "Treatment options for infections due to carbapenem-resistant Acinetobacter baumannii are extremely limited. Minocycline is a semisynthetic tetracycline derivative with activity against this pathogen."

Financial supporters for this research include The Medicines Company, HHS | National Institutes of Health (NIH), National Natural Science Foundation of China (NSFC).

Our news journalists obtained a quote from the research from the University of Pittsburgh, "This study compared susceptibility testing methods that are used in clinical microbiology laboratories (Etest, disk diffusion, and Sensititre broth microdilution methods) for testing of minocycline, tigecycline, and doxycycline against 107 carbapenem-resistant A. baumannii clinical isolates. Susceptibility rates determined with the standard broth microdilution method using cation-adjusted Mueller-Hinton (MH) broth were 77.6% for minocycline and 29% for doxycycline, and 92.5% of isolates had tigecycline MICs of <= 2 μg/ml. Using MH agar from BD and Oxoid, susceptibility rates determined with the Etest method were 67.3% and 52.3% for minocycline, 21.5% and 18.7% for doxycycline, and 71% and 29.9% for tigecycline, respectively. With the disk diffusion method using MH agar from BD and Oxoid, susceptibility rates were 82.2% and 72.9% for minocycline and 34.6% and 34.6% for doxycycline, respectively, and rates of MICs of <= 2 μg/ml were 46.7% and 23.4% for tigecycline. In comparison with the standard broth microdilution results, very major rates were low (similar to 2.8%) for all three drugs across the methods, but major error rates were higher (similar to 5.6%), especially with the Etest method. For minocycline, minor error rates ranged from 14% to 37.4%. For tigecycline, minor error rates ranged from 6.5% to 69.2%. The majority of minor errors were due to susceptible results being reported as intermediate."

According to the news editors, the research concluded: "For minocycline susceptibility testing of carbapenem-resistant A. baumannii strains, very major errors are rare, but major and minor errors overcalling strains as intermediate or resistant occur frequently with susceptibility testing methods that are feasible in clinical laboratories."
For more information on this research see: Comparison of Minocycline Susceptibility Testing Methods for Carbapenem-Resistant Acinetobacter baumannii. *Journal of Clinical Microbiology*, 2016;54(12):2937-2941. *Journal of Clinical Microbiology* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

The news correspondents report that additional information may be obtained from Y.H. Doi, University of Pittsburgh, Sch Med, Div Infect Dis, Pittsburgh, PA 15260, United States. Additional authors for this research include S.L. Bowler, S.F. Kantz, R.T. Mettus, Y. Guo, C.L. McElheny and Y.H. Doi.

**Lung Diseases and Conditions - Acute Chest Syndrome**

**New Acute Chest Syndrome Study Findings Reported from Research Institute (Inhaled bronchodilators for acute chest syndrome in people with sickle cell disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Acute Chest Syndrome have been published. According to news originating from Kingston, Jamaica, by NewsRx correspondents, research stated, "Bronchodilators are used to treat bronchial hyper-responsiveness in asthma. Bronchial hyper-responsiveness may be a component of acute chest syndrome in people with sickle cell disease."

Our news journalists obtained a quote from the research from Research Institute, "Therefore, bronchodilators may be useful in the treatment of acute chest syndrome. This is an update of a previously published Cochrane Review. To assess the benefits and risks associated with the use of bronchodilators in people with acute chest syndrome. Search methods We searched the Cochrane Cystic Fibrosis and Genetic Disorders Group Trials Register comprising references identified from comprehensive electronic database searches, handsearches of relevant journals and abstract books of conference proceedings. Additional searches were carried out on MEDLINE (1966 to 2002) and Embase (1981 to 2002). Date of the most recent search of the Group's Haemoglobinopathies Trials Register: 11 July 2016. Selection criteria Randomised or quasi-randomised controlled trials. Trials using quasi-randomisation methods will be included in future updates of this review if there is sufficient evidence that the treatment and control groups are similar at baseline. Data collection and analysis We found no trials investigating the use of bronchodilators for acute chest syndrome in people with sickle cell disease. We found no trials investigating the use of bronchodilators for acute chest syndrome in people with sickle cell disease. Authors’ conclusions If bronchial hyper-responsiveness is an important component of some episodes of acute chest syndrome in people with sickle cell disease, the use of inhaled
bronchodilators may be indicated."

According to the news editors, the research concluded: "There is need for a well-designed, adequately-powered randomised controlled trial to assess the benefits and risks of the addition of inhaled bronchodilators to established therapies for acute chest syndrome in people with sickle cell disease."

For more information on this research see: Inhaled bronchodilators for acute chest syndrome in people with sickle cell disease. Cochrane Database of Systematic Reviews, 2016; (9):471-484. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Heart Disorders and Diseases - Acute Coronary...

New Acute Coronary Syndrome Study Findings Have Been Reported by Investigators at Duke University (Treatment After Acute Coronary Syndrome: Analysis Of Patient’s Priorities With Analytic Hierarchy Process)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Acute Coronary Syndrome are presented in a new report. According to news reporting originating from Durham, North Carolina, by NewsRx correspondents, research stated, "Cardiovascular disease is one of the most common causes of death worldwide, with many individuals having experienced acute coronary syndrome (ACS). How patients with a history of ACS value aspects of their medical treatment have been evaluated rarely."

Our news editors obtained a quote from the research from Duke University, "The aim of this study was to determine patient priorities for long-term drug therapy after experiencing ACS. To identify patient-relevant treatment characteristics, a systematic literature review and qualitative patient interviews were conducted. A questionnaire was developed to elicit patient's priorities for different characteristics of ACS treatment using Analytic Hierarchy Process (AHP). To evaluate the patient-relevant outcomes, the eigenvector method was applied. Six-hundred twenty-three patients participated in the computer-assisted personal interviews and were included in the final analysis. Patients showed a clear priority for the attribute 'reduction of mortality risk' (weight: 0.402). The second most preferred attribute was the 'prevention of a new myocardial infarction' (weight: 0.272), followed by 'side effect: dyspnea' (weight: 0.165) and 'side effect: bleeding' (weight: 0.117). The 'frequency of intake' was the least important attribute (weight: 0.044). In conclusion, this study shows that patients strongly value a reduction of the mortality risk in post-ACS treatment."

According to the news editors, the research concluded: "Formal consideration of
patient preferences and priorities can help to inform a patient-centered approach, clinical practice, development of future effective therapies, and health policy for decision makers that best represents the needs and goals of the patient."

The news editors report that additional information may be obtained by contacting A.C. Muhlbacher, Duke University, Durham, NC 27706, United States. Additional authors for this research include S. Bethge and A. Kaczynski.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1017/S0266462316000428. This DOI is a link to an online electronic document that is either free or for purchase.

**Heart Disorders and Diseases - Acute Coronary...**

**New Acute Coronary Syndrome Study Findings Have Been Reported by Researchers at First Affiliated Hospital (Platelet-to-Lymphocyte Ratio Improves the Predictive Power of GRACE Risk Score for Long-Term Cardiovascular Events in Patients with Acute ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Acute Coronary Syndrome is the subject of a report. According to news reporting out of Xi’an, People's Republic of China, by NewsRx editors, research stated, "This study aims to evaluate the relationship between platelet-to-lymphocyte ratio (PLR) and GRACE risk score and to examine whether PLR on admission can improve the predictive value of GRACE risk score for cardiovascular disease (CVD) events in patients with acute coronary syndrome (ACS). PLR was calculated from the platelet and lymphocyte counts from the complete blood count of 2,230 ACS patients upon admission."

Our news journalists obtained a quote from the research from First Affiliated Hospital, "The GRACE risk score was also calculated. Spearman's rank correlation demonstrated that GRACE risk score was positively correlated with PLR (r=0.190, p<0.001). After a median follow-up period of 58 months, multivariate Cox analysis showed that both GRACE risk score [hazard ratio (HR) 1.092, 95% confidence interval (CI) 1.067-1.117, p<0.001] and PLR (HR 1.100, 95% CI 1.088-1.112, p<0.001) could independently predict CVD events. Receiver-operating characteristic curve (ROC) analysis proved that using PLR together with GRACE risk score improved the score from 0.70 (95% CI 0.67-0.73, p<0.001) when used
alone to 0.81 (95% CI 0.79-0.83, p<0.001) for CVD events and from 0.73 (95% CI 0.70-0.77, p<0.001) when used alone to 0.80 (95% CI 0.77-0.83, p<0.001) for all-cause mortality."

According to the news editors, the research concluded: "This study proves, for the first time, a positive association between GRACE risk score and PLR, and that a combination of PLR and GRACE risk score is more effective in predicting CVD events in ACS patients."

Our news journalists report that additional information may be obtained by contacting D. Zhou, Dept. of Cardiovascular Medicine, First Affiliated Hospital of Xi’an Jiaotong University, Xi’an, People's Republic of China. Additional authors for this research include Y. Fan, Z. Wan, W. Wen, X. Wang, J. Zhou, T. Chen and Z. Yuan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000442939. This DOI is a link to an online electronic document that is either free or for purchase.

Acute Kidney Injury

New Acute Kidney Injury Study Findings Reported from Yale University (Acute Kidney Injury Severity and Long-Term Readmission and Mortality After Cardiac Surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Acute Kidney Injury have been published. According to news reporting originating from New Haven, Connecticut, by NewsRx correspondents, research stated, "Acute kidney injury (AKI) is a common complication after cardiac surgery. While AKI severity is known to be associated with increased risk of short-term outcomes, its long-term impact is less well understood."

Our news editors obtained a quote from the research from Yale University, "Adult patients undergoing isolated coronary artery bypass graft surgery at eight centers were enrolled into the Northern New England biomarker registry (n = 1,610). Patients were excluded if they had renal failure (n = 15) or died during index admission (n = 38). Severity of AKI was defined using the Acute Kidney Injury Network (AKIN). We linked our cohort to national Medicare and state all-payer claims to ascertain readmissions and to the National Death Index to ascertain survival. Kaplan-Meier and multivariate Cox proportional hazards modeling was conducted for time to readmission and death over 5 years. Within 5 years, 513 patients (33.8%) had AKI with
AKIN stage 1 (29.9%) and stage 2 to 3 (3.9%). There were 620 readmissions (39.9%) and 370 deaths (23.8%). After adjustment, stage 1 AKI patients had a 31% increased risk of readmission (95% confidence interval [CI]: 1.10 to 1.57), whereas stage 2 or 3 patients had a 98% increased risk (95% CI: 1.41 to 2.78) compared with patients having no AKI. Relative to patients without AKI, stage 1 patients had a 56% increased risk of mortality (95% CI: 1.14 to 2.13), whereas stage 2 or 3 patients had a 3.5 times higher risk (95% CI: 2.16 to 5.60). Severity of AKI using the AKIN stage criteria is associated with a significantly increased risk of 5-year readmission and mortality."

According to the news editors, the research concluded: "Our findings suggest that efforts to reduce AKI in the perioperative period may have a significant long-term impact on patients and payers in reducing mortality and health care utilization."

The news editors report that additional information may be obtained by contacting J.R. Brown, Yale University, Sch Med, Temple Med Center, Program Appl Translat Res, New Haven, CT, United States. Additional authors for this research include W.M. Hisey, E.J. Marshall, D.S. Likosky, E.L. Nichols, A.D. Everett, S.K. Pasquali, M.L. Jacobs, J.P. Jacobs and C.R. Parikh.

Oncology - Acute Myeloid Leukemia

New Acute Myeloid Leukemia Data Have Been Reported by Investigators at University of Pittsburgh (Leukapheresis in patients newly diagnosed with acute myeloid leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Acute Myeloid Leukemia is the subject of a report. According to news reporting originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "Hyperleukocytosis is present in 5 to 20 percent of patients with newly diagnosed acute myeloid leukemia (AML). The management of hyperleukocytosis, when symptoms of leukostasis occur, includes intensive supportive care and interventions for rapid cytoreduction."

Our news editors obtained a quote from the research from the University of Pittsburgh, "Leukapheresis is a rapid and effective means of cytoreduction and has been used in AML patients. In the current study, we evaluated the outcomes of 68 newly diagnosed AML patients that underwent leukapheresis and the effects of leukapheresis on various laboratory
parameters. A total of 127 leukapheresis cycles were performed. The median number of leukapheresis cycles was 2 (range, 1-8). The overall survival for all patients was 4.2 months (95% CI 1.2-9.7 months). The median overall survival for patients who achieved complete remission after induction chemotherapy was significantly higher (19.1 months [95% CI 12.1-41.8 months]) than patients that did not achieve complete remission (0.46 months [95% CI 0.33-0.99 months]). Stepwise logistic regression demonstrated that elevated number of peripheral blasts, low platelet count and elevated bilirubin at AML diagnosis were predictive of death within a week. Leukapheresis was effective in reducing the peripheral blood leukocytes and leukemia blasts and was a safe procedure with regard to organ function, coagulation parameters, red blood cells and platelet count."

According to the news editors, the research concluded: "The high initial response rates in newly diagnosed AML patients fit to receive intensive chemotherapy suggest that leukapheresis could be beneficial in reducing the complications associated with hyperleukocytosis until systemic intensive chemotherapy commences."

The news editors report that additional information may be obtained by contacting M. Boyiadzis, University of Pittsburgh, Sch Med, Inst Canc, Div Hematol & Oncol, Pittsburgh, PA 15232, United States. Additional authors for this research include M. Agha, A. Raptis, J.Z. Hou, R. Farah, S.H. Lim, R.L. Redner, A. Im, A. Sehgal, K.A. Dorritie, J.E. Kiss, D. Normolle and M. Boyiadzis.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.transci.2016.07.001. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Acute Myeloid Leukemia

New Acute Myeloid Leukemia Findings from University of Halle Outlined (Azacitidine in combination with intensive induction chemotherapy in older patients with acute myeloid leukemia: The AML-AZA trial of the Study Alliance Leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Acute Myeloid Leukemia have been published. According to news originating from Halle, Germany, by NewsRx correspondents, research stated, "DNA methylation changes are a constant feature of acute myeloid leukemia. Hypomethylating drugs such as azacitidine are active in acute myeloid leukemia (AML) as
monotherapy."

Our news journalists obtained a quote from the research from the University of Halle, "Azacitidine monotherapy is not curative. The AML-AZA trial tested the hypothesis that DNA methyltransferase inhibitors such as azacitidine can improve chemotherapy outcome in AML. This randomized, controlled trial compared the efficacy of azacitidine applied before each cycle of intensive chemotherapy with chemotherapy alone in older patients with untreated AML. Event-free survival (EFS) was the primary end point. In total, 214 patients with a median age of 70 years were randomized to azacitidine/chemotherapy (arm-A) or chemotherapy (arm-B). More arm-A patients (39/105; 37%) than arm-B (25/109; 23%) showed adverse cytogenetics (p=0.057). Adverse events were more frequent in arm-A (15.44) versus 13.52 in arm-B, (p=0.26), but early death rates did not differ significantly (30-day mortality: 6% versus 5%, p=0.76). Median EFS was 6 months in both arms (p=0.96). Median overall survival was 15 months for patients in arm-A compared with 21 months in arm-B (p=0.35)."

According to the news editors, the research concluded: "Azacitidine added to standard chemotherapy increases toxicity in older patients with AML, but provides no additional benefit for unselected patients."

For more information on this research see: Azacitidine in combination with intensive induction chemotherapy in older patients with acute myeloid leukemia: The AML-AZA trial of the Study Alliance Leukemia. Leukemia, 2015;30(3):555-61. (Nature Publishing Group - www.nature.com/; Leukemia - www.nature.com/leu/)

The news correspondents report that additional information may be obtained from C. Muller-Tidow, Dept. of Medicine, Hematology and Oncology, University of Halle, Halle, Germany. Additional authors for this research include P. Tschanter, C. Rollig, C. Thiede, A. Koschmieder, M. Stelljes, S. Koschmieder, M. Dugas, J. Gerss, T. Butterfaß-Bahloul, R. Wagner, M. Eveslage, U. Thiem, S.W. Krause, U. Kaiser, V. Kunzmann and B. Steffen.

Drugs and Therapies - Acyclovir Therapy

New Acyclovir Therapy Findings from King Faisal University Described (Quantification of uptake and clearance of acyclovir in skin layers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Acyclovir Therapy have been published. According to news reporting out of Al Hasa, Saudi Arabia, by NewsRx editors, the research stated, "Quantification of drug uptake and clearance in the skin layers could provide better insight into the skin kinetics of dermatological formulations aimed for deeper skin tissues. This study assessed the skin kinetics of acyclovir in different skin layers following topical application on the abdominal region of Wistar rats."

Our news journalists obtained a quote from the research from King Faisal University,
"In vivo skin pharmacokinetics parameters were determined by two different protocols such as post drug load assessment and subsequent drug load assessment following topical application of 500 mg of cream formulation containing 5% (w/w) of acyclovir. Topical application of acyclovir exhibited concentration gradient between the skin layers (stratum corneum > viable epidermis > dermis) which were inconsistent over the time-course of the study. The rate and extent of drug reaching target site (basal epidermis) was relatively low. The drug uptake and clearance profiles were found to be distinct in all the three skin layers suggesting no drug concentration correlation (P <0.05) between skin layers. Drug concentration in the viable epidermis continued to increase even after termination of therapy (T-max = 4 h) and then declined rapidly. The availability of acyclovir in the target was comparatively low (approximately 0.4% of the applied dose) although an order of magnitude higher percentage was determined in the stratum corneum. The data observed in this study demonstrates low skin uptake and rapid clearance of acyclovir in the target site."

According to the news editors, the research concluded: "Further, the methodology employed can be useful for studying other topical antiviral agents as well as for optimizing formulations for drugs (such as acyclovir) that may enhance their efficacy."

Our news journalists report that additional information may be obtained by contacting A.B. Nair, King Faisal Univ, Coll Clin Pharm, Dept. of Pharmaceut Sci, Al Hasa, Saudi Arabia.

Musculoskeletal Diseases and Conditions...

New Adamantinoma Findings Reported from Medical University (Long-term outcome following treatment of Adamantinoma and Osteofibrous dysplasia of long bones)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Adamantinoma have been published. According to news reporting originating in Vienna, Austria, by NewsRx journalists, research stated, "Adamantinoma (AD) is an ultimately rare, low-grade malignant bone tumor. In most cases it occurs in the tibia of young adults."

The news reporters obtained a quote from the research from Medical University, "Osteofibrous dysplasia (OFD) is a rare, benign, lesion that is typically seen in children. Histopathology, ultrastructure, and cytogenetics indicate that these lesions are closely related. Yet, etiology remains a matter of debate. Local recurrence rates are high for both entities as published in literature and long-term outcomes are scarce, due to the rarity of the disease. AD should be treated by En-Bloc resection while ODF can be treated by curettage or by observation. Consequently, the aim of the present study was to answer following questions: Were local recurrence rates of both entities different based on a retrospective review within a tertiary
referral center for orthopedic oncology? Material and methods: In a retrospective cohort study, 10 patients with AD and 5 patients with OFD (including 1 patient with OFD-like-AD) were reviewed. Primary surgeries for patients with AD were: En-bloc resection in 7, curettage in 2 and amputation in 1. In the OFD group, only 2 patients underwent surgery by curettage. Mean follow-up was 16 years (range: 2-47 years). Nine patients had a minimum follow-up of 10 years (mean: 23 years; range: 10-47 years). Four patients with AD (40%) and 2 patients with OFD (40%) - all of them following surgical removal - suffered from local recurrence. In the 'En bloc' resection group of AD, there were 2 LR (29%). All patients of both groups treated with curettage showed LR. One patient with AD had metastasis at time of diagnosis and died of disease. Another patient with AD was diagnosed with metastasis 67 months after surgery and was still alive with disease at latest follow-up (77 month). The overall prognosis of AD and OFD is good, yet local recurrence rates are high, irrespective of surgical strategy.

According to the news reporters, the research concluded: "While an internationally standardized treatment regime is still missing, a more radical surgical approach should be considered, especially when treating AD."

For more information on this research see: Long-term outcome following treatment of Adamantinoma and Osteofibrous dysplasia of long bones. Orthopaedics & Traumatology-Surgery & Research, 2016;102(7):925-932. Orthopaedics & Traumatology-Surgery & Research can be contacted at: Elsevier Masson, Via Paleocapa 7, 20121 Milano, Italy.

Adenocarcinomas

New Adenocarcinomas Findings from Medical College of Wisconsin Described (Expression, Modulation, and Clinical Correlates of the Autophagy Protein Beclin-1 in Esophageal Adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Adenocarcinomas. According to news reporting from Milwaukee, Wisconsin, by NewsRx journalists, research stated, "Esophageal adenocarcinoma (EAC) is characterized by rapidly increasing incidence and mortality rates and poor survival. Efficacious preventive and treatment options are urgently needed."

The news correspondents obtained a quote from the research from the Medical College of Wisconsin, "An increasing number of pharmacologic agents targeting cancer cell
death via autophagy mechanisms are being evaluated in hopes of circumventing apoptotic and therapeutic resistance. We report for the first time, loss of Beclin-1, a key mediator of autophagy, was significantly linked to prognostic factors in EAC. Specifically, Beclin-1 expression loss occurred in 49.0% of EAC patients versus 4.8% of controls. There was a significant inverse correlation between loss of Beclin-1 with histologic grade and tumor stage supporting a tumor suppressive role for Beclin-1. Autophagy modulation linked to cell death was examined in EAC cell lines following treatment with a proanthocyanidin-rich cranberry extract, C-PAC, and the commonly used autophagy inducer, rapamycin. C-PAC induced Beclin-1-independent autophagy in EAC cells characterized by reduced phosphorylation at serine 15 and 93, and significant cell death induction. In contrast, rapamycin-induced autophagy resulted in concomitant, increases in total Beclin-1 levels as well as Beclin-1-phosphorylation in a cell line specific manner, leading to long-term cell survival. Furthermore, autophagic LC3-II was induced by C-PAC following siRNA suppression of Beclin-1 in EAC cells. Together these data support a prognostic role of Beclin-1 in EAC with evidence that Beclin-dependent autophagy induction is agent specific."

According to the news reporters, the research concluded: "Future studies are necessary to fully interrogate the role autophagy plays in the progression of normal tissue to EAC and how specific agents targeting autophagic mechanisms can be efficaciously applied for cancer prevention or treatment."

Our news journalists report that additional information may be obtained by contacting L.A. Kresty, Medical College of Wisconsin, Dept. of Med, Div Hematol & Oncol, Milwaukee, WI 53226, United States. Additional authors for this research include A.B. Howell and L.A. Kresty.

Adenocarcinomas

New Adenocarcinomas Findings from State University Described

[Antiproliferative activity of monastrol in human adenocarcinoma (MCF-7) and non-tumor (HB4a) breast cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Adenocarcinomas. According to news reporting out of Londrina, Brazil, by NewsRx editors, research stated, "Monastrol is an allosteric inhibitor of the mitotic kinesin Eg5 that exhibits an antiproliferative effect against several cell lines. We investigated the antiproliferative effect of monastrol on human breast adenocarcinoma cells (MCF-7) and mammary epithelial cells (HB4a, non-tumoral)."

Our news journalists obtained a quote from the research from State University,
"Monastrol treatment decreased cell viability only in MCF-7 tumor cells. Real-time cell growth kinetic analysis showed a decrease in the proliferation of MCF-7 cells exposed to monastrol, while in the HB4a cells, only a concentration of 100 𝜇M was able to induce this effect. In a cell cycle analysis, exposure of MCF-7 cells to monastrol led to an increased population of cells in both the G1 and G2/M phases. In HB4a cells, the proportion of cells in the G2/M phase was increased. Monastrol led to an increased mitotic index in both cell lines. Monastrol was not able to induce cell death by apoptosis in any of the cell lines studied. Gene expression analysis was performed to measure the mRNA levels of cell cycle genes, DNA damage indicator gene, and apoptotic related genes. Treatment with monastrol induced in MCF-7 cells a 5-fold increase in the mRNA levels of the CDKN1A gene, an inhibitor of CDKs related with cell cycle arrest in response a stress stimulus, and a 2-fold decrease in CDKN1C mRNA levels in HB4a cells."

According to the news editors, the research concluded: "These results provide evidence that monastrol has a greater antiproliferative effect on MCF-7 tumor cells compared with non-tumor HB4a cells; however, no selective is observed."

For more information on this research see: Antiproliferative activity of monastrol in human adenocarcinoma (MCF-7) and non-tumor (HB4a) breast cells. Naunyn-Schmiedebergs Archives of Pharmacology, 2016;389(12):1279-1288. Naunyn-Schmiedebergs Archives of Pharmacology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

Our news journalists report that additional information may be obtained by contacting L.A. Marques, Univ Estadual Londrina, Dept. of Biol Geral, BR-86057970 Londrina, Parana, Brazil. Additional authors for this research include S.C. Semprebon, A.M. Niwa, G.F.R. D’Epiro, D. Sartori, A. de Fatima, L.R. Ribeiro and M.S. Mantovani.

Membrane Proteins - Adenosine A2 Receptors

New Adenosine A2 Receptors Study Findings Have Been Reported by Researchers at AstraZeneca (Structure-Activity Relationships of the Sustained Effects of Adenosine A2A Receptor Agonists Driven by Slow Dissociation Kinetics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Membrane Proteins - Adenosine A2 Receptors. According to news reporting originating from Cambridge, United Kingdom, by NewsRx correspondents, research stated, "The duration of action of adenosine A(2A) receptor (A2A) agonists is critical for their clinical efficacy, and we sought to better understand how this can be optimized. The in vitro temporal response profiles of a panel of A2A agonists were studied using cAMP assays in recombinantly (CHO) and endogenously (SH-SY5Y) expressing cells."

Our news editors obtained a quote from the research from AstraZeneca, "Some agonists (e.g., 3cd; UK-432,097) but not others (e.g., 3ac; CGS-21680) demonstrated sustained..."
wash-resistant agonism, where residual receptor activation continued after washout. The ability of an antagonist to reverse pre-established agonist responses was used as a surrogate read-out for agonist dissociation kinetics, and together with radioligand binding studies suggested a role for slow off-rate in driving sustained effects. One compound, 3ch, showed particularly marked sustained effects, with a reversal t(1/2) > 6 hours and close to maximal effects that remained for at least 5 hours after washing. Based on the structure-activity relationship of these compounds, we suggest that lipophilic N6 and bulky C2 substituents can promote stable and long-lived binding events leading to sustained agonist responses, although a high compound logD is not necessary.

According to the news editors, the research concluded: "This provides new insight into the binding interactions of these ligands and we anticipate that this information could facilitate the rational design of novel long-acting A2A agonists with improved clinical efficacy."

Keywords for this news article include: Cambridge, United Kingdom, Europe, Adenosine A2A Receptor, Adenosine A2 Receptors, Membrane Proteins, AstraZeneca.

**Drugs and Therapies - Adriamycin Therapy**

**New Adriamycin Therapy Findings from Istanbul Bilim University Described (The Cooperative Effect of Local Angiotensin-II in Liver with Adriamycin Hepatotoxicity on Mitochondria)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Adriamycin Therapy. According to news reporting from Istanbul, Turkey, by NewsRx journalists, research stated, "Adriamycin (ADR) is a drug used clinically for anticancer treatment; however, it causes adverse effects in the liver. The mechanism by which these adverse effects occur remains unclear, impeding efforts to enhance the therapeutic effects of ADR."

The news correspondents obtained a quote from the research from Istanbul Bilim University, "Its hepatotoxicity might be related to increasing reactive oxygen species (ROS) and mitochondrial dysfunction. The interaction between ADR and the local renin-angiotensin system (RAS) in the liver is unclear. ADR might activate the RAS. Angiotensin-II (Ang-II) leads to ROS production and mitochondrial dysfunction. In the present study we investigated whether ADR’s hepatotoxicity interacts with local RAS in causing oxidative stress resulting from mitochondrial dysfunction in the rat liver. Rats were divided into 5 groups: control, ADR, co-treated ADR with captopril, co-treated ADR with Aliskiren, and co-treated ADR with both captopril and Aliskiren. Mitochondria and cytosol were separated from the liver, then..."
biochemical measurements were made from them. Mitochondrial membrane potential (MMP) and ATP levels were evaluated. ADR remarkably decreased MMP and ATP in liver mitochondria (p <0.05). Co-administration with ADR and Aliskiren and captopril improved the dissipation of MMP (p <0.05). The decreased ATP level was restored by treatment with inhibitors of ACE and renin.

According to the news reporters, the research concluded: "Angiotensin-II may contribute to hepatotoxicity of in the ADR via mitochondrial oxidative production, resulting in the attenuation of MMP and ATP production."

For more information on this research see: The Cooperative Effect of Local Angiotensin-II in Liver with Adriamycin Hepatotoxicity on Mitochondria. *Medical Science Monitor*, 2016;22():1013-21.

**Drugs and Therapies - Adverse Drug Reactions**

**New Adverse Drug Reactions Study Findings Have Been Reported by Researchers at China Medical University and Hospital (Clinical Outcomes of Infants With Periorbital Hemangiomas Treated With Oral Propranolol)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Adverse Drug Reactions. According to news reporting out of Shenyang, People's Republic of China, by NewsRx editors, research stated, "Periorbital infantile hemangiomas (IHs) require early intervention because they have the potential risk of causing visual disturbances. In recent years, propranolol has shown promise in the effective management of periorcular and periorbital IHs."

Our news journalists obtained a quote from the research from China Medical University and Hospital, "The objective of our study was to assess the clinical outcomes, efficacy, and safety of propranolol in the management of infants with high-risk periorbital IHs. This retrospective study was conducted at the Stomatological Hospital affiliated with China Medical University. The medical records of infants with periorbital hemangiomas who were treated with systemic propranolol at a dose of 1.0 to 1.5 mg/kg per day between January 2014 and June 2015 were reviewed. We excluded infants who did not qualify for propranolol treatment and infants who received previous therapy or other treatments. The records were reviewed for treatment response, adverse events during treatment, length of treatment, and
recurrences. Treatment response was classified using a 4-point scale system based on reduction in volume as poor (<25%), moderate (25 to 50%), good (50 to 75%), or excellent (>75 to 100%) and change in color, as well as surface texture, by a panel of 3 plastic surgeons using 2-dimensional photographs, clinical examination, and Doppler ultrasonography measurements taken before and after treatment. Of 38 infants with periorbital hemangiomas, 26 were treated with systemic propranolol at a dose of 1.0 to 1.5 mg/kg administered once daily. A total of 11 male and 15 female infants with a mean age of 5.2 months (range, 2 to 12 months) were treated. The mean length of treatment was 22 weeks (range, 4 to 41 weeks). Adverse events of diarrhea (n = 3) and sleep changes (n = 1) were encountered during treatment in 4 patients. The overall treatment response was scored as excellent in 17 patients, good in 7, moderate in 2, and poor in 0. No patients required discontinuation of treatment because of adverse events, and there were no cases of recurrence or tumor regrowth noted during the mean follow-up period of 6.5 months (range, 3 to 10 months). Oral propranolol at a dose of 1.0 to 1.5 mg/kg per day (age <= 3 months, 1.0 mg/kg; age > 3 months, 1.5 mg/kg) was effective and well tolerated for the management of 26 Chinese infants with high-risk periorbital IHs."

According to the news editors, the research concluded: "Early intervention should be considered to reduce risk of visual impairment and improve esthetic outcomes."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.joms.2016.04.021. This DOI is a link to an online electronic document that is either free or for purchase.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Agricultural and Environmental Medicine. According to news reporting originating from Ourense, Spain, by NewsRx correspondents, research stated, "Powdery mildew caused by Uncinula necator and Downy mildew produced by Plasmopara viticola are the most common diseases in the North-West Spain vineyards. Knowledge of airborne spore concentrations could be a useful tool in the Integrated Pest Management protocols in order to reduce the number of pesticide treatments, applied only when there is a real risk of infection."

Our news editors obtained a quote from the research from the University of Vigo, "The study was carried out in a vineyard of the D. O. Ribeiro, in the North-West Spain, during the grapevine active period 2004-2012. A Hirts-type volumetric spore-trap was used for the aerobiological monitoring. During the study period the annual total U. necator spores amount ranged from the 578 spores registered in 2007 to the 4,145 spores sampled during 2008. The highest annual total P. viticola spores quantity was observed in 2010 (1,548 spores) and the lowest in 2005 (210 spores). In order to forecast the concentration of fungal spores, ARIMA models were elaborated. The most accurate models were an ARIMA (3.1.3) for U. necator and (1.0.3) for P. viticola."

According to the news editors, the research concluded: "The possibility to forecast the spore presence 72 hours in advance open an important horizon for optimizing the organization of the harvest processes in the vineyard."

The news editors report that additional information may be obtained by contacting M. Fernandez-Gonzalez, Dept. of Plant Biology and Soil Sciences, Sciences Faculty of Ourense, University of Vigo, Ourense, Spain. Additional authors for this research include D. Ramos-Valcarcel, M.J. Aira and F.J Rodriguez-Rajo.

**Enzymes and Coenzymes - Aldehyde Oxidoreductases**

**New Aldehyde Oxidoreductases Findings Has Been Reported by Investigators at General Hospital (The Alcohol Intolerance Produced by Isoniazid Is Not Due to a Disulfiram-Like Reaction Despite Aldehyde Dehydrogenase Inhibition)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Enzymes and Coenzymes - Aldehyde Oxidoreductases are presented in a new report. According to news reporting out of Patras, Greece, by NewsRx editors, research stated, "Isoniazid (ISO) has been reported to inhibit the hepatic aldehyde dehydrogenase (ALDH) and to cause a disulfiram (DIS)-like reaction, albeit there are no reports
demonstrating increased blood acetaldehyde levels after co-administration of ISO with alcohol. The aim of our study was to clarify whether the alcohol intolerance produced by ISO is indeed due to a typical DIS-like reaction."

Our news journalists obtained a quote from the research from General Hospital, "DIS and ISO were administered to Wistar rats and the hepatic ethanol (ETH) metabolizing enzyme activities along with the levels of brain monoamines were determined. Blood acetaldehyde levels were also evaluated after co-administration of ETH with DIS or ISO. Despite inhibition of the hepatic ALDH, ISO did not result in elevated blood acetaldehyde levels after ETH administration, probably due to the induction of cytochrome P450 2E1 which theoretically leads to an increased elimination rate of acetaldehyde preventing its accumulation. Moreover, ISO produced some minor, but statistically significant, alterations in central monoaminergic neurotransmission. Our results demonstrate for the first time that despite ALDH inhibition ISO does not provoke a typical DIS-like reaction since it does not increase blood acetaldehyde levels after co-administration with ETH."

According to the news editors, the research concluded: "The possibility that the ETH intolerance observed in ISO treatment is a central synergistic effect cannot be excluded."

For more information on this research see: The Alcohol Intolerance Produced by Isoniazid Is Not Due to a Disulfiram-Like Reaction Despite Aldehyde Dehydrogenase Inhibition. Pharmacology, 2016;98(5-6):267-271. Pharmacology can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. Enzymes and Coenzymes - Aldehyde Oxidoreductases

New Aldehyde Oxidoreductases Findings from University of Graz Reported (Formation of Nitric Oxide by Aldehyde Dehydrogenase-2 Is Necessary and Sufficient for Vascular Bioactivation of Nitroglycerin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Aldehyde Oxidoreductases have been published. According to news reporting originating from Graz, Austria, by NewsRx correspondents, research stated, "Aldehyde dehydrogenase-2 (ALDH2) catalyzes vascular bioactivation of the antianginal drug nitroglycerin (GTN), resulting in
activation of soluble guanylate cyclase (sGC) and cGMP-mediated vasodilation. We have previously shown that a minor reaction of ALDH2-catalyzed GTN bioconversion, accounting for about 5% of the main clearance-based turnover yielding inorganic nitrite, results in direct NO formation and concluded that this minor pathway could provide the link between vascular GTN metabolism and activation of sGC."

Financial support for this research came from Austrian Science Fund.

Our news editors obtained a quote from the research from the University of Graz, "However, lack of detectable NO at therapeutically relevant GTN concentrations (1 μM) in vascular tissue called into question the biological significance of NO formation by purified ALDH2. We addressed this issue and used a novel, highly sensitive genetically encoded fluorescent NO probe (geNOp) to visualize intracellular NO formation at low GTN concentrations (1 μM) in cultured vascular smooth muscle cells (VSMC) expressing an ALDH2 mutant that reduces GTN to NO but lacks clearance-based GTN denitration activity. NO formation was compared with GTN-induced activation of sGC. The addition of 1 μM GTN to VSMC expressing either wild-type or C301S/C303S ALDH2 resulted in pronounced intracellular NO elevation, with maximal concentrations of 7 and 17 nm, respectively. Formation of GTN-derived NO correlated well with activation of purified sGC in VSMC lysates and cGMP accumulation in intact porcine aortic endothelial cells infected with wild-type or mutant ALDH2. Formation of NO and cGMP accumulation were inhibited by ALDH inhibitors chloral hydrate and daidzin."

According to the news editors, the research concluded: "The present study demonstrates that ALDH2-catalyzed NO formation is necessary and sufficient for GTN bioactivation in VSMC."

The news editors report that additional information may be obtained by contacting B. Mayer, Graz University, Inst Pharmaceut Sci, Dept. of Pharmacol & Toxicol, A-8010 Graz, Austria. Additional authors for this research include E. Eroglu, M. Waldeck-Weiermair, M. Russwurm, D. Koesling, R. Malli, W.F. Graier, J.T. Fassett, A. Schrammel and B. Mayer.

Algorithms

New Algorithms Findings from University of Perugia Described
(Inherited Platelet Function Disorders: Algorithms for Phenotypic and Genetic Investigation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Algorithms. According to news reporting from Perugia, Italy, by NewsRx journalists, research stated, "Inherited platelet function disorders (IPFDs) manifest with mucocutaneous bleeding and are frequently difficult to diagnose due to their heterogeneity, the complexity of the platelet activation pathways and a lack of standardization of the platelet function laboratory assays and of their use for this purpose. A rational diagnostic approach to IPFDs should follow an algorithm where clinical examination and a stepwise laboratory evaluation play a crucial role."

The news correspondents obtained a quote from the research from the University of Perugia, "A streamlined panel of laboratory tests, with consecutive steps of increasing level of complexity, allows the phenotypic characterization of most IPFDs. A first-line diagnosis of a significant fraction of the IPFD may be made also at nonspecialized centers by using relatively simple tests, including platelet count, peripheral blood smear, light transmission aggregometry, measurement of platelet granule content and release, and the expression of glycoproteins by flow cytometry. Some of the most complex, second-and third-step tests may be performed only in highly specialized laboratories."

According to the news reporters, the research concluded: "Genotyping, including the widespread application of next-generation sequencing, has enabled discovery in the last few years of several novel genes associated with platelet disorders and this method may eventually become a first-line diagnostic approach; however, a preliminary clinical and laboratory phenotypic characterization nowadays still remains crucial for diagnosis of IPFDs."

For more information on this research see: Inherited Platelet Function Disorders: Algorithms for Phenotypic and Genetic Investigation. Seminars In Thrombosis and Hemostasis, 2016;42(3):292-305. (Thieme - www.thieme.com)

New Allergy Immunology Study Findings Recently Were Reported by Researchers at Copenhagen University Hospital (High alcohol consumption causes high IgE levels but not high risk of allergic disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immunology - Allergy Immunology is now available. According to news reporting originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "High alcohol consumption is associated with high IgE levels in observational studies; however, whether high alcohol consumption leads to high IgE levels and allergic disease is unclear. We tested the hypothesis that high alcohol consumption is associated with high IgE levels and allergic disease both observationally and genetically using a Mendelian randomization design free of reverse causation and largely free of confounding."

Our news editors obtained a quote from the research from Copenhagen University Hospital, "Among 111,408 subjects aged 20 to 100 years from the general population, 50,019 had plasma IgE measurements, and 102,270 were genotyped for the alcohol-metabolizing enzymes alcohol dehydrogenase 1B (ADH-1B; rs1229984) and alcohol dehydrogenase 1c (ADH-1C; rs698). Observationally, we investigated associations between IgE levels and allergic disease (allergic asthma, rhinitis, and eczema) and between alcohol consumption and IgE levels and allergic disease. Genetically, we explored potential causal relationships between alcohol consumption and IgE levels and allergic disease. The multivariable adjusted odds ratio for IgE levels greater than versus less than 150 kU/L and compared with subjects without allergic disease was 2.3 (95% CI, 2.2-2.5) for 1 allergic disease, 3.9 (95% CI, 3.5-4.4) for 2 allergic diseases, and 7.5 (95% CI, 6.2-9.0) for 3 allergic diseases. High alcohol consumption was associated with high IgE levels but not with high risk of allergic disease. The odds ratio for high versus low IgE levels per 1 alcoholic drink per week higher consumption was 1.12 (95% CI, 1.02-1.23) genetically and 1.01 (95% CI, 1.01-1.02) observationally; for allergic disease, the corresponding odds ratios were 0.96 (95% CI, 0.92-1.00) genetically and 1.00 (95% CI, 1.00-1.00) observationally."

According to the news editors, the research concluded: "High alcohol consumption is associated observationally and genetically with high IgE levels but not with high risk of allergic disease."

For more information on this research see: High alcohol consumption causes high IgE levels but not high risk of allergic disease. Journal of Allergy and Clinical Immunology, 2016;138(5):1404-1413,733-745. New Alopecia Study Findings Have Been Reported by Researchers at Sheffield Teaching Hospitals NHS Foundation Trust (Risk adapted single-agent dactinomycin or carboplatin for second-line treatment of methotrexate-resistant low-risk gestational trophoblastic neoplasia...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases and Conditions - Alopecia are presented in a new report. According to news originating from Sheffield, United Kingdom, by NewsRx correspondents, research stated, "To evaluate the outcome of patients treated with second-line chemotherapy for methotrexate-resistant low-risk GTN at the Sheffield Centre, UK between 2001 and 2015, including the novel use of single-agent carboplatin as a strategy to reduce exposure to combination chemotherapy. 392 low-risk GTN patients were treated with first-line methotrexate."

Our news journalists obtained a quote from the research from Sheffield Teaching Hospitals NHS Foundation Trust, "The selection of chemotherapy regimen following methotrexate-resistance depended on the volume of residual disease as indicated by the serum hCG value at the time, with patients switching to either single-agent dactinomycin at an hCG level < 150 IU/L from 2001-2010 and <300 IU/L since 2010, or to combination treatment with etoposide/dactinomycin (EA) above these thresholds. In order to reduce exposure to more toxic combination chemotherapy regimens, our treatment policy was revised in 2011, with the recommendation of single-agent carboplatin as an alternative to EA at hCG levels >300 IU/L.

136 (35%) of 392 received second-line chemotherapy following methotrexate-resistance. 59 patients received single-agent dactinomycin with 53 (90%) patients achieving complete hCG response, 3 patients requiring combination chemotherapy or surgery, and 3 patients subsequently spontaneously resolving. 56 patients received EA chemotherapy with hCG complete response in 50 (89%) patients, and the remaining 6 patients were cured with further multi-agent chemotherapy or surgery. With carboplatin, 17/21 (81%) achieved an overall complete hCG response rate, with 4 patients requiring third-line EA. Carboplatin was well tolerated with no significant alopecia; myelosuppression was the most significant toxicity. Overall survival for all patients was 100%. These data show the continued excellent outcomes for methotrexate-resistant low-risk patients treated with single-agent dactinomycin or EA."

According to the news editors, the research concluded: "Our experience with carboplatin is promising and provides an alternative regimen for methotrexate-resistant low-risk disease that avoids alopecia and in-patient treatment."

For more information on this research see: Risk adapted single-agent dactinomycin or carboplatin for second-line treatment of methotrexate resistant low-risk gestational trophoblastic neoplasia. Skin Diseases and Conditions - Alopecia

New Alopecia Study Results Reported from Department of Dermatology (Guidelines on the use of finasteride in androgenetic alopecia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Skin Diseases and Conditions - Alopecia is the subject of a report. According to news originating from Bengaluru, India, by NewsRx correspondents, research stated, "Finasteride is a widely used drug in dermatology for the treatment of androgenetic alopecia. There are many reports of associated sexual side effects."

Our news journalists obtained a quote from the research from the Department of Dermatology, "This article reviews the use of once-daily 1 mg finasteride in androgenetic alopecia and its associated sexual adverse effects. A literature search was performed to collect data on the use of finasteride in male pattern baldness. Relevant literature published till March 2014 was obtained from MEDLINE, EMBASE, CINAHL, Cochrane registers and LILACS. The keywords 'finasteride', 'male pattern baldness' and 'androgenetic alopecia' were used for literature search. Similarly, a search was done for finasteride in female pattern hair loss with keywords 'female pattern baldness', 'finasteride' and 'female pattern alopecia'. All systematic reviews, meta-analyses, national guidelines, randomized controlled trials, prospective open label studies and retrospective case series in the English literature were reviewed. Two hundred sixty two studies were evaluated, twelve of which fulfilled the inclusion criteria. Current evidence on the safety of finasteride indicates that it is safe but there is growing concern about its sexual side effects. In view of this, proper information should be provided to patients prior to starting treatment (Level of recommendation 1+, Grade of recommendation B)."

According to the news editors, the research concluded: "The reported sexual side effects are few and reverse with stoppage of the drug (Grade of recommendation B) but further studies are required."

For more information on this research see: Guidelines on the use of finasteride in androgenetic alopecia. *Indian Journal of Dermatology, Venereology and Leprology*, 2016;82(2):128-34.

**Neurodegenerative Diseases and Conditions**

**New Alzheimer Disease Findings from Central Michigan University Described (Mesenchymal Stem Cells as Treatment for Behavioral Deficits and Neuropathology in the 5xFAD Mouse Model of Alzheimer's Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting from Mountain Pleasant, Michigan, by NewsRx journalists, research stated, "Alzheimer's disease (AD) is characterized by a progressive loss of memory and other cognitive disturbances. The neuropathology of AD includes the major hallmarks of toxic amyloid-b oligomer accumulation and neurofibrillary tangles, as well as increased oxidative stress, cholinergic dysfunction, synapse loss, changes in endogenous neurotrophic factors, and overall degeneration of the brain."

The news correspondents obtained a quote from the research from Central Michigan University, "Adult mesenchymal stem cells (MSCs) offer the potential for a readily available treatment that would be long lasting, have low likelihood of rejection, and could target a variety of pathological deficits. MSCs have been shown to be effective in alleviating symptoms in some transgenic models of AD, but the optimal location for transplanting MSCs has yet to be determined. In the present study, the behavioral effects of transplantation of MSCs into the lateral ventricles, the hippocampus, or both of these regions were compared in the 5xFAD mouse model of AD. The results indicate that MSC transplants effectively reduce learning deficits in the 5xFAD mouse model and demonstrate a clear impact of MSCs on the levels of Ab42 in the brains of 5xFAD mice."

According to the news reporters, the research concluded: "Overall, these findings support the hypothesis that MSCs may be a viable treatment for AD, especially when injected into the lateral ventricles."

For more information on this research see: Mesenchymal Stem Cells as Treatment for Behavioral Deficits and Neuropathology in the 5xFAD Mouse Model of Alzheimer's Disease. *Cell Transplantation*, 2016;25(4):687-703.

Neurodegenerative Diseases and Conditions -...

New Alzheimer Disease Findings from Vrije University Described (Blood-Brain Barrier ABC-transporter P-glycoprotein in Alzheimer's Disease: Still a Suspect?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Alzheimer's disease is a neurodegenerative disorder and the most common form of dementia. One of the pathological hallmarks of the disease is amyloid deposition in the brain."

Our news journalists obtained a quote from the research from Vrije University, "The major cause of amyloid deposition in sporadic Alzheimer's disease is thought to be decreased brain clearance of amyloid. There is compelling preclinical evidence that the blood-brain barrier, a structure that maintains homeostasis in the central nervous system and protects the brain from harmful substances, plays an important role in amyloid clearance. Indeed, several dedicated transporter systems are present at the blood-brain barrier which may have a role in brain amyloid clearance, such as P-glycoprotein (P-gp). In vitro experiments and animal studies indicated increased amyloid deposition when P-gp was eliminated by pharmacological blockade or by genetic modification. And as decreased P-gp expression has been found in AD brains, P-gp became more and more a suspect. Using an imaging technique called positron emission tomography, P-gp transporter function was found to be decreased in Alzheimer's disease patients compared to healthy controls, further establishing the important role of P-gp in the pathogenesis of the disease."

According to the news editors, the research concluded: "In this review, we summarize what is now known about P-gp in Alzheimer's disease pathology, as these transporters may provide a novel target for therapeutic strategies."

The news correspondents report that additional information may be obtained from
New Alzheimer Disease Study Findings Have Been Reported by Researchers at University of Duisburg-Essen (Kallikrein-8 inhibition attenuates Alzheimer's disease pathology in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting originating from Essen, Germany, by NewsRx correspondents, research stated, "Memory loss and increased anxiety are clinical hallmarks of Alzheimer's disease (AD). Kallikrein-8 is a protease implicated in memory acquisition and anxiety, and its mRNA is known to be up-regulated in AD-affected human hippocampus." Funders for this research include German Research Foundation, University Duisburg-Essen.

Our news editors obtained a quote from the research from the University of Duisburg-Essen, "Therefore, an involvement of Kallikrein-8 in Alzheimer's pathogenesis is conceivable but remains to be proved. We determined the cerebral expression of Kallikrein-8 mRNA and protein during the course of AD in patients and in transgenic mice and tested the impact of Kallikrein-8 inhibition on AD-related pathology in mice and in primary glial cells. Kallikrein-8 mRNA and protein were up-regulated in both species at incipient stages of AD. Kallikrein-8 inhibition impeded amyloidogenic amyloid-precursor-protein processing, facilitated amyloid (A beta) clearance across the blood-brain-barrier, boosted autophagy, reduced A beta load and tau pathology, enhanced neuroplasticity, reversed molecular signatures of anxiety, and ultimately improved memory and reduced fear."

According to the news editors, the research concluded: "Kallikrein-8 is a promising new therapeutic target against AD."

The news editors report that additional information may be obtained by contacting A.
Herring, University of Duisburg Essen, Inst Neuropa thol, Essen, Germany. Additional authors

Neurodegenerative Diseases and Conditions -...

New Alzheimer Disease Study Results from Faculty of Medicine
Described (Knowledge and pharmacological management of
Alzheimer's disease by managing community pharmacists: a
nationwide study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators discuss new findings in Neurodegenerative Diseases and
Conditions - Alzheimer Disease. According to news reporting from Msida, Malta, by NewsRx
journalists, research stated, "Managing community pharmacists can play a leading role in
supporting community dwelling individuals with Alzheimer's disease and their caregivers. The
main purpose of this study was to assess knowledge of managing community pharmacists
towards Alzheimer's disease and its pharmacological management."

The news correspondents obtained a quote from the research from the Faculty of
Medicine, "Community pharmacies in the Maltese islands. A nationwide survey was conducted
with full-time managing community pharmacists in possession of a tertiary education degree in
pharmacy studies. The level of knowledge was investigated using the Alzheimer's Disease
Knowledge Scale and the Alzheimer's Disease Pharmacotherapy Measure. Participants were
also asked to rate a number of statements related to disease management. Maltese managing
community pharmacists (57 % response rate) had inadequate knowledge on risk factors,
caregiving issues and pharmacological management of Alzheimer's disease. Age and number of
years working in a community pharmacy setting were found to be negatively correlated with
increased knowledge."

According to the news reporters, the research concluded: "The findings highlight the
need of providing training and continued educational support to managing community
pharmacists in order to provide quality advice to individuals with dementia and their caregivers
in the community."

For more information on this research see: Knowledge and pharmacological
management of Alzheimer's disease by managing community pharmacists: a nationwide study,

Enzymes and Coenzymes - Amidohydrolases

New Amidohydrolases Findings Has Been Reported by Investigators at University of Washington (Class I Histone Deacetylase HDAC1 and WRN RECQ Helicase Contribute Additively to Protect Replication Forks upon Hydroxyurea-induced Arresel)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - Amidohydrolases. According to news reporting originating in Seattle, Washington, by NewsRx journalists, research stated, "The WRN helicase/exonuclease is mutated in Werner syndrome of genomic instability and premature aging. WRN-depleted fibroblasts, although remaining largely viable, have a reduced capacity to maintain replication forks active during a transient hydroxyurea-induced arrest."

The news reporters obtained a quote from the research from the University of Washington, "A strand exchange protein, RAD51, is also required for replication fork maintenance, and here we show that recruitment of RAD51 to stalled forks is reduced in the absence of WRN. We performed a siRNA screen for genes that are required for viability of WRN-depleted cells after hydroxyurea treatment, and identified HDAC1, a member of the class I histone deacetylase family. One of the functions of HDAC1, which it performs together with a close homolog HDAC2, is deacetylation of new histone H4 deposited at replication forks. We show that HDAC1 depletion exacerbates defects in fork reactivation and progression after hydroxyurea treatment observed in WRN- or RAD51-deficient cells. The additive WRN, HDAC1 loss-of-function phenotype is also observed with a catalytic mutant of HDAC1; however, it does not correlate with changes in histone H4 deacetylation at replication forks. On the other hand, inhibition of histone deacetylation by an inhibitor specific to HDACs 1-3, CI-994, correlates with increased processing of newly synthesized DNA strands in hydroxyurea-stalled forks. WRN co-precipitates with HDAC1 and HDAC2."

According to the news reporters, the research concluded: "Taken together, our findings indicate that WRN interacts with HDACs 1 and 2 to facilitate activity of stalled replication forks under conditions of replication stress."

For more information on this research see: Class I Histone Deacetylase HDAC1 and WRN RECQ Helicase Contribute Additively to Protect Replication Forks upon Hydroxyurea-induced Arresel. *Journal of Biological Chemistry*, 2016;291(47):24487-24503,754-765. *Journal of Biological Chemistry* can be contacted at: Amer Soc Biochemistry Molecular
New Amidohydrolases Findings from Chang Gung Memorial Hospital Discussed (Human ATP-Binding Cassette Transporter ABCG2 Confers Resistance to CUDC-907, a Dual Inhibitor of Histone Deacetylase and Phosphatidylinositol 3-Kinase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Enzymes and Coenzymes - Amidohydrolases is the subject of a report. According to news reporting from Taoyuan, Taiwan, by NewsRx journalists, research stated, "CUDC-907 is a novel, dual-acting small molecule compound designed to simultaneously inhibit the activity of histone deacetylase (HDAC) and phosphatidylinositol 3-kinase (PI3K). Treatment with CUDC-907 led to sustained inhibition of HDAC and PI3K activity, inhibition of RAF-MEK-MAPK signaling pathway, and inhibition of cancer cell growth."

Financial supporters for this research include Ministry of Science and Technology, Taiwan, Chang Gung Memorial Hospital, Ministry of Education, Taiwan.

The news correspondents obtained a quote from the research from Chang Gung Memorial Hospital, "CUDC-907 is currently under evaluation in phase I clinical trials in patients with lymphoma or multiple myeloma, and in patients with advanced solid tumors. However, the risk of developing acquired resistance to CUDC-907 can present a significant therapeutic challenge to clinicians in the future and should be investigated. The overexpression of ATP-binding cassette (ABC) drug transporter ABCB1, ABCC1, or ABCG2 is one of the most common mechanisms of developing multidrug resistance (MDR) in cancers and a major obstacle in chemotherapy. In this study, we reveal that ABCG2 reduces the intracellular accumulation of CUDC-907 and confers significant resistance to CUDC-907, which leads to reduced activity of CUDC-907 to inhibit HDAC and PI3K in human cancer cells. Moreover, although CUDC-907 affects the transport function of ABCG2, it was not potent enough to reverse drug resistance mediated by ABCG2 or affect the expression level of ABCG2 in human cancer cells. Taken together, our findings indicate that ABCG2-mediated CUDC-907 resistance can have serious clinical implications and should be further investigated."

According to the news reporters, the research concluded: "More importantly, we demonstrate that the activity of CUDC-907 in ABCG2-overexpressing cancer cells can be
restored by inhibiting the function of ABCG2, which provides support for the rationale of combining CUDC-907 with modulators of ABCG2 to improve the pharmacokinetics and efficacy of CUDC-907 in future treatment trials."

Our news journalists report that additional information may be obtained by contacting C.W. Huang, Center for Advanced Molecular Imaging and Translation, Chang Gung Memorial Hospital, Tao-Yuan, Taiwan. Additional authors for this research include Y.J. Hsieh, S.H. Hsiao, C.Y. Su, Y.Q. Li, Y.H. Huang, C.W. Huang, C.H. Hsieh, J.S. Yu and Y.S Wu.

Enzymes and Coenzymes - Amidohydrolases

New Amidohydrolases Study Findings Have Been Reported by Investigators at University of Liege (Interaction of Avibactam with Class B Metallo-beta-Lactamases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Enzymes and Coenzymes - Amidohydrolases is the subject of a report. According to news reporting originating from Liege, Belgium, by NewsRx correspondents, research stated, "Beta-Lactamases are the most important mechanisms of resistance to the beta-lactam antibacterials. There are two mechanistic classes of beta-lactamases: the serine beta-lactamases (SBLs) and the zinc-dependent metallo-beta-lactamases (MBLs)."

Our news editors obtained a quote from the research from the University of Liege, "Avibactam, the first clinically useful non-beta-lactam beta-lactamase inhibitor, is a broad-spectrum SBL inhibitor, which is used in combination with a cephalosporin antibiotic (ceftazidime). There are multiple reports on the interaction of avibactam with SBLs but few such studies with MBLs. We report biochemical and biophysical studies on the binding and reactivity of avibactam with representatives from all 3 MBL subfamilies (B1, B2, and B3). Avibactam has only limited or no activity versus MBL-mediated resistance in pathogens. Avibactam does not inhibit MBLs and binds only weakly to most of the MBLs tested; in some cases, avibactam undergoes slow hydrolysis of one of its urea N-CO bonds followed by loss of CO2, in a process different from that observed with the SBLs studied."

According to the news editors, the research concluded: "The results suggest that while the evolution of MBLs that more efficiently catalyze avibactam hydrolysis should be
anticipated, pursuing the development of dual-action SBL and MBL inhibitors based on the diazabicyclooctane core of avibactam may be productive."

The news editors report that additional information may be obtained by contacting J.M. Frere, University of Liege, Center Ingn Prot, Liege, Belgium. Additional authors for this research include C. Damblon, J. Brem, N. Smargiasso, P. Mercuri, B. Gilbert, A.M. Rydzik, T.D.W. Claridge, C.J. Schofield and J.M. Frere.

Keywords for this news article include: Liege, Belgium, Europe, Enzymes and Coenzymes, Sulfur Compounds, beta-Lactamases, Amidohydrolases, beta-Lactams, University of Liege.

**Drugs and Therapies - Aminoglycosides**

**New Aminoglycosides Findings Reported from Washington University (Perilymph pharmacokinetics of locally-applied gentamicin in the guinea pig)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Aminoglycosides. According to news reporting originating in St. Louis, Missouri, by NewsRx journalists, research stated, "Intratympanic gentamicin therapy is widely used clinically to suppress the vestibular symptoms of Meniere's disease. Dosing in humans was empirically established and we still know remarkably little about where gentamicin enters the inner ear, where it reaches in the inner ear and what time course it follows after local applications."

Financial supporters for this research include National Institute on Deafness and Other Communication Disorders, National Institutes of Health.

The news reporters obtained a quote from the research from Washington University, "In this study, gentamicin was applied to the round window niche as a 20 µL bolus of 40 mg/ml solution. Ten 2 µL samples of perilymph were collected sequentially from the lateral semi-circular canal (LSCC) at times from 1 to 4 h after application. Gentamicin concentration was typically highest in samples originating from the vestibule and was lower in samples originating from scala tympani. To interpret these results, perilymph elimination kinetics for gentamicin was quantified by loading the entire perilymph space by injection at the LSCC with a 500 µg/ml gentamicin solution followed by sequential perilymph sampling from the LSCC after different delay times. This allowed concentration decline in perilymph to be followed with time. Gentamicin was retained well in scala vestibuli and the vestibule but declined rapidly at the base of scala tympani, dominated by interactions of perilymph with CSF, as reported for other substances. Quantitative analysis, taking into account perilymph kinetics for gentamicin, showed that more gentamicin entered at the round window membrane (57%) than at the stapes (35%) but the lower concentrations found in scala tympani were due to greater losses there. The gentamicin levels found in perilymph of the vestibule, which are higher than would be expected
from round window entry alone, undoubtedly contribute to the vestibulotoxic effects of the drug."

According to the news reporters, the research concluded: "Furthermore, calculations of gentamicin distribution following targeted applications to the RW or stapes are more consistent with cochleotoxicity depending on the gentamicin concentration in scala vestibuli rather than that in scala tympani."

For more information on this research see: Perilymph pharmacokinetics of locally-applied gentamicin in the guinea pig. Hearing Research, 2016;342():101-111. Hearing Research can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Hearing Research - www.journals.elsevier.com/hearing-research/)

Our news correspondents report that additional information may be obtained by contacting A.N. Salt, Washington University, Sch Med, Dept. of Otolaryngol, St Louis, MO 63110, United States. Additional authors for this research include J.J. Hartsock, R.M. Gill, E. King, F.B. Kraus and S.K. Plontke.

Drugs and Therapies - Ampicillins

New Ampicillins Study Findings Recently Were Reported by Researchers at University of Paris [Sub-stoichiometric titanium oxide (Ti4O7) as a suitable ceramic anode for electrooxidation of organic pollutants: A case study of kinetics, ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Ampicillins is now available. According to news reporting originating from Marne la Vallee, France, by NewsRx correspondents, research stated, "Electrochemical degradation of aqueous solutions containing antibiotic amoxicillin (AMX) has been extensively studied in an undivided electrolytic cell using a sub-stoichiometric titanium oxide (Ti4O7) anode, elaborated by plasma deposition. Oxidative degradation of AMX by hydroxyl radicals was assessed as a function of applied current and was found to follow pseudo-first order kinetics."

Funders for this research include EU, ANR (French National Research Agency).

Our news editors obtained a quote from the research from the University of Paris, "The use of carbon-felt cathode enhanced oxidation capacity of the process due to the generation of H2O2. Comparative studies at low current intensity using dimensional stable anode (DSA) and Pt anodes led to the lower mineralization efficiencies compared to Ti4O7 anode: 36 and 41% TOC removal for DSA and Pt respectively compared to 69% for Ti4O7 anode. Besides, the use of boron doped diamond (BDD) anode under similar operating conditions allowed reaching
higher mineralization (94%) efficiency. Although Ti4O7 anode provides a lesser mineralization rate compared to BDD, it exhibits better performance compared to the classical anodes Pt and DSA and can constitutes an alternative to BDD anode for a cost effective electro-oxidation process."

According to the news editors, the research concluded: "Moreover several aromatic and aliphatic oxidation reaction intermediates and inorganic end-products were identified and a plausible mineralization pathway of AMX involving these intermediates was proposed."

The news editors report that additional information may be obtained by contacting M.A. Oturan, Univ Paris Est, UPEM, Lab Geomat & Environment EA 4508, F-77454 Marne La Vallee, France. Additional authors for this research include N. Oturan, S. Raffy, M. Cretin, R. Esmilaire, E. van Hullebusch, G. Esposito and M.A. Oturan.

Chemistry - Analytical Chemistry

New Analytical Chemistry Study Findings have been Reported from University of Copenhagen (Aspects of Quantitation in Mass Spectrometry Imaging Investigated on Cryo-Sections of Spiked Tissue Homogenates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Chemistry - Analytical Chemistry. According to news reporting originating in Copenhagen, Denmark, by NewsRx journalists, research stated, "Internal standards have been introduced in quantitative mass spectrometry imaging in order to compensate for differences in intensities throughout an image caused by, for example, difference in ion suppression or analyte extraction efficiency. To test how well the internal standards compensate for differences in tissue types in, for example, whole-body imaging, a set of tissue homogenates of different tissue types (lung, liver, kidney, heart, and brain) from rabbit was spiked to the same concentration with the drug amitriptyline and imaged in the same experiment using isotope labeled amitriptyline as internal standard."

Financial supporters for this research include Sundheds og Sygdom, Det Frie Forskningsrad, Carlsbergfondet.

The news reporters obtained a quote from the research from the University of Copenhagen, "The results showed, even after correction with internal standard, significantly
lower intensities from brain and to some extent also lung tissue, differences which may be ascribed to binding of the drug to proteins or lipids as known from traditional bioanalysis. The differences, which for these results range approximately within a factor of 3 (but for other compounds in other tissues could be higher), underscore the importance of preparing the standard curve in the same matrix as the unknown sample whenever possible. In, for example, whole-body imaging where a diversity of tissue types are present, this variation across tissue types will therefore add to the overall uncertainty in quantitation. The tissue homogenates were also used in a characterization of various phenomena in quantitative MSI, such as to study how the signal depends of the thickness of the cryo-section, and to assess the accuracy of calibration by droplet deposition. For experiments on liver tissue, calibration by spiked tissue homogenates and droplet deposition was found to provide highly similar results and in both cases linearity with R-2 values of 0.99."

According to the news reporters, the research concluded: "In the process, a new method was developed for preparation of standard curves of spiked tissue homogenates, based on the drilling of holes in a block of frozen liver homogenate, providing easy cryo-slicing and good quantitative performance."

Our news correspondents report that additional information may be obtained by contacting C. Janfelt, University of Copenhagen, Fac Hlth & Med Sci, Dept. of Pharm, DK-2100 Copenhagen, Denmark.

**Oncology - Anaplastic Large Cell Lymphoma**

**New Anaplastic Large Cell Lymphoma Study Results from Department of Hematology Described (Detection of an early adult T-cell leukemia-lymphoma clone in lymph nodes with anaplastic lymphoma kinase-negative anaplastic large cell lymphoma ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Anaplastic Large Cell Lymphoma have been published. According to news originating from Kagoshima, Japan, by NewsRx correspondents, research stated, "A 58-year-old man was admitted to our hospital with systemic lymphadenopathy and was diagnosed with anaplastic lymphoma kinase-negative anaplastic large cell lymphoma (ALCL) by lymph node biopsy. Although he was a human T-cell leukemia virus type I (HTLV-1) carrier, Southern blot analysis of the lymph node did not show monoclonal integration of HTLV-1 provirus deoxyribonucleic acid (DNA)."
Financial support for this research came from Japan Agency for Medical Research and Development.

Our news journalists obtained a quote from the research from the Department of Hematology, "He achieved complete remission after chemotherapy and subsequently, autologous peripheral blood stem cell transplantation (auto-PBSCT) was performed. Fifteen months after the auto-PBSCT, abnormal lymphocytes in the peripheral blood gradually increased. Southern blot analysis revealed monoclonal integration of HTLV-1 provirus DNA and monoclonal rearrangement of TRB. He was diagnosed with chronic type adult T-cell leukemia-lymphoma (ATL), which immediately progressed to the acute type. He died of tumor progression despite intensive chemotherapy. We analyzed genomic alterations of the ALCL and ATL cells using array comparative genomic hybridization. We found that the genomic alteration pattern differed between the two diseases. T-cell receptor clonality analysis using polymerase chain reaction (PCR) showed that the T-cell clone of the ATL was present in the lymph nodes with ALCL involvement, but not in peripheral blood."

According to the news editors, the research concluded: "This finding suggests that lymph nodes can serve as a niche for ATL development."

The news correspondents report that additional information may be obtained from M. Tokunaga, Imamura Bun In Hosp, Dept. of Hematol, Kagoshima, Japan. Additional authors for this research include N. Yoshida, N. Nakano, A. Kubota, S. Takeuchi, Y. Takatsuka, M. Seto and A. Utsunomiya.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cancergen.2016.01.002. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Andersen-Tawil...

New Andersen-Tawil Syndrome Findings from Cleveland Clinic Outlined (The evolution of sports participation guidelines and the influence of genotype-phenotype correlation in long QT syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Andersen-Tawil Syndrome. According to news originating from Cleveland, Ohio, by NewsRx
correspondents, research stated, "Congenital Long QT Syndrome (LQTS) results in abnormal ventricular repolarization in patients with otherwise structurally normal hearts."

Our news journalists obtained a quote from the research from Cleveland Clinic, "Following the initial clinical descriptions of LQTS, there has been a great deal of investigation into the genetic etiology and pathophysiology of these entities, with the goal of improved screening tools and understanding of associated risks. Through this work, heart rhythm experts continue to revise their recommendations regarding sports eligibility."

According to the news editors, the research concluded: "We review the evolution of sports participation recommendations for LQTS."

The news correspondents report that additional information may be obtained from P.F. Aziz, Cleveland Clinic, Cleveland Clin Childrens, Dept. of Pediat Electrophysiol, Cleveland, OH 44195, United States.

**Hematologic Diseases and Conditions - Anemia**

**New Anemia Findings from Peking University Reported (Anemia Among Lactating Mothers In Kokang, Myanmar)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematologic Diseases and Conditions - Anemia is now available. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Anemia is an important public health problem among lactating mothers in the developing countries. The aim of the study was to determine the prevalence of anemia in lactating mothers in Kokang, Myanmar and its associated risk factors."

The news reporters obtained a quote from the research from Peking University, "We conducted a cross sectional study of 65 lactating mothers during June-October 2014. Each participant filled out a questionnaire asking about diet, source of drinking water, health status, socioeconomic and demographic factors. Each participant was also evaluated anthropometrically and had blood taken to determine their hemoglobin and their iron, copper, zinc, calcium, and magnesium levels. The prevalence rate of anemia (hemoglobin 81-120 g/l) in study subjects was 73.8%, and 10.8% had severe anemia (hemoglobin <= 80 g/l). Factors of malnutrition (mid-upper arm circumference < 23.5 cm, p = 0.013), iron deficiency (serum iron concentration < 6.6 mmol/l, p = 0.008), and source of drinking water (p = 0.031) were related to anemia. Fifty-six point three percent of women with anemia had a low serum iron level. Anemia was common among study subjects in Kokang."
According to the news reporters, the research concluded: "Since a large portion of women in our study with anemia had a low serum iron level, we conclude the major cause of anemia in our study was iron deficiency."

Our news correspondents report that additional information may be obtained by contacting Y.M. Zhang, Peking University, Hlth Sci Center, Sch Public Hlth, Dept. of Nutr & Food HygBeijing Key Lab Toxicol Res, Beijing, People's Republic of China. Additional authors for this research include S.J. Cao, H.C. Gao, Q.Y. Xiao, N.N. Win and Y.M. Zhang.

**Pain Medicine - Anesthesiology**

**New Anesthesiology Study Results from University of Manitoba Described (Neurodevelopmental Assessment in Kindergarten in Children Exposed to General Anesthesia before the Age of 4 Years A Retrospective Matched Cohort Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Pain Medicine - Anesthesiology. According to news reporting from Winnipeg, Canada, by NewsRx journalists, research stated, "Animal studies demonstrate general anesthetic (GA) toxicity in the developing brain. Clinical reports raise concern, but the risk of GA exposure to neurodevelopment in children remains uncertain."

The news correspondents obtained a quote from the research from the University of Manitoba, "The authors undertook a retrospective matched cohort study comparing children less than 4 yr of age exposed to GA to those with no GA exposure. The authors used the Early Development Instrument (EDI), a 104-component questionnaire, encompassing five developmental domains, completed in kindergarten as the outcome measure. Mixed-effect logistic regression models generated EDI estimates for single versus multiple GA exposure and compared both single and multiple exposures by the age of 0 to 2 or 2 to 4 yr. Known sociodemographic and physical confounders were incorporated as covariates in the models. A total of 18,056 children were studied: 3,850 exposed to a single GA and 620 exposed to two or more GA, who were matched to 13,586 nonexposed children. In children less than 2 yr of age, there was no independent association between single or multiple GA exposure and EDI results. Paradoxically, single exposure between 2 and 4 yr of age was associated with deficits, most significant for communication/general knowledge (estimate, -0.7; 95% CI, -0.93 to -0.47; P< 0.0001) and language/cognition (estimate, -0.34; 95% CI, -0.52 to -0.16; P< 0.0001) domains. Multiple GA exposure at the age of 2 to 4 yr did not confer greater risk than single GA exposure."
exposure. These findings refute the assumption that the earlier the GA exposure in children, the greater the likelihood of long-term neurocognitive risk."

According to the news reporters, the research concluded: "The authors cannot confirm an association between multiple GA exposure and increased risk of neurocognitive impairment, increasing the probability of confounding to explain the results."

For more information on this research see: Neurodevelopmental Assessment in Kindergarten in Children Exposed to General Anesthesia before the Age of 4 Years A Retrospective Matched Cohort Study. Anesthesiology, 2016;125(4):667-677. Anesthesiology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Cardiovascular Diseases and Conditions - Aneurysm

New Aneurysm Findings from National University Reported [Insights from complex aortic surgery with a Streamliner device for aortic arch repair (STAR)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurysm. According to news originating from Galway, Ireland, by NewsRx correspondents, research stated, "Aortic arch aneurysms and thoracoabdominal aortic arch aneurysms are technically challenging to manage by established surgical and endovascular methods. The Streamliner Multilayer Flow Modulator device (Cardiatis, Isnes, Brussels, Belgium) offers an unorthodox option for these high-risk cases."

Our news journalists obtained a quote from the research from National University, "The Streamliner device for aortic arch repair (STAR) study investigated complex aneurysm cases managed by the Streamliner Multilayer Flow Modulator device and offers an analytic solution for a clinical dilemma. Six cases were included, with a 1-year follow-up, comprising 4 pure arch aneurysms and 2 thoracoabdominal aortic arch aneurysms Crawford type I, from a multicenter database hosted by the Streamliner Multilayer Flow Modulator Global Registry. A total of 50% of cases were performed under instructions for use. All were American Society of Anesthesiology IV and originated from zone 0. All cases were computationally analyzed, which consisted of (1) simulating the treatment on the basis of the postoperative data, (2) repositioning the stents for the failed technical cases, and (3) assessing the effects of overlapping devices on branch patency. Correct device placement induced aneurysm flow streamlining, which reduced the dynamic pressure by 23% to 66%, whereas incorrect placements promoted Failure Mode I with 58% and 16% dynamic pressure increases and aneurysm volume expansion up to 23%."
Overlapped devices improved distal perfusion by increasing arch branch outflows from 5% to 24%. The Streamliner Multilayer Flow Modulator device does not benefit a sac volume greater than 400 cm(3). The Streamliner Multilayer Flow Modulator device is a new technology that can manage complex aortic arch aneurysms and thoracoabdominal aortic arch aneurysms with favorable clinical outcomes if it is performed under instructions for use.

According to the news editors, the research concluded: "Careful procedure planning and perioperative virtual stent placement will avoid foreshortening, prevent inadequate stent overlap lengths, and provide insight into the sufficient numbers of required implanted devices."

The news correspondents report that additional information may be obtained from S. Sultan, Natl Univ Ireland, Galway, Ireland. Additional authors for this research include L. Morris, A. Elhelali, E.P. Kavanagh, V. Lundon, N. Hynes and S. Sultan.

**Cardiovascular Diseases and Conditions - Aneurysm**

**New Aneurysm Study Findings Have Been Reported by Researchers at Department of Vascular Surgery (Staged Hybrid Repair of an Intrathoracic Subclavian Artery Aneurysm Associated with a Long Segment Dissection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Aneurysm have been published. According to news originating from Gastonia, North Carolina, by NewsRx correspondents, research stated, "Intrathoracic subclavian artery aneurysms (ISAAAs) are infrequently seen in clinical practice. We report the repair of a left ISAA associated with a long segment dissection from the ostia extending to the axillary artery."

Our news journalists obtained a quote from the research from the Department of Vascular Surgery, "A hybrid approach was used. Carotid-to-axillary bypass using a reversed greater saphenous vein was first performed, followed by coverage of the origin of the subclavian artery using a thoracic stent graft."

According to the news editors, the research concluded: "Finally, percutaneous access of the radial artery with coil embolization was performed to successfully thrombose the ISAA."

For more information on this research see: Staged Hybrid Repair of an Intrathoracic

The news correspondents report that additional information may be obtained from P.V. Kochupura, CaroMont Reg Med Center, Dept. of Vasc Surg, Gastonia, NC, United States.

**Cardiovascular Diseases and Conditions - Aneurysm**

**New Aneurysm Study Findings Recently Were Reported by Researchers at Eastern Virginia School of Medicine (Anatomic severity grading score for primary descending thoracic aneurysms predicts procedural difficulty and aortic-related ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Aneurysm is now available. According to news reporting from Norfolk, Virginia, by NewsRx journalists, research stated, "An anatomic severity grading (ASG) score for primary descending thoracic aortic aneurysms (DTAs) was developed. The objective of this study was to determine if an ASG score cutoff value for DTAs is predictive of procedural complexity, aortic-related reinterventions, and mortality in patients who undergo thoracic endovascular aortic repair (TEVAR)."

The news correspondents obtained a quote from the research from the Eastern Virginia School of Medicine, "A retrospective review from 2008 to 2013 of patient records was conducted of all consecutive patients who underwent TEVAR for a primary DTA. A comprehensive scoring system of preoperative DTA morphology on the basis of computed tomography angiography images was established to identify and classify anatomic features that might influence outcome after TEVAR. ASG score calculations were achieved using preoperative computed tomography angiography images. Primary outcomes included primary technical success, aortic-related reinterventions, aneurysm-related mortality, and all-cause mortality. Secondary outcomes included procedural complexity (unplanned adjunctive procedures, number of endografts implanted, contrast volume, and procedure time), endoleak formation, endoleak requiring reintervention, stroke and paraplegia, and conversion to open repair. Of 469 patients with a diagnosis of a thoracic aortic aneurysm, 62 patients (13%) underwent TEVAR and had adequate preoperative imaging (mean age, 71 years). Applying the ASG score, we identified 39 patients (63%) with a score $\geq$ 24 (high-score group) and 23 patients (37%) with a score < 24 (low-score group). Mean follow-up was 15.3 months (range, 4 days to 3.7 years; standard deviation, 1 year) for both groups. Freedom from all-cause mortality was significantly different in the high-score (87% at 1 year, 79% at 2 years, and 57% at 3 years) vs the low-score group (100% at 1, 2, and 3-years; log-rank test, P< .021). There was no significant difference between mortality in the high-score (97% at 1 year, 87% at 2 years, and 69% at 3 years) compared with the low-score group (100% at 1, 2, and 3 years; log-rank test, P
Freedom from aortic-related reinterventions was significantly lower in the high-score (82% at 1 year, 68% at 2 years, and 35% at 3 years) compared with the low-score group (100% at 1, 2, and 3 years; log-rank test, P = .002). Operative difficulty in the form of intraoperative adjunct procedures, number of endografts implanted, and procedural time had significant differences between groups (18% vs 0%, P = .038; 79% vs 39%, P = .004; 120 vs 79 minutes, P = .005, respectively). No significant difference in 30-day combined stroke and paraplegia (16%) was present between groups, and no patient had a conversion to open repair during the follow-up period."

According to the news reporters, the research concluded: "Preoperative ASG score for primary DTAs predicted procedure complexity and aortic-related reinterventions after TEVAR."

Our news journalists report that additional information may be obtained by contacting J.M. Panneton, Eastern Virginia Med Sch, Div Vasc Surg, Norfolk, VA, United States. Additional authors for this research include S. Larion, S.S. Ahanchi, K.S. Lavingia, D.J. Dexter and J.M. Panneton.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jvs.2016.03.451. This DOI is a link to an online electronic document that is either free or for purchase.

**Angiogenesis**

**New Angiogenesis Findings from DZHK German Center for Cardiovascular Research Described (PAFAH1B1 and the IncRNA NONHSAT073641 maintain an angiogenic phenotype in human endothelial cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Angiogenesis are presented in a new report. According to news reporting originating from Frankfurt, Germany, by NewsRx correspondents, research stated, "Platelet-activating factor acetyl hydrolase 1B1 (PAFAH1B1, also known as Lis1) is a protein essentially involved in neurogenesis and mostly studied in the nervous system. As we observed a significant expression of PAFAH1B1 in the vascular system, we hypothesized that PAFAH1B1 is important during angiogenesis of endothelial cells as well as in human vascular diseases."
Our news editors obtained a quote from the research from DZHK German Center for Cardiovascular Research, "The functional relevance of the protein in endothelial cell angiogenic function, its downstream targets and the influence of NON-HSAT073641, a long non-coding RNA (lncRNA) with 92% similarity to PAFAH1B1, were studied by knockdown and overexpression in human umbilical vein endothelial cells (HUVEC). Knockdown of PAFAH1B1 led to impaired tube formation of HUVEC and decreased sprouting in the spheroid assay. Accordingly, the overexpression of PAFAH1B1 increased tube number, sprout length and sprout number. LncRNA NONHSAT073641 behaved similarly. Microarray analysis after PAFAH1B1 knockdown and its overexpression indicated that the protein maintains Matrix Gla Protein (MGP) expression. Chromatin immunoprecipitation experiments revealed that PAFAH1B1 is required for active histone marks and proper binding of RNA Polymerase II to the transcriptional start site of MGP. MGP itself was required for endothelial angiogenic capacity and knockdown of both, PAFAH1B1 and MGP, reduced migration. In vascular samples of patients with chronic thromboembolic pulmonary hypertension (CTEPH), PAFAH1B1 and MGP were upregulated. The function of PAFAH1B1 required the presence of the intact protein as overexpression of NONHSAT073641, which was highly upregulated during CTEPH, did not affect PAFAH1B1 target genes."

According to the news editors, the research concluded: "PAFAH1B1 and NONHSAT073641 are important for endothelial angiogenic function."

The news editors report that additional information may be obtained by contacting M.S. Leisegang, German Center Cardiovasc Res DZHK, Partner Site RheinMain, Frankfurt, Germany. Additional authors for this research include C. Fork, J. Preussner, K.K. Prior, D. Iloska, A.E. Vasconez, S. Labocha, C. Angioni, D. Thomas, N.F. Os, M. Looso, S.S. Pullamsetti, G. Geisslinger, D. Steinhilber, R.P. Brandes and M.S. Leisegang.

Angiogenesis

New Angiogenesis Study Findings Have Been Reported by Investigators at University of Michigan (Histone Deacetylase 5 Is Overexpressed in Scleroderma Endothelial Cells and Impairs Angiogenesis via Repression of Proangiogenic Factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Angiogenesis. According to news reporting out of Ann Arbor, Michigan, by NewsRx editors, research stated, "Vascular dysfunction represents a disease-initiating event in systemic sclerosis (SSc; scleroderma). Results of recent studies suggest that epigenetic dysregulation impairs normal angiogenesis and can result in abnormal patterns of blood vessel growth."
Our news journalists obtained a quote from the research from the University of Michigan, "Histone deacetylases (HDACs) control endothelial cell (EC) proliferation and regulate EC migration. Specifically, HDAC-5 appears to be antiangiogenic. This study was undertaken to test whether HDAC-5 contributes to impaired angiogenesis in SSc by repressing proangiogenic factors in ECs. Dermal ECs were isolated from patients with diffuse cutaneous SSc and healthy controls. Angiogenesis was assessed using an in vitro Matrigel tube formation assay. An assay for transposase-accessible chromatin using sequencing (ATAC-seq) was performed to assess and localize the genome-wide effects of HDAC5 knockdown on chromatin accessibility. The expression of HDAC5 was significantly increased in ECs from patients with SSc compared to healthy control ECs. Silencing of HDAC5 in SSc ECs restored normal angiogenesis. HDAC5 knockdown followed by ATAC-seq assay in SSc ECs identified key HDAC5-regulated genes involved in angiogenesis and fibrosis, such as CYR61, PVRL2, and FSTL1. Simultaneous knockdown of HDAC5 in conjunction with either CYR61, PVRL2, or FSTL1 inhibited angiogenesis in SSc ECs. Conversely, overexpression of these genes individually led to an increase in tube formation as assessed by Matrigel assay, suggesting that these genes play functional roles in the impairment of angiogenesis in SSc. Several novel HDAC5-regulated target genes associated with impaired angiogenesis were identified in SSc ECs by ATAC-seq."

According to the news editors, the research concluded: "The results of this study provide a potential link between epigenetic regulation and impaired angiogenesis in SSc, and identify a novel mechanism for the dysregulated angiogenesis that characterizes this disease."

Our news journalists report that additional information may be obtained by contacting A.H. Sawalha, University of Michigan, Ann Arbor, MI 48109, United States. Additional authors for this research include J.D. Wren, M.A. Amin, E. Schiopu, D.A. Fox, D. Khanna and A.H. Sawalha.

Keywords for this news article include: Ann Arbor, Michigan, United States, North and Central America, Deacetylase, Genetics, Enzymes and Coenzymes, Endothelial Cells, Nucleoproteins, Angiogenesis, Proteins, Histones, University of Michigan.

Angiogenesis

New Angiogenesis Study Findings Have Been Reported from Beijing University of Technology (Silver nanoparticles inhibit the function of hypoxia-inducible factor-1 and target genes: insight into the cytotoxicity and antiangiogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Angiogenesis are presented in a new report. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Hypoxia-inducible factor-1 (HIF-1) is a transcription factor that is activated upon exposure to hypoxic stress. It modulates a number of cellular responses
including proliferation, apoptosis, angiogenesis, and metabolism by activating a panel of target genes in response to hypoxia."

Our news editors obtained a quote from the research from the Beijing University of Technology, "The HIF-1 level is often upregulated in the hypoxic microenvironment of solid tumors, which contributes to cancer treatment failure. Here we report that silver nanoparticles (AgNPs), which are widely used as an antimicrobial agent, are an effective inhibitor of HIF-1. AgNPs inhibited the activation of a HIF-dependent reporter construct after the cells were exposed to hypoxic conditions or treated with cobalt chloride, a hypoxia mimetic agent. The AgNPs also interfered with the accumulation of HIF-1 alpha protein and the induction of the endogenous HIF target genes, VEGF-A and GLUT1. Since both HIF-1 and vascular endothelial growth factor-A play an important role in angiogenesis, AgNPs also inhibited angiogenesis in vitro. Our data reveal a new mechanism of how AgNPs act on cellular function, that is, they disrupt HIF signaling pathway."

According to the news editors, the research concluded: "This finding provides a novel insight into how AgNPs can inhibit cancer cell growth and angiogenesis."

For more information on this research see: Silver nanoparticles inhibit the function of hypoxia-inducible factor-1 and target genes: insight into the cytotoxicity and antiangiogenesis. *International Journal of Nanomedicine, 2016;11():6679-6690,6691-6692. **Angiogenesis**

**New Angiogenesis Study Findings Recently Were Reported by Researchers at Henan University of Technology (Identification of resveratrol derivative 3,3',4,4',5,5'-hexamethoxy-trans-stilbene as a novel pro-angiogenic small-molecule compound)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Angiogenesis is now available. According to news originating from Zhengzhou, People's Republic of China, by NewsRx correspondents, research stated, "The potential to promote neovascularization in ischemic tissues using exogenous agents is an attractive avenue for therapeutics. To identify novel pro-angiogenic small-molecule compound, we screened a series of resveratrol methylated derivatives and identified 3,3',4,4',
5,5'-hexamethoxy-trans-stilbene (3,3',4,4',5,5'-HMS) potently promotes proliferation, migration, invasion and tube formation of human umbilical vein VECs (HUVECs) in vitro."

Our news journalists obtained a quote from the research from the Henan University of Technology, "Furthermore, 3,3',4,4',5,5'-HMS accelerates neo-vessels sprouting of rat aortic rings ex vivo, and neovascularization of chick chorioallantoic membrane (CAM) and mouse matrigel plugs in vivo. Microarray analyses show that the level of early growth response 1 (EGR-1), an inducible pro-angiogenic gene regulatory factor, was upregulated. The upregulation of EGR-1 was confirmed by semiquantitative RT-PCR, quantitative real-time PCR and western blotting analyses. In addition, the levels of several pro-angiogenic factors including transforming growth factor beta 1 (TGF-beta 1), vascular endothelial growth factor (VEGF), nitric oxide (NO), and the activity of endothelial NO synthase (eNOS) were elevated in 3,3',4,4',5,5'-HMS-treated HUVECs. Inhibition of NO synthase by L-NAME blocked the pro-angiogenic effects of 3,3',4,4',5,5'-HMS."

According to the news editors, the research concluded: "Our research shows that 3,3',4,4',5,5'-HMS dramatically promoted angiogenesis in vitro, ex vivo and in vivo, which might represent a novel potential agent for the development of therapeutic drugs to treat ischemic diseases."

The news correspondents report that additional information may be obtained from L. Zhang, Henan Univ Technol, Coll Bioengn, Zhengzhou 450001, People's Republic of China. Additional authors for this research include L. Zhang, J.T. Yu, L.K. Chen and B. Zhou.

Angiography

New Angiography Findings from Chinese People's Liberation Army General Hospital Described (Prognostic Value of Gai's Plaque Score and Agatston Coronary Artery Calcium Score for Functionally Significant Coronary Artery Stenosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Angiography have been published. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The prognostic values of the coronary computed tomography angiography (CCTA) score for predicting future cardiovascular events have been previously demonstrated in numerous studies. However, few studies have used the rich information available from CCTA to detect functionally significant coronary lesions."

Our news editors obtained a quote from the research from Chinese People's
Liberation Army General Hospital, "We sought to compare the prognostic values of Gai's plaque score and the coronary artery calcium score (CACS) of CCTA for predicting functionally significant coronary lesions, using fractional flow reserve (FFR) as the gold standard. We retrospectively analyzed 107 visually assessed significant coronary lesions in 88 patients (mean age, 59.6 +/- 10.2 years; 76.14% of males) who underwent CCTA, invasive coronary angiography, and invasive FFR measurement. An FFR < 0.80 indicated hemodynamically significant coronary stenosis. Lesions were divided into two groups using an FFR cutoff value of 0.80. We compared Gai's plaque scores and CACS between the two groups and evaluated the correlations of these scores with FFR. The statistical methods included unpaired t-test, Mann-Whitney U-test, and Spearman's correlation coefficients. Coronary lesions with FFR < 0.80 had higher Gai's scores than those with FFR >= 0.80. Gai's score had the strongest correlation with FFR (r = -0.48, P< 0.01) and had a greater area under the curve = 0.72 (95% confidence interval: 0.61-0.82; P< 0.01) than the CACS of whole arteries and a single artery. Both CACS in a single artery and Gai's plaque score demonstrated a good capacity to assess functionally significant coronary artery stenosis when compared to the gold standard FFR. However, Gai's plaque score was more predictive of FFR < 0.80."

According to the news editors, the research concluded: "Gai's score can be easily calculated in daily clinical practice and could be used when considering revascularization."

The news editors report that additional information may be obtained by contacting L.Y. Gai, Chinese Peoples Liberat Army Gen Hosp, Dept. of Cardiol, Beijing 100853, People's Republic of China. Additional authors for this research include S. Yang, L.Y. Gai, Z.Q. Han, Q. Xin, X.B. Yang, J.J. Yang and Q.H. Jin.

**Angiology**

**New Angiology Data Have Been Reported by Investigators at Johns Hopkins University (Successful facial artery pseudoaneurysm coiling and pedicle preservation following free tissue transfer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Angiology have been presented. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "Patients undergoing free tissue reconstruction are at risk for development of an anastomotic pseudoaneurysm, which may present as delayed neck hemorrhage or a pulsatile neck mass. Diagnosis may be achieved by noninvasive imaging, angiography, and exploration."
The news correspondents obtained a quote from the research from Johns Hopkins University. "Management strategies for head and neck pseudoaneurysms have included open vessel ligation, open direct vessel repair, endovascular parent vessel embolization, and, most recently, endovascular pseudoaneurysm embolization. In patients with anastomotic pseudoaneurysms where adequate flap inosculation is doubted, endovascular pseudoaneurysm embolization with pedicle preservation may be an appropriate primary treatment approach."

According to the news reporters, the research concluded: "We discuss the successful endovascular coiling of an external carotid artery branch anastomotic pseudoaneurysm in a patient one month after free tissue reconstruction of a total laryngopharyngectomy and partial glossectomy defect."

Our news journalists report that additional information may be obtained by contacting S.C. Desai, Johns Hopkins University, Sch Med, Dept. of Otolaryngol Head & Neck Surg, Div Facial Plast & Reconstruct Surg, Baltimore, MD 21205, United States. Additional authors for this research include D.J. Genther, F. Hui, W.K. Mydlarz, G. Griffith and S.C. Desai.

cGMP contents, significantly and L-NAME (100 mmol/l) inhibited the DMSO-induced increases of cGMP. In fura 2-loaded endothelium-denuded aorta, cumulative application of DMSO (1-3%) inhibited PE-induced muscle tension; however, this application did not affect the [Ca2+]	extsubscript{i} level. In PE-precontracted endothelium-denuded aorta, relaxation responses to fasudil were significantly less in the presence of DMSO compared to the control.

According to the news editors, the research concluded: "These results suggest that DMSO causes relaxation by increasing the cGMP content in correlation with the release of NO from endothelial cells and by decreasing the Ca2+ sensitivity of contractile elements partly via inhibiting Rho-kinase in rat aorta."

The news correspondents report that additional information may be obtained from T. Kaneda, Laboratory of Veterinary Pharmacology, School of Veterinary Medicine, Nippon Veterinary and Life Science University, Musashino, Tokyo, Japan. Additional authors for this research include N. Sasaki, N. Urakawa and K. Shimizu.

Angiology

New Angiology Findings Reported from Yantai University [Endothelium-independent vasorelaxant effect of 20(S)-protopanaxadiol on isolated rat thoracic aorta]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Angiology. According to news reporting originating from Yantai, People's Republic of China, by NewsRx correspondents, research stated, "Ginsenosides are considered to be the major pharmacologically active ginseng constituents, whereas 20(S)-protopanaxadiol [20(S)-PPD] is the active metabolite of ginsenosides in gut. In this study we investigated the effect of 20(S)-PPD on isolated rat thoracic aortas as well as its vasorelaxant mechanisms."

Our news editors obtained a quote from the research from Yantai University, "Aortic rings with or without endothelium were prepared from Wistar rats and suspended in organ-chambers. The changes in tension of the preparations were recorded through isometric transducers connected to a data acquisition system. The aortic rings were precontracted with phenylephrine (PE, 1 mu mol/L) or high-K+ (80 mmol/L). Application of 20(S)-PPD (21.5-108.5 mu mol/L) caused concentration-dependent vasodilation of endothelium-intact aortic rings precontracted with PE or high-K+, which resulted in the EC50 values of 90.4 or 46.5 mu mol/L, respectively. The removal of endothelium had no effect on 20(S)-PPD-induced relaxation. The vasorelaxant effect of 20(S)-PPD was also not influenced by the preincubation
with beta-adrenergic receptor antagonist propranolol, or with ATP-sensitive K+ channel blocker glibenclamide, voltage-dependent K+ channel blocker 4-AP and inward rectifier K+ channel blocker BaCl2, whereas it was significantly attenuated by the preincubation with Ca2+-activated K+ (BKCa) channel blocker TEA (1 mmol/L). Furthermore, the inhibition of NO synthesis, cGMP and prostacyclin pathways did not affect the vasorelaxant effect of 20(S)-PPD. In Ca2+-free solution, 20(S)-PPD (108.5 μmol/L) markedly decreased the extracellular Ca2+-induced contraction in aortic rings precontracted with PE or high-K+ and reduced PE-induced transient contraction. Voltage-dependent Ca2+ channel antagonist nifedipine inhibited PE-induced contraction; further inhibition was observed after the application of receptor-operated Ca2+ channel inhibitor SK&F 96365 or 20(S)-PPD. 20(S)-PPD induces vasorelaxation via an endothelium-independent pathway.

According to the news editors, the research concluded: "The inhibition of voltage-dependent Ca2+ channels and receptor-operated Ca2+ channels and the activation of Ca2+-activated K+ channels are probably involved in the relaxation."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/aps.2016.74. This DOI is a link to an online electronic document that is either free or for purchase.

**Angiology**

**New Angiology Findings from Tongji University Discussed (Combined use of Onyx and coils for transarterial balloon-assisted embolization of traumatic carotid-cavernous fistulas: a report of 16 cases with 17 fistulas)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Angiology have been presented. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The combination of coils and Onyx for the treatment of carotid-cavernous fistulas (CCFs) is an interesting new development. The purpose of the current study is to evaluate our preliminary experience with the combined use of coils and Onyx for the treatment of traumatic CCFs."

Our news editors obtained a quote from the research from Tongji University, "Between April 2009 and July 2014, 16 patients with 17 traumatic CCFs were embolized with
the so-called 'armored concrete' treatment modality using coils, Onyx-18, and a non-detachable balloon via the transarterial approach. The outcomes were assessed both clinically and radiologically. Digital subtraction angiography (DSA) follow-up was performed 3 or 6 months after endovascular treatment while clinical follow-up was continued until December 2014. Obliteration of the CCFs was obtained with patency of the parent artery in all 16 cases. Follow-up DSA demonstrated stable occlusion of all the fistulas. Symptoms related to the CCFs were either resolved immediately or gradually over 2 months. No worsening of the cranial neuropathies was observed during the follow-up period which averaged 32.6 months."

According to the news editors, the research concluded: "The 'armored concrete' treatment modality using coils, Onyx, and a non-detachable balloon promises to be a safe, economical, and effective alternative in the management of traumatic CCFs."

The news editors report that additional information may be obtained by contacting Z.Q. Chen, Tongji Univ, Sch Med, Shanghai Peoples Hosp 10, Dept. of Neurosurg, Shanghai 200072, People's Republic of China. Additional authors for this research include W. Guo, R. Shen, J.P. Sun, J. Yin, X.Z. Chen, L. Gao, Z.Q. Chen and Q.B. Zhang.

Angiology

New Angiology Findings from University of Bristol Described (Right internal thoracic artery versus radial artery as the second best arterial conduit: Insights from a meta-analysis of propensity-matched data on long-term survival)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Angiology are discussed in a new report. According to news reporting out of Bristol, United Kingdom, by NewsRx editors, research stated, "Objective(s): We conducted a meta-analysis of propensity score-matching (PSM) studies comparing long-term survival of patients receiving right internal thoracic artery (RITA) versus radial artery (RA) as a second arterial conduit for coronary artery bypass grafting. A literature search was conducted using MEDLINE, EMBASE, and Web of Science to identify relevant articles."

Our news journalists obtained a quote from the research from the University of Bristol, "Primary endpoint was long-term mortality. Secondary endpoints were operative mortality, incidence of sternal wound infection, and repeat revascularization. Binary events were
pooled using the Der-Simonian and Laird method. For time-to-event outcomes, estimates of log hazard ratio (HR) and standard errors obtained were combined using the generic inverse variance method. A total of 8 PSM studies were finally selected including 15,374 patients (RITA, 6739; RA, 8635) with 2992 matched pairs for final comparison. Mean follow-up time ranged from 45 to 168 months. When compared with RA, RITA was associated with a lower risk reduction of late death (HR, 0.75; 95% confidence interval [CI], 0.58-0.97; P = .028) and repeat revascularization (HR, 0.37; 95% CI, 0.16-0.85; P = .03). On the other hand, RITA did not increase operative mortality (odds ratio [OR], 1.53; 95% CI, 0.97-2.39; P = .07). RITA was associated with an increased risk of sternal wound complication when pedicled harvesting was used (OR, 3.18; 95% CI, 1.34-7.57), but not with skeletonized harvesting (OR, 1.07; 95% CI, 0.67-1.71).

According to the news editors, the research concluded: "The present PSM data meta-analysis suggests that the use of RITA compared with RA was associated with superior long-term survival and freedom from repeat revascularization, with similar operative mortality and incidence of sternal wound complication when the skeletonized harvesting technique was used."

Our news journalists report that additional information may be obtained by contacting U. Benedetto, University of Bristol, Sch Clin Sci, Bristol Heart Inst, Bristol, Avon, United Kingdom. Additional authors for this research include M. Gaudino, M. Caputo, R.F. Tranbaugh, C. Lau, A. Di Franco, C. Ng, L.N. Girardi and G.D. Angelini.

Angiology

New Angiology Study Findings Recently Were Reported by Researchers at Boston University (Cross-Sectional Associations of Flow Reversal, Vascular Function, and Arterial Stiffness in the Framingham Heart Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Angiology have been presented. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Experimental studies link oscillatory flow accompanied by flow reversal to impaired endothelial cell function. The relation of flow reversal with vascular function and arterial stiffness remains incompletely defined."
Our news journalists obtained a quote from the research from Boston University, "Approach and Results-We measured brachial diastolic flow patterns along with vasodilator function in addition to tonometry-based central and peripheral arterial stiffness in 5708 participants (age 47 +/- 13 years, 53% women) in the Framingham Heart Study Offspring and Third Generation cohorts. Brachial artery diastolic flow reversal was present in 35% of the participants. In multivariable regression models, the presence of flow reversal was associated with lower flow-mediated dilation (3.9 +/- 0.2 versus 5.0 +/- 0.2%; P<0.0001) and reactive hyperemic flow velocity (50 +/- 0.99 versus 57 +/- 0.93 cm/s; P<0.0001). The presence of flow reversal (compared with absence) was associated with higher central aortic stiffness (carotid-femoral pulse wave velocity 9.3 +/- 0.1 versus 8.9 +/- 0.1 m/s), lower muscular artery stiffness (carotid-radial pulse wave velocity 9.6 +/- 0.1 versus 9.8 +/- 0.1 m/s), and higher forearm vascular resistance (5.32 +/- 0.03 versus 4.66 +/- 0.02 log dyne/s/cm5; P<0.0001). The relations of diastolic flow velocity with flow-mediated dilation, aortic stiffness, and forearm vascular resistance were nonlinear, with a steeper decline in vascular function associated with increasing magnitude of flow reversal. In our large, community-based sample, brachial artery flow reversal was common and associated with impaired vasodilator function and higher aortic stiffness."

According to the news editors, the research concluded: "Our findings are consistent with the concept that flow reversal may contribute to vascular dysfunction."

For more information on this research see: Cross-Sectional Associations of Flow Reversal, Vascular Function, and Arterial Stiffness in the Framingham Heart Study. Arteriosclerosis Thrombosis and Vascular Biology, 2016;36(12):2452-2459. Arteriosclerosis Thrombosis and Vascular Biology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq. 2001 Market St, Philadelphia, PA 19103, USA.

Our news journalists report that additional information may be obtained by contacting N.M. Hamburg, Boston University, Sch Med, Whitaker Cardiovasc Inst, Boston, MA 02215, United States. Angiology

New Angiology Study Findings Recently Were Reported by Researchers at University College (A systematic review and meta-analysis of donor ischaemic preconditioning in liver transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Angiology is now available. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Ischaemic preconditioning (IPC) is a strategy to reduce ischaemia-reperfusion (IR) injury. Its benefit in human liver transplantation is unclear."

Financial support for this research came from Wellington/HCA Research Fellowship.

Our news journalists obtained a quote from the research from University College,
"The aim of this study was to analyse the current evidence for donor IPC in liver transplantation. Systematic review and meta-analysis of studies involving IPC of liver transplant donors. Ovid Medline, Embase and Cochrane CENTRAL were searched up until January 2015. Data retrieved included the primary outcomes of 1-year mortality, incidence of primary graft nonfunction (PGNF) and retransplantation. Secondary outcomes included aspartate aminotransferase (AST) levels on day 3 post-op. Pooled odds ratios (ORs) were calculated for dichotomous data and mean weighted ratios for continuous data. Ten studies included 593 patients (286 IPC; 307 control). IPC was associated with a reduction in mortality at 1 year (6% vs. 11%) although this was not statistically significant (OR 0.54, 95% C. I. 0.28-1.04, P = 0.06). The IPC group had a significantly lower day 3 AST level (WMD -66.41iU, P = 0.04). This meta-analysis demonstrates that IPC reduces liver injury following transplantation and produces a large reduction in 1-year mortality which was not statistically significant."

According to the news editors, the research concluded: "Confirmation of clinical benefit from IPC requires an adequately powered prospective RCT."

Our news journalists report that additional information may be obtained by contacting F.P. Robertson, UCL, Dept. of Surg & Intervent Sci, London, United Kingdom. Additional authors for this research include L.J. Magill, G.P. Wright, B. Fuller and B.R. Davidson.

Angiology

New Angiology Study Findings Recently Were Reported by Researchers at Wenzhou Medical University (High serum levels of sclerostin and Dickkopf-1 are associated with acute ischaemic stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Angiology is now available. According to news reporting from Zhejiang, People's Republic of China, by NewsRx journalists, research stated, "Sclerostin and Dickkopf-1 (Dkk-1) are potent antagonists of Wnt signalling and might therefore play important roles in cardiovascular disease. We investigated whether serum sclerostin and Dkk-1 levels are associated with acute ischaemic stroke and specific stroke subtypes."

The news correspondents obtained a quote from the research from Wenzhou Medical University, "Serum levels of sclerostin and Dkk-1 were measured by ELISA on day 1 and on day 6 after stroke in 62 patients with large artery atherosclerotic (LAA) stroke, on day 1 after stroke in 62 age-and gender-matched patients with small-artery occlusion (SAO) stroke and on
admission in 62 healthy controls. Stroke severity was determined based on the National Institutes of Health Stroke Scale (NIHSS) and by measuring stroke volume on diffusion-weighted imaging. Outcome was measured by the modified Rankin Scale (mRS) on day 90. Compared with controls, serum sclerostin and Dkk-1 levels were significantly higher in both patients with LAA stroke and with SAO stroke, and no difference was detected between the stroke subtypes. Sclerostin and Dkk-1 levels remained stable between the first and sixth day after stroke in the patients with LAA stroke. Receiver operating characteristic curve analysis was used to evaluate sclerostin and Dkk-1 as markers of a high risk of stroke and produced area under curve values of 0.773 and 0.776. Adjusted logistic regression showed that serum sclerostin and Dkk-1 levels remained as independent markers of stroke. No correlations were found between sclerostin or Dkk-1 levels and stroke severity or stroke outcome.

According to the news reporters, the research concluded: "High serum levels of sclerostin and Dkk-1 are associated with acute ischaemic stroke."

For more information on this research see: High serum levels of sclerostin and Dickkopf-1 are associated with acute ischaemic stroke. Atherosclerosis, 2016;253():22-28. Drugs and Therapies - Angiotensin Converting...

New Angiotensin Converting Enzyme Inhibitors Data Have Been Reported by Investigators at Capital Medical University (Enalapril protects against myocardial ischemia/reperfusion injury in a swine model of cardiac arrest and resuscitation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Angiotensin Converting Enzyme Inhibitors have been published. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "There is strong evidence to suggest that angiotensin-converting enzyme inhibitors (ACEIs) protect against local myocardial ischemia/reperfusion (I/R) injury. This study was designed to explore whether ACEIs exert cardioprotective effects in a swine model of cardiac arrest (CA) and resuscitation."

Our news editors obtained a quote from the research from Capital Medical University, "Male pigs were randomly assigned to three groups: sham-operated group, saline treatment group and enalapril treatment group. Thirty minutes after drug infusion, the animals in
the saline and enalapril groups were subjected to ventricular fibrillation (8 min) followed by cardiopulmonary resuscitation (up to 30 min). Cardiac function was monitored, and myocardial tissue and blood were collected for analysis. Enalapril pre-treatment did not improve cardiac function or the 6-h survival rate after CA and resuscitation; however, this intervention ameliorated myocardial ultrastructural damage, reduced the level of plasma cardiac troponin I and decreased myocardial apoptosis. Plasma angiotensin (Ang) II and Ang-(1-7) levels were enhanced in the model of CA and resuscitation. Enalapril reduced the plasma Ang II level at 4 and 6 h after the return of spontaneous circulation whereas enalapril did not affect the plasma Ang-(1-7) level. Enalapril pre-treatment decreased the myocardial mRNA and protein expression of angiotensin-converting enzyme (ACE). Enalapril treatment also reduced the myocardial ACE/ACE2 ratio, both at the mRNA and the protein level. Enalapril pre-treatment did not affect the upregulation of ACE2, Ang II type 1 receptor (AT1R) and MAS after CA and resuscitation. Taken together, these findings suggest that enalapril protects against ischemic injury through the attenuation of the ACE/Ang II/AT1R axis after CA and resuscitation in pigs."

According to the news editors, the research concluded: "These results suggest the potential therapeutic value of ACEIs in patients with CA."

For more information on this research see: Enalapril protects against myocardial ischemia/reperfusion injury in a swine model of cardiac arrest and resuscitation. *International Journal of Molecular Medicine*, 2016;38(5):1463-1473. *International Journal of Molecular Medicine* can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

The news editors report that additional information may be obtained by contacting G.X. Wang, Capital Med Univ, Beijing Friendship Hosp, Dept. of Emergency Med, Beijing 100050, People's Republic of China. Additional authors for this research include Q. Zhang, W. Yuan, J.Y. Wu and C.S. Li.

**Angiotensins**

**New Angiotensins Findings Has Been Reported by Investigators at Shanghai University (Swertiamarin Attenuates Experimental Rat Hepatic Fibrosis by Suppressing Angiotensin II-Angiotensin Type 1 Receptor-Extracellular Signal-Regulated Kinase ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Angiotensins have been published. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "The rennin-angiotensin system (RAS) is crucial in hepatic fibrosis development, and therapies targeting this system may be a promising treatment for hepatic fibrosis. In this study, we investigated the effects of swertiamarin (Swe), an ethanol extract of Gentiana manshurica Kitag, on hepatic fibrosis and its underlying mechanisms through regulating RAS."

The news correspondents obtained a quote from the research from Shanghai University, "Primary rat hepatic stellate cells (HSCs) were isolated and treated with angiotensin
II (Ang II) with or without Swe and losartan. The proliferation and activation of HSCs were measured. Rat hepatic fibrosis was induced by intraperitoneal dimethylnitrosamine (DMN) injection for 4 weeks. Rats were treated with Swe or losartan from the third week until the end of the experiment. Hydroxyproline content in liver tissue was assayed with Jamall's method, and liver collagen deposition was visualized using Sirius red staining. RAS components were analyzed by Western blot, immunofluorescent staining, and real-time reverse-transcription polymerase chain reaction. The results showed that Swe significantly inhibited Ang II-induced HSC proliferation and activation. Swe also significantly suppressed DMN-induced alpha-smooth muscle actin production in rat livers and improved liver function. Swe partially inhibited Ang II-induced angiotensin type 1 receptor (AT1R) up-regulation and suppressed Ang II-induced extracellular signal-regulated kinase (ERK) and c-jun phosphorylation in HSCs. In the DMN-treated rats, Swe treatment significantly inhibited the plasma Ang II levels. DMN-induced AT1R up-regulation, and phosphorylation of ERK and c-jun in rat liver were also inhibited by Swe.

According to the news reporters, the research concluded: "Swe may attenuate hepatic fibrosis through inhibiting HSC activation by regulating the RAS."

Anions

**New Anions Findings from Hartford Hospital Reported (Physical compatibility of tedizolid phosphate with selected i.v. drugs during simulated Y-site administration)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Anions is now available. According to news reporting from Hartford, Connecticut, by NewsRx journalists, research stated, "The physical compatibility of commonly used agents that could be coadministered in the clinical setting with tedizolid phosphate during Y-site administration was evaluated. Tedizolid phosphate vials were
reconstituted to a final concentration of 0.8 mg/mL."

The news correspondents obtained a quote from the research from Hartford Hospital, "All other drugs were prepared according to manufacturers' recommendations and diluted with 0.9% sodium chloride injection (where applicable) to the highest standard concentrations used clinically. Y-site conditions were simulated in culture tubes by mixing 5 mL of tedizolid phosphate solution with 5 mL of the test drug solutions. The physical characteristics, turbidity, and pH of all admixtures were examined immediately after mixing and at 15, 60, and 120 minutes. Incompatibility was defined as gross precipitation, a positive Tyndall beam test, color changes, or increases in turbidity. With simulated Y-site administration, tedizolid phosphate was compatible with 69 of 86 drugs in 0.9% sodium chloride injection, including 24 of 31 antimicrobial agents. Of note, incompatibility was observed immediately after mixing except with ceftaroline and diphenhydramine, whose incompatibility with tedizolid phosphate was apparent after 15 and 60 minutes, respectively. Among the drug classes tested, tedizolid phosphate was compatible only with 1 aminoglycoside (amikacin) and incompatible with 1 echinocandin (caspofungin) and 1 cephalosporin (ceftaroline). In addition, tedizolid phosphate was incompatible with divalent cations (calcium chloride, calcium gluconate, and magnesium sulfate), probably due to precipitation with the phosphate component. A pH change of >1 unit occurred only with epinephrine (at 120 minutes)."

According to the news reporters, the research concluded: "Tedizolid phosphate 0.8 mg/mL in 0.9% sodium chloride injection was physically compatible with 69 of 86 study drugs during simulated Y-site administration."

For more information on this research see: Physical compatibility of tedizolid phosphate with selected i.v. drugs during simulated Y-site administration. American Journal of Health-System Pharmacy, 2016;73(21):1769-1776. Carrier Proteins - Annexins

New Annexins Findings Reported from Fourth Military Medical University (CD147 regulates cancer migration via direct interaction with Annexin A2 and DOCK3-b-catenin-WAVE2 signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Carrier Proteins - Annexins are presented in a new report.
According to news reporting from Xi'an, People's Republic of China, by NewsRx journalists, research stated, "The acquisition of inappropriate migratory feature is crucial for tumor metastasis. It has been suggested that CD147 and Annexin A2 are involved in regulating tumor cell movement, while the regulatory mechanisms are far from clear."

The news correspondents obtained a quote from the research from Fourth Military Medical University, "In this study, we demonstrated that CD147 physically interacted with the N-terminal domain of Annexin A2 and decreased Annexin A2 phosphorylation on tyrosine 23. In vitro kinase assay showed that the I domain of CD147 was indispensable for CD147-mediated downregulation of Annexin A2 phosphorylation by Src. Furthermore, we determined that p-Annexin A2 promoted the expression of dedicator of cytokinesis 3 (DOCK3) and DOCK3 blocked b-catenin nuclear translocation, resulting in inhibition of b-catenin signaling. In addition, DOCK3 inhibited lamellipodium dynamics and tumor cell movement. Also, we found that b-catenin signaling increased WAVE2 expression. Therefore, DOCK3 was characterized as a negative regulator of WAVE2 expression via inhibiting b-catenin signaling."

According to the news reporters, the research concluded: "Our study provides the first evidence that CD147 promotes tumor cell movement and metastasis via direct interaction with Annexin A2 and DOCK3-b-catenin-WAVE2 signaling axis."

For more information on this research see: CD147 regulates cancer migration via direct interaction with Annexin A2 and DOCK3-b-catenin-WAVE2 signaling. Oncotarget, 2016;7(5):5613-29.

Drugs and Therapies - Antiarrhythmic Agents

New Antiarrhythmic Agents Study Results Reported from Medical University (Comparison of the beta-Adrenergic Receptor Antagonists Landiolol and Esmolol: Receptor Selectivity, Partial Agonism, and Pharmacochaperoning Actions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiarrhythmic Agents have been published. According to news reporting out of Vienna, Austria, by NewsRx editors, research stated, "Blockage of beta(1)-adrenergic receptors is one of the most effective treatments in cardiovascular medicine. Esmolol was introduced some three decades ago as a short-acting beta(1)-selective antagonist."

Our news journalists obtained a quote from the research from Medical University,
"Landiolol is a more recent addition. Here we compared the two compounds for their selectivity for beta(1)-adrenergic receptors over beta(2)-adrenergic receptors, partial agonistic activity, signaling bias, and pharmacochaperoning action by using human embryonic kidney (HEK)293 cell lines, which heterologously express each human receptor subtype. The affinity of landiolol for beta(1)-adrenergic receptors and beta(2)-adrenergic receptors was higher and lower than that of esmolol, respectively, resulting in an improved selectivity (216-fold versus 30-fold). The principal metabolite of landiolol (M1) was also b1-selective, but its affinity was very low. Both landiolol and esmolol caused a very modest rise in cAMP levels but a robust increase in the phosphorylation of extracellular signal regulated kinases 1 and 2, indicating that the two drugs exerted partial agonist activity with a signaling bias. If cells were incubated for \( \geq 24 \) hours in the presence of \( \geq 1 \) mu M esmolol, the levels of beta(1)-adrenergic-but not of beta(2)-adrenergic-receptors increased. This effect was contingent on export of the beta(1)-receptor from endoplasmic reticulum and was not seen in the presence of landiolol."

According to the news editors, the research concluded: "On the basis of these observations, we conclude that landiolol offers the advantage of: 1) improved selectivity and 2) the absence of pharmacochaperoning activity, which sensitizes cells to rebound effects upon drug discontinuation."

Our news journalists report that additional information may be obtained by contacting M. Freissmuth, Medical University of Vienna, Inst Pharmacol, Center Phys & Pharmacol, A-1090 Vienna, Austria. Additional authors for this research include S. Sucic, Q. Yang, M. Freissmuth and C. Nanoff.

phospholipid membrane permeability. The objective of this study is to investigate the loading mechanism and validity of applying electrostatic attraction for the colistin entrapment and delivery in liposomes."

Financial support for this research came from Education Department of Liaoning.

The news correspondents obtained a quote from the research from Shenyang Pharmaceutical University. "Anionic lipids with various structures were used for colistin entrapment, and the properties of resulting liposomes (i.e. zeta-potential, EE and release rate) were highly dependent on the structure of anionic lipids. Based on consideration of intermolecular interactions, the retention of electrostatically entrapped colistin is essentially determined by the balance of interfacial hydrophobic attraction and electrostatic repulsion. The liposomal colistin showed the reduced bacterial killing rate, but did not compromise the in vitro antibacterial activity. Specially, the PEGylated liposomal colistin of sodium cholesteryl sulfate (Chol-SO4(-)) showed the best drug retention, resulting in the significantly increased maximum-tolerated dose, prolonged blood circulation and decreased colistin distribution in kidney after intravenous administration in mice."

According to the news reporters, the research concluded: "These results highlight the potential utility of electrostatically entrapped liposome for polycationic colistin delivery."

Our news journalists report that additional information may be obtained by contacting L. Yang, Shenyang Pharmaceutical University, Sch Pharm, Shenyang, People's Republic of China. Additional authors for this research include C.C. Tang, E.B. Zhang and L. Yang.

**Drugs and Therapies - Antibiotics**

**New Antibiotics Data Have Been Reported by Researchers at University of Melbourne [Novel alpha(1)-adrenoceptor antagonism by the fluoroquinolone antibiotic trovafloxacin]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antibiotics have been published. According to news reporting originating in Melbourne, Australia, by NewsRx journalists, research stated, "Trovafloxacin, a fluoroquinolone antibiotic, was recently found to be
an inhibitor of pannexin-1 channels through which ATP is released as 'find-me' signals in apoptotic Jurkat cells. Our interest in the role of pannexin-1 channels in alpha(1)-adrenoceptor-mediated vasoconstriction led us to the novel finding reported here."

The news reporters obtained a quote from the research from the University of Melbourne, "Concentration-response curves to methoxamine and phenylephrine were competitively antagonised by trovafloxacin (1-30 μM) with a pK(B) of 5.54 and 5.32, respectively, in rat mesenteric small arteries isolated for myography. In comparison, prazosin (1-10 nM) antagonised methoxamine concentration-response curves with a pKB of 9.76. Trovafloxacin (1-30 μM) had no effect on either the thromboxane mimetic (U46619) or endothelin-1 concentration-contraction curves. Interestingly, the concentration range is similar for trovafloxacin antagonising the 3 distinct pharmacological targets: (i) fourth generation fluroquinolone antibiotic, (ii) pannexin-1 channel inhibitor in apoptotic cells, and now (iii) as an alpha(1)-adrenoceptor antagonist. When trovafloxacin was in use clinically, CNS side effects of dizziness, flushing and headache consistent with alpha(1)-adrenoceptor antagonism were common."

According to the news reporters, the research concluded: "We conclude that trovafloxacin with its quinolone moiety is a weak alpha(1)-adrenoceptor competitive antagonist in comparison with prazosin."

Our news correspondents report that additional information may be obtained by contacting J.A. Angus, University of Melbourne, Dept. of Pharmacol & Therapeut, Cardiovasc Therapeut Unit, Melbourne, Vic 3010, Australia.

Drugs and Therapies - Antibiotics

New Antibiotics Findings Has Been Reported by Investigators at Northwestern Memorial Hospital (Evaluation of Vancomycin Exposures Associated with Elevations in Novel Urinary Biomarkers of Acute Kidney Injury in Vancomycin-Treated Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news reporting originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Vancomycin has been associated with acute kidney injury (AKI). However, the pharmacokinetic/toxicodynamic relationship for AKI is not well defined.

Funders for this research include HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID), HHS | NIH | National Institute of General Medical Sciences (NIGMS).
Our news editors obtained a quote from the research from Northwestern Memorial Hospital, "Allometrically scaled vancomycin exposures were used to assess the relationship between vancomycin exposure and AKI. Male Sprague-Dawley rats received clinical-grade vancomycin in normal saline (NS) as intraperitoneal (i.p.) injections for 24- to 72-h durations with doses ranging 0 to 200 mg/kg of body weight divided once or twice daily. Urine was collected over the protocol's final 24 h. Renal histopathology was qualitatively scored. Urinary biomarkers (e.g., cystatin C, clusterin, kidney injury molecule 1 [KIM-1], osteopontin, lipocalin 2/neutrophil gelatinase-associated lipocalin 2) were assayed using a Luminex xMAP system. Plasma vancomycin concentrations were assayed by high-performance liquid chromatography with UV detection. A three-compartment vancomycin pharmacokinetic model was fit to the data with the Pmetrics package for R. The exposure-response in the first 24 h was evaluated using Spearman's nonparametric correlation coefficient (r(s)) values for the area under the concentration-time curve during the first 24 h (AUC(0-24)), the maximum concentration in plasma during the first 24 h (Cmax0-24), and the lowest (minimum) concentration in plasma after the dose closest to 24 h (Cmin0-24). A total of 52 rats received vancomycin (n = 42) or NS (n = 10). The strongest exposure-response correlations were observed between AUC(0-24) and Cmax0-24 and urinary AKI biomarkers. Exposure-response correlations (r(s) values) for AUC (0-24), Cmax0-24, and Cmin0-24 were 0.37, 0.39, and 0.22, respectively, for clusterin; 0.42, 0.45, and 0.26, respectively, for KIM-1; and 0.52, 0.55, and 0.42, respectively, for osteopontin. However, no differences in histopathological scores were observed. Optimal sampling times after administration of the i.p. dose were 0.25, 0.75, 2.75, and 8 h for the once-daily dosing schemes and 0.25, 1.25, 14.5, and 17.25 h for the twice-daily dosing schemes."

According to the news editors, the research concluded: "Our observations suggest that AUC(0-24) or Cmax0-24 correlates with increases in urinary AKI biomarkers."

The news editors report that additional information may be obtained by contacting M.H. Scheetz, Northwestern Mem Hosp, Dept. of Pharm, Chicago, IL 60611, United States. Additional authors for this research include W.C. Prozialeck, T.P. Lodise, N. Venkatesan, J.N. O'Donnell, G. Pais, C. Cluff, P.C. Lamar, M.N. Neely, A. Gulati and M.H. Scheetz.

New Antibiotics Findings Has Been Reported by Investigators at Public Hospital System (Determination of Colistin and Colistimethate Levels in Human Plasma and Urine by High-Performance Liquid Chromatography-Tandem Mass Spectrometry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antibiotics is now available. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "Colistin is a polypeptide antibiotic from the polymyxin E group used for the treatment of infections caused by multidrug-resistant gram-negative bacteria. The main constituents, accounting for approximately 85% of this mixture, are colistin A (polymyxin E1) and colistin B (polymyxin E2)."

The news reporters obtained a quote from the research from Public Hospital System, "The aim of this study was to develop and validate new and fast methods of quantification of colistin A and B and its precursors [colistin methanesulfonate sodium (CMS) A and B] by ultraperformance liquid chromatography-tandem mass spectrometry in plasma and urine with short pretreatment and run times. Chromatography was performed on an Acquity UPLC-MS/MS system (WATERS) with a WATERS Acquity UPLC C18 column (4.6 x 150 mm, 3.5 mm particle size). The pretreatment of samples consists of precipitation and extraction into microcolumns plate and HLB 96-well plate 30 mm-30 mg (OASIS) with a Positive Pressure-96 (WATERS). Quantification was performed using a multiple reaction monitoring of the following transitions: m/z 390.9/385.1 for colistin A, m/z 386.2/101.0 for colistin B, and m/z 602.4/241.1 for polymyxin B1 sulfate. In plasma and urine, calibration curves were linear from 30 to 6000 ng/mL for colistin A and from 15 to 3000 ng/mL for colistin B. With an acceptable accuracy and precision, the lower limit of quantification were set at 24.0 ng/mL and 12.0 ng/mL for colistin A and B in plasma, and at 18.0 ng/mL and 9.0 ng/mL for colistin A and B in urine. These LC-MS/MS methods of quantification for colistin A and B and its precursors (CMS A and B) in plasma and urine are fast, simple, specific, sensitive, accurate, precise, and reliable. Furthermore, they are linear and repeatable."

According to the news reporters, the research concluded: "These procedures were successfully applied to a pharmacokinetic study of a critically ill patient suffering from ventilator-associated pneumonia, who was treated with nebulized CMS."

For more information on this research see: Determination of Colistin and Colistimethate Levels in Human Plasma and Urine by High-Performance Liquid Chromatography-Tandem Mass Spectrometry. Therapeutic Drug Monitoring, 2016;38(6):796-803. Therapeutic Drug Monitoring can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Drugs and Therapies - Antibiotics**

**New Antibiotics Findings from Baylor University College of Medicine Described (Nonprescription Antimicrobial Use in a Primary Care Population in the United States)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antibiotics is now available. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Community antimicrobial resistance rates are high in communities with frequent use of nonprescription antibiotics. Studies addressing nonprescription antibiotic use in the United States have been restricted to Latin American immigrants."

Our news editors obtained a quote from the research from the Baylor University College of Medicine, "We estimated the prevalence of nonprescription antibiotic use in the previous 12 months as well as intended use (intention to use antibiotics without a prescription) and storage of antibiotics and examined patient characteristics associated with nonprescription use in a random sample of adults. We selected private and public primary care clinics that serve ethnically and socioeconomiclly diverse patients. Within the clinics, we used race/ethnicity-stratified systematic random sampling to choose a random sample of primary care patients. We used a self-administered standardized questionnaire on antibiotic use. Multivariate regression analysis was used to identify independent predictors of nonprescription use. The response rate was 94%. Of 400 respondents, 20 (5%) reported nonprescription use of systemic antibiotics in the last 12 months, 102 (25.4%) reported intended use, and 57 (14.2%) stored antibiotics at home. These rates were similar across race/ethnicity groups. Sources of antibiotics used without prescriptions or stored for future use were stores or pharmacies in the United States, 'leftover' antibiotics from previous prescriptions, antibiotics obtained abroad, or antibiotics obtained from a relative or friend. Respiratory symptoms were common reasons for the use of nonprescription antibiotics. In multivariate analyses, public clinic patients, those with less education, and younger patients were more likely to endorse intended use. The problem of nonprescription use is not confined to Latino communities."

According to the news editors, the research concluded: "Community antimicrobial stewardship must include a focus on nonprescription antibiotics."

For more information on this research see: Nonprescription Antimicrobial Use in a Primary Care Population in the United States. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5527-5532. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news editors report that additional information may be obtained by contacting L. Grigoryan, Baylor College of Medicine, Dept. of Family & Community Med, Houston, TX 77030, United States. Additional authors for this research include L. Grigoryan, S. Nash and B.W. Trautner.

Drugs and Therapies - Antibiotics

New Antibiotics Findings from Chinese University of Hong Kong
Reported (Fabrication of doxorubicin nanoparticles by controlled
antisolvent precipitation for enhanced intracellular delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Current study results on Drugs and Therapies - Antibiotics have been
published. According to news reporting out of Hong Kong, People's Republic of China, by
NewsRx editors, research stated, "Over-expression of ATP-binding cassette transporters is one
of the most important mechanisms responsible for multidrug resistance. Here, we aimed to
develop a stable polymeric nanoparticle system by flash nanoprecipitation (FNP) for enhanced
anticancer drug delivery into drug resistant cancer cells."

Financial support for this research came from Chinese University of Hong Kong.

Our news journalists obtained a quote from the research from the Chinese University
of Hong Kong, "As an antisolvent precipitation process, FNP works best for highly lipophilic
solute (log P> 6). Thus we also aimed to evaluate the applicability of FNP to drugs with
relatively low lipophilicity (log P = 1-2). To this end, doxorubicin (DOX), an anthracycline
anticancer agent and a P-gp substrate with a logP of 1.3, was selected as a model drug for the
assessment. DOX was successfully incorporated into the amphiphilic diblock copolymer,
polyethylene glycol-b-polyactic acid (PEG-b-PLA), by FNP using a four stream multi-inlet
vortex mixer. Optimization of key processing parameters and co-formulation with the co-
stabilizer, polyvinylpyrrolidone, yielded highly stable, roughly spherical DOX-loaded PEG-b-
PLA nanoparticles (DOX.NP) with mean particle size below 100 nm, drug loading up to 14%,
and drug encapsulation efficiency up to 49%. DOX.NP exhibited a pH-dependent drug release
profile with higher cumulative release rate at acidic pHs. Surface analysis of DOX.NP by XPS
revealed an absence of DOX on the particle surface, indicative of complete drug encapsulation.
While there were no significant differences in cytotoxic effect on P-gp over-expressing
LCC6/MDR cell line between DOX.NP and free DOX in buffered aqueous media, DOX.NP
exhibited a considerably higher cellular uptake and intracellular retention after efflux."

According to the news editors, the research concluded: "The apparent lack of
cytotoxicity enhancement with DOX.NP may be attributable to its slow DOX release inside the
cells."

For more information on this research see: Fabrication of doxorubicin nanoparticles
by controlled antisolvent precipitation for enhanced intracellular delivery. *Colloids and
Surfaces B-Biointerfaces*, 2016;139():249-258. *Colloids and Surfaces B-Biointerfaces* can be

Drugs and Therapies - Antibiotics

New Antibiotics Study Findings Have Been Reported by Researchers at University of Lyon (Impact of untreated urban waste on the prevalence and antibiotic resistance profiles of human opportunistic pathogens in agricultural soils from Burkina Faso)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a new report. According to news reporting out of Villeurbanne, France, by NewsRx editors, research stated, "This study examined the long-term effects of the landfill disposal of untreated urban waste for soil fertilization on the prevalence and antibiotic resistance profiles of various human opportunistic pathogens in soils from Burkina Faso. Samples were collected at three sites in the periphery of Ouagadougou during two campaigns in 2008 and 2011."

Our news journalists obtained a quote from the research from the University of Lyon, "At each site, amendment led to changes in physico-chemical characteristics as shown by the increase in pH, CEC, total C, total N, and metal contents. Similarly, the numbers of total heterotrophic bacteria were higher in the amended fields than in the control ones. No sanitation indicators, i.e., coliforms, Staphylococci, and Enterococci, were detected. Pseudomonas aeruginosa and Burkholderia cepacia complex (Bcc) were detected at a low level in one amended field. Stenotrophomonas maltophilia was detected from both campaigns at the three sites in the amended fields and only once in an unamended field. Diversity analysis showed some opportunistic pathogen isolates to be closely related to reference clinical strains responsible for nosocomial- or community-acquired infections in Northern countries. Antibiotic resistance tests showed that P. aeruginosa and Bcc isolates had a wild-type phenotype and that most S. maltophilia isolates had a multi-drug resistance profile with resistance to 7 to 15 antibiotics. Then we were able to show that amendment led to an increase of some human opportunistic pathogens including multi-drug resistant isolates."

According to the news editors, the research concluded: "Although the application of untreated urban waste increases both soil organic matter content and therefore soil fertility, the consequences of this practice on human health should be considered."

For more information on this research see: Impact of untreated urban waste on the prevalence and antibiotic resistance profiles of human opportunistic pathogens in agricultural soils from Burkina Faso. Environmental Science and Pollution Research, 2016;23(24):25299-
New Antibiotics Study Findings Have Been Reported by Researchers at University of Santiago (First Multitarget Chemo-Bioinformatic Model To Enable the Discovery of Antibacterial Peptides against Multiple Gram-Positive Pathogens)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antibiotics. According to news originating from Santiago de Compostela, Spain, by NewsRx correspondents, research stated, "Antimicrobial peptides (AMPs) have emerged as promising therapeutic alternatives to fight against the diverse infections caused by different pathogenic microorganisms. In this context, theoretical approaches in bioinformatics have paved the way toward the creation of several in silico models capable of predicting antimicrobial activities of peptides."

Financial support for this research came from European Regional Development Fund.

Our news journalists obtained a quote from the research from the University of Santiago, "All current models have several significant handicaps, which prevent the efficient search for highly active AMPs. Here, we introduce the first multitarget (mt) chemobioinformatic model devoted to performing alignment-free prediction of antibacterial activity of peptides against multiple Gram-positive bacterial strains. The model was constructed from a data set containing 2488 cases of AMPs sequences assayed against at least 1 out of 50 Gram-positive bacterial strains. This mt-chemo-bioinformatic model displayed percentages of correct classification higher than 90.00% in both training and prediction (test) sets. For the first time, two computational approaches derived from basic concepts in genetics and molecular biology were applied, allowing the calculations of the relative contributions of any amino acid (in a defined position) to the antibacterial activity of an AMP and depending on the bacterial strain used in the biological assay."

According to the news editors, the research concluded: "The present mt-chemo-bioinformatic model constitutes a powerful tool to enable the discovery of potent and versatile AMPs."

For more information on this research see: First Multitarget Chemo-Bioinformatic Model To Enable the Discovery of Antibacterial Peptides against Multiple Gram-Positive

The news correspondents report that additional information may be obtained from A. Speck-Planche, Dept. of Applied Physics, University of Santiago de Compostela (USC), 15782 Santiago de Compostela, Spain. Additional authors for this research include V.V. Kleandrova, J.M. Ruso and M.N Cordeiro.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.jcim.5b00630. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antibiotics

New Antibiotics Study Findings Have Been Reported from Peking University (The Promising Nanocarrier for Doxorubicin and siRNA Co-delivery by PDMAEMA-based Amphiphilic Nanomicelles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antibiotics have been published. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Synergistic effects of anticancer drug and siRNA have displayed superior advantages for cancer therapy. Herein, we deeply analyzed the feasibility that whether doxorubicin (DOX) and siRNA could be co-delivered by mPEG-PCL-graft-PDMAEMA (PECD) micelles, which mediated excellent DNA/siRNA delivery in vitro and in vivo reported in our previous work."

Financial supporters for this research include Ministry of Science and Technology of the People's Republic of China, National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from Peking University, "DOX-loaded NPs (PECD-D) were developed by nanoprecipitation technology and exhibited high drug loading content (DLC, 9.5%). In vitro cytotoxicity study in MDA-MB-231 cells, PECD-D treated groups had lower IC[50] compared to free DOX groups (F-DOX) at different transfection time (24, 48, and 72h), which maybe attribute to its high cellular uptake and endosomal escape properties. The speculation was confirmed with the results of drug release profile in acidic media, flow cytometry analysis and confocal images. Futhermore, Cy5 labeled siRNA was introduced in PECD-D micelles (PECD-D/siRNA) to track the behavior of dual-loaded nanodrug in vitro and in vivo. Flow cytometry analysis presented that DOX and siRNA were successfully co-delivered into cells, the positive cells ratio were 94.6 and 99.5%, respectively. Confocal images showed that not only DOX and siRNA existed in cytoplasm, but DOX traversed endosome/lysosome and entered into cell nucleus. For in vivo tumor-targeting evaluation in BALB/c nude mice, both DOX and Cy5-siRNA could be detected in tumor sites after intravenous injection with PECD-D/siRNA formulation."

According to the news reporters, the research concluded: "Therefore, we believed
that PECD micelles have a potential ability as DOX and siRNA co-delivery carrier for cancer therapy."

Our news journalists report that additional information may be obtained by contacting Q. Cheng, Laboratory of Nucleic Acid Technology, Institute of Molecular Medicine, Peking University, Beijing 100871, People's Republic of China. Additional authors for this research include L. Du, L. Meng, S. Han, T. Wei, X. Wang, Y. Wu, X. Song, J. Zhou, S. Zheng, Y. Huang, X.J. Liang, H. Cao, A. Dong and Z. Liang.

Drugs and Therapies - Antibiotics

New Antibiotics Study Findings Recently Were Reported by Researchers at University of Messina (Tunable doxorubicin release from polymer-gated multiwalled carbon nanotubes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antibiotics is now available. According to news originating from Messina, Italy, by NewsRx correspondents, research stated, "Two pH and temperature controlled drug delivery systems for cancer therapy are here reported by using vapour phase and liquid phase functionalized multiwalled carbon nanotubes (MWCNT). Both oxidized MWCNT were functionalized at the carboxyl groups with a short hydrophilic polyethylene glycol (PEG) chain."

Our news journalists obtained a quote from the research from the University of Messina, "The nanosystems were loaded with doxorubicin and covered with the biocompatible polymer polyactide, able to form hydrogen bonding with PEG and to entrap the drug inside the two polymeric chains. The different oxidative reaction conditions of MWCNT have demonstrated to deeply affect their agglomeration ability and the available reactive surface area for drug loading which in turn, affected the drug release abilities of the synthesized polymer-gated drug delivery systems. The in vitro release abilities as well as their antiproliferative effect on three different human cancer cell lines were evaluated and compared, highlighting the possibility to tune the amount of drug released by controlling the functionalization degree of the carbon nanotube based material."

According to the news editors, the research concluded: "Biological tests highlighted the high biocompatibility of both systems and their ability to deliver doxorubicin to cancer cells."

The news correspondents report that additional information may be obtained from D. Iannazzo, University of Messina, Dept. of Engn, I-98166 Messina, Italy. Additional authors for this research include D. Iannazzo, S. Ansari, C. Milone, M. Salamo, S. Galvagno, S. Cirmi and M. Navarra.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.010. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Antibiotics**

**New Antibiotics Study Results Reported from Jichi Medical University (Improvement of Predictivity of Teicoplanin Serum Trough Concentrations at Steady State Calculated by Vancomycin Pharmacokinetic Parameter)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antibiotics are presented in a new report. According to news originating from Tochigi, Japan, by NewsRx correspondents, research stated, "According to a recent study and meta-analysis, trough levels of >10 μg/mL teicoplanin (TEIC) may be acceptable for the treatment of uncomplicated infection, but no method of TEIC personalized medicine has been established. Vancomycin (VCM) and TEIC are glycopeptide antibiotic agents effective against methicillin-resistance Staphylococcus aureus."

Our news journalists obtained a quote from the research from Jichi Medical University, "This study aimed to establish TEIC personalized medicine at a steady state calculated by VCM pharmacokinetic parameters. Bayesian forecasting and population mean methods were employed to estimate individual total VCM clearance (CL) using existing population pharmacokinetics (PPK) parameter, and the differences between the CL calculated by these two methods were defined as Delta CL. Serum drug concentration data for patients treated with TEIC were collected at a steady state concentration (>96 h post infusion). There was a significant relationship between the prediction error of TEIC trough level and Delta CL. The relation between Delta CL and TEIC trough concentration at steady state was used to develop the following equation to determine the maintenance dose: TEIC (μg/mL) =1.1119X-6.124 Delta CL+3.9164 (Xis defined as TEIC trough concentration calculated from the PPK parameter)."

According to the news editors, the research concluded: "The results of this study
indicated that it is possible to improve the prediction error of TEIC trough concentration at a steady state for patients who have received VCM therapy."

The news correspondents report that additional information may be obtained from R. Kobayashi, Jichi Med Univ Hosp, Dept. of Pharm, Shimotsuke, Tochigi 3290498, Japan. Additional authors for this research include S. Otomo, Y. Shiba, K. Ebinuma and T. Sudoh.

**Drugs and Therapies - Antibiotics**

**New Antibiotics Study Results Reported from McMaster University (A diverse intrinsic antibiotic resistome from a cave bacterium)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news reporting out of Hamilton, Canada, by NewsRx editors, research stated, "Antibiotic resistance is ancient and widespread in environmental bacteria. These are therefore reservoirs of resistance elements and reflective of the natural history of antibiotics and resistance."

Our news journalists obtained a quote from the research from McMaster University, "In a previous study, we discovered that multi-drug resistance is common in bacteria isolated from Lechuguilla Cave, an underground ecosystem that has been isolated from the surface for over 4 Myr. Here we use whole-genome sequencing, functional genomics and biochemical assays to reveal the intrinsic resistome of *Paenibacillus* sp. LC231, a cave bacterial isolate that is resistant to most clinically used antibiotics. We systematically link resistance phenotype to genotype and in doing so, identify 18 chromosomal resistance elements, including five determinants without characterized homologues and three mechanisms not previously shown to be involved in antibiotic resistance."

According to the news editors, the research concluded: "A resistome comparison across related surface *Paenibacillus* affirms the conservation of resistance over millions of years and establishes the longevity of these genes in this genus."

For more information on this research see: A diverse intrinsic antibiotic resistome from a cave bacterium. *Nature Communications*, 2016;7(1):1-10. *Nature Communications* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW,
New Antibiotics Study Results Reported from Princeton University
(Rapid emergence and mechanisms of resistance by U87 glioblastoma cells to doxorubicin in an in vitro tumor microfluidic ecology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a new report. According to news originating from Princeton, New Jersey, by NewsRx correspondents, research stated, "In vitro prediction of the probable rapid emergence of resistance to a drug in tumors could act to winnow out potential candidates for further costly development. We have developed a microfluidic device consisting of similar to 500 hexagonal microcompartments that provides a complex ecology with wide ranges of drug and nutrient gradients and local populations."

Financial supporters for this research include HHS | NIH | National Cancer Institute (NCI), National Research Foundation Korea, Technology Innovation Program Republic of Korea.

Our news journalists obtained a quote from the research from Princeton University, "This ecology of a fragmented metapopulation induced the drug resistance in stage IV U87 glioblastoma cells to doxorubicin in 7 d. Exome and transcriptome sequencing of the resistant cells identified mutations and differentially expressed genes. Gene ontology and pathway analyses of the genes identified showed that they were functionally relevant to the established mechanisms of doxorubicin action. Specifically, we identified (i) a frame-shift insertion in the filamin-A gene, which regulates the influx and efflux of topoisomerase II poisons; (ii) the overexpression of aldo-keto reductase enzymes, which convert doxorubicin into doxorubicinol; and (iii) activation of NF-kappa B via alterations in the nucleotide-binding oligomerization domain (NOD)-like receptor signaling pathway from mutations in three genes (CARD6, NSD1, and NLRP13) and the overexpression of inflammatory cytokines. Functional experiments support the in silico analyses and, together, demonstrate the effects of these genetic changes."

According to the news editors, the research concluded: "Our findings suggest that, given the rapid evolution of resistance and the focused response, this technology could act as a rapid screening modality for genetic aberrations leading to resistance to chemotherapy as well as counter selection of drugs unlikely to be successful ultimately."

For more information on this research see: Rapid emergence and mechanisms of resistance by U87 glioblastoma cells to doxorubicin in an in vitro tumor microfluidic ecology.
New Anticholinergics Data Have Been Reported by Investigators at Zhejiang University (Benzoate fraction from Gentiana rigescens Franch alleviates scopolamine-induced impaired memory in mice model in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Anticholinergics have been presented. According to news reporting from Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "Ethnopharmacological relevance: G. rigescens Franch (Long Dan Cao in Chinese) is a well-known TCM herb. It is clinically used with other drugs for the treatment of brain diseases such as epilepsy, postherpetic neuralgia in China."

Financial supporters for this research include Science and Technology of Yunnan Province, International Science and Technology Cooperation Program of China, National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from Zhejiang University, "Aim of study: In our previous study, 11 dihydroxybenzoate compounds with NGF mimicking activity from G. rigescens Franch were found. In the present study, the neurogenesis and neuroprotection of a mixture of benzoates (n-GS) were investigated in animal level. The NGF mimicking activity of n-GS from G. rigescens Franch was examined in PC12 cells. The neurogenesis effects of n-GS were investigated in ICR mice with 5-bromo-2-deoxyuridine (BrdU) and neuronal nuclei (NeuN) double immunostaining. Furthermore, the neuroprotection effects of n-GS on the memory in a scopolamine (SCO)-induced mouse model were evaluated with animal behavior tests. The NGF-mimicking function and neurogenesis of n-GS were observed in PC12 cells and in normal mice. Subsequently, we investigated the effects of n-GS on the memory in a SCO-induced mouse model. In Y-maze test, SCO significantly lowered the alternation. This finding was reversed by n-GS and donepezil (DONE). SCO significantly
impaired the mice's performance in novel object recognition (NOR) and Morris water maze (MWM) tests. The time spent to explore the novel object was longer in the n-GS- and DONE treated groups than in the SCO control group. In the MWM test, the escape latency of n-GS- and DONE treated groups was shorter than that of the SCO control group. Mechanism study showed that SCO significantly reduced superoxide dismutase (SOD) but increased the activities of acetylcholinesterase (AChE) and the levels of malondialdehyde (MDA) in the hippocampus and cerebral cortex, which all can be improved by n-GS and DONE. Additionally, the phosphorylation of type 1 insulin-like growth factor (IGF-1) receptor, extracellular signal-regulated kinase (ERK), and CAMP responsive element-binding (CREB) protein in the hippocampus was significantly up-regulated in the treatment group compared with that in the SCO group.

According to the news reporters, the research concluded: "N-GS could alleviate impaired memory of the SCO-induced mouse model by inhibiting AChE activity and oxidative stress, and regulating the IGF-1R/ERK signaling pathway."

Our news journalists report that additional information may be obtained by contacting L. Xiang, Zhejiang University, Coll Pharmaceut Sci, Hangzhou, Zhejiang, People's Republic of China. Additional authors for this research include L.J. Gao, K.Y. Sun, D. Xiao, W.Y. Li, L. Xiang and J.H. Qi.

**Drugs and Therapies - Antidepressants**

**New Antidepressants Findings from Swiss Federal Institute of Technology Described (Solar photo-Fenton and UV/H2O2 processes against the antidepressant Venlafaxine in urban wastewaters and human urine. Intermediates formation and ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antidepressants have been presented. According to news reporting from Lausanne, Switzerland, by NewsRx journalists, research stated, "In this work, the use of Advanced Oxidation Processes (AOPs) against the degradation of an emerging contaminant has been subjected under systematic investigation. The optimization of treatment of the antidepressant drug Venlafaxine (VFA) was performed, using
UV light, the combined UV/H2O2 process, solar light, Fenton and finally the solar photo-Fenton process in laboratory scale."

Funders for this research include Swiss Agency for Development and Cooperation, Swiss National Foundation for the Research for Development Grant.

The news correspondents obtained a quote from the research from the Swiss Federal Institute of Technology, "The degradation kinetics, the time necessary to remove 90% of the contaminant and the optimal reactants concentration were proposed. The treatment in pure water, (synthetic) wastewater and urine was assessed, in an effort to identify the opportunities and pitfalls the application of process would encounter in a field application. Treatment by the UV-based methods was found sufficiently efficient and the application of the solar photo-Fenton process showed feasibility in a potential field application with appropriate context. Real urban wastewater effluents after biological and physicochemical treatment were tested, as well as human urine, as a proposal for on-site collection and treatment was also treated. Biological treatment before applying the tested AOPs improved their efficiency, and the strategy of diluting urine prior to treatment greatly enhanced the efficacy of the process."

According to the news reporters, the research concluded: "Finally, the identification of the degradation pathway and the biodegradability tests of AOPs treated VFA solutions exhibit promising results concerning the strategy of treatment for similar pollutants of emerging concern."

For more information on this research see: Solar photo-Fenton and UV/H2O2 processes against the antidepressant Venlafaxine in urban wastewaters and human urine. Intermediates formation and biodegradability assessment. Chemical Engineering Journal, 2017;308():492-504. Drugs and Therapies - Antiepileptics

New Antiepileptics Data Have Been Reported by Researchers at University of Helsinki Central Hospital (Evidence for spared attention to faces in 7-month-old infants after prenatal exposure to antiepileptic drugs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antiepileptics have been presented.
According to news reporting out of Helsinki, Finland, by NewsRx editors, research stated, "Prenatal antiepileptic drug (AED) exposure is associated with an increased risk of cognitive impairment and autism spectrum disorders detected mainly at the age of two to six years. We examined whether the developmental aberrations associated with prenatal AED exposure could be detected already in infancy and whether effects on visual attention can be observed at this early age."

Funders for this research include Foundation for Pediatric Research, Arvo and Leo Ylppö Foundation, Lastenlinna Foundation, Juselius Foundation, Marta Donner Foundation, Paivikki and Sakari Sohlberg Foundation, Academy of Finland, Finnish Cultural Foundation.

Our news journalists obtained a quote from the research from the University of Helsinki Central Hospital, "We compared a prospective cohort of infants with in utero exposure to AED (n = 56) with infants without drug exposures (n = 62). The assessments performed at the age of seven months included standardized neurodevelopmental scores (Griffiths Mental Developmental Scale and Hammersmith Infant Neurological Examination) as well as a novel eye-tracking-based test for visual attention and orienting to faces. Background information included prospective collection of AED exposure data, pregnancy outcome, neuropsychological evaluation of the mothers, and information on maternal epilepsy type. Carbamazepine, oxcarbazepine, and valproate, but not lamotrigine or levetiracetam, were associated with impaired early language abilities at the age of seven months. The general speed of visuospatial orienting or attentional bias for faces measured by eye-tracker-based tests did not differ between AED-exposed and control infants. Our findings support the idea that prenatal AED exposure may impair verbal abilities, and this effect may be detected already in infancy."

According to the news editors, the research concluded: "In contrast, the early development of attention to faces was spared after in utero AED exposure."

For more information on this research see: Evidence for spared attention to faces in 7-month-old infants after prenatal exposure to antiepileptic drugs. *Epilepsy & Behavior*, 2016;64();62-68. *Epilepsy & Behavior* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Epilepsy & Behavior - www.journals.elsevier.com/epilepsy-and-behavior/)

Our news journalists report that additional information may be obtained by contacting M. Videman, Helsinki Univ Hosp, Helsinki, Finland. Additional authors for this research include S. Stjerna, R. Roivainen, T. Nybo, S. Vanhatalo, E. Gaily and J.M. Leppanen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.yebeh.2016.09.023. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Antifungals**

**New Antifungals Findings Reported from Federal University (Drug utilization study of systemic antifungal agents in a Brazilian tertiary care hospital)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antifungals is now available. According to news reporting originating in Belo Horizonte, Brazil, by NewsRx journalists, research stated, "The inappropriate use of systemic antifungal agents can result in unnecessary exposure, adverse events, increased microbial resistance and increased costs. This study analysed the use of systemic antifungal agents and adherence to treatment guidelines for fungal infections."

The news reporters obtained a quote from the research from Federal University, "A Brazilian tertiary hospital. This cross-sectional study investigated 183 patients who were treated with systemic antifungals. Antifungal drugs were classified according to the fourth level of the Anatomical Therapeutic Chemical classification system. The appropriateness of treatments was analysed with respect to the indication, dose and potential drug-drug interactions. Descriptive and univariate statistical analyses were performed. The main outcome measure was the frequency of adherence to treatment guidelines for fungal infections. The number of established treatments was 320, with 163 (50.9 %) pre-emptive, 63 (19.7 %) targeted, 56 (17.5 %) empirical and 38 (11.9 %) prophylactic treatments. The overall adherence to the treatment guidelines was 29.4 %. The proportion of appropriate treatment considering indication, dosage and drug-drug interactions was 84.1, 67.8 and 47.2 %, respectively. The most commonly prescribed systemic antifungal agents were fluconazole in 170 (53.1 %), voriconazole in 43 (13.4 %) and amphotericin B deoxycholate in 36 (11.3 %) cases. The study showed a low proportion of appropriate antifungal drug use; the dosage and drug-drug interactions criteria were the determining factors for the high percentage of non-adherence to treatment guidelines in the hospital."

According to the news reporters, the research concluded: "The profile of antifungal agents used showed the predominance of fluconazole as well as the use of new antifungal drugs."

Our news correspondents report that additional information may be obtained by contacting A.M.M. Reis, Federal University of Minas Gerais, Fac Farm, Belo Horizonte, MG, Brazil. Additional authors for this research include A.G. dos Santos and A.M.M. Reis.

New Antifungals Findings from University of Liege Discussed
(Continuous production of itraconazole-based solid dispersions by hot melt extrusion: Preformulation, optimization and design space determination)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antifungals. According to news reporting from Liege, Belgium, by NewsRx journalists, research stated, "The purpose of this work was to increase the solubility and the dissolution rate of itraconazole, which was chosen as the model drug, by obtaining an amorphous solid dispersion by hot melt extrusion. Therefore, an initial preformulation study was conducted using differential scanning calorimetry, thermogravimetric analysis and Hansen's solubility parameters in order to find polymers which would have the ability to form amorphous solid dispersions with itraconazole."

Financial support for this research came from WBGreen convention.

The news correspondents obtained a quote from the research from the University of Liege, "Afterwards, the four polymers namely Kollidon ® VA64, Kollidon ® 12PF, Affinisol ® HPMC and Soluplus ®, that met the set criteria were used in hot melt extrusion along with 25 wt.% of itraconazole. Differential scanning confirmed that all four polymers were able to amorphize itraconazole. A stability study was then conducted in order to see which polymer would keep itraconazole amorphous as long as possible. Soluplus ® was chosen and, the formulation was fine-tuned by adding some excipients (AcDiSol ®, sodium bicarbonate and poloxamer) during the hot melt extrusion process in order to increase the release rate of itraconazole. In parallel, the range limits of the hot melt extrusion process parameters were determined. A design of experiment was performed within the previously defined ranges in order to optimize simultaneously the formulation and the process parameters. The optimal formulation was the one containing 2.5 wt.% of AcDiSol ® produced at 155 degrees C and 100 rpm. When tested with a biphasic dissolution test, more than 80% of itraconazole was released in the organic phase after 8 h. Moreover, this formulation showed the desired thermoformability value. From these results, the design space around the optimum was determined. It corresponds to the limits within which the process would give the optimized product."

According to the news reporters, the research concluded: "It was observed that a temperature between 155 and 170 degrees C allowed a high flexibility on the screw speed, from about 75 to 130 rpm."

Our news journalists report that additional information may be obtained by contacting J. Thiry, University of Liege, Dept. of Pharm, CIRM, Lab Pharmaceut Technol & Biopharm, B-4000 Liege, Belgium. Additional authors for this research include P. Lebrun, C. Vinassa, M. Adam, L. Netchacovitch, E. Ziemons, P. Hubert, F. Krier and B. Evrard.

New Antifungals Study Findings Have Been Reported by Investigators at Consejo Nacl Invest Cient and Tecn (Aspergillus fumigatus Intrinsic Fluconazole Resistance Is Due to the Naturally Occurring T301I Substitution in Cyp51Ap)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antifungals have been published. According to news reporting originating in Santa Fe, Argentina, by NewsRx journalists, research stated, "Aspergillus fumigatus intrinsic fluconazole resistance has been demonstrated to be linked to the CYP51A gene, although the precise molecular mechanism has not been elucidated yet. Comparisons between A. fumigatus Cyp51Ap and Candida albicans Erg11p sequences showed differences in amino acid residues already associated with fluconazole resistance in C. albicans. The aim of this study was to analyze the role of the natural polymorphism I301 in Aspergillus fumigatus Cyp51Ap in the intrinsic fluconazole resistance phenotype of this pathogen."

Financial supporters for this research include Consejo Nacional de Investigaciones Cientificas y Tecnicas (CONICET), Ministerio de Ciencia, Tecnologia e Innovacion Productiva (MINCyT).

The news reporters obtained a quote from the research from Consejo Nacl Invest Cient and Tecn, "The I301 residue in A. fumigatus Cyp51Ap was replaced with a threonine (analogue to T315 at Candida albicans fluconazole-susceptible Erg11p) by changing one single nucleotide in the CYP51A gene. Also, a CYP51A knockout strain was obtained using the same parental strain. Both mutants' antifungal susceptibilities were tested. The I301T mutant exhibited a lower level of resistance to fluconazole (MIC, 20 µg/ml) than the parental strain (MIC, 640 µg/ml), while no changes in MIC were observed for other azole- and non-azole-based drugs."

According to the news reporters, the research concluded: "These data strongly implicate the A. fumigatus Cyp51Ap I301 residue in the intrinsic resistance to fluconazole."

Our news correspondents report that additional information may be obtained by contacting G. Garcia-Effron, Consejo Nacl Invest Cient & Tecn, Santa Fe, Argentina. Additional authors for this research include D. Macedo, C. Dudiuk, M.S. Cabeza, S. Gamarra and G. Garcia-Effron.

Drugs and Therapies - Antifungals

New Antifungals Study Findings Have Been Reported from Shujitsu University [Substrate Specificity of Human Cytochrome P450 (CYP) 2C Subfamily and Effect of Azole Antifungal Agents on CYP2C8]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antifungals. According to news reporting from Okayama, Japan, by NewsRx journalists, research stated, "The metabolic activities of aminopyrine N-demethylation and tolbutamide methylhydroxylation by the human hepatic cytochrome P450 (P450 or CYP) 2C subfamily were compared and the effects of azole antifungal agent on the drug-metabolizing activity of CYP2C8 were investigated. Aminopyrine N-demethylation and tolbutamide methylhydroxylation by CYP2C8, CYP2C9, and CYP2C19 were determined by the previous reported methods."

The news correspondents obtained a quote from the research from Shujitsu University, "The effects of five azole antifungal agents, fluconazole, itraconazole, ketoconazole, miconazole, and voriconazole, on the aminopyrine N-demethylation activity by CYP2C8 were investigated. With regard to aminopyrine N-demethylation, CYP2C19 had the lowest Michaelis constant (K-m) and CYP2C8 had the highest maximal velocity (V-max) among the CYP2C subfamily members. The V-max/K-m values for CYP2C8 were the highest, followed by CYP2C19. For tolbutamide methylhydroxylation, the K-m and Vmax for CYP2C19 were three and six times higher than the corresponding values for CYP2C9, and the Vmax/Km value for CYP2C19 was twice that for CYP2C9, whereas hydroxylated tolbutamide formed by CYP2C8 was not detected. Fluconazole, itraconazole, and voriconazole at a concentration of 2 or 10 mu M neither inhibited nor stimulated CYP2C8-mediated aminopyrine N-demethylation activity at substrate concentrations around the K-m (5 mM). However, ketoconazole and miconazole noncompetitively inhibited CYP2C8-mediated aminopyrine N-demethylation with the inhibitory constant values of 1.98 and 0.86 mu M, respectively."

According to the news reporters, the research concluded: "These results suggest that ketoconazole and miconazole might inhibit CYP2C8 clinically."

Our news journalists report that additional information may be obtained by contacting T. Niwa, Shujitsu Univ, Sch Pharm, Naka Ku, Okayama 7038516, Japan.

**Drugs and Therapies - Antifungals**

**New Antifungals Study Findings Reported from Duke Clinical Research Institute (Population Pharmacokinetics of Fluconazole in Premature Infants with Birth Weights Less than 750 Grams)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antifungals. According to news reporting originating in Durham, North Carolina, by NewsRx journalists, research stated, "Fluconazole is an effective agent for prophylaxis of invasive candidiasis in premature infants. The objective of this study was to characterize the population pharmacokinetics (PK) and dosing requirements of fluconazole in infants with birth weights of <750 g. As part of a randomized clinical trial, infants born at <750 g birth weight received intravenous (i.v.) or oral fluconazole at 6 mg/kg of body weight twice weekly."

Financial supporters for this research include HHS | National Institutes of Health (NIH), MOHW | Food and Drug Administration (FDA).

The news reporters obtained a quote from the research from Duke Clinical Research Institute, "Fluconazole plasma concentrations from samples obtained by either scheduled or scavenged sampling were measured using a liquid chromatography-tandem mass spectrometry assay. PK analysis was conducted using NONMEM 7.2. Population PK parameters were allometrically scaled by body weight. Covariates were evaluated by univariable screening followed by multivariable assessment. Fluconazole exposures were simulated in premature infants using the final PK model. A population PK model was developed from 141 infants using 604 plasma samples. Plasma fluconazole PK were best described by a one-compartment model with first-order elimination. Only serum creatinine was an independent predictor for clearance in the final model. The typical population parameter estimate for oral bioavailability in the final model was 99.5%. Scavenged samples did not bias the parameter estimates and were as informative as scheduled samples. Simulations indicated that the study dose maintained fluconazole troughs of >2,000 ng/ml in 80% of simulated infants at week 1 and 59% at week 4 of treatment. Developmental changes in fluconazole clearance are best predicted by serum creatinine in this population."

According to the news reporters, the research concluded: "A twice-weekly dose of 6 mg/kg achieves appropriate levels for prevention of invasive candidiasis in extremely premature infants."

For more information on this research see: Population Pharmacokinetics of Fluconazole in Premature Infants with Birth Weights Less than 750 Grams. Antimicrobial Agents and Chemotherapy, 2016;60(9):5539-5545. Antimicrobial Agents and Chemotherapy
Drugs and Therapies - Antihyperlipidemic Agents

New Antihyperlipidemic Agents Data Have Been Reported by Investigators at Bristol-Myers Squibb [Biliary excretion of pravastatin and taurocholate in rats with bile salt export pump (Bsep) impairment]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antihyperlipidemic Agents are presented in a new report. According to news reporting originating from Princeton, New Jersey, by NewsRx correspondents, research stated, "The bile salt export pump (BSEP) is expressed on the canalicular membrane of hepatocytes regulating liver bile salt excretion, and impairment of BSEP function may lead to cholestasis in humans. This study explored drug biliary excretion, as well as serum chemistry, individual bile acid concentrations and liver transporter expressions, in the SAGE Bsep knockout (KO) rat model."

Our news editors obtained a quote from the research from Bristol-Myers Squibb, "It was observed that the Bsep protein in KO rats was decreased to 15% of that in the wild type (WT), as quantified using LC-MS/MS. While the levels of Ntcp and Mrp2 were not significantly altered, Mrp3 expression increased and Oatp1a1 decreased in KO animals. Compared with the WT rats, the KO rats had similar serum chemistry and showed normal liver transaminases. Although the total plasma bile salts and bile flow were not significantly changed in Bsep KO rats, individual bile acids in plasma and liver demonstrated variable changes, indicating the impact of Bsep KO. Following an intravenous dose of deuterium labeled taurocholic acid (D4-TCA, 2 mg/kg), the D4-TCA plasma exposure was higher and bile excretion was delayed by approximately 0.5 h in the KO rats. No differences were observed for the pravastatin plasma concentration-time profile or the biliary excretion after intravenous administration (1 mg/kg). Collectively, the results revealed that these rats have significantly lower Bsep expression, therefore affecting the biliary excretion of endogenous bile acids and Bsep substrates."

According to the news editors, the research concluded: "However, these rats are able to maintain a relatively normal liver function through the remaining Bsep protein and via the..."
regulation of other transporters."

The news editors report that additional information may be obtained by contacting Y.F. Cheng, Bristol Myers Squibb, Res & Dev, Pharmaceut Candidate Optimizat, Princeton, NJ, United States. Additional authors for this research include C. Freeden, Y.P. Zhang, P. Abraham, H. Shen, D. Wescott, W.G. Humphreys, J.P. Gan and Y.R. Lai.

**Drugs and Therapies - Antihyperlipidemic Agents**

**New Antihyperlipidemic Agents Data Have Been Reported by Researchers at Biochemistry Laboratory (A Cross-Reactivity of Fenofibric Acid With MDMA DRI Assay)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antihyperlipidemic Agents. According to news originating from Clamart, France, by NewsRx correspondents, research stated, "Within the framework of routine fitness examinations, French Air Force military crew underwent urine testing for 3,4 methylenedioxymetamphetamine (MDMA [ecstasy]). The cross-reactivity of a dyslipidemic drug, fenofibrate, with an MDMA immunoassay was studied and confirmed on a large population sample."

Our news journalists obtained a quote from the research from Biochemistry Laboratory, "A 3-year retrospective study was performed on the MDMA DRI Ecstasy Assay on the Unicel DXC 600. In the event of positive test result, a confirmatory testing was carried out by gas chromatography/mass spectrometry (GC/MS) to establish the presence of MDMA. When analysis by GC/MS did not confirm the presence of MDMA, a false-positive result was suspected and the samples were analyzed by high-performance liquid chromatography-mass spectrometry to identify a potential interfering substance. A total of 15,169 urine samples, from 7,803 patients, were tested for 3 years. Of the tested samples, 22 (0.15%) were positive by DRI Ecstasy Assay. None of them were positive by GC/MS. A cross-reactivity of fenofibrate's metabolite with MDMA using this assay was systematically found. Fenofibrate's interference with MDMA immunoassay was confirmed."

According to the news editors, the research concluded: "Fenofibrate being widely prescribed, physicians had to be alerted that this treatment could lead to false-positive results."

For more information on this research see: A Cross-Reactivity of Fenofibric Acid With MDMA DRI Assay. *Military Medicine*, 2016;181(9):1013-1015. *Military Medicine* can be contacted at: Assoc Military Surg Us, 9320 Old Georgetown Rd, Bethesda, MD 20814, USA.
The news correspondents report that additional information may be obtained from S. Bugier, Percy French Military Teaching Hosp, Biochem Lab, F-92140 Clamart, France. Additional authors for this research include C. Garcia-Hejl, P. Vest, J.P. Denis, D. Chianea and C. Renard.

**Drugs and Therapies - Antimicrobials**

**New Antimicrobials Findings from D.M. Meng and Co-Authors Described (Recombinant expression, purification and antimicrobial activity of a novel antimicrobial peptide PaDef in Pichia pastoris)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antimicrobials. According to news originating from College Station, Texas, by NewsRx correspondents, research stated, "The antimicrobial peptide PaDef was isolated from Mexican avocado fruit and was reported to inhibit the growth of Escherichia coli and Staphylococcus aureus in 2013. In this study, an N-terminal 6 x His tagged recombinant PaDef (rPaDef) with a molecular weight of 7.5 KDa, for the first time, was expressed as a secreted peptide in Pichia pastoris."

Funders for this research include Natural Science Foundation of Tianjin City, International Center for Genetic Engineering and Biotechnology, National Natural Science Foundation of China, Science and Technology Commissioner Foundation of Tianjin.

Our news journalists obtained a quote from the research, "The optimal culture condition for rPaDef expression was determined to be incubation with 1.5% methanol for 72 h at 28 degrees C under pH 6.0. Under this condition, the amount of the rPaDef accumulation reached as high as 79.6 mu g per 1 ml of culture medium. Once the rPaDef peptide was purified to reach a 95.7% purity using one-step nickel affinity chromatography, its strong and concentration-dependent antimicrobial activity was detected to be against a broad-spectrum of bacteria of both Gram-negative and Gram-positive. The growth of these bacterial pathogens was almost completely inhibited when the rPaDef peptide was at a concentration of as low as 90 mu g/ml. In summary, our data showed that rPaDef derived from Mexican avocado fruit can be expressed and secreted efficiently when P. pastoris was used as a cell factory."

According to the news editors, the research concluded: "This is the first report on heterologous expression of PaDef in P. pastoris and the approach described holds great promise for antibacterial drug development."

For more information on this research see: Recombinant expression, purification and antimicrobial activity of a novel antimicrobial peptide PaDef in Pichia pastoris. *Protein Expression and Purification*, 2017;130():90-99. *Protein Expression and Purification* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Drugs and Therapies - Antimicrobials

New Antimicrobials Study Findings Have Been Reported by Researchers at Autonomous University (Antimicrobial Activity of Silver Nanoparticles in Polycaprolactone Nanofibers against Gram-Positive and Gram-Negative Bacteria)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antimicrobials are presented in a new report. According to news reporting out of Ciudad Juarez, Mexico, by NewsRx editors, research stated, "Drug-resistance infections have increased extremely quickly in the past years, emerging as a serious health problem in the world. Novel and better antimicrobial agents are still being developed to control associated microorganisms."

Funders for this research include Secretaria de Educacion Publica, Consejo Nacional de Ciencia y Tecnologia.

Our news journalists obtained a quote from the research from Autonomous University, "However, this still represents a great challenge for antimicrobial agents. The aim of this study was to prepare and characterize polycaprolactone nanofibers containing silver nanoparticles and to evaluate their antimicrobial properties against various Gram-positive and negative microorganisms associated with drug resistance infections. Polycaprolactone-silver fibers (PCL-AgNPs) were prepared by reduction in situ method of Ag+ ions by N,N-dimethylformamide in tetrahydrofuran solution with the simple addition of polycaprolactone in the solution for electrospinning. The results of dynamic light scattering and UV-visible spectroscopy showed the presence of silver nanoparticles with diameters of around 10-15 nm. STEM and energy dispersive X-ray spectroscopy confirmed the presence of silver agglomerates distributed over the surface of nanofibers. All PCL-AgNPs nanofibers samples showed good and specific antibacterial effect despite low silver concentration; therefore, this activity might depend on particular microbiological and cell structure characteristics as well as concentration of silver on the nanofibers."

According to the news editors, the research concluded: "PCL-AgNPs nanofibers might have a high potential for medical applications focused on the control of drug-resistance infections."

For more information on this research see: Antimicrobial Activity of Silver Nanoparticles in Polycaprolactone Nanofibers against Gram-Positive and Gram-Negative

Our news journalists report that additional information may be obtained by contacting S.Y. Reyes-Lopez, Univ Autonoma Ciudad Juarez, Inst Ciencias Biomed, Ciudad Juarez 32300, Chihuahua, Mexico. Additional authors for this research include L.F. Espinosa-Cristobal, A. Donohue-Cornejo and S.Y. Reyes-Lopez.

**Drugs and Therapies - Antimicrobials**

**New Antimicrobials Study Findings Reported from Federal University [In Vitro Activity of Melaleuca alternifolia (Tea Tree) in Its Free Oil and Nanoemulsion Formulations Against Pythium insidiosum]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antimicrobials are discussed in a new report. According to news reporting originating in Pelotas, Brazil, by NewsRx journalists, research stated, "Pythium insidiosum is an important aquatic oomycete which can cause pythiosis in both animals and humans. This microorganism shows low susceptibility to antifungal drugs available."

Financial support for this research came from National Council for Scientific and Technological Development (CNPq).

The news reporters obtained a quote from the research from Federal University, "This study analyzed the in vitro antimicrobial activity of Melaleuca alternifolia in its free oil (FO) and nanoemulsion (NE) formulations against Brazilian P. insidiosum isolates. The antimicrobial activity evaluation was performed by the broth microdilution method according to CSLI M38-A2 document adapted to phytopharmaceuticals. Twenty-six P. insidiosum isolates were evaluated, and the minimum inhibitory concentration was determined at 100 % growth inhibition. Melaleuca alternifolia essential oil or FO was obtained commercially. The NE containing 1 % M. alternifolia essential oil was prepared by the spontaneous emulsification method. All P. insidiosum isolates evaluated showed minimum inhibitory concentrations (MIC) ranging from 531.5 to 2125 mu g/mL for the FO formulation; MIC50 and MIC90 showed values between 1062.5 and 2125 mu g/mL, respectively. When the NE formulation was evaluated, MIC values ranged from 132.7 to 2125 mu g/mL and both MIC50 and MIC90 corresponded to 1062.5 mu g/mL. FO and NE formulations of M. alternifolia showed antimicrobial activity against P. insidiosum."

According to the news reporters, the research concluded: "This study demonstrated
that M. alternifolia oil can be an additional therapy in pythiosis treatment; however, further
studies are needed to evaluate the applicability of the plant essential oils in the treatment of
clinical pythiosis."

For more information on this research see: In Vitro Activity of Melaleuca
alternifolia (Tea Tree) in Its Free Oil and Nanoemulsion Formulations Against Pythium
insidiosum. Mycopathologia, 2016;181(11-12):865-869. Mycopathologia can be contacted at:

Drugs and Therapies - Antineoplastic Monoclonal

New Antineoplastic Monoclonal Antibodies Study Results from R.L.
Dillon et al Described (Trastuzumab-deBouganin Conjugate Overcomes
Multiple Mechanisms of T-DM1 Drug Resistance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Researchers detail new data in Drugs and Therapies - Antineoplastic
Monoclonal Antibodies. According to news originating from Winnipeg, Canada, by NewsRx
correspondents, research stated, "The development of antibody drug conjugates has provided
enhanced potency to tumor-targeting antibodies by the addition of highly potent payloads. In the
case of trastuzumab-DM1 (T-DM1), approved for the treatment of metastatic breast cancer, the
addition of mertansine (DM1) to trastuzumab substantially increased progression-free survival."

Our news journalists obtained a quote from the research, "Despite these
improvements, most patients eventually relapse due to complex mechanisms of resistance often
associated with small molecule chemotherapeutics. Therefore, identifying payloads with
different mechanisms of action (MOA) is critical for increasing the efficacy of targeted
therapeutics and ultimately improving patient outcomes. To evaluate payloads with different
MOA, deBouganin, a deimmunized plant toxin that inhibits protein synthesis, was conjugated to
trastuzumab and compared with T-DM1 both in vitro and in vivo. The trastuzumab-deBouganin
conjugate (T-deB) demonstrated greater potency in vitro against most cells lines with high levels
of Her2 expression. In addition, T-deB, unlike T-DM1, was unaffected by inhibitors of
multidrug resistance, Bcl-2-mediated resistance, or Her2-Her3 dimerization. Contrary to T-DM1
that showed only minimal cytotoxicity, T-deB was highly potent in vitro against tumor cells
with cancer stem cell properties. Overall, the results demonstrate the potency and efficacy of
deBouganin and emphasize the importance of using payloads with different MOAs."
According to the news editors, the research concluded: "The data suggest that deBouganin could be a highly effective against tumor cell phenotypes not being addressed by current antibody drug conjugate formats and thereby provide prolonged clinical benefit."

The news correspondents report that additional information may be obtained from R.L. Dillon, Viventia Bio Inc, Winnipeg, Manitoba, Canada. Additional authors for this research include S. Chooniedass, A. Premsukh, G.P. Adams, J. Entwistle, G.C. MacDonald and J. Cizeau.

Drugs and Therapies - Antineoplastics

New Antineoplastics Findings from Kyoto Pharmaceutical University Described (Population Pharmacodynamic Model for Bayesian Prediction of Myelosuppression Profiles Based on Routine Clinical Data after Gemcitabine and Carboplatin Treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antineoplastics are discussed in a new report. According to news reporting from Kyoto, Japan, by NewsRx journalists, research stated, "Hematological toxicity is a serious adverse event and is often a dose-limiting factor in anticancer drugs. The objective of the present study was to develop a modeling and simulation (M&S) procedure for predictions of time course profiles of blood cell counts that reflect myelosuppression profiles."

The news correspondents obtained a quote from the research from Kyoto Pharmaceutical University, "A method for Bayesian prediction of myelosuppression profiles during chemotherapy using a population pharmacodynamic model is proposed, and predictabilities of nadir values and times to nadir (T-nadir) after gemcitabine and carboplatin treatment were evaluated. The model is based on an equation for Erlang distribution, which we previously proposed, and it explains time course profiles of platelet (PLT), red blood cell (RBC) and white blood cell (WBC). PLT, RBC and WBC counts were retrospectively collected from 61 time courses (a total of 472 points) of 27 cancer patients. Predictive performance by a one-point Bayesian prediction was evaluated using data from day 8 in consideration of applicability to outpatients. Some good predictability was obtained for nadir values with some exceptions for PLT and RBC, whereas the predictability of T-nadir was insufficient."

According to the news reporters, the research concluded: "Although the
predictability was not acceptable enough, this M&S approach could be used for supportive care during cancer chemotherapy."

For more information on this research see: Population Pharmacodynamic Model for Bayesian Prediction of Myelosuppression Profiles Based on Routine Clinical Data after Gemcitabine and Carboplatin Treatment. Pharmacology, 2016;98(5-6):284-293.

Drugs and Therapies - Antineoplastics

New Antineoplastics Findings from University of Calabria Outlined
[Novel microspheres based on triterpene saponins from the roots of Physospermum verticillatum (Waldst & Kit) (Apiaceae) for the improvement of gemcitabine release]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antineoplastics are discussed in a new report. According to news originating from Cosenza, Italy, by NewsRx correspondents, research stated, "This study concerns the preparation and characterization of microspheres based on a mixture of triterpene saponins, from Physospermum verticillatum (Waldst & Kit), as a carrier for the specific release of gemcitabine. Triterpene saponins were derivatized with acrylic acid."

Our news journalists obtained a quote from the research from the University of Calabria, "The obtained polymerizable product was characterized by Fourier transform infrared to confirm the ester linkage. Then, spherical microparticles were prepared by suspension radical copolymerization and impregnated with gemcitabine. Microspheres exhibited a mean diameter of 2.7 m. The swelling studies showed that particles swell most at pH 6.2, typical of the tumor pathology, than at pH 7.4, miming physiological conditions. The microspheres were loaded with gemcitabine (LE 72.2%). Their release profile showed an initial dot of around 24% and a further release for 24 h."

According to the news editors, the research concluded: "This carrier could be potentially release the drug in the lung, as a function of different pHs between tumor cells and healthy, reducing the systemic drug toxicity, allowing the reduction of the doses number,
increasing the drug half-life and eliminating the problems related to the fast clearance of gemcitabine administration."

For more information on this research see: Novel microspheres based on triterpene saponins from the roots of Physospermum verticillatum (Waldst & Kit) (Apiaceae) for the improvement of gemcitabine release. The Journal of Pharmacy and Pharmacology, 2016;68 (2):275-81.

The news correspondents report that additional information may be obtained from S. Trombino, Dept. of Pharmacy, Health and Nutritional Sciences, University of Calabria, Arcavacata di Rende, Cosenza, Italy. Additional authors for this research include R. Cassano, S. Mellace, N. Picci, M.R. Loizzo, F. Menichini and R. Tundis.

Drugs and Therapies - Antineoplastics

New Antineoplastics Study Findings Have Been Reported by Researchers at Duke University Medical Center (Lapatinib Plasma and Tumor Concentrations and Effects on HER Receptor Phosphorylation in Tumor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antineoplastics have been presented. According to news reporting originating in Durham, North Carolina, by NewsRx journalists, research stated, "The paradigm shift in cancer treatment from cytotoxic drugs to tumor targeted therapies poses new challenges, including optimization of dose and schedule based on a biologically effective dose, rather than the historical maximum tolerated dose. Optimal dosing is currently determined using concentrations of tyrosine kinase inhibitors in plasma as a surrogate for tumor concentrations."

The news reporters obtained a quote from the research from Duke University Medical Center, "To examine this plasma-tumor relationship, we explored the association between lapatinib levels in tumor and plasma in mice and humans, and those effects on phosphorylation of human epidermal growth factor receptors (HER) in human tumors. Mice bearing BT474 HER2+ human breast cancer xenografts were dosed once or twice daily (BID) with lapatinib. Drug concentrations were measured in blood, tumor, liver, and kidney. In a randomized phase I clinical trial, 28 treatment-na?ve female patients with early stage HER2+ breast cancer received lapatinib 1000 or 1500 mg once daily (QD) or 500 mg BID before evaluating steady-state lapatinib levels in plasma and tumor. In mice, lapatinib levels were 4-fold higher in tumor than blood with a 4-fold longer half-life. Tumor concentrations exceeded the in vitro IC90 (~ 900 nM or 500 ng/mL) for inhibition of HER2 phosphorylation throughout the 12-hour dosing interval. In patients, tumor levels were 6-and 10-fold higher with QD and BID dosing, respectively, compared to plasma trough levels. The relationship between tumor
and plasma concentration was complex, indicating multiple determinants. HER receptor phosphorylation varied depending upon lapatinib tumor concentrations, suggestive of changes in the repertoire of HER homo-and heterodimers. Plasma lapatinib concentrations underestimated tumor drug levels, suggesting that optimal dosing should be focused on the site of action to avoid inappropriate dose escalation."

According to the news reporters, the research concluded: "Larger clinical trials are required to determine optimal dose and schedule to achieve tumor concentrations that maximally inhibit HER receptors."

For more information on this research see: Lapatinib Plasma and Tumor Concentrations and Effects on HER Receptor Phosphorylation in Tumor. Plos One, 2015;10 (11):e0142845. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Drugs and Therapies - Antineoplastics

New Antineoplastics Study Findings Recently Were Reported by Researchers at University of Montreal (Pharmacokinetics and the effect of heat on intraperitoneal pemetrexed using a murine model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antineoplastics. According to news reporting out of Montreal, Canada, by NewsRx editors, research stated, "Pemetrexed is a systemic chemotherapeutic agent used in the treatment of malignant mesothelioma. This drug represents a potentially promising intraperitoneal (IP) agent to use for hyperthermic intraperitoneal chemotherapy (HIPEC) in the treatment of peritoneal mesothelioma."

Our news journalists obtained a quote from the research from the University of Montreal, "However, this has yet to be supported by preclinical studies. Therefore, we aimed to study the effect of pemetrexed dose and perfusion temperature on the resultant pemetrexed concentration in 3 different compartments (systemic circulation, portal circulation and peritoneal tissues) using a murine model. Under general anesthesia, 29 Sprague-Dawley rats were submitted to 3 different doses of IP pemetrexed (500, 1000 and 1500 mg/m(2)) combined with 3 different perfusion temperatures (37, 40 and 43 degrees C) for a total duration of 25 min. At the end of perfusion, samples in different compartments (systemic circulation, portal circulation and peritoneum) were harvested and concentrations of pemetrexed were measured..."
using high performance liquid chromatography. With increasing dose of IP pemetrexed, higher concentrations were measured in the 3 compartments tested. In peritoneal cells, the difference between IP doses of 500 and 1000 mg/m(2) (2.03 vs. 19.17 μg/g, p < 0.001) was greater than the difference between 1000 and 1500 mg/m(2) (19.17 vs. 22.80 μg/g, p = 0.027). When the perfusion temperature increased, we observed a proportional rise of pemetrexed concentration in both the portal and systemic compartments; while in the peritoneal cells, the pemetrexed concentration increased up to 40 degrees C, after which it plateaued. Both heat and increasing doses of IP pemetrexed enhance peritoneal cell concentration of pemetrexed. However, for temperatures above 40 degrees C, pemetrexed concentration reached a plateau in peritoneal cells. Systemic and portal concentrations increased proportionally with both increasing temperatures and IP doses."

According to the news editors, the research concluded: "We believe these results should be taken into consideration for the design of an eventual clinical study in humans." 

Our news journalists report that additional information may be obtained by contacting P. Dube, University of Montreal, Maisonneuve Rosemont Hosp, Maisonneuve Rosemont Res Center, Montreal, PQ, Canada. Additional authors for this research include C. Perrault-Mercier, A. Bouchard-Fortier, J. Hubert, F.A. Leblond, L. Sideris and P. Dube.

Drugs and Therapies - Antipsychotics

New Antipsychotics Study Findings Recently Were Reported by P. Ravenstijn and Co-Researchers (Pharmacokinetics, safety, and tolerability of paliperidone palmitate 3-month formulation in patients with schizophrenia: A phase-1, single-dose, ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antipsychotics. According to news originating from Beerse, Belgium, by NewsRx correspondents, research stated, "This multicenter, randomized, open-label, parallel-group, phase-1 study assessed the pharmacokinetics (PK), safety, and tolerability of the investigational intramuscular paliperidone palmitate 3-month (PP3M) formulation in patients with schizophrenia or schizoaffective disorder. A total of 328 patients (men or women, aged 18-65 years) were enrolled in 1 of 4 separately conducted panels (A to D)."

Financial support for this research came from Janssen Research & Development.
Our news journalists obtained a quote from the research, "Each panel had 2 single-dose treatment periods (period 1, 1 mg intramuscular paliperidone immediate release [IR]; period 2, intramuscular PP3M 75-525 mg eq) separated by a washout of 7-21 days. Overall, 245 of 308 (79.5%) PP3M-dosed patients completed the study. Because the PK studies of panels A and C were compromised by incomplete injection in some patients, PK data from only panels B and D are presented. Safety data from all panels are presented. Peak paliperidone plasma concentration was achieved between 23 and 34 days, and apparent half-life was &sim;2-4 months. Mean plasma AUC&infin; and Cmax of paliperidone appeared to be dose-proportional. Relative bioavailability in comparison with paliperidone was &sim;100% independent of the dose and injection site. Headache and nasopharyngitis were the most common (>7%) treatment-emergent adverse events. Overall, safety and tolerability were similar to those of the 1-month formulation."

According to the news editors, the research concluded: "Results support a once-every-3-months dosing interval in patients with schizophrenia or schizoaffective disorder."

The news correspondents report that additional information may be obtained from P. Ravenstijn, Janssen Research & Development, a Division of Janssen Pharmaceutica NV, Beerse, Belgium. Additional authors for this research include B. Remmerie, A. Savitz, M.N. Samtani, I. Nuamah, C.T. Chang, M. De Meulder, D. Hough and S. Gopal.

**Drugs and Therapies - Antiretrovirals**

**New Antiretrovirals Findings from Catholic University of Leuven Reported [Distinct Effects of T-705 (Favipiravir) and Ribavirin on Influenza Virus Replication and Viral RNA Synthesis]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiretrovirals have been published. According to news reporting originating in Leuven, Belgium, by NewsRx journalists, research stated, "T-705 (favipiravir) is a new antiviral agent in advanced clinical development for influenza therapy. It is supposed to act as an alternative substrate for the viral polymerase, causing inhibition of viral RNA synthesis or virus mutagenesis."
The news reporters obtained a quote from the research from the Catholic University of Leuven, "These mechanisms were also proposed for ribavirin, an established and broad antiviral drug that shares structural similarity with T-705. We here performed a comparative analysis of the effects of T-705 and ribavirin on influenza virus and host cell functions. Influenza virus-infected cell cultures were exposed to T-705 or ribavirin during single or serial virus passaging. The effects on viral RNA synthesis and infectious virus yield were determined and mutations appearing in the viral genome were detected by whole-genome virus sequencing. In addition, the cellular nucleotide pools as well as direct inhibition of the viral polymerase enzyme were quantified. We demonstrate that the anti-influenza virus effect of ribavirin is based on IMP dehydrogenase inhibition, which results in fast and profound GTP depletion and an imbalance in the nucleotide pools. In contrast, T-705 acts as a potent and GTP-competitive inhibitor of the viral polymerase. In infected cells, viral RNA synthesis is completely inhibited by T-705 or ribavirin at >= 50 μM, whereas exposure to lower drug concentrations induces formation of noninfectious particles and accumulation of random point mutations in the viral genome. This mutagenic effect is 2-fold higher for T-705 than for ribavirin."

According to the news reporters, the research concluded: "Hence, T-705 and ribavirin both act as purine pseudobases but profoundly differ with regard to the mechanism behind their antiviral and mutagenic effects on influenza virus."

For more information on this research see: Distinct Effects of T-705 (Favipiravir) and Ribavirin on Influenza Virus Replication and Viral RNA Synthesis. Antimicrobial Agents and Chemotherapy, 2016;60(11):6679-6691. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Drugs and Therapies - Antiretrovirals**

**New Antiretrovirals Study Findings Have Been Reported by Investigators at Center for Disease Control and Prevention (Trends in Racial and Ethnic Disparities in Antiretroviral Therapy Prescription and Viral Suppression in the United States, ...)**
Researchers detail new data in Drugs and Therapies - Antiretrovirals.

According to news originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "To examine trends in racial/ethnic disparities in antiretroviral therapy (ART) prescription and viral suppression among HIV-infected persons in care, overall and among men who have sex with men (MSM), from 2009 to 2013. The Medical Monitoring Project (MMP) is a complex sample survey of HIV-infected adults receiving medical care in the United States."

Our news journalists obtained a quote from the research from Center for Disease Control and Prevention, "We used weighted interview and medical record data collected June 2009-May 2014 to estimate the prevalence of ART prescription and viral suppression among racial/ethnic groups overall and among MSM. We found significant increases in ART prescription and viral suppression among all racial/ethnic groups from 2009 to 2013, both overall and among MSM. By 2013, overall and among MSM, the Hispanic-white disparity in ART prescription was nonexistent, and the black-white disparity was not significant after accounting for differences between blacks and whites in age and length of HIV diagnosis. Despite reductions in racial/ethnic disparities in viral suppression over the time period, significant disparities remained among the total population, even after adjusting for differences in racial/ethnic group characteristics. Encouragingly, however, there was no significant Hispanic-white disparity in viral suppression among MSM by 2013. Despite significant improvements in ART prescription and viral suppression in recent years, racial and ethnic disparities persist, particularly for black persons."

According to the news editors, the research concluded: "If the United States is to achieve the National HIV/AIDS Strategy goal of reducing HIV-related health disparities, continued efforts to accelerate the rate of improvement in ART prescription and viral suppression among Hispanic and black persons may need to be prioritized."

The news correspondents report that additional information may be obtained from L. Beer, Center Dis Control & Prevent, Div HIV AIDS Prevent, Atlanta, GA 30329, United States. Additional authors for this research include H. Bradley, C.L. Mattson, C.H. Johnson, B. Hoots and R.L. Shouse.

New Antiretrovirals Study Findings Have Been Reported by Researchers at University of British Columbia (Factors associated with initiation of antiretroviral therapy among HIV-positive people who use injection drugs in a Canadian setting)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antiretrovirals are presented in a new report. According to news originating from Vancouver, Canada, by NewsRx correspondents, research stated, "To identify behavioral, social, and structural factors associated with time from HIV seroconversion to antiretroviral therapy (ART) initiation among people who use injection drugs (PWID). Two complementary prospective cohorts of PWID linked to comprehensive ART dispensation records in a setting of universal no-cost HIV/AIDS treatment and care."

Our news journalists obtained a quote from the research from the University of British Columbia, "Multivariable extended Cox models of time to ART initiation among baseline HIV-seronegative PWID who seroconverted after recruitment adjusted with a time-updated measure of clinical eligibility for ART. We included 133 individuals of whom 98 (74%) initiated ART during follow-up at a rate of 12.4 per 100 person-years. In a multivariable model adjusted for ART eligibility, methadone maintenance therapy [adjusted hazard ratio (AHR)=2.37, 95% confidence interval (95% CI): 1.56-3.60] and a more recent calendar year of observation (AHR=1.06, 95% CI: 1.00-1.12) were associated with more rapid ART initiation, whereas informal income generation (AHR=0.51, 95% CI: 0.32-0.79) and incarceration (AHR=0.52, 95% CI: 0.28-0.97) were negatively associated with ART initiation. In this sample of community-recruited HIV-positive PWID with well defined dates of HIV seroconversion, we found that two measures related to the criminalization of illicit drug use each independently delayed ART initiation regardless of clinical eligibility. Engagement in methadone promoted ART initiation."

According to the news editors, the research concluded: "Programs to scale-up HIV treatment among PWID should consider decreased criminalization of PWID and increased access to opioid substitution therapy to optimize the impact of ART on HIV/AIDS-associated morbidity, mortality, and HIV transmission."

For more information on this research see: Factors associated with initiation of antiretroviral therapy among HIV-positive people who use injection drugs in a Canadian setting. *Aids*, 2016;30(6):925-32. (Lippincott Williams and Wilkins - www.lww.com; Aids - journals.lww.com/aidsonline/pages/default.aspx)

The news correspondents report that additional information may be obtained from B. Joseph, aBritish Columbia Centre for Excellence in HIV, AIDS bDept. of Medicine cDept. of Sociology, St Paul's Hospital, University of British Columbia, Vancouver, British Columbia, Canada. New Antiretrovirals Study Findings Have Been Reported by Researchers at University of Washington [Intimate Partner Violence and Adherence to HIV Pre-exposure Prophylaxis (PrEP) in African Women in HIV Serodiscordant Relationships: A Prospective ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiretrovirals have been published. According to news reporting originating in Seattle, Washington, by NewsRx journalists, research stated, "Intimate partner violence (IPV) is associated with higher HIV incidence, reduced condom use, and poor adherence to antiretroviral therapy and other medications. IPV may also affect adherence to pre-exposure prophylaxis (PrEP)."

The news reporters obtained a quote from the research from the University of Washington, "We analyzed data from 1785 HIV-uninfected women enrolled in a clinical trial of PrEP among African HIV serodiscordant couples. Experience of verbal, physical, or economic IPV was assessed at monthly visits by face-to-face interviews. Low PrEP adherence was defined as clinic-based pill count coverage <80% or plasma tenofovir levels <40 ng/mL. The association between IPV and low adherence was analyzed using generalized estimating equations, adjusting for potential confounders. In-depth interview transcripts were examined to explain how IPV could impact adherence. Sixteen percent of women reported IPV during a median of 34.8 months of follow-up (interquartile range 27.0-35.0). Overall, 7% of visits had pill count coverage <80%, and 32% had plasma tenofovir <40 ng/mL. Women reporting IPV in the past 3 months had increased risk of low adherence by pill count (adjusted risk ratio 1.49, 95% confidence interval: 1.17 to 1.89) and by plasma tenofovir (adjusted risk ratio 1.51, 95% confidence interval: 1.06 to 2.15). Verbal, economic, and physical IPV were all associated with low adherence. However, the impact of IPV diminished and was not statistically significant 3 months after the reported exposure. In qualitative interviews, women identified several ways in which IPV affected adherence, including stress and forgetting, leaving home without pills, and partners throwing pills away. Women who reported recent IPV in the Partners PrEP Study were at increased risk of low PrEP adherence."

According to the news reporters, the research concluded: "Strategies to mitigate PrEP nonadherence in the context of IPV should be evaluated."

Our news correspondents report that additional information may be obtained by contacting S.T. Roberts, University of Washington, Dept. of Epidemiol, Seattle, WA 98104, United States. Additional authors for this research include J. Haberer, C. Celum, N. Mugo, N.C. Ware, C.R. Cohen, J.W. Tappero, J. Kiari, A. Ronald, A. Mujugira, E. Tumwesigye, E. Were,
E. Irungu and J.M. Baeten.

**Antithrombins**

**New Antithrombins Data Have Been Reported by A. Bouchnita and Co-Authors (Influence of Antithrombin on the Regimes of Blood Coagulation: Insights from the Mathematical Model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Antithrombins is the subject of a report. According to news reporting originating from Rabat, Morocco, by NewsRx correspondents, research stated, "Blood coagulation is regulated through a complex network of biochemical reactions of blood factors."

Funders for this research include Russian Science Support Foundation, PICS CNRS. Our news editors obtained a quote from the research, "The main acting enzyme is thrombin whose propagation in blood plasma leads to fibrin clot formation. Spontaneous clot formation is normally controlled through the action of different plasma inhibitors, in particular, through the thrombin binding by antithrombin."

According to the news editors, the research concluded: "In the current study we develop a mathematical model of clot formation both in quiescent plasma and in blood flow and determine the analytical conditions on the antithrombin concentration corresponding to different regimes of blood coagulation."

The news editors report that additional information may be obtained by contacting A. Bouchnita, Mohamed V Univ, Mohammadia Sch Engineers, Lab Study & Res Appl Math, Rabat, Morocco. Additional authors for this research include T. Galochkina and V. Volpert. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s10441-016-9291-2. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Antivirals**

**New Antivirals Study Findings Recently Were Reported by Researchers at Los Alamos National Laboratory (Modelling the interaction between danoprevir and mericitabine in the treatment of chronic HCV infection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antivirals. According to news reporting originating from Los Alamos, New Mexico, by NewsRx correspondents, research stated, "Modelling HCV RNA decline kinetics under therapy has proven useful for characterizing treatment effectiveness. Here we model HCV viral kinetics (VK) in 72 patients given a combination of danoprevir, a protease inhibitor, and mericitabine, a nucleoside polymerase inhibitor, for 14 days in the INFORM-1 trial."

Our news editors obtained a quote from the research from Los Alamos National Laboratory, "A biphasic VK model with time-varying danoprevir and mericitabine effectiveness and Bliss independence for characterizing the interaction between both drugs provided the best fit to the VK data. The average final antiviral effectiveness of the drug combination varied between 0.998 for 100 mg three times daily of danoprevir and 500 mg twice daily of mericitabine and 0.9998 for 600 mg twice daily of danoprevir and 1,000 mg twice daily of mericitabine. Using the individual parameters estimated from the VK data collected over 2 weeks, we were not able to reproduce the low sustained virological response rates obtained in a more recent study where patients were treated with a combination of mericitabine and ritonavir-boosted danoprevir for 24 weeks."

According to the news editors, the research concluded: "This suggests that drug-resistant viruses emerge after 2 weeks of treatment and that longer studies are necessary to provide accurate predictions of longer treatment outcomes."

The news editors report that additional information may be obtained by contacting A.S. Perelson, Los Alamos Natl Lab, Theoret Biol & Biophys, Los Alamos, NM 87544, United States. Additional authors for this research include J. Guedj, A. Chatterjee, A. Lemenuel-Diot, P.F. Smith and A.S. Perelson.

**Drugs and Therapies - Anxiolytics Sedatives and…**

**New Anxiolytics Sedatives and Hypnotics Study Findings Have Been Reported by A.O. James and Colleagues (Something old, something new: a successful case of meprobamate withdrawal)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Drugs and Therapies - Anxiolytics Sedatives and Hypnotics are discussed in a new report. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "Meprobamate, a benzodiazepine-like drug, was commonly prescribed for anxiety in the 1960s and 1970s, but fell out of favour, at least in part, due to the risk of dependence, for which there is little published evidence to guide clinical management. We discuss a 70-year-old man with a 45-year history of meprobamate dependency and multiple failed previous withdrawal attempts who was successfully withdrawn from meprobamate using diazepam during a 2-week inpatient stay on a specialist Addictions ward."

The news reporters obtained a quote from the research, "An appropriate diazepam dose was established using the Clinical Institute Withdrawal Assessment scale for benzodiazepines (CIWA-B). This dose was then slowly reduced over 12 days."

According to the news reporters, the research concluded: "Multidisciplinary input, especially psychological therapy tackling his underlying anxiety disorder during his admission, was thought to be particularly helpful."

For more information on this research see: Something old, something new: a successful case of meprobamate withdrawal. Bmj Case Reports, 2016;2016():. (BMJ Publishing Group - group.bmj.com/; Bmj Case Reports - casereports.bmj.com/)

Our news correspondents report that additional information may be obtained by contacting A.O. James, South London and Maudsley NHS Trust, London, UK. Additional authors for this research include T.R. Nicholson, R. Hill and J. Bearn.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1136/bcr-2015-213606. This DOI is a link to an online electronic document that is either free or for purchase.

Apoptosis

New Apoptosis Data Have Been Reported by Investigators at Chongqing University (PEG-b-PCL polymeric nano-micelle inhibits vascular angiogenesis by activating p53-dependent apoptosis in zebrafish)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Apoptosis. According to news reporting from Chongqing, People's Republic of China, by NewsRx journalists, research stated, "Micro/nanoparticles could cause adverse effects on cardiovascular system and increase the risk for cardiovascular disease-related events. Nanoparticles prepared from poly(ethylene glycol) (PEG)-b-poly(e-caprolactone) (PCL), namely PEG-b-PCL, a widely studied biodegradable copolymer, are promising carriers for the drug delivery systems."

The news correspondents obtained a quote from the research from Chongqing University, "However, it is unknown whether polymeric PEG-b-PCL nano-micelles give rise to potential complications of the cardiovascular system. Zebrafish were used as an in vivo model to evaluate the effects of PEG-b-PCL nano-micelle on cardiovascular development. The results
showed that PEG-b-PCL nano-micelle caused embryo mortality as well as embryonic and larval malformations in a dose-dependent manner. To determine PEG-b-PCL nano-micelle effects on embryonic angiogenesis, a critical process in zebrafish cardiovascular development, growth of intersegmental vessels (ISVs) and caudal vessels (CVs) in flk1-GFP transgenic zebrafish embryos using fluorescent stereomicroscopy were examined. The expression of fetal liver kinase 1 (flk1), an angiogenic factor, by real-time quantitative polymerase chain reaction (qPCR) and in situ whole-mount hybridization were also analyzed. PEG-b-PCL nano-micelle decreased growth of ISVs and CVs, as well as reduced flk1 expression in a concentration-dependent manner. Parallel to the inhibitory effects on angiogenesis, PEG-b-PCL nano-micelle exposure upregulated p53 pro-apoptotic pathway and induced cellular apoptosis in angiogenic regions by qPCR and terminal deoxynucleotidyl transferase dUTP nick end labeling (TUNEL) apoptosis assay. This study further showed that inhibiting p53 activity, either by pharmacological inhibitor or RNA interference, could abrogate the apoptosis and angiogenic defects caused by PEG-b-PCL nano-micelles, indicating that PEG-b-PCL nano-micelle inhibits angiogenesis by activating p53-mediated apoptosis.

According to the news reporters, the research concluded: "This study indicates that polymeric PEG-b-PCL nano-micelle could pose potential hazards to cardiovascular development."

Keywords for this news article include: Chongqing, People's Republic of China, Asia, Cardiovascular System, Risk and Prevention, Emerging Technologies, Nanotechnology, Angiogenesis, Nanoparticle, Cardiology, Apoptosis, Genetics, p53 Gene, Chongqing University.

**Apoptosis**

**New Apoptosis Findings from Biomedical Center Reported**

(Retrotransposon derepression leads to activation of the unfolded protein response and apoptosis in pro-B cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Apoptosis. According to news reporting originating from Planegg Martinsried, Germany, by NewsRx correspondents, research stated, "The H3K9me3-specific histone methyltransferase Setdb1 impacts on transcriptional regulation by repressing both developmental genes and retrotransposons. How impaired retrotransposon silencing may lead to developmental phenotypes is currently unclear."
Financial support for this research came from Deutsche Forschungsgemeinschaft.

Our news editors obtained a quote from the research from Biomedical Center, "Here, we show that loss of Setdb1 in pro-B cells completely abrogates B cell development. In pro-B cells, Setdb1 is dispensable for silencing of lineage-inappropriate developmental genes. Instead, we detect strong derepression of endogenous murine leukemia virus (MLV) copies. This activation coincides with an unusual change in chromatin structure, with only partial loss of H3K9me3 and unchanged DNA methylation, but strongly increased H3K4me3. Production of MLV proteins leads to activation of the unfolded protein response pathway and apoptosis."

According to the news editors, the research concluded: "Thus, our data demonstrate that B cell development depends on the proper repression of retrotransposon sequences through Setdb1."

The news editors report that additional information may be obtained by contacting G. Schotta, Munich Center Integrated Prot Sci CiPSM, Biomed Center, D-82152 Planegg Martinsried, Germany. Additional authors for this research include A. Ebert, G.P. de Almeida, M. Hinterberger, M. Kazeneri, A. Nuber, J. Ellwart, L. Klein, M. Busslinger and G. Schotta.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1242/dev.130203. This DOI is a link to an online electronic document that is either free or for purchase.

Apoptosis

New Apoptosis Findings from Brown University Discussed (Silencer-of-Death Domain Mediates Acid-Induced Decrease in Cell Apoptosis in Barrett's Associated Esophageal Adenocarcinoma Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Apoptosis. According to news originating from Providence, Rhode Island, by NewsRx correspondents, research stated, "We have shown that NADPH oxidase (NOX) 5-S may mediate the acid-induced decrease in cell apoptosis. However, mechanisms of NOX5-S-dependent decrease in cell apoptosis are not fully understood."

Our news journalists obtained a quote from the research from Brown University, "In this study, we found that silencer-of-death domain (SODD) was significantly increased in esophageal adenocarcinoma (EA) tissues, EA cell lines FLO and OE33, and a dysplastic cell line CP-B. Strong SODD immunostaining was significantly higher in low-grade dysplasia..."
(66.7%), high-grade dysplasia (81.2%), and EA (71.2%) than in Barrett's mucosa (10.5%). Acid treatment significantly increased SODD protein and mRNA expression and promoter activity in FLO cells, an increase that was significantly decreased by the knockdown of NOX5-S and nuclear factor kappa B (NF-kappa B) 1 p50 with their small interfering RNAs. Similarly, acid-induced increase of SODD mRNA was blocked by knockdown of NOX5-S and p50 in a BE cell line CP-A. Overexpression of NOX5-S significantly increased SODD protein expression in FLO cells. Moreover, overexpression of NOX5-S or p50 significantly increased the SODD promoter activity and decreased the caspase 9 activity or apoptosis. NOX5-S overexpression-induced increase in SODD promoter activity was significantly decreased by knockdown of p50. In addition, acid treatment significantly decreased the caspase 9 activity, a decrease that was significantly inhibited by knockdown of SODD. Furthermore, chromatin immunoprecipitation assay showed that NF-kappa B1 p50 bound to SODD genomic DNA containing a NF-kappa B-binding element GGGGACACCCT. This binding element was further confirmed by a gel mobility shift assay.

According to the news editors, the research concluded: "We conclude that acid-induced increase in SODD expression and decrease in cell apoptosis may depend on the activation of NOX5-S and NF-kappa B1 p50 in FLO cells."

The news correspondents report that additional information may be obtained from W.B. Cao, Brown University, Rhode Island Hospital, Dept. of Pathol, Providence, RI 02903, United States. Additional authors for this research include J. Hong and W.B. Cao.

Apoptosis

New Apoptosis Findings from H. Xiao and Co-Researchers Reported (N-Acetyl-L-cysteine Protects the Enterocyte against Oxidative Damage by Modulation of Mitochondrial Function)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Apoptosis is now available. According to news reporting from Changsha, People's Republic of China, by NewsRx journalists, research stated, "The neonatal small intestine is susceptible to damage caused by oxidative stress. This study aimed to evaluate the protective role of antioxidant N-acetylcysteine (NAC) in intestinal epithelial cells against oxidative damage induced by H2O2."

Funders for this research include 973 National Projects Subject, National Natural Science Foundation of China, Open Project Program of State Key Laboratory of Food Science and Technology, Nanchang University, National Science and Technology Ministry.

The news correspondents obtained a quote from the research, "IPEC-J2 cells were
cultured in DMEM-H with NAC and H2O2. After 2-day incubation, IPEC-J2 cells were collected for analysis of DNA synthesis, antioxidation capacity, mitochondrial respiration, and cell apoptosis. The results showed that H2O2 significantly decreased (P < 0.05) proliferation rate, mitochondrial respiration, and antioxidation capacity and increased cell apoptosis and the abundance of associated proteins, including cytochrome C, Bcl-XL, cleaved caspase-3, and total caspase-3. NAC supplementation remarkably increased (P < 0.05) proliferation rate, antioxidation capacity, and mitochondrial bioenergetics but decreased cell apoptosis.

According to the news reporters, the research concluded: "These findings indicate that NAC might rescue the intestinal injury induced by H2O2."

For more information on this research see: N-Acetyl-L-cysteine Protects the Enterocyte against Oxidative Damage by Modulation of Mitochondrial Function. *Mediators of Inflammation*, 2016;():1-9. *Mediators of Inflammation* can be contacted at: Hindawi Publishing Corp, 315 Madison Ave 3RD Flr, Ste 3070, New York, NY 10017, USA. **Apoptosis**

**New Apoptosis Study Findings Have Been Reported from Central South University (MicroRNA-142-3p inhibits hypoxia/reoxygenation-induced apoptosis and fibrosis of cardiomyocytes by targeting high mobility group box 1)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Apoptosis. According to news originating from Changsha, People's Republic of China, by NewsRx correspondents, research stated, "Myocardial ischemia/reperfusion (I/R) injury may cause the apoptosis of cardiomyocytes as well as cardiac fibrosis, which is characterized as the transdifferentiation of fibroblasts to myofibroblasts and collagen deposition. MicroRNAs (miRNAs or miRs) have been demonstrated to be involved in myocardial I/R injury."

Our news journalists obtained a quote from the research from Central South University, "However, the underlying molecular mechanism remains largely unclear. In the present study, mouse cardiomyocyte M6200 cells were treated with hypoxia/reoxygenation (H/R). Our data indicated that H/R treatment led to cell apoptosis, the increased expression of fibrosis-related proteins, namely collagen I, II, III, and fibronectin, as well as the downregulation of miR-142-3p in M6200 cells. Overexpression of miR-142-3p suppressed the H/R-induced..."
apoptosis and fibrosis of M6200 cells. Bioinformatics analysis and a Dual-Luciferase reporter assay further identified high mobility group box 1 (HMGB1) as a direct target gene of miR-142-3p, and miR-142-3p negatively regulated the protein level of HMGB1 in M6200 cells. Furthermore, knockdown of HMGB1 enhanced cell proliferation whereas it inhibited the apoptosis and fibrosis of M6200 cells. In addition, TGF-1/Smad3 signaling was suggested to be involved in the miR-142-3p/HMGB1-mediated apoptosis and fibrosis of M6200 cells treated with H/R. Taken together, the findings of the present study demonstrate that miR-142-3p inhibits H/R-induced apoptosis and fibrosis of cardiomyocytes, partly at least, by the direct inhibition of HMGB1 expression."

According to the news editors, the research concluded: "Therefore, these findings have increased our understanding of the pathogenesis of H/R-induced myocardial injury."

For more information on this research see: MicroRNA-142-3p inhibits hypoxia/reoxygenation-induced apoptosis and fibrosis of cardiomyocytes by targeting high mobility group box 1. International Journal of Molecular Medicine, 2016;38(5):1377-1386. International Journal of Molecular Medicine can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

The news correspondents report that additional information may be obtained from Z.J. Jian, Central South University, Inst Aging & Age Related Dis Res, Changsha 410011, Hunan, People's Republic of China. Additional authors for this research include M. Ouyang, Q. Wang and Z.J. Jian.

Applied Bioinformatics

New Applied Bioinformatics Findings from S. Pirro and Colleagues Discussed (Bioinformatics Prediction and Experimental Validation of MicroRNAs Involved in Cross-Kingdom Interaction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Applied Bioinformatics have been published. According to news reporting originating from Rome, Italy, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) are a class of small non-coding RNAs that act as efficient post-transcriptional regulators of gene expression. In 2012, the first cross-kingdom miRNA-based interaction had been evidenced, demonstrating that exogenous miRNAs act in a manner of mammalian functional miRNAs."

Our news editors obtained a quote from the research, "Starting from this evidence, we defined the concept of cross-kingdom functional homology between plant and mammalian miRNAs as a needful requirement for vegetal miRNA to explicit a regulation mechanism into the host mammalian cell, comparable to the endogenous one. Then, we proposed a new dedicated algorithm to compare plant and mammalian miRNAs, searching for functional sequence homologies between them, and we developed a web software called MirCompare. We also predicted human genes regulated by the selected plant miRNAs, and we determined the role of exogenous miRNAs in the perturbation of intracellular interaction networks. Finally, as already performed by Pirro and coworkers, the ability of MirCompare to select plant miRNAs..."
with functional homologies with mammalian ones has been experimentally confirmed by evaluating the ability of mol-miR168a to downregulate the protein expression of SIRT1, when its mimic is transfected into human hepatoma cell line G2 (HEPG2) cells."

According to the news editors, the research concluded: "This tool is implemented into a user-friendly web interface, and the access is free to public through the website http://160.80.35.140/MirCompare."

For more information on this research see: Bioinformatics Prediction and Experimental Validation of MicroRNAs Involved in Cross-Kingdom Interaction. *Journal of Computational Biology*, 2016;23(12):976-989. *Journal of Computational Biology* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. **New Aquatic Toxicology Findings from Dalian Ocean University Described (Ocean acidification stimulates alkali signal pathway: A bicarbonate sensing soluble adenyl cyclase from oyster Crassostrea gigas mediates physiological changes induced by ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Life Science Research - Aquatic Toxicology. According to news reporting from Dalian, People's Republic of China, by NewsRx journalists, research stated, "Ocean acidification (OA) has been demonstrated to have severe effects on marine organisms, especially marine calcifiers. However, the impacts of OA on the physiology of marine calcifiers and the underlying mechanisms remain unclear."

Financial supporters for this research include National Science Foundation of China, Dalian high level talent innovation.

The news correspondents obtained a quote from the research from Dalian Ocean University, "Soluble adenyl cyclase (sAC) is an acid-base sensor in response to [HCO3-] and an intracellular source of cyclic AMP (cAMP). In the present study, an ortholog of sAC was identified from Pacific oyster Crassostrea gigas (designated as CgsAC) and the catalytic region of CgsAC was cloned and expressed. Similar to the native CgsAC from gill tissues, the recombinant CgsAC protein (rCgsAC) exhibited [HCO3-] mediated cAMP-forming activity, which could be inhibited by a small molecule KH7. After 16 days of CO2 exposure (pH = 7.50), the mRNA transcripts of CgsAC increased in muscle, mantle, hepatopancreas, gill, male gonad and haemocytes, and two truncated CgsAC forms of 45 kD and 20 kD were produced. Cytosolic
CgsAC could be translocated from the cytoplasm and nuclei to the membrane in response to CO2 exposure. Besides, CO2 exposure could increase the production of cAMP and intracellular pH of haemocytes, which was regulated by CgsAC (p < 0.05), suggesting the existence of a [HCO3-]/CgsAC/cAMP signal pathway in oyster. The elevated CO2 could induce an increase of ROS level (p < 0.05) and a decrease of phagocytic rate of haemocytes (p < 0.05), which could be inhibited by KH7. The results collectively suggest that CgsAC is an important acid-base sensor in oyster and the [HCO3-]/CgsAC/cAMP signal pathway might be responsible for intracellular alkalization effects on oxidative phosphorylation and innate immunity under CO2 exposure."

According to the news reporters, the research concluded: "The changes of intracellular pH, ROS, and phagocytosis mediated by CgsAC might help us to further understand the effects of ocean acidification on marine calcifiers."

For more information on this research see: Ocean acidification stimulates alkali signal pathway: A bicarbonate sensing soluble adenylyl cyclase from oyster Crassostrea gigas mediates physiological changes induced by CO2 exposure. *Aquatic Toxicology*, 2016;181 ():124-135. *Aquatic Toxicology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Aquatic Toxicology - www.journals.elsevier.com/aquatic-toxicology/)

Our news journalists report that additional information may be obtained by contacting L.S. Song, Dalian Ocean Univ, Key Lab Mariculture & Stock Enhancement North Chi, Minist Agr, Dalian 116023, People's Republic of China. Additional authors for this research include M.Q. Wang, Z.H. Jia, H. Wang, S. Jiang, H. Chen, L.L. Wang and L.S. Song. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.aquatox.2016.11.002. Membrane Proteins - Arrestins

**New Arrestins Findings from Duke University Described (Distinct cortical and striatal actions of a beta-arrestin-biased dopamine D2 receptor ligand reveal unique antipsychotic-like properties)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Membrane Proteins - Arrestins is now available. According to news reporting out of Durham, North Carolina, by NewsRx editors, research stated, "The current dopamine (DA) hypothesis of schizophrenia postulates striatal hyperdopaminergia and cortical hypodopaminergia. Although partial agonists at DA D2 receptors (D2Rs), like aripiprazole, were developed to simultaneously target both phenomena, they do not effectively improve cortical dysfunction."

Our news journalists obtained a quote from the research from Duke University, "In this study, we investigate the potential for newly developed beta-arrestin2 (beta arr2)-biased D2R partial agonists to simultaneously target hyper-and hypodopaminergia. Using neuron-
specific beta arr2-KO mice, we show that the antipsychotic-like effects of a beta arr2-biased D2R ligand are driven through both striatal antagonism and cortical agonism of D2R-beta arr2 signaling. Furthermore, beta arr2-biased D2R agonism enhances firing of cortical fast-spiking interneurons. This enhanced cortical agonism of the biased ligand can be attributed to a lack of G-protein signaling and elevated expression of beta arr2 and G protein-coupled receptor (GPCR) kinase 2 in the cortex versus the striatum."

According to the news editors, the research concluded: "Therefore, we propose that beta arr2-biased D2R ligands that exert region-selective actions could provide a path to develop more effective antipsychotic therapies."

Our news journalists report that additional information may be obtained by contacting M.G. Caron, Duke University, Medical Center, Dept. of Med & Neurobiol, Durham, NC 27710, United States. Additional authors for this research include S.M. Gee, T.F. Pack, J.D. McCorry, T. Evron, J.C. Snyder, X.B. Yang, R.M. Rodriguez, E. Borrelli, W.C. Wetsel, J. Jin, B.L. Roth, P. O'Donnell and M.G. **Arrhythmia**

**New Arrhythmia Study Results Reported from Yang Ming National University (Pleiotropic Effects of Myocardial MMP-9 Inhibition to Prevent Ventricular Arrhythmia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Arrhythmia is the subject of a report. According to news originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Observational studies have established a strong association between matrix metalloproteinase-9 (MMP-9) and ventricular arrhythmia. However, whether MMP-9 has a causal link to ventricular arrhythmia, as well as the underlying mechanism, remains unclear."

Our news journalists obtained a quote from the research from Yang Ming National University, "Here, we investigated the mechanistic involvement of myocardial MMP-9 in the pathophysiology of ventricular arrhythmia. Increased levels of myocardial MMP-9 are linked to ventricular arrhythmia attacks after angiotensin II (Ang II) treatment. MMP-9-deficient mice were protected from ventricular arrhythmia. Increased expressions of protein kinase A (PKA) and ryanodine receptor phosphorylation at serine 2808 (pS2808) were correlated with inducible..."
ventricular arrhythmia. MMP-9 deficiency consistently prevented PKA and pS2808 increases after Ang II treatment and reduced ventricular arrhythmia. Calcium dynamics were examined via confocal imaging in isolated murine cardiomyocytes. MMP-9 inhibition prevents calcium leakage from the sarcoplasmic reticulum and reduces arrhythmia-like irregular calcium transients via protein kinase A and ryanodine receptor phosphorylation. Human induced pluripotent stem cell-derived cardiomyocytes similarly show that MMP-9 inhibition prevents abnormal calcium leakage.

According to the news editors, the research concluded: "Myocardial MMP-9 inhibition prevents ventricular arrhythmia through pleiotropic effects, including the modulation of calcium homeostasis and reduced calcium leakage."

For more information on this research see: Pleiotropic Effects of Myocardial MMP-9 Inhibition to Prevent Ventricular Arrhythmia. Scientific Reports, 2016;6():1-10. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Heart Disorders and Diseases - Arrhythmogenic...

New Arrhythmogenic Right Ventricular Dysplasia Findings Reported from University of British Columbia (Long-term right ventricular implantable cardioverter-defibrillator lead performance in arrhythmogenic right ventricular cardiomyopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Arrhythmogenic Right Ventricular Dysplasia are discussed in a new report. According to news reporting from Vancouver, Canada, by NewsRx journalists, research stated, "Arrhythmogenic right ventricular cardiomyopathy (ARVC) is a progressive disease characterized by replacement of normal myocardium by fibrofatty tissue. The right ventricular (RV) apex is the typical target for implantable cardioverter-defibrillator (ICD) lead placement, raising concerns for suboptimal lead performance in medium- to long-term follow-up."

The news correspondents obtained a quote from the research from the University of British Columbia, "The purpose of this study was to determine whether placement of ICD leads at the RV apex was associated with performance deterioration of medium-term leads in ARVC patients compared to non-ARVC patients. In this multicenter, retrospective, case-control study, ICD lead performance measures of R-wave, impedance, and pacing thresholds were compared at baseline and between 1-year and 5-year postimplantation follow-up using mixed-effect models.
adjusted for age and sex. One hundred one ARVC patients (49 women, age 50.6 +/- 14.5 years) were compared to 56 control patients (37 women, age 48.2 +/- 14.2 years). The mean difference in R wave between years 1 and 2 was -0.85 mV (P = .16) compared to a mean difference at years 5 and 6 of -1.85 mV (P = .02). There was no difference in impedance or pacing threshold or in lead lifetime between the 2 groups over 6-year follow-up (5.91 +/- 3.89 years vs 5.48 +/- 3.70 years, P = .239). In ARVC patients with ICD leads implanted in the RV apex, ventricular sensing deteriorates significantly during medium term follow-up.

According to the news reporters, the research concluded: "Septal RV lead placement should be explored as the first choice at implantation."

Our news journalists report that additional information may be obtained by contacting S. Chakrabarti, University of British Columbia, Vancouver, BC, Canada. Additional authors for this research include M. Gardner, C. Steinberg, J.A. Yeung-Lai-Wah, J.S. Healey, P. Leong-Sit, A.D. Krahn and S. Chakrabarti.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.hrthm.2016.06.021. This DOI is a link to an online electronic document that is either free or for purchase.

**Arsenic**

**New Arsenic Study Findings Recently Were Reported by Researchers at Jilin Agricultural University (Determination and pharmacokinetic properties of arsenic speciation in Xiao-Er-Zhi-Bao-Wan by high-performance liquid chromatography with ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Arsenic is now available. According to news originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "A method of high performance liquid chromatography with a Hamilton PRP-X100 ion-exchange column (250 x 4.1 mm id, 10 mu m) coupled to inductively coupled plasma mass spectrometry was employed to generate a full concentration-time profile of arsenic speciation after oral administration. The results exhibited good linearity and revealed that, in the pills, the average arsenic concentration was 10105.4 +/- 380.7 mg/kg, and in the water extraction solution, the inorganic As(III) and As(V) concentrations were 220.1 +/- 12.6 and 45.5 +/- 2.3 mg/kg, respectively."

Our news journalists obtained a quote from the research from Jilin Agricultural
University, "No trace of monomethyl arsenic acid was detected in any of the plasma samples. We then successfully applied the established methodology to examine the pharmacokinetics of arsenic speciation. The resulting data revealed that, after oral administration in rats, the plasma concentration of each arsenic species reached C-max shortly after initial dosing, and that the distribution and elimination of As(V) was faster than that of As(III) and dimethyl arsenic acid. Additionally, the t1/2 values of As(V), As(III), and dimethyl arsenic acid were 3.4 +/- 1.6, 14.3 +/- 4.0, and 19.9 +/- 1.6 h, respectively."

According to the news editors, the research concluded: "This study provides references for the determination of arsenic speciation in mineral-containing medicines and could serve as a useful tool in measuring the true toxicity in traditional medicines that contain them."

The news correspondents report that additional information may be obtained from S.H. Yang, Jilin Agr Univ, Coll Tradit Chinese Med, Changchun 130118, People's Republic of China. Additional authors for this research include J.Y. Luo, W.J. Zhou, S.H. Yang and M.H. Yang.

Keywords for this news article include: Changchun, People's Republic of China, Asia, High-Performance Liquid Chromatography, Imaging Technology, Pharmacokinetics, Pharmaceuticals, Arsenic, Jilin Agricultural University.

Arsenicals

New Arsenicals Study Findings Recently Were Reported by Researchers at Nanjing Medical University (A MALAT1/HIF-2a feedback loop contributes to arsenite carcinogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Arsenicals. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Arsenic is well established as a human carcinogen, but the molecular mechanisms leading to arsenic-induced carcinogenesis are complex and elusive. It is also not known if IncRNAs are involved in arsenic-induced liver carcinogenesis."

Our news editors obtained a quote from the research from Nanjing Medical University, "We have found that MALAT1, a non-coding RNA, is over-expressed in the sera of people exposed to arsenite and in hepatocellular carcinomas (HCCs), and MALAT1 has a close relation with the clinicopathological characteristics of HCC. In addition, hypoxia-inducible factor (HIF)-2a is up-regulated in HCCs, and MALAT1 and HIF-2a have a positive correlation in HCC tissues. During the malignant transformation of human hepatic epithelial (L-02) cells induced by a low concentration (2.0 mM) of arsenite, MALAT1 and HIF-2a are increased. In addition, arsenite-induced MALAT1 causes disassociation of the von Hippel-Lindau (VHL)
protein from HIF-2α, therefore, alleviating VHL-mediated HIF-2α ubiquitination, which causes HIF-2α accumulation. In turn, HIF-2α transcriptionally regulates MALAT1, thus forming a positive feedback loop to ensure expression of arsenite-induced MALAT1 and HIF-2α, which are involved in malignant transformation. Moreover, MALAT1 and HIF-2α promote the invasive and metastatic capacities of arsenite-induced transformed L-02 cells and in HCC-LM3 cells. The capacities of MALAT1 and HIF-2α to promote tumor growth are validated in mouse xenograft models. In mice, arsenite induces an inflammatory response, and MALAT1 and HIF-2α are over-expressed. Together, these findings suggest that the MALAT1/HIF-2α feedback loop is involved in regulation of arsenite-induced malignant transformation.

According to the news editors, the research concluded: "Our results not only confirm a novel mechanism involving reciprocal regulation between MALAT1 and HIF-2α, but also expand the understanding of the carcinogenic potential of arsenite."

For more information on this research see: A MALAT1/HIF-2α feedback loop contributes to arsenite carcinogenesis. Oncotarget, 2016;7(5):5769-87.

The news editors report that additional information may be obtained by contacting F. Arsenicals

New Arsenicals Study Findings Recently Were Reported by Researchers at Sichuan University (Arsenite-induced endoplasmic reticulum-dependent apoptosis through disturbance of calcium homeostasis in HBE cell line)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Arsenicals is now available. According to news reporting originating in Chengdu, People's Republic of China, by NewsRx journalists, research stated, "Calcium (Ca) is a ubiquitous cell signal responsible for multiple fundamental cellular functions, including apoptosis. Whether the homeostasis of Ca is involved in arsenite-induced apoptosis remains unclear."

Financial support for this research came from National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Sichuan University, "In this study, we observed that arsenite significantly elevated the intracellular Ca concentration in a dose-and time-dependent manner. By using the CaATPase inhibitor, thapsigargin, and the inositol 1,4,5-trisphosphate receptors (IP3Rs) inhibitor, heparin, we further confirmed that the disturbance of endoplasmic reticulum (ER) Ca homeostasis caused Ca overload in the cells."
Moreover, loss of ER Ca homeostasis also led to ER stress, mitochondrial dysfunction, and NF-kB activation. Importantly, pretreatment of cells with heparin remarkably attenuated the elevated cell apoptosis induced by arsenite, but inhibition of ER Ca uptake with thapsigargin exacerbated arsenite-induced cell damage significantly. Together, we demonstrated for the first time that arsenite disturbed the Ca homeostasis in ER, which subsequently led to ER stress, mitochondrial dysfunction, and NF-kB nuclear translocation, and thus consequently triggering cell apoptosis.

According to the news reporters, the research concluded: "Our findings indicate regulation of disrupted Ca homeostasis in ER may be a potential strategy for prevention of arsenite toxicity. ? 2015 Wiley Periodicals, Inc. Environ Toxicol 32:197-216."

**Arteriovenous Malformation**

**New Arteriovenous Malformation Findings from Careggi University Hospital Outlined (Curative Transvenous Onyx Embolization of a Maxillary Arteriovenous Malformation in a Child: Report of a New Technique)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Arteriovenous Malformation is now available. According to news reporting originating from Florence, Italy, by NewsRx correspondents, research stated, "Endovascular management of maxillary arteriovenous malformation (AVMs) can be complex. Transarterial, transvenous, and direct puncture embolization has been described."

Our news editors obtained a quote from the research from Careggi University Hospital, "The authors report the case of a 9-year-old girl with a hemorrhagic maxillary AVM, which has been treated by transvenous embolization after failure of transarterial embolization. The venous pouch was catheterized with a detachable tip microcatheter and occluded by slow Onyx injection. Onyx filled the pouch and retrogradely reached some arterial feeders, achieving complete occlusion. Bleeding episode ceased and at 6 months follow-up no recurrence was found."

According to the news editors, the research concluded: "Maxillary AVMs can be
successfully treated by transvenous Onyx embolization."

The news editors report that additional information may be obtained by contacting N. Limbucci, *Dept. of Interventional Neuroradiology †Maxillofacial Surgery Unit, Careggi University Hospital, Florence, Italy. Additional authors for this research include G. Spinelli, S. Nappini, L. Renieri, A. Consoli, A. Rosi and S. Mangiafico.

**Musculoskeletal Diseases and Conditions - Arthritis**

**New Arthritis Findings from University of Edinburgh Described (PTPN22 Is a Critical Regulator of Fc gamma Receptor-Mediated Neutrophil Activation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Musculoskeletal Diseases and Conditions - Arthritis. According to news originating from Edinburgh, United Kingdom, by NewsRx correspondents, research stated, "Neutrophils act as a first line of defense against bacterial and fungal infections, but they are also important effectors of acute and chronic inflammation. Genome-wide association studies have established that the gene encoding the protein tyrosine phosphatase nonreceptor 22 (PTPN22) makes an important contribution to susceptibility to autoimmune disease, notably rheumatoid arthritis."

Our news journalists obtained a quote from the research from the University of Edinburgh, "Although PTPN22 is most highly expressed in neutrophils, its function in these cells remains poorly characterized. We show in this article that neutrophil effector functions, including adhesion, production of reactive oxygen species, and degranulation induced by immobilized immune complexes, were reduced in Ptpn22(-/-) neutrophils. Tyrosine phosphorylation of Lyn and Syk was altered in Ptpn22(-/-) neutrophils. On stimulation with immobilized immune complexes, Ptpn22(-/-) neutrophils manifested reduced activation of key signaling intermediates. Ptpn22(-/-) mice were protected from immune complex-mediated arthritis, induced by the transfer of arthritogenic serum. In contrast, in vivo neutrophil recruitment following thioglycollate-induced peritonitis and in vitro chemotaxis were not affected by lack of PTPN22."

According to the news editors, the research concluded: "Our data suggest an important role for PTPN22-dependent dephosphorylation events, which are required to enable full Fc gamma R-induced activation, pointing to an important role for this molecule in neutrophil function."

For more information on this research see: PTPN22 Is a Critical Regulator of Fc
gamma Receptor-Mediated Neutrophil Activation. *Journal of Immunology*, 2016;197(12):4771-4779. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. **Biomedical Engineering - Artificial Cartilage**

**New Artificial Cartilage Study Findings Reported from University of Copenhagen (Role of Electrostatic Interactions on the Transport of Druglike Molecules in Hydrogel-Based Articular Cartilage Mimics: Implications for Drug Delivery)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biomedical Engineering - Artificial Cartilage have been published. According to news reporting from Copenhagen, Denmark, by NewsRx journalists, research stated, "In the field of drug delivery to the articular cartilage, it is advantageous to apply artificial tissue models as surrogates of cartilage for investigating drug transport and release properties. In this study, artificial cartilage models consisting of 0.5% (w/v) agarose gel containing 0.5% (w/v) chondroitin sulfate or 0.5% (w/v) hyaluronic acid were developed, and their rheological and morphological properties were characterized."

The news correspondents obtained a quote from the research from the University of Copenhagen, "UV imaging was utilized to quantify the transport properties of the following four model compounds in the agarose gel and in the developed artificial cartilage models: H-Ala-b-naphthylamide, H-Lys-Lys-b-naphthylamide, lysozyme, and a-lactalbumin. The obtained results showed that the incorporation of the polyelectrolytes chondroitin sulfate or hyaluronic acid into agarose gel induced a significant reduction in the apparent diffusivities of the cationic model compounds as compared to the pure agarose gel. The decrease in apparent diffusivity of the cationic compounds was not caused by a change in the gel structure since a similar reduction in apparent diffusivity was not observed for the net negatively charged protein a-lactalbumin. The apparent diffusivity of the cationic compounds in the negatively charged hydrogels was highly dependent on the ionic strength, pointing out the importance of electrostatic interactions between the diffusant and the polyelectrolytes. Solution based affinity studies between the model compounds and the two investigated polyelectrolytes further confirmed the electrostatic nature of their interactions. The results obtained from the UV imaging diffusion studies are important for understanding the effect of drug physicochemical properties on the transport in articular cartilage."

According to the news reporters, the research concluded: "The extracted information
may be useful in the development of hydrogels for in vitro release testing having features resembling the articular cartilage."

Our news journalists report that additional information may be obtained by contacting F. Ye, Dept. of Pharmacy, Faculty of Health and Medical Sciences, University of Copenhagen, Universitetsparken 2, DK-2100 Copenhagen, Denmark. Additional authors for this research include S. Baldursdottir, S. Hvidt, H. Jensen, S.W. Larsen, A. Yaghmur, C. Larsen and J. Østergaard.

*Lung Diseases and Conditions - Aspiration Pneumonia*

**New Aspiration Pneumonia Findings from University of New Mexico Outlined (Rare complication of a common obesity procedure)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Aspiration Pneumonia. According to news reporting originating from Albuquerque, New Mexico, by NewsRx correspondents, research stated, "Laparoscopic gastric banding has been widely used to treat obesity. Aspiration pneumonia has not been reported as a complication of bariatric surgery."

Our news editors obtained a quote from the research from the University of New Mexico, "We present a patient who had bariatric surgery and presented with aspiration pneumonia. A 64-year-old woman with a medical history of obesity and laparoscopic gastric banding presented to urgent care with 1 month of dry, continuous cough. A chest CT scan demonstrated a large opacity in the left upper lobe peripherally containing an air bronchogram, and the oesophagus was significantly enlarged and fluid filled. The patient was diagnosed with aspiration pneumonia. She received antibiotics and the gastric band was deflated. A repeat CT scan showed resolution of the pneumonia. To our knowledge, aspiration pneumonia is an unreported complication of gastric banding."

According to the news editors, the research concluded: "Not recognising this complication may cause delay in the correct diagnosis and leads to invasive procedures with increased morbidity."

For more information on this research see: Rare complication of a common obesity procedure. *Bmj Case Reports*, 2016;2016():. (BMJ Publishing Group - group.bmj.com/; Bmj Case Reports - casereports.bmj.com/)

New Assisted Reproduction and Genetics Data Have Been Reported by Investigators at Department of Medical Genetics (Reanalysis of human blastocysts with different molecular genetic screening platforms reveals significant discordance in ploidy ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics - Assisted Reproduction and Genetics. According to news reporting out of Bursa, Turkey, by NewsRx editors, research stated, "The objective of this study is to determine mosaicism and its effect on blastocysts; abnormal blastocysts determined by molecular testing were sequentially biopsied and retested. We re-biopsied 37 blastocyst-stage abnormal embryos from eight patients, which were reanalyzed to determine the level of concordance between biopsies and inter-laboratory congruence between reputable commercial PGS laboratories."

Our news journalists obtained a quote from the research from the Department of Medical Genetics, "The main outcome measures were intra-embryo variation between sequential embryo biopsies and inter-laboratory variation between two PGS laboratories. The compatibility between both aCGH and NGS was found to be 11 % (3/27). Importantly, 9/27 (33 %) of embryos originally reported to be aneuploid, upon repeat assessment, were found to be euploid. The concurrence for SNP array and NGS was 50 % (3/6), and 17 % (1/6) of these abnormal embryos tested normal upon re-evaluation with NGS. NGS resulted 41 % (11/27) normal results when 27 of CGH abnormal embryos were retested. Concordance between aCGH and NGS was 4 % (1/27) whereas in three instances, gender discrepancy was observed with NGS when aCGH abnormal embryos were reanalyzed."

According to the news editors, the research concluded: "The results of these studies reinforce the prevalence of inconsistencies during PGS evaluation of trophectoderm biopsies possibly due to variations in platform sensitivity and heightening concerns over the clinical tractability of such technology in human ARTs.."

Our news journalists report that additional information may be obtained by contacting L. Keskintepe, Univ Bursa, Dept. of Med Genet, Bursa, Turkey. Additional authors for this research include M. Dayal, Z. Beyhan, T. Yakut and L. Keskintepe.

Genetics - Assisted Reproduction and Genetics

New Assisted Reproduction and Genetics Findings from Lanzhou University Reported (The effect of chromosomal polymorphisms on the outcomes of fresh IVF/ICSI-ET cycles in a Chinese population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Genetics - Assisted Reproduction and Genetics are presented in a new report. According to news reporting out of Lanzhou, People's Republic of China, by NewsRx editors, research stated, "Chromosomal polymorphisms (CPs) have been reported to be associated with infertility; however, their effects on the outcomes of in vitro fertilization/intracytoplasmic sperm injection-embryo transfer (IVF/ICSI-ET) are still controversial. In this retrospective study, we aimed to evaluate the effect of CPs on IVF/ICSI-ET outcomes."

Our news journalists obtained a quote from the research from Lanzhou University, "To investigate whether CPs affected the outcomes of fresh IVF/ICSI-ET cycles in a Chinese population, we evaluated infertile couples with male carriers of CPs (n = 348), infertile couples with female carriers (n = 99), and unaffected couples (n = 400) who had received their first treatment cycles in our hospital between January 2013 and March 2015. CPs in either male or female carriers seemed to have adverse effects on IVF/ICSI-ET outcomes. CPs in male carriers affected outcomes mainly by decreasing the rates of fertilization, embryo cleavage, good quality embryos, clinical pregnancies, ongoing pregnancies, and deliveries as well as increasing the biochemical pregnancy rate (P < 0.05); CPs in female carriers affected outcomes only by lowering the embryo cleavage rate (P < 0.05). The mean fertilization rate of couples with male CP carriers undergoing IVF was significantly lower than that in those undergoing ICSI (61.1 versus 66.5 %, respectively; P = 0.0004). Our data provide evidence for the involvement of CPs in the poor outcomes of fresh IVF/ICSI-ET cycles in a Chinese population."

According to the news editors, the research concluded: "The use of ICSI might improve outcomes by increasing the fertilization rate for men with CPs."

Our news journalists report that additional information may be obtained by

Genetics - Assisted Reproduction and Genetics

New Assisted Reproduction and Genetics Study Findings Have Been Reported by Researchers at University of Akdeniz (Differential expression pattern of Twist1 in mouse preimplantation embryos suggests its multiple roles during early development)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genetics - Assisted Reproduction and Genetics have been published. According to news reporting out of Antalya, Turkey, by NewsRx editors, research stated, "The purpose of the present study is to understand Twist-related protein 1 (Twist1) spatiotemporal expression patterns and functions during early embryo development. We performed whole-mount double immunofluorescence staining and reverse transcription (RT)-PCR analysis of the Twist1 protein and gene throughout the preimplantation development in mice."

Our news journalists obtained a quote from the research from the University of Akdeniz, "We determined that after compaction, the expression of Twist1 becomes developmentally differentiated and targeted in the inner cells of embryos. In blastocysts at E4.5, uniform staining of the inner cell mass was apparent, and it had been gradually translocated to the nucleus of hatched embryonic cells at E4.75. Furthermore, the effect of potential regulators of Twist on its expression level during blastocyst development was also sought. Accordingly, Twist1 expression appeared to be upregulated in both mRNA and protein level following culture of embryos in the presence of high glucose. Our study revealed the dynamic Twist localization within the early stage of embryo."

According to the news editors, the research concluded: "The results are discussed in terms of potential roles of Twist1 in the processes of lineage segregation, hatching, and implantation in post-compaction embryos and in blastocysts."

Our news journalists report that additional information may be obtained by contacting N. Demir, Akdeniz Univ Campus, Sch Med, Dept. of Histol & Embryol, TR-07070 Antalya, Turkey. Additional authors for this research include S. Pehlivanoglu and N. Demir.

Lung Diseases and Conditions - Asthma

New Asthma Findings from Wannan Medical College Described (An updated meta-analysis of transforming growth factor-beta 1 gene: Three well-characterized polymorphisms with asthma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Asthma is the subject of a report. According to news reporting out of Anhui, People's Republic of China, by NewsRx editors, research stated, "The association between TGF-1 beta polymorphisms and asthma risk has been widely reported, but results were controversial. We performed this meta-analysis based on the Preferred Reporting Items for Systematic Reviews and meta-analyses statement (PRISMA)."

Our news journalists obtained a quote from the research from Wannan Medical College, "Electronic database of Pub Med, Web of Science, CBM, and CNKI were searched for eligible articles published up to September, 2013. The effect summary odds ratio (OR) and 95% confidence intervals were obtained. Finally, a total of 20 articles were identified, 17 studies with 3694 cases and 5613 controls for C-509T polymorphism, 7 studies with 1109 cases and 1098 controls for T869C polymorphism and 5 studies with 849 cases and 829 controls for G915C polymorphism. For C-509T, significant associations with asthma were found in Asians (IT + TC vs. CC: P = 0.004, OR = 1.43, 95%CI = 1.12-1.81, P-heterogeneity = 0.001) and in Caucasians (P= 0.05, OR = 1.16, 95%CI = 1.00-1.34, Pheterogeneity = 0.36). With respect to T869C, a small significant association was observed in overall analysis of allele contrasts(C vs. T: OR = 1.14, 95%CI: 1.01-1.29, P = 0.03) and homozygote comparison (CC vs. TT: OR 1.29, 95%CI: 1.00-1.65, P= 0.05), but no significant risks were found among Caucasian population and Asian population. For G915C polymorphism, no significant association with asthma risk was demonstrated in overall analysis and subgroup analyses according to ethnicity for all genetic models."

According to the news editors, the research concluded: "This meta-analysis suggested that TGF-beta 1 C-509T and T869C polymorphisms may be risk factors for asthma."

Lung Diseases and Conditions - Asthma

New Asthma Study Findings Have Been Reported from Tarbiat Modares University (Conjugated Alpha-Alumina nanoparticle with vasoactive intestinal peptide as a Nano-drug in treatment of allergic asthma in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lung Diseases and Conditions - Asthma have been presented. According to news originating from Tehran, Iran, by NewsRx correspondents, research stated, "Asthma is a chronic respiratory disease characterized by airway inflammation, bronchoconstriction, airway hyperresponsiveness and recurring attacks of impaired breathing. Vasoactive intestinal peptide (VIP) has been proposed as a novel anti-asthma drug due to its effects on airway smooth muscle relaxation, bronchodilation and vasodilation along with its immunomodulatory and anti-inflammatory properties."

Our news journalists obtained a quote from the research from Tarbiat Modares University, "In the current study, we investigated the therapeutic effects of VIP when conjugated with alpha-alumina nanoparticle (alpha-AN) to prevent enzymatic degradation of VIP in the respiratory tract. VIP was conjugated with alpha-AN. Balb/c mice were sensitized and challenged with ovalbumin (OVA) or PBS and were divided in four groups; VIP-treated, alpha-AN-treated, alpha-AN-VIP-treated and beclomethasone-treated as a positive control group. Specific and total IgE level, airway hyperresponsiveness (AHR), bronchial cytokine expression and lung histology were measured. alpha-AN-VIP significantly reduced the number of eosinophils (Eos), serum IgE level, Th2 cytokines and AHR. These effects of a-AN-VIP were more pronounced than that seen with beclomethasone or VIP alone (P <0.05)."

According to the news editors, the research concluded: "The current data indicate that a-AN-VIP can be considered as an effective nano-drug for the treatment of asthma."

For more information on this research see: Conjugated Alpha-Alumina nanoparticle with vasoactive intestinal peptide as a Nano-drug in treatment of allergic asthma in mice. European Journal of Pharmacology, 2016;791():811-820. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. New Asthma Study Findings Recently Were Reported by Researchers at German Center Lung Research [IL-27 Is Essential for Suppression of Experimental Allergic Asthma by the TLR7/8 Agonist R848 (Resiquimod)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lung Diseases and Conditions - Asthma have been presented. According to news reporting originating from Hannover, Germany, by NewsRx correspondents, research stated, "Different models of experimental allergic asthma have shown that the TLR7/8 agonist resiquimod (R848) is a potential inhibitor of type 2 helper cell driven inflammatory responses. However, the mechanisms mediating its therapeutic effects are not fully understood."

Our news editors obtained a quote from the research from German Center Lung Research, "Using a model of experimental allergic asthma, we show that induction of IL-27 by R848 is critical for the observed ameliorative effects. R848 significantly inhibited all hallmarks of experimental allergic asthma, including airway hyperreactivity, eosinophilic airway inflammation, mucus hypersecretion, and Ag-specific Ig production. Whereas R848 significantly reduced IL-5, IL-13, and IL-17, it induced IFN-gamma and IL-27. Neutralization of IL-27 completely reversed the therapeutic effect of R848 in the experimental asthma model, demonstrating dependence of R848-mediated suppression on IL-27. In vitro, R848 induced production of IL-27 by murine alveolar macrophages and dendritic cells and enhanced expression of programmed death ligand 1, whose expression on monocytes and dendritic cells has been shown to regulate peripheral tolerance in both murine and human studies. Moreover, in vitro IL-27 enhanced secretion of IFN-gamma whereas it inhibited IL-5 and IL-13, demonstrating its direct effect on attenuating Th2 responses. Taken together, our study proves that R848-mediated suppression of experimental asthma is dependent on IL-27."

According to the news editors, the research concluded: "These data provide evidence of a central role of IL-27 for the control of Th2-mediated allergic diseases."

For more information on this research see: IL-27 Is Essential for Suppression of Experimental Allergic Asthma by the TLR7/8 Agonist R848 (Resiquimod). *Journal of Immunology*, 2016;197(11):4219-4227. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. New Asthma Study Results Reported from Norwegian Institute of Public Health (Maternal plasma total neopterin and kynurenine/tryptophan levels during pregnancy in relation to asthma development in the offspring)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Asthma have been published. According to news reporting out of Oslo, Norway, by NewsRx editors, research stated, "Neopterin levels and kynurenine/tryptophan ratios (KTRs) increase with IFN-gamma stimulation, indicating T(H)1 immunity, and thus might be inversely associated with asthma. We sought to examine the association of maternal neopterin levels and KTRs during pregnancy with asthma in the offspring."

Our news journalists obtained a quote from the research from the Norwegian Institute of Public Health, "We analyzed the associations of maternal plasma total neopterin levels and KTRs in midpregnancy with asthma at age 7 years among 2883 children in the Norwegian Mother and Child Cohort Study. Asthma was classified either based on registered dispensed asthma medications in the Norwegian Prescription Database or maternal report. We calculated adjusted relative risks using log-binomial regression. The median gestational week of blood sampling was 18 weeks (interquartile range, 17-19 weeks). The risk of dispensed asthma medications at age 7 years was highest among children of mothers in the highest quartile of neopterin levels, whereas the risk was similar in the 3 lowest quartiles. The adjusted relative risk of dispensed asthma medications was 1.66 (95% CI, 1.16-2.38) when comparing children of mothers in the highest quartile with those in the 3 lowest quartiles. A similar association was observed for maternal report of asthma at age 7 years. When we evaluated allergic versus nonallergic asthma, neopterin levels tended to be associated with nonallergic asthma. Maternal KTR was not associated with asthma development. Our findings indicate that high maternal levels of neopterin, a marker of cellular immune activation, during pregnancy were positively associated with asthma in the offspring."

According to the news editors, the research concluded: "Experimental studies would be needed to further elucidate underlying mechanisms."

For more information on this research see: Maternal plasma total neopterin and kynurenine/tryptophan levels during pregnancy in relation to asthma development in the offspring. *Journal of Allergy and Clinical Immunology*, 2016;138(5):1319-1325,624-627. *Journal of Allergy and Clinical Immunology* can be contacted at: Mosby-Elsevier, 360 Park Avenue South, New York, NY 10010-1710, USA. Lung Diseases and Conditions - Asthma

New Asthma Study Results from University of Texas Health Science Center Described (b-Blockers have differential effects on the murine asthma phenotype)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Asthma have been published. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "Our previous studies have shown the b2-adrenoceptor and its endogenous ligand, adrenaline, are required for development of the asthma phenotype in murine asthma models. Chronic administration of some, but not other, b-blockers attenuated the asthma phenotype and led us to hypothesize that biased signalling was the basis of their differential effects, experimentally and clinically."

Financial support for this research came from National Institutes of Health.

The news reporters obtained a quote from the research from the University of Texas Health Science Center, "We used mice with no detectable systemic adrenaline (PNMT(-/-)) and wild-type (WT) mice to study the effects of four b-blockers, alprenolol, carvedilol, propranolol and nadolol, in an ovalbumin sensitization and challenge (Ova S/C) murine model of asthma. The parameters measured were inflammatory cell infiltration, mucous metaplasia and airway hyperresponsiveness. To interpret the pharmacological action of these ligands quantitatively, we conducted computer simulations of three-state models of receptor activation. Ova S/C PNMT(-/-) mice do not develop an asthma phenotype. Here, we showed that administration of alprenolol, carvedilol or propranolol in the absence of interference from adrenaline using Ova S/C PNMT(-/-) mice resulted in the development of an asthma phenotype, whereas nadolol had no effect. Ova S/C WT mice did develop an asthma phenotype, and administration of alprenolol, propranolol and carvedilol had no effect on the asthma phenotype. However, nadolol prevented development of the asthma phenotype in Ova S/C WT mice."

According to the news reporters, the research concluded: "Computer simulations of these four ligands were consistent with the isolated three-state receptor model. b-Blockers have different effects on the murine asthma phenotype that correlate with reported differences in
activation or inhibition of downstream b2-adrenoceptor signalling pathways."

Our news correspondents report that additional information may be obtained by contacting V.J. Thanawala, Dept. of Integrative and Biology Pharmacology, University of Texas Health Science Center, Houston, TX, United States. Additional authors for this research include D.J. Valdez, R. Joshi, G.S. Forkuo, S. Parra, B.J. Knoll, M. Bouvier, P. Leff and R.A Bond.

**Nervous System Diseases and Conditions - Ataxia**

**New Ataxia Study Findings Have Been Reported by Investigators at Institute for Cancer Research and Treatment (IRCCS) (Episodic ataxia and SCA6 within the same family due to the D302N CACNA1A gene mutation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nervous System Diseases and Conditions - Ataxia. According to news reporting out of Milan, Italy, by NewsRx editors, research stated, "Several dominant mutations of CACNA1A gene were associated with at least three different allelic disorders: spino-cerebellar ataxia type 6 (SCA6), episodic ataxia type 2 (EA2), and familial hemiplegic migraine-1 (FHM1). It is generally thought that loss-of-function mutations are associated with EA2, gain-of-function missense mutations with FHM1, and abnormal CAG expansions with SCAB."

Our news journalists obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "But, overlapping features, atypical symptoms and co-occurrence of distinct phenotypes within the same family were reported. We describe a four generation family showing different phenotypes ranging from EA2 to SCA6 and carrying the p.D302N CACNA1A gene mutation."

According to the news editors, the research concluded: "In our family the phenotypes maintained separate and gender differences corresponding to different phenotypes were observed."

For more information on this research see: Episodic ataxia and SCA6 within the
same family due to the D302N CACNA1A gene mutation. *Journal of the Neurological Sciences*, 2016;371():81-84. *Journal of the Neurological Sciences* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of the Neurological Sciences - www.journals.elsevier.com/journal-of-the-neurological-sciences/)

Our news journalists report that additional information may be obtained by contacting L. Pradotto, IRCCS Ist Auxol Italiano, Div Neurol & Neurorehabil, Milan, Italy. Additional authors for this research include M. Mencarelli, M. Bigoni, A. Milesi, A. Di Blasio and A. Mauro.

**Cardiovascular Diseases and Conditions -**

**New Atherosclerosis Findings Has Been Reported by Investigators at Fox Chase Cancer Center (The role of cytokines in the development of atherosclerosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Atherosclerosis contributes to the development of many cardiovascular diseases, which remain the leading cause of death in developed countries. Atherosclerosis is a chronic inflammatory disease of large and medium-sized arteries."

Our news editors obtained a quote from the research from Fox Chase Cancer Center, "It is caused by dyslipidemia and mediated by both innate and adaptive immune responses. Inflammation is a key factor at all stages of atherosclerosis progression. Cells involved in pathogenesis of atherosclerosis were shown to be activated by soluble factors, cytokines, that strongly influence the disease development. Pro-inflammatory cytokines accelerate atherosclerosis progression, while anti-inflammatory cytokines ameliorate the disease."

According to the news editors, the research concluded: "In this review, we discuss the latest findings on the role of cytokines in the development and progression of atherosclerosis."

The news editors report that additional information may be obtained by contacting E.K. Koltsova, Fox Chase Canc Center, Philadelphia, PA 19111, United States. Additional authors for this research include I.O. Peshkova and E.K. Koltsova.

The direct object identifier (DOI) for that additional information is:
New Atherosclerosis Findings from Gifu University Reported (Different Susceptibilities between Apoe- and Ldlr-Deficient Mice to Inflammation-Associated Colorectal Carcinogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting out of Gifu, Japan, by NewsRx editors, research stated, "Hypercholesterolemia resulting in atherosclerosis is associated with an increased risk of ischemic heart disease and colorectal cancer (CRC). However, the roles of apoliprotein (Apo) E (Apoe) and low-density lipoprotein (Ldl) receptor (Ldlr) in colorectal carcinogenesis have not yet been investigated."

Our news journalists obtained a quote from the research from Gifu University, "In this study, we examined the susceptibility of Apoe-deficient and Ldlr-deficient mice, which are genetic animal models of atherosclerosis to azoxymethane (AOM)/dextran sodium sulfate (DSS)-induced colorectal carcinogenesis. In Experiment 1, male Apoe-deficient (n = 20) and wild type (WT) mice (C57BL/6J, n = 21) were treated with a single intraperitoneal (i.p.) injection of AOM (10 mg/kg body weight) and then given 1.5% DSS in drinking water for seven days. They were maintained up to week 20 and sacrificed for the histopathological examination of colorectal tumors. The mRNA expression of cyclooxygenase (Cox)-2, inducible nitric oxide synthase (Nos2), tumor necrosis factor (Tnf)-alpha interleukin (Il)-1 beta, and Il-6 was assayed in the colorectal mucosa. In Experiment 2, male Ldlr-deficient (n = 14) and WT mice (C57BL/6J, n = 10) were given a single i. p. injection of AOM (10 mg/kg body weight) and then given 2% DSS in drinking water for seven days. They were sacrificed at week 20 to evaluate their colorectum histopathologically. In Experiment 1, the multiplicity of CRCs was significantly higher in the Apoe-deficient mice (2.75 +/- 1.48) than in the WT mice (0.62 +/- 0.67). The serum lipoprotein levels in the Apoe-deficient mice were also significantly higher than in the WT mice. In Experiment 2, the incidence (29%) and multiplicity (0.50 +/- 0.94) of CRCs in the Ldlr mice were significantly lower than in the WT mice (80% incidence and 3.10 +/- 2.38 multiplicity). The mRNA expression of two inducible enzymes and certain pro-inflammatory cytokines in the colorectum of each genotype was greater than in the respective WT mice. The values in the Apoe-deficient mice were much greater than in the Ldlr mice."

According to the news editors, the research concluded: "These findings suggest that Apoe-deficient mice showed increased susceptibility to inflammation-associated colorectal carcinogenesis due to their high reactivity to inflammatory stimuli."

For more information on this research see: Different Susceptibilities between Apoe- and Ldlr-Deficient Mice to Inflammation-Associated Colorectal Carcinogenesis. International Journal of Molecular Sciences, 2016;17(11):710-723. International Journal of Molecular
New Atherosclerosis Findings from P.S. Timashev and Colleagues Discussed (Atomic Force Microscopy Study of Atherosclerosis Progression in Arterial Walls)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting originating from Troitsk, Russia, by NewsRx correspondents, research stated, "Cardiovascular disease remains the leading cause of mortality worldwide. Here we suggest a novel approach for tracking atherosclerosis progression based on the use of atomic force microscopy (AFM)."

Our news editors obtained a quote from the research, "Using AFM, we studied cross-sections of coronary arteries with the following types of lesions: Type II-thickened intima; Type III-thickened intima with a lipid streak; Type IV-fibrotic layer over a lipid core; Type Va-unstable fibrotic layer over a lipid core; Type Vc-very thick fibrotic layer. AFM imaging revealed that the fibrotic layer of an atherosclerotic plaque is represented by a basket-weave network of collagen fibers and a subscale network of fibrils that become looser with atherosclerosis progression. In an unstable plaque (Type Va), packing of the collagen fibers and fibrils becomes even less uniform than that at the previous stages, while a stable fibrotic plaque (Vc) has significantly tighter packing. Such alterations of the collagen network morphology apparently, led to deterioration of the Type Va plaque mechanical properties, that, in turn, resulted in its instability and propensity to rupture."

According to the news editors, the research concluded: "Thus, AFM may serve as a useful tool for tracking atherosclerosis progression in the arterial wall tissue."

The news editors report that additional information may be obtained by contacting P.S. Timashev, 1Institute of Laser and Information Technologies, 2 Pionerskaya St, 142092 Troitsk, Moscow, Russia. Additional authors for this research include S.L. Kotova, G.V. Belkova, E.V. Gubar'kova, L.B. Timofeeva, N.D. Gladkova and A.B Solovieva.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1017/S1431927616000039. This DOI is a link to an online electronic
New Atherosclerosis Study Findings Recently Were Reported by Researchers at Affiliated Hospital (Trimethylamine N-oxide induces inflammation and endothelial dysfunction in human umbilical vein endothelial cells via activating ROS-TXNIP-NLRP3 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Atherosclerosis is the subject of a report. According to news originating from Sichuan, People's Republic of China, by NewsRx correspondents, research stated, "Recent research demonstrates that the choline-derived metabolite trimethylamine-N-oxide (TMAO) levels are strongly associated with atherosclerosis and cardiovascular risks. The NLRP3 inflammasome responds to exogenous and endogenous danger signals involved in the development of atherosclerosis."

Financial support for this research came from Sichuan Medical Association Fund of China.

Our news journalists obtained a quote from the research from Affiliated Hospital, "Moreover, thioredoxin-interactive protein (TXNIP) activation is a key event linked to NLRP3 inflammasome via reactive oxygen species (ROS). Whether TMAO prime NLRP3 inflammasome via ROS-TXNIP pathway remains unclear. This study observed the expression of TXNIP-NLRP3 inflammasome stimulated by TMAO in human umbilical vein endothelial cells (HUVECs), aiming to elucidate the mechanism by which the TMAO may contribute to inflammation and endothelial dysfunction. Our data showed that TMAO significantly triggered oxidative stress and activated TXNIP-NLRP3 inflammasome whereat inflammatory cytokines interleukin (IL)-1 beta and IL-18 were released in a dose- and time-dependent manner, but endothelial nitric oxide synthase (eNOS) and production of nitric oxide (NO) were inhibited. Moreover, TMAO-mediated effects were observably reversed by ROS inhibitor N-acetylcysteine (NAC) treatment or siRNA-mediated knockdown TXPIN and NLRP3."

According to the news editors, the research concluded: "Taken together, our results firstly reveal that TMAO induces inflammation and endothelial dysfunction via activating ROS-TXNIP-NLRP3 inflammasome, suggest a likely mechanism for TMAO-dependent enhancement in atherosclerosis and cardiovascular risks."

For more information on this research see: Trimethylamine N-oxide induces inflammation and endothelial dysfunction in human umbilical vein endothelial cells via activating ROS-TXNIP-NLRP3 inflammasome. Biochemical and Biophysical Research Communications, 2016;481(1-2):63-70. Cardiovascular Diseases and Conditions...

New Atherosclerosis Study Findings Recently Were Reported by Researchers at University of Antwerp (NecroX-7 reduces necrotic core formation in atherosclerotic plaques of Apoe knockout mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Atherosclerosis are presented in a new report. According to news reporting out of Antwerp, Belgium, by NewsRx editors, research stated, "A large necrotic core is a key feature of atherosclerotic plaque instability. Necrotic cellular debris accumulates in the lipid-rich core and promotes inflammation, destabilization and ultimately rupture of the plaque."

Our news journalists obtained a quote from the research from the University of Antwerp, "Although the role of necrosis in atherosclerosis is rather clear-cut, not many strategies have been performed up till now to specifically target plaque necrosis. In the present study, we tested the plaque stabilizing potential of NecroX-7, a novel compound with antioxidative and anti-necrotic properties. Male apolipoprotein E (Apoe) knockout mice were treated with NecroX-7 (30 mg/kg) or vehicle, 3 times per week, via intraperitoneal injections for 16 weeks. Meanwhile, mice were fed a western-type diet to induce plaque formation. NecroX-7 reduced total plaque burden in the thoracic aorta as compared to vehicle-treated mice, without affecting total plasma cholesterol. Plaques in the aortic root of NecroX-7-treated mice showed a significant decrease in necrotic core area, 8-oxodG, iNOS and MMP13 expression, while collagen content and minimum fibrous cap thickness were increased. Moreover, NecroX-7 treatment reduced the expression of multiple inflammation markers such as TNF alpha, IL1 beta, iNOS, HMGB1 and RAGE in a NF-kappa beta-dependent manner. In vitro, NecroX-7 prevented tert-butyl hydroperoxide (tBHP)-induced mitochondrial ROS formation, necrosis, iNOS expression and HMGB1 release in primary macrophages. NecroX-7 improves features of plaque stability in Apoe knockout mice by reducing necrotic core formation, oxidative stress and inflammation, and by increasing collagen deposition and fibrous cap thickness."

According to the news editors, the research concluded: "Therefore, NecroX-7 could be a promising pleiotropic drug for the treatment of atherosclerosis."

For more information on this research see: NecroX-7 reduces necrotic core formation in atherosclerotic plaques of Apoe knockout mice. Atherosclerosis, 2016;252():166-
174. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

**Skin Diseases and Conditions - Atopic Dermatitis**

**New Atopic Dermatitis Study Findings Have Been Reported by Researchers at Department of Pediatrics (Bacterial and Viral Infections in Atopic Dermatitis: a Comprehensive Review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Skin Diseases and Conditions - Atopic Dermatitis. According to news reporting originating in Los Angeles, California, by NewsRx journalists, research stated, "Atopic dermatitis (AD) is the most common allergic skin disease in the general population. It is a chronic inflammatory skin disease complicated by recurrent bacterial and viral infections that, when left untreated, can lead to significant complications."

The news reporters obtained a quote from the research from the Department of Pediatrics, "The current article will review immunologic and molecular mechanisms underlying the propensity of AD patients to microbial infections. These infections include Staphylococcus aureus (S. aureus) skin infections, eczema herpeticum, eczema vaccinatum, and eczema coxsackium. Previous studies have shown that skin barrier defects, a decrease in antimicrobial peptides, increased skin pH, or Th2 cytokines such as IL-4 and IL-13 are potential contributing factors for the increased risk of skin infections in AD. In addition, bacterial virulence such as methicillin-resistant S. aureus (MRSA) produces significantly higher number of superantigens that increase their potential in causing infection and more severe cutaneous inflammation in AD patients. More recent studies suggest that skin microbiome including Staphylococcus epidermidis or other coagulase-negative staphylococci may play an important role in controlling S. aureus skin infections in AD. Other studies also suggest that genetic variants in the innate immune response may predispose AD patients to increased risk of viral skin infections. These genetic variants include thymic stromal lymphopoietin (TSLP), type I interferon (alpha, omega), type II interferon (gamma), and molecular pathways that lead to the production of interferons (interferon regulatory factor 2). A common staphylococcal toxin, alpha-toxin, may also play a role in enhancing herpes simplex virus skin infections in AD."

According to the news reporters, the research concluded: "Further understanding of
these disease processes may have important clinical implications for the prevention and treatment of skin infections in this common skin disease."

For more information on this research see: Bacterial and Viral Infections in Atopic Dermatitis: a Comprehensive Review. Clinical Reviews in Allergy & Immunology, 2016;51(3):329-337. Clinical Reviews in Allergy & Immunology can be contacted at: Humana Press Inc, 999 Riverview Drive Suite 208, Totowa, NJ 07512, USA.

Heart Disorders and Diseases - Atrial Fibrillation

New Atrial Fibrillation Data Have Been Reported by R.A. Winkle and Co-Authors (Predicting atrial fibrillation ablation outcome: The CAAP-AF score)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting out of Redwood City, California, by NewsRx editors, research stated, "Patients with a variety of clinical presentations undergo atrial fibrillation (AF) ablation. Long-term ablation success rates can vary considerably."

Our news journalists obtained a quote from the research, "The purpose of this study was to develop a clinical scoring system to predict long-term freedom from AF after ablation. We retrospectively derived the scoring system on a development cohort (DC) of 1125 patients undergoing AF ablation and tested it prospectively in a test cohort (TC) of 937 patients undergoing AF ablation. The demographics of the DC patients were as follows: age 62.3 +/- 10.3 years, male sex 801 (71.2%), left atrial size 4.30 +/- 0.69 cm, paroxysmal AF 348 (30.9%), number of drugs failed 1.3 +/- 1.1, hypertension 525 (46.7%), diabetes 100 (8.9%), prior stroke/transient ischemic attack 78 (6.9%), prior cardioversion 528 (46.9%), and CHADS2 score 0.87 +/- 0.97. Multivariate analysis showed 6 independent variables predicting freedom from AF after final ablation: coronary artery disease (P = .021), atrial diameter (P = .0003), age (P = .004), persistent or long-standing AF (P < .0001), number of antiarrhythmic drugs failed (P < .0001), and female sex (P = .0001). We created a scoring system (CAAP-AF) using these 6 variables, with scores ranging from 0 to 13 points. The 2-year AF-free rates by CAAP-AF scores were as follows: 0 = 1000/0, 1 = 95.70/0, 2 = 96.3%, 3 = 83.1%, 4 = 85.5%, 5 = 79.9%, 6 = 76.1%, 7 = 63.4%, 8 = 51.1%, 9 = 53.6%, and >= 10 = 29.1%. Ablation success decreased as
CAAP-AF scores increased (P < .0001). The CAAP-AF score also predicted freedom from AF in the TC. The 2-year Kaplan-Meier AF-free rates by CAAP-AF scores were as follows: 0 = 1000/0, 1 = 87.0%, 2 = 89.0%, 3 = 91.6%, 4 = 90.5%, 5 = 84.4%, 6 = 70.1%, 7 = 71.0%, 8 = 60.7%, 9 = 68.9%, and >= 10 = 51.3%. As CAAP-AF scores increased, 2-year freedom from AF in the TC decreased (P < .0001). An easily determined clinical scoring system was derived retrospectively and applied prospectively. The CAAP-AF score predicted freedom from AF after ablation in both a DC and a TC of patients undergoing AF ablation."

According to the news editors, the research concluded: "The CAAP-AF score provides a realistic AF ablation outcome expectation for individual patients."

For more information on this research see: Predicting atrial fibrillation ablation outcome: The CAAP-AF score. Heart Rhythm, 2016;13(11):2119-2125. Heart Rhythm can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Heart Rhythm - www.journals.elsevier.com/heart-rhythm/)

Heart Disorders and Diseases - Atrial Fibrillation

New Atrial Fibrillation Findings Has Been Reported by Researchers at Research Hospital (Predictors of Future Atrial Fibrillation Development in Patients with Hypertrophic Cardiomyopathy: A Prospective Follow-Up Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Atrial Fibrillation are presented in a new report. According to news originating from Izmir, Turkey, by NewsRx correspondents, research stated, "We evaluated whether left atrial (LA) phasic functions, P-wave dispersion (PWD), and plasma NT-proBNP levels could predict future development of atrial fibrillation (AF) in patients with hypertrophic cardiomyopathy (HCM). Seventy patients with HCM were evaluated."

Our news journalists obtained a quote from the research from Research Hospital, "The LA phasic functions including the LA total emptying volume (LATEV), LA total emptying fraction (LATEF), LA active emptying volume (LAAEV), LA active emptying fraction (LAAEF), LA passive emptying volume (LAPEV), and LA passive emptying fraction (LAPEF) were evaluated. P-wave dispersion was calculated. Plasma NT-proBNP levels were measured on the same day with echocardiographic study. Patients were followed up 53.09 ? 1.87 months. Patients who developed AF (n=18) had significantly higher PWD values, NT-proBNP levels,
LAVI, E/E' av, and resting LVOT gradients and significantly lower LATEF and LAAEF. In multivariate analysis, LATEF (p=0.002), LAAEF (p=0.007), logNT-proBNP level (p=0.022), and PWD (p=0.018) were associated with AF development. The results of receiver operating characteristic analysis revealed that a LATEF cutoff value 49% with 72% sensitivity and 81% specificity, a LAAEF cutoff value of 36% with 72% sensitivity and 71% specificity, and an NT-proBNP cutoff value of 720 pg/mL predicted future AF development with 72% sensitivity and 60% specificity. A PWD cutoff value of 47.5 ms predicted future AF development with 78% sensitivity and 72% specificity. In patients with HCM, LA phasic functions, PWD, and NT-proBNP levels predict future development of AF.

According to the news editors, the research concluded: "Assessment of LA phasic functions during routine echocardiographic evaluation and measuring NT-proBNP levels and PWD values of patients with HCM during daily practice may provide important data in predicting those at high risk of AF occurrence."

The news correspondents report that additional information may be obtained from K. Tuluce, Dept. of Cardiology, Tepecik Training and Research Hospital, Izmir, Turkey. Additional authors for this research include S. Yakar Tuluce, N. Kahya Eren, U. Kocabas, F. Akyildiz Akçay, R. Gunduz, Z.I. Akyildiz and O. Ergene.

Heart Disorders and Diseases - Atrial Fibrillation

New Atrial Fibrillation Findings from Cleveland Clinic Described (Evolving strategies to prevent stroke and thromboembolism in nonvalvular atrial fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Stroke prevention in patients with nonvalvular atrial fibrillation relies on an assessment of the individual risks for stroke and bleeding. Patients at high risk for stroke are candidates for anticoagulant therapy."

Our news editors obtained a quote from the research from Cleveland Clinic, "Anticoagulants, however, have substantial bleeding risks that must be weighed in the
therapeutic decision. Warfarin has been the traditional choice, but the recently introduced novel oral anticoagulants offer similar efficacy with less bleeding risk. Additionally, they do not require monitoring and have fewer drug interactions and dietary restrictions than warfarin."

According to the news editors, the research concluded: "Several devices, which isolate the left atrial appendage, have become available as treatment options for patients with elevated risks of both thromboembolism and bleeding complications."

The news editors report that additional information may be obtained by contacting A. Hussein, Cardiac Electrophysiology and Pacing, Cleveland Clinic, Cleveland, OH, United States. Additional authors for this research include W. Saliba and O.M Wazni.

**Heart Disorders and Diseases - Atrial Fibrillation**

**New Atrial Fibrillation Findings from Guangdong Cardiovascular Institute Reported (Association of Serum Omentin-1 Concentrations with the Presence of Atrial Fibrillation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Omentin-1 is one of the adipokines associated with obesity, diabetes, and coronary heart disease development. We determined to investigate whether serum omentin-1 concentrations were correlated with the presence of atrial fibrillation (AF)."

The news correspondents obtained a quote from the research from Guangdong Cardiovascular Institute, "Serum omentin-1 concentrations were examined in a cross-sectional population that included 220 patients with AF (70 with paroxysmal AF, 78 with persistent AF, and 72 with permanent AF) and 115 healthy controls. Reduced serum omentin-1 concentrations were found in AF patients compared to the controls. In addition, patients with permanent AF had lower serum omentin-1 concentrations compared to patients with persistent AF and patients with paroxysmal AF. Significantly decreased serum omentin-1 concentrations were observed in persistent AF patients compared to paroxysmal AF patients. Spearman correlation analysis suggested that serum omentin-1 concentrations were negatively correlated with left atrial diameter in AF patients."

According to the news reporters, the research concluded: "Serum omentin-1 concentrations were correlated with the presence of AF and atrial remodeling."

For more information on this research see: Association of Serum Omentin-1 Concentrations with the Presence of Atrial Fibrillation. *Medical Science Monitor*, 2016;22():4749-4754. *Medical Science Monitor* can be contacted at: Int Scientific Literature, Inc, 361
New Atrial Fibrillation Findings from Mayo Clinic Outlined (Left Atrial Appendage Closure for Stroke Prevention in Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting originating in Rochester, Minnesota, by NewsRx journalists, research stated, "Purpose of Review Anticoagulant therapy effectively reduces the incidence of stroke in patients with atrial fibrillation (AF) but is underutilized and frequently contraindicated. The left atrial appendage (LAA) is the primary site of thrombus formation in AF patients."

The news reporters obtained a quote from the research from Mayo Clinic, "Surgical and percutaneous appendage closure has been evaluated as a site-specific therapy to reduce systemic thromboembolism. We will review LAA closure techniques, examine recent outcome data, and discuss the indications for, and potential complications of, each approach. Randomized data examining surgical LAA closure and epicardial closure with the LARIAT device are lacking."

According to the news reporters, the research concluded: "High quality, randomized data supports the efficacy of the WATCHMAN device for stroke prevention in patients with AF."

Our news correspondents report that additional information may be obtained by contacting D.R. Holmes, Mayo Clinic, Dept. of Cardiovasc Dis, Rochester, MN 55905, United States. Additional authors for this research include J.G. Kiani and D.R. Holmes.

Keywords for this news article include: Rochester, Minnesota, United States, North and Central America, Heart Disorders and Diseases, Stroke, Article Review, Risk and Prevention, Atrial Fibrillation, Cardiac Arrhythmias, Heart Disease, Mayo Clinic.
New Atrial Fibrillation Findings from R.J. Piers et al Outlined

(Association between atrial fibrillation and volumetric magnetic resonance imaging brain measures: Framingham Offspring Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news originating from Framingham, Massachusetts, by NewsRx correspondents, research stated, "The increased risk of stroke and cognitive impairment associated with atrial fibrillation (AF) is well documented. However, there is a paucity of research investigating the relations between AF and brain morphology."

Our news journalists obtained a quote from the research, "The purpose of this study was to investigate the association between AF and brain volume measures on magnetic resonance imaging (MRI). The study sample included stroke- and dementia-free participants who attended the Framingham Heart Study offspring cohort 7th examination cycle (1999-2005) and underwent contemporaneous MRI. We examined the association between prevalent AF and brain volume measures (total cerebral volume, frontal lobe volume, temporal lobe volume, temporal horn volume, hippocampal volume, and white matter hyperintensity volume) with linear regression. We first adjusted models for age and sex, and then for vascular risk factors and APOE4. We studied 2144 individuals (mean age 61.8 +/- 9.3 years; 54% women); 73 participants (3.4%) had prevalent AF at the time of MRI. In age- and sex-adjusted models, AF was inversely associated with total cerebral brain volume, frontal brain volume, and temporal brain volume. After further adjustment for vascular risk factors and APOE4, AF remained associated with frontal brain volume."

According to the news editors, the research concluded: "After accounting for vascular risk factor burden, prevalent AF was associated with lobar indexes of vascular brain aging but not with expected white matter changes."

The news correspondents report that additional information may be obtained from R. Au, Framingham Heart Dis Epidemiol Study, Framingham, MA, United States. Additional authors for this research include A. Nishtala, S.R. Preis, C. DeCarli, P.A. Wolf, E.J. Benjamin and R. Au.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.hrthm.2016.07.004. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Atrial Fibrillation

New Atrial Fibrillation Findings from University of British Columbia Described (Cost-Effectiveness of Left Atrial Appendage Closure for Stroke Prevention in Atrial Fibrillation Patients With Contraindications to Anticoagulation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting out of Vancouver, Canada, by NewsRx editors, research stated, "Percutaneous left atrial appendage closure (LAAC) is increasingly performed as an alternative to oral anticoagulation (OAC) in patients with nonvalvular atrial fibrillation (AF). We sought to evaluate the cost-effectiveness of treating OAC contraindicated patients with LAAC compared with aspirin alone."

Our news journalists obtained a quote from the research from the University of British Columbia, "A probabilistic patient-level Markov microsimulation model with a lifetime horizon was performed to assess the discounted lifetime costs, quality-adjusted life years, and incremental cost-effectiveness ratio of LAAC compared with aspirin for patients with AF with contraindications to OAC. Baseline characteristics were based on a published multicenter Canadian LAAC experience. Clinical events included stroke, bleeding, myocardial infarction, and procedure-related complications. Event rates for stroke and bleeding were based on the CHA2DS2-VASc and HAS-BLED scores. The relative efficacies of LAAC and aspirin, as well as utility scores, were obtained from the published literature. Canadian procedural and long-term costs were obtained from the Ontario Case Costing Initiative and the Ontario Ministry of Health and Long Term Care. Aspirin was less effective than LAAC (4.25 +/- 0.53 vs 4.66 +/- 0.34 quality-adjusted life years, respectively). The average discounted lifetime cost was CAD$ 30,748 +/- 11,600 for LAAC and $ 38,974 +/- 18,783 for aspirin. Thus, LAAC was dominant, being more effective and less expensive. Our results were robust with a relatively low degree of uncertainty, as LAAC was the preferred option in more than 90% of simulations at a willingness-to-pay threshold of $ 50,000."

According to the news editors, the research concluded: "LAAC is a novel stroke preventative therapy for non-valvular AF and is a cost-effective alternative to aspirin in patients with contraindications to OAC."

Our news journalists report that additional information may be obtained by contacting J. Saw, University of British Columbia, Vancouver Gen Hosp, Div Cardiol, Vancouver, BC, Canada. Additional authors for this research include M.C. Bennell, S.M. Singh and H.C. Wijeysundera.

Keywords for this news article include: Vancouver, British Columbia, Canada, North and Central America, Platelet Aggregation Inhibitors, Heart Disorders and Diseases,
New Atrial Fibrillation Findings from University of Witten Described
(Impact of Cryoballoon Ablation in Hypertrophic Cardiomyopathy-related Heart Failure due to Paroxysmal Atrial Fibrillation. A Comparative Case Series)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Fibrillation have been presented. According to news reporting originating in Cologne, Germany, by NewsRx journalists, research stated, "Atrial fibrillation (AF) represents a turning point in hypertrophic cardiomyopathy (HCM). Pulmonary Vein Isolation (PVI) with Radiofrequency Catheter Ablation (RFCA) is accepted to be successful in restoring sinus rhythm (SR) in HCM patients."

The news reporters obtained a quote from the research from the University of Witten, "The efficacy of cryoballoon (CB) therapy in HCM patients has not been studied so far. 166 patients with AF underwent PVI with CB technology in our single center between 1/2012 and 12/2015. To evaluate the efficacy of the CB therapy in HCM patients, we compared their clinical outcome with those in 'Non-HCM' AF patients in a 3 and 6 months follow-up. Out of 166 AF patients (65.7% paroxysmal AF, PAF), 4 patients had HCM and PAF (young males < 50 years). During the blanking period, 26 patients (15.8%) suffered from AF recurrence (11.0% PAF), including all HCM patients. The 6 months follow up of ‘Non-HCM’ AF patients showed acceptable results (80% stable SR), whereas the HCM patients remained AF. In Conclusion: Even if the CB provides advantages, the single device cannot be recommended in HCM patients because of early AF recurrences."

According to the news reporters, the research concluded: "Anyway, because of the specific hemodynamic changes in HCM patients with AF, ablation should be sought in an early state of its occurrence, then, however, preferably with RFCA."

For more information on this research see: Impact of Cryoballoon Ablation in Hypertrophic Cardiomyopathy-related Heart Failure due to Paroxysmal Atrial Fibrillation. A Comparative Case Series. International Journal of Medical Sciences, 2016;13(9):664-672. International Journal of Medical Sciences can be contacted at: Ivyspring Int Publ, PO Box 4546, Lake Haven, Nsw 2263, Australia.

Our news correspondents report that additional information may be obtained by contacting P. Maagh, University of Witten Herdecke, Klinikum Koln Merheim, Dept. of Cardiol Rhythmol & Internal Intens Care, D-51109 Cologne, Germany. Additional authors for this research include G. Plehn, A. Christoph, A. Oernek and A. Meissner.

Heart Disorders and Diseases - Atrial Fibrillation

New Atrial Fibrillation Study Findings Have Been Reported by Investigators at Center for Research and Advanced Studies of the National Polytechnic Institute (CINVESTAV) (Chronic atrial ionic remodeling by aldosterone: potentiation of L-type ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting out of Mexico City, Mexico, by NewsRx editors, research stated, "It is widely accepted that aldosterone induces atrial fibrillation (AF) by promoting structural changes, but its effects on the function of primary atrial myocytes remain unknown. We have investigated this point in adult rat atrial myocytes, chronically exposed to the hormone."

Financial support for this research came from Consejo Nacional de Ciencia y Tecnologia.

Our news journalists obtained a quote from the research from the Center for Research and Advanced Studies of the National Polytechnic Institute (CINVESTAV), "This treatment produced larger amplitude of Ca2+ transients, longer action potential (AP) duration, and higher incidence of unsynchronized Ca2+ oscillations. Moreover, it also gave rise to increases in both cell membrane capacitance (C-m, 30 %) and activity of L-type Ca2+ channels (LTCCs, 100 %). Concerning K+ currents, a twofold increase was also observed, but only in a delayed rectifier component (I-Ksus). Interestingly, the maximal conductance (G(max)) of Na+ channels was also enhanced, but it occurred in the face of a negative shift in the voltage dependence of inactivation. Thus, at physiological potentials, a decreased fraction of available channels neutralized the effect on G(Na-max). With regard to the effects on both C-m and LTCCs, they involved activation of mineralocorticoid receptors (MRs), were dose-dependent (EC50 similar to 20-130 nM), and developed and recovered in days. Neither gating currents nor protein levels of LTCCs were altered. Instead, the effect on LTCCs was mimicked by cAMP, reverted by a PKA inhibitor, and attenuated by a nitric oxide donor (short-term exposures). Both EGTA and the antioxidant NAC prevented the increase in C-m, without significantly interfering with the upregulation of LTCCs."

According to the news editors, the research concluded: "Overall, these results show that chronic exposures to aldosterone result in dire functional changes at the single myocyte level, which may explain the link between aldosteronism and AF."

For more information on this research see: Chronic atrial ionic remodeling by aldosterone: potentiation of L-type Ca2+ channels and its arrhythmogenic significance. Pflugers Archiv-European Journal of Physiology, 2016;468(11-12):1823-1835. Pflugers Archiv-European Journal of Physiology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

Heart Disorders and Diseases - Atrial Fibrillation

New Atrial Fibrillation Study Findings Have Been Reported by Investigators at Wenzhou Medical University (Direct His-Bundle Pacing Improved Left Ventricular Function and Remodelling in a Biventricular Pacing Nonresponder)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting originating from Wenzhou, People's Republic of China, by NewsRx correspondents, research stated, "The optimal pacing modality after atrioventricular junction (AVJ) ablation remains unclear."

Our news editors obtained a quote from the research from Wenzhou Medical University, "Herein, we describe the case of a heart failure patient who had AVJ ablation for chronic atrial fibrillation and received a cardiac resynchronization therapy defibrillator device. Because of the lack of clinical response to biventricular pacing, the device was revised with the addition of direct His bundle pacing, which resulted in significant improvement in functional status and left ventricular indices."

According to the news editors, the research concluded: "This case illustrated direct His bundle pacing as an alternative for conventional biventricular pacing in some cardiac resynchronization therapy nonresponders who undergo AVJ ablation for atrial fibrillation and have an intact distal conduction system."

The news editors report that additional information may be obtained by contacting W.J. Huang, Wenzhou Med Univ, Affiliated Hosp 1, Dept. of Cardiol, Key Lab Cardiovasc Dis Wenzhou, Wenzhou, People's Republic of China. Additional authors for this research include L. Su, X. Chen, L. Xu, X.D. Ni and W.J. Huang.

Keywords for this news article include: Wenzhou, People's Republic of China, Asia, Heart Disorders and Diseases, Atrial Fibrillation, Cardiac Arrhythmias, Heart Disease,
New Atrial Fibrillation Study Findings Recently Were Reported by Researchers at University of Leipzig (Successful Repeat Catheter Ablation of Recurrent Longstanding Persistent Atrial Fibrillation With Rotor Elimination as the Procedural ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting out of Leipzig, Germany, by NewsRx editors, research stated, "There remains a lack of consensus regarding the ideal ablation strategy for atrial fibrillation (AF), particularly in patients with persistent or longstanding persistent AF. Given increasing evidence from clinical imaging studies that rotors sustain AF, rotor elimination may be a desirable procedural endpoint."

Our news journalists obtained a quote from the research from the University of Leipzig, "However, there is no description to date of the clinical outcomes using rotor elimination during ablation as the procedural endpoint. Moreover, a series of studies question whether procedural AF termination is a desirable endpoint for ablation after many forms of AF ablation. We report a single-center experience of rotor elimination during AF ablation using Focal Impulse and Rotor Mapping (FIRM), describing 20 consecutive patients with case descriptions of 3 patients with recurrent longstanding persistent AF after prior ablation. In all cases, endocardial mapping using a 64-electrode basket catheter was performed to identify rotors, which were eliminated using radiofrequency catheter ablation. After it was verified that all identified rotors were eliminated, standard ablation consisting of PV isolation was performed. Notably, persistent AF terminated in only 1/20 (5%) patients. However, after a follow-up of 6 months, single-procedure freedom from AF was 80% (16/20 patients) with only 1 patient on antiarrhythmic drugs. All three patients in the highlighted series are AF free despite the lack of acute procedural AF termination."

According to the news editors, the research concluded: "Patients with persistent AF including those with unsuccessful prior ablation can be treated successfully by rotor targeted ablation, using the elimination of all rotors rather than acute AF termination as the procedural endpoint."

New Atrial Fibrillation Study Findings Reported from Brigham and Women's Hospital (Hospital-level variation and predictors of admission after ED visits for atrial fibrillation: 2006 to 2011)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Outpatient management of atrial fibrillation can be a safe alternative to inpatient admission after emergency department (ED) visits. We aim to describe trends and predictors of hospital admission for atrial fibrillation and determine the variation in admission among US hospitals."

Our news editors obtained a quote from the research from Brigham and Women's Hospital, "We analyzed ED visits and hospital admissions for adult patients with a principal diagnosis of atrial fibrillation or atrial flutter in the Nationwide Emergency Department Sample 2006 to 2011. We identified patient and hospital characteristics associated with admission using hierarchical multivariate logistic regression. We analyzed admission rates overall and for patients at low risk of thromboembolic complications (CHA(2)DS(2)-VASc score 0). We compared hospital-level variance with residual variance to estimate the intraclass correlation in models with and without hospital characteristics. From 2006 to 2011, annual ED visits for atrial fibrillation and atrial flutter increased by 30.9% and admission rates decreased from 69.7% to 67.4% (P=.02). Admission was associated with setting (metropolitan teaching vs nonmetropolitan, odds ratio = 1.93 [1.62-2.29]) and region (Northeast vs West, odds ratio = 2.09 [1.67-2.60]). Among patients with 0 CHA(2)DS(2)-VASc score, the national average admission rate was 46.4%. The intraclass correlation was 20.7% adjusting for patient characteristics and hospital clustering, and 19.2% after additionally adjusting for hospital variables. From 2006 to 2011, ED visits for atrial fibrillation in the United States increased by almost a third, with a minimal change in ED admission rates. One-fifth of variation in admission rates is due to hospital site and not explained by hospital characteristics."

According to the news editors, the research concluded: "Hospital-specific practice patterns may identify opportunities to increase outpatient management."

Heart Disorders and Diseases - Atrial Fibrillation

New Atrial Fibrillation Study Findings Reported from University of Palermo (Relationship between HRV measurements and demographic and clinical variables in a population of patients with atrial fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Atrial Fibrillation are discussed in a new report. According to news reporting from Palermo, Italy, by NewsRx journalists, research stated, "Little is known about the role of HRV in atrial fibrillation (AF) patients. Aim of our study was to assess the relationship between HRV measurements and demographic and clinical variables in a population of 274 AF patients."

The news correspondents obtained a quote from the research from the University of Palermo, "We selected all consecutive patients with persistent/permanent AF among whom had performed a Holter ECG in our Department from April 2010 to April 2015. Time-domain analysis of HRV was evaluated. Demographic and clinical variables were collected for each patient. At multivariable logistic regression, a higher pNN50 was associated with ACE inhibitors/ARBs (p = 0.016) and a lower pNN50 with obesity (p = 0.037) and higher heart rate (HR) (p < 0.0005). A higher RMSSD was associated with ACE inhibitors/ARBs (p = 0.001), digoxin (p < 0.0005) and beta-blockers (p = 0.002) and a lower RMSSD with a higher HR (p < 0.0005). A higher SDNNi was associated with ACE inhibitors/ARBs (p < 0.0005), digoxin (p < 0.0005) and beta-blockers (p = 0.002) and a lower SDNNi with dysthyroidism (p = 0.048) and higher HR (p < 0.0005). A higher SDANN was associated with non-dihydropyridine calcium-channel-blockers (p = 0.002) and ACE inhibitors/ARBs (p = 0.002) and a lower SDANN with hypertension (p = 0.034), obesity (p = 0.011), stroke (p = 0.031), pneumonia (p = 0.005) and higher HR (p < 0.0005). A higher SDNN was associated with ACE inhibitors/ARBs (p < 0.0005), digoxin (p < 0.0005) and beta-blockers (p = 0.022) and a lower SDNN with obesity (p = 0.012), pneumonia (p = 0.049) and higher HR (p < 0.0005)."

According to the news reporters, the research concluded: "Our study showed that, in AF patients, there is a direct relationship between some clinical variables and HRV measurements; as for patients with sinus rhythm, even in AF patients this relationship seemed to reflect the autonomic nervous system activity."

For more information on this research see: Relationship between HRV
measurements and demographic and clinical variables in a population of patients with atrial fibrillation. Heart and Vessels, 2016;31(12):2004-2013. Heart and Vessels can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Heart and Vessels - www.springerlink.com/content/0910-8327/)

Heart Disorders and Diseases - Atrial Fibrillation

New Atrial Fibrillation Study Results Reported from Medical College of Georgia (Is It Time to Incorporate the Left Atrial Size to the Current Stroke Risk Scoring Systems for Atrial Fibrillation?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Atrial Fibrillation is now available. According to news reporting out of Augusta, Georgia, by NewsRx editors, research stated, "Primary care physicians and cardiologists rely on risk scoring systems, which consist of a number of clinical variables used together, to predict stroke risk in patients with atrial fibrillation (AF). Ultimately, this helps in determining the need for anticoagulation."

Our news journalists obtained a quote from the research from the Medical College of Georgia, "Left atrial size is not used in any stroke risk scoring system to stratify patients at risk for cardioembolic stroke. Throughout the literature, there is much debate surrounding the use of left atrial size as an additional risk factor for stroke in patients with and without AF. This review summarizes the stroke risk scoring systems in the currently available literature and the increasing risk of stroke associated with left atrial size."

According to the news editors, the research concluded: "The authors propose the consideration of a tool to incorporate both the best available stroke risk scoring systems and the left atrial size, for a better risk assessment and management of AF."

Our news journalists report that additional information may be obtained by contacting J.D. Gardner, Medical College of Georgia, Augusta, GA 30912, United States. Additional authors for this research include W.P. Skelton and R.N. Khouzam.

Keywords for this news article include: Augusta, Georgia, United States, North and Central America, Atrial Fibrillation, Article Review, Heart Disorders and Diseases, Risk and Prevention, Cardiac Arrhythmias, Heart Disease, Stroke, Medical College of Georgia.

Heart Disorders and Diseases - Atrial Fibrillation

New Atrial Fibrillation Study Results Reported from University of Massachusetts (Association of Left Atrial Function IndexWith Late Atrial Fibrillation Recurrence after Catheter Ablation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Fibrillation have been presented. According to news originating from Worcester, Massachusetts, by NewsRx correspondents, research stated, "LAFI and AF Recurrence. Although catheter ablation (CA) for atrial fibrillation (AF) is commonly used to improve symptoms, AF recurrence is common and new tools are needed to better inform patient selection for CA."

Our news journalists obtained a quote from the research from the University of Massachusetts, "Left atrial function index (LAFI), an echocardiographic measure of atrial mechanical function, has shown promise as a noninvasive predictor of AF. We hypothesized that LAFI would relate to AF recurrence after CA. All AF patients undergoing index CA were enrolled in a prospective institutional AF Treatment Registry between 2011 and 2014. LAFI was measured post hoc from pre-ablation clinical echocardiographic images in 168 participants. Participants were mostly male (33% female), middle-aged (60 +/- 10 years), obese and had paroxysmal AF (64%). Mean LAFI was 25.9 +/- 17.6. Over 12 months of follow-up, 78 participants (46%) experienced a late AF recurrence. In logistic regression analyses adjusting for factors known to be associated with AF, lower LAFI remained associated with AF recurrence after CA [OR 0.04 (0.01-0.67), P = 0.02]. LAFI discriminated AF recurrence after CA slightly better than CHADS2 (C-statistic 0.60 LAFI, 0.57 CHADS2). For participants with persistent AF, LAFI performed significantly better than CHADS2 score (C statistic = 0.79 LAFI, 0.56 CHADS2, P = 0.02). LAFI, an echocardiographic measure of atrial function, is associated with AF recurrence after CA and has improved ability to discriminate AF recurrence as compared to the CHADS-2 score, especially among persistent AF patients."

According to the news editors, the research concluded: "Since LAFI can be calculated using standard 2D echocardiographic images, it may be a helpful tool for predicting AF recurrence."

The news correspondents report that additional information may be obtained from

Heart Disorders and Diseases - Atrial Flutter

New Atrial Flutter Study Findings Have Been Reported from Intermountain Medical Center (A Comparison of Remote Magnetic Irrigated Tip Ablation versus Manual Catheter Irrigated Tip Catheter Ablation With and Without Force Sensing Feedback)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Flutter have been presented. According to news reporting originating from Murray, Utah, by NewsRx correspondents, research stated, "Remote magnetic navigation (RMN) and contact force (CF) sensing technologies have been utilized in an effort to improve safety and efficacy of catheter ablation. A comparative analysis of the relative short-and long-term outcomes of AF patients has not been performed."

Our news editors obtained a quote from the research from Intermountain Medical Center, "As such, we comparatively evaluated the safety and efficacy of these technologies. A total of 627 patients who underwent catheter ablation with either a manual irrigated tip catheter: (312, 49.8%) or by RMN: (315, 50.2%) were included in this single-center cohort study. Patients treated with CF (59) were analyzed separately as well. One-and 3-year endpoints included death, HF hospitalization, stroke, TIA, and atrial flutter or AF recurrence. Age averaged 65.1 ? 10.7 years and 64.1% male. One-and 3-year endpoints of death, HF hospitalization, stroke, TIA, and atrial flutter or AF recurrence were statistically similar between manual and RMN treated groups. Fluoroscopy times were significantly lower in the RMN group compared to the manual ablation group (8.47 ? 0.45 vs. 9.63 ? 4.06 minutes, p<0.0001). CF guided patients had 1-year recurrence rate of AF/atrial flutter statistically identical to patients treated with RMN (36.8% vs. 38.6%; p=1.00). RMN results in outcomes similar to manual navigation."

According to the news editors, the research concluded: "The addition of CF sensing catheters did not improve relative procedural outcome or safety profile in comparison to RMN guided ablation in this large observational study of AF ablation."

The news editors report that additional information may be obtained by contacting J.P. Weiss, Intermountain Medical Center, Intermountain Medical Center Heart Institute, Murray, Utah, United States. Additional authors for this research include H.T. May, T.L. Bair, B.G. Crandall, M.J. Cutler, J.D. Day, J.S. Osborn, C. Mallender and T.J. Bunch.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jce.12901. This DOI is a link to an online electronic document that is either free or for purchase.

Atrial Septal Defects

New Atrial Septal Defects Study Findings Recently Were Reported by Researchers at Bordeaux Segalen University (Long-term Complications After Transcatheter Atrial Septal Defect Closure: A Review of the Medical Literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Atrial Septal Defects. According to news reporting originating from Bordeaux, France, by NewsRx correspondents, research stated, "Percutaneous closure has evolved to become the first-line treatment strategy for most cases of secundum atrial septal defect (ASD) in both adults and children. Its safety and efficacy have been proved; percutaneous ASD occlusion offers many advantages over surgical closure, including avoidance of cardiopulmonary bypass, avoidance of sternotomy scar, shorter hospitalization, and a potentially lower incidence of postprocedural complications."

Our news editors obtained a quote from the research from Bordeaux Segalen University, "Periprocedural course and short-term outcome have been widely described, with low mortality and morbidity rates. However, the wide use of ASD closure devices and the growing experience worldwide brought some delayed and rare complications to light. Device thrombosis and cardiac erosion are the most severe late complications of device closure, whereas atrial arrhythmias are the most common. Other delayed complications include nickel allergy, cardiac conduction abnormalities, valvular damage, and device endocarditis. The long-term complication rate is not null and, although rare, some of these complications may be sudden and potentially life-threatening. Moreover, the occurrence and rate of these complications vary with the different devices used currently or in the past. Therefore, both operators and patients need to be aware of these issues to assist them in the choice of intervention or device, or both, and to adapt follow-up modalities."

According to the news editors, the research concluded: "In this review, we sought to describe the type, incidence, and outcome of these rare but potentially serious device closure delayed complications."

For more information on this research see: Long-term Complications After

The news editors report that additional information may be obtained by contacting Z. Jalal, Univ Victor Segalen, Bordeaux, France. Additional authors for this research include S. Hascoet, A.E. Baruteau, X. Iriart, B. Kreitmann, Y. Boudjemline and J.B. Thambo.

Developmental Diseases and Conditions - Autism…

New Autism Spectrum Disorders Data Have Been Reported by Investigators at University of California (If genetic variation could talk: What genomic data may teach us about the importance of gene expression regulation in the genetics of autism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Developmental Diseases and Conditions - Autism Spectrum Disorders have been presented. According to news reporting out of San Francisco, California, by NewsRx editors, research stated, "Autism spectrum disorder (ASD) has been long known to have substantial genetic etiology. Much research has attempted to identify specific genes contributing to ASD risk with the goal of tying gene function to a molecular pathological explanation for ASD."

Our news journalists obtained a quote from the research from the University of California, "A unifying molecular pathology would potentially increase understanding of what is going wrong during development, and could lead to diagnostic biomarkers or targeted preventative or therapeutic directions. We review past and current genetic mapping approaches and discuss major results, leading to the hypothesis that global dysregulation of gene or protein expression may be implicated in ASD rather than disturbance of brain-specific functions."

According to the news editors, the research concluded: "If substantiated, this hypothesis might indicate the need for novel experimental and analytical approaches in order to understand this neurodevelopmental disorder, develop biomarkers, or consider treatment approaches."

Our news journalists report that additional information may be obtained by contacting L.A. Weiss, University of California, Inst Human Genet, San Francisco, CA 94143, United States.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mcp.2016.10.007. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - B-Cell Leukemia

New B-Cell Leukemia Findings from University Medical Center Described (Hepatic B cell leukemia-3 promotes hepatic steatosis and inflammation through insulin-sensitive metabolic transcription factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - B-Cell Leukemia. According to news reporting from Mainz, Germany, by NewsRx journalists, research stated, "The pathomechanisms underlying nonalcoholic fatty liver disease (NAFLD) and the involved molecular regulators are incompletely explored. The nuclear factor-kappa B (NF-kappa B)-cofactor gene B cell leukemia-3 (Bcl-3) plays a critical role in altering the transcriptional capacity of NF-kappa B a key inducer of inflammation but also of genes involved in cellular energy metabolism."

The news correspondents obtained a quote from the research from University Medical Center, "To define the role of Bcl-3 in non-alcoholic steatohepatitis (NASH), we developed a novel transgenic mouse model with hepatocyte-specific overexpression of Bcl-3 (Bcl-3(HeP)) and employed a high-fat, high-carbohydrate dietary feeding model. To characterize the transgenic model, deep RNA sequencing was performed. The relevance of the findings was confirmed in human liver samples. Hepatocyte-specific overexpression of Bcl-3 led to pronounced metabolic derangement, characterized by enhanced hepatic steatosis from increased de novo lipogenesis and uptake, as well as decreased hydrolysis and export of fatty acids. Steatosis in Bcl-3(HeP) mice was accompanied by an augmented inflammatory milieu and liver cell injury. Moreover, Bcl-3 expression decreased insulin sensitivity and resulted in compensatory regulation of insulin-signaling pathways. Based on in vivo and in vitro studies we identified the transcription factors PPAR alpha, PPAR gamma and PGC-1 alpha as critical regulators of hepatic metabolism and inflammation downstream of Bcl-3. Metformin treatment improved the metabolic and inflammatory phenotype in Bcl-3(HeP) mice through modulation of PPARa and PGC-1a. Remarkably, these findings were recapitulated in human NASH, which exhibited increased expression and nuclear localization of Bcl-3. In summary, Bcl-3 emerges as a novel regulator of hepatic steatosis, insulin sensitivity and inflammation in NASH. Lay summary: Non-alcoholic fatty liver disease (NAFLD) is considered the most prevalent liver disease worldwide. Patients can develop end-stage liver disease resulting in liver cirrhosis or hepatocellular carcinoma, but also develop complications unrelated to liver disease, e.g., cardiovascular disease. Still there is no full understanding of the mechanisms that cause NAFLD. In this study, genetically engineered mice were employed to examine the role of a specific protein in the liver that is involved in inflammation and the metabolism, namely Bcl-3. By this approach, a better understanding of the mechanisms contributing to disease progression was established."
According to the news reporters, the research concluded: "This can help to develop novel therapeutic and diagnostic options for patients with NAFLD."

For more information on this research see: Hepatic B cell leukemia-3 promotes hepatic steatosis and inflammation through insulin-sensitive metabolic transcription factors. *Journal of Hepatology, 2016;65(6):1188-1197. Oncology - B-Cell Lymphoma

**New B-Cell Lymphoma Data Have Been Reported by Investigators at National Institutes of Health [Molecular Determinants of Scaffold-induced Linear Ubiquitylation of B Cell Lymphoma/Leukemia 10 (Bcl10) during T Cell Receptor and Oncogenic Caspase ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - B-Cell Lymphoma. According to news reporting from Bethesda, Maryland, by NewsRx journalists, research stated, "The activation of NF-kappa B downstream of T cell receptor (TCR) engagement is a key signaling step required for normal lymphocyte function during the adaptive immune response. During TCR signaling, the adaptor protein Bcl10 is inducibly recruited to the CARD11 scaffold protein as part of a multicomponent complex that induces I kappa B kinase (IKK) activity and NF-kappa B activation."

Financial supporters for this research include National Institutes of Health, Leukemia and Lymphoma Society.

The news correspondents obtained a quote from the research from the National Institutes of Health, "Here, we show that a consequence of this recruitment is the TCR-induced conjugation of Bcl10 with linear-linked polyubiquitin chains to generate the signaling intermediate Lin(Ub)(n)-Bcl10, which is required for the association of Bcl10 with the NEMO subunit of the IKK complex. The TCR-induced generation of Lin(Ub)(n)-Bcl10 requires Bcl10 lysines 17, 31, and 63, CARD11, MALT1, and the HOIP subunit of the linear ubiquitin chain assembly complex (LUBAC) but not the HOIP accessory protein SHARPIN. CARD11 promotes signal-induced Lin(Ub)(n)-Bcl10 generation by co-recruiting Bcl10 with HOIP,
thereby bringing substrate to enzyme. The CARD11-HOIP interaction is rendered TCR-inducible by the four autoinhibitory repressive elements in the CARD11 inhibitory domain and involves the CARD11 coiled-coil domain and two independent regions of HOIP. Interestingly, oncogenic CARD11 variants associated with diffuse large B cell lymphoma spontaneously induce Lin(Ub)(n)-Bcl10 production to extents that correlate with their abilities to activate NF-kappa B and with their enhanced abilities to bind HOIP and Bcl10.

According to the news reporters, the research concluded: "Our results define molecular determinants that control the production of Lin(Ub)(n)-Bcl10, an important signaling intermediate in TCR and oncogenic CARD11 signaling."

Our news journalists report that additional information may be obtained by contacting W.P. Chan, NIAID, National Institutes of Health, Lab Syst Biol, Lymphocyte Biol Sect, Bethesda, MD 20892, United States. Additional authors for this research include C. Yang, W.P. Chan, Z.Q. Wang, K.E. Deibel and J.L. Pomerantz.

---

**Oncology - B-Cell Lymphoma**

**New B-Cell Lymphoma Study Findings Recently Were Reported by Researchers at Fujita Health University (Influence of R-CHOP Therapy on Immune System Restoration in Patients with B-Cell Lymphoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - B-Cell Lymphoma. According to news reporting originating from Aichi, Japan, by NewsRx correspondents, research stated, "To assess the immunosuppressive effect of R CHOP in patients with B-cell lymphoma at 2 years. Parameters of humoral and cell-mediated immunity were assessed in 89 patients with diffuse large B-cell lymphoma or follicular lymphoma before and after 6-8 cycles of R-CHOP-14 or R-CHOP-21 regimen."

Our news editors obtained a quote from the research from Fujita Health University, "Data on pre- and posttreatment serum IgG (sIgG) levels were available for all 89 patients, while the corresponding data on serum CD20+, CD3+, CD4+, and CD8+ lymphocyte counts were
available in only 43. Median slgG levels significantly decreased from 1,221 mg/dl (baseline) to 733 mg/dl (after chemotherapy) (p < 0.001). Although CD20+ and CD4+ cell counts decreased (p < 0.001), no significant effect of chemotherapy on CD3+ and CD8+ cell counts was observed. CD20+ cell counts were restored to baseline levels at the 12-month follow-up. slgG levels and CD4+ cell counts were not completely restored at 24 months, indicating a sustained immunosuppressive effect of R-CHOP in these patients. The incidence of infections over the 2-year period was 16.3-23.6%.

According to the news editors, the research concluded: "The immuno-suppressive effect of R-CHOP in newly diagnosed cases of B-cell lymphoma tends to persist for >2 years, although slgG levels were restored more quickly than CD4+ cell counts."

For more information on this research see: Influence of R-CHOP Therapy on Immune System Restoration in Patients with B-Cell Lymphoma. Oncology, 2016;91(6):302-310. Oncology can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland.

The news editors report that additional information may be obtained by contacting K. Ito, Fujita Hlth Univ, Sch Med, Dept. of Hematol, Toyoake, Aichi, Japan. Additional authors for this research include M. Okamoto, Y. Inaguma, A. Okamoto, M. Ando, Y. Ando, M. Tsuge, A. Tomono, Y. Kakumae, T. Hayashi, S. Yamada and N. Emi.

Oncology - B-Cell Lymphoma

New B-Cell Lymphoma Study Results from Xinjiang Medical University Described (Immunological subtypes analysis of Uygur diffuse large B-cell lymphoma in Xinjiang and their prognostic significance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - B-Cell Lymphoma is now available. According to news originating from Urumqi, People's Republic of China, by NewsRx correspondents, research stated, "This study aims to explore the application of Choi's typing method in the immunological typing of diffuse large B-cell lymphoma (DLBCL) in Xinjiang Autonomous Region and its prognostic significance. Seventy-eight cases of DLBCL tumor tissues from Xinjiang were collected to detect the expression of germinal center B (GCB) cell-expressed transcript-1, FOXP1, CD10, bcl-6, and MUM1 using an immunohistochemical method."

Our news journalists obtained a quote from the research from Xinjiang Medical University, "Then, immunological typing was carried out using Choi's typing method, and the survival analysis was performed using Kaplan-Meier method. Cox proportional hazard model was used to analyze the prognostic factors. GCB-cell-like-DLBCL and non-GCB-DLBCL
accounting for 29.5% (23/78) and 70.5% (55/78), respectively. The 3-year overall survival of GCB-DLBCL was 58%, significantly higher than that of non-GCB-DLBCL (39%, p<0.05).

Multivariate analysis showed that International Prognostic Index and immunological typing were two independent prognostic factors for Uygur patients with DLBCL.

According to the news editors, the research concluded: "Non-GCB-DLBCL is the main type of DLBCL in Xinjiang and Choi's typing method can be a helpful indicator to determine the prognosis of the Uygur DLBCL in Xinjiang."

The news correspondents report that additional information may be obtained from J.P. Bai, Dept. of Bone Oncology, Affiliated Tumor Hospital, Xinjiang Medical University, Urumqi 830011, People's Republic of China. Additional authors for this research include L.P. Liang, LL. Yang, N. Yue, F. Zhao and J.P Bai.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0973-1482.144357. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Asia, Urumqi, Oncology, Hematology, B-Cell Lymphoma, Large B Cell Lymphoma, People's Republic of China, Immunoproliferative Disorders, Lymphoproliferative Disorders, Lymphatic Diseases and Conditions.

**Gram-Positive Bacteria - Bacillus anthracis**

**New Bacillus anthracis Study Findings Have Been Reported by Researchers at Georgia State University (Loss of sl affects heat-shock response and virulence gene expression in Bacillus anthracis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - Bacillus anthracis. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "The pathogenesis of *Bacillus anthracis* depends on several virulence factors, including the anthrax toxin. Loss of the alternative sigma factor sl results in a coordinate decrease in expression of all three toxin subunits."

The news correspondents obtained a quote from the research from Georgia State University, "Our observations suggest that loss of sl alters the activity of the master virulence regulator AtxA, but atxA transcription is unaffected by loss of sl. sl-containing RNA polymerase does not appear to directly transcribe either atxA or the toxin gene pagA. As in *Bacillus subtilis*, loss of sl in *B. anthracis* results in increased sensitivity to heat shock and transcription of sigI, encoding sl, is induced by elevated temperature. Encoded immediately downstream of and part of a bicistronic message with sigI is an anti-sigma factor, RsgI, which controls sl activity. Loss of RsgI has no direct effect on virulence gene expression. sigI appears to be expressed from both the sl and sA promoters, and transcription from the sA promoter is likely more significant to virulence regulation."

According to the news reporters, the research concluded: "We propose a model in which sl can be induced in response to heat shock, whilst, independently, sl is produced under
non-heat-shock, toxin-inducing conditions to indirectly regulate virulence gene expression."

Our news journalists report that additional information may be obtained by contacting J.G. Kim, Dept. of Biology, Georgia State University, Atlanta, GA 30302, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1099/mic.0.000236. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Atlanta, Georgia, Genetics, Bacillaceae, United States, Bacillus anthracis, Gram Positive Rods, Gram Positive Bacteria, Gram-Positive Bacteria, North and Central America, Endospore Forming Bacteria, Gram Positive Endospore Forming Rods.

Surgery - Bariatric Surgery

New Bariatric Surgery Findings from University of Malaga Reported (Metabolomics-Guided Insights on Bariatric Surgery Versus Behavioral Interventions for Weight Loss)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Surgery - Bariatric Surgery. According to news originating from Malaga, Spain, by NewsRx correspondents, research stated, "To review the metabolomic studies carried out so far to identify metabolic markers associated with surgical and dietary treatments for weight loss in subjects with obesity. The Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines were followed."

Our news journalists obtained a quote from the research from the University of Malaga, "Thirty-two studies successfully met the eligibility criteria. The metabolic adaptations shared by surgical and dietary interventions mirrored a state of starvation ketoacidosis (increase of circulating ketone bodies), an increase of acylcarnitines and fatty acid beta-oxidation, a decrease of specific amino acids including branched-chain amino acids (BCAA) and (lyso) glycerophospholipids previously associated with obesity, and adipose tissue expansion. The metabolic footprint of bariatric procedures was specifically characterized by an increase of bile acid circulating pools and a decrease of ceramide levels, a greater perioperative decline in BCAA, and the rise of circulating serine and glycine, mirroring glycemic control and inflammation improvement. In one study, 3-hydroxybutyrate was particularly identified as an early metabolic marker of long-term prognosis after surgery and proposed to increase current prognostic modalities and contribute to personalized treatment. Metabolomics helped in deciphering the metabolic response to weight loss treatments."

According to the news editors, the research concluded: "Moving from association to causation is the next challenge to move to a further level of clinical application."

For more information on this research see: Metabolomics-Guided Insights on Bariatric Surgery Versus Behavioral Interventions for Weight Loss. Obesity, 2016;24(12):2451-
New Bee Venoms Study Findings Recently Were Reported by Researchers at Department of Pharmacology (Characterization of relaxant mechanism of H2 S in mouse corpus cavernosum)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biological Factors - Bee Venoms. According to news reporting from Adana, Turkey, by NewsRx journalists, research stated, "The aim of this study was to investigate the mechanism of H2 S-induced relaxation in mouse corpus cavernosal tissue. L-cysteine (10(-6) ? 10(-3) mol/L) and exogenous H2 S (NaHS; 10(-6) to 10(-3) mol/L) induced concentration-dependent relaxation. L-cysteine-induced relaxations was reduced by d,l-propargylglycine, a cystathionine gamma lyase (CSE) inhibitor but not influenced by aminooxyacetic acid, a cystathionine beta synthase (CBS) inhibitor. L-cysteine induced relaxations, but not of those of H2 S diminished in endothelium-denuded tissues. N(o) -nitro-l-arginine (l-NA; 10(-4) mol/L), a nitric oxide synthase inhibitor, and ODQ (10(-4) mol/L), a guanylyl cyclase inhibitor, increased the H2 S-induced relaxation."

Financial support for this research came from Cukurova University Research Foundation.

The news correspondents obtained a quote from the research from the Department of Pharmacology, "Zaprinast (5 ? 10(-6) mol/L) and sildenafil (10(-6) mol/L), phosphodiesterase inhibitors, inhibited H2 S-induced relaxation. Adenyl cyclase inhibitors N-ethylmaleimide (2.5 ? 10(-5) mol/L) and SQ22536 (10(-4) mol/L) reduced relaxation to H2 S. Also, H2 S-induced relaxation was reduced by KCl (50 mmol/L), 4-aminopyridine (10(-4) mol/L), a Kv inhibitor, glibenclamide (10(-5) mol/L), a KATP inhibitor or barium chloride (10(-5) mol/L), a KIR inhibitor. However, H2 S-induced relaxation was not influenced by apamin (10(-6) mol/L), a SKC a (2+) inhibitor, charybdotoxin (10(-7) mol/L), an IKCa a (2+) and BKCa a (2+) inhibitor or combination of apamin and charybdotoxin. Nifedipine (10(-6) mol/L), an L-type calcium channel blocker and atropine (10(-6) mol/L), a muscarinic receptor blocker, inhibited H2 S-induced relaxation. However, H2 S-induced relaxation was not influenced by ouabain (10(-4) mol/L), a Na(+)/K(+) -ATPase inhibitor."

According to the news reporters, the research concluded: "This study suggests that H2 S endogenously synthesizes from l-cysteine by CSE endothelium-dependent in mouse corpus cavernosum tissue, and exogenous H2 S may cause endothelium-independent relaxations via activation of K channels (KATP channel, KV channels, KIR channels), L-type voltage-gated Ca(2+) channels, adenyl cyclase/cAMP pathway and muscarinic receptor, and there is the
interaction between H2S and NO/cGMP."

Our news journalists report that additional information may be obtained by contacting F. Aydinoglu, Dept. of Pharmacology, Pharmacy Faculty, Cukurova University, Adana, Turkey.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1440-1681.12554. This DOI is a link to an online electronic document that is either free or for purchase.

*Autoimmune Diseases and Conditions - Behcet...*

**New Behcet Disease Findings from Department of Ophthalmology Reported (INTRAVITREAL INFlixIMAB IN REFRACTORY UVEITIS IN BEHCET'S DISEASE A Safety and Efficacy Clinical Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Autoimmune Diseases and Conditions - Behcet Disease have been published. According to news reporting from Cairo, Egypt, by NewsRx journalists, research stated, "To assess the safety and efficacy of intravitreal infliximab (1 mg/0.05 mL) in patients with refractory posterior uveitis in Behcet's disease. Twenty patients were included in this study."

The news correspondents obtained a quote from the research from the Department of Ophthalmology, "Best corrected visual acuity (BCVA), vitreous haze (graded 0-4), vasculitis, retinitis, and papillopathy (presence or absence) were assessed at baseline, Day 1 and Week 2, 4, 6, 8, 12, and 18. Optical coherence tomography (OCT) central foveal thickness, fluorescein angiography, and flash electroretinogram were done at baseline and 4, 12, and 18 weeks. Mean baseline logMAR BCVA was 0.94 (20/160), had improved significantly by Week 2 to 0.6 (20/80) (P < 0.0001), and reached 0.36 (20/40) by Weeks 18 with three injections (P < 0.0001). Mean central foveal thickness OCT decreased significantly from baseline 361 mm to 180 mm at the end of follow-up (P < 0.0001). Profound decrease in mean vitreous haze gradings from two to 0.2 by the end follow-up (P < 0.05). There was a significant reduction in the number of patients with vasculitis (15 at baseline to 1 weeks at 18 weeks), retinitis (nine at baseline to none at 4 weeks), and papillitis (two at baseline to none at 4 weeks) (P < 0.05). No significant electrophysiological changes or ocular adverse inflammatory reactions were observed during the study period."

According to the news reporters, the research concluded: "Intravitreal infliximab appeared to be safe and effective in treating uveitis in Behcet's disease and should be considered
as an alternative to systemic therapies."

For more information on this research see: INTRAVITREAL INFLIXIMAB IN REFRACTORY UVEITIS IN BEHCET'S DISEASE A Safety and Efficacy Clinical Study. *Retina-The Journal of Retinal and Vitreous Diseases*, 2016;36(12):2399-2408. *Retina-The Journal of Retinal and Vitreous Diseases* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Our news journalists report that additional information may be obtained by contacting T.A. Macky, Kasr El Aini Hosp, Dept. of Ophthalmol, Cairo, Egypt. Additional authors for this research include T.A. Macky, M.K. Sidky, G. Ragab and M.M. Soliman.

**Biguanides**

**New Biguanides Study Findings Have Been Reported from Lanzhou University (Metoprolol decreases the plasma exposure of metformin via the induction of liver, kidney and muscle uptake in rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Biguanides are discussed in a new report. According to news reporting originating from Lanzhou, People's Republic of China, by NewsRx correspondents, research stated, "Drug interactions are one of the commonest causes of side effects, particularly in long-term therapy. The aim of the current study was to investigate the possible effects of metoprolol on the pharmacokinetics of metformin in rats and to clarify the mechanism of drug interaction."

Our news editors obtained a quote from the research from Lanzhou University, "In this study, rats were treated with metformin alone or in combination with metoprolol. Plasma, urine and tissue concentrations of metformin were determined by HPLC. Western blotting and real-time qPCR were used to evaluate the expression of rOCTs and rMATE1. The results showed that, after single or 7-day repeated administration, the plasma concentrations of metformin in the co-administration group were significantly decreased compared with that in the metformin group. However, the parameter V/F of metformin in the co-administration group was markedly increased compared with that in the metformin group. The hepatic, renal and muscular K-p of metformin were markedly elevated after co-administration with metoprolol. Consistently, metformin uptake in rat kidney slices was significantly induced by metoprolol. In addition, multiple administrations of metoprolol significantly reduced the expression of rMATE1 in rat kidney as well as the urinary excretion of metformin. Importantly, after long-term administration, lactic acid and uric acid levels in the co-administration group were increased by 25% and 26%, respectively, compared with that in the metformin group."

According to the news editors, the research concluded: "These results indicate that metoprolol can decrease the plasma concentration of metformin via the induction of hepatic,
renal and muscular uptake, and long-term co-administration of metformin and metoprolol can cause elevated lactic acid and uric acid levels."

The news editors report that additional information may be obtained by contacting X.A. Wu, Lanzhou University, Dept. of Pharm, Hosp 1, Lanzhou 730000, People's Republic of China. Additional authors for this research include A.X. Shi, H.Y. Qin, T. Zhang, Y.F. Wu, G.Q. Zhang and X.A. Wu.

**Chemistry - Biochemistry**

**New Biochemistry Data Have Been Reported by Investigators at McGill University (Crystal Structure of the Acid Sphingomyelinase-like Phosphodiesterase SMPDL3B Provides Insights into Determinants of Substrate Specificity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Chemistry - Biochemistry. According to news reporting originating from Montreal, Canada, by NewsRx correspondents, research stated, "The enzyme acid sphingomyelinase-like phosphodiesterase 3B (SMPDL3B) was shown to act as a negative regulator of innate immune signaling, affecting cellular lipid composition and membrane fluidity. Furthermore, several reports identified this enzyme as an off target of the therapeutic antibody rituximab, with implications in kidney disorders."

Financial support for this research came from Canadian Institutes of Health Research.

Our news editors obtained a quote from the research from McGill University, "However, structural information for this protein is lacking. Here we present the high resolution crystal structure of murine SMPDL3B, which reveals a substrate binding site strikingly different from its paralogs. The active site is located in a narrow boot-shaped cavity. We identify a unique loop near the active site that appears to impose size constraints on incoming substrates. A structure in complex with phosphocholine indicates that the protein recognizes this head group via an aromatic box, a typical choline-binding motif. Although a potential substrate for SMPDL3B is sphingomyelin, we identify other possible substrates such as CDP-choline, ATP, and ADP. Functional experiments employing structure-guided mutagenesis in macrophages highlight amino acid residues potentially involved in recognition of endogenous substrates."
According to the news editors, the research concluded: "Our study is an important step toward elucidating the specific function of this poorly characterized enzyme."

The news editors report that additional information may be obtained by contacting B. Nagar, McGill University, Grp Rech Axe Struct Prot, Montreal, PQ H3G 0B1, Canada. Additional authors for this research include L.X. Heinz, K. Illes, G. Superti-Furga and B. Nagar.

**Life Science Research - Biochemistry and Biophysics**

**New Biochemistry and Biophysics Study Findings Have Been Reported by Investigators at University of Wisconsin (Ligand binding phenomena that pertain to the metabolic function of renalase)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Life Science Research - Biochemistry and Biophysics. According to news reporting out of Milwaukee, Wisconsin, by NewsRx editors, research stated, "Renalase catalyzes the oxidation of isomers of beta-NAD(P)H that carry the hydride in the 2 or 6 positions of the nicotinamide base to form beta-NAD(P)(+). This activity is thought to alleviate inhibition of multiple beta-NAD(P)-dependent enzymes of primary and secondary metabolism by these isomers."

Funders for this research include National Science Foundation, National Institutes of Health, National Institute for Allergy and Infectious Disease, UWM Research Growth Initiative Grant.

Our news journalists obtained a quote from the research from the University of Wisconsin, "Here we present evidence for a variety of ligand binding phenomena relevant to the function of renalase. We offer evidence of the potential for primary metabolism inhibition with structures of malate dehydrogenase and lactate dehydrogenase bound to the 6-dihydroNAD isomer. The previously observed preference of renalase from Pseudomonas for NAD-derived substrates over those derived from NADP is accounted for by the structure of the enzyme in complex with NADPH. We also show that nicotinamide nucleosides and mononucleotides reduced in the 2- and 6-positions are renalase substrates, but bind weakly. A seven-fold enhancement of acquisition (k(red)/K-d) for 6-dihydronicotinamide riboside was observed for human renalase in the presence of ADP. However, generally the addition of complement ligands, AMP for mononucleotide or ADP for nucleoside substrates, did not enhance the
reductive half-reaction."

According to the news editors, the research concluded: "Non substrate nicotinamide nucleosides or nucleotides bind weakly suggesting that only beta-NADH and beta-NADPH compete with dinucleotide substrates for access to the active site."

For more information on this research see: Ligand binding phenomena that pertain to the metabolic function of renalase. *Archives of Biochemistry and Biophysics*, 2016;612():46-56. *Archives of Biochemistry and Biophysics* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Biological Factors - Biological Pigments**

**New Biological Pigments Findings from University of Yaounde Described [Simultaneous determination of acetaminophen and tyrosine using a glassy carbon electrode modified with a tetraruthenated cobalt (II) porphyrin intercalated into a smectite ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biological Factors - Biological Pigments. According to news reporting originating from Yaounde, Cameroon, by NewsRx correspondents, research stated, "A new hybrid material has been prepared by intercalating the supramolecular cationic complex [mu-meso-tetra(4-pyridyl)porphyrinatecobalt(II) tetrakis[bis(bipyridine)(chlorido)ruthenium(II)]], referred to as [CoTPyPRu(bipy)(2)Cl(4)](4+) into a Cameroonian smectite clay (from Bagba hill, denoted Ba). The intercalated material (named CoTPyPRu(bipy)(2)-Ba) was used to modify glassy carbon electrodes (GCE), which were successfully applied to the simultaneous determination of acetaminophen (AC) and tyrosine (Tyr)."

Funders for this research include CNPq, Third World Academy of Sciences.

Our news editors obtained a quote from the research from the University of Yaounde, "The CoTPyPRu(bipy)(2)-Ba material was characterized by UV/Vis absorption spectroscopy, X-ray diffractometry and FT-IR spectroscopy. The intercalation of [CoTPyPRu(bipy)(2)Cl(4)](4+) into the Ba interlayer endowed large surface area to the material. Electrodes modified with CoTPyPRu(bipy)(2)-Ba display good compatibility and stability, high selectivity and sensitivity, even with real samples. Working at pH 7.0, AC was oxidized at +0.42 V and
Tyr at 0.72 V (vs Ag/AgCl). Linear calibration plots for AC and Tyr were obtained in the 1 to 50 μM and 1 to 24 μM range, with detection limits of 0.1 μM and 0.5 μM, respectively."

According to the news editors, the research concluded: "The modified electrode was successfully applied to the determination of tyrosine in urine, and of acetaminophen in a pharmaceutical product."

For more information on this research see: Simultaneous determination of acetaminophen and tyrosine using a glassy carbon electrode modified with a tetraruthenated cobalt(II) porphyrin intercalated into a smectite clay. Microchimica Acta, 2016;183(12):3243-3253. Microchimica Acta can be contacted at: Springer Wien, Sachsenplatz 4-6, PO Box 89, A-1201 Wien, Austria. used to predict molecular modeling, the hierarchical nature of protein structure and backbone, and sub-cellular localization. The results showed that Omp100 is most similar to thiamine-phosphate pyrophosphorylase [Haemophilus influenzae PittGG], with a 74% similarity. The predicted structure of Omp100 displayed that it is a protein with positive charge (10.4) in pH 7 and alpha helix dominates other secondary structures located outside the cell. Protein-protein interaction network showed that Omp100 interacted with extra cellular matrix protein adhesion, glycoside hydrolase, Omp 64, phospholipase D/Transphosphatidylase, Flp pilus assembly protein, and heme acquisition system receptor."

According to the news editors, the research concluded: "According to the results, anionic indocyanine green tends to interact with Omp100 during PDT as a major target."

For more information on this research see: Outer membrane protein 100 of Aggregatibacter actinomycetemcomitans act as a biopharmaceutical target for photodynamic therapy: An in silico analysis. Photodiagnosis and Photodynamic Therapy, 2016;16():154-160. Photodiagnosis and Photodynamic Therapy can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. assessments were performed. Intended copies were differentiated as commercially available agents without evidence of rigorous comparative biosimilarity evaluations. Proposed biosimilars for adalimumab, etanercept, infliximab, and rituximab are reported in the published literature. Across indications, approved biosimilars infliximab CT-P13, SB2, and etanercept SB4 have published studies involving the largest number of patients or healthy subjects (n = 1405, 743, and 734, respectively), mostly in rheumatoid arthritis. At data cut-off, only CT-P13 had published data in ankylosing spondylitis (n = 250; randomized control trial) and ulcerative colitis/Crohn’s disease (n = 336; observational studies). Published data were not available for ongoing studies in psoriasis patients. Four intended copies were identified in published studies (total: n = 1430; n = 1372 in observational studies). Thematic analysis of non-empirical publications showed that indication extrapolation remains an issue, particularly for gastroenterologists. While most agents display a moderate to high degree of similarity to their originator in the published studies identified, large discrepancies persist in the overall amount and type of data available in the public domain."

According to the news editors, the research concluded: "Significant gaps exist particularly for intended copies, reinforcing the need to maintain a clear differentiation between these molecules and true biosimilars."

The news editors report that additional information may be obtained by contacting I. Jacobs, Pfizer Inc, Pfizer Essential Hlth, New York, NY 10017, United States. Additional authors for this research include D. Petersel, L. Isakov, S. Lula and K.L. Sewell.

**Oncology - Bladder Cancer**

**New Bladder Cancer Data Have Been Reported by Investigators at Okayama University (Dynamin2 GTPase contributes to invadopodia formation in invasive bladder cancer cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Bladder Cancer. According to news reporting out of Okayama, Japan, by NewsRx editors, research stated, "Cancer cell invasion is mediated by actin-based membrane protrusions termed invadopodia. Invadopodia consist of 'core' F-actin bundles associated with adhesive and proteolytic machineries promoting cell invasion by degrading extracellular matrix (ECM)."

Funders for this research include JSPS Grant-in-Aid for Scientific Research, Okayama Medical foundation, Ryobi Teien Memory Foundation, CREST, JST, O-NECUS
program, EPOK program of Okayama University.

Our news journalists obtained a quote from the research from Okayama University, "Formation of the F-actin core in invadopodia is regulated by various actin-binding proteins including Arp2/3 complex and cortactin. Dynamin GTPase localizes to the invadopodia and is implicated in cancer cell invasion, but its precise role at the invadopodia remained elusive. In this study, we examined the roles of dynamin at the invadopodia of bladder cancer cells. Although all three dynamin isoforms (dynamin1, 2 and 3) are expressed in human bladder cancer cell line T24, only dynamin2 localizes to the invadopodia. Inhibition of dynamin2 function, using either RNA interference (RNAi) or the dynamin specific inhibitor Dynasore, caused defects in invadopodia formation and suppressed invasive activity of 124 bladder cancer cells. Structure-function analysis using dynamin2 deletion fragments identified the proline/arginine-rich domain (PRD) of dynamin2 as indispensable for invadopodia formation and invasiveness of 124 cells."

According to the news editors, the research concluded: "Thus, dynamin2 contributes to bladder cancer invasion by controlling invadopodia formation in bladder cancer cells and may prove a valuable therapeutic target."

For more information on this research see: Dynamin2 GTPase contributes to invadopodia formation in invasive bladder cancer cells. Biochemical and Biophysical Research Communications, 2016;480(3):409-414. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Oncology - Bladder Cancer

New Bladder Cancer Findings Has Been Reported by Investigators at Division of Cancer Surgery (A Systematic Review of Ileal Conduit and Neobladder Outcomes in Primary Bladder Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Bladder Cancer. According to news originating from Melbourne, Australia, by NewsRx correspondents, research stated, "Treatment for muscle invasive bladder cancer with curative intent includes radical cystectomy and urinary diversion. Using PRISMA guidelines, we conducted a systematic review assessing differences in patient selection, operative parameters, complications, and quality of life between
ileal conduit and neobladder cohorts."

Our news journalists obtained a quote from the research from the Division of Cancer Surgery, "Ileal conduit cohorts have more advanced age and disease, more comorbidities and complications, and poorer quality of life. Ileal conduit surgery is associated with adverse patient selection that inhibits reasonable comparison of outcomes with neobladder cohorts."

According to the news editors, the research concluded: "Despite this, we observe longer operative times and hospital stays in neobladder cohorts, perhaps reflecting greater technical difficulty and the need for postoperative bladder training."

For more information on this research see: A Systematic Review of Ileal Conduit and Neobladder Outcomes in Primary Bladder Cancer. Urology, 2016;96():74-79. Urology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Urology - www.journals.elsevier.com/urology/)

Cell Research - Blood Cells

New Blood Cells Data Have Been Reported by Investigators at Duke University (Sevuparin binds to multiple adhesive ligands and reduces sickle red blood cell-induced vaso-occlusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cell Research - Blood Cells. According to news reporting from Durham, North Carolina, by NewsRx journalists, research stated, "Sevuparin is a novel drug candidate in phase II development as a treatment for vaso-occlusive crises (VOC) in patients with sickle cell disease (SCD). As a heparin-derived polysaccharide, sevuparin has been designed to retain anti-adhesive properties, while the antithrombin-binding domains have been eliminated, substantially diminishing its anticoagulant activity."

Funders for this research include Duke University, Radboud Universitair Medisch Centrum, National Institutes of Health, Doris Duke Charitable Foundation, Pfizer.

The news correspondents obtained a quote from the research from Duke University, "Here, we demonstrate that sevuparin inhibits the adhesion of human sickle red blood cells (SS-RBCs) to stimulated cultured endothelial cells invitro. Importantly, sevuparin prevents vaso-occlusion and normalizes blood flow in an in vivo mouse model of SCD vaso-occlusion. Analyses by surface plasmon resonance (SPR) and fluorescence correlation spectroscopy (FCS) demonstrate that sevuparin binds to P- and L-selectins, thrombospondin, fibronectin and von Willebrand factor, all of which are thought to contribute to vaso-occlusion in SCD. Despite low anticoagulation activity, sevuparin has anti-adhesive efficacy similar to the low molecular weight heparin tinzaparin both invitro and in vivo. These results suggest that the anti-adhesive
properties rather than the anticoagulant effects of heparinoids are critical for the treatment of vaso-occlusion in SCD."

According to the news reporters, the research concluded: "Therefore, sevuparin is now being evaluated in SCD patients hospitalized for treatment of VOC."

Our news journalists report that additional information may be obtained by contacting M.J. Telen, Duke University, Sch Med, Duke Comprehens Sickle Cell Center, Dept. of MedDiv Hematol, Durham, NC, United States. Additional authors for this research include M. Batchvarova, S. Shan, P.H. Bovee-Geurts, R. Zennadi, A. Leitgeb, R. Brock and M. Lindgren.

**Cell Research - Blood Cells**

**New Blood Cells Findings from Technical University Reported**

**(Multifractal characterization of morphology of human red blood cells membrane skeleton)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cell Research - Blood Cells is now available. According to news reporting originating in Cluj Napoca, Romania, by NewsRx journalists, research stated, "The purpose of this paper is to show applicability of multifractal analysis in investigations of the morphological changes of ultra-structures of red blood cells (RBCs) membrane skeleton measured using atomic force microscopy (AFM). Human RBCs obtained from healthy and hypertensive donors as well as healthy erythrocytes irradiated with neutrons (45 mGy) were studied."

The news reporters obtained a quote from the research from Technical University, "The membrane skeleton of the cells was imaged using AFM in a contact mode. Morphological characterization of the three-dimensional RBC surfaces was realized by a multifractal method. The nanometre scale study of human RBCs surface morphology revealed a multifractal geometry. The generalized dimensions Dq and the singularity spectrum f(a) provided quantitative values that characterize the local scale properties of their membrane skeleton organization. Surface characterization was made using areal ISO 25178-2: 2012 topography parameters in combination with AFM topography measurement. The surface structure of human RBCs is complex with hierarchical substructures resulting from the organization of the erythrocyte membrane skeleton. The analysed AFM images confirm a multifractal nature of the
surface that could be useful in histology to quantify human RBC architectural changes associated with different disease states."

According to the news reporters, the research concluded: "In case of very precise measurements when the red cell surface is not wrinkled even very fine differences can be uncovered as was shown for the erythrocytes treated with a very low dose of ionizing radiation."

Our news correspondents report that additional information may be obtained by contacting S. Talu, Technical University of Cluj-Napoca, Faculty of Mechanical Engineering, Dept. of AET, Discipline of Descriptive Geometry and Engineering Graphics, Cluj-Napoca, Cluj, Romania. Additional authors for this research include S. Stach, M. Kaczmarska, M. Fornal, T. Grodzicki, W. Pohorecki and K. Burda.

**Hematology - Blood Coagulation Factors**

**New Blood Coagulation Factors Findings Has Been Reported by Researchers at Institute of Biotechnology and Antibiotics (The factor VIII protein and its function)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematology - Blood Coagulation Factors. According to news reporting originating from Warszawa, Poland, by NewsRx correspondents, research stated, "Factor VIII (FVIII), an essential blood coagulation protein, is a key component of the fluid phase blood coagulation system. Human factor VIII is a single chain of about 300 kDa consisting of domains described as A1-A2-B-A3-C1-C2."

Our news editors obtained a quote from the research from the Institute of Biotechnology and Antibiotics, "The protein undergoes processing prior to secretion into blood resulting in a heavy chain of 200 kDa (A1-A2-B) and a light chain of 80 kDa (A3-C1-C2) linked by metal ions. The role of factor VIII is to increase the catalytic efficiency of factor IXa in the activation of factor X."

According to the news editors, the research concluded: "Variants of these factors lead frequently also to severe bleeding disorders."

The news editors report that additional information may be obtained by contacting A. Mazurkiewicz-Pisarek, Institute of Biotechnology and Antibiotics, Bioengineering Department, Warszawa, Poland. Additional authors for this research include G. Plucienniczak, T. Ciach and
A. Plucienniczak.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18388/abp.2015_1056. This DOI is a link to an online electronic document that is either free or for purchase.

Hematology - Blood Coagulation Factors

**New Blood Coagulation Factors Study Findings Have Been Reported from S. Klapoetke et al (Disulfide bond characterization of human factor Xa by mass spectrometry through protein-level partial reduction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematology - Blood Coagulation Factors. According to news reporting out of Durham, North Carolina, by NewsRx editors, research stated, "Protein-level partial reduction was investigated as a novel sample preparation technique to characterize proteins with cystine knots or complex disulfide linkages. Human Factor Xa containing twelve disulfide bonds was selected as a model protein to demonstrate this methodology."

Our news journalists obtained a quote from the research, "Five in twelve disulfide linkages were characterized through conventional non-reduced samples while the other seven disulfide linkages containing cystine knots were successfully characterized though partially reduced samples. Each disulfide linkage was confirmed through product ions generated by an UPLC-ESI QTOF MS system equipped with data independent collision-induced dissociation (CID) acquisition."

According to the news editors, the research concluded: "Free cysteines in the sample were also determined in this study."

For more information on this research see: Disulfide bond characterization of human factor Xa by mass spectrometry through protein-level partial reduction. *Journal of Pharmaceutical and Biomedical Analysis*, 2017;132():238-246. *Journal of Pharmaceutical and Biomedical Analysis* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. New Blood Pressure Data Have Been Reported by Researchers at Tohoku University Graduate School of Medicine (Maternal clinic and home blood pressure measurements during pregnancy and infant birth weight: the BOSHI study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Pressure have been published. According to news reporting originating from Sendai, Japan, by NewsRx correspondents, research stated, "This prospective cohort study compared measurements of maternal home blood pressure (HBP) with clinic blood pressure (CBP) before 20 weeks' gestation to determine associations with the risk of delivering a lower birth weight infant. A total of 605 Japanese women were included."

Our news editors obtained a quote from the research from the Tohoku University Graduate School of Medicine, "Exposures were initial CBP, made between 10 weeks 0 days and 19 weeks 0 days, and HBP for comparison made within 1 week of CBP. Outcome was infant's birth weight, categorized and ranked as follows: &gt;3500 g, 3000-3499 g, 2500-2999 g and &lt;2500 g. The proportional odds model with possible confounding factors was applied to compare the associations between CBP and HBP on infant birth weight. When both CBP and HBP were included simultaneously, the adjusted odds ratios (ORs) per 1 standard deviation (1s.d.) increase in clinic and home diastolic BP (DBP) were 1.06 (95% confidence interval (CI): 0.87-1.30) and 1.28 (95% CI: 1.04-1.58), respectively. The adjusted ORs per 1s.d. increase in clinic and home mean arterial pressure (MAP) were 1.02 (95% CI: 0.83-1.24) and 1.29 (95% CI: 1.04-1.59), respectively. Systolic BP measurement was not associated with infant birth weight."

According to the news editors, the research concluded: "High maternal home DBP and MAP before 20 weeks' gestation was associated with a higher risk of lower infant birth weight than clinic DBP and MAP. Therefore, in addition to CBP, it may be worth having pregnant women measure HBP to determine the risk of lower infant birth weight."

For more information on this research see: Maternal clinic and home blood pressure measurements during pregnancy and infant birth weight: the BOSHI study. Hypertension Research, 2015;39(3):151-7. (Nature Publishing Group - www.nature.com/hr; Hypertension Research - www.nature.com/hr/)

New Blood Pressure Findings from Federal University Outlined (Power spectrum analysis of cardiovascular variability during passive heating in conscious rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Blood Pressure. According to news reporting originating in Vicosa, Brazil, by NewsRx journalists, research stated, "The cardiovascular system plays a direct role in the maintenance of body temperature. Whether passive heating alters cardiovascular autonomic modulation in conscious rats is still unknown."

Financial supporters for this research include CNPq, CAPES, FAPEMIG.

The news reporters obtained a quote from the research from Federal University, "This study investigated the effects of passive heating on systolic blood pressure variability (SBPV) and heart rate variability (HRV) in conscious rats and the involvement of the renin-angiotensin system in the passive heating effects on SBPV and HRV. Fourteen male Wistar rats were randomly assigned to the control group or the losartan treatment group. A catheter was implanted in the left carotid artery to record pulsatile arterial pressure (PAP), and a telemetry sensor was implanted in the abdominal cavity to measure body temperature (T-body). After recovering from surgery, the animals were subjected to a passive heating protocol (35 degrees C; 30 min) in resting conditions, during which T-body, tail skin temperature and PAP were measured. The mean arterial pressure, systolic and diastolic blood pressure, heart rate, double product (i.e., the product of systolic blood pressure by heart rate), SBPV and HRV were calculated from the PAP. SBPV and HRV were analyzed in terms of both time and frequency domains. Increases in the thermoregulatory and cardiovascular parameters were observed during passive heating in both groups, and those increases were reflected in the higher time and frequency domains of the SBPV. However, passive heating was not effective in altering HRV."

According to the news reporters, the research concluded: "Passive heating altered SBPV but not HRV in conscious rats when they were treated with losartan."

Our news correspondents report that additional information may be obtained by contacting T.N. Primola-Gomes, Federal University of Vicosa, Dept. of Educ Fis, Lab Biol Exercicio, Vicosa, MG, Brazil. New Blood Pressure Findings from University of Brasilia Reported
(Carotid baroreflex function at the onset of cycling in men)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Blood Pressure. According to news reporting originating from Brasilia, Brazil, by NewsRx correspondents, research stated, "Arterial baroreflex function is important for blood pressure control during exercise, but its contribution to cardiovascular adjustments at the onset of cycling exercise remains unclear. Fifteen healthy male subjects (24 +/- 1 yr) performed 45-s trials of low- and moderate-intensity cycling, with carotid baroreceptor stimulation by neck suction at -60 Torr applied 0-5, 10-15, and 30-35 s after the onset of exercise."

Financial support for this research came from Grosserer Jakob Ehrenreich og hustru Grete Ehrenreich Fond.

Our news editors obtained a quote from the research from the University of Brasilia, "Cardiovascular responses to neck suction during cycling were compared with those obtained at rest. An attenuated reflex decrease in heart rate following neck suction was detected during moderate-intensity exercise, compared with the response at rest (P < 0.05). Furthermore, compared with the reflex decrease in blood pressure elicited at rest, neck suction elicited an augmented decrease in blood pressure at 0-5 and 10-15 s during low-intensity exercise and in all periods during moderate-intensity exercise (P < 0.05). The reflex depressor response at the onset of cycling was primarily mediated by an increase in the total vascular conductance."

According to the news editors, the research concluded: "These findings evidence altered carotid baroreflex function during the first 35 s of cycling compared with rest, with attenuated bradycardic response, and augmented depressor response to carotid baroreceptor stimulation."

For more information on this research see: Carotid baroreflex function at the onset of cycling in men. American Journal of Physiology-Regulatory Integrative and Comparative Physiology, 2016;311(5):R870-R878. American Journal of Physiology-Regulatory Integrative and Comparative Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

The news editors report that additional information may be obtained by contacting L.C. Vianna, University of Brasilia, Fac Phys Educ, Brasilia, DF, Brazil. New Blood Pressure Study Findings Recently Were Reported by Researchers at Queensland University of Technology (Outdoor Temperature, Heart Rate and Blood Pressure in Chinese Adults: Effect Modification by Individual Characteristics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Pressure have been published. According to news reporting out of Brisbane, Australia, by NewsRx editors, research stated, "We collected data from Kailuan cohort study from 2006 to 2011 to examine whether short-term effects of ambient temperature on heart rate (HR) and blood pressure (BP) are non-linear or linear, and their potential modifying factors. The HR, BP and individual information, including basic characteristics, life style, socio-economic characteristics and other characteristics, were collected for each participant."

Our news journalists obtained a quote from the research from the Queensland University of Technology, "Daily mean temperature and relative humidity were collected. A regression model was used to evaluate associations of temperature with HR and BP, with a non-linear function for temperature. We also stratified the analyses in different groups divided by individual characteristics. 47,591 residents were recruited. The relationships of temperature with HR and BP were 'V' shaped with thresholds ranging from 22 °C to 28 °C. Both cold and hot effects were observed on HR and BP. The differences of effect estimates were observed among the strata of individual characteristics. The effect estimate of temperature was higher among older people. The cold effect estimate was higher among people with lower Body Mass Index. However, the differences of effect estimates among other groups were inconsistent. These findings suggest both cold and hot temperatures may have short-term impacts on HR and BP."

According to the news editors, the research concluded: "The individual characteristics could modify these relationships."

For more information on this research see: Outdoor Temperature, Heart Rate and Blood Pressure in Chinese Adults: Effect Modification by Individual Characteristics. Scientific Reports, 2016;6():21003. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

New Blood Pressure Study Results Reported from Duke University
[Influence of Kidney Function on Blood Pressure Response to Lifestyle Modifications: Secondary Analysis From the Exercise and Nutritional Interventions for Cardiovascular Health ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Blood Pressure. According to news originating from Durham, North Carolina, by NewsRx correspondents, research stated, "The kidney is an important regulator of blood pressure (BP). To determine whether BP response to lifestyle modification varies across normal ranges of kidney function, the authors examined the moderating role of estimated glomerular filtration rate (eGFR) on clinic and ambulatory systolic BP (SBP) response in overweight and obese adults with unmedicated high BP."

Financial supporters for this research include National Heart, Lung, and Blood Institute, General Clinical Research Center, National Institutes of Health.

Our news journalists obtained a quote from the research from Duke University, "Among 144 participants of the Exercise and Nutritional Interventions for Cardiovascular Health (ENCORE) trial, mean age was 52.0 +/- 9.6 years and median eGFR was 89.1 (53-146) mL/min/1.73m(2). After multivariable regression, the interaction between eGFR and weight loss was significant for clinic (P=.023) and ambulatory SBP (P=.041). Similarly, the interaction between eGFR and improved fitness was significant for clinic (P=.041) and ambulatory SBP (P=.044). The relationship between reduced dietary sodium and SBP was not moderated by eGFR. SBP findings were inconsistent for adherence to the Dietary Approaches to Stop Hypertension (DASH) diet."

According to the news editors, the research concluded: "These findings suggest that the effects of lifestyle modifications on SBP may be influenced by eGFR, even when kidney function is preserved."

The news correspondents report that additional information may be obtained from C.C. Tyson, Duke University, Medical Center, Dept. of Med, Durham, NC 27710, United States. Additional authors for this research include P.J. Smith, A. Sherwood, S. Mabe, A.L. Hinderliter and J.A. Blumenthal.

Blood Pressure

New Blood Pressure Study Results Reported from Federal University (Sedentary Behavior and Light Physical Activity Are Associated with Brachial and Central Blood Pressure in Hypertensive Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Blood Pressure are presented in a new report. According to news reporting out of Florianopolis, Brazil, by NewsRx editors, research stated, "Physical activity is recommended as a part of a comprehensive lifestyle approach in the treatment of hypertension, but there is a lack of data about the relationship between different intensities of physical activity and cardiovascular parameters in hypertensive patients. The purpose of this study was to investigate the association between the time spent in physical activities of different intensities and blood pressure levels, arterial stiffness and autonomic modulation in hypertensive patients."

Our news journalists obtained a quote from the research from Federal University, "In this cross-sectional study, 87 hypertensive patients (57.5 ± 9.9 years of age) had their physical activity assessed over a 7 day period using an accelerometer and the time spent in sedentary activities, light physical activities, moderate physical activities and moderate-to-vigorous physical activities was obtained. The primary outcomes were brachial and central blood pressure. Arterial stiffness parameters (augmentation index and pulse wave velocity) and cardiac autonomic modulation (sympathetic and parasympathetic modulation in the heart) were also obtained as secondary outcomes. Sedentary activities and light physical activities were positively and inversely associated, respectively, with brachial systolic (r=0.56; p<0.01), central systolic (r=0.51; p<0.05), brachial diastolic (r=0.45; p<0.01) and central diastolic (r=0.42; p <0.05) blood pressures, after adjustment for sex, age, trunk fat, number of antihypertensive drugs, accelerometer wear time and moderate-to-vigorous physical activities. Arterial stiffness parameters and cardiac autonomic modulation were not associated with the time spent in sedentary activities and in light physical activities (p >0.05)."

According to the news editors, the research concluded: "Lower time spent in sedentary activities and higher time spent in light physical activities are associated with lower blood pressure, without affecting arterial stiffness and cardiac autonomic modulation in hypertensive patients."

Our news journalists report that additional information may be obtained by contacting A.M. Gerage, Dept. of Physical Education, Federal University of Santa Catarina, Florianopolis, Santa Catarina, Brazil. Additional authors for this research include T.R. Benedetti, B.Q. Farah, F.da S. Santana, D. Ohara, L.B. Andersen and R.M Ritti-Dias. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1371/journal.pone.0146078. New Blood Pressure Study Results from Osaka Medical College Described (Improvement of cardiovascular remodelling by chymase inhibitor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Blood Pressure are presented in a new report. According to news originating from Takatsuki, Japan, by NewsRx correspondents, research stated, "Chymase has been identified as an angiotensin II-forming enzyme found in cardiovascular tissues. Angiotensin II is involved not only in the regulation of blood pressure, but also in the progression of cardiovascular remodelling."

Our news journalists obtained a quote from the research from Osaka Medical College, "Interestingly, chymase inhibitors prevent cardiovascular remodelling without lowering blood pressure. The reason why chymase inhibitors do not affect blood pressure may depend on the localization of chymase in?vivo. In normal tissues, chymase is stored in mast cell granules and has no enzymatic function; whereas, in damaged tissues, chymase exhibits enzymatic activity immediately following its release from the granules. Chymase also activates transforming growth factor-b and matrix metalloproteinase-9, both of which are involved in cardiovascular remodelling, and their enzymatic functions are also observed only in damaged tissues. In animal models of hypertension, diabetes and hypercholesterolaemia, chymase inhibitors improve cardiovascular remodelling without a general circulatory effect, including blood pressure."

According to the news editors, the research concluded: "Thus, it is proposed that chymase is a potentially important target for preventing cardiovascular diseases."

The news correspondents report that additional information may be obtained from S. Takai, Dept. of Innovative Medicine, Graduate School of Medicine, Osaka Medical College, Takatsuki, Japan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1440-1681.12549. This DOI is a link to an online electronic document that is either free or for purchase.

Proteins - Blood Proteins

New Blood Proteins Findings from Ben-Gurion University of the Negev Described (T Helper Subsets, Peripheral Plasticity, and the Acute Phase Protein, a1-Antitrypsin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Proteins - Blood Proteins is the subject of a report. According to news reporting originating in Be'er Sheva, Israel, by NewsRx journalists, research stated, "The traditional model of T helper differentiation describes the na?ve T cell as choosing one of several subsets upon stimulation and an added reciprocal inhibition aimed at maintaining the chosen subset. However, to date, evidence is mounting to support the presence of subset plasticity."

The news reporters obtained a quote from the research from the Ben-Gurion University of the Negev, "This is, presumably, aimed at fine-tuning adaptive immune responses according to local signals. Reprograming of cell phenotype is made possible by changes in activation of master transcription factors, employing epigenetic modifications that preserve a flexible mode, permitting a shift between activation and silencing of genes. The acute phase response represents an example of peripheral changes that are critical in modulating T cell responses. a1-antitrypsin (AAT) belongs to the acute phase responses and has recently surfaced as a tolerogenic agent in the context of adaptive immune responses. Nonetheless, AAT does not inhibit T cell responses, nor does it shutdown inflammation per se; rather, it appears that AAT targets non-T cell immunocytes towards changing the cytokine environment of T cells, thus promoting a regulatory T cell profile."

According to the news reporters, the research concluded: "The present review focuses on this intriguing two-way communication between innate and adaptive entities, a crosstalk that holds important implications on potential therapies for a multitude of immune disorders."

Our news correspondents report that additional information may be obtained by contacting B.M. Baranovski, Dept. of Clinical Biochemistry & Pharmacology, Faculty of Health Sciences, Ben-Gurion University of the Negev, 84101 Be'er Sheva, Israel. Additional authors for this research include G.S. Freixo-Lima, E.C. Lewis and P. Rider.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1155/2015/184574. This DOI is a link to an online electronic document that is either free or for purchase.

New Blood Transfusion Data Have Been Reported by Investigators at Radboud University (Effects of a human recombinant alkaline phosphatase on renal hemodynamics, oxygenation and inflammation in two models of acute kidney injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transfusion Medicine - Blood Transfusion have been published. According to news originating from Nijmegen, Netherlands, by NewsRx correspondents, research stated, "Two small clinical trials indicated that administration of bovine intestinal alkaline phosphatase (AP) improves renal function in critically ill patients with sepsis-associated acute kidney injury (AKI), for which the mechanism of action is not completely understood. Here, we investigated the effects of a newly developed human recombinant AP (recAP) on renal oxygenation and hemodynamics and prevention of kidney damage and inflammation in two in vivo AKI models."

Our news journalists obtained a quote from the research from Radboud University, "To induce AKI, male Wistar rats (n = 18) were subjected to renal ischemia (30 min) and reperfusion (I/R), or sham-operated. In a second model, rats (n = 18) received a 30 min infusion of lipopolysaccharide (LPS; 2.5 mg/kg), or saline, and fluid resuscitation. In both models, recAP (1000 U/kg) was administered intravenously (15 min before reperfusion, or 90 min after LPS). Following recAP treatment I/R-induced changes in renal blood flow, renal vascular resistance and oxygen delivery at early, and cortical microvascular oxygen tension at late reperfusion were no longer significantly affected. RecAP did not influence I/R-induced effects on mean arterial pressure. During endotoxemia, recAP treatment did not modulate the LPS-induced changes in systemic hemodynamics and renal oxygenation. In both models, recAP did exert a clear renal protective anti-inflammatory effect, demonstrated by attenuated immunostaining of inflammatory, tubular injury and pro-apoptosis markers."

According to the news editors, the research concluded: "Whether this renal protective effect is sufficient to improve outcome of patients suffering from sepsis-associated AKI is being investigated in a large clinical trial."

The news correspondents report that additional information may be obtained from E. Peters, Radboud University, Medical Center, Dept. of Pharmacol & Toxicol, NL-6500 HB Nijmegen, Netherlands. Transfusion Medicine - Blood Transfusion

New Blood Transfusion Findings Has Been Reported by E.H. Tischler et al (Are Preoperative Serologic Type and Screen Tests Necessary for Primary Total Joint Arthroplasty Patients in Specialty Surgical Hospitals?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transfusion Medicine - Blood Transfusion. According to news reporting from Media, Pennsylvania, by NewsRx journalists, research stated, "Blood loss during total joint arthroplasty (TJA) has been a major concern requiring routine preoperative patient type and screen (T & however, with the implementation of blood conserving therapy, a marked decrease for perioperative transfusions has been observed. Many TJAs are now being performed in T&S mandated specialty surgical hospitals (SSHs) that lack on-site blood banks; therefore, the purpose of our study was to determine whether T&S (1) is necessary in SSH for TJA patients and (2) identifies patient risk factors associated with perioperative blood transfusion in SSH."

The news correspondents obtained a quote from the research, "A retrospective study was conducted on 1034 consecutive primary TJAs performed between 2013 and 2014 at a 12-bed SSH who all received T&S. Patients were matched (1:1) to 964 inpatient TJA patients performed at a university hospital without routine T&S. Data on surgery type, patient demographics, hemoglobin and hematocrit results, and transfusion rates were collected. Multivariate logistic regression identified perioperative transfusion risk factors. Overall transfusion rates for the matched SSH (1.8% [17/964]) and university hospital populations (2.9% [28/964]) were similar (P = .13), with no emergent transfusions. SSH transfusion rates for simultaneous bilateral THA, simultaneous bilateral TKA, unilateral THA, and unilateral TKA were 21.1% (4/19), 3.1% (4/128), 2.7% (12/439), and 0.0% (0/448), respectively. Multivariate logistic regression identified unilateral THA (P <= .001), simultaneous bilateral TJA (P = .001), age (P = .05), and abnormal preoperative hemoglobin (P = .02) as significant transfusion risk factors at SSH."

According to the news reporters, the research concluded: "Due to low transfusion rates and lack of emergency transfusions, we recommend routinely ordering T&S for bilateral THA but not for unilateral TJA patients, at SSHs."

Our news journalists report that additional information may be obtained by contacting E.B. Smith, Phys Care Surg Hosp, Media, PA, United States. Additional authors for this research include A.F. Chen, C.N. Matthews, W.V. Arnold and E.B. Smith.

Transfusion Medicine - Blood Transfusion

New Blood Transfusion Study Findings Have Been Reported by Investigators at Shanghai Jiao-Tong University (Inhibition of PKR protects against H2O2-induced injury on neonatal cardiac myocytes by attenuating apoptosis and inflammation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Transfusion Medicine - Blood Transfusion. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Reactive oxygenation species (ROS) generated from reperfusion results in cardiac injury through apoptosis and inflammation, while PKR has the ability to promote apoptosis and inflammation. The aim of the study was to investigate whether PKR is involved in hydrogen peroxide (H2O2) induced neonatal cardiac myocytes (NCM) injury."

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "In our study, NCM, when exposed to H2O2, resulted in persistent activation of PKR due to NCM endogenous RNA. Inhibition of PKR by 2-aminopurine (2-AP) or siRNA protected against H2O2 induced apoptosis and injury. To elucidate the mechanism, we revealed that inhibition of PKR alleviated H2O2 induced apoptosis companied by decreased caspase3/7 activity, BAX and caspase-3 expression. We also revealed that inhibition of PKR suppressed H2O2 induced NF kappa B pathway and NLRP3 activation. Finally, we found ADAR1 mRNA and protein expression were both induced after H2O2 treatment through STAT-2 dependent pathway. By gain and loss of ADAR1 expression, we confirmed ADAR1 modulated PKR activity. Therefore, we concluded inhibition of PKR protected against H2O2-induced injury by attenuating apoptosis and inflammation. A self-preservation mechanism existed in NCM that ADAR1 expression is induced by H2O2 to limit PKR activation simultaneously."

According to the news editors, the research concluded: "These findings identify a novel role for PKR/ADAR1 in myocardial reperfusion injury."

For more information on this research see: Inhibition of PKR protects against H2O2-induced injury on neonatal cardiac myocytes by attenuating apoptosis and inflammation. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting S. Xue, Shanghai Jiao Tong University, Sch Med, Ren Ji Hosp, Dept. of Cardiovasc Surg, Shanghai, People's Republic of China. Additional authors for this research include M. Men, B. Xie, J.G. Shan, C.X. Wang, J.D. Liu, H. Zheng, W.G. Yang, S. Xue and C.F. Guo.

New Blood Transfusion Study Findings Have Been Reported from University of Rochester (ABO-immune complex formation and impact on platelet function, red cell structural integrity and haemostasis: an in vitro model of ABO non-identical transfusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transfusion Medicine - Blood Transfusion. According to news reporting originating from Rochester, New York, by NewsRx correspondents, research stated, "Transfusion of ABO non-identical platelets has been associated with fatal haemolytic reactions, increased red cell transfusion needs and other adverse effects, but the practice of ABO matching in platelet transfusion is controversial. Immune complexes can be formed from the anti-A and/or anti-B antibodies and ABO soluble antigen(s) present in donor and recipient plasma after ABO non-identical transfusions."

Our news editors obtained a quote from the research from the University of Rochester, "We hypothesized that these immune complexes affect recipient red cell structural integrity, platelet function and haemostasis. Haemolysis, platelet function and haemostatic function were assessed before and after incubation of recipient red cells, platelets and whole blood with normal saline controls, ABO-identical plasma controls or in vitro-generated ABO-immune complexes. ABO-immune complexes caused significantly increased haemolysis (p <0?001), inhibition of platelet function (p=0?001) and disruption of clot formation kinetics (p <0?005) in both group A and O recipient samples. Substantial changes in platelet function, red cell integrity and haemostasis occur after in vitro exposure to immune complexes."

According to the news editors, the research concluded: "These in vitro findings may explain, in part, previously observed associations of ABO non-identical platelet transfusions with adverse effects including increased red cell transfusion needs, organ failure and mortality."

The news editors report that additional information may be obtained by contacting B.J. Zaffuto, James P Wilmot Cancer Center, University of Rochester Medicine, Rochester, NY, United States. Additional authors for this research include G.W. Conley, G.C. Connolly, K.F. Henrichs, C.W. Francis, J.M. Heal, N. Blumberg and M.A Refaai.

New Blood Transfusion Study Findings Recently Were Reported by C. L'Acqua and Co-Researchers (Red blood cell transfusion is associated with increased hemolysis and an acute phase response in a subset of critically ill children)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Transfusion Medicine - Blood Transfusion have been presented. According to news reporting originating in Milan, Italy, by NewsRx journalists, research stated, "In healthy adults, transfusion of older stored red blood cells (RBCs) produces extravascular hemolysis and circulating non-transferrin-bound iron. In a prospective, observational study of critically ill children, we examined the effect of RBC storage duration on the extent of hemolysis by comparing laboratory measurements obtained before, and 4 hr after, RBC transfusion (N=100) or saline/albumin infusion (N=20)."

Financial support for this research came from NIH grants.

The news reporters obtained a quote from the research, "Transfusion of RBCs stored for longer than 4 weeks significantly increased plasma free hemoglobin (p <0.05), indirect bilirubin (p <0.05), serum iron (p <0.001), and non-transferrin-bound iron (p <0.01). However, days of storage duration poorly correlated (R(2) <0.10) with all measured indicators of hemolysis and inflammation. These results suggest that, in critically ill children, most effects of RBC storage duration on post-transfusion hemolysis are overwhelmed by recipient and/or donor factors. Nonetheless, we identified a subset of patients (N=21) with evidence of considerable extravascular hemolysis (i.e., increased indirect bilirubin (>=)0.4 mg/dL). In these patients, transfusion-associated hemolysis was accompanied by increases in circulating non-transferrin-bound iron and free hemoglobin and by an acute phase response, as assessed by an increase in median C-reactive protein levels of 21.2 mg/L (p <0.05). In summary, RBC transfusions were associated with an acute phase response and both extravascular and intravascular hemolysis, which were independent of RBC storage duration."

According to the news reporters, the research concluded: "The 21% of transfusions that were associated with substantial hemolysis conferred an increased risk of inducing an acute phase response."

Our news correspondents report that additional information may be obtained by contacting C. L'Acqua, Dept. of Medical Surgical Pathophysiology and Organ Transplantation, Universita' Degli Studi Di Milano, Milan, Italy. Additional authors for this research include S. Bandypadhyay, R.O. Francis, D.J. McMahon, M. Nellis, S. Sheth, S.G. Kernie, G.M. Brittenham, S.L. Spitalnik and E.A Hod.

New Blood Vessels Findings from Florida International University Described (Echocardiographic and Surgical Correlation of Coronary Artery Patterns in Transposition of the Great Arteries)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Blood Vessels are presented in a new report. According to news reporting out of Miami, Florida, by NewsRx editors, research stated, "Determine the accuracy of echocardiography to diagnose coronary anatomy in transposition of the great arteries and to evaluate the effect of accuracy on surgical outcomes and changes in accuracy over time. Retrospective chart review of neonates admitted February 1999 to March 2013 with transposition."

Our news journalists obtained a quote from the research from Florida International University, "Coronary pattern from the preoperative echocardiogram and operative reports were collected and compared with determine diagnostic accuracy. Coronary patterns were further confirmed by intraoperative images taken during surgery. Tertiary care children's hospital. Neonates with transposition of the great arteries and planned arterial switch operation with an echo and operative report or image describing the coronaries. Not applicable. Accuracy of echocardiography to diagnose coronary anatomy in transposition, and to identify factors related to correct diagnosis. One hundred forty-two patients met inclusion criteria with 122 correctly diagnosed, 16 incorrect, and 4 inconclusive. Accuracy was 86%, with 95% accuracy in patients with typical coronary patterns, 85% with the most common variant (left coronary from the leftward sinus and right and circumflex from the rightward sinus), and 61% with less common patterns. Typical and common variants were more likely to be correct than atypical patterns (P <.001). Cases with ventricular septal defect were more likely to have correctly diagnosed coronaries than with an intact ventricular septum (94% vs. 79%, P = .01). There was no change in accuracy over time (P >.05). There was no difference in duration of cardiopulmonary bypass, cross-clamp times, length of stay, or postoperative stay between the correct and incorrectly diagnosed groups (P >.05). In our center, accuracy of echocardiographic imaging of the coronary arteries in transposition was 86% without improvement over time, and perioperative outcomes were not affected by diagnostic accuracy."

According to the news editors, the research concluded: "Further invasive imaging may not be necessary to determine the coronary pattern in this lesion."

Cell Research - Bone Marrow Cells

New Bone Marrow Cells Study Findings Recently Were Reported by Researchers at State University of New York (Identification of a potent small molecule capable of regulating polyploidization, megakaryocyte maturation, and platelet production)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cell Research - Bone Marrow Cells have been presented. According to news reporting originating from Stony Brook, New York, by NewsRx correspondents, research stated, "Megakaryocytic cell maturation involves polyploidization, and megakaryocyte (MK) ploidy correlates with their maturation and platelet production. Retardation of MK maturation is closely associated with poor MK engraftment after cord blood transplantation and neonatal thrombocytopenia."

Our news editors obtained a quote from the research from the State University of New York, "Despite the high prevalence of thrombocytopenia in a range of settings that affect infants to adults, there are still very limited modalities of treatment. Human CD34(+) cells were isolated from cord blood or bone marrow samples acquired from consenting patients. Cells were cultured and induced using 616452 and compared to current drugs on the market such as rominplostim or TPO. Ploidy analysis was completed using propidium iodide staining and flow cytometry analysis. Animal studies consisted of transplanting human CD34(+) cells into NOD.Cg-Prkdc(scid)Il2rg(tm1Wjl)/SzJ mice followed by daily injections of 15 mg/kg of 616452. Within one week of culture, the chemical was able to induce polyploidization, the process required for megakaryocyte maturation with the accumulation of DNA content, to 64 N or greater to achieve a relative adult size. We observed fold increases as high as 200-fold in cells of 16 N or greater compared to un-induced cells with a dose-dependent manner. In addition, MK differentiated in the presence of 616452 demonstrated a more robust capacity of MK differentiation than that of MKs cultured with rominplostim used for adult idiopathic thrombocytopenic purpura (ITP) patients. In mice transplanted with human cord blood, 616452 strikingly enhanced MK reconstitution in the marrow and human peripheral platelet production. The molecular therapeutic actions for this chemical may be through TPO-independent pathways."

According to the news editors, the research concluded: "Our studies may have an important impact on our fundamental understanding of fetal MK biology, the clinical management of thrombocytopenic neonates and leukemic differentiation therapy."

For more information on this research see: Identification of a potent small molecule capable of regulating polyploidization, megakaryocyte maturation, and platelet production. Journal of Hematology & Oncology, 2016;9();1-11. Journal of Hematology & Oncology can be
New Bone Research Data Have Been Reported by Investigators at Azienda Ospedaliera University (The Use of Integra Dermal Regeneration Template Versus Flaps for Reconstruction of Full-Thickness Scalp Defects Involving the Calvaria: A Cost-Benefit ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Bone Research are presented in a new report. According to news reporting out of Udine, Italy, by NewsRx editors, research stated, "INTEGRA(A ®) Dermal Regeneration Template is a well-known and widely used acellular dermal matrix. Although it helps to solve many challenging problems in reconstructive surgery, the product cost may make it an expensive alternative compared to other reconstruction procedures."

Our news journalists obtained a quote from the research from Azienda Ospedaliera University, "This retrospective study aims at comparing INTEGRA-based treatment to flap surgery in terms of cost and benefit. We considered only patients treated for scalp defects with bone exposure in order to obtain two groups as homogeneous as possible. We identified two groups of patients: 17 patients treated with INTEGRA and 18 patients treated with flaps. All patients were admitted in our institution between 2004 and 2010, and presented a defect of the scalp following trauma or surgery for cancer, causing a loss of the soft tissues of the scalp with bone exposure without pericranium. To calculate the cost in constant euros of each treatment, three parameters were evaluated for each patient: cost of the surgical procedure (number of doctors and nurses involved, surgery duration, anesthesia, material used for surgery), hospitalization cost (hospitalization duration, dressings, drugs, topical agents), and outpatient cost (number of dressing changes, personnel cost, dressings type, anti-infective agents). The statistical test used in this study was the Wilcoxon Mann-Whitney (alpha = 0.05). No significant difference was characterized between the two groups for gender, age, presence of diabetes, mean defect size, and number of surgical procedures. All patients healed with good quality and durable closure. The median total cost per patient was a,notsign11,121 (interquartile range (IQR) 8327-15,571) for the INTEGRA group and a,notsign7259 (IQR 1852-24,443) for the flap group (p = 0.34). A subgroup of patients (six patients in the INTEGRA group and five patients in the flap group) showing defects larger than 100 cm(2) were considered in a second analysis. Median total cost was a,notsign11,825 (IQR 10,695-15,751) for the INTEGRA group and a,notsign23,244 (IQR 17,348-26,942) for the flap group. Both treatments led to a good healing
of the lesions with formation of soft and resistant tissue. No significant difference was characterized between the two groups for days of hospitalization and costs. In cases of patients with defects larger than 100 cm(2) for whom major surgery is needed, the treatment with INTEGRA seemed to be less expensive than the treatment with free flaps or pedicle flaps. This journal requires that authors assign a level of evidence to each article."

According to the news editors, the research concluded: "For a full description of these Evidence-Based Medicine ratings, please refer to the Table of Contents or the A5 online Instructions to Authors. www.springer.com/00266."

Our news journalists report that additional information may be obtained by contacting M. Schiavon, Azienda Osped Univ S Maria Misericordia, Struttura Operat Complessa Chirurg Plast & Center Us, Udine, Italy. Additional authors for this research include M. Francescon, D. Drigo, G. Salloum, R. Baraziol, J. Tesei, E. Fraccalanza and F. Barbone. Keywords for this news article include: Udine, Italy, Europe, Bone Research, Surgery, Azienda Ospedaliera University.

New Bone Research

New Bone Research Study Findings Reported from University of Tokushima (The Nuclear Receptor AhR Controls Bone Homeostasis by Regulating Osteoclast Differentiation via the RANK/c-Fos Signaling Axis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Bone Research is now available. According to news reporting from Tokushima, Japan, by NewsRx journalists, research stated, "The aryl hydrocarbon receptor (AhR) pathway plays a key role in receptor activator of NF-kappa B ligand (RANKL)-mediated osteoclastogenesis. However, the mechanism underlying the regulation of AhR expression in osteoclasts and the signaling pathway through which AhR controls osteoclastogenesis remain unclear."

The news correspondents obtained a quote from the research from the University of Tokushima, "We found that the expression of AhR in bone marrow-derived osteoclasts was upregulated by RANKL at an earlier stage than was the expression of signature osteoclast genes such as those encoding cathepsin K and NFAT, cytoplasmic, calcineurin-dependent 1. In response to RANKL, bone marrow macrophages isolated from AhR(-/-) mice exhibited impaired phosphorylation of Akt and MAPK as well as NF-kappa B, whereas their response to M-CSF remained unchanged. Osteoclast differentiation mediated by the AhR signaling pathway was also regulated in an RANKL/c-Fos-dependent manner. Furthermore, ligand activation of AhR by the smoke toxin benzo[a]pyrene accelerated osteoclast differentiation in a receptor-dependent manner, and AhR-dependent regulation of mitochondrial biogenesis in osteoclasts.
was observed. Moreover, AhR(-/-) mice exhibited impaired bone healing with delayed endochondral ossification."

According to the news reporters, the research concluded: "Taken together, the present results suggest that the RANKL/AhR/c-Fos signaling axis plays a critical role in osteoclastogenesis, thereby identifying the potential of AhR in treating pathological, inflammatory, or metabolic disorders of the bone."

For more information on this research see: The Nuclear Receptor AhR Controls Bone Homeostasis by Regulating Osteoclast Differentiation via the RANK/c-Fos Signaling Axis. *Journal of Immunology*, 2016;197(12):4639-4650. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. **Drugs and Therapies - Botulinum Toxin Therapy**

**New Botulinum Toxin Therapy Study Findings Have Been Reported by Researchers at University Hospital (Sensorimotor modulation by botulinum toxin A in post-stroke arm spasticity: Passive hand movement)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Botulinum Toxin Therapy is the subject of a report. According to news reporting originating in Olomouc, Czech Republic, by NewsRx journalists, research stated, "In post-stroke spasticity, functional imaging may uncover modulation in the central sensorimotor networks associated with botulinum toxin type A (BoNT) therapy. Investigations were performed to localize brain activation changes in stroke patients treated with BoNT for upper limb spasticity using functional magnetic resonance imaging (fMRI)."

Funders for this research include Internal Grant Agency of Ministry of Health of the Czech Republic, Agency for Healthcare Research of Ministry of Health of the Czech Republic, Institutional Support RVO FNOL.

The news reporters obtained a quote from the research from University Hospital, "Seven ischemic stroke patients (4 females; mean age 58.86) with severe hand paralysis and notable spasticity were studied. Spasticity was scored according to the modified Ashworth scale (MAS). fMRI examination was performed 3 times: before (W0) and 4 (W4) and 11weeks (W11) after BoNT. The whole-brain fMRI data were acquired during paced repetitive passive movements of the plegic hand (flexion/extension at the wrist) alternating with rest. Voxel-by-voxel statistical analysis using the General Linear Model (GLM) implemented in FSL (v6.00)/FEAT yielded group session-wise statistical maps and paired between-session contrasts, thresholded at the corrected cluster-wise significance level of p<0.05. As expected, BoNT
transiently lowered MAS scores at W4. Across all the sessions, fMRI activation of the ipsilesional sensorimotor cortex (M1, S1, and SMA) dominated. At W4, additional clusters transiently emerged bilaterally in the cerebellum, in the contralesional sensorimotor cortex, and in the contralesional occipital cortex. Paired contrasts demonstrated significant differences W4 >W0 (bilateral cerebellum and contralesional occipital cortex) and W4 >W11 (ipsilesional cerebellum and SMA). The remaining paired contrast (W0 >W11) showed activation decreases mainly in the ipsilesional sensorimotor cortex (M1, S1, and SMA).

According to the news reporters, the research concluded: "The present study confirms the feasibility of using passive hand movements to map the cerebral sensorimotor networks in patients with post-stroke arm spasticity and demonstrates that BoNT-induced spasticity relief is associated with changes in task-induced central sensorimotor activation, likely mediated by an altered afferent drive from the spasticity-affected muscles."

Our news correspondents report that additional information may be obtained by contacting T. Veverka, Dept. of Neurology, Faculty of Medicine and Dentistry, Palacky University and University Hospital, Olomouc, Czech Republic. Additional authors for this research include P. Hlušťik, P. Hok, P. Otruba, J. Zapletalova, Z. Tudos, A. Krobot and P. Kanovsky.

Proteins - Bovine Serum Albumin

New Bovine Serum Albumin Findings from Kingston University Outlined (Efficient approach to enhance drug solubility by particle engineering of bovine serum albumin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Proteins - Bovine Serum Albumin.

According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "The aim of this study was to investigate the use of bovine serum albumin (BSA) as a solubility enhancer for indometacin (IND) as a model drug. IND-BSA solid dispersions were prepared by both spray drying and freeze drying techniques using IND: BSA solution (20:1 Molar Ratio (MR)) and IND: BSA suspension (100:1 MR)."

The news correspondents obtained a quote from the research from Kingston University. "The solid state of IND in solid dispersions was characterised by SEM, DSC and XRD. The aqueous solubility of IND in the presence of increased amounts of BSA was
evaluated. Additionally, IND dissolution and release profiles were evaluated. IND in solid dispersions with BSA showed significantly higher solubility in water than that of the physical mixture of both. Enhancement factors of 24,000 and 100,000 were obtained for the solid dispersion formulated in 20:1 MR and 100:1 MR, respectively. Dissolution studies in-vitro indicated a significant increase in the dissolution rate of IND from solid dispersions compared to that of the free drug, with almost 95% of the drug dissolved in the first 5 min. Furthermore, an immediate release of IND from BSA solid dispersions was shown.

According to the news reporters, the research concluded: "The potential use of albumin as solubility enhancer for poorly soluble drugs, particularly, for immediate release volume-limited dosage forms is reported."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.11.019. This DOI is a link to an online electronic document that is either free or for purchase.

**Heart Disorders and Diseases - Bradycardia**

**New Bradycardia Findings from C.M. Harris and Co-Researchers Described [Sphingosine-1-Phosphate (S1P) Lyase Inhibition Causes Increased Cardiac S1P Levels and Bradycardia in Rats]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Bradycardia have been published. According to news reporting out of Worcester, Massachusetts, by NewsRx editors, research stated, "Inhibition of the sphingosine-1-phosphate (S1P)-catabolizing enzyme S1P lyase (S1PL) elevates the native ligand of S1P receptors and provides an alternative mechanism for immune suppression to synthetic S1P receptor agonists. S1PL inhibition is reported to preferentially elevate S1P in lymphoid organs."

Our news journalists obtained a quote from the research, "Tissue selectivity could potentially differentiate S1PL inhibitors from S1P receptor agonists, the use of which also results in bradycardia, atrioventricular block, and hypertension. But it is unknown if S1PL inhibition would also modulate cardiac S1P levels or cardiovascular function. The S1PL inhibitor 6-[(2R)-4-(4benzyl-7-chlorophthalazin-1-yl)-2-methylpiperazin-1-yl] pyridine-3-
carbonitrile was used to determine the relationship in rats between drug concentration, S1P levels in select tissues, and circulating lymphocytes. Repeated oral doses of the S1PL inhibitor fully depleted circulating lymphocytes after 3 to 4 days of treatment in rats. Full lymphopenia corresponded to increased levels of S1P of 100- to 1000-fold in lymph nodes, 3-fold in blood (but with no change in plasma), and 9-fold in cardiac tissue. Repeated oral dosing of the S1PL inhibitor in telemeterized, conscious rats resulted in significant bradycardia within 48 hours of drug treatment, comparable in magnitude to the bradycardia induced by 3 mg/kg fingolimod."

According to the news editors, the research concluded: "These results suggest that S1PL inhibition modulates cardiac function and does not provide immune suppression with an improved cardiovascular safety profile over fingolimod in rats."

For more information on this research see: Sphingosine-1-Phosphate (S1P) Lyase Inhibition Causes Increased Cardiac S1P Levels and Bradycardia in Rats. Journal of Pharmacology and Experimental Therapeutics, 2016;359(1):151-158. Heart Disorders and Diseases - Bradycardia

New Bradycardia Study Findings Recently Were Reported by Researchers at Inje University (Anticholinergic premedication to prevent bradycardia in combined spinal anesthesia and dexametomidine sedation: a randomized, double-blind, ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Bradycardia. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "When dexametomidine is used in patients undergoing spinal anesthesia, high incidence of bradycardia in response to parasympathetic activation is reported. Therefore, we aimed to evaluate the effectiveness of atropine premedication for preventing the incidence of bradycardia and the hemodynamic effect on patients undergoing spinal anesthesia with sedation by dexametomidine."

The news correspondents obtained a quote from the research from Inje University, "Randomized, double-blind, placebo-controlled study. Operating room. One hundred fourteen patients (age range, 2-65 years; American Society of Anesthesiology class I-II) participated in
this study, willing to be sedated and to undergo spinal anesthesia. The patients were divided into 2 groups: group A and group C. After performing spinal anesthesia, dexmedetomidine was infused at a loading dose of 0.6 μg/kg for 10 minutes, followed by an infusion at 0.25 μg/kg (kg h). Simultaneously with the loading dose of dexmedetomidine, patients in group A received an intravenous bolus of 0.5 mg atropine, whereas patients in group C received an intravenous normal saline bolus. Data on administration of atropine and ephedrine were collected. Hemodynamic data including heart rate, systolic blood pressure, diastolic blood pressure (DBP), and mean blood pressure (MBP) were also recorded. Main results: The incidence of bradycardia requiring atropine treatment was significantly higher in group C than group A (P = .035). However, the incidence of hypotension needing ephedrine treatment showed no significant difference between the 2 groups (P = .7). Systolic blood pressure and heart rate showed no significant differences between the 2 groups (P = .138 and .464, respectively). However, group A showed significant increases in DBP and MBP, and group C did not (P = .014 and .008, respectively). Prophylactic atropine reduces the incidence of bradycardia in patients undergoing spinal anesthesia with dexmedetomidine sedation. However, DBP and MBP showed significant increases in patients when prophylactic atropine was administrated."

According to the news reporters, the research concluded: "Therefore, atropine premedication should be administered cautiously."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jclinane.2016.07.012. This DOI is a link to an online electronic document that is either free or for purchase.

Neuropeptides - Bradykinin

New Bradykinin Study Findings Have Been Reported by Investigators at University of Texas (Constitutive Desensitization of Opioid Receptors in Peripheral Sensory Neurons)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Neuropeptides - Bradykinin have been presented.
According to news reporting from San Antonio, Texas, by NewsRx journalists, research stated, "Opioid receptors expressed by peripheral pain-sensing neurons are functionally inactive for antinociceptive signaling under most basal conditions; however, tissue damage or exposure to inflammatory mediators (e.g., bradykinin) converts these receptors from a nonresponsive state to a functionally competent state. Here we tested the hypothesis that the basal, nonresponsive state of the mu-and delta-opioid receptors (MOR and DOR, respectively) is the result of constitutive receptor activity that activates desensitization mechanisms, resulting in wMOR and DOR receptor systems that are constitutively desensitized."

The news correspondents obtained a quote from the research from the University of Texas, "Consistent with our previous findings, under basal conditions, neither the MOR agonist [D-Ala(2), N-MePhe(4), Gly-ol(5)]-enkephalin nor the DOR agonist [D-Pen(2,5)]enkephalin, inhibited prostaglandin E-2 (PGE(2))-stimulated cAMP accumulation in peripheral sensory neurons in culture (ex vivo) or inhibited PGE(2)-stimulated thermal allodynia in the rat hind paw in vivo. Prolonged treatment with naloxone induced MOR and DOR responsiveness both in vivo and ex vivo to a similar magnitude as that produced by bradykinin. Also similar to bradykinin, the effect of naloxone persisted for 60 minutes after washout of the ligand. By contrast, prolonged treatment with 6 beta-naltrexol, did not induce functional competence of MOR or DOR but blocked the effect of naloxone. Treatment with siRNA for beta-arrestin2, but not beta-arrestin-1, also induced MOR and DOR functional competence in cultured peripheral sensory neurons."

According to the news reporters, the research concluded: "These data suggest that the lack of responsiveness of MOR and DOR to agonist for antinociceptive signaling in peripheral sensory neurons is due to constitutive desensitization that is likely mediated by beta-arrestin-2."

Our news journalists report that additional information may be obtained by contacting K.A. Berg, Univ Texas Hlth Sci Center San Antonio, Dept. of Pharmacol, San Antonio, TX 78229, United States. Additional authors for this research include T.S. Chavera, R.J. Jamshidi, K.A. Berg and W.P. Clarke.

New Brain Cancer Study Findings Recently Were Reported by Researchers at University of Western Ontario (Topiramate induces acute intracellular acidification in glioblastoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Brain Cancer is the subject of a report. According to news originating from London, Canada, by NewsRx correspondents, research stated, "Reversal of the intracellular/extracellular pH gradient is a hallmark of malignant tumors and is an important consideration in evaluating tumor growth potential and the effectiveness of anticancer therapies. Glioblastoma multiforme (GBM) brain tumors have increased expression of the carbonic anhydrase (CA) isozymes CAII, CAIX and CAXII that contribute to the altered regulation of intracellular pH (pH(i))."

Financial supporters for this research include Ontario Institute for Cancer Research, Natural Sciences and Engineering Research Council of Canada.

Our news journalists obtained a quote from the research from the University of Western Ontario, "The anti-epileptic drug topiramate (TPM) inhibits CA action and may acidify the tumor intracellular compartment. In-vivo detection of acute tumor acidification could aid in cancer diagnosis and monitoring treatment response. Chemical exchange saturation transfer (CEST) magnetic resonance imaging (MRI) has been used to measure tissue pH. Using a recently developed CEST-MRI method called amine/amide concentration independent detection (AACID), we have previously shown intracellular acidification caused by single dose of lonidamine. The current study aims to evaluate the intracellular acidification induced by a single dose of the clinically approved drug TPM. Brain tumors were induced in NU/NU mice by injecting 10(5) U87 human glioblastoma multiforme cells into the right frontal lobe. Using a 9.4T MRI scanner AACID measurements were acquired, before and after administration of TPM (dose: 120 mg/kg, intraperitoneal), 15 +/- 2 days after tumor cell implantation. TPM administration induced acute intracellular acidification (average +/- SD: baseline AACID = 1.14 +/- 0.05; post AACID = 1.19 +/- 0.05, paired ttest p = 0.02) in implanted brain tumors. In contrast, contralateral tissue showed no change in AACID value. These results suggest that topiramate can rapidly induce a tumor specific physiological change detectable by AACID CEST."

According to the news editors, the research concluded: "This pH challenge paradigm could be exploited to aid in tumor detection and monitoring treatment response."

The news correspondents report that additional information may be obtained from R. Bartha, University of Western Ontario, Robarts Res Inst, London, ON N6A 5B7, Canada. Additional authors for this research include N. McVicar, A. Li, M. Bellyou, S. Meakin and R. Bartha.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s11060-016-2258-y. This DOI is a link to an online electronic document that is either free or for purchase.
New Brain Injuries Findings Has Been Reported by Investigators at Tel Aviv University (Novel pharmaceutical treatments for minimal traumatic brain injury and evaluation of animal models and methodologies supporting their development)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Brain Injuries. According to news originating from Tel Aviv, Israel, by NewsRx correspondents, research stated, "The need for effective pharmaceuticals within animal models of traumatic brain injury (TBI) continues to be paramount, as TBI remains the major cause of brain damage for children and young adults. While preventative measures may act to reduce the incidence of initial blunt trauma, well-tolerated drugs are needed to target the neurologically damaging internal cascade of molecular mechanisms that follow."

Financial supporters for this research include Ari and Regine Aprijaskis Fund, Israel Science Foundation.

Our news journalists obtained a quote from the research from Tel Aviv University, "Such processes, known collectively as the secondary injury phase, include inflammation, excitotoxicity, and apoptosis among other changes still subject to research. In this article positive treatment findings to mitigate this secondary injury in rodent TBI models will be overviewed, and include recent studies on Exendin-4, N-Acetyl-L-cysteine, Salubrinal and Thrombin. These studies provide representative examples of methodologies that can be combined with widely available in vivo rodent models to evaluate therapeutic approaches of translational relevance, as well as drug targets and biochemical cascades that may slow or accelerate the degenerative processes induced by TBI. They employ well-characterized tests such as the novel object recognition task for assessing cognitive deficits."

According to the news editors, the research concluded: "The application of such methodologies provides both decision points and a gateway for implementation of further translational studies to establish the feasibility of clinical efficacy of potential therapeutic interventions."

For more information on this research see: Novel pharmaceutical treatments for minimal traumatic brain injury and evaluation of animal models and methodologies supporting their development. *Journal of Neuroscience Methods*, 2016;272():69-76. *Journal of Neuroscience Methods* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Neuroscience Methods - www.journals.elsevier.com/journal-of-neuroscience-methods/)

The news correspondents report that additional information may be obtained from C.G. Pick, Tel Aviv University, Dept. of Anat & Anthropol, Sackler Sch Med, Tel Aviv, Israel. Additional authors for this research include N. Maggio, V. Rubovitch, J. Chapman, S.
New Brain Injuries Study Findings Have Been Reported by Researchers at University of Michigan (Early resuscitation with lyophilized plasma provides equal neuroprotection compared with fresh frozen plasma in a large animal survival model of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Brain Injuries are discussed in a new report. According to news reporting originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "Combined traumatic brain injury (TBI) and hemorrhagic shock (HS) is highly lethal. In previous models of combined TBI + HS, we showed that early resuscitation with fresh frozen plasma (FFP) improves neurologic outcomes."

Our news editors obtained a quote from the research from the University of Michigan, "Delivering FFP, however, in austere environments is difficult. Lyophilized plasma (LP) is a logistically superior alternative to FFP, but data are limited regarding its efficacy for treatment of TBI. We conducted this study to determine the safety and long-term outcomes of early treatment with LP in a large animal model of TBI + HS. Adult anesthetized swine underwent TBI and volume-controlled hemorrhage (40% blood volume) concurrently. After 2 hours of shock, animals were randomized (n = 5 per /group) to FFP or LP (1x shed blood) treatment. Serial blood gases were drawn, and thromboelastography was performed on citrated, kaolin-activated whole-blood samples. Five hours after treatment, packed red blood cells were administered, and animals recovered. A 32-point Neurologic Severity Score was assessed daily for 30 days (0 = normal, 32 = most severe injury). Cognitive functions were tested by training animals to retrieve food from color-coded boxes. Brain lesion size was measured on serial magnetic resonance imaging, and an autopsy was performed at 30 days. The severity of shock and the degree of resuscitation were similar in both groups. Administration of FFP and LP was well tolerated with no differences in reversal of shock or thromboelastography parameters. Animals in both groups displayed the worst Neurologic Severity Score on postoperative Day 1 with rapid recovery and return to baseline within 7 days of injury. Lesion size on Day 3 in FFP-treated animals was 645 +/- 85 versus 219 +/- 20 mm(3) in LP-treated animals (p < 0.05). There were no differences in cognitive functions or delayed treatment-related complications."

According to the news editors, the research concluded: "Early treatment with LP in TBI + HS is safe and provides neuroprotection that is comparable to FFP."

For more information on this research see: Early resuscitation with lyophilized plasma provides equal neuroprotection compared with fresh frozen plasma in a large animal...
survival model of traumatic brain injury and hemorrhagic shock. *Journal of Trauma and Acute Care Surgery*, 2016;81(6):1080-1087. *Journal of Trauma and Acute Care Surgery* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Central Nervous System - Brain Research**

**New Brain Research Study Findings Have Been Reported by Researchers at University of Georgia (Dorsomedial hypothalamic NPY affects cholecystokinin-induced satiety via modulation of brain stem catecholamine neuronal signaling)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System - Brain Research are discussed in a new report. According to news reporting originating in Athens, Georgia, by NewsRx journalists, research stated, "Increased neuropeptide Y (NPY) gene expression in the dorsomedial hypothalamus (DMH) has been shown to cause hyperphagia, but the pathway underlying this effect remains less clear. Hypothalamic neural systems play a key role in the control of food intake, in part, by modulating the effects of meal-related signals, such as cholecystokinin (CCK)."

Financial support for this research came from HHS | NIH | National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK).

The news reporters obtained a quote from the research from the University of Georgia, "An increase in DMH NPY gene expression decreases CCK-induced satiety. Since activation of catecholaminergic neurons within the nucleus of solitary tract (NTS) contributes to the feeding effects of CCK, we hypothesized that DMH NPY modulates NTS neural catecholaminergic signaling to affect food intake. We used an adeno-associated virus system to manipulate DMH NPY gene expression in rats to examine this pathway. Viral-mediated hrGFP anterograde tracing revealed that DMH NPY neurons project to the NTS; the projections were in close proximity to catecholaminergic neurons, and some contained NPY. Viral-mediated DMH NPY overexpression resulted in an increase in NPY content in the NTS, a decrease in NTS tyrosine hydroxylase (TH) expression, and reduced exogenous CCK-induced satiety. Knockdown of DMH NPY produced the opposite effects. Direct NPY administration into the fourth ventricle of intact rats limited CCK-induced satiety and overall TH phosphorylation."

According to the news reporters, the research concluded: "Taken together, these results demonstrate that DMH NPY descending signals affect CCK-induced satiety, at least in
part, via modulation of NTS catecholaminergic neuronal signaling."

Our news correspondents report that additional information may be obtained by contacting C.B. de La Serre, University of Georgia, Dept. of Food & Nutr, Athens, GA 30602, United States. Additional authors for this research include Y.J. Kim, T.H. Moran and S. Bi.

**Oncology - Breast Cancer**

**New Breast Cancer Data Have Been Reported by Investigators at China Academy of Chinese Medical Sciences (Low doses of paclitaxel enhance liver metastasis of breast cancer cells in the mouse model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Paclitaxel is the most commonly used chemotherapeutic agent in breast cancer treatment. In addition to its well-known cytotoxic effects, recent studies have shown that paclitaxel has tumor-supportive activities."

Financial support for this research came from National Natural Science Foundation of China.

The news reporters obtained a quote from the research from the China Academy of Chinese Medical Sciences, "Importantly, paclitaxel levels are not maintained at the effective concentration through one treatment cycle; rather, the concentration decreases during the cycle as a result of drug metabolism. Therefore, a comprehensive understanding of paclitaxel's effects requires insight into the dose-specific activities of paclitaxel and their influence on cancer cells and the host microenvironment. Here we report that a low dose of paclitaxel enhances metastasis of breast cancer cells to the liver in mouse models. We used microarray analysis to investigate gene expression patterns in invasive breast cancer cells treated with low or clinically relevant high doses of paclitaxel. We also investigated the effects of low doses of paclitaxel on cell migration, invasion and metastasis in vitro and in vivo. The results showed that low doses of paclitaxel promoted inflammation and initiated the epithelial-mesenchymal transition, which enhanced tumor cell migration and invasion in vitro. These effects could be reversed by inhibiting NF-kappa B. Furthermore, low doses of paclitaxel promoted liver metastasis in mouse
xenografts, which correlated with changes in estrogen metabolism in the host liver. Collectively, these findings reveal the paradoxical and dose-dependent effects of paclitaxel on breast cancer cell activity, and suggest that increased consideration be given to potential adverse effects associated with low concentrations of paclitaxel during treatment."

According to the news reporters, the research concluded: "Database Gene expression microarray data are available in the GEO database under accession number GSE82048."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/febs.13767. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Breast Cancer**

**New Breast Cancer Data Have Been Reported by Investigators at University of Athens (Current Evidence and Future Perspectives on HuR and Breast Cancer Development, Prognosis, and Treatment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting originating from Athens, Greece, by NewsRx correspondents, research stated, "Hu-antigen R (HuR) is an RNA-binding posttranscriptional regulator that belongs to the Hu/ELAV family. HuR expression levels are modulated by a variety of proteins, microRNAs, chemical compounds, or the microenvironment, and in turn, HuR affects mRNA stability and translation of various genes implicated in breast cancer formation, progression, metastasis, and treatment."

Our news editors obtained a quote from the research from the University of Athens, "The aim of the present review is to critically summarize the role of HuR in breast cancer development and its potential as a prognosticator and a therapeutic target. In this aspect, all the existing English literature concerning HuR expression and function in breast cancer cell lines, in vivo animal models, and clinical studies is critically presented and summarized. HuR modulates many genes implicated in biological processes crucial for breast cancer formation, growth, and
metastasis, whereas the link between HuR and these processes has been demonstrated directly in vitro and in vivo. Additionally, clinical studies reveal that HuR is associated with more aggressive forms of breast cancer and is a putative prognosticator for patients' survival."

According to the news editors, the research concluded: "All the above indicate HuR as a promising drug target for cancer therapy; nevertheless, additional studies are required to fully understand its potential and determine against which types of breast cancer and at which stage of the disease a therapeutic agent targeting HuR would be more effective."

The news editors report that additional information may be obtained by contacting I. Kotta-Loizou, University of Athens, Dept. of Pathol 1, Sch Med, Athens 11527, Greece. Additional authors for this research include S.N. Vasilopoulos, R.H.A. Coutts and S. Theocharis.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.neo.2016.09.002. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Breast Cancer

New Breast Cancer Data Have Been Reported by Researchers at University of Gothenburg (Lipid Heterogeneity Resulting from Fatty Acid Processing in the Human Breast Cancer Microenvironment Identified by GCIB-ToF-SIMS Imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting from Gothenburg, Sweden, by NewsRx journalists, research stated, "Breast cancer is an umbrella term used to describe a collection of different diseases with broad inter- and intratumor heterogeneity. Understanding this variation is critical in order to develop, and precisely prescribe, new treatments."

Financial supporters for this research include Vetenskapsradet, Goteborgs Universitet.

The news correspondents obtained a quote from the research from the University of Gothenburg, "Changes in the lipid metabolism of cancerous cells can provide important indications as to the metabolic state of the cells but are difficult to investigate with conventional histological methods. Due to the introduction of new higher energy (40 kV) gas cluster ion beams (GCIBs), time-of-flight secondary ion mass spectrometry (ToF-SIMS) imaging is now capable of providing information on the distribution of hundreds of molecular species simultaneously on a cellular to subcellular scale. GCIB-ToF-SIMS was used to elucidate changes in lipid composition in nine breast cancer biopsy samples. Improved molecular signal generation by the GCIB produced location-specific information that revealed elevated levels of
essential lipids to be related to inflammatory cells in the stroma, while cancerous areas were
dominated by nonessential fatty acids and a variety of phosphatidylinositol species with further
in-tumor variety arising from decreased desaturase activity."

According to the news reporters, the research concluded: "These changes in lipid
composition due to different enzyme activity are seemingly independent of oxygen availability
and can be linked to favorable cell membrane properties for either proliferation/invasion or drug
resistance/survival."

For more information on this research see: Lipid Heterogeneity Resulting from Fatty
Acid Processing in the Human Breast Cancer Microenvironment Identified by GCIB-ToF-SIMS
Imaging. *Analytical Chemistry*, 2016;88(23):11946-11954. *Analytical Chemistry* can be

**Oncology - Breast Cancer**

**New Breast Cancer Findings Has Been Reported by Investigators at Wake Forest University (Irreversible electroporation inhibits pro-cancer inflammatory signaling in triple negative breast cancer cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new
report. According to news reporting from Winston Salem, North Carolina, by NewsRx
journalists, research stated, "Low-level electric fields have been demonstrated to induce spatial
re-distribution of cell membrane receptors when applied for minutes or hours. However, there is
limited literature on the influence on cell signaling with short transient high-amplitude pulses
typically used in irreversible electroporation (IRE) for cancer treatment."

Funders for this research include National Cancer Institute, National Institutes of
Health.

The news correspondents obtained a quote from the research from Wake Forest
University, "Moreover, literature on signaling pertaining to immune cell trafficking after IRE is
conflicting. We hypothesized that pulse parameters (field strength and exposure time) influence
cell signaling and subsequently impact immune -cell trafficking. This hypothesis was tested in-
vitro on triple negative breast cancer cells treated with IRE, where the effects of pulse
parameters on key cell signaling factors were investigated. Importantly, real time PCR mRNA
measurements and ELISA protein analyses revealed that thymic stromal lymphopoietin (TSLP)
signaling was down regulated by electric field strengths above a critical threshold, irrespective of exposure times spanning those typically used clinically. Comparison with other treatments (thermal shock, chemical poration, kinase inhibitors) revealed that IRE has a unique effect on TSLP."

According to the news reporters, the research concluded: "Because TSLP signaling has been demonstrated to drive pro-cancerous immune cell phenotypes in breast and pancreatic cancers, our finding motivates further investigation into the potential use of IRE for induction of an anti-tumor immune response in vivo."

For more information on this research see: Irreversible electroporation inhibits pro-cancer inflammatory signaling in triple negative breast cancer cells. Bioelectrochemistry, 2017;113():42-50. Oncology - Breast Cancer

New Breast Cancer Findings Reported from European Institute of Oncology (Aspirin and atenolol enhance metformin activity against breast cancer by targeting both neoplastic and microenvironment cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting originating from Milan, Italy, by NewsRx correspondents, research stated, "Metformin can induce breast cancer (BC) cell apoptosis and reduce BC local and metastatic growth in preclinical models. Since Metformin is frequently used along with Aspirin or beta-blockers, we investigated the effect of Metformin, Aspirin and the beta-blocker Atenolol in several BC models."

Our news editors obtained a quote from the research from the European Institute of Oncology, "In vitro, Aspirin synergized with Metformin in inducing apoptosis of triple negative and endocrine-sensitive BC cells, and in activating AMPK in BC and in white adipose tissue (WAT) progenitors known to cooperate to BC progression. Both Aspirin and Atenolol added to the inhibitory effect of Metformin against complex I of the respiratory chain. In both immune-deficient and immune-competent preclinical models, Atenolol increased Metformin activity against angiogenesis, local and metastatic growth of HER2+ and triple negative BC. Aspirin increased the activity of Metformin only in immune-competent HER2+ BC models. Both
Aspirin and Atenolol, when added to Metformin, significantly reduced the endothelial cell component of tumor vessels, whereas pericytes were reduced by the addition of Atenolol but not by the addition of Aspirin."

According to the news editors, the research concluded: "Our data indicate that the addition of Aspirin or of Atenolol to Metformin might be beneficial for BC control, and that this activity is likely due to effects on both BC and microenvironment cells."

For more information on this research see: Aspirin and atenolol enhance metformin activity against breast cancer by targeting both neoplastic and microenvironment cells. Scientific Reports, 2016;6():18673. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting G. Talarico, Laboratory of Hematology-Oncology, European Institute of Oncology, Milan, Italy. Additional authors for this research include S. Orecchioni, K. Dallaglio, F. Reggiani, P. Mancuso, A. Calleri, G. Gregato, V. Labanca, T. Rossi, D.M. Noonan, A. Albini and F. Bertolini.

Oncology - Breast Cancer

New Breast Cancer Findings Reported from General Hospital (Correlation Of Breast Ultrasound Classifications With Breast Cancer In Chinese Women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to identify potential links between ultrasonographic breast parenchymal patterns and the risk of breast cancer in Chinese women. The population of Chinese women at high risk for breast cancer was explored using the ultrasonographic classification."

The news reporters obtained a quote from the research from General Hospital, "Ultrasonographic parenchymal patterns were classified into four types: heterogeneous type, ductal type, mixed type and fibrous type. A total of 5879 Chinese women underwent breast ultrasound examination from May 2010 to April 2014. Of the 5879 women, 256 women had pathology-confirmed breast cancer. Among the remaining 5623 women, 512 randomly selected, age-matched women were recruited into the present study. The correlation between ultrasonographic type and breast cancer revealed that the odds ratio (OR) was highest for the heterogeneous type (odds ratio = 4.11, 95% confidence interval: 2.01-8.41, p< 0.001), followed by the fibrous type (odds ratio = 2.05, 95% confidence interval: 1.51-2.78, p< 0.001). The odds
ratios of the ductal and mixed types were both less than 1 (p < 0.05)."

According to the news reporters, the research concluded: "This study indicates that the heterogeneous and fibrous types in the ultrasonographic classification are associated with an increased risk of breast cancer and, therefore, can be used as a marker of breast cancer risk in the female population of China."

Our news correspondents report that additional information may be obtained by contacting X.Y. Hou, PLA Beijing Military Gen Hosp, Dept. of Ultrasound, Beijing 100700, People's Republic of China. Additional authors for this research include H.Y. Niu, X.L. Huang and Y. Gao.

Oncology - Breast Cancer

New Breast Cancer Findings Reported from Indira Gandhi Medical College [Lymphatic vessel assessment by podoplanin (D2-40) immunohistochemistry in breast cancer]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting from Shimla, India, by NewsRx journalists, research stated, "Lymph node metastasis has an important bearing on the staging of breast cancer. Lymph node metastasis occurs by hematogenous and lymphatic spread."

The news correspondents obtained a quote from the research from Indira Gandhi Medical College, "The hematogenous and lymphatic spread can be quantified by the blood vessel and lymphatic vessel density in the intra-tumoral and peri-tumoral zone by specific markers for blood vessels and lymph vessels. In this study, we are trying to study the localization of podoplanin in lymph vessels of invasive breast carcinoma, to quantify lymphangiogenesis in tissue sections of invasive breast carcinomas by podoplanin immunohistochemistry (IHC) by D2-40 antibody, and compare it with blood microvessel count using CD-31 antibody and correlating clinicopathologic parameters with the results of IHC. IHC for biomarkers D2-40 and CD-31 were performed on sections from 30 mastectomy specimens to assess blood vessel and lymphatic vessel density in intra-tumoral and peri-tumoral zone. The data were analyzed using Statistical Package for Social Sciences (SPSS) version 15.0 statistical analysis software. The results showed that both lymph vessel density and blood vessel density
increased with the increase in lymph node ratio. Lymph node ratio is the ratio of positive lymph nodes to the total number of lymph nodes removed. Taking into account our small sample size, we conclude that a further large-sized study should be carried out to further prove the role of lymphatics in tumor dissemination."

According to the news reporters, the research concluded: "New therapeutic options can be developed targeting the lymphatic channels to arrest the lymphatic spread of the breast cancer."

For more information on this research see: Lymphatic vessel assessment by podoplanin (D2-40) immunohistochemistry in breast cancer. *Journal of Cancer Research and Therapeutics*, 2015;11(4):798-804.

Our news journalists report that additional information may be obtained by contacting S.P. Wahal, Dept. of Pathology, Indira Gandhi Medical College, Shimla, Himachal Pradesh, India. Additional authors for this research include M.M. Goel and R. Mehrotra.

**New Breast Cancer Findings from Academy of Sciences Described (Targeted Smart pH and Thermoresponsive N,O-Carboxymethyl Chitosan Conjugated Nanogels for Enhanced Therapeutic Efficacy of Doxorubicin in MCF-7 Breast Cancer Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting originating in Uttar Pradesh, India, by NewsRx journalists, research stated, "In cancer treatment, developing ideal anticancer drug venting various physiological barriers still remains a daunting challenge. Here, in our work, a series of pH- and temperature responsive nanogels based on poly(N-isopropylacrylamide-co-1-propene-2-3-dicarb oxylate-co-2-acrylamido-2-methyl-1-prop anesulfonate [poly(NIPAAm-IA-AMPS)] cross-linked by ethylene glycol dimethacrylate (EGDMA) were synthesized by random copolymerization."

Financial support for this research came from Council of Scientific and Industrial Research.

The news reporters obtained a quote from the research from the Academy of Sciences, "The molar ratio between monomer comonomers cross-linker was varied to fine-tune the optimum responsiveness of the nanogels. These optimized nanogels were further coupled to N,O-carboxymethyl chitosan (NOCC) stoichiometrically using EDC NHS coupling chemistry to enhance the swelling behavior at lower pH. Interestingly, these NOCC-g-nanogels, when dispersed in aqueous media under sonication, attain nanosize and retain their high water-retention capacity with conspicuous pH and temperature responsiveness (viz. nanogel shrinkage..."
in size beyond 35 degrees C and swelled at acidic pH) in vitro, as reflected by dynamic light scattering data. Doxorubicin (DOX), a potent anticancer drug, was loaded into these nanogels using the physical entrapment method. These drug-loaded nanogels exhibited a slow and sustained DOX release profile at physiological temperature and cytosolic pH. Furthermore, confocal and TEM results demonstrate that these nanogels were swiftly internalized by MCF-7 cells, and cell viability data showed preferential heightened cytotoxicity toward cancer cells (MCF-7 and MDA-MB231) compared to the MCF10A cells (human breast epithelial cell). Furthermore, intracellular DNA damage and cell cycle arrest assays suggest a mitochondrial mediated apoptosis in MCF-7 cells."

According to the news reporters, the research concluded: "This study substantiates our NOCC-g-nanogel platform as an excellent modality for passive diffusive loading and targeted release of entrapped drug(s) at physiological conditions in a controlled way for the improved therapeutic efficacy of the drug in anticancer treatment."

Our news correspondents report that additional information may be obtained by contacting S. Patnaik, Academy Sci & Innovat Res AcSIR, Lucknow 226001, Uttar Pradesh, India. Additional authors for this research include M.P. Purohit, D. Equbal, N. Dhiman, A. Singh, A.K. Kar, J. Shankar, S. Tehlan and S. Patnaik.

Oncology - Breast Cancer

New Breast Cancer Findings from Chongqing Medical University Described (Chemosensitization role of fulvestrant in combination with chemotherapy in postmenopausal hormone receptor positive and human epidermal growth factor negative metastatic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "In metastatic breast cancer (MBC), hormone receptor positive (HR+), human epidermal growth factor negative (HER2-) subtype accounts for the majority. With various new modalities available to prolong life span in this group of patients, the effect is distant from optimum."
Our news journalists obtained a quote from the research from Chongqing Medical University, "Prevalent strategy of treating postmenopausal HR+ HER2- MBC is application of chemotherapy (CT) after progression of disease on endocrine therapy (ET) of several lines. Generally, ET targets HR+ ingredients and CT works better with HR- tumor cells. HR+ MBC, though hormone-sensitive, has HR- portion which reacts poorly to ET. Thus, sequential use of ET and CT neglects its insensitive part and gives rise to drug resistance, while alleviation of tumor burden is the top priority in metastatic setting. Chemohormonal therapy (i.e. concomitant use of ET and chemotherapy) complements for the shortcoming of current therapy strategy targeting both HR+ and HR- ingredients theoretically. Fulvestrant, a pure estrogen receptor antagonist and down regulator, could be a promising agent using concurrently with CT based on chemosensitizing character shown in preclinical and pilot clinical studies. It is hypothesized in this article that chemohormonal therapy with concurrent fulvestrant and CT would be a promising strategy in postmenopausal HR+ HER2- MBC patients."

According to the news editors, the research concluded: "Proof of this hypothesis would help control evolvement of tumor burden and acquisition of drug resistance over a short period of time."

For more information on this research see: Chemosensitization role of fulvestrant in combination with chemotherapy in postmenopausal hormone receptor positive and human epidermal growth factor negative metastatic breast cancer. Medical Hypotheses, 2016;97():59-63. Medical Hypotheses can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. Oncology - Breast Cancer

New Breast Cancer Findings from Columbia University Described (Effect of curcumin and paclitaxel on breast carcinogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Global cancer burden increased to 14.1 million new cases in 2012; and breast cancer is the most common cancer in women worldwide, with nearly 1.7 million new cases diagnosed in 2012. Curcumin is the major bioactive ingredient extracted from the rhizome of the plant"
Curcuma longa (turmeric).

Our news journalists obtained a quote from the research from Columbia University, "Paclitaxel is a microtubule-stabilizing agent originally isolated from the bark of Taxus brevifolia. Curcumin and paclitaxel were evaluated with two human breast cancer cell lines as the luminal MCF-7 and the basal-like MDA-MB-231 that are either positive or negative for hormonal receptors estrogen receptor, progesterone receptor and HER2, respectively. Results indicated that curcumin combined with paclitaxel decreased c-Ha-Ras, Rho-A, p53 and Bcl-xL gene expression in comparison to control and substances alone in MCF-7 cell line. These two substances alone and combined decreased gene expression of Bcl-2 and NF-kappa B. However, CCND1 increased when both substances were combined in MCF-7 cells. Such substances decreased Bcl-2 and increased Bax protein expression. However, curcumin alone decreased I kappa B alpha and Stat-3 gene expression. Paclitaxel alone and combined increased I kappa B alpha and Stat-3. Curcumin alone and combined with paclitaxel increased p53, Bid, caspase-3, caspase-8 and Bax gene expression in MDA-MB-231, whereas Bcl-xL decreased such expression in MDA-MB-231 cells. When paclitaxel and curcumin were combined the expression of Bcl-2 protein was decreased. However, either substance alone and combined increased Bax protein expression corroborating the apoptotic effect of these substances."

According to the news editors, the research concluded: "It can be concluded that curcumin may be of considerable value in synergistic therapy of breast cancer reducing the associated toxicity with use of drugs."

The news correspondents report that additional information may be obtained from G.M. Calaf, Columbia University, Medical Center, Center Radiol Res, New York, NY 10032, United States.

care. We examined factors associated with delays in chemotherapy initiation at an NCI-Designated Comprehensive Cancer Center."

The news reporters obtained a quote from the research from Dana-Farber Cancer Institute, "We identified 523 patients who received postoperative adjuvant chemotherapy between January 2011 and December 2013 at our center. We defined 28 days from last definitive surgery (LDS) to chemotherapy as the target time frame, and an unacceptable delay in chemotherapy initiation (UCD) as greater than 42 days from LDS. Multivariate regression models were used to identify factors associated with UCD and the impact of Oncotype DX testing in patients with hormone receptor (HR) positive breast cancer. Median days between LDS and chemotherapy initiation was 34 (interquartile range, 15), with 30% of patients starting within 28 days of LDS and 26.9% having UCD. Tumor characteristics such as subtype and stage affected UCD; patients with HR-positive or HER2-positive tumors were more likely to be delayed compared with those with triple-negative breast cancer. Patients with stage I disease, those undergoing mastectomy with or without immediate reconstruction, and those whose pathology sign-out was greater than 10 days postoperatively were more likely to be delayed. A higher proportion of UCD was found in HR-positive patients (31%) for whom Oncotype DX testing was ordered compared with those in whom it was not ordered (20%)."

According to the news reporters, the research concluded: "This study provides insight into subpopulations that may be at risk to experience delays in chemotherapy initiation, directing interventions to improve the timeliness of care."

Oncology - Breast Cancer

New Breast Cancer Findings from Department of Microbiology & Immunology Described (The therapeutic potential of mTOR inhibitors in breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting originating in Greenville, North Carolina, by NewsRx journalists, research stated, "Rapamycin and modified rapamycins (rapalogs) have been used to prevent allograft rejection after organ transplant for over 15 years. The mechanistic target of rapamycin (mTOR) has been determined to be a key component of the mTORC1 complex which consists of the
serine/threonine kinase TOR and at least five other proteins which are involved in regulating its activity.

The news reporters obtained a quote from the research from the Department of Microbiology & Immunology, "Some of the best characterized substrates of mTORC1 are proteins which are key kinases involved in the regulation of cell growth (e.g., p70S6K) and protein translation (e.g., 4E-BP1). These proteins may in some cases serve as indicators to sensitivity to rapamycin-related therapies. Dysregulation of mTORC1 activity frequently occurs due to mutations at, or amplifications of, upstream growth factor receptors (e.g., human epidermal growth factor receptor-2, HER2) as well as kinases (e.g., PI3K) and phosphatases (e.g., PTEN) critical in the regulation of cell growth. More recently, it has been shown that certain rapalogs may enhance the effectiveness of hormonal-based therapies for breast cancer patients who have become resistant to endocrine therapy. The combined treatment of certain rapalogs (e.g., everolimus) and aromatase inhibitors (e.g., exemestane) has been approved by the United States Food and Drug Administration (US FDA) and other drug regulatory agencies to treat estrogen receptor positive (ER+) breast cancer patients who have become resistant to hormonal-based therapies and have progressed."

According to the news reporters, the research concluded: "This review will summarize recent basic and clinical research in the area and evaluate potential novel therapeutic approaches."

Our news correspondents report that additional information may be obtained by contacting J.A. McCubrey, East Carolina Univ, Brody Sch Med, Dept. of Microbiol & Immunol, Greenville, NC 27858, United States. Additional authors for this research include A.M. Martelli, L. Cocco, M. Libra, F. Nicoletti, S.L. Abrams and J.A. McCubrey.

**Oncology - Breast Cancer**

**New Breast Cancer Findings from Indiana University Reported (Long intergenic non-coding RNA expression signature in human breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting originating in Indianapolis, Indiana, by NewsRx journalists, research stated, "Breast cancer is a complex disease, characterized by gene deregulation. There is less systematic investigation of the capacity of long intergenic non-coding RNAs (lincRNAs) as biomarkers associated with breast cancer pathogenesis or several clinicopathological variables including receptor status and patient survival."
The news reporters obtained a quote from the research from Indiana University, "We designed a two-stage study, including 1,000 breast tumor RNA-seq data from The Cancer Genome Atlas (TCGA) as the discovery stage, and RNA-seq data of matched tumor and adjacent normal tissue from 50 breast cancer patients as well as 23 normal breast tissue from healthy women as the replication stage. We identified 83 lincRNAs showing the significant expression changes in breast tumors with a false discovery rate (FDR) < 1% in the discovery dataset. Thirty-seven out of the 83 were validated in the replication dataset. Integrative genomic analyses suggested that the aberrant expression of these 37 lincRNAs was probably related with the expression alteration of several transcription factors (TFs). We observed a differential co-expression pattern between lincRNAs and their neighboring genes. We found that the expression levels of one lincRNA (RP5-1198O20 with Ensembl ID ENSG00000230615) were associated with breast cancer survival with P< 0.05."

According to the news reporters, the research concluded: "Our study identifies a set of aberrantly expressed lincRNAs in breast cancer."

Our news correspondents report that additional information may be obtained by contacting C.Y. He, Indiana University, Melvin & Bren Simon Canc Center, Indianapolis, IN 46202, United States. Additional authors for this research include E.K. Wagner, X.Y. Guo, I. May, Q.Y. Cai, W. Zheng, C.Y. He and J.R. Long.

Keywords for this news article include: Indianapolis, Indiana, United States, North and Central America, Women's Health, Breast Cancer, Oncology, Genetics, Indiana University.

oral rucaparib were assessed, using a range of dosing schedules, to determine the safety, tolerability, dose-limiting toxic effects and pharmacodynamic (PD) and pharmacokinetic (PK) profiles. Rucaparib was well tolerated in patients up to doses of 480 mg per day and is a potent inhibitor of PARP, with sustained inhibition &#1087;24 h after single doses. The i.v. rucaparib (intermittent dosing schedule) resulted in an objective response rate (ORR) of only 2% but with 41% (18 out of 44) patients achieved stable disease for &#1087;12 weeks and 3 patients maintaining disease stabilisation for >52 weeks. The ORR for oral rucaparib (across all six dose levels) was 15%. In the oral cohorts, 81% (22 out of 27) of the patients had ovarian cancer and 12 out of 13, who were dosed continuously, achieved RECIST complete response/partial response (CR/PR) or stable disease (SD) &#1087;12 weeks, with a median duration of response of 179 days (range 84-567 days). Rucaparib is well tolerated and results in high levels of PARP inhibition in surrogate tissues even at the lowest dose levels. Rucaparib is active in gBRCA-mutant ovarian cancer and this activity correlates with platinum-free interval."

According to the news reporters, the research concluded: "The key lessons learned from this study is that continuous rucaparib dosing is required for optimal response, the recommended phase 2 dose (RP2D) for continuous oral scheduling has not been established and requires further exploration and, thirdly, the use of a PD biomarker to evaluate dose-response has its limitations."

For more information on this research see: Phase 2 multicentre trial investigating intermittent and continuous dosing schedules of the poly(ADP-ribose) polymerase inhibitor rucaparib in germline BRCA mutation carriers with advanced ovarian and breast cancer. *British Journal of Cancer*, 2016;114(7):723-30. **Oncology - Breast Cancer**

**New Breast Cancer Findings from National Cancer Institute Described (Androgen deprivation therapy sensitizes triple negative breast cancer cells to immune-mediated lysis through androgen receptor independent modulation of osteoprotegerin)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new
According to news originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "Among breast cancer types, triple-negative breast cancer (TNBC) has the fewest treatment options and the lowest 5-year survival rate. Androgen receptor (AR) inhibition has displayed efficacy against breast cancer preclinically and is currently being examined clinically in AR positive TNBC patients."

Our news journalists obtained a quote from the research from National Cancer Institute, "Androgen deprivation has been shown to induce immunogenic modulation; the alteration of tumor cell phenotype resulting in increased sensitivity to immune-mediated killing. We evaluated the ability of AR inhibition to reduce the growth and improve the immune-mediated killing of breast cancer cells with differing expression of the estrogen receptor and AR. While AR expression was required for the growth inhibitory effects of enzalutamide on breast cancer cells, both enzalutamide and abiraterone improved the sensitivity of breast cancer cells to immune-mediated lysis independent of detectable AR expression. This increase in sensitivity was linked to an increase in cell surface tumor necrosis factor-related apoptosis-inducing ligand (TRAIL) receptor expression as well as a significant reduction in the expression of osteoprotegerin (OPG). The reduction in OPG was further examined and found to be critical for the increase in sensitivity of AR-TNBC cells to immune-mediated killing. The data presented herein further support the use of AR inhibition therapy in the AR+ TNBC setting."

According to the news editors, the research concluded: "These data, however, also support the consideration of AR inhibition therapy for the treatment of AR-TNBC, especially in combination with cancer immunotherapy, providing a potential novel therapeutic option for select patients."

For more information on this research see: Androgen deprivation therapy sensitizes triple negative breast cancer cells to immune-mediated lysis through androgen receptor independent modulation of osteoprotegerin. Oncotarget, 2016;7(17):23498-511.

**Oncology - Breast Cancer**

**New Breast Cancer Findings from Sun Yat-Sen University Outlined (27-Hydroxycholesterol increases Myc protein stability via suppressing PP2A, SCP1 and FBW7 transcription in MCF-7 breast cancer cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "27-hydroxycholesterol (27-HC), the most abundant metabolite of cholesterol, is a risk factor for breast cancer. It can increase the proliferation of breast cancer cells and promote the metastasis of breast tumours in mouse models."

Funders for this research include National Natural Science Foundation of China, National Basic Research Program of China, China Postdoctoral Science Foundation.

Our news journalists obtained a quote from the research from Sun Yat-Sen University, "Myc is a critical oncoprotein overexpressed in breast cancer. However, whether 27-HC affects Myc expression has not been reported. In the current study, we aimed to investigate the effects of 27-HC on Myc and the underlying mechanisms in MCF-7 breast cancer cells. Our data demonstrated that 27-HC activated Myc via increasing its protein stability. Three key negative modulators of Myc protein stability, PP2A, SCP1 and FBW7, were suppressed by 27-HC at the transcriptional level. We performed a data-mining analysis of the chromatin immunoprecipitation with next-generation DNA sequencing (ChIP-Seq) data in the ChIPBase, and discovered that a number of putative transcription factors (TFs), including Myc itself, were involved in the transcriptional regulation of PP2A, SCP1 and FBW7."

According to the news editors, the research concluded: "Our results provide a novel mechanistic insight into the activation of Myc by 27-HC via transcriptional repression of PP2A, SCP1 and FBW7 to increase Myc protein stability in breast cancer cells."

For more information on this research see: 27-Hydroxycholesterol increases Myc protein stability via suppressing PP2A, SCP1 and FBW7 transcription in MCF-7 breast cancer cells. Biochemical and Biophysical Research Communications, 2016;480(3):328-333. Oncology - Breast Cancer

New Breast Cancer Findings from T. Reinert and Co-Authors Described (Optimal management of hormone receptor positive metastatic breast cancer in 2016)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating from Porto Alegre, Brazil, by NewsRx correspondents, research stated, "Hormone receptor positive tumors represent the most common form of breast cancer and account for most of the deaths from the disease. Endocrine therapy represents the main initial therapeutic strategy for these patients and has been associated with significant clinical benefits in a majority of patients."

Our news editors obtained a quote from the research, "While in early stages endocrine therapy is administered as part of a curative approach once clinical metastases develop, the disease is considered incurable and the main management objectives are tumor control and quality of life. The two major clinical paradigms of always indicating endocrine therapy in the absence of visceral crises and sequencing endocrine treatments have been guiding our therapeutic approach to these patients. However, for many decades, we have delivered endocrine therapy with a 'one size fits all' approach by applying agents that interfere with hormone receptor signaling equally in every clinical patient scenario. We have been unable to incorporate the well-known biologic principle of different degrees of hormone receptor dependency in our therapeutic recommendations. Recent developments in the understanding of molecular interactions of hormone signaling with other important growth factor, metabolic and cell division pathways have opened the possibility of improving results by modulating hormone signaling and interfering with resistance mechanisms yet to be fully understood. Unfortunately, limitations in the design of trials conducted in this area have made it difficult to develop predictive biomarkers and most of the new combinations with targeted agents, even though showing improvements in clinical endpoints, have been directed to an unselected population of patients."

According to the news editors, the research concluded: "In this review we explore some of the current and most relevant literature in the management of hormone receptor positive advance breast cancer."

For more information on this research see: Optimal management of hormone receptor positive metastatic breast cancer in 2016. Therapeutic Advances In Medical Oncology, 2015;7(6):304-20. (Sage Publications - www.sagepub.com; Therapeutic Advances In Medical Oncology - tam.sagepub.com)

Oncology - Breast Cancer

New Breast Cancer Findings from University of AlbertaOutlined
(Terpolymer Micelles for the Delivery of Arsenic to Breast Cancer Cells: The Effect of Chain Sequence on Polymeric Micellar Characteristics and Cancer Cell Uptake)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting from Edmonton, Canada, by NewsRx journalists, research stated, "In this study, we developed a micellar platform composed of terpolymers for the encapsulation of inorganic arsenite or arsenous acid (As-III). For this purpose, a series of terpolymers composed of poly(ethylene oxide) (PEO, block A), poly(alpha-carboxylate-epsilon-carprolactone) (PCCL, block B), and poly(epsilon-caprolactone) (PCL, block C) with either a blocked, i.e., BC or CB, or random, i.e., (B/C)(ran) block copolymer sequence in the polyester segment was synthesized."

Financial supporters for this research include Canadian Institutes of Health Research, Canada Research Chairs, Alberta Health, Natural Sciences and Engineering Research Council of Canada.

The news correspondents obtained a quote from the research from the University of Alberta, "The COOH groups on block B were further modified with mercaptohexylamine for As-III encapsulation. We then investigated how sequence of terpolymers can affect the stability and surface charge of micelles as well as the cellular uptake of their cargo, i.e., As-III, by MDA-MB-435 cancer cells. H-1 NMR spectroscopy in D2O and CDCl3 was also used to study the structure of different terpolymer micelles. Our results showed micelles with ABC sequence to have better stability over those of ACB and A(B/C)(ran) as reflected by a lower critical micellar concentration. The As-III- loaded ABC micelles were less negatively charged on the surface than the other two types of terpolymer micelles. In line with this observation, ABC micelles showed a substantially enhanced uptake of As-III by MDA-MB-435 cancer cells. Stability and surface charge are key parameters that can influence the performance of polymeric micelles as nanodrug carriers."

According to the news reporters, the research concluded: "Based on these results, we suggest ABC micelles to have improved characteristics for As-III delivery compared to ACB and A(B/C)(ran) micelles."

Our news journalists report that additional information may be obtained by contacting A. Lavasanifar, University of Alberta, Fac Pharm & Pharmaceut Sci, Edmonton, AB T6G 2E1, Canada. Additional authors for this research include M.R. Vakili, X.F. Li, A. Lavasanifar and X.C. Le.

New Breast Cancer Findings from University of Basel Hospital Reported
(Contraception counseling for young breast cancer patients: A practical needs assessment and a survey among medical oncologists)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news originating from Basel, Switzerland, by NewsRx correspondents, research stated, "We analyzed an unselected, consecutive cohort of young breast cancer (BC) patients (<= 40 years, n = 100) with regard to the contraceptive methods used at the time of diagnosis. Based on this data, we assessed the individual need for contraceptive counseling before cancer therapy."

Our news journalists obtained a quote from the research from the University of Basel Hospital, "Secondly, in a study-specific self-report questionnaire, we surveyed 101 medical oncologists with the aim of evaluating attitudes towards contraception and how young patients are being counseled in the practical clinical setting. In 62% of our cohort of young BC patients, we identified situations in which contraceptive counseling was necessary at the time of BC diagnosis. The patients did not use contraception or used an ineffective method (TIER III/IV, 42%), or were using hormonal methods (12%) or IUDs (8%). Almost all respondents of the survey (99%) stated that contraception is an important aspect in the surveillance of young BC patients and the vast majority (90%) discussed this item before starting therapy. Only 20% of the respondents reported that they a) inform the patients that reliable contraception is necessary before starting therapy, b) ask whether contraceptive methods are used during ongoing therapy, and c) regularly refer their patients to specialist counseling by a gynecologist. A large proportion of young women require contraceptive counseling after newly diagnosed BC. Oncologists should be aware that the use of reliable contraceptive methods should not only be discussed before starting therapy, but also during ongoing therapy."

According to the news editors, the research concluded: "Oncologists should consider actively referring their young patients to gynecologists to ensure proper contraceptive counseling."

The news correspondents report that additional information may be obtained from U. Guth, University of Basel Hospital, Womens Hosp, Div Gynecol & Gynecol Oncol, CH-4031 Basel, Switzerland. Additional authors for this research include D.J. Huang, J. Bitzer, B.F. Tirri and R. Moffat.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.breast.2015.10.003. This DOI is a link to an online electronic document that is either free or for purchase.

New Breast Cancer Findings from University of Salamanca Described
(Antitumoral activity of the mithralog EC-8042 in triple negative breast cancer linked to cell cycle arrest in G2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting from Salamanca, Spain, by NewsRx journalists, research stated, "Triple negative breast cancer (TNBC) is an aggressive form of breast cancer. Despite response to chemotherapy, relapses are frequent and resistance to available treatments is often observed in the metastatic setting."

The news correspondents obtained a quote from the research from the University of Salamanca, "Therefore, identification of new therapeutic strategies is required. Here we have investigated the effect of the mithramycin analog EC-8042 (demycarosil-3D-b-D-digitoxosyl mithramycin SK) on TNBC. The drug caused a dose-dependent inhibition of proliferation of a set of TNBC cell lines in vitro, and decreased tumor growth in mice xenografted with TNBC cells. Mechanistically, EC-8042 caused an arrest in the G2 phase of the cell cycle, coincident with an increase in pCDK1 and Wee1 levels in cells treated with the drug. In addition, prolonged treatment with the drug also causes apoptosis, mainly through caspase-independent routes. Importantly, EC-8042 synergized with drugs commonly used in the therapy of TNBC in vitro, and potentiated the antitumoral effect of docetaxel in vivo. Together, these data suggest that the mithralog EC-8042 exerts an antitumoral action on TNBC cells and reinforces the action of standard of care drugs used in the therapy of this disease."

According to the news reporters, the research concluded: "These characteristics, together with a better toxicology profile of EC-8042 with respect to mithramycin, open the possibility of its clinical evaluation."

For more information on this research see: Antitumoral activity of the mithralog EC-8042 in triple negative breast cancer linked to cell cycle arrest in G2. Oncotarget, 2015;6 (32):32856-67.

Our news journalists report that additional information may be obtained by contacting A. Pandiella, Instituto de Biologia Molecular y Celular del Cancer, CSIC-Universidad de Salamanca, Salamanca, Spain. Additional authors for this research include F. Moris, A. Ocana, L.E. Nunez and J.C Montero.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18632/oncotarget.5942. This DOI is a link to an online electronic document that is either free or for purchase.

Diagnostics and Screening - Breast Cancer Screening

New Breast Cancer Screening Findings from Duke University Described (Focal Breast Pain: Does Breast Density Affect the Need for Ultrasound?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Diagnostics and Screening - Breast Cancer Screening have been published. According to news originating from Durham, North Carolina, by NewsRx correspondents, research stated, "This study aimed to determine the utility of directed ultrasound and digital mammogram for evaluating focal breast pain in women with different mammographic breast densities. This institutional review board-approved and Health Insurance Portability and Accountability Act-compliant retrospective study included 413 cases of focal breast pain in 369 women (mean age 53 years)."

Our news journalists obtained a quote from the research from Duke University, "All cases were evaluated with both mammogram and ultrasound and had at least 2 years of imaging follow-up. Exclusion criteria were non-focal, axillary, or radiating pain; palpable or skin changes; pregnancy or lactation; and history of trauma or infection. Breast density, imaging findings, and biopsy results were recorded. Specificity, positive predictive values, and negative predictive values were calculated. Eighteen percent (76 of 413) of cases demonstrated an imaging correlate. Of these, 74% (56 of 76) occurred in dense breasts and 26% (20 of 76) in nondense breasts. Seventy percent (14 of 20) of lesions in nondense breasts were seen with mammography and ultrasound, whereas 30% (6 of 20) were detected only with ultrasound. Of lesions detected in dense breasts, 29% (16 of 56) were seen with mammography and ultrasound, whereas 71% (40 of 56) were detected only with ultrasound. Thirty-one percent (24 of 76) of cases were biopsied, 42% (10 of 24) of which were detected by ultrasound only. No cancer was detected in initial workup. At 2-year follow-up, three women, all with dense breasts, developed cancer in the same quadrant as the initial pain."

According to the news editors, the research concluded: "Directed ultrasound, when performed in conjunction with digital mammography for the evaluation of focal breast pain in women with nondense breasts, is of low utility and may contribute to unnecessary intervention as a result of incidental findings."

The news correspondents report that additional information may be obtained from M.W. Cho, Duke University, Div Breast Imaging, Dept. of Radiol, Medical Center, Durham, NC 27710, United States. Additional authors for this research include L.J. Grimm and K.S. Johnson.

New Breast Cancer Study Findings Have Been Reported by Investigators at Harbin Medical University (Transcriptome sequencing of HER2-positive breast cancer stem cells identifies potential prognostic marker)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating from Harbin, People's Republic of China, by NewsRx correspondents, research stated, "In cancer stem cell theory, breast cancer stem cells (BCSCs) are postulated to be the root cause of recurrence and metastasis in breast cancer. Discovery of new biomarkers and development of BCSC-targeted therapy are practical issues that urgently need to be addressed in the clinic."

Financial support for this research came from National Key Technology Support Program of China.

Our news editors obtained a quote from the research from Harbin Medical University, "However, few breast cancer stem cell targets are known. Given that there are few BCSCs, performing transcriptome sequencing on them thus far has not been possible. With the emergence of single-cell sequencing technology, we have now undertaken such a study. We prepared single-cell suspensions, which were sorted using flow cytometry from breast tumor tissue and adjacent normal breast tissue from two HER2-positive patients. We obtained BCSCs, breast cancer cells, mammary cells, and CD44(+) mammary cells. Transcriptome sequencing was then performed on these four cell types. Using bioinformatics, we identified 404 differentially expressed BCSC genes from the HER2-positive tumors and preliminary explored transcriptome characteristics of BCSCs. Finally, by querying a public database, we found that CA12 was a novel prognostic biomarker in HER2-positive breast cancer, which also had prognostic value in all breast cancer types."

According to the news editors, the research concluded: "Our results suggest that CA12 may be associated with BCSCs, especially HER2-positive BCSCs, and is a potential novel therapeutic target and biomarker."

For more information on this research see: Transcriptome sequencing of HER2-positive breast cancer stem cells identifies potential prognostic marker. Tumor Biology, 2016;37(11):14757-14764. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

The news editors report that additional information may be obtained by contacting D. Pang, Harbin Med Univ, Canc Hosp, Dept. of Breast Surg, Harbin 150040, People's Republic of China. Additional authors for this research include X.Y. Zhang, J.P. Zhou, G.N. Mu, Y.W. Li, Y.X. Zhang and D. Pang.

New Breast Cancer Study Findings Have Been Reported by Investigators at Kathmandu University [Synthesis, Characterization, and Study of In Vitro Cytotoxicity of ZnO-Fe3O4 Magnetic Composite Nanoparticles in Human Breast Cancer Cell Line ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting originating in Kathmandu, Nepal, by NewsRx journalists, research stated, "Novel magnetic composite nanoparticles (MCPs) were successfully synthesized by ex situ conjugation of synthesized ZnO nanoparticles (ZnO NPs) and Fe3O4 NPs using trisodium citrate as linker with an aim to retain key properties of both NPs viz. inherent selectivity towards cancerous cell and superparamagnetic nature, respectively, on a single system. Successful characterization of synthesized nanoparticles was done by XRD, TEM, FTIR, and VSM analyses."

The news reporters obtained a quote from the research from Kathmandu University, "VSM analysis showed similar magnetic profile of thus obtained MCPs as that of naked Fe3O4 NPs with reduction in saturation magnetization to 16.63 emu/g. Also, cell viability inferred from MTT assay showed that MCPs have no significant toxicity towards noncancerous NIH 3T3 cells but impart significant toxicity at similar concentration to breast cancer cell MDA-MB-231. The EC50 value of MCPs on MDA-MB-231 is less than that of naked ZnO NPs on MDA-MB-231, but its toxicity on NIH 3T3 was significantly reduced compared to ZnO NPs. Our hypothesis for this prominent difference in cytotoxicity imparted by MCPs is the synergy of selective cytotoxicity of ZnO nanoparticles via reactive oxygen species (ROS) and exhausting scavenging activity of cancerous cells, which further enhance the cytotoxicity of Fe3O4 NPs on cancer cells."

According to the news reporters, the research concluded: "This dramatic difference in cytotoxicity shown by the conjugation of magnetic Fe3O4 NPs with ZnO NPs should be further studied that might hold great promise for the development of selective and site-specific nanoparticles."

Our news correspondents report that additional information may be obtained by contacting G. Bisht, Kathmandu Univ, Dept. of Chem Sci & Engn, Kathmandu, Nepal. Additional authors for this research include S. Rayamajhi, K.C. Biplab, S.N. Paudel, D. Karna and B.G. Shrestha.

New Breast Cancer Study Findings Have Been Reported by Investigators at Queensland University of Technology (The Impact of Rurality and Disadvantage on the Diagnostic Interval for Breast Cancer in a Large Population-Based Study of 3202 Women in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting from Kelvin Grove, Australia, by NewsRx journalists, research stated, "Delays in diagnosing breast cancer (BC) can lead to poorer outcomes. We investigated factors related to the diagnostic interval in a population-based cohort of 3202 women diagnosed with BC in Queensland, Australia."

The news correspondents obtained a quote from the research from the Queensland University of Technology, "Interviews ascertained method of detection and dates of medical/procedural appointments, and clinical information was obtained from medical records. Time intervals were calculated from self-recognition of symptoms (symptom-detected) or mammogram (screen-detected) to diagnosis (diagnostic interval (DI)). The cohort included 1560 women with symptom-detected and 1642 with screen-detected BC. Symptom-detected women had higher odds of DI of >60 days if they were Indigenous (OR = 3.12, 95% CI = 1.40, 6.98); lived in outer regional (OR = 1.50, 95% CI = 1.09, 2.06) or remote locations (OR = 2.46, 95% CI = 1.39, 4.38); or presented with a 'non-lump' symptom (OR = 1.84, 95% CI = 1.43, 2.36). For screen-detected BC, women who were Indigenous (OR = 2.36, 95% CI = 1.03, 5.80); lived in remote locations (OR = 2.35, 95% CI = 1.24, 4.44); or disadvantaged areas (OR = 1.69, 95% CI = 1.17, 2.43) and attended a public screening facility (OR = 2.10, 95% CI = 1.40, 3.17) had higher odds of DI > 30 days. Our study indicates a disadvantage in terms of DI for rural, disadvantaged and Indigenous women. Difficulties in accessing primary care and diagnostic services are evident."

According to the news reporters, the research concluded: "There is a need to identify and implement an efficient and effective model of care to minimize avoidable longer diagnostic intervals."

Our news journalists report that additional information may be obtained by contacting P.H. Youl, Queensland University of Technology, Sch Public Hlth & Social Work, Kelvin Grove, Qld 4059, Australia. Additional authors for this research include J.F. Aitken, G. Turrell, S.K. Chambers, J. Dunn, C. Pyke and P.D. Baade.

Keywords for this news article include: Kelvin Grove, Australia, Australia and New Zealand, Cancer, Diagnostics and Screening, Epidemiology, Women's Health, Breast Cancer, Oncology, Queensland University of Technology.

New Breast Cancer Study Findings Have Been Reported by Investigators at Roswell Park Cancer Institute (Comprehensive Histologic Scoring to Maximize the Predictability of Pathology-generated Equation of Breast Cancer Oncotype DX Recurrence Score)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting originating from Buffalo, New York, by NewsRx correspondents, research stated, "Pathology-generated equations have been introduced to predict Oncotype DX recurrence score (ORS) in breast cancer. The purpose of the study is to improve these equations."

Our news editors obtained a quote from the research from Roswell Park Cancer Institute, "Slides from 416 (test set) consecutive breast cancers with available Oncotype DX were reviewed. A validation set (n=91) was prospectively scored using the generated formulas from the test set. The following histopathologic features were graded: Nottingham grade (designated as current Nottingham grade), necrosis, and degree of tumor-infiltrating lymphocytes. The following data were extracted from the pathology report: Nottingham grade (designated as reported Nottingham grade), tumor size, ER/PR Allred scores, HER2 status, and ORS. Equations were calculated, one included the reported Nottingham grade, one included the current Nottingham grade, and one included the current Nottingham grade with the other significant histopathologic variables. In the equation that included the reported Nottingham grade, ER, PR, and HER2, the overall concordance with the ORS was 64.86%. After excluding the intermediate category detected by the formula, the concordance rate was 95.28%. When the current Nottingham grade was included, the concordance rate became 69.61% and 98.62%, respectively. When necrosis and the degree of tumor-infiltrating lymphocytes were added to the previous equation, these rates became 70.1% and 98.63%, respectively."

According to the news editors, the research concluded: "Our equation has better correlation with ORS than previously published results."

For more information on this research see: Comprehensive Histologic Scoring to Maximize the Predictability of Pathology-generated Equation of Breast Cancer Oncotype DX Recurrence Score. Applied Immunohistochemistry & Molecular Morphology, 2016;24(10):703-711. New Breast Cancer Study Findings Have Been Reported by Investigators at Royal Devon and Exeter NHS Foundation Trust (The significance of sentinel lymph node micrometastasis in breast cancer: Comparing outcomes with and without axillary clearance)

According to news reporting from Exeter, United Kingdom, by NewsRx journalists, research stated, "Management of micrometastasis in the sentinel node is a controversial topic. Most of the guidelines don't recommend further axillary treatment if micrometastasis are the only finding in the sentinel node."

The news correspondents obtained a quote from the research from Royal Devon and Exeter NHS Foundation Trust, "However, some evidence suggests that micrometastasis have significant effect on long term outcomes and therefore indicate systemic treatment. Retrospective cohort study reviewing the management of patients with micrometastasis in the sentinel nodes. Two groups were compared, those who had further axillary clearance and those who had not. The primary endpoints were loco-regional recurrence and lymphedema rate. The secondary endpoints were distant metastasis rate, OS and DFS. 95 patients were found to have micrometastasis or ITC in the axillary SNB over a period of 10 years. Of those, 38 patients had axillary clearance after SNB, while 57 did not. Lymphedema rate was 18.4% in the axillary clearance group versus 0% in the no axillary clearance group (p < 0.001). The LRR event was rare therefore not compared. Distant metastasis rate was 7.01% in the SNB group versus 2.6% in the axillary clearance group. This compares to 7.01% among the patients who didn't have axillary clearance. All the patients who died had developed distant metastasis as a cause of death. There was a difference in OS between the two groups in favor of the axillary clearance group (p = 0.004). Although not an indication for axillary clearance recent guidelines, micrometastasis and ITC found in the SNB are a sign of a biologically different disease."

According to the news reporters, the research concluded: "This important information should be taken in consideration when planning the adjuvant treatment in those patients among other factors considered."

Our news journalists report that additional information may be obtained by contacting M.M.G. Youssef, Royal Devon & Exeter NHS Fdn Trust, Dept. of Breast Surg, Exeter EX2 5DW, Devon, United Kingdom. Additional authors for this research include D. Cameron, P.H. Pucher, S. Olsen and D. Ferguson.

New Breast Cancer Study Findings Have Been Reported by Investigators at University of Sheffield (The endocrine influence on the bone microenvironment in early breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting originating in Sheffield, United Kingdom, by NewsRx journalists, research stated, "Multiple factors influence the survival of disseminated breast tumour cells (DTCs) in bone. Whereas gene signature studies have identified genes that predict a propensity of tumours to metastasise to bone, the bone environment is key in determining the fate of these tumour cells."

The news reporters obtained a quote from the research from the University of Sheffield, "Breast cancer cells locate to specific niches within the bone that support their survival, regulated by host factors within the bone microenvironment including bone cells, cells of the bone microvasculature, immune cells and the extracellular matrix. Reproductive endocrine hormones that affect bone and clinical studies across the menopausal transition have provided comprehensive understanding of the changes in the bone microenvironment during this time. Menopause is characterized by a decrease in ovarian oestradiol and inhibins, with an increase in pituitary follicle-stimulating hormone and this review will focus on the role of these three hormones in determining the fate of DTCs in bone. Both in vivo and clinical data suggest that premenopausal bone is a conducive environment for growth of breast cancer cells in bone. Adjuvant cancer treatment aims to reduce the risk of tumour recurrence by affecting DTCs. Drugs targeting the bone resorbing osteoclasts, such as bisphosphonates, have therefore been evaluated in this setting. Both preclinical and adjuvant clinical studies have shown that bisphosphonates' ability to decrease tumour growth in bone is influenced by the levels of endocrine hormones, with enhanced effects in a postmenopausal bone microenvironment."

According to the news reporters, the research concluded: "The challenge is to understand the molecular mechanisms behind this phenomenon and to evaluate if alternative adjuvant bone-targeted therapies may be effective in premenopausal women."

For more information on this research see: Endocrine-Related Cancer, 2016;23(12):R567-R576. Endocrine-Related Cancer can be contacted at: Bioscientifica Ltd, Euro House, 22 Apex Court Woodlands, Bradley Stoke, Bristol BS32 4JT, England.

Oncology - Breast Cancer

New Breast Cancer Study Findings Have Been Reported by Researchers at Georgia Institute of Technology (Bacterial Effector Nanoparticles as Breast Cancer Therapeutics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "Bacterial pathogens trigger cell death by a variety of mechanisms, including injection of effector proteins. Effector proteins have great potential as anticancer agents because they efficiently subvert a variety of eukaryotic signaling pathways involved in cancer development, drug resistance, and metastasis."

Financial support for this research came from Division of Materials Research.

Our news editors obtained a quote from the research from the Georgia Institute of Technology, "In breast cancer, MAPK and NF-kB pathways are known to be dysregulated. YopJ, an effector from Yersinia pestis, downregulates MAPK and NF-kB pathways to induce cell death in specific cell types. We expressed YopJ in Escherichia coli as a fusion protein with glutathione S-transferase (GST), forming self-assembled protein nanoparticles with diameters of 100 nm. YopJ-GST nanoparticles efficiently delivered protein to cells, replacing the need for the pathogen secretion mechanism for effector delivery to cells. These nanoparticles induced dose and time dependent death in SKBR-3 breast cancer cells. After 72 h, 97% of cells died, significantly more than with the same molar dose of doxorubicin. Treatment with sublethal doses of nanoparticles decreased cell migration in vitro and downregulated the MAPK ERK 1/2 pathway, which has been correlated to metastasis. Exposure to a panel of breast cancer cell lines showed that YopJ-GST nanoparticles are cytotoxic to different subtypes, including doxorubicin resistant cells. However, they were not cytotoxic to NIH/3T3 fibroblasts or HeLa cells."

According to the news editors, the research concluded: "Thus, YopJ-GST nanoparticles demonstrate the potential of effector proteins as breast cancer therapeutics with selective cytotoxicity and the capacity to decrease metastatic predictive behaviors."

For more information on this research see: Bacterial Effector Nanoparticles as Breast Cancer Therapeutics. Molecular Pharmaceutics, 2016;13(3):710-9. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

The news editors report that additional information may be obtained by contacting L. Herrera Estrada, Dept. of Chemical & Biomolecular Engineering, Georgia Institute of Technology, 950 Atlantic Drive NW, Atlanta, Georgia 30332, United States. Additional authors for this research include T.J. Padmore and J.A Champion.

New Breast Cancer Study Findings Have Been Reported by Researchers at University of Tehran (Enterolactone: A novel radiosensitizer for human breast cancer cell lines through impaired DNA repair and increased apoptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating from Tehran, Iran, by NewsRx correspondents, research stated, "Radiotherapy is a potent treatment against breast cancer, which is the most commonly diagnosed cancer among women. However, the emergence of radioresistance due to increased DNA repair leads to radiotherapeutic failure."

Our news editors obtained a quote from the research from the University of Tehran, "Applying polyphenols combined with radiation is a more promising method to better survival. Enterolactone, a phytoestrogenic polyphenol, has been reported to inhibit an radioresistance signaling pathway, therefore we conjectured that enterolactone could enhance radiosensitivity in breast cancer. To assess this hypothesis, radiation response of enterolactone treated MDA-MB-231 and T47D cell lines and corresponding cellular mechanisms were investigated. Cytotoxicity of enterolactone was measured via MFT assay. Cells were treated with enterolactone before X-irradiation, and clonogenic assay was used to evaluate radiosensitivity. Cell cycle distribution and apoptosis were measured by flow cytometric analysis. In addition, DNA damages and corresponding repair, chromosomal damages, and aberrations were assessed by comet, micronucleus, and cytogenetic assays, respectively. Enterolactone decreased the viability of cells in a concentration- and time dependent manner. Enterolactone significantly enhanced radiosensitivity of cells by abrogating G2/M arrest, impairing DNA repair, and increasing radiation-induced apoptosis. Furthermore, increased chromosomal damages and aberrations were detected in cells treated with enterolactone combined with X-rays than X-ray alone. These effects were more prominent in T47D than MDA-MB-231 cells. To our knowledge, this is the first report that enterolactone is a novel radiosensitizer for breast irrespective of estrogen receptor status."

According to the news editors, the research concluded: "Authors propose enterolactone as a candidate for combined therapy to decrease the radiation dose delivered to patients and subsequent side effects."

The news editors report that additional information may be obtained by contacting B.
New Breast Cancer Study Findings Have Been Reported from Sungkyunkwan University (Goserelin plus tamoxifen compared to chemotherapy followed by tamoxifen in premenopausal patients with early stage-, lymph node-negative breast cancer of luminal ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "To study the outcomes of adjuvant goserelin combined with tamoxifen (GosTam) compared to chemotherapy followed by tamoxifen (ChemTam) in premenopausal patients with early stage, luminal A breast cancer. From 2008 until 2013, data were retrospectively collected for premenopausal patients who underwent surgery for invasive tumors that were <= 2.0 cm, node-negative, strongly positive for estrogen and progesterone receptors, HER-2-negative, and Ki-67 <= 25%.

Financial supporters for this research include Ministry of Education, Ministry of Health & Welfare, Republic of Korea.

The news reporters obtained a quote from the research from Sungkyunkwan University, "The patients were divided into two groups according to adjuvant regimen, either GosTam or ChemTam. All patients who underwent different adjuvant regimens were excluded. In total, 235 patients underwent GosTam and 171 patients underwent ChemTam. There were significantly more patients younger than 40 years in the GosTam group (32% GosTam vs. 22% ChemTam, p = 0.031). Mean tumor size was significantly smaller (1.19 cm vs. 1.48 cm, p< 0.001), Ki-67 significantly lower (p = 0.049), and nuclear grade was low in a significant number of patients in the GosTam group (2% vs. 13%, p< 0.001). After a median follow-up of 51.3 months, there was no mortality in either group. There was no significant difference in 5-year disease-free survival (DFS) between the two groups even after univariate analysis considering age, tumor size, nuclear grade, and P53% (GosTam = 98.9% vs. ChemTam = 95.7%, HR = 0.404, 95% CI = [0.073, 2.222], p = 0.248). There was no difference between treatment groups, and neither chemotherapy nor ovarian suppression seemed to improve the outcome."

According to the news reporters, the research concluded: "Thus, tamoxifen alone might be a sufficient option for this low-risk patient population."

For more information on this research see: Goserelin plus tamoxifen compared to chemotherapy followed by tamoxifen in premenopausal patients with early stage-, lymph node-

**Oncology - Breast Cancer**

**New Breast Cancer Study Findings Have Been Reported from University of Kentucky College of Medicine (Chronic ethanol exposure enhances the aggressiveness of breast cancer: the role of p38g)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting originating from Lexington, Kentucky, by NewsRx correspondents, research stated, "Both epidemiological and experimental studies suggest that ethanol may enhance aggressiveness of breast cancer. We have previously demonstrated that short term exposure to ethanol (12-48 hours) increased migration/invasion in breast cancer cells overexpressing ErbB2, but not in breast cancer cells with low expression of ErbB2, such as MCF7, BT20 and T47D breast cancer cells."

Our news editors obtained a quote from the research from the University of Kentucky College of Medicine, "In this study, we showed that chronic ethanol exposure transformed breast cancer cells that were not responsive to short term ethanol treatment to a more aggressive phenotype. Chronic ethanol exposure (10 days -2 months) at 100 (22 mM) or 200 mg/dl (44 mM) caused the scattering of MCF7, BT20 and T47D cell colonies in a 3-dimension culture system. Chronic ethanol exposure also increased colony formation in an anchorage-independent condition and stimulated cell invasion/migration. Chronic ethanol exposure increased cancer stem-like cell (CSC) population by more than 20 folds. Breast cancer cells exposed to ethanol in vitro displayed a much higher growth rate and metastasis in mice. Ethanol selectively activated p38g MAPK and RhoC but not p38a/b in a concentration-dependent manner. SP-MCF7 cells, a derivative of MCF7 cells which compose mainly CSC expressed high levels of phosphorylated p38g MAPK. Knocking-down p38g MAPK blocked ethanol-induced RhoC activation, cell scattering, invasion/migration and ethanol-increased CSC population. Furthermore, knocking-down p38g MAPK mitigated ethanol-induced tumor growth
and metastasis in mice."

According to the news editors, the research concluded: "These results suggest that chronic ethanol exposure can enhance the aggressiveness of breast cancer by activating p38g MAPK/RhoC pathway."

For more information on this research see: Chronic ethanol exposure enhances the aggressiveness of breast cancer: the role of p38g. Oncotarget, 2016;7(3):3489-505.

The news editors report that additional information may be obtained by contacting M. Xu, Dept. of Pharmacology and Nutritional Sciences, University of Kentucky College of Medicine, Lexington, KY 40536, United States. Additional authors for this research include S. Wang, Z. Ren, J.A. Frank, X.H. Yang, Z. Zhang, Z.J. Ke, X. Shi and J. Luo.

Oncology - Breast Cancer

New Breast Cancer Study Findings Have Been Reported from University of Oviedo (Fibulin-5 downregulates Ki-67 and inhibits proliferation and invasion of breast cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting out of Oviedo, Spain, by NewsRx editors, research stated, "Fibulins not only function as molecular bridges within the cellular microenvironment but also influence cell behavior. Thus, fibulins may contribute to create a permissive microenvironment for tumor growth but can also stimulate different mechanisms that may impede tumor progression."

Our news journalists obtained a quote from the research from the University of Oviedo, "This is the case with Fibulin-5, which has been shown to display both tumor-promoting and tumor-protective functions by mechanisms that are not totally defined. We show new evidence on the tumor-protective functions displayed by Fibulin-5 in MCF-7, T47D and MDA-MB-231 breast cancer cells including the inhibition of invasion and proliferation capacity and hampering the ability to form mammospheres. Reduction in the level of phosphorylation of Ser residues involved in the nuclear translocation of b-catenin may underlie these antitumor effects. We also found that Fibulin-5 reduces the level of expression of Ki-67, a nuclear protein associated with cell proliferation. Moreover, reduction in Fibulin-5 expression corresponds to an increase of Ki-67 detection in breast tissue samples."

According to the news editors, the research concluded: "Overall, our data provide new insights into the influence of Fibulin-5 to modify breast cancer cell behavior and contribute to better understand the connections between fibulins and cancer."

For more information on this research see: Fibulin-5 downregulates Ki-67 and inhibits proliferation and invasion of breast cancer cells. International Journal of Oncology,

Our news journalists report that additional information may be obtained by contacting Y. Mohamedi, Dept. of Biochemistry and Molecular Biology, Faculty of Medicine, University of Oviedo, Oviedo, Spain. Additional authors for this research include T. Fontanil, L. Solares, O. Garcia-Suarez, J. Garcia-Piqueras, J.A. Vega, S. Cal and A.J Obaya.

**Oncology - Breast Cancer**

**New Breast Cancer Study Findings Recently Were Reported by Researchers at Netherlands Cancer Institute (Integration of genomic, transcriptomic and proteomic data identifies two biologically distinct subtypes of invasive lobular breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting from Amsterdam, Netherlands, by NewsRx journalists, research stated, "Invasive lobular carcinoma (ILC) is the second most frequently occurring histological breast cancer subtype after invasive ductal carcinoma (IDC), accounting for around 10% of all breast cancers. The molecular processes that drive the development of ILC are still largely unknown."

The news correspondents obtained a quote from the research from Netherlands Cancer Institute, "We have performed a comprehensive genomic, transcriptomic and proteomic analysis of a large ILC patient cohort and present here an integrated molecular portrait of ILC. Mutations in CDH1 and in the PI3K pathway are the most frequent molecular alterations in ILC. We identified two main subtypes of ILCs: (i) an immune related subtype with mRNA up-regulation of PD-L1, PD-1 and CTLA-4 and greater sensitivity to DNA-damaging agents in representative cell line models; (ii) a hormone related subtype, associated with Epithelial to Mesenchymal Transition (EMT), and gain of chromosomes 1q and 8q and loss of chromosome 11q. Using the somatic mutation rate and eIF4B protein level, we identified three groups with different clinical outcomes, including a group with extremely good prognosis. We provide a comprehensive overview of the molecular alterations driving ILC and have explored links with therapy response."

According to the news reporters, the research concluded: "This molecular characterization may help to tailor treatment of ILC through the application of specific targeted, chemo-and/or immune-therapies."

For more information on this research see: Integration of genomic, transcriptomic and proteomic data identifies two biologically distinct subtypes of invasive lobular breast cancer. *Scientific Reports*, 2016;6():18517. Oncology - Breast Cancer

**New Breast Cancer Study Findings Reported from China Medical University and Hospital (Combination of shear wave elastography and Ki-67 index as a novel predictive modality for the pathological response to neoadjuvant chemotherapy in patients ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting originating in Liaoning, People's Republic of China, by NewsRx journalists, research stated, "This study evaluated shear wave elastography (SWE) and SWE combined with the Ki-67 index as novel predictive modalities for the pathological response of invasive breast cancer to neoadjuvant chemotherapy (NAC). The prospective study recruited 66 eligible patients from July 2014 to November 2015."

Financial supporters for this research include Education Department of Liaoning Province, Shengjing Hospital, China Medical University.

The news reporters obtained a quote from the research from China Medical University and Hospital, "Tumour stiffness, which corresponds with tumour progression and invasiveness, was assessed by quantitative SWE 1 d before biopsy (time point t0, elasticity E0), 1 d before next NAC cycle (t1 - t5, E1 - E5), and 1 d before surgery (t6, E6). The relative changes in SWE parameters after the first and second NAC cycles were considered as the variables [Delta E (t1), Delta E (t2)]. The pathological response was classified according to the residual cancer burden (RCB) protocol. Correlations between RCB scores and variables were evaluated. The predictive diagnostic performances of SWE parameters, Ki-67 index, and the predictive RCB (predRCB) score determined by a linear regression model were compared. Some immunohistochemical and molecular factors and SWE parameters were significantly different among the three RCB groups. The Delta E-mean (t2) and Ki-67 had significantly better diagnostic performance than other parameters regarding predicting the pathological response (the RCB-I response and RCB-III resistance). However, the correlation between Delta E-mean (t2) and Ki-67 index was significantly weaker as a diagnostic predictor (r = 0.29). We generated a new predictive modality, predRCB, which is a multivariable linear regression model that combines Delta E-mean (t2) and the Ki-67 index. The predRCB modality showed better diagnostic performance than SWE parameters and Ki-67 index alone. Our findings highlight the potential utility for adding the Ki-67 index to the SWE results, which may improve the predictive power of SWE and facilitate personalising the treatment regimens of patients with
According to the news reporters, the research concluded: "These results should be validated in the future by performing a multicentre prospective study with a larger cohort."

Our news correspondents report that additional information may be obtained by contacting W. Ren, China Med Univ, Shengjing Hosp, Dept. of Ultrasound, Shenyang 110004, Liaoning, People's Republic of China. Additional authors for this research include S. Zhang, L. Zang, J. Li, J. Li, Y. Kang and W. Ren.

**Oncology - Breast Cancer**

**New Breast Cancer Study Results Reported from Bharati Vidyapeeth University (Evaluating the anticancer activity and nanoparticulate nature of homeopathic preparations of Terminalia chebula)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating from Maharashtra, India, by NewsRx correspondents, research stated, "Breast cancer is the most common cancer diagnosed among women and is the second leading cause of cancer death. Homeopathic medicines are part of the alternative medicines that are given as a supportive therapy in breast cancer."

Financial support for this research came from Bharati Vidyapeeth Deemed University (BVDU).

Our news editors obtained a quote from the research from Bharati Vidyapeeth University. "The objective of this study was to investigate the anticancer activity of commercially available homeopathic preparations of Terminalia chebula (TC) and evaluate their nanoparticulate nature. Mother tincture (MT) and other homeopathic preparations (3X, 6C and 30C) of TC were tested for their effect on the viability of breast cancer (MDAMB231 and MCF7) and non-cancerous (HEK 293) cell lines by 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) assay. Cell growth assay was performed to analyze the effect of the different potencies on the growth kinetics of breast cancer cells. MT and 6C were evaluated for the presence of nanoparticles by using scanning electron microscopy (SEM) and transmission electron microscopy (TEM). MT decreased the viability of breast cancer
(MDAMB231 and MCF7) and non-cancerous (HEK 293) cells. However, the other potencies (3X, 6C and 30C) decreased the viability of only breast cancer cells without affecting the viability of the non-cancerous cells. All the potencies, MT, 3X, 6C and 30C, reduced growth kinetics of breast cancer cells, more specifically at 1:10 dilution at 24, 48 and 72 h. Under SEM, MT appeared as a mesh-like structure whereas under TEM, it showed presence of nanoclusters. On the other hand, 6C potency contained 20 nm sized nanoparticles. The current study reports the anticancer activity of homeopathic preparations of TC against breast cancer and reveals their nanoparticulate nature."

According to the news editors, the research concluded: "These preliminary results warrant further mechanistic studies at both in vitro and in vivo levels to evaluate the potential of TC as nanomedicine in breast cancer."

The news editors report that additional information may be obtained by contacting R. Kaul-Ghanekar, Bharati Vidyapeeth Univ, Interact Res Sch Hlth Affairs, Pune 411043, Maharashtra, India. Additional authors for this research include N. Shah, A. Prabhune, A. Jadhav, P. Ranjekar and R. Kaul-Ghanekar.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.homp.2016.02.004. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Breast Cancer**

**New Breast Cancer Study Results Reported from Complutense University (Therapeutic attitude towards internal mammary chain drainage in patients with breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting out of Madrid, Spain, by NewsRx editors, research stated, "Internal mammary chain (IMC) is one of the main local lymph drainages in breast cancer. However, internal mammary chain sentinel lymph node biopsy (IMC-SLNB) is not always performed."

Our news journalists obtained a quote from the research from Complutense University, "The purpose of this research is to evaluate the outcomes of IMC-SLNB in our institution from 2008 to 2014. We analyzed 1346 women with breast cancer. Six-hundred twenty-two sentinel node biopsies were carried out, one out of ten in IMC territory. Adjuvant radiotherapy in this area was added when positive."

According to the news editors, the research concluded: "IMC-SLNB is feasible, it
may change tumour stage, modify adjuvant therapy and change prognosis in selected patients."

Our news journalists report that additional information may be obtained by contacting K.F. Garcia, Complutense University Madrid, Univ Gen Hosp Gregorio Maranon, Dept. of Gynecol & Obstet, Madrid, Spain. Additional authors for this research include J.S. Riduejo, P.R. Olbes, M.S.L. Molina and M.I.A. Arias.

Oncology - Breast Cancer

New Breast Cancer Study Results from Mayo Clinic Described (Genetic Polymorphisms in the Long Noncoding RNA MIR2052HG Offer a Pharmacogenomic Basis for the Response of Breast Cancer Patients to Aromatase Inhibitor Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "Genetic risks in breast cancer remain only partly understood. Here, we report the results of a genome-wide association study of germline DNA from 4,658 women, including 252 women experiencing a breast cancer recurrence, who were entered on the MA. 27 adjuvant trial comparing the aromatase inhibitors (AI) anastrozole and exemestane."

The news correspondents obtained a quote from the research from Mayo Clinic, "Single-nucleotide polymorphisms (SNP) of top significance were identified in the gene encoding MIR2052HG, a long noncoding RNA of unknown function. Heterozygous or homozygous individuals for variant alleles exhibited a similar to 40% or similar to 63% decrease, respectively, in the hazard of breast cancer recurrence relative to homozygous wild-type individuals. Functional genomic studies in lymphoblastoid cell lines and ER alpha-positive breast cancer cell lines showed that expression from MIR2052HG and the ESR1 gene encoding estrogen receptor-alpha (ER alpha) was induced by estrogen and AI in a SNP-dependent manner. Variant SNP genotypes exhibited increased ER alpha binding to estrogen response elements, relative to wild-type genotypes, a pattern that was reversed by AI treatment. Further, variant SNPs were associated with lower expression of MIR2052HG and ER alpha. RNAi-mediated silencing of MIR2052HG in breast cancer cell lines decreased ER alpha expression, cell proliferation, and anchor-age-independent colony formation. Mechanistic investigations revealed that MIR2052HG sustained ER alpha levels both by promoting AKT/FOXO3-mediated ESR1 transcription and by limiting ubiquitin-mediated, proteasome-dependent degradation of
ER alpha. Taken together, our results define MIR2052HS as a functionally polymorphic gene that affects risks of breast cancer recurrence in women treated with AI.

According to the news reporters, the research concluded: "More broadly, our results offer a pharmacogenomic basis to understand differences in the response of breast cancer patients to AI therapy."

For more information on this research see: Genetic Polymorphisms in the Long Noncoding RNA MIR2052HG Offer a Pharmacogenomic Basis for the Response of Breast Cancer Patients to Aromatase Inhibitor Therapy. *Cancer Research*, 2016;76(23):7012-7023. *Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. **Heart Disorders and Diseases - Brugada Syndrome**

**New Brugada Syndrome Findings from Tohoku University Described (Prognostic Significance of Late Potentials in Outpatients with Type 2 Brugada Electrocardiogram)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Brugada Syndrome are discussed in a new report. According to news reporting from Miyagi, Japan, by NewsRx journalists, research stated, "Brugada syndrome is characterized by distinguishing electrocardiogram (ECG) patterns (coved and saddleback types with day-to-day variation) and occurrence of lethal tachy-arrhythmias. The appearance of coved type ECG (type 1) is required for the diagnosis of Brugada syndrome, whereas the significance of saddleback type ECG (type 2), which is inadequate for the diagnosis, has not been fully established."

The news correspondents obtained a quote from the research from Tohoku University, "We enrolled 34 consecutive patients with type 2 ECG on outpatient-clinic. Among them, 7 patients were ventricular fibrillation (VF) survivors who were diagnosed as Brugada syndrome with transient appearance of type 1 ECG, and showed type 2 ECG on their first outpatient-clinic visit after the VF event (VF group). The remaining 27 were asymptomatic and..."
never showed type 1 ECG on repeated ECG examinations (control group). The VF group showed significantly longer RJ intervals in leads V1 and V2 and QTc intervals in lead V2 compared with the control group (P < 0.030, P < 0.017, and P < 0.030, respectively). Late potentials, detected on the signal-averaged ECG (SA-ECG), reflect conduction abnormalities and are known as one of the risk markers of arrhythmic events. Among the 34 patients, late potentials were negative in 12 patients belonging to the control group."

According to the news reporters, the research concluded: "The SA-ECG could be helpful to identify high-risk patients for its high negative predictive value as the first step, and ECG parameters, including RJ intervals in leads V1 and V2 and QTc interval in lead V2, could be useful for further risk stratification in patients with type 2 Brugada ECG."

Our news journalists report that additional information may be obtained by contacting M. Nakano, Tohoku University, Grad Sch Med, Dept. of Cardiovasc Med, Sendai, Miyagi, Japan. Additional authors for this research include K. Fukuda, M. Kondo, M. Segawa, M. Hirano, T. Chiba, K. Fukasawa, K. Miki, S. Morosawa and H. Shimokawa.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1620/tjem.240.191. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Miyagi, Japan, Asia, Heart Disorders and Diseases, Cardiac Arrhythmias, Brugada Syndrome, Heart Disease, Cardiology, Tohoku University.

**Gram-Negative Bacteria - Burkholderia cepacia**

**New Burkholderia cepacia Study Findings Have Been Reported by Researchers at Aberdeen Royal Infirmary (Combination antimicrobial susceptibility testing of Burkholderia cepacia complex: significance of species)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Burkholderia cepacia are discussed in a new report. According to news reporting from Aberdeen, United Kingdom, by NewsRx journalists, research stated, "The Burkholderia cepacia complex (Bcc) is notorious for the life-threatening pulmonary infections it causes in patients with cystic fibrosis. The multidrug-resistant nature of Bcc and differing infective Bcc species make the design of appropriate treatment regimens challenging."

The news correspondents obtained a quote from the research from Aberdeen Royal Infirmary, "Previous synergy studies have failed to take account of the species of Bcc isolates. Etest methodology was used to facilitate minimum inhibitory concentration (MIC) and antimicrobial combination testing on 258 isolates of Bcc, identified to species level by matrix-assisted laser desorption/ionisation time-of-flight mass spectrometry (MALDI-TOF/MS). The
Most active antimicrobials were trimethoprim/sulphamethoxazole, doxycycline and minocycline (52.5%, 46.4% and 45.9% of isolates susceptible, respectively). Synergy was observed in 9.2% of the 1799 combinations tested; the most common synergistic combinations were tobramycin + ceftazidime, meropenem + tobramycin and levofloxacin + piperacillin/tazobactam (35.4%, 32.3% and 22.2% synergy, respectively). Antimicrobial susceptibility analysis revealed differences between Burkholderia cenocepacia and Burkholderia multivorans.

According to the news reporters, the research concluded: "Disparity in clinical outcome during infection with these two microorganisms necessitates further investigation into the clinical outcomes of treatment regimens in light of species identification and in vitro antimicrobial susceptibility studies."

Our news journalists report that additional information may be obtained by contacting F.K. Abbott, Aberdeen Royal Infirmary, Dept. of Med Microbiol, Aberdeen, United Kingdom. Additional authors for this research include K.E.N. Milne, D.A. Stead and I.M. Gould.

**Oncology - Cancer Care**

**New Cancer Care Study Findings Recently Were Reported by N. Garcia-Rueda and Co-Researchers (The experience of living with advanced-stage cancer: a thematic synthesis of the literature)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Cancer Care is the subject of a report. According to news reporting originating from Navarra, Spain, by NewsRx correspondents, research stated, "The aim of the study was to understand the experience of people living with advanced-stage cancer through literature. The search included The Cochrane Library, PubMed, PsycInfo, CINAHL and Cuiden."

Funders for this research include Universidad de Navarra, Innovation for person-centered care.

Our news editors obtained a quote from the research, "Thirteen studies were included. A qualitative meta-synthesis was conducted. One thread emerged from the thematic synthesis: the desire to live as normally as possible, despite being aware of the proximity of..."
death. Three themes also emerged: 'a process that is unique' with its four sub-themes; 'support network' and 'health context,' each of them having two sub-themes. This study concludes that living with advanced-stage cancer is a unique and complex process which has both positive and negative aspects. The review provides a comprehensive view of the experience, which considers the importance of the support network and the health context in which the person lives. In this study, 'normalcy' is the adjustment to the new reality and living as closely as possible to the way one lived before the disease, while developing a new relationship with being finite and death."

According to the news editors, the research concluded: "A better understanding of the experience of living with advanced-stage cancer will help health professionals to identify the needs of the patients in order to plan individual, high-quality care."

The news editors report that additional information may be obtained by contacting N. Garcia-Rueda, Inst Invest Sanitaria Navarra, IdiSNA, Navarra, Spain. Additional authors for this research include A.C. Valcarcel, M. Saracibar-Razquin and M.A. Solabarrieta.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ecc.12523. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Cancer Epidemiology**

**New Cancer Epidemiology Findings from London School of Hygiene and Tropical Medicine Discussed (The burden of HPV associated cancers in two regions in Nigeria 2012-2014)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Cancer Epidemiology is the subject of a report. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "HPV attributable cancers are the second most common infection-related cancers worldwide, with much higher burden in less developed regions. There are currently no country-specific estimates of the burden of these cancers in Nigeria just like many other low and middle income countries."

Our news editors obtained a quote from the research from the London School of Hygiene and Tropical Medicine, "In this study, we quantified the proportion of the cancer burden in Nigeria that is attributable to HPV infection from 2012 to 2014 using HPV prevalence estimated from previous studies and data from two population based cancer registries (PBCR) in Nigeria. We considered cancer sites for which there is strong evidence of an association with HPV infection based on the International Agency for Research on Cancer (IARC) classification. We obtained age and sex-specific estimates of incident cancers and using the World Standard Population, we derived age standardized incidence (ASR) rates for each cancer type by
categories of sex, and estimated the population attributable fractions (PAF). The two PBCR reported 4336 new cancer cases from 2012 to 2014. Of these, 1627 (37.5%) were in males and 2709 (62.5%) in females. Some 11% (488/4336) of these cancers were HPV associated; 2% (38/1627) in men and 17% (450/2709) in women. Of the HPV associated cancers, 7.8% occurred in men and 92.2% in women. The ASRs for HPV associated cancers was 33.5 per 100,000; 2.3 and 31.2 per 100,000 in men and women respectively. The proportion of all cancers attributable to HPV infection ranged from 10.2 to 10.4% (442-453 of 4336) while the proportion of HPV associated cancers attributable to HPV infection ranged from 90.6% to 92.8% (442-453 of the 488 cases). In men, 55.3% to 68.4% of HPV associated cancers were attributable to HPV infection compared to 93.6% to 94.8% in women. The combined ASR for HPV attributable cancers ranged from 31.0 to 31.7 per 100,000. This was 1.4 to 1.7 per 100,000 in men and 29.6 to 30.0 per 100,000 in women. In women, cervical cancer (n = 392, ASR 28.3 per 100,000) was the commonest HPV attributable cancer, while anal cancer (n = 21, ASR 1.2 per 100,000) was the commonest in men. HPV attributable cancers constitute a substantial cancer burden in Nigerian women, much less so in men."

According to the news editors, the research concluded: "A significant proportion of cancers in Nigerian women would be prevented if strategies such as HPV DNA based screening and HPV vaccination are implemented." For more information on this research see: The burden of HPV associated cancers in two regions in Nigeria 2012-2014. Cancer Epidemiology, 2016;45():91-97. Oncology - Cancer Epidemiology

New Cancer Epidemiology Findings from University of Toronto Described (Estimation of screening sensitivity and sojourn time from an organized screening program)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Epidemiology. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "Regular screening with mammography is widely recommended to reduce breast cancer mortality. However, whether breast screening does more harm than good has long been debated."

Our news editors obtained a quote from the research from the University of Toronto,
"Since a full evaluation of the effect on mortality could take 10-15 years in order to provide a reliable estimate of the eventual benefits and harms, it is unrealistic to expect each new modification of a screening technique to be evaluated in this way. Therefore, one needs to rapidly estimate suitable measures of the screening effect. In this paper, two measures of interest, the length of the pre-clinical state and the screening false negative rate, are discussed. A procedure is proposed to model the pre-clinical disease state duration, the false negative rate of the screening exam, and the underlying incidence rate in the screened population. We applied the model to data from the Ontario Breast Screening Program in Canada. Our results suggest that the mean preclinical duration is longer than 2 years. We also find only small marginal gains by screening every two instead of three years."

According to the news editors, the research concluded: "The most important objective of a screening program should be to encourage first-time screening attendance."

For more information on this research see: Estimation of screening sensitivity and sojourn time from an organized screening program. Cancer Epidemiology, 2016;44():178-185. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. **Oncology - Cancer Epidemiology**

**New Cancer Epidemiology Study Findings Recently Were Reported by Researchers at International Agency for Research on Cancer (Cancer in Central and South America: Introduction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cancer Epidemiology. According to news originating from Lyon, France, by NewsRx correspondents, research stated, "Central and South American countries (including Cuba) are experiencing rapid socio-demographic and epidemiologic changes and the nature of health problems are undergoing transition from infectious to chronic diseases, including cancer. Countries are poorly prepared to respond effectively to the subsequent challenges posed by the new patterns of disease."

Our news journalists obtained a quote from the research from International Agency for Research on Cancer, "Existing data delineating the number of cancer cases and the distribution of cancer types from each country in the region are sparse due to limitations on health information systems for recording incidence and mortality despite improvements made in recent years. There is an urgent need for reliable statistics on cancer to inform governmental entities responsible for cancer control in the region."
According to the news editors, the research concluded: "We attempted to obtain the best available cancer data from each country located in the region to provide an overview of current geographic patterns of cancer incidence and mortality in the 21st century."

For more information on this research see: Cancer in Central and South America: Introduction. *Cancer Epidemiology*, 2016;44():S3-S10. *Cancer Epidemiology* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Cancer Epidemiology - www.journals.elsevier.com/cancer-epidemiology/)

**Biotechnology - Cancer Gene Therapy**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Biotechnology - Cancer Gene Therapy are presented in a new report. According to news reporting from Santa Clara, California, by NewsRx journalists, research stated, "Cancer cells release high levels of lactate that has been correlated to increased metastasis and tumor recurrence. Single-cell measurements of lactate release can identify malignant cells and help decipher metabolic cancer pathways."

Financial support for this research came from National Cancer Institute.

The news correspondents obtained a quote from the research from Santa Clara University, "We present here a novel droplet microfluidic method that allows the fast and quantitative determination of lactate release in many single cells. Using passive forces, droplets encapsulated cells are positioned in an array. The single-cell lactate release rate is determined from the increase in droplet fluorescence as the lactate is enzymatically converted to a fluorescent product. The method is used to measure the cell-to-cell variance of lactate release in K562 leukemia and U87 glioblastoma cancer cell lines and under the chemical inhibition of lactate efflux."

According to the news reporters, the research concluded: "The technique can be used in the study of cancer biology, but more broadly in cell biology, to capture the full range of stochastic variations in glycolysis activity in heterogeneous cell populations in a repeatable and high-throughput manner."

For more information on this research see: Droplet Microfluidic Platform for the Determination of Single-Cell Lactate Release. *Analytical Chemistry*, 2016;88(6):3257-63. (American Chemical Society - www.acs.org; Analytical Chemistry -
New Cancer Genetics Study Findings Recently Were Reported by Researchers at University of New Mexico [Chronic myelogenous leukemia with acquired t(11;14)(q13;q32) CCND1-IGH: A case report and literature review]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cancer Genetics. According to news reporting originating in Albuquerque, New Mexico, by NewsRx journalists, research stated, "Approximately 5-10% of chronic myeloid leukemia (CML) patients are found to have structural or numerical additional chromosomal abnormality (ACAs) in addition to the characteristic t(9;22)(q34;q11.2) BCR/ABL1 at the time of diagnosis. The prognostic significance of such additional chromosomal abnormalities has been controversial."

The news reporters obtained a quote from the research from the University of New Mexico, "Translocation t(11;14)(q13;q32) CCND1-IGH is typically associated with mantle cell lymphoma or a subset of plasma cell myeloma and is exceedingly rare in myeloid neoplasm. Here we report a unique case describing a patient found at diagnosis of chronic phase CML to have both the Philadelphia chromosome as well as t(11;14) a rare cytogenetic combination. The patient was treated with imatinib with appropriate hematologic response but persistent disease by FISH and RT-PCR. She was switched to dasatinib and eventually achieved cytogenetic remission in both translocations, but still with persistent RTPCR evidence of BCR-ABL1 fusion. As cyclin D1 is a regulatory subunit of cyclin-dependent kinases CDK4 and CDK6 and is required for the cells to progress through the G1 phase of the cell cycle, overexpression of cyclin D1 will likely promote cells into cell cycle. This may further augment proliferation in addition to upregulated ABL1 kinase activity in the index case. It may also contribute to the resistance to imatinib, as imatinib only targets on BCR-ABL fusion."

According to the news reporters, the research concluded: "Therefore, the addition of t(11;14)(q13;q32) may have significant implication in patient management."

Our news correspondents report that additional information may be obtained by contacting Q.Y. Zhang, University of New Mexico, Dept. of Pathol, Albuquerque, NM 87131, United States. Additional authors for this research include P. Khalili, D. Quintana, I. Rabinowitz and Q.Y. Zhang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cancergen.2016.09.007. This DOI is a link to an online electronic document that is either free or for purchase.

Cancer Research

New Cancer Research Data Have Been Reported by Investigators at Cleveland Clinic [Recommendations for clinical staging (cTNM) of cancer of the esophagus and esophagogastric junction for the 8th edition AJCC/UICC staging manuals]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cancer Research are discussed in a new report. According to news reporting out of Cleveland, Ohio, by NewsRx editors, research stated, "We report analytic and consensus processes that produced recommendations for clinical stage groups (cTNM) of esophageal and esophagogastric junction cancer for the AJCC/UICC cancer staging manuals, 8th edition. The Worldwide Esophageal Cancer Collaboration (WECC) provided data on 22,123 clinically staged patients with epithelial esophageal cancers."

Our news journalists obtained a quote from the research from Cleveland Clinic, "Risk-adjusted survival for each patient was developed using random survival forest analysis from which (1) data-driven clinical stage groups were identified wherein survival decreased monotonically and was distinctive between and homogeneous within groups and (2) data-driven anatomic clinical stage groups based only on cTNM. The AJCC Upper GI Task Force, by smoothing, simplifying, expanding, and assessing clinical applicability, produced (3) consensus clinical stage groups. Compared with pTNM, cTNM survival was pinched, with poorer survival for early cStage groups and better survival for advanced ones. Histologic grade was distinctive for data-driven grouping of cT2N0M0 squamous cell carcinoma (SCC) and cT1-2N0M0 adenocarcinoma, but consensus removed it. Grouping was different by histopathologic cell type. For SCC, cN0-1 was distinctive for cT3 but not cT1-2, and consensus removed cT4 subclassification and added subgroups 0, IVA, and IVB. For adenocarcinoma, N0-1 was distinctive for cT1-2 but not cT3-4a, cStage II subgrouping was necessary (T1N1M0 [IIA] and T2N0M0 [IIB]), advanced cancers cT3-4aN0-1M0 plus cT2N1M0 comprised cStage III, and consensus added subgroups 0, IVA, and IVB. Treatment decisions require accurate cStage, which differs from pStage."

According to the news editors, the research concluded: "Understaging and overstaging are problematic, and additional factors, such as grade, may facilitate treatment decisions and prognostication until clinical staging techniques are uniformly applied and improved."

Our news journalists report that additional information may be obtained by contacting T.W. Rice, Cleveland Clinic, Cleveland, OH 44195, United States. Additional authors for this research include H. Ishwaran, E.H. Blackstone, W.L. Hofstetter, D.P. Kelsen and C. Apperson-Hansen.

Cancer Research

New Cancer Research Study Findings Recently Were Reported by Researchers at National University (Glycosylation-Based Serum Biomarkers for Cancer Diagnostics and Prognostics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cancer Research is now available. According to news reporting originating from Galway, Ireland, by NewsRx correspondents, research stated, "Cancer is the second most common cause of death in developed countries with approximately 14 million newly diagnosed individuals and over 6 million cancer-related deaths in 2012. Many cancers are discovered at a more advanced stage but better survival rates are correlated with earlier detection."

Financial support for this research came from Science Foundation Ireland.

Our news editors obtained a quote from the research from National University, "Current clinically approved cancer biomarkers are most effective when applied to patients with widespread cancer. Single biomarkers with satisfactory sensitivity and specificity have not been identified for the most common cancers and some biomarkers are ineffective for the detection of early stage cancers. Thus, novel biomarkers with better diagnostic and prognostic performance are required. Aberrant protein glycosylation is well known hallmark of cancer and represents a promising source of potential biomarkers. Glycoproteins enter circulation from tissues or blood cells through active secretion or leakage and patient serum is an attractive option as a source for biomarkers from a clinical and diagnostic perspective. A plethora of technical approaches have been developed to address the challenges of glycosylation structure detection and determination."

According to the news editors, the research concluded: "This review summarises currently utilised glycoprotein biomarkers and novel glycosylation-based biomarkers from the serum glycoproteome under investigation as cancer diagnostics and for monitoring and prognostics and includes details of recent high throughput and other emerging glycoanalytical techniques."

For more information on this research see: Glycosylation-Based Serum Biomarkers for Cancer Diagnostics and Prognostics. Biomed Research International, 2015;2015():490531.
The news editors report that additional information may be obtained by contacting A. Kirwan, Glycoscience Group, National Centre for Biomedical Engineering Science, National University of Ireland Galway, Galway, Ireland. Additional authors for this research include M. Utratna, M.E. O'Dwyer, L. Joshi and M. Kilcoyne.

Oncology - Cancer Research

New Cancer Research Study Findings Reported from University of Ljubljana (Analysing population-based cancer survival - settling the controversies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Cancer Research is now available. According to news reporting originating in Ljubljana, Slovenia, by NewsRx journalists, research stated, "The relative survival field has seen a lot of development in the last decade, resulting in many different and even opposing suggestions on how to approach the analysis. We carefully define and explain the differences between the various measures of survival (overall survival, crude mortality, net survival and relative survival ratio) and study their differences using colon and prostate cancer data extracted from the national population-based cancer registry of Slovenia as well as simulated data."

The news reporters obtained a quote from the research from the University of Ljubljana, "The colon and prostate cancer data demonstrate clearly that when analysing population-based data, it is useful to split the overall mortality in crude probabilities of dying from cancer and from other causes. Complemented by net survival, it provides a complete picture of cancer survival in a given population. But when comparisons of different populations as defined for example by place or time are of interest, our simulated data demonstrate that net survival is the only measure to be used."

According to the news reporters, the research concluded: "The choice of the method should be done in two steps: first, one should determine the measure of interest and second, one should choose among the methods that estimate that measure consistently."

For more information on this research see: Analysing population-based cancer survival - settling the controversies. BMC Cancer, 2016;16():1-8. BMC Cancer can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. (BioMed Central - www.biomedcentral.com/; BMC Cancer - www.biomedcentral.com/bmccancer/)

New Cancer Risk Data Have Been Reported by X. Fang and Co-Authors (Polymorphisms in GEMIN4 and AGO1 Genes Are Associated with the Risk of Lung Cancer: A Case-Control Study in Chinese Female Non-Smokers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Cancer Risk is the subject of a report. According to news reporting originating from Shenyang, People's Republic of China, by NewsRx correspondents, research stated, "MicroRNA biosynthesis genes can affect the regulatory effect of global microRNAs to target mRNA and hence influence the genesis and development of human cancer. Here, we selected five single nucleotide polymorphisms (SNPs) (rs7813, rs2740349, rs2291778, rs910924, rs595961) in two key microRNA biosynthesis genes (GEMIN4 and AGO1) and systematically evaluated the association between these SNPs, the gene-environment interaction and lung cancer risk."

Our news editors obtained a quote from the research, "To control the impact of cigarette smoking on lung cancer, we recruited Chinese female non-smokers for the study. The total number of lung cancer cases and cancer-free controls were 473 and 395 in the case-control study. Four SNPs showed statistically significant associations with lung cancer risk. After Bonferroni correction, rs7813 and rs595961 were evidently still associated with lung cancer risk. In the stratified analysis, our results revealed that all five SNPs were associated with the risk of lung adenocarcinoma; after Bonferroni correction, significant association was maintained for rs7813, rs910924 and rs595961. Haplotype analysis showed GEMIN4 haplotype C-A-G-T was a protective haplotype for lung cancer. In the combined unfavorable genotype analysis, with the increasing number of unfavorable genotypes, a progressively increased gene-dose effect was observed in lung adenocarcinoma. We also found that individuals exposed to cooking oil fumes showed a relatively high risk of lung cancer, but no interactions were found between cooking oil fume exposure or passive smoking exposure with these SNPs, either on an additive scale or a multiplicative scale."

According to the news editors, the research concluded: "Overall, this is the first study showing that rs7813 and rs595961 could be meaningful as genetic markers for lung cancer risk."

For more information on this research see: Polymorphisms in GEMIN4 and AGO1 Genes Are Associated with the Risk of Lung Cancer: A Case-Control Study in Chinese Female Non-Smokers. International Journal of Environmental Research and Public Health, 2016;13 (10):130-142. International Journal of Environmental Research and Public Health can be contacted at: Mdpil Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news editors report that additional information may be obtained by contacting X. Fang, Univ Liaoning Prov, Key Lab Canc Etiol & Intervent, Shenyang 110122, People's Republic of China. Additional authors for this research include Z.H. Yin, X.L. Li, L.Z. Xia and B.S. Zhou.

New Cancer Risk Study Findings Have Been Reported by Investigators at Texas A&M University (Comprehensive site-specific whole genome profiling of stromal and epithelial colonic gene signatures in human sigmoid colon and rectal tissue)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Cancer Risk have been presented. According to news reporting out of College Station, Texas, by NewsRx editors, research stated, "The strength of associations between various exposures (e.g., diet, tobacco, chemopreventive agents) and colorectal cancer risk may partially depend on the complex interaction between epithelium and stroma across anatomic subsites. Currently, baseline data describing genome-wide coding and long noncoding gene expression profiles in the healthy colon specific to tissue type and location are lacking."

Financial support for this research came from HHS | National Institutes of Health (NIH).

Our news journalists obtained a quote from the research from Texas A&M University, "Therefore, colonic mucosal biopsies from 10 healthy participants who were enrolled in a clinical study to evaluate effects of lignan supplementation on gut resiliency were used to characterize the site-specific global gene expression signatures associated with stromal vs. epithelial cells in the sigmoid colon and rectum. Using RNA-seq, we demonstrate that tissue type and location patterns of gene expression and upstream regulatory pathways are distinct. For example, consistent with a key role of stroma in the crypt niche, mRNAs associated with immunoregulatory and inflammatory processes (i.e., CXCL14, ANTXR1), smooth muscle contraction (CALD1), proliferation and apoptosis (GLP2R, IGFBP3), and modulation of extracellular matrix (MMP2, COL3A1, MFAP4) were all highly expressed in the stroma. In comparison, HOX genes (HOXA3, HOXD9, HOXD10, HOXD11, and HOXD-AS2, a HOXD cluster antisense RNA 2), and WNT5B expression were also significantly higher in sigmoid colon compared with the rectum."

According to the news editors, the research concluded: "These findings provide strong impetus for considering colorectal tissue subtypes and location in future observational studies and clinical trials designed to evaluate the effects of exposures on colonic health."

For more information on this research see: Comprehensive site-specific whole genome profiling of stromal and epithelial colonic gene signatures in human sigmoid colon and rectal tissue. *Physiological Genomics*, 2016;48(9):651-659. *Physiological Genomics* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Oncology - Cancer Risk

New Cancer Risk Study Results from Peking Union Medical College Described (Polymorphism of HSD17B1 Ser312Gly with Cancer Risk: Evidence from 66,147 Subjects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Risk. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Hydroxysteroid (17-beta)dehydrogenase 1 (HSD17B1) plays a central role in sex steroid hormone metabolism. HSD17B1 polymorphic variants may contribute to cancer susceptibility."

The news reporters obtained a quote from the research from Peking Union Medical College, "Numerous investigations have been conducted to assess the association between HSD17B1 Ser312Gly polymorphism and cancer risk in multiple ethnicities, yet these have produced inconsistent results. We therefore performed this comprehensive meta-analysis to attempt to provide a quality assessment of the association of interest. Odds ratios (ORs) with 95% confidence intervals (CIs) were used to evaluate the strength of associations. After a systematic literature search of several major public databases, 20 studies involving 29,460 cases and 36,687 controls were included in this meta-analysis. No significant association was found between HSD17B1 Ser312Gly polymorphism and cancer risk. However, Ser312Gly polymorphism showed a significantly decreased risk for Caucasians (there were 44,284 Caucasians for analysis, comprising 19,889 cases and 24,395 controls) in the subgroup analysis by ethnicity (dominant: OR=0.958, 95% CI=0.919-0.998; and allele comparing: OR=0.973, 95% CI=0.947-0.999). And there was the same trend towards risk in the population-based (PB) controls (homozygous: OR=0.951, 95% CI=0.908-0.997 and allele comparing: OR=0.976, 95% CI=0.954-0.999), but not among Asians or hospital-based (HB) controls. In addition, no association was observed in the stratified analysis for breast cancer studies by source of control, ethnicity and quality score. These findings suggested that the HSD17B1 Ser312Gly polymorphism might confer genetic cancer susceptibility in an ethnic-dependent manner, especially among Caucasians."

According to the news reporters, the research concluded: "Well-designed, large-scale studies are warranted to validate these findings."

Our news correspondents report that additional information may be obtained by contacting L. Shi, State Key Laboratory of Molecular Oncology, Dept. of Étiologie and Carcinogenesis, Cancer Institute (Hospital), Peking Union Medical College & Chinese
Academy of Medical Sciences, Beijing, People's Republic of China. Additional authors for this research include X. Yang, X. Dong and B. Zhang.

**Drugs and Therapies - Cancer Therapy**

**New Cancer Therapy Study Findings Have Been Reported by Investigators at Gachon University (New arylated benzo[h]quinolines induce anti-cancer activity by oxidative stress-mediated DNA damage)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cancer Therapy have been published. According to news reporting originating from Inchon, South Korea, by NewsRx correspondents, research stated, "The anti-cancer activity of the benzo[h]quinolines was evaluated on cultured human skin cancer (G361), lung cancer (H460), breast cancer (MCF7) and colon cancer (HCT116) cell lines. The inhibitory effect of these compounds on the cell growth was determined by the MTT assay."

Our news editors obtained a quote from the research from Gachon University, "The compounds 3e, 3f, 3h and 3j showed potential cytotoxicity against these human cancer cell lines. Effect of active compounds on DNA oxidation and expression of apoptosis related gene was studied. We also developed a quantitative method to measure the activity of cyclin-dependent kinases-2 (CDK2) by western blotting in the presence of active compound. In addition, molecular docking revealed that benzo[h]quinolines can correctly dock into the hydrophobic pocket of the targets receptor protein aromatase and CDK2, while their bioavailability/drug-likeness was predicted to be acceptable but requires future optimization."

According to the news editors, the research concluded: "These findings reveal that benzo[h]quinolines act as anti-cancer agents by inducing oxidative stress-mediated DNA damage."

The news editors report that additional information may be obtained by contacting D.K. Yadav, Gachon Univ, Dept. of Pharm, Coll Pharm, Inchon, South Korea. Additional authors for this research include R. Rai, N. Kumar, S. Singh, S. Misra, P. Sharma, P. Shaw, H. Perez-Sanchez, R.L. Mancera, E.H. Choi, M.H. Kim and R. Pratap.

New Cancer Therapy Study Findings Have Been Reported by Investigators at Sun Yat Sen University [Ester-Modified Cyclometalated Iridium(III) Complexes as Mitochondria-Targeting Anticancer Agents]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cancer Therapy have been published. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Organometallic iridium complexes are potent anticancer candidates which act through different mechanisms from cisplatin-based chemotherapy regimens. Here, ten phosphorescent cyclometalated iridium(III) complexes containing 2,2'-bipyridine-4,4'-dicarboxylic acid and its diester derivatives as ligands are designed and synthesized."

The news reporters obtained a quote from the research from Sun Yat Sen University, "The modification by ester group, which can be hydrolysed by esterase, facilitates the adjustment of drug-like properties. The quantum yields and emission lifetimes are influenced by variation of the ester substituents on the Ir(III) complexes. The cytotoxicity of these Ir(III) complexes is correlated with the length of their ester groups. Among them, 4a and 4b are found to be highly active against a panel of cancer cells screened, including cisplatin-resistant cancer cells. Mechanism studies in vitro indicate that they undergo hydrolysis of ester bonds, accumulate in mitochondria, and induce a series of cell-death related events mediated by mitochondria. Furthermore, 4a and 4b can induce pro-death autophagy and apoptosis simultaneously."

According to the news reporters, the research concluded: "Our study indicates that ester modification is a simple and feasible strategy to enhance the anticancer potency of Ir(III) complexes."

Our news correspondents report that additional information may be obtained by contacting C.P. Tan, Sun Yat Sen University Sch Chem, MOE Key Lab Bioinorgan & Synthet Chem, Guangzhou 510275, Guangdong, People's Republic of China. Additional authors for this research include M.H. Chen, X.Y. Hu, R.R. Ye, C.P. Tan, L.N. Ji and Z.W. Mao.

Drugs and Therapies - Cancer Therapy

New Cancer Therapy Study Findings Have Been Reported by Researchers at National Institute of Pharmaceutical Education and Research (An improved approach for predicting drug-target interaction: proteochemometrics to molecular docking)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cancer Therapy have been published. According to news reporting originating from Punjab, India, by NewsRx correspondents, research stated, "Proteochemometric (PCM) methods, which use descriptors of both the interacting species, i.e. drug and the target, are being successfully employed for the prediction of drug-target interactions (DTI). However, unavailability of non-interacting dataset and determining the applicability domain (AD) of model are a main concern in PCM modeling."

Our news editors obtained a quote from the research from the National Institute of Pharmaceutical Education and Research, "In the present study, traditional PCM modeling was improved by devising novel methodologies for reliable negative dataset generation and fingerprint based AD analysis. In addition, various types of descriptors and classifiers were evaluated for their performance. The Random Forest and Support Vector Machine models outperformed the other classifiers (accuracies >98% and >89% for 10-fold cross validation and external validation, respectively). The type of protein descriptors had negligible effect on the developed models, encouraging the use of sequence-based descriptors over the structure-based descriptors. To establish the practical utility of built models, targets were predicted for approved anticancer drugs of natural origin. The molecular recognition interactions between the predicted drug-target pair were quantified with the help of a reverse molecular docking approach. The majority of predicted targets are known for anticancer therapy. These results thus correlate well with anticancer potential of the selected drugs. Interestingly, out of all predicted DTIs, thirty were found to be reported in the ChEMBL database, further validating the adopted methodology."

According to the news editors, the research concluded: "The outcome of this study suggests that the proposed approach, involving use of the improved PCM methodology and molecular docking, can be successfully employed to elucidate the intricate mode of action for drug molecules as well as repositioning them for new therapeutic applications."

For more information on this research see: An improved approach for predicting drug-target interaction: proteochemometrics to molecular docking. Molecular Biosystems, 2016;12(3):1006-14. (Royal Society of Chemistry - www.rsc.org/; Molecular Biosystems - pubs.rsc.org/en/journals/journalissues/mb)

New Cancer Therapy Study Findings Recently Were Reported by Researchers at National Cancer Institute (Phenanthriplatin Acts As a Covalent Poison of Topoisomerase II Cleavage Complexes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Cancer Therapy. According to news reporting out of Bethesda, Maryland, by NewsRx editors, research stated, "Drugs capable of trapping topoisomerase II (Top2), an essential enzyme that cleaves DNA to remove naturally occurring knots and tangles, can serve as potent anticancer agents. The monofunctional platinum agent phenanthriplatin, cis-[Pt(NH3)(2)(phenanthridine)Cl] (NO3), is shown here to trap Top2 in addition to its known modes of inhibition of DNA and RNA polymerases."

Financial support for this research came from National Cancer Institute.

Our news journalists obtained a quote from the research from National Cancer Institute, "Its potency therefore combines diverse modes of action by which phenanthriplatin kills cancer cells. The observation that phenanthriplatin can act as a Top2 poison highlights opportunities to design nonclassical platinum anticancer agents with this novel mechanism of action. Such complexes have the potential to overcome current limitations with chemotherapy, such as resistance, and to provide treatment options for cancers that do not respond well to classical agents."

According to the news editors, the research concluded: "Covalent DNA-platinum lesions implicated in Top2 poisoning are distinctive from those generated by known therapeutic topoisomerase poisons, which typically exert their action by reversible binding at the interface of Top2-DNA cleavage complexes."

For more information on this research see: Phenanthriplatin Acts As a Covalent Poison of Topoisomerase II Cleavage Complexes. ACS Chemical Biology, 2016;11(11):2996-3001. ACS Chemical Biology can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. Drugs and Therapies - Cancer Therapy

New Cancer Therapy Study Findings Recently Were Reported by Researchers at Uppsala University (Characterizing and Controlling the Loading and Release of Cationic Amphiphilic Peptides onto and from PEG-Stabilized Lipodisks)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Cancer Therapy have been presented. According to news reporting originating in Uppsala, Sweden, by NewsRx journalists, research stated, "Recent studies have identified PEG-stabilized lipid nanodisks (lipodisks) as promising carriers for cationic amphiphilic peptides with antimicrobial and anticancer activity. Using fluorimetric and nanogravimetric methods, we have in; this work characterized the parameters describing and controlling the binding of three selected peptides (melittin, LL37, and magainin 2) onto lipodisks."

Financial support for this research came from Cancerfonden.

The news reporters obtained a quote from the research from Uppsala University, "It was found that the affinity of melittin for lipodisks is independent of the disk size and rim charge. On the other hand, the number of binding sites is strongly dependent on both parameters, with the highest loading being obtained for small disks with a negatively charged rim. An optimized composition of the lipodisks was utilized to study the loading of antimicrobial peptides magainin 2 and human LL37. It was observed that although magainin 2 can be loaded in large amounts, it is released very fast upon dilution, which limits future therapeutic applications. In contrast, LL37 can be loaded at relevant concentrations and the formulation is stable."

According to the news reporters, the research concluded: "This opens up for applications of LL37-loaded lipodisks as antibiotics and in anticancer treatments."

Our news correspondents report that additional information may be obtained by contacting V.A. Hernandez, Uppsala University, Dept. of Chem BMC, SE-75123 Uppsala, Sweden. Additional authors for this research include K. Edwards, K. Andersson and V.A. Hernandez.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.langmuir.6b03012. This DOI is a link to an online electronic document that is either free or for purchase.

New Cancer Therapy Study Results from Emory University Described (Metabolism, Biochemical Actions, and Chemical Synthesis of Anticancer Nucleosides, Nucleotides, and Base Analogs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Cancer Therapy is now available. According to news originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "Nucleoside, nucleotide, and base analogs have been in the clinic for decades to treat both viral pathogens and neoplasms. More than 20% of patients on anticancer chemotherapy have been treated with one or more of these analogs."

Financial support for this research came from U.S. Department of Health and Human Services.

Our news journalists obtained a quote from the research from Emory University, "This review focuses on the chemical synthesis and biology of anticancer nucleoside, nucleotide, and base analogs that are FDA-approved and in clinical development since 2000. We highlight the cellular biology and clinical biology of analogs, drug resistance mechanisms, and compound specificity towards different cancer types. Furthermore, we explore analog syntheses as well as improved and scale-up syntheses."

According to the news editors, the research concluded: "We conclude with a discussion on what might lie ahead for medicinal chemists, biologists, and physicians as they try to improve analog efficacy through prodrug strategies and drug combinations."

The news correspondents report that additional information may be obtained from R.F. Schinazi, Emory University, Sch Med, Dept. of Pediat, Center AIDS ResLab Biochem Pharmacol, Atlanta, GA 30322, United States. Additional authors for this research include X. Lu, J.A. Hollenbaugh, J.H. Cho, F. Amblard and R.F. Schinazi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.chemrev.6b00209. This DOI is a link to an online electronic document that is either free or for purchase.

New Carcinogenesis Study Findings Reported from Health Sciences Center (Withaferin A Suppresses the Up-Regulation of Acetyl-CoA Carboxylase 1 and Skin Tumor Formation in a Skin Carcinogenesis Mouse Model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Carcinogenesis. According to news reporting out of Shreveport, Louisiana, by NewsRx editors, research stated, "Withaferin A (WA), a natural product derived from Withania somnifera, has been used in traditional oriental medicines to treat neurological disorders. Recent studies have demonstrated that this compound may have a potential for cancer treatment and a clinical trial has been launched to test WA in treating melanoma."

Our news journalists obtained a quote from the research from Health Sciences Center, "Herein, WA's chemopreventive potential was tested in a chemically-induced skin carcinogenesis mouse model. Pathological examinations revealed that WA significantly suppressed skin tumor formation. Morphological observations of the skin tissues suggest that WA suppressed cell proliferation rather than inducing apoptosis during skin carcinogenesis. Antibody Micro array analysis demonstrated that WA blocked carcinogen-induced up-regulation of acetyl-CoA carboxylase 1 (ACC1), which was further confirmed in a skin cell transformation model. Overexpression of ACC1 promoted whereas knockdown of ACC1 suppressed anchorage-independent growth and oncogene activation of transformable skin cells. Further studies demonstrated that WA inhibited tumor promoter-induced ACC1 gene transcription by suppressing the activation of activator protein 1. In melanoma cells, WA was also able to suppress the expression levels of ACC1. Finally, results using human skin cancer tissues confirmed the up-regulation of ACC1 in tumors than adjacent normal tissues."

According to the news editors, the research concluded: "In summary, our results suggest that withaferin A may have a potential in chemoprevention and ACC1 may serve as a critical target of WA."

Our news journalists report that additional information may be obtained by contacting Y.F. Zhao, LSU Hlth Sci Center Shreveport, Dept. of Pharmacol Toxicol & Neurosci, Shreveport, LA 71130, United States. Additional authors for this research include C.J. Zhang, H.Y. Du, V. Huang, B. Sun, J.P. Harris, Q. Richardson, X.G. Shen, R. Jin, G.H. Li, C.G. Kevil, X. Gu, R.H. Shi and Y.F. Zhao.

Oncology - Carcinomas

New Carcinomas Findings Has Been Reported by Investigators at Guangxi Medical University (CCL18 From Tumor-Cells Promotes Epithelial Ovarian Cancer Metastasis via mTOR Signaling Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Carcinomas. According to news reporting originating from Nanning, People's Republic of China, by NewsRx correspondents, research stated, "CCL18 is a chemotactic cytokine involved in the pathogenesis and progression of various disorders, including cancer. Previously, our results showed high levels of CCL18 in the serum of epithelial ovarian carcinoma patients suggesting its potential as a circulating biomarker."

Our news editors obtained a quote from the research from Guangxi Medical University, "In this study, we determined that CCL18 expression was up-regulated in ovarian carcinoma compared with adjacent tissue and was expressed in carcinoma cells in the tumor and not in normal ovarian epithelial cells by laser capture microdissection coupled with real-time RT-PCR. Moreover, correlation analysis showed that the CCL18 level was positively correlated with the metastasis of patients with ovarian cancer. Survival analysis also revealed that an increased level of CCL18 was associated with worse survival time in ovarian cancer patients. Over-expression of CCL18 led to enhanced migration and invasion of the Skov3 ovarian cancer cell line in vitro and in vivo. Finally, proteomics analysis demonstrated that CCL18-mediated ovarian cancer invasiveness was strongly correlated with the mTORC2 pathway."

According to the news editors, the research concluded: "These findings suggest that the CCL18 chemokine has an important role in chemokine-mediated tumor metastasis, and may serve as a potential predictor for poor survival outcomes for ovarian cancer."

The news editors report that additional information may be obtained by contacting L. Li, Guangxi Med Univ, Affiliated Canc Hosp, Res Department, Nanning 530021, Gaungxi, People's Republic of China. Additional authors for this research include Y. Tang, H.J. Yu, Q.Y. Yin, M.D. Li, L.J. Shi, W. Zhang, D.R. Li and L. Li.

New Carcinomas Findings Reported from University Hospital
(Pazopanib in Renal Cell Carcinoma Dialysis Patients: A Mini-Review and a Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Carcinomas have been presented. According to news originating from Parma, Italy, by NewsRx correspondents, research stated, "Sporadic data are available about pazopanib use in patients with metastatic renal cell carcinoma (mRCC) undergoing dialysis and no systematic review has been previously performed about this issue. The objective of the present mini-review is to provide an overview of clinical outcomes of pazopanib in this population, in order to support the clinical oncologist for the treatment choice and management."

Our news journalists obtained a quote from the research from University Hospital, "All the literature ever published about mRCC dialysis patients receiving pazopanib, until August 2015, was evaluated: only two case series emerged from our search and one more patient from our department was also included, with a total of 11 mRCC dialysis patients overall. Moreover, we described our case of intrapatient dose titration of pazopanib during dialysis. The continued treatment schedule, the short half-life, the predominantly hepatic metabolism, the wide possibility of dose modulation, the favorable tolerability profile and the similar efficacy respect to sunitinib represent factors in favor of pazopanib as first line mRCC treatment in dialysis patients. The knowledge and the good management of toxicity during pazopanib treatment can lead, also in dialysis patients, to the best and longest application of the drug, taking into account the concept of a dose escalation guided by toxicity as a marker of efficacy."

According to the news editors, the research concluded: "The review, together with our single case report, confirmed the efficacy, the good tolerability and the maneuverability of pazopanib treatment in mRCC patients undergoing dialysis."

The news correspondents report that additional information may be obtained from M. Bersanelli, University Hospital of Parma, Via Gramsci 14, 43126, Parma, Italy. Additional authors for this research include F. Facchinetti, M. Tiseo, M. Maiorana and S. Buti.

New Carcinomas Findings from Henan University Outlined (Abnormal expressed long non-coding RNA IRAIN inhibits tumor progression in human renal cell carcinoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Carcinomas is now available. According to news reporting originating from Kaifeng, People's Republic of China, by NewsRx correspondents, research stated, "The long non-coding RNA (lncRNA) IRAIN has been verified to have key roles in tumor biology. The aim of this study was to explore its expression and biological functions in human renal cell carcinoma (RCC) cells."

Our news editors obtained a quote from the research from Henan University, "Quantitative RT-PCR was applied to detect the RNA expression of IRAIN in RCC tissues and cell lines when compared with respective controls. MTT and flow cytometry methods were respectively used to monitor the cell proliferation and apoptosis of 786-O cells after IRAIN was overexpressed. Altered expression of cyclin D1 and Bax was determined by immunoblotting. Xenograft models were finally carried out to confirm the roles of IRAIN in RCC in vivo. IRAIN expression was found to be remarkably decreased in RCC tissues and cell lines. Its overexpression in 786-O cells significantly inhibited cell proliferation and promoted apoptosis. We further demonstrated that cyclin D1 was reduced while apoptosis promoting protein Bax was elevated in IRAIN-overexpressed 786-O cells. Importantly, we found that IRAIN overexpression could suppress in vivo tumorigenesis of RCC, reflected by tumor volume and tumor weight measurement."

According to the news editors, the research concluded: "IRAIN might serve as a novel tumor suppressing lncRNA and a potential therapeutic target in RCC treatment."

For more information on this research see: Abnormal expressed long non-coding RNA IRAIN inhibits tumor progression in human renal cell carcinoma cells. Open Life Sciences, 2016;11(1):200-205. Open Life Sciences can be contacted at: De Gruyter Open Ltd, Bogumila Zuga 32A St, 01-811 Warsaw, Poland.

The news editors report that additional information may be obtained by contacting C.Y. Zhu, Henan Univ, Huaie Hosp, Dept. of Urol Surg, Kaifeng 475000, Henan Province, People's Republic of China. New Carcinomas Study Findings Have Been Reported by Investigators at Central South University (Autophagy prevents sensitizes AKTi-1/2-induced antihepatocellular carcinoma cell activity in vitro and in vivo)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Carcinomas. According to news reporting from Changsha, People's Republic of China, by NewsRx journalists, research stated, "Molecule-targeted therapy has become the research focus for hepatocellular carcinoma (HCC). Persistent PI3K-AKT activation is often detected in HCC, representing a valuable oncotarget for treatment."

The news correspondents obtained a quote from the research from Central South University, "Here, we tested the anti-HCC activity by a potent AKT inhibitor: AKT inhibitor 1/2 (AKTi-1/2). In both established (HepG2 and Huh-7) and primary human HCC cells, treatment with AKTi-1/2 inhibited cell survival and proliferation, but induced cell apoptosis. AKII-1/2 blocked AI T-mTOR activation, yet simultaneously provoked cytoprotective autophagy in HCC cells.-The latter was evidenced by ATG-5 and Beclin-1 upregulation, p62 downregulation as well as LC3B-GFP puncta formation. Autophagy inhibition, via pharmacological inhibitors (3-methyladenine, ammonium chloride, and bafilomycin A1) or Beclin-1 siRNA knockdown, significantly potentiated AKTi-1/2-induced HepG2 cell death and apoptosis. In nude mice, AKTi-1/2 intraperitoneal injection inhibited HepG2 tumor growth. Significantly, its antitumor activity in vivo was further sensitized when combined with Beclin-1 shRNA knockdown in HepG2 tumors. Together, these results demonstrate that autophagy activation serves as a main resistance factor of AKTi-1/2 in HCC cells."

According to the news reporters, the research concluded: "Autophagy prevention therefore sensitizes AKTi-1/2-induced anti-HCC activity in vitro and in vivo."

For more information on this research see: Autophagy prevention sensitizes AKTi-1/2-induced antihepatocellular carcinoma cell activity in vitro and in vivo. *Biochemical and Biophysical Research Communications*, 2016;480(3):334-340. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Oncology - Carcinomas**

New Carcinomas Study Findings Have Been Reported by Researchers at Research Institute and Hospital (A Prospective Multicenter Trial of the Efficacy and Tolerability of Neoadjuvant Sunitinib for Inoperable Metastatic Renal Cell Carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Carcinomas is now available. According to news reporting from Goyang, South Korea, by NewsRx journalists, research stated, "This study..."
aimed to evaluate the efficacy, safety, and tolerability of 2-cycled neoadjuvant sunitinib therapy (NST) in patients with inoperable metastatic renal cell carcinoma (mRCC). Between 2009 and 2012, 14 patients with inoperable mRCC from 5 Korean academic centers were prospectively enrolled after collecting their clinicopathological data and completing health-related questionnaires."

Financial supporters for this research include Pfizer, Korean Urological Oncology Society, National Cancer Center.

The news correspondents obtained a quote from the research from Research Institute and Hospital, "The best overall response (BOR), safety profile, and changes in quality of life during NST were assessed using the RECIST criteria (version 1.0), CTCAE criteria (version 4.0), and the Cancer Quality of Life Questionnaire (QLQ-C30). Among the 14 patients, 9 patients (64.3%) experienced partial response or stable disease state, and 5 patients (35.7%) did not complete treatment, with 1 case of disease progression (7.1%), 3 grade 3 adverse events (21.4%), and 1 voluntary withdrawal (7.1%). Four patients (28.6%) were successfully converted to an operable state and underwent surgery after NST. The BOR for the primary renal lesions was 22.2%, with a median 1.3-cm diameter reduction (range: 0-2.8 cm) from a baseline diameter of 10.3 cm (range: 6.6-15.8 cm). The other 18 measurable metastatic lesions exhibited a BOR of 55.6%. The QLQ-C30 questionnaire results revealed significant improvements in the quality of life domain, although we observed significant increases in the scores for fatigue, nausea and vomiting, and the financial effects of NST (P < 0.05)."

According to the news reporters, the research concluded: "Two-cycle NST provided limited efficacy for resectability of inoperable mRCC, despite mild improvements in the BOR of the primary lesion and quality of life."

For more information on this research see: A Prospective Multicenter Trial of the Efficacy and Tolerability of Neoadjuvant Sunitinib for Inoperable Metastatic Renal Cell Carcinoma. *Journal of Korean Medical Science*, 2016;31(12):1983-1988. *Journal of Korean Medical Science* can be contacted at: Korean Acad Medical Sciences, 302 75 Dong Du Ichon, Dong Yongsan Ku, Seoul 140 031, South Korea.

Our news journalists report that additional information may be obtained by contacting J. Chung, Natl Canc Center, Res Inst & Hosp, Center Prostate Canc, Dept. of Urol, Goyang 10408, South Korea. New Carcinomas Study Findings Have Been Reported from Midwestern University (Tocotrienol Nanoemulsion Platform of Curcumin Elicit Elevated Apoptosis and Augmentation of Anticancer Efficacy against Breast and Ovarian Carcinomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Carcinomas. According to news reporting originating in Glendale, Arizona, by NewsRx journalists, research stated, "Vitamin E (VE) tocotrienols (T3), recognized for their cancer-specific anti-proliferative and pro-apoptotic activities, have been previously fabricated into bio-active nanoemulsion (NE) formulations. Here, our viscosity-adapted delta-T3 NE platform was developed to additionally incorporate curcumin (CUR), which is known for its potent suppression of signaling pathways involved in malignant cell growth, survival and metastasis."

The news reporters obtained a quote from the research from Midwestern University, "Thanks to efficient 70:30 wt % surfactant mix of Lutrol F-127: VE-TPGS, in conjunction with optimal CUR loading, a prototype CUR in delta-T3 NE was successfully prepared. Model CUR/delta-T3 NE demonstrated excellent nano-scale aspects (mean particle size = 261 nm, PDI = 0.27, and zeta-potential = 35 mV), pharmaceutical stability, and controlled release properties. Suitability for systemic administration was also verified via standardized in vitro biocompatibility and hemocompatibility assays. In two human cancer cells (MCF-7 and OVCAR-8), our CUR/delta-T3 NE prominently suppressed constitutive NF-kappa B activation, and significantly induced apoptosis. Finally, the combined CUR/delta-T3 NE produced superior cytotoxicity profiles, in concentration-and time-dependent manners (p <= 0.05), at least three to four folds lower IC50 than in closest CUR control."

According to the news reporters, the research concluded: "The strong synergism, estimated in both cultured carcinomas, revealed the augmented therapeutic efficacy of our CUR/delta-T3 NE combined platform, supporting its strong potential towards pharmaceutical development for cancer therapy."

For more information on this research see: Tocotrienol Nanoemulsion Platform of Curcumin Elicit Elevated Apoptosis and Augmentation of Anticancer Efficacy against Breast and Ovarian Carcinomas. *International Journal of Molecular Sciences*, 2016;17(11):522-538. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Oncology - Carcinomas

New Carcinomas Study Findings Recently Were Reported by Researchers at Emory University (Onodera's Prognostic Nutritional Index as an Independent Prognostic Factor in Clear Cell Renal Cell Carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Carcinomas are discussed in a new report. According to news reporting originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "To evaluate the relationship between the Onodera Prognostic Nutritional Index (OPNI) and overall survival, as well as recurrence-free survival, in clear cell renal cell carcinoma (ccRCC) patients following nephrectomy. Three hundred forty-one patients who underwent nephrectomy for ccRCC were analyzed."

Our news editors obtained a quote from the research from Emory University, "The optimum OPNI cutoff score of 44.7 was determined by receiver operating characteristic analysis and patients were placed in either the low or high OPNI group, with OPNI values of \( \leq 44.7 \) and \( \geq 44.8 \), respectively. Kaplan-Meier analysis was performed to evaluate the univariate impact of the OPNI groups on overall survival and recurrence-free survival. OPNI's association with overall survival and recurrence-free survival, with adjustments for other patient and tumor qualities, was assessed with univariate and multivariate Cox regression analysis. Median (95% CI) overall survival times for the low and high OPNI groups were 21.1 months and 37.9 months, respectively. OPNI was determined to be an independent prognostic factor in multivariate analysis, and after controlling for patient and tumor characteristics, the low OPNI group experienced a 1.67-fold (hazard ratio: 1.67, 95% confidence interval: 1.05-2.68) increased risk of overall mortality."

According to the news editors, the research concluded: "Preoperative OPNI is a valuable independent prognostic indicator of overall survival and recurrence-free survival in patients with ccRCC following nephrectomy."

The news editors report that additional information may be obtained by contacting V.A. Master, Emory University, Dept. of Urol, Emory Winship Canc Inst, Atlanta, GA 30322, United States. Additional authors for this research include D. Patil, Y. Baum, P.T. Nieh, M. Alemozaffar, J.G. Pattaras, K. Ogan and V.A. Master.

New Carcinomas Study Findings Recently Were Reported by Researchers at People's Liberation Army (Association of Vasculogenic Mimicry Formation and CD133 Expression with Poor Prognosis in Ovarian Cancer)

According to news reporting originating from Shijiazhuang, People's Republic of China, by NewsRx correspondents, research stated, "This study was conducted to investigate the association of vasculogenic mimicry (VM) formation and CD133 expression with the clinical outcomes of patients with ovarian cancer. This retrospective study was performed in 120 ovarian carcinoma samples."

Our news editors obtained a quote from the research from People's Liberation Army, "VM formation and CD133 expression was identified with CD31/periodic acid-Schiff double-staining and CD133 immunohistochemical staining. Collected clinical and pathological data included age at diagnosis, histologic type, tumor grade, tumor stage, lymph node metastases and response to chemotherapy. The overall survival time was calculated. VM was identified in 52 (43%) of 120 ovarian carcinoma tissues and CD133 expression was found in 56 (47%) cases. Both VM formation and CD133 expression were associated with advanced tumor stage, high-grade carcinoma and non-response to chemotherapy (p < 0.05). They were also associated with shorter overall survival time (p < 0.05) by log-rank test. Combined marker of VM formation and CD133 expression was associated with high-grade ovarian carcinoma, late-stage disease, non-response to chemotherapy and shorter overall survival time (p < 0.05). VM formation and CD133 expression can provide additional prognostic information for patients with ovarian cancer."

According to the news editors, the research concluded: "Combined marker of VM formation and CD133 expression may be a potent predictor for poor prognosis for patients with ovarian cancer."

For more information on this research see: Association of Vasculogenic Mimicry Formation and CD133 Expression with Poor Prognosis in Ovarian Cancer. Gynecologic and Obstetric Investigation, 2016;81(6):529-536. Gynecologic and Obstetric Investigation can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. Oncology - Carcinomas

New Carcinomas Study Findings Reported from Capital Medical University (miR-19a correlates with poor prognosis of clear cell renal cell carcinoma patients via promoting cell proliferation and suppressing PTEN/SMAD4 expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Carcinomas are presented in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "MicroRNAs (miRNAs) were reported to be involved in the development of clear cell renal cell carcinoma (ccRCC). However, the study on miRNAs in ccRCC is far from complete."

The news correspondents obtained a quote from the research from Capital Medical University, "The present study identified miRNAs which could act as potential novel prognostic markers for ccRCC, and analyzed its possible mechanism. We found that miR-19a correlated with poor prognosis of ccRCC patients via promoting cell proliferation and suppressing PTEN/SMAD4 expression. Both the microarray screening result and TCGA KIRC dataset analysis showed that miR-19a was significantly upregulated in ccRCC tissues, and further analysis of TCGA data revealed that the upregulated level of miR-19a was strongly associated with advanced T stage and poor prognosis of ccRCC patients. Consistent with clinical observations, miR-19a overexpression significantly promoted ccRCC cell proliferation in vitro. To further explore the mechanism by which miR-19a correlated with cell proliferation and poor prognosis of ccRCC, we performed gene set enrichment analysis (GSEA) for target genes of miR-19a in ccRCC patients. Result indicated that the key target genes of miR-19a included SMAD4 and PTEN. In ccRCC tissues, expression levels of SMAD4 and PTEN were negatively correlated with expression level of miR-19a, revealing that miR-19a suppressed the expression of SMAD4 and PTEN in ccRCC patients. miR-19a overexpression significantly suppressed the expression of SMAD4 and PTEN in vitro, further verifying that SMAD4 and PTEN were the target genes of miR-19a in ccRCC cells."

According to the news reporters, the research concluded: "Our results elucidated the tumor promoting role of miR-19a and established miR-19a as a potential novel prognostic marker for ccRCC."

**Oncology - Carcinomas**

**New Carcinomas Study Results Reported from H.B. Hu et al (Three Circulating LncRNA Predict Early Progress of Esophageal Squamous eNN Carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Carcinomas are discussed in a new report. According to news originating from Huaian, People's Republic of China, by NewsRx correspondents, research stated, "Previous studies revealed that circulating (either from plasma or serum) long non-coding RNA may predict the occurrence or prognosis of multiple human malignant tumors. In this study, we mainly explored whether circulating IncRNAs can be utilized as biomarkers predicting the development of human esophageal squamous cell carcinoma (ESCC)."

Our news journalists obtained a quote from the research, "LncRNA microarray was applied to screen the potential biomarkers for ESCC. Each group contained three individual plasma samples. A multi-stage validation and risk score formula detection were used for validation. Eleven dysregulated IncRNAs were obtained after Venny analysis. Further validation in a larger cohort including 205 ESCC patients, 82 patients suffering from esophagus dysplasia and 210 healthy controls confirmed that increased Linc00152, CFLAR-AS1 and POU3F3 might be potential biomarkers for predicting the early progress with an area under curve (AUC) of 0.698, 0.651 and 0.584, respectively. The merged AUC of the three factors and merged with CEA was 0.765 and 0.955, respectively. We also revealed that circulating levels of three IncRNAs were associated with poor post surgery prognosis of ESCC patients."

According to the news editors, the research concluded: "The three circulating IncRNAs might serve as potential biomarkers for predicting the early occurrence of ESCC."

The news correspondents report that additional information may be obtained from H.B. Hu, Xuzhou Med Univ, Affiliated Huaian Hosp, Dept. of Cardiothorac Surg, Huaian, People's Republic of China. Additional authors for this research include H.Y. Jie and X.X. Zheng.

New Carcinomas Study Results from Division of Gynecology Oncology Described (The effect of adjuvant radiation on survival in early stage clear cell ovarian carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Carcinomas. According to news reporting originating in Toronto, Canada, by NewsRx journalists, research stated, "To assess the impact of adjuvant radiotherapy (RT) on survival in patients with stage I and II ovarian clear cell carcinoma (OCCC). Data collection and analysis of stage I and II OCCC patients treated at two tertiary centers in Toronto, between 1995 and 2014, was performed."

The news reporters obtained a quote from the research from the Division of Gynecology Oncology, "Descriptive statistics and Kaplan-Meier survival probability estimates were completed. The log-rank test was used to compare survival curves. 163 patients were eligible. 44 (27%) patients were treated with adjuvant RT: 37 of them received adjuvant chemotherapy (CT), and 7 had RT only. In the no-RT group, there were 119 patients: 83 patients received adjuvant CT and 36 had no adjuvant treatment. The 10 year progression free survival (PFS) was 65% for patients treated with RT, and 59% no-RT patients. There were a total of 41 (25%) recurrences in the cohort: 12 (27.2%) patients in RT group and 29 (243%) in the no-RT group. On multivariable analysis, adjuvant RT was not significantly associated with an increased PFS (0.85 (0.44-1.63) p = 0.63) or overall survival (OS) (0.84 (0.39-1.82) p = 0.66). In the subset of 59 patients defined as high-risk: stage IC with positive cytology and/or surface involvement and stage II: RT was not found to be associated with a better PFS (HR 1.18 (95% CI: 0.55-2.54) or O S(HR 1.04 (95% CI: 0.40-2.69))."

According to the news reporters, the research concluded: "Adjuvant RT was not found to be associated with a survival benefit in patients with stage I and II ovarian clear cell carcinoma or in a high risk subset of patients including stage IC cytology positive/surface involvement and stage II patients."

For more information on this research see: The effect of adjuvant radiation on survival in early stage clear cell ovarian carcinoma. Gynecologic Oncology, 2016;143(2):258-263. New Cardiology Data Have Been Reported by Investigators at University of Colorado (Clinical and biophysical evaluation of variable bipolar configurations during radiofrequency ablation for treatment of ventricular arrhythmias)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news originating from Aurora, Colorado, by NewsRx correspondents, research stated, "Bipolar radiofrequency ablation (bRFA) has been used to create larger ablation lesions and to treat refractory arrhythmias. However, little is known about optimal bRFA settings."

Our news journalists obtained a quote from the research from the University of Colorado, "The purpose of this study was to evaluate various bRFA settings, including active and ground catheter tip orientation and use of variable active and ground catheters during bRFA. Two ablation catheters, 1 active and 1 ground, were oriented across from each other, with viable bovine myocardium in between. The catheter tips were placed in various combinations perpendicular or parallel to the myocardium. The active catheter was either a 3.5-mm externally irrigated or 8-mm tip, and the ground catheter was either a 4-mm, 3.5-mm irrigated, or 8-mm tip. Retrospective analysis was undertaken for all bRFA performed at University of Colorado. The largest and deepest lesions were produced using irrigated active and ground tips, oriented perpendicularly. In 14 cases (10 patients) of bRFA for ventricular tachycardia and premature ventricular complexes, acute success was achieved in 13 of 14 procedures. Long-term success was achieved in 7 of 10 patients, but 3 patients required multiple bRFA ablations. Active and ground catheter tip orientation and type are important determinants of lesion sizes during bRFA. The largest and deepest lesions, without a higher incidence of steam pops, were achieved using 2 irrigated catheters. As the largest published series to date, bRFA ablation can be performed safely and effectively in humans."

According to the news editors, the research concluded: "Larger studies are necessary to better evaluate bRFA efficacy and safety."

The news correspondents report that additional information may be obtained from W.H. Sauer, University of Colorado, Div Cardiol, Sect Cardiac Elect, Aurora, CO 80045, United States. Additional authors for this research include W.S. Tzou, M. Brunnquell, M. Zipse, J.L. Schuller, L.J. Zheng, R.A. Aleong and W.H. Sauer.

New Cardiology Data Have Been Reported by Researchers at LUMC (Heritability of heart rate recovery and vagal rebound after exercise)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiology are presented in a new report. According to news reporting originating from Leiden, Netherlands, by NewsRx correspondents, research stated, "The prognostic power of heart rate recovery (HRR) after exercise has been well established but the exact origin of individual differences in HRR remains unclear. This study aims to estimate the heritability of HRR and vagal rebound after maximal exercise in adolescents."

Financial support for this research came from VU-AMS Revolving Research Fund.

Our news editors obtained a quote from the research from LUMC, "Furthermore, the role of voluntary regular exercise behavior (EB) in HRR and vagal rebound is tested. 491 healthy adolescent twins and their siblings were recruited for maximal exercise testing, followed by a standardized cooldown with measurement of the electrocardiogram and respiratory frequency. Immediate and long-term HRR (HRR60 and HRR180) and vagal rebound (heart rate variability in the respiratory frequency range) were assessed 1 and 3 min after exercise. Multivariate twin modeling was used to estimate heritability of all measured variables and to compute the genetic contribution to their covariance. Heritability of HRR60, HRR180 and immediate and long-term vagal rebound is 60 % (95 % CI: 48-67), 65 % (95 % CI: 54-73), 23 % (95 % CI: 11-35) and 3 % (95 % CI: 0-11), respectively. We find evidence for two separate genetic factors with one factor influencing overall cardiac vagal control, including resting heart rate and respiratory sinus arrhythmia, and a specific factor for cardiac vagal exercise recovery. EB was only modestly associated with resting heart rate (r = -0.27) and HRR (rHRR60 = 0.10; rHRR180 = 0.19) with very high genetic contribution to these associations (88-91 %). Individual differences in HRR and immediate vagal rebound can to a large extent be explained by genetic factors."

According to the news editors, the research concluded: "These innate cardiac vagal exercise recovery factors partly reflect the effects of heritable differences in EB."

For more information on this research see: Heritability of heart rate recovery and vagal rebound after exercise. European Journal of Applied Physiology, 2016;116(11-12):2167-2176. European Journal of Applied Physiology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; European Journal of Applied Physiology - www.springerlink.com/content/1439-6319/)

The news editors report that additional information may be obtained by contacting I. Nederend, LUMC Univ, Medical Center, Dept. of Pediat Cardiol, NL-2333 Leiden, Netherlands. Additional authors for this research include N.M. Schutte, M. Bartels, A.D.J. ten Harkel and E.J.C. de Geus.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s00421-016-3459-y. This DOI is a link to an online electronic document that is either free or for purchase.

New Cardiology Data Have Been Reported by Researchers at Veterans Affairs Medical Center [Selective Assembly of Na,K-ATPase alpha(2) beta(2) Heterodimers in the Heart DISTINCT FUNCTIONAL PROPERTIES AND ISOFORM-SELECTIVE INHIBITORS]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiology. According to news reporting originating from Los Angeles, California, by NewsRx correspondents, research stated, "The Na, K-ATPase alpha(2) subunit plays a key role in cardiac muscle contraction by regulating intracellular Ca2+, whereas alpha(1) has a more conventional role of maintaining ion homeostasis. The beta subunit differentially regulates maturation, trafficking, and activity of alpha-beta heterodimers."

Our news editors obtained a quote from the research from Veterans Affairs Medical Center, "It is not known whether the distinct role of alpha(2) in the heart is related to selective assembly with a particular one of the three beta isoforms. We show here by immunofluorescence and co-immunoprecipitation that alpha(2) is preferentially expressed with beta(2) in T-tubules of cardiac myocytes, forming alpha(2)beta(2) heterodimers. We have expressed human alpha(1)beta(1), alpha(2)beta(1), alpha(2)beta(2), and alpha(2)beta(3) in Pichia pastoris, purified the complexes, and compared their functional properties. alpha(2)beta(2) and alpha(2)beta(3) differ significantly from both alpha(2)beta(1) and alpha(1)beta(1) in having a higher K0.5K+ and lower K0.5Na+ for activating Na, K-ATPase. These features are the result of a large reduction in binding affinity for extracellular K+ and shift of the E1P-E2P conformational equilibrium toward E1P. A screen of perhydro-1,4-oxazepine derivatives of digoxin identified several derivatives (e.g. cyclobutyl) with strongly increased selectivity for inhibition of alpha(2)beta(2) and alpha(2)beta(3) over alpha(1)beta(1) (range 22-33-fold). Molecular modeling suggests a possible basis for isoform selectivity. The preferential assembly, specific T-tubular localization, and low K+ affinity of alpha(2)beta(2) could allow an acute response to raised ambient K+ concentrations in physiological conditions and explain the importance of alpha(2)beta(2) for cardiac muscle contractility."

According to the news editors, the research concluded: "The high sensitivity of alpha(2)beta(2) to digoxin derivatives explains beneficial effects of cardiac glycosides for treatment of heart failure and potential of alpha(2)beta(2)-selective digoxin derivatives for reducing cardiotoxicity."

New Cardiology Findings Reported from Group Health Research Institute (Exploring Provider Reactions to Decision Aid Distribution and Shared Decision Making: Lessons from Two Specialties)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiology is now available. According to news reporting from Seattle, Washington, by NewsRx journalists, research stated, "A critical component of shared decision making (SDM) is the role played by health care providers in distributing decision aids (DAs) and initiating SDM conversations. Existing literature indicates that decisions about designing and implementing DAs must take provider perspectives into account."

The news correspondents obtained a quote from the research from Group Health Research Institute, "However, little is known about how differences in provider attitudes across specialties may impact DA implementation and how provider attitudes may shift after DA implementation. Group Health's Decision Aid Implementation project was carried out in six specialties using 12 video-based DAs for preference-sensitive conditions; this study focused on two of the six specialties. In-depth, qualitative interviews with specialty care providers in two specialties-orthopedics and cardiology-at two time points during DA implementation. Data were analyzed using a thematic analysis approach. We interviewed 19 care providers in orthopedics and cardiology. All respondents believed that providing patients with accurate information on their health conditions and treatment options was important and that most patients wanted an active role in decision making. However, respondents diverged in decision-making styles and views on the practicality and appropriateness of using the DAs and SDM. For example, cardiology specialists were ambivalent about DAs for coronary artery disease because many viewed DAs and SDM as unnecessary or inappropriate for this clinical condition. Provider attitudes towards DAs and SDM were generally stable over two years. Limitations. Limitations include a lack of patient perspectives, social desirability bias, and possible selection bias. Successfully implementing DAs in clinical practice to promote SDM requires addressing individual provider attitudes, beliefs, and knowledge of SDM by specialty."

According to the news reporters, the research concluded: "During DA development and implementation, providers should be asked for input about the specific conditions and care processes that are most appropriate for SDM."

Our news journalists report that additional information may be obtained by contacting C. Hsu, Grp Hlth Res Inst, Seattle, WA 98103, United States. Additional authors for this research include D.T. Liss, D.L. Frosch, E.O. Westbrook and D. Arterburn.
New Cardiology Findings from Baylor University College of Medicine Discussed (Cardiac Lesions in the Critical Care Setting)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiology are discussed in a new report. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "The long-held belief that pregnancy is absolutely contraindicated in maternal cardiovascular disease is no longer justifiable using evidence base medicine."

Our news editors obtained a quote from the research from the Baylor University College of Medicine, "There are some conditions in which pregnancy is contraindicated, and high maternal risk and poor fetal outcome can be predicted. However, in many women with heart disease, a more favorable maternal and fetal outcome is expected."

According to the news editors, the research concluded: "This article focusses on the cardiac conditions that require more attention and have the potential to require observation in the intensive care unit setting."

The news editors report that additional information may be obtained by contacting A.A. Shamshirsaz, Baylor College of Medicine, Div Maternal Fetal Med, Dept. of Obstet & Gynecol, Texas Childrens Pavil Women, Houston, TX 77030, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ogc.2016.07.003. This DOI is a link to an online electronic document that is either free or for purchase.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting originating in Skovde, Sweden, by NewsRx journalists, research stated, "Regenerative therapies hold great potential to change the treatment paradigm for cardiac diseases. Human cardiac progenitor cells can be used for drug discovery in this area and also provide a renewable source of cardiomyocytes."

Financial support for this research came from The Swedish Knowledge Foundation.

The news reporters obtained a quote from the research from the University of Skovde, "However, a better understanding of their characteristics is critical for interpreting data obtained from drug screening using these cells. In the present study, we performed global transcriptional analysis of two important sources of cardiac progenitors, i.e., patient epicardium-derived cells (EPDCs) and cardiac progenitor cells (CPCs) derived from human induced pluripotent stem cells. In addition, we also compared the gene expression profiles of these cells when they were cultured under normoxic and hypoxic conditions. We identified 3,289 mRNAs that were differentially expressed between EPDCs and CPCs. Gene ontology annotation and pathway enrichment analyses further revealed possible unique functions of these two cell populations. Notably, the impact of hypoxia vs normoxia on gene expression was modest and only a few genes (e.g., AK4, ALDOC, BNIP3P1, PGK1, and SLC2A1) were upregulated in EPDCs and CPCs after the cells were exposed to low oxygen for 24 h. Finally, we also performed a focused analysis of the gene expression patterns of a predefined set of 92 paracrine factors. We identified 30 of these genes as differentially expressed, and 29 were expressed at higher levels in EPDCs compared with CPCs."

According to the news reporters, the research concluded: "Taken together, the results of the present study advance our understanding of the transcriptional programs in EPDCs and CPCs and highlights important differences and similarities between these cell populations."

For more information on this research see: Comparative transcriptomic analysis identifies genes differentially expressed in human epicardial progenitors and hiPSC-derived cardiac progenitors. *Physiological Genomics*, 2016;48(11):771-784. *Physiological Genomics* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

**Cardiology**

**New Cardiology Study Findings Have Been Reported by Researchers at Erasmus University Medical Center (Effects of body position on exercise capacity and pulmonary vascular pressure-flow relationships)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiology is now available. According to news reporting out of Brussels, Belgium, by NewsRx editors, research stated, "There has been revival of interest in exercise testing of the pulmonary circulation for the diagnosis of pulmonary vascular disease, but there still is uncertainty about body position and the most relevant measurements. Doppler echocardiography pulmonary hemodynamic measurements were performed at progressively increased workloads in 26 healthy adult volunteers in supine, semirecumbent, and upright positions that were randomly assigned at 24-h intervals."

Our news journalists obtained a quote from the research from Erasmus University Medical Center, "Mean pulmonary artery pressure (mPAP) was estimated from the maximum tricuspid regurgitation jet velocity. Cardiac output was calculated from the left ventricular outflow velocity-time integral. Pulmonary vascular distensibility alpha-index, the percent change of vessel diameter per millimeter mercury of mPAP, was calculated from multipoint mPAP-cardiac output plots. Body position did not affect maximum oxygen uptake (V-O2max), maximum respiratory exchange ratio, ventilatory equivalent for carbon dioxide, or slope of mPAP-cardiac output relationships, which was on average of 1.5 +/- 0.4 mmHg.l(-1).min(-1). Maximum mPAP, cardiac output, and total pulmonary vascular resistance were, respectively, 34 +/- 4 mmHg, 18 +/- 3 l/min, and 1.9 +/- 0.3 Wood units. However, the semirecumbent position was associated with a 10% decrease in maximum workload. Furthermore, cardiac output-workload or cardiac output-V-O2 relationships were nonlinear and variable. These results suggest that body position does not affect maximum exercise testing of the pulmonary circulation when results are expressed as mPAP-cardiac output or maximum total pulmonary vascular resistance. Maximum workload is decreased in semirecumbent compared with upright exercise."

According to the news editors, the research concluded: "Workload or VO2 cannot reliably be used as surrogates for cardiac output."

For more information on this research see: Effects of body position on exercise capacity and pulmonary pressure-flow relationships. *Journal of Applied Physiology*, 2016;121(5):1145-1150. *Journal of Applied Physiology* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

**New Cardiology Study Findings Have Been Reported by Researchers at University Hospital Leicester NHS Trust (Radiation protection training for cardiologists in the era of multiple imaging techniques and complex interventions)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiology is the subject of a report. According to news reporting from Leicester, United Kingdom, by NewsRx journalists, research stated, "Cardiologists are among the heaviest medical users of ionising radiation. This usage is growing in proportion to the expanding range of cardiac diagnostic tests and interventional treatments."

The news correspondents obtained a quote from the research from University Hospital Leicester NHS Trust, "The primary focus of cardiologists is achieving clear diagnoses as well as technically and clinically successful treatments. That has to be set alongside strong awareness of the properties of ionising radiation and associated safety issues."

According to the news reporters, the research concluded: "This article illustrates some of the interplay between contemporary cardiology, radiological techniques, cardiology training and ionising radiation regulations and aims to set context for training and accreditation of cardiologists who use ionising radiation."

Our news journalists report that additional information may be obtained by contacting E.B. Roberts, Univ Hosp Leicester NHS Trust, Dept. of Cardiol, Leicester, Leics, United Kingdom.

### Cardiology

**New Cardiology Study Findings Have Been Reported from P.J. Yu et al (Outcomes of Patients With Prolonged Intensive Care Unit Length of Stay After Cardiac Surgery)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting originating in Bay Shore, New York, by NewsRx journalists, research stated, "To determine in-hospital and post-discharge long-term survival in patients with prolonged intensive care unit (ICU) stays after cardiac surgery. Retrospective, cohort study of cardiac surgery patients from May 2007 to June 2012."

The news reporters obtained a quote from the research, "Single-center cardiac surgery ICU. Patients were grouped according to length of ICU stay: between 1 and 2 weeks, between 2 and 4 weeks, and >4 weeks. None. Of 4,963 patients, 3.3%, 1.6%, and 2.9% of patients stayed 1 to 2 weeks, 2 to 4 weeks, and >4 weeks in the ICU, respectively. In-hospital mortality was 11.1%, 26.6%, and 31.0% for patients with 1 to 2 weeks, 2 to 4 weeks, and >4 weeks ICU stay, respectively. Patients with ICU stays between 1 and 2 weeks had 6 months, 1 year, and 2 year survival rates of 84.4%, 80.0%, and 75.3% after discharge, respectively. Patients with ICU stay between 2 and 4 weeks had similar 6 months, 1 year, and 2 year survival rates of 84.7%, 79.9%, and 74.1%, respectively. In contrast, patients with >4 week ICU stays had significantly lower postdischarge survival rates of 63.3%, 56.4%, and 41.1% at 6 months, 1..."
year, and 2 years, respectively. Postoperative stroke conferred the greatest risk of death within 1 year after discharge (odds ratio 7.6, p = 0.0140). In-hospital mortality rates post-cardiac surgery correlate with length of ICU stay but appear to plateau after 4 weeks."

According to the news reporters, the research concluded: "However, a>4 week ICU length of stay confers a worse long-term outcome post-hospital discharge, especially in patients with postoperative stroke."

Our news correspondents report that additional information may be obtained by contacting P.J. Yu, Hofstra Northwell Sch Med, Dept. of Cardiovasc & Thorac Surg, Bay Shore, NY, United States. Additional authors for this research include H.A. Cassiere, J. Fishbein, R.A. Esposito and A.R. Hartman.

**Cardiology**

**New Cardiology Study Findings Have Been Reported from Queen Mary University (Single-Cell Expression Profiling Reveals a Dynamic State of Cardiac Precursor Cells in the Early Mouse Embryo)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiology. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "In the early vertebrate embryo, cardiac progenitor/precursor cells (CPs) give rise to cardiac structures. Better understanding their biological character is critical to understand the heart development and to apply CPs for the clinical arena."

Our news journalists obtained a quote from the research from Queen Mary University, "However, our knowledge remains incomplete. With the use of single-cell expression profiling, we have now revealed rapid and dynamic changes in gene expression profiles of the embryonic CPs during the early phase after their segregation from the cardiac mesoderm. Progressively, the nascent mesodermal gene Mesp1 terminated, and Nkx2-5+/Tbx5+ population rapidly replaced the Tbx5low+ population as the expression of the cardiac genes Tbx5 and Nkx2-5 increased. At the Early Headfold stage, Tbx5-expressing CPs gradually showed a unique molecular signature with signs of cardiomyocyte differentiation. Lineage-tracing revealed a developmentally distinct characteristic of this population. They underwent progressive differentiation only towards the cardiomyocyte lineage corresponding to the first
heart field rather than being maintained as a progenitor pool. More importantly, Tbx5 likely plays an important role in a transcriptional network to regulate the distinct character of the FHF via a positive feedback loop to activate the robust expression of Tbx5 in CPs."

According to the news editors, the research concluded: "These data expands our knowledge on the behavior of CPs during the early phase of cardiac development, subsequently providing a platform for further study."

The news correspondents report that additional information may be obtained from I. Kokkinopoulos, Translational Medicine and Therapeutics, William Harvey Research Institute, Barts and The London School of Medicine and Dentistry, Queen Mary University of London, London, UK. Additional authors for this research include H. Ishida, R. Saba, P. Ruchaya, C. Cabrera, M. Struebig, M. Barnes, A. Terry, M. Kaneko, Y. Shintani, S. Coppen, H. Shiratori, T. Ameen, C. Mein, H. Hamada, K. Suzuki and K. Yashiro.

**New Cardiology Study Findings Recently Were Reported by Researchers at Beth Israel Deaconess Medical Center (A novel algorithm to predict the QT interval during intrinsic atrioventricular conduction from an electrocardiogram obtained during ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiology. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "QT interval prolongation is a major arrhythmia risk factor. Standard QT interval limits are defined for preserved intrinsic atrioventricular and interventricular conduction."

The news correspondents obtained a quote from the research from Beth Israel Deaconess Medical Center, "However, ventricular pacing (VP) prolongs the QRS duration, induces electrical remodeling, and therefore obscures the intrinsic QT interval. No consensus exists on QT interval monitoring during VP. The aim of this study was to develop an algorithm to predict the QT interval during intrinsic conduction (IC) from the VP electrocardiogram. We measured electrocardiographic intervals QRS, QT, QT(peak), JT(peak), and TpeakTend in 38 participants with cardiac devices and preserved atrioventricular and interventricular conduction. We performed paired measurements in AAI (IC) and DDD (VP) pacing modes at equal heart rates at baseline and after 1 week of VP. We fit linear mixed models to predict IC QT intervals from VP intervals and compared their fit with other proposed methods of IC QT interval estimation. After 1 week of VP, the IC QT interval prolonged while the VP QT interval shortened from their respective baseline values. VP QT interval shortening was due to..."
TpeakTend interval shortening. JT(peak) and QT(peak) intervals prolonged in both pacing modes at 1 week. A formula using VP QT(peak) interval and heart rate closely predicted the IC QT interval (r = 0.94), outperforming other methods, including subtraction of excess QRS duration from the actual QT interval (r = 0.64) and subtraction of fixed values from heart rate corrected QT interval (r = 0.58 and r = 0.69). Validation in 2000 bootstrapped data sets confirmed the models performance (r = 0.93) compared to others (r = 0.430.58).

According to the news reporters, the research concluded: "In patients with VP, a formula using the QT(peak) interval accurately predicts the intrinsic QT interval."

For more information on this research see: A novel algorithm to predict the QT interval during intrinsic atrioventricular conduction from an electrocardiogram obtained during ventricular pacing. Heart Rhythm, 2016;13(10):2076-2082. Heart Rhythm can be contacted at: Elsevier Science Inc. 360 Park Ave South, New York, NY 10010-1710, USA. Cardiology

New Cardiology Study Findings Recently Were Reported by Researchers at Intermountain Medical Center (Reasons for, and outcomes of patients who were referred for a ventricular assist device but were declined: the recent era forgotten ones)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiology. According to news reporting originating in Murray, Utah, by NewsRx journalists, research stated, "Ventricular assist devices (VADs) have a proven survival benefit in select patients with advanced heart failure, yet many patients considered for implantation are declined for various reasons. The outcome of these patients is obscure owing to their exclusion from recent VAD studies."

The news reporters obtained a quote from the research from Intermountain Medical Center, "We aim to compare the outcomes of patients who received a VAD to those who did not. For this study, the Artificial Heart Program's database at Intermountain Medical Center was queried from 2006 to 2012 for patients referred for a VAD. Kaplan-Meier survival analysis was performed with log-rank test determining significance. Of 232 patients included, 118 patients received a VAD and 114 patients did not. The prevailing reason for VAD decline in eligible and willing patients was due to pre-existing illness (39%). Mortality was higher in non-VAD vs. VAD patients (58.8% vs. 35.6%, p<0.001) with a median time-to-death of 67 (IQR:12-314) and
301 (IQR:136-694) d, respectively (p=0.007). In the current era of non-pulsatile VADs, mortality of patients who are considered but not implanted remains high. Additionally, mortality of these patients occurred much sooner."

According to the news reporters, the research concluded: "Educational efforts ensuring timely referral for VAD therapy are important to maximize the number of patients who may benefit."

For more information on this research see: Reasons for, and outcomes of patients who were referred for a ventricular assist device but were declined: the recent era forgotten ones. Clinical Transplantation, 2016;30(3):195-201. (Wiley-Blackwell - www.wiley.com; Clinical Transplantation - onlineibrary.wiley.com/journal/10.1111/(ISSN)1399-0012)

Cardiology

New Cardiology Study Results from A.W. Welsh et al Described (Evaluation of an automated fetal myocardial performance index)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiology. According to news originating from Sydney, Australia, by NewsRx correspondents, research stated, "To compare automated measurements of the fetal left myocardial performance index (MPI) with manual measurements for absolute value, repeatability and waveform acceptability. This was a multicenter international online study using images from uncomplicated, morphologically normal singleton pregnancies (16-38 weeks' gestation)."

Our news journalists obtained a quote from the research, "Single Doppler ultrasound cardiac cycle images of 25 cases were selected, triplicated and randomized (n=75). Six senior observers, unaware of the repetition of images, manually calculated MPI for each waveform and the results were compared with automation. Intraobserver repeatability and interobserver reproducibility were assessed using intraclass correlation coefficients (ICCs) and 95% CI. The agreement between each observer's manualMPI measurements and corresponding automated measurements was evaluated using Bland-Altman plots and ICCs with 95% CI. The degree of variation between experts in the classification of fetal MPI waveform quality was assessed using individual cardiac cycle left MPI images previously classified by two authors as 'optimal', 'suboptimal' or 'unacceptable', with 30 images selected for each quality group. Ten images in each category were duplicated and the resulting 120 images were randomized and then classified online by five observers. The kappa statistic (kappa) was used to demonstrate interobserver and intraobserver agreement and agreement of classifications by the five observers. The automated
measurement software returned the same value for any given image, resulting in an ICC of 1.00. Manual measurements had intraobserver repeatability ICC values ranging from 0.69 to 0.97, and the interobserver reproducibility ICC was 0.78. Comparison of automated vs manual MPI absolute measurements for each observer gave ICCs ranging from 0.77 to 0.96. Interobserver image quality classification agreement gave k=0.69 (P <0.001), and the intraobserver agreement was variable (kappa ranging from 0.40 to 0.81). Automated fetal MPI provides superior repeatability and reproducibility to manual methodology. Additionally, experts vary significantly when classifying suitability of fetal MPI waveforms.

According to the news editors, the research concluded: "Automated MPI may facilitate clinical translation by removing human subjectivity."

The news correspondents report that additional information may be obtained from A.W. Welsh, Univ New South Wales, Sch Womens & Childrens Hlth, Sydney, NSW, Australia. Additional authors for this research include P. Maheshwari, J. Wang, A. Henry, D. Chang, F. Crisi, H.M. Gardiner, E. Hernandez-Andrade, N. Meriki, S. Redmond and S. Yagel.

**New Cardiology Study Results from Q. Xing et al Described (Cardiac performance: a thermal tolerance indicator in scallops)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiology have been presented. According to news reporting from Qingdao, People's Republic of China, by NewsRx journalists, research stated, "Thermal tolerance has become an active research area in marine poikilotherms due to the influence of increased sea temperature caused by global warming. Previous indicators of thermal tolerance in bivalves are generally laborious and time-consuming and even require killing the specimens."

The news correspondents obtained a quote from the research, "In this study, we demonstrated that heart rate (HR) was a stable and reliable indicator for scallop physiological status by applying an infrared-based cardiac performance monitoring system. The feasibility of HR-based Arrhenius break temperatures (ABTs) as a scallop thermal tolerance indicator was evaluated by investigating ABTs of four species with different thermal limits, including the Yesso scallop (Patinopecten yessoensis), the Zhikong scallop (Chlamys farreri), the bay scallop (Argopecten irradians), and the Catarina scallop (Argopecten ventricosus). In accordance with the thermal limits, ABTs of the Yesso scallop, Zhikong scallop, bay scallop, and Catarina scallop were 22.03 +/- 0.19, 29.10 +/- 0.25, 32.20 +/- 0.25, and 34.09 +/- 0.19 degrees C, respectively, suggesting that the ABT could indicate thermal limits in interspecific scallops. Variations in the ABTs were observed among intraspecific scallops with different sizes, weights, and ages, suggesting that smaller and younger scallops tend to have higher thermal
limits. Significant differences in ABT were also observed between pre- and post-spawning individuals, implying that spawning behavior could decrease scallop thermal limits. The above results suggest that HR-based ABT can detect not only interspecific but also intraspecific thermal tolerance in scallops.

According to the news reporters, the research concluded: "This study reports the feasibility of infra-red-based cardiac performance as a rapid, efficient, and noninvasive indicator for bivalve thermal tolerance."

Our news journalists report that additional information may be obtained by contacting L.L. Zhang, Qingdao Natl Lab Marine Sci & Technol, Lab Marine Fisheries Sci & Food Prod Proc, Qingdao, People's Republic of China. Additional authors for this research include Y.P. Li, H.B. Guo, Q. Yu, X.T. Huang, S. Wang, X.L. Hu, L.L. Zhang and Z.M. Bao. Keywords for this news article include: Qingdao, People's Republic of China, Asia, Cardiology.

Cardiology

**New Cardiology Study Results from University of Alberta Described**

(Effect of resveratrol on metabolic and cardiovascular function in male and female adult offspring exposed to prenatal hypoxia and a high-fat diet)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiology. According to news originating from Edmonton, Canada, by NewsRx correspondents, research stated, "Prenatal hypoxia, a common outcome of pregnancy complications, predisposes offspring to the development of metabolic and cardiovascular disorders in later life. We have previously observed that resveratrol improved cardiovascular and metabolic health in adult male rat offspring exposed to prenatal hypoxia and a postnatal high-fat (HF) diet; however, the effects of resveratrol in female rat offspring are not known."

Our news journalists obtained a quote from the research from the University of Alberta, "Our aim was to identify the mechanism(s) by which resveratrol may prevent metabolic and cardiac dysfunction in both male and female rat offspring exposed to prenatal hypoxia and a postnatal HF diet. Offspring that experienced normoxia or hypoxia in utero were fed a HF diet or a HF diet supplemented with resveratrol for 9 weeks following weaning. Body composition, metabolic function, in vivo cardiac function and ex vivo cardiac susceptibility to ischaemia-reperfusion (I/R) injury were assessed at 12 weeks of age. Prenatal hypoxia impaired metabolic function in male, but not female, rat offspring fed a HF diet and this was improved by resveratrol supplementation. Prenatal hypoxia also led to reduced recovery from cardiac I/R injury in male, and to a lesser extent in female, rat offspring fed a HF diet. Indices of cardiac oxidative stress after I/R were enhanced in both male and female rat offspring exposed to prenatal hypoxia. Resveratrol improved cardiac recovery from I/R injury and attenuated
superoxide levels in both male and female rat offspring."

According to the news editors, the research concluded: "Prenatal hypoxia impaired metabolic and cardiac function in a sex-specific manner. Resveratrol supplementation may improve metabolic and cardiovascular health in adult male and female rat offspring exposed to prenatal hypoxia."

The news correspondents report that additional information may be obtained from A. Shah, Dept. of Obstetrics and Gynecology, University of Alberta, Edmonton, Alberta, Canada. Additional authors for this research include L.M. Reyes, J.S. Morton, D. Fung, J. Schneider and S.T Davidge.

Cardiology

New Cardiology Study Results from Walter Reed National Military Medical Center Described (A Quadricuspid Aortic Valve as Seen by Cardiac Magnetic Resonance Imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiology have been presented. According to news reporting originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "We report a case of a 35-year-old active duty male with a rare quadricuspid aortic valve identified via transthoracic echocardiography following the detection of an incidental grade I/VI diastolic murmur."

Our news editors obtained a quote from the research from Walter Reed National Military Medical Center, "Further characterization of the anatomical findings and aortic valve flow dynamics were evaluated with cardiac magnetic resonance imaging. Accurate assessment of the various valve morphologies is essential, as it guides surgical treatment options to correct the defect."

According to the news editors, the research concluded: "Our case highlights the complimentary role of cardiac magnetic resonance imaging in defining the anatomy and functional consequences of a quadricuspid aortic valve."

For more information on this research see: A Quadricuspid Aortic Valve as Seen by Cardiac Magnetic Resonance Imaging. Military Medicine, 2016;181(9):E1177-E1179. Military Medicine can be contacted at: Assoc Military Surg Us, 9320 Old Georgetown Rd, Bethesda, MD 20814, USA.

New Cardiomegaly Findings from Huazhong University of Science and Technology Described (Tanshinone IIA inhibits myocardial remodeling induced by pressure overload via suppressing oxidative stress and inflammation: Possible role of silent ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Cardiomegaly have been presented. According to news reporting originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "Tanshinone IIA (Tan) exerts potential protective effects against cardiovascular diseases. Oxidative stress and inflammation are involved in cardiac hypertrophy."

Financial support for this research came from National Natural Science Foundation of China.

Our news editors obtained a quote from the research from the Huazhong University of Science and Technology, "Activation of silent information regulator 1 (SIRT1) signaling has been suggested to attenuate cardiac hypertrophy. This study aims to evaluate the antioxidative and antiinflammatory effects of Tan treatment in pressure overload-induced myocardial remodeling and elucidate its potential mechanisms. Sprague-Dawley rats were treated with Tan in the absence or presence of the SIRT1 inhibitor sirtinol (SnI) and then subjected to transverse aortic constriction (TAC). Tan conferred cardioprotective effects by improving cardiac function, reducing apoptosis and myocardial remodeling, upregulating SIRT1, Bcl-2 expressions, and downregulating Bax and caspase-3 expressions. Snl attenuated these effects by inhibiting SIRT1 signaling. Tan treatment also reduced myocardium malondialdehyde (MDA) content, and cardiac inflammatory cytokines (TNF-alpha and IL-6) and increased myocardium superoxide dismutase (SOD) level. However, these effects were also abolished by Snl."

According to the news editors, the research concluded: "These results indicate that Tan significantly attenuates TAC-induced myocardial remodeling possibly due to its strong anti-oxidative and anti-inflammatory activity. Importantly, SIRT1 signaling activation is involved in this process."

The news editors report that additional information may be obtained by contacting H.W. Chen, Huazhong University of Science & Technology, Tongji Hosp, Dept. of Emergency Med, Wuhan, People's Republic of China. Additional authors for this research include S.S. Li and H.W. Chen.

Heart Disorders and Diseases - Cardiomegaly

New Cardiomegaly Findings from Jikei University Discussed (Impact of alcohol intake on the relationships of uric acid with blood pressure and cardiac hypertrophy in essential hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Cardiomegaly is the subject of a report. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Hyperuricemia, which is frequently associated with hypertension, can be caused by alcohol intake. To date, limited data have shown the link between alcohol intake and hyperuricemic hypertension."

Our news editors obtained a quote from the research from Jikei University, "We retrospectively examined the influence of alcohol intake on the relationship between the uric acid level and blood pressure or cardio-metabolic parameters in 171 untreated non-failing hypertensive patients (mean 59.3 +/- 10.7 years). Cross-sectional analysis was separately performed in regular alcohol drinkers (more than 25 g/day ethanol, n = 74, 82.4% men) and non-drinkers (n = 97, 33.0% men). Diastolic blood pressure was significantly higher in drinkers than in non-drinkers (101.6 +/- 11.5 mmHg vs. 96.8 +/- 8.2 mmHg, p< 0.01). Estimated glomerular filtration rate (80.4 +/- 14.7 mL/min/1.73 m(2) vs. 80.0 +/- 17.8 mL/min/1.73 m(2)) and body mass index (BMI, 24.7 +/- 4.4 kg/m(2) vs. 24.8 +/- 4.2 kg/m(2)) were similar in the two groups. In the drinker group, the uric acid level (mean 6.3 +/- 1.7 mg/dL) was positively correlated with both systolic and diastolic blood pressures (r = 0.270/p = 0.020 and r = 0.354/p = 0.0020, respectively), and with the markers of cardiac hypertrophy, including electrocardiographic voltage (V1S + V5R, r = 0.244/p = 0.042) and echocardiographic left ventricular mass index (r = 0.270/p = 0.026). These correlations were also observed in the male drinker sub-group. In the nondrinkers, the uric acid level (mean 5.0 +/- 1.4 mg/dL) was positively correlated with BMI (r = 0.369/p = 0.0002) but not with blood pressure or the markers of cardiac hypertrophy. The results suggest that the role of uric acid in blood pressure might differ between hypertensive drinkers and non-drinkers. In regular alcohol drinkers, there was a positive association of uric acid level with blood pressure and the severity of cardiac hypertrophy."

According to the news editors, the research concluded: "In non-regular drinkers, an increased uric acid level is likely to be closely associated with increased BMI."

For more information on this research see: Impact of alcohol intake on the
relationships of uric acid with blood pressure and cardiac hypertrophy in essential hypertension. *Journal of Cardiology*, 2016;68(5-6):447-454. *Journal of Cardiology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Cardiology - www.journals.elsevier.com/journal-of-cardiology/)

Heart Disorders and Diseases - Cardiomegaly

**New Cardiomegaly Study Findings Recently Were Reported by Researchers at State University of Campinas (Increased Circulating Tissue Inhibitor of Metalloproteinase-2 Is Associated With Resistant Hypertension)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Cardiomegaly. According to news reporting out of Sao Paulo, Brazil, by NewsRx editors, research stated, "Resistant hypertension (RH) is associated with organ damage and cardiovascular risk. Evidence suggests the involvement of matrix metalloproteinase 2 (MMP-2) and tissue inhibitor of metalloproteinase 2 (TIMP-2) in hypertension and in cardiovascular remodeling."

Funders for this research include Fundacao de Amparo a Pesquisa do Estado de Sao Paulo, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior.

Our news journalists obtained a quote from the research from the State University of Campinas, "The aim of this study was to assess the levels of MMP-2 and TIMP-2 in RH and its relation with organ damage, including arterial stiffness and cardiac hypertrophy. MMP-2 and TIMP-2 levels were compared among 19 patients with normotension (NT), 116 with nonresistant hypertension (HTN) and 116 patients with resistant HTN (RH). MMP-2 levels showed no differences among NT, HTN, and RH groups, while TIMP-2 levels were higher in RH compared with HTN and NT groups (90.0 [76.1-107.3] vs 70.1 [57.7-88.3] vs 54.7 [40.9-58.1] ng/mL, P<.01), respectively. MMP-2/TIMP-2 ratio was reduced in the RH group compared with the HTN and NT groups (2.7 [1.9-3.4] vs 3.3 [2.6-4.2] vs 4.9 [4.5-5.3], P<.01), respectively. No associations were found between MMP-2 levels, TIMP-2, and MMP-2/TIMP-2 ratio with cardiac hypertrophy and arterial stiffness in the RH and HTN groups. Finally, in a regression analysis, reduced MMP-2/TIMP-2 ratio and increased TIMP-2 levels were
independently associated with RH."

According to the news editors, the research concluded: "The present findings provide evidence that TIMP-2 is associated with RH and might be a possible biomarker for screening RH patients."

Our news journalists report that additional information may be obtained by contacting H. Moreno, Univ Campinas Unicamp, Teaching Hosp, Sao Paulo, Brazil. Heart Disorders and Diseases - Cardiomyopathies

**New Cardiomyopathies Study Findings Have Been Reported by Researchers at University of Melbourne (Diabetic Cardiomyopathy: The Case for a Role of Fructose in Disease Etiology)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Cardiomyopathies is now available. According to news reporting originating in Melbourne, Australia, by NewsRx journalists, research stated, "A link between excess dietary sugar and cardiac disease is clearly evident and has been largely attributed to systemic metabolic dysregulation. Now a new paradigm is emerging, and a compelling case can be made that fructose-associated heart injury may be attributed to the direct actions of fructose on cardiomyocytes."

Financial support for this research came from Diabetes Australia Research Trust. The news reporters obtained a quote from the research from the University of Melbourne, "Plasma and cardiac fructose levels are elevated in patients with diabetes, and evidence suggests that some unique properties of fructose (vs. glucose) have specific cardiomyocyte consequences. Investigations to date have demonstrated that cardiomyocytes have the capacity to transport and utilize fructose and express all of the necessary proteins for fructose metabolism. When dietary fructose intake is elevated and myocardial glucose uptake compromised by insulin resistance, increased cardiomyocyte fructose flux represents a hazard involving unregulated glycolysis and oxidative stress. The high reactivity of fructose supports the contention that fructose accelerates subcellular hexose sugar-related protein modifications,
such as O-GlcNAcylation and advanced glycation end product formation. Exciting recent discoveries link heart failure to induction of the specific high-affinity fructose-metabolizing enzyme, fructokinase, in an experimental setting."

According to the news reporters, the research concluded: "In this Perspective, we review key recent findings to synthesize a novel view of fructose as a cardiopathogenic agent in diabetes and to identify important knowledge gaps for urgent research focus."

restrictive cardiomyopathies. Truncating FLNC mutations were absent in patients with other phenotypes, including 1,078 patients with hypertrophic cardiomyopathy. Fifty-four mutation carriers were identified among 121 screened relatives. The phenotype consisted of left ventricular dilation (68%), systolic dysfunction (46%), and myocardial fibrosis (67%); inferolateral negative T waves and low QRS voltages on electrocardiography (33%); ventricular arrhythmias (82%); and frequent sudden cardiac death (40 cases in 21 of 28 families). Clinical skeletal myopathy was not observed. Penetrance was >97% in carriers older than 40 years. Truncating mutations in FLNC cosegregated with this phenotype with a dominant inheritance pattern (combined logarithm of the odds score: 9.5). Immunohistochemical staining of myocardial tissue showed no abnormal filamin C aggregates in patients with truncating FLNC mutations. Truncating mutations in FLNC caused an overlapping phenotype of dilated and left-dominant arrhythmogenic cardiomyopathies complicated by frequent premature sudden death.

According to the news editors, the research concluded: "Prompt implantation of a cardiac defibrillator should be considered in affected patients harboring truncating mutations in FLNC."

For more information on this research see: Truncating FLNC Mutations Are Associated With High-Risk Dilated and Arrhythmogenic Cardiomyopathies. Journal of the American College of Cardiology, 2016;68(22):2440-2451. Heart Disorders and Diseases - Cardiomyopathies

New Cardiomyopathies Study Results from General Hospital Described [Mangiferin suppressed advanced glycation end products (AGEs) through NF-kB deactivation and displayed anti-inflammatory effects in streptozotocin and high fat diet-diabetic ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Cardiomyopathies. According to news reporting out of Chengdu, People's Republic of China, by NewsRx editors, research stated, "Given the importance of the aggregation of advanced glycation end products (AGEs) and cardiac inflammation in the onset and progression of diabetic cardiomyopathy (DCM), our objective in this study was to demonstrate the
cardioprotective effect of mangiferin, an antidiabetic and anti-inflammatory agent, on diabetic rat model. The DCM model was established by a high-fat diet and a low dose of streptozotocin."

Our news journalists obtained a quote from the research from General Hospital, "DCM rats were treated orally with mangiferin (20 mg/kg) for 16 weeks. Serum and left ventricular myocardium were collected for determination of inflammatory cytokines. AGEs mRNA and protein expression of nuclear factor kappa B (NF-kB) and receptor for AGEs (RAGE) in myocardium were assayed by real-time PCR and Western blot. ROS levels were measured by dihydroethidium fluorescence staining. NF-kB binding activity was assayed by TransAM NF-kB p65 ELISA kit. Chronic treatment with mangiferin decreased the levels of myocardial enzymes (CK-MB, LDH) and inflammatory mediators (TNF-a, IL-1b). Meanwhile, NF-kB is inhibited by the reduction of nuclear translocation of p65 subunit, and mangiferin reduced AGE production and decreased the mRNA and protein expression of RAGE in DCM rats."

According to the news editors, the research concluded: "Our data indicated that mangiferin could significantly ameliorate DCM by preventing the release of inflammatory cytokines, and inhibiting ROS accumulation, AGE/RAGE production, and NF-kB nuclear translocation, suggesting that mangiferin treatment might be beneficial in DCM."

Our news journalists report that additional information may be obtained by contacting J. Hou, a Dept. of Pharmacy, Chengdu Military General Hospital, Chengdu, People's Republic of China. Additional authors for this research include D. Zheng, G. Fung, H. Deng, L. Chen, J. Liang, Y. Jiang and Y. Hu.

Heart Disorders and Diseases - Cardiomyopathies

New Cardiomyopathies Study Results from Washington University Described (Mitochondrial fission/fusion and cardiomyopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Cardiomyopathies have been published. According to news reporting from St. Louis, Missouri, by NewsRx editors, the research stated, "Mitochondria are highly abundant in and essential to the beat-to-beat contractile performance of hearts. However, relatively few cardiac diseases have been attributed to primary mitochondrial dysfunction."

Financial support for this research came from National Institutes of Health.

The news correspondents obtained a quote from the research from Washington University, "The paucity of evidence for 'primary mitochondrial cardiac diseases' may be because such an entity does not exist. Alternately, the consequences of mitochondrial dysfunction on hearts may be so severe that long-term viability is severely impaired and affected individuals are therefore not included in standard genetic screens of adult heart disease subjects."

According to the news reporters, the research concluded: "Here, I review accumulating experimental evidence that impairing mitochondrial fission or fusion causes cardiomyopathy in otherwise normal mice, and consider how these data could motivate screening of perinatal cardiomyopathy subjects for damaging mutations of mitochondrial fission and fusion factors."

Our news journalists report that additional information may be obtained by contacting G.W. Dorn, Washington University, Sch Med, Dept. of Internal Med, Center Pharmacogen, St Louis, MO 63110, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.gde.2016.03.001. This DOI is a link to an online electronic document that is either free or for purchase.

New Cardiovascular Agents Study Findings Have Been Reported from University of Copenhagen [Antiarrhythmic effect of the Ca2+-activated K+ (SK) channel inhibitor ICA combined with either amiodarone or dofetilide in an isolated heart model of ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Cardiovascular Agents. According to news reporting from Copenhagen, Denmark, by NewsRx journalists, research stated, "Dose is an important parameter in terms of both efficacy and adverse effects in pharmacological treatment of atrial fibrillation (AF). Both of the class III antiarrhythmics dofetilide and amiodarone have documented anti-AF effects."

Financial support for this research came from Sundhed og Sygdom, Det Frie Forskningsrad (DK).

The news correspondents obtained a quote from the research from the University of Copenhagen, "While dofetilide has dose-related ventricular side effects, amiodarone primarily has adverse non-cardiac effects. Pharmacological inhibition of small conductance Ca2+-activated K+ (SK) channels has recently been reported to be antiarrhythmic in a number of animal AF models. In a Langendorff model of acutely induced AF on guinea pig hearts, it was investigated whether a combination of the SK channel blocker N-(pyridin-2-yl)-4-(pyridin-2-yl)thiazol-2-amine (ICA) together with either dofetilide or amiodarone provided a synergistic effect. The duration of AF was reduced with otherwise subefficacious concentrations of either dofetilide or amiodarone when combined with ICA, also at a subefficacious concentration. At a concentration level effective as monotherapy, dofetilide produced a marked increase in the QT interval. This QT prolonging effect was absent when combined with ICA at non-efficacious monotherapy concentrations."

According to the news reporters, the research concluded: "The results thereby reveal that combination of subefficacious concentrations of an SK channel blocker and either dofetilide or amiodarone can maintain anti-AF properties, while the risk of ventricular arrhythmias is reduced."

For more information on this research see: Antiarrhythmic effect of the Ca2+-activated K+ (SK) channel inhibitor ICA combined with either amiodarone or dofetilide in an isolated heart model of atrial fibrillation. Pflugers Archiv-European Journal of Physiology, 2016;468(11-12):1853-1863. Pflugers Archiv-European Journal of Physiology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

New Cardiovascular Diseases Data Have Been Reported by Researchers at University of Liverpool (Unstructured treatment interruption: an important risk factor for arterial stiffness in adult Malawian patients with antiretroviral treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases is now available. According to news reporting out of Blantyre, Malawi, by NewsRx editors, research stated, "The aim of the study was to evaluate the impact of unstructured antiretroviral treatment (ART) interruption on arterial stiffness in adult Malawians who are on ART for at least 35 years. The number of treatment interruption events for at least 60 days during ART treatment was quantified in patients for at least 35 years using retrospective routinely collected clinic data."

Our news journalists obtained a quote from the research from the University of Liverpool, "Treatment interruption data were linked to patient carotid-femoral pulse wave velocity (PWV); PWV more than 10 m/s was set as the threshold for clinically significant cardiovascular disease risk. PWV was measured in patients (on ART >= 18 months), during routine ART clinic visits in Blantyre, Malawi, between November 2014 and July 2015. Multivariable linear regression was used to estimate the change in PWV m/s associated with treatment interruption. Multivariable logistic regression was used to estimate risk of PWV more than 10 m/s. All models were controlled for demographic and cardiometabolic risk factors. In 220 patients (median age 45 years, range 37-80 years), 86 (37.4%) patients had at least one treatment interruption event. Median length of treatment interruption events was 75 days (range 31 days to 8 years). Overall, 31 (14%) patients had a PWV more than 10 m/s. In multivariable analysis, we found a 0.2 increase in PWV m/s per treatment interruption event (0.2, 95% confidence interval 0.1-0.4) and a two-fold increased risk of PWV more than 10 m/s per treatment interruption event (adjusted odds ratio 2.2, 95% confidence interval 1.2-4.0). Treatment interruption in patients with ART for at least 35 years is a common and important risk factor for arterial stiffness."

According to the news editors, the research concluded: "Therefore, the link between treatment interruption and cardiovascular disease in this setting in which traditional risks factors are less prevalent needs to be explored further."

For more information on this research see: Unstructured treatment interruption: an important risk factor for arterial stiffness in adult Malawian patients with antiretroviral treatment. Aids, 2016;30(15):2373-2378. Aids can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. New Cardiovascular Diseases Study Findings Have Been Reported by Investigators at University of Barcelona (Role of New Antiplatelet Drugs on Cardiovascular Disease: Update on Cangrelor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases is now available. According to news reporting out of Barcelona, Spain, by NewsRx editors, research stated, "Dual therapy with a P2Y(12) receptor antagonist in addition to aspirin is the antiplatelet treatment of choice in patients with acute coronary syndromes or undergoing percutaneous coronary intervention (PCI). However, available oral P2Y(12) antagonists have several limitations, mostly due to their pharmacological profile, which can affect outcomes in certain clinical settings."

Our news journalists obtained a quote from the research from the University of Barcelona, "Cangrelor is an intravenous, direct-acting, potent P2Y(12) inhibitor with rapid onset and offset of action, which has been recently approved for clinical use in patients undergoing PCI. In clinical trials, cangrelor has demonstrated greater efficacy than clopidogrel with a favorable safety profile among PCI patients not receiving pretreatment with oral P2Y(12) antagonists. However, its definitive role in contemporary practice is yet to be determined."

According to the news editors, the research concluded: "This review aims to provide a comprehensive overview of the current status of knowledge on cangrelor, focusing on its pharmacological properties, clinical development, and the potential applications of this newly available agent."

For more information on this research see: Role of New Antiplatelet Drugs on Cardiovascular Disease: Update on Cangrelor. Current Atherosclerosis Reports, 2016;18 (11):28-37. Current Atherosclerosis Reports can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Health and Medicine - Cardiovascular Electrophysiology are presented in a new report. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "The incidence of unscheduled encounters and problem occurrence between ICD implant and first in-person evaluation (IPE) recommended at 12 weeks is unknown. Automatic remote home monitoring (HM) may be useful in this potentially unstable period."

The news reporters obtained a quote from the research from Heart and Vascular Institute, "ICD patients were randomized 2:1 to HM enabled post-implant (n=908) or to conventional monitoring (CM; n=431). Groups were compared between implant and prior to first scheduled IPE for IPE incidence, causes, and actionability (reprogramming, system revision, medication changes) and event detection time. HM and CM patients were similar (mean age 63 years, 72% male, LVEF 29%, primary prevention 73%, DDD 57%). In the post-implant interval assessed (HM 100 ? 21.3 days vs. CM 101 ? 20.8 days, p=0.54), 85.4% (776/908) HM patients and 87.7% CM (378/431) patients had no cause for IPE (p=0.31). When IPE occurred, actionability in HM (64/177 [36.2%]) was greater versus CM (15/62 [24.2%], p=0.12). Actionable items were discovered sooner with HM (p=0.025). Device reprogramming or lead revision was triggered following 53/177 (29.9%) IPEs in HM versus 9/62 (14.5%) in CM (p=0.018). Arrhythmia detection was enhanced by HM: 276 atrial and ventricular episodes were detected in 135 follow-ups in contrast to CM (65 episodes at 17 IPEs). More silent arrhythmic episodes were discovered by HM (7.2% vs. 1.5% [p=0.15]). Since 27/42 (64.3%) IPEs driven by HM alerts were actionable, event notification was a valuable method for problem detection. Importantly, HM did not increase incidence of non-actionable IPEs (p=0.72).

According to the news reporters, the research concluded: "Activation of automatic remote monitoring should be encouraged soon post-ICD implant."

Our news correspondents report that additional information may be obtained by contacting N. Varma, Heart and Vascular Institute, Cleveland Clinic, Cleveland, Ohio, United States. Additional authors for this research include A.E. Epstein, R. Schweikert, J. Michalski and C.J Love.

Cardiovascular Research

New Cardiovascular Research Data Have Been Reported by Researchers at Sungkyunkwan University (Novel approach to study the cardiovascular effects and mechanism of action of urban particulate matter using lung epithelial-endothelial ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Research have been published. According to news reporting originating from Gyeonggi Do, South Korea, by NewsRx correspondents, research stated, "In vitro models have become increasingly sophisticated, and their usefulness in supporting toxicity testing is well established. The present study was designed to establish a novel in vitro model that mimics the cellular network surrounding airways and pulmonary blood vessels, to study the cardiovascular toxic effects of particulate matter (PM)."

Financial supporters for this research include Ministry of Science, ICT and Future Planning, National Research Foundation of Korea.
