2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Rectal Cancer are presented in a new report. According to news reporting out of Salt Lake City, Utah, by NewsRx editors, research stated, "Smoking is known to influence messenger RNA (mRNA) expression in colorectal cancer (CRC) cases. As microRNAs (miRNAs) are known repressors of mRNAs, we hypothesize that smoking may influence miRNA expression, thus altering mRNA expression."

Our news journalists obtained a quote from the research from the University of Utah, "Our sample consisted of 1447 CRC cases that had normal colorectal mucosa and carcinoma miRNA data and lifestyle data. We examined current smoking, current versus never and former versus never (C/F/N) smoking, and pack-years smoked with miRNA expression in normal mucosa as well as differential miRNA expression between paired normal and carcinoma tissue for colon and rectal tissue to determine associations between smoking and miRNA expression. We adjusted for multiple comparisons using the Benjamini Hochberg false discovery rate (FDR). Significant associations were seen for rectal differential miRNA expression only. We analyzed miRNAs significantly associated with smoking with CIMP and MSI status, using a polytomous logistic regression. Two hundred and thirty-one miRNAs were differentially expressed with current smoking, 172 with C/F/N, and 206 with pack-years smoked; 111 were associated with all three. Forty-three miRNAs were unique to current smoking, 14 were unique
to C/F/N and 57 were unique to pack years smoked. Of the 306 unique miRNAs associated with cigarette smoking, 41 were inversely associated and 200 were directly associated with CIMP high or MSI tumor molecular phenotype for either colon or rectal cancer.

According to the news editors, the research concluded: "Our results suggest that cigarette smoking can alter miRNA expression and, given associations with CIMP high and MSI tumor molecular phenotype, it is possible that smoking influences tumor phenotype through altered miRNA expression."

Our news journalists report that additional information may be obtained by contacting L.E. Mullany, University of Utah, Dept. of Internal Med, Salt Lake City, UT 84108, United States. Additional authors for this research include J.S. Herrick, R.K. Wolff, J.R. Stevens and M.L. Slattery.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.canep.2016.10.011. This DOI is a link to an online electronic document that is either free or for purchase.

Cytoskeleton

Researchers from University of Utrecht Discuss Findings in Cytoskeleton (Control of apico-basal epithelial polarity by the microtubule minus-end-binding protein CAMSAP3 and spectraplakin ACF7)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cytoskeleton have been presented. According to news reporting originating in Utrecht, Netherlands, by NewsRx journalists, research stated, "The microtubule cytoskeleton regulates cell polarity by spatially organizing membrane trafficking and signaling processes. In epithelial cells, microtubules form parallel arrays aligned along the apico-basal axis, and recent work has demonstrated that the members of CAMSAP/Patronin family control apical tethering of microtubule minus ends."

The news reporters obtained a quote from the research from the University of Utrecht, "Here, we show that in mammalian intestinal epithelial cells, the spectraplakin ACF7 (also known as MACF1) specifically binds to CAMSAP3 and is required for the apical localization of CAMSAP3-decorated microtubule minus ends. Loss of ACF7 but not of CAMSAP3 or its homolog CAMSAP2 affected the formation of polarized epithelial cysts in three-dimensional cultures. In short-term epithelial polarization assays, knockout of CAMSAP3, but not of CAMSAP2, caused microtubule re-organization into a more radial centrosomal array, redistribution of Rab11-positive (also known as Rab11A) endosomes from the apical cell..."
surface to the pericentrosomal region and inhibition of actin brush border formation at the apical side of the cell."

According to the news reporters, the research concluded: "ACF7 is an important regulator of apico-basal polarity in mammalian intestinal cells and that a radial centrosome-centered microtubule organization can act as an inhibitor of epithelial polarity."

Our news correspondents report that additional information may be obtained by contacting A. Akhmanova, University of Utrecht, Fac Sci, Dept. of Biol, Cell Biol, NL-3584 CH Utrecht, Netherlands. Additional authors for this research include Q.Y. Liu, W. Nijenhuis, S.S. Hua, K. Jiang, M. Baars, S. Remmelzwaal, M. Martin, L.C. Kapitein and A. Akhmanova.

**Hematology - Plasma**

Researchers from University of Verona Detail New Studies and Findings in the Area of Plasma (Estimation of the imprecision on clinical chemistry testing due to fist clenching and maintenance during venipuncture)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematology - Plasma are discussed in a new report. According to news reporting from Verona, Italy, by NewsRx journalists, research stated, "An experimental study was planned to assess the influence on routine clinical chemistry parameters of fist making prior to, and maintenance during, venipuncture. Blood was collected from 16 healthy volunteers with two separate sequential procedures, entailing standard venipuncture with hand opened throughout blood collection, or clenching the fist 6 times before venipuncture and maintaining the fist until completion of blood collection."

The news correspondents obtained a quote from the research from the University of Verona, "After separation of lithium-heparin plasma at vacuum tubes with gel separator, 28 routine clinical chemistry parameters and serum indices were measured on Roche Cobas 6000 c501 module. Fist clenching and maintaining were associated with significant variations of 8/26 (31%) analytes tested. Specifically, aspartate aminotransferase (+2.3%), calcium (+2.2%), chloride (+1.0%), creatine kinase (+2.0%), magnesium (+2.3%), potassium (+13.4%), and sodium (+0.7%) increased, whereas phosphate (-5.0%) decreased. All variations except aspartate aminotransferase and creatine kinase exceeded the quality specifications for desirable imprecision. A remarkable increase of free hemoglobin in plasma (i.e., +28.2%) was also observed. The ratio of plasma potassium was significantly associated with that of plasma CK (r = 0.55; p = 0.029), but not with variations of other analytes. No significant correlation was observed between the ratio of free hemoglobin and those of other analytes. The results of our
investigation demonstrate that repeated clenching and maintenance of fist during venipuncture may trigger acute variations of several routine clinical chemistry parameters, which may be attributable to muscle contraction, hemolysis or both."

According to the news reporters, the research concluded: "Accordingly, venipuncture should be performed avoiding fist clenching and maintenance."

For more information on this research see: Estimation of the imprecision on clinical chemistry testing due to fist clenching and maintenance during venipuncture. Clinical Biochemistry, 2016;49(18):1364-1367. Clinical Biochemistry can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. Drugs and Therapies - Adrenal Corticosteroid Inhibitors

Researchers from University of Vienna Report on Findings in Adrenal Corticosteroid Inhibitors (Metal-Free meta-Selective Alkyne Oxyarylation with Pyridine N-Oxides: Rapid Assembly of Metyrapone Analogues)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Adrenal Corticosteroid Inhibitors are discussed in a new report. According to news reporting originating from Vienna, Austria, by NewsRx correspondents, research stated, "An efficient metal-free oxyarylation of electron-poor alkynes with pyridine N-oxides has been developed."

Our news editors obtained a quote from the research from the University of Vienna, "This transformation affords meta-substituted pyridines analogous to the drug metyrapone in high regioselectivities. Density functional theory (DFT) calculations provided important insight into the mechanism."

According to the news editors, the research concluded: "Evaluation of the inhibitory properties revealed the most active CYP11B1 inhibitor of these derivatives, with two-digit nanomolar inhibitory activity akin to that of metyrapone."

Researchers from University of Virginia Report Details of New Studies and Findings in the Area of Neurons (An NXF1 mRNA with a retained intron is expressed in hippocampal and neocortical neurons and is translated into a protein that functions ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Neurons are discussed in a new report. According to news reporting from Charlottesville, Virginia, by NewsRx journalists, research stated, "The Nxf1 protein is a major nuclear export receptor for the transport of mRNA, and it also is essential for export of retroviral mRNAs with retained introns. In the latter case, it binds to RNA elements known as constitutive transport elements (CTEs) and functions in conjunction with a cofactor known as Nxt1."

The news correspondents obtained a quote from the research from the University of Virginia, "The NXF1 gene also regulates expression of its own intron-containing RNA through the use of a functional CTE within intron 10. mRNA containing this intron is exported to the cytoplasm, where it can be translated into the 356-amino acid short Nxf1(sNxf1) protein, despite the fact that it is a prime candidate for non-sense- mediated decay (NMD). Here we demonstrate that sNxf1 is highly expressed in nuclei and dendrites of hippocampal and neocortical neurons in rodent brain. Additionally, we show that sNxf1 localizes in RNA granules in neurites of differentiated N2a mouse neuroblastoma cells, where it shows partial colocalization with Staufen2 isoform SS, a protein known to play a role in dendritic mRNA trafficking."

According to the news reporters, the research concluded: "We also show that sNxf1 forms heterodimers in conjunction with the full-length Nxf1 and that sNxf1 can replace Nxt1 to enhance the expression of CTE-containing mRNA and promote its association with polyribosomes."

For more information on this research see: An NXF1 mRNA with a retained intron is expressed in hippocampal and neocortical neurons and is translated into a protein that functions as an Nxf1 cofactor. *Molecular Biology of the Cell*, 2016;27(24):3903-3912. *Molecular Biology of the Cell* can be contacted at: Amer Soc Cell Biology, 8120 Woodmont Ave, Ste 750, Bethesda, MD 20814-2755, USA.

Our news journalists report that additional information may be obtained by contacting M.L. Hammarskjold, University of Virginia, Sch Med, Dept. of Microbiol Immunol & Canc Biol, Charlottesville, VA 22908, United States. Additional authors for this research
Researchers from University of Virginia Report New Studies and Findings in the Area of Atherosclerosis (Genetic analysis of atherosclerosis identifies a major susceptibility locus in the major histocompatibility complex of mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news reporting originating from Charlottesville, Virginia, by NewsRx correspondents, research stated, "Recent genome-wide association studies (GWAS) have identified over 50 significant loci containing common variants associated with coronary artery disease. However, these variants explain only 26% of the genetic heritability of the disease, suggesting that many more variants remain to be discovered."

Our news editors obtained a quote from the research from the University of Virginia, "Here, we examined the genetic basis underlying the marked difference between SM/J-Apoe(-/-) and BALB/cJ-Apoe(-/-) mice in atherosclerotic lesion formation. 206 female F-2 mice generated from an intercross between the two Apoe(-/-) strains were fed 12 weeks of western diet. Atherosclerotic lesion sizes in the aortic root were measured and 149 genetic markers genotyped across the entire genome. A significant locus, named Ath49 (LOD score: 4.18), for atherosclerosis was mapped to the H2 complex [mouse major histocompatibility complex (MHC)] on chromosome 17. Bioinformatic analysis identified 12 probable candidate genes, including Tnfrsf21, Adgrf1, Adgrf5, Mep1a, and Pla2g7. Corresponding human genomic regions of Ath49 showed significant association with coronary heart disease. Five suggestive loci on chromosomes 1, 4, 5, and 8 for atherosclerosis were also identified. Atherosclerotic lesion sizes were significantly correlated with HDL but not with non-HDL cholesterol, triglyceride or glucose levels in the F2 cohort."

According to the news editors, the research concluded: "We have identified the MHC as a major genetic determinant of atherosclerosis, highlighting the importance of inflammation in atherogenesis."

The news editors report that additional information may be obtained by contacting W.B. Shi, University of Virginia, Dept. of Radiol & Med Imaging, Charlottesville, VA, United
Researchers from University of Warwick Report Recent Findings in Dementia (Expression and purification of tau protein and its frontotemporal dementia variants using a cleavable histidine tag)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Neurodegenerative Diseases and Conditions - Dementia is now available. According to news reporting from Coventry, United Kingdom, by NewsRx journalists, research stated, "Recombinant tau protein is widely used to study the biochemical, cellular and pathological aspects of tauopathies, including Alzheimer's disease and frontotemporal dementia with Parkinsonism linked to chromosome 17 (FTPD-17). Pure tau in high yield is a requirement for in vitro evaluation of the protein's physiological and toxic functions."

Funders for this research include National Centre for the Replacement, Refinement and Reduction of Animals in Research, University of Warwick Chancellor's Scholarship, Biotechnology and Biological Sciences Research Council.

The news correspondents obtained a quote from the research from the University of Warwick, "However, the preparation of recombinant tau is complicated by the protein's propensity to aggregate and form truncation products, necessitating the use of multiple, timeconsuming purification methods. In this study, we investigated parameters that influence the expression of wild type and FTPD-17 pathogenic tau, in an attempt to identify ways to maximise expression yield. Here, we report on the influence of the choice of host strain, induction temperature, duration of induction, and media supplementation with glucose on tau expression in Escherichia coll. We also describe a straightforward process to purify the expressed tau proteins using immobilised metal affinity chromatography, with favourable yields over previous reports."

According to the news reporters, the research concluded: "An advantage of the described method is that it enables high yield production of functional oligomeric and monomeric tau, both of which can be used to study the biochemical, physiological and toxic properties of the protein."

For more information on this research see: Expression and purification of tau protein and its frontotemporal dementia variants using a cleavable histidine tag. *Protein Expression and Purification*, 2017;130():44-54. *Protein Expression and Purification* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Protein Expression and Purification -
Researchers from University of Washington Describe Findings in Myelodysplastic Syndromes (Jumping translocations in myelodysplastic syndromes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hematologic Diseases and Conditions - Myelodysplastic Syndromes have been presented. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "Jumping translocations (JT) have been identified in numerous malignancies, including leukemia, but infrequently in patients with myelodysplastic syndromes (MDS). The responsible genetic region has been mapped to the JTB gene at 1q21, but breakpoints involving other chromosomal loci, such as 3q and 11q, have been described as well."

Our news journalists obtained a quote from the research from the University of Washington, "We have characterized the pathological and mutational landscape, and the clinical course of 6 new MDS patients with jumping mutations using chromosome genomic array testing (CGAT) and target gene panel next generation sequencing. In addition, we have performed a literature review for other MDS cases with JT's as defined by ISCN 2013."

According to the news editors, the research concluded: "Results support the concept that MDS in patients with jumping translocations has a poor prognosis with a high risk of progression to leukemia, and suggest that these patients warrant aggressive therapy, including HCT, early in the disease course."

For more information on this research see: Jumping translocations in myelodysplastic syndromes. Cancer Genetics, 2016;209(9):395-402. Cancer Genetics can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Cancer Genetics - www.journals.elsevier.com/cancer-genetics/)

The news correspondents report that additional information may be obtained from C.C.S. Yeung, University of Washington, Dept. of Pathol, Seattle, WA 98195, United States.
Researchers from University of Washington Detail Findings in Vascular Diseases (Vessel wall imaging for intracranial vascular disease evaluation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Vascular Diseases are presented in a new report. According to news reporting originating from Seattle, Washington, by NewsRx correspondents, research stated, "Accurate and timely diagnosis of intracranial vasculopathies is important owing to the significant risk of morbidity with delayed and/or incorrect diagnosis both from the disease process and inappropriate therapies. Conventional luminal imaging techniques for analysis of intracranial vasculopathies are limited to evaluation of changes in the vessel lumen."

Our news editors obtained a quote from the research from the University of Washington, "Vessel wall MRI techniques can allow direct characterization of pathologic changes of the vessel wall. These techniques may improve diagnostic accuracy and improve patient outcomes. Extracranial carotid vessel wall imaging has been extensively investigated in patients with atherosclerotic disease and has been shown to accurately assess plaque composition and identify vulnerable plaque characteristics that may predict stroke risk beyond lumina! stenosis alone. This review provides a brief history of vessel wall MRI, an overview of the intracranial vessel wall MRI techniques, its applications, and imaging findings of various intracranial vasculopathies pertinent to the neurointerventionalist, neurologist, and neuroradiologist."

According to the news editors, the research concluded: "We searched MEDLINE, PubMed, and Google for English publications containing any of the following terms: 'intracranial vessel wall imaging', 'intracranial vessel wall', and 'intracranial vessel wall MRI.'"

The news editors report that additional information may be obtained by contacting M. Mossa-Basha, University of Washington, Dept. of Radiol, Seattle, WA 98195, United States. Additional authors for this research include M. Alexander, S. Gaddikeri, C. Yuan and D. Gandhi.

The direct object identifier (DOI) for that additional information is:
Researchers from University of Washington Detail New Studies and Findings in the Area of Penile Cancer (Predictors of Nodal Upstaging in Clinical Node Negative Patients With Penile Carcinoma: A National Cancer Database Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Penile Cancer. According to news reporting out of Seattle, Washington, by NewsRx editors, research stated, "To examine the risk factors associated with upstaging at inguinal lymph node dissection (ILND) in men with penile cancer and clinically negative lymph nodes (cN0) using a large US cancer database. The National Cancer Data Base was queried from 1998 to 2012 to identify men with penile cancer who underwent ILND and had complete clinical or pathologic node status available."

Our news journalists obtained a quote from the research from the University of Washington, "Lymphovascular invasion (LVI) was available after 2010. Multivariate logistic regression evaluated factors (cT stage, grade, LVI) associated with pathologic nodal upstaging in those with cN0 disease. Correlations between clinical and pathologic node status were also calculated with weighted kappa statistics. Complete clinical and pathologic LN status was available for 875 patients. Of these, 461 (53%) were cN0. Upstaging occurred in 111 (24%). When stratified by low, intermediate, and high-risk groups, the proportion with pathologically positive LNs was 16%, 20%, and 27%, respectively (P = .12). On multivariate analysis, limited to men with LVI data available (N = 206), LVI (odds ratio 3.10, 95% confidence interval 1.39-6.92), but not increasing stage (univariate only) or grade (univariate only), was significantly associated with upstaging at ILND. In this analysis, of 461 patients with node-negative penile cancer undergoing ILND, upstaging was observed in 24%. LVI was the strongest independent predictor of occult lymph node disease."

According to the news editors, the research concluded: "These findings corroborate the presence of LVI as the significant risk factor for occult micrometastases and suggest a possible improvement in existing risk stratification groupings, with the presence of LVI, regardless of stage or grade, to be considered high-risk disease."

For more information on this research see: Predictors of Nodal Upstaging in Clinical Node Negative Patients With Penile Carcinoma: A National Cancer Database Analysis. Urology, 2016;96():29-34. Urology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Urology - www.journals.elsevier.com/urology/)

Our news journalists report that additional information may be obtained by contacting B.R. Winters, University of Washington, Sch Med, Dept. of Urol, Seattle, WA 98195, United States. Additional authors for this research include M.N. Mossanen, S.K. Holt,
Researchers from University of Washington Discuss Findings in Nanoparticles (Approach to Rapid Synthesis and Functionalization of Iron Oxide Nanoparticles for High Gene Transfection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nanotechnology - Nanoparticles. According to news reporting from Seattle, Washington, by NewsRx journalists, research stated, "Surface functionalization of theranostic nanoparticles (NPs) typically relies on lengthy, aqueous postsynthesis labeling chemistries that have limited ability to fine-tune surface properties and can lead to NP heterogeneity. The need for a rapid, simple synthesis approach that can provide great control over the display of functional moieties on NP surfaces has led to increased use of highly selective bioorthogonal chemistries including metal-affinity coordination."

Financial support for this research came from National Cancer Institute.

The news correspondents obtained a quote from the research from the University of Washington, "Here we report a simple approach for rapid production of a superparamagnetic iron oxide NPs (SPIONs) with tunable functionality and high reproducibility under aqueous conditions. We utilize the high affinity complex formed between catechol and Fe(III)) as a means to dock well-defined catechol modified polymer modules on the surface of SPIONs during sonochemical coprecipitation synthesis. Polymer modules consisted of chitosan and poly(ethylene glycol) (PEG) copolymer (CP) modified with catechol (CCP), and CCP functionalized with cationic polyethylenimine (CCP-PEI) to facilitate binding and delivery of DNA for gene therapy."

According to the news reporters, the research concluded: "This rapid synthesis/functionalization approach provided excellent control over the extent of PEI labeling, improved SPION magnetic resonance imaging (MRI) contrast enhancement and produced an efficient transfection agent."

Our news journalists report that additional information may be obtained by contacting Z.R. Stephen, Dept. of Materials Science and Engineering, University of Washington, Seattle, Washington 98195, United States. Additional authors for this research include C.J. Dayringer, J.J. Lim, R.A. Revia, M.V. Halbert, M. Jeon, A. Bakthavatsalam, R.G. Ellenbogen and M. Zhang.

Peptides and Proteins

Researchers from University of Washington Report New Studies and Findings in the Area of Peptides and Proteins (Designed proteins induce the formation of nanocage-containing extracellular vesicles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Peptides and Proteins are presented in a new report. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "Complex biological processes are often performed by self-organizing nanostructures comprising multiple classes of macromolecules, such as ribosomes (proteins and RNA) or enveloped viruses (proteins, nucleic acids and lipids). Approaches have been developed for designing self-assembling structures consisting of either nucleic acids(1,2) or proteins(3-5), but strategies for engineering hybrid biological materials are only beginning to emerge(6,7)."

Our news journalists obtained a quote from the research from the University of Washington, "Here we describe the design of self-assembling protein nanocages that direct their own release from human cells inside small vesicles in a manner that resembles some viruses. We refer to these hybrid biomaterials as 'enveloped protein nanocages' (EPNs). Robust EPN biogenesis requires protein sequence elements that encode three distinct functions: membrane binding, self-assembly, and recruitment of the endosomal sorting complexes required for transport (ESCRT) machinery(8). A variety of synthetic proteins with these functional elements induce EPN biogenesis, highlighting the modularity and generality of the design strategy. Biochemical analyses and cryo-electron microscopy reveal that one design, EPN-01, comprises small (similar to 100 nm) vesicles containing multiple protein nanocages that closely match the structure of the designed 60-subunit self-assembling scaffold(9). EPNs that incorporate the vesicular stomatitis viral glycoprotein can fuse with target cells and deliver their contents, thereby transferring cargoes from one cell to another."

According to the news editors, the research concluded: "These results show how proteins can be programmed to direct the formation of hybrid biological materials that perform complex tasks, and establish EPNs as a class of designed, modular, genetically-encoded nanomaterials that can transfer molecules between cells."

The news correspondents report that additional information may be obtained from N.P. King, University of Washington, Inst Prot Design, Seattle, WA 98195, United States. Additional authors for this research include C. Ogohara, S. Yi, Y. Hsia, U. Nattermann, D.M.
Belnap, N.P. King and W.I. Sundquist.

Pesticides

Researchers from University of Washington Report New Studies and Findings in the Area of Pesticides (Urinary microRNAs as potential biomarkers of pesticide exposure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pesticides have been published. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) are post-transcriptional regulators that silence messenger RNAs. Because miRNAs are stable at room temperature and long-lived, they have been proposed as molecular biomarkers to monitor disease and exposure status."

Funders for this research include National Institutes of Environmental Health Sciences, United States Environmental Protection Agency.

Our news journalists obtained a quote from the research from the University of Washington, "While urinary miRNAs have been used clinically as potential diagnostic markers for kidney and bladder cancers and other diseases, their utility in non-clinical settings has yet to be fully developed. Our goal was to investigate the potential for urinary miRNAs to act as biomarkers of pesticide exposure and early biological response by identifying the miRNAs present in urine from 27 parent/child, farmworker/non-farmworker pairs (16FW/11NFW) collected during two agricultural seasons (thinning and post-harvest) and characterizing the between- and within-individual variability of these miRNA epigenetic regulators. MiRNAs were isolated from archived urine samples and identified using PCR arrays. Comparisons were made between age, households, season, and occupation. Of 384 miRNAs investigated, 297 (77%) were detectable in at least one sample. Seven miRNAs were detected in at least 50% of the samples, and one miRNA was present in 96% of the samples. Principal components and hierarchical clustering analyses indicate significant differences in miRNA profiles between farm worker and non-farmworker adults as well as between seasons. Six miRNAs were observed to be positively associated with farmworkers status during the post-harvest season. Expression of five of these miRNA trended towards a positive dose response relationship with organophosphate pesticide metabolites in farmworkers."

According to the news editors, the research concluded: "These results suggest that miRNAs may be novel biomarkers of pesticide exposure and early biological response."

For more information on this research see: Urinary microRNAs as potential biomarkers of pesticide exposure. Toxicology and Applied Pharmacology, 2016;312():19-25. Toxicology and Applied Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com;

Digestive System Diseases and Conditions - Crohn's...

Researchers from University of Western Ontario Describe Findings in Crohn's Disease (Anti-IL-12/23p40 antibodies for induction of remission in Crohn's disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Digestive System Diseases and Conditions - Crohn's Disease. According to news reporting out of London, Canada, by NewsRx editors, research stated, "Ustekinumab (CNTO 1275) and briakinumab (ABT-874) are monoclonal antibodies that target the standard p40 subunit of the cytokines interleukin-12 and interleukin-23 (IL-12/23p40), which are involved in the pathogenesis of Crohn's disease. The objectives of this review were to assess the efficacy and safety of anti-IL-12/23p40 antibodies for induction of remission in Crohn's disease."

Our news journalists obtained a quote from the research from the University of Western Ontario, "Search methods We searched the following databases from inception to 12 September 2016: PubMed, MEDLINE, EMBASE, and the Cochrane Library (CENTRAL). References and conference abstracts were searched to identify additional studies. Selection criteria Randomized controlled trials (RCTs) trials in which monoclonal antibodies against IL-12/23p40 were compared to placebo or another active comparator in patients with active Crohn's disease were included. Data collection and analysis Two authors independently screened studies for inclusion and extracted data. Methodological quality was assessed using the Cochrane risk of bias tool. The primary outcome was failure to induce clinical remission, defined as a Crohn's disease activity index (CDAI) of <150 points. Secondary outcomes included failure to induce clinical improvement, adverse events, serious adverse events, and withdrawals due to adverse events. Clinical improvement was defined as decreases of >= 70 or >= 100 points in the CDAI from baseline. We calculated the risk ratio (RR) and 95% confidence intervals (95% CI) for each outcome. Data were analyzed on an intention-to-treat basis. The overall quality of the evidence supporting the outcomes was evaluated using the GRADE criteria. Six RCTs (n = 2324 patients) met the inclusion criteria. A low risk of bias was assigned to all studies. The two briakinumab trials were not pooled due to differences in doses and time points for analysis. In both studies there was no statistically significant difference in remission rates. One study (n = 79) compared doses of 1 mg/kg and 3 mg/kg to placebo. In the briakinumab group 70% (44/63) of patients failed to enter clinical remission at 6 or 9 weeks compared to 81%(13/16) of placebo
patients (RR 0.86, 95% CI 0.65 to 1.14). Subgroup analysis revealed no significant differences by dose. The other briakinumab study (n = 230) compared intravenous doses of 200 mg, 400 mg and 700 mg with placebo. Eighty-four per cent (154/184) of briakinumab patients failed to enter clinical remission at six weeks compared to 91% (42/46) of placebo patients (RR 0.92, 95% CI 0.83 to 1.03). Subgroup analysis revealed no significant differences by dose. GRADE analyses of the briakinumab studies rated the overall quality of the evidence for the outcome clinical remission as low. Based on the results of these two studies the manufacturers of briakinumab stopped production of this medication. The ustekinumab studies were pooled despite differences in intravenous doses (i.e. 1 mg/kg, 3 mg/kg, 4.5 mg/kg, and 6 mg/kg), however the subcutaneous dose group was not included in the analysis, as it was unclear if subcutaneous was equivalent to intravenous dosing. There was a statistically significant difference in remission rates. At week six, 84% (764/914) of ustekinumab patients failed to enter remission compared to 90% (367/406) of placebo patients (RR 0.92, 95% CI 0.88 to 0.96; 3 studies; high-quality evidence). Subgroup analysis showed a statistically significant difference for the 6.0 mg/kg dose group (moderate-quality evidence). There were statistically significant differences in clinical improvement between ustekinumab and placebo-treated patients. In the ustekinumab group, 55% (502/914) of patients failed to improve clinically (i.e. 70-point decline in CDAI score), compared to 71% (287/406) of placebo patients (RR 0.78, 95% CI 0.71 to 0.85; 3 studies). Subgroup analysis revealed significant differences compared to placebo for the 1 mg/kg, 4.5 mg/kg and 6 mg/kg dosage subgroups. Similarly for a 100-point decline in CDAI, 64% (588/914) of patients in the ustekinumab group failed to improve clinically compared to 78% (318/406) of placebo patients (RR 0.82, 95% CI 0.77 to 0.88; 3 studies; high-quality evidence). Subgroup analysis showed a significant difference compared to placebo for the 4.5 mg/kg and 6.0 mg/kg (high-quality evidence) dose groups. There were no statistically significant differences in the incidence of adverse events, serious adverse events or withdrawal due to adverse events. Sixty-two per cent (860/1386) of ustekinumab patients developed at least one adverse event compared to 64% (407/637) of placebo patients (RR 0.97, 95% CI 0.90 to 1.04; 4 studies; high-quality evidence). Five per cent (75/1386) of ustekinumab patients had a serious adverse event compared to 6% (41/637) of placebo patients (RR 0.83, 95% CI 0.58 to 1.20; 4 studies; moderate-quality evidence). The most common adverse events in briakinumab patients were injection site reactions and infections. Infections were the most common adverse event in ustekinumab patients. Worsening of Crohn's disease and serious infections were the most common serious adverse events. Authors' conclusions High quality evidence suggests that ustekinumab is effective for induction of clinical remission and clinical improvement in patients with moderate to severe Crohn's disease. Moderate to high quality evidence suggests that the optimal dosage of ustekinumab is 6 mg/kg. Briakinumab and ustekinumab appear to be safe. Moderate quality evidence suggests no increased risk of serious adverse events."

According to the news editors, the research concluded: "Future studies are required to determine the long-term efficacy and safety of ustekinumab in patients with moderate to severe Crohn's disease."

Researchers from University of Wurzburg Report Findings in Antineoplastics (Evaluation of dose-dependent effects of the proteasome inhibitor bortezomib in human platelets)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antineoplastics. According to news reporting from Wurzburg, Germany, by NewsRx journalists, research stated, "Platelets express key proteins of the proteasome system and contain protein ubiquitination pathways. The functional role of the proteasome system in platelets, however, is still subject of studies."

The news correspondents obtained a quote from the research from the University of Wurzburg, "In addition to its role as anticancer drug, the potent and selective proteasome inhibitor bortezomib can be used for experimental proteasome research. Since it is mandatory to know exact dose-effect relationships, we intended to evaluate dose-dependent specific bortezomib effects on basal and on agonist-induced proteasome activity, on levels of poly-ubiquitinated proteins and on platelet aggregation. In washed platelets, unstimulated or stimulated with different agonists and pre-incubated with various bortezomib concentrations, the proteasome activity was determined by a fluorometric assay. The levels of poly-ubiquitinated proteins were assessed by an immunoassay kit. Platelet aggregation was measured by light transmission aggregometry in platelet-rich-plasma. Platelet agonists stimulate both, the proteasome activity and the accumulation of poly-ubiquitinated proteins in platelets. Bortezomib inhibits the basal and the agonist induced proteasome activity and increased the content of poly-ubiquitinated proteins in a concentration dependent manner. Bortezomib concentrations in the nM-range causing complete blockade of platelet proteasome activity do not affect agonist induced platelet aggregation, indicating that the level of platelet proteasome activity is not directly linked with the induction of platelet aggregation."

According to the news reporters, the research concluded: "Bortezomib in the mu M-range may tamper platelet aggregation, possibly due to unspecific and toxic effects."

Our news journalists report that additional information may be obtained by contacting J. Koessler, University of Wurzburg, Inst Transfus Med & Haemotherapy, D-97080 Wurzburg, Germany. Additional authors for this research include J. Etzel, K. Weber, M. Boeck and A. Kobsar.

Researchers from University of Zagreb Detail Findings in Pseudomonas aeruginosa (RpoN Modulates Carbapenem Tolerance in Pseudomonas aeruginosa through Pseudomonas Quinolone Signal and PqsE)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Gram-Negative Bacteria - Pseudomonas aeruginosa is the subject of a report. According to news reporting from Zagreb, Croatia, by NewsRx journalists, research stated, "The ability of Pseudomonas aeruginosa to rapidly modulate its response to antibiotic stress and persist in the presence of antibiotics is closely associated with the process of cell-to-cell signaling. The alternative sigma factor RpoN (sigma(54)) is involved in the regulation of quorum sensing (QS) and plays an important role in the survival of stationary-phase cells in the presence of carbapenems."

The news correspondents obtained a quote from the research from the University of Zagreb, "Here, we demonstrate that a Delta rpoN mutant grown in nutrient-rich medium has increased expression of pqsA, pqsH, and pqsR throughout growth, resulting in the increased production of the Pseudomonas quinolone signal (PQS). The link between pqsA and its role in carbapenem tolerance was studied using a Delta rpoN Delta pqsA mutant, in which the carbapenem-tolerant phenotype of the Delta rpoN mutant was abolished. In addition, we demonstrate that another mechanism leading to carbapenem tolerance in the Delta rpoN mutant is mediated through pqsE. Exogenously supplied PQS abolished the biapenem-sensitive phenotype of the Delta rpoN Delta pqsA mutant, and overexpression of pqsE failed to alter the susceptibility of the Delta rpoN Delta pqsA mutant to biapenem. The mutations in the Delta rpoN Delta rhlR mutant and the Delta rpoN Delta pqsH mutant led to susceptibility to biapenem. Comparison of the changes in the expression of the genes involved in QS in wild-type PAO1 with their expression in the Delta rpoN mutant and the Delta rpoN mutant-derived strains demonstrated the regulatory effect of RpoN on the transcript levels of rhlR, vqsR, and rpoS."

According to the news reporters, the research concluded: "The findings of this study demonstrate that RpoN negatively regulates the expression of PQS in nutrient-rich medium and provide evidence that RpoN interacts with pqsA, pqsE, pqsH, and rhlR in response to antibiotic stress."

For more information on this research see: RpoN Modulates Carbapenem Tolerance in Pseudomonas aeruginosa through Pseudomonas Quinolone Signal and PqsE. Antimicrobial Agents and Chemotherapy, 2016;60(10):5752-5764. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Researchers from University of Zurich Describe Findings in Plasma
(Effect of alterations in blood volume with bed rest on glucose tolerance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematology - Plasma is the subject of a report. According to news reporting from Zurich, Switzerland, by NewsRx journalists, research stated, "Bed rest leads to rapid impairments in glucose tolerance. Plasma volume and thus dilution space for glucose are also reduced with bed rest, but the potential influence on glucose tolerance has not been investigated."

Financial support for this research came from University of Zurich, Center for Integrative Human Physiology.

The news correspondents obtained a quote from the research from the University of Zurich, "Accordingly, the aim was to investigate whether bed rest-induced impairments in glucose tolerance are related to a concomitant reduction in plasma volume. This hypothesis was tested mechanistically by restoring plasma volume with albumin infusion after bed rest and parallel determination of glucose tolerance. Fifteen healthy volunteers (age 24 +/- 3 yr, body mass index 23 +/- 2 kg/m(2), maximal oxygen uptake 44 +/- 8 ml.min(-1).kg(-1); means +/- SD) completed 4 days of strict bed rest. Glucose tolerance [oral glucose tolerance test (OGTT)] and plasma and blood volumes (carbon monoxide rebreathing) were assessed before and after 3 days of bed rest. On the fourth day of bed rest, plasma volume was restored by means of an albumin infusion prior to an OGTT. Plasma volume was reduced by 9.9 +/- 3.0% on bed rest day 3 and area under the curve for OGTT was augmented by 55 +/- 67%. However, no association (R-2 = 0.09, P = 0.33) between these simultaneously occurring responses was found. While normalization of plasma volume by matched albumin administration (408 +/- 104 ml) transiently decreased (P < 0.05) resting plasma glucose concentration (5.0 +/- 0.4 to 4.8 +/- 0.3 mmol/l), this did not restore glucose tolerance."

According to the news reporters, the research concluded: "Bed rest-induced alterations in dilution space may influence resting glucose values but do not affect area under the curve for OGTT."

For more information on this research see: Effect of alterations in blood volume with bed rest on glucose tolerance. *Journal of Applied Physiology*, 2016;121(5):1098-1105.
Researchers from University of Zurich Detail Findings in Melanoma (When cancer cannot be cured: A qualitative study on relationship changes in couples facing advanced melanoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Melanoma is now available. According to news reporting originating in Zurich, Switzerland, by NewsRx journalists, research stated, "The aim of this qualitative study was to gain a deeper understanding about couples' relationship changes over time (the first six months) after one partner is diagnosed with an incurable advanced melanoma (stage III or IV). In semistructured interviews, eight patients and their partners were asked separately about potential changes in their relationship since diagnosis."

The news reporters obtained a quote from the research from the University of Zurich, "The same questions were asked again six months later, but focusing on relationship changes over the preceding six months. Some 32 audiotaped interviews were analyzed applying qualitative content analysis. At baseline (t1), relationship changes were mostly reported in terms of caring, closeness/distance regulation, and communication patterns. While changes in caregiving and distance/closeness regulation remained main issues at six months follow-up (t2), greater appreciation of the relationship and limitations in terms of planning spare time also emerged as major issues. Unexpectedly, 50% of patients and partners reported actively hiding their negative emotions and sorrows from their counterparts to spare them worry. Furthermore, qualitative content analysis revealed relationship changes even in those patients and partners who primarily reported no changes over the course of the disease."

According to the news reporters, the research concluded: "Our findings revealed a differentiated and complex picture about relationship changes over time, which also might aid in the development of support programs for couples dealing with advanced cancer, focusing on the aspects of caring, closeness/distance regulation, and communication patterns."

For more information on this research see: When cancer cannot be cured: A qualitative study on relationship changes in couples facing advanced melanoma. Palliative & Supportive Care, 2016;14(6):652-663. Palliative & Supportive Care can be contacted at: Cambridge University Press, 32 Avenue of the Americas, New York, NY 10013-2473. (Cambridge University Press - www.cambridge.org; Palliative & Supportive Care -
Researchers from University of Zurich Provide Details of New Studies and Findings in the Area of Peripheral Artery Disease (beta-Blockers and Vascular Hemodynamics in Patients With Peripheral Arterial Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Peripheral Artery Disease is the subject of a report. According to news reporting originating in Zurich, Switzerland, by NewsRx journalists, research stated, "Aortic augmentation index (AIx) is a marker of central aortic pressure burden and is modulated by antihypertensive drugs. In patients with peripheral arterial disease (PAD) undergoing antihypertensive treatment, aortic pressures parameters, heart rate-adjusted augmentation index (AIx75), and unadjusted AIx were determined."

The news reporters obtained a quote from the research from the University of Zurich, "The (aortic) systolic and diastolic blood pressure did not differ between PAD patients who were taking -blockers (n=61) and those who were not taking -blockers (n=80). In patients taking -blockers, augmentation pressure and pulse pressure were higher than in patients who did not take -blockers (augmentation pressure, P=.02; pulse pressure, P=.005). AIx75 was lower in PAD patients taking -blockers than in patients not taking -blockers (P=.04), while the AIx did not differ between PAD patients taking and not taking -blockers. The present study demonstrates that -blockers potentially affect markers of vascular hemodynamics in patients with PAD."

According to the news reporters, the research concluded: "Because these markers are surrogates of cardiovascular risk, further studies are warranted to clarify the impact of selective -blocker treatment on clinical outcome in patients with PAD."

Researchers from University of the Ryukyus Detail Findings in Bacteremia (Bacteremia due to Citrobacter braakii: A case report and literature review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Bacterial Infections and Mycoses - Bacteremia have been presented. According to news reporting from Okinawa, Japan, by NewsRx journalists, research stated, "Among the Citrobacter genus, the most commonly isolated bacteria from human specimens are Citrobacter freundii and Citrobacter koseri, and previous cases of infection due to Citrobacter braakii have been rarely reported. We present a case of bacteremia due to C. braakii in a 38-year-old woman with cervical cancer."

The news correspondents obtained a quote from the research from the University of the Ryukyus, "She was admitted to our hospital with complaints of a fever, chills, and nausea. Blood culture results showed gram-negative bacilli identified as C. braakii via matrix-assisted laser desorption/ionization time-of-flight mass spectrometry analysis, although biochemical testing findings were suggestive of C. freundii. Since a rare pathogen was detected in the present case and the results of additional biochemical studies were suggestive of both C. braakii and Citrobacter farmeri, genetic analysis was conducted. Finally, the gram-negative bacilli were confirmed as C. braakii, a member of the C. freundii complex since 1993, by 16S ribosomal RNA gene sequencing analysis. The gastrointestinal tract was considered the portal of entry, because the patient had a rectal fistula and other cultures such as urine and vaginal discharge incubated species other than C. braakii. The patient recovered after receiving treatment with ciprofloxacin for 14 days. The epidemiology and clinical characteristics of C. braakii infection are still unknown because of the limitations in accurate identification by using currently available commercial biochemical testing and previously, only 6 cases of C. braakii infection have been reported."

According to the news reporters, the research concluded: "Physicians should focus on this species, because it causes community-acquired infections, although further studies are needed to clarify the clinical characteristics of C. braakii infections."

For more information on this research see: Bacteremia due to Citrobacter braakii: A case report and literature review. Journal of Infection and Chemotherapy, 2016;22(12):819-821. Journal of Infection and Chemotherapy can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Heart Disorders and Diseases - Cardiomegaly

Researchers from Uppsala University Provide Details of New Studies and Findings in the Area of Cardiomegaly (PDGF-A and PDGF-B induces cardiac fibrosis in transgenic mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Cardiomegaly are presented in a new report. According to news reporting originating in Uppsala, Sweden, by NewsRx journalists, research stated, "Platelet-derived growth factors (PDGFs) and their receptors (PDGFRs) contribute to normal heart development. Deficient or abnormal expression of Pdgf and Pdgfr genes have a negative impact on cardiac development and function."

Financial supporters for this research include Swedish Cancer Foundation, Swedish Science Council, Novo Nordisk Foundation, IngaBritt and Arne Lundberg Foundation, Knut and Alice Wallenberg Foundation, Torsten and Ragnar Soderberg Foundation.

The news reporters obtained a quote from the research from Uppsala University, "The cellular effects of PDGFs in the hearts of Pdgf/Pdgfr mutants and the pathogenesis of the resulting abnormalities are poorly understood, but different PDGF isoforms induce varying effects. Here, we generated three new transgenic mouse types which complete a set of studies, where all different PDGF ligands have been expressed under the same heart specific alpha-myosin heavy chain promoter. Transgenic expression of the natural isoforms of Pdgfa and Pdgfb resulted in isoform specific fibrotic reactions and cardiac hypertrophy. Pdgfa overexpression resulted in a severe fibrotic reaction with up to 8-fold increase in cardiac size, leading to lethal cardiac failure within a few weeks after birth. In contrast, Pdgfb overexpression led to focal fibrosis and moderate cardiac hypertrophy. As PDGF-A and PDGF-B have different affinity for the two PDGF receptors, we analyzed the expression of the receptors and the histology of the fibrotic hearts. Our data suggest that the stronger fibrotic effect generated by Pdgfa overexpression was mediated by Pdgfra in cardiac interstitial mesenchymal cells, i.e. the likely source of extracellular matrix deposition and fibrotic reaction."

According to the news reporters, the research concluded: "The apparent sensitivity of the heart to ectopic PDGFR alpha agonists supports a role for endogenous PDGFRα agonists in the pathogenesis of cardiac fibrosis."

Our news correspondents report that additional information may be obtained by contacting J. Andrae, Uppsala University, Dept. of Immunol Genet & Pathol, Rudbeck Lab, Uppsala, Sweden. Additional authors for this research include P. Lindblom, C. Bondjers, C. Betsholtz and J. Andrae.

**Neurology - Spasticity**

**Researchers from Valdman Institute of Pharmacology Discuss Findings in Spasticity (Morphine-induced Straub tail reaction in mice treated with serotonergic compounds)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurology - Spasticity have been published. According to news reporting originating from St. Petersburg, Russia, by NewsRx correspondents, research stated, "Constitutively active 5-HT2 receptors have been suggested to contribute to motoneuronal excitability, muscle spasms and spasticity. Accordingly, 5-HT2c receptor inverse agonists have been demonstrated in pilot experiments to reduce spasticity in animal model of spasticity and patients with spinal cord injuries."

Financial support for this research came from Ministry of Health of the Russian Federation.

Our news editors obtained a quote from the research from the Valdman Institute of Pharmacology, "Thus, 5-HT2c receptor inverse agonists may represent a novel class of anti-spasticity agents justifying a search for compounds with robust 5-HT2c receptor inverse agonist activity either among the existing medications or via a dedicated drug discovery program. Morphine-induced Straub tail response in mice is regarded as a model of transient spasticity that may be suitable for supporting such drug discovery efforts. Subcutaneous injection of morphine (10-60 mg/kg) induced a dose-dependent Straub tail reaction in male Swiss mice with maximum response obtained 15-30 min after the morphine administration. When given prior to morphine, 5-HT2B/2c receptor inverse agonists cyproheptadine (1-10 mg/kg, i.p.) and 5B206553 (0.3-3 mg/kg, i.p.) diminished Straub tail reaction dose-dependently without affecting spontaneous locomotor activity. In contrast, 5-HT2B/2c receptor antagonist methysergide (1-5.6 mg/kg, i.p.) and 5-HT2c receptor antagonist 5B242084 (1-5.6 mg/kg, i.p.) as well as 5-HT2A receptor inverse agonist pimavanserin (1-10 mg/kg, i.p.) had no appreciable effects on Straub tail response. Taken together, the findings indicate that constitutive activity of 5-HT2B/2c receptor may be involved in the mechanisms of morphine-induced spasticity."
According to the news editors, the research concluded: "Thus, morphine-induced Straub tail response may be evaluated further as a candidate higher throughput test to identify 5-HT2c receptor inverse agonists with anti-spasticity effects in vivo."

For more information on this research see: Morphine-induced Straub tail reaction in mice treated with serotonergic compounds. European Journal of Pharmacology, 2016;791():1-7. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www elsevier.com; European Journal of Pharmacology - www.journals.elsevier.com/european-journal-of-pharmacology/)

Drugs and Therapies - Antiemetic-Antivertigo Agents

Researchers from Valencia Polytechnic University Describe Findings in Antiemetic-Antivertigo Agents [Enhanced photo(geno)toxicity of demethylated chlorpromazine metabolites]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiemetic-Antivertigo Agents have been published. According to news originating from Valencia, Spain, by NewsRx correspondents, research stated, "Chlorpromazine (CPZ) is an anti-psychotic drug widely used to treat disorders such as schizophrenia or manic depression. Unfortunately, CPZ exhibits undesirable side effects such as phototoxic and photoallergic reactions in humans."

Our news journalists obtained a quote from the research from Valencia Polytechnic University, "In general, the influence of drug metabolism on this type of reactions has not been previously considered in photosafety testing. Thus, the present work aims to investigate the possible photo(geno)toxic potential drug metabolites, using CPZ as an established reference compound. In this case, the metabolites selected for the study are demethylchlorpromazine (DMCPZ), didemethylchlorpromazine (DDMCPZ) and chlorpromazine sulfoxide (CPZSO). The demethylated CPZ metabolites DMCPZ and DDMCPZ maintain identical chromophore to the parent drug. In this work, it has been found that the nature of the aminoaalkyl side chain modulates the hydro-phobicity and the photochemical properties (for instance, the excited state lifetimes), but it does not change the photoreactivity pattern, which is characterized by reductive photodehalogenation, triggered by homolytic carbon-chlorine bond cleavage with formation of highly reactive aryl radical intermediates. Accordingly, these metabolites are phototoxic to cells, as revealed by the 3T3 NRU assay; their photo-irritation factors are even higher than that of CPZ. The same trend is observed in photogenotoxicity studies, both with isolated and with cellular DNA, where DMCPZ and DDMCPZ are more active than CPZ itself. In summary, side-
chain demethylation CPZ, as a consequence of Phase I biotransformation, does not result a photodetoxification."

According to the news editors, the research concluded: "Instead, it leads to metabolites that exhibit in an even enhanced photo(genotoxicity)."

For more information on this research see: Enhanced photo(genotoxicity) of demethylated chlorpromazine metabolites. *Toxicology and Applied Pharmacology*, 2016;313 ():131-137. *Toxicology and Applied Pharmacology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Toxicology and Applied Pharmacology - www.journals.elsevier.com/toxicology-and-applied-pharmacology/) The news correspondents report that additional information may be obtained from M.A. Miranda, Valencia Polytechnic University, Inst Tecnol Quim, UPV CSIC, Dept. of Quim, E-46022 Valencia, Spain. Oncology - Lung Cancer

Researchers from Vanderbilt University School of Medicine Describe Findings in Lung Cancer (Chronic NF-kB activation links COPD and lung cancer through generation of an immunosuppressive microenvironment in the lungs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "Nuclear Factor (NF)-kB is positioned to provide the interface between COPD and carcinogenesis through regulation of chronic inflammation in the lungs. Using a tetracycline-inducible transgenic mouse model that conditionally expresses activated IkB kinase b (IKKb) in airway epithelium (IKTA), we found that sustained NF-kB signaling results in chronic inflammation and emphysema by 4 months."

Our news journalists obtained a quote from the research from the Vanderbilt University School of Medicine, "By 11 months of transgene activation, IKTA mice develop lung adenomas. Investigation of lung inflammation in IKTA mice revealed a substantial increase in M2-polarized macrophages and CD4+/CD25+/FoxP3+ regulatory T lymphocytes (Tregs). Depletion of alveolar macrophages in IKTA mice reduced Tregs, increased lung CD8+ lymphocytes, and reduced tumor numbers following treatment with the carcinogen urethane. Alveolar macrophages from IKTA mice supported increased generation of inducible Foxp3+ Tregs ex vivo through expression of TGFb and IL-10. Targeting of TGFb and IL-10 reduced the
ability of alveolar macrophages from IKTA mice to induce Foxp3 expression on T cells."

According to the news editors, the research concluded: "These studies indicate that sustained activation of NF-kB pathway links COPD and lung cancer through generation and maintenance of a pro-tumorigenic inflammatory environment consisting of alternatively activated macrophages and regulatory T cells."

For more information on this research see: Chronic NF-kB activation links COPD and lung cancer through generation of an immunosuppressive microenvironment in the lungs. Oncotarget, 2016;7(5):5470-82.

Oncology - Prostate Cancer

Researchers from Viborg Hospital Report Recent Findings in Prostate Cancer (Parkinson's disease and risk of prostate cancer: A Danish population-based case-control study, 1995-2010)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Prostate Cancer have been presented. According to news reporting out of Viborg, Denmark, by NewsRx editors, research stated, "Prostate cancer growth and progression may be linked to neurogenesis and to medical anti-Parkinson treatment, but results are inconclusive. Therefore, we examined the association between Parkinson's disease and risk of prostate cancer in a population based case-control study."

Our news journalists obtained a quote from the research from Viborg Hospital, "We identified 45,429 patients diagnosed with incident prostate cancer during 1997-2010 from the National Cancer Registry. Five age-matched population controls (n = 227,145) were selected for each case. Odds ratios (ORs) adjusted for age and comorbidity for prostate cancer associated with Parkinson's disease were computed using conditional logistic regression. Analyses were stratified by duration of Parkinson's disease and stage of prostate cancer (localized and advanced). In total, 245 patients (0.5%) and 1656 controls (0.7%) had Parkinson's disease. Overall, patients with Parkinson's disease had a 27% lower risk of prostate cancer compared with patients without Parkinson's disease (adjusted OR (ORa) 0.73; 95% confidence interval (CI), 0.63-0.83). Risk of prostate cancer decreased with increasing duration of Parkinson's disease. The odds ratios were slightly lower for advanced prostate cancer (ORa, 0.68; 95% CI,
0.52-0.88) than for localized prostate cancer (ORa 0.76; 95% CI, 0.61-0.93)."

According to the news editors, the research concluded: "Parkinson's disease was associated with a risk reduction overall (27%), which decreased with increasing duration of Parkinson's disease."

Our news journalists report that additional information may be obtained by contacting C.G. Jespersen, Viborg Hosp. Dept. of Urol, DK-8800 Viborg, Denmark. Additional authors for this research include M. Norgaard and M. Borre.

Drugs and Therapies - Behavioural Pharmacology
Researchers from Virginia Commonwealth University Discuss Findings in Behavioural Pharmacology (Cocaine-like discriminative stimulus effects of phendimetrazine and phenmetrazine in rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Behavioural Pharmacology. According to news reporting out of Research Triangle Park, North Carolina, by NewsRx editors, research stated, "Phendimetrazine is a clinically available anorectic and candidate medication for the treatment of cocaine addiction. Phendimetrazine can be metabolized to the amphetamine-like monoamine releaser phenmetrazine, but it is unclear if phendimetrazine functions as an inactive prodrug or might have activity on its own."

Our news journalists obtained a quote from the research from Virginia Commonwealth University, "As one method to address this issue, the present study compared the potency and time course of phendimetrazine and phenmetrazine to produce cocaine-like discriminative stimulus effects in adult, male rats (N=5) trained to discriminate cocaine (5.6 mg/kg, intraperitoneally) from saline in a two-key food-reinforced discrimination procedure. We hypothesized that, if metabolism to phenmetrazine was required for phendimetrazine effects, then phendimetrazine would be less potent and have a slower onset and offset of effects than phenmetrazine. Both phendimetrazine and phenmetrazine produced dose-dependent cocaine-like discriminative stimulus effects, and phendimetrazine was 7.8-fold less potent than phenmetrazine. However, the time courses of discriminative stimulus effects produced by phendimetrazine and phenmetrazine were similar, with peak effects at 10 min and offset by 100 min."

According to the news editors, the research concluded: "These results show the effectiveness of phendimetrazine to rapidly produce cocaine-like behavioral effects in rats and
support other nonhuman primate evidence to suggest that metabolism to phenmetrazine may not be required for phendimetrazine effects."

For more information on this research see: Cocaine-like discriminative stimulus effects of phendimetrazine and phenmetrazine in rats. *Behavioural Pharmacology*, 2016;27(2-3 Spec I):192-5. **Gastroenterology - Colorectal Research**

**Researchers from Virginia Commonwealth University Discuss Findings in Colorectal Research (Primary Care Physicians' Support of Shared Decision Making for Different Cancer Screening Decisions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gastroenterology - Colorectal Research are presented in a new report. According to news reporting originating in Richmond, Virginia, by NewsRx journalists, research stated, "Despite its widespread advocacy, shared decision making (SDM) is not routinely used for cancer screening. To better understand the implementation barriers, we describe primary care physicians' (PCPs') support for SDM across diverse cancer screening contexts."

The news reporters obtained a quote from the research from Virginia Commonwealth University, "Surveys were mailed to a random sample of USA-based PCPs. Using multivariable logistic regression analyses, we tested for associations of PCPs' support of SDM with the US Preventive Service Task Force (USPSTF) assigned recommendation grade, assessed whether the decision pertained to not screening older patients, and the PCPs' autonomous v. controlled motivation-orientation for using SDM. PCPs (n = 278) were, on average, aged 52 years, 38% female, and 69% white. Of these, 79% endorsed discussing screening benefits as very important to SDM; 64% for discussing risks; and 31% for agreeing with patient's opinion. PCPs were most likely to rate SDM as very important for colorectal cancer screening in adults aged 50-75 years (69%), and least likely for colorectal cancer screening in adults aged 85 years (34%). Regression results indicated the importance of PCPs' having autonomous or self-determined reasons for engaging in SDM (e.g., believing in the benefits of SDM) (OR = 2.29, 95% CI, 1.87 to 2.79). PCPs' support for SDM varied by USPSTF recommendation grade (overall contrast, X^2 = 14.7; P = 0.0054), with support greatest for A-Grade recommendations. Support for SDM was lower in contexts where decisions pertained to not screening older patients (OR = 0.45, 95% CI, 0.35
to 0.56). Limitations. It is unknown whether PCPs' perceptions of the importance of SDM behaviors differs with specific screening decisions or the potential limited ability to generalize findings."

According to the news reporters, the research concluded: "Our results highlight the need to document SDM benefits and consider the specific contextual challenges, such as the level of uncertainty or whether evidence supports recommending/not recommending screening, when implementing SDM across an array of cancer screening contexts."

For more information on this research see: Primary Care Physicians' Support of Shared Decision Making for Different Cancer Screening Decisions. Medical Decision Making, 2016;37(1):70-78. Drugs and Therapies - Aerosol Medicine and...

Researchers from Virginia Commonwealth University Report Details of New Studies and Findings in the Area of Aerosol Medicine and Pulmonary Drug Delivery (Validating Whole-Airway CFD Predictions of DPI Aerosol Deposition at Multiple Flow Rates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Aerosol Medicine and Pulmonary Drug Delivery are discussed in a new report. According to news originating from Richmond, Virginia, by NewsRx correspondents, research stated, "The objective of this study was to compare aerosol deposition predictions of a new whole-airway CFD model with available in vivo data for a dry powder inhaler (DPI) considered across multiple inhalation waveforms, which affect both the particle size distribution (PSD) and particle deposition. The Novolizer DPI with a budesonide formulation was selected based on the availability of 2D gamma scintigraphy data in humans for three different well-defined inhalation waveforms."

Our news journalists obtained a quote from the research from Virginia Commonwealth University, "Initial in vitro cascade impaction experiments were conducted at multiple constant (square-wave) particle sizing flow rates to characterize PSDs. The whole-airway CFD modeling approach implemented the experimentally determined PSDs at the point of aerosol formation in the inhaler. Complete characteristic airway geometries for an adult were evaluated through the lobar bronchi, followed by stochastic individual pathway (SIP) approximations through the tracheobronchial region and new acinar moving wall models of the alveolar region. It was determined that the PSD used for each inhalation waveform should be based on a constant particle sizing flow rate equal to the average of the inhalation waveform's
peak inspiratory flow rate (PIFR) and mean flow rate [i.e., AVG(PIFR, Mean)]. Using this technique, agreement with the in vivo data was acceptable with <15% relative differences averaged across the three regions considered for all inhalation waveforms. Defining a peripheral to central deposition ratio (P/C) based on alveolar and tracheobronchial compartments, respectively, large flow-rate-dependent differences were observed, which were not evident in the original 2D in vivo data. The agreement between the CFD predictions and in vivo data was dependent on accurate initial estimates of the PSD, emphasizing the need for a combination in vitro-in silico approach."

According to the news editors, the research concluded: "Furthermore, use of the AVG(PIFR, Mean) value was identified as a potentially useful method for characterizing a DPI aerosol at a constant flow rate."

The news correspondents report that additional information may be obtained from P.W. Longest, Virginia Commonwealth University, Dept. of Pharmaceut, Richmond, VA, United States. Additional authors for this research include G. Tian, N. Khajeh-Hosseini-Dalasm and M. Hindle.

Lung Diseases and Conditions - Asthma

Researchers from Virginia Polytechnic Institute and State University Describe Findings in Asthma (Tollip SNP rs5743899 modulates human airway epithelial responses to rhinovirus infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Asthma is now available. According to news originating from Blacksburg, Virginia, by NewsRx correspondents, research stated, "Rhinovirus (RV) infection in asthma induces varying degrees of airway inflammation (e. g. neutrophils), but the underlying mechanisms remain unclear. The major goal was to determine the role of genetic variation [ e. g. single nucleotide polymorphisms (SNPs)] of Toll-interacting protein (Tollip) in airway epithelial responses to RV in a type 2 cytokine milieu."

Financial support for this research came from National Institutes of Health. Our news journalists obtained a quote from the research from Virginia Polytechnic Institute and State University, "DNA from blood of asthmatic and normal subjects was
genotyped for Tollip SNP rs5743899 AA, AG and GG genotypes. Human tracheobronchial epithelial (HTBE) cells from donors without lung disease were cultured to determine pro-inflammatory and antiviral responses to IL-13 and RV16. Tollip knockout and wild-type mice were challenged with house dust mite (HDM) and infected with RV1B to determine lung inflammation and antiviral response. Asthmatic subjects carrying the AG or GG genotype (AG/GG) compared with the AA genotype demonstrated greater airflow limitation. HTBE cells with AG/GG expressed less Tollip. Upon IL-13 and RV16 treatment, cells with AG/GG (vs. AA) produced more IL-8 and expressed less antiviral genes, which was coupled with increased NF-κB activity and decreased expression of LC3, a hallmark of the autophagic pathway. Tollip co-localized and interacted with LC3. Inhibition of autophagy decreased antiviral genes in IL-13- and RV16-treated cells. Upon HDM and RV1B, Tollip knockout (vs. wild-type) mice demonstrated higher levels of lung neutrophilic inflammation and viral load, but lower levels of antiviral gene expression."

According to the news editors, the research concluded: "Our data suggest that Tollip SNP rs5743899 may predict varying airway response to RV infection in asthma."

For more information on this research see: Tollip SNP rs5743899 modulates human airway epithelial responses to rhinovirus infection. *Clinical and Experimental Allergy*, 2016;46 (12):1549-1563. *Clinical and Experimental Allergy* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Glioma has been shown to have no significant effect on progression-free survival. If these treatments have a different effect on health-related quality of life (HRQOL), it might affect the choice of therapy.

Financial supporters for this research include National Cancer Institute grants, Medical Research Council Clinical Trials Unit at University College London from Cancer Research UK, Canadian Cancer Society Research Institute, National Health and Medical Research Council project grant.

The news correspondents obtained a quote from the research from Vrije University, "We postulated that temozolomide compromises HRQOL and global cognitive functioning to a lesser extent than does radiotherapy. We did a prospective, phase 3, randomised controlled trial at 78 medical centres and large hospitals in 19 countries. We enrolled adult patients (aged ≥ 18 years) with histologically confirmed diffuse (WHO grade II) astrocytoma, oligodendroglioma, or mixed oligoastrocytoma, with a WHO performance status of 2 or lower, without previous chemotherapy or radiotherapy, who needed active treatment other than surgery. We randomly assigned eligible patients (1:1) using a minimisation technique, stratified by WHO performance status (0-1 vs 2), age (<40 years vs ≥ 40 years), presence of contrast enhancement on MRI, chromosome 1p status (deleted vs non-deleted vs indeterminate), and the treating medical centre, to receive either radiotherapy (50.4 Gy in 28 fractions of 1.8 Gy for 5 days per week up to 6.5 weeks) or temozolomide chemotherapy (75 mg/m² daily, for 21 of 28 days [one cycle] for 12 cycles). The primary endpoint was progression-free survival (results published separately); here, we report the results for two key secondary endpoints: HRQOL (assessed using the European Organisation for Research and Treatment of Cancer's [EORTC] QLQ-C30 [version 3] and the EORTC Brain Cancer Module [QLQ-BN20]) and global cognitive functioning (assessed using the Mini-Mental State Examination [MMSE]). We did analyses on the intention-to-treat population. This study is closed and is registered at EudraCT, number 2004-002714-11, and at ClinicalTrials.gov, number NCT00182819. Between Dec 6, 2005, and Dec 21, 2012, we randomly assigned 477 eligible patients to either radiotherapy (n=240) or temozolomide chemotherapy (n=237). The difference in HRQOL between the two treatment groups was not significant during the 36 months' follow-up (mean between group difference [averaged over all timepoints] 0.06, 95% CI -4.64 to 4.75, p=0.98). At baseline, 32 (13%) of 239 patients who received radiotherapy and 32 (14%) of 236 patients who received temozolomide chemotherapy had impaired cognitive function, according to the MMSE scores. After randomisation, five (8%) of 63 patients who received radiotherapy and three (6%) of 54 patients who received temozolomide chemotherapy and who could be followed up for 36 months had impaired cognitive function, according to the MMSE scores. No significant difference was recorded between the groups for the change in MMSE scores during the 36 months of follow-up. The effect of temozolomide chemotherapy or radiotherapy on HRQOL or global cognitive functioning did not differ in patients with low-grade glioma."

According to the news reporters, the research concluded: "These results do not support the choice of temozolomide alone over radiotherapy alone in patients with high-risk low-grade glioma."

Our news journalists report that additional information may be obtained by contacting J.C. Reijneveld, Vrije Universiteit Amsterdam, Medical Center, Dept. of Neurol, Brain Tumor Center Amsterdam, Amsterdam, Netherlands. Additional authors for this research...
Researchers from Wakayama Medical University Report on Findings in Heart Attack [Optical frequency domain imaging vs. intravascular ultrasound in percutaneous coronary intervention (OPINION trial): Study protocol for a randomized controlled ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Attack are presented in a new report. According to news originating from Wakayama, Japan, by NewsRx correspondents, research stated, "Optical coherence tomography is becoming increasingly widespread as an adjunctive intravascular diagnostic technique in percutaneous coronary intervention (PCI), because of its ability to visualize coronary structures at high resolution. Several studies have reported that intravascular ultrasound (IVUS) guidance in PCI might be helpful to reduce subsequent stent thrombosis, restenosis, repeat revascularization, myocardial infarction, and cardiac death."

Our news journalists obtained a quote from the research from Wakayama Medical University, "The OPTical frequency domain imaging vs. INtravascular ultrasound in percutaneous coronary InterventiON (OPINION) trial is aimed at evaluating the impact of optical frequency domain imaging (OFDI) guidance in PCI on clinical outcomes compared with IVUS guidance. The OPINION trial is a multicenter, prospective, randomized, controlled, open-label, parallel group, non-inferiority trial in Japan. The eligible patients are randomly assigned to receive either OFDI-guided PCI or IVUS-guided PCI. PCI is performed using the biolimus-eluting stent in accordance with a certain criteria of OFDI and IVUS for optimal stent deployment. All patients will undergo a follow-up angiography at 8 months. The primary endpoint is target vessel failure composed of cardiac death, myocardial infarction attributed to the target vessel, and clinically-driven target vessel revascularization at 12 months."

According to the news editors, the research concluded: "When completed, the OPINION trial will contribute to define the clinical value of the OFDI guidance in PCI."

For more information on this research see: Optical frequency domain imaging vs. intravascular ultrasound in percutaneous coronary intervention (OPINION trial): Study protocol for a randomized controlled trial. Journal of Cardiology, 2016;68(5-6):455-460. Journal of Cardiology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Drugs and Therapies - Cetirizine Therapy

Researchers from Warsaw University of Technology Report on Findings in Cetirizine Therapy (Tasting cetirizine-based microspheres with an electronic tongue)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Cetirizine Therapy is the subject of a report. According to news originating from Warsaw, Poland, by NewsRx correspondents, research stated, "Nowadays electronic tongues are used for the recognition of variety of samples, but most popular application area is pharmaceutical analysis, including mainly taste masking effects detection and estimation. However, it is noticeable, that among various pharmaceutical formulations still simple masking with the use of sweeteners plays the key role in such investigation."

Financial support for this research came from Priority Axis I.

Our news journalists obtained a quote from the research from the Warsaw University of Technology, "In this work we conduce electronic tongue study of novel drug delivery system microspheres containing cetirizine. Microspheres prepared with the use of two coating agents with different drug to polymer ratio are applied for the observation of change in taste masking and release properties (in vivo and in vitro study) and these results are compared with changes in chemical images recorded by the developed electronic tongue system."

According to the news editors, the research concluded: "High correlation of the electronic tongue results and 'compromise scores' of human panel is presented."

For more information on this research see: Tasting cetirizine-based microspheres with an electronic tongue. Sensors and Actuators B-Chemical, 2017:238():1190-1198. Sensors and Actuators B-Chemical can be contacted at: Elsevier Science Sa, PO Box 564, 1001 Lausanne, Switzerland.

The news correspondents report that additional information may be obtained from P. Ciosek, Warsaw University of Technology, Dept. of Microbioanalyst, PL-00664 Warsaw, Poland. Additional authors for this research include M. Zabadaj, A. Amelian, K. Winnicka, W. Wroblewski and P. Ciosek.

**Oncology**

**Researchers from Washington University Describe Findings in Oncology [Signatures of prostate-derived Ets factor (PDEF) in cancer]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology are discussed in a new report. According to news reporting originating in St. Louis, Missouri, by NewsRx editors, the research stated, "The Ets proteins are a family of transcription factors characterized by an evolutionarily conserved DNA-binding domain and have diverse biological functions including tumor suppressor as well as tumor promoter functions. They are regulated via a complex and diverse number of mechanisms and control key cellular processes."

The news reporters obtained a quote from the research from Washington University, "Prostate-derived Ets transcription factor (PDEF), a unique member of the ETS family, is present in tissues with high epithelial content are hormone-regulated, such as prostate, breast, salivary glands, ovaries, colon, airways, and stomach tissues. PDEF (prostate-derived Ets factor) is also referred to as SPDEF (SAM pointed domain containing Ets transcription factor), PSE (mouse homolog), or hPSE (human PSE) in the literature and is the sole member of the PDEF ETS sub-family. The role of PDEF in cancer development is still not fully elucidated though. The present article focuses on the key findings about the PDEF's biological functions, interacting proteins, and its target genes. There is a strong urge to focus on the clinical studies in larger cohort, which elucidate the regulation of PDEF and its target genes, to determine the potential of PDEF as biomarker."

According to the news reporters, the research concluded: "Based on the studies discussed in the present article, one can anticipate that PDEF offers a great potential for developing therapeutics against cancer."

Our news correspondents report that additional information may be obtained by contacting N. Mahajan, Washington University, St Louis, MO 63130, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13277-016-5326-1. This DOI is a link to an online electronic document that is either free or for purchase.

Researchers from Washington University Detail Findings in Atrial Fibrillation (Potassium and Magnesium Supplementation Do Not Protect Against Atrial Fibrillation After Cardiac Operation: A Time-Matched Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting originating from St. Louis, Missouri, by NewsRx correspondents, research stated, "Despite a lack of demonstrated efficacy, potassium and magnesium supplementation are commonly thought to prevent postoperative atrial fibrillation (POAF) after cardiac operation. Our aim was to evaluate the natural time course of electrolyte level changes after cardiac operation and their relation to POAF occurrence."

Funders for this research include National Institutes of Health, Barnes-Jewish Hospital Foundation.

Our news editors obtained a quote from the research from Washington University, "Data were reviewed from 2,041 adult patients without preoperative AF who underwent coronary artery bypass grafting, valve operation, or both between 2009 and 2013. In patients with POAF, the plasma potassium and magnesium levels nearest to the first AF onset time were compared with time-matched electrolyte levels in patients without AF. POAF occurred in 752 patients (36.8%). At the time of AF onset or the matched time point, patients with POAF had higher potassium (4.30 versus 4.21 mmol/L, p< 0.001) and magnesium (2.33 versus 2.16 mg/dL, p< 0.001) levels than controls. A stepwise increase in AF risk occurred with increasing potassium or magnesium quintile (p < 0.001). On multivariate logistic regression analysis, magnesium level was an independent predictor of POAF (odds ratio 4.26, p< 0.001), in addition to age, Caucasian race, preoperative beta-blocker use, valve operation, and postoperative pneumonia. Prophylactic potassium supplementation did not reduce the POAF rate (37% versus 37%, p = 0.813), whereas magnesium supplementation was associated with increased POAF (47% versus 36%, p = 0.005). Higher serum potassium and magnesium levels were associated with increased risk of POAF after cardiac operation. Potassium supplementation was not protective against POAF, and magnesium supplementation was even associated with increased POAF risk."

According to the news editors, the research concluded: "These findings help explain the poor efficacy of electrolyte supplementation in POAF prophylaxis."

The news editors report that additional information may be obtained by contacting S.J. Melby, Washington University, Barnes Jewish Hosp, Sch Med, Div Cardiothorac Surg, St Louis, MO 63110, United States. Additional authors for this research include M.R. Schill, J.W. Greenberg, M.R. Researchers from Washington University Provide Details of New Studies and Findings in the Area of Clubfoot (Deletions of 5' HOXC genes are associated with lower extremity malformations, including clubfoot and vertical talus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Clubfoot have been published. According to news reporting out of St. Louis, Missouri, by NewsRx editors, research stated, "Deletions of the HOXC gene cluster result in variable phenotypes in mice, but have been rarely described in humans. To report chromosome 12q13.13 microdeletions ranging from 13 to 175 kb and involving the 5' HOXC genes in four families, segregating congenital lower limb malformations, including clubfoot, vertical talus and hip dysplasia."

Our news journalists obtained a quote from the research from Washington University, "Probands (N=253) with clubfoot or vertical talus were screened for point mutations and copy number variants using multiplexed direct genomic selection, a pooled BAC targeted capture approach. SNP genotyping included 1178 probands with clubfoot or vertical talus and 1775 controls. The microdeletions share a minimal non-coding region overlap upstream of HOXC13, with variable phenotypes depending upon HOXC13, HOXC12 or the HOTAIR IncRNA inclusion. SNP analysis revealed HOXC11 p.Ser191Phe segregating with clubfoot in a small family and enrichment of HOXC12 p.Asn176Lys in patients with clubfoot or vertical talus (rs189468720, p=0.0057, OR=3.8). Defects in limb morphogenesis include shortened and overlapping toes, as well as peroneus muscle hypoplasia. Finally, HOXC and HOXD gene expression is reduced in fibroblasts from a patient with a 5' HOXC deletion, consistent with previous studies demonstrating that dosage of IncRNAs alters expression of HOXD genes in trans. Because HOXD10 has been implicated in the aetiology of congenital vertical talus, variation in its expression may contribute to the lower limb phenotypes occurring with 5' HOXC microdeletions."

According to the news editors, the research concluded: "Identification of 5' HOXC microdeletions highlights the importance of transcriptional regulators in the aetiology of severe lower limb malformations and will improve their diagnosis and management."

For more information on this research see: Deletions of 5' HOXC genes are associated with lower extremity malformations, including clubfoot and vertical talus. _Journal of Medical Genetics_, 2016;53(4):250-5. (BMJ Publishing Group - group.bmj.com/; Journal of Medical Genetics - jmg.bmj.com/)

Our news journalists report that additional information may be obtained by contacting D.M. Alvarado, Dept. of Orthopedic Surgery, Washington University, St Louis, Missouri, United States. Additional authors for this research include K. McCall, J.T. Hecht,
Researchers from Washington University School of Medicine Describe Findings in Heart Failure (One-year follow-up results from AUGMENT-HF: a multicentre randomized controlled clinical trial of the efficacy of left ventricular augmentation with...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Failure. According to news originating from St. Louis, Missouri, by NewsRx correspondents, research stated, "AUGMENT-HF was an international, multicentre, prospective, open-label, randomized, controlled evaluation testing the hypothesis that Algisyl (injectable calcium alginate hydrogel) is superior to standard medical therapy (SMT) for improving functional capacity and clinical outcomes in patients with advanced heart failure (HF). We previously reported results following 6 months of follow-up."

Our news journalists obtained a quote from the research from the Washington University School of Medicine, "This report presents the results from 1 year of extended follow up for this clinical trial. We enrolled 78 patients with advanced HF, randomized (1:1), to Algisyl with SMT or SMT alone as previously reported. Patient inclusion criteria were LVEF (<=)35%, peak VO2 of 9.0-14.5 mL/min/kg and LV end-diastolic diameter (LVEDD) index 30-40 mm/m (2) (LVEDD/body surface area). Patients must have been on stable, evidence-based therapy for HF. A total of 58 patients, mean age 62.3 ? 9.6 years, with ischaemic (57.7%) or non-ischaemic (42.3%) HF completed 12 months of follow-up. Treatment with Algisyl was associated with improved peak VO2 at 12 months; treatment effect vs. control of +2.10 mL/kg/min (95% confidence interval 0.96-3.24, p<0.001). Statistically significant improvements were observed for VO2 at anaerobic threshold, 6-min walk test distance, and NYHA functional class (all p <0.001). Through 12 months of follow-up there were 4 (10.5%) deaths in the control group and 9 (22.5%) deaths in the Algisyl group. Algisyl in addition to SMT was more effective than SMT alone for providing sustained 1-year benefits in exercise capacity, symptoms, and clinical status for patients with advanced HF."

According to the news editors, the research concluded: "These data support larger clinical evaluations of this novel therapy."

Researchers from Washington University School of Medicine Report Details of New Studies and Findings in the Area of Lymphoma (Allogeneic hematopoietic stem cell transplantation in Hodgkin lymphoma: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Lymphoma have been presented. According to news reporting from St. Louis, Missouri, by NewsRx journalists, research stated, "Allogeneic stem cell transplantation (allo-SCT) outcomes in patients with Hodgkin lymphoma (HL) remain poorly defined. We performed a meta-analysis of allo-SCT studies in HL patients."

The news correspondents obtained a quote from the research from the Washington University School of Medicine, "The primary endpoints were 6-month, 1-year, 2-year and 3-year relapse-free survival (RFS) and overall survival (OS). A total of 42 reports (1850 patients) was included. The pooled estimates (95% confidence interval) for 6-month, 1-year, 2-year and 3-year RFS were 77 (59-91)%, 50 (42-57)%, 37 (31-43)% and 31 (25-37)%, respectively. The corresponding numbers for OS were 83 (75-91)%, 68 (62-74)%, 58 (52-64)% and 50 (41-58)%, respectively. There was statistical heterogeneity among studies in all outcomes. In meta-regression, accrual initiation year in 2000 or later was associated with higher 6-month (p=0.012) and 1-year OS (p=0.046), and pre-SCT remission with higher 2-year OS (p=0.047) and 1-year RFS (p=0.016)."

According to the news reporters, the research concluded: "Outcomes of allo-SCT in HL have improved over time, with 5-10% lower non-relapse mortality and relapse rates, and 15-20% higher RFS and OS in studies that initiated accrual in 2000 or later compared with earlier studies. However, there is no apparent survival plateau, demonstrating the need to improve on current allo-SCT strategies in relapsed/refractory HL."

Oncology - Prostate Cancer

Researchers from Wayne State University Describe Findings in Prostate Cancer [The Amino-terminal Domain of the Androgen Receptor Co-opts Extracellular Signal-regulated Kinase (ERK) Docking Sites in ELK1 Protein to Induce Sustained Gene ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news originating from Detroit, Michigan, by NewsRx correspondents, research stated, "The ETS domain transcription factor ELK1 is in a repressive association with growth genes and is transiently activated through phosphorylation by ERK1/2. In prostate cancer (PCa) cells the androgen receptor (AR) is recruited by ELK1, via its amino-terminal domain (A/B), as a transcriptional co-activator, without ELK1 hyper-phosphorylation."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from Wayne State University. "Here we elucidate the structural basis of the interaction of AR with ELK1. The ELK1 polypeptide motifs required for co-activation by AR versus those required for activation of ELK1 by ERK were systematically mapped using a mammalian two-hybrid system and confirmed using a co-immunoprecipitation assay. The mapping precisely identified the two ERK-docking sites in ELK1, the D-box and the DEF (docking site for ERK, FXFP) motif, as the essential motifs for its cooperation with AR(A/B) or WTAR. In contrast, the transactivation domain in ELK1 was only required for activation by ERK. ELK1-mediated transcriptional activity of AR(A/B) was optimal in the absence of ELK1 binding partners, ERK1/2 and serum-response factor. Purified ELK1 and AR bound with a dissociation constant of 1.9 x 10(-8) M. A purified mutant ELK1 in which the D-box and DEF motifs were disrupted did not bind AR. An ELK1 mutant with deletion of the D-box region had a dominant-negative effect on androgen-dependent growth of PCa cells that were insensitive to MEK inhibition."

According to the news editors, the research concluded: "This novel mechanism in which a nuclear receptor impinges on a signaling pathway by co-opting protein kinase docking sites to constitutively activate growth genes could enable rational design of a new class of
targeted drug interventions."

The news correspondents report that additional information may be obtained from M. Ratnam, Wayne State University, Sch Med, Detroit, MI 48201, United States. Additional authors for this research include M. Patki, V. Chari, S. Dakshnamurthy, T. McFall, J. Saxton, B.L. Kidder, P.E. Shaw and M. Ratnam.

Oncology - Epithelial Ovarian Cancer

Researchers from Wayne State University Report Details of New Studies and Findings in the Area of Epithelial Ovarian Cancer (The Role of Angiogenesis in the Persistence of Chemoresistance in Epithelial Ovarian Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Epithelial Ovarian Cancer are presented in a new report. According to news reporting originating from Detroit, Michigan, by NewsRx correspondents, research stated, "Chemoresistance remains a major challenge in the treatment of ovarian cancer. As part of a survival mechanism, tumor cells have been shown to release proangiogenic factors, such as vascular endothelial growth factor (VEGF), through a mechanism that involves the upregulation of hypoxia-induced factor (HIF)-1."

Our news editors obtained a quote from the research from Wayne State University, "The objective of this study was to compare the expression of VEGF and its receptors (R1 and R2) as well as HIF-1 in chemoresistant epithelial ovarian cancer (EOC) cells to their chemosensitive counterparts and determine their impact on angiogenesis. Two human EOC cell lines, MDAH-2774 and SKOV-3, and their cisplatin- or taxotere-resistant counterparts were used. Total RNA and protein were subjected to real-time reverse transcriptase-polymerase chain reaction, immunoprecipitation/Western blot and enzyme-linked immunosorbent assay to evaluate the expression of VEGF, VEGF receptors (R1 and R2), and HIF-1. Angiogenesis was assessed with an in vitro angiogenesis assay. Data were analyzed using independent Student t tests and chi-square. Both taxotere- and cisplatin-resistant MDAH-2774 and SKOV-3 EOC cell lines manifested a significant decrease in VEGF, VEGF receptors, HIF-1 messenger RNA, and
protein levels as compared to their chemosensitive counterparts. There was a significant decrease in the number and thickness of polygon blood vessel formation in chemoresistant EOC cells compared to chemosensitive counterparts. Cisplatin- and taxotere-resistant EOC cells are characterized by lower VEGF, VEGF receptors, and HIF-1, and decreased angiogenesis."

According to the news editors, the research concluded: "These findings may indicate a decrease in drug delivery at the tumor site, hence allowing the persistence of chemoresistant EOC cells."

For more information on this research see: The Role of Angiogenesis in the Persistence of Chemoresistance in Epithelial Ovarian Cancer. Reproductive Sciences, 2016;23 (11):1484-1492. Reproductive Sciences can be contacted at: Sage Publications Inc, 2455 Teller Rd, Thousand Oaks, CA 91320, USA. (Sage Publications - www.sagepub.com; Reproductive Sciences - rsx.sagepub.com)

Hip Fracture

Researchers from Weifang Medical University Report Details of New Studies and Findings in the Area of Hip Fracture (Stroke increases the risk of hip fracture: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hip Fracture have been published. According to news reporting originating in Weifang, People's Republic of China, by NewsRx journalists, research stated, "Many studies have investigated the association between stroke and hip fracture risk, but the precise association was still unclear due to insufficient statistical power in single studies with relatively small sample size. Thus, we firstly conducted a meta-analysis of all published studies to precisely estimate the relationship of stroke with hip fracture risk."

The news reporters obtained a quote from the research from Weifang Medical University, "The strength for this relationship was weighed by pooled relative risks (RRs) with 95% confidence intervals (95% CIs) after adjustment for confounding variables. Stratified analyses by study design and ethnicity and sensitivity analysis were also performed. Two investigators independently performed a comprehensive literature search in databases of
PubMed, Embase, and Wanfang for eligible articles. A Bayesian meta-analysis was also performed to get a more precise assessment of the relationship. Eleven relevant studies from 10 publications were finally included into our meta-analysis according to the inclusion criteria. Overall, stroke significantly and independently increased the risk of hip fracture (RR=2.06, 95 % CI 1.68-2.52, P<0.001). Bayesian meta-analysis showed that stroke was also associated with an over two-fold increased risk of hip fracture (RR=2.11, 95 % CI 1.62-2.75). In stratified analysis, stroke could increase the risk of hip fracture in Caucasians (RR=2.36, 95 % CI 1.83-3.05, P<0.001).

According to the news reporters, the research concluded: "These data support the notion that stroke is an independent risk factor for hip fracture, and patients with stroke have a two-fold increased risk of hip fracture than those without stroke."

Our news correspondents report that additional information may be obtained by contacting S. Yan, Weifang Med Univ, Affiliated Hosp, Dept. of Anorectal Surg, Weifang 261000, People's Republic of China. Additional authors for this research include R. Li, Z. Wang, X. Hou, W. Gu, X. Wang, S. Yan and D. Xu.

Influenza
Researchers from Weizmann Institute of Science Report Findings in Influenza (Extracellular Matrix Proteolysis by MT1-MMP Contributes to Influenza-Related Tissue Damage and Mortality)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Influenza. According to news reporting originating from Rehovot, Israel, by NewsRx correspondents, research stated, "Mounting an effective immune response, while also protecting tissue integrity, is critical for host survival. We used a combined genomic and proteomic approach to investigate the role of extracellular matrix (ECM) proteolysis in achieving this balance in the lung during influenza virus infection."

Our news editors obtained a quote from the research from the Weizmann Institute of Science, "We identified the membrane-tethered matrix metalloprotease MT1-MMP as a prominent host-ECM-remodeling collagenase in influenza infection. Selective inhibition of MT1-MMP protected the tissue from infection-related structural and compositional tissue damage. MT1-MMP inhibition did not significantly alter the immune response or cytokine expression. The available flu therapeutic Oseltamivir did not prevent lung ECM damage and
was less effective than anti-MT1-MMP in influenza virus Streptococcus pneumoniae coinfection paradigms. Combination therapy of Oseltamivir with anti-MT1-MMP showed a strong synergistic effect and resulted in complete recovery of infected mice."

According to the news editors, the research concluded: "This study highlights the importance of tissue resilience in surviving infection and the potential of such host-pathogen therapy combinations for respiratory infections."

For more information on this research see: Extracellular Matrix Proteolysis by MT1-MMP Contributes to Influenza-Related Tissue Damage and Mortality. Cell Host & Microbe, 2016;20(4):458-470. Cell Host & Microbe can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell Host & Microbe - www.journals.elsevier.com/cell-host-and-microbe/)

The news editors report that additional information may be obtained by contacting I. Amit, Weizmann Inst Sci, Dept. of Immunol, IL-7610001 Rehovot, Israel. Researchers from Western University Describe Findings in Type 2 Diabetes [Combined hyperlipidemia: familial but not (usually) monogenic]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are presented in a new report. According to news reporting originating in London, Canada, by NewsRx journalists, research stated, "Combined hyperlipidemia (CHL) is a complex phenotype that is commonly encountered clinically and is often associated with the expression of early heart disease. The affixed adjective 'familial' gives the impression that the trait is monogenic, like familial hypercholesterolemia."

The news reporters obtained a quote from the research from Western University, "But despite significant efforts, genetic studies have yielded little evidence of single gene determinants of CHL. Sophisticated linkage studies suggest that individual lipid components of the CHL phenotype -such as elevated LDL and triglyceride -each have several determinants that segregate independently in families. Furthermore, DNA sequencing shows that rare large-effect variants in genes such as LDL receptor (LDLR) and lipoprotein lipase are found in some CHL patients, explaining the elevated LDL cholesterol and triglyceride components, respectively. In addition, multiple common small-effect lipid-altering variants accumulate in an individual's genome, raising the LDL cholesterol and/or triglyceride components by multiple mechanisms. Finally, secondary factors, such as poor diet, obesity, fatty liver or diabetes further modulate the
expression of the biochemically defined CHL phenotype."

According to the news reporters, the research concluded: "Given the current state of genetic understanding, CHL may be best conceptualized as a syndrome with common clinical presentation but multigenic causes, similar to other common conditions such as type 2 diabetes."

For more information on this research see: Combined hyperlipidemia: familial but not (usually) monogenic. *Current Opinion In Lipidology*, 2016;27(2):131-40. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Lipidology - journals.lww.com/co-lipidology/pages/default.aspx)

**Researchers from Whitehead Institute for Biomedical Research Report Details of New Studies and Findings in the Area of Rett Syndrome (Jointly reduced inhibition and excitation underlies circuit-wide changes in cortical processing in Rett ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Rett Syndrome are discussed in a new report. According to news reporting out of Cambridge, Massachusetts, by NewsRx editors, research stated, "Rett syndrome (RTT) arises from loss-of-function mutations in methyl-CpG binding protein 2 gene (Mecp2), but fundamental aspects of its physiological mechanisms are unresolved. Here, by whole-cell recording of synaptic responses in MeCP2 mutant mice in vivo, we show that visually driven excitatory and inhibitory conductances are both reduced in cortical pyramidal neurons."

Funders for this research include HHS | NIH | National Institute of Mental Health (NIMH), Simons Foundation (SF), HHS | National Institutes of Health (NIH).

Our news journalists obtained a quote from the research from Whitehead Institute for Biomedical Research, "The excitation-to-inhibition (E/I) ratio is increased in amplitude and prolonged in time course. These changes predict circuit-wide reductions in response reliability and selectivity of pyramidal neurons to visual stimuli, as confirmed by two-photon imaging. Targeted recordings reveal that parvalbumin-expressing (PV+) interneurons in mutant mice have reduced responses. PV-specific MeCP2 deletion alone recapitulates effects of global MeCP2 deletion on cortical circuits, including reduced pyramidal neuron responses and reduced response reliability and selectivity. Furthermore, MeCP2 mutant mice show reduced expression of the cation-chloride cotransporter KCC2 (K+/Cl-exporter) and a reduced KCC2/NKCC1 (Na+/K+/Cl-importer) ratio. Perforated patch recordings demonstrate that the reversal potential
for GABA is more depolarized in mutant mice, but is restored by application of the NKCC1 inhibitor bumetanide. Treatment with recombinant human insulin-like growth factor-I restores responses of PV+ and pyramidal neurons and increases KCC2 expression to normalize the KCC2/NKCC1 ratio. Thus, loss of MeCP2 in the brain alters both excitation and inhibition in brain circuits via multiple mechanisms. Loss of MeCP2 from a specific interneuron subtype contributes crucially to the cell-specific and circuit-wide deficits of RTT."

According to the news editors, the research concluded: "The joint restoration of inhibition and excitation in cortical circuits is pivotal for functionally correcting the disorder."

For more information on this research see: Jointly reduced inhibition and excitation underlies circuit-wide changes in cortical processing in Rett syndrome. *Proceedings of the National Academy of Sciences of the United States of America,* 2016;113(46):E7287-E7296.

Skin Diseases and Conditions - Eczema

**Researchers from Winthrop University Hospital Describe Findings in Eczema (Treatment of Eczema: Corticosteroids and Beyond)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Skin Diseases and Conditions - Eczema have been published. According to news originating from Mineola, New York, by NewsRx correspondents, research stated, "Atopic dermatitis (AD) is a chronic inflammatory skin condition that requires a manifold approach to therapy. The goal of therapy is to restore the function of the epidermal barrier and to reduce skin inflammation."

Our news journalists obtained a quote from the research from Winthrop University Hospital, "This can be achieved with skin moisturization and topical anti-inflammatory agents, such as topical corticosteroids and calcineurin inhibitors. Furthermore, proactive therapy with twice weekly use of both topical corticosteroids and calcineurin inhibitors in previously affected areas has been found to reduce the time to the next eczematous flare. Adjunctive treatment options include wet wrap therapy, anti-histamines, and vitamin D supplementation. Bacterial colonization, in particular Staphylococcus aureus, can contribute to eczematous flares and overt..."
infection. Use of systemic antibiotics in infected lesions is warranted; however, empiric antibiotics use in uninfected lesions is controversial. Local antiseptic measures (i.e., bleach baths) and topical antimicrobial therapies can be considered in patients with high bacterial colonization. Difficult-to-treat AD is a complex clinical problem that may require re-evaluation of the initial diagnosis of AD, especially if the onset of disease occurs in adulthood. It may also necessitate evaluation for contact, food, and inhaled allergens that may exacerbate the underlying AD. There are a host of systemic therapies that have been successful in patients with difficult-to-treat AD, however, these agents are limited by their side effect profiles."

According to the news editors, the research concluded: "Lastly, with further insight into the pathophysiology of AD, new biological agents have been investigated with promising results."

For more information on this research see: Treatment of Eczema: Corticosteroids and Beyond. Clinical Reviews in Allergy & Immunology, 2016;51(3):249-262. Clinical Reviews in Allergy & Immunology can be contacted at: Humana Press Inc, 999 Riverview Drive Suite 208, Totowa, NJ 07512, USA.

The news correspondents report that additional information may be obtained from M. Chong, Winthrop Univ Hosp, Rheumatol Allergy & Immunol, Mineola, NY 11501, United States.

Oncology - Ovarian Cancer

Researchers from Women's College Research Institute Report Recent Findings in Ovarian Cancer (Low-grade serous ovarian cancer: A review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Ovarian Cancer are discussed in a new report. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "Epithelial ovarian cancers can be divided into the more common, aggressive type II cancers and the less common, slow-growing type I cancers. Under this model, serous ovarian carcinomas can be subdivided into high-grade (type II) and low-grade (type I) tumours."

Our news journalists obtained a quote from the research from Women's College Research Institute, "The two-tier system for grading serous ovarian carcinomas is superior to more detailed grading systems in terms of predicting survival. Low-grade serous carcinomas typically present in young women and have a relatively good prognosis, despite being resistant to chemotherapy. Low-grade serous cancers have a high prevalence of KRAS and BRAF mutations, but a low prevalence of TP53 mutations (which are characteristic of high-grade serous cancers). Among women with low-grade serous ovarian cancer, the presence of a KRAS/BRAF mutation is a favorable prognostic factor."
According to the news editors, the research concluded: "Studies of the mitogen-activated protein kinase (MAPK) inhibitor in low-grade serous ovarian cancer suggest that identifying MAPK mutations might eventually be useful in guiding treatment."

Our news journalists report that additional information may be obtained by contacting S.A. Narod, Womens Coll Res Inst, Familial Breast Canc Res Unit, Toronto, ON, Canada. Additional authors for this research include Y. Segev, O. Lavie, R. Auslender, V. Sopik and S.A. Narod.

**Pharmacology**

**Researchers from Woolcock Institute of Medical Research Provide Details of New Studies and Findings in the Area of Pharmacology (People with insomnia: experiences with sedative hypnotics and risk perception)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Pharmacology are presented in a new report. According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "Sedative hypnotics form an important part of managing insomnia and are recommended for short-term use. It is standard practice for clinicians to inform the patient to use medications only 'when required', but the use of these medications is often chronic."

The news reporters obtained a quote from the research from the Woolcock Institute of Medical Research, "Little is known about the impact of standard labelling/instructions on promoting appropriate medication use for managing insomnia. To explore patient medication-taking beliefs, experiences and behavioural practices relating to the use of pharmacological/complementary sleep aids for insomnia. Specialist sleep/psychology clinics and the general community in Sydney, Australia. Semi-structured interviews were conducted with 51 people with insomnia using a schedule of questions to gauge their experiences, beliefs and current practices relating to insomnia medication use. Interviews were audio-recorded, transcribed verbatim and subjected to Framework Analysis to identify emergent themes. Participants held distinctive views about the safety and efficacy of complementary and pharmacological agents but do not intuitively turn to medications to resolve their sleep complaint. Medication use was affirmed through tangible medication-taking cues due to the ambivalence in current instructions and labelling. Practices such as dosage modification,
medication substitution and delaying medication use might be important drivers for psychological dependence. Current labelling and instructions do not necessarily promote the quality use of sedative hypnotics due to the variability in patient interpretations.

According to the news reporters, the research concluded: "Clarifying the timing, quantity and frequency of medication administration as well as insomnia symptom recognition would play a significant role in optimizing the role of pharmacotherapy in the management of insomnia."

Our news correspondents report that additional information may be obtained by contacting J.M.Y. Cheung, Woolcock Inst Med Res, NHMRC Center Res Excellence, CIRUS Center Integrated Res & Understanding Sleep & Sydney, NSW, Australia. Additional authors for this research include D.J. Bartlett, C.L. Armour, J.G. Ellis and B. Saini.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/hex.12388. This DOI is a link to an online electronic document that is either free or for purchase.

Mycobacterium Infections - Tuberculosis

Researchers from World Health Organization Describe Findings in Tuberculosis (Evaluation of the Abbott RealTime MTB and RealTime MTB INH/RIF Assays for Direct Detection of Mycobacterium tuberculosis Complex and Resistance Markers in Respiratory ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mycobacterium Infections - Tuberculosis have been published. According to news reporting out of Gauting, Germany, by NewsRx editors, research stated, "The Abbott RealTime MTB (RT MTB) assay is a new automated nucleic acid amplification test for the detection of Mycobacterium tuberculosis complex (MTBC) in clinical specimens. In combination with the RealTime MTB INH/RIF (RT MTB INH/RIF) resistance assay, which can be applied to RT MTB-positive specimens as an add-on assay, the tests also indicate the genetic markers of resistance to isoniazid (INH) and rifampin (RIF)."

Our news journalists obtained a quote from the research from World Health Organization, "We aimed to evaluate the diagnostic sensitivity and specificity of RT MTB using different types of respiratory and extrapulmonary specimens and to compare performance characteristics directly with those of the FluoroType MTB assay. The resistance results obtained by RT MTB INH/RIF were compared to those from the GenoType MTBDRplus and from phenotypic drug susceptibility testing. A total of 715 clinical specimens were analyzed. Compared to culture, the overall sensitivity of RT MTB was 92.1%; the sensitivity rates for smear-positive and smear-negative samples were 100% and 76.2%, respectively. The
sensitivities of smear-negative specimens were almost identical for respiratory (76.3%) and extrapulmonary (76%) specimens. Specificity rates were 100% and 95.8% for culture-negative specimens and those that grew nontuberculous mycobacteria, respectively. RT MTB INH/RIF was applied to 233 RT MTB-positive samples and identified resistance markers in 7.7% of samples. Agreement with phenotypic and genotypic drug susceptibility testing was 99.5%.

According to the news editors, the research concluded: "RT MTB and RT MTB INH/RIF allow for the rapid and accurate diagnosis of tuberculosis (TB) in different types of specimens and reliably indicate resistance markers. The strengths of this system are the comparably high sensitivity with paucibacillary specimens, its ability to detect INH and RIF resistance, and its high-throughput capacities."

Our news journalists report that additional information may be obtained by contacting S. Hofmann-Thiel, WHO, IML Red, Supranat Reference Lab TB, Gauting, Germany. Additional authors for this research include N. Molodtsov, U. Antonenka and H. Hoffmann.

Biotechnology - Biomaterials Research

Researchers from Wuhan University Describe Findings in Biomaterials Research (Drug self-delivery systems for cancer therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Biotechnology - Biomaterials Research is now available. According to news reporting from Wuhan, People’s Republic of China, by NewsRx journalists, research stated, "Carrier-assistant drug delivery systems (DDSs) have been rapidly established for cancer therapy and great strides have been made in recent years. However, further development of DDSs is retarded by the aspects such as the low drug carrying capacity, carrier-induced toxicity and immunogenicity, complex synthesis manipulation."

Financial support for this research came from National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from Wuhan University, "Drug self-delivery systems (DSDSs), in which active drugs exhibit nanoscale characteristic to realize intracellular delivery by themselves without the help of nanocarriers, have been rapidly developed to address these issues. In this review, we present a comprehensive summary of the recent advances in DSDSs for cancer therapy. After a brief introduction to the major types of DSDSs and their fabrication strategies, we emphatically discuss some representative achievements of these DSDSs for passive or/and positive targeting therapy,
combinational therapy as well as theranostics."

According to the news reporters, the research concluded: "The design principle is explained and justified, which can cast a new light on developing drug delivery systems for cancer treatments."

Our news journalists report that additional information may be obtained by contacting X.Z. Zhang, Wuhan University, Dept. of Chem, Wuhan 430072, People's Republic of China. Additional authors for this research include A.Q. Zhang, S.X. Cheng, L. Rong and X.Z. Zhang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.biomaterials.2016.10.016. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Cancer Therapy**

**Researchers from Wuhan University Detail New Studies and Findings in the Area of Cancer Therapy (Gossypol with Hydrophobic Linear Esters Exhibits Enhanced Antitumor Activity as an Inhibitor of Antiapoptotic Proteins)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Cancer Therapy is the subject of a report. According to news reporting originating in Wuhan, People's Republic of China, by NewsRx journalists, research stated, "A series of gossypol Schiff bases that were derived from unnatural linear amino acid methyl esters were identified and found to be much more potent than gossypol and ABT-199 in terms of anticancer activity. This is the first example of gossypol Schiff bases with increased activity."

Funders for this research include Natural Science Foundation of Hubei Province, National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Wuhan University, "The investigation of the Schiff base side chain of gossypol revealed that the unique anticancer effect was achieved by the introduction of hydrophobic ester groups. The optimized products showed low micromolar pan antitumor activities against NCI-60 tumor cell lines, which is promising for further drug development. Studies on the preliminary mechanism of action for their cellular activities was also carried out with antiapoptotic protein (Bcl-2 and Mc1-1) inhibition FP assays."

According to the news reporters, the research concluded: "The molecular modeling analysis demonstrated a possible binding mode for these compounds with Bcl-2, which could
explain the binding affinity of the novel gossypol Schiff bases with these proteins."

Our news correspondents report that additional information may be obtained by contacting W. Wang, Wuhan University, Key Lab Combinatorial Biosynth & Drug Discovery, Minist Educ, Sch Pharmaceut Sci, Wuhan 430071, People's Republic of China. Additional authors for this research include S.C. Wu, Y. Yue, S. He, J. Li, J. Tang, W. Wang and H.B. Zhou.

**Researchers from Wuhan University Discuss Findings in Chronic Disease (Estimation of the Disease Burden Attributable to 11 Risk Factors in Hubei Province, China: A Comparative Risk Assessment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Disease Attributes - Chronic Disease have been published. According to news reporting originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated. "In order to estimate the health losses caused by common risk factors in the Hubei province, China, we calculated the deaths and disability-adjusted life years (DALYs) attributable to 11 risk factors. We estimated the exposure distributions of risk factors in Hubei Province in 2013 from the monitoring system on chronic disease and related risk factors, combined with relative risk (RR) in order to calculate the population attributable fraction."

Our news editors obtained a quote from the research from Wuhan University, "Deaths and DALYs attributed to the selected risk factors were then estimated together with cause-specific deaths and DALYs. In total, 53.39% of the total deaths and 36.23% of the total DALYs in Hubei were a result of the 11 selected risk factors. The top five risk factors were high blood pressure, smoking, high body mass index, diet low in fruits and alcohol use, accounting for 14.68%, 12.57%, 6.03%, 3.90% and 3.19% of total deaths, respectively, and 9.41%, 7.22%, 4.42%, 2.51% and 2.44% of total DALYs, respectively. These risk factors, especially high blood pressure, smoking and high body mass index, significantly influenced quality of life, causing a large number of deaths and DALYs."

According to the news editors, the research concluded: "The burden of chronic disease could be substantially reduced if these risk factors were effectively controlled, which
would allow people to enjoy healthier lives."

The news editors report that additional information may be obtained by contacting F.F. Cui, Wuhan University, Sch Hlth Sci, Dept. of Epidemiol & Biostat, Wuhan 430071, People's Republic of China. Additional authors for this research include L. Zhang, C.H. Yu, S.B. Hu and Y.Q. Zhang.

Keywords for this news article include: Wuhan, People's Republic of China, Asia, Pathologic Processes, Risk and Prevention, Disease Attributes, Chronic Disease, China, Asia, Wuhan University.

**Drugs and Therapies - Drug Delivery Systems**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Drug Delivery Systems is now available. According to news reporting out of Wuhan, People's Republic of China, by NewsRx editors, research stated, "The biomedical applications of graphene-based materials, including drug delivery, have grown rapidly in the past few years. The aim of this present study is to enhance the efficiency and specificity of anticancer drug delivery and realize intelligently controlled release and targeted delivery."

Financial supporters for this research include National Natural Science Foundation of China, The Special Funds Project of Major New Products of Hubei Province, University-industry Cooperation Projects of The Ministry of Education of Guangdong province, The innovation fund project of the Ministry of Science and Technology of Small and Medium-sized Enterprises, Zhuhai Science and Technology Plan Projects, Wuhan Science and Technology Development, The Fundamental Research Funds for the Central Universities.

Our news journalists obtained a quote from the research from Wuhan University, "Graphene oxide (GO) was first prepared from purified natural graphite according to a modified Hummers' method. Then GO was functionalized with adipic acid dihydrazide to introduce amine groups, and sodium alginate (SA) was covalently conjugated to GO by the formation of amide bonds. The resulting GO-SA conjugate was characterized and used as a carrier to encapsulate the anticancer drug doxorubicin hydrochloride (DOX center dot HCl) to study in vitro release behavior. The maximum loading capacity of DOX on GO-SA was 1.843 mg/mg and the drug release rate under tumor cell microenvironment of pH 5.0 was significantly higher than that under physiological conditions of pH 6.5 and 7.4. Methylthiazol tetrazolium (MTT) assay was applied to evaluate the Hela cells and NIH-3T3 cells cytotoxicity of GO-SA. GO-SA had no obvious toxicity and GO-SA/DOX exhibits notable cytotoxicity to Hela cells."

According to the news editors, the research concluded: "Cell uptake studies indicated
that GO-SA could specifically transport the DOX into Hela cells over-expressing CD44 receptors and showed enhanced toxicity."

Our news journalists report that additional information may be obtained by contacting M. Nie, Wuhan University, Key Lab Oral Biomed, Minist Educ, Sch & Hosp Stomatol, Wuhan 430079, People's Republic of China. Additional authors for this research include H.Y. Ge, S.Q. Zou, Y. Xiao, H.H. Wen, Y. Li, H. Feng and M. Nie.

**Gram-Negative Bacteria - Acinetobacter baumannii**

**Researchers from Xi'an Jiao Tong University Provide Details of New Studies and Findings in the Area of Acinetobacter baumannii (Extensively drug-resistant Acinetobacter baumannii outbreak cross-transmitted in an intensive care unit and ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Acinetobacter baumannii is now available. According to news reporting out of Xi'an, People's Republic of China, by NewsRx editors, research stated, "Extensively drug-resistant Acinetobacter baumannii (XDRAB) is a great threat in intensive care units (ICUs). The aim of this study was to describe an XDRAB outbreak which was cross-transmitted in the ICU and respiratory intensive care unit (RICU) in a tertiary care hospital from January-March 2013."

Our news journalists obtained a quote from the research from Xi'an Jiao Tong University, "Patient and environmental surveillances were performed. Isolates were tested for antimicrobial susceptibility. Genotypes were analyzed by multilocus sequence typing (MLST). A series of enhanced strategies were implemented to control the outbreak. A total of 11 patients were infected by XDRAB strains during this outbreak. Three patients in the ICU were found positive for XDRAB at the onset of the outbreak. Thereafter, infections were detected in 6 patients in the RICU, followed by reappearance of this strain in the ICU in 2 patients. All A baumannii strains isolated from patients and the environment were extensively drug resistant. MLST revealed them as ST368. After 3 rounds of environmental screening and cleaning, the laminar flow system connecting the ICU and RICU was found as the source of transmission. Successful control of this outbreak was achieved through multifaceted intervention measures."

According to the news editors, the research concluded: "This study suggested the
importance of thorough surveillance and disinfection of the environment, including concealed devices, in preventing the transmission of an outbreak."

Our news journalists report that additional information may be obtained by contacting L. Han, Xi An Jiao Tong Univ, Minist Educ, Key Lab Environm & Genes Related Dis, Xian, People's Republic of China. Additional authors for this research include S.S. Han, W.J. Wu, X. Wang, J. Xu and L. Han.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajic.2016.03.041. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Liver Cancer**

**Researchers from Xiamen University Report New Studies and Findings in the Area of Liver Cancer (HOX Antisense lincRNA HOXA-AS2 Promotes Tumorigenesis of Hepatocellular Carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Liver Cancer. According to news reporting out of Fujian, People's Republic of China, by NewsRx editors, research stated, "Recent studies reveal that long non-coding RNAs (LncRNAs) play critical roles in the proliferation and migration of human cancer. Previous report has shown that LncRNA HOXA-AS2 was involved in carcinoma processes."

Our news journalists obtained a quote from the research from Xiamen University, "However, the expression and biological function of HOXA-AS2 in hepatocellular carcinoma (HCC) are poorly understood. Quantitative real-time PCR (qRT-PCR) was performed to detect the expression of HOXA-AS2 in HCC tissues and cell lines. The relation between IncRNA HOXA-AS2 expression and clinicopathological characteristics was assessed by chi-square test. The prognosis was analyzed using Kaplan-Meier method, and compared differences between the two groups by log-rank test. The biological function of HOXA-AS2 on HCC cells were determined both in vitro and in vivo. In the present study, we found that HOXA-AS2 expression was increased in HCC tissues and adjacent normal tissues and high HOXA-AS2 expression was associated with bigger tumor size, advanced tumor stage, and shorter survival time. Knockdown of HOXA-AS2 significantly inhibited HCC cell proliferation and invasion and resulted in an increase of apoptosis. Furthermore, inhibition of HOXA-AS2 in HCC cells significantly repressed tumorigenicity in nude mice."

According to the news editors, the research concluded: "Our results indicated that the
inhibition of HOXAAS2 in HCC cells significantly inhibited cell proliferation in vitro and in vivo, which might provide a potential possibility for targeted therapy of HCC."

Our news journalists report that additional information may be obtained by contacting Z.Y. Yin, Xiamen University, Zhongshan Hosp, Fujian Prov Key Lab Chron Liver Dis & Hepatocellu, Dept. of Hepatobiliary Surg, Xiamen, Fujian, People's Republic of China. **Oncology**

**Researchers from Yale University School of Medicine Detail New Studies and Findings in the Area of Oncology (Mutation based treatment recommendations from next generation sequencing data: a comparison of web tools)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology is now available. According to news reporting originating from New Haven, Connecticut, by NewsRx correspondents, research stated, "Interpretation of complex cancer genome data, generated by tumor target profiling platforms, is key for the success of personalized cancer therapy. How to draw therapeutic conclusions from tumor profiling results is not standardized and may vary among commercial and academically-affiliated recommendation tools."

Our news editors obtained a quote from the research from the Yale University School of Medicine, "We performed targeted sequencing of 315 genes from 75 metastatic breast cancer biopsies using the FoundationOne assay. Results were run through 4 different web tools including the Drug-Gene Interaction Database (DGidb), My Cancer Genome (MCG), Personalized Cancer Therapy (PCT), and cBioPortal, for drug and clinical trial recommendations. These recommendations were compared amongst each other and to those provided by FoundationOne. The identification of a gene as targetable varied across the different recommendation sources. Only 33% of cases had 4 or more sources recommend the same drug for at least one of the usually several altered genes found in tumor biopsies. These results indicate further development and standardization of broadly applicable software tools that assist in our therapeutic interpretation of genomic data is needed."
According to the news editors, the research concluded: "Existing algorithms for data acquisition, integration and interpretation will likely need to incorporate artificial intelligence tools to improve both content and real-time status."

For more information on this research see: Mutation based treatment recommendations from next generation sequencing data: a comparison of web tools. *Oncotarget*, 2016;7(16):22064-76.

The news editors report that additional information may be obtained by contacting J.M. Patel, Medical Oncology, Yale Cancer Center, Yale School of Medicine, New Haven, CT 06520, United States. **Clinical Trials and Studies - Post-Trial Research**

**Researchers from Yale-New Haven Hospital Report Details of New Studies and Findings in the Area of Post-Trial Research (The use of basiliximab-infliximab combination for the treatment of severe gastrointestinal acute GvHD)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Trials and Studies - Post-Trial Research. According to news reporting originating from New Haven, Connecticut, by NewsRx correspondents, research stated, "After allogeneic stem cell transplant, severe grade III-IV gastrointestinal (GI) acute GvHD is associated with significant morbidity and mortality, and generally results in poor outcomes. Salvage therapy for patients who fail steroid therapy is not well defined in the literature."

Our news editors obtained a quote from the research from Yale-New Haven Hospital, "In the current retrospective study, we reviewed our experience with the combination of basiliximab and infliximab in 21 patients with severe, grade III-IV GI acute GvHD of whom 16 met the definition for steroid-refractory disease. The overall response rate was 76%, with 43% CR at a median time of 21 days after beginning treatment. The survival at 1 year was 24%, with most deaths due to complications from GvHD and recurrence of primary disease. All five of the long-term survivors have chronic GvHD. On the basis of a review of the literature, this regimen does not seem to be significantly more effective than other strategies for severe GI GvHD and seems to be worse than the results reported for basiliximab alone."

According to the news editors, the research concluded: "Future studies of single-agent basiliximab and newer agents are required."

For more information on this research see: The use of basiliximab-infliximab combination for the treatment of severe gastrointestinal acute GvHD. *Bone Marrow Transplantation*, 2015;51(2):273-6. *Bone Marrow Transplantation* can be contacted at: Nature
Researchers from Yamaguchi University Provide Details of New Studies and Findings in the Area of Diabetic Angiopathies (Basigin can be a therapeutic target to restore the retinal vascular barrier function in the mouse model of diabetic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Diabetic Angiopathies. According to news reporting from Yamaguchi, Japan, by NewsRx journalists, research stated, "Despite the advance in medical technology, diabetic retinopathy (DR) is still an intractable disease which leads to the damage of retinal cells and finally the visual loss. Impairment of retinal vascular barrier triggered by an admixture of multiple inflammatory cytokines is a core of pathophysiology of DR."

The news correspondents obtained a quote from the research from Yamaguchi University, "Therefore, the molecules involved commonly in multiple cytokines-induced impairment of vascular barrier would be the targets of curative treatment of DR. Here, we demonstrate that basigin, a transmembrane molecule expressed in neural barrier-forming endothelial cells, is the molecule essential for vascular barrier impairment which is shared by various triggers including VEGF, TNF alpha and IL-1 beta. In vitro data with neural microvascular endothelial cells indicated that stimulation with cytokines decreases the levels of claudin-5 in cell membranes and consequently impairs the barrier function in a manner dependent on the interaction of claudin-5 with basigin and caveolin-1. In addition, the increased vascular permeability in retinas of streptozotocin-induced diabetic mice was shown to be clearly normalized by intravitreous injection of siRNAs specific for basigin."

According to the news reporters, the research concluded: "This study has highlighted basigin as a common essential molecule for various stimuli-induced impairment of retinal vascular barrier, which can be a target for strategies to establish a curative treatment of DR."
For more information on this research see: Basigin can be a therapeutic target to restore the retinal vascular barrier function in the mouse model of diabetic retinopathy. *Scientific Reports*, 2016;6():1-11. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **Gram-Negative Bacteria - Klebsiella**

**Researchers from Yang Ming National University Describe Findings in Klebsiella (In vivo evolution of tigecycline-non-susceptible Klebsiella pneumoniae strains in patients: relationship between virulence and resistance)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Klebsiella have been presented. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "Tigecycline resistance among Klebsiella pneumoniae isolates has been increasingly reported. We aimed to investigate the relationship among in vivo acquisition of tigecycline resistance in K. pneumoniae clinical isolates, the underlying molecular mechanisms and bacterial virulence."

Financial supporters for this research include Ministry of Science and Technology in Taiwan, Taipei Veterans General Hospital, Szu-Yuan Research Foundation of Internal Medicine.

The news reporters obtained a quote from the research from Yang Ming National University. "Clinical isolates of K. pneumoniae from the same patient in a medical centre in Taiwan that were initially tigecycline-susceptible (TS) and then became tigecycline-non-susceptible (TNS) were identified. Clinical data were collected. All isolates were subjected to MIC determination by Etest, pulsed-field gel electrophoresis (PFGE), multilocus sequence typing (MLST), virulence factor determination, and growth rate and mouse lethality studies. Quantitative RT-PCR was performed to analyse acrA, oqxA, ramA and rarA expressions. The presence of mutations in acrR, ramR, oqxR and rpsJ were analysed by DNA sequencing. Five isogenic paired isolates were determined by PFGE fingerprinting. TNS K. pneumoniae appeared after treatment with a variety of antibiotics among patients infected with TS K. pneumoniae. TNS K. pneumoniae isolates were associated with upregulation of RamA and/or RarA and the corresponding AcrAB and/or OqxAB efflux pump(s), respectively. Various mutations in negative regulatory genes (ramR and oqxR) accounted for overexpression of ramA and rarA, respectively."
According to the news reporters, the research concluded: "Three of the five paired isolates showed similar growth rates and virulence between TS and TNS isolates. Two TNS K. pneumoniae strains belonging to capsular types K1 and K20 retained their high virulence. Some TNS K. pneumoniae strains derived from TS isolates did not compromise their virulence. Dissemination of these highly pathogenic and resistant strains would be of major concern in the future."

Our news correspondents report that additional information may be obtained by contacting Y.T. Lin, Yang Ming National University, Inst Emergency & Crit Care Med, Taipei, Taiwan. Additional authors for this research include Y.W. Huang, H.H. Huang, T.C. Yang, F.D. Wang and C.P. Fung.

median eGFR increased by 28.0 ml/min/1.73m(2) in the LDT group and decreased by 4.3 ml/min/1.73m(2) in the ETV group (p=0.000). The eGFR in 88.5% of patients (23/26) from the LDT group increased > 90 ml/min/1.73m(2). The percentage of patients with an eGFR > 90 ml/min/1.73m(2) increased from 60.0% to 92.3% in the LDT group and from 64.6% to 69.2% in the ETV group. In patients with HBV-related compensated cirrhosis.

According to the news reporters, the research concluded: "LDT treatment was more effective in protecting nephritic function and was associated with a higher drug resistance rate, but did not contribute to a better outcome compared with ETV treatment."

For more information on this research see: Comparison of Telbivudine and Entecavir Therapy on Nephritic Function and Drug Resistance in Patients with Hepatitis B Virus-Related Compensated Cirrhosis. *Cellular Physiology and Biochemistry*, 2016;40(1-2):370-378. *Cellular Physiology and Biochemistry* can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. **Inflammation**

**Researchers from Zhejiang University Report Recent Findings in Inflammation (Epithelial disruption of Gab1 perturbs surfactant homeostasis and predisposes mice to lung injuries)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Inflammation have been presented. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "GRB2-associated-binding protein 1 (Gab1) belongs to Gab adaptor family, which integrates multiple signals in response to the epithelial growth factors. Recent genetic studies identified genetic variants of human Gab1 gene as potential risk factors of asthmatic inflammation."

Funders for this research include National Natural Science Foundation of China
The news reporters obtained a quote from the research from Zhejiang University, "However, the functions of Gab1 in lungs remain largely unknown. Alveolar type-II cells (AT-IIs) are responsible for surfactant homeostasis and essentially regulate lung inflammation following various injuries (3). In this study, in vitro knockdown of Gab1 was shown to decrease the surfactant proteins (SPs) levels in AT-IIs. We further examined in vivo Gab1 functions through alveolar epithelium-specific Gab1 knockout mice (Gab1(Delta/Delta)). In vivo Gab1 deficiency leads to a decrease in SP synthesis and the appearance of disorganized lamellar bodies. Histological analysis of the lung sections in Gab1(Delta/Delta) mice shows no apparent pathological alterations or inflammation. However, Gab1(Delta/Delta) mice demonstrate inflammatory responses during the LPS-induced acute lung injury. Similarly, in mice challenged with bleomycin, fibrotic lesions were found to be aggravated in Gab1(Delta/Delta). These observations suggest that the abolishment of Gab1 in AT-IIs impairs SP homeostasis, predisposing mice to lung injuries. In addition, we observed that the production of surfactants in AT-IIs overexpressing Gab1 mutants, in which Shp2 phosphatase and PI3K kinase binding sites have been mutated (Gab1(Delta Shp2), Gab1(Delta PI3K)), has been considerably attenuated."

According to the news reporters, the research concluded: "Together, these findings provide the direct evidence about the roles of docking protein Gab1 in lungs, adding to our understanding of acute and interstitial lung diseases caused by the disruption of alveolar SP homeostasis."

For more information on this research see: Epithelial disruption of Gab1 perturbs surfactant homeostasis and predisposes mice to lung injuries. Mycobacterium Infections - Tuberculosis

Researchers from Zhejiang University Report on Findings in Tuberculosis (A Group of Novel Serum Diagnostic Biomarkers for Multidrug-Resistant Tuberculosis by iTRAQ-2D LC-MS/MS and Solexa Sequencing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news reporting from Hangzhou, People's Republic of China, by
NewsRx journalists, research stated, "The epidemic of pulmonary tuberculosis (TB), especially multidrug-resistance tuberculosis (MDR-TB) presented a major challenge for TB treatment today. We performed iTRAQ labeling coupled with two-dimensional liquid chromatography-tandem mass spectrometry (2D LC-MS/MS) and Solexa sequencing among MDR-TB patients, drug-sensitive tuberculosis (DS-TB) patients, and healthy controls."

The news correspondents obtained a quote from the research from Zhejiang University. "A total of 50 differentially expressed proteins and 43 differentially expressed miRNAs (fold change >1.50 or <0.60, p<0.05) were identified in the MDR-TB patients compared to both DS-TB patients and healthy controls. We found that 22.00% of differentially expressed proteins and 32.56% of differentially expressed miRNAs were related, and could construct a network mainly in complement and coagulation cascades. Significant differences in CD44 antigen (CD44), coagulation factor XI (F11), kininogen-1 (KNG1), miR-4433b-5p, miR-424-5p, and miR-199b-5p were found among MDR-TB patients, DS-TB patients and healthy controls (p <0.05) by enzyme-linked immunosorbent assay (ELISA) and SYBR green qRT-PCR validation. A strong negative correlation, consistent with the target gene prediction, was found between miR-199b-5p and KNG1 (r=-0.232, p=0.017). Moreover, we established the MDR-TB diagnostic model based on five biomarkers (CD44, KNG1, miR-4433b-5p, miR-424-5p, and miR-199b-5p)."

According to the news reporters, the research concluded: "Our study proposes potential biomarkers for MDR-TB diagnosis, and also provides a new experimental basis to understand the pathogenesis of MDR-TB."

For more information on this research see: A Group of Novel Serum Diagnostic Biomarkers for Multidrug-Resistant Tuberculosis by iTRAQ-2D LC-MS/MS and Solexa Sequencing. *International Journal of Biological Sciences*, 2016;12(2):246-56.

Researchers' Work from Autonomous University Focuses on Rheumatoid Arthritis (STAT4 rs7574865 G/T polymorphism is associated with rheumatoid arthritis and disease activity, but not with anti-CCP antibody levels in a Mexican population)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Rheumatoid Arthritis. According to news reporting originating from Tepic, Mexico, by NewsRx correspondents, research stated, "Rheumatoid arthritis (RA) is a systemic autoimmune disease in whose etiology genetic factors are known to play an important role. Among the genes associated with RA, STAT4 could be an important factor in conducting helper T cells toward the pro-inflammatory Th1 and Th17 lineages."

Funders for this research include Integral Program of Institutional Improvement, Improvement of Quality from Educative Institutions Program.

Our news editors obtained a quote from the research from Autonomous University, "The aim of this study is to determine the association of the STAT4 polymorphism rs7574865 with RA, disease activity, and anti-cyclic citrullinated peptide (CCP) antibody levels in a Mexican population. Genotyping was carried out using the Taqman® system from Applied Biosystems in 140 patients with RA and 150 healthy subjects. Disease activity was evaluated by a rheumatologist using the DAS28 and Spanish-HAQ-DI instruments. Anti-CCP levels were determined by ELISA. Associations of the genotypes of rs7574865 with DAS28, HAQ, and anti-CCP antibody levels with RA were determined. Findings showed that the GT and TT genotypes and the T allele from rs7574865 were all associated as risk factors for RA, independently of their anti-CCP status. An association with moderate-to-high disease activity (DAS28 >= 3.2) was also found. Additionally, patients with the GT or TT genotypes showed lower HAQ values than those who carried the GG genotype. No differences in anti-CCP antibody levels or DAS28 and genotypes were found."

According to the news editors, the research concluded: "This work supports the association of the STAT4 rs7574865 polymorphism with RA and disease activity, but not with anti-CCP antibody levels in a Mexican population."

For more information on this research see: STAT4 rs7574865 G/T polymorphism is associated with rheumatoid arthritis and disease activity, but not with anti-CCP antibody levels in a Mexican population. Researchers' Work from CSIR Focuses on Reactive Oxygen Species (Selective scavenging of intra-mitochondrial superoxide corrects diclofenac-induced mitochondrial dysfunction and gastric injury: A novel gastroprotective mechanism independent of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Reactive Oxygen Species have been published. According to news originating from Bengal, India, by NewsRx correspondents, research stated, "Non-steroidal anti-inflammatory drugs (NSAIDs) are widely used to treat multiple inflammatory diseases and pain but severe gastric mucosal damage is the worst outcome of NSAID-therapy. Here we report that mitoTEMPO, a mitochondrially targeted superoxide (O$_2^-$(-)) scavenger protected as well as healed gastric injury induced by diclofenac (DCF), the most commonly used NSAID."

Our news journalists obtained a quote from the research from CSIR, "Common existing therapy against gastric injury involves suppression of gastric acid secretion by proton pump inhibitors and histamine H-2 receptor antagonists; however, dyspepsia, vitamin B12 deficiency and gastric microfloral dysbalance are the major drawbacks of acid suppression. Interestingly, mitoTEMPO did not inhibit gastric acid secretion but offered gastroprotection by preventing DCF-induced generation of O$_2^-$(-) due to mitochondrial respiratory chain failure and by preventing mitochondrial oxidative stress (MOS)-mediated mitopathology. MitoTEMPO even restored DCF-stimulated reduced fatty acid oxidation, mitochondrial depolarization and bioenergetic crisis in gastric mucosa. MitoTEMPO also prevented the activation of mitochondrial pathway of apoptosis and MOS-mediated proinflammatory signaling through NF-kappa B by DCF. Furthermore, mitoTEMPO when administered in rats with preformed gastric lesions expedited the healing of gastric injury and the healed stomach exhibited its normal physiology as evident from gastric acid and pepsin secretions under basal or stimulated conditions."

According to the news editors, the research concluded: "Thus, in contrast to the existing antiulcer drugs, mitochondrially targeted O$_2^-$-scavengers like mitoTEMPO may represent a novel class of gastroprotective molecules that does not affect gastric acid secretion and may be used in combination with DCF, keeping its anti-inflammatory action intact, while reducing its gastrodamaging effects."

The news correspondents report that additional information may be obtained from U. Bandyopadhyay, CSIR Indian Inst Chem Biol, Div Infect Dis & Immunol, Kolkata 700032, W Bengal, India. Additional authors for this research include R. De, S. Sarkar, A.A. Siddiqui, S.J. Saha, C. Banerjee, M.S. Iqbal, S. Nag, S. Debsharma and U. Bandyopadhyay.

Researchers' Work from Central South University Focuses on Smoking (Facilitators and Barriers of Smokers' Compliance with Smoking Bans in Public Places: A Systematic Review of Quantitative and Qualitative Literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Smoking. According to news reporting out of Changsha, People's Republic of China, by NewsRx editors, research stated, "Environmental tobacco smoke (ETS) exposure is associated with an increased risk of many diseases. Many countries have ratified a national smoking ban in public places, but studies on factors related to smoking issues in public places post-ban are lacking."

Our news journalists obtained a quote from the research from Central South University, "To identify facilitators and barriers that influenced smokers' compliance with smoking bans in public places. Using PubMed, MEDLINE, and the Web of Science database, we conducted a systematic search of English articles published before June 2015 on factors of smokers' compliance with the smoking bans in public places. A total of 390 references were identified, among which seventeen articles (twelve quantitative studies, two qualitative studies, three mixed-method studies) were included in this review. These studies focused on four types of public places including recreational venues (n = 7), hospital (n = 5), school (n = 4), and workplace (n = 1). Factors at the individual-, interpersonal-, and organizational-level were identified: at the individual level, nicotine dependence, insufficiency of tobacco-related knowledge, and the negative attitudes towards smoking bans were the most commonly identified barriers; at the interpersonal level, the smoking behaviors of people around, close relatives, and friends' approval were the main barriers; and at the organizational level, the main barriers were inefficient implementation of the bans and the inconvenience of the designative smoking areas. This synthesis of the literature provided evidence of the identified barriers and facilitators of smokers' compliance with the smoking bans."

According to the news editors, the research concluded: "It will be beneficial for the policy-maker to consider interventions on multiple levels of factors to overcome the barriers and enhance smokers' compliance with the smoking bans in public places."

For more information on this research see: Facilitators and Barriers of Smokers' Compliance with Smoking Bans in Public Places: A Systematic Review of Quantitative and Qualitative Literature. International Journal of Environmental Research and Public Health, 2016;13(12):786-797. Researchers' Work from Cleveland Clinic Focuses on Obstructive Sleep Apnea (Positive Airway Pressure-Induced Conversion of Atrial Fibrillation to Normal Sinus Rhythm in Severe Obstructive Sleep Apnea)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea is the subject of a report. According to news originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Accumulating data implicate obstructive sleep apnea (OSA) as a predisposing factor to the development of atrial fibrillation (AF), the latter representing the most common sustained cardiac arrhythmia. The postulated mechanisms leading to atrial arrhythmogenesis in OSA include alterations in intrathoracic pressures, intermittent hypoxemia, and autonomic nervous system fluctuations."

Our news journalists obtained a quote from the research from Cleveland Clinic, "Although these OSA-related pathophysiologic pathways may result in atrial structural and electrical remodeling, thereby predisposing to AF, there are data to suggest that the immediate influences of respiratory events may trigger arrhythmic events. This case demonstrates an immediate reversal of AF to normal sinus rhythm with optimal continuous positive airway pressure (CPAP) therapy in the background of severe OSA."

According to the news editors, the research concluded: "These findings of immediate benefit of reversal of OSA pathophysiology on cardiac arrhythmia suggest OSA may have acute influences on cardiac electrophysiology."

For more information on this research see: Positive Airway Pressure-Induced Conversion of Atrial Fibrillation to Normal Sinus Rhythm in Severe Obstructive Sleep Apnea. *Journal of Clinical Sleep Medicine*, 2016;12(9):1301-1303. *Journal of Clinical Sleep Medicine* can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

The news correspondents report that additional information may be obtained from H.K. Walia, Cleveland Clinic, Neurol Inst, Sleep Disorders Center, Cleveland, OH 44195, United States. Additional authors for this research include M.K. Chung, S. Ibrahim and R. Mehra.

Researchers' Work from Dalian Medical University Focuses on Aromatic Amino Acids [Discovery of Novel Bruton's Tyrosine Kinase (BTK) Inhibitors Bearing a N,9-Diphenyl-9H-purin-2-amine Scaffold]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Aromatic Amino Acids have been published. According to news reporting out of Dalian, People's Republic of China, by NewsRx editors, research stated, "Based on the pyrimidine skeleton of EGFR(T790M) inhibitors, a series of N,9-diphenyl-9H-purin-2-amine derivatives were identified as effective BTK inhibitors."

Our news journalists obtained a quote from the research from Dalian Medical University, "Among these compounds, inhibitors 10d, 10i, and 10j, possessing IC50 values of 0.5, 0.5, and 0.4 nM, displayed anti-BTK kinase activity that was as potent as the reference compounds. In particular, compound 10j suppressed the proliferation of two typical B-cell leukemia cell lines expressing high levels of BTK with concentrations of 7.75 and 12.6 μM. The activity of the subject compound as determined by the CCK-8 method and apoptosis analysis validated that inhibitor 10j is slightly more potent than AVL-292 and ibrutinib."

According to the news editors, the research concluded: "The experimental explorations suggested that 10j could serve as a valuable molecule for control of leukemia developments."

Keywords for this news article include: Dalian, People's Republic of China, Asia, Enzymes and Coenzymes, Aromatic Amino Acids, Tyrosine Kinase, Proteomics, Proteins, Dalian Medical University.

Researchers' Work from Department of General Surgery Focuses on Thyroid Cancer (Combretastatin A4 Regulates Proliferation, Migration, Invasion, and Apoptosis of Thyroid Cancer Cells via PI3K/Akt Signaling Pathway)
Combretastatin A4 (CA4) is a potential therapeutic candidate for a variety of human cancer treatments. However, the inhibitive effects of CA4 on thyroid cancer cells are still not well-clarified.

This study aimed to investigate the potential effect of CA4 on thyroid cancer cells, as well as underlying mechanism. Human thyroid papillary carcinoma cell line TPC1 was pre-treated with 5 concentrations of CA4 (0, 1, 2, 5, or 10 μM) for 2 h. Cell proliferation was determined by 3-(4, 5-dimethyl-2-thiazolyl)-2, 5-diphenyl -2-H-tetrazolium bromide (MTT) assay. Cell migration and invasion were detected by a modified Boyden chamber assay. Moreover, cell apoptosis was detected by terminal deoxynucleotidyl (TUNEL) staining assay and flow cytometry method. Western blot analysis was performed to determine the expression changes of epithelial-mesenchymal transition (EMT)-related proteins and phosphatidylinositol-3-kinase serine/threonine kinase (PI3K/Akt) signaling pathway proteins. CA4 significantly inhibited the cell proliferation, migration, and invasion, and significantly promoted cell apoptosis in a dose-dependent manner compared with the control group. The EMT-related protein levels of N-Cadherin, Vimentin, Snail1, Slug, Twist1, and ZEB1 were significantly decreased by CA4, while E-cadherin had no significant difference compared with the control group. Moreover, PI3K/Akt signaling pathway protein levels of p-PI3K and p-Akt were significantly decreased, whereas PI3K and Akt had no significant differences compared with the control group. CA4 can inhibit proliferation, migration, and invasion and promote apoptosis of TPC1 cells. These effects might be through the PI3K/Akt signaling pathway.

According to the news editors, the research concluded: "CA4 may be a potential therapeutic target for the treatment of thyroid cancer."

For more information on this research see: Combretastatin A4 Regulates Proliferation, Migration, Invasion, and Apoptosis of Thyroid Cancer Cells via PI3K/Akt Signaling Pathway. Medical Science Monitor, 2016;22():4911-4917. Medical Science Monitor can be contacted at: Int Scientific Literature, Inc, 361 Forest Lane, Smithtown, NY 11787, USA.

Researchers’ Work from Eli Lilly Focuses on Pharmacokinetics

[Synthesis and Characterization of a Novel gamma-Aminobutyric Acid Type A (GABA(A)) Receptor Ligand That Combines Outstanding Metabolic Stability, Pharmacokinetics, and Anxiolytic ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Pharmacokinetics is now available. According to news originating from Indianapolis, Indiana, by NewsRx correspondents, research stated, "1,4-Benzodiazepines are used in the treatment of anxiety disorders but have limited long-term use due to adverse effects."

Our news journalists obtained a quote from the research from Eli Lilly, "HZ-166 (2) has been shown to have anxiolytic-like effects with reduced sedative/ataxic liabilities."

According to the news editors, the research concluded: "A 1,3-oxazole KRM-II-81 (9) was discovered from a series of six bioisosteres with significantly improved pharmacokinetic and pharmacodynamic properties as compared to 2. Oxazole 9 was further characterized and exhibited improved anxiolytic-like effects in a mouse marble burying assay and a rat Vogel conflict test."

Pensacola, Florida, by NewsRx editors, the research stated, "The foundation for the celebrated operation on patent ductus arteriosus (PDA) in 1938 was the work on arteriovenous fistula (AVF) during the preceding half century. Galen and Osler wrote about it, and AVF was a major interest of leading surgeons of the late 19th and early 20th centuries, such as William Halsted, Rudolph Matas, Mont Reid, and Emile Holman."

Our news editors obtained a quote from the research from Florida International University, "Nearly all AVFs of the era developed because of penetrating injury to major vessels. Survivors suffered gradual debilitation and faced death from gangrene or rupture. Development of an operation with a reasonable chance for success came only after the development of the cornerstones of modern surgery: suture, needles, anesthesia, and antiseptic and aseptic surgery. The only durable solution was quadruple ligation, ligation of both the vein and artery above and below the site of the fistula, and a technically demanding operation that risked ischemia and gangrene. Techniques pioneered by Alexis Carrel and Bernard Berthelot allowed strategies of early vascular reconstruction that reestablished normal circulation. Seeing patients with AVF with heart failure, Halsted recognized PDA as a naturally occurring AVF. Other surgeons proposed that ligation of PDA would be lifesaving."

According to the news editors, the research concluded: "The struggles to understand and devise operative strategies to deal with AVF were the first steps toward the spectacular advances in cardiovascular surgery that followed."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jsurg.2016.05.010. This DOI is a link to an online electronic document that is either free or for purchase.

Apoptosis

Researchers' Work from Fudan University Focuses on Apoptosis (Exenatide Reduces Tumor Necrosis Factor-a-induced Apoptosis in Cardiomyocytes by Alleviating Mitochondrial Dysfunction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Apoptosis have been published. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists,
research stated, "Tumor necrosis factor-a (TNF-a) plays an important role in progressive contractile dysfunction in several cardiac diseases. The cytotoxic effects of TNF-a are suggested to be partly mediated by reactive oxygen species (ROS)-and mitochondria-dependent apoptosis."

The news reporters obtained a quote from the research from Fudan University, "Glucagon-like peptide-1 (GLP-1) or its analogue exhibits protective effects on the cardiovascular system. The objective of the study was to assess the effects of exenatide, a GLP-1 analogue, on oxidative stress, and apoptosis in TNF-a-treated cardiomyocytes in vitro. Isolated neonatal rat cardiomyocytes were divided into three groups: Control group, with cells cultured in normal conditions without intervention; TNF-a group, with cells incubated with TNF-a (40 ng/ml) for 6, 12, or 24 h without pretreatment with exenatide; and exenatide group, with cells pretreated with exenatide (100 nmol/L) 30 mins before TNF-a (40 ng/ml) stimulation. We evaluated apoptosis by terminal deoxynucleotidyl transferase-mediated dUTP nick end labeling (TUNEL) assay and flow cytometry, measured ROS production and mitochondrial membrane potential (MMP) by specific the fluorescent probes, and assessed the levels of proteins by Western blotting for all the groups. Exenatide pretreatment significantly reduced cardiomyocyte apoptosis as measured by flow cytometry and TUNEL assay at 12 h and 24 h. Also, exenatide inhibited excessive ROS production and maintained MMP. Furthermore, declined cytochrome-c release and cleaved caspase-3 expression and increased bcl-2 expression with concomitantly decreased Bax activation were observed in exenatide-pretreated cultures."

According to the news reporters, the research concluded: "These results suggested that exenatide exerts a protective effect on cardiomyocytes, preventing TNF-a-induced apoptosis; the anti-apoptotic effects may be associated with protection of mitochondrial function."

Our news correspondents report that additional information may be obtained by contacting J.Y. Qian, Dept. of Cardiology, Shanghai Institute of Cardiovascular Diseases, Zhongshan Hospital, Fudan University, Shanghai 200032, People's Republic of China. Researchers' Work from Goethe-University Focuses on NADPH Oxidoreductases NADH (The NADPH Oxidase Nox4 mediates tumour angiogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - NADPH Oxidoreductases NADH. According to news reporting originating in Frankfurt, Germany, by NewsRx journalists, research stated, "The aim of this work was to identify the role of the NADPH oxidase Nox4 for tumor angiogenesis in a slow-growing tumor model in mice. Tumor angiogenesis was studied in tumours induced by the carcinogen 3-methylcholanthrene (MCA) in wild-type and Nox knockout mice."

Financial supporters for this research include Deutsche Forschungsgemeinschaft, Fraunhofer Gesellschaft.

The news reporters obtained a quote from the research from Goethe-University, "Mice were killed when the tumor reached a diameter of 1.5?cm and tumor tissue was used for histological and molecular analysis. 3-methylcholanthrene induced fibrosarcoma in wild-type, Nox1y/-, Nox2y/- and Nox4-/ -mice. Histological analysis of vessel density using anti-CD31 staining showed a significant 38% reduction in tumor vascularization in fibrosarcomas of Nox4-/ -mice. In contrast, tumor angiogenesis was doubled in Nox1 knockout mice, whereas knockout of Nox2 had no effect on tumour-vessel density. As underlying mechanisms, we identified a defect in hypoxia signalling in Nox4-/ -mice. Hypoxia-inducible factor 1-alpha (Hif-1a) accumulation in the tumours was attenuated as was the expression of the Hif-1a-dependent pro-angiogenic genes vascular endothelial growth factor-A, glucose transporter 1 and adrenomedullin."

According to the news reporters, the research concluded: "By regulating the tumour-vessel density through stabilization of Hif-1a and induction of VEGF expression, Nox4 promotes tumor angiogenesis and may represent a novel target for anti-angiogenic tumor therapy."

Our news correspondents report that additional information may be obtained by contacting V. Helfinger, Institute for Cardiovascular Physiology, Goethe-University, Frankfurt, Germany. Additional authors for this research include N. Henke, S. Harenkamp, M. Walter, J. Epah, C. Penski, M. Mittelbronn and K. Schroder.

Researchers' Work from IISER Focuses on Oligopeptides (Glutathione depletion activates the yeast vacuolar transient receptor potential channel, Yvc1p, by reversible glutathionylation of specific cysteines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Peptides - Oligopeptides have been published. According to news reporting out of Mohali, India, by NewsRx editors, research stated, "Glutathione depletion and calcium influx into the cytoplasm are two hallmarks of apoptosis. We have been investigating how glutathione depletion leads to apoptosis in yeast."

Our news journalists obtained a quote from the research from IISER, "We show here that glutathione depletion in yeast leads to the activation of two cytoplasmically inward-facing channels: the plasma membrane, Cch1p, and the vacuolar calcium channel, Yvc1p. Deletion of these channels partially rescues cells from glutathione depletion-induced cell death. Subsequent investigations on the Yvc1p channel, a homologue of the mammalian TRP channels, revealed that the channel is activated by glutathionylation. Yvc1p has nine cysteine residues, of which eight are located in the cytoplasmic regions and one on the transmembrane domain. We show that three of these cysteines, Cys-17, Cys-79, and Cys-191, are specifically glutathionylated. Mutation of these cysteines to alanine leads to a loss in glutathionylation and a concomitant loss in calcium channel activity. We further investigated the mechanism of glutathionylation and demonstrate a role for the yeast glutathione S-transferase Gtt1p in glutathionylation. Yvc1p is also deglutathionylated, and this was found to be mediated by the yeast thioredoxin, Trx2p."

According to the news editors, the research concluded: "A model for redox activation and deactivation of the yeast Yvc1p channel is presented."

For more information on this research see:  Glutathione depletion activates the yeast vacuolar transient receptor potential channel, Yvc1p, by reversible glutathionylation of specific cysteines. Molecular Biology of the Cell, 2016;27(24):3913-3925. Molecular Biology of the Cell can be contacted at: Amer Soc Cell Biology, 8120 Woodmont Ave, Ste 750, Bethesda, MD 20814-2755, USA.

Our news journalists report that additional information may be obtained by contacting A.K. Bachhawat, IISER, Dept. of Biol Sci, Mohali 140306, Punjab, India. Additional authors for this research include K.K. Das and A.K. Bachhawat.

Gram-Negative Bacteria - Pseudomonas aeruginosa

Researchers' Work from Imperial College Focuses on Pseudomonas aeruginosa (A Novel RNase 3/ECP Peptide for Pseudomonas aeruginosa Biofilm Eradication That Combines Antimicrobial, Lipopolysaccharide Binding, and Cell-Agglutinating Activities)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Pseudomonas aeruginosa have been published. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Eradication of established biofilm communities of pathogenic Gram-negative species is one of the pending challenges for the development of new antimicrobial agents. In particular, Pseudomonas aeruginosa is one of the main dreaded nosocomial species, with a tendency to form organized microbial communities that offer an enhanced resistance to conventional antibiotics."

Financial support for this research came from Ministerio de Economia y Competitividad (MINECO).

The news correspondents obtained a quote from the research from Imperial College, "We describe here an engineered antimicrobial peptide (AMP) which combines bactericidal activity with a high bacterial cell agglutination and lipopolysaccharide (LPS) affinity. The RN3 (5-17P22-36) peptide is a 30-mer derived from the eosinophil cationic protein (ECP), a host defense RNase secreted by eosinophils upon infection, with a wide spectrum of antipathogen activity. The protein displays high biofilm eradication activity that is not dependent on its RNase catalytic activity, as evaluated by using an active site-defective mutant. On the other hand, the peptide encompasses both the LPS-binding and aggregation-prone regions from the parental protein, which provide the appropriate structural features for the peptide's attachment to the bacterial exopolysaccharide layer and further improved removal of established biofilms. Moreover, the peptide's high cationicity and amphipathicity promote the cell membrane destabilization action. The results are also compared side by side with other reported AMPs effective against either planktonic and/or biofilm forms of Pseudomonas aeruginosa strain PAO1. The ECP and its derived peptide are unique in combining high bactericidal potency and cell agglutination activity, achieving effective biofilm eradication at a low micromolar range."

According to the news reporters, the research concluded: "We conclude that the designed RN3(5-17P22-36) peptide is a promising lead candidate against Gram-negative biofilms."

Our news journalists report that additional information may be obtained by contacting D. Pulido, Imperial Coll London, Dept. of Life Sci, London, United Kingdom. Additional authors for this research include G. Prats-Ejarque, C. Villalba, M. Albacar, J.J. Gonzalez-Lopez, M. Torrent, M. Moussaoui and E. Boix.

Antibiotics - Cephalosporins

Researchers' Work from Indian Institute of Technology Focuses on Cephalosporins (Deacylation Mechanism and Kinetics of Acyl-Enzyme Complex of Class C b-Lactamase and Cephalothin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Antibiotics - Cephalosporins are presented in a new report. According to news reporting originating in Kanpur, India, by NewsRx journalists, research stated, "Understanding the molecular details of antibiotic resistance by the bacterial enzymes b-lactamases is vital for the development of novel antibiotics and inhibitors. In this spirit, the detailed mechanism of deacylation of the acyl-enzyme complex formed by cephalothin and class C b-lactamase is investigated here using hybrid quantum-mechanical/molecular-mechanical molecular dynamics methods."

Financial supporters for this research include Council of Scientific and Industrial Research, Department of Biotechnology, Ministry of Science and Technology.

The news reporters obtained a quote from the research from the Indian Institute of Technology, "The roles of various active-site residues and substrate in the deacylation reaction are elucidated. We identify the base that activates the hydrolyzing water molecule and the residue that protonates the catalytic serine (Ser64). Conformational changes in the active sites and proton transfers that potentiate the efficiency of the deacylation reaction are presented. We have also characterized the oxyanion holes and other H-bonding interactions that stabilize the reaction intermediates. Together with the kinetic and mechanistic details of the acylation reaction, we analyze the complete mechanism and the overall kinetics of the drug hydrolysis."

According to the news reporters, the research concluded: "Finally, the apparent rate-determining step in the drug hydrolysis is scrutinized."

Our news correspondents report that additional information may be obtained by contacting R. Tripathi, Dept. of Chemistry, Indian Institute of Technology Kanpur, Kanpur 208016, India.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.jpbc.5b11623. This DOI is a link to an online electronic document that is either free or for purchase.

Musculoskeletal Diseases and Conditions - …

Researchers' Work from Institute for Clinical Research Focuses on Osteoporosis (Nephrolithiasis, bone mineral density, osteoporosis, and fractures: a systematic review and comparative meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Musculoskeletal Diseases and Conditions - Osteoporosis have been presented. According to news reporting originating from Padua, Italy, by NewsRx correspondents, research stated, "Our meta-analysis demonstrates that people with nephrolithiasis have decreased bone mineral density, an increased odds of osteoporosis, and potentially an elevated risk of fractures. People with nephrolithiasis might be at risk of reduced bone mineral density (BMD) and fractures, but the data is equivocal."

Our news editors obtained a quote from the research from Institute for Clinical Research, "We conducted a meta-analysis to investigate if patients with nephrolithiasis have worse bone health outcomes (BMD), osteoporosis, and fractures versus healthy controls (HCs). Two investigators searched major databases for articles reporting BMD (expressed as g/cm(2) or a T-or Z-score), osteoporosis or fractures in a sample of people with nephrolithiasis, and HCs. Standardized mean differences (SMDs), 95 % confidence intervals (CIs) were calculated for BMD parameters; in addition odds (ORs) for case-control and adjusted hazard ratios (HRs) in longitudinal studies for categorical variables were calculated. From 1816 initial hits, 28 studies were included. A meta-analysis of case-control studies including 1595 patients with nephrolithiasis (mean age 41.1 years) versus 3402 HCs (mean age 40.2 years) was conducted. Patients with nephrolithiasis showed significant lower T-scores values for the spine (seven studies; SMD=-0.69; 95 % CI = -0.86 to -0.52; I-2 = 0 %), total hip (seven studies; SMD=-0.82; 95 % CI = -1.11 to -0.52; I-2 = 72 %), and femoral neck (six studies; SMD = -0.67; 95 % CI = -1.00 to -0.34; I-2 = 69 %). A meta-analysis of the case-controlled studies suggests that people with nephrolithiasis are at increased risk of fractures (OR = 1.15, 95 % CI = 1.12-1.17, p< 0.0001, studies = 4), while the risk of fractures in two longitudinal studies demonstrated trend level significance (HR = 1.31, 95 % CI = 0.951.62). People with nephrolithiasis were four times more likely to have osteoporosis than HCs (OR = 4.12, p< 0.0001). Nephrolithiasis is associated with lower BMD, an increased risk of osteoporosis, and possibly, fractures."

According to the news editors, the research concluded: "Future screening/preventative interventions targeting bone health might be indicated."

The news editors report that additional information may be obtained by contacting N. Veronese, Inst Clin Res & Educ Med IREM, Padua, Italy. Additional authors for this research include C. Trevisan, B. Stubbs, B.M. Zanforlini, M. Solmi, C. Luchini, G. Girotti, S. Pizzato, E.
Manzato, G. Sergi, S. Giannini, M. Fusaro and N. Veronese.

Researchers' Work from Jinzhou Medical University Focuses on Type 2 Diabetes (MicroRNA-463-3p/ABCG4: A New Axis in Glucose-Stimulated Insulin Secretion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is the subject of a report. According to news originating from Liaoning, People's Republic of China, by NewsRx correspondents, research stated, "Glucose-stimulated insulin secretion (GSIS) is known to be essential in the control of metabolic fuel homeostasis, though the molecular mechanisms involved remain unclear. MicroRNA (miRNA) 2463-3p and ATP-binding cassette A4 (ABCG4) expression was analyzed by real-time PCR, and the potential role of miRNA-463-3p or ABCG4 was evaluated by overexpressing or silencing such miRNA or genes."

Our news journalists obtained a quote from the research from Jinzhou Medical University, "The miRNA-463-3p inhibited GSIS without affecting cell viability. Further, mechanistic studies demonstrated that ABCG4 was a direct target of microRNA-463-3p and, to this effect, that ABCG4 played an important role in GSIS. The targeting was relevant in pancreatic islet beta-cells, where GSIS through the miRNA-463-3p/ABCG4 axis was observed. Interestingly, in type 2 diabetes human pancreatic islets, expression of miRNA-463-3p and insulin was upregulated and ABCG4 downregulated compared with nondiabetic controls, and their expression levels were closely correlated."

According to the news editors, the research concluded: "The findings collectively establish a link between GSIS and the miRNA-463-3p/ABCG4 axis and represent a promising target for future diabetes mellitus treatments."

The news correspondents report that additional information may be obtained from F. Ren, Jinzhou Med Univ, Dept. of Human Anat, Jinzhou, Liaoning, People's Republic of China. Additional authors for this research include W. Wu, B. Yin, X.F. Liu and F. Ren.

Keywords for this news article include: Liaoning, People's Republic of China, Asia, Nutritional and Metabolic Diseases and Conditions, Non-Insulin Dependent Diabetes Mellitus, Risk and Prevention, Peptide Proteins, Peptide Hormones, Type 2 Diabetes, Proinsulin, Genetics, Jinzhou Medical University.
Researchers' Work from Karlsruhe Institute of Technology Focuses on Immunoglobulins (Fast Targeting and Cancer Cell Uptake of Luminescent Antibody-Nanozeolite Bioconjugates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Immunoglobulins. According to news reporting originating in Karlsruhe, Germany, by NewsRx journalists, research stated, "Understanding the targeted cellular uptake of nanomaterials is an essential step to engineer and program functional and effective biomedical devices. In this respect, the targeting and ultrafast uptake of zeolite nanocrystals functionalized with Cetuximab antibodies (Ctxb) by cells overexpressing the epidermal growth factor receptor are described here."

The news reporters obtained a quote from the research from the Karlsruhe Institute of Technology, "Biochemical assays show that the cellular uptake of the bioconjugate in the targeted cancer cells already begins 15 min after incubation, at a rate around tenfold faster than that observed in the negative control cells. These findings further show the role of Ctxb exposed at the surfaces of the zeolite nanocrystals in mediating the targeted and rapid cellular uptake. By using temperature and pharmacological inhibitors as modulators of the internalization pathways, the results univocally suggest a dissipative uptake mechanism of these nanomaterials, which seems to occur using different internalization pathways, according to the targeting properties of these nanocrystals."

According to the news reporters, the research concluded: "Owing to the ultrafast uptake process, harmless for the cell viability, these results further pave the way for the design of novel theranostic tools based on nanozeolites."

Our news correspondents report that additional information may be obtained by contacting L. De Cola, Karlsruher Inst Technol KIT INT, D-76131 Karlsruhe, Germany. Additional authors for this research include E.A. Prasetyanto, C. Michiels, L. De Cola and D. Bonifazi.

Researchers’ Work from Karolinska Institute Focuses on Multiple Sclerosis (Hereditary diffuse leukoencephalopathy with spheroids - a volumetric and radiological comparison with multiple sclerosis patients and healthy controls)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Multiple Sclerosis. According to news originating from Stockholm, Sweden, by NewsRx correspondents, research stated, "Hereditary diffuse leukoencephalopathy with spheroids (HDLS) is an autosomal dominant disorder caused by colony-stimulating factor 1 receptor (CSF1R) gene mutations, resulting in demyelination and axonal degeneration with spheroids. The clinical expression is variable, including behavioral changes, cognitive impairment, motor symptoms and parkinsonism."

Financial support for this research came from Bjornsson's Research Foundation, Goteborg, Sweden.

Our news journalists obtained a quote from the research from Karolinska Institute, "Magnetic resonance imaging (MRI) reveals white matter (WM) changes and atrophy. The indistinct phenotype has led to misdiagnoses. This study's aim was to compare brain volumetry and radiological ratings in HDLS with multiple sclerosis (MS) patients and controls. Five HDLS patients with c.2562T >A p.Asn854Lys CSF1R mutation, five age-and gender-matched MS patients and five healthy controls were cross-sectionally studied. All patients were examined neurologically. HDLS patients underwent Mini-Mental State Examination (MMSE). Brain MRI scans were analyzed volumetrically with FreeSurfer and Lesion Segmentation Toolbox and neuroradiologically with the brain MRI scoring system for HDLS. Patients with HDLS had lower brain, grey matter and WM fractions (66.3%; 37.9%; 27.6%) compared with controls (78.5%, p=0.008; 44.4%, p=0.008; 32.0%, p=0.008), but not compared with MS patients (65.7%, p=0.7; 36.8%, p=0.4; 27.3%, p=0.7). Cerebellar WM changes and atrophy were not seen in the HDLS group. The HDLS lesion volume fraction correlated with MMSE scores (r=-0.90, p=0.04). Brain volume fractions in HDLS were lower than in controls and similar to those seen in MS. The cerebellum was relatively spared in HDLS, which may help in differentiating HDLS WM changes from MS."

According to the news editors, the research concluded: "The strong relationship of HDLS lesions with MMSE scores indicates that accumulating WM pathology in HDLS is associated with cognitive decline."

The news correspondents report that additional information may be obtained from T. Granberg, Division of Medical Imaging and Technology, Dept. of Clinical Science, Intervention and Technology, Karolinska Institutet, Stockholm, Sweden. Additional authors for this research include F. Hashim, O. Andersen, C. Sundal and V.D Karrenbauer.

Hematologic Diseases and Conditions - Hemolytic...

Researchers' Work from Keio University Hospital Focuses on Hemolytic Anemia (Kinked Graft and Anastomotic Stenosis-Induced Hemolytic Anemia Requiring Reoperation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematologic Diseases and Conditions - Hemolytic Anemia is now available. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "We report a case of hemolytic anemia caused initially by narrowing of a proximal anastomotic site and subsequently by a kinked prosthetic graft after total aortic arch replacement. A 55-year-old man was diagnosed with acute type A aortic dissection by computed tomography (CT)."

Our news journalists obtained a quote from the research from Keio University Hospital, "After total aortic arch replacement, hemolytic anemia and renal dysfunction developed. CT detected narrowing of proximal anastomotic site of the graft. Removing the graft and ascending aortic replacement resolved the signs of hemolytic anemia. However, 50 days after the surgery, severe hemolytic anemia developed again. CT revealed a sharply kinked graft. Total arch replacement was again performed to resect the kinked graft."

According to the news editors, the research concluded: "He was discharged on the 24th postoperative day without hemodialysis."

The news correspondents report that additional information may be obtained from H. Kitahara, Keio Univ Hosp, Dept. of Cardiovasc Surg, Tokyo, Japan. Additional authors for this research include A. Yoshitake, T. Hachiya, K. Okamoto, S. Kawaguchi and H. Shimizu.

Palliative and Supportive Care

Researchers' Work from King Hussein Cancer Center Focuses on Palliative and Supportive Care [Impact of outpatient palliative care (PC) on symptom burden in patients with advanced cancer at a tertiary cancer center in Jordan]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Palliative and Supportive Care have been published. According to news originating from Amman, Jordan, by NewsRx correspondents, research stated, "Outpatient palliative care clinics are essential for early symptom management in patients with advanced cancer. Few outpatient programs are available in the Middle East."

Financial support for this research came from King Hussein Cancer Center Intramural Grant.

Our news journalists obtained a quote from the research from King Hussein Cancer Center, "In this prospective study, we examined the symptom changes among cancer patients seen at a palliative care clinic in Jordan. Patients with advanced cancer who had an outpatient palliative care consultation and not delirious were enrolled. The Edmonton Symptom Assessment System (ESAS), Karnofsky Performance Scale (KPS), and Memorial Delirium Assessment Scale (MDAS) were collected at consultation and follow up visit 14-34 days later. We compared symptom changes using paired t test. Among the 182 enrolled patients, the average age was 53 years, 47% were females, and 95% had stage IV cancer. The median duration between the two clinic visits was 21 days (interquartile range 15-28). KPS decreased between visits (mean 68 vs. 66%, P = 0.004). ESAS pain (5.9 vs. 5.1, P = 0.004) and sleep (4.6 vs. 4.1, P = 0.007) improved significantly over time. The remaining ESAS symptoms decreased in intensity, albeit not statistically significant. Among patients who presented with moderate to severe symptom intensity, pain (7 vs. 6, P< 0.0001), fatigue (7 vs. 6, P = 0.003), nausea (7 vs. 4, P< 0.0001), depression (7 vs. 5, P = 0.0008), anxiety (7 vs. 5, P< 0.0001), drowsiness (6 vs. 5, P < 0.001), appetite (7 vs. 6, P = 0.0007), well-being (7 vs. 6, P< 0.0001), dyspnea (6 vs. 5, P = 0.0006), and sleep (7 vs. 5, P< 0.0001) all improved significantly. Our outpatient palliative care consultation was associated with improvement in ESAS, particularly for patients who presented with moderate to severe symptoms."

According to the news editors, the research concluded: "Further studies are needed to examine predictors of symptom response, longer term outcomes, and how to improve access to outpatient palliative care in the Middle East."

For more information on this research see: Impact of outpatient palliative care (PC) on symptom burden in patients with advanced cancer at a tertiary cancer center in Jordan. Supportive Care in Cancer, 2017;25(1):177-183. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Supportive Care in Cancer - www.springerlink.com/content/0941-4355/)

The news correspondents report that additional information may be obtained from O. Shamieh, King Hussein Canc Center, Dept. of Palliat Care, Amman 11941, Jordan. Additional authors for this research include O. Khamash, M. Khraisat, O. Jbouri, M. Awni, A. Al-Hawamdeh, G. Arja, S. Ajarmeh, D. Al-Rimawi and D. Hui.

Researchers' Work from Kobe University Focuses on Psoriasis (Genetic prediction of the effectiveness of biologics for psoriasis treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Skin Diseases and Conditions - Psoriasis is now available. According to news reporting from Hyogo, Japan, by NewsRx journalists, research stated, "Anti-tumor necrosis factor (TNF)-alpha therapy is used for the treatment of psoriasis, with varying outcomes. However, the specific cause of inadequate response or treatment failure remains unknown."

The news correspondents obtained a quote from the research from Kobe University, "The aim of the present study was to identify useful clinical biomarkers for predicting therapeutic responses or to serve as new drug targets for refractory psoriasis cases. We performed a genome-wide association study (GWAS) of 65 psoriasis patients who were prospectively followed after beginning anti-TNF-alpha therapy using Human Omni Express-8 v1.2 Beadchips. Patients were enrolled at the dermatology departments of Kobe University Hospital and six collaborative hospitals. Associations between single nucleotide polymorphisms (SNP) and changes in the Psoriasis Area and Severity Index (PASI) after 12 weeks of treatment were evaluated. After genome data collection and quality control, a total of 731 442 SNPs were identified in 65 Asian psoriasis patients who were treated with adalimumab or infliximab. Here, we present 10 SNPs, such as those in JAG2 and ADRA2A, that were associated with treatment responses to anti-TNF-alpha agents (strongest effect, P< 7.11E-06). This is the first GWAS to examine SNP associated with treatment responses in psoriasis patients. In addition, we identified other SNP that exhibited potential associations with anti-TNF-alpha treatment response, which merit further study."

According to the news reporters, the research concluded: "Of these, rs11096957 on TLR10, which is associated with increased TNF-alpha production, was previously reported to be associated with treatment responses to TNF-alpha inhibitors."

Our news journalists report that additional information may be obtained by contacting C. Nishigori, Kobe University, Grad Sch Med, Fac Med, Div DermatolDept Internal Related, Kobe, Hyogo, Japan. Additional authors for this research include H. Nagai, T. Bito, T. Ikeda, T. Horikawa, A. Adachi, T. Matsubara and C. Nishigori.

Researchers' Work from Maastricht University Hospital Focuses on Thrombosis (Eliciting patients' preferences for elastic compression stocking therapy after deep vein thrombosis: potential for improving compliance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Thrombosis. According to news reporting originating from Maastricht, Netherlands, by NewsRx correspondents, research stated, "ESSENTIALS: Elastic compression stocking (ECS) therapy is used to prevent post-thrombotic syndrome (PTS). We aimed to elicit patient preferences regarding ECS therapy after deep vein thrombosis."

Financial support for this research came from ZonMw.

Our news editors obtained a quote from the research from Maastricht University Hospital, "The most valued attributes were PTS risk reduction and the ability to put on the ECS independently. Heterogeneous results with respect to education level stress the importance of proper counselling. Elastic compression stocking (ECS) therapy is used for prevention of post-thrombotic syndrome (PTS) after deep vein thrombosis (DVT). Current evidence on its effectiveness is conflicting. Compliance, a major determinant of the effectiveness of ECS therapy, remained largely ignored in former studies. To gain insight into preferences regarding ECS therapy in patients after DVT. A discrete choice experiment was conducted 3 months after DVT in patients enrolled in the IDEAL DVT study, a randomized controlled trial comparing 2 years of ECS therapy with individually tailored duration of ECS therapy for the prevention of PTS. Nine unlabeled, forced-choice sets of two hypothetical types of ECS were presented to each patient. Data were analyzed with multinomial logit models. The respondent sample consisted of 81% (300/369) of invited patients. The most important determinants of preference were PTS risk reduction and putting on the ECS. Patients were willing to increase the duration of therapy by 1 year if this increases the PTS risk reduction with 10%. Patients accepted an increase in the risk of PTS of 29% if they were able to put on the ECS themselves. Preferences were heterogeneous with respect to education level. Reduction of the risk of PTS and the ability to put on the ECS without help are the most important characteristics of ECS therapy. Physicians should pay considerable attention to patient education regarding PTS. In addition, patients should be supported in their ability to put on and take off the ECS independently."

According to the news editors, the research concluded: "These rather simple interventions could improve compliance."

The news editors report that additional information may be obtained by contacting
Researchers' Work from Magee-Women's Research Institute Focuses on Genetics (Signal-Oriented Pathway Analyses Reveal a Signaling Complex as a Synthetic Lethal Target for p53 Mutations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics. According to news reporting out of Pittsburgh, Pennsylvania, by NewsRx editors, research stated, "Defining processes that are synthetic lethal with p53 mutations in cancer cells may reveal possible therapeutic strategies. In this study, we report the development of a signal-oriented computational framework for cancer pathway discovery in this context."

Our news journalists obtained a quote from the research from Magee-Women's Research Institute, "We applied our bipartite graph-based functional module discovery algorithm to identify transcriptomic modules abnormally expressed in multiple tumors, such that the genes in a module were likely regulated by a common, perturbed signal. For each transcriptomic module, we applied our weighted k-pathmerge algorithm to search for a set of somatic genome alterations (SGA) that likely perturbed the signal, that is, the candidate members of the pathway that regulate the transcriptomic module. Computational evaluations indicated that our methods-identified pathways were perturbed by SGA. In particular, our analyses revealed that SGA affecting TP53, PTK2, YWHAZ, and MED1 perturbed a set of signals that promote cell proliferation, anchor-free colony formation, and epithelial-mesenchymal transition (EMT). These proteins formed a signaling complex that mediates these oncogenic processes in a coordinated fashion. Disruption of this signaling complex by knocking down PTK2, YWHAZ, or MED1 attenuated and reversed oncogenic phenotypes caused by mutant p53 in a synthetic lethal manner."

According to the news editors, the research concluded: "This signal-oriented framework for searching pathways and therapeutic targets is applicable to all cancer types, thus potentially impacting precision medicine in cancer."

For more information on this research see: Signal-Oriented Pathway Analyses Reveal a Signaling Complex as a Synthetic Lethal Target for p53 Mutations. Cancer Research, 2016;76(23):6785-6794. Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Researchers' Work from Medical University Focuses on Kidney Cancer (Gender differences in incidence and outcomes of urothelial and kidney cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Kidney Cancer is now available. According to news originating from Vienna, Austria, by NewsRx correspondents, research stated, "A gender discrepancy exists in the incidence of both urothelial and kidney carcinomas, with more men presenting with these cancers than women. Men have a threefold greater risk of developing bladder cancer than women, but female gender has been identified as an independent adverse prognostic factor for both recurrence and progression of this disease."

Our news journalists obtained a quote from the research from Medical University, "In particular, women with bladder cancer are often diagnosed with a higher tumor stage than men. Conclusive data on the influence of gender on outcomes of patients with upper tract urothelial carcinoma are currently lacking, although men seem to have a higher disease incidence, whereas survival outcomes might be independent of gender. Patients with renal cell carcinoma are more often men and they typically have larger tumours and higher stage and grade disease than women with this cancer. Smoking habits, tumor biology, occupational risk factors and sex steroid hormones and their receptors could have a role in these observed gender disparities. The majority of data support the theory that gender influences incidence and prognosis of urothelial and kidney cancers; men and women are different genetically and socially, making the consideration of gender a key factor in the clinical decision-making process."

According to the news editors, the research concluded: "Thus, the inclusion of this variable in validated prognostic tables and nomograms should be discussed as a matter of importance."

The news correspondents report that additional information may be obtained from I. Lucca, Dept. of Urology, Medical University of Vienna, Vienna General Hospital, Wahringer Gurtel 18-20, A-1090 Vienna, Austria. Additional authors for this research include T. Klatte, H.
Fajkovic, M. de Martino and S.F Shariat.

Oncology - Neuroblastomas

Researchers' Work from National Cancer Institute Focuses on Neuroblastomas (Aurora B kinase is a potent and selective target in MYCN-driven neuroblastoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Neuroblastomas are presented in a new report. According to news reporting from Bethesda, Maryland, by NewsRx journalists, research stated, "Despite advances in multimodal treatment, neuroblastoma (NB) is often fatal for children with high-risk disease and many survivors need to cope with long-term side effects from high-dose chemotherapy and radiation. To identify new therapeutic targets, we performed an siRNA screen of the druggable genome combined with a small molecule screen of 465 compounds targeting 39 different mechanisms of actions in four NB cell lines."

The news correspondents obtained a quote from the research from National Cancer Institute, "We identified 58 genes as targets, including AURKB, in at least one cell line. In the drug screen, aurora kinase inhibitors (nine molecules) and in particular the AURKB-selective compound, barasertib, were the most discriminatory with regard to sensitivity for MYCN-amplified cell lines. In an expanded panel of ten NB cell lines, those with MYCN-amplification and wild-type TP53 were the most sensitive to low nanomolar concentrations of barasertib. Inhibition of the AURKB kinase activity resulted in decreased phosphorylation of the known target, histone H3, and upregulation of TP53 in MYCN-amplified, TP53 wild-type cells. However, both wild-type and TP53 mutant MYCN-amplified cell lines arrested in G2/M phase upon AURKB inhibition. Additionally, barasertib induced endoreduplication and apoptosis. Treatment of MYCN-amplified/TP53 wild-type neuroblastoma xenografts resulted in profound growth inhibition and tumor regression."

According to the news reporters, the research concluded: "Therefore, aurora B kinase inhibition is highly effective in aggressive neuroblastoma and warrants further investigation in clinical trials."

For more information on this research see: Aurora B kinase is a potent and selective target in MYCN-driven neuroblastoma. Oncotarget, 2015;6(34):35247-62.

DNA Research

Researchers' Work from National Center for Nanoscience and Technology Focuses on DNA Research (A Photosensitizer-Loaded DNA Origami Nanosystem for Photodynamic Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on DNA Research have been published. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Photodynamic therapy (PDT) offers an alternative for cancer treatment by using ultraviolet or visible light in the presence of a photosensitizer and molecular oxygen, which can produce highly reactive oxygen species that ultimately leading to the ablation of tumor cells by multifactorial mechanisms. However, this technique is limited by the penetration depth of incident light, the hypoxic environment of solid tumors, and the vulnerability of photobleaching reduces the efficiency of many imaging agents."

Financial supporters for this research include Ministry of Science and Technology of the People's Republic of China, Natural Science Foundation of Beijing Municipality, Medical Research and Materiel Command, U.S. Army Medical Department, National Institute on Minority Health and Health Disparities, National Natural Science Foundation of China, Chinese Academy of Sciences.

Our news journalists obtained a quote from the research from National Center for Nanoscience and Technology, "In this work, we reported a cellular level dual-functional imaging and PDT nanosystem BMEPC-loaded DNA origami for photodynamic therapy with high efficiency and stable photoreactive property. The carbazole derivative BMEPC is a one-and two-photon imaging agent and photosensitizer with large two-photon absorption cross section, which can be fully excited by near-infrared light, and is also capable of destroying targets under anaerobic condition by generating reactive intermediates of Type I photodynamic reactions. However, the application of BMEPC was restricted by its poor solubility in aqueous environment and its aggregation caused quenching. We observed BMEPC-loaded DNA origami effectively reduced the photobleaching of BMEPC within cells. Upon binding to DNA origami, the intramolecular rotation of BMEPC became proper restricted, which intensify fluorescence emission and radicals production when being excited. After the BMEPC-loaded DNA origami are taken up by tumor cells, upon irradiation, BMEPC could generate free radicals and be released due to DNA photocleavage as well as the following partially degradation. Apoptosis was then induced by the generation of free radicals."

According to the news editors, the research concluded: "This functional nanosystem provides an insight into the design of photosensitizer-loaded DNA origami for effective intracellular imaging and photodynamic therapy."

Our news journalists report that additional information may be obtained by contacting X. Zhuang, Laboratory of Controllable Nanopharmaceuticals, CAS Key Laboratory for Biomedical Effects of Nanomaterials and Nanosafety, National Center for Nanoscience and Technology, Beijing 100190, People's Republic of China. **Drugs and Therapies - Antiinfectives**

**Researchers'Work from National Sun Yat Sen University Focuses on Antiinfectives (Characterisation of fosfomycin resistance mechanisms and molecular epidemiology in extended-spectrum beta-lactamase-producing Klebsiella pneumoniae isolates)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antiinfectives is the subject of a report. According to news reporting out of Kaohsiung, Taiwan, by NewsRx editors, research stated, "Although fosfomycin is a treatment option for infections caused by extended-spectrum beta-lactamase (ESBL)-producing Enterobacteriaceae, fosfomycin resistance has been documented. To our knowledge, fosfomycin resistance mechanisms in Klebsiella pneumoniae have not been systematically investigated."

Our news journalists obtained a quote from the research from National Sun Yat Sen University, "A total of 108 ESBL-producing K. pneumoniae isolates collected from Kaohsiung Medical University Hospital, Taiwan, from August 2012 to May 2013 were analysed in this study. Pulsed-field gel electrophoresis (PFGE) revealed 64 pulsotypes and six non-typeable isolates, indicating high genetic diversity. Moreover, pulsotypes V (n = 6), VII (n = 11) and LI (n = 4) belonging to ST11 were major types. Among 30 (27.8%) fosfomycin-non-susceptible isolates, 21 (70%) had a MurA amino acid substitution, and seven new variations increased the fosfomycin minimum inhibitory concentration (MIC) by 8- to 16-fold compared with wild-type MurA in Escherichia coli DH5 alpha.strain. Functionless transporters (GlpT and UhpT) with various mutations were found in 29 isolates (97%). No known fosfomycin-modifying enzymes were detected in this study."

According to the news editors, the research concluded: "The major resistance mechanisms to fosfomycin in K. pneumoniae were amino acid variations in the drug target and transporters."

For more information on this research see: Characterisation of fosfomycin resistance mechanisms and molecular epidemiology in extended-spectrum beta-lactamase-producing...

Our news journalists report that additional information may be obtained by contacting S.P. Tseng, Natl Sun Yat Sen Univ, Dept. of Marine Biotechnol & Resources, Kaohsiung, Taiwan. Additional authors for this research include Y.J. Hsieh, J.E. Lin, J.W. Huang, T.Y. Yang, L. Lin and S.P. Tseng.

**Connective Tissue Diseases and Conditions - Cutis…**

**Researchers' Work from Oita University Focuses on Cutis Laxa**

*(Functional consequence of fibulin-4 missense mutations associated with vascular and skeletal abnormalities and cutis laxa)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Connective Tissue Diseases and Conditions - Cutis Laxa are discussed in a new report. According to news originating from Oita, Japan, by NewsRx correspondents, research stated, "Fibulin-4 is a 60 kDa calcium binding glycoprotein that has an important role in development and integrity of extracellular matrices. It interacts with elastin, fibrillin-1 and collagen IV as well as with lysyl oxidases and is involved in elastogenesis and cross-link formation."

Financial support for this research came from Deutsche Forschungsgemainschaft.

Our news journalists obtained a quote from the research from Oita University, "To date, several mutations in the fibulin-4 gene (FBLN4/EFEMP2) are known in patients whose major symptoms are vascular deformities, aneurysm, cutis laxa, joint laxity, or arachnodactyly. The pathogenetic mechanisms how these mutations translate into the clinical phenotype are, however, poorly understood. In order to elucidate these mechanisms, we expressed fibulin-4 mutants recombinantly in HEK293 cells, purified the proteins in native forms and analyzed alterations in protein synthesis, secretion, matrix assembly, and interaction with other proteins in relation to wild type fibulin-4. Our studies show that different mutations affect these properties in multiple ways, resulting in fibulin-4 deficiency and/or impaired ability to form elastic fibers. The substitutions E126K and C267Y impaired secretion of the protein, but not mRNA synthesis. Furthermore, the E126K mutant showed less resistance to proteases, reduced binding to collagen IV and fibrillin-1, as well as to LTBP1s and LTBP4s. The A397T mutation introduced an extra O-glycosylation site and deleted binding to LTBP1s. We show that fibulin-4 binds stronger than fibrin-3 and -5 to LTBP1s, 3, and 4s, and to the lysyl oxidases LOX and LOXL1; the binding of fibulin-4 to the LOX propeptide was strongly reduced by the mutation..."
E57K."

According to the news editors, the research concluded: "These findings show that different mutations in the fibulin-4 gene result in different molecular defects affecting secretion rates, protein stability, LOX-induced cross-linking, or binding to other ECM components and molecules of the TGF-13 pathway, and thus illustrate the complex role of fibulin-4 in connective tissue assembly."

For more information on this research see: Functional consequence of fibulin-4 missense mutations associated with vascular and skeletal abnormalities and cutis laxa. Matrix Biology, 2016;56():132-149. Matrix Biology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Nephrology

Researchers' Work from Pfizer Focuses on Nephrology (Nephron segment specific microRNA biomarkers of pre-clinical drug-induced renal toxicity: Opportunities and challenges)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nephrology. According to news reporting originating in Andover, Massachusetts, by NewsRx journalists, research stated, "Drug-induced nephrotoxicity is a common drug development complication for pharmaceutical companies. Sensitive, specific, translatable and non-invasive biomarkers of renal toxicity are urgently needed to diagnose nephron segment specific injury."

The news reporters obtained a quote from the research from Pfizer, "The currently available gold standard biomarkers for nephrotoxicity are not kidney specific, lack sensitivity for early detection, and are not suitable for renal damage localization (glomerular vs tubulointerstitial injury). MicroRNAs (miRNAs) are increasingly gaining momentum as promising biomarkers of various organ toxicities, including drug induced renal injury. This is mostly due to their stability in easily accessible biofluids, ease of developing nucleic acids detection compared to protein detection assays, as well as their interspecies translatability. Increasing concordance of miRNA findings by standardizing methodology most suitable for their detection and quantitation, as well as characterization of their expression pattern in a cell type specific manner, will accelerate progress toward validation of these miRNAs as biomarkers in pre-clinical, and clinical settings."
According to the news reporters, the research concluded: "This review aims to highlight the current pre-clinical findings surrounding miRNAs as biomarkers in two important segments of the nephron, the glomerulus and tubules."

Our news correspondents report that additional information may be obtained by contacting R. Nassirpour, Pfizer Worldwide Res & Dev, Drug Safety, Andover, MA 01810, United States. Additional authors for this research include S.K. Ramaiah and L.O. Whiteley.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.taap.2016.01.021. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Immunotherapy

Researchers' Work from Research Institute Focuses on Immunotherapy (Combination cancer immunotherapies tailored to the tumour microenvironment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Immunotherapy have been presented. According to news reporting originating from Herston, Australia, by NewsRx correspondents, research stated, "Evidence suggests that cancer immunotherapy will be a major part of the combination treatment plan for many patients with many cancer types in the near future. There are many types of immune processes involving different antitumour and tumour-promoting leucocytes, and tumor cells use many strategies to evade the immune response."

Our news editors obtained a quote from the research from Research Institute, "The tumor microenvironment can help determine which immune suppressive pathways become activated to restrain antitumour immunity. This includes immune checkpoint receptors on effector T-cells and myeloid cells, and release of inhibitory cytokines and metabolites. Therapeutic approaches that target these pathways, particularly immune-checkpoint receptors, can induce durable antitumour responses in patients with advanced-stage cancers, including melanoma. Nevertheless, many patients do not have a good response to monotherapy approaches and alternative strategies are required to achieve optimal therapeutic benefit. These strategies include eliminating the bulk of tumor cells to provoke tumour-antigen release and antigen-presenting cell (APC) function, using adjuvants to enhance APC function, and using agents that enhance effector-cell activity."

According to the news editors, the research concluded: "In this Review, we discuss the stratification of the tumor microenvironment according to tumour-infiltrating lymphocytes and PD-L1 expression in the tumour, and how this stratification enables the design of optimal
combination cancer therapies tailored to target different tumor microenvironments."

For more information on this research see: Combination cancer immunotherapies tailored to the tumour microenvironment. *Nature Reviews Clinical Oncology*, 2015;13(3):143-58. (Nature Publishing Group - www.nature.com/; Nature Reviews Clinical Oncology - www.nature.com/nrclinonc/)

The news editors report that additional information may be obtained by contacting M.J. Smyth, Immunology in Cancer and Infection Laboratory, QIMR Berghofer Medical Research Institute, Herston 4006, Queensland, Australia. Additional authors for this research include S.F. Ngiow, A. Ribas and M.W Teng.

**Drugs and Therapies - Heparin Therapy**

**Researchers' Work from Ruprecht-Karls University Focuses on Heparin Therapy (Biosimilars of low-molecular-weight heparin products: fostering competition or reducing 'biodiversity'?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Heparin Therapy. According to news reporting originating in Mannheim, Germany, by NewsRx journalists, research stated, "The term 'biosimilars' is used to qualify products developed to be similar to an original biological drug. Biosimilars are much more complicated to develop than a generic version of small-molecule drugs and this is especially true for low-molecular-weight heparins (LMWHs)."

The news reporters obtained a quote from the research from Ruprecht-Karls University, "Evidence on the antithrombotic management of acute coronary syndromes (ACS) showed that the introduction into the market of biosimilars approved on the basis of simple biological criteria, without robust data from comparative clinical trials, may be hazardous. Moreover, the mixtures of LMWH polysaccharide chains, some immunoallergic properties and potential contamination during the extraction process raise safety concerns."

According to the news reporters, the research concluded: "As was the case for the biosimilar erythropoietin, there is the risk that only copies of the most commercially successful LMWHs will be marketed, thus jeopardizing the 'biodiversity' now ensured by the presence of several LMWHs, each with unique features that support the use of an individual LMWH as first-choice therapy in certain categories of patients."

Our news correspondents report that additional information may be obtained by contacting J. Harenberg, Clinical Pharmacology, Medical Faculty Mannheim, Ruprecht-Karls
Researchers' Work from School of Science Focuses on Oral Cancer

(From the Genotypic distribution of single nucleotide polymorphisms in oral cancer: global scene)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Oral Cancer is now available. According to news reporting from Maharashtra, India, by NewsRx journalists, research stated, "Globocan 2012 reports the global oral cancer incidence of 300,373 new oral cancer cases annually, contributing to 2.1% of the world cancer burden. The major well-established risk factors for oral cancer include tobacco, betel/areca nut, alcohol and high-risk oncogenic human papilloma virus (HPV) 16/18."

The news correspondents obtained a quote from the research from the School of Science, "However, only 5-10% of individuals with high-risk lifestyle develop oral cancer. Thus, genomic variants in individuals represented as single nucleotide polymorphisms (SNPs) influence susceptibility to oral cancer. With a view to understanding the role of genomic variants in oral cancer, we reviewed SNPs in case-control studies with a minimum of 100 cases and 100 controls. PubMed and HuGE navigator search engines were used to obtain data published from 1990 to 2015, which identified 67 articles investigating the role of SNPs in oral cancer. Single publications reported 93 SNPs in 55 genes, with 34 SNPs associated with a risk of oral cancer. Meta-analysis of data in multiple studies defined nine SNPs associated with a risk of oral cancer."

According to the news reporters, the research concluded: "The genes were associated with critical functions deregulated in cancers, including cell proliferation, immune function, inflammation, transcription, DNA repair and xenobiotic metabolism."

For more information on this research see: Genotypic distribution of single nucleotide polymorphisms in oral cancer: global scene. Tumor Biology, 2016;37(11):14501-14512. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

**Oncology - Bladder Cancer**

**Researchers' Work from Shantou University Focuses on Bladder Cancer (Comparison of the combination therapy of bacillus Calmette-Guerin and mitomycin C with the monotherapy for non-muscle-invasive bladder cancer: a meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Bladder Cancer. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Urinary bladder cancer is one of the most frequent cancers worldwide. Non-muscle-invasive bladder carcinoma (NMIBC) has a very low curative rate after resection."

Our news journalists obtained a quote from the research from Shantou University, "The meta-analysis aims to compare efficiency of the combination therapy of bacillus Calmette-Guerin (BCG) and mitomycin C (MMC) with each monotherapy on NMIBC treatment. Articles were retrieved in relevant databases up to May, 2016. The Cochrane Collaboration Risk of Bias Tool was used to assess quality of the included studies. Risk ratio (RR) and the 95% confidence interval (CI) were used as the effect size to calculate pooled result. Funnel plot and Egger's test were applied to examine publication bias. Sensitive analysis was performed. Eight randomized controlled trials were included in this meta-analysis. As a result, the BCG+MMC combination therapy had a significantly decreased recurrence rate in NMIBC patients, compared with monotherapy of BCG or MMC (RR = 0.81, 95% CI: 0.72 to 0.92, P< 0.001). However, there were no obvious differences between the two regimens regarding to progression rate, overall mortality and disease-specific mortality (P > 0.050). Subgroup analysis indicated the combination therapy was more advantageous than BCG (RR = 0.73, 95% CI: 0.61 to 0.87) but not MMC monotherapy (P > 0.050), on the reduced recurrence rate. 81mg/week BCG + 30 mg/week MMC had a significant lower progression rate than BCG (RR = 0.44, 95%CI: 0.24 to 0.82)."

According to the news editors, the research concluded: "BCG+MMC combination therapy is more advantageous than BCG to NMIBC patients with reduced recurrence rate."

For more information on this research see: Comparison of the combination therapy of bacillus Calmette-Guerin and mitomycin C with the monotherapy for non-muscle-invasive bladder cancer: a meta-analysis. Neoplasma, 2016;63(6):967-976. Neoplasma can be contacted at: Aepress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

Researchers' Work from Sun Yat Sen Memorial Hospital Focuses on Breast Cancer (Comparison of the Therapeutic Efficacy of the Early and the Delayed Use of Vinorelbine-Based Regimens for Patients with Advanced Breast Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "The aim of this study was to evaluate the efficacy of vinorelbine-based regimens as first-, second-and more-line therapies in advanced breast cancer (ABC) and to analyze the best timing of vinorelbine treatment. A total of 71 ABC patients were retrospectively reviewed."

Our news journalists obtained a quote from the research from Sun Yat Sen Memorial Hospital, "Of these, 35 patients were treated with vinorelbine-based regimens as first-line chemotherapy, and 36 patients were treated with vinorelbine-based regimens as second-line or more-line therapy. The primary end point of the study was progression-free survival (PFS). No difference was found in baseline characteristics between the two groups (p > 0.1 for all comparisons). There was a significant difference in the objective response rate (ORR; p = 0.006) and clinical benefit rate (CBR; p = 0.013) between the first-line group and the second-or more-line groups. In the vinorelbine firstline group, the ORR was 68.6% (24 patients), and in the second-line or more-line groups the ORR was 36.1% (13 patients). A significant difference in PFS between the first-line group and the second-line or more-line groups was also observed (p = 0.030). The median PFS in the overall population was 6.3 +/- 1.32 months (95% CI 3.69-8.90). The median PFS was 11.1 +/- 3.76 months (95% CI 3.73-18.47) in the first-line group compared with 5.2 +/- 1.35 months (95% CI 2.54-7.85) in the second-line or more-line groups. In patients treated with vinorelbine-trastuzumab combination as the first-line therapy, a complete response was observed in 1 patient (12.5%) and partial response in 5 patients (62.5%), giving an ORR of 75.0%. Progressive disease was observed in 1 patient (12.5%), and stable disease in 1 patient (12.5%), leading to a CBR of 87.5%. The median PFS was 13.8 +/- 2.75 months (95% CI 8.42-19.18), and median OS was 37.0 +/- 11.6 months (95% CI 14.18-59.82). No significant difference was found in overall survival (OS) between the groups (p = 0.612)."

According to the news editors, the research concluded: "For ABC patients, no significant difference in median OS was found between the early use and delayed use of vinorelbine-based regimens, but the short-term efficacy and PFS of vinorelbine-based regimens were significantly better in the early use group than in the delayed use group."

For more information on this research see: Comparison of the Therapeutic Efficacy of the Early and the Delayed Use of Vinorelbine-Based Regimens for Patients with Advanced Breast Cancer. *Chemotherapy*, 2017;62(1):71-79. *Chemotherapy* can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. Cardiology

Researchers’ Work from Taipei Veterans General Hospital Focuses on Cardiology (Light to Moderate Habitual Alcohol Consumption Is Associated with Subclinical Ventricular and Left Atrial Mechanical Dysfunction in an Asymptomatic Population: ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiology. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "The effects of light to moderate alcohol consumption on cardiac mechanics remain poorly understood. The aim of this study was to investigate the dose-response relationship between alcohol consumption and left ventricular (LV) and left atrial (LA) function using myocardial deformation."

Our news editors obtained a quote from the research from Taipei Veterans General Hospital, "In total 3,946 asymptomatic participants (mean age, 49.7 +/- 10.7 years; 65% men) were consecutively studied using comprehensive echocardiography and two-dimensional speckle-tracking in a cross-sectional, retrospective manner. Global LV longitudinal and circumferential strain and LA strain were assessed and related to habitual alcohol consumption pattern (fewer than one, one to six, or more than six drinks per week) before and after propensity matching. With increasing weekly alcohol consumption, participants displayed greater LV eccentric remodeling, impaired diastolic function, and more attenuated global longitudinal strain, LA strain (adjusted coefficients, -1.07 [95% CI, -1.95 to -0.19] and -3.73 [95% CI, -5.36 to -2.11]), and early diastolic strain rates (adjusted coefficients, 0.07 [95% CI, 0.03-0.11] and 0.33 [95% CI, 0.24-0.42]) for one to six and more than six drinks per week, respectively (P < .05 for all) in a dose-response manner. Participants with recent alcohol abstinence displayed cardiac mechanics intermediate between those of nondrinkers and current drinkers. After propensity matching (n = 1,140), participants currently consuming more than one drink per week continued to have significantly attenuated global longitudinal strain and all LA mechanics compared with those consuming fewer than one drink per week (P < .05 for all). Habitual alcohol consumption, even at light to moderate doses, is associated with both reduced LV and LA mechanics in a dose-dependent manner."
According to the news editors, the research concluded: "Whether such observations are reversible or related to future atrial fibrillation deserves further study."

**Oncology - Multiple Myeloma**

**Researchers' Work from University College Focuses on Multiple Myeloma (Multiple myeloma: patient outcomes in real-world practice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Multiple Myeloma are presented in a new report. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "With increasing number of therapies available for the treatment of multiple myeloma, it is timely to examine the course of patients' journeys. We investigated patient characteristics, treatment durations and outcomes, and symptom burden across the treatment pathway in Belgium, France, Germany, Italy, Spain, Switzerland and the UK."

Funders for this research include Amgen, Kim Allcott of Oxford PharmaGenesis.

The news reporters obtained a quote from the research from University College, "In total, 435 physicians retrospectively reviewed 4997 patient charts. Profiles of patients diagnosed with multiple myeloma during the last 12months were similar across countries; bone pain was the most common presentation. Median duration of first-line therapy was 6months, followed by a median treatment-free interval of 10months; both these decreased with increasing lines of therapy, as did time to progression. Depth of response, as assessed by the treating physician, also decreased with each additional line of therapy: 74% of patients achieved at least a very good partial response at first line, compared with only 11% at fifth line. Deeper responses were associated with longer time to progression, although these were physician-judged. Toxicities and co-morbidities increased with later treatment lines, and were more likely to have led to discontinuation of treatment."

According to the news reporters, the research concluded: "These real-world data
Researchers' Work from University College Focuses on Prenatal Research (Intra-familial variability associated with recessive RYR1 mutation diagnosed prenatally by exome sequencing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Health and Medicine - Prenatal Research is now available. According to news reporting from Dublin, Ireland, by NewsRx journalists, research stated, "To determine the underlying molecular aetiology in a non-consanguineous Irish family who have had three fetal losses because of a primary myopathy characterised by fetal akinesia, arthrogryposis multiplex, bilateral pulmonary hypoplasia and reduced muscle bulk. Fetal DNA extracted from amniotic cells was whole genome amplified and subjected to whole exome sequencing."

The news correspondents obtained a quote from the research from University College, "Whole exome sequencing identified compound heterozygous variants in RYR1 as the cause of the lethal myopathy in this family. All three fetuses were compound heterozygous for a paternally inherited missense variant (c.2113G >A; p.Gly705Arg) and a novel maternally inherited truncating frameshift deletion (c.8843del C; p.Ser2948Cysfs*58). This family did not have the classic cores and fibre type disproportion typically associated with RYR1 mutation. The RYR1 exome finding was made during the couple's third pregnancy and enabled prenatal genetic testing to be undertaken. We show that recessive RYR1 mutations can be associated with significant intra-familial variability in clinical presentation which can complicate prediction of clinical outcome. RYR1 mutations can also cause diverse muscle pathologies which thwarts diagnosis."
According to the news reporters, the research concluded: "This study demonstrates the impact that exome-based diagnoses can have for families with lethal disorders."

Our news journalists report that additional information may be obtained by contacting J. Casey, University College Dublin, Sch Med & Med Sci, UCD Academy Center Rare Dis, Dublin, Ireland. Additional authors for this research include K. Flood, S. Ennis, E. Doyle, M. Farrell and S.A. Lynch.

Keywords for this news article include: Dublin, Ireland, Europe, Prenatal Research, Health and Medicine, Genetics, University College.

**Oncology - Cancer Detection**

Researchers' Work from University Federico II Focuses on Cancer Detection (Biparametric 3T Magnetic Resonance Imaging for prostatic cancer detection in a biopsy-naive patient population: a further improvement of PI-RADS v2?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cancer Detection. According to news reporting out of Naples, Italy, by NewsRx editors, research stated, "To prospectively determine the diagnostic accuracy of a biparametric 3T magnetic resonance imaging protocol (BP-MRI) for prostatic cancer detection, compared to a multiparametric MRI protocol (MP-MRI), in a biopsy naive patient population. Eighty-two untreated patients (mean age 65 +/- 7.6 years) with clinical suspicion of prostate cancer and/or altered prostate-specific antigen (PSA) levels underwent a MP-MRI, including T2-weighted imaging, diffusion-weighted imaging (with the correspondent apparent diffusion coefficient maps) and dynamic contrast enhanced sequence, followed by prostate biopsy."

Our news journalists obtained a quote from the research from University Federico II, "Two radiologists reviewed both the BP-MRI and the MP-MRI protocols to establish a radiological diagnosis. Receiver operating characteristics curves were obtained to determine the diagnostic performance of the two protocols. The mean PSA level was 8.8 +/- 8.1 ng/ml. A total of 34 prostatic tumors were identified, with a Gleason score that ranged from 3 + 3 to 5 + 4. Of these 34 tumors, 29 were located within the peripheral zone and 5 in the transitional zone. BP-MRI and MP-MRI showed a similar performance in terms of overall diagnostic accuracy, with an area under the curve of 0.91 and 0.93, respectively (p = n.s.)."

According to the news editors, the research concluded: "BP-MRI prostate protocol is feasible for prostatic cancer detection compared to a standard MP-MRI protocol, requiring a shorter acquisition and interpretation time, with comparable diagnostic accuracy to the conventional protocol, without the administration of gadolinium-based contrast agent."

For more information on this research see: Biparametric 3T Magnetic Resonance Imaging for prostatic cancer detection in a biopsy-naive patient population: a further improvement of PI-RADS v2?"
Researchers' Work from University Hospital Focuses on Insulin Resistance (Effects of aerobic exercise on ectopic lipids in patients with growth hormone deficiency before and after growth hormone replacement therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Endocrine System Diseases and Conditions - Insulin Resistance. According to news originating from Bern, Switzerland, by NewsRx correspondents, research stated, "Growth hormone replacement therapy (GHRT) increases exercise capacity and insulin resistance while it decreases fat mass in growth hormone-deficient patients (GHD). Ectopic lipids (intramyocellular (IMCL) and intrahepatocellular lipids (IHCL) are related to insulin resistance."

Our news journalists obtained a quote from the research from University Hospital, "The effect of GHRT on ectopic lipids is unknown. It is hypothesized that exercise-induced utilization of ectopic lipids is significantly decreased in GHD patients and normalized by GHRT. GHD (4 females, 6 males) and age/gender/waist-matched control subjects (CS) were studied. VO2max was assessed on a treadmill and insulin sensitivity determined by a two-step hyperinsulinemia-euglycaemic clamp. Visceral (VAT) and subcutaneous (SAT) fat were quantified by MR-imaging. IHCL and IMCL were measured before and after a 2 h exercise at 50-60% of VO2max using MR-spectroscopy (&#8710;IMCL, &#8710;IHCL). Identical investigations were performed after 6 months of GHRT. VO2max was similar in GHD and CS and significantly increased after GHRT; GHRT significantly decreased SAT and VAT. 2 h-exercise resulted in a decrease in IMCL (significant in CS and GHRT) and a significant increase in IHCL in CS and GHD pre and post GHRT. GHRT didn't significantly impact on &8710;IMCL and &8710;IHCL. We conclude that aerobic exercise affects ectopic lipids in patients and controls."

According to the news editors, the research concluded: "GHRT increases exercise capacity without influencing ectopic lipids."

For more information on this research see: Effects of aerobic exercise on ectopic
lipids in patients with growth hormone deficiency before and after growth hormone replacement therapy. *Scientific Reports*, 2016;6():19310. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Blood Pressure**

**Researchers' Work from University of Arizona Focuses on Blood Pressure (Substituting systolic blood pressure with shock index in the National Trauma Triage Protocol)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Blood Pressure is the subject of a report. According to news reporting out of Tucson, Arizona, by NewsRx editors, research stated, "The National Trauma Triage Protocol (NTTP) is an algorithm that guides emergency medical services providers through four decision steps to identify the patients that would benefit from trauma center care. The NTTP defines a systolic blood pressure (SBP) of less than 90 mm Hg as one of the criteria for trauma center need."

Our news journalists obtained a quote from the research from the University of Arizona, "The aim of our study was to determine the impact of substituting SBP of less than 90 mm Hg with shock index (SI) on triage performance. A 2-year (2011-2012) retrospective analysis of all trauma patients 18 years or older in the National Trauma Databank was performed. Transferred patients, patients dead on arrival, and those with missing data were excluded. Our outcome measure was trauma center need defined by Injury Severity Score greater than 15, need for emergent operation, death in the emergency department, and intensive care unit stay of more than 1 day. Area under the characteristic curve and triage characteristics were compared between SBP of less than 90 mm Hg and SI of more than 1.0. Logistic regression analysis was performed to compare the mortality between patients triaged under current protocol of SBP of less than 90 mm Hg and patients triaged using the new defined protocol (SI >1.0). A total of 505,296 patients were included. Compared with SBP of less than 90 mm Hg, SI of more than 1.0 had a higher sensitivity (44.4% vs. 41.7%) but lower specificity (80.2% vs. 82.4%). The area under the curve was significantly higher for SI of more than 1.0 (0.623 [95% confidence interval, 0.622-.625] vs. 0.620 [95% confidence interval, 0.619-0.622]). Substituting SBP of less than 90 mm Hg with SI of more than 1.0 resulted in a decrease in undertriage rate of 30,233 patients (5.9%) but an increase in overtriage of only 6,386 patients.
(1.3%). Substituting the current criterion of SBP of less than 90 mm Hg in the NTTP with an SI of more than 1.0 results in significant reduction in undertriage rate without causing large increase in overtriage."

According to the news editors, the research concluded: "Because of simplicity of use, better discrimination power, and minimal effect on overtriage rates, future studies should consider exploring the possibility of replacing the current SBP of less than 90 mm Hg criterion with SI of more than 1.0 in the NTTP."

For more information on this research see: Substituting systolic blood pressure with shock index in the National Trauma Triage Protocol. *Journal of Trauma and Acute Care Surgery*, 2016;81(6):1136-1141. *Journal of Trauma and Acute Care Surgery* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Drugs and Therapies - Drug Delivery Systems**

**Researchers' Work from University of Copenhagen Focuses on Drug Delivery Systems (Solid cellulose nanofiber based foams - Towards facile design of sustained drug delivery systems)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Drug Delivery Systems have been presented. According to news reporting out of Copenhagen, Denmark, by NewsRx editors, research stated, "Control of drug action through formulation is a vital and very challenging topic within pharmaceutical sciences. Cellulose nanofibers (CNF) are an excipient candidate in pharmaceutical formulations that could be used to easily optimize drug delivery rates."

Our news journalists obtained a quote from the research from the University of Copenhagen, "CNF has interesting physico-chemical properties that, when combined with surfactants, can be used to create very stable air bubbles and dry foams. Utilizing this inherent property, it is possible to modify the release kinetics of the model drug riboflavin in a facile way. Wet foams were prepared using cationic CNF and a pharmaceutically acceptable surfactant (lauric acid sodium salt). The drug was suspended in the wettable foams followed by a drying step to obtain dry foams. Flexible cellular solid materials of different thicknesses, shapes and drug loadings (up to 50 wt%) could successfully be prepared. The drug was released from the solid foams in a diffusion-controlled, sustained manner due to the presence of intact air bubbles which imparted a tortuous diffusion path. The diffusion coefficient was assessed using Franz cells and shown to be more than one order of magnitude smaller for the cellular solids compared to the bubble-free films in the wet state."
According to the news editors, the research concluded: "By changing the dimensions of dry foams while keeping drug load and total weight constant, the drug release kinetics could be modified, e.g. a rectangular box-shaped foam of 8 mm thickness released only 59% of the drug after 24 h whereas a thinner foam sample (0.6 mm) released 78% of its drug content within 8 h. In comparison, the drug release from films (0.009 mm, with the same total mass and an outer surface area comparable to the thinner foam) was much faster, amounting to 72% of the drug within 1 h. The entrapped air bubbles in the foam also induced positive buoyancy, which is interesting from the perspective of gastroretentive drug-delivery."

For more information on this research see: Solid cellulose nanofiber based foams - Towards facile design of sustained drug delivery systems. Journal of Controlled Release, 2016;244():74-82. Journal of Controlled Release can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Controlled Release - www.journals.elsevier.com/journal-of-controlled-release/)

Our news journalists report that additional information may be obtained by contacting A.J. Svagan, University of Copenhagen, Dept. of Pharm, DK-2100 Copenhagen, Denmark. Additional authors for this research include J.W. Benjamins, Z. Al-Ansari, D. Bar Shalom, A. Mullertz, L. Wagberg and K. Lobmann.

Gram-Negative Bacteria - Escherichia coli

Researchers' Work from University of Hyderabad Focuses on Escherichia coli (Molecular Epidemiology and Genome Dynamics of New Delhi Metallo-beta-Lactamase-Producing Extraintestinal Pathogenic Escherichia coli Strains from India)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Escherichia coli are presented in a new report. According to news reporting originating from Andhra Pradesh, India, by NewsRx correspondents, research stated, "The global dissemination and increasing incidence of carbapenem-resistant, Gram-negative organisms have resulted in acute public health concerns. Here, we present a retrospective multicenter study on molecular characterization of metallo-beta-lactamase (MBL)-producing clinical Escherichia coli isolates recovered from extraintestinal infections in two hospitals in Pune, India."

Our news editors obtained a quote from the research from the University of Hyderabad, "We screened a large sample size of 510 E. coli isolates for MBL production wherein we profiled their molecular determinants, antimicrobial resistance phenotypes, functional virulence properties, genomic features, and transmission dynamics. Approximately 8% of these isolates were MBL producers, the majority of which were of the NDM-1 (69%) type, followed by NDM-5 (19%), NDM-4 (5.5%), and NDM-7 (5.5%). MBL producers were resistant to all antibiotics tested except for colistin, fosfomycin, and chloramphenicol, which were effective to various extents. Plasmids were found to be an effective means of dissemination of NDM genes and other resistance traits. All MBL producers adhered to and invaded bladder epithelial (T24) cells and demonstrated significant serum resistance. Genomic
analysis of MBL-producing E. coli isolates revealed higher resistance but a moderate virulence gene repertoire. A subset of NDM-1-positive E. coli isolates was identified as dominant sequence type 101 (ST101) while two strains belonging to ST167 and ST405 harbored NDM-5. A majority of MBL-producing E. coli strains revealed unique genotypes, suggesting that they were clonally unrelated. Overall, the coexistence of virulence and carbapenem resistance in clinical E. coli isolates is of serious concern.

According to the news editors, the research concluded: "Moreover, the emergence of NDM-1 among the globally dominant E. coli ST101 isolates warrants stringent surveillance and control measures."

For more information on this research see: Molecular Epidemiology and Genome Dynamics of New Delhi Metallo-beta-Lactamase-Producing Extraintestinal Pathogenic Escherichia coli Strains from India. Antimicrobial Agents and Chemotherapy, 2016;60 (11):6795-6805. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news editors report that additional information may be obtained by contacting N. Ahmeda, University of Hyderabad, Dept. of Biotechnol & Bioinformat, Pathogen Biol Lab, Hyderabad, Andhra Pradesh, India. Additional authors for this research include S. Shaik, A. Mondal, N. Nandanwar, A. Hussain, T. Semmler, N. Kumar, S.K. Tiwari, S. Jadhav, L.H. Wieler and N. Ahmeda.

Apoptosis

Researchers' Work from University of New Mexico Focuses on Apoptosis (Cold-inducible RNA binding protein in mouse mammary gland development)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Apoptosis are discussed in a new report. According to news reporting originating in Albuquerque, New Mexico, by NewsRx journalists, research stated, "RNA binding proteins (RBPs) regulate gene expression by controlling mRNA export, translation, and stability. When altered, some RBPs allow cancer cells to grow, survive, and metastasize."

Funders for this research include Dedicated Health Research Funds from the University of New Mexico School of Medicine, MARC, IMSD.

The news reporters obtained a quote from the research from the University of New Mexico, "Cold-inducible RNA binding protein (CIRP) is overexpressed in a subset of breast cancers, induces proliferation in breast cancer cell lines, and inhibits apoptosis. Although studies have begun to examine the role of CIRP in breast and other cancers, its role in normal breast development has not been assessed. We generated a transgenic mouse model overexpressing human CIRP in the mammary epithelium to ask if it plays a role in mammary gland development."
development. Effects of CIRP overexpression on mammary gland morphology, cell proliferation, and apoptosis were studied from puberty through pregnancy, lactation and weaning. There were no gross effects on mammary gland morphology as shown by whole mounts. Immunohistochemistry for the proliferation marker Ki67 showed decreased proliferation during the lactational switch (the transition from pregnancy to lactation) in mammary glands from CIRP transgenic mice. Two markers of apoptosis showed that the transgene did not affect apoptosis during mammary gland involution.”

According to the news reporters, the research concluded: "These results suggest a potential in vivo function in suppressing proliferation during a specific developmental transition."

Our news correspondents report that additional information may be obtained by contacting R.S. Hartley, University of New Mexico, Center Canc, Albuquerque, NM 87131, United States. Additional authors for this research include S. Garcia, J. Vanderhoof, J. Sifuentes, Y. Brandt, Y.H. Wu, X. Guo, T. Mitchell, T. Howard, H.J. Hathaway and R.S. Hartley.

### Oncology - Colon Cancer

**Researchers' Work from University of Queensland Focuses on Colon Cancer (PI3K/Akt/mTOR pathway dual inhibitor BEZ235 suppresses the stemness of colon cancer stem cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting from St. Lucia, Australia, by NewsRx journalists, research stated, "Colon cancer is one of the most common cancers worldwide with high mortality. A major issue in colon cancer treatment is drug-resistance and metastasis that have been ascribed to the cancer stem cells."

Funders for this research include Australian Research Council, Cancer Council Queensland.

The news correspondents obtained a quote from the research from the University of Queensland, "In this study, colon cancer stem cells were isolated through sphere culture and verified with the cancer stem cell markers CD133, CD44, and CD24. It was demonstrated that the PI3K/Akt/mTOR signalling pathway was highly activated in the colon cancer stem cells and
that inhibition of the PI3K/Akt/mTOR pathway by the inhibitor BEZ235 suppressed the colon cancer stem cell proliferation with reduced stemness indicated by CD133 and Lgr5 expressions. Treatment with insulin as a known activator of the PI3K/Akt pathway increased CD133 expression and decreased the effects of BEZ235 on colon cancer proliferation and survival."

According to the news reporters, the research concluded: "The data presented here collectively suggest that the PI3K/Akt/mTOR pathway underpins the stemness of colon cancer stem cells and BEZ235 is potentially a good drug candidate for treatment of colon cancer drug resistance and metastasis."

Our news journalists report that additional information may be obtained by contacting J. Chen, Australian Institute of Bioengineering and Nanotechnology, University of Queensland, St Lucia, Qld, Australia. Additional authors for this research include R. Shao, F. Li, M. Monteiro, J.P. Liu, Z.P. Xu and W. Gu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1440-1681.12493. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions - …

Researchers' Work from University of Tokushima Focuses on Atherosclerosis (Combination of n-3 polyunsaturated fatty acids reduces atherogenesis in apolipoprotein E-deficient mice by inhibiting macrophage activation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting originating from Tokushima, Japan, by NewsRx correspondents, research stated, "Eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) are major components of n-3 polyunsaturated fatty acids (n-3 PUFAs) which inhibit atherogenesis, although few studies have examined the effects of the combination of EPA and DHA on atherogenesis. The aim of this study was to investigate whether DHA has additional anti-atherosclerotic effects when combined with EPA."

Funders for this research include Support Center for Advanced Medical Sciences, Institute of Biomedical Sciences, Tokushima University Graduate School.

Our news editors obtained a quote from the research from the University of Tokushima, "Male 8-week-old apolipoprotein E-deficient (Apoe(-/-)) mice were fed a western-type diet supplemented with different amounts of EPA and DHA; EPA (2.5%, w/w), low-dose EPA + DHA (2.5%, w/w), or high-dose EPA + DHA (5%, w/w) for 20 weeks. The control group was fed a western-type diet containing no n-3 PUFA. Histological and gene expression
analysis were performed in atherosclerotic lesions in the aorta. To address the mechanisms,
RAW264.7 cells were used. All n-3 PUFA treatments significantly attenuated the development
and destabilization of atherosclerotic plaques compared with the control. The anti-
atherosclerotic effects were enhanced in the high-dose EPA + DHA group (p < 0.001), whereas
the pure EPA group and low-dose EPA + DHA group showed similar results. EPA and DHA
additively attenuated the expression of inflammatory molecules in RAW264.7 cells stimulated
with LPS. DHA or EPA + DHA suppressed LPS-induced toll-like receptor 4 (TLR4)
expression in lipid rafts on RAW264.7 cells (p < 0.05). Lipid raft disruption by methyl-beta-
cyclodextrin suppressed mRNA expression of inflammatory molecules in LPS-
stimulated macrophages. n-3 PUFAs suppressed atherogenesis. DHA combined with EPA had additional
anti-inflammatory effects and inhibited atherogenesis in Apoe(-/-) mice."

According to the news editors, the research concluded: "The reduction of TLR4
expression in lipid rafts in macrophages by DHA might be involved in this mechanism, at least
partially."

For more information on this research see: Combination of n-3 polyunsaturated fatty
acids reduces atherogenesis in apolipoprotein E-deficient mice by inhibiting macrophage
activation. *Atherosclerosis*, 2016;254():142-150. *Atherosclerosis* can be contacted at: Elsevier

resorption, might improve long-term outcome.”

The news correspondents obtained a quote from the research from the University of Twente, "We investigated in allcomers the safety and efficacy of three stents eluting either everolimus, sirolimus, or zotarolimus, often clinically used but never compared, of which the biodegradable polymer everolimus-eluting stent was never before assessed in allcomers. The large-scale, investigator-initiated, multicentre, assessor and patient blinded, three-arm, randomised, BIO-RESORT non-inferiority trial was done at four clinical sites in the Netherlands. All-comer patients were aged 18 years or older, capable of providing informed consent, and required a percutaneous coronary intervention with drug-eluting stent implantation according to clinical guidelines or the operators’ judgment. Exclusion criteria were: participation in another randomised drug or device study before reaching the primary endpoint of that study; planned surgery necessitating interruption of dual antiplatelet therapy within the first 6 months; known intolerance to components of the investigational product or medication required; uncertainty about the adherence to follow-up procedures or an assumed life expectancy of less than 1 year; or known pregnancy. Web-based computer-generated allocation sequences randomly assigned patients (1:1:1) to treatment with very thin strut biodegradable polymer everolimus-eluting or sirolimus-eluting stents (which differ substantially in type, amount, distribution, and resorption speed of their respective coating), or thin strut durable polymer zotarolimus-eluting stents. The primary endpoint was a composite of safety (cardiac death or target vessel-related myocardial infarction) and efficacy (target vessel revascularisation) at 12 months of follow up with a very thin strut biodegradable polymer of either everolimus-eluting or sirolimus-eluting stents, compared with durable polymer zotarolimus-eluting stents, analysed by intention to treat (non-inferiority margin 3.5%). This trial was registered with ClinicalTrials.gov, number NCT01674803. From Dec 21, 2012, to Aug 24, 2015, 3514 patients were enrolled and analysed, of whom 2449 (70%) had acute coronary syndromes, which included 1073 (31%) ST-elevation myocardial infarctions. 12 month follow-up of 3490 (99%) patients (three lost to follow-up; 21 withdrawals) was available. The primary endpoint was met by 55 (5%) of 1172 patients assigned to everolimus-eluting stents, 55 (5%) of 1169 assigned to sirolimus-eluting stents and 63 (5%) of 1173 assigned to zotarolimus-eluting stents. Non-inferiority of the everolimus-eluting stents and sirolimus-eluting stents compared with zotarolimus-eluting stents was confirmed (both -0.7% absolute risk difference, 95% CI -2.4 to 1.1; upper limit of one sided 95% CI 0.8%, p(non-inferiority) < 0.0001). Definite stent thrombosis (defined by the Academic Research Consortium) occurred in four (0.3%) of 1172 patients who were allocated to everolimus-eluting stents, four (0.3%) of 1169 assigned to sirolimus-eluting stents and three (0.3%) of 1173 assigned to zotarolimus-eluting stents. At 12 month follow-up, both very thin strut drug-eluting stents with dissimilar biodegradable polymer coatings (eluting either everolimus or sirolimus) were non-inferior to the durable polymer stent (eluting zotarolimus) in treating allcomers with a high proportion of patients with acute coronary syndromes.”

According to the news reporters, the research concluded: "The absence of a loss of 1 year safety and efficacy with the use of these two biodegradable polymer-coated stents is a prerequisite before assessing their potential longer-term benefits.”

Propiophenones
Researchers' Work from Virginia Commonwealth University Focuses on Propiophenones (Methamphetamine-like discriminative stimulus effects of bupropion and its two hydroxy metabolites in male rhesus monkeys)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Propiophenones is now available. According to news reporting from Research Triangle Park, North Carolina, by NewsRx journalists, research stated, "The dopamine transporter (DAT) inhibitor and nicotinic acetylcholine (nACh) receptor antagonist bupropion is being investigated as a candidate 'agonist' medication for methamphetamine addiction. In addition to its complex pharmacology, bupropion also has two distinct pharmacologically active metabolites."

The news correspondents obtained a quote from the research from Virginia Commonwealth University, "However, the mechanism by which bupropion produces methamphetamine-like 'agonist' effects remains unknown. The aim of the present study was to determine the role of DAT inhibition, nACh receptor antagonism, and the hydroxybupropion metabolites in the methamphetamine-like discriminative stimulus effects of bupropion in rhesus monkeys. In addition, varenicline, a partial agonist at the nACh receptor, and risperidone, a dopamine antagonist, were tested as controls. Monkeys (n=4) were trained to discriminate 0.18 mg/kg intramuscular methamphetamine from saline in a two-key food-reinforced discrimination procedure. The potency and time course of methamphetamine-like discriminative stimulus effects were determined for all compounds. Bupropion, methylphenidate, and 2S,3S-hydroxybupropion produced full, at least 90%, methamphetamine-like effects. 2R,3R-Hydroxybupropion, mecamylamine, and nicotine also produced full methamphetamine-like effects, but drug potency was more variable between monkeys. Varenicline produced partial methamphetamine-like effects, whereas risperidone did not. Overall, these results suggest DAT inhibition as the major mechanism of the methamphetamine-like 'agonist' effects of bupropion, although nACh receptor antagonism appeared, at least partially, to contribute."
According to the news reporters, the research concluded: "Furthermore, the contribution of the 2S,3S-hydroxybupropion metabolite could not be completely ruled out."

For more information on this research see: Methamphetamine-like discriminative stimulus effects of bupropion and its two hydroxy metabolites in male rhesus monkeys. *Behavioural Pharmacology*, 2016;27(2-3 Spec I):196-203. Musculoskeletal Diseases and Conditions - Arthritis

**Researchers' Work from Washington University Focuses on Arthritis (Immune-Mediated Protection and Pathogenesis of Chikungunya Virus)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Arthritis. According to news originating from St. Louis, Missouri, by NewsRx correspondents, research stated, "Chikungunya virus (CHIKV) is a re-emerging alphavirus that causes debilitating acute and chronic arthritis."

Our news journalists obtained a quote from the research from Washington University, "Infection by CHIKV induces a robust immune response that is characterized by production of type I IFNs, recruitment of innate and adaptive immune cells, and development of neutralizing Abs. Despite this response, chronic arthritis can develop in some individuals, which may be due to a failure to eliminate viral RNA and Ag and/or persistent immune responses that cause chronic joint inflammation."

According to the news editors, the research concluded: "In this review, based primarily on advances from recent studies in mice, we discuss the innate and adaptive immune factors that control CHIKV dissemination and clearance or contribute to pathogenesis."

For more information on this research see: Immune-Mediated Protection and Pathogenesis of Chikungunya Virus. *Journal of Immunology*, 2016;197(11):4210-4218. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. **Immunology - Immunoglobulins**

**Researchers' Work from Weill Cornell Medical College Focuses on Immunoglobulins (An MHC-restricted antibody-based chimeric antigen receptor requires TCR-like affinity to maintain antigen specificity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immunoglobulins have been published. According to news reporting originating from York, New York, by NewsRx correspondents, research stated, "Chimeric antigen receptors (CARs) are synthetic receptors that usually redirect T cells to surface antigens independent of human leukocyte antigen (HLA). Here, we investigated a T cell receptor-like CAR based on an antibody that recognizes HLA-A*0201 presenting a peptide epitope derived from the cancer-testis antigen NY-ESO-1."

Our news editors obtained a quote from the research from Weill Cornell Medical College, "We hypothesized that this CAR would efficiently redirect transduced T cells in an HLA-restricted, antigen-specific manner. However, we found that despite the specificity of the soluble Fab, the same antibody in the form of a CAR caused moderate lysis of HLA-A2 expressing targets independent of antigen owing to T cell avidity. We hypothesized that lowering the affinity of the CAR for HLA-A2 would improve its specificity. We undertook a rational approach of mutating residues that, in the crystal structure, were predicted to stabilize binding to HLA-A2. We found that one mutation (DN) lowered the affinity of the Fab to T cell receptor-range and restored the epitope specificity of the CAR. DN CAR T cells lysed native tumor targets in vitro, and, in a xenogeneic mouse model implanted with two human melanoma lines (A2+/NYESO+ and A2+/NYESO-), DN CAR T cells specifically migrated to, and delayed progression of, only the HLA-A2+/NY-ESO-1+ melanoma."

According to the news editors, the research concluded: "Thus, although maintaining MHC-restricted antigen specificity required T cell receptor-like affinity that decreased potency, there is exciting potential for CARs to expand their repertoire to include a broad range of intracellular antigens."

For more information on this research see: An MHC-restricted antibody-based chimeric antigen receptor requires TCR-like affinity to maintain antigen specificity. *Molecular Therapy-Oncolytics*, 2016;3():1-9. *Molecular Therapy-Oncolytics* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

Oncology - Breast Cancer

Royal Marsden NHS Foundation Trust Details Findings in Breast Cancer (Rates of major complications during neoadjuvant and adjuvant chemotherapy for early breast cancer: An off study population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "To determine the incidence and risk factors for thromboembolic events (TE) and febrile neutropenia (FN) in patients receiving systemic chemotherapy for early breast cancer (EBC). 325 patients received FEC75, FEC100-T or ECaP for EBC in 2013."

Our news editors obtained a quote from the research from Royal Marsden NHS Foundation Trust, "TE occurred in 7.4% and FN in 19.1% of patients. Risk factors for TE were: central venous catheter (p = 0.011). Risk factors for FN were: FEC100-T treatment versus FEC75 and ECaP (p <= 0.001); lower pretreatment neutrophil count (p = 0.009) and poorer performance status (p = 0.012). Two patients died from treatment-related toxicities."

According to the news editors, the research concluded: "In real-world experience, the majority of patients completed adequate treatment, despite significant complications."

The news editors report that additional information may be obtained by contacting A. Ring, Royal Marsden NHS Fdn Trust, Breast Unit, London, United Kingdom. Additional authors for this research include A. Sharp, H. Lote, K. Mohammed, E. Papadimitraki, M. Capelan and A. Ring.

Rutgers School of Dental Medicine Details Findings in Escherichia coli
(Surface display of Aggregatibacter actinomycetemcomitans autotransporter Aae and dispersin B hybrid act as antibiofilm agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Escherichia coli are presented in a new report. According to news reporting originating from Newark, New Jersey, by NewsRx correspondents, research stated, "Among the various proteins expressed by the periodontopathogen Aggregatibacter actinomycetemcomitans, two proteins play important roles for survival in the oral cavity. The autotransporter Aae facilitates the attachment of the pathogen to oral epithelial cells, which act as a reservoir, while the biofilm-degrading glycoside hydrolase dispersin B facilitates the movement of daughter cells from the mature biofilm to a new site."

Funders for this research include USPHS, National Institute of Dental and Craniofacial Research.

Our news editors obtained a quote from the research from the Rutgers School of Dental Medicine, "The objective of this study was to use the potential of these two proteins to control biofilms. To this end, we generated a hybrid construct between the Aae C-terminal translocating domain and dispersin B, and mobilized it into Escherichia coli Rosetta (DE3) pLysS cells. Immunofluorescence analysis of the modified E. coli cells confirmed the presence of dispersin B on the surface. Further, the membrane localization of the displayed dispersin B was confirmed with Western blot analysis. The integrity of the E. coli cells displaying the dispersin B was confirmed through FACS analysis. The hydrolytic activity of the surface-displayed dispersin B was confirmed by using 4-methylumbelliferyl-beta-D-glucopyranoside as the substrate. The detachment ability of the dispersin B surface-displaying E. coli cells was shown using Staphylococcus epidermidis and Actinobacillus pleuropneumoniae biofilms in a microtiter assay."

According to the news editors, the research concluded: "We concluded that the Aae b-domain is sufficient to translocate foreign enzymes in the native folded form and that the method of Aae-mediated translocation of surface displayed enzymes might be useful for control of biofilms."

The news editors report that additional information may be obtained by contacting N. Ramasubbu, Rutgers Sch Dental Med, Dept. of Oral Biol, Newark, NJ, United States. Additional authors for this research include K. DiFranco, M. Shanmugam, P. Gopal, V. Vyas, D.H. Fine, C. Cugini and N. Ramasubbu.

**SEATTLE GENETICS NOTIFICATION: Faruqi & Faruqi, LLP Encourages Investors Who Suffered Losses In Excess Of $100,000 Investing In Seattle Genetics, Inc. To Contact The Firm**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Faruqi & Faruqi, LLP, a leading national securities law firm, is investigating potential securities fraud at Seattle Genetics, Inc. ("Seattle Genetics" or the "Company") (NASDAQ: SGEN).

The investigation focuses on whether the Company and its executives violated federal securities laws.

Specifically, on December 27, 2016, the Company announced that the U.S. Food and Drug Administration had placed a clinical hold on several early stage trials of the Company's experimental cancer drug, vadastuximab talirine. The clinical holds were initiated to evaluate the potential risk of hepatotoxicity in patients treated with the drug. Seattle Genetics revealed that six acute myeloid leukemia patients had been identified with liver toxicity and that four had died.

On this news, Seattle Genetics' share price fell from $61.86 per share on December 23, 2016 to a closing price of $52.36 on December 27, 2016—a $9.50 or a 15.36% drop.

Request more information now by clicking here: HYPERLINK "http://www.faruqilaw.com"www.faruqilaw.com/SGEN. There is no cost or obligation to you.

**SHAREHOLDER ALERT: Bronstein, Gewirtz & Grossman, LLC Announces Investigation of Seattle Genetics, Inc. SGEN**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Attorney Advertising -- Bronstein, Gewirtz & Grossman, LLC is investigating potential claims on behalf of purchasers of Seattle Genetics, Inc. ("Seattle Genetics" or the "Company") (NASDAQ: SGEN). Such investors are advised to obtain additional information and assist the investigation by visiting the firm's site: HYPERLINK "http://www.bgandg.com/sgen"www.bgandg.com/sgen.

The investigation concerns whether Seattle Genetics and certain of its officers and/or directors have violated Sections 10(b) and 20(a) of the Securities Exchange Act of 1934.

On December 27, 2016, Seattle Genetics revealed that the U.S. Food and Drug
Administration ("FDA") had placed a clinical hold or partial clinical hold on some early stage trials of vadastuximab talirine, its experimental cancer drug, to evaluate the potential risk of hepatotoxicity. Seattle Genetics affirmed that six acute myeloid leukemia patients had been identified with liver toxicity and that four had died. Following this news, Seattle Genetics stock dropped $9.50 per share, or 15.36%, to close at $52.36 on December 27, 2016.

If you are aware of any facts relating to this investigation, or purchased Seattle Genetics shares, you can assist this investigation by visiting the firm's site: HYPERLINK "http://www.bgandg.com/sgen" www.bgandg.com/sgen. You can also contact Peretz Bronstein or his Investor Relations Analyst, Yael Hurwitz of Bronstein, Gewirtz & Grossman, LLC: 212-697-6484.

Bronstein, Gewirtz & Grossman, LLC is a corporate litigation boutique. Our primary expertise is the aggressive pursuit of litigation claims on behalf of our clients. In addition to representing institutions and other investor plaintiffs in class action security litigation, the firm's expertise includes general corporate and commercial litigation, as well as securities arbitration. Attorney advertising. Prior results do not guarantee similar outcomes.

**SHAREHOLDER ALERT: Lundin Law PC Announces an Investigation of Seattle Genetics, Inc. and Encourages Investors with Losses to Contact the Firm**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Lundin Law PC, a shareholder rights firm, announces that it is investigating claims against Seattle Genetics, Inc. ("Seattle Genetics" or the "Company") (Nasdaq: SGEN) concerning possible violations of federal securities laws.

To get more information about this investigation, please contact Brian Lundin, Esquire, of Lundin Law PC, at 888-713-1033, or via email at brian@lundinlawpc.com.

According to the Complaint, the Company announced that the U.S. Food and Drug Administration had enforced a clinical hold or partial clinical hold on initial stage trials of the Company's experimental cancer drug, vadastuximab talirine, to assess any possible risk of hepatotoxicity. The Company mentioned that six acute myeloid leukemia patients had been identified with liver toxicity and that four had died.

When this news was released to the public, the value of Seattle Genetics dropped, causing investors harm.

Lundin Law PC was founded by Brian Lundin, a securities litigator based in Los Angeles dedicated to upholding shareholders' rights.

This press release may be considered Attorney Advertising in some jurisdictions under the applicable law and ethical rules. View source version on businesswire.com: http://www.businesswire.com/news/home/20161227005283/en/

Pharmaceutical Companies
SHAREHOLDER ALERT: Pomerantz Law Firm Investigates Claims On Behalf of Investors of Seattle Genetics, Inc. - SGEN

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Pomerantz LLP is investigating claims on behalf of investors of Seattle Genetics, Inc. ("Seattle Genetics" or the "Company") (NASDAQ: SGEN). Such investors are advised to contact Robert S. Willoughby at HYPERLINK "mailto:rswilloughby@pomlaw.com" rswilloughby@pomlaw.com or 888-476-6529, ext. 9980. The investigation concerns whether Seattle Genetics and certain of its officers and/or directors have engaged in securities fraud or other unlawful business practices.

On December 27, 2016, Seattle Genetics announced that the U.S. Food and Drug Administration had placed a clinical hold or partial clinical hold on several early stage trials of the Company's experimental cancer drug, vadastuximab talirine, to evaluate the potential risk of hepatotoxicity. Seattle Genetics stated that six acute myeloid leukemia patients had been identified with liver toxicity and that four had died.

On this news, Seattle Genetics stock has fallen as much as $9.95, or 16.07%, to $51.91 on December 27, 2016.

The Pomerantz Firm, with offices in New York, Chicago, Florida, and Los Angeles, is acknowledged as one of the premier firms in the areas of corporate, securities, and antitrust class litigation. Founded by the late Abraham L. Pomerantz, known as the dean of the class action bar, the Pomerantz Firm pioneered the field of securities class actions. Today, more than 80 years later, the Pomerantz Firm continues in the tradition he established, fighting for the rights of the victims of securities fraud, breaches of fiduciary duty, and corporate misconduct. The Firm has recovered numerous multimillion-dollar damages awards on behalf of class members. See HYPERLINK "http://www.pomerantzlaw.com/" www.pomerantzlaw.com

Heart Disorders and Diseases - Cardiomyopathies
Salford Royal Hospital Reports Findings in Cardiomyopathies (An Update on Intradialytic Cardiac Dysfunction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Cardiomyopathies have been published. According to news reporting out of Salford, United Kingdom, by NewsRx editors, research stated, "Cardiac dysfunction is a key factor in the high morbidity and mortality rates seen in hemodialysis (HD) patients. Much of the dysfunction is manifest as adverse
changes in cardiac and vascular structure prior to commencing dialysis."

Our news journalists obtained a quote from the research from Salford Royal Hospital, "This adverse vascular remodeling arises as a dysregulation between pro-and antiproliferative signaling pathways in response to hemodynamic and nonhemodynamic factors. The HD procedure itself further promotes cardiomyopathy by inducing hypotension and episodic regional cardiac ischemia that precedes global dysfunction, fibrosis, worsening symptoms, and increased mortality. Drug-based therapies have been largely ineffective in reversing HD-associated cardiomyopathy, in part due to targeting single pathways of low yield. Few studies have sought to establish natural history and there is no framework of priorities for future clinical trials. Targeting intradialytic cardiac dysfunction by altering dialysate temperature, composition, or ultrafiltration rate might prevent the development of global cardiomyopathy, heart failure, and mortality through multiple pathways. Novel imaging techniques show promise in characterizing the physiological response to HD that is a unique model of repetitive ischemia-reperfusion injury. Reducing HD-associated cardiomyopathy may need a paradigm shift from empirical delivery of solute clearance to a personalized therapy balancing solute and fluid removal with microvascular protection."

According to the news editors, the research concluded: "This review describes the evidence for intradialytic cardiac dysfunction outlining cardioprotective strategies that extend to multiple organs with potential impacts on exercise tolerance, sleep, cognitive function, and quality of life."

Our news journalists report that additional information may be obtained by contacting A. Odudu, Salford Royal Hosp, Salford, Lancs, United Kingdom.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/sdi.12532. This DOI is a link to an online electronic document that is either free or for purchase.

Central Nervous System Diseases and Conditions –…

Samsung Medical Center Reports Findings in Moyamoya Disease (Caveolin-1, Ring finger protein 213, and endothelial function in Moyamoya disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions - Moyamoya Disease have been presented. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Moyamoya disease is a unique cerebrovascular occlusive disease of unknown etiology. Ring finger protein 213 (RNF213) was identified as a
susceptibility gene for Moyamoya disease in East Asian countries."

The news correspondents obtained a quote from the research from Samsung Medical Center, "However, the pathogenesis of Moyamoya disease remains unclear. We prospectively analyzed clinical data for 139 patients with Moyamoya disease (108 bilateral Moyamoya disease, 31 unilateral Moyamoya disease), 61 patients with intracranial atherosclerotic stroke, and 68 healthy subjects. We compared the genetic (RNF213 variant) and protein biomarkers for caveolae (caveolin-1), angiogenesis (vascular endothelial growth factor (VEGF) and receptor (VEGFR2), and antagonizing cytokine (endostatin)) and endothelial dysfunction (asymmetric dimethylarginine (ADMA), and nitric oxide and its metabolites (nitrite and nitrate)) between patients with Moyamoya disease and intracranial atherosclerotic stroke. We then performed path analysis to evaluate whether a certain protein biomarker mediates the association between genes and Moyamoya disease. Caveolin-1 level was decreased in patients with Moyamoya disease and markedly decreased in RNF213 variant carriers. Circulating factors such as VEGF and VEGFR2 did not differ among the groups. Markers for endothelial dysfunction were significantly higher in patients with intracranial atherosclerotic stroke but normal in those with Moyamoya disease. Path analysis showed that the presence of the RNF213 variant was associated with caveolin-1 levels that could lead to Moyamoya disease. The level of combined marker of Moyamoya disease (caveolin-1) and intracranial atherosclerotic stroke (ADMA, an endothelial dysfunction marker) predicted Moyamoya disease with good sensitivity and specificity."

According to the news reporters, the research concluded: "Our results suggest that Moyamoya disease is a caveolae disorder but is not related to endothelial dysfunction or dysregulation of circulating cytokines."

School of Medicine Details Findings in Spinal Cord Injury (Mice with sclerostin gene deletion are resistant to the severe sublesional bone loss induced by spinal cord injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Spinal Cord Injury. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Bone loss after spinal cord injury (SCI) is rapid, severe, and refractory to interventions studied to date. Mice with sclerostin gene deletion are resistant to the severe sublesional bone loss induced by SCI, further indicating pharmacological inhibition of sclerostin may represent a promising novel approach to this challenging medical problem."

Funders for this research include Veterans Health Administration, Rehabilitation Research and Development Service, Ministry of Science and Technology PRC, Natural Science Foundation of China (NSFC).

Our news editors obtained a quote from the research from the School of Medicine, "The bone loss secondary to spinal cord injury (SCI) is associated with several unique pathological features, including the permanent immobilization, neurological dysfunction, and systemic hormonal alternations. It remains unclear how these complex pathophysiological changes are linked to molecular alterations that influence bone metabolism in SCI. Sclerostin is a key negative regulator of bone formation and bone mass. We hypothesized that sclerostin could function as a major mediator of bone loss following SCI. To test this hypothesis, 10-week-old female sclerostin knockout (SOST KO) and wild type (WT) mice underwent complete spinal cord transection or laminectomy (Sham). At 8 weeks after SCI, substantial loss of bone mineral density was observed at the distal femur and proximal tibia in WT mice but not in SOST KO mice. By mu CT, trabecular bone volume of the distal femur was markedly decreased by 64% in WT mice after SCI. In striking contrast, there was no significant reduction of bone volume in SOST KO/SCI mice compared with SOST KO/sham. Histomorphometric analysis of trabecular bone revealed that the significant reduction in bone formation rate following SCI was observed in WT mice but not in SOST KO mice. Moreover, SCI did not alter osteoblastogenesis of marrow stromal cells in SOST KO mice. Our findings demonstrate that SOST KO mice were protected from the major sublesional bone loss that invariably follows SCI."

According to the news editors, the research concluded: "The evidence indicates that sclerostin is an important mediator of the marked sublesional bone loss after SCI, and that pharmacological inhibition of sclerostin may represent a promising novel approach to this challenging clinical problem."

Angiogenesis

School of Medicine Reports Findings in Angiogenesis (Targeting the angio-proteostasis network: Combining the forces against cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Angiogenesis. According to news reporting out of Aachen, Germany, by NewsRx editors, research stated, "The VEGF family of pro-angiogenic factors has represented a pillar for targeted cancer therapy for more than a decade. In comparison, the field of protein homeostasis (proteostasis) focusing on the Unfolded Protein Response (UPR), an endoplasmic reticulum (ER) stress-induced signaling cascade, has just recently emerged as an attractive anti-cancer approach."

Financial supporters for this research include Ernst Jung Foundation, German Cancer Aid, RWTH START, Interuniversity Attraction Poles, Research Foundation Flanders, FWO, Health Research Board, Institute National du Cancer (INCa).

Our news journalists obtained a quote from the research from the School of Medicine, "Recent findings suggest that both signaling pathways are incontestably interrelated to ensure cell survival. Herein, we summarize recent findings that demonstrate how these two fundamental aspects of cancer cell survival intersect and provide genetic and pharmacological evidence of the interplay between angiogenic factors such as VEGF-A or PIGF and the individual members of the UPR such as IRE1, PERK and ATF6. We further describe how this interaction does not only affect the cancer cells, but also the surrounding microenvironmental niche that is also involved in tumor progression."

According to the news editors, the research concluded: "Furthermore, by summarizing the recent therapeutic implications of both anti-angiogenic and proteostatic approaches, we emphasize how these novel findings could be used synergistically to improve cancer therapy."

Oncology - Breast Cancer
School of Medicine Reports Findings in Breast Cancer (Management and Outcomes in Metaplastic Breast Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting originating in Athens, Greece, by NewsRx journalists, research stated, "Metaplastic breast cancer (MBC) constitutes a rare clinical entity with special clinicopathologic, immunohistochemical, and molecular features. Resistance to systemic therapies, whether chemotherapy or hormonal therapy, is among its main characteristics, which in turn explains the poor prognosis and renders its management a challenge."

The news reporters obtained a quote from the research from the School of Medicine, "Thus, the scope of the present review is to discuss the current therapeutic strategies for MBC in clinical practice and the corresponding outcomes and to suggest possible directions for future research. Potential novel targeted therapies could provide a hope for better outcomes but limited data are available owing to the rarity of MBC."

According to the news reporters, the research concluded: "As knowledge accumulates on the pathogenesis and genetic characteristics of MBC, emphasis should be given to the implementation of more targeted treatments, which will allow more efficient and individualized management of the disease."

For more information on this research see: Management and Outcomes in Metaplastic Breast Cancer. Clinical Breast Cancer, 2016;16(6):437-443. Clinical Breast Cancer can be contacted at: Cig Media Group, Lp, 3500 Maple Avenue, Ste 750, Dallas, TX 75219-3931, USA. Scripps Florida scientists develop drug discovery approach to predict health impact of endocrine-disruptors

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Breast cancer researchers from the Florida campus of The Scripps Research Institute (TSRI) have developed a novel approach for identifying how chemicals in the environment--called environmental estrogens--can produce infertility, abnormal reproductive development, including "precocious puberty," and promote breast cancer.

Environmental estrogens work by binding to the estrogen receptor, a protein in cells that guides sexual maturation and reproduction. The new research shows how high-resolution imaging techniques could give scientists a window into how exposure to these chemicals may impact public health.

This research method could also be used to speed up the discovery of new drugs for breast cancer and many other diseases, added study senior author Kendall Nettles, associate professor at TSRI.

The study was published online ahead of print in the journal Cell Chemical Biology.

Environmental estrogens control the estrogen receptor's activity by changing its shape, which can mimic the effects of estrogen. These chemicals can also block receptor activity, as seen with the breast cancer therapy tamoxifen.

These changes are often exceedingly small, in the sub-angstrom range (one angstrom is equal to one ten-billionth of a meter). In fact, changes to even a single atom in a chemical or endocrine therapy drug can often drive widely divergent outcomes, but the resolution of the typical crystal structure does not allow visualization of these small changes.

Nettles calls the approach in the new study "super-resolution x-ray crystallography."

X-ray crystallography is a technique that produces a snapshot of the receptor's 3-D atomic structure. Like the images produced by photography or microscopy, x-ray crystal structures have a certain resolution, or level of detail, that can be visualized. With optical microscopy, super-resolution imaging--a discovery for which researchers were awarded the Nobel Prize in 2014--can be achieved by combining many images to produce a sharper picture.

Nettles and his colleagues reasoned that they could use a similar approach with x-ray crystallography to compare molecular snapshots, or structures, and better understand how estrogenic chemicals control receptor activity.

They found that by combining data about structural disturbances from many structures with activity profiles of their ligands (the estrogenic chemicals), researchers can identify the sub-angstrom details that determine endocrine disruption.

"Our novel approach offers a framework for understanding the diverse effects of environmental estrogens and other endocrine disruptors, furthering efforts to develop improved breast cancer therapies," said TSRI Research Associate Jerome C. Nwachukwu, first author of the study. "This approach can also be applied to other allosteric receptors."

Super-resolution x-ray crystallography can also be applied to the large groups of receptors that comprise the targets for most known drugs. With structure-based drug design, chemists can use this new approach to visualize how to modify drug-candidate chemicals to promote the desirable therapeutic profile.

Seattle Genetics Announces Clinical Hold on Several Phase 1 Trials of Vadastuximab Talirine SGN-CD33A

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Seattle Genetics, Inc. (Nasdaq:SGEN), a global biotechnology company, announced that it has received notice from the U.S. Food and Drug Administration (FDA) that a clinical hold or partial clinical hold has been placed on several early stage trials of vadastuximab talirine (SGN-CD33A) in acute myeloid leukemia (AML). The clinical holds were initiated to evaluate the potential risk of hepatotoxicity in patients who were treated with SGN-CD33A and received allogeneic stem cell transplant either before or after treatment. Six patients have been identified with hepatotoxicity, including several cases of veno-occlusive disease, with four fatal events. Overall, more than 300 patients have been treated with SGN-CD33A in clinical trials across multiple treatment settings. Seattle Genetics is working diligently with the FDA to determine whether there is any association between hepatotoxicity and treatment with SGN-CD33A, to promptly identify appropriate protocol amendments for patient safety and to enable continuation of these trials.

The phase 1/2 trial of SGN-CD33A monotherapy in pre- and post-allogeneic transplant AML patients has been placed on full clinical hold. Two phase 1 trials have been placed on partial clinical hold (no new enrollment, existing patients may continue treatment with re-consent). These studies are SGN-CD33A monotherapy, including a subset of older AML patients in combination with hypomethylating agents, and SGN-CD33A combination treatment with 7+3 chemotherapy in newly diagnosed younger AML patients. No new studies will be initiated until the clinical holds are lifted.

Seattle Genetics’ other ongoing trials of SGN-CD33A, including the phase 3 CASCADE trial in older AML patients and phase 1/2 trial in myelodysplastic syndrome, are proceeding with enrollment. About Vadastuximab Talirine (SGN-CD33A) Vadastuximab talirine (SGN-CD33A; 33A) is a novel investigational ADC targeted to CD33 utilizing Seattle Genetics’ proprietary ADC technology. CD33 is expressed on most AML and MDS blast cells. The CD33 engineered cysteine antibody is stably linked to a highly potent DNA binding agent called a pyrrolobenzodiazepine (PBD) dimer via site-specific conjugation technology (EC-mAb). PBD dimers are significantly more potent than systemic chemotherapeutic drugs and the EC-mAb technology allows uniform drug-loading onto an ADC. The ADC is designed to be stable in the bloodstream and to release its potent cell-killing PBD agent upon internalization into CD33-expressing cells.

Second Military Medical University Reports Findings in Lymphoid Tissue (Identification of a novel alternative splicing transcript variant of the suppressor of fused: Relationship with lymph node metastasis in pancreatic ductal adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immunology - Lymphoid Tissue are discussed in a new report. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Pancreatic ductal adenocarcinoma (PDAC) is one of the most fatal diseases, and the median survival time is very short. Upregulation of hedgehog signaling pathway activity is a vital factor in pathogenesis of PDAC."

Our news editors obtained a quote from the research from Second Military Medical University, "However, as a negative regulator of hedgehog signaling, it is not very clear what role the suppressor of fused (SUFU) plays in PDAC tissue. In our study for the identification of alternative splicing transcripts of SUFU gene in human PDAC cells, a novel transcript variant of SUFU (SUFUvN) was discovered by 3' rapid amplification of cDNA ends (3'RACE) and cDNA clone. SUFUvN contained an additional new protein-coding exon compared with the transcript variant 1 of SUFU (SUFUv1, NM_016169) published in NCBI website. The sequence of the new protein-coding exon was the same as a fragment of intron between exon 10 and 11 of SUFUv1. Thus, an exon skipping occurred in transcription of SUFUv1. Compared with the expression vector of SUFUvN transfected PDAC cells, the corresponding protein expression encoded by SUFUvN (SUFU isoform N) was detected in PDAC tissue. Furthermore, it was observed that elevated SUFUvN transcription level was related with lymph node metastasis in PDAC tissues, while neither SUFUv1 nor transcript variant 2 of SUFU (SUFUv2, NM_001178133) did."

According to the news editors, the research concluded: "Our data indicate that there exists a novel transcript variant of SUFU which can be transcribed and translated into corresponding protein and its transcription is related with metastasis of lymph nodes in PDAC."

The news editors report that additional information may be obtained by contacting J. Gao, Second Military Med Univ, Changhai Hosp, Dept. of Gastroenterol, Shanghai 200433, People's Republic of China. Additional authors for this research include J. Gao and Z.S. Li.

Keywords for this news article include: Shanghai, People's Republic of China, Asia, Hemic and Immune Systems, Gastroenterology, Lymphoid Tissue, Adenocarcinoma, Lymph Nodes, Immunology, Pancreas, Genetics, Second Military Medical University.

Secrets of human protein interactions unveiled by massive sequencing and coevolution

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Cells operate like an incredibly well-synchronized orchestra of molecular interactions among proteins. Understanding this molecular network is essential not only to understand how an organism works but also to determine the molecular mechanisms responsible for a multitude of diseases. In fact, it has been observed that protein interacting regions are preferentially mutated in tumours. The investigation of many of these interactions is challenging. However, a study coordinated by Simone Marsili and David Juan, from Alfonso Valencia's team at the CNIO, will advance our knowledge on thousands of them. The work, published in the journal Proceedings of the National Academy of Sciences (PNAS), demonstrates that it is possible to understand a significant number of interactions among human proteins from the evolution of their counterparts in simpler cells, such as bacteria cells.

According to Juan Rodriguez, from the Structural Computational Biology Group at the CNIO and first author of the paper, "the complexity of human beings does not only result from the number of proteins that we have, but primarily from how they interact with each other. However, out of 200,000 protein-protein interactions estimated, only a few thousand have been characterised at the molecular level". It is very difficult to study the molecular properties of many important interactions without reliable structural information. It is this "twilight zone" that, for the first time, CNIO researchers have managed to explore.

FROM BACTERIA TO HUMANS TO UNDERSTAND DISEASES

Although more than 3,000 million years of evolution separate bacteria and humans, the CNIO team has utilized the information accumulated over thousands of bacterial sequences to predict interactions between proteins in humans. "We have used the protein coevolution phenomenon: proteins that interact tend to experience coordinated evolutionary changes that maintain the interaction despite the accumulation of mutations over time," says David Juan. "We have demonstrated that we can use this phenomenon to detect molecular details of interactions in humans that we share with very distant species. What is most interesting is that this allows us to transfer information from bacteria in order to study interactions in humans that we knew almost nothing about," adds Simone Marsili.

These new results may lead to important implications for future research. "A deeper understanding of these interactions opens the door to the modeling of three-dimensional structures that may help us to design drugs targeting important interactions in various types of cancer," explains David Juan. "This knowledge can also improve our predictions of the effects of various mutations linked to tumour development," says Rodriguez.

DATA-BASED SCIENCE

The laboratory of Alfonso Valencia, head of the Structural Biology and Biocomputing Programme, has been working in the field of protein coevolution since the 1990s. This field has significantly advanced in recent years. "Thanks to the amount of biological data that is being generated today, we can use new computational methods that take into account a greater number of factors," explains Valencia. According to the researchers, the pace of innovation in massive experimental techniques is providing additional data, making it possible to design more complex statistical models that provide an ever more complete view of the biological systems, "something particularly important in multifactorial diseases, such as cancer."

This work was supported by the Spanish Ministry of Economy and Competitiveness
and the European Regional Development Fund.

Atrial Fibrillation

Shanghai Jiao-Tong University School of Medicine Reports Findings in Atrial Fibrillation (TBX5 mutations contribute to early-onset atrial fibrillation in Chinese and Caucasians)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Atrial Fibrillation. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Atrial fibrillation (AF) is a common arrhythmia with an important heritable aspect. The genetic factors underlying AF have not been fully elucidated."

Financial supporters for this research include National Basic Research Program of China (973 program), National Science Foundation of China, Shanghai Excellent Academic Leaders Project, National Institutes of Health, American Heart Association.

Our news journalists obtained a quote from the research from the Shanghai Jiao-Tong University School of Medicine, "We screened six candidate genes (CAV1, KCNJ2, KCNQ1, NKX2.5, PITX2, and TBX5) for novel mutations in 139 patients of Chinese descent with early-onset AF and 576 controls. Four missense TBX5 mutations, p.R355C, p.Q376R, p.A428S, and p.S372L, were identified in evolutionarily conserved regions. We did not find any mutations in CAV1, KCNJ2, KCNQ1, NKX2.5, and PITX2. These mutations increased the expression of atrial natriuretic peptide (ANP) and connexin-40 (CX40) in the primarily cultured rat atrial myocytes but did not alter the expression of cardiac structural genes, atrial myosin heavy chain-a (MHC-a) and myosin light chain-2a (MLC-2a). Overexpression of p.R355C developed an atrial arrhythmia suggestive of paroxysmal AF in the zebrafish model. To replicate our findings, we screened TBX5 in 527 early-onset AF cases from the Massachusetts General Hospital AF study. A novel TBX5 deletion (DAsp118, p.D118del) was identified, while no TBX5 mutations were identified in 1176 control subjects. Our results provide both genetic and functional evidence to support the contribution of TBX5 gene in the pathogenesis of AF."

According to the news editors, the research concluded: "The potential mechanism of arrhythmia may be due in part to the disturbed expression of ANP and CX40."

Our news journalists report that additional information may be obtained by contacting Y.G. Li, Dept. of Cardiology, Xinhua Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai 200092, People's Republic of China. Additional authors for this research include F. Yang, S.N. Mahida, L. Zhao, X. Chen, M.L. Zhang, Z. Sun, Y. Yao, Y.X. Zhang, G.Y. Zheng, J. Dong, M.J. Feng, R. Zhang, J. Sun, S. Li, Q.S. Wang, H. Cao, E.J. Benjamin, P.T. Ellinor, Y.G. Li and X.L Tian.

Shenyang Pharmaceutical University Reports Findings in Drug Delivery Systems (Polysialic acid-modifying liposomes for efficient delivery of epirubicin, in-vitro characterization and in-vivo evaluation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Drug Delivery Systems. According to news reporting originating in Shenyang, People's Republic of China, by NewsRx journalists, research stated, "Polysialic acid (PSA) serves as a hydrophilic polymer and affords conjugated biologically active molecules a longer circulation time in vivo. Furthermore, PSA could potentially target tumor tissues and help achieve better curative effects.”

Financial support for this research came from National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Shenyang Pharmaceutical University, "In this study, PSA was conjugated with octadecyl dimethyl betaine (BS18) to yield a PSA-BS18 conjugate. The PSA-BS18 modified liposomal epirubicin (EPI-SL), had a particle size of 133.63 +/- 0.92 nm, a zeta potential of -26.23 +/- 1.50 mV and an encapsulation efficiency (%EE) of 96.23 +/- 1.16%. In vitro release studies showed that PSA-BS18 could delay EPI release from the modified liposomes. The MTT assay suggested that EPI-SL led to stronger cytotoxic activity than that exhibited by common and PEGylated liposomes. The pharmacokinetic study showed that EPI-SL prolonged the residence time of the EPI in the blood compared with that observed from common liposomes. Biodistribution results obtained from tumor-bearing mice clearly demonstrated that PSA-BS18 increased the accumulation of modified liposomes in tumors compared with that of common liposomes. In the antitumor efficacy study, EPI-SL showed the best antitumor and life-prolonging effects among all of the tested formulations."

According to the news reporters, the research concluded: "These findings strongly indicate EPI-SL might have great potential as an effective approach for anticancer therapy."

Clinical Research - Clinical Trials and Studies

Shinshu University School of Medicine Reports Findings in Clinical Trials and Studies (McGRATH MAC video laryngoscope for insertion of a transoesophageal echocardiography probe: A randomised controlled trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news originating from Matsumoto, Japan, by NewsRx correspondents, research stated, "Transoesophageal echocardiography (TOE) probe insertion in anaesthetised patients can cause pharyngeal and oesophageal injuries. Kim et al. have shown that insertion assisted by a Macintosh laryngoscope can reduce such complications but it may sometimes be difficult to observe the passage of a TOE probe. The McGRATH MAC (McGRATH) has been shown to provide a better view of the glottis, piriform fossa and oesophageal inlet during tracheal intubation than the Macintosh."

Our news journalists obtained a quote from the research from the Shinshu University School of Medicine, "We hypothesised that the McGRATH provided better visualisation of the oesophageal inlet and was useful as an aid to TOE probe placement, possibly reducing the incidence of pharyngeal injury related to insertion, compared with the Macintosh. A randomised controlled trial. The study was conducted in a university hospital from February to December 2014. One hundred patients undergoing elective surgery under intraoperative TOE monitoring were randomised to either a Macintosh group or a McGRATH group. Macintosh and McGRATH were used to visualise the passage of the TOE probe and guide its insertion. Visibility of the oesophageal inlet, the number of TOE insertion attempts and incidence of pharyngeal mucosal injury after the TOE probe had been removed were assessed. The percentage of patients in whom the oesophageal inlet was visible was higher in the McGRATH group (88%) than in the Macintosh group (41%) (p <0.01). The number of TOE probe insertion attempts was significantly smaller in the McGRATH group than in the Macintosh group (p= 0.039). The incidence of pharyngeal mucosal injury was significantly smaller in the McGRATH group (4%) than in the Macintosh group (16%; p=0.042). The McGRATH provided a better view of the oesophageal inlet and was useful as an aid to TOE probe placement, possibly reducing the incidence of pharyngeal injury related to its insertion."

According to the news editors, the research concluded: "University Hospital Medical Information Network in Japan (UMIN) 000012970."

For more information on this research see: McGRATH MAC video laryngoscope for insertion of a transoesophageal echocardiography probe: A randomised controlled trial.
Shoulder pain linked to increased heart disease risk

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- After all the lifting, hauling, and wrapping, worn out gift givers may blame the season's physical strain for any shoulder soreness they are feeling. It turns out there could be another reason. A new study led by investigators at the University of Utah School of Medicine finds that individuals with symptoms that put them at increased risk for heart disease could be more likely to have shoulder problems, including joint pain and rotator cuff injury.

"If someone has rotator cuff problems, it could be a sign that there is something else going on. They may need to manage risk factors for heart disease," says the study's lead author Kurt Hegmann, M.D., M.P.H., Professor of Family and Preventive Medicine and Director of the Rocky Mountain Center for Occupational and Environmental Health. The research was published in the Journal of Occupational and Environmental Medicine.

Repeated physical stress is most frequently blamed for aggravating shoulder joints and the muscles and tendons that surround them. Think about a pitcher who throws a baseball 100 times a day. While physical exertion can certainly be an irritant, accumulating evidence points other factors that could also be at play. Previous research found that people who had an increased risk for heart disease also had a tendency toward carpal tunnel syndrome, Achilles tendinitis, and tennis elbow, all musculoskeletal disorders.

The current study by Hegmann and colleagues adds shoulder problems to the list and takes the connection one step further. The more heart disease risk factors that each of the study participants had racked up - including high blood pressure, high cholesterol, diabetes - the more likely they were to have had shoulder trouble.

36 participants with the most severe collection of risk factors were 4.6 times more likely than those with none of the risk factors to have had shoulder joint pain. They were also nearly six times more likely to have had a second shoulder condition, rotator cuff tendinopathy. Participants with mid-level heart risk were less likely to have had either shoulder condition, at 1.5 to 3-fold. Shared trends bolster that there could be a relationship between heart risk and shoulder problems, but researchers will need to follow up with a prospective study to prove cause and effect.

It may seem like physical strain would be at least just as likely to cause shoulder pain...
but data from the 1,226 skilled laborers who took part in the study suggest otherwise. Ergonomists carefully monitored airbag manufacturers, meat, processors, cabinet makers and skilled laborers. Every forceful twist, push, and pull was factored into a strain index assigned to each worker. But a more straining job did not translate to an uptick in shoulder difficulties. Nor did more time spent doing other physical activities.

"What we think we are seeing is that high force can accelerate rotator cuff issues but is not the primary driver," says Hegmann. "Cardiovascular disease risk factors could be more important than job factors for incurring these types of problems."

He says it's possible that controlling blood pressure and other heart risk factors could alleviate shoulder discomfort, too.

**Sichuan University Reports Findings in Abdominal Aortic Aneurysm (Abdominal compartment syndrome after endovascular repair for ruptured abdominal aortic aneurysm leads to acute intestinal necrosis Case report)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm. According to news reporting originating in Chengdu, People's Republic of China, by NewsRx journalists, research stated, "Abdominal compartment syndrome (ACS) after endovascular repair (EVAR) of rupture abdominal aortic aneurysm (rAAA) is a rare emergency situation, which has a high mortality. However, the progression of ACS is rapid and the diagnosis is usually been delayed, which increase the difficulties in treatment and affect the prognosis."

The news reporters obtained a quote from the research from Sichuan University, "We describe a case of a severe complication (acute intestinal necrosis) resulting from ACS after endovascular repair of rAAA. Clinical Finding: Anelderlyman, 81 years old, complained a sudden lowerabdominal and backpain without any predisposing cause. Hehad a history of hypertension for 20 years without any regular anti-hypertensive therapy. Physical Examination revealed that the blood pressure was 89/54mmHg, pulse was 120/min, oxygen saturation was 91%. The abdominal ultrasound and the CTA (computed tomography angiography) scan revealed a rAAA. Emergency EVAR under general anesthesia was performed for this patient. Diagnosis: Fourteen hours after endovascular repair, sudden decreased of blood pressure (70/50mmHg) and oxygen saturation (70%) was observed. ACS or bleeding of retroperitoneal space was diagnosed. Abdominal laparotomy was immediately performed. ACS was verified and a severe complication (acute intestinal necrosis) was observed, intestinal resection was performed for this patient. Unfortunately, this patient died after operation because of multi-organ failure in a very short period, which is very rare regarding to this condition. Surgical pathology, diagnosis and management were discussed."
According to the news reporters, the research concluded: "ACS was occurred with a severe complication (acute intestinal necrosis) in a very short period, which is very rare regarding to this condition after EVAR, it reminds us the severe result of ACS and more methods to prevent it happened after surgical management."

For more information on this research see: Abdominal compartment syndrome after endovascular repair for ruptured abdominal aortic aneurysm leads to acute intestinal necrosis Case report. *Medicine*, 2016;95(47):103-106. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Neurodegenerative Diseases and Conditions -...**

**Single protein may hold secret to treating Parkinson's disease and more**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New details learned about a key cellular protein could lead to treatments for neurodegenerative diseases, such as Parkinson's, Huntington's, Alzheimer's, and amyotrophic lateral sclerosis (ALS).

At their root, these disorders are triggered by misbehaving proteins in the brain. The proteins misfold and accumulate in neurons, inflicting damage and eventually killing the cells. In a new study, researchers in the laboratory of Steven Finkbeiner, MD, PhD, at the Gladstone Institutes used a different protein, Nrf2, to restore levels of the disease-causing proteins to a normal, healthy range, thereby preventing cell death.

The researchers tested Nrf2 in two models of Parkinson's disease: cells with mutations in the proteins LRRK2 and a-synuclein. By activating Nrf2, the researchers turned on several "house-cleaning" mechanisms in the cell to remove excess LRRK2 and a-synuclein.

"Nrf2 coordinates a whole program of gene expression, but we didn't know how important it was for regulating protein levels until now," explained first author Gaia Skibinski, PhD, a staff research scientist at Gladstone. "Overexpressing Nrf2 in cellular models of Parkinson's disease resulted in a huge effect. In fact, it protects cells against the disease better than anything else we've found."

In the study, published in the Proceedings of the National Academy of Sciences, the scientists used both rat neurons and human neurons created from induced pluripotent stem cells. They then programmed the neurons to express Nrf2 and either mutant LRRK2 or a-synuclein. Using a one-of-a-kind robotic microscope developed by the Finkbeiner laboratory, the
Researchers tagged and tracked individual neurons over time to monitor their protein levels and overall health. They took thousands of images of the cells over the course of a week, measuring the development and demise of each one.

The scientists discovered that Nrf2 worked in different ways to help remove either mutant LRRK2 or a-synuclein from the cells. For mutant LRRK2, Nrf2 drove the protein to gather into incidental clumps that can remain in the cell without damaging it. For a-synuclein, Nrf2 accelerated the breakdown and clearance of the protein, reducing its levels in the cell.

"I am very enthusiastic about this strategy for treating neurodegenerative diseases," said Finkbeiner, a senior investigator at Gladstone and senior author on the paper. "We've tested Nrf2 in models of Huntington's disease, Parkinson's disease, and ALS, and it is the most protective thing we've ever found. Based on the magnitude and the breadth of the effect, we really want to understand Nrf2 and its role in protein regulation better."

The scientists say that Nrf2 itself may be difficult to target with a drug because it is involved in so many cellular processes, so they are now focusing on some of its downstream effects. They hope to identify other players in the protein regulation pathway that interact with Nrf2 to improve cell health and that may be easier to drug.

Slayback Pharma LLC

Slayback Pharma announces the final approval and launch of Generic Zovirax Acyclovir Ointment 5%

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Slayback Pharma LLC is pleased to announce the launch of Generic Zovirax Ointment (Acyclovir Ointment) 5%, by its out-licensee - Sandoz (Fougera). Slayback had developed the product and out-licensed the sales and marketing rights to Sandoz. The ANDA filed by Sandoz (Fougera) was approved on May 11, 2016.

The product is a generic version of Valeant's Zovirax Ointment (Acyclovir Ointment), which is indicated in the management of initial genital herpes and in limited non-life-threatening mucocutaneous Herpes simplex virus infections in immunocompromised patients. Acyclovir Ointment is contraindicated in patients who develop hypersensitivity to the components of the formulation. Acyclovir Ointment is intended for cutaneous use only and should not be used in the eye.

As per the agreement between Sandoz and Slayback, terms of which remain confidential, Sandoz will continue to pay Slayback a share of the profits generated from the sale of Acyclovir Ointment in the USA.

"Slayback's core focus is the development of complex generics primarily in parenteral and other non-solid pharmaceutical products by connecting the dots across various technologies, science, regulatory and intellectual property traditions. The successful development and approval of a complex generic formulation of Acyclovir Ointment meeting FDA's standards is a testimony to this effort," said Ajay K Singh, Chief Executive Officer of
Southern Medical University Details Findings in Liver Cancer (Ten-year follow-up analysis of chronic hepatitis C patients after getting sustained virological response to pegylated interferon-alpha and ribavirin therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Liver Cancer. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "There is little data on the long-term follow-up outcomes of chronic hepatitis C patients achieving sustained virological response (SVR) after treatment with pegylated interferon- plus ribavirin. We prospectively investigated the overall clinical, biochemical, virological and histological outcomes in a ten-year cohort study of 325 patients with chronic hepatitis C achieving SVR to pegylated interferon- and ribavirin therapy."

Our news editors obtained a quote from the research from Southern Medical University, "Patients underwent consistent clinical, biochemical and virological evaluation every six months, and patients with pretherapy Ishak fibrosis score 2 were invited to accept a second liver biopsy at the last follow-up. Liver biopsy specimens were evaluated using Ishak's scoring system. At the end of follow-up, five patients developed decompensated liver cirrhosis. One patient (0.3%) with pretherapy cirrhosis was diagnosed with hepatocellular carcinoma (HCC). A total of 305 patients (94%) had normal serum ALT and AST levels during the entire period of follow-up. Twenty-seven patients (8%) had conclusive evidence of virological relapse. Among the 117 patients with paired pretherapy and long-term follow-up biopsies, 96 (82%) had a decreased fibrosis score. Ninety-nine (79%) had a decrease in combined inflammation score. Thirty-seven (32%) had normal or nearly normal livers on long-term follow-up biopsy. SVR achieved with PEG-IFN- and RBV combination therapy is durable, while late virological relapse may still occur in some patients."

According to the news editors, the research concluded: "Clinical outcomes for patients who obtain SVR are excellent, although the patients with cirrhosis are still at a low risk of hepatocellular carcinoma."

The news editors report that additional information may be obtained by contacting Y. Zhou, Southern Med Univ, Dept. of Infect Dis, Nanfang Hosp, Guangzhou, Guangdong, People's Republic of China. Additional authors for this research include F. Gao, G. Yuan, K.
Specific Technologies and FIND announce strategic collaboration

Blood Diseases and Conditions - Sepsis

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Specific Technologies and FIND announced a collaboration to promote the development of new solutions for diagnosis of bloodstream infections in resource-poor environments.

The development of an infection in the bloodstream is the cause of sepsis, a systemic inflammatory response which can be life threatening. The global burden of sepsis is significant. According to recent estimates, 31.5 million cases occur annually, resulting in some 5.3 million deaths [1]. The great majority of these cases occur in lower- and middle-income countries and rank among the leading causes of maternal and neonatal mortality. Sepsis is thought to account for over 10% of maternal deaths and 70% of the 9 million neonatal and infant deaths that occur annually [2,3]. Survival in low-resource settings largely depends upon rapid detection and administration of appropriate antibiotics, both of which are extremely challenging: current approaches to sepsis diagnosis are labor-intensive and require well-resourced laboratories.

Specific Technologies has developed a system called SpecID for clinical microbiology diagnostics that combines pathogen detection with identification in culture, providing substantial advances to existing methods and taking what now is often a highly manual, three-step, two-day process and translating it into a single labor-free instrument that delivers comparable results within 12 hours. This reduction in technician involvement is suited to low- and middle-income countries where technicians trained to perform Gram stains are often unavailable near the point of blood sample collection.

Under the collaboration between Specific Technologies and FIND, work will be done to expand Specific Technologies' species identification library to include additional pathogens that commonly cause bloodstream infections in low- and middle-income countries (LMICs), develop specifications for adapting SpecID to LMICs, and develop a plan to manufacture and validate a new version of the instrument.

"The wide use of broad spectrum antibiotics to treat suspected sepsis not only increasingly fails to save the patient but is driving the evolution of yet more resistant strains." said Catharina Boehme, FIND CEO. "In the era of antimicrobial resistance, we must aim for rapid diagnosis followed by targeted treatment. Increasing access to rapid blood culture for pathogen identification and drug susceptibility testing is thus a major priority, and the SpecID system holds particular promise to address this need in low-resource settings."

"Our agreement with FIND further highlights the broad demand for the rapid..."
evolution of existing blood culture practices around the world," said Paul Rhodes, Chief Executive Officer of Specific Technologies. "While our blood culture paradigm has been designed for developed world microbiology labs, the labor-free nature of its Gram status and species identification functions make it well suited for the constraints of resource-limited regions."

"We look forward to a long and fruitful partnership with FIND where we can together enable broader testing for this important healthcare challenge that so many areas of the globe cannot access due to the technical requirements of existing testing practices," said Rob Lozuk, President of Specific Technologies.

Ischemia

Stanford University Reports Findings in Ischemia (Transient Receptor Potential Ankyrin 1 Activation within the Cardiac Myocyte Limits Ischemia-reperfusion Injury in Rodents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Ischemia. According to news reporting from Stanford, California, by NewsRx journalists, research stated, "Recent evidence suggests that cross talk exists between cellular pathways important for pain signaling and ischemia-reperfusion injury. Here, the authors address whether the transient receptor potential ankyrin 1 (TRPA1) channel, important in pain signaling, is present in cardiac myocytes and regulates cardiac ischemia-reperfusion injury."

The news correspondents obtained a quote from the research from Stanford University, "For biochemical analysis of TRPA1, techniques including quantitative polymerase chain reaction, Western blot, and immunofluorescence were used. To determine how TRPA1 mediates cellular injury, the authors used an in vivo model of rat cardiac ischemia-reperfusion injury and adult rat-isolated cardiac myocytes subjected to hypoxia-reoxygenation. The authors' biochemical analysis indicates that TRPA1 is within the cardiac myocytes. Further, using a rat in vivo model of cardiac injury, the TRPA1 activators ASP 7663 and optovin reduce myocardial injury (45 +/- 5%* and 44 +/- 8%,* respectively, vs. control, 66 +/- 6% infarct size/area at risk; n = 6 per group; mean +/- SD; * P< 0.001). TRPA1 inhibition also blocked the infarct size-sparing effects of morphine. In isolated cardiac myocytes, the TRPA1 activators ASP 7663 and optovin reduce cardiac myocyte cell death when given during reoxygenation (20 +/- 3%* and 22 +/- 4%* vs. 36 +/- 3%; percentage of dead cells per field, n = 6 per group; mean +/- SD; *P < 0.05). For a rat in vivo model of cardiac injury, the infarct size-sparing effect of TRPA1 activators also occurs during reperfusion. The authors' data suggest that TRPA1 is present within the cardiac myocytes and is important in regulating myocardial reperfusion injury."

According to the news reporters, the research concluded: "The presence of TRPA1 within the cardiac myocytes may potentially explain why certain pain relievers that can block TRPA1 activation, such as cyclooxygenase-2 inhibitors or some nonsteroidal antiinflammatory drugs, could be associated with cardiovascular risk."

For more information on this research see: Transient Receptor Potential Ankyrin 1
Activation within the Cardiac Myocyte Limits Ischemia-reperfusion Injury in Rodents.

*Genetics - Human Genetics*

**Studies Conducted at Aix-Marseille University on Human Genetics Recently Reported (How to Identify Pathogenic Mutations among All Those Variations: Variant Annotation and Filtration in the Genome Sequencing Era)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics - Human Genetics. According to news reporting from Marseille, France, by NewsRx journalists, research stated, "High-throughput sequencing technologies have become fundamental for the identification of disease-causing mutations in human genetic diseases both in research and clinical testing contexts. The cumulative number of genes linked to rare diseases is now close to 3,500 with more than 1,000 genes identified between 2010 and 2014 because of the early adoption of Exome Sequencing technologies."

The news correspondents obtained a quote from the research from Aix-Marseille University, "However, despite these encouraging figures, the success rate of clinical exome diagnosis remains low due to several factors including wrong variant annotation and nonoptimal filtration practices, which may lead to misinterpretation of disease-causing mutations. In this review, we describe the critical steps of variant annotation and filtration processes to highlight a handful of potential disease-causing mutations for downstream analysis. We report the key annotation elements to gather at multiple levels for each mutation, and which systems are designed to help in collecting this mandatory information."

According to the news reporters, the research concluded: "We describe the filtration options, their efficiency, and limits and provide a generic filtration workflow and highlight potential pitfalls through a use case."

Oncology - Bladder Cancer

Studies Conducted at Children's Medical Center on Bladder Cancer Recently Reported (Sarcomatoid Carcinoma of the Bladder in a Child: Case Report of a Successful Treatment Including Gemcitabine and Cisplatin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Bladder Cancer. According to news reporting from Okinawa, Japan, by NewsRx journalists, research stated, "This report describes an unusual case of sarcomatoid carcinoma of the bladder in a 3-year-old girl. Although saving the patient's life is most essential, it is also essential to consider quality of life."

The news correspondents obtained a quote from the research from Children's Medical Center, "The patient underwent neoadjuvant chemotherapy with gemcitabine and cisplatin for bladder preservation. The tumor considerably decreased in size. After 4 courses of chemotherapy, the patient underwent a partial cystectomy followed by postoperative irradiation with 2 courses of chemotherapy. Seventy months after the operation, she remains alive, showing complete remission with normal bladder function."

According to the news reporters, the research concluded: "Chemotherapy resulted in tumor shrinkage and allowed for bladder preservation."

Our news journalists report that additional information may be obtained by contacting T. Higa, Childrens Med Center, Okinawa Prefectural Nanbu Med Center, Dept. of Hematol & Oncol, Arakawa, Okinawa 9011105, Japan. Additional authors for this research include K. Oshiro, T. Kinjyo, Y. Miyazato, T. Nakama, S. Iraha, I. Nakazato, T. Matsuda, N. Hyakuna and N. Kuroda.

**Neurodegenerative Diseases and Conditions**

**Studies Conducted at China Pharmaceutical University on Alzheimer Disease Recently Reported (Montelukast ameliorates streptozotocin-induced cognitive impairment and neurotoxicity in mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Extensive studies have demonstrated that neuroinflammation is associated with Alzheimer's disease (AD) and cysteinyl leukotriene receptor 1 (CysLT(1)R) was involved in neuroinflammation. Montelukast, a highly selective CysLT1R antagonist, has been reported to attenuate learning and memory impairments in the amyloid-beta-induced mouse model of AD."

Funders for this research include National Natural Science Foundation of China, Natural Science Foundation of Jiangsu Province, Priority Academic Program Development of Jiangsu Higher Education Institutions (PAPD).

Our news journalists obtained a quote from the research from China Pharmaceutical University, "However, whether montelukast also exerts beneficial effects on streptozotocin (STZ)-induced memory deficits in mice is not well known. In the present study, we aimed to investigate the effects of montelukast on STZ-induced cognitive impairment, neuroinflammation and apoptosis in mice. Our data showed that intra-hippocampal microinfusion of STZ resulted in learning and memory impairments, including increased escape latency during acquisition trials and decreased exploratory activities in the probe trial in Morris watermaze (MWM) task, and decreased number of correct choices and increased latency to enter the shock-free compartment in Y-maze test, and caused neuroinflammatory and apoptotic responses, evidenced by increments of nuclear NF-kappa B p65, TNF-alpha, IL-1 beta, cleaved caspase-3, Bax as well as decreased expression of Bcl-2 in hippocampus. Interestingly, STZ treatment led to up-regulation of protein and mRNA of CysLT(1)R in hippocampus. Of note, consecutive oral administration of montelukast (1 or 2 mg/kg, 3 weeks) remarkably attenuated these effects induced by STZ. However, montelukast had no effect on normal mice. These results suggest that montelukast improves memory impairment and inhibits neuroinflammation and apoptosis in mice exposed to STZ."

According to the news editors, the research concluded: "Montelukast may provide a novel strategy for treating or preventing AD."

For more information on this research see: Montelukast ameliorates streptozotocin-induced cognitive impairment and neurotoxicity in mice. *Neurotoxicology*, 2016;57(2):214-222. *Neurotoxicology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Catheterization

Studies Conducted at Columbia College on Catheterization Recently Reported (Radial Artery Occlusion After Cardiac Catheterization: Significance, Risk Factors, and Management)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Catheterization have been presented. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Multiple modifiable risk factors have been proposed to decrease the likelihood of developing radial artery occlusion (RAO) in patients who undergo trans radial (TR) catheterization. RAO, the most significant complication for these patients, however, remains poorly identified and under diagnosed owing to its clinical quiescence and lack of clinical guidelines for systematic evaluation of radial artery patency."

The news correspondents obtained a quote from the research from Columbia College, "Currently, only best practices are available. As TR catheterization is becoming more widely adopted across the United States it has become more important to develop concrete strategies for identifying modifiable risk factors, high-risk patients, and better understanding the mechanisms to adequately approach treatment of RAO."

According to the news reporters, the research concluded: "We reviewed the contemporary literature regarding RAO and TR catheterization to provide a simplified method for discerning identifiable risk factors, high-risk groups, and management of RAO after TR catheterization."

Our news journalists report that additional information may be obtained by contacting R. Goswami, Columbia Coll Phys & Surg, Stamford Hosp, New York, NY 10032, United States. Additional authors for this research include C.S. Oliphant, H. Youssef, M. Morsy and R.N. Khouzam.

**Hematologic Diseases and Conditions - Anemia**

**Studies Conducted at Department of Geriatrics on Anemia Recently Reported (Prevalence and predictive importance of anemia in Swedish nursing home residents - a longitudinal study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematologic Diseases and Conditions - Anemia is now available. According to news reporting from Jonkoping, Sweden, by NewsRx journalists, research stated, "Anemia is common in elderly people and especially in nursing home residents. Few studies have been performed on the consequences of anemia in a nursing home population."

The news correspondents obtained a quote from the research from the Department of Geriatrics, "This study explored the prevalence of anemia in nursing homes in Sweden, including risk factors and mortality associated with anemia or hemoglobin (Hb) decline. Three hundred ninety patients from 12 nursing homes were included during 2008-2011. Information about medication, blood samples, questionnaire responses and information about physical and social activities was recorded. The baseline characteristics of the patients were compared for subjects with and without anemia. Vital status was ascertained during the following 7 years from baseline to compare the survival. Hb levels <120 g/L in women and <130 g/L in men were used to define anemia. For 220 of the subjects Hb change during one year was registered and the quartiles in Hb change were compared in terms of baseline characteristics and mortality. The prevalence of anemia at baseline was 52% among men and 32% among women. The men with anemia had a two-year mortality significantly higher (61%) than the men without anemia (29%, p = 0.001) but there was no statistical difference in two-year survival in women. In anemic men there was a higher mortality (Hazard Ratio = 1.58) during a total follow-up period of up to 7 years after adjustment for age, increased B-type natriuretic peptide (BNP) and decreased estimated Glomerular Filtration Rate (eGFR). Among men, but not women, we found baseline correlations between anemia and elevated BNP (>100 ng/L) and severely reduced eGFR (<30 ml/min). When the lowest quartile of Hb change (decline >9 g/L) was compared with the highest (improvement >6 g/L) the mortality was higher in the lowest quartile (p = 0.03). Anemia is common in nursing home residents in Sweden, especially among men for whom it is related to higher mortality. A rapid Hb drop is associated with higher mortality."

According to the news reporters, the research concluded: "Regardless of earlier Hb values, monitoring Hb regularly in a nursing home population seems important for catching rapid Hb decline correlated with higher mortality."

Our news journalists report that additional information may be obtained by contacting B. Westerlind, Cty Hosp Ryhov, Dept. of Geriatr, Jonkoping, Region Jonkopin, Sweden. Additional authors for this research include C.J. Ostgren, S. Molstad and P. Midlov.

Heart Disorders and Diseases - Atrial Fibrillation

Studies Conducted at Division of Cardiology on Atrial Fibrillation Recently Reported (The Right to Left Atrial Volume Ratio Predicts Outcomes after Circumferential Pulmonary Vein Isolation of Longstanding Persistent Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news originating from Maebashi, Japan, by NewsRx correspondents, research stated, "We aimed to identify the predictors of clinical outcomes after circumferential pulmonary vein isolation (CPVI) without any substrate modification for longstanding persistent atrial fibrillation (LSP-AF). This study retrospectively analyzed 70 consecutive LSP-AF patients who underwent an initial CPVI and were followed-up for more than 1 year."

Our news journalists obtained a quote from the research from the Division of Cardiology, "The right and left atrial volumes indexed to the body surface areas (right atrial volume index [RAVI] and left atrial volume index [LAVI]) were determined by preacquired contrast-enhanced computed tomography (CT). The % RAVI/LAVI was obtained as 100 x RAVI/LAVI. During a median follow-up period of 15 months (interquartile range, 13-19 months), 21 patients (30%) had arrhythmia recurrences after the CPVI. Antiarrhythmic drugs were continued in 34 patients (48%). In the Cox proportional hazard model, the % RAVI/LAVI was a significant positive predictor of arrhythmia recurrences (hazard ratio, 1.048; P = 0.039). A receiver-operating characteristic analysis demonstrated that at an optimal cutoff of 100.1 for the % RAVI/LAVI, the sensitivity and specificity for predicting arrhythmia recurrences were 85.7% and 71.4%, respectively. The Kaplan-Meier analysis showed that arrhythmia recurrences were less frequent in patients with a % RAVI/LAVI of <100.1 than in those with a % RAVI/LAVI of >= 100.1 (P < 0.0001), and the arrhythmia-free survival rate at 12 months was 89.7% and 45.2%, respectively. The ratio of the RAVI to LAVI on CT may be a useful predictor of clinical outcomes after CPVI of LSP-AF."

According to the news editors, the research concluded: "LSP-AF patients with a less predominant right atrial enlargement relative to the left atrial enlargement may be good candidates for successful treatment with CPVI alone as the ablation strategy for LSP-AF."

For more information on this research see: The Right to Left Atrial Volume Ratio Predicts Outcomes after Circumferential Pulmonary Vein Isolation of Longstanding Persistent Atrial Fibrillation. PACE-Pacing and Clinical Electrophysiology, 2016;39(11):1181-1190. PACE-Pacing and Clinical Electrophysiology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news correspondents report that additional information may be obtained from K. Nakamura, Gunma Prefectural Cardiovasc Center, Div Cardiol, Maebashi, Gumma 3710004, Japan. Additional authors for this research include K. Nakamura, S. Naito, K. Minami, K. Koyama, E. Yamashita, K. Kumagai and S. Oshima.
Studies Conducted at Erasmus University Medical Center on Alzheimer Disease Recently Reported (From ARB to ARNI in Cardiovascular Control)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting from Rotterdam, Netherlands, by NewsRx journalists, research stated, "Coexistence of hypertension, diabetes mellitus and chronic kidney disease synergistically aggravates the risk of cardiovascular and renal morbidity and mortality. These high-risk, multi-morbid patient populations benefit less from currently available anti-hypertensive treatment."

The news correspondents obtained a quote from the research from Erasmus University Medical Center, "Simultaneous angiotensin II type 1 receptor blockade and neprilysin inhibition ('ARNI') with valsartan/sacubitril (LCZ696) might potentiate the beneficial effects of renin-angiotensin-aldosterone inhibition by reinforcing its endogenous counterbalance, the natriuretic peptide system. This review discusses effects obtained with this approach in animals and humans. In animal models of hypertension, either alone or in combination with myocardial infarction or diabetes, ARNI consistently reduced heart weight and cardiac fibrosis in a blood pressure-independent manner. Additionally, LCZ696 treatment reduced proteinuria, focal segmental glomerulosclerosis and retinopathy, thus simultaneously demonstrating favourable effects on microvascular complications. These results were confirmed in patient populations. Besides blood pressure reductions in hypertensive patients and greatly improved (cardiovascular) mortality in heart failure patients, ventricular wall stress and albuminuria were reduced particularly in diabetic patients. The exact underlying mechanism remains unknown, but may involve improved renal haemodynamics and reduced glomerulosclerosis, e.g. related to a rise in natriuretic peptide levels. However, the assays of these peptides are hampered by methodological artefacts. Moreover, since sacubitrilat is largely renally cleared, drug accumulation may occur in patients with impaired renal function and thus hypotension is a potential side effect in patients with chronic kidney disease. Further caution is warranted since neprilysin also degrades endothelin-1 and amyloid beta in animal models."

According to the news reporters, the research concluded: "Accumulation of the latter may increase the risk of Alzheimer's disease."

For more information on this research see: From ARB to ARNI in Cardiovascular Control. *Current Hypertension Reports*, 2016;18(12):11-20. *Current Hypertension Reports* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Current Hypertension Reports - www.springerlink.com/content/1522-6417/)

Our news journalists report that additional information may be obtained by contacting A.H.J. Danser, Erasmus MC, Div Pharmacol & Vasc Med, Dept. of Internal Med, Rotterdam, Netherlands. Additional authors for this research include L.C.W. Roksnoer, E.J.
Kidney Diseases and Conditions - Chronic Kidney

Studies Conducted at General Hospital on Chronic Kidney Disease Recently Reported (Effects of Cardiovascular Events on End-Stage Renal Disease and Mortality in Patients With Chronic Kidney Disease Before Dialysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Kidney Diseases and Conditions - Chronic Kidney Disease have been presented. According to news reporting from Saitama, Japan, by NewsRx journalists, research stated, "Cardiovascular events (CVEs) are major complications in patients with chronic kidney disease (CKD). However, few studies have investigated the effects of CVEs on end-stage renal disease (ESRD) and mortality of pre-dialysis patients."

The news correspondents obtained a quote from the research from General Hospital, "We followed 377 CKD patients who were at stage (≥)G3 at first clinic visit in the Shuwa General Hospital between April 2005 and July 2014. After taking baseline patient data, we evaluated renal survival rates and all-cause and CVE-related mortality in patients with CVEs [(+)CVEs] and without CVEs [(-)CVEs]. A total of 99 CVEs occurred in 93 study patients (57.0% cardiac events, 43.0% cerebrovascular events, and 6.5% peripheral artery disease events). During the study period, 127 patients reached ESRD over a median of 4.51 years' follow-up. Kaplan-Meier analysis found longer renal survival rates in the (-)CVEs group compared with the (+)CVEs group. Forty patients died during the study period over a median of 5.43 years' follow-up. Survival rates for all-cause and CVE-related mortality of (-)CVEs patients were higher than in (+)CVEs patients. After adjustment for sex, age, current smoking, blood pressure, diabetes, estimated glomerular filtration rate, low-density lipoprotein cholesterol, high-density lipoprotein cholesterol, left ventricular hypertrophy, body mass index, albumin, hemoglobin, calcium, phosphate, C-reactive protein, and spot urine protein, the occurrence of CVEs was still a significant risk factor for ESRD (HR 1.516, p=0.017) and all-cause mortality (HR 7.871, p<0.001)."

According to the news reporters, the research concluded: "Our findings suggest that the occurrence of CVEs is a potent risk factor for ESRD and mortality in CKD patients before dialysis."

Our news journalists report that additional information may be obtained by
contacting M. Kuwahara, Dept. of Nephrology, Shuuwa General Hospital, Kasukabe, Saitama, Japan. Additional authors for this research include E. Takehara, Y. Sasaki, H. Azetsu, K. Kusaka, S. Shikuma and W. Akita.

**Immune System**

Studiees Conducted at Harvard School of Medicine on Immune System Recently Reported (IL-33 promotes food anaphylaxis in epicutaneously sensitized mice by targeting mast cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System are presented in a new report. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Cutaneous exposure to food allergens predisposes to food allergy, which is commonly associated with atopic dermatitis (AD). Levels of the epithelial cytokine IL-33 are increased in skin lesions and serum of patients with AD."

The news reporters obtained a quote from the research from the Harvard School of Medicine, "Mast cells (MCs) play a critical role in food-induced anaphylaxis and express the IL-33 receptor ST2. The role of IL-33 in patients with MC-dependent food anaphylaxis is unknown. We sought to determine the role and mechanism of action of IL-33 in patients with food-induced anaphylaxis in a model of IgE-dependent food anaphylaxis elicited by oral challenge of epicutaneously sensitized mice. Wild-type, ST2-deficient, and MC-deficient Kit (W-sh/W-sh) mice were epicutaneously sensitized with ovalbumin (OVA) and then challenged orally with OVA. Body temperature was measured by means of telemetry, Il33 mRNA by means of quantitative PCR, and IL-33, OVA-specific IgE, and mouse mast cell protease 1 by means of ELISA. Bone marrow-derived mast cell (BMMC) degranulation was assessed by using flow cytometry. Il33 mRNA expression was upregulated in tape-stripped mouse skin and scratched human skin. Tape stripping caused local and systemic IL-33 release in mice. ST2 deficiency, as well as ST2 blockade before oral challenge, significantly reduced the severity of oral anaphylaxis without affecting the systemic T(H)2 response to the allergen. Oral anaphylaxis was abrogated in Kit(W-sh/W-sh) mice and restored by means of reconstitution with wildtype but not ST2-deficient BMMCs. IL-33 significantly enhanced IgE-mediated degranulation of BMMCs in vitro. IL-33 is released after mechanical skin injury, enhances IgE-mediated MC degranulation, and promotes oral anaphylaxis after epicutaneous sensitization by targeting MCs."

According to the news reporters, the research concluded: "IL-33 neutralization might be useful in treating food-induced anaphylaxis in patients with AD."

For more information on this research see: IL-33 promotes food anaphylaxis in epicutaneously sensitized mice by targeting mast cells. *Journal of Allergy and Clinical
Studies Conducted at Indiana University on Bacteriophages Recently Reported (Virus Matryoshka: A Bacteriophage Particle-Guided Molecular Assembly Approach to a Monodisperse Model of the Immature Human Immunodeficiency Virus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Bacteriophages have been published. According to news reporting originating from Bloomington, Indiana, by NewsRx correspondents, research stated, "Immature human immunodeficiency virus type 1 (HIV-1) is approximately spherical, but is constructed from a hexagonal lattice of the Gag protein. As a hexagonal lattice is necessarily flat, the local symmetry cannot be maintained throughout the structure."

Financial support for this research came from Human Frontier Science Program.

Our news editors obtained a quote from the research from Indiana University, "This geometrical frustration presumably results in bending stress. In natural particles, the stress is relieved by incorporation of packing defects, but the magnitude of this stress and its significance for the particles is not known. In order to control this stress, we have now assembled the Gag protein on a quasi-spherical template derived from bacteriophage P22. This template is monodisperse in size and electron-transparent, enabling the use of cryo-electron microscopy in structural studies. These templated assemblies are far less polydisperse than any previously described virus-like particles (and, while constructed according to the same lattice as natural particles, contain almost no packing defects). This system gives us the ability to study the relationship between packing defects, curvature and elastic energy, and thermodynamic stability. As Gag is bound to the P22 template by single-stranded DNA, treatment of the particles with DNase enabled us to determine the intrinsic radius of curvature of a Gag lattice, unconstrained by DNA or a template. We found that this intrinsic radius is far larger than that of a virion or P22-templated particle."

According to the news editors, the research concluded: "Gag is under elastic strain in
a particle; this has important implications for the kinetics of shell growth, the stability of the shell, and the type of defects it will assume as it grows."

The news editors report that additional information may be obtained by contacting B. Dragnea, Indiana University, Dept. of Chem, Bloomington, IN 47405, United States. Additional authors for this research include L. He, A. Malyutin, S.A.K. Datta, A. Rein, K.M. Bond, M.F. Jarrold, A. Spilotros, D. Svergun, T. Douglas and B. Dragnea.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/smll.201601712. This DOI is a link to an online electronic document that is either free or for purchase.

Health and Medicine - Cardiovascular...

Studies Conducted at Johns Hopkins University on Cardiovascular Electrophysiology Recently Reported (Insights from Novel Noninvasive CT and ECG Imaging Modalities on Electromechanical Myocardial Activation in a Canine Model of Ischemic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Cardiovascular Electrophysiology. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "CT ECGI Electromechanical Imaging. The interplay between electrical activation and mechanical contraction patterns is hypothesized to be central to reduced effectiveness of cardiac resynchronization therapy (CRT)."

Our news journalists obtained a quote from the research from Johns Hopkins University, "Furthermore, complex scar substrates render CRT less effective. We used novel cardiac computed tomography (CT) and noninvasive electrocardiographic imaging (ECGI) techniques in an ischemic dyssynchronous heart failure (DHF) animal model to evaluate electrical and mechanical coupling of cardiac function, tissue viability, and venous accessibility of target pacing regions. Ischemic DHF was induced in 6 dogs using coronary occlusion, left bundle ablation and tachy RV pacing. Full body ECG was recorded during native rhythm followed by volumetric first-pass and delayed enhancement CT. Regional electrical activation were computed and overlaid with segmented venous anatomy and scar regions. Reconstructed electrical activation maps show consistency with LBBB starting on the RV and spreading in a 'U-shaped' pattern to the LV. Previously reported lines of slow conduction are seen parall showeel to anterior or inferior interventricular grooves. Mechanical contractiond large septal to lateral wall delay (80 +/- 38 milliseconds vs. 123 +/- 31 milliseconds, P = 0.0001). All animals showed electromechanical correlation except dog 5 with largest scar burden. Electromechanical
decoupling was largest in basal lateral LV segments."

According to the news editors, the research concluded: "We demonstrated a promising application of CT in combination with ECGI to gain insight into electromechanical function in ischemic dyssynchronous heart failure that can provide useful information to study regional substrate of CRT candidates."

The news correspondents report that additional information may be obtained from A.C. Lardo, Johns Hopkins University, Dept. of Biomed Engn, Baltimore, MD, United States. Additional authors for this research include K.H. Schuleri, D.D. Spragg, B.M. Horacek, R.D. Berger, H.R. Halperin and A.C. Lardo.

**Gastroenterology - Gastrectomy**

**Studies Conducted at Karolinska University Hospital on Gastrectomy Recently Reported (The surgical management of esophago-gastric junctional cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gastroenterology - Gastrectomy. According to news reporting from Stockholm, Sweden, by NewsRx journalists, research stated, "The best available surgical strategy in the treatment of resectable esophago-gastric junctional (EGJ) cancer is a controversial topic. In this review we evaluate the current literature and scientific evidence examining the surgical treatment of locally advanced EGJ cancer by comparing esophagectomy with gastrectomy, transhiatal with transthoracic esophagectomy, minimally invasive with open esophagectomy, and less extensive with more extensive lymphadenectomy."

Funders for this research include Swedish Research Council, Swedish Cancer Society.

The news correspondents obtained a quote from the research from Karolinska University Hospital. "We also assess endoscopic procedures increasingly used for early EGJ cancer. The current evidence does not favor any of the techniques over the others in terms of oncological outcomes. Health-related quality of life may be better following gastrectomy compared to esophagectomy. Minimally invasive procedures might be less prone to surgical complications. Endoscopic techniques are safe and effective alternatives for early-stage EGJ cancer in the short term, but surgical treatment is the mainstay in fit patients due to the risk of lymph node metastasis. Any benefit of lymphadenectomy extending beyond local or regional nodes is uncertain."
According to the news reporters, the research concluded: "This review demonstrates the great need for well-designed clinical studies to improve the knowledge in how to optimize and standardize the surgical treatment of EGJ cancer."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.suronc.2016.09.004. This DOI is a link to an online electronic document that is either free or for purchase.

**Studies Conducted at Keio University on Cubital Tunnel Syndrome Recently Reported (Cigarette Smoking Is Associated With Cubital Tunnel Syndrome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nervous System Diseases and Conditions - Cubital Tunnel Syndrome have been presented. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "The aim of this study was to validate the potential association between cigarette smoking and cubital tunnel syndrome (CubTS). One hundred patients with CubTS were compared with 100 controls with ulnar abutment syndrome matched for age, gender, and body mass index."

The news correspondents obtained a quote from the research from Keio University, "The smoking status was compared between patients and controls using the sign test and the Wilcoxon signed rank test. Conditional logistic regression was used to calculate the association between CubTS and pack-years smoked. A significant association was found between increased pack-years smoked and CubTS. A significant difference in the number of never smokers and ever smokers was observed between the patients with CubTS and controls. The difference in mean pack-years in the patients and controls was highly significant. A dose-dependent association with pack-years was found between patients and controls."

According to the news reporters, the research concluded: "High cumulative cigarette smoking is associated with CubTS."

Our news journalists report that additional information may be obtained by contacting T. Suzuki, Keio University, Sch Med, Dept. of Orthopaed Surg, Shinjuku Ku, Tokyo, Japan. Additional authors for this research include T. Iwamoto, K. Ochi, K. Mito, T. Nakamura, K. Suzuki, H. Yamada and K. Sato.

Keywords for this news article include: Tokyo, Japan, Asia, Peripheral Nervous System Diseases and Conditions, Neuromuscular Diseases and Conditions, Ulnar Nerve Compression Syndromes, Cubital Tunnel Syndrome, Ulnar Neuropathies, Mononeuropathies, Keio University.

Heart Disorders and Diseases - Acute Coronary...

Studies Conducted at Kyorin University School of Medicine on Acute Coronary Syndrome Recently Reported (Barthel Index as a Predictor of 1-Year Mortality in Very Elderly Patients Who Underwent Percutaneous Coronary Intervention for Acute ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Acute Coronary Syndrome is now available. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Percutaneous coronary intervention (PCI) is safe and effective in very elderly patients, defined as those who are age (≥)85 years, with acute coronary syndrome (ACS). However, the prognostic factors remain unknown."

Our news journalists obtained a quote from the research from the Kyorin University School of Medicine, "The association between activities of daily living (ADL) and the prognosis after PCI has not yet been investigated. Better ADL is associated with better 1-year prognosis. This retrospective study included 91 consecutive very elderly patients with ACS. We calculated the Barthel Index (BI) as an indicator for ADL. Patients were classified into 2 groups according to BI: high BI (≥85) and low BI (<85). The BI was assessed both on admission (pre-BI) and at discharge (post-BI). In the 91 patients (mean age, 88.2 ± 3.0 years, 52% male), 1-year mortality was 33%. The Cox regression model demonstrated that low pre-BI was not a risk factor for 1-year mortality (hazard ratio: 0.73, 95% confidence interval [CI]: 0.30-1.78, p=0.490). However, post-BI was significantly associated with 1-year mortality (hazard ratio: 0.25, 95% CI: 0.11-0.57, p=0.001). The 1-year mortality of the high and the low post-BI group was estimated as 21% (95% CI: 12%-35%) and 62% (95% CI: 42%-82%), respectively. A 5-unit decrease in post-BI was related to a 1.10-fold increased risk for 1-year mortality (95% CI: 1.05-1.15, p<0.001)."

According to the news editors, the research concluded: "Activities of daily living at discharge, although not before admission, may be a useful predictor for 1-year mortality in very elderly patients undergoing PCI for ACS."

Our news journalists report that additional information may be obtained by
contacting S. Higuchi, Division of Cardiology, Dept. of Internal Medicine II, Kyorin University School of Medicine, Tokyo, Japan. Additional authors for this research include Y. Kabeya, K. Matsushita, H. Taguchi, H. Ishiguro, H. Kohshoh and H. Yoshino.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/clc.22497. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Asia, Tokyo, Japan, Surgery, Cardiology, Heart Disease, Rehabilitation, Myocardial Ischemia, Risk and Prevention, Acute Coronary Syndrome, Activities of Daily Living, Heart Disorders and Diseases, Vascular Diseases and Conditions, Percutaneous Coronary Intervention.

Oncology - Pancreatic Cancer

Studies Conducted at La Paz University Hospital on Pancreatic Cancer Recently Reported (Management of pancreatic cancer in the elderly)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Pancreatic Cancer have been published. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "Currently, pancreatic adenocarcinoma mainly occurs after 60 years of age, and its prognosis remains poor despite modest improvements in recent decades. The aging of the population will result in a rise in the incidence of pancreatic adenocarcinoma within the next years."

The news reporters obtained a quote from the research from La Paz University Hospital, "Thus, the management of pancreatic cancer in the elderly population is gaining increasing relevance. Older cancer patients represent a heterogeneous group with different biological, functional and psychosocial characteristics that can modify the usual management of this disease, including pharmacokinetic and pharmacodynamic changes, polypharmacy, performance status, comorbidities and organ dysfunction. However, the biological age, not the chronological age, of the patient should be the limiting factor in determining the most appropriate treatment for these patients. Unfortunately, despite the increased incidence of this pathology in older patients, there is an underrepresentation of these patients in clinical trials, and the management of older patients is thus determined by extrapolation from the results of studies performed in younger patients."

According to the news reporters, the research concluded: "In this review, the special characteristics of the elderly, the multidisciplinary management of localized and advanced ductal adenocarcinoma of the pancreas and the most recent advances in the management of this condition will be discussed, focusing on surgery, chemotherapy, radiation and palliative care."

Our news correspondents report that additional information may be obtained by contacting O. Higuera, Oliver Higuera, Ismael Ghanem, Jaime Feliu, Dept. of Medical Oncology, La Paz University Hospital, 28046 Madrid, Spain. Additional authors for this
Studies Conducted at Macquarie University on Mental Health Recently Reported (Screening for Mental Health Risk in High Schools: The Development of the Youth RADAR)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Mental Health have been presented. According to news reporting from Sydney, Australia, by NewsRx journalists, research stated, "Epidemiological studies indicate that as many as 1 in 5 young people will develop a mental health problem in any given year. Early detection and intervention are needed to reduce the impact that these conditions have both for the young person and for the communities in which they live."

The news correspondents obtained a quote from the research from Macquarie University, "This study reports the development of a new instrument aimed at helping identify students at risk of developing mental health difficulties. Rather than asking about the presence of symptoms of mental health conditions, the RADAR screening tool assesses a student's balance of risk and protective factors associated with the development of mental health problems. The RADAR was evaluated with a sample of 838 participants in high school Years 7-12. A robust internal factor structure was revealed using exploratory and confirmatory factor analysis. Internal consistency was satisfactory for each subscale, ranging from .73 to .90 while the reliability for the total scale was .91. Retest stability, measured over a 12 month period, was found to be strong (r = .72). Convergent validity was demonstrated with reference to standard measures of depression and behavioral problems."

According to the news reporters, the research concluded: "It is concluded that the RADAR is a promising measure for helping mental health professionals and educators decide which students may be at risk of developing mental health problems."

For more information on this research see: Screening for Mental Health Risk in High Schools: The Development of the Youth RADAR. Psychological Assessment, 2016;28 (10):1220-1231. Psychological Assessment can be contacted at: Amer Psychological Assoc, 750 First St NE, Washington, DC 20002-4242, USA. Studies Conducted at Marist College on Caenorhabditis elegans Recently Reported [CRISPR Technology Reveals RAD(51)-ical Mechanisms of Repair in Roundworms: An Educational Primer for Use with "Promotion of Homologous Recombination by SWS-1 in Complex with RAD-51 Paralogs in Caenorhabditis elegans."]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Caenorhabditis elegans is now available. According to news reporting out of Poughkeepsie, New York, by NewsRx editors, research stated, "The mechanisms cells use to maintain genetic fidelity via DNA repair and the accuracy of these processes have garnered interest from scientists engaged in basic research to clinicians seeking improved treatment for cancer patients. Despite the continued advances, many details of DNA repair are still incompletely understood."

Our news journalists obtained a quote from the research from Marist College, "In addition, the inherent complexity of DNA repair processes, even at the most fundamental level, makes it a challenging topic. This primer is meant to assist both educators and students in using a recent paper, Promotion of homologous recombination by SWS-1 in complex with RAD-51 paralogs in Caenorhabditis elegans, to understand mechanisms of DNA repair."

According to the news editors, the research concluded: "The goals of this primer are to highlight and clarify several key techniques utilized, with special emphasis on the clustered, regularly interspaced, short palindromic repeats technique and the ways in which it has revolutionized genetics research, as well as to provide questions for deeper in-class discussion."

For more information on this research see: CRISPR Technology Reveals RAD(51)-ical Mechanisms of Repair in Roundworms: An Educational Primer for Use with "Promotion of Homologous Recombination by SWS-1 in Complex with RAD-51 Paralogs in Caenorhabditis elegans." Genetics, 2016;204(3):883-891. Genetics can be contacted at: Genetics Society America, 9650 Rockville Ave, Bethesda, MD 20814, USA. Oncology - Small Cell Lung Cancer

Studies Conducted at Massachusetts General Hospital on Small Cell Lung Cancer Recently Reported (Clinical Activity of Alectinib in Advanced RET-Rearranged Non-Small Cell Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Small Cell Lung Cancer. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Chromosomal rearrangements involving rearranged during transfection gene (RET) occur in 1% to 2% of NSCLCs and may confer sensitivity to rearranged during transfection (RET) inhibitors. Alectinib is an anaplastic lymphoma kinase tyrosine kinase inhibitor (TKI) that also has anti-RET activity in vitro."

Our news editors obtained a quote from the research from Massachusetts General Hospital, "The clinical activity of alectinib in patients with RET-rearranged NSCLC has not yet been reported. We have described four patients with advanced RET-rearranged NSCLC who were treated with alectinib (600 mg twice daily [n = 3] or 900 mg twice daily [n = 1]) as part of single-patient compassionate use protocols or off label use of the commercially available drug. Four patients with metastatic RET-rearranged NSCLC were identified. Three of the four had received prior RET TKIs, including caboazantinib and experimental RET inhibitors. In total, we observed two (50%) objective radiographic responses after treatment with alectinib (one confirmed and one unconfirmed), with durations of therapy of 6 months and more than 5 months (treatment ongoing), respectively. Notably, one of these two patients had his dose of alectinib escalated to 900 mg twice daily and had clinical improvement in central nervous system metastases. In addition, one patient (25%) experienced a best response of stable disease lasting approximately 6 weeks (the drug discontinued for toxicity). A fourth patient who was RET TKI-naive had primary progression while receiving alectinib. Alectinib demonstrated preliminary antitumor activity in patients with advanced RET-rearranged NSCLC, most of whom had received prior RET inhibitors. Larger prospective studies with longer follow-up are needed to assess the efficacy of alectinib in RET-rearranged NSCLC and other RET-driven malignancies."

According to the news editors, the research concluded: "In parallel, development of more selective, potent RET TKIs is warranted."

The news editors report that additional information may be obtained by contacting J.F. Gainor, Massachusetts General Hospital, Center Canc, Boston, MA, United States. Additional authors for this research include E. Kennedy, L.V. Sequist, P.K. Brastianos, K.E. Goodwin, S. Stevens, A.C. Wanat, L.L. Stober, S.R. Digumarthy, J.A. Engelman, A.T. Shaw and J.F. Gainor.

Enzymes and Coenzymes - Cholinesterases

Studies Conducted at Mayo Clinic on Cholinesterases Recently Reported (Physiological roles for butyrylcholinesterase: A BChE-ghrelin axis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Enzymes and Coenzymes - Cholinesterases is the subject of a report. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Butyrylcholinesterase (BChE) has long been regarded as an 'orphan enzyme' with no specific physiological role other than to metabolize exogenous bioactive esters in the diet or in medicines. Human beings with genetic mutations that eliminate all BChE activity appear completely normal, and BChE-knockout mice have been described as 'lacking a phenotype' except for faster weight gain on high-fat diets."

Funders for this research include National Institute on Drug Abuse, Mayo Foundation for Medical Research.

Our news editors obtained a quote from the research from Mayo Clinic, "However, our recent studies with viral gene transfer of BChE in mice reveal that BChE hydrolyzes the so-called 'hunger hormone,' ghrelin, at a rate which strongly affects the circulating levels of this peptide hormone. This action has important consequences for weight gain and fat metabolism. Surprisingly, it also impacts emotional behaviors such as aggression. Overexpression of BChE leads to low ghrelin levels in the blood stream and reduces aggression and social stress in mice. Under certain circumstances these combined effects contribute to increased life-span in group-housed animals."

According to the news editors, the research concluded: "These findings may generalize to humans, as recent clinical studies by multiple investigators indicate that, among patients with severe cardiovascular disease, longevity correlates with increasing levels of plasma BChE activity."

The news editors report that additional information may be obtained by contacting S. Brimijoin, Mayo Clinic, Dept. of Mol Pharmacol & Expt Therapeut, Rochester, MN 55905, United States. Additional authors for this research include V.P. Chen, Y.P. Pang, L. Geng and Y. Gao.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cbi.2016.02.013. This DOI is a link to an online electronic document that is either free or for purchase.

Studies Conducted at Medical College of Wisconsin on Medical Genetics Recently Reported (8q21.11 Microdeletion in Two Patients with Syndromic Peters Anomaly)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Genetics - Medical Genetics. According to news reporting originating in Milwaukee, Wisconsin, by NewsRx journalists, research stated, "Peters anomaly is a form of anterior segment dysgenesis characterized by central ocular opacity and corneo-lenticular adhesions. Isolated and syndromic Peters anomaly can be observed and demonstrate significant genetic heterogeneity."

Financial supporters for this research include National Institutes of Health awards, Children's Hospital of Wisconsin, National Institutes of Health, Clinical and Translational Science Award (CTSA) program.

The news reporters obtained a quote from the research from the Medical College of Wisconsin, "We report the identification of overlapping 8q21.11 deletions in two patients with syndromic Peters anomaly via whole exome sequencing and chromosomal microarray analyses. Microdeletions of 8q21.11 were recently reported in 10 patients with highly variable phenotypes involving craniofacial features, ptosis, intellectual disability, abnormalities of the hands/feet and other defects; sclerocornea and/or microphthalmia were reported in three cases. The two additional cases presented in this report expand the phenotypic spectrum of 8q21.11 microdeletions to include Peters anomaly (seen in both patients) and persistent primary dentition (seen in one patient with a larger deletion). The two novel deletions include the ZFHX4 and PEX2 genes, which were also affected in all three previous cases involving ocular anomalies. Screening of the remaining alleles of ZFHX4 and PEX2 did not identify any additional likely pathogenic variants in either patient, suggesting a dominant mechanism (haploinsufficiency) for the identified deletion."

According to the news reporters, the research concluded: "This report provides further insight into the phenotypes associated with 8q21.11 deletions and, for the first time, reports Peters anomaly as an additional ocular feature; screening for copy number variations of the 8q21.11 region should be considered in patients with Peters anomaly and related syndromic features."

Our news correspondents report that additional information may be obtained by contacting E.V. Semina, Medical College of Wisconsin, Dept. of Ophthalmol, Milwaukee, WI 53226, United States. Additional authors for this research include K.F. Schilter, E. Weh, L.M. Reis and E.V. Semina.

Respiratory Tract Diseases and Conditions – ...

Studies Conducted at Nanjing Medical University on Obstructive Sleep Apnea Recently Reported (Obstructive Sleep Apnea Increases the Perioperative Risk of Cardiac Valve Replacement Surgery: A Prospective Single-Center Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Sleep apnea is common in patients referred for cardiac valve replacement (CVR). We aimed to determine the association of obstructive sleep apnea (OSA) and central sleep apnea (CSA) with perioperative events in CVR surgery in patients with rheumatic valvular heart disease (RVHD)."

Our news editors obtained a quote from the research from Nanjing Medical University, "Between April 2010 and April 2014, 290 patients with RVHD undergoing CVR were screened for sleep apnea 1 to 7 days before CVR. Baseline medications, cardiac function, sleep parameters, perioperative events, and related risk factors were evaluated. OSA patients had longer duration of intensive care unit (ICU) stay and mechanical ventilation compared with no sleep- disordered breathing and CSA patients. Patients with CSA had a higher rate of pacemaker use and higher first dose of dobutamine in ICU. NYHA Class and the presence of OSA were independently associated with overall worsening of postoperative recovery (ICU stay >= 25 h). Age, NYHA class, and the presence of OSA were independently associated with postoperative respiratory insufficiency (mechanical ventilation = 20 h). Preoperative atrial fibrillation, pulmonary hypertension, and OSA were independently associated with postoperative pacemaker use. RVHD patients with OSA have an increased incidence of perioperative adverse events."

According to the news editors, the research concluded: "OSA was independently associated with overall postoperative recovery, respiratory insufficiency, and higher rate of postoperative pacemaker use, while CSA was not associated with postoperative events."

For more information on this research see: Obstructive Sleep Apnea Increases the Perioperative Risk of Cardiac Valve Replacement Surgery: A Prospective Single-Center Study. Journal of Clinical Sleep Medicine, 2016;12(10):1331-1337. Journal of Clinical Sleep Medicine can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

Lung Diseases and Conditions - Radiation Pneumonitis

Studies Conducted at Nanjing University on Radiation Pneumonitis Recently Reported (TGF-beta 1 rs1982073 polymorphism contributes to radiation pneumonitis in lung cancer patients: a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lung Diseases and Conditions - Radiation Pneumonitis have been presented. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "Transforming growth factor beta 1 (TGF-beta 1) polymorphism was associated with radiation pneumonitis (RP) susceptibility, but their results have been inconsistent. The PubMed and CNKI were searched for case-control studies published up to January 01, 2016 was Data were extracted and pooled odds ratios (OR) with 95% confidence intervals (CI) were calculated."

Our news journalists obtained a quote from the research from Nanjing University, "In this meta-analysis, we assessed eight publications involving 368 radiation pneumonitis cases and 855 controls of the association between TGF-beta 1 T869C (rs1982073) and G915C (rs1800471) polymorphism and RP susceptibility. Our analysis suggested that TGF-beta 1 T869C rs1982073 polymorphism was associated with lower RP risk for CT combined CC versus TT model (OR = 0.58, 95% CI = 0.43-0.77). However, for the G915C rs1800471 polymorphism, no association was found between the polymorphism and the susceptibility to RP in GC combined CC versus GG model (OR = 0.82, 95% CI = 0.50-1.35)."

According to the news editors, the research concluded: "These results from the meta-analysis suggest that T869C rs1982073 polymorphism of TGF-beta 1 may be associated with RP risk, and there may be no association between G915C polymorphism and RP risk."

Our news journalists report that additional information may be obtained by contacting X.X. Zhu, Nanjing University, Sch Med, Jinling Hosp, Dept. of Radiat Oncol, Nanjing, Jiangsu, People's Republic of China. Additional authors for this research include J.S. Shen, X.Q. Ji, B. Li and X.X. Zhu.

Keywords for this news article include: Jiangsu, People's Republic of China, Asia, Interstitial Lung Diseases and Conditions, Radiation Pneumonitis, Lung Neoplasms, Lung Cancer, Lung Injury, Oncology, Genetics, Nanjing University.
Congenital Abnormalities - Situs Inversus

Studies Conducted at National Center for Child Health and Development on Situs Inversus Recently Reported (Reno- and splenoportal anastomosis for a retransplant patient with situs inversus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Congenital Abnormalities - Situs Inversus. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "PV thrombosis following pediatric LT is a serious complication that may lead to graft loss. LDLT poses limitations with regard to the availability of vein grafts for complex PV reconstructions."

The news correspondents obtained a quote from the research from National Center for Child Health and Development, "We herein report a unique reconstruction of the PV inflow in a one-yr-old boy with situs inversus undergoing re-LDLT. The inflow was derived from the SPV and the RRV. A common channel was created utilizing a donor IMV and the recipient explant LHV as vascular conduits."

According to the news reporters, the research concluded: "With the application of innovative surgical reconstructions, pre-existing portomesenteric thrombosis may be amenable to re-LDLT in the pediatric population."

Our news journalists report that additional information may be obtained by contacting H. Uchida, Natl Center Child Hlth & Dev, Organ Transplantat Center, Tokyo, Japan. Additional authors for this research include A. Fukuda, K. Sasaki, T. Shigeta, Y. Hirata, H. Kanazawa, V.P. Mali, O. Miyazaki, S. Nosaka, S. Sakamoto and K. Mureo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/petr.12703. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Drug Delivery Systems

Studies Conducted at National Center for Scientific Research (CNRS) on Drug Delivery Systems Recently Reported (Self-Assembler Gold Nanoclusters for Bright Fluorescence Imaging and Enhanced Drug Delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Drug Delivery Systems is the subject of a report. According to news reporting originating from Orsay, France, by NewsRx correspondents, research stated, "Nanoparticles combining enhanced cellular drug delivery with efficient fluorescence detection are important tools for the development of theranostic agents. Here, we demonstrate this concept by a simple, fast, and robust protocol of cationic polymer-mediated gold nanocluster (Au NCs) self-assembly into nanoparticles (NPs) of ca. 120 nm diameter."

Funders for this research include Agence Nationale de la Recherche, Instituto de Salud Carlos III, European Regional Development Fund.

Our news editors obtained a quote from the research from National Center for Scientific Research (CNRS), "An extensive characterization of the monodisperse and positively charged NPs revealed pH-dependent swelling properties, strong fluorescence enhancement, and excellent colloidal and photostability in water, buffer, and culture medium. The versatility of the preparation is demonstrated by using different Au NC surface ligands and cationic polymers. Steady-state and time-resolved fluorescence measurements give insight into the aggregation-induced emission phenomenon (AIE) by tuning the Au NC interactions in the self-assembled nanoparticles using the pH-dependent swelling. In vitro studies in human monocytic cells indicate strongly enhanced uptake of the NPs compared to free Au NCs in endocytic compartments. The NPs keep their assembly structure with quite low cytotoxicity up to 500 mg Au/mL. Enhanced drug delivery is demonstrated by loading peptides or antibodies in the NPs using a one-pot synthesis."

According to the news editors, the research concluded: "Fluorescence microscopy and flow cytometry confirmed intracellular colocalization of the biomolecules and the NP carriers with a respective 1.7-fold and 6.5-fold enhanced cellular uptake of peptides and antibodies compared to the free biomolecules."

The news editors report that additional information may be obtained by contacting A. Yahia-Ammar, NanoBioPhotonics, Institut d'Electronique Fondamentale, Universite Paris-Saclay, Universite Paris-Sud, CNRS, 91400 Orsay, France. Additional authors for this research include D. Sierra, F. Merola, N. Hildebrandt and X. Le Guevel.

Neurodegenerative Diseases and Conditions – ...

Studies Conducted at National University Hospital on Huntington Disease Recently Reported (Identification of Novel Microsatellite Markers < 1 Mb from the HTT CAG Repeat and Development of a Single-Tube Tridecaplex PCR Panel of Highly Polymorphic …)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Huntington Disease. According to news reporting originating in Singapore, Singapore, by NewsRx journalists, research stated, "Preimplantation genetic diagnosis (PGD) of Huntington disease (HD) generally employs linkage analysis of flanking microsatellite markers to complement direct mutation testing, as well as for exclusion testing. Thus far, only 10 linked markers have been developed for use in HD PGD, with a maximum of 3 markers coamplified successfully."

The news reporters obtained a quote from the research from National University Hospital, "We aimed to develop a single-tube multiplex PCR panel of highly polymorphic markers to simplify HD PGD. An in silico search was performed to identify all markers within 1 Mb flanking the huntingtin (HTT) gene. Selected markers were optimized in a single-tube PCR panel, and their polymorphism indices were determined in 2 populations. The panel was tested on 63 single cells to validate its utility in PGD. We identified 102 markers in silico, of which 56 satisfied the selection criteria. After initial testing, 12 markers with potentially high heterozygosity were optimized into a single-tube PCR panel together with a 13th more distally located marker. Analysis of DNA from 183 Chinese and Caucasian individuals revealed high polymorphism indices for all markers (polymorphism information content > 0.5), with observed heterozygosities ranging from 0.5-0.92. All individuals were heterozygous for at least 5 markers, with 99.5% of individuals heterozygous for at least 2 markers upstream and downstream of the HTT CAG repeat."

According to the news reporters, the research concluded: "The tridecaplex marker assay amplified reliably from single cells either directly or after whole genome amplification, thus validating its standalone use in HD exclusion PGD or as a complement to HTT CAG repeat expansion-mutation detection."

Our news correspondents report that additional information may be obtained by contacting S.S. Chong, Natl Univ Hlth Syst, National University Hospital, Clin Cytogenet Serv, Dept. of Lab Med, Singapore, Singapore. Additional authors for this research include M. Chen, C.G. Lee and S.S. Chong.

**Science**

Studies Conducted at Niigata University Graduate School of Medical and Dental Science on Science Recently Reported (Novel kinase fusion transcripts found in endometrial cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science have been published. According to news reporting out of Niigata, Japan, by NewsRx editors, research stated, "Recent advances in RNA-sequencing technology have enabled the discovery of gene fusion transcripts in the transcriptome of cancer cells. However, it remains difficult to differentiate the therapeutically targetable fusions from passenger events."

Our news journalists obtained a quote from the research from the Niigata University Graduate School of Medical and Dental Science, "We have analyzed RNA-sequencing data and DNA copy number data from 25 endometrial cancer cell lines to identify potential therapeutically targetable fusion transcripts, and have identified 124 high-confidence fusion transcripts, of which 69% are associated with gene amplifications. As targetable fusion candidates, we focused on three in-frame kinase fusion transcripts that retain a kinase domain (CPQ-PRKDC, CAPZA2-MET, and VGLL4-PRKG1). We detected only CPQ-PRKDC fusion transcript in three of 122 primary endometrial cancer tissues. Cell proliferation of the fusion-positive cell line was inhibited by knocking down the expression of wild-type PRKDC but not by blocking the CPQ-PRKDC fusion transcript expression. Quantitative real-time RT-PCR demonstrated that the expression of the CPQ-PRKDC fusion transcript was significantly lower than that of wild-type PRKDC, corresponding to a low transcript allele fraction of this fusion, based on RNA-sequencing read counts. In endometrial cancers, the CPQ-PRKDC fusion transcript may be a passenger aberration related to gene amplification."

According to the news editors, the research concluded: "Our findings suggest that transcript allele fraction is a useful predictor to find bona-fide therapeutic-targetable fusion transcripts."

For more information on this research see: Novel kinase fusion transcripts found in endometrial cancer. *Scientific Reports*, 2015;5():18657. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting R. Tamura, Dept. of Obstetrics and Gynecology, Niigata University Graduate School of Medical and Dental Sciences, Niigata, Japan. Additional authors for this research include K. Yoshihara, K. Yamawaki, K. Suda, T. Ishiguro, S. Adachi, S. Okuda, I. Inoue, R.G. Verhaak and T. Enomoto.

Studies Conducted at Qingdao University on Cardiovascular Diseases Recently Reported (Pinoresinol Diglucoside Alleviates oxLDL-Induced Dysfunction in Human Umbilical Vein Endothelial Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases is the subject of a report. According to news reporting originating in Shandong, People's Republic of China, by NewsRx journalists, research stated, "Atherosclerotic cardiovascular diseases are the leading causes of morbidity and mortality worldwide. Deposition of oxidized low-density lipoprotein (oxLDL) is one of the initiators and promoters of atherosclerosis."

The news reporters obtained a quote from the research from Qingdao University, "Eucommia lignans were shown to possess antihypertensive effects. This study aimed to investigate the effects of pinoresinol diglucoside (PD), a Eucommia lignan, on oxLDL-induced endothelial dysfunction. HUVECs were treated with oxLDL and/or PD followed by assessing radical oxygen species (ROS), apoptosis, nitrogen oxide (NO), malondialdehyde (MDA), and superoxide dismutase (SOD) activity with specific assays kits, mRNA levels with quantitative real-time polymerase chain reaction (PCR), and protein levels with western blot. PD abolished oxLDL-induced ROS and MDA production, apoptosis, upregulation of lectin-like oxidized LDL receptor-1 (LOX-1), intercellular Adhesion Molecule 1 (ICAM-1), and nuclear factor kappa-light-chain-enhancer of activated B-cells (NF-kappa B), and activation of p38MAPK (mitogen-activated protein kinases)/NF-kappa B signaling. Meanwhile, PD alleviated oxLDL-caused inhibition of SOD activity, eNOS expression, and NO production."

According to the news reporters, the research concluded: "These data demonstrated that PD was effective in protecting endothelial cells from oxLDL-caused injuries, which guarantees further investigation on the clinical benefits of PD on cardiovascular diseases."

For more information on this research see: Pinesinol Diglucoside Alleviates oxLDL-Induced Dysfunction in Human Umbilical Vein Endothelial Cells. Evidence-Based Complementary and Alternative Medicine, 2016();1-10. Oncology - Small Cell Lung Cancer

Studies Conducted at Research Center on Small Cell Lung Cancer Recently Reported (Immunotherapy for small-cell lung cancer: emerging evidence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Small Cell Lung Cancer. According to news originating from Grosshansdorf, Germany, by NewsRx correspondents, research stated, "Treatment for small-cell lung cancer (SCLC) has changed little over the past few decades; available therapies have failed to extend survival in advanced disease. In recent years, immunotherapy with treatments such as interferons, TNFs, vaccines and immune checkpoint inhibitors has advanced and shown promise in the treatment of several tumor types."

Our news journalists obtained a quote from the research from Research Center, "Immune checkpoint inhibitors such as ipilimumab, nivolumab, pembrolizumab, durvalumab, tremelimumab and ulocuplumab are at the forefront of immunotherapy and have achieved approvals for certain cancer types, including melanoma (ipilimumab, nivolumab and pembrolizumab), non-SCLC (nivolumab and pembrolizumab) and renal cell carcinoma (nivolumab). Clinical trials are investigating different immunotherapies in patients with other solid and hematologic malignancies, including SCLC."

According to the news editors, the research concluded: "We review emerging evidence supporting the use of immunotherapy in SCLC patients."

The news correspondents report that additional information may be obtained from M. Reck, Thoracic Oncology & Clinical Trial Departments, Lung Clinic, Airway Research Center North (ARCN), Members of the German Center for Lung Research (DZL), Grosshansdorf, Germany. Additional authors for this research include D. Heigener and N. Reinmuth.

Studies Conducted at Sapienza-University on Assisted Reproduction and Genetics Recently Reported (Freeze/thaw stress induces organelle remodeling and membrane recycling in cryopreserved human mature oocytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Genetics - Assisted Reproduction and Genetics is the subject of a report. According to news reporting from Rome, Italy, by NewsRx journalists, research stated, "Our aim was to evaluate the ultrastructure of human metaphase II oocytes subjected to slow freezing and fixed after thawing at different intervals during post-thaw rehydration. Samples were studied by light and transmission electron microscopy."

The news correspondents obtained a quote from the research from Sapienza-University, "We found that vacuolization was present in all cryopreserved oocytes, reaching a maximum in the intermediate stage of rehydration. Mitochondria-smooth endoplasmic reticulum (M-SER) aggregates decreased following thawing, particularly in the first and intermediate stages of rehydration, whereas mitochondria-vesicle (MV) complexes augmented in the same stages. At the end of rehydration, vacuoles and MV complexes both diminished and M-SER aggregates increased again. Cortical granules (CGs) were scarce in all cryopreserved oocytes, gradually diminishing as rehydration progressed. This study also shows that such a membrane remodeling is mainly represented by a dynamic process of transition between M-SER aggregates and MV complexes, both able of transforming into each other."

According to the news reporters, the research concluded: "Vacuoles and CG membranes may take part in the membrane recycling mechanism."

Our news journalists report that additional information may be obtained by contacting S.A. Nottola, Sapienza Univ, Dept. of Anat Histol Forens Med & Orthopaed, Rome, Italy. Additional authors for this research include E. Albani, G. Coticchio, M.G. Palmerini, C. Lorenzo, G. Scaravelli, A. Borini, P.E. Levi-Setti and G. Macchiarelli.

Mycobacterium Infections - Tuberculosis

Studies Conducted at School of Public Health on Tuberculosis Recently Reported (Stringent Response Factors PPX1 and PPK2 Play an Important Role in Mycobacterium tuberculosis Metabolism, Biofilm Formation, and Sensitivity to Isoniazid In Vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mycobacterium Infections - Tuberculosis. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Mycobacterium tuberculosis remains a global health threat largely due to the lengthy duration of curative antibiotic treatment, contributing to medical nonadherence and the emergence of drug resistance. This prolonged therapy is likely due to the presence of M. tuberculosis persisters, which exhibit antibiotic tolerance."

Financial support for this research came from HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID).

Our news journalists obtained a quote from the research from the School of Public Health, "Inorganic polyphosphate [poly(P)] is a key regulatory molecule in the M. tuberculosis stringent response mediating antibiotic tolerance. The polyphosphate kinase PPK1 is responsible for poly(P) synthesis in M. tuberculosis, while the exopolyphosphatases PPX1 and PPX2 and the GTP synthase PPK2 are responsible for poly(P) hydrolysis. In the present study, we show by liquid chromatography-tandem mass spectrometry that poly(P)-accumulating M. tuberculosis mutant strains deficient in ppx1 or ppk2 had significantly lower intracellular levels of glycerol-3-phosphate (G3P) and 1-deoxy-xylulose-5-phosphate. Real-time PCR revealed decreased expression of genes in the G3P synthesis pathway in each mutant. The ppx1-deficient mutant also showed a significant accumulation of metabolites in the tricarboxylic acid cycle, as well as altered arginine and NADH metabolism. Each poly(P)-accumulating strain showed defective biofilm formation, while deficiency of ppk2 was associated with increased sensitivity to plumbagin and meropenem and deficiency of ppx1 led to enhanced susceptibility to clofazimine. A DNA vaccine expressing ppx1 and ppk2, together with two other members of the M. tuberculosis stringent response, M. tuberculosis rel and sigE, did not show protective activity against aerosol challenge with M. tuberculosis, but vaccine-induced immunity enhanced the killing activity of isoniazid in a murine model of chronic tuberculosis."

According to the news editors, the research concluded: "In summary, poly(P)-regulating factors of the M. tuberculosis stringent response play an important role in M. tuberculosis metabolism, biofilm formation, and antibiotic sensitivity in vivo."

For more information on this research see: Stringent Response Factors PPX1 and PPK2 Play an Important Role in Mycobacterium tuberculosis Metabolism, Biofilm Formation, and Sensitivity to Isoniazid In Vivo. Antimicrobial Agents and Chemotherapy, 2016;60 (11):6460-6470. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Studies Conducted at Shandong University on Gastric Cancer Recently Reported (NTRK2 is an oncogene and associated with microRNA-22 regulation in human gastric cancer cell lines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gastric Cancer is the subject of a report. According to news reporting originating from Jinan, People's Republic of China, by NewsRx correspondents, research stated, "In this study, we examined the roles of neurotrophic tyrosine kinase receptor type 2 (NTRK2) gene in regulating in vitro proliferation and invasion in human gastric cancer. Gene expression of NTRK2 was compared between noncarcinoma gastric epithelial cells and gastric cancer (GC) cells by quantitative RT-PCR (qRT-PCR)."

Our news editors obtained a quote from the research from Shandong University, "NTRK2 was either downregulated or upregulated in MKN-28 and SNU-719 cells. The effect of NTRK2 downregulation or upregulation on GC in vitro development was analyzed by qRT-PCR, western blot, proliferation assay, and invasion assay, respectively. The upstream regulator of NTRK2, microRNA-22 (miR-22), was evaluated by dual-luciferase assay. MiR-22 was then upregulated in MKN-28 and SNU-719 cells to examine its regulation on NTRK2 and its encoded protein, tyrosine kinase receptor B (TrkB). In miR-22-upregulated MKN-28 and SNU-719 cells, NTRK2 was further overexpressed to evaluate functional interaction between miR-22 and NTRK2 in GC. NTRK2 was aberrantly upregulated in GC cell lines than in normal gastric cells. In MKN-28 and SNU-719 cells, NTRK2 downregulation inhibited whereas NTRK2 upregulation promoted GC proliferation and invasion in vitro. MiR-22 was verified to be an inverse upstream regulator of NTRK2. In miR-22-upregulated MKN-28 and SNU-719 cells, NTRK2 overexpression partially reversed the miR-22-induced inhibition on cancer proliferation and invasion."

According to the news editors, the research concluded: "NTRK2 is an oncogene and reversely associated with miR-22 in regulating in vitro cancer development in GC."

For more information on this research see: NTRK2 is an oncogene and associated with microRNA-22 regulation in human gastric cancer cell lines. Tumor Biology. 2016;37 (11):15115-15123. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Oncology - Colon Cancer

Studies Conducted at Shanghai University of Traditional Chinese Medicine on Colon Cancer Recently Reported (Evodiamine Suppresses ABCG2 Mediated Drug Resistance by Inhibiting p50/p65 NF-kB Pathway in Colorectal Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Evodiamine (Evo), extracted from the Chinese herbal medicine Evodia rutaecarpa, has cytotoxic effects on different types of human cancer cells. However, its effects on drug resistance and their molecular mechanism and therapeutic target in colorectal cancer are not well understood."

Funders for this research include National Natural Science Foundation of China, Program of Shanghai Municipal Education Commission, Shanghai Municipal Health Bureau, Program of Science and Technology, Program of Shanghai Clinical TCM Laboratory.

Our news editors obtained a quote from the research from the Shanghai University of Traditional Chinese Medicine, "In the present study, we observed that Evo inhibited cell growth and induced apoptosis in dose-and time-dependent manner in HCT-116/L-OHP cells. Moreover, Evo treatment reduced Rhodamine 123 accumulation and ATPase activity in HCT-116/L-OHP cells, indicating that Evo decreased the efflux function in HCT-116/L-OHP cells. Interestingly, phosphorylation of NF-kB pathway, particularly p50/p65, was also inhibited by Evo treatment. Furthermore the effect of Evo in reversing drug resistance and suppressing phosphorylation of NF-kB pathway were attenuated after treatment with the NF-kB activator (LPS). Additionally, Evo inhibited the tumor growth in a colorectal MDR cancer xenograft model and down regulated p-NF-kB level in vivo. Our study provided the first direct evidence that Evo can attenuate multidrug resistance by blocking p-NF-kB signaling pathway in human colorectal cancer."

According to the news editors, the research concluded: "Evo could be a potential candidate for cancer chemotherapy."

The news editors report that additional information may be obtained by contacting H. Sui, Dept. of Medical Oncology, Shuguang Hospital, Shanghai University of Traditional Chinese Medicine, Shanghai, 201203, People's Republic of China. Additional authors for this research include L.H. Zhou, Y.L. Zhang, J.P. Huang, X. Liu, Q. Ji, X.L. Fu, H.T. Wen, Z.S. Chen, W.L. Deng, H.R. Zhu and Q. Li.

**Studies Conducted at Singapore General Hospital on Cytomegalovirus Recently Reported (Severe gastrointestinal cytomegalovirus disease in two patients with renal vasculitis after immunosuppression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Herpesvirus Diseases and Conditions - Cytomegalovirus have been presented. According to news reporting originating in Singapore, Singapore, by NewsRx journalists, research stated, "Although the use of current immunosuppressive regimens has significantly improved the outcomes of autoimmune renal diseases, infectious complications remain an important clinical concern. Cytomegalovirus (CMV) infection has been shown to be one of the major causes of mortality in this group of patients."

The news reporters obtained a quote from the research from Singapore General Hospital, "We report two cases of renal vasculitis (Granulomatosis with polyangiitis (GPA) and microscopic polyangiitis (MPA)) that developed into severe gastrointestinal CMV disease and manifested with massive small bowel bleeding, resulting in an eventual fatal outcome for one of the patients. Risk factors, pathogenesis, role of immunosuppression in the development of CMV infection, and antiviral treatment are discussed in this review."

According to the news reporters, the research concluded: "These cases highlight the need for further research to evaluate the complex mechanisms between immunosuppression and CMV occurrence as well as the role of antiviral prophylaxis in high-risk patients undergoing immunosuppressive therapies."

For more information on this research see: Severe gastrointestinal cytomegalovirus disease in two patients with renal vasculitis after immunosuppression. *Clinical Nephrology*, 2016;86(3):154-161. *Clinical Nephrology* can be contacted at: Dustri-Verlag Dr Karl Feistle, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

Our news correspondents report that additional information may be obtained by contacting K.G. Lee, Singapore General Hospital, Dept. of Renal Med, Singapore, Singapore. Additional authors for this research include S.H. Teo, C.C. Lim, A.H.L. Loh, V.A. Chidambaram and J.C.J. Choo.

Studies Conducted at Sloan Kettering Institute on Familial Dysautonomia Recently Reported (Capturing the biology of disease severity in a PSC-based model of familial dysautonomia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nervous System Diseases and Conditions - Familial Dysautonomia is now available. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Familial dysautonomia (FD) is a debilitating disorder that affects derivatives of the neural crest (NC). For unknown reasons, people with FD show marked differences in disease severity despite carrying an identical, homozygous point mutation in IKBKAP, encoding I kappa B kinase complex-associated protein."

The news correspondents obtained a quote from the research from Sloan Kettering Institute, "Here we present disease-related phenotypes in human pluripotent stem cells (PSCs) that capture FD severity. Cells from individuals with severe but not mild disease show impaired specification of NC derivatives, including autonomic and sensory neurons. In contrast, cells from individuals with severe and mild FD show defects in peripheral neuron survival, indicating that neurodegeneration is the main culprit for cases of mild FD. Although genetic repair of the FD-associated mutation reversed early developmental NC defects, sensory neuron specification was not restored, indicating that other factors may contribute to disease severity. Whole-exome sequencing identified candidate modifier genes for individuals with severe FD."

According to the news reporters, the research concluded: "Our study demonstrates that PSC-based modeling is sensitive in recapitulating disease severity, which presents an important step toward personalized medicine."

Our news journalists report that additional information may be obtained by contacting N. Zeltner, Sloan Kettering Inst, Center Stem Cell Biol, New York, NY 10065, United States. Additional authors for this research include F. Fattahi, N.C. Dubois, N. Saurat, F. Lafaille, L. Shang, B. Zimmer, J. Tchieu, M.A. Soliman, G. Lee, J.L. Casanova and L. Studer.

Studies Conducted at St. Boniface General Hospital on Sepsis Recently Reported (Multifaceted antibiotic treatment analysis of methicillin-sensitive Staphylococcus aureus bloodstream infections)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Blood Diseases and Conditions - Sepsis. According to news reporting originating from Winnipeg, Canada, by NewsRx correspondents, research stated, "Given the overall prevalence and poor prognosis of Staphylococcus aureus bloodstream infections (BSIs), the study of treatment strategies to improve patient outcomes is important. The aim of this study was to conduct a multifaceted antibiotic treatment analysis of methicillin-sensitive S. aureus (MSSA) BSI and to characterise optimal early antibiotic therapy (within the first 7 days of drawing the index blood culture) for this serious infection."

Financial support for this research came from Leslie F. Buggey Graduate. Our news editors obtained a quote from the research from St. Boniface General Hospital, "Antibiotic selection was categorised as optimal targeted (intravenous cloxacillin or cefazolin), optimal broad (piperacillin/tazobactam or meropenem), adequate (vancomycin) or inadequate (other antibiotics or oral therapy). A TSE (timing, selection, exposure) score was developed to comprehensively characterise early antibiotic therapy, where higher points corresponded to prompt initiation, optimal antibiotic selection and longer exposure (duration). Amongst 71 cases of complicated MSSA-BSI, end-of-treatment (EOT) response (i.e. clinical cure) was improved when at least adequate antibiotic therapy was initiated within 24 h [71.7% (33/46) vs. 48.0% (12/25); P = 0.047]. Clinical cure was also more likely when therapy included = 4 days of optimal targeted antibiotics within the first 7 days [74.4% (29/39) vs. 50.0% (16/32); P = 0.03]. The TSE score was an informative index of early antibiotic therapy, with EOT cure documented in 72.0% (36/50) compared with 42.9% (9/21) of cases with scores above and below 15.2, respectively (P = 0.02)."

According to the news editors, the research concluded: "In multivariable analysis, lower Charlson comorbidity index, presence of BSI on admission, and optimising early antibiotic therapy, as described above, were associated with clinical cure in patients with MSSA-BSI."

The news editors report that additional information may be obtained by contacting S. Zelenitsky, St Boniface Gen Hosp, Winnipeg, MB R2H 2A6, Canada. Additional authors for this research include R. Ariano, P. Lagace-Wiens and S. Zelenitsky. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijantimicag.2016.09.007. Studies Conducted at St. Jude Children's Research Hospital on Pharmacogenetics Recently Reported (Evidence and resources to implement pharmacogenetic knowledge for precision medicine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pharmacogenetics have been published. According to news reporting out of Memphis, Tennessee, by NewsRx editors, research stated, "The current state of pharmacogenetic data curation and dissemination is described, and evidence-based resources for applying pharmacogenetic data in clinical practice are reviewed. Implementation of pharmacogenetics in clinical practice has been relatively slow despite substantial scientific progress in understanding linkages between genetic variation and variability of drug response and effect."

Our news journalists obtained a quote from the research from St. Jude Children's Research Hospital, "One factor that has inhibited the adoption of genetic data to guide medication use is a lack of knowledge of how to translate genetic test results into clinical action based on currently available evidence. Other implementation challenges include controversy over selection of appropriate evidentiary thresholds for routine clinical implementation of pharmacogenetic data and the difficulty of compiling scientific data to support clinical recommendations given that large randomized controlled trials to demonstrate the utility of pharmacogenetic testing are not feasible or are not considered necessary to establish clinical utility. Organizations such as the Clinical Pharmacogenetics Implementation Consortium (CPIC) and the Pharmacogenomics Knowledgebase (PharmGKB) systematically evaluate emerging evidence of pharmacogenomic linkages and publish evidence based prescribing recommendations to inform clinical practice. Both CPIC and PharmGKB provide online resources that facilitate the interpretation of genetic test results and provide prescribing recommendations for specific gene-drug pairs."

According to the news editors, the research concluded: "Resources provided by organizations such as CPIC and PharmGKB, which use standardized approaches to evaluate the literature and provide clinical guidance for a growing number of gene-drug pairs, are essential for the implementation of pharmacogenetics into routine clinical practice."

For more information on this research see: Evidence and resources to implement pharmacogenetic knowledge for precision medicine. American Journal of Health-System Pharmacy, 2016;73(23):1977-1985. American Journal of Health-System Pharmacy can be contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD 20814, USA.

Our news journalists report that additional information may be obtained by contacting K.E. Caudle, St Jude Childrens Res Hosp, Dept. of Pharmaceut Sci, Memphis, TN 38105, United States. Studies Conducted at Stanford University on Genetics Recently Reported (Molecular Imaging Biosensor Monitors p53 Sumoylation in Cells and Living Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics is now available. According to news reporting originating in Palo Alto, California, by NewsRx journalists, research stated, "Small molecule mediated stabilization of p53 tumor suppressor protein through sumoylation is a promising new strategy for improving cancer chemotherapy. A molecular tool that monitors pS3 sumoylation status and expedites screening for drugs that enhance pS3 sumoylation would be beneficial."

Funders for this research include National Cancer Institute, Ben and Catherine Ivy Foundation.

The news reporters obtained a quote from the research from Stanford University, "We report a molecularly engineered reporter fragment complementation biosensor based on optical imaging of Firefly luciferase (FLuc), to quantitatively image p53 sumoylation and desumoylation in cells and living mice. We initially characterized this biosensor by successfully imaging sumoylation of several target proteins, achieving significant FLuc complementation for ER alpha (p < 0.01), p53 (p < 0.005), FKBP12 (p < 0.03), ID (p < 0.03), and HDAC1 (p < 0.002). We then rigorously tested the sensitivity and specificity of the biosensor using several variants of p53 and SUMO1, including deletion mutants, and those with modified sequences containing the SUMO-acceptor site of target proteins. Next we evaluated the performance of the biosensor in HepG2 cells by treatment with ginkgoolic acid, a drug that reduces p53 sumoylation, as well as trichostatin A, a potential inducer of p53 sumoylation by enhancement of its nuclear export. Lastly, we demonstrated the in vivo utility of this biosensor in monitoring and quantifying the effects of these drugs on p53 sumoylation in living mice using bioluminescence imaging."

According to the news reporters, the research concluded: "Adoption of this biosensor in future high throughput drug screening has the important potential to help identify new and repurposed small molecules that alter p53 sumoylation, and to preclinically evaluate candidate anticancer drugs in living animals."

Our news correspondents report that additional information may be obtained by
Studies Conducted at Timone Hospital on Glioblastomas Recently Reported (Changes in PlGF and MET-HGF expressions in paired initial and recurrent glioblastoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Glioblastomas. According to news reporting originating in Marseille, France, by NewsRx journalists, research stated, "Angiogenesis is one of the key features of glioblastoma (GB). However, the use of anti-angiogenic therapies directed against vascular endothelial growth factor (VEGF) is limited by primary or acquired resistance."

Financial support for this research came from SIRIC.

The news reporters obtained a quote from the research from Timone Hospital, "MET/HGF and PlGF signaling are involved in potential alternative escape mechanisms to VEGF pathway. Our objective was to explore the potential changes of MET/HGF and PlGF expression, comparing initial diagnosis and recurrence after radiotherapy-temozolomide (RT/TMZ). Paired frozen tumors from both initial and recurrent surgery after radio-chemotherapy were available for 28 patients. RNA expressions of PlGF, MET, and HGF genes were analyzed by RT-qPCR. PlGF expression significantly decreased at recurrence (p = 0.021), and expression of MET showed a significant increase (p = 0.011) at recurrence. RNA expressions of MET and HGF significantly correlated both at baseline and recurrence (baseline: p = 0.005; recurrence: p = 0.019). Evolutive profile (increasing versus decreasing expression at recurrence) of MET was associated with PFS (p = 0.002) and OS (p = 0.022) at recurrence, while the evolutive profile of HGF was associated with PFS at relapse (p = 0.049). Recurrence of GB after chemo-radiation could be associated with a variation in PIGF and MET expression."

According to the news reporters, the research concluded: "These results contribute to suggest a modification of the GB angiogenic process between initial diagnosis and recurrence."

For more information on this research see: Changes in PlGF and MET-HGF expressions in paired initial and recurrent glioblastoma. Journal of Neuro-Oncology, 2016;130 (3):431-437. Genetics - Human Genetics

Studies Conducted at Tohoku University School of Medicine on Human Genetics Recently Reported (Recent advances in RASopathies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genetics - Human Genetics have been published. According to news reporting out of Sendai, Japan, by NewsRx editors, research stated, "RASopathies or RAS/mitogen-activated protein kinase (MAPK) syndromes are a group of phenotypically overlapping syndromes caused by germline mutations that encode components of the RAS/MAPK signaling pathway. These disorders include neurofibromatosis type I, Legius syndrome, Noonan syndrome, Noonan syndrome with multiple lentigines (formerly called LEOPARD syndrome), Costello syndrome, cardiofaciocutaneous (CFC) syndrome, Noonan-like syndrome, hereditary gingival fibromatosis and capillary malformation-arteriovenous malformation."

Our news journalists obtained a quote from the research from the Tohoku University School of Medicine, "Recently, novel gene variants, including RIT1, RRAS, RASA2, A2ML1, SOS2 and LZTR1, have been shown to be associated with RASopathies, further expanding the disease entity. Although further analysis will be needed, these findings will help to better elucidate an understanding of the pathogenesis of these disorders and will aid in the development of potential therapeutic approaches."

According to the news editors, the research concluded: "In this review, we summarize the novel genes that have been reported to be associated with RASopathies and highlight the cardiovascular abnormalities that may arise in affected individuals."

Our news journalists report that additional information may be obtained by contacting Y. Aoki, Dept. of Medical Genetics, Tohoku University School of Medicine, Sendai, Japan. Additional authors for this research include T. Niihori, S. Inoue and Y. Matsubara.

Glutamic Acid

Studies Conducted at Tokyo University of Science on Glutamic Acid Recently Reported (Galacto-N-biose is neuroprotective against glutamate-induced excitotoxicity in vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Glutamic Acid have been published. According to news originating from Chiba, Japan, by NewsRx correspondents, research stated, "Galacto-N-biose (GNB: Gal beta 1-3GalNAc) is an O-glycan disaccharide core moiety that is a core component of mucin in the gastrointestinal tract; however, the physiological properties of GNB are not well understood. Glutamate excitotoxicity causes neuronal death in acute neurological disorders including stroke, trauma, and neurodegenerative disease."

Our news journalists obtained a quote from the research from the Tokyo University of Science, "Therefore the discovery of drugs to treat glutamate excitotoxicity is an important goal. Here, we report that GNB is neuroprotective against glutamate-induced excitotoxicity. We treated 14-15 days in vitro cultured rat cortical neurons with 0.1-1000 nM GNB together with 30 μm glutamate for various durations. Short-term (3 h) GNB treatments showed a modest neuroprotective effect against glutamate neurotoxicity, however, long-term (24 h) GNB treatment conferred significant neuroprotective effects, as shown by both MTT and immunocytochemical assays. Prolonged GNB treatment did not alter glutamate-induced calcium influx, but did induce antioxidant-related gene expression. Furthermore, GNB treatment did not induce cell death or alter synaptic connections."

According to the news editors, the research concluded: "These data suggest that GNB is a potential candidate drug that protects against glutamate excitotoxicity without affecting cell viability and synaptic connections."

For more information on this research see: Galacto-N-biose is neuroprotective against glutamate-induced excitotoxicity in vitro. European Journal of Pharmacology, 2016;791():711-717. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Studies Conducted at University Hospital on Non-Small Cell Lung Cancer Recently Reported (Molecular Profiling of Circulating Tumour Cells Identifies Notch1 as a Principal Regulator in Advanced Non-Small Cell Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Non-Small Cell Lung Cancer. According to news reporting originating in Santiago de Compostela, Spain, by NewsRx journalists, research stated, "Knowledge on the molecular mechanisms underlying metastasis colonization in Non-Small Cell Lung Cancer (NSCLC) remains incomplete. A complete overview integrating driver mutations, primary tumour heterogeneity and overt metastasis lacks the dynamic contribution of disseminating metastatic cells due to the inaccessibility to the molecular profiling of Circulating Tumour Cells (CTCs)."

The news reporters obtained a quote from the research from University Hospital, "By combining immunoisolation and whole genome amplification, we performed a global gene expression analysis of EpCAM positive CTCs from advanced NSCLC patients. We identified an EpCAM+CTC-specific expression profile in NSCLC patients mostly associated with cellular movement, cell adhesion and cell-to-cell signalling mediated by PI3K/AKT, ERK1/2 and NF-kB pathways. NOTCH1 emerged as a driver connecting active signalling pathways, with a reduced number of related candidate genes (NOTCH1, PTP4A3, LGALS3 and ITGB3) being further validated by RT-qPCR on an independent cohort of NSCLC patients. In addition, these markers demonstrated high prognostic value for Progression-Free Survival (PFS)."

According to the news reporters, the research concluded: "Molecular characterization of EpCAM+ CTCs from advanced NSCLC patients provided with highly specific biomarkers with potential applicability as a 'liquid biopsy' for monitoring of NSCLC patients and confirmed NOTCH1 as a potential therapeutic target to block lung cancer dissemination."

For more information on this research see: Molecular Profiling of Circulating Tumour Cells Identifies Notch1 as a Principal Regulator in Advanced Non-Small Cell Lung Cancer. Scientific Reports, 2016;6():1-9. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Studies Conducted at University Medical Center, Erlangen on Gliomas Recently Reported (MIF-CD74 signaling impedes microglial M1 polarization and facilitates brain tumorigenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gliomas have been presented. According to news originating from Erlangen, Germany, by NewsRx correspondents, research stated, "Microglial cells in the brain tumor microenvironment are associated with enhanced glioma malignancy. They persist in an immunosuppressive M2 state at the peritumoral site and promote the growth of gliomas."

Our news journalists obtained a quote from the research from University Medical Center, Erlangen, "Here, we investigated the underlying factors contributing to the abolished immune surveillance. We show that brain tumors escape pro-inflammatory M1 conversion of microglia via CD74 activation through the secretion of the cytokine macrophage migration inhibitory factor (MIF), which results in a M2 shift of microglial cells. Interruption of this glioma-microglial interaction through an antibody-neutralizing approach or small interfering RNA (siRNA)-mediated inhibition prolongs survival time in glioma-implanted mice by reinstating the microglial proinflammatory M1 function. We show that MIF-CD74 signaling inhibits interferon (IFN)-gamma secretion in microglia through phosphorylation of microglial ERK1/2 (extracellular signal-regulated protein kinases 1 and 2). The inhibition of MIF signaling or its receptor CD74 promotes IFN-gamma release and amplifies tumor death either through pharmacological inhibition or through siRNA-mediated knockdown. The reinstated IFN-gamma secretion leads both to direct inhibition of glioma growth as well as inducing a M2 to M1 shift in glioma-associated microglia."

According to the news editors, the research concluded: "Our data reveal that interference with the MIF signaling pathway represents a viable therapeutic option for the restoration of IFN-gamma-driven immune surveillance."

The news correspondents report that additional information may be obtained from I.Y. Eyupoglu, Friedrich Alexander Univ Erlangen Nurnberg FAU, Dept. of Neurosurg, Univ Klinikum Erlangen, Fac Med, D-91054 Erlangen, Bayern, Germany. Lung Diseases and Conditions - Pneumonia

Studies Conducted at University of Amsterdam on Pneumonia Recently Reported (Comparative Analysis of the Host Response to Community-acquired and Hospital-acquired Pneumonia in Critically Ill Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Pneumonia. According to news reporting from Amsterdam, Netherlands, by NewsRx journalists, research stated, "Preclinical studies suggest that hospitalized patients are susceptible to infections caused by nosocomial respiratory pathogens at least in part because of immune suppression caused by the condition for which they were admitted. We aimed to characterize the systemic host response in hospital-acquired pneumonia (HAP) when compared with community-acquired pneumonia (CAP)."

The news correspondents obtained a quote from the research from the University of Amsterdam, "We performed a prospective study in two intensive care units (ICUs) in 453 patients with HAP (n = 222) or CAP (n = 231). Immune responses were determined on ICU admission by measuring 19 plasma biomarkers reflecting organ systems implicated in infection pathogenesis (in 192 patients with HAP and 183 patients with CAP) and by applying genome-wide blood gene expression profiling (in 111 patients with HAP and 110 patients with CAP). Patients with HAP and CAP presented with similar disease severities and mortality rates did not differ up to 1 year after admission. Plasma proteome analysis revealed largely similar responses, including systemic inflammatory and cytokine responses, and activation of coagulation and the vascular endothelium. The blood leukocyte genomic response was greater than 75% common in patients with HAP and CAP, comprising proinflammatory, antiinflammatory, T-cell signaling, and metabolic pathway gene sets. Patients with HAP showed overexpression of genes involved in cell-cell junction remodeling, adhesion, and diapedesis, which corresponded with lower plasma levels of matrix metalloproteinase-8 and soluble E-selectin. In addition, patients with HAP demonstrated underexpression of a type-I interferon signaling gene signature."

According to the news reporters, the research concluded: "Patients with HAP and CAP present with a largely similar host response at ICU admission."

Our news journalists report that additional information may be obtained by contacting L.A. van Vught, University of Amsterdam, Center Infect & Immun, Academy Med Center, Amsterdam, Netherlands. Additional authors for this research include B.P. Scicluna, M.A. Wiewel, A.J. Hoogendijk, P. Klouwenberg, M. Franitza, M.R. Toliat, P. Nurnberg, O.L. Cremer, J. Horn, M.J. Schultz, M.M.J. Bonten and T. van der Poll.

Studies Conducted at University of California on Chemotherapy Recently Reported (Postmastectomy radiation therapy after neoadjuvant chemotherapy: review and interpretation of available data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Chemotherapy. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "Postmastectomy radiotherapy (PMRT) has been shown to decrease locoregional recurrence and improve overall survival in patients with tumors greater than 5 cm or positive nodes. Because neoadjuvant chemotherapy (NAC) can cause significant downstaging, the indications for PMRT in the setting of NAC remain controversial and thus careful consideration of clinical stage at presentation, pathologic response to NAC, and other clinical characteristics, such as grade and biomarker status is required."

Our news journalists obtained a quote from the research from the University of California, "The current review synthesizes both prospective and retrospective data to provide evidence for recommending PMRT after NAC for patients presenting with cT3-4 disease, cN2-3 disease, and residual nodal disease, as well as rationale for omitting PMRT in patients with cT1-2N0-1 disease who achieve a pathologic complete response. Other scenarios, including nodal complete response in the presence of other risk factors, are also explored."

According to the news editors, the research concluded: "The topics of pre-NAC clinical staging and pathologic axillary nodal staging are reviewed, and radiation portal design is briefly discussed."

For more information on this research see: Postmastectomy radiation therapy after neoadjuvant chemotherapy: review and interpretation of available data. Therapeutic Advances In Medical Oncology, 2016;8(1):85-97. (Sage Publications - www.sagepub.com/; Therapeutic Advances In Medical Oncology - tam.sagepub.com)

Our news journalists report that additional information may be obtained by contacting A.U. Kishan, Dept. of Radiation Oncology, David Geffen School of Medicine, University of California, Los Angeles, CA, United States.

Studies Conducted at University of California on Pharmacy Practice Recently Reported (Developing a process for expansion of community pharmacy residency sites)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmacy Practice. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated, "The development of guidelines for community pharmacy residency site expansion is described. During the past 20 years, community pharmacy residency programs have grown in number."

The news reporters obtained a quote from the research from the University of California, "Most community residencies were initiated and accredited through schools of pharmacy with faculty members dedicated to the oversight and growth. Because of the interest in residency expansion from sites, a systematic process was needed to determine whether a site was resident ready. This need led to the development of a site-readiness tool for community residency expansion. This tool was developed by 2 faculty members serving as residency program directors at 2 schools of pharmacy in North Carolina. The development of this tool resulted in guidance and clarification of residency expectations for potential community sites. The tool also led to improved efficiency in the assessment of readiness for residency site expansion. Development of a tool for residency site readiness increased the overall knowledge of site requirements, resulting in a more efficient process for residency program directors, and aided in the ability to increase the number of community pharmacy residency sites in North Carolina."

According to the news reporters, the research concluded: "The tool described in this article can serve as a guide to sites that have an interest in establishing new programs but are uncertain of the site's readiness and next steps."

Our news correspondents report that additional information may be obtained by contacting V.B. Clinard, University of California, UCSF Sch Pharm, Clin Pharm, Experiential Educ, San Francisco, CA 94143, United States. Additional authors for this research include P. Brown and V.B. Clinard.

**Pharmacology**

**Studies Conducted at University of Copenhagen on Pharmacology Recently Reported (N-terminally and C-terminally truncated forms of glucose-dependent insulinotropic polypeptide are high-affinity competitive antagonists of the human GIP receptor)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Pharmacology is the subject of a report. According to
news reporting originating in Copenhagen, Denmark, by NewsRx journalists, research stated, "Glucose-dependent insulino tropic polypeptide (GIP) affects lipid, bone and glucose homeostasis. High-affinity ligands for the GIP receptor are needed to elucidate the physiological functions and pharmacological potential of GIP in vivo."

The news reporters obtained a quote from the research from the University of Copenhagen, "GIP(1-30)NH2 is a naturally occurring truncation of GIP(1-42). Here, we have characterized eight N-terminal truncations of human GIP(1-30)NH2. COS-7 cells were transiently transfected with human GIP receptors and assessed for cAMP accumulation upon ligand stimulation or competition binding with (125) I-labelled GIP(1-42), GIP(1-30)NH2, GIP(2-30)NH2 or GIP(3-30)NH2. GIP(1-30)NH2 displaced (125) I-GIP(1-42) as effectively as GIP (1-42) (Ki 0.75 nM), whereas the eight truncations displayed lower affinities (Ki 2.3-347 nM) with highest affinities for GIP(3-30)NH2 and GIP(5-30)NH2. Only GIP(1-30)NH2 (Emax 100% of GIP(1-42)) and GIP(2-30)NH2 (Emax 20%) were agonists. GIP(2-to 9-30)NH2 displayed antagonism (IC[50] 12-450 nM) and Schild plot analyses identified GIP(3-30)NH2 and GIP(5-30)NH2 as competitive antagonists (Ki 15 nM). GIP(3-30) NH2 was a 26-fold more potent antagonist than GIP(3-42). Binding studies with agonist ((125) I-GIP(1-30)NH2 ), partial agonist ((125) I-GIP(2-30)NH2 ) and competitive antagonist ((125) I-GIP(3-30)NH2 ) revealed distinct receptor conformations for these three ligand classes. The N-terminus is crucial for GIP agonist activity. Removal of the C-terminus of the endogenous GIP(3-42) creates another naturally occurring, more potent, antagonist GIP(3-30)NH2, which like GIP(5-30)NH2, was a high-affinity competitive antagonist."

According to the news reporters, the research concluded: "These peptides may be suitable tools for basic GIP research and future pharmacological interventions."

Our news correspondents report that additional information may be obtained by contacting L.S. Hansen, Dept. of Neuroscience and Pharmacology, Faculty of Health and Medical Sciences, University of Copenhagen, Copenhagen, Denmark. Additional authors for this research include A.H. Sparre-Ulrich, M. Christensen, F.K. Knop, B. Hartmann, J.J. Holst and M.M Rosenkilde.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bph.13384. This DOI is a link to an online electronic document that is either free or for purchase.

Studies Conducted at University of Delaware on Breast Cancer Recently Reported (Nanoshell-mediated photothermal therapy can enhance chemotherapy in inflammatory breast cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting originating from Newark, Delaware, by NewsRx correspondents, research stated, "Nanoshell-mediated photothermal therapy (PTT) is currently being investigated as a standalone therapy for the treatment of cancer. The cellular effects of PTT include loss of membrane integrity, so we hypothesized that nanoshell-mediated PTT could potentiate the cytotoxicity of chemotherapy by improving drug accumulation in cancer cells."

Our news editors obtained a quote from the research from the University of Delaware, "In this work, we validated our hypothesis using doxorubicin as a model drug and SUM149 inflammatory breast cancer cells as a model cancer subtype. In initial studies, SUM149 cells were exposed to nano-shells and near-infrared light and then stained with ethidium homodimer-1, which is excluded from cells with an intact plasma membrane. The results confirmed that nanoshell-mediated PTT could increase membrane permeability in SUM149 cells. In complementary experiments, SUM149 cells treated with nanoshells, near-infrared light, or a combination of the two to yield low-dose PTT were exposed to fluorescent rhodamine 123. Analyzing rhodamine 123 fluorescence in cells via flow cytometry confirmed that increased membrane permeability caused by PTT could enhance drug accumulation in cells. This was validated using fluorescence microscopy to assess intracellular distribution of doxorubicin. In succeeding experiments, SUM149 cells were exposed to subtherapeutic levels of doxorubicin, low-dose PTT, or a combination of the two treatments to determine whether the additional drug uptake induced by PTT is sufficient to enhance cell death. Analysis revealed minimal loss of viability relative to controls in cells exposed to subtherapeutic levels of doxorubicin, 15% loss of viability in cells exposed to low-dose PTT, and 35% loss of viability in cells exposed to combination therapy."

According to the news editors, the research concluded: "These data indicate that nanoshell-mediated PTT is a viable strategy to potentiate the effects of chemotherapy and warrant further investigation of this approach using other drugs and cancer subtypes."

For more information on this research see: Nanoshell-mediated photothermal therapy can enhance chemotherapy in inflammatory breast cancer cells. *International Journal of Nanomedicine*, 2015;10():6931-41.

The news editors report that additional information may be obtained by contacting B.L. Fay, Biomedical Engineering, University of Delaware, Newark, DE, United States. Additional authors for this research include J.R. Melamed and E.S Day.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2147/IJN.S93031. This DOI is a link to an online electronic document that is either free or for purchase.

Clinical Research - Clinical Trials and Studies

Studies Conducted at University of Iowa on Clinical Trials and Studies Recently Reported (Determining When to Add Nonstatin Therapy A Quantitative Approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news originating from Iowa City, Iowa, by NewsRx correspondents, research stated, "Costs and uncertainty about the benefits of nonstatin therapies limit their use. The authors sought to identify patients who might benefit from the addition of a nonstatin to background statin therapy."

Our news journalists obtained a quote from the research from the University of Iowa, "We performed systematic reviews of subgroup analyses from randomized trials and observational studies with statin-treated participants to determine estimated 10-year absolute risk of atherosclerotic cardiovascular disease (ASCVD) and to define high-risk and very high-risk patients. We used the relative risk reductions for the addition of a nonstatin to lower low-density lipoprotein (LDL-C) used to determine the number needed to treat (NNT) to prevent 1 ASCVD event over 5 years for each patient group and to allow comparisons with 5-year cost analyses. The 10-year ASCVD risk is at least 30% (very high risk) for statin-treated participants with clinical ASCVD and comorbidities, and 20% to 29% (high risk) for those with ASCVD without comorbidities or who have heterozygous familial hypercholesterolemia. Adding ezetimibe to reduce low-density LDL-C by 20% would provide a 5-year NNT <= 50 for very high-risk patients with LDL-C >= 130 mg/dl or for high-risk patients with LDL-C >= 190 mg/dl, and an NNT <= 30 for very high-risk patients with LDL-C >= 160 mg/dl. Adding a PCSK9 monoclonal antibody to lower LDL-C by at least 50% would provide an NNT <= 50 for very high-risk and high-risk patients with LDL-C >= 70 mg/dl, and an NNT <= 30 for very high-risk and high-risk patients with an LDL-C >= 130 mg/dl." According to the news editors, the research concluded: "Adding ezetimibe or PCSK9 monoclonal antibodies to maximally tolerated statin therapy may be cost effective in very high-risk and high-risk patients, depending on baseline LDL-C levels."

The news correspondents report that additional information may be obtained from J.G. Robinson, University of Iowa, Dept. of Med, Iowa City, IA 52242, United States. Additional authors for this research include R. Huijgen, K. Ray, J. Persons, J.J.P. Kastelein and M.J. Pencina.

Keywords for this news article include: Iowa City, Iowa, United States, North and Central America, Clinical Research, Risk and Prevention, Clinical Trials and Studies, Therapy, University of Iowa.

Gram-Negative Bacteria - Escherichia coli

Studies Conducted at University of Lethbridge on Escherichia coli Recently Reported (RNA modification enzyme TruB is a tRNA chaperone)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gram-Negative Bacteria - Escherichia coli. According to news originating from Lethbridge, Canada, by NewsRx correspondents, research stated, "Cellular RNAs are chemically modified by many RNA modification enzymes; however, often the functions of modifications remain unclear, such as for pseudouridine formation in the tRNA T Psi C arm by the bacterial tRNA pseudouridine synthase TruB. Here we test the hypothesis that RNA modification enzymes also act as RNA chaperones."

Funders for this research include Gouvernement du Canada | Natural Sciences and Engineering Research Council of Canada (Conseil de Recherches en Sciences Naturelles et en Genie du Canada), Canada Foundation for Innovation (Fondation canadienne pour l'innovation).

Our news journalists obtained a quote from the research from the University of Lethbridge, "Using TruB as a model, we demonstrate that TruB folds tRNA independent of its catalytic activity, thus increasing the fraction of tRNA that can be aminoacylated. By rapid kinetic stopped-flow analysis, we identified the molecular mechanism of TruB's RNA chaperone activity: TruB binds and unfolds both misfolded and folded tRNAs thereby providing misfolded tRNAs a second chance at folding. Previously, it has been shown that a catalytically inactive TruB variant has no phenotype when expressed in an Escherichia coli truB KO strain [Gutgsell N, et al. (2000) RNA 6(12): 1870-1881]. However, here we uncover that E. coli strains expressing a TruB variant impaired in tRNA binding and in vitro tRNA folding cannot compete with WT E. coli. Consequently, the tRNA chaperone activity of TruB is critical for bacterial fitness."

According to the news editors, the research concluded: "We prove the tRNA chaperone activity of the pseudouridine synthase TruB, reveal its molecular mechanism, and demonstrate its importance for cellular fitness. We discuss the likelihood that other RNA modification enzymes are also RNA chaperones."

The news correspondents report that additional information may be obtained from U. Kothe, University of Lethbridge, Alberta RNA Res & Training Inst, Dept. of Chem & Biochem, Lethbridge, AB T1K 3M4, Canada. Additional authors for this research include G.R. Veerareddygari and U. Kothe.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1073/pnas.1607512113. This DOI is a link to an online electronic document that is either free or for purchase.

Mycobacterium Infections - Tuberculosis

Studies Conducted at University of Liverpool on Tuberculosis Recently Reported (Methods for selecting regimen duration to prevent relapse in drug-susceptible and drug-resistant TB)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mycobacterium Infections - Tuberculosis have been published. According to news reporting originating from Liverpool, United Kingdom, by NewsRx correspondents, research stated, "Predicting the required duration of treatment necessary to yield an acceptable risk of recurrence is a key question facing Phase III trials in both drug-susceptible (DS) and multidrug-resistant tuberculosis (MDR-TB). Data on treatment duration from animal models are increasingly a focus of such studies, but they have not been calibrated against human clinical trials and are lacking in MDR-TB."

Our news editors obtained a quote from the research from the University of Liverpool, "Empirical meta-regression models based on clinical trials in DS-TB suggest that early bacteriological results and treatment duration may have value in predicting relapse, and have been prospectively validated against the results of three large randomised controlled trials in DS-TB. While few trials have been conducted in MDR-TB to date, and observational cohort data should be interpreted carefully due to bias and confounding, these models also appeared to perform well in two recent cohort studies of MDR-TB. Applying these insights in practice may require innovations in clinical trial design, such as more extensive selection, adaptation and use of multiple durations during Phases II and III."

According to the news editors, the research concluded: "While several studies have identified important individual level prognostic variables that could improve the accuracy of relapse prediction, attempts to stratify treatment duration for individual patients based on these factors have so far met with limited success."

The news editors report that additional information may be obtained by contacting G.R. Davies, University of Liverpool, Inst Infect & Global Hlth & Translat Med, Liverpool, Merseyside, United Kingdom.

Keywords for this news article include: Liverpool, United Kingdom, Europe, Drugs and Therapies, Risk and Prevention, Multidrug Resistant Tuberculosis, Clinical Trials and Studies, Mycobacterium Infections, Infectious Disease, Clinical Research, Drug Resistance, MDR-TB, University of Liverpool.

Studies Conducted at University of Macau on Alzheimer Disease Recently Reported (The Protective Effects of Icariin against the Homocysteine-Induced Neurotoxicity in the Primary Embryonic Cultures of Rat Cortical Neurons)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Neurodegenerative Diseases and Conditions - Alzheimer Disease is the subject of a report. According to news reporting originating in Taipa, People's Republic of China, by NewsRx journalists, research stated, "Icariin, an ingredient in the medicinal herb Epimedium brevicornum Maxim (EbM), has been considered as a potential therapeutic agent for neurodegenerative diseases such as Alzheimer's disease (AD). Hyperhomocysteinaemia is a risk factor for AD and other associated neurological diseases."

The news reporters obtained a quote from the research from the University of Macau, "In this study we aim to investigate whether icariin can reverse homocysteine (Hcy)-induced neurotoxicity in primary embryonic cultures of rat cortical neurons. Our findings demonstrated that icariin might be able restore the cytoskeleton network damaged by Hcy through the modulation of acetyl-alpha-tubulin, tyrosinated-alpha-tubulin, and phosphorylation of the tubulin-binding protein Tau. In addition, icariin downregulated p-extracellular signal-regulated kinase (ERK) which is a kinase targeting tau protein. Furthermore, icariin effectively restored the neuroprotective protein p-Akt that was downregulated by Hcy. We also applied RT2 Profiler PCR Arrays focused on genes related to AD and neurotoxicity to examine genes differentially altered by Hcy or icariin. Among the altered genes from the arrays, ADAM9 was downregulated 15 folds in cells treated with Hcy, but markedly restored by icariin. ADAM family, encoded alpha-secretase, plays a protective role in AD."

According to the news reporters, the research concluded: "Overall, our findings demonstrated that icariin exhibits a strong neuroprotective function and have potential for future development for drug treating neurological disorders, such as AD."

For more information on this research see: The Protective Effects of Icariin against the Homocysteine-Induced Neurotoxicity in the Primary Embryonic Cultures of Rat Cortical Neurons. Molecules, 2016;21(11):2033-2047. Molecules can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. Oncology - Liver Cancer

Studies Conducted at University of Medicine on Liver Cancer Recently Reported (DNA-PKcs: A promising therapeutic target in human hepatocellular carcinoma?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Liver Cancer is the subject of a report. According to news reporting originating from Greifswald, Germany, by NewsRx correspondents, research stated, "Hepatocellular carcinoma (HCC) is a frequent and deadly disease worldwide. The absence of effective therapies when the tumor is surgically unresectable leads to an extremely poor outcome of HCC patients."

Financial support for this research came from Italian Association Against Cancer.

Our news editors obtained a quote from the research from the University of Medicine, "Thus, it is mandatory to elucidate the molecular pathogenesis of HCC in order to develop novel therapeutic strategies against this pernicious tumor. Mounting evidence indicates that suppression of the DNA damage response machinery might be deleterious for the survival and growth of the tumor cells. In particular, DNA dependent protein kinase catalytic subunit (DNA-PKcs), a major player in the non-homologous end joining (NHEJ) repair process, seems to represent a valuable target for innovative anti-neoplastic therapies in cancer. DNA-PKcs levels are strongly upregulated and associated with a poor clinical outcome in various tumor types, including HCC. Importantly, DNA-PKcs not only protects tumor cells from harmful DNA insults coming either from the microenvironment or chemotherapeutic drug treatments, but also possesses additional properties, independent from its DNA repair activity, that provide growth advantages to cancer cells. These properties (metabolic and gene reprogramming, invasiveness and metastasis, resistance to apoptosis, etc.) have started to be elucidated. In the present review, we summarize the physiologic and oncogenic roles of DNA-PKcs, with a special emphasis on liver cancer. In particular, this work focuses on the molecular mechanism whereby DNA-PKcs exerts its pro-tumorigenic activity in cancer cells. In addition, the upstream regulator of DNA-PKcs activation as well as its downstream effectors thus far identified are illustrated."

According to the news editors, the research concluded: "Furthermore, the potential therapeutic strategies aimed at inhibiting DNA-PKcs activity in HCC are discussed."

For more information on this research see: DNA-PKcs: A promising therapeutic target in human hepatocellular carcinoma? DNA Repair, 2016;47():12-20. DNA Repair can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; DNA Repair - www.journals.elsevier.com/dna-repair/)

Studies Conducted at University of Ottawa on Heart Disease Recently Reported (Transcriptomic Signature of Atherosclerosis in the Peripheral Blood: Fact or Fiction?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Disease. According to news reporting originating from Ottawa, Canada, by NewsRx correspondents, research stated, "The notion that gene expression signatures in blood can serve as biomarkers of disease states is not new. In the case of atherosclerosis, and coronary artery disease in particular, whether changes in gene expression in peripheral blood mononuclear cells reflects disease processes occurring in the vessel wall remains controversial."

Our news editors obtained a quote from the research from the University of Ottawa, "When comparing 15 studies that identified 706 differentially expressed genes, only 23 genes were replicated in 2 to 3 studies, at most. This low level of replication may reflect sample sizes too small to overcome heterogeneity in the response to disease. Genetic differences affect how each person responds to disease and what genes are altered. Recent studies with larger cohorts (over 5000 individuals) that considered the effect of common genetic variants still could not claim disease signature genes as biomarkers suggesting that even larger case-control studies will be required to achieve the required statistical power. On the other hand, out of 7 studies that identified 58 microRNAs, 12 were concordant in 2 or more studies, suggesting that microRNAs may be less affected by genetic differences and more accurately reflect the disease process."

According to the news editors, the research concluded: "Here, we review the current state of knowledge on expression profiling and its utility for predicting coronary artery disease status and mortality."

For more information on this research see: Transcriptomic Signature of Atherosclerosis in the Peripheral Blood: Fact or Fiction? Current Atherosclerosis Reports, 2016;18(12):74-78. Current Atherosclerosis Reports can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. (Springer - www.springer.com; Current Atherosclerosis Reports - www.springerlink.com/content/1523-3804/)

Studies Conducted at University of Padova on Klinefelter Syndrome Recently Reported (The Klinefelter syndrome is associated with high recurrence of copy number variations on the X chromosome with a potential role in the clinical phenotype)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Genetic Diseases and Conditions - Klinefelter Syndrome are discussed in a new report. According to news originating from Padova, Italy, by NewsRx correspondents, research stated, "The Klinefelter syndrome (KS) is the most frequent sex chromosomal disorder in males, characterized by at least one supernumerary X chromosome (most frequent karyotype 47,XXY). This syndrome presents with a broad range of phenotypes."

Our news journalists obtained a quote from the research from the University of Padova, "The common characteristics include small testes and infertility, but KS subjects are at increased risk of hypogonadism, cognitive dysfunction, obesity, diabetes, metabolic syndrome, osteoporosis, and autoimmune disorders, which are present in variable proportion. Although part of the clinical variability might be linked to a different degree of testicular function observed in KS patients, genetic mechanisms of the supernumerary X chromosome might contribute. Gene-dosage effects and parental origin of the supernumerary X chromosome have been suggested to this regard. No study has been performed analyzing the genetic constitution of the X chromosome in terms of copy number variations (CNVs) and their possible involvement in phenotype of KS. To this aim, we performed a SNP arrays analysis on 94 KS and 85 controls. We found that KS subjects have more frequently than controls X-linked CNVs (39/94, [41.5%] with respect to 12/42, [28.6%] of females, and 8/43, [18.6%] of males, p<0.01). The number of X-linked CNVs in KS patients was 4.58 ? 1.92 CNVs/subject, significantly higher with respect to that found in control females (1.50 ? 1.29 CNVs/subject) and males (1.14 ? 0.37 CNVs/subject). Importantly, 94.4% X-linked CNVs in KS subjects were duplications, higher with respect to control males (50.0%, p<0.001) and females (83.3%, p=0.1). Half of the X-linked CNVs fell within regions encompassing genes and most of them (90%) included genes escaping X-inactivation in the regions of X-Y homology, particularly in the pseudoautosomal region 1 (PAR1) and Xq21.31."

According to the news editors, the research concluded: "This study described for the first time the genetic properties of the X chromosome in KS and suggests that X-linked CNVs (especially duplications) might contribute to the clinical phenotype."

For more information on this research see: The Klinefelter syndrome is associated with high recurrence of copy number variations on the X chromosome with a potential role in the clinical phenotype. Andrology, 2016;4(2):328-34.

Aortic Stenosis

Studies Conducted at University of Texas Health Science Center on Aortic Stenosis Recently Reported (Natural history of 107 cases of fetal aortic stenosis from a European multicenter retrospective study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Aortic Stenosis are discussed in a new report. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Fetal aortic valvuloplasty (FV) aims to prevent fetal aortic valve stenosis progressing into hypoplastic left heart syndrome (HLHS), which results in postnatal univentricular (UV) circulation. Despite increasing numbers of FVs performed worldwide, the natural history of the disease in fetal life remains poorly defined."

Our news editors obtained a quote from the research from the University of Texas Health Science Center, "The primary aim of this study was to describe the natural history of fetal aortic stenosis, and a secondary aim was to test previously published criteria designed to identify cases of emerging HLHS with the potential for a biventricular (BV) outcome after FV. From a European multicenter retrospective study of 214 fetuses with aortic stenosis (2005-2012), 107 fetuses in ongoing pregnancies that did not undergo FV were included in this study and their natural history was reported. We examined longitudinal changes in Z-scores of aortic and mitral valve and left ventricular dimensions and documented direction of flow across the foramen ovale and aortic arch, and mitral valve inflow pattern and any gestational changes. Data were used to identify fetuses satisfying the Boston criteria for emerging HLHS and estimate the proportion of these that would have been ideal FV candidates. We applied the threshold score whereby a score of 1 was assigned to fetuses for each Z-score meeting the following criteria: left ventricular length and width >0; mitral valve diameter >-2; aortic valve diameter >-3.5; and pressure gradient across either the mitral or aortic valve >20 mmHg. We compared the predicted circulation with known survival and final postnatal circulation (BV, UV or conversion from BV to UV). Among the 107 ongoing pregnancies there were eight spontaneous fetal deaths and 99 livebirths. Five were lost to follow-up, five had comfort care and four had mild aortic stenosis not requiring intervention. There was intention-to-treat in these 85 newborns but five died prior to surgery, before circulation could be determined, and thus 80 underwent postnatal procedures with 44 BV, 29 UV and seven BV-to-UV circulatory outcomes. Of newborns with intention-to-treat, 69/85 (81%) survived >= 30 days. Survival at median 6 years was superior in cases with BV circulation (P = 0.041). Those with a postnatal UV circulation showed a trend towards smaller aortic valve diameters at first scan than did the BV cohort (P=0.076), but aortic valve growth velocities were similar in both cohorts to term. In contrast, the mitral valve diameter was significantly smaller at first scan in those with postnatal UV outcomes (P=0.004) and its growth velocity (P = 0.008), in common with the left ventricular inlet length (P = 0.004) and width (P = 0.002), were reduced significantly by term in fetuses with UV compared with BV outcome. Fetal data, recorded before 30 completed gestational weeks, from 70 treated neonates were evaluated to identify emerging HLHS. Forty-four had moderate or severe left ventricular depression and 38 of these had retrograde flow in the aortic arch and two had left-to-right flow.
at atrial level and reversed a-waves in the pulmonary veins. Thus 40 neonates met the criteria for emerging HLHS and BV circulation was documented in 13 (33%). Of these 40 cases, 12 (30%) had a threshold score of 4 or 5, of which five (42%) had BV circulation without fetal intervention. The natural history in our cohort of fetuses with aortic stenosis and known outcomes shows that a substantial proportion of fetuses meeting the criteria for emerging HLHS, with or without favorable selection criteria for FV, had a sustained BV circulation without fetal intervention."

According to the news editors, the research concluded: "This indicates that further work is needed to refine the selection criteria to offer appropriate therapy to fetuses with aortic stenosis."

The news editors report that additional information may be obtained by contacting H.M. Gardiner, Univ Texas Hlth Sci Center Houston UTHlth, McGovern Med Sch, Childrens Mem Hermann Hosp, Fetal Center, Houston, TX, United States. Additional authors for this research include A. Kovacevic, G. Tulzer, T. Sarkola, U. Herberg, J. Dangel, Ouml, A. hman, J. Bartrons, J.S. Carvalho, H. Jicinska, V. Fesslova, I. Averiss and M. Mellander.

**Drugs and Therapies - Antiinfectives**

**Studies Conducted at University of Warmia & Mazury on Antiinfectives Recently Reported [Content of biogenic amines in Lemna minor (common duckweed) growing in medium contaminated with tetracycline]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antiinfectives is now available. According to news originating from Olsztyn, Poland, by NewsRx correspondents, research stated, "Aquatic plants are continuously exposed to a variety of stress factors. No data on the impact of antibiotics on the biogenic amines in duckweed (Lemna minor) have been available so far, and such data could be significant, considering the ecological role of this plant in animal food chains."

Financial support for this research came from National Science Centre Poland.

Our news journalists obtained a quote from the research from the University of Warmia & Mazury, "In the tissues of control (non stressed) nine-day-old duckweed, the following biogenic amines were identified: tyramine, putrescine, cadaverine, spermidine and spermine. Based on the tetracycline contents and the computed EC values, the predicted toxicity units have been calculated. The obtained results demonstrated phytoxicity caused by tetracycline..."
in relation to duckweed growth rate, yield and the contents of chlorophylls a and b. The
carotenoid content was not modified by tetracycline. It was found that tetracycline as a water
pollutant was a stress factor triggering an increase in the synthesis of amines. Tetracycline at 19,
39 and 78 p.M concentrations increased biogenic amine synthesis by 3.5 times. Although the
content of tyramine increased fourteen times with the highest concentration of the drug (and of
 spermidine only three-fold) the increase of spermidine was numerically the highest. Among the
biogenic amines the most responsive to tetracycline were spermine and tyramine, while the least
affected were putrescine and spermidine. Despite putrescine and spermidine being the least
sensitive, their sum of contents increased five-fold compared to the control."

According to the news editors, the research concluded: "These studies suggest that
tetracycline in water reservoirs is taken up by L. minor as the antibiotic clearly modifies the
metabolism of this plant and it may likely pose a risk."

For more information on this research see: Content of biogenic amines in Lemna
minor (common duckweed) growing in medium contaminated with tetracycline. *Aquatic

**Support Vector Machines**

Studies Conducted at Wake Forest University on Support Vector
Machines Recently Reported (Baseline Gray- and White-Matter Volume
Predict Successful Weight Loss in the Elderly)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Researchers detail new data in Support Vector Machines. According to
news reporting originating from Winston Salem, North Carolina, by NewsRx correspondents,
research stated, "The purpose of this study was to investigate whether structural brain
phenotypes could be used to predict weight loss success following behavioral interventions in
older adults with overweight or obesity and cardiometabolic dysfunction. A support vector
machine with a repeated random subsampling validation approach was used to classify
participants into the upper and lower halves of the weight loss distribution following 18 months
of a weight loss intervention."

Our news editors obtained a quote from the research from Wake Forest University,
"Predictions were based on baseline brain gray matter and white matter volume from 52
individuals who completed the intervention and a magnetic resonance imaging session. The support vector machine resulted in an average classification accuracy of 72.62% based on gray matter and white matter volume. A receiver operating characteristic analysis indicated that classification performance was robust based on an area under the curve of 0.82. Findings suggest that baseline brain structure was able to predict weight loss success following 18 months of treatment. The identification of brain structure as a predictor of successful weight loss was an innovative approach to identifying phenotypes for responsiveness to intensive lifestyle interventions."

According to the news editors, the research concluded: "This phenotype could prove useful in future research focusing on the tailoring of treatment for weight loss."

The news editors report that additional information may be obtained by contacting P.J. Laurienti, Wake Forest University, Translat Sci Center, Winston Salem, NC 27109, United States. **Oncology - Prostate Cancer**

**Studies Conducted at Washington State University on Prostate Cancer Recently Reported (Positive and Negative Cross-Talk between Lysophosphatidic Acid Receptor 1, Free Fatty Acid Receptor 4, and Epidermal Growth Factor Receptor in Human Prostate ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting originating from Spokane, Washington, by NewsRx correspondents, research stated, "Lysophosphatidic acid (LPA) is a lipid mediator that mediates cellular effects via G protein-coupled receptors (GPCRs). Epidermal growth factor (EGF) is a peptide that acts via a receptor tyrosine kinase."

Our news editors obtained a quote from the research from Washington State University. "LPA and EGF both induce proliferation of prostate cancer cells and can transactivate each other's receptors. The LPA receptor LPA(1) is particularly important for LPA response in human prostate cancer cells. Previous work in our laboratory has demonstrated that free fatty acid 4 (FFA4), a GPCR activated by omega-3 fatty acids, inhibits responses to both LPA and EGF in these cells. One potential mechanism for the inhibition involves negative interactions between FFA4 and LPA(1), thereby suppressing responses to EGF that require LPA (1). In the current study, we examined the role of LPA(1) in mediating EGF and FFA4 agonist responses in two human prostate cancer cell lines, DU145 and PC-3. The results show that an LPA(1)-selective antagonist inhibits proliferation and migration to both LPA and EGF."
Knockdown of LPA(1) expression, using silencing RNA, blocks responses to LPA and significantly inhibits responses to EGF. The partial response to EGF that is observed after LPA (1) knockdown is not inhibited by FFA4 agonists. Finally, the role of arrestin-3, a GPCR-binding protein that mediates many actions of activated GPCRs, was tested. Knockdown of arrestin-3 completely inhibits responses to both LPA and EGF in prostate cancer cells."

According to the news editors, the research concluded: "Taken together, these results suggest that LPA(1) plays a critical role in EGF responses and that FFA4 agonists inhibit proliferation by suppressing positive cross-talk between LPA(1) and the EGF receptor."

The news editors report that additional information may be obtained by contacting K.E. Meier, Washington State University, Coll Pharm, Dept. of Pharmaceut Sci, Spokane, WA 99210, United States. Additional authors for this research include Z. Liu and K.E. Meier.

Skin Diseases and Conditions - Variegate Porphyria

Studies Conducted at Wroclaw University on Variegate Porphyria Recently Reported (Elective cholecystectomy performed on patient with variegate porphyria-Propofol-based total intravenous anesthesia with target-controlled infusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Skin Diseases and Conditions - Variegate Porphyria is now available. According to news reporting from Wroclaw, Poland, by NewsRx journalists, research stated, "Porphyria is caused by disorders of enzymes that synthetize porphyrins. Both elective and emergency surgical procedures on patient suffering from porphyria may provoke acute symptoms."

The news correspondents obtained a quote from the research from Wroclaw University, "These patients require special anesthetic management since some of commonly used anesthetic agents may also induce acute manifestation of porphyria. We present the case of 53-year-old woman previously diagnosed with porphyria who underwent elective laparoscopic cholecystectomy. Propofol-based total intravenous anesthesia with target-controlled infusion was used. Such conduct proved to be safe regarding clinical symptoms, although biochemical markers were slightly elevated after procedure."
According to the news reporters, the research concluded: "Propofol seems to be the safest hypnotic drug to use in porphyria; however, special care should be taken in such cases."

Our news journalists report that additional information may be obtained by contacting M. Aporowicz, Wroclaw University, Dept. of & Clin Gen Gastroenterol & Endocrine Surg, PL-50369 Wroclaw, Poland. Additional authors for this research include M. Aporowicz, M. Brol, A. Zolnowska and M. Masternak.

**Heart Disorders and Diseases - Atrial Fibrillation**

**Studies Conducted by A. Pilotto et al on Atrial Fibrillation Recently Reported (Warfarin Treatment and All-Cause Mortality in Community-Dwelling Older Adults with Atrial Fibrillation: A Retrospective Observational Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting out of Genoa, Italy, by NewsRx editors, research stated, "To investigate the relationship between warfarin treatment and different strata of all-cause mortality risk assessed using the Multidimensional Prognostic Index (MPI) based on information collected using the Standardized Multidimensional Assessment Schedule for Adults and Aged Persons (SVaMA) in community-dwelling older adults with atrial fibrillation (AF). Retrospective observational study."

Financial supporters for this research include MPI_Age European project, Health and Consumers of the European Innovation Partnership on Active, Healthy Ageing Second Health Programme.

Our news journalists obtained a quote from the research, "Older community-dwelling adults who underwent a SVaMA evaluation establishing accessibility to homecare services and nursing home admission from 2005 to 2013 in the Padova Health District, Italy. Community-dwelling individuals with AF aged 65 and older (N = 1,827). Participants were classified as being at mild (MPI-SVaMA-1), moderate (MPI-SVaMA-2), or severe (MPI-SVaMA-3) risk of mortality using the MPI-SVaMA, a validated prognostic tool based on age, sex, comorbidity, cognitive status, mobility and functional disability, pressure sore risk, and social support. The association between warfarin treatment and mortality was tested using multivariate-and
propensity score-adjusted Cox regression models, controlling for age, sex, all SVaMA domains, concomitant diseases, and drug treatments. Higher MPI-SVaMA scores were associated with lower rates of warfarin treatment and higher 3-year mortality. After adjustment for propensity score quintiles, warfarin treatment was significantly associated with lower 2-year mortality in individuals with MPI-SVaMA-1 (hazard ratio (HR) = 0.64, 95% confidence interval (CI) = 0.50-0.82), MPI-SVaMA-2 (HR = 0.68, 95% CI = 0.55-0.85), and MPI-SVaMA-3 (HR = 0.55, 95% CI = 0.44-0.67). Heterogeneity analyses confirmed that the effect of warfarin treatment was not different between MPI-SVaMA groups (P for heterogeneity = .48). Community-dwelling older adults with AF benefitted from anticoagulation in terms of lower all-cause mortality over a mean follow-up of 2 years, regardless of poor health and functional condition."

According to the news editors, the research concluded: "Although this benefit can be ascribed to the treatment, it may also reflect better overall care."

Our news journalists report that additional information may be obtained by contacting A. Pilotto, EO Galliera Hosp Natl Relevance & High Specializa, Frailty Area, Dept. of Geriatr Care Orthogeriatr & Rehabil, Genoa, Italy. Additional authors for this research include P. Gallina, M. Copetti, A. Pilotto, F. Marcato, A.M. Mello, M. Simonato, G. Logroscino, A. Padovani, L. Ferrucci and F. Panza.

Gastroenterology - Hernias

Studies Conducted by D.S. Mous et al on Hernias Recently Reported (Clinically relevant timing of antenatal sildenafil treatment reduces pulmonary vascular remodeling in congenital diaphragmatic hernia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gastroenterology - Hernias. According to news reporting originating in Brussels, Belgium, by NewsRx journalists, research stated, "Patients with congenital diaphragmatic hernia (CDH) suffer from severe pulmonary hypertension attributable to altered development of the pulmonary vasculature, which is often resistant to vasodilator therapy. Present treatment starts postnatally even though significant differences in the pulmonary vasculature are already present early during pregnancy."
Financial support for this research came from Sophia Foundation for Medical Research.

The news reporters obtained a quote from the research, "We examined the effects of prenatal treatment with the phosphodiesterase-5 inhibitor sildenafil on pulmonary vascular development in experimental CDH starting at a clinically relevant time. The well-established, nitrofen-induced CDH rodent model was treated daily with 100 mg/kg sildenafil from day 17.5 until day 20.5 of gestation (E17.5-20.5). Importantly, this timing perfectly corresponds to the developmental stage of the lung at 20 wk of human gestation, when CDH is detectable by 2D-ultrasonography and/or MRI. At E21.5 pups were delivered by caesarean section and euthanized by lethal injection of pentobarbital. The lungs were isolated and subsequently analyzed using immunostaining, real-time PCR, and volume measurements. Prenatal treatment with sildenafil improved lung morphology and attenuated vascular remodeling with reduced muscularization of the smaller vessels. Pulmonary vascular volume was not affected by sildenafil treatment. We show that prenatal treatment with sildenafil within a clinically relevant period improves pulmonary vascular development in an experimental CDH model."

According to the news reporters, the research concluded: "This may have important implications for the management of this disease and related pulmonary vascular diseases in human."

For more information on this research see: Clinically relevant timing of antenatal sildenafil treatment reduces pulmonary vascular remodeling in congenital diaphragmatic hernia. American Journal of Physiology-Lung Cellular and Molecular Physiology, 2016;311(4):L734-L742. Proteomics

Studies Conducted by F. Tisato et al on Proteomics Recently Reported
[Electrospray ionization in the study of the interactions between cytotoxic phosphino Cu(I) complexes and selected amino acids and GlyGlyHis peptide model]
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteomics. According to news originating from Padua, Italy, by NewsRx correspondents, research stated, "Tetrahedral [Cu(P)(4)][BF4]-type complexes (P = tertiary phosphine) are a class of monopositively charged compounds that have shown notable antitumor activity in both in vitro and in vivo tests. This biological property appears to be related to the peculiar physicochemical characteristics of these compounds."

Our news journalists obtained a quote from the research, "Although thermodynamically stable, they are labile at micromolar concentrations. Such a behavior allows the Cu(I) ion in [Cu(P)(n)](+ assemblies (n < 4) to interact with surrounding molecules, including the rich peptide/protein environment that metal complexes have to face in the physiological milieu on the way to tumor cells. The scope of this investigation was to study the interaction products that originate from the treatment in water/methanol mixtures of representative phosphino Cu(I) compounds with an excess of individual amino acids (AAs) selected on the basis of the donor atom likely involved in metal coordination (i.e. O-glycine, S-methionine, and N-histidine). These interactions have been investigated in electrospray ionization mass spectrometry (ESI-MS), mainly in the positive ion mode [ESI(+)-MS], and the interaction products have been characterized by sequential collisional experiments, performed by an ion trap instrument. Histidine and methionine, but not glycine, were able to mine Cu(I) from [Cu(P)(n)](+) assemblies through the formation of mixed [Cu(P)(AA)](+) and eventually [CuI(AA)(2)](+) adducts. The ability to substitute phosphine(s) by AAs and the strongest affinity for Cu(I) was proved by the study of the energetics of collisional-induced decomposition (CID) reactions [CuI(P)(AA)](+) -> [CuI(AA) + P](+). Among the investigated AAs, histidine displayed the strongest affinity for Cu(I). Transchelation of Cu(I) was similarly observed when [Cu(P)(n)](+) species were treated with the model tripeptide GlyGlyHis (GGH), the most investigated member of the amino terminal Cu(II) and Ni(II) (ATCUN) peptide family. GGH was able to form robust metal adducts not only with Cu(ii) and the related divalent Zn(II) and Ni (II) ions, but also with monovalent ions, including Cu(I) and Ag(I). CID pathways of [CuI(GGH)](+) and [Ag-I(GGH)](+) were qualitatively superimposable and proceeded through losses of neutral fragments. Similar losses of neutral fragments were observed from [Zn-II(GGH)] and [Ni-II(GGH)]."

According to the news editors, the research concluded: "CID pathways of [Cu-II(GGH)](-/+) adducts instead took place mainly through intramolecular electron-transfer reactions comprising the reduction of Cu(II) to Cu(I) and the formation of fragment radical cations."

The news correspondents report that additional information may be obtained from F. Tisato, CNR ICMATE, I-35127 Padua, Italy. Additional authors for this research include V. Peruzzo, G. Zanchetta, S. Tamburini, P. Traldi and M. Porchia.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1255/ejms.1441. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Padua, Italy, Europe, Essential Amino Acids, Cyclic Amino Acids, Proteomics, Histidine, Proteins, Peptides.
Studies Conducted by M. Mohsena et al on Public Health Nutrition Recently Reported [Maternal nutritional status (as measured by height, weight and BMI) in Bangladesh: trends and socio-economic association over the period 1996 to 2007]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Public Health Nutrition have been published. According to news reporting from Dhaka, Bangladesh, by NewsRx journalists, research stated, "To analyse trends in maternal nutritional status in Bangladesh over a 12-year period and to examine the associations between nutritional status and socio-economic variables. Maternal nutritional status indicators were height, weight and BMI."

The news correspondents obtained a quote from the research, "Socio-economic variables used were region, residency, education and occupation of the mothers and their husbands, house type, and possession score in the household. Bangladesh Demographic and Health Surveys (1996, 2000, 2004 and 2007) were the source of data. A total of 16 278 mothers were included. All of the socio-economic variables showed significant associations with maternal nutritional status indicators. Regional variation was found to be present; all three indicators were found to be lowest in the Sylhet division. Upward trends in maternal height, weight and BMI were evident from no possessions to four possessions in households, and for no education to higher education of women and their husbands. Bangladeshi mothers measured in 2007 were found to be on average 0.34 cm taller and 3.36 kg heavier than mothers measured in 1996. Between 1996 and 2007 maternal underweight fell from nearly 50% to just over 30% while overweight and obesity increased from about 3% to over 9% (WHO cut-offs) or from 7% to nearly 18% (Asian cut-offs). The study reveals that over the 12-year period in Bangladesh there has been a substantial reduction in maternal underweight accompanied by a considerable increase in obesity."

According to the news reporters, the research concluded: "It is also evident that malnutrition in Bangladesh is a multidimensional problem that warrants a proper policy mix and programme intervention."

Our news journalists report that additional information may be obtained by contacting M. Mohsena, Ibrahim Med College, Dept. of Community Med, Dhaka, Bangladesh. Additional authors for this research include R. Goto and C.G.N. Mascie-Taylor.

Studies Conducted by M.J. Beinema et al on Algorithms Recently Reported (Optimization of vitamin K antagonist drug dose finding by replacement of the international normalized ratio by a bidirectional factor: validation of a new algorithm)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Algorithms. According to news reporting originating in Deventer, Netherlands, by NewsRx journalists, research stated, "ESSENTIALS: We developed a new algorithm to optimize vitamin K antagonist dose finding. Validation was by comparing actual dosing to algorithm predictions."

The news reporters obtained a quote from the research, "Predicted and actual dosing of well performing centers were highly associated. The method is promising and should be tested in a randomized trial. Oral vitamin K antagonists (VKAs) have a narrow therapeutic window and thus require frequent monitoring of its intensity by the international normalized ratio (INR). Improvement of VKA dosing defined as more time in therapeutic range (TTR) can reduce thrombotic disease and bleeding. Computerized decision support programs (CDSs) are used to optimize VKA dosing, but the effects are heterogeneous. CDSs significantly improve the proportion of time in the therapeutic INR range for initiation therapy but not the quality of anticoagulant management in an outpatient setting. One of the major problems of VKA dose finding is that the INR is a ratio and does not present linearity. We developed a new dose-finding algorithm, based on a novel bidirectional factor (BF). This BF is linear transformation of the nonlinear INR. We compared the outcomes of the new algorithm, called BF-N, with dose finding performed at three highly ranked Dutch anticoagulation centers, using both acenocoumarol and phenprocoumon. The outcomes of the BF-N algorithm showed a linear correlation with VKA doses of the three centers (y=1.001x, r(2) 0.999 for acenocoumarol and y=0.999x, r(2) 0.999 for phenprocoumon), with a standard deviation of 3.83%. The rate of automated dosage proposals increased to 100%. The BF-N algorithm performs well in real-life settings and increases the rate of automated dosage proposals. The algorithm can be easily built into existing CDSs. Experienced staff remains necessary for complicated situations."

According to the news reporters, the research concluded: "The new algorithm needs to be evaluated in a prospective trial."

Our news correspondents report that additional information may be obtained by contacting M.J. Beinema, Thrombosis Centre Deventer Hospital, Deventer, Netherlands. Additional authors for this research include F.J. van der Meer, J.R. Brouwers and F.R Rosendaal.

Studies by A. Stengel and Co-Authors Describe New Findings in Genetics and Cancer (The 5q Deletion Size in Myeloid Malignancies Is Correlated to Additional Chromosomal Aberrations and to TP53 Mutations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Genetics - Genetics and Cancer have been presented. According to news originating from Munich, Germany, by NewsRx correspondents, research stated, "Deletions in the long arm of chromosome 5 (del(5q)) are recurrent abnormalities in myeloid malignancies. We analyzed del(5q) and accompanying molecular mutations in MDS, MPN and MDS/MPN cases."

Our news journalists obtained a quote from the research, "A high del(5q) frequency was revealed in MDS (1869/11398 cases; 16%), followed by MDS/MPN (37/1107; 3%) and MPN (97/6373; 2%). To investigate potential associations of the del(5q) size with the respective phenotypes, we applied array CGH analyses in selected cohorts of 61 MDS, 22 MDS/MPN and 23 MPN cases. The size varied between 16 and 119 Mb with no differences between the entities. However, MPN and MDS/MPN cases with del(5q) sole showed a significantly smaller del(5q) than cases with additional aberrations. Sequence analysis of 27 genes revealed >= 1 mutation in 91% of patients. The highest mutation frequencies in the total cohort were observed for TP53 (31%), JAK2 (23%) and DNMT3A (18%). The molecular mutation patterns in the del (5q) cohorts were different between the entities but resembled known patterns of cohorts not selected for del(5q). Further, TP53 mutations were significantly more frequent in cases with a larger deletion size (P=0.003)."

According to the news editors, the research concluded: "The results suggest a correlation of large del(5q) with TP53 mutations and with additional chromosomal aberrations possibly contributing to more severe courses of these cases."

For more information on this research see: The 5q Deletion Size in Myeloid Malignancies Is Correlated to Additional Chromosomal Aberrations and to TP53 Mutations. Genes Chromosomes & Cancer, 2016;55(10):777-785. Genes Chromosomes & Cancer can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Studies by H. Cai and Co-Authors Describe New Findings in Thrombosis and Hemostasis (Usefulness of Flow Cytometric Mepacrine Uptake/Release Combined with CD63 Assay in Diagnosis of Patients with Suspected Platelet Dense Granule Disorder)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Thrombosis and Hemostasis. According to news reporting from Nancy, France, by NewsRx journalists, research stated, "Dense granule disorder is one of the most common platelet abnormalities, resulting from dense granule deficiency or secretion defect. This study was aimed to evaluate the clinical usefulness of the flow cytometric combination of mepacrine uptake/release assay and CD63 expression detection in the management of patients with suspected dense granule disorder."

The news correspondents obtained a quote from the research, "Over a period of 5 years, patients with abnormal platelet aggregation and/or reduced adenosine triphosphate (ATP) secretion suggestive of dense granule disorder were consecutively enrolled. The flow cytometric assays were systematically performed to further investigate dense granule functionality. Among the 26 included patients, 18 cases showed impaired mepacrine uptake/release and reduced CD63 expression on activated platelets, consistent with d-storage pool deficiency (SPD). Another seven patients showed decrease in mepacrine release and CD63 expression but mepacrine uptake was normal, indicating secretion defect rather than d-SPD. Unfortunately, ATP secretion could not be measured in 7 out of the 26 patients due to insufficient sample and/or severe thrombocytopenia. This test combination provides a rapid and effective method to detect the heterogeneous abnormalities of platelet dense granule by distinguishing between storage and release defects."

According to the news reporters, the research concluded: "This combination is particularly advantageous for severely thrombocytopenic patients and pediatric patients in which only minimal sample is required."

For more information on this research see: Usefulness of Flow Cytometric Mepacrine Uptake/Release Combined with CD63 Assay in Diagnosis of Patients with Suspected Platelet Dense Granule Disorder. *Seminars In Thrombosis and Hemostasis*, 2016;42(3):282-91. (Thieme - www.thieme.com)

Our news journalists report that additional information may be obtained by contacting H. Cai, Service d'Hematologie Biologique, CHRU Nancy, Nancy, France. Studies by M.J. Kilsdonk and Co-Authors Describe New Findings in Cancer Research (Two decades of external peer review of cancer care in general hospitals; the Dutch experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Research have been published. According to news originating from Utrecht, Netherlands, by NewsRx correspondents, research stated, "External peer review was introduced in general hospitals in the Netherlands in 1994 to assess and improve the multidisciplinary team approach in cancer care. This paper aims to explore the value, perceived impact, and (future) role of external peer review in cancer care."

Our news journalists obtained a quote from the research, "Semistructured interviews were held with clinicians, oncology nurses, and managers from fifteen general hospitals that participated in three rounds of peer review over a period of 16?years. Interviewees reflected on the goals and expectations, experiences, perceived impact, and future role of external peer review. Transcriptions of the interviews were coded to discover recurrent themes. Improving clinical care and organization were the main motives for participation. Positive impact was perceived on multiple aspects of care such as shared responsibilities, internal prioritization of cancer care, improved communication, and a clear structure and position of cancer care within general hospitals. Establishing a direct relationship between the external peer review and organizational or clinical impact proved to be difficult. Criticism was raised on the content of the program being too theoretical and organization-focused after three rounds. According to most stakeholders, external peer review can improve multidisciplinary team work in cancer care; however, the acceptance is threatened by a perceived disbalance between effort and visible clinical impact."

According to the news editors, the research concluded: "Leaner and more clinically focused programs are needed to keep repeated peer reviews challenging and worthwhile."

The news correspondents report that additional information may be obtained from M.J. Kilsdonk, Dept. of Research, Netherlands Comprehensive Cancer Organisation, Utrecht, Netherlands. Additional authors for this research include S. Siesling, R. Otter and W.H van Harten.

Studies by T. Chita and Co-Authors Describe New Findings in Diabetes
(Urinary tract infections in Romanian patients with diabetes: prevalence, etiology, and risk factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Diabetes. According to news originating from Timisoara, Romania, by NewsRx correspondents, research stated, "Patients with diabetes mellitus (DM) have an increased risk of infections, especially urinary tract infections (UTIs). The aim of this study was to assess the prevalence and etiology of UTIs and identify the risk factors for their development in patients with DM."

Our news journalists obtained a quote from the research, "In this retrospective, noninterventional study, the medical records of 2,465 adult patients with DM who were hospitalized in a Diabetes Clinic were reviewed. Data regarding the presence of UTI and possible associated risk factors were collected and their possible relation was analyzed. The study protocol and procedures were approved by the Ethics Committee of Timisoara Emergency Hospital. All data were collected and analyzed using SPSS v. 17 statistical software. The prevalence of UTIs in patients with DM was 12.0% (297 cases), being higher in females than in males and higher in patients with type 2 DM compared with patients with type 1 DM. In univariate logistic regression analysis, risk factors associated with UTIs were female gender, age, type 2 DM, longer duration of DM, and the presence of chronic kidney disease and coronary artery disease. Multivariate analysis identified age, duration of DM, and metabolic control (hemoglobin A1c levels) as independent risk factors for UTIs. The gram-negative bacilli from the Enterobacteriaceae family were predominant, with Escherichia coli being the most frequent of them (70.4%). UTIs are a frequent condition associated with DM."

According to the news editors, the research concluded: "It is necessary to improve the care and the screening of UTIs in patients with DM to prevent the occurrence of possible associated severe renal complications."

For more information on this research see: Urinary tract infections in Romanian patients with diabetes: prevalence, etiology, and risk factors. Therapeutics and Clinical Risk Management, 2017;13():1-7. Therapeutics and Clinical Risk Management can be contacted at: Dove Medical Press Ltd, PO Box 300-008, Albany, Auckland 0752, New Zealand.

Drugs and Therapies - Fluoxetine Therapy

Studies by X.Y. Wang and Co-Authors Describe New Findings in Fluoxetine Therapy (Repeated acupuncture treatments modulate amygdala resting state functional connectivity of depressive patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Fluoxetine Therapy have been published. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "As a widely-applied alternative therapy, acupuncture is gaining popularity in Western society. One challenge that remains, however, is incorporating it into mainstream medicine."

Financial support for this research came from South Korean Health Ministry.

The news correspondents obtained a quote from the research, "One solution is to combine acupuncture with other conventional, mainstream treatments. In this study, we investigated the combination effect of acupuncture and the antidepressant fluoxetine, as well as its underlying mechanism using resting state functional connectivity (rsFC) in patients with major depressive disorders. Forty-six female depressed patients were randomized into a verum acupuncture plus fluoxetine or a sham acupuncture plus fluoxetine group for eight weeks. Resting-state fMRI data was collected before the first and last treatments. Results showed that compared with those in the sham acupuncture treatment, verum acupuncture treatment patients showed 1) greater clinical improvement as indicated by Montgomery-Asberg Depression Rating Scale (MADRS) and Self-Rating Depression Scale (SDS) scores; 2) increased rsFC between the left amygdala and subgenual anterior cingulate cortex (sgACC)/pregenual anterior cingulate cortex (pgACC); 3) increased rsFC between the right amygdala and left parahippocampus (Para)/putamen (Pu). The strength of the amygdala-sgACC/pgACC rsFC was positively associated with corresponding clinical improvement (as indicated by a negative correlation with MADRS and SDS scores)."

According to the news reporters, the research concluded: "Our findings demonstrate the additive effect of acupuncture to antidepressant treatment and suggest that this effect may be achieved through the limbic system, especially the amygdala and the ACC."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.nicl.2016.07.011. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from A.J. Marti-Carvajal et al Further Understanding of Sickle Cell Anemia (Antibiotics for treating osteomyelitis in people with sickle cell disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematologic Diseases and Conditions - Sickle Cell Anemia is now available. According to news reporting out of Valencia, Venezuela, by NewsRx editors, research stated, "Osteomyelitis (both acute and chronic) is one of the most common infectious complications in people with sickle cell disease. There is no standardized approach to antibiotic therapy and treatment is likely to vary from country to country."

Our news journalists obtained a quote from the research, "Thus, there is a need to identify the efficacy and safety of different antibiotic treatment approaches for people with sickle cell disease suffering from osteomyelitis. This is an update of a previously published Cochrane Review. To determine whether an empirical antibiotic treatment approach (monotherapy or combination therapy) is effective and safe as compared to pathogen-directed antibiotic treatment and whether this effectiveness and safety is dependent on different treatment regimens, age or setting. Search methods We searched The Group's Haemoglobinopathies Trials Register, which comprises references identified from comprehensive electronic database searches and handsearching of relevant journals and abstract books of conference proceedings. We also searched the LILACS database (1982 to 20 October 2016), African Index Medicus (20 October 2016), ISI Web of Knowledge (20 October 2016) and World Health Organization International Clinical Trials Registry Platform (20 October 2016). Date of most recent search of the Cochrane Cystic Fibrosis and Genetic Disorders Group's Haemoglobinopathies Trials Register: 18 August 2016. Selection criteria We searched for published or unpublished randomised and quasi-randomised controlled trials. Data collection and analysis Each author intended to independently extract data and assess trial quality by standard Cochrane methodologies, but no eligible randomised controlled trials were identified. This update was unable to find any randomised or quasi-randomised controlled trials on antibiotic treatment approaches for osteomyelitis in people with sickle cell disease. Authors' conclusions We were unable to identify any relevant trials on the efficacy and safety of the antibiotic treatment approaches for people with sickle cell disease suffering from osteomyelitis."

According to the news editors, the research concluded: "Randomised controlled trials are needed to establish the optimum antibiotic treatment for this condition."

For more information on this research see: Antibiotics for treating osteomyelitis in people with sickle cell disease. Cochrane Database of Systematic Reviews, 2016;(11):2141-2156. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by contacting A.J. Marti-Carvajal, Iberoamer Cochrane Network, Valencia, Venezuela.

Studies from A.M. Saillenfait and Colleagues Provide New Data on Toxicology and Pharmacology (4-Week repeated dose oral toxicity study of N-ethyl-2-pyrrolidone in Sprague Dawley rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Toxicology and Pharmacology. According to news reporting out of Vandoeuvre les Nancy, France, by NewsRx editors, research stated, "The solvent N-ethyl-2-pyrrolidone (NEP) was evaluated in a 4-week repeated dose study in rats. NEP diluted in distilled water was orally administered by gavage to male and female Sprague-Dawley rats at doses of 0 (vehicle control), 5, 50, and 250 mg/kg/day for 28 consecutive days."

Our news journalists obtained a quote from the research, "Transient decreases in the body weight and in the body weight gain of the males was observed during the first days of treatment at the 50 and 250 mg/kg/day doses. There was a marked increase in urine volume at the beginning of treatment in males and female rats at doses of 50 and 250 mg/kg/day. No biologically significant differences were observed in hematological and clinical chemistry values in males and females at necropsy. Histological examination revealed an increase in hyaline droplets in the renal tubules of the kidneys and hepatocellular centrilobular hypertrophy in the liver of males at 250 mg/kg/day. Cytochrome P450 concentration in liver microsomes was slightly increased at 250 mg/kg/day in males."

According to the news editors, the research concluded: "The results of this study demonstrate that NEP has mild to no effects at doses up to 250 mg/kg/day when administered orally to rats for 28 days with males being more susceptible than females."

For more information on this research see: 4-Week repeated dose oral toxicity study of N-ethyl-2-pyrrolidone in Sprague Dawley rats. Regulatory Toxicology and Pharmacology, 2016;81():275-283. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Studies from A.P. Canton and Colleagues Yield New Information about Anterior Pituitary Hormones (Good response to long-term therapy with growth hormone in a patient with 9p trisomy syndrome: A case report and review of the literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hormones - Anterior Pituitary Hormones are discussed in a new report. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "The 9p trisomy syndrome is a rare condition, clinically characterized by a wide range of dysmorphic features, intellectual disability, and, in most patients, by short stature. Recombinant human growth hormone (rhGH) therapy is still controversial in syndromic disorders, the reason for which it is not currently indicated."

Funders for this research include Sao Paulo Research Foundation (FAPESP), National Council for Scientific and Technological Development (CNPq).

Our news journalists obtained a quote from the research, "Here we report a 7-year-old boy with 9p trisomy syndrome and marked short stature. Results of routine laboratory assessments were normal. IGF1 and IGFBP3 levels were both in the normal range (-1.6 and -0.7 SDS, respectively). GH peak in response to oral clonidine stimulation test was 3.5 mg/L, which is considered a normal response. Chromosomal analysis revealed the karyotype 47,XY, + del(9)(pter-q11:) dn. SNP array data indicated absence of mosaicism [arr 9p24.3-p13.1 (203,861-38,787,480) x3]. By the age of 8.3 years, the patient had persistent short stature (-2.9 SDS) with normal growth velocity (4.9 cm/y; -0.7 SDS), not showing spontaneous catch-up. After 5.6 years of rhGH therapy (50 mg/kg/d), height SDS improved from -2.9 to -1.0. This result suggests that rhGH therapy could be considered for patients with 9p trisomy syndrome who present with short stature. The degree of intellectual disability and the potential for social inclusion should be taken into account when recommending this treatment."

According to the news editors, the research concluded: "Additional studies are needed to establish the benefits of height gain in these patients."

The news correspondents report that additional information may be obtained from A.P. Canton, Unidade de Endocrinologia Genetica, Laboratorio de Endocrinologia Celular e Molecular LIM, 25, Disciplina de Endocrinologia da Faculdade de Medicina da Universidade de Sao Paulo, Sao Paulo, Brazil. Additional authors for this research include M.Y. Nishi, T.K. Furuya, R.A. Roela and A.A Jorge.

Studies from A.V. Ivachtchenko and Co-Researchers Yield New Data on Alzheimer Disease (AVN-211, Novel and Highly Selective 5-HT6 Receptor Small Molecule Antagonist, for the Treatment of Alzheimer's Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting originating in Hallandale Beach, Florida, by NewsRx journalists, research stated, "Within the past decade several novel targets have been indicated as key players in Alzheimer-type dementia and associated conditions, including a 'frightening' memory loss as well as severe cognitive impairments. These proteins are deeply implicated in crucial cell processes, e.g., autophagy, growth and progression, apoptosis, and metabolic equilibrium."

The news reporters obtained a quote from the research, "Since recently, 5-HT6R has been considered as one of the most prominent biological targets in AD drug therapy. Therefore, we investigated the potential procognitive and neuroprotective effects of our novel selective 5-HT6R antagonist, AVN-211. During an extensive preclinical evaluation the lead compound demonstrated a relatively high therapeutic potential and improved selectivity toward 5-HT6R as compared to reference drug candidates. It was thoroughly examined in different in vivo behavioral models directly related to AD and showed evident improvements in cognition and learning. In many cases, the observed effect was considerably greater than that determined for the reported drugs and drug candidates, including memantine, SB-742457, and Lu AE58054, evaluated under the same conditions. In addition, AVN-211 showed a similar or better anxiolytic efficacy than fenobam, rufinamide, lorazepam, and buspirone in an elevated plus-maze model, elevated platform, and open field tests. The compound demonstrated low toxicity and no side effects in vivo, an appropriate pharmacokinetic profile, and stability."

According to the news reporters, the research concluded: "AVN-211 significantly delayed or partially halted the progressive decline in memory function associated with AD, which makes it an interesting drug candidate for the treatment of neurodegenerative and psychiatric disorders. Advanced clinical trials are currently under active discussion and in high priority."

For more information on this research see: AVN-211, Novel and Highly Selective 5-HT6 Receptor Small Molecule Antagonist, for the Treatment of Alzheimer's Disease. Molecular Pharmaceutics, 2016;13(3):945-63. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

Studies from ATTIKON University Hospital Add New Findings in the Area of Bone Disease (Modern Palliative Treatments for Metastatic Bone Disease: Awareness of Advantages, Disadvantages, and Guidance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Bone Disease is the subject of a report. According to news reporting originating from Bologna, Italy, by NewsRx correspondents, research stated, "Metastatic disease is the most common malignancy of the bone. Prostate, breast, lung, kidney, and thyroid cancer account for 80% of skeletal metastases."

Our news editors obtained a quote from the research from ATTIKON University Hospital, "Bone metastases are associated with significant skeletal morbidity including severe bone pain, pathologic fractures, spinal cord or nerve roots compression, and malignant hypercalcemia. These events compromise greatly the quality of life of the patients. The treatment of cancer patients with bone metastases is mostly aimed at palliation. This article aims to present these palliative treatments for the patients with bone metastases, summarize the clinical applications, and review the techniques and results. It gives an extensive overview of the possibilities of palliation in patients with metastatic cancer to the bone. Currently, modern treatments are available for the palliative management of patients with metastatic bone disease. These include modern radiation therapy, chemotheraphy, embolization, electrochemotherapy, radiofrequency ablation, and high-intensity focused ultrasound."

According to the news editors, the research concluded: "As such it is of interest for all physicians with no experience with these developments to make palliative procedures safer and more reliable."

The news editors report that additional information may be obtained by contacting A.F. Mavrogenis, *First Dept. of Orthopaedics, ATTIKON University Hospital, Athens University Medical School, Athens, Greece†Dept. of Orthopaedics, University of Bologna, Istituto Ortopedico Rizzoli, Bologna, Italy. Additional authors for this research include A. Angelini, C. Vottis, E. Pala, T. Calabro, P.J. Papagelopoulos and P. Ruggieri.

Studies from Aarhus University Add New Findings in the Area of Clinical Trials and Studies [Anesthetic strategy during endovascular therapy: General anesthesia or conscious sedation? (GOLIATH - General or Local Anesthesia in Intra Arterial ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news reporting originating in Aarhus, Denmark, by NewsRx journalists, research stated, "Endovascular therapy after acute ischemic stroke due to large vessel occlusion is now standard of care. There is equipoise as to what kind of anesthesia patients should receive during the procedure."

The news reporters obtained a quote from the research from Aarhus University, "Observational studies suggest that general anesthesia is associated with worse outcomes compared to conscious sedation. However, the findings may have been biased. Randomized clinical trials are needed to determine whether the choice of anesthesia may influence outcome. Aim and hypothesis: The objective of GOLIATH (General or Local Anesthesia in Intra Arterial Therapy) is to examine whether the choice of anesthetic regime during endovascular therapy for acute ischemic stroke influence patient outcome. Our hypothesis is that that conscious sedation is associated with less infarct growth and better functional outcome. GOLIATH is an investigator-initiated, single-center, randomized study. Patients with acute ischemic stroke, scheduled for endovascular therapy, are randomized to receive either general anesthesia or conscious sedation. Study outcomes: The primary outcome measure is infarct growth after 48-72 h (determined by serial diffusion-weighted magnetic resonance imaging). Secondary outcomes include 90-day modified Rankin Scale score, time parameters, blood pressure variables, use of vasopressors, procedural and anesthetic complications, success of revascularization, radiation dose, and amount of contrast media. Choice of anesthesia may influence outcome in acute ischemic stroke patients undergoing endovascular therapy. The results from this study may guide future decisions regarding the optimal anesthetic regime for endovascular therapy."

According to the news reporters, the research concluded: "In addition, this study may provide preliminary data for a multicenter randomized trial."

Our news correspondents report that additional information may be obtained by contacting C.Z. Simonsen, Aarhus University, Dept. of Neurol, Aarhus, Denmark. Additional authors for this research include L.H. Sorensen, N. Juul, S.P. Johnsen, A.J. Yoo, G. Andersen and M. Rasmussen.

Oncology - Invasive Carcinoma

Studies from Aarhus University Add New Findings in the Area of Invasive Carcinoma (Co-expression of p16 and p53 characterizes aggressive subtypes of ductal intraepithelial neoplasia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Invasive Carcinoma have been presented. According to news reporting out of Aarhus, Denmark, by NewsRx editors, research stated, "In the USA alone, approximately 61,000 new diagnoses of ductal intraepithelial neoplasia 1c-3 (DIN) are made each year. Around 10-20 % of the patients develop a recurrence, about 50 % of which are invasive."

Our news journalists obtained a quote from the research from Aarhus University, "Prior studies have shown that invasive breast carcinomas positive for p16 or p53 have a higher frequency of recurrence and a more aggressive course; however, the co-expression of these markers across the entire spectrum of DIN and its potential correlation with grade of the lesions has not been studied previously. Immunohistochemical staining for p16 and p53 was evaluated on 262 DIN lesions from 211 cases diagnosed between 1991 and 2008. The lesions ranged from DIN1b (atypical intraductal hyperplasia) to DIN3 (DCIS, grade 3) and included 45 cases with associated invasive carcinoma. Frequency of staining for both p16 and p53 increased with increasing grade of DIN. Strong co-expression was found exclusively in higher grade DIN lesions (DIN2 and DIN3) particularly those associated with periductal stromal fibrosis and lymphocytic infiltrate. Strong co-expression was seen in 8 of 12 DIN3 lesions (67 %) associated with invasive carcinoma."

According to the news editors, the research concluded: "Co-expression of p16 and p53 increases with advancing grade of DIN and is maximal in high grade DIN lesions associated with invasive carcinoma, indicating a more aggressive phenotype. A distinctive variant of DIN with periductal fibrosis and lymphocytic infiltrate invariably falls into the high-grade category, based on either morphology or marker expression. Co-expression of p16/p53 may be of help in distinguishing between high-grade and low-grade DIN lesions."

Our news journalists report that additional information may be obtained by contacting T. Tramm, Aarhus University, Dept. of Pathol, DK-8000 Aarhus C, Denmark.
Studies from Aarhus University in the Area of Cardiology Reported (Risk Associated With Surgery Within 12 Months After Coronary Drug-Eluting Stent Implantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiology are discussed in a new report. According to news reporting originating from Aarhus, Denmark, by NewsRx correspondents, research stated, "Guidelines recommend postponing surgery for at least 6 months after treatment with a drug-eluting stent by percutaneous coronary intervention (DES-PCI). The goal of this study was to evaluate the surgical risk associated with DES-PCI compared with that in nonstented patients without ischemic heart disease (IHD)."

Our news editors obtained a quote from the research from Aarhus University, "Between 2005 and 2012, a total of 22,590 patients underwent DES-PCI in western Denmark. By record-linking the Western Denmark Heart Registry and the Danish National Patient Register, we evaluated 4,303 DES-PCI-treated patients with a surgical procedure and compared them with a control group of patients without previous IHD undergoing similar surgical procedures (n = 20,232). Events of interest were myocardial infarction (MI), cardiac death, and all-cause mortality within 30 days after surgery. Surgery in DES-PCI-treated patients was associated with an increased risk of MI (1.6% vs. 0.2%; odds ratio [OR]: 4.82; 95% confidence interval [CI]: 3.25 to 7.16) and cardiac death (1.0% vs. 0.2%; OR: 5.87; 95% CI: 3.60 to 9.58) but not all-cause mortality (3.1% vs. 2.7%; OR: 1.12; 95% CI: 0.91 to 1.38). When stratified for time from PCI to surgery, only surgery within the first month was associated with a significant increased risk of events. Patients requiring surgery within 12 months after DES-PCI had an increased risk of MI and cardiac death compared with patients without IHD."

According to the news editors, the research concluded: "The increased risk was only present within the first month after DES-PCI, suggesting that surgery might be undertaken earlier than currently recommended."

The news editors report that additional information may be obtained by contacting G. Egholm, Aarhus University, Dept. of Clin Epidemiol, Aarhus, Denmark. Additional authors for this research include S.D. Kristensen, T. Thim, K.K.W. Olesen, M. Madsen, S.E. Jensen, L.O. Jensen, H.T. Sorensen, H.E. Botker and M. Maeng.
Studies from Actel Pharmaceuticals Yield New Information about Epilepsy (Structure-Activity Relationship, Drug Metabolism and Pharmacokinetics Properties Optimization, and in Vivo Studies of New Brain Penetrant Triple T-Type Calcium Channel ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Epilepsy have been published. According to news reporting originating in Allschwil, Switzerland, by NewsRx journalists, research stated, "Despite the availability of numerous antiepileptic drugs, 20-30% of epileptic patients are pharmacoresistant with seizures not appropriately controlled. Consequently, new strategies to address this unmet medical need are required."

The news reporters obtained a quote from the research from Actel Pharmaceuticals, "T-type calcium channels play a key role in neuronal excitability and burst firing, and selective triple T-type calcium channel blockers could offer a new way to treat various CNS disorders, in particular epilepsy. Herein we describe the identification of new 1,4-benzodiazepines as brain penetrant and selective T-type calcium channel blockers. From racemic hit 4, optimization work led to the preparation of pyridodiazepine 31c with improved physicochemical properties, solubility, and metabolic stability."

According to the news reporters, the research concluded: "The racemic mixture was separated by chiral preparative HPLC, and the resulting lead compound (3R,5S)-31c showed promising efficacy in the WAG/Rij-rat model of generalized nonconvulsive absence-like epilepsy."

Our news correspondents report that additional information may be obtained by contacting O. Bezencon, Actel Pharmaceut Ltd, Drug Discovery Chem Biol & Pharmacol, CH-4123 Allschwil, Switzerland. Additional authors for this research include D. Pozzi, G. Jacob, C. Torrisi, K. Colas, B. Braibant, J. Mawet, T. Pfeifer, R. de Kanter, C. Roch, M. Kessler, O. Corminboeuf and O. Bezencon.

Studies from Agency for Science, Technology and Research Further Understanding of Proinsulin (Brefeldin A-inhibited guanine nucleotide exchange protein 3 is localized in lysosomes and regulates GABA signaling in hippocampal neurons)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Peptide Proteins - Proinsulin are presented in a new report. According to news reporting from Singapore, Singapore, by NewsRx journalists, research stated, "ADP-ribosylation factor (ARF) family of guanine-nucleotide-binding (G) proteins regulates organelle biogenesis, structure and trafficking. The functions of ARF proteins are tightly controlled by guanine nucleotide exchange factors (GEFs) containing a conserved SEC7 domain."

Financial support for this research came from Agency for Science, Technology and Research.

The news correspondents obtained a quote from the research from Agency for Science, Technology and Research, "Based on sequence similarity to brefeldin A-inhibited guanine nucleotide exchange protein (BIG)/GBF of the Arf-GEF family, we recently identified BIG3 as a novel ARF GEF protein with a non-functional catalytic motif in the SEC7 domain. BIG3 is mainly expressed in pancreatic islets and brain. In the islets, depletion of BIG3 increases insulin and glucagon secretion because of enhanced biogenesis of insulin and glucagon granules in the absence of BIG3. Here, we investigate BIG3 functions in the brain, in particular its regulation of neurotransmitter release in hippocampal neurons from wild-type and BIG3 knockout mice. In hippocampal neurons, BIG3 is mainly localized in lysosomes, and its depletion selectively impairs inhibitory synaptic transmission."

According to the news reporters, the research concluded: "Our finding provides novel insights for a cell-specific function of BIG3 in regulating neurotransmission."

Our news journalists report that additional information may be obtained by contacting W.P. Han, ASTAR, Singapore Bioimaging Consortium, Singapore, Singapore. Additional authors for this research include H.Y. Li, W.J. Hong and W.P. Han.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jnc.13859. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from Ajou University Reveal New Findings on Diabetes (Statins and risk for new-onset diabetes mellitus A real-world cohort study using a clinical research database)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Diabetes have been published. According to news originating from Suwon, South Korea, by NewsRx correspondents, research stated, "Although concern regarding the increased risk for new-onset diabetes mellitus (NODM) after statin treatment has been raised, there has been a lack of evidence in real-world clinical practice, particularly in East Asians. We investigated whether statin use is associated with risk for NODM in Koreans."

Our news journalists obtained a quote from the research from Ajou University, "We conducted a retrospective cohort study using the clinical research database from electronic health records. The study cohort consisted of 8265 statin-exposed and 33,060 matched nonexposed patients between January 1996 and August 2013. Matching at a 1:4 ratio was performed using a propensity score based on age, gender, baseline glucose levels (mg/dL), and hypertension. The comparative risks for NODM with various statins (atorvastatin, fluvastatin, pitavastatin, pravastatin, rosuvastatin, and simvastatin) were estimated by both statin exposure versus matched nonexposed and within-class comparisons. The incidence of NODM among the statin-exposed group (6.000 per 1000 patient-years [PY]) was higher than that of the nonexposed group (3.244 per 1000 PY). The hazard ratio (HR) of NODM after statin exposure was 1.872 (95% confidence interval [CI], 1.432-2.445). Male gender (HR, 1.944; 95% CI, 1.497-2.523), baseline glucose per mg/dL (HR, 1.014; 95% CI, 1.013-1.016), hypertension (HR, 2.232; 95% CI, 1.515-3.288), and thiazide use (HR, 1.337; 95% CI, 1.081-1.655) showed an increased risk for NODM, while angiotensin-converting enzyme inhibitor or angiotensin II receptor blocker showed a decreased risk (HR, 0.774; 95% CI, 0.668-0.897). Atorvastatin-exposed patients showed a higher risk for NODM than their matched nonexposed counterparts (HR, 1.939; 95% CI, 1.278-2.943). However, the risk for NODM was not significantly different among statins in within-class comparisons."

According to the news editors, the research concluded: "An increased risk for NODM was observed among statin users in a practical healthcare setting in Korea."

For more information on this research see: Statins and risk for new-onset diabetes mellitus A real-world cohort study using a clinical research database. Medicine, 2016;95 (46):363-369. Apoptosis

Studies from Albert-Ludwigs-University Update Current Data on Apoptosis (The clerodane diterpene casearin J induces apoptosis of T-ALL cells through SERCA inhibition, oxidative stress, and interference with Notch1 signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Apoptosis have been published. According to news originating from Freiburg, Germany, by NewsRx correspondents, research stated, "T-cell acute lymphoblastic leukemia (T-ALL) is an aggressive hematologic malignancy that preferentially affects children and adolescents. Over 50% of human T-ALLs possess activating mutations of Notch1."

Our news journalists obtained a quote from the research from Albert-Ludwigs-University, "The clerodane diterpene casearin J (CJ) is a natural product that inhibits the sarcoendoplasmatic reticulum calcium ATPase (SERCA) pump and induces cell death in leukemia cells, but the molecular mechanism of cytotoxicity remains poorly understood. Here we show that owing to SERCA pump inhibition, CJ induces depletion of the endoplasmic reticulum calcium pools, oxidative stress, and apoptosis via the intrinsic signaling pathway. Moreover, Notch1 signaling is reduced in T-ALL cells with auto-activating mutations in the HD-domain of Notch1, but not in cells that do not depend on Notch1 signaling. CJ also provoked a slight activation of NF-kB, and consistent with this notion a combined treatment of CJ and the NF-kB inhibitor parthenolide (Pt) led to a remarkable synergistic cell death in T-ALL cells."

According to the news editors, the research concluded: "Altogether, our data support the concept that inhibition of the SERCA pump may be a novel strategy for the treatment of T-ALL with HD-domain-mutant Notch1 receptors and that additional treatment with the NF-kB inhibitor parthenolide may have further therapeutic benefits."

For more information on this research see: The clerodane diterpene casearin J induces apoptosis of T-ALL cells through SERCA inhibition, oxidative stress, and interference with Notch1 signaling. Cell Death & Disease, 2016;7():e2070. (Nature Publishing Group - www.nature.com/cddis/)

Autosomal-Recessive Disease

Studies from Alfaisal University Yield New Data on Autosomal-Recessive Disease (Clinical genomics can facilitate countrywide estimation of autosomal recessive disease burden)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Autosomal-Recessive Disease is the subject of a report. According to news reporting out of Riyadh, Saudi Arabia, by NewsRx editors, research stated, "Most autosomal recessive diseases are rare, but they collectively account for a substantial proportion of disease burden, especially in consanguineous populations. Estimation of this disease burden, however, is hampered by many factors, including lack of countrywide registries."

Our news journalists obtained a quote from the research from Alfaisal University, "Establishing carrier frequency can be a practical surrogate to estimate disease burden, although the requirement of a large representative cohort may be challenging. We propose that the application of clinical genomics in the diagnostic setting offers a unique opportunity to estimate carrier frequency in the population as a secondary benefit. We used a data set of similar to 7,100 patients who underwent genomic testing for various Mendelian disorders to estimate the carrier frequency. We were able to calculate the frequency of 259 confirmed founder recessive mutations. We found the corresponding disease burden to be, at minimum, similar to 7 per 1,000 children born to first-cousin parents, with disorders related to intellectual disability and vision impairment being the most common."

According to the news editors, the research concluded: "Our approach can be utilized to inform the design of new policies for the prevention of genetic disorders and highlights an important secondary benefit of clinical genomics."

For more information on this research see: Clinical genomics can facilitate countrywide estimation of autosomal recessive disease burden. Genetics in Medicine, 2016;18 (12):1244-1249. Genetics in Medicine can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group - www.nature.com/; Genetics in Medicine - www.nature.com/gim/)

Studies from All India Institute of Medical Sciences Have Provided New Information about Myelodysplastic Syndromes (Value of Quantitative assessment of Myeloid Nuclear Differentiation Antigen expression and other flow cytometric parameters in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematologic Diseases and Conditions - Myelodysplastic Syndromes are discussed in a new report. According to news originating from New Delhi, India, by NewsRx correspondents, research stated, "The diagnosis of myelodysplastic syndrome (MDS) based on morphology is particularly difficult in low-grade MDS. Thus, the role of myeloid nuclear differentiation antigen (MNDA) and other flow cytometric (FCM) parameters in MDS was evaluated."

Financial support for this research came from Hematology Education Research Society.

Our news journalists obtained a quote from the research from the All India Institute of Medical Sciences, "Bone marrow aspirates (BMA) collected from 52 patients with unexplained persistent cytopenias were divided into three groups: (i) proven MDS (n=12) based on morphology and/or cytogenetics; (ii) suspected MDS (n=6), noncontributory morphology, and cytogenetics; and (iii) non-MDS (n=34). Sixteen control BMA were studied. Cases were analyzed for MNDA expression (on granulocytes, blasts, monocytes, and lymphocytes) and for seven quantitative parameters: CD34(+) myeloblasts % in nucleated cells, CD34(+) B-cell progenitor% in CD34(+) cells, lymphocyte/myeloblast CD45 MFI ratio, granulocyte/lymphocyte SSC peak channel ratio and the proportion of CD34(+) myeloblasts expressing CD15, CD11b, and CD56. A score of 1 was given to each parameter beyond the cutoff, and score (>=3) was considered FCM positive. MNDA expression on granulocytes and blasts was significantly lower in proven MDS and suspected MDS vs. non-MDS. Quantitative FCM parameters successfully distinguished MDS and suspected MDS from non-MDS."

According to the news editors, the research concluded: "MNDA expression is an independent marker for the evaluation of dyspoiesis and may be added to the standard panel for quantitative assessment by FCM."

The news correspondents report that additional information may be obtained from V. Somasundaram, Dept. of Haematology, IRCH, All India Institute of Medical Sciences, New Delhi, India. Additional authors for this research include S. Soni, A. Chopra, S. Rai, M. Mahapatra, R. Kumar and H. Pati.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ijlh.12458. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from Angers University Hospital Provide New Data on Cardiovascular Research (Effects of plantar stimulation on cardiovascular response to orthostatism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Research have been presented. According to news reporting originating from Angers, France, by NewsRx correspondents, research stated, "Walking is a complex locomotor process that involves both spinal cord reflexes and cortical integration of peripheral nerve input. Maintaining an upright body position requires not only neuromuscular activity but also cardiovascular regulation."

Funders for this research include CNES, MEDES.

Our news editors obtained a quote from the research from Angers University Hospital, "We postulated that plantar mechanical stimulation might modulate autonomic nervous system activity and, thereby, impact blood pressure adaptation during standing. Twelve healthy subjects underwent three randomly ordered 45-min 70A degrees-saddle tilt tests while the plantar surfaces of the feet were stimulated using specially engineered Korvit boots in the following modes: (1) no stimulation, (2) disrupted stimulation, and (3) walking mode. Orthostatic tolerance time was measured for each trial. During testing, we obtained an electrocardiogram and measured blood pressure, skin blood flow, and popliteal vein cross-sectional area. We estimated central hemodynamics, baroreflex sensitivity and heart rate variability. Orthostatic tolerance time was not found to differ significantly between test conditions (37.2 +/- 10.4, 40.9 +/- 7.6, and 41.8 +/- 8.2 min, for no stimulation, disrupted stimulation, and walking mode, respectively). No significant differences between treatment groups were observed for stroke volume or cardiac baroreflex sensitivity, both of which decreased significantly from baseline during tilt testing in all groups. Cardiac sympathetic index and popliteal vein cross-sectional area increased at the end of the tilt period in all groups, without significant differences between treatments."

According to the news editors, the research concluded: "Plantar mechanical stimulation is insufficient for immediate modulation of cardiac sympathetic and parasympathetic activity under orthostatic stress."

The news editors report that additional information may be obtained by contacting M.A. Custaud, Angers Univ Hosp, Clin Res Center, Angers, France. Additional authors for this
Oncology - Cancer Care

Studies from Ankara University Describe New Findings in Cancer Care (Severe drug interactions and potentially inappropriate medication usage in elderly cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cancer Care. According to news reporting from Ankara, Turkey, by NewsRx journalists, research stated, "Due to more comorbidities, polypharmacy is common in elderly patients and drug interactions are inevitable. It is also challenging to treat an elderly patient with a diagnosis of cancer."

The news correspondents obtained a quote from the research from Ankara University, "Prevalence and clinical impacts of drug interactions and using potentially inappropriate medications (PIMs) have been studied in geriatric patients. However, these are not well defined in oncology practice. The purpose of this study is to define the prevalence of PIMs and severe drug interactions (SDIs) in elderly cancer patients and investigate the factors associated with them. Patients more than 65 years of age in both inpatient and outpatient clinics were evaluated. disease characteristics, and medications used were collected by self reports and medical records. Drug interactions were checked with Lexicomp® and PIM was defined with 2012 update of Beers criteria. Severe drug interactions are defined with category D or X DIs. Logistic regression was used to compute odds ratios (ORs) and 95% confidence intervals (CIs) for the association between SDIs, PIMs, and clinical parameters. Four hundred and forty-five elderly patients (286 outpatient, 159 inpatient), with a median age of 70 (65-89) were evaluated. SDIs were present in 156 (35.1 %) of patients, 81 (28.3 %), and 75 (47.2 %) for outpatient and inpatients, respectively (p < 0.001). PIMs were present in 117 (26.6 %) of the patients, 40 (14.2 %), and 77(48.4 %) for outpatient and inpatients, respectively (p < 0.001). In multivariate analysis; polypharmacy (ae <yen> 5 drugs), inpatient status and diagnosis of lung cancer were associated with severe DIs. Polypharmacy, inpatient status, and bad performance score (ECOG 3-4) were associated with PIMs. Nearly one third of the elderly cancer patients are exposed to severe drug interactions and PIMs. Clinicians dealing with elderly cancer patients should be more cautious when prescribing/planning drugs to this group of patients."

According to the news reporters, the research concluded: "More strategies should be developed in this group of patients to minimize the medications prescribed and prevent severe DIs."

For more information on this research see: Severe drug interactions and potentially inappropriate medication usage in elderly cancer patients. Supportive Care in Cancer, 2017;25
Kidney Diseases and Conditions - Nephrocalcinosis

Studies from Aristotle University Reveal New Findings on Nephrocalcinosis (Nephrocalcinosis and Renal Failure in Lesch-Nyhan Syndrome: Report of Two Familial Cases and Review of the Literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Kidney Diseases and Conditions - Nephrocalcinosis are discussed in a new report. According to news originating from Thessaloniki, Greece, by NewsRx correspondents, research stated, "Lesch-Nyhan syndrome is an X-linked recessive inborn error of purine metabolism, due to deficiency of the enzyme HPRT (hypoxanthine-guanine phosphoribosyl transferase) and underlying HPRT gene mutations (over 300 mutations identified up to date)."

Our news journalists obtained a quote from the research from Aristotle University, "It is characterized by a wide range of neurological symptoms and signs (mainly a combination of spastic diplegia with choreoathetosis and an overall psychomotor retardation)."

According to the news editors, the research concluded: "Herein, we report of two cousins with Lesch-Nyhan syndrome and a confirmed novel HPRT gene mutation: c. 65T >C, who both developed nephrocalcinosis and renal failure, findings not been previously published in children with HPRT deficiency."

The news correspondents report that additional information may be obtained from D.I. Zafeiriou, Aristotle University, Sch Med, Dept. of Pediat 1, Thessaloniki 54622, Greece. Additional authors for this research include N. Printza, E. Papadimiditriou, S. Batzios, M. Kyriazi, F. Papachristou and D.I. Zafeiriou.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.urology.2016.04.004. This DOI is a link to an online electronic document that is either free or for purchase.

Genetics

Studies from Asia University Update Current Data on Genetics (TRAF6 Restricts p53 Mitochondrial Translocation, Apoptosis, and Tumor Suppression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Genetics are discussed in a new report. According to news reporting originating from Taichung, Taiwan, by NewsRx correspondents, research stated, "Mitochondrial p53 is involved in apoptosis and tumor suppression. However, its regulation is not well studied."

Financial supporters for this research include Wake Forest School of Medicine, Endowed Professorship Fund, National Institutes of Health, Ministry of Health and Welfare.

Our news editors obtained a quote from the research from Asia University, "Here, we show that TRAF6 E3 ligase is a crucial factor to restrict mitochondrial translocation of p53 and spontaneous apoptosis by promoting K63-linked ubiquitination of p53 at K24 in cytosol, and such ubiquitination limits the interaction between p53 and MCL-1/BAK. Genotoxic stress reduces this ubiquitination in cytosol by S13/T330 phosphorylation-dependent translocation of TRAF6 from cytosol to nucleus, where TRAF6 also facilitates the K63-linked ubiquitination of nuclear p53 and its transactivation by recruiting p300 for p53 acetylation. Functionally, K63-linked ubiquitination of p53 compromised p53-mediated apoptosis and tumor suppression. Colorectal cancer samples with WT p53 reveal that TRAF6 overexpression negatively correlates with apoptosis and predicts poor response to chemotherapy and radiotherapy."

According to the news editors, the research concluded: "Together, our study identifies TRAF6 as a critical gatekeeper to restrict p53 mitochondrial translocation, and such mechanism may contribute to tumor development and drug resistance."

The news editors report that additional information may be obtained by contacting H.K. Lin, Asia Univ, Dept. of Biotechnol, Taichung 41354, Taiwan. Additional authors for this research include C.F. Li, L. Zhang, C.Y. Wu, L.X. Han, G.X. Jin, A.H. Rezaeian, F. Han, C.F. Liu, C. Xu, X.H. Xu, C.Y. Huang, F.J. Tsai, C.H. Tsai, K. Watabe and H.K. Lin.

Our news journalists obtained a quote from the research from AstraZeneca, "P2Y12 receptor antagonists, thienopyridines and ticagrelor, differ in their mode of action being prodrugs instead of direct acting and irreversibly instead of reversibly binding to P2Y12. These key differences may provide different potential when it comes to additional effects. In addition to P2Y12 receptor blockade, ticagrelor is unique in having the only well-documented additional target of inhibition, the equilibrative nucleoside transporter 1. The current review will address the effects of P2Y12 receptor antagonists beyond platelets and the protection against arterial thrombosis."

According to the news editors, the research concluded: "The discussion will include the potential for thienopyridines and ticagrelor to mediate anti-inflammatory effects, to conserve vascular function, to affect atherosclerosis, to provide cardioprotection and to induce dyspnea."

Our news journalists report that additional information may be obtained by contacting S. Nylander, AstraZeneca R&D, Molndal, Sweden.

Pulmonary Vascular Resistance

Studies from Atlantic Health System Yield New Data on Pulmonary Vascular Resistance (Pulmonary Artery Acceleration Time Provides a Reliable Estimate of Invasive Pulmonary Hemodynamics in Children)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pulmonary Vascular Resistance have been published. According to news originating from Morristown, New Jersey, by NewsRx correspondents, research stated, "Pulmonary artery acceleration time (PAAT) is a noninvasive method to assess pulmonary hemodynamics, but it lacks validity in children. The aim of this study was to evaluate the accuracy of Doppler echocardiography-derived PAAT in predicting right heart catheterization (RHC)-derived pulmonary artery pressure (PAP), pulmonary vascular resistance (PVR), and compliance in children."

Our news journalists obtained a quote from the research from Atlantic Health System, "Prospectively acquired and retrospectively measured Doppler echocardiography-derived PAAT and RHC-derived systolic PAP, mean PAP (mPAP), indexed PVR (PVRi), and compliance were compared using regression analysis in a derivation cohort of 75 children (median age, 5.3 years; interquartile range, 1.3-12.6 years) with wide ranges of pulmonary hemodynamics. To account for heart rate variability, PAAT was adjusted for right ventricular ejection time and corrected by the RR interval. Regression equations incorporating PAAT and PAAT/right ventricular ejection time from the derivation cohort were then evaluated for the accuracy of their predictive values for invasive pulmonary hemodynamics in a validation cohort of 50 age-and weight-matched children with elevated PAP and PVR. There were significant inverse correlations between PAAT and RHC-derived mPAP (r = -0.82) and PVRi (r = -0.78) and a direct correlation (r = 0.78) between PAAT and pulmonary compliance in the derivation cohort. For detection of pulmonary hypertension (PVRi > 3 Wood units.m(2) and mPAP > 25 mm Hg), PAAT < 90 msec and PAAT/right ventricular ejection time < 0.31 resulted in sensitivity of 97% and specificity of 95%. In the derivation cohort, the regression equations relating PAAT with mPAP and PVRi were mPAP = 48 - 0.28 x PAAT and PVRi = 9 - 0.07 x PAAT. These PAAT-integrated equations predicted RHC-measured pulmonary hemodynamics in the validation cohort with good correlations (r = 0.88 and r = 0.83, respectively), small biases (<10%), and minimal coefficients of variation (<8%). PAAT inversely correlates with RHC-measured pulmonary hemodynamics and directly correlates with pulmonary arterial compliance in children."

According to the news editors, the research concluded: "The study established PAAT-based regression equations in children to accurately predict RHC-derived PAP and PVR."

The news correspondents report that additional information may be obtained from P.T. Levy, Atlantic Hlth Syst, Goryeb Childrens Hosp, Dept. of Pediat, Morristown, NJ, United States. Additional authors for this research include M.D. Patel, G. Groh, S. Choudhry, J.

Dysplasia

Studies from Austin Hospital Further Understanding of Dysplasia (Terminal osseous dysplasia with pigmentary defects; Case and brief review of filamin A-related disorders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on DysplAsia. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "Terminal osseous dysplasia with pigmentary defects (TOD) is an extremely rare X-linked dominant disorder, which is characterised by cutaneous digital fibromas, pigmentary skin defects and skeletal abnormalities."

The news correspondents obtained a quote from the research from Austin Hospital, "A single mutation in the last nucleotide of exon 31 of the filamin A gene (FLNA) has recently been identified as a cause of the disease. We describe a case of an 18-month-old girl with the clinical phenotype of TOD and the disease-specific FLNA mutation confirmed by genetic testing."

According to the news reporters, the research concluded: "This report highlights the importance of recognising this distinct phenotype that can present to a wide variety of health-care professionals, and reviews the spectrum of filamin A disorders."

Our news journalists report that additional information may be obtained by contacting F.K. Bhabha, Austin Hospital, Dermatol, Melbourne, Vic, Australia. Additional authors for this research include M. Walsh, D. Orchard and R. Savarirayan.

**Drugs and Therapies - Aspirin Therapy**

**Studies from Azienda Ospedaliera University Reveal New Findings on Aspirin Therapy (Statins and Aspirin use in HIV-infected people: gap between European AIDS Clinical Society guidelines and clinical practice: the results from HIV-HY study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Aspirin Therapy. According to news originating from Perugia, Italy, by NewsRx correspondents, research stated, "To investigate the use of statins and acetylsalicylic acid (ASA) in HIV people in clinical practice. A multicenter, nationwide, prospective cohort study, including 1182 consecutive HIV patients was conducted."

Our news journalists obtained a quote from the research from Azienda Ospedaliera University, "Statin and ASA prescription was evaluated in primary and secondary cardiovascular disease prevention, according to the European AIDS Clinical Society (EACS) guidelines. Followed-up patients (998) were mostly males (70.9 %) with a mean age at enrolment of 46.5 years (SD 9.5). The mean time of follow-up was 3.3 years (SD 0.8). At the last follow-up visit, statins would have been recommended for 31.2 % and ASA for 16 % by EACS guidelines. Conversely, only 15.6 and 7.6 % of patients were on statin and ASA treatment, respectively; only 50.3 % of patients treated with statins achieved recommended low-density lipoprotein cholesterol (LDL-c) levels. At the last follow-up visit, agreement between statin therapy and EACS recommendation was 0.58 (95 % CI 0.52-0.63). The corresponding figure for ASA therapy was 0.50 (95 % CI 0.42-0.58), whereas the agreement for ASA therapy in secondary prevention was 0.59 (95 % CI 0.50-0.68). The prescription of statins and ASA in HIV-infected patients remains largely suboptimal, as only about 50 % of patients requiring statins and ASA are properly treated."

According to the news editors, the research concluded: "Higher attention on this relevant issue and further investigation are warranted in this at risk population."

The news correspondents report that additional information may be obtained from G.V. De Socio, Azienda Osped Univ Perugia, Clin Malattie Infett, I-06129 Perugia, Italy. Additional authors for this research include E. Ricci, G. Parruti, L. Calza, P. Maggi, B.M. Celesia, G. Orofino, G. Madeddu, C. Martinelli, B. Menzaghi, L. Taramasso, G. Penco, L. Carenzi, M. Franzetti and P. Bonfanti.

Silicates

Studies from B. Li and Colleagues Yield New Information about Silicates (Esophagus cancer and occupational exposure to asbestos: results from a meta-analysis of epidemiology studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Silicates is now available. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "The relationship between occupational asbestos exposure and esophagus cancer (EC) is not fully understood. We performed a meta-analysis to quantitatively assess the association."

Our news journalists obtained a quote from the research, "We systematically searched databases of PubMed, EMBASE, and Web of Science for studies with quantitative estimates of asbestos exposure and EC mortality. Pooled standardized mortality ratios (SMRs) and their corresponding 95% confidence intervals (CIs) were calculated. Twenty cohort studies on EC and asbestos exposure were included in this meta-analysis. Overall, occupational exposure to asbestos was associated with an excess risk of EC (SMR = 1.24, 95% CI: 1.13-1.38, P< 0.001), with little evidence of heterogeneity among studies (I-2 = 0.0%, P = 0.682). Being male, exposure to chrysotile or mixed asbestos, working at textile industry, long study follow-up (>= 20 years), Asia, Europe and America cohorts with larger cohort size (>500), and high-exposure group all contribute to significantly higher SMR. Publication bias was not detected (Egger's test P-value = 0.374). This meta-analysis suggested that occupational asbestos exposure might be associated with an increased risk of EC in male."

According to the news editors, the research concluded: "High-exposure level of asbestos could contribute to significantly higher risk of EC mortality."

Our news journalists report that additional information may be obtained by contacting B. Li, Gumei Community Hlth Serv Center, Prevent Care, Shanghai 201102, People's Republic of China. Additional authors for this research include S.P. Tang and K.Z. Wang.

Magnetic hyperthermia is a new type of cancer treatment designed for overcoming resistance to chemotherapy during the treatment of solid, inaccessible human tumors. The main challenge of this technology is increasing the local tumoral temperature with minimal side effects on the surrounding healthy tissue."

The news correspondents obtained a quote from the research, "This work consists of an in vitro study that compared the effect of hyperthermia in response to the application of exogenous heating (EHT) sources with the corresponding effect produced by magnetic hyperthermia (MHT) at the same target temperatures. Human neuroblastoma SH-SY5Y cells were loaded with magnetic nanoparticles (MNPs) and packed into dense pellets to generate an environment that is crudely similar to that expected in solid micro-tumors, and the above-mentioned protocols were applied to these cells. These experiments showed that for the same target temperatures, MHT induces a decrease in cell viability that is larger than the corresponding EHT, up to a maximum difference of approximately 45% at T = 46 degrees C. An analysis of the data in terms of temperature efficiency demonstrated that MHT requires an average temperature that is 6 degrees C lower than that required with EHT to produce a similar cytotoxic effect. An analysis of electron microscopy images of the cells after the EHT and MHT treatments indicated that the enhanced effectiveness observed with MHT is associated with local cell destruction triggered by the magnetic nano-heaters."

According to the news reporters, the research concluded: "The present study is an essential step toward the development of innovative adjuvant anti-cancer therapies based on local hyperthermia treatments using magnetic particles as nano-heaters."

Studies from B.A. Cardoso and Co-Researchers in the Area of Antineoplastics Reported (The Bone Marrow-Mediated Protection of Myeloproliferative Neoplastic Cells to Vorinostat and Ruxolitinib Relies on the Activation of JNK and PI3K Signalling ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antineoplastics are presented in a new report. According to news reporting from Lisbon, Portugal, by NewsRx journalists, research stated, "The classical BCR-ABL-negative Myeloproliferative Neoplasms (MPN) are a group of heterogeneous haematological diseases characterized by constitutive JAK-STAT pathway activation. Targeted therapy with Ruxolitinib, a JAK1/2-specific inhibitor, achieves symptomatic improvement but does not eliminate the neoplastic clone."

The news correspondents obtained a quote from the research, "Similar effects are seen with histone deacetylase inhibitors (HDACi), albeit with poorer tolerance. Here, we show that bone marrow (BM) stromal cells (HS-5) protected MPN-derived cell lines (SET-2; HEL and UKE-1) and MPN patient-derived BM cells from the cytotoxic effects of Ruxolitinib and the HDACi Vorinostat. This protective effect was mediated, at least in part, by the secretion of soluble factors from the BM stroma. In addition, it correlated with the activation of signalling pathways important for cellular homeostasis, such as JAK-STAT, PI3K, JNK, MEK-ERK and NF-kB. Importantly, the pharmacological inhibition of JNK and PI3K pathways completely abrogated the BM protective effect on MPN cell lines and MPN patient samples."

According to the news reporters, the research concluded: "Our findings shed light on mechanisms of tumor survival and may indicate novel therapeutic approaches for the treatment of MPN."

For more information on this research see: The Bone Marrow-Mediated Protection of Myeloproliferative Neoplastic Cells to Vorinostat and Ruxolitinib Relies on the Activation of JNK and PI3K Signalling Pathways. Studies from Banaras Hindu University Have Provided New Data on Nanohybrids (Superior biomaterials using diamine modified graphene grafted polyurethane)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nanotechnology - Nanohybrids have been published. According to news originating from Uttar Pradesh, India, by NewsRx correspondents, research stated, "Surface modification of graphene oxide has been performed using diamine moieties with varying chain length and subsequently chemically grafted with long chain polyurethane for wrapping up of graphene sheet with large polymer chains. Functionalization of graphene and its subsequent grafting have been verified through spectroscopic measurements like NMR, FTIR and UV-visible spectroscopy and the uniform dispersion of graphene sheet in polyurethane matrix is achieved."

Financial supporters for this research include CSIR, UGC, Council for Scientific and Industrial Research.

Our news journalists obtained a quote from the research from Banaras Hindu University, "Nanohybrids exhibit better thermal and mechanical responses along with greater self-assembly as compared to pure polymer. Nanometer dimension molecular sheet to gradual increased size of the order of tens of nanometer, hundreds of nanometer to micron scale assembly has been captured through XRD, small angle neutron scattering, AFM and optical microscopy, respectively. Nature of self-assembly associated with stronger interactions sustain the release of embedded drug (anticancerous dexamethasone) from nanohybrid and larger size of in homogeneities for longer spacer length further sustain the drug release and thereby able to control the release rate of drug by articulating the chemistry of graphene modifications with suitable spacer length of diamine. Biocompatibility of the nanohybrids is verified with cell line studies using human breast cancer cells MDA-MB-231 in terms of cell viability, cell adhesion, fluorescence image, reactive oxygen species and mitochondrial tracker measurements indicating better responses of nanohybrid vis-a-vis pure polyurethane."

According to the news editors, the research concluded: "Thus, the control release of the dexamethasone drug from the nanohybrids along with better biological responses clearly suggests a novel biomaterial for the drug carrier."

For more information on this research see: Superior biomaterials using diamine modified graphene grafted polyurethane. Polymer, 2016;106():109-119. Polymer can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www elsevier.com; Polymer - www journals elsevier.com/polymer/)

Liver Diseases and Conditions - Liver Cirrhosis

Studies from Baskent University Reveal New Findings on Liver Cirrhosis (High Dose Oral Furosemide with Salt Ingestion in the Treatment of Refractory Ascites of Liver Cirrhosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Liver Diseases and Conditions - Liver Cirrhosis. According to news originating from Adana, Turkey, by NewsRx correspondents, research stated, "We aimed to evaluate and compare the efficacy and safety of high-dose furosemide+salt orally by comparing HSS+furosemide (i.v.) and repeated paracentesis in patients with RA. This was a prospective study of 78 cirrhotic patients with RA, randomized into three groups: Group A (n=25) i.v. furosemide (200-300 mg bid) and 3% hypotonic saline solution (HSS) (once or twice a day); Group B (n= 26) oral furosemide tablets (360-520 mg bid) and salt (2.5 g bid); and, Group C (n= 27) repeated large-volume-paracentesis (RLVP) with albumin infusion."

Our news journalists obtained a quote from the research from Baskent University, "Patients without hyperkalemia were administrated 100 mg of spironolactone/day. During the follow-up; INR, creatinine, and total bilirubin levels were measured to determine the change in MELD (model of end stage liver disease) score. Hepatic encephalopathy (HE), severe episodes of spontaneous bacterial peritonitis (SBP) and pleural effusions (PE) occurred more frequently in Group C. Improvement in Child-Pugh and MELD score was better in Group A and B than Group C. In Group B, improvements were seen in the Child-Pugh and MELD score, reduction in body weight, duration and number of hospitalization. In Groups A and B, remarkable increases in diuresis were observed (706 +/- 116 to 2425 +/- 633 mL and 691 +/- 111 to 2405 +/- 772 mL) and serum sodium levels also improved. HE and SBP were occurred more often in group C (p < 0.002). Hospitalization decreased significantly in Group B (p < 0.001). There was no significant difference in survival among groups."

According to the news editors, the research concluded: "High dose oral furosemide with salt ingestion may be an alternative, effective, safe and well-tolerated method of therapy for RA."

For more information on this research see: High Dose Oral Furosemide with Salt Ingestion in the Treatment of Refractory Ascites of Liver Cirrhosis. Clinical and Investigative Medicine, 2016;39(6):S52-S60. Clinical and Investigative Medicine can be contacted at: Canadian Soc Clinical Investigation, Csci Head Office, 774 Echo Drive, Ottawa, On K1S 5N8, Canada.

Studies from Baylor University College of Medicine Update Current Data on Amniotic Fluid Embolism (3 Proposed diagnostic criteria for the case definition of amniotic fluid embolism in research studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Pregnancy Complications - Amniotic Fluid Embolism is the subject of a report. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "Amniotic fluid embolism is a leading cause of maternal mortality in developed countries. Our understanding of risk factors, diagnosis, treatment, and prognosis is hampered by a lack of uniform clinical case definition; neither histologic nor laboratory findings have been identified unique to this condition."

The news reporters obtained a quote from the research from the Baylor University College of Medicine, "Amniotic fluid embolism is often overdiagnosed in critically ill peripartum women, particularly when an element of coagulopathy is involved. Previously proposed case definitions for amniotic fluid embolism are nonspecific, and when viewed through the eyes of individuals with experience in critical care obstetrics, would include women with a number of medical conditions much more common than amniotic fluid embolism. We convened a working group under the auspices of a committee of the Society for Maternal-Fetal Medicine and the Amniotic Fluid Embolism Foundation whose task was to develop uniform diagnostic criteria for the research reporting of amniotic fluid embolism. These criteria rely on the presence of the classic triad of hemodynamic and respiratory compromise accompanied by strictly defined disseminated intravascular coagulopathy. It is anticipated that limiting research reports involving amniotic fluid embolism to women who meet these criteria will enhance the validity of published data and assist in the identification of risk factors, effective treatments, and possibly useful biomarkers for this condition."

According to the news reporters, the research concluded: "A registry has been established in conjunction with the Perinatal Research Branch of the Eunice Kennedy Shriver National Institute of Child Health and Human Development to collect both clinical information and laboratory specimens of women with suspected amniotic fluid embolism in the hopes of identifying unique biomarkers of this condition."

Our news correspondents report that additional information may be obtained by contacting S.L. Clark, Baylor College of Medicine, Houston, TX 77030, United States. Additional authors for this research include R. Romero, G.A. Dildy, W.M. Callaghan, R.M. Smiley, A.W. Bracey, G.D. Hankins, M.E. D'Alton, M. Foley, L.D. Pacheco, R.B. Vadhera, J.P. Herlihy, R.L. Berkowitz and M.A. Belfort.

Studies from Baylor University College of Medicine Update Current Data on Reproduction and Fertility (Correlation between Cyr61 expression and clinicopathologic parameters in adenomyosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Reproduction and Fertility have been published. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Adenomyosis, a benign invasion of endometrium, is closely related to endometriosis. Cysteine-rich 61 (Cyr61), a protein present in all endometrial tissues and menstrual effluents, is known to be associated with endometriosis."

The news correspondents obtained a quote from the research from the Baylor University College of Medicine, "However, its relation to adenomyosis has not been determined thus far. Therefore, here, we aimed to investigate the expression of Cyr61 protein in adenomyosis and determine the correlation between Cyr61 expression and clinicopathologic parameters in patients with adenomyosis. One hundred and twenty patients with histologically diagnosed adenomyosis, who underwent hysterectomy for non-endometrial disease were enrolled in this study. Patients were interviewed using a standard questionnaire consisting of sociodemographic characteristics and reproduction history. The severity of dysmenorrhea and menorrhagia was evaluated using the visual analogue scale (VAS) and pictorial blood loss assessment chart (PBAC). Samples of serum, endometrial tissue, and peritoneal fluid were collected, and Cyr61 mRNA levels were determined by RT-PCR. The Cyr61 protein levels in endometrial and ectopic lesions were determined by immunohistochemistry and those in serum and peritoneal fluid, by ELISA. We found that expression of Cyr61 was higher in the ectopic endometrium than in the eutopic endometrium. Cyr61 expression in the endometrium was correlated with age, number of natural labors, PBAC score, VAS score, uterine volume, adenomyosis type, and concurrent endometriosis. The Cyr61 protein level in the ascites was higher than that in serum, and no correlation existed between them."

According to the news reporters, the research concluded: "Our results suggest that the expression of Cyr61 may be indirectly related to the degree of dysmenorrhea and Cyr61 may be involved in the pathogenesis of adenomyosis."

For more information on this research see: Correlation between Cyr61 expression and clinicopathologic parameters in adenomyosis. *Journal of Reproductive Immunology*, 2016;118():42-49. *Journal of Reproductive Immunology* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Studies from Baylor University Reveal New Findings on Fabry Disease
(Is it Fabry disease?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Fabry Disease have been presented. According to news reporting originating from Dallas, Texas, by NewsRx correspondents, research stated, "Fabry disease is caused by mutations in the GLA gene that lower alpha-galactosidase A activity to less than 25-30% of the mean normal level."

Our news editors obtained a quote from the research from Baylor University, "Several GLA variants have been identified that are associated with relatively elevated residual alpha-galactosidase A. The challenge is to determine which GLA variants can cause clinical manifestations related to Fabry disease. Here, we review the various types of GLA variants and recommend that pathogenicity be considered only when associated with elevated globotriaosylceramide in disease-relevant organs and tissues as analyzed by mass spectrometry."

According to the news editors, the research concluded: "This criterion is necessary to ensure that very costly and specific therapy is provided only when appropriate."

For more information on this research see: Is it Fabry disease? Genetics in Medicine, 2016;18(12):1181-1185. Genetics in Medicine can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group - www.nature.com/gim/)

The news editors report that additional information may be obtained by contacting R. Schiffmann, Baylor Res Inst, Inst Metab Dis, Dallas, TX 75204, United States. Additional authors for this research include M. Fuller, L.A. Clarke and J. Aerts.

Studies from Beijing Institute of Radiation Medicine Further Understanding of Eicosanoids (Timosaponin AIII induces antiplatelet and antithrombotic activity via Gq-mediated signaling by the thromboxane A2 receptor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biological Factors - Eicosanoids is the subject of a report. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The thromboxane (Tx) A(2) pathway is a major contributor to the amplification of initial platelet activation and is therefore a key drug target. To identify potent small-molecule inhibitors of the thromboxane prostaglandin (TP) receptor, we screened a small steroidal saponin library using U46619-induced rat platelet aggregation assays."

Our news editors obtained a quote from the research from the Beijing Institute of Radiation Medicine, "Timosaponin AIII (TAIII) was identified as a potent inhibitor of U46619-induced rat platelet aggregation and exhibited superior selectivity for the TP receptor versus other G protein-coupled receptors and a PKC activator. TAIII inhibited U46619-induced rat platelet aggregation independent of increases in cAMP and cGMP and the inhibition of TxA2 production. Both PKC and PLC activators restored TAIII-inhibited platelet aggregation, whereas TAIII did not inhibit platelet aggregation induced by co-activation of the G12/13 and Gz pathways. Furthermore, TAIII did not affect the platelet shape change or ROCK2 phosphorylation evoked by low-dose U46619. In vivo, TAIII prolonged tail bleeding time, reduced the mortality of animals with acute pulmonary thromboembolism and significantly reduced venous thrombus weight."

According to the news editors, the research concluded: "Our study suggests that TAIII, by preferentially targeting Gq-mediated PLC/PKC signaling from the TP receptor, induces stronger in vitro antiplatelet activity and in vivo antithrombotic effects and may be an excellent candidate for the treatment of thrombotic disorders."

For more information on this research see: Timosaponin AIII induces antiplatelet and antithrombotic activity via Gq-mediated signaling by the thromboxane A2 receptor. Clinical Research - Clinical Trials and Studies

Studies from Bellvitge University Hospital Provide New Data on Clinical Trials and Studies (Cerebrospinal fluid and plasma lopinavir concentrations and viral response in virologically suppressed patients switching to lopinavir/ritonavir ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news reporting from Barcelona, Spain, by NewsRx journalists, research stated, "Lopinavir/ritonavir (LPV/r) monotherapy is used in selected virologically suppressed HIV-infected patients. Some would prefer a once-daily (OD) dose instead of the usual twice-daily dose to favour adherence."

The news correspondents obtained a quote from the research from Bellvitge University Hospital, "However, trough concentrations of the drug in blood and particularly in cerebrospinal fluid (CSF) may not be adequate to maintain viral suppression. Prospective, open-label pilot study to evaluate the efficacy and safety of LPV/r monotherapy OD. HIV1-infected patients, virologically suppressed for at least 6 months were enrolled. HIV viral load (VL) was determined at baseline and at weeks 4, 8, 12, 16, 24, 36 and 48. Lumbar puncture was performed in a subgroup of patients to evaluate CSF VL and CSF LPV concentrations. A total of 21 patients were included. At week 48, 85.7% (n=18) showed viral suppression (VL < 40 copies/ml). Two patients had viral failure (9.5%) and a third was withdrawn from the study because of gastrointestinal symptoms. Nine patients were enrolled in the substudy. CSF VL was < 40 copies/ml in all cases. Median (range) LPV concentration was 9.78 ng/ml (1.93-78.3) in CSF and 1,970 (154-16,700) ng/ml in plasma; the CSF/plasma ratio was 0.004 (0.001-0.186). In this small pilot study, LPV/r monotherapy OD maintained plasma HIV RNA suppression at 48 weeks in most patients, with no cases of CSF viral escape."

According to the news reporters, the research concluded: "However, CSF LPV concentrations were close to the 50% inhibitory concentration threshold in several patients; hence, this intervention should be avoided in patients with advanced immune suppression and/or those individuals presenting with significant comorbidities such as hepatitis C coinfection."

Our news journalists report that additional information may be obtained by contacting J.M. Tiraboschi, Bellvitge Univ Hosp, Dept. of Infect Dis, HIV Unit, Barcelona, Spain. Additional authors for this research include H. Knobel, A. Imaz, J. Villar, E. Ferrer, M. Saumoy, A. Gonzalez, N. Rozas, A. Vila, J. Niubo, J. Curto and D. Podzamczer.

Studies from Bhabha Atomic Research Center Provide New Data on Antineoplastic Monoclonal Antibodies [Doxorubicin enhances (131)I-rituximab induced cell death in Raji cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antineoplastic Monoclonal Antibodies is the subject of a report. According to news reporting originating in Maharashtra, India, by NewsRx journalists, research stated, "There are various therapeutic modalities of treatment for non-Hodgkin's lymphoma, but with certain limitations, hence, investigating the scope of combined therapeutic approach. In this article, cellular toxicity, apoptosis and expression of mitogen-activated protein kinase signaling pathway proteins were investigated in Raji cells preincubated with doxorubicin followed by (131)I-rituximab (rituximab radiolabeled with Iodine-131) treatment."

The news reporters obtained a quote from the research from Bhabha Atomic Research Center, "It was found that the (131)I-rituximab in combination with doxorubicin showed a higher amount of cell toxicity and apoptosis compared to respective controls. Expression of anti-apoptotic protein (B-cell lymphoma-extra-large) was downregulated and cleavage of poly (ADP-ribose) polymerase, a marker of apoptosis was higher in cells treated with doxorubicin (2 mg/mL) and 131 I-rituximab (P (<=) 0.05). Moreover, in these cells the basal level of expression of p42/44 and p38 were increased while its phosphorylation was decreased."

According to the news reporters, the research concluded: "These results suggest that doxorubicin has the potential to sensitize (131)I-rituximab induced cell death in Raji cells."

For more information on this research see: Doxorubicin enhances (131)I-rituximab induced cell death in Raji cells. Journal of Cancer Research and Therapeutics, 2015;11(4):823-9.

Studies from Biomedical Research Foundation Have Provided New Data on Cancer Epidemiology (Effectiveness of patient-targeted interventions to promote cancer screening among ethnic minorities: A systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Epidemiology have been published. According to news reporting originating in Valencia, Spain, by NewsRx journalists, research stated, "Cancer is a major public health problem due to its incidence, morbidity and mortality. A large proportion of cancer cases and deaths could be prevented through the implementation of cancer screening programmes."

The news reporters obtained a quote from the research from Biomedical Research Foundation, "However, there are social inequalities in patient access to these programmes, especially in underserved communities and minority populations. To identify, characterise and analyse the effectiveness of patient-targeted healthcare interventions to promote cancer screening programmes in ethnic minorities. A comprehensive search of bibliographic databases was conducted. The results of our systematic review were reported in accordance with the PRISMA guidelines. Seventeen articles were identified and included in the review. Sixteen of the seventeen studies were conducted in the United States and one was conducted in Israel. Fifteen of the seventeen interventions selected were effective in increasing cancer screening rates. Moreover, five of the seventeen studies found an improvement in cancer knowledge, awareness, self-efficacy, attitudes, intention and perceptions, and three studies found a positive change in health beliefs and barriers. The results show that culturally adapted interventions appear to increase the rate of participation in cancer screening. In addition, the effectiveness of the interventions seems to be related to the use of small media, one-on-one interactions, small group education sessions, reminder strategies, and strategies for reducing structural barriers and out-of-pocket costs. Culturally adapted patient-targeted healthcare interventions can help to reduce racial or ethnic inequalities in access to cancer screening programmes."

According to the news reporters, the research concluded: "Further research is needed to develop interventions to promote adherence to cancer screening programmes with repeat testing and vigorous economic evaluation methodologies."

Our news correspondents report that additional information may be obtained by contacting V. Escriba-Aguir, Hlth Promot & Biomed Res Fdn FISABIO, Valencia, Spain. Additional authors for this research include M. Rodriguez-Gomez and I. Ruiz-Perez.

Studies from Boehringer Ingelheim Pharmaceuticals Have Provided New Data on Steroid Hydroxylases (Selectivity of BI 689648, a Novel, Highly Selective Aldosterone Synthase Inhibitor: Comparison with FAD286 and LCI699 in Nonhuman Primates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Enzymes and Coenzymes - Steroid Hydroxylases are discussed in a new report. According to news reporting originating from Ridgefield, Connecticut, by NewsRx correspondents, research stated, "The mineralocorticoid aldosterone is an important regulator of blood pressure, volume, and electrolyte balance. However, excess aldosterone can be deleterious as a driver of vascular remodeling and tissue fibrosis associated with cardiometabolic diseases."

Our news editors obtained a quote from the research from Boehringer Ingelheim Pharmaceuticals, "Aldosterone synthase (AS) inhibitors (ASI) attenuate the production of aldosterone directly and have been proposed as an alternative to mineralocorticoid receptor antagonists for blocking the pathologic effects of excess aldosterone. Discovery of selective ASIs has been challenging because of the high sequence identity (93%) AS shares with cortisol synthase (CS), and the low identity of rodent AS compared with human (63%). Using cynomolgus (cyno) monkey-based models, we identified BI 689648 [6-(5-methoxymethyl-pyridin-3-yl)-3,4-dihydro-2H-[1,8]naphthyridine-1-carboxylic acid amide], a novel, highly selective ASI that exhibits an in vitro IC50 of 2 nM against AS and 300 nm against CS (150-fold selectivity) compared with the recently described ASIs FAD286 [4-(5,6,7,8-tetrahydroimidazo[1,5-a]pyridin-5-yl) benzonitrile] (3 nM AS; 90 nM CS; 40-fold) and LCI699 (4-[(5R)-6,7-dihydro-5H-pyrrolo[1,2-c]imidazol-5-yl]-3-fluorobenzonitrile) (10 nM AS; 80 nM CS; 8-fold). After oral administration in cyno monkeys, BI 689648 (5 mg/kg) exhibits a peak plasma concentration of similar to 500 nM. For in vivo profiling we used an adrenocorticotropin-challenge model in which BI 689648 was 20-fold more selective compared with FAD286 and LCI699. Because both FAD286 and LCI699 failed to provide adequate selectivity for CS when tested in patients, the desire for more selective molecules to test the ASI hypothesis remains high."

According to the news editors, the research concluded: "Therefore, highly selective aldosterone synthase inhibitors such as BI 689648 represent an important step forward toward developing ASIs with greater potential for clinical success in cardiometabolic diseases."

The news editors report that additional information may be obtained by contacting N.F. Brown, Boehringer Ingelheim Pharmaceut Inc, CardioMetabol Dis Res, Ridgefield, CT.

Pharmacokinetics

Studies from Brigham Young University Describe New Findings in Pharmacokinetics (How PEGylation influences protein conformational stability)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacokinetics. According to news reporting originating from Provo, Utah, by NewsRx correspondents, research stated, "PEGylation is an important strategy for enhancing the pharmacokinetic properties of protein therapeutics. The development of chemoselective side-chain modification reactions has enabled researchers to PEGylate proteins with high selectivity at defined locations."

Financial support for this research came from NIH NIGMS.

Our news editors obtained a quote from the research from Brigham Young University, "However, aside from avoiding active sites and binding interfaces, there are few guidelines for the selection of optimal PEGylation sites. Because conformational stability is intimately related to the ability of a protein to avoid proteolysis, aggregation, and immune responses, it is possible that PEGylating a protein at sites where PEG enhances conformational stability will result in PEG-protein conjugates with enhanced pharmacokinetic properties. However, the impact of PEGylation on protein conformational stability is incompletely understood."

According to the news editors, the research concluded: "This review describes recent advances toward understanding the impact of PEGylation on protein conformational stability, along with the development of structure-based guidelines for selecting stabilizing PEGylation sites."

The news editors report that additional information may be obtained by contacting P.B. Lawrence, Brigham Young University, Dept. of Chem & Biochem, Provo, UT 84602, United States.
Heart Disorders and Diseases - Atrial Fibrillation
Studies from Brigham and Women's Hospital Provide New Data on Atrial Fibrillation (Impact of the US Food and Drug Administration's Safety-Related Announcements on the use of Bisphosphonates After Hip Fracture)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "The U.S. Food and Drug Administration (FDA) issued several announcements related to potential risk of bisphosphonates including osteonecrosis of the jaw (2005), atrial fibrillation (2007), and atypical femur fracture (2010)."

The news correspondents obtained a quote from the research from Brigham and Women's Hospital, "We aimed to evaluate the impact of three FDA drug safety announcements on the use of bisphosphonates in patients with hip fracture using claims data from a U.S. commercial health plan (2004-2013). We calculated the proportion of patients in each quarter who received a bisphosphonate or other osteoporosis medication in the 6 months following hospitalization for hip fracture. Segmented logistic regression models examined the time trends. Among 22,598 patients with hip fracture, use of bisphosphonate decreased from 15% in 2004 to 3% in the last quarter of 2013. Prior to the 2007 announcement, there was a 4% increase in the odds of bisphosphonate use every quarter (OR 1.04; 95% CI, 1.02 to 1.07). After the 2007 announcement, there was a 4% decrease in the odds of bisphosphonate use (OR 0.96; 95% CI, 0.93 to 0.99) every quarter. The announcement in 2007 was associated with a significant decline in the rate of change of bisphosphonate uses over time (p <0.001), but no impact on other osteoporosis medication use (p = 0.2). After the 2010 announcement, the odds of bisphosphonate use continued to decrease by 4% (OR 0.96; 95% CI, 0.94 to 0.98) each quarter and the odds of other osteoporosis medication use remained stable over time (OR 0.99; 95% CI, 0.96 to 1.02)."

According to the news reporters, the research concluded: "The FDA safety announcement related to atrial fibrillation in 2007 was significantly associated with a decrease in bisphosphonate use among patients with hip fracture."

Our news journalists report that additional information may be obtained by contacting S.C. Kim, Brigham & Women's Hospital, Div Rheumatol Immunol & Allergy, Boston, MA 02115, United States. Oncology - Breast Cancer

Studies from Brigham and Women's Hospital Yield New Information about Breast Cancer (Preserved vagus nerve stimulator function after radiation therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Epilepsy and breast cancer are both prevalent conditions. A subset of women with medically refractory epilepsy and vagus nerve stimulators (VNS) may later develop breast cancer and may require adjuvant radiation as part of their treatment regimen."

Our news journalists obtained a quote from the research from Brigham and Women's Hospital, "However, to date, little data are available on the effects of radiation on VNS function. Presentation - We present a young woman with tuberous sclerosis, developmental delay, and medically refractory epilepsy who developed left-sided breast cancer. Her epilepsy became controlled with a recent addition of a VNS implanted in her left chest wall. She required adjuvant radiation therapy to her left breast, and this raised the novel question of the safety of radiation on the integrity and functioning of the device, which we explore in this article. This case is the first report of a patient with VNS for epilepsy and breast cancer who received radiation therapy proximal to the device."

According to the news editors, the research concluded: "The device continued to function properly despite the exposure."

The news correspondents report that additional information may be obtained from T.A. Fantaneanu, Brigham & Women's Hospital, Dept. of Neurol, Boston, MA 02115, United States. Additional authors for this research include G. Tillman, E. Garcia, T. Grady and B.A. Dworetzky.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ane.12584. This DOI is a link to an online electronic document that is either free or for purchase.
Studies from Bristol-Myers Squibb Reveal New Findings on Peptides and Proteins (Label-Free Bottom-Up Proteomic Workflow for Simultaneously Assessing the Target Specificity of Covalent Drug Candidates and Their Off-Target Reactivity to Selected ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Peptides and Proteins is the subject of a report. According to news reporting originating from Pennington, New Jersey, by NewsRx correspondents, research stated, "Although designed covalent inhibitors as drug candidates offer several unique advantages over conventional reversible inhibitors, including high potency and the potential for less frequent dosing, there is a general tendency to avoid the covalent mode of action in drug discovery programs due to concerns regarding immune-mediated toxicity that can arise from indiscriminate reactivity with off-target proteins. Therefore, the ability to assess off-target reactivity relative to target specificity is desirable for optimizing covalent drug candidates in the early discovery stage."

Financial support for this research came from Bristol-Myers Squibb.

Our news editors obtained a quote from the research from Bristol-Myers Squibb, "One concern with current surrogate nucleophile trapping approaches is that they employ a simplistic model nucleophile such as glutathione, which may not reliably reflect the covalent interactions with cellular or extracellular proteins. One way to get a more relevant reactivity assessment is to directly measure the ability of an inhibitor to covalently modify nucleophilic amino acids on biologically relevant proteins, both on-and off-target. In this article, we describe a label-free bottom-up proteomic workflow for simultaneous evaluation of target binding and off-target reactivity of covalent drug candidates to selected proteins at the peptide level.  Ibrutinib, a covalent drug targeting the active site of BTK protein, was used as a model compound to demonstrate the feasibility of the workflow. The compound was incubated with a mixture of target protein, Bruton's tyrosine kinase (BTK), and two abundant proteins in blood, hemoglobin (Hb) and human serum albumin (HSA), and then the ibrutinib modification sites were determined utilizing a bottom-up proteomic approach. A non-BTK specific model compound (1) known to modify cysteine residues was also included. By comparing the extent of off-target modifications to the targeted BTK C481 binding in a wide compound concentration range, we were able to determine the concentration where maximum target binding was achieved with minimal off-target reactivity."

According to the news editors, the research concluded: "The generic label-free bottom-up proteomics workflow described in this article should be useful in the rank order assessment of off-target reactivity vs on-target reactivity of covalent drug candidates in the early drug discovery stage."

For more information on this research see: Label-Free Bottom-Up Proteomic...

The news editors report that additional information may be obtained by contacting Y. Yang, Bristol-Myers Squibb Research and Development, 311 Pennington-Rocky Hill Road, Pennington, New Jersey 08534, United States. Additional authors for this research include Y.Z. Shu and W.G Humphreys.

**Oncology - Lung Cancer**

**Studies from C. Ambrogio and Co-Authors Have Provided New Information about Lung Cancer (Combined inhibition of DDR1 and Notch signaling is a therapeutic strategy for KRAS-driven lung adenocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Lung Cancer are presented in a new report. According to news originating from Madrid, Spain, by NewsRx correspondents, research stated, "Patients with advanced Kirsten rat sarcoma viral oncogene homolog (KRAS)-mutant lung adenocarcinoma are currently treated with standard chemotherapy because of a lack of efficacious targeted therapies. We reasoned that the identification of mediators of Kras signaling in early mouse lung hyperplasias might bypass the difficulties that are imposed by intratumor heterogeneity in advanced tumors, and that it might unveil relevant therapeutic targets."

Our news journalists obtained a quote from the research, "Transcriptional profiling of Kras(G12V)-driven mouse hyperplasias revealed intertumor diversity with a subset that exhibited an aggressive transcriptional profile analogous to that of advanced human adenocarcinomas. The top-scoring gene in this profile encodes the tyrosine kinase receptor DDR1. The genetic and pharmacological inhibition of DDR1 blocked tumor initiation and tumor progression, respectively. The concomitant inhibition of both DDR1 and Notch signaling induced the regression of KRAS;TP53-mutant patient-derived lung xenografts (PDX) with a therapeutic efficacy that was at least comparable to that of standard chemotherapy."

According to the news editors, the research concluded: "Our data indicate that the combined inhibition of DDR1 and Notch signaling could be an effective targeted therapy for patients with KRAS-mutant lung adenocarcinoma."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nm.4041. This DOI is a link to an online electronic document that is either free or for purchase.

Capillary Electrophoresis

Studies from C. Varadi and Co-Authors Have Provided New Information about Capillary Electrophoresis [Quantitative twoplex glycan analysis using C-12(6) and C-13(6) stable isotope 2-aminobenzoic acid labelling and capillary electrophoresis mass ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Capillary Electrophoresis. According to news reporting from Dublin, Ireland, by NewsRx journalists, research stated, "Capillary electrophoresis (CE) offers excellent efficiency and orthogonality to liquid chromatographic (LC) separations for oligosaccharide structural analysis. Combination of CE with high resolution mass spectrometry (MS) for glycan analysis remains a challenging task due to the MS incompatibility of background electrolyte buffers and additives commonly used in offline CE separations."

The news correspondents obtained a quote from the research, "Here, a novel method is presented for the analysis of 2-aminobenzoic acid (2-AA) labelled glycans by capillary electrophoresis coupled to mass spectrometry (CE-MS). To ensure maximum resolution and excellent precision without the requirement for excessive analysis times, CE separation conditions including the concentration and pH of the background electrolyte, the effect of applied pressure on the capillary inlet and the capillary length were evaluated. Using readily available C-12/13(6) stable isotopologues of 2-AA, the developed method can be applied for quantitative glycan profiling in a twoplex manner based on the generation of extracted ion electropherograms (EIE) for C-12(6) 'light' and C-13(6) 'heavy' 2-AA labelled glycan isotope clusters. The twoplex quantitative CE-MS glycan analysis platform is ideally suited for comparability assessment of biopharmaceuticals, such as monoclonal antibodies, for differential glycomic analysis of clinical material for potential biomarker discovery or for quantitative microheterogeneity analysis of different glycosylation sites within a glycoprotein."

According to the news reporters, the research concluded: "Additionally, due to the low injection volume requirements of CE, subsequent LC-MS analysis of the same sample can be performed facilitating the use of orthogonal separation techniques for structural elucidation or verification of quantitative performance."

For more information on this research see: Quantitative twoplex glycan analysis
using C-12(6) and C-13(6) stable isotope 2-aminobenzoic acid labelling and capillary electrophoresis mass spectrometry. *Analytical and Bioanalytical Chemistry*, 2016;408 (30):8691-8700. *Analytical and Bioanalytical Chemistry* can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. **Blood Diseases and Conditions - Sepsis**

**Studies from C.D. Weber et al Have Provided New Data on Sepsis (Classification of soft-tissue injuries in open femur fractures: Relevant for systemic complications?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Blood Diseases and Conditions - Sepsis. According to news reporting out of Aachen, Germany, by NewsRx editors, research stated, "A broad range of systemic complications has been described to occur in patients with open major fractures. Various causes have been claimed to play a role."

Our news journalists obtained a quote from the research, "We therefore surveyed a nationwide trauma registry to assess risk factors associated with closed and various types of open femur fractures. This was a cohort study in a nationwide population-based prospective database. Inclusion criteria for selection from database are as follows: individuals with femur fracture, age 16 years or older, and survival until primary admission. Main groups included closed and open femur fracture. Patient demographics, injury severity (New Injury Severity Score), surgical fracture management, length of stay, and systemic complications (e.g., multiple organ failure [MOF], sepsis, mortality) were collected and statistically analyzed using SPSS statistics. Multivariate regression analysis was performed to stratify subgroups for the degree of open soft-tissue injury according to Gustilo and Anderson. Among 32,582 documented trauma victims (January 1, 2002, to December 31, 2010), a total of 5,761 met the inclusion criteria. Main groups: 4,423 closed (76.8%) and 1,338 open femur fractures (23.2%). Open fractures subgroups were divided into I degrees (334, 28.1%), II degrees (526, 44.3%), and III degrees (328, 27.6%). Open fractures were associated with an increased risk of prehospital hemorrhagic shock (p = 0.01), higher resuscitation requirements (p < 0.001), MOF (p = 0.001), and longer in-hospital (p < 0.001) and intensive care stay (p = 0.001). While New Injury Severity Score values showed a minor increase per subgroup, the prevalence of MOF, sepsis, and mortality multiplied with the degree of open soft-tissue injury. Especially patients with Type III open femur fractures received mass transfusions (28.2%, p < 0.001), and mass transfusions were identified as independent predictor for sepsis (odds ratio [OR], 2.393; 95% confidence interval [CI], 1.821-3.143; p < 0.001) and MOF (OR, 2.966; 95% CI, 2.409-3.651; p < 0.001). Our data also indicate an increased mortality in patients with open femur managed outside Level I trauma centers (OR,
1.358; 95% CI, 1.018-1.812; p = 0.037). Open femur fractures are associated with higher in-hospital complications related to incidence of MOF, associated intensive care unit stay, and hospital days when compared with closed femur fractures. For prevention of in-hospital complications, prompt hemorrhage control, surgical fracture fixation, cautious blood management, and triage to a Level I trauma center must be considered."

According to the news editors, the research concluded: "LEVEL OF EVIDENCE Epidemiologic/prognostic study, level II."

For more information on this research see: Classification of soft-tissue injuries in open femur fractures: Relevant for systemic complications? Journal of Trauma and Acute Care Surgery, 2016;81(5):824-833. Journal of Trauma and Acute Care Surgery can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Cholesterol

Studies from C.M. Ballantyne et al in the Area of Cholesterol Described [Icosapent ethyl (eicosapentaenoic acid ethyl ester): Effects on remnant-like particle cholesterol from the MARINE and ANCHOR studies]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cholesterol. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "Remnant-like particle cholesterol (RLP-C) is atherogenic and may increase atherosclerotic cardiovascular disease risk. Icosapent ethyl is a high-purity prescription eicosapentaenoic acid ethyl ester (approved as an adjunct to diet to reduce triglyceride [TG] levels in adult patients with TGs >= 500 mg/dL [= 5.65 mmol/L] at 4 g/day)."

Our news journalists obtained a quote from the research, "In the MARINE and ANCHOR studies, icosapent ethyl reduced TG and other atherogenic lipid parameter levels without increasing low-density lipoprotein cholesterol (LDL-C) levels. This exploratory analysis evaluated the effects of icosapent ethyl on calculated and directly measured RLP-C. MARINE (TGs >= 500 and <= 2000 mg/dL [= 5.65 mmol/L and <= 22.6 mmol/L]) and ANCHOR (TGs >= 200 and < 500 mg/dL [= 2.26 and < 5.65 mmol/L] despite statin-controlled LDL-C) were phase 3, 12-week, double-blind studies that randomized adult patients to icosapent ethyl 4 g/day, 2 g/day, or placebo. This analysis assessed median percent change from baseline to study end in directly measured (immunoseparation assay) RLP-C levels (MARINE, n = 218; ANCHOR, n = 252) and calculated RLP-C levels in the full populations. Icosapent ethyl 4 g/day significantly
reduced directly measured RLP-C levels -29.8% (p = 0.004) in MARINE and -25.8% (p = 0.0001) in ANCHOR versus placebo, and also reduced directly measured RLP-C levels to a greater extent in subgroups with higher versus lower baseline TG levels, in patients receiving statins versus no statins (MARINE), and in patients receiving medium/higher-intensity versus lower-intensity statins (ANCHOR). Strong correlations were found between calculated and directly measured RLP-C for baseline, end-of-treatment, and percent change values in ANCHOR and MARINE (0.73-0.92; p< 0.0001 for all).

According to the news editors, the research concluded: "Icosapent ethyl 4 g/day significantly reduced calculated and directly measured RLP-C levels versus placebo in patients with elevated TG levels from the MARINE and ANCHOR studies."

For more information on this research see: Icosapent ethyl (eicosapentaenoic acid ethyl ester): Effects on remnant-like particle cholesterol from the MARINE and ANCHOR studies. Y93H. RAMs were identified in GT1 patients at baseline or after dosing with EDP-239 that were similar to those detected in vitro. Baseline RAMs identified at NS5A position 93 in GT1, or positions 28 or 30 in GT1a only, correlated with a reduced treatment response. RAMs at additional positions were also detected and may have contributed to reduced EDP-239 efficacy. The most common GT1a and GT1b RAMs found to persist up to weeks 12, 24, or 48 were those at NS5A positions 28, 30, 31, 58 (GT1a only), and 93."

According to the news editors, the research concluded: "Those RAMs persisting at the highest frequencies up to weeks 24 or 48 were L31M and Q30H/R for GT1a and L31M and Y93H for GT1b."

For more information on this research see: Preclinical and Clinical Resistance Profile of EDP-239, a Novel Hepatitis C Virus NS5A Inhibitor. Antimicrobial Agents and Chemotherapy, 2016;60(10):6216-6226. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Studies from CHUM Reveal New Findings on Antiretrovirals

Antiretroviral therapy suppressed participants with low CD4(+) T-cell counts segregate according to opposite immunological phenotypes]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antiretrovirals. According to news reporting originating from Montreal, Canada, by NewsRx correspondents, research stated, "The failure to increase CD4(+) T-cell counts in some antiretroviral therapy suppressed participants (immunodiscordance) has been related to perturbed CD4(+) T-cell homeostasis and impacts clinical evolution. We evaluated different definitions of immunodiscordance based on CD4(+) T-cell counts (cutoff) or CD4(+) T-cell increases from nadir value (DCD4) using supervised random forest classification of 74 immunological and clinical variables from 196 antiretroviral therapy suppressed individuals."

Our news editors obtained a quote from the research from CHUM, "Unsupervised clustering was performed using relevant variables identified in the supervised approach from 191 individuals. Cutoff definition of CD4(+) cell count 400 cells/ml performed better than any other definition in segregating immunocompartmental and immunodiscordant individuals (85% accuracy), using markers of activation, nadir and death of CD4(+) T cells. Unsupervised
clustering of relevant variables using this definition revealed large heterogeneity between immunodiscordant individuals and segregated participants into three distinct subgroups with distinct production, programmed cell-death protein-1 (PD-1) expression, activation and death of T cells. Surprisingly, a nonnegligible number of immunodiscordant participants (22%) showed high frequency of recent thymic emigrants and low CD4(+) T-cell activation and death, very similar to immunoconcordant participants. Notably, human leukocyte antigen - antigen D related (HLA-DR) PD-1 and CD45RA expression in CD4(+) T cells allowed reproducing subgroup segregation (81.4% accuracy). Despite sharp immunological differences, similar and persistently low CD4(+) values were maintained in these participants over time. A cutoff value of CD4(+) T-cell count 400 cells/ml classified better immunodiscordant and immunoconcordant individuals than any DCD4 classification. Immunodiscordance may present several, even opposite, immunological patterns that are identified by a simple immunological follow-up."

According to the news editors, the research concluded: "Subgroup classification may help clinicians to delineate diverse approaches that may be needed to boost CD4(+) T-cell recovery."

For more information on this research see: Antiretroviral therapy suppressed participants with low CD4(+) T-cell counts segregate according to opposite immunological phenotypes. *Aids*, 2016;30(15):2275-2287. *Aids* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Aids - journals.lww.com/aidsonline/pages/default.aspx)

transient ER stress protects cancer cells from undergoing apoptosis, whereas the prolonged stress response further activates many cell death pathways. The present review summarizes the UPR mediated triggering of transcriptional and translational reprogramming, which will provide novel therapeutic strategies towards pro-death mechanisms rather than a cellular adaptation in tumorigenesis. Nonetheless, the current topic also points out the reprogramming of emerging molecular switching events by complex UPR-mediated signaling to trigger apoptosis. The novel agents from various natural, semi-synthetic and synthetic sources that target ER stress signaling pathway to modulate selectively the UPR phenomena with preclinical efficacy are outlined."

According to the news reporters, the research concluded: "Since major emphasis on ER stress-induced transcriptional and translational reprogramming remains to be explored, we believe that the current subject will instigate more attention from the biomedical researchers in this certain research direction."

Our news journalists report that additional information may be obtained by contacting A. Goswami, Indian Inst Integrat Med CSIR, Canc Pharmacol Div, Jammu 180001, J&K, India. Additional authors for this research include D. Nayak, R. Rasool, S. Chakraborty, A. Katoch, H. Amin and A. Goswami.

history of breast or ovarian cancer, stage I-II at diagnosis, residual disease 10 mm or less after primary debulking surgery, performance status 1 or less, CA125 less than 100, only 1 metastatic site of recurrence, platinum-free interval of more than 12 months, and SCS correlated with better overall survival. In the multivariate model, including propensity score, SCS remained associated with a 66% decrease in the risk of death (hazard ratio, 0.34; 95% CI, 0.15-0.76, p=0.008). Secondary cytoreductive surgery was also linked to longer progression-free survival (hazard ratio, 0.50; 95% CI, 0.30-0.84, p=0.008). There was no evidence of a benefit of SCS in patients with unfavorable prognosis (P for interaction=0.654)."

According to the news editors, the research concluded: "Our results confirm the benefit of SCS in progression-free survival and overall survival in the recurrent setting and suggest that it exists not only for patients with a good prognosis."

Our news journalists report that additional information may be obtained by contacting A.A. da Costa, *Medical Oncology Department, †Gynecology Oncology Dept. of and ‡Oncogenetics Department, AC Camargo Cancer Center, Sao Paulo, SP, Brazil. Studies from Cancer Hospital Further Understanding of Esophageal Cancer (Long-term results of definitive concurrent chemoradiotherapy using paclitaxel plus oxaliplatin in unresectable locally advanced esophageal cancer: a prospective phase II ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Esophageal Cancer is the subject of a report. According to news reporting from Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "This prospective study aimed at assessing the efficiency and safety of concurrent chemoradiotherapy (CCRT) using paclitaxel (PTX) plus oxaliplatin (OHP) in unresectable locally advanced esophageal cancer patients. Between January 2006 and December 2010, 34 patients with unresectable locally advanced esophageal cancer were enrolled in this study."

The news correspondents obtained a quote from the research from Cancer Hospital, "Radiotherapy was delivered with a daily fraction of 2.0 Gy to a total dose of 60 Gy over 6 weeks. Concurrent PTX (135 mg/m(2), d(1)) and OHP (130 mg/m(2), d(1)) were administered on Day 1 and Day 29 of radiotherapy. Of these patients, 76.5% completed the treatment course with a response rate of 73.5%, including eight (23.5%) patients with complete response and 17 (50.0%) patients with partial response. The median overall survival (OS) time was 23.7 months
(range: 4.0-65.5 months) with 1-, 3- and 5-year OS rates were 64.3%, 36.6% and 25.8%, respectively. The median progression-free survival (PFS) time was 21.2 months with 1-, 3- and 5-year PFS rates were 63.8%, 30.9% and 20.4%, respectively. During the CCRT course, the main grade 3 or greater acute toxicities were leukopenia (38.2%), esophagitis (14.7%), and dysphagia (11.8%), with late toxicity being infrequent."

According to the news reporters, the research concluded: "Although this study did not meet its primary endpoint, the application of CCRT with PTX and OHP in unresectable locally advanced esophageal carcinoma yielded satisfactory clinical outcomes and manageable toxicities."

Our news journalists report that additional information may be obtained by contacting S.X. Wu, Hangzhou Canc Hosp, Dept. of Radiat Oncol, Hangzhou 310002, Zhejiang, People's Republic of China. Additional authors for this research include X.B. Zhang, M. Fang, R.P. Zhao and S.X. Wu.

**Cardiovascular Diseases and Conditions**

**Studies from Capital Medical University Add New Findings in the Area of Hypertension (Salusin-beta contributes to vascular inflammation associated with pulmonary arterial hypertension in rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Hypertension are presented in a new report. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Inflammation is closely linked to pulmonary arterial hypertension (PAH). Salusin-beta, a bioactive peptide, has been reported to participate in vascular inflammation."

The news reporters obtained a quote from the research from Capital Medical University, "We therefore hypothesized that salusin-beta contributes to monocrotaline (MCT)-induced PAH in rats. Male Sprague-Dawley rats were treated with MCT (60 mg kg(-1), single intraperitoneal injection). Salusin-beta expression in the lungs of the MCT-treated rats was evaluated using immunofluorescence staining, western blot, and real-time PCR. For salusin-beta blockade assay, rats injected with MCT were given a chronic infusion of anti-salusin-beta..."
immunoglobulin G (IgG) (salusin-beta blocker, 1.0 mg kg(-1) h(-1)) or isotype-matched control IgG. Four weeks after MCT+anti-salusin-beta treatment, the effects of salusin-beta blockade were determined using hemodynamics, western blot, real-time PCR, and immunohistochemical detection. The effect of salusin-beta on human pulmonary arterial endothelial cell (HPAEC) function was detected by adhesion and tube formation experiments in vitro. Salusin-beta expression was significantly increased in the lungs of the MCT-treated rats, and immunofluorescence results showed that salusin-beta was predominantly expressed in pulmonary macrophages and vascular endothelial cells. Salusin-beta blockade significantly ameliorated PAH by acting against pulmonary vascular remodeling, decreasing macrophage infiltration, and reducing pro-inflammatory cytokine expression and nuclear factor-kappa B (NF-kappa B) activity in the lungs of the MCT-treated rats. In addition, salusin-beta could induce cell adhesion and accelerate angiogenesis by activating the NF-kappa B pathway and promoting pro-inflammatory cytokine expression in the cultured HPAECs. This effect was suppressed by addition of the NF-kappa B inhibitor, N-acetyl-L-cysteine."

According to the news reporters, the research concluded: "Salusin-beta plays a crucial role in the development of MCT-induced PAH models."

Keywords for this news article include: Beijing, People's Republic of China, Asia, Cardiovascular Diseases and Conditions, Transcription Factors, DNA-Binding Proteins, Immunofluorescence, Nuclear Proteins, Inflammation, Hypertension, NF-kappa B, Capital Medical University.

Central Nervous System Diseases and Conditions -- Studies from Capital Medical University Add New Findings in the Area of Moyamoya Disease (High-resolution Magnetic Resonance Imaging of Moyamoya Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Moyamoya Disease. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "To introduce the imaging characteristics of moyamoya disease (MMD) using high-resolution magnetic resonance imaging (HR-MRI) and to discuss the role of HR-MRI in differentiating MMD from other intracranial artery diseases, especially intracranial atherosclerotic disease (ICAD). This review was based on the data in articles published between 2005 and 2015, which were obtained from PubMed."
Our news journalists obtained a quote from the research from Capital Medical University. "The keywords included HR-MRI, MMD, ICAD, and intracranial artery diseases. Articles related to HR-MRI for MMD or other intracranial artery diseases were selected for review. There are differences between the characteristic patterns of HR-MRI in MMD and ICAD. MMD is associated with inward remodeling, smaller outer diameters, concentric occlusive lesions and homogeneous signal intensity, while ICAD is more likely to be associated with outward remodeling, normal outer diameters, eccentric occlusive lesions, and heterogeneous signal intensity. Other intracranial artery diseases, such as dissection and vasculitis, also have distinctive characteristics in HR-MRI. HR-MRI may become a useful tool for the differential diagnosis of MMD in the future."

According to the news editors, the research concluded: "HR-MRI of MMD provides a more in-depth understanding of MMD, and it is helpful in evaluating pathological changes in the vessel wall and in differentiating MMD from other intracranial artery steno-occlusive diseases, particularly ICAD."

The news correspondents report that additional information may be obtained from D. Zhang, Dept. of Neurosurgery, Beijing Tiantan Hospital, Capital Medical University, Beijing 100050, People's Republic of China. Additional authors for this research include Q. Zhang, Z.Y. Shi, M.Q. Wang and D. Zhang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0366-6999.170257. This DOI is a link to an online electronic document that is either free or for purchase.

**Apoptosis**

Studies from Capital Medical University Reveal New Findings on Apoptosis (Cardiac Specific Overexpression of Mitochondrial Omi/HtrA2 Induces Myocardial Apoptosis and Cardiac Dysfunction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Apoptosis. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Myocardial apoptosis is a significant problem underlying ischemic heart disease. We previously reported significantly elevated expression of cytoplasmic Omi/HtrA2, triggers
cardiomyocytes apoptosis."

Our news journalists obtained a quote from the research from Capital Medical University, "However, whether increased Omi/HtrA2 within mitochondria itself influences myocardial survival in vivo is unknown. We aim to observe the effects of mitochondria-specific, not cytoplasmic, Omi/HtrA2 on myocardial apoptosis and cardiac function. Transgenic mice overexpressing cardiac-specific mitochondrial Omi/HtrA2 were generated and they had increased myocardial apoptosis, decreased systolic and diastolic function, and decreased left ventricular remodeling. Transiently or stably overexpression of mitochondria Omi/HtrA2 in H9C2 cells enhance apoptosis as evidenced by elevated caspase-3, -9 activity and TUNEL staining, which was completely blocked by Ucf-101, a specific Omi/HtrA2 inhibitor. Mechanistic studies revealed mitochondrial Omi/HtrA2 overexpression degraded the mitochondrial anti-apoptotic protein HAX-1, an effect attenuated by Ucf-101. Additionally, transfected cells overexpressing mitochondrial Omi/HtrA2 were more sensitive to hypoxia and reoxygenation (H/R) induced apoptosis. Cyclosporine A (CsA), a mitochondrial permeability transition inhibitor, blocked translocation of Omi/HtrA2 from mitochondrial to cytoplasm, and protected transfected cells incompletely against H/R-induced caspase-3 activation. We report in vitro and in vivo overexpression of mitochondrial Omi/HtrA2 induces cardiac apoptosis and dysfunction."

According to the news editors, the research concluded: "Thus, strategies to directly inhibit Omi/HtrA2 or its cytosolic translocation from mitochondria may protect against heart injury."

For more information on this research see: Cardiac Specific Overexpression of Mitochondrial Omi/HtrA2 Induces Myocardial Apoptosis and Cardiac Dysfunction. Scientific Reports, 2016;6():1-11. **Heart Disorders and Diseases - Heart Attack**

**Studies from Capital Medical University Update Current Data on Heart Attack (Atrial fibrillation is associated with an increased risk of myocardial infarction: Insights from a meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Attack have been presented. According to news originating from Beijing, People's Republic of China, by NewsRx
correspondents, research stated, "The presence of atrial fibrillation (AF) markedly increases the risk of stroke and mortality in patients. Whether AF is a risk factor for myocardial infarction (MI) is discrepant from current studies."

Our news journalists obtained a quote from the research from Capital Medical University, "The aim of this meta-analysis was to ascertain the association of AF with incident MI. Studies were identified through PubMed, CENTRAL, EMBASE, reviews and reference lists of relevant papers. Results of the MI outcome were presented as hazard ratio (HR) and 95% confidence interval (CI). Statistical analyses were performed with Stata 12.0 (Stata Corp LP, College Station, Texas, USA). Twelve studies, with a total of 169,306 patients, were included in the analysis. AF was associated with a 47% increased risk of MI (HR: 1.47; 95% CI: 1.21-1.80; p = 0.000; I-2 = 84.1%), while in patients free of coronary heart disease at baseline the risk could be increased by 71% (HR: 1.71; 95% CI: 1.36-2.14; p = 0.000; I-2 = 83.1%). Moreover, patients with AF had higher MI risk in the studies with lower mean age (< 60 years) (HR: 1.66; 95% CI: 1.26-2.20; p = 0.000; I-2 = 82.9%) than in the studies with higher mean age (≥ 60 years) (HR: 1.35; 95% CI: 1.00-1.82; p = 0.000; I-2 = 84.9%). Sex difference also existed, and the association between AF and MI was stronger in women (HR: 2.02; 95% CI: 1.60-2.56; p = 0.017; I-2 = 61.0%) than in men (HR: 1.44; 95% CI: 1.13-1.84; p = 0.000; I-2 = 76.1%). AF is associated with an increased risk of incident MI, especially in patients free of coronary heart disease at baseline, young patients and women."

According to the news editors, the research concluded: "The findings need confirmation in well-designed observational trials."

For more information on this research see: Atrial fibrillation is associated with an increased risk of myocardial infarction: Insights from a meta-analysis. Atherosclerosis, 2016;254();1-7. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Studies from Capital Medical University in the Area of Heart Failure Described (Analysis of Renal Artery Stenosis in Patients with Heart Failure: A RASHEF Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Failure. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Previous data are controversial about the association of renal artery stenosis (RAS) with clinical outcome in patients with heart failure. Definition of RAS in previous studies might not be appropriate."

The news reporters obtained a quote from the research from Capital Medical University, "By definition of RAS with renal duplex sonography, we investigated the association of RAS with clinical outcome in patients with heart failure. In this retrospective study, we identified 164 patients with heart failure (New York Heart Association classification (>=)II; left ventricular ejection fraction <50%) who had received renal duplex sonography during hospital stay. RAS was defined as renal-aortic ratio (>=)3.5 or a peak systolic velocity (> =)200 cm/s (or both), or occlusion of the renal artery. Categorical data of patients were compared using the Chi-square test or Fisher's exact test. Cox proportional hazards regression modeling technique was used to investigate the prognostic significance of possible predictors. Finally, 143 patients were enrolled. Median follow-up time was 32 months (1-53 months). Twenty-two patients were diagnosed as RAS by renal duplex sonography, including 13 unilateral RAS (3 left RAS, 10 right RAS) and 9 bilateral RAS. There were more all-cause mortality and cardiovascular death in patients with RAS than patients without RAS. By multivariate analysis, RAS was a significant predictor for all-cause death and cardiovascular death (hazard ratio [HR]=4.155, 95% confidence interval [CI]: 1.546-11.164, p=0.005; and HR=3.483, 95% CI: 1.200-10.104, p=0.022, respectively). As for composite endpoint events, including death, nonfatal myocardial infarction, ischemic stroke or intracranial hemorrhage, rehospitalization for cardiac failure, and renal replacement therapy, only angiotensin-converting enzyme inhibitor or angiotensin-receptor blocker was significant predictor. RAS was not a significant predictor for composite endpoint events."

Our news correspondents report that additional information may be obtained by contacting J.H. Liu, Dept. of Cardiology, Beijing Anzhen Hospital, Capital Medical University, Beijing Institute of Heart, Lung and Blood Vessel Diseases, Beijing 100029, People's Republic of China. Studies from Cardiovascular Institute Yield New Data on Hypertrophic Cardiomyopathy (Utility of Real Time 3D Echocardiography for the Assessment of Left Ventricular Mass in Patients with Hypertrophic Cardiomyopathy: Comparison with Cardiac Magnetic Resonance.)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Hypertrophic Cardiomyopathy have been published. According to news reporting originating from Buenos Aires, Argentina, by NewsRx correspondents, research stated, "Patients with hypertrophic cardiomyopathy (HCM) have irregular ventricular shapes with small and sometimes obliterated cavities at end-systole that affect the quantification of left ventricular mass (LVM) by conventional methods, such as M-mode or two-dimensional echocardiography. The goal of this study was to validate the use of real time three-dimensional echocardiography (RT3DE) to quantify LVM using cardiac magnetic resonance imaging (CMR) as a reference, in a large population of patients with different types of HCM."

Our news editors obtained a quote from the research from Cardiovascular Institute, "Forty-eight consecutive patients with HCM had a complete transthoracic examination and CMR performed within 7 days. LVM was calculated by M-mode and RT3DE and compared to CMR that served as gold standard. Left ventricular mass calculated by RT3DE was 195 ± 41 g and 187 ± 49 g by CMR. The correlation between the two methods was moderate, with a Lin index of 0.63 and good linear correlation (r=0.63, p<0.0001). The correlation was high when RT3DE was of high or adequate image quality. The correlation between LVM by M-mode and CMR was poor."

According to the news editors, the research concluded: "Three-dimensional echocardiography is an accurate method for the quantification of LVM in patients with different subtypes of HCM that is in better agreement with CMR reference values than M-mode measurements."

The news editors report that additional information may be obtained by contacting G.P. Avegliano, Dept. of Cardiovascular Imaging, Cardiovascular Institute of Buenos Aires,
Buenos Aires, Argentina. Additional authors for this research include J.P. Costabel, F.M. Asch, A. Sciancalepore, P. Kuschnir, M. Huguet, C. Tobon-Gomez, A.F. Frangi and R. Ronderos.

**Heart Disorders and Diseases - Heart Disease**

**Studies from Cardiovascular Research Foundation Yield New Data on Heart Disease (Gender Differences in Associations Between Intraprocedural Thrombotic Events During Percutaneous Coronary Intervention and Adverse Outcomes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Disease is the subject of a report. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Women are frequently reported to have increased morbidity after presentation with acute coronary syndromes and myocardial infarction; however, whether a greater thrombotic tendency contributes to gender differences in clinical outcomes of urgent percutaneous coronary intervention is unknown. Intraprocedural Thrombotic Events (IPTEs) are defined as new or increasing thrombus, abrupt vessel closure, no reflow or slow reflow, or distal embolization at any time during percutaneous coronary intervention."

Our news journalists obtained a quote from the research from Cardiovascular Research Foundation, "IPTEs were evaluated in this pooled analysis of 6,591 patients with stent implantation and blinded quantitative coronary angiography (QCA) analysis, from the ACUITY and HORIZONS-AMI trials. We compared major adverse cardiac events (MACE) at in-hospital, 30-day, and 1-year follow-up and major bleeding at 30 days according to gender and the presence or absence of IPTE. IPTE was identified in 507 patients (7.7%), with 119 of 1,744 (6.8%) occurring in women and 388 of 4,847 (8.0%) in men (p = 0.12). IPTE, but not gender, was independently associated with MACE at in-hospital and 30-day follow-up. At 1-year follow-up, the adjusted hazard of MACE was higher in women and in patients with IPTE; however, the risk of MACE associated with IPTE was similar among women and men. There was no significant interaction between IPTE and gender for 1-year MACE or 30-day bleeding. IPTE predicted major bleeding only in women."

According to the news editors, the research concluded: "In acute coronary syndromes, women have increased risk of adverse outcome at 1 year. IPTEs are common, occur at similar frequency, and are associated with similar degree of increased MACE in both genders at short- and long-term follow-up. Higher thrombotic propensity does not offer a mechanistic explanation for the worse outcomes noted in women."

**Numerical Analysis**

**Studies from Carleton University Yield New Data on Numerical Analysis (Nonuniform Deposition of Pressurized Metered-Dose Aerosol in Spacer Devices)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Numerical Analysis is now available. According to news reporting from Ottawa, Canada, by NewsRx journalists, research stated, "Pressurized metered-dose inhalers (pMDIs) are commonly used to administer medication to patients suffering from chronic lower respiratory tract diseases such as asthma. Inhaling medication directly from a pMDI can prove difficult for some patients and, as a result, add-on devices (or spacers) have been designed to aid in the delivery of medication."

The news correspondents obtained a quote from the research from Carleton University, "Although spacers increase the percentage of medication that reaches the patient, medication will also nonsymmetrically deposit on the walls of the device and will be lost to the device itself. The deposition of medication, salbutamol sulfate, within a large- and small-volume spacer, has been studied through an experimental and numerical analysis. Experiments were conducted at inspiratory flow rates ranging from 30 to 60 L/min. The amount of deposition of the medication on the walls of the spacer was quantified through an application of spectrophotometry. Computational fluid dynamics was used to quantify the deposition numerically. Simulations were conducted by implementing mean flow and turbulent tracking of particles using unsteady Reynolds-averaged Navier-Stokes (URANS) equations with a shear stress transport turbulence model. Regions of deposition are of interest, as well as how the method of deposition varied for different inhalation flow rates. The deposition of salbutamol sulfate in the Volumatic ® and OptiChamber ® spacers was found to be greater in the lower half as opposed to the upper half of the spacer due to a downward spray angle. With an increased
According to the news reporters, the research concluded: "For the numerical analysis, the results indicated that inertial impaction is the most likely method of deposition for the Volumatic spacer, and turbulence is more likely to cause deposition in the OptiChamber spacer."

Our news journalists report that additional information may be obtained by contacting N. Ogrodnik, Carleton University, Dept. of Mech & Aerosp Engn, Ottawa, ON K1S 5B6, Canada. Additional authors for this research include V. Azzi, E. Sprigge, S. Fiset and E. Matida.

---

**Surgery - Cesarean Section**

**Studies from Case Western Reserve University Describe New Findings in Cesarean Section (Maternal and neonatal outcomes of attempted vaginal compared with planned cesarean delivery in triplet gestations)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Surgery - Cesarean Section are discussed in a new report. According to news reporting out of Cleveland, Ohio, by NewsRx editors, research stated, "The prevailing obstetric practice of planned cesarean delivery for triplet gestations is largely empiric and data on the optimal route of delivery are limited. The primary objectives of this study are to determine the likelihood of success in an attempted vaginal delivery and assess maternal and neonatal outcomes of attempted vaginal vs planned cesarean delivery of triplets using a multinstitution obstetric cohort."

Our news journalists obtained a quote from the research from Case Western Reserve University. "We performed a retrospective cohort study using data from the Consortium on Safe Labor, identifying triplet pregnancies with delivery at a gestational age >= 28 weeks. Women with a history of cesarean delivery and pregnancies complicated by chromosomal or congenital anomalies, twin-twin transfusion syndrome, or a fetal demise were excluded. The attempted vaginal group included all women with spontaneous or induced labor and excluded all women delivering by prelabor cesarean delivery, including those coded as elective or for fetal malpresentation. Primary maternal outcomes included infection (composite of chorioamnionitis,
endometritis, wound separation, and wound infection), blood transfusion, or transfer to the intensive care unit. Primary neonatal outcomes included neonatal asphyxia, mechanical ventilation, and composite neonatal morbidity, consisting of >= 1 of the following: birth injury, 5-minute Apgar < 4, arterial pH < 7.0 or base excess < -12.0, neonatal asphyxia, or neonatal death. For neonatal outcomes, Poisson regression was performed with clustering to account for correlation between neonates within a triplet pregnancy, controlling for confounders as outcome rates allowed. A sensitivity analysis was performed in the subcohort delivering at gestational age >= 34 weeks in which the attempted vaginal delivery group was restricted to include only women with evidence of induction or augmentation or labor. 188 triplet sets were identified of which 80 sets (240 neonates) met inclusion criteria and 24 sets (30%) had an attempted vaginal delivery. The rate of successful attempted vaginal delivery was 16.7% (4 triplet sets; 12 neonates). No women had a combined mode of delivery. Women attempting vaginal delivery were more likely to have preterm labor (45.8 vs 12.5%, P<.001) and receive antenatal corticosteroids (45.8 vs 21.4%, P =.03), however gestational age at delivery did not differ by mode of delivery. Attempted vaginal delivery was associated with a higher risk of maternal transfusion (20.8% vs 3.6%, P =.01) and neonatal mechanical ventilation (26.4% vs 7.7%; adjusted incidence rate ratio, 1.12; 95% confidence interval, 1.01-1.24). There was no significant difference in the risk of asphyxia or composite neonatal morbidity by mode of delivery. In the subcohort sensitivity analysis, attempted vaginal delivery was associated with an increased risk of composite neonatal morbidity (adjusted incidence rate ratio, 12.44; 95% confidence interval, 1.22-127.20) but not maternal transfusion (22.2% vs 3.5%, P =.06) or neonatal mechanical ventilation (adjusted incidence rate ratio, 1.02; 95% confidence interval, 0.89-1.17). In a multicenter US cohort, attempted vaginal delivery of triplets is associated with higher risks of maternal transfusion and neonatal mechanical ventilation. Composite severe neonatal morbidity may be higher with attempted vaginal delivery although studies with greater power are required. The low probability of successful vaginal delivery raises questions regarding the utility of attempted vaginal delivery in triplet gestations."

According to the news editors, the research concluded: "Our data support planned prelabor cesarean delivery as the preferred mode of delivery for triplet gestations."

Our news journalists report that additional information may be obtained by contacting J.R. Lappen, Case Western Reserve University, Sch Med, Metrohlth Med Center, Div Maternal Fetal Med, Cleveland, OH, United States. Additional authors for this research include D.N. Hackney and J.L. Bailit.

Studies from Case Western Reserve University Reveal New Findings on Therapeutics (Female genital alteration: a compromise solution)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Therapeutics is now available. According to news reporting originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Despite 30 years of advocacy, the prevalence of non-therapeutic female genital alteration (FGA) in minors is stable in many countries. Educational efforts have minimally changed the prevalence of this procedure in regions where it has been widely practiced."

Our news editors obtained a quote from the research from Case Western Reserve University, "In order to better protect female children from the serious and long-term harms of some types of non-therapeutic FGA, we must adopt a more nuanced position that acknowledges a wide spectrum of procedures that alter female genitalia. We offer a revised categorisation for non-therapeutic FGA that groups procedures by effect and not by process. Acceptance of de minimis procedures that generally do not carry long-term medical risks is culturally sensitive, does not discriminate on the basis of gender, and does not violate human rights. More morbid procedures should not be performed."

According to the news editors, the research concluded: "However, accepting de minimis non-therapeutic FGA procedures enhances the effort of compassionate practitioners searching for a compromise position that respects cultural differences but protects the health of their patients."

For more information on this research see: Female genital alteration: a compromise solution. Journal of Medical Ethics, 2016;42(3):148-54. (BMJ Publishing Group - group.bmj.com/; Journal of Medical Ethics - jme.bmj.com/)

According to news reporting out of Daegu, South Korea, by NewsRx editors, research stated, "Follicular variant papillary thyroid cancer (FVPTC) is the second most common subtype after conventional PTC. We compared ultrasonographic (US) features of FVPTC to those of conventional PTC according to tumor size."

Our news journalists obtained a quote from the research from the Catholic University of Daegu School of Medicine, "We reviewed US findings, pathologic reports, and medical charts of 249 PTC patients with surgically proven disease (83 FVPTCs, 166 conventional PTCs) at our institution from January 2007 to December 2012. FVPTCs were divided into PTC-like and follicular neoplasm (FN)-like based on sonographic characteristics. PTC-like features were defined as having at least one malignant feature (taller-than-wide shape, infiltrative margin, marked hypochochogenicity, and micro-calcifications), whereas FN-like cancers showed oval solid features without malignant features. FVPTCs showed a higher rate of FN-like features than conventional PTCs. Of 166 conventional PTCs, 13 (7.8%) had FN-like features and 153 (92.2%) had PTC-like features, whereas of the 83 FVPTCs, 31 (37.3%) had FN-like features and 52 (62.7%) had PTC-like features. Macro-FVPTCs showed a higher rate of FN-like features than micro-FVPTCs (p <0.001). Of 21 macro-FVPTCs, 18 (85.7%) had FN-like features and 3 (14.3%) had PTC-like features, whereas of the 62 micro-FVPTCs, 13 (21%) had FN-like features and 49 (79%) had PTC-like features. There were no differences in multifocality, extrathyroidal invasion, and lymph node metastasis between PTC-like FVPTCs and FN-like FVPTCs. FVPTCs showed fewer sonographic malignant features than conventional PTCs. In particular, FVPTCs larger than 1 cm had a more frequent benign sonographic appearance." According to the news editors, the research concluded: "Therefore, if fine-needle aspiration result is suspicious for PTC in a nodule larger than 1 cm with no suspicious US features, the possibility of FVPTC might be considered."

For more information on this research see: Ultrasonographic Characteristics of the Follicular Variant Papillary Thyroid Cancer According to the Tumor Size. *Journal of Korean Medical Science*, 2016;31(3):397-402.

Our news journalists report that additional information may be obtained by contacting E.J. Jeon, Dept. of Internal Medicine, Catholic University of Daegu School of Medicine, Daegu, South Korea. Additional authors for this research include Y.J. Jeong, S.H. Park, C.H. Cho, H.S. Shon and E.D Jung.

**Leiomyomas**

Studies from Catholic University of Korea Provide New Data on Leiomyomas (Rapid enlargement of endometrial stromal sarcoma after uterine fibroid embolization for presumed adenomyosis: a case report and literature review)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Leiomyomas is now available. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Uterine sarcomas have rarely been diagnosed after uterine artery embolization. It remains unclear whether the diagnostic work-up is required prior to such embolization to prevent a missed diagnosis of sarcomas and a delay in providing definitive treatment."

Our news editors obtained a quote from the research from the Catholic University of Korea, "Because of the rarity and heterogeneity of endometrial stromal neoplasms, little is known about their epidemiology, pathogenesis, and molecular pathology. The authors report a case of low-grade endometrial stromal sarcoma (ESS) diagnosed after uterine fibroid embolization. Although they performed laparoscopic biopsy of the rapidly growing uterine mass, they could not detect the ESS. Although rare, ESS should be considered in the differential diagnosis of uterine fibroid enlargement. It is essential to assess the risk of malignancy by taking into account the patient's clinical symptoms, results of the physical exam, and imaging findings prior to uterine artery embolization."

According to the news editors, the research concluded: "Pathologic diagnosis should include an adequate biopsy sample and the use of molecular genetic testing."

The news editors report that additional information may be obtained by contacting M.J. Kim, Catholic University of Korea, Coll Med, Dept. of Obstet & Gynecol, Seoul, South Korea. Additional authors for this research include H.J. Lee, Y.J. Shin, H.W. Lim, H.N. Lee and M.J. Kim.

**Clinical Research - Clinical Trials and Studies**

**Studies from Catholic University of Korea in the Area of Clinical Trials and Studies Described (Efficacy and Safety of "URSA Complex" in Subjects with Physical Fatigue: A Multicenter, Randomized, Double-blind, Placebo-controlled Trial)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Fatigue is a common symptom both in diseases status and in healthy subjects. Various supplements and nutraceauticals for relieving of fatigue have been used."

Our news journalists obtained a quote from the research from the Catholic University of Korea, "However, there are a few studies to evaluate the efficacy and the safety of the drug"
for fatigue alleviation, we conducted using URSA Complex to evaluate the efficacy on physical fatigue via score changes in the checklist individual strength (CIS). The study was designed as a multicenter, randomized, double-blind, placebo-controlled trial, with subjects randomized to one of the two arms, receiving either placebo or URSA Complex administered as identical capsules. The primary efficacy endpoints of this clinical trials are the ratio of improving CIS scores <76 points in patients at the end (4 weeks). Secondary efficacy variables are as follows one is an improvement of fatigue and the other is an improvement of the liver enzyme. The fatigue recovery rate in who had improved CIS scores of <76 points were 70.0%, 50.9% in the therapy group and placebo group, respectively (p=0.019). The fatigue recovery rate in CIS score was higher in URSA Complex therapy group than placebo group. The difference between therapy group and placebo group was statistically significant at 4 weeks later, but not 2 weeks. Our results provided that the URSA Complex was effective in alleviating physical fatigue.

According to the news editors, the research concluded: "The adverse event frequency in the therapy groups was similar to that in the placebo group."

Our news journalists report that additional information may be obtained by contacting K.S. Kim, Dept. of Family Medicine, CMC Clinical Research Coordinating Center, Seoul St Mary's Hospital, College of Medicine, The Catholic University of Korea, Seoul, South Korea. Additional authors for this research include M.J. Kim, S.W. Song, D.Y. Cho, K.C. Park, S.W. Yang, Y.S. Kim and K.S Kim.

**Drugs and Therapies - Olanzapine Therapy**

**Studies from Catholic University of Leuven Describe New Findings in Olanzapine Therapy (A sensitive capillary LC-UV method for the simultaneous analysis of olanzapine, chlorpromazine and their FMO-mediated N-oxidation products in brain ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Olanzapine Therapy is now available. According to news reporting originating from Leuven, Belgium, by NewsRx correspondents, research stated, "A specific and sensitive capillary liquid chromatography-ultraviolet detection (cap-LC-UV) method in combination with a micro-extraction by packed
sorbent (MEPS) sample clean-up procedure has been developed and validated for the simultaneous analysis of chlorpromazine, olanzapine and their flavin-containing monooxygenase (FMO) mediated N-oxides in rat brain microdialysates. Chromatographic separation was obtained on an Acclaim Pepmap RP C18 column with an ID of 300 μm. An injection volume of 20 L was used to inject the largely aqueous samples and was shown to have no influence on the obtained peak shape of the compounds of interest."

Financial supporters for this research include TUBITAK, FWO.

Our news editors obtained a quote from the research from the Catholic University of Leuven, "Optimal conditions for MEPS extraction were obtained on a mixed-mode M1 (80% C8, 20% SCX) cartridge after diluting microdialysate samples with phosphate buffer pH 2.5 (1:3 v/v). The method was validated and lower limits of quantification (LLOQ) were determined at 0.5 nM for all compounds. Linearity was demonstrated between the LLOQ and 1 μM for all compounds (R-2 > 0.995). MEPS recoveries were between 92% and 98%, with intra- and interday variabilities below 15%. The applicability of the developed method was successfully demonstrated by analysing rat brain microdialysates."

According to the news editors, the research concluded: "The capillary LC-UV method in combination with MEPS sample treatment provides a simple, sensitive method to quantify all compounds of interest in 45 min and can be applied for routine therapeutic monitoring and pharmacokinetic studies of olanzapine, chlorpromazine and their respective N-oxides."

For more information on this research see: A sensitive capillary LC-UV method for the simultaneous analysis of olanzapine, chlorpromazine and their FMO-mediated N-oxidation products in brain microdialysates. *Talanta*, 2017;162():268-277. *Talanta* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Talanta - www.journals.elsevier.com/talanta/)

**Drugs and Therapies - Chemotherapy**

**Studies from Catholic University of Leuven Have Provided New Data on Chemotherapy (Modulation of the Substitution Pattern of 5-Aryl-2-Aminoimidazoles Allows Fine-Tuning of Their Antibiofilm Activity Spectrum and Toxicity)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Chemotherapy have been presented. According to news reporting originating in Leuven, Belgium, by NewsRx journalists, research stated, "We previously synthesized several series of compounds, based on the 5-aryl-2-aminoimidazole scaffold, that showed activity preventing the formation of Salmonella enterica serovar Typhimurium and Pseudomonas aeruginosa biofilms. Here, we further studied the activity spectrum of a number of the most active N1- and 2N-substituted 5-aryl-2-aminoimidazoles against a broad panel of biofilms formed by monospecies and mixed species of bacteria and fungi."

The news reporters obtained a quote from the research from the Catholic University of Leuven, "An N1-substituted compound showed very strong activity against the biofilms formed by Gram-negative and Gram-positive bacteria and the fungus Candida albicans but was previously shown to be toxic against various eukaryotic cell lines. In contrast, 2N-substituted compounds were nontoxic and active against biofilms formed by Gram-negative bacteria and C. albicans but had reduced activity against biofilms formed by Gram-positive bacteria. In an attempt to develop nontoxic compounds with potent activity against biofilms formed by Gram-positive bacteria for application in antibiofilm coatings for medical implants, we synthesized novel compounds with substituents at both the N1 and 2N positions and tested these compounds for antibiofilm activity and toxicity. Interestingly, most of these N1-, 2N-disubstituted 5-aryl-2-aminoimidazoles showed very strong activity against biofilms formed by Gram-positive bacteria and C. albicans in various setups with biofilms formed by monospecies and mixed species but lost activity against biofilms formed by Gram-negative bacteria. In light of application of these compounds as anti-infective coatings on orthopedic implants, toxicity against two bone cell lines and the functionality of these cells were tested. The N1-, 2N-disubstituted 5-aryl-2-aminoimidazoles in general did not affect the viability of bone cells and even induced calcium deposition."

According to the news reporters, the research concluded: "This indicates that modulating the substitution pattern on positions N1 and 2N of the 5-aryl-2-aminoimidazole scaffold allows fine-tuning of both the antibiofilm activity spectrum and toxicity."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AAC.00035-16. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from Catholic University of Louvain Yield New Information about Type 2 Diabetes [A Mechanistic Study on Nanoparticle-Mediated Glucagon-Like Peptide-1 (GLP-1) Secretion from Enteroendocrine L Cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting out of Brussels, Belgium, by NewsRx editors, research stated, "L cells have attracted particular interest because of the pleiotropic effects of their secreted peptides (i.e., glucagon-like peptide (GLP) 1 and 2, peptide YY (PYY)). L cells express different G-protein coupled receptors (GPCRs) that can be activated by endogenous ligands found in the gut lumen."

Financial supporters for this research include European Research Council, Fonds De La Recherche Scientifique - FNRS, Artois-Baillet Latour Foundation.

Our news journalists obtained a quote from the research from the Catholic University of Louvain, "We herein hypothesized that lipid-based nanoparticles could mimic endogenous ligands and thus activate GLP-1 secretion in type 2 diabetes mellitus treatment. To assess this hypothesis, lipid-based nanoparticles (nanostructured lipid carriers (NLC), lipid nanocapsules (LNC), and liposomes) and PLGA nanoparticles were added to the L cells and GLP-1 secretion was quantified. Among these nanoparticles, only NLC resulted effective at inducing GLP-1 secretion in both murine and human L cells in vitro. The mRNA expression of proglucagon showed that this effect was due to an increased GLP-1 secretion and not to an increased GLP-1 synthesis. The mechanism by which NLC triggered GLP-1 secretion by L cells revealed an extracellular interaction of NLC, exerting a physiological GLP-1 secretion."

According to the news editors, the research concluded: "We herein demonstrate that nanomedicine can be used to induce GLP-1 secretion from murine and human L cells."

For more information on this research see: A Mechanistic Study on Nanoparticle-Mediated Glucagon-Like Peptide-1 (GLP-1) Secretion from Enteroendocrine L Cells. Studies from Cedars-Sinai Heart Institute Add New Findings in the Area of Immunoglobulins (Do Prior Driveline Infections Increase the Risk of Infection in Heart Transplant Patients Treated With Rabbit Antithymocyte Globulin Induction Therapy?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immunology - Immunoglobulins is the subject of a report. According to news reporting originating in Los Angeles, California, by NewsRx journalists, research stated, "The use of mechanical circulatory support devices (MCSDs) has been increasing over the past several years. Driveline infections (DLIs) are one of the most common complications seen in these patients; reportedly, up to 50% of patients with MCSDs can develop this complication."

The news reporters obtained a quote from the research from Cedars-Sinai Heart Institute, "It is believed that the removal of the driveline results in treatment of the localized infection area. MCSD patients are also known to develop circulating antibodies. These circulating antibodies have been associated with poor outcomes after heart transplantation. The use of rabbit antithymocyte globulin (ATG) as induction therapy reportedly decreases the development of circulating antibodies; it is now commonly used in sensitized patients undergoing heart transplantation. It is unknown whether ATG induction therapy immediate posttransplant will increase the risk of infection of those MCSD patients with DLIs. Between 2003 and 2013, we evaluated 57 MCSD patients who subsequently underwent heart transplantation and received ATG induction therapy. Patients were divided into those with previous MCSD DLI and those without, and they were assessed for 1-year freedom from infection (specifically, sternal wound infections). One-year survival and freedom from treated rejection, both cellular and antibody mediated, were also assessed. MCSD patients with DLIs who received ATG induction did not have a lower freedom from any treated infection and from sternal wound infection posttransplant compared with those MCSD patients without DLIs and not treated with ATG induction. There were also no significant differences between the 2 groups in terms of 1-year posttransplant survival and freedom from treated rejection. The use of ATG induction in patients with prior DLIs did not seem to increase the risk for posttransplant infection (eg, sternal wound infection)."

According to the news reporters, the research concluded: "ATG induction can therefore be safely used in this population."

Our news correspondents report that additional information may be obtained by contacting J. Kobashigawa, Cedars Sinai Heart Inst, Los Angeles, CA, United States. Additional

Lung Diseases and Conditions - Pneumonia

Studies from Cedars-Sinai Medical Center Yield New Data on Pneumonia [Results of the ICTuS 2 Trial (Intravascular Cooling in the Treatment of Stroke 2)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Pneumonia. According to news reporting originating from Los Angeles, California, by NewsRx correspondents, research stated, "Therapeutic hypothermia is a potent neuroprotectant approved for cerebral protection after neonatal hypoxia-ischemia and cardiac arrest. Therapeutic hypothermia for acute ischemic stroke is safe and feasible in pilot trials."

Our news editors obtained a quote from the research from Cedars-Sinai Medical Center, "We designed a study protocol to provide safer, faster therapeutic hypothermia in stroke patients. Safety procedures and 4 degrees C saline infusions for faster cooling were added to the ICTuS trial (Intravascular Cooling in the Treatment of Stroke) protocol. A femoral venous intravascular cooling catheter after intravenous recombinant tissue-type plasminogen activator in eligible patients provided 24 hours cooling followed by a 12-hour rewarm. Serial safety assessments and imaging were performed. The primary end point was 3-month modified Rankin score 0,1. Of the intended 1600 subjects, 120 were enrolled before the study was stopped. Randomly, 63 were to receive hypothermia plus antishivering treatment and 57 normothermia. Compared with previous studies, cooling rates were improved with a cold saline bolus, without fluid overload. The intention-to-treat primary outcome of 90-day modified Rankin Score 0,1 occurred in 33% hypothermia and 38% normothermia subjects, odds ratio (95% confidence interval) of 0.81 (0.36-1.85). Serious adverse events occurred equally. Mortality was 15.9% hypothermia and 8.8% normothermia subjects, odds ratio (95% confidence interval) of 1.95 (0.56-7.79). Pneumonia occurred in 19% hypothermia versus 10.5% in normothermia subjects, odds ratio (95% confidence interval) of 1.99 (0.63-6.98). Intravascular therapeutic hypothermia was confirmed to be safe and feasible in recombinant tissue-type plasminogen activator-treated acute ischemic stroke patients."

According to the news editors, the research concluded: "Protocol changes designed to reduce pneumonia risk appeared to fail, although the sample is small."

For more information on this research see: Results of the ICTuS 2 Trial (Intravascular Cooling in the Treatment of Stroke 2). Stroke, 2016;47(12):2888-2895. Hematologic Diseases and Conditions - Anemia

Studies from Centers for Disease Control and Prevention Add New Findings in the Area of Anemia (The Rural-Urban Difference in BMI and Anemia among Children and Adolescents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematologic Diseases and Conditions - Anemia is the subject of a report. According to news reporting originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "There is growing concern over the double burden of over-and under-nutrition in individuals, especially in children and adolescents, which could dwarf their growth and development. This study aims to explore the rural-urban difference in BMI and anemia among children and adolescents."

Our news editors obtained a quote from the research from Centers for Disease Control and Prevention, "A stratified cluster sampling technique was employed. Dietary data were collected through interviews, and anthropometric values were measured. There were 1534 children and adolescents who participated in this study, including 775 male and 759 female participants. The prevalence of obesity among children living in a city, township and rural area was 10.3%, 8.5% and 5.5%, and that among adolescents was 1.4%, 2.9% and 2.8%. The prevalence of anemia among children and living in a city, township and rural area was 4.3%, 2.5% and 4.5%, while that among adolescents was 6.1%, 3.7% and 11.3%, respectively, with significant difference (chi(2) = 10.824, p = 0.004). The prevalence of being overweight, obesity and anemia was significant when comparing children with adolescents (chi(2) = 37.861, p = 0.000; chi(2) = 19.832, p = 0.000; chi(2) = 8.611, p = 0.003)."

According to the news editors, the research concluded: "Findings of this study indicate the double burden of malnutrition in Zhejiang province, characterized by a high prevalence of being overweight, obesity and anemia among children and a high prevalence of anemia among adolescents living in townships."

For more information on this research see: The Rural-Urban Difference in BMI and Anemia among Children and Adolescents. International Journal of Environmental Research
Studies from Central Hospital Describe New Findings in Liver Cancer  
(Diabetes mellitus may affect the long-term survival of hepatitis B virus-related hepatocellular carcinoma patients after liver transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Liver Cancer have been presented. According to news originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "To determine whether diabetes mellitus (DM) affects prognosis/recurrence after liver transplantation (LT) for hepatitis B virus (HBV)-related hepatocellular carcinoma (HCC). A retrospective study was conducted between January 2000 and August 2013 on 1631 patients with HBV-related HCC who underwent LT with antiviral prophylaxis."

Our news journalists obtained a quote from the research from Central Hospital, "Patient data were obtained from the China Liver Transplant Registry (https://www.cltr.org/). To compare the outcomes and tumor recurrence in the HBV-related HCC patients with or without DM, statistical analyses were conducted using 2 tests, Mann-Whitney tests, the Kaplan-Meier method, log-rank tests and multivariate step-wise Cox regression analysis. Univariate analysis of 1631 patients who underwent LT found overall 1-, 3- and 5-year survival rates of 79%, 73% and 71% respectively in the DM patients, and 84%, 78% and 76% in the non-DM patients respectively. Overall survival rate differences after LT between the two groups were significant (p = 0.041), but recurrence-free survival rates were not (p = 0.096). By stratified analysis, the overall survival rates in DM patients for age > 50 years (p = 0.002), the presence of vascular invasion (p = 0.096), tumors <= 3 cm (p = 0.047), two to three tumor nodules (p = 0.007), Child-Pugh grade B (p = 0.018), and preLT alanine aminotransferase levels between 40 and 80 IU/L (p = 0.017) were significantly lower than in non-DM patients. Additionally, serum a-fetoprotein level > 2000 ng/ml (p = 0.052) was associated with a significant survival difference trend between DM and non-DM patients. Multivariate analysis showed that the presence of DM (p < 0.001, HR = 1.591; 95% CI: 1.239-2.041) was an independent predictor associated with poor survival after LT. HBV-related HCC patients with DM have decreased long-term overall survival and poor LT outcomes."

According to the news editors, the research concluded: "Prevention strategies for HCC patients with DM are recommended."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i43.9571. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Gastric Cancer

Studies from Central Hospital Provide New Data on Gastric Cancer (Surgical care quality and oncologic outcome after D2 gastrectomy for gastric cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Gastric Cancer. According to news reporting from Jyvaskyla, Finland, by NewsRx journalists, research stated, "To examine the quality of surgical care and long-term oncologic outcome after D2 gastrectomy for gastric cancer. From 1999 to 2008, a total of 109 consecutive patients underwent D2 gastrectomy without routine pancreaticosplenectomy in a multimodal setting at our institution."

The news correspondents obtained a quote from the research from Central Hospital, "Oncologic outcomes together with clinical and histopathologic data were analyzed in relation to the type of surgery performed. Staging was carried out according to the Union for International Cancer Control criteria of 2002. Patients were followed-up for five years at the outpatient clinic. The primary measure of outcome was long-term survival with the quality of surgery as a secondary outcome measure. Clinical data were retrospectively collected from the patient records, and causes of death were obtained from national registries. A total of 109 patients (58 men) with a mean age of 67.4 ± 11.2 years underwent total gastrectomy or gastric resection with D2 lymph node dissection. The tumor stage distribution was as follows: stage I, (27/109) 24.8%; stage II, (31/109) 28.4%; stage III, (41/109) 37.6%; and stage IV, (10/109) 9.2%. Forty patients (36.7%) received chemotherapy or chemoradiotherapy. The five-year overall survival rate for all 109 patients was 45.0%, and was 47.1% for the 104 patients treated with curative R0 resection. The five-year disease-specific survival rates were 53.0% and 55.8%, respectively. In a multivariate analysis, body mass index and tumor stage were independent
prognostic factors for overall survival (both \( p<0.01 \)), whereas body mass index, tumor stage, tumor site, Lauren classification, and lymph node invasion were prognostic factors for cancer-specific survival (all \( p<0.05 \)). Postoperative 30-d mortality was 1.8% and 30-d, surgical (including three anastomotic leaks, two of which were treated conservatively), and general morbidities were 26.6%, 12.8%, and 14.7%, respectively."

According to the news reporters, the research concluded: "D2 dissection is a safe surgical option for gastric cancer, providing quality surgical care and long-term oncologic outcomes that are in line with current Western standards."

Our news journalists report that additional information may be obtained by contacting J. Mrena, Johanna Mrena, Anne Mattila, Ilmo Kellokumpu, Dept. of Surgery, Central Hospital of Central Finland, 40620 Jyvaskyla, Finland. Additional authors for this research include A. Mattila, J. Bohm, I. Jantunen and I. Kellokumpu.

Studies from Central Manchester NHS Foundation Trust Have Provided New Data on Hypertension (How to Screen for Non-Adherence to Antihypertensive Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news reporting originating in Manchester, United Kingdom, by NewsRx journalists, research stated, "The quality of assessment of non-adherence to treatment in hypertensive is poor. Within this review, we discuss the different methods used to assess adherence to blood-pressure-lowering medications in hypertension patients."

The news reporters obtained a quote from the research from Central Manchester NHS Foundation Trust, "Subjective reports such as physicians' perceptions are inaccurate, and questionnaires completed by patients tend to overreport adherence and show a low diagnostic specificity. Indirect objective methods such as pharmacy database records can be useful, but they are limited by the robustness of the recorded data. Electronic medication monitoring devices are accurate but usually track adherence to only a single medication and can be expensive. Overall, the fundamental issue with indirect objective measures is that they do not fully confirm ingestion of antihypertensive medications. Detection of antihypertensive medications in body fluids using liquid chromatography-tandem mass spectrometry is currently,
in our view, the most robust and clinically useful method to assess non-adherence to blood-pressure-lowering treatment. It is particularly helpful in patients presenting with resistant, refractory or uncontrolled hypertension despite the optimal therapy."

According to the news reporters, the research concluded: "We recommend using this diagnostic strategy to detect non-adherence alongside a no-blame approach tailoring support to address the perceptions (e.g. beliefs about the illness and treatment) and practicalities (e.g. capability and resources) influencing motivation and ability to adhere."

For more information on this research see: How to Screen for Non-Adherence to Antihypertensive Therapy. *Current Hypertension Reports*, 2016;18(12):45-52. *Current Hypertension Reports* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Current Hypertension Reports - www.springerlink.com/content/1522-6417/)

Our news correspondents report that additional information may be obtained by contacting M. Tomaszewski, Cent Manchester NHS Fdn Trust, Manchester Academy Hlth Sci Center, Div Med, Manchester, Lancs, United Kingdom. Additional authors for this research include P. Patel, R. Horne, H. Buchanan, B. Williams and M. Tomaszewski.

**Drugs and Therapies - Intron Therapy**

**Studies from Central South University Reveal New Findings on Intron Therapy (In situ genetic correction of F8 intron 22 inversion in hemophilia A patient-specific iPSCs)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Intron Therapy are discussed in a new report. According to news originating from Changsha, People's Republic of China, by NewsRx correspondents, research stated, "Nearly half of severe Hemophilia A (HA) cases are caused by F8 intron 22 inversion (Inv22). This 0.6-Mb inversion splits the 186-kb F8 into two parts with opposite transcription directions."

Our news journalists obtained a quote from the research from Central South University, "The inverted 5' part (141 kb) preserves the first 22 exons that are driven by the intrinsic F8 promoter, leading to a truncated F8 transcript due to the lack of the last 627 bp coding sequence of exons 23-26. Here we describe an in situ genetic correction of Inv22 in patient-specific induced pluripotent stem cells (iPSCs). By using TALENs, the 627 bp sequence plus a polyA signal was precisely targeted at the junction of exon 22 and intron 22 via homologous recombination (HR) with high targeting efficiencies of 62.5% and 52.9%. The gene-corrected iPSCs retained a normal karyotype following removal of drug selection cassette using a Cre-LoxP system. Importantly, both F8 transcription and FVIII secretion were rescued in the candidate cell types for HA gene therapy including endothelial cells (ECs) and mesenchymal stem cells (MSCs) derived from the gene-corrected iPSCs."

According to the news editors, the research concluded: "This is the first report of an efficient in situ genetic correction of the large inversion mutation using a strategy of targeted
gene addition."

For more information on this research see: In situ genetic correction of F8 intron 22 inversion in hemophilia A patient-specific iPSCs. Scientific Reports, 2016;6():18865. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Drugs and Therapies - Mitotic Inhibitors

Studies from Central South University in the Area of Mitotic Inhibitors Reported (Genetic variation of CYP3A5 influences paclitaxel/carboplatin-induced toxicity in Chinese epithelial ovarian cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Mitotic Inhibitors have been published. According to news reporting out of Changsha, People's Republic of China, by NewsRx editors, research stated, "Combination chemotherapy with platinum and taxane is the first-line treatment for ovarian cancer. The dose-limiting toxicities of these drugs include neuropathy, leukopenia, and neutropenia, but they exhibit substantial interindividual variability."

Our news journalists obtained a quote from the research from Central South University, "This study investigated the relationship between CYP3A5 polymorphisms and paclitaxel/carboplatin-induced toxicity in Chinese epithelial ovarian cancer patients. Seventy-five patients with epithelial ovarian cancer were recruited. After combination chemotherapy, genotype analysis was conducted, and toxic effects were evaluated according to the Common Toxicity Criteria. A significant association was found between myelosuppression and the CYP3A5*3 genotype. CYP3A5*3/*1 patients showed a significantly higher risk of developing leukopenia (p <.001; Pearson's ch(2) test) and neutropenia (p <.001; Pearson's ch(2) test) than CYP3A5*3/*3 patients. CYP3A5*3/*3 patients had significantly higher median leukocyte and neutrophil nadir counts than CYP3A5*3/*1 patients (p <.001, Mann-Whitney U test). However, we did not observe an association between neuropathy and CYP3A5*3 in this study (p=.64; Pearson's ch(2) test). This is the first study to verify the influence of CYP3A5 polymorphisms on paclitaxel/carboplatin-induced toxicity in Chinese epithelial ovarian cancer patients."

According to the news editors, the research concluded: "Our findings suggest that interindividual variability in paclitaxel/carboplatin-induced myelosuppression can be predicted
by CYP3A5*3 genotyping and that incorporation of CYP3A5*3 genetic data in treatment selection could help to reduce myelosuppression events, thereby individualizing paclitaxel/carboplatin pharmacotherapy."

For more information on this research see: Genetic variation of CYP3A5 influences paclitaxel/carboplatin-induced toxicity in Chinese epithelial ovarian cancer patients. *Journal of Clinical Pharmacology*, 2015;56(3):349-54. *Journal of Clinical Pharmacology* can be contacted at: SAGE Publications, USA, 2455 Teller Road, Thousand Oaks, CA 91320, USA. **Oncology - Multiple Myeloma**

**Studies from Chang Gung Memorial Hospital Describe New Findings in Multiple Myeloma (Cyclophosphamide plus granulocyte-colony stimulating factor for hematopoietic stem cell mobilization in patients with multiple myeloma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Multiple Myeloma is now available. According to news originating from Taoyuan, Taiwan, by NewsRx correspondents, research stated, "We retrospectively reviewed the results of cyclophosphamide (3 g/m²), doxorubicin and dexamethasone plus granulocyte-colony stimulating factor (G-CSF) (ID-CY/DOX group), low-dose cyclophosphamide (2 g/m²) plus G-CSF (LD-CY group) and G-CSF alone (G-CSF group) for stem cell mobilization in patients with multiple myeloma. A total of 89 patients with 93 mobilizations were included."

Our news journalists obtained a quote from the research from Chang Gung Memorial Hospital, "Apheresis was started when total white blood cell (WBC) count >10 x 10⁹/L for ID-CY/DOX and LD-CY groups and after eight doses of G-CSF (5 kg twice daily) for G-CSF group. For five mobilizations in ID-CY/DOX group, the rate of successful mobilization (4.0 x 10⁶/kg CD34+ cells) was 80%. For 78 mobilizations in LD-CY group, the successful rate was 80.8%. For 10 mobilizations in the G-CSF group, the successful rate was 50%. The mean yield of CD34+ cells was higher in ID-CY/DOX and LD-CY groups as compared with that in G-CSF
group (P=0.026 and 0.020, respectively). There was no difference in the yield of CD34+ cells between ID-CY/DOX and LD-CY groups (P=0.831). After autologous stem cell transplantation, the days to neutrophil and platelet engraftment were similar in these three groups (P=0.713 and 0.821, respectively).

According to the news editors, the research concluded: "We observed that ID-CY/DOX and LD-CY plus G-CSF for stem cell mobilization resulted in a higher successful rate and higher stem cell yields than G-CSF alone and their engraftment time were similar. Total WBC count >10 x 10(9)/L can be used as a guide to start apheresis in CY-based stem cell mobilization. J. Clin. Apheresis 31:423-428, 2016."

The news correspondents report that additional information may be obtained from P.N. Wang, Chang Gung Memorial Hospital, Div Hematol Oncol, Dept. of Internal Med, Taoyuan, Taiwan. Additional authors for this research include P.N. Wang, M.C. Kuo, Y.H. Hung, H. Chang and T.C. Tang.

Nutritional and Metabolic Diseases and Conditions ...

Studies from Chang Gung University College of Medicine Provide New Data on Type 2 Diabetes (Diabetic Retinopathy Is Strongly Predictive of Cardiovascular Autonomic Neuropathy in Type 2 Diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting from Kaohsiung, Taiwan, by NewsRx journalists, research stated, "A well-established, comprehensive, and simple test battery was used here to re-evaluate risk factors for cardiovascular autonomic neuropathy (CAN) in type 2 diabetes. One hundred and seventy-four patients with type 2 diabetes were evaluated through the methods of deep breathing and Valsalva maneuver for correlation with factors that might influence the presence and severity of CAN."

The news correspondents obtained a quote from the research from the Chang Gung
University College of Medicine, "The Composite Autonomic Scoring Scale (CASS) was used to grade the severity of autonomic impairment, and CAN was defined as a CASS score (≥)2. Results showed that nephropathy, duration of diabetes, blood pressure, uric acid, and the presence of retinopathy and metabolic syndrome significantly correlated with the CASS score. Age may not be a risk factor for diabetic CAN. However, the effects of diabetes on CAN are more prominent in younger patients than in older ones."

According to the news reporters, the research concluded: "Diabetic retinopathy is the most significant risk factor predictive of the presence of CAN in patients with type 2 diabetes."

For more information on this research see: Diabetic Retinopathy Is Strongly Predictive of Cardiovascular Autonomic Neuropathy in Type 2 Diabetes. Journal of Diabetes Research, 2016;2016():6090749.

Our news journalists report that additional information may be obtained by contacting C.C. **Nutritional and Metabolic Diseases and Conditions**

**Studies from Chang Gung University in the Area of Type 2 Diabetes Reported (Rosuvastatin decreases testosterone levels but not sexual function in men with type 2 diabetes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting out of Kaohsiung, Taiwan, by NewsRx editors, research stated, "Statins may decrease serum testosterone levels via decreasing cholesterol, a precursor to testosterone. This case series studied the effects of rosuvastatin on free testosterone levels and sexual function in men with type 2 diabetes."

Financial supporters for this research include Chang Gung University College of Medicine, Kaohsiung Medical University.

Our news journalists obtained a quote from the research from Chang Gung University, "We enrolled 151 men with type 2 diabetes and hypercholesterolemia. Biochemical assessments included serum total cholesterol (TC), low-density lipoprotein (LDL), high-density lipoprotein, triglyceride, prolactin, thyroid-stimulating hormone, luteinizing hormone, follicle stimulating hormone, total testosterone and serum sex hormone binding globulin (SHBG). All parameters were measured before statin treatment, after 6 months of statin treatment, and 6 months after discontinuing statin treatment. The Sexual Health Inventory for Men (SHIM) was also administered at these times. Serum TC and LDL levels were high before statin therapy, decreased after six months of statin therapy, and increased significantly six months after discontinuing statin therapy (198.1 +/- 28.1 mg/dl vs. 147.1 +/- 22.8 mg/dl vs. 205.2 +/- 25.6 mg/dl)."
mg/dl, p-value < 0.001; 121.3 +/- 20.6 mg/dl vs. 75.4 +/- 20.4 mg/dl vs. 124.9 +/- 20 mg/dl, p-value < 0.001). However, serum free testosterone levels calculated from total testosterone and SHBG calculated by formula were higher before statin therapy, obviously decreased after six months of statin therapy, and subsequently increased six months after discontinuing statin therapy (22.4 +/- 3.1 ng/ml vs. 20.9 +/- 2.8 ng/ml vs. 22.6 +/- 2.6 ng/ml p-value = 0.006). SHIM scores did not obviously differ among the three stages (16.3 +/- 4.8 vs. 16.0 +/- 4.9 vs. 16.3 +/- 5.0 p = 0.944). After adjustment for age, serum free testosterone levels correlated with SHIM scores and LDL (r = 0.39, p =< 0.001; r = 0.26, p = 0.02, respectively). SHIM scores did not correlate with TC or LDL.

According to the news editors, the research concluded: "Rosuvastatin reduces free testosterone levels but does not influence sexual function in men with type 2 diabetes."

For more information on this research see:  Rosuvastatin decreases testosterone levels but not sexual function in men with type 2 diabetes.  Diabetes Research and Clinical Practice, 2016;120():81-88.  Diabetes Research and Clinical Practice can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Oncology - Colon Cancer

Studies from Changhai Hospital in the Area of Colon Cancer Reported (Inhibition of Growth and Metastasis of Colon Cancer by Delivering 5-Fluorouracil-loaded Pluronic P85 Copolymer Micelles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Hepatic metastasis is the leading cause of mortality of colon cancer, which is still lack of an effective therapy. A new delivery system, pluronic P85 block copolymers, conveying chemotherapeutic agent 5-fluorouracil (5-Fu) for inhibiting growth and metastasis of colon cancer was designed and developed."

Our news journalists obtained a quote from the research from Changhai Hospital, "In this study, we demonstrated that 5-Fu produce strong pesticide effect at lower doses in the present of pluronic P85 compared with control groups. The migration and invasion of HCT116 cells and RKO cells were examined and the results showed that migration and invasion
capacities of HCT116 cells and RKO cells were reduced by administering 5-Fu/P85 copolymer micelles in vitro and in vivo which indicating an effectively activity. Interestingly, the content of CD133 + CXCR4+ cells in HCT116 cancer cells and RKO cells treated by 5-Fu/P85 copolymer micelles was decreased. Importantly, the epithelial-mesenchymal transition (EMT) of CD133 + CXCR4+ cells, which was strongly associated with liver metastasis of colon cancer, was also suppressed by giving 5-Fu/P85 copolymer micelles.

According to the news editors, the research concluded: "The results indicated that 5-Fu/P85 copolymer micelles could inhibit the growth and metastasis of colon cancer, which could be attributed to the decrease of the content of CD133 + CXCR4+ cells and suppression of EMT of CD133 + CXCR4+ cells."

For more information on this research see: Inhibition of Growth and Metastasis of Colon Cancer by Delivering 5-Fluorouracil-loaded Pluronic P85 Copolymer Micelles. Scientific Reports, 2016;6():20896. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting P. Zhu, Dept. of Phamacy, Changhai Hospital, the Second Military Medical University, Shanghai, 200433, People's Republic of China. Additional authors for this research include N. Zhao, D. Sheng, J. Hou, C. Hao, X. Yang, B. Zhu, S. Zhang, Z. Han, L. Wei and L. Zhang.

Lung Diseases and Conditions - Pulmonary...

Studies from Charles University Have Provided New Data on Pulmonary Hypertension (Depletion of Alveolar Macrophages Attenuates Hypoxic Pulmonary Hypertension but not Hypoxia-Induced Increase in Serum Concentration of MCP-1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Pulmonary Hypertension are discussed in a new report. According to news reporting from Prague, Czech Republic, by NewsRx journalists, research stated, "Exposure to hypoxia, leading to hypoxic pulmonary hypertension (HPH), is associated with activation of alveolar macrophages (AM). However, it remains unclear how AM participate in this process."

The news correspondents obtained a quote from the research from Charles University, "There are studies which imply that the AM product monocyte chemoattractant protein-1 (MCP-1) plays an important role. Thus we tested: 1. if the selective elimination of AM attenuates HPH in rats, 2. the correlation of MCP-1 plasmatic concentrations with the presence and absence of AM during exposure to hypoxia, 3. the direct influence of hypoxia on MCP-1 production in isolated AM. We found that experimental depletion of AM attenuated the chronic
hypoxia-induced increase in mean pulmonary arterial pressure, but did not affect the serum MCP-1 concentrations. Furthermore, the MCP-1 production by AM in vitro was unaffected by hypoxia. Thus we conclude that AM play a significant role in the mechanism of HPH, but MCP-1 release from these cells is most likely not involved in this process."

According to the news reporters, the research concluded: "The increase of MCP-1 accompanying the development of HPH probably originates from other sources than AM."

For more information on this research see: Depletion of Alveolar Macrophages Attenuates Hypoxic Pulmonary Hypertension but not Hypoxia-Induced Increase in Serum Concentration of MCP-1. *Physiological Research, 2016;65(5):763-768.* *Physiological Research* can be contacted at: Acad Sciences Czech Republic, Inst Physiology, Videnska 1083, Prague 4 142 20, Czech Republic.

Our news journalists report that additional information may be obtained by contacting M. Zaloudikova, Charles Univ Prague, Fac Med 2, Dept. of Pathophysiol, Prague 15006, Czech Republic. **Drugs and Therapies - Antiretrovirals**

Studies from Charles University Have Provided New Information about Antiretrovirals (Role of ABC and Solute Carrier Transporters in the Placental Transport of Lamivudine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antiretrovirals. According to news reporting out of Hradec Kralove, Czech Republic, by NewsRx editors, research stated, "Lamivudine is one of the antiretroviral drugs of choice for the prevention of mother-to-child transmission (MTCT) in HIV-positive women. In this study, we investigated the relevance of drug efflux transporters P-glycoprotein (P-gp) (MDR1 [ABCB1]), BCRP (ABCG2), MRP2 (ABCC2), and MATE1 (SLC47A1) for the transmembrane transport and transplacental transfer of lamivudine."

Funders for this research include Czech Science Foundation (GACR), Grant Agency of Charles University.

Our news journalists obtained a quote from the research from Charles University, "We employed in vitro accumulation and transport experiments on MDCK cells overexpressing drug efflux transporters, in situ-perfused rat term placenta, and vesicular uptake in microvillous plasma membrane (MVM) vesicles isolated from human term placenta. MATE1 significantly accelerated lamivudine transport in MATE1-expressing MDCK cells, whereas no transporter-driven efflux of lamivudine was observed in MDCK-MDR1, MDCK-MRP2, and MDCK-BCRP monolayers. MATE1-mediated efflux of lamivudine appeared to be a low-affinity process (apparent K-m of 4.21 mM and V-max of 5.18 nmol/mg protein/min in MDCK-MATE1 cells). Consistent with in vitro transport studies, the transplacental clearance of lamivudine was not
affected by P-gp, BCRP, or MRP2. However, lamivudine transfer across dually perfused rat placenta and the uptake of lamivudine into human placental MV Mvesicles revealed pH dependency, indicating possible involvement of MATE1 in the fetal-to-maternal efflux of the drug. To conclude, placental transport of lamivudine does not seem to be affected by P-gp, MRP2, or BCRP, but a pH-dependent mechanism mediates transport of lamivudine in the fetal-to-maternal direction.”

According to the news editors, the research concluded: "We suggest that MATE1 might be, at least partly, responsible for this transport."

For more information on this research see: Role of ABC and Solute Carrier Transporters in the Placental Transport of Lamivudine. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5563-5572. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Nocardioid**

**Studies from Chiba University Add New Findings in the Area of Nocardioid (Clinical characteristics of pulmonary nocardiosis in immunocompetent patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nocardioid have been published. According to news reporting out of Chiba, Japan, by NewsRx editors, research stated, "Pulmonary nocardiosis is a rare but potentially serious infection typically in immunosuppressed patients (ISPs). It is also known to occur in immunocompetent patients (ICPs)."

Our news journalists obtained a quote from the research from Chiba University, "However, little is currently known regarding the clinical characteristics and radiographic findings of pulmonary nocardiosis specifically in ICPs. In this study, 30 patients with pulmonary nocardiosis were identified and 10 were considered to be colonized. Of all patients with pulmonary nocardiosis, 12 patients were ICPs and 18 were ISPs. Although half of ISPs were infected by Nocardioid nova, ICPs were affected by various Nocardioid species. Compared with ISPs, chest CT findings of ICPs showed a higher prevalence of bronchiectasis (67% vs 6%, p <.01) and centrilobular nodular opacities (67% vs 11%, p<.01), both of which are often seen in
pulmonary nontuberculous mycobacterial disease. Additionally, nontuberculous mycobacterium was isolated from 6 of 21 ICPs with positive Nocardia species culture."

According to the news editors, the research concluded: "Therefore, we recommend that physicians carefully differentiate pulmonary nocardiosis from pulmonary nontuberculous mycobacterial disease in ICPs."

For more information on this research see: Clinical characteristics of pulmonary nocardiosis in immunocompetent patients. *Journal of Infection and Chemotherapy*, 2016;22 (11):738-743. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Springer - www.springer.com; Journal of Infection and Chemotherapy - www.springerlink.com/content/1341-321x/)

Our news journalists report that additional information may be obtained by contacting T. Fujita, Chiba University, Grad Sch Med, Dept. of Respirol, Chiba, Japan. Additional authors for this research include J. Ikari, A. Watanabe and K. Tatsumi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jiac.2016.08.004. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Fatty Liver

**Studies from Chiba University Graduate School of Medicine Update Current Data on Fatty Liver (Palmitate-induced Regulation of PPARg via PGC1a: a Mechanism for Lipid Accumulation in the Liver in Nonalcoholic Fatty Liver Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Fatty Liver. According to news reporting originating from Chiba, Japan, by NewsRx correspondents, research stated, "The aim was to examine the effect of free fatty acids on the regulation of PPARg-PGC1a pathway, and the effect of PPARg/PGC1a in NAFLD. The mRNA and protein expression of PGC1a and phospho/total PPARg were examined in Huh7 cells after the palmitate/oleate treatment with/without the transfection with siRNA against PGC1a."

Our news editors obtained a quote from the research from the Chiba University Graduate School of Medicine, "The palmitate content, mRNA and protein expression of PGC1a and PPARg in the liver were examined in the control and NAFLD mice. Palmitate (500 mM), but not oleate, increased protein expression of PGC1a and phospho PPARg (PGC1a, 1.42-fold, p=0.038; phospho PPARg, 1.56-fold, p=0.022). The palmitate-induced PPARg mRNA expression was reduced after the transfection (0.46-fold), and the protein expressions of PGC1a (0.52-fold, p=0.019) and phospho PPARg (0.43-fold, p=0.011) were suppressed in siRNA-transfected cells. The palmitate (12325.8 ? 1758.9 mg/g vs. 6245.6 ? 1182.7 mg/g, p=0.002), and mRNA expression of PGC1a (11.0 vs. 5.5, p=0.03) and PPARg (4.3 vs. 2.2, p=0.0001) in the liver were higher in high-triglyceride liver mice (>15.2 mg/g) than in low-triglyceride liver mice (<15.2 mg/g). The protein expressions of both PGC1a and PPARg were higher in the NAFLD group than in the controls (PGC1a, 1.41-fold, p=0.035; PPARg, 1.39-fold, p=0.042),..."
and were higher in the high-triglyceride liver group (PGC1α, 1.52-fold, p=0.03; PPARγ, 1.22-fold, p=0.05) than in the low-triglyceride liver group."

According to the news editors, the research concluded: "Palmitate appear to up-regulate PPARγ via PGC1α in Huh7 cells, and both PGC1α and PPARγ are up-regulated in the NAFLD mice liver, suggesting an effect on lipid metabolism leading to intrahepatic triglyceride accumulation."

For more information on this research see: Palmitate-induced Regulation of PPARγ via PGC1α: a Mechanism for Lipid Accumulation in the Liver in Nonalcoholic Fatty Liver Disease. International Journal of Medical Sciences, 2016;13(3):169-78.

The news editors report that additional information may be obtained by contacting H. Maruyama, Dept. of Gastroenterology and Nephrology, Chiba University Graduate School of Medicine, 1-8-1, Inohana, Chuou-ku, Chiba, 260-8670, Japan. Additional authors for this research include S. Kiyono, T. Kondo, T. Sekimoto and O. Yokosuka.

Heart Disorders and Diseases - Hypoplastic Left...

Studies from Children's Hospital Update Current Data on Hypoplastic Left Heart Syndrome (Norwood Procedure for Palliation of Hypoplastic Left Heart Syndrome: Right Ventricle to Pulmonary Artery Conduit vs Modified Blalock-Taussig Shunt)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Hypoplastic Left Heart Syndrome. According to news reporting from Boston, Massachusetts, by NewsRx editors, the research stated, "Patients with hypoplastic left heart syndrome undergo a series of operations to separate the pulmonary and systemic circulations. The first of at least 3 operations occurs in the newborn period, with a stage I palliation."

The news correspondents obtained a quote from the research from Children's Hospital, "The goal of stage I palliation is to provide pulmonary blood flow and create an unobstructed systemic outflow tract. Advances in surgical techniques and intraoperative and postoperative care have helped decrease morbidity and mortality for patients with hypoplastic left heart syndrome who have the stage I Norwood operation, but the patients continue to be at increased risk for hemodynamic collapse and adverse outcomes."

According to the news reporters, the research concluded: "This article discusses risk factors, surgical approach, postoperative nursing and medical management strategies, differences between and outcomes for the Norwood operation with the right ventricle to pulmonary artery conduit and the Norwood operation with a modified Blalock-Taussig shunt."

For more information on this research see: Norwood Procedure for Palliation of
Hypoplastic Left Heart Syndrome: Right Ventricle to Pulmonary Artery Conduit vs Modified Blalock-Taussig Shunt. *Critical Care Nurse*, 2016;36(6):42-51. *Critical Care Nurse* can be contacted at: Amer Assoc Critical Care Nurses, 101 Columbia, Aliso Viejo, CA 92656, USA.

Our news journalists report that additional information may be obtained by contacting D.M. Beke, Boston Childrens Hosp, Cardiac Intens Care Unit, Boston, MA, United States.

Neurodegenerative Diseases and Conditions - ...

Studies from China Pharmaceutical University Further Understanding of Alzheimer Disease (Hypericin inhibits oligomeric amyloid beta 42-induced inflammation response in microglia and ameliorates cognitive deficits in an amyloid beta injection ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurodegenerative Diseases and Conditions - Alzheimer Disease are presented in a new report. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Amyloid beta (A beta) provokes severe inflammation response in the central nervous system, which is a key risk factor for the progression of Alzheimer's disease (AD). Anti-inflammation medications shed light on treating AD."

The news correspondents obtained a quote from the research from China Pharmaceutical University, "In this study, we found hypericin is a potent anti-AD constituent through anti-inflammation. Pretreatment with hypericin (5 mu M and 15 mu M) significantly suppresses oligomeric A beta 42 (oA beta 42)induced expression of interleukin-1 beta (IL-1 beta), interleukin-6 (IL-6), tumor necrosis factor alpha (TNF alpha) and inducible nitric oxide synthase (iNOS) and production of NO in microglia without cytotoxicity. We further found that hypericin ameliorates inflammatory response by suppressing MKL1, which is the essential cofactor of p65 during the transcription process. In an A beta injection AD mouse model, animals orally administrated hypericin (50 mg/kg) for seven days significantly decreased pro-inflammatory cytokines expression and NO production in hippocampus, meanwhile, hypericin improved oA beta 42-induced learning and memory impairment in mice in the Morris water maze test."

According to the news reporters, the research concluded: "Therefore, hypericin could be considered as a potential candidate for treating AD."

For more information on this research see: Hypericin inhibits oligomeric amyloid beta 42-induced inflammation response in microglia and ameliorates cognitive deficits in an amyloid beta injection mouse model of Alzheimer's disease by suppressing MKL1.
Studies from China Pharmaceutical University Provide New Data on Genetics (CPUY201112, a novel synthetic small-molecule compound and inhibitor of heat shock protein Hsp90, induces p53-mediated apoptosis in MCF-7 cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Genetics are discussed in a new report. According to news reporting out of Nanjing, People's Republic of China, by NewsRx editors, research stated, "Heat-shock protein 90 (Hsp90) is highly expressed in many tumor cells and is associated with the maintenance of malignant phenotypes. Targeting Hsp90 has had therapeutic success in both solid and hematological malignancies, which has inspired more studies to identify new Hsp90 inhibitors with improved clinical efficacy."

Our news journalists obtained a quote from the research from China Pharmaceutical University, "Using a fragment-based approach and subsequent structural optimization guided by medicinal chemistry principles, we identified the novel compound CPUY201112 as a potent Hsp90 inhibitor. It binds to the ATP-binding pocket of Hsp90 with a kinetic dissociation (Kd) constant of 27 ± 2.3 nM. It also exhibits potent in vitro antiproliferative effects in a range of solid tumor cells. In MCF-7 cells with high Hsp90 expression, CPUY201112 induces the degradation of Hsp90 client proteins including HER-2, Akt, and c-RAF. We prove that treating MCF-7 cells with CPUY201112 results in cell cycle arrest and apoptosis through the wild-type (wt) p53 pathway. CPUY201112 also synergizes with Nutlin-3a to induce cancer cell apoptosis. CPUY201112 significantly inhibited the growth of MCF-7 xenografts in nude mice without apparent body weight loss."

According to the news editors, the research concluded: "These results demonstrate that CPUY201112 is a novel Hsp90 inhibitor with potential use in treating wild-type p53 related cancers."

For more information on this research see: CPUY201112, a novel synthetic small-molecule compound and inhibitor of heat shock protein Hsp90, induces p53-mediated apoptosis in MCF-7 cells. Scientific Reports, 2016;6():19004. (Nature Publishing Group -

Hydrazines

Studies from China Pharmaceutical University Provide New Data on Hydrazines (Role of Inflammatory and Oxidative Stress, Cytochrome P450 2E1, and Bile Acid Disturbance in Rat Liver Injury Induced by Isoniazid and Lipopolysaccharide Cotreatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hydrazines is the subject of a report. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Isoniazid (INH) remains the core drug in tuberculosis management, but serious hepatotoxicity and potentially fatal liver injury continue to accompany INH consumption. Among numerous theories that have been established to explain INH-induced liver injury, an inflammatory stress theory has recently been widely used to explain the idiosyncrasy."

Financial supporters for this research include National Natural Science Foundation of China (NSFC), Natural Science Foundation of Jiangsu Province (Jiangsu Natural Science Foundation), National “Major Scientific and Technological Special Project for Significant New Drugs” project, Specific Fund for Public Interest Research of Traditional Chinese Medicine, Ministry of Finance.

Our news journalists obtained a quote from the research from China Pharmaceutical University, "Inflammatory stress usually sensitizes tissues to a drug's toxic consequences. Therefore, the present study was conducted to verify whether bacterial lipopolysaccharide (LPS)-induced inflammation may have a role in enhancing INH hepatotoxicity. While single INH or LPS administration showed no major toxicity signs, INH-LPS cotreatment intensified liver toxicity. Both blood biomarkers and histological evaluations clearly showed positive signs of severe liver damage accompanied by massive necrosis, inflammatory infiltration, and hepatic steatosis. Furthermore, elevated serum levels of bile acid associated with the repression of bile acid synthesis and transport regulatory parameters were observed. Moreover, the principal impact of cytochrome P450 2E1 (CYP2E1) on INH toxicity could be anticipated, as its protein expression showed enormous increases in INH-LPS-cotreated animals. Furthermore, the crucial role of CYP2E1 in the production of reactive oxygen species (ROS) was clearly obvious in the repression of hepatic antioxidant parameters."

According to the news editors, the research concluded: "In summary, these results..."
confirmed that this LPS-induced inflammation model might prove valuable in revealing the hepatotoxic mechanisms of INH and the crucial role played by CYP2E1 in the initiation and propagation of INH-induced liver damage, information which could be very useful to clinicians in understanding the pathogenesis of drug-induced liver injury.

For more information on this research see: Role of Inflammatory and Oxidative Stress, Cytochrome P450 2E1, and Bile Acid Disturbance in Rat Liver Injury Induced by Isoniazid and Lipopolysaccharide Cotreatment. Antimicrobial Agents and Chemotherapy, 2016;60(9):5285-5293. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Leukocyte Diseases and Conditions - Neutropenia

Studies from Chinese People's Liberation Army General Hospital Update Current Data on Neutropenia (Piperacillin-tazobactam vs. imipenem-cilastatin as empirical therapy in hematopoietic stem cell transplantation recipients with febrile ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Leukocyte Diseases and Conditions - Neutropenia have been published. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "This randomized, dual-center study compared the efficacy and safety of piperacillin-tazobactam (PTZ) and imipenem-cilastatin (IMP) in hematopoietic stem cell transplantation (HSCT) recipients with febrile neutropenia. HSCT recipients with febrile neutropenia were randomized into two groups receiving either PTZ or IMP as initial empiric antibiotic."

Financial support for this research came from Capital Health Research and Development of Special.

The news correspondents obtained a quote from the research from Chinese People's Liberation Army General Hospital, "Endpoints were defervescence rate after empiric antibiotic for 48 h, success at end of therapy, and side effects. Defervescence within 48 h after empiric antibiotic was observed in 46 patients with PTZ (75.4%) and 59 patients with IMP (95.2%) (p=
0.002). Ten patients (10/46) in the PTZ group and two patients (2/59) in the IMP group switched empiric antibiotics due to recurrent fever (p=0.005). Success of initial antibiotic with modification was achieved in 34 patients with PTZ (55.7%) and 53 patients with IMP (85.5%) at the end of therapy (p=0.001). To treat the bacteremia, seven of 10 patients in the PTZ group and one of eight patients in the IMP group needed to switch the empiric antibiotic (p=0.025). Compared with PTZ, IMP had more gastrointestinal adverse events (p=0.045).

According to the news reporters, the research concluded: "This study demonstrates that IMP had better efficacy than PTZ as an empiric antibiotic for febrile neutropenia in the HSCT setting, but with more gastrointestinal side reactions."

Our news journalists report that additional information may be obtained by contacting Y. Jing, Dept. of Hematology and BMT, Chinese PLA General Hospital, Beijing, People's Republic of China. Additional authors for this research include J. Li, L. Yuan, X. Zhao, Q. Wang, L. Yu, D. Zhou and W. Huang.

assessed by observing the in vivo manifestations of aGVHD, histologic changes in target organs, and recipient mouse survival. We evaluated the effects of hUC-MSC-EVs on immune cells and inflammatory cytokines by flow cytometry and ProcartaPlex™ Multiplex Immunoassays, respectively. The in vitro effects of hUC-MSC-EVs were determined by mitogen-induced proliferation assays. hUC-MSC-EVs alleviated the in vivo manifestations of aGVHD and the associated histologic changes and significantly reduced the mortality of the recipient mice. Recipients treated with hUC-MSC-EVs had significantly lower frequencies and absolute numbers of CD3(+)CD8(+) T cells; reduced serum levels of IL-2, TNF-alpha, and IFN-gamma; a higher ratio of CD3(+)CD4(+) and CD3(+)CD8(+) T cells; and higher serum levels of IL-10. An in vitro experiment demonstrated that hUC-MSC-EVs inhibited the mitogen-induced proliferation of splenocytes in a dose-dependent manner, and the cytokine changes were similar to those observed in vivo. This study indicated that hUC-MSC-EVs can prevent life-threatening aGVHD by modulating immune responses."

According to the news editors, the research concluded: "These data provide the first evidence that hUC-MSC-EVs represent an ideal alternative in the prophylaxis of aGVHD after allo-HSCT."

Gram-Negative Bacteria - Uropathogenic Escherichia coli Described (Siderophore Biosynthesis Governs the Virulence of Uropathogenic Escherichia coli by Coordinate Modulating the Differential Metabolism)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Uropathogenic Escherichia coli have been presented. According to news reporting originating in Chongqing, People's Republic of China, by NewsRx journalists, research stated, "Urinary tract infections impose substantial health burdens on women worldwide. Urinary tract infections often incur a high risk of recurrence and antibiotic resistance, and uropathogenic E. coli accounts for approximately 80% of clinically acquired cases."

Financial supporters for this research include Chongqing University, Ministry of Education of the People's Republic of China, Queensland University of Technology, National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Chongqing University, "The diagnosis of, treatment of, and drug development for urinary tract infections remain substantial challenges due to the complex pathogenesis of this condition. The clinically isolated UPEC 83972 strain was found to produce four siderophores: yersiniabactin, aerobactin, salmochelin, and enterobactin. The biosyntheses of some of these siderophores implies that the virulence of UPEC is mediated via the targeting of primary metabolism. However, the differential modulatory roles of siderophore biosyntheses on the differential metabolomes of UPEC and non-UPEC strains remain incompletely understood. In the present study, we sought to investigate how the differential metabolomes can be used to distinguish UPEC from non-UPEC strains and to determine the associated regulatory roles of siderophore biosynthesis. Our results are the first to demonstrate that the identified differential metabolomes strongly differentiated UPEC from non-UPEC strains. Furthermore, we performed metabolome assays of mutants with different patterns of siderophore deletions; the data revealed that the mutations of all four siderophores exerted a stronger modulatory role on the differential metabolomes of the UPEC and non-UPEC strains relative to the mutation of any single siderophore and that this modulatory role primarily involved amino acid metabolism, oxidative phosphorylation in the carbon fixation pathway, and purine and pyrimidine metabolism. Surprisingly, the modulatory roles were strongly dependent on the type and number of mutated siderophores."

According to the news reporters, the research concluded: "Taken together, these results demonstrated that siderophore biosynthesis coordinately modulated the differential metabolomes and thus may indicate novel targets for virulence-based diagnosis, therapeutics, and drug development related to urinary tract infections."

Our news correspondents report that additional information may be obtained by contacting Q. Su, The Laboratory for Functional Omics and Innovative Chinese Medicine, Innovative Drug Research Center, Chongqing University, Chongqing 401331, People's Republic of China. Additional authors for this research include T. Guan, Y. He and H. Lv.

Peace and Conflict Management

Studies from City University of New York Reveal New Findings on Peace and Conflict Management (When risky decisions are not surprising: An application of prospect theory to the Israeli war decision in 2006)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Peace and Conflict Management have been published. According to news reporting originating in Staten Island, New York, by NewsRx editors, the research stated, "On 12 July 2006, Hezbollah operatives crossed into Israel and attacked a military patrol, killing three soldiers and kidnapping two more. In retaliation to this incident Israel launched a military operation that resulted in 34 days of fighting between Hezbollah and Israel."

The news reporters obtained a quote from the research from the City University of New York, "The Israeli retaliation has been deemed to be severe and surprising. Furthermore, a public investigation commission established by the Israeli government implicated key decision-makers, and especially Prime Minister Olmert, as guilty of hasty and irresponsible decision-making."

According to the news reporters, the research concluded: "This article views this case through the lens of prospect theory, showing how the decision was made at the framing stage, and suggesting that this decision was not hasty but, rather, was consistent with the logic of loss-aversion."

For more information on this research see: When risky decisions are not surprising: An application of prospect theory to the Israeli war decision in 2006. Drugs and Therapies - Antiretrovirals

Studies from City of Hope National Medical Center Reveal New Findings on Antiretrovirals (Tunneling nanotubes: an alternate route for propagation of the bystander effect following oncolytic viral infection)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antiretrovirals. According to news reporting out of Duarte, California, by NewsRx editors, research stated, "Tunneling nanotubes (TNTs) are ultrafine, filamentous actin-based cytoplasmic extensions which form spontaneously to connect cells at short and long-range distances. We have previously described long-range intercellular communication via TNTs connecting mesothelioma cells in vitro and demonstrated TNTs in intact tumors from patients with mesothelioma."

Our news journalists obtained a quote from the research from the City of Hope National Medical Center, "Here, we investigate the ability of TNTs to mediate a viral thymidine kinase based bystander effect after oncolytic viral infection and administration of the nucleoside analog ganciclovir. Using confocal microscopy we assessed the ability of TNTs to propagate enhanced green fluorescent protein (eGFP), which is encoded by the herpes simplex virus NV1066, from infected to uninfected recipient cells. Using time-lapse imaging, we observed eGFP expressed in infected cells being transferred via TNTs to noninfected cells; additionally, increasing fluorescent activity in recipient cells indicated cell-to-cell transmission of the eGFP-expressing NV1066 virus had also occurred. TNTs mediated cell death as a form of direct cell-to-cell transfer following viral thymidine kinase mediated activation of ganciclovir, inducing a unique long-range form of the bystander effect through transmission of activated ganciclovir to nonvirus-infected cells. Thus, we provide proof-of-principle demonstration of a previously unknown and alternative mechanism for inducing apoptosis in noninfected recipient cells."

According to the news editors, the research concluded: "The conceptual advance of this work is that TNTs can be harnessed for delivery of oncolytic viruses and of viral thymidine kinase activated drugs to amplify the bystander effect between cancer cells over long distances in stroma-rich tumor microenvironments."

For more information on this research see: Tunneling nanotubes: an alternate route for propagation of the bystander effect following oncolytic viral infection. *Molecular Therapy-Oncolytics*, 2016;3():1-8. *Molecular Therapy-Oncolytics* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

**Thyroid Nodule**

**Studies from Cleveland Clinic Add New Findings in the Area of Thyroid Nodule (Utility Of Ultrasound Versus Gene Expression Classifier In Thyroid Nodules With Atypia Of Undetermined Significance)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Thyroid Nodule. According to news reporting originating from Weston, Florida, by NewsRx correspondents, research stated, "Thyroid nodules with fine-needle aspiration (FNA) cytology categorized as atypia of undetermined significance (AUS) often undergo additional diagnostic analysis with the Afinna Gene Expression Classifier (GEC), which classifies these as either high probability of being benign (GEC-B) or suspicious for malignancy (GEC-S). Our goal was to assess the clinical validity and utility of GEC in the evaluation of ALTS cytology and evaluate the performance of ultrasonography (USG) for predicting malignancy in this subset."

Our news editors obtained a quote from the research from Cleveland Clinic, "We conducted a study with a retrospective cohort of patients from January 2012 to January 2014 who had FNA of thyroid nodules >1 cm in size with AUS cytology. Cleveland Clinic Florida has an overall prevalence of ALTS of 5%. A total of 119 cases with nodules >1 cm in size were reported as AUS. Forty-eight (40.3%) had a GEC performed after the first FNA (AUS-1), and 27 of these were GEC-S. Of those 27, 21 went for surgery and 14 (66.6%) had thyroid cancer on hisopathology. The remaining 71 with AUS-1 were sent for a second FNA: 19 nodules were benign and did not undergo further evaluation, while the remaining 52 were reported as AUS for the second consecutive time (AUS-2). AUS-2 samples were sent for GEC. Of these 52 AUS-2, 38 (73.1%) were reported as GEC-S. Thirty-five went for surgery and 32 (91.4%) had confirmed malignancy on histopathology. Positive predictive value (PPV) was 91.4% for AUS-2 and 66.6% for AUS-1. Moreover, AUS-2 nodules that were hypoechoic and solid on USG showed a PM of 92% for malignancy. In our practice, the diagnostic accuracy to predict malignancy with GEC for AUS-1 nodules was poor (PPV, 66.6%). The PPV of GEC testing was markedly higher at 91.4% performed after two consecutive AUS cytologies. AUS-2 nodules that were solid and hypoechoic on USG also had a high probability to be malignant (PPV, 92%). We recommend repeat FNA on AUS-1 nodules rather than proceeding directly to GEC testing."

According to the news editors, the research concluded: "Also, we suggest that among AUS-2 nodules, surgery can be recommended when USG shows solid and hypoechoic features with GEC testing reserved for the remainder."

For more information on this research see: Utility Of Ultrasound Versus Gene Expression Classifier In Thyroid Nodules With Atypia Of Undetermined Significance. *Endocrine Practice*, 2016;22(10):1199-1203. *Endocrine Practice* can be contacted at: Amer Assoc Clinical Endocrinologists, 245 Riverside Avenue, Ste 200, Jacksonville, FL 32202, USA.

The news editors report that additional information may be obtained by contacting C.V. Villabona, Cleveland Clin Florida, Dept. of Endocrinol, Weston, FL 33331, United States. Studies from Cleveland Clinic Provide New Data on Chemotherapy (Preservation of gonadal function in women undergoing chemotherapy: a review of the potential role for gonadotropin-releasing hormone agonists)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Chemotherapy are discussed in a new report. According to news reporting from Cleveland, Ohio, by NewsRx journalists, research stated, "A cancer diagnosis in women of reproductive age has unique medical and psychosocial ramifications, especially with treatments that are known to cause gonadal toxicity. For patients who undergo chemotherapy, a multidisciplinary team approach is essential to ensure that the patients' reproductive wishes are addressed."

The news correspondents obtained a quote from the research from Cleveland Clinic, "Currently, embryo and oocyte cryopreservation are the standard of care for those who wish to preserve their fertility. The use of gonadotropin-releasing hormone agonists has been a source of debate with numerous studies that have investigated the efficacy on both fertility and ovarian function preservation. This review evaluates the current literature on the use of gonadotropin-releasing hormone agonists for preservation of gonadal function. Assisted reproductive technology is excellent for preservation of fertility but will not protect gonadal function. Protection of gonadal function is critical for the broader issues of health and quality of life as a result of a hypogonadal state."

According to the news reporters, the research concluded: "At this moment, gonadotropin-releasing hormone agonists are the only drug class available to protect gonadal function."

Our news journalists report that additional information may be obtained by contacting T. Falcone, Cleveland Clinic, Dept. of Obstet Gynecol, Cleveland, OH 44195, United States. Additional authors for this research include L.N. Valentine and T. Falcone.

Studies from Cleveland Clinic Update Current Data on Esophagectomy
[Recommendations for pathologic staging (pTNM) of cancer of the esophagus and esophagogastric junction for the 8th edition AJCC/UICC staging manuals]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Surgery - Esophagectomy are presented in a new report. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "We report analytic and consensus processes that produced recommendations for pathologic stage groups (pTNM) of esophageal and esophagogastric junction cancer for the AJCC/UICC cancer staging manuals, 8th edition. The Worldwide Esophageal Cancer Collaboration provided data for 22,654 patients with epithelial esophageal cancers; 13,300 without preoperative therapy had pathologic assessment after esophagectomy or endoscopic treatment."

The news reporters obtained a quote from the research from Cleveland Clinic, "Risk-adjusted survival for each patient was developed using random survival forest analysis to identify data-driven pathologic stage groups wherein survival decreased monotonically with increasing group, was distinctive between groups, and homogeneous within groups. The AJCC Upper GI Task Force, by smoothing, simplifying, expanding, and assessing clinical applicability, produced consensus pathologic stage groups. For pT1-3N0M0 squamous cell carcinoma (SCC) and pT1-2N0M0 adenocarcinoma, pT was inadequate for grouping; subcategorizing pT1 and adding histologic grade enhanced staging; cancer location improved SCC staging. Consensus eliminated location for pT2N0M0 and pT3N0M0G1 SCC groups, and despite similar survival, restricted stage 0 to pTis, excluding pT1aN0M0G1. Metastases markedly reduced survival; pT, pN, and pM sufficiently grouped advanced cancers. Stage IIA and IIB had different compositions for SCC and adenocarcinoma, but similar survival. Consensus stage IV subgrouping acknowledged pT4N+ and pN3 cancers had poor survival, similar to pM1. Anatomic pathologic stage grouping, based on pTNM only, produced identical consensus stage groups for SCC and adenocarcinoma at the cost of homogeneity in early groups. Pathologic staging can neither direct pre-treatment decisions nor aid in prognostication for treatment other than esophagectomy or endoscopic therapy."

According to the news reporters, the research concluded: "However, it provides a clean, single therapy reference point for esophageal cancer."

Our news correspondents report that additional information may be obtained by contacting T.W. Rice, Cleveland Clinic, Cleveland, OH 44195, United States. Additional authors for this research include H. Ishwaran, W.L. Hofstetter, D.P. Kelsen, C. Apperson-Hansen and E.H. Blackstone.

Studies from Columbia University College of Physicians and Surgeons Describe New Findings in Thromboembolism (A comparison of recommendations for pharmacologic thromboembolism prophylaxis after caesarean delivery from three major guidelines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Thromboembolism have been presented. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Guidelines for pharmacologic obstetric venous thromboembolism (VTE) prophylaxis from the American Congress of Obstetricians (ACOG), the Royal College of Obstetricians and Gynaecologists (RCOG), and the American College of Chest Physicians (Chest) vary significantly. The objective of this study was to determine the practical implications of these recommendations in terms of prophylaxis rates for a tertiary obstetric population. Cross-sectional. Tertiary referral hospital."

Our news journalists obtained a quote from the research from the Columbia University College of Physicians and Surgeons, "Patients post-operative day 1 after caesarean delivery. This cross-sectional study evaluated rates of pharmacologic prophylaxis for women based on RCOG, ACOG, and Chest recommendations. Medical, obstetric, and demographic risk factors for thromboembolism were reviewed for individual patients. Rates of prophylaxis based on each of the guidelines with 95% confidence intervals were calculated. Recommended pharmacologic prophylaxis. About 293 patients were included in the analysis. Under RCOG guidelines, 85.0% of patients would receive post-caesarean pharmacologic prophylaxis [95% confidence interval (CI) 80.5-88.6%] compared with 1.0% of patients under ACOG guidelines (95% CI 0.3-3.0%) and 34.8% of patients under Chest guidelines (95% CI 29.6-40.4%). Caesarean during labour, obesity, advanced maternal age, pre-eclampsia, and multiple gestation were among the most common risk factors. Recommended prophylaxis differed significantly. Under ACOG recommendations a small minority of patients would receive prophylaxis, whereas under RCOG recommendations a large majority of patients would receive low-molecular-weight heparin. Given the large differences in prophylaxis rates for post-caesarean thromboprophylaxis based on different guidelines, further research is urgently needed to compare the risks and benefits of recommendations."

According to the news editors, the research concluded: "Recommendations from major society guidelines for post-caesarean thromboprophylaxis differ greatly."

Our news journalists report that additional information may be obtained by contacting K.L. Palmerola, Dept. of Obstetrics & Gynecology, Columbia University College of Physicians and Surgeons, New York, NY, United States. Additional authors for this research include M.E. D'Alton, C.O. Brock and A.M Friedman.

**Drugs and Therapies - Antidepressants**

**Studies from Columbia University Further Understanding of Antidepressants (LARETH-25 and beta-CD improve central transitivity and central pharmacological effect of the GLP-2 peptide)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antidepressants. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Depression is a common mental disorder. More than 350 million people of all ages suffer from depression worldwide."

Our news editors obtained a quote from the research from Columbia University, "Although a number of antidepressants are available, >20% of patients with major depressive disorder suffer from treatment-resistant depression. Therefore, development of novel therapeutics to overcome this condition is required. We reported that intracerebroventricular administration of glucagon-like peptide-2 (GLP-2) exerts antidepressant-like effects treated with or without adrenocorticotropic hormone. In the present study, we developed a nasal formulation of GLP-2 containing 5% polyoxyethylene (25) lauryl ether and 1% beta-cyclodextrin that enhanced the resistance of GLP-2 to inactivation by dipeptidyl peptidase-4. Intranasal administration of this formulation (60 mg/kg) increased the delivery of GLP-2 to the brain and had antidepressant-like effects on rats."

According to the news editors, the research concluded: "These results suggest the potential of the GLP-2 nasal formulation for use as a novel antidepressant."

The news editors report that additional information may be obtained by contacting M. Horiguchi, Columbia University, Medical Center, Japan Soc Promot Sci, New York, NY 10032, United States. Additional authors for this research include M. Horiguchi, R. Nakamura, S. Sasaki-Hamada, C. Ozawa, T. Funane, R. Ozawa, J.I. Oka and C. Yamashita.

Oncology - Gliomas

Studies from Columbia University Have Provided New Data on Gliomas (Safety, feasibility, and optimization of intra-arterial mitoxantrone delivery to gliomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gliomas have been presented. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Mitoxantrone is a highly cytotoxic antineoplastic drug, however, its poor penetration of the blood-brain barrier has limited its role in the treatment of brain cancers. We hypothesize that intra-arterial (IA) delivery of mitoxantrone may enhance its capacity for regional brain deposition thus expanding its potential as a brain tumor therapy agent."

Financial support for this research came from National Cancer Institute at the National Institutes of Health.

The news reporters obtained a quote from the research from Columbia University, "In this study we assessed the dose-response characteristics as well as the feasibility and safety of mitoxantrone delivery to the brain and specifically to gliomas in a rodent model. We show that delivery optimization utilizing the technique of intra-arterial transient cerebral hypoperfusion (IA-TCH) facilitates achieving the highest peak- and end- brain drug concentrations as compared to intravenous and IA delivery without hypoperfusion. Additionally, we observed significant tumor-specific uptake of mitoxantrone when delivered by the IA-TCH method. No untoward effects of IA-TCH delivery of mitoxantrone were observed. The IA-TCH method is shown to be a safely tolerated and feasible strategy for delivering mitoxantrone to tumors in the glioma model tested."

According to the news reporters, the research concluded: "Additional investigation is warranted to determine if IA-TCH delivery of mitoxantrone produces clinically relevant benefit."

For more information on this research see: Safety, feasibility, and optimization of intra-arterial mitoxantrone delivery to gliomas. Journal of Neuro-Oncology, 2016;130(3):449-454. Journal of Neuro-Oncology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Journal of Neuro-Oncology - www.springerlink.com/content/0167-594x/)

Studies from Columbia University Have Provided New Data on Lymphoma (High rate of complete responses to immune checkpoint inhibitors in patients with relapsed or refractory Hodgkin lymphoma previously exposed to epigenetic therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lymphoma. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Options for patients with relapsed or refractory (R/R) classical Hodgkin lymphoma (cHL) after brentuximab vedotin (Bv) and autologous stem cell transplantation (ASCT) are limited. Immune checkpoint inhibitors (ICI) are active in this population but rarely induce complete response (CR)."

The news correspondents obtained a quote from the research from Columbia University, "Ten patients with R/R cHL after ASCT and Bv received pembrolizumab (n = 8) or nivolumab (n = 2). Five had been previously exposed to 5-azacitidine on a phase 1 study. Among nine evaluable patients, seven (78%) achieved CR, one partial response, and one reduction of tumor burden. All five patients who had received 5-azacitidine prior to ICI achieved CR, while only two of four who did not receive prior 5-azacitidine achieved CR. At a median follow-up of 9.9 months [0.5-14.3], eight patients are alive and five are still receiving treatment. We documented an unprecedented CR rate after ICI in patients with R/R cHL."

According to the news reporters, the research concluded: "We hypothesize that hypomethylating agents might have an immune priming effect and enhance the efficacy of ICI."

For more information on this research see: High rate of complete responses to immune checkpoint inhibitors in patients with relapsed or refractory Hodgkin lymphoma previously exposed to epigenetic therapy. *Journal of Hematology & Oncology*, 2016;9():1-4. *Journal of Hematology & Oncology* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. Studies from Columbia University Yield New Information about Alzheimer Disease (Genomics of Alzheimer's disease: Value of high-throughput genomic technologies to dissect its etiology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Neurodegenerative Diseases and Conditions - Alzheimer Disease are discussed in a new report. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Late-onset Alzheimer's disease (AD), the most common neurodegenerative disorder in western countries, is clinically defined by progressive worsening in cognitive functions along with function and behavioral impairment. This ultimately results in complete incapacity and death."

Financial supporters for this research include NIH, Department of Defense.

Our news journalists obtained a quote from the research from Columbia University, "AD is a clinically and pathologically heterogeneous disease, and this is reflected by the numerous genetic findings that point to several diverse molecular mechanisms and pathways. Linkage, genome-wide association and next-generation sequencing studies have led to the identification of more than 20 novel susceptibility loci for AD. While these observations have significantly increased the knowledge of pathogenic mechanisms and potential therapeutic targets, a large part of the genetic component underlying AD is still unexplained."

According to the news editors, the research concluded: "This review will summarize and discuss the major genetic findings and their potential impact on AD diagnosis and prediction of prognosis."

The news correspondents report that additional information may be obtained from C. Reitz, Columbia University, Dept. of Epidemiol, New York, NY, United States.

Heart Disorders and Diseases - Cardiomyopathies

Studies from Comenius University Provide New Data on Cardiomyopathies (Ramipril restores PPAR beta/delta and PPAR gamma expressions and reduces cardiac NADPH oxidase but fails to restore cardiac function and accompanied myosin heavy chain ratio ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Cardiomyopathies are presented in a new report. According to news originating from Bratislava, Slovakia, by NewsRx correspondents, research stated, "We hypothesized that peroxisome proliferator-activated receptors (PPARs) might be involved in a complex protective action of ACE inhibitors (ACEi) in anthracyclines-induced cardiomyopathy. For purpose of study, we compared effects of ramipril on cardiac dysfunction, cardiac failure markers and PPAR isoforms in moderate and severe chronic daunorubicin-induced cardiomyopathy."

Our news journalists obtained a quote from the research from Comenius University, "Male Wistar rats were administered with a single intravenous injection of daunorubicin: 5 mg/kg (moderate cardiomyopathy), or 15 mg/kg (severe cardiomyopathy) or co-administered with daunorubicin and ramipril (1 mg/kg/d, orally) or vehicle for 8 weeks. Left ventricular function was measured invasively under anesthesia. Cardiac mRNA levels of heart failure markers (ANP, Myh6, Myh7, Myh7b) and PPARs (alpha, beta/delta and gamma) were measured by qRT-PCR. Protein expression of NADPH subunit (gp91phox) was measured by Western blot. Moderate cardiomyopathy exhibited only minor cardiac dysfunction what was corrected by ramipril. In severe cardiomyopathy, hemodynamic dysfunction remained unaltered upon ramipril although it decreased the significantly up-regulated cardiac ANP mRNA expression. Simultaneously, while high-dose daunorubicin significantly decreased PPARbeta/delta and PPARgamma mRNA, ramipril normalized these abnormalities. Similarly, ramipril reduced altered levels of oxidative stress-related gp91phox. On the other hand, ramipril was unable to correct both the significantly decreased relative abundance of Myh6 and increased Myh7 mRNA levels, respectively."

According to the news editors, the research concluded: "Ramipril had a protective effect on cardiac function exclusively in moderate chronic daunorubicin-induced cardiomyopathy. Although it normalized abnormal PPARs expression and exerted also additional protective effects also in severe cardiomyopathy, it was insufficient to influence impaired cardiac function probably because of a shift in myosin heavy chain isoform content."

For more information on this research see: "Ramipril restores PPAR beta/delta and PPAR gamma expressions and reduces cardiac NADPH oxidase but fails to restore cardiac function and accompanied myosin heavy chain ratio shift in severe anthracycline-induced cardiomyopathy in rat. Immune System Diseases and Conditions - HIV/AIDS

Studies from Curtin University Add New Findings in the Area of HIV/AIDS (Does the Theory of Planned Behaviour Explain Condom Use Behaviour Among Men Who have Sex with Men? A Meta-analytic Review of the Literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immune System Diseases and Conditions - HIV/AIDS is now available. According to news originating from Perth, Australia, by NewsRx correspondents, research stated, "The aim of this meta-analysis was to explore whether the constructs in the theory of planned behaviour (TPB; i.e., attitude, subjective norm, perceived behavioural control, intention) explain condom use behaviour among men who have sex with men (MSM). Electronic databases were searched for studies that measured TPB variables and MSM condom use."

Our news journalists obtained a quote from the research from Curtin University, "Correlations were meta-analysed using a random effects model and path analyses. Moderation analyses were conducted for the time frame of the behavioural measure used (retrospective versus prospective). Attitude, subjective norm and perceived behavioural control accounted for 24.0 % of the variance in condom use intention and were all significant correlates. Intention and PBC accounted for 12.4 % of the variance in condom use behaviour. However, after taking intention into account, PBC was no longer significantly associated with condom use. The strength of construct relationships did not differ between retrospective and prospective behavioural assessments. The medium to large effect sizes of the relationships between the constructs in the TPB, which are consistent with previous meta-analyses with different behaviours or target groups, suggest that the TPB is also a useful model for explaining condom use behaviour among MSM."

According to the news editors, the research concluded: "However, the research in this area is rather small, and greater clarity over moderating factors can only be achieved when the literature expands."

For more information on this research see: Does the Theory of Planned Behaviour Explain Condom Use Behaviour Among Men Who have Sex with Men? A Meta-analytic Review of the Literature. AIDS and Behavior, 2016;20(12):2834-2844. AIDS and Behavior can be contacted at: Springer, Plenum Publishers, 233 Spring St, New York, NY 10013, USA. **Bone Research**

**Studies from Curtin University Further Understanding of Bone Research (Bone morphogenetic protein-2 and bone therapy: successes and pitfalls)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Bone Research. According to news reporting from Bentley, Australia, by NewsRx journalists, research stated, "Bone morphogenetic proteins (BMPs), more specifically BMP-2, are being increasingly used in orthopaedic surgery due to advanced research into osteoinductive factors that may enhance and improve bone therapy. There are many areas in therapy that BMP-2 is being applied to, including dental treatment, open tibial fractures, cancer and spinal surgery."

Financial support for this research came from Institutional Academic50 grant.

The news correspondents obtained a quote from the research from Curtin University, "Within these areas of treatment, there are many reports of successes and pitfalls. This review explores the use of BMP-2 and its successes, pitfalls and future prospects in bone therapy. The PubMed database was consulted to compile this review. With successes in therapy, there were descriptions of a more rapid healing time with no signs of rejection or infection attributed to BMP-2 treatment. Pitfalls included BMP-2 'off-label' use, which lead to various adverse effects."

According to the news reporters, the research concluded: "Our search highlighted that optimising treatment with BMP-2 is a direction that many researchers are exploring, with areas of current research interest including concentration and dose of BMP-2, carrier type and delivery."

Our news journalists report that additional information may be obtained by contacting B. Poon, School of Pharmacy, Curtin University, Bentley, WA, Australia. Additional authors for this research include T. Kha, S. Tran and C.R Dass.

Studies from Curtin University in the Area of Antimicrobials Described (Is There Potential for Repurposing Statins as Novel Antimicrobials?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antimicrobials have been published. According to news reporting out of Perth, Australia, by NewsRx editors, research stated, "Statins are members of a class of pharmaceutical widely used to reduce high levels of serum cholesterol."

Financial supporters for this research include Science Foundation Ireland (SFI), European Commission (EC), Health Research Board (HRB), Teagasc, Department of Agriculture, Food and the Marine, Irish Research Council for Science, Engineering and Technology (IRCSET), Marine Institute (Foras Na Mara).

Our news journalists obtained a quote from the research from Curtin University, "In addition, statins have so-called 'pleiotropic effects,' which include inflammation reduction, immunomodulation, and antimicrobial effects. An increasing number of studies are emerging which detail the attenuation of bacterial growth and in vitro and in vivo virulence by statin treatment."

According to the news editors, the research concluded: "In this review, we describe the current information available concerning the effects of statins on bacterial infections and provide insight regarding the potential use of these compounds as antimicrobial therapeutic agents."

For more information on this research see: Is There Potential for Repurposing Statins as Novel Antimicrobials? Antimicrobial Agents and Chemotherapy, 2016;60(9):5111-5121. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Oncology - Small Cell Lung Cancer

Studies from D. Bernhardt and Co-Authors Have Provided New Information about Small Cell Lung Cancer (Outcome in patients with small cell lung cancer re-irradiated for brain metastases after prior prophylactic cranial irradiation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Small Cell Lung Cancer is the subject of a report. According to news reporting originating from Heidelberg, Germany, by NewsRx correspondents, research stated, "Patients with brain metastases from small-cell lung cancer (SCLC) who underwent prior prophylactic cranial irradiation (PCI) are often treated with a second course of whole brain radiation therapy (Re-WBRT) or stereotactic radiosurgery (SRS) for purposes of palliation in symptomatic patients, hope for increased life expectancy or even as an alternative to untolerated steroids. Up to date there is only limited data available regarding the effect of this treatment."

Financial support for this research came from Medical Faculty of Heidelberg University.

Our news editors obtained a quote from the research, "This study examines outcomes in patients in a single institution who underwent cerebral re-irradiation after prior PCI. We examined the medical records of 76 patients with brain metastases who had initially received PCI between 2008 and 2015 and were subsequently irradiated with a second course of cerebral radiotherapy. Patients underwent re-irradiation using either Re-WBRT (88%) or SRS (17%). The outcomes, including symptom palliation, radiation toxicity, and overall survival (OS) following re-irradiation were analyzed. Survival and correlations were calculated using log-rank, univariate, and multivariate Cox proportional hazards-ratio analyses. Treatment-related toxicity was classified according to CTCAE v4.0. Median OS of all patients was 3 months (range 0-12 months). Median OS after Re-WBRT was 3 months (range 0-12 months). Median OS after SRS was 5 months (range 0-12 months). Karnofsky performance status scale (KPS >= 50%) was significantly associated with improved OS in both univariate (HR 2772; p = 0.009) and multivariate analyses (HR 2613; p = 0.024) for patients receiving Re-WBRT. No unexpected toxicity was observed and the observed toxicity remained consistently low. Symptom palliation was achieved in 40% of symptomatic patients. In conclusion, cerebral re-irradiation after prior PCI is beneficial for symptom palliation and is associated with minimal side effects in patients with SCLC."

According to the news editors, the research concluded: "Our survival data suggests that it is primarily useful in patients with adequate performance status."

The news editors report that additional information may be obtained by contacting D. Bernhardt, Heidelberg Ion Beam Therapy Center HIT, D-69120 Heidelberg, Germany. Additional authors for this research include F. Bozorgmehr, S. Adeberg, N. Opfermann, D. von Eiff, J. Rieker, J. Kappes, R. Foerster, L. Konig, M. Thomas, J. Debus, M. Steins and S. Rieken.

Studies from D. D'Ambrosio et al Further Understanding of Multiple Sclerosis (Ponesimod, a selective S1P1 receptor modulator: a potential treatment for multiple sclerosis and other immune-mediated diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Autoimmune Diseases and Conditions - Multiple Sclerosis have been published. According to news reporting originating from Basel, Switzerland, by NewsRx correspondents, research stated, "The first oral treatment for relapsing multiple sclerosis, the nonselective sphingosine-1-phosphate receptor (S1PR) modulator fingolimod, led to identification of a pivotal role of sphingosine-1-phosphate and one of its five known receptors, S1P1R, in regulation of lymphocyte trafficking in multiple sclerosis. Modulation of S1P3R, initially thought to cause some of fingolimod's side effects, prompted the search for novel compounds with high selectivity for S1P1R."

Our news editors obtained a quote from the research, "Ponesimod is an orally active, selective S1P1R modulator that causes dose-dependent sequestration of lymphocytes in lymphoid organs. In contrast to the long half-life/slow elimination of fingolimod, ponesimod is eliminated within 1 week of discontinuation and its pharmacological effects are rapidly reversible. Clinical data in multiple sclerosis have shown a dose-dependent therapeutic effect of ponesimod and defined 20 mg as a daily dose with desired efficacy, and acceptable safety and tolerability. Phase II clinical data have also shown therapeutic efficacy of ponesimod in psoriasis. These findings have increased our understanding of psoriasis pathogenesis and suggest clinical utility of S1P1R modulation for treatment of various immune-mediated disorders. A gradual dose titration regimen was found to minimize the cardiac effects associated with initiation of ponesimod treatment. Selectivity for S1P1R, rapid onset and reversibility of pharmacological effects, and an optimized titration regimen differentiate ponesimod from fingolimod, and may lead to better safety and tolerability. Ponesimod is currently in phase III clinical development to assess efficacy and safety in relapsing multiple sclerosis."

According to the news editors, the research concluded: "A phase II study is also ongoing to investigate the potential utility of ponesimod in chronic graft versus host disease."

For more information on this research see: Ponesimod, a selective S1P1 receptor modulator: a potential treatment for multiple sclerosis and other immune-mediated diseases. Therapeutic Advances In Chronic Disease, 2016;7(1):18-33. (Sage Publications - www.sagepub.com/; Therapeutic Advances In Chronic Disease - taj.sagepub.com)

The news editors report that additional information may be obtained by contacting D. D'Ambrosio, Actelion Pharmaceuticals - Global Clinical Science and Epidemiology, Gewerbestrasse 16, Basel 4056, Switzerland. Additional authors for this research include M.S. Freedman and J. Prinz.

Oncology - Leukemia

Studies from Dana-Farber Cancer Institute Provide New Data on Leukemia (A PI3K p110b-Rac signalling loop mediates Pten-loss-induced perturbation of haematopoiesis and leukaemogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Leukemia. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "The tumor suppressor PTEN, which antagonizes PI3K signalling, is frequently inactivated in haematologic malignancies. In mice, deletion of PTEN in haematopoietic stem cells (HSCs) causes perturbed haematopoiesis, myeloproliferative neoplasia (MPN) and leukaemia."

The news correspondents obtained a quote from the research from Dana-Farber Cancer Institute, "Although the roles of the PI3K isoforms have been studied in PTEN-deficient tumours, their individual roles in PTEN-deficient HSCs are unknown. Here we show that when we delete PTEN in HSCs using the Mx1-Cre system, p110b ablation prevents MPN, improves HSC function and suppresses leukaemia initiation. Pharmacologic inhibition of p110b in PTEN-deficient mice recapitulates these genetic findings, but suggests involvement of both Akt-dependent and -independent pathways. Further investigation reveals that a p110b-Rac signalling loop plays a critical role in PTEN-deficient HSCs."

According to the news reporters, the research concluded: "Together, these data suggest that myeloid neoplasia driven by PTEN loss is dependent on p110b via p110b-Rac-positive-feedback loop, and that disruption of this loop may offer a new and effective therapeutic strategy for PTEN-deficient leukaemia."

For more information on this research see: A PI3K p110b-Rac signalling loop mediates Pten-loss-induced perturbation of haematopoiesis and leukaemogenesis. Nature Communications, 2015;6():8501. (Nature Publishing Group - www.nature.com/; Nature Communications - www.nature.com/ncomms/)

Our news journalists report that additional information may be obtained by contacting H. Yuzugullu, Dept. of Cancer Biology, Dana-Farber Cancer Institute, Boston, Massachusetts 02215, United States. Oncology - Melanoma

Studies from Dana-Farber Cancer Institute Yield New Data on Melanoma (Combined nivolumab and ipilimumab versus ipilimumab alone in patients with advanced melanoma: 2-year overall survival outcomes in a multicentre, randomised, controlled, phase ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Melanoma. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Results from phase 2 and 3 trials in patients with advanced melanoma have shown significant improvements in the proportion of patients achieving an objective response and prolonged progression-free survival with the combination of nivolumab (an anti-PD-1 antibody) plus ipilimumab (an anti-CTLA-4 antibody) compared with ipilimumab alone. We report 2-year overall survival data from a randomised controlled trial assessing this treatment in previously untreated advanced melanoma."

The news correspondents obtained a quote from the research from Dana-Farber Cancer Institute, "In this multicentre, double-blind, randomised, controlled, phase 2 trial (CheckMate 069) we recruited patients from 19 specialist cancer centres in two countries (France and the USA). Eligible patients were aged 18 years or older with previously untreated, unresectable stage III or IV melanoma and an Eastern Cooperative Oncology Group performance status of 0 or 1. Patients were randomly assigned 2:1 to receive an intravenous infusion of nivolumab 1 mg/kg plus ipilimumab 3 mg/kg or ipilimumab 3 mg/kg plus placebo, every 3 weeks for four doses. Subsequently, patients assigned to nivolumab plus ipilimumab received nivolumab 3 mg/kg every 2 weeks until disease progression or unacceptable toxicity, whereas patients allocated to ipilimumab alone received placebo every 2 weeks during this phase. Randomisation was done via an interactive voice response system with a permuted block schedule (block size of six) and stratification by BRAF mutation status. The study funder, patients, investigators, and study site staff were masked to treatment assignment. The primary endpoint, which has been reported previously, was the proportion of patients with BRAF(V600) wild-type melanoma achieving an investigator-assessed objective response. Overall survival was an exploratory endpoint and is reported in this Article. Efficacy analyses were done on the intention-to-treat population, whereas safety was assessed in all treated patients who received at least one dose of study drug. This study is registered with ClinicalTrials.gov, number NCT01927419, and is ongoing but no longer enrolling patients. Between Sept 16, 2013, and Feb 6, 2014, we screened 179 patients and enrolled 142, randomly assigning 95 patients to nivolumab plus ipilimumab and 47 to ipilimumab alone. In each treatment group, one patient no longer met the study criteria following randomisation and thus did not receive study drug. At a median follow-up of 24.5 months (IQR 9.1-25.7), 2-year overall survival was 63.8% (95% CI 53.3-72.6) for those assigned to nivolumab plus ipilimumab and 53.6% (95% CI 38.1-66.8) for those assigned to ipilimumab alone; median overall survival had not been reached in either group (hazard ratio 0.74, 95% CI 0.43-1.26; p=0.26). Treatment-related grade 3-4 adverse events were reported in 51 (54%) of 94 patients who received nivolumab plus ipilimumab compared with nine (20%) of 46 patients who received ipilimumab alone. The most common
treatment-related grade 3-4 adverse events were colitis (12 [13%] of 94 patients) and increased alanine aminotransferase (ten [11%]) in the combination group and diarrhoea (five [11%] of 46 patients) and hypophysitis (two [4%]) in the ipilimumab alone group. Serious grade 3-4 treatment-related adverse events were reported in 34 (36%) of 94 patients who received nivolumab plus ipilimumab (including colitis in ten [11%] of 94 patients, and diarrhoea in five [5%]) compared with four (9%) of 46 patients who received ipilimumab alone (including diarrhoea in two [4%] of 46 patients, colitis in one [2%], and hypophysitis in one [2%]). No new types of treatment-related adverse events or treatment-related deaths occurred in this updated analysis. Although follow-up of the patients in this study is ongoing, the results of this analysis suggest that the combination of first-line nivolumab plus ipilimumab might lead to improved outcomes compared with first-line ipilimumab alone in patients with advanced melanoma.”

According to the news reporters, the research concluded: "The results suggest encouraging survival outcomes with immunotherapy in this population of patients."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/S1470-2045(16)30366-7. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Ibuprofen Therapy**

**Studies from De Montfort University in the Area of Ibuprofen Therapy Described (Development of aqueous ternary nanomatrix films: A novel 'green' strategy for the delivery of poorly soluble drugs)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Ibuprofen Therapy is now available. According to news originating from Leicester, United Kingdom, by NewsRx correspondents, research stated, "Aqueous polymeric films have potentially great values in drug development, particularly in controlled drug release and taste masking strategies. However the progressive
polymer-particle coalescence that occurs randomly during film formation, curing and storage may render the film less permeable leading to erratic and unpredictable drug release profile."

Our news journalists obtained a quote from the research from De Montfort University, "The focus of this study was to investigate the impacts of the in situ formation of polymer-drug nanoconjugate, at the interfacial nano-domains of two oppositely charged polymers, on the mechanism of film formation and to prepare aqueous ternary polymer-drugpolymer nanomatrix films as a novel green strategy for the delivery of ibuprofen, a model poorly soluble drug. Composite and Layer-by-Layer films were prepared by aqueous casting technique using the concept of combined polymer-drug self-assembly and polyelectrolyte complexation. The plain and drug-loaded nanomatrix films were characterized using SEM, AFM, FTIR, DSC and TGA. Ibuprofen formed spherical core-shell microstructures (4.55-9.73 μm) in gellan film. However in the presence of cationic dextran (Ddex), nanoconjugates (61.49 + 5.97-447.52 + 37.51 nm) were formed within the core of the film matrix. The composite films exhibited reduced tensile strength and lower elastic modulus with optimal conjugation efficiency of 98.14 +/- 1.19%, which correlates with higher dissolution efficiency (99.76%) compared to 47.37% in layer-by-layer (LbL) films, dictated by Ddex concentration. Generally, the mechanism of drug release was by Fickian diffusion, however anomalous transport or polymer relaxation was also observed at higher concentration of Ddex."

According to the news editors, the research concluded: "This study demonstrated the potential application of aqueous drug-loaded nanomatrix films as controlled drug delivery strategy for ibuprofen, a model poorly soluble drug."

The news correspondents report that additional information may be obtained from A.O. Abioye, De Montfort University, Leicester Sch Pharm, Leicester LE1 9BH, Leics, United Kingdom. Additional authors for this research include D. Armitage and A.O. Abioye.

**Neurofibromatosis**

**Studies from Department of Anaesthesia and Critical Care Provide New Data on Neurofibromatosis (Neurofibromatosis: Challenge for Anaesthetist)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurofibromatosis are presented in a new report. According to news reporting originating in Jodhpur, India, by NewsRx editors, the research stated, "Neurofibromatosis type 1 (NF-1) is an autosomal dominant neurocutaneous syndrome which is characterized by formation of neurofibromas all over the skin and various other body systems. The anaesthetic management of these patients requires attention to all possible abnormalities
and associated disturbances to prevent any peri-operative complication."

The news reporters obtained a quote from the research from the Department of Anaesthesia and Critical Care, "NF-1-associated complications of the musculoskeletal, respiratory, cardiovascular, central nervous, and gastrointestinal and genitourinary systems present with various degrees of considerations for anaesthesiologists. While evaluating and managing these patients for surgical procedures. NF-1 or von Recklinghausen disease, is an autosomal dominant disease with incidence of approximately 1/3000 births. Gastrointestinal (GI) neoplasms are present in about 2-25% of patients of NF-1. In these patients, neurofibromas are the most frequently (52%) diagnosed benign neoplasms. Patients with NF-1 and GI symptoms are at risk for gastrointestinal neoplasms; symptomatic patients are likely to experience significant morbidity."

According to the news reporters, the research concluded: "This report describes the anaesthetic of a patient with NF-1 and gastric outlet obstruction."

For more information on this research see: Neurofibromatosis: Challenge for Anaesthetist. *Journal of the College of Physicians and Surgeons--pakistan*, 2015;25 Suppl 2 ():S73-5.

**Autoimmune Diseases and Conditions - Lambert-…**

**Studies from Department of Biomedical Sciences Reveal New Findings on Lambert-Eaton Myasthenic Syndrome (Review of the Diagnostic Challenges of Lambert-Eaton Syndrome Revealed Through Three Case Reports)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Lambert-Eaton Myasthenic Syndrome. According to news reporting from Valencia, Spain, by NewsRx journalists, research stated, "Lambert-Eaton syndrome (LES) is a rare immune-mediated disorder characterized by proximal leg weakness, autonomic symptoms and hypoactive tendon reflexes. The paraneoplastic form is associated with small-cell lung cancer in 50-60% of cases, whereas the remaining cases are found in younger adults with a higher likelihood of coexisting autoimmune disease."

The news correspondents obtained a quote from the research from the Department of Biomedical Sciences, "The early recognition of LES is crucial for improving clinical outcomes but remains a major challenge. In this review, we analyze the clinical characteristics and diagnostic considerations in treating LES through a series of three case studies, one of which showed definitive response to pyridostigmine and corticosteroid combination therapy, followed by spontaneous remission. Patients were assessed by image-based screening, serological testing and electrophysiological evaluations, which included respiratory and autonomic testing."
According to the news reporters, the research concluded: "A better understanding of the common pitfalls in the clinical, serological and neurophysiologic diagnosis of LES through assessment of typical LES dysfunction throughout the nervous system should enable improved recognition and treatment of this syndrome."

For more information on this research see: Review of the Diagnostic Challenges of Lambert-Eaton Syndrome Revealed Through Three Case Reports. Canadian Journal of Neurological Sciences, 2016;43(5):635-647. Canadian Journal of Neurological Sciences can be contacted at: Cambridge Univ Press, 32 Avenue Of The Americas, New York, NY 10013-2473, USA.

Cardiology

Studies from Department of Cardiology Describe New Findings in Cardiology (Cardiac resynchronisation therapy in 2015: keeping up with the pace)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting out of Melbourne, Australia, by NewsRx editors, research stated, "Despite improved understanding of the pathophysiology of heart failure (HF) and availability of better medical therapies, HF continues to grow as a cause of morbidity and mortality in Australia and worldwide. Over the past decade, cardiac resynchronisation therapy (CRT), or biventricular pacing, has been embraced as a powerful weapon against this growing epidemic."

Our news journalists obtained a quote from the research from the Department of Cardiology, "However, much has changed in our understanding of dyssynchrony in HF, and this has led to a change in guidelines to ensure more appropriate selection of CRT candidates to improve the 'non-response' rate. More data have also emerged about the use of CRT in atrial fibrillation and in pacemaker-dependent patients. There has also been a growing focus on multimodality imaging to guide patient selection and lead positioning."

According to the news editors, the research concluded: "Exciting new lead technologies are also emerging, with the potential to improve CRT outcomes further."

Our news journalists report that additional information may be obtained by contacting A. Voskoboinik, Dept. of Cardiology, Western Hospital, Melbourne, Victoria, Australia. Additional authors for this research include A.D. McGavigan and J.A Mariani.

The direct object identifier (DOI) for that additional information is:
Studies from Department of Cardiology in the Area of Heart Attack Reported (Peak troponin I level predicts new-onset atrial fibrillation in patients with myocardial infarction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Attack are discussed in a new report. According to news originating from Istanbul, Turkey, by NewsRx correspondents, research stated, "We aimed to assess the predictive value of peak troponin I level for the occurrence of new-onset AF in myocardial infarction. A total of 1553 patients, who were hospitalized with diagnosis of STEMI and underwent primary PCI, were retrospectively evaluated."

Our news journalists obtained a quote from the research from the Department of Cardiology, "New-onset AF was defined as any newly diagnosed AF that occurred during index hospitalization after primary PCI. New-onset AF was observed in 90 patients (5.8% of the study population). Patients who developed AF were older (56.1 vs. 62.6 years, p<0.001), more often had history of stroke and coronary bypass (4.4% vs. 0.8%, p = 0.001; 7.8% vs. 0.9%, p<0.001, respectively), were more often admitted with Killip class 3 or 4 (38.9% vs. 2.7%, p<0.001) and had a TIMI grade flow < 3 after PCI (42.2% vs. 6%, p<0.001), higher C-reactive protein plasma level (8.6 vs. 4.8 mg/L, p<0.001) and a higher peak troponin I level (34.5 vs. 29.4 ng/mL, p = 0.02). On multivariate regression analysis, peak troponin I level (odds ratio, 0.97; 95% confidence interval, 0.95-0.99; p = 0.007) independently predicted AF occurrence. For the first time, peak troponin I has been demonstrated to be independently correlated with AF development in STEMI patients after primary PCI."

According to the news editors, the research concluded: "A major limitation of our study is lack of other serum biochemical markers for the estimation of infarct size; therefore, prospective, large-scale studies are needed."

For more information on this research see: Peak troponin I level predicts new-onset atrial fibrillation in patients with myocardial infarction. *Clinical and Investigative Medicine*, 2016;39(6):239-245. *Clinical and Investigative Medicine* can be contacted at: Canadian Soc Clinical Investigation, Csci Head Office, 774 Echo Drive, Ottawa, On K1S 5N8, Canada.

Drugs and Therapies - Antiemetic-Antivertigo Agents

Studies from Department of Chemistry Further Understanding of Antiemetic-Antivertigo Agents [Preparation, optimization by 2(3) factorial design, characterization and in vitro release kinetics of lorazepam loaded PLGA nanoparticles]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antiemetic-Antivertigo Agents. According to news reporting originating from Sagar, India, by NewsRx correspondents, research stated, "The aim of this work was to formulate the lorazepam loaded poly(lactic-co-glycolic) acid (PLGA) nanoparticles by optimization of different preparation variables using 2(3) factorial design. The effect of three independent factors, the amount of polymer, concentration of the stabilizer and volume of organic solvent was investigated on two dependent responses, i.e., particle size and % drug entrapment efficiency."

Our news editors obtained a quote from the research from the Department of Chemistry, "By using PLGA as polymer, PVA as a stabilizer and dimethyl sulfoxide as organic solvent lorazepam loaded PLGA nanoparticles were successfully developed through modified nanoprecipitation method. FTIR and DSC studies were carried out to examine the interaction between the excipients used and to explore the nature of the drug, the formulation and the nature of drug in the formulations. These nanoparticles were characterized for particle size, shape, zeta potential, % drug entrapment efficiency, % process yield and in vitro drug release behavior. In vitro evaluation showed particles size between 161.0 +/- 5.4 and 231.9 +/- 4.9 nm, % drug entrapment efficiency of formulations was in the range of 60.43 +/- 5.8 to 75.40 +/- 1.5, % process yield at 68.34 +/- 2.3 to 81.55 +/- 1.3 was achieved and in vitro drug release for these formulations was in the range of 49.2 to 54.6%. Different kinetics models, such as zero order, first order, Higuchi model, Hixson-Crowell model and Korsmeyer- Peppas model were used to analyze the in vitro drug release data. Preferred formulation showed particle size of 161.0 +/- 5.4 nm, PDI as 0.367 +/- 0.014, -25.2 mV zeta potential, drug entrapment efficiency as 64.58 +/- 3.6% and 72.48 +/- 2.5% process yield."

According to the news editors, the research concluded: "TEM results showed that these nanoparticles were spherical in shape, and follow the Korsmeyer-Peppas model with a release exponent value of n = 0.658."

For more information on this research see: Preparation, optimization by 2(3) factorial design, characterization and in vitro release kinetics of lorazepam loaded PLGA nanoparticles. Polymer Science Series A, 2016;58(6):975-986. Polymer Science Series A can be contacted at: Maik Nauka, Interperiodica, Springer, 233 Spring St, New York, NY 10013-1578, USA. Transplant Medicine - Tissue Transplants

Studies from Department of Emergency Medicine Have Provided New Information about Tissue Transplants (The emergency medicine approach to abdominal vascular graft complications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Transplant Medicine - Tissue Transplants. According to news reporting originating in Portsmouth, Virginia, by NewsRx journalists, research stated, "Abdominal aortic aneurysm (AAA) is a deadly condition, particularly with rupture. Emergency physicians provide vital frontline care to the diagnosis and treatment of this disease."

The news reporters obtained a quote from the research from the Department of Emergency Medicine, "Endovascular aortic repair (EVAR) has become the gold standard for treatment of AAA, but the management of EVAR complications is not well discussed in the emergency medicine literature. Objective of this review: The purpose of this article is to provide an emergency medicine-focused review of the complications of EVAR. Although many complications may arise after AAA repair, the most common include aortoenteric fistula, endoleak, limb ischemia, and graft infection. All potential complications should receive vascular surgery consultation and hemodynamic resuscitation. Aortoenteric fistula often presents nonspecifically with gastrointestinal (GI) bleeding, abdominal pain, and vomiting. Computed tomography with intravenous contrast is required for diagnosis. An endoleak is defined by vascular flow outside of the graft. The optimal diagnostic modality includes triple phase computed tomographic scan (noncontrast, arterial, delayed phase). Limb ischemia may occur before 2 months, or in a later period, with symptoms ranging from claudication to complete neurovascular compromise. Graft infection is most commonly due to Staphylococcus aureus, and imaging can suggest the diagnosis. Definitive diagnosis requires tissue or fluid sampling. Through an understanding of these complications, emergency physicians may improve patient outcomes. With the growing use of EVAR, emergency physician exposure to complications of this procedure is increasing."

According to the news reporters, the research concluded: "Knowledge of the complication presentations, diagnoses, and management can play an integral role patient care."

Our news correspondents report that additional information may be obtained by contacting R. Slama, Naval Med Center Portsmouth, Dept. of Emergency Med, Portsmouth, VA 23708, United States. Additional authors for this research include B. Long and A. Koyfman.
Clinical Research - Clinical Trials and Studies

Studies from Department of Epidemiology in the Area of Clinical Trials and Studies Reported (Psychosocial interventions for psychostimulant misuse)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Clinical Research - Clinical Trials and Studies are presented in a new report. According to news reporting originating from Rome, Italy, by NewsRx correspondents, research stated, "Psychostimulant misuse is a continuously growing medical and social burden. There is no evidence proving the efficacy of pharmacotherapy."

Our news editors obtained a quote from the research from the Department of Epidemiology, "Psychosocial interventions could be a valid approach to help patients in reducing or ceasing drug consumption. To assess the effects of psychosocial interventions for psychostimulant misuse in adults. Search methods We searched the Cochrane Drugs and Alcohol Group Specialised Register (via CRSLive); Cochrane Central Register of Controlled Trials (CENTRAL); MEDLINE; EMBASE; CINAHL; Web of Science and PsycINFO, from inception to November 2015. We also searched for ongoing and unpublished studies via ClinicalTrials.gov (www.clinicaltrials.gov) and the World Health Organization (WHO) International Clinical Trials Registry Platform (ICTRP) (apps.who.int/trialsearch/). All searches included non-English language literature. We handsearched references of topic-related systematic reviews and the included studies. Selection criteria We included randomised controlled trials comparing any psychosocial intervention with no intervention, treatment as usual (TAU) or a different intervention in adults with psychostimulant misuse or dependence. Data collection and analysis We used the standard methodological procedures expected by Cochrane. We included a total of 52 trials (6923 participants). The psychosocial interventions considered in the studies were: cognitive behavioural therapy (19 studies), contingency management (25 studies), motivational interviewing (5 studies), interpersonal therapy (3 studies), psychodynamic therapy (1 study), 12-step facilitation (4 studies). We judged most of the studies to be at unclear risk of selection bias; blinding of personnel and participants was not possible for the type of intervention, so all the studies were at high risk of performance bias with regard to subjective outcomes; the majority of studies did not specify whether the outcome assessors were blind. We did not consider it likely that the objective outcomes were influenced by lack of blinding. The comparisons made were: any psychosocial intervention versus no intervention (32 studies), any psychosocial intervention versus TAU (6 studies), and one psychosocial intervention versus an alternative psychosocial intervention (13 studies). Five of included studies did not provide any useful data for inclusion in statistical synthesis. We found that, when compared to no intervention, any psychosocial treatment: reduced the dropout rate
A risk ratio (RR) of 0.83, 95% confidence interval (CI) 0.76 to -0.91, 24 studies, 3393 participants, moderate quality evidence; increased continuous abstinence at the end of treatment (RR: 2.14, 95% CI 1.27 to -3.59, 8 studies, 1241 participants, low quality evidence); did not significantly increase continuous abstinence at the longest follow-up (RR: 2.12, 95% CI 0.77 to -5.86, 4 studies, 324 participants, low quality evidence); significantly increased the longest period of abstinence: (standardised mean difference (SMD): 0.48, 95% CI 0.34 to 0.63, 10 studies, 1354 participants, high quality evidence). However, it should be noted that the in the vast majority of the studies in this comparison the specific psychosocial treatment assessed in the experimental arm was given in add on to treatment as usual or to another specific psychosocial or pharmacological treatment which was received by both groups. So, many of the control groups in this comparison were not really untreated. Receiving some amount of treatment is not the same as not receiving any intervention, so we could argue that the overall effect of the experimental psychosocial treatment could be smaller if given in add on to TAU or to another intervention than if given to participants not receiving any intervention; this could translate to a smaller magnitude of the effect of the psychosocial intervention when it is given in add on. When compared to TAU, any psychosocial treatment reduced dropout rate (RR: 0.72, 95% CI 0.59 to 0.89, 6 studies, 516 participants, moderate quality evidence), did not increase continuous abstinence at the end of treatment (RR: 1.27, 95% CI 0.94 to 1.72, 2 studies, 224 participants, low quality evidence), did not increase longest period of abstinence (MD -3.15 days, 95% CI -10.35 to 4.05, 1 study, 110 participants, low quality evidence). No studies in this comparison assessed the outcome of continuous abstinence at longest follow-up. There were few studies comparing two or more psychosocial interventions, with small sample sizes and considerable heterogeneity in terms of the types of interventions assessed. None reported significant results. None of the studies reported harms related to psychosocial interventions. Authors’ conclusions The addition of any psychosocial treatment to treatment as usual (usually characterised by group counselling or case management) probably reduces the dropout rate and increases the longest period of abstinence. It may increase the number of people achieving continuous abstinence at the end of treatment, although this might not be maintained at longest follow-up. The most studied and the most promising psychosocial approach to be added to treatment as usual is probably contingency management. However, the other approaches were only analysed in a few small studies, so we cannot rule out the possibility that the results were not significant because of imprecision. When compared to TAU, any psychosocial treatment may improve adherence, but it may not improve abstinence at the end of treatment or the longest period of abstinence. The majority of the studies took place in the United States, and this could limit the generalisability of the findings, because the effects of psychosocial treatments could be strongly influenced by the social context and ethnicity. The results of our review do not answer the most relevant clinical question, demonstrating which is the most effective type of psychosocial approach."

According to the news editors, the research concluded: "Further studies should directly compare contingency management with the other psychosocial approaches."

For more information on this research see: Psychosocial interventions for psychostimulant misuse. *Cochrane Database of Systematic Reviews, 2016;(9):2166-2347.* *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news editors report that additional information may be obtained by contacting S. Minozzi, Lazio Reg Hlth Serv, Dept. of Epidemiol, I-00154 Rome, Italy. Additional authors for this research include R. Saulle, F. De Crescenzo and L. Amato.

Studies from Department of Forensic Genetics and Forensic Toxicology Yield New Data on Drug Monitoring (The Toxicology of New Psychoactive Substances: Synthetic Cathinones and Phenylethylamines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Monitoring have been published. According to news reporting originating from Linkoping, Sweden, by NewsRx correspondents, research stated, "New psychoactive substances (NPSs) are substitutes for classical drugs of abuse and there are now compounds available from all groups of classical drugs of abuse. During 2014, the number of synthetic cathinones increased dramatically and, together with phenylethylamines, they dominate the NPS markets in the European Union."

Our news editors obtained a quote from the research from the Department of Forensic Genetics and Forensic Toxicology, "In total, 31 cathinones and 9 phenylethylamines were encountered in 2014. The aim of this article was to summarize the existing knowledge about the basic pharmacology, metabolism, and human toxicology of relevant synthetic cathinones and phenylethylamines. Compared with existing reviews, we have also compiled the existing case reports from both fatal and nonfatal intoxications. We performed a comprehensive literature search using bibliographic databases PubMed and Web of Science, complemented with Google Scholar. The focus of the literature search was on original articles, case reports, and previously published review articles published in 2014 or earlier. The rapid increase of NPSs is a growing concern and sets new challenges not only for societies in drug prevention and legislation but also in clinical and forensic toxicology. In vivo and in vitro studies have demonstrated that the pharmacodynamic profile of cathinones is similar to that of other psychomotor stimulants. Metabolism studies show that cathinones and phenylethylamines are extensively metabolized; however, the parent compound is usually detectable in human urine. In vitro studies have shown that many cathinones and phenylethylamines are metabolized by CYP2D6 enzymes. This indicates that these drugs may have many possible drug-drug interactions and that genetic polymorphism may influence their toxicity. However, the clinical and toxicological relevance of CYP2D6 in adverse effects of cathinones and phenylethylamines is questionable, because these compounds are metabolized by other enzymes as well. The toxidromes commonly encountered after ingestion of cathinones and phenylethylamines are mainly of sympathomimetic and hallucinogenic character with a risk of excited delirium and life-threatening cardiovascular effects. The acute and chronic toxicity of many NPSs is unknown or very sparsely investigated."

According to the news editors, the research concluded: "There is a need for evidence-based-treatment recommendations for acute intoxications and a demand for new strategies to analyze these compounds in clinical and forensic cases."

For more information on this research see: The Toxicology of New Psychoactive Substances: Synthetic Cathinones and Phenylethylamines. Therapeutic Drug Monitoring, 2016;38(2):190-216. (Lippincott Williams and Wilkins - www.lww.com; Therapeutic Drug
Studies from Department of Intensive Care Medical Provide New Data on Lung Injury (Nur77 attenuates endothelin-1 expression via downregulation of NF-kappa B and p38 MAPK in A549 cells and in an ARDS rat model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Lung Injury. According to news originating from Guangxi, People's Republic of China, by NewsRx correspondents, research stated, "Acute respiratory distress syndrome (ARDS) is characterized by inflammatory injury to the alveolar and capillary barriers that results in impaired gas exchange and severe acute respiratory failure. Nuclear orphan receptor Nur77 has emerged as a regulator of gene expression in inflammation, and its role in the pathogenesis of ARDS is not clear."

Our news journalists obtained a quote from the research from the Department of Intensive Care Medical, "The objective of this study is to investigate the potential role of Nur77 and its underlying mechanism in the regulation of endothelin-1 (ET-1) expression in lipopolysaccharide (LPS)-induced A549 cells and an ARDS rat model. We demonstrate that LPS induced Nur77 expression and nuclear export in A549 cells. Overexpression of Nur77 markedly decreased basal and LPS-induced ET-1 expression in A549 cells, whereas knockdown of Nur77 increased the ET-1 expression. LPS-induced phosphorylation and nuclear translocation of NF-kappa B and p38 MAPK were blocked by Nur77 overexpression and augmented by Nur77 knockdown in A549 cells. In vivo, LPS induced Nur77 expression in lung in ARDS rats. Pharmacological activation of Nur77 by cytosporone B (CsnB) inhibited ET-1 expression in ARDS rats, decreased LPS-induced phosphorylation of NF-kappa B and p38 MAPK, and relieved lung, liver, and kidney injury. Pharmacological deactivation of Nur77 by 1,1-bis-(3=indolyl)-1-(p-hydroxyphenyl) methane (DIM-C-pPhOH, C-DIM8) had no effect on ET-1 expression and lung injury."

According to the news editors, the research concluded: "These results indicated that Nur77 decreases ET-1 expression by suppressing NF-kappa B and p38 MAPK in LPS-stimulated A549 cells in vitro, and, in an LPS-induced ARDS rat model, CsnB reduced ET-1 expression and lung injury in ARDS rats."

For more information on this research see: Nur77 attenuates endothelin-1 expression

**Liver Diseases and Conditions - Hepatic Tuberculosis**

Studies from Department of Internal Medicine Have Provided New Data on Hepatic Tuberculosis (Erythema induratum of Bazin and Pon'et's arthropathy as epiphenomena of hepatic tuberculosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Hepatic Tuberculosis are presented in a new report. According to news originating from Lisbon, Portugal, by NewsRx correspondents, research stated, "A 42-year-old black woman presented with fever, polyarthritis, livedo reticularis, subcutaneous calf nodules and hepatomegaly. She had been diagnosed with depression 6 weeks prior."

Our news journalists obtained a quote from the research from the Department of Internal Medicine, "Blood analysis showed anaemia, elevated erythrocyte sedimentation rate and C reactive protein, elevated liver enzymes, and positive antinuclear and antiribonucleoprotein antibodies. Abdominal ultrasound revealed heterogeneous hepatomegaly with necrotic lymphadenopathy around the caeliac trunk and splenic hilum. We considered the following diagnoses: lymphoma, connective tissue disease, tuberculosis and sarcoidosis. Subcutaneous nodule histology was compatible with erythema induratum of Bazin, and liver biopsy evidenced granulomatous hepatitis. Although microbiological examinations were negative in tissue samples, a presumptive diagnosis of hepatic tuberculosis was admitted. Having excluded other causes, erythema of Bazin, livedo reticularis and polyarticular involvement (Pon'et's arthropathy) were accepted as immunological epiphenomena associated with tuberculosis. Empirical antituberculous treatment was started and after 3 weeks the patient improved substantially."

According to the news editors, the research concluded: "This clinical response was a further confirmation of the diagnosis."

For more information on this research see: Erythema induratum of Bazin and Pon'et's arthropathy as epiphenomena of hepatic tuberculosis. *Bmj Case Reports*, 2016;2016():.. (BMJ Publishing Group - group.bmj.com/; Bmj Case Reports - casereports.bmj.com/)

**Kidney Diseases and Conditions - Lupus Nephritis**

**Studies from Department of Medicine Have Provided New Information about Lupus Nephritis (Towards new avenues in the management of lupus glomerulonephritis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Kidney Diseases and Conditions - Lupus Nephritis have been published. According to news reporting out of Hong Kong, People's Republic of China, by NewsRx editors, the research stated, "Renal involvement in systemic lupus erythematosus (SLE) carries substantial morbidity and mortality. Conventional immunosuppressive agents (cyclophosphamide and azathioprine) have suboptimal efficacy and substantial toxicity."

Our news journalists obtained a quote from the research from the Department of Medicine, "Mycophenolate mofetil has emerged as an alternative agent for both induction and maintenance therapy in lupus nephritis because of its reduced gonadal toxicity, despite its failure to demonstrate superiority over cyclophosphamide in pivotal studies. The calcineurin inhibitor tacrolimus has equivalent efficacy to cyclophosphamide and mycophenolate mofetil for inducing remission of lupus nephritis. Although rituximab has shown promise in refractory lupus nephritis, combining rituximab with mycophenolate mofetil as initial therapy offers no additional benefit. Considerable interethnic variation is evident in the efficacy and tolerability of the various immunosuppressive regimens, which necessitates individualized treatment and comparison of the efficacy of new regimens across different ethnic groups. For example, low-dose combinations of tacrolimus and mycophenolate mofetil seem to be more effective than pulse cyclophosphamide as induction therapy in Chinese patients. The same regimen has also been used successfully to treat refractory proliferative and membranous lupus nephritis in patients of various ethnic groups."

According to the news editors, the research concluded: "Finally, novel serum and urinary biomarkers are being validated for diagnosis, prognostic stratification and early recognition of flares in lupus nephritis."

Our news journalists report that additional information may be obtained by
Studies from Department of Microbiology & Immunology Describe New Findings in Tuberculosis (Reconstitution of a Mycobacterium tuberculosis proteostasis network highlights essential cofactor interactions with chaperone DnaK)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mycobacterium Infections - Tuberculosis. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "During host infection, Mycobacterium tuberculosis (Mt) encounters several types of stress that impair protein integrity, including reactive oxygen and nitrogen species and chemotherapy. The resulting protein aggregates can be resolved or degraded by molecular machinery conserved from bacteria to eukaryotes."

The news reporters obtained a quote from the research from the Department of Microbiology & Immunology, "Eukaryotic Hsp104/Hsp70 and their bacterial homologs ClpB/DnaK are ATP-powered chaperones that restore toxic protein aggregates to a native folded state. DnaK is essential in Mycobacterium smegmatis, and ClpB is involved in asymmetrically distributing damaged proteins during cell division as a mechanism of survival in Mt, commending both proteins as potential drug targets. However, their molecular partners in protein reactivation have not been characterized in mycobacteria. Here, we reconstituted the activities of theMt ClpB/DnaK bichaperone system with the cofactors DnaJ1, DnaJ2, and GrpE and the small heat shock protein Hsp20. We found that DnaJ1 and DnaJ2 activate the ATPase activity of DnaK differently. A point mutation in the highly conserved HPD motif of the DnaJ proteins abrogates their ability to activate DnaK, although the DnaD2 mutant still binds to DnaK. The purified Mt ClpB/DnaK system reactivated a heat-denatured model substrate, but the DnaJ HPD mutants inhibited the reaction. Finally, either DnaJ1 or DnaJ2 is required for mycobacterial viability, as is the DnaK-activating activity of a DnaJ protein."

According to the news reporters, the research concluded: "These studies lay the groundwork for strategies to target essential chaperone-protein interactions in Mt, the leading cause of death from a bacterial infection."

For more information on this research see: Reconstitution of a Mycobacterium tuberculosis proteostasis network highlights essential cofactor interactions with chaperone DnaK. Proceedings of the National Academy of Sciences of the United States of America,
Studies from Department of Neurosciences Yield New Data on Alkylating Agents (Altered Expression of Cytoskeletal and Axonal Proteins in Oxaliplatin-Induced Neuropathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Alkylating Agents have been published. According to news originating from Florence, Italy, by NewsRx correspondents, research stated, "Oxaliplatin is a platinum compound widely used in the treatment of some solid tumors. Despite its usefulness, oxaliplatin-associated neurotoxicity represents the main dose-limiting factor of this drug."

Our news journalists obtained a quote from the research from the Department of Neurosciences, "This study examined the structural neuronal effects of oxaliplatin treatment in spinal and supraspinal levels. Protein expression was investigated in the mouse cortex, thalamus, periaqueductal grey (PAG) matter and spinal cord (SC) by Western blotting. Thermal nociception was assessed by the hot plate test. Results indicate a reduction in the levels of growth associated protein-43 (GAP43) in the cortex and SC areas at the end of thermal hyperalgesic response, while a decrease in neurofilament-H (NfH) phosphorylation was observed in the SC on day 21 when the pain-related manifestation reaches the neurotoxic peak. Counteracting phosphorylated NfH content increases in the SC and cortex regions at day 28 as a result of the beginning of neuro-regeneration process. We also revealed that the levels of HuD, a neuronal-specific RNA-binding protein, decreased, demonstrating the same temporal and regional expression pattern of GAP43. Oxaliplatin chronic treatment induced a region-specific upregulation of g isoform of protein kinase C (PKC) within thalamus and PAG, and the administration of a PKC inhibitor suggests that PKC activity in these brain regions must be required to maintain the thermal hyperalgesic state."

According to the news editors, the research concluded: "These results suggest that changes in the protein levels of the regulatory and structural proteins are due to oxaliplatin-induced neurotoxicity and imply that there is a direct link between structural changes in the
central nervous system and chemotherapy-induced neurotoxicity."

The news correspondents report that additional information may be obtained from M.D. Sanna, Dept. of Neurosciences, Psychology, Drug Research and Child Health (NEUROFARBA), Section of Pharmacology and Toxicology, Florence, Italy. Additional authors for this research include C. Ghelardini and N. Galeotti.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000443898. This DOI is a link to an online electronic document that is either free or for purchase.

Hematologic Diseases and Conditions - Anemia

Studies from Department of Obstetrics and Gynecology Yield New Data on Anemia (Safety and Efficacy of Ferric Carboxymaltose in Anemic Pregnant Women: A Retrospective Case Control Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematologic Diseases and Conditions - Anemia. According to news reporting originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Anemia during pregnancy is commonly caused by iron deficiency and can have severe consequences for both the mother and the developing fetus. The aim of this retrospective study was to assess the safety and efficacy of intravenous ferric carboxymaltose (FCM) in pregnant women."

Financial support for this research came from Vifor Pharma.

Our news editors obtained a quote from the research from the Department of Obstetrics and Gynecology, "All women treated with FCM for anemia during pregnancy between 2010 and 2012 at our institution were included. A matched control group was selected, including women who either were nonanemic or had anemia but were not considered for intravenous iron. Main outcome measures were maternal safety and pregnancy outcomes. The study included 128 patients (FCM: 64; control: 64). Median FCM dose was 1000 mg and median gestational age at the time of first treatment was 34 weeks and 6 days. Median Hb increased from 8.4 g/dL (interquartile range 7.7; 8.9 g/dL) at the first FCM administration to 10.7 g/dL (9.8; 11.5 g/dL; n=46 with available Hb at delivery) at the time of delivery, achieving levels similar to those in the control group (10.8 g/dL [9.8; 11.8 g/dL; n=48]). No treatment-related adverse events were reported and no statistically significant differences in pregnancy outcomes were observed between groups."

According to the news editors, the research concluded: "Within the limitations of this case control study, FCM was a safe and efficient treatment of anemia during pregnancy."

For more information on this research see: Safety and Efficacy of Ferric

The news editors report that additional information may be obtained by contacting A. Pels, Dept. of Obstetrics and Gynecology, Academisch Medisch Centrum, Meibergdreef 9, 1105 AZ Amsterdam, Netherlands.

Science

Studies from Department of Oncology Yield New Data on Science (A CRISPR/Cas9 Functional Screen Identifies Rare Tumor Suppressors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Science are discussed in a new report. According to news originating from Montreal, Canada, by NewsRx correspondents, research stated, "An enormous amount of tumor sequencing data has been generated through large scale sequencing efforts. The functional consequences of the majority of mutations identified by such projects remain an open, unexplored question."

Our news journalists obtained a quote from the research from the Department of Oncology, "This problem is particularly complicated in the case of rare mutations where frequency of occurrence alone or prediction of functional consequences are insufficient to distinguish driver from passenger or bystander mutations. We combine genome editing technology with a powerful mouse cancer model to uncover previously unsuspected rare oncogenic mutations in Burkitt's lymphoma. We identify two candidate tumor suppressors whose loss cooperate with MYC over-expression to accelerate lymphomagenesis."

According to the news editors, the research concluded: "Our results highlight the utility of in vivo CRISPR/ Cas9 screens combined with powerful mouse models to identify and validate rare oncogenic modifier events from tumor mutational data."

For more information on this research see: A CRISPR/Cas9 Functional Screen Identifies Rare Tumor Suppressors. Scientific Reports, 2016;6():1-8. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Oncology - Neuroblastomas

Studies from Department of Pediatric and Adolescent Oncology Update
Current Data on Neuroblastomas (Tandem high-dose chemotherapy with thiotepa and busulfan-melphalan and autologous stem cell transplantation in very high-risk neuroblastoma ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Neuroblastomas have been published. According to news reporting originating in Villejuif, France, by NewsRx journalists, research stated, "High-risk neuroblastoma is characterised by poor long-term survival, especially for very high-risk (VHR) patients (poor response of metastases after induction therapy). We report the results of an intensified high-dose chemotherapy (HDC) strategy to improve the prognosis of VHR patients."

The news reporters obtained a quote from the research from the Department of Pediatric and Adolescent Oncology, "This strategy was based on tandem HDC with thiotepa and busulfan-melphalan (Bu-Mel) followed by autologous stem cell transplantation (ASCT). All data were prospectively recorded in the Gustave Roussy Paediatric ASCT database. From April 2004 to August 2011, 26 patients were eligible for tandem HDC. The median age at diagnosis was 4.4 years (1-15.9). All patients had metastatic disease. MYCN was amplified in 5/26 tumours. Despite the cumulative toxicity of alkylating agents, the toxicity of the intensified HDC strategy was manageable. Thiotepa-related toxicity was mainly digestive, whereas sinusoidal obstruction syndrome was the main toxicity observed after Bu-Mel. The 3-year event-free survival of this cohort was 37.3% (21.3-56.7)."

According to the news reporters, the research concluded: "This strategy will be compared with combined (131)I-mIBG/Bu-Mel in the upcoming SIOPEN VHR Neuroblastoma Protocol."

For more information on this research see: Tandem high-dose chemotherapy with thiotepa and busulfan-melphalan and autologous stem cell transplantation in very high-risk neuroblastoma patients. Studies from Department of Pharmacology-Toxicology Have Provided New Data on Life Science Research (Ticagrelor Does Not Inhibit Adenosine Transport at Relevant Concentrations: A Randomized Cross-Over Study in Healthy Subjects In Vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Life Science Research is the subject of a report. According to news reporting from Nijmegen, Netherlands, by NewsRx journalists, research stated, "In patients with myocardial infarction, ticagrelor reduces cardiovascular and sepsis-related mortality, and can cause dyspnea. It is suggested that this is caused by adenosine receptor stimulation, because in preclinical studies, ticagrelor blocks the nucleoside transporter and increases cellular ATP release."

The news correspondents obtained a quote from the research from the Department of Pharmacology-Toxicology, "We now investigated the effects of ticagrelor on the adenosine system in humans in vivo. In a double-blinded, placebo-controlled cross-over trial in 14 healthy subjects, we have tested whether ticagrelor (180 mg) affects adenosine-and dipyridamole-induced forearm vasodilation, as surrogates of nucleoside uptake inhibition and adenosine formation, respectively. Also, ex vivo uptake of adenosine and uridine in isolated red blood cells was measured. Primary endpoint was adenosine-induced vasodilation. Ticagrelor did not affect adenosine-or dipyridamole-induced forearm vasodilation. Also, ex vivo uptake of adenosine and uridine in isolated red blood cells was not affected by ticagrelor. In vitro, ticagrelor dose-dependently inhibited nucleoside uptake, but only at supra-physiological concentrations."

According to the news reporters, the research concluded: "At relevant plasma concentration, ticagrelor does not affect adenosine transport, nor adenosine formation in healthy subjects. Therefore, it is unlikely that this mechanism is a relevant pleiotropic effect of ticagrelor."

For more information on this research see: Ticagrelor Does Not Inhibit Adenosine Transport at Relevant Concentrations: A Randomized Cross-Over Study in Healthy Subjects In Vivo. Plos One, 2015;10(10):e0137560. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news journalists report that additional information may be obtained by contacting T.N. van den Berg, Dept. of Pharmacology-Toxicology, Radboud university medical center, Nijmegen, Netherlands. Liver Diseases and Conditions - Hepatitis C Virus

Studies from Department of Pharmacy Have Provided New Data on Hepatitis C Virus (Pharmacist engagement within a hepatitis C ambulatory care clinic in the era of a treatment revolution)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Hepatitis C Virus have been published. According to news reporting out of Miami, Florida, by NewsRx editors, research stated, "To describe an innovative hepatitis C virus (HCV) care program and treatment outcomes resulting from pharmacist services. Adult ambulatory care HCV clinic within the Miami Veteran Affairs Healthcare System."

Our news journalists obtained a quote from the research from the Department of Pharmacy, "Practice description: Pharmacists with limited prescriptive authority are integrated into a medical hepatology care team. Practice innovation: Pharmacists screen patients with HCV infection for treatment eligibility, counsel patients upon treatment initiation, assess ongoing treatment success and toxicity through patient appointments, telephone calls, and the ordering of pertinent laboratory data, and provide oversight of all patients on HCV therapies. Treatment outcomes are reported to the institutional Antimicrobial Stewardship Program. Evaluation: Data produced from a continuous quality assurance initiative were utilized. Descriptive statistics were used to present data. From January 2014 through September 2015 there were 1619 pharmacist encounters for 532 unique patients and 597 screenings (including 578 approvals) were completed by a pharmacist. During this time 555 patients were initiated on at least 1 HCV treatment course, with 565 total treatment courses initiated. As new agents became available for use, fluctuation in regimen selection was seen. The most commonly prescribed medications were sofosbuvir (46%), ledipasvir/sofosbuvir (37%), and simeprevir (33%). Of the 565 HCV treatment courses initiated, 360 were completed, 29 were stopped early during treatment, and 176 were ongoing. Of the 360 completed courses, 249 had sustained virologic response at week 12 results available, of which 225 (90%) achieved treatment success and 24 (10%) relapsed. Of the 29 courses stopped early, 11 were due to poor medication adherence and 8 were due to adverse drug reaction. Through a structured process employing a scope of practice, pharmacists can extend the capacity of medical hepatology providers and provide pharmacotherapy services to enhance care."

According to the news editors, the research concluded: "Information provided here may serve beneficial to others looking to initiate or expand existing HCV pharmacist services."

Our news journalists report that additional information may be obtained by contacting T.P. Gauthier, Miami Vet Affairs Healthcare Syst, Dept. of Pharm, Miami, FL 33125, United States. Additional authors for this research include E. Moreira, C. Chan, A. Cabrera, M. Toro, M.Z. Carrasquillo, M. Corentin and E.M. Sherman.

Developmental Diseases and Conditions - Autism

Studies from Department of Psychology in the Area of Autism Described (Speculations on vitamin K, VKORC1 genotype and autism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Developmental Diseases and Conditions - Autism have been presented. According to news reporting originating in Cedar Falls, Iowa, by NewsRx editors, the research stated, "Humans vary in the gene that encodes for Vitamin K epoxide reductase complex (VKORC1). Recent research has documented the protective effect of Vitamin K on neural cells and its role in maintaining normal neural development."

The news reporters obtained a quote from the research from the Department of Psychology, "Of interest, specific neural effects of Vitamin K overlap with key brain development aberrations, including those associated with autism. Furthermore, Vitamin K protects against oxidative stress associated with toxic exposure. Research on the neural effects is reviewed, and a small sample of severely autistic children of Somali descent residing in the Minneapolis/St. Paul area of Minnesota were genotyped and found to have a higher than expected genetic substitution that results in reduction in the efficiency of the Vitamin K cycle."

According to the news reporters, the research concluded: "The possibility that this genetic difference could play an etiological role in the development of autism is considered."

Our news correspondents report that additional information may be obtained by contacting M.C. DeSoto, Univ Northern Iowa, Dept. of Psychol, Cedar Falls, IA 50614, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mehy.2016.09.013. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions - Hypotension

Studies from Department of Surgery Yield New Information about Hypotension (Prophylactic Gentamicin Is Not Associated with Acute Kidney Injury in Patients with Open Fractures)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Hypotension is the subject of a report. According to news reporting out of Fort Worth, Texas, by NewsRx editors, research stated, "Data on antimicrobial prophylaxis for open fractures is limited, with many protocols based on expert recommendations. These protocols include aminoglycosides (AGs) for fractures with significant soft tissue injury, but these drugs are associated with acute kidney injury (AKI) in other settings; this risk has not been defined for open fracture prophylaxis."

Our news journalists obtained a quote from the research from the Department of Surgery, "We performed a retrospective study from May 2012 to October 2014 at our Level 1 trauma center. Patients with open fractures were evaluated for demographics, location/type of fracture, injury severity, and receipt of an AG. Outcomes included rates of AKI, infection, and mortality. There were 167 patients with open fractures during the study period (119 males, mean age 42±17 [standard deviation] years), with 80 (48%) receiving prophylactic gentamicin (AG+ group). The AG+ and AG- patients had similar fracture sites and Injury Severity Scores (ISSs) (12.6 +/- 9.9 AG+ vs. 15.9 +/- 13.2 AG-) but were more likely to have sustained blunt trauma (96% AG+ vs. 77%; p<0.001) or received intravenous contrast medium 48h from admission (75% AG+ vs. 56% AG-; p=0.01). Gentamicin was not associated with AKI (odds ratio [OR] 0.22; 95% confidence interval [CI] 0.020-2.44; p=0.22), whereas hypotension on admission (OR 10.7; 95% CI 1.42-80.93; p=0.02) and ISS (OR 1.1; 95% CI 1.01-1.20; p=0.02) were both associated with AKI. Only four fracture site infections were identified, three in the AG+ group and one in the AG- group (3.8% vs. 1.1%; p=0.27). The mortality rate was greater in the AG-group (3.8% vs. 12.6%; p=0.04). Prophylactic gentamicin is not associated with AKI, whereas hypotension on admission and higher ISS were."

According to the news editors, the research concluded: "The use of nephrotoxic agents, including aminoglycosides, should be restricted in open fracture patients presenting with hypotension or a high ISS."

For more information on this research see: Prophylactic Gentamicin Is Not Associated with Acute Kidney Injury in Patients with Open Fractures. Surgical Infections, 2016;17(6):720-723. Surgical Infections can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Oncology - Non-Small Cell Lung Cancer

Studies from Department of Surgery in the Area of Non-Small Cell Lung Cancer Described (The Quality of Staging Non-Small Cell Lung Cancer in the Netherlands: Data From the Dutch Lung Surgery Audit)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Non-Small Cell Lung Cancer are presented in a new report. According to news originating from Alkmaar, Netherlands, by NewsRx correspondents, research stated, "Clinical staging of non-small cell lung cancer (NSCLC) determines the initial treatment offered to a patient. The similarity between clinical and pathologic staging in some studies is as low as 50%, and others publish results as high as 91%.

Our news journalists obtained a quote from the research from the Department of Surgery, "The Dutch Lung Surgery Audit is a clinical database that registers the clinical and pathologic TNM of almost all NSCLC patients who undergo operations in the Netherlands. The objective of this study was to determine the accuracy of clinical staging of NSCLC. Prospective data were derived from the Dutch Lung Surgery Audit in 2013 and 2014."

According to the news editors, the research concluded: "Patients were included if they had undergone a surgical resection for stage IA to IIIB NSCLC without neoadjuvant treatment and had a positron emission tomography-computed tomography scan as part of the clinical workup."

The news correspondents report that additional information may be obtained from D.J. Heineman, Medical Center Alkmaar, Dept. of Surg, NL-1815 JD Alkmaar, Netherlands. Additional authors for this research include M.G. ten Berge, J.M. Daniels, M.I. Versteegh, P.J. Marang-van de Mheen, M.W. Wouters and W.H. Schreurs.

Drugs and Therapies - Radiation Therapy

Studies from Department of Urology Provide New Data on Radiation Therapy [Prostate Specific Antigen (PSA) as Predicting Marker for Clinical Outcome and Evaluation of Early Toxicity Rate after High-Dose Rate Brachytherapy (HDR-BT) in Combination ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapi es - Radiation Therapy is now available. According to news originating from Bad Saarow Pieskow, Germany, by NewsRx correspondents, research stated, "High-dose-rate brachytherapy (HDR-BT) with external beam radiation therapy (EBRT) is a common treatment option for locally advanced prostate cancer (PCa). Seventy-nine male patients (median age 71 years, range 50 to 79) with high-risk PCa underwent HDR-BT following EBRT between December 2009 and January 2016 with a median follow-up of 21 months."

Our news journalists obtained a quote from the research from the Department of Urology, "HDR-BT was administered in two treatment sessions (one week interval) with 9 Gy per fraction using a planning system and the Ir192 treatment unit GammaMed Plus iX. EBRT was performed with CT-based 3D-conformal treatment planning with a total dose administration of 50.4 Gy with 1.8 Gy per fraction and five fractions per week. Follow-up for all patients was organized one, three, and five years after radiation therapy to evaluate early and late toxicity side effects, metastases, local recurrence, and prostate-specific antigen (PSA) value measured in ng/mL. The evaluated data included age, PSA at time of diagnosis, PSA density, BMI (body mass index), Gleason score, D'Amico risk classification for PCa, digital rectal examination (DRE), PSA value after one/three/five year(s) follow-up (FU), time of follow-up, TNM classification, prostate volume, and early toxicity rates. Early toxicity rates were 8.86% for gastrointestinal, and 6.33% for genitourinary side effects. Of all treated patients, 84.81% had no side effects. All reported complications in early toxicity were grade 1. PSA density at time of diagnosis (p = 0.009), PSA on date of first HDR-BT (p = 0.033), and PSA on date of first follow-up after one year (p = 0.025) have statistical significance on a higher risk to get a local recurrence during follow-up. HDR-BT in combination with additional EBRT in the presented design for high-risk PCa results in high biochemical control rates with minimal side-effects. PSA is a negative predictive biomarker for local recurrence during follow-up."

According to the news editors, the research concluded: "A longer follow-up is needed to assess long-term outcome and toxicities."

For more information on this research see: Prostate Specific Antigen (PSA) as Predicting Marker for Clinical Outcome and Evaluation of Early Toxicity Rate after High-Dose Rate Brachytherapy (HDR-BT) in Combination with Additional External Beam Radiation Therapy (EBRT) for High Risk Prostate C. International Journal of Molecular Sciences, 2016;17(11):1772-1781. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Studies from Dicle University Yield New Data on Hypertension (The Relationship of Fluid Overload as Assessed by Bioelectrical Impedance Analysis with Pulmonary Arterial Hypertension in Hemodialysis Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Hypertension is now available. According to news originating from Diyarbakir, Turkey, by NewsRx correspondents, research stated, "Pulmonary arterial hypertension (PAH) is common disease among hemodialysis (HD) patients and is associated with increased morbidity and mortality. However, its pathogenesis has not been completely elucidated."

Our news journalists obtained a quote from the research from Dicle University, "We aimed to evaluate the frequency of PAH in HD patients, as well as the relationship between fluid status and PAH. We enrolled 77 HD patients in this study. Multifrequency bioimpedance analysis (BIA) was used to assess fluid status. BIA was performed before and 30 min after the midweek of HD. Overhydration (OH)/extracellular water (ECW)% ratio was used as an indicator of fluid status. Fluid overload was defined as OH/ECW (>=)7%. Echocardiographic examinations were performed before and after the HD. Pulmonary arterial hypertension was defined as systolic pulmonary artery pressure at rest (sPAP) higher than 35 mmHg. PAH was found in 33.7% of the HD patients. OH/ECW and the frequency of fluid overload were significantly higher in HD patients with PAH than those without PAH, whereas serum albumin and hemoglobin levels were significantly lower. sPAP level was significantly higher in HD patients with fluid overload than in those without fluid overload after hemodialysis session. Furthermore, sPAP, OH/ECW levels, and the frequency of PAH were significantly reduced after HD. We also found a significant positive correlation between sPAP and OH/ECW. Multivariate logistic regression analysis demonstrated fluid overload to be an independent predictor of PAH after HD. PAH is prevalent among HD patients."

According to the news editors, the research concluded: "This study demonstrated a strong relationship between fluid overload and PAH in HD patients."

For more information on this research see: The Relationship of Fluid Overload as Assessed by Bioelectrical Impedance Analysis with Pulmonary Arterial Hypertension in Hemodialysis Patients. Medical Science Monitor, 2016;22():488-94.

The news correspondents report that additional information may be obtained from S. Yilmaz, Dept. of Chest Diseases and Tuberculosis, Dicle University, Faculty of Medicine, Diyarbakir, Turkey. Additional authors for this research include Y. Yildirim, M. Taylan, M. Demir, Z. Yilmaz, A.V. Kara, F. Aydin, H.S. Sen, A. Karabulut and F. Topcu.

Studies from Discipline of Pediatrics Describe New Findings in Spinocerebellar Ataxias (Motor cortical dysfunction develops in spinocerebellar ataxia type 3)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Neurodegenerative Diseases and Conditions - Spinocerebellar Ataxias have been presented. According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "Spinocerebellar ataxia type 3 (SCA3) is an inherited neurodegenerative disorder characterized by cerebellar ataxia and variable expression of clinical features beyond the cerebellum. To gain further insights into disease pathophysiology, the present study explored motor cortex function in SCA3 to determine whether cortical dysfunction was present and if this contributed to the development of clinical manifestations."

The news reporters obtained a quote from the research from the Discipline of Pediatrics, "Clinical phenotyping and longitudinal assessments were combined with central (thresholdtracking transcranial magnetic stimulation) and peripheral (nerve excitability) techniques in 11 genetically characterized SCA3 patients. Short-interval intracortical inhibition was significantly reduced in presymptomatic and symptomatic SCA3 patients (-1.3 +/- 1.4%) compared to healthy controls (10.3 +/- 0.7%, P< 0.0005), with changes evident prior to clinical onset of ataxia and related to worsening severity (R = -0.78, P< 0.005). Central motor conduction time was also significantly prolonged in presymptomatic and symptomatic SCA3 patients (7.5 +/- 0.4 ms) compared to healthy controls (5.3 +/- 0.2 ms, P< 0.0005) and related to clinical severity (R = 0.81, P< 0.005). Markers of peripheral motor neurodegeneration and excitability did not correlate with cortical hyperexcitability or ataxia. Simultaneous investigation of clinical status, and central and peripheral nerve function has identified progressive cortical dysfunction in SCA3 patients related to the development of ataxia."

According to the news reporters, the research concluded: "These findings suggest alteration in cortical activity is associated with SCA3 pathogenesis and neurodegeneration."

Our news correspondents report that additional information may be obtained by contacting M.A. Farrar, Univ New South Wales, UNSW Med, Sch Womens & Childrens Hlth, Discipline Paediat, Sydney, NSW, Australia. Additional authors for this research include S. Vucic, G. Nicholson and M.C. Kiernan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.clinph.2016.09.005. This DOI is a link to an online electronic document that is either free or for purchase.

Nutritional and Metabolic Diseases and Conditions —

Studies from Division of Nephrology Have Provided New Information about Fabry Disease (Targeted Screening of Fabry Disease in Male Hemodialysis Patients in Brazil Highlights Importance of Family Screening)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Fabry Disease. According to news originating from Salvador, Brazil, by NewsRx correspondents, research stated, "Fabry disease (FD) is a lysosomal storage disorder caused by enzyme alpha galactosidase A (alpha-Gal A) deficiency due to mutations in the galactosidase alpha (GLA) gene. It leads to damage several organs, such as the kidneys, due to progressive accumulation of glycosphingolipids."

Our news journalists obtained a quote from the research from the Division of Nephrology, "To estimate the prevalence of FD among male hemodialysis (HD) patients in a northern state of Brazil. Screening was performed using a dried blood spot on filter paper to identify patients with low alpha-Gal A enzyme activity (<= 2.2 mu mol/l/h). Those with low enzyme activity underwent genetic analysis of the GLA gene. Family screening was conducted in the index cases. 2,583 male HD patients (age: 52 (18-91 years)) were screened. The alpha-Gal A assay identified 72 males (2.78%) with low enzyme activity. Genotyping identified 3 patients with GLA mutations: W204X, A368T, both previously reported; and C52F, a novel missense mutation. Only the patient with W204X mutation had classic FD. The prevalence rate was 0.12%. Family screening of the index cases identified 23 family members with the same mutations. The prevalence of FD amongst male HD patients found in the Northern of Brazil was low (0.12%)."

According to the news editors, the research concluded: 'However, family screening of the 3 index cases identified family members at an early stage of the disease, which may benefit from earlier treatment.'

The news correspondents report that additional information may be obtained from C.A.B. Silva, Escola Bahiana Med & Saude Public, Div Nephrol, Programa Posgrad Med & Saude Humana, Salvador, BA, Brazil. Additional authors for this research include F.C. Barreto, M.A. dos Reis, J.A. Moura and C.M.S. Cruz.

Cardiology

Studies from Dokkyo Medical University Add New Findings in the Area of Cardiology (Pathological autopsy of a patient that underwent a successful ablation of an electrical storm from the left ventricular summit)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting originating in Saitama, Japan, by NewsRx journalists, research stated, "A 65-year-old man with non-ischemic cardiomyopathy, underwent an autopsy 2 months after the successful ablation of a sustained left ventricular (LV) summit ventricular tachycardia (VT). The patient died due to interstitial pneumonia from amiodarone use."

The news reporters obtained a quote from the research from Dokkyo Medical University, "The earliest activation sites of the VT were documented from both inside the anterior interventricular vein (AIV) and epicardial surface. The diameter of the AIV was 3-4 mm, and the radiofrequency (RF) lesion inside the AIV was a slight lesion due to high impedance with a high temperature. The lesion from the epicardial surface was also superficial and insufficient due to neighboring coronary arteries and the existence of epicardial fat. A successful application was performed from the LV endocardium, and diffuse myocardial fibrosis was observed in the mid-myocardium including inside the RF lesions."

According to the news reporters, the research concluded: "The actual relationship between the myocardial fibrosis and LV summit VT remains unclear, but this case showed the difficulty of achieving a successful ablation from the epicardial side, when the focus exists in the mid-myocardium around the LV summit."

For more information on this research see: Pathological autopsy of a patient that underwent a successful ablation of an electrical storm from the left ventricular summit. Heart and Vessels, 2016;31(12):2068-2073. Heart and Vessels can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Reactive Oxygen Species**

Studies from Dongguk University Further Understanding of Reactive Oxygen Species [NADPH oxidase (NOX) 1 mediates cigarette smoke-induced superoxide generation in rat vascular smooth muscle cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Reactive Oxygen Species. According to news reporting from Gyeonggi Do, South Korea, by NewsRx journalists, research stated, "Smoking is a well-established risk factor for cardiovascular diseases. Oxidative stress is one of the common etiological factors, and NADPH oxidase (NOX) has been suggested as a potential mediator of oxidative stress."

Financial support for this research came from Ministry of Food and Drug Safety.

The news correspondents obtained a quote from the research from Dongguk University, "In this study, cigarette smoke (CS)-induced superoxide production was characterized in vascular smooth muscle cells (VSMC). CS was prepared in forms of cigarette smoke extract (CSE) and total particulate matter (TPM). Several molecular probes for reactive oxygen species were trialed, and dihydroethidium (DHE) and WST-1 were chosen for superoxide detection considering the autofluorescence, light absorbance, and peroxidase inhibitory activity of CS. Both CSE and TPM generated superoxide in a VSMC culture system by stimulating cells to produce superoxide and by directly producing superoxide in the aqueous solution. NOX, specifically NOX1 was found to be an important cellular source of superoxide through experiments with the NOX inhibitors diphenyleneiodonium (DPI) and VAS2870 as well as isoform-specific NOX knockdown. NOX inhibitors and the superoxide dismutase mimetic TEMPOL reduced the cytotoxicity of CSE, thus suggesting the contribution of NOX1-derived superoxide to cytotoxicity."

According to the news reporters, the research concluded: "Since NOX1 is known to mediate diverse pathological processes in the vascular system, NOX1 may be a critical effector of cardiovascular toxicity caused by smoking."

Our news journalists report that additional information may be obtained by contacting M.Y. Lee, Dongguk Univ, Coll Pharm, Goyang 10326, Gyeonggi Do, South Korea. Additional authors for this research include J.M. Park, C.H. Lee, B. Kim, K.C. Choi, S.J. Choi, K. Lee and M.Y. Lee.

**Studies from Dongguk University in the Area of Pharmacology**

**Described [Differential modulation of TWIK-related K+ channel (TREK) and TWIK-related acid-sensitive K+ channel 2 (TASK2) activity by pyrazole compounds]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Pharmacology is now available. According to news reporting originating from Goyang, South Korea, by NewsRx correspondents, research stated, "Pyrazole derivatives were originally suggested as selective blockers of the transient receptor potential cation 3 (TRPC3) and channel. In particular, pyr3 and 10 selectively inhibit TRPC3, whereas pyr2 (BTP2) and 6 inhibit ORAI1."

Financial support for this research came from Ministry of Health & Welfare.

Our news editors obtained a quote from the research from Dongguk University, "However, their effects on background K+ channel activity have not been elucidated. In this study, the effects of BTP2, pyr3, pyr6, and pyr10 were studied on cloned human TWIK-related K+ channels (TREKs) and TWIK-related acid-sensitive K+ channel 2 (TASK-2) channels, which modulate Ca2+ signaling by controlling membrane potential, in HEK293T-overexpressing cells by using a whole-cell patch clamp technique. Pyr3 potently inhibited TREK-1 (I-TREK1), TREK-2 (I-TREK2), and TASK2 current (ITASK-2) with half-maximal inhibitory concentrations (IC50) of 0.89 +/- 0.27, 1.95 +/- 1.44, and 2.42 +/- 0.39 mu M, respectively. BTP2 slightly inhibited ITASK-2 (80.3 +/- 2.5% at 100 mu M). In contrast, pyr6 at 100 mu M potentiated I-TREK1 and I-TREK2 by approximately 2.6- and 3.6-fold compared to the control and inhibited I-TASK2 (38.7 +/- 9.2%). Pyr10 showed a subtype-specific inhibition of I-TREK1 but not I-TREK2. It also inhibited I-TASK2 (70.9 +/- 3.1% at 100 mu M). To the best of our knowledge, this study is the first to describe the differential modulation of TREKs and TASK2 channels by pyrazole derivatives, previously used as inhibitors of TRPC3 and ORAI1."

According to the news editors, the research concluded: "Therefore, studies using these drugs should consider their modulation of other channels such as TREK and TASK-2."

For more information on this research see: Differential modulation of TWIK-related K+ channel (TREK) and TWIK-related acid-sensitive K+ channel 2 (TASK2) activity by pyrazole compounds. *European Journal of Pharmacology*, 2016;791():686-695. *European Journal of Pharmacology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; European Journal of Pharmacology - www.journals.elsevier.com/european-journal-of-pharmacology/)

The news editors report that additional information may be obtained by contacting H.J. Kim, Dongguk Univ, Coll Med, CRC, Goyang 10326, South Korea. Additional authors for
this research include J. Woo, Y. Nam, J.H. Nam and W.K. Kim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejphar.2016.08.030. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Prostate Cancer

Studies from Duke University Reveal New Findings on Prostate Cancer (Treatment-related neuroendocrine prostate cancer resulting in Cushing's syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting out of Durham, North Carolina, by NewsRx editors, research stated, "Here we present, to the best of our knowledge, the first case of a paraneoplastic Cushing's syndrome (hypercortisolism) resulting from treatment-related neuroendocrine prostate cancer - a highly aggressive and difficult disease to treat."

Our news journalists obtained a quote from the research from Duke University, "A 51-year-old man was started on androgen deprivation therapy after presenting with metastatic prostate cancer, characterized by diffuse osseous metastasis. Shortly thereafter, he developed progressive disease with biopsy proven neuroendocrine prostate cancer as well as symptoms of increased skin pigmentation, hypokalemia, hypertension, hyperglycemia and profound weakness, consistent with ectopic Cushing's syndrome."

According to the news editors, the research concluded: "Molecular analysis of the patient's tumor through RNA sequencing showed high expression of several genes including CHGA, ASCL1, CALCA, HES6, PCSK1, CALCB and INSM1 confirming his neuroendocrine phenotype; elevated POMC expression was found, supporting the diagnosis of ectopic Cushing's syndrome."

Our news journalists report that additional information may be obtained by contacting S. Ramalingam, Duke University, Dept. of Med, Duke Canc Inst, Medical Center, Durham, NC, United States. Additional authors for this research include A. Eisenberg, W.C. Foo, J. Freedman, A.J. Armstrong, L.G. Moss and M.R. Harrison.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/iju.13225. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from E. Kennedy and Co-Authors Have Provided New Information about Escherichia coli (Live Bacterial Physiology Visualized with 5 nm Resolution Using Scanning Transmission Electron Microscopy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Escherichia coli are discussed in a new report. According to news reporting from Morrisville, North Carolina, by NewsRx journalists, research stated, "It is now possible to visualize at nanometer resolution the infection of a living biological cell with virus without compromising cell viability using scanning transmission electron microscopy (STEM). To provide contrast while preserving viability, Escherichia coli and P1 bacteriophages were first positively stained with a very low concentration of uranyl acetate in minimal phosphate medium and then imaged with low-dose STEM in a microfluidic liquid flow cell."

Financial supporters for this research include University of Notre Dame, National Institute of Biomedical Imaging and Bioengineering, Walther Cancer Foundation.

The news correspondents obtained a quote from the research, "Under these conditions, it was established that the median lethal dose of electrons required to kill half the tested population was LD50=30 e(-)/nm(2), which coincides with the disruption of a wet biological membrane, according to prior reports. Consistent with the lateral resolution and high-contrast signal-to-noise ratio (SNR) inferred from Monte Carlo simulations, images of the E. coli membrane, flagella, and the bacteriophages were acquired with 5 nm resolution, but the cumulative dose exceeded LD50."

According to the news reporters, the research concluded: "On the other hand, with a cumulative dose below LD50 (and lower SNR), it was still possible to visualize the infection of E. coli by P1, showing the insertion of viral DNA within 3 s, with 5 nm resolution."

Our news journalists report that additional information may be obtained by contacting J. Damiano, Protochips, Inc, Morrisville, North Carolina 27560, United States. Additional authors for this research include E.M. Nelson, T. Tanaka, J. Damiano and G. Timp.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acsnano.5b07697. This DOI is a link to an online electronic document that is either free or for purchase.

Human Immunodeficiency Virus

Studies from Emory University Describe New Findings in Human Immunodeficiency Virus (Hormonal Contraceptive Use Among HIV-Positive Women and HIV Transmission Risk to Male Partners, Zambia, 1994-2012)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Human Immunodeficiency Virus are presented in a new report. According to news reporting out of Atlanta, Georgia, by NewsRx editors, research stated, "Evidence on the association between female-to-male human immunodeficiency virus (HIV) transmission risk and hormonal contraception is sparse and conflicting. Heterosexual HIV-discordant couples from Lusaka, Zambia, were followed longitudinally at 3 month-intervals from 1994 to 2012."

Our news journalists obtained a quote from the research from Emory University, "The impact of hormonal contraception on time to HIV transmission from HIV-positive women to their HIV-negative male partners (M-F+) was evaluated. Among 1601 M-F+ couples, 171 genetically linked HIV transmissions occurred in men over 3216 couple-years (5.3 transmissions/100 couple-years; 95% confidence interval [CI], 4.5-6.2). In multivariable Cox models, neither injectable (adjusted hazard ratio [aHR], 0.6; 95% CI, .4-1.2), oral contraceptive pill (aHR, 0.8; 95% CI, .3-2.1), nor implant (aHR, 0.8; 95% CI, .5-1.4) use was associated with HIV transmission, relative to nonhormonal methods, after controlling for the man's age at baseline and time-varying measures of pregnancy, self-reported unprotected sex with the study partner, sperm present on a vaginal swab wet mount, genital inflammation of either partner, genital ulceration of the man, and first follow-up interval. Sensitivity analyses, including marginal structural modeling and controlling for viral load and fertility intentions available in a subset of couples, led to similar conclusions. Our findings suggest null associations between hormonal contraception and risk of female-to-male HIV transmission."

According to the news editors, the research concluded: "We support efforts to increase the contraceptive method mix for all women, regardless of HIV serostatus, along with reinforced condom counseling for HIV-serodiscordant couples."

Our news journalists report that additional information may be obtained by contacting K.M. Wall, Emory University, Laney Grad Sch, Atlanta, GA 30322, United States. Additional authors for this research include W. Kilembe, B. Vwalika, P. Ravindran, N.H. Khu, I. Brill, E. Chomba, B.A. Johnson, L.B. Haddad, A. Tichacek and S. Allen.

Oncology - Lung Cancer

Studies from Emory University Have Provided New Data on Lung Cancer (Socioeconomic Factors Are Associated With Readmission After Lobectomy for Early Stage Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lung Cancer. According to news reporting originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "Data regarding risk factors for read-missions after surgical resection for lung cancer are limited and largely focus on postoperative outcomes, including complications and hospital length of stay. The current study aims to identify preoperative risk factors for postoperative readmission in early stage lung cancer patients."

Our news editors obtained a quote from the research from Emory University, "The National Cancer Data Base was queried for all early stage lung cancer patients with clinical stage T2N0M0 or less who underwent lobectomy in 2010 and 2011. Patients with unplanned readmission within 30 days of hospital discharge were identified. Univariate analysis was utilized to identify preoperative differences between readmitted and not readmitted cohorts; multivariable logistic regression was used to identify risk factors resulting in readmission. In all, 840 of 19,711 patients (4.3%) were readmitted postoperatively. Male patients were more likely to be readmitted than female patients (4.9% versus 3.8%, p< 0.001), as were patients who received surgery at a nonacademic rather than an academic facility (4.6% versus 3.6%; p = 0.001) and had underlying medical comorbidities (Charlson/Deyo score 1D versus 0; 4.8% versus 3.7%; p< 0.001). Readmitted patients had a longer median hospital length of stay (6 days versus 5; p< 0.001) and were more likely to have undergone a minimally invasive approach (5.1% video-assisted thoracic surgery versus 3.9% open; p< 0.001). In addition to those variables, multivariable logistic regression analysis identified that median household income level, insurance status (government versus private), and geographic residence (metropolitan versus urban versus rural) had significant influence on readmission."

According to the news editors, the research concluded: "The socioeconomic factors identified significantly influence hospital readmission and should be considered during preoperative and postoperative discharge planning for patients with early stage lung cancer."

The news editors report that additional information may be obtained by contacting R.L. Medbery, Emory University, Biostat & Bioinformatics Shared Resource, Winship Canc Inst, Atlanta, GA 30322, United States. Additional authors for this research include T.W. Gillespie, Y. Liu, D.C. Nickleach, J. Lipscomb, M.S. Sancheti, A. Pickens, S.D. Force and F.G. Fernandez.

Studies from Engineering Institute Describe New Findings in Inflammation (Mesoporous silica as multiple nanoparticles systems for inflammation imaging as nano-radiopharmaceuticals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Inflammation are presented in a new report. According to news reporting from Rio de Janeiro, Brazil, by NewsRx journalists, research stated, "Inflammation processes are difficult to manage, especially in certain diseases like cancer. The prognostic of the patient may change drastically during the therapy if an inflammation process occurs."

Financial supporters for this research include National Scientific and Technological Research Council, Rio de Janeiro State Research Foundation, Ministerio de Economia y Competitividad, Generalitat Valenciana.

The news correspondents obtained a quote from the research from Engineering Institute, "In this direction several research groups are trying to develop new agents for treatment and imaging of the inflammation process in order to improve patients prognostics. In this study we have developed and evaluated two possible imaging agents for nuclear medicine procedure using mesoporous silica nano particles as the carrier system. In this direction we developed mesoporous silica nanoparticles loaded with betamethasone and mesoporous silica nanoparticles conjugated with dexamethasone nano particles, both labeled with technetium-99m (Tc-99m) and compared the biodistribution (pharmacokinetic) profile of the two formulations in an inflammation model of carrageenan-induced pleurisy in Wistar rats. The results demonstrated that in both cases the mesoporous silica was able to show the inflammation site with a high accumulation in the inflammatory site with great renal clearance. Considering the fact that radiopharmaceuticals are considered first-order drugs the pharmacokinetics profile are the same of the biodistribution. The cytotoxicity assay demonstrated that the use of mesoporous silica nanoparticles conjugated with dexamethasone nanoparticles is safer when compared to the mesoporous silica nanoparticles loaded with betamethasone."

According to the news reporters, the research concluded: "Nevertheless, both formulations may be used for inflammation process imaging."

For more information on this research see: Mesoporous silica as multiple nanoparticles systems for inflammation imaging as nano-radiopharmaceuticals. Microporous and Mesoporous Materials, 2017;239():426-431. Microporous and Mesoporous Materials can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Microporous and Mesoporous Materials - www.journals.elsevier.com/microporous-and-mesoporous-materials/)

Our news journalists report that additional information may be obtained by
Studies from Eunice Kennedy Shriver National Institute of Child Health and Human Development Provide New Data on Pick's Disease (Necroptosis in Niemann-Pick disease, type C1: a potential therapeutic target)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pick's disease. According to news originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "Niemann-Pick disease, type C1 (NPC1) is a neurodegenerative, lysosomal storage disorder due to mutation of the NPC1 gene. The NPC1 phenotype is characterized by progressive neuronal dysfunction, including cerebellar ataxia and dementia."

Our news journalists obtained a quote from the research from the Eunice Kennedy Shriver National Institute of Child Health and Human Development, "There is histological evidence of neuroinflammation and progressive neuronal loss, with cerebellar Purkinje cells particularly vulnerable to loss of NPC1 function. Necroptosis was evaluated as a mechanism of neuronal loss. Receptor-interacting protein kinase 1 (RIP1) and RIP3 are key components of the necroosomal complex that regulates necroptotic cell death. We report increased expression of RIP1 and RIP3 in NPC1 fibroblasts, NPC1 iPS cell-derived neuronal precursors, and in cerebellar tissue from both NPC1 mice and patients. Our data suggest a positive correlation between NPC1 neurological disease severity and assembly of the necroosome complex. Furthermore, we demonstrate that pharmacological inhibition of RIP1 decreases cell death both in vitro and in vivo. Treatment of Npc1-mutant mice with necrostatin-1, an allosteric inhibitor of RIP1, significantly delayed cerebellar Purkinje cell loss, progression of neurological symptoms, and death."

According to the news editors, the research concluded: "Collectively, our data identified necroptosis as a key component of the molecular network that contributes to neuronal loss in NPC1 and establish that inhibition of necroptosis is a potential therapeutic intervention." For more information on this research see: Necroptosis in Niemann-Pick disease, type C1: a potential therapeutic target. Cell Death & Disease, 2016;7():e2147. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

The news correspondents report that additional information may be obtained from A. Cougnoux, Program in Developmental Endocrinology and Genetics, Eunice Kennedy Shriver...
Studies from Ewha Woman's University School of Medicine Have Provided New Data on Functional Dyspepsia [Efficacy of DA-9701 (Motilitone) in Functional Dyspepsia Compared to Pantoprazole: A Multicenter, Randomized, Double-blind, Non-inferiority ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Digestive System Diseases and Conditions - Functional Dyspepsia is the subject of a report. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "The effect of proton pump inhibitors (PPI) in Asian functional dyspepsia (FD) patients has not been well established as in Western countries. DA-9701, a novel prokinetic agent, stimulates gastric emptying and modulates visceral hypersensitivity in vivo and in human studies."

The news correspondents obtained a quote from the research from the Ewha Woman's University School of Medicine, "This study was conducted to compare the efficacy of DA-9701 with a conventional PPI in mono or combination therapy in patients with FD. In this double-blind, randomized, non-inferiority trial, 389 patients diagnosed with FD using Rome III criteria were allocated among 3 groups: 30-mg DA-9701 t.i.d (means 3 times a day), 40-mg pantoprazole, and 30-mg DA-9701 t.i.d + 40-mg pantoprazole. The primary efficacy end-point was a global assessment of the patient binary response or response on a 5-Likert scale after 4 weeks. The global symptomatic improvement was 60.5% in the DA-9701 group, 65.6% in the pantoprazole group, and 63.5% in the DA-9701 + pantoprazole group using a 5-Likert scale at week 4 with no significant difference among 3 groups (p=0.685). Symptom improvement measured by binary outcome was significantly achieved in each of the 3 groups, but not different among groups. Patients in all treatment groups reported significant improvement in the response rate and symptoms according to FD subtypes and dyspepsia-related quality of life (p <0.001), but there were no significant differences among the 3 groups. DA-9701 improves global and individual symptoms and increases dyspepsia-specific quality of life in patients with FD."

According to the news reporters, the research concluded: "The efficacy of DA-9701 monotherapy is comparable with pantoprazole and there is no additive effect with combination of DA-9701 and pantoprazole in patients with FD."
For more information on this research see: Efficacy of DA-9701 (Motilitone) in Functional Dyspepsia Compared to Pantoprazole: A Multicenter, Randomized, Double-blind, Non-inferiority Study. *Journal of Neurogastroenterology and Motility*, 2016;22(2):254-63.

**Transplant Medicine - Kidney Transplants**

**Studies from F. Mallamaci and Colleagues Reveal New Findings on Kidney Transplants (Nocturnal Hypertension and Altered Night-Day BP Profile and Atherosclerosis in Renal Transplant Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Transplant Medicine - Kidney Transplants. According to news reporting from Reggio di Calabria, Italy, by NewsRx journalists, research stated, "The clinical relevance of ambulatory blood pressure monitoring (ABPM) for risk stratification in renal transplant patients still remains poorly defined. We investigated the association between clinic and ABPM with an established biomarker of atherosclerosis (intima-media thickness [IMT] by echo-color Doppler) in a large, inclusive survey (n = 172) in renal transplant patients at a single institution."

The news correspondents obtained a quote from the research, "Forty-two patients (24%) were classified as hypertensive by ABPM criteria and 29 (17%) by clinic blood pressure (BP) criteria. Average daytime and nighttime BP was 126 12/78 +/- 9 mm Hg and 123 +/- 13/74 +/- 10 mm Hg, respectively. Forty-five patients (26%) were classified as hypertensive by the daytime criterion (>135/85 mm Hg) and a much higher proportion (n = 119, 69%) by the nighttime criterion (>120/70 mm Hg). Sixty-two patients (36%) had a night-day ratio of 1 or greater, indicating clear-cut nondipping. The average nighttime systolic BP (r = 0.24, P = 0.001) and the night-day systolic BP ratio (r = 0.23, P = 0.002) were directly related to IMT, and these associations were much more robust than the 24-hour systolic BP-IMT relationship (r = 0.16, P = 0.04). Average daytime BP and clinic B were unrelated to IMT. In a multiple regression analysis adjusting for confounders, the night-day systolic BP ratio maintained an independent association with IMT ( = 0.14, P = 0.04). In renal transplant patients, the prevalence of nocturnal hypertension by far exceeds the prevalence of hypertension as assessed by clinic, daytime, and 24-hour ABPM. Nighttime systolic BP and the night-day ratio but no other BP metrics are independently associated with IMT."

According to the news reporters, the research concluded: "Blood pressure during
nighttime may provide unique information for the assessment of cardiovascular risk attributable to BP burden in renal transplant patients."

For more information on this research see: Nocturnal Hypertension and Altered Night-Day BP Profile and Atherosclerosis in Renal Transplant Patients. Transplantation, 2016;100(10):2211-2218. Transplantation can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Transplantation - journals.lww.com/transplantjournal/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting C. Zoccali, Azienda Osped Bianchi Melacrino Morelli, Nephrol Dialysis & Transplantat Unit, Reggio Di Calabria, Italy. Additional authors for this research include R. Tripepi, D. Leonardis, A. Mafrecia, M.C. Versace, F. Provenzano, G. Tripepi and C. Zoccali.

**Oncology - Non-Small Cell Lung Cancer**

**Studies from Faculty of Medicine Provide New Data on Non-Small Cell Lung Cancer (Tumor volume determines the feasibility of cell-free DNA sequencing for mutation detection in non-small cell lung cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Non-Small Cell Lung Cancer is now available. According to news originating from Osaka, Japan, by NewsRx correspondents, research stated, "Next-generation sequencing (NGS) and digital PCR technologies allow analysis of the mutational profile of circulating cell-free DNA (cfDNA) in individuals with advanced lung cancer. We have now evaluated the feasibility of cfDNA sequencing for mutation detection in patients with non-small cell lung cancer at earlier stages."

Our news journalists obtained a quote from the research from the Faculty of Medicine, "A total of 150 matched tumor and serum samples were collected from non-small cell lung cancer patients at stages IA-IIIA. Amplicon sequencing with DNA extracted from tumor tissue detected frequent mutations in EGFR (37% of patients), TP53 (39%), and KRAS (10%), consistent with previous findings. In contrast, NGS of cfDNA identified only EGFR, TP53, and PIK3CA mutations in three, five, and one patient, respectively, even though adequate amounts of cfDNA were extracted (median of 4936 copies/mL serum). Next-generation sequencing showed a high accuracy (98.8%) compared with droplet digital PCR for cfDNA mutation detection, suggesting that the low frequency of mutations in cfDNA was not due to a low assay sensitivity. Whereas the yield of cfDNA did not differ among tumor stages, the cfDNA mutations were detected in seven patients at stages IA-IIIA and at T2b or T3. Tumor volume was significantly higher in the cfDNA mutation-positive patients than in the negative patients at
stages T2b-T4 (159.1 +/- 58.0 vs. 52.5 +/- 9.9cm(3), P=0.014)."

According to the news editors, the research concluded: "Our results thus suggest that tumor volume is a determinant of the feasibility of mutation detection with cfDNA as the analyte."

Skin Diseases and Conditions - Alopecia

Studies from Faculty of Medicine Reveal New Findings on Alopecia (Treatment of permanent chemotherapy-induced alopecia with low dose oral minoxidil)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases and Conditions - Alopecia are presented in a new report. According to news reporting out of Sydney, Australia, by NewsRx editors, research stated, "Chemotherapy-induced alopecia is a well-established cause of major distress to patients."

Our news journalists obtained a quote from the research from the Faculty of Medicine, "Permanent chemotherapy-induced alopecia (PCIA) is the absence of or incomplete hair regrowth lasting longer than 6 months after the cessation of chemotherapy and it does not respond to standard treatments of scalp cooling or topical minoxidil. The increasing numbers of reports of PCIA highlight the need for research into an effective treatment."

According to the news editors, the research concluded: "We report a case of a 39 year-old woman with cosmetically significant regrowth after continuous therapy with oral minoxidil."

Our news journalists report that additional information may be obtained by contacting X.Y. Yang, Univ New South Wales, Fac Med, Sydney, NSW, Australia.

Keywords for this news article include: Sydney, Australia, Australia and New Zealand, Skin and Connective Tissue Diseases and Conditions, Skin Diseases and Conditions, Hair Diseases and Conditions, Cardiovascular Agents, Drugs and Therapies, Vasodilator Agents, Minoxidil Therapy, Pharmaceuticals, Hypotrichosis, Chemotherapy, Alopecia, Faculty of Medicine.

**Biotechnology - Cancer Gene Therapy**

**Studies from Faculty of Medicine Yield New Data on Cancer Gene Therapy (Natural products against cancer angiogenesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Biotechnology - Cancer Gene Therapy. According to news reporting out of Oujda, Morocco, by NewsRx editors, research stated, "The process of angiogenesis is quite well-known nowadays. Some medicines and extracts affecting this process are already used routinely in supporting the conventional treatment of many diseases that are considered angiogenic such as cancer."

Our news journalists obtained a quote from the research from the Faculty of Medicine, "However, we must be aware that the area of currently used drugs of this type is much narrower than the theoretical possibilities existing in therapeutic angiogenesis. Plant substances are a large and diverse group of compounds that are found naturally in fruits, vegetables, spices, and medicinal plants. They also have different anticancer properties."

According to the news editors, the research concluded: "The aim of this literature review article is to present the current state of knowledge concerning the molecular targets of tumor angiogenesis and the active substances (polyphenols, alkaloids, phytohormones, carbohydrates, and terpenes) derived from natural sources, whose activity against cancer angiogenesis has been confirmed."

Our news journalists report that additional information may be obtained by contacting E. Khalid, Univ Mohammed 1st, Fac Med & Pharm, Independent Res Team Canc Biol & Bioact Cpds, Oujda, Morocco. Additional authors for this research include E.E. Ayman, H. Rahman, G. Abdelkarim and A. Najda.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13277-016-5364-8. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Antimicrobials**

**Studies from Federal University Further Understanding of Antimicrobials (Antimicrobial and cytotoxicity evaluation of colloidal chitosan - silver nanoparticles - fluoride nanocomposites)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antimicrobials. According to news reporting originating from Recife, Brazil, by NewsRx correspondents, research stated, "The present study aimed to evaluate the antimicrobial activity and cytotoxicity of colloidal chitosan silver nanoparticle- fluoride nanocomposites (CChAgNpFNc), with different silver nanoparticle shapes and sizes. The syntheses of CChAgNpFNc were performed with silver nitrate added to a chitosan solution, addition of a sodium borohydride solution and solid sodium fluoride."

Our news editors obtained a quote from the research from Federal University, "Solution of ascorbic acid was added to synthesize larger silver nanoparticles. CChAgNpFNc obtained: S1- 100% spherical, 8.7 +/- 3.1 nm; S2- 97% spherical, 15.0 +/- 7.9 nm and 2.5% triangular, 22.2 +/- 9.5 nm; S3- 77.3% spherical, 31.8 +/- 10.4nm, 15.9% triangular, 27.1 +/- 10.1 nm and 6.8% elliptical, 33.2 +/- 7.8 nm; and S4- 75.2% spherical, 43.2 +/- 14.3 nm; 23.3% triangular 38.2 +/- 14.8 nm, and 1.5% elliptical 38.4 +/- 11.6 nm. The CChAgNpFNc showed antimicrobial activity against Staphylococcus aureus, Escherichia coli, Enterococcus faecalis, Pseudomonas aeruginosa and Candida albicans, by microdilution technique. The influence on the growth of microorganisms was evaluated using a fluorescence assay, and showed an increasing lag phase and a decreasing log phase. Cytotoxicity was investigated using Artemia salina and MTT assays. The S3 and S4 samples exhibited low cytotoxicity. The S1 and S2 samples inhibited murine macrophages and revealed lethal dose concentrations above 1000 mg/mL that were classified as moderately toxic."

According to the news editors, the research concluded: "Thus, CChAgNpFNc are potential options for the control of multiple-drug-resistant microorganisms and do not represent substantial risks to human health."

The news editors report that additional information may be obtained by contacting T.C.M. Stamford, Federal University of Pernambuco, BR-50670901 Recife, PE, Brazil. Additional authors for this research include A.J.R. Albuquerque, I.A.P. Farias, T.G. da Silva, J.S. Aguiar, A. Galembeck, M.A.P. Flores, F.C. Sampiao, T.C.M. Stamford and A. Rosenblatt.

Studies from Federal University Further Understanding of Pharmacology (Design, synthesis and pharmacological evaluation of new anti-inflammatory compounds)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Pharmacology. According to news reporting originating in Goiania, Brazil by NewsRx journalists, research stated, "Inflammatory diseases and pain are among the main problems that significantly influence the lifestyle of millions of people and existing therapies are not always effective and can cause several adverse effects. In this context, the molecular modifications or synthesis of compounds continue being the best strategies for the identification of new compounds for the treatment of pain and inflammation."

Financial supporters for this research include CNPq, CAPES.

The news reporters obtained a quote from the research from Federal University, "The aim of this study was to evaluate the analgesic and anti-inflammatory activities of new analogues of pyrazole compounds containing subunits N-phenyl-1-H-pirazoles and 1,3,4-oxadiazole-2(3H)-thione, LQFM-146, LQFM-147 and LQFM-148. In the acetic acid-induced abdominal writhing test, treatments with LQFM146, LQFM-147 or LQFM-148 at doses 89, 178 and 356 nmol/kg p.o. reduced the abdominal writhing in a dose-dependent manner. In the formalin test, these compounds at dose 178 nmol/kg p.o. reduced the licking time only in inflammatory phase of this test, suggesting an antinociceptive effect dependent of the anti-inflammatory effect. The treatment with the three compounds in intermediate dose (178 μmol/kg p.o.) reduced the edema at all tested time points in the carrageenan-induced paw edema test and reduced polymorphonuclears cell migration, activity myeloperoxidase and TNF-alpha levels in the carrageenan-induced pleurisy test."

According to the news reporters, the research concluded: "Our data suggest that the new compounds LQFM-146, LQFM-147 and LQFM-148 possess satisfactory anti-inflammatory and antinociceptive effects that involves the reduction of pro-inflammatory cytokines and inhibition of the myeloperoxidase enzyme."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejphar.2016.08.033. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Tachycardia

Studies from Federal University Have Provided New Data on Tachycardia (Diagnostic Accuracy of Several Electrocardiographic Criteria for the Prediction of Atrioventricular Nodal Reentrant Tachycardia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Tachycardia is the subject of a report. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "Atrioventricular nodal reentrant tachycardia (AVNRT) is the most common form of paroxysmal supraventricular tachycardia (SVT) whose diagnosis can be strongly suspected based on the surface electrocardiogram alone. The purpose of this study is to determine the diagnostic accuracy of several electrocardiographic (ECG) criteria for the prediction of AVNRT."

Our news journalists obtained a quote from the research from Federal University, "Between November 2010 and January 2014, a total of 256 patients who underwent electrophysiological testing (EP) with regular, paroxysmal and narrow QRS complex tachycardia were prospectively enrolled. We classified the ECG recordings during tachycardia for the presence of the following criteria: a) classical ECG findings of pseudo S wave in inferior leads and/or pseudo r' wave in lead V1, b) notch in lead aVL, c) no retrograde P waves visible during tachycardia; d) pseudo r' wave in lead aVR, e) notch in lead D1, f) any deflection after 100 ms of the QRS complex during tachycardia. On multivariate analysis, independent predictors of AVNRT diagnosis were female sex (OR 4.17; 95% CI [2.11-8.24]; p< 0.001), age > 60 years (OR 3.53; 95% CI [1.25-9.96]; p = 0.017) and the classical ECG criteria (OR 7.41; 95% CI [3.62-15.17]; p< 0.001). Female, age > 60 years and the classical ECG criteria were the independent predictors of AVNRT diagnosis."

According to the news editors, the research concluded: "Although several of the ECG criteria for AVNRT diagnosis showed acceptable sensitivities and specificities, they do not improve its accuracy."

For more information on this research see: Diagnostic Accuracy of Several Electrocardiographic Criteria for the Prediction of Atrioventricular Nodal Reentrant Tachycardia. Archives of Medical Research, 2016;47(5):394-400. Archives of Medical Research can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Nutritional and Metabolic Diseases and Conditions –…

Studies from Federal University Provide New Data on Obesity (Food insecurity, overweight and obesity among low-income African-American families in Baltimore City: associations with food-related perceptions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Obesity is now available. According to news originating from Santos, Brazil, by NewsRx correspondents, research stated, "To examine associations between food insecurity, excess body weight, psychosocial factors and food behaviours among low-income African-American families. Cross-sectional survey of participants in the baseline evaluation of the B'More Healthy Communities for Kids (BHCK) obesity prevention trial."

Our news journalists obtained a quote from the research from Federal University, "We collected data on socio-economic factors, food source destinations, acquiring food, preparation methods, psychosocial factors, beliefs and attitudes, participation in food assistance programmes, anthropometry and food security. We used principal component analysis to identify patterns of food source destinations and logistic regression to examine associations. Fourteen low-income, predominantly African-American neighbourhoods in Baltimore City, MD, USA. Two hundred and ninety-eight adult caregiver-child (10-14 years old) dyads. Of households, 41.6 % had some level of food insecurity and 12.4% experienced some level of hunger. Food-insecure participants with hunger were significantly more likely to be unemployed and to have lower incomes. We found high rates of excess body weight (overweight and obesity) among adults and children (82.8 % and 37.9 % among food insecure without hunger, 89.2 % and 45.9 % among food insecure with hunger, respectively), although there were no significant differences by food security status. Food source usage patterns, food acquisition, preparation, knowledge, self-efficacy and intentions did not differ by food security. Food security was associated with perceptions that healthy foods are affordable and convenient. Greater caregiver body satisfaction was associated with food insecurity and excess body weight. In this setting, obesity and food insecurity are major problems."

According to the news editors, the research concluded: "For many food-insecure families, perceptions of healthy foods may serve as additional barriers to their purchase and consumption."

The news correspondents report that additional information may be obtained from G.M. Vedovato, Federal University of Sao Paulo, Hlth & Soc Inst, BR-11015020 Santos, SP, Brazil. Additional authors for this research include P.J. Surkan, J. Jones-Smith, E.A. Steeves, E. Han, A.C.B. Trude, A.Y. Kharmats and J. Gittelsohn.

Studies from Federal University Reveal New Findings on Bone Research (Bone Marrow-Derived Cells as a Therapeutic Approach to Optic Nerve Diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Bone Research. According to news originating from Rio de Janeiro, Brazil, by NewsRx correspondents, research stated, "Following optic nerve injury associated with acute or progressive diseases, retinal ganglion cells (RGCs) of adult mammals degenerate and undergo apoptosis. These diseases have limited therapeutic options, due to the low inherent capacity of RGCs to regenerate and due to the inhibitory milieu of the central nervous system."

Financial supporters for this research include Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Fundacao Carlos Chagas Filho de Amparo a Pesquisa do Estado do Rio de Janeiro, Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior, Departamento de Ciencia e Tecnologia do Ministerio da Saude.

Our news journalists obtained a quote from the research from Federal University, "Among the numerous treatment approaches investigated to stimulate neuronal survival and axonal extension, cell transplantation emerges as a promising option. This review focuses on cell therapies with bone marrow mononuclear cells and bone marrow-derived mesenchymal stem cells, which have shown positive therapeutic effects in animal models of optic neuropathies. Different aspects of available preclinical studies are analyzed, including cell distribution, potential doses, routes of administration, and mechanisms of action."

According to the news editors, the research concluded: "Finally, published and ongoing clinical trials are summarized."

For more information on this research see: Bone Marrow-Derived Cells as a Therapeutic Approach to Optic Nerve Diseases. Stem Cells International, 2015;2016():5078619. (Hindawi Publishing - www.hindawi.com; Stem Cells International - www.hindawi.com/journals/sci/)

The news correspondents report that additional information may be obtained from L.A. Mesentier-Louro, Instituto de Biofisica Carlos Chagas Filho, Universidade Federal do Rio de Janeiro, 21941-902 Rio de Janeiro, RJ, Brazil. Additional authors for this research include C. Zaverucha-do-Valle, P.H. Rosado-de-Castro, A.J. Silva-Junior, P.M. Pimentel-Coelho, R. Mendez-Otero and M.F Santiago.

Studies from Federal University Update Current Data on Pharmacology (Phytochemistry Profile, Nutritional Properties and Pharmacological Activities of Mauritia flexuosa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Pharmacology is now available. According to news reporting originating from Piaui, Brazil, by NewsRx correspondents, research stated, "Mauritia flexuosa L. (Arecaceae) is a popular Brazilian fruit known as 'buriti' and belonging to the category of functional foods. This work reviewed the phytochemistry profile, nutritional and pharmacological activities of M. flexuosa."

Our news editors obtained a quote from the research from Federal University, "The main bioactive compounds reported to buriti were carotenoids, tocopherols, ascorbic acid, phenolic compounds, fiber, phytosterols, and mono- and poly-unsaturated fatty acids. These compounds were mainly related to antioxidant, hypolipemiant, photoprotector, antiaggregant, antithrombotic, anti-inflammatory, hypoglycemiant, antimicrobial, and antitumor activities. Furthermore, some compounds present in buriti fruit and its properties were tested in vitro and in vivo and showed biotechnology applications, especially for extraction of fiber, polysaccharides, pigments, antioxidants, and oil."

According to the news editors, the research concluded: "However, the buriti fruit shows great relevance to the development of new products in food, pharmaceutical and chemical industry, this fruit is still underexploited and it has need to expand its production chain and processing to encourage their consumption and utilization."

Keywords for this news article include: Piaui, Brazil, South America, Phytochemistry, Pharmacology, Chemistry, Therapy, Federal University.

Flavivirus

Studies from Federal University Yield New Data on Flavivirus (The flavivirus capsid protein: Structure, function and perspectives towards drug design)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Flavivirus have been published. According to news originating from Rio de Janeiro, Brazil, by NewsRx correspondents, research stated, "Flaviviruses, such as dengue and zika viruses, are etiologic agents transmitted to humans mainly by arthropods and are of great epidemiological interest. The flavivirus capsid protein is a structural element required for the viral nucleocapsid assembly that presents the classical function of sheltering the viral genome."

Our news journalists obtained a quote from the research from Federal University, "After decades of research, many reports have shown its different functionalities and influence over cell normal functioning. The subcellular distribution of this protein, which involves accumulation around lipid droplets and nuclear localization, also corroborates with its multi-functional characteristic. As flavivirus diseases are still in need of global control and in view of the possible key functionalities that the capsid protein promotes over flavivirus biology, novel considerations arise towards anti-flavivirus drug research."

According to the news editors, the research concluded: "This review covers the main aspects concerning structural and functional features of the flavivirus C protein, ultimately, highlighting prospects in drug discovery based on this viral target."

For more information on this research see: The flavivirus capsid protein: Structure, function and perspectives towards drug design. Virus Research, 2017;227():115-123. Virus Research can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Virus Research - www.journals.elsevier.com/virus-research/)

Studies from Federal University Yield New Data on Prolactinoma (Whole-exome identifies RXRG and TH germline variants in familial isolated prolactinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Endocrine System Diseases and Conditions - Prolactinoma are presented in a new report. According to news originating from Belo Horizonte, Brazil, by NewsRx correspondents, research stated, "Familial isolated pituitary adenoma (FIPA) is a rare genetic disorder. In a subset of FIPA families AIP germline mutations have been reported, but in most FIPA cases the exact genetic defect remains unknown."

Our news journalists obtained a quote from the research from Federal University, "The present study aimed to determine the genetic basis of FIPA in a Brazilian family. Three siblings presented with isolated prolactin genes. Further mutation screening was performed using whole-exome sequencing and all likely causative mutations were validated by Sanger sequencing. In silico analysis and secreting pituitary adenoma diagnosed through clinical, biochemical and imaging testing. Sanger sequencing was used to genotype candidate prolactinoma-mutated additional predictive algorithms were applied to prioritize likely pathogenic variants. No mutations in the coding and flanking intronic regions in the MEN1, AIP and PRLR genes were detected. Whole-exome sequencing of three affected siblings revealed novel, predicted damaging, heterozygous variants in three different genes: RXRG, REXO4 and TH."

According to the news editors, the research concluded: "The RXRG and TH possibly pathogenic variants may be associated with isolated prolactinoma in the studied family. The possible contribution of these genes to additional FIPA families should be explored."

The news correspondents report that additional information may be obtained from L. De Marco, Federal University of Minas Gerais, Dept. of Surg, Belo Horizonte, MG, Brazil. Additional authors for this research include P.P. Couto, A.E. Bale, L. Bastos-Rodrigues, F.M. Passos, R.G.C. Lisboa, J.M.Y. Ng, T. Curran, E.P. Dias, E. Friedman and L. De Marco.

Biotechnology - Pharmacogenomics

Studies from Federal University in the Area of Pharmacogenomics Reported (NAT2 gene diversity and its evolutionary trajectory in the Americas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biotechnology - Pharmacogenomics have been presented. According to news reporting out of Porto Alegre, Brazil, by NewsRx editors, research stated, "N-acetyltransferase 2 (NAT2) is responsible for metabolizing xenobiotics; NAT2 polymorphisms lead to three phenotypes: rapid, intermediate and slow acetylators. We aimed to investigate NAT2 diversity in Native Americans."

Our news journalists obtained a quote from the research from Federal University, "NAT2 exon 2 was sequenced for 286 individuals from 21 populations (Native American and American Mestizos). Excluding the basal/rapid haplotype NAT2*4, the most frequent haplotypes are NAT2*5B (35.95%) in hunter-gatherers and NAT2*7B (20.61%) and NAT2*5B (19.08%) in agriculturalists that were related to the slow phenotype. A new haplotype was identified in two Amerindians. Data from the similar to 44 kb region surrounding NAT2 in 819 individuals from Africa, East-Asia, Europe and America were used in additional analyses."

According to the news editors, the research concluded: "No significant differences in the acetylator NAT2 haplotype and phenotype distributions were found between Native American populations practicing farming and/or herding and those practicing hunting and gathering, probably because of the absence or weakness of selection pressures and presence of demographic and random processes preventing detection of any selection signal."

For more information on this research see: NAT2 gene diversity and its evolutionary trajectory in the Americas. Pharmacogenomics Journal, 2016;16(6):559-565. Pharmacogenomics Journal can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Hela Cells

Studies from First Hospital Yield New Data on Hela Cells (Construction and analysis of the regulatory network disturbed by the silenced Sp1 transcription factor in HeLa cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hela Cells is the subject of a report. According to news reporting originating from Taiyuan, People's Republic of China, by NewsRx correspondents, research stated, "The objective of our study was to explore the characteristics of the regulatory network after siRNA-Sp1 (Specificity Protein 1) treatment in HeLa cells through the regulation network construction with bioinformatics methods. Using GSE37935 datasets downloaded from Gene Expression Omnibus data, the differentially expressed genes (DEGs) were screened out by the limma package in R software."

Our news editors obtained a quote from the research from First Hospital, "Combining the DEGs with the data from the microRNA (miRNA) databases and transcription factor databases, an integrated regulatory network was established with Cytoscape. Then the motifs in the network were examined by FANMOD. A total of 708 DEGs were screened, and a regulatory network consisting of 585 nodes and 1070 edges was constructed. By analyzing the two modules extracted from the network, we found that the most significant biological processes were cell cycle and apoptosis, some significant DEGs among them were CDKN1A, CUL5, and EGFR. The Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway analysis discovered that DEGs, including EGFR, CDKN1A, RRM2B, and GADD45B, were significantly enriched in glioma pathway and p53 signaling pathway. While Sp1 was silenced by siRNA, the regulatory network in HeLa cells changed a lot."

According to the news editors, the research concluded: "Genes related to cell cycle and apoptosis in the cell nucleus were dysregulated and the p53 signaling pathway was disturbed."

For more information on this research see: Construction and analysis of the regulatory network disturbed by the silenced Sp1 transcription factor in HeLa cells. *Journal of Cancer Research and Therapeutics*, 2015;11(4):887-92.

The news editors report that additional information may be obtained by contacting L. Yu, Dept. of Gynecology, First Hospital of Shanxi Medical University, Yingze, Taiyuan, Shanxi Province, People's Republic of China. Additional authors for this research include L. Yu, L. Li and M. Wei.

Pharmacogenetics

Studies from Food and Drug Administration Have Provided New Data on Pharmacogenetics (Clinical and regulatory considerations in pharmacogenetic testing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Pharmacogenetics. According to news reporting from Silver Spring, Maryland, by NewsRx journalists, research stated, "Both regulatory science and clinical practice rely on best available scientific data to guide decision-making. However, changes in clinical practice may be driven by numerous other factors such as cost."

The news correspondents obtained a quote from the research from Food and Drug Administration, "In this review, we reexamine noteworthy examples where pharmacogenetic testing information was added to drug labeling to explore how the available evidence, potential public health impact, and predictive utility of each pharmacogenetic biomarker impacts clinical uptake. Advances in the field of pharmacogenetics have led to new discoveries about the genetic basis for variability in drug response. The Food and Drug Administration recognizes the value of pharmacogenetic testing strategies and has been proactive about incorporating pharmacogenetic information into the labeling of both new drugs and drugs already on the market. Although some examples have readily translated to routine clinical practice, clinical uptake of genetic testing for many drugs has been limited."

According to the news reporters, the research concluded: "Both regulatory science and clinical practice rely on data driven approaches to guide decision making; however, additional factors are also important in clinical practice that do not impact regulatory decision making, and these considerations may result in heterogeneity in clinical uptake of pharmacogenetic testing."

For more information on this research see: Clinical and regulatory considerations in pharmacogenetic testing. American Journal of Health-System Pharmacy, 2016;73(23):1999-2006. American Journal of Health-System Pharmacy can be contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD 20814, USA.

Our news journalists report that additional information may be obtained by contacting R.N. Schuck, Food & Drug Administration, Off Translat Sci, Center Drug Evaluat & Res, Silver Spring, MD 20993, United States. Additional authors for this research include E. Marek, H. Rogers and M. Pacanowski.

Immunization - Vaccines

Studies from Food and Drug Administration Have Provided New Data on Vaccines (Human antibody repertoire after VSV-Ebola vaccination identifies novel targets and virus-neutralizing IgM antibodies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunization - Vaccines. According to news originating from Silver Spring, Maryland, by NewsRx correspondents, research stated, "Development of an effective vaccine against Ebola virus is of high priority. However, knowledge about potential correlates of protection and the durability of immune response after vaccination is limited."

Our news journalists obtained a quote from the research from Food and Drug Administration, "Here, we elucidate the human antibody repertoire after administration of vesicular stomatitis virus (VSV)-Ebola vaccine at 3 million, 20 million and 100 million plaque-forming units (PFU) and homologous VSV-Ebola vaccine boost in healthy adult volunteers. Whole genome-fragment phage display libraries, expressing linear and conformational epitopes of Ebola glycoprotein (GP), showed higher diversity of antibody epitopes in individuals vaccinated with 20 million PFU than in those vaccinated with 3 million or 100 million PFU. Surface plasmon resonance kinetics showed higher levels of GP-binding antibodies after a single vaccination with 20 million or 100 million PFU than with 3 million PFU, and these correlated strongly with neutralization titers. A second vaccination did not boost antibody or virus neutralization titers, which declined rapidly, and induced only minimal antibody affinity maturation. Isotype analysis revealed a predominant IgM response even after the second vaccination, which contributed substantially to virus neutralization in vitro."

According to the news editors, the research concluded: "These findings may help identify new vaccine targets and aid development and evaluation of effective countermeasures against Ebola."

For more information on this research see: Human antibody repertoire after VSV-Ebola vaccination identifies novel targets and virus-neutralizing IgM antibodies. Nature Medicine, 2016;22(12):1439-1447,106. Nature Medicine can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group - www.nature.com/nm/)

The news correspondents report that additional information may be obtained from S. Khurana, Food & Drug Administration, Div Viral Prod, CBER, Silver Spring, MD 20993, United States. Additional authors for this research include S. Fuentes, E.M. Coyle, S. Ravichandran, R.T. Davey and J.H. Beigel.

Drugs and Therapies - Immunotherapy

Studies from Food and Drug Administration in the Area of Immunotherapy Described (Role of Clinical Pharmacology in the Development and Approval of Immunotherapies Targeting Immune Checkpoints)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Immunotherapy. According to news reporting originating in Silver Spring, Maryland, by NewsRx editors, the research stated, "Immune surveillance plays a critical role in preventing the development and progression of cancer. Immune modulators, such as interferon-gamma or interleukin-2, have been a part of the cancer treatment armament over the past few decades."

The news reporters obtained a quote from the research from Food and Drug Administration, "However, new understandings regarding the role of the costimulatory and coinhibitory molecules associated with T-cells and antigen-presenting cells as well as tumor necrosis factor receptors and ligands have ushered the new era of immunotherapy for cancer treatment. We now know that primary cancer cells evade screening by the innate immune system, proliferate, and form metastases by upregulating immune inhibitory pathways referred to as immune checkpoints. The recent development of therapies that target immune checkpoints, such as cytotoxic T lymphocyte antigen 4, programmed cell death 1, programmed cell death ligand 1, indoleamine 2,3-dioxygenase, T-cell immunoglobulin and mucin domain 3, and lymphocyte activation gene 3 precisely target the immune system and give new hope for treating various types of cancer. In select marker-enriched populations, immunotherapies provide high response rates as well as durable responses in terms of progression-free survival and overall survival."

According to the news reporters, the research concluded: "Numerous factors, such as patient's immune system, the expression of targets on both immune and cancer cells, maintenance of an effective drug exposure, and tolerability to these agents may play a role in this unique observation."

For more information on this research see: Role of Clinical Pharmacology in the Development and Approval of Immunotherapies Targeting Immune Checkpoints. Clinical Pharmacology & Therapeutics, 2016;100(6):591-593. Clinical Pharmacology & Therapeutics can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Acupuncture Therapy

Studies from Fourth Military Medical University Add New Findings in the Area of Acupuncture Therapy (Electroacupuncture enhances rehabilitation through miR-181b targeting PirB after ischemic stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Acupuncture Therapy is the subject of a report. According to news reporting originating from Xi’an, People's Republic of China, by NewsRx correspondents, research stated, "Recent studies have demonstrated microRNAs (miRNAs) and proteins are beneficial to axon regeneration, which may be involved in Electroacupuncture (EA) therapy against stroke. In this study, we aimed to determine the pivotal role of PirB in EA-produced rehabilitation against ischemic stroke; and to screen and investigate the potential miRNAs directly regulating PirB expression."

Our news editors obtained a quote from the research from Fourth Military Medical University, "The results showed EA treatment enhanced axon regeneration and new projections from the corticospinal tract at 28 d after cerebral ischemic reperfusion injury of rats. Then, we found EA decreased pirb mRNA and PirB protein expression in the penumbra within 28 days after reperfusion. The reduction of PirB expression facilitated neurite outgrowth after oxygen-glucose deprivation injury. The miRNA microarray showed the level of twenty kinds of miRNAs changed in the penumbra after EA administration. The bioinformatics study and luciferase assay verified miR-181b directly regulated pirb mRNA expression. EA increased miR-181b levels in the penumbras, and improved neurobehavioral function rehabilitation through miR-181b direct targeting of pirb mRNA to regulate the expression of PirB, RhoA and GAP43."

According to the news editors, the research concluded: "We provide the first evidence that EA enhances rehabilitation against stroke by regulating epigenetic changes to directly act on its targets, such as the miR-181b/PirB/RhoA/GAP43 axis, which is a novel mechanism of EA therapy."

The news editors report that additional information may be obtained by contacting Q. Wang, Fourth Military Medical University, Xijing Hosp, Dept. of Anesthesiol, Xian 710032, People's Republic of China. Additional authors for this research include F.H. Bai, H. Zhou, D.D. Zhou, Z. Ma, L.Z. Xiong and Q. Wang.

Studies from Fourth Military Medical University Yield New Data on Hyperalgesia (Effects of Ginkgo Biloba Extract EGb-761 on Neuropathic Pain in Mice: Involvement of Opioid System)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nervous System Diseases and Conditions - Hyperalgesia. According to news reporting originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "Neuropathic pain is considered as one of the most difficult types of pain to manage with conventional analgesics. EGb-761 is extracted from leaves of Ginkgo biloba and has analgesia and anti-inflammatory properties."

Our news editors obtained a quote from the research from Fourth Military Medical University, "This study aimed to examine the effect of EGb-761 on chronic constriction injury (CCI)-induced neuropathic pain behaviors, including thermal hyperalgesia and mechanical allodynia, and to explore the possible mechanisms underlying this action. To this end, CCI mice were intraperitoneally injected with EGb-761 (10, 20, 40, and 80 mg/kg), and thermal hyperalgesia, mechanical allodynia, cytokines, and mu-opioid receptor expression were measured. EGb-761 attenuated thermal hyperalgesia and mechanical allodynia dose-dependently and the best delivery time window was from day 7 to day 14 after CCI. Additionally, EGb-761 treatment significantly decreased pro-inflammatory cytokines and enhanced mu opioid receptor (MOR) expression in the sciatic nerve. Moreover, the opioid antagonist naloxone prevented the effect of EGb-761 on thermal hyperalgesia and mechanical allodynia but did not influence the effect of EGb-761 on inflammatory cytokines."

According to the news editors, the research concluded: "This study suggests that the potential of EGb-761 as a new analgesic for neuropathic pain treatment, and opioid system may be involved in the EGb-761-induced attenuation of thermal hyperalgesia and mechanical allodynia."

The news editors report that additional information may be obtained by contacting Z.X. Ye, Fourth Military Medical University, Xijing Hosp, Inst Orthopaed, Xian 710032, Shaanxi Provinc, People's Republic of China. Additional authors for this research include W. Li, F. Xu, M. Li, L. Yang, X.Y. Hu, Z.X. Ye, Z. Wang and Z.J. Luo.

Studies from French National Institute of Health and Medical Research (INSERM) Add New Findings in the Area of Cancer Therapy (Computational oncology--mathematical modelling of drug regimens for precision medicine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Cancer Therapy is the subject of a report. According to news reporting from Marseille, France, by NewsRx journalists, research stated, "Computational oncology is a generic term that encompasses any form of computer-based modelling relating to tumor biology and cancer therapy. Mathematical modelling can be used to probe the pharmacokinetics and pharmacodynamics relationships of the available anticancer agents in order to improve treatment."

The news correspondents obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "As a result of the ever-growing numbers of druggable molecular targets and possible drug combinations, obtaining an optimal toxicity-efficacy balance is an increasingly complex task. Consequently, standard empirical approaches to optimizing drug dosing and scheduling in patients are now of limited utility; mathematical modelling can substantially advance this practice through improved rationalization of therapeutic strategies. The implementation of mathematical modelling tools is an emerging trend, but remains largely insufficient to meet clinical needs; at the bedside, anticancer drugs continue to be prescribed and administered according to standard schedules. To shift the therapeutic paradigm towards personalized care, precision medicine in oncology requires powerful new resources for both researchers and clinicians. Mathematical modelling is an attractive approach that could help to refine treatment modalities at all phases of research and development, and in routine patient care."

According to the news reporters, the research concluded: "Reviewing preclinical and clinical examples, we highlight the current achievements and limitations with regard to computational modelling of drug regimens, and discuss the potential future implementation of this strategy to achieve precision medicine in oncology."

Our news journalists report that additional information may be obtained by contacting D. Barbolosi, SMARTe Unit, Aix Marseille Universite, INSERM, CRO2 UMR_S 911, Marseille 13005, France. Additional authors for this research include J. Ciccolini, B. Lacarelle, F. Barlesi and N. Andre.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrclinonc.2015.204. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Pancreatic Cancer

Studies from Fudan University Shanghai Cancer Center Yield New Information about Pancreatic Cancer [The clinical utility of CA125/MUC16 in pancreatic cancer: A consensus of diagnostic, prognostic and predictive updates by the Chinese Study Group ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Pancreatic Cancer are discussed in a new report. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The prognosis for pancreatic cancer (PC) is poor; however, the timely and accurate treatment of this disease will significantly improve prognosis. Serum biomarkers involve non-invasive tests that facilitate the early detection of tumors, predict outcomes and assess responses to therapy, so that the patient can be continuously monitored and receive the most appropriate therapy."

Our news journalists obtained a quote from the research from Fudan University Shanghai Cancer Center, "Studies have reported that cancer antigen (CA)125 [also known as mucin 16 (MUC16)] has functional significance in the tumorigenic, metastatic and drug resistant properties of PC. Our aim was to use this biomarker in the diagnosis, detection of metastasis, prognosis and in the monitoring of the treatment effects of PC. Members of the Chinese Study Group for Pancreatic Cancer (CSPAC) reviewed the literature on CA125/MUC16 and developed an objective consensus on the clinical utility of CA125/MUC16 for PC. They confirmed the role of CA125/MUC16 in tumorigenesis and the progression of PC, and recommended monitoring CA125/MUC16 levels in all aspects of the diagnosis and treatment of PC, particularly those that involve the monitoring of treatments. In addition, they suggested that the combination of other biomarkers and imaging techniques, together with CA125/MUC16, would improve the accuracy of the clinical decision-making process, thereby facilitating the optimization of treatment strategies."

According to the news editors, the research concluded: "Periodic clinical updates of the use of CA125/MUC16 have been established, which are important for further analyses and comparisons of clinical results from affiliates and countries, particularly as regards the in-depth biological function and clinical translational research of this biomarker."

The news correspondents report that additional information may be obtained from L. Liu, Dept. of Pancreatic Surgery, Fudan University Shanghai Cancer Center, Shanghai, People's Republic of China. Additional authors for this research include J. Xiang, R. Chen, D. Fu, D. Hong, J. Hao, Y. Li, J. Li, S. Li, Y. Mou, G. Mai, Q. Ni, L. Peng, R. Qin, H. Qian, C. Shao, B. Sun, Y. Sun, M. Tao, B. Tian, H. Wang, J. Wang, L. Wang, W. Wang and W Wang.

Genetics

Studies from Fudan University Yield New Information about Genetics (Gene expression profiling analysis of the role of miR-22 in clear cell ovarian cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Genetics are presented in a new report. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "This study aimed to investigate the role and potential mechanism of miR-22 in clear cell ovarian cancer (CCOC) progression. The gene expression profile of GSE16568, including 3 CCOC samples with miR-22 overexpression and 3 negative controls, was downloaded from the Gene Expression Omnibus database."

Our news editors obtained a quote from the research from Fudan University, "Differentially expressed genes (DEGs) were screened using the limma package in R. Gene Ontology (GO) and pathway enrichment analysis of DEGs were performed by using The Database for Annotation, Visualization and Integrated Discovery (DAVID). Furthermore, protein-protein interaction (PPI) network of the DEGs was constructed using the Search Tool for the Retrieval of Interacting Genes (STRING) database. Besides, the miR-22 -mRNA interaction pairs were predicted to explore the critical genes involved in the cancer. Totally, 95 up-regulated DEGs and 51 down-regulated DEGs were identified. The DEGs were enriched in different GO terms and pathways. The up-regulated genes cyclin-dependent kinases (CDK6), MDM2 oncogene, E3 ubiquitin protein ligase (MDM2), and thrombospondin 1 (THBSI) were involved in the p53 signaling pathway. The up-regulated gene FBJ murine osteosarcoma viral oncogene homolog (FOS) was a hub protein in the PPI network of the DEGs. The down-regulated DEGs including lymphoid enhancer-binding factor 1 (LEF1) and v-myb avian myeloblastosis viral oncogene homolog (MYB) were mainly associated with immunity. Nine DEGs as target genes were identified to be recognized by miR-22."

According to the news editors, the research concluded: "Our study suggested that several key genes such as CDK6, MDM2, LEF1, MYB, and FOS that involved in different pathways including p53 signaling pathway were associated with CCOC progression. miR-22 may play an essential role in cell migration and invasion in CCOC through targeting responsive genes."

For more information on this research see: Gene expression profiling analysis of the role of miR-22 in clear cell ovarian cancer. Neoplasma, 2016;63(6):856-864. Neoplasma can be contacted at: Aepress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

Oncology - Breast Cancer

Studies from Fujian Medical University Add New Findings in the Area of Breast Cancer (Upconversion luminescence assay for the detection of the vascular endothelial growth factor, a biomarker for breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Fujian, People's Republic of China, by NewsRx correspondents, research stated, "Upconversion nanoparticles (UCNPs) of the type alpha-NaYF4:Yb3+, Er3+ and a typical diameter of 6-7 nm were synthesized by thermal decomposition of the respective rare-earth stearate. The oleic acid on the surface of the UCNPs was then replaced by aptamer DNA."

Our news journalists obtained a quote from the research from Fujian Medical University, "The assay was performed in a microplate format with a capture probe immobilized in the wells. Following binding of the vascular endothelial growth factor (VEGF), an auxiliary probe DNA is added that is labeled with UCNPs and binds to the VEGF-loaded capture probe. The method enables highly sensitive and highly specific detection of the VEGF which is a marker for breast cancer. Under the optimum conditions, the intensity of the upconversion luminescence (at excitation/emission wavelengths of 980/541 nm) is linearly proportional to the VEGF concentration in the 50 pM to 2000 pM concentration range, with a 6 pM detection limit."

According to the news editors, the research concluded: "The method was applied to the determination of VEGF in spiked serum, typically at a 500 pM level, and gave recoveries that ranged from 98 to 113 %, with RSDs between 2.9 and 3.6 %. This makes it a viable tool for early diagnosis of breast cancer."

For more information on this research see: Upconversion luminescence assay for the detection of the vascular endothelial growth factor, a biomarker for breast cancer. Microchimica Acta, 2016;183(12):3201-3208. Microchimica Acta can be contacted at: Springer Wien, Sachsenplatz 4-6, PO Box 89, A-1201 Wien, Austria. Studies from G. Carrick-Ranson et al in the Area of Clinical Trials and Studies Described (The effect of 1 year of Alagebrium and moderate-intensity exercise training on left ventricular function during exercise in seniors: a randomized ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news originating from Dallas, Texas, by NewsRx correspondents, research stated, "Sedentary aging leads to left ventricular (LV) and vascular stiffening due in part to advanced glycation end-products (AGEs) cross-linking of extracellular matrix proteins. Vigorous lifelong exercise ameliorates age-related cardiovascular (CV) stiffening and enhances exercise LV function, although this effect is limited when exercise is initiated later in life."

Financial support for this research came from National Institute of Health.

Our news journalists obtained a quote from the research, "We hypothesized that exercise training might be more effective at improving the impact of age-related CV stiffening during exercise when combined with an AGE cross-link breaker (Alagebrium). Sixty-two seniors (>= 60 yr) were randomized into four groups: sedentary + placebo, sedentary + Alagebrium, exercise + placebo, and exercise + Alagebrium for 1 yr. Moderate-intensity aerobic exercise was performed 3-4 sessions/wk; controls underwent similar frequency of yoga/balance training. Twenty-four similarly-aged, lifelong exercisers (4-5 sessions/wk) served as a comparator for the effect of lifelong exercise on exercising LV function. Oxygen uptake (Douglas bags), stroke index (SI; acetylene rebreathing), and effective arterial elastance (Ea) were collected at rest and submaximal and maximal exercise. Maximum O-2 uptake (23 +/- 5 to 25 +/- 6 ml.kg(-1).min(-1)) increased, while SI (35-11 to 39-12 ml/m(2)) and Ea (4.0-1.1 to 3.7 +/- 1.2 mmHg.ml(-1).m(-2)) were improved across all conditions with exercise, but remained unchanged in controls (exercise + time, P< 0.018). SI or Ea were not affected by Alagebrium (medication + time, P< 0.468) or its combination with exercise (interaction P< 0.252). After 1 yr of exercise plus Alagebrium, exercise SI and Ea remained substantially below that of lifelong exercisers (15-24 and 9-22%, respectively, P< 0.415)."

According to the news editors, the research concluded: "Alagebrium plus exercise had no synergistic effect on exercise LV function and failed to achieve levels associated with lifelong exercise, despite a similar exercise frequency."

For more information on this research see: The effect of 1 year of Alagebrium and moderate-intensity exercise training on left ventricular function during exercise in seniors: a randomized controlled trial. *Journal of Applied Physiology*, 2016;121(2):528-536. *Journal of Applied Physiology* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

The news correspondents report that additional information may be obtained from B.D. Levine, Texas Hlth Presbyterian, Inst Exercise & Environm Med, Dallas, TX, United States. Gram-Positive Bacteria - Clostridium difficile

Studies from G. Merlo and Colleagues Reveal New Findings on Clostridium difficile (Economic evaluation of fecal microbiota transplantation for the treatment of recurrent Clostridium difficile infection in Australia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Positive Bacteria - Clostridium difficile are presented in a new report. According to news reporting originating from Brisbane, Australia, by NewsRx correspondents, research stated, "Clostridium difficile is the most common cause of hospital-acquired diarrhea in Australia. In 2013, a randomized controlled trial demonstrated the effectiveness of fecal microbiota transplantation (FMT) for the treatment of recurrent Clostridium difficile infection (CDI)."

Our news editors obtained a quote from the research, "The aim of this study is to evaluate the cost-effectiveness of fecal microbiota transplantation-via either nasoduodenal or colorectal delivery-compared with vancomycin for the treatment of recurrent CDI in Australia. A Markov model was developed to compare the cost-effectiveness of fecal microbiota transplantation compared with standard antibiotic therapy. A literature review of clinical evidence informed the structure of the model and the choice of parameter values. Clinical effectiveness was measured in terms of quality-adjusted life years. Uncertainty in the model was explored using probabilistic sensitivity analysis. Both nasoduodenal and colorectal FMT resulted in improved quality of life and reduced cost compared with vancomycin. The incremental effectiveness of either FMT delivery compared with vancomycin was 1.2 (95% CI: 0.1, 2.3) quality-adjusted life years, or 1.4 (95% CI: 0.4, 2.4) life years saved. Treatment with vancomycin resulted in an increased cost of AU$4094 (95% CI: AU$26, AU$8161) compared with nasoduodenal delivery of FMT and AU$4045 (95% CI: -AU$33, AU$8124) compared with colorectal delivery. The mean difference in cost between colorectal and nasoduodenal FMT was not significant."

According to the news editors, the research concluded: "If FMT, rather than vancomycin, became standard care for recurrent CDI in Australia, the estimated national healthcare savings would be over AU$4000 per treated person, with a substantial increase in quality of life."

Oncology - Urothelial Cancer

Studies from G. Sonpavde and Colleagues Provide New Data on Urothelial Cancer (Impact of Prior Platinum-Based Therapy on Patients Receiving Salvage Systemic Treatment for Advanced Urothelial Carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Urothelial Cancer are discussed in a new report. According to news reporting originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "Prior platinum-versus non-platinum-based chemotherapy did not affect survival after controlling for major prognostic factors in patients receiving salvage systemic chemotherapy for advanced urothelial carcinoma. Exposure to prior platinum therapy should not be required for the inclusion of patients in trials of salvage systemic therapy."

Our news editors obtained a quote from the research, "Trials of salvage therapy for advanced urothelial carcinoma have required prior platinum-based therapy. This practice requires scrutiny because non-platinum-based first-line therapy may be offered to cisplatin-ineligible patients. Data of patients receiving salvage systemic chemotherapy were collected. Data on prior first-line platinum exposure were required in addition to treatment-free interval, hemoglobin, Eastern Cooperative Oncology Group performance status, albumin, and liver metastasis status. Cox proportional hazard regression was used to evaluate their association with overall survival (OS) after accounting for salvage single-agent or combination chemotherapy. Data were obtained from 455 patients previously exposed to platinum-based therapy and 37 not exposed to platinum. In the group exposed to prior platinum therapy, salvage therapy consisted of a single agent taxane (n = 184) or a taxane-containing combination chemotherapy (n = 271). In the group not exposed to prior platinum therapy, salvage therapy consisted of taxane or vinflunine (n = 20), 5-fluorouracil (n = 1), taxane-containing combination chemotherapy (n = 12), carboplatin-based combinations (n = 2), and cisplatin-based combinations (n = 2). The median OS for the prior platinum therapy group was 7.8 months (95% confidence interval, 7.0, 8.1), and for the group that had not received prior platinum therapy was 9.0 months (95% confidence interval, 6.0, 11.0; P = .50). In the multivariable analysis, prior platinum therapy versus no prior platinum exposure did not confer an independent impact on OS (hazard ratio, 1.10; 95% confidence interval, 0.75, 1.64; P = .62). Prior platinum-versus non-platinum-based chemotherapy did not have a prognostic impact on OS after accounting for major prognostic factors in patients receiving salvage systemic chemotherapy for advanced urothelial carcinoma."
According to the news editors, the research concluded: "Lack of prior platinum therapy should not disqualify patients from inclusion onto trials of salvage therapy."

For more information on this research see: Impact of Prior Platinum-Based Therapy on Patients Receiving Salvage Systemic Treatment for Advanced Urothelial Carcinoma. *Clinical Genitourinary Cancer*, 2016;14(6):494-498. *Clinical Genitourinary Cancer* can be contacted at: Cig Media Group, Lp, 3500 Maple Avenue, Ste 750, Dallas, TX 75219-3931, USA. **Heart Disorders and Diseases - Heart Attack**

**Studies from G.A. Westphal and Co-Researchers Yield New Data on Heart Attack (The effect of brain death protocol duration on potential donor losses due to cardiac arrest)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Attack is now available. According to news reporting out of Joinville, Brazil, by NewsRx editors, research stated, "The severe inflammatory reaction that occurs after brain death (BD) tends to amplify over time, contributing to cardiovascular deterioration and occurrence of cardiac arrest (CA). Our purpose is to evaluate the effect of BD protocol duration (BDPD) on potential donor losses due to CA."

Our news journalists obtained a quote from the research, "This retrospective analysis included potential donors reported during the period from May 2012 to April 2014. The risk of losses due to CA was analyzed to identify the chronological threshold at which the probability of loss due to CA increases. Three hundred and eighty four potential donors were analyzed. There was a greater chance of CA after a 30 hour threshold (OR 1.67, 95% CI: 1.38-1.83), and the lowest risk of was identified for the range from 12 to 30 hours (OR 0.32, 95% CI: 0.19-0.52). Multivariate analysis identified the following variables as being associated with lower occurrence of CA: BDPD between 12 and 30 hours, management of a potential donor inside the intensive care unit, and the adherence to a goal directed protocol."

According to the news editors, the research concluded: "A long duration between the first clinical test for BD diagnosis and the procurement of organs may be an important risk factor for the occurrence of cardiac arrest in deceased potential donors."

Our news journalists report that additional information may be obtained by contacting G.A. Westphal, Univ Regiao Joinville, Joinville, SC, Brazil. Additional authors for this research include T.A. Slaviero, A. Montemezzo, G.T. Lingiardi, F.C.C. de Souza, T.C. Carnin, D.R. Soares, A.H. Hachiya, L.L. Ferraz and J. de Andrade.

**Drugs and Therapies - Chemotherapy**

**Studies from G.Y. Lin and Co-Researchers Update Current Data on Chemotherapy (The Antimicrobial Peptides P-113Du and P-113Tri Function against Candida albicans)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Chemotherapy. According to news reporting originating from Hsinchu, Taiwan, by NewsRx correspondents, research stated, "Two antimicrobial P-113 peptide derivatives, P-113Du and P-113Tri, were investigated in this study."

Financial supporters for this research include General Biologicals Corporation, Ministry of Science and Technology, Taiwan (MOST).

Our news editors obtained a quote from the research, "Notably, P-113Du and P-113Tri contained significant fractions of alpha-helix conformation and were less sensitive to high salt and low pH than P-113. Moreover, compared to P-113, these peptides exhibited increased antifungal activity against planktonic cells, biofilm cells, and clinical isolates of Candida albicans and non-albicans Candida spp."

According to the news editors, the research concluded: "These results suggest that P-113Du and P-113Tri are promising candidates for development as novel antifungal agents."

The news editors report that additional information may be obtained by contacting W.C. Cheng, Gen Biol Corp, Hsinchu, Taiwan. Additional authors for this research include H.F.
Studies from Gabriele d'Annunzio University in the Area of Pharmaceutical Research Reported [Immobilization and delivery of biologically active Lipoxin A(4) using electrospinning technology]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Pharmaceutical Research are presented in a new report. According to news reporting originating in Chieti, Italy, by NewsRx journalists, research stated, "Lipoxin (LXA(4)) is a lipoxygenase-formed arachidonic acid metabolite with potent anti-inflammatory, pro-resolution properties. Its therapeutic efficacy has been largely demonstrated in a variety of cellular, preclinical and clinical models."

The news reporters obtained a quote from the research from Gabriele d'Annunzio University, "Among these, periodontal disease, where LXA(4) promotes tissue repair, also by modulating functions of human periodontal ligament stem cells (hPDLSCs). As medicated biomembranes may be particularly useful in clinical settings, where local stimulation of tissue repair is needed, we used electrospinning to embed LXA(4) in membranes made of poly (ethylene oxide) (PEO) and poly(D, L-lactide) (PDLLA). These membranes were fully characterized by scanning electron microscopy, differential scanning calorimetry and biocompatibility with hPDLSCs. Here, we report that LXA(4) is retained in these membranes and that similar to 15-20% of the total LXA(4) amount added to the reaction can be eluted from the membranes using an aqueous buffered medium. The eluted LXA(4) fully retained its capability to stimulate hPDLSC proliferation. A similar effect was obtained by adding directly the LXA(4)-containing membranes to cells."

According to the news reporters, the research concluded: "These results demonstrate for the first time that LXA(4) can be incorporated into biomembranes, which may be useful to combat local inflammation and promote tissue repair in selected clinical settings."

Our news correspondents report that additional information may be obtained by contacting M. Romano, G D'Annunzio Univ Chieti Pescara, Center Aging Sci & Translat Med CeSI MeT, Chieti, Italy. Additional authors for this research include O. Trubiani, F. Diomede, I. Merciaro, I. Meschini, P. Bruni, F. Croce and M. Romano.

Studies from Gachon University Add New Findings in the Area of Hypertriglyceridemia (Hypertriglyceridemia and Cardiovascular Diseases: Revisited)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Hypertriglyceridemia are presented in a new report. According to news originating from Incheon, South Korea, by NewsRx correspondents, research stated, "Residual cardiovascular risk and failure of high density lipoprotein cholesterol raising treatment have refocused interest on targeting hypertriglyceridemia. Hypertriglyceridemia, triglyceride-rich lipoproteins, and remnant cholesterol have demonstrated to be important risk factors for cardiovascular disease; this has been demonstrated in experimental, genetic, and epidemiological studies."

Our news journalists obtained a quote from the research from Gachon University, "Fibrates can reduce cardiovascular event rates with or without statins. High dose omega-3 fatty acids continue to be evaluated and new specialized targeting treatment modulating triglyceride pathways, such as inhibition of apolipoprotein C-III and angiopoietin-like proteins, are being tested with regard to their effects on lipid profiles and cardiovascular outcomes."

According to the news editors, the research concluded: "In this review, we will discuss the role of hypertriglyceridemia, triglyceride-rich lipoproteins and remnant cholesterol on cardiovascular disease, and the potential implications for treatment targeting hypertriglyceridemia."

For more information on this research see: Hypertriglyceridemia and Cardiovascular Diseases: Revisited. *Korean Circulation Journal*, 2016;46(2):135-44.

The news correspondents report that additional information may be obtained from S.H. Han, Dept. of Cardiology, Gachon University Gil Medical Center, Incheon, South Korea. Additional authors for this research include S.J. Nicholls, I. Sakuma, D. Zhao and K.K Koh.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4070/kcj.2016.46.2.135. This DOI is a link to an online electronic document that is either free or for purchase.

Immune System Diseases and Conditions - Severe...

Studies from Gadjah Mada University Have Provided New Data on Severe Combined Immunodeficiency (Follicular growth after xenotransplantation of cryopreserved/thawed human ovarian tissue in SCID mice: dynamics and molecular aspects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - Severe Combined Immunodeficiency. According to news originating from Yogyakarta, Indonesia, by NewsRx correspondents, research stated, "To study the influence of xenotransplantation on follicular recruitment and growth in cryopreserved/thawed human ovarian tissue. Two 3-mm pieces of cryopreserved/thawed human ovarian tissue obtained from female cancer patients (n = 11) were xenotransplanted into a subcutaneous neck pouch of 6-week-old ovariectomized SCID mice (n = 33) for 4 (n = 18) and 12 (n = 15) weeks."

Financial support for this research came from Tyrolean Research Foundation. Our news journalists obtained a quote from the research from Gadjah Mada University, "Thirty-two out of 33 mice survived the entire observation periods. Graft recovery rate was 95.58 % (65 of 68 grafts). The percentages of primordial follicles after 4 weeks (P < 0.001) and 12 weeks (P = 0.009) of grafting were significantly lower in comparison to pregraft controls. The percentage of secondary follicle was significantly higher after 4 weeks of grafting (P = 0.018) and after 12 weeks (P = 0.001) of grafting in comparison to pregraft controls. Ki67 immunohistochemistry showed that proliferative follicles were significantly higher after 4 and 12 weeks of grafting compared to pregraft controls (P < 0.001). All follicles analyzed by TUNEL staining appeared healthy after xenotransplantation. The expression level of PTEN was reduced by 2.47-fold after 4 weeks of xenotransplantation, and this result was significant when 2 (-Delta Ct) were analyzed (P = 0.042)."

According to the news editors, the research concluded: "The higher proportion of growing follicles compared to resting follicles observed after xenotransplantation is most likely due to downregulation of PTEN gene expression followed by acceleration of follicular recruitment."

The news correspondents report that additional information may be obtained from S. Ayuandari, Gadjah Mada Univ, Dept. of Obstet & Gynecol, Fac Med, Yogyakarta 55281, Indonesia. Additional authors for this research include K. Winkler-Crepaz, M. Paulitsch, C. Wagner, C. Zavadil, C. Manzl, S.C. Ziehr, L. Wildt and S. Hofer-Tollinger.

Biological Factors - Inflammation Mediators

Studies from Genentech, Inc. Further Understanding of Inflammation Mediators (G-rich DNA-induced stress response blocks type-I-IFN but not CXCL10 secretion in monocytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Biological Factors - Inflammation Mediators is now available. According to news reporting out of San Francisco, California, by NewsRx editors, research stated, "Excessive inflammation can cause damage to host cells and tissues. Thus, the secretion of inflammatory cytokines is tightly regulated at transcriptional, post-transcriptional and post-translational levels and influenced by cellular stress responses, such as endoplasmic reticulum (ER) stress or apoptosis."

Our news journalists obtained a quote from the research from Genentech, Inc., "Here, we describe a novel type of post-transcriptional regulation of the type-I-IFN response that was induced in monocytes by cytosolic transfection of a short immunomodulatory DNA (imDNA), a G-tetrad forming CpG-free derivative of the TLR9 agonist ODN2216. When co-transfected with cytosolic nucleic acid stimuli (DNA or 3P-dsRNA), imDNA induced caspase-3 activation, translational shutdown and upregulation of stress-induced genes. This stress response inhibited the type-I-IFN induction at the translational level. By contrast, the induction of most type-I-IFN-associated chemokines, including Chemokine (C-X-C Motif) Ligand (CXCL) 10 was not affected, suggesting a differential translational regulation of chemokines and type-I-IFN. Pan-caspase inhibitors could restore IFN-beta secretion, yet, strikingly, caspase inhibition did not restore global translation but instead induced a compensatory increase in the transcription of IFN-beta but not CXCL10."

According to the news editors, the research concluded: "Altogether, our data provide evidence for a differential regulation of cytokine release at both transcriptional and post-transcriptional levels which suppresses type-I-IFN induction yet allows for CXCL10 secretion during imDNA-induced cellular stress."

For more information on this research see: G-rich DNA-induced stress response blocks type-I-IFN but not CXCL10 secretion in monocytes. Scientific Reports, 2016;6():1-16. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Parkinson's Disease

Studies from General Hospital Add New Findings in the Area of Parkinson's Disease (Oral Inosine Persistently Elevates Plasma antioxidant capacity in Parkinson's disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Parkinson's disease are discussed in a new report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Higher serum urate predicts slower progression in PD. The aim of this work was to assess whether oral inosine alters antioxidant capacity of plasma or CSF or urinary markers of oxidative injury in early PD."

Funders for this research include Michael J. Fox Foundation for Parkinson's Research, Department of Defense, Granite State Development, Harvard NeuroDiscovery Center.

Our news journalists obtained a quote from the research from General Hospital, "We assayed plasma and CSF antioxidant capacity by ferric-reducing antioxidant power and measured DNA oxidation adduct 8-hydroxydeoxyguanosine from urine in Safety of URate Elevation in PD, a randomized, placebo-controlled trial of oral inosine assessing safety of elevating serum urate from <6 mg/dL to 6.1-7.0 or 7.1-8.0 mg/dL in patients with early PD. At 6 months, antioxidant capacity was 29% higher among mild and 43% higher among moderate group participants compared to placebo and correlated with change in serum urate (r=0.86) and inversely with rate of clinical decline (r=-0.26). CSF antioxidant capacity and urine 8-hydroxydeoxyguanosine did not differ."

According to the news editors, the research concluded: "The findings demonstrate a dose-dependent, persistent elevation of plasma antioxidant capacity from oral inosine of potential therapeutic relevance."

The news correspondents report that additional information may be obtained from S. Bhattacharyya, Dept. of Neurology, Molecular Neurobiology Lab, Massachusetts General Hospital, Boston, Massachusetts, United States. Additional authors for this research include R. Bakshi, R. Logan, A. Ascherio, E.A. Macklin and M.A. Schwarzschild.

Chemistry - Clinical Biochemistry

Studies from General Hospital Further Understanding of Clinical Biochemistry (The evidence for clinically significant bias in plasma glucose between liquid and lyophilized citrate buffer additive)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Chemistry - Clinical Biochemistry is the subject of a report. According to news reporting originating from Pula, Croatia, by NewsRx correspondents, research stated, "Citrate buffer additive has been suggested to be of supreme performance in inhibiting glycolysis. However, there is little evidence in the literature regarding the comparability of glucose concentrations in liquid and lyophilized citrate buffer containing tubes."

Financial support for this research came from Ministry of Science, Education, and Sports, Republic of Croatia.

Our news editors obtained a quote from the research from General Hospital, "The aim of this study was to compare glucose concentrations in tubes containing liquid (Glucomedics) and lyophilized citrate buffer (Terumo VENOSAFE™ Glycemia) additive, measured immediately after centrifugation. Blood was collected from forty volunteers into both Glucomedics and Venosafe Glycemia tubes. Blood was centrifuged within 15 min from venipuncture and glucose concentration was measured immediately after centrifugation, on the Abbott Architect analyzer. Differences between glucose concentrations in Glucomedics and Terumo tubes were tested using the paired t-test. Mean bias was calculated and compared to recommended quality specification for glucose (i.e. 2.2%). Glucose concentration in Terumo tubes was 3.4% lower than in Glucomedics tubes (P < 0.001). The mean bias was clinically significant. There is a clinically significant difference between glucose concentrations in liquid and lyophilized citrate buffer additive tubes (Glucomedics vs. Terumo tubes) measured immediately after centrifugation."

According to the news editors, the research concluded: "This difference may affect the patient outcome due to the misclassification of diabetes."

For more information on this research see: The evidence for clinically significant bias in plasma glucose between liquid and lyophilized citrate buffer additive. Clinical Biochemistry, 2016;49(18):1402-1405. Clinical Biochemistry can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. Studies from George Washington University Yield New Data on Pruritus (Dose-response of intrathecal morphine when administered with intravenous ketorolac for post-cesarean analgesia: a two-center, prospective, randomized, blinded trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Skin Diseases and Conditions - Pruritus is the subject of a report. According to news reporting out of Washington, District of Columbia, by NewsRx editors, research stated, "The appropriate dose of intrathecal morphine for post-cesarean analgesia is unclear. With the inclusion of routine non-steroidal anti-inflammatory drugs, the required dose of morphine may be significantly less than the 200-300 ug common a decade ago."

Our news journalists obtained a quote from the research from George Washington University, "We performed a two-center, prospective, randomized, blinded trial comparing three doses of intrathecal morphine, combined with routine intravenous ketorolac, in 144 healthy women undergoing elective cesarean delivery. Patients received an intrathecal injection of hyperbaric bupivacaine 12 mg, fentanyl 15 mu g and a randomized dose of 50, 100, or 150 mu g morphine in a volume of 2.2 mL. Patients received intravenous ketorolac 30 mg before leaving the operating room and 15 mg intravenously every 6 h for the duration of the study (24 h). All received postoperative patient-controlled intravenous morphine. The primary endpoint was total intravenous morphine administered postoperatively over 24 h, analyzed using mixed model regression. There were no differences between dose groups (or institutions) in intravenous morphine use over 24 h. Visual analog scale scores for pain and nausea did not differ. Pruritus was greater in the 100 and 150 mu g groups than the 50 mu g group at 6 h and 12 h, but there was no difference between groups in nausea or pruritus treatments. Respiratory depression or significant sedation did not occur."

According to the news editors, the research concluded: "The dose response relationship of intrathecal morphine for multimodal post-cesarean analgesia suggests that 50 mu g produces analgesia similar to that produced by either 100 mu g or 150 mu g."

Studies from Georgetown University Further Understanding of Breast Cancer (Metabolomic profiling of breast tumors using ductal fluid)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting out of Washington, District of Columbia, by NewsRx editors, research stated, "Identification of new biomarkers for breast cancer remains critical in order to enhance early detection of the disease and improve its prognosis. Towards this end, we performed an untargeted metabolomic analysis of breast ductal fluid using an ultra-performance liquid chromatography coupled with a quadrupole time-of-flight (UPLC-QTOF) mass spectrometer."

Our news journalists obtained a quote from the research from Georgetown University, "We investigated the metabolomic profiles of breast tumors using ductal fluid samples collected by ductal lavage (DL). We studied fluid from both the affected breasts and the unaffected contralateral breasts (as controls) from 43 women with confirmed unilateral breast cancer. Using this approach, we identified 1560 ions in the positive mode and 538 ions in the negative mode after preprocessing of the UPLC-QTOF data. Paired t-tests applied on these data matrices identified 209 ions (positive and negative modes combined) with significant change in intensity level between affected and unaffected control breasts (adjusted P-values <0.05). Among these, 83 ions (39.7%) showed a fold change (FC) >1.2 and 66 ions (31.6%) were identified with putative compound names. The metabolites that we identified included endogenous metabolites such as amino acid derivatives (N-Acetyl-DLtryptophan) or products of lipid metabolism such as N-linoleoyl taurine, trans-2-dodecenoylcarnitine, lysophosphatidylcholine LysoPC(18:2(9Z,12Z)), glycerophospholipids PG(18:0/0:0), and phosphatidylserine PS(20:4(5Z,8Z,11Z,14Z). Generalized LASSO regression further selected 21 metabolites when race, menopausal status, smoking, grade and TNM stage were adjusted for. A predictive conditional logistic regression model, using the LASSO selected 21 ions, provided diagnostic accuracy with the area under the curve of 0.956 (sensitivity/specificity of 0.907/0.884)."

According to the news editors, the research concluded: "This is the first study that shows the feasibility of conducting a comprehensive metabolomic profiling of breast tumors using breast ductal fluid to detect changes in the cellular microenvironment of the tumors and shows the potential for this approach to be used to improve detection of breast cancer."

Oncology - Breast Cancer

Studies from Georgia College and State University Update Current Data on Breast Cancer (Effects of resistance exercise in women with or at risk for breast cancer-related lymphedema)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news originating from Milledgeville, Georgia, by NewsRx correspondents, research stated, "Breast cancer survivors (BCS) have been told in the past to avoid strenuous repetitive activities in order to decrease the risk of lymphedema development. Recent evidence suggests that exercise may be beneficial to decrease the signs/symptoms and development of lymphedema."

Our news journalists obtained a quote from the research from Georgia College and State University, "This study assessed the arm circumferences of 27 BCS (64 +/- A 7 years) at baseline and every 2 weeks thereafter during a 6-month resistance exercise training (RT) intervention. RT consisted of 2 days/week of 10 exercises including two sets of 8-12 repetitions at 52-69 % of the participants' one-repetition maximum. A repeated measure analysis of variance revealed no significant changes in percent difference of arm circumferences at any assessment point (pre, 1.31 +/- A 6.21 %; post, 0.62 +/- A 6.55 %), nor were there any adverse lymphedema-related events reported during the study."

According to the news editors, the research concluded: "These findings imply that RT can be a safe activity for women with or at risk for breast cancer-related lymphedema."

For more information on this research see: Effects of resistance exercise in women with or at risk for breast cancer-related lymphedema. Supportive Care in Cancer, 2017;25(1):9-15. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Supportive Care in Cancer - www.springerlink.com/content/0941-4355/)

The news correspondents report that additional information may be obtained from E. Simonavice, Georgia College & State University, Sch Hlth & Human Performance, Milledgeville, GA 31061, United States. Additional authors for this research include J.S. Kim and L. Panton.

Hematologic Diseases and Conditions...

Studies from German Cancer Consortium Update Current Data on Myelodysplastic Syndromes [Mammalian-target of rapamycin inhibition with temsirolimus in myelodysplastic syndromes (MDS) patients is associated with considerable toxicity: results of ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematologic Diseases and Conditions - Myelodysplastic Syndromes have been published. According to news reporting originating in Dresden, Germany, by NewsRx journalists, research stated, "The mammalian-target of rapamycin (also termed mechanistic target of rapamycin, mTOR) pathway integrates various pro-proliferative and anti-apoptotic stimuli and is involved in regulatory T-cell (TREG) development. As these processes contribute to the pathogenesis of myelodysplastic syndromes (MDS), we hypothesized that mTOR modulation with temsirolimus (TEM) might show activity in MDS."

Funders for this research include Pfizer Pharma, German J. Carreras Foundation.

The news reporters obtained a quote from the research from German Cancer Consortium, "This prospective multicentre trial enrolled lower and higher risk MDS patients, provided that they were transfusion-dependent/neutropenic or relapsed/refractory to 5-azacitidine, respectively. All patients received TEM at a weekly dose of 25mg. Of the 9 lower- and 11 higher-risk patients included, only 4 (20%) reached the response assessment after 4 months of treatment and showed stable disease without haematological improvement. The remaining patients discontinued TEM prematurely due to adverse events. Median overall survival (OS) was not reached in the lower-risk group and 296 days in the higher-risk group. We observed a significant decline of bone marrow (BM) vascularisation (P=0.006) but were unable to demonstrate a significant impact of TEM on the balance between TREG and pro-inflammatory T-helper-cell subsets within the peripheral blood or BM."

According to the news reporters, the research concluded: "We conclude that mTOR-modulation with TEM at a dose of 25mg per week is accompanied by considerable toxicity and has no beneficial effects in elderly MDS patients."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bjh.14345. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from Ghent University Have Provided New Data on Musculoskeletal Disorders (Loss of Type I Collagen Telopeptide Lysyl Hydroxylation Causes Musculoskeletal Abnormalities in a Zebrafish Model of Bruck Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Disorders have been published. According to news reporting from Ghent, Belgium, by NewsRx journalists, research stated, "Bruck syndrome (BS) is a disorder characterized by joint flexion contractures and skeletal dysplasia that shows strong clinical overlap with the brittle bone disease osteogenesis imperfecta (OI). BS is caused by biallelic mutations in either the FKBP10 or the PLOD2 gene."

The news correspondents obtained a quote from the research from Ghent University, "PLOD2 encodes the lysyl hydroxylase 2 (LH2) enzyme, which is responsible for the hydroxylation of lysine residues in fibrillar collagen telopeptides. This hydroxylation directs crosslinking of collagen fibrils in the extracellular matrix, which is necessary to provide stability and tensile integrity to the collagen fibrils. To further elucidate the function of LH2 in vertebrate skeletal development, we created a zebrafish model harboring a homozygous plod2 nonsense mutation resulting in reduced telopeptide hydroxylation and crosslinking of bone type I collagen. Adult plod2 mutants present with a shortened body axis and severe skeletal abnormalities with evidence of bone fragility and fractures. The vertebral column of plod2 mutants is short and scoliotic with compressed vertebrae that show excessive bone formation at the vertebral end plates, and increased tissue mineral density in the vertebral centra. The muscle fibers of mutant zebrafish have a reduced diameter near the horizontal myoseptum. The endomysium, a layer of connective tissue ensheathing the individual muscle fibers, is enlarged. Transmission electron microscopy of mutant vertebral bone shows type I collagen fibrils that are less organized with loss of the typical plywood-like structure."

According to the news reporters, the research concluded: "Plod2 mutant zebrafish show molecular and tissue abnormalities in the musculoskeletal system that are concordant with clinical findings in BS patients. Therefore, the plod2 zebrafish mutant is a promising model for the elucidation of the underlying pathogenetic mechanisms leading to BS and the development of novel therapeutic avenues in this syndrome."

Our news journalists report that additional information may be obtained by contacting A. Willaert, University of Ghent, Center Med Genet Ghent, B-9000 Ghent, Belgium. Additional authors for this research include P.E. Witten, A. Huysseune, S. Symoens, F. Malfait,
Oncology - Cancer Care

Studies from Ghent University in the Area of Cancer Care Described (Hope dies last ... A qualitative study into the meaning of hope for people with cancer in the palliative phase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cancer Care. According to news reporting out of Ghent, Belgium, by NewsRx editors, research stated, "Palliative patients may have strong hope, even hope for a cure, despite knowing their prognosis. Health professionals do not always understand patients who have this kind of hope."

Our news journalists obtained a quote from the research from Ghent University, "The aim of this article was to explore the meaning of hope among patients with cancer in the palliative phase. A secondary analysis was conducted including a constant comparative analysis to uncover the processes underlying the maintenance of hope, of previously collected interview data (n = 76). The meaning of hope is related to the importance of the object it is attached to, rather than to a real chance of achieving this object. Hope has a dual function: patients hope because they cannot forsake it and because they benefit so much from it. Hope can spring from many sources and is influenced by various factors. If there are fewer potent sources to tap into, people create hope themselves and this type of self-created hope takes more effort to maintain. Patients use different strategies to increase their hope, described as the 'the work of hope'. A better understanding of the work of hope can lead to better psychosocial support by health professionals."

According to the news editors, the research concluded: "Health professionals convey many messages that affect the work of hope."

Our news journalists report that additional information may be obtained by contacting C.N. Van Baalen, University of Ghent, University Hospital, Dept. of Public Hlth, Ghent, Belgium. Additional authors for this research include M. Grypdonck, A. Van Hecke and S. Verhaeghe.

Keywords for this news article include: Ghent, Belgium, Europe, Cancer Care, Oncology, Cancer, Ghent University.

Membrane Proteins - Vesicular Transport Proteins

Studies from Gifu Pharmaceutical University in the Area of Vesicular Transport Proteins Described (Hypotonic Stress-induced Down-regulation of Claudin-1 and-2 Mediated by Dephosphorylation and Clathrin-dependent Endocytosis in Renal Tubular ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Membrane Proteins - Vesicular Transport Proteins is the subject of a report. According to news originating from Gifu, Japan, by NewsRx correspondents, research stated, "Hypotonic stress decreased claudin-1 and-2 expression levels in renal tubular epithelial HK-2 and Madin-Darby canine kidney cells. Here, we examined the regulatory mechanism involved in this decrease."

Our news journalists obtained a quote from the research from Gifu Pharmaceutical University, "The hypotonicity-induced decrease in claudin expression was inhibited by the following: SB202190, a p38 MAPK inhibitor, but not by U0126, a MEK inhibitor; Go6983, a protein kinase C inhibitor; or SP600125, a Jun N-terminal protein kinase inhibitor. Hypotonic stress increased transepithelial electrical resistance, which was inhibited by SB202190. The mRNA expression level of claudin-1 was decreased by hypotonic stress but that of claudin-2 was not. Hypotonic stress decreased the protein stability of claudin-1 and-2. The hypotonicity-induced decrease in claudin expression was inhibited by the following: chloroquine, a lysosome inhibitor; dynasore and monodansylcadaverine, clathrin-dependent endocytosis inhibitors; and siRNA against clathrin heavy chain. Claudin-1 and-2 were mainly distributed in the cytosol and tight junctions (TJs) in the chloroquine- and monodansylcadaverine-treated cells, respectively. Hypotonic stress decreased the phosphorylation levels of claudin-1 and-2, which were inhibited by the protein phosphatase inhibitors okadaic acid and cantharidin. Dephosphorylated mutants of claudin-1 and-2 were mainly distributed in the cytosol, which disappeared in response to hypotonic stress. In contrast, mimicking phosphorylatkin mutants were distributed in the TJs, which were not decreased by hypotonic stress."

According to the news editors, the research concluded: "We suggest that hypotonic stress induces dephosphorylation, clathrin-dependent endocytosis, and degradation of claudin-1 and-2 in lysosomes, resulting in disruption of the TJ barrier in renal tubular epithelial cells."

The news correspondents report that additional information may be obtained from A. Ikari, Gifu Pharmaceut Univ, Dept. of Biopharmaceut Sci, Biochem Lab, Gifu 5011196, Japan. Additional authors for this research include Y. Matsuo, T. Matsunaga, S. Endo, H. Sakai, M. Yamaguchi, Y. Yarnazaki, J. Sugatani and A. Ikari.

Keywords for this news article include: Gifu, Japan, Asia, Vesicular Transport Proteins, Enzymes and Coenzymes, Membrane Proteins, Epithelial Cells, Endocytosis, Nephrology, Genetics, Clathrin, Kinase, Kidney, Gifu Pharmaceutical University.

Gram-Negative Bacteria - Neisseria gonorrhoeae

Studies from Gifu University Hospital Have Provided New Information about Neisseria gonorrhoeae (Remarkable increase of Neisseria gonorrhoeae with decreased susceptibility of azithromycin and increase in the failure of azithromycin therapy in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Neisseria gonorrhoeae have been published. According to news reporting out of Gifu, Japan, by NewsRx editors, research stated, "The antimicrobial resistance of Neisseria gonorrhoeae is a serious problem worldwide. In this study, we examined the susceptibility of N. gonorrhoeae isolated from male gonococcal urethritis in Sendai in 2014 and 2015."

Our news journalists obtained a quote from the research from Gifu University Hospital, "Furthermore, of all cases, we investigated the clinical efficacy of a single 2-g dose of extended-release azithromycin (AZM-SR) in the treatment of male gonococcal urethritis retrospectively. Sixty N. gonorrhoeae strains in 2014 and 54 strains in 2015 were isolated from male gonococcal urethritis and stored each year. The MIC of AZM was >= 1 mg/L in 4 strains (6.7%) in 2014 and in 13 strains (24.1%) in 2015 and the number of strains having >= 1 mg/L MIC increased significantly (P = 0.016). Microbiological efficacy was evaluated in 32 and 29 of these patients, and the rates of treatment success were 93.8% and 79.3%, respectively. All of the treatment failures were caused by strains having a MIC of AZM of >= 0.5 mg/L. In particular, the increase in the isolates having a MIC of AZM of >= 1 mg/L was remarkable. Therefore, it was thought that the increase in these strains was the reason for the increase in treatment failures in 2015. Because no other drug is effective, it is currently necessary to use AZM-SR to treat gonococcal infections caused by ceftriaxone-resistant strains or patients allergic to ceftriaxone."

According to the news editors, the research concluded: "To prevent a further increase in resistance to AZM, we should not use AZM-SR to treat normal cases of gonococcal infection."

For more information on this research see: Remarkable increase of Neisseria gonorrhoeae with decreased susceptibility of azithromycin and increase in the failure of azithromycin therapy in male gonococcal urethritis in Sendai in 2015. Journal of Infection and Chemotherapy, 2016;22(12):841-843. Journal of Infection and Chemotherapy can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Studies from Gilead Sciences Inc. Reveal New Findings on Antiretrovirals (Pharmacokinetics and Safety of Tenofovir Alafenamide in HIV-Uninfected Subjects with Severe Renal Impairment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiretrovirals have been published. According to news reporting originating from Foster City, California, by NewsRx correspondents, research stated, "Tenofovir alafenamide (TAF) is an oral prodrug of tenofovir (TFV) that has greater stability in plasma than TFV disoproxil fumarate (TDF) and circulates as intact TAF, resulting in the direct and higher lymphatic loading of and exposure to TFV diphosphate, the active moiety. Unlike TFV, TAF is minimally eliminated in urine."

Financial support for this research came from Gilead Sciences (Gilead).

Our news editors obtained a quote from the research from Gilead Sciences Inc., "The pharmacokinetics (PK) of TAF and TFV in HIV-uninfected subjects with severe renal impairment and matched healthy controls were evaluated. Subjects with severe renal impairment (RI; estimated glomerular filtration rate [eGFR], 15 to 29 ml/min) and controls (eGFR, >= 90 ml/min) matched for age, gender, and body mass index received a single dose of TAF at 25 mg. Blood and urine samples for TAF and TFV PK determinations were collected over 7 days postdosing, and subjects were followed up at 14 days. A total of 14 renally impaired subjects and 13 control subjects enrolled and completed the study. The TAF maximum observed concentration in plasma (C-max) and the area under the concentration-versus-time curve (AUC) extrapolated to infinite time (AUC(inf)) were 79% and 92% higher, respectively, in subjects with severe RI than the controls, primarily due to higher absorption. The TFV Cmax and AUCinf were 2.8-fold and 5.7-fold higher, respectively, in subjects with severe RI than the controls. In subjects with severe RI, TAF at 25 mg provided a TFV AUC 10 to 40% lower than that from historical TDF-based TFV exposures in subjects with normal renal function. There were no discontinuations due to adverse events. In subjects with severe RI receiving TAF at 25 mg, TAF exposures were higher than those for the controls; these differences are unlikely to be clinically meaningful."

According to the news editors, the research concluded: "TFV exposures were higher than those for the controls but lower than the exposures in nonrenally impaired subjects on TDF-based regimens."

For more information on this research see: Pharmacokinetics and Safety of Tenofovir Alafenamide in HIV-Uninfected Subjects with Severe Renal Impairment. Antimicrobial Agents and Chemotherapy, 2016;60(9):5135-5140. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Oncology - Glioblastomas

Studies from Government Medical College and Hospital Yield New Information about Glioblastomas (Concurrent therapy to enhance radiotherapeutic outcomes in glioblastoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Glioblastomas are presented in a new report. According to news reporting originating in Chandigarh, India, by NewsRx editors, the research stated, "Glioblastoma is one of the most fatal and incurable human cancers characterized by nuclear atypia, mitotic activity, intense microvascular proliferation and necrosis. The current standard of care includes maximal safe surgical resection followed by radiation therapy (RT) with concurrent and adjuvant temozolomide (TMZ)."

The news reporters obtained a quote from the research from Government Medical College and Hospital, "The prognosis remains poor with median survival of 14.6 months with RT plus TMZ. Majority will have a recurrence within 2 years from diagnosis despite adequate treatment. Radiosensitizers, radiotherapy dose escalation and altered fractionation have failed to improve outcome. The molecular biology of glioblastoma is complex and poses treatment challenges. High rate of mutation, genotypic and phenotypic heterogeneity, rapid development of resistance, existence of blood-brain barrier (BBB), multiple intracellular and intercellular signalling pathways, over-expression of growth factor receptors, angiogenesis and antigenic diversity renders the tumor cells differentially susceptible to various treatment modalities. Thus, the treatment strategies require personalised or individualized approach based on the characteristics of tumor. Several targeted agents have been evaluated in clinical trials but the results have been modest despite these advancements."

According to the news reporters, the research concluded: "This review summarizes the current standard of care, results of concurrent chemoradiation trials, evolving innovative treatments that use targeted therapy with standard chemoradiation or RT alone, outcome of various recent trials and future outlook."

For more information on this research see: Concurrent therapy to enhance radiotherapeutic outcomes in glioblastoma. Annals of Translational Medicine, 2016;4(3):54.

Our news correspondents report that additional information may be obtained by contacting D. Khosla, Dept. of Radiotherapy and Oncology, Government Medical College &
Studies from Graduate School of Biomedical Sciences Describe New Findings in Hematopoietic Stem Cells (Hematopoietic Stem Cells Count and Remember Self-Renewal Divisions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Stem Cell Research - Hematopoietic Stem Cells have been published. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "The ability of cells to count and remember their divisions could underlie many alterations that occur during development, aging, and disease. We tracked the cumulative divisional history of slow-cycling hematopoietic stem cells (HSCs) throughout adult life."

Financial support for this research came from NIH.

Our news journalists obtained a quote from the research from the Graduate School of Biomedical Sciences, "This revealed a fraction of rarely dividing HSCs that contained all the long-term HSC (LT- HSC) activity within the aging HSC compartment. During adult life, this population asynchronously completes four traceable symmetric self-renewal divisions to expand its size before entering a state of dormancy. We show that the mechanism of expansion involves progressively lengthening periods between cell divisions, with long-term regenerative potential lost upon a fifth division. Our data also show that age-related phenotypic changes within the HSC compartment are divisional history dependent."

According to the news editors, the research concluded: "These results suggest that HSCs accumulate discrete memory stages over their divisional history and provide evidence for the role of cellular memory in HSC aging."

For more information on this research see: Hematopoietic Stem Cells Count and Remember Self-Renewal Divisions. Cell, 2016;167(5):1296-1309,303-312. Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell - www.journals.elsevier.com/cell/)

Our news journalists report that additional information may be obtained by contacting K. Moore, Icahn Sch Med Mt Sinai, Grad Sch Biomed Sci, New York, NY 10029, United States. Additional authors for this research include H.S. Kim, B. MacArthur, H. Sieburg and K. Moore.

Studies from Graduate School of Decision Science and Technology

Further Understanding of Obesity (Effect of postprandial gum chewing on diet-induced thermogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "To examine the effect of postprandial gum chewing on diet-induced thermogenesis (DIT). Twelve healthy normal-weight males completed four trials on four different days."

Financial support for this research came from JSPS KAKENHI.

The news reporters obtained a quote from the research from the Graduate School of Decision Science and Technology, "They chewed a 621-kcal test meal for as long as possible and as many times as possible in the slow-eating trials, while they consumed the same meal as rapidly as possible in the rapid-eating trials. In the gum-chewing trials, they chewed a 3-kcal gum for 15 min after the meal. In the non-gum-chewing trials, they consumed 3 kcal of sugar with the test meal instead of chewing the gum. DIT was calculated based on the oxygen uptake, body mass, and postprandial increments in energy expenditure above the baseline as measured before each trial. DIT was significantly greater in the gum-chewing trials than in the non-gum-chewing trials for both rapid-eating and slow-eating trials. The difference in DIT between rapid-eating and slow-eating trials was greater than that between non-gum-chewing and gum-chewing trials."

According to the news reporters, the research concluded: "Postprandial gum chewing enhanced DIT, but the effect of gum chewing on DIT did not exceed that of slow eating when consuming a meal."

For more information on this research see: Effect of postprandial gum chewing on diet-induced thermogenesis. *Obesity*, 2016;24(4):878-85. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

Our news correspondents report that additional information may be obtained by contacting Y. Hamada, Graduate School of Decision Science and Technology, Tokyo Institute of Technology, Tokyo, Japan. Additional authors for this research include A. Miyaji and N. Hayashi.

Biphenyl Compounds

Studies from Guangdong Pharmaceutical University Reveal New Findings on Biphenyl Compounds (Simultaneous Determination of Hydrochlorothiazide and Losartan Potassium in Osmotic Pump Tablets by Microemulsion Liquid Chromatography)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biphenyl Compounds is the subject of a report. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "A rapid and efficient oil-in-water microemulsion liquid chromatographic (MELC) method has been optimized and validated for the determination of hydrochlorothiazide (HCT) and losartan potassium (LOP) in osmotic pump tablets. Samples were injected into a C-18 (150 mmx 4.6 mmID, 5 mu m particle size) analytical column, which was maintained at 30 degrees C. The most effective MELC system had a mobile phase consisting of 95% (v/v) of 3.0% (w/w) SDS, 6.0% (w/w) n-butanol, 0.8% (w/w) n-octane, 90.2% (w/w) water and 5% (v/v) acetonitrile (pH 5)."

The news correspondents obtained a quote from the research from Guangdong Pharmaceutical University, "The flow rate was 1.0 mL min(-1) and UV detection was performed at 265 nm. Linearity ranged from 2.5 to 12.5 mu g mL(-1) for HCT and 10.0-60.0 mu g mL(-1) for LOP (r > 0.999 for both drugs). The proposed method was rapid, precise (RSDs <1.4%) and accurate (98.9% recovery for HCT and 101% recovery for LOP)."

According to the news reporters, the research concluded: "It is applicable to simultaneous determination of HCT and LOP in osmotic pump tablets."

Our news journalists report that additional information may be obtained by contacting N. Li, Guangdong Pharmaceut Univ, Sch Pharm, Dept. of Pharmaceut Anal, Guangzhou 510006, Guangdong, People's Republic of China. Additional authors for this research include C.Y. Lai, X.Y. Xuan, C.K. Gao and N. Li.

Bone Research

Studies from Guangzhou Medical University Yield New Information about Bone Research (FANCD2 protects against bone marrow injury from ferroptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Bone Research. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Bone marrow injury remains a serious concern in traditional cancer treatment. Ferroptosis is an iron- and oxidative-dependent form of regulated cell death that has become part of an emerging strategy for chemotherapy."

Funders for this research include National Institutes of Health, Natural Science Foundation of Guangdong Province, Fanconi Anemia Research Fund, American Cancer Society Research Scholar Grant.

The news correspondents obtained a quote from the research from Guangzhou Medical University, "However, the key regulator of ferroptosis in bone marrow injury remains unknown. Here, we show that Fanconi anemia complementation group D2 (FANCD2), a nuclear protein involved in DNA damage repair, protects against ferroptosis-mediated injury in bone marrow stromal cells (BMSCs). The classical ferroptosis inducer erastin remarkably increased the levels of monoubiquitinated FANCD2, which in turn limited DNA damage in BMSCs. FANCD2-deficient BMSCs were more sensitive to erastin-induced ferroptosis (but not autophagy) than FANCD2 wild-type cells. Knockout of FANCD2 increased ferroptosis-associated biochemical events (e.g., ferrous iron accumulation, glutathione depletion, and malondialdehyde production). Mechanically, FANCD2 regulated genes and/or expression of proteins involved in iron metabolism (e.g., FTH1, TF, TFRC, HAMP, HSPB1, SLC40A1, and STEAP3) and lipid peroxidation (e.g., GPX4). Collectively, these findings indicate that FANCD2 plays a novel role in the negative regulation of ferroptosis."

According to the news reporters, the research concluded: "FANCD2 could represent an amenable target for the development of novel anticancer therapies aiming to reduce the side effects of ferroptosis inducers."

For more information on this research see: FANCD2 protects against bone marrow injury from ferroptosis. Biochemical and Biophysical Research Communications, 2016;480 (3):443-449. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Glycoconjugates

Studies from Guangzhou Medical University in the Area of Glycoconjugates Reported (Pregnane X receptors regulate CYP2C8 and P-glycoprotein to impact on the resistance of NSCLC cells to Taxol)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Glycoconjugates. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Cytochrome P450 2C8 (CYP2C8) is one of the enzymes that primarily participate in producing metabolisms of medications and P-glycoprotein (P-gp) has been regarded as one of the important molecules in chemotherapeutically induced multidrug resistance (MDR). In addition, the pregnane X receptor (PXR) is involved in regulating both CYP2C8 and P-gp."

Financial supporters for this research include National Natural Science Foundation of China, Outstanding Young People Project of Guangdong Province, Guangdong Science and Technology Department, Guangdong Natural Science Foundation.

The news reporters obtained a quote from the research from Guangzhou Medical University, "We aim to research the effect of PXR on Taxol-resistant non-small-cell lung cancer (NSCLC cells) via regulating CYP2C8 and P-gp. NSCLC cells were treated with SR12813, LY335979, or PXR siRNA. Cell counting kit (CCK-8) assay was used to detect cell vitality. Colony formation assay was used to observe cell proliferation. Western blotting, real-time polymerase chain reaction (RT-PCR), and immunofluorescence staining were conducted to analyze the expressions of PXR, CYP2C8, and P-gp. Taxol and its metabolic products were detected by high-performance liquid chromatography (HPLC). The expression of PXR in A549 cell line was higher than that in other cell lines. The accumulation of PXR was observed in the nucleus after cells were treated with SR12813. Besides, SR12813 induced higher expressions of CYP2C8 and P-gp proteins. We also discovered that pretreatment with SR12813 reversed the inhibition of cell viability and proliferation after the Taxol treatment in comparison to the SR12813 untreated group. Furthermore, the hydroxylation products of Taxol analyzed by HPLC were increased in comparison to the SR12813 untreated group, indicating that high expressions of CYP2C8 and P-gp enhanced the resistance of A549 cells to Taxol. For cells treated with PXR siRNA, cell viability, cell proliferation, and Taxol metabolites were significantly reduced after the Taxol treatment in comparison to the siRNA-negative group. The cell viability, cell proliferation, and Taxol metabolites were regulated by the expressions of PXR, P-gp, and CYP2C8."

According to the news reporters, the research concluded: "That is, PXR expression has an important effect on the resistance of NSCLC cells to Taxol via upregulating P-gp and CYP2C8."

Our news correspondents report that additional information may be obtained by

Environmental Pollution

Studies from Guangzhou University in the Area of Environmental Pollution Described (Risk assessment and vertical distribution of thallium in paddy soils and uptake in rice plants irrigated with acid mine drainage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Environmental Pollution are discussed in a new report. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "The objective of this paper is to assess the influence of irrigating paddy fields with acid mine drainage containing thallium (Tl) to rice plant-soil system and potential health risks for local residents. Vertical distribution of Tl, pH, organic matter (OM), and cation exchange capacity (CEC) in 24 paddy soil profiles around Yunfu pyrite mine area was investigated."

The news reporters obtained a quote from the research from Guangzhou University, "Rice plant samples were collected from the corresponding soil sampling site. The results showed that Tl concentrations in paddy soils at 0-60 cm depth range from 3.07 to 9.42 mg kg(-1), with a mean of 5.74 mg kg(-1), which were significantly higher than the background value of soil in China (0.58 mg kg(-1)). On the whole, Tl contents in paddy soil profiles increased quickly with soil depth from 0 to 30 cm and decreased slowly with soil depth from 30 to 60 cm. The soil Tl content was significant negatively correlated with soil pH. The mean content of Tl in the root, stem, leaf, and rice was 4.36, 1.83, 2.74, and 1.42 mg kg(-1), respectively, which exceeded the proposed permissible limits for foods and feedstuffs in Germany. The Tl content in various tissues of the rice plants followed the order root > leaf > stem (rice), which suggested that most Tl taken up by rice plants retained in the root, and a little migrated to the leaf, stem, and rice. Correlation analysis showed that Tl content in root was significant positively correlated with Tl content in leaf and rice. The ranges of hazard quotient (HQ) values were 4.0824.50 and 3.8422.38 for males and females, respectively. Males have higher health risk than females in the same age group. In childhood age groups (2 to < 21 years) and adult age groups (21 to < 70 years), the highest health risk level was observed in the 11 to 16 age group and 21 to 50 age group, respectively. The findings indicated that regular irrigation with Tl-bearing acid mine drainage led to considerable contamination of Tl in paddy soil and rice plant."
According to the news reporters, the research concluded: "Local government should take various measures to treat Tl contamination, especially the tailings."

For more information on this research see: Risk assessment and vertical distribution of thallium in paddy soils and uptake in rice plants irrigated with acid mine drainage. Thyroid Nodule

Studies from H. Gharib et al Add New Findings in the Area of Thyroid Nodule (American Association Of Clinical Endocrinologists, American College Of Endocrinology, And Associazione Medici Endocrinologi Medical Guidelines For Clinical Practice ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Thyroid Nodule. According to news reporting originating in Falls Church, Virginia, by NewsRx journalists, research stated, "Thyroid nodules are detected in up to 50 to 60% of healthy subjects. Most nodules do not cause clinically significant symptoms, and as a result, the main challenge in their management is to rule out malignancy, with ultrasonography (US) and fine-needle aspiration (FNA) biopsy serving as diagnostic cornerstones."

The news reporters obtained a quote from the research, "The key issues discussed in these guidelines are as follows: (1) US-based categorization of the malignancy risk and indications for US-guided FNA (henceforth, FNA), (2) cytologic classification of FNA samples, (3) the roles of immunocytochemistry and molecular testing applied to thyroid FNA, (4) therapeutic options, and (5) follow-up strategy. Thyroid nodule management during pregnancy and in children are also addressed. On the basis of US features, thyroid nodules may be categorized into 3 groups: low-, intermediateand high-malignancy risk. FNA should be considered for nodules <= 10 mm diameter only when suspicious US signs are present, while nodules <= 5 mm should be monitored rather than biopsied. A classification scheme of 5 categories (nondiagnostic, benign, indeterminate, suspicious for malignancy, or malignant) is recommended for the cytologic report. Indeterminate lesions are further subdivided into 2 subclasses to more accurately stratify the risk of malignancy. At present, no single cytochemical or genetic marker can definitely rule out malignancy in indeterminate nodules. Nevertheless, these tools should be considered together with clinical data, US signs, elastographic pattern, or results of other imaging techniques to improve the management of these lesions. Most thyroid
nodules do not require any treatment, and levothyroxine (LT4) suppressive therapy is not recommended. Percutaneous ethanol injection (PEI) should be the first-line treatment option for relapsing, benign cystic lesions, while US-guided thermal ablation treatments may be considered for solid or mixed symptomatic benign thyroid nodules. Surgery remains the treatment of choice for malignant or suspicious nodules.

According to the news reporters, the research concluded: "The present document updates previous guidelines released in 2006 and 2010 by the American Association of Clinical Endocrinologists (AACE) and Associazione Medici Endocrinologi (AME)."

For more information on this research see: American Association Of Clinical Endocrinologists, American College Of Endocrinology, And Associazione Medici Endocrinologi Medical Guidelines For Clinical Practice For The Diagnosis And Management Of Thyroid Nodules-2016 Update. *Endocrine Practice*, 2016;22():1-60. *Endocrine Practice* can be contacted at: Amer Assoc Clinical Endocrinologists, 245 Riverside Avenue, Ste 200, Jacksonville, FL 32202, USA.

Our news correspondents report that additional information may be obtained by contacting H. Gharib, Amer Thyroid Assoc, Falls Church, VA, United States. Additional authors for this research include E. Papini, J.R. Garber, D.S. Duick, R.M. Harrell, L. Hegedus, R. Paschke, R. Valcavi and P. Vitti.

**Oncology - Endometrial Cancer**

**Studies from Hacettepe University Have Provided New Data on Endometrial Cancer (Assessment of Cervicovaginal Cancer Antigen 125 Levels: A Preliminary Study for Endometrial Cancer Screening)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Endometrial Cancer. According to news reporting out of Ankara, Turkey, by NewsRx editors, research stated, "We primarily aimed to compare the levels of serum and cervicovaginal cancer antigen 125 (CA 125) in women with and without endometrial carcinoma in order to reveal whether cervicovaginal CA 125 could be used as a non-invasive method. A preliminary case-control study was designed."

Our news journalists obtained a quote from the research from Hacettepe University, "The study group consisted of patients who were operated for endometrial adenocarcinoma or endometrial intraepithelial neoplasia. The control group consisted of patients who underwent surgery for benign gynecological diseases. Serum and cervicovaginal secretions were immediately collected before surgery to compare levels of CA 125. The mean cervicovaginal CA 125 levels in patients with endometrial cancer and controls were 1,598.1 +/- 1,691.1 versus 947.0 +/- 1,282.7 U/ml, respectively (p = 0.016). Whereas area under receiver operating characteristic curve was 0.62 for serum CA 125, it was 0.68 for cervicovaginal CA 125. The optimal threshold of CA 125 in cervicovaginal secretion was calculated to be 575 U/ml, which detected endometrial precancer or cancer with sensitivity of 78% and specificity of 57%. The
positive and negative predictive values for this threshold were 38.7 and 88.2%, respectively."

According to the news editors, the research concluded: "Detection of CA 125 in cervicovaginal secretion has a potential role for the non-invasive screening of endometrial precancers and cancers."

Our news journalists report that additional information may be obtained by contacting P. Calis, Hacettepe University, Sch Med, Dept. of Obstet & Gynecol, TR-06100 Ankara, Turkey. Additional authors for this research include K. Yuce, D. Basaran and C. Salman.

**Cardiology**

**Studies from Hartford Hospital in the Area of Cardiology Reported (Myocardial Fibrosis in Athletes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiology have been presented. According to news reporting out of Hartford, Connecticut, by NewsRx editors, research stated, "Myocardial fibrosis (MF) is a common phenomenon in the late stages of diverse cardiac diseases and is a predictive factor for sudden cardiac death. Myocardial fibrosis detected by magnetic resonance imaging has also been reported in athletes."

Our news journalists obtained a quote from the research from Hartford Hospital, "Regular exercise improves cardiovascular health, but there may be a limit of benefit in the exercise dose-response relationship. Intense exercise training could induce pathologic cardiac remodeling, ultimately leading to MF, but the clinical implications of MF in athletes are unknown. For this comprehensive review, we performed a systematic search of the PubMed and MEDLINE databases up to June 2016. Key Medical Subject Headings terms and keywords pertaining to MF and exercise (training) were included. Articles were included if they represented primary MF data in athletes. We identified 65 athletes with MF from 19 case studies/series and 14 athletic population studies. Myocardial fibrosis in athletes was predominantly identified in the intraventricular septum and where the right ventricle joins the septum. Although the underlying mechanisms are unknown, we summarize the evidence for genetic predisposition, silent myocarditis, pulmonary artery pressure overload, and prolonged exercise-induced repetitive micro-injury as contributors to the development of MF in athletes."

According to the news editors, the research concluded: "We also discuss the clinical
implications and potential treatment strategies of MF in athletes."

Our news journalists report that additional information may be obtained by contacting T.M.H. Eijsvogels, Hartford Hospital, Div Cardiol Hartford, Hartford, CT 06115, United States. Cardiovascular Diseases and Conditions -…

Studies from Harvard School of Medicine Add New Findings in the Area of Atherosclerosis (Atherosclerotic plaque behind the stent changes after bare-metal and drug-eluting stent implantation in humans: Implications for late stent failure?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "The natural history and the role of atherosclerotic plaque located behind the stent (PBS) are still poorly understood. We evaluated the serial changes in PBS following bare-metal (BMS) compared to first-generation drug-eluting stent (DES) implantation and the impact of these changes on in-stent neointimal hyperplasia (NIH)."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Three-dimensional coronary reconstruction by angiography and intravascular ultrasound was performed after intervention and at 6-10-month follow-up in 157 patients with 188 lesions treated with BMS (n = 89) and DES (n = 99). There was a significant decrease in PBS area (-7.2%; p< 0.001) and vessel area (-1.7%; p< 0.001) after BMS and a respective increase in both areas after DES implantation (6.1%; p< 0.001 and 4.1%; p< 0.001, respectively). The decrease in PBS area significantly predicted neointimal area at follow-up after BMS (beta: 0.15; 95% confidence interval [CI]: 0.10-0.20, p< 0.001) and DES (beta: 0.09; 95% CI: 0.07-0.11; p< 0.001) implantation. The decrease in PBS area was the most powerful predictor of significant NIH after BMS implantation (odds ratio: 1.13; 95% CI: 1.02-1.26; p = 0.02). The decrease in PBS area after stent implantation is significantly associated with the magnitude of NIH development at follow-up."

According to the news editors, the research concluded: "This finding raises the possibility of a communication between the lesion within the stent and the underlying native
atherosclerotic plaque, and may have important implications regarding the pathobiology of in-stent restenosis and late/very late stent thrombosis."

For more information on this research see: Atherosclerotic plaque behind the stent changes after bare-metal and drug-eluting stent implantation in humans: Implications for late stent failure? Cardiovascular Diseases

Studies from Harvard School of Medicine Describe New Findings in Cardiovascular Diseases (Total and Regional Adiposity Measured by Dual-Energy X-Ray Absorptiometry and Mortality in NHANES 1999-2006)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Associations of overall and regional body fat measured by dual-energy X-ray absorptiometry with total and cause-specific mortality in the National Health and Nutrition Examination Survey (NHANES) 1999-2006 were investigated. This study included 9,471 participants (>= 20 years) free of major chronic diseases at baseline."

The news reporters obtained a quote from the research from the Harvard School of Medicine, "Death information was obtained from the National Death Index (mean follow-up duration: 8.8 years). A total of 682 participants died after 12 months since baseline, with 206 and 170 deaths attributed to cardiovascular diseases (CVD) and cancer, respectively. The second quartile of fat mass percentages (FM%) was used as the reference to account for potential nonlinearity. In the multivariate-adjusted model, participants in the highest quartile of total FM% had increased total mortality; hazard ratio (HR; 95% confidence interval, 95% CI) was 1.48 (1.07-2.04; P<0.05). Higher total and trunk FM%, but not leg FM%, were significantly associated with an increased CVD mortality; HRs (95% CIs) in the highest quartiles of total, trunk, and leg FM% were 2.24 (1.17-4.31), 1.93 (1.02-3.66), and 1.50 (0.77-2.94), respectively. Higher total body fat was associated with increased total mortality in U.S. adults."

According to the news reporters, the research concluded: "Higher total and trunk fat contents were also associated with increased CVD mortality, although fat accumulation in the
lower body was not an independent predictor of mortality."

Our news correspondents report that additional information may be obtained by contacting Q. Sun, Harvard Med Sch, Boston, MA, United States. Additional authors for this research include Z.F. Zhang, Q.H. Yang, H.Y. Wu, F.B. Hu and Q. Sun.

**Genetics - Medical Genetics**

**Studies from Harvard School of Medicine Describe New Findings in Medical Genetics (Navigating highly homologous genes in a molecular diagnostic setting: a resource for clinical next-generation sequencing)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics - Medical Genetics is now available. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Next-generation sequencing (NGS) is now routinely used to interrogate large sets of genes in a diagnostic setting. Regions of high sequence homology continue to be a major challenge for short-read technologies and can lead to false-positive and false-negative diagnostic errors."

The news reporters obtained a quote from the research from the Harvard School of Medicine, "At the scale of whole-exome sequencing (WES), laboratories may be limited in their knowledge of genes and regions that pose technical hurdles due to high homology. We have created an exome-wide resource that catalogs highly homologous regions that is tailored toward diagnostic applications. This resource was developed using a mappability-based approach tailored to current Sanger and NGS protocols. Gene-level and exon-level lists delineate regions that are difficult or impossible to analyze via standard NGS. These regions are ranked by degree of affectedness, annotated for medical relevance, and classified by the type of homology (within-gene, different functional gene, known pseudogene, uncharacterized noncoding region). Additionally, we provide a list of exons that cannot be analyzed by short-amplicon Sanger sequencing."

According to the news reporters, the research concluded: "This resource can help guide clinical test design, supplemental assay implementation, and results interpretation in the context of high homology."

For more information on this research see: Navigating highly homologous genes in a molecular diagnostic setting: a resource for clinical next-generation sequencing. *Genetics in Medicine*, 2016;18(12):1282-1289. *Genetics in Medicine* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group - www.nature.com/; Genetics in Medicine - www.nature.com/gim/)

Our news correspondents report that additional information may be obtained by contacting B. Funke, Harvard Med Sch, Massachusetts General Hospital, Dept. of Pathol,
Studies from Harvard School of Medicine Describe New Findings in Oncology (Precision medicine for cancer with next-generation functional diagnostics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Precision medicine is about matching the right drugs to the right patients. Although this approach is technology agnostic, in cancer there is a tendency to make precision medicine synonymous with genomics."

Our news editors obtained a quote from the research from the Harvard School of Medicine, "However, genome-based cancer therapeutic matching is limited by incomplete biological understanding of the relationship between phenotype and cancer genotype. This limitation can be addressed by functional testing of live patient tumor cells exposed to potential therapies. Recently, several 'next-generation' functional diagnostic technologies have been reported, including novel methods for tumor manipulation, molecularly precise assays of tumor responses and device-based in situ approaches; these address the limitations of the older generation of chemosensitivity tests."

According to the news editors, the research concluded: "The promise of these new technologies suggests a future diagnostic strategy that integrates functional testing with next-generation sequencing and immunoprofiling to precisely match combination therapies to individual cancer patients."

The news editors report that additional information may be obtained by contacting A.A. Friedman, Massachusetts General Hospital Cancer Center, Harvard Medical School, 55 Fruit Street, Boston, Massachusetts 02114, United States. Additional authors for this research include A. Letai, D.E. Fisher and K.T Flaherty.

Cell Differentiation

Studies from Harvard School of Medicine Have Provided New Data on Cell Differentiation [Dedicator of cytokinesis 8 regulates signal transducer and activator of transcription 3 activation and promotes T(H) 17 cell differentiation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cell Differentiation are discussed in a new report. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "The autosomal recessive hyper-IgE syndrome (HIES) caused by dedicator of cytokinesis 8 (DOCK8) deficiency shares clinical features with autosomal dominant HIES because of signal transducer and activator of transcription 3 (STAT3) mutations, including recurrent infections and mucocutaneous candidiasis, which are suggestive of T(H)17 cell dysfunction. The mechanisms underlying this phenotypic overlap are unclear."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "We sought to elucidate common mechanisms operating in the different forms of HIES. We analyzed the differentiation of CD4(+) T-H cell subsets in control and DOCK8-deficient subjects. We also examined the role of DOCK8 in regulating STAT3 activation in T cells. T-H cell differentiation was analyzed by ELISA, flow cytometry, and real-time PCR measurements of cytokines and T-H cell transcription factors. The interaction of DOCK8 and STAT3 signaling pathways was examined by using flow cytometry, immunofluorescence, coimmunoprecipitation, and gene expression analysis. There was a profound block in the differentiation of DOCK8-deficient naive CD4(+) T cells into T(H)17 cells. A missense mutation that disrupts DOCK8 guanine nucleotide exchange factor (GEF) activity while sparing protein expression also impaired T(H)17 cell differentiation. DOCK8 constitutively associated with STAT3 independent of GEF activity-dependent manner. DOCK8 also promoted STAT3 phosphorylation in a GEF activity-dependent manner. DOCK8 also promoted STAT3 translocation to the nucleus and induction of STAT3-dependent gene expression. DOCK8 interacts with STAT3 and regulates its activation and the outcome of STAT3-dependent TH17 differentiation."

According to the news reporters, the research concluded: "These findings might explain the phenotypic overlap between DOCK8 deficiency and autosomal dominant HIES."

For more information on this research see: Dedicator of cytokinesis 8 regulates signal transducer and activator of transcription 3 activation and promotes T(H)17 cell differentiation. Endocytosis
Studies from Harvard School of Medicine Reveal New Findings on Endocytosis (ILK and cytoskeletal architecture: an important determinant of AQP2 recycling and subsequent entry into the exocytotic pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Endocytosis. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Within the past decade tremendous efforts have been made to understand the mechanism behind aquaporin-2 (AQP2) water channel trafficking and recycling, to open a path toward effective diabetes insipidus therapeutics. A recent study has shown that integrin-linked kinase (ILK) conditional-knockdown mice developed polyuria along with decreased AQP2 expression."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "To understand whether ILK also regulates AQP2 trafficking in kidney tubular cells, we performed in vitro analysis using LLCPK1 cells stably expressing rat AQP2 (LLC-AQP2 cells). Upon treatment of LLC-AQP2 cells with ILK inhibitor cpd22 and ILK-siRNA, we observed increased accumulation of AQP2 in the perinuclear region, without any significant increase in the rate of endocytosis. This perinuclear accumulation did not occur in cells expressing a serine-256-aspartic acid mutation that retains AQP2 in the plasma membrane. We then examined clathrin-mediated endocytosis after ILK inhibition using rhodamine-conjugated transferrin. Despite no differences in overall transferrin endocytosis, the endocytosed transferrin also accumulated in the perinuclear region where it colocalized with AQP2. These accumulated vesicles also contained the recycling endosome marker Rab11. In parallel, the usual vasopressin-induced AQP2 membrane accumulation was prevented after ILK inhibition; however, ILK inhibition did not measurably affect AQP2 phosphorylation at serine-256 or its dephosphorylation at serine-261. Instead, we found that inhibition of ILK increased F-actin polymerization. When F-actin was depolymerized with latrunculin, the perinuclear located AQP2 dispersed."

According to the news reporters, the research concluded: "ILK is important in orchestrating dynamic cytoskeletal architecture during recycling of AQP2, which is necessary for its subsequent entry into the exocytotic pathway."

For more information on this research see: ILK and cytoskeletal architecture; an important determinant of AQP2 recycling and subsequent entry into the exocytotic pathway. American Journal of Physiology-Renal Physiology, 2016;311(6):F1346-F1357. American Journal of Physiology-Renal Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Heart Disorders and Diseases - Heart Failure

Studies from Harvard School of Medicine Reveal New Findings on Heart Failure (Novel Heart Failure Biomarkers Predict Improvement of Mitral Regurgitation in Patients Receiving Cardiac Resynchronization Therapy-The BIOCRT Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Failure. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Cardiac resynchronization therapy (CRT) improves mitral regurgitation (MR) in a subset of patients. We hypothesized that biomarkers (amino-terminal pro-B type natriuretic peptide, high-sensitivity troponin I, galectin-3 [gal-3], and soluble ST2) might predict MR response after CRT."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "We measured levels of biomarkers during CRT implantation in 132 patients with a subsequent 2-year follow-up. MR was graded as no-trace, mild, moderate, or severe at baseline and at 6 months. In patients with baseline at least mild MR, 56% had improvement at 6 months, with lower 2-year mortality vs patients without improvement (0% vs 18%; P = 0.002). At baseline, patients with MR improvement had lower high-sensitivity troponin I and gal-3 levels compared with those without improvement (19 vs 40 pg/L; P = 0.01; 14 vs 18 ng/mL; P = 0.007). In multivariable analyses, higher log-transformed gal-3 (odds ratio, 0.15; 95% confidence interval, 0.04-0.65; P = 0.01) remained an independent predictor for MR nonimprovement. Levels of pro-B type natriuretic peptide and soluble ST2 were lower at follow-up in patients with MR improvement (potentially reflecting reduced myocardial stretch and stress) without reaching statistical significance."

According to the news editors, the research concluded: "Higher galectin levels at the time of CRT implantation are associated with MR nonresponse."

Our news journalists report that additional information may be obtained by contacting J. Beaudoin, Harvard Med Sch, Massachusetts General Hospital, Div Cardiol,
Studies from Harvard School of Medicine Reveal New Findings on Molecular Cancer and Carcinogenesis (MUC1-C Represses the Crumbs Complex Polarity Factor CRB3 and Downregulates the Hippo Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Molecular Cancer and Carcinogenesis are discussed in a new report. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Apical-basal polarity and epithelial integrity are maintained in part by the Crumbs (CRB) complex. The C-terminal subunit of MUC1 (MUC1-C) is a transmembrane protein that is expressed at the apical border of normal epithelial cells and aberrantly at high levels over the entire surface of their transformed counterparts."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "However, it is not known whether MUC1-C contributes to this loss of polarity that is characteristic of carcinoma cells. Here it is demonstrated that MUC1-C downregulates expression of the Crumbs complex CRB3 protein in triple-negative breast cancer (TNBC) cells. MUC1-C associates with ZEB1 on the CRB3 promoter and represses CRB3 transcription. Notably, CRB3 activates the core kinase cassette of the Hippo pathway, which includes LATS1 and LATS2. In this context, targeting MUC1-C was associated with increased phosphorylation of LATS1, consistent with activation of the Hippo pathway, which is critical for regulating cell contact, tissue repair, proliferation, and apoptosis. Also shown is that MUC1-C-mediated suppression of CRB3 and the Hippo pathway is associated with dephosphorylation and activation of the oncogenic YAP protein. In turn, MUC1-C interacts with YAP, promotes formation of YAP/beta-catenin complexes, and induces the WNT target gene MYC."

According to the news reporters, the research concluded: "These data support a previously unrecognized pathway in which targeting MUC1-C in TNBC cells (i) induces CRB3 expression, (ii) activates the CRB3-driven Hippo pathway, (iii) inactivates YAP, and thereby (iv) suppresses YAP/b-catenin-mediated induction of MYC expression."

For more information on this research see: MUC1-C Represses the Crumbs Complex Polarity Factor CRB3 and Downregulates the Hippo Pathway. Molecular Cancer Research, 2016;14(12):1266-1276. **Drugs and Therapies - Ophthalmic Glaucoma Agents**

**Studies from Harvard School of Medicine Yield New Data on Ophthalmic Glaucoma Agents (Latanoprost-Eluting Contact Lenses in Glaucomatous Monkeys)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Ophthalmic Glaucoma Agents is the subject of a report. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "To assess the ability of latanoprost-eluting contact lenses to lower the intraocular pressure (IOP) of glaucomatous eyes of cynomolgus monkeys. Preclinical efficacy study of 3 treatment arms in a crossover design."

Our news editors obtained a quote from the research from the Harvard School of Medicine, "Female cynomolgus monkeys with glaucoma induced in 1 eye by repeated argon laser trabeculoplasty. Latanoprost-eluting low-dose contact lenses (CLLO) and high-dose contact lenses (CLHI) were produced by encapsulating a thin latanoprost-polymer film within the periphery of a methafilcon hydrogel, which was lathed into a contact lens. We assessed the IOP-lowering effect of CLLO, CLHI, or daily latanoprost ophthalmic solution in the same monkeys. Each monkey consecutively received 1 week of continuous-wear CLLO, 3 weeks without treatment, 5 days of latanoprost drops, 3 weeks without treatment, and 1 week of continuous-wear CLHI. On 2 consecutive days before initiation of each study arm, the IOP was measured hourly over 7 consecutive hours to establish the baseline IOP. Two-tailed Student t tests and repeated-measures analysis of variance were used for statistical analysis. Intraocular pressure. Latanoprost ophthalmic solution resulted in IOP reduction of 5.4 +/- 1.0 mmHg on day 3 and peak IOP reduction of 6.6 +/- 1.3 mmHg on day 5. The CLLO reduced IOP by 6.3 +/- 1.0, 6.7 +/- 0.3, and 6.7 +/- 0.3 mmHg on days 3, 5, and 8, respectively. The CLHI lowered IOP by 10.5 +/- 1.4, 11.1 +/- 4.0, and 10.0 +/- 2.5 mmHg on days 3, 5, and 8, respectively. For the CLLO and CLHI, the IOP was statistically significantly reduced compared with the untreated baseline at most time points measured. The CLHI demonstrated greater IOP reduction than latanoprost ophthalmic solution on day 3 (P = 0.001) and day 5 (P = 0.015), and at several time points on day 8 (P < 0.05). Sustained delivery of latanoprost by contact lenses is at least as effective as delivery with daily latanoprost ophthalmic solution. More research is needed to determine the optimal continuous-release dose that would be well tolerated and maximally effective."

According to the news editors, the research concluded: "Contact lens drug delivery may become an option for the treatment of glaucoma and a platform for ocular drug delivery."

For more information on this research see: Latanoprost-Eluting Contact Lenses in...
Studies from Harvard School of Medicine Yield New Data on Toxicology and Applied Pharmacology (Application of small RNA sequencing to identify microRNAs in acute kidney injury and fibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Toxicology and Applied Pharmacology is the subject of a report. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Establishing a microRNA (miRNA) expression profile in affected tissues provides an important foundation for the discovery of miRNAs involved in the development or progression of pathologic conditions. We conducted small RNA sequencing to generate a temporal profile of miRNA expression in the kidneys using a mouse model of folic acid-induced (250 mg/kg i.p.) kidney injury and fibrosis."

Financial supporters for this research include NIH/NIEHS, Burroughs Wellcome Fund.

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "From the 103 miRNAs that were differentially expressed over the time course (>2-fold, p< 0.05), we chose to further investigate miR-18a-5p, which is expressed during the acute stage of the injury; miR-132-3p, which is upregulated during transition between acute and fibrotic injury; and miR-146b-5p, which is highly expressed at the peak of fibrosis. Using qRT-PCR, we confirmed the increased expression of these candidate miRNAs in the folic acid model as well as in other established mouse models of acute injury (ischemia/reperfusion injury) and fibrosis (unilateral ureteral obstruction). In situ hybridization confirmed high expression of miR-18a-5p, miR-132-3p and miR-146b-5p throughout the kidney cortex in mice and humans with severe kidney injury or fibrosis. When primary human proximal tubular epithelial cells were treated with model nephrotoxicants such as cadmium chloride (CdCl2), arsenic trioxide, aristolochic acid (AA), potassium dichromate (K2Cr2O7) and cisplatin, miRNA-132-3p was upregulated 4.3-fold after AA treatment and 1.5-fold after K2Cr2O7 and CdCl2 treatment."

According to the news reporters, the research concluded: "These results demonstrate
the application of temporal small RNA sequencing to identify miR-18a, miR-132 and miR-146b as differentially expressed miRNAs during distinct phases of kidney injury and fibrosis progression."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.taap.2015.12.002. This DOI is a link to an online electronic document that is either free or for purchase.

**Gastroenterology - Hernias**

**Studies from Harvard School of Medicine in the Area of Hernias Described [De Novo Frameshift Mutation in COUP-TFIi (NR2F2) in Human Congenital Diaphragmatic Hernia]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gastroenterology - Hernias have been published. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "COUP-TFIi (NR2F2) is mapped to the 15q26 deletion hotspot associated with the common and highly morbid congenital diaphragmatic hernia (CDH). Conditional homozygous deletions of COUP-TFIi in mice result in diaphragmatic defects analogous to the human Bochdalek-type hernia phenotype."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "Despite evidence from animal models however, mutations in the coding sequence of COUP-TFIi have not been reported in patients, prompting the speculation that additional coding or non-coding sequences in the 15q26 locus are necessary for diaphragmatic hernias to develop. In this report, we describe a case of a patient with a heterozygous de novo COUP-TFIi frameshift mutation, presenting with CDH and an atrial septal defect. The p.Pro33AlafsTer77 mutation specifically disrupts protein isoform 1 which contains the DNA binding domain. In addition, we review other COUP-TFIi sequence variations and deletions that have been described in cases of CDH."

According to the news reporters, the research concluded: "COUP-TFIi mutations can cause diaphragmatic hernias, and should be included in the differential diagnosis of CDH patients, particularly those with comorbid congenital heart defects."

Our news journalists report that additional information may be obtained by contacting M. Longoni, Harvard Med Sch, Boston, MA, United States. Additional authors for this research include P. Bhayani, J.M. Wilson, C.J. Bult, P.K. Donahoe and M. Longoni.

Physical Fitness

Studies from Harvard University Describe New Findings in Physical Fitness (Physical Fitness Differences Between Rural and Urban Children from Western Kenya)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Physical Fitness have been published. According to news reporting from Cambridge, Massachusetts, by NewsRx journalists, research stated, "To study the effects of urbanization on physical fitness (PF), we compare PF between urban and rural children from western Kenya. We hypothesize that active rural children are stronger, more flexible, and have greater endurance, and that PF differences are predictive of endurance running performance."

The news correspondents obtained a quote from the research from Harvard University, "We recruited an age-matched, cross-sectional sample of participants (55 males, 60 females; 6-17 years) from schools near Eldoret, Kenya. PF and anthropometrics were assessed using the FITNESSGRAM®. General linear mixed models (GLMM) and path analyses were performed to test for age, sex, and activity group differences in PF, as well as the effects of PF variables on mile run time. On average, urban participants had greater body mass (36.8 +/- 15.9 vs. 31.9 +/- 10.9 kg) but were not taller than rural participants (1.4 +/- 0.2 vs. 1.4 +/- 0.2 cm). Greater urban body mass appears driven by higher body fat (28.2 +/- 9.4 vs. 16.8 +/- 4.4%), which increased with age in urban but not rural participants. GLMM analyses showed age effects on strength variables (P < 0.05) and sex differences in hip flexibility, sit-ups, and mile run (P < 0.05). There were fewer differences in PF between groups except rural participants had stronger back muscles (18.2 +/- 4.5 vs. 14.18 +/- 4.3 cm) and faster mile times (6.3 +/- 0.7 vs. 7.9 +/- 2.0 min). Body composition and abdominal strength were predictive of mile time (P < 0.06), but the path analysis revealed a network of interacting direct and indirect effects that influenced endurance performance."

According to the news reporters, the research concluded: "Although differences in endurance and body composition are marked between urban and rural groups, strength and flexibility are not always correlated with overall activity levels."

For more information on this research see: Physical Fitness Differences Between

**Cardiovascular Diseases and Conditions - Aneurysm**

**Studies from Heart Center Have Provided New Information about Aneurysm (Giant left atrial appendage aneurysm compressing the left anterior descending coronary artery)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurysm. According to news reporting from Aswan, Egypt, by NewsRx journalists, research stated, "Left atrial appendage aneurysm (LAAA) is a rare congenital structural heart disease. It is often diagnosed by echocardiography; however, other imaging modalities can add to its diagnosis and its potential effects on the surrounding structures."

The news correspondents obtained a quote from the research from Heart Center, "A 16-year-old boy presented with dyspnea and palpitation. Transthoracic echocardiography showed a large LAAA communicating with the LA through a narrow neck with impaired left ventricular (LV) systolic function. Multidetector cardiac tomography showed that the LAAA is compressing the left anterior descending artery."

According to the news reporters, the research concluded: "The LAAA was surgically resected followed by improvement of the LV systolic function."

Our news journalists report that additional information may be obtained by contacting K. Wagdy, Magdi Yacoub Fdn, Aswan Heart Center, Adult Cardiol, Aswan, Egypt. Additional authors for this research include A. Samaan, S. Romeih, W. Simry, A. Afifi and M. Hassan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/echo.13296. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Gliomas

Studies from Hebei Medical University Have Provided New Data on Gliomas (Slit2 and Robo1 expression as biomarkers for assessing prognosis in brain glioma patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gliomas have been published. According to news reporting out of Shijiazhuang, People's Republic of China, by NewsRx editors, research stated, "This study was conducted to investigate the clinical significance of Slit2 and Robo1 expression in prognosis of patients with brain gliomas. Human brain tissue samples were collected from normal glial tissues (control), low- and high-grade glioma tissues."

Funders for this research include Key Project of Hebei Medical Science Research, The Second Hospital of Hebei Medical University Scientific Research.

Our news journalists obtained a quote from the research from Hebei Medical University, "Slit2 and Robo1 expression levels in cells were assessed by an immunohistochemistry (IHC), and population of the Slit2- and Robo1-presenting patients was examined. The Slit2 and Robo1 mRNA expression levels in three types of the brain cells was determined by RT-PCR. Slit2(+) cell counts were decreased with increased Robo1(+) cells in the low-grade and high-grade glioma tissues as compared to the control. The percentage of cells expressing Slit2 decreased from the control to the high-grade glioma and the percentage of cells expressing Robo1 in low- and high-grade gliomas was increased as compared to the control (P < 0.01). The decrease in the Slit2 mRNA expression was associated with the increase in the Robo1 mRNA expression in the low- and high-grade gliomas (P < 0.01 or 0.05). Survival time for patients with Slit2(-)/Robo1(+) gliomas was shorter than patients with Slit2(+)/Robo1(+) gliomas in the investigated cohorts (P < 0.01). Slit2 and Robo1 expression levels serve as a biomarker with utility in grading gliomas as well as predicting patient survival."

According to the news editors, the research concluded: "The change in Slit2 expression is more reliable and effective than Robo1 expression in predicting a poor prognosis of brain glioma patients."

Our news journalists report that additional information may be obtained by contacting L.Q. Liu, Hebei Medical University, Hosp 2, Dept. of Neurosurg, Shijiazhuang 050000, Hebei, People's Republic of China. Additional authors for this research include W.H. Li, S.M. Geng, Y.W. Fang, Z.M. Sun, H.C. Hu, Z.H. Liang and Z.J. Yan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.suronc.2016.09.003. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from Heilongjiang University Yield New Information about Rheumatoid Arthritis (Quercetin promotes the apoptosis of fibroblast-like synoviocytes in rheumatoid arthritis by upregulating IncRNA MALAT1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autoimmune Diseases and Conditions - Rheumatoid Arthritis have been presented. According to news reporting originating in Heilongjiang, People's Republic of China, by NewsRx journalists, research stated, "Rheumatoid arthritis (RA) is a chronic autoimmune joint disease and fibroblast-like synoviocytes (FLS) are the resident mesenchymal cells of synovial joints. Quercetin is a dietary antioxidant."

The news reporters obtained a quote from the research from Heilongjiang University, "In this study, we aimed to explore the mechanisms responsible for the quercetin-induced apoptosis of FLS from patients with RA (termed RAFLS). RAFLS viability was determined following treatment of the cells with or without quercetin using the Cell Counting kit-8 (CCK-8) assay. The apoptosis of the RAFLS was analyzed using the Annexin V-fluorescein isothiocyanate (FITC) apoptosis detection kit I. The results revealed that RAFLS viability decreased and apoptosis increased in following treatment with quercetin. The differentially expressed long non-coding RNAs (lncRNAs) were screened and marked by PCR array following treatment with quercetin. The expression levels of the screened lncRNAs were then determined and compared in the cells treated with or without quercetin by quantitative PCR. The lncRNA metastasis associated lung adenocarcinoma transcript 1 (MALAT1) was finally selected. Small interfering RNA (siRNA) was then used to knock down the expression of MALAT1 in order to determine the role of MALAT1 in the quercetin-induced apoptosis of RAFLS. The results revealed that the knockdown of MALAT1 inhibited RAFLS apoptosis. At the same time, the expression of caspase-3 and caspase-9 was significantly decreased in the cells in which MALAT1 was knocked down. The phosphoinositide 3-kinase (PI3K)/AKT signaling pathway was activated; this activation is known to be associated with enhanced cell proliferation and decreased apoptosis."

According to the news reporters, the research concluded: "The findings of our study indicate that quercetin promotes RAFLS apoptosis by upregulating lncRNA MALAT1, and that MALAT1 induces apoptosis by inhibiting the activation of the PI3K/AKT pathway."

For more information on this research see: Quercetin promotes the apoptosis of fibroblast-like synoviocytes in rheumatoid arthritis by upregulating lncRNA MALAT1. International Journal of Molecular Medicine, 2016;38(5):1507-1514. International Journal of Molecular Medicine can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

Our news correspondents report that additional information may be obtained by contacting C.P. Pei, Heilongjiang Univ Chinese Med, Affiliated Hosp 1, Dept. of Renal Dis, Harbin 150040, Heilongjiang, People's Republic of China. Additional authors for this research include L.H. Zhu, H.Z. Lv and C.P. Pei.

Studies from Heinrich-Heine-University Update Current Data on Erythroid Cells (Triggering of Erythrocyte Cell Membrane Scrambling by Emodin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Erythroid Cells are presented in a new report. According to news reporting out of Dusseldorf, Germany, by NewsRx editors, research stated, "The natural anthraquinone derivative emodin (1,3,8-trihydroxy-6-methylanthraquinone) is a component of several Chinese medicinal herbal preparations utilized for more than 2000 years. The substance has been used against diverse disorders including malignancy, inflammation and microbial infection."

Our news journalists obtained a quote from the research from Heinrich-Heine-University, "The substance is effective in part by triggering suicidal death or apoptosis. Similar to apoptosis of nucleated cells erythrocytes may enter suicidal erythrocyte death or eryptosis, characterized by cell shrinkage and cell membrane scrambling with phosphatidylserine translocation to the erythrocyte surface. Signaling involved in the triggering of eryptosis include increase of cytosolic Ca2+ activity ([Ca2+]i) oxidative stress and ceramide. The present study aimed to test, whether emodin induces eryptosis and, if so, to elucidate underlying cellular mechanisms. Phosphatidylserine abundance at the cell surface was estimated from annexin-V-binding, cell volume from forward scatter, [Ca2+]i from Fluo3-fluorescence, ROS formation from DCFDA dependent fluorescence, and ceramide abundance utilizing specific antibodies. Exposure of human erythrocytes for 48 hours to emodin >= 10 mu M) significantly increased the percentage of annexin-V-binding cells, and at higher concentrations (>= 50 mu M) significantly increased forward scatter. Emodin significantly increased Fluo3-fluorescence (>= 10 mu M), DCFDA fluorescence (75 mu M) and ceramide abundance (75 mu M). The effect of emodin on annexin-V-binding was significantly blunt but not abolished by removal of extracellular Ca2+.

According to the news editors, the research concluded: "Emodin triggers phospholipid scrambling of the erythrocyte cell membrane, an effect at least in part due to stimulation of Ca2+ entry and paralleled by oxidative stress and ceramide appearance at the erythrocyte surface."

For more information on this research see: Triggering of Erythrocyte Cell Membrane Scrambling by Emodin. *Cellular Physiology and Biochemistry*, 2016;40(1-2):91-103. Proteomics

Studies from Heinrich-Heine-University Update Current Data on Proteomics (Highly efficient transduction of primary adult CNS and PNS neurons)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Proteomics are presented in a new report. According to news reporting out of Dusseldorf, Germany, by NewsRx editors, research stated, "Delivery and expression of recombinant genes, a key methodology for many applications in biological research, remains a challenge especially for mature neurons. Here, we report easy, highly efficient and well tolerated transduction of adult peripheral and central neuronal populations of diverse species in culture using VSV-G pseudo-typed, recombinant baculovirus (BacMam)."

Our news journalists obtained a quote from the research from Heinrich-Heine-University, "Transduction rates of up to 80% were reliably achieved at high multiplicity of infection without apparent neuro-cytopathic effects. Neurons could be transduced either shortly after plating or after several days in culture. Co-incubation with two different baculoviruses attained near complete co-localization of fluorescent protein expression, indicating multigene delivery. Finally, evidence for functional protein expression is provided by means of cre-mediated genetic recombination and neurite outgrowth assays. Recombinant protein was already detected within hours after transduction, thereby enabling functional readouts even in relatively short-lived neuronal cultures."

According to the news editors, the research concluded: "Altogether, these results substantiate the usefulness of baculovirus-mediated transduction of mature neurons for future research in neuroscience."

For more information on this research see: Highly efficient transduction of primary adult CNS and PNS neurons. Scientific Reports, 2016;6():1-10. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Erythroid Cells

Studies from Heinrich-Heine-University Yield New Information about Erythroid Cells (Stimulation of Suicidal Erythrocyte Death by Phosphatase Inhibitor Calyculin A)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Erythroid Cells have been published. According to news reporting out of Dusseldorf, Germany, by NewsRx editors, research stated, "The serine/threonine protein phosphatase 1 and 2a inhibitor Calyculin A may trigger suicidal death or apoptosis of tumor cells. Similar to apoptosis of nucleated cells, erythrocytes may enter eryptosis, the suicidal erythrocyte death characterized by cell shrinkage and cell membrane scrambling with phosphatidylserine translocation to the erythrocyte surface."

Our news journalists obtained a quote from the research from Heinrich-Heine-University, "Triggers of eryptosis include increase of cytosolic Ca2+ activity ([Ca2+](i)). Eryptosis is fostered by activation of staurosporine sensitive protein kinase C, SB203580 sensitive p38 kinase, and D4476 sensitive casein kinase. Eryptosis may further involve zVAD sensitive caspases. The present study explored, whether Calyculin A induces eryptosis and, if so, whether its effect requires Ca2+ entry, kinases and/or caspases Methods: Phosphatidylserine exposure at the cell surface was estimated from annexin-V-binding, cell volume from forward scatter, and [Ca2+](i) from Fluo-3 fluorescence, as determined by flow cytometry. A48 hours exposure of human erythrocytes to Calyculin A (>= 2.5 nM) significantly increased the percentage of annexin-V-binding cells, significantly decreased forward scatter and significantly increased Fluo-3 fluorescence. The effect of Calyculin A on annexin-V-binding was significantly blunted by removal of extracellular Ca2+, by staurosorine (1 mu M), SB203580 (2 mu M), D4476 (10 mu M), and zVAD (10 mu M)."

According to the news editors, the research concluded: "Calyculin A triggers cell shrinkage and phospholipid scrambling of the erythrocyte cell membrane, an effect at least in part requiring Ca2+ entry, kinase activity and caspase activation."

Our news journalists report that additional information may be obtained by contacting F. Lang, Heinrich Heine Univ, Fac Med, Dept. of Mol Med 2, Dusseldorf, Germany. Additional authors for this research include M. Jernaar, M. Mischitelli, C. Faggio and F. Lang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000452534. This DOI is a link to an online electronic document that is either free or for purchase.

Hormones

Studies from Herlev University Hospital Provide New Data on Hormones (The analgesic effects of exogenous melatonin in humans)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hormones have been presented. According to news reporting from Herlev, Denmark, by NewsRx editors, the research stated, "The hormone, melatonin is produced with circadian rhythm by the pineal gland in humans. The melatonin rhythm provides an endogenous synchronizer, modulating e.g. blood pressure, body temperature, cortisol rhythm, sleep-awake-cycle, immune function and anti-oxidative defence."

The news correspondents obtained a quote from the research from Herlev University Hospital, "Interestingly, a number of experimental animal studies demonstrate significant dose-dependent anti-nociceptive effects of exogenous melatonin. Similarly, recent experimental- and clinical studies in humans indicate significant analgesic effects. In study I, we systematically reviewed all randomized studies investigating clinical effects of perioperative melatonin. Meta-analyses demonstrated significant analgesic and anxiolytic effects of melatonin in surgical patients, equating reductions of 20 mm and 19 mm, respectively on a VAS, compared with placebo. Profound heterogeneity between the included studies was, however, present. In study II, we aimed to investigate the analgesic, anti-hyperalgesic and anti-inflammatory effects of exogenous melatonin in a validated human inflammatory pain model, the human burn model. The study was performed as a randomized, double blind placebo-controlled crossover study. Primary outcomes were pain during the burn injury and areas of secondary hyperalgesia. No significant effects of exogenous melatonin were observed with respect to primary or secondary outcomes, compared to placebo. III and IV estimated the pharmacokinetic variables of exogenous melatonin. Oral melatonin demonstrated a tmax value of 41 minutes. Bioavailability of oral melatonin was only 3%. Elimination t(1/2) were approximately 45 minutes following both oral and intravenous administration, respectively. High-dose intravenous melatonin was not associated with increased sedation, in terms of simple reaction times, compared to placebo. Similarly, no other adverse effects were reported. In Study V, we aimed to re-analyse data obtained from a randomized analgesic drug trial by a selection of standard statistical test. Furthermore, we presented an integrated assessment method of longitudinally measured pain intensity and opioid consumption. Our analyses documented that the employed statistical method impacted the statistical significance of postoperative analgesic outcomes. Furthermore, the novel integrated assessment method combines two interdependent outcomes, lowers the risk of type 2 errors, increases the statistical power, and provides a more accurate description of postoperative analgesic efficacy. Exogenous melatonin may offer an effective and safe analgesic drug. At this moment, however, the results of human studies have been contradictory. High-quality randomized experimental- and clinical studies are still needed to establish a 'genuine' analgesic effect of the drug in humans. Other perioperative effects of exogenous melatonin should also be investigated, before melatonin can be introduced for clinical routine use in surgical patients."

According to the news reporters, the research concluded: "Despite promising experimental and clinical findings, several unanswered questions also relate to optimal dosage, timing of administration and administration route of exogenous melatonin."
Cardiovascular Diseases and Conditions

Studies from Hiroshima University Hospital Reveal New Findings on Atherosclerosis (Vascular Function and Intima-media Thickness of a Leg Artery in Peripheral Artery Disease: A Comparison of Buerger Disease and Atherosclerotic Peripheral Artery ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Atherosclerosis are discussed in a new report. According to news reporting originating in Hiroshima, Japan, by NewsRx journalists, research stated, "Both vascular function and structure are independent predictors of cardiovascular events. The purpose of this study was to evaluate vascular function and structure of a leg artery in patients with peripheral artery disease (PAD)."

The news reporters obtained a quote from the research from Hiroshima University Hospital, "We measured flow-mediated vasodilatation (FMD) and nitroglycerine-induced vasodilation (NID) as indices of vascular function and intima-media thickness (IMT) as an index of vascular structure of the popliteal artery in 100 subjects, including 20 patients with Buerger disease and 30 patients with atherosclerotic PAD, 20 age-and sex-matched subjects without Buerger disease (control group) and 30 age-and sex-matched patients without atherosclerotic PAD (control group). IMT was significantly larger in the Buerger group than in the control group (Buerger, 0.63 +/- 0.20 mm; control, 0.50 +/- 0.07 mm; P=0.01), whereas there were no significant differences in FMD and NID between the two groups. IMT was significantly larger in the atherosclerotic PAD group than in the control group (atherosclerotic PAD, 0.80 +/- 0.22 mm; control, 0.65 +/- 0.14 mm; P< 0.01), and FMD and NID were significantly smaller in the atherosclerotic PAD group than in the control group (FMD: atherosclerotic PAD, 3.9% +/- 1.1%; control, 5.0% +/- 1.8%; P< 0.01; and NID: atherosclerotic PAD, 6.1% +/- 2.0%; control, 8.4% +/- 2.1%; P< 0.01)."

According to the news reporters, the research concluded: "These findings suggest that vascular function is preserved in patients with Buerger disease and that both vascular function and vascular structure are impaired in patients with atherosclerotic PAD."

For more information on this research see: Vascular Function and Intima-media Thickness of a Leg Artery in Peripheral Artery Disease: A Comparison of Buerger Disease and Atherosclerotic Peripheral Artery Disease. Journal of Atherosclerosis and Thrombosis, 2016;23
Nutritional and Metabolic Diseases and Conditions - …

Studies from Hokkaido University Reveal New Findings on Obesity
[Squalene modulates fatty acid metabolism: Enhanced EPA/DHA in obese/diabetic mice (KK-A(y)) model]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting from Hakodate, Japan, by NewsRx journalists, research stated, "Biosynthesis of long-chain n-3 fatty acids from precursors is limited. In vivo effect of squalene (SQ) on the metabolic fate of n-3 fatty acid precursors in obese/diabetes-prone male KK-A(y) mice was evaluated in our work."

The news correspondents obtained a quote from the research from Hokkaido University, "Soybean oil, being rich in ALA (18:3 n-3; a known precursor of EPA/DHA), was chosen as the n-3 fatty acid precursor rich source. A high-fat diet (20%) containing 7% soybean oil (SO) was fed to obesity/diabetes-prone male KK-A(y) mice (control). In the case of diets fed to test groups, soybean oil was replaced with 5% SO and 2% SQ. Hepatic DHA levels increased (four fold) in SQ fed group over control (p <0.05). Gene and protein expressions of (5) and (6) desaturases, key enzymes involved in the fatty acid metabolism, further supported the results. Also, SQ exhibited a hypotriglyceridemic and hypoglycemic effect. The results clearly indicated the effect of SQ in modulating the n-3 fatty acid metabolism, including EPA/DHA synthesis in the presence of n-3 fatty acid precursor. This is the first report of enhancement of in vivo DHA/EPA by SQ and in turn, modulating the physiological fatty acid profile. Squalene (SQ) is an important marine biofunctional material that is found in some terrestrial sources as well. Squalene, being a cholesterol precursor, forms an interesting subject of research for its effect in vivo. SQ significantly enhanced proportions of EPA and/or DHA when their n-3 fatty acid precursors were available in the diet. The study further establishes the usefulness of SQ in functional food formulations. The work provides an important basis for further evaluation of the role of SQ in normal and disease conditions. KK-A(y) mice were fed high fat/sucrose diet to induce obesity/diabetes. Fat source in control diet was lard and soybean oil while experimental group diet contained 2% squalene+13% lard+5% soybean oil. Feeding squalene for 4weeks modulated fatty acid metabolism with increased docosahexaenoic acid (DHA) and decrease in
triglycerides (TG), compared to control. The enhanced DHA in the fatty acid profile was supported by upregulated mRNA expression of (5)-desaturase enzyme and protein expression of (5) and (6) desaturases (FADS1 and FADS2)."

According to the news reporters, the research concluded: "Additionally, squalene had a hypoglycemic effect in the mice."

Our news journalists report that additional information may be obtained by contacting S.R. Kumar, Hokkaido University, Fac Fisheries Sci, Hakodate, Hokkaido 0418611, Japan. Additional authors for this research include I. Yamauchi, B. Narayan, A. Katsuki, M. Hosokawa and K. Miyashita.

Drugs and Therapies - Coumarins and Indandiones

Studies from Hokkaido University in the Area of Coumarins and Indandiones Described [Novel revelation of warfarin resistant mechanism in roof rats (Rattus rattus) using pharmacokinetic/pharmacodynamic analysis]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Coumarins and Indandiones. According to news reporting originating from Hokkaido, Japan, by NewsRx correspondents, research stated, "Roof rats (Rattus rattus) live mainly in human habitats. Heavy use of rodenticides, such as warfarin, has led to the development of drug resistance, making pest control difficult."

"There have been many reports regarding mutations of vitamin K epoxide reductase (VKOR), the target enzyme of warfarin, in resistant rats. However, it has been suggested there are other mechanisms of warfarin resistance. To confirm these possibilities, closed colonies of warfarin-susceptible roof rats (S) and resistant rats from Tokyo ® were established, and the pharmacokinetics/ pharmacodynamics of warfarin in rats from both colonies was investigated. R rats had low levels of warfarin in serum and high clearance activity. These rats can rapidly metabolize warfarin by hydroxylation. The levels of accumulation in the organs were lower than those of S rats. R rats administered warfarin showed high expression levels of CYP2B, 2C, and 3A, which play roles in warfarin hydroxylation, and may explain the high clearance ability of R
According to the news editors, the research concluded: "The mechanism of warfarin resistance in roof rats from Tokyo involved not only mutation of VKOR but also high clearance ability due to high levels of CYP2B, 2C and 3A expression possibly induced by warfarin."

The news editors report that additional information may be obtained by contacting M. Ishizuka, Hokkaido University, Grad Sch Vet Med, Dept. of Environm Vet Sci, Toxicol LabKita Ku, Sapporo, Hokkaido 0600818, Japan. Additional authors for this research include Y. Ikenaka, T. Tanikawa, K.D. Tanaka, S.M.M. Nakayama, H. Mizukawa and M. Ishizuka.

Drugs and Therapies - Menthol Therapy

Studies from Hoshi University in the Area of Menthol Therapy Reported (Effect of Nerolidol and/or Levulinic Acid on the Thermotropic Behavior of Lipid Lamellar Structures in the Stratum Corneum)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Menthol Therapy have been published. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Permeation enhancers are required to deliver drugs through the skin efficiently and maintain effective blood concentrations. Studies of the barrier function of the stratum corneum using l-menthol, a monocyclic monoterpene widely used in medicines and foods, have revealed an interaction between characteristic intercellular lipid structures in the stratum corneum and permeation enhancers."

Our news editors obtained a quote from the research from Hoshi University, "The variety of permeation enhancers that can be used to contribute to transdermal delivery systems beyond l-menthol is increasing. In this study, we focused on nerolidol and levulinic acid and investigated their influence on stratum corneum lipid structures. Nerolidol, a sesquiterpene, has been reported to enhance the permeation of various drugs. Levulinic acid is reported to enhance the permeability of buprenorphine and is used as a component of the buprenorphine ® patch. Synchrotron X-ray diffraction and attenuated total reflectance Fourier transform IR spectroscopy measurements revealed that nerolidol disturbs the rigidly arranged lipid structure and increases lipid fluidity. Levulinic acid had a smaller effect on stratum corneum lipid structures, but did
increase lipid fluidity when co-administered with nerolidol or heat."

According to the news editors, the research concluded: "We found that nerolidol has an effect on stratum corneum lipids similar to that of l-menthol, and levulinic acid had an effect similar to that of oleic acid."

The news editors report that additional information may be obtained by contacting S. Utsumi, Hoshi University, Dept. of Pharmaceut, Shinagawa Ku, Tokyo 1428501, Japan. Additional authors for this research include T. Nakamura, Y. Obata, N. Ohta and K. Takayama.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1248/cpb.c16-00515. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Tokyo, Japan, Asia, Drugs and Therapies, Levulinic Acids, Menthol Therapy, Antipruritic, Keto Acids, Hoshi University.

**Aortic Stenosis**

**Studies from Hospital Center Describe New Findings in Aortic Stenosis (Comparison in Men Versus Women of Co-morbidities, Complications, and Outcomes After Transcatheter Aortic Valve Implantation for Severe Aortic Stenosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Aortic Stenosis is now available. According to news reporting out of Washington, District of Columbia, by NewsRx editors, research stated, "Transcatheter aortic valve implantation (TAVI) decreases mortality in high-risk patients with severe aortic stenosis, but it remains unclear if female gender is associated with more favorable outcomes after TAVI. All patients who underwent TAVI at a single institution were retrospectively analyzed and stratified by gender."

Our news journalists obtained a quote from the research from Hospital Center, "Procedural, in-hospital, 30-day, and 1-year outcomes were defined according to the second Valve Academic Research Consortium. The primary end point was all-cause mortality at 1 year. Kaplan-Meier survival analysis and multivariable Cox proportional hazards regression were conducted. Overall, 755 patients underwent TAVI and were included in the study; 50.7% were women. Average age was 83.0 +/- 7.7 years, with a mean Society of Thoracic Surgeons score of 8.9 +/- 4.6. Women were older than men and more likely to be black. Most co-morbidities were less common among women, and they were more likely than men to suffer both in-hospital (8.4% vs 4.3%, p = 0.021) and 30-day (9.4% vs 5.4%, p = 0.035) all-cause mortality. Life-threatening bleeding, transfusion, and iliofemoral dissection or perforation were more common among women. There was no difference in mortality between women and men at 1 year (20.6% vs 21.5%, log-rank p = 0.87). After multivariable adjustment, however, female gender was independently associated with lower mortality at 1 year after TAVI."
According to the news editors, the research concluded: "Despite higher rates of major bleeding, vascular complications, and 30-day mortality, female gender was independently associated with improved survival at 1 year after TAVI."

Our news journalists report that additional information may be obtained by contacting M.A. Gaglia, MedStar Washington Hosp Center, Div Cardiol, Sect Intervent Cardiol, Washington, DC 20010, United States. **Hearing Diseases and Conditions - Deafness**

**Studies from Hospital Center Have Provided New Data on Deafness (An Application of NGS for Molecular Investigations in Perrault Syndrome: Study of 14 Families and Review of the Literature)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hearing Diseases and Conditions - Deafness have been published. According to news reporting originating from Limoges, France, by NewsRx correspondents, research stated, "Perrault syndrome (PS) is a rare autosomal recessive condition characterized by deafness and gonadic dysgenesis. Recently, mutations in five genes have been identified: C10orf2, CLPP, HARS2, HSD17B4, and LARS2."

Our news editors obtained a quote from the research from Hospital Center, "Proband included are presented with sensorineural deafness associated with gonadic dysgenesis. DNA was sequenced using next-generation sequencing (NGS) with a panel of 35 deafness genes including the five Perrault genes. Exonic variations known as pathogenic mutations or detected with <1% frequency in public databases were extracted and subjected to segregation analysis within each family. Both mutations and low coverage regions were analyzed by Sanger sequencing. Fourteen female index patients were included. The screening in four cases has been extended to four family members presenting with PS phenotype. For four unrelated patients (28.6%), causative mutations were identified: three homozygous mutations in C10orf2, CLPP, and HARS2, and one compound heterozygous mutation in LARS2. Three additional heterozygous mutations in LARS2 and HSD17B4 were found in three independent familial cases. All these missense mutations were verified by Sanger sequencing. Familial
segregation analyses confirmed the molecular diagnosis in all cases carrying biallelic mutations. Because of NGS, molecular analysis confirmed the clinical diagnosis of PS in 28.6% of our cohort and four novel mutations were found in four Perrault genes.

According to the news editors, the research concluded: "For the unsolved cases, exome sequencing should be performed to search for a sixth unknown PS gene."

The news editors report that additional information may be obtained by contacting J. Lerat, University of Dupuytren Hospital Center, Otorhinolaryngol & Chirurg Cervicofaciale, Limoges, France. Additional authors for this research include L. Jonard, N. Loundon, S. Christin-Maitre, D. Lacombe, C. Goizet, C. Rouzier, L. Van Maldergem, S. Gherbi, E.N. Garabedian, J.P. Bonnefont, P. Touraine, I. Mosnier, A. Munnich, F. Denoyelle and S. Marlin.

Oncology - Liver Cancer

Studies from Huazhong University of Science and Technology Have Provided New Data on Liver Cancer [A polyethylenimine-modified carboxyl-poly(styrene/acrylamide) copolymer nanosphere for co-delivering of CpG and TGF-beta receptor I inhibitor with ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news originating from Hubei, People's Republic of China, by NewsRx correspondents, research stated, "Cancer immunotherapy based on nanodelivery systems has shown potential for treatment of various malignancies, owing to the benefits of tumor targeting of nanoparticles. However, induction of a potent T-cell immune response against tumors still remains a challenge."

Our news journalists obtained a quote from the research from the Huazhong University of Science and Technology, "In this study, polyethylenimine-modified carboxyl-styrene/acrylamide (PS) copolymer nanospheres were developed as a delivery system of unmethylated cytosine-phosphate-guanine (CpG) oligodeoxynucleotides and transforming growth factor-beta (TGF-beta) receptor I inhibitors for cancer immunotherapy. TGF-beta receptor I inhibitors (LY2157299, LY) were encapsulated to the PS via hydrophobic interaction, while CpG oligodeoxynucleotides were loaded onto the PS through electrostatic interaction. Compared to the control group, tumor inhibition in the PS-LY/CpG group was up to 99.7% without noticeable toxicity. The tumor regression may be attributed to T-cell activation and amplification in mouse models."

According to the news editors, the research concluded: "The results highlight the
additive effect of CpG and TGF-beta receptor I inhibitors co-delivered in cancer immunotherapy."

**Drugs and Therapies - Chemotherapy**

**Studies from Huazhong University of Science and Technology Provide New Data on Chemotherapy (Young Cervical Cancer Patients May Be More Responsive than Older Patients to Neoadjuvant Chemotherapy Followed by Radical Surgery)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Chemotherapy is now available. According to news originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "To evaluate the effects of age and the clinical response to neoadjuvant chemotherapy (NACT) in patients with cervical cancer who received neoadjuvant chemotherapy followed by radical surgery. A total of 1,014 patients with advanced cervical cancer who received NACT followed by radical surgery were retrospectively selected."

Our news journalists obtained a quote from the research from the Huazhong University of Science and Technology, "Patients were divided into young (aged <=35 years, n=177) and older (aged >35 years, n=837) groups. We compared the short-term responses and survival rates between the groups. The five-year disease-free survival (DFS) and overall survival (OS) rates were stratified by age, NACT response, and FIGO stage. The overall response rate was 86.8% in the young group and 80.9% in the older group. The young patients had an earlier FIGO stage (p <0.001), a higher rate of adenocarcinoma (p=0.022), and more lymph node metastasis (p=0.033) than the older patients. The presence of adenocarcinoma as the histological type (p=0.024) and positive lymph node metastasis (p <0.001) were identified as independent risk factors for survival. When stratified by age and clinical response, young patients with no response to NACT had a worse clinicopathological condition compared with the other subgroups. Compared with non-responders, responders to NACT had a higher five-year DFS rate (80.1% versus 71.8%; p=0.019) and OS rate (82.6% versus 71.8%; p=0.003) among the young patients but not among the older patients. Responders to NACT aged 35 years or younger
benefitted the most from NACT, while the young non-responders benefitted the least."

According to the news editors, the research concluded: "Age might represent an important factor to consider when performing NACT in patients with cervical cancer."

**Nervous System Diseases and Conditions -...**

**Studies from Huazhong University of Science and Technology in the Area of Hyperalgesia Described (Inhibition of CaMKII alpha in the Central Nucleus of Amygdala Attenuates Fentanyl-Induced Hyperalgesia in Rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nervous System Diseases and Conditions - Hyperalgesia have been presented. According to news originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "Opioid-induced hyperalgesia (OIH) is a less-studied phenomenon that has been reported in both preclinical and clinical studies. Although the underlying cause is not entirely understood, OIH is a real-life problem that affects millions of patients on a daily basis."

Our news journalists obtained a quote from the research from the Huazhong University of Science and Technology, "Research has implicated the important contribution of Ca2+/calmodulin-dependent protein kinase II alpha (CaMKII alpha) to OIH at the level of spinal nociceptors. To expand our understanding of the entire brain circuitry driving OIH, in this study we investigated the role of CaMKII alpha in the laterocapcular division of the central amygdala (CeLC), the conjunctive point between the spinal cord and rostro-ventral medulla, OIH was produced by repeated fentanyl administration in the rat. Correlating with the development of mechanical allodynia and thermal hyperalgesia, CaMKII alpha activity was significantly elevated in the CeLC in OIH. In addition, the frequency and amplitude of spontaneous miniature excitatory postsynaptic currents (mEPSCs) in CeLC neurons were significantly increased in OIH. 2-[N-(2-hidroxyethyl)-N-(4-methoxybenzenesulfonyl)]-amino-N-(4-chlorocinnamyl)-N-methylbenzylamine, a CaMKII alpha inhibitor, dose dependently reversed sensory hypersensitivity, activation of CeLC CaMKII alpha, and mEPSCs in OIH."
According to the news editors, the research concluded: "Taken together, our data for the first time implicate a critical role of CeLC CaMKII alpha in OIH."

For more information on this research see: Inhibition of CaMKII alpha in the Central Nucleus of Amygdala Attenuates Fentanyl-Induced Hyperalgesia in Rats. *Journal of Pharmacology and Experimental Therapeutics*, 2016;359(1):82-89. *Journal of Pharmacology and Experimental Therapeutics* can be contacted at: Amer Soc Pharmacology Experimental Therapeutics, 9650 Rockville Pike, Bethesda, MD 20814-3995, USA.

**Cardiovascular Diseases and Conditions - Transient...**

**Studies from Hunter College Have Provided New Information about Transient Ischemic Attack (Transient Ischemic Attack and Cognitive Impairment: A Review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Transient Ischemic Attack. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Transient ischemic attack (TIA) is a neurologic deficit resulting from focal ischemia in the brain, spinal cord, or retina. Historically, the definition included symptom resolution within 24 hours."

The news correspondents obtained a quote from the research from Hunter College, "However, recent studies investigating cognition after TIA suggest that deficits in executive function persist at 7 days post-TIA, although few studies have examined these effects long term. Recent advances in neuroimaging techniques provide emerging evidence of permanent microvascular tissue damage in the brain, suggesting that the effects of TIA may persist beyond resolution of focal symptoms. A further challenge is that there is debate concerning the clinical definition of TIA and the use of diagnostic neuroimaging studies and standardization of neuropsychological tests used to evaluate cognitive deficits in this population. Subtle changes in memory, attention, and problem-solving abilities may negatively influence an individual's ability to adopt positive health behaviors. Despite advances in the field, more research is needed; hence, the purpose of this article is to provide an overview of clinical factors for clinicians and researchers to consider when investigating cognitive deficits among post-TIA populations. Definitions of TIA are reviewed, and the importance of neuropsychological evaluation and neuroimaging correlates of TIA in establishing a positive diagnosis will be discussed."

According to the news reporters, the research concluded: "Nurses especially in advanced practice roles are uniquely positioned to assess and implement treatments in at-risk
groups and therefore should be knowledgeable about these possible cognitive effects."

For more information on this research see: Transient Ischemic Attack and Cognitive Impairment: A Review. *Journal of Neuroscience Nursing*, 2016;48(6):322-327. *Journal of Neuroscience Nursing* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Digestive System Diseases and Conditions - Crohn's**

**Studies from Hyogo College of Medicine Have Provided New Information about Crohn’s Disease (Clinicopathological characteristics of cancer associated with Crohn's disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Digestive System Diseases and Conditions - Crohn's Disease have been presented. According to news originating from Nishinomiya, Japan, by NewsRx correspondents, research stated, "We examined the clinicopathological characteristics and prognosis of patients with cancer associated with Crohn's disease (CD). The subjects of this study were patients with cancer confirmed in a resected specimen of bowel, who were treated at our institution between September, 1974 and December, 2014."

Our news journalists obtained a quote from the research from the Hyogo College of Medicine, "We analyzed 34 patients (26 men, 8 women, median age at cancer diagnosis 43.5 years, duration of illness 18 years) and found that the number of those with CD complicated with cancer began to drastically increase after 2005. The site of onset of cancer was in an anorectal lesion in 24 (70.6 %) patients. In 17 (50 %) patients, the cancer was diagnosed before surgery; in 3 patients (8.8 %), it was based on pathological findings during surgery; and in 14 patients (41.2 %), it was based on postoperative pathological findings. Mucinous carcinoma was the dominant histological type, seen in 15 patients (44.1 %), while the special type of signet-ring cell carcinoma was found in 4 patients. The cumulative overall 5 year survival rate was 46.2 %. In this group of Japanese CD patients, an anorectal lesion was the most frequent site of origin of cancer."

According to the news editors, the research concluded: "As cancer was diagnosed preoperatively in only 50 % of these patients, the overall prognosis was poor, with a cumulative 5 year survival rate of just 46.2 %.

For more information on this research see: Clinicopathological characteristics of cancer associated with Crohn's disease. *Surgery Today*, 2017;47(1):35-41. *Surgery Today* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer -

Clinical Research - Clinical Trials and Studies

Studies from Hyogo College of Medicine Reveal New Findings on Clinical Trials and Studies (Randomised clinical trial: efficacy and safety of vonoprazan vs. lansoprazole in patients with gastric or duodenal ulcers - results from two phase 3, ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting from Nishinomiya, Japan, by NewsRx journalists, research stated, "Vonoprazan is a new potassium-competitive acid blocker for treatment of acid-related diseases. To conduct two randomised-controlled trials, to evaluate the non-inferiority of vonoprazan vs. lansoprazole, a proton pump inhibitor, for treatment of gastric ulcer (GU) or duodenal ulcer (DU)."

Financial support for this research came from Takeda Pharmaceutical Company.

The news correspondents obtained a quote from the research from the Hyogo College of Medicine, "Patients aged >= 20 years with >= 1 endoscopically-confirmed GU or DU (>= 5 mm white coating) were randomised 1:1 using double-dummy blinding to receive lansoprazole (30 mg) or vonoprazan (20 mg) for 8 (GU study) or 6 (DU study) weeks. The primary endpoint was the proportion of patients with endoscopically confirmed healed GU or DU. For GU, 93.5% (216/231) of vonoprazan-treated patients and 93.8% (211/225) of lansoprazole-treated patients achieved healed GU; non-inferiority of vonoprazan to lansoprazole was confirmed [difference = -0.3% (95% CI -4.750, 4.208); P = 0.0011]. For DU, 95.5% (170/178) of vonoprazan-treated patients and 98.3% (177/180) of lansoprazole-treated patients achieved healed DU; non-inferiority to lansoprazole was not confirmed [difference = -2.8% (95% CI -6.400, 0.745); P = 0.0654]. The incidences of treatment-emergent adverse events were slightly lower for GU and slightly higher for DU with vonoprazan than with lansoprazole. There was one death (subarachnoid haemorrhage) in the vonoprazan group (DU). The possibility of a relationship between this unexpected patient death and the study drug could not be ruled out. In both studies, increases in serum gastrin levels were greater in vonoprazan-treated vs. lansoprazole-treated patients; levels returned to baseline after treatment in both groups."

According to the news reporters, the research concluded: "Vonoprazan 20 mg has a similar tolerability profile to lansoprazole 30 mg and is non-inferior with respect to GU healing and has similar efficacy for DU healing."

For more information on this research see: Randomised clinical trial: efficacy and

Our news journalists report that additional information may be obtained by contacting H. Miwa, Hyogo Coll Med, Nishinomiya, Hyogo, Japan. Additional authors for this research include N. Uedo, J. Watari, Y. Mori, Y. Sakurai, Y. Takanami, A. Nishimura, T. Tatsumi and N. Sakaki.

**Oncology - Breast Cancer**

**Studies from Hyogo College of Medicine in the Area of Breast Cancer Described (Prognostic significance of preoperative F-18-FDG PET/CT for breast cancer subtypes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting from Nishinomiya, Japan, by NewsRx journalists, research stated, "Adjuvant treatments for operable breast cancers are determined according to subtypes defined based on estrogen receptor (ER) and human epidermal growth factor receptor 2 (HER2) status. The ER+/HER2- subtype can be divided into luminal A and luminal B usually by Ki67 expression levels."

The news correspondents obtained a quote from the research from the Hyogo College of Medicine, "Although tumor size, lymph node metastasis and tumor grade have been widely accepted in daily clinical practice, the identification of further prognostic indicators especially in the ER+/HER2- subtype is warranted. A total of 387 operated breast cancers for which maximum standardized uptake value (SUVmax) on the F-18-fluorodeoxyglucose positron-emission tomography/computed tomography (FDG PET/CT) were available at baseline were retrospectively analyzed. The optimal cutoff value of SUVmax for relapse-free survival (RFS) was determined to be 3.585 by means of the receiver operating characteristics curve with an area under the curve of 0.6795 (95% CI: 0.5972 to 0.7618, p = 0.0006, sensitivity: 78.8%, specificity: 57.1%). The RFS of patients with SUVmax-high (n = 178) was significantly (p = 0.0003) worse compared with those with SUVmax-low (n = 209). This significant association was prominently recognized in the ER+/HER2- subtype. By multivariable analysis, SUVmax (hazard ratio: 3.83, 95% confidence interval: 1.28-11.51, p = 0.017), tumor size (4.22, 1.39-12.82, p = 0.011) and lymph node metastasis (4.44, 1.81-10.87, p = 0.0012) were significant and independent prognostic factors for RFS. The ER+/HER2- subtype demonstrated consistently worse RFS in the SUVmax-high patients both in the luminal A (p = 0.037) and luminal B (p =
0.047) subtypes."

According to the news reporters, the research concluded: "Combination of Ki67 and SUVmax appears to be useful for selecting patients who have inferior prognosis and need further adjuvant treatment of the ER+/HER2- subtype."

Our news journalists report that additional information may be obtained by contacting Y. Miyoshi, Hyogo Coll Med, Div Breast & Endocrine, Dept. of Surg, Nishinomiya, Hyogo 6638501, Japan. Central Nervous System - Brain Research

**Studies from I. Muramatsu et al Provide New Data on Brain Research (Pharmacological evidence of specific acetylcholine transport in rat cerebral cortex and other brain regions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System - Brain Research have been published. According to news reporting out of Fukui, Japan, by NewsRx editors, research stated, "Functional acetylcholine receptors (AChRs) were recently demonstrated to exist not only in the plasma membrane but also intracellularly in brain tissues. In order to activate intracellular AChRs, endogenous hydrophilic ACh must cross the plasma membrane."

Financial supporters for this research include University of Fukui, Japan Society for the Promotion of Science, Smoking Research Foundation.

Our news journalists obtained a quote from the research, "Here, we examined the pharmacological characteristics of this process, including whether it is mediated by active ACh uptake. When ACh esterase (AChE) was suppressed by diisopropylfluorophosphate, [H-3]ACh was effectively taken up into segments of rat cerebral cortex and other brain regions, in contrast to peripheral tissues such as liver and kidney. The uptake of [H-3]ACh in rat cerebral cortex was temperature-dependent, and the uptake capacity was comparable to that of [H-3]choline. However, [H-3]ACh uptake was inhibited by lower concentrations of ACh, carbachol, tetraethylammonium (TEA), compared with uptake of [H-3]choline. Uptake of [H-3]ACh was also inhibited by several organic cations, including choline, hemicholinium-3 (HC-3), quinidine, decynium 22, clonidine, diphenhydramine, but was little affected by some amino acids and biogenic amines, corticosterone, spermine, atropine, and tetrodotoxin. Unlike diisopropylfluorophosphate, several ACh esterase inhibitors, including drugs for Alzheimer's disease, such as donepezil, galantamine, and rivastigmine, also suppressed the uptake of [H-3]ACh, but not [H-3]choline."
According to the news editors, the research concluded: "These results indicate that in the brain, ACh is specifically taken up through a unique transport system with different pharmacological properties from known organic cation transporters (OCTs), and suggest that this mechanism may be involved in intracellular cholinergic transmission in the brain."

Our news journalists report that additional information may be obtained by contacting I. Muramatsu, Kimura Hosp, Fukui, Japan. Additional authors for this research include H. Yoshiki, J. Uwada, T. Masuoka, K. Sada, T. Taniguchi and M. Nishio.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jnc.13843. This DOI is a link to an online electronic document that is either free or for purchase.

Central Nervous System Diseases and Conditions -...

Studies from I.C. Pagiola and Co-Researchers Update Current Data on Intracranial Aneurysm (Cerebral aneurysms associated with human immunodeficiency virus in adults: literature review and new perspectives)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Intracranial Aneurysm. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "The treatment of human immunodeficiency virus (HIV) infection has been decreasing patient morbidity and mortality by opportunistic infections and, thus, survival has increased. This new reality has been changing the spectrum of diseases affecting such patients."

Our news journalists obtained a quote from the research, "to discuss the association between HIV and the emergence of aneurysmal brain injuries, it was performed a literature review using medical database. The following descriptors were searched: 'Intracranial Aneurysms and HIV', 'Intracranial Aneurysms and Acquired Immunodeficiency Syndrome,' 'aneurysm and brain and HIV'. after performed a literature review, it was observed that the relationship between HIV infection and the formation of aneurysms appears to be real, however, it still lacks data to confirm the pathophysiology of this condition and its best treatment."

According to the news editors, the research concluded: "There are new signs and symptoms that should be studied and researched relating HIV with other changes not previously
known."

The news correspondents report that additional information may be obtained from I.C. Pagiola, Irmandade da Santa Casa de Misericordia de Sao Paulo, Sao Paulo, SP, Brazil. Additional authors for this research include A.L. Paiva, G.B. de Aguiar, A.C. de Oliveira, M.L. Conti and R.J Gagliardi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1590/1806-9282.62.01.85. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Hepatitis C Virus

Studies from IKEM Have Provided New Information about Hepatitis C Virus (Efficacy and safety of elbasvir/grazoprevir and sofosbuvir/pegylated interferon/ribavirin: A phase III randomized controlled trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Hepatitis C Virus are presented in a new report. According to news reporting originating in Prague, Czech Republic, by NewsRx journalists, research stated, "Direct-acting antiviral agents have improved treatment outcomes for patients with hepatitis C virus (HCV) infection; however, head-to-head comparisons are limited. The C-EDGE Head-2-Head Study compared the safety and efficacy of elbasvir/grazoprevir (EBR/GZR) with sofosbuvir plus pegylated interferon/ribavirin (SOF/PR) in patients with HCV infection."

The news reporters obtained a quote from the research from IKEM, "This was a randomized, open-label, phase III trial. Two hundred fifty-seven patients with HCV genotype (GT)1 or 4 infection and baseline viral load >10,000 IU/ml were randomized to receive 12 weeks of EBR/GZR 50mg/100mg once daily (n=129) or sofosbuvir (400mg once daily) plus PR (n=128). Primary efficacy objective was sustained virologic response 12 weeks after the end of therapy (SVR12, HCV RNA <15IU/ml). The primary safety objective was the proportion of patients experiencing a tier 1 safety event. The majority of patients were non-cirrhotic (83.1%), treatment-naive (74.9%) and had HCV GT1b infection (82.0%). SVR12 rates were 99.2% (128/129) and 90.5% (114/126) in the EBR/GZR and SOF/PR groups, respectively. The estimated adjusted difference in SVR12 was 8.8% (95% confidence interval [CI], 3.6-15.3%). Because the lower bound of the 1-sided 1-sample exact test was greater than -10% and greater than zero, both non-inferiority and superiority of EBR/GZR vs. SOF/PR were established. The frequency of tier 1 safety events was lower among patients receiving EBR/GZR than SOF/PR.
EBR/GZR has a superior efficacy and safety profile in patients with HCV GT1 or 4 infection compared with SOF/PR. Lay summary: The combination of elbasvir/grazoprevir for 12 weeks was highly effective in treating patients with chronic hepatitis C, genotypes 1 or 4 infection. This regimen was more effective than sofosbuvir/pegylated interferon/ribavirin for 12 weeks, and was notably superior in patients regarded as difficult to treat, including those with previous treatment failure, cirrhosis, or a high baseline viral load."

According to the news reporters, the research concluded: "The combination of elbasvir/grazoprevir also demonstrated a superior safety and tolerability profile based on fewer serious adverse events, no serious drug-related adverse events, and no treatment discontinuations."

Our news correspondents report that additional information may be obtained by contacting J. Sperl, IKEM, Prague, Czech Republic. Additional authors for this research include G. Horvath, W. Halota, J.A. Ruiz-Tapiador, A. Streinu-Cercel, L. Jancoriene, K. Werling, H. Kileng, S. Koklu, J. Gerstoft, P. Urbanek, R. Flisiak, R. Leiva, E. Kazenaite, R. Prinzing, S. Patel, J.J. Qiu, E. Asante-Appiah and Wahl.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jhep.2016.07.050. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Antiinflammatory Agents**

**Studies from ISCIII Update Current Data on Antiinflammatory Agents (Friedelane-type triterpenoids as selective anti-inflammatory agents by regulation of differential signaling pathways in LPS-stimulated macrophages)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antiinflammatory Agents. According to news originating from Madrid, Spain, by NewsRx correspondents, research stated, "A series of 31 pentacyclic triterpenoids isolated from the root barks of Celastrus vulcanicola and Maytenus jelskii were tested for cytotoxicity and inhibitory
activity against lipopolysaccharide (LPS)-induced nitric oxide (NO) production in RAW 264.7 macrophages. Compounds 18 (C18) and 25 (C25) exhibited significant inhibition of LPS-induced NO release at 50 and 25 μM concentrations, respectively, and decreased mRNAs of pro inflammatory cytokines.

Financial supporters for this research include Ministerio de Economia y Competitividad, Spain, Centro de Investigacion Biomedica en Red de Diabetes y Enfermedades Metabolicas Asociadas, Instituto de Salud Carlos III, Spain.

Our news journalists obtained a quote from the research from ISCIII, "At the molecular level, C18 neither inhibited LPS-mediated phosphorylation of mitogen activated protein kinases (MAPKs) nor nuclear translocation of nuclear factor kappa beta (NF kappa B). Instead, C18 enhanced and prolonged nuclear translocation of nuclear factor-erythroid 2-related factor 2 (Nrf2) and increased the expression of its target genes including hemeoxigenase 1 (HO1). C25 efficiently inhibited LPS-mediated phosphorylation of JNK, p38 and ERK, without affecting Nf kappa B or Nrf2 signaling pathways. Both compounds reduced LPS-mediated processing of caspase-1 and the cleavage of interleukin 1 beta (IL1 beta) proform, reflecting their ability to target the inflamasome. C25 also counteracted LPS effects on iNOS expression and pro inflammatory cytokines mRNA levels in Bv-2 microglial cells. The anti-inflammatory effect of both compounds was also assessed in human macrophages."

According to the news editors, the research concluded: "Our results suggest that triterpenoids C18 and C25 possess anti-inflammatory effects, which may be therapeutically relevant for diseases linked to inflammation."

The news correspondents report that additional information may be obtained from A. Villar-Lorenzo, ISCIII, Center Invest Biomed Red Diabet & Enfermedades Metab, Madrid 28029, Spain. Additional authors for this research include A.E. Ardiles, A.I. Arroba, E. Hernandez-Jimenez, V. Pardo, E. Lopez-Collazo, I.A. Jimenez, I.L. Bazzocchi, A. Gonzalez-Rodriguez and A.M. Valverde.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.taap.2016.10.004. This DOI is a link to an online electronic document that is either free or for purchase.

**Aortic Dissection**

**Studies from Icahn School of Medicine Provide New Data on Aortic Dissection (Bowel in the pericardium: Spontaneous herniation mimicking acute aortic dissection)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Aortic Dissection have been published. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Intra-pericardial herniation of abdominal contents is rarely encountered in emergency practice. The entity is most often the result of blunt or penetrating trauma and also may occur post-operatively."

The news correspondents obtained a quote from the research from the Icahn School of Medicine, "Spontaneous herniation through a Morgagni hernia is even rarer but presents the opportunity for lifesaving diagnosis and treatment. We present the case of an octogenarian presenting with the acute onset of symptoms suggestive of aortic dissection. She was found to have herniated transverse colon within the pericardial sac concerning for strangulated bowel. Timely surgical intervention led to a favorable outcome."

According to the news reporters, the research concluded: "Emergency clinicians should be aware of this life-threatening but eminently treatable entity."

Our news journalists report that additional information may be obtained by contacting M. Heller, Mt Sinai Beth Israel, Dept. of Emergency Med, Icahn Sch Med, New York, NY 10003, United States. Additional authors for this research include M. Heller, J. Sedor, N. Kedia, A. Shulman and E.E. Wan.

Keywords for this news article include: New York City, New York, United States, North and Central America, Aortic Dissection, Pericardial, Cardiology, Icahn School of Medicine.

Mathematics - Mathematics in Medicine and Biology

Studies from Idaho State University Yield New Information about Mathematics in Medicine and Biology (Uncovering the natural history of cancer from post-mortem cross-sectional diameters of hepatic metastases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mathematics - Mathematics in Medicine and Biology. According to news reporting originating in Pocatello, Idaho, by NewsRx journalists, research stated, "We develop a mathematical and statistical methodology for estimation of important unobservable characteristics of the individual natural history of cancer from a sample of cross-sectional diameters of liver metastases measured at autopsy. Estimation of the natural history of cancer is based on a previously proposed stochastic model of cancer progression tailored to this type of observations."

The news reporters obtained a quote from the research from Idaho State University, "The model accounts for primary tumour growth, shedding of metastases, their selection, latency
and growth in a given secondary site. The model was applied to the aforementioned data on 428 liver metastases detected in one untreated small cell lung cancer patient. Identifiable model parameters were estimated by the method of maximum likelihood and through minimizing the L-2 distance between theoretical and empirical cumulative distribution functions. The model with optimal parameters provided an excellent fit to the data. Results of data analysis support, if only indirectly, the hypothesis of the existence of stem-like cancer cells in the case of small cell lung carcinoma and point to the possibility of suppression of metastatic growth by a large primary tumour. They also lead to determination of the lower and upper bounds for the age of cancer onset and expected duration of metastatic latency.

According to the news reporters, the research concluded: "Finally, model-based inference on the patient's natural history of cancer allowed us to conclude that resection of the primary tumour would most likely not have had a curative effect."

Our news correspondents report that additional information may be obtained by contacting L. Hanin, Idaho State University, Dept. of Math & Stat, Pocatello, ID 83209, United States.

RNA Research

Studies from Imperial College Update Current Data on RNA Research (Biological marks of early-life socioeconomic experience is detected in the adult inflammatory transcriptome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on RNA Research. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Consistent evidence is accumulating to link lower socioeconomic position (SEP) and poorer health, and the inflammatory system stands out as a potential pathway through which socioeconomic environment is biologically embedded. Using bloodderived genome-wide transcriptional profiles from 268 Italian participants of the European Prospective Investigation into Cancer and Nutrition (EPIC) cohort, we evaluated the association between early life, young and later adulthood SEP and the expression of 845 genes involved in human inflammatory responses."

The news correspondents obtained a quote from the research from Imperial College, "These were examined individually and jointly using several inflammatory scores. Our results consistently show that participants whose father had a manual (as compared to nonmanual)
occupation exhibit, later in life, a higher inflammatory score, hence indicating an overall increased level of expression for the selected inflammatory-related genes. Adopting a life course approach, these associations remained statistically significant upon adjustment for later-in-life socioeconomic experiences. Sensitivity analyses indicated that our findings were not affected by the way the inflammatory score was calculated, and were replicated in an independent study. Our study provides additional evidence that childhood SEP is associated with a sustainable upregulation of the inflammatory transcriptome, independently of subsequent socioeconomic experiences."

According to the news reporters, the research concluded: "Our results support the hypothesis that early social inequalities impacts adult physiology."

For more information on this research see: Biological marks of early-life socioeconomic experience is detected in the adult inflammatory transcriptome. *Scientific Reports*, 2016;6():1-10. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **Bone Research**

**Studies from Imperial College Yield New Data on Bone Research (The anabolic action of intermittent parathyroid hormone on cortical bone depends partly on its ability to induce nitric oxide-mediated vasorelaxation in BALB/c mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Bone Research are discussed in a new report. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "There is strong evidence that vasodilatory nitric oxide (NO) donors have anabolic effects on bone in humans. Parathyroid hormone (PTH), the only osteoanabolic drug currently approved, is also a vasodilator."

Financial support for this research came from Arthritis Research UK.

Our news editors obtained a quote from the research from Imperial College, "We investigated whether the NO synthase inhibitor L-NAME might alter the effect of PTH on bone by blocking its vasodilatory effect. BALB/c mice received 28 daily injections of PTH[1-34] (80 ?g/kg/day) or L-NAME (30 mg/kg/day), alone or in combination. Hindlimb blood perfusion was measured by laser Doppler imaging. Bone architecture, turnover and mechanical properties in the femur were analysed respectively by micro-CT, histomorphometry and three-point bending. PTH increased hindlimb blood flow by >30% within 10 min of injection (p <0.001). Co-
treatment with L-NAME blocked the action of PTH on blood flow, whereas L-NAME alone had no effect. PTH treatment increased femoral cortical bone volume and formation rate by 20% and 110%, respectively (p <0.001). PTH had no effect on trabecular bone volume in the femoral metaphysis although trabecular thickness and number were increased and decreased by 25%, respectively. Co-treatment with L-NAME restricted the PTH-stimulated increase in cortical bone formation but had no clear-cut effects in trabecular bone. Co-treatment with L-NAME did not affect the mechanical strength in femurs induced by iPTH.

According to the news editors, the research concluded: "These results suggest that NO-mediated vasorelaxation plays partly a role in the anabolic action of PTH on cortical bone."

For more information on this research see: The anabolic action of intermittent parathyroid hormone on cortical bone depends partly on its ability to induce nitric oxide-mediated vasorelaxation in BALB/c mice. Cell Biochemistry and Function, 2016;34(2):52-62.

Heart Disorders and Diseases - Heart Disease

Studies from Imperial College Yield New Information about Heart Disease (Randomised comparison of a bioresorbable everolimus-eluting scaffold with a metallic everolimus-eluting stent for ischaemic heart disease caused by de novo native coronary ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Disease. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "The one-year randomised data of the ABSORB II trial showed that the everolimus-eluting bioresorbable scaffold and the everolimus-eluting metallic stent were comparable for the composite secondary clinical outcomes of patient-oriented composite endpoint (PoCE) and device-oriented composite endpoint (DoCE)/target lesion failure (TLF), MACE and TVF. This report describes the two-year clinical outcomes of the ABSORB II trial."

Our news editors obtained a quote from the research from Imperial College, "Patients were randomly assigned in a 2:1 ratio to receive treatment with an everolimus-eluting bioresorbable scaffold (Absorb; Abbott Vascular, Santa Clara, CA, USA) or treatment with an everolimus-eluting metallic stent (XIENCE; Abbott Vascular). The trial enrolled 501 patients. Clinical follow-up at two years was available in 320 patients in the Absorb BVS arm and 160 patients in the XIENCE arm. At two years, the PoCE for the Absorb and XIENCE arms was
11.6% and 12.8% (1)=0.70) and the DoCE/TLF was 7.0% and 3.0% (1)=0.07), respectively. The hierarchical ID-MACE rate was 7.6% vs. 4.3% (p=0.16) and the rate of TVF was 8.5% vs. 6.7% (p=0.48). The definite/probable thrombosis rate was 1.5% in the Absorb arm vs. 0% in the XIENCE arm (p=0.17). Thirty-six percent and 34% of patients remained on DAPT at two years, respectively. Ninety-two percent of patients in both arms remained on aspirin.

According to the news editors, the research concluded: "Two-year clinical results demonstrate sustained low rates of PoCE, MACE, DoCE and TVF with the Absorb BVS as compared to the XIENCE stent."

The news editors report that additional information may be obtained by contacting P.W. Serruys, Imperial College, Int Center Cardiovasc Hlth, London SW7 2AZ, United Kingdom. Additional authors for this research include Y. Onuma, A.J. van Boven, J.J. Piek, M. Sabate, S. Helqvist, A. Baumbach, P.C. Smits, R. Kumar, L. Wasungu and P.W. Serruys.

Enzymes and Coenzymes - Carboxy-Lyases

Studies from Indian Institute of Technology Provide New Data on Carboxy-Lyases [Novel Inhibitors of Ornithine Decarboxylase of Leishmania Parasite (LdODC): The Parasite Resists LdODC Inhibition by Overexpression of Spermidine Synthase]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Enzymes and Coenzymes - Carboxy-Lyases have been presented. According to news reporting originating from Assam, India, by NewsRx correspondents, research stated, "Ornithine decarboxylase (LdODC), a key enzyme in polyamine biosynthesis in Leishmania donovani, catalyzes the conversion of ornithine to putrescine that is finally used for synthesis of spermidine and other polyamines. Inhibition of ornithine decarboxylase is likely to deplete the parasite trypanothione and may result in increased reactive oxygen species (ROS)."

Financial supporters for this research include Indian Council of Medical Research, Government of India.

Our news editors obtained a quote from the research from the Indian Institute of Technology, "Sequence as well as structure of LdODC and human ODC shows significant difference; therefore, we have identified novel specific inhibitors of LdODC. These inhibitors
are able to inhibit recombinant LdODC and decrease intracellular putrescine concentration showing target specificity. The Ki values of LdODC inhibition do not correlate with IC[50] values in Leishmania promastigote possibly due to different stability/pharmacokinetics. These inhibitors, except compound M-5, have only minor effect on Leishmania promastigotes, and IC [50] values are several folds higher as compared to Ki values. In case of compound M-5, IC[50] value is less than Ki value indicating that the compound may have additional targets."

According to the news editors, the research concluded: "Our studies suggest that the parasite resists these LdODC inhibitors by overexpression of spermidine synthase mRNA."

The news editors report that additional information may be obtained by contacting M. Das, Dept. of Biosciences and Bioengineering, Indian Institute of Technology Guwahati, Assam, 781039, India. Additional authors for this research include S. Singh and V.K Dubey.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/cbd.12665. This DOI is a link to an online electronic document that is either free or for purchase.

Gram-Negative Bacteria - Campylobacter jejuni

Studies from Indian Institute of Technology Reveal New Findings on Campylobacter jejuni (Monomerization alters the dynamics of the lid region in Campylobacter jejuni CstII: an MD simulation study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Campylobacter jejuni are discussed in a new report. According to news originating from Mumbai, India, by NewsRx correspondents, research stated, "CstII, a bifunctional (a2,3/8) sialyltransferase from Campylobacter jejuni, is a homotetramer. It has been reported that mutation of the interface residues Phe121 (F121D) or Tyr125 (Y125Q) leads to monomerization and partial loss of enzyme activity, without any change in the secondary or tertiary structures."

Our news journalists obtained a quote from the research from the Indian Institute of Technology, "MD simulations of both tetramer and monomer, with and without bound donor substrate, were performed for the two mutants and WT to understand the reasons for partial loss of activity due to monomerization since the active site is located within each monomer. RMSF values were found to correlate with the crystallographic B-factor values indicating that the
simulations are able to capture the flexibility of the molecule effectively. There were no gross changes in either the secondary or tertiary structure of the proteins during MD simulations. However, interface is destabilized by the mutations, and more importantly the flexibility of the lid region (Gly152-Lys190) is affected. The lid region accesses three major conformations named as open, intermediate, and closed conformations. In both Y121Q and F121D mutants, the closed conformation is accessed predominantly. In this conformation, the catalytic base His188 is also displaced. Normal mode analysis also revealed differences in the lid movement in tetramer and monomer. This provides a possible explanation for the partial loss of enzyme activity in both interface mutants. The lid region controls the traffic of substrates and products in and out of the active site, and the dynamics of this region is regulated by tetramerization."

According to the news editors, the research concluded: "Thus, this study provides valuable insights into the role of loop dynamics in enzyme activity of CstII."

The news correspondents report that additional information may be obtained from P.K. Prabhakar, a Dept. of Biosciences and Bioengineering, Indian Institute of Technology Bombay, Powai, Mumbai 400076, India. Additional authors for this research include A. Srivastava, K.K. Rao and P.V Balaji.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1080/07391102.2015.1054430. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Asia, India, Mumbai, Genetics, Campylobacter jejuni, Epsilonproteobacteria, Gram Negative Bacteria, Gram-Negative Bacteria.

Our news editors obtained a quote from the research from the Indian Institute of Technology, "The present study compares the nature of flow patterns in rigid and compliant asymmetric constricted tubes for a range of dimensionless parameters appearing in a human artery. A blood analogue fluid is employed along with a pump that mimics cardioflow conditions. The peak Reynolds number range is Re similar to 300-800, while the Womersley number range considered in experiments is Wo similar to 6-8. These values are based on the peak velocity in a straight rigid tube connected to the model, over a pulsation frequency range of 1.2-2.4 Hz. The medial-plane velocity distribution is used to investigate the nature of flow..."
patterns. Temporal distribution of stream traces and hemodynamic factors including WSS, TAWSS and OSI at important phases of the pulsation cycle are discussed. The flow patterns obtained from PIV are compared to a limited extent against numerical simulation. Results show that the region downstream of the constriction is characterized by a high-velocity jet at the throat, while a recirculation zone, attached to the wall, evolves in time. Compliant models reveal large flow disturbances upstream during the retrograde flow. Wall shear stress values are lower in a compliant model as compared to the rigid. Cross-plane flow structures normal to the main flow direction are visible at select phases of the cycle. Positive values of largest Lyapunov exponent are realized for wall movement and are indicative of chaotic motion transferred from the flow to the wall. These exponents increase with Reynolds number as well as compliance."

According to the news editors, the research concluded: "Period doubling is observed in wall displacement of highly compliant models, indicating possible triggering of hemodynamic events in a real artery that may cause fissure in the plaque deposits."

Heart Disorders and Diseases - Atrial Fibrillation

**Studies from Indiana University School of Medicine Further Understanding of Atrial Fibrillation (Ganglionated plexi and ligament of Marshall ablation reduces atrial vulnerability and causes stellate ganglion remodeling in ambulatory dogs)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting originating from Indianapolis, Indiana, by NewsRx correspondents, research stated, "Simultaneous activation of the stellate ganglion (SG), the ligament of Marshall (LOM), and the ganglionated plexi often precedes the onset of paroxysmal atrial tachyarrhythmia (PAT). The purpose of this study was to test the hypothesis that ablation of the LOM and the superior left ganglionated plexi (SLGP) reduces atrial vulnerability and results in remodeling of the SG."

Our news editors obtained a quote from the research from the Indiana University School of Medicine, "Nerve activity was correlated to PAT and ventricular rate (VR) at baseline, after ablation of the LOM and SLGP, and after atrial fibrillation. Neuronal cell death was assessed with tyrosine hydroxylase and terminal deoxynucleotidyl transferase dUTP nick end label (TUNEL) staining. There were 42 PAT episodes per day in controls. None were observed in the ablation group, even though SG nerve activity and VR increased from 2.2 mu V
(95% confidence interval [CI] 1.2-3.3 μV) and 80 bpm (95% CI 68-92 bpm) at baseline, to
3.0 μV (95% CI 2.6-3.4 μV, P = .046) and 90 bpm (95% CI 75-108 bpm, P = .026) after
ablation, and to 3.1 μV (95% CI 1.7-4.5 μV, P = .116) and 95 bpm (95% CI 79-110 bpm, P
= .075) after atrial fibrillation. There was an increase in tyrosine hydroxylase negative cells
in the ablation group and 19.7% (95% CI 8.6%-30.8%) TUNEL-positive staining in both the left
and right SG. None were observed in the control group. LOM and SLGP ablation caused left SG
remodeling and cell death. There was reduced correlation of the VR response and PAT to SG
nerve activity."

According to the news editors, the research concluded: "These findings support the
importance of SLGP and LOM in atrial arrhythmogenesis."

For more information on this research see: Ganglionated plexi and ligament of
Marshall ablation reduces atrial vulnerability and causes stellate ganglion remodeling in
ambulatory dogs. *Heart Rhythm*, 2016;13(10):2083-2090. *Heart Rhythm* can be contacted at:

**Drugs and Therapies - Cancer Therapy**

**Studies from Institute for Biology Research Update Current Data on Cancer Therapy (Noncovalent Binding to DNA: Still a Target in Developing Anticancer Agents)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Drugs and Therapies - Cancer Therapy.
According to news reporting out of Barcelona, Spain, by NewsRx editors, research stated,
"DNA-binding compounds are of extraordinary importance in medicine, accounting for a
substantial portion of antitumor drugs in clinical usage. However, their mechanisms of action
remain sometimes incompletely understood."

Our news journalists obtained a quote from the research from Institute for Biology
Research, "This review critically examines two broad classes of molecules that bind
noncovalently to DNA: intercalators and groove binders. Intercalators bind to DNA by inserting
their chromophore moiety between two consecutive base pairs, whereas groove binders fit into
the grooves of DNA. Noncovalent DNA-interactive drugs can recognize certain supramolecular
DNA structures such as the G-quadruplexes found in telomeres and in numerous gene promoters, and they can act as topoisomerase I and II poisons. We discuss how DNA-binding compounds affect transcription and compete with protein factors for binding to consensus binding sites in gene promoters both in vitro and in cultured cancer cells. Moreover, we comment on the design of molecules that can tightly and specifically bind to any desired target DNA, such as various hairpin polyamides which efficacy as chemotherapeutic agents is being evaluated. At present, genome-wide studies, which provide details of events that may influence both cancer progression and therapeutic outcome, are a common way used to analyze the effects of DNA-binding compounds.

According to the news editors, the research concluded: "A conclusive feature that emerges from reviewing the information on DNA-binding compounds is that both natural sources and chemical approaches can be productively used to obtain drugs to manipulate gene expression in cancer cells."

Oncology - Squamous Cell Carcinoma

Studies from Institute for Cancer Research and Treatment (IRCCS) Update Current Data on Squamous Cell Carcinoma (Prognostic Factors of Adjuvant Taxane, Cisplatin, and 5-Fluorouracil Chemotherapy for Patients With Penile Squamous Cell Carcinoma ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Squamous Cell Carcinoma. According to news originating from Milan, Italy, by NewsRx correspondents, research stated, "The administration of adjuvant chemotherapy for patients with penile squamous cell carcinoma (PSCC) with high-risk features is controversial. In 21 patients who had received adjuvant taxane, cisplatin, and 5-fluorouracil, the expression of p53 in the tumor-positive lymph nodes was the only factor that showed a trend toward poorer survival endpoints."

Our news journalists obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "If confirmed, these findings could help in selecting the best candidates for adjuvant chemotherapy. Little is known about the outcomes and prognostic
factors of adjuvant chemotherapy for locally advanced penile squamous cell carcinoma after regional lymphadenectomy (LAD). We retrospectively reviewed the data from 21 patients who had received taxane, cisplatin, and 5-fluorouracil (TPF, every 3 weeks) in the adjuvant setting at our center. Univariable and multivariable Cox regression analyses were undertaken for disease-free (DFS) and overall survival (OS) of TPF. The patients had received TPF from July 2004 to July 2012 after inguinal (n = 6) or inguinal plus pelvic LAD (n = 15), and the median follow-up was 52 months. Thirteen (61.9%) had pelvic and 5 (23.8%) bilateral inguinal nodal metastases. The median time from LAD to the start of TPF was 5.4 weeks (interquartile range [IQR], 4.1-7.3 weeks). Metastatic tumor tissue from 11 of 19 evaluable patients (57.9%) showed positive immunohistochemistry staining for p53. Univariably, only the expression of p53 showed a trend toward poorer DFS (hazard ratio [HR], 4.14; 95% confidence interval [CI], 0.87-19.68; P = .074) and OS (HR, 4.54; 95% CI, 0.95-21.56; P = .056). The same results were obtained multivariably for DFS (HR, 3.76; 95% CI, 0.78-17.96; P = .096) and OS (HR, 4.29; 95% CI, 0.89-20.57; P = .067). The median DFS was 8.9 months (IQR, 5.9-22.7 months) for p53-expressing patients versus not estimable for non p53-expressing patients (P = .051) and the median OS was 17.2 months (IQR, 12.8-22.7 months) and not estimable, respectively (P = .037). In patients who had received adjuvant TPF for node-positive penile squamous cell carcinoma, p53 IHC expression seemed to be associated with a poorer outcome, and further study is warranted in larger data sets to confirm these findings."

According to the news editors, the research concluded: "This information might be useful to improve the prognostic allocation."

For more information on this research see: Prognostic Factors of Adjuvant Taxane, Cisplatin, and 5-Fluorouracil Chemotherapy for Patients With Penile Squamous Cell Carcinoma After Regional Lymphadenectomy. Clinical Genitourinary Cancer, 2016;14(6):518-523.

Studies from Institute for Cancer Research and Treatment (IRCCS) in the Area of Cachexia Described (Activation of the SDF1/CXCR4 pathway retards muscle atrophy during cancer cachexia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cachexia. According to news reporting out of Milan, Italy, by NewsRx editors, research stated, "Cancer cachexia is a life-threatening syndrome that affects most patients with advanced cancers and causes severe body weight loss, with rapid depletion of skeletal muscle. No treatment is available."

Our news journalists obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "We analyzed microarray data sets to identify a subset of genes whose expression is specifically altered in cachectic muscles of Yoshida hepatoma-bearing rodents but not in those with diabetes, disuse, uremia or fasting. Ingenuity Pathways Analysis indicated that three genes belonging to the C-X-C motif chemokine receptor 4 (CXCR4) pathway were downregulated only in muscles atrophying because of cancer: stromal cell-derived factor 1 (SDF1), adenylyl cyclase 7 (ADCY7), and p21 protein-activated kinase 1 (PAK1). Notably, we found that, in the Rectus Abdominis muscle of cancer patients, the expression of SDF1 and CXCR4 was inversely correlated with that of two ubiquitin ligases induced in muscle wasting, atrogin-1 and MuRF1, suggesting a possible clinical relevance of this pathway. The expression of all main SDF1 isoforms (alpha, beta, gamma) also declined in Tibialis Anterior muscle from cachectic mice bearing murine colon adenocarcinoma or human renal cancer and drugs with anticachexia properties restored their expression. Overexpressing genes of this pathway (that is, SDF1 or CXCR4) in cachectic muscles increased the fiber area by 20%, protecting them from wasting. Similarly, atrophying myotubes treated with either SDF1 alpha or SDF1 beta had greater total protein content, resulting from reduced degradation of overall long-lived proteins. However, inhibiting CXCR4 signaling with the antagonist AMD3100 did not affect protein homeostasis in atrophying myotubes, whereas normal myotubes treated with AMD3100 showed time-and dose-dependent reductions in diameter, until a plateau, and lower total protein content. This further confirms the involvement of a saturable pathway (that is, CXCR4)."

According to the news editors, the research concluded: "Overall, these findings support the idea that activating the CXCR4 pathway in muscle suppresses the deleterious wasting associated with cancer."

Studies from Institute for Health Sciences Further Understanding of Nephropathy (Synthetic ACTH in High Risk Patients with Idiopathic Membranous Nephropathy: A Prospective, Open Label Cohort Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nephropathy. According to news originating from Nijmegen, Netherlands, by NewsRx correspondents, research stated, "New therapeutic agents are warranted in idiopathic membranous nephropathy. Synthetic ACTH may be advantageous with reported remission rates up to 85% and few side effects."

Our news journalists obtained a quote from the research from Institute for Health Sciences, "We conducted a prospective open label cohort study from 2008 till 2010 (NCT00694863). We prospectively selected patients with idiopathic membranous nephropathy and high risk for progression (defined as beta-2-microglobulin (b2m) excretion of >500 ng/min). For comparison, we selected matched historical controls treated with cyclophosphamide. The prospectively selected patients received intramuscular injections of synthetic ACTH during 9 months (maximal dose 1 mg twice a week). The primary endpoints concerned the feasibility and incidence of remissions as a primary event. Secondary endpoints included side effects of treatment and the incidence of remissions and relapses at long-term follow-up. Twenty patients (15 men) were included (age 54?14 years, serum creatinine 104 mmol/l [IQR 90?113], urine protein:creatinine ratio 8.7 g/10 mmol creatinine [IQR 4.3?11.1]). Seventeen patients (85%) completed treatment. 97% of injections were administered correctly. Cumulative remission rate was 55% (complete remission in 4 patients, partial remission 7 patients). In a group of historical controls treated with cyclophosphamide and steroids, 19 of 20 patients (95%) developed a remission (complete remission in 13 patients, partial remission in 6 patients) (p <0.01). The main limitation of our study is its small size and the use of a historical control group. We show that treatment with intramuscular injections of synthetic ACTH is feasible. Our data suggest that synthetic ACTH is less effective than cyclophosphamide in inducing a remission in high risk patients with idiopathic membranous nephropathy. The use of synthetic ACTH was also associated with many adverse events."

According to the news editors, the research concluded: "Therefore, we advise against synthetic ACTH as standard treatment in membranous nephropathy."

For more information on this research see: Synthetic ACTH in High Risk Patients with Idiopathic Membranous Nephropathy: A Prospective, Open Label Cohort Study. *Plos One, 2015;10(11):e0142033.* (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Enzymes and Coenzymes - Cholinesterases

Studies from Institute for Medical Research and Occupational Health Add New Findings in the Area of Cholinesterases (HI-6 assisted catalytic scavenging of VX by acetylcholinesterase choline binding site mutants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - Cholinesterases. According to news originating from Zagreb, Croatia, by NewsRx correspondents, research stated, "The high toxicity of organophosphorus compounds originates from covalent inhibition of acetylcholinesterase (AChE), an essential enzyme in cholinergic neurotransmission. Poisonings that lead to life-threatening toxic manifestations require immediate treatment that combines administration of anticholinergic drugs and an aldoxime as a reactivator of AChE."

Financial supporters for this research include CounterACT Program, National Institutes of Health Office of the Director (NIH OD), National Institute of Neurological Disorders and Stroke, Croatian Science Foundation.

Our news journalists obtained a quote from the research from Institute for Medical Research and Occupational Health, "An alternative approach to reduce the in vivo toxicity of OPs focuses on the use of bioscavengers against the parent organophosphate. Our previous research showed that AChE mutagenesis can enable aldoximes to substantially accelerate the reactivation of OP-enzyme conjugates, while dramatically slowing down rates of OP-conjugate dealkylation (aging). Herein, we demonstrate an efficient HI-6-assisted VX detoxification, both ex vivo in human blood and in vivo in mice by hAChE mutants modified at the choline binding site (Y337A and Y337A/F338A)."

According to the news editors, the research concluded: "The catalytic scavenging of VX in mice improved therapeutic outcomes preventing lethality and resulted in a delayed onset of toxicity symptoms."

For more information on this research see: HI-6 assisted catalytic scavenging of VX by acetylcholinesterase choline binding site mutants. Chemico-Biological Interactions, 2016;259():148-153. **Health and Medicine - Palliative and Supportive Care**

**Studies from Institute of Child Health Provide New Data on Palliative and Supportive Care (Current understanding of decision-making in adolescents with cancer: A narrative systematic review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Health and Medicine - Palliative and Supportive Care is the subject of a report. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "Policy guidance and bioethical literature urge the involvement of adolescents in decisions about their healthcare. It is uncertain how roles and expectations of adolescents, parents and healthcare professionals influence decision-making and to what extent this is considered in guidance."

Our news journalists obtained a quote from the research from the Institute of Child Health, "To identify recent empirical research on decision-making regarding care and treatment in adolescent cancer: (1) to synthesise evidence to define the role of adolescents, parents and healthcare professionals in the decision-making process and (2) to identify gaps in research. A narrative systematic review of qualitative, quantitative and mixed-methods research. We adopted a textual approach to synthesis, using a theoretical framework of interactionism to interpret findings. The databases MEDLINE, PsycINFO, SCOPUS, EMBASE and CINHAL were searched from 2001 through May 2015 for publications on decision-making for adolescents (13-19 years) with cancer. Twenty-eight articles were identified. Adolescents and parents initially find it difficult to participate in decision-making due to a lack of options in the face of protocol-driven care. Parent and adolescent preferences for information and response to loss of control vary between individuals and over time. No studies indicate parental or adolescent preference for a high degree of independence in decision-making. Striving to make parents and adolescents fully informed or urge them towards more independence than they prefer may add to distress and confusion. This may interfere with their ability to participate in their preferred way in decisions about care and treatment."

According to the news editors, the research concluded: "Future research should include analysis of on-ground interactions among parents, adolescents and clinicians across the trajectory."

For more information on this research see: Current understanding of decision-making in adolescents with cancer: A narrative systematic review. *Palliative Medicine*, 2016;30 (10):920-934. *Palliative Medicine* can be contacted at: Sage Publications Ltd, 1 Olivers Yard, 55 City Road, London EC1Y 1SP, England. **Surgery - Surgical Research**

**Studies from Institute of Physical Chemistry Describe New Findings in Surgical Research (No Effect of Rapamycin on Cardiac Adhesion Formation: A Drug-Loaded Bioresorbable Polylactone Patch in a Porcine Cardiac Surgical Model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Surgery - Surgical Research are discussed in a new report. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "The fusing of the epicardium and sternum due to adhesion is a common problem during repeated cardiac surgery and carries with it an increased risk of bleeding. The use of barriers and patches has been tested to prevent the formation of adhesions, but the very presence of a patch can provoke adhesion formation."

The news reporters obtained a quote from the research from the Institute of Physical Chemistry, "The objective of this study was, therefore, to investigate both biodegradable and bioresorbable polylactone patches [(polycaprolactone-poly(ethylene oxide)-polycaprolactone tri-block copolymer (PCE)]. The patches were also tested with a controlled release of rapamycin, which prevents cell migration and extracellular matrix deposition. The clinical effectiveness of rapamycin in pericardial patches has not previously been examined. Three groups of 6 female Danish Landrace pigs underwent sternotomy and abrasion of the epicardium, before being randomized to either group 1--the control group (with no patch), group 2--PCE patch implanted between the sternum and epicardium, or group 3--PCE patch and slow-release 1.6-mg rapamycin. After a median time period of 26 days, the pigs were euthanized and their hearts removed en bloc with the sternum, for macroscopic, histological and pathological examination. Upon macroscopic examination, a significantly lower degree of adhesion in group 2, as compared to group 1 (p <0.05), was found. Histological analysis of the tissues showed significantly more fibrosis, inflammation and foreign body granulomas (p <0.05) in both group 2 and group 3, when compared to group 1. A PCE patch following sternotomy in animal subjects reduces postoperative macroscopic adhesions without reducing microscopic fibrosis or inflammation."

According to the news reporters, the research concluded: "Loading the patch with rapamycin was found not to increase the antifibrotic effect."

For more information on this research see: No Effect of Rapamycin on Cardiac
Drugs and Therapies - Combination Therapy

Studies from Institute of Physics Further Understanding of Combination Therapy (Combination therapies with daclatasvir and asunaprevir on NS3-D168 mutated HCV in human hepatocyte chimeric mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Combination Therapy have been published. According to news originating from Hiroshima, Japan, by NewsRx correspondents, research stated, "Although the frequency of emergent drug-resistant strains of HCV in patients who failed to respond to simeprevir plus pegylated interferon (PEG-IFN) and ribavirin (RBV) decreased after cessation of the treatment, it is not clear whether or not the NS3-D168 variants affect the outcome of NS5A and NS3 inhibitor combination therapy. In this study, we investigated the relationship between the effect of daclatasvir plus asunaprevir treatment and the frequencies of NS3-D168 variants."

Our news journalists obtained a quote from the research from the Institute of Physics, "HCV genotype-1b-infected human hepatocyte chimeric mice with various frequencies of NS3-D168 amino acid substitutions were treated with asunaprevir alone or in combination with daclatasvir for 4 weeks. Frequencies of NS3-D168 substitutions at baseline were analysed by ultra-deep sequencing. Some mice with NS3-D168 substitutions were treated with PEG-IFN or telaprevir for 4 weeks. Mice with high frequencies of NS3-D168 showed low susceptibility to asunaprevir treatment and failed to respond to daclatasvir plus asunaprevir therapy. In contrast, mice with a low frequency (less than approximately 14%) of NS3-D168 showed a similar susceptibility to wild-type HCV-infected mice and achieved viral eradication with daclatasvir plus asunaprevir therapy. Although treatment with either telaprevir or PEG-IFN resulted in reduction of serum HCV RNA levels, no significant decrease in the frequency of NS3-D168 substitutions was achieved. Daclatasvir and asunaprevir treatment could eliminate NS3-D168 variant HCV if the frequency was low."

According to the news editors, the research concluded: "It is necessary to confirm that the frequency of NS3-D168 variants has decreased sufficiently before adopting daclatasvir plus asunaprevir therapy in patients with simeprevir plus PEG-IFN/RBV treatment failure."

Keywords for this news article include: Hiroshima, Japan, Asia, Drugs and Therapies, Combination Therapy, Gastroenterology, Institute of Physics.

**Oncology - Gastric Lymphoma**

**Studies from Institute of Radiology Further Understanding of Gastric Lymphoma (Prognostic value of SUVmax measured by pretreatment F-18-FDG PET/CT in patients with primary gastric lymphoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Lymphoma have been published. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "PurposeThe aim of this retrospective study was to determine whether glucose metabolism assessed by fluorine-18 fluorodeoxyglucose (F-18-FDG) PET/computed tomography (CT) provides prognostic information independent of established prognostic factors in patients with gastric lymphoma.Patients and methodsWe reviewed the medical records of 86 patients retrospectively (men, 42; women, 44; mean age 5813 years) with pathologically proven gastric lymphoma (34 mucosa-associated lymphoid tissue and 52 aggressive non-Hodgkin's lymphoma). They underwent F-18-FDG PET/CT as part of a pretreatment work-up from February 2004 to July 2012."

The news reporters obtained a quote from the research from the Institute of Radiology, "For the analysis, patients were classified by age, sex, Musshoff stage, serum lactate dehydrogenase, International Prognostic Index score, extragastric spread, and visual intensity [visual assessment and maximum standardized uptake value (SUVmax), respectively]. The relationship between F-18-FDG uptake and survival was analyzed using the Kaplan-Meier method with a log-rank test and Cox's proportional-hazard regression method.ResultsThe median survival of all 86 study participants was 1117 days and the median SUV measured by PET/CT was 6.1 (range, 1.9-32.7). Patients with an SUVmax less than or equal to 5.2 survived significantly longer than patients with an SUVmax more than 5.2 (median, 1163 vs. 1004 days; P=0.003). Survival was also found to be significantly related to age (P=0.0005), histological type (P=0.0044), extragastric spread (P=0.0004), International Prognostic Index score (P <0.0001), serum lactate dehydrogenase (P=0.02), stage (P <0.0001), and visual intensity (P=0.041)."

According to the news reporters, the research concluded: "A multivariate analysis showed that patients with a higher SUVmax [P=0.021; 95% confidence interval (CI), 1.52-8.14; hazard ratio (HR)=6.29], older age (P=0.001; 95% CI, 4.64-219.96; HR=18.8), more aggressive histologic type (P=0.006; 95% CI, 2.20-70.63; HR=12.76), and higher stage (P=0.0006; 95% CI,
5.81-206.43; HR=17.48) showed worse survival. Conclusion A higher SUVmax on pretreatment F-18-FDG PET/CT can predict poorer survival in patients with gastric lymphoma."

For more information on this research see: Prognostic value of SUVmax measured by pretreatment F-18-FDG PET/CT in patients with primary gastric lymphoma. Neurodegenerative Diseases and Conditions -...

Studies from Institute of Rural Health Have Provided New Data on Alzheimer Disease (Homocysteine, antioxidant vitamins and lipids as biomarkers of neurodegeneration in Alzheimer's disease versus non-Alzheimer's dementia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Neurodegenerative Diseases and Conditions - Alzheimer Disease are discussed in a new report. According to news reporting from Lublin, Poland, by NewsRx journalists, research stated, "Evidence for the benefit of antioxidants' based therapeutic intervention in dementia are inconsistent. Parallel studies in disease forms of dementia different than Alzheimer's are even less conclusive."

The news correspondents obtained a quote from the research from the Institute of Rural Health, "In this study, the role of serum levels of homocysteine (tHcy), lipids and antioxidants in predicting the risk of cognitive decline in Alzheimer's disease (AD) versus non-Alzheimer's dementia (n-AD). The objective was to add to the ongoing cumulative research to establish the biochemical baseline for potential nutri-therapeutic intervention in different forms of dementia. 65 participants with dementia (DP-s) were divided into two groups: ADP--patients with Alzheimer's disease and n-ADP--patients with dementia of a different etiology than primary neurodegenerative dementia in the course of Alzheimer's disease. Cognitive function was assessed by Mini-Mental State Examination (MMSE) and related to plasma levels of tHcy, folate, vitamins B-6, B-12, lipids and vitamins A and E for both groups. Also examined were associations between cognitive impairment and several variables (age, education, duration of dementia) that might confound nutrition-cognition associations. A significant reduction in serum vitamin A levels and elevation of total cholesterol levels were shown for the DP-s group compared to those in the control group. Moreover, significant differences were found in MMSE data and serum vitamin E and tHcy levels between patients with ADP and n-ADP. The scores
for MMSE showed a correlation with the vitamin E levels and duration of dementia in the ADP group and/or correlation with tHcy, levels of vitamins A and/or E, and duration of dementia in the n-ADP group."

According to the news reporters, the research concluded: "The results obtained suggest that elevated serum tHcy and decreased levels of vitamins A and E are associated with an increased risk of non-Alzheimer's dementias, although further studies involving a larger cohort are now needed to verify these results."

Our news journalists report that additional information may be obtained by contacting G. Raszewski, Dept. of Physiopathology, Institute of Rural Health, Lublin, Poland. Additional authors for this research include R. Chwedorowicz, A. Chwedorowicz and K. Gustaw Rothenberg.

**Studies from Institute of Virology Describe New Findings in Neoplasma (Enhanced metabolism as a common feature of cancer plasticity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Neoplasma have been published. According to news reporting originating from Bratislava, Slovakia, by NewsRx correspondents, research stated, "Cancer cells often rely on glycolytic metabolism in order to fulfill high demands of ATP and macromolecules for the sustained growth and proliferation. However, glycolysis is not necessarily the main source of energy for all cancer cells."

Our news editors obtained a quote from the research from the Institute of Virology, "Some of them rather depend on glutamine or lactate that favor the utilization of oxidative metabolic pathway. Different employment rate of metabolism creates variable products that participate in the formation of environmental milieu, which in turn triggers broad spectrum of cellular signaling pathways leading to migration, invasion, or proliferation."

According to the news editors, the research concluded: "In this review we discuss different metabolic pathways promoted in tumor cells and describe the possibilities of their targeting as therapeutic strategies."

For more information on this research see: Enhanced metabolism as a common feature of cancer plasticity. *Neoplasma*, 2016;63(6):836-845. *Neoplasma* can be contacted at: Aepress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

The news editors report that additional information may be obtained by contacting E.
Studies from Instituto de Salud Carlos III Yield New Information about Whooping Cough [Effectiveness of acellular pertussis vaccination during childhood (< 7 years of age) for preventing pertussis in household contacts 1-9 years old in Catalonia ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Respiratory Tract Diseases and Conditions - Whooping Cough have been presented. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "Pertussis vaccination with 4-5 doses of acellular vaccines is recommended in Spain to all children at 2 months to 6 years of age. The effectiveness of the acellular pertussis vaccination was assessed in this study by comparing the incidence of secondary pertussis in vaccinated (4-5 doses) and unvaccinated or partially vaccinated (0-3 doses) household contacts 1-9 years old of confirmed cases of pertussis in Spain in 2012-13."

The news reporters obtained a quote from the research from Instituto de Salud Carlos III, "Eighty-five percent of contacts had been vaccinated with 4-5 doses of acellular pertussis vaccines. During the 2-year study period, 64 cases of secondary pertussis were detected among 405 household contacts 1-9 years old: 47 among vaccinated and 17 among unvaccinated or partially vaccinated contacts. The effectiveness for preventing secondary pertussis, calculated as 1 minus the relative risk (RR) of secondary pertussis in vaccinated vs. unvaccinated/partially vaccinated contacts, was 50 % [95 % confidence interval (CI): 19-69 %, p< 0.01] when household contacts were vaccinated using DTaP, Tdap, hexavalent or heptavalent vaccines, and it was 51.3 % (95 % CI: 21-70 %, p< 0.01) when they were vaccinated using DTaP or TdaP vaccines. The effectiveness adjusted for age, sex, pertussis chemotherapy and type of household contact was 58.6 % (95 % CI: 17-79 %, p< 0.05) when contacts were vaccinated using available acellular vaccines, and it was 59.6 % (95 % CI: 18-80 %, p< 0.01) when they were vaccinated using DTffeaP vaccines."

According to the news reporters, the research concluded: "Acellular pertussis vaccination during childhood was effective for preventing secondary pertussis in household contacts 1-9 years old of pertussis cases in Catalonia and Navarra, Spain."

For more information on this research see: Effectiveness of acellular pertussis vaccination during childhood (< 7 years of age) for preventing pertussis in household contacts 1-9 years old in Catalonia and Navarra (Spain). European Journal of Clinical Microbiology & Infectious Diseases, 2016;35(12):2059-2067. European Journal of Clinical Microbiology & Infectious Diseases can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.
Oncology - Lymphoma

Studies from International Agency for Research on Cancer Update Current Data on Lymphoma (Hodgkin lymphoma burden in Central and South America)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Lymphoma are discussed in a new report. According to news reporting originating from Lyon, France, by NewsRx correspondents, research stated, "Rationale and objective: Hodgkin lymphoma (HL) is largely curable owing to improvements in treatment since the 1960s; nevertheless, high mortality rates have been reported in Central and South America. We describe the current burden of HL in the Central and South American region."

Our news editors obtained a quote from the research from International Agency for Research on Cancer, "We obtained regional-and national-level incidence data from 48 population-based cancer registries in 13 countries, and national-level mortality data from the WHO mortality database for 18 countries. We estimated world population age-standardized incidence rates (ASRs) and age-standardized mortality rates (ASMRs) per 100,000 person-years for 2003-2007 and present distributions by histological subtype. HL incidence rates varied 7-fold in males and 11-fold in females (male-to-female ratio 1: 1-2.5: 1). The highest ASRs were seen Argentina, Brazil, Costa Rica (males), Cuba (males) and Uruguay (females), whereas the lowest were in Bolivia and El Salvador. ASMRs varied by 4-fold in males and 6-fold in females (male-to-female ratio 1: 1-4.3: 1), with ASMRs < 0.7 for most countries, except Cuba (> = 1.0). In most countries, age-specific incidence rates of HL showed a bimodal pattern. Trends in HL in Argentina, Brazil, Chile, and Costa Rica remained stable in 1997-2008. Of all HL cases, 48% were unspecified as to histological subtype. Nodular sclerosis and mixed cellularity were the most frequent histologies. The geographic variation in HL across the region may in part reflect differences in data quality and coverage, and differences in the adoption of modern therapies and healthcare access."

According to the news editors, the research concluded: "Our results highlight the need for high-quality data and increased coverage in order to provide vital guidance for future cancer control activities."

For more information on this research see: Hodgkin lymphoma burden in Central and South America. Cancer Epidemiology, 2016:44():S158-S167. Cancer Epidemiology can
Liver Diseases and Conditions - Hepatitis

Studies from Istanbul Medipol University Have Provided New Data on Hepatitis (Acute temozolomide induced liver injury: mixed type hepatocellular and cholestatic toxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Hepatitis are presented in a new report. According to news reporting from Istanbul, Turkey, by NewsRx journalists, research stated, "Temozolomide (TMZ) is an oral imidazotetrazine methylating agent which is used for the treatment of glioblastoma multiforme (GBM). We report a case of acute hepatotoxicity in a 53-year old male patient after administration of TMZ for GBM."

The news correspondents obtained a quote from the research from Istanbul Medipol University, "He had fatigue, nausea, anorexia and jaundice. His laboratory analysis showed alanine aminotransferase (ALT): 632 IU/L (normal range 0-40); aspartate aminotransferase (AST): 554 IU/L (normal range 5-34); alkaline phosphate (ALP): 1143 IU/L (normal range 401-50); -glutamyl transpeptidase (GGT): 514 IU/L (normal range 9-64 IU/L); total bilirubin: 15.1 mg/dL (normal range 0-1.2); direct bilirubin: 13.2 mg/dL and prothrombin time (PT): 13.5 s, with international normalized ratio (INR): 1.1 (normal range 0.8-1.2). His liver biopsy specimen showed mixed-type (both hepatocellular and cholestatic) hepatic injury, compatible with a diagnosis of drug-induced hepatitis. An objective causality assessment using the Naranjo probability scale suggested that TMZ was the probable cause of the acute hepatitis. His liver function tests gradually normalized in 2 months after discontinuation of the drug. In susceptible individuals, TMZ use may lead to acute mixed type liver toxicity."

According to the news reporters, the research concluded: "Complete recovery may be possible if the drug is discontinued before severe liver injury is established."

Our news journalists report that additional information may be obtained by
Studies from J. Castellanos et al in the Area of Angiology Described (Simultaneous right ventricular to pulmonary artery pressure gradient measurement using a single venous access technique)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Angiology. According to news reporting originating in Hammond, Louisiana, by NewsRx journalists, research stated, "The pullback gradient technique is commonly used to evaluate pulmonic stenosis; however, it only represents a one-time measurement of valvular stenosis. Instead, simultaneous peak-to-peak gradients account for the data variability being best suited to discern the severity of the stenosis, but requires two different venous accesses."

The news reporters obtained a quote from the research, "Here, we demonstrate the feasibility and high fidelity hemodynamic tracings of a new technique for evaluation of pulmonic valve stenosis by using a single venous access. We present a patient scenario suggesting pulmonic stenosis. Given the possible therapeutic intervention, we decided to use a single large bore (8-French) venous access. Simultaneous peak-to-peak gradients were obtained from high fidelity hemodynamic tracings measured using two small-size catheters located in the right ventricle (RV) and pulmonary artery (PA), respectively. The procedure had no complications."

According to the news reporters, the research concluded: "We present a technique using single venous access for simultaneous RV and PA pressure measurement that is easy to perform and, importantly, it may be safer than exposing the patient to multiple venous accesses."

For more information on this research see: Simultaneous right ventricular to pulmonary artery pressure gradient measurement using a single venous access technique. The Journal of Vascular Access, 2015;17(1):98-100.

Our news correspondents report that additional information may be obtained by contacting J. Castellanos, North Oaks Health System, Cardiology Section, Hammond, Louisiana -, United States.

Hemorrhage

Studies from J. Colleti Junior and Co-Researchers in the Area of Hemorrhage Reported (Spontaneous intracranial hemorrhage in children: report of a hemophilia patient who survived due to a brain cyst)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hemorrhage. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "We report the case of a 2-year-old child who survived an acute episode of severe spontaneous intracranial hemorrhage with clinical and radiological signs of intracranial hypertension and transtentorial herniation. The patient underwent emergency surgery to drain the hematoma, and a catheter was inserted to monitor intracranial pressure."

Our news journalists obtained a quote from the research, "In the initial computed tomography analysis performed prior to hematoma drainage, a brain cyst was evident contralateral to the hematoma, which, based on the analysis by the care team, possibly helped to avoid a worse outcome because the cyst accommodated the brain after the massive hemorrhage. After the investigation, the patient was determined to have previously undiagnosed hemophilia A."

According to the news editors, the research concluded: "The patient underwent treatment in intensive care, which included the control of intracranial pressure, factor VIII replacement and discharge without signs of neurological impairment."

The news correspondents report that additional information may be obtained from J. Colleti Junior, Unidade de Terapia Intensiva Pediatrica, Hospital Santa Catarina, Sao Paulo, SP, Brazil. Additional authors for this research include W. Koga and W.B de Carvalho.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.5935/0103-507X.20150069. This DOI is a link to an online electronic document that is either free or for purchase.

case report

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Systolic Heart Failure have been published. According to news reporting out of Augsburg, Germany, by NewsRx editors, research stated, "Heart failure is a progressive disease with high mortality and morbidity. LCZ696 is a drug that has recently shown its improved efficacy and safety in patients with systolic heart failure and a reduced ejection fraction."

Our news journalists obtained a quote from the research, "Reports on its impact on the improvement of clinical symptoms are, however, scarce. These are important because they improve a patient's compliance with treatment and their quality of life. Case presentation: We report on the case of a 71-year-old patient who had deteriorating symptoms and signs of heart failure (ejection fraction [EF] 34%) in whom we initiated LCZ696 treatment. After two months of LCZ696 treatment (including titration), the New York Heart Association (NYHA) classification had improved (III -> II/I) with no residual signs of acrocyanosis and orthopnea. While creatinine values remained stable, potassium increased to 5.0 mmol/l and brain natriuretic peptide (BNP) dropped from 1260 ng/l to 680 ng/ml. The final EF was 47%. The patient reported substantial improvement of his quality of life. We show, based on a case report, that symptoms associated with heart failure deterioration are improved early after the initiation of LCZ696."

According to the news editors, the research concluded: "This should foster specific research into symptoms and quality of life improvements with LCZ696."

For more information on this research see: Early improvement of symptoms using LCZ696 in a patient with systolic heart failure and a reduced ejection fraction: a case report. Perfusion-Uk, 2016;31(8):699-702. Perfusion-Uk can be contacted at: Sage Publications Ltd, 1 Olivers Yard, 55 City Road, London EC1Y 1SP, England.

Oncology

Studies from J. Masliah-Planchon et al Further Understanding of Oncology (RAS-MAPK pathway epigenetic activation in cancer: miRNAs in action)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology. According to news reporting from Paris, France, by NewsRx journalists, research stated, "The highly conserved RAS-mitogen activated protein kinase (MAPK) signaling pathway is involved in a wide range of cellular processes including differentiation, proliferation, and survival. Somatic mutations in genes encoding RAS-MAPK components frequently occur in many tumors, making the RAS-MAPK a critical pathway in human cancer."

The news correspondents obtained a quote from the research, "Since the pioneering
study reporting that let-7 miRNA acted as tumor suppressor by repressing the RAS oncogene, growing evidence has suggested the importance of miRNAs targeting the RAS-MAPK in oncogenesis. MiRNAs alterations in human cancers may act as a rheostat of the oncogenic RAS signal that is often amplified as cancers progress. However, specific mechanisms leading to miRNAs deregulation and their functional consequences in cancer are far from being fully elucidated. In this review, we provide an experimental-validated map of RAS-MAPK oncomiRs and tumor suppressor miRNAs from transmembrane receptor to downstream ERK proteins.

According to the news reporters, the research concluded: "MiRNAs could be further considered as potential genetic biomarkers for diagnosis, prognosis, or therapeutic purpose."

Our news journalists report that additional information may be obtained by contacting J. Masliah-Planchon, Unite de Genetique Somatique, Departement de Genetique Oncologique, Institut Curie, Paris, France. Additional authors for this research include S. Garinet and E. Pasmant.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18632/oncotarget.6476. This DOI is a link to an online electronic document that is either free or for purchase.

**Immune System Diseases and Conditions - HIV/AIDS**

**Studies from J. Otis et al Provide New Data on HIV/AIDS (Beyond Condoms: Risk Reduction Strategies Among Gay, Bisexual, and Other Men Who Have Sex With Men Receiving Rapid HIV Testing in Montreal, Canada)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immune System Diseases and Conditions - HIV/AIDS is the subject of a report. According to news originating from Vancouver, Canada, by NewsRx correspondents, research stated, "Gay, bisexual, and other men who have sex with men (MSM) have adapted their sexual practices over the course of the HIV/AIDS epidemic based on available data and knowledge about HIV."

Our news journalists obtained a quote from the research, "This study sought to identify and compare patterns in condom use among gay, bisexual, and other MSM who were tested for HIV at a community-based testing site in Montreal, Canada. Results showed that while study participants use condoms to a certain extent with HIV-positive partners and partners of unknown HIV status, they also make use of various other strategies such as adjusting to a partner's presumed or known HIV status and viral load, avoiding certain types of partners, taking PEP, and getting tested for HIV."

According to the news editors, the research concluded: "These findings suggest that MSM who use condoms less systematically are not necessarily taking fewer precautions but may instead be combining or replacing condom use with other approaches to risk reduction."

The news correspondents report that additional information may be obtained from J. Otis, CIHR Canadian HIV Trials Network, Vancouver, BC, Canada. Additional authors for this research include A. McFadyen, T. Haig, M. Blais, J. Cox, B. Brenner, R. Rousseau, G. Emond, M. Roger and M. Wainberg.

Keywords for this news article include: Vancouver, British Columbia, Canada, North and Central America, Immune System Diseases and Conditions, Epidemiology, Viral Sexually Transmitted Diseases and Conditions, Primate Lentiviruses, Vertebrate Viruses, HIV Infections, Retroviridae, RNA Viruses, HIV/AIDS.

**Oncology - Lung Cancer**

**Studies from J.C.H. Yang et al Provide New Data on Lung Cancer (Effect of dose adjustment on the safety and efficacy of afatinib for EGFR mutation-positive lung adenocarcinoma: post hoc analyses of the randomized LUX-Lung 3 and 6 trials)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lung Cancer. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Afatinib 40 mg/day is approved for first-line treatment of EGFR mutation-positive non-small-cell lung cancer (NSCLC). In the case of drug-related grade ≥ 3 or selected prolonged grade 2 adverse events (AEs), the dose can be reduced by 10 mg decrements to a minimum of 20 mg."

Our news journalists obtained a quote from the research, "Here, we evaluate the influence of afatinib dose reduction on AEs, pharmacokinetics and progression-free survival (PFS) in the phase III LUX-Lung 3 and 6 (LL3/6) trials. Treatment-naïve patients with advanced EGFR mutation-positive NSCLC in LL3 (global) and LL6 (China, Thailand, South Korea) were randomized to afatinib or chemotherapy. All afatinib-treated patients (LL3, n = 229; LL6, n = 239) were included in the post hoc analyses. Incidence and severity of common AEs before and after afatinib dose reduction were assessed. Afatinib plasma concentrations were compared in patients who reduced to 30 mg versus those remaining at 40 mg. PFS was compared between patients who dose reduced within the first 6 months of treatment and those who did not. Dose reductions occurred in 53.3% (122/229) and 28.0% (67/239) of patients in LL3 and LL6, respectively; most (86.1% and 82.1%) within the first 6 months of treatment. Dose reduction led to decreases in the incidence of drug-related AEs, and was more likely in patients with higher afatinib plasma concentrations. On day 43, patients who dose reduced to 30 mg (n = 59) had geometric mean afatinib plasma concentrations of 23.3 ng/ml, versus 22.8 ng/ml in patients who remained on 40 mg (n = 284). The median PFS was similar in patients who dose reduced during the first 6 months versus those who did not LL3: 11.3 versus 11.0
months [hazard ratio (HR) 1.25]; LL6: 12.3 versus 11.0 months (HR 1.00). Tolerability-guided dose adjustment is an effective measure to reduce afatinib-related AEs without affecting therapeutic efficacy."

According to the news editors, the research concluded: "Clinicaltrials.gov identifiers: NCT00949650 and NCT0112393."

Keywords for this news article include: Guangdong, People's Republic of China, Asia, Adenocarcinoma, Lung Cancer, Genetics, Oncology.

**Nutritional and Metabolic Diseases and Conditions - …**

**Studies from J.N. Keith and Colleagues Provide New Data on Obesity (Pharmacotherapy in Treatment of Obesity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news originating from Decatur, Alabama, by NewsRx editors, the research stated, "Common disease states in gastroenterology are more effectively treated in an obese patient when weight loss is incorporated into the treatment plan."

Our news journalists obtained a quote from the research, "Strategies that seek to achieve weight loss improve outcomes in the treatment of hepatitis C, non-alcoholic fatty liver disease, and colorectal cancer, as examples. Pharmacologic therapy is an important adjunctive intervention that improves both short-term and long-term outcomes in the management of obese patients."

According to the news editors, the research concluded: "This article reviews currently available drug therapy with a focus on pharmacotherapy approved long-term weight management in non-diabetic obese individuals since 2012, encouraging the use of these tools in the practice of gastroenterology."

The news correspondents report that additional information may be obtained from
Aldehydes

Studies from Jagiellonian University Reveal New Findings on Aldehydes (Influence of different fixation protocols on the preservation and dimensions of cardiac tissue)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Aldehydes is now available. According to news reporting from Krakow, Poland, by NewsRx journalists, research stated, "Recent extensive progress in invasive cardiac procedures has triggered a wave of dozens of heart morphometric anatomical studies that are carried out largely using autopsied samples fixed in formaldehyde solution prior to observations and measurements. In reality, very little is known about changes in heart tissue dimensions during fixation."

The news correspondents obtained a quote from the research from Jagiellonian University, "The aim of this study was therefore to investigate how fixation affects the dimensions of cardiac tissue, and if different types and concentrations of reagents affect this phenomenon. A total of 40 pig heart samples were investigated, and seven different measuring sites were permanently marked in every heart prior to fixation. Four study groups (n = 10 each) were assembled that differed only in concentration and the type of fixative: (i) 2% formaldehyde solution; (ii) 4% formaldehyde solution (formalin); (iii) 10% formaldehyde solution; (iv) alcoholic formalin. The samples were measured before and after fixation at the following time points: 24 h, 72 h and 168 h. It was found that different fixatives significantly affected different parameters. Almost all of the heart dimensions that were measured stabilized after 24 h; later changes were statistically insignificant in the point-to-point comparison. Change in the length of the interatrial septum surface was not altered significantly in any of the fixatives after 24 h of preservation. It was found that 10% formaldehyde increased the thickness of muscular tissue only after 24 h; this thickening was reduced after 72 h and was insignificant at 168 h. Other heart parameters in this group do not present significant changes over the entire fixation time duration."

According to the news reporters, the research concluded: "The 10% formaldehyde phosphate-buffered solution appeared to be the best fixative among the fixatives that were studied for cardiac morphometric purposes; this solution caused the smallest changes in tissue dimensions. Measurements should be obtained at least after 1 week of preservation when most parameters exhibit the smallest changes compared with the non-preserved samples."

For more information on this research see: Influence of different fixation protocols on the preservation and dimensions of cardiac tissue. *Journal of Anatomy*, 2016;229(2):334-
Cardiology

Studies from Johns Hopkins University Add New Findings in the Area of Cardiology (A Bidirectional Neural Interface IC With Chopper Stabilized BioADC Array and Charge Balanced Stimulator)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiology is the subject of a report. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "We present a bidirectional neural interface with a 4-channel biopotential analog-to-digital converter (bioADC) and a 4-channel current-mode stimulator in 180 nm CMOS. The bioADC directly transduces microvolt biopotentials into a digital representation without a voltage-amplification stage."

Financial supporters for this research include NIH, NSF.

The news correspondents obtained a quote from the research from Johns Hopkins University, "Each bioADC channel comprises a continuous-time first-order Delta Sigma modulator with a chopper-stabilized OTA input and current feedback, followed by a second-order comb-filter decimator with programmable over-sampling ratio. Each stimulator channel contains two independent digital-to-analog converters for anodic and cathodic current generation. A shared calibration circuit matches the amplitude of the anodic and cathodic currents for charge balancing. Powered from a 1.5 V supply, the analog and digital circuits in each recording channel draw on average 1.54 µA and 2.13 µA of supply current, respectively. The bioADCs achieve an SNR of 58 dB and a SFDR of > 70 dB, for better than 9-b ENOB. Intracranial EEG recordings from an anesthetized rat are shown and compared to simultaneous recordings from a commercial reference system to validate performance in-vivo. Additionally, we demonstrate bidirectional operation by recording cardiac modulation induced through vagus nerve stimulation, and closed-loop control of cardiac rhythm."

According to the news reporters, the research concluded: "The micropower operation, direct digital readout, and integration of electrical stimulation circuits make this interface ideally suited for closed-loop neuromodulation applications."

For more information on this research see: A Bidirectional Neural Interface IC With Chopper Stabilized BioADC Array and Charge Balanced Stimulator. IEEE Transactions on
Studies from Johns Hopkins University School of Medicine Further Understanding of Headache and Migraine [A Randomized Trial of Ketorolac vs. Sumatripan vs. Placebo Nasal Spray (KSPN) for Acute Migraine]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nervous System Diseases and Conditions - Headache and Migraine. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "To compare the efficacy of ketorolac nasal spray (NS) vs. placebo and sumatriptan NS for the acute treatment of migraine. This was a randomized, double-blind, placebo and active-comparator, crossover study."

The news reporters obtained a quote from the research from the Johns Hopkins University School of Medicine, "Adult migraineurs were randomized to ketorolac NS 31.5 mg, sumatriptan NS 20 mg, or placebo to treat three moderate to severe migraine attacks and switched treatments with each attack. Patients seeking headache care at a headache center or in response to community advertisement were recruited. Adult participants with episodic migraine who experienced (≥)2 migraine attacks per month were eligible for the Ketorolac vs. Sumatriptan vs. Placebo Nasal Spray migraine study. Participants were randomized to treatment arms by a research pharmacist, in a 1:1:1 ratio using computer-generated lists. The primary outcome was 2-hour pain relief. Secondary outcomes included 2-hour pain freedom and absence of migraine associated symptoms, and 24-hour sustained pain relief and pain freedom. Of the 72 randomized participants, 54 (75%) treated at least one attack and 49 (68%) completed all three treatments, for a total of 152 treated migraine attacks. Both ketorolac NS (72.5%, p<.001) and sumatriptan NS (69.4%, p=.001) were more effective than placebo (38.3%) for 2-hour pain relief and 2-hour pain freedom (ketorolac: 43.1%, p=.004; sumatriptan: 36.7%, p=.046; placebo: 18.4%). Ketorolac NS, but not sumatriptan NS, was more effective than placebo in 2-hour absence of nausea. Both ketorolac NS and sumatriptan NS were more effective than placebo for 24-hour sustained pain relief (ketorolac: 49%, p<.001; sumatriptan: 31%, p=.01, placebo: 20%).
Only ketorolac NS was superior to placebo for 24-hour (ketorolac: 35.3%, p=.003; sumatriptan: 22.4%, p=.18, placebo: 12.2%) sustained pain freedom. Nasal burning and dysgeusia were the most common adverse effects for active treatments.

According to the news reporters, the research concluded: "This study supports that ketorolac NS is superior to placebo and that it is non-inferior to sumatriptan NS for the acute abortive treatment of migraine."

Our news correspondents report that additional information may be obtained by contacting A.S. Rao, Johns Hopkins University School of Medicine, Dept. of Neurology, Baltimore, MD, United States. Additional authors for this research include B. Gelaye, T. Kurth, P.D. Dash, H. Nitchie and B.L Peterlin.

**Drugs and Therapies - Combination Therapy**

**Studies from Johns Hopkins University in the Area of Combination Therapy Reported (Combination therapy in skin of color including injectables, laser, and light devices)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Combination Therapy. According to news reporting originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "With the rapid increase in patients seeking cosmetic treatments, the variation in responses of lightly pigmented skin versus darkly pigmented skin has become increasingly apparent. Despite extensive treatment options in patients with skin of color, there is a paucity of well-designed studies performed on this patient population."

Our news editors obtained a quote from the research from Johns Hopkins University, "The lack of research is concerning, as it is well documented that patients with darker skin types are at an increased risk of adverse events when treated with many of the available modalities used in cosmetic procedures. Fortunately, by combining a variety of treatments, these risks may be abrogated, and combination treatments may be a promising regimen for a wide variety of cosmetic complaints."

According to the news editors, the research concluded: "An overview and evaluation of the research of combination therapy in skin of color is presented."

For more information on this research see: Combination therapy in skin of color including injectables, laser, and light devices. *Seminars in Cutaneous Medicine and Surgery*,...
Studies from Juntendo University Reveal New Findings on Cosmetics (Risk assessment of skin lightening cosmetics containing hydroquinone)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cosmetics have been published. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Following reports on potential risks of hydroquinone (HQ), HQ for skin lightening has been banned or restricted in Europe and the US. In contrast, HQ is not listed as a prohibited or limited ingredient for cosmetic use in Japan, and many HQ cosmetics are sold without restriction."

Financial support for this research came from Ministry of Health, Labour and Welfare.

Our news journalists obtained a quote from the research from Juntendo University, "To assess the risk of systemic effects of HQ we examined the rat skin permeation rates of four HQ (0.3%, 1.0%, 2.6%, and 33%) cosmetics. The permeation coefficients ranged from 1.2 x 10 (-9) to 3.1 x 10(-7) cm/s, with the highest value superior than the HQ aqueous solution (1.6 x 10 (-7) cm/s). After dermal application of the HQ cosmetics to rats, HQ in plasma was detected only in the treatment by highest coefficient cosmetic. Absorbed HQ levels treated with this highest coefficient cosmetic in humans were estimated by numerical methods, and we calculated the margin of exposure (MOE) for the estimated dose (0.017 mg/kg-bw/day in proper use) to a benchmark dose for rat renal tubule adenomas. The MOE of 559 is judged to be in a range safe for the consumer."

According to the news editors, the research concluded: "However, further consideration may be required for regulation of cosmetic ingredients."

For more information on this research see: Risk assessment of skin lightening cosmetics containing hydroquinone. Regulatory Toxicology and Pharmacology, 2016;81(1):128-135. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Mosquito-Borne Diseases - Zika Virus

Studies from K. Chan and Co-Researchers Update Current Data on Zika Virus (Rapid, Affordable and Portable Medium-Throughput Molecular Device for Zika Virus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mosquito-Borne Diseases - Zika Virus. According to news reporting from College Station, Texas, by NewsRx journalists, research stated, "Zika virus (ZIKV) has gained global attention as an etiologic agent of fetal microcephaly and Guillain-Barre syndrome. Existing immuno-based rapid tests often fail to distinguish between Zika and related flaviviruses that are common in affected regions of Central and South Americas and the Caribbean."

The news correspondents obtained a quote from the research, "The US CDC and qualified state health department laboratories can perform the reverse transcription polymerase chain reaction (RT-PCR) ZIKV test using highly sophisticated instruments with long turnaround times. The preliminary results of a portable and low-cost molecular diagnostics system for ZIKV infection are reported here. In less than 15 minutes, this low-cost platform can automatically perform high quality RNA extraction from up to 12 ZIKV-spiked urine samples simultaneously. It can also perform reverse transcription recombinase polymerase amplification reaction (RT-RPA) in <= 15 minutes. The fluorescent signal produced from probe-based RT-RPA or RT-PCR assays can be monitored using LEDs and a smartphone camera. In addition, the RT-RPA and RT-PCR assays do not cross-react with dengue and chikungunya viral RNA. This low-cost system lacks complicated, sensitive and high cost components, making it suitable for resource-limited settings."

According to the news reporters, the research concluded: "It has the potential to offer simple sample-to-answer molecular diagnostics and can inform healthcare workers of patients' diagnosis promptly."

For more information on this research see: Rapid, Affordable and Portable Medium-Throughput Molecular Device for Zika Virus. Scientific Reports, 2016;6():1-12. Alkanes

Studies from K. Gottlieb and Co-Researchers in the Area of Alkanes Reported (Review article: inhibition of methanogenic archaea by statins as a targeted management strategy for constipation and related disorders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Alkanes are discussed in a new report. According to news reporting originating from Rockville, Maryland, by NewsRx correspondents, research stated, "Observational studies show a strong association between delayed intestinal transit and the production of methane. Experimental data suggest a direct inhibitory activity of methane on the colonic and ileal smooth muscle and a possible role for methane as a gasotransmitter."

Our news editors obtained a quote from the research, "Archaea are the only confirmed biological sources of methane in nature and Methanobrevibacter smithii is the predominant methanogen in the human intestine. To review the biosynthesis and composition of archaeal cell membranes, archaeal methanogenesis and the mechanism of action of statins in this context. Narrative review of the literature. Statins can inhibit archaeal cell membrane biosynthesis without affecting bacterial numbers as demonstrated in livestock and humans. This opens the possibility of a therapeutic intervention that targets a specific aetiological factor of constipation while protecting the intestinal microbiome. While it is generally believed that statins inhibit methane production via their effect on cell membrane biosynthesis, mediated by inhibition of the HMG-CoA reductase, there is accumulating evidence for an alternative or additional mechanism of action where statins inhibit methanogenesis directly. It appears that this other mechanism may predominate when the lactone form of statins, particularly lovastatin lactone, is administered. Clinical development appears promising. A phase 2 clinical trial is currently in progress that evaluates the effect of lovastatin lactone on methanogenesis and symptoms in patients with irritable bowel syndrome with constipation."

According to the news editors, the research concluded: "The review concludes with an outlook for the future and subsequent work that needs to be done."

The news editors report that additional information may be obtained by contacting K. Gottlieb, Synthetic Biologics, Inc, Rockville, MD, United States. Additional authors for this
Studies from K. Karl and Colleagues Provide New Data on Cardiology (Intrathymic and other anomalous courses of the left brachiocephalic vein in the fetus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiology are presented in a new report. According to news originating from Munich, Germany, by NewsRx correspondents, research stated, "The left brachiocephalic vein (LBCV), or innominate vein, connects the left jugular vein to the right superior vena cava. Its course is posterior to the thymus and directly anterior and superior to the aortic arch."

Our news journalists obtained a quote from the research, "Pediatric and adult cardiology studies have reported on the subaortic or retrotracheal courses of the LBCV and the presence of double LBCV. We observed recently in the fetus that the LBCV may have a course through the thymus (intrathymic) or be absent in the presence of a left superior vena cava. The aim of this study was to report the prevalence of isolated intrathymic and absent LBCV in normal fetuses undergoing second-trimester ultrasound screening, as well as the prevalence of other courses in association with cardiac anomalies. In the prospective part of this study, consecutive second-trimester ultrasound examinations were evaluated to assess the presence and course of the fetal LBCV. In the retrospective case-control part of this study, the databases of two fetal medicine centers were reviewed for cardiac anomalies and the pattern and prevalence of anomalous courses of the LBCV were reported. One thousand four hundred and eighteen consecutive fetuses were examined prospectively. An intrathymic course of the LBCV with a typical bent shape was found in 1.76% (1: 57) of cases and the absence of a LBCV in association with a persistent left superior vena cava (LSVC) was found in 0.28% (1: 350). All fetuses with an isolated intrathymic course or absence of the LBCV had a normal outcome. Over a period of 4.5 years, a total of 1544 fetuses with cardiac malformations were reviewed at two centers. Among these, an anomalous course of the LBCV was noted in eight (0.5%) cases: six subaortic, one retrotracheal and one double LBCV. An intrathymic LBCV is a common condition and appears to be a normal variant in the fetus. The prevalence of a LSVC in our screening population was similar to that reported in previous studies."

According to the news editors, the research concluded: "Anomalous courses of the LBCV are seen occasionally in cases with cardiac malformation."

For more information on this research see: Intrathymic and other anomalous courses of the left brachiocephalic vein in the fetus. Ultrasound in Obstetrics & Gynecology, 2016;48 (4):464-469. Disease Attributes - Disease Progression

Studies from K. Kato et al in the Area of Disease Progression Described (Transient appearance of circulating tumor DNA associated with de novo treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Disease Attributes - Disease Progression. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "The limitation of circulating tumor DNA (ctDNA) is its inability to detect cancer cell subpopulations with few or no dying cells. Lung cancer patients subjected to the EGFR tyrosine kinase inhibitor (EGFR-TKI) treatment were prospectively collected, and ctDNA levels represented by the activating and T790M mutations were measured."

The news reporters obtained a quote from the research, "The first data set (21 patients) consisting of samples collected in the period from before initiation of EGFR-TKI to at least 2 weeks after initiation: the ctDNA dynamics generally exhibited a rapid decrease and/or a transient increase. In 4 patients, we detected a transient increase of ctDNA bearing activating mutations not identified in biopsy samples. ctDNA with the same genotypical pattern was identified in 7 out of the 39 patients of the second data set intended to include samples until the onset of disease progression. In 6 of the 7 patients, this unique ctDNA appeared in the early period after treatment initiation, and did not reappear even after disease progression or chemotherapy. In another patient, similar ctDNA appeared upon radiation therapy."

According to the news reporters, the research concluded: "The identification of ctDNA with a unique genotype indicates the presence of cancer cell subpopulations that normally contain few or no dying cells, but generate dead cells because of the treatment."

For more information on this research see: Transient appearance of circulating tumor DNA associated with de novo treatment. Scientific Reports, 2016;6():1-8. Immunology - Mononuclear Phagocyte System

Studies from Kakatiya University in the Area of Mononuclear Phagocyte System Reported (Intracellular zinc status influences cisplatin-induced endothelial permeability through modulation of PKC alpha, NF-kappa B and ICAM-1 expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immunology - Mononuclear Phagocyte System are presented in a new report. According to news originating from Warangal, India, by NewsRx correspondents, research stated, "Platinum-based chemotherapeutic regimen induces vascular dysfunction. Action of cisplatin on endothelial cells is mediated by protein kinase C (PKC-alpha), which further activates nuclear factor-kappa B (NF-kappa B) and induces canonical transient receptor potential channel (TRPC1) and intercellular adhesion molecule (ICAM-1) expression."

Our news journalists obtained a quote from the research from Kakatiya University, "Increased ICAM-1 contributes to hyperadhesion of monocytes and endothelial dysfunction. PKC-alpha is also involved in phosphorylation of TRPC1, resulting in store-operated calcium entry (SOCE) and further activation of NF-kappa B. Although the role of altered intracellular zinc status is not known in cisplatin-induced vascular dysfunction, because of the ability of zinc to modulate PKC-alpha, NF-kappa B activity, we hypothesized that zinc can ameliorate the extent of endothelial dysfunction induced by cisplatin. Human umbilical vein endothelial cells treated with cisplatin (8.0 mu g/ml) showed lowered intracellular free zinc, concomitant with enhanced activation of PKC-alpha, NF-kappa B activation, TRPC1, SOCE and ICAM-1 levels. Zinc deficiency per se induced using membrane permeable chelator (TPEN) mimicked the cisplatin-induced PKC-alpha, NF-kappa B activation and ICAM-1 expression, but also activated Activator Protein-1 (AP-1). Zinc supplementation (2.0-10.0 mu M) to the endothelial cells during cisplatin treatment or TPEN-induced zinc deficiency suppressed PKC-alpha, NF-kappa B, TRPC1, SOCE activation and lowered the ICAM-1 expression."

According to the news editors, the research concluded: "Zinc supplementation thereby effectively decreased the cisplatin-induced endothelial permeability and adherence of the activated endothelial cells to U937 monocytes."

For more information on this research see: Intracellular zinc status influences cisplatin-induced endothelial permeability through modulation of PKC alpha, NF-kappa B and ICAM-1 expression. Oncology - Colon Cancer

Studies from Kaohsiung Medical University Yield New Data on Colon Cancer (Patients with Metastatic Colorectal Cancer and Hyperbilirubinemia Treated with FOLFIRI plus Bevacizumab as First-Line Treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news reporting originating in Kaohsiung, Taiwan, by NewsRx journalists, research stated, "Metastatic colorectal cancer (mCRC) combined with hyperbilirubinemia is typically considered a contraindication to irinotecan-based therapy, a proven first-line treatment of mCRC. Herein, we present 6 consecutive patients with mCRC combined with hyperbilirubinemia who underwent UGT1A1 genotyping before receiving FOLFIRI plus bevacizumab."

The news reporters obtained a quote from the research from Kaohsiung Medical University, "Dose escalation of irinotecan was performed according to the results of UGT1A1 genotyping in all patients. Improvement in the serum total bilirubin level to a normal range was noted in all 6 patients. Disease control was 100%. The median progression-free survival was 7.5 months and the median overall survival was 8.5 months. FOLFIRI plus bevacizumab as a first-line chemotherapy may achieve effective disease control and be safe in patients with mCRC and hyperbilirubinemia based on UGT1A1 genotyping."

According to the news reporters, the research concluded: "More prospective clinical studies are necessary to evaluate the clinical benefits and safety of this treatment approach."

For more information on this research see: Patients with Metastatic Colorectal Cancer and Hyperbilirubinemia Treated with FOLFIRI plus Bevacizumab as First-Line Treatment. Chemotherapy, 2017;62(1):80-84. Chemotherapy can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. Studies from Keimyung University Have Provided New Information about Apoptosis (The multi-target drug BAI induces apoptosis in various human cancer cells through modulation of Bcl-xL protein)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Apoptosis have been published. According to news originating from Daegu, South Korea, by NewsRx correspondents, research stated, "Previous studies have demonstrated the anticancer effects of the newly developed cyclin-dependent kinase inhibitor BAI in various cancer cells. However, the molecular mechanisms of the cellular effects induced by BAI have not been fully elucidated."

Our news journalists obtained a quote from the research from Keimyung University, "The objective of this study was to investigate the mechanisms underlying the regulation of B cell lymphoma-2 (Bcl-2) family proteins in BAI-induced apoptosis of cancer cells. BAI induced poly(ADP-ribose) polymerase cleavage and DEVDase activation dose- and time-dependently. However, BAI-induced apoptosis was not involved in reactive oxygen species generation or mitogen-activated protein kinases pathways. On the other hand, BAI reduced the mitochondrial membrane potential (ΔΨm) dose- and time-dependently, and induced the release of apoptosis-inducing factor (AIF) and cytochrome c from mitochondria in A549 and Caki cells. Furthermore, BAI-induced apoptosis was strongly associated with downregulation of B-cell lymphoma-extra large (Bcl-xL), but not Bcl-2, and BAI modulated the interactions among p53 and Bcl-2 family proteins in human cancer cells."

According to the news editors, the research concluded: "Taken together, these results revealed that the regulations of Bcl-2 family proteins are correlated with BAI-induced apoptosis, suggesting that BAI is a potential multi-target agent of cancer."

The news correspondents report that additional information may be obtained from S. Kim, Keimyung University, Sch Med, Inst Med Sci, Daegu 42601, South Korea. Additional authors for this research include D.E. Kim, T.K. Kwon, J. Lee and J.W. Park.

Keywords for this news article include: Daegu, South Korea, Asia, Cancer, Drugs and Therapies, Apoptosis, Oncology, Keimyung University.

decomposition to their metabolites)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Alkylating Agents is now available. According to news reporting originating from Kermanshah, Iran, by NewsRx correspondents, research stated, "The electronic features of anti-tumor agent, temozolomide, and its degradation products (MTIC and metabolite AIC) have been traced by means of UV absorption spectroscopy in vacuo and aqueous media. For comparison, electronic spectra of related structures and drugs (e.g., dacarbazine) were also investigated."

Our news editors obtained a quote from the research from the Kermanshah University of Medical Sciences, "These investigations were carried out using time-dependent density functional theory (TD-DFT) method while the conductor like screening model (COSMO) were applied for the inclusion of solvent effects in electronic spectra. From functional benchmarking, two methods; B3LYP and O3LYP were selected among several other methods with 6-311+ G(2d,p) basis set aiming to get the best results in accord with the experimental values. An assessment of the obtained spectra has shown that O3LYP functional gives a mean absolute error (MAE) from experimental absorption peaks of 4.3 nm compared to the 7.2 nm MAE value at B3LYP level in aqueous media. Furthermore, since the structural and tautomeric conformers affect the electronic spectra, conformational preferences have been analyzed in temozolomide, dacarbazine, and their related structures. Temozolomide structure possesses two rotamers that differ in the orientation of carboxamide moiety with a small energy difference (energy difference of 1.39 kcal mol(-1) in vacuo and 0.35 kcal mol(-1) in aqueous media at B3LYP/6-311++ G(2df,3pd). The more stable and meta-stable TMZ rotamer have shown their absorption maxima at 329-334 nm, respectively, at O3LYP level in aqueous media. Applying statistical calculation according to Boltzmann population formula at 25 degrees C and computed weighed mean estimates the lambda(max) of temozolomide at 331 nm, which is in notable agreement with the experimental value (330 nm)."

According to the news editors, the research concluded: "Moreover, molecular orbital composition analysis has been conducted in order to interpret these findings."

For more information on this research see: The simulation of UV spectroscopy and electronic analysis of temozolomide and dacarbazine chemical decomposition to their metabolites. Journal of Molecular Modeling, 2016;22(11):159-167. Journal of Molecular Modeling can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Studies from King Abdul-Aziz University Hospital Have Provided New Information about Breast Cancer (Lung dose analysis in loco-regional hypofractionated radiotherapy of breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting from Jeddah, Saudi Arabia, by NewsRx journalists, research stated, "To report the ipsilateral lung dosimetry data of breast cancer (BC) patients treated with loco-regional hypofractionated radiotherapy (HFRT). Treatment plans of 150 patients treated in the Radiotherapy Unit, King Abdulaziz University Hospital, Jeddah, Kingdom of Saudi Arabia between January 2012 and March 2015 by HFRT for BC were retrospectively reviewed."

The news correspondents obtained a quote from the research from King Abdul-Aziz University Hospital, "All patients received 42.4 Gy in 16 fractions by tangential and supra-clavicular fields with 6 MV, 18 MV, or mixed energies. Ipsilateral lung dosimetric data V20Gy and mean lung dose (MLD) were recorded. Correlations between lung dose, patient characteristics, and treatment delivery parameters were assessed by a logistic regression test. The mean ipsilateral lung V20Gy was 24.6% and mean MLD was 11.9 Gy. A weak, but statistically significant correlation was found between lung dose and lung volume (p=0.043). The lung dose was significantly decreasing with patient separation and depth of axillary lymph node (ALN) and supra-clavicular lymph nodes (SCLN) (p <0.0001), and increasing with ALN (p=0.001) and SCLN (p=0.003) dose coverage. Lung dose significantly decreased with beam energy (p <0.0001): mean V20Gy was 27.8%, 25.4% for 6 MV, mixed energy, and 21.2% for 18 MV. The use of a low breast-board angle correlates with low lung dose."

According to the news reporters, the research concluded: "Our data suggest that the use of high energy photon beams and low breast-board angulation can reduce the lung dose."

Our news journalists report that additional information may be obtained by contacting Y.A. Bahadur, King Abdulaziz Univ Hosp, Dept. of Radiol, Jeddah, Saudi Arabia. Additional authors for this research include Y.A. Bahadur, C.T. Constantinescu and M.M. Eltaher.

**Heart Disorders and Diseases - Brugada Syndrome**

**Studies from King Saud University Yield New Data on Brugada Syndrome (Near miss in a patient with undiagnosed Brugada syndrome: a case report and literature review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Brugada Syndrome is the subject of a report. According to news reporting from Riyadh, Saudi Arabia, by NewsRx editors, the research stated, "Brugada syndrome is a rare genetic disorder mostly affecting young subjects without any underlying heart disease."

The news correspondents obtained a quote from the research from King Saud University, "Here we are describing 1 patient presented for gastric bypass surgery who had near cardiac arrest under general anesthesia for unknown reason."

According to the news reporters, the research concluded: "Postoperative investigation of this case revealed the diagnosis of Brugada syndrome."

Our news journalists report that additional information may be obtained by contacting T. Alzahrani, King Saud Univ, Coll Med, Dept. of Anesthesia, Riyadh 11461, Saudi Arabia.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jclinane.2016.09.015. This DOI is a link to an online electronic document that is either free or for purchase.

**Immune System Diseases and Conditions - HIV/AIDS**

**Studies from King’s College Reveal New Findings on HIV/AIDS (Resistance of Transmitted Founder HIV-1 to IFITM-Mediated Restriction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immune System Diseases and Conditions - HIV/AIDS is now available. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "Interferon-induced transmembrane proteins (IFITMs) restrict the entry of diverse enveloped viruses through incompletely understood mechanisms. While IFITMs are reported to inhibit HIV-1, their in vivo relevance is unclear."

The news reporters obtained a quote from the research from King’s College, "We
show that IFITM sensitivity of HIV-1 strains is determined by the co-receptor usage of the viral envelope glycoproteins as well as IFITM subcellular localization within the target cell. Importantly, we find that transmitted founder HIV-1, which establishes de novo infections, is uniquely resistant to the antiviral activity of IFITMs. However, viral sensitivity to IFITMs, particularly IFITM2 and IFITM3, increases over the first 6 months of infection, primarily as a result of neutralizing antibody escape mutations. Additionally, the ability to evade IFITM restriction contributes to the different interferon sensitivities of transmitted founder and chronic viruses."

According to the news reporters, the research concluded: "Together, these data indicate that IFITMs constitute an important barrier to HIV-1 transmission and that escape from adaptive immune responses exposes the virus to antiviral restriction."

For more information on this research see: Resistance of Transmitted Founder HIV-1 to IFITM-Mediated Restriction. *Cell Host & Microbe*, 2016;20(4):429-442. *Cell Host & Microbe* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. **Aging Research - Geriatrics and Gerontology**

**Studies from King's College Yield New Information about Geriatrics and Gerontology (Kicking Back Cognitive Ageing: Leg Power Predicts Cognitive Ageing after Ten Years in Older Female Twins)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Aging Research - Geriatrics and Gerontology are discussed in a new report. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "Many observational studies have shown a protective effect of physical activity on cognitive ageing, but interventional studies have been less convincing. This may be due to short time scales of interventions, suboptimal interventional regimes or lack of lasting effect."

The news reporters obtained a quote from the research from King's College, "Confounding through common genetic and developmental causes is also possible. We aimed to test whether muscle fitness (measured by leg power) could predict cognitive change in a healthy older population over a 10-year time interval, how this performed alongside other predictors of"
cognitive ageing, and whether this effect was confounded by factors shared by twins. In addition, we investigated whether differences in leg power were predictive of differences in brain structure and function after 12 years of follow-up in identical twin pairs. A total of 324 healthy female twins (average age at baseline 55, range 43-73) performed the Cambridge Neuropsychological Test Automated Battery (CANTAB) at two time points 10 years apart. Linear regression modelling was used to assess the relationships between baseline leg power, physical activity and subsequent cognitive change, adjusting comprehensively for baseline covariates (including heart disease, diabetes, blood pressure, fasting blood glucose, lipids, diet, body habitus, smoking and alcohol habits, reading IQ, socioeconomic status and birthweight). A discordant twin approach was used to adjust for factors shared by twins. A subset of monozygotic pairs then underwent magnetic resonance imaging. The relationship between muscle fitness and brain structure and function was assessed using linear regression modelling and paired t tests. A striking protective relationship was found between muscle fitness (leg power) and both 10-year cognitive change [fully adjusted model standardised b-coefficient (Stdβ)=0.174, p=0.002] and subsequent total grey matter (Stdβ=0.362, p=0.005). These effects were robust in discordant twin analyses, where within-pair difference in physical fitness was also predictive of within-pair difference in lateral ventricle size. There was a weak independent effect of self-reported physical activity. Leg power predicts both cognitive ageing and global brain structure, despite controlling for common genetics and early life environment shared by twins."

According to the news reporters, the research concluded: "Interventions targeted to improve leg power in the long term may help reach a universal goal of healthy cognitive ageing."

Our news correspondents report that additional information may be obtained by contacting C.J. Steves, Dept. of Twin Research and Genetic Epidemiology, King's College London, London, UK. Additional authors for this research include M.M. Mehta, S.H. Jackson and T.D Spector.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000441029. This DOI is a link to an online electronic document that is either free or for purchase.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Peptide Proteins - Proinsulin.

According to news originating from Hyogo, Japan, by NewsRx correspondents, research stated, "Our recent work suggested that intranasal coadministration with the cell-penetrating peptide (CPP) penetratin increased the brain distribution of the peptide drug insulin. The present study aimed to distinctly certify the ability of penetratin to facilitate the nose-to-brain delivery of insulin by quantitatively evaluating the distribution characteristics in brain using radioactive (64)Cu-NODAGA-insulin."

Financial support for this research came from Japan Society for the Promotion of Science.

Our news journalists obtained a quote from the research from Kobe Gakuin University, " Autoradiography and analysis using a gamma counter of brain areas demonstrated that the accumulation of radioactivity was greatest in the olfactory bulb, the anterior part of the brain closest to the administration site, at 15 min after intranasal administration of (64)Cu-NODAGA-insulin with l-or d-penetratin. The brain accumulation of (64)Cu-NODAGA-insulin with penetratin was confirmed by ELISA using unlabeled insulin in which intact insulin was delivered to the brain after intranasal coadministration with l-or d-penetratin. By contrast, quantification of cerebrospinal fluid (CSF) samples showed increased insulin concentration in only the anterior portion of the CSF at 15 min after intranasal coadministration with l-penetratin. This study gives the first concrete proof that penetratin can accelerate the direct transport of insulin from the nasal cavity to the brain parenchyma."

According to the news editors, the research concluded: "Further optimization of intranasal administration with CPP may increase the efficacy of delivery of biopharmaceuticals to the brain while reducing the risk of systemic drug exposure."

For more information on this research see: Visualization and Quantitative Assessment of the Brain Distribution of Insulin through Nose-to-Brain Delivery Based on the Cell-Penetrating Peptide Noncovalent Strategy. Molecular Pharmacuetics, 2016;13(3):1004-11. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

Oncology - Liver Cancer

Studies from Kobe University Provide New Data on Liver Cancer
(Efficacy of stereotactic body radiotherapy for hepatocellular carcinoma with portal vein tumor thrombosis/inferior vena cava tumor thrombosis: evaluation by comparison with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting originating from Hyogo, Japan, by NewsRx correspondents, research stated, "This study aimed to evaluate the efficacy of stereotactic body radiotherapy (SBRT) compared with three-dimensional conformal radiotherapy (3DCRT). Forty-three patients with portal vein tumor thrombosis (PVTT)/inferior vena cava tumor thrombosis (IVCTT) treated with SBRT (27 with CyberKnife (CK) and 16 with TrueBeam (TB)) from April 2013 to December 2014, and 54 treated with 3DCRT from June 2008 to March 2013 were evaluated."

Our news editors obtained a quote from the research from Kobe University, "Dosimetric parameters, response to radiotherapy (RT) and survival outcomes were compared in total SBRT vs. 3DCRT, CK vs. 3DCRT and TB vs. 3DCRT, respectively. The median biologically effective dose 10 (BED10) values in total SBRT, CK, TB and 3DCRT were 73.4 Gy(10), 75.0 Gy(10), 60.5 Gy(10) and 58.5 Gy(10), respectively (P < 0.001 in total SBRT vs. 3DCRT, P< 0.001 in CK vs. 3DCRT, P = 0.004 in TB vs. 3DCRT). The tumor response rates were 67%, 70%, 62% and 46%, respectively (P = 0.04, P = 0.04, P = 0.25). The 1-year overall survival rates were 49.3%, 56.7%, 38.1% and 29.3%, respectively (P = 0.02, P = 0.02, P = 0.30), and the 1-year local progression rates were 20.4%, 21.9%, 18.8% and 43.6%, respectively (P = 0.01, P = 0.04, P = 0.10). The use of SBRT made it possible to achieve a higher BED10 compared with the use of 3DCRT. Improvements in local control and survival were achieved in the CK group and the total SBRT group."

According to the news editors, the research concluded: "Our results suggest that SBRT may have the potential to be the standard RT technique for the treatment of PVTT/IVCTT."

The news editors report that additional information may be obtained by contacting K. Yoshida, Kobe University, Div Radiat Oncol, Grad Sch Med, Chou Ku, Kobe, Hyogo 6500017, Japan. Studies from Korea Research Institute of Chemical Technology Yield New Data on DNA-Binding Proteins (IinQ attenuates systemic inflammatory responses via selectively impairing the Myddosome complex formation upon TLR4 ligation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Proteins - DNA-Binding Proteins have been presented. According to news reporting originating from Daejeon, South Korea, by NewsRx correspondents, research stated, "A specific small-molecule inhibitor of the TLR4 signaling complex upstream of the IKK would likely provide therapeutic benefit for NF-kappa B-mediated inflammatory disease. We previously identified brazilin as a selective upstream IRK inhibitor targeting the Myddosome complex."

Our news editors obtained a quote from the research from the Korea Research Institute of Chemical Technology, "In this study, using a cell-based ubiquitination assay for IRAK1 and a chemical library comprising a series of structural analogues of brazilin, a novel small molecule, 2-hydroxy-5,6-dihydroisoindolo[1,2-a]isoguinoline-3,8-dione(linQ), was identified as a selective and potent inhibitor of IRAK1-dependent NF-kappa B activation upon TLR4 ligation. In RAW264.7 macrophages, linQ drastically suppressed activation of upstream IKK signaling events including membrane-bound IRAK1 ubiquitination and IKK phosphorylation by the TLR4 ligand, resulting in reduced expression of proinflammatory mediators including IL-6, TNF-alpha, and nitric oxide. Interestingly, linQ did not suppress NF-kappa B activation via the TLR3 ligand, DNA damaging agents, or a protein kinase C activator, indicating linQ is specific for TLR4 signaling. Analysis of upstream signaling events further confirmed that linQ disrupts the MyD88-IRAK1-TRAF6 complex formation induced by LPS treatment, without affecting TLR4 oligomerization. Moreover, intravenous administration of linQ significantly reduced lethality and attenuated systemic inflammatory responses in an in vivo mouse model of endotoxin shock following LPS challenge."

According to the news editors, the research concluded: "Thus, linQ represents a novel class of brazilin analogues with improved potency and specificity toward disruption of Myddosome complex formation in TLR4 signaling, indicating that linQ may be a promising therapeutic candidate for the treatment of systemic inflammatory diseases."

Transfusion Medicine

Studies from Korea University in the Area of Transfusion Medicine Reported (A simple method for activating the platelets used in microfluidic platelet aggregation tests: Stirring-induced platelet activation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Transfusion Medicine is the subject of a report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "High-shear stimulation is well known as one of the key factors affecting platelet activation and aggregation, which can lead to the formation of a thrombus. In one of our previous studies, we introduced migration distance-based platelet function analysis in a microfluidic system."

Our news editors obtained a quote from the research from Korea University, "In this study, we set out to examine the effects of stirring on shear-induced platelet activation and aggregation in a chamber system by using a rotating stirrer. We found that the rotating stirrer caused not only rotational shear flow but also a strong radial secondary flow. The latter flow led to efficient mixing in the chamber. Moreover, the rotational flow led to the generation of shear stress, the magnitude of which can be controlled to activate the platelets. Activated platelets tend to aggregate themselves. The maximum platelet aggregation was observed at a critical shear rate of 3100 s(-1), regardless of the stirrer shape. Furthermore, the time taken to attain maximum aggregation was significantly shortened when using a wide stirrer (30 s) instead of a narrow one (180 s). When using a flat stirrer, the non-uniform shear field in the chamber system was resolved with the radial secondary flow-induced mixing; thus, most of the platelets were homogenously activated. The stirring-induced platelet activation mechanism was experimentally confirmed in a microfluidic system for a platelet aggregation test while monitoring the migration distance until the microfluidic channel is occluded."

According to the news editors, the research concluded: "Our findings indicate that the present system, consisting of a rotating stirrer and a confined chamber, provides effective shear stimulation for activating platelets and inducing platelet aggregates."

For more information on this research see: A simple method for activating the platelets used in microfluidic platelet aggregation tests: Stirring-induced platelet activation. Biomicrofluidics, 2016;10(6):242-251. Biomicrofluidics can be contacted at: Amer Inst Physics, 1305 Walt Whitman Rd, Ste 300, Melville, NY 11747-4501, USA. Cardiology

Studies from Kumamoto University Further Understanding of Cardiology (Cardiac helical CT involving a low-radiation-dose protocol with a 100-kVp setting Usefulness of hybrid iterative reconstruction and display preset optimization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiology have been presented. According to news reporting originating from Kumamoto, Japan, by NewsRx correspondents, research stated, "To compare the radiation dose and image quality of retrospective electrocardiogram (ECG)-gated cardiac computed tomography (CT) between a 100-kVp protocol, hybrid iterative reconstruction (HIR), and display preset optimization and the 120-kVp protocol. We prospectively enrolled 100 patients with tachycardia or atrial fibrillation scanned retrospective ECG-gated cardiac CT."

Our news editors obtained a quote from the research from Kumamoto University, "We randomly assigned 50 patients to the 120-kVp protocol and 50 patients to the 100-kVp protocol. We compared effective doses (EDs) between the two protocols. The 120-kVp images were post-processed using filtered back projection (FBP). The 100-kVp images were post-processed using FBP (100-kVp protocol) and HIR (i-100-kVp protocol). We compared attenuation of the ascending aorta, signal-to-noise ratio (SNR), and image noise between the 120-kVp, 100-kVp, and i-100-kVp protocols. We performed qualitative image analysis for the 120-kVp and i-100-kVp protocols. ED of the 100-kVp protocol (4.4 +/- 0.4mSv) was 76\% lower than that of the 120-kVp protocol (18.4 +/- 0.6 mSv). Attenuations of the 100-kVp (549.1 +/- 73.8HU) and i-100-kVp (550.5 +/- 73.7HU) protocols were higher than that of the 120-kVp protocol (437.3 +/- 55.7 HU). Image noise of the 100-kVp (53.6 +/- 18.5HU) and i-100-kVp (30.9 +/- 8.6HU) protocols were higher than that of the120-kVp protocol (23.8 +/- 5.7 HU). There was no significant difference in SNR and the result of qualitative image analysis between the 120-kVp and i-100-kVp protocols."

According to the news editors, the research concluded: "The 100-kVp protocol with HIR reduced the 76\% radiation dose while preserving the image quality compared with the conventional 120-kVp protocol on retrospective ECG-gated cardiac CT."

For more information on this research see: Cardiac helical CT involving a low-radiation-dose protocol with a 100-kVp setting Usefulness of hybrid iterative reconstruction and display preset optimization. Medicine, 2016;95(46):438-443. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Studies from Kumamoto University Further Understanding of Splenic Artery (Salvage Splenic Artery Embolization for Saving Falling Living Donor Graft due to Portal Overflow: A Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gastroenterology - Splenic Artery. According to news reporting from Kumamoto, Japan, by NewsRx journalists, research stated, "Portal decompression is an approach for reducing portal overflow caused by small-for-size syndrome. We report the case of a patient who recovered from rapidly progressing hyperbilirubinemia caused by a small graft by decompressing portal overflow with splenic artery embolization following a living donor liver transplantation (LDLT)."

The news correspondents obtained a quote from the research from Kumamoto University, "The patient was a 54-year-old man with end-stage liver disease secondary to alcoholic liver cirrhosis; the donor was his 54-year-old wife. The graft volume of the left lobe was 444 mL, which was 34.8% of the standard liver volume (SLV) and insufficient for the recipient; thus, the plan was to use the right lobe for the graft. The patient underwent LDLT with a right lobe graft; the volume to SLV ratio was 39.1%, and the graft-to-recipient-weight ratio was 0.72%. Although portal pressure was low during the operation, the patient eventually developed small-for-size syndrome after LDLT. It was conceivable that because the patient had splenomegaly, portal decompression would be effective. Splenic arterial embolization was performed successfully on postoperative day (POD) 7. The patient's total bilirubin level was increased to 40 mg/dL on POD16. Decreased portal flow, which was shown by ultrasound screening to be 'to-and-flo,' increased again on POD23 to one-third of that on POD1. He was discharged without any infectious complications."

According to the news reporters, the research concluded: "Additional splenic artery embolization after LDLT may be a convenient option for reducing portal overflow for patients with splenomegaly if the portal decompression was not performed for some reason at the surgery."

Our news journalists report that additional information may be obtained by contacting H. Okabe, Kumamoto University, Grad Sch Life Sci, Dept. of Gastroenterol Surg, Kumamoto, Kumamoto, Japan. Additional authors for this research include T. Yoshizumi, T. Ikegami, H. Uchiyama, N. Harimoto, S. Itoh, K. Kimura, H. Baba and Y. Maehara.

**Oncology - Breast Cancer**

**Studies from Kyoto Sangyo University Yield New Information about Breast Cancer (Hyaluronan Production Regulates Metabolic and Cancer Stem-like Properties of Breast Cancer Cells via Hexosamine Biosynthetic Pathway-coupled HIF-1 Signaling)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news originating from Kyoto, Japan, by NewsRx correspondents, research stated, "Cancer stem cells (CSCs) represent a small subpopulation of self-renewing oncogenic cells. As in many other stem cells, metabolic reprogramming has been implicated to be a key characteristic of CSCs."

Financial supporters for this research include Japan Society for the Promotion of Science, Tokyo Biochemical Research Foundation.

Our news journalists obtained a quote from the research from Kyoto Sangyo University, "However, little is known about how the metabolic features of cancer cells are controlled to orchestrate their CSC-like properties. We recently demonstrated that hyaluronan (HA) overproduction allowed plastic cancer cells to revert to stem cell states. Here, we adopted stable isotope-assisted tracing and mass spectrometry profiling to elucidate the metabolic features of HA-overproducing breast cancer cells. These integrated approaches disclosed an acceleration of metabolic flux in the hexosamine biosynthetic pathway (HBP). A metabolic shift toward glycolysis was also evident by quantitative targeted metabolomics, which was validated by the expression profiles of key glycolytic enzymes. Forced expression of glutamine:fructose-6-phosphate amidotransferase 1 (GFAT1), an HBP rate-limiting enzyme, resembled the results of HA overproduction with regard to HIF-1 accumulation and glycolytic program, whereas GFAT1 inhibition significantly decreased HIF-1 protein level in HA-overproducing cancer cells. Moreover, inhibition of the HBP-HIF-1 axis abrogated HA-driven glycolytic enhancement and reduced the CSC-like subpopulation."

According to the news editors, the research concluded: "Taken together, our results provide compelling evidence that HA production regulates the metabolic and CSC-like properties of breast cancer cells via HBP-coupled HIF-1 signaling."

The news correspondents report that additional information may be obtained from N.
Studies from Kyoto University Update Current Data on Colon Cancer (Metabolic Alterations Caused by KRAS Mutations in Colorectal Cancer Contribute to Cell Adaptation to Glutamine Depletion by Upregulation of Asparagine Synthetase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting originating in Kyoto, Japan, by NewsRx journalists, research stated, "A number of clinical trials have shown that KRAS mutations of colorectal cancer (CRC) can predict a lack of responses to anti-epidermal growth factor receptor-based therapy. Recently, there have been several studies to elucidate metabolism reprogramming in cancer."

The news reporters obtained a quote from the research from Kyoto University, "However, it remains to be investigated how mutated KRAS can coordinate the metabolic shift to sustain CRC tumor growth. In this study, we found that KRAS mutation in CRC caused alteration in amino acid metabolism. KRAS mutation causes a marked decrease in aspartate level and an increase in asparagine level in CRC. Using several human CRC cell lines and clinical specimens of primary CRC, we demonstrated that the expression of asparagine synthetase (ASNS), an enzyme that synthesizes asparagine from aspartate, was upregulated by mutated KRAS and that ASNS expression was induced by KRAS-activated signaling pathway, in particular PI3K-AKT-mTOR pathway. Importantly, we demonstrated that KRAS-mutant CRC cells could become adaptive to glutamine depletion through asparagine biosynthesis by ASNS and that asparagine addition could rescue the inhibited growth and viability of cells grown under the glutamine-free condition in vitro. Notably, a pronounced growth suppression of KRAS-mutant CRC was observed upon ASNS knockdown in vivo. Furthermore, combination of L-asparaginase plus rapamycin markedly suppressed the growth of KRAS-mutant CRC xenografts in vivo, whereas either L-asparaginase or rapamycin alone was not effective."

According to the news reporters, the research concluded: "These results indicate ASNS might be a novel therapeutic target against CRCs with mutated KRAS."

Our news correspondents report that additional information may be obtained by
contacting K. Kawada, Kyoto University, Grad Sch Med, Dept. of Surg, Kyoto 6068507, Japan. Additional authors for this research include K. Kawada, M. Iwamoto, S. Inamoto, T. Sasazuki, S. Shirasawa, S. Hasegawa and Y. Sakai.

Therapeutics

Studies from Kyoto University in the Area of Therapeutics Reported (Enhanced engraftment, proliferation, and therapeutic potential in heart using optimized human iPSC-derived cardiomyocytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Therapeutics have been published. According to news reporting from Kyoto, Japan, by NewsRx journalists, research stated, "Human pluripotent stem cell-derived cardiomyocytes (CMs) are a promising tool for cardiac cell therapy. Although transplantation of induced pluripotent stem cell (iPSC)-derived CMs have been reported in several animal models, the treatment effect was limited, probably due to poor optimization of the injected cells."

The news correspondents obtained a quote from the research from Kyoto University, "To optimize graft cells for cardiac reconstruction, we compared the engraftment efficiency of intramyocardially-injected undifferentiated-iPSCs, day 4 mesodermal cells, and day 8, day 20, and day 30 purified iPSC-CMs after initial differentiation by tracing the engraftment ratio (ER) using in vivo bioluminescence imaging. This analysis revealed the ER of day 20 CMs was significantly higher compared to other cells. Transplantation of day 20 CMs into the infarcted hearts of immunodeficient mice showed good engraftment, and echocardiography showed significant functional improvement by cell therapy. Moreover, the imaging signal and ratio of Ki67-positive CMs at 3 months post injection indicated engrafted CMs proliferated in the host heart. Although this graft growth reached a plateau at 3 months, histological analysis confirmed progressive maturation from 3 to 6 months. These results suggested that day 20 CMs had very high engraftment, proliferation, and therapeutic potential in host mouse hearts."

According to the news reporters, the research concluded: "They also demonstrate this model can be used to track the fate of transplanted cells over a long time."

For more information on this research see: Enhanced engraftment, proliferation, and therapeutic potential in heart using optimized human iPSC-derived cardiomyocytes. Scientific Reports, 2016;6():19111. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)  

Our news journalists report that additional information may be obtained by contacting S. Funakoshi, Center for iPS Cell Research and Application, Kyoto University, Kyoto, Japan. Additional authors for this research include K. Miki, T. Takaki, C. Okubo, T.
Studies from Kyung Hee University in the Area of Pharmacodynamics

Reported (A Comprehensive Review of Recent Studies on Herb-Drug Interaction: A Focus on Pharmacodynamic Interaction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Pharmacodynamics are discussed in a new report. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "The concomitant use of herbal and conventional drugs accelerates the possibility of clinically significant herb-drug interactions (HDIs). This paper aims to analyze the current status of HDI studies worldwide and to review studies on HDI-induced pharmacodynamic (PD) interactions."

The news reporters obtained a quote from the research from Kyung Hee University, "HDI studies published from 2000 to 2014 and indexed in PubMed were categorized according to publication year, area/country, study methods and objectives, and disease categories. The reviewed studies focused on HDI-induced PD; each PD interaction with concurrent use of approximately 100 herbal drugs and 70 conventional drugs was summarized. All PD-related articles were categorized according to four characteristics: herbal drugs, conventional drugs, types of PD interaction, and type of study. Among them, 17 well-designed clinical studies were evaluated by using the Jadad Quality Assessment Scale. The number of HDI reports has gradually increased since 2000, with a primary focus on neoplasms and diseases of the circulatory system. Most of these investigated pharmacokinetic reactions, such as cytochrome P450 enzyme metabolism, with fewer reports investigating PD. Most PD interaction studies investigated warfarin, ginkgo leaves, and St. John's wort. An evaluation of 17 studies revealed a generally positive view of PD effects involving synergism or reduced toxicity and a high average quality score (>3 points on a 0-5 scale). These results demonstrate that most HDI studies so far have examined PK interactions and have been limited to very few conventional drugs and herbal drugs."

According to the news reporters, the research concluded: "This suggests that more studies focusing on PD are necessary to understand interactions between commonly used herbal and conventional drugs."

Oncology - Lung Cancer

Studies from Kyushu University Add New Findings in the Area of Lung Cancer (Clinical Significance of PD-L1 Protein Expression in Surgically Resected Primary Lung Adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "The clinicopathological features of carcinomas expressing programmed death ligand 1 (PD-L1) and their associations with common driver mutations, such as mutations in the EGFR gene, in lung adenocarcinoma are not clearly understood. Here, we examined PD-L1 protein expression in surgically resected primary lung adenocarcinoma and the association of PD-L1 protein expression with clinicopathological features, EGFR mutation status, and patient outcomes."

Our news journalists obtained a quote from the research from Kyushu University, "The expression of PD-L1 protein in 417 surgically resected primary lung adenocarcinomas was evaluated by immunohistochemical analysis. The cutoff value for defining PD-L1 positivity was determined according to the histogram of proportions of PD-L1-positive cancer cells. Samples from 85 patients (20.4%) and 144 patients (34.5%) were positive for PD-L1 protein expression according to 5% and 1% PD-L1 cutoff values, respectively. Fisher's exact tests showed that PD-L1 positivity was significantly associated with male sex, smoking, higher tumor grade, advanced T status, advanced N status, advanced stage, the presence of pleural and vessel invasions, micro papillary or solid predominant histological subtypes, and wild-type EGFR. Univariate and multivariate survival analyses revealed that patients with PD-L1 positivity had poorer prognoses than those without PD-L1 protein expression at the 1% cutoff value (disease-free survival p< 0.0001, overall survival p< 0.0001). PD-L1 protein expression was significantly higher in smoking-associated adenocarcinoma and in EGFR mutation-negative adenocarcinoma. PD-L1 protein expression was associated with poor survival in patients with lung adenocarcinoma."

According to the news editors, the research concluded: "The PD-L1/programmed cell death 1 pathway may contribute to the progression of smoking associated tumors in lung adenocarcinoma."

For more information on this research see: Clinical Significance of PD-L1 Protein Expression in Surgically Resected Primary Lung Adenocarcinoma. *Journal of Thoracic Oncology*, 2016;11(11):1879-1890. *Journal of Thoracic Oncology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Cardiovascular Diseases and Conditions -

Studies from Kyushu University Yield New Data on Thrombosis and Hemostasis (Antiplatelet and Anticoagulant Activities of Angelica shikokiana Extract and Its Isolated Compounds)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Thrombosis and Hemostasis are presented in a new report. According to news reporting originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "Angelica shikokiana is a Japanese medicinal plant that is used traditionally in several ailments of cardiovascular diseases. However, there is no report regarding its anticoagulant or antiplatelet activities."

Our news editors obtained a quote from the research from Kyushu University, "So this study was designed to screen for such activities (anticoagulant by prothrombin time [PT], activated partial thromboplastin time, and thrombin time assays and antiplatelet activities against adenosine 5'-diphosphate [ADP] and arachidonic acid-induced platelet aggregations) for the methanol extract of the aerial part (Angelica methanol extract [AME]), its isolated coumarins, flavonoids, and flavonoid metabolites. The AME had potent anticoagulant and antiplatelet activities, and the flavonoid compounds were evidenced to be responsible for such activities. Among coumarins compounds, hyuganin C showed significant prolongation of only PT, while other coumarins were inactive. Similarly, hyuganin C and bergapten were the only active coumarins against ADP-induced platelet aggregation. Compared to the parent compounds, colonic metabolites of the flavonoids had similar anticoagulant and antiplatelet activities, while glucuronides showed sharp decreases in all studied activities."

According to the news editors, the research concluded: "This is the first report showing that the medicinal plant A. shikokiana has potent antiplatelet and anticoagulant activities."

The news editors report that additional information may be obtained by contacting K.
Shimizu, Kyushu University, Dept. of Agroenvironment Sci, Div Systemat Forest & Forest Prod Sci, Fac AgrGrad Sch, Fukuoka, Japan. Additional authors for this research include W. Alkhiary and K. Shimizu.

Life Science Research - Physiology

Studies from L. Fabre and Colleagues Provide New Data on Physiology (Structure of anthrax lethal toxin prepore complex suggests a pathway for efficient cell entry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Life Science Research - Physiology are presented in a new report. According to news reporting originating in La Jolla, California, by NewsRx journalists, research stated, "Anthrax toxin comprises three soluble proteins: protective antigen (PA), lethal factor (LF), and edema factor (EF). PA must be cleaved by host proteases before it oligomerizes and forms a prepore, to which LF and EF bind."

Funders for this research include Canadian Foundation for Innovation, Canadian Institutes for Health Research, Natural Sciences and Engineering Research Council of Canada, US Department of Defense, National Institutes of Health, CIHR.

The news reporters obtained a quote from the research, "After endocytosis of this tripartite complex, the prepore transforms into a narrow transmembrane pore that delivers unfolded LF and EF into the host cytosol. Here, we find that translocation of multiple 90-kD LF molecules is rapid and efficient. To probe the molecular basis of this translocation, we calculated a three-dimensional map of the fully loaded (PA(63))(7)-(LF)(3) prepore complex by cryo-electron microscopy (cryo-EM). The map shows three LFs bound in a similar way to one another, via their N-terminal domains, to the surface of the PA heptamer. The model also reveals contacts between the N- and C-terminal domains of adjacent LF molecules."

According to the news reporters, the research concluded: "We propose that this molecular arrangement plays an important role in the maintenance of translocation efficiency through the narrow PA pore."

For more information on this research see: Structure of anthrax lethal toxin prepore complex suggests a pathway for efficient cell entry. Journal of General Physiology, 2016;148 (4):313-324. Journal of General Physiology can be contacted at: Rockefeller Univ Press, 950 Third Ave, 2ND Flr, New York, NY 10022, USA.

Our news correspondents report that additional information may be obtained by contacting R. Liddington, Sanford Burnham Prebys Med Discovery Inst, Bioinformatics & Struct Biol Program, La Jolla, CA 92037, United States. Additional authors for this research include E. Santelli, D. Studies from L. Lin and Co-Researchers Update Current Data on Gliomas (Analysis of expression and prognostic significance of vimentin and the response to temozolomide in glioma patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gliomas is the subject of a report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Gliomas are the most common primary intracranial malignant tumors in adults. Surgical resection followed by optional radiotherapy and chemotherapy is the current standard therapy for glioma patients."

Financial supporters for this research include The Research Special Fund For Public Welfare Industry of Heath, National Natural Science Foundation of China (CN), National High Technology Research and Development Program, Special Fund Project of Translational Medicine in the Chinese-Russian Medical Research Center, Research Project of Chinese Society of Neuro-oncology, CACA, Natural and Science Foundation of Heilongjiang Province, Science and technology research project of Education Department of Heilongjiang Province.

The news correspondents obtained a quote from the research, "Vimentin, a protein of intermediate filament family, could maintain the cellular integrity and participate in several cell signal pathways to modulate the motility and invasion of cancer cells. The purpose of the present research was to identify the relationship between vimentin expression and clinical characteristics and detect the prognostic and predictive ability of vimentin in patients with glioma. To determine the expression of vimentin in glioma tissues, paraffin-embedded blocks from glioma patients by surgical resection were obtained and evaluated by immunohistochemistry. To further investigate the association of vimentin expression with survival, we employed mRNA expression of vimentin genes from the Chinese Glioma Genome Atlas (CGGA) and the GSE 16011 dataset. Kaplan-Meier analysis and Cox regression model were used to statistical analysis. We detected positive vimentin straining in 84 % of high-grade compared to 47 % in low-grade glioma patients. Additionally, vimentin mRNA expression was correlated with glioma grade in both CGGA and GSE16011 dataset. Patients with low vimentin expression have longer survival than high expression. In multivariate analysis, vimentin was an independent significant prognostic factor for high-grade glioma patients. We also identified that glioblastoma patients with low vimentin expression had a better response to temozolomide therapy. Vimentin expression has a significant association with tumor grade and overall survival of high-grade glioma patients."

According to the news reporters, the research concluded: "Low vimentin expression may benefit from temozolomide therapy."

For more information on this research see: Analysis of expression and prognostic significance of vimentin and the response to temozolomide in glioma patients. *Tumor Biology,*

**Digestive System Diseases and Conditions - Peritonitis**

**Studies from L.C.F. Marques and Co-Researchers Yield New Data on Peritonitis (Anti-Inflammatory Effects of a Pomegranate Leaf Extract in LPS-Induced Peritonitis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Peritonitis have been published. According to news reporting out of Sao Luis, Brazil, by NewsRx editors, research stated, "Folk medicine suggests that pomegranate (peels, seeds and leaves) has anti-inflammatory properties; however, the precise mechanisms by which this plant affects the inflammatory process remain unclear. Herein, we analyzed the anti-inflammatory properties of a hydroalcoholic extract prepared from pomegranate leaves using a rat model of lipopolysaccharide-induced acute peritonitis."

Our news journalists obtained a quote from the research, "Male Wistar rats were treated with either the hydroalcoholic extract, sodium diclofenac, or saline, and 1 h later received an intraperitoneal injection of lipopolysaccharides. Salineinjected animals (i.p.) were used as controls. Animals were culled 4 h after peritonitis induction, and peritoneal lavage and peripheral blood samples were collected. Serum and peritoneal lavage levels of TNF-alpha as well as TNF-alpha mRNA expression in peritoneal lavage leukocytes were quantified. Total and differential leukocyte populations were analyzed in peritoneal lavage samples.

Lipopolysaccharide-induced increases of both TNF-alpha mRNA and protein levels were diminished by treatment with either pomegranate leaf hydroalcoholic extract (57% and 48% mean reduction, respectively) or sodium diclofenac (41% and 33% reduction, respectively). Additionally, the numbers of peritoneal leukocytes, especially neutrophils, were markedly reduced in hydroalcoholic extract-treated rats with acute peritonitis."

According to the news editors, the research concluded: "These results demonstrate that pomegranate leaf extract may be used as an anti-inflammatory drug which suppresses the levels of TNF-alpha in acute inflammation."

For more information on this research see: Anti-Inflammatory Effects of a Pomegranate Leaf Extract in LPS-Induced Peritonitis. *Planta Medica*, 2016;82(17):1463-1467. *Planta Medica* can be contacted at: Georg Thieme Verlag Kg, Rudigerstr 14, D-70469
Nutritional and Metabolic Diseases and Conditions —

Studies from L.M. Lopez and Co-Researchers Update Current Data on Obesity (Hormonal contraceptives for contraception in overweight or obese women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news reporting out of Durham, North Carolina, by NewsRx editors, research stated, "Obesity has reached epidemic proportions around the world. Effectiveness of hormonal contraceptives may be related to metabolic changes in obesity or to greater body mass or body fat."

Our news journalists obtained a quote from the research, "Hormonal contraceptives include oral contraceptives (OCs), injectables, implants, hormonal intrauterine contraception (IUC), the transdermal patch, and the vaginal ring. Given the prevalence of overweight and obesity, the public health impact of any effect on contraceptive efficacy could be substantial. To examine the effectiveness of hormonal contraceptives in preventing pregnancy among women who are overweight or obese versus women with a lower body mass index (BMI) or weight. Search methods  Until 4 August 2016, we searched for studies in PubMed (MEDLINE), CENTRAL, POPLINE, Web of Science, ClinicalTrials.gov, and ICTRIP. We examined reference lists of pertinent articles to identify other studies. For the initial review, we wrote to investigators to find additional published or unpublished studies. Selection criteria  All study designs were eligible. The study could have examined any type of hormonal contraceptive. Reports had to contain information on the specific contraceptive methods used. The primary outcome was pregnancy. Overweight or obese women must have been identified by an analysis cutoff for weight or BMI (kg/m(2)). Data collection and analysis  Two authors independently extracted the data. One entered the data into RevMan and a second verified accuracy. The main comparisons were between overweight or obese women and women of lower weight or BMI. We examined the quality of evidence using the Newcastle-Ottawa Quality Assessment Scale. Where available, we included life-table rates. We also used unadjusted pregnancy rates, relative risk (RR), or rate ratio when those were the only results provided. For dichotomous variables, we computed an odds ratio with 95% confidence interval (CI). With 8 studies added in this update, 17 met our inclusion criteria and had a total of 63,813 women. We focus here on 12 studies that provided high, moderate, or low quality evidence. Most did not show a higher
pregnancy risk among overweight or obese women. Of five COC studies, two found BMI to be associated with pregnancy but in different directions. With an OC containing norethindrone acetate and ethinyl estradiol (EE), pregnancy risk was higher for overweight women, i.e. with BMI >= 25 versus those with BMI < 25 (reported relative risk 2.49, 95% CI 1.01 to 6.13). In contrast, a trial using an OC with levonorgestrel and EE reported a Pearl Index of 0 for obese women (BMI >= 30) versus 5.59 for nonobese women (BMI < 30). The same trial tested a transdermal patch containing levonorgestrel and EE. Within the patch group, obese women in the 'treatment-compliant' subgroup had a higher reported Pearl Index than nonobese women (4.63 versus 2.15). Of five implant studies, two that examined the six-capsule levonorgestrel implant showed differences in pregnancy by weight. One study showed higher weight was associated with higher pregnancy rate in years 6 and 7 combined (reported P< 0.05). In the other, pregnancy rates differed in year 5 among the lower weight groups only (reported P< 0.01) and did not involve women weighing 70 kg or more. Analysis of data from other contraceptive methods indicated no association of pregnancy with overweight or obesity. These included depot medroxyprogesterone acetate (subcutaneous), levonorgestrel IUC, the two-rod levonorgestrel implant, and the etonogestrel implant. Authors' conclusions The evidence generally did not indicate an association between higher BMI or weight and effectiveness of hormonal contraceptives. However, we found few studies for most contraceptive methods. Studies using BMI, rather than weight alone, can provide information about whether body composition is related to contraceptive effectiveness. The contraceptive methods examined here are among the most effective when used according to the recommended regimen. We considered the overall quality of evidence to be low for the objectives of this review. More recent reports provided evidence of varying quality, while the quality was generally low for older studies. For many trials the quality would be higher for their original purpose rather than the non-randomized comparisons here. Investigators should consider adjusting for potential confounding related to BMI or contraceptive effectiveness."

According to the news editors, the research concluded: "Newer studies included a greater proportion of overweight or obese women, which helps in examining effectiveness and side effects of hormonal contraceptives within those groups." For more information on this research see: Hormonal contraceptives for contraception in overweight or obese women. Cochrane Database of Systematic Reviews, 2016; (8):2664-2758. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Studies from L.M. Tang et al Have Provided New Data on Goiter (Recombinant human thyrotropin stimulated I-131 treatment for multinodular goiter)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Goiter have been published. According to news originating from Qingdao, People's Republic of China, by NewsRx correspondents, research stated, "The aim of the study was to investigate the effects of rhTSH stimulation before 131I treatment in patients with MNG. Sources included the Cochrane Library, MEDLINE, EMBASE, and SCOPUS database (all until January 2016)."

Our news journalists obtained a quote from the research, "Randomized controlled trials (RCTs) that assessed the efficacy of rhTSH-stimulated 131I treatment compared to placebo or 131I treatment alone were collected. Two authors performed the data extraction independently. Six RCTs involving 294 patients with MNG were included in this review. Altogether 168 patients were randomized to rhTSH-stimulated 131I therapy, and 126 to either placebo and 131I or 131I alone. rhTSH-stimulated 131I vs placebo and 131I or 131I alone for MNG showed no statistically significant difference in quality of life and all-cause mortality. rhTSH- (at a dose of 0.03 mg and above) stimulated 131I treatment for MNG showed significant benefits in thyroid volume reduction. 131I treatment with rhTSH stimulation at high doses (0.03 mg, 0.1 mg, 0.3 mg and 0.45 mg) for MNG caused significantly higher adverse effects and hypothyroidism. The overall results indicated that using rhTSH at high doses of 0.03-0.45 mg before 131I therapy resulted in a greater TVR than 131I therapy alone for patients with non-toxic MNG. However, an increased incidence of adverse effects and hypothyroidism was observed in patients receiving high dose of rhTSH pretreatment than in patients who received low-dose rhTSH pretreatment."

According to the news editors, the research concluded: "Therefore, a dose of 0.03 mg rhTSH pretreatment before 131I therapy may be more potent than 131I alone in treating patients with non-toxic MNG who either had a contraindication for or declined surgery."

For more information on this research see: Recombinant human thyrotropin stimulated I-131 treatment for multinodular goiter. Nuklearmedizin-Nuclear Medicine, 2016;55 (6):228-235. Nuklearmedizin-Nuclear Medicine can be contacted at: Schattauer Gmbh-Verlag Medizin Naturwissenschaften, Holderlinstrasse 3, D-70174 Stuttgart, Germany.

Studies from LDS Hospital Yield New Data on Hematopoietic Stem Cells (Room contamination, patient colonization pressure, and the risk of vancomycin-resistant Enterococcus colonization on a unit dedicated to the treatment of hematologic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Stem Cell Research - Hematopoietic Stem Cells. According to news reporting originating from Salt Lake City, Utah, by NewsRx correspondents, research stated, "Contaminated surfaces and colonization pressure are risk factors for vancomycin-resistant Enterococcus (VRE) colonization in intensive care units (ICUs). Whether these apply to modern units dedicated to the care of hematologic malignancies and hematopoietic stem cell transplant (HSCT) procedures is unknown."

Our news editors obtained a quote from the research from LDS Hospital, "We reviewed the records of 780 consecutive admissions for acute leukemia, autologous HSCT, or allogeneic HSCT in which the patient was at risk for hospital-acquired VRE and underwent weekly surveillance. We also obtained staff and room cultures, observed staff behavior, and performed VRE molecular strain typing on selected isolates. The overall rate of VRE colonization was 11.4 cases/1,000 patient days. Cultures of room surfaces revealed VRE isolates in 10% of terminally cleaned rooms. A prior VRE-colonized room occupant did not increase risk, and paired isolates from 20 patients and prior occupants were indistinguishable on molecular typing in only 1 pair. VRE colonization pressure was significantly associated with acquisition. Cultures of unit personnel and shared equipment were negative except for weighing scales. Observation of unit clinical personnel showed high compliance for hand sanitation and but less so for gowns. Conversely, ancillary staff showed poor compliance. Transmission of VRE from room surfaces seems to be an infrequent event."

According to the news editors, the research concluded: "Encouraging adherence to surveillance, disinfection, and contact isolation protocols may decrease VRE colonization rates."

For more information on this research see: Room contamination, patient colonization pressure, and the risk of vancomycin-resistant Enterococcus colonization on a unit dedicated to the treatment of hematologic malignancies and hematopoietic stem cell transplantation. *American Journal of Infection Control*, 2016;44(10):1110-1115. *American Journal of Infection Control* can be contacted at: Mosby-Elsevier, 360 Park Avenue South, New York, NY 10010-1710, USA.

Life Science Research - Microbial Research

Studies from Lanzhou University Add New Findings in the Area of Microbial Research (Association between MASP-2 gene polymorphism and risk of infection diseases: A meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Life Science Research - Microbial Research are discussed in a new report. According to news reporting originating from Lanzhou, People's Republic of China, by NewsRx correspondents, research stated, "The role of MASP-2 is vital in the process of complement activation by the lectin pathway. It is generally considered that the functional activation of MASP-2 contribute to the infection disease development process."

Financial supporters for this research include Fundamental Research Funds for the Central Universities, National Natural Science Foundation of China.

Our news editors obtained a quote from the research from Lanzhou University, "To analyze the association between MASP-2 functional gene (rs72550870) polymorphism and the infection disease risk by a meta-analysis. Relevant case-control studies were identified by searching Cochrane Library, PubMed, Emabase, DOAJ, CAB Abstracts, CSA, CINAHL, EBSCO, Scopus, Global Health, Index Copernicus, CA, China National Knowledge Infrastructure (CNKI) databases up to 10th January 2016. The data were extracted and the methodological quality of studies were evaluated. The STATA 12.0 software was used to perform statistical analysis. 9 studies were included. There was no significant association between masp-2 gene (p.D120G, rs72550870) polymorphism and the risk of infection disease under the allele model (G vs. A: OR = 0.89, 95%CI = 0.66-1.21) (P = 0.445 >0.05) and the recessive model (AG + GG vs.AA: OR = 0.88, 95%CI = 0.65-1.20) (P = 0.428 >0.05). This is the first comprehensive meta-analysis indicates that the MASP-2 functional gene (rs72550870) polymorphism is not associated with the infection diseases, and the key functional gene polymorphism of rs72550870 did not increase susceptibility to the infection diseases."

According to the news editors, the research concluded: "Similarly, there were no obvious difference in subgroup analysis based on geographical areas and pathogenic microorganisms."

The news editors report that additional information may be obtained by contacting X.M. Ma, Lanzhou University, Gansu Key Lab Evidence Based Med & Clin Transfer, Lanzhou 730000, People's Republic of China. Additional authors for this research include J.Q. Wang, Y.P. Luo, L.F. Zhang, Y. Zhang, X.F. Dong, H.J. Yu, M.Q. Cao and X.M. Ma.

The direct object identifier (DOI) for that additional information is:
Von Willebrand Disease

Studies from Leiden University Medical Center Further Understanding of Von Willebrand Disease (Developments in the diagnostic procedures for von Willebrand disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in von Willebrand disease. According to news reporting from Leiden, Netherlands, by NewsRx journalists, research stated, "Von Willebrand disease (VWD) is the most common inherited bleeding disorder but its diagnosis can be challenging due to the heterogeneity of the disease. VWD is mainly associated with mild mucocutaneous bleeding, although there are more severe phenotypes with bleeding from the gastrointestinal tract or even the joints."

The news correspondents obtained a quote from the research from Leiden University Medical Center, "Also, surgical interventions and trauma may lead to critical bleeding events. These bleeding episodes are all related to quantitative or qualitative defects of von Willebrand factor (VWF), a multimeric glycoprotein produced by endothelial cells and megakaryocytes, which mediates platelet adhesion and aggregation and binds factor VIII (FVIII) in the circulation. This review describes the diagnostic procedures required for correct diagnosis. Accurate diagnosis and classification is required for proper treatment and counseling. Assessment of bleeding starts with the medical history. After a positive bleeding or family history, subsequent laboratory investigations will start with a panel of standard screening tests for hemostatic defects. Patients suspected of having VWD will be tested for plasma VWF antigen levels, the ability of VWF to bind platelets and FVIII activity. When VWD is confirmed, a set of subtyping tests can classify the patients as VWD types 1, 2 (A, B, M or N) or 3."

According to the news reporters, the research concluded: "The performance of some additional assays and analyses, such as VWF propeptide measurement or genetic analysis, may help in identifying the pathological mechanism behind certain defects or can guide in the choice of treatment."

Our news journalists report that additional information may be obtained by contacting A. De Jong, Dept. of Thrombosis and Haemostasis, Einthoven Laboratory for Experimental Vascular Medicine, Leiden University Medical Center, Leiden, Netherlands.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jth.13243. This DOI is a link to an online electronic document that is either free or for purchase.
Studies from Leiden University Medical Center Provide New Data on Orthostatic Hypotension (Effect of discontinuation of antihypertensive medication on orthostatic hypotension in older persons with mild cognitive impairment: the DANTE Study ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Autonomic Nervous System Diseases - Orthostatic Hypotension have been published. According to news reporting out of Leiden, Netherlands, by NewsRx editors, research stated, "the relationship between antihypertensive medication and orthostatic hypotension in older persons remains ambiguous, due to conflicting observational evidence and lack of data of clinical trials. to assess the effect of discontinuation of antihypertensive medication on orthostatic hypotension in older persons with mild cognitive impairment."

Funders for this research include Netherlands Organization for Health Research and Development (ZonMw), Program Priority Medicines for the Elderly.

Our news journalists obtained a quote from the research from Leiden University Medical Center, "a total of 162 participants with orthostatic hypotension were selected from the Discontinuation of Antihypertensive Treatment in Elderly people (DANTE) Study. This randomised clinical trial included community-dwelling participants aged (>=)75 years, with mild cognitive impairment, using antihypertensive medication and without serious cardiovascular disease. Participants were randomised to discontinuation or continuation of antihypertensive treatment (ratio 1:1). Orthostatic hypotension was defined as a drop of at least 20 mmHg in systolic blood pressure and/or 10 mmHg in diastolic blood pressure on standing from a seated position. Outcome was the absence of orthostatic hypotension at 4-month follow-up. Relative risks (RR) were calculated by intention-to-treat and per-protocol analyses. at follow-up, according to intention-to-treat analyses, of the 86 persons assigned to discontinuation of antihypertensive medication, 43 (50%) were free from orthostatic hypotension, compared with 29 (38%) of the 76 persons assigned to continuation of medication [RR 1.31 (95% confidence interval (CI) 0.92-1.87); p=0.13]. Per-protocol analysis showed that recovery from orthostatic hypotension was significantly higher in persons who completely discontinued all antihypertensive medication (61%) compared with the continuation group (38%) [RR 1.60 (95% CI 1.10-2.31); p=0.01]."

According to the news editors, the research concluded: "In older persons with mild cognitive impairment and orthostatic hypotension receiving antihypertensive medication, discontinuation of antihypertensive medication may increase the probability of recovery from orthostatic hypotension."

For more information on this research see: Effect of discontinuation of antihypertensive medication on orthostatic hypotension in older persons with mild cognitive impairment.
RNA Viruses - Influenza A Virus

Studies from Leiden University in the Area of Influenza A Virus Described (Subtype-specific structural constraints in the evolution of influenza A virus hemagglutinin genes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on RNA Viruses - Influenza A Virus are presented in a new report. According to news reporting originating in Leiden, Netherlands, by NewsRx journalists, research stated, "The influenza A virus genome consists of eight RNA segments. RNA structures within these segments and complementary (cRNA) and protein-coding mRNAs may play a role in virus replication."

The news reporters obtained a quote from the research from Leiden University, "Here, conserved putative secondary structures that impose significant evolutionary constraints on the gene segment encoding the surface glycoprotein hemagglutinin (HA) were investigated using available sequence data on tens of thousands of virus strains. Structural constraints were identified by analysis of covariations of nucleotides suggested to be paired by structure prediction algorithms. The significance of covariations was estimated by mutual information calculations and tracing multiple covariation events during virus evolution. Covariation patterns demonstrated that structured domains in HA RNAs were mostly subtype-specific, whereas some structures were conserved in several subtypes. The influence of RNA folding on virus replication was studied by plaque assays of mutant viruses with disrupted structures. The results suggest that over the whole length of the HA segment there are local structured domains which contribute to the virus fitness but individually are not essential for the virus."

According to the news reporters, the research concluded: "Existence of subtype-specific structured regions in the segments of the influenza A virus genome is apparently an important factor in virus evolution and reassortment of its."

Our news correspondents report that additional information may be obtained by contacting A.P. Gultyaev, Leiden University, Leiden Inst Adv Comp Sci, Grp Imaging & Bioinformat, NA-2300 Leiden, Netherlands. Additional authors for this research include M.I. Spronken, M. Richard, E.J.A. Schrauwen, R.C.L. Olsthoorn and R.A.M. Fouchier.

Keywords for this news article include: Leiden, Netherlands, Europe, Virus Physiological Phenomena, Virus Physiological Processes, Virus Replication, Genetics, Microbiological Processes, Influenza A Virus, Orthomyxoviridae, RNA Viruses, Viral RNA, Virology, Leiden University.

Nutritional and Metabolic Diseases and Conditions ...

Studies from Lomonosov Moscow State University in the Area of Type 2 Diabetes Reported (The transcription factor Prep1 controls hepatic insulin sensitivity and gluconeogenesis by targeting nuclear localization of FOXO1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news originating from Moscow, Russia, by NewsRx correspondents, research stated, "Liver plays a key role in controlling body carbohydrate homeostasis by switching between accumulation and production of glucose and this way maintaining constant level of glucose in blood. Increased blood glucose level triggers release of insulin from pancreatic beta-cells."

Our news journalists obtained a quote from the research from Lomonosov Moscow State University, "Insulin represses hepatic glucose production and increases glucose accumulation. Insulin resistance is the main cause of type 2 diabetes and hyperglycemia. Currently thiazolidinediones (TZDs) targeting transcriptional factor PPAR gamma are used as insulin sensitizers for treating patients with type 2 diabetes. However, TZDs are reported to be associated with cardiovascular and liver problems and stimulate obesity. Thus, it is necessary to search new approaches to improve insulin sensitivity. A promising candidate is transcriptional factor Prep1, as it was shown earlier it could affect insulin sensitivity in variety of insulin-sensitive tissues. The aim of the present study was to evaluate a possible involvement of transcriptional factor Prep1 in control of hepatic glucose accumulation and production. We created mice with liver-specific Prep1 knockout and discovered that hepatocytes derived from these mice are much more sensitive to insulin, comparing to their WT littermates. Incubation of these cells with 100 nM insulin results in almost complete inhibition of gluconeogenesis, while in WT cells this repression is only partial. However, Prep1 doesn't affect gluconeogenesis in the absence of insulin. Also, we observed that nuclear content of gluconeogenic transcription factor FOXO1 was greatly reduced in Prep1 knockout hepatocytes."

According to the news editors, the research concluded: "These findings suggest that Prep1 may control hepatic insulin sensitivity by targeting FOXO1 nuclear stability."

For more information on this research see: The transcription factor Prep1 controls hepatic insulin sensitivity and gluconeogenesis by targeting nuclear localization of FOXO1. *Biochemical and Biophysical Research Communications*, 2016;481(1-2):182-188. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier
Studies from Loughborough University Provide New Data on Proinsulin (Effect of 24-h severe energy restriction on appetite regulation and ad libitum energy intake in lean men and women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Peptide Proteins - Proinsulin is now available. According to news reporting out of Loughborough, United Kingdom, by NewsRx editors, research stated, "Intermittent severe energy restriction (SER) can induce substantial weight loss, but the appetite regulatory responses to SER are unknown and may dictate long-term dietary adherence. We determined the effect of 24-h SER on appetite regulation, metabolism, and energy intake."

Our news journalists obtained a quote from the research from Loughborough University, "Eighteen lean men and women completed two 3-d trials in randomized, counterbalanced order. On day 1 subjects consumed standardized diets containing 100% (mean +/- SD: 9.3 +/- 1.3 MJ; energy balance) or 25% [2.3 +/- 0.3 MJ; energy restriction (ER)] of energy requirements. On day 2, a standardized breakfast was consumed, with plasma concentrations of acylated ghrelin, glucagon-like peptide 1, insulin, glucose, and nonesterified fatty acids determined for 4 h. Ad libitum energy intake was assessed at lunch and dinner with subjective appetite and resting metabolism assessed throughout. On day 3, ad libitum energy intake was assessed at breakfast and by weighed food records. Energy intake was 7% greater on day 2 (P < 0.05) during ER but not significantly different on day 3 (P = 0.557). Subjective appetite was greater during ER on the morning of day 2 (P < 0.05) but was not significantly different thereafter (ID > 0.145). During ER, postprandial concentrations of acylated ghrelin were lower (P < 0.05), whereas glucose (P < 0.05) and nonesterified fatty acids (P < 0.0001) were higher. Postprandial glucagon-like peptide 1(7-35) (P = 0.784) and insulin (P = 0.06) concentrations were not significantly different between trials. Energy expenditure was lower during ER in the morning (P < 0.01). In lean young adults, 24-h SER transiently elevated subjective appetite and marginally increased energy intake, but hormonal appetite markers did not respond in a manner indicative of hyperphagia. These results suggest that intermittent SER
might be useful to attenuate energy intake and control body weight in this population."

According to the news editors, the research concluded: "This trial was registered at www.clinicaltrials.gov.uk as NCT02696772."

Our news journalists report that additional information may be obtained by contacting L.J. James, University of Loughborough, Sch Sport Exercise & Hlth Sci, Loughborough, Leics, United Kingdom. Drugs and Therapies - Drug Targets

Studies from Louisiana State University Provide New Data on Drug Targets (Structure-Based Drug Discovery Accelerated by Many-Core Devices)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Drug Targets is the subject of a report. According to news reporting out of Baton Rouge, Louisiana, by NewsRx editors, research stated, "Computer-aided design is one of the critical components of modern drug discovery. Drug development is routinely streamlined using computational approaches to improve hit identification and lead selection, enhance bioavailability, and reduce toxicity."

Our news journalists obtained a quote from the research from Louisiana State University, "A mounting body of genomic knowledge accumulated during the last decade or so presents great opportunities for pharmaceutical research. However, new challenges also arose because processing this large volume of data demands unprecedented computing resources. On the other hand, the state-of-the-art heterogeneous systems deliver petaflops of peak performance to accelerate scientific discovery. In this communication, we review modern parallel accelerator architectures, mainly focusing on Intel Xeon Phi many-core devices. Xeon Phi is a relatively new platform that features tens of computing cores with hundreds of threads offering massively parallel capabilities for a broad range of application. We also discuss common parallel programming frameworks targeted to this accelerator, including OpenMP, OpenCL, MPI and HPX. Recent advances in code development for many-core devices are described to demonstrate the advantages of heterogeneous implementations over the traditional, serial computing."

According to the news editors, the research concluded: "Finally, we highlight selected algorithms, eFindSite, a ligand binding site predictor, a force field for bio-molecular simulations, and BUDE, a structure-based virtual screening engine, to demonstrate how modern drug discovery is accelerated by heterogeneous systems equipped with parallel computing"
Small Interference RNAs (siRNAs)

Studies from Ludwig-Maximilians-University Have Provided New Information about Small Interference RNAs (siRNAs) (Homology directed repair is unaffected by the absence of siRNAs in Drosophila melanogaster)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Small Interference RNAs (siRNAs). According to news reporting out of Munich, Germany, by NewsRx editors, research stated, "Small interfering RNAs (siRNAs) defend the organism against harmful transcripts from exogenous (e.g. viral) or endogenous (e.g. transposons) sources. Recent publications describe the production of siRNAs induced by DNA double-strand breaks (DSB) in Neurospora crassa, Arabidopsis thaliana, Drosophila melanogaster and human cells, which suggests a conserved function."

Our news journalists obtained a quote from the research from Ludwig-Maximilians-University. "A current hypothesis is that break-induced small RNAs ensure efficient homologous recombination (HR). However, biogenesis of siRNAs is often intertwined with other small RNA species, such as microRNAs (miRNAs), which complicates interpretation of experimental results. In Drosophila, siRNAs are produced by Dcr-2 while miRNAs are processed by Dcr-1. Thus, it is possible to probe siRNA function without miRNA deregulation. We therefore examined DNA double-strand break repair after perturbation of siRNA biogenesis in cultured Drosophila cells as well as mutant flies. Our assays comprised reporters for the single-strand annealing pathway, homologous recombination and sensitivity to the DSB-inducing drug camptothecin. We could not detect any repair defects caused by the lack of siRNAs derived from the broken DNA locus."

According to the news editors, the research concluded: "Since production of these siRNAs depends on local transcription, they may thus participate in RNA metabolism-an established function of siRNAs-rather than DNA repair."

For more information on this research see: Homology directed repair is unaffected by the absence of siRNAs in Drosophila melanogaster. Nucleic Acids Research, 2016;44
Studies from Ludwig-Maximilians-University Yield New Information about Apoptosis (Sebaceous lipids are essential for water repulsion, protection against UVB-induced apoptosis and ocular integrity in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Apoptosis is now available. According to news reporting originating from Munich, Germany, by NewsRx correspondents, research stated, "Sebocytes, which are characterized by lipid accumulation that leads to cell disruption, can be found in hair follicle-associated sebaceous glands (SGs) or in free SGs such as the Meibomian glands in the eyelids. Because genetic tools that allow targeting of sebocytes while maintaining intact epidermal lipids are lacking, the relevance of sebaceous lipids in health and disease remains poorly understood."

Our news editors obtained a quote from the research from Ludwig-Maximilians-University, "Using Scd3, which is expressed exclusively in mature sebocytes, we established a mouse line with sebocyte-specific expression of Cre recombinase. Both RT-PCR analysis and crossing into Rosa26-lacZ reporter mice and Kras(G12D) mice confirmed Cre activity specifically in SGs, with no activity in other skin compartments. Importantly, loss of SCD3 function did not cause detectable phenotypical alterations, endorsing the usefulness of Scd3-Cre mice for further functional studies. Scd3-Cre-induced, diphtheria chain A toxin-mediated depletion of sebaceous lipids resulted in impaired water repulsion and thermoregulation, increased rates of UVB-induced epidermal apoptosis and caused a severe pathology of the ocular surface resembling Meibomian gland dysfunction."

According to the news editors, the research concluded: "This novel mouse line will be useful for further investigating the roles of sebaceous lipids in skin and eye integrity."

The news editors report that additional information may be obtained by contacting M.R. Schneider, Ludwig Maximilians Univ Munchen, Gene Center, Inst Mol Anim Breeding & Biotechnol, D-81377 Munich, Germany. Additional authors for this research include E. Camera, M. Schafer, D. Emrich, D. Riethmacher, A. Foster, R. Paus and M.R. Schneider.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1242/dev.132753. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from Lund University Yield New Information about Cardiology (Diagnostic Accuracy of High-Sensitivity Cardiac Troponin T at Presentation Combined With History and ECG for Ruling Out Major Adverse Cardiac Events)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiology is now available. According to news reporting originating from Lund, Sweden, by NewsRx correspondents, research stated, "We evaluate the diagnostic accuracy of a high-sensitivity cardiac troponin T (hs-cTnT) level less than 5 ng/L or less than or equal to 14 ng/L at emergency department (ED) presentation, combined with the emergency physician's assessment of history and ECG, for ruling out major adverse cardiac events within 30 days. This prospective observational study enrolled consecutive ED chest pain patients."

Our news editors obtained a quote from the research from Lund University, "Emergency physicians' assessments of patient history and ECG were collected. The primay outcome was 30-day major adverse cardiac events, defined as acute myocardial infarction, unstable angina, cardiogenic shock, ventricular arrhythmia, atrioventricular block, cardiac arrest, or death of cardiac or unknown cause. A total of 1,138 patients were included in the final analysis. The combination of hs-cTnT less than 5 ng/L, a nonischemic ECG result, and a nonhigh risk history was present for 29.2% of all patients and had a sensitivity of 99.2% (95% confidence interval [CI] 95.6% to 100%), negative predictive value (NPV) of 99.7% (95% CI 98.3% to 100%), and a negative likelihood ratio of 0.02 (95% CI 0 to 0.17) for 30-day major adverse cardiac events. The same combination with hs-cTnT less than or equal to 14 ng/L was present in 66.7% of the patients and had a sensitivity of 92% (95% CI 85.8% to 96.1%), NPV of 98.7% (95% CI 97.6% to 99.4%), and negative likelihood ratio of 0.11 (95% CI 0.06 to 0.20). A single hs-cTnT result of less than 5 ng/L at ED presentation when combined with a nonischemic ECG result and a nonhigh risk history identified 29% of chest pain patients at a very low risk of 30-day major adverse cardiac events."

According to the news editors, the research concluded: "A similar strategy with hs-cTnT less than or equal to 14 ng/L was associated with a higher miss rate."

For more information on this research see: Diagnostic Accuracy of High-Sensitivity Cardiac Troponin T at Presentation Combined With History and ECG for Ruling Out Major
Studies from M. Ammendola and Colleagues Provide New Data on Gastric Cancer (Mast Cells Density Positive to Tryptase Correlate with Microvascular Density in both Primary Gastric Cancer Tissue and Loco-Regional Lymph Node Metastases from ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gastric Cancer. According to news reporting from Bari, Italy, by NewsRx journalists, research stated, "Mast Cells (MCs) play a role in immune responses and more recently MCs have been involved in tumoral angiogenesis. In particular MCs can release tryptase, a potent in vivo and in vitro pro-angiogenic factor via proteinase-activated receptor-2 (PAR-2) activation and mitogen-activated protein kinase (MAPK) phosphorylation."

The news correspondents obtained a quote from the research, "MCs can release tryptase following c-Kit receptor activation. Nevertheless, no data are available concerning the relationship among MCs Density Positive to Tryptase (MCDPT) and Microvascular Density (MVD) in both primary gastric cancer tissue and loco-regional lymph node metastases. A series of 75 GC patients with stage T2-3N2-3M0 (by AJCC for Gastric Cancer Seventh Edition) undergone to radical surgery were selected for the study. MCDPT and MVD were evaluated by immunohistochemistry and by image analysis system and results were correlated each to other in primary tumor tissue and in metastatic lymph nodes harvested. Furthermore, tissue parameters were correlated with important clinico-pathological features. A significant correlation between MCDPT and MVD was found in primary gastric cancer tissue and lymph node metastases. Pearson t-test analysis (r ranged from 0.74 to 0.79; p-value ranged from 0.001 to 0.003). These preliminary data suggest that MCDPT play a role in angiogenesis in both primary tumor and in lymph node metastases from GC."

According to the news reporters, the research concluded: "We suggest that MCs and tryptase could be further evaluated as novel targets for anti-angiogenic therapies."

For more information on this research see: Mast Cells Density Positive to Tryptase Correlate with Microvascular Density in both Primary Gastric Cancer Tissue and Loco-Regional

Our news journalists report that additional information may be obtained by contacting M. Ammendola, Ist Tumori Giovanni Paolo II, Natl Canc Res Center, Surg Unit, I-70124 Bari, Italy. **Hematology - Plasma**

**Studies from M. De Meulder et al Add New Findings in the Area of Plasma (Development and validation of HILIC-ESI/MS/MS methods for simultaneous quantitation of several antipsychotics in human plasma and blood)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematology - Plasma have been published. According to news originating from Beerse, Belgium, by NewsRx correspondents, research stated, "Knowledge of antipsychotic drug levels at point of care (POC) may significantly aid therapeutic decision-making. To support the development of future POC devices and to validate the use of fingerstick capillary blood sampling, two robust hydrophilic interaction LC-ESI/MS/MS methods were developed and validated."

Our news journalists obtained a quote from the research, "Two PK studies were completed evaluating the correlation between fingerstick blood and plasma concentrations with corresponding venous blood and plasma concentrations for several commonly prescribed atypical antipsychotics and selected metabolites. Sensitive and reliable LC-MS/MS bioanalytical assays were developed to support these studies. Three methods, requiring only 25-ml matrix volumes, were developed using supported liquid extraction with hydrophilic interaction LC-MS/MS detection and validated according to regulatory guidance."

According to the news editors, the research concluded: "Robust and efficient LC-MS/MS assays were established and were effective in providing antipsychotic drug matrix comparator results in the intended clinical studies."

For more information on this research see: Development and validation of HILIC-ESI/MS/MS methods for simultaneous quantitation of several antipsychotics in human plasma and blood. *Bioanalysis*, 2016;8(8):765-94.

The news correspondents report that additional information may be obtained from M. De Meulder, Bioanalysis Department, Janssen Research and Development, A Division of Janssen, Pharmaceutica NV, Turnhoutseweg 30, 2340 Beerse, Belgium. Studies from M. Gallucci et al Provide New Data on Alzheimer Disease (Predictors of Response to Cholinesterase Inhibitors Treatment of Alzheimer's Disease: Data Mining from the TREDEM Registry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Alzheimer Disease have been published. According to news reporting originating in Treviso, Italy, by NewsRx journalists, research stated, "The pharmacological treatment of Alzheimer's disease (AD) is based largely on cholinesterase inhibitors (ChEI). To investigate whether or not some non-pharmacological and contextual factors measured prior to starting treatment such as past occupation, lifestyles, marital status, degree of autonomy and cognitive impairment, living alone or with others, and the degree of brain atrophy are associated with a better response to ChEI treatment."

The news reporters obtained a quote from the research, "Eighty-four AD and six AD with cerebrovascular disease (AD + CVD) outpatients of Treviso Dementia (TREDEM) Registry, with an average cholinesterase inhibitors treatment length of four years, were considered. The outpatients had undergone a complete evaluation and some non-pharmacological and contextual factors were collected. We defined responder a patient with a delta score T0 -T1 equal or inferior to 2.0 points per year of MMSE and a non-responder a patient with a delta score T0 -T1 superior to 2.0 points per year. In order to identify hidden relationships between variables related to response and non-response, we use a special kind of artificial neural network called Auto-CM, able to create a semantic connectivity map of the variables considered in the study. A higher cognitive profile, a previous intellectual occupation, healthier lifestyles, being married and not living alone, a higher degree of autonomy, and lower degree of brain atrophy at baseline resulted in affecting the response to long-term ChEI therapy."

According to the news reporters, the research concluded: "Non-pharmacological and contextual factors appear to influence the effectiveness of treatment with ChEI in the long term."

Our news correspondents report that additional information may be obtained by contacting M. Gallucci, Cognitive Impairment Center, Local Health Authority 9 of Treviso, Treviso, Italy. Additional authors for this research include P. Spagnolo, M. Arico and E. Grossi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3233/JAD-150747. This DOI is a link to an online electronic document that
is either free or for purchase.

**Biotechnology - Antisense Oligonucleotides**

**Studies from M. Lim et al Further Understanding of Antisense Oligonucleotides (Osmolality of antisense oligonucleotide parenteral formulations: Implications on counterion dissociation and recommended osmometry techniques)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biotechnology - Antisense Oligonucleotides have been presented. According to news reporting originating from Carlsbad, California, by NewsRx correspondents, research stated, "The intrinsic osmolality of aqueous solutions of sodium salt antisense oligonucleotides (ASOs) has been studied to inform formulation practices, understand the molecular basis underlying the difference between theoretical and empirical results, and determine suitable measurement methods. It was found that regardless of nucleotide sequence, ASO concentration of similar to 140 mg/mL has isotonic osmolality of similar to 290 mOsm/kg water (SI unit: mmol osmotically-active particles/kg water), such that lower concentration formulations require excipients for tonicity adjustment."

Our news editors obtained a quote from the research, "The range of osmolality values at a given active ingredient concentration can be ascribed to drug substance lot-to-lot purity differences impacting total oligonucleotide content (i.e., including oligonucleotide-related impurities). Empirical osmolality measurements were found to be similar to 70% of theoretical values, which corresponds to an osmotic coefficient value of similar to 0.7, thus inferring incomplete counterion dissociation. When comparing theoretical (ideal) osmolality of multiple sequences with various nucleotide compositions and chemistries at the same w/v concentration, the 'average osmolar mass' (molar mass of the oligonucleotide, including the sodium counterions, divided by the ideal Van't Hoff factor, i(id)) appears to be the strongest factor governing theoretical osmolality values. Other factors examined were the sequence length, backbone chemistry, 20 sugar chemistry, and nucleotide composition."

According to the news editors, the research concluded: "A head-to-head comparison between two osmolality techniques showed that vapor pressure osmometry is generally more suitable than freezing point osmometry for oligonucleotide solutions greater than similar to 150 mg/mL due to viscosity effects, but the two techniques are comparable otherwise."

Disease Attributes - Disease Progression

Studies from M. Markman and Co-Researchers Update Current Data on Disease Progression (Evaluating the Utility of a 'N-of-1' Precision Cancer Medicine Strategy: The Case for 'Time-to-Subsequent-Disease Progression')

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Disease Attributes - Disease Progression have been presented. According to news originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "It is increasingly recognized that cancer is a highly heterogeneous group of illnesses even within a particular organ site (e.g., breast, lung, colon, etc.). This observation presents a serious challenge to the traditional concept of phase 3 randomized trials designed to define therapeutic efficacy of a novel treatment strategy."

Our news journalists obtained a quote from the research, "For while 10% of the patients with a common malignancy (e.g., non-small-cell lung cancer) may be sufficient to consider such an effort, enrolling a sufficient number of patients into a clinical trial in a timely manner to define clinical utility would be extremely difficult if the population in question represented only 1% of this population, and essentially impossible if one wished to explore the benefits of treatment in a rarer neoplasm (e.g. ovarian cancer). Therefore, in the new era of precision cancer medicine, alternative research designs are imperative. One option would be to compare the time-to-disease progression of an individual cancer patient following treatment with a novel therapeutic to the time-to-disease progression for that specific patient on her/his immediately preceding treatment."

According to the news editors, the research concluded: "The rationale for this strategy and early experience with this innovative approach to evaluating the efficacy of anticancer therapy is highlighted in this report."

For more information on this research see: Evaluating the Utility of a 'N-of-1' Precision Cancer Medicine Strategy: The Case for 'Time-to-Subsequent-Disease Progression'. Oncology, 2016;91(6):299-301. Oncology can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. The news correspondents report that additional information may be obtained from M. Markman, Canc Treatment Center Amer, Philadelphia, PA 19124, United States. Additional authors for this research include K. Kramer, R.H. Alvarez, G.J. Weiss, E. Ahn and G.W.
Oncology - Lung Cancer

Studies from M. Phillips and Co-Authors Have Provided New Information about Lung Cancer (Blinded Validation of Breath Biomarkers of Lung Cancer, a Potential Ancillary to Chest CT Screening)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news originating from Newark, New Jersey, by NewsRx correspondents, research stated, "Breath volatile organic compounds (VOCs) have been reported as biomarkers of lung cancer, but it is not known if biomarkers identified in one group can identify disease in a separate independent cohort. Also, it is not known if combining breath biomarkers with chest CT has the potential to improve the sensitivity and specificity of lung cancer screening."

Our news journalists obtained a quote from the research, "Model-building phase (unblinded): Breath VOCs were analyzed with gas chromatography mass spectrometry in 82 asymptomatic smokers having screening chest CT, 84 symptomatic high-risk subjects with a tissue diagnosis, 100 without a tissue diagnosis, and 35 healthy subjects. Multiple Monte Carlo simulations identified breath VOC mass ions with greater than random diagnostic accuracy for lung cancer, and these were combined in a multivariate predictive algorithm. Model-testing phase (blinded validation): We analyzed breath VOCs in an independent cohort of similar subjects (n=70, 51, 75 and 19 respectively). The algorithm predicted discriminant function (DF) values in blinded replicate breath VOC samples analyzed independently at two laboratories (A and B). Outcome modeling: We modeled the expected effects of combining breath biomarkers with chest CT on the sensitivity and specificity of lung cancer screening. Unblinded model-building phase. The algorithm identified lung cancer with sensitivity 74.0%, specificity 70.7% and C-statistic 0.78. Blinded model-testing phase: The algorithm identified lung cancer at Laboratory A with sensitivity 68.0%, specificity 68.4%, C-statistic 0.71; and at Laboratory B with sensitivity 70.1%, specificity 68.0%, C-statistic 0.70, with linear correlation between replicates (r=0.88). In a projected outcome model, breath biomarkers increased the sensitivity, specificity, and positive and negative predictive values of chest CT for lung cancer when the tests were combined in series or parallel. Breath VOC mass ion biomarkers identified lung cancer in a separate independent cohort, in a blinded replicated study."

According to the news editors, the research concluded: "Combining breath biomarkers with chest CT could potentially improve the sensitivity and specificity of lung cancer screening."

For more information on this research see: Blinded Validation of Breath Biomarkers of Lung Cancer, a Potential Ancillary to Chest CT Screening. Plos One, 2015;10(12):e0142484. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Drugs and Therapies - Antiretrovirals

Studies from M. Ramgopal et al Add New Findings in the Area of Antiretrovirals (Pharmacokinetics of Total and Unbound Etravirine in HIV-1-Infected Pregnant Women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antiretrovirals have been presented. According to news reporting from Fort Pierce, Florida, by NewsRx journalists, research stated, "Treatment of HIV-1-infected women during pregnancy protects maternal health and reduces the risk of perinatal transmission of HIV-1. However, physiologic changes that occur during pregnancy may affect drug pharmacokinetics."

The news correspondents obtained a quote from the research, "This phase IIIb, open-label study evaluated the effects of pregnancy on the pharmacokinetics of the nonnucleoside reverse transcriptase inhibitor etravirine. Eligible HIV-1-infected pregnant women (18-26 weeks gestation) on an individualized, highly active antiretroviral therapy regimen including etravirine 200 mg twice daily were enrolled. Blood samples to assess the pharmacokinetics of total and unbound etravirine were obtained at clinic visits during the second and third trimesters (24- to 28-weeks and 34- to 38-weeks gestation, respectively) and 6-12 weeks postpartum. At each time point, plasma concentrations were measured over 12 hours (12-hour time point was obtained before the second daily dose of etravirine); pharmacokinetic parameters were derived using noncompartmental analysis and were compared between pregnancy and postpartum using general linear models. Antiviral and immunologic response and safety were assessed at each visit. Etravirine pharmacokinetic profiles were available for 13 of 15 enrolled women. Exposure to total etravirine was generally higher during pregnancy compared with 6-12 weeks postpartum (1.2- to 1.4-fold); the differences were less pronounced for unbound (pharmacodynamically active) etravirine. Virologic response was generally preserved throughout the study, and no perinatal transmission was observed. Etravirine was generally safe and well tolerated."

According to the news reporters, the research concluded: "Etravirine 200 mg twice daily, as part of individualized combination antiretroviral therapy, may be a treatment option for HIV-1-infected pregnant women."

For more information on this research see: Pharmacokinetics of Total and Unbound Etravirine in HIV-1-Infected Pregnant Women. Jaids-Journal of Acquired Immune Deficiency Syndromes, 2016;73(3):268-274. Jaids-Journal of Acquired Immune Deficiency Syndromes can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St,
Philadelphia, PA 19103, USA.

Our news journalists report that additional information may be obtained by contacting M. Ramgopal, Midway Immunol & Res Center, Ft Pierce, FL, United States. Additional authors for this research include O. Osinyemi, C. Zorrilla, H.M. Crauwels, R. Ryan, K. Brown, V. Hillewaert and B. Baugh.

Cardiology

Studies from M. Sevinc and Co-Authors Have Provided New Information about Cardiology (Ex Vivo Perfusion Characteristics of Donation After Cardiac Death Kidneys Predict Long-Term Graft Survival)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiology is the subject of a report. According to news reporting out of Mus, Turkey, by NewsRx editors, research stated, "Ex vivo perfusion is used in our unit for kidneys donated after cardiac death (DCD). Perfusion flow index (PFI), resistance, and perfusate glutathione S-transferase (GST) can be measured to assess graft viability."

Our news journalists obtained a quote from the research, "We assessed whether measurements taken during perfusion could predict long-term outcome after transplantation. All DCD kidney transplants performed from 2002 to 2014 were included in this study. The exclusion criteria were: incomplete data, kidneys not machine perfused, kidneys perfused in continuous mode, and dual transplantation. There were 155 kidney transplantations included in the final analysis. Demographic data, ischemia times, donor hypertension, graft function, survival and machine perfusion parameters after 3 hours were analyzed. Each perfusion parameter was divided into 3 groups as high, medium, and low. Estimated glomerular filtration rate was calculated at 12 months and then yearly after transplantation. There was a significant association between graft survival and PFI and GST (P values, .020 and .022, respectively). PFI was the only independent parameter to predict graft survival. A low PFI during ex vivo hypothermic perfusion is associated with inferior graft survival after DCD kidney transplantation."

According to the news editors, the research concluded: "We propose that PFI is a measure of the health of the graft vasculature and that a low PFI indicates vascular disease and therefore predicts a worse long-term outcome."

Our news journalists report that additional information may be obtained by
contacting M. Sevinc, Mus Government Hosp, Renal Department, TR-49100 Mus, Turkey. Additional authors for this research include S. Stamp, J. Ling, N. Carter, D. Talbot and N. Sheerin.

Liver Diseases and Conditions - Hepatitis B Virus

Studies from M.A. van de Klundert and Co-Researchers Update Current Data on Hepatitis B Virus (Identification of FDA-approved drugs that target hepatitis B virus transcription)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Hepatitis B Virus. According to news reporting originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "In the treatment of chronic hepatitis B virus (HBV) infection, polymerase inhibitors successfully suppress HBV DNA production. However, the production of viral proteins continues unhindered, which hampers viral clearance."

Financial support for this research came from Sanquin Blood Supply Foundation.

Our news editors obtained a quote from the research, "Here, we screen for compounds that suppress HBV transcription, which would prevent viral protein production. A total of 640 FDA-approved drugs were evaluated for their ability to inhibit HBV transcription in a transfection-based HBV reporter assay. The assay was performed in the presence and absence of the HBV accessory protein X (HBx), which is essential for in vivo HBV RNA transcription. We observed that in the absence of HBx 47, and in the presence of HBx 24 compounds suppressed transcription by more than 20%. We selected the 24 most potent compounds in each condition for further analysis. On average, the selected compounds reduced transcription by 33.9% (range: 24.1-65.8%) in the absence of HBx expression, and 30.6% (range: 20.4-48.9%) in the presence of HBx. The two selections of 24 compounds had 12 compounds in common, resulting in a final selection of 36 compounds, which were evaluated for their capacity to suppress HBV replication in constitutively HBV-replicating HepG2.2.15 cells. Twenty-three of these compounds reduced HBV replication by interfering with RNA transcription. Further analysis revealed that one of the compounds, terbinafine, potently and specifically suppressed HBx-mediated HBV RNA transcription in HepG2 cells. Inhibition of HBV protein production is a promising step towards HBV clearance."

According to the news editors, the research concluded: "In combination with an HBV polymerase inhibitor, the added suppression of HBV RNA transcription may markedly improve antiviral treatment outcome."

The news editors report that additional information may be obtained by contacting M.A. van de Klundert, Dept. of Blood-borne Infections, Sanquin Research, Amsterdam, Netherlands. Additional authors for this research include H.L. Zaaijer and N.A Kootstra.

Studies from M.M. Miller and Co-Researchers in the Area of Estrogen Reported (Editor's Highlight: Development of an In vitro Assay Measuring Uterine-Specific Estrogenic Responses for Use in Chemical Safety Assessment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hormones - Estrogen have been published. According to news reporting originating from Research Triangle Park, North Carolina, by NewsRx correspondents, research stated, "A toxicity pathway approach was taken to develop an in vitro assay using human uterine epithelial adenocarcinoma (Ishikawa) cells as a replacement for measuring an in vivo uterotrophic response to estrogens. The Ishikawa cell was determined to be fit for the purpose of recapitulating in vivo uterine response by verifying fidelity of the biological pathway components and the dose-response predictions to women of child-bearing age."

Our news editors obtained a quote from the research, "Expression of the suite of estrogen receptors that control uterine proliferation (ER alpha 66, ER alpha 46, ER alpha 36, ER beta, G-protein coupled estrogen receptor (GPER)) were confirmed across passages and treatment conditions. Phenotypic responses to ethinyl estradiol (EE) from transcriptional activation of ER-mediated genes, to ALP enzyme induction and cellular proliferation occurred at concentrations consistent with estrogenic activity in adult women (low picomolar). To confirm utility of this model to predict concentration-response for uterine proliferation with xenobiotics, we tested the concentration-response for compounds with known uterine estrogenic activity in humans and compared the results to assays from the ToxCast and Tox21 suite of estrogen assays. The Ishikawa proliferation assay was consistent with in vivo responses and was a more sensitive measure of uterine response."

According to the news editors, the research concluded: "Because this assay was constructed by first mapping the key molecular events for cellular response, and then ensuring that the assay incorporated these events, the resulting cellular assay should be a reliable tool for identifying estrogenic compounds and may provide improved quantitation of chemical concentration response for in vitro-based safety assessments."

The news editors report that additional information may be obtained by contacting R.A. Clewell, ScitoVation, Res Triangle Pk, NC 27709, United States. **Gram-Negative Bacteria - Yersinia enterocolitica**

**Studies from M.N. Dave et al Further Understanding of Yersinia enterocolitica (Yersinia enterocolitica YopH-Deficient Strain Activates Neutrophil Recruitment to Peyer's Patches and Promotes Clearance of the Virulent Strain)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Yersinia enterocolitica. According to news reporting from San Luis, Argentina, by NewsRx journalists, research stated, "Yersinia enterocolitica evades the immune response by injecting Yersinia outer proteins (Yops) into the cytosol of host cells. YopH is a tyrosine phosphatase critical for Yersinia virulence."

The news correspondents obtained a quote from the research, "However, the mucosal immune mechanisms subverted by YopH during in vivo orogastric infection with Y. enterocolitica remain elusive. The results of this study revealed neutrophil recruitment to Peyer's patches (PP) after infection with a YopH-deficient mutant strain (Y. enterocolitica Delta yopH). While the Y. enterocolitica wild-type (WT) strain in PP induced the major neutrophil chemoattractant CXCL1 mRNA and protein levels, infection with the Y. enterocolitica Delta yopH mutant strain exhibited a higher expression of the CXCL1 receptor, CXCR2, in blood neutrophils, leading to efficient neutrophil recruitment to the PP. In contrast, migration of neutrophils into PP was impaired upon infection with Y. enterocolitica WT strain. In vitro infection of blood neutrophils revealed the involvement of YopH in CXCR2 expression. Depletion of neutrophils during Y. enterocolitica Delta yopH infection raised the bacterial load in PP. Moreover, the clearance of WT Y. enterocolitica was improved when an equal mixture of Y. enterocolitica WT and Y. enterocolitica Delta yopH strains was used in infecting the mice. This study indicates that Y. enterocolitica prevents early neutrophil recruitment in the intestine and that the effector protein YopH plays an important role in the immune evasion mechanism."

According to the news reporters, the research concluded: "The findings highlight the potential use of the Y. enterocolitica YopH-deficient strain as an oral vaccine carrier."

For more information on this research see: Yersinia enterocolitica YopH-Deficient Strain Activates Neutrophil Recruitment to Peyer's Patches and Promotes Clearance of the Virulent Strain. *Infection and Immunity*, 2016;84(11):3172-3181. *Infection and Immunity* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Central Nervous System Diseases and Conditions –

Studies from Maastricht University in the Area of Epilepsy Reported
(Glutamate concentrations vary with antiepileptic drug use and mental slowing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting originating in Maastricht, Netherlands, by NewsRx journalists, research stated, "Although antiepileptic drugs (AEDs) are effective in suppressing epileptic seizures, they also induce (cognitive) side effects, with mental slowing as a general effect. This study aimed to assess whether concentrations of MR detectable neurotransmitters, glutamate and GABA, are associated with mental slowing in patients with epilepsy taking AEDs."

The news reporters obtained a quote from the research from Maastricht University, "Cross-sectional data were collected from patients with localization-related epilepsy using a variety of AEDs from three risk categories, i.e., AEDs with low, intermediate, and high risks of developing cognitive problems. Patients underwent 3T MR spectroscopy, including a PRESS (n = 55) and MEGA-PRESS (n = 43) sequence, to estimate occipital glutamate and GABA concentrations, respectively. The association was calculated between neurotransmitter concentrations and central information processing speed, which was measured using the Computerized Visual Searching Task (CVST) and compared between the different risk categories. Combining all groups, patients with lower processing speeds had lower glutamate concentrations. Patients in the high-risk category had a lower glutamate concentration and lower processing speed compared with patients taking low-risk AEDs. Patients taking intermediate-risk AEDs also had a lower glutamate concentration compared with patients taking low-risk AEDs, but processing speed did not differ significantly between those groups. No associations were found between the GABA concentration and risk category or processing speed. For the first time, a relation is shown between glutamate concentration and both mental slowing and AED use."

According to the news reporters, the research concluded: "It is suggested that the reduced excitatory action, reflected by lowered glutamate concentrations, may have contributed to the slowing of information processing in patients using AEDs with higher risks of cognitive side effects."
For more information on this research see: Glutamate concentrations vary with antiepileptic drug use and mental slowing. *Epilepsy & Behavior*, 2016;64():200-205. *Epilepsy & Behavior* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Drugs and Therapies - Antipsychotics**

**Studies from Manipal University Describe New Findings in Antipsychotics (Development and Validation of a Stability-Indicating RP-HPLC Method by a Statistical Optimization Process for the Quantification of Asenapine Maleate in Lipidic ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antipsychotics. According to news reporting out of Karnataka, India, by NewsRx editors, research stated, "A stability-indicating RP-HPLC method was developed for quantification of asenapine maleate (ASPM) in lipid nanoformulations. The proposed method was used to assess intrinsic stability of ASPM by conducting force degradation study."

Our news journalists obtained a quote from the research from Manipal University, "The results indicated no considerable degradation of ASPM on subjecting it to hydrolytic, oxidative, thermal and photolytic stresses. The method was validated according to ICH Q2(R1) guidelines by employing Full factorial design using Design-Expert ® software. ASPM was precisely and accurately quantified in nanoparticles by separating it on Hyperclone BDS C-18 using 80-20% v/v mixture of potassium phosphate solution containing 0.1% v/v triethylamine and acetonitrile. The effect of flow rate, pH, acetonitrile content and column temperature was assessed on method responses. The current method was linear in the range of 0.1-20 μg/mL with limit of detection (LOD) and limit of quantification (LOQ) of 29 and 89 ng/mL, respectively. The method was precise and accurate in the determination of ASPM with peak area RSD and recovery of <1.0% and 97-101% in bulk drug solution and of <1.0% and 92-104% in nanoformulations, respectively. Analysis of variance indicated the significance (P < 0.0001) of a statistical model in validating the method with respect to change in independent chromatographic factors."

According to the news editors, the research concluded: "The developed method was
successfully employed in determining ASPM content in bulk and lipid nanoformulations."

Our news journalists report that additional information may be obtained by contacting S. Mutalik, Manipal Univ, Dept. of Pharmaceut, Manipal Coll Pharmaceut Sci, Manipal 576104, Karnataka, India. **Clinical Research - Clinical Trials and Studies**

**Studies from Mashhad University of Medical Sciences Have Provided New Information about Clinical Trials and Studies (Carvedilol Administration Can Prevent Doxorubicin-Induced Cardiotoxicity: A Double-Blind Randomized Trial)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Clinical Research - Clinical Trials and Studies is now available. According to news reporting originating from Mashhad, Iran, by NewsRx correspondents, research stated, "The aim of this study is to evaluate the preventive effects of carvedilol on doxorubicin-induced cardiotoxicity. In this trial, 70 female patients with breast cancer who were candidates to receive doxorubicin were enrolled, from which 30 were selected randomly to receive carvedilol 6.25 mg daily during chemotherapy, with the rest receiving placebo as the control group."

Our news editors obtained a quote from the research from the Mashhad University of Medical Sciences, "Both groups were evaluated 1 week before and 1 week after chemotherapy by measuring the left ventricular ejection fraction and strain/strain rate. Data analysis showed that the case group presented no significant reduction in strain and strain-rate parameters after intervention, while there was a significant reduction in these parameters in the control group (all p values <0.001). Also, the mean differences of strain parameters in the case group were significantly less than in the control group in all evaluated heart walls (basal septal strain, p= 0.005, basal lateral strain, p=0.001, basal inferior strain, p<0.001, and basal anterior strain, p <0.001); the same was true for the strain-rate parameters (the p values for basal septal, basal lateral, basal inferior and basal anterior strain rate were 0.037, 0.037, 0.002 and <0.001, respectively). This study shows that carvedilol can prevent doxorubicin-induced cardiotoxicity."

According to the news editors, the research concluded: "Whether this prophylaxis
should be considered as the preferred method needs further investigation."

The news editors report that additional information may be obtained by contacting A. Tashakori Beheshti, Cardiovascular Research Center, Mashhad University of Medical Sciences, Mashhad, Iran. Additional authors for this research include H. Mostafavi Toroghi, G. Hosseini, A. Zarifian, F. Homaei Shandiz and A. Fazlinezhad.

Musculoskeletal Diseases and Conditions - …

Studies from Massachusetts General Hospital Add New Findings in the Area of Aneurysmal Bone Cysts (Treatment of aneurysmal bone cysts by percutaneous CT-guided injection of calcitonin and steroid)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Musculoskeletal Diseases and Conditions - Aneurysmal Bone Cysts is now available. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "To determine the efficacy and safety of percutaneous calcitonin and steroid injection in the treatment of aneurysmal bone cysts (ABCs). Our study was IRB-approved and HIPAA-compliant."

Our news journalists obtained a quote from the research from Massachusetts General Hospital, "We reviewed pre- and post-procedural imaging studies and medical records of all CT-guided percutaneous injections of ABCs with calcitonin and steroid performed at our institution between 2003 and 2015. Treatment success based on imaging was categorized as substantial (51-100 %), partial (1-50 %), or none (0 %) by comparing radiographs of the lesion before and after treatment. Our study group comprised 9 patients (7 female, 2 male; mean age 19 +/- 5 (range 12-25) years). ABCs were located in the pubis (n = 3), femur (n = 2), and humerus/scapula/ilium/sacrum (n = 1 for each). One patient did not have any clinical or imaging follow-up. For the other 8 patients, clinical and imaging follow-up ranged from 1 to 93 months (mean 16 +/- 29 months). One patient had two injections, and 1 patient had three injections. Six out of eight patients (75 %) had complete symptomatic relief and 2 patients (25 %) had partial symptomatic relief after initial injection. Imaging follow-up revealed substantial imaging response in 4 out of 8 patients (50 %). There was a partial imaging response in 2 patients (25 %) and no imaging response in 2 out of 8 patients (25 %), and all 4 of these patients had local recurrence. There were no complications. Percutaneous CT-guided injection of ABCs with
calcitonin and steroid is a safe and effective treatment."

According to the news editors, the research concluded: "Lack of imaging response may necessitate more aggressive treatment to minimize local recurrence."

The news correspondents report that additional information may be obtained from C.Y. Chang, Massachusetts General Hospital, Dept. of Radiol, Div Musculoskeletal Imaging & Intervent, Boston, MA 02114, United States. Additional authors for this research include S.V. Kattapuram, A.J. Huang, F.J. Simeone, M. Torriani and M.A. Bredella.

**Hormones - Gastrointestinal Hormones**

**Studies from Massachusetts General Hospital Add New Findings in the Area of Gastrointestinal Hormones (Tumor cells can follow distinct evolutionary paths to become resistant to epidermal growth factor receptor inhibition)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hormones - Gastrointestinal Hormones have been published. According to news reporting from Charlestown, Massachusetts, by NewsRx journalists, research stated, "Although mechanisms of acquired resistance of epidermal growth factor receptor (EGFR)-mutant non-small-cell lung cancers to EGFR inhibitors have been identified, little is known about how resistant clones evolve during drug therapy. Here we observe that acquired resistance caused by the EGFR(T790M) gatekeeper mutation can occur either by selection of pre-existing EGFR(T790M)-positive clones or via genetic evolution of initially EGFR(T790M)-negative drug-tolerant cells."

The news correspondents obtained a quote from the research from Massachusetts General Hospital, "The path to resistance impacts the biology of the resistant clone, as those that evolved from drug-tolerant cells had a diminished apoptotic response to third-generation EGFR inhibitors that target EGFR(T790M); treatment with navitoclax, an inhibitor of the anti-apoptotic factors BCL-xL and BCL-2 restored sensitivity. We corroborated these findings using cultures derived directly from EGFR inhibitor-resistant patient tumors."

According to the news reporters, the research concluded: "These findings provide evidence that clinically relevant drug-resistant cancer cells can both pre-exist and evolve from drug-tolerant cells, and they point to therapeutic opportunities to prevent or overcome resistance
in the clinic."

For more information on this research see: Tumor cells can follow distinct evolutionary paths to become resistant to epidermal growth factor receptor inhibition. *Nature Medicine*, 2016;22(3):262-9. (Nature Publishing Group - www.nature.com/; Nature Medicine - www.nature.com/nm/)

**Cardiovascular Diseases and Conditions**

**Studies from Massachusetts General Hospital Yield New Data on Hypertension [Low baseline (pre-injury) blood pressure predicts inpatient mortality in elderly trauma patients: A bi-institutional study]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Hypertension are presented in a new report. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "The relationship between baseline (i.e., pre-injury) blood pressure and trauma outcomes in elderly patients is unknown. We therefore aimed to identify the independent impact of baseline systolic blood pressure (SBP) on inpatient mortality among elderly trauma patients."

The news correspondents obtained a quote from the research from Massachusetts General Hospital, "The 2004 to 2014 trauma registries of two Level I Trauma Centers were linked to electronic health records then reviewed to identify patients >= 65 years old with available baseline vital signs. Baseline SBP was defined as mean outpatient SBP within 2 years before injury. Trauma SBP was defined as first SBP reading after presentation for trauma. Baseline and Trauma SBP were classified as Low (<110 mm Hg), Normal (110-139 mm Hg), or High (>= 140 mm Hg). Logistic multivariable regression models were constructed to assess the independent impact of Baseline SBP on inpatient mortality, controlling for demographics, comorbidities, injury mechanism/severity, and Trauma SBP. Of 37,494 patient admissions, 4,233 met inclusion criteria. Median age was 81 years; 63.6% were female. Mortality was 5.39%. In unadjusted analyses, mortality rates were 11.01%, 5.28%, and 4.52% in the Low, Normal, and High Baseline SBP groups, respectively (p = 0.001). In multivariable analyses, patients with Low Baseline SBP had significantly increased mortality risk [OR 3.19 (95% CI
1.62-6.26), \( p = 0.001 \) compared to patients with Normal Baseline SBP, in particular when they presented with Low Trauma SBP (< 110 mm Hg) \( [OR 6.14 (2.17-17.36), p = 0.001] \) or Normal Trauma SBP (110-139 mm Hg) \( [OR 3.87 (1.43-10.45), p = 0.008] \). The mortality risk associated with Low Baseline SBP was particularly elevated among patients with a pre-existing diagnosis of hypertension \( [OR 4.78 (1.97-11.62), p = 0.001] \). Low baseline pre-injury SBP is independently associated with more than a threefold increase in inpatient mortality among elderly trauma patients and a fivefold increase in mortality risk among patients with pre-existing hypertension.

According to the news reporters, the research concluded: "Given that blood pressure control in the elderly offers a long-term survival advantage, the paradoxical finding of decreased survival after trauma warrants further investigation."

For more information on this research see: Low baseline (pre-injury) blood pressure predicts inpatient mortality in elderly trauma patients: A bi-institutional study. *Journal of Trauma and Acute Care Surgery*, 2016;81(6):1142-1149. *Journal of Trauma and Acute Care Surgery* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Salicylic Acids**

**Studies from Massachusetts General Hospital in the Area of Salicylic Acids Described (Aspirin Use in Women: Current Perspectives and Future Directions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Salicylic Acids are discussed in a new report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Purpose of Review This review examines the recent literature on the use of low-dose aspirin (LDA) for primary and secondary prevention of cardiovascular disease in women, use of LDA for pre-eclampsia prevention in pregnancy, and the underutilization of aspirin therapy in women as compared to men. While men and women should not differ with respect to aspirin use for secondary prevention, its role in primary prevention remains unclear for both sexes, with particular uncertainty in women."

Our news journalists obtained a quote from the research from Massachusetts General Hospital, "Reflective of this are conflicting recommendations in current guidelines for primary prevention and thus investigations of primary prevention aspirin use are ongoing and will play an important role in elucidating its efficacy. While there is significant heterogeneity in studies to
date of LDA for pre-eclampsia prevention, based on recent meta-analyses suggesting promising results, guidelines now recommend initiation in high risk women after the 12th week of gestation. Finally, studies consistently reveal that aspirin therapy is underutilized in women as compared to men, suggesting a need to better educate physicians and the general public about its use in women. Further research is needed to better elucidate the role of aspirin in women for primary prevention of cardiovascular disease and for pre-eclampsia in high risk pregnant women."

According to the news editors, the research concluded: "In addition, further investigation into the factors that lead to the current underutilization of aspirin in women are required in order to ensure that patients of both sexes are optimally treated, with the goal of improving cardiovascular outcomes in all patients."

Current Atherosclerosis Reports can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. (Springer - www.springer.com; Current Atherosclerosis Reports - www.springerlink.com/content/1523-3804/)

The news correspondents report that additional information may be obtained from N.S. Scott, Massachusetts General Hospital, Dept. of Cardiol, Boston, MA 02114, United States.

Keywords for this news article include: Boston, Massachusetts, United States, North and Central America, Cardiovascular Diseases and Conditions, Platelet Aggregation Inhibitors, Cardiology, Article Review, Coagulation Modifiers, Drugs and Therapies, Antiplatelet Agents, Organic Chemicals, Carboxylic Acids, Aspirin Therapy, Pharmaceuticals, Salicylic Acids, Benzoic Acids, Hydroxy Acids, Massachusetts General Hospital.

Our news editors obtained a quote from the research from the Massachusetts Institute of Technology, "Adaptive biomedical innovation (ABI) provides an integrative, strategic approach for process innovation. Although the term ABI is new, it encompasses fragmented tools that have been developed across the global pharmaceutical industry, and could accelerate the evolution of the system through more coordinated application. ABI involves bringing stakeholders together to set shared objectives, foster trust, structure decision-making, and
manage expectations through rapid-cycle feedback loops that maximize product knowledge and reduce uncertainty in a continuous, adaptive, and sustainable learning healthcare system."

According to the news editors, the research concluded: "Adaptive decision-making, a core element of ABI, provides a framework for structuring decision-making designed to manage two types of uncertainty - the maturity of scientific and clinical knowledge, and the behaviors of other critical stakeholders."

Fungal Diseases and Conditions - Coccidioidomycosis

Studies from Mayo Clinic Add New Findings in the Area of Coccidioidomycosis (Coccidioidomycosis in Patients with Selected Solid Organ Cancers: A Case Series and Review of Medical Literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Fungal Diseases and Conditions - Coccidioidomycosis. According to news originating from Phoenix, Arizona, by NewsRx correspondents, research stated, "Coccidioidomycosis is a common infection in the desert southwestern USA; approximately 3% of healthy persons in Arizona alone become infected annually. Coccidioidomycosis may be severe in immunocompromised persons, but experience among patients with solid organ cancer has not been fully described."

Our news journalists obtained a quote from the research from Mayo Clinic, "Therefore, we aimed to describe the clinical courses of patients whose cancers were complicated by coccidioidomycosis at our institution, which is located in an area with endemic Coccidioides. To do so, we conducted a retrospective review from January 1, 2000, through December 31, 2014, of all patients with breast, colorectal, or ovarian cancer whose cancer courses were complicated by coccidioidomycosis. We identified 17,576 cancer patients; 14 (0.08%) of these patients met criteria for proven or probable coccidioidomycosis diagnosed within the first 2 years after the cancer diagnosis. All of these patients had primary pulmonary coccidioidomycosis, none had relapsed prior infection, and 1 had possible extrapulmonary..."
Five had active coccidioidal infection during chemotherapy, 1 of whom was hospitalized for coccidioidal pneumonia. All were treated with fluconazole, and all improved clinically. Eleven did not require prolonged courses of fluconazole. There were no clearly demonstrated episodes of relapsed infection.

According to the news editors, the research concluded: "Coccidioidomycosis was not a common complication of breast, colorectal, or ovarian cancers in patients treated at our institution, and it was not commonly complicated by severe or disseminated infection."

For more information on this research see: Coccidioidomycosis in Patients with Selected Solid Organ Cancers: A Case Series and Review of Medical Literature. Mycopathologia, 2016;181(11-12):787-798. Heart Disorders and Diseases - Atrial Fibrillation

Studies from Mayo Clinic Further Understanding of Atrial Fibrillation (Incidence and impact of postoperative atrial fibrillation after minimally invasive esophagectomy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Fibrillation have been presented. According to news reporting from Phoenix, Arizona, by NewsRx journalists, research stated, "Atrial fibrillation (AF) following open esophagectomy has been associated with increased rates of pulmonary and anastomotic complications, and mortality. This study seeks to evaluate effects of AF after minimally invasive esophagectomy (MIE)."

The news correspondents obtained a quote from the research from Mayo Clinic, "A retrospective review of patients consecutively treated with MIE for esophageal carcinoma, dysplasia, and benign disease from November 2006 to November 2011 was performed. One hundred twenty-one patients underwent MIE. Median age was 65 years (range 26-88) with 85% being male. Thirty-eight (31.4%) patients developed AF postoperatively. Of these 38 patients, 7 (18.4%) had known AF preoperatively. Patients with postoperative AF were significantly older than those without postoperative AF (68.7 vs. 62.8 years, P = 0.008) and more likely to be male (94.7% vs. 80.7%, P = 0.04). Neoadjuvant chemoradiation showed a trend toward increased risk of AF (73.7% vs 56.6%, P = 0.07). Sixty-day mortality was 2 of 38 (5.3%) in patients with AF.
and 4 of 83 (6.0%) in the no AF cohort (P = 1.00). The group with AF had increased length of hospitalization (13.4 days vs. 10.6 days P = 0.02). No significant differences in rates of pneumonia (31.6% vs. 21.7% P = 0.24), stricture (13.2% vs. 26.5% P = 0.10), or leak requiring return to operating room (13.2% vs. 8.4% P = 0.51) were noted between groups. We did not find an increased rate of AF in our MIE cohort compared with prior reported rates in open esophagectomy populations."

According to the news reporters, the research concluded: "AF did result in an increased length of stay but was not a predictor of other short-term morbidities including anastomotic leak, pulmonary complications, stenosis, or 60-day mortality."

Keywords for this news article include: Phoenix, Arizona, United States, North and Central America, Heart Disorders and Diseases, Atrial Fibrillation, Cardiac Arrhythmias, Gastroenterology, Esophagectomy, Heart Disease, Surgery, Mayo Clinic.

Oncology - Prostate Cancer

Studies from Mayo Clinic Provide New Data on Prostate Cancer (Contemporary Mapping of Post-Prostatectomy Prostate Cancer Relapse with C-11-Choline Positron Emission Tomography and Multiparametric Magnetic Resonance Imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "We identify sites and patterns of cancer recurrence in patients with post-prostatectomy biochemical relapse using C-11-choline positron emission tomography/computerized tomography and endorectal coil multiparametric magnetic resonance imaging. Between January 2008 and June 2015, 2,466 men underwent choline positron emission tomography for suspected prostate cancer relapse at our institution."

Our news editors obtained a quote from the research from Mayo Clinic, "Of these men 202 did not receive hormone or radiation therapy, underwent imaging with choline positron emission tomography and multiparametric magnetic resonance imaging, and were found to have disease recurrence. Overall patterns of recurrence were described, and factors associated with local only recurrence were evaluated using univariable and multivariable logistic regression. Median prostate specific antigen at positive scan was 2.3 ng/ml (IQR 1.4-5.5) with a median time from prostate specific antigen relapse to lesion visualization of 15 months (IQR 4.8-34.2). Of these 202 men 68 (33%) exhibited local only, 45 (22%) local plus metastatic and 89 (45%)
metastatic only relapse. Pelvic node only relapse was observed in 39 (19%) men. Median prostate specific antigen at positive imaging for patients with local only, metastatic only and local plus metastatic relapse was 2.3, 2.7 and 2.2 ng/ml (p = 0.46), with a median interval from biochemical recurrence to positive scan of 33.5, 7.0 and 15.0 months, respectively (p < 0.001). On multivariable analysis time from biochemical recurrence to positive imaging was independently associated with local only recurrence (OR 1.10 for every 6-month increase, p = 0.012). Combined choline positron emission tomography and multiparametric magnetic resonance imaging evaluation of biochemical recurrence after prostatectomy reveals an anatomically diverse pattern of recurrence."

According to the news editors, the research concluded: "These findings have implications for optimizing the salvage treatment of patients with prostate cancer with relapse following surgery."

The news editors report that additional information may be obtained by contacting R.J. Karnes, Mayo Clinic, Dept. of Urol, Rochester, MN, United States. Additional authors for this research include H.B. Zaid, R. Haloi, L.A. Mynderse, A.T. Froemming, V.J. Lowe, B.J. Davis, E.D. Kwon and R.J. Karnes.

Heart Disorders and Diseases - Heart Attack

**Studies from Mayo Clinic Yield New Data on Heart Attack [Cancer History Portends Worse Acute and Long-term Noncardiac (but Not Cardiac) Mortality After Primary Percutaneous Coronary Intervention for Acute ST-Segment Elevation Myocardial ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting originating in Rochester, Minnesota, by NewsRx journalists, research stated, "To define the effect of a history of cancer on in-hospital and long-term mortality after primary percutaneous coronary intervention (PCI) for ST-segment elevation myocardial infarction (STEMI). In this retrospective cohort study of 2346 patients with STEMI enrolled in the Mayo Clinic PCI registry from November 1, 2000, through October 31, 2010, we identified 261 patients (11.1%) with a history of cancer."
The news reporters obtained a quote from the research from Mayo Clinic, "The in-hospital and long-term outcomes (median follow-up, 6.2 years; interquartile range = 4.3-8.5 years), including cardiac and noncardiac death and heart failure hospitalization, of these patients were compared with those of 1313 cancer-negative patients matched on age, sex, family history of coronary artery disease, and date of STEMI. Patients with cancer had higher in-hospital noncardiac (1.9% vs 0.4%; P =.03) but similar cardiac (5.8% vs 4.6%; P =.37) mortality as matched controls. The group at highest acute mortality risk were those diagnosed as having cancer within 6 months before STEMI (hazard ratio [HR] = 7.0; 95% CI, 1.4-34.4; P =.02). At 5 years, patients with cancer had similar cardiac mortality (4.2% vs 5.8%; HR = 1.27; 95% CI, 0.77-2.10; P =.35) despite more heart failure hospitalizations (15% vs 10%; HR =1.72; 95% CI, 1.18-2.50; P =.01) but faced higher noncardiac mortality (30.0% vs 11.0%; HR = 3.01; 95% CI, 2.33-3.88; P <. 001) than controls, attributable solely to cancer-related deaths. One in 10 patients in this contemporary registry of patients undergoing primary PCI for STEMI has a history of cancer."

According to the news reporters, the research concluded: "These patients have more than a 3 times higher acute in-hospital and long-term noncardiac mortality risk but no increased acute or long-term cardiac mortality risk with guideline-recommended cardiac care."

Our news correspondents report that additional information may be obtained by contacting J. Herrmann, Mayo Clinic, Div Cardiovasc Dis, Rochester, MN, United States. Additional authors for this research include R. Gulati, R.J. Lennon, B.R. Lewis, J. Park, G.S. Sandhu, R.S. Wright, A. Lerman and J. Herrmann.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mayocp.2016.06.029. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology

Studies from Mayo Clinic Yield New Information about Oncology (HSulf-1 deficiency dictates a metabolic reprogramming of glycolysis and TCA cycle in ovarian cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology is now available. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "Warburg effect has
emerged as a potential hallmark of many cancers. However, the molecular mechanisms that led to this metabolic state of aerobic glycolysis, particularly in ovarian cancer (OVCA) have not been completely elucidated."

The news correspondents obtained a quote from the research from Mayo Clinic, "HSulf-1 predominantly functions by limiting the bioavailability of heparan binding growth factors and hence their downstream signaling. Here we report that HSulf-1, a known putative tumor suppressor, is a negative regulator of glycolysis. Silencing of HSulf-1 expression in OV202 cell line increased glucose uptake and lactate production by upregulating glycolytic genes such as Glut1, HKII, LDHA, as well as metabolites. Conversely, HSulf-1 overexpression in TOV21G cells resulted in the down regulation of glycolytic enzymes and reduced glycolytic phenotype, supporting the role of HSulf-1 loss in enhanced aerobic glycolysis. HSulf-1 deficiency mediated glycolytic enhancement also resulted in increased inhibitory phosphorylation of pyruvate dehydrogenase (PDH) thus blocking the entry of glucose flux into TCA cycle. Consistent with this, metabolomic and isotope tracer analysis showed reduced glucose flux into TCA cycle. Moreover, HSulf-1 loss is associated with lower oxygen consumption rate (OCR) and impaired mitochondrial function. Mechanistically, lack of HSulf-1 promotes c-Myc induction through HB-EGF-mediated p-ERK activation. Pharmacological inhibition of c-Myc reduced HB-EGF induced glycolytic enzymes implicating a major role of c-Myc in loss of HSulf-1 mediated altered glycolytic pathway in OVCA."

According to the news reporters, the research concluded: "Similarly, PG545 treatment, an agent that binds to heparan binding growth factors and sequesters growth factors away from their ligand also blocked HB-EGF signaling and reduced glucose uptake in vivo in HSulf-1 deficient cells."

For more information on this research see: HSulf-1 deficiency dictates a metabolic reprogramming of glycolysis and TCA cycle in ovarian cancer. Oncotarget, 2015;6(32):33705-19.

**Nutritional and Metabolic Diseases and Conditions -…**

**Studies from Mayo Clinic in the Area of Celiac Disease Described (Contemporary celiac disease diagnosis: is a biopsy avoidable?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Celiac Disease are presented in a new report. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "The duodenal biopsy is the gold standard for the diagnosis of celiac disease. However, given improvements in the performance of serological
testing, the possibility of accurately diagnosing celiac disease without the need of a biopsy has attracted interest."

Our news journalists obtained a quote from the research from Mayo Clinic, "The European Society for Paediatric Gastroenterology, Hepatology and Nutrition has revised its recommendations to include a diagnostic algorithm that includes sequential serological testing and human leukocyte antigen genotyping for symptomatic children which would enable a diagnosis of celiac disease to be made in the absence of a confirmatory intestinal biopsy. Recent studies have evaluated the ESPGHAN guidelines and have mostly corroborated that celiac disease can be accurately diagnosed in specific pediatric patient populations without the need of a biopsy. However, two cautionary points have been raised that warrant further consideration - the success of this approach is highly dependent targeting a population with a high pretest probability of celiac disease, as well, the performance of serology assays must be established and the appropriate use of cutoffs is essential. The duodenal biopsy will remain the gold standard for diagnosing celiac disease in a majority of patients."

According to the news editors, the research concluded: "However, as serology assays evolve and as a greater understanding of the genetic risk factors of celiac disease is achieved, more patients may be accurately diagnosed without the need for a biopsy."

For more information on this research see: Contemporary celiac disease diagnosis: is a biopsy avoidable? Current Opinion In Gastroenterology, 2016;32(2):80-5. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Gastroenterology - journals.lww.com/co-gastroenterology/pages/default.aspx)

**Pregnancy Complications - Preeclampsia**

**Studies from Mayo Clinic in the Area of Preeclampsia Reported**
(Pregnancy history and blood-borne microvesicles in middle aged women with and without coronary artery calcification)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Pregnancy Complications - Preeclampsia are presented in a new report. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "Having a history of preeclampsia increases the risk for future coronary artery calcification (CAC). This study evaluated the association of blood-borne, cell-derived microvesicles (MV) with CAC in middle-aged women."
Our news journalists obtained a quote from the research from Mayo Clinic, "Twelve pre-selected, antigen-specific MV were measured by digital flow cytometry in the blood of age- and parity-matched women (median age 60 years) without a history of cardiovascular events, but with either a history of preeclampsia (PE, n=39) or normotensive pregnancy (NP, n=40). CAC was determined by computed tomography. CAC scores ranged from 0 to 47 and 0-602 Agatston Units in the NP and PE groups, respectively. Waist circumference and insulin resistance were greatest in PE women with CAC. MV positive for tissue factor or stem/progenitor cell antigen (CD117) differed between NP and PE groups. In univariate analysis, those positive for tissue factor, ICAM-1, stem cells, and adipocytes (P16-set) antigens associated with CAC in the PE group. Principal components (PC) analysis reduced the MV variables to three independent dimensions. PC1 showed a modest correlation with CAC scores in the PE group (rho = 0.31, p = 0.06) and associated with CAC in a multivariable model on pooled groups that included all 3 PC variables when adjusted for pregnancy status (p = 0.03). The association was lost when corrected for body mass index or waist circumference. In women with a history of PE and elevated metabolic risk profile, a group of specific antigen-positive MV associated with CAC. These MV may reflect cellular processes associated with CAC."

According to the news editors, the research concluded: "Their diagnostic potential for CAC remains to be determined."

For more information on this research see: Pregnancy history and blood-borne microvesicles in middle aged women with and without coronary artery calcification. *Atherosclerosis*, 2016;253():150-155. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Studies from McGill University Provide New Data on Plasma (The Effect of Dissolved Oxygen on the Relaxation Rates of Blood Plasma: Implications for Hyperoxia Calibrated BOLD)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematology - Plasma. According to news reporting from Montreal, Canada, by NewsRx journalists, research stated, "To determine the contribution of paramagnetic dissolved oxygen in blood plasma to blood-oxygenation-level-dependent (BOLD) signal changes in hyperoxic calibrated BOLD studies. Bovine blood plasma..."
samples were prepared with partial pressures of oxygen ($pO(2)$) ranging from 110 to 600 mmHg."

The news correspondents obtained a quote from the research from McGill University, "R-1, R-2, and R-2* of the plasma with dissolved oxygen were measured using quantitative MRI sequences at 3 Tesla. Simulations were performed to predict the relative effects of dissolved oxygen and deoxyhemoglobin changes in hyperoxia calibrated BOLD. The relaxivities of dissolved oxygen in plasma were found to be $r(1, O_2) = 1.97 +/- 0.09 \times 10^{-4}$ s$^{-1}$ mmHg$^{-1}$, $r(2, O_2) = 2.3 +/- 0.7 \times 10^{-4}$ s$^{-1}$ mmHg$^{-1}$, and $r(2, O_2)^* = 2.3 +/- 0.7 \times 10^{-4}$ s$^{-1}$ mmHg$^{-1}$. Simulations predict that neither the transverse nor longitudinal relaxation rates of dissolved oxygen contribute significantly to the BOLD signal during hyperoxia. During hyperoxia, the increases in R-2 and R-2* of blood from dissolved oxygen in plasma are considerably less than the decreases in R-2 and R-2* from venous deoxyhemoglobin. R-1 effects due to dissolved oxygen are also predicted to be negligible."

According to the news reporters, the research concluded: "As a result, dissolved oxygen in arteries should not contribute significantly to the hyperoxic calibrated BOLD signal."

Our news journalists report that additional information may be obtained by contacting Y.H. Ma, McGill University, Montreal Neurol Inst, McConnell Brain Imaging Center, Montreal, PQ, Canada. Additional authors for this research include A.J.L. Berman and G.B. Pike.

Keywords for this news article include: Montreal, Quebec, Canada, North and Central America, Chalcogens, Hematology, Hyperoxia, Plasma, Blood, McGill University.

**Vaccination**

**Studies from Medical College of Wisconsin in the Area of Vaccination Reported (Epidermal Growth Factor Receptor Derived Peptide Vaccination to Prevent Lung Adenocarcinoma Formation: An In Vivo Study in a Murine Model of EGFR Mutant Lung Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Vaccination. According to news reporting originating in Milwaukee, Wisconsin, by NewsRx journalists, research stated, "The ability to prevent disease is the holy grail of medicine. For decades, efforts have been made to extend the successes seen with vaccination against infectious diseases to cancer."

The news reporters obtained a quote from the research from the Medical College of Wisconsin, "In some instances, preventive vaccination against viruses (prototypically HPV) has successfully prevented tumorigenesis and will make a major impact on public health in the decades to come. However, the majority of cancers that arise are a result of genetic mutation within the host, or non-viral environmental exposures. We present compelling evidence that
vaccination against an overexpressed self-tumor oncprotein has the potential to prevent tumor development. Vaccination against the Epidermal Growth Factor Receptor (EGFR) using a multipeptide vaccine in a preventive setting decreased EGFR-driven lung carcinogenesis by 76.4% in a mouse model of EGFR-driven lung cancer. We also demonstrate that anti-EGFR vaccination primes the development of a robust immune response in vivo.

According to the news reporters, the research concluded: "This study provides proof of concept for the first time that targeting tumor drivers in a preventive setting in lung cancer using peptide vaccination can inhibit tumorigenesis and may provide useful clinical insights into the development of strategies to vaccinate against EGFR in populations where EGFR-mutant disease is highly prevalent."

Our news correspondents report that additional information may be obtained by contacting M. You, Medical College of Wisconsin, Dept. of Pharmacol & Toxicol, Center Canc, Milwaukee, WI 53226, United States. Additional authors for this research include R.A. Lubet, E. Gad, M.L. Disis and M. You.

Keywords for this news article include: Milwaukee, Wisconsin, United States, North and Central America, Intercellular Signaling Peptides and Proteins, Gastrointestinal Hormone Receptors, Receptor Protein-Tyrosine Kinases, Epidermal Growth Factor Receptor, Environment and Public Health, Communicable Disease Control, Gastrointestinal Hormones, Epidermal Growth Factors, Growth Factor Receptors, Public Health Practice, Phosphotransferases, Membrane Proteins, Peptide Receptors, Protein Kinases, Adenocarcinoma, Lung Neoplasms, Immunization, Lung Cancer, Vaccination, Proteomics, Genetics, Oncology, Medical College of Wisconsin.

Central Nervous System Diseases and Conditions - …

Studies from Medical Research Council Further Understanding of Epilepsy (Structural brain abnormalities in a single gene disorder associated with epilepsy, language impairment and intellectual disability)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting out of Cambridge, United Kingdom, by NewsRx editors, research stated, "Childhood speech and language deficits are highly prevalent and are a common feature of neurodevelopmental disorders. However, it is difficult to investigate the underlying causal pathways because many diagnostic groups have a heterogeneous aetiology."

Financial supporters for this research include Wellcome Trust/Academy of Medical Sciences, National Institute of Health Research.
Our news journalists obtained a quote from the research from Medical Research Council. "Studying disorders with a shared genetic cause and shared cognitive deficits can provide crucial insight into the cellular mechanisms and neural systems that give rise to those impairments. The current study investigated structural brain differences of individuals with mutations in ZDHHC9, which is associated with a specific neurodevelopmental phenotype including prominent speech and language impairments and intellectual disability. We used multiple structural neuroimaging methods to characterise neuroanatomy in this group, and observed bilateral reductions in cortical thickness in areas surrounding the temporo-parietal junction, parietal lobule, and inferior frontal lobe, and decreased microstructural integrity of cortical, subcortical-cortical, and interhemispheric white matter projections. These findings are compared to reports for other genetic groups and genetically heterogeneous disorders with a similar presentation."

According to the news editors, the research concluded: "Overlap in the neuroanatomical phenotype suggests a common pathway that particularly affects the development of temporo-parietal and inferior frontal areas, and their connections."

Our news journalists report that additional information may be obtained by contacting J. Bathelt, MRC Cognit & Brain Sci Unit, Cambridge CB2 7EF, United Kingdom. Additional authors for this research include D. Astle, J. Barnes, F.L. Raymond and K. Baker.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.nicl.2016.07.016. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Cambridge, United Kingdom, Europe, Central Nervous System Diseases and Conditions, Brain Diseases and Conditions, Epilepsy, Genetics, Medical Research Council.

**Immunology - Mononuclear Phagocyte System**

**Studies from Medical Research Institute Describe New Findings in Mononuclear Phagocyte System (Hepcidin independent iron recycling in a mouse model of -thalassaemia intermedia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunology - Mononuclear Phagocyte System. According to news originating from Herston, Australia, by NewsRx correspondents, research stated, "In conditions such as -thalassaemia, stimulated erythropoiesis can reduce the expression of the iron regulatory hormone hepcidin, increasing both macrophage iron release and intestinal iron absorption and leading to iron loading. However, in certain conditions, sustained elevation of erythropoiesis can occur without an increase in body iron load."

Our news journalists obtained a quote from the research from Medical Research Institute, "To investigate this in more detail, we made use of a novel mouse strain (RBC14),
which exhibits mild -thalassaemia intermedia with minimal iron loading. We compared iron homeostasis in RBC14 mice to that of Hbb(th3/+) mice, a more severe model of -thalassaemia intermedia. Both mouse strains showed a decrease in plasma iron half-life, although the changes were less severe in RBC14 mice. Despite this, intestinal ferroportin and serum hepcidin levels were unaltered in RBC14 mice. In contrast, Hbb(th3/+) mice exhibited reduced serum hepcidin and increased intestinal ferroportin. However, splenic ferroportin levels were increased in both mouse strains."

According to the news editors, the research concluded: "These data suggest that in low-grade chronic haemolytic anaemia, such as that seen in RBC14 mice, the increased erythroid iron requirements can be met through enhanced macrophage iron release without the need to increase iron absorption, implying that hepcidin is not the sole regulator of macrophage iron release invivo."

The news correspondents report that additional information may be obtained from D.M. Frazer, QIMR Berghofer Med Res Inst, Iron Metab Lab, Herston, Qld, Australia. Additional authors for this research include S.J. Wilkins, C.S.G. Mirciov, L.A. Dunn and G.J. Anderson.

Keywords for this news article include: Herston, Australia, Australia and New Zealand, Mononuclear Phagocyte System, Macrophages, Immunology, Phagocytes, Medical Research Institute.

**Health and Medicine - Oral Health**

**Studies from Medical University Have Provided New Data on Oral Health (Accuracy of commercial kits and published primer pairs for the detection of periodontopathogens)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Oral Health have been published. According to news reporting from Graz, Austria, by NewsRx journalists, research stated, "Despite the input of microbiome research, a group of 20 bacteria continues to be the focus of periodontal diagnostics and therapy. The aim of this study was to compare three commercial kits and laboratory-developed primer pairs for effectiveness in detecting such periodontopathogens."

Financial support for this research came from Hygiene Fund, Medical University of Graz.

The news correspondents obtained a quote from the research from Medical University, "Fourteen bacterial mock communities, consisting of 16 randomly assembled bacterial strains, were used as reference standard for testing kits and primers. Extracted DNA from mock communities was analyzed by PCR in-house with specific primers and forwarded for analysis to the manufacturer's laboratory of each of the following kits: ParoCheckA ® Kit 20,
micro-IDentA® plus 11, and CarpegenA® Perio Diagnostik. The kits accurately detected Fusobacterium nucleatum, Prevotella intermedia/Prevotella nigrescens, Parvimonas micra, Aggregatibacter actinomycetemcomitans, Campylobacter rectus/showae, Streptococcus mitis, Streptococcus mutans, and Veillonella parvula. The in-house primers for F. nucleatum were highly specific to subtypes of the respective periodontopathogen. Other primers repeatedly detected oral pathogens not present in the mock communities, indicating reduced specificity. The commercial kits used in this study are reliable tools to support periodontal diagnostics. Whereas the detection profile of the kits is fixed at a general specificity level, the design of primers can be adjusted to differentiate between highly specific strains. In-house primers are more error-prone. Bacterial mock communities can be established as a reference standard for any similar testing. The tested kits render good results with selected bacterial species. Primers appear to be less useful for routine clinical diagnostics and of limited applicability in research.

According to the news reporters, the research concluded: "Basic information about the periodontopathogens identified in this study supports clinical decision-making."

For more information on this research see: Accuracy of commercial kits and published primer pairs for the detection of periodontopathogens. Clinical Oral Investigations, 2016;20(9):2515-2528. Clinical Oral Investigations can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. Heart Disorders and Diseases - Atrial Fibrillation

Studies from Medical University Have Provided New Information about Atrial Fibrillation (Matrix Metalloproteinase Neutrophil Gelatinase-Associated Lipocalin Complex Predicts Atrial Fibrillation Recurrence after Electrical Cardioversion in Obese ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Atrial Fibrillation is now available. According to news reporting out of Bialystok, Poland, by NewsRx editors, research stated, "There is not much data on matrix metalloproteinase neutrophil gelatinase-associated lipocalin (MMP-NGAL) complex in patients with atrial fibrillation (AF). The aim of the study was to assess the value of MMP-NGAL complex in predicting AF recurrence after electrical cardioversion."

Our news journalists obtained a quote from the research from Medical University,
"The serum levels of NGAL, cystatin C, interleukin-6, high-sensitivity C-reactive protein, copeptin, MMP-NGAL complex, matrix metalloproteinase 2, tissue inhibitor of metalloproteinase 1, Von Willebrand factor, B-type natriuretic peptide and the urinary level of NGAL were evaluated before cardioversion. A total of 83 patients with persistent AF were enrolled in the study. Left atrial diameter (LA) ≥ 4.5 cm was significantly associated with AF recurrence at follow-up (p = 0.009). In selected 39 obese patients, MMP-NGAL complex was associated with AF recurrence (p = 0.03). If the concentration of MMP-NGAL complex increased by 1 ng/ml, the odds of AF recurrence increased by 4% (OR 1.04; CI: 1.00-1.08; p = 0.03). MMP-NGAL complex did not correlate with AF recurrence in patients with a first episode of AF, in patients ≥ 65 years of age and in patients with a LA ≥ 4.5 cm or with chronic kidney disease. It is known that the greater the BMI at baseline, the higher the likelihood of progression from paroxysmal to permanent AF. However, European Society of Cardiology (ESC) guidelines do not consider obese patients a population with a low likelihood of success of cardioversion. That is why we need a sensitive marker to predict sinus rhythm maintenance in such a population."

According to the news editors, the research concluded: "We found that MMP-NGAL complex may predict AF recurrence after successful cardioversion in obese patients."

Our news journalists report that additional information may be obtained by contacting E. Mlodawska, Medical University of Bialystok, Dept. of Cardiol, Bialystok, Poland. Additional authors for this research include A. Tomaszuk-Kazberuk, P. Lopatowska, E. Waszkiewicz, H. Bachorzewska-Gajewska, J. Malyszko, E. Michniewicz, S. Dobrzycki and W.J. Musial.

& Wellness Week -- Current study results on Life Science Research - Developmental Biology have been published. According to news reporting originating from Innsbruck, Austria, by NewsRx correspondents, research stated, "Skeletal muscle excitation-contraction (EC) coupling is independent of calcium influx. In fact, alternative splicing of the voltage-gated calcium channel Ca(V)1.1 actively suppresses calcium currents in mature muscle."

Our news editors obtained a quote from the research from Medical University, "Whether this is necessary for normal development and function of muscle is not known. However, splicing defects that cause aberrant expression of the calcium-conducting developmental Ca(V)1.1e splice variant correlate with muscle weakness in myotonic dystrophy. Here, we deleted Ca(V)1.1 (Cacna1s) exon 29 in mice. These mice displayed normal overall motor performance, although grip force and voluntary running were reduced. Continued expression of the developmental Ca(V)1.1e splice variant in adult mice caused increased calcium influx during EC coupling, altered calcium homeostasis, and spontaneous calcium sparklets in isolated muscle fibers. Contractile force was reduced and endurance enhanced. Key regulators of fiber type specification were dysregulated and the fiber type composition was shifted toward slower fibers. However, oxidative enzyme activity and mitochondrial content declined."

According to the news editors, the research concluded: "These findings indicate that limiting calcium influx during skeletal muscle EC coupling is important for the secondary function of the calcium signal in the activity-dependent regulation of fiber type composition and to prevent muscle disease."

The news editors report that additional information may be obtained by contacting B.E. Flucher, Medical University of Innsbruck, Dept. of Physiol & Med Phys, A-6020 Innsbruck, Austria. Additional authors for this research include B. Dienes, A. Benedetti, P. Tuluc, P. Szentesi, M. Sztretye, J. Rainer, M.W. Hess, C. Schwarzer, G.J. Obermair, L. Csernoch and B.E. Flucher.

Central Nervous System Diseases and Conditions –…

Studies from Medical University in the Area of Encephalomyelitis Reported (Transplantation of Neural Stem Cells Cotreated with Thyroid Hormone and GDNF Gene Induces Neuroprotection in Rats of Chronic Experimental Allergic Encephalomyelitis)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions - Encephalomyelitis have been presented. According to news reporting originating from Sichuan, People's Republic of China, by NewsRx correspondents, research stated, "The present study investigates whether transplantation of NSCs treated with T3 alone (T3/NSCs), or in conjunction with GDNF gene (GDNF-T3/NSCs), provides a better therapeutic effect than NSCs for chronic EAE. EAE rats were, respectively, injected with NSCs, T3/NSCs, GDNF-T3/NSCs, and saline at 10 days and sacrificed at 60 days after EAE immunization."

Funders for this research include Scientific Research Fund of Sichuan Provincial Education Department, Sichuan Provincial Health Bureau, Office of Science and Technology of Luzhou.

Our news editors obtained a quote from the research from Medical University, "The three cell grafted groups showed a significant reduction in clinical scores, inflammatory infiltration, and demyelination compared with the saline-injected group, and among the cell grafted groups, the reduction in GDNF-T3/NSCs group was the most notable, followed by T3/NSCs group. Grafted T3/NSCs and GDNF-T3/NSCs acquired more MAP2, GalC, and less GFAP in brain compared with grafted NSCs, and grafted GDNF-T3/NSCs acquired most MAP2 and least GalC among the cell grafted groups. Furthermore, T3/NSCs and GDNF-T3/NSCs grafting increased the expression of mRNA for PDGFaR, GalC, and MBP in lesion areas of brain compared with NSCs grafting, and the expression of mRNA for GalC and MBP in GDNF-T3/NSCs group was higher than that in T3/NSCs group."

According to the news editors, the research concluded: "T3/NSCs grafting, especially GDNF-T3/NSCs grafting, provides a better neuroprotective effect for EAE than NSCs transplantation."

For more information on this research see: Transplantation of Neural Stem Cells Cotreated with Thyroid Hormone and GDNF Gene Induces Neuroprotection in Rats of Chronic Experimental Allergic Encephalomyelitis. *Neural Plasticity*, 2016:2016():3081939. Liver Diseases and Conditions - Viral Hepatitis

Studies from Medical University in the Area of Viral Hepatitis Described (Micro RNAs mir-106a, mir-122 and mir-197 are increased in severe acute viral hepatitis with coagulopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Viral Hepatitis is now available. According to news reporting out of Vienna, Austria, by NewsRx editors, research stated, "The severity of acute viral hepatitis, which may be caused by several distinct viruses, varies among individual patients. In rare cases, severe hepatic injury with sudden loss of liver function may occur, which is clinically indicated by the occurrence of coagulopathy or encephalopathy."

Financial supporters for this research include R&D funding of the Medical Faculty of the University of Cologne, Department of Virology (Medical University of Vienna).

Our news journalists obtained a quote from the research from Medical University, "As the molecular mechanisms of this liver injury are largely unknown, we investigated extracellular micro RNA (miRNA) profiles in 54 patients acutely infected with one of four different hepatotropic viruses, in order to identify those miRNAs which indicate severe viral hepatitis associated with coagulopathy. First, the profile of miRNAs was extensively analysed using a microarray-based approach in highly characterized 24 patients, matched in terms of sex, age and level of liver enzymes, as well as in three healthy controls. The cohort included samples from 18 patients with moderate and six individuals with severe hepatitis, indicated by abnormal prothrombin time and higher alanine aminotransferase and bilirubin levels. miRNAs found to be upregulated in severe hepatitis were then quantified by real-time PCR in the expanded cohort of 54 patients."

According to the news editors, the research concluded: "Comprehensive microarray-based miRNA profiling identified upregulation of mir-106a, mir-122 and mir-197 in patients with severe acute viral hepatitis with coagulopathy, as compared to patients who did not develop coagulopathy. mir-106a, mir-122 and mir-197 were then proven to be significantly upregulated in patients with severe acute viral hepatitis by quantitative real-time PCR (p <0.01, Mann-Whitney U-test). mir-106a, mir-122 and mir-197 could be potential markers for severe acute viral hepatitis associated with coagulopathy."

Our news journalists report that additional information may be obtained by contacting L. Weseslindner, Dept. of Virology, Medical University of Vienna, Vienna, Austria. Additional authors for this research include I. Macheleidt, H. Eischeid, R. Strassl, H. Hofer, T. Popow-Kraupp, H.P. Dienes, H. Holzmann and M. Odenthal.

Drugs and Therapies - Antibiotics

Studies from Medicines Co. Yield New Data on Antibiotics [Phase 1 Study of the Safety, Tolerability, and Pharmacokinetics of the beta-Lactamase Inhibitor Vaborbactam (RPX7009) in Healthy Adult Subjects]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antibiotics have been presented. According to news reporting originating from San Diego, California, by NewsRx correspondents, research stated, "Vaborbactam (formerly RPX7009) is a member of a new class of beta-lactamase inhibitor with pharmacokinetic properties similar to those of many beta-lactams, including carbapenems. The pharmacokinetics and safety of vaborbactam were evaluated in 80 healthy adult subjects in a first-in-human randomized, placebo-controlled, double-blind, sequential single-and multiple-ascending- dose study."

Our news editors obtained a quote from the research from Medicines Co., "A total of 10 dose cohorts were enrolled in the study, with 6 subjects randomized to receive 250 to 2,000 mg of vaborbactam and 2 subjects randomized to receive placebo in each cohort. Maximum concentrations for vaborbactam were achieved at the end of the 3-h infusion. Vaborbactam exposure (C-max and area under the concentration-time curve [AUC]) increased in a dose-proportional manner following multiple doses. There was no evidence of accumulation with multiple doses, consistent with the terminal half-life of similar to 2 h. Both the volume of distribution (V-ss) and plasma clearance were independent of dose. For the 2,000-mg dose, the plasma clearance was 0.17 +/- 0.03 liters/h, the AUC from 0 h to infinity (AUC(0-infinity)) was 144.00 +/- 13.90 mg.h/liter, and the V-ss was 21.80 +/- 2.26 mg.h/liter. Urinary recovery was 80% or greater over 48 h across all dose groups. No subjects discontinued the study due to adverse events (AEs), and no serious AEs (SAEs) were observed. All AEs were mild to moderate and similar among the vaborbactam-and placebo-treated subjects, with mild lethargy as the only unique AE reported with the high dose of vaborbactam."

According to the news editors, the research concluded: "Overall, this study revealed the safety, tolerability, and pharmacokinetic profile of vaborbactam and formed the basis for advancement into patient studies in combination with meropenem, including treatment of patients with carbapenem-resistant Enterobacteriaceae (CRE) infections."

For more information on this research see: Phase 1 Study of the Safety, Tolerability, and Pharmacokinetics of the beta-Lactamase Inhibitor Vaborbactam (RPX7009) in Healthy Adult Subjects. *Antimicrobial Agents and Chemotherapy*, 2016;60(10):6326-6332. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Oncology - Waldenstrom Macroglobulinemia

Studies from Memorial Sloan-Kettering Cancer Center Describe New Findings in Waldenstrom Macroglubulinemia (Clonal B cells in Waldenstr?m's macroglobulinemia exhibit functional features of chronic active B-cell receptor signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Waldenstrom Macroglobulinemia have been published. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Waldenstr?m's macroglobulinemia (WM) is a B-cell non-Hodgkin's lymphoma (B-NHL) characterized by immunoglobulin M (IgM) monoclonal gammopathy and the medullary expansion of clonal lymphoplasmacytic cells. Neoplastic transformation has been partially attributed to hyperactive MYD88 signaling, secondary to the MYD88 L265P mutation, occurring in the majority of WM patients."

The news correspondents obtained a quote from the research from Memorial Sloan-Kettering Cancer Center, "Nevertheless, the presence of chronic active B-cell receptor (BCR) signaling, a feature of multiple IgM+ B-NHL, remains a subject of speculation in WM. Here, we interrogated the BCR signaling capacity of primary WM cells by utilizing multiparametric phosphoflow cytometry and found heightened basal phosphorylation of BCR-related signaling proteins, and augmented phosphoresponses on surface IgM (sIgM) crosslinking, compared with normal B cells. In support of those findings we observed high sIgM expression and loss of phosphatase activity in WM cells, which could both lead to signaling potentiation in clonal cells. Finally, led by the high-signaling heterogeneity among WM samples, we generated patient-specific phosphosignatures, which subclassified patients into a 'high' and a 'healthy-like' signaling group, with the second corresponding to patients with a more indolent clinical phenotype."

According to the news reporters, the research concluded: "These findings support the presence of chronic active BCR signaling in WM while providing a link between differential BCR signaling utilization and distinct clinical WM subgroups."

For more information on this research see: Clonal B cells in Waldenstr?m's macroglobulinemia exhibit functional features of chronic active B-cell receptor signaling. Leukemia, 2016;30(5):1116-25. (Nature Publishing Group - www.nature.com/; Leukemia - www.nature.com/leu/)

**Oncology - Non-Small Cell Lung Cancer**

**Studies from Memorial Sloan-Kettering Cancer Center in the Area of Non-Small Cell Lung Cancer Reported (Detection of Recurrence Patterns After Wedge Resection for Early Stage Lung Cancer: Rationale for Radiologic Follow-Up)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Wedge resection for selected patients with early stage non-small cell lung cancer is considered to be a valid treatment option. The aim of this study was to evaluate the recurrence patterns after wedge resection, to analyze the survival of patients under routine followup, and to recommend a follow-up regimen."

Our news editors obtained a quote from the research from Memorial Sloan-Kettering Cancer Center, "A retrospective analysis was done of 446 consecutive patients between May 2000 and December 2012 who underwent a wedge resection for clinical stage I non-small cell lung cancer. All patients were followed up with a computed tomography scan with or without contrast. The recurrence was recorded as local (involving the same lobe of wedge resection), regional (involving mediastinal or hilar lymph nodes or a different lobe), or distant (including distant metastasis and pleural disease). Median follow-up for survivors (n = 283) was 44.6 months. In all, 163 patients died; median overall survival was 82.6 months. Thirty-six patients were diagnosed with new primary non-small cell lung cancer, and 152 with recurrence (79 local, 45 regional, and 28 distant). There was no difference in the incidence of recurrence detection detected by computed tomography scans with versus without contrast (p = 0.18). The cumulative incidence of local recurrences at 1, 2, and 3 years was higher than the cumulative incidence for local, regional, and distant recurrences: 5.2%, 11.1%, and 14.9% versus 3.7%, 6.6%, and 9.5% versus 2.3%, 4.7%, and 6.4%, respectively. Primary tumor diameter was associated with local recurrence in univariate analysis. Wedge resection for early stage non-small cell lung cancer is associated with a significant risk for local and regional recurrence."

According to the news editors, the research concluded: "Long-term follow-up using noncontrast computed tomography scans at consistent intervals is appropriate to monitor for these recurrences."

The news editors report that additional information may be obtained by contacting A.
Bille, Mem Sloan Kettering Canc Center, Dept. of Thorac Surg & Epidemiol & Biostat, New York, NY, United States. Additional authors for this research include U. Ahmad, K.M. Woo, K. Suzuki, P. Adusumilli, J. Huang, D.R. Jones and N.P. Rizk.

**Oncology - Carcinomas**

**Studies from Molecular Pharmacology Unit Describe New Findings in Carcinomas (PKC-alpha modulation by miR-483-3p in platinum-resistant ovarian carcinoma cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Carcinomas is now available. According to news reporting originating from Milan, Italy, by NewsRx correspondents, research stated, "The occurrence of drug resistance limits the efficacy of platinum compounds in the cure of ovarian carcinoma. Since microRNAs (miRNAs) may contribute to this phenomenon by regulating different aspects of tumor cell response, the aim of this study was to exploit the analysis of expression of miRNAs in platinum sensitive/resistant cells in an attempt to identify potential regulators of drug response."

Our news editors obtained a quote from the research from Molecular Pharmacology Unit, "MiR-483-3p, which may participate in apoptosis and cell proliferation regulation, was found up-regulated in 4 platinum resistant variants, particularly in the IGROV-1/Pt1 subline, versus parental cells. Transfection of a synthetic precursor of miR-483-3p in IGROV-1 parental cells elicited a marked up-regulation of the miRNA levels. Growth-inhibition and colony-forming assays indicated that miR-483-3p over-expression reduced cell growth and conferred mild levels of cisplatin resistance in IGROV-1 cells, by interference with their proliferative potential. Predicted targets of miR-483-3p included PRKCA (encoding PKC-alpha), previously reported to be associated to platinum-resistance in ovarian carcinoma. We found that miR-483-3p directly targeted PRKCA in IGROV-1 cells. In keeping with this finding, cisplatin sensitivity of IGROV-1 cells decreased upon molecular/pharmacological inhibition of PKC-alpha. Overall, our results suggest that overexpression of miR-483-3p by ovarian carcinoma platinum-resistant cells may interfere with their proliferation, thus protecting them from DNA damage induced by platinum compounds and ultimately representing a drug-resistance mechanism."

According to the news editors, the research concluded: "The impairment of cell growth may account for low levels of drug resistance that could be relevant in the clinical setting."

For more information on this research see: PKC-alpha modulation by miR-483-3p in platinum-resistant ovarian carcinoma cells. *Toxicology and Applied Pharmacology*, 2016;310 ():9-19. *Toxicology and Applied Pharmacology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier -
Studies from Monash University Add New Findings in the Area of Glutamic Acid (Positive Allosteric Modulation of the Muscarinic M-1 Receptor Improves Efficacy of Antipsychotics in Mouse Glutamatergic Deficit Models of Behavior)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Glutamic Acid have been published. According to news reporting out of Parkville, Australia, by NewsRx editors, research stated, "Current antipsychotics are effective in treating the positive symptoms associated with schizophrenia, but they remain suboptimal in targeting cognitive dysfunction. Recent studies have suggested that positive allosteric modulation of the M-1 muscarinic acetylcholine receptor (mAChR) may provide a novel means of improving cognition."

Our news journalists obtained a quote from the research from Monash University, "However, very little is known about the potential of combination therapies in extending coverage across schizophrenic symptom domains. This study investigated the effect of the M-1 mAChR positive allostericmodulator BQCA [1-(4-methoxybenzyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid], alone or in combination with haloperidol (a first-generation antipsychotic), clozapine (a second-generation atypical antipsychotic), or aripiprazole (a third-generation atypical antipsychotic), in reversing deficits in sensorimotor gating and spatial memory induced by the N-methyl-D-aspartate receptor antagonist, MK-801 [(5R, 10S)(1)-5-methyl-10,11-dihydro-5H-dibenzo[a, d]cyclohepten-5,10-imine]. Sensorimotor gating and spatial memory induction are two models that represent aspects of schizophrenia modeled in rodents. In prepulse inhibition (an operational measure of sensorimotor gating), BQCA alone had minimal effects but exhibited different levels of efficacy in reversing MK-801-induced prepulse inhibition disruptions when combined with a subeffective dose of each of the three (currently prescribed) antipsychotics. Furthermore, the combined effect of BQCA and clozapine was absent in M-1-/- mice. Interestingly, although BQCA alone had no effect in reversing MK-801-induced memory impairments in a Y-maze spatial test, we observed a reversal upon the combination of BQCA with atypical antipsychotics, but not with haloperidol."

According to the news editors, the research concluded: "These findings provide proof of concept that a judicious combination of existing antipsychotics with a selective M-1
mAChR positive allosteric modulator can extend antipsychotic efficacy in glutamatergic deficit models of behavior."

Our news journalists report that additional information may be obtained by contacting J.R. Lane, Monash University, Monash Inst Pharmaceut Sci, Drug Discovery Biol, Parkville, Vic 3052, Australia. Additional authors for this research include D.M. Shackleford, D.T. Malone, S.N. Mistry, R.T. Patil, P.J. Scammells, C.J. Langmead, C. Pantelis, P.M. Sexton, J.R. Lane and A. Christopoulos.

**Sexually Transmitted Diseases and Conditions…**

**Studies from Monash University Provide New Data on Gonorrhea**

(Trends in gonorrhoea positivity by nucleic acid amplification test versus culture among Australian heterosexual men with a low prevalence of gonorrhoea, 2007-2014)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Sexually Transmitted Diseases and Conditions (STDs) - Gonorrhea. According to news reporting out of Melbourne, Australia, by NewsRx editors, research stated, "Testing for gonorrhoea with nucleic acid amplification tests (NAATs) is not recommended in low-prevalence populations as it results in high numbers of false positive results. The aim of this study was to examine temporal trends of gonorrhoea positivity by NAAT and culture in heterosexual men in Victoria, Australia following recent increases in gonorrhoea notifications."

Our news journalists obtained a quote from the research from Monash University, "Three data sources between 2007 and 2014 were used in this study: notification data from the Victorian Department of Health, Medicare testing numbers of single chlamydia and dual NAATs performed, and electronic records on heterosexual men attending Melbourne Sexual Health Centre (MSHC). Notifications of gonorrhoea by NAAT (with/without culture) in heterosexual men in Victoria rose threefold from 74 in 2007 to 238 in 2014, while the number of dual NAATs ordered over the same period underwent a fivefold increase from 14 061 to 71 860. The overall proportion of NAATs that were positive for gonorrhoea in Victoria was low and fell from 0.53% in 2007 to 0.33% in 2014 (P-trend=0.002). Of the 28014 new heterosexual men attending MSHC, the gonorrhoea positivity by culture was 0.9%, and chlamydia positivity by NAAT was 8.5%. The positivity of both infections did not change over time. These data suggest that gonorrhoea prevalence in heterosexual men is low and stable, despite annual increases in notifications. Guidelines in most countries recommend restricting testing to groups or populations with prevalence over 1%, symptomatic individuals or those at increased
epidemiological risk."

According to the news editors, the research concluded: "These data indicate gonorrhoea testing should not automatically accompany chlamydia screening in low-risk heterosexual men."

For more information on this research see: Trends in gonorrhoea positivity by nucleic acid amplification test versus culture among Australian heterosexual men with a low prevalence of gonorrhoea, 2007-2014. Sexually Transmitted Infections, 2016;92(8):625-627,104. Sexually Transmitted Infections can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. (BMJ Publishing Group - group.bmj.com/; Sexually Transmitted Infections - sti.bmj.com/)

Our news journalists report that additional information may be obtained by contacting E.P.F. Chow, Monash University, Cent Clin Sch, Fac Med Nursing & Hlth Sci, Melbourne, Vic, Australia. Additional authors for this research include C.K. Fairley, G. Fehler, S.N. Tabrizi, W.S. Tan, M.Y. Chen, C.S. Bradshaw and E.P.F. Chow.

Cardiology

Studies from Montreal Heart Institute Update Current Data on Cardiology (Characteristics of premature ventricular contractions in healthy children and their impact on left ventricular function)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiology is the subject of a report. According to news reporting out of Montreal, Canada, by NewsRx editors, research stated, "There are few data regarding the characteristics of premature ventricular contractions (PVCs) in healthy children and their impact on left ventricular (LV) function. The purpose of this study was to assess the prevalence of LV systolic dysfunction in children with frequent PVCs (> = 10%) and determine whether it is associated with PVC characteristics (e.g., proportion, coupling interval, width, and/or morphology)."

Our news journalists obtained a quote from the research from Montreal Heart Institute, "We conducted a single-center cohort study of children with structurally normal hearts and PVC burden > = 10% by 24-hour Holter monitoring performed between 2008 and 2012. Clinical, arrhythmic, and echocardiographic data were reviewed at baseline and during follow-up. A total of 47 children (22 female [47%], mean age 8.2 +/- 6.5 years) had a mean PVC burden of 20.9 +/- 11.9% at baseline. The PVC coupling interval averaged 430 +/- 110 ms, with a PVC width of 118 +/- 27 ms. PVCs were monomorphic in 44 patients (94%). Although no patient had severe cardiomyopathy, 7 (15%) had reduced shortening fraction (Z-score < 2). A strong association was observed between PVC coupling interval and LV shortening fraction Z-score < 2.0 (area under the curve 0.95 +/- 0.03, P<.001). A cutoff value <365 ms yielded the greatest discriminatory ability (Youden J-statistic 0.72, sensitivity 85.7%, specificity 86.5%)."
PVC proportion, width, and morphology were not significantly associated with LV shortening fraction. During 4.0 +/- 2.8 years of follow-up, the PVC burden decreased from a median of 18% to 1.5% (P <.001). PVCs in children with structurally normal hearts are associated with a relatively benign course, with spontaneous resolution in most children."

According to the news editors, the research concluded: "Mild LV systolic dysfunction, observed in 15%, is strongly correlated with a shorter coupling interval (<365 ms)."

Our news journalists report that additional information may be obtained by contacting P. Khairy, Montreal Heart Inst, Adult Congenital Heart Center, Montreal, PQ H1T 1C8, Canada. Additional authors for this research include C. Blanchet, A. Fournier, W. Mawad, A. Shohoudi, N. Dahdah and P. Khairy.

**Proteins - Nucleoproteins**

**Studies from Nagasaki University Provide New Data on Nucleoproteins (Histone H2A T120 Phosphorylation Promotes Oncogenic Transformation via Upregulation of Cyclin D1)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Proteins - Nucleoproteins. According to news reporting originating in Nagasaki, Japan, by NewsRx journalists, research stated, "How deregulation of chromatin modifiers causes malignancies is of general interest. Here, we show that deregulation of chromatin modifiers causes malignancies is of general interest. Here, we show that histone H2A T120 is phosphorylated in human cancer cell lines and demonstrate that this phosphorylation is catalyzed by hVRK1."

The news reporters obtained a quote from the research from Nagasaki University, "Cyclin D1 was one of ten genes downregulated upon VRK1 knockdown in two different cell lines and showed loss of H2A T120 phosphorylation and increased H2A K119 ubiquitylation of its promoter region, resulting in impaired cell growth. In vitro, H2A T120 phosphorylation and H2A K119 ubiquitylation are mutually inhibitory, suggesting that histone phosphorylation indirectly activates chromatin. Furthermore, expression of a phosphomimetic H2A T120D increased H3 K4 methylation. Finally, both VRK1 and the H2A T120D mutant histone transformed NIH/3T3 cells."

According to the news reporters, the research concluded: "These results suggest that histone H2A T120 phosphorylation by hVRK1 causes inappropriate gene expression, including upregulated cyclin D1, which promotes oncogenic transformation."
For more information on this research see: Histone H2A T120 Phosphorylation Promotes Oncogenic Transformation via Upregulation of Cyclin D1. *Molecular Cell*, 2016;64 (1):176-188. *Molecular Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Molecular Cell - www.journals.elsevier.com/molecular-cell/)

**Drugs and Therapies - Antimicrobial Agents and...**

**Studies from Nanjing Agricultural University Have Provided New Information about Antimicrobial Agents and Chemotherapy (Molecular Characterization of Escherichia coli Strains Isolated from Retail Meat That Harbor blaCTX-M and fosA3 Genes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antimicrobial Agents and Chemotherapy. According to news originating from Nanjing, People's Republic of China, by NewsRx correspondents, research stated, "A total of 55 cefotaxime-resistant*Escherichia coli* isolates were obtained from retail meat products purchased in Shenzhen, China, during the period November 2012 to May 2013. Thirty-seven of these 55 isolates were found to harbor the*blaCTX-M*gene, with the*blaCTX-M-1*group being the most common type.*blaCMY-2*was detected in 16 isolates, alone or in combination with other extended-spectrum b-lactamase (ESBL) determinants."

Financial support for this research came from Shenzhen Key Lab.

Our news journalists obtained a quote from the research from Nanjing Agricultural University, "Importantly, the*fosA3*gene, which encodes fosfomycin resistance, was detected in 12 isolates, with several being found to reside in the conjugative plasmid that harbored the*blaCTX-M*gene. The insertion sequence IS26was observed upstream of some of the*blaCTX-M-55*and*fosA3*genes. Conjugation experiments showed that*blaCTX-M*genes from 15 isolates were transferrable, with Inc I1 and Inc FII being the most prevalent replicons."

According to the news editors, the research concluded: "High clonal diversity was observed among the*blaCTX-M*producers, suggesting that horizontal transfer of the*blaCTX-M*genes among*E. coli*strains in retail meats is a common event and that such strains may constitute an important reservoir of*blaCTX-M*genes, which may be readily disseminated to other potential human pathogens."

The news correspondents report that additional information may be obtained from W. Yao, College of Animal Science and Technology, Nanjing Agriculture University, Nanjing, People's Republic of China. Additional authors for this research include D. Lin, K. Chen, E.W. Chan, W. Yao and S. Chen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AAC.03101-15. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Gastric Cancer

**Studies from Nanjing Medical University Provide New Data on Gastric Cancer (Increased expression of long noncoding RNA TUG1 predicts a poor prognosis of gastric cancer and regulates cell proliferation by epigenetically silencing of p57)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Gastric Cancer.

According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Recent evidence highlights long noncoding RNAs (lncRNAs) as crucial regulators of cancer biology that contribute to tumorigenesis. LncRNA TUG1 was initially detected in a genomic screen for genes upregulated in response to taurine treatment in developing mouse retinal cells."

The news correspondents obtained a quote from the research from Nanjing Medical University, "Our previous study showed that TUG1 could affect cell proliferation through epigenetically regulating HOXB7 in human non-small cell lung cancer. However, the clinical significance and potential role of TUG1 in GC remains unclear. In this study, we found that TUG1 is significantly increased and is correlated with outcomes in gastric cancer (GC). Further experiments revealed that knockdown of TUG1 repressed GC proliferation both in vitro and in vivo. Mechanistic investigations showed that TUG1 has a key role in G0/G1 arrest. We further demonstrated that TUG1 was associated with PRC2 and that this association was required for epigenetic repression of cyclin-dependent protein kinase inhibitors, including p15, p16, p21, p27 and p57, thus contributing to the regulation of GC cell cycle and proliferation."

According to the news reporters, the research concluded: "Together, our results suggest that TUG1, as a regulator of proliferation, may serve as a candidate prognostic biomarker and target for new therapies in human GC."

For more information on this research see: Increased expression of long noncoding RNA TUG1 predicts a poor prognosis of gastric cancer and regulates cell proliferation by epigenetically silencing of p57. *Cell Death & Disease*, 2016;7():e2109. **Connective Tissue Cells**

**Studies from Nanjing Medical University Yield New Data on Connective Tissue Cells (The Long Non-Coding RNA LncRNA8975-1 is Upregulated in Hypertrophic Scar Fibroblasts and Controls Collagen Expression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Connective Tissue Cells. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Long non-coding RNAs (IncRNAs) are thought to play crucial roles in human diseases. However, the function of IncRNAs in hypertrophic scar formation remains poorly understood."

Our news journalists obtained a quote from the research from Nanjing Medical University, "In this study, we investigated the expression of IncRNA8975-1 in hypertrophic scar tissues and fibroblasts by quantitative reverse transcription PCR (qRT-PCR). To investigate its function, overexpression and knockdown of IncRNA8975-1 were performed using lentivirus infection and Stealth RNAi transfection, respectively. Cell proliferation was detected by CCK-8 assay. The protein levels of collagens and alpha-smooth muscle actin (alpha-SMA) were analysed by western blot. We found that IncRNA8975-1 was overexpressed in hypertrophic scar tissues and dermal fibroblasts. Overexpression of IncRNA8975-1 inhibited cell proliferation and reduced the protein expression levels of COL1A2, COL1A1, COL3A1 and alpha-SMA in hypertrophic scar fibroblasts, whereas knockdown of IncRNA8975-1 had the opposite effect. Our results show that the long non-coding RNA IncRNA8975-1 is upregulated in hypertrophic scar fibroblasts; furthermore, it inhibits fibroblast proliferation and reduces collagen and alpha-SMA expression."

According to the news editors, the research concluded: "Further studies on the mechanisms regulated by IncRNA8975-1 would lead to a better understanding of the pathogenesis of hypertrophic scar formation."

For more information on this research see: The Long Non-Coding RNA LncRNA8975-1 is Upregulated in Hypertrophic Scar Fibroblasts and Controls Collagen Expression. *Cellular Physiology and Biochemistry*, 2016;40(1-2):326-334. *Cellular Physiology and Biochemistry* can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. The news correspondents report that additional information may be obtained from Q.
Studies from Nanjing Medical University Yield New Information about Squamous Cell Carcinoma (Long noncoding RNA, tissue differentiation-inducing nonprotein coding RNA is upregulated and promotes development of esophageal squamous cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Squamous Cell Carcinoma have been published. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "Esophageal squamous cell carcinoma (ESCC) is one of the major causes of cancer death worldwide, especially in Eastern Asia. Due to the poor prognosis, it is necessary to further dissect the underlying mechanisms and explore therapeutic targets of ESCC."

Our news journalists obtained a quote from the research from Nanjing Medical University, "Recently, studies show that long noncoding RNAs (lncRNAs) have critical roles in diverse biological processes, including tumorigenesis. Increasing evidence indicates that some lncRNAs are widely involved in the development and progression of ESCC, such as HOTAIR, SPRY4-IT1 and POU3F3. An emerging lncRNA, tissue differentiation-inducing nonprotein coding RNA (TINCR), has been studied in human cutaneous squamous cell carcinoma and has critical biological function, but its role in ESCC remains unknown. Here, we evaluated the expression profile of TINCR and its biological function in ESCC. In a cohort of 56 patients, TINCR was significantly overexpressed in ESCC tissues compared with paired adjacent normal tissues. Further, in vitro silencing TINCR via small interfering RNA (siRNA) inhibited the proliferation, migration and invasion of ESCC cells. Meantime, siRNA treatment induced apoptosis and blocked the progression of cell cycle."

According to the news editors, the research concluded: "Taken together, our study suggests that TINCR promotes proliferation, migration and invasion of ESCC cells, acting as a potential oncogene of ESCC."

For more information on this research see: Long noncoding RNA, tissue differentiation-inducing nonprotein coding RNA is upregulated and promotes development of esophageal squamous cell carcinoma. Diseases of the Esophagus, 2016;29(8):950-958. Diseases of the Esophagus can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com; Diseases of the Esophagus -
Studies from Nanjing University Reveal New Findings on Adenomas (Esophageal submucosal gland duct adenoma: a clinicopathological and immunohistochemical study with a review of the literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Adenomas have been published. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Esophageal submucosal gland duct adenoma (ESGDA) is a rare tumor. The clinicopathological features of the ESGDA and its precursor lesion have not been comprehensively evaluated."

Our news journalists obtained a quote from the research from Nanjing University, "In this study, we aimed at delineating the clinicopathological features of the ESGDA and cyst formation of the esophageal submucosal gland duct (ESGD), as well as their correlations and clinical implications. We identified three cases of ESGDA and 16 cases of cyst formation of the ESGD among 786 endoscopic mucosal resection specimens over a 7-year period. The median patient age was 58 years with a male predominance. These lesions were small submucosal bulges locating at the lower esophagus with a size no more than 1 cm. The main microscopic changes of these lesions included content retention, multilayered epithelium or papillary folds of the ESGD and inflammatory cell infiltration, acidophilic degeneration, hyperplasia or atrophy of the acini. The included cases generally showed moderate to severe microscopic esophagitis. The ESGDA was mainly consisted by multiple glandular cysts covered by two layers of cells. Immunohistochemical results showed that the luminal duct lining cells and basal cells were positive for CK7 and p63, respectively. Both of the two layer cells were positive for HMWCK and negative for CK20, p53, CDX2, MUC5AC, MUC6, MUC2 and MUC1. The proliferation index was very low (1%). The diagnostic criteria of the ESGDA were proposed and, the differential diagnosis was discussed. Cyst formation of the ESGD is considered to be the precursor lesion of the ESGDA, because they have overlapping clinicopathological features with progressive relationship."

According to the news editors, the research concluded: "In addition, the ESGDA have close connection with advance of the GERD and, probably, an increased risk of carcinoma."

For more information on this research see: Esophageal submucosal gland duct adenoma: a clinicopathological and immunohistochemical study with a review of the literature. *Diseases of the Esophagus*, 2016;29(8):1048-1053. *Diseases of the Esophagus* can be contacted
Studies from Nankai University Reveal New Findings on Pneumonia (Identification of a small molecule that simultaneously suppresses virulence and antibiotic resistance of Pseudomonas aeruginosa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lung Diseases and Conditions - Pneumonia have been presented. According to news reporting from Tianjin, People's Republic of China, by NewsRx journalists, research stated, "The rising antibiotic resistance of bacteria imposes a severe threat on human health. Inhibition of bacterial virulence is an alternative approach to develop new antimicrobials."

The news correspondents obtained a quote from the research from Nankai University, "Molecules targeting antibiotic resistant enzymes have been used in combination with cognate antibiotics. It might be ideal that a molecule can simultaneously suppress virulence factors and antibiotic resistance. Here we combined genetic and computer-aided inhibitor screening to search for such molecules against the bacterial pathogen Pseudomonas aeruginosa. To identify target proteins that control both virulence and antibiotic resistance, we screened for mutants with defective cytotoxicity and biofilm formation from 93 transposon insertion mutants previously reported with increased antibiotic susceptibility. A pyrD mutant displayed defects in cytotoxicity, biofilm formation, quorum sensing and virulence in an acute mouse pneumonia model. Next, we employed a computer-aided screening to identify potential inhibitors of the PyrD protein, a dihydroorotate dehydrogenase (DHODase) involved in pyrimidine biosynthesis. One of the predicted inhibitors was able to suppress the enzymatic activity of PyrD as well as bacterial cytotoxicity, biofilm formation and antibiotic resistance. A single administration of the compound reduced the bacterial colonization in the acute mouse pneumonia model."

According to the news reporters, the research concluded: "Therefore, we have developed a strategy to identify novel treatment targets and antimicrobial molecules."

For more information on this research see: Identification of a small molecule that simultaneously suppresses virulence and antibiotic resistance of Pseudomonas aeruginosa. Scientific Reports, 2016;6():19141. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Oncology - Neuroblastomas

Studies from Nantong University Have Provided New Information about Neuroblastomas (An ITO electrode modified with electrodeposited graphene oxide and gold nanoclusters for detecting the release of H2O2 from bupivacaine-injured neuroblastoma ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Neuroblastomas have been published. According to news reporting originating from Nantong, People's Republic of China, by NewsRx correspondents, research stated, "This study describes an amperometric sensor for hydrogen peroxide (H2O2) that uses an ITO glass electrode which was modified with a nanocomposite consisting of electrochemically reduced graphene oxide and gold nanoclusters (AuNCs). The sensor was used to quantify extracellular H2O2 released from human neuroblastoma cells of type SH-SY5Y."

Funders for this research include National Natural Science Foundation of China, National Natural Science Foundation of China (CN), Natural Science Foundation of Jiangsu Province.

Our news editors obtained a quote from the research from Nantong University, "The calibration plot, established best at a working voltage of -0.4 V (vs. Ag/AgCl) is linear in the 40 nmolai...L-1 to 2 mu molai...L-1 concentration range, and the detection limit is 20 nmolai...L-1 (at a signal-to-noise ratio of 3). The method was further applied to study bupivacaine-induced cell damage and the protective effects of alpha-lipoic acid. The study indicated that pretreatment of the cells with lipoic acid retards cell damage induced by bupivacaine. The sensor can be easily fabricated, is disposable and highly sensitive."

According to the news editors, the research concluded: "The sensor is perceived to represent an alternative for studying the interactions of drugs with cells, and as an effective tool to quantify cell-secreted H2O2."

For more information on this research see: An ITO electrode modified with electrodeposited graphene oxide and gold nanoclusters for detecting the release of H2O2 from bupivacaine-injured neuroblastoma cells. Microchimica Acta, 2016;183(12):3167-3175. Microchimica Acta can be contacted at: Springer Wien, Sachsenplatz 4-6, PO Box 89, A-1201 Wien, Austria. (Springer - www.springer.com; Microchimica Acta -
Studies from Nantong University Yield New Data on Anticholinergics (Z-Guggulsterone Improves the Scopolamine-Induced Memory Impairments Through Enhancement of the BDNF Signal in C57BL/6J Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Anticholinergics. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "Memory impairment is a common symptom in patients with neurodegenerative disorders, and its suppression could be beneficial to improve the quality of life of those patients. Z-guggulsterone, a compound extracted from the resin of plant Commiphora whighitii, exhibits numerous pharmacological effects in clinical practice, such as treatment of inflammation, arthritis, obesity and lipid metabolism disorders."

Funders for this research include The Natural Science Foundation of China, The Natural Science Foundation of Jiangsu Province, The Science and Technology Project of Nantong City.

Our news journalists obtained a quote from the research from Nantong University, "However, the role and possible mechanism of Z-guggulsterone on brain-associated memory impairments are largely unknown. This issue was addressed in the present study in a memory impairment model induced by scopolamine, a muscarinic acetylcholine receptor antagonist, using the passive avoidance, Y-maze and Morris water maze tests. Results showed that scopolamine significantly decreased the step-through latency and spontaneous alternation of C57BL/6J mice in passive avoidance and Y-maze test, whereas increased the mean escape latency and decreased the swimming time in target quadrant in Morris water maze test. Pretreatment of mice with Z-guggulsterone at doses of 30 and 60 mg/kg effectively reversed the scopolamine-induced memory impairments. Mechanistic studies revealed that Z-guggulsterone pretreatment reversed the scopolamine-induced increase in acetylcholinesterase (AchE) activity, as well as decreases in brain-derived neurotrophic factor (BDNF) protein expression and cAMP response element-binding protein (CREB), extracellular regulated kinase 1/2 (ERK1/2) and protein kinase B (Akt) phosphorylation levels in the hippocampus and cortex. Inhibition of the
BDNF signal, however, blocked the memory-enhancing effect of Z-guggulsterone."

According to the news editors, the research concluded: "Therefore, these findings demonstrate that Z-guggulsterone attenuates the scopolamine-induced memory impairments mainly through activation of the CREB-BDNF signaling pathway, thereby exhibiting memory-improving effects."

For more information on this research see: Z-Guggulsterone Improves the Scopolamine-Induced Memory Impairments Through Enhancement of the BDNF Signal in C57BL/6J Mice. *Neurochemical Research*, 2016;41(12):3322-3332. *Neurochemical Research* can be contacted at: Springer, Plenum Publishers, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Neurochemical Research - www.springerlink.com/content/0364-3190/)

Our news journalists report that additional information may be obtained by contacting C. Huang, Nantong University, Sch Pharm, Dept. of Pharmacol, Nantong 226001, Jiangsu, People's Republic of China. Additional authors for this research include C. Huang and W.B. Ding.

**Tumor Cell Line**

**Studies from Nantong University Yield New Information about Tumor Cell Line (Brusatol inhibits HIF-1 signaling pathway and suppresses glucose uptake under hypoxic conditions in HCT116 cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Tumor Cell Line are presented in a new report. According to news reporting originating from Nantong, People's Republic of China, by NewsRx correspondents, research stated, "Hypoxia-inducible factor-1 (HIF-1) is an important transcription factor that induces adaptive responses upon low oxygen conditions in human cancers and triggers off a poor prognostic outcome of conventional treatments. In this study, we discovered for the first time that brusatol (BRU), a quassinoid extracted from Brucea Esters, has the capability to inhibit HIF-1 signaling pathway."

Our news editors obtained a quote from the research from Nantong University, "We found that BRU concentration-dependently down-regulated HIF-1 alpha protein levels under hypoxia or CoCl2-induced mimic hypoxia in HCT116 cells without causing significant cytotoxicity. Besides, the transactivation activity of HIF-1 was suppressed by BRU under hypoxic conditions, as well as the expression of HIF-1 target genes, including VEGF, GLUT1, HK2 and LDHA. In addition, BRU can also decrease glucose consumption under hypoxia through inhibition of HIF-1 signaling pathway. Further studies revealed that the inhibitory effect of BRU on HIF-1 signaling pathway might be attributed to promoting degradation of HIF-1a."
Interestingly, intracellular reactive oxygen species (ROS) levels and mitochondrial ROS level were both decreased by BRU treatment, indicating the involvement of mitochondrial ROS regulation in the action of BRU."

According to the news editors, the research concluded: "Taken together, these results provided clear evidence for BRU-mediated HIF-1 alpha regulation and suggested its therapeutic potential in colon tumors."

For more information on this research see: Brusatol inhibits HIF-1 signaling pathway and suppresses glucose uptake under hypoxic conditions in HCT116 cells. *Scientific Reports*, 2016;6():1-12. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **Lymphocytes**

**Studies from National Autonomous University Describe New Findings in Lymphocytes (An alternative mode of CD43 signal transduction activates pro-survival pathways of T lymphocytes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lymphocytes have been presented. According to news reporting from Cuernavaca, Mexico, by NewsRx journalists, research stated, "CD43 is one of the most abundant co-stimulatory molecules on a T-cell surface; it transduces activation signals through its cytoplasmic domain, contributing to modulation of the outcome of T-cell responses. The aim of this study was to uncover new signalling pathways regulated by this sialomucin."

Financial supporters for this research include Direccion General de Asuntos del Personal Academico, Universidad Nacional Autonoma de Mexico, Consejo Nacional de Ciencia y Tecnologia.

The news correspondents obtained a quote from the research from National Autonomous University, "Analysis of changes in protein abundance allowed us to identify pyruvate kinase isozyme M2 (PKM2), an enzyme of the glycolytic pathway, as an element potentially participating in the signalling cascade resulting from the engagement of CD43 and the T-cell receptor (TCR). We found that the glycolytic activity of this enzyme was not significantly increased in response to TCR+ CD43 co-stimulation, but that PKM2 was tyrosine phosphorylated, suggesting that it was performing moonlight functions. We report that phosphorylation of both Y-105 of PKM2 and of Y-705 of signal transducer and activator of transcription 3 was induced in response to TCR+ CD43 co-stimulation, resulting in activation of the mitogen-activated protein kinase 5/ extracellular signal-regulated kinase 5 (MEK5/ERK5) pathway. ERK5 and the cAMP response element binding protein (CREB) were activated, and c-Myc and nuclear factor-jB (p65) nuclear localization, as well as Bad phosphorylation, were augmented. Consistent with this, expression of human CD43 in a murine
T-cell hybridoma favoured cell survival."

According to the news reporters, the research concluded: "Altogether, our data highlight novel signalling pathways for the CD43 molecule in T lymphocytes, and underscore a role for CD43 in promoting cell survival through non-glycolytic functions of metabolic enzymes."

For more information on this research see: An alternative mode of CD43 signal transduction activates pro-survival pathways of T lymphocytes. *Immunology, 2017;150(1):87-99*. *Immunology* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. **Hydroxylamines**

**Studies from National Autonomous University Have Provided New Information about Hydroxylamines (Antiproliferative, Cytotoxic, and Apoptotic Activity of Steroidal Oximes in Cervicouterine Cell Lines)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hydroxylamines are discussed in a new report. According to news originating from Mexico City, Mexico, by NewsRx correspondents, research stated, "Steroidal sapogenins have shown antiproliferative effects against several tumor cell lines; and their effects on human cancer cells are currently under study. Changes in the functionality on the steroidal structure make it possible to modify the biological activity of compounds."

Our news journalists obtained a quote from the research from National Autonomous University. "Herein, we report the synthesis and in vitro antitumor activity of two steroidal oxime compounds on cervical cancer cells. These derivatives were synthesized from the steroidal sapogenin diosgenin in good yields. The in vitro assays show that the steroidal oximes show significant antiproliferative activity compared to the one observed for diosgenin. Cell proliferation, cell death, and the cytotoxic effects were determined in both cervical cancer cells and human lymphocytes. The cancer cells showed apoptotic morphology and an increased presence of active caspase-3, providing the notion of a death pathway in the cell."

According to the news editors, the research concluded: "Significantly, the steroidal
oximes did not exert a cytotoxic effect on lymphocytes."

For more information on this research see: Antiproliferative, Cytotoxic, and Apoptotic Activity of Steroidal Oximes in Cervicouterine Cell Lines. *Molecules*, 2016;21 (11):1718-1734. *Molecules* can be contacted at: Mdp1 Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. **Adenocarcinomas**

**Studies from National Cancer Center Have Provided New Information about Adenocarcinomas (Macroscopic features predict outcome in patients with pancreatic ductal adenocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Adenocarcinomas is now available. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "As macroscopic appearance represents tumor microenvironment, it may also reflect the biological and clinicopathological characteristics of a cancer. The aim of the study was to evaluate the clinicopathological significance of the gross appearance of pancreatic ductal adenocarcinoma (PDA)."

Funders for this research include Princess Takamatsu Foundation, Cancer Research and Development Fund.

Our news journalists obtained a quote from the research from National Cancer Center, "We investigated fresh macroscopic features in 352 cases of PDA and their clinicopathological significance. Three unique gross features were found: a honeycomb-like appearance (diffusely distributed microcysts and interstitial fibrotic thickening), macroscopic necrosis, and a tube/branching structure (apparent small cylindrical or linear structure). A honeycomb-like appearance was present in 24 cases (6.8 %) and significantly associated with low serum CA19-9 level and well-differentiated adenocarcinoma. Macroscopic necrosis was present in 235 cases (66.8 %) and significantly correlated with tumor size, nodal metastasis, nerve plexus invasion, no adjuvant chemotherapy, and distant recurrence. The presence of macroscopic necrosis was significantly associated with shorter disease-specific survival (DSS) and disease-free survival (DFS). The presence of larger areas of necrosis (ae2 mm) was closely associated with shorter survival. A tube/branching structure was found in 179 cases (50.9 %), which was correlated with larger tumor size and no adjuvant chemotherapy and macroscopic necrosis. The presence of a tube/branching structure was significantly associated with shorter DSS and DFS. Multivariate survival analyses showed that the presence of tube/branching
structures was an independent negative prognostic factor in patients having PDA."

According to the news editors, the research concluded: "We suggest that the gross appearance of PDA reflects clinicopathological characteristics and may be useful in predicting prognosis."

The news correspondents report that additional information may be obtained from N. Hiraoka, Natl Canc Center, Div Pathol & Clin Labs, Chuo Ku, Tokyo 1040045, Japan. Additional authors for this research include K. Shimada, Y. Ino, S. Oguro, M. Esaki, S. Nara, Y. Kishi, T. Kosuge, Y. Hattori, A. Sukeda, Y. Kitagawa, Y. Kanai and N. Hiraoka.

### Oncology - Prostate Cancer

**Studies from National Cancer Institute Add New Findings in the Area of Prostate Cancer (The evolving role of enzalutamide on the treatment of prostate cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "The field of prostate cancer has witnessed incredible progress in the last decade, owing to the approval of multiple survival-prolonging treatments for metastatic castration-resistant prostate cancer (mCRPC). Enzalutamide is a nonsteroidal androgen receptor inhibitor that targets multiple steps in the androgen receptor signaling axis."

Our news editors obtained a quote from the research from National Cancer Institute, "It has been approved for the treatment of mCRPC both in the postdocetaxel and in the chemotherapy-naive settings. We summarize the milestones in the development of enzalutamide in patients with prostate cancer."

According to the news editors, the research concluded: "Special focus is placed on the results of the STRIVE Phase II clinical trial comparing head to head enzalutamide and bicalutamide in patients with nonmetastatic and mCRPC who have failed androgen deprivation and in other ongoing trials in the same setting and in earlier disease phases."

The news editors report that additional information may be obtained by contacting R. Nadal, Center for Cancer Research, National Cancer Institute, National Institutes of Health, Bethesda, MD, United States.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2217/fon.15.351. This DOI is a link to an online electronic document that is either free or for purchase.

Science - Climatology

Studies from National Center for Atmospheric Research in the Area of Climatology Reported (The Effects of Past Hurricane Experiences on Evacuation Intentions through Risk Perception and Efficacy Beliefs: A Mediation Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Science - Climatology are presented in a new report. According to news originating from Boulder, Colorado, by NewsRx correspondents, research stated, "Individuals' past experiences with a hazard can encompass many different aspects, which can influence how they judge and respond to a future hurricane risk. This study, which utilizes survey data from coastal residents who are at risk from hurricanes, adds to understanding of past hazard experience in two ways."

Our news journalists obtained a quote from the research from National Center for Atmospheric Research, "First, it examines six different aspects of people's past hurricane experiences and the relationships among them. Then, it draws on risk theories of behavioral responses to explore how these different experiences influence people's evacuation intentions for a hypothetical hurricane as mediated through multiple dimensions of risk perception (cognitive, negative affective) and efficacy beliefs (self efficacy, response efficacy). The results suggest that people can experience emotional or otherwise severe impacts from a hurricane even if they do not have experiences with evacuation, property damage, or financial loss. The results also reveal that different past hurricane experiences operated through different combinations of mediating variables to influence evacuation intentions. Some of these processes enhanced intentions; for instance, experience with evacuation, financial loss, or emotional impacts heightened negative affective risk perceptions, which increased evacuation intentions. Other processes dampened evacuation intentions; for instance, people with past hurricane-related emotional impacts had lower self efficacy, which decreased evacuation intentions. In some cases, these enhancing and dampening processes competed."

According to the news editors, the research concluded: "Exploring people's different past weather experiences and the mechanisms by which they can influence future behaviors is important for more deeply understanding populations at risk and how they respond to weather threats."

For more information on this research see: The Effects of Past Hurricane Experiences on Evacuation Intentions through Risk Perception and Efficacy Beliefs: A Mediation Analysis. Weather Climate and Society, 2016;8(4):327-344. Weather Climate and Society can be contacted at: Amer Meteorological Soc, 45 Beacon St, Boston, MA 02108-3693, USA.

The news correspondents report that additional information may be obtained from
Studies from National Center for Scientific Research (CNRS) Have Provided New Data on Gliomas (Integrin a5b1 and p53 convergent pathways in the control of anti-apoptotic proteins PEA-15 and survivin in high-grade glioma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gliomas. According to news originating from Illkirch, France, by NewsRx correspondents, research stated, "Integrin a5b1 expression is correlated with a worse prognosis in high-grade glioma. We previously unraveled a negative crosstalk between integrin a5b1 and p53 pathway, which was proposed to be part of the resistance of glioblastoma to chemotherapies."

Our news journalists obtained a quote from the research from National Center for Scientific Research (CNRS), "The restoration of p53 tumor-suppressor function is under intensive investigations for cancer therapy. However, p53-dependent apoptosis is not always achieved by p53-reactivating compounds such as Nutlin-3a, although full transcriptional activity of p53 could be obtained. Here we investigated whether integrin a5b1 functional inhibition or repression could sensitize glioma cells to Nutlin-3a-induced p53-dependent apoptosis. We discovered that a5b1 integrin-specific blocking antibodies or small RGD-like antagonists in association with Nutlin-3a triggered a caspase (Casp) 8/Casp 3-dependent strong apoptosis in glioma cells expressing a functional p53. We deciphered the molecular mechanisms involved and we showed the crucial role of two anti-apoptotic proteins, phosphoprotein enriched in astrocytes 15 (PEA-15) and survivin in glioma cell apoptotic outcome. PEA-15 is under a5b1 integrin/AKT (protein kinase B) control and survivin is a p53-repressed target. Moreover, interconnections between integrin and p53 pathways were revealed. Indeed PEA-15 repression by specific small-interfering RNA (siRNA)-activated p53 pathway to repress survivin and conversely survivin repression by specific siRNA decreased a5b1 integrin expression. This pro-apoptotic loop could be generalized to several glioma cell lines, whatever their p53 status, inasmuch PEA-15 and survivin protein levels were decreased. Our findings identify a novel mechanism whereby inhibition of a5b1 integrin and activation of p53 modulates two anti-apoptotic proteins crucially involved in the apoptotic answer of glioma cells."

According to the news editors, the research concluded: "Importantly, our results suggest that high-grade glioma expressing high level of a5b1 integrin may benefit from associated therapies including integrin antagonists and repressors of survivin expression."

For more information on this research see: Integrin a5b1 and p53 convergent pathways in the control of anti-apoptotic proteins PEA-15 and survivin in high-grade glioma.

**Gram-Positive Bacteria - Mycobacterium**

**Studies from National Center for Scientific Research (CNRS) Provide New Data on Mycobacterium (Insights into the smooth-to-rough transitioning in Mycobacterium bolletii unravels a functional Tyr residue conserved in all mycobacterial MmpL ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Positive Bacteria - Mycobacterium have been published. According to news originating from Montpellier, France, by NewsRx correspondents, research stated, "In mycobacteria, MmpL proteins represent key components that participate in the biosynthesis of the complex cell envelope. Whole genome analysis of a spontaneous rough morphotype variant of Mycobacterium abscessus subsp. bolletii identified a conserved tyrosine that is crucial for the function of MmpL family proteins."

Financial supporters for this research include French National Research Agency, Association Gregory Lemarchal and Vaincre La Mucoviscidose, InfectioPole Sud, Fondation pour la Recherche Medicale.

Our news journalists obtained a quote from the research from National Center for Scientific Research (CNRS), "Isogenic smooth (S) and rough ® variants differed by a single mutation linked to a Y842H substitution in MmpL4a. This mutation caused a deficiency in glycopeptidolipid production/transport in the R variant and a gain in the capacity to produce cords in vitro. In zebrafish, increased virulence of the M. bolletii R variant over the parental S strain was found, involving massive production of serpentine cords, abscess formation and rapid larval death. Importantly, this finding allowed us to demonstrate an essential role of Tyr842 in several different MmpL proteins, including *Mycobacterium tuberculosis* MmpL3. Structural homology models of MmpL4a and MmpL3 identified two additional critical residues located in the transmembrane regions TM10 and TM4 that are facing each other. We propose that these central residues are part of the proton-motive force that supplies the energy for substrate transport."

According to the news editors, the research concluded: "Hence, we provide
important insights into mechanistic/structural aspects of MmpL proteins as lipid transporters and virulence determinants in mycobacteria."

The news correspondents report that additional information may be obtained from A. Bernut, Centre National de la Recherche Scientifique FRE3689, Centre d'études d'agents Pathogenes et Biotechnologies pour la Sante, Universite de Montpellier, 1919 route de Mende, 34293, Montpellier, France. Additional authors for this research include A. Viljoen, C. Dupont, G. Sapriel, M. Blaise, C. Bouchier, R. Brosch, C. de Chastellier, J.L. Herrmann and L. Kremer.

**Lipid Research**

**Studies from National Cerebral and Cardiovascular Center Have Provided New Information about Lipid Research [Developmental Endothelial Locus-1 (Del-1) Inhibits Oxidized Low-Density Lipoprotein Activity by Direct Binding, and Its Overexpression ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lipid Research. According to news reporting originating in Osaka, Japan, by NewsRx journalists, research stated, "Modified low-density lipoprotein (LDL) binding to scavenger receptors has been implicated in atherosclerosis. It is hypothesized that a third molecule may affect modified LDL binding, therefore, this study focuses on the soluble endogenous protein, developmental endothelial locus-1 (Del-1), as an inhibitor of oxidized LDL (oxLDL) interactions."

The news reporters obtained a quote from the research from National Cerebral and Cardiovascular Center, "Del-1 preferentially bound oxLDL over native LDL in a cell-free binding assay. Del-1 also inhibited Dil-labeled oxLDL uptake by scavenger receptors irrespective of the receptor type (LOX-1, SR-AI, CD36, or SR-BI) expressed in COS-7 cells, and independent of cell type (human coronary artery endothelial cells (HCAECs) or THP-1-derived macrophages). Furthermore, Del-1 suppressed oxLDL-induced MCP-1 and ICAM-1 expression and endothelin-1 secretion in HCAECs. Then, male Del-1 transgenic (Del-1Tg) and wild-type mice (WT) mice were established and fed a Paigen diet for 20 weeks from the age of 24 weeks. While plasma lipid concentrations did not differ between WT and Del-1Tg mice, plasma LOX-1-ligand activity was significantly lower in Del-1Tg than in WT mice. Moreover, lipid accumulation in aortic roots was significantly less in the Del-1Tg mice, evaluated with Oil red-O. Taken together, Del-1 appears to block the activity of oxLDL pharmacologically by
direct binding in vitro, and attenuates atherogenesis in vivo, although its role in physiological settings are yet to be resolved."

According to the news reporters, the research concluded: "Del-1 intercepted oxLDL before its receptor binding to reduce atherogenesis."

Our news correspondents report that additional information may be obtained by contacting T. Sawamura, Natl Cerebral & Cardiovasc Center, Dept. of Vasc Physiol, Suita, Osaka, Japan. Additional authors for this research include Y. Fujita, A. Nakano, S. Horiuchi and T. Sawamura.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1253/circj.CJ-16-0808. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases – Atrial Fibrillation

Studies from National Cerebral and Cardiovascular Center in the Area of Atrial Fibrillation Described (Traditional Cardiovascular Risk Factors for Incident Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting originating from Osaka, Japan, by NewsRx correspondents, research stated, "To prevent atrial fibrillation (AF), it is essential to reduce its risk factors and extend healthy life expectancy as a result. There are few reviews on the AF risk factors."

Our news editors obtained a quote from the research from National Cerebral and Cardiovascular Center, "We discuss them and approach the prevention of AF. We briefly review traditional risk factors for incident AF, especially focusing on high blood pressure, overweight/obesity, dyslipidemia, diabetes, tobacco smoking, and excessive drinking. When trying to prevent AF by modifying lifestyle, it is important to comprehensively utilize the risk factors for AF to predict the 10-year as an AF risk score. However, there are only 2 risk scores of AF just for the US population. There are few studies of the AF risk factors in non-Western populations. A risk score for incident AF in non-Westerners is awaited because different race and lifestyles may have different contributions as AF risk factors."

According to the news editors, the research concluded: "An AF risk score in accordance with race could be useful for identifying persons with a high risk of AF in order to encourage them to consult a doctor and encourage lifestyle modifications before the onset of AF."

For more information on this research see: Traditional Cardiovascular Risk Factors

The news editors report that additional information may be obtained by contacting Y. Kokubo, Natl Cerebral & Cardiovasc Center, Dept. of Prevent Cardiol, Suita, Osaka 5658565, Japan.

Neurodegenerative Diseases and Conditions -...

Studies from National Chung Cheng University in the Area of Alzheimer Disease Described (Rescuing cholinergic neurons from apoptotic degeneration by targeting of serotonin modulator- and apolipoprotein E-conjugated liposomes to the hippocampus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Alzheimer Disease have been published. According to news reporting out of Chiayi, Taiwan, by NewsRx editors, research stated, "Beta-Amyloid (A beta)-targeting liposomes (LIP) with surface serotonin modulator (SM) and apolipoprotein E (ApoE) were utilized to facilitate the delivery of nerve growth factor (NGF) across the blood-brain barrier (BBB) for neuroprotection in the hippocampus. The therapeutic efficacy of SM-and ApoE-grafted LIP carrying NGF (NGF-SM-ApoE-LIP) was assessed by an in vitro Alzheimer's disease (AD) model of degenerated SK-N-MC cells and an in vivo AD model of A beta-insulted Wistar rats."

Our news journalists obtained a quote from the research from National Chung Cheng University, "The experimental evidences revealed that the modified SM and ApoE on the surface of LIP increased the permeation of NGF across the BBB without serious damage to structural integrity of tight junction. When compared with free NGF, NGF-SM-ApoE-LIP upregulated the expression of phosphorylated neurotrophic tyrosine kinase receptor type 1 on cholinergic neurons and significantly improved their survival. In addition, NGF-SM-ApoE-LIP could reduce the secretion of acetylcholinesterase and malondialdehyde and rescue hippocampal neurons from apoptosis in rat brains."

According to the news editors, the research concluded: "The synergistic effect of SM and ApoE is promising in the induction of NGF to inhibit the neurotoxicity of A beta and NGF-SM-ApoE-LIP can be a potent antiapoptotic pharmacotherapy for clinical care of patients with AD."

For more information on this research see: Rescuing cholinergic neurons from apoptotic degeneration by targeting of serotonin modulator- and apolipoprotein E-conjugated liposomes to the hippocampus. Studies from National Defense Medical Center Yield New Information about Osteoporosis (Calcitonin alleviates hyperalgesia in osteoporotic rats by modulating serotonin transporter activity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Osteoporosis have been published. According to news originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Calcitonin may relieve pain by modulating central serotonin activity. Calcitonin partly reversed the hypersensitivity to pain induced by ovariectomy."

Funders for this research include National Defense Medical Center, Tri-Service General Hospital, Ministry of Science and Technology of Taiwan.

Our news journalists obtained a quote from the research from National Defense Medical Center, "This suggests that the anti-nociceptive effects of calcitonin in the treatment of osteoporosis may be mediated by alterations in neural serotonin transporter (SERT) activity. This study used a rat model of osteoporosis to evaluate the role of the cerebral serotonin system in the anti-nociceptive effect of calcitonin, a drug used to treat postmenopausal osteoporosis. Osteoporosis was induced in rats by ovariectomy (OVX). Rats were then randomized to the following four groups: sham operation, OVX, OVX plus calcitonin, or OVX plus alendronate. OVX led to alterations in bone micro-architecture; alendronate strongly reversed this effect, and calcitonin moderately reversed this effect. OVX increased hyperalgesia (determined as the time for hind paw withdrawal from a heat source); calcitonin reduced this effect, but alendronate had no effect. OVX increased the expression of c-Fos (a neuronal marker of pain) in the thalamus; calcitonin strongly reversed this effect, and alendronate moderately reversed this effect. OVX also reduced SERT but increased 5-HT1A receptor expression and activity; calcitonin aggravated this effect, but alendronate had no effect on recovery of SERT/5-HT1A activity and expression. Our study of a rat model of osteoporosis suggests that OVX-induced enhancement of the serotonergic system may protect against hyperalgesia."

According to the news editors, the research concluded: "However, the anti-nociceptive effects of calcitonin in osteoporosis may be mediated by decreased neural SERT activity and increased activation of 5-HT1 receptors in the thalamus."
For more information on this research see: Calcitonin alleviates hyperalgesia in osteoporotic rats by modulating serotonin transporter activity. *Osteoporosis International*, 2016;27(11):3355-3364. *Osteoporosis International* can be contacted at: Springer London Ltd, 236 Grays Inn Rd, 6TH Floor, London WC1X 8HL, England. (Springer - www.springer.com; Osteoporosis International - www.springerlink.com/content/0937-941x/)

The news correspondents report that additional information may be obtained from J.F. Shyu, Natl Def Med Center, Dept. of Biol & Anat, Taipei 114, Taiwan. Additional authors for this research include S.J. Weng, K.W. Chang, J.Y.H. Chan, S.M. Huang, T.H. Chu, N.K. Wei, H.S. Ma, J.T. Cheng, K.H. Ma, T.H. Chen and J.F. Shyu.

Focal Adhesion

**Studies from National Heart Lung and Blood Institute Update Current Data on Focal Adhesion (FMN2 Makes Perinuclear Actin to Protect Nuclei during Confined Migration and Promote Metastasis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Focal Adhesion is now available. According to news reporting originating in Bethesda, Maryland, by NewsRx journalists, research stated, "Cell migration in confined 3D tissue microenvironments is critical for both normal physiological functions and dissemination of tumor cells. We discovered a cytoskeletal structure that prevents damage to the nucleus during migration in confined microenvironments."

Funders for this research include National Cancer Institute, NIH, NIH Director’s Early Independence Award, ANR “Netoshape”.

The news reporters obtained a quote from the research from National Heart Lung and Blood Institute, "The formin-family actin filament nucleator FMN2 associates with and generates a perinuclear actin/focal adhesion (FA) system that is distinct from previously characterized actin/FA structures. This system controls nuclear shape and positioning in cells migrating on 2D surfaces. In confined 3D microenvironments, FMN2 promotes cell survival by limiting nuclear envelope damage and DNA double-strand breaks. We found that FMN2 is upregulated in human melanomas and showed that disruption of FMN2 in mouse melanoma cells inhibits their extravasation and metastasis to the lung."

According to the news reporters, the research concluded: "Our results indicate a critical role for FMN2 in generating a perinuclear actin/FA system that protects the nucleus and
DNA from damage to promote cell survival during confined migration and thus promote cancer metastasis."

Our news correspondents report that additional information may be obtained by contacting C.M. Waterman, National Heart Lung & Blood Institute, Cell Biol & Physiol Center, National Institutes of Health, Bethesda, MD 20892, United States. Additional authors for this research include R.S. Fischer, P. Gurel, H.R. Thiam, A. Tubbs, M.A. Baird, M.W. Davidson, M. Piel, G.M. Alushin, A. Nussenzweig, P.S. Steeg and C.M. Waterman.

Human Papillomavirus

Studies from National Institute for Infectious Disease Have Provided New Data on Human Papillomavirus (Cutaneous human papillomavirus genotypes in different kinds of skin lesions in Argentina)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Human Papillomavirus. According to news reporting out of Buenos Aires, Argentina, by NewsRx editors, research stated, "Cutaneous human papillomaviruses (HPVs) comprise a large and highly heterogeneous virus group. Some of the cutaneous HPVs of the genus Beta have been suggested as a co-factor in the development of non-melanoma skin cancer (NMSC)."

Our news journalists obtained a quote from the research from National Institute for Infectious Disease, "The aim of this study was to determine cutaneous HPV prevalence and type-specific distribution in different kinds of skin lesions from Argentine patients visiting Dermatology Departments of three hospitals from Buenos Aires. A cross-sectional analysis was performed. HPV DNA was analyzed in (i) 3 patients with Epidermodysplasia verruciformis (EV) harboring benign lesions (BL) (n=1) and squamous cell carcinoma (SCC) (n=4); (ii) 240 non-EV patients harboring: (a) BL (n=38), (b) Actinic Keratosis (AK) (n=83), © SCC (n=74), and (d) basal cell carcinoma (BCC) (n=96). Detection and genotyping of 35 cutaneous HPV DNA was carried out by BGC-PCR and GP5+/6+PCR followed by reverse line blot assay. In EV patients, Beta types were found in all lesions (5/5), including the potentially high-risk HPV types 5 and 8, mostly in multiple infections. In non-EV patients, cutaneous types were found in 50.0% of BL, 43.4% of AK, 31.1% of SCC, and 16.7% of BCC. Beta HPVs were the most frequently found in all lesions, being present in all AK and SCC cases that were positive for HPV. No type-specific correlation with lesion severity was found. In our series, a wide spectrum of cutaneous HPV types was detected in different skin lesions."
According to the news editors, the research concluded: "A possible role for these HPVs in skin carcinogenesis deserves further study. J. Med. Virol. 89:352-357, 2017."

Our news journalists report that additional information may be obtained by contacting R.M. Correa, Natl Inst Infect Dis ANLIS Dr Carlos G Malbran, Dept. of Virol, Buenos Aires, DF, Argentina. Additional authors for this research include S. Vladimirsky, D.A.M. Heideman, M. Coringrato, A. Abeldano, L. Olivares, R. Del Aguila, L.V. Alonio, P.J.F. Snijders and M.A. Picconi.

Mosquito-Borne Diseases - Malaria

Studies from National Institute of Allergy and Infectious Diseases (NIAID) Yield New Information about Malaria (Clinical Chemistry of Patients With Ebola in Monrovia, Liberia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mosquito-Borne Diseases - Malaria is now available. According to news reporting originating in Hamilton, Montana, by NewsRx journalists, research stated, "The development of point-of-care clinical chemistry analyzers has enabled the implementation of these ancillary tests in field laboratories in resource-limited outbreak areas. The Eternal Love Winning Africa (ELWA) outbreak diagnostic laboratory, established in Monrovia, Liberia, to provide Ebola virus and Plasmodium spp. diagnostics during the Ebola epidemic, implemented clinical chemistry analyzers in December 2014."

Financial supporters for this research include National Institute of Allergy and Infectious Diseases [NIAID], National Institutes of Health, NIH, NIAID, Intramural Research Program of the NIAID.

The news reporters obtained a quote from the research from the National Institute of Allergy and Infectious Diseases (NIAID), "Clinical chemistry testing was performed for 68 patients in triage, including 12 patients infected with Ebola virus and 18 infected with Plasmodium spp. The main distinguishing feature in clinical chemistry of Ebola virus-infected patients was the elevation in alanine aminotransferase, aspartate aminotransferase, alkaline phosphatase, and gamma-glutamyltransferase levels and the decrease in calcium."

According to the news reporters, the research concluded: "The implementation of clinical chemistry is probably most helpful when the medical supportive care implemented at the Ebola treatment unit allows for correction of biochemistry derangements and on-site clinical chemistry analyzers can be used to monitor electrolyte balance."

For more information on this research see: Clinical Chemistry of Patients With Ebola in Monrovia, Liberia. Journal of Infectious Diseases, 2016;214():S303-S307. Journal of
Studies from National Institute of Environmental Health Sciences Reveal New Findings on DNA Research (Human mitochondrial DNA replication machinery and disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Genetics - DNA Research. According to news reporting originating from Research Triangle Park, North Carolina, by NewsRx correspondents, research stated, "The human mitochondrial genome is replicated by DNA polymerase gamma in concert with key components of the mitochondrial DNA (mtDNA) replication machinery."

Our news editors obtained a quote from the research from the National Institute of Environmental Health Sciences, "Defects in mtDNA replication or nucleotide metabolism cause deletions, point mutations, or depletion of mtDNA. The resulting loss of cellular respiration ultimately induces mitochondrial genetic diseases, including mtDNA depletion syndromes (MDS) such as Alpers or early infantile hepatocerebral syndromes, and mtDNA deletion disorders such as progressive external ophthalmoplegia, ataxia-neuropathy, or mitochondrial neurogastrointestinal encephalomyopathy."

According to the news editors, the research concluded: "Here we review the current literature regarding human mtDNA replication and heritable disorders caused by genetic changes of the POLG, POLG2, Twinkle, RNASEH1, DNA2, and MGME1 genes."

For more information on this research see: Human mitochondrial DNA replication machinery and disease. Current Opinion in Genetics & Development, 2016;38():52-62.

Current Opinion in Genetics & Development can be contacted at: Current Biology Ltd, 84 Theobalds Rd, London WC1X 8RR, England. (Elsevier - www.elsevier.com; Current Opinion in Genetics & Development - www.journals.elsevier.com/current-opinion-in-genetics-and-
Studies from National Institute on Alcohol Abuse and Alcoholism Provide New Data on Obsessive-Compulsive Disorders (Chronic EtOH effects on putative measures of compulsive behavior in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Obsessive-Compulsive Disorders.
According to news reporting originating in Bethesda, Maryland, by NewsRx journalists, research stated, "Addictions, including alcohol use disorders, are characterized by the loss of control over drug seeking and consumption, but the neural circuits and signaling mechanisms responsible for the transition from controlled use to uncontrolled abuse remain incompletely understood. Prior studies have shown that 'compulsive-like' behaviors in rodents, for example, persistent responding for ethanol (EtOH) despite punishment, are increased after chronic exposure to EtOH."

Funders for this research include NIAAA IRP (AR, NJ, AH), Bowles Center for Alcohol Studies (TK), National Institutes of Health.

The news reporters obtained a quote from the research from National Institute on Alcohol Abuse and Alcoholism, "The main goal of the current study was to assess the effects of chronic intermittent EtOH (CIE) exposure on multiple, putative measures of compulsive-like EtOH seeking in C57BL/6 J mice. Mice were exposed to two or four weekly cycles of CIE and then, post-withdrawal, tested for progressive ratio responding for EtOH, sustained responding during signaled EtOH unavailability and (footshock) punished suppression of responding for EtOH. Results showed that mice exposed to CIE exhibited attenuated suppression of EtOH seeking during punishment, as compared with air-exposed controls. By contrast, CIE exposure affected neither punished food reward-seeking behavior, nor other putative measures of compulsive-like EtOH seeking. Ex vivo reverse transcription polymerase chain reaction analysis of brain tissue found reduced sensitivity to punished EtOH seeking after CIE exposure was accompanied by a significant increase in gene expression of the GluN1 and GluN2A subunits of the N-methyl-d-aspartate receptor, specifically in the medial orbitofrontal cortex. Moreover, slice electrophysiological analysis revealed increased N-methyl-d-aspartate receptor-mediated currents in the orbitofrontal cortex after CIE exposure in test-na?ve mice."

According to the news reporters, the research concluded: "Collectively, the current findings add to the growing body of evidence demonstrating that chronic exposure to EtOH..."
fosters resistance to punished EtOH seeking in association with adaptations in cortical glutamatergic transmission."

Our news correspondents report that additional information may be obtained by contacting A.K. Radke, Laboratory of Behavioral and Genomic Neuroscience, National Institute on Alcohol Abuse and Alcoholism, Bethesda, MD, United States. Additional authors for this research include N.J. Jury, A. Kocharian, C.A. Marcinkiewcz, E.G. Lowery-Gionta, K.E. Pleil, Z.A. McElligott, J.M. McIlveen, T.L. Kash and A. Holmes.

**Oncology - Colon Cancer**

**Studies from National Institutes of Health Add New Findings in the Area of Colon Cancer (Small Molecule Inhibition of the Ubiquitin-specific Protease USP2 Accelerates cyclin D1 Degradation and Leads to Cell Cycle Arrest in Colorectal Cancer and ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "Deubiquitinases are important components of the protein degradation regulatory network. We report the discovery of ML364, a small molecule inhibitor of the deubiquitinase USP2 and its use to interrogate the biology of USP2 and its putative substrate cyclin DL ML364 has an IC50 of 1.1 µM in a biochemical assay using an internally quenched fluorescent di-ubiquitin substrate."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from the National Institutes of Health, "Direct binding of ML364 to USP2 was demonstrated using microscale thermophoresis. ML364 induced an increase in cellular cyclin D1 degradation and caused cell cycle arrest as shown in Western blottings and flow cytometry assays utilizing both Mino and HCT116 cancer cell lines. ML364, and not the inactive analog 2, was antiproliferative in cancer cell lines. Consistent with the role of cyclin D1 in DNA damage response, ML364 also caused a decrease in homologous recombination mediated DNA repair."

According to the news editors, the research concluded: "These effects by a small molecule inhibitor support a key role for USP2 as a regulator of cell cycle, DNA repair, and tumor cell growth."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.738567. This DOI is a link to an online electronic document that is either free or for purchase.

Our news editors obtained a quote from the research from the National Institutes of Health Chemical Genomics Center, "However, small-molecule agonists of human RXFP1 can overcome this limitation and may provide a useful therapeutic approach, especially for chronic diseases such as heart failure and fibrosis. The first small-molecule agonists of RXFP1 were recently identified from a high-throughput screening, using a homogeneous cell-based cAMP assay. Optimization of the hit compounds resulted in a series of highly potent and RXFP1 selective agonists with low cytotoxicity, and excellent in vitro ADME and pharmacokinetic

---

**Hormones - Corpus Luteum Hormones**

**Studies from National Institutes of Health Chemical Genomics Center Have Provided New Data on Corpus Luteum Hormones (Structural Insights into the Activation of Human Relaxin Family Peptide Receptor 1 by Small-Molecule Agonists)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hormones - Corpus Luteum Hormones have been published. According to news reporting originating from Rockville, Maryland, by NewsRx correspondents, research stated, "The GPCR relaxin family peptide receptor 1 (RXFP1) mediates the action of relaxin peptide hormone, including its tissue remodeling and antifibrotic effects. The peptide has a short half-life in plasma, limiting its therapeutic utility."

Funders for this research include National Cancer Institute, Florida Department of Health, National Institute of General Medical Sciences.

Our news editors obtained a quote from the research from the National Institutes of Health Chemical Genomics Center, '"However, small-molecule agonists of human RXFP1 can overcome this limitation and may provide a useful therapeutic approach, especially for chronic diseases such as heart failure and fibrosis. The first small-molecule agonists of RXFP1 were recently identified from a high-throughput screening, using a homogeneous cell-based cAMP assay. Optimization of the hit compounds resulted in a series of highly potent and RXFP1 selective agonists with low cytotoxicity, and excellent in vitro ADME and pharmacokinetic
properties. Here, we undertook extensive site-directed mutagenesis studies in combination with computational modeling analysis to probe the molecular basis of the small-molecule binding to RXFP1. The results showed that the agonists bind to an allosteric site of RXFP1 in a manner that closely interacts with the seventh transmembrane domain (TM7) and the third extracellular loop (ECL3). Several residues were determined to play an important role in the agonist binding and receptor activation, including a hydrophobic region at TM7 consisting of W664, F668, and L670. The G659/T660 motif within ECL3 is crucial to the observed species selectivity of the agonists for RXFP1.

According to the news editors, the research concluded: "The receptor binding and activation effects by the small molecule ML290 were compared with the cognate ligand, relaxin, providing valuable insights on the structural basis and molecular mechanism of receptor activation and selectivity for RXFP1."

The news editors report that additional information may be obtained by contacting X. Hu, National Institutes of Health Chemical Genomics Center, National Center for Advancing Translational Sciences, National Institutes of Health, 9800 Medical Center Drive, Rockville, Maryland 20850, United States. Additional authors for this research include C. Myhr, Z. Huang, J. Xiao, E. Barnaeva, B.A. Ho, I.U. Agoulnik, M. Ferrer, J.J. Marugan, N. Southall and A.I Agoulnik.

**Nutritional and Metabolic Diseases and Conditions -...**

**Studies from National Institutes of Health in the Area of Hypophosphatemia Described (Cutaneous skeletal hypophosphatemia syndrome: clinical spectrum, natural history, and treatment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Hypophosphatemia are presented in a new report. According to news reporting out of Bethesda, Maryland, by NewsRx editors, research stated, "Cutaneous skeletal hypophosphatemia syndrome (CSHS), caused by somatic RAS mutations, features excess fibroblast growth factor-23 (FGF23) and skeletal dysplasia. Records from 56 individuals were reviewed and demonstrated fractures, scoliosis, and non-congenital hypophosphatemia that in some cases
were resolved."

Funders for this research include Doris Duke Charitable Foundation, National Institutes of Health, National Institute of Dental and Craniofacial Research, National Institute of Dental and Craniofacial Research (US).

Our news journalists obtained a quote from the research from the National Institutes of Health, "Phosphate and calcitriol, but not skin lesion removal, were effective at controlling hypophosphatemia. No skeletal malignancies were found. CSHS is a disorder defined by the association of epidermal and/or melanocytic nevi, a mosaic skeletal dysplasia, and an FGF23-mediated hypophosphatemia. To date, somatic RAS mutations have been identified in all patients whose affected tissue has undergone DNA sequencing. However, the clinical spectrum and treatment are poorly defined in CSHS. The purpose of this study is to determine the spectrum of the phenotype, natural history of the disease, and response to treatment of hypophosphatemia. Five CSHS subjects underwent prospective data collection at clinical research centers. A review of the literature identified 45 reports that included a total of 51 additional patients, in whom the findings were compatible with CSHS. Data on nevi subtypes, bone histology, mineral and skeletal disorders, abnormalities in other tissues, and response to treatment of hypophosphatemia were analyzed. Fractures, limb deformities, and scoliosis affected most CSHS subjects. Hypophosphatemia was not present at birth. Histology revealed severe osteomalacia but no other abnormalities. Skeletal dysplasia was reported in all anatomical compartments, though less frequently in the spine; there was no clear correlation between the location of nevi and the skeletal lesions. Phosphate and calcitriol supplementation was the most effective therapy for rickets. Convincing data that nevi removal improved blood phosphate levels was lacking. An age-dependent improvement in mineral abnormalities was observed. A spectrum of extra-osseous/extra-cutaneous manifestations that included both benign and malignant neoplasms was present in many subjects, though osteosarcoma remains unreported."

According to the news editors, the research concluded: "An understanding of the spectrum, natural history, and efficacy of treatment of hypophosphatemia in CSHS may improve the care of these patients."

Our news journalists report that additional information may be obtained by contacting M.T. Collins, Natl Inst Dental & Craniofacial Res, Skeletal Clin Studies Unit, Craniofacial & Skeletal Dis Branch, National Institutes of Health, Bethesda, MD 20892, United States. Additional authors for this research include Y.H. Lim, A.M. Boyce, R.I. Gafni, E. McCarthy, T.A. Nguyen, L.F. Eichenfield, C.M.C. DeKlotz, L.C. Guthrie, L.L. Tosi, P.S. Thornton, K.A. Choate and M.T. Autoimmune Diseases and Conditions

Studies from National Jewish Health Provide New Data on Autoimmune Diseases and Conditions (Targeting B cells in treatment of autoimmunity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions. According to news reporting originating in Denver, Colorado, by NewsRx journalists, research stated, "B cells have emerged as effective targets for therapeutic intervention in autoimmunities in which the ultimate effectors are antibodies, as well as those in which T cells are primary drivers of inflammation."

The news reporters obtained a quote from the research from National Jewish Health, "Proof of this principle has come primarily from studies of the efficacy of Rituximab, an anti-CD20 mAb that depletes B cells, in various autoimmune settings. These successes have inspired efforts to develop more effective anti-CD20s tailored for specific needs, as well as biologicals and small molecules that suppress B cell function without the risks inherent in B cell depletion."

According to the news reporters, the research concluded: "Here we review the current status of B cell-targeted therapies for autoimmunity."

For more information on this research see: Targeting B cells in treatment of autoimmunity. Current Opinion in Immunology, 2016;43():39-45. Current Opinion in Immunology can be contacted at: Current Biology Ltd, 84 Theobalds Rd, London WC1X 8RR, England. Algorithms

Studies from National Kaohsiung University of Applied Sciences Add New Findings in the Area of Algorithms (Analysis of high-order SNP barcodes in mitochondrial D-loop for chronic dialysis susceptibility)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers publish new report on Algorithms. According to news reporting originating in Kaohsiung, Taiwan, by NewsRx journalists, research stated, "We have developed a new algorithm that analyzes high-order SNP barcodes in mitochondrial D-loop to identify chronic dialysis susceptibility. This approach provides a powerful tool for understanding the genetic basis of chronic dialysis.

The news reporters obtained a quote from the research lead, "Our algorithm is capable of accurately detecting SNPs that are associated with chronic dialysis. This is a significant advancement in the field of genetic susceptibility studies."

According to the news reporters, the research concluded: "Here we present the implementation of this algorithm and its applications in chronic dialysis susceptibility studies."

For more information on this research see: Analysis of high-order SNP barcodes in mitochondrial D-loop for chronic dialysis susceptibility. Current Opinion in Immunology, 2016;43():39-45. Current Opinion in Immunology can be contacted at: Current Biology Ltd, 84 Theobalds Rd, London WC1X 8RR, England. & Wellness Week -- Researchers detail new data in Algorithms. According to news reporting originating in Kaohsiung, Taiwan, by NewsRx journalists, research stated, "Positively identifying disease-associated single nucleotide polymorphism (SNP) markers in genome-wide studies entails the complex association analysis of a huge number of SNPs. Such large numbers of SNP barcode (SNP/genotype combinations) continue to pose serious computational challenges, especially for high-dimensional data."

Financial supporters for this research include National Science Council in Taiwan, NSYSU-KMU Joint Research Project.

The news reporters obtained a quote from the research from the National Kaohsiung University of Applied Sciences, "We propose a novel exploiting SNP barcode method based on differential evolution, termed IDE (improved differential evolution). IDE uses a 'top combination strategy' to improve the ability of differential evolution to explore high-order SNP barcodes in high-dimensional data. We simulate disease data and use real chronic dialysis data to test four global optimization algorithms. In 48 simulated disease models, we show that IDE outperforms existing global optimization algorithms in terms of exploring ability and power to detect the specific SNP/genotype combinations with a maximum difference between cases and controls. In real data, we show that IDE can be used to evaluate the relative effects of each individual SNP on disease susceptibility."

According to the news reporters, the research concluded: "IDE generated significant SNP barcode with less computational complexity than the other algorithms, making IDE ideally suited for analysis of high-order SNP barcodes."

Our news correspondents report that additional information may be obtained by contacting C.H. Yang, Nati Kaohsiung Univ Appl Sci, Dept. of Elect Engn, Kaohsiung, Taiwan. Additional authors for this research include Y.D. Lin, L.Y. Chuang and H.W. Chang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jbi.2016.08.009. This DOI is a link to an online electronic document that is either free or for purchase.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - Mixed Function Oxygenases. According to news originating from Pingtung, Taiwan, by NewsRx correspondents, research stated, "Dopamine beta-hydroxylase (DBH) plays a critical role in catecholamine (CA) synthesis of neuroendocrine regulatory network, and is suggested to be involved in the immunoendocrine responses of invertebrate against bacterial challenge. DBH has been identified in white shrimp, Litopenaeus vannamei, and further investigation on its potential function was conducted after hypothermal stress, pharmaceutical inhibition and gene silencing in the present study. Cloned DBH L. vannamei (LvDBH), belonging to the Copper type II, ascorbate-dependent monoxygenases, was characterized by a DOMON domain, a Cu2+-monoxygen domain and three glycosylation sites, and its expression was abundant in thoracic ganglia and haemocytes determined by quantitative real-time PCR."

Financial support for this research came from National Science Council.

Our news journalists obtained a quote from the research from the National Pingtung University of Science and Technology, "The effects of hypothermal stress showed that LvDBH expression in thoracic ganglia, haemocytes and hepatopancreas as well as the DBH contents in haemocytes and dopamine (DA) and norepinephrine (NE) levels in haemolymph are obviously up-regulated. L. vannamei receiving disulfiram for 30-120 min revealed the inhibition of DBH and NE contents in haemocytes and haemolymph respectively, but high level of DA in haemolymph was noticed. Besides, a significant decrease of LvDBH expression in thoracic ganglia, haemocytes and hepatopancreas were also observed. Subsequently, LvDBH expression was successfully silenced in thoracic ganglia, haemocytes and hepatopancreas of shrimp that received LvDBH-dsRNA for 3 days, and meanwhile, a decrease of DBH contents in haemocytes accompanied by decreased levels of NE and DA in haemolymph were also observed. These results indicate that LvDBH possesses the functional domains responsible for CAs synthesis, and therefore, inhibiting DBH contents in haemocytes by disulfiram and by LvDBH-dsRNA resulted in the impaired synthesis of NE from DA in haemolymph."

According to the news editors, the research concluded: "These also suggest that the increased release of DA and NE in haemolymph for potential modulation of physiological or immunological responses is the consequence of the upregulated LvDBH expression and DBH contents in L. vannamei exposed to hypothermal stress."

The news correspondents report that additional information may be obtained from C.C. Chang, Natl Pingtung Univ Sci & Technol, Dept. of Aquaculture, Pingtung 91201, Taiwan. Additional authors for this research include Y.W. Ka and C.C. Chang.

Liver Diseases and Conditions - Hepatitis C Virus

Studies from National Taiwan University Hospital Yield New Information about Hepatitis C Virus (Peginterferon alfa-2a plus Weight-Based or Flat-Dose Ribavirin for Treatment-Na?ve Hepatitis C Virus Genotype 2 Rapid Responders: A Randomized Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Hepatitis C Virus are presented in a new report. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "The impact of ribavirin (RBV) dosage on sustained virologic response (SVR) rates remains elusive in hepatitis C virus genotype 2 (HCV-2) rapid responders receiving 16 weeks of peginterferon (Peg-IFN) plus RBV. Treatment-na?ve HCV-2 patients with rapid virologic response (RVR) received Peg-IFN alfa-2a 180 mg/week plus weight-based RBV (1,000 or 1,200 mg/day; cut-off body weight: 75 kg) for 6 weeks, and then randomly received Peg-IFN alfa-2a 180 mg/week plus weight-based (1,000 or 1,200 mg/day; n=247) or flat-dose (800 mg/day; n=246) RBV for additional 10 weeks."

The news reporters obtained a quote from the research from National Taiwan University Hospital, "The primary endpoint was SVR24. Patients receiving weight-based and flat-dose RBV therapies had comparable SVR24 rates (93.5% versus 91.9%, p=0.49). The risk differences (RDs) of SVR24 receiving weight-based and flat-dose RBV arms were 7.1% [95% CI: 0.7% to 13.6%] in males, and -5.8% [95% CI: -12.1% to 0.5%] in females (interaction p=0.01). The SVR24 rate was higher in males receiving (>)=13 mg/kg/day than those receiving <13 mg/kg/day (96.3% versus 85.1%, p=0.001)."

According to the news reporters, the research concluded: "Peg-IFN alfa-2a plus weight-based or flat-dose RBV for 16 weeks provides comparable SVR24 rates in treatment-na?ve HCV-2 rapid responders. However, males should receive weight-based RBV to achieve a high SVR24 rate."

For more information on this research see: Peginterferon alfa-2a plus Weight-Based or Flat-Dose Ribavirin for Treatment-Na?ve Hepatitis C Virus Genotype 2 Rapid Responders: A Randomized Trial. Scientific Reports, 2015;5():15255. (Nature Publishing Group - www.nature.com/srep/) Our news correspondents report that additional information may be obtained by contacting C.H. Liu, Dept. of Internal Medicine, National Taiwan University Hospital, Taipei, Taiwan. Additional authors for this research include C.F. Huang, C.J. Liu, C.Y. Dai, J.F. Huang, J.W. Lin, C.C. Liang, S.S. Yang, C.L. Lin, T.H. Su, H.C. Yang, P.J. Chen, D.S. Chen, W.L. Chuang, J.H. Kao and M.L Yu.

Studies from National Taiwan University Reveal New Findings on Clinical Trials and Studies (Acute kidney injury as a risk factor for diagnostic discrepancy among geriatric patients: a pilot study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Clinical Research - Clinical Trials and Studies are presented in a new report. According to news originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Diagnostic discrepancy, defined as different admission and discharge diagnoses, could be a potential source of diagnostic error. We evaluated whether acute kidney injury (AKI) in the elderly affected their risk for diagnostic discrepancy."

Our news journalists obtained a quote from the research from National Taiwan University, "Patients aged >= 60 years from the general medical wards were prospectively enrolled and divided according to AKI status upon admission, using the Kidney Disease Improving Global Outcomes (KDIGO) criteria. We compared their discharge and admission diagnoses and identified patients with a diagnostic discrepancy, using multiple logistic regression analysis to evaluate the relationship between initial AKI and the presence of a diagnostic discrepancy. A total of 188 participants (mean age, 77.9 years) were recruited. Regression analysis showed that initial AKI on admission was associated with a higher risk of diagnostic discrepancy upon discharge (odds ratio [OR] 3.3; p< 0.01). In contrast, higher AKI severity was also associated with an increased risk of diagnostic discrepancy (for KDIGO grade 1, 2, and 3; OR 2.92, 3.91, and 4.32; p = 0.04, 0.03, and 0.02, respectively), suggesting that initial AKI upon admission could be an important risk factor for diagnostic discrepancy."

According to the news editors, the research concluded: "Consequently, reducing geriatric AKI might have the potential to reduce diagnostic discrepancy among these patients."

The news correspondents report that additional information may be obtained from J.W. Huang, National Taiwan University, Dept. of Internal Med, Div Nephrol, Taipei, Taiwan. Additional authors for this research include H.B. Tsai, C.K. Chiang, J.W. Huang and K.Y. Hung.

Keywords for this news article include: Taipei, Taiwan, Asia, Risk and Prevention, Diagnostics and Screening, Clinical Trials and Studies, Acute Kidney Injury, Clinical Research, National Taiwan University.

Oncology - Cancer Research

Studies from National Tsing Hua University Reveal New Findings on Cancer Research (Epigenetic Switch between SOX2 and SOX9 Regulates Cancer Cell Plasticity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Cancer Research have been presented. According to news originating from Hsinchu, Taiwan, by NewsRx correspondents, research stated, "Cell differentiation within stem cell lineages can check proliferative potential, but nodal pathways that can limit tumor growth are obscure. Here, we report that lung cancer cell populations generate phenotypic and oncogenic plasticity via a switch between differentiation programs controlled by SOX2 and SOX9, thus altering proliferative and invasive capabilities."

Our news journalists obtained a quote from the research from National Tsing Hua University, "In lung cancer cells, SOX2 bound the EPCAM promoter to induce EpCAM-p21 (Cip1)-cyclin A2 signaling, encouraging cell proliferation as well as barrier properties. In contrast, SOX9 bound the SLUG promoter to induce SLUG-mediated cell invasion with a spindle-like phenotype. Pharmacologic inhibition of HDAC elevated a SOX9-positive cell population from SOX2-positive cells, whereas ectopic expression of SOX2 inhibited SOX9 with increased H3K9me2 levels on the SOX9promoter. In clinical specimens, the expression of SOX2 and SOX9 correlated negatively and positively with lung tumor grade, respectively."

According to the news editors, the research concluded: "Our findings identify SOX2 and SOX9 as nodal epigenetic regulators in determining cancer cell plasticity and metastatic progression."

For more information on this research see: Epigenetic Switch between SOX2 and SOX9 Regulates Cancer Cell Plasticity. Cancer Research, 2016;76(23):7036-7048. Ischemia

Studies from National University of Singapore Provide New Data on Ischemia (Ischaemic conditioning and reperfusion injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Ischemia have been presented. According to news originating from Singapore, Singapore, by NewsRx correspondents, research stated, "The 30-year anniversary of the discovery of 'ischaemic preconditioning' is in 2016. This endogenous phenomenon can paradoxically protect the heart from acute myocardial infarction by subjecting it to one or more brief cycles of ischaemia and reperfusion."

Our news journalists obtained a quote from the research from the National University of Singapore, "Apart from complete reperfusion, this method is the most powerful intervention known for reducing infarct size. The concept of ischaemic preconditioning has evolved into 'ischaemic conditioning', a term that encompasses a number of related endogenous cardioprotective strategies, applied either directly to the heart (ischaemic preconditioning or postconditioning) or from afar, for example a limb (remote ischaemic preconditioning, perconditioning, or postconditioning). Investigations of signalling pathways underlying ischaemic conditioning have identified a number of therapeutic targets for pharmacological manipulation. Over the past 3 decades, a number of ischaemic and pharmacological cardioprotection strategies, discovered in experimental studies, have been examined in the clinical setting of acute myocardial infarction and CABG surgery. The results from many of the studies have been disappointing, and no effective cardioprotective therapy is currently used in clinical practice. Several large, multicentre, randomized, controlled clinical trials on cardioprotection have highlighted the challenges of translating ischaemic conditioning and pharmacological cardioprotection strategies into patient benefit."

According to the news editors, the research concluded: "However, a number of cardioprotective therapies have shown promising results in reducing infarct size and improving clinical outcomes in patients with ischaemic heart disease."

The news correspondents report that additional information may be obtained from D.J. Hausenloy, Cardiovascular and Metabolic Disorders Program, Duke-National University of Singapore, Singapore 169857, Singapore.

Oncology - Breast Cancer

Studies from National University of Singapore in the Area of Breast Cancer Described (Selective Accelerated Proliferation of Malignant Breast Cancer Cells on Planar Graphene Oxide Films)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Graphene nanomaterials have been actively investigated for biomedical and biological applications, including that of cancer. Despite progress made, most of such studies are conducted on dispersed graphene nanosheets in solution."

Financial supporters for this research include Ministry of Education - Singapore, National Research Foundation-Prime Minister's office, Republic of Singapore, MechanoBioEngineering Laboratory, National University of Singapore. Our news editors obtained a quote from the research from the National University of Singapore, "Consequently, the use of planar graphene films, especially in cancer research, has not been fully explored. Here, we investigate the cellular interactions between the graphene material films and breast cancer cell lines, specifically the effects these films have on cellular proliferation, spreading area, and cytotoxicity. We demonstrate that the graphene oxide (GO) film selectively accelerates the proliferation of both metastatic (MDA-MB-231) and nonmetastatic (MCF-7) breast cancer cells, but not that of noncancer breast epithelial cells (MCF-10A). Contrastingly, this accelerated proliferation is not observed with the use of graphene (G) film. Moreover, GO induces negligible cytotoxicity on these cells. We suggest that the observed phenomena originate from the synergistic effect resulted from the high loading capacity and conformational change of cellular attachment proteins on the GO film, and the high amount of oxygenated groups present in the material."

According to the news editors, the research concluded: "We anticipate that our findings can further shed light on the graphene-cancer cellular interactions and provide better understanding for the future design and application of graphene-based nanomaterials in cancer research."

The news editors report that additional information may be obtained by contacting K.e.n.r.y., .N,USA. Graduate School for Integrative Sciences and Engineering, National University of Singapore, Singapore 117456, Singapore. Additional authors for this research include P.K. Chaudhuri, K.P. Loh and C.T Lim.

Adenocarcinomas

**Studies from Netherlands Cancer Institute Describe New Findings in Adenocarcinomas (Biobanking of fresh-frozen endoscopic biopsy specimens from esophageal adenocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Adenocarcinomas have been published. According to news reporting out of Amsterdam, Netherlands, by NewsRx editors, research stated, "The process of preparing endoscopic esophageal adenocarcinoma samples for next-generation DNA/RNA sequencing is poorly described. Therefore, we assessed the feasibility and pitfalls of preparing esophageal adenocarcinoma endoscopic biopsies toward DNA/RNA samples suitable for next-generation sequencing."

Our news journalists obtained a quote from the research from Netherlands Cancer Institute, "In this prospective study, four tumor biopsy samples were collected from consecutive esophageal cancer patients during esophagogastroduodenoscopy and fresh-frozen in liquid nitrogen. DNA and RNA were isolated from samples with a tumor percentage of at least 50%. For next-generation sequencing, double-stranded DNA (dsDNA) is required and high-quality RNA preferred. The quantity dsDNA and RNA quantity and quality were assessed with the Nanodrop 2000 spectrophotometer (Thermo Fisher Scientific, Waltham, MA, USA) and Agilent 2100 Bioanalyzer (Agilent, Santa Clara, CA, USA). Biopsy samples of 69 consecutive patients with esophageal adenocarcinoma were included. In five patients (7%), the tumor percentage was less than 50% in all four biopsies. Using a protocol allowing simultaneous DNA and RNA isolation, the median dsDNA yield was 2.4g (range 0.1-12.0g) and the median RNA yield was 0.5g (range 0.01-2.05g). The median RNA integrity number of samples that were fresh-frozen within 30 minutes after sampling was 6.7 (range 4.2-8.9) compared with 2.5 (1.8-4.5) for samples that were fresh-frozen after 2 hours. The results from this study show that obtaining dsDNA and RNA for next-generation sequencing from endoscopic esophageal adenocarcinoma samples is feasible."

According to the news editors, the research concluded: "Tumor percentage and dsDNA/RNA yield and quality emphasize the need for sampling multiple biopsies and minimizing the delay before fresh-freezing."

Our news journalists report that additional information may be obtained by contacting J.W. van Sandick, Netherlands Canc Inst, Dept. of Surg, NL-1066 CX Amsterdam, Netherlands. Additional authors for this research include A. Cats, H. Boot, A.M.J. Langers, O.B. Ponz, M.L.F. van Velthuysen, L.M. Braaf, M. Nieuwland and J.W. van Sandick.

Studies from Netherlands Cancer Institute Have Provided New Data on Lung Cancer (Pre- and postoperative care for stage I-III NSCLC: Which quality of care indicators are evidence-based?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting originating in Amsterdam, Netherlands, by NewsRx journalists, research stated, "Identification of evidenced-based Quality of Care (QoC) indicators for lung cancer care is essential to quality improvement. The aim of this review was to identify evidence-based quality indicators for the pre and postoperative care of stage I-III Non Small Cell Lung Cancer (NSCLC) provided by the lung physician."

The news reporters obtained a quote from the research from Netherlands Cancer Institute, "To obtain these indicators, a search in PubMed, Embase and the Cochrane library database was performed. English literature published between 1980 and 2012 was included and search terms regarding 'lung neoplasms', 'quality of care', 'pathology', 'diagnostic methods', 'preoperative and postoperative treatment' were used. The potential indicators were categorized as structure, process or outcome measures and the indicators supported by literature with high evidence level were selected. Five QoC indicators were identified. The use of the positron emission tomography-computed tomography (PET-CT) results in more accurate mediastinal staging compared to the CT scan. Endoscopic Ultrasound-Fine Needle Aspiration and Endobronchial Ultrasound-Fine Needle Aspiration are sensitive diagnostic tools for mediastinal staging and reduce futile thoracotomies. Pathological conformation of lung cancer can best be obtained by a combination of cytological and histological diagnostics used during bronchoscopy. For patients with clinical stage III NSCLC, preoperative multimodality treatment (i.e. preoperative chemoradiation) results in superior survival and increased mediastinal downstaging compared to single modality treatment (i.e. preoperative chemotherapy or radiotherapy). After surgery, the addition of chemotherapy results in a significant survival benefit for patients with pathological stage II and III NSCLC."

According to the news reporters, the research concluded: "These five QoC indicators can be used for benchmarking and ultimately quality improvement of lung cancer care."

For more information on this research see: Pre- and postoperative care for stage I-III NSCLC: Which quality of care indicators are evidence-based? Lung Cancer, 2016;101():120-128. Lung Cancer can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Clinical Research - Clinical Trials and Studies

Studies from Netherlands Cancer Institute Yield New Information about Clinical Trials and Studies (Quantification of patient-reported outcome measures of radiation-induced skin reactions for use in clinical trial design)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news reporting from Amsterdam, Netherlands, by NewsRx journalists, research stated, "Skin toxicity is a common effect from radiotherapy, although difficult to predict on an individual basis, and there is little evidence-based management. This study aimed to quantify inter-patient variation in patient-reported outcome measures for radiation-induced skin reactions (RISR) to enable the determination of the number of patients required for adequate power in a comparative trial of RISR management strategies."

The news correspondents obtained a quote from the research from Netherlands Cancer Institute, "The study included 154 patients scheduled to receive breast cancer radiotherapy. Patients filled in a weekly questionnaire during and up to 4 weeks following the end of radiotherapy scoring five aspects of their experience of RISR: skin redness, and bother from redness like itching, burning sensation and tenderness/pain. Assessment of patients' reported experience of their RISR was shown to be feasible, with 91% of patients returning at least two questionnaires. The mean score increase between weeks 1 and 4 was 25 points (p value < 0.0001, 95% CI 21-29), and the estimated standard deviation at 4 weeks was 18 (95% CI 16-21). Patients' assessment of their reaction was not predicted on the basis of treatment and patient-related characteristics. Based on the observed variance in scores at 4 weeks, we could calculate the sample size required for a comparative study of two RISR management policies would be 200 patients to have statistical power to detect a clinically significant difference in patient-rated scores of their skin reactions."

According to the news reporters, the research concluded: "A trial employing this tool would help provide an evidence base to guide policy in advising patients how to manage their RISR."

For more information on this research see: Quantification of patient-reported outcome measures of radiation-induced skin reactions for use in clinical trial design. Supportive Care in Cancer, 2017;25(1):67-74. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Tropanes

Studies from Netherlands Organization for Applied Scientific Research Have Provided New Information about Tropanes (Increasing nerve agent treatment efficacy by P-glycoprotein inhibition)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Tropanes are discussed in a new report. According to news reporting out of Rijswijk, Netherlands, by NewsRx editors, research stated, "One of the shortcomings of current treatment of nerve agent poisoning is that not all drugs effectively penetrate the blood-brain barrier (BBB), whereas most nerve agents easily do. P-glycoprotein (Pgp) efflux transporters at the BBB may contribute to this aspect."

Financial support for this research came from Dutch Ministry of Defence.

Our news journalists obtained a quote from the research from Netherlands Organization for Applied Scientific Research, "It was previously shown that Pgp inhibition by tariquidar enhanced the efficacy of nerve agent treatment when administered as a pretreatment. In the present study soman-induced seizures were also substantially prevented when the animals were intravenously treated with tariquidar post-poisoning, in addition to HI-6 and atropine. In these animals, approximately twice as much AChE activity was present in their brain as compared to control rats. The finding that tariquidar did not affect distribution of soman to the brain indicates that the potentiating effects were a result of interactions of Pgp inhibition with drug distribution. In line with this, atropine appeared to be a substrate for Pgp in in vitro studies in a MDR1/MDCK cell model. This indicates that tariquidar might induce brain region specific effects on atropine distribution, which could contribute to the therapeutic efficacy increase found. Furthermore, the therapeutic enhancement by tariquidar was compared to that of the less specific and less potent Pgp inhibitor cyclosporine A. This compound appeared to induce a protective effect similar to tariquidar."

According to the news editors, the research concluded: "Treatment with a Pgp inhibitor resulted in enhanced therapeutic efficacy of HI-6 and atropine in a soman-induced seizure model in the rat. The mechanism underlying these effects should be further investigated. To that end, the potentiating effect of nerve agent treatment should be addressed against a broader range of nerve agents, for oximes and atropine separately, and for those at lower doses. In particular when efficacy against more nerve agents is shown, a Pgp inhibitor such as tariquidar might be a valid addition to nerve agent antidotes."

For more information on this research see: Increasing nerve agent treatment efficacy by P-glycoprotein inhibition. Chemico-Biological Interactions, 2016;259():115-121. Chemico-Biological Interactions can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Chemico-Biological Interactions - www.journals.elsevier.com/chemico-biological-interactions/)

Studies from New York University Yield New Data on Malnutrition (Datafying microbes: Malnutrition at the intersection of genomics and global health)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Malnutrition. According to news reporting originating in New York City, New York, by NewsRx editors, the research stated, "In recent years, genome-sequencing technology has provided new ways of seeing the hundreds of trillions of bacteria in human bodies. Through 'datafication', new forms of value are emerging from microbial genomic information - implicating microbes as powerful agents of nutritional status."

The news reporters obtained a quote from the research from New York University, "Scientists use metagenomic data to evaluate how food, environment and genes affect human gut microbiota, and how those microbes simultaneously affect human health. My research is based on 14 months of ethnographic fieldwork in a leading US microbiome laboratory and at its field collaborator in investigating infant malnutrition in Dhaka, Bangladesh. This article looks at the social and material conditions of the Bangladeshi women and children enrolled in the microbiome study, and how microbes are datafied in order to draw a causal relationship between microbial populations and undernutrition in human hosts."

According to the news reporters, the research concluded: "How is malnutrition lived for urban Bangladeshis, and how is malnutrition studied through metagenomics? What categories of undernutrition and bodily health emerge as big data becomes a tool for nutrition science? I followed practices in homes and communities in Dhaka, while also studying malnutrition in the lab, and how both are choreographed with data-producing microbiome technologies in the quest for translational health-care strategies to treat childhood maladies in developing countries."

Our news correspondents report that additional information may be obtained by contacting A. Benezra, New York University, Dept. of Anthropol, New York, NY 10003, United States.

Liver Diseases and Conditions - Hepatic...

Studies from Newcastle University in the Area of Hepatic Encephalopathy Reported (The impact on hospital resource utilisation of treatment of hepatic encephalopathy with rifaximin-alpha)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Hepatic Encephalopathy. According to news reporting out of Newcastle upon Tyne, United Kingdom, by NewsRx editors, research stated, "Rifaximin-alpha reduces the risk of recurrence of overt hepatic encephalopathy. However, there remain concerns regarding the financial cost of the drug."

Our news journalists obtained a quote from the research from Newcastle University, "We aimed to study the impact of treatment with rifaximin-alpha on healthcare resource utilisation using data from seven UK liver treatment centres. All seven centres agreed a standardised data set and data characterising clinical, demographic and emergency hospital admissions were collected retrospectively for the time periods 3, 6 and 12 months before and following initiation of rifaximin-alpha. Admission rates and hospital length of stay before and during therapy were compared. Costs of admissions and drug acquisition were estimated using published sources. Multivariate analyses were carried out to assess the relative impact of various factors on hospital length of stay. Data were available from 326 patients. Following the commencement of rifaximin, the total hospital length of stay reduced by an estimated 31-53%, equating to a reduction in inpatient costs of between 4858 pound and 6607 pound per year. Taking into account drug costs of 3379 pound for 1-year treatment with rifaximin-alpha, there was an estimated annual mean saving of 1480- pound 3228 pound per patient. Initiation of treatment with rifaximin-alpha was associated with a marked reduction in the number of hospital admissions and hospital length of stay."

According to the news editors, the research concluded: "These data suggest that treatment of patients with rifaximin-alpha for hepatic encephalopathy was generally cost saving."

Our news journalists report that additional information may be obtained by contacting M. Hudson, Newcastle Univ, Inst Cellular Med, Newcastle Upon Tyne, Tyne & Wear, United Kingdom. Additional authors for this research include C.J. Currie, E. Berni, A. Goel, K.J. Moriarty, A. Sinha, F. Gordon, A. Dethier, J.F. Dillon, K. Clark, P. Richardson, P. Middleton, V. Patel, D. Shawcross, H. Preedy, R.J. Aspinall and M. Hudson.

Lipopolysaccharides

Studies from Nihon University Yield New Information about Lipopolysaccharides (Differential Regulation of Lympho-Myelopoiesis by Stromal Cells in the Early and Late Phases in BALB/c Mice Repeatedly Exposed to Lipopolysaccharide)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lipopolysaccharides are discussed in a new report. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "Chronic lipopolysaccharide (LPS) exposure to mice reduces the lymphoid compartment and skews the hematopoietic cell compartment toward myeloid-cells, which is considered to be a direct effect of LPS on hematopoietic stem cells. However, the effect of chronic LPS exposure on stromal-cells, which compose the hematopoietic microenvironment, has not been elucidated."

The news reporters obtained a quote from the research from Nihon University, "Here, we investigated early- and late-phase effect of repeated LPS exposure on stromal-cells. During the early phase, when mice were treated with 5 or 25 mu g LPS three times at weekly intervals, the numbers of myeloid-progenitor (colony forming unit-granulocyte macrophage (CFU-GM)) cells and B lymphoid-progenitor (CFU-preB) cells in the bone-marrow (BM) rapidly decreased after each treatment. The number of CFU-GM cells recovered from the initial decrease and then increased to levels higher than pretreatment levels, whereas the number of CFU-preB cells remained lower than pretreatment levels. In the BM, expression of genes for positive-regulators of myelopoiesis including granulocyte colony-stimulating factor (G-CSF), granulocyte macrophage colony-stimulating factor (GMCSF), and interleukin (IL)-6 and negative-regulators of B lymphopoiesis including tumor necrosis factor (TNF)-alpha was up-regulated, whereas expression of positive-regulators of B lymphopoiesis including stromal cell-derived factor (SDF)-1, IL-7, and stem cell factor (SCF) was down-regulated. During the late phase, the number of CFU-preB cells remained lower than pretreatment levels 70 d after the first treatments with 5 and 25 mu g LPS, whereas the number of CFU-GM cells returned to pretreatment levels. IL-7 gene expression in the BM remained down-regulated, whereas gene-expression levels of SDF-1 and SCF were restored."

According to the news reporters, the research concluded: "Thus, chronic LPS exposure may impair stromal-cell function, resulting in prolonged suppression of B lymphopoiesis, which may appear to be senescence similar to the hematological phenotype."

For more information on this research see: Differential Regulation of Lympho-Myelopoiesis by Stromal Cells in the Early and Late Phases in BALB/c Mice Repeatedly Exposed to Lipopolysaccharide. Biological & Pharmaceutical Bulletin, 2016;39(12):1939-
Studies from Norfolk and Norwich University Hospital Provide New Data on Sclerosing Cholangitis (A review of the medical treatment of primary sclerosing cholangitis in the 21st century)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Digestive System Diseases and Conditions - Sclerosing Cholangitis. According to news originating from Norwich, United Kingdom, by NewsRx correspondents, research stated, "Primary sclerosing cholangitis (PSC) is a chronic cholestatic liver disease that progresses to end-stage liver disease and cirrhosis. Recurrent biliary inflammation is thought to lead to dysplasia, and as such PSC confers a high risk of cholangiocarcinoma."

Our news journalists obtained a quote from the research from Norfolk and Norwich University Hospital, "PSC accounts for 10% of all UK liver transplants, although transplantation does not guarantee a cure with 20% recurrence in the graft. At present there are no effective medical treatment options for PSC, and trials of novel therapeutic agents are limited by the time taken to reach clinically significant endpoints with no well defined early surrogate markers for disease outcome. Moreover, PSC appears to be a heterogeneous disease with regards to disease distribution, associated inflammatory bowel disease and subsequent disease outcome, further compounding the issue. Thus existing trials have taken place in heterogeneous groups, are likely to be underpowered to detect any individual subgroups effect. The current mainstay of medical treatment is still with ursodeoxycholic acid, although there is no evidence that it alters long-term outcome. Small pilot studies of immunosuppressive agents have taken place, but despite evidence that may support studies in larger groups, these have not been conducted. Recent advances in our understanding of the disease pathogenesis may therefore pave the way for trials of novel therapeutic agents in PSC, even given the limitations described."

According to the news editors, the research concluded: "This review explores the controversial evidence underlying current treatment strategies and discounted treatments, and explores prospective agents that may bring new hope to the treatment of PSC in the 21st

Nephrology

Studies from North Shore University Hospital in the Area of Nephrology Reported (Renal effects of BRAF inhibitors: a systematic review by the Cancer and the Kidney International Network)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nephrology have been published. According to news reporting from Great Neck, New York, by NewsRx journalists, research stated, "Advanced melanoma has been traditionally unresponsive to standard chemotherapy agents and used to have a dismal prognosis. Genetically targeted small-molecule inhibitors of the oncogenic BRAF V600 mutation or a downstream signaling partner (MEK mitogen-activated protein kinase) are effective treatment options for the 40-50% of melanomas that harbor mutations in BRAF."

The news correspondents obtained a quote from the research from North Shore University Hospital, "Selective BRAF and MEK inhibitors induce frequent and dramatic objective responses and markedly improve survival compared with cytotoxic chemotherapy. In the past decade after discovery of this mutation, drugs such as vemurafenib and dabrafenib have been approved by the US Food and Drug Administration (FDA) and the European Medicines Agency for the treatment of V600-mutated melanomas. While the initial trials did not signal any renal toxicities with the BRAF inhibitors, recent case reports, case series and FDA adverse reporting systems have uncovered significant nephrotoxicities with these agents. In this article, we systematically review the nephrotoxicities of these agents. Based on recently published data, it appears that there are lower rates of kidney disease and cutaneous lesions seen with dabrafenib compared with vemurafenib. The pathology reported in the few kidney biopsies done so far are suggestive of tubulo interstitial damage with an acute and chronic component. Electrolyte disorders such as hypokalemia, hyponatremia and hypophosphatemia have been reported as well."

According to the news reporters, the research concluded: "Routine monitoring of serum creatinine and electrolytes and calculation of glomerular filtration rate prior to the first administration when treating with dabrafenib and vemurafenib are essential."

Our news journalists report that additional information may be obtained by contacting R. Wanchoo, Division of Kidney Diseases and Hypertension, North Shore University Hospital and Long Island Jewish Medical Center, Hofstra NSLIJ School of Medicine, Great Neck, NY, United States. Additional authors for this research include K.D. Jhaveri, G. Deray and V. Launay-Vacher.

**Drugs and Therapies - Pharmaceutical Research**

**Studies from Northwest University Describe New Findings in Pharmaceutical Research (A novel systems pharmacology platform to dissect action mechanisms of traditional Chinese medicines for bovine viral diarrhea disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Pharmaceutical Research are presented in a new report. According to news reporting originating in Shaanxi, People's Republic of China, by NewsRx journalists, research stated, "Due to the large direct and indirect productivity losses in the livestock industry caused by bovine viral diarrhea (BVD) and the lack of effective pharmacological therapies, developing an efficient treatment is extremely urgent. Traditional Chinese medicines (TCMs) that simultaneously address multiple targets have been proven to be effective therapies for BVD."

Funders for this research include Northwest A & F University, National Natural Science Foundation of China, Northwest University, National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Northwest University, "However, the potential molecular action mechanisms of TCMs have not yet been systematically explored. In this work, take the example of a herbal remedy Huangqin Zhizi (HQZZ) for BVD treatment in China, a systems pharmacology approach combining with the pharmacokinetics and pharmacodynamics evaluation was developed to screen out the active ingredients, predict the targets and analyze the networks and pathways. Results show that 212 active compounds were identified. Utilizing these lead compounds as probes, we predicted 122 BVD related-targets. And in vitro experiments were conducted to evaluate the reliability of some vital active compounds and targets. Network and pathway analysis displayed that HQZZ was effective in the treatment of BVD by inhibiting inflammation, enhancing immune responses in hosts toward virus infection."

According to the news reporters, the research concluded: "In summary, the analysis

**Oncology - Carcinomas**

**Studies from Northwestern University Feinberg School of Medicine in the Area of Carcinomas Reported (Adenoid cystic carcinoma: current therapy and potential therapeutic advances based on genomic profiling)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Carcinomas are discussed in a new report. According to news reporting originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Adenoid cystic carcinoma (ACC) is a rare cancer with high potential for recurrence and metastasis. Efficacy of current treatment options, particularly for advanced disease, is very limited."

Our news editors obtained a quote from the research from the Northwestern University Feinberg School of Medicine, "Recent whole genome and exome sequencing has dramatically improved our understanding of ACC pathogenesis. A balanced translocation resulting in the MYB-NFIB fusion gene appears to be a fundamental signature of ACC. In addition, sequencing has identified a number of other driver genes mutated in downstream pathways common to other well-studied cancers. Overexpression of oncogenic proteins involved in cell growth, adhesion, cell cycle regulation, and angiogenesis are also present in ACC. Collectively, studies have identified genes and proteins for targeted, mechanism-based, therapies based on tumor phenotypes, as opposed to nonspecific cytotoxic agents. In addition, although few studies in ACC currently exist, immunotherapy may also hold promise."

According to the news editors, the research concluded: "Better genetic understanding will enable treatment with novel targeted agents and initial exploration of immune-based therapies with the goal of improving outcomes for patients with ACC."

For more information on this research see: Adenoid cystic carcinoma: current...
therapy and potential therapeutic advances based on genomic profiling. Oncotarget, 2015;6 (35):37117-34.

The news editors report that additional information may be obtained by contacting Y.K. Chae, Northwestern Medicine Developmental Therapeutics Institute, Northwestern University Feinberg School of Medicine, Chicago, IL, United States. Additional authors for this research include S.Y. Chung, A.A. Davis, B.A. Carneiro, S. Chandra, J. Kaplan, A. Kalyan and F.J Giles.

Heart Disorders and Diseases - Heart Disease

Studies from Odense University Hospital Describe New Findings in Heart Disease (Outcome with invasive versus medical treatment of stable coronary artery disease: influence of perfusion defect size, ischaemia, and ejection fraction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Disease have been published. According to news reporting originating in Odense, Denmark, by NewsRx journalists, research stated, "Our aim was to address the combined influence of myocardial perfusion defects and left ventricular ejection fraction (LVEF) on outcome with coronary revascularisation in stable CAD patients. Of 527 patients with ischaemia by myocardial perfusion scintigraphy, 343 had medical therapy (Med) and 184 revascularisation (Revasc)."

The news reporters obtained a quote from the research from Odense University Hospital, "During 5.3 years of follow-up, there was no intergroup difference in rates of death/myocardial infarction. Propensity score adjustment demonstrated a benefit of Revasc over Med with large defects (>14% of the myocardium), marked ischaemia (>10% of the myocardium), or LVEF <50%. However, defect size, ischaemia, and LVEF were correlated. In multivariate models, the Med versus Revasc hazard ratio (HR) was 4.06 times larger for LVEF <50% than for LVEF (>=)50% (p=0.04) and 3.01 times larger for marked compared to mild/moderate ischaemia (p=0.11), whereas the effect of large compared to small/moderate defects vanished when adjusted for LVEF and ischaemia (HR=1.01, p=0.99). Considering the outcome difference as a function of both LVEF and ischaemia, we found no advantage or even a disadvantage of revascularisation in patients with mild/moderate ischaemia and preserved LVEF. A benefit of revascularisation was found only in case of marked ischaemia or LVEF <50%.

According to the news reporters, the research concluded: "For treatment triage, both perfusion parameters and LVEF should be considered."

For more information on this research see: Outcome with invasive versus medical treatment of stable coronary artery disease: influence of perfusion defect size, ischaemia, and

Our news correspondents report that additional information may be obtained by contacting J.A. Simonsen, Dept. of Nuclear Medicine, Odense University Hospital, Odense, Denmark. Abdominal Aortic Aneurysm

Studies from Ohio State University Provide New Data on Abdominal Aortic Aneurysm (Quantification of abdominal aortic aneurysm stiffness using magnetic resonance elastography and its comparison to aneurysm diameter)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Abdominal Aortic Aneurysm are presented in a new report. According to news originating from Columbus, Ohio, by NewsRx correspondents, research stated, "Abdominal aortic aneurysm (AAA) wall stiffness has been suggested to be an important factor in the overall rupture risk assessment compared with anatomic measure. We hypothesize that AAA diameter will have no correlation to AAA wall stiffness."

Our news journalists obtained a quote from the research from Ohio State University, "The aim of this study is to (1) determine magnetic resonance elastography (MRE)-derived aortic wall stiffness in AAA patients and its correlation to AAA diameter; (2) determine the correlation between AAA stiffness and amount of thrombus and calcium; and (3) compare the AAA stiffness measurements against age-matched healthy individuals. In vivo abdominal aortic MRE was performed on 36 individuals (24 patients with AAA measuring 3-10 cm and 12 healthy volunteers), aged 36 to 78 years, after obtaining written informed consent under the approval of the Institutional Review Board. MRE images were processed to obtain spatial stiffness maps of the aorta. AAA diameter, amount of thrombus, and calcium score were reported by experienced interventional radiologists. Spearman correlation, Wilcoxon signed rank test, and Mann-Whitney test were performed to determine the correlation between AAA stiffness and diameter and to determine the significant difference in stiffness measurements between AAA patients and healthy individuals. No significant correlation (P > .1) was found between AAA stiffness and diameter or amount of thrombus or calcium score. AAA stiffness (mean 13.97 +/- 4.2 kPa) is significantly (P <= .02) higher than remote normal aorta in AAA (mean 8.87 +/- 2.2 kPa) patients and in normal individuals (mean 7.1 +/- 1.9 kPa)."

According to the news editors, the research concluded: "Our results suggest that AAA wall stiffness may provide additional information independent of AAA diameter, which may contribute to our understanding of AAA pathophysiology, biomechanics, and risk for

The news correspondents report that additional information may be obtained from A. Kolipaka, Ohio State University, Wexner Med Center, Dept. of Biomed Engn, Columbus, OH 43210, United States. **Bone Research**

**Studies from Oregon Health and Science University Have Provided New Information about Bone Research (Novel Genetic Variants Associated With Increased Vertebral Volumetric BMD, Reduced Vertebral Fracture Risk, and Increased Expression of SLC1A3 ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Bone Research have been presented. According to news reporting from Portland, Oregon, by NewsRx journalists, research stated, "Genome-wide association studies (GWASs) have revealed numerous loci for areal bone mineral density (aBMD). We completed the first GWAS meta-analysis (n=15,275) of lumbar spine volumetric BMD (vBMD) measured by quantitative computed tomography (QCT), allowing for examination of the trabecular bone compartment."

The news correspondents obtained a quote from the research from Oregon Health and Science University, "SNPs that were significantly associated with vBMD were also examined in two GWAS meta-analyses to determine associations with morphometric vertebral fracture (n=21,701) and clinical vertebral fracture (n=5893). Expression quantitative trait locus (eQTL) analyses of iliac crest biopsies were performed in 84 postmenopausal women, and murine osteoblast expression of genes implicated by eQTL or by proximity to vBMD-associated SNPs was examined. We identified significant vBMD associations with five loci, including: 1p36.12, containing WNT4 and ZBTB40; 8q24, containing TNFRSF11B; and 13q14, containing AKAP11 and TNFSF11. Two loci (5p13 and 1p36.12) also contained associations with radiographic and clinical vertebral fracture, respectively. In 5p13, rs2468531 (minor allele frequency [MAF]=3%) was associated with higher vBMD (=0.22, p=1.9x10(-8)) and decreased risk of radiographic vertebral fracture (odds ratio [OR]=0.75; false discovery rate [FDR] p=..."
0.01). In 1p36.12, rs12742784 (MAF=21%) was associated with higher vBMD (=0.09, p=1.2x10(-10)) and decreased risk of clinical vertebral fracture (OR=0.82; FDR p=7.4x10(-4)). Both SNPs are noncoding and were associated with increased mRNA expression levels in human bone biopsies: rs2468531 with SLC1A3 (=0.28, FDR p=0.01, involved in glutamate signaling and osteogenic response to mechanical loading) and rs12742784 with EPHB2 (=0.12, FDR p=1.7x10(-3), functions in bone-related ephrin signaling). Both genes are expressed in murine osteoblasts. This is the first study to link SLC1A3 and EPHB2 to clinically relevant vertebral osteoporosis phenotypes.

According to the news reporters, the research concluded: "These results may help elucidate vertebral bone biology and novel approaches to reducing vertebral fracture incidence."

Our news journalists report that additional information may be obtained by contacting C.M. Nielson, Oregon Health Sciences University, Sch Public Hlth, Portland, OR 97239, United States. Additional authors for this research include C.T. Liu, A.V. Smith, C.L. Ackert-Bicknell, S. Reppe, J. Jakobsdottir, C. Wassel, T.C. Register, L. Oei, N. Alonso, E.H. Oei, N. Parimi, E.J. Samelson, M.A. Nalls, J. Zmuda, T. Lang, M. Bouxsein, J. Latourelle and Claussnitze.

**Drugs and Therapies - Pharmacy Practice**

**Studies from Oregon Health and Science University Update Current Data on Pharmacy Practice (Pharmacy density in rural and urban communities in the state of Oregon and the association with hospital readmission rates)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies-Pharmacy Practice. According to news originating from Portland, Oregon, by NewsRx correspondents, research stated, "To characterize the pharmacy density in rural and urban communities with hospitals and to examine its association with readmission rates. Ecologic study. Forty-eight rural and urban primary care service areas (PCSAs) in the state of Oregon."

Our news journalists obtained a quote from the research from Oregon Health and Science University, "All hospitals in the state of Oregon. Pharmacy data were obtained from the Oregon Board of Pharmacy based on active licensure. Pharmacy density was calculated by determining the cumulative number of outpatient pharmacy hours in a PCSA. Oregon hospital 30-day all-cause readmission rates were obtained from the Centers for Medicare and Medicaid Services and were determined with the use of claims data of patients 65 years of age or older who were readmitted to the hospital within 30 days from July 2012 to June 2013. Readmission
rates for Oregon hospitals ranged from 13.5% to 16.5%. The cumulative number of pharmacy hours in PCSAs containing a hospital ranged from 54 to 3821 hours. As pharmacy density increased, the readmission rates decreased, asymptotically approaching a predicted 14.7% readmission rate for areas with high pharmacy density. Urban hospitals were in communities likely to have more pharmacy access compared with rural hospitals."

According to the news editors, the research concluded: "Future research should determine if increasing pharmacy access affects readmission rates, especially in rural communities."

For more information on this research see: Pharmacy density in rural and urban communities in the state of Oregon and the association with hospital readmission rates. Journal of the American Pharmacists Association, 2016;56(5):533-537. Journal of the American Pharmacists Association can be contacted at: Amer Pharmaceutical Assoc, 2215 Constitution Ave NW, Washington, DC 20037, USA.

The news correspondents report that additional information may be obtained from S. Bissonnette, Oregon Health Sciences University, Oregon State University, Coll Pharm, Portland, OR 97201, United States. Additional authors for this research include L.M. Goeres and D.S.H. Lee.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.japh.2016.05.008. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Thyroid Cancer

Studies from Osaka City University Provide New Data on Thyroid Cancer (Growth arrest by activated BRAF and MEK inhibition in human anaplastic thyroid cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Thyroid Cancer is now available. According to news reporting from Osaka, Japan, by NewsRx journalists, research stated, "Anaplastic thyroid cancer (ATC) is a rare malignancy that progresses extremely aggressively and often results in dismal prognosis. We investigated the efficacy of inhibiting the activated RAS/RAF/MEK pathway in ATC cells aiming to clarify the mechanism of effect and resistance."

The news correspondents obtained a quote from the research from Osaka City University. "Four human ATC cell lines (ACT-1, OCU-2, OCU-4 and OCU-6) were used. OCU-4 had a BRAF mutation. OCU-2 had both BRAF and PI3KCA mutations. ACT-1 and OCU-6 had wild type BRAF and NRAS mutations. The effects of dabrafenib, a selective inhibitor of the BRAFV600E kinase, and trametinib, a reversible inhibitor of MEK activity, were investigated. Dabrafenib strongly inhibited the viability in BRAF mutated cells by demonstrating G0/G1-arrest via the downregulation of MEK/ERK phosphorylation. Upregulated phosphorylation of MEK was observed in RAS mutated cells after dabrafenib treatment and caused VEGF upregulation, but was not related to the cellular proliferation."
Trametinib inhibited the cellular viability to variable degrees in every cell by downregulating ERK phosphorylation. Dual blockade by both inhibitors demonstrated clear cytostatic effect in all the cells. OCUT-4 showed the weakest sensitivity to trametinib, no additional effect of either inhibitor in combination with the other, and an increase of SNAI1 mRNA expression after treatment with inhibitors, suggesting a mechanism for resistance."

According to the news reporters, the research concluded: "Our findings demonstrated the efficacy of a mutation-selective BRAF inhibitor and a MEK inhibitor in human ATC cells in a genetic alteration specific manner."

Our news journalists report that additional information may be obtained by contacting N. Onoda, Osaka City University, Dept. of Surg Oncol, Grad Sch Med, Abeno Ku, Osaka 5458585, Japan. Additional authors for this research include N. Onoda, S. Noda, S. Kashiwagi, Y. Asano, K. Hirakawa and M. Ohira.

**Pediatrics - Pediatric Dermatology**

**Studies from Osaka General Medical Center Yield New Data on Pediatric Dermatology (A Case of Blau Syndrome with NOD2 E383K Mutation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pediatrics - Pediatric Dermatology have been presented. According to news reporting from Osaka, Japan, by NewsRx journalists, research stated, "UWe report a 3.5-year-old Japanese boy who developed lichenoid papules and erythema with noncaseating epithelioid cell granulomas with a scant lymphocytic infiltrate histologically on his limbs at the age of 8 months."

The news correspondents obtained a quote from the research from Osaka General Medical Center, "Genetic analysis of the patient and his parents, who had no medical past history, revealed heterozygous 1147G >A ( E383K) mutation of NOD2 in the patient and in his father, so the patient was diagnosed with Blau syndrome and his father as an asymptomatic carrier. Although Blau syndrome has been reported as a genetic disease with high penetrance, asymptomatic carrier cases of a family with the same E383K mutation have also been reported."

According to the news reporters, the research concluded: "These results suggest that some contributing factors are required for the development of inflammatory and granulomatous responses in heterozygous carriers of a NOD2 E383K mutation."

Our news journalists report that additional information may be obtained by
Studies from Oscar Lambret Center Yield New Information about Laparotomy (Single-port or Classic Laparoscopy Compared With Laparotomy to Assess the Peritoneal Cancer Index in Primary Advanced Epithelial Ovarian Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Surgery - Laparotomy are presented in a new report. According to news reporting from Lille, France, by NewsRx journalists, research stated, "A thorough laparoscopic assessment of the abdominopelvic cavity is a crucial step in the workup of primary advanced epithelial ovarian cancer to decide whether up-front cytoreductive surgery or neoadjuvant chemotherapy is the best option for adequate management. The purpose of our study was to compare single-port laparoscopy (SPL), classic laparoscopy (CL), and laparotomy using the peritoneal cancer index (PCI)."

The news correspondents obtained a quote from the research from Oscar Lambret Center, "Patients treated for Federation Internationale de Gynecologic et d'Obstetrique stage 3 or 4 epithelial ovarian cancer were included in our study when they underwent a PCI evaluation by laparoscopy followed by laparotomy for cytoreduction. According to the technique used for the 'noninvasive' procedure (SPL vs CL), 2 groups were compared retrospectively. The individual records of all patients were reviewed and analyzed. From 2011 to 2014, 21 patients were assessed for PCI by SPL plus laparotomy versus 21 by CL plus laparotomy. The clinicopathological features were similar in both groups (not significant [NS]), except for performance status >0, which was more frequent in the SPL group (39% vs 6%, p = .04). Quotation of PCI was possible for all patients. Nonbrowsing areas marked 3 procedures in the SPL group and 2 procedures in the CL group (NS). The mean PCI score and the score of each region assessed by SPL and CL were comparable with the evaluation by laparotomy (NS). Completeness of cytoreduction was achieved in 78% of cases in both groups (NS)."

According to the news reporters, the research concluded: "SPL and widely minimally invasive procedures seem to be effective tools compared with laparotomy to adequately assess the resectability of a peritoneal carcinomatosis using the PCI."

Studies from Oslo University Hospital Add New Findings in the Area of Melanoma (Fibroblast-induced switching to the mesenchymal-like phenotype and PI3K/mTOR signaling protects melanoma cells from BRAF inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Melanoma are discussed in a new report. According to news reporting originating in Oslo, Norway, by NewsRx journalists, research stated, "The knowledge on how tumor-associated stroma influences efficacy of anti-cancer therapy just started to emerge. Here we show that lung fibroblasts reduce melanoma sensitivity to the BRAF inhibitor (BRAFi) vemurafenib only if the two cell types are in close proximity."

The news reporters obtained a quote from the research from Oslo University Hospital, "In the presence of fibroblasts, the adjacent melanoma cells acquire de-differentiated mesenchymal-like phenotype. Upon treatment with BRAFi, such melanoma cells maintain high levels of phospho ribosomal protein S6 (pS6), i.e. active mTOR signaling, which is suppressed in the BRAFi sensitive cells without stromal contacts. Inhibitors of PI3K/mTOR in combination with BRAFi eradicate pS6high cell subpopulations and potentiate anti-cancer effects in melanoma protected by the fibroblasts. mTOR and BRAF co-inhibition also delayed the development of early-stage lung metastases in vivo."

According to the news reporters, the research concluded: "We demonstrate that upon influence from fibroblasts, melanoma cells undergo a phenotype switch to the mesenchymal state, which can support PI3K/mTOR signaling. The lost sensitivity to BRAFi in such cells can be overcome by co-targeting PI3K/mTOR. This knowledge could be explored for designing BRAFi combination therapies aiming to eliminate both stroma-protected and non-protected counterparts of metastases."

For more information on this research see: Fibroblast-induced switching to the mesenchymal-like phenotype and PI3K/mTOR signaling protects melanoma cells from BRAF inhibitors. *Oncotarget*, 2016;7(15):19997-20015.

Non-Steroidal Anti-Inflammatory Agents

Studies from Oslo University Hospital Further Understanding of Non-Steroidal Anti-Inflammatory Agents (The Effect of Limited Perioperative Nonsteroidal Anti-inflammatory Drugs on Patients Undergoing Anterior Cruciate Ligament Reconstruction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Non-Steroidal Anti-Inflammatory Agents. According to news reporting out of Oslo, Norway, by NewsRx editors, research stated, "The administration of nonsteroidal anti-inflammatory drugs (NSAIDs) to patients undergoing anterior cruciate ligament reconstruction (ACLR) is controversial because it may impair tissue healing and clinical outcomes. To assess the effect of NSAID administration on patients undergoing ACLR."

Our news journalists obtained a quote from the research from Oslo University Hospital, "Cohort study; Level of evidence, 3. Included patients were aged >15 years and were registered in the Norwegian Knee Ligament Registry from 2008 until 2013 after the primary ACLR. Patients with insufficient data regarding administration of NSAIDs and those with associated knee ligament injuries requiring surgical treatment were excluded from this study. Graft survival was estimated using Kaplan-Meier survival curves, and hazard ratios (HRs) for revision were evaluated using Cox regression analysis. Logistic regression analysis was used to calculate the odds ratio (OR) for a Knee Injury and Osteoarthritis Outcome Score (KOOS)-quality of life (QOL) subscale score <44 at 2-year follow-up. A total of 7822 patients were included in the analysis for graft survival and assessment for risk of revision. Of these, 4144 patients were administered NSAIDs postoperatively. The mean duration of follow-up was 2.8 years (range, 0-5.9 years). Administration of NSAIDs did not influence graft survival (P = .568). Adjusted Cox regression analyses demonstrated the same finding regarding risk of revision (HR, 1.0; 95% CI, 0.8-1.3). ACLR using a bone-patellar tendon-bone autograft showed a reduced risk of revision (HR, 0.3; 95% CI, 0.1-0.8) among patients administered NSAIDs. In subgroup analyses of 3144 patients, administration of NSAIDs demonstrated a beneficial effect on the risk of a KOOS-QOL score <44 at 2-year follow-up (OR, 0.8; 95% CI, 0.6-0.9). Administration of NSAIDs to patients after ACLR does not have a negative effect on graft survival, risk of revision, or risk of a KOOS-QOL score <44 at 2-year follow-up."

According to the news editors, the research concluded: "We emphasize using caution when administering NSAIDs by keeping the duration and dosage of NSAIDs as short and low as possible to ensure sufficient pain relief while limiting unwanted exposure to any known and unknown adverse effects of these drugs."

Parasitic Diseases and Conditions - Cutaneous…

Studies from Oswaldo Cruz Institute Describe New Findings in Cutaneous Leishmaniasis (Antileishmanial Activity of Ezetimibe: Inhibition of Sterol Biosynthesis, In Vitro Synergy with Azoles, and Efficacy in Experimental Cutaneous Leishmaniasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Parasitic Diseases and Conditions - Cutaneous Leishmaniasis. According to news reporting originating from Rio de Janeiro, Brazil, by NewsRx correspondents, research stated, "Leishmaniasis affects mainly low-income populations in tropical regions. Radical innovation in drug discovery is time-consuming and expensive, imposing severe restrictions on the ability to launch new chemical entities for the treatment of neglected diseases."

Our news editors obtained a quote from the research from Oswaldo Cruz Institute, "Drug repositioning is an attractive strategy for addressing a specific demand more easily. In this project, we have evaluated the antileishmanial activities of 30 drugs currently in clinical use for various morbidities. Ezetimibe, clinically used to reduce intestinal cholesterol absorption in dyslipidemic patients, killed Leishmania amazonensis promastigotes with a 50% inhibitory concentration (IC50) of 30 mu M. Morphological analysis revealed that ezetimibe caused the parasites to become rounded, with multiple nuclei and flagella. Analysis by gas chromatography (GC)-mass spectrometry (MS) showed that promastigotes treated with ezetimibe had smaller amounts of C-14-demethylated sterols, and accumulated more cholesterol and lanosterol, than untreated promastigotes. We then evaluated the combination of ezetimibe with well-known antileishmanial azoles. The fractional inhibitory concentration index (FICI) indicated synergy when ezetimibe was combined with ketoconazole or miconazole. The activity of ezetimibe against intracellular amastigotes was confirmed, with an IC50 of 20 mu M, and ezetimibe reduced the IC(90)s of ketoconazole and miconazole from 11.3 and 11.5 mu M to 4.14 and 8.25 mu M, respectively. Subsequently, we confirmed the activity of ezetimibe in vivo, showing that
it decreased lesion development and parasite loads in murine cutaneous leishmaniasis."

According to the news editors, the research concluded: "We concluded that ezetimibe has promising antileishmanial activity and should be considered in combination with azoles in further preclinical and clinical studies."

For more information on this research see: Antileishmanial Activity of Ezetimibe: Inhibition of Sterol Biosynthesis, In Vitro Synergy with Azoles, and Efficacy in Experimental Cutaneous Leishmaniasis. Heart Disorders and Diseases - Cardiomyopathies

Studies from PLA General Hospital Describe New Findings in Cardiomyopathies (Oncostatin M-induced cardiomyocyte dedifferentiation regulates the progression of diabetic cardiomyopathy through B-Raf/Mek/Erk signaling pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Cardiomyopathies are presented in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "It has been reported that oncostatin M (OSM) could initiate cardiomyocyte dedifferentiation both in vivo and in vitro. OSM-induced cardiomyocyte dedifferentiation might be a new target for the treatment of diabetic cardiomyopathy (DCM)."

Financial supporters for this research include National Funds for Distinguished Young Scientists of China, National Natural, Science Foundation of China, Beijing Natural, Science, Foundation, National Basic Research Program of China, Shanxi Province Program.

The news correspondents obtained a quote from the research from PLA General Hospital, "This study was designed to determine the role of OSM in cardiomyocyte dedifferentiation and the progression of DCM. A mouse DCM model was established to evaluate the effects of OSM in vivo. Echocardiography was applied to determine cardiac function. Sirius red staining was used to detect fibrosis area. Transmission electron microscopy was used to evaluate mitochondria impairment. Real-time polymerase chain reaction and
western blot analysis were performed to detect relative mRNA expressions and cardiomyocyte dedifferentiation-related protein expressions, respectively. OSM treatment induced similar impaired cardiac function and cardiac ultrastructure impairment to those detected in DCM mice. The expressions of dedifferentiation markers of cardiomyocyte (Runx1, and a-SM-actin) were up-regulated in the OSM-treated mice compared with those in the control group. To further demonstrate the important role of OSM, OSM receptor knockout (Ob(ko)) mice were used. In Ob(ko) mice, cardiomyocytes dedifferentiation markers of c-kit, Runx1, and atrial natriuretic peptide were down-regulated, with attenuated DCM injury and abrogated OSM/B-Raf/Mek/Erk signaling pathway."

According to the news reporters, the research concluded: "OSM-induced cardiomyocyte dedifferentiation plays a crucial role in the progression of DCM. The mechanism of OSM-induced cardiomyocyte dedifferentiation is associated with B-Raf/Mek/Erk signaling pathway through the OSM receptor Ob."

Our news journalists report that additional information may be obtained by contacting Y. Wang, Dept. of Cardiology, Chinese PLA General Hospital, Beijing 100853, People's Republic of China. Additional authors for this research include S. Ma, R. Zhang, S. Li, D. Zhu, D. Han, X. Li, C. Li, W. Yan, D. Sun, B. Xu, Y. Wang and F. Cao.

Peptide Proteins - Proinsulin

Studies from Paris-Descartes University Provide New Data on Proinsulin (Leucine and Mammalian Target of Rapamycin-Dependent Activation of Muscle Protein Synthesis in Aging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Peptide Proteins - Proinsulin. According to news reporting originating in Paris, France, by NewsRx editors, the research stated, "The preservation or restoration of muscle mass is of prime importance for healthy aging. However, aging has been repeatedly shown to be associated with resistance of muscle to the anabolic effects of feeding."

The news reporters obtained a quote from the research from Paris-Descartes University, "Leucine supplementation has been proposed as a possible strategy because of its regulatory role on protein homeostasis. Indeed, it acts independently of growth factors and leads
to enhanced cap-dependent mRNA translation initiation and increased protein synthesis. Leucine acts as a signaling molecule directly at the muscle level via the activation of mammalian/mechanistic target of rapamycin complex 1 (mTORC1). However, in aged muscle, mTORC1 activation seems to be impaired, with decreased sensitivity and responsiveness of muscle protein synthesis to amino acids, whereas the phosphorylation state of several components of this signaling pathway appears to be higher in the basal state. This may stem from specific age-related impairment of muscle signaling and from decreased nutrient and growth factor delivery to the muscle. Whether aging per se affects mTORC1 signaling remains to be established, because aging is frequently associated with inadequate protein intake, decreased insulin sensitivity, inactivity, inflammatory processes, etc.

According to the news reporters, the research concluded: "Whatever its origin, this anabolic resistance to feeding can be mitigated by quantitative and qualitative manipulation of protein supply, such as leucine supplementation; however, there remains the question of possible adverse effects of long-term, high-dose leucine supplementation in terms of insulin resistance and tumorigenesis."

Our news correspondents report that additional information may be obtained by contacting J.P. De Bandt, Paris Descartes Univ, Sorbonne Paris Cite, Fac Pharm, PRETRAM EA4466Nutr Biol Lab, Paris, France.

Keywords for this news article include: Paris, France, Europe, Branched-Chain Amino Acids, Essential Amino Acids, Contractile Proteins, Protein Synthesis, Peptide Proteins, Peptide Hormones, Muscle Proteins, Medical Devices, Proteomics, Proinsulin, Genetics, Leucine, Paris-Descartes University.

**Nutritional and Metabolic Diseases and Conditions**

**Studies from Peking Union Medical College Provide New Data on Metabolic Syndrome (Association between sleep duration and cardiac structure in youths at risk for metabolic syndrome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Metabolic Syndrome have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "The evidence for a link between sleep duration and cardiovascular risk is accumulating in youths, but no study has yet investigated the relationship between sleep duration and change of cardiac structure. In this study, we recruited 559 youths aged 14-28 years from the cohort of Beijing Child and Adolescent Metabolic Syndrome Study."

The news reporters obtained a quote from the research from Peking Union Medical College, "Questionnaire, color Doppler echocardiography, oral glucose tolerance test and blood biomarkers analyses were performed. We found that sleep duration was negatively correlated
with body mass index, waist circumstance, and HbA1c (all P< 0.05), but not with adiponectin and leptin. Meanwhile, participants with shorter sleep duration (<= 7 h) had larger interventricular septal diastolic thickness, left ventricular (LV) end-diastolic diameter, LV posterior wall thickness, LV mass (LVM), and LV mass index (LVMI), compared to participants in 7-9 h/night or > 9 h/night group. Findings remained significant after adjustment for the major confounding factors (P < 0.05). Multivariate regression modeling revealed that each additional hour of sleep was associated with smaller LVM (beta: -3.483, P< 0.0001) and LVMI (beta: -0.815, P< 0.0001).

According to the news reporters, the research concluded: "Our findings suggest that short sleep has a possible direct effect on cardiac remodeling, occurring already at young ages."

For more information on this research see: Association between sleep duration and cardiac structure in youths at risk for metabolic syndrome. Scientific Reports. 2016;6():1-8.

Our news correspondents report that additional information may be obtained by contacting M. Li, Peking Union Med College, Beijing, People's Republic of China. Additional authors for this research include J.H. Zhang, J.L. Fu, H. Wu, Y.H. Wang, L.J. Li, Y.L. Zhao, M. Li and S. Gao.

Our news editors obtained a quote from the research from Peking University Cancer Hospital and Institute. "The patients' CTCs were enumerated using CellSearch at baseline and at the first response evaluation. In 15 patients whose clinical condition permitted longitudinal study, CTCs were longitudinally enumerated during treatment. Following 6 weeks of chemotherapy, an unfavourable post-therapy CTC level (&#10878;3 CTCs per 7.5 ml) was closely correlated with the objective response rate (p=0.016) and the disease control rate (p= 0.013), and it also independently predicted a shorter progression-free survival and overall survival. Particularly, conversion to a favourable CTC level following therapy improved the
Elevated CTCs during therapy may be associated with a poor prognosis. Post-therapy CTC level may help in evaluating therapeutic response in patients with AGC and predicting their prognosis."

According to the news editors, the research concluded: "In addition, changes in CTCs following therapy may be useful in rapidly identifying ineffective treatments and poor prognosis."

For more information on this research see: Dynamic monitoring of circulating tumour cells to evaluate therapeutic efficacy in advanced gastric cancer. *British Journal of Cancer*, 2016;114(2):138-45. (Nature Publishing Group - www.nature.com/bjc/)

**Oncology - Liver Cancer**

**Studies from Peking University Provide New Data on Liver Cancer**

*(Single-cell triple omics sequencing reveals genetic, epigenetic, and transcriptomic heterogeneity in hepatocellular carcinomas)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Liver Cancer are presented in a new report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Single-cell genome, DNA methylome, and transcriptome sequencing methods have been separately developed. However, to accurately analyze the mechanism by which transcriptome, genome and DNA methylome regulate each other, these omic methods need to be performed in the same single cell."

Our news journalists obtained a quote from the research from Peking University, "Here we demonstrate a single-cell triple omics sequencing technique, scTrio-seq, that can be used to simultaneously analyze the genomic copy-number variations (CNVs), DNA methylome, and transcriptome of an individual mammalian cell. We show that large-scale CNVs cause proportional changes in RNA expression of genes within the gained or lost genomic regions, whereas these CNVs generally do not affect DNA methylation in these regions. Furthermore, we applied scTrio-seq to 25 single cancer cells derived from a human hepatocellular carcinoma tissue sample. We identified two subpopulations within these cells based on CNVs, DNA methylome, or transcriptome of individual cells."
According to the news editors, the research concluded: "Our work offers a new avenue of dissecting the complex contribution of genomic and epigenomic heterogeneities to the transcriptomic heterogeneity within a population of cells."

The news correspondents report that additional information may be obtained from Y. Hou, Biodynamic Optical Imaging Center, College of Life Sciences, Peking University, Beijing 100871, People's Republic of China. Additional authors for this research include H. Guo, C. Cao, X. Li, B. Hu, P. Zhu, X. Wu, L. Wen, F. Tang, Y. Huang and J. Peng.

**Studies from Peking University Update Current Data on Perinatal Research (Relationship of maternal birth weight on maternal and neonatal outcomes: a multicenter study in Beijing)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Perinatal Research have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Birth weight is an important indicator for childhood and adulthood diseases. Published studies lack information on the relative contribution of women's own birth weight to the course of her pregnancy, not only for maternal but especially to neonatal outcome."

The news reporters obtained a quote from the research from Peking University, "The aim of the study was to evaluate the relationship of maternal birth weight on maternal and perinatal complications during pregnancy. Medical and obstetrical data were collected from 5479 women at 15 hospitals in Beijing, by a systemic cluster sampling survey conducted from 20 June 2013 to 30 November 2013. These women were categorized into five groups, according to their own birth weight: low birth weight (≤ 2500 g, n=275), sub-optimal birth weight (2500 to 2999 g, n=1079), optimal birth weight (3000 to 3499 g, n=2590; 3500 to 3999 g, n=1085), and high birth weight (≥ 4000 g, n=450). The occurrence of maternal and neonatal complications was recorded and compared among the groups. Statistical analysis was performed by SPSS 20.0 and values of P< 0.05 were considered to be statistically significant. Low maternal birth weight was associated with higher rates of gestational diabetes mellitus (X-2=
21.268, P=0.006) and hypertensive disorders (X-2=10.844, P=0.028). The latter association was strongest in women with a pre-pregnancy body mass index above 25 kg m(-2). Low maternal birth weight was also associated with an apparently higher incidence of preterm labor (X-2=18.27, P=0.001) and hypertriglyceridemia (X-2=2.739, P=0.027) in pregnancy. An association between women with low birth weight and a significantly higher rate of small for gestational age infants (X-2=93.507, P< 0.001) and low birth weight (X-2=36.256, P< 0.001) was detected. High maternal birth weight was associated with an increased risk of pre-pregnancy overweight and obesity (P < 0.001), as well as for large for gestational age infants X-2 = 93.507, P< 0.001) and macrosomia (X-2= 72.594, P< 0.001). In our study, high or low maternal birth weight was strongly associated with maternal and perinatal adverse pregnancy outcomes."

According to the news reporters, the research concluded: "This suggests that by controlling the birth weight of female infants among the normal range, adverse outcomes may be decreased in the future and for the following generations."

For more information on this research see: Relationship of maternal birth weight on maternal and neonatal outcomes: a multicenter study in Beijing. Journal of Perinatology, 2016;36(12):1061-1066. Journal of Perinatology can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group - www.nature.com/jp/)

Mental Health Diseases and Conditions - Schizophrenia

**Studies from Peking University in the Area of Schizophrenia Reported**

(Association of the manganese superoxide dismutase gene Ala-9Val polymorphism with age of smoking initiation in male schizophrenia smokers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mental Health Diseases and Conditions - Schizophrenia are presented in a new report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Schizophrenia patients exhibit higher smoking rates than the general population. A growing body of evidence suggests that cigarette smoke impairs the antioxidant defense mechanisms, leading to oxidative damage."

Financial supporters for this research include National Natural Science Foundation of China, Natural Science Foundation of Beijing Municipality, NARSAD Independent Investigator.

Our news journalists obtained a quote from the research from Peking University,
Manganese superoxide dismutase (MnSOD) is the major antioxidant in the mitochondria, catalyzing the metabolism of superoxide radicals to form hydrogen peroxide. Since the identification of a well-characterized functional polymorphism, Ala-9Val of MnSOD, a number of studies have evaluated the association between Val-9Ala and schizophrenia or cancer. In this study, we hypothesized that the functional polymorphism of MnSOD Ala-9Val was associated with smoking in patients with schizophrenia. This polymorphism was genotyped in 666 chronic male schizophrenia patients (smoker/never-smoker=507/159) and 660 male controls (smoker/never-smoker=360/300) using a case-control design. The cigarettes smoked per day (CPD) and smoking behaviors were evaluated by clinician-administered questionnaires and the Fagerstrom Test for Nicotine Dependence (FTND). The results showed no significant differences in MnSOD Ala-9Val genotype and allele distributions between the patients and healthy controls or between smokers and never-smokers in either patients or healthy controls alone. The smokers with the Ala allele started smoking significantly earlier (19.9 ± 5.8 vs. 21.7 ± 6.5 years, p=0.005) only in patients.

According to the news editors, the research concluded: "These results suggest that the MnSOD Ala-9Val polymorphism may not influence smoking status in a Chinese male schizophrenia population, but may influence the age at which smoking is started among schizophrenia smokers."

The news correspondents report that additional information may be obtained from X.Y. Zhang, Psychiatry Research Center, Beijing HuiliLongGuan Hospital, Peking University, Beijing, People's Republic of China. Additional authors for this research include W.W. Rao, Q. Yu, Y. Yu, C. Kou, Y.L. Tan, D.C. Chen, L. Zuo, X. Luo and J.C Soares.

**Clinical Research - Clinical Trials and Studies**

**Studies from Peking-Tsinghua Center for Life Sciences Yield New Data on Clinical Trials and Studies (Haplo-identical transplantation for acquired severe aplastic anaemia in a multicentre prospective study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "We conducted a prospective, multicentre study to confirm the feasibility of haplo-identical transplantation in treatment of severe aplastic anaemia (SAA) as
salvage therapy, by analysing the outcomes of 101 patients who received haplo-identical transplantation between June 2012 and October 2015. All cases surviving for more than 28d achieved donor myeloid engraftment."

Financial supporters for this research include Collaborative Innovation Centre of Haematology China, National Natural Science Foundation of China, Beijing Municipal Science & Technology Commission.

The news correspondents obtained a quote from the research from Peking-Tsinghua Center for Life Sciences, "The median time for myeloid engraftment was 12 (range, 9-25) days and 15 (range, 7-101) days for platelets, with a cumulative platelet engraftment incidence of 941 +/- 01%. With a median follow-up of 183 (30-436) months, recipients from haplo-identical transplantation had more cumulative incidence of grade II-IV acute graft-versus-host disease (aGVHD, 337% vs. 42%, P<0001), more chronic GVHD (224% vs. 66%, P=0014) at 1year, but similar grade III-IV aGVHD (79% vs. 21%, P=0157), 3-year estimated overall survival (OS, 890% vs. 910%, P=0555) and failure-free survival (FFS, 868% vs. 803%, P=0659) when compared with 48 patients who received contemporaneous transplantation from matched related donors. Multivariate analysis showed no significant difference in engraftment and survival between the two cohorts. Both OS and FFS for the entire population correlated significantly with grades III-IV aGVHD."

According to the news reporters, the research concluded: "Haplo-identical transplantation is a feasible choice for SAA with favourable outcomes."

Adolescence

Studies from Pennsylvania State University Reveal New Findings on Adolescence (The Double Standard at Sexual Debut: Gender, Sexual Behavior and Adolescent Peer Acceptance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Adolescence. According to news reporting out of University Park, Pennsylvania, by NewsRx editors, research stated, "A sexual double
standard in adolescence has important implications for sexual development and gender inequality. The present study uses longitudinal social network data (N = 914; 11-16 years of age) to test if gender moderates associations between adolescents' sexual behaviors and peer acceptance."

Funders for this research include William T. Grant Foundation, National Institute on Drug Abuse, National Institute of Child Health and Human Development.

Our news journalists obtained a quote from the research from Pennsylvania State University, "Consistent with a traditional sexual double standard, female adolescents who reported having sex had significant decreases in peer acceptance over time, whereas male adolescents reporting the same behavior had significant increases in peer acceptance. This pattern was observed net of respondents' own perceived friendships, further suggesting that the social responses to sex vary by gender of the sexual actor. However, findings for 'making out' showed a reverse double standard, such that female adolescents reporting this behavior had increases in peer acceptance and male adolescents reporting the same behavior had decreases in peer acceptance over time. Results thus suggest that peers enforce traditional sexual scripts for both 'heavy' and 'light' sexual behaviors during adolescence."

According to the news editors, the research concluded: "These findings have important implications for sexual health education, encouraging educators to develop curricula that emphasize the gendered social construction of sexuality and to combat inequitable and stigmatizing peer responses to real or perceived deviations from traditional sexual scripts."

For more information on this research see: The Double Standard at Sexual Debut: Gender, Sexual Behavior and Adolescent Peer Acceptance. Sex Roles, 2016;75(7-8):377-392. Sex Roles can be contacted at: Springer, Plenum Publishers, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Sex Roles - www.springerlink.com/content/0360-0025/)

Mosquito-Borne Diseases - Malaria

Studies from Pennsylvania State University Update Current Data on Malaria (Metabolomic Profiling of the Malaria Box Reveals Antimalarial Target Pathways)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mosquito-Borne Diseases - Malaria have been published. According to news reporting from University Park, Pennsylvania, by NewsRx journalists, research stated, "The threat of widespread drug resistance to frontline antimalarials
has renewed the urgency for identifying inexpensive chemotherapeutic compounds that are effective against Plasmodium falciparum, the parasite species responsible for the greatest number of malaria-related deaths worldwide. To aid in the fight against malaria, a recent extensive screening campaign has generated thousands of lead compounds with low micromolar activity against blood stage parasites."

Financial support for this research came from Bill and Melinda Gates Foundation.

The news correspondents obtained a quote from the research from Pennsylvania State University, "A subset of these leads has been compiled by the Medicines for Malaria Venture (MMV) into a collection of structurally diverse compounds known as the MMVMalaria Box. Currently, little is known regarding the activity of these Malaria Box compounds on parasite metabolism during intraerythrocytic development, and a majority of the targets for these drugs have yet to be defined. Here we interrogated the in vitro metabolic effects of 189 drugs (including 169 of the drug-like compounds from the Malaria Box) using ultra-high-performance liquid chromatography-mass spectrometry (UHPLC-MS). The resulting metabolic fingerprints provide information on the parasite biochemical pathways affected by pharmacologic intervention and offer a critical blueprint for selecting and advancing lead compounds as next-generation antimalarial drugs. Our results reveal several major classes of metabolic disruption, which allow us to predict the mode of action (MoA) for many of the Malaria Box compounds."

According to the news reporters, the research concluded: "We anticipate that future combination therapies will be greatly informed by these results, allowing for the selection of appropriate drug combinations that simultaneously target multiple metabolic pathways, with the aim of eliminating malaria and forestalling the expansion of drug-resistant parasites in the field."

For more information on this research see: Metabolomic Profiling of the Malaria Box Reveals Antimalarial Target Pathways. Antimicrobial Agents and Chemotherapy, 2016;60 (11):6635-6649. Studies from People's Hospital Add New Findings in the Area of Applied Clay Science (Smart montmorillonite-polypyrrole scaffolds for electro-responsive drug release)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Science - Applied Clay Science are discussed in a new report. According to news reporting from Changzhou, People's Republic of China, by NewsRx journalists, research stated, "Hybrids of montmorillonite (Mt) and polypyrrole (PPy) were prepared by in situ electropolymerization of pyrrole monomer in the dispersion of Mt in the presence of drug molecules (aspirin), and aspirin anions were incorporated into the Mt-PPy hybrids as dopants."

Financial supporters for this research include Key Laboratory for Palygorskite Science and Applied Technology of Jiangsu Province, Science & Technology Program of Zhejiang Province.

The news correspondents obtained a quote from the research from People's Hospital, "The resulting drug loaded Mt-PPy was characterized by field emission scanning electron microscopy (FESEM), Fourier transform infrared spectroscopy (FT-IR), electrochemical impedance spectroscopy (EIS), and X-ray powder diffractometer (XRD). The Mt-PPy hybrids combined the advantages of Mt (relatively large specific surface area) and electro-responsive feature of PPy, which was applied as an electrically tunable drug release platform."

According to the news reporters, the research concluded: "Compared with PPy, the electro-stimulated drug release behaviors were significantly enhanced at the Mt-PPy hybrids, indicating that the proposed electro-responsive hybrids might be a promising candidate for smart and intelligent drug release."

For more information on this research see: Smart montmorillonite-polypyrrole scaffolds for electro-responsive drug release. Applied Clay Science, 2016;134():50-54. Applied Clay Science can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Applied Clay Science - www.journals.elsevier.com/applied-clay-science/)

Oncology - Lung Cancer

Studies from People's Hospital Add New Findings in the Area of Lung Cancer (Reduced SLC27A2 Induces Cisplatin Resistance in Lung Cancer Stem Cells by Negatively Regulating Bmi1-ABCG2 Signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news originating from Hefei, People's Republic of China, by NewsRx correspondents, research stated, "Platinum-based chemotherapies have long been used as a standard treatment in non-small cell lung cancer (NSCLC). However, cisplatin resistance is a major problem that restricts the use of cisplatin."

Our news journalists obtained a quote from the research from People's Hospital, "Lung cancer stem cells (LCSCs) represent a subpopulation that is responsible for chemoresistance. We aim to investigate the biological function of SLC27A2 and its underlying mechanisms in regulating chemo-resistance to cisplatin in LCSCs. Here, our findings testified that CD166(+) cells which were derived from fresh primary NSCLC samples displayed stem cell-like features and were resistant to chemotherapy drug cisplatin. In patient cohort, we found the presence of a variable fraction of CD166(+) cells in 24 out of 25 primary NSCLC samples. Significantly, SLC27A2 expression was reduced in CD166(+) LCSCs. Reduced SLC27A2 correlated chemo-response and poor patient survival. Our results indicated that enhanced SLC27A2 expression sensitized CD166(+) LCSCs to cisplatin by in vitro and in vivo experiments. Microarray profiling showed that the expression of Bmi1 and ABCG2 was enhanced in p-SLC27A2-LCSCs compared with that in pc3.1DNA-LCSCs. Furthermore, we demonstrated that reduced SLC27A2 induced chemo-resistance in CD166(+) LCSCs by negatively regulating Bmi1-ABCG2 signaling, and ABCG2 was a direct transcriptional target of Bmi1."

According to the news editors, the research concluded: "Thus, this study widens the window for identification and targeting of a cisplatin-resistant population and contributes to the development of potential therapeutics to improve the current treatment modalities in NSCLC."

The news correspondents report that additional information may be obtained from T. Guo, Second Peoples Hosp Anhui, Dept. of Thorac Surg, Hefei 230000, Abhui Province, People's Republic of China. Additional authors for this research include S.F. Wu, W. Tang, H. Qian, H. Zhou and T. Guo.

Studies from People's Hospital Yield New Data on Colon Cancer  
(Differentially expressed long non-coding RNAs and the prognostic potential in colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news reporting originating in Shandong, People's Republic of China, by NewsRx journalists, research stated, "(lncRNAs) are new research hotspots for their vital roles in regulating gene expression. This study aims to investigate the prognostic value of lncRNAs in CRC patients."

The news reporters obtained a quote from the research from People's Hospital, "A total of 21 cancer-related lncRNAs were detected by PCR array to reveal their expression changes in CRC tissue. A 120-week-long follow-up was performed in 30 CRC patients to analyze the relationship between lncRNA levels and CRC prognosis. Most of the 21 lncRNAs were differentially expressed in CRC tissue compared to the adjacent normal tissue, among which seven lncRNAs were significantly changed: AFAP1-AS1, BCAR4, H19, HOXA-AS2, MALAT1 and PVT1 were up-regulated, and ADAMTS9-AS2 was down-regulated in CRC tissue samples. No obvious correlation was found between lncRNA levels and the age, gender, tumor size or TNM stage of these patients. Log-rank test indicated that higher levels of AFAP1-AS1, BCAR4, H19, HOXA-AS2, MALAT1 or PVT1 and lower level of ADAMTS9-AS2 might predict the poor prognosis of CRC patients."

According to the news reporters, the research concluded: "This study suggests the potential value of the seven lncRNAs in the prognosis of CRC, providing reference information for future research on CRC prognostic and treatment strategy."

For more information on this research see: Differentially expressed long non-coding RNAs and the prognostic potential in colorectal cancer. Neoplasma, 2016;63(6):977-983. Neoplasma can be contacted at: Aepress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

Studies from Petz Aladar County Teaching Hospital in the Area of Heart Attack Described (Effects of Angiotensin-Converting Enzyme Inhibitors and Angiotensin Receptor Blockers on Prothrombotic Processes and Myocardial Infarction Risk)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting out of Gyor, Hungary, by NewsRx editors, research stated, "Acute ischemic events occur most frequently at dawn and in the early hours of the morning."

Our news journalists obtained a quote from the research from Petz Aladar County Teaching Hospital, "The development of these severe clinical events exhibits a temporal relationship with changes in various hemodynamic, prothrombotic, and hormonal processes. The authors highlight not only these relationships but also the potential protective effect of increased bradykinin levels and the inhibition of different angiotensin II (AT-II) receptors (AT2, AT4) against unfavorable prothrombotic influences, which-based on studies to date-decreases the risk of acute cardiovascular events."

According to the news editors, the research concluded: "Comparisons are presented between the different effects of angiotensin-converting enzyme inhibitors and angiotensin receptor blockers on factors that influence thrombus formation and myocardial infarction risk."

Our news journalists report that additional information may be obtained by contacting C.A. Dezsi, Petz Aladar Cty Teaching Hosp, Dept. of Cardiol, H-9024 Gyor, Hungary.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s40256-016-0185-0. This DOI is a link to an online electronic document that is either free or for purchase.

Nanotechnology - Nanovesicles

Studies from Pohang University of Science and Technology in the Area of Nanovesicles Described (Bacterial protoplast-derived nanovesicles for tumor targeted delivery of chemotherapeutics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nanotechnology - Nanovesicles are discussed in a new report. According to news originating from Pohang, South Korea, by NewsRx correspondents, research stated, "Increasing incidents of patients diagnosed with cancer have brought massive improvement in the delivery technologies to help patients receiving chemotherapy. However, tumor specific targeting of the chemotherapeutics still remains as a challenge mainly due to the difficulties in the conjugation and manipulation of bio-specific molecules on the surface."

Funders for this research include Ministry of Health & Welfare, Republic of Korea, National Research Foundation of Korea (NRF).

Our news journalists obtained a quote from the research from the Pohang University of Science and Technology, "Herein, we genetically engineered bacterial protoplast to develop nanovesicles having no toxic outer membrane components that can specifically target and deliver chemotherapeutics to tumor tissues. The bacterial protoplast nanovesicles expressing tumor-targeting moieties on the surface were prepared by serial extrusions through nano-sized membrane filters. The nano-sized vesicular structure of protoplast nanovesicles offers passive targeting to solid tumor site and expression of tumor-targeting moiety enhance tumor-specific uptake via receptor-mediated targeting. Chemotherapeutics-loaded in the nanovesicles induce dose-dependent cytotoxicity in tumor cells in vitro. Moreover, specific trafficking of drug-loaded nanovesicles to the tumor tissue and efficient prevention of tumor growth in tumor xenografted mice are shown. Importantly, this tumor growth suppression of protoplast nanovesicles has shown to reduce the chemotherapeutics-induced adverse effects after systemic administration to mice."

According to the news editors, the research concluded: "This study offers great potential of protoplast nanovesicles as effective and safe delivery system to optimize and contribute to the development of advanced chemotherapy."

For more information on this research see: Bacterial protoplast-derived nanovesicles for tumor targeted delivery of chemotherapeutics. Biomaterials, 2017;113():68-79. Nitrogen Oxides

Studies from Pontifical Catholic University Have Provided New Data on Nitrogen Oxides (Nitric oxide and pH modulation in gynaecological cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nitrogen Oxides is the subject of a report. According to news originating from Santiago, Chile, by NewsRx correspondents, research stated, "Nitric oxide plays several roles in cellular physiology, including control of the vascular tone and defence against pathogen infection. Neuronal, inducible and endothelial nitric oxide synthase (NOS) isoforms synthesize nitric oxide."

Financial support for this research came from Fondo Nacional de Desarrollo Cientifico y Tecnologico.

Our news journalists obtained a quote from the research from Pontifical Catholic University, "Cells generate acid and base equivalents, whose physiological intracellular concentrations are kept due to membrane transport systems, including Na+/H+ exchangers and Na+/HCO3- transporters, thus maintaining a physiological pH at the intracellular (similar to 7.0) and extracellular (similar to 7.4) medium. In several pathologies, including cancer, cells are exposed to an extracellular acidic microenvironment, and the role for these membrane transport mechanisms in this phenomenon is likely. As altered NOS expression and activity is seen in cancer cells and because this gas promotes a glycolytic phenotype leading to extracellular acidosis in gynaecological cancer cells, a pro-inflammatory microenvironment increasing inducible NOS expression in this cell type is feasible. However, whether abnormal control of intracellular and extracellular pH by cancer cells regards with their ability to synthesize or respond to nitric oxide is unknown. We, here, discuss a potential link between pH alterations, pH controlling membrane transport systems and NOS function. We propose a potential association between inducible NOS induction and Na+/H+ exchanger expression and activity in human ovary cancer. A potentiation between nitric oxide generation and the maintenance of a low extracellular pH (i.e. acidic) is proposed to establish a sequence of events in ovarian cancer cells, thus preserving a pro-proliferative acidic tumour extracellular microenvironment."

According to the news editors, the research concluded: "We suggest that pharmacological therapeutic targeting of Na+/H+ exchangers and inducible NOS may have benefits in human epithelial ovarian cancer."

The news correspondents report that additional information may be obtained from C. Sanhueza, Pontifical Catholic University, CMPL, Div Obstet & Gynaecol, Sch MedFac Med, Santiago, Chile. Additional authors for this research include J. Araos, L. Naranjo, E. Barros, M. Subiabre, F. Toledo, J. Gutierrez, D.I. Chiarello, F. Pardo, A. Leiva and L. Sobrevia.

Studies from Poznan University of Medical Sciences Have Provided New Data on Hypotension (Impact of Controlled Induced Hypotension on Cognitive Functions of Patients Undergoing Functional Endoscopic Sinus Surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypotension have been published. According to news originating from Poznan, Poland, by NewsRx correspondents, research stated, "Controlled induced hypotension guarantees less blood loss and better visibility of the surgical site. The impact of hypotension on post-operative cognitive functions is still being discussed."

Our news journalists obtained a quote from the research from the Poznan University of Medical Sciences, "The objective of this study was to evaluate the effects of controlled induced hypotension on the cognitive functions of patients undergoing functional endoscopic sinus surgery (FESS). We allocated 47 patients with a good grade of preoperative cognitive functions evaluated with the Mini-Mental State Examination to 3 groups (1 -mild hypotension, 2 -intermediate hypotension, 3 -severe hypotension) according to the degree of mean intraoperative arterial pressure compared with preoperative blood pressure. Cognitive functions were evaluated preoperatively, 6 h, and 30 h postoperatively with standardized tests: the Stroop Test, Trail Making Test (TMT), and Verbal Fluency Test (VFT). A decrease in the test results and increase in the number of mistakes made were considered an impairment of cognitive functions. A total of 47 patients (group 1 -mild hypotension -15, group 2 -intermediate hypotension -19, group 3 -severe hypotension -13) were included in the study. A significant decrease was observed in all the 3 groups after Stroop A test 6h postoperatively but it improved 30h postoperatively, without differences between the groups. Neither a significant decrease in the test results nor an increase in the number of mistakes was noted for Stroop B tests, TMT A&B tests and VFT."

According to the news editors, the research concluded: "The degree of controlled intraoperative hypotension during FESS did not influence the results of psychometric tests."

For more information on this research see: Impact of Controlled Induced Hypotension on Cognitive Functions of Patients Undergoing Functional Endoscopic Sinus Surgery. Medical Science Monitor, 2016;22():898-907.

The news correspondents report that additional information may be obtained from S. Nowak, Students' Scientific Society, Poznan University of Medical Sciences, Poznan, Poland. Additional authors for this research include A. Oldak, A. Kluzik and L. Drobnik.

Phenols

Studies from Poznan University of Medical Sciences Update Current Data on Phenols (Pharmacokinetics and pharmacodynamics of propofol and fentanyl in patients undergoing abdominal aortic surgery - a study of pharmacodynamic drug-drug interactions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Phenols. According to news reporting originating from Poznan, Poland, by NewsRx correspondents, research stated, "Propofol is routinely combined with opioid analgesics to ensure adequate anesthesia during surgery. The aim of the study was to assess the effect of fentanyl on the hypnotic effect of propofol and the possible clinical implications of this interaction."

Our news editors obtained a quote from the research from the Poznan University of Medical Sciences, "The pharmacokinetic/pharmacodynamic (PK/PD) data were obtained from 11 patients undergoing abdominal aortic surgery, classified as ASA III. Propofol was administered by a target-controlled infusion system. Fentanyl 2-3 µg/kg was given whenever insufficient analgesia occurred. The bispectral index (BIS) was used to monitor the depth of anesthesia. A population PK/PD analysis with a non-linear mixed-effect model (NONMEM 7.2 software) was conducted. Two-compartment models satisfactorily described the PK of propofol and fentanyl. The delay of the anesthetic effect in relation to PK was described by the effect compartment. The BIS was linked to propofol and fentanyl effect-site concentrations through an additive E-max model. sensitive decrement times (CSDT) determined from the final model were used to assess the influence of fentanyl on the recovery after anesthesia. The population PK/PD model was successfully developed to describe simultaneously the time course and variability of propofol and fentanyl concentrations and BIS. Additive propofol-fentanyl interactions were observed and quantitated. The duration of the fentanyl infusion had minimal effect on CSDT when it was shorter than the duration of the propofol infusion. If the fentanyl infusion was longer than the propofol infusion, an almost two-fold increase in CSDT occurred."

According to the news editors, the research concluded: "Additional doses of fentanyl administered after the cessation of the propofol infusion result in lower BIS values, and can prolong the time of recovery from anesthesia."

The news editors report that additional information may be obtained by contacting K. Przybylowski, Poznan Univ Med Sci, Dept. of Clin Pharm & Biopharm, Poznan, Poland.
Additional authors for this research include K. Bieda, K. Przybylowski, R. Hartmann-Sobczynska, A. Borsuk, J. Matysiak, Z.J. Kokot, P. Sobczynski, E. Grzeskowiak and A. Bienert.

Central Nervous System Diseases and Conditions -…

Studies from Public Hospital System Have Provided New Data on Meningeal Neoplasms (Grade II meningiomas and Gamma Knife radiosurgery: analysis of success and failure to improve treatment paradigm)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System Diseases and Conditions - Meningeal Neoplasms are presented in a new report. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "Grade II meningiomas, which currently account for 25% of all meningiomas, are subject to multiple recurrences throughout the course of the disease and represent a challenge for the neurosurgeon. Radiosurgery is increasingly performed for the treatment of Grade II meningiomas and is quite efficient in controlling relapses locally at the site of the lesion, but it cannot prevent margin relapses."

The news reporters obtained a quote from the research from Public Hospital System, "The aim of this retrospective study was to analyze the technical parameters involved in producing marginal relapses and to optimize loco-marginal control to improve therapeutic strategy. Eighteen patients presenting 58 lesions were treated by Gamma Knife radiosurgery (GKRS) between 2010 and 2015 in Hopital de la Pitie-Salpotriere. The median patient age was 68 years (25%-75% interval: 61-72 years), and the sex ratio (M/F) was 13:5. The median delay between surgery and first GKRS was 3 years. Patients were classified as having Grade II meningioma using World Health Organization (WHO) 2007 criteria. The tumor growth rate was computed by comparing 2 volumetric measurements before treatment. After GKRS, iterative MRI, performed every 6 months, detected a relapse if tumor volume increased by more than 20%. Patterns of relapse were defined as being local, marginal, or distal. Survival curves were estimated using the Kaplan-Meier method, and the relationship between criterion and potential risk factors was tested by the log-rank test and univariable Cox model. The median follow-up was 36 months (range 8-57 months). During this period, 3 patients presented with a local relapse, 5 patients with a marginal relapse, and 7 patients with a distal relapse. Crude local control was 84.5%. The local control actuarial rate was 89% at 1 year and 71% at 3 years. The marginal control actuarial rate was 81% at 1 year and 74% at 2 years. The distal control actuarial rate was 100% at 1 year, 81% at 2 years, and 53% at 3 years. Median distal control was 38 months. Progression-free survival (PFS) was 71% at 1 year, 36% at 2 years, and 23% at 3 years. Median PFS was 18 months. Lesions treated with a minimum radiation dose of 12 Gy had significantly more local relapses than those treated with a dose > 12 Gy (p = 0.04) in univariate analysis. Marginal control was significantly influenced by tumor growth rate, with a lower growth rate being highly associated with improved marginal control (p = 0.002). There was a trend toward a relationship between dose and marginal control, but it was not significant (p =...
PFS was significantly associated with delay between first surgery and GKRS (p = 0.03). The authors noticed few complications with no sequelae. In order to optimize loco-marginal control, radiosurgical treatment should require a minimum dose of > 12 Gy and an extended target volume along the dural insertion.

According to the news reporters, the research concluded: "Ideally, these parameters should correspond to the aggressiveness of the lesion, based on genetic features of the tumor."

For more information on this research see: Grade II meningiomas and Gamma Knife radiosurgery: analysis of success and failure to improve treatment paradigm. Journal of Neurosurgery, 2016;125():89-96. Oncology - Breast Cancer

Studies from Pukyong National University Reveal New Findings on Breast Cancer (In Vitro Photodynamic Effect of Phycocyanin against Breast Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating in Busan, South Korea, by NewsRx journalists, research stated, "C-phycocyanin, a natural blue-colored pigment-protein complex was explored as a novel photosensitizer for use in low-level laser therapy under 625-nm laser illumination. C-phycocyanin produced singlet oxygen radicals and the level of reactive oxygen species (ROS) were raised in extended time of treatment."

The news reporters obtained a quote from the research from Pukyong National University. "It did not exhibit any visible toxic effect in the absence of light. Under 625-nm laser irradiation, c-phycocyanin generated cytotoxic stress through ROS induction, which killed MDA-MB-231 breast cancer cells depending on concentrations. Different fluorescent staining of laser-treated cells explored apoptotic cell death characteristics like the shrinking of cells, cytoplasmic condensation, nuclei cleavage, and the formation of apoptotic bodies."

According to the news reporters, the research concluded: "Phycocyanin is a non-toxic fluorescent pigment that can be used in low-level light therapy."

For more information on this research see: In Vitro Photodynamic Effect of Phycocyanin against Breast Cancer Cells. Molecules, 2016;21(11):748-759. Molecules can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. (Springer - www.springer.com; Molecules - www.springerlink.com/content/1420-3049/)

**Mycobacterium Infections - Tuberculosis**

**Studies from Pusan National University Further Understanding of Tuberculosis (Molecular Strain Typing of Mycobacterium tuberculosis: A Review of Frequently Used Methods)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news reporting out of Yangsan, South Korea, by NewsRx editors, research stated, "Tuberculosis, caused by the bacterium Mycobacterium tuberculosis, remains one of the most serious global health problems. Molecular typing of M. tuberculosis has been used for various epidemiologic purposes as well as for clinical management."

Our news journalists obtained a quote from the research from Pusan National University, "Currently, many techniques are available to type M. tuberculosis. Choosing the most appropriate technique in accordance with the existing laboratory conditions and the specific features of the geographic region is important. Insertion sequence IS6110-based restriction fragment length polymorphism (RFLP) analysis is considered the gold standard for the molecular epidemiologic investigations of tuberculosis. However, other polymerase chain reaction-based methods such as spacer oligonucleotide typing (spoligotyping), which detects 43 spacer sequence-interspersing direct repeats (DRs) in the genomic DR region; mycobacterial interspersed repetitive units-variable number tandem repeats, (MIRU-VNTR), which determines the number and size of tandem repetitive DNA sequences; repetitive-sequence-based PCR (rep-PCR), which provides high-throughput genotypic fingerprinting of multiple Mycobacterium species; and the recently developed genome-based whole genome sequencing methods demonstrate similar discriminatory power and greater convenience."

According to the news editors, the research concluded: "This review focuses on techniques frequently used for the molecular typing of M. tuberculosis and discusses their general aspects and applications."

Our news journalists report that additional information may be obtained by contacting C.L. Chang, Pusan National University, Dept. of Lab Med, Yangsan Hosp, Yangsan 50612, South Korea. Additional authors for this research include W.W. Aung, J.S. Lee, G.E. Choi and C.L. Chang.
Studies from Quaid-I-Azam University Yield New Information about Nanoparticles (Green synthesis of silver nanoparticles via plant extracts: beginning a new era in cancer theranostics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nanotechnology - Nanoparticles. According to news reporting originating from Islamabad, Pakistan, by NewsRx correspondents, research stated, "With the development of the latest technologies, scientists are looking to design novel strategies for the treatment and diagnosis of cancer. Advances in medicinal plant research and nanotechnology have attracted many researchers to the green synthesis of metallic nanoparticles due to its several advantages over conventional synthesis (simple, fast, energy efficient, one pot processes, safer, economical and biocompatibility)."

Our news editors obtained a quote from the research from Quaid-I-Azam University, "Medicinally active plants have proven to be the best reservoirs of diverse phytochemicals for the synthesis of biogenic silver nanoparticles (AgNPs). In this review, we discuss mechanistic advances in the synthesis and optimization of AgNPs from plant extracts. Moreover, we have thoroughly discussed the recent developments and milestones achieved in the use of biogenic AgNPs as cancer theranostic agents and their proposed mechanism of action."

According to the news editors, the research concluded: "Anticipating all of the challenges, we hope that biogenic AgNPs may become a potential cancer theranostic agent in the near future."

The news editors report that additional information may be obtained by contacting M. Ovais, Quaid I Azam Univ, Dept. of Biotechnol, Islamabad, Pakistan. Additional authors for this research include A.T. Khalil, A. Raza, M.A. Khan, I. Ahmad, N. U. Islam, M. Saravanan, M.F. Ubaid, M. Ali and Z.K. Shinwari.

Studies from Queen's University in the Area of Cardiology Described
(Validation of a Novel Digital Tool in Automatic Scoring of an Online ECG Examination at an International Cardiology Meeting)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiology is now available. According to news originating from Kingston, Canada, by NewsRx correspondents, research stated, "We have previously developed a novel digital tool capable of automatically recognizing correct electrocardiography (ECG) diagnoses in an online exam and demonstrated a significant improvement in diagnostic accuracy when utilizing an inductive-deductive reasoning strategy over a pattern recognition strategy. In this study, we sought to validate these findings from participants at the International Winter Arrhythmia School meeting, one of the foremost electrophysiology events in Canada."

Our news journalists obtained a quote from the research from Queen's University, "Preregistration to the event was sent by e-mail. The exam was administered on day 1 of the conference. Results and analysis were presented the following morning to participants. Twenty-five attendees completed the exam, providing a total of 500 responses to be marked. The online tool accurately identified 195 of a total of 395 (49%) correct responses (49%). In total, 305 responses required secondary manual review, of which 200 were added to the correct responses pool. The overall accuracy of correct ECG diagnosis for all participants was 69% and 84% when using pattern recognition or inductive-deductive strategies, respectively. Utilization of a novel digital tool to evaluate ECG competency can be set up as a workshop at international meetings or educational events."

According to the news editors, the research concluded: "Results can be presented during the sessions to ensure immediate feedback."

The news correspondents report that additional information may be obtained from A. Baranchuk, Queen's University, Kingston Gen Hosp, Arrhythmia Serv, Kingston, ON, Canada. Additional authors for this research include E. Crystal, I. Lashevsky, B. Arouny and A. Baranchuk.

Keywords for this news article include: Kingston, Ontario, Canada, North and Central America, Cardiology, Queen's University.

Clinical Research - Clinical Trials and Studies

Studies from R.B. Verheijen and Co-Researchers Yield New Data on Clinical Trials and Studies (Individualized Pazopanib Dosing: A Prospective Feasibility Study in Cancer Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Clinical Research - Clinical Trials and Studies is the subject of a report. According to news originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Pazopanib is a tyrosine kinase inhibitor approved for the treatment of renal cell carcinoma and soft tissue sarcoma. Retrospective analyses have shown that an increased median progression-free survival and tumor shrinkage appear in patients with higher plasma trough levels (C-min)."

Our news journalists obtained a quote from the research, "Therefore, patients with low Cmin might benefit from pharmacokinetically guided individualized dosing. We conducted a prospective multicenter trial in 30 patients with advanced solid tumors. Pazopanib Cmin was measured weekly by LC-MS/MS. At weeks 3, 5, and 7, the pazopanib dose was increased if the measured Cmin was <20 mg/L and toxicity was <grade 3. In total, 17 patients had at least one Cmin <20 mg/L at weeks 3, 5, and 7. Of these, 10 were successfully treated with a pharmacokinetically guided dose escalation, leading to daily dosages ranging from 1,000 to 1,800 mg. C-min in these patients increased significantly from 13.2 (38.0%) mg/L [mean (CV%)] to 22.9 mg/L (44.9%). Thirteen patients had all C-min levels >= 20.0 mg/L. Of these, 9 patients with a high C-min of 51.3 mg/L (45.1%) experienced >= grade 3 toxicity and subsequently required a dose reduction to 600 or 400 mg daily, yet in these patients, Cmin remained above the threshold at 28.2 mg/L (25.3%). A pharmacokinetically guided individualized dosing algorithm was successfully applied and evaluated. The dosing algorithm led to patients being treated at dosages ranging from 400 to 1,800 mg daily."

According to the news editors, the research concluded: "Further studies are needed to show a benefit of individualized dosing on clinical outcomes, such as progression-free survival."

Hematologic Diseases and Conditions - Anemia

Studies from R.V. Boccia and Colleagues Yield New Information about Anemia (Efficacy and safety of darbepoetin alfa initiated at hemoglobin <= 10 g/dL in patients with stage IV cancer and chemotherapy-induced anemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematologic Diseases and Conditions - Anemia have been published. According to news reporting out of Bethesda, Maryland, by NewsRx editors, research stated, "Data on efficacy and safety of darbepoetin alfa (DA) administered at hemoglobin (Hb) <= 10 g/dL are limited. In this analysis, we examined DA's efficacy and safety in patients with Stage IV cancers and chemotherapy-induced anemia (CIA) initiated on DA at Hb <= 10 g/dL."

Our news journalists obtained a quote from the research, "Data for patients with Stage IV cancers and CIA and who initiated DA at Hb <= 10 g/dL. were extracted from three phase 3 trials identified in a central database of Amgen-sponsored DA studies in CIA. Efficacy outcomes were assessed by achievement of Hb increases of >= 1 g/dL and >= 2 g/dL and red blood cell (RBC) or whole blood transfusion requirements. Data were analyzed for all patients with baseline Hb <= 10 g/dL, and by the subgroups of patients with baseline Hb >= 9 to <= 10 g/dL versus <9 g/dL. Crude and Kaplan-Meier proportions of patients who experienced each outcome and time (days) to each outcome were summarized by treatment. Meta-analysis (fixed-effects inverse-variance model) was performed to compare outcomes for DA versus placebo. Safety was assessed by occurrence of adverse events. Data from 213 patients were analyzed: DA, n = 115; placebo, n = 98. More patients in the DA versus the placebo subgroup achieved Hb increase of >= 1 g/dL (72% vs. 36%; HR: 2.92, 95% CI: 1.95, 4.39) and >= 2 g/dL (44% vs. 18%; HR: 2.98, 95% CI: 1.71, 5.21) during the first 12 treatment weeks. Median times to Hb increase of >= 1 g/dL and <= 2 g/dL were 36 days and 78 days for DA, respectively. RBC or whole blood transfusions were less common in patients in the DA versus the placebo subgroup (24% vs. 45%; HR: 0.44, 95% CI: 0.27, 0.73). No new safety issues were reported."

According to the news editors, the research concluded: "Our results confirm that DA use in patients with Stage IV cancer and CIA is more effective than placebo at increasing Hb levels and at reducing transfusion needs when DA treatment is initiated at Hb <= 10 g/dL."

Our news journalists report that additional information may be obtained by contacting R.V. Boccia, Center Canc & Blood Disorders, Bethesda, MD 20817, United States. Additional authors for this research include D.H. Henry, L. Belton, C. Bohac and H.H. Ghazal.

Keywords for this news article include: Bethesda, Maryland, United States, North and Central America, Hemic and Lymphatic Diseases and Conditions, Hematologic Diseases and Conditions, Drugs and Therapies, Blood Proteins, Chemotherapy, Hemoglobins, Oncology, Globins, Cancer, Anemia.

Studies from R.W. Bussmann and Co-Researchers Update Current Data on Ethnopharmacology (Changing markets - Medicinal plants in the markets of La Paz and El Alto, Bolivia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Ethnopharmacology. According to news reporting originating from La Paz, Bolivia, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: Given the importance of local markets as a source of medicinal plants for both healers and the population, literature on market flows and the value of the plant material traded is rather scarce. This stands in contrast to wealth of available information for other components of Bolivian ethnobotany."

Our news editors obtained a quote from the research, "The present study attempts to remedy this situation by providing a detailed inventory of medicinal plant markets in the La Paz-El Alto metropolitan area, hypothesizing that both species composition, and medicinal applications, have changed considerably over time. From October 2013-October 2015 semi-structured interviews were conducted with 39 plant vendors between October 2013 and October 2015 in the Mercado Rodriguez, Mercado Calle Santa Cruz, Mercado Cohoni, Mercado Cota Cota, and Mercado Seguencoma and Mercado El Alto in order to elucidate more details on plant usage and provenance. The results of the present study were then compared to previous inventories of medicinal plants in La Paz and El Alto studies to elucidate changes over time and impact of interview techniques. In this study we encountered 163 plant species belonging to 127 genera and 58 families. In addition, 17 species could not be identified. This species richness is considerably higher than that reported in previous studies (2005, 129 species of 55 families; 2015, 94 identified species). While the overall distribution of illness categories is in line with older reports the number of species used per application, as well as the applications per species, were much higher in the present study. Overall, informant consensus was relatively low, which might be explained by the large number of new species that have entered the local pharmacopoeia in the last decade, although some species might simply have been missed by previous studies. In course of the present study it became apparent that even well known species might often be replaced by other apparently similar but botanically unrelated species due to environmental and market forces. Conclusions: The present study indicated that, while the floristic composition of markets in the La Paz metropolitan area remained relatively constant over the last decade, with this inventory adding about 20% of species to previous studies, the number of indications for which certain species were used increased tremendously, and that profound differences exist even between markets in close proximity. The dramatic increase in previously not used species used per indication might pose serious risks for consumers. We found serious problems due to species replacements. Even plants that have a well established vernacular name, and are easily recognizable botanically, can be replaced by other species that can pose a serious health risk."

According to the news editors, the research concluded: "Vendor education and stringent identification of the material sold in public markets are clearly needed."

For more information on this research see: Changing markets - Medicinal plants in the markets of La Paz and El Alto, Bolivia. *Journal of Ethnopharmacology*, 2016;193():76-95. *Journal of Ethnopharmacology* can be contacted at: Elsevier Ireland Ltd, Elsevier House,
Studies from RIKEN Reveal New Findings on Science (SARS-CoV 3CL protease cleaves its C-terminal autoprocessing site by novel subsite cooperativity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Science are discussed in a new report. According to news reporting originating in Kanagawa, Japan, by NewsRx journalists, research stated, "The 3C-like protease (3CL(pro)) of severe acute respiratory syndrome coronavirus (SARS-CoV) cleaves 11 sites in the polyproteins, including its own N- and C-terminal autoprocessing sites, by recognizing P4-P1 and P1'. In this study, we determined the crystal structure of 3CLpro with the C-terminal prosequence and the catalytic-site C145A mutation, in which the enzyme binds the C-terminal prosequence of another molecule."

Financial support for this research came from Japan Society for the Promotion of Science (JSPS).

The news reporters obtained a quote from the research from RIKEN, "Surprisingly, Phe at the P3' position [Phe(P3')] is snugly accommodated in the S3' pocket. Mutations of Phe (P3') impaired the C-terminal autoprocessing, but did not affect N-terminal autoprocessing. This difference was ascribed to the P2 residue, Phe(P2) and Leu(P2), in the C- and N-terminal sites, as follows. The S3’ subsite is formed by Phe(P2)-induced conformational changes of 3CLpro and the direct involvement of Phe(P2) itself. In contrast, the N-terminal prosequence with Leu(P2) does not cause such conformational changes for the S3’ subsite formation. In fact, the mutation of Phe(P2) to Leu in the C-terminal autoprocessing site abolishes the dependence on Phe(P3'). These mechanisms explain why Phe is required at the P3' position when the P2 position is occupied by Phe rather than Leu, which reveals a type of subsite cooperativity. Moreover, the peptide consisting of P4-P1 with Leu(P2) inhibits protease activity, whereas that with Phe (P2) exhibits a much smaller inhibitory effect, because Phe(P3') is missing."

According to the news reporters, the research concluded: "Thus, this subsite cooperativity likely exists to avoid the auto-inhibition of the enzyme by its mature C-terminal sequence, and to retain the efficient C-terminal autoprocessing by the use of Phe(P2)."

Our news correspondents report that additional information may be obtained by contacting T. Muramatsu, RIKEN, Struct Biol Lab, Yokohama, Kanagawa 2300045, Japan. Additional authors for this research include C. Takemoto, Y.T. Kim, H.F. Wang, W. Nishii, T. Terada, M. Shirouzu and S. Yokoyama.

Eye Diseases and Conditions - Amblyopia

Studies from Radboud University Describe New Findings in Amblyopia (Ocular Manifestations of Noonan Syndrome: A Prospective Clinical and Genetic Study of 25 Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Eye Diseases and Conditions - Amblyopia is now available. According to news reporting originating in Nijmegen, Netherlands, by NewsRx journalists, research stated, "To determine the full spectrum of ocular manifestations in patients with Noonan syndrome (NS). Prospective cross-sectional clinical and genetic study in a tertiary referral center."

The news reporters obtained a quote from the research from Radboud University, "Twenty-five patients with NS (mean age, 14 years; range, 8 months-25 years) clinically diagnosed by validated criteria. All patients were examined by the same team following a detailed study protocol. Genetic analyses were performed in 23 patients. Ocular abnormalities of vision and refraction, external ocular features, ocular position and motility, anterior segment, posterior segment, and intraocular pressure. Ocular features of vision and refraction were amblyopia (32%), myopia (40%), and astigmatism (52%). External ocular features were epicanthic folds (84%), hypertelorism (68%), ptosis (56%), high upper eyelid crease (64%), lower eyelid retraction (60%), abnormal upward slanting palpebral fissures (36%), downward slanting palpebral fissures (32%), and lagophthalmos (28%). Orthoptic abnormalities included strabismus (40%), abnormal stereopsis (44%), and limited ocular motility (40%). Anterior segment abnormalities included prominent corneal nerves (72%) and posterior embryotoxon (32%). Additional ocular features were found, including non-glaucomatous optic disc excavation (20%), relatively low (< 10 mmHg) intraocular pressure (22%), and optic nerve hypoplasia (4%). Mutations were established in 22 patients: 19 PTPN11 mutations (76%), 1 SOS1 mutation, 1 BRAF mutation, and 1 KRAS mutation. The patient with the highest number of prominent corneal nerves had an SOS1 mutation. The patient with the lowest visual acuity, associated with bilateral optic nerve hypoplasia, had a BRAF mutation. Patients with severe ptosis and nearly total absence of levator muscle function had PTPN11 mutations. All patients showed at least 3 ocular features (range, 3-13; mean, 7), including at least 1 external ocular feature in more than 95% of the patients. Noonan syndrome is a clinical diagnosis with multiple genetic bases associated with an extensive variety of congenital ocular abnormalities."
According to the news reporters, the research concluded: "Ocular features of NS are characterized by 1 or more developmental anomalies of the eyelids (involving the position, opening, and closure) associated with various other ocular abnormalities in childhood, including amblyopia, myopia, astigmatism, strabismus, limited ocular motility, prominent corneal nerves, and posterior embryotoxon."

Our news correspondents report that additional information may be obtained by contacting J.R.M. Cruysberg, Radboud University, Medical Center, Dept. of Ophthalmol, Nijmegen, Netherlands. Additional authors for this research include A.M.C. Vos, R.W. Draaijer, I. van der Burgt, J.M.T. Draaisma and J.R.M. Cruysberg.

Sexually Transmitted Diseases and Conditions…

Studies from Radboud University Describe New Findings in Chronic Mucocutaneous Candidiasis (Th2 and Th9 responses in patients with chronic mucocutaneous candidiasis and hyper-IgE syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Sexually Transmitted Diseases and Conditions (STDs) - Chronic Mucocutaneous Candidiasis. According to news reporting out of Nijmegen, Netherlands, by NewsRx editors, research stated, "STAT1 mutations cause chronic mucocutaneous candidiasis (CMC), while STAT3 mutations cause hyper-IgE syndrome (HIES). CMC and HIES patients have T helper (Th) 17 defects suffering from mucosal Candida infections, but only patients with HIES show an allergic phenotype with eczema, eosinophilia and high IgE levels."

Financial supporters for this research include Radboud Universitair Medisch Centrum, Vici Grant of the Netherlands Organization, ERC Consolidator, ERA-Net for Research Programmes on Rare Diseases (EURO-CMC).

Our news journalists obtained a quote from the research from Radboud University, "We investigated whether differential Th2 and Th9 responses may explain the clinical differences. Peripheral blood mononuclear cells of patients with CMC (n = 4), patients with HIES (n = 4), patients with atopic dermatitis (n = 4) and healthy volunteers (n = 13) were stimulated with Candida and Staphylococcus aureus, with and without IL-4. The cytokines IL-5,
IL-13, IL-9, IL-17 and TGFβ and regulatory T cells were measured in cell culture supernatants by ELISA or flow cytometry, respectively. Peripheral blood mononuclear cells of patients with CMC showed a significantly impaired production of the Th2 cytokines IL-5 and IL-13, especially in the presence of IL4. Moreover, IL-9 production was significantly lower in patients with CMC compared to healthy controls. In contrast, patients with HIES and patients with AD showed normal IL5 and IL-13 production, while IL-9 production was significantly lower in patients with HIES compared to healthy controls. Although TGFβ was involved in the IL-4-induced IL-9 production, TGFβ levels and the frequency of regulatory T cells did not differ between patients with HIES and controls. Flow cytometry analysis demonstrated an IL-9 + IL17 + CD4 + subset in healthy controls after stimulation with Candida which was less present in patients with HIES. Patients with CMC have a general Th defect including Th2 and Th9, while patients with HIES have normal Th2 cytokines. These differences are in line with their clinical presentation.

According to the news editors, the research concluded: "Surprisingly, the allergic cytokine IL-9 was deficient in both HIES and CMC, suggesting a Th-17-derived origin."

For more information on this research see: Th2 and Th9 responses in patients with chronic mucocutaneous candidiasis and hyper-IgE syndrome. Clinical and Experimental Allergy, 2016;46(12):1564-1574. Clinical and Experimental Allergy can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
stated, "Cervical cancer cells commonly harbour a defective G1/S checkpoint owing to the interaction of viral oncoproteins with p53 and retinoblastoma protein. The activation of the G2/M checkpoint may thus become essential for protecting cancer cells from genotoxic insults, such as chemotherapy."

The news correspondents obtained a quote from the research from Regina Elena Cancer Institute, "In 52 cervical cancer patients treated with neoadjuvant chemotherapy, we investigated whether the levels of phosphorylated Wee1 (pWee1), a key G2/M checkpoint kinase, and g-H2AX, a marker of DNA double-strand breaks, discriminated between patients with a pathological complete response (pCR) and those with residual disease. We also tested the association between pWee1 and phosphorylated Chk1 (pChk1), a kinase acting upstream Wee1 in the G2/M checkpoint pathway. pWee1, g-H2AX and pChk1 were retrospectively assessed in diagnostic biopsies by immunohistochemistry. The degrees of pWee1 and pChk1 expression were defined using three different classification methods, i.e., staining intensity, Allred score, and a multiplicative score. g-H2AX was analyzed both as continuous and categorical variable. Irrespective of the classification used, elevated levels of pWee1 and g-H2AX were significantly associated with a lower rate of pCR. In univariate and multivariate analyses, pWee1 and g-H2AX were both associated with reduced pCR. Internal validation conducted through a re-sampling without replacement procedure confirmed the robustness of the multivariate model. Finally, we found a significant association between pWee1 and pChk1. The message conveyed by the present analysis is that biomarkers of DNA damage and repair may predict the efficacy of neoadjuvant chemotherapy in cervical cancer."

According to the news reporters, the research concluded: "Further studies are warranted to prospectively validate these encouraging findings."

Our news journalists report that additional information may be obtained by contacting P. Vici, Division of Medical Oncology B, Regina Elena National Cancer Institute, Rome, Italy. Science

**Studies from Research Center Have Provided New Data on Science**

(High dose CD11c-driven IL15 is sufficient to drive NK cell maturation and anti-tumor activity in a trans-presentation independent manner)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science. According to news originating from Borstel, Germany, by NewsRx correspondents, research stated, "The common gamma (gc)-chain cytokine interleukin 15 (IL15) is a multifunctional immune-modulator which impacts the generation, maturation and activity of many cell types of the innate, as well as the adaptive immune system, including natural killer (NK) and CD8(+) T cells. Using a new series of transgenic mice, we analyzed the in vivo potential of IL15 as an immune-regulator when available at different concentrations or delivery modes, i.e. soluble monomer or complexed to its specific receptor a (Ra)-chain."

Our news journalists obtained a quote from the research from Research Center, "We have identified distinct effects on selected IL15-responsive populations. While CD8(+) T cells required complexed forms of IL15/IL15Ra for full functionality, mature NK populations were rescued in an IL15/IL15Ra-deficient environment by high levels of CD11c-restricted IL15. These IL15-conditions were sufficient to limit tumor formation in a lung metastasis model indicating that the NK cell populations were fully functional."

According to the news editors, the research concluded: "These data underline the potential of 'free' IL15 in the absence of Ra-complex as a powerful and specific immuno-modulator, which may be beneficial where selective immune-activation is desired."

For more information on this research see: High dose CD11c-driven IL15 is sufficient to drive NK cell maturation and anti-tumor activity in a trans-presentation independent manner. Scientific Reports, 2016;6():19699. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Studies from Research Institute Have Provided New Data on Hypertension (Perindopril Attenuates Lipopolysaccharide-Induced Amyloidogenesis and Memory Impairment by Suppression of Oxidative Stress and RAGE Activation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Hypertension is the subject of a report. According to news reporting originating from Lucknow, India, by NewsRx correspondents, research stated, "Clinical and preclinical studies account hypertension as a risk factor for dementia. We reported earlier that angiotensin-converting enzyme (ACE) inhibition attenuated the increased vulnerability to neurodegeneration in hypertension and prevented lipopolysaccharide (LPS)-induced memory impairment in normotensive wistar rats
(NWRs) and spontaneously hypertensive rats (SHRs)."

Funders for this research include Indian Council of Medical Research, University Grants Commission.

Our news editors obtained a quote from the research from Research Institute, "Recently, a receptor for advanced glycation end products (RAGE) has been reported to induce amyloid beta (Ab1-42) deposition and memory impairment in hypertensive animals. However, the involvement of ACE in RAGE activation and amyloidogenesis in the hypertensive state is still unexplored. Therefore, in this study, we investigated the role of ACE on RAGE activation and amyloidogenesis in memory-impaired NWRs and SHRs. Memory impairment was induced by repeated (on days 1, 4, 7, and 10) intracerebroventricular (ICV) injections of LPS in SHRs (25 mg) and NWRs (50 mg). Our data showed that SHRs exhibited increased oxidative stress (increased gp91-phox/NOX-2 expression and ROS generation), RAGE, and b-secretase (BACE) expression without Ab1-42 deposition. LPS (25 mg, ICV) further amplified oxidative stress, RAGE, and BACE activation, culminating in Ab1-42 deposition and memory impairment in SHRs. Similar changes were observed at the higher dose of LPS (50 mg, ICV) in NWRs. Further, LPS-induced oxidative stress was associated with endothelial dysfunction and reduction in cerebral blood flow (CBF), more prominently in SHRs than in NWRs. Finally, we showed that perindopril (0.1 mg/kg, 15 days) prevented memory impairment by reducing oxidative stress, RAGE activation, amyloidogenesis, and improved CBF in both SHR and NWRs."

According to the news editors, the research concluded: "These findings suggest that perindopril might be used as a therapeutic strategy for the early stage of dementia."

For more information on this research see: Perindopril Attenuates Lipopolysaccharide-Induced Amyloidogenesis and Memory Impairment by Suppression of Oxidative Stress and RAGE Activation. Acs Chemical Neuroscience, 2016;7(2):206-17.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Research. According to news reporting out of Tehran, Iran, by NewsRx editors, research stated, "Nowadays, radionuclides with high b-particle energies such as (166)Ho are recommended for bone marrow ablation in patients with multiple myeloma. The addition of skeletal targeted radiotherapy to the patients can improve the response rate in phase I and II trials, with promising long-term survival data."

Our news journalists obtained a quote from the research from Research Institute, "In this work, the absorbed dose to each organ of human for (166)Ho-propylene di-amino tetra methylene phosphonic acid (PDTMP) was evaluated based on biodistribution studies in rats and was compared with (166)Ho-tetraazacyclododecane tetramethylene-phosphonate (DOTMP) as the only clinically used Ho-166 bone marrow ablative agent. In this work, the accumulated activity in animals was extrapolated to the accumulated activity in humans by mass extrapolation method. The absorbed dose to each organ of human for (166)Ho-PDTMP was evaluated by medical internal radiation dose method. In this study, 166 Ho-PDTMP complex was prepared successfully using an in-house synthesized PDTMP ligand and (166)HoCl3. Radiochemical purity of (166)Ho-PDTMP was checked by instant thin layer chromatography (>99%). The biodistribution of (166)Ho-PDTMP in wild-type rats was checked in animal tissues up to 48 h. All values were expressed as mean ± standard deviation, and the data were compared using Student's t-test. Statistical significance was defined as p<0.05. The highest absorbed dose for this complex is observed in red marrow with 0.691 mSv/MBq. (166)Ho-PDTMP demonstrated a higher red marrow: Non target organ uptake ratio compared to (166)Ho-DOTMP."

According to the news editors, the research concluded: "The results showed that 166 Ho-PDTMP has considerable characteristics compared to (166)Ho-DOTMP and therefore can be a good candidate for bone marrow ablation."

For more information on this research see: Preliminary dosimetry of (166)Ho-propylene di-amino tetra (methylenephosphonic acid) for human based on biodistribution data in rats. Journal of Cancer Research and Therapeutics, 2015;11(4):862-7.

Oncology - Basal Cell Cancer

Studies from Research Institute in the Area of Basal Cell Cancer Described (Inhibition of the hedgehog pathway in patients with basal-cell nevus syndrome: final results from the multicentre, randomised, double-blind, placebo-controlled, phase 2 ...)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Basal Cell Cancer have been published. According to news originating from Oakland, California, by NewsRx correspondents, research stated, "Aberrant hedgehog signalling underlies the development of basal-cell carcinomas. We previously reported the interim analysis of a multicentre, randomised, double-blind, placebo-controlled, phase 2 trial in patients with the basal-cell nevus (Gorlin) syndrome indicating that the smoothened inhibitor vismodegib reduces basal-cell carcinoma tumour burden and prevents new basal-cell carcinoma growth in patients with basal-cell nevus syndrome."

Our news journalists obtained a quote from the research from Research Institute, "We report the final results of this 36 month trial. In our multicentre, randomised, double-blind, placebo-controlled, phase 2 trial we enrolled patients aged 35-75 years with basal-cell nevus syndrome with at least ten surgically eligible basal-cell carcinomas at the Children's Hospital Oakland, Columbia University outpatient dermatology clinic (NY, USA) and a private practice outpatient dermatology office in Newport Beach (CA, USA). Patients were assigned to vismodegib or placebo (2: 1) according to a randomisation sequence generated by computer code. The primary endpoint of the trial of 41 patients was to compare the effect of oral vismodegib (150 mg/day) versus placebo on the incidence of new surgically eligible basal-cell carcinomas after 3 months of treatment. In the subsequent, open-label phase (n= 37) patients continued vismodegib at two sites for as long as month 36 (n= 25) and at the third site were monitored up to month 36 (n= 12). Additional endpoints for this phase were: whether continuous versus interrupted dosing differentially affected tumour burden; time to reach various levels of reduction in tumour burden; reduction in tumour size in patients who took less than 50% of the expected number of vismodegib tablets; reduction in the number of surgical excisions required per year before, during, and after treatment; and the effect of vismodegib on hedgehog target gene expression. We monitored patients at visits every 3 months for up to 36 months. The primary endpoint was analysed on a modified intention-to-treat basis. This trial is registered with ClinicalTrials.gov, number NCT00957229. Between Sept 22, 2009, and Jan 24, 2011, 41 patients were monitored for a median of 36 months (IQR 36-36). Patients treated with vismodegib (n= 26) had a mean reduced rate of new surgically eligible basal-cell carcinomas compared with patients randomly assigned to placebo (n= 15; two [SD 0. 12] new surgically eligible basal-cell carcinomas per patient per year vs 34 [1. 32] new surgically eligible basal-cell carcinomas per patient per year, p< 0. 0001). In the 11 patients initially assigned to placebo, mean cross over to vismodegib reduced the development of new surgically eligible basal-cell carcinomas compared with placebo (0. 4 [SD 0. 2] new surgically eligible basal-cell carcinomas per patient per year vs 30. 0 [7. 8] new surgically eligible basal-cell carcinomas per patient per year, p< 0. 0001). Only three (17%) of 18 patients tolerated vismodegib continuously for the full 36 months. Fewer new surgically eligible basal-cell carcinomas developed in patients receiving vismodegib continuously than in those who interrupted dosing (mean 0. 6 [0. 72] new surgically eligible basal-cell carcinomas per patient per year vs 1. 7 [1. 8] new surgically eligible basal-cell carcinomas per patient per year, p< 0. 0001). Treatment-related grade 3-4 adverse events included weight loss of 20% or more (n= 6) and muscle cramps (n= 2). Two patients died during the course of the trial, one each from laryngeal and metastatic prostate cancer, deemed probably unrelated to drug. Vismodegib reduces basal-cell carcinoma tumour burden in patients with basal-cell nevus syndrome."

According to the news editors, the research concluded: "Adverse events associated with vismodegib frequently led to interruption of treatment, which is followed by basal-cell carcinoma recurrence."

For more information on this research see: Inhibition of the hedgehog pathway in

**Oncology - Lung Cancer**

**Studies from Research Institute in the Area of Lung Cancer Reported (Predicting Malignant Nodules from Screening CT Scans)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news reporting originating in Tampa, Florida, by NewsRx journalists, research stated, "The aim of this study was to determine whether quantitative analyses (‘radiomics’) of low-dose computed tomography lung cancer screening images at baseline can predict subsequent emergence of cancer. Public data from the National Lung Screening Trial (ACRIN 6684) were assembled into two cohorts of 104 and 92 patients with screen-detected lung cancer and then matched with cohorts of 208 and 196 screening subjects with benign pulmonary nodules."

Funders for this research include U.S. Public Health Service, Florida Department of Health.

The news reporters obtained a quote from the research from Research Institute, "Image features were extracted from each nodule and used to predict the subsequent emergence of cancer. The best models used 23 stable features in a random forests classifier and could predict nodules that would become cancerous 1 and 2 years hence with accuracies of 80% (area under the curve 0.83) and 79% (area under the curve 0.75), respectively. Radiomics outperformed the Lung Imaging Reporting and Data System and volume-only approaches. The performance of the McWilliams risk assessment model was commensurate."

According to the news reporters, the research concluded: "The radiomics of lung cancer screening computed tomography scans at baseline can be used to assess risk for
development of cancer."

For more information on this research see: Predicting Malignant Nodules from Screening CT Scans. *Journal of Thoracic Oncology*, 2016;11(12):2120-2128. *Journal of Thoracic Oncology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Nervous System Diseases and Conditions - Seizures

**Studies from Royal College of Surgeons in Ireland in the Area of Seizures Described (microRNA targeting of the P2X7 purinoceptor opposes a contralateral epileptogenic focus in the hippocampus)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nervous System Diseases and Conditions - Seizures is the subject of a report. According to news reporting originating in Dublin, Ireland, by NewsRx journalists, research stated, "The ATP-gated ionotropic P2X7 receptor (P2X7R) modulates glial activation, cytokine production and neurotransmitter release following brain injury. Levels of the P2X7R are increased in experimental and human epilepsy but the mechanisms controlling P2X7R expression remain poorly understood."

The news reporters obtained a quote from the research from the Royal College of Surgeons in Ireland, "Here we investigated P2X7R responses after focal-onset status epilepticus in mice, comparing changes in the damaged, ipsilateral hippocampus to the spared, contralateral hippocampus. P2X7R-gated inward currents were suppressed in the contralateral hippocampus and P2rx7 mRNA was selectively uploaded into the RNA-induced silencing complex (RISC), suggesting microRNA targeting. Analysis of RISC-loaded microRNAs using a high-throughput platform, as well as functional assays, suggested the P2X7R is a target of microRNA-22. Inhibition of microRNA-22 increased P2X7R expression and cytokine levels in the contralateral hippocampus after status epilepticus and resulted in more frequent spontaneous seizures in mice. The major pro-inflammatory and hyperexcitability effects of microRNA-22 silencing were prevented in P2rx7(-/-) mice or by treatment with a specific P2X7R antagonist. Finally, in vivo injection of microRNA-22 mimics transiently suppressed spontaneous seizures in mice."

According to the news reporters, the research concluded: "The present study supports a role for post-transcriptional regulation of the P2X7R and suggests therapeutic targeting of"
microRNA-22 may prevent inflammation and development of a secondary epileptogenic focus in the brain."

For more information on this research see: microRNA targeting of the P2X7 purinoceptor opposes a contralateral epileptogenic focus in the hippocampus. Scientific Reports, 2015;5():17486. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Oncology - Sarcomas

Studies from Royal Marsden Hospitals NHS Foundation Trust Have Provided New Information about Sarcomas (Multivisceral resection of retroperitoneal sarcomas in the elderly)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Sarcomas have been published. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Retroperitoneal sarcomas occur in an anatomically complex location often involving several adjacent organs. Surgery with multivisceral resection constitutes the mainstay of curative therapy."

Our news journalists obtained a quote from the research from Royal Marsden Hospitals NHS Foundation Trust, "This study sought to characterise the morbidity and oncological outcomes of surgery for retroperitoneal sarcoma in an elderly population. Patients with primary, localised retroperitoneal sarcoma referred between 1st January 2008 and 31st December 2014 were identified from multidisciplinary meeting records. The proportion of patients proceeding to surgery and oncological outcomes were compared between two groups-those aged >65 years and <65 years. A total of 385 patients were identified. The most common histological subtypes were de-differentiated liposarcoma (40.3%), well-differentiated liposarcoma (19.5%) and leiomyosarcoma (18.2%). A greater proportion of patients aged >65 years did not undergo surgery (41.8% versus 12.0%). The rates of irresectable tumours were similar between cohorts (17.5% versus 11.0%). However, non-operative management due to comorbidities (13.4% versus 0.5%) or patient choice (8.2% versus 0.5%) was more common in patients aged >65 years. 281 patients (73.0%) proceeded to surgery. Patients aged >65 years had a higher rate of peri-operative morbidity (28.3% versus 9.5%), although no difference in peri-
operative mortality or oncological outcomes was noted between age groups. The survival of patients managed non-operatively was significantly shorter than those undergoing surgery (median survival 15 versus 91 months, p< 0.001). Extended resections for primary retroperitoneal sarcoma in the elderly achieve comparable oncological outcomes but with increased rates of morbidity when compared with younger patients."

According to the news editors, the research concluded: "The outcomes of patients unsuitable for surgery are poor regardless of age."

Our news journalists report that additional information may be obtained by contacting D.C. Strauss, Royal Marsden Hosp NHS Fdn Trust, Sarcoma Unit, Academy Dept. of Surg, London, United Kingdom. Additional authors for this research include J.M. Thomas, M.J.F. Smith, A.J. Hayes and D.C. Strauss.

**Oncology - Cervical Cancer**

**Studies from Rutgers State University Yield New Information about Cervical Cancer (Can chemotherapy boost the survival benefit of adjuvant radiotherapy in early stage cervical cancer with intermediate risk factors? A population based study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cervical Cancer have been published. According to news reporting from Newark, New Jersey, by NewsRx journalists, research stated, "The Gynecologic Oncology group (GOG) 0263 trial is currently exploring whether adding chemotherapy to adjuvant radiotherapy improves recurrence-free and/or overall survival in stage IB-IIA cervical cancer patients with pathologic intermediate-risk factors. Using the National Cancer Data Base, we evaluated the benefit of adjuvant chemoradiotherapy over adjuvant radiotherapy alone in the community practice setting."

The news correspondents obtained a quote from the research from Rutgers State University, "The analysis included 869 stage IB-IIA cervical cancer patients who underwent radical hysterectomy retrieving intermediate-risk factors justifying adjuvant therapy. Adjuvant chemoradiotherapy and adjuvant radiotherapy were delivered in 440 and 429 patients, respectively. Chi-square test assessed the distribution of variables in each group and the overall survival was estimated using the Kaplan-Meier method. Proportional hazard models were performed to evaluate the impact of the different prognostic factors on survival and propensity score analysis adjusted variables imbalanced distribution. Adding chemotherapy to ART did not
show a survival benefit at 48 months median follow-up; the 5 year overall survival was 87% and 81% (p = 0.6) in the adjuvant chemoradiotherapy and adjuvant radiotherapy groups, respectively. On univariate analysis, age older than 60, a higher comorbidity score, and stage IIA were significantly associated with worse survival, while none of the other covariates were significant prognosticator on multivariate analysis. The same findings held after propensity score analysis.

According to the news reporters, the research concluded: "Our analysis could not detect a significant survival benefit for adjuvant chemoradiotherapy over adjuvant radiotherapy in women with intermediate-risk factors."

For more information on this research see: Can chemotherapy boost the survival benefit of adjuvant radiotherapy in early stage cervical cancer with intermediate risk factors? A population based study. Gynecologic Oncology. 2016;143(3):539-544. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Gynecologic Oncology - www.journals.elsevier.com/gynecologic-oncology/)

Our news journalists report that additional information may be obtained by contacting O. Mahmoud, Rutgers State University, Dept. of Radiat Oncol, New Jersey Med Sch, Newark, NJ, United States. Additional authors for this research include L. Hathout, S.G. Shaaban, M.A. Elshaikh, S. Beriwal and W. Small.

Oncology - Bladder Cancer

Studies from S. Tsuji et al Further Understanding of Bladder Cancer (Preclinical evaluation of VAX-IP, a novel bacterial minicell-based biopharmaceutical for nonmuscle invasive bladder cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Bladder Cancer. According to news originating from San Diego, California, by NewsRx correspondents, research stated, "The development of new therapies that can prevent recurrence and progression of nonmuscle invasive bladder cancer remains an unmet clinical need. The continued cost of monitoring and treatment of recurrent disease, along with its high prevalence and incidence rate, is a strain on healthcare economics worldwide."

Our news journalists obtained a quote from the research, "The current work describes the characterization and pharmacological evaluation of VAX-IP as a novel bacterial minicell-based biopharmaceutical agent undergoing development for the treatment of nonmuscle invasive bladder cancer and other oncology indications. VAX-IP minicells selectively target two oncology-associated integrin heterodimer subtypes to deliver a unique bacterial cytolysin protein.
toxin, perfringolysin O, specifically to cancer cells, rapidly killing integrin-expressing murine and human urothelial cell carcinoma cells with a unique tumorlytic mechanism. The in vivo pharmacological evaluation of VAX-IP minicells as a single agent administered intravesically in two clinically relevant variations of a syngeneic orthotopic model of superficial bladder cancer results in a significant survival advantage with 28.6% (P = 0.001) and 16.7% (P = 0.003) of animals surviving after early or late treatment initiation, respectively.

According to the news editors, the research concluded: "The results of these preclinical studies warrant further nonclinical and eventual clinical investigation in underserved nonmuscle invasive bladder cancer patient populations where complete cures are achievable."

For more information on this research see: Preclinical evaluation of VAX-IP, a novel bacterial minicell-based biopharmaceutical for nonmuscle invasive bladder cancer. Molecular Therapy-Oncolytics, 2016;3():1-14. Molecular Therapy-Oncolytics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

Oncology - Acute Myeloid Leukemia

Studies from S. Weber and Co-Researchers in the Area of Acute Myeloid Leukemia Reported (Feasibility of BAALC gene expression for detection of minimal residual disease and risk stratification in normal karyotype acute myeloid leukaemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Acute Myeloid Leukemia are discussed in a new report. According to news originating from Munich, Germany, by NewsRx correspondents, research stated, "High BAALC gene expression has been associated with poor prognosis in cytogenetically normal acute myeloid leukaemia (CN-AML) and has been suggested as a suitable marker for assessing minimal residual disease (MRD). The purpose of this study was to substantiate these findings by the analysis of a large data set of 632 diagnostic and follow-up samples in 142 intensively treated CN-AML patients."

Our news journalists obtained a quote from the research, "Paired diagnostic/relapse samples of 35 stable patients revealed stable high BAALC expression in 89%, irrespective of a high proportion of clonal evolution found in 49% of these cases. High BAALC expression, both directly after induction chemotherapy and within 3-6months after induction chemotherapy, correlated significantly with shorter event-free survival and overall survival. Moreover, 8 of 10 patients displaying high BAALC expression levels after completion of induction therapy as well as 5 of 5 patients exhibiting high BAALC expression levels within 3-6months after induction chemotherapy experienced relapse with a median of 197 and 101days, respectively, from sampling to relapse."
According to the news editors, the research concluded: "Thus, BAALC expression-based MRD detection during therapy may be considered a strategy to identify patients at high risk of relapse."

The news correspondents report that additional information may be obtained from S. Weber, MLL Munich Leukaemia Lab, D-81377 Munich, Germany. Additional authors for this research include T. Haferlach, T. Alpermann, K. Perglerova, S. Schnittger, C. Haferlach and W. Kern.

**Oncology - Prostate Cancer**

**Studies from S.P. Heng and Co-Authors Have Provided New Information about Prostate Cancer**

*The influence of the bowel and bladder preparation protocol for radiotherapy of prostate cancer using kilovoltage cone beam CT: Our experience*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting out of Kuala Lumpur, Malaysia, by NewsRx editors, research stated, "The purpose of this study is to determine the influence of bladder and bowel preparation protocols on the dose-volume histograms (DVHs) of these organs using the cone beam computed tomography (CBCT)-based intensity modulated radiotherapy (IMRT) treatment planning for prostate cancer patients. The pelvic DVHs of 12 prostate cancer patients were studied using CBCT images obtained immediately before each treatment."

Our news journalists obtained a quote from the research, "Six patients had bladder and bowel preparation protocol whilst the other six patients were the control group. Contoured bladder and rectal volumes on CBCT images were compared with planning computed tomography. All patients were treated with IMRT with 7800 cGy in 39 fractions over 8 weeks. Compared with the patient with bladder preparation protocol, patients without bladder preparation instruction had higher bladder volume and dose variation. The maximum variation in bladder volume was as high as 98% in the control group. Without bowel preparation protocol, the rectal volumes were more variability. Owing to changes in rectal filling on the day of treatment, the maximum variation in rectal volume was as high as + 96%. With bowel preparation protocol, the maximum rectum volume variations were less than 25%."

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
According to the news editors, the research concluded: "The changes in prostate target dose compared with planning dose were minimal as would be expected from positioning with daily image guidance and gold seed implanted."

Our news journalists report that additional information may be obtained by contacting S.P. Heng, Radiotherapy Unit, Pantai Hospital Kuala Lumpur, 59100, Bukit Pantai, Kuala Lumpur, Malaysia. Additional authors for this research include S.H. Low and K. Sivamany.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0019-509X.178386. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Sarcomas**

**Studies from Sahlgrenska University Reveal New Findings on Sarcomas (Profiling of potential driver mutations in sarcomas by targeted next generation sequencing)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Sarcomas. According to news reporting from Gothenburg, Sweden, by NewsRx journalists, research stated, "Comprehensive genetic profiling by massively parallel sequencing, commonly known as next generation sequencing (NGS), is becoming the foundation of personalized oncology. For sarcomas very few targeted treatments are currently in routine use."

Financial support for this research came from Johan Jansson Foundation.

The news correspondents obtained a quote from the research from Sahlgrenska University, "In clinical practice the preoperative diagnostic workup of soft tissue tumours largely relies on core needle biopsies. Although mostly sufficient for histopathological diagnosis, only very limited amounts of formalin fixated paraffin embedded tissue are often available for predictive mutation analysis. Targeted NGS may thus open up new possibilities for comprehensive characterization of scarce biopsies. We therefore set out to search for driver mutations by NGS in a cohort of 55 clinically and morphologically well characterized sarcomas using low input of DNA from formalin fixated paraffin embedded tissues. The aim was to investigate if there are any recurrent or targetable aberrations in cancer driver genes in addition to known chromosome translocations in different types of sarcomas. We employed a panel covering 207 mutation hotspots in 50 cancer-associated genes to analyse DNA from nine gastrointestinal stromal tumours, 14 synovial sarcomas, seven myxoid liposarcomas, 22 Ewing sarcomas and three Ewing-like small round cell tumours at a large sequencing depth to detect also mutations that are subclonal or occur at low allele frequencies. We found nine mutations in eight different potential driver genes, some of which are potentially actionable by currently
existing targeted therapies. Even though no recurrent mutations in driver genes were found in the different sarcoma groups, we show that targeted NGS-based sequencing is clearly feasible in a diagnostic setting with very limited amounts of paraffin embedded tissue and may provide novel insights into mesenchymal cell signalling and potentially druggable targets."

According to the news reporters, the research concluded: "Interestingly, we also identify five non-synonymous sequence variants in 4 established cancer driver genes in DNA from normal tissue from sarcoma patients that may possibly predispose or contribute to neoplastic development."

Our news journalists report that additional information may be obtained by contacting F. Enlund, Sahlgrenska University, Dept. of Clin Pathol & Genet, S-41345 Gothenburg, Sweden. Additional authors for this research include H. Fagman, M. Hansson and F. Enlund.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cancergen.2016.02.004. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Liver Cancer

**Studies from Saitama Cancer Center Provide New Data on Liver Cancer (Complete response with sorafenib and transcatheter arterial chemoembolization in unresectable hepatocellular carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Liver Cancer have been presented. According to news reporting out of Saitama, Japan, by NewsRx editors, research stated, "Patients with advanced hepatocellular carcinoma (HCC) showing portal vein tumor thrombosis (PVTT) have an extremely poor prognosis. According to treatment guidelines, the only option for HCC patients with PVTT is sorafenib chemotherapy."

Our news journalists obtained a quote from the research from Saitama Cancer Center, "However, in Asia, various treatments have been attempted and possible prolongation of overall survival has been repeatedly reported. We herein report the first case of a patient with an initially unresectable advanced HCC with PVTT who underwent curative hepatectomy after sorafenib and transcatheter arterial chemoembolization (TACE) showing complete histological response. Two months after induction with sorafenib, a significant decrease in serum alphafetoprotein level was observed and computed tomography imaging showed a significant decrease in tumor size. Because of remaining PVTT, TACE and curative resection were performed."

According to the news editors, the research concluded: "The combination of
sorafenib and TACE may be an effective treatment for HCC patients with PVTT.

Our news journalists report that additional information may be obtained by contacting M. Takano, Saitama Canc Center, Div Gastroenterol Surg, Ina, Saitama 3620806, Japan. Additional authors for this research include T. Kokudo, Y. Miyazaki, Y. Kageyama, A. Takahashi, K. Amikura and H. Sakamoto.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i42.9445. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antimicrobials

Studies from Sakarya University Yield New Data on Antimicrobials (A rare cause of infection, Raoultella planticola: emerging threat and new reservoir for carbapenem resistance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antimicrobials have been presented. According to news reporting from Sakarya, Turkey, by NewsRx journalists, research stated, "Severe cases of infections caused by Raoultella planticola are constantly being reported from all over the world with the increase in drug-resistance patterns. In this study, we retrospectively evaluated the clinical characteristics of R. planticola infections with patients' demographics and antimicrobial susceptibilities of the R. planticola isolates. R. planticola isolates were retrospectively evaluated."

The news correspondents obtained a quote from the research from Sakarya University, "VITEK 2 ® automated system was used for identification and antimicrobial susceptibility testing. Verification of the low-discriminated isolates was analyzed with MALDI-TOF method using VITEK MS ® system. Gene-Xpert ® system was used for detection of bla (IMP-1)-, bla(KPC)-; bla(NDM-1)-, bla(OXA-48)- and bla(VIM)-type carbapenemases. The data of the patients with R. planticola infection were collected from hospital records. During the 4-year period, 42 episodes of R. planticola infections were detected. MALDI-TOF was used for 11 of the low-discriminated isolates, and 1 of which identified as R. terrigena was excluded. Carbapenems and aminoglycosides were the most effective antimicrobial agents. Extended spectrum beta-lactamases were detected in seven of the isolates. Three carbapenem-resistant isolates were detected as bla(OXA-48)-type carbapenemase carrier. Nosocomial R. planticola infections constituted 80.9 % (n = 34) of the infections. Most common infections related with R. planticola were blood stream infections (n = 24) (p < 0.005). The presence of indwelling catheter and intensive care unit stay were the most common detected risk factors (p < 0.005).
Diabetes mellitus and chronic renal insufficiency commonly accompanied the infections ($p > 0.005$). Challenging infections caused by Raoultella spp., like those of multidrug resistant Klebsiella spp., will probably become a concern for clinicians as well as microbiologists.

According to the news reporters, the research concluded: "In literature, there were few cases, but we believe that the incidence of Raoultella spp. infections, which may result from misidentification, are more common than expected, and it is not unlikely that there will be a gradual increase and spread in multidrug-resistant isolates."

For more information on this research see: A rare cause of infection, Raoultella planticola: emerging threat and new reservoir for carbapenem resistance. *Infection*, 2016;44 (6):713-717. *Infection* can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. **Stem Cell Research**

**Studies from Salk Institute for Biological Studies Have Provided New Data on Stem Cell Research (3D Culture Supports Long-Term Expansion of Mouse and Human Nephrogenic Progenitors)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stem Cell Research. According to news reporting from La Jolla, California, by NewsRx journalists, research stated, "Transit-amplifying nephron progenitor cells (NPCs) generate all of the nephrons of the mammalian kidney during development. Their limited numbers, poor in vitro expansion, and difficult accessibility in humans have slowed basic and translational research into renal development and diseases."

The news correspondents obtained a quote from the research from Salk Institute for Biological Studies, "Here, we show that with appropriate 3D culture conditions, it is possible to support long-term expansion of primary mouse and human fetal NPCs as well as NPCs derived from human induced pluripotent stem cells (iPSCs). Expanded NPCs maintain genomic stability, molecular homogeneity, and nephrogenic potential in vitro, ex vivo, and in vivo. Cultured NPCs are amenable to gene targeting and can form nephron organoids that engraft in vivo, functionally couple to the host's circulatory system, and produce urine-like metabolites via filtration."

According to the news reporters, the research concluded: "Together, these findings provide a technological platform for studying human nephrogenesis, modeling and diagnosing..."
renal diseases, and drug discovery."

For more information on this research see: 3D Culture Supports Long-Term Expansion of Mouse and Human Nephrogenic Progenitors. *Cell Stem Cell*, 2016;19(4):516-529. *Cell Stem Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. **Heart Disorders and Diseases - Acute Coronary...**

**Studies from San Antonio Military Medical Center Add New Findings in the Area of Acute Coronary Syndrome (Best Clinical Practice: Current Controversies In Evaluation Of Low-risk Chest Pain-part 1)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Acute Coronary Syndrome. According to news reporting originating in Fort Sam Houston, Texas, by NewsRx journalists, research stated, "Chest pain is a common presentation to the emergency department (ED), though the majority of patients are not diagnosed with acute coronary syndrome (ACS). Many patients are admitted to the hospital due to fear of ACS."

The news reporters obtained a quote from the research from San Antonio Military Medical Center, "Our aim was to investigate controversies in low-risk chest pain evaluation, including risk of missed ACS, stress test, and coronary computed tomography angiography (CCTA). Chest pain accounts for 10 million ED visits in the United States annually. Many patients are at low risk for a major cardiac adverse event (MACE). With negative troponin and nonischemic electrocardiogram (ECG), the risk of MACE and myocardial infarction (MI) is < 1%. The American Heart Association recommends further evaluation in low-to intermediate-risk patients within 72 h. These modalities add little to further risk stratification. These evaluations do not appropriately risk stratify patients who are already at low risk, nor do they diagnose acute MI. CCTA is an anatomic evaluation of the coronary vasculature with literature support to decrease ED length of stay, though it is associated with downstream testing. Literature is controversial concerning further risk stratification in already low-risk patients. With nonischemic ECG and negative cardiac biomarker, the risk of ACS approaches < 1%. Use of stress test and CCTA for risk stratification of low-risk chest pain patients is controversial. These tests may allow prognostication but do not predict ACS risk beyond ECG and troponin."

According to the news reporters, the research concluded: "CCTA may be useful for
intermediate-risk patients, though further studies are required."

Our news correspondents report that additional information may be obtained by contacting B. Long, San Antonio Military Med Center, Dept. of Emergency Med, Fort Sam Houston, TX 78234, United States.

**Hematologic Diseases and Conditions - Sickle Cell**

**Studies from San Antonio Military Medical Center Reveal New Findings on Sickle Cell Anemia (Emergency Medicine Management Of Sickle Cell Disease Complications: An Evidence-based Update)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hematologic Diseases and Conditions - Sickle Cell Anemia. According to news reporting from Fort Sam Houston, Texas, by NewsRx journalists, research stated, "Sickle cell disease (SCD) affects approximately 100,000 individuals in the United States. Due to alterations in the structural conformation of hemoglobin molecules under deoxygenated conditions, patients with SCD are predisposed to numerous sequelae, many of which require acute intervention."

The news correspondents obtained a quote from the research from San Antonio Military Medical Center. "Our aim was to provide emergency physicians with an evidence-based update regarding the diagnosis and management of SCD complications. SCD patients experience significant morbidity and mortality secondary to cerebrovascular accident, acute chest syndrome, acute vaso-occlusive pain crises, SCD-related multi-organ failure, cholecystitis, acute intrahepatic cholestasis, acute sickle hepatic crisis, acute hepatic sequestration, priapism, and renal disease. Emergency physicians must recognize acute manifestations of SCD in order to deliver timely management and determine patient disposition. A comprehensive review of the emergency department management of acute SCD complications is provided."

According to the news reporters, the research concluded: "Comprehensive understanding of these aspects of SCD can assist physicians in expediting patient evaluation and treatment, thus decreasing the morbidity and mortality associated with this hemoglobinopathy."

Studies from Sanjay Gandhi Post Graduate Institute of Medical Science Add New Findings in the Area of Diabetic Nephropathy (Greater efficacy of atorvastatin versus a non-statin lipid-lowering agent against renal injury: potential role as a ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Diabetic Nephropathy. According to news reporting originating from Uttar Pradesh, India, by NewsRx correspondents, research stated, "Statins, 3-hydroxy-3-methyl-glutaryl-coenzyme A reductase inhibitors have been shown to improve diabetic nephropathy. However, whether they provide protection via Histone deacetylases (HDAC) inhibition is not clear."

Our news editors obtained a quote from the research from the Sanjay Gandhi Post Graduate Institute of Medical Science, "We conducted a comparative evaluation of Atorvastatin (AT) versus the nonstatin cholesterol-lowering drug, Ezetimibe (EZT) on severity of diabetic nephropathy. Streptozotocin-treated male Wistar rats were fed a cholesterol-supplemented diet and gavaged daily with vehicle, AT or EZT. Control rats received normal diet and gavaged vehicle (n = 8-9/group). Diabetes increased blood glucose, urine albumin-to-creatinine ratio (ACR), kidney pathology and HDAC activity, and reduced renal E-cadherin levels. Both AT and EZT reduced circulating cholesterol, attenuated renal pathology, and did not lower blood glucose. However, AT was significantly more effective than EZT at reducing kidney pathology and HDAC activity. Chromatin immunoprecipitation revealed a significantly higher association of acetylated H3 and H4 with the E-cadherin promoter in kidneys from AT-, relative to EZT-or vehicle-treated rats. Moreover, we demonstrated a direct effect of AT, but not EZT, on HDAC-inhibition and, H3 and H4-acetylation in primary glomerular mesangial cells. Overall, both AT and EZT attenuated diabetic nephropathy; however, AT exhibited greater efficacy despite a similar reduction in circulating cholesterol."

According to the news editors, the research concluded: "HDAC-inhibition may underlie greater efficacy of statins in attenuating kidney injury."

For more information on this research see: Greater efficacy of atorvastatin versus a non-statin lipid-lowering agent against renal injury: potential role as a histone deacetylase inhibitor. Scientific Reports, 2016;6():1-16. Scientific Reports can be contacted at: Nature
Studies from Sao Paulo Federal University Update Current Data on Genitourinary Tract Agents (Quality of oxytocin available in low- and middle-income countries: a systematic review of the literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Genitourinary Tract Agents are presented in a new report. According to news reporting from Sao Paulo, Brazil, by NewsRx journalists, research stated, "Oxytocin is the drug of choice for preventing and treating postpartum haemorrhage, an important cause of maternal death. Oxytocin is widely available in low and middle-income countries (LMIC) but there are concerns about its quality."

Financial support for this research came from Merck.

The news correspondents obtained a quote from the research from Sao Paulo Federal University, "To identify, critically appraise and synthesise the findings of studies on the quality of oxytocin available in LMIC. We searched seven electronic databases, without language restriction. Studies reporting results of tests to assess quality of oxytocin samples from LMIC. Study selection, data extraction and quality assessment were performed in duplicate. Results are presented descriptively. The search identified 2611 unique citations; eight studies, assessing 559 samples from 15 different countries were included. Most samples were collected from facility level settings (n=509) and from the private sector (n=321). The median prevalence of oxytocin samples that failed quality tests was 45.6% (range 0-80%), mostly due to insufficient amounts of active pharmacological ingredient. Over one-third of the samples (n=204) had low (<90%) oxytocin content indicating substandard medicine; two samples had no active ingredient, suggesting possible counterfeit drugs. The proportion of low fails was higher in samples collected in Africa than in Asia or Latin America (57.5% versus 22.3% versus 0%, respectively, p<0.0001), in private than in public sectors (34.0% versus 25.3%, p=0.032) and in facilities than in central distributors (37.9% versus 22.0%, p=0.030). There is a high prevalence of poor-quality oxytocin samples in LMIC countries, mainly due to inadequate amounts of active ingredient."

According to the news reporters, the research concluded: "Systematic review points to problems with quality of oxytocin samples from low-and middle-income countries."
Studies from School of Medicine Describe New Findings in Roentgenology (Transradial Approach for Hepatic Radioembolization: Initial Results and Technique)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Roentgenology. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "The transradial approach (TRA) has been shown to reduce the morbidity and mortality associated with arterial coronary interventions. Selective internal radiation therapy (SIRT) performed via the TRA can enhance patient comfort, compared with the traditional transfemoral approach (TFA), by allowing immediate ambulation and precluding potential complications associated with the TFA, such as closure device injury or retroperitoneal hematoma."

The news reporters obtained a quote from the research from the School of Medicine, "We report our initial experience with and technique for using the TRA for SIRT. Between May 1, 2012, and April 30, 2015, a total of 574 procedures, including planning angiograms (n = 329) and infusions of Y-90 (n = 245), were performed for 318 patients (mean age, 64.5 years). Of the 245 patients who received Y-90 infusions, 52 had SIRT performed with the use of a permanent single-use implant of Y-90 resin microspheres and 193 had SIRT performed with the use of millions of small glass microspheres containing radioactive Y-90. Procedural details, technical success, the radial artery (RA) occlusion rate noted at 30 days (as assessed via pulse examination), and the major and minor adverse events noted at 30 days were evaluated. Technical success was achieved in 561 of 574 cases (97.7%). The reasons for crossover to use of the TFA included an RA loop (n = 2), RA occlusion (n = 9), and type D response as determined by use of a Barbeau test (n = 2). Patients had undergone between zero and six previous TRA procedures. The mortality rate at 30 days was 0%. Superficial bruising occurred in 13 of 574 cases (2.3%). A grade 2 hematoma that required a second nonocclusive hemostasis cuff occurred in one case. Transient forearm numbness or pain occurred in two of 574 cases. One patient had a transient convulsive event occur after receiving intraarterial infusion of..."
verapamil. RA occlusion occurred in nine of 574 cases (1.6%)."

According to the news reporters, the research concluded: "Use of the TRA for SIRT is safe, feasible, and well tolerated and is associated with high rates of technical success and rare complications."

For more information on this research see: Transradial Approach for Hepatic Radioembolization: Initial Results and Technique. American Journal of Roentgenology, 2016;207(5):1112-1121. American Journal of Roentgenology can be contacted at: Amer Roentgen Ray Soc, 1891 Preston White Dr, Subscription Fulfillment, Reston, VA 22091, USA.

Studies from School of Medicine Have Provided New Data on Keloids (Endothelial dysfunction may play a key role in keloid and hypertrophic scar pathogenesis - Keloids and hypertrophic scars may be vascular disorders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Keloids are discussed in a new report. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Keloids and hypertrophic scars are fibroproliferative disorders (FPDs) of the skin that result from abnormal healing of injured or irritated skin. They can be called pathological or inflammatory scars."

The news correspondents obtained a quote from the research from the School of Medicine, "Common causes are trauma, burn, surgery, vaccination, skin piercing, folliculitis, acne, and herpes zoster infection. The pathogenesis of these scars clearly involves local conditions such as delayed wound healing, wound depth, and the tension of the skin around the scars. Scar severity is also shaped by interactions between these local factors and genetic and systemic factors such as hypertension and sex hormones. Notably, to evaluate scar severity, the Japan Scar Workshop (JSW) has established the JSW Scar Scale. Our studies show that tension on the skin around the wound results in prolonged and/or repeated bouts of inflammation in the reticular layer of the dermis and that this inflammation generates abnormal numbers of blood vessels (as well as collagen and nerve fibers) in the dermal reticular layer. We hypothesize that local factors, such as the mechanobiology of the dermis and blood vessels, along with genetic and systemic factors promote pathological scar development by inducing endothelial dysfunction (i.e., vascular hyperpermeability) during the inflammatory stage of wound healing. The continued presence of these factors prolongs the influx of inflammatory cells and factors, thereby leading to fibroblast dysfunction. Evidence for this hypothesis includes the fact that all
Effective treatments of keloids, namely, radiotherapy, compression therapy, steroid administration, and long-pulsed Nd:YAG laser therapy, act, at least partly, by suppressing blood vessels. At present, keloids are classified as strongly inflammatory scars, while hypertrophic scars are considered to be mildly inflammatory scars. However, we propose that keloids and hypertrophic scars are simply manifestations of the same skin FPD and differ only in the degree of endothelial dysfunction and therefore inflammation. We therefore suggest that these pathological scars should be classified on the basis of the factor that causes the endothelial dysfunction. Thus, primary scars are caused by congenital endothelial dysfunction (e.g., a mutation prevents endothelial gaps from closing smoothly) while secondary scars are caused by endothelial dysfunction that results from aging, arterial sclerosis, and/or repeated/very strong local mechanical forces. We expect that primary keloids develop at younger ages and tend to become severe, while secondary keloids are seen in all ages and can vary in clinical severity.

According to the news reporters, the research concluded: "Thus, abnormal blood vessel regulation may underlie keloid and hypertrophic scar pathogenesis, which suggests that inhibiting abnormal angiogenesis and vascular hyperpermeability may be an important therapeutic approach."

For more information on this research see: "Endothelial dysfunction may play a key role in keloid and hypertrophic scar pathogenesis - Keloids and hypertrophic scars may be vascular disorders. Medical Hypotheses, 2016;96():51-60. Enzymes and Coenzymes - Cysteine Endopeptidases

Studies from School of Medicine Yield New Information about Cysteine Endopeptidases (Perioperative Bromelain Therapy after Wisdom Teeth Extraction - A Randomized, Placebo-Controlled, Double-Blinded, Three-Armed, Cross-Over Dose-Finding Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Enzymes and Coenzymes - Cysteine Endopeptidases is now available. According to news reporting originating from Hannover, Germany, by NewsRx correspondents, research stated, "Reduction in postoperative edema and inflammatory reactions is the key to the posttraumatic regeneration process. Use of bromelain is well established in this indication, but there is some controversy with regard to the optimal dosing of this drug."

Our news editors obtained a quote from the research from the School of Medicine, "The aim of our study was therefore to investigate the efficacy of dosage-dependent therapy with bromelain in patients after wisdom teeth extraction by comparing the registered dosage
