Our news journalists obtained a quote from the research from the University of Oxford, "In several species, MKS and NPHP proteins form separate complexes that cooperate with Cep290 to assemble the TZ, but flies seem to lack core components of the NPHP module. We show that MKS proteins in flies are spatially separated from Cep290 at the TZ, and that flies mutant for individual MKS genes fail to recruit other MKS proteins to the TZ, whereas Cep290 seems to be recruited normally. Although there are abnormalities in microtubule and membrane organisation in developing MKS mutant cilia, these defects are less apparent in adults, where sensory cilia and sperm flagella seem to function quite normally."

According to the news editors, the research concluded: "Thus, localising MKS proteins to the cilium or flagellum is not essential for viability or fertility in flies."

The news correspondents report that additional information may be obtained from J.W. Raff, University of Oxford, Sir William Dunn Sch Pathol, Oxford OX1 3RE, United Kingdom. Additional authors for this research include J.S. Titlow, I. Davis, A.R. Barker, H.R. Dawe, J.W. Raff and H. Roque.

New Peptides and Proteins Findings from Virginia Commonwealth University Reported (Multi-kinase inhibitors can associate with heat shock proteins through their NH2-termini by which they suppress chaperone function)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Peptides and Proteins. According to news reporting originating in Richmond, Virginia, by NewsRx journalists, research stated, "We performed proteomic studies using the GRP78 chaperone-inhibitor drug AR-12 (OSU-03012) as bait. Multiple additional chaperone and chaperone-associated proteins were shown to interact with AR-12, including: GRP75, HSP75, BAG2; HSP27; ULK-1; and thioredoxin."

The news reporters obtained a quote from the research from Virginia Commonwealth University, "AR-12 down-regulated in situ immuno-fluorescence detection of ATP binding chaperones using antibodies directed against the NH2-termini of the proteins but only weakly reduced detection using antibodies directed against the central and COOH portions of the proteins. Traditional SDS-PAGE and western blotting assessment methods did not exhibit any alterations in chaperone detection. AR-12 altered the sub-cellular distribution of chaperone proteins, abolishing their punctate speckled patterning concomitant with changes in protein co-localization. AR-12 inhibited chaperone ATPase activity, which was enhanced by sildenafil; inhibited chaperone -chaperone and chaperone -client interactions; and docked in silico with the ATPase domains of HSP90 and of HSP70. AR-12 combined with sildenafil in a GRP78 plus HSP27 -dependent fashion to profoundly activate an eIF2a/ATF4/CHOP/Beclin1 pathway in parallel with inactivating mTOR and increasing ATG13 phosphorylation, collectively resulting in formation of punctate toxic autophagosomes. Over-expression of [GRP78 and HSP27] prevented: AR-12 -induced activation of ER stress signaling and maintained mTOR activity; AR-12 -mediated down-regulation of thioredoxin, MCL-1 and c-FLIP-s; and preserved tumor cell viability."

According to the news reporters, the research concluded: "Thus the inhibition of chaperone protein functions by AR-12 and by multi-kinase inhibitors very likely explains why these agents have anti-tumor effects in multiple genetically diverse tumor cell types."

For more information on this research see: Multi-kinase inhibitors can associate with heat shock proteins through their NH2-termini by which they suppress chaperone function. Oncotarget, 2016;7(11):12975-96.

Percutaneous Coronary Intervention

New Percutaneous Coronary Intervention Study Findings Recently Were Reported by Researchers at Johns Hopkins University (Patients without ST elevation after return of spontaneous circulation may benefit from emergent percutaneous intervention: ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Percutaneous Coronary Intervention is the subject of a report. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "The American Heart Association recommends that post-arrest patients with evidence of ST elevation myocardial infarction (STEMI) on electrocardiogram (ECG) be emergently taken to the catheterization lab for percutaneous coronary intervention (PCI). However, recommendations regarding the utility of emergent PCI for patients without ST elevation are less specific."

The news reporters obtained a quote from the research from Johns Hopkins University, "This review examined the literature on the utility of PCI in post-arrest patients without ST elevation compared to patients with STEMI. A systematic review of the English language literature was performed for all years to March 1, 2015 to examine the hypothesis that a percentage of post-cardiac arrest patients without ST elevation will benefit from emergent PCI as defined by evidence of an acute culprit coronary lesion. Out of 1067 articles reviewed, 11 articles were identified that allowed for analysis of data to examine our study hypothesis. These studies show that patients presenting post cardiac arrest with STEMI are thirteen times more likely to be emergently taken to the catheterization lab than patients without STEMI; OR 13.8 (95% CI 4.9-39.0). Most importantly, the cumulative data show that when taken to the catheterization lab as much as 32.2% of patients without ST elevation had an acute culprit lesion requiring intervention, compared to 71.9% of patients with STEMI; OR 0.15 (95% CI 0.06-0.34)."

According to the news reporters, the research concluded: "The results of this systematic review demonstrate that nearly one third of patients who have been successfully resuscitated from cardiopulmonary arrest without ST elevation on ECG have an acute lesion that would benefit from emergent percutaneous coronary intervention."

For more information on this research see: Patients without ST elevation after return of spontaneous circulation may benefit from emergent percutaneous intervention: A systematic review and meta-analysis. Resuscitation, 2016;108():54-60. Resuscitation can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. New Peripheral Nervous System Research Data Have Been Reported by Researchers at Xiangya Hospital (MFN2-related genetic and clinical features in a cohort of Chinese CMT2 patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Peripheral Nervous System Research. According to news reporting originating in Changsha, People's Republic of China, by NewsRx journalists, research stated, "Charcot-Marie-Tooth disease 2A (CMT2A), caused by mutations in the mitofusin 2 gene (MFN2), is the most common CMT2 subtype. The aim of our study is to assess the frequency and summarize the genetic and clinical characteristics of Chinese CMT2A patients."

Funders for this research include Fundamental Research Funds for the Central Universities of Central South University, Hunan Provincial Natural Science Foundation of China, High Level Health Personnel “225” Training Project of Hunan Province.

The news reporters obtained a quote from the research from Xiangya Hospital, "A total of 17 coding exons of MFN2 were detected by direct sequencing in 82 unrelated Chinese families diagnosed as CMT2. Clinical evaluations were analyzed among CMT2A patients. We identified 14 missense variants in 9 sporadic and 6 familial cases, including four novel mutations (T129A, S249F, Q367P, and Q674L), 4 known mutations (R94W, R94Q, T105M, C132Y, M376V and Q751X), and 4 rare missense variants (K120E, C217F, K307E and T356S). A total of 23 patients had early-onset phenotype. Two patients had a CMTNS score of 0 to 10; 16 had a score of 11 to 20; and 7 had a score greater than 20. Five patients were confirmed a de novo origin. Six of 14 variants were located or closed to the GTPase domain. We report four novel mutations and four rare missense variants. MFN2 mutations account for 18% of CMT2 families in mainland China."

According to the news reporters, the research concluded: "The common characteristics of Chinese pedigree are early disease onset and moderate phenotypes."

Our news correspondents report that additional information may be obtained by contacting Y. Xie, Dept. of Neurology, the Third Xiangya Hospital, Changsha, People's Republic of China. Additional authors for this research include X. Li, L. Liu, Z. Hu, S. Huang, Y. Zhan, X. Zi, K. Xia, B. Tang and R. Zhang.

Personalized Medicine

New Personalized Medicine Study Results from KRIBB Described (Application of cancer-associated glycoforms and glycan-binding probes to an in vitro diagnostic multivariate index assay for precise diagnoses of cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Personalized Medicine. According to news reporting originating in Daejeon, South Korea, by NewsRx journalists, research stated, "Personalized medicine has emerged as a widely accepted trend in medicine for the efficacious and safe treatment of various diseases. It covers every medical treatment tailored according to various properties of individuals."

Financial support for this research came from National Research Council of Science & Technology.

The news reporters obtained a quote from the research from KRIBB, "Cancer-associated glycosylation mirrors cancer states more precisely, and this 'sweet side of cancer' is thus intended to spur the development of an advanced in vitro diagnostic system. The changes of glyco-codes are often subtle and thus not easy to trace, thereby making it difficult to discriminate changes from various compounding factors. Special glycan-binding probes, often lectins, can be paired with aglycosylated antibodies to enable quantitative and qualitative measurements of glycoforms."

According to the news reporters, the research concluded: "With the in vitro diagnosis multivariate index assay (IVDMIA) considered to be capable of yielding patient-specific results, the combinatorial use of multiple glycoproteins may be a good modality to ensure disease-specific, personalized diagnoses."

Our news correspondents report that additional information may be obtained by contacting J.G. Kang, Genome Editing Research Center, KRIBB, Daejeon, South Korea. Additional authors for this research include J.H. Ko and Y.S Kim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/pmic.201500553. This DOI is a link to an online electronic document that is either free or for purchase.

New Pharmaceutical Research Findings Has Been Reported by Investigators at University of Hamburg (Multispectral UV imaging for surface analysis of MUPS tablets with special focus on the pellet distribution)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Pharmaceutical Research have been published. According to news reporting from Hamburg, Germany, by NewsRx journalists, research stated, "In the present study the applicability of multispectral UV imaging in combination with multivariate image analysis for surface evaluation of MUPS tablets was investigated with respect to the differentiation of the API pellets from the excipients matrix, estimation of the drug content as well as pellet distribution, and influence of the coating material and tablet thickness on the predictive model. Different formulations consisting of coated drug pellets with two coating polymers (Aquacoat ® ECD and Eudragit ® NE 30 D) at three coating levels each were compressed to MUPS tablets with various amounts of coated pellets and different tablet thicknesses."

The news correspondents obtained a quote from the research from the University of Hamburg, "The coated drug pellets were clearly distinguishable from the excipients matrix using a partial least squares approach regardless of the coating layer thickness and coating material used. Furthermore, the number of the detected drug pellets on the tablet surface allowed an estimation of the true drug content in the respective MUPS tablet. In addition, the pellet distribution in the MUPS formulations could be estimated by UV image analysis of the tablet surface."

According to the news reporters, the research concluded: "This study revealed that UV imaging in combination with multivariate image analysis is a promising approach for the automatic quality control of MUPS tablets during the manufacturing process."

Our news journalists report that additional information may be obtained by contacting A. Novikova, University of Hamburg, Dept. of Chem, Div Pharmaceut Technol, D-20146 Hamburg, Germany. Additional authors for this research include J.M. Carstensen, T. Rades and C.S. Leopold.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.09.087. This DOI is a link to an online electronic document that is either free or for purchase.

New Pharmaceutical Research Study Findings Have Been Reported by Investigators at Ewha Woman's University (Transcriptional modulation of regulatory T cell development by novel regulators NR4As)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Pharmaceutical Research have been published. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Regulatory T (Treg) cells with high expression of both CD25 and Foxp3 are developed in the thymus and also peripheral tissues. Treg cells suppress the activation and functions of effector T cells raised against specific antigens and are crucial for maintaining immune homeostasis."

Financial support for this research came from National Research Foundation of Korea.

Our news journalists obtained a quote from the research from Ewha Woman's University, "Treg cell development is associated with the induction of and epigenetic alterations of forkhead transcription factor Foxp3. Foxp3 expression is increased by the activation of several transcription factors including nuclear factor-kappa B (NF-kappa B), nuclear factor of activated T cells (NFAT), and Smad3 in response to various signals such as TGF beta, retinoic acid, and rapamycin. Recently, the orphan nuclear receptor 4A proteins (NR4As) including NR4A1 (Nur77), NR4A2 (Nurr1), and NR4A3 (Nor1) are reported to regulate Treg cell development through activation of Foxp3 and have therapeutic potentials in treating immune disorders."

According to the news editors, the research concluded: "This review summarizes the function and regulatory mechanisms of Treg cells and also implicates current advances in immunomodulatory functions of NR4As and their therapeutic potentials in inflammation and cancer."

For more information on this research see: Transcriptional modulation of regulatory T cell development by novel regulators NR4As. Archives of Pharmacal Research, 2016;39 (11):1530-1536. Archives of Pharmacal Research can be contacted at: Pharmaceutical Soc Korea, 1489-3 Suhcho-Dong, Suhcho-Ku, Seoul 137-071, South Korea. (Springer - www.springer.com; Archives of Pharmacal Research - www.springerlink.com/content/0253-6269/)

New Pharmacoepidemiology and Drug Safety Data Have Been Reported by Researchers at Ajou University (Provider risk factors for medication administration error alerts: analyses of a large-scale closed-loop medication administration system using ...)
New Pharmacokinetics Findings from Wenzhou Medical University Discussed (A Simple and Rapid UPLC Method for the Determination of Rosavin in Rat Plasma and Its Application to a Pharmacokinetic Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pharmacokinetics have been published. According to news reporting originating in Wenzhou, People's Republic of China, by NewsRx journalists, research stated, "Rosavin is a bioactive antidepressant component isolated from Rhodiola rosea L. In this work, an ultra-performance liquid chromatography (UPLC) method was established for the determination of rosavin in rat plasma. The chromatographic separation was achieved on a HSS T3 column (100 mm x 2.1 mm, 1.8 mu m) with a gradient mobile phase consisting of acetonitrile and water (0.1% formic acid)."

The news reporters obtained a quote from the research from Wenzhou Medical University, "Plasma samples were processed with one-step protein precipitation. Rutin was chosen as internal standard and the detection wavelength was 249 nm. The pharmacokinetic parameters were analyzed using the drug and statistics software. The results showed that the established method has an excellent linearity in the range of 10-1,000 ng/mL (R-2 = 0.992) with a lower limit of quantification (10 ng/mL). The intra-and interday precision (relative standard deviation) were from 2.0 to 10.6% and the extraction recovery was 92.4-95.1%.

According to the news reporters, the research concluded: "The simple and rapid UPLC method was successfully applied to the pharmacokinetic and bioavailability study of rosavin in rats."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/chromsci/bmw044. This DOI is a link to an online electronic document that is either free or for purchase.

New Pharmacokinetics Study Findings Have Been Reported by Investigators at Taussig Cancer Institute (Pharmacokinetically Guided Dosing of Oral Drugs: True Precision Oncology?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacokinetics. According to news reporting originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Higher plasma concentrations of tyrosine kinase inhibitors (TKI), such as pazopanib, are associated with improved clinical outcomes."

Our news editors obtained a quote from the research from Taussig Cancer Institute, "However, TKI pharmacokinetics exhibit significant interpatient variability, resulting in inconsistent and unpredictable plasma drug levels."

According to the news editors, the research concluded: "An individualized dosing approach based on patient pharmacokinetics data and toxicity can potentially optimize plasma concentrations of pazopanib."

For more information on this research see: Pharmacokinetically Guided Dosing of Oral Drugs: True Precision Oncology? Clinical Cancer Research, 2016;22(23):5626-5628. Clinical Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Pharmacokinetics

New Pharmacokinetics Study Findings Reported from University Medical Center (Heritability of Caffeine Metabolism: Environmental Effects Masking Genetic Effects on CYP1A2 Activity but Not on NAT2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Pharmacokinetics is now available. According to news originating from Gottingen, Germany, by NewsRx correspondents, research stated, "Heritability of caffeine pharmacokinetics and cytochrome P450 1A2 (CYP1A2) activity is controversial. Here, we analyzed the pharmacokinetics of caffeine, an in vivo probe drug for CYP1A2 and arylamine N-acetyltransferase 2 (NAT2) activity, in monozygotic (MZ) and dizygotic (DZ) twins."

For more information on this research see: Pharmacokinetics - Clinical Pharmacology Research, 2016;22(23):5626-5628. Clinical Pharmacology Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. (American Association for Cancer Research - www.aacr.com; Clinical Pharmacology Research - clincancerres.aacrjournals.org/)

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
Our news journalists obtained a quote from the research from University Medical Center, "In the entire group, common and unique environmental effects explained most variation in caffeine area under the curve (AUC). Apparently, smoking and hormonal contraceptives masked the genetic effects on CYP1A2 activity. However, when excluding smokers and users of hormonal contraceptives, 89% of caffeine AUC variation was due to genetic effects and, even in the entire group, 8% of caffeine AUC variation could be explained by a CYP1A1/1A2 promoter polymorphism (rs2470893). In contrast, nearly all of the variations (99%) of NAT2 activity were explained by genetic effects."

According to the news editors, the research concluded: "This study illustrates two very different situations in pharmacogenetics from an almost exclusively genetic determination of NAT2 activity with no environmental modulation to only moderate genetic effects on CYP1A2 activity with strong environmental modulation."

For more information on this research see: Heritability of Caffeine Metabolism: Environmental Effects Masking Genetic Effects on CYP1A2 Activity but Not on NAT2. Clinical Pharmacology & Therapeutics, 2016;100(6):606-616. Clinical Pharmacology & Therapeutics can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. **Drugs and Therapies - Pharmacology and Physiology**

**New Pharmacology and Physiology Study Findings Have Been Reported by Researchers at Georgia State University [17-(allylamino)-17-demethoxygeldanamycin drives Hsp70 expression but fails to improve morphological or functional recovery in injured ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmacology and Physiology. According to news reporting out of Atlanta, Georgia, by NewsRx editors, research stated, "The stress inducible 70 kDa heat shock protein (Hsp70) is instrumental to efficient morphological and functional recovery following skeletal muscle injury because of its roles in protein quality control and molecular signalling. Therefore, in attempt to improve recovery, Hsp70 expression was increased with 17-(allylamino)-17-demethoxygeldanamycin (17-AAG) prior to and following an intramuscular injection of barium chloride (BaCl2) into the tibialis anterior (TA) of healthy young mice."

Our news journalists obtained a quote from the research from Georgia State University, "To assess recovery, regenerating fibre cross-sectional area (CSA) of the TA and in vivo peak isometric torque produced by the anterior crural muscles (TA, extensor digitorum..."
longus and extensor hallucis muscles) were analyzed for up to 3 weeks after the injury. Because treatment of 17-AAG and Hsp70 are known to influence inflammatory and myogenic signalling, tumor necrosis factor-a (TNF-a) and myogenin content were also assessed. This study reports that 17-AAG was effective at up-regulating Hsp70 expression, increasing content fivefold in the uninjured muscle. However, this significant increase in Hsp70 content did not enhance morphological or functional recovery following the injury, as the return of regenerating fibre CSA and in vivo peak isometric torque did not differ compared to that of the injured muscle from the vehicle treated mice. Treatment with 17-AAG also altered TNF-a and myogenin content, increasing both to a greater extent after the injury.

According to the news editors, the research concluded: "Together, these findings demonstrate that although 17-AAG may alter molecular makers of regeneration, it does not improve recovery following BaCl2-induced skeletal muscle injury in healthy young mice."

Our news journalists report that additional information may be obtained by contacting C.W. Baumann, Muscle Biology Laboratory, Dept. of Kinesiology and Health, Georgia State University, Atlanta, GA, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1440-1681.12477. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Pharmacy Practice**

**New Pharmacy Practice Findings from M.E. Sanders and Co-Researchers Described (Probiotic use in at-risk populations)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Pharmacy Practice is the subject of a report. According to news reporting out of Centennial, Colorado, by NewsRx editors, research stated, "To inform health care providers about quality standards for manufacture of probiotic products being recommended for at-risk patient populations. Probiotics are used in a variety of clinical settings, sometimes in at-risk populations for therapeutic endpoints."

Our news journalists obtained a quote from the research, "Although probiotics might not be approved as drugs, they are sometimes used for the prevention or treatment of disease. In the United States, and many regions of the world, probiotic products are marketed as dietary supplements (not drugs) and are therefore subject to different manufacturing and quality control standards than approved drugs are. Health care providers need to be assured that probiotic products used in at-risk populations are safe for this use. Pharmacists should require certificates of analysis, which document quality standards, from manufacturers of products stocked in hospital formularies or other pharmacies dispensing to at-risk people. Although responsible
manufacturers use stringent quality standards on their processes and finished products, using a third party to verify compliance with manufacturing and accuracy of product labeling adds assurance to end users that the product is of high quality. It is in patients’ best interest to use probiotics in the prevention and treatment of conditions when the evidence is convincing. To protect high-risk patients, probiotic products should meet stringent microbiological standards. Product testing results should be available for review before recommending probiotic products to at-risk individuals."

According to the news editors, the research concluded: "For products used in at-risk populations, manufacturers should provide this information or participate in a third-party verification program that certifies compliance."

Our news journalists report that additional information may be obtained by contacting M.E. Sanders, Int Sci Assoc Probiot & Prebiot, Centennial, CO 80122, United States. Additional authors for this research include D.J. Merenstein, A.C. Ouwehand, G. Reid, S. Salminen, M.D. Cabana, G. Paraskevakos and G. Leyer.

**New Pharmacy and Pharmaceutical Sciences Findings from C. Shimizu et al Outlined**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Pharmacy and Pharmaceutical Sciences are discussed in a new report. According to news reporting originating in Shizuoka, Japan, by NewsRx journalists, research stated, "Heavy and long-term alcohol consumption increase the risk of alcohol-related diseases. Epidemiological studies show moderate drinking reduces the risk of mortality, cardiovascular diseases, and brain infarction in the J-shaped or U-shaped curve effect."

The news reporters obtained a quote from the research, "However, why moderate drinkers may be healthy and non-drinkers may be ill in diverse populations remains controversial. Herein, we examined the relationship between moderate/lifelong alcohol intake and aging, especially aging-related cognitive functions in senescence-accelerated mouse prone 8 (SAMP8) model. SAMP8 model (5-week-old, male, n = 36), a model of age-related cognitive deficit, were group-housed (n = 6/cage) and provided free access to water (water group, n = 18) or 1% ethanol (EtOH group, n = 18, intake started when mice were 9 weeks old). The object
recognition test (ORT) and object location test (OLT) were used to evaluate cognitive functions. The intestinal flora at the age of 87 weeks was analyzed by terminal restriction fragment length polymorphism (T-RFLP). The lifespan of the EtOH-group mice was about 4 weeks longer than that of the water-group mice. In the EtOH group, spatial recognition impairment, assessed by OLT, was observed later (age, 73 weeks) than that in the water group (age, 52 weeks). The spinal curvature and skin conditions progressed significantly slower in the EtOH group than in the water group. Moreover, diarrhea symptoms only appeared in the water group, at the age of 82 weeks. The T-RFLP analysis of the intestinal flora indicated higher Lactobacillales order and lower Clostridium cluster XI in the EtOH group than in the water group, although those were extremely high in some mice close to death in both groups. Water-group mice with diarrhea presented significantly higher Clostridium cluster XI than did those without diarrhea (P = 0.017).

According to the news reporters, the research concluded: "Moderate alcohol intake changes intestinal flora and positively affects aging of SAMP8 model."

Our news correspondents report that additional information may be obtained by contacting C. Shimizu, SAPPORO HOLDINGS LTD, Frontier Labs Value Creat, Yaizu, Shizuoka, Japan. Additional authors for this research include Y. Oki, Y. Mitani, Y. Tsuchiya and T. Nabeshima.

Phenothiazines

New Phenothiazines Findings Reported from University of Tehran (Evaluation of photo-activated disinfection effectiveness with methylene blue against Porphyromonas gingivalis involved in endodontic infection: An in vitro study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Phenothiazines have been presented. According to news reporting out of Tehran, Iran, by NewsRx editors, research stated, "Eradication or suppression of microbial pathogens is a major goal in endodontic infection therapy. Sub-lethal doses of photo-activated disinfection (sPAD) as a new treatment method might be able to control the microorganisms involved in endodontic infections normally treated with PAD."

Financial support for this research came from Tehran University of Medical Sciences
Our news journalists obtained a quote from the research from the University of Tehran, "This study evaluated the effect of sPAD using methylene blue (MB) in combination with diode laser irradiation on the growth and biofilm formation ability of Porphyromonas gingivalis as an endodontic pathogen. The anti-microbial and anti-biofilm potential of sPAD against P. gingivalis were assessed at sub-lethal doses of MB and irradiation by diode laser on colony forming unit and crystal violet assays, respectively. MB-sPAD using 25 µg/mL at a fluency of 117.18 J/cm(2) and 50-100 µg/mL at a fluency of 93.75J/cm(2) significantly P. gingivalis growth when compared to the control. MB at 100 µg/mL at a fluency of 117.18 J/cm(2) in MB-mediated PAD showed a significant inhibitory effect on biofilm formation in P. gingivalis compared with MB-sPAD. High doses of MB-mediated sPAD exhibited anti-microbial and anti-biofilm potential activity, whereas lower doses of MB-mediated sPAD did not display this ability."

According to the news editors, the research concluded: "Therefore, the dose of PAD used in vivo should be taken into account for endodontic treatment."

Our news journalists report that additional information may be obtained by contacting A. Bahador, Univ Tehran Med Sci, Laser Res Center, Dental Res Inst, Tehran, Iran. Additional authors for this research include N. Chiniforush, R. Raooofian, B. Pourakbari, R. Ghorbanzadeh, F. Bazarjani and A. Bahador.

glucokinase protein activators. The conformations obtained by molecular dynamics simulation were superimposed according to the twelve alignments tested in a virtual three-dimensional box comprised of 2,000 cells.

Financial supporters for this research include Conselho Nacional de Desenvolvimento Científico e Tecnológico, Coordenação de Aperfeiçoamento de Pessoal de Nível Superior, Fundação de Amparo a Pesquisa do Estado de Minas Gerais.

The news reporters obtained a quote from the research from Federal University, "The models were generated by the technique that combines genetic algorithms and partial least squares. The best alignment models generated with a determination coefficient (r(2)) between 0.674 and 0.743 and cross-validation (q(2)) between 0.509 and 0.610, indicating good predictive capacity."

According to the news reporters, the research concluded: "The 4D-QSAR models developed in this study suggest novel molecular regions to be explored in the search for better glucokinase activators."

Our news correspondents report that additional information may be obtained by contacting T.M. de Assis, Dept. of Chemistry, Federal University of Lavras, PO Box 3037, Lavras, 37200-000, Brazil. Chemistry - Physical Chemistry

New Physical Chemistry Data Have Been Reported by Researchers at University of Maryland (Constant pH Molecular Dynamics Reveals pH-Modulated Binding of Two Small-Molecule BACE1 Inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Chemistry - Physical Chemistry have been published. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Targeting β-secretase (BACE1) with small-molecule inhibitors offers a promising route for treatment of Alzheimer's disease. However, the intricate pH dependence of BACE1 function and inhibitor efficacy has posed major challenges for structure-based drug design."
Financial supporters for this research include Division of Molecular and Cellular Biosciences, National Institute of General Medical Sciences.

Our news journalists obtained a quote from the research from the University of Maryland, "Here we investigate two structurally similar BACE1 inhibitors that have dramatically different inhibitory activity using continuous constant pH molecular dynamics (CpHMD). At high pH, both inhibitors are stably bound to BACE1; however, within the enzyme active pH range, only the iminopyrimidinone-based inhibitor remains bound, while the aminothiazine-based inhibitor becomes partially dissociated following the loss of hydrogen bonding with the active site and change of the 10s loop conformation. The drastically lower activity of the second inhibitor is due to the protonation of a catalytic aspartate and the lack of a propyne tail."

According to the news editors, the research concluded: "This work demonstrates that CpHMD can be used for screening pH-dependent binding profiles of small-molecule inhibitors, providing a new tool for structure-based drug design and optimization."

The news correspondents report that additional information may be obtained from C.R. Ellis, Dept. of Pharmaceutical Sciences, University of Maryland School of Pharmacy, Baltimore, Maryland 21201, United States. Additional authors for this research include C.C. Tsai, X. Hou and J. Shen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.jpcl.6b00137. This DOI is a link to an online electronic document that is either free or for purchase.

Physical Fitness

New Physical Fitness Study Results Reported from Aalborg University (Association Between Physical Fitness and Academic Achievement in a Cohort of Danish School Pupils)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Physical Fitness are discussed in a new report. According to news originating from Aalborg, Denmark, by NewsRx correspondents, research stated, "Time spent on physical activity in elementary school has been altered to improve core academics. However, little is known about the relationship between physical fitness and academic achievement."

Financial support for this research came from Helsefonden.

Our news journalists obtained a quote from the research from Aalborg University, "We examined the association between physical fitness and academic achievement and investigated the influence of parental socioeconomic status and ethnicity. Participants were 542 girls and 577 boys aged 13 to 15 residing in the Danish municipality of Aalborg. A watt-max cycle ergometer test was completed to evaluate physical fitness as represented by VO(2)max"
Academic achievement was measured 1 school year later through a series of mandatory exams within the humanities, sciences, and all obligatory defined exams. Parental income and education were drawn from nationwide registers. Linear regression models were used to investigate the association. Adjusting for ethnicity and parental socioeconomic status, the effect size of the humanities was 0.08 grad/VO(2)max (95% CI: 0.05 to 0.11) for girls and 0.06 grad/VO(2)max (95% CI: 0.03 to 0.08) for boys. The effect size of the sciences was 0.09 grad/VO(2)max (95% CI: 0.05 to 0.13) for girls and 0.06 grad/VO(2)max (95% CI: 0.03 to 0.09) for boys. The effect size of the defined exams was 0.09 grad/VO(2)max (95% CI: 0.06 to 0.11) for girls and 0.06 grad/VO(2)max (95% CI: 0.03 to 0.08) for boys.

According to the news editors, the research concluded: "We found a statistically significant positive association between physical fitness and academic achievement after adjusting for ethnicity and parental socioeconomic status."

The news correspondents report that additional information may be obtained from M.P. Andersen, Aalborg Univ, Fac Med, Dept. of Hlth Sci & Technol, Public Hlth & Epidemiol Grp, DK-9220 Aalborg, Denmark. Additional authors for this research include R.N. Mortensen, H. Vardinghus-Nielsen, J. Franch, C. Torp-Pedersen and H. Boggild.

Physiology, Nutrition and Metabolism

New Physiology, Nutrition and Metabolism Study Findings Have Been Reported by Researchers at University of Porto (Exercise mitigates mitochondrial permeability transition pore and quality control mechanisms alterations in nonalcoholic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Physiology, Nutrition and Metabolism have been presented. According to news reporting out of Porto, Portugal, by NewsRx editors, research stated, "Mitochondrial quality control and apoptosis have been described as key components in the pathogenesis of nonalcoholic steatohepatitis (NASH); exercise is recognized as a nonpharmacological strategy to counteract NASH-associated consequences. We aimed to analyze the effect of voluntary physical activity (VPA) and endurance training (ET) against NASH-induced mitochondrial permeability transition pore (mPTP) opening and mitochondrial and cellular quality control deleterious alterations."

Our news journalists obtained a quote from the research from the University of Porto, "Forty-eight male Sprague-Dawley rats were divided into standard-diet sedentary (SS, n=
16), standard-diet VPA (n=8), high-fat diet sedentary (HS, n=16), and high-fat diet VPA (n=8). After 9 weeks of diet treatment, half of the SS and HS groups were engaged in an ET program for 8 weeks, 5 days/week, 1 h/day. Liver mPTP susceptibility through osmotic swelling, mPTP-related proteins (cyclophilin D, Sirtuin3, Cofilin-1), markers of mitochondrial biogenesis ((mitochondrial transcription factor A (Tfam) and peroxisome proliferator-activated receptor gamma co-activator protein (PGC-1a)), dynamics (Mitofusin 1 (Mfn1), Mitofusin 2 (Mfn2), Dynamin related protein 1, and Optic atrophy 1)), auto/mitophagy (Beclin-1, microtubule-associated protein 1 light chain 3, p62, PINK1, and Parkin), and apoptotic signaling (Bax, Bcl-2) and caspases-like activities were assessed. HS animals showed an increased susceptibility to mPTP, compromised expression of Tfam, Mfn1, PINK1, and Parkin and an increase in Bax content (HS vs. SS). ET and VPA improved biogenesis-related proteins (PGC-1a) and autophagy signaling (Beclin-1 and Beclin-1/Bcl-2 ratio) and decreased apoptotic signaling (caspases 8 activity, Bax content, and Bax/Bcl-2 ratio). However, only ET decreased mPTP susceptibility and positively modulated Bcl-2, Tfam, Mfn1, Mfn2, PINK1, and Parkin content.

According to the news editors, the research concluded: "Exercise reduces the increased susceptibility to mPTP induced by NASH and promotes the increase of auto/mitophagy and mitochondrial fusion towards a protective phenotype."

Our news journalists report that additional information may be obtained by contacting I.O. Goncalves, a Research Center in Physical Activity, Health and Leisure, Faculty of Sport, University of Porto, Rua Dr Placido Costa, n° 91 4200-450 Porto, Portugal. Drugs and Therapies - Piperazine Therapy

**New Piperazine Therapy Study Results Reported from Charles University (Large-Scale Synthesis of Piperazine-2,6-dione and Its Use in the Synthesis of Dexrazoxane Analogues)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- A new study on Drugs and Therapies - Piperazine Therapy is now available. According to news reporting out of Hradec Kralove, Czech Republic, by NewsRx editors, research stated, "An efficient, large-scale synthesis of piperazine-2,6-dione was developed."

Our news journalists obtained a quote from the research from Charles University, "The advantages of this procedure include the use of inexpensive starting materials, satisfactory yields, and a convenient workup without the need for chromatographic techniques. Furthermore, this procedure can be easily modified for the preparation of 1-substituted piperazine-2,6-dione hydrobromides."

According to the news editors, the research concluded: "The utility of the prepared piperazine-2,6-dione was demonstrated in the synthesis of a novel analogue of the only drug used in clinical practice to prevent anthracycline-induced cardiotoxicity, dexrazoxane."

For more information on this research see: Large-Scale Synthesis of Piperazine-2,6-dione and Its Use in the Synthesis of Dexrazoxane Analogues. Synthesis-Stuttgart, 2016;48 (24):4580-4588. Synthesis-Stuttgart can be contacted at: Georg Thieme Verlag Kg, Ruderstr 14, D-70469 Stuttgart, Germany.

Our news journalists report that additional information may be obtained by contacting J. Roh, Charles Univ Prague, Fac Pharm Hradec Kralove, Hradec Kralove 50005, Czech Republic. Additional authors for this research include G. Karabanovich, V. Novakova, T. Simunek and K. Vavrova.

Hematology - Plasma

New Plasma Data Have Been Reported by Investigators at University of Colorado (Glutamine metabolism drives succinate accumulation in plasma and the lung during hemorrhagic shock)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematology - Plasma is now available. According to news reporting out of Aurora, Colorado, by NewsRx editors, research stated, "Metabolomic investigations have consistently reported succinate accumulation in plasma after critical injury. Succinate receptors have been identified on numerous tissues, and succinate has been directly implicated in postsischemic inflammation, organ dysfunction, platelet activation, and the generation of reactive oxygen species, which may potentiate morbidity and mortality risk to patients."

Our news journalists obtained a quote from the research from the University of Colorado, "Metabolic flux (heavy-isotope labeling) studies demonstrate that glycolysis is not the primary source of increased plasma succinate during protracted shock. Glutamine is an alternative parent substrate for ATP generation during anaerobic conditions, a biochemical
mechanism that ultimately supports cellular survival but produces succinate as a catabolite. We hypothesize that succinate accumulation during hemorrhagic shock is driven by glutaminolysis. Sprague-Dawley rats were subjected to hemorrhagic shock for 45 minutes (shock, \(n = 8\)) and compared with normotensive shams (sham, \(n = 8\)). At 15 minutes, animals received intravenous injection of C-13(5)-N-15(2)-glutamine solution (iLG). Blood, brain, heart, lung, and liver tissues were harvested at defined time points. Labeling distribution in samples was determined by ultrahigh-pressure liquid chromatography-mass spectrometry metabolomic analysis. Repeated-measures analysis of variance with Tukey comparison determined significance of relative fold change in metabolite level from baseline. Hemorrhagic shock instigated succinate accumulation in plasma and lungs tissues (8.5- vs. 1.1-fold increase plasma succinate level from baseline, shock vs. sham, \(p = 0.001\); 3.2-fold higher succinate level in lung tissue, shock vs. sham, \(p = 0.006\)). Metabolomic analysis identified labeled glutamine and labeled succinate in plasma (\(p = 0.002\)) and lung tissue (\(p = 0.013\)), confirming glutamine as the parent substrate. Kinetic analyses in shams showed constant total levels of all metabolites without significant change due to iLG. Glutamine metabolism contributes to increased succinate concentration in plasma during hemorrhagic shock."

According to the news editors, the research concluded: "The glutaminolytic pathway is implicated as a therapeutic target to prevent the contribution of succinate accumulation in plasma and the lung-to-postshock pathogenesis."

For more information on this research see: Glutamine metabolism drives succinate accumulation in plasma and the lung during hemorrhagic shock. *Journal of Trauma and Acute Care Surgery*, 2016;81(6):1012-1019. *Journal of Trauma and Acute Care Surgery* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Hematology - Plasma**

**New Plasma Findings from Academy of Sciences of the Czech Republic Described (Quantitation of isobaric phosphatidylcholine species in human plasma using a hybrid quadrupole linear ion-trap mass spectrometer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematology - Plasma. According to news reporting from Prague, Czech Republic, by NewsRx journalists, research stated,
"Phosphatidylcholine (PC) species in human plasma are used as biomarkers of disease. PC biomarkers are often limited by the inability to separate isobaric PCs."

Funders for this research include National Institute of Food and Agriculture, Agricultural Research Service.

The news correspondents obtained a quote from the research from the Academy of Sciences of the Czech Republic, "In this work, we developed a targeted shotgun approach for analysis of isobaric and isomeric PCs. This approach is comprised of two MS methods: a precursor ion scanning (PIS) of mass m/z 184 in positive mode (PIS m/z +184) and MS3 fragmentation in negative mode, both performed on the same instrument, a hybrid triple quadrupole ion-trap mass spectrometer. The MS3 experiment identified the FA composition and the relative abundance of isobaric and sn-1, sn-2 positional isomeric PC species, which were subsequently combined with absolute quantitative data obtained by PIS m/z +184 scan. This approach was applied to the analysis of a National Institute of Standards and Technology human blood plasma standard reference material (SRM 1950). We quantified more than 70 PCs and confirmed that a majority are present in isobaric and isomeric mixtures. The FA content determined by this method was comparable to that obtained using GC with flame ionization detection, supporting the quantitative nature of this MS method."

According to the news reporters, the research concluded: "This methodology will provide more in-depth biomarker information for clinical and mechanistic studies."

Our news journalists report that additional information may be obtained by contacting P. Zacek, Biochem Academy Sci Czech Republ, Prague 16610 6, Czech Republic. Additional authors for this research include M. Bukowski, T.A. Rosenberger and M. Picklo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1194/jlr.D070656. This DOI is a link to an online electronic document that is either free or for purchase.

**Hematology - Plasma**

**New Plasma Study Findings Have Been Reported by Investigators at University Medical Center (Development of a Simple and Rapid Method to Measure the Free Fraction of Tacrolimus in Plasma Using Ultrafiltration and LC-MS/MS)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematology - Plasma. According to news reporting originating in Utrecht, Netherlands, by NewsRx journalists, research stated, "Tacrolimus is an immunosuppressant mainly used in the prophylaxis of solid organ transplant..."
rejection. Therapeutic drug monitoring of tacrolimus is essential for avoiding toxicity related to overexposure and transplant rejection from underexposure."

The news reporters obtained a quote from the research from University Medical Center, "Previous studies suggest that unbound tacrolimus concentrations in the plasma may serve as a better predictor of tacrolimus-associated nephrotoxicity and neurotoxicity compared to tacrolimus concentration in whole blood. Monitoring the plasma concentrations of unbound tacrolimus might be of interest in preventing tacrolimus-related toxicity. Therefore, the aim was to develop a method for the measurement of total and unbound tacrolimus concentrations in plasma. The sample preparation for the determination of the plasma concentrations of unbound tacrolimus consisted of an easy-to-use ultrafiltration method followed by solid-phase extraction. To determine the total concentration of tacrolimus in plasma, a simple method based on protein precipitation was developed. The extracts were injected into a Thermo Scientific HyPurity C18 column using gradient elution. The analytes were detected by liquid chromatography-tandem mass spectrometry with positive ionization. The method was validated over a linear range of 1.00-200 ng/L for unbound tacrolimus concentrations in plasma and 100-3200 ng/L for total plasma concentrations. The lower limit of quantification was 1.00 ng/L in ultrafiltrate and 100 ng/L in plasma. The inaccuracy and imprecision for the determination of unbound tacrolimus concentrations in ultrafiltrate and plasma showed a maximum coefficients of variation (CV) of 11.7% and a maximum bias of 3.8%. A rapid and easy method based on ultrafiltration and liquid chromatography-tandem mass spectrometry was established to measure the total and unbound tacrolimus concentrations in plasma."

According to the news reporters, the research concluded: "This method can facilitate further investigations on the relationship between plasma concentrations of unbound tacrolimus and clinical outcomes in transplant recipients."

For more information on this research see: Development of a Simple and Rapid Method to Measure the Free Fraction of Tacrolimus in Plasma Using Ultrafiltration and LC-MS/MS. *Therapeutic Drug Monitoring*, 2016;38(6):722-727. *Therapeutic Drug Monitoring* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Platinum Compounds

New Platinum Compounds Findings Reported from Department of Pharmacology (Edaravone alleviates cisplatin-induced neurobehavioral deficits via modulation of oxidative stress and inflammatory mediators in the rat hippocampus)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Platinum Compounds are presented in a new report. According to news originating from Gauhati, India, by NewsRx correspondents, research stated, "Cisplatin is a chemotherapeutic agent used in the treatment of malignant tumors. A major clinical limitation of cisplatin is its potential toxic effects, including neurotoxicity."

Our news journalists obtained a quote from the research from the Department of Pharmacology, "Edaravone, a potent free radical scavenger, has been reported to have the neuroprotective effect against neurological deficits. The aim of the present study was to determine the neuroprotective effect of edaravone against cisplatin-induced behavioral and biochemical anomalies in male Wistar rats. Our results showed that cisplatin (5 mg/kg/week, i.p.) administration for seven weeks caused marked cognitive deficits and motor incoordination in rats. This was accompanied by oxido-nitrosative stress, neuroinflammation, NE-kappa B activation and down regulation of Nrf2/HO-1 gene expression level in the hippocampus. Edaravone (10 mg/kg/week, i.p.) treatment for seven weeks inhibited the aforementioned neurobehavioral and neurochemical deficits. Furthermore, edaravone was found to up-regulate the gene expression level of Nrf2/HO-1 and prevented the cisplatin-induced NE-kappa B activation."

According to the news editors, the research concluded: "These findings demonstrated that oxido-nitrosative stress and inflammatory signaling mediators play a key role in the development of cisplatin-induced neurobehavioral deficits which were prevented by edaravone treatment."

For more information on this research see: Edaravone alleviates cisplatin-induced neurobehavioral deficits via modulation of oxidative stress and inflammatory mediators in the rat hippocampus. European Journal of Pharmacology, 2016;791():51-61. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; European Journal of Pharmacology - www.journals.elsevier.com/european-journal-of-pharmacology/)

The news correspondents report that additional information may be obtained from M. Lahkar, Gauhati Med College, Dept. of Pharmacol, Gauhati, India. Additional authors for this research include M. Kwatra, T. Singh, R. Pant, P. Kushwah, S. Ahmed, D. Dwivedi, B. Saroha and M. Lahkar.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Platinum Compounds. According to news reporting originating in Shenzhen, People's Republic of China, by NewsRx journalists, research stated, "DNA damage response plays a key role not only in maintaining genome integrity but also in mediating the antitumor efficacy of DNA-damaging antineoplastic drugs. Herein, we report the rational design and evaluation of a Pt-IV anticancer prodrug inhibiting nucleotide excision repair (NER), one of the most pivotal processes after the formation of cisplatin-induced DNA damage that deactivates the drug and leads to drug resistance in the clinic."

The news reporters obtained a quote from the research from the City University of Hong Kong, "This dual-action prodrug enters cells efficiently and causes DNA damage while simultaneously inhibiting NER to promote apoptotic response. The prodrug is strongly active against the proliferation of cisplatin-resistant human cancer cells with an up to 88-fold increase in growth inhibition compared with cisplatin, and the prodrug is muchmore active than a mixture of cisplatin and an NER inhibitor."

According to the news reporters, the research concluded: "Our study highlights the importance of targeting downstream pathways after the formation of Pt-induced DNA damage as a novel strategy to conquer cisplatin resistance."

Our news correspondents report that additional information may be obtained by contacting G.Y. Zhu, City University of Hong Kong, Shenzhen Res Inst, Shenzhen, People's Republic of China. Additional authors for this research include Z.F. Xu and G.Y. Zhu.

Lung Diseases and Conditions - Pneumonia

New Pneumonia Study Findings Reported from J. Hoffmann and Co-Authors (Viral and bacterial co-infection in severe pneumonia triggers innate immune responses and specifically enhances IP-10: a translational study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Pneumonia. According to news reporting from Lyon, France, by NewsRx journalists, research stated, "Mixed
viral and bacterial infections are widely described in community-acquired pneumonia; however, the clinical implications of co-infection on the associated immunopathology remain poorly studied. In this study, microRNA, mRNA and cytokine/chemokine secretion profiling were investigated for human monocyte-derived macrophages infected in-vitro with Influenza virus A/H1N1 and/or Streptococcus pneumoniae."

The news correspondents obtained a quote from the research, "We observed that the in-vitro co-infection synergistically increased interferon-gamma-induced protein-10 (CXCL10, IP-10) expression compared to the singly-infected cells conditions. We demonstrated that endogenous miRNA-200a-3p, whose expression was synergistically induced following co-infection, indirectly regulates CXCL10 expression by targeting suppressor of cytokine signaling-6 (SOCS-6), a well-known regulator of the JAK-STAT signaling pathway. Additionally, in a subsequent clinical pilot study, immunomodulators levels were evaluated in samples from 74 children (≤ 5 years-old) hospitalized with viral and/or bacterial community-acquired pneumonia. Clinically, among the 74 cases of pneumonia, patients with identified mixed-detection had significantly higher (3.6-fold) serum IP-10 levels than those with a single detection (P = 0.03), and were significantly associated with severe pneumonia (P < 0.01)."

According to the news reporters, the research concluded: "This study demonstrates that viral and bacterial co-infection modulates the JAK-STAT signaling pathway and leads to exacerbated IP-10 expression, which could play a major role in the pathogenesis of pneumonia."

**Hematologic Diseases and Conditions - Polycythemia**

**New Polycythemia Study Findings Recently Were Reported by Researchers at Eunice Kennedy Shriver National Institute of Child Health and Human Development (Novel insights into the polycythemia-paraganglioma-somatostatinoma syndrome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematologic Diseases and Conditions - Polycythemia are discussed in a new report. According to news reporting from Bethesda, Maryland, by
NewsRx journalists, research stated, "Worldwide, the syndromes of paraganglioma (PGL), somatostatinoma (SOM) and early childhood polycythemia are described in only a few patients with somatic mutations in the hypoxia-inducible factor 2 alpha (HIF2A). This study provides detailed information about the clinical aspects and course of 7 patients with this syndrome and brings into perspective these experiences with the pertinent literature."

The news correspondents obtained a quote from the research from the Eunice Kennedy Shriver National Institute of Child Health and Human Development, "Six females and one male presented at a median age of 28 years (range 11-46). Two were found to have HIF2A somatic mosaicism. No relatives were affected. All patients were diagnosed with polycythemia before age 8 and before PGL/SOM developed. PGLs were found at a median age of 17 years (range 8-38) and SOMs at 29 years (range 22-38). PGLs were multiple, recurrent and metastatic in 100, 100 and 29% of all cases, and SOMs in 40, 40 and 60%, respectively. All PGLs were primarily norepinephrine-producing. All patients had abnormal ophthalmologic findings and those with SOMs had gallbladder disease. Computed tomography (CT) and magnetic resonance imaging revealed cystic lesions at multiple sites and hemangiomas in 4 patients (57%), previously thought to be pathognomonic for von Hippel-Lindau disease. The most accurate radiopharmaceutical to detect PGL appeared to be [F-18]- fluorodihydroxyphenylalanine ([F-18]-FDOPA). Therefore, [F-18]-FDOPA PET/CT, not [Ga-68]-(DOTA)-[Tyr3]-octreotate ([Ga-68]-DOTATATE) PET/CT is recommended for tumor localization and aftercare in this syndrome. The long term prognosis of the syndrome is unknown. However, to date no deaths occurred after 6 years follow-up."

According to the news reporters, the research concluded: "Physicians should be aware of this unique syndrome and its diagnostic and therapeutic challenges."

For more information on this research see: Novel insights into the polycythemia-paraganglioma-somatostatinoma syndrome. *Endocrine-Related Cancer*, 2016;23(12):899-908. *Endocrine-Related Cancer* can be contacted at: Bioscientifica Ltd, Euro House, 22 Apex Court Woodlands, Bradley Stoke, Bristol BS32 4JT, England.

New Polyethylene Glycols Findings from University of Belgrade Outlined (Lignin model compound in alginate hydrogel: a strong antimicrobial agent with high potential in wound treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Polyethylene Glycols have been published. According to news reporting originating in Belgrade, Serbia, by NewsRx journalists, research stated, "Nowadays bacterial resistance to known antibiotics is a serious health problem. In order to achieve more efficient treatment, lately there is an effort to find new substances, such as certain biomaterials, that are non-toxic to humans with antibiotic potential."

Financial support for this research came from Ministry of Education, Science and Technological Development of the Republic of Serbia.

The news reporters obtained a quote from the research from the University of Belgrade, "Lignins and lignin-derived compounds have been proposed to be good candidates for use in medicine and health maintenance. In this study, the antibacterial activity of the lignin model polymer dehydrogenate polymer (DHP) in alginate hydrogel (Alg) was studied. The obtained results show that DHP-Alg has strong antimicrobial activity against several bacterial strains and biofilms and does not have a toxic effect on human epithelial cells."

According to the news reporters, the research concluded: "These results strongly suggest its application as a wound healing agent or as an adjunct substance for wound treatments."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijantimicag.2016.08.014. This DOI is a link to an online electronic document that is either free or for purchase.

**Membrane Proteins - Polymyxins**

**New Polymyxins Findings from Monash University Discussed (p53 Mediates Colistin-Induced Autophagy and Apoptosis in PC-12 Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Membrane Proteins - Polymyxins are presented in a new report. According to news reporting from Parkville, Australia, by NewsRx journalists, research stated, "The mechanism of colistin-induced neurotoxicity is still unknown. Our recent study (L.Zhang, Y.H.Zhao, W.J. Ding, G.Z. Jiang, Z.Y. Lu, L. Li, J. L. Wang, J.Li, and J.C."

Financial supporters for this research include National Natural Science Foundation of China (NSFC), Natural Science Fund of Heilongjiang Province.

The news correspondents obtained a quote from the research from Monash University, "Li, Antimicrob Agents Chemother 59:2189-2197, 2015, http://dx.doi.org/10.1128/AAC.04092-14; H. Jiang, J. C. Li, T. Zhou, C. H. Wang, H. Zhang, and H. Wang, Int J Mol Med 33: 1298-1304, 2014, http://dx.doi.org/10.3892/ijmm.2014.1684) indicates that colistin induces autophagy and apoptosis in rat adrenal medulla PC-12 cells, and there is interplay between both cellular events. As an important cellular stress sensor, phosphoprotein p53 can trigger cell cycle arrest and apoptosis and regulate autophagy. The aim of the present study was to investigate the involvement of the p53 pathway in colistin-induced neurotoxicity in PC-12 cells. Specifically, cells were treated with colistin (125 μg/ml) in the absence and presence of a p53 inhibitor, pifithrin-alpha(PFT- alpha; 20 nM), for 12 h and 24 h, and the typical hallmarks of autophagy and apoptosis were examined by fluorescence/immunofluorescence microscopy and electron microscopy, real-time PCR, and Western blotting. The results indicate that colistin had a stimulatory effect on the expression levels of the target genes and proteins involved in autophagy and apoptosis, including LC3-II/I, p53, DRAM (damage-regulated autophagy modulator), PUMA (p53 upregulated modulator of apoptosis), Bax, p-AMPK (activated form of AMP-activated protein kinase), and caspase-3. In contrast, colistin appeared to have an inhibitory effect on the expression of p-mTOR (activated form of mammalian target of rapamycin), which is another target protein in autophagy. Importantly, analysis of the levels of p53 in the cells treated with colistin revealed an increase in nuclear p53 at 12 h and cytoplasmic p53 at 24 h. Pretreatment of colistin-treated cells with PFT-alpha inhibited autophagy and promoted colistin-induced apoptosis."

According to the news reporters, the research concluded: "This is the first study to demonstrate that colistin-induced autophagy and apoptosis are associated with the p53-mediated pathway."

For more information on this research see: p53 Mediates Colistin-Induced Autophagy and Apoptosis in PC-12 Cells. *Antimicrobial Agents and Chemotherapy*, 2016;60 (9):5294-5301. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiobiology, 1752 N St NW, Washington, DC 20036-2904, USA. Membrane Proteins - Porins

New Porins Study Findings Recently Were Reported by M.M. Albataineh and Co-Researchers (Activation of the metabolic sensor AMP-activated protein kinase inhibits aquaporin-2 function in kidney principal cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Membrane Proteins - Porins have been published. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "Aquaporin-2 (AQP2) is essential to maintain body water homeostasis. AQP2 traffics from intracellular vesicles to the apical membrane of kidney collecting duct principal cells in response to vasopressin [arginine vasopressin (AVP)], a hormone released with low intravascular volume, which causes decreased kidney perfusion."

Our news journalists obtained a quote from the research, "Decreased kidney perfusion activates AMP-activated kinase (AMPK), a metabolic sensor that inhibits the activity of several transport proteins. We hypothesized that AMPK activation also inhibits AQP2 function. These putative AMPK effects could protect interstitial ionic gradients required for urinary concentration during metabolic stress when low intravascular volume induces AVP release. Here we found that short-term AMPK activation by treatment with 5-aminoimidazole-4-carboxamide-1-beta-D-ribofuranoside (AICAR; 75 min) in kidney tissue prevented baseline AQP2 apical accumulation in principal cells, but did not prevent AQP2 apical accumulation in response to the AVP analog desmopressin (dDAVP). Prolonged AMPK activation prevented AQP2 cell membrane accumulation in response to forskolin in mouse collecting duct mpkCCD (c14) cells. Moreover, AMPK inhibition accelerated hypotonic lysis of Xenopus oocytes expressing AQP2. We performed phosphorylation assays to elucidate the mechanism by which AMPK regulates AQP2. Although AMPK weakly phosphorylated immunoprecipitated AQP2 in vitro, no direct AMPK phosphorylation of the AQP2 COOH-terminus was detected by mass spectrometry. AMPK promoted Ser-261 phosphorylation and antagonized dDAVP-dependent phosphorylation of other AQP2 COOH-terminal sites in cells. Our findings suggest an increasing, time-dependent antagonism of AMPK on AQP2 regulation with AICAR-dependent inhibition of cAMP-dependent apical accumulation and AVP-dependent phosphorylation of AQP2."

According to the news editors, the research concluded: "This inhibition likely occurs via a mechanism that does not involve direct AQP2 phosphorylation by AMPK."

Keywords for this news article include: Los Angeles, California, United States, North and Central America, Intracellular Signaling Peptides and Proteins, AMP-Activated Protein Kinases, Membrane Transport Proteins, Membrane Glycoproteins, Enzymes and Coenzymes, Membrane Proteins, Carrier Proteins, Ion Channels, Aquaporin 2, Vasopressin, Aquaporins, Hormones, Porins.

**Post-Traumatic Stress Disorders**

**New Post-Traumatic Stress Disorders Study Findings Have Been Reported from University of Cape Town (Pharmacology for sleep disturbance in PTSD)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Post-Traumatic Stress Disorders have been presented. According to news reporting originating from Rondebosch, South Africa, by NewsRx correspondents, research stated, "Symptoms of sleep disturbance, particularly nightmares and insomnia, are a central feature of post-traumatic stress disorder (PTSD). Emerging evidence suggests that specific treatment of PTSD-related sleep disturbance improves other symptoms of the disorder, which in turn suggests that such disturbance may be fundamental to development and maintenance of the disorder."

Financial supporters for this research include EU Marie Curie International Staff Exchange Scheme, National Research Foundation.

Our news editors obtained a quote from the research from the University of Cape Town, "This mini-review focuses on pharmacological treatment of sleep disturbance in adult PTSD (specifically, studies testing the efficacy of antidepressants, adrenergic inhibiting agents, antipsychotics and benzodiazepine and non-benzodiazepine hypnotics). We conclude that only prazosin, an adrenergic inhibiting agent, has had its efficacy established by multiple randomised controlled trials. There is also high-level evidence supporting use of eszopiclone, as well as risperidone and olanzapine as adjunct therapy. Antidepressants such as sertraline, venlafaxine and mirtazapine, benzodiazepines such as alprazolam and clonazepam and non-benzodiazepine hypnotics such as zolpidem appear ineffective in treating PTSD-related sleep disturbance. Most studies that report reduced frequency of nightmares and insomnia also report decreases in overall symptom severity."

According to the news editors, the research concluded: "Such findings suggest that (i) sleep disruption is central to PTSD; (ii) treating sleep disruption may be an effective way to address other symptoms of the disorder and (iii) PTSD symptoms tend to cluster together in predictable ways."

For more information on this research see: Pharmacology for sleep disturbance in PTSD. *Human Psychopharmacology*, 2016;31(2):156-63. (Wiley-Blackwell - www.wiley.com/;
New Post-Trial Research Findings from University Hospital Discussed
(Diagnostic contribution of a second percutaneous needle biopsy in patients with spontaneous diskitis and negative blood cultures and first biopsy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Trials and Studies - Post-Trial Research are discussed in a new report. According to news originating from Reims, France, by NewsRx correspondents, research stated, "The primary objective was to assess the diagnostic contribution of a second percutaneous needle biopsy in patients with spontaneous diskitis and negative findings from blood cultures and the first biopsy. We also assessed the sensitivity of the first biopsy and the diagnostic contribution of post-biopsy blood cultures."

Financial support for this research came from Reims and Charleville-Mezieres hospitals.

Our news journalists obtained a quote from the research from University Hospital, "Multicenter retrospective study of patients managed between 2004 and 2014. We excluded patients with postoperative diskitis. We identified 63 patients with spontaneous diskitis, negative blood cultures, and at least one percutaneous needle biopsy during the study period. The first biopsy established the diagnosis in 33 (52%) patients. Of the 30 remaining patients, 10 (33%) had a second biopsy, which was positive in 6 (60%), and 20 (67%) received probabilistic antibiotic therapy. There were 8 positive blood cultures after the first biopsy but, among them, 7 occurred in biopsy-positive patients. Biopsy yield varied with the guidance method (needle guidance software or imaging by computed tomography and/or fluoroscopy) and operators. Antibiotic therapy within the 6 months preceding the first biopsy was significantly associated with having a negative first biopsy (15/30 versus 7/33; odds ratio, 3.13; 95% confidence interval, 1.07-9.13; P<0.05)."

According to the news editors, the research concluded: "In our study, a second needle biopsy was useful, providing the bacteriological diagnosis in 60% of cases of spontaneous diskitis with negative findings from blood cultures and the first biopsy."

For more information on this research see: Diagnostic contribution of a second percutaneous needle biopsy in patients with spontaneous diskitis and negative blood cultures and first biopsy. Joint Bone Spine, 2016;83(6):715-719. Joint Bone Spine can be contacted at:
Clinical Trials and Studies - Post-Trial Research

New Post-Trial Research Study Findings Recently Were Reported by Researchers at Lankenau Institute for Medical Research (Insights from HuR biology point to potential improvement for second-line ovarian cancer therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Trials and Studies - Post-Trial Research. According to news reporting out of Wynnewood, Pennsylvania, by NewsRx editors, research stated, "This retrospective study aimed to investigate the role that an RNA-binding protein, HuR, plays in the response of high-grade serous ovarian tumors to chemotherapeutics. We immunohistochemically stained sections of 31 surgically-debulked chemo-na?ve ovarian tumors for HuR and scored the degree of HuR cytoplasmic staining."

Our news journalists obtained a quote from the research from Lankenau Institute for Medical Research, "We found no correlation between HuR intracellular localization in tumor sections and progression free survival (PFS) of these patients, 29 of whom underwent second-line gemcitabine/platin combination therapy for recurrent disease. Ribonucleoprotein immunoprecipitation (RNP-IP) analysis of ovarian cancer cells in culture showed that cytoplasmic HuR increases deoxycytidine kinase (dCK), a metabolic enzyme that activates gemcitabine. The effects of carboplatin treatment on HuR and WEE1 (a mitotic inhibitor) expression, and on cell cycle kinetics, were also examined. Treatment of ovarian cancer cells with carboplatin results in increased HuR cytoplasmic expression and elevated WEE1 expression, arresting cell cycle G2/M transition. This may explain why HuR cytoplasmic localization in chemo-na?ve tumors is not predictive of therapeutic response and PFS following second-line gemcitabine/platin combination therapy."

According to the news editors, the research concluded: "These results suggest treatment of recurrent ovarian tumors with a combination of gemcitabine, carboplatin, and a WEE1 inhibitor may be potentially advantageous as compared to current clinical practices."

For more information on this research see: Insights from HuR biology point to potential improvement for second-line ovarian cancer therapy. Oncotarget, 2016;7(16):21812-24.

Our news journalists report that additional information may be obtained by
contacting Y.H. Huang, Lankenau Institute for Medical Research, Wynnewood, PA 19086, United States. Additional authors for this research include W. Peng, N. Furuuchi, J.B. DuHadaway, M. Jimbo, A. Pirritano, C.J. Dunton, G.S. Daum, B.E. Leiby, J.R. Brody and J.A Sawicki.

Clinical Trials and Studies - Pre-Trial Research

New Pre-Trial Research Data Have Been Reported by Investigators at University of Chicago (Treatment with methylnaltrexone is associated with increased survival in patients with advanced cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Trials and Studies - Pre-Trial Research. According to news originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Methylnaltrexone (MNTX), a peripherally acting mu-opioid receptor (MOR) antagonist, is FDA-approved for treatment of opioid-induced constipation (OIC). Preclinical data suggest that MOR activation can play a role in cancer progression and can be a target for anticancer therapy."

Our news journalists obtained a quote from the research from the University of Chicago, "Pooled data from advanced end-stage cancer patients with OIC, despite laxatives, treated in two randomized (phase III and IV), placebo-controlled trials with MNTX were analyzed for overall survival (OS) in an unplanned post hoc analysis. MNTX or placebo was given subcutaneously during the double-blinded phase, which was followed by the open-label phase, allowing MNTX treatment irrespective of initial randomization. In two randomized, controlled trials, 229 cancer patients were randomized to MNTX (117, 51%) or placebo (112, 49%). Distribution of patients' characteristics and major tumor types did not significantly differ between arms. Treatment with MNTX compared with placebo [76 days, 95% confidence interval (CI) 43-109 versus 56 days, 95% CI 43-69; P = 0.033] and response (laxation) to treatment compared with no response (118 days, 95% CI 59-177 versus 55 days, 95% CI 40-70; P< 0.001) had a longer median OS, despite 56 (50%) of 112 patients ultimately crossing over from placebo to MNTX. Multivariable analysis demonstrated that response to therapy [hazard ratio (HR) 0.47, 95% CI 0.29-0.76; P = 0.002] and albumin >= 3.5 (HR 0.46, 95% CI 0.30-0.69; P< 0.001) were independent prognostic factors for increased OS. Of interest, there was no difference in OS between MNTX and placebo in 134 patients with advanced illness other than cancer treated in these randomized studies (P = 0.88). This unplanned post hoc analysis of two randomized trials demonstrates that treatment with MNTX and, even more so, response to MNTX are associated with increased OS, which supports the preclinical hypothesis that MOR can play a role in cancer progression."

According to the news editors, the research concluded: "Targeting MOR with
MNTX warrants further investigation in cancer therapy. NCT00401362, NCT00672477."

The news correspondents report that additional information may be obtained from J. Moss, University Chicago, Pritzker Sch Med, Dept. of Anesthesia & Crit Care, Chicago, IL 60637, United States. Additional authors for this research include L.K. Johnson, D.D. Karp, J.T. Atkins, P.A. Singleton and J. Moss.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/annonc/mdw317. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Chicago, Illinois, United States, North and Central America, Peripheral Opioid Receptor Antagonists, Functional Bowel Disorder Agents, Clinical Trials and Studies, Gastrointestinal Agents, Drugs and Therapies, Pre-Trial Research, Clinical Research, Methylnaltrexone, Placebos, Oncology, Therapy, Cancer, University of Chicago.

Pregnancy Complications - Pregnancy-Induced...

**New Pregnancy-Induced Hypertension Study Findings Have Been Reported from Shandong University (Serum Beta-Trace Protein as a Novel Predictor of Pregnancy-Induced Hypertension)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Pregnancy Complications - Pregnancy-Induced Hypertension. According to news reporting from Shandong, People's Republic of China, by NewsRx journalists, research stated, "Beta-trace protein (BTP) has emerged as a novel biomarker of cardiovascular risk. However, the level of circulating BTP in pregnancy-induced hypertension (PIH) is still unknown."

The news correspondents obtained a quote from the research from Shandong University. "The aim of this study was to determine the concentration of serum BTP in healthy pregnant women and patients with PIH. No significant difference was found in the serum concentration of BTP in patients with a normal pregnancy. In contrast, serum BTP levels in women with PIH (n=46) were significantly higher than those in women with normal pregnancy (n=57). Receiver operating characteristic analysis revealed that using a serum BTP value of 321.3 ng/mL as a cutoff produced a sensitivity of 91.3% and a specificity of 89.5%.

According to the news reporters, the research concluded: "Taken together, these findings suggest that a higher serum BTP concentration in PIH patients compared with those with normal pregnancy and serum BTP might be a novel biomarker in the diagnosis of PIH."

New Proglucagon Findings Reported from Wageningen University (The Noncaloric Sweetener Rebaudioside A Stimulates Glucagon-Like Peptide 1 Release and Increases Enteroendocrine Cell Numbers in 2-Dimensional Mouse Organoids Derived from Different ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Peptide Proteins - Proglucagon. According to news reporting from Wageningen, Netherlands, by NewsRx journalists, research stated, "Glucagon-like peptide 1 (GLP-1) contributes to satiety and plays a pivotal role in insulin secretion and glucose homeostasis. Similar to GLP-1, peptide YY (PYY) and cholecystokinin also influence food intake."

The news correspondents obtained a quote from the research from Wageningen University, "The secretion of these hormones by enteroendocrine cells along the intestine is modulated by nutrients. Preparations from the Stevia rebaudiana plant, including rebaudioside A, are increasingly being used as noncaloric sweeteners. We investigated the effects of rebaudioside A on enteroendocrine cells by assessing both cell numbers as well as their secretory capacity in an organoid model. A 2-dimensional organoid model derived from duodenal, jejunal, and ileal crypts of a C57BL/6J mouse was developed and characterized with the use of gene expression and immunofluorescence. We stimulated these organoids with 10 mmol/L rebaudioside A for 1 h and measured their GLP-1, PYY, and cholecystokinin release. We also analyzed the effects of rebaudioside A on gene expression in enteroendocrine cells after an 18-h incubation. The 2-dimensional organoids contained crypt cells and differentiated villus cells, including enterocytes and goblet and enteroendocrine cells. These enteroendocrine cells stained positive for GLP-1, PYY, and serotonin. The cultured 2-dimensional organoids maintained their location-specific gene expression patterns. Compared with the control, rebaudioside A induced GLP-1 secretion 1.7-fold in the duodenum (P < 0.01), 2.2-fold in the jejunum (P < 0.01), and 4.3-fold in the ileum (P < 0.001). PYY release was increased by rebaudioside A 3-fold in the ileum compared with the control (P < 0.05). Long-term (18-h) stimulation with the sweetener induced the expression of the enteroendocrine-specific markers chromogranin A, glucagon, Pyy, and cholecystokinin 3.5- (P < 0.001), 3.5- (P < 0.001), 3.8- (P < 0.05), and 6.5-fold (P < 0.001), respectively."
According to the news reporters, the research concluded: "These results show novel ex vivo effects of rebaudioside A on enteroendocrine cells of the mouse small intestine and highlight potentially new applications for rebaudioside A in metabolic diseases."

Our news journalists report that additional information may be obtained by contacting J. Meijerink, Wageningen University, Div Human Nutr, Wageningen, Netherlands. Additional authors for this research include J.P. ten Klooster, S. Muckenschnabl, R. Pieters, H.F.J. Hendriks, R.F. Witkamp and J. Meijerink.

Peptide Proteins - Proinsulin

New Proinsulin Study Results Reported from E. Maseroli et al (Cardiometabolic Risk and Female Sexuality: Focus on Clitoral Vascular Resistance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Peptide Proteins - Proinsulin are discussed in a new report. According to news reporting originating in Rome, Italy, by NewsRx journalists, research stated, "The relation between sexual and cardiovascular health in women is not well defined. Clitoral color Doppler ultrasound (CDU) with assessment of the pulsatility index (PI), reflecting resistance to blood flow, has been proposed as an objective measurement of sexual functioning."

The news reporters obtained a quote from the research, "To investigate associations between clitoral PI and cardiometabolic risk factors, sexual and intrapsychic parameters, and self-perception of body image. Seventy-one adult heterosexual women in a stable relationship attending our clinic for sexual dysfunction were consecutively recruited. Patients underwent physical, laboratory, and clitoral color Doppler ultrasound examinations and completed the Female Sexual Function Index, the Middlesex Hospital Questionnaire, and the Body Uneasiness Test (BUT). Clitoral PI was positively correlated with body mass index (r = 0.441, P< .0001), waist circumference (r = 0.474, P< .0001), glycemia (r = 0.300, P = .029), insulin (r = 0.628, P = .002), homeostatic model assessment index (r = 0.605, P = .005), triglycerides (r = 0.340, P = .011), total cholesterol (r = 0.346, P = .010), and low-density lipoprotein cholesterol (r = 0.334, P = .016). All relations, with the exception of glycemia, retained statistical significance after adjusting for age, smoking habit, and years since menopause (P < .0001 for body mass index,
waist circumference, and triglycerides; P < .05 for all other associations). Analysis of covariance, after adjusting for confounders, showed that women with obesity or metabolic syndrome (MetS) showed significantly higher PI values (obesity: F = 17.79, P = .001; MetS: F = 7.37, P = .019). In particular, a stepwise increase of PI was found as a function of increasing MetS components (beta = 0.434, P = .007). Clitoral PI was negatively associated with Female Sexual Function Index arousal (beta = -0.321, P = .014) and satisfaction (beta = -0.289, P = .026) scores and positively associated with Middlesex Hospital Questionnaire somatized anxiety symptoms, even after adjusting for age, smoking habit, years since menopause, and current use of psychiatric medication (beta = 0.354, P = .011). A positive association also was observed between PI and the BUT positive symptom distress index (beta = 0.322, P = .039) and BUT for dislike of the womb, genitals, and breast (beta = 0.538, P < .0001; beta = 0.642, P < .0001; beta = 0.549, P < .0001, respectively). After introducing waist circumference as another covariate, the associations between clitoral PI and the BUT positive symptom distress index and BUT dislike of the womb, genitals, and breast retained statistical significance (P = .038 for positive symptom distress index; P < .0001 for dislike of womb, genitals, and breast). Clitoral vascular resistance is positively associated with MetS (in particular insulin resistance), decreased sexual arousal, body image concerns, and increased somatized anxiety symptoms."

According to the news reporters, the research concluded: "Further studies are needed to establish whether treatment of metabolic abnormalities might improve clitoral color Doppler ultrasound indices and sexual outcomes."

Our news correspondents report that additional information may be obtained by contacting L. Vignozzi, Istituto Nazionale Biostrutture e Biosistemi, Rome, Italy. **Propanolamines**

**New Propanolamines Findings from Indian Institute of Technology Discussed (Amino Functionalized Graphene Oxide and Polymer Nanocomposite Based Electrochemical Platform for Sensitive Assay of Anti-Doping Drug Atenolol in Biological Fluids)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Propanolamines have been published. According
An ultra-sensitive method based on the electrodeposited polymer nano-composite using amino functionalized graphene oxide (EAGO) and conductive polymer (poly 4-amino-3-hydroxy-1-naphthalenesulfonic acid; p-AHNSA) for the determination of atenolol (ATN) is presented. The surface morphology of the polymer nano-composite has been investigated by using Cyclic voltammetry (CV), Square wave voltammetry (SWV), Electrochemical Impedance Spectroscopy (EIS), Field Emission-Scanning Electron Microscopy (FE-SEM), Fourier transform infrared spectroscopy (FTIR) and Powder X-ray diffraction (XRD).

The news reporters obtained a quote from the research from the Indian Institute of Technology, "The oxidation of ATN occurred in a well-defined, pH dependent peak. The polymer nano-composite modified surface electro-catalyzed the electrochemical oxidation of atenolol in comparison to the unmodified surface and GO/p-(AHNSA) modified surface. The determination of atenolol was carried out in the wide concentration range and a linear calibration plot was observed in the range 0.1-300 μM with sensitivity and detection limit (L.O.D.) of 0.1334 μA M⁻¹ and 20 nM (n = 3), respectively."

According to the news reporters, the research concluded: "The analytical applicability of the developed method has been demonstrated in detecting ATN in the pharmaceutical formulations and biological fluids (urine and plasma) with excellent recoveries of > 97%.

Our news correspondents report that additional information may be obtained by contacting R.N. Goyal, Indian Inst Technol Roorkee, Dept. of Chem, Roorkee 247667, Uttar Pradesh, India.

Propranolol is widely used to prevent gastroesophageal variceal bleeding; however, some patients could not benefit from propranolol. This study is to evaluate the relationship between CYP2D6 and b2-adrenergic receptor (b2-AR) gene polymorphisms and the hemodynamic response to propranolol in Chinese Han patients.

Our news journalists obtained a quote from the research from the School of Medicine, "The clinical data of patients with gastroesophageal varices undergoing hepatic venous pressure gradient (HVPG) measurement before and 7 days after oral propranolol administration in our department were collected. Four single nucleotide polymorphisms of CYP2D6 and b2-AR genes were detected. The relationship was identified by logistic regression model. Thirty patients were involved in the analysis. Sixty milligram propranolol twice each day was well tolerated by all the patients. The initial and secondary average of HVPG was 17.4 ? 5.8 mmHg vs. 13.2 ? 4.8 mmHg, respectively (t=5.726, p<0.001). Twenty patients responded to propranolol. The mean reduction value of HVPG was 6.6 ? 3.6 mmHg (range from 3 to 19). Genotype analysis showed: 20 homozygotes for C/C188 and 10 for heterozygous C/T188, 8 homozygotes for G/G4268 and 22 heterozygotes for G/C4268, 14 homozygotes for Gly16 and 10 heterozygotes, and 6 homozygotes for Arg16, 27 homozygotes for Gln27 and 3 heterozygotes. The multivariate logistic regression analysis indicated that CYP2D6 (188C >T) genotype was an independent predicting factor for HVPG response to propranolol (p=0.033). CYP2D6 (188C >T) gene polymorphisms influence the hemodynamic response to propranolol in this population of Chinese Han patients with gastroesophageal varices."

According to the news editors, the research concluded: "However, HVPG response cannot be completely predicted from CYP2D6 and b2-AR gene polymorphisms."

Our news journalists report that additional information may be obtained by contacting F. Zhang, Dept. of Gastroenterology, Affiliated Drum Tower Hospital of Nanjing University Medical School, Nanjing, People's Republic of China. Additional authors for this research include X. Duan, M. Zhang, Z. Li, Q. He, Y. Wang, C. Miao, W. Zhong, X. Zou and Y. Zhuge.

Oncology - Prostate Cancer

New Prostate Cancer Data Have Been Reported by Researchers at University Health Network (Limitations in Predicting Organ Confined Prostate Cancer in Patients with Gleason Pattern 4 on Biopsy: Implications for Active Surveillance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "In prostate cancer biopsy Gleason score predicts stage and helps determine active surveillance suitability. Evidence suggests that small incremental differences in the quantitative percent of Gleason pattern 4 on biopsy stratify disease extent, biochemical failure following surgery and eligibility for active surveillance."

Our news journalists obtained a quote from the research from University Health Network, "We explored the overall quantitative percent of Gleason pattern 4 levels and adverse outcomes in patients with low and intermediate risk prostate cancer to whom active surveillance may be offered under expanded criteria. We analyzed the records of patients with biopsy Gleason score 6 (3 + 3) or 7 (3 + 4) who underwent radical prostatectomy from January 2008 to August 2015. Age, prostate specific antigen, Gleason score, quantitative percent of Gleason pattern 4, overall percent positive cores (percent of prostate cancer) and clinical stage were explored as predictors of nonorgan confined disease and time to failure after radical prostatectomy. In 1,255 patients biopsy Gleason score 7 (3 + 4) was associated with T3 or greater disease at radical prostatectomy in 35.0% compared with Gleason score 6 (3 + 3) in 19.0% (p < 0.001). On multivariate analysis for each quantitative percent of Gleason pattern 4 increase there were 2% higher odds of T3 or greater disease (OR 1.02, 95% CI 1.01-1.04, p<0.001). When stratified, patients with Gleason score 7 (3 + 4) only approximated the pT3 rates of Gleason score 6 (3 + 3) when prostate specific antigen was less than 8 ng/ml and the percent of prostate cancer was less than 15%. In those cases the quantitative percent of Gleason pattern 4 had less effect. Time to failure after radical prostatectomy was worse in Gleason score 7 (3 + 4) than 6 (3 + 3) cases. The quantitative percent of Gleason pattern 4 helps predict advanced disease and Gleason score 7 (3 + 4) is associated with worse outcomes. However, the impact of the quantitative percent of Gleason pattern 4 on adverse pathological and clinical outcomes is best used in combination with prostate specific antigen, age and disease volume since each has a greater impact on predicting nonorgan confined disease."

According to the news editors, the research concluded: "The calculated absolute risk of T3 or greater can be used in shared decision making on prostate cancer treatment by patients and clinicians."

The news correspondents report that additional information may be obtained from N. Perlis, Univ Hlth Network, Dept. of Surg Oncol, Div Urol, Toronto, ON, Canada. Additional authors for this research include R. Sayyid, A. Evans, T. Van der Kwast, A. Toi, A. Finelli, G. Kulkarni, R. Hamilton, A.R. Zlotta, J. Trachtenberg, S. Ghai and N.E. Fleshner.

Oncology - Prostate Cancer

New Prostate Cancer Data Have Been Reported by Researchers at University of Quebec (Association between lifetime alcohol consumption and prostate cancer risk: A case-control study in Montreal, Canada)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting out of Laval, Canada, by NewsRx editors, research stated, "Alcohol intake may increase the risk of prostate cancer (PCa). Many previous studies harbored important methodological limitations."

Our news journalists obtained a quote from the research from the University of Quebec, "We conducted a population-based case-control study of PCa comprising 1933 cases and 1994 controls in Montreal, Canada. Lifetime alcohol consumption was elicited, by type of beverage, during in-person interviews. Odds ratios (OR) and 95% confidence intervals (CI) assessed the association between alcohol intake and PCa risk, adjusting for potential confounders and considering the subjects' PCa screening history. We observed a weak, non-significant positive association between high consumption of total alcohol over the lifetime and risk of high-grade PCa (OR = 1.18, 95% CI 0.81-1.73). Risk estimates were more pronounced among current drinkers (OR = 1.40, 95% CI 1.00-1.97), particularly after adjusting for the timing of last PCa screening (OR = 1.52, 95% CI 1.07-2.16). These associations were largely driven by beer consumption. The OR for high-grade PCa associated with high beer intake was 1.37 (95% CI 1.00-1.89); it was 1.49 (95% CI 0.99-2.23) among current drinkers and 1.68 (95% CI 1.10-2.57) after adjusting for screening recency. High cumulative consumption of spirits was associated with a lower risk of low-grade PCa (OR = 0.75, 95% CI 0.60-0.94) but the risk estimate no longer achieved statistical significance when restricting to current users. No association was found for wine consumption. Findings add to the accumulating evidence that high alcohol consumption increases the risk of high-grade PCa."

According to the news editors, the research concluded: "This association largely reflected beer intake in our population, and was strengthened when taking into account PCa screening history."

For more information on this research see: Association between lifetime alcohol consumption and prostate cancer risk: A case-control study in Montreal, Canada. Cancer Epidemiology, 2016;45():11-17. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd,
New Prostate Cancer Findings Has Been Reported by Investigators at Emory University (Neurovascular bundle-sparing radiotherapy for prostate cancer using MRI-CT registration: A dosimetric feasibility study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting originating in Atlanta, Georgia, by NewsRx journalists, research stated, "Sexual dysfunction after radiotherapy for prostate cancer remains an important late adverse toxicity. The neurovascular bundles (NVB) that lie posterolaterally to the prostate are typically spared during prostatectomy, but in traditional radiotherapy planning they are not contoured as an organ-at-risk with dose constraints."

The news reporters obtained a quote from the research from Emory University, "Our goal was to determine the dosimetric feasibility of 'NVB-sparing' prostate radiotherapy while still delivering adequate dose to the prostate. Twenty-five consecutive patients with prostate cancer (with no extraprostatic disease on pelvic magnetic resonance imaging [MRI]) who that were treated with external beam radiotherapy, with the same primary planning target volume margins, to a dose of 79.2 Gy were evaluated. Pelvic MRI and simulation computed tomography scans were registered using dedicated software to allow for bilateral NVB target delineation on T2-weighted MRI. A volumetric modulated arc therapy plan was generated using the NVB bilaterally with 2 mm margin as an organ to spare and compared to the patient's previously delivered plan. Dose-volume histogram endpoints for NVB, rectum, bladder, and planning target volume 79.2 were compared between the 2 plans using a 2-tailed paired t-test. The V70 for the NVB was significantly lower on the NVB-sparing plan (p <0.01), while rectum and bladder endpoints were similar. Target V100% was similar but V-105% was higher for the NVB-sparing plans (p <0.01). 'NVB-sparing' radiotherapy is dosimetrically feasible using CT-MRI registration, and for volumetric modulated arc therapy technology-target coverage is acceptable without increased dose to other normal structures, but with higher target dose inhomogeneity."

According to the news reporters, the research concluded: "The clinical impact of
'NVB-sparing' radiotherapy is currently under study at our institution."

Our news correspondents report that additional information may be obtained by contacting R.J. Cassidy, Emory University, Dept. of Radiat Oncol, Winship Canc Inst, Atlanta, GA 30322, United States. Additional authors for this research include X. Yang, T. Liu, M. Thomas, S.G. Nour and A.B. Jani.

Keywords for this news article include: Atlanta, Georgia, United States, North and Central America, Clinical Trials and Studies, Prostatic Neoplasms, Clinical Research, Prostate Cancer, Radiotherapy, Oncology, Therapy, Emory University.

**Oncology - Prostate Cancer**

**New Prostate Cancer Findings Reported from Nanjing University**

*(Contrast-enhanced transrectal ultrasound for prediction of prostate cancer aggressiveness: The role of normal peripheral zone time-intensity curves)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "To assess the role of time-intensity curves (TICs) of the normal peripheral zone (PZ) in the identification of biopsy-proven prostate nodules using contrast-enhanced transrectal ultrasound (CETRUS). This study included 132 patients with 134 prostate PZ nodules."

Our news journalists obtained a quote from the research from Nanjing University, "Arrival time (AT), peak intensity (PI), mean transit time (MTT), area under the curve (AUC), time from peak to one half (TPH), wash in slope (WIS) and time to peak (TTP) were analyzed using multivariate linear logistic regression and receiver operating characteristic (ROC) curves to assess whether combining nodule TICs with normal PZ TICs improved the prediction of prostate cancer (PCa) aggressiveness. The PI, AUC (p < 0.001 for both), MTT and TPH (p = 0.011 and 0.040 respectively) values of the malignant nodules were significantly higher than those of the benign nodules. Incorporating the PI and AUC values (both, p< 0.001) of the normal PZ TIC, but not the MTT and TPH values (p = 0.076 and 0.159 respectively), significantly improved the AUC for prediction of malignancy (PI: 0.784-0.923; AUC: 0.758-0.891) and assessment of cancer aggressiveness (p < 0.001)." According to the news editors, the research concluded: "Thus, all these findings indicate that incorporating normal PZ TICs with nodule TICs in CETRUS readings can improve the diagnostic accuracy for PCa and cancer aggressiveness assessment."

New Prostate Cancer Findings from P.S. Jadhavar and Colleagues Discussed (Targeting prostate cancer with compounds possessing dual activity as androgen receptor antagonists and HDAC6 inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "While enzalutamide and abiraterone are approved for treatment of metastatic castration-resistant prostate cancer (mCRPC), approximately 20-40% of patients have no response to these agents. It has been stipulated that the lack of response and the development of secondary resistance to these drugs may be due to the presence of AR splice variants."

Our news editors obtained a quote from the research, "HDAC6 has a role in regulating the androgen receptor (AR) by modulating heat shock protein 90 (Hsp90) acetylation, which controls the nuclear localization and activation of the AR in androgen-dependent and independent scenarios. With dual-acting AR-HDAC6 inhibitors it should be possible to target patients who don't respond to enzalutamide. Herein, we describe the design, synthesis and biological evaluation of dual-acting compounds which target AR and are also specific towards HDAC6. Our efforts led to compound 10 which was found to have potent dual activity (HDAC6 IC50 = 0.0356 μM and AR binding IC50 <=0.03 μM)."

According to the news editors, the research concluded: "Compound 10 was further evaluated for antagonist and other cell-based activities, in vitro stability and pharmacokinetics."

The direct object identifier (DOI) for that additional information is:
New Prostate Cancer Findings from RWTH Aachen University Discussed (Prediction of radiation-induced toxicity by in vitro radiosensitivity of lymphocytes in prostate cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news originating from Aachen, Germany, by NewsRx correspondents, research stated, "To identify predictive assays for radiation-induced toxicity in prostate cancer patients. Patients have been surveyed prospectively before and up to 16 months after radiotherapy using a validated questionnaire."

Our news journalists obtained a quote from the research from RWTH Aachen University, "Subgroups of 25 patients with minor and larger score changes, respectively, were selected for g-H2AX, G2 and Annexin V assays. A significantly higher spontaneous chromatid aberration yield (HR: 1.46 [95% CI: 1.02-2.09]; p=0.04), higher levels of early apoptotic (HR: 1.12 [95% CI: 1.01-1.24]; p=0.04) and late apoptotic and necrotic (HR: 1.10 [95% CI: 0.99-1.23]; p=0.08) lymphocytes 24 h post-irradiation were found in patients with a bowel bother score decrease greater than 20 points more than 1 year after treatment."

According to the news editors, the research concluded: "Chromatid aberration and apoptosis/necrosis assays appear to be suitable for the prediction of radiation-induced toxicity."

The news correspondents report that additional information may be obtained from M. Pinkawa, Dept. of Radiation Oncology, RWTH Aachen University, Pauwelsstrasse 30, 52057 Aachen, Germany. Additional authors for this research include K. Brzozowska, R. Kriehuber, M.J. Eble and S. Schmitz.

New Prostate Cancer Study Findings Have Been Reported from University of Lausanne (Inhibition of Notch pathway arrests PTEN-deficient advanced prostate cancer by triggering p27-driven cellular senescence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology-Prostate Cancer are discussed in a new report. According to news reporting originating in Lausanne, Switzerland, by NewsRx journalists, research stated, "Activation of NOTCH signalling is associated with advanced prostate cancer and treatment resistance in prostate cancer patients. However, the mechanism that drives NOTCH activation in prostate cancer remains still elusive."

The news reporters obtained a quote from the research from the University of Lausanne, "Moreover, preclinical evidence of the therapeutic efficacy of NOTCH inhibitors in prostate cancer is lacking. Here, we provide evidence that PTEN loss in prostate tumours upregulates the expression of ADAM17, thereby activating NOTCH signalling. Using prostate conditional inactivation of both Pten and Notch1 along with preclinical trials carried out in Pten-null prostate conditional mouse models, we demonstrate that Pten-deficient prostate tumours are addicted to the NOTCH signalling. Importantly, we find that pharmacological inhibition of gamma-secretase promotes growth arrest in both Pten-null and Pten/Trp53-null prostate tumours by triggering cellular senescence."

According to the news reporters, the research concluded: "Altogether, our findings describe a novel pro-tumorigenic network that links PTEN loss to ADAM17 and NOTCH signalling, thus providing the rational for the use of gamma-secretase inhibitors in advanced prostate cancer patients."

Our news correspondents report that additional information may be obtained by contacting A. Alimonti, Univ Lausanne UNIL, Fac Biol & Med, CH-1011 Lausanne, Switzerland. Additional authors for this research include M.L. Perciato, A. Toso, A. Alajati, J.J. Chen, H. Gerber, M. Dimitrov, A. Rinaldi, N. Delaleu, E. Pasquini, R. D'Antuono, S. Pinton, M. Losa, L. Gnetti, A. Arribas, P. Fraering, F. Bertoni, A. Nepveu and A. Alimonti.

New Prostate Cancer Study Findings Have Been Reported from University of Michigan (Noninvasive Ablation of Prostate Cancer Spheroids Using Acoustically-Activated Nanodroplets)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Prostate Cancer are discussed in a new report. According to news reporting out of Ann Arbor, Michigan, by NewsRx editors, research stated, "We have developed acoustically activated nanodroplets (NDs) using an amphiphilic triblock copolymer, which self-assembles and encapsulates different perfluorocarbons including perfluorpentane (PFP) and perfluorohexane (PFH). Applying histotripsy pulses (i.e., short, high pressure, ultrasound pulses) to solutions of PFP- and PFH-NDs generated bubble clouds at a significantly reduced acoustic pressure compared to the cavitation pressure observed for histotripsy treatment alone."

Funders for this research include U.S. Department of Defense, National Science Foundation. Our news journalists obtained a quote from the research from the University of Michigan, "In this report, we summarize the results of combining histotripsy at low frequency (345 and 500 kHz) with PFP-NDs and PFH-NDs on the ablation of PC-3 and C4-2B prostate cancer cells. Using custom built histotripsy transducers coupled to a microscope and a high speed recording camera, we imaged the generation of a cavitation bubble cloud in response to different ultrasound regimes in solution and in tissue-mimicking gel phantoms. We quantified the associated ablation of individual cancer cells and 3D spheroids suspended in solution and embedded in tissue phantoms to compare the ablative capacity of PFP-NDs and PFH-NDs. Results show that histotripsy pulses at high acoustic pressure (26.2 MPa) ablated 80% of prostate cancer spheroids embedded in tissue-mimicking gel phantoms. In comparison, combining histotripsy pulses at a dramatically lower acoustic pressure (12.8 MPa) with PFP-NDs and PFH-NDs caused an ablation of 40% and 80% of the tumor spheroid volumes, respectively."

According to the news editors, the research concluded: "These results show the potential of acoustically activated NDs as an image-guided ablative therapy for solid tumors and highlight the higher ablative capacity of PFH-NDs, which correlates with the boiling point of the encapsulated PFH and the stability of the formed bubble cloud."

For more information on this research see: Noninvasive Ablation of Prostate Cancer Spheroids Using Acoustically-Activated Nanodroplets. Molecular Pharmaceutics, 2016;13 (12):4054-4065. New Prostate Cancer Study Findings Recently Were Reported by T. Horrill and Co-Researchers (Active surveillance in prostate cancer: a concept analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news originating from Winnipeg, Canada, by NewsRx editors, the research stated, "To report an analysis of the concept of active surveillance. Prostate cancer has become more prevalent since the introduction of PSA screening, however, many men are diagnosed with low-risk disease that may not require treatment."

Our news journalists obtained a quote from the research, "Active surveillance is a treatment strategy used to avoid treatment and related adverse effects when immediate treatment is not necessary. A universal definition is lacking. Concept analysis. The CINAHL, PubMed, Scopus, Cochrane Library and Google Scholar databases were searched for literature published between 1980 and 2014 using the term active surveillance. The method of Walker and Avant (2010) was used to analyse the concept of active surveillance, specifically within the context of prostate cancer. Key attributes of active surveillance emerging from the analysis include: regular and purposeful monitoring, early detection of disease progression and planned curative intervention if necessary. Multiple terms are used in the literature to refer to the concept of active surveillance. Active surveillance can cause uncertainty, and prompt men to make lifestyle changes and seek more information on prostate cancer. Active surveillance is not well understood, and ambiguity remains around the concept. Active surveillance and watchful waiting are used interchangeably in the literature and in clinical practice, but in fact do not refer to the same strategy. Active surveillance can generate significant uncertainty for the patient and family, which may be a barrier to choosing it as a treatment strategy and nursing research in this area is limited. Nurses need a clear understanding of active surveillance and how it differs from other strategies in order to reduce ambiguity around the concept."

According to the news editors, the research concluded: "Nurses must be aware of the uncertainty accompanying active surveillance, and a need exists for continued nursing research in this area."

New Prostate Cancer Study Findings Reported from Nagoya Central Hospital (Photoselective Vaporization of the Prostate: Long-Term Outcomes and Safety During 10 Years of Follow-Up)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting out of Nagoya, Japan, by NewsRx editors, research stated, "To evaluate the long-term outcomes and safety photoselective vaporization of the prostate (PVP). From April 2005 to December 2015, a total of 1154 patients with benign prostatic hyperplasia underwent PVP."

Our news journalists obtained a quote from the research from Nagoya Central Hospital, "The type of Green Light laser was an 80W potassium-titanyl-phosphate laser and later a 120W lithium triborate laser. Before and after surgery, the International Prostate Symptom Score (IPSS), maximum urinary flow rate (Qmax), post-voiding volume of residual urine (PVR), prostate-specific antigen (PSA) level, and prostate volume were assessed regularly. After surgery, events such as second PVP, transurethral incision, and permanent urethral catheterization were defined as retreatment. The mean and median periods of follow-up after PVP were 35.4 and 24.0 months, respectively. The maximum duration of follow-up was 125 months. Compared with before surgery, the IPSS, quality of life score, and PSA concentration improved significantly, even at 10 years after PVP; however, Qmax and PVR were not improved at 10 years. The retreatment-free survival rate was 93.9% at 5 years and 79.0% at 10 years. Prostate cancer was found in 27 cases after PVP, and all patients who were found to have prostate cancer remained alive. Prostate cancer-free survival after PVP was 96.7% at 5 years and 89.4% at 10 years. Our data suggest that the efficacy of PVP was maintained for 10 years; however, it may decrease after more than 10 years."

According to the news editors, the research concluded: "PVP also did not promote the progression of or worsen the prognosis of prostate cancer."

For more information on this research see: Photoselective Vaporization of the Prostate: Long-Term Outcomes and Safety During 10 Years of Follow-Up. *Journal of Endourology, 2016;30(12):1306-1311.* *Journal of Endourology* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Oncology - Prostate Cancer

New Prostate Cancer Study Findings Reported from Queensland University of Technology (Sex Hormone Binding Globulin Modifies Testosterone Action and Metabolism in Prostate Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news originating from Brisbane, Australia, by NewsRx correspondents, research stated, "Sex Hormone Binding Globulin (SHBG) is the major serum carrier of sex hormones. However, growing evidence suggests that SHBG is internalised and plays a role in regulating intracellular hormone action."

Funders for this research include Royal Brisbane and Women’s Hospital Research Foundation, Science Education and Research Trust Fund.

Our news journalists obtained a quote from the research from the Queensland University of Technology, "This study was to determine whether SHBG plays a role in testosterone uptake, metabolism, and action in the androgen sensitive LNCaP prostate cancer cell line. Internalisation of SHBG and testosterone, the effects of SHBG on testosterone uptake, metabolism, regulation of androgen responsive genes, and cell growth were assessed. LNCaP cells internalised SHBG by a testosterone independent process. Testosterone was rapidly taken up and effluxed as testosterone-glucuronide; however this effect was reduced by the presence of SHBG. Addition of SHBG, rather than reducing testosterone bioavailability, further increased testosterone-induced expression of prostate specific antigen and enhanced testosterone-induced reduction of androgen receptor mRNA expression. Following 38 hours of testosterone treatment cell morphology changed and growth declined; however, cotreatment with SHBG abrogated these inhibitory effects."

According to the news editors, the research concluded: "These findings clearly demonstrate that internalised SHBG plays an important regulatory and intracellular role in modifying testosterone action and this has important implications for the role of SHBG in health and disease."

The news correspondents report that additional information may be obtained from K. Richard, Queensland University of Technology, Sch Biomed Sci, Brisbane, Qld 4000, Australia. Additional authors for this research include T. Pham, B.C. McWhinney, J.P. Ungerer, C.J. Pretorius, D.J. Richard, R.H. Mortimer, M.C. d'Emden and K. Richard.

Oncology - Prostate Cancer

New Prostate Cancer Study Results Reported from Johns Hopkins University (Detection of aggressive prostate cancer associated glycoproteins in urine using glycoproteomics and mass spectrometry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Prostate Cancer have been presented. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Clinical management of prostate cancer remains a significant challenge due to the lack of available tests for guiding treatment decisions. The blood prostate-specific antigen test has facilitated early detection and intervention of prostate cancer."

Our news journalists obtained a quote from the research from Johns Hopkins University, "However, blood prostate-specific antigen levels are less effective in distinguishing aggressive from indolent prostate cancers and other benign prostatic diseases. Thus, the development of novel approaches specific for prostate cancer that can differentiate aggressive from indolent disease remains an urgent medical need. In the current study, we evaluated urine specimens from prostate cancer patients using LC-MS/MS, with the aim of identifying effective urinary prostate cancer biomarkers. Glycoproteins from urine samples of prostate cancer patients with different Gleason scores were characterized via solid phase extraction of N-linked glycosite-containing peptides and LC-MS/MS. A total of 2923 unique glycosite-containing peptides were identified. Glycoproteomic comparison on urine and tissues from aggressive and non-aggressive prostate cancers as well as sera from prostate cancer patients revealed that the majority of AG prostate cancer associated glycoproteins were more readily detected in patient's urine than serum samples."

According to the news editors, the research concluded: "Our data collectively indicate that urine provides a potential source for biomarker testing in patients with AG prostate cancer."

Our news journalists report that additional information may be obtained by contacting H. Zhang, Johns Hopkins University, Dept. of Pathol, Baltimore, MD 21287, United States. Additional authors for this research include J. Chen, S.S. Sun, W.M. Yang, S. Yang, P. Shah, N. Hoti, B. Veltri and H. Zhang.

New Prostate Cancer Study Results Reported from Xi'an Jiaotong University (Expression of netrin-1 by hypoxia contributes to the invasion and migration of prostate carcinoma cells by regulating YAP activity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Prostate Cancer are discussed in a new report. According to news originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "Hypoxia is a hallmark of solid tumor growth microenvironment and appropriates the major contributor for the failure and poor prognosis of clinical tumor treatment, including prostate cancer (PCa). Ectopic expression of netrin-1 is reportedly associated with the progression of several carcinomas."

Our news journalists obtained a quote from the research from Xi'an Jiaotong University, "Here, we aimed to investigate the role of netrin-1 in hypoxic metastasis potential of prostate carcinoma. Here, hypoxia induced the up-regulation of netrin-1 mRNA and protein expression in prostate cancer cell lines PC3 and DU145. Importantly, knockdown of netrin-1 dramatically suppressed cell invasion, migration and epithelial-to-mesenchymal transition (EMT) of PC3 and DU145 cells under hypoxia. Furthermore, hypoxia treatment increased the activity of Yes-associated protein (YAP) by increasing YAP expression in the nucleus and inhibiting p-YAP levels. However, YAP activation was notably restrained following netrin-1 down-regulation. Interestingly, interrupting YAP expression attenuated hypoxia-triggered cell invasion, migration and EMT of DU145 cells. More importantly, restoring YAP expression strikingly antagonized the inhibitory effects of netrin-1 decrease on the metastatic potential of prostate cancer cells. Together, these results indicate that netrin-1 may function as a positive regulator of hypoxia-triggered malignant behavior in PCa by activating the YAP signaling."

According to the news editors, the research concluded: "Accordingly, netrin-1 could be a promising therapeutic agent against prostate carcinoma."

For more information on this research see: Expression of netrin-1 by hypoxia contributes to the invasion and migration of prostate carcinoma cells by regulating YAP activity. Experimental Cell Research, 2016;349(2):302-309. Experimental Cell Research can be contacted at: Elsevier Inc, 525 B Street, Ste 1900, San Diego, CA 92101-4495, USA. New Prostate Cancer Study Results from Technical University Described (p38 MAPK regulates the Wnt inhibitor Dickkopf-1 in osteotropic prostate cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting originating from Dresden, Germany, by NewsRx correspondents, research stated, "The Wnt inhibitor Dickkopf-1 (DKK-1) has been associated with the occurrence of bone metastases in osteotropic prostate cancer by inhibiting osteoblastogenesis. P38 mitogen-activated protein kinase (MAPK) activity is also dysregulated in advanced prostate cancer."

Our news editors obtained a quote from the research from Technical University, "However, the impact of p38 MAPK signaling on DKK-1 remains unknown. Inhibition of p38 MAPK signaling in osteolytic PC3 cells by small molecule inhibitors (doramapimod, LY2228820 and SB202190) suppressed DKK-1 expression, whereas activation of p38 MAPK by anisomycin increased DKK-1. Further dissection by targeting individual p38 MAPK isoforms with siRNA revealed a stronger role for MAPK11 than MAPK14 and MAPK12 in the regulation of DKK-1. Moreover, prostate cancer cells with a predominantly osteolytic phenotype produced sufficient amounts of DKK-1 to inhibit Wnt3a-induced osteoblastic differentiation in C2C12 cells. This inhibition was blocked directly by neutralizing DKK-1 using a specific antibody and also indirectly by blocking p38 MAPK. Furthermore, tissue expression in human prostate cancer revealed a correlation between p38 MAPK and DKK-1 expression with higher expression in tumor compared with normal tissues."

According to the news editors, the research concluded: "These results reveal that p38 MAPK regulates DKK-1 in prostate cancer and may present a potential target in osteolytic prostate cancers."

For more information on this research see: p38 MAPK regulates the Wnt inhibitor Dickkopf-1 in osteotropic prostate cancer cells. Cell Death & Disease, 2016;7():e2119. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

New Protease Inhibitors Data Have Been Reported by Investigators at Dalian Ocean University [Polymorphism in a serine protease inhibitor gene and its association with the resistance of bay scallop (Argopecten irradians) to Listonella anguillarum ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Protease Inhibitors is the subject of a report. According to news reporting out of Dalian, People's Republic of China, by NewsRx editors, research stated, "Serine protease inhibitors (SPIs) play a crucial role in regulation of both host and bacterial serine protease. They are classified into several protein families, where Kazal-type inhibitors are one of families with multi-domain."

Funders for this research include Research Foundation for Talented Scholars in Dalian Ocean University, Chinese Ministry of Science and Technology, Modern Agro-industry Technology Research System.

Our news journalists obtained a quote from the research from Dalian Ocean University, "In the present study, the polymorphism of AiSPI from Bay scallop Argopecten irradians was found to be associated with disease resistance of bay scallop against Listonella anguillarum. Nine single nucleotide polymorphisms (SNPs) were identified in the exon region of AiSPI, where five SNPs were non-synonymous mutation. Three of these mutations were located in 'kazal-like 3'domain, two SNP loci positioned at +536, +1312 were selected for further association studies. For the locus +536, the genotype frequency of A/G in the resistant stock (12.8%) was significantly lower (p < 0.05) than that in the susceptible stock (35.1%), while, the genotype A/A in the resistant stock (87.2%) was significantly higher in comparison with susceptible stock (64.9%) (p < 0.05). The G allele frequencies were 6.4% and 17.6% in resistant stock and susceptible stock, respectively, and chi(2)-test revealed a significant difference in the frequency distribution between the two stocks (p < 0.05). But there was no significant association between the mutation C-T at locus +1312 with either resistant or susceptible group (p > 0.05). The genotype frequencies of T/T, T/C, C/C at locus +1312 were 94.6%, 2.7% and 2.7% respectively in the susceptible stock, while 100%, 0% and 0% respectively in the resistant stock. The amino acid change for the mutation at locus +536 A-G was from asparagine to serine, and the predicted homology model of this amino acid variation could affect its function as well as the structural integrity of the domain. In vitro elastase inhibition assay of the protein variants at locus +536 was conducted to explicate the effect of SNP. The increasing concentration of protein (0 mmol/L- 2.93 mmol/L) was incubated with 80 nmol/L elastase where the residual enzyme activity values for rAiSPI (N) with A variant and rAiSPI (S) with G variant were started to reduce from 0.40 to 0.215 and 0.435 to 0.356, respectively. The elastase inhibition ability of rAiSPI (N) variant was significantly higher than that of rAiSPI (S) (p < 0.01)."

According to the news editors, the research concluded: "The results suggested that the mutation at locus +536A/A significantly associated with disease resistance of bay scallop would shed light for selective breeding program."

For more information on this research see: Polymorphism in a serine protease inhibitor gene and its association with the resistance of bay scallop (Argopecten irradians) to

**Proteomics**

**New Proteomics Findings Reported from Houston Community College (Stimulation of Protein Expression Through the Harmonic Resonance of Frequency-Specific Music)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Proteomics are discussed in a new report. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "The use of specific frequencies for specific individual amino acids may increase the potential energy of protein molecules in the medium [1]. The resonance would also increase the movement of particles in the cytosol, increasing the collisions necessary for the conduction of protein expression."

Our news journalists obtained a quote from the research from Houston Community College, "The clash of two waves that share frequencies will exhibit an increase in energy through an increase in amplitude [2]. The increase in energy would in turn increase the number of collisions forming the tRNA-amino acid, increasing the amino acid acquire for ribosomes to improve intracellular efficiency in gene expression. To test the hypothesis, Red Fluorescent Protein (RFP) in transformed BL-21 strains of E. coli and p53 protein of MCF-7 were examined after exposure to sounds of specific frequencies. Through the exposure of the experimental systems to a sequence of sounds that match the frequencies of specific amino acids, the levels of RFP exhibition respective to the control groups in the bacterial medium increased two-fold in terms of RFU. The experiments that targeted the p53 protein with the 'music' showed a decrease in the cell prevalence in the MCF-7 type breast cancer cells by 28%, by decreasing the speed of tumour formation."

According to the news editors, the research concluded: "Exposure to 'music' that was designed through assigning a musical note for every single one of the twenty unique amino acids, produced both an analytical and a visible shift in protein synthesis, making it as potential
tool for reducing procedural time uptake.

For more information on this research see: Stimulation of Protein Expression Through the Harmonic Resonance of Frequency-Specific Music. *Clinical and Investigative Medicine*, 2016;39(6):S34-S38. Clinical and Investigative Medicine can be contacted at: Canadian Soc Clinical Investigation, Csci Head Office, 774 Echo Drive, Ottawa, On K1S 5N8, Canada.

**Skin Diseases and Conditions - Pruritus**

**New Pruritus Study Findings Have Been Reported by Researchers at University of Freiburg (Pharmacological interventions for pruritus in adult palliative care patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases and Conditions - Pruritus are presented in a new report. According to news reporting originating in Freiburg, Germany, by NewsRx journalists, research stated, "This is an update of the original Cochrane review published in 2013 (Issue 6). Pruritus occurs in patients with disparate underlying diseases and is caused by different pathologic mechanisms."

The news reporters obtained a quote from the research from the University of Freiburg, "In palliative care patients, pruritus is not the most prevalent but is one of the most puzzling symptoms. It can cause considerable discomfort and affects patients' quality of life. To assess the effects of different pharmacological treatments for preventing or treating pruritus in adult palliative care patients. Search methods For this update, we searched CENTRAL (the Cochrane Library), and MEDLINE (OVID) up to 9 June 2016 and Embase (OVID) up to 7 June 2016. In addition, we searched trial registries and checked the reference lists of all relevant studies, key textbooks, reviews and websites, and we contacted investigators and specialists in pruritus and palliative care regarding unpublished data. Selection criteria We included randomised controlled trials (RCTs) assessing the effects of different pharmacological treatments, compared with a placebo, no treatment, or an alternative treatment, for preventing or treating pruritus in palliative care patients. Data collection and analysis Two review authors independently assessed the identified titles and abstracts, performed data extraction and assessed the risk of bias and methodological quality. We summarised the results descriptively and quantitatively (meta-analyses) according to the different pharmacological interventions and the diseases associated with pruritus. We assessed the evidence using GRADE (Grading of Recommendations Assessment, Development and Evaluation) and created 10 'Summary of findings' tables. In total, we included 50 studies and 1916 participants in the review. We added 10 studies with 627 participants for this update. Altogether, we included 39 different treatments for pruritus in four different patient groups. The overall risk of bias profile was heterogeneous and ranged from high to low risk. However, 48 studies (96%) had a high risk of bias due to low sample size (i.e. fewer than 50 participants per treatment arm). Using GRADE criteria, we
downgraded our judgement on the quality of evidence to moderate in seven and to low in three comparisons for our primary outcome (pruritus), mainly due to imprecision and risk of bias. In palliative care participants with pruritus of different nature, the treatment with the drug paroxetine, a selective serotonin reuptake inhibitor, reduced pruritus by 0.78 points (numerical analogue scale from 0 to 10; 95% confidence interval (CI) -1.19 to -0.37; one RCT, N = 48, quality of evidence: moderate) compared to placebo. For participants suffering from uraemic pruritus (UP), gabapentin was more effective than placebo (visual analogue scale (VAS): 0 to 10), mean difference (MD) -5.91, 95% CI -6.87 to -4.96; two RCTs, N = 118, quality of evidence: moderate). The kappa-opioid receptor agonist nalfurafine showed amelioration of UP (VAS 0 to 10, MD -0.95, 95% CI -1.32 to -0.58; three RCTs, N = 422, quality of evidence: moderate) and only few adverse events. Moreover, cromolyn sodium relieved UP participants from pruritus by 2.94 points on the VAS (0 to 10) (95% CI -4.04 to -1.83; two RCTs, N = 100, quality of evidence: moderate) compared to placebo. In participants with cholestatic pruritus (CP), data favoured rifampin (VAS: 0 to 100, MD -24.64, 95% CI -31.08 to -18.21; two RCTs, N = 42, quality of evidence: low) and flumecinol (RR > 1 favours treatment group; RR 1.89, 95% CI 1.05 to 3.39; two RCTs, N = 69, quality of evidence: low) and showed a low incidence of adverse events in comparison with placebo. The opioid antagonist naltrexone reduced pruritus for participants with CP (VAS: 0 to 10, MD -2.26, 95% CI -3.19 to -1.33; two RCTs, N = 52, quality of evidence: moderate) compared to placebo. However, effects in participants with UP were inconclusive (percentage difference -12.30%, 95% CI -25.82% to 1.22%, one RCT, N = 32). Furthermore, large doses of opioid antagonists (e.g. naltrexone) could be inappropriate in palliative care patients because of the risk of reducing analgesia. For participants with HIV-associated pruritus, it is uncertain whether drug treatment with hydroxyzine hydrochloride, pentoxifylline, triamcinolone or indomethacin reduces pruritus because the evidence was of very low quality (e.g. small sample size, lack of blinding). Authors' conclusions Different interventions tended to be effective for CP and UP. However, therapies for patients with malignancies are still lacking."

According to the news reporters, the research concluded: "Due to the small sample sizes in most meta-analyses and the heterogeneous methodological quality of the included trials, the results should be interpreted cautiously in terms of generalisability."

For more information on this research see: Pharmacological interventions for pruritus in adult palliative care patients. *Cochrane Database of Systematic Reviews*, 2016; (11):2540-2799. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news correspondents report that additional information may be obtained by contacting W. Siemens, University of Freiburg, Medical Center, Fac Med, Clin Palliat Care, Freiburg, Germany. Additional authors for this research include C. Xander, J.J. Meerpohl, S. Buroh, G. Antes, G. Schwarz and G. Becker.

New Pseudomonas aeruginosa Study Findings Have Been Reported by Researchers at University of Wisconsin (A Comparative Analysis of Synthetic Quorum Sensing Modulators in Pseudomonas aeruginosa: New Insights into Mechanism, Active Efflux ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Pseudomonas aeruginosa have been published. According to news reporting originating in Madison, Wisconsin, by NewsRx journalists, research stated, "Quorum sensing (QS) is a chemical signaling mechanism that allows bacterial populations to coordinate gene expression in response to social and environmental cues. Many bacterial pathogens use QS to initiate infection at high cell densities."

Financial supporters for this research include Burroughs Wellcome Fund, National Institute of General Medical Sciences.

The news reporters obtained a quote from the research from the University of Wisconsin, "Over the past two decades, chemical antagonists of QS in pathogenic bacteria have attracted substantial interest for use both as tools to further elucidate QS mechanisms and, with further development, potential anti-infective agents. Considerable recent research has been devoted to the design of small molecules capable of modulating the LasR QS receptor in the opportunistic pathogen Pseudomonas aeruginosa. These molecules hold significant promise in a range of contexts; however, as most compounds have been developed independently, comparative activity data for these compounds are scarce. Moreover, the mechanisms by which the bulk of these compounds act are largely unknown. This paucity of data has stalled the choice of an optimal chemical scaffold for further advancement. Herein, we submit the best-characterized LasR modulators to standardized cell-based reporter and QS phenotypic assays in P.?aeruginosa, and we report the first comprehensive set of comparative LasR activity data for these compounds. Our experiments uncovered multiple interesting mechanistic phenomena (including a potential alternative QS-modulatory ligand binding site/partner) that provide new, and unexpected, insights into the modes by which many of these LasR ligands act."

According to the news reporters, the research concluded: "The lead compounds, data trends, and mechanistic insights reported here will significantly aid the design of new small molecule QS inhibitors and activators in P.?aeruginosa, and in other bacteria, with enhanced potencies and defined modes of action."

Our news correspondents report that additional information may be obtained by contacting J.D. Moore, Dept. of Chemistry, University of Wisconsin-Madison, 1101 University Avenue, Madison, Wisconsin 53706, United States. Additional authors for this research include F.M. Rossi, M.A. Welsh, K.E. Nyffeler and H.E Blackwell.

Gram-Negative Bacteria - Pseudomonas aeruginosa

New Pseudomonas aeruginosa Study Findings Have Been Reported from Hartford Hospital (Population Pharmacokinetics and Safety of Ceftolozane-Tazobactam in Adult Cystic Fibrosis Patients Admitted with Acute Pulmonary Exacerbation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Pseudomonas aeruginosa have been published. According to news reporting originating from Hartford, Connecticut, by NewsRx correspondents, research stated, "Ceftolozane-tazobactam has potent activity against Pseudomonas aeruginosa, a pathogen associated with cystic fibrosis (CF) acute pulmonary exacerbations (APE). Due to the rapid elimination of many antibiotics, CF patients frequently have altered pharmacokinetics."

Financial support for this research came from Merck (Merck & Co., Inc.).

Our news editors obtained a quote from the research from Hartford Hospital, "In this multicenter, open-label study, we described the population pharmacokinetics and safety of ceftolozane- tazobactam at 3 g every 8 h (q8h) in 20 adult CF patients admitted with APE. Population pharmacokinetics were determined using the nonparametric adaptive grid program in Pmetrics for R. A 5,000-patient Monte Carlo simulation was performed to determine the probability of target attainment (PTA) for the ceftolozane component at 1.5 g and 3 g of ceftolozane-tazobactam q8h across a range of MICs using a primary threshold exposure of 60% free time above the MIC (fT >MIC). In these 20 adult CF patients, ceftolozane and tazobactam concentration data were best described by 2-compartment models, and ceftolozane clearance (CL) was significantly correlated with creatinine clearance (r = 0.71, P< 0.001). These data suggest that ceftolozane and tazobactam clearance estimates in CF patients are similar to those in adults without CF (ceftolozane CF CL, 4.76 +/- 1.13 liter/h; tazobactam CF CL, 20.51 +/- 4.41 liter/h). However, estimates of the volume of the central compartment (V-c) were lower than those for adults without CF (ceftolozane CF V-c, 7.51 +/- 2.05 liters; tazobactam CF V-c, 7.85 +/- 2.66 liters). Using a threshold of 60% fT >MIC, ceftolozane-tazobactam regimens of 1.5 g and 3 g q8h should achieve PTAs of >= 90% at MICs up to 4 and 8 mu g/ml, respectively. Ceftolozane-tazobactam at 3 g q8h was well tolerated."

According to the news editors, the research concluded: "These observations support additional studies of ceftolozane-tazobactam for Pseudomonas aeruginosa APE in CF patients."

For more information on this research see: Population Pharmacokinetics and Safety of Ceftolozane-Tazobactam in Adult Cystic Fibrosis Patients Admitted with Acute Pulmonary Exacerbation. Antimicrobial Agents and Chemotherapy, 2016;60(11):6578-6584. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. New Pseudomonas aeruginosa Study Findings Reported from Sapienza University (Positively charged biopolymeric nanoparticles for the inhibition of Pseudomonas aeruginosa biofilms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Negative Bacteria - Pseudomonas aeruginosa. According to news reporting originating from Rome, Italy, by NewsRx correspondents, research stated, "Currently, many microbial infections have the potential to become lethal owing to the development of antimicrobial resistance by means of different mechanisms and mainly on the basis of the fact that many drugs are unable to reach therapeutic levels in the target sites. This requires the use of high doses and frequent administrations, causing adverse side effects or in some cases toxicity."

Our news editors obtained a quote from the research from Sapienza University, "The use of nanoparticle systems could help overcome such problems and increase drug efficacy. In the present study, we developed a new drug delivery system based on the use of biopolymeric nanovectors loaded with tobramycin (Tb), which is the standard antibiotic for the treatment of Cystic Fibrosis-associated P. aeruginosa lung infections. Tb-loaded biopolymeric nanoparticles composed by dextran sulfate (DS) and chitosan (CS) were prepared by ionotropic gelation. We optimized drug entrapment in DS/CS nanoparticles, obtaining particles of 170 nm and with a drug loading of 400 lg Tb/mg of nanoparticles."

According to the news editors, the research concluded: "In accord with in vitro release experiments, such preparations were able to release approximately 25 % of their cargo in 60 h. In vitro, the antimicrobial efficacy of the drug delivery system on P. aeruginosa biofilm was tested and compared to the effects of free drug revealing that this formulation can reduce the viability of P. aeruginosa biofilms for 48 h with a single-dose administration."

The news editors report that additional information may be obtained by contacting C.
Palocci, Roma La Sapienza University, Dept. of Chem, Rome, Italy. Additional authors for this research include E.G. Di Domenico, F. Ascenzioni and C. Palocci.

Skin Diseases and Conditions - Psoriasis

New Psoriasis Findings from Federal University Described (Increased IL17A, IFNG, and FOXP3 Transcripts in Moderate-Severe Psoriasis: A Major Influence Exerted by IL17A in Disease Severity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Skin Diseases and Conditions - Psoriasis. According to news reporting out of Recife, Brazil, by NewsRx editors, research stated, "Psoriasis is a chronic and recurrent dermatitis, mediated by keratinocytes and T cells. Several proinflammatory cytokines contribute to formation and maintenance of psoriatic plaque."

Funders for this research include Instituto Nacional de Ciencia e Tecnologia para Inovacao Farmaceutica, Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior, Fundacao de Amparo a Ciencia e Tecnologia de Pernambuco, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico.

Our news journalists obtained a quote from the research from Federal University, "The Th1/Th17 pathways and some of IL-1 family members were involved in psoriasis pathogenesis and could contribute to disease activity. Therefore, we sought to analyse skin transcript levels of IL17A, IL22, RORC, IL8, IFNG, IL33, IL36A, FOXP3, and IL10 and correlate with clinic of patients with plaque-type psoriasis. In order to conduct that, we collected punch biopsies from lesional skin and obtained tissue RNA. After reverse transcription, qRT-PCR quantified the relative mRNA expression. The main results revealed increased transcripts levels of IL17A, IFNG, and FOXP3 in moderate-severe patients. Despite this, only IL17A can increase the chance to worsen disease severity. We also observed many significant positive correlations between each transcript."

According to the news editors, the research concluded: "IL17A is elevated in lesional skin from psoriasis patients and plays crucial role in disease severity."

For more information on this research see: Increased IL17A, IFNG, and FOXP3 Transcripts in Moderate-Severe Psoriasis: A Major Influence Exerted by IL17A in Disease Severity. Skin Diseases and Conditions - Psoriasis

New Psoriasis Study Findings Reported from Health Science Center (‘I should have taken that further’ - missed opportunities during cardiovascular risk assessment in patients with psoriasis in UK primary care settings: a mixed-methods study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Skin Diseases and Conditions - Psoriasis. According to news reporting from Manchester, United Kingdom, by NewsRx journalists, research stated, "Unhealthy lifestyle is common in psoriasis, contributing to worsening disease and increased cardiovascular disease (CVD) risk. CVD risk communication should improve patients' understanding of risk and risk-reducing behaviours; however, the effectiveness of risk screening is debated and evaluation currently limited."

The news correspondents obtained a quote from the research from Health Science Center, "To examine the process of assessing for and communicating about CVD risk in the context of psoriasis. Mixed-methods study in English general practices to (i) determine proportions of CVD risk factors among patients with psoriasis at risk assessment and (ii) examine patient and practitioner experiences of risk communication to identify salient 'process' issues. Audio recordings of consultations informed in-depth interviews with patients and practitioners using tape-assisted recall, analysed with framework analysis. Patients with psoriasis (n = 287) undergoing CVD risk assessment; 29 patients and 12 practitioners interviewed. A high proportion of patients had risk factor levels apparent at risk assessment above NICE recommendations: very high waist circumference (52%), obesity (35%), raised blood pressure (29%), smoking (18%) and excess alcohol consumption (18%). There was little evidence of personalized discussion about CVD risk and behaviour change support in consultations. Professionals reported a lack of training in behaviour change, while patients wanted to discuss CVD risk/risk reduction and believed practitioners to be influential in supporting lifestyle management. Despite high levels of risk factors identified, opportunities may be missed in consultations to support patients with psoriasis to understand CVD risk/risk reduction."

According to the news reporters, the research concluded: "Practitioners need training in behaviour change techniques to capitalize on 'teachable moments' and increase the effectiveness of risk screening."

For more information on this research see: 'I should have taken that further' - missed opportunities during cardiovascular risk assessment in patients with psoriasis in UK primary care settings: a mixed-methods study. *Health Expectations*, 2016;19(5):1121-1137. *Health Expectations* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ,
Health and Medicine - Public Health

New Public Health Findings Has Been Reported by Investigators at University of Surrey (The impact of body vigilance on help-seeking for cancer 'alarm' symptoms: a community-based survey)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Public Health have been published. According to news originating from Guildford, United Kingdom, by NewsRx correspondents, research stated, "The act of detecting bodily changes is a pre-requisite for subsequent responses to symptoms, such as seeking medical help. This is the first study to explore associations between self-reported body vigilance and help-seeking in a community sample currently experiencing cancer 'alarm' symptoms."

Our news journalists obtained a quote from the research from the University of Surrey, "Using a cross-sectional study design, a 'health survey' was mailed through primary care practices to 4913 UK adults (age >= 50 years, no cancer diagnosis), asking about symptom experiences and medical help-seeking over the previous three months. Body vigilance, cancer worry and current illness were assessed with a small number of self-report items derived from existing measures. The response rate was 42% (N = 2042). Almost half the respondents (936/2042; 46%) experienced at least one cancer alarm symptom. Results from logistic regression analysis revealed that paying more attention to bodily changes was significantly associated with help-seeking for cancer symptoms (OR = 1.44; 1.06-1.97), after controlling for socio-demographics, current illness and cancer worry. Being more sensitive to bodily changes was not significantly associated with help-seeking. Respondents who paid attention to their bodily changes were more likely to seek help for their symptoms. Although the use of a cross-sectional study design and the limited assessment of key variables preclude any firm conclusions, encouraging people to be body vigilant may contribute towards earlier cancer diagnosis."

According to the news editors, the research concluded: "More needs to be understood about the impact this might have on cancer-related anxiety."

New Public Health Nutrition Findings from University of Bergen Discussed (Local spatial clustering of stunting and wasting among children under the age of 5 years: implications for intervention strategies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Health and Medicine - Public Health Nutrition. According to news reporting from Bergen, Norway, by NewsRx journalists, research stated, "The present study aimed to evaluate the clustering of undernutrition indicators of children under the age of 5 years in relation to different scales. A community-based cross-sectional study design was employed."

The news correspondents obtained a quote from the research from the University of Bergen, "We collected anthropometric data, geographic locations/elevations of households and other data from visited households. We used a retrospective purely spatial Poisson probability model to identify and locate clusters (high rates) of stunting and wasting using the software SaTScan™ version 9.1.1. We ran a logistic regression model to help evaluate the causes of clustering. Six villages in the Meskane Mareko District (38.45763 degrees E, 8.042144 degrees N) of southern Ethiopia. We surveyed 2371 children aged <5 years, who were found in 1744 households. We found a micro-level variation in the risk of stunting and wasting within the studied district. We found the most likely significant clusters for wasting and severe wasting in two of the six villages. For stunting, a single large cluster size of 390 cases (304.19 expected) in 756 households was identified (relative risk = 1.48, P< 0.01). For severe stunting, a single cluster size of 106 cases (69.39 expected) in 364 households was identified (relative risk = 1.69, P = 0.035). We conclude that the distribution of wasting and stunting was partly spatially structured. We identified distinct areas within and between villages that have a higher risk than the underlying at-risk population."

According to the news reporters, the research concluded: "Our analysis identified the spatial locations of high-risk areas for stunting that could be an input for geographically targeting and optimizing nutritional interventions."

New Public Health Study Findings Have Been Reported by Investigators at University of Twente [Study protocol for a non-inferiority trial of a blended smoking cessation treatment versus face-to-face treatment (LiveSmokefree-Study)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Health and Medicine - Public Health have been presented. According to news reporting originating from Enschede, Netherlands, by NewsRx correspondents, research stated, "Smoking cessation can significantly reduce the risk of developing smoking-related diseases. Several face-to-face and web-based treatments have shown to be effective."

Our news editors obtained a quote from the research from the University of Twente, "Blending of web-based and face-to-face treatment is expected to improve smoking cessation treatment. The primary objective of this study is to compare the prolonged abstinence rate of the blended smoking cessation treatment with the face-to-face treatment. Secondary objectives are to assess the benefits of blended treatment in terms of cost effectiveness and patient satisfaction, and to identify mechanisms underlying successful smoking cessation. This study will be a single-center randomized controlled non-inferiority-trial with parallel group design. Patients (n = 344) will be randomly assigned to either the blended or the face-to-face group. Both treatments will consist of ten sessions with equal content held within 6 months. In the blended treatment five out of ten sessions will be delivered online. The treatments will cover the majority of behavior change techniques that are evidence-based within smoking cessation counseling. All face-to-face sessions in both treatments will take place at the outpatient smoking cessation clinic of a hospital. The primary outcome parameter will be biochemically validated prolonged abstinence at 15 months from the start of the smoking cessation treatment. This RCT will be the first study to examine the effectiveness of a blended smoking cessation treatment. It will also be the first study to explore patient satisfaction, adherence, cost-effectiveness, and the clinically relevant influencing factors of a blended smoking cessation treatment."

According to the news editors, the research concluded: "The findings of this RCT are expected to substantially strengthen the base of evidence available to inform the development and delivery of smoking cessation treatment."

For more information on this research see: Study protocol for a non-inferiority trial of a blended smoking cessation treatment versus face-to-face treatment (LiveSmokefree-Study). *BMC Public Health*, 2016;16():8-18. *BMC Public Health* can be contacted at: Biomed Central
New Pulmonary Embolism Data Have Been Reported by Researchers at McMaster University (Rapid quantitative D-dimer to exclude pulmonary embolism: a prospective cohort management study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Pulmonary Embolism is the subject of a report. According to news reporting from Hamilton, Canada, by NewsRx journalists, research stated, "ESSENTIALS: It is not known if D-dimer testing alone can safely exclude pulmonary embolism (PE). We studied the safety of using a quantitative latex agglutination D-dimer to exclude PE in 808 patients. 52% of patients with suspected PE had a negative D-dimer test and were followed for 3 months."

Funders for this research include Heart & Stroke Foundation of Ontario, Heart and Stroke Foundation of Canada.

The news correspondents obtained a quote from the research from McMaster University, "The negative predictive value of D-dimer testing alone was 99.8%, suggesting it may safely exclude PE. Strategies are needed to exclude pulmonary embolism (PE) efficiently without the need for imaging tests. Although validated rules for clinical probability assessment can be combined with D-dimer testing to safely exclude PE, the rules can be complicated or partially subjective, which limits their use. To determine if PE can be safely excluded in patients with a negative D-dimer without incorporating clinical probability assessment. We enrolled consecutive outpatients and inpatients with suspected PE from four tertiary care hospitals. All patients underwent D-dimer testing using the MDA D-dimer test, a quantitative latex agglutination assay. PE was excluded in patients with a D-dimer less than 750 mg FEU L(-1) without further testing. with D-dimer levels of 750 mg FEU L(-1) or higher underwent standardized imaging tests for PE. All patients in whom PE was excluded had anticoagulant therapy withheld and were followed for 3 months for venous thromboembolism (VTE). Suspected events during follow-up were adjudicated centrally. Eight hundred and eight patients were enrolled, of whom 99 (12%) were diagnosed with VTE at presentation. Four hundred and twenty (52%) patients had a negative D-dimer level at presentation and were not treated with anticoagulants; of these, one had VTE during follow-up. The negative predictive value of D-dimer testing for PE was 99.8% (95% confidence interval, 98.7-99.9%)."

According to the news reporters, the research concluded: "A negative latex agglutination D-dimer assay is seen in about one-half of patients with suspected PE and reliably excludes PE as a stand-alone test."

Our news journalists report that additional information may be obtained by contacting S.M. Bates, Dept. of Medicine, McMaster University, Hamilton, ON, Canada. Additional authors for this research include S. Takach Lapner, J.D. Douketis, C. Kearon, J. Julian, S. Parpia, S. Schulman, J.I. Weitz, L.A. Linkins, M. Crowther, W. Lim, F.A. Spencer, A.Y. Lee, P.L. Gross and J. Ginsberg.

**Lung Diseases and Conditions - Pulmonary Embolism**

**New Pulmonary Embolism Findings Reported from Kyungpook National University School of Medicine (Factors determining clot resolution in patients with acute pulmonary embolism)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Pulmonary Embolism is now available. According to news reporting from Daegu, South Korea, by NewsRx journalists, research stated, "There are limited data on the rate of clot resolution after acute pulmonary embolism and risk factors for residual emboli. The aim of the present study was to investigate the rate of clot resolution over time and identify risk factors of residual emboli in pulmonary embolism patients."

The news correspondents obtained a quote from the research from the Kyungpook National University School of Medicine, "We retrospectively analyzed pulmonary embolism patients with follow-up computed tomography (CT) scans taken between day 3 and day 90. The patients were classified into three cohorts, depending on the time of CT scan: day 3-7, day 8-21, and day 22-90. Each cohort was regrouped into the residual embolus and complete resolution groups. The rate of complete resolution of pulmonary emboli was 24% at 3-7 days, 47% at 8-21 days, and 78% at 22-90 days. In a multivariate analysis, independent predictors in each cohort were lobar or larger pulmonary artery pulmonary embolism and a right ventricle/left ventricle diameter ratio within 1 week, lobar or larger pulmonary artery pulmonary embolism at 1-3 weeks, and central pulmonary embolism at 3 weeks to 3 months. The rate of venous thromboembolism (VTE) recurrence, frequency of an adverse outcome, and in-hospital mortality did not differ between the two groups in each cohort. Complete resolution of pulmonary emboli occurred in most pulmonary embolism patients. Regardless of the time interval, larger pulmonary artery involvement by pulmonary emboli was only independent predictor of residual emboli."
According to the news reporters, the research concluded: "The presence of residual emboli was not associated with an adverse outcome of pulmonary embolism and rate of VTE recurrence."

For more information on this research see: Factors determining clot resolution in patients with acute pulmonary embolism. Blood Coagulation & Fibrinolysis, 2016;27(3):294-300. (Lippincott Williams and Wilkins - www.lww.com; Blood Coagulation & Fibrinolysis - journals.lww.com/bloodcoagulation/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting K.J. Choi, aDept. of Internal Medicine bDept. of Radiology cDept. of Preventive Medicine, Kyungpook National University School of Medicine, Daegu, South Korea. **Lung Diseases and Conditions - Pulmonary Embolism**

**New Pulmonary Embolism Findings from Juntendo University Described (CT pulmonary angiography-based scoring system to predict the prognosis of acute pulmonary embolism)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Pulmonary Embolism have been published. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "The purpose is to develop a comprehensive risk-scoring system based on CT findings for predicting 30-day mortality after acute pulmonary embolism (PE), and to compare it with PE Severity Index (PESI). The study included consecutive 1698 CT pulmonary angiograms (CTPA) positive for acute PE performed at a single institution (2003-2010)."

Our news journalists obtained a quote from the research from Juntendo University, "Two radiologists independently assessed each study regarding clinically relevant findings and then performed adjudication. These variables plus patient clinical information were included to build a LASSO logistic regression model to predict 30-day mortality. A point score for each significant variable was generated based on the final model. PESI score was calculated in 568 patients who visited the hospital after 2007. Inter-reader agreements of interpretations were > 95% except for septal bowing (92%). The final prediction model showed superior ability over PESI (AUC = 0.822 vs 0.745) for predicting all-cause 30 day mortality (12.4%). The scoring system based on the significant variables (age (years), pleural effusion (+20), pericardial effusion (+20), lung/liver/bone lesions suggesting malignancy (+60), chronic interstitial lung disease (+20), enlarged lymph node in thorax (+20), and ascites (+40)) stratified patients into 4
severity categories, with mortality rates of 0.008% in class-I (≤ 50 pt), 3.8% in class-II (51-100 pt), 17.6% in class-III (101-150 pt), and 40.9% in class-IV (>150 pt). The mortality rate in the CTPA-high risk category (class-IV) was higher than those in the PESI's high risk (27.4%) and very high risk (25.2%) categories. The CTPA-based model was superior to PESI in predicting 30-day mortality.

According to the news editors, the research concluded: "Incorporating the CTPA-based scoring system into image interpretation workflows may help physicians to select the most appropriate management approach for individual patients."

The news correspondents report that additional information may be obtained from K.K. Kumamaru, Juntendo University, Dept. of Radiol, Tokyo, Japan. Additional authors for this research include S.S. Saboo, A. Aghayev, P. Cai, C.G. Quesada, E. George, Z. Hussain, T.R. Cai and F.J. Rybicki.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jcct.2016.08.007. This DOI is a link to an online electronic document that is either free or for purchase.

Lung Diseases and Conditions - Pulmonary Fibrosis

New Pulmonary Fibrosis Study Findings Have Been Reported by Researchers at Central South University (TGF-b1 Upregulates the Expression of Triggering Receptor Expressed on Myeloid Cells 1 in Murine Lungs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Pulmonary Fibrosis is now available. According to news reporting originating from Changsha, People's Republic of China, by NewsRx correspondents, research stated, "Triggering receptor expressed on myeloid cells 1 (TREM-1) increases the expression of TGF-b family genes, which are known as profibrogenic cytokines in the pathogenesis of pulmonary fibrosis. In this study, we determined whether TGF-b1 regulated the expression of TREM-1 in a mouse model of pulmonary fibrosis."

Our news editors obtained a quote from the research from Central South University, "The expression of TGF-b1 and TREM-1 was increased on day 7, 14, and 21 after single intratracheal injection of bleomycin (BLM). And there was positive correlation between the expression of TGF-b1 and TREM-1. TGF-b1 increased expression of TREM-1 mRNA and
protein in a time-and dose-dependent manner in mouse macrophages. The expression of the activator protein 1 (AP-1) was increased in lung tissues from mouse after BLM injection and in mouse macrophages after TGF-b1 treatment, respectively. TGF-b1 significantly increased the relative activity of luciferase in the cells transfected with plasmid containing wild type-promoter of TREM-1. But TGF-b1 had no effect on the activity of luciferase in the cells transfected with a mutant-TREM1 plasmid carrying mutations in the AP-1 promoter binding site."

According to the news editors, the research concluded: "We found the expression of TREM-1 was increased in lung tissues from mice with pulmonary fibrosis. TGF-b1 increased the expression of TREM-1 in mouse macrophages partly via the transcription factor AP-1."

For more information on this research see: TGF-b1 Upregulates the Expression of Triggering Receptor Expressed on Myeloid Cells 1 in Murine Lungs. *Scientific Reports*, 2016;6 ():18946. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Lung Diseases and Conditions - Pulmonary**

**New Pulmonary Hypertension Study Results Reported from University of Chile (2-Aminoethyldiphenylborinate modifies the pulmonary circulation in pulmonary hypertensive newborn lambs partially gestated at high altitude)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Pulmonary Hypertension. According to news reporting from Santiago, Chile, by NewsRx journalists, research stated, "Calcium signaling through store-operated channels (SOC) is involved in hypoxic pulmonary hypertension. We determined whether a treatment with 2-aminoethyldiphenylborinate (2-APB), a compound with SOC blocker activity, reduces pulmonary hypertension and vascular remodeling."

Funders for this research include FONDECYT, Vicerrectoria de Investigacion y Desarrollo, Universidad de Chile VID-Enlace.

The news correspondents obtained a quote from the research from the University of Chile, "Twelve newborn lambs exposed to perinatal chronic hypoxia were studied, six of them received a 2-APB treatment and the other six received vehicle treatment for 10 days in both cases. Throughout this period, we recorded cardiopulmonary variables and on day 11 we
evaluated the response to an acute hypoxic challenge. Additionally, we assessed the vasoconstrictor and vasodilator function in isolated pulmonary arteries as well as their remodeling in lung slices. 2-APB reduced pulmonary arterial pressure between the 3rd and 10th days, cardiac output between the 4th and 8th days, and pulmonary vascular resistance at the 10th day of treatment. The pulmonary vasoconstrictor response to acute hypoxia was reduced by the end of treatment. 2-APB also decreased maximal vasoconstrictor response to the thromboxane mimetic U46619 and endothelin-1 and increased maximal relaxation to 8-bromoguanosine 3', 5'-cyclic monophosphate (8-BrcGMP). The maximal relaxation and potency to phosphodiesterase-5 and Rhokinase inhibition with sildenafil and fasudil, respectively, were also increased. Finally, 2-APB reduced the medial and adventitial layers' thickness, the expression of alpha-actin, and the percentage of Ki67-positive nuclei of small pulmonary arteries. Taken together, our results indicate that 2-APB reduces pulmonary hypertension, vasoconstrictor responses, and pathological remodeling in pulmonary hypertensive lambs."

According to the news reporters, the research concluded: "SOC targeting may be a useful strategy for the treatment of neonatal pulmonary hypertension; however, further testing of specific blockers is needed."

Our news journalists report that additional information may be obtained by contacting R.V. Reyes, University of Chile, Fac Med, Inst Ciencias Biomed ICBM, Programa Fisiopatol, Santiago, Chile. Additional authors for this research include S. Quezada, F. Moraga, G. Ebensperger, E.A. Herrera, F. Benaldo, I. Hernandez, R. Ebensperger, S. Ramirez, A.J. Llanos and R.V. Reyes.

Sleep Diseases and Conditions - REM Sleep…

New REM Sleep Behavior Disorder Findings from Second Military Medical University Outlined (Effects of Rotigotine on REM Sleep Behavior Disorder in Parkinson Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Sleep Diseases and Conditions - REM Sleep Behavior Disorder is the subject of a report. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "REM sleep behavior disorder (RBD) is a common manifestation of Parkinson disease (PD). In this study, we assessed the effects of rotigotine transdermal patch on RBD features in patients with PD."
Our news journalists obtained a quote from the research from Second Military Medical University, "In this prospective open-label study, eleven PD patients with untreated RBD were administered rotigotine patches for up to seven months to ameliorate their parkinsonism. The severities of their RBD symptoms before and after rotigotine therapy were evaluated through patient and bed partner interviews, a validated evaluation scale (REM sleep behavior disorder questionnaire-Hong Kong, RBDQ-HK), and blinded assessments based on video-polysomnographic (VPSG) measure. Rotigotine improved parkinsonism and subjective sleep quality in PD patients with RBD. The RBDQ-HK total score, especially the Factor 2 score, was decreased, which demonstrated that the subjective severity of RBD symptoms was improved after rotigotine treatment, especially the frequency and severity of abnormal RBD-related motor behaviors. The VPSG analyses showed that the total sleep time (TST) and stage 1% were increased and that the PLMS index was decreased. However, no differences in the RBD-related sleep measures were observed. The improved RBD symptoms and VPSG measures of PD patients in this study (TST, stage 1%, and PLMS index) suggest that, in PD, rotigotine may partially improve RBD-related symptoms."

According to the news editors, the research concluded: "Rotigotine should be considered to be an optional drug for the treatment of RBD symptoms in PD."

For more information on this research see: Effects of Rotigotine on REM Sleep Behavior Disorder in Parkinson Disease. _Journal of Clinical Sleep Medicine_, 2016;12 (10):1403-1409. _Journal of Clinical Sleep Medicine_ can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

The news correspondents report that additional information may be obtained from Z.X. Zhao, Second Military Med Univ, Changzheng Hosp, Dept. of Neurol, Shanghai 200003, People's Republic of China. Additional authors for this research include Y.C. Yang, H.J. Wu, D.M. Lan, Y. Chen and Z.X. Zhao.

**Enzymes and Coenzymes - RNA-Directed DNA...**

**New RNA-Directed DNA Polymerase Findings from Carnegie Mellon University Described (Oxidative guanine base damage regulates human telomerase activity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - RNA-
Directed DNA Polymerase. According to news reporting from Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "Changes in telomere length are associated with degenerative diseases and cancer. Oxidative stress and DNA damage have been linked to both positive and negative alterations in telomere length and integrity."

The news correspondents obtained a quote from the research from Carnegie Mellon University, "Here we examined how the common oxidative lesion 8-oxo-7,8-dihydro-2'-deoxyguanine (8-oxoG) regulates telomere elongation by human telomerase. When 8-oxoG is present in the dNTP pool as 8-oxodGTP, telomerase utilization of the oxidized nucleotide during telomere extension is mutagenic and terminates further elongation. Depletion of MTH1, the enzyme that removes oxidized dNTPs, increases telomere dysfunction and cell death in telomerase-positive cancer cells with shortened telomeres. In contrast, a preexisting 8-oxoG within the telomeric DNA sequence promotes telomerase activity by destabilizing the G-quadruplex DNA structure."

According to the news reporters, the research concluded: "We show that the mechanism by which 8-oxoG arises in telomeres, either by insertion of oxidized nucleotides or by direct reaction with free radicals, dictates whether telomerase is inhibited or stimulated and thereby mediates the biological outcome."

Our news journalists report that additional information may be obtained by contacting P.L. Opresko, Carnegie Mellon University, Center Nucle Acids Sci & Technol, Pittsburgh, PA 15213, United States. Additional authors for this research include J. Lormand, A. Bose, H.T. Lee, G.S. Kim, J.F. Li, R.W. Sobol, B.D. Freudenthal, S. Myong and P.L. Opresko.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nsmb.3319. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Radiation Therapy

New Radiation Therapy Study Findings Recently Were Reported by Researchers at Prince of Wales Clinical School (Radiation therapy for people with cancer: what do written information materials tell them?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Radiation Therapy have been presented. According to news reporting out of Sydney, Australia, by NewsRx editors, research stated, "This study aimed to compare and contrast the contents of different types of written
patient information about radiotherapy, namely (1) hospital radiotherapy departments vs. cancer control organisations and (2) generic vs. tumour-specific materials. A coding framework, informed by existing patients’ information needs literature, was developed and applied to 54 radiotherapy information resources.”

Funders for this research include Sydney Medical School, Australian National and Health Medical Research Council Early Career Researcher Fellowship.

Our news journalists obtained a quote from the research from the Prince of Wales Clinical School, "The framework comprised 12 broad themes; cancer diagnosis, general information about radiotherapy, treatment planning, daily treatment, side effects, self-care management, external radiotherapy, internal radiotherapy, impact on daily activities, post-treatment, psychosocial health and other content, such as a glossary. Materials produced by cancer organisations contained significantly more information than hospital resources on diagnosis, general radiotherapy information, internal radiotherapy and psychosocial health. However, hospital materials provided more information about treatment planning, daily treatment and the impact on daily activities. Compared to generic materials, tumour-specific resources were superior in providing information about diagnosis, daily treatment, side effects, post-treatment and psychosocial health. Information about internal radiotherapy, prognosis and chronic side effects were poorly covered by most resources. Collectively, hospital and cancer organisation resources complement each other in meeting patients’ information needs."

According to the news editors, the research concluded: "Identifying ways to consolidate different information sources could help comprehensively address patients’ medical and psychosocial information needs about radiotherapy.”

Our news journalists report that additional information may be obtained by contacting S.K. Smith, Univ New South Wales, Psychosocial Res Grp, Prince Wales Clin Sch, Fac Med, Sydney, NSW, Australia. Additional authors for this research include B. Yan, C. Milross and H.M. Dhillon.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ecc.12366. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Sydney, Australia, Australia and New Zealand, Drugs and Therapies, Radiation Therapy, Psychosocial, Radiotherapy, Hospital, Oncology, Cancer, Prince of Wales Clinical School.

Oncology - Rectal Cancer

New Rectal Cancer Findings from University of Ulsan Described (Phase II Study of Preoperative Capecitabine and Oxaliplatin-based Intensified Chemoradiotherapy With or Without Induction Chemotherapy in Patients With Locally Advanced Rectal ...
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Rectal Cancer. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "Controversy surrounds the management of patients with locally advanced rectal cancer with synchronous resectable liver metastases (LMs). This study was designed to improve both systemic and local control in these patients."

The news reporters obtained a quote from the research from the University of Ulsan, "Patients with locally advanced rectal cancer (cT3-4N0 or cTanyN1-2) and synchronous resectable liver-limited metastases (cMLa) were randomly assigned to receive either preoperative treatments of induction CapeOx, followed by chemoradiotherapy with CapeOx (CapeOx-RT) (arm A) or CapeOx-RT alone (arm B). Induction CapeOx consisted of oxaliplatin 130 mg/m(2) on day 1 and capcitabine 1000 mg/m(2) twice daily on days 1 to 14, every 3 weeks for 2 cycles; CapeOx-RT consisted of radiotherapy with 45 Gy/25 daily fractions +/- 5.4 Gy/3 fractions, oxaliplatin 50 mg/m(2) weekly for 5 weeks, and capcitabine 825 mg/m(2) twice daily on days 1 to 38. Total mesorectal excision and simultaneous liver metastasectomy were planned within 6 weeks after completion of preoperative treatments. The primary endpoint was R0 resection rate of both the primary tumor and LMs. Thirty-eight patients were randomly assigned to the present study, 18 to arm A and 20 to arm B. The overall R0 resection rate for both the primary tumor and LMs was 77.8% in arm A and 70.0% in arm B (P=0.72). The median progression-free survival was 14.2 versus 15.1 months (P=0.422) and the 3-year overall survival rate was 75.0% versus 88.8% (P=0.29), respectively."

According to the news reporters, the research concluded: "Both treatment strategies showed considerable R0 resection rates; however, further study will be warranted to apply these intensified strategies in clinical practice."

For more information on this research see: Phase II Study of Preoperative Capecitabine and Oxaliplatin-based Intensified Chemoradiotherapy With or Without Induction Chemotherapy in Patients With Locally Advanced Rectal Cancer and Synchronous Liver-limited Resectable Metastases. American Journal of Clinical Oncology-Cancer Clinical Trials, 2016;39(6):623-629. New Rectal Cancer Study Findings Have Been Reported by Investigators at Ohio State University (Neoadjuvant Therapy for Rectal Cancer Affects Lymph Node Yield and Status Without Clear Implications on Outcome: The Case for Eliminating a Metric ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Rectal Cancer have been presented. According to news reporting originating from Columbus, Ohio, by NewsRx correspondents, research stated, "Nodal status has long been considered pivotal to oncologic care, staging, and management. This has resulted in the establishment of rudimentary metrics regarding adequate lymph node yield in colon and rectal cancers for accurate cancer staging."

Our news editors obtained a quote from the research from Ohio State University, "In the era of neoadjuvant treatment, the implications of lymph node yield and status on patient outcomes remains unclear. This study included 1,680 patients with locally advanced rectal cancer from the NCCN prospective oncology database stratified into 3 groups based on preoperative therapy received: no neoadjuvant therapy, neoadjuvant chemoradiation, and neoadjuvant chemotherapy. Clinicopathologic characteristics and survival were compared between the groups, with univariate and multivariate analyses undertaken. The clinicopathologic characteristics demonstrated statistically significant differences and heterogeneity among the 3 groups. The neoadjuvant chemoradiation group demonstrated the statistically lowest median lymph node yield (n=15) compared with 17 and 18 for no-neoadjuvant and neoadjuvant chemotherapy, respectively (P <.0001). Neoadjuvant treatment did impact survival, with chemoradiation demonstrating increased median overall survival of 42.7 compared with 37.3 and 26.6 months for neoadjuvant chemotherapy and noneoadjuvant therapy, respectively (P <.0001). Patients with a yield of fewer than 12 lymph nodes had improved median overall survival of 43.3 months compared with 36.6 months in patients with 12 or more lymph nodes (P=.009). Multivariate analysis demonstrated that neither node yield nor status were predictors for overall survival. This analysis reiterates that nodal yield in rectal cancer is multifactorial, with neoadjuvant therapy being a significant factor. Node yield and status were not significant predictors of overall survival."

According to the news editors, the research concluded: "A nodal metric may not be clinically relevant in the era of neoadjuvant therapy, and guidelines for perioperative therapy may need reconsideration."

For more information on this research see: Neoadjuvant Therapy for Rectal Cancer Affects Lymph Node Yield and Status Without Clear Implications on Outcome: The Case for Eliminating a Metric and Using Preoperative Staging to Guide Therapy. *Journal of the National Comprehensive Cancer Network*, 2016;14(12):1528-1534. *Journal of the National Comprehensive Cancer Network* can be contacted at: Harborside Press, 37 Main St, Cold Spring Harbor, NY 11724, USA.

The news editors report that additional information may be obtained by contacting S.R.Z. Abdel-Misih, Ohio State University, Div Surg Oncol, Wexner Med Center, Arthur G James Canc Hosp, Columbus, OH 43210, United States. Additional authors for this research include L. Wei, A.B. Benson, S. Cohen, L. Lai, J. Skibber, N. Wilkinson, M. Weiser, D. Schrag and T. Bekaii-Saab.

Rehabilitation

New Rehabilitation Study Findings Have Been Reported by Investigators at Baylor University College of Medicine (Anesthetizing a child for a large compressive mediastinal mass with distraction techniques and music therapies as the sole agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Rehabilitation have been published. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "Anesthetic management of the child with an anterior mediastinal mass is challenging. The surgical/procedural goal typically is to obtain a definitive tissue diagnosis to guide treatment; the safest approach to anesthesia is often one that alters cardiorespiratory physiology the least."

Our news journalists obtained a quote from the research from the Baylor University College of Medicine, "In severe cases, this may translate to little or no systemic sedatives/analgesics. Distraction techniques, designed to shift attention away from procedure-related pain (such as counting, listening to music, non procedure-related talk), may be of great benefit, allowing for avoidance of pharmaceuticals."

According to the news editors, the research concluded: "In this report, we present an approach in children where the anesthetic risk is deemed excessive."

The news correspondents report that additional information may be obtained from A.C. Adler, Baylor College of Medicine, Dept. of Anesthesiol Perioperat & Pain Med, Houston, TX 77030, United States. Additional authors for this research include E.R. Schwartz', J.M. Waters and P.A. Stricker.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jclinane.2016.09.021. This DOI is a link to an online electronic document that is either free or for purchase.

Reproductive Techniques

New Reproductive Techniques Findings from School of Public Health Described (Contraceptive practices among women: the second Australian study of health and relationships)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Reproductive Techniques have been published. According to news reporting originating from Sydney, Australia, by NewsRx correspondents, research stated, "To document the use of contraception by a representative sample of Australian women aged 16-49 years and compare it with 2001-2002. Women were asked about their use of contraception and method used or reason for non-use during computer-assisted telephone interviews in 2012-2013."

Our news editors obtained a quote from the research from the School of Public Health, "Women were sampled by random digit dialling of landline and mobile phones (participation rate 67.2%). Of a weighted sample of 5654 heterosexually active women interviewed 81% were using a method of contraception including sterilisation; this amounts to 66% of all women aged 16-49. Of those who were not using a method, 42% were pregnant or wanted a baby, 25% said they or their partners were infertile, 5% were currently not having intercourse, 3% were past menopause and 25% were apparently at risk of unintended pregnancy. Of those who used a method, 33% used oral contraceptives, 30% condoms and 19% sterilisation as their primary method. Use of condoms, intrauterine devices, implants and emergency contraception has increased since 2002, and use of sterilisation has fallen. Method used varied by age group, location, occupational group, relationship status and parity. A third of women had ever used emergency contraception, with the highest rate among women in their 20s. Australian women have access to a wide range of effective contraceptive methods."

According to the news editors, the research concluded: "Given the high levels of use, most unintended pregnancies in Australia are likely to be attributable to method failure or inconsistent use."

The news editors report that additional information may be obtained by contacting J. Richters, Univ New South Wales, Sch Public Hlth & Community Med, Sydney, NSW, Australia. Additional authors for this research include S. Fitzadam, A. Yeung, T. Caruana, C. Rissel, J.M. Simpson and R. de Visser.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.contraception.2016.06.016. This DOI is a link to an online electronic document that is either free or for purchase.

New Respiratory Distress Syndrome Study Findings Have Been Reported by T. Baranovich and Co-Researchers (The Hemagglutinin Stem-Binding Monoclonal Antibody VIS410 Controls Influenza Virus-Induced Acute Respiratory Distress Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Respiratory Tract Diseases and Conditions - Respiratory Distress Syndrome. According to news reporting out of Cambridge, Massachusetts, by NewsRx editors, research stated, "Most cases of severe influenza are associated with pulmonary complications, such as acute respiratory distress syndrome (ARDS), and no antiviral drugs of proven value for treating such complications are currently available. The use of monoclonal antibodies targeting the stem of the influenza virus surface hemagglutinin (HA) is a rapidly developing strategy for the control of viruses of multiple HA subtypes."

Financial support for this research came from HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID).

Our news journalists obtained a quote from the research, "However, the mechanisms of action of these antibodies are not fully understood, and their ability to mitigate severe complications of influenza has been poorly studied. We evaluated the effect of treatment with VIS410, a human monoclonal antibody targeting the HA stem region, on the development of ARDS in BALB/c mice after infection with influenza A(H7N9) viruses. Prophylactic administration of VIS410 resulted in the complete protection of mice against lethal A(H7N9) virus challenge. A single therapeutic dose of VIS410 given 24 h after virus inoculation resulted in dose-dependent protection of up to 100% of mice inoculated with neuraminidase inhibitor-susceptible or -resistant A(H7N9) viruses. Compared to the outcomes in mock-treated controls, a single administration of VIS410 improved viral clearance from the lungs, reduced virus spread in lungs in a dose-dependent manner, resulting in a lower lung injury score, reduced the extent of the alteration in lung vascular permeability and protein accumulation in bronchoalveolar lavage fluid, and improved lung physiologic function."

According to the news editors, the research concluded: "Thus, antibodies targeting the HA stem can reduce the severity of ARDS and show promise as agents for controlling pulmonary complications in influenza."

For more information on this research see: The Hemagglutinin Stem-Binding Monoclonal Antibody VIS410 Controls Influenza Virus-Induced Acute Respiratory Distress Syndrome. Antimicrobial Agents and Chemotherapy, 2016;60(4):2118-31. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news journalists report that additional information may be obtained by contacting S.E. Sloan, Visterra, Inc, Cambridge, Massachusetts, United States. Drugs and Therapies - Respiratory Inhalant Products

New Respiratory Inhalant Products Findings from University of Calabria Outlined [Cromolyn as surface active drug (surfadrug): Effect of the self-association on diffusion and percutaneous permeation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Respiratory Inhalant Products is now available. According to news reporting originating in Cosenza, Italy, by NewsRx journalists, research stated, "Cromolyn sodium, or disodium cromoglycate (CS), is a surface active drug: a pharmacologically active compound with an amphiphilic nature. At certain conditions it is able to self-associate in several kind of supramolecular aggregates."

Financial support for this research came from MIUR, the Italian Ministry for University.

The news reporters obtained a quote from the research from the University of Calabria, "Since CS could play the role of both carrier and drug, bypassing the use of additional excipients and increasing the system biocompatibility, the effects of cromolyn self-aggregates on diffusion and percutaneous permeation across rabbit ear skin were investigated. Niosomes (vesicular systems, 0.5 wt% of CS), monomeric and isotropic solutions (0.5 and 5 wt% of CS), nematic (15 wt% of CS) and hexagonal phases (30 wt% of CS) were selected as supramolecular systems and tested as transdermal delivery systems. Results demonstrated that CS was able to form vesicular structures of about 500 nm of diameter and this formulation gave the higher percutaneous permeation profile (systemic action), while isotropic solution and liquid crystals mesophases acted as slower release reservoir of drug on the skin surface (local action), as confirmed by diffusion coefficients. Diffusion rates through a synthetic membrane were dependent both on CS concentration present into the formulations and on its structural organization: maximum diffusion was noticed with isotropic solution, a lower amount of diffused cromolyn sodium was achieved by hexagonal phase."

According to the news reporters, the research concluded: "Consequently, CS appears as a versatile surfadrug as, depending on the disease degree, it is possible to modulate its permeation profile by choosing the most appropriate formulation."

For more information on this research see: Cromolyn as surface active drug (surfadrug): Effect of the self-association on diffusion and percutaneous permeation. Colloids and Surfaces B-Biointerfaces, 2016;139():132-137. Colloids and Surfaces B-Biointerfaces can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands.

Our news correspondents report that additional information may be obtained by contacting L. Tavano, University of Calabria, Dept. of Pharm Hlth & Nutr Sci, I-87036 Cosenza, Italy. Additional authors for this research include F.P. Nicoletta, N. Picci and R. Muzzalupo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.colsurfb.2015.12.010. This DOI is a link to an online electronic document that is either free or for purchase.
New Respiratory Syncytial Viruses Study Results from Imperial College Described (T cell responses are elicited against Respiratory Syncytial Virus in the absence of signalling through TLRs, RLRs and IL-1R/IL-18R)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in RNA Viruses - Respiratory Syncytial Viruses. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Pattern recognition receptors (PRRs) and cytokine receptors are key players in the initiation of immune responses to infection. PRRs detecting viral RNA, such as toll like receptor (TLR)-3, -7/8, and RIG-I like receptors (RLRs; RIG-I and MDA-5), as well as cytokine receptors such as interleukin 1 receptor (IL-1R), have been implicated in responses to RNA viruses that infect the airways."

Our news journalists obtained a quote from the research from Imperial College, "The latter includes respiratory syncytial virus (RSV), a human pathogen that can cause severe lower respiratory tract infections, especially in infants. To evaluate the collective contribution of PRRs and IL-1R signalling to RSV immunity, we generated Myd88/Trif/Mavs(-/-) mice that are deficient in signalling by all TLRs, RLRs and IL-1R, as well as other cytokine receptors such as IL-18 receptor. Early production of pro-inflammatory mediators and lung infiltration by immune cells were completely abrogated in infected Myd88/Trif/Mavs(-/-) mice. However, RSV-specific CD8(+) T cells were elicited and recruited into the lungs and airways. Consistent with these findings, Myd88/Trif/Mavs(-/-) mice survived RSV infection but displayed higher viral load and weight loss."

According to the news editors, the research concluded: "These data highlight an unappreciated level of redundancy in pathways that couple innate virus sensing to adaptive immunity, providing the host with remarkable resilience to infection."

For more information on this research see: T cell responses are elicited against Respiratory Syncytial Virus in the absence of signalling through TLRs, RLRs and IL-1R/IL-18R. Scientific Reports, 2015;5():18533. (Nature Publishing Group - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting M. Goritzka, Centre for Respiratory Infections, Respiratory Infections Section, St Mary's campus, National Heart and Lung Institute, Faculty of Medicine, Imperial College London, London, W2 1PG, UK. Additional authors for this research include C. Pereira, S. Makris, L.R. Durant and C. Johansson.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/srep18533. This DOI is a link to an online electronic document that is either free or for purchase.

New Retinal Vein Occlusion Study Findings Have Been Reported by Investigators at Cukurova University (Choroidal Thickness Changes After Intravitreal Dexamethasone Implant Injection For The Treatment Of Macular Edema Due To Retinal Vein Occlusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Retinal Vein Occlusion. According to news reporting from Adana, Turkey, by NewsRx journalists, research stated, "To investigate changes in choroidal thickness after intravitreal injection of a dexamethasone implant for macular edema due to retinal vein occlusion. Thirty-one eyes of 31 patients, treated with a single dose of a dexamethasone implant for retinal vein occlusion-associated macular edema, were included."

The news correspondents obtained a quote from the research from Cukurova University, "Subfoveal choroidal thickness (SFCT) and central macular thickness of the affected eyes were compared with those of the normal contralateral eyes at baseline and 1, 3, and 5 months after injection. The mean SFCT of the affected eyes (296.3 μm +/- 61.6 μm) was significantly higher than that of the contralateral eyes (251.2 μm +/- 57.7 μm; P< 0.001) at baseline. After injection, the mean SFCT was decreased compared with baseline in the treated eyes at months 1, 3, and 5. There was a correlation between SFCT and central macular thickness in the affected eyes at baseline (r = 0.397, P = 0.027). The change in SFCT was not correlated with the change in central macular thickness after injection. In the contralateral eyes, the mean SFCT did not change significantly. Subfoveal choroidal thickness in eyes with macular edema due to retinal vein occlusion was higher than that of the contralateral eyes."

According to the news reporters, the research concluded: "Intravitreal injection of a dexamethasone implant was associated with a reduction in the choroidal thickness of the treated eye."

For more information on this research see: Choroidal Thickness Changes After Intravitreal Dexamethasone Implant Injection For The Treatment Of Macular Edema Due To Retinal Vein Occlusion. Retina-The Journal of Retinal and Vitreous Diseases, 2016;36 (12):2297-2303. New Retinal Vein Occlusion Study Findings Have Been Reported from Department of Ophthalmology (Lysophosphatidic Acids And Autotaxin In Retinal Vein Occlusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Eye Diseases and Conditions - Retinal Vein Occlusion have been published. According to news reporting from Los Angeles, California, by NewsRx journalists, research stated, "To analyze the levels of lysophosphatidic acids (LPAs) and autotaxin (ATX) in undiluted vitreous of untreated patients with retinal vein occlusion (RVO). Sixty-four vitreous samples (40 RVO, 24 controls with idiopathic floaters) were analyzed in this retrospective case series using LC/MS for LPAs 16:0, 18:0, 18:1, 20:4, and ELISA kits or Luminex technology for ATX, angiopoetin-1 (ANG-1), interleukin-6 (IL-6), interleukin-7 (IL-7), interleukin-8 (IL-8), monocyte chemoattractant protein-1 (MCP-1), pigment epithelium-derived factor (PEDF), and vascular endothelial growth factor (VEGF)."

The news correspondents obtained a quote from the research from the Department of Ophthalmology, "LPA and ATX levels were correlated with the visual acuity, central macular thickness (CMT), average retinal thickness (AvT), vitreal cytokine levels and with each other. Levels of every LPA species tested and ATX were significantly increased in the vitreous fluid from all patients with RVO (total LPAs: 968.0 +/- 842.3 nM; ATX: 2.5 +/- 1.02 nM) compared with controls (total LPAs: 225.2 +/- 292.8 nM, P< 0.0001; ATX:1.9 +/- 1.00 nM, P = 0.005). There were strong positive correlations between the vitreal levels of IL-6, IL-8, MCP-1, VEGF and LPAs."

According to the news reporters, the research concluded: "Levels of LPAs and ATX were positively correlated with proinflammatory cytokines and VEGF and might thus play an important role in the development of macular edema secondary to RVO."

For more information on this research see: Lysophosphatidic Acids And Autotaxin In Retinal Vein Occlusion. *Retina-The Journal of Retinal and Vitreous Diseases*, 2016;36 (12):2311-2318. *Retina-The Journal of Retinal and Vitreous Diseases* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

New Retinoblastoma Study Findings Reported from University of Utah

[Cell-specific Kaiso (ZBTB33) Regulation of Cell Cycle through Cyclin D1 and Cyclin E1]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Eye Diseases and Conditions - Retinoblastoma are discussed in a new report. According to news reporting out of Salt Lake City, Utah, by NewsRx editors, research stated, "The correlation between aberrant DNA methylation with cancer promotion and progression has prompted an interest in discerning the associated regulatory mechanisms. Kaiso (ZBTB33) is a specialized transcription factor that selectively recognizes methylated CpG-containing sites as well as a sequence-specific DNA target."

Funders for this research include American Cancer Society, National Cancer Institute.

Our news journalists obtained a quote from the research from the University of Utah, "Increasing reports link ZBTB33 overexpression and transcriptional activities with metastatic potential and poor prognosis in cancer, although there is little mechanistic insight into how cells harness ZBTB33 transcriptional capabilities to promote and progress disease. Here we report mechanistic details for how ZBTB33 mediates cell-specific cell cycle regulation. By utilizing ZBTB33 depletion and overexpression studies, it was determined that in HeLa cells ZBTB33 directly occupies the promoters of cyclin D1 and cyclin El, inducing proliferation by promoting retinoblastoma phosphorylation and allowing for E2F transcriptional activity that accelerates G(1)-to-S-phase transition. Conversely, in HEK293 cells ZBTB33 indirectly regulates cyclin E abundance resulting in reduced retinoblastoma phosphorylation, decreased E2F activity, and decelerated G(1) transition."

According to the news editors, the research concluded: "Thus, we identified a novel mechanism by which ZBTB33 mediates the cyclin D1/cyclin El/BR1/E2E pathway, controlling passage through the G(1) restriction point and accelerating cancer cell proliferation."

Our news journalists report that additional information may be obtained by contacting B.A. Buck-Koehntop, University of Utah, Dept. of Chem, Salt Lake City, UT 84112, United States. Additional authors for this research include T.W. Terooatea and B.A. Buck-Koehntop.

New Rett Syndrome Findings from Maastricht University Outlined (Neurophysiology Versus Clinical Genetics in Rett Syndrome: A Multicenter Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Central Nervous System Diseases and Conditions - Rett Syndrome is now available. According to news reporting originating in Maastricht, Netherlands, by NewsRx journalists, research stated, "Many studies have attempted to establish the genotype-phenotype correlation in Rett syndrome (RTT). Cardiorespiratory measurements provide robust objective data, to correlate with each of the different clinical phenotypes."

The news reporters obtained a quote from the research from Maastricht University, "It has important implications for the management and treatment of this syndrome. The aim of this study was to correlate the genotype with the quantitative cardiorespiratory data obtained by neurophysiological measurement combined with a clinical severity score. This international multicenter study was conducted in four European countries from 1999 to 2012. The study cohort consisted of a group of 132 well-defined RTT females aged between 2 and 43 years with extended clinical, molecular, and neurophysiological assessments. Diagnosis of RTT was based on the consensus criteria for RTT and molecular confirmation. Genotype-phenotype analyses of clinical features and cardiorespiratory data were performed after grouping mutations by the same type and localization or having the same putative biological effect on the MeCP2 protein, and subsequently on eight single recurrent mutations. A less severe phenotype was seen in females with CTS, p.R133C, and p.R294X mutations. Autonomic disturbances were present in all females, and not restricted to nor influenced by one specific group or any single recurrent mutation. The objective information from non-invasive neurophysiological evaluation of the disturbed central autonomic control is of great importance in helping to organize the lifelong care for females with RTT."

According to the news reporters, the research concluded: "Further research is needed to provide insights into the pathogenesis of autonomic dysfunction, and to develop evidence-based management in RTT."

Our news correspondents report that additional information may be obtained by contacting E.E. Smeets, Maastricht University, Medical Center, Netherlands Rett Expertise Center GKC, NL-6202 AZ Maastricht, Netherlands. Additional authors for this research include E.E. Smeets, P. Julu, I.W.E. Om, G. Pini, S. Bigoni, S. Hansen, F. Apartopoulos, R. Delamont,
New Rheumatic Heart Disease Findings from M.S. Sreekanth and Co-Researchers Reported (Association of IL-1 beta+3953 C and HLA-DRB1*15 with Coronary Artery and Rheumatic Heart Diseases in South India)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Rheumatic Heart Disease have been published. According to news originating from Tamil Nadu, India, by NewsRx correspondents, research stated, "Among the various candidate genes predisposing for cardiovascular diseases, HLA-DRB1* and IL-1 beta +3953C/T alleles have been implicated repeatedly. To test these in South India, we carried out a case control study of 323 Coronary Artery Disease (CAD) patients, 56 Rheumatic Heart Disease (RHD) patients and 254 endemic controls."

Our news journalists obtained a quote from the research, "The polymorphisms were studied by PCR - SSP and ARMS-PCR methods and results analyzed for various clinical and demographic parameters. In CAD, HLA-DRB1*14 allele showed significant predisposition (OR: 2.19; 95% CI: 1.04-4.58; p value = 0.023), particularly in male patients (OR: 4.07; 95% CI: 1.20-13.81; p value = 0.01) and further in males with Triple Vessel Disease (OR: 5.49; 95% CI: 1.45-20.60; p value = 0.007). On the other hand, HLA-DRB1*15 predisposed for RHD (OR: 3.56; 95% CI: 1.87-6.78; p value = 0.001) in both the genders. Population stratification showed this higher risk association in Vanniyar caste (OR: 5.00; 95% CI: 1.27-19.59; p value = 0.022). Among the IL1-beta +3953C/T polymorphism, the ancestral allele 'C' showed a significant high risk association with CAD (OR: 1.83; 95% CI: 1.24-2.70; p value = 0.001), particularly in Mudaliar (OR: 6.07; 95% CI: 1.77-20.74; p value = 0.003; AF = 0.7) and Vanniyar castes (OR: 3.67; 95% CI: 0.92-14.57; p value = 0.05; AF = 0.660). Two different cardiac ailments studied, RHD & CAD thus showed varied associations in this South Indian cohorts."

According to the news editors, the research concluded: "RHD having an infectious aetiology shared a HLA-DRB1*15 high risk association, while HLA-DRB1*14 and IL-1 +3953C predisposed for CAD, an inflammatory disorder, reiterating the diverse genetic predisposition of the two cardiac ailments studied."

For more information on this research see: Association of IL-1 beta+3953 C and HLA-DRB1*15 with Coronary Artery and Rheumatic Heart Diseases in South India. Human Immunology, 2016;77(12):1275-1279. Autoimmune Diseases and Conditions - Rheumatoid…

New Rheumatoid Arthritis Findings from M. Dougados and Co-Researchers Described (Evaluation of the Disease Activity Score in Twenty-Eight Joints-Based Flare Definitions in Rheumatoid Arthritis: Data From a Three-Year Clinical Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Rheumatoid Arthritis. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "To assess the flare rate using published criteria (Disease Activity Score in 28 joints [DAS28-2] increase between visits of >1.2 or >0.6 if current DAS28 (>=3.2) in patients receiving constant treatment, and to compare published flare criteria to criteria used by study investigators after biologic treatment discontinuation in the ACT-RAY study. Patients with rheumatoid arthritis (n=553) were randomized to add tocilizumab to ongoing methotrexate, or switch to tocilizumab plus placebo."

Financial support for this research came from F. Hoffmann-La Roche, Ltd.

Our news editors obtained a quote from the research, "If DAS28 (<=3.2 occurred at week 24, treatment remained constant until week 52; here we assessed the DAS28-2 flare rate. Between weeks 52 and 104, patients in sustained remission (DAS28 <2.6 at 2 consecutive visits 12 weeks apart) discontinued tocilizumab and were assessed every 4 weeks. Per protocol, flare was defined as a worsening of disease activity that required treatment beyond the permitted therapy based on investigator opinions (investigator flare) and was compared with the DAS28-2 definition. After tocilizumab discontinuation, DAS28-2 was sensitive (88-100%), but not specific (57-65%), for detecting investigator flare. Under constant treatment, DAS28-2 criteria were met in 136 cases per 100 patient-years despite stable disease activity. Sustained flares were infrequent. Other DAS28-based criteria led to similar conclusions. DAS28-based flare occurred more often than investigator-defined flares after biologic agent discontinuation."

According to the news editors, the research concluded: "More stringent criteria may be more appropriate for clinical practice."

The news editors report that additional information may be obtained by contacting M. Dougados, Hopital Cochin, Paris, France. Additional authors for this research include T.W. Huizinga, E.H. Choy, C.O. Bingham, M. Aassi and C. Bernasconi.

Autoimmune Diseases and Conditions - Rheumatoid ...

New Rheumatoid Arthritis Findings from X.F. Li and Co-Researchers Reported (MicroRNA-20a negatively regulates expression of NLRP3-inflammasome by targeting TXNIP in adjuvant-induced arthritis fibroblast-like synoviocytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Autoimmune Diseases and Conditions - Rheumatoid Arthritis is the subject of a report. According to news reporting from Hefei, People's Republic of China, by NewsRx journalists, research stated, "Rheumatoid arthritis (RA) is a heterogenic and systemic autoimmune disease characterized by synovitis and joint structural damage. However, the pathogenesis of RA is still obscure."

Financial supporters for this research include National Science Fundations of China, Doctoral Program of Higher Education, Anhui Provincial Natural Science Foundation.

The news correspondents obtained a quote from the research, "It has been reported microRNA-20a (miRNA-20a) was significantly associated with the regulation of pro inflammatory cytokines release in RA FLS. The purpose of this study was to explore the function and underlying mechanisms of miRNA-20a on NLRP3-inflammasome in adjuvant-induced arthritis (AA) fibroblast-like synoviocytes (FLSs) in vitro. In this study, using a combination of Western blotting, Q-PCR, and ELISA analysis, we investigated the influence and function of miRNA-20a on NLRP3-inflammasome by targeting TXNIP in AA FLSs. In the present study, the expression of NLRP3-inflammasome was significant up-regulated in AA model in vitro. Our study indicated that silence of NLRP3 down-regulated the expression of NLRP3-inflammasome and the secretion of IL-1 beta and MMP-1. Moreover, over-expression of miR-20a decreased formation of NLRP3-inflammasome, including NLRP3, ASC and caspase-1, and suppressed the secretion of IL-1 beta and MMP-1, along with down-regulated the expressions of TXNIP in primary FLSs isolated from AA. With the combined use of prediction programs and luciferase assay, the rat TXNIP mRNA 3'UTR predicted to be targeted by miR-20a. Similarly, inhibitor TXNIP expression by TXNIP-siRNA markedly repressed formation of NLRP3-inflammasome and the secretion of IL-1 beta and MMP-1."

According to the news reporters, the research concluded: "Taken together, these results indicate that miR-20a may play a pivotal role in the NLRP3-inflammasome by targeted inhibit TXNIP expression in AA FLSs."

For more information on this research see: MicroRNA-20a negatively regulates expression of NLRP3-inflammasome by targeting TXNIP in adjuvant-induced arthritis fibroblast-like synoviocytes. Joint Bone Spine, 2016;83(6):695-700. Joint Bone Spine can be

Autoimmune Diseases and Conditions - Rheumatoid...

New Rheumatoid Arthritis Study Findings Have Been Reported by Researchers at Veterans General Hospital (Rheumatoid Arthritis Risk Associated with Periodontitis Exposure: A Nationwide, Population-Based Cohort Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Autoimmune Diseases and Conditions - Rheumatoid Arthritis is the subject of a report. According to news reporting originating in Taichung, Taiwan, by NewsRx journalists, research stated, "The risk of periodontitis (PD) is increased in the patient group of rheumatoid arthritis (RA). RA and PD also shared some pathological mechanism."

The news reporters obtained a quote from the research from Veterans General Hospital, "The aim of this study is to investigate the risk of RA associated with PD exposure. This study identified 3 mutually exclusive cohorts using the 1999-2010 Taiwanese National Health Insurance Research Database (NHIRD) to investigate the association between PD and the risk of incident RA. All patients with PD in 2000 were identified from the database of all enrollees as the PD cohort. From the representative database of 1,000,000 enrollees randomly selected in 2010 (LHID2010), individuals without any periodontal disease (PO) during 1999-2010 were selected as the non-PO cohort. Individuals who were not included in the non-PO cohort and received dental scaling (DS) no more than two times per year during 1999-2010 were selected as the DS cohort from LHID2010. Using cox proportional regression analysis, hazard ratios (HRs) with 95% confidence intervals (CIs) were calculated to quantify the association between PD exposure and RA development. In the three-group comparison using the non-PO cohort as reference, we found that the risk of RA was higher in the PD and DS cohorts (HRs, 1.89 and 1.43; 95% CIs, 1.56-2.29 and 1.09-1.87, respectively). For comparisons between two cohorts, the PD cohort had a higher risk of RA than the non-PO and DS cohorts (HRs, 1.91 and 1.35; 95% CIs, 1.57-2.30 and 1.09-1.67, respectively)."

According to the news reporters, the research concluded: "PD was associated with an increased risk of RA development."
For more information on this research see: Rheumatoid Arthritis Risk Associated with Periodontitis Exposure: A Nationwide, Population-Based Cohort Study. Plos One, 2015;10 (10):e0139693. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Autoimmune Diseases and Conditions - Rheumatoid ...

New Rheumatoid Arthritis Study Results Reported from A. Balasubramanian et al (Glucocorticoid exposure and fracture risk in patients with new-onset rheumatoid arthritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autoimmune Diseases and Conditions - Rheumatoid Arthritis have been presented. According to news reporting originating from Salt Lake City, Utah, by NewsRx correspondents, research stated, "Retrospective claims analysis indicated that high levels of daily and cumulative doses of systemic glucocorticoids were associated with elevated fracture risk in a large cohort of new RA patients under age 65. Heightened risk began to decline within months of discontinuation."

Financial support for this research came from Amgen.

Our news editors obtained a quote from the research, "Findings were similar among patients age <50 years. We evaluated the impact of systemic glucocorticoid exposure on fracture risk among relatively young patients with new-onset rheumatoid arthritis (RA). Using administrative data, we identified 42,127 RA patients diagnosed January 1, 2005-December 31, 2012, age 18-64 years, with benefits coverage for >= 12 months before RA diagnosis. Follow-up extended to clinical fracture, cancer diagnosis, or December 31, 2012. Glucocorticoid users were new to therapy. Fracture incidence rates (IR) were stratified by glucocorticoid exposure expressed as prednisone equivalent doses. Cox's proportional hazards models estimated fracture risk adjusted for demographics and baseline clinical characteristics to assess dose-response relationships with current (daily) and prior (cumulative) dose, and by time since discontinuation. Most patients (85 %) had glucocorticoid exposure. Exposed and unexposed patients were demographically similar (74 % female; mean age 49.7 and 48.8 years); 1 % had prior fracture. Fracture IRs (95% confidence intervals) were 5 to 9 per 1000 person-years at doses < 15 mg/day, 16.0 (11.0, 22.6) at doses >= 15 mg/day, and 13.4 (10.7, 16.7) at cumulative doses >= 5400 mg. Adjusted fracture risk was approximately 2-fold higher at highest dose levels compared with 0 mg/day current daily dose and < 675 mg cumulative dose, respectively."
Fracture risk was 29% lower at 60-182 days post-discontinuation compared with ongoing use and was similar to unexposed patients by 12 months. Findings were similar among patients age < 50 years.

According to the news editors, the research concluded: "Among younger, new-onset RA patients, fracture risk was significantly elevated at high levels of daily and cumulative dose, and was similar to unexposed patients by 12 months post-discontinuation."

The news editors report that additional information may be obtained by contacting S.W. Wade, Wade Outcomes Res & Consulting, Salt Lake City, UT, United States. Additional authors for this research include S.W. Wade, R.A. Adler, C.J.F. Lin, M. Maricic, C.D. O'Malley, K. Saag and J.R. Curtis.

Autoimmune Diseases and Conditions - Rheumatoid...

New Rheumatoid Arthritis Study Results from Institute for Rehabilitation Described [The-2518 A/G polymorphism in the monocyte chemoattractant protein 1 gene (MCP-1) is associated with an increased risk of rheumatoid arthritis in Argentine ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Autoimmune Diseases and Conditions - Rheumatoid Arthritis. According to news reporting originating in Buenos Aires, Argentina, by NewsRx journalists, research stated, "The aim of this study was to analyze the influence of nucleotide transition (G/A) in position -2518 of the MCP-1 gene related to the susceptibility of developing RA."

The news reporters obtained a quote from the research from Institute for Rehabilitation, "Two hundred twenty-three consecutive RA patients according to 2010 ACR/EULAR criteria were included; 120 healthy subjects were used as controls. MCP-1 -2518 A/G polymorphism (AG + GG) was present in 162 (72.6%) RA patients and in 63 (52.5%) healthy subjects [OR 2.44 (IC95% 1.53-3.88, p = 0.0002)]; associations for heterozygotes and homozygotes were OR 1.92 (IC95% 1.19-3.15, p = 0.001) and OR 5.19 (IC95% 2.34-11.51, p = 0.001), respectively."

According to the news reporters, the research concluded: "In Argentine patients,
MCP-1 gene polymorphism confers susceptibility for developing RA."

For more information on this research see: The-2518 A/G polymorphism in the monocyte chemoattractant protein 1 gene (MCP-1) is associated with an increased risk of rheumatoid arthritis in Argentine patients. Clinical Rheumatology, 2016;35(12):3057-3061.

Gram-Negative Bacteria - Rickettsia

New Rickettsia Findings Reported from Center for Disease Control and Prevention (Development of a Rickettsia bellii-Specific TaqMan Assay Targeting the Citrate Synthase Gene)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Rickettsia are discussed in a new report. According to news reporting out of Atlanta, Georgia, by NewsRx editors, research stated, "Rickettsia bellii is a rickettsial species of unknown pathogenicity that infects argasid and ixodid ticks throughout the Americas. Many molecular assays used to detect spotted fever group (SFG) Rickettsia species do not detect R. bellii, so that infection with this bacterium may be concealed in tick populations when assays are used that screen specifically for SFG rickettsiae."

Our news journalists obtained a quote from the research from Center for Disease Control and Prevention, "We describe the development and validation of a R. bellii-specific, quantitative, real-time PCR TaqMan assay that targets a segment of the citrate synthase (gltA) gene. The specificity of this assay was validated against a panel of DNA samples that included 26 species of Rickettsia, Orientia, Ehrlichia, Anaplasma, and Bartonella, five samples of tick and human DNA, and DNA from 20 isolates of R. bellii, including 11 from North America and nine from South America. A R. bellii control plasmid was constructed, and serial dilutions of the plasmid were used to determine the limit of detection of the assay to be one copy per 4 ml of template DNA."

According to the news editors, the research concluded: "This assay can be used to better determine the role of R. bellii in the epidemiology of tickborne rickettsioses in the Western Hemisphere."

Our news journalists report that additional information may be obtained by contacting J.A. Hecht, Center Dis Control & Prevent, Rickettsial Zoonoses Branch, Natl Center Emerging & Zoonot Infect Dis, Atlanta, GA 30333, United States. Additional authors for this research include M.E.J. Allerdice, F.S. Krawczak, M.B. Labruna, C.D. Paddock and S.E. Karpathy.

**Rickettsia**

**New Rickettsia Study Findings Recently Were Reported by Researchers at Collaborative Innovation Center for Diagnosis and Treatment of Infectious Disease (Extensive genetic diversity of Rickettsiales bacteria in multiple mosquito species)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Rickettsia. According to news originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Rickettsiales are important zoonotic pathogens, causing severe disease in humans globally. Although mosquitoes are an important vector for diverse pathogens, with the exception of members of the genus Wolbachia little is known about their role in the transmission of Rickettsiales."

Our news journalists obtained a quote from the research from the Collaborative Innovation Center for Diagnosis and Treatment of Infectious Disease, "Herein, Rickettsiales were identified by PCR in five species of mosquitoes (Anopheles sinensis, Armigeres subalbatus, Aedes albopictus, Culex quinquefasciatus and Cu. tritaeniorhynchus) collected from three Chinese provinces during 2014-2015. Subsequent phylogenetic analyses of the rrs, groEL and gltA genes revealed the presence of Anaplasma, Ehrlichia, Candidatus Neoehrlichia, and Rickettsia bacteria in mosquitoes, comprising nine documented and five tentative species bacteria, as well as three symbionts/endosymbionts. In addition, bacteria were identified in mosquito eggs, larvae, and pupae sampled from aquatic environments. Hence, these data suggest that Rickettsiales circulate widely in mosquitoes in nature. Also of note was that Ehrlichia and Rickettsia bacteria were detected in each life stage of laboratory cultured mosquitoes, suggesting that Rickettsiales may be maintained in mosquitoes through both transstadial and transovarial transmission."

According to the news editors, the research concluded: "In sum, these data indicate that mosquitoes may have played an important role in the transmission and evolution of Rickettsiales in nature."

For more information on this research see: Extensive genetic diversity of

**Risk Management**

**New Risk Management Study Findings Recently Were Reported by S.C. Anenberg and Co-Researchers (Survey of Ambient Air Pollution Health Risk Assessment Tools)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Risk Management have been published. According to news reporting originating from Washington, District of Columbia, by NewsRx correspondents, research stated, "Designing air quality policies that improve public health can benefit from information about air pollution health risks and impacts, which include respiratory and cardiovascular diseases and premature death. Several computer-based tools help automate air pollution health impact assessments and are being used for a variety of contexts."

Our news editors obtained a quote from the research, "Expanding information gathered for a May 2014 World Health Organization expert meeting, we survey 12 multinational air pollution health impact assessment tools, categorize them according to key technical and operational characteristics, and identify limitations and challenges. Key characteristics include spatial resolution, pollutants and health effect outcomes evaluated, and method for characterizing population exposure, as well as tool format, accessibility, complexity, and degree of peer review and application in policy contexts. While many of the tools use common data sources for concentration-response associations, population, and baseline mortality rates, they vary in the exposure information source, format, and degree of technical complexity. We find that there is an important tradeoff between technical refinement and accessibility for a broad range of applications. Analysts should apply tools that provide the appropriate geographic scope, resolution, and maximum degree of technical rigor for the intended assessment, within resources constraints. Asystematic intercomparison of the tools' inputs, assumptions, calculations, and results would be helpful to determine the appropriateness of each for different types of assessment."

According to the news editors, the research concluded: "Future work would benefit from accounting for multiple uncertainty sources and integrating ambient air pollution health impact assessment tools with those addressing other related health risks (e.g., smoking, indoor pollution, climate change, vehicle accidents, physical activity)."

For more information on this research see: Survey of Ambient Air Pollution Health

**Engineering - Safety Engineering**

**New Safety Engineering Findings from Valencia Polytechnic University Described (Motor vehicles overtaking cyclists on two-lane rural roads: Analysis on speed and lateral clearance)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Engineering - Safety Engineering have been published. According to news reporting from Valencia, Spain, by NewsRx journalists, research stated, "Two-lane rural roads in Spain accommodate significant bicycle traffic volumes, mainly associated to sport and leisure activities. Motor vehicles' higher speed, weight and volume, compared to cyclists, represent a serious safety concern when overtaking a bicycle."

Financial support for this research came from Spanish Ministry of Economy.

The news correspondents obtained a quote from the research from Valencia Polytechnic University, "Spanish traffic rules determine a minimum 1.5 m lateral distance. This research characterised 2928 overtaking manoeuvres in the overtaking lateral clearance between motor vehicle and bicycle, as well as in the motor vehicle speed, in contrast with previous research. Two instrumented bicycles were equipped with laser rangefinders, a GPS tracker and three video cameras. They rode along seven rural road segments at a speed between 15 and 25 km/h, centred on the paved shoulder, or as close as possible to the outer edge. Besides, this methodology allowed the characterisation of the overtaken vehicle type, its left lane occupation as well as its interaction with opposing traffic flow. For each session, rider's general risk perception was also registered. The analysis suggested that lateral clearance is not the only factor that influenced rider's risk perception, although current standards are only related to it. On the contrary, a combined factor of lateral clearance, vehicle type and vehicle speed had a more significant correlation with the perceived risk. This agreed with literature models of transient aerodynamic forces between overtaking and overtaken vehicles. Results showed that effect of heavy vehicles on bicyclists was also strong."

According to the news reporters, the research concluded: "In addition to this, the combined factor of clearance and speed was higher on tangent sections where overtaking was permitted."

For more information on this research see: Motor vehicles overtaking cyclists on two-lane rural roads: Analysis on speed and lateral clearance. *Safety Science*, 2017;92():302-310. *Safety Science* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae
Amsterdam, Netherlands.

**Gram-Negative Bacteria - Salmonella enterica**

**New Salmonella enterica Study Results Reported from Osaka University (Phenotype microarray analysis of the drug efflux systems in Salmonella enterica serovar Typhimurium)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Salmonella enterica have been published. According to news originating from Osaka, Japan, by NewsRx correspondents, research stated, "A large number of drug efflux transporters have been identified in Salmonella enterica serovar Typhimurium, and increased expression of these transporters confers drug resistance in this organism. Here we compared the respiration activities of the wild-type strain and a mutant with nine deleted transporters by phenotype microarray analysis."

Funders for this research include Japanese Society for the Promotion of Science (JSPS), JSPS Fellows, JSPS, Japan Agency for Medical Research and Development (AMED), Japan Science and Technology Agency, JST, Naito Foundation, Senri Life Science Foundation.

Our news journalists obtained a quote from the research from Osaka University, "The mutant was susceptible to 66 structurally unrelated compounds including many antibiotics, dyes, detergents, antihistamine agents, plant alkaloids, antidepressants, antipsychotic drugs, and antiprotozoal drugs. To investigate the effect of each transporter on the susceptibilities to these drugs, we used the single transporter mutants, several multiple deletion mutants, and the transporter overexpressor strains to determine minimum inhibitory concentrations of ampicillin, erythromycin, minocycline, ciprofloxacin, orphenadrine, amitriptyline, thioridazine, and chlorpromazine. The data indicate that the increased susceptibilities of the mutant lacking nine transporter genes are mainly dependent on the absence of the acrAB efflux genes as well as the tolC gene. In addition to the AcrAB-TolC efflux system, the results from the overexpressor strains show that AcrEF confers resistance to these compounds as well as AcrAB of Escherichia coli, MexAB-OprM and MexXY-OprM of Pseudomonas aeruginosa."

According to the news editors, the research concluded: "The results highlight the importance of the efflux systems not only for resistance to antibiotics but also for resistance to antihistamine agents, plant alkaloids, antidepressants, antipsychotic drugs, and antiprotozoal drugs."

For more information on this research see: Phenotype microarray analysis of the

The news correspondents report that additional information may be obtained from K. Nishino, Osaka University, Grad Sch Pharmaceut Sci, Suita, Osaka 5650871, Japan. Additional authors for this research include T. Fujioka, K. Hayashi, S. Yamasaki, M. Hayashi-Nishino and K. Nishino.

**Gram-Negative Bacteria - Salmonella typhimurium**

**New Salmonella typhimurium Study Findings Have Been Reported by Investigators at VIT University (Identification of Potential Therapeutics to Conquer Drug Resistance in Salmonella typhimurium: Drug Repurposing Strategy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Salmonella typhimurium have been presented. According to news reporting originating in Tamil Nadu, India, by NewsRx journalists, research stated, "Salmonella typhimurium is the main cause of gastrointestinal illness in humans, and treatment options are decreasing because drug-resistant strains have emerged. The objective of this study was to use computational drug repurposing to identify a novel candidate with an effective mechanism of action to circumvent the drug resistance."

The news reporters obtained a quote from the research from VIT University, "We used the Mantra 2.0 database to initially screen drug candidates that share similar gene expression profiles to those of quinolones. Data were further reduced using pharmacophore mapping theory. Finally, we employed molecular-simulation studies to calculate the binding affinity of the screened candidates with DNA gyrase, alongside an analysis of side effects. A total of 16 drug candidates from the Mantra 2.0 database were screened. The pharmacophoric features of the screened candidates were examined and nalidixic acid features compared using the PharamGist program. A total of 11 compounds with the highest pharmacophore score were considered for binding energy calculation. Finally, we analysed the side effects of the eight drug candidates that showed significant binding affinity in the simulation study."

According to the news reporters, the research concluded: "Overall, flufenamic acid and sulconazole may be potential drug candidates that could be studied in vitro to assess their resistance profile against Salmonella enterica Typhimurium."

For more information on this research see: Identification of Potential Therapeutics

Our news correspondents report that additional information may be obtained by contacting K. Ramanathan, VIT Univ, Sch Bio Sci & Technol, Dept. of Biotechnol, Vellore 632014, Tamil Nadu, India. Additional authors for this research include V. Shanthi and K. Ramanathan.

**Mental Health Diseases and Conditions - Schizophrenia**

**New Schizophrenia Findings from Xi'an Jiaotong University Outlined (Association of the NOTCH4 Gene Polymorphism rs204993 with Schizophrenia in the Chinese Han Population)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mental Health Diseases and Conditions - Schizophrenia. According to news reporting out of Xi'an, People's Republic of China, by NewsRx editors, research stated, "NOTCH4 regulates signaling pathways associated with neuronal maturation, a process involved in the development and patterning of the central nervous system. The NOTCH4 gene has also been identified as a possible susceptibility gene for schizophrenia (SCZ)."

Financial supporters for this research include National Science Foundation for Post-Doctoral Scientists of Shaanxi, National Science Foundation for Post-Doctoral Scientists of China.

Our news journalists obtained a quote from the research from Xi'an Jiaotong University, "The objective of this study was to examine the relationship between NOTCH4 polymorphisms and SCZ in the Chinese Han population. The rs2071287 and rs204993 polymorphisms of the NOTCH4 gene were analyzed in 443 patients with SCZ and 628 controls of Han Chinese descent. Single SNP allele-, genotype-, and gender-specific associations were analyzed using different models (i.e., additive, dominant, and recessive models). This association study revealed that the rs204993 polymorphism is significantly associated with susceptibility for SCZ and that the AA genotype of rs204993 is associated with a higher risk for SCZ (p=0.027; OR=1.460; 95% CI, 1.043-2.054). Our data are consistent with those obtained in previous studies that suggested that rs204993 is associated with SCZ and that the AA genotype of rs204993 demonstrates a higher risk."

According to the news editors, the research concluded: "Further large-scale association analyses in Han Chinese populations are warranted."

Our news journalists report that additional information may be obtained by contacting B. Zhang, College of Medicine & Forensic, Health Science Center, Xi’an Jiaotong University, Xi’an 710061, People’s Republic of China. Additional authors for this research include Q.R. Fan, W.H. Li, N. Mental Health Diseases and Conditions - Schizophrenia

New Schizophrenia Study Findings Have Been Reported from Center for Addiction and Mental Health (Genetic association analysis of N-methyl-D-aspartate receptor subunit gene GRIN2B and clinical response to clozapine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mental Health Diseases and Conditions - Schizophrenia. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "Approximately 30% of patients with schizophrenia fail to respond to antipsychotic therapy and are classified as having treatment-resistant schizophrenia. Clozapine is the most efficacious drug for treatment-resistant schizophrenia and may deliver superior therapeutic effects partly by modulating glutamate neurotransmission."

Our news journalists obtained a quote from the research from Center for Addiction and Mental Health, "Response to clozapine is highly variable and may depend on genetic factors as indicated by twin studies. We investigated eight polymorphisms in the N-methyl-D-aspartate glutamate receptor subunit gene GRIN2B with response to clozapine. GRIN2B variants were genotyped using standard TaqMan procedures in 175 European patients with schizophrenia deemed resistant or intolerant to treatment. Response was assessed using change in Brief Psychiatric Rating Scale scores following six months of clozapine therapy. Categorical and continuous response was assessed using chi-squared test and analysis of covariance, respectively. No associations were observed between the variants and response to clozapine. A-allele carriers of rs1072388 responded marginally better to clozapine therapy than GG-homozygotes; however, the difference was not statistically significant (p=0.067, uncorrected). Our findings do not support a role for these GRIN2B variants in altering response to clozapine in our sample."

According to the news editors, the research concluded: "Investigation of additional glutamate variants in clozapine response is warranted."

For more information on this research see: Genetic association analysis of N-methyl-D-aspartate receptor subunit gene GRIN2B and clinical response to clozapine. Human Psychopharmacology, 2016;31(2):121-34. (Wiley-Blackwell - www.wiley.com/; Human

**New Science Data Have Been Reported by Investigators at Institute of Physical Chemistry [Antibacterial and anticancer PDMS surface for mammalian cell growth using the Chinese herb extract paeonol(4-methoxy-2-hydroxyacetophenone)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news reporting originating in Warsaw, Poland, by NewsRx journalists, research stated, "Polydimethylsiloxane (PDMS) is widely used as a cell culture platform to produce micro-and nano-technology based microdevices. However, the native PDMS surface is not suitable for cell adhesion and is always subject to bacterial pollution and cancer cell invasion."

The news reporters obtained a quote from the research from the Institute of Physical Chemistry, "Coating the PDMS surface with antibacterial or anticancer materials often causes considerable harm to the non-cancer mammalian cells on it. We have developed a method to fabricate a biocompatible PDMS surface which not only promotes non-cancer mammalian cell growth but also has antibacterial and anticancer activities, by coating the PDMS surface with a Chinese herb extract, paeonol. Coating changes the wettability and the elemental composition of the PDMS surface. Molecular dynamic simulation indicates that the absorption of paeonol onto the PDMS surface is an energy favourable process. The paeonol-coated PDMS surface exhibits good antibacterial activity against both Gram-positive and Gram-negative bacteria. Moreover considerable antibacterial activity is maintained after the coated surface is rinsed or incubated in water. The coated PDMS surface inhibits bacterial growth on the contact surface and promotes non-cancer mammalian cell growth with low cell toxicity; meanwhile the growth of cancer cells is significantly inhibited."

According to the news reporters, the research concluded: "Our study will potentially guide PDMS surface modification approaches to produce biomedical devices."

For more information on this research see: Antibacterial and anticancer PDMS surface for mammalian cell growth using the Chinese herb extract paeonol(4-methoxy-2-hydroxyacetophenone). *Scientific Reports*, 2016;6():1-11. *Scientific Reports* can be contacted
New Science Data Have Been Reported by Investigators at University of Claude Bernard (Phosphatidylinositol 3-kinase inhibition restores Ca2+ release defects and prolongs survival in myotubularin-deficient mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science. According to news reporting out of Villeurbanne, France, by NewsRx editors, research stated, "Mutations in the gene encoding the phosphoinositide 3-phosphatase myotubularin (MTM1) are responsible for a pediatric disease of skeletal muscle named myotubular myopathy (XLMTM). Muscle fibers from MTM1-deficient mice present defects in excitation-contraction (EC) coupling likely responsible for the disease-associated fatal muscle weakness."

Our news journalists obtained a quote from the research from the University of Claude Bernard, "However, the mechanism leading to EC coupling failure remains unclear. During normal skeletal muscle EC coupling, transverse (t) tubule depolarization triggers sarcoplasmic reticulum (SR) Ca2+ release through ryanodine receptor channels gated by conformational coupling with the t-tubule voltage-sensing dihydropyridine receptors. We report that MTM1 deficiency is associated with a 60% depression of global SR Ca2+ release over the full range of voltage sensitivity of EC coupling. SR Ca2+ release in the diseased fibers is also slower than in normal fibers, or delayed following voltage activation, consistent with the contribution of Ca2+-gated ryanodine receptors to EC coupling. In addition, we found that SR Ca2+ release is spatially heterogeneous within myotubularin-deficient muscle fibers, with focally defective areas recapitulating the global alterations."

According to the news editors, the research concluded: "Importantly, we found that pharmacological inhibition of phosphatidylinositol 3-kinase (PtdIns 3-kinase) activity rescues the Ca2+ release defects in isolated muscle fibers and increases the lifespan and mobility of XLMTM mice, providing proof of concept for the use of PtdIns 3-kinase inhibitors in myotubular myopathy and suggesting that unbalanced PtdIns 3-kinase activity plays a critical role in the pathological process."

New Science Data Have Been Reported by Researchers at University of Tsukuba (BMP-SMAD-ID promotes reprogramming to pluripotency by inhibiting p16/INK4A-dependent senescence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news originating from Ibaraki, Japan, by NewsRx correspondents, research stated, "Fibrodysplasia ossificans progressiva (FOP) patients carry a missense mutation in ACVR1 [617G > A (R206H)] that leads to hyperactivation of BMP-SMAD signaling. Contrary to a previous study, here we show that FOP fibroblasts showed an increased efficiency of induced pluripotent stem cell (iPSC) generation."

Financial support for this research came from HHS | National Institutes of Health (NIH).

Our news journalists obtained a quote from the research from the University of Tsukuba, "This positive effect was attenuated by inhibitors of BMP-SMAD signaling (Dorsomorphin or LDN1931890) or transducing inhibitory SMADs (SMAD6 or SMAD7). In normal fibroblasts, the efficiency of iPSC generation was enhanced by transducing mutant ACVR1 (617G > A) or SMAD1 or adding BMP4 protein at early times during the reprogramming. In contrast, adding BMP4 at later times decreased iPSC generation. ID genes, transcriptional targets of BMP-SMAD signaling, were critical for iPSC generation. The BMP-SMAD-ID signaling axis suppressed p16/INK4A-mediated cell senescence, a major barrier to reprogramming."

According to the news editors, the research concluded: "These results using patient cells carrying the ACVR1 R206H mutation reveal how cellular signaling and gene expression change during the reprogramming processes."

The news correspondents report that additional information may be obtained from Y.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1073/pnas.1603668113. This DOI is a link to an online electronic document that is either free or for purchase.

New Science Findings Has Been Reported by Investigators at University of Seville (The role of PIM1/PIM2 kinases in tumors of the male reproductive system)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news reporting out of Seville, Spain, by NewsRx editors, research stated, "The PIM family of serine/threonine kinases has three highly conserved isoforms (PIM1, PIM2 and PIM3). PIM proteins are regulated through transcription and stability by JAK/STAT pathways and are overexpressed in hematological malignancies and solid tumors."

Our news journalists obtained a quote from the research from the University of Seville, "The PIM kinases possess weak oncogenic abilities, but enhance other genes or chemical carcinogens to induce tumors. We generated conditional transgenic mice that overexpress PIM1 or PIM2 in male reproductive organs and analyzed their contribution to tumorigenesis. We found an increase in alterations of sexual organs and hyperplasia in the transgenic mice correlating with inflammation. We also found that PIM1/2 are overexpressed in a subset of human male germ cells and prostate tumors correlating with inflammatory features and stem cell markers. Our data suggest that PIM1/2 kinase overexpression is a common feature of male reproductive organs tumors, which provoke tissue alterations and a large inflammatory response that may act synergistically during the process of tumorigenesis."

According to the news editors, the research concluded: "There is also a correlation with markers of cancer stem cells, which may contribute to the therapy resistance found in tumors overexpressing PIM kinases."

For more information on this research see: The role of PIM1/PIM2 kinases in tumors of the male reproductive system. Scientific Reports, 2016;6():1-13. News Science Findings Reported from Johns Hopkins University
(Evolution of cellular morpho-phenotypes in cancer metastasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Science is now available. According to news reporting originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Intratumoral heterogeneity greatly complicates the study of molecular mechanisms driving cancer progression and our ability to predict patient outcomes. Here we have developed an automated high-throughput cell-imaging platform (htCIP) that allows us to extract high-content information about individual cells, including cell morphology, molecular content and local cell density at single-cell resolution."

Our news editors obtained a quote from the research from Johns Hopkins University, "We further develop a comprehensive visually-aided morpho-phenotyping recognition (VAMPIRE) tool to analyze irregular cellular and nuclear shapes in both 2D and 3D microenvironments. VAMPIRE analysis of ~39,000 cells from 13 previously sequenced patient-derived pancreatic cancer samples indicate that metastasized cells present significantly lower heterogeneity than primary tumor cells. We found the same morphological signature for metastasis for a cohort of 10 breast cancer cell lines."

According to the news editors, the research concluded: "We further decipher the relative contributions to heterogeneity from cell cycle, cell-cell contact, cell stochasticity and heritable morphological variations."

For more information on this research see: Evolution of cellular morpho-phenotypes in cancer metastasis. Scientific Reports, 2015;5():18437. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

New Science Findings from Institute of Immunology and Experimental Therapy Outlined (Mammalian Host-Versus-Phage immune response determines phage fate in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science. According to news originating from Wroclaw, Poland, by NewsRx correspondents, research stated, "Emerging bacterial antibiotic resistance draws attention to bacteriophages as a therapeutic alternative to treat bacterial infection. Examples of phage that combat bacteria abound."

Our news journalists obtained a quote from the research from the Institute of Immunology and Experimental Therapy, "However, despite careful testing of antibacterial activity in vitro, failures nevertheless commonly occur. We investigated immunological response of phage antibacterial potency in vivo. Anti-phage activity of phagocytes, antibodies, and serum complement were identified by direct testing and by high-resolution fluorescent microscopy. We accommodated the experimental data into a mathematical model. We propose a universal schema of innate and adaptive immunity impact on phage pharmacokinetics, based on the results of our numerical simulations. We found that the mammalian-host response to infecting bacteria causes the concomitant removal of phage from the system."

According to the news editors, the research concluded: "We propose the notion that this effect as an indirect pathway of phage inhibition by bacteria with significant relevance for the clinical outcome of phage therapy."

For more information on this research see: Mammalian Host-Versus-Phage immune response determines phage fate in vivo. Scientific Reports, 2015;5():14802. (Nature Publishing Group - www.nature.com/srep/)

The news correspondents obtained that additional information may be obtained from K. Hodyra-Stefaniak, Bacteriophage Laboratory, Institute of Immunology and Experimental Therapy, Polish Academy of Sciences, Weigla 12, 53-114 Wroclaw, Poland. New Science Findings from University of Gothenburg Reported (Global analysis of somatic structural genomic alterations and their impact on gene expression in diverse human cancers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science. According to news originating from Gothenburg, Sweden, by NewsRx correspondents, research stated, "The analysis of somatic structural genomic alterations and their impact on gene expression in diverse human cancers is presented.

The news correspondents reported that additional information may be obtained from the University of Gothenburg, Department of Cell Biology, Sweden. Additional authors for this research include S. Persson, J. Larsson, K. Hansson, M. Wahlsten, A. Olofsson, and I. Kalland.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/srep14802. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Sweden, Europe, Gothenburg, Science.

& Wellness Week -- Current study results on Science have been published. According to news reporting originating from Gothenburg, Sweden, by NewsRx correspondents, research stated, "Tumor genomes are mosaics of somatic structural variants (SVs) that may contribute to the activation of oncogenes or inactivation of tumor suppressors, for example, by altering gene copy number amplitude. However, there are multiple other ways in which SVs can modulate transcription, but the general impact of such events on tumor transcriptional output has not been systematically determined."

Our news editors obtained a quote from the research from the University of Gothenburg, "Here we use whole-genome sequencing data to map SVs across 600 tumors and 18 cancers, and investigate the relationship between SVs, copy number alterations (CNAs), and mRNA expression. We find that 34% of CNA breakpoints can be clarified structurally and that most amplifications are due to tandem duplications. We observe frequent swapping of strong and weak promoters in the context of gene fusions, and find that this has a measurable global impact on mRNA levels. Interestingly, several long noncoding RNAs were strongly activated by this mechanism. Additionally, SVs were confirmed in telomere reverse transcriptase (TERT) upstream regions in several cancers, associated with elevated TERT mRNA levels. We also highlight high-confidence gene fusions supported by both genomic and transcriptomic evidence, including a previously undescribed paired box 8 (PAX8)-nuclear factor, erythroid 2 like 2 (NFE2L2) fusion in thyroid carcinoma."

According to the news editors, the research concluded: "In summary, we combine SV, CNA, and expression data to provide insights into the structural basis of CNAs as well as the impact of SVs on gene expression in tumors."

The news editors report that additional information may be obtained by contacting E. Larsson, University of Gothenburg, Dept. of Med Biochem & Cell Biol, Inst Biomed, Sahlgrenska Academy, SE-40530 Gothenburg, Sweden. Additional authors for this research include J. Bhadury, J.W. Karlsson, J.A. Nilsson and E. Larsson.

Science

New Science Study Findings Have Been Reported by Investigators at Institute of Animal Science (Co-expression analysis and identification of fecundity-related long non-coding RNAs in sheep ovaries)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Science. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Small Tail Han sheep, including the FecB(B)FecB(B) (Han BB) and FecB(+) FecB(+) (Han++) genotypes, and Dorset sheep exhibit different fecundities. To identify novel long non-coding RNAs (lncRNAs) associated with sheep fecundity to better understand their molecular mechanisms, a genome-wide analysis of mRNAs and lncRNAs from Han BB, Han++ and Dorset sheep was performed."

Our news editors obtained a quote from the research from the Institute of Animal Science, "After the identification of differentially expressed mRNAs and IncRNAs, 16 significant modules were explored by using weighted gene coexpression network analysis (WGCNA) followed by functional enrichment analysis of the genes and lncRNAs in significant modules. Among these selected modules, the yellow and brown modules were significantly related to sheep fecundity. lncRNAs (e.g., NR0B1, XLOC_041882, and MYH15) in the yellow module were mainly involved in the TGF-beta signalling pathway, and NYAP1 and BCORL1 were significantly associated with the oxytocin signalling pathway, which regulates several genes in the coexpression network of the brown module. Overall, we identified several gene modules associated with sheep fecundity, as well as networks consisting of hub genes and IncRNAs that may contribute to sheep prolificacy by regulating the target mRNAs related to the TGF-beta and oxytocin signalling pathways."

According to the news editors, the research concluded: "This study provides an alternative strategy for the identification of potential candidate regulatory IncRNAs."

For more information on this research see: Co-expression analysis and identification of fecundity-related long non-coding RNAs in sheep ovaries. Scientific Reports, 2016;6():1-10. New Science Study Findings Have Been Reported by Researchers at Ulsan National Institute of Science and Technology (Cell Nucleus-Targeting Zwitterionic Carbon Dots)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news originating from Ulsan, South Korea, by NewsRx correspondents, research stated, "An innovative nucleus-targeting zwitterionic carbon dot (CD) vehicle has been developed for anticancer drug delivery and optical monitoring. The zwitterionic functional groups of the CDs introduced by a simple one-step synthesis using b-alanine as a passivating and zwitterionic ligand allow cytoplasmic uptake and subsequent nuclear translocation of the CDs."

Our news journalists obtained a quote from the research from the Ulsan National Institute of Science and Technology, "Moreover, multicolor fluorescence improves the accuracy of the CDs as an optical code. The CD-based drug delivery system constructed by non-covalent grafting of doxorubicin, exhibits superior antitumor efficacy owing to enhanced nuclear delivery in vitro and tumor accumulation in vivo, resulting in highly effective tumor growth inhibition."

According to the news editors, the research concluded: "Since the zwitterionic CDs are highly biocompatible and effectively translocated into the nucleus, it provides a compelling solution to a multifunctional nanoparticle for substantially enhanced nuclear uptake of drugs and optical monitoring of translocation."

For more information on this research see: Cell Nucleus-Targeting Zwitterionic Carbon Dots. *Scientific Reports*, 2015;5():18807. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from Y.K. Jung, Dept. of Chemistry, Ulsan National Institute of Science and Technology (UNIST), UNIST-gil 50, Ulsan 689-798, South Korea. Additional authors for this research include E. Shin and B.S Kim.

New Science Study Findings Recently Were Reported by Researchers at Johns Hopkins University (Evaluating the evaluation of cancer driver genes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Science is the subject of a report. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Sequencing has identified millions of somatic mutations in human cancers, but distinguishing cancer driver
genes remains a major challenge. Numerous methods have been developed to identify driver genes, but evaluation of the performance of these methods is hindered by the lack of a gold standard, that is, bona fide driver gene mutations."

Financial support for this research came from HHS | NIH | National Cancer Institute (NCI).

Our news journalists obtained a quote from the research from Johns Hopkins University, "Here, we establish an evaluation framework that can be applied to driver gene prediction methods. We used this framework to compare the performance of eight such methods. One of these methods, described here, incorporated a machine-learning-based ratiometric approach. We show that the driver genes predicted by each of the eight methods vary widely. Moreover, the P values reported by several of the methods were inconsistent with the uniform values expected, thus calling into question the assumptions that were used to generate them. Finally, we evaluated the potential effects of unexplained variability in mutation rates on false-positive driver gene predictions."

According to the news editors, the research concluded: "Our analysis points to the strengths and weaknesses of each of the currently available methods and offers guidance for improving them in the future."

The news correspondents report that additional information may be obtained from B. Vogelstein, Johns Hopkins Med Inst, Howard Hughes Med Inst, Baltimore, MD 21231, United States. Additional authors for this research include N. Papadopoulos, K.W. Kinzler, B. Vogelstein and R. Karchin.

disorders including muscular dystrophies. Although a few research groups have used them for skeletal muscle differentiation, most were based on gene over-expression or long-term mesenchymal differentiation and retrospective identification of myogenic cells."

Our news editors obtained a quote from the research from the University of Texas Health Science Center, "Therefore, this study was aimed to generate a knock-in reporter human iPS cell line for MYF5, as an early myogenic specification gene, to allow prospective identification and purification of myogenic progenitors from human iPS cells. By using a CRISPR/Cas9 double nickase strategy, a 2A-GFP reporter was inserted before the stop codon of the MYF5 gene using homologous recombination. This approach allowed for highly efficient in-frame targeting of MYF5 in human iPS cells. Furthermore, in order to prove the reporter function, endogenous MYF5 expression was induced using a novel dead Cas9-VP160 transcriptional activator. Induced clones demonstrated appropriate MYF5-GFP co-expression. Finally, to confirm the differentiation potential, reporter human iPS clones were differentiated through embryoid body method and MYF5-GFP(+) myogenic cells were sorted and characterized."

According to the news editors, the research concluded: "These data provides valuable guidelines for generation of knock-in reporter human iPS cell lines for myogenic genes which can be used for disease modeling, drug screening, gene correction and future in vivo applications."

For more information on this research see: Generation and Characterization of a MYF5 Reporter Human iPSC Cell Line Using CRISPR/Cas9 Mediated Homologous Recombination. Scientific Reports, 2016;6():18759. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting J. Wu, Center for Stem Cell and Regenerative Medicine (CSCRM), Brown Foundation Institute of Molecular Medicine (IMM), University of Texas Health Science Center at Houston, Houston, TX 77030, United States. Science

New Science Study Results from Beijing Normal University Described
(Applicability of drinking water treatment residue for lake restoration in relation to metal/metalloid risk assessment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science have been published. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Drinking water treatment residue (DWTR), a byproduct generated during potable water production, exhibits a high potential for recycling to control eutrophication.
However, this beneficial recycling is hampered by unclear metal/metalloid pollution risks related to DWTR."

Our news editors obtained a quote from the research from Beijing Normal University, "In this study, the pollution risks of Al, As, Ba, Be, Cd, Co, Cr, Cu, Fe, Mn, Mo, Ni, Pb, and Zn due to DWTR application were first evaluated for lake water based on human health risk assessment models and comparison of regulatory standards. The risks of DWTR were also evaluated for sediments on the basis of toxicity characteristics leaching procedure and fractionation in relation to risk assessment code. Variations in the biological behaviors of metal/metalloid in sediments caused by DWTR were assessed using Chironomus plumosus larvae and Hydrilla verticillata. Kinetic luminescent bacteria test (using Aliivibrio fischeri) was conducted to analyze the possibility of acute and chronic detrimental effects of sediment with DWTR application. According to the obtained results, we identify a potential undesirable effect of DWTR related to Fe and Mn (typically under anaerobic conditions); roughly present a dosage threshold calculation model; and recommend a procedure for DWTR prescreening to ensure safe application."

According to the news editors, the research concluded: "Overall, managed DWTR application is necessary for successful eutrophication control."

The news editors report that additional information may be obtained by contacting C.H. Wang, Beijing Normal University, Sch Environm, Key Lab Water & Sediment Sci, Minist Educ, Beijing 100875, People's Republic of China. Additional authors for this research include C.H. Wang, Y.S. Pei and H.L. Jiang.

Proteins - Scleroproteins

New Scleroproteins Findings from University of Oslo Reported (The effect of culture medium and carrier on explant culture of human limbal epithelium: A comparison of ultrastructure, keratin profile and gene expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - Scleroproteins have been published. According to news reporting originating from Oslo, Norway, by NewsRx correspondents, research stated, "Patients with limbal stem cell deficiency (LSCD) often experience pain and photophobia due to recurrent epithelial defects and chronic inflammation of the cornea. Successfully restoring a healthy corneal surface in these patients by transplantation of ex vivo expanded human limbal epithelial cells (LECs) may alleviate these symptoms and significantly improve their quality of life."

Funders for this research include Norwegian Financial Mechanism, Ministry of
Our news editors obtained a quote from the research from the University of Oslo, "The clinical outcome of transplantation is known to be influenced by the quality of transplanted cells. Presently, several different protocols for cultivation and transplantation of LECs are in use. However, no consensus on an optimal protocol exists. The aim of this study was to examine the effect of culture medium and carrier on the morphology, staining of selected keratins and global gene expression in ex vivo cultured LECs. Limbal biopsies from cadaveric donors were cultured for three weeks on human amniotic membrane (HAM) or on tissue culture coated plastic (PL) in either a complex medium (COM), containing recombinant growth factors, hormones, cholera toxin and fetal bovine serum, or in medium supplemented only with human serum (HS). The expanded LECs were examined by light microscopy (LM), transmission electron microscopy (TEM), immunohistochemistry (IHC) for keratins K3, K7, K8, K12, K13, K14, K15 and K19, as well as microarray and qRT-PCR analysis. The cultured LECs exhibited similar morphology and keratin staining on LM, TEM and IHC examination, regardless of the culture condition. The epithelium was multilayered, with cuboidal basal cells and flattened superficial cells. Cells were attached to each other by desmosomes. Adhesion complexes were observed between basal cells and the underlying carrier in LECs cultured on HAM, but not in LECs cultured on PL. GeneChip Human Gene 2.0 ST microarray (Affymetrix) analysis revealed that 18,653 transcripts were >= 2 fold up or downregulated (p <= 0.05). Cells cultured in the same medium (COM or HS) showed more similarities in gene expression than cells cultured on the same carrier (HAM or PL). When each condition was compared to HAM/COM, no statistical difference was found in the transcription level of the selected genes associated with keratin expression, stemness, proliferation, differentiation, apoptosis, corneal wound healing or autophagy."

According to the news editors, the research concluded: "The results indicate that ex vivo cultures of LECs on HAM and PL, using culture media supplemented with COM or HS, yield tissues with similar morphology and keratin staining. The gene expression appears to be more similar in cells cultured in the same medium (COM or HS) compared to cells cultured on the same carrier (HAM or PL)."

The news editors report that additional information may be obtained by contacting M. Pathak, University of Oslo, Oslo, Norway. Additional authors for this research include O.K. Olstad, L. Drolsum, M.C. Moe, N. Smorodinova, S. Kalasova, K. Jirsova, B. Nicolaissen and A. Noer.

New Sclerotherapy Study Results Reported from Children's Hospital (A Vulvovaginal Mass in a 16-Year-Old Adolescent: A Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Sclerotherapy. According to news reporting originating from Miami, Florida, by NewsRx correspondents, research stated, "Vulvar varicosities might be misdiagnosed as vulvar venous malformations in the prepubertal or pubertal age. If seen isolated, they can mimic other masses that are usually seen in this anatomic area like a hernia or a cyst."

Our news editors obtained a quote from the research from Children's Hospital, "Depending on the associated symptoms and clinical findings, imaging modalities investigate the nature of such a mass and might provide a therapeutic alternative besides surgery. We report a case of an isolated asymptomatic vulvar varicosity in a 16-year-old adolescent. A pelvic ultrasound followed by a Doppler and a magnetic resonance imaging scan confirmed the diagnosis. We used guided direct sclerotherapy for successful treatment. Summary and Conclusion: Optimal management and outcome are assured using a multidisciplinary approach."

According to the news editors, the research concluded: "Guided sclerotherapy provides a safe, effective, and minimally invasive procedure to treat vulvar varicosities."

The news editors report that additional information may be obtained by contacting J. Naous, Nicklaus Childrens Hosp, Div Adolescent Med, Miami, FL 33155, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jpag.2015.09.003. This DOI is a link to an online electronic document that is either free or for purchase.

Blood Diseases and Conditions - Sepsis

New Sepsis Findings from G. Rolando and Co-Researchers Described (Prognostic value of ventricular diastolic dysfunction in patients with severe sepsis and septic shock)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Blood Diseases and Conditions - Sepsis. According to news originating from Buenos Aires, Argentina, by NewsRx correspondents, research stated, "To evaluate the prevalence of myocardial dysfunction and its prognostic value in patients with severe sepsis and septic shock. Adult septic patients admitted
to an intensive care unit were prospectively studied using transthoracic echocardiography within
the first 48 hours after admission and thereafter on the 7th-10th days."

Our news journalists obtained a quote from the research, "Echocardiographic
variables of biventricular function, including the E/e' ratio, were compared between survivors
and non-survivors. A total of 99 echocardiograms (53 at admission and 46 between days 7 -10)
were performed on 53 patients with a mean age of 74 (SD 13) years. Systolic and diastolic
dysfunction was present in 14 (26%) and 42 (83%) patients, respectively, and both types of
dysfunction were present in 12 (23%) patients. The E/e' ratio, an index of diastolic dysfunction,
was the best predictor of hospital mortality according to the area under the ROC curve (0.71)
and was an independent predictor of outcome, as determined by multivariate analysis (OR=1.36
[1.05 -1.76], p=0.02). In septic patients admitted to an intensive care unit, echocardiographic
systolic dysfunction is not associated with increased mortality."

According to the news editors, the research concluded: "In contrast, diastolic
dysfunction is an independent predictor of outcome."

For more information on this research see: Prognostic value of ventricular diastolic
dysfunction in patients with severe sepsis and septic shock, *Revista Brasileira De Terapia

The news correspondents report that additional information may be obtained from G.
Rolando, Instituto Medico de Alta Complejidad, Buenos Aires, Argentina. Additional authors

**Blood Diseases and Conditions - Sepsis**

**New Sepsis Study Findings Have Been Reported by Researchers at Loyola University (Modulation of Interleukins in Sepsis-Associated Clotting Disorders: Interplay With Hemostatic Derangement)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Blood Diseases and Conditions - Sepsis are discussed in a new report. According to news reporting originating in Maywood, Illinois, by NewsRx journalists, research stated, "Interleukins play a central role in the immune system and are
involved in a variety of immunological, inflammatory, and infectious disease states including
sepsis syndrome. Levels of interleukins may correlate with overall survival and may directly or
indirectly affect some of the regulators of coagulation and fibrinolysis, thereby disrupting
hemostasis and thrombosis."

The news reporters obtained a quote from the research from Loyola University, "Our
hypothesis is that in sepsis-associated coagulopathies (SACs), interleukins may be upregulated,
leading to hemostatic imbalance by generating thrombogenic mediators. We profiled the levels
of interleukins IL-1, IL-1, IL-2, IL-4, IL-6, IL-8, and IL-10 in addition to d-dimer (DD) in patients with SAC and in normal donors. We observed the highest increase in interleukins IL-6 (322-fold), IL-8 (48-fold), IL-10 (72-fold), and DD (18-fold).

According to the news reporters, the research concluded: "This suggests that interleukins such as IL-6 and IL-10 have a close association with coagulopathy and fibrinolytic dysregulation in sepsis and can be considered as candidates for potential therapeutic targets in SAC."

Our news correspondents report that additional information may be obtained by contacting J. Fareed, Loyola University, Medical Center, Dept. of Pathol & Pharmacol, Maywood, IL 60153, United States. Additional authors for this research include D. Syed, D. Khan, S. Tetik, A. Walborn, D. Hoppensteadt, M. Mosier and J. Fareed.

Oncology - Serous Carcinoma

New Serous Carcinoma Data Have Been Reported by Researchers at Cleveland Clinic (Racial disparity in survival of patients with uterine serous carcinoma: Changes in clinical characteristics, patterns of care and outcomes over time from 1988 to ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Serous Carcinoma. According to news reporting originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "To determine if the disparities in the outcome between white (W) and African American (AA) patients with uterine serous carcinoma (USC) have changed over time. Women with USC were identified using the SEER database from 1988 to 2011 (N = 7667)."

Our news editors obtained a quote from the research from Cleveland Clinic, "Years of the study were divided into three periods (1988-1997,1998-2004 and 2005-2011). Overall (OS) and disease specific survivals (DSS) was estimated. Over the three time periods, African American patients continued to be younger and less likely to have cancer directed surgery and extensive lymphadenectomy when compared to white patients. In multi variable analysis adjusting for age, race, marital status, stage, cancer-directed surgery, extent of lymphadenectomy, adjuvant radiation, and geographic location, AA was significantly associated with worse DSS and OS in the three time periods compared to white race. African American patients were 29% (95% CI 1.03-1.62, p = 0.027) in 1988-1997, 40% in 1998-2004 (95% CI
1.21-1.63, p< 0.0001) and 34% in 2005-2011 (95% CI 1.13-1.59, p = 0.0008) more likely to die from uterine cancer compared to their white counterparts. A slight improvement in the difference in OS over time was noted comparing African American and white patients. African American patients were 46% (95% CI 1.23-1.73, p< 0.0001) in 1988-1997, 39% in 1998-2004 (95% CI 1.23-1.56, p< 0.0001) and 26% in 2005-2011 (95% CI 1.10-1.45, p< 0.0001) more likely to die from any cause compared to their white counterparts. Significant improvement in outcome was noted in both racial groups over time."

According to the news editors, the research concluded: "However, African American patients continued to have worse outcome than white patients over time."

For more information on this research see: Racial disparity in survival of patients with uterine serous carcinoma: Changes in clinical characteristics, patterns of care and outcomes over time from 1988 to 2011. Gynecologic Oncology, 2016;143(2):334-345. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Gynecologic Oncology - www.journals.elsevier.com/gynecologic-oncology/)

The news editors report that additional information may be obtained by contacting H. Mahdi, Cleveland Clinic, Div Gynecol Oncol, Ob Gyn & Womens Hlth Inst, Cleveland, OH 44106, United States. Additional authors for this research include X.Z. Han, F. Abdul-Karim and R. Vargas.

New Severe Combined Immunodeficiency Findings from University of Colorado Described (Single-Dose Primaquine in a Preclinical Model of Glucose-6-Phosphate Dehydrogenase Deficiency: Implications for Use in Malaria Transmission-Blocking Programs)

New Severe Combined Immunodeficiency Findings from University of Colorado Described (Single-Dose Primaquine in a Preclinical Model of Glucose-6-Phosphate Dehydrogenase Deficiency: Implications for Use in Malaria Transmission-Blocking Programs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - Severe Combined Immunodeficiency have been published. According to news reporting out of Denver, Colorado, by NewsRx editors, research stated, "Individuals with glucose-6-phosphate dehydrogenase (G6PD) deficiency (G6PDd) are at risk for developing hemolytic anemia when given the antimalarial drug primaquine (PQ). The WHO Evidence Review Group released a report suggesting that mass administration of a single dose of PQ at 0.25 mg of base/kg of body weight (mpk) (mouse equivalent of 3.125 mpk) could potentially reduce malaria transmission based on its gametocytocidal activity and could be safely administered to G6PD-deficient individuals, but there are limited safety data available confirming the optimum single dose of PQ."

Financial supporters for this research include Medicines for Malaria Venture
Our news journalists obtained a quote from the research from the University of Colorado, "A single-dose administration of PQ was therefore assessed in our huRBC-SCID mouse model used to predict hemolytic toxicity with respect to G6PD deficiency. In this model, nonobese diabetic (NOD)/SCID mice are engrafted with human red blood cells (huRBC) from donors with the African or Mediterranean variant of G6PD (A-G6PDd or Med-G6PDd, respectively) and demonstrate dose-dependent sensitivity to PQ. In mice engrafted with A-G6PD-deficient huRBC, single-dose PQ at 3.125, 6.25, or 12.5 mpk had no significant loss of huRBC compared to the vehicle control group. In contrast, in mice engrafted with Med-G6PDd huRBC, a single dose of PQ at 3.125, 6.25, or 12.5 mpk resulted in a significant, dose-dependent loss of huRBC compared to the vehicle control group."

According to the news editors, the research concluded: "Our data suggest that administration of a single low dose of 0.25 mpk of PQ could induce hemolytic anemia in MedG6PDd individuals but that use of single-dose PQ at 0.25 mpk as a gametocytocidal drug to block transmission would be safe in areas where A-G6PDd predominates."

**New Short Bowel Syndrome Study Findings Recently Were Reported by Researchers at Children’s Hospital (Liver steatosis induced by small bowel resection is prevented by oral vancomycin)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Digestive System Diseases and Conditions - Short Bowel Syndrome are discussed in a new report. According to news reporting out of St. Louis,
Missouri, by NewsRx editors, research stated, "Intestinal failure associated liver disease causes significant mortality in patients with short bowel syndrome. Steatosis, a major component of intestinal failure associated liver disease has been shown to persist even after weaning from parenteral nutrition."

Our news journalists obtained a quote from the research from Children's Hospital, "We sought to determine whether steatosis occurs in our murine model of short bowel syndrome and whether steatosis was affected by manipulation of the intestinal microbiome. Male C57BL6 mice underwent 50% small bowel resection and orogastric gavage with vancomycin or vehicle for 10 weeks. DNA was extracted from stool samples then sequenced using 16s rRNA. Liver lipid content was analyzed. Bile acids were measured in liver and stool. Compared with unoperated mice, small bowel resection resulted in significant changes in the fecal microbiome and was associated with a>25-fold increase in steatosis. Oral vancomycin profoundly altered the gut microbiome and was associated with a 15-fold reduction in hepatic lipid content after resection. There was a 17-fold reduction in fecal secondary bile acids after vancomycin treatment. Massive small bowel resection in mice is associated with development of steatosis and prevented by oral vancomycin."

According to the news editors, the research concluded: "These findings implicate a critical role for gut bacteria in intestinal failure associated liver disease pathogenesis and illuminate a novel, operative model for future investigation into this important morbidity."

For more information on this research see: Liver steatosis induced by small bowel resection is prevented by oral vancomycin. Surgery, 2016;160(6):1485-1495. Surgery can be contacted at: Mosby-Elsevier, 360 Park Avenue South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Surgery - www.journals.elsevier.com/surgery/)

China, by NewsRx journalists, research stated, "Primary Sjögren's syndrome (pSS) is a complex autoimmune disorder. So far, genetic research in pSS has lagged far behind and the underlying biological mechanism is unclear."

The news reporters obtained a quote from the research from the Institute of Psychology, "Further exploring existing genome-wide association study (GWAS) data is urgently expected to uncover disease-related gene combination patterns. Herein, we conducted a network-based analysis by integrating pSS GWAS in Han Chinese with a protein-protein interactions network to identify pSS candidate genes. After module detection and evaluation, 8 dense modules covering 40 genes were obtained for further functional annotation. Additional 31 MHC genes with significant gene-level P-values (sigMHC-gene) were also remained. The combined module genes and sigMHC-genes, a total of 71 genes, were denoted as pSS candidate genes. Of these pSS candidates, 14 genes had been reported to be associated with any of pSS, RA, and SLE, including STAT4, GTF2I, HLA-DPB1, HLA-DRB1, PTTG1, HLA-DQB1, MBL2, TAP2, CFLAR, NF-kBIE, HLA-DRA, APOM, HLA-DQA2 and NOTCH4. This is the first report of the network-assisted analysis for pSS GWAS data to explore combined gene patterns associated with pSS."

According to the news reporters, the research concluded: "Our study suggests that network-assisted analysis is a useful approach to gaining further insights into the biology of associated genes and providing important clues for future research into pSS etiology."

For more information on this research see: Network-assisted analysis of primary Sjögren's syndrome GWAS data in Han Chinese. *Scientific Reports*, 2015;5():18855. (Nature Publishing Group - www.nature.com; Scientific Reports - www.nature.com/srep)

Oncology - Skin Cancer

New Skin Cancer Data Have Been Reported by Researchers at Cancer Center (The European Status Quo in legal recognition and patient-care services of occupational skin cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Skin Cancer is now available. According to news reporting originating from Berlin, Germany, by NewsRx correspondents, research stated, "Skin cancer is the most common malignancy in Caucasian populations worldwide and ultraviolet radiation (UVR) is known for being the number one carcinogen. As, especially in outdoor workers, UVR is an inevitable carcinogen, the prevention and management of UVR-related skin cancers in these at-risk populations represent a collective challenge for
Our news editors obtained a quote from the research from Cancer Center, "To provide an overview on the current regulations on the acknowledgement and management of work-related skin cancer in 11 European countries. Dermatologists from 11 countries networking within the EU Horizon 2020 COST Action TD1206 'StanDerm' contributed to a standardized survey regarding current national regulations, implemented for the recognition, prevention and management as well as possible compensation regulations in their individual country of residence. Ten of 11 participating countries in this survey reported the existence of an established programme available on certain occupational diseases; work-related skin diseases were only specifically recognized in eight countries. Seven of 11 countries recognize cutaneous squamous cell carcinoma in outdoor workers as 'occupational skin cancer'. Basal cell carcinoma (6 of 11), actinic keratosis (5 of 11), Bowen's disease (5 of 11) and malignant melanoma (5 of 11) are not as regularly approved as potentially 'work-induced'. Only a few of the countries included into this survey established a general documentation system (national registry) on occupational skin diseases. So far, representatives of only three countries of this survey referred to a specific established national programme for the prevention, management or compensation of occupational skin cancers acquired during work-related UVR exposure. This survey highlights the need for mandatory regulations on the prevention, management and potential compensation of work-related UV-induced skin cancer across Europe. Against the background of a joint European domestic market, equal standards of occupational safety across Europe should include binding regulations for the protection and management of work-related skin cancer."

According to the news editors, the research concluded: "The design of a common regulation to meet the increasing incidence of skin cancers in outdoor workers should become part of the European agenda, ensuring equal working and living conditions in the member states."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jdv.13609. This DOI is a link to an online electronic document that is either free or for purchase.

Skin Diseases

New Skin Diseases Findings from Yale University Described (The X-Ray Crystal Structure of the Keratin 1-Keratin 10 Helix 2B Heterodimer Reveals Molecular Surface Properties and Biochemical Insights into Human Skin Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Skin Diseases. According to news reporting out of New Haven, Connecticut, by NewsRx editors, research stated, "Keratins 1 (K1) and 10 (K10) are the primary keratins expressed in differentiated epidermis. Mutations in K1/K10 are associated with human skin diseases."

Our news journalists obtained a quote from the research from Yale University, "We determined the crystal structure of the complex between the distal (2B) helices of K1 and K10 to better understand how human keratin structure correlates with function. The 3.3 angstrom resolution structure confirms many features inferred by previous biochemical analyses, but adds unexpected insights. It demonstrates a parallel, coiled-coil heterodimer with a predominantly hydrophobic intermolecular interface; this heterodimer formed a higher order complex with a second K1-K10-2B heterodimer via a Cys401(K10) disulfide link, although the bond angle is unanticipated. The molecular surface analysis of K1-K10-2B identified several pockets, one adjacent to the disulfide linkage and conserved in K5-K14. The solvent accessible surface area of the K1-K10 structure is 20-25% hydrophobic. The 2B region contains mixed acidic and basic patches proximally (N-terminal), whereas it is largely acidic distally (C-terminal). Mapping of conserved and nonconserved residues between K1-K10 and K5-K14 onto the structure demonstrated the majority of unique residues align along the outer helical ridge."

According to the news editors, the research concluded: "Finally, the structure permitted a fresh analysis of the deleterious effects caused by K1/K10 missense mutations found in patients with phenotypic skin disease."

Our news journalists report that additional information may be obtained by contacting C.G. Bunick, Yale University, Dept. of Dermatol, New Haven, CT 06520, United States.

New Small Interference RNAs (siRNAs) Data Have Been Reported by Researchers at National University (NON-VIRAL XYLOSYLTRANSFERASE-1 siRNA DELIVERY AS AN EFFECTIVE ALTERNATIVE TO CHONDROITINASE IN AN IN VITRO MODEL OF REACTIVE ASTROCYTES)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Small Interference RNAs (siRNAs) are discussed in a new report. According to news originating from Galway, Ireland, by NewsRx correspondents, research stated, "Reactive astrocitosis and the subsequent glial scar is ubiquitous to injuries of the central nervous system, especially spinal cord injury (SCI) and primarily serves to protect against further damage, but is also a prominent inhibitor of regeneration. Manipulating the glial scar by targeting chondroitin sulfate proteoglycans (CSPGs) has been the focus of much study as a means to improve axon regeneration and subsequently functional recovery."

Financial support for this research came from Science Foundation Ireland.

Our news journalists obtained a quote from the research from National University, "In this study we investigate the ability of small interfering RNA (siRNA) delivered by a non-viral polymer vector to silence the rate limiting enzyme involved in CSPG synthesis. Gene expression of this enzyme, xylosyltransferase-1, was silenced by 65% in Neu7 astrocytes which conferred a reduced expression of CSPGs. Furthermore, conditioned medium taken from treated Neu7s, or co-culture experiments with dorsal root ganglia (DRG) showed that siRNA treatment resulted in a more permissive environment for DRG neurite outgrowth than treatment with chondroitinase ABC alone."

According to the news editors, the research concluded: "These results indicate that there is a role for targeted siRNA therapy using polymeric vectors to facilitate regeneration of injured axons following central nervous system injury."

For more information on this research see: NON-VIRAL XYLOSYLTRANSFERASE-1 siRNA DELIVERY AS AN EFFECTIVE ALTERNATIVE TO CHONDROITINASE IN AN IN VITRO MODEL OF REACTIVE ASTROCYTES. Neuroscience, 2016;339():267-275. Neuroscience can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. Small Interference RNAs (siRNAs)

New Small Interference RNAs (siRNAs) Study Findings Reported from Institute of Obstetrics and Gynecology (CXCR4-targeted modular peptide carriers for efficient anti-VEGF siRNA delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Small Interference RNAs (siRNAs) have been published. According to news reporting originating from St. Petersburg, Russia, by NewsRx correspondents, research stated, "The application of small interfering RNA (siRNA) for specific gene inhibition is a promising strategy in gene therapy treatments. The efficient cellular delivery of therapeutic siRNA is a critical step in RNA interference (RNAi) application."

Funders for this research include Russian Science Foundation, Russian Foundation for Basic Research, President of Russian Federation scholarship.

Our news editors obtained a quote from the research from the Institute of Obstetrics and Gynecology, "Highly efficient siRNA carriers should be developed for specific cellular uptake, stable RNA-complexes formation and intracellular RNA release. To study these features, we evaluated modular peptide carriers bearing CXCR4 targeting ligand for their ability to condense siRNA, facilitate endosomal escape and VEGFA gene silencing in CXCR4-expressing endothelial and glioblastoma cells. Peptide carriers were shown to condense and protect siRNA from RNase degradation. Various N/P ratios were used for physicochemical characterization to optimize siRNA/peptide complexes for in vitro studies. On average, cytotoxicity of siRNA-polyplexes depended on cell type and was not higher than that of PEI/siRNA complexes. VEGFA gene knockdown was significantly improved with CXCR4-targeted carriers in contrast to nontargeted peptides. siRNA delivery by means of ligandconjugated carriers resulted in 2.5-3-fold decrease of VEGF expression in glioblastoma cells and in 1.5-2-fold decrease of VEGF expression in endothelial cells. Delivery of siRNA/polyplexes resulted in 2-6-fold decrease in VEGF protein yield and in significant inhibition of endothelial cells migration."

According to the news editors, the research concluded: "The study shows that implication of peptide carriers modified with CXCR4 ligand is a promising approach to develop targeted siRNA delivery system into CXCR4-expressing cancer and endothelial cells."

The news editors report that additional information may be obtained by contacting A. Kiselev, DO Ott Res Inst Obstet Gynecol & Reproductol, St Petersburg 199034, Russia. Additional authors for this research include A. Shubina, D. Sokolov, S. Selkov, V. Baranov and A. Kiselev.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.049. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Solid Cancer**

**New Solid Cancer Findings Reported from R. Bahleda and Co-Authors** *(Phase I study of afatinib combined with nintedanib in patients with advanced solid tumours)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Solid Cancer. According to news reporting originating in Villejuif, France, by NewsRx journalists, research stated, "This Phase I study evaluated continuous-and intermittent-dosing (every other week) of afatinib plus nintedanib in patients with advanced solid tumours. In the dose-escalation phase (n=45), maximum tolerated doses (MTDs) were determined for continuous/intermittent afatinib 10, 20, 30 or 40 mg once daily plus continuous nintedanib 150 or 200 mg twice daily."

The news reporters obtained a quote from the research, "Secondary objectives included safety and efficacy. Clinical activity of continuous afatinib plus nintedanib at the MTD was further evaluated in an expansion phase (n=25). The most frequent dose-limiting toxicities were diarrhoea (11%) and transaminase elevations (7%). Maximum tolerated doses were afatinib 30 mg continuously plus nintedanib 150 mg, and afatinib 40 mg intermittently plus nintedanib 150 mg. Treatment-related adverse events (mostly Grade≤3) included diarrhoea (98%), asthenia (64%), nausea (62%) and vomiting (60%). In the dose-escalation phase, two patients had partial responses (PRs) and 27 (60%) had stable disease (SD). In the expansion phase, one complete response and three PRs were observed (all non-small cell lung cancer), with SD in 13 (52%) patients. No pharmacokinetic interactions were observed. MTDs of continuous or intermittent afatinib plus nintedanib demonstrated a manageable safety profile with proactive management of diarrhoea."

According to the news reporters, the research concluded: "Antitumour activity was observed in patients with solid tumours."

Our news correspondents report that additional information may be obtained by contacting R. Bahleda, Drug Development Department, Gustave Roussy, 114 Rue Edouard Vaillant, 94805 Villejuif Cedex, France. Additional authors for this research include A. Hollebecque, A. Varga, A. Gazzah, C. Massard, E. Deutsch, N. Amellal, F. Farace, M. Ould-Kaci, F. Roux, K. Marzin and J.C Soria.

Spermatozoa

New Spermatozoa Study Results Reported from University of Texas (The regulatory repertoire of PLZF and SALL4 in undifferentiated spermatogonia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Spermatozoa have been published. According to news reporting originating from San Antonio, Texas, by NewsRx correspondents, research stated, "Spermatogonial stem cells (SSCs) maintain spermatogenesis throughout adulthood through balanced self-renewal and differentiation, yet the regulatory logic of these fate decisions is poorly understood. The transcription factors Sal-like 4 (SALL4) and promyelocytic leukemia zinc finger (PLZF; also known as ZBTB16) are known to be required for normal SSC function, but their targets are largely unknown."

Financial supporters for this research include National Science Foundation, National Institutes of Health, Max and Minnie Tomerlin Voelcker Fund, Helen Freeborn Kerr Charitable Foundation, University of Texas at San Antonio.

Our news editors obtained a quote from the research from the University of Texas, "ChIP-seq in mouse THY1+ spermatogonia identified 4176 PLZF-bound and 2696 SALL4-bound genes, including 1149 and 515 that were unique to each factor, respectively, and 1295 that were bound by both factors. PLZF and SALL4 preferentially bound gene promoters and introns, respectively. Motif analyses identified putative PLZF and SALL4 binding sequences, but rarely both at shared sites, indicating significant non-autonomous binding in any given cell. Indeed, the majority of PLZF/SALL4 shared sites contained only PLZF motifs. SALL4 also bound gene introns at sites containing motifs for the differentiation factor DMRT1. Moreover, mRNA levels for both unique and shared target genes involved in both SSC self-renewal and differentiation were suppressed following SALL4 or PLZF knockdown."

According to the news editors, the research concluded: "Together, these data reveal the full profile of PLZF and SALL4 regulatory targets in undifferentiated spermatogonia, including SSCs, which will help elucidate mechanisms controlling the earliest cell fate decisions in spermatogenesis."

The news editors report that additional information may be obtained by contacting B.P. Hermann, Univ Texas San Antonio, Dept. of Biol, San Antonio, TX 78249, United States. Additional authors for this research include Z. Gao, K. Mutoji, Y.C. Song, J.H. Ruan and B.P. Hermann.

The direct object identifier (DOI) for that additional information is:
http://dx.doi.org/10.1242/dev.132761. This DOI is a link to an online electronic document that is either free or for purchase.

Musculoskeletal Diseases and Conditions - Spinal...

New Spinal Stenosis Study Findings Recently Were Reported by Researchers at Tianjin Medical University General Hospital (MicroRNA-221 Regulates Hypertrophy of Ligamentum Flavum in Lumbar Spinal Stenosis by Targeting TIMP-2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Musculoskeletal Diseases and Conditions - Spinal Stenosis are presented in a new report. According to news reporting from Tianjin, People's Republic of China, by NewsRx journalists, research stated, "A study of lumbar ligamentum flavum (LF). The aim of this study was to identify LF hypertrophy related microRNAs (miRNAs) expression profile and to investigate the role of miRNAs in the development of LF hypertrophy in lumbar spinal stenosis (LSS)."

The news correspondents obtained a quote from the research from Tianjin Medical University General Hospital, "Although histologic and biologic literature on LF hypertrophy is available, the pathomechanism is still unknown. Accumulating evidence suggests that microRNAs (miRNAs) participate in many physiologic processes, including cell proliferation, differentiation, and fibrosis, but the role of specific miRNAs involved in LF hypertrophy remains elusive. An initial screening of LF tissues miRNA expression by miRNA microarray was performed using samples from 10 patients and 10 controls, respectively. Subsequently, differential expression was validated using qRT-PCR. Then, functional analysis of the miRNAs in regulating collagens I and III expression was carried out. Western blotting and luciferase reporter assay were also used to detect the target gene. In addition, the thickness of the LF at the level of the facet joint was measured on axial T1-weighted magnetic resonance images. We identified 18 miRNAs that were differentially expressed in patients compared with controls. Following qRT-PCR confirmation, miR-221 was significantly lower in LF tissues of patients than controls. The LF was significantly thicker in patients than that in controls. Bioinformatics target prediction identified tissue inhibitors of matrix metalloproteinase (TIMP)-2 as a putative target of miR-221. Furthermore, luciferase reporter assays demonstrated that miR-221 directly targets TIMP-2 and affects the protein expression of TIMP-2 in fibroblasts isolated from LF. Of note, miR-221 mimic reduced mRNA and protein expression of collagens I and collagen III in fibroblasts isolated from LF. The downregulation of miR-221 might contribute to LF hypertrophy by promoting collagens I and III expression via the induction of TIMP-2."

According to the news reporters, the research concluded: "Our study also underscores the potential of miR-221 as a novel therapeutic target in LSS."

For more information on this research see: MicroRNA-221 Regulates Hypertrophy of Ligamentum Flavum in Lumbar Spinal Stenosis by Targeting TIMP-2. Spine, 2016;41 (4):275-82. (Lippincott Williams and Wilkins - www.lww.com; Spine - journals.lww.com/spinejournal/pages/default.aspx)
Our news journalists report that additional information may be obtained by contacting Y.Q. Xu, Dept. of Orthopedic Surgery, Tianjin Medical University General Hospital, Tianjin, People's Republic of China. Additional authors for this research include Z.H. Zhang, Y.F. Zheng and S.Q Feng.

Oncology - Squamous Cell Carcinoma

New Squamous Cell Carcinoma Findings from Faculty of Medicine Discussed (FGFR gene alterations in lung squamous cell carcinoma are potential targets for the multikinase inhibitor nintedanib)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Squamous Cell Carcinoma. According to news reporting out of Osaka, Japan, by NewsRx editors, research stated, "Fibroblast growth factor receptor (FGFR) gene alterations are relatively frequent in lung squamous cell carcinoma (LSCC) and are a potential targets for therapy with FGFR inhibitors. However, little is known regarding the clinicopathologic features associated with FGFR alterations."

Funders for this research include Ministry of Health, Labor, and Welfare of Japan, Astellas Pharma, AstraZeneca, Boehringer Ingelheim, Bristol Myers Squibb, Chugai, Chugai Pharmaceutical, Daiichi Sankyo, Eisai, Eli Lilly, EPS Associates, Japan Clinical Research Operations, Meso Scale Diagnostics, Oncotherapy Science, Ono Pharmaceutical, Pfizer, Quintiles, Taiho Pharmaceutical, Takeda Pharmaceutical.

Our news journalists obtained a quote from the research from the Faculty of Medicine, "The angiokinase inhibitor nintedanib has shown promising activity in clinical trials for non-small cell lung cancer. We have now applied next-generation sequencing (NGS) to characterize FGFR alterations in LSCC patients as well as examined the antitumor activity of nintedanib in LSCC cell lines positive for FGFR1 copy number gain (CNG). The effects of nintedanib on the proliferation of and FGFR signaling in LSCC cell lines were examined invitro, and its effects on tumor formation were examined invivo. A total of 75 clinical LSCC specimens were screened for FGFR alterations by NGS. Nintedanib inhibited the proliferation of FGFR1 CNG-positive LSCC cell lines in association with attenuation of the FGFR1-ERK signaling pathway invitro and invivo. FGFR1 CNG (10.7%), FGFR1 mutation (2.7%), FGFR2 mutation (2.7%), FGFR4 mutation (5.3%), and FGFR3 fusion (1.3%) were detected in LSCC specimens by NGS. Clinicopathologic features did not differ between LSCC patients positive or negative for FGFR alterations. However, among the 36 patients with disease recurrence after surgery, prognosis was significantly worse for those harboring FGFR alterations."

According to the news editors, the research concluded: "Screening for FGFR
alterations by NGS warrants further study as a means to identify patients with LSCC recurrence after surgery who might benefit from nintedanib therapy."

**Oncology - Squamous Cell Carcinoma**

**New Squamous Cell Carcinoma Findings from Second Military Medical University Discussed (miR-214 inhibits invasion and migration via downregulating GALNT7 in esophageal squamous cell cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Squamous Cell Carcinoma is now available. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Previous studies verified that miR-214 is of great significance in the invasion and migration of a variety of cancers. It has been demonstrated that UDP-N-acetyl-alpha-D-galactosamine: polypeptide N-acetylgalactosaminyltransferase 7(GALNT7) is a putative target of miR-214."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Second Military Medical University, "We performed this study to figure out howmiR-214 and GALNT7 play their roles in the invasion and migration of esophageal squamous cell carcinoma(ESCC). The expression of miR-214 was significantly downregulated in tumors compared to the corresponding non-tumor tissues while GALNT7 showed an opposite tendency. The low expression of miR-214 and the high expression of GALNT7 were found positively correlated with poor tumor differentiation (P = 0.004), tumor invasion (P = 0.013), and lymph nodemetastasis (P = 0.012) in ESCC patients. Functional study demonstrated that overexpression of miR-214 or knockdown of GALNT7 could weaken invasive and migratory ability in Eca109, TE1, and KYSE150. Moreover, tumorigenicity assay showed us mice injected with cells containing miR-214 mimic or GALNT7 small interfering RNA formed substantially smaller tumors than that in miR-214 inhibitor group."
According to the news editors, the research concluded: "Consequently, we concluded that miR-214 shows potential to be a diagnostic marker and therapeutic target in ESCC."

The news correspondents report that additional information may be obtained from H.Z. Chen, Second Military Med Univ, Shanghai Hosp, Dept. of Thorac Surg, Shanghai 200433, People's Republic of China. Additional authors for this research include L. Xu, C.G. Li, Y. Yuan, S.D. Huang and H.Z. Chen.

**Oncology - Squamous Cell Carcinoma**

**New Squamous Cell Carcinoma Findings from Sun Yat Sen University Reported (Integrin alpha 7 is a functional cancer stem cell surface marker in oesophageal squamous cell carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Squamous Cell Carcinoma. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Non-CG methylation has been associated with stemness regulation in embryonic stem cells. By comparing differentially expressed genes affected by non-CG methylation between tumour and corresponding non-tumour tissues in oesophageal squamous cell carcinoma (OSCC), we find that Integrin alpha 7 (ITGA7) is characterized as a potential cancer stem cell (CSC) marker."

The news correspondents obtained a quote from the research from Sun Yat Sen University, "Clinical data show that a high frequency of ITGA7(+) cells in OSCC tissues is significantly associated with poor differentiation, lymph node metastasis and worse prognosis. Functional studies demonstrate that both sorted ITGA7(+) cells and ITGA7 overexpressing cells display enhanced stemness features, including elevated expression of stemness-associated genes and epithelial-mesenchymal transition features, as well as increased abilities to self-renew, differentiate and resist chemotherapy. Mechanistic studies find that ITGA7 regulates CSC properties through the activation of the FAK-mediated signalling pathways."

According to the news reporters, the research concluded: "As knockdown of ITGA7 can effectively reduce the stemness of OSCC cells, ITGA7 could be a potential therapeutic target in OSCC treatment."

For more information on this research see: Integrin alpha 7 is a functional cancer stem cell surface marker in oesophageal squamous cell carcinoma. *Nature Communications*, 2016;7():1-14. *Nature Communications* can be contacted at: Nature Publishing Group,
New Squamous Cell Carcinoma Study Findings Recently Were Reported by F.P. Xu and Co-Researchers (Overexpression of SRC-3 promotes esophageal squamous cell carcinoma aggressiveness by enhancing cell growth and invasiveness)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Squamous Cell Carcinoma is the subject of a report. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Steroid receptor coactivator-3 (SRC-3), a transcriptional coactivator for nuclear receptors and other transcription factors, plays an important role in the genesis and progression of several cancers. However, studies investigated the role of SRC-3 in esophageal squamous cell carcinomas (ESCCs) are limited, and the role of SRC-3 in tumor progression remains unclear."

Financial supporters for this research include National Natural Science Foundation of China, National Clinical Key Subject Construction Project Fund of China.

Our news journalists obtained a quote from the research, "We examined the expression of SRC-3 in 8 ESCC cell lines and 302 human ESCC tissues by qPCR, Western blot, and immunohistochemistry. In addition, ESCC cell lines were subjected to proliferation and invasion assays, tumorigenicity assay, flow cytometry assay, qPCR, Western blot, and Chromatin Immunoprecipitation assay to investigate the role of SRC-3 in cancer progression. SRC-3 was overexpressed in 48% of cases and correlated with poor overall (P = 0.0076) and progression-free (P = 0.0069) survival of surgically resected ESCC patient. Cox regression analysis revealed that SRC-3 is an independent prognostic marker. Furthermore, we found that activation of insulin-like growth factor (IGF)/AKT) was involved in the SRC-3 on the cell growth and invasiveness in two ESCC cell lines, Eca109 and EC18 cells."

According to the news editors, the research concluded: "SRC-3 overexpression is clinically and functionally relevant to the progression of human ESCC, and might be a useful molecular target for ESCC prognosis and treatment."

For more information on this research see: Overexpression of SRC-3 promotes esophageal squamous cell carcinoma aggressiveness by enhancing cell growth and invasiveness. Cancer Medicine, 2016;5(12):3500-3511. Cancer Medicine can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell -

Oncology - Squamous Cell Carcinoma

New Squamous Cell Carcinoma Study Findings Recently Were Reported by Researchers at Tianjin Medical University (The unusual yin-yang fashion of RIZ1/RIZ2 contributes to the progression of esophageal squamous cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Squamous Cell Carcinoma is the subject of a report. According to news reporting originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "Retinoblastoma protein-interacting zinc finger gene RIZ encodes two different protein products, RIZ1 and RIZ2. Observations suggest that RIZ1 is a tumor suppressor, while RIZ2 acts as a negative regulator of RIZ1 and may play a positive role in oncogenesis."

Our news editors obtained a quote from the research from Tianjin Medical University, "The imbalance amount of RIZ1 and RIZ2 may be involved in cancer development. In this study we detected the expression levels of RIZ1 and RIZ2 mRNA in human esophageal squamous cell carcinoma (ESCC) tissue specimens, reexpressed RIZ1 in the human ESCC cell line EC109 in which RIZ1 mRNA level was not detected, examined the changes of RIZ1 and RIZ2 mRNA expression, investigated the changes of proliferation, and apoptosis of the cells. We found that RIZ1 mRNA expression is commonly decreased or at undetectable level in human esophageal squamous cancer tissue specimens compared to the normal tissue specimens, while RIZ2 is usually expressed. With the forced expression of RIZ1, RIZ2 mRNA expression did not change, The ESCC cell proliferation was inhibited and apoptosis was induced."

According to the news editors, the research concluded: "This unusual yin-yang fashion of RIZ1/RIZ2 may contribute to the progression of ESCC."

For more information on this research see: The unusual yin-yang fashion of RIZ1/RIZ2 contributes to the progression of esophageal squamous cell carcinoma. Open Life Sciences, 2016;11(1):136-141. Open Life Sciences can be contacted at: De Gruyter Open Ltd, Bogumila Zuga 32A St, 01-811 Warsaw, Poland.

**Gram-Positive Bacteria - Staphylococcus aureus**

**New Staphylococcus aureus Findings Reported from Department of Medicine (Diagnostic accuracy of methicillin-resistant Staphylococcus aureus nasal colonization to predict methicillin-resistant S aureus soft tissue infections)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Gram-Positive Bacteria - Staphylococcus aureus is the subject of a report. According to news reporting out of West Haven, Connecticut, by NewsRx editors, research stated, "Nasal methicillin-resistant Staphylococcus aureus (MRSA) testing at admission to the hospital was found to have a positive likelihood ratio of 8.5 and a negative likelihood ratio of 0.41 for predicting MRSA soft tissue infections."

Our news journalists obtained a quote from the research from the Department of Medicine, "The clinical utility of this test depends on the prevalence of MRSA infection. In high prevalence populations, nasal MRSA is useful to rule in MRSA infections."

According to the news editors, the research concluded: "In low prevalence populations it may be useful to rule out infections."

Our news journalists report that additional information may be obtained by contacting C.G. Gunderson, Vet Affairs Connecticut Healthcare Syst, Dept. of Med, West Haven, CT, United States. Additional authors for this research include J.L. Holleck, J.J. Chang, N. Merchant, S. Lin and S. Gupta.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajic.2016.03.039. This DOI is a link to an online electronic document that is either free or for purchase.

Gram-Positive Bacteria - Staphylococcus aureus

New Staphylococcus aureus Findings Reported from University Medical Center (Staphylococcus aureus protects its immune-evasion proteins against degradation by neutrophil serine proteases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Positive Bacteria - Staphylococcus aureus have been presented. According to news originating from Utrecht, Netherlands, by NewsRx correspondents, research stated, "Neutrophils store large quantities of neutrophil serine proteases (NSPs) that contribute, via multiple mechanisms, to antibacterial immune defences. Even though neutrophils are indispensable in fighting Staphylococcus aureus infections, the importance of NSPs in anti-staphylococcal defence is yet unknown."

Financial support for this research came from Nederlandse Organisatie voor Wetenschappelijk Onderzoek.

Our news journalists obtained a quote from the research from University Medical Center, "However, the fact that S. aureus produces three highly specific inhibitors for NSPs [the extracellular adherence proteins (EAPs) Eap, EapH1 and EapH2], suggests that these proteases are important for host defences against this bacterium. In this study we demonstrate that NSPs can inactivate secreted virulence factors of S. aureus and that EAP proteins function to prevent this degradation. Specifically, we find that a large group of S. aureus immune-evasion proteins is vulnerable to proteolytic inactivation by NSPs. In most cases, NSP cleavage leads to functional inactivation of virulence proteins. Interestingly, proteins with similar immune-escape functions appeared to have differential cleavage sensitivity towards NSPs. Using targeted mutagenesis and complementation analyses in S. aureus, we demonstrate that all EAP proteins can protect other virulence factors from NSP degradation in complex bacterial supernatants. These findings show that NSPs inactivate S. aureus virulence factors. Moreover, the protection by EAP proteins can explain why this antibacterial function of NSPs was masked in previous studies."

According to the news editors, the research concluded: "Furthermore, our results indicate that therapeutic inactivation of EAP proteins can help to restore the natural host immune defences against S."

The news correspondents report that additional information may be obtained from D.A. Stapels, Medical Microbiology, University Medical Center Utrecht, Utrecht, Netherlands. Additional authors for this research include A. Kuipers, M. von Kockritz-Blickwede, M. Ruyken, A.T. Tromp, M.J. Horsburgh, C.J. de Haas, J.A. van Strijp, K.P. van Kessel and S.H Rooijakkers.

**Stem Cell Research**

**New Stem Cell Research Findings Has Been Reported by Investigators at University of California (Comparison of Endothelial Differentiation Capacities of Human and Rat Adipose-Derived Stem Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Stem Cell Research is the subject of a report. According to news reporting out of Sacramento, California, by NewsRx editors, research stated, "The authors compared the endothelial differentiation capacities of human and rat adipose-derived stem cells to determine whether human adipose-derived stem cells can be a source of endothelial cells clinically. Human and rat adipose-derived stem cells were harvested and characterized with flow cytometry and trilineage differentiation."

Our news journalists obtained a quote from the research from the University of California, "Cells from passages III through V were fed with endothelial cell differentiation medium for up to 3 weeks. Cells were harvested after 1, 2, and 3 weeks, and endothelial differentiation was evaluated with quantitative reverse-transcriptase polymerase chain reaction, flow cytometry, and angiogenic sprouting assays. Both human and rat adipose-derived stem cells were CD90(+), CD44(+), and CD31(-) before differentiation. The cells were successfully differentiated into adipogenic, osteogenic, and chondrogenic lineages. Expression of endothelial cell-specific genes peaked at the second week of differentiation in both human and rat cells. The fold changes in expression of CD31, vascular endothelial growth factor receptor-1, nitric oxide synthase, and von Willebrand factor genes at week 2 were 0.4 +/- 0.1, 34.7 +/- 0.3, 2.03 +/- 0.25, and 12.5 +/- 0.3 respectively, in human adipose-derived stem cells; and 1.5 +/- 1.01, 21.6 +/- 1.7, 17.9 +/- 0.6, and 11.2 +/- 1.3, respectively, in rat cells. The percentages of CD31(+) cells were 0.2, 0.64, and 1.6 in human cell populations and 0.5, 5.91, and 11.5 in rat cell populations at weeks 1, 2, and 3, respectively. Rat adipose-derived stem cell-derived endothelial cells displayed enhanced sprouting capability compared with the human cells. Human adipose-derived stem cells responded less strongly to EGM-2MV endothelial differentiation medium than did the rat cells."

According to the news editors, the research concluded: "Still, the human cells have the potential to become a clinical source of endothelial cells with modifications in the differentiation conditions.""

Our news journalists report that additional information may be obtained by contacting D.E. Sahar, University of California, Medical Center, Dept. of Surg, Div Plast Surg, Sacramento, CA 95817, United States. Additional authors for this research include K. Devi,
New Stem Cell Research Findings Reported from Western Michigan University [Human B-1 and B-2 B Cells Develop from Lin(-)CD34(+)_CD38(lo) Stem Cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Stem Cell Research is now available. According to news reporting originating from Kalamazoo, Michigan, by NewsRx correspondents, research stated, "The B-1 B cell population is an important bridge between innate and adaptive immunity primarily because B-1 cells produce natural Ab. Murine B-1 and B-2 cells arise from distinct progenitors; however, in humans, in part because it has been difficult to discriminate between them phenotypically, efforts to pinpoint the developmental origins of human B-1 and B-2 cells have lagged."

Our news editors obtained a quote from the research from Western Michigan University, "To characterize progenitors of human B-1 and B-2 cells, we separated cord blood and bone marrow Lin(-)CD34(+)_hematopoietic stem cells into Lin(-)CD34(+)_CD38(lo) and Lin(-)CD34(+)_CD38(hi) populations. We found that transplanted Lin(-)CD34(+)_CD38(lo) cells, but not Lin(-)CD34(+)_CD38(hi) cells, generated a CD19(+) B cell population after transfer into immunodeficient NOD.Cg-Prkdc(scid) Il2rg(tm1wjl)/SxJ neonates. The emergent CD19(+) B cell population was found in spleen, bone marrow, and peritoneal cavity of humanized mice and included distinct populations displaying the B-1 or the B-2 cell phenotype. Engrafted splenic B-1 cells exhibited a mature phenotype, as evidenced by low-to-intermediate expression levels of CD24 and CD38. The engrafted B-1 cell population expressed a VH-DH-JH composition similar to cord blood B-1 cells, including frequent use of VH4-34 (8 versus 10%, respectively). Among patients with hematologic malignancies who underwent hematopoietic stem cell transplantation, B-1 cells were found in the circulation as early as 8 wk posttransplantation."

According to the news editors, the research concluded: "Altogether, our data demonstrate that human B-1 and B-2 cells develop from a Lin(-)CD34(+)_CD38(lo) stem cell population, and engrafted B-1 cells in humanized mice exhibit an Ig-usage pattern comparable to B-1 cells in cord blood."

For more information on this research see: Human B-1 and B-2 Cells Develop from Lin(-)CD34(+)_CD38(lo) Stem Cells. *Journal of Immunology*, 2016;197(10):3950-3958. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Stilbenes

New Stilbenes Findings Reported from Panjab University (QbD-Driven Development and Validation of a HPLC Method for Estimation of Tamoxifen Citrate with Improved Performance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Stilbenes. According to news reporting from Chandigarh, India, by NewsRx journalists, research stated, "The current studies entail Quality by Design (QbD)-enabled development of a simple, rapid, sensitive and cost-effective high-performance liquid chromatographic method for estimation of tamoxifen citrate (TMx). The factor screening studies were performed using a 7-factor 8-run Taguchi design."

Financial support for this research came from University Grants Commission (UGC).

The news correspondents obtained a quote from the research from Panjab University, "Systematic optimization was performed employing Box-Behnken design by selecting the mobile phase ratio, buffer pH and oven temperature as the critical method parameters (CMPs) identified from screening studies, thus evaluating the critical analytical attributes (CAAs), namely, peak area, retention time, theoretical plates and peak tailing as the parameters of method robustness. The optimal chromatographic separation was achieved using acetonitrile and phosphate buffer (pH 3.5) 52:48 v/v as the mobile phase with a flow rate 0.7 mL/min, an oven temperature 40 degrees C and UV detection at 256 nm. The method was validated as per the ICH recommended conditions, which revealed high degree of linearity, accuracy, precision, sensitivity and robustness over the existing liquid chromatographic methods of the drug. Also the method was applied for the estimation of TMx in nanostructured formulations, which indicated no significant change in the retention time."

According to the news reporters, the research concluded: "In a nutshell, the studies demonstrated successful development of the HPLC method of TMx with improved understanding of the relationship among the influential variables for enhancing the method performance."

Our news journalists report that additional information may be obtained by contacting B. Singh, Panjab University, UGC Center Adv Studies, Univ Inst Pharmaceut Sci, Chandigarh 160014, India. Additional authors for this research include S. Beg, O.P. Katare and B. Singh.

Oncology - Stomach Cancer

New Stomach Cancer Findings from International Agency for Research on Cancer Outlined (Stomach cancer burden in Central and South America)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Stomach Cancer have been published. According to news reporting out of Lyon, France, by NewsRx editors, research stated, "Rationale and objective: Stomach cancer mortality rates in Central and South America (CSA) are among the highest in the world. We describe the current burden of stomach cancer in CSA."

Our news journalists obtained a quote from the research from International Agency for Research on Cancer, "We obtained regional and national-level cancer incidence data from 48 population-based registries (13 countries) and nation-wide cancer deaths from WHO's mortality database (18 countries). We estimated world population age-standardized incidence (ASR) and mortality (ASMR) rates per 100,000 and estimated annual percent change to describe time trends. Stomach cancer was among the 5 most frequently diagnosed cancers and a leading cause of cancer mortality. Between CSA countries, incidence varied by 6-fold and mortality by 5-6-fold. Males had up to 3-times higher rates than females. From 2003 to 2007, the highest ASRs were in Chile, Costa Rica, Colombia, Ecuador, Brazil and Peru (males: 19.2-29.1, females: 9.7-15.1). The highest ASMRs were in Chilean, Costa Rican, Colombian and Guatemalan males (17.4-24.6) and in Guatemalan, Ecuadorian and Peruvian females (10.5-17.1). From 1997 to 2008, incidence declined by 4% per year in Brazil, Chile and Costa Rica; mortality declined by 3-4% in Costa Rica and Chile. 60-96% of all the cancer cases were unspecified in relation to gastric sub-site but, among those specified, non-cardia cancers occurred 2-13 times more frequently than cardia cancers. The variation in rates may reflect differences in the prevalence of Helicobacter pylori infection and other risk factors. High mortality may additionally reflect deficiencies in healthcare access."

According to the news editors, the research concluded: "The high proportion of unspecified cases calls for improving cancer registration processes."

For more information on this research see: Stomach cancer burden in Central and South America. Cancer Epidemiology, 2016;44():S62-S73. New Stomatitis Findings Reported from Janssen Pharmaceuticals KK

A comparison of overall survival with 40 and 50 mg/m(2) pegylated liposomal doxorubicin treatment in patients with recurrent epithelial ovarian cancer: Propensity score-matched analysis of real-world data.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mouth Diseases and Conditions - Stomatitis have been published. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "In clinical practice, 40 mg/m(2) of pegylated liposomal doxorubicin (PLD40) has been used as an initial dosage for treating recurrent epithelial ovarian cancer (OC) instead of the recommended dose of 50 mg/m2 (PLD50). However, no robust evidence is available to support the use of PLD40."

Our news journalists obtained a quote from the research from Janssen Pharmaceuticals KK, "This post-hoc study aimed to compare the efficacy and safety of initial PLD dosages in propensity score (P-score)-matched dataset. The data source was a PLD postmarketing surveillance dataset (n = 2189) conducted in Japan. Eligibility criteria for the present study were as follows: recurrent OC, history of chemotherapy, and treatment with PLD monotherapy at a dosage between 35.5 and 54.4 mg/m(2). Overall survival (OS) was compared between PLD50- and PLD40-treated groups using the log-rank test. Incidences of palmar-plantar erythrodysesthesia (PPE) and stomatitis were also compared between the groups. Overall, 503 matched pairs were generated using P-score analysis. The median survival time with PLD50 and PLD40 was 383 and 350 days, respectively, with a hazard ratio of 1.10 (95% confidence interval, 0.98-1.26; p = 0.211), although the difference was not statistically significant in the P-score-matched dataset. However, the incidence and severity of PPE and stomatitis were significantly lower with PLD40. Our study showed that the efficacy of PLD did not differ based on initial dosages, but the risk of adverse events was reduced with PLD40."

According to the news editors, the research concluded: "Considering the balance between patient benefits and risks, our results support the use of PLD40 in clinical practice."

For more information on this research see: A comparison of overall survival with 40 and 50 mg/m(2) pegylated liposomal doxorubicin treatment in patients with recurrent epithelial ovarian cancer: Propensity score-matched analysis of real-world data. *Gynecologic Oncology*, 2016;143(2):246-251. *Gynecologic Oncology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Our news journalists report that additional information may be obtained by contacting M. Nakayama, Janssen Pharmaceut KK, Medical Affairs Div, Chiyoda Ku, Tokyo 1010065, Japan. Additional authors for this research include H. Kobayashi, T. Takahara, Y. Nishimura, K. Fukushima and K. Yoshizawa.
Central Nervous System Diseases and Conditions —

New Subarachnoid Hemorrhage Study Findings Have Been Reported by M. Balbi and Co-Researchers (Acute changes in neurovascular reactivity after subarachnoid hemorrhage in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage. According to news originating from Munich, Germany, by NewsRx correspondents, research stated, "Subarachnoid hemorrhage causes acute and long-lasting constrictions of pial arterioles. Whether these vessels dilate normally to neuronal activity is of great interest since a mismatch between delivery and consumption of glucose and oxygen may cause additional neuronal damage."

Our news journalists obtained a quote from the research, "Therefore, we investigated neurovascular reactivity of pial and parenchymal arterioles after experimental subarachnoid hemorrhage. C57BL/6 mice were subjected to subarachnoid hemorrhage by filament perforation or sham surgery. Neurovascular reactivity was assessed 3 h later by forepaw stimulation or inhalation of 10% CO2. Diameters of cerebral arterioles were assessed using two-photon microscopy. Neurovascular coupling and astrocytic endfoot Ca2+ were measured in brain slices using two-photon and infrared-differential interference contrast microscopy. Vessels of sham-operated mice dilated normally to CO2 and forepaw stimulation. Three hours after subarachnoid hemorrhage, CO2 reactivity was completely lost in both pial and parenchymal arterioles, while neurovascular coupling was not affected. Brain slices studies also showed normal neurovascular coupling and a normal increase in astrocytic endfoot Ca2+ acutely after subarachnoid hemorrhage."

According to the news editors, the research concluded: "These findings suggest that communication between neurons, astrocytes, and parenchymal arterioles is not affected in the first few hours after subarachnoid hemorrhage, while CO2 reactivity, which is dependent on NO signaling, is completely lost."

The news correspondents report that additional information may be obtained from N. Plesnila, Munich Cluster Syst Neurol, Munich, Germany. Additional authors for this research include M. Koide, S.M. Schwarzmaier, G.C. Wellman and N. Plesnila.

Keywords for this news article include: Munich, Germany, Europe, Central Nervous System Diseases and Conditions, Cardiovascular Diseases and Conditions, Brain Diseases and Conditions, Cerebrovascular Disorders, Intracranial Hemorrhages, Subarachnoid Hemorrhage.
Central Nervous System Diseases and Conditions –…

New Subdural Hematoma Findings from Virginia Commonwealth University Outlined (Tranexamic Acid for Recurring Subdural Hematomas Following Surgical Evacuation: A Clinical Case Series)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Subdural Hematoma. According to news originating from Richmond, Virginia, by NewsRx correspondents, research stated, "Chronic subdural hematomas (SDHs) are commonly encountered in neurosurgery. Optimal management of SDHs remains a significant challenge."

Our news journalists obtained a quote from the research from Virginia Commonwealth University, "Current treatment options generally include supportive care or surgical intervention. A significant proportion of patients have surgery; however, the reoperation rate is considered high. There are also cases in which additional surgical procedures would carry significant morbidity, and as a result, there is a need for nonsurgical medical therapies. We describe the use of tranexamic acid (TXA) as a nonsurgical option for the treatment of recurrent SDHs following surgery. Patients were identified as candidates for potential TXA therapy and followed prospectively. The decision to administer TXA was made on the basis of history, presentation, and prognosis after further surgical intervention. Data collected included patient imaging, treatment administered, and both radiologic and clinical outcomes. Three patients underwent surgical evacuation of a chronic SDH (two via burr hole washout and one via craniotomy). All patients had recurrence identified on subsequent imaging. Two patients had poorer predicted outcomes if additional surgical intervention was necessary, and one refused additional surgical intervention. TXA was administered, in the same dosing and scheduled course, to all patients. Complete resolution was observed on imaging, and in the case of the patient who was symptomatic, clinical improvement was also noted."

According to the news editors, the research concluded: "TXA may be considered for the treatment of recurrent SDHs following surgical evacuation in patients for whom additional surgery would add significant morbidity."

The news correspondents report that additional information may be obtained from R.A. Vega, Virginia Commonwealth Univ Hlth Syst, Dept. of Neurosurg, Medical Coll Virginia, Richmond, VA 23298, United States. Additional authors for this research include L. Hutchins and R.A. Vega.

New Sudden Death Findings from Cedars-Sinai Medical Center Reported (Tpeak-to-Tend interval corrected for heart rate: A more precise measure of increased sudden death risk?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Sudden Death have been published. According to news originating from Los Angeles, California, by NewsRx correspondents, research stated, "The Tpeak to Tend (Tpe) interval on the 12-lead electrocardiogram predicts an increased risk of sudden cardiac arrest (SCA). There is controversy over whether Tpe would be more useful if corrected for heart rate (Tpec)."

Our news journalists obtained a quote from the research from Cedars-Sinai Medical Center, "We evaluated whether the predictive value of Tpe for SCA improves with heart rate correction and sought to determine an optimal cutoff value for Tpec in the context of SCA risk. Cases of SCA (n = 628; mean age 66.4 +/- 14.5 years; n = 416, 66.2% men) from the Oregon Sudden Unexpected Death Study with an archived electrocardiogram available prior and unrelated to the SCA event were analyzed. Comparisons were made with control subjects (n = 819; mean age 66.7 +/- 11.5 years; n = 559, 68.2% men). The Tpe interval was corrected for heart rate using Bazett (TpecBa) and Fridericia (TpecFd) formulas, and the predictive value of Tpec for SCA was evaluated using logistic regression models. The area under the curve for Tpec predicting SCA improved with both correction formulas. TpecBa and TpecFd were shown to have an area under the curve of 0.695 and 0.672, respectively, as compared with a baseline of 0.601 with an uncorrected Tpe. A TpecBa value of >90 ms was predictive of SCA, independent of age, sex, comorbidities, QRS duration, corrected QT interval, and severely reduced left ventricular ejection fraction (<= 35%; odds ratio 2.8; 95% confidence interval 1.92-4.17; P < .0001). Correcting Tpe for heart rate, using either the Bazett or the Fridericia formula, improved the independent predictive value of this marker for the assessment of SCA risk."

According to the news editors, the research concluded: "Prolongation of TpecBa beyond 90 ms was associated with a nearly 3-fold increased risk of SCA."

The news correspondents report that additional information may be obtained from S.S. Chugh, Cedars Sinai Med Center, Inst Heart, Los Angeles, CA 90048, United States. Additional authors for this research include C. Rusinaru, K. Reinier, A. Uy-Evanado, H. Chugh, K. Gunson, J. Jui and S.S. Chugh.

Sulfanilamides

New Sulfanilamides Findings from Hoshi University Described (The effect of structurally related impurities on crystallinity reduction of sulfamethazine by grinding)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Sulfanilamides. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "In this study, the effect of structurally related impurities on crystallinity reduction of sulfamethazine by grinding was evaluated. The crystallinity of sulfamethazine was not decreased when it was ground alone."

Financial supporters for this research include Research on Development of New Drugs, Japan Society for the Promotion of Science.

The news correspondents obtained a quote from the research from Hoshi University, "However, when structurally related impurities with sulfonamide derivatives were blended, the crystallinity of sulfamethazine was decreased by grinding. Other materials without a sulfonamide moiety showed no such effect. The Raman spectra of sulfamethazine demonstrated that there was a difference between its crystalline and amorphous states within its sulfonamide structure."

According to the news reporters, the research concluded: "It was suggested that the sulfonamide structure of the impurities was important in causing the inhibition of recrystallization of sulfamethazine during grinding."

Our news journalists report that additional information may be obtained by contacting Y. Hamada, Hoshi University, Grad Sch Pharmaceut Sci, Shinagawa Ku, Tokyo 1428501, Japan. Additional authors for this research include M. Onoa, M. Ohara and E. Yonemochi.

New Sulfur Amino Acids Findings from University of Geneva Described
(Cysteine-specific Chemical Proteomics: From Target Identification to Drug Discovery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Sulfur Amino Acids. According to news reporting originating in Geneva, Switzerland, by NewsRx journalists, research stated, "Our laboratory focuses on chemical proteomics-enabled discovery of new cysteine-reactive small molecules with intriguing biomedical activities as well as identification and detailed characterization of their proteomic targets. In this overview article, we summarize our progress since 2013 in this research field."

The news reporters obtained a quote from the research from the University of Geneva, "We have developed a novel mass spectrometry-based chemoproteomic method that allows detection and monitoring of up to 3000 reactive cysteines in any cellular proteome. This is achieved via strategic use of two clickable, cysteine-reactive chemical probes with complementary substrate selectivity profiles, iodoacetamide and ethynyl benziodoxolone. Using this method, we have been able to identify the direct biological targets of curcumin, a diarylheptanoid natural product with anticancer activity, and deoxyelephantopin, a highly cytotoxic natural sesquiterpene lactone. Furthermore, we have developed chloromethyl triazoles (CMTs) as a novel chemical scaffold for cysteine-reactive inhibitors that can be accessed from commercially available substrates in only two chemical steps."

According to the news reporters, the research concluded: "From a small collection of chloromethyl triazoles, we have identified compound AA-CW236 as the first non-pseudosubstrate inhibitor of MGMT, a DNA repair protein that renders several devastating cancer forms resistant to chemotherapy."

For more information on this research see: Cysteine-specific Chemical Proteomics: From Target Identification to Drug Discovery. Chimia, 2016;70(11):764-767. Chimia can be contacted at: Swiss Chemical Soc, Schwarztorstrasse 9, Ch-3007 Bern, Switzerland.

Our news correspondents report that additional information may be obtained by contacting A. Adibekian, University of Geneva, Dept. of Organ Chem, CH-1211 Geneva 4, Switzerland. Additional authors for this research include D. Abegg, C. Wang, A. Shuster and A. Adibekian.

New Sulfur Amino Acids Study Results from University of Louisville Described (Homocysteine, Alcoholism, and Its Potential Epigenetic Mechanism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Sulfur Amino Acids is the subject of a report. According to news originating from Louisville, Kentucky, by NewsRx correspondents, research stated, "Alcohol is the most socially accepted addictive drug. Alcohol consumption is associated with some health problems such as neurological, cognitive, behavioral deficits, cancer, heart, and liver disease."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from the University of Louisville, "Mechanisms of alcohol-induced toxicity are presently not yet clear. One of the mechanisms underlying alcohol toxicity has to do with its interaction with amino acid homocysteine (Hcy), which has been linked with brain neurotoxicity. Elevated Hcy impairs with various physiological mechanisms in the body, especially metabolic pathways. Hcy metabolism is predominantly controlled by epigenetic regulation such as DNA methylation, histone modifications, and acetylation. An alteration in these processes leads to epigenetic modification."

According to the news editors, the research concluded: "Therefore, in this review, we summarize the role of Hcy metabolism abnormalities in alcohol-induced toxicity with epigenetic adaptation and their influences on cerebrovascular pathology."

The news correspondents report that additional information may be obtained from N. Tyagi, University of Louisville, Sch Med, Dept. of Physiol, Louisville, KY 40292, United States. Additional authors for this research include C.J. Mallonee, A.K. George, S.C. Tyagi and N. Tyagi.

New Sulfur Compounds Study Findings Have Been Reported by Researchers at Anadolu University (Synthesis and Evaluation of New Benzodioxole-Based Thiosemicarbazone Derivatives as Potential Antitumor Agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Sulfur Compounds have been published. According to news reporting originating in Eskisehir, Turkey, by NewsRx journalists, research stated, "New benzodioxole-based thiosemicarbazone derivatives were synthesized and evaluated for their cytotoxic effects on A549 human lung adenocarcinoma, C6 rat glioma and NIH/3T3 mouse embryonic fibroblast cells. In order to examine the correlation between anticancer activity and cholinesterases, the compounds were evaluated for their inhibitory effects on AChE and BuChE."

The news reporters obtained a quote from the research from Anadolu University, "The most effective anticancer agents were investigated for their effects on DNA synthesis, apoptosis and mitochondrial membrane potential. 4-(1,3-Benzodioxol-5-yl)-1-([1,1'-biphenyl]-4-ylmethylene)thiosemicarbazide (5) was identified as the most promising anticancer agent against C6 and A549 cell lines due to its inhibitory effects on C6 and A549 cells and low toxicity to NIH/3T3 cells. Compound 5 increased early and late apoptosis in A549 and C6 cells. Compound 5 also caused disturbance on mitochondrial membrane potential and showed DNA synthesis inhibitory activity in A549 and C6 cells. Compound 5 was investigated for SIRT1 inhibitory activity to provide mechanistic insight and for that purpose docking studies were also performed for this compound on SIRT1. On the other hand, compound 5 did not show any inhibitory activity against AChE and BuChE."

According to the news reporters, the research concluded: "This outcome pointed out that there is no relationship between anticancer activity of compound 5 and cholinesterases."

For more information on this research see: Synthesis and Evaluation of New Benzodioxole-Based Thiosemicarbazone Derivatives as Potential Antitumor Agents. Molecules, 2016;21(11):2652-2669. New Sweat Gland Diseases Study Findings Have Been Reported by Investigators at National Institutes of Health (Foxc1 Ablated Mice Are Anhidrotic and Recapitulate Features of Human Miliaria Sweat Retention Disorder)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Sweat Gland Diseases is now available. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Sweat glands are critical for thermoregulation. The single tubular structure of sweat glands has a lower secretory portion and an upper reabsorptive duct leading to the secretory pore in the skin."

Our news journalists obtained a quote from the research from the National Institutes of Health, "Genes that determine sweat gland structure and function are largely unidentified. Here we report that a Fox family transcription factor, Foxc1, is obligate for appreciable sweat duct activity in mice. When Foxc1 was specifically ablated in skin, sweat glands appeared mature, but the mice were severely hypohidrotic. Morphologic analysis revealed that sweat ducts were blocked by hyperkeratotic or parakeratotic plugs. Consequently, lumens in ducts and secretory portions were dilated, and blisters and papules formed on the skin surface in the knockout mice. The phenotype was strikingly similar to the human sweat retention disorder miliaria. We further show that Foxc1 deficiency ectopically induces the expression of keratinocyte terminal differentiation markers in the duct luminal cells, which most likely contribute to keratotic plug formation. Among those differentiation markers, we show that Sprr2a transcription is directly repressed by overexpressed Foxc1 in keratinocytes."

According to the news editors, the research concluded: "In summary, Foxc1 regulates sweat duct luminal cell differentiation, and mutant mice mimic miliaria and provide a possible animal model for its study."

The news correspondents report that additional information may be obtained from C.Y. Cui, NIA, Lab Genet & Genom, National Institutes of Health, Baltimore, MD 21224, United States. Additional authors for this research include R. Ishii, D.P. Campbell, M. Michel, Y.L. Piao, T. Kume and D. Schlessinger.

**Takayasu's Arteritis**

**New Takayasu's Arteritis Study Findings Have Been Reported by Investigators at Beijing Union Medical College Hospital (The efficacy of Mycophenolate mofetil for the treatment of Chinese Takayasu's arteritis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Takayasu's arteritis have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "To investigate the therapeutic effect of mycophenolate mofetil (MMF) on Chinese Takayasu's arteritis (TAK) patients. Thirty consecutive TAK outpatients were prospectively enrolled during 2013 to 2015."

The news reporters obtained a quote from the research from Beijing Union Medical College Hospital, "MMF combined with glucocorticoid was the primary treatment regimen. If clinical stable disease could not be reached, another traditional immunosuppressive agent could be added. All patients were evaluated and followed up every 3 months and vascular image studies by Doppler ultrasonography were repeated every 6 months. The effectiveness of MMF was defined as: (1) ESR < 20 mm/hr; (2) CRP < 10 mg/L or hs-CRP < 3 mg/L; (3) stable or improved in vascular image studies; (4) clinical assessment is stable, improved or in remission; (5) the dosage of glucocorticoid could be tapered to less than 15 mg/day. ESR < 40 mm/hr, CRP < 20 mg/L or hs-CRP < 6 mg/L, but meet the other three criteria is defined as partial effectiveness. MMF alone combined with corticosteroid was effective in 12 (40.0%) patients. When MMF combined with methotrexate less than 15 mg/week, the effective rate was 30.0% (9/30), including partial effective in 3 patients. When MMF combined with azathioprine 100150 mg/day, the effective rate was 10.0% (3/30), including partial effective in 1 patient. Four patients withdrew due to side effects. Two patients failed to show response."

According to the news reporters, the research concluded: "The overall effective rate of therapy including MMF in treating TAK is 80%.

Our news correspondents report that additional information may be obtained by contacting X.P. Tian, Beijing Union Med Coll Hosp, Peking Union Med College, Dept. of Rheumatol & Clin Immunol, Beijing 100032, People's Republic of China. Additional authors for this research include Y.J. New Takotsubo Cardiomyopathy Findings from University of Foggia Reported (Serum interleukin 6 and 10 levels in Takotsubo cardiomyopathy: Increased admission levels may predict adverse events at follow-up)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Takotsubo Cardiomyopathy. According to news reporting from Foggia, Italy, by NewsRx journalists, research stated, "Systemic inflammation has been hypothesized as a possible mechanism of Takotsubo cardiomyopathy (TTC). Aim of the study was to assess the role of interleukin (IL)-6 and IL-10 in subjects with an episode of TTC."

The news correspondents obtained a quote from the research from the University of Foggia, "Fifty-six consecutive subjects with TTC were prospectively enrolled in the study and followed for a mean of 178 days. Circulating levels of IL-6, IL-10, clinical condition and left ventricular ejection fraction were evaluated at admission. Incidence of death, re-hospitalization and recurrence of TTC during follow-up was also recorded. 23% of patients experienced in-hospital complications while 20% of patients had adverse events at follow-up. IL-6 and IL-10 serum levels at admission were higher in subjects with adverse events at follow-up (120 +/- 294 vs. 22 +/- 40 pg/ml, p<0.05; 13 +/- 35 vs. 2 +/- 3 pg/ml, p = 0.05, respectively). Increased serum levels of IL-6 and IL-10 were associated with higher adverse events rates at follow-up (Log-Rank p<0.001, <0.05, hazard ratio 8.6, 5.1, respectively) and mortality rates (Log-Rank p <0.001, p<0.05, hazard ratio 20.8, 7.1, respectively). Subjects with both increased IL-6 and IL-10 levels were characterized by an increased risk of adverse events when compared to subjects with only IL-6 or IL-10 increased levels or with values below cutoff values (Log-Rank p<0.01 for any event, <0.001 for death; hazard ratio 1.20 for any event, 1.31 for death), even after correction for age, LVEF and NTproBNP levels in multivariable Cox analysis."

According to the news reporters, the research concluded: "Serum IL-6 and IL-10 admission levels are associated with higher risk of adverse events during follow-up."

For more information on this research see: Serum interleukin 6 and 10 levels in Takotsubo cardiomyopathy: Increased admission levels may predict adverse events at follow-up. Atherosclerosis, 2016;254():28-34. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Our news journalists report that additional information may be obtained by contacting N.D. Brunetti, University of Foggia, Foggia, Italy. Additional authors for this research include N. Tarantino, A. Ferraretti, R. Ieva, F. Musaico, F. Guastafierro, L. Di Martino, M. Di Biase and N.D. Brunetti.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.atherosclerosis.2016.09.012. This DOI is a link to an online electronic document that is either free or for purchase.

New Takotsubo Cardiomyopathy Study Results from DZHK German Center for Cardiovascular Research Described (Management of arrhythmias in patients with Takotsubo cardiomyopathy: Is the implantation of permanent devices necessary?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Takotsubo Cardiomyopathy is now available. According to news reporting from Lubeck, Germany, by NewsRx journalists, research stated, "Arrhythmias are frequent in Takotsubo cardiomyopathy (TTC) and a major determinant of outcome. The purpose of this study was to provide a rationale for management strategies, particularly for permanent device implantation given the reversible nature of TTC."

The news correspondents obtained a quote from the research from DZHK German Center for Cardiovascular Research, "Treatment strategies of arrhythmias including ventricular fibrillation (VF), ventricular tachycardia (VT), asystole, pulse less electrical activity, and complete atrioventricular (AV) or sinoatrial block were assessed in a bicentric cohort of consecutive patients with TTC (n = 286) with a mean follow-up period of 3.3 +/- 2.4 years. The prevalence of arrhythmias during the acute phase of TTC was 12.2% (n = 35), consisting predominantly of VT (n = 16 [5.6%]), VF (n = 7 [2.4%]), and complete AV block (n = 8 [2.8%]). Seven patients received a permanent pacemaker because of complete AV (n = 6) or sinoatrial (n = 1) block. Regular device checkups were available in 2 patients and demonstrated ongoing high-degree AV block despite recovery of left ventricular function. Three patients with transient bradyarrhythmias who did not receive devices died shortly after hospital discharge from unknown causes. One patient received an implantable cardioverter-defibrillator after resuscitation for VF and did not require device interventions during 2-year follow-up. Patients with polymorphic VT (n = 7), monomorphic VT (n = 6), or VF (n = 2) who were discharged from hospital survived or died of noncardiac reasons, with the cause of death remaining unclear in 1 patient with monomorphic sustained VT. Our data suggest that bradyarrhythmias in the acute setting of TTC may require permanent pacemaker implantation."

According to the news reporters, the research concluded: "In contrast, polymorphic ventricular arrhythmias might be managed with a temporary approach (eg, wearable cardioverter-defibrillators) until recovery of repolarization time and left ventricular function."

Our news journalists report that additional information may be obtained by contacting I. Eitel, German Center Cardiovasc Res DZHK, Lubeck, Germany. Additional authors for this research include K.P. Rommel, C. Eitel, C. Moller, T. Graf, S. Desch, H. Thiele and I. Eitel.

The direct object identifier (DOI) for that additional information is:
New Tay-Sachs Disease Study Findings Have Been Reported by Researchers at University of Pennsylvania (Tay-Sachs disease mutations in HEXA target the alpha chain of hexosaminidase A to endoplasmic reticulum-associated degradation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Tay-Sachs Disease. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Loss of function of the enzyme beta-hexosaminidase A (HexA) causes the lysosomal storage disorder Tay-Sachs disease (TSD). It has been proposed that mutations in the alpha chain of HexA can impair folding, enzyme assembly, and/or trafficking, yet there is surprisingly little known about the mechanisms of these potential routes of pathogenesis."

The news correspondents obtained a quote from the research from the University of Pennsylvania, "We therefore investigated the biosynthesis and trafficking of TSD-associated HexA alpha mutants, seeking to identify relevant cellular quality control mechanisms. The alpha mutants E482K and G269S are defective in enzymatic activity, unprocessed by lysosomal proteases, and exhibit altered folding pathways compared with wild-type alpha. E482K is more severely misfolded than G269S, as observed by its aggregation and inability to associate with the HexA beta chain. Importantly, both mutants are retrotranslocated from the endoplasmic reticulum (ER) to the cytosol and are degraded by the proteasome, indicating that they are cleared via ER-associated degradation (ERAD). Leveraging these discoveries, we observed that manipulating the cellular folding environment or ERAD pathways can alter the kinetics of mutant alpha degradation. Additionally, growth of patient fibroblasts at a permissive temperature or with chemical chaperones increases cellular Hex activity by improving mutant alpha folding."

According to the news reporters, the research concluded: "Therefore modulation of the ER quality control systems may be a potential therapeutic route for improving some forms of TSD."

Our news journalists report that additional information may be obtained by contacting Y. Argon, University of Pennsylvania, Children's Hospital of Philadelphia, Dept. of Pathol & Lab Med, Philadelphia, PA 19104, United States. Additional authors for this research include Y. Iwamoto and Y. Argon.

Central Nervous System - Tegmentum Mesencephali

**New Tegmentum Mesencephali Study Findings Have Been Reported by Investigators at RIKEN (Isoforms of the Erythropoietin receptor in dopaminergic neurons of the Substantia Nigra)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Central Nervous System - Tegmentum Mesencephali is the subject of a report. According to news reporting from Kanagawa, Japan, by NewsRx journalists, research stated, "Erythropoietin receptor (EpoR) regulates erythrocytes differentiation in blood. In the brain, EpoR has been shown to protect several neuronal cell types from cell death, including the A9 dopaminergic neurons (DA) of the Substantia Nigra (SN)."

Funders for this research include Ministero dell'Istruzione, dell'Universita e della Ricerca, European Commission, Ministry of Education, Culture, Sports, Science, and Technology.

The news correspondents obtained a quote from the research from RIKEN, "These cells form the nigrostriatal pathway and are devoted to the control of postural reflexes and voluntary movements. Selective degeneration of A9 DA neurons leads to Parkinson's disease. By the use of nanoCAGE, a technology that allows the identification of Transcription Start Sites (TSSs) at a genome-wide level, we have described the promoter-level expression atlas of mouse A9 DA neurons purified with Laser Capture Microdissection (LCM). Here, we identify mRNA variants of the Erythropoietin Receptor (DA-EpoR) transcribed from alternative TSSs. Experimental validation and full-length cDNA cloning is integrated with gene expression analysis in the FANTOM5 database. In DA neurons, the EpoR gene encodes for a N-terminal truncated receptor. Based on STAT5 phosphorylation assays, we show that the new variant of N-terminally truncated EpoR acts as decoy when co-expressed with the full-length form. A similar isoform is also found in human."

According to the news reporters, the research concluded: "This work highlights new complexities in the regulation of Erythropoietin (EPO) signaling in the brain."

Oncology - Testicular Cancer

New Testicular Cancer Findings Reported from University of Turin (Baldness and testicular cancer: the EPSAM case-control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Testicular Cancer are presented in a new report. According to news reporting originating from Torino, Italy, by NewsRx correspondents, research stated, "The etiology of testicular cancer is largely unexplained. Research has mainly focused on prenatal exposures, especially to sex hormones, while less attention has been paid to exposures that may act also postnatally."

Financial supporters for this research include Piedmont Region, Universita degli Studi di Torino.

Our news editors obtained a quote from the research from the University of Turin, "As baldness has been previously associated with testicular cancer risk we focused on baldness and body hairiness, which are both associated with androgen activity. We used data of the Postnatal Exposures and Male Health (EPSAM) study, a case-control study on testicular cancer conducted in the Province of Turin, Italy, involving cases diagnosed between 1997 and 2008. Information was collected using mailed questionnaires. Analyses included 255 cases and 459 controls. We calculated ORs and 95% CIs to estimate testicular cancer risk among those who developed baldness and among those with body hairiness. We found an inverse association between testicular cancer and baldness (OR: 0.67, 95% CI: 0.46-0.98) and body hairiness (OR: 0.78, 95% CI: 0.53-1.16), although the latter had wider CIs. The inverse association between baldness and testicular cancer is consistent with the results from previous studies."

According to the news editors, the research concluded: "These results suggest that androgens activity may influence testicular cancer risk."

For more information on this research see: Baldness and testicular cancer: the EPSAM case-control study. Andrology, 2016;4(2):251-6.

The news editors report that additional information may be obtained by contacting G. Moirano, Cancer Epidemiology Unit-CERMS, Dept. of Medical Sciences, University of Turin and CPO-Piemonte, Torino, Italy. Additional authors for this research include D. Zugna, C.
Grasso, P. Lista, L. Ciuffreda, N. Segnan, F. Merletti and L. Richiardi.

Tetracyclines

New Tetracyclines Study Findings Have Been Reported from Tehran University of Medical Sciences (Minocycline Attenuates Depressive-Like Behaviour Induced by Rat Model of Testicular Torsion: Involvement of Nitric Oxide Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Tetracyclines. According to news originating from Tehran, Iran, by NewsRx correspondents, research stated, "Testicular torsion/detorsion (T/D) can induce depression in pre-and post-pubertal patients. This study was conducted to investigate the psychological impact of testicular torsion and mechanism underlying its depressive-like behaviour, as well as antidepressant-like activity of minocycline and possible involvement of nitric oxide (NO)/cyclic GMP pathway in this paradigm in male rats undergoing testicular T/D."

Our news journalists obtained a quote from the research from the Tehran University of Medical Sciences, "Unilateral T/D was performed in 36 male adult Wistar rats, and different doses of minocycline were injected alone or combined with N(o) -nitro-l-arginine methyl ester (l-NAME), non-specific NO synthase (NOS) inhibitor; aminoguanidine (AG), specific inducible NOS inhibitor; l-arginine, an NO precursor; and selective PDE5i, sildenafil. After assessment of locomotor activity in open-field test, immobility times were recorded in the forced swimming test (FST). Moreover, 30 days after testicular T/D, testicular venous testosterone and serum nitrite concentrations were measured. A correlation was observed between either a decrease in plasma testosterone or an increase in serum nitrite concentrations with prolongation in immobility time in the testicular T/D-operated rats FST. Minocycline (160 mg/kg) exerted the highest significant antidepressant-like effect in the operated rats in the FST (p <0.001). Furthermore, combination of subeffective doses of minocycline (80 mg/kg) and either l-NAME (10 mg/kg) or AG (50 mg/kg) demonstrated a significant robust antidepressant-like activity in T/D group (p <0.01). Consequently, NO/cGMP pathway was involved in testicular T/D-induced depressive-like behaviour and antidepressant-like activity of minocycline in the animal model."

According to the news editors, the research concluded: "Moreover, a contribution was observed between either decreased testosterone or elevated serum nitrite levels and depressive-like behaviour following testicular T/D."

For more information on this research see: Minocycline Attenuates Depressive-Like Behaviour Induced by Rat Model of Testicular Torsion: Involvement of Nitric Oxide Pathway. Basic & Clinical Pharmacology & Toxicology, 2015;118(4):249-58. (Wiley-Blackwell - www.wiley.com/; Basic & Clinical Pharmacology & Toxicology -

Heart Disorders and Diseases - Tetralogy of Fallot

New Tetralogy of Fallot Study Results Reported from Children's Hospital (Assessment of Microvolt T Wave Alternans in Children with Repaired Tetralogy of Fallot during 24-Hour Holter Electrocardiography)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Tetralogy of Fallot have been published. According to news reporting originating from Izmir, Turkey, by NewsRx correspondents, research stated, "We aimed to examine microvolt T wave alternans (MTWA) in 24-hour Holter electrocardiography (ECG) of children with repaired tetralogy of Fallot (TOF) to assess associations of MTWA with ventricular arrhythmias, ECG parameters, and echocardiographic findings. Holter ECG records and archive files of 56 repaired TOF patients (62.5% male) who were analyzed retrospectively."

Our news editors obtained a quote from the research from Children's Hospital, "Subjects' ECG parameters and MTWA values were compared with age-sex-matched control group. T wave changes were analyzed by time-domain-modified moving average method from the three channels of 24-hour Holter ECG. Mean age was 123.4 +/- 48.3 months. Median MTWA value was 55.5 mu V in the control group, whereas 95.5 mu V in patients group (P < 0.001). A significant weak positive correlation was found between the presence of ventricular extrasystoles and tricuspid regurgitation. There was no correlation between ECG parameters, echocardiographic findings, and MTWA. MTWA was increased in children with repaired TOF as reported before."

According to the news editors, the research concluded: "To our knowledge, this is the first study analyzing MTWA with 24-hour Holter ECG in repaired TOF patients."

The news editors report that additional information may be obtained by contacting O. Doksoz, Izmir Dr Behcet Uz Childrens Hosp, Dept. of Pediat Cardiol, Izmir, Turkey. Additional authors for this research include T. Mese, U. Karaarslan, G. Ceylan, S. Demirpence, V. Tavli
New Therapeutic Drug Monitoring Data Have Been Reported by M.D.R. Fernandez and Co-Authors (Determination of Antidepressants in Hair via UHPLC-MS/MS as a Complementary Informative Tool for Clinical and Forensic Toxicological Assessments)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Therapeutic Drug Monitoring. According to news reporting from Brussels, Belgium, by NewsRx journalists, research stated, "Hair analysis is a complementary approach for the detection of antidepressants (ADs) in clinical and forensic schemes because it yields a picture of long-term exposure over a time window depending on the length of the hair. A fast and sensitive ultra-high performance liquid chromatography tandem mass spectrometry method using a BEH C18 column with a mobile phase consisting of ammonium acetate/acetonitrile was developed and validated according to international guidelines for the simultaneous analysis of 24 ADs in hair."

The news correspondents obtained a quote from the research, "Methanol/acetonitrile/ammonium formate buffer 1 mmol/L (25: 25:50, vol/vol/vol) was used to extract the drugs from the hair matrix before a solid-phase extraction using cation exchange cartridges was applied. Hair samples (n = 18) obtained from a US workplace drug testing center were analyzed to demonstrate the method applicability. The limit of quantification values ranged from 0.006 to 0.05 ng/mg hair, and the calibration curves ranged from the LOQ up to 10 ng/mg hair. The bias and imprecision were,15% for all the compounds except maprotiline (17%). This was evaluated with 2 'in-house' QCs and 1 authentic hair sample from an amitriptyline user. No significant matrix effects for most of the compounds were observed, and the extraction efficiency of the sample cleanup procedure ranged from 40% to 80% (relative standard deviation,15%) [except for demethylcitalopram, didemethylcitalopram, and trazodone (relative standard deviation,33%)]. The method was then successfully applied to the analysis of hair samples from workplace drug testing. The samples were analyzed in 1-cm segments to determine the medication history of the patient. When a sample was reported positive, information concerning the prescription was obtained anonymously for several samples. Concentrations of (minimum-maximum value in ng/mg) citalopram (0.01-132: extrapolated), trazodone (0.01-5.3), sertraline (0.05-0.1), paroxetine (0.02-1.0), bupropion (0.05-0.6), fluoxetine (0.5-8), and amitriptyline (0.2-4.8), including metabolites, are reported."

According to the news reporters, the research concluded: "This study may be of interest to clinical and forensic laboratories for interpretation because it demonstrates the AD concentration windows in hair and the link to the prescribed drugs."

For more information on this research see: Determination of Antidepressants in Hair via UHPLC-MS/MS as a Complementary Informative Tool for Clinical and Forensic Toxicological Assessments. *Therapeutic Drug Monitoring*, 2016;38(6):751-760. *Therapeutic
**New Therapeutics Findings from Nagoya City University Discussed**

(Whole-pelvic radiotherapy with spot-scanning proton beams for uterine cervical cancer: a planning study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Therapeutics is now available. According to news reporting originating in Nagoya, Japan, by NewsRx journalists, research stated, "The aim of this study was to compare the dosimetric parameters of whole-pelvic radiotherapy (WPRT) for cervical cancer among plans involving 3D conformal radiotherapy (3D-CRT), intensity-modulated radiotherapy (IMRT), or spot-scanning proton therapy (SSPT). The dose distributions of 3D-CRT-, IMRT-, and SSPT-based WPRT plans were compared in 10 patients with cervical cancer."

The news reporters obtained a quote from the research from Nagoya City University, "All of the patients were treated with a prescribed dose of 50.4 Gy in 1.8-Gy daily fractions, and all of the plans involved the same planning target volume (PTV) constrictions. A 3D-CRT plan involving a four-field box, an IMRT plan involving seven coplanar fields, and an SSPT plan involving four fields were created. The median PTV D95% did not differ between the 3D-CRT, IMRT and SSPT plans. The median conformity index 95% and homogeneity index of the IMRT and SSPT were better than those of the 3D-CRT. The homogeneity index of the SSPT was better than that of the IMRT. SSPT resulted in lower median V20 values for the bladder wall, small intestine, colon, bilateral femoral heads, skin, and pelvic bone than IMRT. Comparing the Dmean values, SSPT spared the small intestine, colon, bilateral femoral heads, skin and pelvic bone to a greater extent than the other modalities. SSPT can reduce the irradiated volume of the organs at risk compared with 3D-CRT and IMRT, while maintaining excellent PTV coverage."

According to the news reporters, the research concluded: "Further investigations of SSPT are warranted to assess its role in the treatment of cervical cancer."

Our news correspondents report that additional information may be obtained by
contacting S. Hashimoto, Nagoya City University, Dept. of Radiol, Grad Sch Med Sci, Mizuho Ku, Nagoya, Aichi 4678601, Japan. Additional authors for this research include Y. Shibamoto, H. Iwata, H. Ogino, H. Shibata, T. Toshito, C. Sugie and J. Mizoe.

Therapeutics

New Therapeutics Findings from National Institute of Mental Health Described (Concise Review: Progress and Challenges in Using Human Stem Cells for Biological and Therapeutics Discovery: Neuropsychiatric Disorders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Therapeutics are presented in a new report. According to news reporting out of Bethesda, Maryland, by NewsRx editors, the research stated, "In facing the daunting challenge of using human embryonic and induced pluripotent stem cells to study complex neural circuit disorders such as schizophrenia, mood and anxiety disorders, and autism spectrum disorders, a 2012 National Institute of Mental Health workshop produced a set of recommendations to advance basic research and engage industry in cell-based studies of neuropsychiatric disorders. This review describes progress in meeting these recommendations, including the development of novel tools, strides in recapitulating relevant cell and tissue types, insights into the genetic basis of these disorders that permit integration of risk-associated gene regulatory networks with cell/circuit phenotypes, and promising findings of patient-control differences using cell-based assays."

Our news journalists obtained a quote from the research from the National Institute of Mental Health, "However, numerous challenges are still being addressed, requiring further technological development, approaches to resolve disease heterogeneity, and collaborative structures for investigators of different disciplines. Additionally, since data obtained so far is on small sample sizes, replication in larger sample sets is needed."

According to the news editors, the research concluded: "A number of individual success stories point to a path forward in developing assays to translate discovery science to therapeutics development."

Our news journalists report that additional information may be obtained by contacting D.M. Panchision, Division of Neuroscience and Basic Behavioral Science, National Institute of Mental Health, Bethesda, Maryland, United States.

**New Thrombolysis Findings Reported from Department of Neurology**

**New Thrombolysis Findings Reported from Department of Neurology [Stroke Thrombolysis in a Centralized and a Decentralized System (Helsinki and Telemedical Project for Integrative Stroke Care Network)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Thrombolysis is the subject of a report. According to news reporting out of Munich, Germany, by NewsRx editors, research stated, "Intravenous thrombolysis with tissue-type plasminogen activator (tPA) for acute ischemic stroke is more effective when delivered early. Timely delivery is challenging particularly in rural areas with long distances."

Our news journalists obtained a quote from the research from the Department of Neurology, "We compared delays and treatment rates of a large, decentralized telemedicine-based system and a well-organized, large, centralized single-hospital system. We analyzed the centralized system of the Helsinki University Central Hospital (Helsinki and Province of Uusimaa, Finland, 1.56 million inhabitants, 9096 km(2)) and the decentralized TeleStroke Unit network in a predominantly rural area (Telemedical Project for Integrative Stroke Care [TEMPiS], South-East Bavaria, Germany, 1.94 million inhabitants, 14 992 km(2)). All consecutive tPA treatments were prospectively registered. We compared tPA rates per total ischemic stroke admissions in the Helsinki and TEMPiS catchment areas. For delay comparisons, we excluded patients with basilar artery occlusions, in-hospital strokes, and those being treated after 270 minutes. From January 1, 2011, to December 31, 2013, 912 patients received tPA in Helsinki University Central Hospital and 1779 in TEMPiS hospitals. Area-based tPA rates were equal (13.0% of 7017 ischemic strokes in the Helsinki University Central Hospital area versus 13.3% of 14637 ischemic strokes in the TEMPiS area; P= 0.078). Median prehospital delays were longer (88; interquartile range, 60-135 versus 65; 48-101 minutes; P< 0.001) but in-hospital delays were shorter (18; interquartile range, 13-30 versus 39; 26-56 minutes; P< 0.001) in Helsinki University Central Hospital compared with TEMPiS with no difference in overall delays (117; interquartile range, 81-168 versus 115; 87-155 minutes; P= 0.45)."

According to the news editors, the research concluded: "A decentralized telestroke thrombolysis service can achieve similar treatment rates and time delays for a rural population as a centralized system can achieve for an urban population."

For more information on this research see: Stroke Thrombolysis in a Centralized and a Decentralized System (Helsinki and Telemedical Project for Integrative Stroke Care Network). *Stroke*, 2016;47(12):2999-3004. *Stroke* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Thrombopoietin

New Thrombopoietin Findings Reported from Waseda University (Thrombopoietin induces production of nucleated thrombocytes from liver cells in Xenopus laevis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Thrombopoietin is the subject of a report. According to news reporting out of Wakamatsu, Japan, by NewsRx editors, research stated, "The development of mammalian megakaryocytes (MKs) and platelets, which are thought to be absent in non-mammals, is primarily regulated by the thrombopoietin (TPO)/Mpl system. Although non-mammals possess nucleated thrombocytes instead of platelets, the features of nucleated thrombocyte progenitors remain to be clarified."

Our news journalists obtained a quote from the research from Waseda University, "Here, we provide the general features of TPO using Xenopus laevis TPO (xLTPO). Hepatic and splenic cells were cultured in liquid suspension with recombinant xLTPO. These cells differentiated into large, round, polyploid CD41-expressing cells and were classified as X. laevis MKs, comparable to mammalian MKs. The subsequent culture of MKs after removal of xLTPO produced mature, spindle-shaped thrombocytes that were activated by thrombin, thereby altering their morphology. xLTPO induced MKs in cultured hepatic cells for at least three weeks; however, this was not observed in splenic cells; this result demonstrates the origin of early haematopoietic progenitors in the liver rather than the spleen. Additionally, xLTPO enhanced viability of peripheral thrombocytes, indicating the xLTPO-Mpl pathway stimulates anti-apoptotic in peripheral thrombocytes. The development of thrombocytes from MKs via the TPO-Mpl system in X. laevis plays a crucial role in their development from MKs, comparable to mammalian thrombopoiesis."

According to the news editors, the research concluded: "Thus, our results offer insight into the cellular evolution of platelets/MKs in vertebrates."

For more information on this research see: Thrombopoietin induces production of nucleated thrombocytes from liver cells in Xenopus laevis. Scientific Reports, 2015;5():18519. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting Y. Tanizaki, Dept. of Biology, Faculty of Education and Integrated Arts and Sciences, Waseda University, 2-2 Wakamatsu, Shinjuku, Tokyo, 162-8480, Japan. Additional authors for this research include M. Ichisugi, M. Obuchi-Shimoji, T. Ishida-Iwata, A. Tahara-Mogi, M. Meguro-Ishikawa and T. Kato.

Cardiovascular Diseases and Conditions - Thrombosis

New Thrombosis Findings from Brigham and Women's Hospital Discussed (Thrombosis, Hypercoagulable States, and Anticoagulants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Thrombosis are presented in a new report. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Patients with derangements of secondary hemostasis resulting from inherited or acquired thrombophilias are at increased risk of venous thromboemboli (VTE)."

The news correspondents obtained a quote from the research from Brigham and Women's Hospital, "Evaluation of a patient with suspected VTE proceeds via evidence-based algorithms that involve computing a pretest probability based on the history and physical examination; this guides subsequent work-up, which can include D dimer and/or imaging. Testing for hyper-coagulable disorders should be pursued only in patients with VTE with an increased risk for an underlying thrombophilia."

According to the news reporters, the research concluded: "Direct oral anticoagulants are first-line VTE therapies, but they should be avoided in patients who are pregnant, have active cancer, antiphospholipid antibody syndrome, severe renal insufficiency, or prosthetic heart valves."

For more information on this research see: Thrombosis, Hypercoagulable States, and Anticoagulants. Primary Care, 2016;43(4):619-635,CP6. Primary Care can be contacted at: W B Saunders Co-Elsevier Inc, 1600 John F Kennedy Boulevard, Ste 1800, Philadelphia, PA 19103-2899, USA. New Thrombosis Study Findings Have Been Reported by Researchers at Second Affiliated Hospital (Extensive blooming artifact predicts no recanalization after intravenous thrombolysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Thrombosis have been published. According to news reporting originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Hemosiderin exhibits a stronger T2 shortening effect than deoxyhemoglobin. The extent of the 'blooming artifact' may therefore reflect a composition of different iron forms."

Financial supporters for this research include Science Technology Department of Zhejiang Province, National Natural Science Foundation of China.

Our news editors obtained a quote from the research from Second Affiliated Hospital, "Our aim was to investigate the relationship between extent of susceptibility vessel sign (SVS) width beyond the lumen and middle cerebral artery (MCA) recanalization. Clinical and imaging data from consecutive acute ischaemic stroke patients with MCA occlusion who underwent susceptibility-weighted imaging (SWI) before intravenous thrombolysis were examined. The source images of magnitude and angiography were used to obtain the width of SVS and MCA at the interface, respectively. The presence of MCA SVS was observed in 64 patients on initial SWI scans and recanalization was observed in 30 (46.9%) patients. The overestimation ratio of thrombus width on SWI was an acceptable predictor for no recanalization [odds ratio 1.360 per 0.1; 95% confidence interval (CI) 1.093-1.691; p=0.006]. The optimal cut-off point was identified at 1.943, and this yielded a sensitivity of 67.6% and a specificity of 86.7%. Extensive blooming artifact, defined as overestimation ratio (>=)2, independently predicted no recanalization (odds ratio 9.687, 95% CI 1.974-47.545; p=0.005) and unfavorable outcome (odds ratio 4.916, 95% CI 1.049-23.051; p=0.043). The extent of SVS width beyond the lumen might reflect the content of hemosiderin."

According to the news editors, the research concluded: "An extreme overestimation ratio might indicate aged thrombus, which may be resistant to thrombolysis."

The news editors report that additional information may be obtained by contacting S. Yan, Dept. of Neurology, School of Medicine, Second Affiliated Hospital of Zhejiang University, Hangzhou, People's Republic of China. Additional authors for this research include Q. Chen, X. Zhang, M. Xu, Q. Han, A. Shao, D.S. Liebeskind and M. Lou.

New Thrombosis Study Findings Recently Were Reported by Researchers at Juntendo University (A Case Report of Severe Hepatic Artery Vasospasm Induced by Hepatic Arterial Buffer Response After Liver Transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Thrombosis are presented in a new report. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "The management of severe hepatic artery vasospasm soon after liver transplantation (LT) is challenging because it can lead to hepatic artery thrombosis and subsequent graft failure. A 61-year-old man with hepatitis C cirrhosis and portal vein thrombosis received a deceased donor LT."

Our news editors obtained a quote from the research from Juntendo University, "On postoperative day 1, Doppler ultrasonography revealed a high resistance waveform in the hepatic artery. Angiography showed severe vasospasm of the donor hepatic artery on postoperative day 3. Strong hepatic arterial buffer response (HABR) was considered for this etiology due to high portal vein velocity. Therefore, vasodilators, including nitroglycerin and prostaglandin E1, were initiated. The waveform of the hepatic artery vasospasm gradually improved as portal vein velocity decreased by Doppler ultrasonography within 7 days after LT."

According to the news editors, the research concluded: "Hepatic arterial buffer response can induce hepatic artery vasospasm immediately after LT. This vasospasm type may be managed conservatively with a positive outcome."

The news editors report that additional information may be obtained by contacting K. Uchida, Juntendo University, Sch Med, Atop Res Center, Tokyo, Japan. Additional authors for this research include K. Uchida, S. Nishida, D.M. Levi, G. Selvaggi, A. Tekin, J. Fan, T. Froud and A.G. Tzakis.

Cardiovascular Diseases and Conditions - Thrombosis

New Thrombosis Study Results from School of Medicine Described (Sinus thrombectomy for purulent cerebral venous sinus thrombosis utilizing a novel combination of the Trevo stent retriever and the Penumbra ACE aspiration catheter: the stent anchor with mobile aspiration technique)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Thrombosis. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Intracranial complications of sinusitis are rare but life threatening. We present a case of a 17-year-old woman with sinusitis who deteriorated over the course of 12 days from subdural empyema and global purulent cerebral venous sinus thrombosis."

Our news journalists obtained a quote from the research from the School of Medicine, "The patient was managed with surgery and mechanical thrombectomy utilizing a novel 'stent anchor with mobile aspiration technique', in which a Trevo stent retriever (Stryker) was anchored in the superior sagittal sinus (SSS) while a 5 MAX ACE reperfusion catheter (Penumbra) was passed back and forth from the SSS to the sigmoid sinus with resultant dramatic improvement in venous outflow. The patient was extubated on postoperative day 3 and was discharged with minimal lower extremity weakness on postoperative day 11. This is the first report using the Trevo stent retriever for sinus thrombosis."

According to the news editors, the research concluded: "It is important to keep these rare complications in mind when evaluating patients with oral and facial infections."

The news correspondents report that additional information may be obtained from J. Mocco, Icahn Sch Med Mt Sinai, Dept. of Neurosurg, New York, NY 10029, United States. Additional authors for this research include M. Pain, H.K. Zarzour, P. Baxter, S. Ghatan and J. Mocco.

Thrombotic Microangiopathy

New Thrombotic Microangiopathy Findings Has Been Reported by Investigators at French National Institute of Health and Medical Research (INSERM) (Collapsing glomerulopathy is common in the setting of thrombotic microangiopathy of the native ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Thrombotic Microangiopathy is the subject of a report. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "Thrombotic microangiopathy (TMA) is a poorly recognized cause of collapsing glomerulopathy. The frequency and significance of collapsing glomerulopathy associated with renal TMA have not been specifically studied in native kidney biopsy specimens."

Our news editors obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "Here we retrospectively documented clinicopathologic features of 53 patients with histologically proven TMA in the native kidney, with special emphasis on changes due to focal segmental glomerulosclerosis (FSGS). Histological TMA was related to hypertensive nephropathy in 21 patients, genetic complement abnormalities in 9, drugs in 7, and to other causes in 16 patients. Almost half (26 patients) presented with arteriolar, 6 with glomerular, and 21 with mixed TMA. Using the Columbia classification system for the 53 patients with histological TMA, 33 had concurrent FSGS lesions with collapsing glomerulopathy the dominant variant in 19 patients (58% of the FSGS cases), not otherwise specified in 9 patients, cellular in 3, and perihilar or tip lesions in 1 patient each. The presence of FSGS was associated with a poor renal prognosis, with no prognostic difference between collapsing glomerulopathy and other FSGS variants."

According to the news editors, the research concluded: "Thus, collapsing glomerulopathy is frequently found in native kidney biopsies with TMA, suggesting that endothelial injury may play an important role in the pathophysiology of FSGS."

The news editors report that additional information may be obtained by contacting D. Buob, INSERM, UMR S 1155, Paris, France. Additional authors for this research include M. Decambron, V. Gnmemi, M. Frimat, M. Hoffmann, R. Azar, J.D. Gheerbrant, T. Guincestre, C. Noel, M.C. Copin and F. Glowacki.

Lymphatic Diseases and Conditions - Thymoma

New Thymoma Study Findings Have Been Reported by Researchers at Yonsei University (Spontaneous rupture of hepatic metastasis from a thymoma: A case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lymphatic Diseases and Conditions - Thymoma. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Bleeding resulting from spontaneous rupture of the liver is an infrequent but potentially life threatening complication that may be associated with an underlying liver disease. A hepatocellular carcinoma or hepatic adenoma is frequently reported is such cases."

Our news editors obtained a quote from the research from Yonsei University, "However, hemoperitoneum resulting from a hepatic metastatic thymoma is extremely rare. Here, we present a case of a 62-year-old man with hypovolemic shock induced by ruptured hepatic metastasis from a thymoma. At the first hospital admission, the patient had a 45-mm anterior mediastinal mass that was eventually diagnosed as a type A thymoma. The mass was excised, and the patient was disease-free for 6 years. He experienced sudden-onset right upper quadrant pain and was again admitted to our hospital. We noted large hemoperitoneum with a 10-cm encapsulated mass in S5/8 and a 2.3-cm nodular lesion in the right upper quadrant of the abdomen."

According to the news editors, the research concluded: "He was diagnosed with hepatic metastasis from the thymoma, and he underwent chemotherapy and surgical excision."

The news editors report that additional information may be obtained by contacting J.Y. Park, Yonsei University, Coll Med, Dept. of Internal Med, Seoul 120752, South Korea. Additional authors for this research include Y.E. Park, M.S. Ki, S.J. Lee, S.H. Beom, D.H. Han, Y.N. Park and J.Y. Park.

New Thyroid Cancer Findings Reported from Department of Medical Oncology (Three cases of thyroid cancer following the diagnosis of testicular cancer: treatment-related complication or genetics?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Thyroid Cancer. According to news reporting originating in Glasgow, United Kingdom, by NewsRx journalists, research stated, "Large-scale epidemiological studies have shown that the incidence of second primary thyroid cancer in subjects diagnosed and treated for testicular cancer is raised. This finding is strongly associated to treatment with radiotherapy and/or chemotherapy and it is explained by their mutagenic effect."

The news reporters obtained a quote from the research from the Department of Medical Oncology, "On the other hand, inherited cancer susceptibility syndromes inducing both testicular and thyroid cancers denote that these tumours might share common genomic aberrations. We herein present our experience with three cases of metachronous development of thyroid cancer after diagnosis and treatment of testicular cancer in our tertiary cancer centre."

According to the news reporters, the research concluded: "Our case report contributes to the limited available literature on such findings and aims to raise awareness of the cancer physicians treating these particular tumour types."

Our news correspondents report that additional information may be obtained by contacting P. Spiliopoulou, Beatson West Scotland Canc Center, Dept. of Med Oncol, Glasgow, Lanark, United Kingdom. Additional authors for this research include S.P. Bowers, S. Gibson, J. White and N. Reed.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/0036933016635409. This DOI is a link to an online electronic document that is either free or for purchase.

to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Familial non-medullary thyroid cancer (FNMT) constitutes 3-9% of all thyroid cancers. Out of all FNMT cases, only 5% in the syndromic form has well-studied driver germline mutations."

Our news editors obtained a quote from the research, "These associated syndromes include Cowden syndrome, familial adenomatous polyposis, Gardner syndrome, Carney complex type 1, Werner syndrome and DICER1 syndrome. It is important for the clinician to recognize these phenotypes so that genetic counseling and testing can be initiated to enable surveillance for associated malignancies and genetic testing of family members. The susceptibility chromosomal loci and genes of 95% of FNMT cases remain to be characterized. To date, 4 susceptibility genes have been identified (SRGAP1 gene (12q14), TITF-1/NKX2.1 gene (14q13), FOXE1 gene (9q22.33) and HABP2 gene (10q25.3)), out of which only the FOXE1 and the HABP2 genes have been validated by separate study groups. The causal genes located at the other 7 FNMT-associated chromosomal loci (TCO (19q13.2), fPTC/PRN (7q21), FTEN (8p23.1-p22), NMTC1 (9q21), MNG1 (14q32), 6q22, 8q24) have yet to be identified. Increasingly, gene regulatory mechanisms (miRNA and enhancer elements) are recognized to affect gene expression and FNMT tumorigenesis. With newer sequencing technique, along with functional studies, there has been progress in the understanding of the genetic basis of FNMT."

According to the news editors, the research concluded: "In our review, we summarize the FNMT studies to date and provide an update on the recently reported susceptibility genes including novel germline SEC23B variant in Cowden syndrome, SRGAP1 gene, FOXE1 gene and HABP2 genes in non-syndromic FNMT."

For more information on this research see: Familial non-medullary thyroid cancer: unraveling the genetic maze. *Endocrine-Related Cancer*, 2016;23(12):R577-R595. *Endocrine-Related Cancer* can be contacted at: Bioscientifica Ltd, Euro House, 22 Apex Court Woodlands, Bradley Stoke, Bristol BS32 4JT, England.

The news editors report that additional information may be obtained by contacting J. Ngeow, Duke NUS Med Sch, Oncol Academy Clin Program, Singapore, Singapore.

in a new report. According to news reporting out of Bhubaneswar, India, by NewsRx editors, research stated, "Wound, burn and tissue related diseases are the most common and devastating forms of trauma worldwide and thousands are still dying each year when they are left untreated. The traditional treatments for wound infection using medicinal plant extracts in hydrogels and ointment formulations have several disadvantages, delicate shape and dry up quickly upon exposure to air."

Our news journalists obtained a quote from the research, "Indeed, there is need for the development of an alternative form of dressing material for wound healing applications. Because the medicinal plant products are economical, researchers have adopted a novel approach of complexing the active components of plants with various groups of polymers to develop biodegradable fabrications. Moreover, fabricated constructs are very extremely useful as scaffold in tissue regeneration with known successes in wound healing/dressing applications that the fabricated substitutes mimic the extracellular matrix of tissue. In this review, we give an extensive overview on scientifically evaluated bioactive molecules of medicinal plants as well as plant extract blended polymeric constructs for the possible treatment of various skin injuries."

According to the news editors, the research concluded: "In addition, the technological challenges and future trends for recent developments of the treatments of wound infections are extensively summarized."

Our news journalists report that additional information may be obtained by contacting S.S. Behera, Govt Odisha, Dept. of Fisheries & Anim Resource Dev, Bhubaneswar, Odisha, India. Additional authors for this research include S.S. Behera, S. Singh, S.I. Rizvi and A.K. Singh.

Biomedical Engineering - Tissue Engineering

New Tissue Engineering Findings from H. Miyoshi and Colleagues Discussed (A Perturbation Analysis to Understand the Mechanism How Migrating Cells Sense and Respond to a Topography in the Extracellular Environment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biomedical Engineering - Tissue Engineering have been presented. According to news reporting originating from Hyogo, Japan, by NewsRx correspondents, research stated, "Migrating cells in vivo monitor the physiological state of an organism by integrating the physical as well as chemical cues in the extracellular microenvironment, and alter the migration mode, in order to achieve their unique function. The
clarification of the mechanism focusing on the topographical cues is important for basic biological research, and for biomedical engineering specifically to establish the design concept of tissue engineering scaffolds."

Our news editors obtained a quote from the research, "The aim of this study is to understand how cells sense and respond to the complex topographical cues in vivo by exploring in vitro analyses to complex in vivo situations in order to simplify the issue. Since the intracellular mechanical events at subcellular scales and the way of the coordination of these events are supposed to change in the migrating cells, a key to success of the analysis is a mechanical point of view with a particular focus of the subcellular mechanical events. We designed an experimental platform to explore the mechanical requirements in a migrating fibroma cell responding to micro-grooves. The micro-grooved structure is a model of gap structures, typically seen in the microenvironments in vivo. In our experiment, the contributions of actomyosin force generation can be spatially divided and analyzed in the cell center and peripheral regions."

According to the news editors, the research concluded: "The analysis specified that rapid leading edge protrusion, and the cell body translocation coordinated with the leading edge protrusion are required for the turning response at a micro-groove."

The news editors report that additional information may be obtained by contacting H. Miyoshi, AMED, PRIME, Chuo Ku, Kobe, Hyogo 6500047, Japan. Additional authors for this research include K. Suzuki, J. Ju, J.S. Ko, T. Adachi and Y. Yamagata.

Technology.

The news correspondents obtained a quote from the research from the School of Chemical Engineering, "Therapeutic agents, including chemotherapeutic agents, protein drugs or cells, are easily mixed with the low-viscous polymer solution at room temperature. Therapeutic-agents-containing solutions are readily injected into target sites through syringe or catheter, which could form hydrogel depot and serve as bioactive molecules release carriers. In particular, they are convenient for in vivo injection in a minimally invasive manner. Owing to their ease of handling, hydrogel scaffolds encapsulated with a wide array of therapeutic agents including growth factors, cells or fillers have been used in regeneration or filling of the defect area. Therefore, injectable hydrogels found a variety of biomedical applications, such as drug delivery and tissue engineering. Here, we summarize the chemical designs and recent developments of polysaccharide-based injectable hydrogels, giving a special attention to hydrogels prepared using amphiphilic polysaccharides for biomedical applications."

According to the news reporters, the research concluded: "Advantages and future perspectives of polysaccharide-based injectable hydrogels are highlighted."

Our news journalists report that additional information may be obtained by contacting D.S. Lee, Sungkyunkwan University Theranost Macromol Res Center, Sch Chem Engn, Suwon, South Korea. Additional authors for this research include V.H.G. Phan and D.S. Lee.

Biomedical Engineering - Tissue Engineering

New Tissue Engineering Study Findings Have Been Reported by Investigators at Yonsei University (Mussel Adhesion-Inspired Reverse Transfection Platform Enhances Osteogenic Differentiation and Bone Formation of Human Adipose-Derived Stem Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Biomedical Engineering - Tissue Engineering is now available. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Using small interfering RNA (siRNA) to regulate gene expression is an emerging strategy for stem cell manipulation to improve stem cell therapy. However, conventional methods of siRNA delivery into stem cells based on solution-mediated transfection

...
are limited due to low transfection efficiency and insufficient duration of cell-siRNA contact during lengthy culturing protocols."

Funders for this research include Ministry of Science, ICT and Future Planning, Ministry of Health and Welfare.

The news correspondents obtained a quote from the research from Yonsei University. "To overcome these limitations, a bio-inspired polymer-mediated reverse transfection system is developed consisting of implantable poly(lactic-co-glycolic acid) (PLGA) scaffolds functionalized with siRNA-lipidoid nanoparticle (sLNP) complexes via polydopamine (pDA) coating. Immobilized sLNP complexes are stably maintained without any loss of siRNA on the pDA-coated scaffolds for 2 weeks, likely due to the formation of strong covalent bonds between amine groups of sLNP and catechol group of pDA. siRNA reverse transfection with the pDA-sLNP-PLGA system does not exhibit cytotoxicity and induces efficient silencing of an osteogenesis inhibitor gene in human adipose-derived stem cells (hADSCs), resulting in enhanced osteogenic differentiation of hADSCs. Finally, hADSCs osteogenically committed on the pDA-sLNP-PLGA scaffolds enhanced bone formation in a mouse model of critical-sized bone defect."

According to the news reporters, the research concluded: "Therefore, the bio-inspired reverse transfection system can provide an all-in-one platform for genetic modification, differentiation, and transplantation of stem cells, simultaneously enabling both stem cell manipulation and tissue engineering."

Our news journalists report that additional information may be obtained by contacting S.W. Cho, Yonsei University, Dept. of Biotechnol, Seoul 120749, South Korea. Additional authors for this research include J.H. Cho, Y. Jin, K. Yang, J.S. Lee, H.J. Park, H.S. Han, J. Lee, H. Jeon, H. Shin and S.W. Cho.

**Toluene**

**New Toluene Findings from Kangwon National University Described (3D Visualization of Developmental Toxicity of 2,4,6-Trinitrotoluene in Zebrafish Embryogenesis Using Light-Sheet Microscopy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Toluene. According to news reporting
from Chunchon, South Korea, by NewsRx journalists, research stated, "Environmental contamination by trinitrotoluene is of global concern due to its widespread use in military ordnance and commercial explosives. Despite known long-term persistence in groundwater and soil, the toxicological profile of trinitrotoluene and other explosive wastes have not been systematically measured using in vivo biological assays."

The news correspondents obtained a quote from the research from Kangwon National University, "Zebrafish embryos are ideal model vertebrates for high-throughput toxicity screening and live in vivo imaging due to their small size and transparency during embryogenesis. Here, we used Single Plane Illumination Microscopy (SPIM)/light sheet microscopy to assess the developmental toxicity of explosive-contaminated water in zebrafish embryos and report 2,4,6-trinitrotoluene-associated developmental abnormalities, including defects in heart formation and circulation, in 3D. Levels of apoptotic cell death were higher in the actively developing tissues of trinitrotoluene-treated embryos than controls. Live 3D imaging of heart tube development at cellular resolution by light-sheet microscopy revealed trinitrotoluene-associated cardiac toxicity, including hypoplastic heart chamber formation and cardiac looping defects, while the real time PCR (polymerase chain reaction) quantitatively measured the molecular changes in the heart and blood development supporting the developmental defects at the molecular level."

According to the news reporters, the research concluded: "Identification of cellular toxicity in zebrafish using the state-of-the-art 3D imaging system could form the basis of a sensitive biosensor for environmental contaminants and be further valued by combining it with molecular analysis."

For more information on this research see: 3D Visualization of Developmental Toxicity of 2,4,6-Trinitrotoluene in Zebrafish Embryogenesis Using Light-Sheet Microscopy. International Journal of Molecular Sciences, 2016;17(11):2290-2303. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Keywords for this news article include: Chunchon, South Korea, Asia, Trinitrotoluene, Hydrocarbons, Cardiology, Kangwon National University.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
Kingdom, by NewsRx journalists, research stated, "The aim of this paper is to compare results from inhalation studies with those from intraperitoneal and intrapleural tests, where available, for a number of fibrous and particulate test materials. The objective is to determine how well intraperitoneal/intrapleural studies predict the pathological responses observed in more standard in vivo studies of pulmonary toxicity, with a particular focus on carcinogenicity."

Financial support for this research came from ECFIA.

The news reporters obtained a quote from the research from the University of Hertfordshire, "Published toxicity data was obtained for a number of materials including asbestos, wollastonite, MMVF (including glass fibres, stone wools and RCF), silicon carbide whiskers, potassium octatitanate, quartz, kevlar, polypropylene and titanium dioxide. For some of the fibrous material reviewed, there is conformity between the results of intraperitoneal and inhalation tests such that they are either consistently positive or consistently negative. For the remaining fibrous materials reviewed, intraperitoneal and inhalation tests give different results, with positive results in the intraperitoneal test not being reflected by positive inhalation results. It is suggested that the intraperitoneal test can be used to exonerate a dust or fibre (because if negative in the intraperitoneal test it is extremely unlikely to be positive in either inhalation or intratracheal tests) but should not be used to positively determine that a dust or fibre is carcinogenic by inhalation."

According to the news reporters, the research concluded: "We would argue against the use of intraperitoneal tests for human health risk assessment except perhaps for the purpose of exonerating a material from classification as a carcinogen."

For more information on this research see: A comparison of the results from intrapleural and intra-peritoneal studies with those from inhalation and intratracheal tests for the assessment of pulmonary responses to inhalable dusts and fibres. Drugs and Therapies - Toxicology and Pharmacology

New Toxicology and Pharmacology Findings from Incyte Discussed [Results from oral gavage carcinogenicity studies of ruxolitinib in Tg.rasH2 mice and Sprague-Dawley (Crl:CD) rats]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Toxicology and Pharmacology is
now available. According to news reporting originating in Wilmington, Delaware, by NewsRx journalists, research stated, "Ruxolitinib is a selective and potent inhibitor of Janus kinase (JAK) 1 and JAK2. It is approved for the treatment of patients with intermediate or high-risk myelofibrosis, or those with polycythemia vera who have had an inadequate response to or are intolerant of hydroxyurea."

Financial support for this research came from Incyte Corporation.

The news reporters obtained a quote from the research from Incyte, "To investigate its carcinogenic potential, ruxolitinib was administered by oral gavage once daily to Tg.rasH2 mice for 6 months at doses of 15, 45 or 125 mg/kg/day, and to Sprague-Dawley (Crl:CD) rats for 2 years at 10, 20 or 60 mg/kg/day. Ruxolitinib had no effect on survival, and did not increase the incidence of any neoplastic findings in either species. Exposure (AUC) was similar to or exceeded that associated with therapeutic use. Lymphoid depletion and a decrease in extramedullary hematopoiesis in the spleen occurred in rats, which were attributed to the pharmacologic activity of ruxolitinib. In Tg.rasH2 mice, increased inflammation in the nasal cavity was observed. Dose-dependent decreases in a number of spontaneous neoplastic/preneoplastic lesions were observed in rats, including mammary tumors in females, adrenal pheochromocytomas in males, hepatocellular adenomas/carcinomas in males, and hepatic basophilic (males and females) and eosinophilic (males) foci. Peribiliary fibrosis was also decreased. Clear cell foci in the liver were increased in females."

According to the news reporters, the research concluded: "Based on the results of these studies, ruxolitinib is not considered to be carcinogenic."

For more information on this research see: Results from oral gavage carcinogenicity studies of ruxolitinib in Tg.rasH2 mice and Sprague-Dawley (Crl:CD) rats. Regulatory Toxicology and Pharmacology, 2016;81():305-315. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Drugs and Therapies - Toxicology and Pharmacology

New Toxicology and Pharmacology Findings from Merck & Company Reported [Use of an in vitro human skin permeation assay to assess bioequivalence of two topical cream formulations containing butenafine hydrochloride (1%, w/w)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Toxicology and Pharmacology is
now available. According to news reporting originating in West Point, Pennsylvania, by NewsRx journalists, research stated, "The primary objective of this work was to investigate, using an in vitro human skin permeation study, whether changes in the excipients of butenafine hydrochloride cream would have any effect on bio-performance of the formulation. Such in vitro data would be a surrogate for any requirement of a bio-equivalence (BE) study to demonstrate formulation similarity."

The news reporters obtained a quote from the research from Merck & Company, "A LC-MS/MS method for quantitation of butenafine in various matrices was developed and validated. A pilot study was performed to validate the in vitro skin permeation methodology using three cream formulations containing butenafine hydrochloride at concentrations of 0.5, 1.0 and 1.5% (w/w). Finally, a definitive in vitro human skin permeation study was conducted, comparing the extent of butenafine hydrochloride permeation from the new formulation to that from the current formulation. The results of the study comparing the two formulations showed that there was no statistically significant difference in the extent of butenafine permeation into human skin."

According to the news reporters, the research concluded: "These in vitro data demonstrated that the formulation change is likely to have no significant impact on the bioperformance of 1% (w/w) butenafine hydrochloride cream."

For more information on this research see: Use of an in vitro human skin permeation assay to assess bioequivalence of two topical cream formulations containing butenafine hydrochloride (1%, w/w). Regulatory Toxicology and Pharmacology, 2016;82():14-19. Drugs and Therapies - Toxicology and Pharmacology

New Toxicology and Pharmacology Study Findings Recently Were Reported by N. Lin and Co-Researchers [Comparison of in vivo immunomodulatory effects of 5-hydroxymethylfurfural and 5, 5'-oxydimethylenebis (2-furfural)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Toxicology and Pharmacology are discussed in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "The standard of 5-Hydroxymethylfurfural (5-HMF) existed in dextrose injection as an inevitable by-product during high-temperature
setrilization has been included in pharmacopoeias considering its hazardous effects on human health. We found that the concentrations of 5-HMF in some traditional Chinese medicine injections (TCMIs) far exceeded its limit in dextrose injection."

The news correspondents obtained a quote from the research, "Besides, we detected 5, 5'-Oxydimethylenebis (2-furfural) (OMBF) in those TCMIs containing high concentrations of 5-HMF. We investigated the in vivo immunomodulatory effects of 5-HMF and OMBF at three dose levels using the reporter antigen popliteal lymph node assay (RA-PLNA), which allows the straightforward examination and mechanistic study of immunotoxicity of low molecular weight compounds. We found that 5-HMF increased the production of IgG(2a) and IFN-gamma when co-injected with TNP-OVA, indicating its capability of providing a co-stimulatory signal to evoke a typical type-1 immune response. Compared with the 5-HMF, OMBF elevated the production of IgG(1) IgG(2), IL-4 and IFN-gamma in response to both reporter antigens, suggesting that OMBF can act as a neo-antigen or neo-epitope to elicit a mixed type-1 and type-2 immune response."

According to the news reporters, the research concluded: "It indicates that both 5-HMF and OMBF have immunosensitizing potential with different mechanisms, and exposure to 5-HMF and OMBF may represent a safety concern for humans."

For more information on this research see: Comparison of in vivo immunomodulatory effects of 5-hydroxymethylfurfural and 5, 5'-oxydimethylenebis (2-furfural). Regulatory Toxicology and Pharmacology, 2016;81():500-511. Respiratory Tract Diseases and Conditions - Tracheal…

New Tracheal Stenosis Study Findings Recently Were Reported by Researchers at University of Miami (Two lost airways and one unexpected problem: undiagnosed tracheal stenosis in a morbidly obese patient)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Respiratory Tract Diseases and Conditions - Tracheal Stenosis have been presented. According to news reporting out of Miami, Florida, by NewsRx editors, research stated, "Anesthetic care of the morbidly obese is complex due to anatomic and physiologic alterations. Airway management in particular can be challenging."

Our news journalists obtained a quote from the research from the University of Miami, "High body mass index is predictive of difficult ventilation and possibly difficult
intubation. Other airway anomalies, such as tracheal stenosis, add to the complexity of airway management. Tracheal stenosis, a form of central airway obstruction, may be challenging to diagnose, especially in the obese. Comorbidities can mask the diagnosis and routine imaging may fail to identify the pathology."

According to the news editors, the research concluded: "We present the case of a morbidly obese patient with 2 failed intubations due to difficult anatomy compounded with undiagnosed tracheal stenosis."

Our news journalists report that additional information may be obtained by contacting M.A. Cobas, University of Miami, Leonard Miller Sch Med, Dept. of Anesthesiol Perioperat Med & Pain Management, Miami, FL 33136, United States. Additional authors for this research include N.D. Martin and H.B. Barkin.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jclinane.2016.07.026. This DOI is a link to an online electronic document that is either free or for purchase.

**Proteins - Transcription Factors**

**New Transcription Factors Findings Has Been Reported by Investigators at University of Ljubljana [Transcription factor HIF1A: downstream targets, associated pathways, polymorphic hypoxia response element (HRE) sites, and initiative for ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Proteins - Transcription Factors. According to news originating from Ljubljana, Slovenia, by NewsRx correspondents, research stated, "Hypoxia-inducible factor-1 alpha (HIF-1 alpha) has crucial role in adapting cells to hypoxia through expression regulation of many genes. Identification of HIF-1 alpha target genes (HIF1 alpha-TGs) is important for understanding the adapting mechanism."

Financial support for this research came from Javna Agencija za Raziskovalno Dejavnost RS.

Our news journalists obtained a quote from the research from the University of Ljubljana, "The aim of the present study was to collect known HIF1 alpha-TGs and identify their associated pathways. Targets and associated genomics data were retrieved using PubMed, WoS (http://apps.webofknowledge.com/), HGNC (http://www.genenames.org/), NCBI (http://www.ncbi.nlm.nih.gov/), Ensemblv.84 (http://www.ensembl.org/index.html), DAVID
Bioinformatics Resources (https://david.ncifcrf.gov/), and Disease Ontology database (http://disease-ontology.org/). From 51 papers, we collected 98 HIF-1 alpha TGs found to be associated with 20 pathways, including metabolism of carbohydrates and pathways in cancer. Reanalysis of genomic coordinates of published HREs (hypoxia response elements) revealed six polymorphisms within HRE sites (HRESNPs): ABCG2, ACE, CA9, and CP. Due to large heterogeneity of results presentation in scientific literature, we also propose a first step towards reporting standardization of HIF-1 alpha-target interactions consisting of ten relevant data types. Suggested minimal checklist for reporting will enable faster development of a complete catalog of HIF-1 alpha-TGs, data sharing, bioinformatics analyses, and setting novel more targeted hypotheses.”

According to the news editors, the research concluded: "The proposed format for data standardization is not yet complete but presents a baseline for further optimization of the protocol with additional details, for example, regarding the experimental validation.”

For more information on this research see: Transcription factor HIF1A: downstream targets, associated pathways, polymorphic hypoxia response element (HRE) sites, and initiative for standardization of reporting in scientific literature. Tumor Biology, 2016;37(11):14851-14861. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. **Nursing - Transcultural Nursing**

**New Transcultural Nursing Study Findings Have Been Reported from University of California (Aging, Genetic Variations, and Ethnopharmacology: Building Cultural Competence Through Awareness of Drug Responses in Ethnic Minority Elders)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nursing - Transcultural Nursing. According to news reporting from Los Angeles, California, by NewsRx journalists, research stated. "Unique drug responses that may result in adverse events are among the ethnocultural differences described by the Agency for Healthcare Research and Quality. These differences, often attributed to a lack of adherence on the part of the older adult, may be linked to genetic variations that influence drug responses in different ethnic groups."

The news correspondents obtained a quote from the research from the University of California, "The paucity of research coupled with a lack of knowledge among health care providers compound the problem, contributing to further disparities, especially in this era of personalized medicine and pharmacogenomics. This article examines how age-related changes
and genetic differences influence variations in drug responses among older adults in unique ethnocultural groups."

According to the news reporters, the research concluded: "The article starts with an overview of age-related changes and ethnopharmacology, moves to describing genetic differences that affect drug responses, with a focus on medications commonly prescribed for older adults, and ends with application of these issues to culturally congruent health care."

Our news journalists report that additional information may be obtained by contacting D.L. Woods, University of California, Los Angeles, CA, United States. Additional authors for this research include J.C. Mentes, M. Cadogan and L.R. Phillips.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/1043659615606202. This DOI is a link to an online electronic document that is either free or for purchase.

**Transfusion Medicine**

**New Transfusion Medicine Findings from Singapore National University Described (Farnesoid X Receptor and Its Ligands Inhibit the Function of Platelets)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Transfusion Medicine. According to news originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Although initially seemingly paradoxical because of the lack of nucleus, platelets possess many transcription factors that regulate their function through DNA-independent mechanisms. These include the farnesoid X receptor (FXR), a member of the superfamily of ligand-activated transcription factors, that has been identified as a bile acid receptor."

Our news journalists obtained a quote from the research from Singapore National University, "In this study, we show that FXR is present in human platelets and FXR ligands, GW4064 and 6 alpha-ethyl-chenodeoxycholic acid, modulate platelet activation nongenomically. Approach and Results-FXR ligands inhibited the activation of platelets in response to stimulation of collagen or thrombin receptors, resulting in diminished intracellular calcium mobilization, secretion, fibrinogen binding, and aggregation. Exposure to FXR ligands also reduced integrin alpha(IIb)beta(3) outside-in signaling and thereby reduced the ability of platelets to spread and to stimulate clot retraction. FXR function in platelets was found to be associated with the modulation of cyclic guanosine monophosphate levels in platelets and associated downstream inhibitory signaling. Platelets from FXR-deficient mice were refractory
to the actions of FXR agonists on platelet function and cyclic nucleotide signaling, firmly linking the nongenomic actions of these ligands to the FXR. This study provides support for the ability of FXR ligands to modulate platelet activation."

According to the news editors, the research concluded: "The atheroprotective effects of GW4064, with its novel antiplatelet effects, indicate FXR as a potential target for the prevention of atherothrombotic disease."

For more information on this research see: Farnesoid X Receptor and Its Ligands Inhibit the Function of Platelets. Arteriosclerosis Thrombosis and Vascular Biology, 2016;36 (12):2324-2333. Arteriosclerosis Thrombosis and Vascular Biology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Cardiovascular Diseases and Conditions - Transient

New Transient Ischemic Attack Study Findings Reported from University of Oxford (Hemodynamic correlates of transient cognitive impairment after transient ischemic attack and minor stroke: A transcranial Doppler study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Transient Ischemic Attack. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "Transient cognitive impairment (TCI) on the Mini Mental State Evaluation score is common after transient ischemic attack/minor stroke and might identify patients at increased risk of dementia. We aimed to replicate TCI using the Montreal Cognitive Assessment (MoCA), compare it with persistent Mild Cognitive Impairment (PMCI), and to determine whether global cerebral hemodynamic changes could explain transient impairment."

Our news journalists obtained a quote from the research from the University of Oxford, "Consecutive patients with transient ischemic attack/minor stroke (NIHSS <= 3) were assessed with the MoCA and transcranial Doppler ultrasound acutely and at 1 month. We compared patients with TCI (baseline MoCA < 26 with >= 2 points increase at 1 month), PMCI (MoCA < 26 with < 2 points increase), and no cognitive impairment (NCI; MoCA >= 26). Of 326 patients, 46 (14.1%) had PMCI, 98 (30.1%) TCI, and 182 (55.8%) NCI. At baseline, TCI patients had higher systolic blood pressure (150.95 +/- 21.52 vs 144.86 +/- 22.44 mmHg, p = 0.02) and lower cerebral blood flow velocities, particularly end-diastolic velocity (30.16 +/- 9.63 vs 35.02 +/- 9.01 cm/s, p< 0.001) and mean flow velocity (48.95 +/- 12.72 vs 54 +/- 12.46 cm/s, p = 0.001) than those with NCI, but similar clinical and hemodynamic profiles to those with

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
PMCI. Systolic BP fell between baseline and 1 month (mean reduction = 14.01 +/- 21.26 mmHg) and end-diastolic velocity and mean flow velocity increased (mean increase = +2.42 +/- 6.41 and 1.89 +/- 8.77 cm/s, respectively), but these changes did not differ between patients with TCI, PMCI, and NCI. TCI is detectable with the MoCA after transient ischemic attack and minor stroke and has similar clinical and hemodynamic profile to PMCI.

According to the news editors, the research concluded: "However, TCI does not appear to be due to exaggerated acute reversible global hemodynamic changes."

The news correspondents report that additional information may be obtained from S. Mazzucco, University of Oxford, Nuffield Dept. of Clin Neurosci, Oxford, United Kingdom. Additional authors for this research include L.X. Li, M.A. Tuna, S.T. Pendlebury, R. Wharton and P.M. Rothwell.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/1747493016661565. This DOI is a link to an online electronic document that is either free or for purchase.

Triterpenes

New Triterpenes Findings Has Been Reported by Investigators at Nanjing University (Simultaneous determination of notoginsenoside R1 and ginsenoside Re in rat plasma by ultra high performance liquid chromatography with tandem mass spectrometry ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Triterpenes have been published. According to news reporting originating in Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "A rapid and high sensitive ultra high performance liquid chromatography with tandem mass spectrometry method for the simultaneous determination of notoginsenoside R1 and ginsenoside Re in rat plasma was developed. The analytes and internal standard, digoxin, were extracted from rat plasma via protein precipitation with methanol and separated on an Phenomenex Gemini C-18 column within 2 min."

The news reporters obtained a quote from the research from Nanjing University, "Quantitation was performed on a triple quadrupole mass spectrometer employing electrospray ionization technique, operating in multiple reaction monitoring and positive ion mode. The precursor to product ion transitions monitored for notoginsenoside R1, ginsenoside Re, and internal standard were m/z 955.5 -> 775.5, 969.6 -> 789.1, and 803.6 -> 283.1, respectively. The
assay was validated with linear range of 1.9-380 ng/mL for notoginsenoside R1 and 0.5-100 ng/mL for ginsenoside Re. The intra-and interday precisions (RSD%) were within 8.96% for each analyte. The absolute recoveries were greater than 93% for R1 and 96% for Re. Each analyte was stable during all sample storage, preparation, and analytic procedures."

According to the news reporters, the research concluded: "The method was successfully applied to a pharmacokinetic study of Xuesaitong dispersible tablets in eight rats."

Keywords for this news article include: Jiangsu, People's Republic of China, Asia, High-Performance Liquid Chromatography, Imaging Technology, Pharmacokinetics, Pharmaceuticals, Ginsenosides, Triterpenes, Nanjing University.

**Parasitic Diseases and Conditions - Trypanosomiasis**

**New Trypanosomiasis Study Findings Recently Were Reported by Researchers at Swiss Tropical and Public Health Institute (Efficacy, Safety, and Dose of Pafuramidine, a New Oral Drug for Treatment of First Stage Sleeping Sickness, in a Phase 2a ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Parasitic Diseases and Conditions - Trypanosomiasis have been presented. According to news reporting originating from Basel, Switzerland, by NewsRx correspondents, research stated, "Sleeping sickness (human African trypanosomiasis [HAT]) is caused by protozoan parasites and characterized by a chronic progressive course, which may last up to several years before death. We conducted two Phase 2 studies to determine the efficacy and safety of oral pafuramidine in African patients with first stage HAT."

Our news editors obtained a quote from the research from Swiss Tropical and Public Health Institute, "The Phase 2a study was an open-label, non-controlled, proof-of-concept study where 32 patients were treated with 100 mg of pafuramidine orally twice a day (BID) for 5 days at two trypanosomiasis reference centers (Angola and the Democratic Republic of the Congo [DRC]) between August 2001 and November 2004. The Phase 2b study compared pafuramidine in 41 patients versus standard pentamidine therapy in 40 patients. The Phase 2b study was open-label, parallel-group, controlled, randomized, and conducted at two sites in the DRC between April 2003 and February 2007. The Phase 2b study was then amended to add an open-label sequence (Phase 2b-2), where 30 patients received pafuramidine for 10 days. The primary efficacy endpoint was parasitologic cure at 24 hours (Phase 2a) or 3 months (Phase 2b) after
treatment completion. The primary safety outcome was the rate of occurrence of World Health Organization Toxicity Scale Grade 3 or higher adverse events. All subjects provided written informed consent. Pafuramidine for the treatment of first stage HAT was comparable in efficacy to pentamidine after 10 days of dosing. The cure rates 3 months post-treatment were 79% in the 5-day pafuramidine, 100% in the 7-day pentamidine, and 93% in the 10-day pafuramidine groups. In Phase 2b, the percentage of patients with at least 1 treatment-emergent adverse event was notably higher after pentamidine treatment (93%) than pafuramidine treatment for 5 days (25%) and 10 days (57%)."

According to the news editors, the research concluded: "These results support continuation of the development program for pafuramidine into Phase 3."

**Tryptamines**

**New Tryptamines Findings from ARUP Described** (A high-performance liquid chromatography method for the serotonin release assay is equivalent to the radioactive method)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Tryptamines. According to news reporting originating from Salt Lake City, Utah, by NewsRx correspondents, research stated, "The serotonin release assay (SRA) is considered the gold standard laboratory test for heparin-induced thrombocytopenia (HIT). The historic SRA method uses platelets loaded with radiolabeled serotonin to evaluate platelet activation by HIT immune complexes."

Our news editors obtained a quote from the research from ARUP, "However, a nonradioactive method is desirable. We report the performance characteristics of a high-performance liquid chromatography (HPLC) SRA method. We validated the performance characteristics of an HPLC-SRA method, including correlation with a reference laboratory using the radioactive method. Serotonin released from reagent platelets was quantified by HPLC using
fluorescent detection. Results were expressed as % release and classified as positive, negative, or indeterminate based on previously published cutoffs. Serum samples from 250 subjects with suspected HIT were tested in the HPLC-SRA and with the radioactive method. Concordant classifications were observed in 230 samples (92%). Sera from 41 healthy individuals tested negative. Between-run imprecision studies showed standard deviation of <6 (% release) for positive, weak positive, and negative serum pools. Stability studies demonstrated stability after two freeze-thaw cycles or up to a week of refrigeration."

According to the news editors, the research concluded: "The HPLC-SRA has robust performance characteristics, equivalent to the historic radioactive method, but avoids the complexities of working with radioactivity."

The news editors report that additional information may be obtained by contacting N.K. Sono-Koree, ARUP Laboratories Institute for Clinical and Experimental Pathology, Salt Lake City, UT, United States. Additional authors for this research include R.A. Crist, E.L. Frank, G.M. Rodgers and K.J Smock.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ijlh.12442. This DOI is a link to an online electronic document that is either free or for purchase.

**Mycobacterium Infections - Tuberculosis**

**New Tuberculosis Data Have Been Reported by H.H. Soutter and Co-Authors (Discovery of cofactor-specific, bactericidal Mycobacterium tuberculosis InhA inhibitors using DNA-encoded library technology)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mycobacterium Infections - Tuberculosis is the subject of a report. According to news reporting out of Waltham, Massachusetts, by NewsRx editors, research stated, "Millions of individuals are infected with and die from tuberculosis (TB) each year, and multidrug-resistant (MDR) strains of TB are increasingly prevalent. As such, there is an urgent need to identify novel drugs to treat TB infections."

Our news journalists obtained a quote from the research, "Current frontline therapies include the drug isoniazid, which inhibits the essential NADH-dependent enoyl-acyl-carrier protein (ACP) reductase, InhA. To inhibit InhA, isoniazid must be activated by the catalase-peroxidase KatG. Isoniazid resistance is linked primarily to mutations in the katG gene."
Discovery of InhA inhibitors that do not require KatG activation is crucial to combat MDR TB. Multiple discovery efforts have been made against InhA in recent years. Until recently, despite achieving high potency against the enzyme, these efforts have been thwarted by lack of cellular activity. We describe here the use of DNA-encoded X-Chem (DEX) screening, combined with selection of appropriate physical properties, to identify multiple classes of InhA inhibitors with cell-based activity. The utilization of DEX screening allowed the interrogation of very large compound libraries (10^{11} unique small molecules) against multiple forms of the InhA enzyme in an multiplexed format."

According to the news editors, the research concluded: "Comparison of the enriched library members across various screening conditions allowed the identification of cofactor-specific inhibitors of InhA that do not require activation by KatG, many of which had bactericidal activity in cell-based assays."

**Mycobacterium Infections - Tuberculosis**

**New Tuberculosis Data Have Been Reported by Researchers at Center for Disease Control and Prevention (Discovery and Optimization of Two Eis Inhibitor Families as Kanamycin Adjuvants against Drug-Resistant M. tuberculosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Mycobacterium Infections - Tuberculosis. According to news reporting originating in Atlanta, Georgia, by NewsRx journalists, research stated, "Drug-resistant tuberculosis (TB) is a global threat and innovative approaches such as
using adjuvants of anti-TB therapeutics are required to combat it. High-throughput screening yielded two lead scaffolds of inhibitors of Mycobacterium tuberculosis (Mt) acetyltransferase Eis, whose upregulation causes resistance to the anti-TB drug kanamycin (KAN)."

Financial supporters for this research include National Institute of Allergy and Infectious Diseases, Firland Foundation, College of Pharmacy, University of Kentucky, Center for Chemical Genomics, University of Michigan.

The news reporters obtained a quote from the research from Center for Disease Control and Prevention, "Chemical optimization on these scaffolds resulted in potent Eis inhibitors. One compound restored the activity of KAN in a KAN-resistant Mt strain."

According to the news reporters, the research concluded: "Model structures of Eis-inhibitor complexes explain the structure activity relationship."

For more information on this research see: "Discovery and Optimization of Two Eis Inhibitor Families as Kanamycin Adjuvants against Drug-Resistant M. tuberculosis. ACS Medicinal Chemistry Letters, 2016;7(12):1219-1221. ACS Medicinal Chemistry Letters can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; ACS Medicinal Chemistry Letters - www.pubs.acs.org/journal/amclct)"

Mycobacterium Infections - Tuberculosis

New Tuberculosis Findings from A. Disratthakit and Co-Researchers Reported (Role of gyrB Mutations in Pre-extensively and Extensively Drug-Resistant Tuberculosis in Thai Clinical Isolates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mycobacterium Infections - Tuberculosis is the subject of a report. According to news reporting originating in Bangkok, Thailand, by NewsRx journalists, research stated, "DNA gyrase mutations are a major cause of quinolone resistance in Mycobacterium tuberculosis. We therefore conducted the first comprehensive study to determine the diversity of gyrase mutations in pre-extensively drug-resistant (pre-XDR) (n = 71) and extensively drug-resistant (XDR) (n = 30) Thai clinical tuberculosis (TB) isolates."

Funders for this research include Royal Golden Jubilee Ph.D. Program, Research and
Development, Faculty of Medicine Siriraj Hospital, Japan Science and Technology Agency and National Science and Technology Development Agency.

The news reporters obtained a quote from the research, "All pre-XDR-TB and XDR-TB isolates carried at least one mutation within the quinolone resistance-determining region of GyrA (G88A [1.1%], A90V [17.4%], S91P [1.1%], or D94A/G/H/N/V/Y [72.7%]) or GyrB (D533A [1.1%], N538D [1.1%], or E540D [2.2%]). MIC and DNA gyrase supercoiling inhibition assays were performed to determine the role of gyrase mutations in quinolone resistance. Compared to the MICs against M. tuberculosis H37Rv, the levels of resistance to all quinolones tested in the isolates that carried GyrA-D94G or GyrB-N538D (8-to 32-fold increase) were significantly higher than those in isolates bearing GyrA-D94A or GyrA-A90V (2-to 8-fold increase) (P < 0.01). Intriguingly, GyrB-E540D led to a dramatic resistance to later-generation quinolones, including moxifloxacin, gatifloxacin, and sparfloxacin (8-to 16-fold increases in MICs and 8.3- to 11.2-fold increases in 50% inhibitory concentrations [IC(50)s]). However, GyrB-E540D caused low-level resistance to early-generation quinolones, including ofloxacin, levofloxacin, and ciprofloxacin (2-to 4-fold increases in MICs and 1.5-to 2.0-fold increases in IC(50)s). In the present study, DC-159a was the most active antituberculosis agent and was little affected by the gyrase mutations described above."

According to the news reporters, the research concluded: "Our findings suggest that although they are rare, gyrB mutations have a notable role in quinolone resistance, which may provide clues to the molecular basis of estimating quinolone resistance levels for drug and dose selection."

For more information on this research see: Role of gyrB Mutations in Pre-extensively and Extensively Drug-Resistant Tuberculosis in Thai Clinical Isolates. Antimicrobial Agents and Chemotherapy, 2016;60(9):5189-5197. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting A. Chaiprasert, Siriraj Fdn, Drug Resistant TB Res Fund, Bangkok, Thailand. Additional authors for this research include T. Pramananan, C. Tribuddharat, I. Thaipisuttikul, N. Doi, M. Leechawengwongs and A. Chaiprasert.

New Tuberculosis Findings from L. Moreira-Teixeira and Co-Authors Described (Type I IFN Inhibits Alternative Macrophage Activation during Mycobacterium tuberculosis Infection and Leads to Enhanced Protection in the Absence of IFN-gamma Signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mycobacterium Infections - Tuberculosis are presented in a new report. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Tuberculosis causes similar to 1.5 million deaths every year, thus remaining a leading cause of death from infectious diseases in the world. A growing body of evidence demonstrates that type I IFN plays a detrimental role in tuberculosis pathogenesis, likely by interfering with IFN-gamma-dependent immunity."

The news correspondents obtained a quote from the research, "In this article, we reveal a novel mechanism by which type I IFN may confer protection against Mycobacterium tuberculosis infection in the absence of IFN-gamma signaling. We show that production of type I IFN by M. tuberculosis-infected macrophages induced NO synthase 2 and inhibited arginase 1 gene expression. In vivo, absence of both type I and type II IFN receptors led to strikingly increased levels of arginase 1 gene expression and protein activity in infected lungs, characteristic of alternatively activated macrophages. This correlated with increased lung bacterial burden and pathology and decreased survival compared with mice deficient in either receptor. Increased expression of other genes associated with alternatively activated macrophages, as well as increased expression of Th2-associated cytokines and decreased TNF expression, were also observed. Thus, in the absence of IFN-gamma signaling, type I IFN suppressed the switching of macrophages from a more protective classically activated phenotype to a more permissive alternatively activated phenotype."

According to the news reporters, the research concluded: "Together, our data support a model in which suppression of alternative macrophage activation by type I IFN during M. tuberculosis infection, in the absence of IFN-gamma signaling, contributes to host protection."

For more information on this research see: Type I IFN Inhibits Alternative Macrophage Activation during Mycobacterium tuberculosis Infection and Leads to Enhanced Protection in the Absence of IFN-gamma Signaling. *Journal of Immunology*, 2016;197 (12):4714-4726. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. New Tuberculosis Findings from University of Alabama Described (8-Hydroxyquinolines Are Boosting Agents of Copper-Related Toxicity in Mycobacterium tuberculosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mycobacterium Infections - Tuberculosis are presented in a new report. According to news reporting originating in Birmingham, Alabama, by NewsRx journalists, research stated, "Copper (Cu) ions are likely the most important immunological metal-related toxin utilized in controlling bacterial infections. Impairment of bacterial Cu resistance reduces viability within the host."

Funders for this research include HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID), National Science Foundation (NSF).

The news reporters obtained a quote from the research from the University of Alabama, "Thus, pharmacological enhancement of Cu-mediated antibacterial toxicity may lead to novel strategies in drug discovery and development. Screening for Cu toxicity-enhancing antibacterial molecules identified 8-hydroxyquinoline (8HQ) to be a potent Cu-dependent bactericidal inhibitor of Mycobacterium tuberculosis. The MIC of 8HQ in the presence of Cu was 0.16 μM for replicating and nonreplicating M. tuberculosis cells. We found 8HQ's activity to be dependent on the presence of extracellular Cu and to be related to an increase in cell-associated labile Cu ions. Both findings are consistent with 8HQ acting as a Cu ionophore. Accordingly, we identified the 1:1 complex of 8HQ and Cu to be its active form, with Zn, Fe, or Mn neither enhancing nor reducing its Cu-specific action. This is remarkable, considering that the respective metal complexes have nearly identical structures and geometries. Finally, we found 8HQ to kill M. tuberculosis selectively within infected primary macrophages. Given the stark Cu-dependent nature of 8HQ activity, this is the first piece of evidence that Cu ions within macrophages may bestow antibacterial properties to a Cu-dependent inhibitor of M. tuberculosis."

According to the news reporters, the research concluded: "Our findings highlight the metal-binding ability of the 8-hydroxyquinoline scaffold to be a potential focus for future medicinal chemistry and highlight the potential of innate immunity-inspired screening platforms to reveal molecules with novel modes of action against M. tuberculosis."

For more information on this research see: 8-Hydroxyquinolines Are Boosting Agents of Copper-Related Toxicity in Mycobacterium tuberculosis. Antimicrobial Agents and Chemotherapy, 2016;60(10):5765-5776. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting F. Wolschendorf, Univ Alabama Birmingham, Dept. of Med, Div Infect Dis, Birmingham, AL 35294, United States. New Tuberculosis Findings from University of Kentucky Reported
(Sulfonamide-Based Inhibitors of Aminoglycoside Acetyltransferase Eis Abolish Resistance to Kanamycin in Mycobacterium tuberculosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mycobacterium Infections - Tuberculosis are presented in a new report. According to news originating from Lexington, Kentucky, by NewsRx correspondents, research stated, "A two-drug combination therapy where one drug targets an offending cell and the other targets a resistance mechanism to the first drug is a time-tested, yet underexploited approach to combat or prevent drug resistance. By high-throughput screening, we identified a sulfonamide scaffold that served as a pharmacophore to generate inhibitors of Mycobacterium tuberculosis acetyltransferase Eis, whose upregulation causes resistance to the aminoglycoside (AG) antibiotic kanamycin A (KAN) in Mycobacterium tuberculosis." Funders for this research include National Institute of Allergy and Infectious Diseases, Firland Foundation, College of Pharmacy, University of Kentucky, Center for Chemical Genomics, University of Michigan.

Our news journalists obtained a quote from the research from the University of Kentucky, "Rational systematic derivatization of this scaffold to maximize Eis inhibition and abolish the Eis-mediated KAN resistance of M. tuberculosis yielded several highly potent agents. A crystal structure of Eis in complex with one of the most potent inhibitors revealed that the inhibitor bound Eis in the AG-binding pocket held by a conformationally malleable region of Eis (residues 28-37) bearing key hydrophobic residues."

According to the news editors, the research concluded: "These Eis inhibitors are promising leads for preclinical development of innovative AG combination therapies against resistant TB."

The news correspondents report that additional information may be obtained from O.V. Tsodikov, University of Kentucky, Dept. of Pharmaceut Sci, Coll Pharm, Lexington, KY 40536, United States. Additional authors for this research include M.J. Willby, K.D. Green, C.S.
New Tuberculosis Study Findings Recently Were Reported by Researchers at Global Alliance for TB Drug Development (TB Alliance regimen development for multidrug-resistant tuberculosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mycobacterium Infections - Tuberculosis have been published. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "The recent approval of new tuberculosis (TB) drugs raises hope for new and more effective anti-tuberculosis treatment regimens."

Our news journalists obtained a quote from the research from Global Alliance for TB Drug Development, "The Global Alliance for TB Drug Development (TB Alliance) is committed to ensuring that new anti-tuberculosis drugs fulfill the needs of patients, their families and the local health services that serve the communities. Here we present highlights of the TB Alliance's pipeline of regimen development, with novel regimens for patients with drug-susceptible, multidrug-resistant and extensively drug-resistant TB."

According to the news editors, the research concluded: "The ongoing clinical trials (STAND, NC-005, Nix-TB and LIN-CL001) are outlined and their rationale and goals presented."

The news correspondents report that additional information may be obtained from S. Murray, Global Alliance TB Drug Dev TB Alliance, New York, NY 10005, United States. Additional authors for this research include C. Mendel and M. Spigelman.

New Type 1 Diabetes Mellitus Findings Reported from University of Helsinki (Endotoxins are associated with visceral fat mass in type 1 diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus have been published. According to news originating from Helsinki, Finland, by NewsRx correspondents, research stated, "Bacterial lipopolysaccharides (LPS), potent inducers of inflammation, have been associated with chronic metabolic disturbances. Obesity is linked to dyslipidemia, increased body adiposity, and endotoxemia."

Our news journalists obtained a quote from the research from the University of Helsinki, "We investigated the cross-sectional relationships between serum LPS activity and body adiposity as well as inflammation in 242 subjects with type 1 diabetes. Body fat distribution was measured by DXA and serum LPS activity by the limulus amebocyte lysate end-point assay. Since no interaction between visceral fat mass and sex was observed, data were pooled for the subsequent analyses. LPS was independently associated with visceral fat mass, when adjusted for traditional risk factors (age, sex, kidney status, hsCRP, insulin sensitivity). In the multivariate analysis, serum LPS activity and triglyceride concentrations had a joint effect on visceral fat mass, independent of these factors alone. A combination of high LPS and high hsCRP concentrations was also observed in those with the largest visceral fat mass."

According to the news editors, the research concluded: "High serum LPS activity levels were associated with visceral fat mass in subjects with type 1 diabetes strengthening its role in the development of central obesity, inflammation and insulin resistance."

For more information on this research see: Endotoxins are associated with visceral fat mass in type 1 diabetes. Scientific Reports, 2016;6():1-6. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

New Type 1 Diabetes Mellitus Study Findings Have Been Reported by Researchers at Sapienza University [Saxagliptin improves glycaemic control and C-peptide secretion in latent autoimmune diabetes in adults (LADA)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus. According to news reporting from Rome, Italy, by NewsRx journalists, research stated, "To assess the efficacy and tolerability of saxagliptin and C-peptide secretion in patients with diagnosed type 2 diabetes classified as glutamic acid decarboxylase antibody (GADA)-positive or GADA-negative. Post hoc analysis of data pooled from five randomized, placebo-controlled, 24-week phase 3 studies (n=2709) was conducted."

The news correspondents obtained a quote from the research from Sapienza University, "We evaluated mean change from baseline at week 24 in HbA1c, fasting plasma glucose, postprandial plasma glucose, fasting and postprandial C-peptide, and HOMA2-%b and the proportion of patients achieving HbA1c <7% (53 mmol/mol) at week 24. Saxagliptin produced greater adjusted mean reductions from baseline in HbA1c versus placebo for GADA-negative [difference vs placebo (95% CI), -0.62% (-0.71% to -0.54%); -6.8 mmol/mol (-7.8, -5.9)] and GADA-positive patients [-0.64% (-1.01% to -0.27%); -7.0 mmol/mol (-11.0, -3.0)]. Consistently, saxagliptin produced a greater reduction from baseline in fasting plasma glucose and postprandial plasma glucose versus placebo in GADA-positive versus GADA-negative patients, and more patients achieved HbA1c <7% (53 mmol/mol) with saxagliptin versus placebo in both GADA-negative and GADA-positive patients. Saxagliptin increased b-cell function as assessed by HOMA2-%b and postprandial C-peptide area under the curve from baseline in patients in both GADA-positive and GADA-negative patients. Adverse events and hypoglycaemic events were similar across treatment groups and GADA categories. Saxagliptin was effective in lowering blood glucose levels and generally well tolerated in GADA-positive patients."

According to the news reporters, the research concluded: "Interestingly, saxagliptin appears to improve b-cell function in these patients, although a longer treatment duration may be needed to confirm this finding."

For more information on this research see: Saxagliptin improves glycaemic control and C-peptide secretion in latent autoimmune diabetes in adults (LADA). Diabetes, 2015;32 (3):289-96. (Elsevier - www.elsevier.com; Diabetes - www.journals.elsevier.com/diabetes-and-metabolic-syndrome-clinical-research-and-reviews/)

New Type 2 Diabetes Data Have Been Reported by Investigators at Shandong University (Association between DPP4 gene polymorphism and serum lipid levels in Chinese type 2 diabetes individuals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting out of Shandong, People's Republic of China, by NewsRx editors, research stated, "The goal of the genetic investigation was to identify the associations of serum lipid levels and DPP-4 variants in Chinese type 2 diabetes patients. We detected four variants of the DPP4 gene in. 190 Chinese individuals with type 2 diabetes and tested for an association with dyslipidemia in 82 selected samples."

Funders for this research include Forbidden City International Pharmacist Forum, Natural Science Foundation of Shandong Province, China, National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Shandong University, "Data including basic information, HbA1c, FPG, serum lipid parameters were collected. Statistical analysis was performed by SPSS 13.0 through ANOVA and chi(2) test. The genetic polymorphism of rs466/1443, rs3788979, rs7608798 and rs1558957 in Chinese type 2 diabetes were consistent with Hardy-Weinberg equilibrium. The CT genotype of rs4664443 suffered from higher serum TG (P = 0.013), LDL (P = 0.044) and ApoB (P = 0.006) levels, whereas the TT genotype of rs7608798 exhibited a lower serum TG level (P = 0.037). For rs3788979, the serum TG level (P = 0.034) and BMI (P = 0.04) were significantly different among genotypes. Moreover, serum TG and TC levels and BMI showed a positive correlation with the number unfavorable alleles, and individuals with more than two unfavorable alleles had higher TG (P = 0.004), TC (P = 0.011), and BMI (P = 0.044) values."

According to the news editors, the research concluded: "This is the first study to investigate DPP4 allelic distributions and their association with dyslipidemia in Chinese type 2 diabetes patients, which may have clinical significance."

Our news journalists report that additional information may be obtained by contacting L. Liao, Shandong University, Shandong Prov Qianfoshan Hosp, Dept. of Endocrinol, Jinan, Shandong, People's Republic of China. Additional authors for this research include Y. Han, X.J. Zhou, B. Zhang, Y. Li, Z.S. Wang, L. Liao and L.Q. Su.

Nutritional and Metabolic Diseases and Conditions —

New Type 2 Diabetes Findings from McGill University Described
(Pharmacosurveillance without borders: electronic health records in different countries can be used to address important methodological issues in estimating the risk of adverse events)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting from Montreal, Canada, by NewsRx journalists, research stated, "Evaluate methodological advantages and limitations of an international pharmacosurveillance system based on electronic health records (EHRs). Type 2 diabetes was used as an exemplar."

The news correspondents obtained a quote from the research from McGill University, "Cohorts of newly treated diabetics were followed in each country (Quebec, Canada; Massachusetts, United States; Manchester, UK) from 2009 to 2012 using local EHR systems. Cox proportional hazards models were used to assess the risk of cardiovascular events. A total of 44,913 newly treated diabetics were identified; 82.6% (United States) to 93.1% (Canada) were started on biguanides; 13% of patients failed to fill initial prescriptions. An increased risk of cardiovascular events with sulfonylureas was observed when dispensing [hazard ratio (HR): 2.83] vs. ERR. prescribing (HR: 2.47) data were used. The addition of clinical data produced a threefold to 10-fold increase in comorbidity for obesity and renal disease, but had no impact on the risk of different hypoglycemic therapies. The risk of cardiovascular events with sulfonylureas was higher in the United States [HR: 3.4; 95% confidence interval (CI): 2.1, 5.5] compared to England (HR: 1.3; 95% CI: 1.1, 1.6)."

According to the news reporters, the research concluded: "An international surveillance system based on EHRs may provide more timely information about drug safety and new opportunities to estimate potential sources of bias and health system effects on drug-related outcomes."

For more information on this research see: Pharmacosurveillance without borders; electronic health records in different countries can be used to address important methodological issues in estimating the risk of adverse events. *Journal of Clinical Epidemiology*, 2016;77 ():101-111. *Journal of Clinical Epidemiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Nutritional and Metabolic Diseases and Conditions - …

New Type 2 Diabetes Findings from Poznan University of Medical Sciences Outlined (The Impact of Pharmacotherapy of Type 2 Diabetes Mellitus on IL-1b, IL-6 and IL-10 Secretion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting originating from Poznan, Poland, by NewsRx correspondents, research stated, "The aim of this study was to assess the impact of pharmacotherapy of diabetes on atherosclerosis, as reflected in interleukin (IL)-1b, IL-6 and IL-10 serum levels. We studied patients with type 2 diabetes, treated with metformin, insulin combined with metformin and conventional insulin."

Our news editors obtained a quote from the research from the Poznan University of Medical Sciences, "IL-1b, IL-6 and IL-10 serum levels were assayed using BD? Cytometric Bead Array. Multivariate analysis of covariance was performed to exclude the impact of some metabolic and anthropometric factors on differences in cytokines concentrations among the participants receiving different pharmacotherapy. The serum concentrations of IL-1b and IL-6 were significantly higher and IL-10 serum levels were significantly lower in the insulin-treated group than in other therapeutic groups. Covariance analysis confirmed that differences in IL-1b and IL-6 levels were determined by pharmacotherapy and fasting plasma glucose, whereas in IL-10 levels by the therapy only. Additionally, peptide C modified differences in IL-1b levels and HbA1c in IL-6 concentrations. This study revealed that both pharmacotherapy and glycemic control may modify some pro-atherogenic factors, such as IL-1b and IL-6."

According to the news editors, the research concluded: "The therapy with metformin and insulin combined with metformin seems to be much more beneficial in terms of their impact on pro-inflammatory cytokines secretion in comparison to conventional insulinotherapy."

For more information on this research see: The Impact of Pharmacotherapy of Type 2 Diabetes Mellitus on IL-1b, IL-6 and IL-10 Secretion. Pharmacology, 2016;97(3-4):189-94. (Karger - www.karger.com/; Pharmacology - content.karger.com/ProdukteDB/produkte.asp?Aktion=JournalHome&ProduktNr=224274)

The news editors report that additional information may be obtained by contacting M. Borowska, Dept. of Pharmacology, Poznan University of Medical Sciences, Poznan, Poland. Additional authors for this research include M. Dworacka, A. Wesolowska, H. Winiarska, E. Krzyzagorska and G. Dworacki.

New Type 2 Diabetes Study Findings Have Been Reported by Investigators at Instituto de Salud Carlos III [A dysregulation of glucose metabolism control is associated with carotid atherosclerosis in patients with coronary heart disease ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is now available. According to news reporting from Madrid, Spain, by NewsRx journalists, research stated, "Patients with coexisting coronary heart disease (CHD) and type 2 diabetes mellitus (T2DM) are at high risk of cardiovascular recurrence, however, it is not well established whether they exhibit an increased intima-media thickness of both common carotid arteries (IMT-CC). Furthermore, whether this relationship is inherent to T2DM or depends on glycemic control has not been tested in large cohorts."

The news correspondents obtained a quote from the research from Instituto de Salud Carlos III, "Our aim was to determine whether clinical categories and/or analytical markers of glucose metabolism control were associated with IMT-CC in CHD patients. 1002 patients aged 20-75 years, categorized into normal glucose tolerance (NGT), impaired fasting glucose (IFG), impaired glucose tolerance (IGT) or T2DM, underwent an oral glucose tolerance test (OGTT) and an IMT-CC measurement. IMT-CC was higher in T2DM patients with HbA1c > 6.5% compared to T2DM patients with HbA1c < 6.5% (p = 0.001), patients with IFG or IGT (p < 0.001) and NGT (p < 0.001). When age was considered, IMT-CC was influenced by glucose metabolism control only in patients with age < 61 years (p < 0.01). In a multiple linear regression analysis, glucose concentration at 120 min, but not other OGTT time-points appeared as a significant independent contributor of IMT-CC (p < 0.001). Moreover, a multiple logistic regression and the area under curve (AUC) of the ROC curve analysis showed a predictive power of glucose at 120 min to detect those CHD patients at the highest risk, defined as IMT-CC >= 0.7 mm (R-2 = 0.221; AUC = 0.761). Our results highlight the importance of properly controlling glucose metabolism in CHD patients, in younger populations in particular, providing an easy way of categorizing patients with an increased IMT-CC."

According to the news reporters, the research concluded: "Moreover, glucose concentration at 120 min could contribute to CVD risk and its determination could be used as a predictive tool to identify those CHD patients at the highest risk."

For more information on this research see: A dysregulation of glucose metabolism control is associated with carotid atherosclerosis in patients with coronary heart disease (CORDIOPREV-DIAB study). Atherosclerosis, 2016;253():178-185. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Nutritional and Metabolic Diseases and Conditions - …

New Type 2 Diabetes Study Findings Have Been Reported by Investigators at Magna Graecia University (A polymorphism of HMGA1 protects against proliferative diabetic retinopathy by impairing HMGA1-induced VEGFA expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is now available. According to news reporting from Catanzaro, Italy, by NewsRx journalists, research stated, "Diabetic retinopathy (DR) is a major complication of diabetes mellitus, and is the leading cause of blindness in working-age people. Usually, DR progresses from the asymptomatic non-proliferative DR that does not significantly alter vision, to proliferative DR (PDR), which can result in aberrant retinal neovessel formation and blindness."

The news correspondents obtained a quote from the research from Magna Graecia University, "The High-Mobility-Group A1 (HMGA1) protein is a transcriptional master regulator of numerous genes, including metabolic and inflammatory genes, which, by modulating the expression of angiogenic factors, may induce retinal neovascularization, a hallmark of PDR. Herein, we examined the relationship between HMGA1 rs139876191 variant and DR. Results revealed that patients with type 2 diabetes, who were carriers of the HMGA1 rs139876191 variant had a significantly lower risk of developing PDR, compared to non-carrier diabetic patients. From a mechanistic point of view, our findings indicated that, by adversely affecting HMGA1 protein expression and function, the HMGA1 rs139876191 variant played a key role in this protective mechanism by downregulating the expression of vascular endothelial growth factor A (VEGFA), a major activator of neovascularization in DR."

According to the news reporters, the research concluded: "These data provide new insights into the pathogenesis and progression of DR, and may offer opportunities for discovering novel biomarkers and therapeutic targets for diagnosis, prevention and treatment of PDR."
For more information on this research see: A polymorphism of HMGA1 protects against proliferative diabetic retinopathy by impairing HMGA1-induced VEGFA expression. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Nutritional and Metabolic Diseases and Conditions…

New Type 2 Diabetes Study Findings Have Been Reported by Investigators at University of Basel Hospital (Fibrates for primary prevention of cardiovascular disease events)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are presented in a new report. According to news reporting originating in Basel, Switzerland, by NewsRx journalists, research stated, "Fibrates are effective for modifying atherogenic dyslipidaemia, and particularly for lowering serum triglycerides. However, evidence that fibrates reduce mortality and morbidity associated with cardiovascular disease (CVD), or overall mortality and morbidity, in the primary prevention of CVD is lacking."

The news reporters obtained a quote from the research from the University of Basel Hospital, "This Cochrane Review and meta-analysis aimed to evaluate the clinical benefits and harms of fibrates versus placebo or usual care or fibrates plus other lipid-modifying drugs versus other lipid-modifying drugs alone for the primary prevention of cardiovascular disease (CVD) morbidity and mortality. Search methods We searched the Cochrane Central Register of Controlled Trials (CENTRAL), MEDLINE (Ovid), Embase (Ovid), CINAHL (EBSCO), and Web of Science (all from inception to 19 May 2016). We searched four clinical trial registers (last searched on 3 August 2016) with the help of an experienced professional librarian. We searched the databases to identify randomised controlled trials (RCTs) evaluating the clinical effects of fibrate therapy in the primary prevention of CVD events. We did not impose any language restrictions. Selection criteria We aimed to include all RCTs comparing the effects of fibrate monotherapy versus placebo or usual care, or fibrates plus other lipid-modifying drugs versus other lipid-modifying drugs alone. Included studies had a follow-up of at least six months for the primary prevention of CVD events. We excluded trials with clofibrate, because it was withdrawn from the market in 2002. Data collection and analysis Two reviewers independently screened titles and abstracts for potential study inclusion. Two review authors
independently retrieved the full-text papers and extracted data. Disagreements were resolved by consensus. We calculated risk ratios (RRs) and accompanying 95% confidence intervals (CIs) for aggregate data on primary and secondary outcomes. We tested for heterogeneity with the Cochrane Q-test and used the I-2 statistic to measure inconsistency of treatment effects across studies. Using the GRADE approach, we assessed the quality of the evidence and used the GRADE profiler software (GRADEpro GDT) to import data from Review Manager 5 to create 'Summary of findings' tables. We identified six eligible trials including 16,135 individuals. The mean age of trial populations varied across trials; between 47.3 and 62.3 years. Four trials included individuals with diabetes mellitus type 2 only. The mean treatment duration and follow-up of participants across trials was 4.8 years. We judged the risks of selection and performance bias to be low; risks of detection bias, attrition bias, and reporting bias were unclear. Reporting of adverse effects by included trials was very limited; that is why we used discontinuation of therapy due to adverse effects as a proxy for adverse effects. Patients treated with fibrates had a reduced risk for the combined primary outcome of CVD death, non-fatal myocardial infarction, or non-fatal stroke compared to patients on placebo (risk ratio (RR) 0.84, 95% confidence interval (CI) 0.74 to 0.96; participants = 16,135; studies = 6; moderate-quality of evidence). For secondary outcomes we found RRs for fibrate therapy compared with placebo of 0.79 for combined coronary heart disease death or non-fatal myocardial infarction (95% CI 0.68 to 0.92; participants = 16,135; studies = 6; moderate-quality of evidence); 1.01 for overall mortality (95% CI 0.81 to 1.26; participants = 8471; studies = 5; low-quality of evidence); 1.01 for non-CVD mortality (95% CI 0.76 to 1.35; participants = 8471; studies = 5; low-quality of evidence); and 1.38 for discontinuation of therapy due to adverse effects (95% CI 0.71 to 2.68; participants = 4805; studies = 3; I-2 = 74%; very low-quality of evidence). Data on quality of life were not available from any trial. Trials that evaluated fibrates in the background of statins (2 studies) showed no benefits in preventing cardiovascular events. Authors' conclusions Moderate-quality evidence suggests that fibrates lower the risk for cardiovascular and coronary events in primary prevention, but the absolute treatment effects in the primary prevention setting are modest (absolute risk reductions < 1%). There is low-quality evidence that fibrates have no effect on overall or non-CVD mortality.

According to the news reporters, the research concluded: "Very low-quality evidence suggests that fibrates are not associated with increased risk for adverse effects."

For more information on this research see: Fibrates for primary prevention of cardiovascular disease events. Cochrane Database of Systematic Reviews, 2016;(11):468-536. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

New Type 2 Diabetes Study Findings Have Been Reported by Investigators at University of Florida (Hepatic ZIP14-mediated Zinc Transport Contributes to Endosomal Insulin Receptor Trafficking and Glucose Metabolism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news originating from Gainesville, Florida, by NewsRx correspondents, research stated, "Zinc influences signaling pathways through controlled targeted zinc transport. Zinc transporter Zip14 KO mice display a phenotype that includes impaired intestinal barrier function with low grade chronic inflammation, hyperinsulinemia, and increased body fat, which are signatures of diet-induced diabetes (type 2 diabetes) and obesity in humans."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from the University of Florida, "Hyperglycemia in type 2 diabetes and obesity is caused by insulin resistance. Insulin resistance results in inhibition of glucose uptake by liver and other peripheral tissues, principally adipose and muscle and with concurrently higher hepatic glucose production. Therefore, modulation of hepatic glucose metabolism is an important target for antidiabetic treatment approaches. We demonstrate that during glucose uptake, cell surface abundance of zinc transporter ZIP14 and mediated zinc transport increases. Zinc is distributed to multiple sites in hepatocytes through sequential translocation of ZIP14 from plasma membrane to early and late endosomes. Endosomes from Zip14 KO mice were zinc-deficient because activities of the zinc-dependent insulin-degrading proteases insulin-degrading enzyme and cathepsin D were impaired; hence insulin receptor activity increased. Transient increases in cytosolic zinc levels are concurrent with glucose uptake and suppression of glycogen synthesis. In contrast, Zip14 KO mice exhibited greater hepatic glycogen synthesis and impaired gluconeogenesis and glycolysis related to low cytosolic zinc levels. We can conclude that ZIP14-mediated zinc transport contributes to regulation of endosomal insulin receptor activity and glucose homeostasis in hepatocytes."

According to the news editors, the research concluded: "Therefore, modulation of ZIP14 transport activity presents a new target for management of diabetes and other glucose-related disorders."

The news correspondents report that additional information may be obtained from R.J. Cousins, University of Florida, Dept. of Biochem & Mol Biol, Coll Med, Gainesville, FL 32611, United States. Additional authors for this research include C. Troche, M.H. Kim and R.J. Cousins.

New Type 2 Diabetes Study Findings Have Been Reported by Investigators at Wageningen University (Intake of different types of dairy and its prospective association with risk of type 2 diabetes: The Rotterdam Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news reporting from Wageningen, Netherlands, by NewsRx journalists, research stated, "The prevalence of type 2 diabetes (T2DM) is increasing. Several studies have suggested a beneficial effect of several major dairy nutrients on insulin production and sensitivity."

Funders for this research include FrieslandCampina, Erasmus University Rotterdam, Netherlands Organisation of Scientific Research (NWO), Netherlands Organisation for Health Research and Development (ZonMw), Ministry of Education, Culture, and Science, Ministry of Health, Welfare, and Sports, European Commission (DG-XII), Nestle Nutrition (Nestec Ltd.), Metagenics Inc.

The news correspondents obtained a quote from the research from Wageningen University, "Conversely, harmful effects have been suggested as well. This study aimed to investigate the impact of the full-range of dairy products and its association with incidence T2DM in Dutch adults aged >= 55 years participating in the Rotterdam Study. Dairy intake was assessed with a validated FFQ, including total, skimmed, semi-skimmed, full-fat, fermented, and non-fermented dairy, and subclasses of these product groups. Verified prevalent and incident diabetes were documented. Cox proportional hazards regression and spline regression were used to analyse data, adjusting for age, sex, alcohol, smoking, education, physical activity, body mass index, intake of total energy, energy-adjusted meat, and energy-adjusted fish intake. Median total dairy intake was 398 g/day (IQR 259-559 g/day). Through 9.5 +/- 4.1 years of follow-up, 393 cases of incident T2DM were reported. Cox and spline regression did not point towards associations of total dairy consumption, dairy consumption based on fat content, non-fermented or fermented dairy consumption, or individual dairy product consumption with incident T2DM. The HR for total dairy intake and T2DM was 0.93 (95% CI: 0.70-1.23) in the upper quartile (P-for trend 0.76)."

According to the news reporters, the research concluded: "This prospective cohort study did not point towards an association between dairy consumption and T2DM."

For more information on this research see: Intake of different types of dairy and its

**New Type 2 Diabetes Study Results from Federal University Described** *(Therapeutic potential of green tea on risk factors for type 2 diabetes in obese adults - a review)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting out of Goiania, Brazil, by NewsRx editors, research stated, "Green tea has been associated with positive effects in the treatment of obesity and other associated comorbidities such as type 2 diabetes. These benefits are thought to be related to the anti-inflammatory and antioxidant effects of green tea and to the reduction in body fat percentage exhibited by its bioactive compounds."

Our news journalists obtained a quote from the research from Federal University, "The predominant active compounds in green tea are flavonoid monomers known as catechins, in particular epigallocatechin-3-gallate, which is the most abundant and most effective catechin in metabolic care, particularly among obese patients. The objective of this review was to investigate the effects of green tea on body composition, oxidative stress, inflammation and insulin resistance, risk factors for the development of type 2 diabetes in obese individuals and the mechanisms that underlie the modulatory actions of green tea compounds on these risk factors."

According to the news editors, the research concluded: "Although green tea has therapeutic potential in the treatment of obese individuals, the findings of this review demonstrate the need for a greater number of studies to confirm the positive effects of green tea, especially regarding the modulation of obesity."

Our news journalists report that additional information may be obtained by contacting P.B. Botelho, Fed Univ Goias UFG, Nutr Fac, Lab Res Clin Nutr & Sports Labince, Goiania, Go, Brazil. Additional authors for this research include D.M. Silva, A.C. de Morais, J.F. Mota and P.B. Botelho.

New Type 2 Diabetes Study Results from University of California Described (Impaired Collateral Flow Compensation During Chronic Cerebral Hypoperfusion in the Type 2 Diabetic Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated, "The presence of collaterals is associated with a reduced risk of stroke and transient ischemic attack in patients with steno-occlusive carotid artery disease. Although metabolic syndrome negatively impacts collateral status, it is unclear whether and to what extent type 2 diabetes mellitus affects cerebral collateral flow regulation during hypoperfusion."

The news reporters obtained a quote from the research from the University of California, "We examined the spatial and temporal changes of the leptomeningeal collateral flow and the flow dynamics of the penetrating arterioles in the distal middle cerebral artery and anterior cerebral artery branches over 2 weeks after unilateral common carotid artery occlusion (CCAO) using optical coherent tomography in db/+ and db/db mice. We also assessed the temporal adaptation of the circle of Willis after CCAO by measuring circle of Willis vessel diameters. After unilateral CCAO, db/db mice exhibited diminished leptomeningeal collateral flow compensation compared with db/+ mice, which coincided with a reduced dilation of distal anterior cerebral artery branches, leading to reduced flow not only in pial vessels but also in penetrating arterioles bordering the distal middle cerebral artery and anterior cerebral artery. However, no apparent cell death was detected in either strain of mice during the first week after CCAO. db/db mice also experienced a more severe early reduction in the vessel diameters of several ipsilateral main feeding arteries in the circle of Willis, in addition to a delayed post-CCAO adaptive response by 1 to 2 weeks, compared with db/+ mice."

According to the news reporters, the research concluded: "Type 2 diabetes mellitus is an additional risk factor for hemodynamic compromise during cerebral hypoperfusion, which may increase the severity and the risk of stroke or transient ischemic attack."

For more information on this research see: Impaired Collateral Flow Compensation During Chronic Cerebral Hypoperfusion in the Type 2 Diabetic Mice. Stroke, 2016;47 (12):3014-3021. Stroke can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Inflammatory Bowel Diseases and Conditions –

New Ulcerative Colitis Study Results Reported from Poznan University of Medical Sciences (Bone Metabolism and the c.-223C > T Polymorphism in the 5'UTR Region of the Osteoprotegerin Gene in Patients with Inflammatory Bowel Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Inflammatory Bowel Diseases and Conditions - Ulcerative Colitis have been presented. According to news reporting originating from Poznan, Poland, by NewsRx correspondents, research stated, "Osteoporosis is more frequent in inflammatory bowel disease (IBD) patients. A reduction in bone mineral mass in these individuals is caused not only by inflammatory processes in the bowel, because osteoporosis occurs already in very young IBD patients and in newly diagnosed individuals who have not yet undergone any pharmacological treatment."

Our news editors obtained a quote from the research from the Poznan University of Medical Sciences, "One of individual determinants of the bone turnover parameters is osteoprotegerin (OPG) encoded by the TNFRSF11B gene. The c.-223C > T polymorphism in this gene has been extensively studied in post-menopausal osteoporosis patients. However, no such studies exist for osteoporosis related to IBD. The aim of our study was to determine whether the c.-223C > T (rs2073617) polymorphism in the 5'UTR region of the gene encoding osteoprotegerin is a functional polymorphism which may change the gene expression and resulting OPG levels, and so be associated with osteopenia and osteoporosis, and impaired bone metabolism in Crohn's disease and ulcerative colitis patients. Our study included 198 IBD patients and 41 healthy controls. Lumbar spine and femoral neck bone mineral density, T-score, Z-score as well as OPG, RANKL, vitamin D, calcium and interleukin 4 and 10 concentrations were determined for all study subjects. Genotyping of the TNFRSF11B polymorphic site was performed by restriction fragment length polymorphism technique. Statistical analyses were conducted using Statistica software. Odds ratios, 95% confidence intervals, and P values were...
calculated using the HWE calculator. Our results did not allow determining an unequivocal association between the polymorphic variants of the TNFRSF11B 5'UTR region and a susceptibility to osteoporosis in IBD patients. We have shown, however, that the c.-223T allele was twice as more frequent in Crohn's disease (CD) patients than among controls (OR = 1.99, P value = 0.009). Interestingly, average osteoprotegerin levels in CD patients did not significantly differ from those in controls, whereas in ulcerative colitis patients, OPG levels were significantly lower. We have concluded that low OPG levels may be associated with osteoporosis in ulcerative colitis, but it is not correlated with the c.-223C > T polymorphism in the TNFRSF11B gene. In CD patients, in turn, we observed increased RANKL levels."

According to the news editors, the research concluded: "Our observations confirm different pathogeneses of Crohn's disease and ulcerative colitis as well as different molecular backgrounds of osteoporosis associated with these two diseases."

For more information on this research see: Bone Metabolism and the c.-223C > T Polymorphism in the 5'UTR Region of the Osteoprotegerin Gene in Patients with Inflammatory Bowel Disease. **New University of Lisbon Reports Findings in Clostridium difficile (The SpolIIQ-SpolIIIAH complex of Clostridium difficile controls forespore engulfment and late stages of gene expression and spore morphogenesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Positive Bacteria - Clostridium difficile have been presented. According to news reporting originating in Oeiras, Portugal, by NewsRx journalists, research stated, "Engulfment of the forespore by the mother cell is a universal feature of endosporulation. In Bacillus subtilis, the forespore protein SpolIQ and the mother cell protein SpolIIIAH form a channel, essential for endosporulation, through which the developing spore is nurtured."
The news reporters obtained a quote from the research from the New University of Lisbon, "The two proteins also form a backup system for engulfment. Unlike in B. subtilis, SpoIIQ of Clostridium difficile has intact LytM zinc-binding motifs. We show that spoIIQ or spoIIIAH deletion mutants of C. difficile result in anomalous engulfment, and that disruption of the SpoIIQ LytM domain via a single amino acid substitution (H120S) impairs engulfment differently. SpoIIQ and SpoIIQ(H120S) interact with SpoIIIAH throughout engulfment. SpoIIQ, but not SpoIIQ(H120S), binds Zn(2+), and metal absence alters the SpoIIQ-SpoIIIAH complex in vitro. Possibly, SpoIIQ(H120S) supports normal engulfment in some cells but not a second function of the complex, required following engulfment completion. We show that cells of the spoIIQ or spoIIIAH mutants that complete engulfment are impaired in post-engulfment, forespore and mother cell-specific gene expression, suggesting a channel-like function."

According to the news reporters, the research concluded: "Both engulfment and a channel-like function may be ancestral functions of SpoIIQ-SpoIIIAH while the requirement for engulfment was alleviated through the emergence of redundant mechanisms in B. subtilis and related organisms."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/mmi.13311. This DOI is a link to an online electronic document that is either free or for purchase.

Surgery - Urethrotomy

New Urethrotomy Study Findings Have Been Reported by Investigators at Research Hospital (Modified platelet-rich plasma with transforming growth factor beta 1 neutralization antibody injection may reduce recurrence rate of urethral stricture)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Surgery - Urethrotomy have been presented. According to news reporting out of Van, Turkey, by NewsRx editors, the research stated, "Urethral stricture is one of the most bothersome urologic disease among urologists and has a substantial impact on quality of life and healthcare costs. Although it can be cured with internal urethrotomy easily,
post-surgery stricture recurrence is challenging."

Our news journalists obtained a quote from the research from Research Hospital, "Several adjuvant therapies have been used in conjunction with internal urethrotomy but none of them are used routinely because the pathophysiology of the disease is still obscure. Fibrosis is the most accused hypothesis for the action. Platelet-rich plasma (PRP) is an autologous blood product containing a high concentration of platelets that is being used for a very wide range of clinical healing applications. It comprises a concentration of fundamental protein growth factors shown to be actively excreted by platelets to initiate accurate wound healing. Although PRP can play a critical role in wound healing and has been used in fibrotic diseases successfully, it has some deleterious cytokines such as transforming growth factor beta 1 (TGF beta 1) which can also cause fibrosis."

According to the news editors, the research concluded: "The new hypothesis is that the subcutaneous injection of neutralized platelet-rich plasma with TGF beta 1 antibody at the planned urethrotomy site may prevent recurrence and provide superior healing and long-term results."

For more information on this research see: Modified platelet-rich plasma with transforming growth factor beta 1 neutralization antibody injection may reduce recurrence rate of urethral stricture. Medical Hypotheses, 2016;97():1-3. Medical Hypotheses can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. Urologic Diseases and Conditions - Urinary Tract...

New Urinary Tract Infections Study Findings Have Been Reported by Investigators at Nara Medical University (Bacteremia secondary to Alloscardovia omnicolens urinary tract infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Urologic Diseases and Conditions - Urinary Tract Infections have been presented. According to news reporting from Nara, Japan, by NewsRx journalists, research stated, "A 70-year-old woman was admitted to our hospital with malaise, bilateral leg edema, and oliguria. She had a history of advanced uterine cancer."

The news correspondents obtained a quote from the research from Nara Medical University, "Bilateral double-J catheters were inserted because growth of intra-abdominal metastases led to bilateral ureteral stricture and hydronephrosis. Two days later, she suddenly developed high fever. Thin gram-positive bacilli of moderate length were detected in the anaerobic blood culture bottles. We performed 16S ribosomal RNA analysis of the isolate and it showed 100% match with Alloscardovia omnicolens DSM 21503T."
According to the news reporters, the research concluded: "She was successfully treated with cefmetazole in addition to percutaneous nephrostomy."

For more information on this research see: Bacteremia secondary to Alloscardovia omnicolens urinary tract infection. *Journal of Infection and Chemotherapy*, 2016;22(6):424-425. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. New Urology Findings from University of Chicago Outlined (Iatrogenic Bladder Injury: National Analysis of 30-Day Outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Urology have been published. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "To examine the risk factors and outcomes of BI, a rare complication of abdominopelvic surgery. We queried the National Surgical Quality Improvement Program database to identify intraoperative bladder injury (BI) defined by the Current Procedural Terminology code for cystorrhaphy from 2005 to 2013."

Our news journalists obtained a quote from the research from the University of Chicago, "Propensity-score matching balanced the differences between patients with BI and the controls. The factors matched included age, body mass index, race, modified frailty index, and procedure category. There were 1685 cases of BI in 1,541,736 surgeries (0.11%). Although 49.5% of surgeries were performed in an open fashion, this approach accounted for 69.3% of BI (P < .001). Prior to matching, mortality rates and morbidity were increased for the BI group (P < .001). Moreover, age, recent chemotherapy or radiation or steroid history, and smoking were among the risk factors for BI (all P< .05). Resident involvement increased the odds of BI and complications after BI, but decreased the risk of readmission (all P<.05). After matching, 30-day mortality was no longer increased for patients with BI (P < .001). Patients with BI requiring repair did have increased median length of stay (6 days [interquartile range IQR: 3-11] vs 5 [IQR: 2-9]; P< .001) and operative time (203 min [IQR: 140-278] vs 134 [IQR: 86-199]; P <.001). BI patients were more likely to undergo reoperation (7.7% vs 5.3%; P = .005). Urine infection, sepsis, and bleeding were more likely in the BI group compared with the matched controls (all P<.001). Delayed repair was rare. We present the largest national series assessing iatrogenic BI and subsequent repair. BI increases 30-day complications, reoperation, and length of stay but does not increase 30-day mortality compared with matched controls."
According to the news editors, the research concluded: "More complex surgical cases and increased baseline comorbidity were risk factors for BI."

Our news journalists report that additional information may be obtained by contacting A.J. Cohen, Univ Chicago Med, Urol Sect, Dept. of Surg, Chicago, IL 60637, United States. Additional authors for this research include V.T. Packiam, C.U. Nottingham, J.J. Pariser, S.F. Faris and G.T. Bales.

**Health and Medicine - Urology**

**New Urology Study Findings Have Been Reported by Investigators at University Hospital (The translational potential of microRNAs as biofluid markers of urological tumours)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Urology. According to news reporting originating in Berlin, Germany, by NewsRx journalists, research stated, "MicroRNAs (miRNAs) are secreted by cells in-vesicles, bound in a ribonucleoprotein complex or as free molecules."

The news reporters obtained a quote from the research from University Hospital, "These miRNA secretion pathways are dysregulated in cancer, making miRNAs attractive candidate molecules for liquid biopsies. A number of studies have investigated the regulation of miRNA secretion into blood and urine and suggested that miRNAs are noninvasive diagnostic, prognostic and surveillance markers in urological carcinomas, and research in this area has increased over the past 5 years."

According to the news reporters, the research concluded: "However, methodological and analytical pitfalls exist and require addressing to enable future translation of the laboratory findings regarding miRNAs as biomarkers into clinical practice in bladder cancer, kidney cancer, prostate cancer and testicular cancer."

Our news correspondents report that additional information may be obtained by contacting K. Jung, Univ Hosp Charite, Berlin Inst Urol Res, D-10117 Berlin, Germany. Additional authors for this research include C. Stephan, G.M. Yousef, G. Kristiansen and K.
Jung.

Immunization - Vaccines

New Vaccines Findings from Free University Described (Intralymphatic mRNA vaccine induces CD8 T-cell responses that inhibit the growth of mucosally located tumours)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immunization - Vaccines is the subject of a report. According to news reporting from Brussels, Belgium, by NewsRx journalists, research stated, "The lack of appropriate mouse models is likely one of the reasons of a limited translational success rate of therapeutic vaccines against cervical cancer, as rapidly growing ectopic tumours are commonly used for preclinical studies. In this work, we demonstrate that the tumor microenvironment of TC-1 tumours differs significantly depending on the anatomical location of tumor lesions (i.e. subcutaneously, in the lungs and in the genital tract)."

The news correspondents obtained a quote from the research from Free University, "Our data demonstrate that E7-TriMix mRNA vaccine-induced CD8(+) T lymphocytes migrate into the tumor nest and control tumor growth, although they do not express mucosa-associated markers such as CD103 or CD49a. We additionally show that despite the presence of the antigen-specific T cells in the tumor lesions, the therapeutic outcomes in the genital tract model remain limited. Here, we report that such a hostile tumor microenvironment can be reversed by cisplatin treatment, leading to a complete regression of clinically relevant tumours when combined with mRNA immunization."

According to the news reporters, the research concluded: "We thereby demonstrate the necessity of utilizing clinically relevant models for preclinical evaluation of anticancer therapies and the importance of a simultaneous combination of anticancer immune response induction with targeting of tumor environment."

For more information on this research see: Intralymphatic mRNA vaccine induces CD8 T-cell responses that inhibit the growth of mucosally located tumours. *Scientific Reports*, 2016;6():22509. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting L. Bialkowski, Laboratory of Molecular and Cellular Therapy, Vrije Universiteit Brussel, Laarbeeklaan 103E, 1090 Brussels, Belgium. Additional authors for this research include A. van Weijnen, K. Van der Jeught, D. Renmans, L. Daszkiewicz, C. Heirman, G. Stange, K. Breckpot, J.L. Aerts and K. Thielemans.

New Vaccines Findings from K. Oddsson and Co-Researchers Described

Attitudes and knowledge among parents or guardians of 12-year-old girls about HPV vaccination - A population-based survey in Iceland

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunization - Vaccines have been published.

According to news reporting from Reykjavik, Iceland, by NewsRx journalists, research stated, "To assess attitude and knowledge among parents or guardians of 12-year-old girls about human papillomavirus (HPV), cervical cancer, and HPV vaccination. A mail survey was sent to a randomized sample of 1,000 parents or guardians of 12-year-old girls from a cohort of total 2,092 girls born in 1995 and registered in the Icelandic National Register by the end of December 2007."

The news correspondents obtained a quote from the research, "Of the 994 eligible parents, 583 (59%) returned the questionnaire. Majority of the respondents were mothers who had two or three children. More than one-third of respondents had university education and 84% were married or living with a partner. Over two-thirds did not know that HPV causes cervical cancer and genital warts. Almost all (> 90%) would vaccinate theirs daughters with a HPV vaccine, 73% said they would vaccinate their sons, or themselves if the vaccine was effective for them. Only 11% believed HPV vaccination would increase promiscuity or decrease cervical screening attendance."

According to the news reporters, the research concluded: "In Iceland, willingness to vaccinate young girls with HPV vaccine is high, however, knowledge about HPV infections is limited."

For more information on this research see: Attitudes and knowledge among parents or guardians of 12-year-old girls about HPV vaccination - A population-based survey in Iceland. European Journal of Gynaecological Oncology, 2016;37(6):837-841. New Vaccines Study Findings Have Been Reported by C. Willame and Colleagues (Importance of feasibility assessments before implementing non-interventional pharmacoepidemiologic studies of vaccines: lessons learned and recommendations for future ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunization - Vaccines. According to news reporting from Wavre, Belgium, by NewsRx journalists, research stated, "Investigational and marketed vaccines are increasingly evaluated, and manufacturers are required to put in place mechanisms to monitor long-term benefit-risk profiles. However, generating such evidence in real-world settings remains challenging, especially when rare adverse events are assessed."

The news correspondents obtained a quote from the research, "Planning of an appropriate study design is key to conducting a valid study. The aim of this paper is to illustrate how feasibility assessments support the generation of robust pharmacoepidemiological data. Following an initiative launched by the International Society for Pharmacoepidemiology in May 2014, a working group including members of the private and public sectors, was formed to assess the value of conducting feasibility assessments as a necessary step before embarking on larger-scale post-licensure studies. Based on five real-life examples of feasibility assessments, lessons learned and recommendations were issued by the working group to support scientific reasoning and decision making when designing pharmacoepidemiologic vaccine studies. The working group developed a toolbox to provide a pragmatic approach to conducting feasibility assessments. The toolbox contains two main components: the scientific feasibility and the operational feasibility. Both components comprise a series of specific questions aimed at overcoming methodological and operational challenges. A feasibility assessment should be formalized as a necessary step prior to the actual start of any pharmacoepidemiologic study. It should remain a technical evaluation and not a hypothesis testing."

According to the news reporters, the research concluded: "The feasibility assessment report may facilitate communication with regulatory agencies toward improving the quality of study protocols and supporting the endorsement of study objectives and methods addressing regulatory commitments."

Our news journalists report that additional information may be obtained by contacting C. Willame, GSK Vaccines, Business & Decis Life Sci, B-1300 Wavre, Belgium. Additional authors for this research include L. Baril, J. van den Bosch, G.L.C. Ferreira, R. Williams, D. Rosillon and C. Cohet.

New Vaccines Study Findings Have Been Reported by Researchers at University of California (Novel cancer antigens for personalized immunotherapies: latest evidence and clinical potential)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immunization - Vaccines is now available. According to news reporting originating from Sacramento, California, by NewsRx correspondents, research stated, "The clinical success of monoclonal antibody immune checkpoint modulators such as ipilimumab, which targets cytotoxic T lymphocyte-associated antigen 4 (CTLA-4), and the recently approved agents nivolumab and pembrolizumab, which target programmed cell death receptor 1 (PD-1), has stimulated renewed enthusiasm for anticancer immunotherapy, which was heralded by Science as 'Breakthrough of the Year' in 2013. As the potential of cancer immunotherapy has been recognized since the 1890s when William Coley showed that bacterial products could be beneficial in cancer patients, leveraging the immune system in the treatment of cancer is certainly not a new concept; however, earlier attempts to develop effective therapeutic vaccines and antibodies against solid tumors, for example, melanoma, frequently met with failure due in part to self-tolerance and the development of an immunosuppressive tumor microenvironment."

Our news editors obtained a quote from the research from the University of California, "Increased knowledge of the mechanisms through which cancer evades the immune system and the identification of tumor-associated antigens (TAAs) and negative immune checkpoint regulators have led to the development of vaccines and monoclonal antibodies targeting specific tumor antigens and immune checkpoints such as CTLA-4 and PD-1. This review first discusses the established targets of currently approved cancer immunotherapies and then focuses on investigational cancer antigens and their clinical potential."

According to the news editors, the research concluded: "Because of the highly heterogeneous nature of tumors, effective anticancer immunotherapy-based treatment regimens will likely require a personalized combination of therapeutic vaccines, antibodies and chemotherapy that fit the specific biology of a patient's disease."

For more information on this research see: Novel cancer antigens for personalized immunotherapies: latest evidence and clinical potential. Therapeutic Advances In Medical Oncology, 2016;8(1):4-31. (Sage Publications - www.sagepub.com/; Therapeutic Advances In Medical Oncology - tam.sagepub.com)

The news editors report that additional information may be obtained by contacting G.T. Wurz, Dept. of Internal Medicine, Division of Hematology and Oncology, University of California, Davis, Sacramento, CA, United States. Additional authors for this research include C.J. Kao and M.W DeGregorio.

New Vaccines Study Results from Leiden University Described
(Repeated fractional intradermal dosing of an inactivated polio vaccine by a single hollow microneedle leads to superior immune responses)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immunization - Vaccines. According to news reporting originating in Leiden, Netherlands, by NewsRx journalists, research stated, "The purpose of this study was to investigate the effect of various repeated fractional intradermal dosing schedules of inactivated polio vaccine serotype 1 (IPV1) on IPV1-specific IgG responses in rats. By utilizing an applicator that allowed for precisely controlled intradermal microinjections by using a single hollow microneedle, rats were immunized intradermally with 5 D-antigen units (DU) of IPV1 at 150 μm skin depth."

The news reporters obtained a quote from the research from Leiden University, "This dose was administered as a bolus, or in a repeated fractional dosing schedule: 4 doses of 1.25DU (1/4th of total dose) were administered on four consecutive days or every other day; 8 doses of 0.625 DU (1/8th of total dose) were administered on eight consecutive days; or 4 exponentially increasing doses (0.04, 0.16, 0.8 and 4 DU), either with or without an exponentially increasing CpG oligodeoxynucleotide 1826 (CpG) dose, were administered on four consecutive days. All of these fractional dosing schedules resulted in up to ca. 10-fold higher IPV1-specific IgG responses than intradermal and intramuscular bolus dosing. IPV1 combined with adjuvant CpG in exponential dosing did not significantly increase the IPV1-specific IgG responses further, which demonstrated that maximal responses were achieved by fractional dosing."

According to the news reporters, the research concluded: "Repeated fractional intradermal IPV1 dosing leads to superior IPV1-specific IgG responses without the use of adjuvants. These results indicate that a controlled release delivery system for intradermal IPV1 delivery can potentiate IPV1-specific IgG responses."

For more information on this research see: Repeated fractional intradermal dosing of an inactivated polio vaccine by a single hollow microneedle leads to superior immune responses. *Journal of Controlled Release*, 2016;242():141-147. *Journal of Controlled Release* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Controlled Release - www.journals.elsevier.com/journal-of-controlled-release/)

Our news correspondents report that additional information may be obtained by contacting P. Schipper, Leiden University, Leiden Academy Center Drug Res, Cluster BioTherapeut, Div Drug Delivery Technol, NL-2300 RA Leiden, Netherlands. Cardiovascular Diseases and Conditions - Vasculitis

New Vasculitis Study Findings Recently Were Reported by Researchers at Hospital Clinic (Antibody-Mediated Acute Vascular Rejection of Kidney Allografts: Fifteen-Year Follow-up)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Vasculitis are presented in a new report. According to news reporting out of Madrid, Spain, by NewsRx editors, research stated, "Although acute vascular rejection (AVR) is associated with a high risk of graft loss, it remains unclear whether AVR with accompanied cellular or humoral rejection (AHR) has dissimilar outcomes. The aim of this study was to examine the association between subtypes of AVR and graft loss."

Our news journalists obtained a quote from the research from Hospital Clinic, "We assessed patients who provided biopsy samples for acute allograft rejection from 1998 to 2014. To investigate distinct rejection patterns, we retrospectively assessed rejection episodes with review of graft histology as well as donor-specific anti-HLA antibodies when available. A total of 1,004 patients were biopsied and included in the main analyses, of which 259 (32.87%) had acute biopsy-proven rejection. We identified three patterns of graft rejection defined according to the presence of peritubular capillaritis (ptc): a) T-cell mediated acute vascular rejection if ptc free; b) humoral-mediated acute vascular rejection if ptc >0; and c) T-cell mediated rejection if vasculitis = 0 and ptc = 0 (148 [57%], 70 [27%], and 41 [16%], respectively). At 5 years, graft survival was lower among patients with ptc-vascular rejection than those with T-cell vascular rejection (72.3% vs 83.2%; P = .010). T-cell mediated rejection without vasculitis had similar survival compared with rejection absence (89.3% vs 89.2%; P = .698). Multivariate analysis adjusted by age and sex showed that risk of graft loss was higher in biopsies with high scores of glomerulitis (g2-g3); vasculitis (v2-v3), capillaritis (ptc2- ptc3), or interstitial inflammation (i2-i3). However, tubulitis and C4d were not statically significant. We conclude that antibody-mediated AVR involves a poorer prognosis than T-cell mediated AVR."

According to the news editors, the research concluded: "The presence of tubulitis does not seem to determine a poor long-term renal graft prognosis."

Our news journalists report that additional information may be obtained by contacting B.R. Cubillo, Hosp Clin San Carlos, Nephrol, Madrid, Spain. Additional authors for this research include I.P. Flores, N. Calvo, A. Pascual, J.A. Cortes, M.A. Moreno, J. Blanco and A.S. Fructuoso.

The direct object identifier (DOI) for that additional information is:
http://dx.doi.org/10.1016/j.transproceed.2016.09.015. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions - Venous...

New Venous Thromboembolism Data Have Been Reported by Investigators at Department of Orthopedic Surgery (Rate of Transfusions After Total Knee Arthroplasty in Patients Receiving Lovenox or High-Dose Aspirin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Venous Thromboembolism are discussed in a new report. According to news reporting originating from Honolulu, Hawaii, by NewsRx correspondents, research stated, "Controversy continues regarding the use of powerful anticoagulants for venous thromboembolism prophylaxis in patients undergoing total knee arthroplasty (TKA). To comply with institution-mandated guidelines and pressure from hospitalist intent on complying with conventionally recommended anticoagulation guidelines, we singularly changed our chemoprophylaxis practice from using aspirin to Lovenox and noted that transfusion rates increased substantially."

Our news editors obtained a quote from the research from the Department of Orthopedic Surgery, "A retrospective case review was performed to evaluate transfusion requirement differences in primary TKA patients receiving Lovenox (unilateral TKA: n = 135, bilateral TKA: n = 44) or aspirin (unilateral TKA: n = 153, bilateral TKA: n = 45) for venous thromboembolism prophylaxis. Pearson's chi-square tests were used to evaluate surgical complications and the rate of transfusions between aspirin and Lovenox groups. Independent t tests were used to evaluate the units of packed red blood cells transfused, hemoglobin drop, and hematocrit drop between aspirin and Lovenox groups. Lovenox was found to significantly increase (P < .01) the rate of transfusion, units of packed red blood cells, hemoglobin drop, and hematocrit drop compared to aspirin in both unilateral and bilateral TKA patients, without significantly decreasing venous thromboembolism events (aspirin: 3 pulmonary embolisms and 4 deep venous thrombosis; Lovenox: 3 pulmonary embolisms and 2 deep venous thrombosis)."

According to the news editors, the research concluded: "Our findings suggest that aspirin is as effective as Lovenox in preventing venous thromboembolism and that the use of Lovenox significantly increases the likelihood of requiring transfusions after surgery."

The news editors report that additional information may be obtained by contacting C.K. Nakasone, Straub Bone & Joint Center, Dept. of Orthoped Surg, Honolulu, HI, United
New Venous Thromboembolism Data Have Been Reported by Investigators at Johns Hopkins University (The Johns Hopkins Venous Thromboembolism Collaborative: Multidisciplinary Team Approach to Achieve Perfect Prophylaxis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Venous Thromboembolism have been published. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Venous thromboembolism (VTE) is an important cause of preventable harm in hospitalized patients. The critical steps in delivery of optimal VTE prevention care include (1) assessment of VTE and bleeding risk for each patient, (2) prescription of risk-appropriate VTE prophylaxis, (3) administration of risk-appropriate VTE prophylaxis in a patient-centered manner, and (4) continuously monitoring outcomes to identify new opportunities for learning and performance improvement."

Our news journalists obtained a quote from the research from Johns Hopkins University, "To ensure that every hospitalized patient receives VTE prophylaxis consistent with their individual risk level and personal care preferences, we organized a multidisciplinary task force, the Johns Hopkins VTE Collaborative. To achieve the goal of perfect prophylaxis for every patient, we developed evidence-based, specialty-specific computerized clinical decision support VTE prophylaxis order sets that assist providers in ordering risk-appropriate VTE prevention. We developed novel strategies to improve provider VTE prevention ordering practices including face-to-face performance reviews, pay for performance, and provider VTE scorecards. When we discovered that prescription of risk-appropriate VTE prophylaxis does not ensure its administration, our multidisciplinary research team conducted in-depth surveys of patients, nurses, and physicians to design a multidisciplinary patient-centered educational intervention to eliminate missed doses of pharmacologic VTE prophylaxis that has been funded by the Patient Centered Outcomes Research Institute. We expect that the studies currently underway will bring us closer to the goal of perfect VTE prevention care for every patient."

According to the news editors, the research concluded: "Our learning journey to eliminate harm from VTE can be applied to other types of harm."

For more information on this research see: The Johns Hopkins Venous

Keywords for this news article include: Baltimore, Maryland, United States, North and Central America, Cardiovascular Diseases and Conditions, Risk and Prevention, Vascular Diseases and Conditions, Embolism and Thrombosis, Venous Thromboembolism, Hematology, Johns Hopkins University.

New Venous Thromboembolism Study Results Reported from Institute Gulbenkian de Ciencia (Mitochondrial genome association study with peripheral arterial disease and venous thromboembolism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Venous Thromboembolism have been published. According to news reporting originating in Oeiras, Portugal, by NewsRx journalists, research stated, "Peripheral arterial disease (PAD) and venous thromboembolism (VTE) are vascular traits sharing common modifiable and non-modifiable risk factors. These vascular pathologies have known nuclear-encoded genetic risk factors and the mitochondrial DNA may account for part of the missing heritability."

Funders for this research include National Human Genome Research Institute, National Heart, Lung, and Blood Institute, NIH, NIH Genes, Environment and Health Initiative [GEI], Gene Environment Association Studies (GENEVA), NIH GEI, NIH contract “High throughput genotyping for studying the genetic contributions to human disease”.

The news reporters obtained a quote from the research from Institute Gulbenkian de Ciencia, "To determine if PAD and VTE have a dual genetic control (mitochondrial and nuclear), we hereby investigated the association of mitochondrial DNA polymorphisms and haplogroups with these vascular traits. The association of mitochondrial single nucleotide polymorphisms (mtSNPs) and haplogroups was tested in 1652 PAD cases and 1629 controls from the eMERGE PAD genome-wide association study (GWAS), and 1241 VTE cases and 1278 controls from the GENEVA GWAS of venous thrombosis (dbGaP accession numbers phs000203. v1. p1 and phs000289. v2. p1, respectively). 66 and 72 mtSNPs passed quality control filters and were tested for association with PAD and VTE, respectively. Significant evidence of population stratification could not be detected in both datasets. Three mtSNPs (m. 477T > C, m. 9667A > G, and m. 10915T > C) were nominally associated (3.01 x 10(-3) <= pa <= 3.96 x 10(-2)) with PAD in the logistic regression adjusted for confounding factors, and m. 11914G > A was nominally associated (pa = 4.14 x 10(-2)) with VTE. None of the nine major
mitochondrial haplogroups were associated with either PAD or VTE."

According to the news reporters, the research concluded: "Unlike other vascular diseases such as stroke and diabetes, these results suggest that common mitochondrial variants individually or in combination do not play a major role in PAD and VTE susceptibility."

For more information on this research see: Mitochondrial genome association study with peripheral arterial disease and venous thromboembolism. Atherosclerosis, 2016;252():97-105. Heart Disorders and Diseases - Ventricular Tachycardia

New Ventricular Tachycardia Study Findings Recently Were Reported by Researchers at Na Homolce Hospital (Catheter Ablation of Ischemic Ventricular Tachycardia With Remote Magnetic Navigation: STOP-VT Multicenter Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Ventricular Tachycardia. According to news reporting from Prague, Czech Republic, by NewsRx journalists, research stated, "Catheter ablation is an effective treatment of scar-related ventricular tachycardia (VT), but the overall complexity of the procedure has precluded its widespread use. Remote magnetic navigation (RMN) has been shown to facilitate cardiac mapping and ablation of VT in a retrospective series."

Funders for this research include Stereotaxis, St. Louis, Biosense-Webster and St. Jude Medical, Biosense-Webster, St. Jude Medical, and Boston Scientific.

The news correspondents obtained a quote from the research from Na Homolce Hospital, "STOP-VT is the first multicenter, prospective, single-arm and single-procedure study evaluating RMN-based mapping and ablation of post-infarction VT. Patients with documented VT and prior MI, in whom an ICD was implanted either for primary or secondary prevention, were recruited from four EU and US centers. Either a transseptal (48 patients) or transaortic (5 patients) approach was employed to gain access for ventricular endocardial mapping/ablation during VT (entrainment mapping, activation mapping) and/or substrate mapping in sinus rhythm (elimination of fractionated/late potentials, variable extent of substrate modification) with RMN and irrigated RF ablation. The primary endpoints were as follows: (i) non-inducibility of the
target VT or any other sustained VT; (ii) elimination of sustained VT/VF during ICD follow-up of up to 12 months. The cohort included 53 consecutive patients (median age 67 years, 49 men, median LVEF 31%). One hemodynamically unstable patient was excluded at the onset of mapping. Inducibility of sustained VT was achieved an average of 2.2 times per patient (1-8), with mean tachycardia cycle length (TCL) 374 milliseconds (179-510). Mean total procedure and fluoroscopy times were 223 minutes and 8.7 minutes, respectively; mean cumulative fluoroscopy time during mapping and ablation was 0.95 minutes; maximum power averaged 42.3 W with nominal saline 30 cc/min irrigation; mean cumulative RF time was 38 minutes. Non-inducibility of the target VT was achieved in 49/52 patients (94.2%) and non-inducibility of any VT was achieved in 38/52 patients (73.1%). A combination of RMN and manual ablation was performed in two patients, rendering one non-inducible. During the 12-month ICD follow-up period, freedom from any sustained VT/VF was observed in 30 patients (62%), of which 19 (63%) were off antiarrhythmic medications. Five patients expired during follow-up: one presented with a VT storm, but for the others, death was not related to VT/VF (MI-cardiogenic shock, pulmonary embolism, bronchogenic carcinoma, end stage heart failure). No procedural complications were reported.

According to the news reporters, the research concluded: "This first prospective, single-procedure, multicenter study indicates that remote magnetic navigation is a safe and effective method for catheter ablation of post-infarction VT."

Our news journalists report that additional information may be obtained by contacting J. Skoda, Cardiology Department, Na Homolce Hospital, Prague, Czech Republic. Additional authors for this research include A. Arya, F. Garcia, E. Gerstenfeld, F. Marchlinski, G. Hindricks, J. Miller, J. Petru, L. Sediva, Q. Sha, M. Janotka, M. Chovanec, P. Waldauf, P. Neuzil and V.Y Reddy.

New Ventricular Tachycardia Study Findings Recently Were Reported by Researchers at Tomsk Polytechnic University (Radionuclide Assessment of Cardiac Function and Dyssynchrony in Children with Idiopathic Ventricular Tachycardia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Ventricular Tachycardia have been published. According to news reporting from Tomsk, Russia, by NewsRx journalists, research stated, "The aim of the study was to evaluate the impact of idiopathic ventricular tachycardia and premature ventricular beats on cardiac function and dyssynchrony and to elucidate relationships between data of scintigraphic and intracardiac electrophysiology studies (EPSs). The study comprised 64 patients with idiopathic ventricular arrhythmias (VAs; median age of 14 years ranging from 8 to 18 years)."

The news correspondents obtained a quote from the research from Tomsk Polytechnic University, "The control group comprised 20 patients (median age of 12 ranging from 7 to 16 years) without cardiac arrhythmias. EPS and radiofrequency ablation (RFA) procedure for VA were performed in 21 children according to indications. The functional state of both ventricles was assessed by gated blood pool single photon emission computer tomography (GBP-SPECT) before and after RFA in all patients. Patients with VA had local areas of asynchronous myocardial contraction (AMC). Compared with the control group, VA patients had significantly higher values of end-diastolic volume, end-systolic volume, and lower contractility indices. Negative association was found between total numbers of AMC areas and cardiac contractility indices. Ectopic foci localization, determined based on EPS data, was associated with AMC areas topography based on GBP-SPECT. RFA procedure significantly improved cardiac contractility indices; AMC areas completely disappeared or decreased compared with the preoperative conditions. In VA patients, AMC areas were localized mostly in the right ventricle. Comparison of the results of GBP-SPECT and EPS studies showed a relationship between AMC localizations and ectopic foci topography."

According to the news reporters, the research concluded: "The fact that AMC areas disappeared after RFA supports the hypothesis stating that the presence of AMC areas is a scintigraphic symptom of ectopic focus."

Membrane Proteins - Vesicular Transport Proteins

New Vesicular Transport Proteins Study Findings Reported from Vanderbilt University (Caveolin-1 is an aggresome-inducing protein)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Membrane Proteins - Vesicular Transport Proteins have been presented. According to news reporting from Nashville, Tennessee, by NewsRx journalists, research stated, "Caveolin-1 (Cav1) drives the formation of flask-shaped membrane invaginations known as caveolae that participate in signaling, clathrin-independent endocytosis and mechanotransduction. Overexpression or mutations of Cav1 can lead to its mistrafficking, including its accumulation in a perinuclear compartment previously identified as the Golgi complex."

The news correspondents obtained a quote from the research from Vanderbilt University, "Here, we show that in the case of overexpressed Cav1-GFP, this perinuclear compartment consists of cytoplasmic inclusion bodies generated in response to the accumulation of aggregates of misfolded proteins, known as aggresomes. Aggresomes containing Cav1-GFP are encased within vimentin cages, form in a microtubule-dependent manner, and are enriched in a number of key regulators of protein turnover, including ubiquitin, VCP/p97 and proteasomes. Interestingly, aggresome induction was cell-type dependent and was observed for many but not all Cav1 constructs tested. Furthermore, endogenous Cav1 accumulated in aggresomes formed in response to proteasomal inhibition. Our finding that Cav1 is both an aggresome-inducing and aggresome-localized protein provides new insights into how cells handle and respond to misfolded Cav1."

According to the news reporters, the research concluded: "They also raise the possibility that aggresome formation may contribute to some of reported phenotypes associated with overexpressed and/or mutant forms of Cav1."

Gram-Negative Bacteria - *Vibrio alginolyticus*

**New Vibrio alginolyticus Findings Reported from South China Normal University [Identification, characterization and expression analysis of tumor suppressor protein p53 from pufferfish (Takifugu obscurus) after the Vibrio alginolyticus challenge]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - *Vibrio alginolyticus* are presented in a new report. According to news reporting from Guangdong, People’s Republic of China, by NewsRx journalists, research stated, "The tumor suppressor protein p53 plays a critical role in cell cycle, apoptosis and DNA repair. In this study, the full-length pufferfish p53 (Pfp53) was obtained, containing an open reading frame of 1095 bp, a 5'UTR of 157 bp and a 3'UTR of 285 bp with a poly (A) tail."

Funders for this research include National Natural Science Foundation of China, Hainan Applied Technology Research and Development and Demonstration Projects, China Postdoctoral Science Foundation, Ministry of Agriculture, Guangdong Provincial Natural Science Foundation, Scientific and Technological Planning Project of Guangdong Province, Science and technology innovation of Higher School Guangdong Province, Project of Guangdong Provincial Oceanic and Fishery Administration, Scientific and Technological Planning Project of Guangzhou City.

The news correspondents obtained a quote from the research from South China Normal University, "The Pfp53 encoded a polypeptide of 364 amino acids with a theoretical isoelectric point of 8.03 and predicted molecular weight of 40.6 kDa. Pfp53 was ubiquitously expressed in various tissues with a high-level expression in kidney, liver and gill. *Vibrio alginolyticus* challenge could induce ROS production and disrupt Ca2+ homeostasis, subsequently leading to the induction of DNA damage and apoptosis, while the *Vibrio alginolyticus*-induced oxidative stress can also increase the non-specific immunity. The pufferfish challenged with *Vibrio alginolyticus* showed a sharp increase of Pf-p53 transcript in liver. Subcellular localization analysis revealed that Pfp53 was primarily localized in nucleus. Furthermore, overexpression of Pfp53 in HeLa cells could inhibit cell proliferation and the transcriptional activities of the NF-kappa B promoter."

According to the news reporters, the research concluded: "Taken together, our results indicated that Pf-p53 may play an important role in the immune response to *Vibrio alginolyticus* challenge."

For more information on this research see: Identification, characterization and expression analysis of tumor suppressor protein p53 from pufferfish (Takifugu obscurus) after the *Vibrio alginolyticus* challenge. *Fish & Shellfish Immunology*, 2016;59():312-322. *Fish & Shellfish Immunology* can be contacted at: Academic Press Ltd- Elsevier Science Ltd, 24-28 Oval Rd, London NW1 7DX, England. Viral Load

New Viral Load Study Findings Have Been Reported by Researchers at School of Medicine (Effects of Chronic Diurnal Disruption and Acute Inflammatory Challenge on Mice with Latent Murine Gammaherpesvirus Infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Viral Load have been published. According to news reporting out of Springfield, Illinois, by NewsRx editors, research stated, "People who engage in shift work (SW) have increased risk of developing illnesses, including infectious diseases and various inflammatory conditions. We hypothesized that exposure to repeated cycles of diurnal disruption, mimicking SW, influences viral clearance, latent viral load, or viral reactivation from latency in mice infected with murine gammaherpesvirus (MuGHV)."

Our news journalists obtained a quote from the research from the School of Medicine, "To test this idea, we inoculated BALB/cByJ and C.129S7(B6)-Ifng(tm1Ts)/J (IFNgKO) mice with MuGHV and housed them under either a stable light:dark (LD) cycle or one mimicking SW. Compared with BALB/cByJ mice, IFNγKO mice generally had higher levels of lytic virus during the 6-wk period after inoculation. In addition, more IFNgKO mice were positive for replicating virus than were BALB/cByJ mice. Exposure to SW did not alter these measures consistently. After the virus had entered the latent phase of infection, mice received either LPS or pyrogen-free saline intraperitoneally. Mice exposed to SW and then injected with LPS during latent infection had greater viral loads and more replicating virus in the lung at 7 d after injection than did either mice that received pyrogen-free saline or those exposed to LD and then treated with LPS. Some cytokine and chemokine concentrations were changed in lung collected 1 d after but not at 7 d after LPS administration."

According to the news editors, the research concluded: "These findings suggest that exposure to repeated chronic diurnal disruption and an acute inflammatory challenge during latent MuGHV infection, in the context of impaired host immune competence, contribute to enhanced viral reactivity and an increased viral load that might trigger 'sickness behavior' symptoms of infectious disease and perhaps contribute to chronic fatigue syndrome."

Neurodevelopmental Diseases and Conditions —

New Williams Syndrome Study Findings Have Been Reported by Investigators at Department of Pediatrics (Williams syndrome and mature B-Leukemia: A random association?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodevelopmental Diseases and Conditions - Williams Syndrome have been published. According to news originating from Como, Italy, by NewsRx correspondents, research stated, "Williams syndrome (WBS) is a rare neurodevelopmental disorder with specific phenotypic characteristics and cardiac abnormalities, but is not considered as a cancer predisposing condition. However, in rare cases, malignancies have been described in patients with WBS, with hematologic cancer (mainly Burkitt Lymphoma and Acute Lymphoblastic Leukemia) as the most represented."

Our news journalists obtained a quote from the research from the Department of Pediatrics, "We report here the case of a boy with WS and B-NHL. This is the unique case within the large cohort of patients (n = 117) followed in our institution for long time (mean clinical follow-up, 13 years)."

According to the news editors, the research concluded: "We herewith propose that the BCL7B gene, located in the chromosomal region commonly deleted in Williams syndrome, could potentially have a role in this particular association."

For more information on this research see: Williams syndrome and mature B-Leukemia: A random association? European Journal of Medical Genetics, 2016;59(12):634-640. European Journal of Medical Genetics can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; European Journal of Medical Genetics - www.journals.elsevier.com/european-journal-of-medical-genetics/)

New beta-Lactams Study Findings Have Been Reported by Researchers at Institute of Medicine [Antimicrobial Susceptibility among European Gram-Negative and Gram-Positive Isolates Collected as Part of the Tigecycline Evaluation and Surveillance ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on beta-Lactams have been published. According to news reporting from Leipzig, Germany, by NewsRx journalists, research stated, "European centers (n = 226) involved in the Tigecycline Evaluation and Surveillance Trial (TEST, 2004-2014) submitted data and bacterial isolates. Minimal inhibitory concentrations and susceptibility were determined using Clinical and Laboratory Standards Institute methods and European Committee on Antimicrobial Susceptibility Testing breakpoints."

The news correspondents obtained a quote from the research from the Institute of Medicine, "The rates of the following resistant pathogens increased from 2004 to 2014: extended-spectrum beta-lactamase (ESBL)-positive Escherichia coli (from 8.9 to 16.9%), multidrug-resistant Acinetobacter baumannii complex (from 15.4 to 48.5%), and ESBL-positive Klebsiella pneumoniae (from 17.2 to 23.7%). The rate of methicillin-resistant Staphylococcus aureus was 27.5% in 2004 and 28.9% in 2014. Resistance to the carbapenems (imipenem and meropenem) was 37.4 and 14.5% for A. baumannii complex and Pseudomonas aeruginosa, respectively. Carbapenem resistance was <= 4.3% among the Enterobacteriaceae and 0.2% against Streptococcus pneumoniae. The resistance to tigecycline ranged between 7.4% against ESBL-producing K. pneumoniae and 0.0% against S. aureus. The carbapenems and tigecycline were active against Enterobacteriaceae. Agents with activity against A. baumannii complex and P. aeruginosa are limited."

According to the news reporters, the research concluded: "The carbapenems, tigecycline, linezolid, and vancomycin were active against Gram-positive organisms."

Our news journalists report that additional information may be obtained by contacting A.C. Rodloff, Inst Med Mikrobiol & Infekt Epidemiol, DE-04103 Leipzig, Germany.

New pharmacon allows testicular tumors to shrink

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Testicular cancer is the most common malignant tumor disease in men between 20 and 40 years of age. It can usually be treated well. In some cases, however, the cancer hardly responds or does not respond at all to treatment. A substance that was originally destined to be an innovative contraceptive is offering new hope in these cases. An experimental drug with the cryptic name JQ1 blocks sperm maturation and was discussed to be a male contraceptive. Instead, it may be suitable for cancer therapy.

JQ1 belongs to a new class of drugs with far-reaching abilities: its members fundamentally influence which genes in the cell are active and which are not. The hereditary material DNA is similar to an extremely long strip of Morse code, on which the assembly instructions for the cellular molecules are found. To fit into the cell nuclei, this strip of Morse code is wrapped around small protein balls at regular intervals - the histones. Histones and DNA together resemble a string of pearls.

However, the histones do not only play a structural role. They also feature chemical tags - called methyl or acetyl groups. These tags signal to the synthesis machinery in the cell whether the strip of Morse code should be read at this point or not. "JQ1 inhibits those proteins that read these histone marks and thus changes the gene activity in the cell," explains Prof. Hubert Schorle from the Institute for Pathology at the University of Bonn.

The cancer cells react very sensitive to these changes: they activate a suicide program, called apoptosis. "In a testicular cancer mouse model, the tumors began to shrink after administering JQ1," explains the lead author of the study, Sina Jostes. "In contrast, healthy skin cells seem to tolerate JQ1 very well."

Especially effective in combination

Besides JQ1, other drugs that alter the marks of the histones are also known. One of these is romidepsin. The laboratory in Bonn was recently able to show that romidepsin is also very effective at fighting testicular cancer cells. Unlike JQ1, romidepsin is already approved for the treatment of patients with certain types of cancer.

"In our study, we treated mice with both JQ1 and romidepsin," explains Dr. Daniel Nettersheim, who helped in planning and performing the studies. "This way, we achieved a similar effect alike JQ1 or romidepsin treatment alone, but we could reduce the quantities of both substances. Such a combination therapy to treat testicular tumors may be much better tolerated. Chemotherapy-resistant patients could also benefit from this." However, clinical studies are now needed to move the treatment towards the clinics.

Besides scientists from the University of Bonn, the studies also involved researchers from the University of St. Gallen (Switzerland) and Harvard Medical School (USA).

**Amyotrophic Lateral Sclerosis**

**New tool shines light on protein condensation in living cells**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A tool that uses light to manipulate matter inside living cells has begun to explain how proteins assemble into different liquid and gel-like solid states, a key to understanding many critical cellular operations.

Marvels of complexity, cells host many thousands of simultaneous chemical reactions. Some reactions happen inside specialized compartments, called organelles. Certain organelles, however, lack any membrane to wall themselves off from the rest of the matter floating within cells. These membraneless organelles somehow persist as self-contained structures amidst a cellular sea of water, proteins, nucleic acids and other molecules.

Scientists at Princeton University have developed a new tool -- dubbed optoDroplet -- that offers unprecedented access to manipulating and understanding the chemistry that allows membraneless organelles to function.

"This optoDroplet tool is starting to allow us to dissect the rules of physics and chemistry that govern the self-assembly of membraneless organelles," said Clifford Brangwynne, an assistant professor of chemical and biological engineering at Princeton and senior author of a paper published online in Cell on Dec. 29. "The basic mechanisms underlying this process are very poorly understood, and if we get a handle on it, there might be a hope for developing interventions and treatments for devastating diseases connected with protein aggregation, such as ALS."

Previous research has demonstrated that membraneless organelles assemble within the cell by a process known as a phase transition: examples of familiar phase transitions include water vapor condensing into dew droplets or liquid water freezing into solid ice. Studies over the last several years by Brangwynne and colleagues have revealed that altering the concentration of certain proteins, or modifying their structure, appears to trigger a phase change that allows proteins to condense into droplet-like organelles.

To date, though, most studies have used purified proteins studied in test tubes, and researchers have had few methods to study phase transitions in the frenetic dynamos that are living cells. OptoDroplets will help scientists learn about when phase transitions go awry, yielding solid-like gels and crystalline aggregates of proteins implicated in diseases including Alzheimer's and amyotrophic lateral sclerosis (ALS).

OptoDroplet relies on a technique called optogenetics, involving proteins whose behavior can be altered by exposure to light. (Cells are mostly water and thus essentially transparent.) The researchers showed that they could induce phase transitions and create membraneless organelles by switching on the light-activated proteins. They also could undo the transitions by simply turning the light off. Increasing the light intensity and protein concentrations allowed the researchers to further control the transition. By changing those inputs, they can determine when condensed liquid protein droplets form, as well as solid-like, protein aggregates, possibly linked to diseases.

"OptoDroplet provides us a level of control we can use to precisely map what we call the phase diagram in living cells," said Brangwynne. "With that, we're beginning to understand how cells use their natural machinery to move through this intracellular phase diagram to assemble different types of organelles."

The lead author of the paper is Yongdae Shin, a postdoctoral fellow in Brangwynne's Soft Living Matter Group, part of Princeton's Department of Chemical and Biological
Engineering. Co-authors Joel Berry and Mikko Haataj a of the Department of Mechanical and Aerospace Engineering helped develop mathematical models for understanding the intracellular phase behavior, while Nicole Pannucci and Jared Tootcher of the Department of Molecular Biology are experts in optogenetics and helped guide the molecular design of the optoDroplet proteins. The work was supported in part by the National Institutes of Health and the National Science Foundation.

Using mouse and human cells, the research team spliced in a gene for a light-sensitive protein from a plant called a mouse-ear cress (or Arabidopsis thaliana,) a relative of cabbage and mustard that is a mainstay of genetics research. Blue light exposure causes the protein to self-associate, scrunching up on itself.

The light-sensitive tag was fused to protein components thought to drive phase transitions in living cells. Using the light, the researchers found that they could induce the proteins to huddle up, mimicking the condensation process that naturally occurs in cells. "To use the analogy of water vapor, you can think of what we did as using a laser to locally change the temperature of some area of the air so that water droplets would condense out of it," said Brangwynne.

The team repeatedly prompted the proteins to condense and then dissolve by turning the light on and off. The process proved fully reversible, even after many cycles. However, with high-intensity light or high concentrations of proteins, the researchers created semi-solid gels. Those gels were initially reversible, but over time they solidified to form irreversible lumpy aggregates, similar to those found in some diseases.

"We've shown with optoDroplet that we can readily assemble and disassemble phase-separated liquids, and they do not appear to cause any problem for the cell," said Brangwynne. "But the gel-like assemblies appear to be more problematic, since over many cycles, they develop into persistent aggregates that the cell can no longer deal with and that can start to gum up healthy biological processes."

One example is the protein called FUS. The FUS protein is critical for the cell's operations; it helps produce other proteins and repair damaged DNA. But scores of genetic mutations can cause the FUS protein to become too sticky, leading to ALS, also known as Lou Gehrig's disease. A neurological condition in which patients lose the ability to voluntarily control their muscles, ALS is marked by clumps of protein accumulating in nerve cells. Those clumps might stem from FUS or other proteins pathologically aggregating, instead of staying as dynamic fluid droplets. Huntington's disease and Alzheimer's also involve clumps of proteins clogging up cells, again suggesting that abnormal phase transitions in cells are closely connected with these conditions.

Edward Lemke, a researcher at the European Molecular Biology Laboratory in Heidelberg, Germany, who was not involved in the Cell study, noted the promise of optoDroplet.

"The proteins targeted by optoDroplet are an important constituent of phase-separating proteins, many of which are also associated with infamous diseases," Lemke said. "The optoDroplet system gives access to modulating the state of these proteins inside the cell in a minimally invasive and highly controlled fashion, so it can provide new insights on how they carry out their function."

Brangwynne and colleagues look forward to continuing to experiment with optoDroplet to better understand cells' complex behaviors.

"This is fundamental science we're doing, answering basic questions about phase transitions in cells," Brangwynne said. "But we're hoping these insights will reveal not only how healthy cells work, but also how they can become diseased, and maybe eventually cured."

Heart Disorders and Diseases - Heart Disease

North Bristol NHS Trust Details Findings in Heart Disease (Low-dose intensive insulin therapy in patients with Acute Coronary Syndrome accompanied by Left Ventricular Failure: audit of two UK hospitals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Disease. According to news reporting originating in Bristol, United Kingdom, by NewsRx journalists, research stated, "To determine whether a low-dose intravenous insulin regimen reduces blood glucose levels at a timely rate and associated side effects among patients with Acute Coronary Syndrome and Left Ventricular Failure. Induced hypoglycaemia and the associated risks have questioned the benefits of intensive insulin therapy in patients presenting with raised blood glucose levels and Acute Coronary Syndromes."

The news reporters obtained a quote from the research from North Bristol NHS Trust, "Local audit data identified that patients with Acute Coronary Syndrome and Left Ventricular Failure experienced more hypoglycaemic episodes than those with Acute Coronary Syndrome alone. Consequently, a new regimen of low-dose insulin for this group was implemented and audited over 12 months. Audit. Thirty-six consecutive patient notes with a diagnosis of Acute Coronary Syndrome and blood glucose of >= 10 mmol/l treated with a new insulin therapy regimen were analysed. Data were extracted using a standardised form and entered into an Excel spreadsheet for analysis. The mean age of the sample was 70 years with 66% of subjects being men and 50% presenting with Acute Coronary Syndrome and Left Ventricular Failure. The low-dose regimen was effective in achieving normoglycaemia, (range 4-8 mmol/l) for a consecutive six-hour period. This was achieved in 72% of patients and within a median time of 13 hours. The audit suggests that a low-dose insulin regimen can effectively stabilise blood glucose in patients presenting with both Acute Coronary Syndrome and Left Ventricular Failure."

According to the news reporters, the research concluded: "The importance of regularly monitoring blood sugar levels is vital and highlights the role of nurses in minimising patient risk and promoting safety."

Our news correspondents report that additional information may be obtained by contacting N. Manning, North Bristol NHS Trust, Southmead Hosp, Cardiac Rehab Department, Bristol, Avon, United Kingdom.

Biotechnology - Pharmacogenomics

NorthShore University Health System Details Findings in Pharmacogenomics (Implementation of a multidisciplinary pharmacogenomics clinic in a community health system)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology - Pharmacogenomics. According to news reporting originating from Evanston, Illinois, by NewsRx correspondents, research stated, "The development and implementation of a multidisciplinary pharmacogenomics clinic within the framework of an established community based medical genetics program are described. Pharmacogenomics is an important component of precision medicine that holds considerable promise for pharmacotherapy optimization."

Our news editors obtained a quote from the research from NorthShore University Health System, "As part of the development of a health system-wide integrated pharmacogenomics program, in early 2015 Northshore University Health System established a pharmacogenomics clinic run by a multidisciplinary team including a medical geneticist, a pharmacist, a nurse practitioner, and genetic counselors. The team identified five key program elements: (1) a billable-service provider, (2) a process for documentation of relevant medication and family histories, (3) personnel with the knowledge required to interpret pharmacogenomic results, (4) personnel to discuss risks, benefits, and limitations of pharmacogenomic testing, and (5) a mechanism for reporting results. The most important program component is expert interpretation of genetic test results to provide clinically useful information; pharmacists are well positioned to provide that expertise. At the Northshore University HealthSystem pharmacogenomics clinic, patient encounters typically entail two one-hour visits and follow a standardized workflow. At the first visit, pharmacogenomics-focused medication and family histories are obtained, risks and benefits of genetic testing are explained, and a test sample is collected; at the second visit, test results are provided along with evidence-based pharmacotherapy recommendations."

According to the news editors, the research concluded: "A multidisciplinary clinic providing genotyping and related services can facilitate the integration of pharmacogenomics into clinical care and meet the needs of early adopters of precision medicine."

The news editors report that additional information may be obtained by contacting H.M. Dunnenberger, NorthShore Univ HealthSyst, Center Mol Med, Evanston, IL 60201, United States. Additional authors for this research include M. Biszewski, G.C. Bell, A. Sereika, H. May, S.G. Johnson, P.J. Hulick and J. Khandekar.

Nervous System Diseases and Conditions - Charcot-Marie-Tooth Disease [X-linked Charcot-Marie-Tooth disease type 6 (CMTX6) patients with a p.R158H mutation in the pyruvate dehydrogenase kinase isoenzyme 3 gene]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nervous System Diseases and Conditions - Charcot-Marie-Tooth Disease is now available. According to news reporting originating from Sydney, Australia, by NewsRx correspondents, research stated, "Charcot-Marie-Tooth disease (CMT) is the most common inherited peripheral neuropathy. Mutations in the pyruvate dehydrogenase kinase isoenzyme 3 (PDK3) gene have been found to cause X-linked dominant CMT type 6 (CMTX6)."

Funders for this research include Korean Health Technology R&D Project, Ministry of Health & Welfare, Republic of Korea, National Research Foundation of Korea, Korean Government, Ministry of Science ICT and Future Planning, Australian National Health and Medical Research Project Grant.

Our news editors obtained a quote from the research from Northcott Neuroscience Laboratory, "This study identified the p.R158H PDK3 mutation after screening 67 probable X-linked CMT families. The mutation fully segregated with the phenotype, and genotyping the family indicated the mutation arose on a different haplotype compared with the original Australian CMTX6 family. Results of bisulphite sequencing suggest that methylated deamination of a CpG dinucleotide may cause the recurrent p.R158H mutation. The frequency of the p.R158H PDK3 mutation in Koreans is very rare. Magnetic resonance imaging revealed fatty infiltration involving distal muscles in the lower extremities. In addition, fatty infiltrations were predominantly observed in the soleus muscles, with a lesser extent in tibialis anterior muscles. This differs from demyelinating CMT1A patients and is similar to axonal CMT2A patients."

According to the news editors, the research concluded: "The clinical, neuroimaging, and electrophysiological findings from a second CMTX6 family with the p.R158H PDK3 mutation were similar to the axonal neuropathy reported in the Australian family."

For more information on this research see: X-linked Charcot-Marie-Tooth disease type 6 (CMTX6) patients with a p.R158H mutation in the pyruvate dehydrogenase kinase

**Heart Disorders and Diseases - Heart Failure**

**Novel drug may help repair failing hearts**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Cimaglermin, a new experimental drug, may help restore cardiac function after heart failure, according to a first-in-man study published in *JACC: Basic to Translational Science*.

Heart failure, characterized by a loss of cardiac function, is among the leading causes of death worldwide. A significant portion of heart failure patients, particularly those with severe left ventricular systolic dysfunction, do not sufficiently respond to current medical therapy.

Researchers examined the safety and efficacy of a single infusion of cimaglermin, which acts as a growth factor for the heart, helping the structural, metabolic and contractile elements of the heart to repair itself following injury. The study enrolled 40 heart failure patients who were taking optimal medical therapy for at least three months prior to the trial. Compared to patients who received a placebo, patients who received a high dose of cimaglermin had a sustained increase in left ventricular ejection fraction, or pumping capacity, through 90 days after dosing, with the maximum increase reached at day 28.

"These findings support continued clinical development of the investigational drug cimaglermin, including further safety evaluations and detailing the potential improvement on clinical heart failure outcome measures," said Daniel J. Lenihan MD, from the division of cardiovascular medicine at Vanderbilt University and the lead author of the study. "As with all experimental therapeutics, additional studies will be required and subject to regulatory review to determine if the relative risks and benefits of cimaglermin warrant approval."

The most common side effects were headache and nausea, which were temporarily associated with exposure to the drug. One patient receiving the highest planned dose of cimaglermin experienced an adverse reaction that met the stopping criteria of Federal Drug Administration guidance for drug induced liver injury.

Limitations of this study include the small sample size and the fact that patients only
received a single infusion rather than multiple doses.

"Although the results of the study must be regarded as provisional because of the small numbers of patients, the results of this study are nonetheless very exciting," said Douglas L. Mann, MD, FACC, editor-in-chief of JACC: Basic to Translational Science. "Instead of blocking the fundamental mechanisms that lead to cardiac injury, the early results with cimaglermin suggest that it may also be possible to administer therapeutics that allow the failing heart to repair itself using its own repair mechanisms. If the results of this study can be replicated and translated into improvements in clinical outcomes in larger numbers of patients in phase II and III clinical trials, it will represent a paradigm shift in the way in which clinicians treat patients with heart failure."

Keywords for this news article include: Heart Disease, American College of Cardiology, Cardiovascular Diseases and Conditions, Heart Disorders and Diseases - Heart Failure.

Foodborne Diseases and Conditions - Listeria

Off-switch for CRISPR-Cas9 gene editing system discovered

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- UC San Francisco researchers have discovered a way to switch off the widely used CRISPR-Cas9 gene-editing system using newly identified anti-CRISPR proteins that are produced by bacterial viruses. The technique has the potential to improve the safety and accuracy of CRISPR applications both in the clinic and for basic research.

The new study, published in Cell on Dec. 29, 2016, was led by Benjamin Rauch, PhD, a post-doctoral researcher in the laboratory of Joseph Bondy-Denomy, PhD, who is a UCSF Sandler Faculty Fellow in the Department of Microbiology and Immunology.

CRISPR-Cas9 evolved in bacteria as an immune system to protect against viral infections, but in the past decade it has excited both researchers and the general public as a general-use gene editing system, enabling scientists to quickly and efficiently modify genetic information and tweak gene activity in virtually any organism.

Many hope CRISPR will speed efforts to directly treat genetic disorders, among many other applications, but for the most part the technology has not yet proven quite precise enough, making occasional unintended edits along with the intended ones. Researchers and bioethicists also worry that the technology's very power and ease of use raise the possibility that it could potentially cause harm, either intentionally or by accident.

The newly discovered anti-CRISPR proteins -- which are the first to work against the type of CRISPR-Cas9 system most commonly used by laboratories and the burgeoning gene editing industry -- could help resolve both problems, Bondy-Denomy says, enabling more precise control in CRISPR applications but also providing a fail-safe to quickly block any potentially harmful uses of the technology.

To find such a switch, Bondy-Denomy and Rauch turned to the same billion-year arms race between viruses and bacteria that produced the CRISPR system itself:

"Just as CRISPR technology was developed from the natural anti-viral defense systems in bacteria, we can also take advantage of the anti-CRISPR proteins that viruses have sculpted to get around those bacterial defenses," Rauch said.
How it was done: identifying "self-targeting" bacteria

In order to discover an anti-CRISPR protein that would work against the type of CRISPR-Cas9 system most labs now use, which depends on a protein called SpyCas9 as its targeted DNA clippers, the researchers came up with a clever trick: They reasoned that they should be able to identify bacteria with inactivated CRISPR systems by looking for evidence of so-called "self-targeting" -- bacterial strains where some virus had successfully gotten through the Cas9 blockade and inserted its genes into the bacterial genome. The team hypothesized that these phages must encode some anti-CRISPR agent, or else Cas9 would kill the bacteria by cutting its own genome where the viral DNA had been inserted.

"Cas9 isn't very smart," Bondy-Denomy said. "It's not able to avoid cutting the bacterium's own DNA if it is programmed to do so. So we looked for strains of bacteria where the CRISPR-Cas9 system ought to be targeting its own genome - the fact that the cells do not self-destruct was a clue that the whole CRISPR system was inactivated."

Using a bioinformatics approach designed by Rauch, the team examined nearly 300 strains of Listeria, a bacterial genus famous for its role in food-borne illness, and found that three percent of strains exhibited "self-targeting". Further investigation isolated four distinct anti-CRISPR proteins that proved capable of blocking the activity of the Listeria Cas9 protein, which is very similar to SpyCas9.

Additional experiments showed that two of the four anti-CRISPR proteins -- which the researchers dubbed AcrIIA2 and AcrIIA4 -- worked to inhibit the ability of the commonly used SpyCas9 to target specific genes in other bacteria - such as E. coli - as well as in engineered human cells. Together, the results suggest that AcrIIA proteins are potent inhibitors of the CRISPR-Cas9 gene editing system as it has been adopted in labs around the world.

"The next step is to show in human cells that using these inhibitors can actually improve the precision of gene editing by reducing off-target effects," Rauch said. "We also want to understand exactly how the inhibitor proteins block Cas9's gene targeting abilities, and continue the search for more and better CRISPR inhibitors in other bacteria."

Off-switch could improve accuracy and safety of many CRISPR applications

Rauch and Bondy-Denomy believe the ability to deactivate SpyCas9 will make CRISPR-based gene editing much safer and more precise by resolving the ongoing problem of unintended "off-target" gene modifications, which become more likely the longer the CRISPR gene editing machinery remains active in target cells.

The discovery could also be a boon for scientists using newer CRISPR techniques pioneered in part at UCSF - such as CRISPR interference and CRISPR activation -- which use Cas9 not to modify gene sequences but to precisely tune their activity up and down. Using anti-CRISPR proteins, researchers could boost or block gene activity temporarily, potentially even synchronizing choreographed bursts of activity from sets of interconnected genes across the genome, which could be key to studying and treating complex, multi-gene diseases.

CRISPR inhibitors could also prove to be a valuable safeguard, the researchers say, enabling scientists to quickly halt any application of CRISPR gene editing outside the lab.

"Researchers and the public are reasonably concerned about CRISPR being so powerful that it potentially gets put to dangerous uses," Bondy-Denomy said. "These inhibitors provide a mechanism to block nefarious or out-of-control CRISPR applications, making it safer to explore all the ways this technology can be used to help people."

Oncology - Soft Tissue Sarcomas

Oscar Lambret Center Details Findings in Soft Tissue Sarcomas [Safety and efficacy of regorafenib in patients with advanced soft tissue sarcoma (REGOSARC): a randomised, double-blind, placebo-controlled, phase 2 trial]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Soft Tissue Sarcomas is now available. According to news reporting from Lille, France, by NewsRx journalists, research stated, "Regorafenib is a multikinase inhibitor with proven activity in refractory gastrointestinal stromal tumours and chemotherapy-refractory advanced colorectal cancers. We assessed this agent's efficacy and safety in patients with metastatic soft tissue sarcomas previously treated with anthracycline."

The news correspondents obtained a quote from the research from Oscar Lambret Center, "In this randomised, double-blind, phase 2 trial undertaken in France and Austria, we enrolled patients aged 18 years and older with advanced soft tissue sarcomas who had received previous doxorubicin or other anthracycline treatment. These patients were randomly assigned (1: 1) into one of the following four cohorts: liposarcoma, leiomyosarcoma, synovial sarcoma, and other sarcomas. Participants were treated with oral regorafenib (160 mg per day 3 weeks on and 1 week off) or matched placebo. Patients receiving placebo were offered optional crossover in case of centrally confirmed disease progression. The random allocation schedule was computer-generated with permuted blocks of four patients, with two stratification factors: country (France or Austria) and previous exposure to pazopanib (yes or no). Eligibility criteria included patients with histologically proven advanced and inoperable soft tissue sarcomas with intolerance or failure to doxorubicin or other anthracycline-based chemotherapy and at least one unidimensionally or bidimensionally measurable lesion according to Response Evaluation Criteria in Solid Tumors (RECIST; version 1.1). The primary endpoint was RECIST-based progression-free survival after central radiological review in the intention-to-treat population. Physicians, and radiologists of the panel were masked to treatment allocation. This study is still open for recruitment for an additional stratum (patients previously treated with pazopanib) and registered with ClinicalTrials.gov, NCT01900743. From Aug 5, 2013, to Nov 26, 2014, 182 patients were randomly assigned to one of four cohorts and included in the final analysis. At the cutoff date (Jan 7, 2016), the number of required events was reached for the four cohorts. In the liposarcoma cohort, progression-free survival was 1.1 months (95% CI 0.9-2.3) with regorafenib versus 1.7 months (0.9-1.8) with placebo (HR 0.89 [95% CI 0.48-1.64] p=0.70). In the leiomyosarcoma cohort, progression-free survival was 3.7 months (95% CI 2.5-5.0) with regorafenib versus 1.8 (1.0-2.8) months with placebo (HR 0.46 [95% CI 0.46-0.80] p=0.0045). In the synovial sarcoma cohort, progression-free survival was 5.6 months (95% CI 1.4-11.6) with regorafenib versus 1.0 (0.8-1.4) with placebo (HR 0.10 [95% CI 0.03-0.35] p<0.0001). In the other sarcoma cohort, progression-free survival was 2.9 months (95% CI 1.0-7.8) with regorafenib versus 1.0 (0.9-1.9) with placebo (HR 0.46 [95% CI 025-081] p=0.0061). Before crossover, the most common clinically significant grade 3 or higher adverse events were arterial hypertension (17 [19%] events in the 89 patients in the regorafenib group vs two [2%] events in the 92 patients in the placebo group), hand and foot skin reaction (14 [15%] vs no events) and
asthenia (12 [13%] vs six [6%]). One treatment-related death occurred in the regorafenib group due to liver failure. Regorafenib has an important clinical antitumour effect in non-adipocytic soft tissue sarcomas, improving progression-free survival."

According to the news reporters, the research concluded: "Regorafenib should be further evaluated in this setting, and its therapeutic role has to be defined in the context of the growing therapeutic armamentarium, already including one approved multikinase inhibitor, pazopanib."

Clinical Research - Clinical Trials and Studies

Ottawa Hospital Research Institute Details Findings in Clinical Trials and Studies (A Phase II Study of PF-03446962 in Patients with Advanced Malignant Pleural Mesothelioma. CCTG Trial IND.207)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news reporting from Ottawa, Canada, by NewsRx journalists, research stated, "There is no approved second-line systemic therapy option for malignant pleural mesothelioma (MPM), but targeting angiogenesis is an area of investigation. PF-03446962 is a fully human antibody against activin receptor-like kinase 1, which is commonly expressed in tumor vasculature."

The news correspondents obtained a quote from the research from Ottawa Hospital Research Institute, "We performed a multicenter, open label, single-arm, two-stage phase II study of PF-03446962 in patients with MPM and progressive disease after platinum-based chemotherapy. In total, 17 patients were enrolled, but no partial or complete responses were observed. The trial did not meet the prespecified response criterion for moving to the second stage. There were only three grade 3 (G3) or higher non-hematological toxicities observed (G3 hypertension [n=2] and G3 fatigue [n=1]) and just one episode of G3 lymphopenia."
According to the news reporters, the research concluded: "PF-03446962, despite being generally well tolerated, failed to demonstrate efficacy in the treatment of advanced MPM as a single agent. There are no plans for further investigation of this agent in MPM."

Our news journalists report that additional information may be obtained by contacting P. Wheatley-Price, Ottawa Hosp Res Inst, Ottawa Hosp Canc Center, Ottawa, ON, Canada. Additional authors for this research include Q. Chu, M. Bonomi, J. Seely, A. Gupta, G. Goss, J. Hilton, R. Feld, C.W. Lee, J.R. Goffin, A. Maksymiuk, N. Murray, L. Hagerman and P.A. Bradbury.

Nutritional and Metabolic Diseases and Conditions —

Overweight affects DNA methylation

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- The extra pounds you gain during the holidays will not only show up on your hips but will also affect your DNA. This is the result of a large-scale international study coordinated by Helmholtz Zentrum Munchen, a partner in the German Center for Diabetes Research, which has now been published in 'Nature'. The study shows that a high BMI leads to epigenetic changes at nearly 200 loci of the genome - with effects on gene expression.

While our genes do not change in the course of life, our lifestyle can directly influence their surroundings. Scientists speak here of the epigenome (Greek epi: over, outside of, around), which refers to everything that happens on or around the genes. Up to now there has not been much research on how the epigenome is altered as a result of being overweight. "This issue is particularly relevant because an estimated one and a half billion people throughout the world are overweight," said first author Dr. Simone Wahl of the Research Unit Molecular Epidemiology (AME) at Helmholtz Zentrum Munchen, "especially considering that being overweight can have adverse consequences and lead to diabetes and diseases of the cardiovascular and metabolic systems."

For this reason, the international research team led by Dr. Christian Gieger and Dr. Harald Grallert of the AME (as well as Jaspal Kooner and John Chambers of Imperial College London) examined possible correlations between body mass index (BMI) and epigenetic changes.* Using state-of-the-art technology, the team carried out the world's largest study so far on the subject.

The scientists examined the blood samples of over 10,000 women and men from
Europe. A large proportion of these were inhabitants of London of Indian ancestry, who according to the authors are at high risk for obesity and metabolic diseases. In a first step with 5,387 samples *, the research team identified 207 gene loci that were epigenetically altered dependent on the BMI. They then tested these candidate loci in blood samples of an additional 4,874 subjects and were able to confirm 187 of these*. Further studies and long-term observations also indicated that the changes were predominantly a consequence of being overweight - not the cause.

"In particular, significant changes were found in the expression of genes responsible for lipid metabolism and substrate transport, but inflammation-related gene loci were also affected," said group leader Harald Grallert. From the data, the team was also able to identify epigenetic markers that could predict the risk of type 2 diabetes.

"Our results allow new insights into which signaling pathways are influenced by obesity", said Christian Gieger, head of the AME. "We hope that this will lead to new strategies for predicting and possibly preventing type 2 diabetes and other consequences of being overweight." Next, within the framework of translational research in the German Center for Diabetes Research, the researchers want to investigate in detail how the epigenetic changes affect the expression of the underlying genes.

C Reactive Protein

Peking Union Medical College Details Findings in C Reactive Protein (Enhanced pro-protein convertase subtilisin/kexin type 9 expression by C-reactive protein through p38MAPK-HNF1 alpha pathway in HepG2 cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in C Reactive Protein. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Plasma C-reactive protein (CRP) concentration is associated positively with cardiovascular risk, including dyslipidemia. We suggested a regulating role of CRP on pro-protein convertase subtilisin/kexin type 9 (PCSK9), a key regulator of low-density lipoprotein (LDL) metabolism, and demonstrated the PCSK9 as a pathway linking CRP and LDL regulation."

The news correspondents obtained a quote from the research from Peking Union Medical College, "Firstly, experiments were carried out in the presence of human CRP on the protein and mRNA expression of PCSK9 and LDL receptor (LDLR) in human hepatoma cell line HepG2 cells. Treatment with CRP (10 mu g/ml) enhanced significantly the mRNA and protein expression of PCSK9 and suppressed the expression of LDLR. Of note, a late return of LDLR mRNA levels occurred at 12 hrs, while the LDLR protein continued to decrease at 24 hrs, suggesting that the late decrease in LDLR protein levels was unlikely to be accounted for the decrease in LDL mRNA. Secondly, the role of PCSK9 in CRP-induced LDLR decrease and the
underlying pathways were investigated. As a result, the inhibition of PCSK9 expression by small interfering RNA (siRNA) returned partly the level of LDLR protein and LDL uptake during CRP treatment; CRP-induced PCSK9 increase was inhibited by the p38MAPK inhibitor, SB203580, resulting in a significant rescue of LDLR protein expression and LDL uptake; the pathway was involved in hepatocyte nuclear factor 1 alpha (HNF1 alpha) but not sterol responsive element-binding proteins (SREBPs) preceded by the phosphorylation of p38MAPK.

According to the news reporters, the research concluded: "These findings indicated that CRP increased PCSK9 expression by activating p38MAPK-HNF1 alpha pathway, with a certain downstream impairment in LDL metabolism in HepG2 cells."

Our news journalists report that additional information may be obtained by contacting J.J. Li, Chinese Academy Med Sci, Peking Union Med College, Natl Center Cardiovasc Dis, Div Dyslipidemia Fu Wai Hosp, Beijing, People's Republic of China. Additional authors for this research include C.G. **Nutritional and Metabolic Diseases and Conditions**

**Penn expert : Human genome sequences linked to health data will change clinical medicine**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- PHILADELPHIA - The value of intersecting the sequencing of individuals' exomes (all expressed genes) or full genomes to find rare genetic variants -- on a large scale -- with their detailed electronic health record (EHR) information has "myriad benefits, including the illumination of basic human biology, the early identification of preventable and treatable illnesses, and the identification and validation of new therapeutic targets," wrote Daniel J. Rader, MD, chair of the Department of Genetics, in the Perelman School of Medicine at the University of Pennsylvania, in Science this week, with Scott M. Damrauer, MD, an assistant professor of Surgery at Penn and the Veterans Affairs Medical Center in Philadelphia.

Their commentary accompanies two linked studies on the topic in the same issue. One reports on whole-exome sequencing of more than 50,000 individuals from the Geisinger Health System in Pennsylvania and the analyses of rare variants with data from longitudinal electronic health records. They identified hundreds of people with rare "loss-of-function" gene variants that were linked to observable physiological characteristics, or phenotypes. The second
article reports on a study that identified individuals in the same database with familial hypercholesterolemia, many of whom had not been diagnosed or treated.

"These results demonstrate the enormous potential of this approach for promoting scientific biomedical discovery and influencing the practice of clinical medicine," the authors wrote. v

Because sequencing ever-larger datasets of human exomes -- and full genomes -- has become faster, more accurate, and less expensive, researchers can find rare genetic variants more quickly. And then matching these rare genetic finds to EHR phenotype data has the potential to inform health care in important ways.

"Many single-gene disorders like familial hypercholesterolemia [FH] are under-diagnosed," Rader said. "Once an individual with a single-gene disorder is identified, not only can that person be placed on appropriate medical intervention, but we can also screen his or her extended family members to see who else carries the mutant gene and may benefit from preventative approaches." He cites a recent list of 59 "medically actionable" genes, curated by the American College of Medical Genetics and Genomics (ACMG), in which loss of function mutations can lead to specific medical interventions. For example, individuals from the extended family of a person found to have FH who also carry the mutation should have their cholesterol checked and be placed on medication to reduce cholesterol.

"Identifying rare variants can also contribute to our understanding of more common, complex disorders such as Type 2 diabetes or chronic kidney disease," Rader said. "These efforts will one day reveal the fundamental value of what the genome contains for health and disease and pave the way for precision medicine in every clinic and hospital."

Oncology - Breast Cancer

Peter MacCallum Cancer Center Reports Findings in Breast Cancer
( Clinical relevance of host immunity in breast cancer: from TILs to the clinic)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating from Victoria, Australia, by NewsRx correspondents, research stated, "The clinical relevance of the host immune system in breast cancer has long been unexplored. Studies developed over the past decade have highlighted the biological heterogeneity of breast cancer, prompting researchers to investigate whether the role of the immune system in this malignancy is similar across different molecular subtypes of the disease."

Our news editors obtained a quote from the research from Peter MacCallum Cancer Center, "The presence of high levels of lymphocytic infiltration has been consistently associated with a more-favourable prognosis in patients with early stage triple-negative and HER2-positive breast cancer. These infiltrates seem to reflect favourable host antitumour immune responses, suggesting that immune activation is important for improving survival outcomes. In this
Review, we discuss the composition of the immune infiltrates observed in breast cancers, as well as data supporting the clinical relevance of host antitumour immunity, as represented by lymphocytic infiltration, and how this biomarker could be used in the clinical setting.

According to the news editors, the research concluded: "We also discuss the rationale for enhancing immunity in breast cancer, including early data on the efficacy of T-cell checkpoint inhibition in this setting."

For more information on this research see: Clinical relevance of host immunity in breast cancer: from TILs to the clinic. Nature Reviews Clinical Oncology, 2015;13(4):228-41. (Nature Publishing Group - www.nature.com/; Nature Reviews Clinical Oncology - www.nature.com/nrclinonc/)

Oncology - Small Cell Lung Cancer

**PharmaMar and Chugai enter into a license and commercialization agreement for PM1183**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- PharmaMar (MSE:PHM) has announced the signing of an exclusive license, development and commercialization agreement with Chugai Pharmaceutical Co. Ltd. (TSE:4519) for its third marine-derived anticancer drug PM1183 (lurbinectedin) in Japan. Under the terms of this agreement, PharmaMar will receive an upfront payment of €30 million, along with double-digit tiered royalties, and will also be eligible for receiving payments in line with the progress of the development and sales milestones; potentially worth over €100 million.

PharmaMar will continue to conduct the clinical development activities for the first two indications of PM1183 (platinum-resistant ovarian cancer and small cell lung cancer) in Japan, whereas Chugai will make milestone payments at study initiation and will be responsible for registration filing. In addition, Chugai will have the rights to conduct clinical development in Japan to pursue additional indications and may contribute to the global development. PharmaMar will retain the exclusive production rights of lurbinectedin and will supply the API to Chugai.

PM1183 is PharmaMar´s third anticancer drug and is currently under development for the treatment of several types of solid tumors. The Company has recently completed the recruitment of patients in a Phase III study in platinum resistant ovarian cancer, and during the month of August, a pivotal Phase III trial in small cell lung cancer was initiated.

According to Luis Mora, Managing Director of PharmaMar´s Oncology Business
"we are about to address our second strategic alliance with Chugai for the commercialization of a marine based anti-tumor compound. With this agreement, we will contribute to the sale of PM1183 in Japan. Meanwhile, we shall continue with the clinical development of the molecule and to advance in the upcoming regulatory steps to obtain its approval in the years to come".

"Both companies share the same value to bring PM1183 - an innovative marine based medicine to the Japanese patients so that we can contribute to the treatment," said Chugai's Representative Director, President and Chief Operating Officer, Tatsuro Kosaka. "Chugai is committed to continuously provide innovative medicines to the patients. We hope to obtain approval based on the clinical results attained so far, and also from new results that will come in the future".

Autoimmune Diseases and Conditions

Preventing too much immunity

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Scientists at the Immunology Frontier Research Center (IFReC), Osaka University, Japan, report a new molecular mechanism that could explain the cause of some autoimmune diseases.

While the immune system is crucial for protecting the body from infection and disease, prolonged activation can damage healthy tissue. After its activation, the immune system is shut off by specialized immune cells known as regulatory T cells (Treg cells). Understanding the development of Treg cells is thought to be critical for combating autoimmune diseases. "The development of Treg cells in the thymus depends on super-enhancer establishment," explains IFReC Professor Shimon Sakaguchi.

This super-enhancer establishment permits the expression of genes specific for Treg cell development. "Super-enhancers appeared to be a pre-requisite for Treg cell development, so we sought molecules controlling super-enhancers," he added.

In the most recent publication by the Sakaguchi lab, which can be seen in Nature Immunology, Sakaguchi and his team report that Satb1 regulates the super enhancers essential for Treg cell development.

Looking at the Treg cell development pathway, the scientists found that the level of Satb1 was highest before Treg cells develop, and dropped after Treg cell development. Further study showed that Satb1 bound to the super enhancers responsible for Treg cell development, but again, only in progenitors that differentiated into Treg cells and not Treg cells themselves. Therefore, Satb1 may regulate the epigenetic changes that precede the creation of Treg cells.

"Satb1 appears to be necessary for the differentiation of Treg cells, but not for the maintenance of Treg cells," said Dr. Yohko Kitagawa, who first-authored the study.

Indeed, in mice lacking Satb1, the development of Treg cells was impaired and the mice showed symptoms of autoimmune disease. Furthermore, the progenitors cells of these mice showed inferior super enhancer activity, which resulted in less expression of the genes necessary for Treg cell development.
Based on these findings, Sakaguchi theorizes that defective Satb1-dependent super-enhancer establishment could be a cause of autoimmune diseases and allergy. "Autoimmune diseases are due to hyperactive immune systems. One cause is not having enough Treg cells. Understanding how this occurs is an important step towards treating autoimmune diseases," he said.

Heart Disorders and Diseases - Heart Attack

Rate of death, heart attack after noncardiac surgery decreases, although risk of stroke increases

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- In a study published online by JAMA Cardiology, Sripal Bangalore, M.D., M.H.A., of the New York University School of Medicine, New York, and colleagues examined national trends in perioperative cardiovascular outcomes and mortality after major noncardiac surgery.

Worldwide, more than 300 million noncardiac surgeries are performed each year. Major adverse cardiovascular and cerebrovascular events (MACCE), including heart attack and ischemic stroke, are a significant source of perioperative (the period of time extending from when the patient goes into the hospital for surgery until discharged home) illness and death. Despite the significant burden perioperative events place on the national health care system, recent data are lacking on trends in perioperative MACCE among patients hospitalized for major noncardiac surgery.

Using the National Inpatient Sample, the researchers for this study identified patients who underwent major noncardiac surgery from January 2004 to December 2013. Among 10,581,621 hospitalizations (average patient age, 66 years; 57 percent female) for major noncardiac surgery, perioperative MACCE (defined as in-hospital, all-cause death, acute myocardial infarction [AMI; heart attack]), or acute ischemic stroke), occurred in 317,479 hospitalizations (3 percent), corresponding to an annual incidence of approximately 150,000 events. Major adverse cardiovascular and cerebrovascular events occurred most frequently in patients undergoing vascular (7.7 percent), thoracic (6.5 percent), and transplant surgery (6.3 percent).

Between 2004 and 2013, the frequency of MACCE declined from 3.1 percent to 2.6 percent, driven by a decline in frequency of perioperative death and AMI, but there was an increase in perioperative ischemic stroke from 0.52 percent in 2004 to 0.77 percent in 2013.

Men had higher risk of perioperative MACCE than women. In analyses of perioperative events by race and ethnicity, non-Hispanic black patients had the highest rates of perioperative death and ischemic stroke in comparison to other racial groups. "Perioperative MACCE occurs in 1 of every 33 hospitalizations for noncardiac surgery," the authors write. "Cardiovascular complications after noncardiac surgery remain a major source of morbidity and mortality. Despite improvements in perioperative outcomes over the past decade, the significant increase in the rate of ischemic stroke in this analysis requires confirmation and further study. Additional efforts are necessary to improve perioperative..."
Skin Diseases and Conditions - Tinea pedis

Recent Data from A. Shemer and Co-Authors Highlight Findings in Tinea pedis (Increased Risk of Tinea Pedis and Onychomycosis Among Swimming Pool Employees in Netanya Area, Israel)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases and Conditions - Tinea pedis are presented in a new report. According to news reporting originating in London, Canada, by NewsRx journalists, research stated, "Tinea pedis and onychomycosis often co-occur in individuals. A relationship between swimming pools and tinea pedis exists; however, little research has investigated the relationship between onychomycosis, tinea pedis, and swimming pools."

The news reporters obtained a quote from the research, "This study sought to examine the prevalence of tinea pedis and onychomycosis among swimming pool employees, a population that may be at risk of tinea infections. Samples were taken from 169 employees at 21 swimming pools in the Netanya area, Israel. KOH microscopy and culture was used to identify fungi. About 46% of swimming pool employees had concurrent tinea pedis and onychomycosis, 30% had tinea pedis only, and 6% had onychomycosis only, compared to 10, 8, and 8% of controls, respectively. After adjusting for age and gender, swimming pool employees were 20x more likely to have concurrent tinea pedis and onychomycosis, 15x more likely to have tinea pedis only, and 3x more likely to have onychomycosis only compared to controls. The present results are in agreement with previous research and support that swimming pools remain an important source of fungal contamination."

According to the news reporters, the research concluded: "More attention to hygienic guidelines and preventative measures may be needed in these settings."

For more information on this research see: Increased Risk of Tinea Pedis and Onychomycosis Among Swimming Pool Employees in Netanya Area, Israel. Mycopathologia, 2016;181(11-12):851-856. Mycopathologia can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Mycopathologia - www.springerlink.com/content/0301-486x/)

Recent Data from E.H. Wang and Co-Authors Highlight Findings in Prostate Cancer: (Disparities in Treatment of Patients With High-risk Prostate Cancer: Results From a Population-based Cohort)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "To assess the variation in primary treatment of high-risk prostate cancer (PCa) by different hospital characteristics in the United States. We used the National Cancer Data Base to identify patients diagnosed with pretreatment high-risk PCa from 2004 to 2011."

The news reporters obtained a quote from the research, "The primary outcomes were different forms of primary therapy or watchful waiting (WW) across different types of hospitals (community, comprehensive cancer community, and academic hospitals). Multivariable logistic regression analyses were used to test for differences in treatment by hospital type. During the study period, we identified 102,701 men diagnosed with high-risk PCa. Overall, the most common treatment was radical prostatectomy (37.0%) followed by radiation therapy (33.2%) and WW (8.5%). Compared with white men with high-risk PCa, black men had lower adjusted odds ratios (OR) for surgery at comprehensive community (OR: 0.64; P< .001) and academic (OR: 0.62; P< .001) hospitals. Similarly, black men were also more likely to be managed with WW at community (OR: 1.49; P< .001), comprehensive cancer community (OR: 1.24; P<. 001), and academic (OR: 1.55; P<. 001) hospitals, as well as with radiation therapy at comprehensive cancer community (OR: 1.27; P<. 001) and academic hospitals (OR: 1.23; P<. 001). Disparities in the use of WW and different primary treatments among patients with high-risk PCa persisted across different types of hospitals and over time."

According to the news reporters, the research concluded: "Our findings highlight a significant racial disparity in the use of curative therapy for high-risk PCa that should be urgently addressed to ensure that all men with PCa receive appropriate care across all racial groups and cancer care facilities."

For more information on this research see: Disparities in Treatment of Patients With High-risk Prostate Cancer: Results From a Population-based Cohort. Urology, 2016;95():88-94. Recent Data from G.K. Raju and Co-Authors Highlight Findings in Non-Small Cell Lung Cancer (A Benefit-Risk Analysis Approach to Capture Regulatory Decision-Making: Non-Small Cell Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Non-Small Cell Lung Cancer is the subject of a report. According to news reporting from Cambridge, Massachusetts, by NewsRx journalists, research stated, "Drug regulators around the world make decisions about drug approvability based on qualitative benefit-risk analyses. There is much interest in quantifying regulatory approaches to benefit and risk."

The news correspondents obtained a quote from the research, "In this work the use of a quantitative benefit-risk analysis was applied to regulatory decision-making about new drugs to treat advanced non-small cell lung cancer (NSCLC). Benefits and risks associated with 20 US Food and Drug Administration (FDA) decisions associated with a set of candidate treatments submitted between 2003 and 2015 were analyzed. For benefit analysis, the median overall survival (OS) was used where available. When not available, OS was estimated based on overall response rate (ORR) or progression-free survival (PFS). Risks were analyzed based on magnitude (or severity) of harm and likelihood of occurrence. Additionally, a sensitivity analysis was explored to demonstrate analysis of systematic uncertainty."

According to the news reporters, the research concluded: "FDA approval decision outcomes considered were found to be consistent with the benefit-risk logic."

Our news journalists report that additional information may be obtained by contacting G.K. Raju, Light Pharma Inc, Cambridge, MA 02142, United States. Additional authors for this research include K. Gurumurthi, R. Domike, D. Kazandjian, G. Blumenthal, R. Pazdur and J. Woodcock.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cpt.501. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiology**

**Recent Data from N. Benyounes and Co-Authors Highlight Findings in Cardiology (Could quantitative longitudinal peak systolic strain help in the detection of left ventricular wall motion abnormalities in our daily echocardiographic practice?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiology is the subject of a report. According to news originating from Paris, France, by NewsRx correspondents, research stated, "Background.- Transthoracic echocardiography is the most commonly used tool for the detection of left ventricular wall motion (LVWM) abnormalities using 'naked eye evaluation'. This subjective and operator-dependent technique requires a high level of clinical training and experience."

Our news journalists obtained a quote from the research, "Two-dimensional speckle-tracking echocardiography (2D-STE), which is less operator-dependent, has been proposed for this purpose. However, the role of on-line segmental longitudinal peak systolic strain (LPSS) values in the prediction of LVWM has not been fully evaluated. Aim.-To test segmental LPSS for predicting LVWM abnormalities in routine echocardiography laboratory practice. Methods.-LVWM was evaluated by an experienced cardiologist, during routine practice, in 620 patients; segmental LPSS values were then calculated. -In this work, reflecting real life, 99.6% of segments were successfully tracked. Mean (95% confidence interval [CI]) segmental LPSS values for normal basal (n=3409), mid (n=3468) and apical (n=3466) segments were -16.7% (-16.9% to 16.5%), -18.2% (-18.3% to 18.0%) and -21.1% (-21.3% to 20.9%), respectively. Mean (95% CI) segmental LPSS values for hypokinetic basal (n=114), mid (n=116) and apical (n=90) segments were -7.7% (-9.0% to 6.3%), -10.1% (-11.1% to 9.0%) and -9.3% (-10.5% to 8.1%), respectively. Mean (95% CI) segmental LPSS values for akinetic basal (n=128), mid (n = 95) and apical (n=91) segments were 6.6% (-8.0% to 5.1%), 6.1% (-7.7% to 4.6%) and 4.2% (-5.4% to 3.0%), respectively. LPSS allowed the differentiation between normal and abnormal segments at basal, mid and apical levels. An LPSS value $\geq -12\%$ detected abnormal segmental motion with a sensitivity of 78% for basal, 70% for mid and 82% for apical segments."

According to the news editors, the research concluded: "Conclusions.-Segmental LPSS values may help to differentiate between normal and abnormal left ventricular segments."

For more information on this research see: Could quantitative longitudinal peak systolic strain help in the detection of left ventricular wall motion abnormalities in our daily echocardiographic practice? Archives of Cardiovascular Diseases, 2016;109(10):533-541. Archives of Cardiovascular Diseases can be contacted at: Elsevier Masson, Via Paleocapa 7, 20121 Milano, Italy. Recent Findings by A. Prytula and Colleagues in Liver Transplants Provides New Insights (Tacrolimus Predose Concentration Is Associated With Hypertension in Pediatric Liver Transplant Recipients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Liver Transplants. According to news originating from Ghent, Belgium, by NewsRx correspondents, research stated, "The aim of the study was to analyze the incidence of hypertension in pediatric liver transplantation (LT) recipients using ambulatory blood pressure measurements (ABPM) and to identify factors associated with hypertension. We also investigated whether hypertension or tacrolimus predose concentration (TAC C-0) was associated with increased left ventricular (LV) wall thickness."

Our news journalists obtained a quote from the research, "On a retrospective longitudinal base, we included 39 pediatric LT recipients. Median time since transplantation was 65 months (range: 11-183). Two consecutive ABPM were analyzed with a median time interval of 13 months. Data from echocardiographic evaluation parallel to the baseline ABPM were analyzed. All patients except 1 were prescribed tacrolimus. The median TAC C-0 was 4 ng/mL (range 0.9-11.2). Univariate and multivariate logistic regression models were fitted to identify factors associated with systolic and diastolic hypertension and LV wall thickness. Twenty-two of 39 children were hypertensive at baseline and 19 of 32 were hypertensive at follow-up. At baseline 10 (26%) children had masked systolic hypertension. TAC C-0 was associated with systolic (P=0.007, Exp(B) 2.02, 95% CI 1.2-3.3) and diastolic (P=0.044, Exp(B) 1.48, 95% CI 1.0-2.2) hypertension. LV wall thickness was increased in children after LT compared with healthy population, but it was not associated with hypertension or TAC C(0.)

Conclusions:Given the high prevalence of masked hypertension, ABPM should be performed in all pediatric LT recipients."

According to the news editors, the research concluded: "Systolic and diastolic hypertension is associated with TAC C-0; therefore, children with a higher target TAC C-0 require a more intensive blood pressure surveillance."

For more information on this research see: Tacrolimus Predose Concentration Is Associated With Hypertension in Pediatric Liver Transplant Recipients. Journal of Pediatric Gastroenterology and Nutrition, 2016;63(6):616-623. Journal of Pediatric Gastroenterology and Nutrition can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Clinical Research - Clinical Trials and Studies

Recent Findings by E.M. Roth and Colleagues in Clinical Trials and Studies Provides New Insights (A phase III randomized trial evaluating alirocumab 300 mg every 4 weeks as monotherapy or add-on to statin: ODYSSEY CHOICE I)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news originating from Cincinnati, Ohio, by NewsRx correspondents, research stated, "In previous phase III studies, the PCSK9 monoclonal antibody alirocumab was administered at doses of 75 or 150 mg every 2 weeks (Q2W). CHOICE I (NCT01926782) evaluated 300 mg every 4 weeks (Q4W) in patients on either maximally tolerated statin or no statin, both +/- other lipid-lowering therapies."

Our news journalists obtained a quote from the research, "CHOICE I included patients with hypercholesterolemia at moderate-to-very-high cardiovascular risk. Patients were randomized to alirocumab 300 mg Q4W, 75 mg Q2W (calibrator arm), or placebo for 48 weeks, with dose adjustment for either alirocumab arm to 150 mg Q2W at Week (W) 12 if at W8 LDL-C levels were > 70/100 mg/dL (1.8/2.6 mmol/L) depending on cardiovascular risk or LDL-C reduction was <30% from baseline. Co-primary endpoints were percent LDL-C change from baseline to W24, and to time-averaged LDL-C over W21-24. Approximately two-thirds of randomized patients were receiving statins. At W12, 14.7% (no statin) and 19.3% (statin) of patients receiving alirocumab 300 mg Q4W required dose adjustment. At W24, significant LDL-C reductions from baseline were observed with alirocumab 300 mg Q4W: mean differences were -52.7% (no statin; placebo: -0.3%) and -58.8% (statin; placebo: -0.1%). Average LDL-C reductions from baseline to W21-24 were also significantly greater with alirocumab 300 mg Q4W vs. placebo in patients not receiving (-56.9% vs. -1.6%) and receiving statin (-65.8% vs. -0.8%). Treatment-emergent adverse event rates ranged from 61.1 to 75.0% (placebo) and 71.5 to 78.1% (alirocumab 300 mg Q4W)."

According to the news editors, the research concluded: "Alicrocumab 300 mg Q4W is a viable additional treatment option in patients requiring LDL-C-lowering."

For more information on this research see: A phase III randomized trial evaluating alirocumab 300 mg every 4 weeks as monotherapy or add-on to statin: ODYSSEY CHOICE I. Atherosclerosis, 2016;254():254-262. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Recent Findings by F. Aziz and Colleagues in Chronic Kidney Disease Provides New Insights (The Triad of Sleep Apnea, Hypertension, and Chronic Kidney Disease: A Spectrum of Common Pathology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Kidney Diseases and Conditions - Chronic Kidney Disease are discussed in a new report. According to news reporting from Columbia, Missouri, by NewsRx journalists, research stated, "Obstructive sleep apnea (OSA), hypertension, and chronic kidney disease (CKD) are different entities and are generally managed individually most of the time. However, CKD, OSA, and hypertension share many common risk factors and it is not uncommon to see this complex triad together."

The news correspondents obtained a quote from the research, "In fact, they share similar pathophysiology and have been interlinked with each other. The common pathophysiology includes chronic volume overload, hyperaldosteronism, increased sympathetic activity, endothelial dysfunction, and increased inflammatory markers. The combination of this triad has significant negative impact on the cardiovascular health, and increases the mortality and morbidity in this complicated group of patients. On one hand, progression of CKD can lead to the worsening of OSA and hypertension; similarly, worsening sleep apnea can make the hypertension difficult to treat and enhance the progression of CKD."

According to the news reporters, the research concluded: "This review article highlights the bidirectional interlink among these apparently different disease processes which share common pathophysiological mechanisms and emphasizes the importance of treating them collectively to improve outcomes."

Our news journalists report that additional information may be obtained by contacting K. Chaudhary, Harry S Truman Vet Hosp, Nephrol Sect, Columbia, MO, United States.

Recent Findings from A. Amundsen and Co-Researchers Yields New Information on Cancer Care (Adapting an Australian question prompt list in oncology to a Norwegian setting-a combined method approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Cancer Care are presented in a new report. According to news reporting out of Tromso, Norway, by NewsRx editors, research stated, "A question prompt list (QPL) is an inexpensive communication aid that has been proved effective in encouraging patients to ask questions during medical consultations. The aim of this project was to develop a QPL for Norwegian cancer patients."

Our news journalists obtained a quote from the research, "A multimethod approach was chosen combining literature review, focus groups, and a survey in the process of culturally adjusting an Australian QPL for the Norwegian setting. Participants were recruited from the University Hospital of North Norway. They were asked to review and comment on iterative drafts of the QPL. Eighteen patients, mean age 54, participated in the focus groups, and 31 patients, mean age 55, participated in the survey. Focus groups suggested that topics related to accompanying relatives, children as next of kin, and rehabilitation were important and should be added to the original QPL. The survey revealed that most questions from the original QPL were considered both useful and understandable. Although half of the patients found some questions about prognosis unpleasant, the vast majority considered the same questions useful. Questions regarding clinical studies, multidisciplinary teams, and public versus private hospitals had lower ratings of usefulness. QPLs require some adjustment to the local cultural context, and a mixed method approach may provide a useful model for future cultural adaptation of QPLs."

According to the news editors, the research concluded: "The present QPL has been adjusted to the needs of oncology patients in the Norwegian health care setting."

For more information on this research see: Adapting an Australian question prompt list in oncology to a Norwegian setting-a combined method approach. Supportive Care in Cancer, 2017;25(1):51-58. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Supportive Care in Cancer - www.springerlink.com/content/0941-4355/)

Recent Findings from A. Herman and Co-Researchers Yields New Information on Psoriasis (Topically Used Herbal Products for the Treatment of Psoriasis - Mechanism of Action, Drug Delivery, Clinical Studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases and Conditions - Psoriasis are presented in a new report. According to news reporting originating in Warsaw, Poland, by NewsRx journalists, research stated, "Psoriasis is a chronic inflammatory skin disease characterized histologically by hyperproliferation and aberrant differentiation of epidermal keratinocytes. A wide range of conventional medical therapies to treat psoriasis is established, from topical therapies and systemic medications through to phototherapy or combinations of those."

The news reporters obtained a quote from the research, "However, most of these therapies have a limited efficacy and may cause a number of side effects, including cutaneous atrophy, organ toxicity, carcinogenicity, and broadband immunosuppression, which are restricting their long-term use. Therefore, it would be desirable to use herbal products as an alternative treatment for psoriasis that causes fewer side effects. For this purpose, several electronic databases and literature references were used to summarize the current knowledge acquired on the basis of animal studies and clinical trials regarding herbal products used to treat psoriasis topically. This review discusses the mechanisms of herbal products activities through (1) inhibition of the keratinocyte hyperproliferation and inducing apoptosis, (2) inhibition of immune-inflammatory reaction, (3) suppression of phosphorylase kinase (PhK) activity, and (4) inhibition of the hedgehog (Hh) signaling pathway."

According to the news reporters, the research concluded: "Moreover, the penetration of herbal products through the psoriatic skin barrier, novel herbal drug delivery systems in psoriasis treatment, and possible adverse effects of herbal therapy are discussed."

For more information on this research see: Topically Used Herbal Products for the Treatment of Psoriasis - Mechanism of Action, Drug Delivery, Clinical Studies. Planta Medica, 2016;82(17):1447-1455. Planta Medica can be contacted at: Georg Thieme Verlag Kg, Rudigerstr 14, D-70469 Stuttgart, Germany. (Thieme - www.thieme.com)

Drugs and Therapies - Drug Delivery Systems

Recent Findings from Abo Akademi University Has Provided New Information about Drug Delivery Systems (Printed Drug-Delivery Systems for Improved Patient Treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Drug Delivery Systems is now available. According to news reporting out of Turku, Finland, by NewsRx editors, research stated, "The use of various types of printing technologies offer potential solutions for personalized medicine and tailored dosage forms to meet the needs of individual treatments of the future. Many types of scenario for printed dosage form exist and the concepts include, on the simplest level, accurately deposited doses of drug substances."

Our news journalists obtained a quote from the research from Abo Akademi University, "In addition, computer design allows endless opportunities to create suitable geometries with tailored functionality and different levels of complexity to control the release properties of one or multiple drug substances. It will take some time to convert these technological developments in printing to better treatments for patients, because challenges exist."

According to the news editors, the research concluded: "However, printing technologies are developing fast and have the potential to allow the use of versatile materials to manufacture sophisticated drug-delivery systems and biofunctional constructs for personalized treatments."

Our news journalists report that additional information may be obtained by contacting N. Sandler, Abo Akad University, Pharmaceut Sci Lab, Turku, Finland.

Hematologic Diseases and Conditions - Sickle Cell...

Recent Findings from Ain Shams University Provides New Insights into Sickle Cell Anemia (Tartrate-Resistant Acid Phosphatase 5b in Young Patients With Sickle Cell Disease and Trait Siblings: Relation to Vasculopathy and Bone Mineral Density)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematologic Diseases and Conditions - Sickle Cell Anemia have been published. According to news reporting out of Cairo, Egypt, by NewsRx editors, research stated, "Bone involvement is a frequent cause of acute morbidity in sickle cell disease (SCD). Tartrate-resistant acid phosphatase 5b (TRACP 5b), a bone resorption marker, is produced specifically by activated osteoclasts."

Our news journalists obtained a quote from the research from Ain Shams University, "We assessed bone mineral density (BMD) in 30 young patients with SCD and 17 asymptomatic patients with sickle cell trait (SCT) compared with 32 healthy controls and determined TRACP 5b levels in relation to vascular complications. Serum ferritin, alkaline phosphatase (ALP), and TRACP 5b were measured. Echocardiography was performed with assessment of BMD using dual energy X-ray absorptiometry (DXA). The BMD was decreased in patients with SCD compared with SCT and controls (P = .005), with no significant difference between the latter 2 groups. Patients with SCD had higher incidence of bone complications than SCT group and controls (P = .03). The SCD group with abnormal DXA scan had higher ferritin and ALP than normal BMD. Serum TRACP 5b was significantly higher in patients with SCD than SCT and controls (P = .003). The TRACP 5b levels were associated with severe vaso-occlusive crisis (P = .022). Patients treated with hydroxyurea and those on chelation therapy had lower TRACP 5b levels than untreated patients. The TRACP 5b level was positively correlated with lactate dehydrogenase, while there was no relation with ferritin, ALP, or BMD. We suggest that bone complications frequently occur in SCD as reflected by low BMD and high ALP and TRACP 5b. Hemolysis and iron overload may be involved in the occurrence of these complications."

According to the news editors, the research concluded: "The lack of correlation between abnormal DXA scan and high TRACP 5b suggests that bone disease in SCD is multifactorial."

Our news journalists report that additional information may be obtained by contacting A.A.G. Tantawy, Ain Shams University, Dept. of Pediat, Fac Med, Cairo, Egypt. Additional authors for this research include A.A.G. Tantawy, A.A. Hamed, A.A.M. Adly, E.A.R. Ismail and S.M. Makkeyah.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/1076029615594001. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Findings from Ajou University Provides New Insights into Antineoplastic Monoclonal Antibodies [Bacterial production and structure-functional validation of a recombinant antigen-binding fragment (Fab) of an anti-cancer therapeutic antibody ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antineoplastic Monoclonal Antibodies have been published. According to news reporting originating from Gyeonggi Do, South Korea, by NewsRx correspondents, research stated, "Fragment engineering of monoclonal antibodies (mAbs) has emerged as an excellent paradigm to develop highly efficient therapeutic and/or diagnostic agents. Engineered mAb fragments can be economically produced in bacterial systems using recombinant DNA technologies."

Financial support for this research came from Korea Small and Medium Business Administration.

Our news editors obtained a quote from the research from Ajou University, "In this work, we established recombinant production in Escherichia coli for monovalent antigen-binding fragment (Fab) adopted from a clinically used anticancer mAB drug cetuximab targeting epidermal growth factor receptor (EGFR). Recombinant DNA constructs were designed to express both polypeptide chains comprising Fab in a single vector and to secrete them to bacterial periplasmic space for efficient folding. Particularly, a C-terminal engineering to confer an interchain disulfide bond appeared to be able to enhance its heterodimeric integrity and EGFR-binding activity. Conformational relevance of the purified final product was validated by mass spectrometry and crystal structure at 1.9 resolution. Finally, our recombinant cetuximab-Fab was found to have strong binding affinity to EGFR overexpressed in human squamous carcinoma model (A431) cells. Its binding ability was comparable to that of cetuximab. Its EGFR-binding affinity was estimated at approximately 0.7 nM of Kd in vitro, which was quite stronger than the binding affinity of natural ligand EGF."

According to the news editors, the research concluded: "Hence, the results validate that our construction could serve as an efficient platform to produce a recombinant cetuximab-Fab with a retained antigen-binding functionality."

For more information on this research see: Bacterial production and structure-functional validation of a recombinant antigen-binding fragment (Fab) of an anti-cancer therapeutic antibody targeting epidermal growth factor receptor. Applied Microbiology and Biotechnology, 2016;100(24):10521-10529. Applied Microbiology and Biotechnology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Recent Findings from Albert Einstein College of Medicine Has Provided New Data on Cardiology (Remote Magnetic Navigation: A Focus on Catheter Ablation of Ventricular Arrhythmias)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting out of Bronx, New York, by NewsRx editors, research stated, "VT ablation is based on percutaneous catheter insertion under fluoroscopic guidance to selectively destroy (i.e., ablate) myocardial tissue regions responsible for the initiation or propagation of ventricular arrhythmias. Although the last decade has witnessed a rapid evolution of ablation equipment and techniques, the control over catheter movement during manual ablation has remained largely unchanged."

Our news journalists obtained a quote from the research from the Albert Einstein College of Medicine, "Moreover, the procedures are long, and require ergonomically unfavorable positions, which can lead to operator fatigue. In an attempt to overcome these constraints, several technical advancements, including remote magnetic navigation (RMN), have been developed. RMN utilizes a magnetic field to remotely manipulate specially designed soft-tip ablation catheters anywhere in the x, y, or z plane inside the patient's chest. RMN also facilitates titration of the contact force between the catheter and the myocardial tissue, which may reduce the risk of complications while ensuring adequate lesion formation. There are several non-randomized studies showing that RMN has similar efficacy to manual ablation, while complication rates and total radiation exposure appears to be lower."

According to the news editors, the research concluded: "Although these data are promising, larger randomized studies are needed to prove that RMN is superior to manual ablation of VT."

Our news journalists report that additional information may be obtained by contacting P. Aagaard, Montefiore-Einstein Center for Heart and Vascular Care, Montefiore Medical Center, Albert Einstein College of Medicine, Bronx, New York, United States. Additional authors for this research include A. Natale, D. Briceno, H. Nakagawa, S. Mohanty,
Recent Findings from Ankara Numune Training and Research Hospital Provides New Insights into Abdominal Aortic Aneurysm (Transient Ischemic Attacks of Spinal Cord due to Abdominal Aortic Aneurysm Thrombus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm. According to news reporting originating from Ankara, Turkey, by NewsRx correspondents, research stated, "Thrombosis due to abdominal aortic aneurysm is a rare condition that causes high mortality."

Our news editors obtained a quote from the research from Ankara Numune Training and Research Hospital, "Transient ischemic attack of the spinal cord can occur as a result of trash emboli from thrombus in abdominal aortic aneurysm. This condition generally occurs during operation of abdominal aortic aneurysm; very rarely, it can also be seen in laminated abdominal aortic aneurysm."

According to the news editors, the research concluded: "Here, we present a case of a patient presenting with bilateral lower extremity paralysis resulting from transient ischemic attack of the spinal cord due to infrarenal abdominal aortic aneurysm."

The news editors report that additional information may be obtained by contacting I. Ates, Ankara Numune Training & Res Hosp, Dept. of Internal Med, Ankara, Turkey. Additional authors for this research include M. Kaplan, M. Ozcalik and N. Yilmaz.

Keywords for this news article include: Ankara, Turkey, Eurasia, Central Nervous System Diseases and Conditions, Cardiovascular Diseases and Conditions, Vascular Diseases and Conditions, Aortic Diseases and Conditions, Transient Ischemic Attack, Abdominal Aortic Aneurysm, Spinal Cord, Thrombosis, Cardiology, Ankara Numune Training and Research Hospital.

Recent Findings from Auburn University Provides New Insights into Tissue Engineering (Polymeric Biomaterials for In Vitro Cancer Tissue Engineering and Drug Testing Applications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biomedical Engineering - Tissue Engineering is the subject of a report. According to news reporting from Auburn, Alabama, by NewsRx journalists, research stated, "Biomimetic polymers and materials have been widely used in tissue engineering for regeneration and replication of diverse types of both normal and diseased tissues. Cancer, being a prevalent disease throughout the world, has initiated substantial interest in the creation of tissue-engineered models for anticancer drug testing."

The news correspondents obtained a quote from the research from Auburn University, "The development of these in vitro three-dimensional (3D) culture models using novel biomaterials has facilitated the investigation of tumorigenic and associated biological phenomena with a higher degree of complexity and physiological context than that provided by established two-dimensional culture models. In this review, an overview of a wide range of natural, synthetic, and hybrid biomaterials used for 3D cancer cell culture and investigation of cancer cell behavior is presented. The role of these materials in modulating cell-matrix interactions and replicating specific tumorigenic characteristics is evaluated. In addition, recent advances in biomaterial design, synthesis, and fabrication are also assessed."

According to the news reporters, the research concluded: "Finally, the advantages of incorporating polymeric biomaterials in 3D cancer models for obtaining efficacy data in anticancer drug testing applications are highlighted."

For more information on this research see: Polymeric Biomaterials for In Vitro Cancer Tissue Engineering and Drug Testing Applications. Tissue Engineering Part B-Reviews, 2016;22(6):470-484. Transfusion Medicine - Blood Transfusion

Recent Findings from Biomedical Research Institute Provides New Insights into Blood Transfusion (Brain hemorrhage after endovascular reperfusion therapy of ischemic stroke: a threshold-finding whole-brain perfusion CT study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Transfusion Medicine - Blood Transfusion is the subject of a report. According to news reporting from Barcelona, Spain, by NewsRx journalists, research stated, "Endovascular reperfusion therapy is increasingly used for acute ischemic stroke treatment. The occurrence of parenchymal hemorrhage is clinically relevant and increases with reperfusion therapies."

The news correspondents obtained a quote from the research from Biomedical Research Institute, "Herein we aimed to examine the optimal perfusion CT-derived parameters and the impact of the duration of brain ischemia for the prediction of parenchymal hemorrhage after endovascular therapy. A cohort of 146 consecutive patients with anterior circulation occlusions and treated with endovascular reperfusion therapy was analyzed. Recanalization was assessed at the end of reperfusion treatment, and the rate of parenchymal hemorrhage at follow-up neuroimaging. In regression analyses, cerebral blood volume and cerebral blood flow performed better than Delay Time maps for the prediction of parenchymal hemorrhage. The most informative thresholds (receiver operating curves) for relative cerebral blood volume and relative cerebral blood flow were values lower than 2.5% of normal brain. In binary regression analyses, the volume of regions with reduced relative cerebral blood volume and/or relative cerebral blood flow was significantly associated with an increased risk of parenchymal hemorrhage, as well as delayed vessel recanalization."

According to the news reporters, the research concluded: "These results highlight the relevance of the severity and duration of ischemia as drivers of blood-brain barrier disruption in acute ischemic stroke and support the role of perfusion CT for the prediction of parenchymal hemorrhage."

Our news journalists report that additional information may be obtained by contacting S. Amaro, August Pi & Sunyer Biomed Res Inst IDIBAPS, Barcelona, Spain. Additional authors for this research include C. Laredo, R.L. Tudela, X. Urra, A. Lopez-Rueda, L. Llull, L. Oleaga, S. Amaro and A. Chamorro.

Clinical Research - Clinical Trials and Studies

Recent Findings from Burdwan Medical College Provides New Insights into Clinical Trials and Studies (Role of olanzapine in chemotherapy-induced nausea and vomiting on platinum-based chemotherapy patients: a randomized controlled study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Clinical Research - Clinical Trials and Studies are presented in a new report. According to news reporting originating from Bengal, India, by NewsRx correspondents, research stated, "Even with the use of modern antiemetic drugs, chemotherapy-induced nausea and vomiting (CINV) is still a cause of great distress to the patients. Olanzapine, primarily marketed as an antipsychotic, was found to reduce nausea and vomiting in some chemotherapy patients."

Financial support for this research came from NON FUNDED.

Our news editors obtained a quote from the research from Burdwan Medical College, "But it was never tested in Indian population with a diverse genetic background. The present study aims to evaluate the role of olanzapine in CINV in patients receiving platinum-based chemotherapy. The study was a randomized, controlled, assessor-blinded study on 100 chemotherapy-naïve consenting patients receiving any one from cisplatin, carboplatin or oxaliplatin. The control group (n = 50) received palonosetron and dexamethasone in the approved therapeutic dose from the day 1 of chemotherapy. The test group (n = 50) received additional olanzapine 10 mg/day from day 1 for five consecutive days. CINV and quality of life (QoL) were assessed. Vomiting was significantly less among the olanzapine-treated patients. Control of delayed emesis was significantly better in this group (complete response among 96 vs. 42% in the control group, p value < 0.0001). Incidence and severity of nausea was significantly less in this group. Failure of anti-CINV measure was 4% in this group compared to 26% of the patients of the control group during overall days 1-5. Though sedation was more in these olanzapine-treated patients, there was no dose-limiting adverse event. Quality of life was also better among the olanzapine-treated patients."

According to the news editors, the research concluded: "Olanzapine was found to be effective as add-on in the control of CINV."

For more information on this research see: Role of olanzapine in chemotherapy-induced nausea and vomiting on platinum-based chemotherapy patients: a randomized controlled study. Supportive Care in Cancer, 2017;25(1):145-154. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Supportive Care in Cancer - www.springerlink.com/content/0941-4355/)

The news editors report that additional information may be obtained by contacting S. Mukhopadhyay, Burdwan Med College, Pharmacovigilance, Dept. of Pharmacol, Burdwan 713102, W Bengal, India. Additional authors for this research include G. Kwatra, K.P. Alice and D. Badyal.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s00520-016-3386-9. This DOI is a link to an online electronic document that is either free or for purchase.
Musculoskeletal Diseases and Conditions —

Recent Findings from CHA University Provide New Insights into Osteoarthritis (AIMP1 downregulation restores chondrogenic characteristics of dedifferentiated/degenerated chondrocytes by enhancing TGF-b signal)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Osteoarthritis. According to news reporting originating in Gyeonggi Do, South Korea, by NewsRx journalists, research stated, "Dedifferentiation and degeneration of chondrocytes critically influences the efficiency of cartilage repair. One of the causes is the defect of transforming growth factor (TGF)-b signaling that promotes chondrogenic differentiation and degeneration."

The news reporters obtained a quote from the research from CHA University, "In the present study, we found that aminoacyl-tRNA synthetase-interacting multifunctional protein 1 (AIMP1) negatively regulates TGF-b signaling via interactions with Smad2 and Smad3 in immunoprecipitation assay and luciferase assay. In addition, we observed that the AIMP1 expression level was significantly increased in osteoarthritis (OA) patient-derived degenerated chondrocytes compared with healthy control. So, we hypothesized that downregulation of AIMP1 using small-interfering RNA (siRNA) technology in dedifferentiated (collected at passage #6) and degenerated (obtained from OA-affected areas) chondrocytes could lead to recover TGF-b signaling in both chondrocytes. Indeed, AIMP1 downregulation restored TGF-b signaling by promoting phosphorylation of Smad2 and Smad3, which shows redifferentiated characteristics in both dedifferentiated and degenerated chondrocytes. Additionally, implantation analyses using in vivo mouse model clearly showed that AIMP1 downregulation resulted in the increased chondrogenic potential as well as the enhanced cartilage tissue formation in both dedifferentiated and degenerated chondrocytes. Histological analyses clarified that AIMP1 downregulation increased expression levels of collagen type II (Col II) and aggrecan, but not Col I expression."

According to the news reporters, the research concluded: "Taken together, these data indicate that AIMP1 downregulation using siRNA is a novel tool to restore TGF-b signaling and thereby increases the chondrogenic potential of dedifferentiated/degenerated chondrocytes, which could be further developed as a therapeutic siRNA to treat OA."

For more information on this research see: AIMP1 downregulation restores chondrogenic characteristics of dedifferentiated/degenerated chondrocytes by enhancing TGF-b signal. *Cell Death & Disease*, 2016;7():e2099. (Nature Publishing Group - [www.nature.com/cddis/](http://www.nature.com/cddis/))

Parasitic Diseases and Conditions - Leishmaniasis

Recent Findings from CSIR Provides New Insights into Leishmaniasis (A Novel Spirooxindole Derivative Inhibits the Growth of Leishmania donovani Parasites both In Vitro and In Vivo by Targeting Type IB Topoisomerase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Parasitic Diseases and Conditions - Leishmaniasis is now available. According to news originating from Kolkata, India, by NewsRx correspondents, research stated, "Visceral leishmaniasis is a fatal parasitic disease, and there is an emergent need for development of effective drugs against this neglected tropical disease. We report here the development of a novel spirooxindole derivative, N-benzyl-2,2'alpha-3,3', 5', 6', 7', 7 alpha,alpha'-octahydro-2methoxycarbonyl-spiro[indole-3,3'-pyrrolizidine]-2-one (compound 4c), which inhibits Leishmania donovani topoisomerase IB (LdTopIB) and kills the wild type as well as drug-resistant parasite strains."

Funders for this research include Department of Science and Technology, Ministry of Science and Technology (DST), Council of Scientific and Industrial Research (CSIR), Department of Biotechnology, Ministry of Science and Technology (DBT).

Our news journalists obtained a quote from the research from CSIR, "This compound inhibits catalytic activity of LdTopIB in a competitive manner. Unlike camptothecin (CPT), the compound does not stabilize the DNA-topoisomerase IB cleavage complex; rather, it hinders drug-DNA-enzyme covalent complex formation. Fluorescence studies show that the stoichiometry of this compound binding to LdTopIB is 2:1 (mole/mole), with a dissociation constant of 6.65 mu M. Molecular docking with LdTopIB using the stereoisomers of compound 4c produced two probable hits for the binding site, one in the small subunit and the other in the hinge region of the large subunit of LdTopIB. This spirooxindole is highly cytotoxic to promastigotes of L. donovani and also induces apoptosis-like cell death in the parasite. Treatment with compound 4c causes depolarization of mitochondrial membrane potential, formation of reactive oxygen species inside parasites, and ultimately fragmentation of nuclear DNA. Compound 4c also effectively clears amastigote forms of wild-type and drug-resistant parasites from infected mouse peritoneal macrophages but has less of an effect on host macrophages. Moreover, compound 4c showed strong antileishmanial efficacies in the BALB/c mouse model of leishmaniasis."

According to the news editors, the research concluded: "This compound potentially can be used as a lead for developing excellent antileishmanial agents against emerging drug-resistant strains of the parasite."
For more information on this research see: A Novel Spirooxindole Derivative Inhibits the Growth of Leishmania donovani Parasites both In Vitro and In Vivo by Targeting Type IB Topoisomerase. Antimicrobial Agents and Chemotherapy, 2016;60(10):6281-6293.

Oncology - Breast Cancer

Recent Findings from Cancer Research Institute Provides New Insights into Breast Cancer (Evaluation of expression profiles of microRNAs and two target genes, FOXO3a and RUNX2, effectively supports diagnostics and therapy predictions in breast ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting out of Bratislava, Slovakia, by NewsRx editors, research stated, "Breast cancer (BC) including its progression into bone metastasis is a complex process involving changes in gene expression and function of both, microRNAs (miRNAs) and their target genes. Deregulation of miRNAs has been described as a crucial factor responsible for the initiation and progression of BC, and specific miRNA expression profiles have been found to be associated with particular disease states, histological tumor types, and BRCA1/2 or HER status."

Our news journalists obtained a quote from the research from Cancer Research Institute, "BRCA1 tumor suppressor is involved in DNA damage response and repair and epigenetically controls miR-155 expression and its pre-cancerous potential. MiR-155 targets 3’UTR region of multiple components of the pro-oncogenic signaling cascades, including FOXO3a tumor suppressor and RUNX2 transcription factor regulating metastatic potential in BC. We employed qRT-PCR to determine expression level and examine possible regulatory role of selected miRNAs (miR-17, miR-18a, miR-19a, miR-20a, miR-21, miR-27a and miR-155) and their impact on expression modulation of FOXO3a and RUNX2 in peripheral blood mononuclear cells (PBMCs) in healthy individuals, in women carrying BRCA1 mutations with no disease manifestation, in women carrying BRCA1 mutations after tumor resection and therapy and in women with BC of unknown BRCA1 status in acute stage before tumor resection. Our results showed significant increase of miR-17, miR-19a, miR-21, miR-27, miR-155 and RUNX2 expression in PBMCs in BRCA1 patients and patients in acute stage, while
FOXO3a expression was significantly decreased in these patients. MiR-18a and miR-20a expression was not affected."

According to the news editors, the research concluded: "We propose that expression changes reported in this study could provide significant additive information for early BC diagnosis, disease development prediction and therapy outcome monitoring."

For more information on this research see: Evaluation of expression profiles of microRNAs and two target genes, FOXO3a and RUNX2, effectively supports diagnostics and therapy predictions in breast cancer. Neoplasma, 2016;63(6):941-951. Neoplasma can be contacted at: Aepress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

Our news journalists report that additional information may be obtained by contacting D. Jurkovicova, Slovak Academy Sci, Canc Res Inst, Biomed Res Center, Bratislava 84505, Slovakia. Recent Findings from Central South University Has Provided New Data on Hereditary Hemorrhagic Telangiectasia (Thalidomide Effects in Patients with Hereditary Hemorrhagic Telangiectasia During Therapeutic Treatment and in Fli-EGFP Transgenic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Hereditary Hemorrhagic Telangiectasia are discussed in a new report. According to news reporting originating in Changsha, People's Republic of China, by NewsRx journalists, research stated, "Hereditary hemorrhagic telangiectasia (HHT) is an autosomal dominant disease characterized by recurrent epistaxis, mucocutaneous telangiectasia, and arteriovenous malformations. The efficacy of traditional treatments for HHT is very limited."

The news reporters obtained a quote from the research from Central South University. "The aim of this study was to investigate the therapeutic role of thalidomide in HHT patients and the effect in FLI-EGFP transgenic zebrafish model. HHT was diagnosed according to Shovlin criteria. Five HHT patients were treated with thalidomide (100 mg/d). The Epistaxis Severity Score (ESS), telangiectasia spots, and hepatic computed tomography angiography (CTA) were used to assess the clinical efficacy of thalidomide. The Fli-EGFP zebrafish model was investigated for the effect of thalidomide on angiogenesis. Dynamic real-time polymerase chain reaction assay, ELISA and Western blotting from patient's peripheral blood mononuclear cells and plasma were used to detect the expression of transforming growth factor beta 3 (TGF-b3) messenger RNA (mRNA) and vascular endothelial growth factor (VEGF) protein before and after 6 months of thalidomide treatment. The average ESS before and after thalidomide were
6.966 \pm 3.093 and 1.799 \pm 0.627, respectively (p=0.009). The 'telangiectatic spot' on the tongue almost vanished; CTA examination of case 2 indicated a smaller proximal hepatic artery and decreased or ceased hepatic artery collateral circulation. The Fli-EGFP zebrafish model manifested discontinuous vessel development and vascular occlusion (7 of 10 fishes), and the TGF-b3 mRNA expression of five patients was lower after thalidomide therapy. The plasma VEGF protein expression was down-regulated in HHT patients. Thalidomide reverses telangiectasia and controls nosebleeds by down-regulating the expression of TGF-b3 and VEGF in HHT patients."

According to the news reporters, the research concluded: "It also leads to vascular remodeling in the zebrafish model."

Our news correspondents report that additional information may be obtained by contacting G.S. Zhang, Division of Hematology, Second Xiangya Hospital, Central South University, Changsha, Hunan 410011, People's Republic of China. Additional authors for this research include Y.F. Yi, S.K. Zhou, S.S. Xie and G.S Zhang.

Heart Disorders and Diseases - Hypoplastic Left... Recent Findings from Children's Hospital Provides New Insights into Hypoplastic Left Heart Syndrome (Understanding the Hybrid Stage I Approach for Hypoplastic Left Heart Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Hypoplastic Left Heart Syndrome are presented in a new report. According to news reporting originating in Columbus, Ohio, by NewsRx journalists, research stated, "Hybrid stage I palliation combines cardiothoracic surgery and interventional transcatheter procedures for treatment of hypoplastic left heart syndrome. The approach is an alternative to the Norwood procedure, the traditional first stage of surgical palliation."

The news reporters obtained a quote from the research from Children's Hospital,
"Hybrid stage I palliation involves placing bilateral branch pulmonary artery bands and a patent ductus arteriosus stent through a median sternotomy, performed without cardiopulmonary bypass. The purpose of the bands is to control blood flow to the lungs and protect the pulmonary bed while the stent sustains systemic cardiac output. A balloon atrial septostomy is performed to create an atrial septal defect for unobstructed blood flow from the left atrium to the right atrium. The second stage of palliative surgery is the comprehensive stage II, which incorporates removal of the stent and pulmonary artery bands, atrial septectomy, anastomosis of the diminutive ascending aorta to the main pulmonary artery, aortic arch augmentation, and bidirectional cavopulmonary anastomosis."

According to the news reporters, the research concluded: "The traditional Fontan procedure completes the series of palliation."

For more information on this research see: Understanding the Hybrid Stage I Approach for Hypoplastic Left Heart Syndrome. Critical Care Nurse. 2016;36(5):48-55. Critical Care Nurse can be contacted at: Amer Assoc Critical Care Nurses, 101 Columbia, Aliso Viejo, CA 92656, USA.

Our news correspondents report that additional information may be obtained by contacting S.L. Cheatham, Nationwide Childrens Hosp, Center Heart, Cardiac Catheterization Suites, Columbus, OH, United States.

**Oncology - Breast Cancer**

**Recent Findings from Chongqing Medical University Provide New Insights into Breast Cancer (LncRNA-Hh Strengthen Cancer Stem Cells Generation in Twist-Positive Breast Cancer via Activation of Hedgehog Signaling Pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting out of Chongqing, People's Republic of China, by NewsRx editors, research stated, "Cancer stem cells (CSCs) are a subpopulation of neoplastic cells with self-renewal capacity and limitless proliferative potential as well as high invasion and migration capacity. These cells are commonly associated with epithelial-mesenchymal transition (EMT), which is also critical for tumor metastasis."

Funders for this research include National Natural Science Foundation of China, National Institutes of Health.

Our news journalists obtained a quote from the research from Chongqing Medical University, "Recent studies illustrate a direct link between EMT and stemness of cancer cells. Long non-coding RNAs (lncRNAs) have emerged as important new players in the regulation of
multiple cellular processes in various diseases. To date, the role of IncRNAs in EMT-associated CSC stemness acquisition and maintenance remains unclear. In this study, we discovered that a set of IncRNAs were dysregulated in Twist-positive mammosphere cells using IncRNA microarray analysis. Multiple IncRNAs-associated canonical signaling pathways were identified via bioinformatics analysis. Especially, the Shh-GLI1 pathway associated IncRNA-Hh, transcriptionally regulated by Twist, directly targets GAS1 to stimulate the activation of hedgehog signaling (Hh). The activated Hh increases GLI1 expression, and enhances the expression of SOX2 and OCT4 to play a regulatory role in CSC maintenance. Thus, the mammosphere-formation efficiency (MFE) and the self-renewal capacity in vitro, and oncogenicity in vivo in Twist-positive breast cancer cells are elevated. IncRNA-Hh silence in Twist-positive breast cells attenuates the activated Shh-GLI1 signaling and decreases the CSC-associated SOX and OCT4 levels, thus reduces the MFE and tumorigenesis of transplanted tumor.

According to the news editors, the research concluded: "Our results reveal that IncRNAs function as an important regulator endowing Twist-induced EMT cells to gain the CSC-like stemness properties."

Our news journalists report that additional information may be obtained by contacting M. Zhou, Key Laboratory of Laboratory Medical Diagnostics, Chinese Ministry of Education, Chongqing Medical University, Chongqing, People's Republic of China. Additional authors for this research include Y. Hou, G. Yang, H. Zhang, G. Tu, Y.E. Du, S. Wen, L. Xu, X. Tang, S. Tang, L. Yang, X. Cui and M. Liu.

**Oncology - Gliomas**

**Recent Findings from City of Hope National Medical Center Has Provided New Information about Gliomas [Increased Expression of System x(c)(-) in Glioblastoma Confers an Altered Metabolic State and Temozolomide Resistance]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gliomas is the subject of a report. According to news reporting from Duarte, California, by NewsRx journalists, research stated, "Glioblastoma multiforme is the most aggressive malignant primary brain tumor in adults. Several studies have shown that glioma cells upregulate the expression of xCT (SLC7A11), the catalytic subunit of system x©(-), a transporter involved in cystine import, that modulates glutathione production and glioma growth."
The news correspondents obtained a quote from the research from the City of Hope National Medical Center, "However, the role of system x©(-) in regulating the sensitivity of glioma cells to chemotherapy is currently debated. Inhibiting system x©(-) with sulfasalazine decreased glioma growth and survival via redox modulation, and use of the chemotherapeutic agent temozolomide together with sulfasalazine had a synergistic effect on cell killing. To better understand the functional consequences of system x©(-) in glioma, stable SLC7A11-knockdown and -overexpressing U251 glioma cells were generated. Modulation of SLC7A11 did not alter cellular proliferation but overexpression did increase anchorage-independent cell growth. Knockdown of SLC7A11 increased basal reactive oxygen species (ROS) and decreased glutathione generation resulting in increased cell death under oxidative and genotoxic stress. Overexpression of SLC7A11 resulted in increased resistance to oxidative stress and decreased chemosensitivity to temozolomide. In addition, SLC7A11 overexpression was associated with altered cellular metabolism including increased mitochondrial biogenesis, oxidative phosphorylation, and ATP generation."

According to the news reporters, the research concluded: "These results suggest that expression of SLC7A11 in the context of glioma contributes to tumorigenesis, tumor progression, and resistance to standard chemotherapy."

For more information on this research see: Increased Expression of System x©(-) in Glioblastoma Confers an Altered Metabolic State and Temozolomide Resistance. Molecular Cancer Research, 2016;14(12):1229-1242. Molecular Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Our news journalists obtained a quote from the research from Cooper Union, "Five OSAS and six control obese girls between 14 and 18 years of age were studied. All underwent polysomnography, critical closing pressure (P-crit) studies, and dynamic MRI of the upper airway during awake tidal breathing. Effective airway compliance was defined as the slope of cross-sectional area vs. average pressure between maximum inspiration and maximum expiration along the pharyngeal airway. Pharyngeal pressure fields were calculated by using image-based computational fluid dynamics and nasal resistance. Spearman correlations were calculated to test associations between apnea-hypopnea index (AHI), P-crit, and airway compliance. Effective compliances in the nasopharynx (C-NP) and velopharynx (C-VP) were lower and negative in OSAS compared with controls: -4.4 vs. 1.9 (mm(2)/cmH(2)O, P = 0.012) and -2.1 vs. 3.9 (mm(2)/cmH(2)O, P = 0.021), respectively, suggesting a strong phasic pharyngeal dilator activity during inspiration in OSAS compared with controls. For all subjects, CNP and AHI correlated negatively (τ(S) = -0.69, P = 0.02), and passive P-crit correlated with CNP (τ(S) = -0.76, P = 0.006) and with AHI (τ(S) = 0.86, P = 0.0006). Pharyngeal mechanics obtained during wakefulness could be used to characterize subjects with OSAS."

According to the news editors, the research concluded: "Moreover, negative effective compliance during wakefulness and its correlation to AHI and P-crit suggest that phasic dilator activity of the upper pharynx compensates for negative pressure loads in these subjects."

For more information on this research see: Computational fluid dynamics upper airway effective compliance, critical closing pressure, and obstructive sleep apnea severity in obese adolescent girls. Journal of Applied Physiology, 2016;121(4):925-931. Journal of Applied Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Drugs and Therapies - Antibiotics

Recent Findings from Department of Clinical Pharmacology Provide New Insights into Antibiotics (Pharmacokinetics and Pulmonary Distribution of Clarithromycin and Rifampicin after Concomitant and Consecutive Administration in Foals)
According to news originating from Greifswald, Germany, by NewsRx correspondents, research stated, "Drug interactions often result from multiple pharmacokinetic changes, such as after rifampicin (RIF) and clarithromycin (CLA) in the treatment of abscessing lung diseases. Comedication of RIF may interact with CLA disposition by either induction of presystemic elimination processes and/or inhibition of uptake mechanisms because it regulates gene transcription and modulates function of various CYP enzymes, multidrug efflux and uptake transporters for which CLA is a substrate."

Our news journalists obtained a quote from the research from the Department of Clinical Pharmacology, "To distinguish the transcriptional changes from the modulating interaction components upon CLA absorption and pulmonary distribution, we initiated a repeated-dose study in 12 healthy foals with CLA (7.5 mg/kg, p.o., b.i.d.) in comedication with RIF (10 mg/kg, p.o., b.i.d.) given either concomitantly with CLA or consecutively 4 h after CLA. Affinity of CLA to human P-gp, MRP2, and MRP3 and to OCT1, OCT3, and PEPT1 was measured using SF9-derived inside-out membrane vesicles and transfected HEK293 cells, respectively. ABCB1 (P-gp) induction by RIF and affinity of CLA to equine P-gp were studied using primary equine hepatocytes. Absolute bioavailability of CLA was reduced from \( \sim 40\% \) to below 5% after comedication of RIF in both schedules of administration, and Tmax occurred \( \sim 2-3 \) h earlier. The loss of bioavailability was not associated with increased 14-hydroxyclarithromycin (14-OH-CLA) exposure. After consecutive dosing, absolute bioavailability and pulmonary penetration of CLA increased \( \sim 2 \)-fold compared to concomitant use. In vitro, CLA showed affinity to human and equine P-gp. Expression of ABCB1 mRNA was upregulated by RIF in 7 of 8 duodenal biopsy specimens and in primary equine hepatocytes."

According to the news editors, the research concluded: "The major undesired influence of RIF on oral absorption and pulmonary distribution of CLA is associated with induction of intestinal P-gp. Consecutive administration to avoid competition with its intestinal uptake transport results in significantly, although not clinically relevant, improved systemic exposure."

For more information on this research see: Pharmacokinetics and Pulmonary Distribution of Clarithromycin and Rifampicin after Concomitant and Consecutive Administration in Foals. Molecular Pharmaceutics, 2016;13(3):1089-99. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

The news correspondents report that additional information may be obtained from S. Berlin, Dept. of Clinical Pharmacology, Center of Drug Absorption and Transport (C_DAT), University Medicine of Greifswald, Greifswald, Germany. Additional authors for this research include L. Spieckermann, S. Oswald, M. Keiser, S. Lumpe, A. Ullrich, M. Grube, M. Hasan, M. Venner and W. Siegmund.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.molpharmaceut.5b00907. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Findings from Department of Medicine Has Provided New Information about Cancer Risk (Increased yield of actionable mutations using multi-gene panels to assess hereditary cancer susceptibility in an ethnically diverse clinical cohort)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Risk. According to news reporting originating in Los Angeles, California, by NewsRx journalists, research stated, "This study aims to assess multi-gene panel testing in an ethnically diverse clinical cancer genetics practice. We conducted a retrospective study of individuals with a personal or family history of cancer undergoing clinically indicated multi-gene panel tests of 6-110 genes, from six commercial laboratories."

The news reporters obtained a quote from the research from the Department of Medicine, "The 475 patients in the study included 228 Hispanics (47.6%), 166 non Hispanic Whites (35.4%), 55 Asians (11.6%), 19 Blacks (4.0%), and seven others (1.5%). Panel testing found that 15.6% (74/475) of patients carried deleterious mutations for a total of 79 mutations identified. This included 7.4% (35/475) of patients who had a mutation identified that would not have been tested with a gene-by-gene approach. The identification of a panel added mutation impacted clinical management for most of cases (69%, 24/35), and genetic testing was recommended for the first degree relatives of nearly all of them (91%, 32/35). Variants of uncertain significance (VUSs) were identified in a higher proportion of tests performed in ethnic minorities. Multi-gene panel testing increases the yield of mutations detected and adds to the capability of providing individualized cancer risk assessment. VUSs represent an interpretive challenge due to less data available outside of White, non-Hispanic populations."

According to the news reporters, the research concluded: "Further studies are necessary to expand understanding of the implementation and utilization of panels across broad clinical settings and patient populations."

Our news correspondents report that additional information may be obtained by contacting C. Ricker, Univ Southern Calif, Dept. of Med, Los Angeles, CA 90033, United States. Additional authors for this research include J.O. Culver, K. Lowstuter, D. Sturgeon, J.D. Sturgeon, C.R. Chanock, W.J. Gauderman, K.J. McDonnell, G.E. Idos and S.B. Gruber.

Peptides and Proteins

Recent Findings from Dow AgroSciences LLC Has Provided New Information about Peptides and Proteins (Rapid simulated gastric fluid digestion of in-seed/grain proteins expressed in genetically engineered crops)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Peptides and Proteins is now available. According to news reporting out of Indianapolis, Indiana, by NewsRx editors, research stated, "The speed of simulated gastric digestion of proteins expressed in genetically engineered (GE) crops is commonly used to inform the allergenicity risk assessment. However, persistence of purified proteins in simulated gastric fluid (SGF) is poorly correlated with the allergenic status of proteins."

Our news journalists obtained a quote from the research from Dow AgroSciences LLC, "It has been proposed that the plant or food matrix may affect the digestion of proteins and should be considered in interpreting digestion results. Here the SGF digestion of several GE proteins both as purified preparations and in soybean, corn, and cotton seed/grain extracts (in-matrix) are compared. Cry1F, Cry1Ac, phosphinothricin acetyltransferase (PAT), aryloxyalkanoate dioxygenase-1 (AAD-1), aryloxyalkanoate dioxygenase-12 (AAD-12), and double mutant 5-enol pyruvylshikimate-3-phosphate synthase (2mEPSPS) were all found to rapidly digest both as purified protein preparations and in seed/grain extracts from GE crops expressing these proteins."

According to the news editors, the research concluded: "Based on these results, purified protein from microbial sources is a suitable surrogate for proteins in-matrix when conducting SGF digestion studies."

For more information on this research see: Rapid simulated gastric fluid digestion of in-seed/grain proteins expressed in genetically engineered crops. Regulatory Toxicology and Pharmacology, 2016;81():106-112. Recent Findings from EMD Serono Advance Knowledge in Metabolic Syndrome (Predictors of Treatment Response to Tesamorelin, a Growth Hormone-Releasing Factor Analog, in HIV-Infected Patients with Excess Abdominal Fat)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Metabolic Syndrome have been published. According to news reporting from Rockland, Massachusetts, by NewsRx journalists, research stated, "Tesamorelin, a synthetic analog of human growth hormone-releasing factor, decreases visceral adipose tissue (VAT) in human immunodeficiency virus (HIV)-infected patients with lipodystrophy. 1) To evaluate the utility of patient characteristics and validated disease-risk scores, namely indicator variables for the metabolic syndrome defined by the International Diabetes Federation (MetS-IDF) or the National Cholesterol Education Program (MetS-NCEP) and the Framingham Risk Score (FRS), as predictors of VAT reduction during tesamorelin therapy at 3 and 6 months, and 2) To explore the characteristics of patients who reached a threshold of VAT <140 cm², a level associated with lower risk of adverse health outcomes, after 6 months of treatment with tesamorelin."

The news correspondents obtained a quote from the research from EMD Serono, "Data were analyzed from two Phase 3 studies in which HIV-infected patients with excess abdominal fat were randomized in a 2:1 ratio to receive tesamorelin 2 mg (n=543) or placebo (n=263) subcutaneously daily for 6 months, using ANOVA and ANCOVA models. Metabolic syndrome (MetS-IDF or MetS-NCEP) and FRS were significantly associated with VAT at baseline. Presence of metabolic syndrome ([MetS-NCEP), triglyceride levels >1.7 mmol/L, and white race had a significant impact on likelihood of response to tesamorelin after 6 months of therapy (interaction p-values 0.054, 0.063, and 0.025, respectively). No predictive factors were identified at 3 months. The odds of a VAT reduction to <140 cm² for subjects treated with tesamorelin was 3.9 times greater than that of subjects randomized to placebo after controlling for study, gender, baseline body mass index (BMI) and baseline VAT (95% confidence interval [CI] 2.03; 7.44). Individuals with baseline MetS-NCEP, elevated triglyceride levels, or white race were most likely to experience reductions in VAT after 6 months of tesamorelin treatment."

According to the news reporters, the research concluded: "The odds of response of VAT <140 cm² was 3.9 times greater for tesamorelin-treated patients than that of patients receiving placebo."

For more information on this research see: Predictors of Treatment Response to Tesamorelin, a Growth Hormone-Releasing Factor Analog, in HIV-Infected Patients with Excess Abdominal Fat. Plos One, 2015;10(10):e0140358. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Drugs and Therapies - Cancer Therapy

Recent Findings from Emory University Has Provided New Information about Cancer Therapy (New Anticancer Drugs Associated With Large Increases In Costs And Life Expectancy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Cancer Therapy are presented in a new report. According to news originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "Spending on anticancer drugs has risen rapidly over the past two decades. A key policy question is whether new anticancer drugs offer value, given their high cost."

Our news journalists obtained a quote from the research from Emory University, "Using data from the Surveillance, Epidemiology, and End Results (SEER)-Medicare database, we assessed the value of new cancer treatments in routine clinical practice for patients with metastatic breast, lung, or kidney cancer or chronic myeloid leukemia in the periods 1996-2000 and 2007-11. We found that there were large increases in medical costs, but also large gains in life expectancy. For example, among patients with breast cancer who received physician-administered drugs, lifetime costs-including costs for outpatient and inpatient care-increased by $72,000 and life expectancy increased by thirteen months."

According to the news editors, the research concluded: "Changes in life expectancy and costs were much smaller among patients who did not receive these drugs."

For more information on this research see: New Anticancer Drugs Associated With Large Increases In Costs And Life Expectancy. Health Affairs, 2016;35(9):1581-1587. Health Affairs can be contacted at: Project Hope, 7500 Old Georgetown Rd, Ste 600, Bethesda, MD 20814-6133, USA.

The news correspondents report that additional information may be obtained from D.H. Howard, Emory University, Dept. of Hlth Policy & Management, Atlanta, GA 30322, United States. Additional authors for this research include M.E. Chernew, T. Abdelgawad, G.L. Smith, J. Sollano and D.C. Grabowski.

Recent Findings from Federal University Provides New Insights into HIV/AIDS (TRIM5 gene polymorphisms in HIV-1-infected patients and healthy controls from Northeastern Brazil)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immune System Diseases and Conditions - HIV/AIDS is the subject of a report. According to news reporting out of Recife, Brazil, by NewsRx editors, research stated, "Humans show heterogeneity in vulnerability to HIV-1 infection, partially under control of genes involved in host immunity and virus replication. TRIM5 alpha protein has restriction activity against replication of many retroviruses."

Financial supporters for this research include Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Fundacao de Amparo a Ciencia e Tecnologia do Estado de Pernambuco.

Our news journalists obtained a quote from the research from Federal University, "Human TRIM5 gene single nucleotide polymorphisms have been reported as involved in susceptibility to HIV-1 infection. We recruited 213 HIV-1-positive patients and 234 healthy uninfected controls from Northeast Brazil; two non-synonymous variants at exon 2, rs3740996 (H43Y) and rs10838525 (R136Q), and one regulatory polymorphism (rs16934386) at 5'UTR region of TRIM5 were analyzed. The R136Q variation presented significant differences between HIV-1-positive patients and healthy controls. The 136Q allele and the 136QQ genotype were more frequent in healthy controls (32.7 and 10.2 %, respectively) than in HIV-1-positive patients (136Q allele: 24.4 %; OR 0.66; CI 95 % 0.49-0.90; p value = 0.008/136QQ genotype: 4.2 %; OR 0.33; CI 95 % 0.13-0.79; p = 0.008) also after adjusting for age and sex. We also stratified our findings according to the presence of CCR5 Delta 32 variation, but the results remained the same. We observed that rs10838525 (R136Q) and rs3740996 (H43Y) were in linkage disequilibrium (D' = 0.71), forming four possible haplotypes. The H43-136Q haplotype was significantly more frequent in healthy controls (28.2 %) than in HIV-positive patients (21.4 %; OR 0.69; CI 95 % 0.50-0.96; p = 0.022). An increased frequency of allele (136Q) and genotype (136QQ) of the non-synonymous rs10838525 (R136Q) variant and the haplotype (43H-136Q) was observed among healthy controls individuals."

According to the news editors, the research concluded: "Being aware of the limitation of this study (unavailability of exposed but uninfected individuals), we hypothesize a potential role for TRIM5 variations in the protection against HIV-1 infection."

For more information on this research see: TRIM5 gene polymorphisms in HIV-1-infected patients and healthy controls from Northeastern Brazil. Immunologic Research, 2016;64(5-6):1237-1242. Life Science Research - Human Reproduction

Recent Findings from Free University Provides New Insights into Human Reproduction (Cryopreservation of testicular tissue or testicular cell suspensions: a pivotal step in fertility preservation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Human Reproduction have been published. According to news reporting originating in Brussels, Belgium, by NewsRx journalists, research stated, "Germ cell depletion caused by chemical or physical toxicity, disease or genetic predisposition can occur at any age. Although semen cryopreservation is the first reflex for preserving male fertility, this cannot help out prepubertal boys."

Funders for this research include European Commission Research and Innovation Marie Slodowska Actions (MSCA), Seventh Framework program, Agency for Innovation by Science and Technology (IWT), Flemish League against Cancer-Public Utility Foundation, Vrije Universiteit Brussel (Methusalem), UZ Brussel (Wetenschappelijk Fonds Willy Gepts).

The news reporters obtained a quote from the research from Free University, "Yet, these boys do have spermatogonial stem cells (SSCs) that able to produce sperm at the start of puberty, which allows them to safeguard their fertility through testicular tissue (TT) cryopreservation. SSC transplantation (SSCT), TT grafting and recent advances in in vitro spermatogenesis have opened new possibilities to restore fertility in humans. However, these techniques are still at a research stage and their efficiency depends on the amount of SSCs available for fertility restoration. Therefore, maintaining the number of SSCs is a critical step in human fertility preservation. Standardizing a successful cryopreservation method for TT and testicular cell suspensions (TCSs) is most important before any clinical application of fertility restoration could be successful. This review gives an overview of existing cryopreservation protocols used in different animal models and humans. Cell recovery, cell viability, tissue integrity and functional assays are taken into account. Additionally, biosafety and current perspectives in male fertility preservation are discussed. An extensive PubMed and Medline database search was conducted. Relevant studies linked to the topic were identified by the search terms: cryopreservation, male fertility preservation, (immature)testicular tissue, testicular cell suspension, spermatogonial stem cell, gonadotoxicity, radiotherapy and chemotherapy. The feasibility of fertility restoration techniques using frozen-thawed TT and TCS has been proven in animal models. Efficient protocols for cryopreserving human TT exist and are currently applied in the clinic. For TCSs, the highest post-thaw viability reported after vitrification is 55.6 +/- 23.8%. Yet, functional proof of fertility restoration in the human is lacking. In addition, few to no data are available on the safety aspects inherent to offspring generation with gametes derived from frozen-thawed TT or TCSs. Moreover, clarification is needed on whether it is better to cryopreserve TT or TCS. Fertility restoration techniques are very promising and expected to be implemented in the clinic in the near future. However, inter-center variability needs to be overcome and the gametes produced for reproduction purposes need to be subjected
to safety studies."

According to the news reporters, the research concluded: "With the perspective of a future clinical application, there is a dire need to optimize and standardize cryopreservation and safety testing before using frozen-thawed TT of TCSs for fertility restoration."

**Heart Disorders and Diseases - Cardiomegaly**

**Recent Findings from French National Institute of Health and Medical Research (INSERM) Provide New Insights into Cardiomegaly (Endothelial cell dysfunction and cardiac hypertrophy in the STOX1 model of preeclampsia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Cardiomegaly. According to news originating from Paris, France, by NewsRx correspondents, research stated, "Preeclampsia is a disease of pregnancy involving systemic endothelial dysfunction. However, cardiovascular consequences of preeclampsia are difficult to analyze in humans."

Our news journalists obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "The objective of the present study is to evaluate the cardiovascular dysfunction induced by preeclampsia by examining the endothelium of mice suffering of severe preeclampsia induced by STOX1 overexpression. Using Next Generation Sequencing on endothelial cells of mice carrying either transgenic or control embryos, we discovered significant alterations of gene networks involved in inflammation, cell cycle, and cardiac hypertrophy. In addition, the heart of the preeclamptic mice revealed cardiac hypertrophy associated with histological anomalies. Bioinformatics comparison of the networks of modified genes in the endothelial cells of the preeclamptic mice and HUVECs exposed to plasma from preeclamptic women identified striking similarities. The cardiovascular alterations in the pregnant mice are comparable to those endured by the cardiovascular system of preeclamptic women."

According to the news editors, the research concluded: "The STOX1 mice could help
to better understand the endothelial dysfunction in the context of preeclampsia, and guide the search for efficient therapies able to protect the maternal endothelium during the disease and its aftermath."

For more information on this research see: Endothelial cell dysfunction and cardiac hypertrophy in the STOX1 model of preeclampsia. *Scientific Reports*, 2016;6():19196. (Nature Publishing Group - www.nature.com/srep/)

**Drugs and Therapies - Transdermal Delivery**

**Recent Findings from Friedrich-Schiller-University Has Provided New Information about Transdermal Delivery (Transdermal delivery from liposomal formulations - Evolution of the technology over the last three decades)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Transdermal Delivery is now available. According to news reporting from Jena, Germany, by NewsRx journalists, research stated, "Strong barrier properties of stratum corneum often limits the efficiency of drug delivery through skin. Several strategies were tried to improve permeation of drug through skin for local as well as systemic drug delivery."

The news correspondents obtained a quote from the research from Friedrich-Schiller-University, "Incorporation of the drug within flexible liposomal vesicles has been one of the popular and well-studied approaches for delivering drug to deeper layers of the skin or even systemic circulation. Flexible/deformable/elastic liposomal systems such as invasomes, Transfersomes®, ethosomes, niosomes, etc. have demonstrated encouraging results in delivering small molecules and large proteins to the skin. It is necessary to recognize the promising concepts and analyze their potential, since a clear understanding of the drawbacks and advantages of these approaches will lead towards future development. In the current review we have attempted to give an overview of different liposomal drug carriers for transdermal drug delivery and their efficiency as drug delivery system through different in vivo and in vitro studies."

According to the news reporters, the research concluded: "Also, an overview of the studies which investigated the interactions between skin and vesicles, which have lead us to our current understanding of the skin penetration mechanisms of liposomal formulations is
presented."

For more information on this research see: Transdermal delivery from liposomal formulations - Evolution of the technology over the last three decades. Oncology - Colon Cancer

Recent Findings from Fudan University Shanghai Cancer Center Has Provided New Data on Colon Cancer (RPS7 inhibits colorectal cancer growth via decreasing HIF-1a-mediated glycolysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Ribosomal protein S7 (RPS7) acts as a tumor suppressor in primary tumorigenesis but its role in cancer metabolism remains unclear. In this study, we demonstrate that RPS7 inhibits the colorectal cancer (CRC) cell glycolysis by suppressing the expression of hypoxia-inducible transcription factor-1a (HIF-1a) and the metabolic promoting proteins glucose transporter 4 (GLUT4) and lactate dehydrogenase B (LDHB)."

Our news journalists obtained a quote from the research from Fudan University Shanghai Cancer Center, "Further study found that the enhanced expression of HIF-1a abrogates the overexpression effects of RPS7 on CRC. In vivo assays also demonstrate that RPS7 suppresses colorectal cancer tumorigenesis and glycolysis. Clinically, the tissue microarray (TMA) analysis discloses the negative regulatory association between RPS7 and HIF-1a in colorectal cancer. Meanwhile, overexpression of RPS7 in colorectal cancer tissues predicts good overall survival and progression-free survival, but high expression level of HIF-1a indicates poor overall survival and progression-free survival."

According to the news editors, the research concluded: "Overall, we reveal that RPS7 inhibits colorectal cancer glycolysis through HIF-1a-associated signaling and may be a promising biomarker for prognosis prediction and a potential target for therapeutic treatment."

For more information on this research see: RPS7 inhibits colorectal cancer growth via decreasing HIF-1a-mediated glycolysis. Oncotarget, 2016;7(5):5800-14.

The news correspondents report that additional information may be obtained from W. Zhang, Cancer Institute and Dept. of Medical Oncology, Fudan University Shanghai Cancer Center, Shanghai 200032, People's Republic of China. Additional authors for this research include D. Tong, F. Liu, D. Li, J. Li, X. Cheng and Z. Wang.

Endothelial Cells

Recent Findings from Fuzhou University Has Provided New Information about Endothelial Cells (S-nitrosocaptopril interrupts adhesion of cancer cells to vascular endothelium by suppressing cell adhesion molecules via inhibition of the NF-kappa B ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Endothelial Cells. According to news reporting originating from Fuzhou, People's Republic of China, by NewsRx correspondents, research stated, "Inflammatory cytokines can induce the expression of cell adhesion molecules (CAMs) in endothelial cells. The induction may play an important role in attracting circulating tumor cells (CTCs) to endothelial cells."

Our news editors obtained a quote from the research from Fuzhou University, "S-nitrosocaptopril (CapNO) is known to produce vasorelaxation and interfere the hetero-adhesion of CTCs to vascular endothelium via down-regulating the expression of CAMs. To elucidate the mechanisms underlying the inhibition of CapNO on CAMs, in this study, we examined the relationship between cytokines and CAMs expression and investigated the effects of CapNO on cytokine-induced NF-kappa B and JAK/STAT signal pathways. The activation of CAMs by cytokines was dependent on concentrations and reaction time of cytokines, and the combination of cytokines could produce a strong synergistic effect. IL-1 beta induced the expression of CAMs on endothelial cells by activating NF-kappa B and JAK/STAT pathways. CapNO inhibited IL-1 beta-stimulated NF-kappa B pathway by down-regulating IKK-alpha and inducing Ix13-alpha directly. CapNO also inhibited JAK/STAT pathway by inhibiting JAK2 and STAT3 expressions. These effects bring about down-regulating CAMs expression on endothelial cells."

According to the news editors, the research concluded: "These results suggest that CapNO may interrupt adhesion of cancer cells to endothelium by suppressing CAMs via inhibiting the NF-kappa B and JAK/STAT pathways in endothelial cells."

The news editors report that additional information may be obtained by contacting L. Jia, Fuzhou Univ, Coll Chem, Biopharmaceut Photocatalysis, State Key Lab Photocatalysis Energy & Environm, Fuzhou 350002, People's Republic of China. Additional authors for this research include Y.S. Lu, Y.L. Cheng, T. Yu, X.D. Xie, H.Y. Liang, Y.Y. Ye and L. Jia.

Pneumococcal Disease

Recent Findings from G. Errico and Co-Authors Provide New Insights into Pneumococcal Disease [Application of capsular sequence typing (CST) to serotype non-viable Streptococcus pneumoniae isolates from an old collection]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pneumococcal Disease have been published. According to news reporting originating from Rome, Italy, by NewsRx correspondents, research stated, "Serotyping of Streptococcus pneumoniae is essential for monitoring changes in the pneumococcal population and the impact of vaccines. Recently, various DNA-based methods have become available and are increasingly used because they are cheaper and easier to perform than the Quellung reaction."

Our news editors obtained a quote from the research, "Our aim was to apply a DNA-based method, capsular sequence typing (CST), to a collection of non-viable lyophilized pneumococcal isolates dating from the 1980s to elucidate the serotypes circulating in Italy 30 years ago. As a preliminary evaluation of the method, CST was applied to 68 recent pneumococcal isolates representative of the most common serotypes circulating in Italy in invasive pneumococcal disease (IPD) previously serotyped by the Quellung reaction. CST was then applied to 132 lyophilized non-viable isolates. A serotype-specific polymerase chain reaction (PCR), using primers suggested by the Centers for Disease Control and Prevention (CDC), was performed when CST did not yield a univocal serotype. Considering the control isolates, CST concordance with the Quellung reaction was 95.6 %. For the non-viable lyophilized isolates, CST identified a univocal serotype for 59.4 % of the isolates. This percentage increased to 78.1 % if CST was combined with serotype-specific PCR. The most frequent serotypes in the collection of non-viable strains were: 3 (15.6 %), 14 (11.7 %), 35B (5.5 %), 19A (5.5 %), and 8 (4.7 %). CST proved to be a valid method for serotyping pneumococcal strains and provided information about pneumococcal serotypes present in Italy 30 years ago."

According to the news editors, the research concluded: "The combination of CST with serotype-specific PCR was an effective strategy to identify pneumococcal serotypes that can be suggested also for routine laboratories."

For more information on this research see: Application of capsular sequence typing (CST) to serotype non-viable Streptococcus pneumoniae isolates from an old collection. Cardiovascular Diseases and Conditions -...

Recent Findings from General Hospital Provides New Insights into Atherosclerosis (GDF11 Protects against Endothelial Injury and Reduces Atherosclerotic Lesion Formation in Apolipoprotein E-Null Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news reporting originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "Growth differentiation factor 11 (GDF11) reduces cardiac hypertrophy, improves cerebral vasculature and enhances neurogenesis in ageing mice. Higher growth differentiation factor 11/8 (GDF11/8) is associated with lower risk of cardiovascular events in humans."

Our news editors obtained a quote from the research from General Hospital, "Here, we showed that adeno-associated viruses-GDF11 and recombinant GDF11 protein improve endothelial dysfunction, decrease endothelial apoptosis, and reduce inflammation, consequently decrease atherosclerotic plaques area in apolipoprotein mice. Moreover, adeno-associated viruses-GDF11 and recombinant GDF11 stabilize atherosclerotic plaques by selectively decreasing in macrophages and T lymphocytes, while increasing in collagen and vascular smooth muscle cells within plaques. In addition, GDF11 inhibit palmitic acid-induced endothelial apoptosis and ameliorate palmitic acid-induced inflammatory response in RAW264.7 macrophages in vitro. Mechanistically, GDF11 activates the TGF-beta/Smad2/3, AMPK/endothelial nitricoxide synthase (eNOS) while suppresses INK and NF-kappa B pathways. In humans, circulating GDF11/8 is positively associated with flow-mediated endothelium-dependent dilation in overweight subjects."

According to the news editors, the research concluded: "We concluded that adeno-associated viruses-GDF11 and recombinant GDF11 protect against endothelial injury and reduce atherosclerosis in apolipoprotein E-/- mice, thus may be providing a novel approach to the treatment of atherosclerosis."

For more information on this research see: GDF11 Protects against Endothelial Injury and Reduces Atherosclerotic Lesion Formation in Apolipoprotein E-Null Mice. Molecular Therapy, 2016;24(11):1926-1938. Molecular Therapy can be contacted at: Nature
Recent Findings from Giannina Gaslini Institute Has Provided New Information about Human Genetics (WES in a family trio suggests involvement of TECPR2 in a complex form of progressive motor neuron disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Genetics - Human Genetics are discussed in a new report. According to news originating from Genoa, Italy, by NewsRx correspondents, research stated, "We have performed whole-exome sequencing in a family trio with a 16-year-old girl suffering of progressive motor neuron disease. There was no family history of the disease and no parental consanguinity."

Our news journalists obtained a quote from the research from Giannina Gaslini Institute, "Our exome analysis indicated the proband as a compound heterozygote for two missense variants in the TECPR2 gene according to a recessive mode of inheritance. The TECPR2 gene has been reported as a positive regulator of autophagy which is an essential mechanism for maintaining neuron homeostasis and survival and plays a key role in major adult and pediatric neurodegenerative diseases. Variants in this gene have been found responsible for a recently described form of hereditary spastic paraplegia called SPG49 in two previous reports. We propose that both variants causing amino acid substitution, p.Leu684Val and p.Thr903Met, inherited in trans-phase compound heterozygote form, can be responsible for the phenotype observed in our patient. We also consider the possible contribution of a heterozygous variant in the SPG7 gene."

According to the news editors, the research concluded: "Sanger sequencing confirmed the segregation of variants within the family tree including the patient's unaffected brother."

For more information on this research see: WES in a family trio suggests involvement of TECPR2 in a complex form of progressive motor neuron disease. *Clinical Genetics*, 2016;90(2):182-185. *Clinical Genetics* can be contacted at: Wiley-Blackwell, 111
Recent Findings from Graduate School Provides New Insights into Heart Disease (Birth weight and risk of ischemic heart disease: A Mendelian randomization study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Disease is the subject of a report. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Low birth weight is a risk factor for cardiovascular disease. However, the association could be confounded by many factors."

The news reporters obtained a quote from the research from Graduate School, "We used Mendelian randomization to clarify the role of birth weight in ischemic heart disease (IHD) and lipids. We used all 7 single nucleotide polymorphisms (SNPs) independently contributing to birth weight at genome wide significance (p < 5 x 10(-8)) in separate sample instrumental variable analysis to estimate the effect of birth weight on IHD using the CARDIoGRAMplusC4D 1000 Genomes based GWAS case (n = 60,801)-control (n = 123,504) study and on lipids using GLGC (n = 188,577). Higher genetically predicted birth weight was associated with lower risk of IHD (odds ratio (OR) 0.96 per 100 grams, 95% confidence interval (CI) 0.93 to 0.99), but the association was not robust to sensitivity analyses excluding SNPs related to height or use of weighted median methods. Genetically predicted birth weight was not associated with low density lipoprotein cholesterol or triglycerides, but was associated with lower high density lipoprotein cholesterol (-0.014 standard deviation, 95% CI-0.027 to -0.0005) and the association was more robust to the sensitivity analyses."

According to the news reporters, the research concluded: "Our study does not show strong evidence for an effect of birth weight on IHD and lipids."

For more information on this research see: Birth weight and risk of ischemic heart disease: A Mendelian randomization study. Scientific Reports, 2016;6():1-7. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Recent Findings from Guangxi Medical University Has Provided New Information about Ventricular Fibrillation (Edaravone improves survival and neurological outcomes after CPR in a ventricular fibrillation model of rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Ventricular Fibrillation have been presented. According to news reporting originating from Guangxi, People's Republic of China, by NewsRx correspondents, research stated, "Overproduction of free radicals is a main factor contributing to cerebral injury after cardiac arrest (CA)/cardiopulmonary resuscitation (CPR). We sought to evaluate the impact of edaravone on the survival and neurological outcomes after CA/CPR in rats."

Funders for this research include National Natural Science Foundation of China, Guangxi Natural Science Foundation.

Our news editors obtained a quote from the research from Guangxi Medical University, "Rats were subjected to CA following CPR. For survival study, the rats with restoration of spontaneous circulation (ROSC) were randomly allocated to one of the two groups (edaravone and saline group, n = 20/each group) to received Edaravone (3 mg/kg) or normal saline. Another 10 rats without experiencing CA and CPR served as the sham group. Survival was observed for 72 hours and the neurological deficit score (NDS) was calculated at 12, 24, 48, and 72 hours after ROSC. For the neurological biochemical analysis study, rats were subjected to the same experimental procedures. Then, edaravone group (n = 24), saline group (n = 24) and sham group (n = 16) were further divided into 4 subgroups according to the different time intervals (12, 24, 48, and 72 hours following ROSC). Brain tissues were harvested at relative time intervals for evaluation of oxidative stress, TUNEL staining and apoptotic gene expression. Edaravone improved postresuscitative survival time and neurological deficit, decreased brain malonyaldehyde level, increased superoxide dismutase activities, decreased proapoptotic gene expression of capase-8, capase-3, and Bax, and increased antiapoptotic Bcl-2 expression at 12, 24, 48, and 72 hours after ROSC."

According to the news editors, the research concluded: "Edaravone improves survival and neurological outcomes following CPR via antioxidative and antiapoptotic effects in rats."

The news editors report that additional information may be obtained by contacting L. Xie, Guangxi Med Univ, Sch Preclin Sci, Dept. of Physiol, Nanning 530021, Guangxi, People's
Republic of China. Additional authors for this research include L.Y. Lei, N. Li, F.Y.R. Shi, M.H. Chen and L. Xie.

Oncology - Glioblastomas

Recent Findings from Harbin Medical University Has Provided New Data on Glioblastomas (Identification and characterization of IncRNA mediated transcriptional dysregulation dictates IncRNA roles in glioblastoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Glioblastomas. According to news reporting originating in Harbin, People's Republic of China, by NewsRx journalists, research stated, "Long non-coding RNAs (lncRNAs) modulate gene expression, and lncRNA misregulation is associated with cancer. However, precise functional roles in biological and disease processes have been described for only a few lncRNAs."

The news reporters obtained a quote from the research from Harbin Medical University, "Identification of genome-wide lncRNA-mediated transcriptional dysregulations may improve cancer treatments. In the present study, we used a computational framework that combined lncRNA and gene expression profiles with transcription factor (TF)-target relationships to comprehensively identify dysregulatory lncRNA-TF-gene triplets. In glioblastoma (GBM), we found that most lncRNAs affect multiple targets and primarily affect TF activity in trans. Six different classes of lncRNA-mediated transcriptional dysregulations were identified, with most lncRNAs either enhancing or attenuating target gene expression. Functional analysis of lncRNAs via their dysregulated targets implicated lncRNA modulators in some hallmarks of cancer, providing a new way to predict lncRNA function. Finally, we identified several lncRNA-TF-gene triplets (including HOTAIR-MXI1-CD58/PRKCE and HOTAIR-ATF5-NCAM1) that are associated with glioblastoma prognosis."

According to the news reporters, the research concluded: "The integration of lncRNA modulators into transcriptional regulatory networks will further enhance our understanding of lncRNA functions in cancer."

For more information on this research see: Identification and characterization of lncRNA mediated transcriptional dysregulation dictates lncRNA roles in glioblastoma. Oncotarget, 2016;7(29):45027-45041.

Our news correspondents report that additional information may be obtained by contacting Y. Li, College of Bioinformatics Science and Technology and Bio-Pharmaceutical Key Laboratory of Heilongjiang Province, Harbin Medical University, Harbin 150081, People's Republic of China. Heart Disorders and Diseases - Heart Failure

Recent Findings from Heart and Vascular Institute Has Provided New Information about Heart Failure (Ventricular Assist Device Therapy in Older Patients With Heart Failure: Characteristics and Outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Failure. According to news originating from Falls Church, Virginia, by NewsRx correspondents, research stated, "Limited data exist on outcomes in patients years of age supported with the use of continuous flow left ventricular assist devices (LVADs). Data on 1149 continuous-flow LVAD recipients was queried from the Mechanical Circulatory Support Research Network."

Our news journalists obtained a quote from the research from Heart and Vascular Institute, "Groups were assigned based on age: >= 70 years ('older patients') and <70 years. The primary outcome was survival at one-year based on age grouping. Compared with younger patients (54.3 +/- 11.2 y; n = 986), older patients (73.4 +/- 3.0 y) constituted only 14% of LVAD implants. Older patients had similar rates of device thrombosis (P = .47) and stroke (P = .44), but survival-free of gastrointestinal bleeding (GIB) at 1 year was lower compared with younger patients (58% vs 69%; P< .01). Unadjusted survival at 1 year in older patients was 75% compared with 84% in younger patients, and at 2 years 65% versus 73% (P = .18). Age >= 70 years was not associated with increased mortality (adjusted hazard ratio [aHR] 0.94, 95% confidence interval [CI] 0.70-1.26; P = .67). Preoperative creatinine (aHR 1.57, 95% CI: 1.30-1.89, P< .0001), bilirubin (aHR 1.22, 95% CI 1.05-1.42; P = .010), and ischemic cardiomyopathy (aHR 1.43, 95% CI 1.11-1.84; P = .005) portended increased risk of death. In older patients, the only predictor of mortality was creatinine (HR 2.1, 95% CI 1.2-3.4; P = .007). Creatinine >= 1.4 mg/dL was associated with a 1-year survival of 65%, compared with 84% when the creatinine was <1.4 mg/dL (P = .009). Age >70 years is an important consideration when assessing LVAD risk, but other correlates may be more predictive of LVAD survival. Older patients without renal dysfunction have survival similar to younger patients."

According to the news editors, the research concluded: "Older patients should be counseled about age-correlated risks, including higher rates of GIB."

**Oncology - Thyroid Cancer**

**Recent Findings from Hebei Medical University Provides New Insights into Thyroid Cancer (Iodine-131: An Effective Method for Treating Lymph Node Metastases of Differentiated Thyroid Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Thyroid Cancer are discussed in a new report. According to news reporting originating from Shijiazhuang, People's Republic of China, by NewsRx correspondents, research stated, "The aim of this study was to assess the efficacy of radioactive iodine-131 (I-131) therapy for lymph node metastasis of differentiated thyroid cancer (DTC) and to identify influential factors using univariate and multivariate analyses to determine if identified factors influence the efficacy of treatment. This study included a retrospective review of 218 patients with histologically proven DTC in the post-operation stage."

Our news editors obtained a quote from the research from Hebei Medical University, "After thyroid tissue remnants were eliminated with I-131 therapy, patients' lymph node status was confirmed by ultrasound and by I-131 whole body scan regarding lymph node metastasis, and then patients were treated with I-131 as appropriate. The treatment efficacy was assessed and possible influencing factors were identified using univariate and multivariate analyses. The total effective rate of I-131 therapy was 88.07% (including a cure rate of 20.64% and an improvement rate of 67.43%). The non-effective rate was 11.93%. Of the total 406 lymph nodes of 218 patients, 319 lymph nodes (78.57%) were judged to be effectively cured, including 133 (32.75%) lymph nodes that were totally eliminated and 186 (45.82%) lymph nodes that shrunk. Eighty-seven (21.43%) of the 406 lymph nodes had no obvious change. No lymph nodes were found to be in a continuously enlarging state. Distant metastasis, size of lymph node, human serum thyroglobulin (HTG) level, and condition of thyroid remnants ablation were identified as the independent factors influencing the efficacy of treatment using univariate and multivariate analyses. The use of I-131 is a promising treatment for lymph node metastasis of DCT."

According to the news editors, the research concluded: "Distant metastasis, size of lymph nodes, HTG level, and condition of thyroid remnant ablation were independent factors influencing the treatment efficacy."

For more information on this research see: Iodine-131: An Effective Method for Treating Lymph Node Metastases of Differentiated Thyroid Cancer. *Medical Science Monitor*, 2016;22():4924-4928. *Medical Science Monitor* can be contacted at: Int Scientific Literature,

Ischemia

Recent Findings from Hokkaido University Has Provided New Information about Ischemia (Hydrogen Gas Ameliorates Hepatic Reperfusion Injury After Prolonged Cold Preservation in Isolated Perfused Rat Liver)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Ischemia. According to news reporting out of Hokkaido, Japan, by NewsRx editors, research stated, "Hydrogen gas reduces ischemia and reperfusion injury (IRI) in the liver and other organs. However, the precise mechanism remains elusive."

Our news journalists obtained a quote from the research from Hokkaido University, "We investigated whether hydrogen gas ameliorated hepatic I/R injury after cold preservation. Rat liver was subjected to 48-h cold storage in University of Wisconsin solution. The graft was reperfused with oxygenated buffer with or without hydrogen at 378 for 90 min on an isolated perfusion apparatus, comprising the H-2(+) and H-2 (-) groups, respectively. In the control group (CT), grafts were reperfused immediately without preservation. Graft function, injury, and circulatory status were assessed throughout the perfusion. Tissue samples at the end of perfusion were collected to determine histopathology, oxidative stress, and apoptosis. In the H-2(-) group, IRI was indicated by a higher aspartate aminotransferase (AST), alanine aminotransferase (ALT) leakage, portal resistance, 8-hydroxy-2-deoxyguanosine-positive cell rate, apoptotic index, and endothelial endothelin-1 expression, together with reduced bile production, oxygen consumption, and GSH/GSSG ratio (vs. CT). In the H-2(+) group, these harmful changes were significantly suppressed [vs. H-2(-)]."

According to the news editors, the research concluded: "Hydrogen gas reduced hepatic reperfusion injury after prolonged cold preservation via the maintenance of portal flow, by protecting mitochondrial function during the early phase of reperfusion, and via the suppression of oxidative stress and inflammatory cascades thereafter."

For more information on this research see: Hydrogen Gas Ameliorates Hepatic Reperfusion Injury After Prolonged Cold Preservation in Isolated Perfused Rat Liver. Artificial Organs, 2016;40(12):1128-1136. Artificial Organs can be contacted at: Wiley-Blackwell, 111
Recent Findings from Hokkaido University Hospital Has Provided New Information about Kidney Transplants (Successful treatment with foscarnet for ganciclovir-resistant cytomegalovirus infection in a kidney transplant recipient: A case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Transplant Medicine - Kidney Transplants have been presented. According to news reporting originating from Hokkaido, Japan, by NewsRx correspondents, research stated, "Cytomegalovirus (CMV) infection is the most common infectious complication following solid organ transplantation. Ganciclovir (GCV)-resistant CMV infection may be fatal, and is difficult to treat while avoiding allograft rejection."

Our news editors obtained a quote from the research from Hokkaido University Hospital, "A 31-year-old woman received a second ABO-incompatible kidney transplant, from her father. Induction therapy consisted of basiliximab and rituximab followed by maintenance immunosuppression with tacrolimus, mycophenolate mofetil, and methylprednisolone. Her CMV serostatus was D+/R- at second transplant and she received prophylactic low-dose valganciclovir (VGCV). BK polyoma virus nephropathy (BKVN) developed 7 months after transplant concurrent with CMV hepatitis and retinitis. VGCV was increased to a therapeutic dose combined with reduced immunosuppression with minimal methylprednisolone (2mg/day) and everolimus (0.5mg/day). However, pp65 antigenaemia continued to increase for 6 weeks. Her CMV was defined as ganciclovir (GCV)-resistant. Foscarnet was therefore administered and her CMV disease resolved within 2 weeks. Kidney allograft dysfunction developed 9 months after transplant, and graft biopsy showed tubulointerstitial injury with crystal deposition suggesting foscarnet nephrotoxicity, with no findings of BKVN or rejection. Kidney function recovered after cessation of foscarnet and the patient had good graft function 18 months after transplant. This case demonstrates the successful use of foscarnet to treat GCV-resistant CMV infection after ABO-incompatible kidney transplant complicated with BKVN, without acute allograft rejection."

According to the news editors, the research concluded: "This case further highlights the need to establish appropriate management for CMV D+/R- patients to avoid the acquisition of GCV-resistant gene mutations."

The news editors report that additional information may be obtained by contacting D. Iwami, Hokkaido Univ Hosp, Dept. of Urol, Sapporo, Hokkaido, Japan. Additional authors for this research include Y. Ogawa, H. Fujita, K. Morita, H. Sasaki, Y. Oishi, H. Higuchi, K. Hatanaka and N. Shinohara.

**Gram-Negative Bacteria - Salmonella**

**Recent Findings from Hong Kong Polytechnic University Has Provided New Information about Salmonella (IncHI2 Plasmids Are the Key Vectors Responsible for oqxAB Transmission among Salmonella Species)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Salmonella have been published. According to news reporting out of Hong Kong, People's Republic of China, by NewsRx editors, research stated, "This study reported and analyzed the complete sequences of two oqxAB-bearing IncHI2 plasmids harbored by a clinical Salmonella enterica serovar Typhimurium strain and an S. Indiana strain of animal origin, respectively."

Financial support for this research came from FHB | Health and Medical Research Fund (HMRF).

Our news journalists obtained a quote from the research from Hong Kong Polytechnic University, "In particular, pA3T recovered from S. Indiana comprised the resistance determinants oqxAB, aac(6') Ib-cr, fosA3, and bla(CTX-M-14)."

According to the news editors, the research concluded: "Further genetic screening of 63 oqxAB-positive Salmonella isolates revealed that the majority carried IncHI2 plasmids, confirming that such plasmids play a pivotal role in dissemination of oqxAB in Salmonella spp."

For more information on this research see: IncHI2 Plasmids Are the Key Vectors Responsible for oqxAB Transmission among Salmonella Species. *Antimicrobial Agents and Chemotherapy*, 2016;60(11):6911-6915. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Cardiology
Recent Findings from Huazhong University of Science and Technology Has Provided New Information about Cardiology (Inhibitory effects of hesperetin on Nav1.5 channels stably expressed in HEK 293 cells and on the voltage-gated cardiac sodium...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiology. According to news reporting out of Wuhan, People's Republic of China, by NewsRx editors, research stated, "Voltage-gated sodium channels composed of a pore-forming alpha subunit and auxiliary beta subunits are responsible for the upstroke of the action potential in cardiac myocytes. The pore-forming subunit of the cardiac sodium channel Nav1.5, which is encoded by SCN5A, is the main ion channel that conducts the voltage-gated cardiac sodium current (I-Na) in cardiac cells."

Our news journalists obtained a quote from the research from the Huazhong University of Science and Technology, "The current study sought to investigate the inhibitory effects of hesperetin on human cardiac Nav1.5 channels stably expressed in human embryonic kidney 293 (HEK 293) cells and on the voltage-gated cardiac sodium current (I-Na) in human atrial myocytes. The effects of hesperetin on human cardiac Nav1.5 channels expressed in HEK 293 cells and on cardiac Na+ currents in human atrial myocytes were examined through whole-cell patch-clamp techniques. Nav1.5 currents were potently and reversibly suppressed in a concentration-and voltage-dependent manner by hesperetin, which exhibited an IC50 of 62.99 μmol/L. Hesperetin significantly and negatively shifted the voltage-dependent activation and inactivation curves. Hesperetin also markedly decelerated Nav1.5 current inactivation and slowed the recovery from Nav1.5 channel inactivation. The hesperetin-dependent blockage of Nav1.5 currents was frequency-dependent. Hesperetin also potently and reversibly inhibited Na+ current (I-Na) in human atrial myocytes, consistently with its effects on Nav1.5 currents in HEK 293 cells. Hesperetin is a potent inhibitor of I-Na in human atrial myocytes and Nav1.5 channels expressed in human embryonic kidney 293 cells."

According to the news editors, the research concluded: "Hesperetin probably functions by blocking the open state and the inactivated state of these channels."

For more information on this research see: Inhibitory effects of hesperetin on Nav1.5 channels stably expressed in HEK 293 cells and on the voltage-gated cardiac sodium...

**Autoimmune Diseases and Conditions - Behcet…**

**Recent Findings from Imperial College Has Provided New Information about Behcet Disease (A low balance between microparticles expressing tissue factor pathway inhibitor and tissue factor is associated with thrombosis in Behcet’s Syndrome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Behcet Disease. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Thrombosis is common in Behcet's Syndrome (BS), and there is a need for better biomarkers for risk assessment. As microparticles expressing Tissue Factor (TF) can contribute to thrombosis in preclinical models, we investigated whether plasma microparticles expressing Tissue Factor (TF) are increased in BS."

Our news editors obtained a quote from the research from Imperial College, "We compared blood plasma from 72 healthy controls with that from 88 BS patients (21 with a history of thrombosis (Th+) and 67 without (Th-). Using flow cytometry, we found that the total plasma MP numbers were increased in BS compared to HC, as were MPs expressing TF and Tissue Factor Pathway Inhibitor (TFPI) (all p< 0.0001). Amongst BS patients, the Th+ group had increased total and TF positive MP numbers (both p<= 0.0002) compared to the Th-group, but had a lower proportion of TFPI positive MPs (p < 0.05). Consequently, the ratio of TFPI positive to TF positive MP counts (TFPI/TF) was significantly lower in Th+ versus Th-BS patients (p = 0.0002), and no patient with a TFPI/TF MP ratio > 0.7 had a history of clinical thrombosis."

According to the news editors, the research concluded: "TF-expressing MP are increased in BS and that an imbalance between microparticulate TF and TFPI may predispose to thrombosis."

For more information on this research see: A low balance between microparticles expressing tissue factor pathway inhibitor and tissue factor is associated with thrombosis in Behcet's Syndrome. *Scientific Reports*, 2016;6():1-12. *Scientific Reports* can be contacted at:
Recent Findings from Inha University School of Medicine Has Provided New Data on Immunoproteins (Antiallergic effects of anti-interleukin-33 are associated with suppression of immunoglobulin light chain and inducible nitric oxide synthase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immunology - Immunoproteins is the subject of a report. According to news reporting originating from Incheon, South Korea, by NewsRx correspondents, research stated, "We aimed to find novel genes that are significantly induced in allergic mice and that are significantly downregulated with anti-interleukin (IL) 33 treatment. Thirty-six mice were allocated into each of group A (intraperitoneal [i.p.]) sensitized and intranasally challenged to saline solution), group B (sensitized and challenged to ovalbumin), group C (sensitized and challenged with ovalbumin, and null treatment with i.p. saline solution), and group D (sensitized and challenged with ovalbumin, and treatment with anti-IL-33 i.p. injection)."

Our news editors obtained a quote from the research from the Inha University School of Medicine, "We counted the number of nose-scratching in 10 minutes, serum ovalbumin-specific immunoglobulin E (IgE), and titers of cytokines (IL-1, IL-4, IL-5, IL-10, IL-13) in bronchoalveolar lavage fluid. By using one whole lung from each mouse, we performed microarray analysis and real-time polymerase chain reaction. group D showed a significantly reduced nose-scratching events and lower serum ovalbumin-specific IgE compared with groups B and C. All the cytokines in the bronchoalveolar lavage fluid were significantly decreased after anti-IL-33 treatment. Microarray analysis revealed that group B (immunoglobulin free light chain [IgFLC], 89.1 times; nitric oxide synthase [NOS] 2, 11.5 times) and group C (IgFLC, 141.6 times; NOS2, 11.7 times) had significantly increased expression of IgFLC and NOS2 genes compared with group A. After anti-IL-33 treatment, group D showed significantly decreased expression of both IgFLC (49.3 times) and NOS2 (6.5 times). In real-time polymerase chain reaction, groups B and C had significantly increased expression of these genes (IgFLC, 10.4 times and 29 times, respectively; NOS2, 3.8 times and 4.5 times, respectively). After
treatment, group D showed significantly decreased expression of IgFLC (5.0 times) and NOS2 (2.5 times).

According to the news editors, the research concluded: "The antiallergic effect of anti-IL-33 can be explained by suppression of IgFLC and NOS2 in a murine model of allergic rhinitis."

The news editors report that additional information may be obtained by contacting C.S. Park, Dept. of Pharmacology, Hypoxia-Related Disease Research Center, Inha Research Institute for Medical Sciences, Inha University College of Medicine, Incheon, South Korea. Additional authors for this research include T.Y. Jang, M.J. Heo, A.Y. Jung and Y.H Kim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2500/ajra.2015.29.4251. This DOI is a link to an online electronic document that is either free or for purchase.

Immunology - Antigens

Recent Findings from Inovio Pharmaceuticals Provides New Insights into Antigens (Augmentation of cellular and humoral immune responses to HPV16 and HPV18 E6 and E7 antigens by VGX-3100)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immunology - Antigens is now available. According to news originating from Plymouth Meeting, Pennsylvania, by NewsRx correspondents, research stated, "We have previously demonstrated the immunogenicity of VGX-3100, a multicomponent DNA immunotherapy for the treatment of Human Papillomavirus (HPV) 16/18-positive CIN2/3 in a phase 1 clinical trial. Here, we report on the ability to boost immune responses with an additional dose of VGX-3100."

Our news journalists obtained a quote from the research from Inovio Pharmaceuticals, "Patients completing our initial phase 1 trial were offered enrollment into a follow on trial consisting of a single boost dose of VGX-3100. Data show both cellular and humoral immune responses could be augmented above pre-boost levels, including the induction of interferon (IFN), production, tumor necrosis factor (TNF) a production, CD8+ T cell activation and the synthesis of lytic proteins. Moreover, observation of antigen-specific regulation of immune-related gene transcripts suggests the induction of a proinflammatory response following the boost. Analysis of T cell receptor (TCR) sequencing suggests the localization of putative HPV-specific T cell clones to the cervical mucosa, which underscores the putative mechanism of action of lesion regression and HPV16/18 elimination noted in our double-blind placebo-controlled phase 2B trial. Taken together, these data indicate that VGX-3100 drives the induction of robust cellular and humoral immune responses that can be
augmented by a fourth 'booster' dose."

According to the news editors, the research concluded: "These data could be important in the scope of increasing the clinical efficacy rate of VGX-3100."

For more information on this research see: Augmentation of cellular and humoral immune responses to HPV16 and HPV18 E6 and E7 antigens by VGX-3100. Molecular Therapy-Oncolytics, 2016;3(1):1-11. Molecular Therapy-Oncolytics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

Drugs and Therapies - Ketoprofen Therapy

Recent Findings from Institute of Research and Development Has Provided New Information about Ketoprofen Therapy (Solid State Interactions Between Ketoprofen and Excipients in Solid Dosage Forms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Ketoprofen Therapy is the subject of a report. According to news reporting originating in Cluj Napoca, Romania, by NewsRx journalists, research stated, "This study assesses the solid-solid interactions between the commercial form of Ketoprofen (KET), a non steroidal anti-inflammatory drug of the propionic acid class, and several widely used pharmaceutical excipients."

The news reporters obtained a quote from the research from the Institute of Research and Development, "The work was carried out on drug-excipient mixtures, in 1:1 (w:w) ratio, blended in an agate mortar at room temperature. The compatibility/incompatibility of KET with the proposed excipients was highlighted by the most commonly used analytic methods: differential scanning calorimetry (DSC), Fourier transformed infrared spectroscopy (FT-IR) and powder X-ray diffraction (PXRD)."

According to the news reporters, the research concluded: "The interactions between KET and three of the excipients, namely Macrogol 6000, magnesium stearate dehydrate and lactose monohydrate were evidenced by DSC and further confirmed by FT-IR and PXRD analysis."

For more information on this research see: Solid State Interactions Between Ketoprofen and Excipients in Solid Dosage Forms. Revista De Chimie, 2016;67(10):2043-2048. Revista De Chimie can be contacted at: Chiminform Data S A, Calea Plevnei Nr 139, Sector 6, Bucharest R-77131, Romania.

Our news correspondents report that additional information may be obtained by
Recent Findings from International University Has Provided New Information about Thrombocytopenia (Linezolid-Induced Thrombocytopenia Is Caused by Suppression of Platelet Production via Phosphorylation of Myosin Light Chain 2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematologic Diseases and Conditions - Thrombocytopenia is the subject of a report. According to news reporting out of Tochigi, Japan, by NewsRx editors, research stated, "Linezolid (LZD) is an antimicrobial that is commonly used for treatment of vancomycin-resistant Enterococci and methicillin-resistant Staphylococcus aureus infections. However, the development of thrombocytopenia, one of the most frequent adverse side effects of this antimicrobial, can lead to discontinuation of LZD treatment."

Our news journalists obtained a quote from the research from International University, "While clinical studies indicate that risk factors for the development of LZD-induced thrombocytopenia include treatment for >14 consecutive days, renal dysfunction, and chronic liver disease, the fundamental mechanism governing the pathogenesis of this disorder remains unclear. In this study, we aimed to elucidate the mechanism of LZD-induced thrombocytopenia by investigating the impact of LZD treatment on platelet destruction and production using rat platelet-rich plasma (PRP) and human immortalized cell lines, respectively. Compared to the control population, an increase in lactate dehydrogenase release was not detected upon exposure of rat PRP to varying concentrations of LZD, indicating that this compound is not cytotoxic towards platelets. Meanwhile, LZD treatment resulted in a significant dose-dependent increase in the proliferation of HEL human erythroleukemia and MEG-01 human megakaryoblast cells in vitro, but did not influence the differentiation of these cell lines. Lastly, LZD treatment yielded elevated levels of phosphorylation of myosin light chain 2 (MLC2), which regulates platelet release, in MEG-01 cells. Based on these results, we speculate that LZD induces thrombocytopenia by promoting MLC2 phosphorylation and thereby suppressing the release of platelets from mature megakaryocytes."

According to the news editors, the research concluded: "These findings provide the first insight into the mechanism of LZD-mediated thrombocytopenia and may facilitate the development of strategies to treat and/or prevent this disease."

Recent Findings from Iowa State University Has Provided New Information about Obesity (More efficient, perhaps, but at what price? Pleasure and enjoyment responses to high-intensity interval exercise in low-active women with obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting out of Ames, Iowa, by NewsRx editors, research stated, "Fewer than 1.5% of women with obesity in the USA are physically active at recommended levels. High-intensity interval exercise (HIIE) has been proposed as a possible solution to the problem of low activity, based on the dual promise of accelerating the accrual of benefits while reducing the time commitment."

Our news journalists obtained a quote from the research from Iowa State University, "However, concerns have been raised about the appeal and sustainability of HIIE. The purpose of this study was to compare during-exercise affective valence and post-exercise enjoyment in response to a bout of HIIE and a longer, isocaloric bout of moderate-intensity continuous exercise (MICE). Within-subjects experiment. Low-active women with obesity (N = 24) completed one bout of HIIE (3-min warm-up, four 3-min intervals of recumbent cycling at 115% of Watts at the ventilatory threshold, four 2-min periods of active recovery at 85% of Watts at the ventilatory threshold, 5-min cool-down) and one bout of MICE (3-min warm-up, 25 min of recumbent cycling at 90% of Watts at the ventilatory threshold, 5-min cool down) in counterbalanced order. The Feeling Scale (FS) was administered during exercise and the Physical Activity Enjoyment Scale (PACES) was administered after cool-down. Differences were found for both FS (condition by time interaction: p< 0.001, eta(2) = 0.27) and PACES (p = 0.04, d = -0.38), with both outcomes favoring MICE."

According to the news editors, the research concluded: "The lower pleasure and enjoyment associated with HIIE compared to MICE underscore the importance of considering not only physiological adaptations but also the appeal and sustainability of HIIE for low-active women with obesity."

For more information on this research see: More efficient, perhaps, but at what price? Pleasure and enjoyment responses to high-intensity interval exercise in low-active women with obesity. Psychology of Sport and Exercise, 2017;28():1-10. Psychology of Sport and Exercise can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam,
Recent Findings from J. Gotte and Co-Researchers Yields New Information on Prostheses (Redo Aortic Valve Implantation After Full Root Replacement Using A Sutureless Valve Prosthesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Prostheses. According to news reporting originating from Stuttgart, Germany, by NewsRx correspondents, research stated, "We report the case of a 83-year-old man who had undergone a full root replacement with a stentless bio-prosthesis 15 years earlier. He was now diagnosed with severe aortic valve regurgitation secondary to leaflet degeneration, moderate mitral regurgitation, and single-vessel coronary artery disease."

Our news editors obtained a quote from the research, "To reduce cross-clamp time and technical difficulties a sutureless aortic prosthesis was used. His surgery and postoperative course were uneventful."

According to the news editors, the research concluded: "This is the first report of the successful use of a sutureless aortic valve prosthesis in a patient after bioprosthetic full root replacement who required additional mitral repair and coronary artery bypass surgery."

The news editors report that additional information may be obtained by contacting J. Gotte, Sana Cardiac Surg Stuttgart GmbH, D-70174 Stuttgart, Germany. Additional authors for this research include W. Hemmer, D. Roser, M. Liebrich and N. Doll.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.01.067. This DOI is a link to an online electronic document that is either free or for purchase.

Anions

Recent Findings from J.R. Condon and Co-Researchers Yields New Information on Anions (Inhibition of cancer cell mitosis by reducing the availability of phosphate)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Anions is now available. According to news originating from London, United Kingdom, by NewsRx editors, the research stated, "The addition of phosphate groups is an essential requirement for the proper functioning of cyclin and cyclin dependent kinase which control various stages in the mitotic division of cancer cells. Thus limiting the availability of phosphate is likely to interfere with the metabolism of rapidly growing malignant cells."

Our news journalists obtained a quote from the research, "The human hormone glucagon and the anti metabolite mithramycin reduce serum phosphate by increasing phosphaturia and are both very effective in treating Paget's disease of bone, a precancerous condition. In this disorder large doses of glucagon given intravenously relieve bone pain and cause serum phosphate and alkaline phosphatase as well as urine hydroxyproline to fall, indicating a marked reduction in bone turnover. A constant iv infusion of glucagon was given to each of three patients all of whom had secondary malignant bone deposits. Two of the patients had primary prostate cancer and one had a squamous cell lung tumour. All three patients had relief of bone pain and a fall in serum alkaline phosphatase. Serum acid phosphatase also fell in the two patients with prostate cancer. It is proposed that the marked drop in serum phosphate due to glucagon causes intracellular phosphate to fall. This in turn disrupts the addition and removal of phosphate groups essential for the proper functioning of cyclin and cyclin dependent kinase. These two proteins control the transition from G1 to S (DNA synthesis phase) and G2 to M (mitotic phase) in the dividing cycle of malignant cells. Depriving a tumour of an essential ingredient used in phosphorylation reactions will disrupt its growth. It is also proposed that, by the same mechanism, glucagon induced hypophosphataemia renders malignant cells more sensitive to established chemotherapeutic agents and radiation waves. If this hypothesis proves to be correct, lowering intracellular phosphate may become an useful tool in cancer therapy."

According to the news editors, the research concluded: "However extensive studies are necessary to determine whether mitosis in cancer cells can be advantageously disrupted by glucagon induced hypophosphataemia."

The news correspondents report that additional information may be obtained from J.R. Condon, Greenwich Dist Hosp, London, United Kingdom.

Musculoskeletal Diseases and Conditions ...

Recent Findings from Jichi Medical University Provides New Insights into Duchenne Muscular Dystrophy (Low Six4 and Six5 gene dosage improves dystrophic phenotype and prolongs life span of mdx mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Musculoskeletal Diseases and Conditions - Duchenne Muscular Dystrophy are discussed in a new report. According to news originating from Tochigi, Japan, by NewsRx correspondents, research stated, "Muscle regeneration is an important process for skeletal muscle growth and recovery. Repair of muscle damage is exquisitely programmed by cellular mechanisms inherent in myogenic stem cells, also known as muscle satellite cells."

Funders for this research include Ministry of Education, Culture, Sports, Science, and Technology, Ichiro Kanehara Foundation for the Promotion of Medical Sciences and Medical Care, Nakatomi Foundation.

Our news journalists obtained a quote from the research from Jichi Medical University, "We demonstrated previously the involvement of homeobox transcription factors, SIX1, SIX4 and SIX5, in the coordinated proliferation and differentiation of isolated satellite cells in vitro. However, their roles in adult muscle regeneration in vivo remain elusive. To investigate SIX4 and SIX5 functions during muscle regeneration, we introduced knockout alleles of Six4 and Six5 into an animal model of Duchenne Muscular Dystrophy (DMD), mdx (Dmd(mdx)/Y) mice, characterized by frequent degeneration-regeneration cycles in muscles. A lower number of small myofibers, higher number of thick ones and lower serum creatine kinase and lactate dehydrogenase activities were noted in 50-week-old Six4(+/-)5(+/-)Dmd(mdx)/Y mice than Dmd(mdx)/Y mice, indicating improvement of dystrophic phenotypes of Dmd (mdx)/Y mice. Higher proportions of cells positive for MYOD1 and MYOG (markers of regenerating myonuclei) and SIX1 (a marker of regenerating myoblasts and newly regenerated myofibers) in 12-week-old Six4(+/-)5(+/-)Dmd(mdx)/Y mice suggested enhanced regeneration, compared with Dmd mdx /Y mice. Although grip strength was comparable in Six4(+/-)5(+/-) Dmd(mdx)/Y and Dmd(mdx)/Y mice, treadmill exercise did not induce muscle weakness in Six4(+/-)5(+/-)Dmd(mdx)/Y mice, suggesting higher regeneration capacity. In addition, Six4 (+/-)5(+/-)Dmd(mdx)/Y mice showed 33.8% extension of life span."

According to the news editors, the research concluded: "The results indicated that low Six4 and Six5 gene dosage improved dystrophic phenotypes of Dmd(mdx)/Y mice by enhancing muscle regeneration, and suggested that SIX4 and SIX5 are potentially useful de novo targets in therapeutic applications against muscle disorders, including DMD."

For more information on this research see:  Low Six4 and Six5 gene dosage

**Cardiovascular Research**

**Recent Findings from Johns Hopkins University Has Provided New Information about Cardiovascular Research (Cardiovascular implantable electronic device function and longevity at autopsy: an underestimated resource)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Research have been published. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "The feasibility and safety of postmortem cardiovascular implantable electronic device (CIED; pacemaker or defibrillator) retrieval for reuse has been shown. To date, studies indicate a low yield of reusable postmortem CIEDs (17%-30%)."

The news reporters obtained a quote from the research from Johns Hopkins University, "The purpose of this study was to test the hypothesis that a higher rate of reusable CIEDs would be identified upon postmortem retrieval when an institutional protocol for systematic and routine acquisition, interrogation, reprogramming, and manufacturer analysis was used. Over a 6-year period, all subjects referred for autopsy underwent concomitant CIED pulse generator retrieval and enrollment in the Johns Hopkins Post-Mortem CIED Registry. CIEDs were interrogated, reprogrammed, and submitted for manufacturer analysis. In total, 84 autopsies had CIEDs (37 pacemakers, 47 implantable cardioverter-defibrillators). CIEDs were implanted 2.84 +/- 2.32 years before death, with 30% implanted <1 year before death. Overall, CIED postmortem longevity was 4.79 +/- 3.41 years, with 56% demonstrating longevity >= 4 years (this group had an estimated mean longevity of 7.37 +/- 2.44 years). Manufacturer analyses uncovered 2 falsely triggered elective replacement indication alerts, confirmed 5 correctly triggered elective replacement indication alerts, identified a recalled pacemaker, and verified that a defibrillator had undergone nonprogrammable hard reset. When a protocol for systematic and routine postmortem CIED retrieval, interrogation, reprogramming, and analysis was used, we noted that >60% of pacemakers and >50% of defibrillators demonstrated normal functional status with projected longevities >7 years on average."

According to the news reporters, the research concluded: "Formation of a national hospital-based 'CIED donor network' would facilitate larger scale charitable efforts in
underserved countries."

Our news correspondents report that additional information may be obtained by contacting S.K. Sinha, Johns Hopkins University, Sch Med, Div Cardiol, Baltimore, MD, United States. Autoimmune Diseases and Conditions - Rheumatoid...

Recent Findings from Johns Hopkins University Has Provided New Information about Rheumatoid Arthritis (Measuring transaminases in patients with rheumatoid arthritis on weekly methotrexate: does timing of blood testing matter?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Autoimmune Diseases and Conditions - Rheumatoid Arthritis. According to news reporting originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "The change in transaminase levels over a single week during therapy with methotrexate (MTX) has not been investigated or reported to date. In clinical practice, it is common to observe abnormal transaminase levels upon routine blood work for toxicity monitoring."

Financial supporters for this research include The Johns Hopkins Arthritis Center Discovery Fund, National Institute of Arthritis and Musculoskeletal and Skin Diseases (NIAMS).

Our news editors obtained a quote from the research from Johns Hopkins University, "Many have suggested that such lab abnormalities can sometimes be attributed to sampling blood for toxicity monitoring proximately following MTX dosing. The aim of our study was to evaluate changes in transaminase levels (AST/ALT) over 1 week after MTX administration in rheumatoid arthritis (RA) patients. In this small proof of concept study, we evaluated 13 patients with RA taking stable doses of methotrexate and background medications (e.g., NSAIDs and prednisone), but no other disease-modifying anti-rheumatic drugs (DMARDs). All patients were on a stable dose of folic acid. Patients received their usual doses of MTX administered at a specified time, and then sequential blood samples were obtained over the course of 7 days. Peripheral blood was obtained at each time point to measure serum transaminases. We did not observe any significant change in sequential transaminases over 1 week in relationship to MTX.
administration. It is possible that MTX therapy alone does not lead to significant weekly transaminase variations, contrary to our clinical expectations."

According to the news editors, the research concluded: "The addition of other medications (i.e., NSAIDs) to stable MTX regimen may result in transaminase abnormalities."

The news editors report that additional information may be obtained by contacting C.A. Mecoli, Johns Hopkins Div Rheumatol, Baltimore, MD 21224, United States. Additional authors for this research include N.G. Delev and C.O. Bingham.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s10067-016-3361-3. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Human Serum Albumin Therapy

Recent Findings from L. Sulkowski and Co-Researchers Yields New Information on Human Serum Albumin Therapy (Characteristics of the Protoporphyrin IX Binding Sites on Human Serum Albumin Using Molecular Docking)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Human Serum Albumin Therapy is now available. According to news reporting originating in Czestochowa, Poland, by NewsRx journalists, research stated, "Human serum albumin (HSA) is the main plasma protein responsible for a distribution of drugs in the human circulatory system. The binding to HSA is one of the factors that determines both the pharmacological actions and the side effects of drugs."

The news reporters obtained a quote from the research, "The derivative of heme, protoporphyrin IX (PpIX), is a hydrophobic photosensitizer widely used in photodynamic diagnosis and therapy of various malignant disorders. Using absorption and fluorescence spectroscopy, it has been demonstrated that PpIX forms complexes with HSA. Its binding sites in the tertiary structure of HSA were found in the subdomains IB and IIA. PpIX binds to HSA in one class of binding sites with the association constant of 1.68 x 10(5) M-1 and 2.30 x 10(5) M-1 for an excitation at wavelength lambda(ex) = 280 nm and 295 nm, respectively. The binding interactions between HSA and PpIX have been studied by means of molecular docking simulation using the CLC Drug Discovery Workbench (CLC DDWB) computer program. PpIX
creates a strong 'sandwich-type' complex between its highly conjugated porphine system and aromatic side chains of tryptophan and tyrosine."

According to the news reporters, the research concluded: "In summary, fluorescent studies on binding interactions between HSA and PpIX have been confirmed by the results of computer simulation."

For more information on this research see: Characteristics of the Protoporphyrin IX Binding Sites on Human Serum Albumin Using Molecular Docking. *Molecules*, 2016;21 (11):1507-1525. *Molecules* can be contacted at: Mdpï Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. **Oncology**

**Recent Findings from L. Zitvogel and Co-Authors Yields New Data on Oncology (Mouse models in oncoimmunology)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology are presented in a new report. According to news reporting originating from Villejuif, France, by NewsRx correspondents, research stated, "Fundamental cancer research and the development of efficacious antineoplastic treatments both rely on experimental systems in which the relationship between malignant cells and immune cells can be studied. Mouse models of transplantable, carcinogen-induced or genetically engineered malignancies - each with their specific advantages and difficulties - have laid the foundations of oncoimmunology."

Our news editors obtained a quote from the research, "These models have guided the immunosurveillance theory that postulates that evasion from immune control is an essential feature of cancer, the concept that the long-term effects of conventional cancer treatments mostly rely on the reinstatement of anticancer immune responses and the preclinical development of immunotherapies, including currently approved immune checkpoint blockers. Specific aspects of pharmacological development, as well as attempts to personalize cancer treatments using patient-derived xenografts, require the development of mouse models in which murine genes and cells are replaced with their human equivalents. Such 'humanized' mouse models are being progressively refined to characterize the leukocyte subpopulations that belong to the innate and acquired arms of the immune system as they infiltrate human cancers that are subjected to experimental therapies."

According to the news editors, the research concluded: "We surmise that the ever-advancing refinement of murine preclinical models will accelerate the pace of therapeutic optimization in patients."

The news editors report that additional information may be obtained by contacting L. Zitvogel, GRCC, CICBT1428, Center Clin Invest Biotherapies Canc, F-94805 Villejuif, France. Additional authors for this research include J.M. Pitt, R. Daillere, M.J. Smyth and G. Kroemer.

Enzymes and Coenzymes - Esterases

Recent Findings from M.T. Certo and Co-Authors Provide New Insights into Esterases (Salient Features of Endonuclease Platforms for Therapeutic Genome Editing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - Esterases. According to news reporting originating from Cambridge, Massachusetts, by NewsRx correspondents, research stated, "Emerging gene-editing technologies are nearing a revolutionary phase in genetic medicine: precisely modifying or repairing causal genetic defects. This may include any number of DNA sequence manipulations, such as knocking out a deleterious gene, introducing a particular mutation, or directly repairing a defective sequence by site-specific recombination."

Our news editors obtained a quote from the research, "All of these edits can currently be achieved via programmable rare-cutting endonucleases to create targeted DNA breaks that can engage and exploit endogenous DNA repair pathways to impart site-specific genetic changes. Over the past decade, several distinct technologies for introducing site-specific DNA breaks have been developed, yet the different biological origins of these gene-editing technologies bring along inherent differences in parameters that impact clinical implementation."

According to the news editors, the research concluded: "This review aims to provide an accessible overview of the various endonuclease-based gene-editing platforms, highlighting the strengths and weakness of each with respect to therapeutic applications."

For more information on this research see: Salient Features of Endonuclease Platforms for Therapeutic Genome Editing. Molecular Therapy, 2016;24(3):422-9. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

The news editors report that additional information may be obtained by contacting M.T. Certo, bluebird bio, Cambridge, Massachusetts, United States.

Recent Findings from Mayo Clinic Provides New Insights into Arthroplasty (Survivorship After Primary Total Hip Arthroplasty in Solid-Organ Transplant Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Arthroplasty. According to news reporting originating in Rochester, Minnesota, by NewsRx journalists, research stated, "Although a growing number of primary total hip arthroplasties (THAs) are being performed on solid-organ transplant (SOT) recipients, long-term patient and implant surviviorships have not been well studied in contemporary transplant and arthroplasty practices. A total of 136 THAs (105 patients) with prior SOT were retrospectively reviewed from 2000 to 2013 at mean clinical follow-up of 5 years."

The news reporters obtained a quote from the research from Mayo Clinic, "The mean age was 59 years, with 39% being females. The most common SOT was renal (56%), followed by liver (24%). Patient mortality was 3.8% and 13.3% at 2 and 5 years, respectively. There were 9 revisions (6.6%), including 5 (4%) for deep periprosthetic infection. Implant survivorship free of any revision was 95% and 94% at 2 and 5 years, respectively. Transplant type or surgical indication did not significantly impact patient or implant survivorship. Compared with the general population, SOT patients undergoing THA have slightly higher mortality rates at 5 years."

According to the news reporters, the research concluded: "Implant survivorship free of revision was slightly lower than the general population, primarily due to an increased risk of periprosthetic joint infection."

Our news correspondents report that additional information may be obtained by contacting M.P. Abdel, Mayo Clinic, Dept. of Orthoped Surg, Rochester, MN 55905, United States. Additional authors for this research include C.K. Ledford, J.M. Statz, K.I. Perry, T.M. Mabry, A.D. Hanssen and M.P. Abdel.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.arth.2016.04.012. This DOI is a link to an online electronic document that is either free or for purchase.

Disease Attributes - Disease Progression

Recent Findings from Medical University Provide New Insights into Disease Progression (Biomarkers of evasive resistance predict disease progression in cancer patients treated with antiangiogenic therapies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Disease Attributes - Disease Progression is now available. According to news reporting from Innsbruck, Austria, by NewsRx journalists, research stated, "Numerous antiangiogenic agents are approved for the treatment of oncological diseases. However, almost all patients develop evasive resistance mechanisms against antiangiogenic therapies."

The news correspondents obtained a quote from the research from Medical University, "Currently no predictive biomarker for therapy resistance or response has been established. Therefore, the aim of our study was to identify biomarkers predicting the development of therapy resistance in patients with hepatocellular cancer (n=11), renal cell cancer (n=7) and non-small cell lung cancer (n=2). Thereby we measured levels of angiogenic growth factors, tumor perfusion, circulating endothelial cells (CEC), circulating endothelial progenitor cells (CEP) and tumor endothelial markers (TEM) in patients during the course of therapy with antiangiogenic agents, and correlated them with the time to antiangiogenic progression (aTTP). Importantly, at disease progression, we observed an increase of proangiogenic factors, upregulation of CEC/CEP levels and downregulation of TEMs, such as Robo4 and endothelial cell-specific chemotaxis regulator (ECSCR), reflecting the formation of torturous tumor vessels. Increased TEM expression levels tended to correlate with prolonged aTTP (ECSCR high=275 days vs. ECSCR low=92.5 days; p=0.07 and for Robo4 high=387 days vs. Robo4 low=90.0 days; p=0.08). This indicates that loss of vascular stabilization factors aggravates the development of antiangiogenic resistance. Thus, our observations confirm that CEP/CEC populations, proangiogenic cytokines and TEMs contribute to evasive resistance in antiangiogenic treated patients."

According to the news reporters, the research concluded: "Higher TEM expression during disease progression may have clinical and pathophysiological implications, however, validation of our results is warranted for further biomarker development."

For more information on this research see: Biomarkers of evasive resistance predict disease progression in cancer patients treated with antiangiogenic therapies. Oncotarget, 2016;7 (15):20109-23.

Our news journalists report that additional information may be obtained by contacting A. Pircher, Dept. of Internal Medicine V, Hematology and Oncology, Medical University Innsbruck, Innsbruck, Austria. Additional authors for this research include K. Johrer, F. Kocher, N. Steiner, I. Graziadei, I. Heidegger, R. Pichler, N. Leonhartsberger, C. Kremser, J. Kern, G. Untergasser, E. Gunsilius and W. Hilbe.

Nutritional and Metabolic Diseases and Conditions –…

Recent Findings from Memorial Hospital Provide New Insights into Acidosis (Chronic Metabolic Acidosis Activates Renal Tubular Sodium Chloride Cotransporter through Angiotension II-dependent WNK4-SPAK Phosphorylation Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Acidosis is now available. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "The mechanism by which chronic metabolic acidosis (CMA) regulates sodium (Na(+-))-chloride (Cl(-)) cotransporter (NCC) in the renal distal convoluted tubules remains unexplored. We examined the role of STE20/SPS1-related proline/alanine-rich kinase (SPAK) and with-no-lysin kinase 4 (WNK4) on expression of NCC in mouse models of CMA."

Our news editors obtained a quote from the research from Memorial Hospital, "CMA was induced by NH4Cl in wild type mice (WTA mice), SPAK, and WNK4 knockout mice. The quantities of Ncc mRNA, expression of total NCC, phosphorylated (p)-NCC, SPAK and WNK4 in the kidneys as well as NCC inhibition with hydrochlorothiazide and Na(+) balance were evaluated. Relative to WT mice, WTA mice had similar levels of Ncc mRNA, but increased expression of total and p-NCC, SPAK, and WNK4 and an exaggerated response to hydrochlorothiazide which could not be observed in SPAK or WNK4 knockout mice with CMA. In WTA mice, increased plasma renin activity, aldosterone and angiotensin II concentrations accompanied by a significantly negative Na(+) balance. High Na(+) diet abolished the enhanced NCC expression in WTA mice. Furthermore, an angiotensin II type 1 receptor blocker rather than a mineralocorticoid receptor antagonist exerted a marked inhibition on Na(+) reabsorption and NCC phosphorylation in WTA mice."

According to the news editors, the research concluded: "CMA increases WNK4-SPAK-dependent NCC phosphorylation and appears to be secondary to previous natriuresis with volume-dependent angiotensin II activation."

For more information on this research see: Chronic Metabolic Acidosis Activates Renal Tubular Sodium Chloride Cotransporter through Angiotension II-dependent WNK4-SPAK Phosphorylation Pathway. Scientific Reports, 2016;6():18360. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Recent Findings from Mt. Sinai Hospital Has Provided New Information about Lumpectomy [The MarginProbe (R) System: An Innovative Approach to Reduce the Incidence of Positive Margins Found After Lumpectomy]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Surgery - Lumpectomy is the subject of a report. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "The goal of lumpectomy surgery for breast cancer is to completely remove the tumor and have clear margins, reducing the rates of local recurrence. The MarginProbe ® System is a new device that can detect microscopic tumor cells at or close to the margin of the surgical resection intraoperatively, providing the surgeon with the ability to re-excite tissue at the time of surgery, reducing the need for a second surgery to obtain clear margins."

Our news journalists obtained a quote from the research from Mt. Sinai Hospital, "At a Glance  Lumpectomy surgery followed by radiation is the recommended treatment for early-stage breast cancer; however, successful lumpectomy is contingent upon cancer-free surgical margins. Current standards of intraoperative margin assessments include visual inspection, palpation, and imaging techniques, which are all less than reliable."

According to the news editors, the research concluded: "The MarginProbe ® System, used during lumpectomy surgery, has been shown to reduce the need for a second surgery because of positive tumor margins."

The news correspondents report that additional information may be obtained from S. Gola, Mt. Sinai Hospital, Preventable Admiss Care Team, New York, NY 10029, United States.

Gram-Negative Bacteria - Burkholderia

Recent Findings from N. Castanheira and Co-Authors Provide New Insights into Burkholderia (Plant growth-promoting Burkholderia species isolated from annual ryegrass in Portuguese soils)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria -
Burkholderia. According to news reporting out of Oeiras, Portugal, by NewsRx editors, research stated, "To search for culturable Burkholderia species associated with annual ryegrass in soils from natural pastures in Portugal, with plant growth-promoting effects. Annual ryegrass seedlings were used to trap Burkholderia from two different soils in laboratory conditions."

Funders for this research include Fundacao para a Ciencia e a Tecnologia, Programa Leonardo da Vinci, Fundecyt, Espana.

Our news journalists obtained a quote from the research, "A combined approach using genomic fingerprinting and sequencing of 16S rRNA and recA genes resulted in the identification of Burkholderia strains belonging to the species Burkholderia graminis, Burkholderia fungorum and the Burkholderia cepacia complex. Most strains were able to solubilize mineral phosphate and to synthesize indole acetic acid; some of them could produce siderophores and antagonize the phytopathogenic oomycete, Phytophthora cinnamomi. A strain (G2Bd5) of B. graminis was selected for gnotobiotic plant inoculation experiments. The main effects were the stimulation of root growth and enhancement of leaf lipid synthesis and turnover. Fluorescence in situ hybridization and confocal laser microscopy evidenced that strain G2Bd5 is a rhizospheric and endophytic colonizer of annual ryegrass. This work revealed that annual ryegrass can naturally associate with members of the genus Burkholderia. A novel plant growth promoting strain of B. graminis was obtained."

According to the news editors, the research concluded: "The novel strain belongs to the plant-associated Burkholderia cluster and is a promising candidate for exploitation as plant inoculant in field conditions."

Our news journalists report that additional information may be obtained by contacting N. Castanheira, Instituto Nacional de Investigacao Agraria e Veterinaria, IP, Oeiras, Portugal. Recent Findings from N. Matsuo and Co-Authors Yields New Data on Anorexia (Predictors of responses to corticosteroids for anorexia in advanced cancer patients: a multicenter prospective observational...
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Anorexia is the subject of a report. According to news reporting from Akita, Japan, by NewsRx journalists, research stated, "Although corticosteroids are widely used to relieve anorexia, information regarding the factors predicting responses to corticosteroids remains limited. The purpose of the study is to identify potential factors predicting responses to corticosteroids for anorexia in advanced cancer patients."

The news correspondents obtained a quote from the research, "Inclusion criteria for this multicenter prospective observational study were patients who had metastatic or locally advanced cancer and had an anorexia intensity score of 4 or more on a 0-10 Numerical Rating Scale (NRS). Univariate and multivariate analyses were conducted to identify the factors predicting ae yen >2-point reduction in NRS on day 3. Among 180 patients who received corticosteroids, 99 (55 %; 95 % confidence interval [CI], 47-62 %) had a response with ae yen >2-point reduction. Factors that significantly predicted responses were Palliative Performance Scale (PPS) > 40 and absence of drowsiness. In addition, factors that tended to be associated with ae yen >2-point reduction in NRS included PS 0-3, absence of diabetes mellitus, absence of peripheral edema, presence of lung metastasis, absence of peritoneal metastasis, baseline anorexia NRS of > 6, presence of pain, and presence of constipation. A multivariate analysis showed that the independent factors predicting responses were PPS of > 40 (odds ratio = 2.7 [95 % CI = 1.4-5.2]), absence of drowsiness (2.6 [1.3-5.0]), and baseline NRS of > 6 (2.4 [1.1-4.8]). Treatment responses to corticosteroids for anorexia may be predicted by PPS, drowsiness, and baseline symptom intensity."

According to the news reporters, the research concluded: "Larger prospective studies are needed to confirm these results."

For more information on this research see: Predictors of responses to corticosteroids for anorexia in advanced cancer patients: a multicenter prospective observational study. Recent Findings from Nanchang University Provides New Insights into Breast Cancer (LINC00978 predicts poor prognosis in breast cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating in Nanchang, People's Republic of China, by NewsRx journalists, research stated, "Breast cancer is the most frequently diagnosed cancer and the leading cause of cancer death among women worldwide. Long non-coding RNAs (lncRNAs) are a class of non-coding RNAs in the human genome that involves in breast cancer development and progression."

The news reporters obtained a quote from the research from Nanchang University, "Here, we identify a lncRNA, LINC00978, which is upregulated in breast cancer cell lines and tissues compared with corresponding controls. Furthermore, LINC00978 expression is negatively associated with hormone receptor (HR) status in 195 breast cancer patients studied (p = 0.033). Kaplan-Meier survival analysis shows that patients with high LINC00978 expression have poorer disease-free survival (DFS) than those with low LINC00978 expression (p = 0.012), and multivariate analysis identifies LINC00978 as an independent prognostic factor in breast cancer (p = 0.008, hazard ratio [HR] = 2.270, 95% confidence interval [CI]1.237-4.165)."

According to the news reporters, the research concluded: "Our study indicates that LINC00978 may be an oncogene in breast cancer, and can serve as a potential biomarker to predict prognosis in breast cancer patients."

For more information on this research see: LINC00978 predicts poor prognosis in breast cancer patients. Scientific Reports, 2016;6():1-7. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. "Defects in the adenosine-uridine (AU)-rich elements (AREs), which mediate post-transcriptional regulation, play important roles in cancers. Both tristetraprolin (TTP, also known as TIS11 and ZFP36) and human antigen R (HuR, also known as ELAVL1) are two important and closely related AU-rich RNA-binding proteins (ARE-BPs)."

Financial support for this research came from Jiangsu Health Department.

The news reporters obtained a quote from the research from Nanjing Medical University, "High-expression or aberrant nuclear/cytoplasmic distribution of HuR and decreased TTP have been found in many types of cancers. TTP mediates the decay of target mRNAs, whereas HuR generally stabilizes target transcripts and promotes translation of certain mRNAs. Furthermore, thousands of overlapping binding sites of TTP and HuR were found in more than 1300 genes. RNA-IP experiments also indicated that TTP can bind directly to and destabilize HuR mRNA. The dysregulation of TTP and HuR has been found to play an important role in the progression of cancers, including inflammation-related cancer, as well as in proliferation, apoptosis, angiogenesis, metastasis, invasion, and chemotherapy resistance."

According to the news reporters, the research concluded: "In this review, we provided an overview of the role of TTP and HuR, as well as the underlying mechanisms of the TTP-HuR axis in cancers."

For more information on this research see: Dysregulation of TTP and HuR plays an important role in cancers. Tumor Biology, 2016;37(11):14451-14461. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Our news correspondents report that additional information may be obtained by contacting J.Z. Xia, Nanjing Medical University, Affiliated Wuxi Hosp 2, Translat Med Center, Wuxi 214002, Jiangsu, People's Republic of China. Additional authors for this research include N.N. Ding, J. Guo, J.Z. Xia and Y.L. Ruan.

Oncology - Lung Cancer

Recent Findings from Nanjing University Provides New Insights into Lung Cancer (Cancer-associated fibroblasts treated with cisplatin facilitates chemoresistance of lung adenocarcinoma through IL-11/IL-11R/STAT3 signaling pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lung Cancer. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Cancer-associated fibroblasts (CAF) are recognized as one of the key determinants in the malignant progression of lung adenocarcinoma. And its contributions to chemoresistance acquisition of lung cancer has raised more and more attention."
Our news journalists obtained a quote from the research from Nanjing University, "In our study, cancer associated fibroblasts treated with cisplatin conferred chemoresistance to lung cancer cells. Meanwhile, Interleukin-11 (IL-11) was significantly up-regulated in the CAF stimulated by cisplatin. As confirmed in lung adenocarcinoma cells in vivo and in vitro, IL-11 could protect cancer cells from cisplatin-induced apoptosis and thus promote their chemoresistance. Furthermore, it was also observed that IL-11 induced STAT3 phosphorylation and increased anti-apoptotic protein Bcl-2 and Survivin expression in cancer cells. The effect could be abrogated by suppressing STAT3 phosphorylation or silencing IL-11R alpha expression in cancer cells."

According to the news editors, the research concluded: "Chemotherapy-induced IL-11 upregulation in CAF promotes lung adenocarcinoma cell chemoresistance by activating IL-11R/STAT3 anti-apoptotic signaling pathway."

For more information on this research see: Cancer-associated fibroblasts treated with cisplatin facilitates chemoresistance of lung adenocarcinoma through IL-11/IL-11R/STAT3 signaling pathway. Scientific Reports, 2016;6():1-13. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Peptide Proteins - Peptide Hormones

Recent Findings from National Chung Hsing University Provides New Insights into Peptide Hormones (Ginkgoghrelins, unique acylated flavonoid diglycosides in Folium Ginkgo, stimulate growth hormone secretion via activation of the ghrelin receptor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Peptide Proteins - Peptide Hormones are presented in a new report. According to news reporting originating in Taichung, Taiwan, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Folium Ginkgo, the dried leaf of Ginkgo biloba L. is a traditional Chinese medicine listed in the Pharmacopoeia of the People's Republic of China with several therapeutic effects, including prevention of aging. It is used as herbal medicine for the treatment of several aging-related diseases."

Financial support for this research came from National Chung-Hsing University. The news reporters obtained a quote from the research from National Chung Hsing University. "The therapeutic effects of Folium Ginkgo on aging-related diseases are suspected to be similar to the anti-aging effects of growth hormone release induced by ghrelin. Candidate components responsible for the anti-aging effects via the ghrelin receptor-activated pathway were searched from the known compounds found in Folium Ginkgo. Two acylated flavonoid
diglycosides, tentatively named ginkgoghrelins in this study, were selected and isolated from the methanol extract of Folium Ginkgo, and their chemical structures were confirmed by spectroscopic analysis. These two compounds were examined for their capability of stimulating growth hormone release of rat primary anterior pituitary cells via activation of the ghrelin receptor. The major metabolites of ginkgoghrelins in rat bile were detected after intravenous injection and structurally analyzed by mass spectroscopy. Molecular modeling of ginkgoghrelins docking to the ghrelin receptor was exhibited to explore the possible interaction within the binding pocket. Similar to growth hormone-releasing hormone-6 (GHRP-6), a synthetic analog of ghrelin, ginkgoghrelins were demonstrated to stimulate growth hormone secretion of rat primary anterior pituitary cells in a dose dependent manner, and the stimulation was inhibited by [D-Arg(1), D-Phe(5), D-Trp(7,9) Leu(11)]-substance P, an inverse agonist of the ghrelin receptor. Putative metabolites of ginkgoghrelins via glucuronidation and methylation were detected in bile of rats after intravenous injection. Molecular modeling and docking showed that ginkgoghrelins as well as GHRP-6 could fit in and adequately interact with the binding pocket of the ghrelin receptor."

According to the news reporters, the research concluded: "The results suggest that ginkgoghrelins are putative components partly accounting for the anti-aging effects of Folium Ginkgo possibly via activation of the ghrelin receptor, and possess great potential to be developed as non-peptidyl analogs of ghrelin."

Our news correspondents report that additional information may be obtained by contacting J.T.C. Tzen, National Chung Hsing University, Grad Inst Biotechnol, Taichung 402, Taiwan. Additional authors for this research include T.Y. Chung, Y.C. Li, Y.H. Lo, N.H. Lin, P.C. Kuo, W.Y. Chen and J.T.C. Tzen.

Cardiovascular Diseases and Conditions - Thrombosis

Recent Findings from Nordic Bioscience Advance Knowledge in Thrombosis (Collagen-mediated hemostasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Thrombosis have been published. According to news reporting originating in Herlev, Denmark, by NewsRx journalists, research stated, "Collagens mediate essential hemostasis by maintaining the integrity and stability of the vascular wall. Imbalanced turnover of collagens by uncontrolled
formation and/or degradation may result in pathologic conditions such as fibrosis."

The news reporters obtained a quote from the research from Nordic Bioscience, "Thickening of the vessel wall because of accumulation of collagens may lead to arterial occlusion or thrombosis. Thinning of the wall because of collagen degradation or deficiency may lead to rupture of the vessel wall or aneurysm. Preventing excessive hemorrhage or thrombosis relies on collagen-mediated actions. Von Willebrand factor, integrins and glycoprotein VI, as well as clotting factors, can bind collagen to restore normal hemostasis after trauma."

According to the news reporters, the research concluded: "This review outlines the essential roles of collagens in mediating hemostasis, with a focus on collagens types I, III, IV, VI, XV, and XVIII."

Our news correspondents report that additional information may be obtained by contacting T. Manon-Jensen, Nordic Bioscience A, S, Herlev, Denmark. Additional authors for this research include N.G. Kjeld and M.A Karsdal.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jth.13249. This DOI is a link to an online electronic document that is either free or for purchase.

Mental Health

Recent Findings from Nottingham Trent University Has Provided New Information about Mental Health (Pathways through the criminal justice system for prisoners with acute and serious mental illness)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mental Health. According to news reporting from Nottingham, United Kingdom, by NewsRx journalists, research stated, "To evaluate pathways through the criminal justice system for 63 prisoners under the care of prison mental health services. A small number (3%) were acutely mentally ill at prison reception, which may reflect the successful operation of liaison and diversion services at earlier stages in the pathway."

Funders for this research include NHS England, Nottingham Trent University, St George's University Hospitals NHS Foundation.

The news correspondents obtained a quote from the research from Nottingham Trent University. "However, a third (33%) went onto display acute symptoms at later stages. Cases displaying suicide risk at arrest, with a history of in-patient care, were at increased risk of acute deterioration in the first weeks of imprisonment, with a general absence of health assessments for these cases prior to their imprisonment. Inconsistencies in the transfer of mental health
information to health files may result in at-risk cases being overlooked, and a lack of
standardisation at the court stage results in difficulties determining onward service provision
and outcomes. Greater consistency in access to pre-prison health services in the criminal justice
system is needed, especially for those with preexisting vulnerabilities, and it may have a role in
preventing subsequent deterioration."

According to the news reporters, the research concluded: "A single system for health
information flow across the whole pathway would be beneficial."

For more information on this research see: Pathways through the criminal justice
system for prisoners with acute and serious mental illness. Journal of Forensic and Legal
Medicine, 2016;44():162-168. Journal of Forensic and Legal Medicine can be contacted at:
(Elsevier - www.elsevier.com; Journal of Forensic and Legal Medicine -

Digestive System Diseases and Conditions - Crohn's

Recent Findings from Nottingham University Hospital NHS Trust
Provide New Insights into Crohn's Disease (Ustekinumab for the
treatment of Crohn's disease: can it find its niche?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Digestive System Diseases and
Conditions - Crohn's Disease. According to news reporting from Nottingham, United Kingdom,
by NewsRx journalists, research stated, "Crohn's disease is an immune-mediated disease that
results in panenteric chronic inflammation in genetically predisposed individuals exposed to an
appropriate environment. The past two decades have witnessed the emergence of an important
class of drugs known as anti-tumour necrosis factor (TNF) agents in the treatment of Crohn's
disease."

The news correspondents obtained a quote from the research from Nottingham
University Hospital NHS Trust, "Unfortunately, the utility of these agents have been hampered
by primary and secondary nonresponse in a significant proportion of patients. Ustekinumab, a
monoclonal antibody to the p40 subunit of interleukin (IL) 12 and 23, is a novel
pharmacotherapy for this patient cohort that offers an out-of-class option. It is approved for use
in psoriasis and psoriatic arthritis, and has now been evaluated in phase II trials for moderate-to-
severe Crohn's disease."

According to the news reporters, the research concluded: "We here review the
published literature and describe a potential clinical role for its use in this disease cohort."

For more information on this research see: Ustekinumab for the treatment of Crohn's disease: can it find its niche? *Therapeutic Advances In Gastroenterology*, 2016;9(1):26-36. *Therapeutic Advances In Gastroenterology* can be contacted at: SAGE Publications, USA, 2455 Teller Road, Thousand Oaks, CA 91320, USA. (Sage Publications - www.sagepub.com; Therapeutic Advances In Gastroenterology - tag.sagepub.com)

Our news journalists report that additional information may be obtained by contacting E.G. Simon, Dept. of Gastroenterology, Christian Medical College, Vellore, India NIHR Biomedical Research Unit in Gastrointestinal and Liver Diseases, Nottingham University Hospitals NHS Trust and The University of Nottingham, Nottingham, UK. Additional authors for this research include S. Ghosh, M. Iacucci and G.W Moran.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/1756283X15618130. This DOI is a link to an online electronic document that is either free or for purchase.

**Ear Diseases and Conditions - Otitis Media**

**Recent Findings from Ohio State University Has Provided New Information about Otitis Media (Multi-scale finite element modeling of Eustachian tube function: influence of mucosal adhesion)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Ear Diseases and Conditions - Otitis Media. According to news originating from Columbus, Ohio, by NewsRx correspondents, research stated, "The inability to open the collapsible Eustachian tube (ET) leads to the development of chronic Otitis Media (OM). Although mucosal inflammation during OM leads to increased mucin gene expression and elevated adhesion forces within the ET lumen, it is not known how changes in mucosal adhesion alter the biomechanical mechanisms of ET function."

Our news journalists obtained a quote from the research from Ohio State University, "In this study, we developed a novel multi-scale finite element model of ET function in adults that utilizes adhesion spring elements to simulate changes in mucosal adhesion. Models were created for six adult subjects, and dynamic patterns in muscle contraction were used to simulate the wave-like opening of the ET that occurs during swallowing. ET opening is highly sensitive to the level of mucosal adhesion and that exceeding a critical value of adhesion leads to rapid ET dysfunction. Parameter variation studies and sensitivity analysis indicate that increased mucosal adhesion alters the relative importance of several tissue biomechanical properties. For example, increases in mucosal adhesion reduced the sensitivity of ET function to tensor veli palatini muscle forces but did not alter the insensitivity of ET function to levator veli palatini
muscle forces. Interestingly, although changes in cartilage stiffness did not significantly influence ET opening under low adhesion conditions, ET opening was highly sensitive to changes in cartilage stiffness under high adhesion conditions."

According to the news editors, the research concluded: "Therefore, our multi-scale computational models indicate that changes in mucosal adhesion as would occur during inflammatory OM alter the biomechanical mechanisms of ET function."

The news correspondents report that additional information may be obtained from S.N. Ghadiali, Ohio State University, Wexner Med Center, Davis Heart & Lung Res Inst, Columbus, OH 43210, United States. Additional authors for this research include J.D. Swarts and S.N. Ghadiali.

Keywords for this news article include: Columbus, Ohio, United States, North and Central America, Ear Diseases and Conditions, Otorhinolaryngology, Eustachian Tube, Medical Devices, Otitis Media, Genetics, Ohio State University.

**Oncology - Gastric Cancer**

**Recent Findings from Osaka City University Graduate School of Medicine Advance Knowledge in Gastric Cancer (Fibroblast growth factor receptor signaling as therapeutic targets in gastric cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gastric Cancer. According to news reporting originating in Osaka, Japan, by NewsRx journalists, research stated, "Fibroblast growth factor receptors (FGFRs) regulate a variety of cellular functions, from embryogenesis to adult tissue homeostasis. FGFR signaling also plays significant roles in the proliferation, invasion, and survival of several types of tumor cells."

The news reporters obtained a quote from the research from the Osaka City University Graduate School of Medicine, "FGFR-induced alterations, including gene amplification, chromosomal translocation, and mutations, have been shown to be associated with the tumor initiation and progression of gastric cancer, especially in diffuse-type cancers. Therefore, the FGFR signaling pathway might be one of the therapeutic targets in gastric cancer. This review aims to provide an overview of the role of FGFR signaling in tumorigenesis, tumor progression, proliferation, and chemoresistance."

According to the news reporters, the research concluded: "We also discuss the accumulating evidence that demonstrates the effectiveness of using clinical therapeutic agents to inhibit FGFR signaling for the treatment of gastric cancer."

For more information on this research see: Fibroblast growth factor receptor signaling as therapeutic targets in gastric cancer. *World Journal of Gastroenterology*, 2016;22
Heart Disorders and Diseases - Heart Attack

Recent Findings from Osaka University Has Provided New Data on Heart Attack (Myeloid cell-derived LRG attenuates adverse cardiac remodelling after myocardial infarction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Attack is the subject of a report. According to news reporting originating from Osaka, Japan, by NewsRx correspondents, research stated, "Leucine-rich a2-glycoprotein (LRG) is considered as a biomarker of the clinical activities of chronic inflammatory diseases, including heart failure. However, its pathophysiological roles in cardiac remodelling after myocardial infarction (MI) remain to be clarified."

Financial supporters for this research include MEXT/JSPS KAKENHI, Ministry of Health, Labour and Welfare.

Our news editors obtained a quote from the research from Osaka University, "In this study, we have addressed functional roles of LRG in cardiac remodelling after MI. MI was generated by ligating the left coronary artery in mice. Real-time reverse transcription (RT)-PCR and immunoblot analyses revealed that the expressions of LRG transcript and protein were up-regulated in post-infarct myocardium. LRG protein was produced by heart-infiltrating myeloid cells, such as macrophages and neutrophils. To elucidate functional roles of LRG in cardiac remodelling, we generated MI in wild-type (WT) and LRG-deficient (LRG(-/-)) mice and found that LRG gene ablation aggravated myocardial fibrosis with cardiac dysfunction after MI. Immunohistochemical analyses with anti-CD31 antibody revealed that capillary density decreased at border zone in LRG(-/-) mice compared with WT mice. Consistently, the expression of apelin receptor was reduced in LRG(-/-) mice, implying that the impaired angiogenic activity is associated with adverse cardiac remodelling in LRG(-/-) mice. Moreover, LRG gene ablation suppressed the activation of smad1/5/8, a pro-angiogenic signalling pathway. Finally, the transplantation of WT bone marrow cells into LRG(-/-) mice attenuated cardiac fibrosis with functional improvement after MI, accompanied by restoration of capillary density compared with the bone marrow transplantation from LRG(-/-) mice. LRG, produced by heart-infiltrating myeloid cells, suppresses adverse cardiac remodelling after MI as a novel cardioprotective factor."
According to the news editors, the research concluded: "LRG signalling could be a therapeutic target against cardiovascular diseases."

The news editors report that additional information may be obtained by contacting Y. Fujio, Laboratory of Clinical Science and Biomedicine, Graduate School of Pharmacological Sciences, Osaka University, 1-6 Yamada-oka, Suita, Osaka, Japan. Additional authors for this research include H. Nakayama, M. Fujimoto, H. Honda, S. Serada, H. Ishibashi-Ueda, A. Kasai, M. Obana, Y. Sakata, Y. Sawa, Y. Fujio and T. Naka.

**Intranuclear Space**

**Recent Findings from Palacky University Provides New Insights into Intranuclear Space (Chromosomal aberrations in childhood acute lymphoblastic leukemia: 15-year single center experience)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Intranuclear Space have been published. According to news originating from Olomouc, Czech Republic, by NewsRx correspondents, research stated, "Genetic analysis of leukemic cells significantly impacts prognosis and treatment stratification in childhood acute lymphoblastic leukemia (ALL). Our retrospective single center study of 86 children with ALL enrolled into three consecutive treatment protocols (ALL-BFM 90, ALL-BFM 95 and ALL IC-BFM 2002) between 1991 and 2007 demonstrates the importance of conventional cytogenetics and fluorescence in situ hybridization (FISH)."

Financial supporters for this research include Czech Ministry of Health, Czech Ministry of Education, Youth and Sports.

Our news journalists obtained a quote from the research from Palacky University, "Cytogenetic and FISH examinations were performed successfully in 82/86 (95.3%) patients and chromosomal changes were detected in 78 of the 82 (95.1%) patients: in 69/73 patients with B-cell precursor (BCP)-ALL and in 9/9 patients with T-lineage ALL (T-ALL). The most frequent chromosomal changes in subgroups divided according to WHO classification independent of treatment protocol and leukemia subtype were hyperdiploidy in 36 patients (with >= 50 chromosomes in 23 patients, with 47-49 chromosomes 13 patients) followed by translocation t(12;21) with ETV6/RUNX1 fusion detected by FISH in 18 (22%) patients. Additional changes were detected in 16/18 (88.8%) ETV6/RUNX1-positive ALL patients with predominant deletion or rearrangement of untranslocated ETV6 allele. Unique aberrations were
detected in 4 patients and dicentric chromosomes in 8 patients, one with T-ALL."

According to the news editors, the research concluded: "These results demonstrate that cytogenetics and FISH successfully provided important prognostic information and revealed not only recurrent but also new and rare rearrangements requiring further investigation in terms of prognostic significance."

The news correspondents report that additional information may be obtained from M. Jarosova, Palacky Univ, Univ Hosp Olomouc, Fac Med & Dental, Dept. of Hematooncol, Olomouc 77515, Czech Republic. Additional authors for this research include J. Volejnikova, I. Porizkova, M. Holzerova, D. Pospisilova, Z. Novak, J. Vrbkova and V. Mihal.

**Oncology - Colon Cancer**

**Recent Findings from Peking Union Medical College Has Provided New Information about Colon Cancer (Exploration of the Optimal Minimum Lymph Node Count after Colon Cancer Resection for Patients Aged 80 Years and Older)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Colon Cancer are presented in a new report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The elderly colon cancer (CC) patients are increasing and represent a heterogeneous patient group. The objectives of this study were to identify the features of lymph node examination and to explore the optimal minimum lymph node count after CC resection for patients aged >= 80."

Our news journalists obtained a quote from the research from Peking Union Medical College, "Using the Surveillance, Epidemiology, and End Results (SEER) database, we identified 65719 CC patients in stage I-III between 2004 and 2012, 26.0% of patients were aged >= 80. The median node count decreased with increasing age, which were 25.5, 20.2, 17.8 and 16.9 for patients aged 20-39, 40-59, 60-79, and >= 80. The rate of >= 12 nodes and the rate of node positivity for patients aged >= 80 were obviously lower than younger patients. Using X-tile analysis, we determined 9 nodes as the optimal node count for patients aged >= 80. Then, we compared the 5-year cancer specific survival (CSS) between patients with >= 9 nodes and < 9 nodes. The results showed the 5-year CSSs were improved for patients with >= 9 nodes. Furthermore, the rate of node positivity and survival under the 9-node measure were equal to
According to the news editors, the research concluded: "Therefore, the lymph node examination should be discriminately evaluated for elder patients, and 9-node measure was available for patients aged >= 80."

For more information on this research see: Exploration of the Optimal Minimum Lymph Node Count after Colon Cancer Resection for Patients Aged 80 Years and Older. Scientific Reports, 2016;6():1-8. Pharmacokinetics
Recent Findings from People's Liberation Army Has Provided New Information about Pharmacokinetics (Determination of sophoraflavanone G and kurarinone in rat plasma by UHPLC-MS/MS and its application to a pharmacokinetic study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacokinetics. According to news originating from Harbin, People's Republic of China, by NewsRx correspondents, research stated, "This study aimed to develop and validate a simple and sensitive ultra high performance liquid chromatography tandem mass spectrometry method for the simultaneous determination of sophoraflavanone G and kurarinone in rat plasma by using rutin as the internal standard. Then, the developed method was applied to investigate the pharmacokinetics of sophoraflavanone G and kurarinone in rats after dosing the flavonoid extract from Sophora flavescens."

Our news journalists obtained a quote from the research from People's Liberation Army, "Plasma samples were processed using a liquid-liquid extraction procedure with ethyl acetate. The analysis was performed on a triple quadrupole tandem mass spectrometer by multiple reaction monitoring with an electrospray ionization source in negative ionization mode. Quantitative ion transitions of m/z 423.2 -> 161.2, 437.2 -> 161.1, and 609.3 -> 300.3 were monitored for sophoraflavanone G, kurarinone, and rutin, respectively. The calibration curves of the two analytes exhibited good linearity ((r)^2 >0.9923) over the range of 0.1-200 ng/mL for sophoraflavanone G and 0.1-1000 ng/mL for kurarinone. Relative standard deviations were less than 13.2% for the intra-and inter-day precisions and no more than 12.6% for the recovery, showing good precision and satisfactory accuracy of the developed method."

According to the news editors, the research concluded: "The validated method was successfully applied to the pharmacokinetic study of sophoraflavanone G and kurarinone after a single intravenous (25 mg/kg) and oral (500 mg/kg) administration of the flavonoid extract from
S. flavescens, and the absolute bioavailability for sophoraflavanone G and kurarinone was about 36 and 17%, respectively."

The news correspondents report that additional information may be obtained from W.Z. Deng, Peoples Liberat Army, Hosp 211, Harbin 150080, People's Republic of China. Additional authors for this research include W.J. Zhang, X. Li, B.S. Shan, J.J. Liu and W.Z. Deng.

Oncology - Acute Myeloid Leukemia

Recent Findings from Postgraduate Institute of Medical Education and Research Provide New Insights into Acute Myeloid Leukemia (Immunohistochemical Detection of NPM1 Mutation in Acute Myeloid Leukemia and its Association With Cup-like Nuclear ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Acute Myeloid Leukemia. According to news reporting out of Chandigarh, India, by NewsRx editors, research stated, "Blasts showing cup-like nuclei in acute myeloid leukemia (AML) have been identified in patients with nucleophosmin 1 gene (NPM1) mutation, that is, AML with cytoplasmic NPM (NPMc+ AML). We analyzed 100 consecutive cases of AML, and defined the cutoff percentages of cup-like blasts in peripheral blood and bone marrow aspirate smears that can predict NPMc+ AML."

Our news journalists obtained a quote from the research from the Postgraduate Institute of Medical Education and Research, "A lower cutoff level of (>=)10% blasts in peripheral blood and (>=)9% in bone marrow aspirate gave an excellent specificity for NPMc+ AML and a positive-predictive value of 90.9% and a negative-predictive value of 87.6% for NPMc+ AML. Cup-like nuclei were associated with higher total leukocyte count, higher blasts percentage, AML-M1 subtype, and human leukocyte antigen-DR region negativity."

According to the news editors, the research concluded: "Our results suggest that cup-like nuclei represent an important morphologic clue that can predict NPMc+ AML and guide toward prioritizing the further workup of AML patients."

For more information on this research see: Immunohistochemical Detection of NPM1 Mutation in Acute Myeloid Leukemia and its Association With Cup-like Nuclear Morphology of Blasts. Applied Immunohistochemistry & Molecular Morphology, 2016;24(4):261-7. (Lippincott Williams and Wilkins - www.lww.com; Applied Immunohistochemistry & Molecular Morphology - journals.lww.com/appliedimmunohist/pages/default.aspx)

Oncology - Breast Cancer

Recent Findings from R. Ocana-Riola and Co-Researchers Yields New Information on Breast Cancer [Geographical and Temporal Variations in Female Breast Cancer Mortality in the Municipalities of Andalusia (Southern Spain)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news originating from Granada, Spain, by NewsRx correspondents, research stated, "The last published figures have shown geographical variations in mortality with respect to female breast cancer in European countries. However, national health policies need a dynamic image of the geographical variations within the country."

Our news journalists obtained a quote from the research, "The aim of this paper was to describe the spatial distribution of age-specific mortality rates from female breast cancer in the municipalities of Andalusia (southern Spain) and to analyze its evolution over time from 1981 to 2012. An ecological study was devised. Two spatio-temporal hierarchical Bayesian models were estimated. One of these was used to estimate the age-specific mortality rate for each municipality, together with its time trends, and the other was used to estimate the age-specific rate ratio compared with Spain as a whole. The results showed that 98% of the municipalities exhibited a decreasing or a flat mortality trend for all the age groups. In 2012, the geographical variability of the age-specific mortality rates was small, especially for population groups below 65. In addition, more than 96.6% of the municipalities showed an age-specific mortality rate similar to the corresponding rate for Spain, and there were no identified significant clusters."

According to the news editors, the research concluded: "This information will contribute towards a reflection on the past, present and future of breast cancer outcomes in Andalusia."

The news correspondents report that additional information may be obtained from R. Ocana-Riola, Inst Invest Biosanitaria Granada, Granada 18012, Spain. Additional authors for this research include C. Montano-Remacha and J.M. Mayoral-Cortes.
Keywords for this news article include: Granada, Spain, Europe, Women's Health, Breast Cancer, Oncology.

Oncology - Breast Cancer

Recent Findings from San Raffaele Scientific Institute Provide New Insights into Breast Cancer (Effects of the scaffold proteins liprin-a1, b1 and b2 on invasion by breast cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Milano, Italy, by NewsRx correspondents, research stated, "The expression of the scaffold protein liprin-a1 is upregulated in human breast cancer. This protein is part of a molecular network that is important for tumor cell invasion in vitro."

Funders for this research include AIRC (Italian Association for Cancer Research), Italian Ministry for Research.

Our news journalists obtained a quote from the research from San Raffaele Scientific Institute, "Liprin-a1 promotes invasion by supporting the protrusive activity at the leading edge of the migrating tumor cell and the degradation of the extracellular matrix by invadopodia. In this study, we have addressed the role of liprin-a1 in the invasive process in vivo and of liprin-proteins in tumor cell motility. The human tumor cell line MDA-MB-231 expresses liprin-a1 and is able to promote the formation of metastasis in mice. Liprin-a proteins may hetero-oligomerize with the members of the subfamily of the liprin-b adaptor proteins. Analysis of the role of liprin-b1 and liprin-b2 has shown that while liprin-b1 contributes positively to tumor cell motility in vitro; liprin-b2 has a negative effect on both cell motility and invasion. Interestingly, we also observed differential effects on the ability of tumor cells to degrade the extracellular matrix, which is required for efficient invasion by tumor cells. In addition, analysis of the formation of lung metastases in vivo revealed that while the overexpression of liprin-a1 in MDA-MB-231 cells did not evidently affect the metastatic process, silencing of the endogenous protein strongly impaired the formation of metastases by two independent invasion assays, without inhibiting the growth of primary tumours. Our data support an important role of distinct liprin family members in the regulation of tumor cell invasion, highlighting pro-invasive and anti-invasive effects by liprin-a1 and liprin-b2, respectively."

According to the news editors, the research concluded: "Our results indicate the importance of liprins in breast cancer cell invasion, and are expected to lead to future investigations on the mechanisms underlying the effects of distinct liprin proteins in different processes linked to tumor cell migration and invasion."

The news correspondents report that additional information may be obtained from S. Chiaretti, Division of Neuroscience, Cell Adhesion Laboratory, San Raffaele Scientific Institute, Milano, 20132, Italy. Additional authors for this research include V. Astro, E. Chiricozzi and I. de Curtis.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/boc.201500063. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Breast Cancer

Recent Findings from School of Medicine Provide New Insights into Breast Cancer (BRCA1 inhibits AR-mediated proliferation of breast cancer cells through the activation of SIRT1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating in Nanjing, People's Republic of China, by NewsRx journalists, research stated, "Breast cancer susceptibility gene 1 (BRCA1) is a tumor suppressor protein that functions to maintain genomic stability through critical roles in DNA repair, cell-cycle arrest, and transcriptional control. The androgen receptor (AR) is expressed in more than 70% of breast cancers and has been implicated in breast cancer pathogenesis."

The news reporters obtained a quote from the research from the School of Medicine, "However, little is known about the role of BRCA1 in AR-mediated cell proliferation in human breast cancer. Here, we report that a high expression of AR in breast cancer patients was associated with shorter overall survival (OS) using a tissue microarray with 149 non-metastatic breast cancer patient samples. We reveal that overexpression of BRCA1 significantly inhibited expression of AR through activation of SIRT1 in breast cancer cells. Meanwhile, SIRT1 induction or treatment with a SIRT1 agonist, resveratrol, inhibits AR-stimulated proliferation. Importantly, this mechanism is manifested in breast cancer patient samples and TCGA database, which showed that low SIRT1 gene expression in tumor tissues compared with normal adjacent tissues predicts poor prognosis in patients with breast cancer."

According to the news reporters, the research concluded: "Taken together, our findings suggest that BRCA1 attenuates AR-stimulated proliferation of breast cancer cells via SIRT1 mediated pathway."

For more information on this research see: BRCA1 inhibits AR-mediated proliferation of breast cancer cells through the activation of SIRT1. Scientific Reports, 2016;6 ():22034. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Recent Findings from School of Medicine Provides New Insights into Health and Society (Geographical disparities in access to cancer management and treatment services in England)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Health and Society. According to news originating from Norwich, United Kingdom, by NewsRx correspondents, research stated, "This study seeks to examine the extent to which cancer services are geographically located according to cancer incidence, and assess the association with cancer survival. We identified hospital sites serving English PCTs (Primary Care Trusts) with the management and treatment of breast, lung and colorectal cancer."

Our news journalists obtained a quote from the research from the School of Medicine, "Geographical access was estimated as travel time in minutes from LSOAs (Lower Super Output Areas) to the nearest hospital site and aggregated to PCT level. Correlations between PCT level mean travel times and cancer cases were estimated using Spearman's rank correlation. Associations between PCT level mean travel times and cancer relative survival rates were estimated using linear regression with adjustment for area deprivation and for a PCT level measure of the reported ease of obtaining a doctor's appointment. We found that cancer services tended to be located farther from areas with more cancer cases, and longer average travel times are associated with worse survival after adjustment for age, sex, year and area deprivation."

According to the news editors, the research concluded: "This suggests that geographical access to cancer services remains a concern in England."

The news correspondents report that additional information may be obtained from P. Murage, Univ East Anglia, Norwich Med Sch, Norwich, Norfolk, United Kingdom. Additional authors for this research include S.M. Crawford, M. Bachmann and A. Jones.

Skin Diseases and Conditions - Acne Vulgaris

Recent Findings from Seoul National University Provides New Insights into Acne Vulgaris (Recent progress in the research about Propionibacterium acnes strain diversity and acne: pathogen or bystander?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Skin Diseases and Conditions - Acne Vulgaris is the subject of a report. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Recent progress has steadily reported the existence of the diverse strains of Propionibacterium acnes, and these studies have contributed to the elucidation of their contradictory roles between normal commensals and pathogens. In this review, the authors aim to provide an update on the recent understanding of research about P. acnes strain diversity and acne, analyzing the potential implications for clinical applications."

Our news journalists obtained a quote from the research from Seoul National University, "Before the era of genomic research, P. acnes was known to be distinguished based on serological agglutination tests, cell wall sugar analysis, or fermentation traits. Since the complete genome sequence of P. acnes was first deciphered, genetic studies based on sequence data have expanded with the introduction of more refined and precise DNA-based typing methods, including multilocus sequence typing and metagenomics. These sophisticated techniques have revealed that P. acnes consists of phylogenetically distinct cluster groups with various pathogenic traits, including elicitation of inflammation, protein secretome profile, and unique distribution patterns in various skin loci. In following large-scale studies from patients' acne samples have revealed that specific sequence types are included within the phylogenetic divisions and further suggested that particular P. acnes strains play an etiologic role in acne while others are associated with health, providing a firm platform for evidential-based research into the exact role of this organism in acne."

According to the news editors, the research concluded: "We strongly believe that future research would provide fruitful results in not only clarifying the apparent controversy with respect to roles of P. acnes but also developing therapeutic drugs by pinpointing specific targets of the pathogenic strain only."

Our news journalists report that additional information may be obtained by contacting D.H. Suh, Seoul National University, Coll Med, Dept. of Dermatol, Seoul 110744, South Korea.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ijd.13282. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Findings from Shanghai Jiao-Tong University Provide New Insights into Thrombocytopenia (Interleukin-17-producing CD4+ T lymphocytes are increased in patients with primary immune thrombocytopenia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematologic Diseases and Conditions - Thrombocytopenia are discussed in a new report. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "The present study was performed to investigate the role of interleukin-17-producing CD4-positive T cells in the pathogenesis of primary immune thrombocytopenia (ITP). Peripheral blood was collected from ITP patients and healthy controls."

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "The immunophenotyping of T lymphocytes and the detection of T helper 1/2/17 (Th1/Th2/Th17) cells were performed by flow cytometry, Th1/Th2/Th17-associated cytokines were determined by cytokines microarray and ELISA. The association between Th17 and T regulatory cells (Tregs) was also investigated. The percentage of Th17 and Th1 cells were markedly increased in ITP patients especially in those with severe ITP compared with normal controls. Th17 cytokines microarray revealed the upregulation of proinflammatory cytokines and downregulation of inflammatory inhibitory cytokines in ITP patients compared with that in the normal controls. Further ELISA analysis verified high levels of Th17-associated proinflammatory cytokines such as interleukin-17A/F, interleukin-6 and interleukin-23 and low levels of inflammatory inhibitory factors including interleukin-10 and transforming growth factor-b in ITP patients compared with normal controls. We also observed that the ratio of Th17/Treg was significantly higher in severe ITP than that in mild ITP and normal controls and inversely correlated with platelet count. In addition, Tregs from ITP patients could suppress the secretion of interferon-g by effector CD4-positive T cells, but had no effect on interleukin-17 production in vitro."

According to the news editors, the research concluded: "Th17 cells are increased in ITP patients, and the inversion of Th17/Treg may contribute to the activation of autoimmunity."

For more information on this research see: Interleukin-17-producing CD4+ T lymphocytes are increased in patients with primary immune thrombocytopenia. Blood Coagulation & Fibrinolysis, 2016;27(3):301-7. (Lippincott Williams and Wilkins - www.lww.com; Blood Coagulation & Fibrinolysis - journals.lww.com/bloodcoagulation/pages/default.aspx)

Recent Findings from Shanghai Jiao-Tong University School of Medicine Has Provided New Data on Breast Cancer (Structural simulation of adenosine phosphate via plumbagin and zoledronic acid competitively targets JNK/Erk to synergistically ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "The treatment of breast cancer-induced osteolysis remains a challenge in clinical settings. Here, we explored the effect and mechanism of combined treatment with zoledronic acid (ZA) and plumbagin (PL), a widely investigated component derived from Plumbago zeylanica, against breast cancer-induced osteoclastogenesis."

The news correspondents obtained a quote from the research from the Shanghai Jiao-Tong University School of Medicine, "We found that the combined treatment with PL and ZA suppressed cell viability of precursor osteoclasts and synergistically inhibited MDA-MB-231-induced osteoclast formation (combination index=0.28) with the abrogation of recombinant mouse receptor activator of nuclear factor-kB ligand (RANKL)-induced activation of NF-kB/MAPK (nuclear factor-kB/mitogen-activated protein kinase) pathways. Molecular docking suggested a putative binding area within c-Jun N-terminal kinase/extracellular signal-regulated kinase (JNK/Erk) protease active sites through the structural mimicking of adenosine phosphate (ANP) by the spatial combination of PL with ZA. A homogeneous time-resolved fluorescence assay further illustrated the direct competitiveness of the dual drugs against ANP docking to phosphorylated JNK/Erk, contributing to the inhibited downstream expression of c-Jun/c-Fos/NFATc-1 (nuclear factor of activated T cells, cytoplasmic, calcineurin-dependent 1). Then, in vivo testing demonstrated that the combined administration of PL and ZA attenuated breast cancer growth in the bone microenvironment. Additionally, these molecules prevented the destruction of proximal tibia, with significant reduction of tartrate-resistant acid phosphatase (TRAcP)-positive osteoclast cells and potentiation of apoptotic cancer cells, to a greater extent when combined than when the drugs were applied independently."

According to the news reporters, the research concluded: "Altogether, the combination treatment with PL and ZA could significantly and synergistically suppress osteoclastogenesis and inhibit tumorigenesis both in vitro and in vivo by simulating the spatial structure of ANP to inhibit competitively phosphorylation of c-Jun N-terminal kinase/extracellular signal-regulated kinase (JNK/Erk)."

For more information on this research see: Structural simulation of adenosine phosphate via plumbagin and zoledronic acid competitively targets JNK/Erk to synergistically

**Proteins - Carrier Proteins**

**Recent Findings from ShanghaiTech University Provides New Insights into Carrier Proteins (Unusual Processing Generates SPA LncRNAs that Sequester Multiple RNA Binding Proteins)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - Carrier Proteins have been published. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "We identify a type of polycistronic transcript-derived long noncoding RNAs (lncRNAs) that are 50 small nucleolar RNA (snoRNA) capped and 30 polyadenylated (SPAs). SPA processing is associated with nascent mRNA 30 processing and kinetic competition between XRN2 trimming and Pol II elongation."

Funders for this research include MOST, NSFC.

The news reporters obtained a quote from the research from ShanghaiTech University, "Following cleavage/polyadenylation of its upstream gene, the downstream uncapped pre-SPA is trimmed by XRN2 until this exonuclease reaches the co-transcriptionally assembled snoRNP. This snoRNP complex prevents further degradation, generates a snoRNA 50 end, and allows continuous Pol II elongation. The imprinted 15q11-q13 encodes two SPAs that are deleted in Prader-Willi syndrome (PWS) patients. These lncRNAs form a nuclear accumulation that is enriched in RNA binding proteins (RBPs) including TDP43, RBFOX2, and hnRNP M. Generation of a human PWS cellular model by depleting these lncRNAs results in altered patterns of RBPs binding and alternative splicing."

According to the news reporters, the research concluded: "Together, these results expand the diversity of lncRNAs and provide additional insights into PWS pathogenesis."

For more information on this research see: Unusual Processing Generates SPA LncRNAs that Sequester Multiple RNA Binding Proteins. *Molecular Cell*, 2016;64(3):534-548. *Molecular Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. Enzymes and Coenzymes

Recent Findings from Showa Pharmaceutical University Provides New Insights into Enzymes and Coenzymes (Utility of non-human primates in drug development: Comparison of non-human primate and human drug-metabolizing cytochrome P450 enzymes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Enzymes and Coenzymes is now available. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Cynomolgus monkeys (Macaca fascicularis, an Old World Monkey) have been widely used as a non-human primate model in preclinical studies because of their genetic and physiological similarity to humans. This trend has been followed by common marmoset (Callithrix jacchus, a New World Monkey)."

The news correspondents obtained a quote from the research from Showa Pharmaceutical University, "However, drug -metabolism properties in these non -human primates have not been fully understood due to limited information on cytochrome P450 (P450) enzymes, major drug -metabolizing enzymes in humans. Multiple forms of cynomolgus monkey P450 enzymes have been identified and characterized in comparison to those of humans, including a cynomolgus monkey specific form, P450 2C76. Similarly, marmoset P450 1A/B, 2A, 2C, 2D, and 4F enzymes were recently identified and characterized to understand drug metabolism properties. In this research update, updates for marmoset, cynomolgus monkey, and human P450 cDNAs are provided. Marmoset and cynomolgus monkey P450 enzymes showed high sequence homology to their human counterparts and generally had similar substrate recognition functionality to human P450 enzymes; however, they also possibly contribute to limited specific differences in drug oxidative metabolism partly due to small differences in amino acid residues. These findings provide a foundation for successful use of non -human primates as preclinical models and will help to further understand molecular mechanisms of human P450 function."

According to the news reporters, the research concluded: "In addition to the P450 enzymes, flavin-containing monooxygenases, another monooxygenase family, in these non-
Human primates have been found to be involved in the oxidation of a variety of compounds associated with pharmacological and/or toxicological effects in humans and are also described.

Recent Findings from Sir Ganga Ram Hospital Provides New Insights into Heart Surgery (Parachute Tricuspid Valve: A Case Treated by Open Heart Surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Surgery - Heart Surgery. According to news reporting out of New Delhi, India, by NewsRx editors, research stated, "Parachute valve is the malformation of an atrioventricular valve in which the tension apparatus springs from a single papillary muscle or group of muscles."

Our news journalists obtained a quote from the research from Sir Ganga Ram Hospital, "Parachute tricuspid valve is a rare anomaly with no surgically repaired case to date. We describe a case of parachute deformity of the tricuspid valve leading to hemodynamically significant severe tricuspid stenosis."

According to the news editors, the research concluded: "The present case was successfully repaired surgically along with atrial septal defect (ASD) and ventricular septal defect (VSD) closure."

Our news journalists report that additional information may be obtained by contacting A. Gupta, Sir Ganga Ram Hosp, Dept. of Paediat Cardiac Sci, New Delhi, India. Additional authors for this research include R. Kalra, R.K. Joshi, N. Aggarwal, M. Aggarwal, R. Pandey and R. Joshi.
Brachytherapy

Recent Findings from Soochow University Has Provided New Information about Brachytherapy [CT-guided implantation of I-125 seeds (permanent brachytherapy) for metastatic tumors of the hepatic portal system: Effectiveness and safety in 13 patients]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Brachytherapy is now available. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "To retrospectively evaluate the efficacy and safety of CT-guided implantation of I-125 seeds (permanent brachytherapy) for metastatic tumors of the hepatic portal system (HPS). Between January 2012 and January 2015, 13 patients with metastases measuring >3.0 cm in short-axis diameter, which remained in the HPS after conventional chemotherapy and/or transcatheter arterial chemoembolization, and for which an effective therapeutic dose from external beam radiotherapy could not be delivered, received CT-guided I-125 brachytherapy."

Our news journalists obtained a quote from the research from Soochow University, "Clinical data were studied retrospectively. In terms of metrological requirements, the minimum dose to 90% of the target volume (D-90) was 90-160 Gy for I-125 seeds with activity of 2.96 x 10(7)Bq. CT-based evaluation after 2, 4, and 8 weeks, as well as 6 months after implantation enabled review of local control of tumors. All symptoms were improved after 125I brachytherapy. The mean value for D-90 for implantation of I-125 seeds was 136 Gy. Complete response (CR) partial response (PR) was documented in 61.5%, 69.2%, and 84.6% of patients at 2 weeks, 4 weeks, and 6 months after implantation, respectively. Four of 13 patients had complete response, 7 cases had PR, 1 patient had stable disease, and 1 case had progressive disease. All metastatic foci were controlled by implantation. No serious complications were observed. CT-guided I-125 brachytherapy is a safe and effective treatment for metastatic tumors of the HPS and can achieve good local control in the short term as long as the radiation dose is sufficient."

According to the news editors, the research concluded: "CT-guided I-125 brachytherapy carries few complications, is simple, safe, and a good complement to cancer treatment."

Our news journalists report that additional information may be obtained by contacting X.L. Zhu, Soochow Univ, Affiliated Hosp 1, Dept. of Intervent Radiol, Suzhou, Jiangsu, People's Republic of China. Additional authors for this research include Q.G. Xie, W.G. Wang, Y.Y. Hua, Y. Cheng, L. Li and X.L. Zhu.

Recent Findings from Soochow University Provides New Insights into Chalcogens (TaOx decorated perfluorocarbon nanodroplets as oxygen reservoirs to overcome tumor hypoxia and enhance cancer radiotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Chalcogens have been published. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Cancer radiotherapy (RT) is a clinically used tumor treatment strategy applicable for a wide range of solid tumors. However, during RT treatment of tumors, only a small portion of applied ionizing irradiation energy is absorbed by the tumor, in which the largely hypoxic microenvironment also limits the antitumor efficacy of RT."

Financial supporters for this research include National Research Programs from Ministry of Science and Technology (MOST), National Natural Science Foundation of China, Natural Science Fund for Distinguished Young Scholars, Jiangsu Higher Education Institutions.

Our news journalists obtained a quote from the research from Soochow University, "In this work, we rationally fabricate polyethylene glycol (PEG) stabilized perfluorocarbon (PFC) nano-droplets decorated with TaOx nanoparticles (TaOx@PFC-PEG) as a multifunctional RT sensitizer. The obtained TaOx@PFC-PEG nanoparticles on one hand can absorb X-ray by TaOx to concentrate radiation energy within tumor cells, on the other hand after saturating PFC with oxygen will act as an oxygen reservoir to gradually release oxygen and improve tumor oxygenation. As the result, remarkably enhanced in vivo RT treatment is achieved with TaOx@PFC-PEG nanoparticles in our mouse tumor model experiments."

According to the news editors, the research concluded: "Our work thus presents a new nanotechnology strategy to enhance RT-induced tumor treatment by simultaneously concentrating radiation energy within tumors and improving tumor oxygenation, using one multifunctional agent."

For more information on this research see: TaOx decorated perfluorocarbon nanodroplets as oxygen reservoirs to overcome tumor hypoxia and enhance cancer radiotherapy. Biomaterials, 2017;112():257-263. Biomaterials can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Biomaterials - www.journals.elsevier.com/biomaterials/)

Drugs and Therapies - Antiinfectives

Recent Findings from Southern University of Chile Provides New Insights into Antiinfectives (Pentamidine antagonizes the benznidazole's effect in vitro, and lacks of synergy in vivo: Implications about the polyamine transport as an ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antiinfectives have been presented. According to news reporting originating from Valdivia, Chile, by NewsRx correspondents, research stated, "Benznidazole is the first-line drug used in treating Chagas disease, which is caused by the parasite Trypanosoma cruzi (T. cruzi). However, benznidazole has limited efficacy and several adverse reactions."

Our news editors obtained a quote from the research from the Southern University of Chile, "Pentamidine is an antiprotozoal drug used in the treatment of leishmaniasis and African trypanosomiasis. In T. cruzi, pentamidine blocks the transport of putrescine, a precursor of trypanothione, which constitutes an essential molecule in the resistance of T. cruzi to benznidazole. In the present study, we describe the effect of the combination of benznidazole and pentamidine on isolated parasites, mammalian cells and in mice infected with T. cruzi. In isolated trypomastigotes, we performed a dose matrix scheme of combinations, where pentamidine antagonized the effect of benznidazole, mainly at concentrations below the EC50 of pentamidine. In T. cruzi-infected mammalian cells, pentamidine reversed the effect of benznidazole (measured by qPCR). In comparison, in infected BALB/c mice, pentamidine failed to get synergy with benznidazole, measured on mice survival, parasitemia and amastigote nest quantification. To further explain the in vitro antagonism, we explored whether pentamidine affects intracellular trypanothione levels, however, pentamidine produced no change in trypanothione concentrations. Finally, the T cruzi polyamine permease (TcPAT12) was overexpressed in epimastigotes, showing that pentamidine has the same trypanocidal effect, independently of transporter expression levels."

According to the news editors, the research concluded: "These results suggest that, in spite of the high potency in the putrescine transport blockade, TcPAT12 permease is not the main target of pentamidine, and could explain the lack of synergism between pentamidine and benznidazole."

For more information on this research see: Pentamidine antagonizes the benznidazole's effect in vitro, and lacks of synergy in vivo: Implications about the polyamine transport as an anti-Trypanosoma cruzi target. Experimental Parasitology, 2016;171():23-32. Experimental Parasitology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Experimental Parasitology - www.journals.elsevier.com/experimental-parasitology/)

The news editors report that additional information may be obtained by contacting R. Lopez-Munoz, Univ Austral Chile, Fac Ciencias Vet, Inst Farmacol & Morfofisiol, Valdivia, Chile. Additional authors for this research include L. Castro, C. Reigada, L. Cortes, M.V. Diaz, M.R. Miranda, C.A. Pereira, M. Lapier, C. Campos-Estrada, A. Morello, U. Kemmerling, J.D.
Recent Findings from Sun Yat Sen University Provides New Insights into Nasopharyngeal Carcinoma (Induction chemotherapy plus concurrent chemoradiotherapy versus concurrent chemoradiotherapy alone in locoregionally advanced nasopharyngeal ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Nasopharyngeal Carcinoma have been presented. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "The value of adding cisplatin, fluorouracil, and docetaxel (TPF) induction chemotherapy to concurrent chemoradiotherapy in locoregionally advanced nasopharyngeal carcinoma is unclear. We aimed to compare TPF induction chemotherapy plus concurrent chemoradiotherapy with concurrent chemoradiotherapy alone in a suitably powered trial."

Our news editors obtained a quote from the research from Sun Yat Sen University, "We did an open-label, phase 3, multicentre, randomised controlled trial at ten institutions in China. Patients with previously untreated, stage II-IVB (except T3-4N0) nasopharyngeal carcinomas, aged 18-59 years without severe comorbidities were enrolled. Eligible patients were randomly assigned (1:1) to receive induction chemotherapy plus concurrent chemoradiotherapy or concurrent chemoradiotherapy alone (three cycles of 100 mg/m(2) cisplatin every 3 weeks, concurrently with intensity-modulated radiotherapy). Induction chemotherapy was three cycles of intravenous docetaxel (60 mg/m(2) on day 1), intravenous cisplatin (60 mg/m(2) on day 1), and continuous intravenous fluorouracil (600 mg/m(2) per day from day 1 to day 5) every 3 weeks before concurrent chemoradiotherapy. Randomisation was by a computer-generated random number code with a block size of four, stratified by treatment centre and disease stage (III or IV). Treatment allocation was not masked. The primary endpoint was failure-free survival calculated from randomisation to locoregional failure, distant failure, or death from any cause; required sample size was 476 patients (238 per group). We did efficacy analyses in our intention-to-treat population. The follow-up is ongoing; in this report, we present the 3-year survival results and adverse effects. This trial is registered with ClinicalTrials.gov, number NCT01245959. Between March 1, 2011, and Aug 22, 2013, 241 patients were assigned to induction chemotherapy plus concurrent chemoradiotherapy and 239 to concurrent chemoradiotherapy alone. After a median follow-up of 45 months (IQR 38-49), 3-year failure-free survival was 80% (95% CI 75-85) in the induction chemotherapy plus concurrent chemoradiotherapy group and 72% (66-78) in the concurrent chemoradiotherapy alone group (hazard ratio 0.68, 95% CI 0.48-0.97; p=0.034). The most common grade 3 or 4 adverse events during treatment in the 239 patients in the induction chemotherapy plus concurrent chemoradiotherapy group versus the 238 patients in concurrent chemoradiotherapy alone group were neutropenia (101 [42%] vs 17 [7%]), leucopenia (98 [41%] vs 41 [17%]), and stomatitis (98 [41%] vs 84 [35%]). Addition of TPF induction chemotherapy to concurrent..."
chemoradiotherapy significantly improved failure-free survival in locoregionally advanced nasopharyngeal carcinoma with acceptable toxicity."

According to the news editors, the research concluded: "Long-term follow-up is required to determine long-term efficacy and toxicities."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/S1470-2045%2816%2930410-7. This DOI is a link to an online electronic document that is either free or for purchase.

Neuropathy

Recent Findings from Taipei Medical University Advance Knowledge in Neuropathy (Melatonin relieves neuropathic allodynia through spinal MT2-enhanced PP2Ac and downstream HDAC4 shuttling-dependent epigenetic modification of hmgb1 transcription)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neuropathy. According to news originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Melatonin (MLT; N-acetyl-5-methoxytryptamine) exhibits analgesic properties in chronic pain conditions. While researches linking MLT to epigenetic mechanisms have grown exponentially over recent years, very few studies have investigated the contribution of MLT-associated epigenetic modification to pain states."

Financial supporters for this research include National Science Council, Mackay Memorial Hospital, Department of Medicine, Mackay Medical College, Taipei Medical University, Saint Paul's Hospital.

Our news journalists obtained a quote from the research from Taipei Medical University, "Here, we report that together with behavioral allodynia, spinal nerve ligation (SNL) induced a decrease in the expression of catalytic subunit of phosphatase 2A (PP2Ac) and enhanced histone deacetylase 4 (HDAC4) phosphorylation and cytoplasmic accumulation, which epigenetically alleviated HDAC4-suppressed hmgb1 gene transcription, resulting in
increased high-mobility group protein B1 (HMGB1) expression selectively in the ipsilateral dorsal horn of rats. Focal knock-down of spinal PP2Ac expression also resulted in behavioral allodynia in association with similar protein expression as observed with SNL. Notably, intrathecal administration with MLT increased PP2Ac expression, HDAC4 dephosphorylation and nuclear accumulation, restored HDAC4-mediated hmgb1 suppression and relieved SNL-sensitized behavioral pain; these effects were all inhibited by spinal injection of 4P-PDOT (a MT2 receptor antagonist, 30 minutes before MLT) and okadaic acid (OA, a PP2A inhibitor, 3 hr after MLT). Our findings demonstrate a novel mechanism by which MLT ameliorates neuropathic allodynia via epigenetic modification.

According to the news editors, the research concluded: "This MLT-exhibited anti-allodynia is mediated by MT2-enhanced PP2Ac expression that couples PP2Ac with HDAC4 to induce HDAC4 dephosphorylation and nuclear import, herein increases HDAC4 binding to the promoter of hmgb1 gene and upregulates HMGB1 expression in dorsal horn neurons."

The news correspondents report that additional information may be obtained from T.B. Lin, Dept. of Physiology, School of Medicine, College of Medicine, Taipei Medical University, Taipei, Taiwan. Additional authors for this research include M.C. Hsieh, C.Y. Lai, J.K. Cheng, H.H. Wang, Y.P. Chau, G.D. Chen and H.Y Peng.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jpi.12307. This DOI is a link to an online electronic document that is either free or for purchase.

Science - Neurological Science

Recent Findings from Tel Aviv University Has Provided New Information about Neurological Science (Malformations of Cortical Development: From Postnatal to Fetal Imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science - Neurological Science. According to news reporting out of Tel Aviv, Israel, by NewsRx editors, research stated, "Abnormal fetal corticogenesis results in malformations of cortical development (MCD). Abnormal cell proliferation leads to microcephaly or megalencephaly, incomplete neuronal migration results in heterotopia and lissencephaly, neuronal overmigration manifests as cobblestone malformations, and anomalous postmigrational cortical organization is responsible for polymicrogyria and focal cortical dysplasias."

Our news journalists obtained a quote from the research from Tel Aviv University, "MCD comprises various congenital brain disorders, caused by different genetic, infectious, or vascular etiologies and is associated with significant neurological morbidity. Although MCD are
rarely diagnosed prenatally, both dedicated multiplanar neurosonography and magnetic resonance imaging enable good demonstration of fetal cortical development. The imaging signs of fetal MCD are: delayed or absent cerebral sulcation; premature abnormal sulci; thin and irregular hemispheric parenchyma; wide abnormal overdeveloped gyri; wide opening of isolated sulci; nodular bulging into the lateral ventricles; cortical clefts; intraparenchymal echogenic nodules; and cortical thickening."

According to the news editors, the research concluded: "The postnatal and prenatal imaging features of four main malformations of cortical development: lissencephaly, cobblestone malformations, periventricular nodular heterotopia, and polymicrogyria are described."

For more information on this research see: Malformations of Cortical Development: From Postnatal to Fetal Imaging. *Canadian Journal of Neurological Sciences*, 2016;43(5):611-618. *Canadian Journal of Neurological Sciences* can be contacted at: Cambridge Univ Press, 32 Avenue Of The Americas, New York, NY 10013-2473, USA.

Our news journalists report that additional information may be obtained by contacting T. Lerman-Sagie, Tel Aviv University, Sackler Fac Med, Tel Aviv, Israel.

**Oncology - Prostate Cancer**

**Recent Findings from Temple University Advance Knowledge in Prostate Cancer (The role of radical prostatectomy in high-risk localized, node-positive and metastatic prostate cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "A lack of quality evidence comparing management strategies confounds complex treatment decisions for patients with high-risk prostate cancers. No randomized trial comparing surgery to radiation has been successfully completed."

Our news editors obtained a quote from the research from Temple University, "Despite inherent selection biases, however, observational and registry data suggest improved outcomes for patients initially managed with prostatectomy. As consensus shifts away from aggressive treatment for low-risk disease and toward multimodal treatment of locally advanced and metastatic disease, there is renewed interest in surgery for local control in patients presenting with high-risk localized, node-positive and minimally metastatic disease."

According to the news editors, the research concluded: "The objective of this review is to examine the evidence evaluating clinical outcomes of patients with high-risk clinically localized, node-positive and metastatic prostate cancer treated with radical prostatectomy."

Recent Findings from Tokyo Medical and Dental University Provides New Insights into Gastric Cancer (Postoperative Complications of Laparoscopic Total Gastrectomy versus Open Total Gastrectomy for Gastric Cancer in a Meta-Analysis of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Some meta-analyses of case-controlled studies (CCSs) have shown that laparoscopic or laparoscopy-assisted total gastrectomy (LTG) had some short-term advantages over open total gastrectomy (OTG). However, postoperative complications differed somewhat among the meta-analyses, and some CCSs included in the meta-analyses had mismatched factors between LTG and OTG."

Our news editors obtained a quote from the research from Tokyo Medical and Dental University, "CCSs comparing postoperative complications between LTG and OTG were identified in PubMed and Embase. Studies matched for patients' status, tumor stage, and the extents of lymph-node dissection were included. Outcomes of interest, such as anastomotic, other intra-abdominal, wound, and pulmonary complications, were evaluated in a meta-analysis performed using ReviewManager version 5.3 software. This meta-analysis included a total of 2,560 patients (LTG, 1,073 patients; OTG, 1,487 patients) from 15 CCSs. Wound complications were significantly less frequent in LTG than in OTG (n = 2,430; odds ratio [OR] 0.30, 95% confidence interval [CI] 0.29-0.85, P = 0.01, I-2 = 0%, and OR 0.46, 95% CI 0.17-0.52, P<0.0001, I-2 = 0%). However, the incidence of anastomotic complications was slightly but not significantly higher in LTG than in OTG (n = 2,560; OR 1.44, 95% CI 0.96-2.16, P = 0.08, I-2 = 0%)."

According to the news editors, the research concluded: "LTG was associated with a lower incidence of wound-related postoperative complications than was OTG in this meta-analysis of CCSs; however, some concern remains about anastomotic problems associated with LTG."

For more information on this research see: Postoperative Complications of Laparoscopic Total Gastrectomy versus Open Total Gastrectomy for Gastric Cancer in a Meta-
Heart Disorders and Diseases - Heart Attack

Recent Findings from Tufts University Has Provided New Information about Heart Attack (The Evolving Paradigm Of Individualized Postresuscitation Care After Cardiac Arrest)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "The postresuscitation period after a cardiac arrest is characterized by a wide range of physiological derangements."

The news correspondents obtained a quote from the research from Tufts University, "Variations between patients include preexisting medical problems, the underlying cause of the cardiac arrest, presence or absence of hemodynamic and circulatory instability, severity of the ischemia-reperfusion injury, and resuscitation-related injuries such as pulmonary aspiration and rib or sternal fractures. Although protocols can be applied to many elements of postresuscitation care, the widely disparate clinical condition of cardiac arrest survivors requires an individualized approach that stratifies patients according to their clinical profile and targets specific treatments to patients most likely to benefit."

According to the news reporters, the research concluded: "This article describes such an individualized approach, provides a practical framework for evaluation and triage at the bedside, and reviews concerns specific to all members of the interprofessional postresuscitation care team."

For more information on this research see: The Evolving Paradigm Of Individualized Postresuscitation Care After Cardiac Arrest. American Journal of Critical Care, 2016;25(6):556-564. American Journal of Critical Care can be contacted at: Amer Assoc Critical Care Nurses, 101 Columbia, Aliso Viejo, CA 92656, USA.

Our news journalists report that additional information may be obtained by contacting D.B. Seder, Tufts University, Sch Med, Med, Boston, MA 02111, United States.

**Oncology - Prostate Cancer**

**Recent Findings from University College Has Provided New Data on Prostate Cancer (The challenging landscape of medical device approval in localized prostate cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Findings of research using modern multiparametric MRI have provided clinicians with reliable targets for guiding prostate biopsy sampling and directing targeted therapy, often termed focal therapy, to specific areas of the prostate. This emerging shift in treatment strategy from a whole-gland approach to a lesion-specific or region-specific approach requires novel medical devices."

Our news journalists obtained a quote from the research from University College, "The rules regulating the approval and clinical use of such new devices often differ between the USA and Europe, and these differences can affect the treatments that patients receive. Current regulatory pathways for approval of various image-guided biopsy and focal therapy devices intended to be used in patients with prostate cancer are discussed in detail."

According to the news editors, the research concluded: "Finally, we offer some perspective on the current status of research in the field, and propose a potential roadmap towards the establishment of timely, safe and standardized criteria for optimal evaluation of novel image-guided devices for treatment of patients with localized prostate cancer."

Our news journalists report that additional information may be obtained by contacting M. Valerio, Division of Surgery and Interventional Science, University College London, 21 University Street, London WC1E 6AU, UK. Additional authors for this research include M. Emberton, S.E. Eggener and H.U Ahmed.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrurol.2015.289. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Findings from University Duisburg-Essen Have Provided New Data on Atrial Fibrillation (The value of basic research insights into atrial fibrillation mechanisms as a guide to therapeutic innovation: a critical analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Atrial Fibrillation are presented in a new report. According to news reporting originating in Essen, Germany, by NewsRx journalists, research stated, "Atrial fibrillation (AF) is an extremely common clinical problem associated with increased morbidity and mortality. Current antiarrhythmic options include pharmacological, ablation, and surgical therapies, and have significantly improved clinical outcomes."

Financial supporters for this research include European Network for Translational Research in Atrial Fibrillation, Canadian Institutes of Health Research, Heart and Stroke Foundation of Canada, Federation francaise de Cardiologie, National Institutes of Health, American Heart Association.

The news reporters obtained a quote from the research from University Duisburg-Essen, "However, their efficacy remains suboptimal, and their use is limited by a variety of potentially serious adverse effects. There is a clear need for improved therapeutic options. Several decades of research have substantially expanded our understanding of the basic mechanisms of AF. Ectopic firing and re-entrant activity have been identified as the predominant mechanisms for arrhythmia initiation and maintenance. However, it has become clear that the clinical factors predisposing to AF and the cellular and molecular mechanisms involved are extremely complex. Moreover, all AF-promoting and maintaining mechanisms are dynamically regulated and subject to remodelling caused by both AF and cardiovascular disease. Accordingly, the initial presentation and clinical progression of AF patients are enormously heterogeneous. An understanding of arrhythmia mechanisms is widely assumed to be the basis of therapeutic innovation, but while this assumption seems self-evident, we are not aware of any papers that have critically examined the practical contributions of basic research into AF mechanisms to arrhythmia management. Here, we review recent insights into the basic mechanisms of AF, critically analyse the role of basic research insights in the development of presently used anti-AF therapeutic options and assess the potential value of contemporary experimental discoveries for future therapeutic innovation."

According to the news reporters, the research concluded: "Finally, we highlight some of the important challenges to the translation of basic science findings to clinical application."

Our news correspondents report that additional information may be obtained by contacting D. Dobrev, Institute of Pharmacology, West German Heart and Vascular Center, Faculty of Medicine, University Duisburg-Essen, Hufelandstr 55, D-45122 Essen, Germany. Additional authors for this research include V. Algalarondo, N. Voigt, J. Melka, X.H. Wehrens, D. Dobrev and S. Nattel.

Recent Findings from University Hospital Provide New Insights into Hydroxycorticosteroids (Does Pregnenolone Enhance Exposure Therapy in Obsessive-Compulsive Disorder? - A Pilot, Interim Report of a Randomized, Placebo-Controlled, Double-Blind ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hydroxycorticosteroids are discussed in a new report. According to news reporting from Hamburg, Germany, by NewsRx journalists, research stated, "Exposure therapy is an effective cognitive-behavioral treatment for patients with obsessive-compulsive disorder (OCD). However, a further amelioration of symptoms by additional drugs that enhance extinction learning is desirable."

The news correspondents obtained a quote from the research from University Hospital, "An interesting candidate is pregnenolone, which positively modulates NMDA and GABAA receptors in preclinical studies and influences amygdala and prefrontal activity in humans. We present pilot data showing high acceptance and good tolerability of pregnenolone given 2 h before exposure sessions in OCD patients."

According to the news reporters, the research concluded: "As per our interim analyses, exposure treatment resulted in significantly improved main outcome parameters, but no effects of pregnenolone vs. placebo pretreatment were detectable thus far."

Our news journalists report that additional information may be obtained by contacting M. Kellner, Dept. of Psychiatry and Psychotherapy, University Hospital Eppendorf, Hamburg, Germany. Additional authors for this research include S. Nowack, V. Wortmann, A. Yassouridis and K. Wiedemann.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1055/s-0035-1569371. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Findings from University Hospital Provide New Insights into Immune System (Stress-Induced In Vivo Recruitment of Human Cytotoxic Natural Killer Cells Favors Subsets with Distinct Receptor Profiles and Associates with Increased ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immune System have been published. According to news originating from Basel, Switzerland, by NewsRx correspondents, research stated, "Acute stress drives a 'high-alert' response in the immune system. Psychoactive drugs induce distinct stress hormone profiles, offering a sought-after opportunity to dissect the in vivo immunological effects of acute stress in humans."

Our news journalists obtained a quote from the research from University Hospital, "3,4-methylenedioxymethamphetamine (MDMA), methylphenidate (MPH), or both, were administered to healthy volunteers in a randomized, double-blind, placebo-controlled crossover-study. Lymphocyte subset frequencies, natural killer (NK) cell immune-phenotypes, and changes in effector function were assessed, and linked to stress hormone levels and expression of CD62L, CX3CR1, CD18, and stress hormone receptors on NK cells. MDMA/MPH >MDMA >MPH robustly induced an epinephrine-dominant stress response. Immunologically, rapid redistribution of peripheral blood lymphocyte-subsets towards phenotypically mature NK cells occurred. NK cytotoxicity was unaltered, but they expressed slightly reduced levels of the activating receptor NKG2D. Preferential circulation of mature NK cells was associated with high epinephrine receptor expression among this subset, as well as expression of integrin ligands previously linked to epinephrine-induced endothelial detachment. The acute epinephrine-induced stress response was characterized by rapid accumulation of mature and functional NK cells in the peripheral circulation."

According to the news editors, the research concluded: "This is in line with studies using other acute stressors and supports the role of the acute stress response in rapidly mobilizing the innate immune system to counteract incoming threats."

For more information on this research see: Stress-Induced In Vivo Recruitment of Human Cytotoxic Natural Killer Cells Favors Subsets with Distinct Receptor Profiles and Associates with Increased Epinephrine Levels. Plos One, 2015;10(12):e0145635. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Recent Findings from University of Agriculture Provides New Insights into Clinical Trials and Studies [A Novel Extract of Fenugreek Husk (FenuSMART (TM)) Alleviates Postmenopausal Symptoms and Helps to Establish the Hormonal Balance: A ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news reporting out of Bangalore, India, by NewsRx editors, research stated, "Despite the widespread use of hormone replacement therapy, various reports on its side effects have generated an increasing interest in the development of safe natural agents for the management of postmenopausal discomforts. The present randomized, double-blinded, placebo-controlled study investigated the effect of 90-day supplementation of a standardized extract of fenugreek (Trigonella foenum-graecum) (FenuSMART ™), at a dose of 1000 mg/day, on plasma estrogens and postmenopausal discomforts."

Our news journalists obtained a quote from the research from the University of Agriculture, "Eighty-eight women having moderate to severe postmenopausal discomforts and poor quality of life (as evidenced from the scores of Greene Climacteric Scale, short form SF-36 ® and structured medical interview) were randomized either to extract-treated (n = 44) or placebo (n = 44) groups. There was a significant (p < 0.01) increase in plasma estradiol (120%) and improvements on various postmenopausal discomforts and quality of life of the participants in the extract-treated group, as compared with the baseline and placebo. While 32% of the subjects in the extract group reported no hot flashes after supplementation, the others had a reduction to one to two times per day from the baseline stages of three to five times a day."

According to the news editors, the research concluded: "Further analysis of haematological and biochemical parameters revealed the safety of the extract and its plausible role in the management of lipid profile among menopausal women."

Our news journalists report that additional information may be obtained by contacting S.S. Begum, Univ Agr Sci, Bangalore 560065, Karnataka, India. Additional authors for this research include H.K. Jayalakshmi, H.G. Vidyavathi, G. Gopakumar, I. Abin, M. Balu, K. Geetha, S.V. Suresha, M. Vasundhara and I.M. Krishnakumar.

Recent Findings from University of Basel Provides New Insights into Chemical Biology (The best of both worlds: reaping the benefits from mammalian and bacterial therapeutic circuits)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Chemical Research - Chemical Biology have been published. According to news originating from Basel, Switzerland, by NewsRx correspondents, research stated, "Synthetic biology has revolutionized the field of biology in the last two decades. By taking apart natural systems and recombining engineered parts in novel constellations, it has not only unlocked a staggering variety of biological control mechanisms but it has also created a panoply of biomedical achievements, such as innovative diagnostics and therapies."

Our news journalists obtained a quote from the research from the University of Basel, "The most common mode of action in the field of synthetic biology is mediated by synthetic gene circuits assembled in a systematic and rational manner. This review covers the most recent therapeutic gene circuits implemented in mammalian and bacterial cells designed for the diagnosis and therapy of an extensive array of diseases."

According to the news editors, the research concluded: "Highlighting new tools for therapeutic gene circuits, we describe a future that holds a plethora of potentialities for the medicine of tomorrow."

The news correspondents report that additional information may be obtained from M. Fussenegger, University of Basel, Fac Life Sci, CH-4058 Basel, Switzerland.

Recent Findings from University of California Provides New Insights into Dengue Hemorrhagic Fever (Homotypic Dengue Virus Reinfections in Nicaraguan Children)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Mosquito-Borne Diseases - Dengue Hemorrhagic
Fever are discussed in a new report. According to news reporting out of Berkeley, California, by NewsRx editors, research stated, "Infection with any of the 4 related dengue virus serotypes (DENV-1-4) is thought to result in lifelong immunity to homotypic reinfection (ie, reinfection with the same serotype). Archived serum samples collected as part of an ongoing pediatric dengue cohort study in Nicaragua were tested for DENV by real-time reverse transcription polymerase chain reaction."

Financial supporters for this research include Thrasher Research Fund (early career award 11979 to J. J. W.), National Institute of Allergy and Infectious Diseases, National Institutes of Health, Pediatric Dengue Vaccine Initiative (grant VE-1 to E. H.), Bill and Melinda Gates Foundation and the Instituto Carlos Slim de la Salud (grant to E. H.).

Our news journalists obtained a quote from the research from the University of California, "Samples were collected from 2892 children who presented with an acute febrile illness clinically attributed to a non-DENV cause (hereafter, 'C cases'). Test results were added to a database of previously identified symptomatic dengue cases in the cohort to identify repeat infections. Four patients with homotypic DENV reinfections were identified and confirmed among 29 repeat DENV infections (13.8%) with serotype confirmation. Homotypic reinfections with DENV-1, DENV-2, and DENV-3 occurred 325-621 days after the initial infection. Each patient experienced 1 symptomatic dengue case and 1 DENV-positive C case, and 2 patients presented with symptomatic dengue during their second infection. These DENV-positive C cases did not elicit long-lived humoral immune responses, despite viremia levels of up to 6.44 log(10) copies per mL of serum. We describe the first set of virologically confirmed homotypic DENV reinfections."

According to the news editors, the research concluded: "Such cases challenge the current understanding of DENV immunity and have important implications for modeling DENV transmission."

Our news journalists report that additional information may be obtained by contacting E. Harris, University of California, Sch Public Hlth, Div Infect Dis & Vaccinol, Berkeley, CA 94720, United States. Additional authors for this research include A. Balmaseda, L. Gresh, M.K. Sahoo, M. Montoya, C.L. Wang, J. Abeynayake, G. Kuan, B.A. Pinsky and E. Harris.

Recent Findings from University of Cambridge Has Provided New Information about Neuropeptides (Role of enteroendocrine L-cells in arginine vasopressin-mediated inhibition of colonic anion secretion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Neuropeptides. According to news reporting originating in Cambridge, United Kingdom, by NewsRx journalists, research stated, "Arginine vasopressin (AVP) regulates fluid balance and blood pressure via AVP receptor (AVPR) 2 in the kidney and AVP receptor 1A in vascular smooth muscle. Its role in intestinal function has received less attention."

The news reporters obtained a quote from the research from the University of Cambridge, "We hypothesized that enteroendocrine L-cells producing glucagon-like peptide 1 (GLP-1) and peptide YY (PYY) may be a target of AVP and contribute to the control of fluid balance. Avpr1b expression was assessed by quantitative RT-PCR on fluorescence-activated cell sorting-isolated L- and control cells and was enriched in colonic L-cells. AVP stimulated GLP-1 and PYY release from primary cultured murine and human colonic cells and was associated with elevated calcium and cAMP concentrations in L-cells as measured in cultures from GLU-Cre/ROSA26-GCaMP3 and GLU-Epac2camps mice. An antagonist of AVPR1B reduced AVP-triggered hormone secretion from murine and human cells. In Ussing chambers, basolaterally applied AVP reduced colonic anion secretion and this effect was blocked by a specific neuropeptide Y receptor Y1 (NPY1R) antagonist. In human serum, PYY concentrations were higher in samples with raised osmolality or copeptin (a surrogate marker for AVP)."

According to the news reporters, the research concluded: "We propose that AVP activates L-cell AVPR1B, causing GLP-1 and PYY secretion. PYY in turn reduces colonic anion secretion via epithelial NPY1R. Our data suggest L-cells are active players in the hypothalamic control of intestinal fluid homeostasis, providing a potential link between the regulation of blood volume/pressure/osmolality and blood glucose."

Our news correspondents report that additional information may be obtained by contacting F. Reimann, University of Cambridge, Metab Res Labs, Addenbrookes Hospital, Wellcome TrustMRC Inst Metab Sci, Cambridge CB2 0QQ, United Kingdom. Additional authors for this research include J. Liver Diseases and Conditions - Fatty Liver

Recent Findings from University of Colorado Provides New Insights into Fatty Liver [Perilipin-2 Deletion Impairs Hepatic Lipid Accumulation by Interfering with Sterol Regulatory Element-binding Protein (SREBP) Activation and Altering the Hepatic ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Fatty Liver is now available. According to news reporting originating in Aurora, Colorado, by NewsRx journalists, research stated, "Perilipin-2 (PLIN2) is a constitutively associated cytoplasmic lipid droplet coat protein that has been implicated in fatty liver formation in non-alcoholic fatty liver disease. Mice with or without whole-body deletion of perilipin-2 (Plin2-null) were fed either Western or control diets for 30 weeks."

Financial support for this research came from National Institutes of Health.

The news reporters obtained a quote from the research from the University of Colorado, "Perilipin-2 deletion prevents obesity and insulin resistance in Western diet-fed mice and dramatically reduces hepatic triglyceride and cholesterol levels in mice fed Western or control diets. Gene and protein expression studies reveal that PLIN2 deletion suppressed SREBP-1 and SREBP-2 target genes involved in de novo lipogenesis and cholesterol biosynthetic pathways in livers of mice on either diet. GC-MS lipidomics demonstrate that this reduction correlated with profound alterations in the hepatic lipidome with significant reductions in both desaturation and elongation of hepatic neutral lipid species. To examine the possibility that lipidomic actions of PLIN2 deletion contribute to suppression of SREBP activation, we isolated endoplasmic reticulum membrane fractions from long-term Western diet-fed wild type (WT) and Plin2-null mice. Lipidomic analyses reveal that endoplasmic reticulum membranes from Plin2-null mice are markedly enriched in -3 and -6 long-chain polyunsaturated fatty acids, which others have shown inhibit SREBP activation and de novo lipogenesis."

According to the news reporters, the research concluded: "Our results identify PLIN2 as a determinant of global changes in the hepatic lipidome and suggest the hypothesis that these actions contribute to SREBP-regulated de novo lipogenesis involved in non-alcoholic fatty liver disease."

Our news correspondents report that additional information may be obtained by contacting J.L. McManaman, University of Colorado, Div Reprod Sci, Aurora, CO 80045, United States. Additional authors for this research include E. Bales, D.J. Orlicky and J.L. McManaman.

Recent Findings from University of Delaware Provides New Insights into Complementary and Alternative Medicine (Yoga Helps Put the Pieces Back Together: A Qualitative Exploration of a Community-Based Yoga Program for Cancer Survivors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Complementary and Alternative Medicine. According to news originating from Newark, Delaware, by NewsRx correspondents, research stated, "A qualitative research methods approach was used to explore the experiences of participants in an ongoing community-based yoga program developed for cancer survivors and their support persons. 25 participants took part in a series of semistructured focus groups following a seven-week yoga program and at three-and six-month follow-ups."

Financial supporters for this research include Social Sciences and Humanities Research Council of Canada, Alberta Innovates-Health Solutions, Vanier Canada Graduate scholarship, Canadian Imperial Bank of Commerce.

Our news journalists obtained a quote from the research from the University of Delaware, "Focus groups were transcribed verbatim and analyzed using a process of inductive thematic analysis. The group was comprised of 20 cancer survivors, who were diagnosed on average 25.40 (20.85) months earlier, and five support persons. Participants had completed the yoga program an average of 3.35 (3.66) times previously and attended approximately 1.64 (0.70) of three possible focus groups. Four key themes were identified: (1) safety and shared understanding; (2) cancer-specific yoga instruction; (3) benefits of yoga participation; (4) mechanisms of yoga practice. Qualitative research provides unique and in-depth insight into the yoga experience. Specifically, cancer survivors and support persons participating in a community-based yoga program discussed their experiences of change over time and were acutely aware of the beneficial effects of yoga on their physical, psychological, and social well-being."

According to the news editors, the research concluded: "Further, participants were able to articulate the mechanisms they perceived as underpinning the relationship between yoga and improved well-being as they developed their yoga practice."

For more information on this research see: Yoga Helps Put the Pieces Back Together: A Qualitative Exploration of a Community-Based Yoga Program for Cancer Survivors. Evidence-Based Complementary and Alternative Medicine, 2016;():1-10. Recent Findings from University of Fukui Provides New Insights into Spinal Cord Injury [alpha(1D)-Adrenoceptor blockade increases voiding efficiency by improving external urethral sphincter activity in rats with spinal cord injury]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Spinal Cord Injury have been published. According to news reporting from Fukui, Japan, by NewsRx journalists, research stated, "Ideal therapy for lower urinary tract dysfunction in patients with spinal cord injury (SCI) should decrease detrusor overactivity, thereby promoting urine storage at low intravesical pressure and promoting efficient voiding at low pressure by decreasing detrusor-sphincter dyssynergia. Here we investigated blockade of various alpha-adrenoceptors to determine the subtype that was principally responsible for improving the voiding dysfunction."

The news correspondents obtained a quote from the research from the University of Fukui, "The effects of the intravenous alpha-blocker naftopidil, the alpha-blocker BMY 7378, and the alpha-blocker silodosin were evaluated using cystometrography and external urethral sphincter-electromyography (EMG) in decerebrated, unanesthetized female Sprague-Dawley rats with chronic SCI following transection at Th8. Parameters measured included the voided volume, residual volume, voiding efficiency, and burst and silent periods on EMG. Compared with values in decerebrated non-SCI rats, EMG of decerebrated SCI rats revealed more prominent tonic activity, significantly shorter periods of bursting activity, and a reduced ratio of the silent to active period during bursting. Compared with the value before drug administration (control), the voiding efficiency was significantly increased by naftopidil (1 and 3 mg/kg) (<0.05 each), and the burst (<0.01 and <0.05, respectively) and silent periods (<0.01 each) on EMG were significantly lengthened. BMY 7378 (1 mg/kg) significantly increased voiding efficiency and lengthened the burst periods (<0.05 each). Silodosin did not affect any parameters."

According to the news reporters, the research concluded: "These results suggest that alpha-blockade reduces the urethral resistance associated with detrusor-sphincter dyssynergia, thus improving voiding efficiency in SCI rats."

Pike, Bethesda, MD 20814, USA.

Our news journalists report that additional information may be obtained by contacting O. Yokoyama, Univ Fukui, Dept. of Urol, Fac Med Sci, Fukui 9101193, Japan. Additional authors for this research include H. Yamauchi, H. Ito, H. Akino and O. Yokoyama.

Keywords for this news article include: Fukui, Japan, Asia, Central Nervous System Diseases and Conditions, Nervous System Trauma, Spinal Cord Injuries, Spinal Cord Injury, University of Fukui.

**Drugs and Therapies - Antiretrovirals**

**Recent Findings from University of Genoa Provides New Insights into Antiretrovirals (Switch from unboosted protease inhibitor to a single-tablet regimen containing rilpivirine improves cholesterol and triglycerides)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiretrovirals have been published. According to news originating from Genoa, Italy, by NewsRx correspondents, research stated, "This study aimed to evaluate the efficacy, tolerability and potential savings of combined antiretroviral therapy (cART) simplification from an unboosted protease inhibitor (PI) regimen with atazanavir or fosamprenavir to a single-tablet regimen (STR) based on rilpivirine/emtricitabine/tenofovir disoproxil fumarate (RPV/FTC/TDF) among HIV-1-infected patients with HIV-1 RNA <50 copies/mL. This was a retrospective, multicentre, open-label, 12-week trial."

Our news journalists obtained a quote from the research from the University of Genoa, "Plasma HIV-1-RNA levels, CD4+ cell counts, cholesterol, triglycerides, bilirubin, glycaemia, creatinine and physical examination were performed at baseline and at scheduled follow-up. All patient costs were calculated and were estimated for 52 weeks of therapy. Fifty-one patients were enrolled [28 male (54.9%)]. At baseline, 30 patients (58.8%) were treated with FTC/TDF, 20 (39.2%) with abacavir/lamivudine and 1 (2.0%) with lamivudine/zidovudine. Thirty-three patients (64.7%) received atazanavir. All patients maintained HIV-RNA <50 copies/mL; the median CD4+ cell count remained stable. Mean triglycerides decreased from 124 mg/dL (range, 39-625) at enrolment to 108.7 mg/dL (range, 39-561) at study end (P = 0.25). At baseline, mean cholesterol was 172.8 +/- 38.1 mg/dL and decreased to 161.9 +/- 38.6 mg/dL (P = 0.038); likewise, median total bilirubin decreased from 1.07 mg/dL (range, 0.2-4.7) to 0.6 mg/dL (range, 0.13-3.1) (P < 0.001). cART-related annual cost reduction with a STR was (sic) 3155.47 per patient (-24%). Non-cART patient management expenses were (sic)402.68 vs. (sic) 299.10 for atazanavir or fosamprenavir and STR regimens, respectively."

According to the news editors, the research concluded: "Switching to RPV/FTC/TDF from an unboosted PI in virologically suppressed HIV-infected patients is safe and is associated with a reduction in triglycerides, cholesterol and cART-related costs."

For more information on this research see: Switch from unboosted protease inhibitor to a single-tablet regimen containing rilpivirine improves cholesterol and triglycerides. International Journal of Antimicrobial Agents, 2016;48(5):551-554. International Journal of Antimicrobial Agents can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae
Recent Findings from University of Leeds Provide New Insights into Medical Genetics (Deficiency of the myogenic factor MyoD causes a perinatally lethal fetal akinesia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Health and Medicine - Medical Genetics is the subject of a report. According to news reporting originating from Leeds, United Kingdom, by NewsRx correspondents, research stated, "Lethal fetal akinesia deformation sequence (FADS) describes a clinically and genetically heterogeneous phenotype that includes fetal akinesia, intrauterine growth retardation, arthrogryposis and developmental anomalies. Affected babies die as a result of pulmonary hypoplasia."

Our news editors obtained a quote from the research from the University of Leeds, "We aimed to identify the underlying genetic cause of this disorder in a family in which there were three affected individuals from two sibships. Autosomal-recessive inheritance was suggested by a family history of consanguinity and by recurrence of the phenotype between the two sibships. We performed exome sequencing of the affected individuals and their unaffected mother, followed by autozygosity mapping and variant filtering to identify the causative gene. Five autozygous regions were identified, spanning 31.7 Mb of genomic sequence and including 211 genes. Using standard variant filtering criteria, we excluded all variants as being the likely pathogenic cause, apart from a single novel nonsense mutation, c.188C > A p.(Ser63*) (NM_002478.4), in MYOD1. This gene encodes an extensively studied transcription factor involved in muscle development, which has nonetheless not hitherto been associated with a hereditary human disease phenotype. We provide the first description of a human phenotype that appears to result from MYOD1 mutation."

According to the news editors, the research concluded: "The presentation with FADS is consistent with a large body of data demonstrating that in the mouse, MyoD is a major
controller of precursor cell commitment to the myogenic differentiation programme."

For more information on this research see: Deficiency of the myogenic factor MyoD causes a perinatally lethal fetal akinesia. Journal of Medical Genetics, 2016;53(4):264-9. (BMJ Publishing Group - group.bmj.com; Journal of Medical Genetics - jmg.bmj.com/)

The news editors report that additional information may be obtained by contacting C.M. Watson, Yorkshire Regional Genetics Service, St James's University Hospital, Leeds, UK School of Medicine, University of Leeds, St James's University Hospital, Leeds, UK. Additional authors for this research include L.A. Crinnion, H. Murphy, M. Newbould, S.M. Harrison, C. Lascelles, A. Antanaviciute, I.M. Carr, E. Sheridan, D.T. Bonthron and A. Smith.

Eye Diseases and Conditions - Proliferative...

Recent Findings from University of Liverpool Provides New Insights into Proliferative Vitreoretinopathy (Controlling drug release from non-aqueous environments: Moderating delivery from ocular silicone oil drug reservoirs to combat ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Proliferative Vitreoretinopathy. According to news reporting out of Liverpool, United Kingdom, by NewsRx editors, research stated, "In a number of cases of retinal detachment, treatment may require the removal of the vitreous humour within the eye and replacement with silicone oil to aid healing of the retina. The insertion of silicone oil offers the opportunity to also deliver drugs to the inside of the eye; however, drug solubility in silicone oil is poor and release from this hydrophobic drug reservoir is not readily controlled."

Our news journalists obtained a quote from the research from the University of Liverpool, "Here, we have designed a range of statistical graft copolymers that incorporate dimethylsiloxane and ethylene glycol repeat units within the side chains, allowing short chains of oligo(ethylene glycol) to be solubilised within silicone oil and provide hydrogen bond acceptor sites to interact with acid functional drug molecules. Our hypothesis included the potential for such interactions to be able to delay/control drug release and for polymer architecture and composition to play a role in the silicone oil miscibility of the targeted polymers. This strategy has been successfully demonstrated using both ibuprofen and all-trans retinoic acid; drugs with anti-inflammatory and anti-proliferation activity. After the copolymers were shown to be non-toxic to retinal pigment epithelial cells, studies of drug release using radiochemical approaches showed that the presence of 10 v/v% of a linear graft copolymer could extend ibuprofen release over three-fold (from 3 days to >9 days) whilst the release of all-trans retinoic from the silicone oil phase was extended to >72 days."

According to the news editors, the research concluded: "These timescales are highly clinically relevant showing the potential to tune drug delivery during the healing process and

...
offer an efficient means to improve patient outcomes."

For more information on this research see: Controlling drug release from non-aqueous environments: Moderating delivery from ocular silicone oil drug reservoirs to combat proliferative vitreoretinopathy. *Journal of Controlled Release*, 2016;244():41-51. *Journal of Controlled Release* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Hormones - Corpus Luteum Hormones**

**Recent Findings from University of Melbourne Advance Knowledge in Corpus Luteum Hormones [Time-dependent activation of prostacyclin and nitric oxide pathways during continuous i.v. infusion of serelaxin (recombinant human H2 relaxin)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hormones - Corpus Luteum Hormones have been published. According to news reporting originating from Parkville, Australia, by NewsRx correspondents, research stated, "In the RELAX-AHF trial, a 48 h i.v. serelaxin infusion reduced systemic vascular resistance in patients with acute heart failure. Consistent with preclinical studies, serelaxin augments endothelial vasodilator function in rat mesenteric arteries."

Our news editors obtained a quote from the research from the University of Melbourne, "Little is known about the contribution of endothelium-derived relaxing factors after a longer duration of continuous serelaxin treatment. Here we have assessed vascular reactivity and mechanistic pathways in mesenteric arteries and veins and the aorta after 48 or 72 h continuous i.v. infusion of serelaxin. Male rats were infused with either placebo or serelaxin (13.3 mg?kg(-1) ?h(-1)) via the jugular vein using osmotic minipumps. Vascular function was assessed using wire myography. Changes in gene and protein expression and 6-keto PGF1a levels were determined by quantitative PCR, Western blot and ELISA respectively. Continuous i.v. serelaxin infusion augmented endothelium-dependent relaxation in arteries (mesenteric and aorta) but not in mesenteric veins. In mesenteric arteries, 48 h i.v. serelaxin infusion increased basal NOS activity, associated with increased endothelial NOS (eNOS) expression. Interestingly, phosphorylated-eNOS(Ser1177), eNOS and basal NOS activity were reduced in mesenteric veins following 72 h serelaxin treatment. At 72 h, serelaxin treatment improved bradykinin-mediated relaxation through COX2-derived PGI2 production. Continuous i.v.
serelaxin infusion enhanced endothelial vasodilator function in arteries but not in veins. The underlying mediator at 48 h was NO but there was a transition to PGI2 by 72 h.

According to the news editors, the research concluded: "Activation of the PGI2-dependent pathway is key to the prolonged vascular response to serelaxin treatment."

Life Science Research - Developmental Biology

Recent Findings from University of Michigan Has Provided New Information about Developmental Biology (hPSC-derived lung and intestinal organoids as models of human fetal tissue)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Developmental Biology. According to news originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "In vitro human pluripotent stem cell (hPSC) derived tissues are excellent models to study certain aspects of normal human development. Current research in the field of hPSC derived tissues reveals these models to be inherently fetal-like on both a morphological and gene expression level."

Our news journalists obtained a quote from the research from the University of Michigan, "In this review we briefly discuss current methods for differentiating lung and intestinal tissue from hPSCs into individual 3-dimensional units called organoids. We discuss how these methods mirror what is known about in vivo signaling pathways of the developing embryo. Additionally, we will review how the inherent immaturity of these models lends them to be particularly valuable in the study of immature human tissues in the clinical setting of premature birth."

According to the news editors, the research concluded: "Human lung organoids (HLOs) and human intestinal organoids (HIOs) not only model normal development, but can also be utilized to study several important diseases of prematurity such as respiratory distress
syndrome (RDS), bronchopulmonary dysplasia (BPD), and necrotizing enterocolitis (NEC)."

For more information on this research see: hPSC-derived lung and intestinal organoids as models of human fetal tissue. *Developmental Biology*, 2016;420(2):230-238. Developmental Biology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Developmental Biology - www.journals.elsevier.com/developmental-biology/)

The news correspondents report that additional information may be obtained from J.R. Spence, University of Michigan, Sch Med, Center Organogenesis, Ann Arbor, MI, United States.

**Eye Diseases and Conditions - Optic Atrophy**

**Recent Findings from University of Montpellier Has Provided New Information about Optic Atrophy (WFS1 in Optic Neuropathies: Mutation Findings in Nonsyndromic Optic Atrophy and Assessment of Clinical Severity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Eye Diseases and Conditions - Optic Atrophy. According to news reporting originating in Montpellier, France, by NewsRx journalists, research stated, "To search for WFS1 mutations in patients with optic atrophy (OA) and assess visual impairment. Retrospective molecular genetic and clinical study."

The news reporters obtained a quote from the research from the University of Montpellier, "Patients with OA followed at a national referral center specialized in genetic sensory diseases. Mutation screening in WFS1 was performed by Sanger sequencing. WFS1-positive patients were evaluated on visual acuity (VA) and retinal nerve fiber layer (RNFL) thickness using time-domain (TD) or spectral-domain (SD) optical coherence tomography (OCT). Statistical analysis was performed. Mutation identification, VA values, and RNFL thickness in sectors. Biallelic WFS1 mutations were found in 3 of 24 unrelated patients (15%) with autosomal recessive nonsyndromic optic atrophy (arNSOA) and in 8 patients with autosomal recessive Wolfram syndrome (arWS) associated with diabetes mellitus and OA. Heterozygous mutations were found in 4 of 20 unrelated patients (20%) with autosomal dominant OA. The 4 WFS1-mutated patients of this latter group with hearing loss were diagnosed with autosomal dominant Wolfram-like syndrome (adWLS). Most patients had VA decrease, with logarithm of the minimum angle of resolution (logMAR) values lower in arWS than in arNSOA (1.530 vs. 0.440; P = 0.026) or adWLS (0.240; P = 0.006) but not differing between arNSOA and adWLS (P = 0.879). All patients had decreased RNFL thickness that was worse in arWS than in arNSOA (SD OCT, 35.50 vs. 53.80 mu m; P = 0.018) or adWLS (TD-OCT, 45.84 vs. 59.33 mu m; P = 0.049). The greatest difference was found in the inferior
bundle. Visual acuity was negatively correlated with RNFL thickness (r = -0.89; P = 0.003 in SD OCT and r = -0.75; P = 0.01 in TD-OCT). WFS1 is a gene causing arNSOA. Patients with this condition had significantly less visual impairment than those with arWS."

According to the news reporters, the research concluded: "Thus systematic screening of WFS1 must be performed in isolated, sporadic, or familial optic atrophies."

Our news correspondents report that additional information may be obtained by contacting C.P. Hamel, University of Montpellier, Montpellier, France. Additional authors for this research include I. Meunier, V. Daien, C. Baudoin, F. Halloy, B. Bocquet, C. Blanchet, C. Delettre, E. Eslenjaud, A. Roubertie, G. Lenaers and C.P. Hamel.

**Clinical Research - Clinical Trials and Studies**

**Recent Findings from University of Oslo Provides New Insights into Clinical Trials and Studies (Routine vs. on-demand analgesia in colonoscopy: a randomized clinical trial)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Clinical Research - Clinical Trials and Studies are presented in a new report. According to news reporting out of Oslo, Norway, by NewsRx editors, research stated, "Background and study aims: Colonoscopy is frequently performed with opioid analgesia, but the impact of drug delivery timing has not been studied in detail. Low-dose opioids administered before the procedure may provide better pain control than on-demand administration when the patient experiences pain."

Our news journalists obtained a quote from the research from the University of Oslo, "A total of 119 outpatients were randomized to receive 50 mu g of fentanyl either before colonoscopy (routine group) or on demand if needed during the colonoscopy (on-demand group). Additional fentanyl or midazolam was allowed in both groups if required. The primary outcome was pain measured on both a 100-mm visual analog scale (VAS; 0= no pain, 100= worst possible pain) and a four-point Likert scale (no, slight, moderate, or severe pain) immediately after the procedure. A total of 61 patients in the routine group and 58 patients in the on-demand group were included in the study. Mean VAS pain scores were 27.4mm in the routine group and 30.5mm in the on-demand group (mean difference -3.2mm; 95% confidence interval -11.9 to 5.5; P= 0.5). On the Likert scale, moderate or severe pain was experienced by
25.0% and 31.5% of patients in the routine and on-demand groups, respectively (p= 0.5). Cecal intubation rate and time to reach the cecum were similar between the groups. More patients in the on-demand group (81.0 %) than in the routine group (62.3 %) were able to leave the clinic without the need for recovery time (P= 0.03).

According to the research editors, the research concluded: "Routine administration of fentanyl did not provide better analgesia during colonoscopy than on-demand fentanyl, and more patients needed time for recovery."

For more information on this research see: Routine vs. on-demand analgesia in colonoscopy: a randomized clinical trial. Endoscopy, 2016;48(9):823-828. Endoscopy can be contacted at: Georg Thieme Verlag Kg, Rudigerstr 14, D-70469 Stuttgart, Germany. (Thieme - www.thieme.com)

Our news journalists report that additional information may be obtained by contacting O. Holme, University of Oslo, Inst Hlth & Soc, Oslo, Norway. Additional authors for this research include T. de Lange, A. Stallemo, H. Wiig, A. Hasund, K. Dvergsnes, K. Garborg, C.M. Ystrom, M. Loberg, G. Hoff, M. Brethauer and M. Kalager.

**Myeloid Cells**

**Recent Findings from University of Sydney Advance Knowledge in Myeloid Cells (Scanning Electron Microscopy Reveals Two Distinct Classes of Erythroblastic Island Isolated from Adult Mammalian Bone Marrow)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Myeloid Cells have been published. According to news reporting out of Camperdown, Australia, by NewsRx editors, research stated, "Erythroblastic islands are multicellular clusters in which a central macrophage supports the development and maturation of red blood cell (erythroid) progenitors. These clusters play crucial roles in the pathogenesis observed in animal models of hematological disorders."

Our news journalists obtained a quote from the research from the University of Sydney, "The precise structure and function of erythroblastic islands is poorly understood. Here, we have combined scanning electron microscopy and immuno-gold labeling of surface proteins to develop a better understanding of the ultrastructure of these multicellular clusters. The erythroid-specific surface antigen Ter-119 and the transferrin receptor CD71 exhibited distinct patterns of protein sorting during erythroid cell maturation as detected by immuno-gold labeling. During electron microscopy analysis we observed two distinct classes of erythroblastic islands. The islands varied in size and morphology, and the number and type of erythroid cells interacting with the central macrophage. Assessment of femoral marrow isolated from a cavid rodent species (guinea pig, Cavis porcellus) and a marsupial carnivore species (fat-tailed..."
dunnarts, Sminthopsis crassicaudata) showed that while the morphology of the central macrophage varied, two different types of erythroblastic islands were consistently identifiable."

According to the news editors, the research concluded: "Our findings suggest that these two classes of erythroblastic islands are conserved in mammalian evolution and may play distinct roles in red blood cell production."

For more information on this research see: Scanning Electron Microscopy Reveals Two Distinct Classes of Erythroblastic Island Isolated from Adult Mammalian Bone Marrow. *Microscopy and Microanalysis*, 2016;22(2):368-78. (Cambridge University Press - www.cambridge.org; Microscopy and Microanalysis - journals.cambridge.org/action/displayJournal?jid=MAM)

Our news journalists report that additional information may be obtained by contacting J.H. Yeo, 1Discipline of Anatomy & Histology, School of Medical Sciences, Bosch Institute, University of Sydney, Camperdown, NSW 2050, Australia. Additional authors for this research include B.M. McAllan and S.T Fraser.

**Recent Findings from University of Technology Has Provided New Data on Osteomyelitis (Calcium phosphate nanocoatings and nanocomposites, part 2: thin films for slow drug delivery and osteomyelitis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Osteomyelitis. According to news reporting originating from Broadway, Australia, by NewsRx correspondents, research stated, "During the last two decades although many calcium phosphate based nanomaterials have been proposed for both drug delivery, and bone regeneration, their coating applications have been somehow slow due to the problems related to their complicated synthesis methods. In order to control the efficiency of local drug delivery of a biomaterial the critical pore sizes as well as good control of the chemical composition is pertinent."

Our news editors obtained a quote from the research from the University of Technology, "A variety of calcium phosphate based nanocoated composite drug delivery systems are currently being investigated. This review aims to give an update into the advancements of calcium phosphate nanocoatings and thin film nanolaminates."

According to the news editors, the research concluded: "In particular recent research on PLA/hydroxyapatite composite thin films and coatings into the slow drug delivery for the possible treatment of osteomyelitis is covered."

The news editors report that additional information may be obtained by contacting B. Ben-Nissan, Faculty of Science, University of Technology Sydney, 15 Broadway, Ultimo NSW 2007, Australia. Additional authors for this research include I. Macha, S. Cazalbou and A.H Choi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2217/nnm.15.220. This DOI is a link to an online electronic document that is either free or for purchase.

Central Nervous System Diseases and Conditions -…

Recent Findings from University of Texas Has Provided New Information about Subarachnoid Hemorrhage [THSD1 (Thrombospondin Type 1 Domain Containing Protein 1) Mutation in the Pathogenesis of Intracranial Aneurysm and Subarachnoid Hemorrhage]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage are presented in a new report. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "A ruptured intracranial aneurysm (IA) is the leading cause of a subarachnoid hemorrhage. This study seeks to define a specific gene whose mutation leads to disease."

Our news journalists obtained a quote from the research from the University of Texas, "More than 500 IA probands and 100 affected families were enrolled and clinically characterized. Whole exome sequencing was performed on a large family, revealing a segregating THSD1 (thrombospondin type 1 domain containing protein 1) mutation. THSD1 was sequenced in other probands and controls. Thsd1 loss-of-function studies in zebrafish and mice were used for in vivo analyses and functional studies performed using an in vitro endothelial cell model. A nonsense mutation in THSD1 was identified that segregated with the 9 affected (3 suffered subarachnoid hemorrhage and 6 had unruptured IA) and was absent in 13 unaffected family members (LOD score 4.69). Targeted THSD1 sequencing identified mutations in 8 of 507 unrelated IA probands, including 3 who had suffered subarachnoid hemorrhage (1.6% [95% confidence interval, 0.8%-3.1%]). These THSD1 mutations/rare variants were highly enriched in our IA patient cohort relative to 89,040 chromosomes in Exome Aggregation Consortium (ExAC) database (P < 0.0001). In zebrafish and mice, Thsd1 loss-of-function caused cerebral bleeding (which localized to the subarachnoid space in mice) and increased mortality. Mechanistically, THSD1 loss impaired endothelial cell focal adhesion to the basement membrane. These adhesion defects could be rescued by expression of wild-type..."
THSD1 but not THSD1 mutants identified in IA patients. This report identifies THSD1 mutations in familial and sporadic IA patients and shows that THSD1 loss results in cerebral bleeding in 2 animal models."

According to the news editors, the research concluded: "This finding provides new insight into IA and subarachnoid hemorrhage pathogenesis and provides new understanding of THSD1 function, which includes endothelial cell to extracellular matrix adhesion."

For more information on this research see: THSD1 (Thrombospondin Type 1 Domain Containing Protein 1) Mutation in the Pathogenesis of Intracranial Aneurysm and Subarachnoid Hemorrhage. Stroke, 2016;47(12):3005-3013. Stroke can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Oncology - Cervical Cancer

Recent Findings from University of Texas Provides New Insights into Cervical Cancer (Quality of life after radical trachelectomy for early-stage cervical cancer: A 5-year prospective evaluation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Cervical Cancer. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "To longitudinally assess quality of life (QOL) in women undergoing radical trachelectomy for early-stage cervical cancer. We prospectively enrolled patients with stage IA1-IB1 cervical cancer prior to undergoing radical trachelectomy to complete validated QOL instruments."

The news reporters obtained a quote from the research from the University of Texas, "These instruments included the General Health-Related QOL (SF-12), Functional Assessment of Cancer Therapy-Cervix (FACT-Cx), MD Anderson Symptom Inventory (MDASI), Female Sexual Functioning Index (FSFI), and Satisfaction with Decision scale (SWD). Instruments were filled out at baseline, postoperatively at 6 weeks, 6 months, 1 year, and annually thereafter for 4 years. Thirty-nine patients enrolled in the study, and 32 patients were evaluable. The scores
for FSFI-arousal (p = 0.0002), lubrication (p < 0.0001), orgasm (p = 0.006), pain (p = 0.01), satisfaction (p = 0.03) and total score (p = 0.004) showed a significant decline at 6 weeks then returned to baseline levels by 6 months. The scores for FACT-Cx functional well-being (p = 0.02) and physical well-being (p < 0.0001), SF-12 bodily pain (p < 0.0001), physical functioning (p < 0.0001), role physical (p < 0.0001), role emotional (p = 0.03), social functioning (p = 0.002), and MDASI total (p = 0.04) showed significantly worsened symptoms at 6 weeks then returned to baseline by 6 months. The scores for FACT-Cx emotional well-being showed significant worsening of symptoms that persisted at 6-weeks (p = 0.004), 6 months (p = 0.007), 1 year (p = 0.001), 2 years (p = 0.002), and 4 years (p = 0.03). There was no difference in SWD. Several quality of life assessments decline immediately postoperatively after radical trachelectomy, however, return to baseline thereafter."

According to the news reporters, the research concluded: "The long-term emotional impact of this surgery highlights a need for perioperative counseling in these patients."

For more information on this research see: Quality of life after radical trachelectomy for early-stage cervical cancer: A 5-year prospective evaluation. Gynecologic Oncology, 2016;143(3):596-603. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Nutritional and Metabolic Diseases and Conditions -...

Recent Findings from University of Tokyo Provides New Insights into Type 2 Diabetes (J-curve relation between daytime nap duration and type 2 diabetes or metabolic syndrome: A dose-response meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Adequate sleep is important for good health, but it is not always easy to achieve because of social factors. Daytime napping is widely prevalent around the world."

Our news journalists obtained a quote from the research from the University of Tokyo, "We performed a meta-analysis to investigate the association between napping (or
excessive daytime sleepiness: EDS) and the risk of type 2 diabetes or metabolic syndrome, and
to quantify the potential dose-response relation using cubic spline models. Electronic databases
were searched for articles published up to 2016, with 288,883 Asian and Western subjects.
Pooled analysis revealed that a long nap (>= 60 min/day) and EDS were each significantly
associated with an increased risk of type 2 diabetes versus no nap or no EDS (odds ratio 1.46
(95% CI 1.23-1.74, p < 0.01) for a long nap and 2.00 (1.58-2.53) for EDS). In contrast, a short
nap (< 60 min/day) was not associated with diabetes (p = 0.75). Dose-response meta-analysis
showed a J-curve relation between nap time and the risk of diabetes or metabolic syndrome,
with no effect of napping up to about 40 minutes/day, followed by a sharp increase in risk at
longer nap times. In summary, longer napping is associated with an increased risk of metabolic
disease."

According to the news editors, the research concluded: "Further studies are needed to
confirm the benefit of a short nap."

For more information on this research see: J-curve relation between daytime nap
duration and type 2 diabetes or metabolic syndrome: A dose-response meta-analysis. Scientific
Reports, 2016;6():1-10. Scientific Reports can be contacted at: Nature Publishing Group,
Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group -
www.nature.com/; Scientific Reports - www.nature.com/srep/)

Pharmacokinetics
Recent Findings from University of Ulsan College of Medicine Has
Provided New Data on Pharmacokinetics (Population plasma and urine
pharmacokinetics of ivabradine and its active metabolite S18982 in
healthy Korean volunteers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Pharmacokinetics are discussed in a new report.
According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated,
"Ivabradine, a selective inhibitor of the pacemaker current (If), is used for heart failure and
coronary heart disease and is mainly metabolized to S18982. The purpose of this study was to
explore the pharmacokinetics (PK) of ivabradine and S18982 in healthy Korean volunteers."

The news correspondents obtained a quote from the research from the University of
Ulsan College of Medicine, "Subjects in a phase I study were randomized to receive 2.5, 5, or
10 mg of ivabradine administered every 12 hours for 4.5 days, and serial plasma and urine
concentrations of ivabradine and S18982 were measured. The plasma PK of ivabradine was best
described by a 2-compartment model with mixed 0-and first-order absorption, linked to a 2-
compartment model for S18982. The introduction of interoccasion variabilities and period as
covariate into absorption-related parameters improved the model fit. Urine data have been
applied to estimate renal and nonrenal clearance, enabling a more detailed description of the elimination process. We developed a population PK model describing the plasma and urine PK of ivabradine and S18982 in healthy Korean adult males."

According to the news reporters, the research concluded: "This model might be useful for predicting the plasma and urine PK of ivabradine, potentially helping to identify the optimal dosing regimens in various clinical situations."

Our news journalists report that additional information may be obtained by contacting H.Y. Choi, Dept. of Clinical Pharmacology and Therapeutics, Asan Medical Center, University of Ulsan College of Medicine, Seoul, South Korea. Additional authors for this research include K.S. Bae, S.H. Cho, J.L. Ghim, S. Choe, J.A. Jung and H.S Lim.

**Recent Findings from University of Ulsan Provides New Insights into Acinetobacter baumannii (In Vitro Synergistic Activity of Antimicrobial Agents in Combination against Clinical Isolates of Colistin-Resistant Acinetobacter baumannii)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Acinetobacter baumannii have been presented. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Emerging resistance to colistin in clinical Acinetobacter baumannii isolates is of growing concern. Since current treatment options for these strains are extremely limited, we investigated the in vitro activities of various antimicrobial combinations against colistin-resistant A. baumannii."

Financial support for this research came from Ministry of Health and Welfare (MOHW).

Our news journalists obtained a quote from the research from the University of Ulsan, "Nine clinical isolates (8 from bacteremia cases and 1 from a pneumonia case) of colistin-resistant A. baumannii were collected in Asan Medical Center, Seoul, South Korea, between January 2010 and December 2012. To screen for potential synergistic effects, multiple
combinations of two antimicrobials among 12 commercially available agents were tested using the multiple-combination bactericidal test (MCBT). Checkerboard tests were performed to validate these results. Among the 9 colistin-resistant strains, 6 were pandrug resistant and 3 were extensively drug resistant. With MCBT, the most effective combinations were colistin-rifampin and colistin-teicoplanin; both combinations showed synergistic effect against 8 of 9 strains. Colistin-aztreonam, colistin-meropenem, and colistin-vancomycin combinations showed synergy against seven strains. Colistin was the most common constituent of antimicrobial combinations that were active against colistin-resistant A. baumannii. Checkerboard tests were then conducted in colistin-based combinations. Notably, colistin-rifampin showed synergism against all nine strains (100%). Both colistin-vancomycin and colistin-teicoplanin showed either synergy or partial synergy. Colistin combined with another beta-lactam agent (aztreonam, ceftazidime, or meropenem) showed a relatively moderate effect. Colistin combined with ampicillin-sulbactam, tigecycline, amikacin, azithromycin, or trimethoprim-sulfamethoxazole demonstrated limited synergism."

According to the news editors, the research concluded: "Using MCBT and checkerboard tests, we found that only colistin-based combinations, particularly those with rifampin, glycopeptides, or beta-lactams, may confer therapeutic benefits against colistin-resistant A. baumannii."

For more information on this research see: In Vitro Synergistic Activity of Antimicrobial Agents in Combination against Clinical Isolates of Colistin-Resistant Acinetobacter baumannii. & Wellness Week -- Data detailed on Drugs and Therapies - Antibiotics have been presented. According to news originating from Salt Lake City, Utah, by NewsRx correspondents, research stated, "Surgical debridement and broad-spectrum empiric antibiotics are first-line therapy for necrotizing soft tissue infections (NSTI). The objective of this multi-center retrospective review was to evaluate antimicrobial agent initiation and duration and compare outcomes in the treatment of patients with NSTI."

Our news journalists obtained a quote from the research from the University of Utah, "This review included adults with NSTI, as indicated by International Classification of Diseases, 9th Edition, Clinical Modification codes 728.86, 608.33, or 040.0, who were admitted to three academic institutions between 1/1/09 and 5/15/14. Demographics, antibiotic practices, operative management, and clinical outcomes were compared. A total of 341 patients were identified at the three centers. Subjects were comparable in age (median 53 years, p=0.14), gender (67% male, p=0.57) and body mass index (median 31.9 (p=0.31) between sites. No significant difference was found in time from admission to start of empiric antibiotic therapy between the three centers (median 1 d for each, p=0.70), but duration of antibiotic therapy was significantly different (Site A=16 d, Site B=12 d, Site C=9 d, medians, p<0.001). Although total number of operations differed between sites (median of two at Sites A and B, three at Site C, p=0.001), sites consistently operated on the day of patient arrival to their facility, and the number of debridements did not differ (median of two for all sites, p=0.10). Mortality rate (Site A=22%, Site B=18%, and Site C=9%, p=0.02) and length of stay for survivors (Site A=29 d, Site B=16 d, Site C=19 d, medians, p=0.001) was significantly different among centers. Variation in antibiotic duration between centers with expertise in the care of NSTI illustrates how little is known about best care practices for patients with NSTI."

According to the news editors, the research concluded: "Future studies should emphasize development of evidence-based practices for NSTI management to further improve the outcomes of this complex group of patients."

For more information on this research see: A Multi-Center Review of Care Patterns and Outcomes in Necrotizing Soft Tissue Infections. Surgical Infections, 2016;17(6):773-778. Liver Diseases and Conditions - Hepatitis C Virus

Recent Findings from University of Utrecht Has Provided New Information about Hepatitis C Virus (Tyrphostin AG1478 Inhibits Encephalomyocarditis Virus and Hepatitis C Virus by Targeting Phosphatidylinositol 4-Kinase III alpha)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Hepatitis C Virus have been published. According to news reporting out of Utrecht, Netherlands, by NewsRx editors, research stated, "Encephalomyocarditis virus (EMCV), like hepatitis C virus (HCV), requires phosphatidylinositol 4-kinase III alpha(PI4KA) for genome replication."

Our news journalists obtained a quote from the research from the University of Utrecht, "Here, we demonstrate that tyrphostin AG1478, a known epidermal growth factor receptor (EGFR) inhibitor, also inhibits PI4KA activity, both in vitro and in cells. AG1478 impaired replication of EMCV and HCV but not that of an EMCV mutant previously shown to escape PI4KA inhibition."

According to the news editors, the research concluded: "This work uncovers novel cellular and antiviral properties of AG1478, a compound previously regarded only as a cancer chemotherapy agent."

For more information on this research see: Tyrphostin AG1478 Inhibits Encephalomyocarditis Virus and Hepatitis C Virus by Targeting Phosphatidylinositol 4-Kinase III alpha. Antimicrobial Agents and Chemotherapy, 2016;60(10):6402-6406. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Drugs and Therapies - Adrenal Cortical Steroids

Recent Findings from University of Western Australia Has Provided New Information about Adrenal Cortical Steroids (Maternofetal pharmacokinetics and fetal lung responses in chronically catheterized
sheep receiving constant, low-dose infusions ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Adrenal Cortical Steroids have been published. According to news reporting from Drugs and Therapies - Adrenal Cortical Steroids, research stated, "Antenatal steroids are standard of care for cases of anticipated preterm labor to improve neonatal outcomes. However, steroids are potent drugs, and their use in pregnancy remains largely unoptimized."

The news correspondents obtained a quote from the research from the University of Western Australia, "The objective of the study was to measure the maternofetal pharmacokinetics of constant, low-dose intravenous betamethasone phosphate infusions and correlate these data with the transcriptional effect exerted by subclinical betamethasone exposures on the ovine fetal lung. Thirty-two ewes carrying a single fetus had surgery to catheterize fetal and maternal jugular veins at 116 days of gestation (term, 150 days). Animals were recovered for 2 days and then were randomized to receive 2 sequential maternal intravenous infusions of either (n = 4/group) of the following: 1) saline, 0.125, 0.04, or 0.0125 mg/kg betamethasone phosphate over 3 hours; or 2) saline, 0.25, 0.08, or 0.025 mg/kg betamethasone phosphate over 12 hours. Each infusion was separated by 2 days. Fetal lung tissue was collected for analysis using quantitative polymerase chain reaction and an ovine-specific microarray. Plasma betamethasone levels from time-course catheter samples were determined by mass spectrometry. Data were assessed for distribution, variance, and tested by an analysis of variance. Betamethasone was detectable (>1 ng/mL) in fetal plasma only in animals randomized to 0.125 mg/kg 3 hour or 0.250 mg/kg 12 hour infusions. Fetal betamethasone half-lives were 1.7-2.8 times greater than maternal values. At maximum concentration, fetal plasma betamethasone levels were approximately 10% of maternal levels. Compared with saline control, all animals, other than those receiving 0.0125 mg/kg 3 hour betamethasone phosphate infusions, had evidence of dose-dependent glucocorticoid transcriptional responses in the fetal lung. Constant maternal betamethasone infusions delivering substantially lower fetal and maternal betamethasone maximal concentrations than those achieved with current clinical treatment protocols were associated with dose-dependent changes in glucocorticoid-response markers in the fetal lung."

According to the news reporters, the research concluded: "Further studies to determine the minimally efficacious dose of steroids for improving outcomes in preterm infants should be viewed as a priority."

Our news journalists report that additional information may be obtained by contacting M.W. Kemp, University of Western Australia, ARC Center Excellence, Sch Womens & Infants Hlth, Perth, WA, Australia. Additional authors for this research include M. Saito, H. Usuda, T.J. Molloy, Y. Miura, S. Sato, S. Watanabe, M. Clarke, M. Fossler, A. Schmidt, S.G. Kallapur, B.W. Kramer, J.P. Newnham and A.H. Jobe.

Recent Findings from University of Western Sydney Has Provided New Information about Cervical Cancer (Barriers to cervical cancer screening experienced by lesbian women: a qualitative study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cervical Cancer. According to news reporting from Penrith, Australia, by NewsRx journalists, research stated, "Aims and objectives. To provide deeper insights into the experiences of lesbian women in accessing cervical cancer screening and to inform strategies to increase the uptake of these services for this group of women."

The news correspondents obtained a quote from the research from the University of Western Sydney, "Lesbian women continue to face significant health disparities and are at increased risk for specific medical conditions. With cervical cancer being largely a preventable disease, early detection through the Papanicolaou test is crucial, as it enables treatment to commence early and limit the progression of the disease. Although the rates of cervical abnormalities among lesbian women are similar to that of the general population, lesbian women are less likely to have regular cervical screening. The reasons for this are largely unknown and there is a paucity of research that explores cervical cancer screening in lesbian women. Qualitative descriptive design. Participants (n = 9) were recruited via media release and those living in New South Wales who self-identified as lesbian, meeting the inclusion criteria were recruited for the study. Semi-structured, face to face and telephone interviews were used to obtain narrative data from lesbian women on their experiences of cervical screening. Three main themes emerged from the data: 'Lack of opportunistic screening'; 'Fear of penetration' and 'Encountering heterosexism and discrimination'. This current study builds on existing knowledge and further, has identified issues that have not been previously raised in the literature. New findings from this study highlight participants' fear of penetration, and stigma associated with accessing information, as substantial barriers to cervical screening. Relevance to clinical practice."

According to the news reporters, the research concluded: "This study's findings can guide future research and highlight possibilities for specific strategies to reduce health disparities among lesbian women."

Our news journalists report that additional information may be obtained by contacting C. Curmi, University of Western Sydney, Sch Nursing & Midwifery, Penrith, NSW 2751, Australia. Additional authors for this research include K. Peters and Y. Salamonson.

The direct object identifier (DOI) for that additional information is:
Recent Findings from University of York Has Provided New Information about Obesity (Simple tests for the diagnosis of childhood obesity: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating in York, United Kingdom, by NewsRx journalists, research stated, "There is a need to accurately quantify levels of adiposity in order to identify overweight and obesity in children. This systematic review aimed to identify all diagnostic accuracy studies evaluating simple tests for obesity and adiposity, including body mass index (BMI), skin-fold thickness and waist circumference, compared against high-quality reference tests."

The news reporters obtained a quote from the research from the University of York, "Twenty-four cohort studies including 25,807 children were included. BMI had good performance when diagnosing obesity: a sensitivity of 81.9% (95% confidence interval [CI]: 73.0 to 93.8) for a specificity of 96.0% (95% CI: 93.8 to 98.1). It was less effective at diagnosing overweight (sensitivity: 76.3%, 95% CI: 70.2 to 82.4; specificity: 92.1% 95% CI: 90.0 to 94.3). When diagnosing obesity, waist circumference had similar performance (sensitivity: 83.8%; specificity: 96.5%). Skin-fold thickness had slightly poorer performance (sensitivity: 72.5%; specificity: 93.7%). Few studies considered any other tests. There was no conclusive evidence that any test was generally superior to the others. BMI is a good simple diagnostic test for identifying childhood adiposity. It identifies most genuinely obese and adipose children while misclassifying only a small number as obese."

According to the news reporters, the research concluded: "There was no conclusive evidence that any test should be preferred to BMI, and the extra complexity of skin-fold thickness tests does not appear to improve diagnostic accuracy."

Our news correspondents report that additional information may be obtained by contacting M. Simmonds, University of York, Center Reviews & Disseminat, York YO10 5DD, N Yorkshire, United Kingdom. Additional authors for this research include A. Llewellyn, C.G. Owen and N. Woolacott.

Recent Findings from Veterans Affairs Medical Center Has Provided New Information about Inflammation (Loss of Junctional Adhesion Molecule A Promotes Severe Steatohepatitis in Mice on a Diet High in Saturated Fat, Fructose, and Cholesterol)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Inflammation. According to news reporting originating in Decatur, Georgia, by NewsRx journalists, research stated, "There is evidence from clinical studies that compromised intestinal epithelial permeability contributes to the development of nonalcoholic steatohepatitis (NASH), but the exact mechanisms are not clear. Mice with disruption of the gene (F11r) encoding junctional adhesion molecule A (JAM-A) have defects in intestinal epithelial permeability."

The news reporters obtained a quote from the research from Veterans Affairs Medical Center, "We used these mice to study how disruption of the intestinal epithelial barrier contributes to NASH. Male C57BL/6 (control) or F11r(-/-) mice were fed a normal diet or a diet high in saturated fat, fructose, and cholesterol (HFCD) for 8 weeks. Liver and intestinal tissues were collected and analyzed by histology, quantitative reverse-transcription polymerase chain reaction, and flow cytometry. Intestinal epithelial permeability was assessed in mice by measuring permeability to fluorescently labeled dextran. The intestinal microbiota were analyzed using 16S ribosomal RNA sequencing. We also analyzed biopsy specimens from proximal colons of 30 patients with nonalcoholic fatty liver disease (NAFLD) and 19 subjects without NAFLD (controls) undergoing surveillance colonoscopy. F11r(-/-) mice fed a HFCD, but not a normal diet, developed histologic and pathologic features of severe NASH including steatosis, lobular inflammation, hepatocellular ballooning, and fibrosis, whereas control mice fed a HFCD developed only modest steatosis. Interestingly, there were no differences in body weight, ratio of liver weight: body weight, or glucose homeostasis between control and F11r(-/-) mice fed a HFCD. In these mice, liver injury was associated with significant increases in mucosal inflammation, tight junction disruption, and intestinal epithelial permeability to bacterial endotoxins, compared with control mice or F11r(-/-) mice fed a normal diet. The HFCD led to a significant increase in inflammatory microbial taxa in F11r(-/-) mice, compared with control mice. Administration of oral antibiotics or sequestration of bacterial endotoxins with sevelamer hydrochloride reduced mucosal inflammation and restored normal liver histology in F11r(-/-) mice fed a HFCD. Protein and transcript levels of JAM-A were significantly lower in the intestinal mucosa of patients with NAFLD than without NAFLD; decreased expression of JAM-A correlated with increased mucosal inflammation. Mice with defects in intestinal epithelial permeability develop more severe steatohepatitis after a HFCD than control mice, and colon tissues from patients with NAFLD have lower levels of JAM-A and higher levels of inflammation than subjects without NAFLD. These findings indicate that intestinal epithelial barrier function and microbial dysbiosis contribute to the development of NASH."

According to the news reporters, the research concluded: "Restoration of intestinal barrier integrity and manipulation of gut microbiota might be developed as therapeutic strategies..."
for patients with NASH."

**Central Nervous System Diseases and Conditions —**

**Recent Findings from Walter Reed Army Institute of Research Has Provided New Information about Brain Injuries (Neurochemical changes following combined hypoxemia and hemorrhagic shock in a rat model of penetrating ballistic-like brain injury: A ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Central Nervous System Diseases and Conditions - Brain Injuries. According to news originating from Silver Spring, Maryland, by NewsRx correspondents, research stated, "Energy metabolic dysfunction is a key determinant of cellular damage following traumatic brain injury and may be worsened by additional insults. This study evaluated the acute/subacute effects of combined hypoxemia (HX) and hemorrhagic shock (HS) on cerebral interstitial levels of glucose, lactate, and pyruvate in a rat model of penetrating ballistic-like brain injury (PBBI)."

Our news journalists obtained a quote from the research from the Walter Reed Army Institute of Research, "Rats were randomly assigned into the sham control, PBBI, and combined injury (P + HH) groups. The P + HH group received PBBI followed by 30-minute HX and 30 minute HS. Samples were collected from striatum (perilesional region) using intracerebral microdialysis at 1 to 3 hours after injury and then at 1 to 3, 7, and 14 days after injury. Glucose, lactate, and pyruvate were measured in the dialysate samples. Glucose levels dropped significantly up to 24 hours following injury in both PBBI and P + HH groups (p < 0.05). A reduction in pyruvate was observed in the PBBI group from 24 to 72 hours after injury (vs. sham). In the P + HH group, the pyruvate was significantly reduced from 2 to 24 hours after injury (p < 0.05 vs. PBBI). This prominent reduction persisted for 14 days after injury. In contrast, lactate levels were significantly increased in the PBBI group during the first 24 hours after injury and remained elevated out to 7 days. The P + HH group exhibited a similar trend of
lactate increase as did the PBBI group. Critically, P + HH further increased the lactate-to-
pyruvate ratio by more than twofold (vs. PBBI) during the first 24 hours. The ratio reached a
peak at 2 hours and then gradually decreased, but the level remained significantly higher than
that in the sham control from 2 to 14 days after injury (p < 0.05). This study identified the
temporal profile of energy-related neurochemical dysregulation induced by PBBI and combined
injury in the perilesional region."

According to the news editors, the research concluded: "Furthermore, combined HX
and HS further reduced the pyruvate level and increased the lactate-to-pyruvate ratio following
PBBI, indicating the exacerbation of posttraumatic metabolic perturbation."

For more information on this research see: Neurochemical changes following
combined hypoxemia and hemorrhagic shock in a rat model of penetrating ballistic-like brain

**Oncology - Prostate Cancer**

**Recent Findings from Western University Provides New Insights into
Prostate Cancer (Target margins in radiotherapy of prostate cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to
news reporting from London, Canada, by NewsRx journalists, research stated, "We reviewed the
literature on the use of margins in radiotherapy of patients with prostate cancer, focusing on
different options for image guidance (IG) and technical issues. The search in PubMed database
was limited to include studies that involved external beam radiotherapy of the intact prostate."

The news correspondents obtained a quote from the research from Western
University, "Post-prostatectomy studies, brachytherapy and particle therapy were excluded. Each
article was characterized according to the IG strategy used: positioning on external marks using
room lasers, bone anatomy and soft tissue match, usage of fiducial markers, electromagnetic
tracking and adapted delivery. A lack of uniformity in margin selection among institutions was
evident from the review. In general, introduction of pre-and in-treatment IG was associated with
smaller planning target volume (PTV) margins, but there was a lack of definitive
experimental/clinical studies providing robust information on selection of exact PTV values. In
addition, there is a lack of comparative research regarding the cost-benefit ratio of the different
strategies: insertion of fiducial markers or electromagnetic transponders facilitates prostate
gland localization but at a price of invasive procedure; frequent pretreatment imaging increases patient in-room time, dose and labour; online plan adaptation should improve radiation delivery accuracy but requires fast and precise computation.

According to the news reporters, the research concluded: "Finally, optimal protocols for quality assurance procedures need to be established."

Our news journalists report that additional information may be obtained by contacting S. Yartsev, Western Univ, Dept. of Med Biophys, London, ON, Canada.

Keywords for this news article include: London, Ontario, Canada, North and Central America, Cancer, Article Review, Prostatic Neoplasms, Prostate Cancer, Radiotherapy, Oncology, Therapy, Western University.

**Adenocarcinomas**

**Recent Findings from Xi'an Jiao Tong University Provides New Insights into Adenocarcinomas (The Management and Prognostic Prediction of Adenocarcinoma of Appendix)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Adenocarcinomas. According to news reporting out of Shaanxi, People's Republic of China, by NewsRx editors, research stated, "Malignant tumours of the appendix are quite rare, especially appendiceal adenocarcinomas, which may be difficult to detect preoperatively or intraoperatively. We collected data for 1404 patients with adenocarcinoma of the appendix from the Surveillance, Epidemiology, and End Results Program (SEER) database to explore the potential associations between clinicopathological factors and overall survival."

Our news journalists obtained a quote from the research from Xi'an Jiao Tong University, "Furthermore, a novel nomogram for predicting prognosis was developed based on our analysis of the SEER data. The nomogram prediction model included seven prognostic factors derived based on different clinical estimates. When compared with the traditional tumour-node-metastasis (TNM) staging system, the nomogram prediction model showed superior discriminatory power (Harrell's C-index, 0.741 vs. 0.686) and a greater degree of similarity to actual 5-year overall survival after calibration (Akaike Information Criterion index, 5270.781 vs. 5430.141). Finally, we provide recommendations for the management of patients with adenocarcinoma of the appendix. Notably, we found the depth of adenocarcinoma invasion may be used as an indicator to determine the optimal surgical approach. For mucinous adenocarcinomas of the appendix, because these tumours are characterized by unique biological behaviour, intraoperative hyperthermic intraperitoneal chemotherapy (HIPEC) is recommended."

According to the news editors, the research concluded: "However, whether systematic chemotherapy should be administered to patients with adenocarcinoma of the appendix requires further investigation."

Keywords for this news article include: Shaanxi, People's Republic of China, Asia, Adenocarcinomas, Adenocarcinoma, Epidemiology, Xi'an Jiao Tong University.

Oncology - Cancer Research

Recent Findings from Yale University Provides New Insights into Cancer Research (Era of a Single Population-Based Payment to a Cancer Center Delivering the Value of Interventional Oncology in Accountable Care Organizations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Research.

According to news reporting from New Haven, Connecticut, by NewsRx journalists, research stated, "To curtail increasing health care costs, the government has ushered in the era of the Accountable care organization (ACO)."

The news correspondents obtained a quote from the research from Yale University, "The purposes of this review are to evaluate the effects the ACO will have on the practice of interventional oncology and its role in cancer care and to explore methods to assimilate. Proposed action points include integration into the modern-day cancer center, adoption of an outpatient clinic, mandatory performance measures, and workflow and cost analysis."

According to the news reporters, the research concluded: "If adaptations are made, interventional oncology can continue its role in cancer treatment, will provide more effective care, and reach more patients in the new ACO."

For more information on this research see: Era of a Single Population-Based Payment to a Cancer Center Delivering the Value of Interventional Oncology in Accountable Care Organizations. *Cancer Journal*, 2016;22(6):423-426. *Cancer Journal* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Recent Findings from Zhejiang University Advance Knowledge in Pancreatic Cancer (IR-780 Loaded Phospholipid Mimicking Homopolymeric Micelles for Near-IR Imaging and Photothermal Therapy of Pancreatic Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Pancreatic Cancer is now available. According to news reporting originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "IR-780 iodide, a near-infrared (near-IR) fluorescent dye, can be utilized as an effective theranostic agent for both imaging and photothermal therapy. However, its lipophilicity limits its further biomedical applications."

Funders for this research include Ministry of Education of the People's Republic of China, National Natural Science Foundation of China, Zhejiang Province.

Our news editors obtained a quote from the research from Zhejiang University, "Herein, we synthesized a phospholipid mimicking amphiphilic homopolymer poly(12-(methacryloyloxy)dodecyl phosphorylcholine) (PMDPC) via reversible addition-fragmentation chain transfer (RAFT) polymerization. The amphiphilic homopolymer PMDPC can be self-assembled into micelles and used for the encapsulation of IR-780. The IR-780 loaded micelles (PMDPC-IR-780) exhibited low cytotoxicity in the dark, whereas remarkable photothermal cytotoxicity to pancreatic cancer cells (BxPC-3) was observed upon near-IR laser irradiation. We further investigated in vivo biodistribution of PMDPC-IR-780 micelles. Higher accumulation of PMDPC-IR-780 than that of free IR-780 in tumor tissue was verified, which might be ascribed to the enhanced permeability and retention (EPR) effect and long circulation time benefitting from the zwitterionic phosphorylcholine surface."

According to the news editors, the research concluded: "Therefore, the IR-780 loaded phospholipid mimicking homopolymeric micelles could have great potential for cancer theranostics."

The news editors report that additional information may be obtained by contacting Y. Chen, MOE Key Laboratory of Macromolecular Synthesis and Functionalization, Dept. of Polymer Science and Engineering, Zhejiang University, Hangzhou 310027, People's Republic of China. Additional authors for this research include Z. Li, H. Wang, Y. Wang, H. Han, Q. Jin and J. Ji.

Neutral Amino Acids

Recent Findings from Zhejiang University Has Provided New Data on Neutral Amino Acids (Obg-like ATPase 1 regulates global protein serine/threonine phosphorylation in cancer cells by suppressing the GSK3b-inhibitor 2-PP1 positive feedback loop)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neutral Amino Acids. According to news reporting from Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "OLA1 is an Obg family P-loop NTPase that possesses both GTP-and ATP-hydrolyzing activities. Here we report that OLA1 is a GSK3b interacting protein, and through its ATPase activity, inhibits the GSK3b-mediated activation of protein serine/threonine phosphatase 1 (PP1)."

The news correspondents obtained a quote from the research from Zhejiang University, "It is hypothesized that GSK3b phosphorylates inhibitor 2 (I-2) of PP1 at Thr-72 and activates the PP1 ? I-2 complex, which in turn dephosphorylates and stimulates GSK3b, thus forming a positive feedback loop. We revealed that the positive feedback loop is normally suppressed by OLA1, and becomes over-activated under OLA1 deficiency, resulting in increased cellular PP1 activity and dephosphorylation of multiple Ser/Thr phosphoproteins, and more strikingly, decreased global protein threonine phosphorylation. Furthermore, using xenograft models of colon cancer (H116) and ovarian cancer (SKOV3), we established a correlation among downregulation of OLA1, over-activation of the positive feedback loop as indicated by under-phosphorylation of I-2, and more aggressive tumor growth."

According to the news reporters, the research concluded: "This study provides the first evidence for the existence of a GSK3b-I-2-PP1 positive feedback loop in human cancer cells, and identifies OLA1 as an endogenous suppressor of this signaling motif."

For more information on this research see: Obg-like ATPase 1 regulates global protein serine/threonine phosphorylation in cancer cells by suppressing the GSK3b-inhibitor 2-PP1 positive feedback loop. Oncotarget, 2016;7(3):3427-39.

Our news journalists report that additional information may be obtained by contacting D. Xu, Dept. of Surgical Oncology, The Second Affiliated Hospital, School of Medicine, Zhejiang University, Hangzhou, Zhejiang 310009, People's Republic of China. Additional authors for this research include R. Song, G. Wang, P.V. Jeyabal, A.M. Weiskoff, K. Ding and Z.Z Shi.

Eye Diseases and Conditions - Age-Related Macular... 

Recent Findings in Age-Related Macular Degeneration Described by Researchers from Xi'an Jiao Tong University (The Association between LIPC rs493258 Polymorphism and the Susceptibility to Age-Related Macular Degeneration)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Eye Diseases and Conditions - Age-Related Macular Degeneration. According to news reporting originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "The purpose of this study was to evaluate the association of the hepatic lipase (LIPC) rs493258 polymorphism and susceptibility to age-related macular degeneration (AMD). A systematic search in PubMed, EMBASE, and ISI web of science databases was performed to identify eligible published studies without language restrictions up to April 2016."

Our news editors obtained a quote from the research from Xi'an Jiao Tong University, "Pooled odds ratios (ORs) with 95% confidence intervals (CIs) in different stages of AMD were estimated under different genetic models using meta-analytic methods. Seven studies comprising 20,559 cases and 17,200 controls met the inclusion criteria and were included in the meta-analysis. The LIPC rs493258 polymorphism showed a significant association with a lower risk of AMD under the allelic model (OR = 0.87, 95% CI = 0.84-0.90). Significant relationships between the variant and AMD were also observed in other genetic models (OR ranging from 0.71 to 0.86, all p<0.05). Stratified analysis based on ethnicity found that LIPC rs493258 polymorphism had a significant association with the decreased risk of the disease in the Caucasian population, but not in the Asian population. For late AMD, significant associations of the rs493258 polymorphism with a lower risk of this disease were also observed in the allelic genetic model (OR = 0.87, 95% CI = 0.83-0.90). This meta-analysis demonstrates that the T allele in the LIPC rs493258 polymorphism was significantly associated with the risk of any and late AMD."

According to the news editors, the research concluded: "The associations of the locus with early and late AMD risk in various populations need further exploration."

For more information on this research see: The Association between LIPC rs493258 Polymorphism and the Susceptibility to Age-Related Macular Degeneration. *International Journal of Environmental Research and Public Health*, 2016;13(10):1189-1198. *International Journal of Environmental Research and Public Health* can be contacted at: Mdpi Ag, St Albans-Anlage 66, Ch-4052 Basel, Switzerland.

The news editors report that additional information may be obtained by contacting Y.F. Wang, Xi An Jiao Tong Univ, Sch Public Hlth, Hlth Sci Center, Xian 710061, People's Republic of China. Additional authors for this research include M.X. Wang, X.Q. Zhang, J. Nie, M. Zhang, X.H. Liu and L. Ma.

Drugs and Therapies - Alendronate Therapy

Recent Findings in Alendronate Therapy Described by Researchers from Federal University (Solid-State Phase Transition Mechanism and Physical-Chemical Study of the Crystal Forms of Monosodium Alendronate: Trihydrate versus Anhydrate)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Alendronate Therapy are presented in a new report. According to news reporting originating from Alenafas, Brazil, by NewsRx correspondents, research stated, "Alendronic acid is one of the most effective diphosphonate compounds used for clinical treatment of bone disorders. It is administered orally as its monosodium salt, for which hydrate and anhydrous crystal forms are known."

Our news editors obtained a quote from the research from Federal University, "The monosodium alendronate trihydrate form (NaH(4)A center dot 3H(2)O) is incorporated into medicines as the Active Pharmaceutical Ingredient (API). The NaH(4)A center dot 3H(2)O form can be dehydrated at temperatures above 115 degrees C, resulting in the anhydrous form (NaH(4)A). Although the crystal structures of both forms have already been reported, an investigation of the reversible dehydration/hydration solid-phase transition is presented here for the first time. A solid-state mechanism for the phase transition, which involves the reversible dehydration-hydration of the NaH(4)A center dot 3H(2)O and NaH(4)A forms, is also proposed. A systematic study comparing the equilibrium solubility and discriminatory intrinsic dissolution of the NaH(4)A center dot 3H(2)O and NaH(4)A forms is included. To achieve this goal, an alternative method of quantifying alendronate anions released from the crystal forms into solution, flame photometry, is proposed and validated."

According to the news editors, the research concluded: "The stability and interconversion of the NaH(4)A center dot 3H(2)O and NaH(4)A forms are probed by differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), Fourier transform infrared spectroscopy-attenuated total reflectance (FTIR-ATR), and powder X-ray diffraction (PXRD)."

The news editors report that additional information may be obtained by contacting A.C. Doriguetto, Univ Fed Alenafas, Inst Quim, Lab Cristallog, BR-37130000 Alenafas, MG, Brazil. Additional authors for this research include A.L.M. Viana, O. Viana and A.C. Doriguetto.

Keywords for this news article include: Alenafas, Brazil, South America, Alendronate Therapy Sodium, Drugs and Therapies, Bisphosphonates, Pharmaceuticals, Hormones, Federal University.

Hematologic Diseases and Conditions - Anemia

Recent Findings in Anemia Described by Researchers from University of Florida (End-tidal carbon dioxide and occult injury in trauma patients ETCO2 does not rule out severe injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematologic Diseases and Conditions - Anemia. According to news reporting originating from Jacksonville, Florida, by NewsRx correspondents, research stated, "To determine if early measurement of end-tidal carbon dioxide (ETCO2) in nonintubated patients triaged to a level 1 trauma center has utility in ruling out severe injury. We performed a prospective cohort study of adult patients triaged to our urban, academic, level 1 trauma center."

Our news editors obtained a quote from the research from the University of Florida, "Included patients had ETCO2 measured within 30 minutes of arrival. Chart review was performed on enrolled patients to identify severe injury defined by: admission to an intensive care unit, need for an invasive procedure, blood product transfusion, acute blood loss anemia, and acute clinically significant finding on computed tomographic scan. Of 170 patients enrolled, 115 met the outcome of no severe injury. Mean ETCO2 for patients without and with severe injury was 33.1mmHg (SD, 5.8) and 30.3mmHg (SD, 6.7), respectively. This difference reached statistical significance (P = .05), but did not demonstrate added clinical utility when combined with Glasgow Coma Scale, systolic blood pressure, and age in predicting the primary outcome (area under curve, 0.70 with ETCO2 vs area under curve, 0.68 without ETCO2, P = .5). Patients with ETCO2 <= 30mmHg were found to be older, more likely to require intensive care unit admission or emergency operative intervention, develop acute blood loss anemia, and have an acute finding on computed tomography than patients with a higher ETCO2. End-tidal carbon dioxide cannot be used to rule out severe injury in patients meeting criteria for trauma center care."

According to the news editors, the research concluded: "The ETCO2 <= 30 mm Hg may be associated with increased risk of traumatic severe injury."

The news editors report that additional information may be obtained by contacting D.J. Williams, University of Florida, Dept. of Emergency Med, Jacksonville, FL 32209, United States. Additional authors for this research include F.W. Guirgis, T.K. Morrissey, J. Wilkerson, R.L. Wears, C. Kalynych, A.J. Kerwin and S.A. Godwin.

Keywords for this news article include: Jacksonville, Florida, United States, North and Central America, Hematologic Diseases and Conditions, Inorganic Carbon Compounds, Carbon Dioxide, Chemicals, Anemia, University of Florida.

Recent Findings in Antiepileptics Described by Researchers from Albany College of Pharmacy and Health Sciences (Anticonvulsants Based on the a-Substituted Amide Group Pharmacophore Bind to and Inhibit Function of Neuronal Nicotinic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antiepileptics have been presented. According to news reporting out of Albany, New York, by NewsRx editors, the research stated, "Although the antiepileptic properties of a-substituted lactams, acetamides, and cyclic imides have been known for over 60 years, the mechanism by which they act remains unclear. I report here that these compounds bind to the nicotinic acetylcholine receptor (nAChR) and inhibit its function."

Financial supporters for this research include Epilepsy Foundation, Partnership for Pediatric Epilepsy Research.

Our news journalists obtained a quote from the research from the Albany College of Pharmacy and Health Sciences, "Using transient kinetic measurements with functionally active, nondesensitized receptors, I have discovered that (i) a-substituted lactams and cyclic imides are noncompetitive inhibitors of heteromeric subtypes (such as a4b2 and a3b4) of neuronal nAChRs and (ii) the binding affinity of these compounds toward the nAChR correlates with their potency in preventing maximal electroshock (MES)-induced convulsions in mice. Based on the hypothesis that a-substituted amide group is the essential pharmacophore of these drugs, I found and tested a simple compound, 2-phenylbutyramide. This compound indeed inhibits nAChR and shows good anticonvulsant activity in mice. Molecular docking simulations suggest that a-substituted lactams, acetamides, and cyclic imides bind to the same sites on the extracellular domain of the receptor."

According to the news editors, the research concluded: "These new findings indicate that inhibition of brain nAChRs may play an important role in the action of these antiepileptic drugs, a role that has not been previously recognized."

For more information on this research see: Anticonvulsants Based on the a-Substituted Amide Group Pharmacophore Bind to and Inhibit Function of Neuronal Nicotinic Acetylcholine Receptors. Acs Chemical Neuroscience, 2016;7(3):316-26. (American Chemical Society - www.acs.org; Acs Chemical Neuroscience - www.pubs.acs.org/journal/acncdm)

Drugs and Therapies - Antiretrovirals

Recent Findings in Antiretrovirals Described by Researchers from University of Toronto (A Multi-State Model Examining Patterns of Transitioning Among States of Engagement in Care in HIV-Positive Individuals Initiating Combination Antiretroviral Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antiretrovirals is now available. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "Common measures of engagement in care fail to acknowledge that infrequent follow-up may occur either intentionally among patients with sustained virologic suppression or unintentionally among patients with poor clinical outcomes. Five states of HIV care were defined within the Canadian Observational Cohort Collaboration following combination antiretroviral therapy (cART) initiation: (1) guidelines HIV care [suppressed viral load (VL) and CD4 >200 cells per cubic millimeter, no gaps in cART >3 months, no gaps in CD4 or VL measurement >6 months], (2) successful care with decreased frequency of follow-up (as above except no gaps in CD4 or VL measurement >12 months), (3) suboptimal care (unsuppressed VL, CD4,200 cells per cubic millimeter on 2 consecutive visits, >= 1 gap in cART >3 months, or >= 1 gap in CD4 or VL measurement >12 months), (4) loss to follow-up (no contact for 18 months), and (5) death."

Our news journalists obtained a quote from the research from the University of Toronto, "Multi-state models were used to determine factors associated with transitioning among states. In total, 7810 participants were included. Younger age, female gender, Indigenous ethnicity, and people who have injected drugs were associated with increased likelihoods of transitioning from guidelines to suboptimal care and decreased likelihoods of transitioning from suboptimal to guidelines care. One-fifth of individuals in successful, decreased follow-up after cART initiation (mean sojourn time 0.72 years) were in suboptimal care in subsequent years. Using routinely collected data, we have developed a flexible framework that characterizes patient transitions among states of HIV clinical care."

According to the news editors, the research concluded: "We have demonstrated that multi-state models provide a useful approach to supplement 'cascade of care' work."

For more information on this research see: A Multi-State Model Examining Patterns of Transitioning Among States of Engagement in Care in HIV-Positive Individuals Initiating Combination Antiretroviral Therapy. Jaulds-Journal of Acquired Immune Deficiency Syndromes, 2016;73(5):531-539. Recent Findings in Anxiolytics Sedatives and Hypnotics Described by L.R. Pinto Jr and Colleagues (Eszopiclone versus zopiclone in the treatment of insomnia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Anxiolytics Sedatives and Hypnotics. According to news reporting originating in Sao Paulo, Brazil, by NewsRx journalists, research stated, "To determine the therapeutic effects of two selective GABA-A agonists, zopiclone and eszopiclone, in the treatment of insomnia. This study comprised a phase III, single-center, randomized, double-blind, double-dummy, parallel-group, non-inferiority trial."

The news reporters obtained a quote from the research, "Patients were randomized to receive zopiclone 7.5 mg or eszopiclone 3 mg, both orally, for four weeks. In total, 199 patients were evaluated during two visits and then followed for at least six weeks. The primary endpoint was the Insomnia Severity Index after four weeks of treatment. Secondary endpoints were obtained through polysomnography data, including total sleep time, sleep latency and sleep efficiency. The frequency of adverse events was also analyzed. ClinicalTrials.gov: NCT01100164. The primary efficacy analysis demonstrated the non-inferiority of eszopiclone over zopiclone. Analysis of objective parameters assessed by polysomnography showed that eszopiclone increased total sleep time and also improved sleep efficiency. The safety profile of both study treatments was similar and the most common events reported in both groups were dysgeusia, headache, dizziness, irritability and nausea. Adverse events were observed in 223 patients, 109 (85.2%) in the eszopiclone group and 114 (87.7%) in the zopiclone group."

According to the news reporters, the research concluded: "Based on the Insomnia Severity Index at the end of four weeks of treatment, eszopiclone demonstrated efficacy comparable to that of zopiclone in the treatment of insomnia, increasing total sleep time as well as sleep efficiency according to polysomnography."

Our news correspondents report that additional information may be obtained by contacting L.R. Pinto Jr, Departamento de Psicobiologia, Universidade Federal de Sao Paulo (UNIFESP), Sao Paulo, SP, Brazil. Additional authors for this research include L.R. Bittencourt, E.C. Treptow, L.R. Braga and S. Tufik.

Recent Findings in Aplastic Anemia Described by Researchers from Kyung Hee University (Invasive Fungal Sinusitis by Lasiodiplodia theobromae in an Patient with Aplastic Anemia: An Extremely Rare Case Report and Literature Review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Bone Marrow Diseases and Conditions - Aplastic Anemia are presented in a new report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Human Lasiodiplodia theobromae infection has not been reported frequently. We report the first case of invasive L. theobromae nasal and neck infection."

Our news editors obtained a quote from the research from Kyung Hee University, "A 66-year-old male visited our hospital with anemia and general weakness. He showed pancytopenia, and his bone marrow examination revealed markedly decreased hematopoietic cells. The patient was presumed to have iatrogenic aplastic anemia due to mushroom toxicity. He began treatment for multiple organ infections with broad-spectrum antibiotics and antifungal agents. During hospitalization, he complained of nasal obstruction and left neck lymph node enlargement. A mass-like lesion was observed, and a nasal mass biopsy was performed. The mass was identified as a fungal ball. He underwent surgical excision for the nasal mass and the neck lymph node. The pathologic examination indicated an invasive fungal infection, and the lymph node revealed chronic granulomatous inflammation with fungal infection. 18s rRNA sequencing revealed that the sequence shared 99 % identity with L. theobromae. The nasal mass fungus was identified by internal transcribed spacer region sequencing from pathologic paraffin sections. The obtained sequence corresponded to Lasiodiplodia or Macrophoma. The sequence corresponded to the neck discharge sequence results. Hence, the patient was diagnosed with invasive fungal sinusitis with neck lymph node involvement caused by L. theobromae. To our knowledge, this is the first report of L. theobromae infection in Korea and the first report of invasive L. theobromae fungal sinusitis in the literature."

According to the news editors, the research concluded: "We should include more precise evaluations of additional novel fungal species as possible candidates."

For more information on this research see: Invasive Fungal Sinusitis by Lasiodiplodia theobromae in an Patient with Aplastic Anemia: An Extremely Rare Case Report and Literature Review. Mycopathologia, 2016;181(11-12):901-908. Mycopathologia can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Mycopathologia - www.springerlink.com/content/0301-486x/)

Recent Findings in Applied Bioinformatics Described by Researchers from Nanjing Medical University (Expression and prognostic value of E2F activators in NSCLC and subtypes: a research based on bioinformatics analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Applied Bioinformatics have been presented. According to news reporting from Changzhou, People's Republic of China, by NewsRx journalists, research stated, "E2F activators (E2F1-3) codify a family of transcription factors (TFs) in higher eukaryotes. E2F activators are involved in the cell cycle regulation and synthesis of DNA in mammalian cells, and their overexpression has been detected in many human cancers."

The news correspondents obtained a quote from the research from Nanjing Medical University, "However, their clinical significance has not been deeply researched in non-small-cell lung cancer (NSCLC), and bioinformatics analysis has never been reported to explore their clinical role in NSCLC. In the current study, we investigated the expression and prognostic value of E2F activators in NSCLC patients through the 'TCGA datasets' and the 'Kaplan-Meier plotter' (KM plotter) database. Hazard ratio (HR), 95% confidence intervals, and log-rank P were calculated. Compared with normal tissue samples, E2F activators were overexpressed in NSCLC tissues, in lung adenocarcinoma (LUAD) tissues, and in lung squamous cell carcinoma (LUSC) tissues. In NSCLC patients, E2F1 expression was significantly correlated with age, sex, and tumor stage. E2F2 expression was found to be significantly correlated with sex and tumor size. We further demonstrated that E2F1 and E2F2 overexpressions were significantly associated with poor prognosis. In LUAD patients, E2F1 expression was significantly correlated with tumor size and tumor stage. E2F2 expression was significantly correlated with lymph node status and tumor stage. E2F1 and E2F2 overexpression showed a significant association with poor prognosis, while E2F3 overexpression was significantly correlated to better prognosis. In LUSC patients, E2F1 was concluded to be significantly correlated with tumor stage."

According to the news reporters, the research concluded: "However, E2F activators were not found to be correlated to prognosis."

For more information on this research see: Expression and prognostic value of E2F activators in NSCLC and subtypes: a research based on bioinformatics analysis. Tumor Biology, 2016;37(11):14979-14987. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. Arrhythmia

Recent Findings in Arrhythmia Described by Researchers from Children's Hospital (Arrhythmias After Stage I Hybrid Palliation in Single-Ventricle Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Arrhythmia are presented in a new report. According to news reporting from Columbus, Ohio, by NewsRx journalists, research stated, "The hybrid procedure is an alternative palliative strategy for patients with single-ventricle physiology. No data exist documenting the incidence of arrhythmias after the hybrid procedure."

The news correspondents obtained a quote from the research from Children's Hospital, "Goal of this study was to determine the incidence and type of arrhythmias in patients undergoing the hybrid procedure. A retrospective chart review was performed including all patients undergoing the hybrid procedure between January of 2010 through December of 2013. Sixty-five patients underwent the hybrid procedure during this time period (43 HLHS, 22 other). Average gestational age at admission was 37.7 weeks. Average age at time of procedure was 7.6 days. Five patients had documented arrhythmias (7.7%). Four were supraventricular tachycardias, and 1 was a sinus bradycardia. One patient with arrhythmia died during hospitalization, and another patient with arrhythmia died during the interstage period. Hybrid palliation for patients with single-ventricle physiology has a low incidence of arrhythmias. In this cohort of patients, arrhythmias did not contribute to mortality."

According to the news reporters, the research concluded: "There was a trend toward association between arrhythmias and longer total length of hospital stay."

For more information on this research see: Arrhythmias After Stage I Hybrid Palliation in Single-Ventricle Patients. Pediatric Cardiology, 2016;37(8):1416-1421. Pediatric Cardiology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Pediatric Cardiology - www.springerlink.com/content/0172-0643/)

Recent Findings in Asthma Described by Researchers from Department of Internal Medicine (Autophagy in airway diseases: a new frontier in human asthma?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Asthma have been published. According to news originating from Davis, California, by NewsRx correspondents, research stated, "The study of autophagy ('self-eating'), a fundamental cell fate pathway involved in physiological and pathological subcellular processes, opens a new frontier in the continuous search for novel therapies for human asthma. Asthma is a complex syndrome with different disease phenotypes."

Financial supporters for this research include National Institutes of Health, Manitoba Medical Services Foundation.

Our news journalists obtained a quote from the research from the Department of Internal Medicine, "Autophagy plays a central role in cell physiology, energy and metabolism, and cell survival. Autophagy's hallmark is the formation of double-membrane autophagic autophagosomes, and this process is operational in airway epithelial and mesenchymal cells in asthma. Genetic associations between autophagy genes and asthma have been observed including single nucleotide polymorphisms in Atg5 which correlate with reduced lung function. Immune mechanisms important in asthma such as Th2 cells and eosinophils also manifest autophagy. Lastly, we address the role of autophagy in extracellular matrix deposition and fibrosis in asthmatic airways remodeling, a pathologic process still without effective therapy, and discuss potential pharmacologic inhibitors."

According to the news editors, the research concluded: "We end by offering two opposing but plausible hypotheses as to how autophagy may be directly involved in airway fibrosis."

The news correspondents report that additional information may be obtained from A.A. Zeki, Division of Pulmonary, Critical Care and Sleep Medicine, Dept. of Internal Medicine, Center for Comparative Respiratory Biology and Medicine, Davis, CA, United States. Additional authors for this research include B. Yeganeh, N.J. Kenyon, M. Post and S. Ghavami.

Cardiovascular Diseases and Conditions...

**Recent Findings in Atherosclerosis Described by Researchers from Huazhong University of Science and Technology (Selenoprotein S Is Highly Expressed in the Blood Vessels and Prevents Vascular Smooth Muscle Cells From Apoptosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Atherosclerosis have been presented. According to news originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "Atherosclerosis and related cardiovascular diseases (CVD) represent one of the greatest threats to human health worldwide. The protection of vascular smooth muscle cells (VSMCs) from apoptosis in the plaque has become an important therapeutic target for atherosclerotic plaque stabilization."

Funders for this research include National Natural Science Foundation of China, Excellent Youth Foundation of Hubei Scientific Committee.

Our news journalists obtained a quote from the research from the Huazhong University of Science and Technology, "A significant association of selenoprotein S (SelS) gene polymorphism with atherosclerotic CVD has been reported in epidemiologic studies, but the underlying mechanism remains unknown. In this paper, SelS expression in the thoracic aorta and its role in the protection of VSMCs from apoptosis have been studied. Western blot analysis showed that SelS was highly expressed in rat thoracic aorta. SelS gene silence by small interference RNA (siRNA) rendered VSMCs more sensitive to hydrogen peroxide or tunicamycin-induced injury and apoptosis, as determined by MTT assay, Hoechst staining, and annexin V/propidium iodide staining. SelS silence aggravated hydrogen peroxide-induced oxidative stress and phosphorylation of p38 MAPK and c-Jun N-terminal kinase (JNK) in VSMCs. Furthermore, SelS silence enhanced endoplasmic reticulum (ER) stress induced by hydrogen peroxide or tunicamycin, as showed by the increased protein levels of ER chaperone 78 kDa glucose-regulated protein (GRP78), ER stress transducer phosphorylated protein kinase RNA like ER kinase (PERK), and the proapoptotic transcription factor C/EBP homologous protein (CHOP)."

According to the news editors, the research concluded: "The present study suggested that SelS highly expressed in the blood vessel might protect VSMCs from apoptosis by inhibiting oxidative stress and ER stress. Our finding provided mechanistic insights for the potential preventive role of SelS in atherosclerotic CVD."

The news correspondents report that additional information may be obtained from Y. Ye, School of Chemistry and Chemical Engineering, Huazhong University of Science and Technology, Wuhan, 430074, People's Republic of China. Additional authors for this research include F. Fu, X. Li, J. Yang and H. Liu.

Recent Findings in Atrial Fibrillation Described by Researchers from Henry Ford Hospital (Impact of Preoperative Atrial Fibrillation on Postoperative Thromboembolic Events After Left Ventricular Assist Device Implantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting originating from Detroit, Michigan, by NewsRx correspondents, research stated, "The incidence of atrial fibrillation (AF) among patients undergoing left ventricular assist device (LVAD) implantation is high. However, the impact of AF on clinical outcomes has not been clarified."

Our news editors obtained a quote from the research from Henry Ford Hospital, "We reviewed our 9-year experience of continuous flow (CF) LVADs to determine the impact of preoperative AF on stroke, device thrombosis, and survival. Between March 2006 and May 2015, 231 patients underwent implantation of 240 CF LVADs, 127 (52.9%) as bridge to transplantation and 113 (47.1%) as destination therapy. Effect of AF on postoperative outcomes was assessed by using Kaplan-Meier survival and Cox proportional hazard regression. There were 78 patients (32.5%) with preoperative AF with a mean age of 55.7 +/- 11.4 years. A similar incidence of stroke was found in patients with and without AF, 12.8% versus 16.0%, respectively (p = 0.803). Survival was similar, with 1-, 6-, 12-, and 24-month survivals of 96.2%, 91.7%, 84.5%, and 69.2%, respectively, for AF patients, versus 93.1%, 85.0%, 79.4%, and 74.1%, respectively, for non-AF patients (p = 0.424). Preoperative AF was not a significant independent predictor of survival with the use of Cox proportional hazard regression (hazard ratio 1.08, 95% confidence interval: 0.66 to 1.76). Preoperative AF was associated with a similar incidence of postoperative stroke, device thrombosis, and survival."

According to the news editors, the research concluded: "On the basis of these data, it seems unnecessary to perform a left atrial appendage ligation or to alter postoperative anticoagulation in patients with AF undergoing LVAD implantation."

The news editors report that additional information may be obtained by contacting L. Xuereb, Henry Ford Hospital, Inst Heart & Vasc, Div Cardiothorac Surg, Detroit, MI, United States. Additional authors for this research include P.H. Go, B. Kaur, S. Akrawe, H.W. Nemeh, J. Borgi, C.T. Williams, G. Paone and J.A. Morgan.

Recent Findings in Autacoids Described by Researchers from Tel Aviv University (Does Polypharmacy in Nursing Homes Affect Long-Term Mortality?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biological Factors - Autacoids have been published. According to news reporting out of Petah Tiqwa, Israel, by NewsRx editors, research stated, "To investigate the association between polypharmacy and mortality in nursing home (NH) residents. Prospective observational cohort study."

Our news journalists obtained a quote from the research from Tel Aviv University, "Six NHs in central Israel. Mobile with dementia and fully dependent residents (N = 764; n = 558 (73%) fully dependent, n = 206 (27%) mobile residents with dementia requiring institutional care; mean age 82.2 +/- 5.9). Two-year mortality and its association with number of drugs that individual residents were taking at baseline, controlled for multiple confounders. At baseline, 268 residents were taking five or fewer drugs per day, 202 were taking six or seven, and 294 were taking eight or more. In the multivariate analysis, the likelihood of dying within 2 years in the group taking six or seven drugs per day (odds ratio (OR = 0.95, 95% CI = 0.63-1.43) and in those taking eight or more (OR = 1.20, 95% CI = 0.78-1.84) was similar to that of those taking five or fewer. Variables at baseline independently associated with greater mortality were male sex (OR = 1.75, 95% CI = 1.24-2.46), older age (OR = 1.07, 95% CI = 1.04-1.10), higher Charlson Comorbidity Index (OR = 1.17, 95% CI = 1.04-1.30), and taking anticoagulant (OR = 1.78, 95% CI = 1.01-3.13) or antihyperglycemic medication (OR = 1.69, 95% CI = 1.12-2.53). Variables at baseline independently associated with lower mortality were higher body mass index (OR = 0.99, 95% CI = 0.93-0.99) and taking lipid-lowering medication (OR = 0.54, 95% CI = 0.36-0.80) and selective serotonin reuptake inhibitors or serotonin-norepinephrine reuptake inhibitors (OR = 0.52, 95% CI = 0.37-0.75)."

According to the news editors, the research concluded: "Polypharmacy, defined quantitatively according to number of drugs, was not associated with mortality in these NH residents."

Our news journalists report that additional information may be obtained by
contacting A. Schlesinger, Tel Aviv University, Sackler Sch Med, Petah Tiqwa, Israel. Additional authors for this research include A. Weiss, O. Nenaydenko, A. Adunsky and Y. Beloosesky.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jgs.14213. This DOI is a link to an online electronic document that is either free or for purchase.

Biomedical Engineering - Bioprosthetics

Recent Findings in Bioprosthetics Described by Researchers from University of British Columbia (Computed tomography assessment for transcatheter aortic valve in valve implantation: The vancouver approach to predict anatomical risk for coronary ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biomedical Engineering - Bioprosthetics have been published. According to news originating from Vancouver, Canada, by NewsRx correspondents, research stated, "Valve-in-valve implantation of a transcatheter heart valve into a failed bioprosthetic heart valve has emerged as a treatment alternative to repeat conventional surgery."

Our news journalists obtained a quote from the research from the University of British Columbia, "This requires careful pre-procedural assessment using non-invasive imaging to identify patients at risk for procedure related adverse events, such as ostial coronary occlusion."

According to the news editors, the research concluded: "Herein we report how to comprehensively assess aortic root anatomy using computed tomography prior to transcatheter valve implantation for failed bioprosthetic aortic valves."

The news correspondents report that additional information may be obtained from J. Leipsic, University of British Columbia, St Pauls Hosp, Vancouver, BC, Canada. Additional authors for this research include J. Soon, D. Dvir, J.K. Park, C. Naoum, S.H. Kueh, D.A. Wood, B.L. Norgaard, K. Selvakumar, J. Ye, A. Cheung, J.G. Webb and J. Leipsic.

Recent Findings in Bone Research Described by Researchers from University of Bristol (Bone Mineral Density Is Positively Related to Carotid Intima-Media Thickness: Findings From a Population-Based Study in Adolescents and Premenopausal Women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Bone Research have been published. According to news reporting from Bristol, United Kingdom, by NewsRx journalists, research stated, "Osteoporosis and cardiovascular disease (CVD) are both common causes of morbidity and mortality. Previous studies, mainly of people older than 60 years, suggest a relationship between these conditions."

The news correspondents obtained a quote from the research from the University of Bristol, "Our aim was to determine the association between bone characteristics and CVD markers in younger and middle-aged individuals. Women (n=3366) and their adolescent offspring (n=4368) from the UK population-based cohort study, Avon Longitudinal Study of Parents and Children (ALSPAC), were investigated. We measured total body (TB) and hip bone mineral density (BMD), TB bone area (BA) and bone mineral content (BMC) by dual-energy X-ray absorptiometry (DXA), and carotid intima-media thickness (cIMT) by high-resolution ultrasound. Arterial distensibility was calculated as the difference between systolic and diastolic arterial diameters. Linear regression determined associations between bone exposures and cIMT (in adolescents) and both cIMT and arterial distensibility (in women), generating partial correlation coefficients. Mean (SD) age of women was 48 (4.2) years, body mass index (BMI) was 26.2 (5.0) kg/m(2), and 71% were premenopausal. In confounder-adjusted analyses (age, height, lean mass, fat mass, menopause, smoking, estrogen replacement, calcium/vitamin D supplementation, and education) TB and hip BMD were both positively associated with cIMT (0.071 [0.030, 0.112], p=0.001; 0.063 [0.025, 0.101], p=0.001, respectively). Femoral neck BMD and TB BMC, BMC, and BA were positively associated with arterial distensibility. Mean (SD) age of adolescents was 17 (0.4) years, BMI was 23 (4.1) kg/m(2), and 44.5% were male. Total hip and TB measurements were positively associated with cIMT, with similar magnitudes of association to those found in their mothers. In contrast to most published findings, we identified weak positive associations between BMD and cIMT in predominantly premenopausal women and their adolescent offspring. We found greater femoral neck BMD and TB DXA measurements to be associated with reduced arterial stiffness."

According to the news reporters, the research concluded: "Rather than a relationship with preclinical atherosclerosis, in these relatively young populations, we speculate our associations between BMD, cIMT, and arterial distensibility may reflect a shared relationship between bone and vascular growth and development."

Recent Findings in Brain Cancer Described by Researchers from New York University (Phase I study of temozolomide in combination with thiotepa and carboplatin with autologous hematopoietic cell rescue in patients with malignant brain tumors with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Brain Cancer have been published. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Recurrence of malignant brain tumors results in a poor prognosis with limited treatment options. High-dose chemotherapy with autologous hematopoietic cell rescue (AHCR) has been used in patients with recurrent malignant brain tumors and has shown improved outcomes compared with standard chemotherapy."

Our news editors obtained a quote from the research from New York University, "Temozolomide is standard therapy for glioblastoma and has also shown activity in patients with medulloblastoma/primitive neuro-ectodermal tumor (PNET), particularly those with recurrent disease. Temozolomide was administered twice daily on days -10 to -6, followed by thiotepa 300 mg/m(2) per day and carboplatin dosed using the Calvert formula or body surface area on days -5 to -3, with AHCR day 0. Twenty-seven patients aged 3-46 years were enrolled. Diagnoses included high-grade glioma (n=12); medulloblastoma/PNET (n=9); central nervous system (CNS) germ cell tumor (n=4); ependymoma (n=1) and spinal cord PNET (n=1). Temozolomide doses ranged from 100 mg/m(2) per day to 400 mg/m(2) per day. There were no toxic deaths. Prolonged survival was noted in several patients including those with recurrent high-grade glioma, medulloblastoma and CNS germ cell tumor. Increased doses of temozolomide are feasible with AHCR."

According to the news editors, the research concluded: "A phase II study using temozolomide, carboplatin and thiotepa with AHCR for children with recurrent malignant brain tumors is being conducted through the Pediatric Blood and Marrow Transplant Consortium."

For more information on this research see: Phase I study of temozolomide in combination with thiotepa and carboplatin with autologous hematopoietic cell rescue in patients with malignant brain tumors with minimal residual disease. Bone Marrow Transplantation, 2016;51(4):542-5.
Brain Research

Recent Findings in Brain Research Described by Researchers from University of Groningen (PET Tracers for Imaging of ABC Transporters at the Blood-Brain Barrier: Principles and Strategies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Brain Research. According to news reporting originating from Groningen, Netherlands, by NewsRx correspondents, research stated, "ABC transporters at the human blood-brain barrier protect the brain against the entry of harmful compounds but may also limit (or prevent) the cerebral entry of therapeutic drugs (e.g. anti-epileptics, antidepressants and antipsychotics). The efflux function of these transporters may be impaired in neurodegenerative disorders like Alzheimer and Parkinson disease."

Our news editors obtained a quote from the research from the University of Groningen, "For such reasons, there is much interest in modulation of the efflux function of ABC transporters and in the monitoring of this function with positron emission tomography (PET). The efflux function of P-glycoprotein, an important member of the ABC transporter family, can be quantified with the PET tracer ®-[C-11] verapamil, but the lipophilicity of this probe and the formation of radioactive metabolites which enter the brain complicate such measurements considerably. ®-[C-11] verapamil is also not very suitable for the detection of P-gp upregulation, as may occur in epilepsy or drug resistance."

According to the news editors, the research concluded: "Current radiochemical efforts are therefore focused on the development of PET probes with improved characteristics, for example; capability to detect both up and down regulation of transporter function and expression, a better metabolic profile (no brain-entering metabolites), reduced lipophilicity and a longer physical half-life (labeling with F-18 instead of C-11)."

For more information on this research see: PET Tracers for Imaging of ABC Transporters at the Blood-Brain Barrier: Principles and Strategies. Current Pharmaceutical
Recent Findings in Brugada Syndrome Described by Researchers from University of Montreal (Predictors of Ventricular Arrhythmias and Sudden Death in a Quebec Cohort With Brugada Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Brugada Syndrome. According to news reporting originating in Montreal, Canada, by NewsRx journalists, research stated, "Patients with Brugada syndrome (BrS) are at risk for ventricular arrhythmias (VAs) and sudden death. Identification of high-risk individuals beyond those with syncope or resuscitated sudden death remains a major challenge."

The news reporters obtained a quote from the research from the University of Montreal, "We assessed the value of clinical, electrophysiological, and electrocardiographic (ECG) features, including depolarization and repolarization metrics, in predicting arrhythmic events and sudden death in consecutive patients with BrS diagnosed between 2002 and 2013 in Quebec, Canada. Qualifying electrocardiograms with the highest type 1 ST-segment elevations were reviewed and analyzed by 2 electrophysiologists who were blinded to clinical history. Survival analyses were adjusted for Firth bias correction and left truncation. A total of 105 patients, 79.8% of whom were men, were diagnosed with BrS at a mean age of 46.2 +/- 13.3 years and were followed for 59.6 +/- 16.4 months. Ten (9.5%) had a history of cardiac arrest, 37 (35.2%) had syncope, and 7 (6.7%) experienced 20 arrhythmic events during follow-up, all consisting of appropriate ICD therapy (7 antitachycardia pacing; 13 shocks). In multivariate Cox regression analyses, a spontaneous type 1 electrocardiographic (ECG) pattern (hazard ratio [HR], 10.80; 95% confidence interval [CI], 1.03-113.87; P = 0.0476), maximal T peak-end (Tp-e) duration >= 100 ms (HR, 29.73; 95% CI, 1.33-666.37; P = 0.0325), and QRS duration in lead V-6 > 110 ms (HR, 15.27; 95% CI, 1.07-217.42; P = 0.0443) were independently associated with VAs or aborted sudden cardiac death."

According to the news reporters, the research concluded: "In a multicentre cohort with BrS from Quebec, Canada, VAs and sudden death were independently associated with standard 12-lead ECG features, including a spontaneous type 1 pattern, depolarization (QRS in
lead V6), and repolarization (maximal Tp-e duration) criteria."

Oncology - Cancer Research

Recent Findings in Cancer Research Described by Researchers from University Medical Center (Role of tumour-free margin distance for loco-regional control in vulvar cancer-a subset analysis of the Arbeitsgemeinschaft Gynakologische Onkologie ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Cancer Research are discussed in a new report. According to news reporting from Hamburg, Germany, by NewsRx journalists, research stated, "Aim of the study: A tumour-free pathological resection margin of >= 8 mm is considered state-of-the-art. Available evidence is based on heterogeneous cohorts."

The news correspondents obtained a quote from the research from University Medical Center, "This study was designed to clarify the relevance of the resection margin for loco-regional control in vulvar cancer. AGO-CaRE-1 is a large retrospective study. Patients (n = 1618) with vulvar cancer >= FIGO stage IB treated at 29 German gynecologic-cancer-centres 1998-2008 were included. This subgroup analysis focuses on solely surgically treated node-negative patients with complete tumour resection (n = 289). Of the 289 analysed patients, 141 (48.8%) had pT1b, 140 (48.4%) pT2 and 8 (2.8%) pT3 tumours. One hundred twenty-five (43.3%) underwent complete vulvectomy, 127 (43.9%) partial vulvectomy and 37 (12.8%) radical local excision. The median minimal resection margin was 5 mm (1 mm-33 mm); all patients received groin staging, in 86.5% with full dissection. Median follow-up was 35.1 months. 46 (15.9%) patients developed recurrence, thereof 34 (11.8%) at the vulva, after a median of 18.3 months. Vulvar recurrence rates were 12.6% in patients with a margin <8mm and 10.2% in patients with a margin >= 8 mm. When analysed as a continuous variable, the margin distance had no statistically significant impact on local recurrence (HR per mm increase:
Multivariate analyses did also not reveal a significant association between the margin and local recurrence neither when analysed as continuous variable nor categorically based on the 8 mm cutoff. Results were consistent when looking at disease-free-survival and time-to-recurrence at any site (HR per mm increase: 0.949, 95% CI: 0.864-1.041; p = 0.267).

According to the news reporters, the research concluded: "The need for a minimal margin of 8 mm could not be confirmed in the large and homogeneous node-negative cohort of the AGO-CaRE database."

Our news journalists report that additional information may be obtained by contacting L. Woelber, Eppendorf University Medical Center, Dept. of Gynecol, Hamburg, Germany. Additional authors for this research include L.F. Griebel, C. Eulenburg, J. Sehouli, J. Jueckstock, F. Hilpert, N. de Gregorio, A. Hasenburg, A. Ignatov, P. Hillemanns, S. Fuerst, H.G. Strauss, K.H. Baumann, F.C. Thiel, A. Mustea, W. Meier, P. Harter, P. Wimberger and Han.

Recent Findings in Cancer Therapy Described by Researchers from Silesian Technical University [Miktoarm star copolymers from D-(-)-salicin core aggregated into dandelion-like structures as anticancer drug delivery systems: synthesis, ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Cancer Therapy. According to news reporting out of Gliwice, Poland, by NewsRx editors, research stated, "The beta-glucoside-based heterofunctional initiator was used in the synthesis of well-defined eight-armed miktopolymers by sequential ring opening polymerization (ROP) of epsilon-caprolactone (CL) and atom transfer radical (co) polymerization (ATRP) of methyl methacrylate (MMA) and/or tert-butyl methacrylate (tBMA). Consequently, methacrylic acid (MAA) repeating units were introduced via selective cleavage of pendant tert-butyl protecting groups."

Our news journalists obtained a quote from the research from Silesian Technical University, "Both the amphiphilic copolymers and miktoarm copolymers were self-assembled at 37 degrees C and pH 7.4. The aggregates of miktoarm polymers were larger than that formed by polymethacrylate homoarm stars (>= 250 nm vs <= 200 nm). The critical aggregation concentrations (CAC) of (mikto) stars were relatively low (0.006-0.411 mg/mL) and decreased with the increase in MAA fraction content. Both MAA-based mikto- and homoarmed (co) polymers with shorter arms exhibited lower doxorubicin (DOX) loading capacity, whereas
camptothecin (CPT) was encapsulated preferably by miktostars. The kinetic profiles of drug release showed that the rate of release was higher at acidic environment (pH 5.0) than in neutral pH.

According to the news editors, the research concluded: "In the most cases the studied miktopolymer systems demonstrated the well-controlled delivery of the model anticancer drugs, which can be adjusted by structural parameters of polymeric carriers."

Our news journalists report that additional information may be obtained by contacting D. Neugebauer, Silesian Technical University, Dept. of Phys Chem & Technol Polymers, Fac Chem, PL-44100 Gliwice, Poland. Additional authors for this research include J. Odrobinska, S. Grzadka, L. Mielanczyk and D. Neugebauer.

Keywords for this news article include: Gliwice, Poland, Europe, Drug Delivery Systems, Drugs and Therapies, Cancer Therapy, Silesian Technical University.

**Oncology - Carcinoid Tumor**

**Recent Findings in Carcinoid Tumor Described by Researchers from University Hospital (A case of parenchymal-sparing right mainstem bronchial sleeve resection for carcinoid tumor)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Carcinoid Tumor have been published. According to news reporting from Leuven, Belgium, by NewsRx journalists, research stated, "Neuroendocrine tumors are rare bronchial carcinomata often presenting in a central airway. Resection usually includes a sleeve of the bronchus with the underlying lobe."

The news correspondents obtained a quote from the research from University Hospital, "Case report We present a 19-year old male with retro-obstructive pneumonia from a tumor in the right mainstem bronchus. Bronchoscopy showed an obstructive mass confirmed as being a typical carcinoid on biopsy. Sleeve resection of the mainstem bronchus only was successfully performed sparing the entire right lung."

According to the news reporters, the research concluded: "This type of limited tumoral resection should be reserved for carefully selected patients with a low-grade neoplasm without extrabronchial extension and with both tumor-negative lymph nodes and bronchial margins on frozen section."

Our news journalists report that additional information may be obtained by contacting D. Van Raemdonck, University Hospital Leuven, Dept. of Thorac Surg, Leuven,
Belgium. Additional authors for this research include H. Decaluwe and D. Van Raemdonck. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1080/00015458.2015.1136490. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Carcinoma Ex Pleomorphic Adenoma**

**Recent Findings in Carcinoma Ex Pleomorphic Adenoma Described by Researchers from University of Copenhagen (The interleukin-6/Janus kinase/STAT3 pathway in pleomorphic adenoma and carcinoma ex pleomorphic adenoma of the lacrimal gland)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Carcinoma Ex Pleomorphic Adenoma have been published. According to news reporting originating in Copenhagen, Denmark, by NewsRx journalists, research stated, "PurposePleomorphic adenoma (PA) is the most common tumour of the lacrimal gland, but very little is known about its biology. It has a tendency to recur and an ability to transform into the high-grade malignancy carcinoma ex pleomorphic adenoma (ca-ex-PA), which is also largely unexplored."

Financial supporters for this research include Traun Pedersens Memorial Grant, Einar Willumsens Memorial Grant, Kraeftens Bekæmpelse.

The news reporters obtained a quote from the research from the University of Copenhagen, "In this study, we examine the expression of the interleukin-6/Janus kinase/STAT3 (IL-6/JAK/STAT3) pathway components in PA and ca-ex-PA. MethodsSixteen PAs and two ca-ex-PAs were examined with immunohistochemistry. Seven PAs were subjected to microdissection and subsequent qPCR. ResultsThe IL-6/JAK/STAT3 pathway was overexpressed in PA compared to normal lacrimal gland. Overexpression of phosphorylated JAK1 (p-JAK1) and cyclin D1 was significantly overexpressed in ductal cells compared with myoepithelial cells in PA. A shift from p-JAK1 to p-JAK2 and p-Tyk2 overexpression was seen between PA and ca-ex-PA, combined with a high p-STAT3 expression in the latter. ConclusionThe IL-6/JAK/STAT3 pathway is overexpressed in PA, and this overexpression was even more pronounced in ca-ex-PA, with a shift in the JAKs mediating STAT3 phosphorylation."

According to the news reporters, the research concluded: "Future studies are needed to clarify whether PA and ca-ex-PA could be treated with targeted therapy directed against components of the IL-6/JAK/STAT3 pathway."

Our news correspondents report that additional information may be obtained by
Recent Findings in Cardiology Described by Researchers from Ohio State University (Controllable Large-Scale Transfection of Primary Mammalian Cardiomyocytes on a Nanochannel Array Platform)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiology. According to news reporting originating from Columbus, Ohio, by NewsRx correspondents, research stated, "While electroporation has been widely used as a physical method for gene transfection in vitro and in vivo, its application in gene therapy of cardiovascular cells remains challenging. Due to the high concentration of ion-transport proteins in the sarcolemma, conventional electroporation of primary cardiomyocytes tends to cause ion-channel activation and abnormal ion flux, resulting in low transfection efficiency and high mortality."

Our news editors obtained a quote from the research from Ohio State University, "In this work, a high-throughput nanoelectroporation technique based on a nanochannel array platform is reported, which enables massively parallel delivery of genetic cargo (microRNA, plasmids) into mouse primary cardiomyocytes in a controllable, highly efficient, and benign manner. A simple 'dipping-trap' approach was implemented to precisely position a large number of cells on the nanoelectroporation platform. With dosage control, our device precisely titrates the level of miR-29, a potential therapeutic agent for cardiac fibrosis, and determines the minimum concentration of miR-29 causing side effects in mouse primary cardiomyocytes. Moreover, the dose-dependent effect of miR-29 on mitochondrial potential and homeostasis is monitored."

According to the news editors, the research concluded: "Altogether, our nanochannel array platform provides efficient trapping and transfection of primary mouse cardiomyocyte, which can improve the quality control for future microRNA therapy in heart diseases."

The news editors report that additional information may be obtained by contacting D. Gallego-Perez, Ohio State University, Dept. of Surg, Center Regenerat Med & Cell Based
Recent Findings in Cardiovascular Agents Described by Researchers from College of Pharmacy and Health Sciences (A-803467, a tetrodotoxin-resistant sodium channel blocker, modulates ABCG2-mediated MDR in vitro and in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Cardiovascular Agents. According to news reporting out of Queens, New York, by NewsRx editors, research stated, "ATP-binding cassette subfamily G member 2 (ABCG2) is a member of the ABC transporter superfamily proteins, which has been implicated in the development of multidrug resistance (MDR) in cancer, apart from its physiological role to remove toxic substances out of the cells. The diverse range of substrates of ABCG2 includes many antineoplastic agents such as topotecan, doxorubicin and mitoxantrone."

Our news journalists obtained a quote from the research from the College of Pharmacy and Health Sciences, "ABCG2 expression has been reported to be significantly increased in some solid tumors and hematologic malignancies, correlated to poor clinical outcomes. In addition, ABCG2 expression is a distinguishing feature of cancer stem cells, whereby this membrane transporter facilitates resistance to the chemotherapeutic drugs. To enhance the chemosensitivity of cancer cells, attention has been focused on MDR modulators. In this study, we investigated the effect of a tetrodotoxin-resistant sodium channel blocker, A-803467 on ABCG2-overexpressing drug selected and transfected cell lines. We found that at non-toxic concentrations, A-803467 could significantly increase the cellular sensitivity to ABCG2 substrates in drug-resistant cells overexpressing either wild-type or mutant ABCG2. Mechanistic studies demonstrated that A-803467 (7.5 mM) significantly increased the intracellular accumulation of [(3)H]-mitoxantrone by inhibiting the transport activity of ABCG2, without altering its expression levels. In addition, A-803467 stimulated the ATPase activity in membranes overexpressed with ABCG2. In a murine model system, combination treatment of A-803467 (35 mg/kg) and topotecan (3 mg/kg) significantly inhibited the tumor growth in mice xenografted with ABCG2-overexpressing cancer cells."

According to the news editors, the research concluded: "Our findings indicate that a combination of A-803467 and ABCG2 substrates may potentially be a novel therapeutic treatment in ABCG2-positive drug resistant cancers."

For more information on this research see: A-803467, a tetrodotoxin-resistant sodium channel blocker, modulates ABCG2-mediated MDR in vitro and in vivo. Oncotarget,

Drugs and Therapies - Central Nervous System Agents

Recent Findings in Central Nervous System Agents Described by P.B. Prajapati and Colleagues (y Development and Validation of Stability-Indicating HPTLC Method for Estimation of Naratriptan Hydrochloride in Its Pharmaceutical Dosage Form and Its ...

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Central Nervous System Agents are discussed in a new report. According to news reporting originating in Gujarat, India, by NewsRx journalists, research stated, "The present research project involves development and validation of a stability-indicating HPTLC method for the estimation of naratriptan-HCl in their pharmaceutical dosage forms and its content uniformity testing. Naratriptan-HCl was subjected to alkaline, acidic, oxidative, neutral, thermal (dry heat) and photo-degradation conditions."

The news reporters obtained a quote from the research, "The chromatographic separation was carried out using a precoated silica gel G 60 F-254 TLC plate as the stationary phase and dichloromethane-toluene-methanol-triethylamine (4: 4: 2:1, v/v/v/v) as the mobile phase. The spots of NRT-HCl and its degradation products were detected at 290 nm. The R-f value of NRT-HCl was found to be 0.60 +/- 0.02. The linearity was obtained in the range of 100-500 ng/spot. The limit of detection and limit of quantitation were found to be 6.07 ng/spot and 18.41 ng/spot, respectively. The percentage recovery was found in the range of 98.87-99.55%. NRT-HCl was degraded under acidic, alkaline and oxidative conditions while stable under photolytic, neutral and dry heat conditions."

According to the news reporters, the research concluded: "The developed method was applied for estimation of naratriptan-HCl in marketed formulations and its content uniformity testing."

Our news correspondents report that additional information may be obtained by contacting P.B. Prajapati, Maliba Pharm College, Taradi 394350, Gujarat, India. Additional authors for this research include J. Chotalia, K.B. Bodiwala, B.P. Marolia and S.A. Shah.

Oncology - Cervical Cancer

Recent Findings in Cervical Cancer Described by Researchers from National Cancer Registry (Temporal changes in the cervical cancer burden in Bulgaria: Implications for eastern european countries going through transition)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cervical Cancer have been published. According to news originating from Sofia, Bulgaria, by NewsRx correspondents, research stated, "In most developed countries, incidence of cervical cancer declined likely due to well-established cervical cancer screening programs. However, such decline has not been identified in Eastern Europe, where such programs are not well established."

Financial support for this research came from National Cancer Institute, USA.

Our news journalists obtained a quote from the research from National Cancer Registry, "This study utilized data of the Bulgarian Cancer Registry for the period 1993-2013. Age-standardized incidence and mortality trends were analyzed using Joinpoint regression. Maps were created to illustrate spatial distributions of rates. The northern region of Bulgaria showed a larger cervical cancer burden than the southern region and rural women tended to be diagnosed at older ages (p < 0.0001) and later stages (p < 0.0001) than urban women. The distribution of disease stages changed over the 21 years, with most common stages of diagnosis being stage II in 1993 (39.2%) to stage I in 2013 (44.7%; p< 0.0001). While age-standardized mortality slightly increased over the 21 years (from 4.8 to 5.2 per 100,000; p = 0.009), age-standardized incidence increased from 14.0 to 21.4 per 100,000 up until 2006 (p < 0.001), after which it plateaued. The lack of a similar plateau in mortality may be because the second most prevalent stage of diagnosis in recent years was stage III, indicating diagnosis at advanced symptomatic stages. Cervical cancer incidence is expected to continue to decrease if screening programs are strengthened and human papillomavirus vaccines are widely utilized."

According to the news editors, the research concluded: "As Bulgaria has shared cervical cancer trends with other Eastern European countries in the past, it may be beneficial to develop future prevention interventions based on a regional, rather than a country-specific level."

Recent Findings in Chemotherapy Described by Researchers from Kansai Medical University (Clinical outcomes of pancreatic ductal adenocarcinoma resection following neoadjuvant chemoradiation therapy vs. chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Chemotherapy have been published. According to news originating from Osaka, Japan, by NewsRx correspondents, research stated, "We compared the clinical outcomes of pancreatic ductal adenocarcinoma (PDAC) resection after neoadjuvant chemoradiation therapy (NACRT) vs. chemotherapy (NAC). The study population comprised 81 patients with UICC stage T3/4 PDAC, treated initially by NACRT with S-1 in 40 and by NAC with gemcitabine + S-1 in 41."

Our news journalists obtained a quote from the research from Kansai Medical University, "This was followed by pancreatectomy with routine nerve plexus resection in 35 of the patients who had received NACRT and 32 of those who had received NAC. We compared the survival curves and clinical outcomes of these two groups. The rates of clinical response, surgical resectability, and margin-negative resection were similar. The NACRT group patients had significantly higher rates of Evans stage >= IIB tumors (29 vs. 0 %, respectively, p = 0.010) and negative lymph nodes (49 vs. 16 %, respectively, p = 0.021) than the NAC group patients. There was no difference in disease-free survival between the groups, but the disease-specific survival of the NAC group patients was better than that of the NACRT group patients (p = 0.034). Patients undergoing pancreatectomy with nerve plexus resection following NACRT had significantly higher rates of intractable diarrhea and ascites but consequently received significantly less adjuvant chemotherapy and therapeutic chemotherapy for relapse."

According to the news editors, the research concluded: "NACRT followed by pancreatectomy with nerve plexus resection is superior for achieving local control, but postoperative diarrhea and ascites may prohibit continuation of adjuvant chemotherapy or chemotherapy for relapse (UMIN4148)."

For more information on this research see: Clinical outcomes of pancreatic ductal adenocarcinoma resection following neoadjuvant chemoradiation therapy vs. chemotherapy. *Surgery Today*, 2017;47(1):84-91. *Surgery Today* can be contacted at: Springer, 233 Spring St,

**Lung Diseases and Conditions - Chronic Obstructive**

**Recent Findings in Chronic Obstructive Pulmonary Disease Described by Researchers from Montpellier University Hospital (CCSP G38A polymorphism environment interactions regulate CCSP levels differentially in COPD)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease have been published. According to news originating from Montpellier, France, by NewsRx correspondents, research stated, "Impaired airway homeostasis in chronic obstructive pulmonary disease (COPD) could be partly related to club cell secretory protein (CCSP) deficiency. We hypothesize that CCSP G38A polymorphism is involved and aim to examine the influence of the CCSP G38A polymorphism on CCSP transcription levels and its regulatory mechanisms."

Our news journalists obtained a quote from the research from Montpellier University Hospital, "CCSP genotype and CCSP levels in serum and sputum were assessed in 66 subjects with stable COPD included in a 1-yr observational study. Forty-nine of them had an exacerbation. In an in vitro study, the impact on the CCSP promoter of 38G wild-type or 38A variant was assessed. BEAS-2B cells were transfected by either the 38G or 38A construct, in the presence/absence of cigarette smoke extract (CSE) or lipopolysaccharides (LPS). Cotransfections with modulating transcription factors, p53 and Nkx2.1, identified by in silico analysis by using ConSite and TFSEARCH were conducted. A allele carrier COPD patients had lower serum and sputum CCSP levels, especially among active smokers, and a decreased body mass index, airflow obstruction, dyspnea, and exercise capacity (BODE) score. In vitro, baseline CCSP transcription levels were similar between the wild and variant constructs. CSE decreased more profoundly the CCSP transcription level of 38A transfected cells. The opposite effect was observed with p53 cotransfection. LPS stimulation induced CCSP repression in 38A promoter transfected cells. Cotransfection with Nkx2.1 significantly activated the CCSP promoters irrespective of the polymorphism. Circulating CCSP levels are associated with smoking and the CCSP G38A polymorphism. CSE, LPS, and the Nkx2.1 and p53 transcription factors modulated
According to the news editors, the research concluded: "The 38A polymorphism exaggerated the CCSP repression in response to p53 and CSE."

The news correspondents report that additional information may be obtained from A. Bourdin, Montpellier Univ Hosp, Dept. of Resp Dis, Montpellier, France. Additional authors for this research include J. Varilh, A. Bergougnoux, A.S. Gamez, J. Bonini, A. Pommier, A. Petit, N. Molinari, I. Vachier, M. Taulan-Cadars and A. Bourdin.

**Recent Findings in Cleft Lip and Palate Described by Researchers from University of Regensburg (Van der Woude and Popliteal Pterygium Syndromes: Broad Intrafamilial Variability in a Three Generation Family with Mutation in IRF6)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mouth Disease and Conditions - Cleft Lip and Palate is now available. According to news reporting originating from Regensburg, Germany, by NewsRx correspondents, research stated, "Patients with Van der Woude syndrome typically present with cleft lip, cleft lip and palate, or with cleft palate only. In contrast to non-syndromic cleft lip and/or palate, Van der Woude syndrome typically is characterized by bilateral, paramedian lower-lip pits."

Our news editors obtained a quote from the research from the University of Regensburg, "Popliteal pterygium syndrome shares features with Van der Woude syndrome, but, in addition, is characterized by a popliteal pterygium, genital anomalies, cutaneous syndactyly of the fingers and the toes, and a characteristic pyramidal fold of skin overlying the nail of the hallux. In some patients oral synechiae or eyelid synechiae are present. Van der Woude Syndrome and Popliteal pterygium syndrome are autosomal dominantly inherited disorders caused by heterozygous mutations in IRF6. We present a three generation family with tremendous intrafamilial phenotypic variability. The newborn index patient had a diagnosis of Popliteal pterygium syndrome. The mother presented with a classic Van der Woude Syndrome, while the maternal grandfather had Van der Woude Syndrome as well as minor signs of Popliteal pterygium syndrome. In all three affecteds the known pathogenic mutation c.265A >G, p.Lys89Glu in IRF6 was identified."
According to the news editors, the research concluded: "While inter-as well as intrafamilial variability has been described in IRF6-related disorders, the occurrence of a typical Van der Woude Syndrome without any other anomalies as well as a diagnosis of Popliteal pterygium syndrome in the same family is rare."

The news editors report that additional information may be obtained by contacting A. Busche, University of Regensburg, Inst Humangenet, Regensburg, Germany. Additional authors for this research include U. Hehr, P. Sieg and G. Gillessen-Kaesbach.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/ajmg.a.37791. This DOI is a link to an online electronic document that is either free or for purchase.

**Clinical Research - Clinical Trials and Studies**

**Recent Findings in Clinical Trials and Studies Described by Researchers from Autonomous University (Cancer randomized trials showed that dissemination bias is still a problem to be solved)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting originating in Barcelona, Spain, by NewsRx journalists, research stated, "The objective of the present study was to determine the publication rate of cancer randomized controlled trial (RCTs) and to analyze the determinants of the publication, as well as to estimate the possible existence of a location and time lag bias. We also described the bibliometric characteristics of the publications."

The news reporters obtained a quote from the research from Autonomous University, "Study design and Setting: We conducted an observational study that identified publications resulting from RCTs involving cancer-related drug products. These studies were authorized and registered by the Spanish Agency of Medicines and Medical Devices between 1999 and 2003. We identified 168 publications of 303 RCTs, resulting in a publication rate of 55.4% after a mean follow-up of 12 years. The only factor associated to the likelihood of nonpublication was the study setting favoring only national RCTs (odds ratio 2.7; 95% confidence interval 1.5-4.8). Type of sponsor did not seem to be associated, although the largest volume of nonpublished trials is international, industry-sponsored. Positive results seemed to be associated to a
publication in a higher impact factor journal and a shorter time-to-publication. About half of the cancer RCTs during the target period have not been published."

According to the news reporters, the research concluded: "The national setting is a factor associated to nonpublication, whereas the direction of results determines its dissemination (impact factor and timely publication)."

For more information on this research see: Cancer randomized trials showed that dissemination bias is still a problem to be solved. *Journal of Clinical Epidemiology*, 2016;77 ():84-90. *Journal of Clinical Epidemiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Recent Findings in Cushing Syndrome Described by Researchers from Medical College of Wisconsin (Postsurgical Recurrent Cushing Disease: Clinical Benefit Of Early Intervention In Patients With Normal Urinary Free Cortisol)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Adrenal Gland Diseases and Conditions - Cushing Syndrome have been published. According to news reporting originating in Menomonee Falls, Wisconsin, by NewsRx journalists, research stated, "To assess the performance of biochemical markers in the detection of recurrent Cushing disease (CD), as well as the potential benefit of early intervention in recurrent CD patients with elevated late-night salivary cortisol (LNSC) and normal urinary free cortisol (UFC). The design was a single-center, retrospective chart review."

The news reporters obtained a quote from the research from the Medical College of Wisconsin, "Patients treated by the authors from 2008-2013 were included. Recurrence was defined by postsurgical remission of CD with subsequent abnormal LNSC, UFC, or dexamethasone suppression test (DST). We identified 15 patients with postsurgical recurrent CD after initial remission; all but one underwent testing with LNSC, DST, and ITC. Although 12 of 15 patients had normal UFC at time of recurrence, DST was abnormal in 11 of 15, and all 14 patients with LNSC results had >= 1 elevated measurement. Nine patients (7 with normal UFC) showed radiologic evidence of a pituitary tumor at time of recurrence. Among the 14 patients with available follow-up data, 12 have demonstrated significant improvement since receiving treatment. Five patients underwent repeat pituitary surgery and 4 achieved clinical and biochemical remission. Eight patients received mifepristone or cahergoline, and 6 showed clinical and/or biochemical improvement. Three patients (2 with prior mifepristone) underwent..."
bilateral adrenalectomy and demonstrated significant clinical improvements. LNSC is more sensitive than UFC or DST for detection of CD recurrence. Prompt intervention when LNSC is elevated, despite normal-ITC, may yield significant clinical benefit for many patients with CD."

According to the news reporters, the research concluded: "Early treatment for patients with recurrent CD should be prospectively evaluated, utilizing LNSC elevation as an early biochemical marker."

For more information on this research see: Postsurgical Recurrent Cushing Disease: Clinical Benefit Of Early Intervention In Patients With Normal Urinary Free Cortisol. *Endocrine Practice*, 2016;22(10):1216-1223. *Endocrine Practice* can be contacted at: Amer Assoc Clinical Endocrinologists, 245 Riverside Avenue, Ste 200, Jacksonville, FL 32202, USA.

**Lung Diseases and Conditions - Cystic Fibrosis**

**Recent Findings in Cystic Fibrosis Described by Researchers from General Hospital (Duration of intravenous antibiotic therapy in people with cystic fibrosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Cystic Fibrosis. According to news originating from Sheffield, United Kingdom, by NewsRx correspondents, research stated, "Respiratory disease is the major cause of mortality and morbidity in cystic fibrosis. Life expectancy of people with cystic fibrosis has increased dramatically in the last 40 years."

Our news journalists obtained a quote from the research from General Hospital, "One of the major reasons for this increase is the mounting use of antibiotics to treat chest exacerbations caused by bacterial infections. The optimal duration of intravenous antibiotic therapy is not clearly defined. Individuals usually receive intravenous antibiotics for 14 days, but treatment may range from 10 to 21 days. A shorter duration of antibiotic treatment risks inadequate clearance of infection which could lead to further lung damage. Prolonged courses of intravenous antibiotics are expensive and inconvenient and the incidence of allergic reactions to antibiotics also increases with prolonged courses. The use of aminoglycosides requires frequent monitoring to avoid some of their side effects. However, some organisms which infect people with cystic fibrosis are known to be multi-resistant to antibiotics, and may require a longer course of treatment. This is an update of previously published reviews. To assess the optimal
duration of intravenous antibiotic therapy for treating chest exacerbations in people with cystic fibrosis. Search methods We searched the Cochrane Cystic Fibrosis and Genetic Disorders Group Trials Register which comprises references identified from comprehensive electronic database searches, handsearches of relevant journals, abstract books and conference proceedings. Most recent search of the Group's Cystic Fibrosis Trials Register: 05 May 2016. Selection criteria Randomised and quasi-randomised controlled trials comparing different durations of intravenous antibiotic courses for acute respiratory exacerbations in people with CF, either with the same drugs at the same dosage, the same drugs at a different dosage or frequency or different antibiotics altogether, including studies with additional therapeutic agents. Data collection and analysis No eligible trials were identified. Authors' conclusions There are no clear guidelines on the optimum duration of intravenous antibiotic treatment. Duration of treatment is currently based on unit policies and response to treatment. Shorter duration of treatment should improve quality of life and compliance; result in a reduced incidence of drug reactions; and be less costly. However, this may not be sufficient to clear a chest infection and may result in an early recurrence of an exacerbation.

According to the news editors, the research concluded: "This systematic review identifies the need for a multicentre, randomised controlled trial comparing different durations of intravenous antibiotic treatment as it has important clinical and financial implications."

For more information on this research see: Duration of intravenous antibiotic therapy in people with cystic fibrosis. Cochrane Database of Systematic Reviews, 2016; (9):1281-1300. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

**Dual-Energy X-Ray Absorptiometry**

**Recent Findings in Dual-Energy X-Ray Absorptiometry Described by Researchers from University of Sao Paulo [Visceral fat measured by DXA is associated with increased risk of non-spine fractures in nonobese elderly women: a population-based ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Dual-Energy X-Ray Absorptiometry. According to news reporting originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "The present study investigates the relationship between visceral fat measured by dual-energy X-ray absorptiometry (DXA) and the incidence of non-spine fractures in community-dwelling elderly women. We demonstrated a potential negative effect of visceral fat
on bone health in nonobese women.

Our news editors obtained a quote from the research from the University of Sao Paulo, "The protective effect of obesity on bone health has been questioned because visceral fat has been demonstrated to have a deleterious effect on bone. The aim of this study was to investigate the association of visceral fat measured by DXA with the incidence of non-spine fractures in community-dwelling elderly women. This longitudinal prospective population-based cohort study evaluated 433 community-dwelling women aged 65 years or older. A specific clinical questionnaire, including personal history of a fragility fracture in non-spine osteoporotic sites, was administered at baseline and after an average of 4.3 years. All incidences of fragility fractures during the study period were confirmed by affected-site radiography. Visceral adipose tissue (VAT) was measured in the android region of a whole-body DXA scan. The mean age was 72.8 +/- 4.7 years, and 28 incident non-spine osteoporotic fractures were identified after a mean follow-up time of 4.3 +/- 0.8 years. According to the Lipschitz classification for nutritional status in the elderly, 38.6 % of women were nonobese (BMI < 27 kg/m (2)) and 61.4 % were obese/overweight. Logistic regression models were used to estimate the relationship between VAT and non-spine fractures in elderly women. After adjusting for age, race, previous fractures, and BMD, VAT (mass, area, volume) had a significant association with the incidence of non-spine fractures only in nonobese elderly women (VAT mass: OR, 1.42 [95 % CI, 1.09-1.85; p = 0.010]; VAT area: OR, 1.19 [95 % CI, 1.05-1.36; p = 0.008]; VAT volume: OR, 1.40 [95 % CI, 1.09-1.80; p = 0.009])."

According to the news editors, the research concluded: "This study suggests a potential negative effect of visceral adiposity on bone health in nonobese women."

For more information on this research see: Visceral fat measured by DXA is associated with increased risk of non-spine fractures in nonobese elderly women: a population-based prospective cohort analysis from the Sao Paulo Ageing & Health (SPAH) Study. Osteoporosis International, 2016;27(12):3525-3533. Osteoporosis International can be contacted at: Springer London Ltd, 236 Grays Inn Rd, 6TH Floor, London WC1X 8HL, England. 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Human Herpesvirus Diseases and Conditions - Epstein-Barr Virus have been published. According to news reporting originating from Guangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Nasopharyngeal carcinoma is associated with Epstein-Barr virus (EBV). The current study investigated change in the plasma EBV DNA load in the first 3 months after treatment and its clinical significance in NPC."

Our news editors obtained a quote from the research from Sun Yat-Sen University Cancer Center, "A total of 273 patients with non-metastatic, histologically-proven NPC treated with radiotherapy or chemoradiotherapy were retrospectively reviewed. EBV DNA was detectable in 19/273 (7.0%) patients at the end of therapy (end-DNA). Three months later, 16/273 (5.9%) patients had detectable EBV DNA (3-month-DNA). To investigate risk stratified by the pattern of change in post-treatment EBV-DNA, we divided patients into four subgroups: Group 1, undetectable end-DNA and 3-month-DNA (n=244); Group 2, detectable end-DNA and undetectable 3-month-DNA (n=13); Group 3, undetectable end-DNA and detectable 3-month-DNA (n=7); and Group 4, detectable end-DNA and 3-month-DNA (n=2). Patients with delayed remission of EBV DNA after treatment (Group 2) had significantly poorer 3-year DFS (48.6% vs. 89.7%, p<0.001), DMFS (48.6% vs. 94.6%, p<0.001) and OS (91.7% vs. 97.5%, p<0.001) than those with persistently undetectable EBV DNA post-treatment (Group 1). Five of the seven patients with re-emergent EBV DNA (Group 3) and both patients with persistent EBV DNA post-treatment (Group 4) developed disease failure. Plasma EBV DNA load continues to change during the first 3 months after treatment."

According to the news editors, the research concluded: "The pattern of change in EBV DNA load post-treatment could help identify patients with different prognoses."

For more information on this research see: Risk stratification based on change in plasma Epstein-Barr virus DNA load after treatment in nasopharyngeal carcinoma. Oncotarget, 2016;7(8):9576-85.

The news editors report that additional information may be obtained by contacting Y. Zhang, Dept. of Radiation Oncology, Sun Yat-Sen University Cancer Center, State Key Laboratory of Oncology in South China, Collaborative Innovation Center of Cancer Medicine, Guangzhou 510060, People's Republic of China. Additional authors for this research include W.F. Li, Y.P. Mao, R. Guo, L.L. Tang, H. Peng, Y. Sun, Q. Liu, L. Chen and J. Ma.

Recent Findings in Escherichia coli Described by Researchers from French National Institute for Agricultural Research (INRA) (Escherichia coli ClbS is a colibactin resistance protein)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Escherichia coli have been published. According to news reporting originating in Toulouse, France, by NewsRx journalists, research stated, "The genomic pks island codes for the biosynthetic machinery that produces colibactin, a peptide-polyketide metabolite. Escherichia coli is a genotoxin that contributes to the virulence of extra-intestinal pathogenic Escherichia coli and promotes colorectal cancer. In this work, we examined whether the pks-encoded clbS gene of unknown function could participate in the self-protection of E. coli-producing colibactin."

The news reporters obtained a quote from the research from French National Institute for Agricultural Research (INRA), "A clbS mutant was not impaired in the ability to inflict DNA damage in HeLa cells, but the bacteria activated the SOS response and ceased to replicate. This autotoxicity phenotype was markedly enhanced in a clbS uvrB double mutant inactivated for DNA repair by nucleotide excision but was suppressed in a clbS clbA double mutant unable to produce colibactin. In addition, ectopic expression of clbS protected infected HeLa cells from colibactin."

According to the news reporters, the research concluded: "Thus, ClbS is a resistance protein blocking the genotoxicity of colibactin both in the procaryotic and the eucaryotic cells."

Our news correspondents report that additional information may be obtained by contacting N. Bossuet-Greif, INRA, USC 1360, Toulouse, France. Additional authors for this research include D. Dubois, C. Petit, S. Tronnet, P. Martin, R. Bonnet, E. Oswald and J.P Nougayrede.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/mmi.13272. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: France, Europe, Toulouse, Genetics, Proteobacteria, Escherichia coli, Enterobacteriaceae, Gram Negative Bacteria, Gram-Negative Bacteria.

Neuropeptides - Galanin

Recent Findings in Galanin Described by Researchers from University of Cambridge (Galanin inhibits GLP-1 and GIP secretion via the GAL1 receptor in enteroendocrine L and K cells)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Neuropeptides - Galanin is the subject of a report. According to news reporting from Cambridge, United Kingdom, by NewsRx journalists, research stated, "Galanin is a widely expressed neuropeptide, which in the gut is thought to modulate gastrointestinal motility and secretion. We aimed to elucidate the poorly characterised mechanisms underlying the inhibitory effect of galanin and the potential involvement of G-protein coupled inwardly rectifying potassium, Kir 3, (GIRK) channels in glucagon-like peptide 1 (GLP-1) and glucose-dependent insulinotropic polypeptide (GIP) secretion."

Funders for this research include MRC, Wellcome Trust.

The news correspondents obtained a quote from the research from the University of Cambridge, "Purified murine L and K cells were analysed for expression of galanin receptors and GIRK subunits. Hormone secretion was measured from primary murine intestinal cultures. Intracellular cAMP was monitored in primary L cells derived from mice expressing the Epac2camps sensor under the control of the proglucagon promoter. Galanin receptor 1 (GAL1, Galr1) and GIRK channel 1 (Kir 3.1, Kcnj3) and 4 (Kir 3.4, Kcnj5) mRNA expression was highly enriched in K and L cells. Galanin and a selective GAL1 receptor agonist (M617) potently inhibited GLP-1 and GIP secretion from primary small intestinal cultures. In L cells, galanin significantly inhibited the forskolin-induced cAMP response. The GIRK1/4 activator ML297 significantly reduced glucose-stimulated and IBMX-stimulated GLP-1 secretion but had no effect on GIP. The GIRK blocker tertiapin-Q did not impair galanin-mediated GLP-1 inhibition. Galanin, acting via the GAL1 receptor and Gi-coupled signalling in L and K cells, is a potent inhibitor of GLP-1 and GIP secretion."

According to the news reporters, the research concluded: "Although GIRK1/4 channels are expressed in these cells, their activation does not appear to play a major role in galanin-mediated inhibition of incretin secretion."

Our news journalists report that additional information may be obtained by contacting A. Psichas, Metabolic Research Laboratories and MRC Metabolic Diseases Unit, WT-MRC Institute of Metabolic Science, Addenbrooke's Hospital, University of Cambridge, Cambridge, CB2 0QQ, UK. Additional authors for this research include L.L. Glass, S.J. Sharp, F. Reimann and F.M Gribble.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bph.13407. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Findings in Genetic Epidemiology Described by Researchers from School of Public Health (A perspective on interaction effects in genetic association studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Genetics - Genetic Epidemiology are discussed in a new report. According to news reporting out of Boston, Massachusetts, by NewsRx editors, the research stated, "The identification of gene-gene and gene-environment interaction in human traits and diseases is an active area of research that generates high expectation, and most often lead to high disappointment. This is partly explained by a misunderstanding of the inherent characteristics of standard regression-based interaction analyses."

Our news journalists obtained a quote from the research from the School of Public Health, "Here, I revisit and untangle major theoretical aspects of interaction tests in the special case of linear regression; in particular, I discuss variables coding scheme, interpretation of effect estimate, statistical power, and estimation of variance explained in regard of various hypothetical interaction patterns. Linking this components it appears first that the simplest biological interaction models-in which the magnitude of a genetic effect depends on a common exposure-are among the most difficult to identify. Second, I highlight the demerit of the current strategy to evaluate the contribution of interaction effects to the variance of quantitative outcomes and argue for the use of new approaches to overcome this issue. Finally, I explore the advantages and limitations of multivariate interaction models, when testing for interaction between multiple SNPs and/or multiple exposures, over univariate approaches."

According to the news editors, the research concluded: "Together, these new insights can be leveraged for future method development and to improve our understanding of the genetic architecture of multifactorial traits."

Our news journalists report that additional information may be obtained by contacting H. Aschard, Harvard TH Sch Public Hlth, Dept. of Epidemiol, Boston, MA 02115, United States.

Eye Diseases and Conditions - Glaucoma

Recent Findings in Glaucoma Described by Researchers from Oregon Health and Science University (Baseline Fourier-Domain Optical Coherence Tomography Structural Risk Factors for Visual Field Progression in the Advanced Imaging for Glaucoma Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Eye Diseases and Conditions - Glaucoma have been published. According to news reporting originating in Portland, Oregon, by NewsRx journalists, research stated, "To identify baseline structural parameters that predict the progression of visual field (VF) loss in patients with open-angle glaucoma. Multicenter cohort study."

Financial support for this research came from NIH.

The news reporters obtained a quote from the research from Oregon Health and Science University, "Participants from the Advanced Imaging for Glaucoma (AIG) study were enrolled and followed up. VF progression is defined as either a confirmed progression event on Humphrey Progression Analysis or a significant (P < .05) negative slope for VF index (VFI). Fourier-domain optical coherence tomography (FDOCT) was used to measure optic disc, peripapillary retinal nerve fiber layer (NFL), and macular ganglion cell complex (GCC) thickness parameters. A total of 277 eyes of 188 participants were followed up for 3.7 +/- 2.1 years. VF progression was observed in 83 eyes (30%). Several baseline NFL and GCC parameters, but not disc parameters, were found to be significant predictors of progression on univariate Cox regression analysis. The most accurate single predictors were the GCC focal loss volume (FLV), followed closely by NFL-FLV. An abnormal GCC-FLV at baseline increased risk of progression by a hazard ratio of 3.1. Multivariate Cox analysis showed that combining age and central corneal thickness with GCC-FLV in a composite index called 'Glaucoma Composite Progression Index' (GCPI) further improved the accuracy of progression prediction. GCC-FLV and GCPI were both found to be significantly correlated with the annual rate of change in VFI. Focal GCC and NFL loss as measured by FDOCT are the strongest predictors for VF progression among the measurements considered."

According to the news reporters, the research concluded: "Older age and thinner central corneal thickness can enhance the predictive power using the composite risk model."

Our news correspondents report that additional information may be obtained by contacting D. Huang, Oregon Health Sciences University, Casey Eye Inst, Portland, OR 97239, United States. Additional authors for this research include A. Dastiridou, B.A. Francis, O. Tan, R. Varma, D.S. Greenfield, J.S. Schuman, M. Sehi, V. Chopra and D. Huang.

Drugs and Therapies - Health-System Pharmacy

Recent Findings in Health-System Pharmacy Described by Researchers from Eshelman School of Pharmacy (The layered learning practice model: Lessons learned from implementation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Health-System Pharmacy. According to news reporting out of Chapel Hill, North Carolina, by NewsRx editors, research stated, "Pharmacists' views about the implementation, benefits, and attributes of a layered learning practice model (LLPM) were examined. Eligible and willing attending pharmacists at the same institution that had implemented an LLPM completed an individual, 90-minute, face-to-face interview using a structured interview guide developed by the interdisciplinary study team."

Our news journalists obtained a quote from the research from the Eshelman School of Pharmacy, "Interviews were digitally recorded and transcribed verbatim without personal identifiers. Three researchers independently reviewed preliminary findings to reach consensus on emerging themes. In cases where thematic coding diverged, the researchers discussed their analyses until consensus was reached. Of 25 eligible attending pharmacists, 24 (96%) agreed to participate. The sample was drawn from both acute and ambulatory care practice settings and all clinical specialty areas. Attending pharmacists described several experiences implementing the LLPM and perceived benefits of the model. Attending pharmacists identified seven key attributes for hospital and health-system pharmacy departments that are needed to design and implement effective LLPMs: shared leadership, a systematic approach, good communication, flexibility for attending pharmacists, adequate resources, commitment, and evaluation. Participants also highlighted several potential challenges and obstacles for organizations to consider before implementing an LLPM."

According to the news editors, the research concluded: "According to attending pharmacists involved in an LLPM, successful implementation of an LLPM required shared leadership, a systematic approach, communication, flexibility, resources, commitment, and a process for evaluation."

For more information on this research see: The layered learning practice model: Lessons learned from implementation. American Journal of Health-System Pharmacy, 2016;73 (24):2077-2082. Recent Findings in Heart Attack Described by Researchers from Medical College of Wisconsin (Acute Myocardial Infarction in Adult Congenital Patients with Bodily Isomerism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Attack have been presented. According to news reporting originating in Milwaukee, Wisconsin, by NewsRx journalists, research stated, "Children born with congenital malformations of the heart are increasingly surviving into adulthood. This population of patients possesses lesion-specific complication risks while still being at risk for common illnesses."

The news reporters obtained a quote from the research from the Medical College of Wisconsin, "Bodily isomerism or heterotaxy, is a unique clinical entity associated with congenital malformations of the heart which further increases the risk for future cardiovascular complications. We aimed to investigate the frequency of myocardial infarction in adults with bodily isomerism. We utilized the 2012 iteration of the Nationwide Inpatient Sample to identify adult inpatient admissions associated with acute myocardial infarction in patients with isomerism. Data regarding demographics, comorbidities and various procedures were collected and compared between those with and without isomerism. A total of 6,907,109 admissions were analyzed with a total of 172,394 admissions being associated with an initial encounter for acute myocardial infarction. The frequency of myocardial infarction did not differ between those with and without isomerism and was roughly 2% in both groups. Similarly, the number of procedures and in-hospital mortality did not differ between the two groups."

According to the news reporters, the research concluded: "The frequency and short-term prognosis of acute myocardial infarction is similar in patients with and without isomerism."

For more information on this research see: Acute Myocardial Infarction in Adult Congenital Patients with Bodily Isomerism. Congenital Heart Disease, 2016;11(6):548-553. Congenital Heart Disease can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Recent Findings in Heart Attack Described by Researchers from Seoul National University (A multicentre observational study of inter-hospital transfer for post-resuscitation care after out-of-hospital cardiac arrest)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Attack is now available. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "To provide therapeutic hypothermia (TH) to survivors after out-of-hospital cardiac arrest (OHCA), inter-hospital transfers (IHT) are frequently required. The safety of IHT remains controversial."

Financial support for this research came from Korea Centers for Disease Control and Prevention (CDC).

The news correspondents obtained a quote from the research from Seoul National University, "The aim of this study was to investigate whether the effect of TH on brain recovery after OHCA differs between IHT and direct arrival groups. We identified patients with OHCA of presumed cardiac aetiology who were resuscitated by emergency medical services and experienced return-of-spontaneous circulation in 27 hospitals between January and December 2014. The main exposure variables were TH and IHT. The primary endpoint was discharge with good neurological recovery. We compared outcomes between the TH and non-TH groups using multivariable logistic regression with an interaction term between TH and IHT, after adjusting for potential confounders. Among 1616 patients, 576 patients were included in the final analyses. Neurologic recovery was better in the TH group (46.2%) than in the non-TH group (20.1%) (adjusted odds ratio [aOR] 2.03 [95% confidence interval (CI) 1.24-3.33]). In the interaction model for the outcome of good neurological recovery, the aOR for TH was 2.82 (95% CI 1.59-5.01) in the direct transfer group vs. 0.76 (95% CI 0.29-2.01) in the IHT group. The measure of interaction on the multiplicative scale in this model was also statistically significant (OR 0.27 [95% CI 0.07-0.83]; p = 0.02). IHT modified the effect of TH on neurological recovery for survivors of OHCA."

According to the news reporters, the research concluded: "TH is significantly less beneficial for good neurological recovery in patients who arrive via IHT than for those who arrive directly."

Our news journalists report that additional information may be obtained by contacting K.O. Ahn, Seoul National University, Biomed Res Inst, Lab Emergency Med Serv, Seoul 110744, South Korea. Additional authors for this research include K.O. Ahn, S.D. Shin, K.J. Song, Y.S. Ro, J.Y. Kim, E.J. Lee and Y.J. Lee.

Recent Findings in Heart Attack Described by Researchers from Xi'an Jiaotong University (Chest Pain after Aortic Valve Replacement: Rupture of Right Sinus of Valsalva Presenting as Myocardial Infarction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting out of Xi'an, People's Republic of China, by NewsRx editors, research stated, "A 47-year-old male presented with retrosternal chest pain, which had started 4 days previously and had become excruciating for the past 6 h. He had undergone mechanical aortic valve replacement surgery 4 months previously."

Our news journalists obtained a quote from the research from Xi'an Jiaotong University, "Electrocardiography, echocardiography, computed tomography-angiography of the aorta. Rupture of the right sinus of Valsalva and right coronary artery dissection."

According to the news editors, the research concluded: "The defect in the right coronary sinus was closed, and the dissection at the root of the right coronary artery was resected and the right coronary artery bypassed to the root of the aorta."

Our news journalists report that additional information may be obtained by contacting J. She, Cardiovascular Department, First Affiliated Hospital of Medical College, Xi'an Jiaotong University, Xi'an, People's Republic of China. Additional authors for this research include Z. Hu, Y. Deng, F. Liu and Z. Yuan.

Recent Findings in Heart Failure Described by Researchers from University of Washington (Neonatal Diesel Exhaust Particulate Exposure Does Not Predispose Mice to Adult Cardiac Hypertrophy or Heart Failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Failure. According to news reporting out of Seattle, Washington, by NewsRx editors, research stated, "We have previously reported that in utero and early life exposure to diesel exhaust particulates predisposes mice to adult heart failure, and that in utero exposure alone is sufficient to confer this predisposition. This follow up study addresses whether neonatal exposure alone can also confer this predisposition."

Our news journalists obtained a quote from the research from the University of Washington, "Newborn male C57BL/6 mice were exposed to diesel exhaust (DE) particulates immediately after birth until weaning at 21 days of age, whereupon they were transferred to filtered air (FA) conditions. At the age of 12 weeks, transverse aortic constriction (TAC) was performed followed by weekly echocardiography for three weeks. After the last echocardiogram, mice were euthanized for organ harvest, gravimetry and histology. Neonatal exposure to DE particulates did not increase susceptibility to cardiac hypertrophy or heart failure after TAC when compared to FA exposed controls (ventricular weight/body weight ratio 7.505 vs. 7.517 mg/g, p = Not Significant (NS)). The left ventricular ejection fraction after TAC was similar between groups at one week, two weeks, and three weeks after procedure. Histological analysis showed no difference in the degree of cardiac hypertrophy or fibrosis."

According to the news editors, the research concluded: "Neonatal exposure to DE particulates does not predispose mice to TAC-induced cardiac hypertrophy and heart failure in adulthood, in contrast to previously published results showing susceptibility due to in utero exposure."

For more information on this research see: Neonatal Diesel Exhaust Particulate Exposure Does Not Predispose Mice to Adult Cardiac Hypertrophy or Heart Failure. *International Journal of Environmental Research and Public Health*, 2016;13(12):105-111. *International Journal of Environmental Research and Public Health* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Recent Findings in Hepatitis C Virus Described by V. Knop and Colleagues (Regression of fibrosis and portal hypertension in HCV-associated cirrhosis and sustained virologic response after interferon-free antiviral therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Hepatitis C Virus have been presented. According to news reporting from Frankfurt, Germany, by NewsRx journalists, research stated, "It is still controversial, whether and to what amount cirrhosis and portal hypertension are reversible in patients with hepatitis C virus (HCV)-associated cirrhosis and sustained virologic response (SVR) after interferon-free antiviral therapy. In this study, we prospectively evaluated dynamics of liver and spleen stiffness in HCV-infected patients with advanced liver disease and SVR after interferon-free treatment."

The news correspondents obtained a quote from the research, "A total of 54 patients with HCV-associated cirrhosis and SVR were included. Liver and spleen stiffness was measured at therapy baseline (BL), end of treatment (EOT) and 24 weeks after EOT (FU24) by transient liver elastography (L-TE) as well as by acoustic radiation force impulse of the liver (L-ARFI) and spleen (S-ARFI), as well as biochemical, virologic and clinical data. Improvement of liver and spleen stiffness was found in 44 of 50 (88%), 31 of 54 (57%) and 25 of 54 (46%) of patients assessed by L-TE, L-ARFI and S-ARFI between baseline and FU24. Liver stiffness assessed by L-TE improved between BL [median (range), 32.5 (9.1-75) kPa] and EOT [median (range), 21.3 (6.7-73.5) kPa; (P <.0001)], and between BL and FU24 [median (range), 21.2 (5.4-70) kPa; (P <.0001)]. Liver stiffness assessed by L-ARFI improved between BL [median (range), 2.7 (1.2-4.1) m/s] and FU24 [median (range), 2.4 (1.2-3.9) m/s; P=.002], while spleen stiffness remained unchanged."

According to the news reporters, the research concluded: "Our data suggest that improvement of liver stiffness may be rather due to reduced necroinflammation and may be due to a less extent to regression of cirrhosis, as dynamics of liver stiffness improvement was more pronounced between BL and EOT than BL and FU24."

Our news journalists report that additional information may be obtained by contacting M.W. Welker, Univ Klinikum Frankfurt, Medizin Klin 1, Frankfurt, Germany. Additional authors for this research include D. Hoppe, T. Welzel, J. Vermehren, E. Herrmann, A. Vermehren, M. Friedrich-Rust, C. Sarrazin, S. Zeuzem and M.W. Welker.

Recent Findings in Human Genetics Described by Researchers from CHA University (Evidence for No Significant Impact of Müllerian Anomalies on Reproductive Outcomes of Twin Pregnancy in Korean Women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics - Human Genetics. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The present article aimed to evaluate the impact of congenital Müllerian anomalies (MA) on twin pregnancy after 24 gestational weeks in Korean women. All records of twin pregnancies in a large maternity hospital in Korea between January 2005 and July 2013 were analyzed."

Our news editors obtained a quote from the research from CHA University, "Patients with monochorionic monoamniotic (MCMA) twins, non-Korean patients, patients with twins delivered prior to 24 gestational weeks, and patients with miscarriage of one fetus or intrauterine fetal death (IUFD) before 24 gestational weeks were excluded from data analysis. In total, 1,422 women with twin pregnancy were eligible for data analysis, including 17 (1.2%) who had a known congenital MA (septate uterus, bicornuate uterus, arcuate uterus, and unicornuate uterus). Except for the mode of conception, baseline demographics were similar between women with MA and those without MA. No significant differences were found in pregnancy outcomes of gestational age at delivery (p=.86), birth weight of smaller and larger twins (p=.54 and p=.65), and number of twins with birth weight <5th percentile for gestational age (p=.43). The rates of obstetrical complications such as pre-eclampsia, gestational diabetes mellitus (GDM), placenta previa, cerclage, IUFD, and postpartum hemorrhage were not significantly different between the two groups either."

According to the news editors, the research concluded: "We concluded that the presence of congenital MA may not increase obstetrical risks in outcomes of pregnancy of twins delivered after 24 gestational weeks."

The news editors report that additional information may be obtained by contacting S. Shim, Dept. of Obstetrics and Gynecology, CHA Gangnam Medical Center, CHA University, Seoul, South Korea. Additional authors for this research include Y.M. Hur, da H. Kim, S.J. Seong, M.L. Kim and J.S Shin.

Recent Findings in Immune System Described by Researchers from Sheffield Teaching Hospitals (The therapeutic potential of epigenetic manipulation during infectious diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immunology - Immune System are discussed in a new report. According to news reporting originating in Sheffield, United Kingdom, by NewsRx journalists, research stated, "Epigenetic modifications are increasingly recognized as playing an important role in the pathogenesis of infectious diseases. They represent a critical mechanism regulating transcriptional profiles in the immune system that contributes to the cell-type and stimulus specificity of the transcriptional response."

The news reporters obtained a quote from the research from Sheffield Teaching Hospitals, "Recent data highlight how epigenetic changes impact macrophage functional responses and polarization, influencing the innate immune system through macrophage tolerance and training. In this review we will explore how post translational modifications of histone tails influence immune function to specific infectious diseases. We will describe how these may influence outcome, highlighting examples derived from responses to acute bacterial pathogens, models of sepsis, maintenance of viral latency and HIV infection."

According to the news reporters, the research concluded: "We will discuss how emerging classes of pharmacological agents, developed for use in oncology and other settings, have been applied to models of infectious diseases and their potential to modulate key aspects of the immune response to bacterial infection and HIV therapy."

Our news correspondents report that additional information may be obtained by contacting D.H. Dockrell, Sheffield Teaching Hosp, Sheffield, S Yorkshire, United Kingdom. Additional authors for this research include P. Morris, M.J. Dickman and D.H. Dockrell.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.pharmthera.2016.07.013. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Findings in Ischemia Described by Researchers from Institute of Biomedical Research (Polyethylene Glycol Preconditioning: An Effective Strategy to Prevent Liver Ischemia Reperfusion Injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Ischemia have been presented. According to news reporting originating in Barcelona, Spain, by NewsRx journalists, research stated, "Hepatic ischemia reperfusion injury (IRI) is an inevitable clinical problem for liver surgery. Polyethylene glycols (PEGs) are water soluble nontoxic polymers that have proven their effectiveness in various in vivo and in vitro models of tissue injury."

Financial supporters for this research include Fondo de Investigaciones Sanitarias, Generalitat de Catalunya.

The news reporters obtained a quote from the research from the Institute of Biomedical Research, "The present study aims to investigate whether the intravenous administration of a high molecular weight PEG of 35 kDa (PEG 35) could be an effective strategy for rat liver preconditioning against IRI. PEG 35 was intravenously administered at 2 and 10 mg/kg to male Sprague Dawley rats. Then, rats were subjected to one hour of partial ischemia (70%) followed by two hours of reperfusion. The results demonstrated that PEG 35 injected intravenously at 10 mg/kg protected efficiently rat liver against the deleterious effects of IRI. This was evidenced by the significant decrease in transaminases levels and the better preservation of mitochondrial membrane polarization. Also, PEG 35 preserved hepatocyte morphology as reflected by an increased F-actin/G-actin ratio and confocal microscopy findings. In addition, PEG 35 protective mechanisms were correlated with the activation of the prosurvival kinase Akt and the cytoprotective factor AMPK and the inhibition of apoptosis."

According to the news reporters, the research concluded: "Thus, PEG may become a suitable agent to attempt pharmacological preconditioning against hepatic IRI."

Our news correspondents report that additional information may be obtained by contacting M. Bejaoui, Experimental Pathology Department, Institute of Biomedical Research of Barcelona (IIBB), CSIC, Rossello 161, Barcelona, 08036 Catalonia, Spain. Additional authors for this research include E. Pantazi, M. Calvo, E. Folch-Puy, A. Serafin, G. Pasut, A. Panisello, R. Adam and J. Rosello-Catafau.

Recently, researchers from Saitama Medical University have described their findings on the long-term outcomes of 154 patients treated with balloon-occluded retrograde transvenous obliteration (B-RTO) for gastric fundal varices. The study aimed to clarify the long-term outcome of therapeutic strategies including B-RTO for patients with gastric fundal varices. The subjects were 154 patients with gastric fundal varices fulfilling the criteria for receiving B-RTO.

In patients showing variceal bleeding, endoscopic therapies and/or balloon tamponade was performed to achieve hemostasis. B-RTO was accomplished with injection of 5% ethanolamine olate through a standard balloon catheter except for patients with atypical varices, in whom a microballoon catheter was used to occlude drainage vessels other than a gastrorenal shunt. In patients complicated with esophageal varices at baseline, endoscopic therapies were performed following B-RTO. Balloon-occluded retrograde transvenous obliteration was performed successfully in 147 patients (95%), including 15 patients using a microballoon catheter. Complete variceal obliteration was achieved in all patients. Additional endoscopic therapies for esophageal varices were performed in 31 patients. Gastric varices did not recur in any of these patients. The cumulative survival rates at 1, 3, and 5 years after B-RTO were 91%, 76%, and 72%, respectively. Child-Pugh scores and hepatocellular carcinoma complication were identified as prognostic factors associated with survival rates. The cumulative exacerbation rates of esophageal varices at 1, 3, and 5 years were 13%, 20%, and 27%, respectively, and rupture developed in six patients, which were successfully treated with endoscopic therapies.

According to the news editors, the research concluded: "Therapeutic strategies including B-RTO with a microballoon catheter were useful to achieve a favorable outcome in patients with gastric fundal varices especially in those manifesting Child-Pugh class-A liver damage and/or those without hepatocellular carcinoma complication."

The news correspondents report that additional information may be obtained from S. Mochida, Saitama Med Univ, Dept. of Gastroenterol & Hepatom, Fac Med, Moroyama, Saitama 3500495, Japan. Additional authors for this research include M. Nakazawa, S. Ando, K. Sugawara and S. Mochida.

Recent Findings in Lung Cancer Described by Researchers from Department of Radiation Oncology (Focal Adhesion Kinase Regulates the DNA Damage Response and Its Inhibition Radiosensitizes Mutant KRAS Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Lung Cancer is the subject of a report. According to news originating from Dallas, Texas, by NewsRx correspondents, research stated, "Non-small cell lung cancer (NSCLC) is the leading cause of cancer-related deaths worldwide due to the limited availability of effective therapeutic options. For instance, there are no effective strategies for NSCLCs that harbor mutant KRAS, the most commonly mutated oncogene in NSCLC."

Our news journalists obtained a quote from the research from the Department of Radiation Oncology, "Thus, our purpose was to make progress toward the generation of a novel therapeutic strategy for NSCLC. We characterized the effects of suppressing focal adhesion kinase (FAK) by RNA interference (RNAi), CRISPR/CAS9 gene editing or pharmacologic approaches in NSCLC cells and in tumor xenografts. In addition, we tested the effects of suppressing FAK in association with ionizing radiation (IR), a standard-of-care treatment modality. FAK is a critical requirement of mutant KRAS NSCLC cells. With functional experiments, we also found that, in mutant KRAS NSCLC cells, FAK inhibition resulted in persistent DNA damage and susceptibility to exposure to IR. Accordingly, administration of IR to FAK-null tumor xenografts causes a profound antitumor effect in vivo. FAK is a novel regulator of DNA damage repair in mutant KRAS NSCLC and its pharmacologic inhibition leads to radiosensitizing effects that could be beneficial in cancer therapy."

According to the news editors, the research concluded: "Our results provide a framework for the rationale clinical testing of FAK inhibitors in NSCLC patients."

For more information on this research see: Focal Adhesion Kinase Regulates the DNA Damage Response and Its Inhibition Radiosensitizes Mutant KRAS Lung Cancer. Clinical Cancer Research, 2016;22(23):5851-5863. Clinical Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Oncology - Lung Cancer
Recent Findings in Lung Cancer Described by Researchers from Yale University (EGFR-GRB2 Protein Colocalization Is a Prognostic Factor Unrelated to Overall EGFR Expression or EGFR Mutation in Lung Adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news originating from New Haven, Connecticut, by NewsRx correspondents, research stated, "EGFR is a therapeutic target in NSCLC for EGFR-mutant patients. Proximity ligation assay (PLA) is a method to detect functional signaling associated protein complexes."

Funders for this research include National Institutes of Health, Yale SPORE in Lung Cancer, Yale Cancer Center, OKIBEE.

Our news journalists obtained a quote from the research from Yale University, "Growth factor receptor bound protein 2 (GRB2) is an adaptor protein that binds to the phosphorylated residues of active EGFR. Interaction of EGFR and GRB2 correlates with active EGFR signaling and leads to activation of the MAPK/ERK pathway. A PLA developed to detect EGFR-GRB2 interaction was measured by quantitative immunofluorescence using Automated Quantitative Analysis technology. EGFR pathway activation was assessed in patients with NSCLC with different mutation status along with overall EGFR expression. Additionally, the PLA to detect EGFR-GRB2 interaction was evaluated as a prognostic marker in two cohorts of patients with lung adenocarcinoma. The PLA to detect EGFR-GRB2 interaction was unrelated to overall EGFR expression or mutation in a series of patients with NSCLC with known mutation status. EGFR-mutant (p = 0.04) and EGFR/KRAS wild-type tumors (p = 0.0049) had significantly higher EGFR pathway activation compared with KRAS-mutant cases, with no significant difference shown between mutation sites. In two series of patients with lung adenocarcinoma, the PLA to detect EGFR-GRB2 interaction was independently associated with longer survival (hazard ratio = 0.46, 95% confidence interval: 0.2-0.78, p = 0.0085 and hazard ratio = 0.48, 95% confidence interval: 0.2-0.85, p = 0.017). Total EGFR protein expression alone was not correlated with outcome. EGFR colocalization with GRB2 as assessed by PLA is not correlated with EGFR expression levels or mutation status, defining a patient group that may show EGFR pathway activation, as illustrated by its prognostic value."

According to the news editors, the research concluded: "Future studies may determine whether this group is more likely to respond to EGFR-targeted therapies."

For more information on this research see: EGFR-GRB2 Protein Colocalization Is a Prognostic Factor Unrelated to Overall EGFR Expression or EGFR Mutation in Lung Adenocarcinoma. Journal of Thoracic Oncology, 2016;11(11):1901-1911. Journal of Thoracic Oncology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Oncology - Malignant Pleural Effusion

Recent Findings in Malignant Pleural Effusion Described by Researchers from Chinese People's Liberation Army General Hospital
(Combination use of paclitaxel and avastin enhances treatment effect for the NSCLC patients with malignant pleural ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Malignant Pleural Effusion. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "The current study is conducted to investigate efficacy of the chemotherapy drug paclitaxel in combination with Avastin (Roche Diagnostics GmbH., Mannheim, Germany) (antiangiogenic agent) in treatment of malignant pleural effusions (MPEs). Twenty-four patients with non-small cell lung cancer were randomly assigned for 2 treatment approaches."

The news reporters obtained a quote from the research from Chinese People's Liberation Army General Hospital, "Ten patients received paclitaxel (175 mg/m(2)) alone, and 14 patients took a combination therapy of paclitaxel and Avastin (5 mg/kg). Efficacy of the treatment approaches in the patients was validated with the change in the MPE volume. Pharmacokinetic (PK) profile and urinary excretion rate of paclitaxel were analyzed with serum vascular endothelial growth factor (VEGF) level, and adverse events were examined as well. The combination therapy reduced the MPE level with a successful rate of 29% and a survival rate of 25% over the single paclitaxel treatment in the study cohort (both P<0.05). PKs for the combined treatment displayed a rapid distribution of the anticancer drug paclitaxel with an obvious increase in its elimination half-life in the pleural fluid (both P<0.01). Mean residence time of paclitaxel increased in the presence of Avastin (P <0.01). Serum VEGF levels significantly reduced in the Avastin-treated patients as compared to the paclitaxel-treated ones (P <0.01). The urinary excretion rate was similar in the study cohort. Incidence of adverse events for the 2 treatment approaches was similar in the patients." According to the news reporters, the research concluded: "Intervention of Avastin enhances potency of paclitaxel in treatment of MPEs with the increased survival rate of the patients through inhibiting VEGF production and prolonging time of ongoing interaction between the chemotherapy drug and the tumor tissues."
For more information on this research see: Combination use of paclitaxel and avastin enhances treatment effect for the NSCLC patients with malignant pleural effusion. Medicine, 2016;95(47):153-160. Membrane Proteins - Membrane Glycoproteins

Recent Findings in Membrane Glycoproteins Described by Researchers from Baker IDI Heart and Diabetes Institute (Small GTPase ARF6 Regulates Endocytic Pathway Leading to Degradation of ATP-Binding Cassette Transporter A1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Membrane Proteins - Membrane Glycoproteins are discussed in a new report. According to news reporting originating in Melbourne, Australia, by NewsRx journalists, research stated, "ABCA1 (ATP-binding cassette transporter A1) is the principal protein responsible for cellular cholesterol efflux. Abundance and functionality of ABCA1 is regulated both transcriptionally and post-translationally, with endocytosis of ABCA1 being an important element of post-translational regulation."

The news reporters obtained a quote from the research from Baker IDI Heart and Diabetes Institute, "Functional ABCA1 resides on the plasma membrane but can be internalized and either degraded or recycled back to the plasma membrane. The interaction between the degradative and recycling pathways determines the abundance of ABCA1 and may contribute to the efflux of intracellular cholesterol. Approach and Results-Here, we show that the principal pathway responsible for the internalization of ABCA1 leading to its degradation in macrophages is ARF6-dependent endocytic pathway. This pathway was predominant in the regulation of ABCA1 abundance and efflux of plasma membrane cholesterol. Conversely, the efflux of intracellular cholesterol was predominantly controlled by ARF6-independent pathways, and inhibition of ARF6 shifted ABCA1 into recycling endosomes enhancing efflux of intracellular cholesterol."

According to the news reporters, the research concluded: "We conclude that ARF6-dependent pathway is the predominant route responsible for the ABCA1 internalization and
degradation, whereas ARF6-independent endocytic pathways may contribute to ABCA1 recycling and efflux of intracellular cholesterol."

For more information on this research see: Small GTPase ARF6 Regulates Endocytic Pathway Leading to Degradation of ATP-Binding Cassette Transporter A1. *Arteriosclerosis Thrombosis and Vascular Biology*, 2016;36(12):2292-2303. *Arteriosclerosis Thrombosis and Vascular Biology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Autoimmune Diseases and Conditions - Multiple...

**Recent Findings in Multiple Sclerosis Described by Researchers from University of Medicine and Dentistry of New Jersey (UMDNJ) (Predictive cytokine biomarkers of clinical response to glatiramer acetate therapy in multiple sclerosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Autoimmune Diseases and Conditions - Multiple Sclerosis are presented in a new report. According to news reporting originating in Piscataway, New Jersey, by NewsRx journalists, research stated, "A prospective study of 62 patients with relapsing-remitting multiple sclerosis (RRMS) treated with Glatiramer acetate (GA) was conducted to evaluate the value of baseline and treatment-modulated cytokines in predicting the clinical response to the drug after 2 years of therapy. There were 32 responders and 30 non-responders."

Financial supporters for this research include Wadsworth Foundation, TEVA Pharmaceuticals.

The news reporters obtained a quote from the research from the University of Medicine and Dentistry of New Jersey (UMDNJ), "GA upregulated Th2/regulatory cytokines and inhibited Th1 cytokines in sera or PBMC supernatants 3 and 6 months into treatment. We found two prognostic models with clinical utility. A model based on IL-18 at baseline, the change in TNFα from baseline to 3 months, the change in IL-4 from baseline to 6 months, and the change in the log of the ratio of TNFα/IL-4 from baseline to 6 months had an area under the curve (AUC) of 0.80. A high IL-18 level at baseline and a reduction of TNF-alpha over time are associated with a response to GA."

According to the news reporters, the research concluded: "Although the study identified predictive biomarkers of clinical response to GA, the results will need to be validated in other data sets."

For more information on this research see: Predictive cytokine biomarkers of
Recent Findings in Obesity Described by J. Lopez-Minguez and Colleagues (Circadian rhythms, food timing and obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news originating from Murcia, Spain, by NewsRx correspondents, research stated, "It is known that our physiology changes throughout the day and that several physiological hormones display circadian rhythmicity. The alteration of this normal pattern is called chronodisruption (CD)."

Our news journalists obtained a quote from the research, "In recent years, it has been demonstrated that CD is related to obesity. Although several factors may be causing CD, one important aspect to consider is the failure in our internal clock. Indeed, studies performed in mutant animals have demonstrated that mutations in clock genes are related to obesity. In human subjects, mutations are rare (<1% of the population). Nevertheless, it is rather common to have genetic variations in one SNP, which underlie differences in our vulnerability to disease. Several SNP in clock genes are related to obesity and weight loss. Taking into account that genetics is behind CD, as has already been demonstrated in twins' models, the question is: Are we predestinated? We will see along these lines that nutrigenetics and epigenetics answer: No, we are not predestinated. Through nutrigenetics we know that our behaviours may interact with our genes and may decrease the deleterious effect of one specific risk variant. From epigenetics the message is even more positive: it is demonstrated that by changing our behaviours we can change our genome. Herein, we propose modifying what, how, and when we eat as an effective tool to decrease our genetic risk, and as a consequence to diminish CD and decrease obesity."

According to the news editors, the research concluded: "This is a novel and very
promising area in obesity prevention and treatment.”

The news correspondents report that additional information may be obtained from M. Garaulet, IMIB Arrixaca, Murcia, Spain. Additional authors for this research include P. Gomez-Abellan and M. Garaulet.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1017/S0029665116000628. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Findings in Obesity Described by Researchers from University of Colorado (Body Mass Index and the Spontaneous Onset of Parturition)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Obesity is the subject of a report. According to news reporting out of Denver, Colorado, by NewsRx editors, research stated, “To investigate the relationship between body mass index (BMI) and the onset of parturition throughout gestation. This was a secondary analysis of the Maternal-Fetal Medicine Units Network Preterm Prediction Study.”

Our news journalists obtained a quote from the research from the University of Colorado, “Time-to-spontaneous-birth-event (ie, ‘survival’) methods were used to study the association of BMI with the timing of spontaneous onset of labor throughout gestation with indicated births censored at delivery. A Kaplan-Meier estimate of the probability of spontaneous labor was compared with a log rank test across five categories of BMI (kg/m(2)): underweight (less than 18.5), normal weight (18.5-24.99), preobese (25-29.99), obese I (30-34.99), and obese II+ (35 or greater). A proportional hazards model was estimated to compare time to spontaneous onset of labor adjusted for multiple variables known to be associated with the onset of labor. Normal-weight women (n=1,054) had a median delivery gestational age of 39 3/7 weeks. Obese II+ women (n=178) had a median delivery gestational age 5 days later than normal-weight women (P <.001). Delivery gestational age of preobese (n=866) and obese I (n=548) women was not significantly different from normal-weight women. Underweight women (n=41) had a median delivery gestational age 5 days earlier than normal-weight women (P <.001). Compared with women with normal BMIs, obese II+ women were significantly less likely and underweight women significantly more likely to enter spontaneous labor at all gestational ages. In the multivariable model, BMI was significantly associated with spontaneous onset of labor.
throughout pregnancy (BMI [five-unit] adjusted hazard ratio \(0.874, 0.829-0.921\)). Body mass index is significantly associated with the likelihood of the spontaneous onset of labor at all gestational ages with gestational age at the time of delivery and BMI being inversely related."

According to the news editors, the research concluded: "This novel observation unifies previous reports focusing on the association of overweight and underweight BMIs and preterm and postterm birth and may inform discussions surrounding elective induction of labor at term."

For more information on this research see: Body Mass Index and the Spontaneous Onset of Parturition. Obstetrics and Gynecology, 2016;128(5):1033-1038. Obstetrics and Gynecology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Respiratory Tract Diseases and Conditions -...

Recent Findings in Obstructive Sleep Apnea Described by R. Soca and Colleagues (Parasomnia Overlap Disorder with Sexual Behaviors during Sleep in a Patient with Obstructive Sleep Apnea)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea. According to news reporting originating in St. Paul, Minnesota, by NewsRx journalists, research stated, "Sleep-related abnormal sexual behaviors (sexsomnia) are classified as a subtype of NREM sleep parasomnias. Sexsomnia has been reported as part of parasomnia overlap disorder (POD) in two other patients."

The news reporters obtained a quote from the research, "We present the case of a 42-year-old male patient with video-polysomnography (vPSG) documented POD. The patient had sleepwalking, sleep-related eating, confusional arousals, sexsomnia, sleepwalking, and REM sleep behavior disorder (RBD). Confusional arousals and RBD were documented during the vPSG. This case had the added complexity of obstructive sleep apnea (OSA) playing a role in sleepwalking and sleep related eating, with good response to nasal continuous positive airway pressure (nCPAP)."

According to the news reporters, the research concluded: "The sexsomnia did not respond to nCPAP but responded substantially to bedtime clonazepam therapy."

For more information on this research see: Parasomnia Overlap Disorder with Sexual Behaviors during Sleep in a Patient with Obstructive Sleep Apnea. Journal of Clinical Sleep Medicine, 2016;12(8):1189-1191. Journal of Clinical Sleep Medicine can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

Oncology

Recent Findings in Oncology Described by Researchers from Peking University [Crosstalk between autophagy and intracellular radiation response (Review)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Autophagy induced by radiation is critical to cell fate decision. Evidence now sheds light on the importance of autophagy induced by cancer radiotherapy."

Our news journalists obtained a quote from the research from Peking University, "Traditional view considers radiation can directly or indirectly damage DNA which can activate DNA damage the repair signaling pathway, a large number of proteins participating in DNA damage repair signaling pathway such as p53, ATM, PARP1, FOXO3a, mTOR and SIRT1 involved in autophagy regulation. However, emerging recent evidence suggests radiation can also cause injury to extranuclear targets such as plasma membrane, mitochondria and endoplasmic reticulum (ER) and induce accumulation of ceramide, ROS, and Ca2+ concentration which activate many signaling pathways to modulate autophagy. Herein we review the role of autophagy in radiation therapy and the potent intracellular autophagic triggers induced by radiation."

According to the news editors, the research concluded: "We aim to provide a more theoretical basis of radiation-induced autophagy, and provide novel targets for developing cytotoxic drugs to increase radiosensitivity."

Our news journalists report that additional information may be obtained by contacting J.J. Wang, Peking University, Hosp 3, Dept. of Radiat Oncol, Beijing 100191, People's Republic of China. Additional authors for this research include H. Wang, L. Huang, Y. Zhao and J.J. Wang.

Recent Findings in Primary Graft Dysfunction Described by Researchers from University of Strasbourg (Microparticles: A new insight into lung primary graft dysfunction?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Primary Graft Dysfunction is the subject of a report. According to news reporting originating in Strasbourg, France, by NewsRx journalists, research stated, "Lung transplantation is the only life-saving treatment for end stage respiratory disease. The immediate outcome is still hampered by primary graft dysfunction."

The news reporters obtained a quote from the research from the University of Strasbourg, "The latter is a form of acute lung injury occurring within the 30 min following the unclamping of the pulmonary artery that prompts ischemia reperfusion injury. Severe forms may need prolonged mechanical ventilation and extra-corporeal membrane oxygenation. Overall, primary graft dysfunction accounts for at least one third of the deaths during the first post-operative month. Despite increasing experience and knowledge on the underlying cellular events, there is still a lack of an early marker of ischemia reperfusion graft injuries. Microparticles are plasma membrane vesicles that are released from damaged or stressed cells in biological fluids and remodeling tissues, among which the lung parenchyma during acute or chronic injury. We recently evidenced alveolar microparticles as surrogate markers of strong ischemia injury in ex-vivo reperfusion experimental models."

According to the news reporters, the research concluded: "We propose herein new insights on how microparticles may be helpful to evaluate the extent of lung ischemia reperfusion injuries and predict the occurrence of primary graft dysfunction."

For more information on this research see: Microparticles: A new insight into lung primary graft dysfunction? Human Immunology, 2016;77(11):1101-1107. Human Immunology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Human Immunology - www.journals.elsevier.com/human-immunology/)

Oncology - Prostate Cancer

Recent Findings in Prostate Cancer Described by Researchers from CSIR (Disulfiram and Its Novel Derivative Sensitize Prostate Cancer Cells to the Growth Regulatory Mechanisms of the Cell by Re-Expressing the Epigenetically Repressed Tumor ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting out of Uttar Pradesh, India, by NewsRx editors, research stated, "Estrogen Receptor-beta (ER-beta), a tumor-suppressor in prostate cancer, is epigenetically repressed by hypermethylation of its promoter. DNA-methyltransferases (DNMTs), which catalyze the transfer of methyl-groups to CpG islands of gene promoters, are overactive in cancers and can be inhibited by DNMT-inhibitors to re-express the tumor suppressors."

Our news journalists obtained a quote from the research from CSIR, "The FDA-approved nucleoside DNMT-inhibitors like 5-Azacytidine and 5-Aza-deoxycytidine carry notable concerns due to their off-target toxicity, therefore non-nucleoside DNMT inhibitors are desirable for prolonged epigenetic therapy. Disulfiram (DSF), an antabuse drug, inhibits DNMT and prevents proliferation of cells in prostate and other cancers, plausibly through the re-expression of tumor suppressors like ER-beta. To increase the DNMT-inhibitory activity of DSF, its chemical scaffold was optimized and compound-339 was discovered as a doubly potent DSF-derivative with similar off-target toxicity. It potently and selectively inhibited cell proliferation of prostate cancer (PC3/DU145) cells in comparison to normal (non-cancer) cells by promoting cell-cycle arrest and apoptosis, accompanied with inhibition of total DNMT activity, and re-expression of ER-beta (mRNA/protein). Bisulfite-sequencing of ER-beta promoter revealed that compound-339 demethylated CpG sites more efficaciously than DSF, restoring near-normal methylation status of ER-beta promoter. Compound-339 docked on to the MTase domain of DNMT1 with half the energy of DSF. In xenograft mice-model, the tumor volume regressed by 24% and 50% after treatment with DSF and compound-339, respectively, with increase in ER-beta expression. Apparently both compounds inhibit prostate cancer cell proliferation by re-expressing the epigenetically repressed tumor-suppressor ER-beta through inhibition of DNMT activity."

According to the news editors, the research concluded: "Compound-339 presents a new lead for further study as an anti-prostate cancer agent."

Gupta.

Oncology - Prostate Cancer

Recent Findings in Prostate Cancer Described by Researchers from Case Western Reserve University (Contemporary National Trends of Prostate Cancer Screening Among Privately Insured Men in the United States)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting from Cleveland, Ohio, by NewsRx journalists, research stated, "To assess the possible impact of changes to the clinical guidelines from the US Preventive Services Task Force recommendations in 2012 on the national trends of prostate-specific antigen (PSA) screening and identify patient characteristics associated with PSA screening from a large private insurance database. We conducted a retrospective cohort study of men between 40 and 80 years of age who underwent PSA screening for prostate cancer from 2008 to 2013 in a population-based cohort of privately insured patients."

The news correspondents obtained a quote from the research from Case Western Reserve University, "Unadjusted and adjusted rates were calculated using member-years and reported per 1000 member-years. Rates of PSA screening remained stable from 190.4 per 1000 member-years in 2008 to 196.4 in 2013 (P = .66). From 2008 to 2013, PSA screening did not change for patients aged 50-59 (236.5 to 241.1 per 1000 member-years; P = .78), 60-64 (284.1 to 288.3 per 1000 member-years; P = .77), 65-69 (250.6 to 248.0 per 1000 member-years; P = .56), and 70-74 (266.4 to 280.3 per 1000 member-years; P = .17). However, patients = 75 years had marked decrease in the rate of PSA screening from 201.5 to 124.1 per 1000 member-years (P = .04). Across different racial groups, PSA screening rates remain unchanged over time irrespective of age. Among this population-based cohort of privately insured men, we found little effect on PSA screening from changes to the US Preventive Services Task Force clinical practice guidelines. However, the rates of PSA screening were much lower among older men (>75 years)."

According to the news reporters, the research concluded: "Further research is needed to assess the impact of the new guidelines on prostate cancer incidence and survival."

For more information on this research see: Contemporary National Trends of Prostate Cancer Screening Among Privately Insured Men in the United States. Urology, 2016;97():111-116. Urology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Urology - www.journals.elsevier.com/urology/)

Our news journalists report that additional information may be obtained by
Recent Findings in Pulmonary Medicine Described by Researchers from University of Turin (Infant weight trajectories and early childhood wheezing: the NINFEA birth cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Health and Medicine - Pulmonary Medicine. According to news reporting from Turin, Italy, by NewsRx journalists, research stated, "Rapid postnatal weight gain has been associated with wheezing and asthma in children, but it remains unclear whether it acts independently of overweight. We aimed to disentangle the roles of infant's size and weight gain velocity in the development of wheezing in early childhood using a novel method that allows for mutual adjustment for different aspects of growth."

The news correspondents obtained a quote from the research from the University of Turin, "Data were obtained from the NINFEA questionnaires where weight measurements from birth up to 18 months of age were assessed in 4492 term singletons. Wheezing was defined as at least one episode of wheezing/whistling in the chest occurring between 6 and 18 months of age. The SuperImposition by Translation And Rotation model was used to estimate individual weight trajectories defined by three child-specific parameters: size, velocity and tempo, that is age at peak weight velocity. These parameters were standardised and related to wheezing using logistic regression with effects expressed as an increase of one SD. A median of five weight measurements per child were obtained. Infant size (OR=1.28; 95% CI 1.12 to 1.46) and weight gain velocity (OR=1.30; 95% CI 1.15 to 1.48) were independently positively associated with wheezing. We found no evidence of an effect of tempo on infant wheezing. The estimates were changed only minimally after adjustment for potential confounders. Faster growth and larger size in the first 18 months of life are both independently associated with an increased risk of wheezing."

According to the news reporters, the research concluded: "These findings suggest that early growth patterns play a role in shaping the occurrence of wheezing."

Recent Findings in Science Described by Researchers from Leiden University (The effect of standardized food intake on the association between BMI and H-1-NMR metabolites)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news reporting from Leiden, Netherlands, by NewsRx journalists, research stated, "Multiple studies have shown that levels of H-1-NMR metabolites are associated with disease and risk factors of disease such as BMI. While most previous investigations have been performed in fasting samples, meta-analysis often includes both cohorts with fasting and non-fasting blood samples."

The news correspondents obtained a quote from the research from Leiden University, "In the present study comprising 153 participants (mean age 63 years; mean BMI 27 kg/m(2)) we analyzed the effect of a standardized liquid meal (SLM) on metabolite levels and how the SLM influenced the association between metabolites and BMI. We observed that many metabolites, including glycolysis related metabolites, multiple amino acids, LDL diameter, VLDL and HDL lipid concentration changed within 35 minutes after a standardized liquid meal (SLM), similarly for all individuals. Remarkable, however, is that the correlations of metabolite levels with BMI remained highly similar before and after the SLM. Hence, as exemplified with the disease risk factor BMI, our results suggest that the applicability of 1H-NMR metabolites as disease biomarkers depends on the standardization of the fasting status rather than on the fasting status itself."

According to the news reporters, the research concluded: "Future studies are required to investigate the dependency of metabolite biomarkers for other disease risk factors on the fasting status."

Our news journalists report that additional information may be obtained by contacting P.E. Slagboom, Leiden University, Medical Center, Dept. of Mol Epidemiol, NL-2300 RC Leiden, Netherlands. Additional authors for this research include E.B. van den Akker,
Recent Findings in Science Described by T. Yeo and Colleagues
(Microfluidic enrichment for the single cell analysis of circulating tumor cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Science is now available. According to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Resistance to drug therapy is a major concern in cancer treatment. To probe clones resistant to chemotherapy, the current approach is to conduct pooled cell analysis."

Our news editors obtained a quote from the research, "However, this can yield false negative outcomes, especially when we are analyzing a rare number of circulating tumor cells (CTCs) among an abundance of other cell types. Here, we develop a microfluidic device that is able to perform high throughput, selective picking and isolation of single CTC to 100% purity from a larger population of other cells. This microfluidic device can effectively separate the very rare CTCs from blood samples from as few as 1 in 20,000 white blood cells. We first demonstrate isolation of pure tumor cells from a mixed population and track variations of acquired T790M mutations before and after drug treatment using a model PC9 cell line. With clinical CTC samples, we then show that the isolated single CTCs are representative of dominant EGFR mutations such as T790M and L858R found in the primary tumor."

According to the news editors, the research concluded: "With this single cell recovery device, we can potentially implement personalized treatment not only through detecting genetic aberrations at the single cell level, but also through tracking such changes during an anticancer therapy."

For more information on this research see: Microfluidic enrichment for the single cell analysis of circulating tumor cells. Scientific Reports, 2016;6():22076. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting T. Yeo, Clearbridge Accelerator Pte Ltd, 81 Science Park Drive, The Chadwick, #02-03, Singapore Science Park 1, Singapore 118257, Singapore. Additional authors for this research include S.J. Tan, C.L. Central Nervous System Diseases and Conditions -…

Recent Findings in Spinal Cord Injury Described by R. Requejo-Aguilar and Colleagues (Combined polymer-curcumin conjugate and ependymal progenitor/stem cell treatment enhances spinal cord injury functional recovery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Spinal Cord Injury. According to news originating from Valencia, Spain, by NewsRx correspondents, research stated, "Spinal cord injury (SCI) suffers from a lack of effective therapeutic strategies. Animal models of acute SCI have provided evidence that transplantation of ependymal stem/progenitor cells of the spinal cord (epSPCs) induces functional recovery, while systemic administration of the anti-inflammatory curcumin provides neuroprotection."

Funders for this research include Spanish Ion Channel Initiative, Instituto de Salud Carlos III, MINECO.

Our news journalists obtained a quote from the research, "However, functional recovery from chronic stage SCI requires additional enhancements in available therapeutic strategies. Herein, we report on a combination treatment for SCI using epSPCs and a pH-responsive polymer-curcumin conjugate. The incorporation of curcumin in a pH-responsive polymeric carrier mainchain, a polyacetal (PA), enhances blood bioavailability, stability, and provides a means for highly localized delivery. We find that PA-curcumin enhances neuroprotection, increases axonal growth, and can improve functional recovery in acute SCI. However, when combined with epSPCs, PA-curcumin also enhances functional recovery in a rodent model of chronic SCI."

According to the news editors, the research concluded: "This suggests that combination therapy may be an exciting new therapeutic option for the treatment of chronic SCI in humans."

The news correspondents report that additional information may be obtained from M.J. Vicent, Principe Felipe Res Center, Polymer Therapeut Lab, Valencia 46012, Spain. Additional authors for this research include A. Alastrue-Agudo, M. Cases-Villar, E. Lopez-Mocholi, R. England, M.J. Vicent and V. Moreno-Manzano.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.biomaterials.2016.10.032. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Findings in Squamous Cell Carcinoma Described by Researchers from Southern Medical University (MicroRNA-127 is a tumor suppressor in human esophageal squamous cell carcinoma through the regulation of oncogene FMNL3)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Squamous Cell Carcinoma. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "In this study, we investigated the expression patterns and functional roles of microRNA 127 (miR-127) and its target gene Formin-Like 3 (FMNL3) in human esophageal squamous cell carcinoma (ESCC). Quantitative RT-PCR (qRT-PCR) was used to compare miR-127 expression between ESCC cell lines and normal esophageal epithelium cell line, as well as paired ESCC tumors and adjacent normal esophageal tissues in 33 patients."

Our news editors obtained a quote from the research from Southern Medical University, "We found miR-127 was aberrantly downregulated in both ESCC cell lines and human ESCC tumors. In ESCC cell lines TE-1 and ECA109 cells, lentiviral-induced miR-127 upregulation markedly inhibited cancer proliferation and migration in vitro, and tumorigenicity in vivo. Through dual-luciferase assay and qRT-PCR, FMNL3 was confirmed to be the downstream target gene of miR-127 in ESCC. Finally, FMNL3 was downregulated by siRNA in TE-1 and ECA109 cells. And we discovered that SiRNA-induced FMNL3 downregulation had tumor suppressive effect in ESCC, inhibiting cancer proliferation, migration in vitro, and tumorigenicity in vivo. These results suggest that miR-127 is downregulated and acting as tumor suppressor in ESCC."

According to the news editors, the research concluded: "Inversely, FMNL3, the target gene of miR-127, is upregulated and acting as an oncogene in ESCC."

For more information on this research see: MicroRNA-127 is a tumor suppressor in human esophageal squamous cell carcinoma through the regulation of oncogene FMNL3. European Journal of Pharmacology, 2016;791():603-610. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Recent Findings in Steatosis Described by Researchers from Veterans General Hospital (Aliskiren Reduces Hepatic steatosis and Epididymal Fat Mass and Increases Skeletal Muscle Insulin Sensitivity in High-Fat Diet-Fed Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Steatosis are discussed in a new report. According to news reporting from Taipei, Taiwan, by NewsRx journalists, research stated, "Aliskiren has been found to reduce chronic injury and steatosis in the liver of methionine-choline-deficient (MCD) diet-fed mice. This study investigated whether aliskiren has an anti-steatotic effect in HFD-fed mice, which are more relevant to human patients with non-alcoholic fatty liver disease than MCD mice."

The news correspondents obtained a quote from the research from Veterans General Hospital, "Mice fed with 4-week normal chow or HFD randomly received aliskiren (50 mg/kg/day) or vehicle via osmotic minipumps for further 4 weeks. Aliskiren reduced systemic insulin resistance, hepatic steatosis, epididymal fat mass and increased gastrocnemius muscle glucose transporter type 4 levels with lower tissue angiotensin II levels in the HFD-fed mice. In addition, aliskiren lowered nuclear peroxisome proliferator-activated receptor gamma and its down-signaling molecules and increased cytochrome P450 4A14 and carnitine palmitoyltransferase 1A (CPT1a) in liver. In epididymal fat, aliskiren inhibited expressions of lipogenic genes, leading to decrease in fat mass, body weight, and serum levels of leptin and free fatty acid. Notably, in the gastrocnemius muscle, aliskiren increased phosphorylation of insulin receptor substrate 1 and Akt."

According to the news reporters, the research concluded: "Based on these beneficial effects on liver, peripheral fat and skeletal muscle, aliskiren is a promising therapeutic agent for patients with NAFLD."

For more information on this research see: Aliskiren Reduces Hepatic steatosis and Epididymal Fat Mass and Increases Skeletal Muscle Insulin Sensitivity in High-Fat Diet-Fed Mice. Scientific Reports, 2016;6():18899. (Nature Publishing Group - www.nature.com; Scientific Reports - www.nature.com/srep/)

Recent Findings in Thoracic Aortic Aneurysm Described by Researchers from University of Pittsburgh (Regional Disruptions in Endothelial Nitric Oxide Pathway Associated With Bicuspid Aortic Valve)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Respiratory Tract Diseases and Conditions - Thoracic Aortic Aneurysm have been presented. According to news reporting from Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "Endothelial nitric oxide (NO) synthase (eNOS) has been implicated in the development of bicuspid aortic valve (BAV) and with differential expression in the ascending aorta of BAV patients. However, little is known about functional disruptions in the eNOS pathway and the effect on BAV-associated aortic dilatation."

Funders for this research include National Heart, Lung, and Blood Institute, National Institutes of Health, American Heart Association.

The news correspondents obtained a quote from the research from the University of Pittsburgh, "We tested the hypothesis that eNOS function is regionally diminished in ascending thoracic aortic aneurysms associated with BAV. Thoracic aortic aneurysms specimens were collected from patients with BAV (n=21) or tricuspid aortic valve (n=12). Tissue samples were harvested from three circumferential regions corresponding to locations above the right, left, and noncoronary sinuses. Adventitial-stripped specimens containing media and intima only were analyzed for NO synthase 3 gene expression and total eNOS protein. Indicators of eNOS activity (pSer1177-eNOS) and NO bioavailability (phosphorylation of vasodilator-stimulated phosphoprotein at Ser239) were also measured. NO synthase 3 and eNOS protein were elevated in the right aortic region of BAV specimens compared with tricuspid aortic valve specimens. Activation of eNOS, as indicated by pSer1177-eNOS, was higher in BAV specimens across all regions. Despite increases in eNOS and pSer1177-eNOS, BAV specimens displayed no change in pSer239-vasodilator-stimulated phosphoprotein compared with tricuspid aortic valve specimens. BAV is associated with regional disruptions in the eNOS pathway, most markedly in the right aortic region."

According to the news reporters, the research concluded: "The discrepancy between increased eNOS activity and the absence of increased NO bioavailability in this region provides insight into physiologic mechanisms potentially underlying the asymmetric dilatation pattern observed in BAV."

Our news journalists report that additional information may be obtained by contacting M.P. Kotlarczyk, University of Pittsburgh, Center Vasc Remodeling & Regenerat, Pittsburgh, PA, United States. Additional authors for this research include M. Billaud, B.R. Green, J.C. Hill, S. Shiva, E.E. Kelley, J.A. Phillips and T.G. Gleason.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.04.001. This DOI is a link to an online electronic document that is either free or for purchase.
Recent Findings in Tuberculosis Described by Researchers from Ishikawa Prefectural Central Hospital (Paradoxical reaction to antituberculosis therapy after 6 months of treatment for pulmonary tuberculosis: A case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news originating from Ishikawa, Japan, by NewsRx correspondents, research stated, "Paradoxical reactions (PRs) to antituberculosis (anti-TB) drugs during treatment are well known phenomena, but a PR presenting as a new pulmonary lesion after completion of treatment is extremely rare, and little is known about the management of such cases. A 44-year-old man was diagnosed with pulmonary TB."

Our news journalists obtained a quote from the research from Ishikawa Prefectural Central Hospital, "His sputum cultures became negative 45 days after the initiation of standard anti-TB treatment. Upon the patient's completion of 6 months of anti-TB therapy, computed tomography revealed a new irregularly shaped mass in the lower left pulmonary lobe. A transbronchial lung biopsy (TBLB) revealed caseous necrosis and granulomatosis surrounded by epithelioid and multinucleated giant cells. Cultures of both the TBLB specimen and bronchoalveolar lavage fluid remained negative for TB. The CT shadow disappeared 6 months later without further administration of anti-TB drugs."

According to the news editors, the research concluded: "Careful observation without therapy may be sufficient for a patient treated for TB who develops a PR upon completion of treatment, if the patient has achieved a bacteriological remission."

For more information on this research see: Paradoxical reaction to antituberculosis therapy after 6 months of treatment for pulmonary tuberculosis: A case report. Journal of Infection and Chemotherapy, 2016;22(11):748-751. Journal of Infection and Chemotherapy can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Springer - www.springer.com; Journal of Infection and Chemotherapy - www.springerlink.com/content/1341-321x/)

The news correspondents report that additional information may be obtained from A. Okazaki, Ishikawa Prefectural Cent Hosp, Dept. of Resp Med, Kanazawa, Ishikawa, Japan. Additional authors for this research include S. Watanabe, T. Yoneda, J. Hara, M. Nishitsuji, K. Nishi and K. Kasahara.

Recent Findings in Type 1 Diabetes Mellitus Described by Researchers from Sahlgrenska University Hospital (LDL cholesterol is not a good marker of cardiovascular risk in Type 1 diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus are presented in a new report. According to news reporting from Gothenburg, Sweden, by NewsRx journalists, research stated, "LDL cholesterol (LDL-C) is considered an important cardiovascular disease (CVD) risk factor. Less is known in Type 1 diabetes."

Financial support for this research came from The Swedish Association of Local Authorities and Regions funds the NDR.

The news correspondents obtained a quote from the research from Sahlgrenska University Hospital. "We assessed LDL-C and total cholesterol to HDL cholesterol ratio (TC/HDL-C) as predictors of CVD in Type 1 diabetes. The study monitored 30 778 people with Type 1 diabetes, baseline 2003-2006, to 31 December 2011. Cox regression analyses were performed with LDL-C and TC/HDL-C as predictors of fatal/non-fatal CVD. Models were adjusted for traditional CVD risk factors. Hazard ratios (HR) (with 95% CI) per 1 mmol/l increase in LDL-C for CVD were 1.09 (1.01-1.18) in people without lipid-lowering medication and 1.02 (0.95-1.09) in people with lipid-lowering medication (p=0.02 and 0.65). In people aged 40 years or older having a CVD risk factor, and in people with a history of CVD, HR was 1.07 (0.99-1.16) and 1.02 (0.92-1.13) (p=0.07 and 0.66). HR per 1 unit increase in TC/HDL-C was 1.12 (1.05-1.20) in people without lipid-lowering medication and 1.08 (1.02-1.15) in people with lipid-lowering medication (p <0.001 and 0.01). For people aged 40 or older and people with a history of CVD, HR was 1.16 (1.09-1.24) and 1.04 (0.95-1.14) (p <0.001 and 0.43). Broken down into octiles, LDL-C was not a significant predictor of CVD in any group. Higher octiles of TC/HDL-C were significant predictors for CVD in people without lipid-lowering medication and in those aged 40 years or older. In this study of people with Type 1 diabetes in clinical practice, LDL-C was not a good predictor of CVD. We found no support for an LDL-C cut-off point <2.6 mmol/l."

According to the news reporters, the research concluded: "TC/HDL-C seems more reliable as a marker for CVD risk when considering primary prevention."

For more information on this research see: LDL cholesterol is not a good marker of cardiovascular risk in Type 1 diabetes. Diabetic Medicine, 2015;33(3):316-23. (Wiley-Blackwell - www.wiley.com; Diabetic Medicine - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1464-5491)

Our news journalists report that additional information may be obtained by contacting C. Hero, Dept. of Medicine, Sahlgrenska University Hospital, University of Gothenburg, Gothenburg, Sweden. Additional authors for this research include A.M. Svensson,
Recent Findings in Type 2 Diabetes Described by Researchers from Johns Hopkins University Bloomberg School of Public Health

(Triglycerides to high-density lipoprotein-cholesterol ratio, glycemic control and cardiovascular risk in obese patients ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been presented. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "This article provides an update on the role of the triglyceride to high-density lipoprotein-cholesterol (triglyceride/HDL-C) ratio in the setting of obesity-related insulin resistance and type 2 diabetes mellitus. Insulin resistance and type 2 diabetes mellitus are well-established risk factors for cardiovascular diseases, and are commonly associated with metabolic abnormalities such as hypertriglyceridemia, low HDL-C and presence of small, dense low-dense lipoprotein (LDL) particles."

Our news journalists obtained a quote from the research from the Johns Hopkins University Bloomberg School of Public Health, "Mounting evidence suggests that the triglyceride/HDL-C ratio is a marker of insulin resistance, although this relationship might vary as a function of ethnicity and sex. The triglyceride/HDL-C ratio has also been shown to correlate with other atherogenic lipid measurements, such as triglyceride-rich lipoproteins, remnant cholesterol and small dense LDL particles. Recent epidemiologic studies have shown that the triglyceride/HDL-C ratio associates with cardiovascular risk, mainly because of its association with insulin resistance. Finally, triglyceride/HDL-C can also be a marker of glycemic control, especially in obese patients with type 2 diabetes mellitus. The triglyceride/HDL-C integrates information on triglyceride-rich lipoproteins, insulin resistance and glycemic control."

According to the news editors, the research concluded: "Future studies may better define its specific clinical role."

For more information on this research see: Triglycerides to high-density lipoprotein-cholesterol ratio, glycemic control and cardiovascular risk in obese patients with type 2 diabetes. Current Opinion In Endocrinology, Diabetes, and Obesity, 2016;23(2):150-6.

Our news journalists report that additional information may be obtained by contacting R. Quispe, a Johns Hopkins Ciccarone Center for the Prevention of Heart Disease b Welch Center, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States. Additional authors for this research include S.S. Martin and S.R Jones.

The direct object identifier (DOI) for that additional information is:
Recent Findings in Uveitis Described by Researchers from University Hospital (Adalimumab for Treatment of Noninfectious Uveitis Immunogenicity and Clinical Relevance of Measuring Serum Drug Levels and Antidrug Antibodies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Eye Diseases and Conditions - Uveitis are discussed in a new report. According to news reporting originating from Leon, Spain, by NewsRx correspondents, research stated, "To evaluate the rate of immunogenicity induced by adalimumab and its relationship with drug serum levels and clinical responses in patients with noninfectious uveitis. Prospective observational study."

Our news editors obtained a quote from the research from University Hospital, "Consecutive patients from 1 referral center who initiated treatment with adalimumab for active noninfectious uveitis resistant to conventional therapy. All patients received 40 mg adalimumab every other week. Patients were evaluated clinically and immunologically before and after 4, 8, and 24 weeks of treatment. Clinical evaluation included assessment of changes in visual acuity, degree of inflammation in the anterior chamber and vitreous cavity, central macular thickness, and retinal angiographic leakage. Immunologic evaluation included assessment of serum trough adalimumab and antibodies against adalimumab (AAA) levels and class II HLA typing. Twenty-five patients were enrolled. Overall, 18 of 25 patients (72%) showed a favorable clinical response to adalimumab therapy. Eleven patients (44%) achieved a complete response and 7 (28%) achieved a partial response. However, 7 of 25 patients (28%) were considered nonresponders. Median trough adalimumab serum levels were higher in responders than in nonresponders (P < 0.001). We observed AAA positivity (AAA+) at least 1 time point in 8 of 25 patients (32%), including 4 with transitory AAA and 4 with permanent AAA. In all patients with permanent AAA+, trough adalimumab levels became undetectable (P < 0.001). However, in patients who demonstrated transitory AAA+, no correlation was observed between AAA titers and adalimumab trough levels (P = 0.2). Concomitant immunosuppression did not show any protective effect on adalimumab immunogenicity in our cohort. An association between the presence of AAA+ and a worse uveitis outcome was observed only in patients with permanent AAA+, which correlated with undetectable adalimumab trough levels (P = 0.014). Treatment of noninfectious uveitis with adalimumab is associated with high rates of favorable clinical response. Overall, adalimumab trough levels were higher in responder patients. Development of permanent AAA was associated with undetectable trough adalimumab levels and worse uveitis outcome."

According to the news editors, the research concluded: "Immunogenicity was more
common in patients in whom uveitis was associated with a systemic disease and was not influenced by concomitant immunosuppressors."

The news editors report that additional information may be obtained by contacting J.G.R. de Morales, Univ Hosp Leon, Uveitis Unit, Leon, Spain. Additional authors for this research include S. Calleja-Antolin, I. Garzo-Garcia, A.M. Nunez-Garnes, C. Alvarez-Castro, M. Franco-Benito and J.G.R. de Morales.

Viral RNA

**Recent Findings in Viral RNA Described by Researchers from Wuhan University (Nucleocapsid proteins: roles beyond viral RNA packaging)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Viral RNA have been published. According to news reporting out of Wuhan, People's Republic of China, by NewsRx editors, research stated, "Viral nucleocapsid proteins (NCs) enwrap the RNA genomes of viruses to form NC-RNA complexes, which act as a template and are essential for viral replication and transcription. Beyond packaging viral RNA, NCs also play important roles in virus replication, transcription, assembly, and budding by interacting with viral and host cellular proteins."

Funders for this research include National Science Foundation, Major State Basic Research Development Program (973 Program).

Our news journalists obtained a quote from the research from Wuhan University, "Additionally, NCs can inhibit interferon signaling response and function in cell stress response, such as inducing apoptosis. Finally, NCs can be the target of vaccines, benefiting from their conserved gene sequences."

According to the news editors, the research concluded: "Here, we summarize important findings regarding the additional functions of NCs as much more than structural RNA-binding proteins, with specific emphasis on (1) their association with the viral life cycle, (2) their association with host cells, and (3) as ideal candidates for vaccine development."

Our news journalists report that additional information may be obtained by contacting B. Ding, State Key Laboratory of Virology, College of Life Sciences, Wuhan University, Wuhan, People's Republic of China. Additional authors for this research include Y.
Qin and M. Chen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/wrna.1326. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Chronic Hepatitis C…

Recent Reports from Burnet Institute Highlight Findings in Chronic Hepatitis C Virus (Cost-effectiveness of treating chronic hepatitis C virus with direct-acting antivirals in people who inject drugs in Australia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Chronic Hepatitis C Virus is now available. According to news reporting originating in Melbourne, Australia, by NewsRx journalists, research stated, "Reducing the burden of hepatitis C virus (HCV) related liver disease will require treating people who inject drugs (PWID), the group at most risk of infection and transmission. We determine the cost-effectiveness of treating PWID with interferon-free direct-acting antiviral therapy in Australia."

Financial support for this research came from Victorian Infectious Diseases Service Special Purpose Fund.

The news reporters obtained a quote from the research from Burnet Institute, "Using a deterministic model of HCV treatment and liver disease progression, including a fixed rate of re-infection, the expected healthcare costs and quality-adjusted life years (QALYs) of a cohort of newly HCV-infected PWID were calculated for: no treatment; treatment after initial infection ('early-treatment'); and treatment prior to developing compensated cirrhosis ('late-treatment'). Incremental cost-effectiveness ratios (ICERs) were used to compare scenarios. Late-treatment was cost-effective compared to no treatment, with a discounted average gain of 2.98 (95% confidence interval 2.88-5.22) QALYs per person for an additional cost of $15,132 ($11,246-18,922), giving an ICER of $5078 ($2847-5295) per QALY gained. Compared to late-treatment, early-treatment gained a further discounted average of 2.27 (0.58-4.80) QALYs per person for $38,794 ($34,789-41,367), giving an ICER of $17,090 ($2847-63,282), which was cost-effective in approximately 90% of Monte-Carlo uncertainty simulations. For every 100 newly HCV-infected PWID, there were an estimated 40 (39-56) eventual liver-related deaths without treatment, compared to 7 (6-11) and 8 (7-13) with early-treatment and late-treatment available respectively. Treating HCV-infected PWID with new therapies is cost-effective and could prevent a significant number of liver-related deaths."

According to the news reporters, the research concluded: "Although late-treatment was the most cost-effective option, the cost per QALY gained for early-treatment compared to late-treatment is likely to be below unofficial Australian willingness to pay thresholds."

For more information on this research see: Cost-effectiveness of treating chronic hepatitis C virus with direct-acting antivirals in people who inject drugs in Australia. Journal of

Our news correspondents report that additional information may be obtained by contacting N. Scott, Centre for Population Health, Burnet Institute, Melbourne, Victoria, Australia. Additional authors for this research include D.M. Iser, A.J. Thompson, J.S. Doyle and M.E Hellard.

Oncology - Brain Cancer
Recent Reports from Case Western Reserve University Highlight Findings in Brain Cancer (Crossing the barrier: treatment of brain tumors using nanochain particles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Brain Cancer. According to news reporting from Cleveland, Ohio, by NewsRx journalists, research stated, "Despite advancements in surgery and radiotherapy, the aggressive forms of brain tumors, such as gliomas, are still uniformly lethal with current therapies offering only palliation complicated by significant toxicities. Gliomas are characteristically diffuse with infiltrating edges, resistant to drugs and nearly inaccessible to systemic therapies due to the brain-tumor barrier."

Financial support for this research came from National Cancer Institute.

The news correspondents obtained a quote from the research from Case Western Reserve University, "Currently, aggressive efforts are underway to further understand brain-tumor's microenvironment and identify brain tumor cell-specific regulators amenable to pharmacologic interventions. While new potent agents are continuously becoming available, efficient drug delivery to brain tumors remains a limiting factor. To tackle the drug delivery issues, a multicomponent chain-like nanoparticle has been developed. These nanochains are comprised of iron oxide nanospheres and a drug-loaded liposome chemically linked into a 100-nm linear, chain-like assembly with high precision. The nanochain possesses a unique ability to scavenge the tumor endothelium. By utilizing effective vascular targeting, the nanochains achieve rapid deposition on the vascular bed of glioma sites establishing well-distributed drug reservoirs on the endothelium of brain tumors. After reaching the target sites, an on-command, external low-power radiofrequency field can remotely trigger rapid drug release, due to mechanical disruption of the liposome, facilitating widespread and effective drug delivery into regions harboring brain tumor cells. Integration of the nanochain delivery system with the appropriate combination of complementary drugs has the potential to unfold the field and allow significant expansion of therapies for the disease where success is currently very limited."
According to the news reporters, the research concluded: "WIREs Nanomed Nanobiotechnol 2016, 8:678-695. doi: 10.1002/wnan.1387 For further resources related to this article, please visit the WIREs website."

For more information on this research see: Crossing the barrier: treatment of brain tumors using nanochain particles. Wiley Interdisciplinary Reviews Nanomedicine and Nanobiotechnology, 2016;8(5):678-95.

Our news journalists report that additional information may be obtained by contacting E. Karathanasis, Dept. of Biomedical Engineering and Dept. of Radiology, Case Comprehensive Cancer Center, Case Western Reserve University, Cleveland, OH, United States.

Oncology - Head and Neck Cancer

Recent Reports from Department of Medical Oncology Highlight Findings in Head and Neck Cancer (Cetuximab promotes epithelial to mesenchymal transition and cancer associated fibroblasts in patients with head and neck cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Head and Neck Cancer are discussed in a new report. According to news reporting originating from Brussels, Belgium, by NewsRx correspondents, research stated, "To investigate if cetuximab induces epithelial to mesenchymal transition (EMT) and activation of cancer associated fibroblast (CAF) in the tumors of patients with squamous cell carcinoma of the head and neck (SCCHN). Cetuximab was administered for two weeks prior to surgery to 20 treatment-na?ve patients."

Our news editors obtained a quote from the research from the Department of Medical Oncology, "Five untreated patients were included as controls. Tumor biopsies were performed at baseline and before surgery. Gene expression profiles and quantitative real-time PCR (qRT-PCR) analysis of the pre-and post-treatment biopsies were compared. To further investigate EMT and CAF, correlations between previously described EMT and CAF markers and our microarray data set were calculated. Gene expression profile analyses and qRT-PCR showed that some of the genes modified by cetuximab were related to CAFs and EMT (ZNF521, CXCL12, ASPN, OLFML3, OLFM1, TWIST1, LEF1, ZEB1, FAP). We identified 2 patient clusters with different EMT and CAF characteristics. Whereas one cluster showed clear upregulation of expression of genes implicated in CAF and EMT including markers of embryologic pathways like NOTCH and Wnt, the other did not."

According to the news editors, the research concluded: "Even if EMT and CAFs are implicated in cetuximab resistance in pre-clinical models, we demonstrate for the first time that
these molecular processes may occur clinically early on."

For more information on this research see: Cetuximab promotes epithelial to mesenchymal transition and cancer associated fibroblasts in patients with head and neck cancer. *Oncotarget, 2015;6(33):34288-99.*

The news editors report that additional information may be obtained by contacting S. Schmitz, Institut Roi Albert II, Dept. of Medical Oncology, Cliniques Universitaires Saint-Luc and Institut de Recherche Clinique et Experimentale (Pole MIRO), Universite Catholique de Louvain, Brussels, Belgium. **Recent Reports from Florida State University Highlight Findings in Obesity (Combined whole-body vibration training and L-citrulline supplementation improves pressure wave reflection in obese postmenopausal women)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting out of Tallahassee, Florida, by NewsRx editors, research stated, "Postmenopausal women have increased wave reflection (augmentation pressure (AP) and index (Alx)) and reduced muscle function that predispose them to cardiac diseases and disability. Our aim was to examine the combined and independent effects of whole-body vibration training (WBVT) and L-citrulline supplementation on aortic hemodynamics and plasma nitric oxide metabolites (NOx) in postmenopausal women."

Our news journalists obtained a quote from the research from Florida State University, "Forty-one obese postmenopausal women were randomized to 3 groups: 1-citrulline, WBVT+1-citrulline and WBVT+Placebo for 8 weeks. Brachial and aortic systolic blood pressure, diastolic blood pressure, AP, Alx, Alx adjusted to 75 beats/min (Alx@75), and NOx were measured before and after 8 weeks. All groups similarly decreased (p <0.05) brachial and aortic pressures as well as AP, and similarly increased (p <0.05) NOx levels. Alx and Alx@75 decreased (p <0.01) in the WBVT+1-citrulline and WBVT+Placebo groups, but not in the L-citrulline group. The improvement in Alx@75 (-10.5%  ? 8.8%, p<0.05) in the WBVT+1-citrulline group was significant compared with the l-citrulline group. l-Citrulline supplementation and WBVT alone and combined decreased blood pressures. The combined intervention reduced Alx@75."

According to the news editors, the research concluded: "This study supports the effectiveness of WBVT+1-citrulline as a potential intervention for prevention of hypertension-related cardiac diseases in obese postmenopausal women."

Our news journalists report that additional information may be obtained by contacting A. Wong, a Dept. of Nutrition, Food and Exercise Sciences, The Florida State University, Tallahassee, FL 32306, United States. Additional authors for this research include S. Alvarez-Alvarado, S.J. Jaime, A.W. Kinsey, M.T. Spicer, T.A. Madzima and A. Figueroa.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1139/apnm-2015-0465. This DOI is a link to an online electronic document that is either free or for purchase.

**Connective Tissue Cells**

**Recent Reports from French National Institute of Health and Medical Research (INSERM) Highlight Findings in Connective Tissue Cells (TGF-b1 and GDF5 Act Synergistically to Drive the Differentiation of Human Adipose Stromal Cells toward Nucleus ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Connective Tissue Cells have been presented. According to news originating from Nantes, France, by NewsRx correspondents, research stated, "Degenerative disc disease (DDD) primarily affects the central part of the intervertebral disc namely the nucleus pulposus (NP). DDD explains about 40% of low back pain and is characterized by massive cellular alterations that ultimately result in the disappearance of resident NP cells."

Our news journalists obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "Thus, repopulating the NP with regenerative cells is a promising therapeutic approach and remains a great challenge. The objectives of this study were to evaluate the potential of growth factor-driven protocols to commit human adipose stromal cells (hASCs) toward NP-like cell phenotype and the involvement of Smad proteins in this differentiation process. Here, we demonstrate that the transforming growth factor-b1 and the growth differentiation factor 5 synergistically drive the nucleopulpogenic differentiation process. The commitment of the hASCs was robust and highly specific as attested by the expression of NP-related genes characteristic of young healthy human
NP cells. In addition, the engineered NP-like cells secreted an abundant aggrecan and type II collagen rich extracellular matrix comparable with that of native NP. Furthermore, we demonstrate that these in vitro engineered cells survived, maintained their specialized phenotype and secretory activity after in vivo transplantation in nude mice subcutis. Finally, we provide evidence suggesting that the Smad 2/3 pathway mainly governed the acquisition of the NP cell molecular identity while the Smad1/5/8 pathway controlled the NP cell morphology."

According to the news editors, the research concluded: "This study offers valuable insights for the development of biologically-inspired treatments for DDD by generating adapted and exhaustively characterized autologous regenerative cells."

The news correspondents report that additional information may be obtained from P. Colombier, INSERM UMRS 791, Laboratoire d'Ingenierie Osteo Articulaire et Dentaire (LIOAD), Nantes, France. Additional authors for this research include J. Clouet, C. Boyer, M. Ruel, G. Bonin, J. Lesoeur, A. Moreau, B.H. Fellah, P. Weiss, L. Lescaudron, A. Camus and J. Guicheux.

**Liver Diseases and Conditions - Non-Alcoholic...**

**Recent Reports from Gradenigo Hospital Highlight Findings in Non-Alcoholic Steatohepatitis (Non-alcoholic steatohepatitis: emerging molecular targets and therapeutic strategies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Non-Alcoholic Steatohepatitis have been published. According to news reporting out of Turin, Italy, by NewsRx editors, research stated, "Non-alcoholic fatty liver disease -the most common chronic liver disease -encompasses a histological spectrum ranging from simple steatosis to non-alcoholic steatohepatitis (NASH). Over the next decade, NASH is projected to be the most common indication for liver transplantation."

Our news journalists obtained a quote from the research from Gradenigo Hospital, "The absence of an effective pharmacological therapy for NASH is a major incentive for research into novel therapeutic approaches for this condition. The current focus areas for research include the modulation of nuclear transcription factors; agents that target lipotoxicity and oxidative stress; and the modulation of cellular energy homeostasis, metabolism and the inflammatory response."

According to the news editors, the research concluded: "Strategies to enhance resolution of inflammation and fibrosis also show promise to reverse the advanced stages of
liver disease."

Our news journalists report that additional information may be obtained by contacting G. Musso, Gradenigo Hospital, Corso Regina Margherita 8, 10132 Turin, Italy. Additional authors for this research include M. Cassader and R. Gambino.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrd.2015.3. This DOI is a link to an online electronic document that is either free or for purchase.

**Liver Diseases and Conditions - Chronic Hepatitis B…**

**Recent Reports from Okayama University Graduate School of Medicine Highlight Findings in Chronic Hepatitis B Virus (Entecavir Reduces Hepatocarcinogenesis in Chronic Hepatitis B Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Chronic Hepatitis B Virus have been presented. According to news reporting from Okayama, Japan, by NewsRx journalists, research stated, "Chronic hepatitis B (CHB) leads to cirrhosis and hepatocellular carcinoma (HCC). With a cohort of 1,206 CHB patients who visited Okayama University Hospital and related hospitals in 2011 and 2012, we compared the incidence rates of HCC among the patients grouped by age, hepatitis B virus (HBV) DNA, hepatitis B e antigen (HBeAg), and treatment."

The news correspondents obtained a quote from the research from the Okayama University Graduate School of Medicine, "HCCs were observed in 115 patients with the median observation period of 1,687 days. Among the HCC patients aged >35 years, HBV DNA >4 log copies/mL and positive HBeAg at diagnosis (n=184), the HCC incidence rate was 8.4% at 5 years in the entecavir (ETV)-treated patients, 21.8% in the lamivudine (LVD)-treated patients, and 26.4% among the patients not treated with drugs. The cumulative HCC incidence was significantly reduced in the ETV-treated patients compared to those treated with LVD or not treated (p=0.013). Among the patients aged >35 years with HBV DNA >4 log copies/mL and negative HBeAg (n=237), the cumulative HCC incidence was 14.6% in 5 years in ETV group and 13.9% among those not treated with a drug (p >0.05). Only small numbers of HCCs occurred in other patients."

According to the news reporters, the research concluded: "In CHB patients aged >35 years with HBV DNA >4 log copies/mL and positive HBeAg, ETV treatment is recommended for the suppression of HCC development."

Recent Reports from Rice University Highlight Findings in Neisseria meningitidis (The Neisseria meningitidis CRISPR-Cas9 System Enables Specific Genome Editing in Mammalian Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Neisseria meningitidis have been presented. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "The clustered regularly-interspaced short palindromic repeats (CRISPR)-CRISPR-associated (Cas) system from Streptococcus pyogenes (Spy) has been successfully adapted for RNA-guided genome editing in a wide range of organisms. However, numerous reports have indicated that Spy CRISPR-Cas9 systems may have significant off-target cleavage of genomic DNA sequences differing from the intended on-target site."

The news reporters obtained a quote from the research from Rice University, "Here, we report the performance of the Neisseria meningitidis (Nme) CRISPR-Cas9 system that requires a longer protospacer-adjacent motif for site-specific cleavage, and present a comparison between the Spy and Nme CRISPR-Cas9 systems targeting the same protospacer sequence. The results with the native crRNA and tracrRNA as well as a chimeric single guide RNA for the Nme CRISPR-Cas9 system were also compared. Our results suggest that, compared with the Spy system, the Nme CRISPR-Cas9 system has similar or lower on-target cleavage activity but a reduced overall off-target effect on a genomic level when sites containing three or fewer mismatches are considered."

According to the news reporters, the research concluded: "Thus, the Nme CRISPR-Cas9 system may represent a safer alternative for precision genome engineering applications."

For more information on this research see: The Neisseria meningitidis CRISPR-Cas9 System Enables Specific Genome Editing in Mammalian Cells. Molecular Therapy, 2016;24 (3):645-54. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

Recent Reports from Rowan University Highlight Findings in Rheumatic Diseases and Conditions (The role of ANKH in pathologic mineralization of cartilage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Musculoskeletal Diseases and Conditions - Rheumatic Diseases and Conditions. According to news originating from Camden, New Jersey, by NewsRx editors, the research stated, "ANKH is the human homolog of a gene whose dysfunction in a mutant mouse strain results in progressive ankylosis of the spine as well as soft tissue mineralization. ANKH mutations have been reported in inherited human disorders such as familial calcium pyrophosphate deposition disease (CPPD) and cranial metaphyseal dysplasia; however, research into the function of the ANKH protein has been more challenging."

Our news journalists obtained a quote from the research from Rowan University, "Progress has recently been made to understand the role of ANKH in the regulation of physiological and pathological mineralization. ANKH expression is regulated by intracellular levels of oxygen, phosphate and calcium as well as by the growth factor TGF-β. In addition, ANKH expression affects chondrogenesis, osteoblastogenesis and osteoclastogenesis. ANKH appears to interact with several cellular proteins, including the phosphate transporter PiT-1, and with proteins involved in NF-kappa b signaling, suggesting that ANKH may play an important non-PPi transporter role. ANKH has also been shown to regulate ATP efflux from chondrocytes. ANKH expression, as well as its potential non-PPi transporter functions, plays a variety of roles in the regulation of cellular events that surround differentiation and mineralization in bone and cartilage."

According to the news editors, the research concluded: "Additional studies are warranted to further elucidate the contributions of ANKH to human health and disease, and to determine if ANKH deserves targeting for the treatment of diseases such as CPPD."

For more information on this research see: The role of ANKH in pathologic mineralization of cartilage. *Current Opinion In Rheumatology*, 2016;28(2):145-51. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Rheumatology - journals.lww.com/co-rheumatology/pages/default.aspx)

Oncology - Carcinomas

Recent Reports from Taipei Medical University Highlight Findings in Carcinomas (Melatonin inhibits MMP-9 transactivation and renal cell carcinoma metastasis by suppressing Akt-MAPKs pathway and NF-kB DNA-binding activity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Carcinomas are presented in a new report. According to news reporting out of Taipei, Taiwan, by NewsRx editors, research stated, "Renal cell carcinoma (RCC) is the most lethal of all urological malignancies because of its potent metastasis potential. Melatonin exerts multiple tumour-suppressing activities through antiproliferative, proapoptotic, and anti-angiogenic actions and has been tested in clinical trials."

Financial support for this research came from Taipei Medical University.

Our news journalists obtained a quote from the research from Taipei Medical University, "However, the antimetastatic effect of melatonin and its underlying mechanism in RCC are unclear. In this study, we demonstrated that melatonin at the pharmacologic concentration (0.5-2 mm) considerably reduced the migration and invasion of RCC cells (Caki-1 and Achn). Furthermore, we found that melatonin suppressed metastasis of Caki-1 cells in spontaneous and experimental metastasis animal models. Mechanistic investigations revealed that melatonin transcriptionally inhibited MMP-9 by reducing p65-and p52-DNA-binding activities. Moreover, the Akt-mediated JNK1/2 and ERK1/2 signaling pathways were involved in melatonin-regulated MMP-9 transactivation and cell motility. Clinical samples revealed an inverse correlation between melatonin receptor 1A (MTNR1A) and MMP-9 expression in normal kidney and RCC tissues. In addition, a higher survival rate was found in MTNR1A(high)/MMP-9(low) patients than in MTNR1A(low)/MMP-9(high) patients."

According to the news editors, the research concluded: "Overall, our results provide new insights into the role of melatonin-induced molecular regulation in suppressing RCC metastasis and suggest that melatonin has potential therapeutic applications for metastatic RCC."

Our news journalists report that additional information may be obtained by contacting Y.W. Lin, Graduate Institute of Clinical Medicine, Taipei Medical University, Taipei, Taiwan. Additional authors for this research include L.M. Lee, W.J. Lee, C.Y. Chu, P.
Recent Reports from Tianjin Medical University Highlight Findings in Anticholinergics (a-Melanocyte-stimulating hormone ameliorates ocular surface dysfunctions and lesions in a scopolamine-induced dry eye model via PKA-CREB and MEK-Erk pathways)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Anticholinergics. According to news reporting originating in Tianjin, People's Republic of China, by NewsRx journalists, research stated, "Dry eye is a highly prevalent, chronic, and multifactorial disease that compromises quality of life and generates socioeconomic burdens. The pathogenic factors of dry eye disease (DED) include tear secretion abnormalities, tear film instability, and ocular surface inflammation."

The news reporters obtained a quote from the research from Tianjin Medical University, "An effective intervention targeting the pathogenic factors is needed to control this disease. Here we applied a-Melanocyte-stimulating hormone (a-MSH) twice a day to the ocular surface of a scopolamine-induced dry eye rat model. The results showed that a-MSH at different doses ameliorated tear secretion, tear film stability, and corneal integrity, and corrected overexpression of proinflammatory factors, TNF-a, IL-1b, and IFN-g, in ocular surface of the dry eye rats. Moreover, a-MSH, at 10(-4) mg/ml, maintained corneal morphology, inhibited apoptosis, and restored the number and size of conjunctival goblet cells in the dry eye rats. Mechanistically, a-MSH activated both PKA-CREB and MEK-Erk pathways in the dry eye corneas and conjunctivas; pharmacological blockade of either pathway abolished a-MSH's protective effects, suggesting that both pathways are necessary for a-MSH's protection under dry eye condition."

According to the news reporters, the research concluded: "The peliotropic protective functions and explicit signaling mechanism of a-MSH warrant translation of the a-MSH-containing eye drop into a novel and effective intervention to DED."

For more information on this research see: a-Melanocyte-stimulating hormone ameliorates ocular surface dysfunctions and lesions in a scopolamine-induced dry eye model via PKA-CREB and MEK-Erk pathways. *Scientific Reports*, 2015;5():18619. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting Y. Ru, Tianjin Medical University Eye Hospital, Tianjin Medical University Eye Institute, College of Optometry and Ophthalmology, Tianjin Medical University, Tianjin, 300384, People's Republic of China. Additional authors for this research include Y. Huang, H.
Recent Reports from University of Sydney Highlight Findings in Cataracts (Sporadic and Familial Congenital Cataracts: Mutational Spectrum and New Diagnoses Using Next-Generation Sequencing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Eye Diseases and Conditions - Cataracts is now available. According to news reporting originating from Sydney, Australia, by NewsRx correspondents, research stated, "Congenital cataracts are a significant cause of lifelong visual loss. They may be isolated or associated with microcornea, microphthalmia, anterior segment dysgenesis (ASD) and glaucoma, and there can be syndromic associations."

Financial support for this research came from Ophthalmic Research Institute of Australia.

Our news editors obtained a quote from the research from the University of Sydney, "Genetic diagnosis is challenging due to marked genetic heterogeneity. In this study, next-generation sequencing (NGS) of 32 cataract-associated genes was undertaken in 46 apparently nonsyndromic congenital cataract probands, around half sporadic and half familial cases. We identified pathogenic variants in 70% of cases, and over 68% of these were novel. In almost two-thirds (20/33) of these cases, this resulted in new information about the diagnosis and/or inheritance pattern. This included identification of: new syndromic diagnoses due to NHS or BCOR mutations; complex ocular phenotypes due to PAX6 mutations; de novo autosomal-dominant or X-linked mutations in sporadic cases; and mutations in two separate cataract genes in one family. Variants were found in the crystallin and gap junction genes, including the first report of severe microphthalmia and sclerocornea associated with a novel GJA8 mutation. Mutations were also found in rarely reported genes including MAF, VIM, MIP, and BFSP1."

According to the news editors, the research concluded: "Targeted NGS in presumed nonsyndromic congenital cataract patients provided significant diagnostic information in both familial and sporadic cases."

The news editors report that additional information may be obtained by contacting A.S. Ma, Eye Genetics Research, The Children's Hospital at Westmead, Save Sight Institute, Children's Medical Research Institute, University of Sydney, Sydney, New South Wales,
Oncology - Liver Cancer

Recent Reports from University of Ulsan College of Medicine Highlight Findings in Liver Cancer (Inactivation of Hippo Pathway Is Significantly Associated with Poor Prognosis in Hepatocellular Carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Liver Cancer have been presented. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "The Hippo pathway is a tumor suppressor in the liver. However, the clinical significance of Hippo pathway inactivation in HCC is not clearly defined."

Our news journalists obtained a quote from the research from the University of Ulsan College of Medicine, "We analyzed genomic data from human and mouse tissues to determine clinical relevance of Hippo pathway inactivation in HCC. We analyzed gene expression data from Mst1/2(-/-) and Sav1(-/-) mice and identified a 610-gene expression signature reflecting Hippo pathway inactivation in the liver [silence of Hippo (SOH) signature]. By integrating gene expression data from mouse models with those from human HCC tissues, we developed a prediction model that could identify HCC patients with an inactivated Hippo pathway and used it to test its significance in HCC patients, via univariate and multivariate Cox analyses. HCC patients (National Cancer Institute cohort, n=113) with the SOH signature had a significantly poorer prognosis than those without the SOH signature [p <0.001 for overall survival (OS)]. The significant association of the signature with poor prognosis was further validated in the Korean (n=100, p=0.006 for OS) and Fudan University cohorts (n=242, p=0.001 for OS). On multivariate analysis, the signature was an independent predictor of recurrence-free survival (HR, 1.6; 95% confidence interval, 1.12-2.28: p=0.008). We also demonstrated significant concordance between the SOH HCC subtype and the hepatic stem cell HCC subtype that had been identified in a previous study (p <0.001)."

According to the news editors, the research concluded: "Inactivation of the Hippo pathway in HCC is significantly associated with poor prognosis."

For more information on this research see: Inactivation of Hippo Pathway Is Significantly Associated with Poor Prognosis in Hepatocellular Carcinoma. *Clinical Cancer Research*, 2015;22(5):1256-64. *Clinical Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Polyomavirus

Recent Research from Academic Medical Center Highlight Findings in Polyomavirus (Predominant Tubular Interleukin-18 Expression in Polyomavirus-Associated Nephropathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Polyomavirus have been presented. According to news originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Polyomavirus-associated nephropathy (PVAN) occurs in a significant percentage of renal transplant recipients, with BK virus reactivation as the main causative agent. PVAN leads to tubular damage and may result in allograft loss."

Our news journalists obtained a quote from the research from Academic Medical Center, "In this study, we analyzed the antiviral immune response in PVAN. Transcription of the proinflammatory cytokine interleukin-18 (IL-18) was significantly higher in PVAN biopsies compared with T cell-mediated rejection (TCMR) (1.42 +/- 0.20 and 0.69 +/- 0.10, respectively; *P = 0.0021). Tubular expression of IL-18 was significantly increased in PVAN compared with TCMR (2.00 +/- 0.24 and 1.333 +/- 0.13, respectively; *P = 0.028). In contrast, in TCMR, IL-18 was expressed predominantly by CD163-positive macrophages."

According to the news editors, the research concluded: "These data suggest that the antiviral immune response in PVAN is partly coordinated by the tubular epithelium, whereas in TCMR, this may be controlled by inflammatory cells."

For more information on this research see: Predominant Tubular Interleukin-18 Expression in Polyomavirus-Associated Nephropathy. Transplantation, 2016;100(10):E88-E95. Transplantation can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Transplantation - journals.lww.com/transplantjournal/pages/default.aspx)

The news correspondents report that additional information may be obtained from G. Stokman, Academy Med Center, Dept. of Pathol, NL-1105 AZ Amsterdam, Netherlands. Additional authors for this research include J. Kers, U. Yapici, J.J. Hoelbeek, N. Claessen, O.J. de Boer, M.G. Netea, L. Hilbrands, F.J. Bemelman, I.J.M. ten Berge and S. Florquin.
Recent Research from Alagappa University Highlight Findings in Serratia (Piper betle and its bioactive metabolite phytol mitigates quorum sensing mediated virulence factors and biofilm of nosocomial pathogen Serratia marcescens in vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gram-Negative Bacteria - Serratia. According to news reporting out of Tamil Nadu, India, by NewsRx editors, research stated, "Ethnopharmacological relevance: Piper betle, a tropical creeper plant belongs to the family Piperaceae. The leaves of this plant have been well known for their therapeutic, religious and ceremonial value in South and Southeast Asia."

Financial supporters for this research include Department of Biotechnology, Government of India, University Grants Commission, New Delhi, India.

Our news journalists obtained a quote from the research from Alagappa University, "It has also been reported to possess several biological activities including antimicrobial, antioxidant, antiinociceptive, antidiabetic, insecticidal and gastroprotective activities and used as a common ingredient in indigenous medicines. In Indian system of ayurvedic medicine, P. betle has been well recognized for its antiseptic properties and is commonly applied on wounds and lesions for its healing effects. Aim of the study: To evaluate the anti-quorum sensing (anti-QS) and antibiofilm efficacy of P. betle and its bioactive metabolite phytol against Serratia marcescens. The P. betle ethyl acetate extract (PBE) was evaluated for its anti-QS efficacy against S. marcescens by assessing the prodigiosin and lipase production at 400 and 500 μg ml(-1) concentrations. In addition, the biofilm biomass quantification assay was performed to evaluate the antibiofilm activity of PBE against S. marcescens. Besides, the influence of PBE on bacterial biofilm formation was assessed through microscopic techniques. The biofilm related phenomenons like exopolysaccharides (EPS) production, hydrophobicity and swarming motility were also examined to support the antibiofilm activity of PBE. Transcriptional analysis of QS regulated genes in S. marcescens was also done. Characterization of PBE was done by separation through column chromatography and identification of active metabolites by gas chromatography-mass spectrometry. The major compounds of active fractions such as hexadecanoic acid, eugenol and phytol were assessed for their anti-QS activity against S. marcescens. Further, the in vitro bioassays such as protease, biofilm and HI quantification were also carried out to confirm the anti-QS and antibiofilm potential of phytol in PBE. PBE inhibits QS mediated prodigiosin pigment production in S. marcescens, which confirmed its anti QS potential against S. marcescens. At 500 μg ml(-1) concentration, PBE significantly inhibited the production of protease, lipase, biofilm and EPS to the level of 71%, 68%, 65% and 43% in S. marcescens, respectively. Further, their antibiofilm efficacy was confirmed through microscopic techniques. In addition, PBE effectively inhibited the hydrophobicity and swarming motility. Additionally, the results of qPCR analysis validated the down regulation of QS genes.
Chromatographic techniques the presence of hexadecanoic acid, eugenol and phytol in PBE and the potential bioactive compound with anti-QS activity was identified as phytol. In vitro assays with phytol evidenced the potent inhibition of QS-controlled prodigiosin, protease, biofilm and hydrophobicity in S. marcescens, without exerting any deleterious effect on its growth.

According to the news editors, the research concluded: "This study demonstrates the promising anti-QS and antibiofilm activities of PBE and its active metabolite phytol, and confirms the ethnopharmacological applications of these leaves against S. marcescens infections."

Our news journalists report that additional information may be obtained by contacting A.V. Ravi, Alagappa Univ, Dept. of Biotechnol, Karaikudi 630004, Tamil Nadu, India. Additional authors for this research include K.R. Devi, A. Kannappan, S.K. Pandian and A.V. Ravi.

**Cardiothoracic**

**Recent Research from Albert Einstein College of Medicine Highlight Findings in Cardiothoracic (Sex and the Risk of AKI Following Cardiothoracic Surgery: A Meta-Analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiothoracic. According to news reporting originating from Bronx, New York, by NewsRx correspondents, research stated, "Being a woman is a well established risk factor for the development of cardiothoracic surgery-associated AKI. In striking contrast, women are less likely to develop AKI associated with noncardiac surgical procedures than men."

Our news editors obtained a quote from the research from the Albert Einstein College of Medicine, "In an attempt to ascertain why being a woman might be protective for ischemic AKI after general surgery but deleterious in patients undergoing cardiothoracic surgery, we examined cardiothoracic surgery-associated AKI in greater detail. & measurements We performed a systematic review and meta-analysis of cardiothoracic surgery-associated AKI studies published between January of 1978 and December of 2015 to further explore the
relationship between sex and cardiothoracic surgery-associated AKI. Sixty-four studies were identified that provided sex-specific data regarding the incidence of cardiothoracic surgery-associated AKI among 1,057,412 subjects. Using univariate analysis, women were more likely than men to develop AKI postoperatively (odds ratio, 1.21; 95% confidence interval, 1.09 to 1.33; P<0.001). However, when the analysis was restricted to the 120,464 subjects reported in 29 studies that used the Acute Kidney Injury Network criteria, the RIFLE criteria, or the Kidney Disease Improving Global Outcomes criteria to define AKI, there was no significant sex-related difference in risk. Seventeen studies used multivariate analysis to assess risk factors for cardiothoracic surgery-associated AKI and provided sex-specific odd ratios. Among the 1,587,181 individuals included in these studies, the risk of developing cardiothoracic surgery-associated AKI was not significantly associated with sex (odds ratio, 1.04; 95% confidence interval, 0.92 to 1.19; P=0.51). However, when the analysis was restricted to the 5106 subjects reported in four studies that used the Acute Kidney Injury Network criteria to define AKI, the risk of developing AKI was significantly lower in women compared with in men (odds ratio, 0.75; 95% confidence interval, 0.65 to 0.87; P<0.001).

According to the news editors, the research concluded: "Our systematic review and meta-analysis contradict the generally held consensus that being a woman is an independent risk factor for the development of cardiothoracic surgery-associated AKI."

The news editors report that additional information may be obtained by contacting J. Neugarten, Montefiore Med Center, Albert Einstein College of Medicine, Dept. of Med, Div Nephrol, Bronx, NY 10467, United States. Additional authors for this research include S. Sandilya, B. Singh and L. Golestaneh.

and CH3) with 2-amino-3-(5-bromo-2-hydroxybenzylamino)maleonitrile. The solvatochromic behaviors of the molecules were probed by studying their UV-Vis spectra in five pure organic solvents of different polarities."

Financial support for this research came from Arak University.

Our news journalists obtained a quote from the research from Arak University, "The p-NO2 substituted receptor shows a dramatic color change from yellow to blue upon the addition of fluoride ion in CH3CN. This capability was studied by systematic TD-DFT calculations. These compounds were assayed for their in vitro antibacterial activities against Gram-positive (S. aureus, S. epidermidis and L monocytogenes) and Gram-negative (E. coli, P. aeruginosa and K. pneumonia) bacteria by disc diffusion method."

According to the news editors, the research concluded: "The results indicated that the compounds show good inhibition against Gram positive bacteria namely L monocytogenes as compared to standard drugs."

The news correspondents report that additional information may be obtained from H. Khanmohammadi, Arak Univ, Fac Sci, Dept. of Chem, Arak 3815688349, Iran. Additional authors for this research include V. Arab, K. Rezaeian, G.R. Talei, M. Pass and N. Shabani.

Heart Disorders and Diseases - Cardiac Tamponade

**Recent Research from Catholic University of Korea Highlight Findings in Cardiac Tamponade (Cardiac Tamponade due to Suprahepatic Surgical Exploration in Liver Retransplantation: A Case Report)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Cardiac Tamponade is now available. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Cardiac tamponade is an emergency condition that requires early recognition and prompt pericardial decompression. Little has been reported on cardiac tamponade in liver retransplantation (reLT), but most cases are fatal."

The news correspondents obtained a quote from the research from the Catholic University of Korea, "We managed a case of reLT complicated by accidental cardiac tamponade. A 59-year-old man underwent an emergency reLT because of liver cirrhosis with recurrent hepatitis B. During the dissection, suprahepatic exploration was attempted, but this resulted in severe hemorrhage because of the many tissue adhesions. After 1 hour of allograft reperfusion, the cardiac index and blood pressure dropped markedly despite volume...

---

Recent Research from Catholic University of Korea Highlight Findings in Cardiac Tamponade (Cardiac Tamponade due to Suprahepatic Surgical Exploration in Liver Retransplantation: A Case Report)
resuscitation, and the central venous pressure increased abruptly. Using transthoracic echocardiography, cardiac tamponade was diagnosed, and an urgent pericardiotomy was performed. Although bizarre changes in the electrocardiogram were observed briefly, the vital signs normalized."

According to the news reporters, the research concluded: "After a short period of hypotension and hyperlactatemia in the intensive care unit, the patient was transferred to a ward in satisfactory condition on postoperative day 7. This case demonstrates the need for careful monitoring of hemodynamics during suprahepatic exploration with marked tissue adhesions in reLT."

Our news journalists report that additional information may be obtained by contacting C.S. Park, Catholic University of Korea, Coll Med, Seoul St Marys Hosp, Dept. of Anesthesiol & Pain Med, Seoul 06591, South Korea. Additional authors for this research include Y.K. Jeon, D.G. Kim, G.H. Na, Y.S. Yi and C.S. Park.

systolic dysfunction was significantly prevalent (43.8% vs. 20.0%, p = 0.03) and the improvement in LV ejection fraction (EF) more than 10% on FU echocardiography was more significantly frequent (62.5% vs. 23.3%, p = 0.003) in the reversible TR group than in the non-reversible TR group. However, the other echocardiographic parameters, including right ventricular function were not different between the groups. In multivariate analysis using Cox proportional hazard model, the improvement of LVEF more than 10% was the only independent predictor of reversible TR (HR = 7.39, 95%CI 1.80-30.28, p = 0.005). Nine patients died only in patients with non-reversible TR (12.7%), but the reversibility of TR was not associated with mortality. The improvement of LV systolic function was the only independent predictor of reversible TR.

According to the news editors, the research concluded: "Appropriate medical therapy including management for heart failure should be considered before performing surgery in patients with severe functional TR and AF, especially in patients with LV dysfunction."

Our news journalists report that additional information may be obtained by contacting K.H. Kim, Chonnam Natl Univ Hosp, Dept. of Translat Res Center Aging, Gwangju, South Korea. Membrane Proteins - Vesicular Transport Proteins
Recent Research from Chubu University Highlight Findings in Vesicular Transport Proteins (Caveolin-1 facilitates internalization and degradation of ABCA1 and probucol oxidative products interfere with this reaction to increase HDL biogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Membrane Proteins - Vesicular Transport Proteins have been presented. According to news reporting from Kasugai, Japan, by NewsRx journalists, research stated, "Expression of ATP binding cassette transporter (ABC) A1, a key membrane protein for biogenesis of high-density lipoprotein (HDL), is regulated not only by its gene transcription but also by its intracellular degradation to modulate plasma HDL concentration. We previously showed that inhibition of ABCA1 degradation by probucol oxidative products, spiroquinone (SQ) and diphenoquinone (DQ), increased HDL biogenesis and reverse cholesterol
transport, and achieved reduction of atherosclerosis in animal models."

The news correspondents obtained a quote from the research from Chubu University, "The background mechanism has thus been investigated. Involvement of caveolin-1, a protein of multiple functions in cell biology, particularly in cholesterol trafficking, has been examined for its roles in ABCA1 degradation as well as the effects of SQ and DQ on the reaction. ABCA1 protein was increased in caveolin-1-deficient mouse embryonic fibroblasts, not by increase of transcription but by decrease in its internalization and degradation. Transfection and expression of caveolin-1 normalized the protein level and the rate of degradation of ABCA1. Immunoprecipitation experiments demonstrated association between ABCA1 and caveolin-1 and SQ and DQ disrupted this interaction. The effects of SQ and DQ to increase ABCA1 and cell cholesterol release induced by apolipoprotein A-I were dependent on expression of caveolin-1. Fluorescence imaging of ABCA1 and caveolin-1 in cultured cells demonstrated their co-localization as well as its disruption by SQ and DQ, being consistent with the biochemical findings. Caveolin-1 enhances internalization and degradation of ABCA1 by its association with ABCA1."

According to the news reporters, the research concluded: "Interference of this interaction by probucol oxidative products suppresses ABCA1 degradation and increase HDL biogenesis."

For more information on this research see: Caveolin-1 facilitates internalization and degradation of ABCA1 and probucol oxidative products interfere with this reaction to increase HDL biogenesis. Atherosclerosis, 2016;253():54-60. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Neutral Amino Acids

Recent Research from Dalian Medical University Highlight Findings in Neutral Amino Acids (Evaluation of PFOS-mediated neurotoxicity in rat primary neurons and astrocytes cultured separately or in co-culture)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neutral Amino Acids. According to news reporting originating in Dalian, People's Republic of China, by NewsRx journalists,
research stated, "Perfluorooctane sulfonate (PFOS) is a potential neurotoxicant reported by epidemiological investigations and experimental studies, while the underlying mechanisms are still unclear. Astrocytes not only support for the construction of neurons, but also conduct neuronal functions through glutamate-glutamine cycle in astrocyteneuron crosstalk."

The news reporters obtained a quote from the research from Dalian Medical University, "In the present study, the effect of PFOS exposure on rat primary hippocampal neurons or cortex astrocytes was evaluated. Then the role of the astrocytes in PFOS-induced toxic effect on neurons was explored with astrocyte-neuron co-culture system. Exposure of rat primary hippocampal neurons to PFOS has led to oxidation-antioxidation imbalance, increased apoptosis and abnormal autophagy. The adverse effect of PFOS on rat primary cortex astrocytes manifested in the form of altered extracellular glutamate and glutamine concentrations, decreased glutamine synthase activity, as well as decreased gene expression of glutamine synthase, glutamate transporters and glutamine transporters in the glutamate-glutamine cycle. Especially, the alleviation of PFOS-inhibited neurite outgrowth in neurons could be observed in astrocyte-neuron co-culture system, though the ability of astrocytes in fostering neurite outgrowth was affected by PFOS. These results indicated that both astrocytes and neurons might be the targets of PFOS-induced neurotoxicity, and astrocytes could protect against PFOS-inhibited neurite outgrowth in primary cultured neurons."

According to the news reporters, the research concluded: "Our research might render some information in explaining the mechanisms of PFOS-induced neurotoxicity."

For more information on this research see: Evaluation of PFOS-mediated neurotoxicity in rat primary neurons and. astrocytes cultured separately or in co-culture. Toxicology in Vitro, 2017;38():77-90. Toxicology in Vitro can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. clinical score to predict difficult ventilation through a supraglottic airway device. The score was proposed from our previously reported derivation data, and we prospectively validated the score in 5532 patients from November 2013 to April 2014.

Our news editors obtained a quote from the research from Dokkyo Medical University, "Predictive accuracy of the score was compared by the area under the receiver operating characteristic (ROC) curve (AUC). We assigned point values to each of the identified four risk factors: male, age >45 yr, short thyromental distance, and limited neck movement, their sum composing the score. The score ranged between 0 and 7 points. The optimal predictive level of the score was determined using ROC curve analysis. The AUC of the score was 0.75 (95% CI 0.66 to 0.84) in the validation data set, and was similar to that in the derivation data set (0.80; 95% CI 0.75 to 0.86). In derivation and validation data sets, the incidence of low risk categories (scores 0-3) was 0.42% vs 0.32% and of high risk categories (scores 4-7) was 3% vs 1.7% respectively. A score 4 or greater is associated with a six to seven fold increased risk of difficult ventilation through a supraglottic airway device."

According to the news editors, the research concluded: "The new score for prediction of difficult ventilation through a supraglottic airway device is easy to perform and reliable, and could help anaesthetists plan for difficult airway management."

The news editors report that additional information may be obtained by contacting T. Saito, Dokkyo Med Univ, Koshigaya Hosp, Dept. of Anaesthesia, Koshigaya, Saitama 3438555, Japan. Additional authors for this research include S.T.H. Chew, W.L. Liu, K.K. Thinn, T. Asai and L.K. Ti.

Hematology - Blood Coagulation Factors

Recent Research from Erasmus University Highlight Findings in Blood Coagulation Factors (von Willebrand Factor, ADAMTS13 Activity, and Decline in Kidney Function: A Population-Based Cohort Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematology - Blood Coagulation Factors have been published. According to news reporting out of Rotterdam, Netherlands, by NewsRx editors, research stated, "Altered levels of von Willebrand factor (vWF) and ADAMTS13 can promote thrombosis and disturb blood flow in kidney microcirculations. We investigated the association of serum vWF: ADAMTS13 ratio in relation to decline in kidney function."

Financial supporters for this research include Baxalta Innovations GmbH, Nestle Nutrition (Nestec Ltd), Metagenics Inc, AXA.

Our news journalists obtained a quote from the research from Erasmus University, "Prospective cohort study. 2,479 individuals (mean age, 65.1 +/- 5.9 [SD] years; 43% men) from the population-based Rotterdam Study. Predictors: vWF, ADAMTS13, and vWF: ADAMTS13
ratio. Annual decline in estimated glomerular filtration rate (eGFR), halving of eGFR, and new-onset eGFR < 60 mL/min/1.73 m(2) were assessed. During a median follow-up of 11 (range, 7.81-13.57) years, 500 cases of new-onset eGFR < 60 mL/min/1.73 m(2) occurred. The population had a mean eGFR decline of 0.96 +/- 0.92 mL/min/1.73 m 2 per year. Higher vWF:ADAMTS13 ratio was associated with steeper annual decline in eGFR (difference, -0.06 [95% CI, -0.09 to -0.02] mL/min/1.73 m(2) per year) and higher risk for new-onset eGFR < 60 mL/min/1.73 m(2) (OR, 1.13; 95% CI, 1.01-1.27). Likewise, higher vWF: ADAMTS13 ratio was associated with higher risk for halving of eGFR (OR, 1.40; 95% CI, 1.02-1.93). After adjustment for cardiovascular risk factors and blood group, effect estimates remained the same. Limitations: No data available for albuminuria. Participants were classified based on a single measurement of vWF and ADAMTS13."

According to the news editors, the research concluded: "In this population-based study, we showed that higher vWF: ADAMTS13 ratio is associated with decline in kidney function, suggesting a role of elevated prothrombotic factors in the development and progression of kidney disease."

Our news journalists report that additional information may be obtained by contacting A. Dehghan, Erasmus University, Medical Center, Dept. of Epidemiol, Rotterdam, Netherlands. Additional authors for this research include P.S. de Vries, J. Boender, M.A.H. Sonneveld, E.J. Hoorn, A. Hofman, M.P.M. de Maat, O.H. Franco, M.A. Ikram, F.W.G. Leebeek and A. Dehghan.

Oncology - Esophageal Cancer

Recent Research from Federal University Highlight Findings in Esophageal Cancer (Unchanging pattern of prevalence of esophageal cancer, overall and by histological subtype, in the endoscopy service of the main referral hospital in the central ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Esophageal Cancer are presented in a new report. According to news reporting originating in Porto Alegre, Brazil, by NewsRx journalists, research stated, "Squamous cell carcinoma (SCC) and adenocarcinoma (ADC) are the two main histological types of esophageal cancer. Southern Brazil has the highest rates of esophageal
The news reporters obtained a quote from the research from Federal University, "This study assessed the trend changes in the histological types of esophageal cancer, in a 20-year period, in the central region of Rio Grande do Sul State, Brazil. We searched all cases of esophageal cancer from 1993 to 2012 by their histological diagnosis, grouping the patients in 4-year time periods to evaluate time trends. Among 18,441 upper gastrointestinal endoscopies we identified 686 cases of esophageal cancer. Histological study confirmed the diagnosis of SCC in 640 (93.3%) patients and ADC in 46 (6.7%). Overall, 522 men were diagnosed with esophageal carcinoma; from these, 489 (93.6%) presented SCC, and 33 (6.3%) ADC. Among women, 164 had the diagnosis of esophageal cancer, 151 (92%) SCC, and 13 (7.9%) ADC. The proportion found among men and women was 3.1:1, respectively. The prevalence rate of esophageal cancer, along a 20 year-period, remained stable, as well as the rates of SCC and ADC."

According to the news reporters, the research concluded: "SCC was the most common type of esophageal cancer, and ADC presented very low prevalence."

Our news correspondents report that additional information may be obtained by contacting R.B. Fagundes, Univ Fed Rio Grande do Sul, Fac Med, Programa Postgraduate Ciencias Gastroenterol & Hepato, Porto Alegre, RS, Brazil. Additional authors for this research include D. de Carli, R.V. Xaubet and J.C. Cantarelli.

**Terminal Care**

**Recent Research from Free University Highlight Findings in Terminal Care (Euthanasia in Belgium: trends in reported cases between 2003 and 2013)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Terminal Care. According to news reporting from Brussels, Belgium, by NewsRx journalists, research stated, "In 2002, the Belgian Act on Euthanasia came into effect, regulating the intentional ending of life by a physician at the patient's explicit request. We undertook this study to describe trends in officially reported euthanasia cases in Belgium with regard to patients' sociodemographic and clinical profiles, as well as decision-making and performance characteristics."

The news correspondents obtained a quote from the research from Free University, "We used the database of all euthanasia cases reported to the Federal Control and Evaluation Committee on Euthanasia in Belgium between Jan. 1, 2003, and Dec. 31, 2013 (n = 8752). The
committee collected these data with a standardized registration form. We analyzed trends in patient, decision-making and performance characteristics using a (2) technique. We also compared and analyzed trends for cases reported in Dutch and in French. The number of reported euthanasia cases increased every year, from 235 (0.2% of all deaths) in 2003 to 1807 (1.7% of all deaths) in 2013. The rate of euthanasia increased significantly among those aged 80 years or older, those who died in a nursing home, those with a disease other than cancer and those not expected to die in the near future (p < 0.001 for all increases). Reported cases in 2013 most often concerned those with cancer (68.7%) and those under 80 years (65.0%). Palliative care teams were increasingly often consulted about euthanasia requests, beyond the legal requirements to do so (p < 0.001). Among cases reported in Dutch, the proportion in which the person was expected to die in the foreseeable future decreased from 93.9% in 2003 to 84.1% in 2013, and palliative care teams were increasingly consulted about the euthanasia request (from 34.0% in 2003 to 42.6% in 2013). These trends were not significant for cases reported in French. Since legalization of euthanasia in Belgium, the number of reported cases has increased each year. Most of those receiving euthanasia were younger than 80 years and were dying of cancer.

According to the news reporters, the research concluded: "Given the increases observed among non-terminally ill and older patients, this analysis shows the importance of detailed monitoring of developments in euthanasia practice."

For more information on this research see: Euthanasia in Belgium: trends in reported cases between 2003 and 2013. Canadian Medical Association Journal, 2016;188(16):E407-E414. Central Nervous System Diseases and Conditions -…

Recent Research from Goethe-University Hospital Highlight Findings in Subarachnoid Hemorrhage (Cerebral vasospasm and delayed cerebral infarctions in 225 patients with non-aneurysmal subarachnoid hemorrhage: the underestimated risk of Fisher 3 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage is now available. According to news reporting from Frankfurt, Germany, by NewsRx journalists, research stated. "Recent data have shown increasing numbers of non-aneurysmal subarachnoid hemorrhage (NASAH). However, data are limited and often
only small series have been published."

The news correspondents obtained a quote from the research from Goethe-University Hospital, "Our objective was to analyze the rate of cerebral vasospasm (CVS), delayed cerebral infarction (DCI), and their influence on the clinical outcome, especially in patients with diffuse Fisher 3 bleeding pattern NASAH (Fi3). Between 1999 and 2014, 225 patients had NASAH. CVS, DCI, and outcome (according to the modified Rankin Scale at 6 months) were analyzed retrospectively. Patients were stratified according to the bleeding type. After univariate analysis a multivariate analysis was performed and NASAH Fi3 was also compared with aneurysmal SAH Fi3. Patient characteristics and the outcome of perimesencephalic (PM) and non-PM (NPM) SAH were similar. Excluding Fi3, PM and NPM without Fi3 had similar patient characteristics, clinical course, and outcome. In particular, the Fi3 subgroup had a significantly increased risk of CVS, DCI, unfavorable outcome, hydrocephalus, and death. Early hydrocephalus was associated with Fi3 and intraventricular hemorrhage. The multivariate regression model showed the variables elderly patients, Fi3, and early hydrocephalus as independent and significant predictors for an unfavorable outcome. A further comparison of NASAH Fi3 with aneurysmal SAH Fi3 showed similar characteristics, CVS rate, and mortality. Patients with NASAH without a Fi3 bleeding pattern had a similar excellent outcome to patients with PM-SAH. Patients with Fi3 had a high risk for early hydrocephalus, CVS, DCI, and an unfavorable outcome, similar to patients with aneurysmal SAH. After multivariate analysis, early hydrocephalus, elderly patients, and Fi3 were identified as negative prognostic factors."

According to the news reporters, the research concluded: "Therefore, patients with Fi3 are at risk and need careful clinical observation."

Our news journalists report that additional information may be obtained by contacting J. Konczalla, Goethe Univ Hosp, Dept. of Neurosurg, D-60528 Frankfurt, Germany. Additional authors for this research include S. Kashefiolasl, N. Brawanski, S. Lescher, C. Senft, J. Platz and V. Seifert.

Recent Research from Gujarat Cancer and Research Institute Highlight Findings in Oral Cancer (Role of miRNA dynamics and cytokine profile in governing CD44v6/Nanog/PTEN axis in oral cancer: modulating the master regulators)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Oral Cancer are presented in a new report. According to news reporting originating from Gujarat, India, by NewsRx correspondents, research stated, "Late diagnosis, low therapeutic response, and metastasis are accountable for poor 5-year survival rate of OSCC. These failures are attributed to the existence of 'cancer stem cell (CSC) subpopulation.'

Financial support for this research came from The Gujarat Cancer Society. Our news editors obtained a quote from the research from Gujarat Cancer and Research Institute, "Hence, it is necessary to identify and understand the mechanism of CSCs in tumor development, metastasis, and chemotherapeutic response. Propelling evidences suggest that microRNA (miRNA)-mediated regulation and cytokines of tumor microenvironment have the ability to modulate CSC signalling pathway; however, their exact mechanism needs to be elucidated. Thus, in this study, we characterized CSC markers and highlighted the miRNA dynamics and cytokine profile regulating these CSCs in a pathway-dependent manner. Our results demonstrated CD44+ subpopulation as tumor-initiating cells with self-renewal capability, tumorigenic growth potential and intrinsic chemoresistance. These tumors exhibited increased expression of CSC markers (CD44v3, CD44v6, Nanog, and Bmi1) and significantly reduced expression of PTEN and ATM in OSCC patients. Pathway analysis of these CSC markers demonstrated a prospective pathway regulated by miRNA and cytokine network. On analyzing these modulators, we observed decreased expression of miRNA542-3p, miRNA34a and miRNA9, and significant upregulation of miRNA21, thus forming an unexplored axis. Cytokine profiling revealed significantly increased levels of IL-6 and IL-8 compared to normals and demonstrated their strong association with CD44v6. Collectively, this study indicates that miR5423p and miR34a targets the CD44v6-Nanog-PTEN axis, thus playing a vital role in regulating the CSC properties."

According to the news editors, the research concluded: "Furthermore, we speculate an impinging role of cytokines IL-6 and IL-8 in regulating this CSC-mediated pathway which can have prognostic and therapeutic implications."

For more information on this research see: Role of miRNA dynamics and cytokine profile in governing CD44v6/Nanog/PTEN axis in oral cancer: modulating the master regulators. Recent Research from H. Lundbeck AS Highlight Findings in Phosphodiesterase Inhibitors (Novel Approach toward 3,3-Difluoropiperidines from Easily Available Starting Materials and Synthesis of a New Phosphodiesterase Inhibitor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Phosphodiesterase Inhibitors. According to news originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "A novel methodology for the synthesis of 3,3-difluoropiperidines has been developed."

Our news journalists obtained a quote from the research from H. Lundbeck AS, "The target compounds are prepared in three steps using a robust protocol and simple starting materials. The incorporation of the fluorine is achieved by using the cheap and easily available ethyl 2-bromo-2,2-difluoroacetate as building block."

According to the news editors, the research concluded: "Using this methodology, a new potent in vitro phosphodiesterase 2A (PDE2A) inhibitor containing the functionalized fluorinated piperidine scaffold has been prepared."

For more information on this research see: Novel Approach toward 3,3-Difluoropiperidines from Easily Available Starting Materials and Synthesis of a New Phosphodiesterase Inhibitor. *Synlett*, 2016;27(20):2803-2806. *Synlett* can be contacted at: Georg Thieme Verlag Kg, Rudigerstr 14, D-70469 Stuttgart, Germany. (Thieme - www.thieme.com)

Hematologic Diseases and Conditions - Sickle Cell...

Recent Research from HCPA Highlight Findings in Sickle Cell Anemia (The role of BCL11A and HMIP-2 polymorphisms on endogenous and hydroxyurea induced levels of fetal hemoglobin in sickle cell anemia patients from southern Brazil)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematologic Diseases and Conditions - Sickle Cell Anemia. According to news reporting from Porto Alegre, Brazil, by NewsRx journalists, research stated, "High levels of fetal hemoglobin (HbF) reduce sickle cell anemia (SCA) morbidity and mortality. HbF levels vary considerably and there is a strong genetic component that influences HbF production."

The news correspondents obtained a quote from the research from HCPA, "Genetic polymorphisms at three quantitative trait loci (QTL): Xmn1-HBG2, HMIP-2 and BCL11A, have been shown to influence HbF levels and disease severity in SCA. Hydroxyurea (HU) is a drug that increases HbF. We investigated the influence of single nucleotide polymorphisms (SNPs) at the Xmn1-HBG2 (rs7482144); BCL11A (rs1427407, rs1427407 and rs1188680); and HMIP-2 (rs9399137 and rs9402686) loci on baseline and HU-induced HbF levels in 111 HbSS patients. We found that both BCL11A and HMIP-2 were associated with increased endogenous levels of HbF. Interestingly, we also found that BCL11A was associated with higher induction of HbF with HU. This effect was independent of the effect of BCL11A on baseline HbF levels."

According to the news reporters, the research concluded: "Additional studies will be needed to validate these findings and explain the ample inter-individual variations in HbF levels at baseline and HU-induced in patients with SCA."

For more information on this research see: The role of BCL11A and HMIP-2 polymorphisms on endogenous and hydroxyurea induced levels of fetal hemoglobin in sickle cell anemia patients from southern Brazil. Blood Cells Molecules and Diseases, 2016;62():32-37. Blood Cells Molecules and Diseases can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA.

Liver Diseases and Conditions - Hepatitis

Recent Research from Huazhong University of Science and Technology Highlight Findings in Hepatitis (Sustained immune control in HBeAg-positive patients who switched from entecavir therapy to pegylated interferon-alpha 2a: 1 year follow-up of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Liver Diseases and Conditions - Hepatitis is the subject of a report. According to news reporting originating in Wuhan, People's Republic of China, by NewsRx journalists, research stated, "In the OSST study, hepatitis B e antigen (HBeAg)-positive chronic hepatitis B patients who switched from long-term entecavir (ETV) therapy to pegylated interferon-alpha 2a (PEG-IFN-alpha 2a; 40 kDa) achieved higher rates of HBeAg seroconversion and hepatitis B surface antigen (HBsAg) loss than those who continued ETV. Herein we report the sustainability of serological responses during 1 year of untreated follow-up in patients who switched from ETV to PEGIFN-alpha 2a therapy."

The news reporters obtained a quote from the research from the Huazhong University of Science and Technology, "A total of 62 patients who completed 48 weeks of PEG-IFN-alpha 2a therapy were followed-up for 48 weeks off treatment. Primary end points were HBeAg seroconversion and maintenance of HBeAg seroconversion at 48 weeks post-treatment. Secondary end points included HBsAg loss, HBV DNA < 1,000 copies/ml and alanine aminotransferase normalization (< 1x upper limit of normal). The HBeAg seroconversion rate increased from 17.7% (11/62) at the end of treatment to 38.7% (24/62) 1 year post-treatment. Sustained HBeAg seroconversion was achieved by 63.6% (7/11) patients with end-of-treatment responses, while late HBeAg seroconversion was achieved by 33.3% (17/51) of patients who did not have end-of-treatment responses. Sustained HBsAg loss was documented in 6 of 7 patients, and sustained HBV DNA suppression was achieved in 60% (27/45) of patients with an end-of-treatment response. In patients who do not achieve HBeAg seroconversion during long-term ETV therapy, switching to finite treatment with PEG-IFN-alpha 2a produces HBeAg seroconversion in a substantial proportion of patients at end of treatment and during 1 year of follow-up."

According to the news reporters, the research concluded: "Moreover, HBeAg seroconversion and HBsAg loss are sustained in most patients during 1 year of untreated follow-up."

For more information on this research see: Sustained immune control in HBeAg-positive patients who switched from entecavir therapy to pegylated interferon-alpha 2a: 1 year follow-up of the OSST study. Antiviral Therapy, 2016;21(4):337-344. Antiviral Therapy can be contacted at: Int Medical Press Ltd, 2-4 Idol Lane, London EC3R 5DD, England.

Our news correspondents report that additional information may be obtained by contacting Q. Ning, Huazhong University of Science & Technology, Tongji Hosp, Tongji Med College, Wuhan, People's Republic of China. Additional authors for this research include J.J. Jiang, J.L. Hou, D.M. Tan, Y.T. Sun, M.Z. Zhao and Q. Ning.

Recent Research from Jimei University Highlight Findings in Vibrio parahaemolyticus (PI3K-AKT signaling pathway is involved in hypoxia/thermal-induced immunosuppression of small abalone Haliotis diversicolor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Vibrio parahaemolyticus have been presented. According to news reporting from Xiamen, People's Republic of China, by NewsRx journalists, research stated, "The PI3K-AKT signal pathway has been found to be involved in many important physiological and pathological processes of the innate immune system of vertebrates and invertebrates. In this study, the AICT (HdAKT) and P131C (HdPI3K) gene of small abalone Haliotis diversicolor were cloned and characterized for the important status of PI3K and AICT protein in PI3K-AKT signaling pathway."

Funders for this research include Natural Science Foundation of China, Innovation Team Foundation of Jimei University, Fujian Agriculture and Forestry University.

The news correspondents obtained a quote from the research from Jimei University, "The full length cDNAs of HdAICT and HdPI3K are 2126 bp and 6052 bp respectively, encoding proteins of 479 amino acids and 1097 amino acids, respectively. The mRNA expression level of fourteen genes in the PI3K-AICT signaling pathway were detected by quantitative real-time PCR. The results showed that all these fourteen genes were ubiquitously expressed in seven selected tissues. Meanwhile, HdAKT was expressed in haemocytes with the highest expression level (p < 0.05) next in hepatopancreas (p < 0.05). On the other hand, the expression level of HdPI3K in haemocytes was higher than other tissues. Under normal condition, the gene expression level of HdAKT, HdPI3K, and other PI3K-AKT signaling pathway members were significantly up-regulated by Vibrio parahaemolyticus infection which demonstrated that HdAKT, HdPI3K, and other PI3K-AKT signaling pathway members play a role in the innate immune system of abalone. The mRNA expression of these genes in gills, haemocytes and hepatopancreas was significantly down regulated after the Vibrio parahaemolyticus stimulation with environment stimulation (thermal, hypoxia and thermal & hypoxia). These results indicate that the dual/multiple stresses defeat the immune system and lead to immunosuppression in abalone."

According to the news reporters, the research concluded: "PI3K-AKT signaling pathway may be involved in hypoxia/thermal-induced immunosuppression of small abalone Haliotis diversicolor."

For more information on this research see: PI3K-AKT signaling pathway is involved in hypoxia/thermal-induced immunosuppression of small abalone Haliotis diversicolor. Recent Research from Ludwig-Maximilians-University Highlight Findings in Acute Respiratory Distress Syndrome (Predictors of Inadequate Linezolid Concentrations after Standard Dosing in Critically Ill Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Acute Respiratory Distress Syndrome have been published. According to news reporting originating in Munich, Germany, by NewsRx journalists, research stated, "Adequate linezolid blood concentrations have been shown to be associated with an improved clinical outcome. Our goal was to assess new predictors of inadequate linezolid concentrations often observed in critically ill patients."

Financial support for this research came from Merieux Research Grant.

The news reporters obtained a quote from the research from Ludwig-Maximilians-University. "Fifty-two critically ill patients with severe infections receiving standard dosing of linezolid participated in this prospective observational study. Serum samples (median, 32 per patient) were taken on four consecutive days, and total linezolid concentrations were quantified. Covariates influencing linezolid pharmacokinetics were identified by multivariate analysis and a population pharmacokinetic model. Target attainment (area under the concentration-time curve over 12 h [AUC(12)]/MIC ratio of >50; MIC = 2 mg/liter) was calculated for both the study patients and a simulated independent patient group (n = 67,000). Target attainment was observed for only 36% of the population on both days 1 and 4. Independent covariates related to significant decreases of linezolid concentrations included higher weight, creatinine clearance rates, and fibrinogen and antithrombin concentrations, lower concentrations of lactate, and the presence of acute respiratory distress syndrome (ARDS). Linezolid clearance was increased in ARDS patients (by 82%) and in patients with elevated fibrinogen or decreased lactate concentrations. In simulated patients, most covariates, including fibrinogen and lactate concentrations and weight, showed quantitatively minor effects on target attainment (difference of <= 9% between the first and fourth quartiles of the respective parameters). In contrast, the presence of ARDS had the strongest influence, with only <= 6% of simulated patients reaching this target."

According to the news reporters, the research concluded: "The presence of ARDS was identified as a new and strong predictor of insufficient linezolid concentrations, which
might cause treatment failure. Insufficient concentrations might also be a major problem in patients with combined alterations of other covariate parameters."

For more information on this research see: Predictors of Inadequate Linezolid Concentrations after Standard Dosing in Critically Ill Patients. Oncology - Osteosarcomas

Recent Research from Mie University Highlight Findings in Osteosarcomas (STAT3 inhibitor, cucurbitacin I, is a novel therapeutic agent for osteosarcoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Osteosarcomas. According to news reporting from Mie, Japan, by NewsRx journalists, research stated, "The development of clinical agents remains a costly and time-consuming process. Although identification of new uses of existing drugs has been recognized as a more efficient approach for drug discovery than development of novel drugs, little screening of drugs that might be used for a rare malignant tumor such as osteosarcoma (OS) has been performed."

The news correspondents obtained a quote from the research from Mie University, "In this study, we attempted to identify new molecular targeted agents for OS by employing Screening Committee of Anticancer Drugs (SCADS) kits. To screen compounds for OS treatment, their effect on cell viability of the OS cell lines 143B, MG63, HOS, SAOS-2, and HUO9 were evaluated. Candidate drugs were narrowed down based on a global anti-proliferative effect against these five OS cell lines. After excluding cytotoxic compounds and compounds unsuitable for in vivo administration, cucurbitacin I was extracted. Cucurbitacin I has been found to have cytotoxic and anti-proliferative properties against several tumors through inhibition of signal transducer and activator of transcription 3 (STAT3) activation. Cucurbitacin I dose- and time-dependently inhibited the proliferation of all five OS cell lines. Following cucurbitacin I treatment, STAT3 was inactivated and analysis of Mc1-1, cleaved
PARP and caspase-3 indicated apoptosis induction. Expression of cell cycle regulator proteins, such as phospho-cyclin D1, c-Myc and survivin, were suppressed. Finally, cucurbitacin I potently inhibited the tumor growth of human OS 143B cells in nude mice."

According to the news reporters, the research concluded: "Our in vitro and in vivo results suggest that STAT3 inhibition by cucurbitacin I will be an effective and new approach for the treatment of OS."

Our news journalists report that additional information may be obtained by contacting K. Asanuma, Mie Univ, Dept. of Orthoped Surg, Sch Med, Tsu, Mie 5148507, Japan. Additional authors for this research include K. Asanuma, A. Matsumine, T. Matsubara, T. Nakamura, T. Iino, Y. Asanuma, M. Goto, K. Okuno, T. Kakimoto, Y. Yada and A. Sudo.

**Immune System Diseases and Conditions - HIV/AIDS**

**Recent Research from National Center for Global Health and Medicine Highlight Findings in HIV/AIDS (Prognosis of ocular syphilis in patients infected with HIV in the antiretroviral therapy era)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "To describe the clinical course and prognosis of ocular syphilis in patients infected with HIV-1 in the antiretroviral therapy (ART) era. We conducted a single-centre retrospective chart review of ocular syphilis in patients infected with HIV-1 diagnosed between August 1997 and July 2015."

The news reporters obtained a quote from the research from National Center for Global Health and Medicine, "The prognosis of best-corrected visual acuity (BCVA) was analysed. The study subjects were 30 eyes of 20 men who had sex with men (MSM) (median age, 41). Loss of vision and posterior uveitis were the most common ocular clinical features (43%) and location of inflammation at presentation (50%), respectively. The median baseline BCVA was 0.4 (IQR 0.2-1.2), including three eyes with hand motion. BCVA <= 0.4 at diagnosis was significantly associated with posterior uveitis or panuveitis (p=0.044). Seventy-five per cent were treated with intravenous benzylpenicillin and 53% were diagnosed with neurosyphilis. After treatment (median follow-up: 21 months), BCVA improved in 89% of the eyes, including all eyes with hand motion, to a median BCVA of 1.2 (IQR 0.8-1.2). Kaplan-Meier analysis showed that >28 days of ocular symptoms before diagnosis was the only factor associated with poor prognosis of BCVA. Three patients (15%) developed recurrence after treatment. The prognosis of BCVA in HIV-infected patients with ocular syphilis in the ART era was favourable after proper treatment. Having >28 days of ocular symptoms before diagnosis
was associated with poor prognosis."

According to the news reporters, the research concluded: "Changes in visual acuity in HIV-infected MSM should prompt an immediate assessment for ocular syphilis as delays in diagnosis and therapy can lead to irreversible visual loss."

For more information on this research see: Prognosis of ocular syphilis in patients infected with HIV in the antiretroviral therapy era. *Sexually Transmitted Infections*, 2016;92 (8):605-610. *Sexually Transmitted Infections* can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. **Peripheral Artery Disease**

**Recent Research from Queen Margaret Hospital Highlight Findings in Peripheral Artery Disease (Ankle brachial index for the diagnosis of lower limb peripheral arterial disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Peripheral Artery Disease have been presented. According to news reporting out of Fife, United Kingdom, by NewsRx editors, research stated, "Peripheral arterial disease (PAD) of the lower limb is common, with prevalence of both symptomatic and asymptomatic disease estimated at 13% in the over 50 age group. Symptomatic PAD affects about 5% of individuals in Western populations between the ages of 55 and 74 years."

Our news journalists obtained a quote from the research from Queen Margaret Hospital, "The most common initial symptom of PAD is muscle pain on exercise that is relieved by rest and is attributed to reduced lower limb blood flow due to atherosclerotic disease (intermittent claudication). The ankle brachial index (ABI) is widely used by a variety of healthcare professionals, including specialist nurses, physicians, surgeons and podiatrists working in primary and secondary care settings, to assess signs and symptoms of PAD. As the ABI test is non-invasive and inexpensive and is in widespread clinical use, a systematic review of its diagnostic accuracy in people presenting with leg pain suggestive of PAD is highly
relevant to routine clinical practice. To estimate the diagnostic accuracy of the ankle brachial index (ABI) - also known as the ankle brachial pressure index (ABPI) - for the diagnosis of peripheral arterial disease in people who experience leg pain on walking that is alleviated by rest.

Search methods We carried out searches of the following databases in August 2013: MEDLINE (Ovid SP), Embase (Ovid SP), the Cumulative Index to Nursing and Allied Health Literature (CINAHL) (EBSCO), Latin American and Caribbean Health Sciences (LILACS) (Bireme), Database of Abstracts of Reviews of Effects and the Health Technology Assessment Database in The Cochrane Library, the Institute for Scientific Information (ISI) Conference Proceedings Citation Index -Science, the British Library Zetoc Conference search and Medion.

Selection criteria We included cross-sectional studies of ABI in which duplex ultrasonography or angiography was used as the reference standard. We also included cross-sectional or diagnostic test accuracy (DTA) cohort studies consisting of both prospective and retrospective studies. Participants were adults presenting with leg pain on walking that was relieved by rest, who were tested in primary care settings or secondary care settings (hospital outpatients only) and who did not have signs or symptoms of critical limb ischaemia (rest pain, ischaemic ulcers or gangrene). The index test was ABI, also called the ankle brachial pressure index (ABPI) or the Ankle Arm Index (AAI), which was performed with a hand-held doppler or oscillometry device to detect ankle vessels. We included data collected via sphygmomanometers (both manual and aneroid) and digital equipment. Data collection and analysis Two review authors independently replicated data extraction by using a standard form, which included an assessment of study quality, and resolved disagreements by discussion. Two review authors extracted participant-level data when available to populate 2x2 contingency tables (true positives, true negatives, false positives and false negatives). After a pilot phase involving two review authors working independently, we used the methodological quality assessment tool the Quality Assessment of Diagnostic Accuracy Studies-2 (QUADAS-2), which incorporated our review question - along with a flow diagram to aid reviewers' understanding of the conduct of the study when necessary and an assessment of risk of bias and applicability judgements. We screened 17,055 records identified through searches of databases. We obtained 746 full-text articles and assessed them for relevance. We scrutinised 49 studies to establish their eligibility for inclusion in the review and excluded 48, primarily because participants were not patients presenting solely with exertional leg pain, investigators used no reference standard or investigators used neither angiography nor duplex ultrasonography as the reference standard. We excluded most studies for more than one reason. Only one study met the eligibility criteria and provided limb-level accuracy data from just 85 participants (158 legs). This prospective study compared the manual doppler method of obtaining an ABI (performed by untrained personnel) with the automated oscillometric method. Limb-level data, as reported by the study, indicated that the accuracy of the ABI in detecting significant arterial disease on angiography is superior when stenosis is present in the femoropopliteal vessels, with sensitivity of 97% (95% confidence interval (CI) 93% to 99%) and specificity of 89% (95% CI 67% to 95%) for oscillometric ABI, and sensitivity of 95% (95% CI 89% to 97%) and specificity of 56% (95% CI 33% to 70%) for doppler ABI. The ABI threshold was not reported. Investigators attributed the lower specificity for doppler to the fact that a tibial or dorsalis pedis pulse could not be detected by doppler in 12 of 27 legs with normal vessels or non-significant lesions. The superiority of the oscillometric (automated) method for obtaining an ABI reading over the manual method with a doppler probe used by inexperienced operators may be a clinically important finding. Authors' conclusions Evidence about the accuracy of the ankle brachial index for the diagnosis of PAD in people with leg pain on exercise that is alleviated by rest is sparse. The single study included in our review provided only limb-level data from a few participants. Well-designed cross-sectional studies are required to evaluate the accuracy of ABI in patients presenting with early symptoms of
peripheral arterial disease in all healthcare settings."

According to the news editors, the research concluded: "Another systematic review of existing studies assessing the use of ABI in alternative patient groups, including asymptomatic, high-risk patients, is required."

For more information on this research see: Ankle brachial index for the diagnosis of lower limb peripheral arterial disease. *Cochrane Database of Systematic Reviews*, 2016; (9):967-1002. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Nutritional and Metabolic Diseases and Conditions – …

**Recent Research from Research Institute Highlight Findings in Type 1 Diabetes Mellitus (The role of FOXP3 in autoimmunity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus. According to news reporting originating from Vancouver, Canada, by NewsRx correspondents, research stated, "FOXP3 controls the development and function of T regulatory cells (Tregs). Autoimmunity is linked to changes in FOXP3 activity that can occur at multiple levels and lead to Treg dysfunction."

Financial supporters for this research include Canadian Institutes for Health Research, The Canucks for Kids Foundation, JDRF.

Our news editors obtained a quote from the research from Research Institute, "For example, changes in IL-2 signaling, FOXP3 transcription and/or post-translational modifications can all contribute to loss of self-tolerance. As additional pathways of FOXP3 regulation are elucidated, new therapeutic approaches to increase Treg activity either by cell therapy or pharmacological intervention are being tested."

According to the news editors, the research concluded: "Early success from pioneering studies of Treg-based therapy in transplantation has promoted the undertaking of similar studies in autoimmunity, with emerging evidence for the effectiveness of these approaches, particularly in the context of type 1 diabetes."

For more information on this research see: The role of FOXP3 in autoimmunity. *Current Opinion in Immunology*, 2016;43():16-23. *Current Opinion in Immunology* can be contacted at: Current Biology Ltd, 84 Theobalds Rd, London WC1X 8RR, England. (Elsevier - www.elsevier.com; Current Opinion in Immunology - www.journals.elsevier.com/current-opinion-in-immunology/)

The news editors report that additional information may be obtained by contacting M.K. Levings, BC Childrens Hosp, Res Inst, Vancouver, BC, Canada. Additional authors for this research include L. Cook and M.K. Levings.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.coi.2016.07.004. This DOI is a link to an online electronic document that is either free or for purchase.

Vinyl Compounds
Recent Research from Southeast University Highlight Findings in Vinyl Compounds (Use of polyvinylpyrrolidone-iodine solution for sterilisation and preservation improves mechanical properties and osteogenesis of allografts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Vinyl Compounds are discussed in a new report. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Allografts eliminate the disadvantages associated with autografts and synthetic scaffolds but are associated with a disease-transmission risk. Therefore, allograft sterilisation is crucial."

Our news journalists obtained a quote from the research from Southeast University, "We aimed to determine whether polyvinylpyrrolidone-iodine (PVP-I) can be used for sterilisation and as a new wet-preservation method. PVP-I-sterilised and preserved allografts demonstrated improved mechanical property, osteogenesis, and excellent microbial inhibition. A thigh muscle pouch model of nude mice showed that PVP-I-preserved allografts demonstrated better ectopic formation than Co-60-sterilised allografts (control) in vivo (P < 0.05). Furthermore, the PVP-I-preserved group showed no difference between 24 h and 12 weeks of allograft preservation (P > 0.05). PVP-I-sterilised allografts showed more hydrophilic surfaces and PVP-I-sterilised tendons showed higher mechanical strength than Co-60-sterilised tendons (P < 0.05). The level of residual PVP-I was higher without washing and with prolonged preservation (P < 0.05). In vitro cellular tests showed that appropriate PVP-I concentration was nontoxic to preosteoblast cells, and cellular differentiation measured by alkaline phosphatase activity and osteogenic gene markers was enhanced (P < 0.05)."

According to the news editors, the research concluded: "Therefore, the improved biological performance of implanted allografts may be attributable to better surface properties and residual PVP-I, and PVP-I immersion can be a simple, easy method for allograft sterilisation and preservation."

For more information on this research see: Use of polyvinylpyrrolidone-iodine solution for sterilisation and preservation improves mechanical properties and osteogenesis of allografts. Scientific Reports, 2016;6():1-13. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from Y.

**Oncology - Carcinoma Ex Pleomorphic Adenoma**

**Recent Research from State University Highlight Findings in Carcinoma Ex Pleomorphic Adenoma (Carcinoma ex-pleomorphic adenoma derived from recurrent pleomorphic adenoma shows important difference by array CGH compared to recurrent pleomorphic ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Carcinoma Ex Pleomorphic Adenoma are presented in a new report. According to news reporting originating from Campinas, Brazil, by NewsRx correspondents, research stated, "A key step of cancer development is the progressive accumulation of genomic changes resulting in disruption of several biological mechanisms. Carcinoma ex-pleomorphic adenoma (CXPA) is an aggressive neoplasm that arises from a pleomorphic adenoma."

Our news editors obtained a quote from the research from State University, "CXPA derived from a recurrent PA (RPA) has been rarely reported, and the genomic changes associated with these tumors have not yet been studied. We analyzed CXPA from RPAs and RPAs without malignant transformation using array comparative genomic hybridization (array-CGH) to identify somatic copy number alterations and affected genes. DNA samples extracted from FFPE tumors were submitted to array-CGH investigation, and data was analyzed by Nexus Copy Number Discovery Edition v.7. No somatic copy number alterations were found in RPAs without malignant transformation. As for CXPA from RPA, although genomic profiles were unique for each case, we detected some chromosomal regions that appear to be preferentially affected by copy number alterations. The first case of CXPA-RPA (frankly invasive myoepithelial carcinoma) showed copy number alterations affecting 1p36.33p13, 5p and chromosomes 3 and 8. The second case of CXPA-RPA (frankly invasive epithelial-myop epithelial carcinoma) showed several alterations at chromosomes 3, 8, and 16, with two amplifications at 8p12p11.21 and 12q14.3q21.2. The third case of CXPA-RPA (minimally invasive epithelial-myop epithelial carcinoma) exhibited amplifications at 12q13.3q14.1, 12q14.3, and 12q15."

According to the news editors, the research concluded: "The occurrence of gains at chromosomes 3 and 8 and genomic amplifications at 8p and 12q, mainly those encompassing the HMGA2, MDM2, WIF1, WHSC1L1, LIRG3, CDK4 in CXAP from RPA can be a significant promotional factor in malignant transformation."

For more information on this research see: Carcinoma ex-pleomorphic adenoma derived from recurrent pleomorphic adenoma shows important difference by array CGH compared to recurrent pleomorphic adenoma without malignant transformation. *Brazilian*
Recent Research from Tabriz University of Medical Sciences Highlight Findings in Acute Chest Syndrome (Blood transfusions for treating acute chest syndrome in people with sickle cell disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Acute Chest Syndrome is now available. According to news originating from Tabriz, Iran, by NewsRx correspondents, research stated, "Sickle cell disease is an inherited autosomal recessive blood condition and is one of the most prevalent genetic blood diseases worldwide. Acute chest syndrome is a frequent complication of sickle cell disease, as well as a major cause of morbidity and the greatest single cause of mortality in children with sickle cell disease."

Our news journalists obtained a quote from the research from the Tabriz University of Medical Sciences, "Standard treatment may include intravenous hydration, oxygen as treatment for hypoxia, antibiotics to treat the infectious cause and blood transfusions may be given. This is an update of a Cochrane review first published in 2010. To assess the effectiveness of blood transfusions, simple and exchange, for treating acute chest syndrome by comparing improvement in symptoms and clinical outcomes against standard care. Search methods We searched The Cochrane Cystic Fibrosis and Genetic Disorders Group’s Haemoglobinopathies Trials Register, which comprises references identified from comprehensive electronic database searches and handsearching of relevant journals and abstract books of conference proceedings. Date of the most recent search: 25 April 2016. Selection criteria Randomised controlled trials and quasi-randomised controlled trials comparing either simple or exchange transfusion versus standard care (no transfusion) in people with sickle cell disease suffering from acute chest syndrome. Data collection and analysis Both authors independently selected trials and assessed the risk of bias, no data could be extracted. One trial was eligible for inclusion in the review. While in the multicentre trial 237 people were enrolled (169 SCC, 42 SC, 15 S beta degrees - thalassemia, 11S beta(+)thalassemia); the majority were recruited to an observational arm and only ten participants met the inclusion criteria for randomisation. Of these, four were randomised to the transfusion arm and received a single transfusion of 7 to 13 ml/kg packed red blood cells, and six were randomised to standard care.
None of the four participants who received packed red blood cells developed acute chest syndrome, while 33% (two participants) developed acute chest syndrome in standard care arm. No data for any pre-defined outcomes were available. Authors' conclusions We found only one very small randomised controlled trial; this is not enough to make any reliable conclusion to support the use of blood transfusion. Whilst there appears to be some indication that chronic blood transfusion may play a roll in reducing the incidence of acute chest syndrome in people with sickle cell disease and albeit offering transfusions may be a widely accepted clinical practice, there is currently no reliable evidence to support or refute the perceived benefits of these as treatment options; very limited information about any of the potential harms associated with these interventions or indeed guidance that can be used to aid clinical decision making. Clinicians should therefore base any treatment decisions on a combination of; their clinical experience, individual circumstances and the unique characteristics and preferences of adequately informed people with sickle cell disease who are suffering with acute chest syndrome."

According to the news editors, the research concluded: "This review highlights the need of further high quality research to provide reliable evidence for the effectiveness of these interventions for the relief of the symptoms of acute chest syndrome in people with sickle cell disease."

For more information on this research see: Blood transfusions for treating acute chest syndrome in people with sickle cell disease. *Cochrane Database of Systematic Reviews*, 2016;(8):2414-2431. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news correspondents report that additional information may be obtained from S. Dastgiri, Tabriz Univ Med Sci, Tabriz Hlth Serv Management Res Center, Tabriz 5166615739, Iran.

**Genetics**

**Recent Research from Technical University Highlight Findings in Genetics (Design of a molecular support for cryo-EM structure determination)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Genetics is the subject of a report. According to news reporting from Garching, Germany, by NewsRx journalists, research stated, "Despite the recent rapid progress in cryo-electron microscopy (cryo-EM), there still exist ample opportunities for improvement in sample preparation. Macromolecular complexes may disassociate or adopt nonrandom orientations against the extended air-water interface that exists for a short time
before the sample is frozen."

Funders for this research include EMBO, Deutsche Forschungsgemeinschaft (DFG), EC | European Research Council (ERC), Medical Research Council (MRC).

The news correspondents obtained a quote from the research from Technical University, "We designed a hollow support structure using 3D DNA origami to protect complexes from the detrimental effects of cryo-EM sample preparation. For a first proof-of-principle, we concentrated on the transcription factor p53, which binds to specific DNA sequences on double-stranded DNA. The support structures spontaneously form monolayers of preoriented particles in a thin film of water, and offer advantages in particle picking and sorting. By controlling the position of the binding sequence on a single helix that spans the hollow support structure, we also sought to control the orientation of individual p53 complexes. Although the latter did not yet yield the desired results, the support structures did provide partial information about the relative orientations of individual p53 complexes. We used this information to calculate a tomographic 3D reconstruction, and refined this structure to a final resolution of similar to 15 angstrom."

According to the news reporters, the research concluded: "This structure settles an ongoing debate about the symmetry of the p53 tetramer bound to DNA."

Our news journalists report that additional information may be obtained by contacting H. Dietz, Technical University of Munich, Walter Schottky Inst, Dept. of Phys, D-85748 Garching, Germany. Additional authors for this research include T.A.M. Bharat, A.C. Joerger, X.C. Bai, F. Praetorius, A.R. Fersht, H. Dietz and S.H.W. Scheres.

Bone Research

Recent Research from Tokyo Medical and Dental University Highlight Findings in Bone Research (Supramolecular inclusion complexation of simvastatin with methylated beta-cyclodextrins for promoting osteogenic differentiation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Bone Research are discussed in a new report. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Statins are recognized as a potential candidate to induce the regeneration of bone. However,
Statins are a strongly hydrophobic drug and it is difficult to administer at the local sites."

The news correspondents obtained a quote from the research from Tokyo Medical and Dental University, "In this study, the inclusion complexes of simvastatin (SV) with hydroxypropyl-beta-cyclodextrin (HP-beta-CD) and randomly methylated beta-cyclodextrin (RM-beta-CD) were prepared to improve the water-solubility and the osteogenic differentiation ability of the inclusion complexes in MC3T3-E1 cells was investigated. The water-solubility of SV increased linearly upon the addition of both HP-beta-CD and RM-beta-CD, due to the formation of inclusion complexes. The osteogenic differentiation ability of the inclusion complexes were evaluated by the production of alkaline phosphatase (ALP) and late stage osteogenetic gene expression in MC3T3-E1 cells after 14 days of culture. As a result, the RM-beta-CD/SV inclusion complexes showed significantly higher ALP production and the expression of bone sialoprotein (BSP) and osteocalcin (OCN) than the untreated and free SV-treated cells. Additionally, the production of bone morphogenetic protein-2 (BMP-2) from MC3T3-E1 cells after the treatment with RM-beta-CD/SV inclusion complexes was significantly higher than the untreated and free SV-treated cells."

According to the news reporters, the research concluded: "Accordingly, it is concluded that the inclusion complexation of SV with RM-beta-CD is a potential formulation for bone regenerative therapy to improve water-solubility and osteodifferentiation efficiency."

Our news journalists report that additional information may be obtained by contacting A. Tamura, Tokyo Medical & Dental University, Inst Biomat & Bioengn, Dept. of Organ Biomat, Chiyoda Ku, Tokyo 1010062, Japan. Additional authors for this research include T. Inada, A. Tonegawa, A. Tamura, S. Yamaguchi, K. Harada and N. Yui.

Oncology - Colon Cancer

Recent Research from Tokyo University of Agriculture and Technology Highlight Findings in Colon Cancer (Transcriptome and long noncoding RNA sequencing of three extracellular vesicle subtypes released from the human colon cancer LIM1863 cell ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Previously we reported that LIM1863 colorectal cancer (CRC) cells secrete three distinct extracellular vesicle
subtypes - two subpopulations of exosomes (apical EpCAM-Exos and basolateral A33-Exos) and shed microvesicles (sMVs) - with distinct protein and miRNA signatures. Here, we extend our omics approach to understand the fundamental role of LIM1863-derived EVs by performing a comprehensive analysis of their mRNAs and long non-coding RNAs (lncRNAs) using RNA-Seq."

Our news journalists obtained a quote from the research from the Tokyo University of Agriculture and Technology, "We show that 2,389 mRNAs, 317 pseudogene transcripts, 1,028 lncRNAs and 206 short non-coding RNAs selectively distributed to (i.e., are enriched in) LIM1863 EVs, relative to the parent cell. An Ensembl/UniProtKB analysis revealed 1,937 mRNAs encode canonical proteins, 348 isoforms (including splice-variant proteins), and 119 'missing proteins' (i.e., annotated in Ensembl but not UniProtKB). Further dissection of our protein/RNA data revealed that 6/151 observed RNA binding proteins have the potential to interact with similar to 75% of EV-enriched RNAs. Intriguingly, the co-existence of U1 and U2 ribonucleoproteins and their cognate snRNAs in LIM1863 EVs suggests a possible association of CRC EVs with recipient cell splicing events."

According to the news editors, the research concluded: "Our data reveal several potential lncRNA CRC biomarkers and novel splicing/fusion genes that, collectively, will advance our understanding of EV biology in CRC and accelerate the development of EV-based diagnostics and therapeutics."

For more information on this research see: Transcriptome and long noncoding RNA sequencing of three extracellular vesicle subtypes released from the human colon cancer LIM1863 cell line. Scientific Reports, 2016;6():1-14. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting R.J. Simpson, Tokyo University of Agriculture & Technology, Global Innovat Res Organization, Tokyo, Japan. Recent Research from Umea University Highlight Findings in Head and Neck Cancer (Motives that head and neck cancer patients have for contacting a specialist nurse - an empirical study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Head and Neck Cancer have been presented. According to news reporting out of Umea, Sweden, by NewsRx editors, research stated, "Aims and objectives. The purpose of this study is to systematically explore the motives for patients with head and neck cancer to contact a specialist nurse during two years postdiagnosis."

Funders for this research include Cancerfonden, Swedish Laryng Foundation, Cancer Research Foundation in Northern Sweden.

Our news journalists obtained a quote from the research from Umea University,
"Research focusing on the role of specialist nurses in cancer care almost exclusively concern cancers other than head and neck cancer. Qualitative, descriptive study based on the contacts between patients with head and neck cancer and a specialist nurse. Patients were invited to contact a specialist nurse by telephone. The specialist nurse took systematic field notes, that is, she registered who contacted her, the nature of the call and the outcome. Sixty patients were included. In descending order, the motives for contact were questions about practical and uncomplicated matters, consultations about medical troubles/worries, presenting a report of the patient's situation, requests for additional information about the treatment plan and requests for medical information. The pattern of the patients' motivations for calling was not related to medical or social factors, suggesting that the initiative to make contact is very much a question of the complexity of individual life circumstances. Very few referrals were sent from the specialist nurse to other professionals. The specialist nurse turned out to be more than just a coordinator of health-care resources. The findings bring up questions about the potential of the nurse's function as a coordinator, but also as a potential attachment figure, and questions about the nurse's relationships to other professionals. Relevance to clinical practice. When implementing a specialist nurse function, it is important to decide whether the function should be inspired by a broader relational perspective."

According to the news editors, the research concluded: "In addition to the indispensible competence and experience in the clinical field of head and neck cancer, training in counselling and acquaintance with object-relational psychology will then be desirable."

Our news journalists report that additional information may be obtained by contacting P. Salander, Umea University, Dept. of Social Work, S-90187 Umea, Sweden. Additional authors for this research include J. Isaksson, B. Granstrom and G. Laurell.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jocn.13283. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Umea, Sweden, Europe, Head and Neck Neoplasms, Head and Neck Cancer, Oncology, Umea University.

**Platinum Compounds**

**Recent Research from University of Algarve Highlight Findings in Platinum Compounds (Ecotoxicological assessment of the anticancer drug cisplatin in the polychaete Nereis diversicolor)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Platinum Compounds is the subject of a report.

According to news reporting from Faro, Portugal, by NewsRx journalists, research stated, "Anticancer drugs are designed to inhibit tumor cell proliferation by interacting with DNA and altering cellular growth factors. When released into the waterbodies of municipal and hospital
effluents these pharmaceutical compounds may pose a risk to non-target aquatic organisms, due to their mode of action (cytotoxic, genotoxic, mutagenic and teratogenic)."

Financial support for this research came from National Council for Scientific and Technological Development.

The news correspondents obtained a quote from the research from the University of Algarve, "The present study aimed to assess the ecotoxicological potential of the alkylating agent cisplatin (CisPt) to the polychaete Nereis diversicolor, at a range of relevant environmental concentrations (i.e. 0.1, 10 and 100 ng Pt L-1). Behavioural impairment (burrowing kinetic impairment), ion pump effects (SR Ca2+-ATPase), neurotoxicity (AChE activity), oxidative stress (SOD, CAT and GPXs activities), metal exposure (metallothionein-like proteins - MTLP), biotransformation (GST), oxidative damage (LPO) and genotoxicity (DNA damage), were selected as endpoints to evaluate the sublethal responses of the ragworms after 14-days of exposure in a water-sediment system. Significant burrowing impairment occurred in worms exposed to the highest CisPt concentration (100 ng Pt L-1) along with neurotoxic effects. The activity of antioxidant enzymes (SOD, CAT) and second phase biotransformation enzyme(GST) was inhibited but such effects were compensated by MTLP induction. Furthermore, LPO levels also increased."

According to the news reporters, the research concluded: "Results showed that the mode of action of cisplatin may pose a risk to this aquatic species even at the range of ng L-1."

Our news journalists report that additional information may be obtained by contacting M.J. Bebianno, University of Algarve, Center Marine & Environm Res, CIMA, P-8005135 Faro, Portugal. Additional authors for this research include M.B. Morais, T. Rocha, D.M.S. Abessa, M. Aureliano and M.J. Bebianno.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.scitotenv.2016.09.185. This DOI is a link to an online electronic document that is either free or for purchase.

Hodgkin Lymphoma. According to news reporting originating in Los Angeles, California, by NewsRx journalists, research stated, "MicroRNAs, small non-coding RNAs involved in gene regulation, are implicated in lymphomagenesis. We evaluated whether genetic variations in microRNA coding regions, binding sites, or biogenesis genes (collectively referred to as miRNA-SNPs) were associated with risk of AIDS-associated non-Hodgkin lymphoma (AIDS-NHL), and serum levels of four lymphoma-related microRNAs."

Funders for this research include National Institutes of Health, UCLA AIDS Institute.

The news reporters obtained a quote from the research from the University of California, "Twenty-five miRNA-SNPs were genotyped in 180 AIDS-NHL cases and 529 HIV-infected matched controls from the Multicenter AIDS Cohort Study (MACS), and real-time polymerase chain reaction was used to quantify serum microRNA levels. Adjusted odds ratios (ORs) estimated using conditional logistic regression evaluated associations between miRNA-SNPs and AIDS-NHL risk. A semi-Bayes shrinkage approach was employed to reduce likelihood of false-positive associations. Adjusted mean ratios (MR) calculated using linear regression assessed associations between miRNA-SNPs and serum microRNA levels. DDX20 rs197412, a non-synonymous miRNA biogenesis gene SNP, was associated with AIDS-NHL risk (OR = 1.34 per minor allele; 95% CI: 1.02-1.75), and higher miRNA-222 serum levels nearing statistical significance (MR = 1.21 per minor allele; 95% CI: 0.98-1.49). MiRNA-196a2 rs11614913 was associated with decreased central nervous system (CNS) AIDS-NHL (CT vs. CC OR = 0.52; 95% CI: 0.27-0.99). The minor allele of HIF1A rs2057482, which creates a miRNA-196a2 binding site, was associated with systemic AIDS-NHL risk (OR = 1.73 per minor allele; 95% CI: 1.12-2.67), and decreased CNS AIDS-NHL risk (OR = 0.49 per minor allele; 95% CI: 0.25-0.94). This study suggests that a few miRNA-SNPs are associated with AIDS-NHL risk and may modulate miRNA expression."

According to the news reporters, the research concluded: "These results support a role for miRNA in AIDS-NHL and may highlight pathways to be targeted for risk stratification or therapeutics."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.canep.2016.09.007. This DOI is a link to an online electronic document that is either free or for purchase.

Nanotechnology - Nanoparticles

Recent Research from University of Coimbra Highlight Findings in Nanoparticles (Can lipid nanoparticles improve intestinal absorption?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nanotechnology - Nanoparticles have been presented. According to news reporting originating in Coimbra, Portugal, by NewsRx journalists, research stated, "Lipid nanoparticles and their multiple designs have been considered appealing nanocarrier systems. Bringing the benefits of these nanosystems together with conventional coating technology clearly results in product differentiation."

Financial support for this research came from Fundacao para a Ciencia e a Tecnologia.

The news reporters obtained a quote from the research from the University of Coimbra, "This work aimed at developing an innovative solid dosage form for oral administration based on tableting nanostructured lipid carriers (NLC), coated with conventional polymer agents. NLC dispersions co-encapsulating olanzapine and simvastatin (Combo-NLC) were produced by high pressure homogenization, and evaluated in terms of scalability, drying procedure, tableting and performance from in vitro release, cytotoxicity and intestinal permeability stand points. Factorial design indicated that the scaling-up of the NLC production is clearly feasible. Spray-drying was the method selected to obtain dry particles, not only because it consists of a single step procedure, but also because it facilitates the coating process of NLC with different polymers. Modified NLC formulations with the polymers allowed obtaining distinct release mechanisms, comprising immediate, delayed and prolonged release. Sureteric: Combo-NLC provided a low cytotoxicity profile, along with a ca. 12-fold OL/3-fold SV higher intestinal permeability, compared to those obtained with commercial tablets."

According to the news reporters, the research concluded: "Such findings can be ascribed to drug protection and control over release promoted by NLC, supporting them as a versatile platform able to be modified according to the intended needs."

Our news correspondents report that additional information may be obtained by contacting C. Vitorino, University of Coimbra, Fac Pharm, Polo Ciencias Saude, P-3000548 Coimbra, Portugal. Additional authors for this research include H.T. Soares, L.G. Arnaut, J.J. Sousa, A. Pais and C. Vitorino.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.09.065. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Research from University of Heidelberg Highlight Findings in Information and Data Modeling (Comparative evaluation of methods approximating drug prescription durations in claims data: modeling, simulation, and application to real data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Information Technology - Information and Data Modeling. According to news reporting originating in Heidelberg, Germany, by NewsRx journalists, research stated, "The purpose of this study was to compare the predictive accuracy of different methods suggested for approximation of drug prescription durations in claims data. We expanded a well-established modeling and simulation framework to compare approximated drug prescription durations with 'true' (i.e., simulated) durations."

The news reporters obtained a quote from the research from the University of Heidelberg, "Real claims data of persons aged >= 65 years insured by the German nationwide 'Statutory Health Insurance Fund' AOK between 2010 and 2012 provided empiric input parameters that were completed with missing information on actual dosing patterns from an observational cohort. The distinct approximation methods were based on crude measures (one tablet a day), population-averaged measures (defined daily doses), or individually-derived measures (longitudinal coverage approximation of the applied dose, COV). As a proof-of-principle, we assessed the methods' performance to predict the well-characterized bleeding risks of anticoagulant, antiplatelet, and/or non-steroidal anti-inflammatory drugs. When applied to modeling and simulation data sets, the closest, least biased, and thus most accurate approximation was observed using the COV approximation. In a real-data example, rather similar results to an external reference were obtained for all methods. However, some of the differences between methods were meaningful, and the most reasonable and consistent results were obtained with the COV approach. Based on theoretically most accurate approximations and practically reasonable estimates, the individual COV approach was preferable over the population-averaged defined daily dose technique, although the latter might be justified in certain situations."

According to the news reporters, the research concluded: "Advantages of the COV approach are expected to be even bigger for drug therapies with particularly large dosing heterogeneity."

For more information on this research see: Comparative evaluation of methods approximating drug prescription durations in claims data: modeling, simulation, and application to real data. *Pharmacoepidemiology and Drug Safety*, 2016;25(12):1434-1442.

Our news correspondents report that additional information may be obtained by contacting A.D. Meid, Heidelberg Univ, Dept. of Clin Pharmaco & Pharmacoepidemiol, D-69120 Heidelberg, Germany. Additional authors for this research include D. Heider, J.B. Adler, R. Quinzler, H. Brenner, C. Gunster, H.H. Konig and W.E. Haefeli.

Keywords for this news article include: Heidelberg, Germany, Europe, Drug Prescriptions, Drugs and Therapies, Epidemiology, Risk and Prevention, Information and Data Modeling, Information Technology, University of Heidelberg.
Recent Research from University of Malaysia Highlight Findings in Blood Coagulation Factors (Aptamer-based impedimetric determination of the human blood clotting factor IX in serum using an interdigitated electrode modified with a ZnO nanolayer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematology - Blood Coagulation Factors. According to news reporting out of Arau, Malaysia, by NewsRx editors, research stated, "This article describes a sensitive impedimetric method for the determination of human blood coagulation factor IX protein (FIX) which is present in extremely low concentration in serum. An interdigitated electrode (IDE) whose surface was layered with zinc oxide was modified with two kinds of probes."

Funders for this research include UM-HIR grant, UM-HIR.

Our news journalists obtained a quote from the research from the University of Malaysia, "One is an antibody, the other an aptamer against FIX. A comparative study between anti-FIX aptamer and anti-FIX antibody showed the aptamer to possess higher affinity for FIX. A sandwich aptamer assay was worked out by using the FIX-binding aptamer on the surface of the IDE. It has a detection limit as low as 10 pM which makes it 4 to 30-fold more sensitive than any other method reported for FIX. Moreover, to practice detection in clinical samples, FIX was detected from the human blood serum by spiking."

According to the news editors, the research concluded: "In our perception, the sensitivity of the ZnO-modified IDE presented here makes it a promising tool for sensing clinically relevant analytes that are present in very low (sub-pM) concentrations."

For more information on this research see: Aptamer-based impedimetric determination of the human blood clotting factor IX in serum using an interdigitated electrode modified with a ZnO nanolayer. Microchimica Acta, 2017;184(1):117-125. Microchimica Acta can be contacted at: Springer Wien, Sachsenplatz 4-6, PO Box 89, A-1201 Wien, Austria. (Springer - www.springer.com; Microchimica Acta - www.springerlink.com/content/0026-3672/)

Recent Research from University of Maryland Highlight Findings in Staph Infections [Staphylococcal chromosomal cassettes mec (SCCmec): A mobile genetic element in methicillin-resistant Staphylococcus aureus]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Staph Infections have been published. According to news reporting originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Considered to be a potential 'superbug', methicillin-resistant Staphylococcus aureus (MRSA) has been one of the major recent infectious pathogens and thus poses a challenge to hospital infection control. The mobile genetic element staphylococcal chromosomal cassette mec (SCCmec) carries both the mecA or mecC gene, encoding for a novel specific penicillin-binding protein (PBP2a), and site-specific recombinase genes ccrAB orfand ccrC."

Financial supporters for this research include National 973-Plan of China, National Natural Science Foundation of China, International Science & Technology Cooperation Program, National Outstanding Doctoral Dissertation Funding, Guangdong Outstanding Doctoral Dissertation Funding, State Key Laboratory of Food Science and Technology, Jiangnan University, Key Laboratory for Green Chemical Process of Ministry of Education in Wuhan Institute of Technology.

Our news editors obtained a quote from the research from the University of Maryland, "In MRSA, the acquisition of SCCmec leads to the resistance to the beta-lactam antibiotics. As SCCmec plays a core role in the antimicrobial resistance characteristics, molecular epidemiology and evolution of MRSA, a thorough summary and comprehensive understanding of the prevalence and structural characteristics of SCCmec may aid in global surveillance, implementation and investigation on MRSA isolates, as well as further development of preventive and therapeutic approaches."

According to the news editors, the research concluded: "Consequently, this review is aimed at describing the history, prevalence, types and subtypes, and current typing methods of SCCmec, with the focus on the typical structures of the SCCmec cassette."

The news editors report that additional information may be obtained by contacting Z.B. Xu, University of Maryland, Sch Dental, Dept. of Microbial Pathogenesis, Baltimore, MD 21201, United States. Additional authors for this research include D.Q. Chen, B.M. Peters, L. Li, B. Li, Z.B. Xu and M.E. Shirliff.

Recent Research from University of Nebraska Highlight Findings in Squamous Cell Carcinoma (Comparison of outcomes between rectal squamous cell carcinoma and adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Squamous Cell Carcinoma are discussed in a new report. According to news reporting originating in Omaha, Nebraska, by NewsRx journalists, research stated, "Large, population-based analyses of rectal squamous cell carcinoma (SCC) have not been previously conducted. We assessed patterns of care, prognostic factors, and outcomes of rectal SCC and adenocarcinoma (AC) in population-based cohorts."

The news reporters obtained a quote from the research from the University of Nebraska, "Surveillance, Epidemiology, and End Results (SEER) registry searches were performed (1998-2011), producing 42,308 nonmetastatic rectal cancer patients (999 SCC and 41,309 AC). tumor, and treatment characteristics were compared. Based on risk factors, SCC/AC groups were subdivided into low-, intermediate-, and high-risk groups. Overall survival (OS) was compared between histological and risk groups using Kaplan-Meier method and log-rank test. Multivariate logistic regression models evaluated prognostic factors for 5-year survival. Cox regression modeling was performed on propensity-matched data. Rectal SCC, more common in females and associated with larger tumors of higher grade, was more often treated with radiotherapy (RT) than surgery. Surgery was associated with higher OS in AC but not SCC, and RT had proportionally greater benefits in SCC. These effects of RT and surgery were retained when stratified into risk groups (particularly high/intermediate-risk). Favorable prognostic factors for survival included younger age, non-black race, SCC histology, size <= 3.9 cm, localized stage, lower grade, surgery, and RT. For SCC, race, tumor grade, and surgery were not prognostic factors for survival. Cox regression modeling of propensity-matched data showed that AC histology increased risk of death versus SCC."

According to the news reporters, the research concluded: "In the largest analysis of rectal SCC to date, and in the notable absence (and likelihood) of prospective data, nonsurgical and RT-based treatment is recommended."

Our news correspondents report that additional information may be obtained by contacting C. Lin, Univ Nebraska Med Center, Dept. of Radiat Oncol, Omaha, NE 68198, United States. Additional authors for this research include V. Verma, N.R. Bennion, A.R. Bhirud, J.L. Li, M.E. Charlton, C. Are and C. Lin.

Nutritional and Metabolic Diseases and Conditions –

Recent Research from University of Otago Highlight Findings in Type 2 Diabetes (The Type 2 Diabetic Heart: Its Role in Exercise Intolerance and the Challenge to Find Effective Exercise Interventions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are presented in a new report. According to news reporting originating in Dunedin, New Zealand, by NewsRx journalists, research stated, "The metabolic and microvascular benefits of regular exercise for people with diabetes are unequivocal."

The news reporters obtained a quote from the research from the University of Otago, "However, cardiovascular disease, which disproportionately affects people with diabetes, is not reduced by regular exercise, and heart disease remains the leading cause of death for people with type 2 diabetes. 'Subclinical' changes in the function of the diabetic left ventricle are common and reduce cardiac reserve and exercise capacity."

According to the news reporters, the research concluded: "This review describes the changes in resting and exercising left ventricular function, and the possible causes of these changes, and introduces the possibility that more vigorous exercise may be needed to improve left ventricular function and reduce rates of cardiovascular disease in people with type 2 diabetes."

For more information on this research see: The Type 2 Diabetic Heart: Its Role in Exercise Intolerance and the Challenge to Find Effective Exercise Interventions. Sports Medicine, 2016;46(11):1605-1617. Sports Medicine can be contacted at: Adis Int Ltd, 5 The Warehouse Way, Northcote 0627, Auckland, New Zealand. Recent Research from University of Pittsburgh Highlight Findings in Chronic Pancreatitis [A Carboxyl Ester Lipase (CEL) Mutant Causes Chronic Pancreatitis by Forming Intracellular Aggregates That Activate Apoptosis]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Digestive System Diseases and Conditions - Chronic Pancreatitis is the subject of a report. According to news reporting out of Pittsburgh, Pennsylvania, by NewsRx editors, research stated, "Patients with chronic pancreatitis (CP) frequently have genetic risk factors for disease. Many of the identified genes have been connected to trypsinogen activation or trypsin inactivation."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from the University of Pittsburgh, "The description of CP in patients with mutations in the variable number of tandem repeat (VNTR) domain of carboxyl ester lipase (CEL) presents an opportunity to study the pathogenesis of CP independently of trypsin pathways. We tested the hypothesis that a deletion and frameshift mutation (C563fsX673) in the CEL VNTR causes CP through proteotoxic gain-of-function activation of maladaptive cell signaling pathways including cell death pathways. HEK293 or AR42J cells were transfected with constructs expressing CEL with 14 repeats in the VNTR (CEL14R) or C563fsX673 CEL (CEL maturity onset diabetes of youth with a deletion mutation in the VNTR (MODY)). In both cell types, CEL MODY formed intracellular aggregates. Secretion of CEL MODY was decreased compared with that of CEL14R. Expression of CEL MODY increased endoplasmic reticulum stress, activated the unfolded protein response, and caused cell death by apoptosis."

According to the news editors, the research concluded: "Our results demonstrate that disorders of protein homeostasis can lead to CP and suggest that novel therapies to decrease the intracellular accumulation of misfolded protein may be successful in some patients with CP."

Our news journalists report that additional information may be obtained by contacting M.E. Lowe, University of Pittsburgh, Medical Center, Children's Hospital of Pittsburgh, Dept. of Pediat, Pittsburgh, PA 15224, United States. Additional authors for this research include G. Jones, W.A. Sevilla, D.B. Stolz, K.E. Magee, M. Haughney, A. Mukherjee, Y. Wang and M.E. Lowe.

**Oncology - Ovarian Cancer**

**Recent Research from University of Pittsburgh Highlight Findings in Ovarian Cancer (Symptom management in women with recurrent ovarian cancer: Do patients and clinicians agree on what symptoms are most important?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Ovarian Cancer are presented in a new report. According to news reporting originating in Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "We sought to compare symptoms identified as a priority by patients with recurrent ovarian cancer to symptoms most frequently documented by their clinicians, and examine the association between clinician documentation of symptoms and subsequent clinical intervention. Single-institution, retrospective chart review of patients enrolled in WRITE Symptoms Study (GOG 259), a randomized controlled trial of internet-based recurrent ovarian cancer symptom management."

The news reporters obtained a quote from the research from the University of Pittsburgh, "As part of the trial, women completed the Symptom Representation Questionnaire for 28 symptoms and selected 3 priority symptoms (PS). We compared patient-reported PS to clinician documentation of symptoms and interventions over the time period corresponding to study enrollment. At least one PS was documented in 92% of patients. Of 150 PS reported by patients, 53% were never documented by clinicians; these symptoms tended to be less directly related to disease or treatment status. Symptoms not identified by patients as PS were frequently documented by clinicians; these symptoms tended to relate to physiologic effects of disease and treatment toxicity. 58% of patients had at least one PS intervention. PS intervened for were documented at 2.58 visits vs 0.50 visits for PS not receiving intervention (p <= 0.0001). Discordance was identified between symptoms reported by patients as important and symptoms documented by clinicians. Symptoms more frequently documented were also more frequently intervened for."

According to the news reporters, the research concluded: "Our study illustrates the need to improve identification of symptoms important to patients, and suggests that improving communication between patients and clinicians could increase intervention rates to enhance quality of life in women with recurrent ovarian cancer."

For more information on this research see: Symptom management in women with recurrent ovarian cancer: Do patients and clinicians agree on what symptoms are most important? *Gynecologic Oncology*, 2016;143(2):367-370. *Gynecologic Oncology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Oncology - Liver Metastasis**

**Recent Research from University of Tokyo Highlight Findings in Liver Metastasis (The innate immune receptor Dectin-2 mediates the phagocytosis of cancer cells by Kupffer cells for the suppression of liver metastasis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Metastasis have been published. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, “Tumor metastasis is the cause of most cancer deaths. Although metastases can form in multiple end organs, the liver is recognized as a highly permissive organ.”

Funders for this research include MEXT, Japan Agency for Medical Research and Development (A-MED).

The news correspondents obtained a quote from the research from the University of Tokyo, "Nevertheless, there is evidence for immune cell-mediated mechanisms that function to suppress liver metastasis by certain tumors, although the underlying mechanisms for the suppression of metastasis remain elusive. Here, we show that Dectin-2, a C-type lectin receptor (CLR) family of innate receptors, is critical for the suppression of liver metastasis of cancer cells. We provide evidence that Dectin-2 functions in resident macrophages in the liver, known as Kupffer cells, to mediate the uptake and clearance of cancer cells. Interestingly, Kupffer cells are selectively endowed with Dectin-2-dependent phagocytic activity, with neither bone marrow-derived macrophages nor alveolar macrophages showing this potential. Concordantly, subcutaneous primary tumor growth and lung metastasis are not affected by the absence of Dectin-2. In addition, macrophage C-type lectin, a CLR known to be complex with Dectin-2, also contributes to the suppression of liver metastasis."

According to the news reporters, the research concluded: "Collectively, these results highlight the hitherto poorly understood mechanism of Kupffer cell-mediated control of metastasis that is mediated by the CLR innate receptor family, with implications for the development of anticancer therapy targeting CLRs."

For more information on this research see: The innate immune receptor Dectin-2 mediates the phagocytosis of cancer cells by Kupffer cells for the suppression of liver metastasis. *Proceedings of the National Academy of Sciences of the United States of America*, 2016;113(49):14097-14102. *Proceedings of the National Academy of Sciences of the United States of America* can be contacted at: Natl Acad Sciences, 2101 Constitution Ave NW, Washington, DC 20418, USA. Chemistry - Coordination Chemistry

Recent Research from University of Wroclaw Highlight Findings in Coordination Chemistry (Harnessing the power of fungal siderophores for the imaging and treatment of human diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Chemistry - Coordination Chemistry have been published. According to news reporting out of Wroclaw, Poland, by NewsRx editors, research stated, "Innovative strategies are needed to address the current lack of clinically available antifungal drugs and for diagnostic techniques. 'Repurposing' of antifungal drugs, similar to techniques currently being utilized with 'older' antibacterial drugs in order to combat widespread resistance in the face of a dearth of new drugs, could prove beneficial. Although as yet very limited for fungi, a siderophore-based 'Trojan Horse' strategy, in the form of siderophore-antibiotic conjugates, siderophore-fluorescent probe conjugates, or Ga(III)-siderophore complexes, reveals potential clinical relevance and provides a strategy for targeting fungal infections through drug delivery, imaging, and in diagnostics."

Funders for this research include Polish National Science Centre, Wroclaw Centre of Biotechnology.

Our news journalists obtained a quote from the research from the University of Wroclaw, "The application of siderophores against pathogenic fungi is evolving but is still far from its full potential, and further studies are needed to demonstrate their advantages and limitations. One of the biggest obstacles in developing fungus-specific diagnostics and side-effects-free therapeutics is that apart from the fungal cell wall, fungi are metabolically similar to mammalian cells; thus, pathogen-specific targets are extremely limited. One of the few fundamental differences between fungal and mammalian cells lies in the iron acquisition system. The most common mechanism is mediated by small organic chelators siderophores, often essential for fungal virulence and pathogenicity. Fungi synthesize mainly hydroxamate-type siderophores, which are excreted into the environment, and bind ferric ions with high affinity and selectivity. Delivery of iron-loaded siderophores back to the pathogen occurs via specific membrane receptors and transport proteins. Natural siderophores are generally not species-specific; they exhibit broad-spectrum activity and can be recognized by various types of
microorganisms. Moreover, they generally miss proper sites for incorporating additional functionalities; e.g. fluorescent probes, surface-adhesive moieties or drug molecules, to be used for imaging and/or as therapeutic conjugates smuggled into microbial species via siderophore recognition and a 'Trojan Horse' strategy. Biomimetic analogues can overcome both these limitations and offer novel tools for both diagnostics and therapeutics.

According to the news editors, the research concluded: "Siderophore mimics with a narrow spectrum of activity offer the possibility of developing selective diagnostic tools, while those with broad-spectrum activity may find therapeutic applications as antifungal drug delivery tools."

For more information on this research see: Harnessing the power of fungal siderophores for the imaging and treatment of human diseases. *Coordination Chemistry Reviews*, 2016;327():84-109. *Coordination Chemistry Reviews* can be contacted at: Elsevier Science Sa, PO Box 564, 1001 Lausanne, Switzerland. **Lung Diseases and Conditions - Cystic Fibrosis**

**Recent Research from University of the South, Toulon-Var Highlight Findings in Cystic Fibrosis (The 1-Minute Sit-to-Stand Test in Adults With Cystic Fibrosis: Correlations With Cardiopulmonary Exercise Test, 6-Minute Walk Test, and Quadriceps ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Cystic Fibrosis is now available. According to news reporting out of Toulon, France, by NewsRx editors, research stated, "Exercise testing is part of the regular assessment of patients with cystic fibrosis (CF). We aimed to evaluate (1) the convergent validity of the 1-min sit-to-stand (STS) test in CF by investigating its relationships with peak oxygen uptake (peak V-O2), quadriceps strength, and quality of life and (2) to compare these associations with those of the 6-min walk test (6MWT)."

Our news journalists obtained a quote from the research from the University of the South, Toulon-Var, "Twenty-five adults with CF (FEV1 = 59 +/- 24%) performed the STS test, the 6MWT, quadriceps strength assessment, and cardiopulmonary exercise test (CPET). Physical activity level, quality of life, and self-esteem were assessed by questionnaires. STS repetitions, 6-min walk distance, quadriceps strength, and peak V-o2 were, respectively, 71 12,0 10, 93 29, and 62 +/- 16% of predicted. The STS test had moderate associations with peak V-o2
(r = 0.56, P = 0.004), quadriceps strength (r = 0.52, P = 0.008), and some questionnaire items (e.g., perceived physical strength, r = 0.67, P < 0.001) only when repetitions were expressed as a product of body weight. Overall, these associations were weaker than those obtained from 6-min walk distance x weight. Oxygen desaturation during the STS test was strongly associated with oxygen desaturation during CPET (r = 0.80, P < 0.001). Peak heart rate was lower during the STS test as compared with CPET (P < 0.001) and the 6MWT (P = 0.009). The STS test cannot be used as a replacement for, CPET to accurately assess peak exercise capacity in CF. The STS test may have utility in detecting patients with CF who may exhibit a high level of oxygen desaturation during heavy exercise.

According to the news editors, the research concluded: "Further studies should identify the factors contributing to STS performance to confirm the potential interest of STS repetitions x body weight outcome as a useful submaximal exercise parameter in CF."

For more information on this research see: The 1-Minute Sit-to-Stand Test in Adults With Cystic Fibrosis: Correlations With Cardiopulmonary Exercise Test, 6-Minute Walk Test, and Quadriceps Strength. Respiratory Care, 2016;61(12):1620-1628. Respiratory Care can be contacted at: Daedalus Enterprises Inc, 9425 N MacArthur Blvd, Ste 100, Irving, TX 75063-4706, USA.

Sleep Diseases and Conditions - Sleep Disorders

Recent Research from VAMC Highlight Findings in Sleep Disorders (Obese Veterans Enrolled in a Veterans Affairs Medical Center Outpatient Weight Loss Clinic Are Likely to Experience Disordered Sleep and Posttraumatic Stress)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Sleep Diseases and Conditions - Sleep Disorders are discussed in a new report. According to news reporting originating from Richmond, Virginia, by NewsRx correspondents, research stated, "This cross-sectional study aimed to characterize sleep patterns, the quality and duration of sleep, and estimate the prevalence of common sleep disorders and posttraumatic stress disorder (PTSD) in a hospital-based Veterans Affairs MOVE! (Managing Overweight Veterans Everywhere) clinic. Participants completed five instruments: the Pittsburgh Sleep Quality Index (PSQI), Smith's Measure of Morningness/Eveningness,
Restless Legs Syndrome Rating Scale, the STOP Questionnaire, and the Posttraumatic Stress Disorder (PTSD) Checklist-Civilian Version (PCL-C)."

Our news editors obtained a quote from the research from VAMC, "Enrolled Veterans (n = 96) were mostly male (78%), African American (49%), mean age 58 (standard deviation [SD] 10.6) years, and mean body mass index (BMI) 38.4 kg/m(2) (SD 8.4). By PSQI, 89% rated sleep quality as 'poor' (mean = 11.1, SD = 5.1), consistent with severely impaired sleep. Most were at high risk for sleep disorders including restless leg syndrome (53%), obstructive sleep apnea (66%), and circadian sleep disorders (72%). Forty-seven percent endorsed clinically significant symptoms of PTSD. Hypotheses-generating regression models suggest sleep latency (minutes before falling asleep) was associated with BMI (p = 0.018).

Bedtime, getting up time, hours of sleep, waking up in the middle of the night or early morning, having to get up to use the bathroom, inability to breathe comfortably, cough or snore loudly, feeling too cold or too hot, having bad dreams, pain, and frequency of having trouble sleeping, were not significantly associated with BMI. Our cross-sectional study suggests that sleep difficulties are common among Veterans referred to a weight loss program at a Veterans Affairs Hospital."

According to the news editors, the research concluded: "Controlled studies are needed to investigate whether the results are generalizable and whether obesity among veterans is a risk factor for sleep disorders and PTSD."

For more information on this research see: Obese Veterans Enrolled in a Veterans Affairs Medical Center Outpatient Weight Loss Clinic Are Likely to Experience Disordered Sleep and Posttraumatic Stress. *Journal of Clinical Sleep Medicine*, 2016;12(7):997-1002. *Journal of Clinical Sleep Medicine* can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

**Leukocyte Diseases and Conditions - Leukopenia**

Recent Research from Yale University Highlight Findings in Leukopenia (Novel Developments in Leukopenia and Pancytopenia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Leukocyte Diseases and Conditions - Leukopenia have been published. According to news reporting originating in New Haven, Connecticut, by NewsRx journalists, research stated, "Cytopenias are not disease entities in and of themselves;
rather, they are the expression of various underlying disease processes."

The news reporters obtained a quote from the research from Yale University, "Careful attention to details in patients' presentation, careful history and examination, as well as attention to the ancillary parameters of the complete blood count with a peripheral blood smear can point the clinician toward the appropriate workup. Causes of cytopenias can be inherited or acquired; the latter include medication related, autoimmune, or neoplastic causes."

According to the news reporters, the research concluded: "Emergencies need to be recognized in a timely fashion and expert consultation obtained."

For more information on this research see: Novel Developments in Leukopenia and Pancytopenia. Primary Care, 2016;43(4):559-573,CP5. Drugs and Therapies - Antigonadotropic Agents

Recent Research from Yamaguchi University Highlight Findings in Antigonadotropic Agents (Development of hepatocellular carcinoma after long-term immunosuppressive therapy including danazol in a dog)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antigonadotropic Agents. According to news originating from Yamaguchi, Japan, by NewsRx correspondents, research stated, "A 2-year-old female beagle was referred to our hospital for evaluation of anemia. Laboratory tests, including bone marrow cytology, revealed non-regenerative immune-mediated anemia (NRIMA)."

Our news journalists obtained a quote from the research from Yamaguchi University, "Although initial immunosuppressive multi-drug therapy was not effective, additional administration of danazol was successful in treating the anemia. However, hepatocellular carcinoma (HCC) developed about 20 months after the administration of danazol. In humans, several cases of development of HCC after the administration of danazol have been reported."

According to the news editors, the research concluded: "The present report describes a case of HCC development in a dog after chronic administration of danazol in addition to other immunosuppressive drugs."
For more information on this research see: Development of hepatocellular carcinoma after long-term immunosuppressive therapy including danazol in a dog. *Journal of Veterinary Medical Science, 2016;78(10):1611-1614. Journal of Veterinary Medical Science can be contacted at: Japan Soc Vet Sci, Univ Tokyo, 1-1-1 Yayoi, Bunkyo-Ku, Tokyo, 103, Japan.

Drugs and Therapies - Antiretrovirals

Recent Studies by J. Fox and Co-Authors Add New Data to Antiretrovirals Findings (Pharmacokinetic/Pharmacodynamic Investigation of Single-Dose Oral Maraviroc in the Context of HIV-1 Pre-exposure Prophylaxis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antiretrovirals. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "To investigate the pharmacokinetics/pharmacodynamics of single-dose maraviroc 300 mg in HIV-1 exposure compartments. Maraviroc concentrations in blood, secretions (vaginal, urethral, oral, and rectal), and tissue (vaginal and rectal) were measured, and ex vivo challenge was performed in 54 healthy volunteers to study protection from HIV infection."

Our news editors obtained a quote from the research, "Maraviroc Cmax occurred within 4 hours in most compartments. Concentrations from 4 to 72 hours were above intracellular (IC) IC90 in all compartments, range 15-8095 ng/mL. Mean AUC(0-72) compartment-to-plasma ratios were highest in the rectum (45-819) and urethra (144) compared with the female genital tract (1.6-4.8) and saliva (0.2). No sex differences in AUC0-72 or Cmax were observed. No ex vivo protection from HIV-1BaL occurred in rectal or vaginal tissue."

According to the news editors, the research concluded: "Despite high and sustained concentrations, single-dose maraviroc was not protective against ex vivo challenge of vaginal/rectal tissue."

The news editors report that additional information may be obtained by contacting J.
Recent Studies by J.D. Song and Co-Authors Add New Data to Non-Small Cell Lung Cancer Findings (Non-small cell lung cancer: quantitative phenotypic analysis of CT images as a potential marker of prognosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Non-Small Cell Lung Cancer. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "This was a retrospective study to investigate the predictive and prognostic ability of quantitative computed tomography phenotypic features in patients with non-small cell lung cancer (NSCLC). 661 patients with pathological confirmed as NSCLC were enrolled between 2007 and 2014. 592 phenotypic descriptors was automatically extracted on the pre-therapy CT images. Firstly, support vector machine (SVM) was used to evaluate the predictive value of each feature for pathology and TNM clinical stage."

Our news journalists obtained a quote from the research, "Secondly, Cox proportional hazards model was used to evaluate the prognostic value of these imaging signatures selected by SVM which subjected to a primary cohort of 138 patients, and an external independent validation of 61 patients. The results indicated that predictive accuracy for histopathology, N staging, and overall clinical stage was 75.16%, 79.40% and 80.33%, respectively. Besides, Cox models indicated the signatures selected by SVM: 'correlation of co-occurrence after wavelet transform' was significantly associated with overall survival in the two datasets (hazard ratio [HR]: 1.65, 95% confidence interval [CI]: 1.41-2.75, p = 0.010; and HR: 2.74, 95% CI: 1.10-6.85, p = 0.027, respectively)."

According to the news editors, the research concluded: "Our study indicates that the phenotypic features might provide some insight in metastatic potential or aggressiveness for NSCLC, which potentially offer clinical value in directing personalized therapeutic regimen selection for NSCLC."

The news correspondents report that additional information may be obtained from D.

Environmental Health - Environmental Research and…

Recent Studies by L. Bauld and Co-Authors Add New Data to Environmental Research and Public Health Findings (English Stop-Smoking Services: One-Year Outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Environmental Health - Environmental Research and Public Health. According to news reporting originating from Nottingham, United Kingdom, by NewsRx correspondents, research stated, "The UK is a global leader in stop-smoking support-providing free behavioral support and cessation medication via stop smoking services (SSS) without charge to smokers. This study aimed to explore the client and service characteristics associated with abstinence 52 weeks after quitting."

Our news editors obtained a quote from the research, "A prospective cohort study of 3057 SSS clients in nine different areas of England who began their quit attempt between March 2012 and March 2013 was conducted. Important determinants of long-term quitting were assessed through quit rates and multivariable logistic regression. Our results showed that the overall weighted carbon monoxide validated quit rate for clients at 52 weeks was 7.7% (95% confidence interval (CI) 6.6-9.0). The clients of advisors, whose main role was providing stop-smoking support, were more likely to quit long-term than advisors who had a generalist role in pharmacies or general practices (odds ratio (OR) 2.3 (95% CI 1.2-4.6)). Clients were more likely to achieve abstinence through group support than one-to-one support (OR 3.4 (95% CI 1.7-6.7)). Overall, one in thirteen people who set a quit date with the National Health Service (NHS) Stop-Smoking Service maintain abstinence for a year. Improving abstinence is likely to require a greater emphasis on providing specialist smoking cessation support."

According to the news editors, the research concluded: "Results from this study suggest that over 18,000 premature deaths were prevented through longer-term smoking cessation achieved by smokers who accessed SSS in England from March 2012 to April 2013, but outcomes varied by client characteristic and the type of support provided."

The news editors report that additional information may be obtained by contacting L. Bauld, UK Center Tobacco & Alcohol Studies, Nottingham, United Kingdom. Additional authors for this research include R. Hiscock, F. Dobbie, P. Aveyard, T. Coleman, J. Leonardi-Bee, H. McRobbie and A. McEwen.

Recent Studies by L.V. Vasileva and Co-Authors Add New Data to Tropanes Findings (Beneficial effect of commercial Rhodiola extract in rats with scopolamine induced memory impairment on active avoidance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Tropanes. According to news reporting from Plovdiv, Bulgaria, by NewsRx journalists, research stated, "Rhodiola rosea L., family Crassulaceae also known as Golden Root or Arctic root is one of the most widely used medicinal plants with effect on cognitive dysfunction, psychological stress and depression. The aim of the study was to examine the effect of a standardized commercial Rhodiola extract on learning and memory processes in naive rats as well as its effects in rats with scopolamine-induced memory impairment."

The news correspondents obtained a quote from the research, "Sixty male Wistar rats were used in the study. The experiment was conducted in two series - on naive rats and on rats with scopolamine-induced model of impaired memory. The active avoidance test was performed in an automatic conventional shuttle box set-up. The criteria used were the number of conditional stimuli (avoidances), the number of unconditioned stimuli (escapes) as well as the number of intertrial crossings. The chemical fingerprinting of the standardized commercial Rhodiola extract was performed by means of nuclear magnetic resonance (NMR). Naive rats treated with standardized Rhodiola extract increased the number of avoidances during the learning session and memory retention test compared to the controls. Rats with scopolamine-induced memory impairment treated with Rhodiola extract showed an increase in the number of avoidances during the learning session and on the memory tests compared to the scopolamine group. The other two parameters were not changed in rats treated with the extract of Rhodiola in the two series. It was found that the studied Rhodiola extract exerts a beneficial effect on learning and memory processes in naive rats and rats with scopolamine-induced memory impairment. The observed effect is probably due to multiple underlying mechanisms including its modulating effect on acetylcholine levels in the brain and MAO-inhibitory activity leading to stimulation of the monoamines neurotransmission."

According to the news reporters, the research concluded: "In addition the pronounced stress-protective properties of Rhodiola rosea L. could also play a role in the improvement of cognitive functions."

Oncology - Breast Cancer

Recent Studies by M. Motallebnezhad and Co-Authors Add New Data to Breast Cancer Findings (Antiproliferative and apoptotic effects of a specific anti-insulin-like growth factor I receptor single chain antibody on breast cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting from Tehran, Iran, by NewsRx journalists, research stated, "Insulin-like growth factor I receptor (IGF-IR) is expressed on breast cancer cells and involves in metastasis, survival, and proliferation. Currently, application of IGF-IR-targeting monoclonal antibodies (mAbs), alone or in combination with other drugs, is a promising strategy for breast cancer therapy."

The news correspondents obtained a quote from the research, "Single-chain fragment variable (scFv) antibodies have been introduced as appropriate tools for tumor-targeting purposes because of their advantages over whole antibodies. In the present study, we employed a naive phage library and isolated scFvs against a specific epitope from extracellular domain of IGF-IR by panning process. The selected scFvs were further characterized using polyclonal and monoclonal phage ELISA, soluble monoclonal ELISA, and colony PCR and sequencing. Antiproliferative and apoptotic effects of selected scFv antibodies on breast cancer cell lines were also evaluated by MTT and Annexin V/PI assays. The results of ELISA indicated specific reactions of the isolated scFvs against the IGF-IR peptide, and analyses of PCR product and sequencing confirmed the presence of full length V-H and V kappa inserts. Treatment of MCF7 and SKBR3 cells with anti-IGF-IR scFv led to a significant growth inhibition. The results also showed that scFv treatment significantly augmented trastuzumab growth inhibitory effects on SKBR3 cells. The percentage of the apoptotic MCF7 and SKBR3 cells after 24-h treatment with scFv was 39 and 30.70 %, respectively. Twenty-four-hour treatment with scFv in combination with trastuzumab resulted in 44.75 % apoptosis of SKBR3 cells."

According to the news reporters, the research concluded: "Taken together, our results demonstrate that the targeting of IGF-IR by scFv can be an effective strategy in the treatment of breast cancer and provide further evidence for effectiveness of dual targeting of HER2 and IGF-IR in breast cancer therapy."

For more information on this research see: Antiproliferative and apoptotic effects of a specific anti-insulin-like growth factor I receptor single chain antibody on breast cancer cells. Tumor Biology, 2016;37(11):14841-14850. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Our news journalists report that additional information may be obtained by contacting V. Younesi, Pishtaz Teb Diagnost, Tehran, Iran. Additional authors for this research include V. Younesi, L. Aghebati-Maleki, H. Nickho, E. Safarzadeh, M. Ahmadi, A.A.
Recent Studies by M.S. Bakken and Co-Authors Add New Data to Hip Fracture Findings (Antipsychotic Drugs and Risk of Hip Fracture in People Aged 60 and Older in Norway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hip Fracture have been published. According to news reporting out of Bergen, Norway, by NewsRx editors, research stated, "To examine associations between exposure to various subgroups of antipsychotic drugs and risk of hip fracture in older adults. Nationwide cohort study. Norway, 2005-2010."

Our news journalists obtained a quote from the research, "Everyone living in Norway born before 1945 (N = 906,422). Information was obtained on all prescriptions of antipsychotic drugs dispensed from 2004 to 2010 (Norwegian Prescription Database) and data on all primary hip fractures from 2005 to 2010 (Norwegian Hip Fracture Registry). Incidence rates of hip fracture during person-time exposed and unexposed to antipsychotic drugs were compared by calculating the standardized incidence ratio (SIR). Thirty-nine thousand nine hundred thirty-eight (4.4%) participants experienced a primary hip fracture. Greater risk of hip fracture was associated with exposure to any antipsychotic (SIR = 2.1, 95% confidence interval (CI) = 1.9-2.1), first-generation antipsychotics (SIR = 2.0, 95% CI = 1.8-2.2), second-generation antipsychotics (SIR = 2.2, 95% CI = 1.9-2.4), prolactin-sparing antipsychotics (SIR = 2.4, 95% CI = 1.8-3.1) and prolactin-elevating antipsychotics (SIR = 2.0, 95% CI = 1.9-2.2). In people aged 60 and older in Norway, those who took an antipsychotic drug had twice the risk of sustaining a hip fracture during exposure than during nonexposure. Although confounding by indication, comorbidity, or other drugs used cannot be excluded, this association is relevant for clinical practice because hip fracture and antipsychotic drug use are prevalent in vulnerable older individuals."

According to the news editors, the research concluded: "Clinical studies examining mechanisms or causality of the observed association between antipsychotic drug use and excess risk of hip fracture are needed."

Our news journalists report that additional information may be obtained by contacting M.S. Bakken, Haraldsplass Deaconess Hosp, Kavli Res Center Geriatr & Dementia, Bergen, Norway. Additional authors for this research include J. Schlott, A. Engeland, L.B. Engesceter and S. Ruths.

Immunology - Immunoglobulins

Recent Studies by R.P. Carroll and Co-Authors Add New Data to Immunoglobulins Findings [Angiotensin II type-1 receptor antibody (AT1Rab) associated humoral rejection and the effect of peri operative plasma exchange and candesartan]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Immunoglobulins. According to news reporting out of Adelaide, Australia, by NewsRx editors, research stated, "Angiotensin II type 1 antibodies (AT1Rab) can mediate antibody mediated rejection (AMR). Pre transplant AT1Rab levels, and risk of rejection were assessed in Kidney Transplant Recipients (KTR) transplanted in our centre from 2013 to 2014 (n = 145). 14/145 (9.7%) KTR experienced antibody mediated rejection (AMR)."

Our news journalists obtained a quote from the research, "The Hazard Ratio for AMR = 3.7 [95% CI 2-26] (p = 0.009) for KTR with AT1Rab levels >17.5 U/ml. 6/11 of KTR with levels >25 U/ml experienced AMR. In 2015 (n = 80) KTR were transplanted and 6/80 KTR experienced rejection (2 AMR and 4 TCMR with vascular lesions). 7/80 of KTR had AT1Rab 17.5-25 U/ml and none experienced rejection and were induced with ATG and candesartan. 7/80 had AT1Rab 25-40 U/ml and received pre and post-operative plasma exchange, ATG and candesartan and 1/7 experienced TCMR with a vascular lesion."

According to the news editors, the research concluded: "This perioperative regimen may alter the risk of rejection in patients with high levels of AT1Ab and further studies are needed."

For more information on this research see: Angiotensin II type-1 receptor antibody (AT1Rab) associated humoral rejection and the effect of peri operative plasma exchange and candesartan. *Human Immunology*, 2016;77(12):1154-1158. *Human Immunology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Human Immunology - www.journals.elsevier.com/human-immunology/)

Our news journalists report that additional information may be obtained by contacting R.P. Carroll, Univ South Australia, Adelaide, SA, Australia. Additional authors for this research include M. Riceman, C.M. Hope, A. Zeng, S. Deayton, G.D. Bennett and P.T. Coates.

Mycobacterium Infections - Tuberculosis

Recent Studies from CIBERES Add New Data to Tuberculosis (Urgent Implementation in a Hospital Setting of a Strategy To Rule Out Secondary Cases Caused by Imported Extensively Drug-Resistant Mycobacterium tuberculosis Strains at Diagnosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mycobacterium Infections - Tuberculosis. According to news originating from Madrid, Spain, by NewsRx correspondents, research stated, "Current migratory movements require new strategies for rapidly tracking the transmission of high-risk imported Mycobacterium tuberculosis strains. Whole-genome sequencing (WGS) enables us to identify single-nucleotide polymorphisms (SNPs) and therefore design PCRs to track specific relevant strains."

Funders for this research include ISCIII, MINECO, Russian Science Foundation (RSF).

Our news journalists obtained a quote from the research from CIBERES, "However, fast implementation of these strategies in the hospital setting is difficult because professionals working in diagnostics, molecular epidemiology, and genomics are generally at separate institutions. In this study, we describe the urgent implementation of a system that integrates genomics and molecular tools in a genuine high-risk epidemiological alert involving 2 independent importations of extensively drug resistant (XDR) and pre-XDR Beijing M. tuberculosis strains from Russia into Spain. Both cases involved commercial sex workers with long-standing tuberculosis (TB). The system was based on strain-specific PCRs tailored from WGS data that were transferred to the local node that was managing the epidemiological alert. The optimized tests were available for prospective implementation in the local node 33 working days after receiving the primary cultures of the XDR strains and were applied to all 42 new incident cases."

According to the news editors, the research concluded: "An interpretable result was obtained in each case (directly from sputum for 27 stain-positive cases) and corresponded to the amplification profiles for strains other than the targeted pre-XDR and XDR strains, which made it possible to prospectively rule out transmission of these high-risk strains at diagnosis."

For more information on this research see: Urgent Implementation in a Hospital Setting of a Strategy To Rule Out Secondary Cases Caused by Imported Extensively Drug-Resistant Mycobacterium tuberculosis Strains at Diagnosis. *Journal of Clinical Microbiology*, 2016;54(12):2969-2974. *Journal of Clinical Microbiology* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

Heart Disorders and Diseases - Atrial Fibrillation

Recent Studies from Caritas Medical Center Add New Data to Atrial Fibrillation (Anticoagulation for stroke prevention in elderly patients with non-valvular atrial fibrillation: what are the obstacles?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Atrial Fibrillation are presented in a new report. According to news reporting originating from Hong Kong, People's Republic of China, by NewsRx editors, the research stated, "The elderly with atrial fibrillation are more prone to stroke. Oral anticoagulants such as warfarin are effective in the prevention of atrial fibrillation associated stroke and systemic embolism."

Our news editors obtained a quote from the research from Caritas Medical Center, "The CHADS(2) or CHA(2)DS(2)-VASc score and HAS-BLED score were developed to stratify stroke risk associated with atrial fibrillation and bleeding risk in a patient with atrial fibrillation, respectively, to facilitate the decision for and safe use of oral anticoagulant. Nonetheless, the decision for anticoagulation is not straightforward and the elderly with non valvular atrial fibrillation are often precluded from anticoagulant prescription. Advanced age and disadvantages associated with the elderly such as fall, comorbidities, cognitive impairment, and polypharmacy contribute to the over-concern of physicians about bleeding risk. Various treatment options such as low-intensity warfarin and aspirin plus clopidogrel have been suggested but are inferior to dose-adjusted warfarin. Novel oral anticoagulants with promising efficacy and convenience hold great appeal."

According to the news editors, the research concluded: "Optimal management of underlying medical conditions and modifiable stroke risk factors, together with intervention to improve the safe use of oral anticoagulants, are useful."

For more information on this research see: Anticoagulation for stroke prevention in elderly patients with non-valvular atrial fibrillation: what are the obstacles? Hong Kong Medical Journal, 2016;22(6):608-615. Heart Disorders and Diseases - Heart Failure

Recent Studies from Charles University Add New Data to Heart Failure (Circulating Microparticles as a Predictor of Vascular Properties in Patients on Mechanical Circulatory Support; Hype or Hope?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Failure. According to news originating from Prague, Czech Republic, by NewsRx correspondents, research stated, "Microparticles are small circulating vesicles originating from circulatory system and vascular wall cells released during their activation or damage. They possess different roles in regulation of endothelial function, inflammation, thrombosis, angiogenesis, and in general, cellular stress."

Our news journalists obtained a quote from the research from Charles University, "Microparticles are the subject of intensive research in pulmonary hypertension, atherosclerotic disease, and heart failure. Another recently emerging role is the evaluation of the status of vasculature in end-stage heart failure patients treated with implantable ventricular assist devices. In patients implanted as destination therapy, assessment of the long-term effect of currently used continuous-flow left ventricular assist devices (LVADs) on vasculature might be of critical importance. However, unique continuous flow pattern generated by LVADs makes it difficult to assess reliably the vascular function with most currently used methods, based mainly on ultrasound detection of changes of arterial dilatation during pulsatile flow. In this respect, the measurement of circulating microparticles as a marker of vascular status may help to elucidate both short- and long-term effects of LVADs on the vascular system."

According to the news editors, the research concluded: "Because data regarding this topic are very limited, this review is focused on the advantages and caveats of the circulating microparticles as markers of vascular function in patients on continuous-flow LVADs."

For more information on this research see: Circulating Microparticles as a Predictor of Vascular Properties in Patients on Mechanical Circulatory Support; Hype or Hope? Physiological Research, 2016;65(5):727-735. Physiological Research can be contacted at: Acad Sciences Czech Republic, Inst Physiology, Videnska 1083, Prague 4 142 20, Czech Republic.

The news correspondents report that additional information may be obtained from P. Ivak, Charles Univ Prague, Fac Med 3, Prague, Czech Republic. Additional authors for this research include J. Pitha and I. Netuka.

Recent Studies from Daiichi Sankyo Add New Data to Glycols
(Evaluation of species difference in peripheral lymphocyte reduction
effect of CS-0777, a sphingosine 1-phosphate receptor modulator,
based on a pharmacokinetic/pharmacodynamic model ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Glycols have been published. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Pharmacokinetic (PK) and pharmacodynamic (PD) modeling was conducted for the reduction of peripheral lymphocytes after oral administration of CS-0777 to healthy rats, monkeys and experimental autoimmune encephalomyelitis (EAE) induced rats. The phosphorylated active metabolite of CS-0777, M1, is a selective sphingosine 1-phosphate receptor-1 modulator."

Our news journalists obtained a quote from the research from Daiichi Sankyo, "A linear one- and two-compartment model with a reversible metabolism process characterized the time courses of CS-0777 and M1 concentrations in rats and monkeys, respectively. The relationship between lymphocyte counts and M1 concentrations in blood was well described by an indirect response model in all animals examined. An I-max of 0.815 and an IC50 of 6.58nM in healthy rats, an I-max of 0.807 and an IC50 of 5.09nM in the EAE rats, an I-max of 0.789 and an IC50 of 0.484nM in monkeys were estimated by the indirect PD model. Since the IC50 values calculated in terms of the unbound plasma concentration in rats and monkeys were within a similar range, after correction of the IC50 in blood described above with the blood to plasma concentration ratio and the plasma free fraction of M1, it was revealed that there is no species difference in the essential activity of M1 against lymphocyte reduction. The sensitivity of the lymphocytes to M1 was not affected by the EAE status."

According to the news editors, the research concluded: "Comparison of the simulated lymphocyte reduction in EAE rats after multiple dosing with CS-0777 and the actual EAE clinical scores implies that the significant suppressive effect on EAE did not require the elimination of all lymphocytes from the blood."

The news correspondents report that additional information may be obtained from S. Inaba, Daiichi Sankyo Co Ltd, Drug Metab & Pharmacokin Res Labs, Tokyo, Japan. Additional authors for this research include M. Goto, K. Tanaka-takanaka, H. Tanaka, W. Tomisato, H. Yuita, H. Doi-Komuro, R. Inoue, K. Oshima, T. Kagari, T. Shimozato and T. Izumi.
Post-Traumatic Stress Disorders

Recent Studies from Dicle University Add New Data to Post-Traumatic Stress Disorders (The Levels of Cortisol and Oxidative Stress and DNA Damage in Child and Adolescent Victims of Sexual Abuse with or without Post-Traumatic Stress Disorder)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Post-Traumatic Stress Disorders have been published. According to news reporting from Diyarbakir, Turkey, by NewsRx journalists, research stated, "The aim of this study was to investigate whether cortisol and oxidative stress levels and DNA damage differ between individuals who developed PTSD or not following a sexual trauma. The study included 61 children aged between 5 and 17 years who sustained sexual abuse (M/F: 18/43)."

The news correspondents obtained a quote from the research from Dicle University, "The patients were divided into two groups: patients with PTSD and patients without PTSD based, based on the results of a structured psychiatric interview (K-SADS-PL and CAPS-CA). Cortisol, glutathione peroxidase (GPx), superoxide dismutase (SOD), coenzyme Q 8-Hydroxy-2-Deoxyguanosine (8-OHdG) were all evaluated by the ELISA method. Our evaluation revealed a diagnosis of PTSD in 51% (n=31) of victims. There was no significant difference between the groups with or without PTSD in terms of cortisol, GPx, SOD, coenzyme Q, and 8-OHdG levels. There was no correlation between CAPS scores and GPx, SOD, coenzyme Q, and 8-OHdG levels between patients with or without PTSD. In patients with PTSD, both cortisol and 8-OHdG levels decreased with increasing time after trauma, and there was no significant correlation with cortisol and 8-OHdG levels in patients without PTSD."

According to the news reporters, the research concluded: "Although the present study did not find any difference between the groups in terms of 8-OHdG concentrations, the decreases in both cortisol and 8-OHdG levels with increasing time after trauma is considered to indicate a relationship between cortisol and DNA damage."

For more information on this research see: The Levels of Cortisol and Oxidative Stress and DNA Damage in Child and Adolescent Victims of Sexual Abuse with or without Post-Traumatic Stress Disorder. *Psychiatry Investigation*, 2016;13(6):616-621. *Psychiatry Investigation* can be contacted at: Korean Neuropsychiatric Assoc, Rn 522, G-Five Central Plaza 1685-8 Seoco 4-Dong, Seoco-Gu, Seoul, 137-882, South Korea.

Our news journalists report that additional information may be obtained by contacting S. Simsek, Dicle University, Sch Med, Dept. of Child Psychiat, TR-21280 Diyarbakir, Turkey. Additional authors for this research include T. Yuksel, I. Kaplan, C. Uysal and H. Aktas.

Central Nervous System Diseases and Conditions –

Recent Studies from Eli Lilly Add New Data to Epilepsy (Forebrain-selective AMPA-receptor antagonism guided by TARP gamma-8 as an antiepileptic mechanism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Central Nervous System Diseases and Conditions - Epilepsy is the subject of a report. According to news reporting originating in Indianapolis, Indiana, by NewsRx journalists, research stated, "Pharmacological manipulation of specific neural circuits to optimize therapeutic index is an unrealized goal in neurology and psychiatry. AMPA receptors are important for excitatory synaptic transmission(1), and their antagonists are antiepileptic(2)."

The news reporters obtained a quote from the research from Eli Lilly, "Although efficacious, AMPA-receptor antagonists, including perampanel (Fycompa), the only approved antagonist for epilepsy, induce dizziness and motor impairment(3,4). We hypothesized that blockade of forebrain AMPA receptors without blocking cerebellar AMPA receptors would be antiepileptic and devoid of motor impairment. Taking advantage of an AMPA receptor auxiliary protein, TARP gamma-8, which is selectively expressed in the forebrain and modulates the pharmacological properties of AMPA receptors(5), we discovered that LY3130481 selectively antagonized recombinant and native AMPA receptors containing gamma-8, but not gamma-2 (cerebellum) or other TARP members. Two amino acid residues unique to gamma-8 determined this selectivity. We also observed antagonism of AMPA receptors expressed in hippocampal, but not cerebellar, tissue from an patient with epilepsy. Corresponding to this selective activity, LY3130481 prevented multiple seizure types in rats and mice and without motor side effects."

According to the news reporters, the research concluded: "These findings demonstrate the first rationally discovered molecule targeting specific neural circuitries for therapeutic advantage."

For more information on this research see: Forebrain-selective AMPA-receptor antagonism guided by TARP gamma-8 as an antiepileptic mechanism. Nature Medicine, 2016;22(12):1496-1501,177-180. Nature Medicine can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group - www.nature.com/; Nature Medicine - www.nature.com/nm/)

Recent Studies from Erasmus University Medical Center Add New Data to Blood Pressure (Reference Values for Noninvasive Blood Pressure in Children during Anesthesia A Multicentered Retrospective Observational Cohort Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Blood Pressure is the subject of a report. According to news reporting out of Rotterdam, Netherlands, by NewsRx editors, research stated, "Although noninvasive blood pressure (NIBP) monitoring during anesthesia is a standard of care, reference ranges for blood pressure in anesthetized children are not available. We developed sex-and age-specific reference ranges for NIBP in children during anesthesia and surgery."

Our news journalists obtained a quote from the research from Erasmus University Medical Center, "In this retrospective observational cohort study, we included NIBP data of children with no or mild comorbidity younger than 18 yr old from the Multicenter Perioperative Outcomes Group data set. Sex-specific percentiles of the NIBP values for age were developed and extrapolated into diagrams and reference tables representing the 50th percentile (0 SD), +1 SD, -1 SD, and the upper (+2 SD) and lower reference ranges (-2 SD). In total, 116,362 cases from 10 centers were available for the construction of NIBP age-and sex-specific reference curves. The 0 SD of the mean NIBP during anesthesia varied from 33 mmHg at birth to 67 mmHg at 18 yr. The low cutoff NIBP (2 SD below the 50th percentile) varied from 17 mmHg at birth to 47 mmHg at 18 yr old. This is the first study to present reference ranges for blood pressure in children during anesthesia."

According to the news editors, the research concluded: "These reference ranges based on the variation of values obtained in daily care in children during anesthesia could be used for rapid screening of changes in blood pressure during anesthesia and may provide a consistent reference for future blood pressure-related pediatric anesthesia research."

For more information on this research see: Reference Values for Noninvasive Blood Pressure in Children during Anesthesia A Multicentered Retrospective Observational Cohort Study. Anesthesiology, 2016;125(5):904-913. Anesthesiology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Recent Studies from Federal University Add New Data to Gastric Cancer

**Oncology - Gastric Cancer**

**Recent Studies from Federal University Add New Data to Gastric Cancer**

*(Current advances in targeted therapies for metastatic gastric cancer: improving patient care)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gastric Cancer. According to news reporting out of Sao Paulo, Brazil, by NewsRx editors, research stated, "In this article, we review the literature on the current advances in targeted therapies for metastatic gastric cancer aimed at improving patient care. We conclude that the key to guiding targeted therapy is individual biomarkers, which are not completely elucidated."

Our news journalists obtained a quote from the research from Federal University, "HER2 overexpression is the only predictive biomarker currently in use. Furthermore, it is necessary to understand that gastric tumors are heterogeneous; therefore, is impossible to evaluate a novel biological compound without evaluating personal biomarkers."

According to the news editors, the research concluded: "The selection of patients who are able to receive each treatment is paramount for improving advanced gastric cancer survival and reducing unnecessary costs."

Our news journalists report that additional information may be obtained by contacting P.N. Aguiar, Division of Medical Oncology, Federal University of Sao Paulo, Sao Paulo, Brazil. Additional authors for this research include T.P. Muniz, R.R. Miranda, H. Tadokoro, N.M. Forones, I.D. Monteiro, P. Castelo-Branco, Y.Y. Janjigian and R.A Mello.

**Oncology - Gliomas**

**Recent Studies from Fudan University Add New Data to Gliomas (Effect of Hyperbaric Oxygen on the Growth of Intracranial Glioma in Rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gliomas. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Numerous studies have confirmed that hyperbaric oxygen (HBO) in combination with radiotherapy or chemotherapy may increase the efficacy of radiotherapy or chemotherapy in patients with glioma. However, whether HBO therapy alone may inhibit or promote the growth of malignant tumors remains controversial."
The news correspondents obtained a quote from the research from Fudan University, "This study aimed to investigate the effect of HBO on the growth of glioma in rats, and the impact of HBO on the expression of vascular endothelial growth factor (VEGF) and hypoxia-inducible factor 1-alpha (HIF-1a), angiogenesis, and apoptosis of glioma cells. Male Sprague-Dawley rats were treated with or without HBO after glioma cell inoculation and followed for up to 16 days postinoculation. Rats were randomized to receive bilateral forelimb function tests (n=20 per group) and head magnetic resonance imaging (n=5 per group). Differences between HBO and control groups were tested using 2-sample independent t-tests and changes over time within treatment groups were analyzed using a repeated measurement analysis of variance with Bonferroni correction. The effect of HBO on the expression of VEGF, HIF-1a, von Willebrand factor, angiogenesis, and tumor cell apoptosis were also examined (n=5 per group). Forelimb function scores were reduced in both HBO-treated and control groups. HBO-treated rats had significantly larger tumor volume and more water in the cerebellum compared with control rats. The intratumoral expression of VEGF was significantly higher in HBO-treated rats compared with control rats (23.2% vs. 13.3%, p=0.002). HIF-1a was significantly increased in HBO-treated rats compared with controls in the expression of both intratumoral (72.7% vs. 54.9%, p=0.001) and peritumoral (2.6% vs. 1.9%, p=0.003) cells. The intratumoral microvessel density (MVD) was significantly higher in the HBO group (15.6 vessels/field vs. 4.4 vessels/field, p<0.001), and the peritumoral MVD was not significantly different between the two groups (p>0.05). Apoptosis was significantly lower in HBO-treated rats compared with controls (44.4% vs. 82.8% for intratumoral; 10.1% vs. 77.5% for peritumoral, both p<0.001). The current results demonstrate that HBO alone may promote tumor growth, and is therefore not suitable to treat patients with gliomas with neurological deficits or disorders with HBO alone."

According to the news reporters, the research concluded: "If HBO must be used as a mean of rehabilitation, it is recommended that HBO should be combined with radiotherapy or chemotherapy."

Our news journalists report that additional information may be obtained by contacting Z.Y. Qin, Dept. of Neurosurgery, Huashan Hospital, Shanghai Medical College, Fudan University, Shanghai 200040, People's Republic of China. Additional authors for this research include J.R. Chen, H.Z. Xu and Z.Y Qin.

Recent Studies from German Cancer Research Center Add New Data to Immunotherapy (Neurological sequelae of cancer immunotherapies and targeted therapies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Immunotherapy. According to news reporting from Heidelberg, Germany, by NewsRx journalists, research stated, "Neurological complications of cancer and of anticancer treatments can be substantially disabling to patients, especially with classic chemotherapies. As a rare but important complication, targeted therapies might also result in similar unwanted effects, partly because inhibition of VEGF is a common downstream effect."

The news correspondents obtained a quote from the research from German Cancer Research Center, "Therapeutic antibodies, such as the CD20-depleting antibody rituximab, and underlying haematological malignancies, can induce long-lasting cellular immunosuppression, predisposing patients to opportunistic CNS infections, such as progressive multifocal leukoencephalopathy, where treatment-induced recovery can result in severe reconstitution of immune inflammatory syndromes of the central nervous system. Immune-related neurological adverse events, particularly from immune-activating checkpoint inhibitors, occur as a result of immune activation, resulting in organ-specific autoimmune-like disease. The prevalence of immune-related neurological adverse events might only be about 1%-a low prevalence compared with toxicities in other organs-but it constitutes new patterns of neurological toxic forms, which could result in considerable morbidity and fatal outcomes."

According to the news reporters, the research concluded: "Clinicians should be aware of treatment-associated neurotoxicity, and consider discontinuation of the drug with parallel supportive measures to help patients."

For more information on this research see: Neurological sequelae of cancer immunotherapies and targeted therapies. Lancet Oncology, 2016;17(12):E529-E541. Recent Studies from Harvard School of Medicine Add New Data to Angiology (Validity assessment of grading scales predicting complications from embolization of cerebral arteriovenous malformations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Angiology have been published. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Endovascular embolization, though initially approved as an adjunctive therapy for surgical excision of cerebral arteriovenous malformations (AVMs), has found extensive use in the management of these lesions. A number of systems have been proposed to stratify AVMs by the procedural risk of embolization, including the Buffalo score and AVM Neuroendovascular grade."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "An external validity assessment of these systems has not been performed. A retrospective review of all patients who underwent embolization of cerebral AVMs at a single institution, between 2010 and 2016, was performed. Data including patient demographics, AVM characteristics, procedural details, complications, and outcomes were collected. Fifty-five embolization procedures in 39 patients (median age 53.1 years) were identified. Ten (25.6%) patients underwent more than 1 embolization procedure. A triaxial catheter system for support was used in 48 (87.3%) of the embolization procedures and a detachable tip microcatheter was used in 28 (50.9%). Complete obliteration of the AVM was achieved in 10.9% of the cases. There was one (2.6%) mortality unrelated to the procedure. Three minor (5.5%) and 2 major (3.6%) clinical complications occurred. Neither Spetzler-Martin grade, Buffalo score, or AVM Neuroendovascular grade correlated with complications. Neither Buffalo score nor AVM Neuroendovascular grade predicted complications from embolization in the present study."

According to the news editors, the research concluded: "Given the relative infrequency of complications, the number of factors that may influence AVM treatment, recent advancements in endovascular technologies, and the subjectivity inherent in these grading systems, the relative utility of risk stratification scales in the embolization of AVMs remains largely unknown."

For more information on this research see: Validity assessment of grading scales predicting complications from embolization of cerebral arteriovenous malformations. Clinical Neurology and Neurosurgery, 2016;151():102-107. Clinical Neurology and Neurosurgery can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Clinical Neurology and Neurosurgery - www.journals.elsevier.com/clinical-neurology-and-neurosurgery/)

Salicylic Acid

Recent Studies from Hunan University Add New Data to Salicylic Acid (Salicylic Acid Regulates Pollen Tip Growth through an NPR3/NPR4-Independent Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Salicylic Acid have been presented. According to news reporting out of Changsha, People's Republic of China, by NewsRx editors, research stated, "Tip growth is a common strategy for the rapid elongation of cells to forage the environment and/or to target to long-distance destinations. In the model tip growth system of Arabidopsis pollen tubes, several small molecule hormones regulate their elongation, but how these rapidly diffusing molecules control extremely localized growth remains mysterious."

Our news journalists obtained a quote from the research from Hunan University, "Here we show that the interconvertible salicylic acid (SA) and methylated SA (MeSA), well characterized for their roles in plant defense, oppositely regulate Arabidopsis pollen tip growth with SA being inhibitory and MeSA stimulatory. The effect of SA and MeSA was independent of known NPR3/NPR4 SA receptor-mediated signaling pathways. SA inhibited clathrin-mediated endocytosis in pollen tubes associated with an increased accumulation of less stretchable demethylated pectin in the apical wall, whereas MeSA did the opposite. Furthermore, SA and MeSA alter the apical activation of ROP1 GTPase, a key regulator of tip growth in pollen tubes, in an opposite manner. Interestingly, both MeSA methylesterase and SA methyltransferase, which catalyze the interconversion between SA and MeSA, are localized at the apical region of pollen tubes, indicating of the tip-localized production of SA and MeSA and consistent with their effects on the apical cellular activities."

According to the news editors, the research concluded: "These findings suggest that local generation of a highly diffusible signal can regulate polarized cell growth, providing a novel mechanism of cell polarity control apart from the one involving protein and mRNA polarization."

Our news journalists report that additional information may be obtained by contacting X.M. Liu, Hunan Univ, Coll Biol, State Key Lab Chemo Biosensing & Chemometr, Hunan Prov Key Lab Plant Funct Genom & Dev Regula, Changsha 410082, Hunan, People's Republic of China. Recent Studies from Inje University Add New Data to Immunotherapy
(Signal transducer and activator of transcription proteins: regulators of myeloid-derived suppressor cell-mediated immunosuppression in cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Immunotherapy have been published. According to news reporting originating from Gimhae, South Korea, by NewsRx correspondents, research stated, "The success of cancer immunotherapy in patients depends on overcoming immunosuppressive mechanisms in addition to stimulating effective anticancer immune responses. Myeloid-derived suppressor cells (MDSCs) inhibit a spectrum of immune responses, including adaptive immune responses and innate immune responses at the tumor site."

Financial support for this research came from National Research Foundation of Korea.

Our news editors obtained a quote from the research from Inje University; "MDSCs have been targeted to overcome immunosuppression either by reducing their numbers or downregulating their immunosuppressive activities. Although signal transducer and activator of transcription (STAT) proteins are recognized as signaling and transcription factors induced by cytokines in normal cells, they also have roles in cancer and cancer-related cells, as well as MDSC differentiation and function. In in vitro and in vivo studies, including studies on humans, selective STAT3 inhibitors such as Stattic and S3I-201 have demonstrated potential in regulating MDSC-mediated immunosuppression. Thus, STAT pathways represent a promising target in cancer immunotherapy."

According to the news editors, the research concluded: "Herein, we review the roles of STAT signaling in MDSC biology, and the clinical potential of STAT inhibitors in regulating tumor-associated immunosuppression mediated by MDSCs."

The news editors report that additional information may be obtained by contacting Y.J. Kim, Inje Univ, Coll Pharm, Lab Microbiol & Immunol, Gimhae 621749, South Korea.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s12272-016-0822-9. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Studies from Institute of Food Research Add New Data to Science (Identification of critical paralog groups with indispensable roles in the regulation of signaling flow)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Science is the subject of a report. According to news reporting from Norwich, United Kingdom, by NewsRx journalists, research stated, "Extensive cross-talk between signaling pathways is required to integrate the myriad of extracellular signal combinations at the cellular level. Gene duplication events may lead to the emergence of novel functions, leaving groups of similar genes-termed paralogs-in the genome."

The news correspondents obtained a quote from the research from the Institute of Food Research, "To distinguish critical paralog groups (CPGs) from other paralogs in human signaling networks, we developed a signaling network-based method using cross-talk annotation and tissue-specific signaling flow analysis. 75 CPGs were found with higher degree, betweenness centrality, closeness, and `bowtieness' when compared to other paralogs or other proteins in the signaling network. CPGs had higher diversity in all these measures, with more varied biological functions and more specific post-transcriptional regulation than non-critical paralog groups (non-CPG). Using TGF-beta, Notch and MAPK pathways as examples, SMAD2/3, NOTCH1/2/3 and MEK3/6-p38 CPGs were found to regulate the signaling flow of their respective pathways. Additionally, CPGs showed a higher mutation rate in both inherited diseases and cancer, and were enriched in drug targets."

According to the news reporters, the research concluded: "The results revealed two distinct types of paralog groups in the signaling network: CPGs and non-CPGs. Thus highlighting the importance of CPGs as compared to non-CPGs in drug discovery and disease pathogenesis."

Our news journalists report that additional information may be obtained by contacting T. Korcsmaros, Inst Food Res, Gut Hlth & Food Safety Programme, Norwich, Norfolk, United Kingdom. Additional authors for this research include J. Brooks, D. Fazekas, E. Ari, T. Vellai, P. Csermely, T. Korcsmaros and K. Lenti.

Recent Studies from Institute of Science Add New Data to Kidney Transplants (Acute kidney transplant rejection mediated by angiotensin II type 1 receptor antibodies in a pediatric hyperimmune patient)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Kidney Transplants is now available. According to news reporting out of Rome, Italy, by NewsRx editors, research stated, "Several cases of severe antibody-mediated rejection (AMR) secondary to antibodies against the angiotensin II type 1 receptor (AT1R-Ab) have been described with variable outcome. We report the case of a 13-year-old boy whose first kidney transplant failed due to steroid-resistant acute cellular rejection, with the subsequent development of sensitization."

Our news journalists obtained a quote from the research from the Institute of Science, "He received a second kidney transplant which was complicated by early humoral rejection, with weakly positive staining for the complement degradation product C4d. Test results were negative for donor-specific antibodies against human leukocyte antigens (HLA-DSA) and MHC class I-related chain A (MICA) but positive for AT1R-Ab. Retrospective testing of the sera collected during the first kidney transplant was also positive for AT1R-Ab. We therefore hypothesized that the failure of the first transplant was secondary to the same cause. Losartan was immediately introduced into the therapeutic regimen, and the patient showed an excellent clinical and histological recovery. Testing for AT1R-Ab in any hypertensive patient with acute rejection who tests negative or weakly positive for C4d and negative for HLA-DSA and who is refractory to therapy is highly advisable. Pre-transplant AT1R-Ab may be indicative of the outcome in patients whose first transplant failed."

According to the news editors, the research concluded: "Prompt initiation of treatment with losartan-immediately after transplantation in patients with pre-existing AT1R-Ab-should be encouraged."

For more information on this research see: Acute kidney transplant rejection mediated by angiotensin II type 1 receptor antibodies in a pediatric hyperimmune patient. Pediatric Nephrology, 2017;32(1):185-188. Pediatric Nephrology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Heart Disorders and Diseases - Atrial Fibrillation

Recent Studies from Istanbul University Add New Data to Atrial Fibrillation (Effects of inspiratory muscle training on pulmonary function, respiratory muscle strength and functional capacity in patients with atrial fibrillation: a randomized ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting originating from Istanbul, Turkey, by NewsRx correspondents, research stated, "To investigate the effects of inspiratory muscle training on pulmonary function, respiratory muscle strength and functional capacity in patients with atrial fibrillation. Prospective randomized controlled single-blind study."

Our news editors obtained a quote from the research from Istanbul University, "Cardiology department of a university hospital. A total of 38 patients with permanent atrial fibrillation were randomly allocated to either a treatment group (n = 19; age 66.2 years (8.8)) or a control group (n = 19; age 67.1 years (6.4)). The training group received inspiratory muscle training at 30% of maximal inspiratory pressure for 15 minutes twice a day, 7 days a week, for 12 weeks alongside the standard medical treatment. The control group received standard medical treatment only. Spirometry, maximal inspiratory and expiratory pressures and 6-minute walking distance was measured at the beginning and end of the study. There was a significant increase in maximal inspiratory pressure (27.94 cmH(2)O (8.90)), maximal expiratory pressure (24.53 cmH(2)O (10.34)), forced vital capacity (10.29% (8.18) predicted), forced expiratory volume in one second (13.88% (13.42) predicted), forced expiratory flow 25%-75% (14.82% (12.44) predicted), peak expiratory flow (19.82% (15.62) predicted) and 6-minute walking distance (55.53 m (14.13)) in the training group (p < 0.01). No significant changes occurred in the control group (p > 0.05)."

According to the news editors, the research concluded: "Inspiratory muscle training can improve pulmonary function, respiratory muscle strength and functional capacity in patients with atrial fibrillation."

For more information on this research see: Effects of inspiratory muscle training on pulmonary function, respiratory muscle strength and functional capacity in patients with atrial fibrillation: a randomized controlled trial. Clinical Rehabilitation, 2016;30(12):1165-1174. Clinical Rehabilitation can be contacted at: Sage Publications Ltd, 1 Oliers Yard, 55 City Road, London EC1Y 1SP, England. (Sage Publications - www.sagepub.com; Clinical Rehabilitation - cre.sagepub.com)

The news editors report that additional information may be obtained by contacting R. Demir, Istanbul University, Dept. of Cardiol, Istanbul, Turkey. Additional authors for this research include R. Demir, Z. Yigit and H.N. Gurses.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/0269215515628038. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Bromfenac Therapy

Recent Studies from JNT University Add New Data to Bromfenac Therapy (Development and Validation of a New Stability-Indicating RP-UPLC Method for the Quantitative Determination of Bromfenac Sodium and Its Impurities in an Ophthalmic Dosage Form)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Bromfenac Therapy. According to news reporting out of Andhra Pradesh, India, by NewsRx editors, research stated, "A new rapid stability-indicating reversed-phase UPLC method was developed and validated for the determination of Bromfenac sodium and its impurities in Bromfenac ophthalmic solution. During literature search, only a few publications were found about Bromfenac sodium."

Our news journalists obtained a quote from the research from JNT University, "There is no official monograph in the pharmacopoeias about Bromfenac sodium. Chromatographic separation has been achieved on a polar-embedded Waters Acquity BEH Shield RP18 (100 mmx 2.1 mm, 1.7 mu m) column under gradient elution by using a binary mixture of potassium dihydrogen phosphate (0.01 M, pH 3.3) and acetonitrile (ACN) at a flow rate of 0.5 mL/min. Chromatogram was monitored at 265 nm using a photodiode array detector (PDA). The drug and its related impurities are eluted within 13 min. Resolution of Bromfenac sodium and all eight potential impurities have been achieved greater than 4.0 for all pairs of compounds. To prove the stability-indicating power of the method, the drug was subjected to hydrolytic (acid, alkaline and water), oxidative, photolytic and thermal stress, and the major degradation products were identified based on LC-MS analysis."

According to the news editors, the research concluded: "The developed method was validated as per ICH guidelines with respect to specificity, linearity, limit of detection, limit of quantification, precision, accuracy and robustness."

Our news journalists report that additional information may be obtained by contacting S. Koppala, JNT Univ, Center Chem Sci & Technol, IST, Hyderabad 500085, Andhra Pradesh, India. Additional authors for this research include V.R. Reddy and J.S. Anireddy.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/chromsci/bmw089. This DOI is a link to an online electronic document that is either free or for purchase.

Ethanol

Recent Studies from Jawaharlal Nehru Technological University Add New Data to Ethanol (Chronic treatment with a selective 5-HT6 receptor antagonist alters the behavioral and neurochemical effects of ethanol in young adult rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Ethanol. According to news reporting from Hyderabad, India, by NewsRx journalists, research stated, "Experimental evidence indicates a potential role of 5-HT6 receptors in the regulation of addictive behavior. We studied the effects of a potent and selective 5-HT6 receptor antagonist (compound A) on voluntary ethanol intake and behavioral/neurochemical changes induced by ethanol."

The news correspondents obtained a quote from the research from Jawaharlal Nehru Technological University, "The pharmacokinetic interaction of compound A and ethanol was assessed. The effect of compound A on schedule-induced ethanol polydipsia was studied to determine its effect on voluntary ethanol intake. Open-field and ethanol-induced loss of righting reflex assays were carried out to determine the effect of compound A on the ataxic and sedative effects of ethanol. The effect on motor learning was evaluated using rotarod and brain microdialysis was carried out to study the effect on monoaminergic neurotransmission. No significant changes were observed in the pharmacokinetic parameters of compound A when cotreated with ethanol. Compound A significantly decreased voluntary ethanol consumption and attenuated the effects of ethanol on motor learning. Compound A also antagonized the sedative and ataxic effects of ethanol. The effect of ethanol on the dopaminergic and noradrenergic neurotransmission was blocked by compound A. The effects of compound A were evident only after chronic treatment."

According to the news reporters, the research concluded: "Compound A may have attenuated the behavioral effects of ethanol by blocking the ethanol-induced efflux of dopamine and norepinephrine in the motor cortex."

For more information on this research see: Chronic treatment with a selective 5-HT6 receptor antagonist alters the behavioral and neurochemical effects of ethanol in young adult rats. Behavioural Pharmacology, 2016;27(2-3 Spec I):225-35. (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology - journals.lww.com/behaviouralpharm/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting P. Heart Disorders and Diseases - Atrial Fibrillation

Recent Studies from Jikei University Add New Data to Atrial Fibrillation (Adenosine testing during cryoballoon ablation and radiofrequency ablation of atrial fibrillation: A propensity score-matched analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Fibrillation have been presented. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "The infusion of adenosine triphosphate after radio-frequency (RF) pulmonary vein (PV) isolation (PVI), which may result in acute transient PV-atrium reconnection, can unmask dormant conduction. The purpose of this study was to compare the incidence and characteristics of dormant conduction after cryoballoon (CB) and RF ablation of atrial fibrillation (AF)."

The news reporters obtained a quote from the research from Jikei University, "Of 414 consecutive patients undergoing initial catheter ablation of paroxysmal AF, 246 (59%) propensity score-matched patients (123 CB-PVI and 123 RF-PVI) were included. Dormant conduction was less frequently observed in patients who underwent CB-PVI than in those who underwent RF-PVI (4.5% vs 12.8% of all PVs; P<.0001). The incidence of dormant conduction in each PV was lower in patients who underwent CB-PVI than in those who underwent RF-PVI in the left superior PV (P < .0001) and right superior PV (P = .001). The site of dormant conduction was mainly located around the bottom of both inferior PVs after CB-PVI. Multivariable analysis revealed that a longer time to the elimination of the PV potential (odds ratio 1.018; 95% confidence interval 1.001-1.036; P =.04) and the necessity of touch-up ablation (odds ratio 3.242; 95% confidence interval 2.761-7.111; P< .0001) were independently associated with the presence of dormant conduction after CB-PVI. After the elimination of dormant conduction by additional ablation, the AF free rate was similar in patients with and without dormant conduction after both CB-PVI and RF-PVI (P = .28 and P = .73, respectively)."

According to the news reporters, the research concluded: "The results of the propensity score-matched analysis showed that dormant PV conduction was less frequent after CB ablation than after RF ablation and was not associated with ablation outcomes."

Our news correspondents report that additional information may be obtained by contacting M. Tokuda, Jikei Univ, Sch Med, Dept. of Cardiol, Minato Ku, Tokyo 1058461, Japan. Heart Disorders and Diseases - Heart Disease

Recent Studies from Johns Hopkins University Add New Data to Heart Disease (The Risk Continuum of Atherosclerosis and its Implications for Defining CHD by Coronary Angiography)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Disease is now available. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "Patients undergoing coronary angiography for suspected coronary heart disease who are found to have coronary atherosclerotic disease with <50% diameter stenosis may carry a risk of adverse cardiac events similar to that in patients with single-vessel obstructive disease. Yet clinical practice guidelines offer no direction for managing symptomatic patients with nonobstructive coronary atherosclerosis because current diagnostic criteria for coronary heart disease are not met."

The news correspondents obtained a quote from the research from Johns Hopkins University, "Accordingly, secondary preventive measures are not endorsed, and their role is not defined in this setting. Available data suggest that we are missing the opportunity to provide effective preventive measures in millions of patients with nonobstructive coronary heart disease."

According to the news reporters, the research concluded: "The emergence of noninvasive coronary angiography in patients with suspected coronary heart disease provides the opportunity to transition from a categorical perspective on the presence or absence of coronary heart disease to accepting the risk continuum from atherosclerosis and its implications for diagnosis and management."

For more information on this research see: The Risk Continuum of Atherosclerosis and its Implications for Defining CHD by Coronary Angiography. *Journal of the American College of Cardiology*, 2016;68(22):2467-2478. *Journal of the American College of Cardiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.

Apoptosis

Recent Studies from Konkuk University Add New Data to Apoptosis (Loss of PGL-1 and PGL-3, members of a family of constitutive germ-granule components, promotes germline apoptosis in C. elegans)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Apoptosis. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "In Caenorhabditis elegans, the mechanisms regulating germline apoptosis remain largely unknown, except for the core machinery. Here, we found that mutants of pgl-1 and pgl-3, encoding members of a family of constitutive protein components of germline-specific P granules, showed increased germline apoptosis under both physiological and DNA-damaged conditions."

Our news journalists obtained a quote from the research from Konkuk University, "We also found that the number of germ cells that lost PGL proteins increased significantly following UV irradiation, and that only those PGL-absent germ cells were selectively engulfed by gonadal sheath cells in adult hermaphrodite gonads. We further revealed that CEP-1, the p53 homolog, and the caspase CED-3 promoted elimination of PGL-1 from germ cells following UV irradiation. Furthermore, protein levels of CED-4, the Apaf-1 homolog, and cytoplasmic translocation of SIR-2.1, a Sirtuin homolog, significantly increased in pgl mutants and increased even more following UV irradiation. CED-4 and SIR-2.1 were essential for high levels of germline apoptosis in pgl mutants."

According to the news editors, the research concluded: "PGL proteins suppress excessive germline apoptosis by repressing both the protein levels of CED-4 and the cytoplasmic translocation of SIR-2.1. Our study has revealed new roles for PGL-1 and PGL-3 in the control of germline apoptosis."

Our news journalists report that additional information may be obtained by contacting Y.H. Shim, Dept. of Bioscience and Biotechnology, Konkuk University, Seoul 143-701, Republic of Korea Institute of KU Biotechnology, Konkuk University, Seoul 143-701, South Korea. Additional authors for this research include Y.H. Shim and I. Kawasaki.

Recent Studies from Kunming Medical University Add New Data to Lipopolysaccharides (Protective effect of Xuebijing injection on D-galactosamine- and lipopolysaccharide-induced acute liver injury in rats through the regulation of p38 MAPK, MMP-9 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lipopolysaccharides is the subject of a report. According to news reporting from Kunming, People's Republic of China, by NewsRx journalists, research stated, "Xuebijing injection (XBJ) has long been used to treat infectious diseases in China. The therapeutic effect of XBJ is probably associated with anti-inflammatory effects."

The news correspondents obtained a quote from the research from Kunming Medical University, "However, the precise mechanisms responsible for the effects of XBJ remain unknown. The present study was conducted in order to evaluate the protective effects of XBJ in a rat model of D-galactosamine (D-Gal)- and lipopolysaccharide (LPS)-induced acute liver injury. In the present study, the rats were injected with D-Gal and LPS intraperitoneally to induce acute liver injury. Two hours prior to D-Gal and LPS administration, the treatment group was administered XBJ by intravenous infusion. The effects of XBJ on D-Gal- and LPS-induced expression of tumor necrosis factor (TNF)-alpha-induced protein 8-like 2 (TIPE2), nuclear factor-B (NF-B), matrix metalloproteinase-9 (MMP-9) and heme oxygenase-1 (HO-1) as well as mitogen-activated protein kinase (MAPK) signaling was examined using reverse transcription-quantitative polymerase chain reaction (RT-qPCR), western blot analysis, immunofluorescence, as well as by analysing the serum levels of pro-inflammatory cytokines and the transaminases, alanine aminotransferase (ALT) and aspartate aminotransferase (AST). Myeloperoxidase (MPO), malondialdehyde (MDA) and superoxide dismutase (SOD) levels in the rat liver tissues were also measured. For histological analysis, hematoxylin and eosin (H&E)-stained liver samples were evaluated. The results showed that XBJ upregulated TIPE2 and HO-1 expression, reduced the expression of NF-B65 and MMP-9, inhibited the LPS-induced gene expression of c-jun N-terminal kinase (JNK) and p38 MAPK, decreased the generation of pro-inflammatory cytokines [interleukin (IL)-6, IL-13 and TNF-], inhibited ALT and AST activity, and ameliorated D-Gal- and LPS-induced liver injury. The histological results also demonstrated that XBJ attenuated D-Gal- and LPS-induced liver inflammation. It was found that XBJ may prevent LPS-induced pro-inflammatory gene expression through inhibiting the NF-B and MAPK signaling pathways by upregulating TIPE2 expression, thereby attenuating LPS-induced liver injury in rats."

According to the news reporters, the research concluded: "The marked protective effects of XBJ suggest that it has the potential to be used in the treatment of LPS-induced liver injury."

For more information on this research see: Protective effect of Xuebijing injection on D-galactosamine- and lipopolysaccharide-induced acute liver injury in rats through the regulation of p38 MAPK, MMP-9 and HO-1 expression by increasing TIPE2 expression. *International Journal of Molecular Medicine, 2016;38(5):1419-1432. International Journal of Molecular Medicine* can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

Our news journalists report that additional information may be obtained by contacting W. Zhang, Kunming Med Univ, Hosp 1, Dept. of Emergency Med, Kunming
Recent Studies from Mahidol University Add New Data to Reciprocating Tachycardia (Determining the Site of Accessory Pathways in Orthodromic Reciprocating Tachycardia by Using the Response to Right Ventricular Pacing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Reciprocating Tachycardia. According to news reporting originating from Bangkok, Thailand, by NewsRx correspondents, research stated, "Postpacing interval (PPI) after right ventricular (RV) pacing entrainment minus tachycardia cycle length (TCL) with a correction for atrioventricular (AV) node delay (corrected PPI-TCL) was useful to differentiate atrioventricular node reentrant tachycardia (AVNRT) from orthodromic reciprocating tachycardia (ORT). However, the value of corrected PPI-TCL in determining the site of the accessory pathway (AP) in ORT has not been investigated."

Our news editors obtained a quote from the research from Mahidol University, "The purpose of this study was to assess whether the corrected PPI-TCL is useful in differentiating ORT using a left-sided AP from a right-sided AP. We studied 52 patients with ORT using a left-sided AP and 13 patients with a right-sided AP. The PPI was measured upon cessation of the RV pacing at a cycle length 10-40 ms shorter than the TCL. The corrected PPI-TCL was calculated from the subtraction of the increment in AV nodal conduction time of the first PPI from the PPI-TCL. The mean corrected PPI-TCL was 83 ± 20 ms in patients with ORT using a left-sided AP and 27 ± 19 ms in patients with a right-sided AP (P (<=) 0.001). All patients with ORT using a left-sided AP except three patients with left septal AP and none of the patients with ORT using a right-sided AP had a corrected PPI-TCL >55 ms."

According to the news editors, the research concluded: "The corrected PPI-TCL after the RV pacing entrainment is useful to guide differentiating ORT using a left-sided AP from a right-sided AP."

The news editors report that additional information may be obtained by contacting W. Boonyapisit, Division of Cardiology, Dept. of Medicine, Faculty of Medicine Siriraj Hospital, Mahidol University, Bangkok, Thailand. Additional authors for this research include
Recent Studies from Manipal University Add New Data to Clostridium difficile (Characterization Of Clostridium Difficile Isolated From Diarrheal Patients In A Tertiary-care Hospital, Karnataka, South India)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - Clostridium difficile. According to news reporting originating from Karnataka, India, by NewsRx correspondents, research stated, "Increase in Clostridium difficile infection in tertiary-care hospitals in Karnataka, South India with a paucity of data on antibiotic susceptibility and genetic characteristics of the pathogen from this region of the country necessitated this study. From April 2012 to December 2014, 480 hospitalized antibiotic-associated diarrhea cases with a history of antibiotic treatment in the previous three weeks were enrolled."

Our news editors obtained a quote from the research from Manipal University, "Sixteen percent of the samples were positive for C. difficile toxins A and B by rapid enzyme immunoassay, anaerobic culture and multiplex PCR. In 40 representative strains, minimum inhibitory concentrations (MICs) determined by E-test revealed that 39 strains were resistant to imipenem and moxifloxacin (MIC > 32 μg/ml), 38 to clindamycin (MIC > 256 μg/ml) and 19 to tetracycline (MIC > 4 μg/ml), while all 40 strains were susceptible to ampicillin (MIC < 2 μg/ml), ampicillin sulbactam (MIC < 8 μg/ml), metronidazole (MIC < 8 μg/ml) and vancomycin group (MIC <2 μg/ml). Pulsed field gel-electrophoresis (PFGE) of 13 representative strains grouped them into three clusters: cluster A consisting of two strains having > 65% similarity, cluster B of 6 strains with 100% similarity (considered clonal) and 3 strains with > 85% similarity, and cluster C of 2 strains with 50% similarity. Clusters A and C contained unrelated strains having different antibiograms."

According to the news editors, the research concluded: "Periodic monitoring of resistance profiles with epidemiological typing by PFGE should aid in interpretation of emerging drug resistant C. difficile clones."

For more information on this research see: Characterization Of Clostridium Difficile Isolated From Diarrheal Patients In A Tertiary-care Hospital, Karnataka, South India. Southeast Asian Journal of Tropical Medicine and Public Health, 2016;47(6):1221-1230. Southeast Asian Journal of Tropical Medicine and Public Health can be contacted at: Southeast Asian Ministers Educ Organization, Seameo-Tropmed, 420-6 Rajvithi Rd, Bangkok 10400, Thailand.

The news editors report that additional information may be obtained by contacting B. Mamatha, Manipal Univ, Cent Res Lab, Enter Dis Div, Manipal, Karnataka, India. Additional
authors for this research include B. Mamatha, P.M. Mukhyaprana, H.H. Manjunatha, P.P. Gururaja and R. Thandavarayan.

Keywords for this news article include: Karnataka, India, Asia, Gram-Positive Endospore-Forming Bacteria, Gram-Positive Endospore-Forming Rods, Clostridium, Epidemiology, Gram-Positive Bacteria, Clostridium difficile, Antibacterial Agents, Drugs and Therapies, Antimicrobials, Antibiotics, Genetics, Diarrhea, Manipal University.

**Drugs and Therapies - Natural Penicillins**

**Recent Studies from McMaster University Add New Data to Natural Penicillins (Structural and Kinetic Characterization of Diazabicyclococtanes as Dual Inhibitors of Both Serine-b-Lactamases and Penicillin-Binding Proteins)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Natural Penicillins are presented in a new report. According to news reporting out of Hamilton, Canada, by NewsRx editors, research stated, "Avibactam is a diazabicyclococtane b-lactamase inhibitor possessing outstanding but incomplete efficacy against multidrug-resistant Gram-negative pathogens in combination with b-lactam antibiotics. Significant pharmaceutical investment in generating derivatives of avibactam warrants a thorough characterization of their activity."

Funders for this research include Howard Hughes Medical Institute, Canadian Institutes of Health Research, Canada Foundation for Innovation, Canada Research Chairs, Natural Sciences and Engineering Research Council of Canada, British Columbia Knowledge Development Fund.

Our news journalists obtained a quote from the research from McMaster University, "We show here through structural and kinetic analysis that select diazabicyclooctane derivatives display effective but varied inhibition of two clinically important b-lactamases (CTX-M-15 and OXA-48). Furthermore, these derivatives exhibit considerable antimicrobial activity (MIC (<=) 2 mg/mL) against clinical isolates of *Pseudomonas aeruginosa*, *Escherichia coli*, and *Enterobacter* spp. Imaging of cell phenotype along with structural and biochemical experiments unambiguously demonstrate that this activity, in *E. coli*, is a result of targeting penicillin-binding protein 2. Our results suggest that structure-activity relationship studies for the purpose of drug discovery must consider both b-lactamases and penicillin-binding proteins as targets."

According to the news editors, the research concluded: "We believe that this approach will yield next-generation combination or monotherapies with an expanded spectrum of activity against currently untreatable Gram-negative pathogens."

Our news journalists report that additional information may be obtained by contacting A.M. King, MG DeGroote Institute for Infectious Disease Research, McMaster University, Hamilton, Ontario L8S 4K1, Canada. Additional authors for this research include D.T. King, S. French, E. Brouillette, A. Asli, J.A. Alexander, M. Vuckovic, S.N. Maiti, T.R.
Suicide

Recent Studies from McMaster University Add New Data to Suicide (Body Mass Index Is an Important Predictor for Suicide: Results from a Systematic Review and Meta-Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Suicide is now available. According to news reporting originating in Hamilton, Canada, by NewsRx journalists, research stated, "Public health concerns for the independent management of obesity and suicidal behavior are rising. Emerging evidence suggests body weight plays an important role in quantifying the risk of suicide."

Financial supporters for this research include Canadian Institute for Health Research, Brain and Behavior Research Foundation.

The news reporters obtained a quote from the research from McMaster University, "In light of these findings, we aimed to clarify the association between body mass index (BMI) and suicidal behavior by systematically reviewing and evaluating the literature. Studies were identified by searching MEDLINE, EMBASE, PsycINFO, and CINAHL from inception to January 2015, supplemented by hand and grey literature searches. Study screening, data extraction, and risk of bias assessment were conducted in duplicate. We included 38 observational studies. Meta-analyses supported an inverse association between BMI and completed suicide. Pooled summary estimates demonstrated that underweight was significantly associated with an increased risk of completed suicide (HR=1.21, 95% CI 1.07 to 1.36, p=.002), and obesity (HR=0.71, 95% CI 0.56 to 0.89, p=.003) and overweight (HR=0.78, 95% CI 0.75 to 0.82, p<.0001) were significantly associated with a decreased risk of completed suicide relative to normal weight. A qualitative summary of the literature demonstrated conflicting evidence regarding the association between BMI and attempted suicide and revealed no association between BMI and suicidal ideation. BMI may be used to aid the assessment of suicide risk, especially that of completed suicide."

According to the news reporters, the research concluded: "However, unmeasured confounders and systematic biases of individual studies limit the quality of evidence."

For more information on this research see: Body Mass Index Is an Important Predictor for Suicide: Results from a Systematic Review and Meta-Analysis. Suicide and Life-Threatening Behavior, 2016;46(6):697-736. Suicide and Life-Threatening Behavior can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com/; Suicide and Life-Threatening Behavior - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1943-278X)
Recent Studies from Ministry of Health Add New Data to Meningitis (Population Pharmacokinetics and Dosing Regimen Optimization of Meropenem in Cerebrospinal Fluid and Plasma in Patients with Meningitis after Neurosurgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Meningitis. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Meropenem is used to manage postneurosurgical meningitis, but its population pharmacokinetics (PPK) in plasma and cerebrospinal fluid (CSF) in this patient group are not well-known. Our aims were to (i) characterize meropenem PPK in plasma and CSF and (ii) recommend favorable dosing regimens in postneurosurgical meningitis patients."

Financial support for this research came from Ministry of Science and Technology of the People's Republic of China (MOST).

Our news journalists obtained a quote from the research from the Ministry of Health, "Eighty-two patients were enrolled to receive meropenem infusions of 2 g every 8 h (q8h), 1 g q8h, or 1 g q6h for at least 3 days. Serial blood and CSF samples were collected, and concentrations were determined and analyzed via population modeling. Probabilities of target attainment (PTA) were predicted via Monte Carlo simulations, using the target of unbound meropenem concentrations above the MICs for at least 40% of dosing intervals in plasma and at least of 50% or 100% of dosing intervals in CSF. A two-compartment model plus another CSF compartment best described the data. The central, intercentral/peripheral, and intercentral/CSF compartment clearances were 22.2 liters/h, 1.79 liters/h, and 0.01 liter/h, respectively. Distribution volumes of the central and peripheral compartments were 17.9 liters and 3.84 liters, respectively. The CSF compartment volume was fixed at 0.13 liter, with its clearance calculated by the observed drainage amount. The multiplier for the transfer from the central to the CSF compartment was 0.172. Simulation results show that the PTAs increase as infusion is prolonged and as the daily CSF drainage volume decreases."

According to the news editors, the research concluded: "A 4-hour infusion of 2 g q8h with CSF drainage of less than 150 ml/day, which provides a PTA of >90% for MICs of <= 8 mg/liter in blood and of <= 0.5 mg/liter or 0.25 mg/liter in CSF, is recommended."
Oncology - Colon Cancer

Recent Studies from Nanjing University Add New Data to Colon Cancer (MicroRNAs as Regulators, Biomarkers and Therapeutic Targets in the Drug Resistance of Colorectal Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Chemotherapy and targeted therapy are the main options for advanced colorectal cancer (CRC). However, resistance to these therapies is a major challenge in the clinic."

The news reporters obtained a quote from the research from Nanjing University, "Understanding molecular mechanisms and developing effective strategies against the drug resistance are highly desired. Increasing evidence has revealed that microRNAs (miRNAs) are closely linked to drug resistance in CRC. The explosion of knowledge in this field has brought forward new predictive and therapeutic opportunities. In this review, we systemically summarize the roles of miRNAs as regulators, tissue or circulating biomarkers, and therapeutics in the CRC resistance to 5-fluorouracil (5-FU), oxaliplatin and anti-EGFR therapy."

According to the news reporters, the research concluded: "We also discuss the potential unsettled issues and future directions concerning these processes."

For more information on this research see: MicroRNAs as Regulators, Biomarkers and Therapeutic Targets in the Drug Resistance of Colorectal Cancer. Cellular Physiology and Biochemistry, 2016;40(1-2):62-76. Cellular Physiology and Biochemistry can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. Drugs and Therapies - Antineoplastics

Recent Studies from National Defense Medical College Add New Data to Antineoplastics (Impact of UGT1A1 genotype upon toxicities of combination with low-dose irinotecan plus platinum)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antineoplastics. According to news reporting originating from Tokorozawa, Japan, by NewsRx correspondents, research stated, "Irinotecan-induced severe toxicities are possibly related to UGT1A1*6 and *28 genotypes. However, the correlation between UGT1A1 polymorphisms and the risk of toxicities induced by low-dose irinotecan plus platinum combination therapy still remains controversial."

Our news editors obtained a quote from the research from National Defense Medical College, "This prospective observational study aimed to examine the correlation between UGT1A1 genotypes and clinical outcomes of low-dose irinotecan (median 60 mg/m(2), range 25-115 mg/m(2)) plus platinum in Japanese patients with solid tumors. Toxicity profiles were compared between UGT1A1 SNP heterozygotes (hetero-group) and patients with homozygous SNP profile (*6/*6, *28/*28 and *6/*28). Logistic regression models were used to identify independent risk factors for these toxicities. A total of 331 patients were enrolled: 84% with hetero-group and 16% with homo-group. Although the initial irinotecan dose was similar, the dose intensities during the three cycles were significantly lower in the homo-group (p <0.01). Grade 3/4 hematological toxicities were significantly more frequent in the homo-group. Multivariable analysis identified UGT1A1 genotype (p <0.01) as an independent factor for grade 4 hematological toxicity in the first treatment cycle. UGT1A1 genotype has a major impact on the increased risk of severe hematological toxicities, even in low-dose irinotecan regimens."

According to the news editors, the research concluded: "UGT1A1 genotypes are useful biomarkers for predicting severe hematological toxicities in patients treated with irinotecan plus platinum analog."

Recent Studies from National University Add New Data to Neurons (Evidence for a role of glycoprotein M6a in dendritic spine formation and synaptogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Neurons is now available. According to news reporting from Buenos Aires, Argentina, by NewsRx journalists, research stated, "Neuronal glycoprotein M6a belongs to the tetraspan proteolipid protein (PLP) family. Mutations in GPM6A gene have been related to mental disorders like schizophrenia, bipolar disorders and claustrophobia."

The news correspondents obtained a quote from the research from National University, "M6a is expressed mainly in neuronal cells of the central nervous system and it has been extensively related to neuronal plasticity. M6a induces neuritogenesis and axon/filopodium outgrowth; however its mechanism of action is still unresolved. We recently reported that the integrity of the transmembrane domains (TMDs) 2 and 4 are critical for M6a filopodia induction. There is also experimental data suggesting that M6a might be involved in synaptogenesis. In this regard, we have previously determined that M6a is involved in filopodia motility, a process that is described in the first step of the filopodial model for synaptogenesis. In this work we analyzed the possible involvement of M6a in synaptogenesis and spinogenesis, and evaluated the effect of two non-synonymous SNPs present in the coding region of TMD2-GPM6A in these processes. The results showed that endogenous M6a colocalized with both, pre-synaptic (synaptophysin) and post-synaptic (NMDA-R1), markers along of neuronal soma and dendrites. M6a-overexpressing neurons displayed an increased number of synaptophysin and NMDA-R1 puncta and, also, an increased number of colocalization puncta between both markers. Conversely, the number of synaptic puncta markers in neurons expressing nsSNP variants was similar to those of control neurons. Overexpression of M6a is accompanied by an increase in spine density, particularly in mature spines, as compared with neurons expressing...
mGFP or GPM6A nsSNP variants."

According to the news reporters, the research concluded: "Taken together, these results suggest that M6a contributes positively to spine and, likely, synapse formation."

For more information on this research see: Evidence for a role of glycoprotein M6a in dendritic spine formation and synaptogenesis. *Molecular and Cellular Neuroscience*, 2016;77():95-104. *Molecular and Cellular Neuroscience* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Drugs and Therapies - Antiepileptics**

**Recent Studies from Oslo University Hospital Add New Data to Antiepileptics (Discrepancies between physicians' prescriptions and patients' use of antiepileptic drugs)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antiepileptics is now available. According to news originating from Oslo, Norway, by NewsRx correspondents, research stated, "The purpose of this study was to investigate whether prescribed antiepileptic drugs (AEDs) were consistent with what patients actually used, and to explore challenges in treatment and reasons for possible discrepancies according to patients' view of their medication. Anonymized data were collected from a questionnaire distributed to in-and outpatients and their physicians at the National Center for Epilepsy, Norway."

Our news journalists obtained a quote from the research from Oslo University Hospital, "They were asked to report AEDs and dosages currently used. Additionally, 20 patients were interviewed regarding AED treatment. This information was analyzed qualitatively. Answers from 174 patients and their physicians were analyzed. The patients' mean age was 43 years (21-83 years), 85 (49%) were women, and 56% used AED polytherapy (2-5 AEDs). For 56 patients (32%), there was a discrepancy regarding either dosage (n = 70) or prescribed drug (n = 32) (12%). There were discrepancies for all top 10 used drugs, with a similar distribution of patients stating lower or higher doses. Based upon interviews of 20 patients, concerns and challenges in AED treatment were addressed. Polytherapy and adverse effects which reduced the patients' quality of life were the most important obstacles for adherence to the treatment. This study revealed that 32% of the patients had one or more
discrepancies between what the physician had prescribed and what the patients actually used, in either the type or the dosages of AEDs. Polytherapy, adverse effects, and poor adherence were common challenges.

According to the news editors, the research concluded: "Improved communication and information about AEDs may improve adherence and thus treatment outcome."

The news correspondents report that additional information may be obtained from C.J. Landmark, Oslo Univ Hosp, Dept. of Pharmacol, Oslo, Norway. Additional authors for this research include O. Henning, A. Baftiu, A.G. Granas, S.I. Johannessen, K.O. Nakken and C.J. Landmark.

**Life Science Research - Molecular Biology**

**Recent Studies from Peking Union Medical College Add New Data to Molecular Biology (Semisynthetic and SAR Studies of Amide Derivatives of Neocrotocembraneic Acid as Potential Antitumor Agents)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Life Science Research - Molecular Biology. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "A series of novel amide derivatives of cembranoid neocrotocembraneic acid were designed and synthesized."

Our news journalists obtained a quote from the research from Peking Union Medical College, "The antiproliferative activities of these derivatives were evaluated against three human tumor cell lines (the human cervical cancer cell line HeLa, chronic myeloid leukemia cell line K562 and leukemia multidrug-resistant cell line K562/A02). Some of the synthesized compounds exhibited moderate to good activity against all three cancer cell lines."

According to the news editors, the research concluded: "Particularly, compound 8a exhibited more potent antiproliferative activity than the reference drug etoposide against drug-resistant cell line K562/A02, indicating that it possessed a great potential for further development as a multidrug resistance modulator by structural modification."

For more information on this research see: Semisynthetic and SAR Studies of Amide Derivatives of Neocrotocembraneic Acid as Potential Antitumor Agents. Molecules, 2016;21(11):2424-2433. Nursing - Oncology Nursing
Recent Studies from People's Hospital Add New Data to Oncology Nursing (The Chinese version of hospital anxiety and depression scale: Psychometric properties in Chinese cancer patients and their family caregivers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nursing - Oncology Nursing have been published. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "The Hospital Anxiety and Depression Scale (HADS) acts as one of the most frequently used self reported measures in cancer practice. The evidence for construct validity of HADS, however, remains inconclusive."

Our news editors obtained a quote from the research from People's Hospital, "The objective of this study is to evaluate the psychometric properties of the Chinese version HADS (C-HADS) in terms of construct validity, internal consistency reliability, and concurrent validity in dyads of Chinese cancer patients and their family caregivers. This was a cross-sectional study, conducted in multiple centers: one hospital in each of the seven different administrative regions in China from October 2014 to May 2015. A total of 641 dyads, consisting of cancer patients and family caregivers, completed a survey assessing their demographic and background information, anxiety and depression using C-HADS, and quality of life (QOL) using Chinese version SF-12. Data analysis methods included descriptive statistics, confirmatory factor analysis (CFA), and Pearson correlations. Both the two-factor and one-factor models offered the best and adequate fit to the data in cancer patients and family caregivers respectively. The comparison of the two-factor and single-factor models supports the basic assumption of two-factor construct of C-HADS. The overall and two subscales of C-HADS in both cancer patients and family caregivers had good internal consistency and acceptable concurrent validity. The Chinese version of the HADS may be a reliable and valid screening tool, as indicated by its original two-factor structure."

According to the news editors, the research concluded: "The finding supports the basic assumption of two-factor construct of HADS."

Drugs and Therapies - Central Nervous System Agents

Recent Studies from Purdue University Add New Data to Central Nervous System Agents (Improved Release of Celecoxib from High Drug Loading Amorphous Solid Dispersions Formulated with Polyacrylic Acid and Cellulose Derivatives)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Central Nervous System Agents have been published. According to news reporting from West Lafayette, Indiana, by NewsRx journalists, research stated, "Amorphous solid dispersions (ASDs) have been extensively exploited as a strategy for improving the dissolution performance of poorly water-soluble drugs. However, factors underpinning the observed dissolution profiles are not clearly understood, and the choice of polymeric carriers is largely empirical."

Financial support for this research came from Center for Pharmaceutical Processing Research, Purdue University.

The news correspondents obtained a quote from the research from Purdue University. "In the current study, the dissolution performance of a high drug loading ASD containing the poorly water-soluble, anti-inflammatory agent, celecoxib, was optimized by using binary polymers combinations. Polyacrylic acid (PAA), a highly water-soluble polymer, was used to substantially increase the dissolution rate of the drug, while hydroxypropyl methyl cellulose (HPMC) or HPMC acetate succinate (HPMCAS) were added to stabilize the solid amorphous matrix against crystallization upon hydration, as well as to maintain supersaturation. Quantitative measurements of the impact of the polymers on the solution nucleation and growth rates of celecoxib revealed that, while the cellulose derivatives are effective nucleation inhibitors, it is more difficult to completely prevent crystal growth in solutions containing seed crystals, in particular at high supersaturations. Therefore, it is critical to prevent the formation of crystals in the dissolving matrix during dissolution. By using certain ratios of HPMC and PAA, both rapid release as well as crystallization inhibition could be achieved, even at high drug loadings."

According to the news reporters, the research concluded: "Utilizing combinations of polymers may therefore be useful to tailor release profiles while providing optimized crystallization inhibition."

For more information on this research see: Improved Release of Celecoxib from High Drug Loading Amorphous Solid Dispersions Formulated with Polyacrylic Acid and Cellulose Derivatives. Molecular Pharmaceutics, 2016;13(3):873-84. (American Chemical
Recent Studies from Research Hospital Add New Data to Heart Bypass Surgery (Preoperative Platelet to Lymphocyte Ratio Is Associated with Early Morbidity and Mortality after Coronary Artery Bypass Grafting)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Surgery - Heart Bypass Surgery. According to news reporting from Kocaeli, Turkey, by NewsRx journalists, research stated, "To investigate the association of platelet to lymphocyte ratio to mortality and morbidity after coronary artery bypass grafting operation. We evaluated records of 916 patients who underwent coronary artery bypass grafting operation between January 2009 and May 2014 retrospectively."

The news correspondents obtained a quote from the research from Research Hospital, "Patients were grouped as Group 1 (n=604) if the platelet to lymphocyte ratio was above 142 and Group 2 (n=312) if platelet to lymphocyte ratio was below 142. The number of patients who developed a neurologic event during the hospital stay and in the first postoperative month was 7 (1.2%) in Group 1 and 12 (3.8%) in Group 2 for which the difference was statistically significant (p=.007). Early term mortality occurred in 3 patients (0.5%) in Group 1 and in 10 patients (3.2%) in Group 2 for which the difference was statistically highly significant (p=.001). In univariate and multivariate regression analysis, the preoperative platelet to lymphocyte ratio was determined as an independent risk factor for occurrence of atrial fibrillation in the early postoperative period, reoperation for sternum dehiscence, occurrence of a neurologic event, prolonged stay in the hospital and mortality."

According to the news reporters, the research concluded: "In this study, elevated levels of platelet to lymphocyte ratio were associated with mortality and morbidity after coronary artery bypass grafting operation."

Our news journalists report that additional information may be obtained by contacting H. Saskin, Dept. of Cardiovascular Surgery, Derince Training and Research Hospital, Kocaeli, Turkey. Additional authors for this research include C. Duzyol, K.S. Ozcan, R. Aksoy and M. Idiz.

Oncology - Ovarian Cancer

Recent Studies from Sacred Heart Catholic University Add New Data to Ovarian Cancer (Laparoscopic Versus Laparotomic Surgical Staging for Early-Stage Ovarian Cancer: A Case-Control Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Ovarian Cancer are discussed in a new report. According to news reporting originating in Rome, Italy, by NewsRx journalists, research stated, "To evaluate the oncologic outcomes of patients with early-stage ovarian cancer (eOC) managed by laparoscopy or laparotomy in a single high-volume gynecologic cancer center. Retrospective case-control study (Canadian Task Force classification II-2)."

The news reporters obtained a quote from the research from Sacred Heart Catholic University, "Catholic University of the Sacred Heart, Rome, Italy. Data of consecutive women with eOC undergoing comprehensive laparoscopic staging between 2007 and 2013 were matched with a cohort of patients undergoing open surgery between 2000 and 2011. Four-year survival outcomes were analyzed using the Kaplan-Meier method. Sixty women undergoing staging via laparoscopy were compared with a cohort of 120 patients undergoing open surgery. Baseline characteristics were similar between groups. Seventy percent of patients underwent adjuvant platinum based chemotherapy without differences between the 2 groups. Operative time (p =.01), estimated blood loss (p =.032), and median hospital stay (p =.001) were higher in patients submitted to laparotomic versus laparoscopic staging. As of October 2015, median duration of follow-up was 38 months (range, 24-48), recurrent disease was documented in 16 patients (13.3%) in the laparotomic group and in 5 patients (8.3%) in the laparoscopic group (p =.651), without differences in the pattern of recurrence presentation. Four-year progression-free survival (PFS) and overall survival (OS) rates were 89% and 92% in the laparoscopic group, respectively, and 81% and 91% in the laparotomic group, without any statistical significant difference between the groups (4-year PFS p =.651; 4-year OS p =.719)."

According to the news reporters, the research concluded: "The findings of the present study suggests that in the surgical treatment of FIGO stage I ovarian cancer, laparoscopy is associated with equivalent oncologic outcome compared with a conventional abdominal approach."

Our news correspondents report that additional information may be obtained by
contacting V. Gallotta, Sacred Heart Catholic University, Div Gynecol Oncol, Rome, Italy. Additional authors for this research include M. Petrillo, C. Conte, G. Vizzielli, A. Fagotti, G. Ferrandina, F. Fanfani, B. Costantini, V. Carbone and G. Scambia.

Cardiovascular Diseases and Conditions -...

Recent Studies from School of Medicine Add New Data to Atherosclerosis (Intraoperative middle cerebral artery pressure measurements during superficial temporal artery to middle cerebral artery bypass procedures in patients with cerebral ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Atherosclerosis is now available. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "No previous study has monitored middle cerebral artery (MCA) pressure during the superficial temporal artery (STA)-MCA bypass procedure for cerebral atherosclerotic disease. In this paper, the authors describe their method of monitoring MCA pressure and report their initial data on intraoperative MCA pressure and its relationship with hemodynamics prior to and after the bypass procedures."

Our news editors obtained a quote from the research from the School of Medicine, "The results from a total of 39 revascularization procedures performed between 2004 and 2014 were analyzed. The patient group included 27 men and 12 women, and their mean age at surgery was 67.6 years (range 39-83 years). The authors investigated the MCA pressure via the STA during STA-MCA bypass procedures. After one branch of the STA was anastomosed to the MCA, the other branch was connected to an arterial line, and a clip was placed temporally on the main STA trunk to monitor the pre-anastomosis MCA pressure. Simultaneously, the radial artery (RA) pressure was determined before removing the temporal clip to measure the post-anastomosis MCA pressure. The relationship between MCA pressures and single photon emission computed tomography findings and the risk factors for hyperperfusion after STA-MCA bypass were analyzed. The MCA/RA (%) pressure was significantly correlated with that of the resting stenotic/normal side cerebral blood flow (CBF) ratio (%) in the linear regression analysis (slope 1.200, r(2) = 0.3564, F = 20.49, p< 0.0001). The intraoperative MCA pressure was 39.3% of RA pressure in patients with Powers' Stage 2 cerebral atherosclerotic disease. After 1 branch of the STA was anastomosed, the intraoperative MCA pressure increased to 75.3% of the RA pressure. The rate of increase in pressure was significantly correlated with the increase in the STA diameter in the linear regression analysis (slope 2.59, r(2) = 0.205, F = 9.549, p = 0.0038). Hyperperfusion occurred in 2 cases. When mean values for these 2 patients were compared with those for the 37 patients without hyperperfusion, significant differences were found in the stenotic/normal side CBF ratio (p = 0.0001), pre-anastomosis MCA pressure (p = 0.02), rate of increase in pressure (p = 0.02), pre-anastomotic MCA/RA pressure ratio (p =
0.01), vascular reserve (p = 0.0489), and STA diameter (p = 0.0002). The measurement of intraoperative MCA pressure may be a useful technique to assess cerebral perfusion and for predicting the risk of hyperperfusion."

According to the news editors, the research concluded: "Monitoring MCA pressure is recommended during STA-MCA bypass procedures for atherosclerotic disease."

For more information on this research see: Intraoperative middle cerebral artery pressure measurements during superficial temporal artery to middle cerebral artery bypass procedures in patients with cerebral atherosclerotic disease. *Journal of Neurosurgery*, 2016;125 (6):1367-1373. *Journal of Neurosurgery* can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

**Recent Studies from Scripps Research Institute Add New Data to Molecular and Cellular Biology (CRY2 and FBXL3 Cooperatively Degrade c-MYC)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Life Science Research - Molecular and Cellular Biology are presented in a new report. According to news reporting originating from La Jolla, California, by NewsRx correspondents, research stated, "For many years, a connection between circadian clocks and cancer has been postulated. Here we describe an unexpected function for the circadian repressor CRY2 as a component of an FBXL3-containing E3 ligase that recruits T58-phosphorylated c-MYC for ubiquitylation. c-MYC is a critical regulator of cell proliferation; T58 is central in a phosphodegron long recognized as a hotspot for mutation in cancer."

Funders for this research include NIH, Kinship Foundation, Sidney Kimmel Cancer Research Foundation, Lung Cancer Research Foundation, Swedish Research Council, Deutsche Forschungsgemeinschaft, American Heart Association, NIGMS.

Our news editors obtained a quote from the research from Scripps Research Institute, "This site is also targeted by FBXW7, although the full machinery responsible for its turnover has remained obscure. CRY1 cannot substitute for CRY2 in promoting c-MYC degradation. Their unique functions may explain prior conflicting reports that have fueled uncertainty about the relationship between clocks and cancer."

According to the news editors, the research concluded: "We demonstrate that c-MYC is a target of CRY2-dependent protein turnover, suggesting a molecular mechanism for
circadian control of cell growth and a new paradigm for circadian protein degradation."

For more information on this research see: CRY2 and FBXL3 Cooperatively Degrade c-MYC. *Molecular Cell*, 2016;64(4):774-789. *Molecular Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Molecular Cell - www.journals.elsevier.com/molecular-cell/)

The news editors report that additional information may be obtained by contacting K.A. Lamia, Scripps Res Inst, Dept. of Physiol Chem, La Jolla, CA 92037, United States. **Oncology - Pancreatic Cancer**

**Recent Studies from Shanghai Jiao-Tong University Add New Data to Pancreatic Cancer (Periostin promotes the chemotherapy resistance to gemcitabine in pancreatic cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Pancreatic Cancer. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Pancreatic ductal adenocarcinoma (PDAC) ranks fourth among cancer-related deaths. The nucleoside analog gemcitabine has been the cornerstone of adjuvant chemotherapy in PDAC for decades."

Financial support for this research came from The National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "However, gemcitabine resistance develops within weeks of chemotherapy initiation, which might be intrinsic to cancer cells and influenced by tumor microenvironment. Recently, pancreatic stellate cells (PSCs) have greatly increased our attention on tumor microenvironment-mediated drug resistance. Periostin is exclusively overexpressed in PSCs and the stroma of PDAC creating a tumor-supportive microenvironment in the pancreas. However, whether periostin contributed to chemoresistance in PDAC remains unknown. Therefore, we focused on the role of periostin in PDAC by observing the effects of silencing this gene on gemcitabine resistance in vitro and in vivo aiming to explore the possible molecular mechanism. In this study, the pancreatic cancer cell (PCC) proliferation and apoptosis were assayed to investigate the sensitivity to gemcitabine after silencing periostin. We provide the evidence that periostin not only drives the carcinogenic process itself but also significantly associated with gemcitabine-induced apoptosis. These findings collectively indicated that periostin increases the chemoresistance to gemcitabine."

According to the news editors, the research concluded: "Thus, targeting periostin..."
might offer a new opportunity to overcome the gemcitabine resistance of PDAC."

The news correspondents report that additional information may be obtained from Q. Zhao, Shanghai Jiao Tong University, Sch Med, Natl Minist Educ, Shanghai 200025, People's Republic of China. Additional authors for this research include F. Li, F. Gao, L.X. Xing, P. Qin, X.X. Liang, J.J. Zhang, X.H. Qiao, L.Z. Lin, Q. Zhao and L.F. Du.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13277-016-5321-6. This DOI is a link to an online electronic document that is either free or for purchase.

**RNA Viruses - Lentivirus**

**Recent Studies from Sichuan University Add New Data to Lentivirus (Effect of lentiviral vector overexpression alpha-calcitonin gene-related peptide on titanium implant osseointegration in alpha-CGRP-deficient mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on RNA Viruses - Lentivirus. According to news reporting originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "Alpha-Calcitonin gene-related peptide (alpha-CGRP) plays a significant pathophysiological role in bone development, metabolism and remodeling around dental implants. However, the half-life of alpha-CGRP in plasma is only 10 min, which affects its long-time application and an alternative approach should be developed to deliver alpha-CGRP over long periods of time."

Our news editors obtained a quote from the research from Sichuan University, "The aim of this study is to investigate whether a lentiviral alpha-CGRP overexpression vector system can express this target-gene longer at peri-implant sites, thus enhancing osseointegration. Animals were divided to the following groups: alpha-CGRP(-/-), alpha-CGRP(-/-) with lentivirus transfection and alpha-CGRP(+/+) mice. MS Spectrum imaging observations identified the successful transfection of alpha-CGRP around experimental implants inserted in the femurs at 5 days after injection. Histomorphometrical analysis indicated an increase of bone-implant contact (BIC) at 1-month healing in the transfection group. Moreover, real-time RT-PCR and western blot results of bone-related markers Runx2, Osterix, and BSP levels elevated in lentivirus-transfected mice at 21 days, compared to the untreated alpha-CGRP(-/-) mice. There was no significant difference between the transfection group and alpha-CGRP(+/+) group.
Further alpha-CGRP protein detection confirmed the persistent expression of this transgene at 21 days post-operatively."

According to the news editors, the research concluded: "These results suggest that this lentiviral vector system expresses alpha-CGRP in an effective, appropriate and sustained manner, which might have a potential application in enhancing titanium implant osseointegration."

The news editors report that additional information may be obtained by contacting P. Gong, Sichuan University, West China Hosp Stomatol, Dept. of Implantol, Chengdu 610041, People's Republic of China. Additional authors for this research include L. Ma, N. Wei, T.L. Wang, Q.Q. Yao, B. Yang, Y. Xiong, Y.Y. Wu and P. Gong.

Heart Disorders and Diseases - Heart Failure
Recent Studies from St Anselm College Add New Data to Heart Failure (Planning for Deactivation of Implantable Cardioverter Defibrillators at the End of Life in Patients With Heart Failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Failure is now available. According to news reporting originating in Manchester, New Hampshire, by NewsRx editors, the research stated, "Implantable cardioverter defibrillators (ICDs) may be burdensome in end-stage heart failure. At the end of life, as many as one-fifth to one-third of patients experience an ICD shock."

The news reporters obtained a quote from the research from St Anselm College, "Critical care nurses should be aware of the potential burden of these shocks at the end of life as well as the ethics and organizational policies surrounding ICD deactivation. This literature review examines the issues surrounding ICD therapy at the end of life. Based on this author's findings, recommendations for discussing and implementing ICD deactivation are offered. Health care organizations should have clear policies addressing ICD deactivation to provide for seamless integration of palliative care services throughout the course of heart failure."

According to the news reporters, the research concluded: "These policies should empower nurses to activate resources in a timely manner and should clearly outline processes for ICD deactivation."

For more information on this research see: Planning for Deactivation of Implantable Cardioverter Defibrillators at the End of Life in Patients With Heart Failure. Critical Care Nurse, 2016;36(6):24-31. Critical Care Nurse can be contacted at: Amer Assoc Critical Care
Recent Studies from Sungkyunkwan University Add New Data to Sepsis (Genipin alleviates sepsis-induced liver injury by restoring autophagy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Blood Diseases and Conditions - Sepsis have been presented. According to news reporting out of Suwon, South Korea, by NewsRx editors, research stated, "Autophagy is an essential cytoprotective system that is rapidly activated in response to various stimuli including inflammation and microbial infection. Genipin, an aglycon of geniposide found in gardenia fruit, is well known to have anti-inflammatory, antibacterial and antioxidative properties."

Funders for this research include Ministry of Science, ICT & Future Planning, So-Jin Kim.

Our news journalists obtained a quote from the research from Sungkyunkwan University, "This study examined the protective mechanisms of genipin against sepsis, with particular focus on the autophagic signalling pathway. Mice were subjected to sepsis by caecal ligation and puncture (CLP). Genipin (1, 2.5 and 5 mg?kg(-1) ) or vehicle (saline) was injected i.v. immediately (0 h) after CLP, and chloroquine (60 mg?kg(-1) ), an autophagy inhibitor, was injected i.p. 1 h before CLP. Blood and liver tissues were isolated 6 h after CLP. Genipin improved survival rate and decreased serum levels of aminotransferases and pro-inflammatory cytokines after CLP; effects abolished by chloroquine. The liver expression of autophagy-related protein (Atg)12-Atg5 conjugate increased after CLP, and this increase was enhanced by genipin. CLP decreased Atg3 protein liver expression, and genipin attenuated this decrease. CLP impaired autophagic flux, as indicated by increased liver expression of microtubule-associated protein-1 light chain 3-II and sequestosome-1/p62 protein; this impaired autophagic flux was restored by genipin, and chloroquine abolished this effect. Genipin also attenuated the decreased expression of lysosome-associated membrane protein-2 and Rab7 protein and increased expression of calpain 1 protein induced by CLP in the liver. Our findings suggest that genipin protects against septic injury by restoring impaired autophagic flux."

According to the news editors, the research concluded: "Therefore, genipin might be a potential therapeutic agent for the treatment of sepsis."

For more information on this research see: Genipin alleviates sepsis-induced liver injury by restoring autophagy. *British Journal of Pharmacology*, 2016;173(6):980-91. *British Journal of Pharmacology* can be contacted at: Nature Publishing Group, 345 Park Avenue

Our news journalists report that additional information may be obtained by contacting H.I. Cho, School of Pharmacy, Sungkyunkwan University, Suwon, 440-746, South Korea. Additional authors for this research include S.J. Kim, J.W. Choi and S.M Lee.

Life Science Research - Molecular and Cellular Biology

Recent Studies from Swiss Federal Institute of Technology Add New Data to Molecular and Cellular Biology (The MMS22L-TONSL heterodimer directly promotes RAD51-dependent recombination upon replication stress)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Life Science Research - Molecular and Cellular Biology have been presented. According to news reporting from Zurich, Switzerland, by NewsRx journalists, research stated, "Homologous recombination (HR) is a key pathway that repairs DNA double-strand breaks (DSBs) and helps to restart stalled or collapsed replication forks. How HR supports replication upon genotoxic stress is not understood."

The news correspondents obtained a quote from the research from the Swiss Federal Institute of Technology, "Using invivo and invitro approaches, we show that the MMS22L-TONSL heterodimer localizes to replication forks under unperturbed conditions and its recruitment is increased during replication stress in human cells. MMS22L-TONSL associates with replication protein A (RPA)-coated ssDNA, and the MMS22L subunit directly interacts with the strand exchange protein RAD51. MMS22L is required for proper RAD51 assembly at DNA damage sites invivo, and HR-mediated repair of stalled forks is abrogated in cells expressing a MMS22L mutant deficient in RAD51 interaction. Similar to the recombination mediator BRCA2, recombinant MMS22L-TONSL limits the assembly of RAD51 on dsDNA, which stimulates RAD51-ssDNA nucleoprotein filament formation and RAD51-dependent strand exchange activity invitro."

According to the news reporters, the research concluded: "Thus, by specifically regulating RAD51 activity at uncoupled replication forks, MMS22L-TONSL stabilizes perturbed replication forks by promoting replication fork reversal and stimulating their HR-mediated restart invivo."

For more information on this research see: The MMS22L-TONSL heterodimer directly promotes RAD51-dependent recombination upon replication stress. *Embo Journal*, 2016;35(23):2584-2601. *Embo Journal* can be contacted at: Wiley-Blackwell, 111 River St,
Apoptosis

Recent Studies from Takeda Pharmaceutical Add New Data to Apoptosis [An inhibitor of apoptosis protein antagonist T-3256336 potentiates the antitumor efficacy of the Nedd8-activating enzyme inhibitor pevonedistat (TAK-924/MLN4924)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Apoptosis have been presented. According to news reporting originating from Fujisawa, Japan, by NewsRx correspondents, research stated, "Inhibitors of apoptosis proteins (IAPs) are antiapoptotic regulators that block cell death, and are frequently overexpressed in several human cancers, where they facilitate evasion of apoptosis and promote cell survival. IAP antagonists are also known as second mitochondria-derived activator of caspase (SMAC)-mimetics, and have recently been considered as novel therapeutic agents for inducing apoptosis, alone and in combination with other anticancer drugs."

Our news editors obtained a quote from the research from Takeda Pharmaceutical, "In this study, we showed that T-325636, the orally available IAP antagonist has synergistically enhances the antiproliferative effects of the NEDD8-activating enzyme (NAE) inhibitor pevonedistat (TAK-924/MLN4924), and these effects were attenuated by a TNF alpha-neutralizing antibody. In the present mechanistic analyses, pevonedistat induced TNF alpha mRNA and triggered IAP antagonist-dependent extrinsic apoptotic cell death in cancer cell lines. Furthermore, synergistic effects of the combination of T-325636 and pevonedistat were demonstrated in a HL-60 mouse xenograft model."

According to the news editors, the research concluded: "Our findings provide mechanistic evidence of the effects of IAP antagonists in combination with NAE inhibitors, and demonstrate the potential of a new combination therapy for cancer."

Therapeutics

Recent Studies from University Health Network Add New Data to Therapeutics (Investigation of the 4D composite MR image distortion field associated with tumor motion for MR-guided radiotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Therapeutics is the subject of a report. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "Magnetic resonance (MR) images are affected by geometric distortions due to the specifics of the MR scanner and patient anatomy. Quantifying the distortions associated with mobile tumors is particularly challenging due to real anatomical changes in the tumor's volume, shape, and relative location within the MR imaging volume."

Our news editors obtained a quote from the research from University Health Network, "In this study, the authors investigate the 4D composite distortion field, which combines the effects of the susceptibility-induced and system-related distortion fields, experienced by mobile lung tumors. The susceptibility (ch) effects were numerically simulated for two specific scenarios: (a) a full motion cycle of a lung tumor due to breathing as depicted on ten phases of a 4D CBCT data set and (b) varying the tumor size and location in lung tissue via a synthetically generated sphere with variable diameter (4-80 mm). The ch simulation procedure relied on the segmentation and generation of 3D susceptibility (ch) masks and computation of the magnetic field by means of finite difference methods. A system-related distortion field, determined with a phantom and image processing algorithm, was used as a reference. The 4D composite distortion field was generated as the vector summation of the ch-induced and system-related fields. The analysis was performed for two orientations of the main magnetic field (B0), which correspond to several MRIgRT system configurations. Specifically, B0 was set along the z-axis as in the case of a cylindrical-bore scanner and in the (x,y)-plane as for a biplanar MR. Computations were also performed for a full revolution at 15° increments in the case of a rotating biplanar magnet. Histograms and metrics such as maximum, mean, and range were used to evaluate the characteristics of the 4D distortion field. The ch-induced field depends on the change in volume and shape of the moving tumor as well as the local surrounding anatomy. In the case of system-related distortions, the tumor experiences increased field perturbations as it moves further away from the MR isocenter. For a mobile lung tumor, the 4D composite field, corresponding to a 1.5 T field and a readout gradient of 5 mT/m, amounts to 3.0 and 2.8 mm for the MRIgRT system designs featuring B0 oriented along the z-axis (cylindrical-bore scanner) and in the (x,y)-plane (biplanar scanner), respectively. For a rotating biplanar scanner, the composite distortion field varied nonlinearly with the rotation.
Overall, the dominant contribution to the composite field was from the system-related distortion field. The tumor centroid experienced a systematic shift of 2 mm and showed a negligible perturbation for different B0 values. The dependency on the tumor size was also investigated, namely the max values varied from 1.2 to 2.5 mm for spherical volumes with a diameter between 4 and 80 mm. The composite distortion field requires adequate quantification for lung radiation therapy applications such as treatment planning, pretreatment patient setup verification, and real-time treatment delivery guidance. For certain scenarios such as small tumor volumes, the spatial distortions may be corrected by applying systematic shifts derived from a single tumor motion phase.

According to the news editors, the research concluded: "In the case of high readout gradients common to fast imaging applications, the distortions were found to be less than 1 mm irrespective of scanner configuration."

Oncology - Gastric Cancer

Recent Studies from University Hospital Add New Data to Gastric Cancer (In the nick of time: arterial thrombosis on starting combination chemotherapy in metastatic gastric adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gastric Cancer. According to news reporting out of Birmingham, United Kingdom, by NewsRx editors, research stated, "A 70-year-old man newly diagnosed with metastatic gastric adenocarcinoma was started on standard first-line palliative chemotherapy with anthracycline (epirubicin), platinum (oxaliplatin) and fluoropyrimidine (capecitabine); EOX combination chemotherapy. 5 days after the first cycle of chemotherapy, he presented with tachycardia with associated severe abdominal and lumbar pains. Initial investigations confirmed life-threatening metabolic acidosis with
serum lactate of 9.7 mmol/L (normal range 0.5-2.2 mmol/L)."

Our news journalists obtained a quote from the research from University Hospital, "CT angiogram identified acute arterial thrombosis within the abdominal aorta, lumbar and right common iliac artery, which was absent on staging contrast CT scan 6 weeks prior. The patient was immediately anticoagulated and chemotherapy discontinued. Urgent oncology and surgical opinions advised conservative management. The patient responded well to early treatment and survived this acute episode."

According to the news editors, the research concluded: "He was subsequently started on life-long treatment dose enoxaparin and second-line single agent chemotherapy with docetaxel (taxotere), with no reported complications."

For more information on this research see: In the nick of time: arterial thrombosis on starting combination chemotherapy in metastatic gastric adenocarcinoma. Bmj Case Reports, 2016;2016():. (BMJ Publishing Group - group.bmj.com; Bmj Case Reports - casereports.bmj.com)

Oncology - Liver Cancer

Recent Studies from University Hospital Add New Data to Liver Cancer (Prognostic Value of Pre-transplantation Serum Alpha-Fetoprotein Levels in Hepatocellular Carcinoma Recurrence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news reporting from Valencia, Spain, by NewsRx journalists, research stated, "Serum alpha-fetoprotein (AFP) value is still not included in the consensus guidelines to make decisions referring to liver transplantation (LT) for hepatocellular carcinoma (HCC).

Many studies demonstrated the influence of high AFP level in poor prognosis after LT for HCC."

The news correspondents obtained a quote from the research from University Hospital, "We studied 301 consecutive recipients transplanted for HCC from January 2002 to December 2011. The median follow-up was 64.3 months (interquartile range, 41.6-90.8). HCC recurrence was 31.6% when AFP was >400 ng/mL and 50% when AFP was >1,000 ng/mL. Specificity to predict HCC recurrence was 95.1% (95% confidence interval [CI], 91.9-97.1) when AFP was >400 ng/mL and 98.9% (95% CI, 96.8-99.6) when AFP was >1,000 ng/mL. The overall survival (P = .008) and disease-free survival (P = .004) differed between patients groups..."
when an AFP cutoff level of 1,000 ng/mL was used."

According to the news reporters, the research concluded: "The predictive accuracy of high pre-transplantation serum AFP level for HCC post-transplantation recurrence should be used in decision algorithms for LT."

Our news journalists report that additional information may be obtained by contacting E.M. Montalva, Le Fe Univ Hosp, Unit Hepato Biliary Pancreat Surg & Transplantat, Valencia, Spain. Additional authors for this research include M. Cantos, A. Bosca, A. Rubin, C. Vinaixa, P. Granero, J. Maupoey and R. Lopez-Andujar.

Cardiovascular Research

Recent Studies from University Medical Center Add New Data to Cardiovascular Research (Bisphosphonates for cardiovascular risk reduction: A systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Research are discussed in a new report. According to news reporting originating from Utrecht, Netherlands, by NewsRx correspondents, research stated, "Bisphosphonates might be effective in reducing cardiovascular events due to their ability to reduce calcification in arterial walls. We aimed to investigate the effects of treatment with bisphosphonates on the prevention of atherosclerotic processes and cardiovascular disease."

Our news editors obtained a quote from the research from University Medical Center, "Pubmed, Embase and the Cochrane Library were systematically reviewed by two independent investigators for randomized controlled studies published up to January 2016, in which the effect of bisphosphonates on arterial wall disease, cardiovascular events, cardiovascular mortality or all-cause mortality were reported. There was no restriction for the type of population used in the trials. Random-effects models were used to calculate the pooled estimates. 61 trials reporting the effects of bisphosphonates on the outcomes of interest were included. Bisphosphonates had beneficial effects on arterial wall disease regarding arterial calcification (pooled mean percentage difference of 2 trials -11.52 (95% CI -16.51 to -6.52, p< 0.01, I-2 13%), but not on arterial stiffness (pooled mean percentage difference of 2 trials -2.82; 95% CI -10.71-5.07; p = 0.48, I-2 59%). No effect of bisphosphonate treatment on
cardiovascular events was found (pooled RR of 20 trials 1.03; 95% CI 0.91-1.17, I-2 16%), while a lower risk for cardiovascular mortality was observed in patients treated with bisphosphonates (pooled RR of 10 trials 0.81; 95% CI 0.64-1.02; I-2 0%) although not statistically significant. Patients treated with bisphosphonates had a reduced risk of all-cause mortality (pooled RR of 48 trials 0.90; 95% CI 0.84-0.98; I-2 53%). In this systematic review and meta-analysis it is shown that bisphosphonates reduce arterial wall calcification but have no effect on arterial stiffness or on cardiovascular events."

According to the news editors, the research concluded: "Bisphosphonates tend to reduce the risk of cardiovascular mortality and reduce all-cause mortality in various patient groups, including osteoporosis and cancer patients."

For more information on this research see: Bisphosphonates for cardiovascular risk reduction: A systematic review and meta-analysis. *Atherosclerosis*, 2016;252():106-115.

**Drugs and Therapies - Central Nervous System Agents**

**Recent Studies from University Medical Center Add New Data to Central Nervous System Agents [Counter-flow suggests transport of dantrolene and 5-OH dantrolene by the organic anion transporters 2 (OAT2) and 3 (OAT3)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Central Nervous System Agents have been published. According to news reporting originating in Gottingen, Germany, by NewsRx journalists, research stated, "Dantrolene is the only available drug for the treatment of malignant hyperthermia, a life-threatening inborn sensitivity of the ryanodine receptor (RyR1) in skeletal muscles to volatile anesthetics. Dantrolene is metabolized in the liver to 5-OH dantrolene."

The news reporters obtained a quote from the research from University Medical Center, "Both compounds are zwitterions or net negatively charged. Here, we investigated interactions of dantrolene and 5-OH dantrolene with solute carrier (SLC) family members occurring in skeletal muscle cells, hepatocytes, and renal proximal tubule cells. SLC22A8 (organic anion transporter 3, OAT3) was very sensitive to both compounds exhibiting IC50
values of 0.35 +/- 0.03 and 1.84 +/- 0.34 μM, respectively. These IC50 concentrations are well below the plasma concentration in patients treated with dantrolene (3-28 μM). SLC22A7 (OAT2) was less sensitive to dantrolene and 5-OH dantrolene with IC50 values of 15.6 +/- 2.1 and 15.8 +/- 3.2 μM, respectively. SLCO1B1 (OATP1B1), SLCO1B3 (OATP1B3), and SLCO2B1 (OATP2B1) mainly interacted with 5-OH dantrolene albeit with higher IC50 values than those observed for OAT2 and OAT3. Dantrolene and 5-OH dantrolene failed to inhibit uptake of 1-methyl-4-phenylpyrimidinium (MPP) by OCT1 and of carnitine by OCTN2. In counter-flow experiments on OAT3, dantrolene and 5-OH dantrolene decreased pre-equilibrated cellular [H-3]estrone-3-sulfate (ES) content as did the transported substrates glutarate, furosemide, and bumetanide. With OAT2, dantrolene and 5-OH dantrolene slightly decreased the pre-equilibrated [H-3] cGMP content."

According to the news reporters, the research concluded: "If no other transporter markedly contributes to uptake or release of ES or cGMP, respectively, these data suggest that OAT3 and OAT2 may be involved in absorption, metabolism, and excretion of dantrolene and its metabolite 5-OH dantrolene."

For more information on this research see: Counter-flow suggests transport of dantrolene and 5-OH dantrolene by the organic anion transporters 2 (OAT2) and 3 (OAT3). Pflugers Archiv-European Journal of Physiology, 2016;468(11-12):1909-1918. Pflugers Archiv-European Journal of Physiology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

Our news correspondents report that additional information may be obtained by contacting B.C. Burckhardt, Univ Med Center Gottingen, Inst System Physiol & Pathophysiol, D-37073 Gottingen, Germany. Additional authors for this research include M. Henjakovic, Y. Hagos and G. Burckhardt.

Biotechnology - Cancer Gene Therapy

Recent Studies from University of Alberta Add New Data to Cancer Gene Therapy (Single and Combinational siRNA Therapy of Cancer Cells: Probing Changes in Targeted and Nontargeted Mediators after siRNA Treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biotechnology - Cancer Gene Therapy have been published. According to news reporting from Edmonton, Canada, by NewsRx journalists, research stated, "Cancer cells are known to be heterogeneous and plastic, which imparts innate and acquired abilities to resist molecular targeting by short interfering RNA (siRNA). Not all cancer cells in a population would show a similar responsiveness to targeting of genes critical for their survival and even the responders could quickly transform and switch to alternative
mechanism(s) for their survival."

Funders for this research include Chapman University, Natural Sciences and Engineering Research Council of Canada, Canadian Breast Cancer Foundation, Office of Research, University of Alberta.

The news correspondents obtained a quote from the research from the University of Alberta, "This study was designed to look at this phenomenon by analyzing the effect of siRNA silencing of selected protein mRNAs involved in cell survival and proliferation on other protein mRNAs that could contribute to cell survival. We compared the gene expression profile of the initial population after siRNA silencing to the subpopulation that survived the siRNA silencing, to identify potential overexpressions that might explain the cell survival. Our studies show that silencing well-selected protein mRNAs simultaneously could offer advantages compared to individual siRNA silencing due to an additional impact on the expression level of certain protein mRNAs. We also demonstrate that overexpression of certain protein mRNAs could explain the innate unresponsiveness of a subpopulation of cells."

According to the news reporters, the research concluded: "These observations could be a stepping stone for further investigation of the possibility of significant synergistic effect for this combinational RNA interference strategy."

Our news journalists report that additional information may be obtained by contacting H.M. Aliabadi, University of Alberta, Fac Engn, Dept. of Chem & Mat Engn, Edmonton, AB T6G 2G6, Canada. Additional authors for this research include P. Mandipoor, M. Bisoffi, J.C. Hugh and H. Uludag.

**Oncology**

**Recent Studies from University of Bath Add New Data to Oncology**

(tek1 and MEK2 inhibitors and cancer therapy: the long and winding road)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology have been published. According to news reporting out of Bath, United Kingdom, by NewsRx editors, research stated, "The role of the ERK signalling pathway in cancer is thought to be most prominent in tumours in which mutations in the receptor tyrosine kinases RAS, BRAF, CRAF, MEK1 or MEK2 drive growth
factor-independent ERK1 and ERK2 activation and hence inappropriate cell proliferation and survival. New drugs that inhibit RAF or MEK1 and MEK2 have recently been approved or are currently undergoing late-stage clinical evaluation."

Our news journalists obtained a quote from the research from the University of Bath, "In this Review, we consider the ERK pathway, focusing particularly on the role of MEK1 and MEK2, the 'gatekeepers' of ERK1/2 activity. We discuss their validation as drug targets, the merits of targeting MEK1 and MEK2 versus BRAF and the mechanisms of action of different inhibitors of MEK1 and MEK2."

According to the news editors, the research concluded: "We also consider how some of the systems-level properties (intrapathway regulatory loops and wider signalling network connections) of the ERK pathway present a challenge for the success of MEK1 and MEK2 inhibitors, discuss mechanisms of resistance to these inhibitors, and review their clinical progress."

Our news journalists report that additional information may be obtained by contacting C.J. Caunt, Dept. of Biology and Biochemistry, University of Bath, Claverton Down, Bath BA2 7AY, UK. Additional authors for this research include M.J. Sale, P.D. Smith and S.J Cook.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrc4000. This DOI is a link to an online electronic document that is either free or for purchase.

Diabetes

Recent Studies from University of California Add New Data to Diabetes (Simultaneous in vivo assessment of cardiac and hepatic metabolism in the diabetic rat using hyperpolarized MRS)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Diabetes have been presented. According to news originating from San Francisco, California, by NewsRx correspondents, research stated, "Understanding and assessing diabetic metabolism is vital for monitoring disease progression and improving treatment of patients. In vivo assessments, using MRI and MRS, provide non-invasive and accurate measurements, and the development of hyperpolarized C-13 spectroscopy in particular has been demonstrated to provide valuable metabolic data in real time."

Our news journalists obtained a quote from the research from the University of California, "Until now, studies have focussed on individual organs. However, diabetes is a systemic disease affecting multiple tissues in the body. Therefore, we have developed a technique to simultaneously measure metabolism in both the heart and liver during a single acquisition. A hyperpolarized C-13 MRS protocol was developed to allow acquisition of metabolic data from the heart and liver during a single scan. This protocol was subsequently
used to assess metabolism in the heart and liver of seven control male Wistar rats and seven diabetic rats (diabetes was induced by three weeks of high-fat feeding and a 30 mg/kg injection of streptozotocin). Using our new acquisition, we observed decreased cardiac and hepatic pyruvate dehydrogenase flux in our diabetic rat model. These diabetic rats also had increased blood glucose levels, decreased insulin, and increased hepatic triglycerides. Decreased production of hepatic [1-C-13] alanine was observed in the diabetic group, but this change was not present in the hearts of the same diabetic animals. We have demonstrated the ability to measure cardiac and hepatic metabolism simultaneously, with sufficient sensitivity to detect metabolic alterations in both organs.

According to the news editors, the research concluded: "Further, we have non-invasively observed the different reactions of the heart and liver to the metabolic challenge of diabetes."

The news correspondents report that additional information may be obtained from L.M. Le Page, University of California, Dept. of Radiol & Biomed Imaging, San Francisco, CA 94143, United States. Additional authors for this research include D.R. Ball, V. Ball, M.S. Dodd, J.J. Miller, L.C. Heather and D.J. Tyler.

**Mosquito-Borne Diseases - Zika Virus**

**Recent Studies from University of California Add New Data to Zika Virus (Zika virus cell tropism in the developing human brain and inhibition by azithromycin)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mosquito-Borne Diseases - Zika Virus. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "The rapid spread of Zika virus (ZIKV) and its association with abnormal brain development constitute a global health emergency. Congenital ZIKV infection produces a range of mild to severe pathologies, including microcephaly."

Funders for this research include HHS | NIH | National Institute of Neurological Disorders and Stroke (NINDS), Howard Hughes Medical Institute (HHMI), HHS | NIH | National Institute of Mental Health (NIMH), Paul G. Allen Family Foundation, Damon Runyon Cancer Research Foundation (Damon Runyon).

Our news editors obtained a quote from the research from the University of California, "To understand the pathophysiology of ZIKV infection, we used models of the developing brain that faithfully recapitulate the tissue architecture in early to midgestation. We identify the brain cell populations that are most susceptible to ZIKV infection in primary human
tissue, provide evidence for a mechanism of viral entry, and show that a commonly used antibiotic protects cultured brain cells by reducing viral proliferation. In the brain, ZIKV preferentially infected neural stem cells, astrocytes, oligodendrocyte precursor cells, and microglia, whereas neurons were less susceptible to infection. These findings suggest mechanisms for microcephaly and other pathologic features of infants with congenital ZIKV infection that are not explained by neural stem cell infection alone, such as calcifications in the cortical plate. Furthermore, we find that blocking the glia-enriched putative viral entry receptor AXL reduced ZIKV infection of astrocytes in vitro, and genetic knockdown of AXL in a glial cell line nearly abolished infection. Finally, we evaluate 2,177 compounds, focusing on drugs safe in pregnancy. We show that the macrolide antibiotic azithromycin reduced viral proliferation and virus-induced cytopathic effects in glial cell lines and human astrocytes.

According to the news editors, the research concluded: "Our characterization of infection in the developing human brain clarifies the pathogenesis of congenital ZIKV infection and provides the basis for investigating possible therapeutic strategies to safely alleviate or prevent the most severe consequences of the epidemic."

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
& Wellness Week -- Current study results on Oncology - Thyroid Cancer have been published. According to news originating from Catania, Italy, by NewsRx correspondents, research stated, "The diffuse sclerosing variant (DSV) of papillary thyroid cancer (PTC) is considered an aggressive histotype associated with poor prognosis. However, the available data for both the outcome and best management of this disease are inconsistent."

Our news journalists obtained a quote from the research from the University of Catania, "This study reviewed the current literature by searching PubMed up to November 30, 2015, using the search terms 'diffuse sclerosing variant' and 'papillary thyroid cancer (or carcinoma)' and selecting only studies evaluating recurrent/persistent disease and cancer-related mortality in both DSV and classic PTC (cPTC). The association with some features of aggressiveness at diagnosis, the risk of recurrence or persistence, and the risk of cancer-related death were reported as odds ratio (OR) with confidence intervals (CI). Meta-regression analysis was used to assess the effect of covariates across the studies. Ten studies met the eligibility criteria and contributed 585 DSV and 64,611 cPTC patients. Relative to patients with cPTC, patients with DSV exhibited a higher risk of extrathyroidal extension and lymph node and distant metastases. The risk of persistent/recurrent disease was three times higher in patients with DSV than it was in cPTC patients (OR = 3.19 [CI 1.86-5.49]). This risk was not different when only studies where post-surgical 131 I was routinely administered were considered (OR = 2.07 [CI 0.88-4.90]). The risk of cancer-related mortality was not different between DSV and cPTC (OR = 1.34 [CI 0.76-2.38]). This meta-analysis confirms the aggressive biological behavior of DSV thyroid cancer."

According to the news editors, the research concluded: "When preoperatively suspected, total thyroidectomy with lymph node excision followed by radiiodine therapy should be the correct management for DSV."

For more information on this research see: Outcome of the Diffuse Sclerosing Variant of Papillary Thyroid Cancer: A Meta-Analysis. Thyroid, 2016;26(9):1285-1292. Thyroid can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Health and Medicine - Hematology Research

Recent Studies from University of Pennsylvania Add New Data to Hematology Research [Real-world clinical experience in the Connect ((R)) chronic lymphocytic leukaemia registry: a prospective cohort study of 1494 patients across 199 US centres]
Investigators publish new report on Health and Medicine - Hematology Research. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "The clinical course of chronic lymphocytic leukaemia (CLL) is heterogeneous, and treatment options vary considerably. The Connect(®) CLL registry is a multicentre, prospective observational cohort study that provides a real-world perspective on the management of, and outcomes for, patients with CLL."

Our news editors obtained a quote from the research from the University of Pennsylvania, "Between 2010 and 2014, 1494 patients with CLL and that initiated therapy, were enrolled from 199 centres throughout the USA (179 community-, 17 academic-, and 3 government-based centres). Patients were grouped by line of therapy at enrolment (LOT). We describe the clinical and demographic characteristics of, and practice patterns for, patients with CLL enrolled in this treatment registry, providing patient-level observational data that represent real-world experiences in the USA. Fluorescence in situ hybridization (FISH) analyses were performed on 49 <bold > </bold >3% of patients at enrolment. The most common genetic abnormalities detected by FISH were del(13q) and trisomy 12 (45 <bold > </bold >7% and 20 <bold > </bold >8%, respectively). Differences in disease characteristics and comorbidities were observed between patients enrolled in LOT1 and combined LOT2/3 cohorts. Important trends observed include the infrequent use of genetic prognostic testing, and differences in patient characteristics for patients receiving chemoimmunotherapy combinations."

According to the news editors, the research concluded: "These data represent experiences of patients with CLL in the USA, which may inform treatment decisions in everyday practice."

The news editors report that additional information may be obtained by contacting A. Mato, University of Pennsylvania, Abramson Canc Center, Center CLL, Philadelphia, PA 19104, United States. Additional authors for this research include C. Nabhan, N.E. Kay, M.A. Weiss, N. Lamanna, T.J. Kipps, D.L. Grinblatt, I.W. Flinn, M.F. Kozloff, C.R. Flowers, C.M. Farber, P. Kiselev, A.S. Swern, K. Sullivan, E.D. Flick and J.P. Sharman.

Drugs and Therapies - Antifungals
Recent Studies from University of Texas Add New Data to Antifungals (Albumin Enhances Caspofungin Activity against Aspergillus Species by Facilitating Drug Delivery to Germinating Hyphae)

Recent Studies from University of Texas Add New Data to Antifungals (Albumin Enhances Caspofungin Activity against Aspergillus Species by Facilitating Drug Delivery to Germinating Hyphae)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Drugs and Therapies - Antifungals are discussed in a new report. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "The modest in vitro activity of echinocandins against Aspergillus implies that host-related factors augment the action of these antifungal agents in vivo. We found that, in contrast to the other antifungal agents (voriconazole, amphotericin B) tested, caspofungin exhibited a profound increase in activity against various Aspergillus species under conditions of cell culture growth, as evidenced by a (>=)4-fold decrease in minimum effective concentrations (MECs) (p=0.0005)."

The news correspondents obtained a quote from the research from the University of Texas, "Importantly, the enhanced activity of caspofungin against Aspergillus spp. under cell culture conditions was strictly dependent on serum albumin and was not observed with the other two echinocandins, micafungin and anidulafungin. Of interest, fluorescently labeled albumin bound preferentially on the surface of germinating Aspergillus hyphae, and this interaction was further enhanced upon treatment with caspofungin. In addition, supplementation of cell culture medium with albumin resulted in a significant, 5-fold increase in association of fluorescently labeled caspofungin with Aspergillus hyphae (p <0.0001)."

According to the news reporters, the research concluded: "Collectively, we found a novel synergistic interaction between albumin and caspofungin, with albumin acting as a potential carrier molecule to facilitate antifungal drug delivery to Aspergillus hyphae."

For more information on this research see: Albumin Enhances Caspofungin Activity against Aspergillus Species by Facilitating Drug Delivery to Germinating Hyphae. *Antimicrobial Agents and Chemotherapy*, 2015;60(3):1226-33. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news journalists report that additional information may be obtained by contacting D.P. Kontoyiannis, Dept. of Infectious Diseases, The University of Texas, MD Anderson Cancer Center, Houston, Texas, United States. Additional authors for this research include A. Andrianaki, T. Akoumianaki, I. Kyrmizi, N. Albert, D. Perlin, G. Samonis, D.P. Kontoyiannis and G. Chamilos.

**Gram-Negative Bacteria - Pseudomonas aeruginosa**

**Recent Studies from University of Texas Add New Data to Pseudomonas aeruginosa (Ceftazidime/Avibactam: Who Says You Can’t Teach an Old Drug New Tricks?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gram-Negative Bacteria - Pseudomonas aeruginosa. According to news reporting originating in Richardson, Texas, by NewsRx journalists, research stated, "Gram-negative resistance continues to rise with treatment.
options becoming more limited. Ceftazidime/avibactam was recently approved in the United States and Europe, which combines an established third-generation cephalosporin with a new, unique, non-beta-lactam beta-lactamase inhibitor."

The news reporters obtained a quote from the research from the University of Texas, "This review conducts a thorough examination of structure, pharmacology, spectrum of activity, pharmacokinetics/pharmacodynamics, in vitro and clinical efficacy and safety/tolerability of ceftazidime/avibactam, as well as detailed future directions for the agent. Pubmed and clinicaltrials.gov searches, as well as abstracts from the 2015 Interscience Conference on Antimicrobial Agents and Chemotherapy/International Society of Chemotherapy (ICAAC/ICC) and ID Week meetings and the 2016 American Society of Microbiology Microbe meeting, were conducted from January 2004 - September 2016. Relevant search terms included ceftazidime, ceftazidime/avibactam, avibactam, NXL104 and AVE1330A. The US package insert for ceftazidime/avibactam (02/2015) and European public assessment report (06/2016) were also reviewed. In vitro susceptibility for ceftazidime/avibactam displayed potent activity against many Enterobacteriaceae including extended-spectrum-beta-lactamase (ESBL) and carbapenemase-producing strains, as well as Pseudomonas aeruginosa. Phase II clinical trials utilized for approval demonstrated comparable safety and efficacy to imipenem/cilastatin for treatment of complicated urinary tract infections (70.4% vs. 71.4%) and combined with metronidazole compared to meropenem in complicated intra-abdominal infections (91.2% vs 93.4%). Phase III data displayed non-inferior efficacy of ceftazidime/avibactam compared to doripenem for complicated urinary tract infections (70.2% vs 66.2%) and combined with metronidazole compared to meropenem in complicated intra-abdominal infections (82.5% vs 84.9%), as well as comparable safety. Ceftazidime/avibactam was well-tolerated but does require renal adjustments. Additionally, 3 case series and a single case report have demonstrated the potential for ceftazidime/avibactam against multidrug resistant organisms for compassionate use or failure after previous therapy."

According to the news reporters, the research concluded: "By adding avibactam to ceftazidime, clinicians' antimicrobial armamentarium is expanded, potentially increasing the ability to combat multi-drug resistant gram-negative pathogens, particularly ESBL and carbapenemase-producing organisms, as well as Pseudomonas aeruginosa."

Our news correspondents report that additional information may be obtained by contacting R.L. Akins, Univ Texas Dallas, Dept. of Biol Sci, Richardson, TX 75083, United States. Additional authors for this research include J.K. Ortwine and R.L. Akins.

Recent Studies from University of Tokyo Add New Data to Chronic Kidney Disease (Expanding roles of the hypoxia-response network in chronic kidney disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Kidney Diseases and Conditions - Chronic Kidney Disease have been presented. According to news reporting out of Tokyo, Japan, by NewsRx editors, the research stated, "Studies over the last two decades have established tubulointerstitial hypoxia as a final common pathway leading to end-stage kidney disease (ESKD). Chronic kidney disease (CKD) is frequently associated with various degrees of hypoxic injury in distinct tubular segments, depending on the etiology and pathological stages, which constitutes an intricate link among inflammation, oxidative stress and fibrosis."

Financial support for this research came from Japan Society for the Promotion of Science.

Our news journalists obtained a quote from the research from the University of Tokyo, "Resident cells in the kidney are equipped with mechanisms through which they cope with hypoxia. Here, transcription of genes by hypoxia-inducible factors (HIFs) plays a central role. In the ischemic kidney, HIF-1 is expressed in tubular and glomerular epithelial cells and in papillary interstitial cells, whereas HIF-2 is expressed in endothelial cells and interstitial fibroblasts. There is ample evidence that HIF protects the kidney from acute ischemic damage. In CKD, studies suggest that the function of HIF may be suppressed because of factors, such as oxidative stress and uremia, which may underlie the pathogenesis of both CKD and co-existing problems, such as renal anemia. Based on these observations, efforts are in progress to test whether restoration and activation of HIF might protect the kidney from CKD. Initial studies using non-specific or supraphysiological HIF activation suggested that the role of HIF may be multifactorial and depend on pathological context. On the other hand, specific HIF stabilizers, such as prolyl hydroxylase (PHD) inhibitors, are being developed for the treatment of renal anemia."

According to the news editors, the research concluded: "Application of these compounds in experimental CKD may override those previous findings and provide deeper insight into the roles of hypoxia and oxygen-sensing pathways."

For more information on this research see: Expanding roles of the hypoxia-response network in chronic kidney disease. *Clinical and Experimental Nephrology.* 2016;20(6):835-844. *Clinical and Experimental Nephrology* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Recent Studies from University of Tokyo Add New Data to Gastric Cancer (Production of Cisplatin-Incorporating Hyaluronan Nanogels via Chelating Ligand-Metal Coordination)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gastric Cancer have been presented. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Hyaluronan (HA) is a promising drug carrier for cancer therapy because of its CD44 targeting ability, good biocompatibility, and biodegradability. In this study, cisplatin (CDDP)-incorporating HA nanogels were fabricated through a chelating ligand-metal coordination cross-linking reaction."

Financial supporters for this research include Ministry of Education, Culture, Sports, Science, and Technology, Japan Society for the Promotion of Science, Ministry of Health, Labour and Welfare.

The news correspondents obtained a quote from the research from the University of Tokyo, "We conjugated chelating ligands, iminodiacetic acid or malonic acid, to HA and used them as a precursor polymer. By mixing the ligand-conjugated HA with CDDP, cross-linking occurred via coordination of the ligands with the platinum in CDDP, resulting in the spontaneous formation of CDDP-loaded HA nanogels. The nanogels showed pH-responsive release of CDDP, because the stability of the ligand-platinum complex decreases in an acidic environment. Cell viability assays for MKN45P human gastric cancer cells and Met-5A human mesothelial cells revealed that the HA nanogels selectively inhibited the growth of gastric cancer cells. In vivo experiments using a mouse model of peritoneal dissemination of gastric cancer demonstrated that HA nanogels specifically localized in peritoneal nodules after the intraperitoneal administration. Moreover, penetration assays using multicellular tumor spheroids indicated that HA nanogels had a significantly higher ability to penetrate tumors than conventional, linear HA."

According to the news reporters, the research concluded: "These results suggest that chelating-ligand conjugated HA nanogels will be useful for targeted cancer therapy."

Our news journalists report that additional information may be obtained by contacting M. Shinohara, Institute of Industrial Science, The University of Tokyo, 4-6-1 Komaba, Meguro-ku, Tokyo 153-8505, Japan. Additional authors for this research include S. Hiramoto, Y. Amano, M. Sato, Y. Suzuki, M. Shinohara, S. Emoto, H. Yamaguchi, H. Ishigami, Y. Sakai, J. Kitayama and T. Ito.

Hereditary Angioedema

Recent Studies from University of Toronto Add New Data to Hereditary Angioedema (C1-esterase inhibitor for short-term prophylaxis in a patient with hereditary angioedema with normal C1 inhibitor function)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hereditary Angioedema is the subject of a report. According to news reporting from Toronto, Canada, by NewsRx journalists, research stated, "Hereditary angioedema with normal C1-esterase inhibitor (HAE-nC1INH) perioperative is a rare condition which could have potential disastrous ramifications for the anesthesiologist in the perioperative period. However, there is limited evidence and/or guidelines on the optimal way to manage these patients."

The news correspondents obtained a quote from the research from the University of Toronto, "We present the case of a patient with HAE-nC1INH who was successfully managed in the perioperative period with plasma derived Cl-esterase inhibitor (pdC1INH). A 29-year-old woman with a diagnosis of HAE-nC1INH presented to the preoperative consultation in preparation for an upcoming total thyroidectomy. She had a 14-year history of ongoing lip and facial edema sometimes necessitating emergency department visitation. Close consultation with her immunologist, transfusion medicine specialists, and anesthesia care providers allowed for a preoperative plan to provide the patient adequate prophylaxis. Both pdC1INH and tranexamic acid were given preoperatively. The patient underwent surgery with no complications."

According to the news reporters, the research concluded: "A multi-disciplinary team of clinical immunologists, transfusion medicine specialists, and anesthesiologists facilitated the successful perioperative management of a patient with HAE-nC1INH; pdC1INH may a suitable prophylactic perioperative therapy for this rare patient population."

Our news journalists report that additional information may be obtained by contacting A. Alam, University of Toronto, Sunnybrook Hlth Sci Center, Dept. of Anesthesia Trauma Emergency & Crit Care Prog, Toronto, ON M4N 3M5, Canada. Additional authors for this research include J. Callum and A. Alam.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jclinane.2016.08.042. This DOI is a link to an online electronic document that is either free or for purchase.

Recent Studies from University of Wollongong Add New Data to Vaccination (Australian general practice nurse's knowledge, attitudes and practices regarding influenza vaccination: a cross-sectional survey)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Vaccination are discussed in a new report. According to news reporting originating from Wollongong, Australia, by NewsRx correspondents, research stated, "Aims and objectives. The aim of this study was to examine the knowledge, attitudes and practices of Australian general practice nurses (GPNs) regarding influenza vaccination."

Our news editors obtained a quote from the research from the University of Wollongong, "Despite the evidence for the benefits of influenza vaccination, vaccination rates remain sub-optimal. The knowledge, attitudes and practices of nurses both affects vaccination rates and the advice given to consumers. Given their significant role in opportunistic and planned vaccinations, GPNs are in an optimal position to positively influence vaccination rates. A descriptive cross-sectional survey was used. GPNs were recruited by email to complete an online survey. The survey tool comprised the King's College Nurses' Influenza Vaccination Questionnaire and adapted demographic items. Data analysis used descriptive and inferential statistics. Open-ended questions were analysed using thematic analysis. Most of the 85 respondents had received the seasonal influenza vaccination in the last year (n = 67; 78.8%); fewer received the H1N1 vaccination (n = 54; 63.5%). Intention to receive vaccination was affected by previous vaccination. Those who had received the seasonal influenza vaccine in the last year had a higher total knowledge score. The seasonal and total influenza knowledge score was high, with lower scores on the H1N1 sub-scale. A positive correlation was identified between influenza knowledge and risk perception. This study highlighted the high level of knowledge amongst GPNs related to seasonal influenza, whilst identifying a knowledge deficit around the H1N1 items. It demonstrated that GPN's knowledge of seasonal influenza was related to vaccination status and risk perception. Further research is required to explore how this translates into the advice GPNs give to consumers. Relevance to clinical practice. Influenza vaccination should be considered as a key topic for GPN's ongoing professional development. The evidence for links between education and vaccination uptake should encourage employers to facilitate opportunities for this training."

According to the news editors, the research concluded: "Future efforts to increase vaccination uptake in nurses should promote the benefits of vaccination in protecting the individual rather than as a professional responsibility."

For more information on this research see: Australian general practice nurse's knowledge, attitudes and practices regarding influenza vaccination: a cross-sectional survey.

The news editors report that additional information may be obtained by contacting S. Smith, University of Wollongong, Sch Nursing, Wollongong, NSW 2522, Australia. Additional authors for this research include J. Sim and E. Halcomb.

Drugs and Therapies - Cancer Therapy

Recent Studies from Xi'an Jiao Tong University Add New Data to Cancer Therapy (HMGB1-mediated autophagy decreases sensitivity to oxymatrine in SW982 human synovial sarcoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Cancer Therapy are presented in a new report. According to news reporting originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "Oxymatrine (OMT) is a type of alkaloid extracted from a traditional Chinese medicinal herb, Sophora flavescens. Although the antitumor activities of OMT have been observed in various cancers, there are no reports regarding the effects of OMT on human synovial sarcoma."

Our news editors obtained a quote from the research from Xi'an Jiao Tong University, "In the present study, we analyzed the antitumor activities of OMT in SW982 human synovial sarcoma cells and determine whether high mobility group box protein 1 (HMGB1)-mediated autophagy was associated with its therapeutic effects. We found that OMT exhibited antitumor activity in SW982 cells and facilitated increases in autophagy. Inhibition of autophagy by 3-MA or ATG7 siRNA increased the level of apoptosis, which indicated that OMT-induced autophagy protected cells from the cytotoxicity of OMT. Administration of OMT to SW982 cells increased the expression of HMGB1. When HMGB1 was inhibited via HMGB1-siRNA, OMT-induced autophagy was decreased, and apoptosis was increased. Furthermore, we found that HMGB1-siRNA significantly increased the expression of p-Akt and p-mTOR. OMT-induced autophagy may be mediated by the Akt/mTOR pathway, and HMGB1 plays a vital role in the regulation of autophagy."

According to the news editors, the research concluded: "Therefore, we believe that combining OMT with an inhibitor of autophagy or HMGB1 may make OMT more effective in the treatment of human synovial sarcoma."

For more information on this research see: HMGB1-mediated autophagy decreases sensitivity to oxymatrine in SW982 human synovial sarcoma cells. Scientific Reports, 2016;6 ():1-10. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/;
Recent Studies from Yantai University Add New Data to Parkinson's Disease (Intranasal delivery of rotigotine to the brain with lactoferrin-modified PEG-PLGA nanoparticles for Parkinson's disease treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Parkinson's disease. According to news reporting out of Yantai, People's Republic of China, by NewsRx editors, research stated, "Sustainable and safe delivery of brain-targeted drugs is highly important for successful therapy in Parkinson's disease (PD). This study was designed to formulate biodegradable poly(ethylene glycol)-poly(lactic-co-glycolic acid) (PEG-PLGA) nanoparticles (NPs), which were surface-modified with lactoferrin (Lf), for efficient intranasal delivery of rotigotine to the brain for the treatment of PD."

Our news journalists obtained a quote from the research from Yantai University, "Rotigotine NPs were prepared by nanoprecipitation, and the effect of various independent process variables on the resulting properties of NPs was investigated by a Box-Behnken experimental design. The physicochemical and pharmaceutical properties of the NPs and Lf-NPs were characterized, and the release kinetics suggested that both NPs and Lf-NPs provided continuous, slow release of rotigotine for 48h. Neither rotigotine NPs nor Lf-NPs reduced the viability of 16HBE and SH-SY5Y cells; in contrast, free rotigotine was cytotoxic. Qualitative and quantitative cellular uptake studies demonstrated that accumulation of Lf-NPs was greater than that of NPs in 16HBE and SH-SY5Y cells. Following intranasal administration, brain delivery of rotigotine was much more effective with Lf-NPs than with NPs. The brain distribution of rotigotine was heterogeneous, with a higher concentration in the striatum, the primary region affected in PD. This strongly suggested that Lf-NPs enable the targeted delivery of rotigotine for the treatment of PD."

According to the news editors, the research concluded: "Taken together, these results demonstrated that Lf-NPs have potential as a carrier for nose-to-brain delivery of rotigotine for the treatment of PD."

For more information on this research see: Intranasal delivery of rotigotine to the brain with lactoferrin-modified PEG-PLGA nanoparticles for Parkinson's disease treatment. *International Journal of Nanomedicine*, 2016;11():6547-6559. *International Journal of Nanomedicine* can be contacted at: Dove Medical Press Ltd, PO Box 300-008, Albany, Auckland 0752, New Zealand.

Drugs and Therapies - Cardiovascular Agents

Recent Studies from Yonsei University Add New Data to Cardiovascular Agents (Simultaneous Determination of Sildenafil, Tadalafil, and Vardenafil in Pharmaceutical Preparations by High-Temperature Gas Chromatography/Mass Spectrometry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cardiovascular Agents have been published. According to news reporting from Wonju, South Korea, by NewsRx journalists, research stated, "Sildenafil (SD), tadalafil (TD), and vardenafil (VD) are drugs used to treat erectile dysfunction (ED). Pharmaceutical counterfeiting-related SD, TD, and VD compounds are becoming a critical problem due to their harmful side-effects."

The news correspondents obtained a quote from the research from Yonsei University, "Especially, SD and TD are two major counterfeit ED drugs in South Korea. In this study, a new high-temperature gas chromatography/mass spectrometry (HTGC/MS) method was developed for the rapid determination of SD, TD, and VD in pharmaceutical preparations. A HT GC column was introduced for the rapid analysis of high molecular weight and high boiling point compounds. High-speed centrifugation led to shortened time for results. Calibration curves were linear (R (2) = 0.9972) over the concentration ranges of 12.5-100 A mu g mg(-1) for TD and VD, and 25-175 A mu g mg(-1) for SD. The intra- and inter-day precisions were within 7.5 %, while the intra- and inter-day accuracies ranged from -3.0 to 8.0 %. The limits of quantification were 0.7 A mu g mg(-1) (SD and TD) and 0.13 A mu g mg(-1) (VD)."

According to the news reporters, the research concluded: "The recoveries were in the range of 87.3-102.4 %. The developed method was rapid and accurate both for routine quantitative measurement of SD, TD, and VD in pharmaceutical preparations as well as screening their suspected counterfeit compounds."

Ischemia

Recent Studies from Zhongnan Hospital of Wuhan University Add New Data to Ischemia (Effect Of Intraperitoneal Resuscitation With Different Concentrations Of Sodium Pyruvate On Intestinal Ischemia Reperfusion Injury In Hemorrhagic Shock Rat)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Ischemia is now available. According to news reporting originating from Hubei, People's Republic of China, by NewsRx correspondents, research stated, "To determine the effects of intraperitoneal resuscitation (PR) with different concentrations of sodium pyruvate (PY) on intestinal ischemia reperfusion injury in rats hemorrhagic shock (HS). Sixty rats were randomly assigned to six groups."

Our news editors obtained a quote from the research from the Zhongnan Hospital of Wuhan University, "These included: group SHAM, intravenous resuscitation only (VR) group, and four PR groups based on resuscitation fluid: glucose-lactate-based peritoneal dialysis solution (LA), and PY-1.1%, PY-1.6%, and PY-2.2% (concentrations in grams/dL). Mean arterial pressure (MAP) was monitored continuously. Blood pH, base excess (BE), lactate, intestinal myeloperoxidase (MPO), malondialdehyde (MDA), tumor necrosis factor alpha (TNF-alpha), interleukin-6 (IL-6), activated caspase-3, and zonula occludens-1 (ZO-1) were measured; intestinal mucosal damage index (IMDI) and subcellular changes were observed; apoptotic index (AI) was calculated. Three hours after resuscitation, in PY groups, MPO, MDA, and TNF-alpha were significantly lower than VR and LA groups, while pH and BE were higher. PY groups showed less expression of activated caspase-3 but elevated ZO-1. Among PY groups, group PY-1.1% had the lowest MPO, MDA and TNF-alpha, and had less pathological damage and subcellular changes than other experimental groups. PR using PY solution combined with VR provided protection against intestinal ischemia-reperfusion injury following HS and resuscitation. Under the same hypertonic condition, 1.1% PY solution showed significant advantages compared with 2.2% and 1.6% solutions."

According to the news editors, the research concluded: "The underlying mechanisms may include the maintenance of hemodynamic stability, regulation of homeostasis, inhibition of oxidative stress and inflammation, and protection of intestinal epithelial tight junction barrier function."
For more information on this research see: Effect Of Intraperitoneal Resuscitation With Different Concentrations Of Sodium Pyruvate On Intestinal Ischemia Reperfusion Injury In Hemorrhagic Shock Rat. *Shock*, 2016;45(4):441-9. (Lippincott Williams and Wilkins - www.lww.com; Shock - journals.lww.com/shockjournal/pages/default.aspx)

The news editors report that additional information may be obtained by contacting L.L. Jiang, Dept. of Anesthesiology, Zhongnan Hospital of Wuhan University, Wuhan, Hubei, People's Republic of China. **Airborne Disease**

**Report Summarizes Airborne Disease Study Findings from N. Ogata and Co-Researchers (Inactivation of Airborne Bacteria and Viruses Using Extremely Low Concentrations of Chlorine Dioxide Gas)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Airborne Disease. According to news reporting originating from Kyoto, Japan, by NewsRx correspondents, research stated, "Infectious airborne microbes, including many pathological microbes that cause respiratory infections, are commonly found in medical facilities and constitute a serious threat to human health. Thus, an effective method for reducing the number of microbes floating in the air will aid in the minimization of the incidence of respiratory infectious diseases."

Our news editors obtained a quote from the research, "Here, we demonstrate that chlorine dioxide (ClO2) gas at extremely low concentrations, which has no detrimental effects on human health, elicits a strong effect to inactivate bacteria and viruses and significantly reduces the number of viable airborne microbes in a hospital operating room. In one set of experiments, a suspension of *Staphylococcus aureus*, bacteriophage MS2, and bacteriophage PHX174 were released into an exposure chamber. When ClO2 gas at 0.01 or 0.02 parts per million (ppm, volume/volume) was present in the chamber, the numbers of surviving microbes in the air were markedly reduced after 120 min. The reductions were markedly greater than the natural reductions of the microbes in the chamber. In another experiment, the numbers of viable airborne bacteria in the operating room of a hospital collected over a 24-hour period in the presence or absence of 0.03 ppm ClO2 gas were found to be 10.9 ? 6.7 and 66.8 ? 31.2 colony-forming units/m3 (n=9, p<0.001), respectively. Taken together, we conclude that ClO2 gas at extremely low concentrations ( (<=)0.03 ppm) can reduce the number of viable microbes floating in the air in a room."

According to the news editors, the research concluded: "These results strongly support the potential use of ClO2 gas at a non-toxic level to reduce infections caused by the
inhalation of pathogenic microbes in nursing homes and medical facilities."

The news editors report that additional information may be obtained by contacting N. Ogata, Taiko Pharmaceutical Co, Ltd, Seikacho, Kyoto, Japan. Additional authors for this research include M. Sakasegawa, T. Miura, T. Shibata, Y. Takigawa, K. Taura, K. Taguchi, K. Matsubara, K. Nakahara, D. Kato, K. Sogawa and H. Oka.

Neurodegenerative Diseases and Conditions...

Report Summarizes Alzheimer Disease Study Findings from University of Jinan (RPS23RG1 reduces Ab oligomer-induced synaptic and cognitive deficits)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting originating in Guangzhou, People's Republic of China, by NewsRx journalists, research stated, "Alzheimer's disease (AD) is the most common form of dementia in the elderly. It is generally believed that b-amyloidogenesis, tau-hyperphosphorylation, and synaptic loss underlie cognitive decline in AD."

The news reporters obtained a quote from the research from the University of Jinan, "Rps23rg1, a functional retroposed mouse gene, has been shown to reduce Alzheimer's b-amyloid (Ab) production and tau phosphorylation. In this study, we have identified its human homolog, and demonstrated that RPS23RG1 regulates synaptic plasticity, thus counteracting Ab oligomer (oAb)-induced cognitive deficits in mice. The level of RPS23RG1 mRNA is significantly lower in the brains of AD compared to non-AD patients, suggesting its potential role in the pathogenesis of the disease. Similar to its mouse counterpart, human RPS23RG1 interacts with adenylate cyclase, activating PKA/CREB, and inhibiting GSK-3. Furthermore, we show that human RPS23RG1 promotes synaptic plasticity and offsets oAb-induced synaptic loss in a PKA-dependent manner in cultured primary neurons. Overexpression of Rps23rg1 in transgenic mice consistently prevented oAb-induced PKA inactivation, synaptic deficits, suppression of long-term potentiation, and cognitive impairment as compared to wild type littermates."

According to the news reporters, the research concluded: "Our study demonstrates that RPS23RG1 may reduce the occurrence of key elements of AD pathology and enhance synaptic functions to counteract oAb-induced synaptic and cognitive deficits in AD."

For more information on this research see: RPS23RG1 reduces Ab oligomer-induced...
synaptic and cognitive deficits. *Scientific Reports*, 2016;6():18668. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Neurodegenerative Diseases and Conditions -**

**Report Summarizes Amyotrophic Lateral Sclerosis Study Findings from Jozef Stefan Institute [Anti-sense DNA d(GGCCCC)n expansions in C9ORF72 form i-motifs and protonated hairpins]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neurodegenerative Diseases and Conditions - Amyotrophic Lateral Sclerosis. According to news reporting out of Ljubljana, Slovenia, by NewsRx editors, research stated, "The G4C2 hexanucleotide repeat expansion mutation (HREM) in C9ORF72, represents the most common mutation associated with amyotrophic lateral sclerosis (ALS) and frontotemporal lobar degeneration (FTLD). Three main disease mechanisms have been proposed to date: C9ORF72 haploinsufficiency, RNA toxicity, and accumulation of dipeptide repeat proteins."

Our news journalists obtained a quote from the research from Jozef Stefan Institute, "Pure GC content of the HREM potentially enables the formation of various non-B DNA structures such as G-quadruplexes and i-motifs. These structures are proposed to act as promoters and regulatory elements affecting replication, transcription and translation of the surrounding region. G-quadruplexes have already been shown on the G-rich sense DNA and RNA strands (G4C2)n, the structure of the anti-sense (G2C4)n strand remains unresolved. Similar C-rich sequences may, under acidic conditions, form i-motifs consisting of two parallel duplexes in a head to tail orientation held together by hemi-protonated C(+)-C pairs. We show that d(G2C4)n repeats do form i-motif and protonated hairpins even under near-physiological conditions. Rather than forming a DNA duplex, i-motifs persist even in the presence of the sense strand. This preferential formation of G-quadruplex and i-motif/hairpin structures over duplex DNA, may explain HREM replicational and transcriptional instability."

According to the news editors, the research concluded: "Furthermore, i-motifs/hairpins can represent a novel pharmacological target for C9ORF72 associated ALS and FTLD."

For more information on this research see: Anti-sense DNA d(GGCCCC)n expansions in C9ORF72 form i-motifs and protonated hairpins. *Scientific Reports*, 2015;5
Our news journalists report that additional information may be obtained by contacting A. Kovanda, Dept. of Biotechnology, Jožef Stefan Institute, Jamova 39, SI-1000 Ljubljana, Slovenia. Additional authors for this research include M. Zalar, P. Šket, J. Plavec and B. Rogelj.

Drugs and Therapies - Antibiotics

Report Summarizes Antibiotics Study Findings from Medical University (Robust HPLC-MS/MS method for levofloxacin and ciprofloxacin determination in human prostate tissue)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antibiotics have been published. According to news reporting out of Gdansk, Poland, by NewsRx editors, research stated, "Fluoroquinolones are the drugs of choice in the prevention of bacterial infections after transrectal ultrasound guided prostate biopsy. In order to improve assessment of antibacterial efficacy in the target tissue a simple, selective, rapid and robust HPLC-ESI-MS/MS method for the determination of levofloxacin and ciprofloxacin concentrations in human prostate bioptates was developed and validated."

Our news journalists obtained a quote from the research from Medical University, "Preparation procedure for prostate samples (10 mg) was carried out using homogenization and filtration steps. Analyses were performed within 3.5 min using RP C-18 column in the isocratic elution mode with mobile phase composed of a mixture of 0.1% formic acid aqueous solution and 0.1% formic acid methanol solution (v/v; 79:21). The method was linear between 0.3 μg/g and 15 μg/g for levofloxacin and ciprofloxacin with coefficient of correlation (r) >= 0.999. The limit of detection and the limit of quantification for levofloxacin were 0.06 μg/g and 0.2 μg/g and for ciprofloxacin were 0.04 μg/g and 0.13 μg/g, respectively. Average concentrations (+/- SD) of levofloxacin and ciprofloxacin obtained from patients tissue were 5.4 +/- 2.2 μg/g and 3.9 +/- 1.5 μg/g, respectively. Additionally, during validation procedure a novel, experimental design approach was applied for the robustness study. For evaluation of analytical method robustness, Plackett-Burman design was employed and for sample preparation method robustness Fractional Factorial design was used. The developed and validated method was successfully applied to examine prostate tissue samples obtained from patients enrolled into a clinical study."

According to the news editors, the research concluded: "Up to now, there has been no other HPLC-ESI-MS/MS method reported for the simultaneous determination of
levofloxacin and ciprofloxacin in human prostatic tissue."

For more information on this research see: Robust HPLC-MS/MS method for levofloxacin and ciprofloxacin determination in human prostate tissue. *Journal of Pharmaceutical and Biomedical Analysis*, 2017;132():173-183. *Journal of Pharmaceutical and Biomedical Analysis* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Drugs and Therapies - Antibiotics**

**Report Summarizes Antibiotics Study Findings from Shenyang Pharmaceutical University (Determination of Doxorubicin in Stealth Hyaluronic Acid-Based Nanoparticles in Rat Plasma by the Liquid-Liquid Nanoparticles-Breaking Extraction Method: ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antibiotics. According to news reporting originating in Shenyang, People's Republic of China, by NewsRx journalists, research stated, "An efficient extraction of doxorubicin (Dox) from homemade stealth hyaluronic acid (HA)-based nanoparticles (NPs) in rat plasma could not be performed by previously published methods. Therefore, we attempted to establish the novel NPs-breaking and UPLC-MS-MS method for evaluating the pharmacokinetic profiles of the homemade stealth HA NPs in rats."

The news reporters obtained a quote from the research from Shenyang Pharmaceutical University, "The pretreatment method of plasma samples used the liquid-liquid extraction method with isopropyl alcohol as NPs-breaking and protein-precipitating solvents, and the NPs-breaking efficiency of isopropyl alcohol was as high as 97.2%. The analyte and gliclazide (internal standard) were extracted from plasma samples with isopropyl alcohol and were separated on UPLC BEH C-18 with a mobile phase consisting of methanol and water (containing 0.1% formic acid). The method demonstrated good linearity at the concentrations ranging from 5 to 5,000 ng/mL. The intra-and interday relative standard deviations were >10%.

According to the news reporters, the research concluded: "Finally, the method was successfully applied to a pharmacokinetic study of homemade stealth HA-based NPs in rats following intravenous administration."

For more information on this research see: Determination of Doxorubicin in Stealth

**Drugs and Therapies - Antiemetic-Antivertigo Agents**

**Report Summarizes Antiemetic-Antivertigo Agents Study Findings from University of Bari (Carbon monoxide contributes to the constipating effects of granisetron in rat colon)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiemetic-Antivertigo Agents have been published. According to news reporting originating from Bari, Italy, by NewsRx correspondents, research stated, "To investigate the mechanisms underlying the potential contribution of the heme oxygenase/carbon monoxide (HO/CO) pathway in the constipating effects of granisetron. For in vivo studies, gastrointestinal motility was evaluated in male rats acutely treated with granisetron [25, 50, 75 μg/kg/subcutaneous (sc)], zinc protoporphyrin IX [ZnPPIX, 50 μg/kg/intraperitoneal (ip)] and hemin (50 μmol/L/kg/ip), alone or in combination."

Our news editors obtained a quote from the research from the University of Bari, "For in vitro studies, the contractile neurogenic response to electrical field stimulation (EFS, 3, 5, 10 Hz, 14 V, 1 ms, pulse trains lasting 10 s), as well as the contractile myogenic response to acetylcholine (ACh, 0.1-100 μmol/L) were evaluated on colon specimens incubated with granisetron (3 μmol/L, 15 min), ZnPPIX (10 μmol/L, 60 min) or CO-releasing molecule-3 (CORM-3, 100, 200, 400 μmol/L) alone or in combination. These experiments were performed under co-treatment with or without atropine (3 μmol/L, a muscarinic receptor antagonist) or N-G-nitro-L-Arginine (L-NNA, 100 μmol/L, a nitric oxide synthase inhibitor). Administration of granisetron (50, 75 μg/kg) in vivo significantly increased the time to first defecation (P = 0.045 vs vehicle-treated rats), clearly suggesting a constipating effect of this drug. Although administration of ZnPPIX or hemin alone had no effect on this gastrointestinal motility parameter, ZnPPIX co-administered with granisetron abolished the granisetron-induced constipation. On the other hand, co-administration of hemin and granisetron did not modify the increased constipation observed under granisetron alone. When administered in vitro, granisetron alone (3 μmol/L) did not significantly modify the colon's contractile response to either EFS or ACh. Incubation with ZnPPIX alone (10 μmol/L) significantly reduced the..."
colon's contractile response to EFS (P = 0.016) but had no effect on contractile response to ACh. Co-administration of ZnPPIX and atropine (3 μmol/L) abolished the ZnPPIX-mediated decrease in contractile response to EFS. Conversely, incubation with CORM-3 (400 μmol/L) alone increased both the contractile response to EFS at 10 Hz (10 Hz: 71.02 +/- 19.16 vs 116.25 +/- 53.70, P = 0.01) and the contractile response to ACh (100 μmol/L) (P = 0.012). Co-administration of atropine abolished the CORM-3-mediated effects on the EFS-mediated response. When granisetron was co-incubated in vitro with ZnPPIX, the ZnPPIX-mediated decrease in colon contractile response to EFS was lost. On the other hand, co-incubation of granisetron and CORM-3 (400 μmol/L) further increased the colon's contractile response to EFS (at 5 Hz: P = 0.007; at 10 Hz: P = 0.001) and to ACh (ACh 10 μmol/L: P = 0.001; ACh 100 μmol/L: P = 0.001) elicited by CORM-3 alone. L-NNA co-administered with granisetron and CORM-3 abolished the potentiating effect of CORM-3 on granisetron on both the EFS-induced and ACh-induced contractile response.

According to the news editors, the research concluded: "Taken together, findings from in vivo and in vitro studies suggest that the HO/CO pathway is involved in the constipating effects of granisetron."

The news editors report that additional information may be obtained by contacting M.A. De Salvia, Univ Bari Aldo Moro, Sch Med, Dept. of Biomed Sci & Human Oncol, Pharmacol Sect, I-70124 Bari, Italy. Drugs and Therapies - Antiretrovirals

Report Summarizes Antiretrovirals Study Findings from Academic Medical Center (White matter hyperintensities in relation to cognition in HIV-infected men with sustained suppressed viral load on combination antiretroviral therapy)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antiretrovirals are presented in a new report. According to news reporting originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "The objective of this study was to assess whether HIV-infected patients on long-term successful combination antiretroviral therapy (cART) have more extensive white matter hyperintensities (WMH) of presumed vascular origin compared with uninfected controls and whether these intensities are associated with cognitive impairment. Furthermore, we explored potential determinants of increased WMH load long-term suppressed HIV infection."

Our news editors obtained a quote from the research from Academic Medical Center, "A cross-sectional comparison of WMH in an observational cohort. Clinical, cognitive, and MRI data were collected from 103 middle-aged, aviremic HIV-infected men on cART, and 70 HIV-uninfected, otherwise similar controls. In the MRI data, WMH load was quantified by automated approaches and qualitatively reviewed by an experienced neuroradiologist using the Fazekas scale. HIV-infected men had an increased WMH load. Among HIV-infected patients, increased WMH load was independently associated with older age, higher DBP, higher D-dimer levels, and longer time spent with a CD4(+) cell count below 500 cells/ml. HIV-associated cognitive deficits were associated with increased WMH load. WMH are more extensive and associated with cognitive deficits in middle-aged, aviremic cART-treated HIV-infected men. The extent of WMH load was associated with both cardiovascular risk factors and past immune deficiency. As cognitive impairment in these same patients is also associated with these risk factors, this may suggest that in the setting of HIV, WMH, and cognitive deficits share a common cause."

According to the news editors, the research concluded: "This supports the importance of optimizing cardiovascular risk management, and early, effective treatment of HIV infection."

For more information on this research see: White matter hyperintensities in relation to cognition in HIV-infected men with sustained suppressed viral load on combination antiretroviral therapy. *Aids*, 2016;30(15):2329-2339. *Aids* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Report Summarizes Applied Materials & Interfaces Study Findings from Dublin City University (Pulsed-Plasma Physical Vapor Deposition Approach Toward the Facile Synthesis of Multilayer and Monolayer Graphene for Anticoagulation Applications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Materials Research - Applied Materials & Interfaces have been published. According to news reporting originating from Dublin, Ireland, by NewsRx correspondents, research stated, "We demonstrate the growth of multilayer and single-layer graphene on copper foil using bipolar pulsed direct current (DC) magnetron sputtering of a graphite target in pure argon atmosphere. Single-layer graphene (SG) and few-layer graphene (FLG) films are deposited at temperatures ranging from 700 °C to 920 °C within <30 min."

Funders for this research include Science Foundation Ireland, Higher Education Authority.

Our news editors obtained a quote from the research from Dublin City University, "We find that the deposition and post-deposition annealing temperatures influence the layer thickness and quality of the graphene films formed. The films were characterized using atomic force microscopy (AFM), scanning electron microscopy (SEM), high-resolution transmission electron microscopy (HRTEM), Raman spectroscopy, X-ray photoelectron spectroscopy (XPS), and optical transmission spectroscopy techniques. Based on the above studies, a diffusion-controlled mechanism was proposed for the graphene growth. A single-step whole blood assay was used to investigate the anticoagulant activity of graphene surfaces. Platelet adhesion, activation, and morphological changes on the graphene/glass surfaces, compared to bare glass, were analyzed using fluorescence microscopy and SEM techniques. We have found significant suppression of the platelet adhesion, activation, and aggregation on the graphene-covered surfaces, compared to the bare glass, indicating the anticoagulant activity of the deposited graphene films."

According to the news editors, the research concluded: "Our production technique represents an industrially relevant method for the growth of SG and FLG for various applications including the biomedical field."

The news editors report that additional information may be obtained by contacting R.K. Vijayaraghavan, National Centre for Plasma Science and Technology, ‡School of Electronic Engineering, Biomedical Diagnostics Institute and ||School of Physical Sciences, Dublin City University, Glasnevin, Dublin 9, Ireland. Additional authors for this research include C. Gaman, B. Jose, A.P. McCoy, T. Cafolla, P.J. McNally and S. Daniels.

Heart Disorders and Diseases - Arrhythmogenic...

Report Summarizes Arrhythmogenic Right Ventricular Dysplasia Study Findings from University Medical Center (Prolonged Electromechanical Interval Unmasks Arrhythmogenic Right Ventricular Dysplasia/Cardiomyopathy in the Subclinical Stage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Arrhythmogenic Right Ventricular Dysplasia. According to news reporting originating in Utrecht, Netherlands, by NewsRx journalists, research stated, "Arrhythmogenic right ventricular dysplasia/cardiomyopathy (ARVD/C) is characterized by high incidence of ventricular arrhythmias. Overt ARVD/C is preceded by a subclinical stage with lack of detectable ECG and structural abnormalities."

Financial support for this research came from Interuniversity Cardiology Institute of the Netherlands.

The news reporters obtained a quote from the research from University Medical Center, "Activation delay is present before structural abnormalities and is a hallmark of arrhythmogenesis. Deformation imaging may unmask activation delay in the subclinical stage. Three groups were compared: (1) mutation-positive definite ARVD/C-patients fulfilling 2010 Task Force criteria (TFC) (n=44); (2) asymptomatic mutation carriers not fulfilling TFC and without history of ventricular arrhythmias (n=31); and (3) controls (n=30). All underwent ECG and echocardiographic deformation imaging. As a surrogate for local activation delay the electromechanical interval (EMI) was measured, defined as time between onset-QRS and onset of shortening. Arrhythmic outcome (PVC-count, VT) of asymptomatic mutation carriers was correlated with EMI and ECG TFC. In definite ARVD/C-patients, EMI was prolonged in all lateral RV segments. In asymptomatic mutation carriers, prolonged EMI was detected in the subtricuspid area in 14/31. Terminal activation duration (>=)55 milliseconds (definition: supporting information) was the only ECG abnormality in this group (8/31). After a mean follow-up of 4.2 ± 3.1 years 10/31 asymptomatic mutation carriers experienced arrhythmic outcome. Prolonged subtricuspid EMI was the only parameter significantly associated with arrhythmogenesis during follow-up. In ARVD/C-patients, EMI prolongation was present throughout the RV. In asymptomatic mutation carriers, prolonged EMI in the subtricuspid area is often detected without any additional abnormalities."

According to the news reporters, the research concluded: "These preliminary results indicate that prolonged EMI is a new parameter unmasking activation delay in the subclinical stage and may contribute to risk stratification."

Our news correspondents report that additional information may be obtained by contacting T.P. Mast, Dept. of Cardiology, University Medical Center Utrecht, Utrecht, Netherlands. Additional authors for this research include A.J. Teske, A.S. Te Riele, J.A. Groeneweg, J.F. Van Der Heijden, B.K. Velthuis, P. Loh, P.A. Doevendans, T.A. Van Veen, D. Dooijes, J.M. De Bakker, R.N. Hauer and M.J Cramer.

Oncology - Astrocytomas

Report Summarizes Astrocytomas Study Findings from Copenhagen University Hospital (A new NFIA:RAF1 fusion activating the MAPK pathway in pilocytic astrocytoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Astrocytomas is now available. According to news reporting originating in Copenhagen, Denmark, by NewsRx journalists, research stated, "Pilocytic astrocytoma (PA) is one of the most common brain cancers among children and activation of the Mitogen-Activated Protein Kinase (MAPK) pathway is considered the hallmark. In the majority of cases, oncogenic BRAF fusions or BRAF V600E mutations are observed, while RAF1 or NF1 alterations are more rarely found."

The news reporters obtained a quote from the research from Copenhagen University Hospital, "However, in some cases, no apparent cancer driver events can be identified. Here, we describe a novel fusion between the transcription factor nuclear factor 1A (NFIA) and Raf-1 proto- oncogene (RAF1) in a 5-year old boy with PA. The novel fusion was identified as part of a comprehensive genomic tumor profiling. We show that the NFIA:RAF1 fusion results in constitutive Raft kinase activity, leading to activation of downstream MEK1/2 cascade and increased proliferation of cancer cells. The NFIA:RAF1 fusion displayed distinct subcellular localization towards the plasma membrane indicative of Raf-1 activation, in contrast to both wild type NFIA and Raf-1, which were localized in the nucleus and cytoplasm, respectively."

According to the news reporters, the research concluded: "Our data support the existence of rare oncogenic RAF1 fusions with constitutive Raf-1 activity. This highlights the need for broad genetic testing in order to refine diagnostics of PA and to unravel potential treatment options, e.g. with MEK inhibitors."

For more information on this research see: A new NFIA:RAF1 fusion activating the MAPK pathway in pilocytic astrocytoma. Cancer Genetics, 2016;209(10):440-444. Cardiovascular Diseases and Conditions -...

Report Summarizes Atherosclerosis Study Findings from E.A. Ivanova and Co-Researchers (Cellular Model of Atherogenesis Based on Pluripotent Vascular Wall Pericytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news reporting originating in Leuven, Belgium, by NewsRx journalists, research stated, "Pericytes are pluripotent cells that can be found in the vascular wall of both microvessels and large arteries and veins. They have distinct morphology with long branching processes and form numerous contacts with each other and with endothelial cells, organizing the vascular wall cells into a three-dimensional network."

Financial support for this research came from Russian Scientific Foundation.

The news reporters obtained a quote from the research, "Accumulating evidence demonstrates that pericytes may play a key role in the pathogenesis of vascular disorders, including atherosclerosis. Macrovascular pericytes are able to accumulate lipids and contribute to growth and vascularization of the atherosclerotic plaque. Moreover, they participate in the local inflammatory process and thrombosis, which can lead to fatal consequences. At the same time, pericytes can represent a useful model for studying the atherosclerotic process and for the development of novel therapeutic approaches. In particular, they are suitable for testing various substances' potential for decreasing lipid accumulation induced by the incubation of cells with atherogenic low-density lipoprotein."

According to the news reporters, the research concluded: "In this review we will discuss the application of cellular models for studying atherosclerosis and provide several examples of successful application of these models to drug research."

For more information on this research see: Cellular Model of Atherogenesis Based on Pluripotent Vascular Wall Pericytes. Stem Cells International, 2016;2016():7321404. (Hindawi Publishing - www.hindawi.com; Stem Cells International - www.hindawi.com/journals/sci/)

Heart Disorders and Diseases - Atrial Fibrillation

Report Summarizes Atrial Fibrillation Study Findings from University Health Network (Identifying Patients With Atrial Fibrillation in Administrative Data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Atrial Fibrillation are presented in a new report. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "Identifying patients with atrial fibrillation (AF) using administrative data is important for epidemiologic and outcomes research. Although administrative data cover large populations, it is necessary to assess their validity in identifying AF patients."

Our news journalists obtained a quote from the research from University Health Network, "We used Ontario family physician electronic medical records from the Electronic Medical Record Administrative data Linked Database (EMRALD) as a reference standard to assess the accuracy of administrative data algorithms in identifying patients with AF. From a random sample of 7500 adult patients, patients with AF as recorded in family physician records were identified. The optimal algorithm consisted of any of: hospitalization or an emergency room code for AF or prescription for an AF-specific antiarrhythmic agent or billing code for cardioversion, or prescription for an anticoagulant that was accompanied by a physician billing code for arrhythmia. The algorithm sensitivity was 80.7% (95% confidence interval [CI], 75.1-86.3), specificity 99.1% (95% CI, 98.9-99.3), positive predictive value 71.1% (95% CI, 65.1-77.1), and negative predictive value 99.5% (95% CI, 99.3-99.7). This algorithm, applied to the Ontario population, resulted in a calculated increase in AF prevalence from 1.68% to 2.36% over the years 2000-2014. Anticoagulation rates for AF patients increased from 53% in 2011 to 60% in 2014. Among AF patients receiving anticoagulants, novel oral anticoagulant utilization increased from < 5% in 2011 to > 50% in 2014."

According to the news editors, the research concluded: "Identifying patients with AF can be done using administrative data, and the algorithm can be used to assess trends in disease burden over time and patterns of care in large populations."

Our news journalists report that additional information may be obtained by contacting K. Tu, Toronto Western Hosp, Univ Hlth Network, Family Hlth Team, Toronto, ON, Canada. Additional authors for this research include R. Nieuwlaat, S.Y. Cheng, L. Wing, N.
Ivers, C.L. Atzema, J.S. Healey and P. Dorian.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cjca.2016.06.006. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Atrial Fibrillation

Report Summarizes Atrial Fibrillation Study Findings from Zhejiang University (Perindopril for the prevention of atrial fibrillation recurrence after radiofrequency catheter ablation: One-year experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting from Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "Recurrence of atrial fibrillation (AF) after ablation is still high. Perindopril plays an essential role in AF induction and maintenance."

The news correspondents obtained a quote from the research from Zhejiang University, "We aimed to prove that perindopril (8 mg) could prevent recurrence after pulmonary vein isolation. Patients with paroxysmal AF who received radio frequency ablation were randomized to a 3 -month course of perindopril 8 mg once daily (perindopril group) or placebo (placebo group). Angiotensin-II (Ang-II) therapy and standard transthoracic echocardiography were performed. All 256 patients with paroxysmal AF who received radiofrequency ablation were randomized. And we followed them for complete 1 year. The 3 -month recurrence and the 1 -year recurrence were compared between the 2 groups. The 3 -month recurrence of AF was observed in 33 (26.19%) of 126 patients in the placebo group vs 19 (14.62%) 130 patients who received perindopril 8 mg once daily (x2, P =.021). One-year recurrence of AF was observed in 36 (28.5%) of 126 patients in the placebo group as compared with 21 (16.2%) of 130 patients who received perindopril after 1 year (P =.017). The kappa value was 0.94 in the control group (P <.001) and 0.96 in the perindopril group (P <.001) between 3 -month and 1 -year recurrence. The Ang-II level was related to the left atrial distance with the reduction in AF recurrence (r = 0.17, P =.005 at 3 months; r = 0.25, P<.001 at 1 year). Perindopril is an effective and safe treatment for the prevention of AF recurrence after radiofrequency catheter ablation."

According to the news reporters, the research concluded: "This effect seems to be strongly associated with a significant decrease in Ang-II level and left atrial distance."

Our news journalists report that additional information may be obtained by contacting L.R. Zheng, Zhejiang University, Coll Med, Affiliated Hosp 1, Div Cardiol,
Report Summarizes Biochemistry Study Findings from Dental Research Institute (Epigenetic regulation of CFTR in salivary gland)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Chemistry - Biochemistry. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Cystic fibrosis transmembrane conductance regulator (CFTR) plays a key role in exocrine secretion, including salivary glands. However, its functional expression in salivary glands has not been rigorously studied."

Financial supporters for this research include Oromaxillofacial Dysfunction Research Center for the Elderly, National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from Dental Research Institute, "In this study, we investigated the expression pattern and regulatory mechanism of CFTR in salivary glands using immunohistochemistry, western blot analysis, Ussing chamber study, methylation-specific PCR, and bisulfite sequencing. Using an organ culture technique, we found that CFTR expression was first detected on the 15th day at the embryonic stage (E15) and was observed in ducts but not in acini. CFTR expression was confirmed in HSG and SIMS cell lines, which both originated from ducts, but not in the SMG C-6 cell line, which originated from acinar cells. Treatment of SMG C-6 cells with 5-aza-2'-deoxycytidine (5-Aza-CdR) restored the expression level of CFTR mRNA in a time-dependent manner. Restoration of CFTR was further confirmed by a functional study. In the Ussing chamber study, 10 μM C-act-A1, a CFTR activator, did not evoke any currents in SMG C-6 cells. In contrast, in SMG C-6 cells pretreated with 5-Aza-CdR, C-act-A1 evoked a robust increase of currents, which were inhibited by the CFTR inhibitor CFTRinh-172. Furthermore, forskolin mimicked the currents activated by C-act-A1. In our epigenetic study, SMG C-6 cells showed highly methylated CG pairs in the CFTR CpG island and most of the methylated CG pairs were demethylated by 5-Aza-CdR."

According to the news reporters, the research concluded: "Our results suggest that epigenetic regulation is involved in the development of salivary glands by silencing the CFTR gene in a tissue-specific manner."

For more information on this research see: Epigenetic regulation of CFTR in salivary gland. Biochemical and Biophysical Research Communications, 2016;481(1-2):31-37. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier -
Blood Pressure

Report Summarizes Blood Pressure Study Findings from School of Medicine (The response of the vestibulosympathetic reflex to linear acceleration in the rat)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Blood Pressure. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "The vestibulosympathetic reflex (VSR) increases blood pressure (BP) upon arising to maintain blood flow to the brain. The optimal directions of VSR activation and whether changes in heart rate (HR) are associated with changes in BP are still not clear."

Financial support for this research came from HHS | NIH | National Institute on Deafness and Other Communication Disorders (NIDCD).

Our news editors obtained a quote from the research from the School of Medicine, "We used manually activated pulses and oscillatory linear accelerations of 0.2-2.5 g along the naso-occipital, interaural, and dorsoventral axes in isoflurane-anesthetized, male Long-Evans rats. BP and HR were recorded with an intra-aortic sensor and acceleration with a three-dimensional accelerometer. Linear regressions of BP changes in accelerations along the upward, downward, and forward axes had slopes of approximate to 3-6 mmHg. g(-1) (P < 0.05). Lateral and backward accelerations did not produce consistent changes in BP. Thus upward, downward, and forward translations were the directions that significantly altered BP. HR was unaffected by these translations. The VSR sensitivity to oscillatory forward-backward translations was approximate to 6-10 mmHg. g(-1) at frequencies of approximate to 0.1 Hz (0.2 g), decreasing to zero at frequencies above 2 Hz (1.8 g). Upward, 70 degrees tilts of an alert rat increased BP by 9 mmHg. g(-1) without changes in HR, indicating that anesthesia had not reduced the VSR sensitivity. The similarity in BP induced in alert and anesthetized rats indicates that the VSR is relatively insensitive to levels of alertness and that the VSR is likely to cause changes in BP through modification of peripheral vascular resistance."

According to the news editors, the research concluded: "Thus the VSR, which is directed toward the cardiovascular system, is in contrast to the responses in the alert state that can produce sweating, alterations in BP and HR, and motion sickness."

For more information on this research see: The response of the vestibulosympathetic reflex to linear acceleration in the rat. Journal of Neurophysiology, 2016;116(6):2752-2764.
Blood Pressure

Report Summarizes Blood Pressure Study Findings from University of Nove Julho (Resistance or aerobic training decreases blood pressure and improves cardiovascular autonomic control and oxidative stress in hypertensive menopausal rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Blood Pressure. According to news reporting out of Sao Paulo, Brazil, by NewsRx editors, research stated, "We investigated whether resistance training (RT) vs. aerobic training (AT) differentially impacts on arterial pressure and related mechanisms in ovariectomized spontaneously hypertensive rats (SHRs). Female SHRs were ovariectomized and assigned to one of the following groups: sedentary, AT, or RT; sham sedentary SHR were used as control group."

Financial supporters for this research include Ministry of Science, Technology and Innovation | Conselho Nacional de Desenvolvimento Cientifico e Tecnologico (National Council for Scientific and Technological Development), Sao Paulo Research Foundation (FAPESP).

Our news journalists obtained a quote from the research from the University of Nove Julho, "AT was performed on a treadmill, whereas RT was performed on a vertical ladder. Both exercise protocols were performed for 8 wk, 5 days/wk. Arterial pressure, baroreflex sensitivity, autonomic modulation, and cardiac oxidative stress parameters (lipid peroxidation, protein oxidation, redox balance, NADPH oxidase, and antioxidant enzymes activities) were analyzed. Ovariectomy increased mean arterial pressure (similar to 9 mmHg), sympathetic modulation (similar to 40%), and oxidative stress in sedentary rats. Both RT and AT reduced mean arterial pressure (similar to 20 and similar to 8 mmHg, respectively) and improved baroreflex sensitivity compared with sedentary ovariectomized rats. However, RT-induced arterial pressure decrease was significantly less pronounced than AT. Lipid peroxidation and protein oxidation were decreased while antioxidant enzymes were increased in both trained groups vs. sedentaries. The reduced glutathione was higher after AT vs. other groups, whereas oxidized glutathione was lower after RT vs. AT. Moreover, sympathetic and parasympathetic modulations were highly correlated with cardiac oxidative stress parameters."

According to the news editors, the research concluded: "Both RT and AT can decrease arterial pressure in a model of hypertension and menopause; although, at different
magnitudes this decrease was related to attenuated autonomic dysfunction in association with cardiac oxidative stress improvement in both exercise protocols."

For more information on this research see: Resistance or aerobic training decreases blood pressure and improves cardiovascular autonomic control and oxidative stress in hypertensive menopausal rats. *Journal of Applied Physiology*, 2016;121(4):1032-1038. *Journal of Applied Physiology* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

**Drugs and Therapies - Botulinum Toxin Therapy**

**Report Summarizes Botulinum Toxin Therapy Study Findings from Aristotle University (Do we understand how botulinum toxin works and have we optimized the way it is administered to the bladder? ICI-RS 2014)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Botulinum Toxin Therapy is the subject of a report. According to news reporting originating in Thessaloniki, Greece, by NewsRx journalists, research stated, "The use of botulinum toxin A (BoNT/A) is commonplace now in the management of refractory overactive bladder and neurogenic detrusor overactivity (NDO). Despite one formulation now having a license, the full mechanism of action is not fully understood."

The news reporters obtained a quote from the research from Aristotle University, "Furthermore practice varies worldwide in the way the toxin is delivered to the bladder. At the ICI-RS 2014 Meeting in Bristol, UK a Think Tank session was conducted on the topic of 'Do we understand how botulinum toxin works and have we optimized the way it is administered to the bladder?' This manuscript reflects the Think Tank's summary and opinion. An overview of the existing evidence and consensus regarding mechanism of action and practical aspects of BoNT/A administration was presented. Further avenues of potential research were suggested. BoNT/A effect in the bladder is complex with likely effects on both efferent and afferent nerves. The site of action is controversial with the relative contribution of the detrusor as opposed to the suburothelial effects remaining unclear and open to further studying. The classical concept of prevention of acetylcholine release in the bladder is not supported by a wealth of evidence on neurotransmitters although co-localization studies have suggested cholinergic nerves are the most affected by BoNT/A. There is more robust evidence for effects on the purinergic system and afferent desensitization and emerging evidence for central effects. A variety of technique
studies were presented. OnabotulinumtoxinA has recently been studied in large phase III trials and with this there is a standardized injection technique which is trigone-sparing. The evidence for altering location of injection is mixed with some studies suggesting less voiding dysfunction in bladder base injections alone but others suggesting location of injection does not affect outcomes. Early pilot data and evidence of instillation either with electromotive drug administration (EMDA) or in liposomes were also presented as an alternative to injections. The mechanism of action of BoNT/A in the bladder is complex and not fully understood. There is emerging support for its role on afferent mechanisms."

According to the news reporters, the research concluded: "The technical aspects of the injection procedure have been standardized to a certain extent but further study is required in larger scale studies to assess minimizing voiding dysfunction, improving tolerability, and assessing alternatives to injections."

For more information on this research see: Do we understand how botulinum toxin works and have we optimized the way it is administered to the bladder? ICI-RS 2014. Neurourology and Urodynamics, 2016;35(2):293-8. (Wiley-Blackwell - www.wiley.com; Neurourology and Urodynamics - onlinelibrary.wiley.com/journal/10.1002/(ISSN)1520-6777)

Our news correspondents report that additional information may be obtained by contacting A. Apostolidis, 2nd Dept. of Urology, Aristotle University of Thessaloniki, Thessaloniki, Greece. Additional authors for this research include M.S. Rahnama'i, C. Fry, R. Dmochowski and A. Sahai.

Oncology - Bowel Cancer

Report Summarizes Bowel Cancer Study Findings from Department of Medical Oncology (Survival impact of the Australian National Bowel Cancer Screening Programme)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Bowel Cancer. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "The Australian National Bowel Cancer Screening Program (NBCSP) has been offering age-based faecal occult blood testing since 2006. With the rapid expansion of this programme, the NBCSP will ultimately offer biennial screening to all 50-74 years old by 2020."

The news correspondents obtained a quote from the research from the Department of Medical Oncology, "Participation rates remain low. Previous reports have described an increased proportion of earlier stage cancers in patients with NBCSP-detected tumours. Data on consecutive patients enrolled into a prospective, comprehensive, multidisciplinary database at six Victorian hospitals were examined. Clinicopathologic and outcome data were compared for NBCSP and symptomatic presentation patients. We identified 3743 patients that presented with
colorectal cancer (CRC) at participating hospitals since May 2006. Of 1930 patients aged between 50 and 70 years, 141 (7.3%) had a NBCSP detected cancer, 1441 (74.7%) presented with symptoms and 266 (13.8%) were diagnosed through screening outside of the NBCSP. Based on the American Society of Anaesthesiology score, the NBCSP patients were fitter. They had an earlier stage of diagnosis and were more likely to be female and less likely to have lymphovascular invasion or to present as an emergency. NBCSP detected patients had a lower rate of recurrence (HR 0.17, p=0.0001) and fewer deaths (HR 0.19, p=0.005). Patients with NBCSP-detected CRC have a markedly reduced risk of CRC recurrence and death compared with patients with a symptomatic presentation. The dominant driver of this appears to be earlier stage at diagnosis."

According to the news reporters, the research concluded: "Increased promotion of the impact of the NBCSP, including data related to the survival impact, should be undertaken to increase participation rates and achieve further survival gains."

Our news journalists report that additional information may be obtained by contacting S. Ananda, Dept. of Medical Oncology, Royal Melbourne Hospital, Melbourne, Victoria, Australia. Additional authors for this research include H. Wong, I. Faragher, I.T. Jones, M. Steele, S. Kosmider, J. Desai, J. Tie, K. Field, R. Wong, B. Tran, S. Bae and P. Gibbs.

**Oncology - Breast Cancer**

**Report Summarizes Breast Cancer Study Findings from A. Grundy and Co-Researchers (Occupational exposure to magnetic fields and breast cancer among Canadian men)***

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Calgary, Canada, by NewsRx correspondents, research stated, "Occupational magnetic field (MF) exposure has been suggested as a risk factor for breast cancer in both men and women. Due to the rarity of this disease in men, most epidemiologic studies investigating this relationship have been limited by small sample sizes."

Financial support for this research came from Cancer Care Ontario.

Our news journalists obtained a quote from the research, "Herein, associations of several measures of occupational MF exposure with breast cancer in men were investigated using data from the population-based case-control component of the Canadian National Enhanced Cancer Surveillance System. Lifetime job histories were provided by 115 cases and 570 controls. Average MF exposure of individual jobs was classified into three categories (<0.3,
0.3 to <0.6, or (>=)0.6 mT) through expert blinded review of participant's lifetime occupational histories. The impact of highest average and cumulative MF exposure, as well as exposure duration and specific exposure-time windows, on cancer risk was examined using logistic regression. The proportion of cases (25%) with a highest average exposure of (>=)0.3 mT was higher than among controls (22%). We found an elevated risk of breast cancer in men who were exposed to (>=)0.6 mT (odds ratio [OR]=1.80, 95% CI=0.82-3.95) when compared to those with exposures <0.3 mT. Those exposed to occupational MF fields for at least 30 years had a nearly threefold increase in risk of breast cancer (OR=2.77, 95% CI=0.98-7.82) when compared to those with background levels of exposure. Findings for the other time-related MF variables were inconsistent.

According to the news editors, the research concluded: "Our analysis, in one of the largest case-control studies of breast cancer in men conducted to date, provides limited support for the hypothesis that exposure to MF increases the risk breast cancer in men."

The news correspondents report that additional information may be obtained from A. Grundy, Dept. of Cancer Epidemiology and Prevention Research, Alberta Health Services - Cancer Control Alberta, Calgary, Alberta, Canada. Additional authors for this research include S.A. Harris, P.A. Demers, K.C. Johnson, D.A. Agnew and P.J Villeneuve.

Cardiology

Report Summarizes Cardiology Study Findings from Monash University (Benign Cardiac Effects of Hemoglobin H Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiology are discussed in a new report. According to news originating from Clayton, Australia, by NewsRx correspondents, research stated, "Hemoglobin H (HbH) disease is associated with iron overload, but whether this results in serious cardiac or vascular sequelae is unresolved. We identified 39 adult subjects (age 42 ± 12 years, 13 men) with HbH disease who had undergone echocardiography, 27 of whom had also undergone cardiac and liver magnetic resonance assessment of iron loading using T2*-weighted imaging."

Our news journalists obtained a quote from the research from Monash University, "None of the subjects had a history of heart failure or arrhythmias. There were 13/39 subjects with a ferritin level within the sex-based normal range and only 4/39 had ferritin >1,000 ng/ml. Left ventricular (LV) and left atrial dilatation was common, but LV ejection fraction was normal ( (>=)55%) in all subjects. Age was positively correlated with log ferritin in the 27
nontransfused subjects \((r=0.43)\) and was inversely correlated with the transmitral E wave and E/A ratio \((r=-0.69 \text{ and } r=-0.79, \text{ respectively})\), but no relation of log ferritin with E or E/A was evident. The peak tricuspid regurgitation velocity was normal in 24/29 subjects for whom this was obtained, and it was no more than mildly elevated in the other 5. None of the tested subjects had an abnormal cardiac T2* reading, but half had evidence of liver iron loading.

According to the news editors, the research concluded: "No myocardial iron loading or serious cardiac or vascular sequelae were identified in this cohort with HbH disease."

The news correspondents report that additional information may be obtained from C. Sheeran, Thalassaemia Service, Monash University and Monash Health, Clayton, Vic, Australia. Additional authors for this research include D.K. Bowden, S.R. Pasricha, K. Cheng, G. Romanelli and R.E Peverill.

**Cardiology**

**Report Summarizes Cardiology Study Findings from University Hospital (Symptoms Of Cardiac Anxiety In Family Members Of Intensive Care Unit Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiology is the subject of a report. According to news originating from Ioannina, Greece, by NewsRx correspondents, research stated, "Studies have shown an association between intensive care unit environments and symptoms of psychological distress in family members of critically ill patients. To investigate levels of cardiac anxiety in family members of intensive care unit patients."

Our news journalists obtained a quote from the research from University Hospital, "From March 2012 to July 2013, on the third day after the patient's admission, 223 family members of 147 patients completed the Cardiac Anxiety Questionnaire. A total score was calculated from 3 subscales: fear and worry about heart sensations, avoidance of activities reproducing cardiac symptoms, and heart-focused attention and monitoring of cardiac activity. Among the family members, 142 were women (63.7%) and 81 (36.3%) were men, 150 (67.3%) were married, and 37 (16.6%) were unemployed. Their mean score for overall cardiac anxiety was 1.11 (SD, 0.64), significantly higher \((P < .001)\) than for the general Greek population. Although all 3 subscales scores were significantly higher than for the general population, the highest score was recorded for the avoidance subscale \((mean, 1.77; SD, 0.68)\). The relationship to the patient had a significant effect on heart-focused attention \((F=5 = 3.51; P = .03)\). The mean..."
score for patients' siblings (2.0; SD, 0.01) differed significantly (P =.02) from the mean for other family member groups. Older adults (P =.02) and married participants (P =.05) reported higher levels of fear and worry related to cardiac stimuli, and women further reported higher levels of cardioprotective avoidance behavior (P =.02)."

According to the news editors, the research concluded: "A noticeable number of family members of critical care patients had moderate to severe cardiac anxiety during the hospitalization of their relatives."

For more information on this research see: Symptoms Of Cardiac Anxiety In Family Members Of Intensive Care Unit Patients. American Journal of Critical Care, 2016;25(5):448-456. American Journal of Critical Care can be contacted at: Amer Assoc Critical Care Nurses, 101 Columbia, Aliso Viejo, CA 92656, USA.

Cardiovascular Research

Report Summarizes Cardiovascular Research Study Findings from T.O. Kiviniemi and Co-Researchers (Trends in rates, patient selection and prognosis of coronary revascularisations in Finland between 1994 and 2013: the CVDR)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Research have been published. According to news reporting originating from Framingham, Massachusetts, by NewsRx correspondents, research stated, "The aim of the study was to investigate the 20-year trends in rates, patient selection and prognosis of coronary revascularisations in Finland. We identified patients from nationwide registers who had undergone first-ever percutaneous coronary intervention (PCI) or coronary artery bypass grafting (CABG) between 1994 and 2013."

Our news editors obtained a quote from the research, "We examined changes in procedure rates, patient characteristics and estimated hazard ratios (HR) and 95% confidence intervals for cardiovascular events during this period. Between 1994 and 2013, 85,482 PCIs and 74,338 CABGs were performed. During this period, PCI rates more than quadrupled while CABG rates declined by two thirds. Between 1994-1998 and 2009-2013, the proportion of urgent procedures and mean patient age increased while the proportion of women remained stable. Although unadjusted mortality rose, the multivariable-adjusted HRs for 28-day mortality (PCI: 0.62 [0.49-0.79]; CABG: 0.62 [0.54-0.72]) and five-year incidence of cardiovascular death (PCI: 0.72 [0.66-0.80]; CABG: 0.77 [0.72-0.83]), myocardial infarction (PCI: 0.47 [0.44-0.50]; CABG: 0.31 [0.29-0.32]) and stroke (PCI: 0.37 [0.34-0.40]; CABG: 0.36 [0.33-0.38]) were lower in the last five-year period than in the period 1994-1998. Although revascularisation
patients are older than before, post-procedural prognosis has improved drastically in recent years."

According to the news editors, the research concluded: "Understanding the changing characteristics and prognosis of these patients is important for the interpretation of previous and future studies."

The news editors report that additional information may be obtained by contacting T.J. Niiranen, Framingham Heart Dis Epidemiol Study, Framingham, MA 01702, United States. Central Nervous System Diseases and Conditions - …

Report Summarizes Cerebral Infarction Study Findings from Zhejiang University (Serial Attacks: Contralateral Hematoma Secondary to Decompressive Craniectomy for Traumatic Brain Injury Led to Posttraumatic Cerebral Infarction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Cerebral Infarction. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "A 40-year-old man suffered severe brain injury and received left side subdural hematoma evacuation with decompressive craniectomy. Intraoperative brain swelling had occurred during the surgery."

The news reporters obtained a quote from the research from Zhejiang University, "Postoperative computed tomography (CT) scan was done immediately and showed a contralateral epidural hematoma resulting in herniation. Secondary hematoma evacuation was performed and found a linear fracture near a bleeding meningeal artery. 2 days later CT scan showed cerebral infarction mainly in right posterior cerebral artery distribution."

According to the news reporters, the research concluded: "Early diagnosis by postoperative CT scan or other potential ways such as intraoperative sonography is important to prompt treatments and interrupt the pathophysiological chain of the serial attacks."

Our news correspondents report that additional information may be obtained by
Oncology - Cervical Cancer

Report Summarizes Cervical Cancer Study Findings from Statens Serum Institute (Cervical cancer screening in Greenland, 1997-2011: Screening coverage and trends in the incidence of high-grade cervical lesions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Cervical Cancer are discussed in a new report. According to news reporting from Copenhagen, Denmark, by NewsRx journalists, research stated, "In spite of the high incidence of cervical cancer in Greenland, no assessment has been made of the impact of organized cervical screening, introduced in 1998, in relation to occurrence of high-grade cervical lesions. The objectives of the present study were to estimate coverage of the screening program and to examine possible changes in cervical intraepithelial neoplasia (CIN3) incidence in Greenland during 1997-2011 according to calendar period and age."

The news correspondents obtained a quote from the research from Statens Serum Institute, "Using nationwide registries, we calculated age-standardized incidence rates for all women born and living in Greenland. To investigate whether possible variation in the incidence of CIN3 were related to differences in screening coverage, we further estimated relative risks of CIN3 within two years of screening among women who participated in the screening program using log-linear binomial regression. Coverage of the screening program was low during 1997-2011 with the highest level of 54% observed in 2011. Peaks in CIN3 incidence of around 300 per 100,000 person-years were observed in 1999 and between 2009 and 2011, while the incidence was lower of approximately 100 per 100,000 person-years between 2000 and 2008. During 2009-2011, the highest incidence was found among women aged 25-34 years. Similar patterns of CIN3 risk according to calendar period and age groups were observed among screened women."

According to the news reporters, the research concluded: "The great variations in CIN3 incidence and low screening coverage observed during 1997-2011 suggest that improvements in the Greenlandic screening program are warranted."

For more information on this research see: Cervical cancer screening in Greenland, 1997-2011: Screening coverage and trends in the incidence of high-grade cervical lesions.
Report Summarizes Coloboma Study Findings from University of Pittsburgh (The hyaloid vasculature facilitates basement membrane breakdown during choroid fissure closure in the zebrafish eye)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Eye Diseases and Conditions - Coloboma is the subject of a report. According to news reporting originating in Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "A critical aspect of vertebrate eye development is closure of the choroid fissure (CF). Defects in CF closure result in colobomas, which are a significant cause of childhood blindness worldwide."

Funders for this research include National Science Foundation, National Eye Institute, NIH CORE, NIH, NIH-NCRR.

The news reporters obtained a quote from the research from the University of Pittsburgh, "Despite the growing number of mutated loci associated with colobomas, we have a limited understanding of the cell biological underpinnings of CF closure. Here, we utilize the zebrafish embryo to identify key phases of CF closure and regulators of the process. Utilizing Laminin-111 as a marker for the basement membrane (BM) lining the CF, we determine the spatial and temporal patterns of BM breakdown in the CF, a prerequisite for CF closure. Similarly, utilizing a combination of in vivo time-lapse imaging, beta-catenin immunohistochemistry and F-actin staining, we determine that tissue fusion, which serves to close the fissure, follows BM breakdown closely. Periocular mesenchyme (POM)-derived endothelial cells, which migrate through the CF to give rise to the hyaloid vasculature, possess distinct actin foci that correlate with regions of BM breakdown. Disruption of talin1, which encodes a regulator of the actin cytoskeleton, results in colobomas and these correlate with structural defects in the hyaloid vasculature and defects in BM breakdown. cloche mutants, which entirely lack a hyaloid vasculature, also possess defects in BM breakdown in the CF."

According to the news reporters, the research concluded: "Taken together, these data support a model in which the hyaloid vasculature and/or the POM-derived endothelial cells that give rise to the hyaloid vasculature contribute to BM breakdown during CF closure."

For more information on this research see: The hyaloid vasculature facilitates basement membrane breakdown during choroid fissure closure in the zebrafish eye.
Our news correspondents report that additional information may be obtained by contacting J.M. Gross, University of Pittsburgh, Sch Med, Dept. of Dev Biol, Pittsburgh, PA 15213, United States. Oncology - Cutaneous Melanoma

Report Summarizes Cutaneous Melanoma Study Findings from Laboratory for Molecular Cancer Biology (The emerging role of long non-coding RNAs in cutaneous melanoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Cutaneous Melanoma is the subject of a report. According to news reporting out of Leuven, Belgium, by NewsRx editors, research stated, "Malignant melanoma is a highly aggressive form of skin cancer, the incidence of which is rising rapidly. Although MAPK-targeting therapies and immune checkpoint blockade are emerging as attractive therapeutic approaches, their utility is limited to only a subset of patients who often acquire resistance."

Our news journalists obtained a quote from the research from Laboratory for Molecular Cancer Biology, "A better understanding of the aetiologies and genetic underpinnings of melanoma is therefore critical for the development of adjuvant or alternative therapeutic strategies aimed at increasing the proportion of responders and improving treatment efficacy. A key step in identifying novel therapeutic targets may be the shift in focus from the protein-coding components to the non-coding portion of the genome. The latter, representing about 98% of the genome, serves as a template for the transcription of many thousands of long non-coding RNAs (lncRNAs). Intriguingly, lncRNA loci are frequently mutated or altered in a variety of cancers, including melanoma, and there is growing evidence that lncRNAs can function as cancer-causing oncogenes or tumour suppressors."

According to the news editors, the research concluded: "In this review, we summarize recent data highlighting the importance of lncRNAs in the biology of melanoma and their potential utility as biomarkers and therapeutic targets."

Our news journalists report that additional information may be obtained by contacting J.C. Marine, Center Biol Dis, Lab Mol Canc Biol, Leuven, Belgium. Additional authors for this research include E.A. Coe, J.C. Marine and K.W. Vance.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/pcmr.12537. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Dermatological Agents

Report Summarizes Dermatological Agents Study Findings from McGill University (Confoundning by drug formulary restriction in pharmacoepidemiologic research)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Dermatological Agents are presented in a new report. According to news reporting from Montreal, Canada, by NewsRx journalists, research stated, "The potential consequences of confounding due to drug formulary restrictions in pharmacoepidemiologic research remain incompletely understood. Our objective was to illustrate this potential bias using the example of fluticasone/salmeterol combination therapy, an oral inhaler used to treat asthma and chronic obstructive pulmonary disease, whose use is restricted in the province of Quebec, Canada."

Financial supporters for this research include Canadian Institutes of Health Research (CIHR), Fonds de Recherche du Quebec - Sante, Canadian Institutes of Health Research.

The news correspondents obtained a quote from the research from McGill University, "We identified all new users of fluticasone/salmeterol in Quebec's administrative databases and classified those who received their initial dispensing of fluticasone/salmeterol between 1 September 1999 and 30 September 2003 as users from the liberal period and those who received it between 1 January 2004 and 31 October 2006 as users from the restricted period. The primary outcome was time to first hospitalization for respiratory causes within 12 months of cohort entry. Our cohort included 72 154 new users from the liberal period and 5058 from the restricted period. Compared with use during the liberal period, use during the restricted period was associated with an increased rate of hospitalization for respiratory causes (crude hazard ratio [HR]=1.41, 95% confidence interval [CI]=1.32, 1.51). Subsequent adjustment for age, sex, and hospitalization for respiratory causes in the previous year attenuated the association (HR=1.05, 95%CI=0.98, 1.12). Further adjustment for other potential confounders resulted in a lower rate during the restricted period (HR=0.78, 95%CI=0.73, 0.83)."

According to the news reporters, the research concluded: "Formulary restrictions can result in substantial and unexpected confounding and should be considered during the design and analysis of pharmacoepidemiologic studies."

Hematologic Diseases and Conditions - ... 

Report Summarizes Disseminated Intravascular Coagulation Study Findings from University of Ulsan [Performance Evaluation of Five Different Disseminated Intravascular Coagulation (DIC) Diagnostic Criteria for Predicting Mortality in Patients with ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hematologic Diseases and Conditions - Disseminated Intravascular Coagulation. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "Disseminated intravascular coagulation (DIC) is a major complication in sepsis patients. We compared the performance of five DIC diagnostic criteria, focusing on the prediction of mortality."

The news reporters obtained a quote from the research from the University of Ulsan, "One hundred patients with severe sepsis or septic shock admitted to intensive care unit (ICU) were enrolled. Routine DIC laboratory tests were performed over the first 4 days after admission. The overall ICU and 28-day mortality in DIC patients diagnosed from five criteria (International Society on Thrombosis and Haemostasis [ISTH], the Japanese Association for Acute Medicine [JAAM], the revised JAAM [R-JAAM], the Japanese Ministry of Health and Welfare [JMHW] and the Korean Society on Thrombosis and Hemostasis [KSTH]) were compared. Both KSTH and JMHW criteria showed superior performance than ISTH, JAAM and R-JAAM criteria in the prediction of overall ICU mortality in DIC patients (odds ratio 3.828 and 5.181, P= 0.018 and 0.006, 95% confidence interval 1.256-11.667 and 1.622-16.554, respectively) when applied at day 1 after admission, and survival analysis demonstrated significant prognostic impact of KSTH and JMHW criteria on the prediction of 28-day mortality (P = 0.007 and 0.049, respectively) when applied at day 1 after admission."

According to the news reporters, the research concluded: "Both KSTH and JMHW criteria would be more useful than other three criteria in predicting prognosis in DIC patients with severe sepsis or septic shock."

For more information on this research see: Performance Evaluation of Five Different Disseminated Intravascular Coagulation (DIC) Diagnostic Criteria for Predicting Mortality in

Our news correspondents report that additional information may be obtained by contacting S. Jang, University of Ulsan, Coll Med, Dept. of Lab Med, Seoul, South Korea. Additional authors for this research include S.H. Park, S.B. Hong and S. Jang.

**Drugs and Therapies - Drug Delivery Systems**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Drug Delivery Systems is now available. According to news originating from Barcelona, Spain, by NewsRx correspondents, research stated, "We describe for the first time the synthesis and photochemical properties of a coumarin-caged cyclic RGD peptide and demonstrate that uncaging can be efficiently performed with biologically compatible green light. This was accomplished by using a new dicyanocoumarin derivative (DEAdcCE) for the protection of the carboxyl function at the side chain of the aspartic acid residue, which was selected on the basis of Fmoc-tBu SPPS compatibility and photolysis efficiency."

Financial supporters for this research include Secretaria de Estado de Investigacion, Desarrollo e Innovacion, Generalitat de Catalunya, Universitat de Barcelona.

Our news journalists obtained a quote from the research from the University of Barcelona, "The shielding effect of a methyl group incorporated in the coumarin derivative near the ester bond linking both moieties in combination with the use of acidic additives such as HOBt or Oxyma during the basic Fmoc-removal treatment were found to be very effective for minimizing aspartimide-related side reactions. In addition, a conjugate between the dicyanocoumarin-caged cyclic RGD peptide and ruthenocene, which was selected as a metallodrug model cargo, has been synthesized and characterized."

According to the news editors, the research concluded: "The fact that green-light triggered photoactivation can be efficiently performed both with the caged peptide and with its ruthenocenoyl bioconjugate reveals great potential for DEAdcCE-caged peptide sequences as selective drug carriers in the context of photocontrolled targeted anticancer strategies."

Ebola Virus

Report Summarizes Ebola Virus Study Findings from University of Manitoba (Prophylactic Efficacy of Quercetin 3-beta-O-D-Glucoside against Ebola Virus Infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Ebola Virus. According to news reporting originating from Winnipeg, Canada, by NewsRx correspondents, research stated, "Ebola outbreaks occur on a frequent basis, with the 2014-2015 outbreak in West Africa being the largest one ever recorded. This outbreak has resulted in over 11,000 deaths in four African countries and has received international attention and intervention."

Our news editors obtained a quote from the research from the University of Manitoba, "Although there are currently no approved therapies or vaccines, many promising candidates are undergoing clinical trials, and several have had success in promoting recovery from Ebola. However, these prophylactics and therapeutics have been designed and tested only against the same species of Ebola virus as the one causing the current outbreak. Future outbreaks involving other species would require reformulation and possibly redevelopment. Therefore, a broad-spectrum alternative is highly desirable. We have found that a flavonoid derivative called quercetin 3-beta-O-D-glucoside (Q3G) has the ability to protect mice from Ebola even when given as little as 30 min prior to infection. Furthermore, we have demonstrated that this compound targets the early steps of viral entry. Most promisingly, antiviral activity against two distinct species of Ebola virus was seen."

According to the news editors, the research concluded: "This study serves as a proof of principle that Q3G has potential as a prophylactic against Ebola virus infection."

For more information on this research see: Prophylactic Efficacy of Quercetin 3-beta-O-D-Glucoside against Ebola Virus Infection. Antimicrobial Agents and Chemotherapy, 2016;60(9):5182-5188. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news editors report that additional information may be obtained by contacting X.G. Qiu, University of Manitoba, Dept. of Med Microbiol, Winnipeg, MB, Canada. Additional authors for this research include A. Kroeker, S.H. He, R. Kozak, J. Audet, M. Mbikay and M.
Endothelial Cells

Report Summarizes Endothelial Cells Study Findings from University of Michigan (Organization of Endothelial Cells, Pericytes, and Astrocytes into a 3D Microfluidic in Vitro Model of the Blood-Brain Barrier)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Endothelial Cells is the subject of a report. According to news reporting from Ann Arbor, Michigan, by NewsRx journalists, research stated, "The endothelial cells lining the capillaries supplying the brain with oxygen and nutrients form a formidable barrier known as the blood-brain barrier (BBB), which exhibits selective permeability to small drug molecules and virtually impermeable to macromolecular therapeutics. Current in vitro BBB models fail to replicate this restrictive behavior due to poor integration of the endothelial cells with supporting cells (pericytes and astrocytes) following the correct anatomical organization observed in vivo."

Funders for this research include Horace H. Rackham School of Graduate Studies, University of Michigan, National Institute of Biomedical Imaging and Bioengineering.

The news correspondents obtained a quote from the research from the University of Michigan, "We report the coculture of mouse brain microvascular endothelial cells (b.End3), pericytes, with/without C8-D1A astrocytes in layered microfluidic channels forming three-dimensional (3D) bi- and triculture models of the BBB. The live/dead assay indicated high viability of all cultured cells up to 21 days. Trans-endothelial electrical resistance (TEER) values confirmed the formation of intact monolayers after 3 days in culture and showed statistically higher values for the triculture model compared to the single and biculture models. Screening the permeability of (14)C-mannitol and (14)C-urea showed the ability of bi- and triculture models to discriminate between different markers based on their size. Further, permeability of (14)C-mannitol across the triculture model after 18 days in culture matched its reported permeability across the BBB in vivo. Mathematical calculations also showed that the radius of the tight junctions pores in the triculture model is similar to the reported diameter of the BBB in vivo. Finally, both the bi-and triculture models exhibited functional expression of the P-glycoprotein efflux pump, which increased with the increase in the number of days in culture."

According to the news reporters, the research concluded: "These results collectively indicate that the triculture model is a robust in vitro model of the BBB."

Our news journalists report that additional information may be obtained by contacting J.D. Wang, Dept. of Biomedical Engineering, University of Michigan, 1101 Beal
Oncology - Epithelial Ovarian Cancer

Report Summarizes Epithelial Ovarian Cancer Study Findings from Delaware State University (Age-specific discrimination of blood plasma samples of healthy and ovarian cancer prone mice using laser-induced breakdown spectroscopy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Epithelial Ovarian Cancer. According to news reporting originating from Dover, Delaware, by NewsRx correspondents, research stated, "Epithelial ovarian cancer (EOC) mortality rates are strongly correlated with the stage at which it is diagnosed. Detection of EOC prior to its dissemination from the site of origin is known to significantly improve the patient outcome."

Funders for this research include National Science Foundation, National Aeronautics and Space Administration.

Our news editors obtained a quote from the research from Delaware State University, "However, there are currently no effective methods for early detection of the most common and lethal subtype of EOC We sought to determine whether laser-induced breakdown spectroscopy (LIBS) and classification techniques such as linear discriminant analysis (IDA) and random forest (RF) could classify and differentiate blood plasma specimens from transgenic mice with ovarian carcinoma and wild type control mice. Herein we report results using this approach to distinguish blood plasma samples obtained from serially bled (at 8, 12, and 16 weeks) tumor-bearing TgMISIIR-TAg transgenic and wild type cancer-free littermate control mice. We have calculated the age-specific accuracy of classification using 18,000 laser-induced breakdown spectra of the blood plasma samples from tumor-bearing mice and wild type controls. When the analysis is performed in the spectral range 250 nm to 680 nm using LDA, these are 76.7 (+/- 2.6)%, 71.2 (+/- 1.3)%, and 73.1 (+/- 1.4)%, for the 8, 12 and 16 weeks. When the RF classifier is used, we obtain values of 78.5 (+/- 2.3)% 76.9 (+/- 2.1)% and 75.4 (+/- 2.0)% in the spectral range of 250 nm to 680 nm, and 81.0 (+/- 1.8)% 80.4 (+/- 2.1)% and 79.6 (+/- 3.5)% in 220 nm to 850 nm. In addition, we report, the positive and negative predictive values of the classification of the two classes of blood plasma samples. The approach used in this study is rapid, requires only 5 μL of blood plasma, and is based on the use of unsupervised and widely accepted multivariate analysis algorithms."

According to the news editors, the research concluded: "These findings suggest that LIBS and multivariate analysis may be a novel approach for detecting EOC."

For more information on this research see: Age-specific discrimination of blood plasma samples of healthy and ovarian cancer prone mice using laser-induced breakdown spectroscopy.

The news editors report that additional information may be obtained by contacting N. Melikechi, Delaware State Univ, Opt Sci Center Appl Res, Dover, DE 19901, United States. Additional authors for this research include Y. Markushin, D.C. Connolly, J. Lasue, E. Ewusi-Annan and S. Makrogianis.

**Gram-Negative Bacteria - Escherichia coli**

**Report Summarizes Escherichia coli Study Findings from University of Oxford [Complete Sequencing of Plasmids Containing bla(OXA-163) and bla(OXA-48) in Escherichia coli Sequence Type 131]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Negative Bacteria - Escherichia coli. According to news reporting out of Oxford, United Kingdom, by NewsRx editors, research stated, "OXA-48-like enzymes have emerged as important extended-spectrum beta-lactamases/carbapenemases in Escherichia coli sequence type 131 (ST131)."

Our news journalists obtained a quote from the research from the University of Oxford, "We report the structures of the first fully sequenced bla(OXA-163) plasmid and of two other bla(OXA-48) plasmids in this lineage. bla(OXA-163) was located on a 71-kb IncN plasmid with other resistance genes. bla(OXA-48) was present on IncL/M plasmids, genetically similar to other bla(OXA-48) plasmid sequences, and consistent with interspecies/interlineage spread."

According to the news editors, the research concluded: "The presence of bla(OXA-48)-like genes on epidemic plasmids in ST131 is of concern."

For more information on this research see: Complete Sequencing of Plasmids Containing bla(OXA-163) and bla(OXA-48) in Escherichia coli Sequence Type 131. *Antimicrobial Agents and Chemotherapy*, 2016;60(11):6948-6951. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Ethylamines Study Findings from University of Oregon (Evidence of a broad histamine footprint on the human exercise transcriptome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Ethylamines is the subject of a report. According to news reporting from Eugene, Oregon, by NewsRx journalists, research stated, "Histamine is a primordial signalling molecule, capable of activating cells in an autocrine or paracrine fashion via specific cell surface receptors. In humans, aerobic exercise is followed by a post-exercise activation of histamine H-1 and H-2 receptors localized to the previously exercised muscle."

The news correspondents obtained a quote from the research from the University of Oregon, "This could trigger a broad range of cellular adaptations in response to exercise. Thus, we exploited RNA sequencing to explore the effects of H-1 and H-2 receptor blockade on the exercise transcriptome in human skeletal muscle tissue harvested from the vastus lateralis. We found that exercise exerts a profound influence on the human transcriptome, causing the differential expression of more than 3000 protein-coding genes. The influence of histamine blockade post-exercise was notable for 795 genes that were differentially expressed between the control and blockade condition, which represents >25% of the number responding to exercise."

According to the news reporters, the research concluded: "The broad histamine footprint on the human exercise transcriptome crosses many cellular functions, including inflammation, vascular function, metabolism, and cellular maintenance."

Our news journalists report that additional information may be obtained by contacting J.R. Halliwill, University of Oregon, Dept. of Human Physiol, Eugene, OR 97403, United States. Additional authors for this research include A.D. Hocker, J.E. Mangum, M.J. Luttrell, D.W. Turnbull, A.J. Struck, M.R. Ely, D.C. Sieck, H.C. Dreyer and J.R. Halliwill.

Proteins - Extracellular Matrix Proteins

Report Summarizes Extracellular Matrix Proteins Study Findings from UERJ (A combination of stereological methods, biochemistry and electron microscopy for the investigation of drug treatment effects in experimental animals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Extracellular Matrix Proteins. According to news originating from Rio de Janeiro, Brazil, by NewsRx correspondents, research stated, "Some chemotherapeutic agents used for breast cancer (BC) treatment can induce severe side effects in the ovarian tissue. The combination of cyclophosphamide and docetaxel (TC) is widely used for BC treatment; however, its late effects in the ovary are not completely understood."

Our news journalists obtained a quote from the research from UERJ, "The main purpose of this study was to evaluate the structural and ultrastructural alterations in the ovarian stroma induced by TC treatment. Wistar rats were divided into two groups: a control group and a TC group. They were euthanized 5 months after the end of treatment, and their plasma and ovaries were collected. Important alterations were noted. The serum estradiol level was significantly reduced in the TC group compared with the control group. Additionally, the number of apoptotic nuclei was higher in the TC group. The role of the inflammatory response in the development of ovarian damage was investigated, and we found an increased number of mast cells and increased expression of TNF-a in the TC group. The involvement of fibrosis was also investigated. The results showed that the TC group had increased expression levels of TGF-b1, collagen type I (col-I) and collagen type III (col-III) compared with the control group. Ultrastructural analysis revealed the presence of collagen fibrils in the treated group and illustrated that the ovarian tissue architecture was more disorganized in this group than in the control group."

According to the news editors, the research concluded: "The results from this study are important in the study of chemotherapy-induced ovarian failure and provide further insight into the mechanisms involved in the development of this disease."

The news correspondents report that additional information may be obtained from A.C. De Moraes, Laboratorio de Pesquisas em Celulas-Tronco, Departamento de Histologia e Embriologia, Instituto de Biologia Roberto Alcantara Gomes, UERJ, Rio de Janeiro, RJ, Brazil. Additional authors for this research include C.B. Andrade, C. Salata, A.L. Nascimento, I.P. Ramos, R.C. Goldenberg, J.J. Carvalho and A.C Machado.

Immune System Diseases and Conditions - HIV/AIDS

Report Summarizes HIV/AIDS Study Findings from Royal Free Hospital (Clinical characteristics and outcomes of HIV-associated immune complex kidney disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immune System Diseases and Conditions - HIV/AIDS. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "The pathogenesis and natural history of HIV-associated immune complex kidney disease (HIVICK) is not well understood. Key questions remain unanswered, including the role of HIV infection and replication in disease development and the efficacy of antiretroviral therapy (ART) in the prevention and treatment of disease."

Financial support for this research came from Medical Research Council, UK.

The news correspondents obtained a quote from the research from Royal Free Hospital, "In this multicentre study, we describe the renal pathology of HIVICK and compare the clinical characteristics of patients with HIVICK with those with IgA nephropathy and HIV-associated nephropathy (HIVAN). Poisson regression models were used to identify risk factors for each of these pathologies. Between 1998 and 2012, 65 patients were diagnosed with HIVICK, 27 with IgA nephropathy and 70 with HIVAN. Black ethnicity and HIV RNA were associated with HIVICK, receipt of ART with IgA nephropathy and black ethnicity and CD4 cell count with HIVAN. HIVICK was associated with lower rates of progression to end-stage kidney disease compared with HIVAN and IgA nephropathy (p <0.0001). Patients with HIVICK who initiated ART and achieved suppression of HIV RNA experienced improvements in estimated glomerular filtration rate and proteinuria. These findings suggest a pathogenic role for HIV replication in the development of HIVICK and that ART may improve kidney function in patients who have detectable HIV RNA at the time of HIVICK diagnosis."

According to the news reporters, the research concluded: "Our data also suggest that IgA nephropathy should be viewed as a separate entity and not included in the HIVICK spectrum."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/ndt/gfv436. This DOI is a link to an online electronic document that is either free or for purchase.

**Immune System Diseases and Conditions - HIV/AIDS**

**Report Summarizes HIV/AIDS Study Findings from University of Missouri (NMR detection of intermolecular interaction sites in the dimeric 5’-leader of the HIV-1 genome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immune System Diseases and Conditions - HIV/AIDS have been presented. According to news reporting out of Columbia, Missouri, by NewsRx editors, research stated, "HIV type-1 (HIV-1) contains a pseudodiploid RNA genome that is selected for packaging and maintained in virions as a noncovalently linked dimer. Genome dimerization is mediated by conserved elements within the 5’-leader of the RNA, including a palindromic dimer initiation signal (DIS) that has been proposed to form kissing hairpin and/or extended duplex intermolecular contacts."

Our news journalists obtained a quote from the research from the University of Missouri, "Here, we have applied a H-2-edited NMR approach to directly probe for intermolecular interactions in the full-length, dimeric HIV-1 5'-leader (688 nucleotides; 230 kDa). The interface is extensive and includes DIS: DIS base pairing in an extended duplex state as well as intermolecular pairing between elements of the upstream Unique-5’ (U5) sequence and those near the gag start site (AUG). Other pseudopalindromic regions of the leader, including the transcription activation (TAR), polyadenylation (PolyA), and primer binding (PBS) elements, do not participate in intermolecular base pairing. Using a 2H-edited one-dimensional NMR approach, we also show that the extended interface structure forms on a time scale similar to that of overall RNA dimerization."

According to the news editors, the research concluded: "Our studies indicate that a kissing dimer-mediated structure, if formed, exists only transiently and readily converts to the extended interface structure, even in the absence of the HIV-1 nucleocapsid protein or other RNA chaperones."

For more information on this research see: NMR detection of intermolecular interaction sites in the dimeric 5’-leader of the HIV-1 genome. *Proceedings of the National Academy of Sciences of the United States of America*, 2016;113(46):13033-13038.

Heart Disorders and Diseases - Heart Failure

Report Summarizes Heart Failure Study Findings from Department of Internal Medicine (The Lymphocyte Count and Neutrophil/lymphocyte Ratio are Independent Predictors for Adverse Cardiac Events in Ischemic Heart Failure but not with Non-ischemic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Failure have been presented. According to news reporting originating in Cluj Napoca, Romania, by NewsRx journalists, research stated, "The predictive value of some biomarkers in heart failure is not yet established. A high value of white blood cell (WBC) count and neutrophil/lymphocyte ratio (NLR) was found to be a marker of higher long term cardiovascular mortality in patients with ischemic heart disease."

The news reporters obtained a quote from the research from the Department of Internal Medicine, "Recent data suggests that some specific types of leucocytes have different predictive values for the cardiovascular risk. This value is improved by using NLR. The purpose of the study was to evaluate the predictive values of WBC count, NLR, WBC differential formula (WBC-DF) for cardiovascular events in patients with non-ischemic heart failure (NIHF) as compared with ischemic heart failure (IHF). Our study included 256 patients with HF (147 with IHF and 109 with NIHF), NYHA class II-IV. They signed informed consent and underwent clinical and laboratory assessment: lipid profile, NT-proBNP, CRP, WBC, NLR and WBC-DF. The patients were followed up for one year. In patients with IHF, significantly higher levels of NT-proBNP (p <0.001), CRP (p <0.005), WBC (p <0.005), lymphocytes (p <0.05) and NRL values (1.27 (1.2-1.36) vs 0.99 (0.4 - 1.15), p<0.02) were found as compared with NIHF. A significant difference between NRL values was found only in patients in NYHA class II vs III. A positive correlation between NRL and NT-proBNP level was found (p <0.05). The lymphocyte count, NLR and NYHA class (p <0.001) represent independent predictors for the rehospitalization and cardiac events in HF patients."

According to the news reporters, the research concluded: "Our study has shown that for patients in the same NYHA class, the lymphocyte count and NLR are independent predictors for adverse cardiac events only in IHF."

For more information on this research see: The Lymphocyte Count and Neutrophil/lymphocyte Ratio are Independent Predictors for Adverse Cardiac Events in Ischemic Heart Failure but not with Non-ischemic Heart Failure. *Revista De Chimie*, 2016;67 (10):2091-2094. *Revista De Chimie* can be contacted at: Chiminform Data S A, Calea Plevnei Nr 139, Sector 6, Bucharest R-77131, Romania.

Heart Disorders and Diseases - Heart Failure

Report Summarizes Heart Failure Study Findings from University of Pittsburgh (Growing Relevance of Cardiac Rehabilitation for an Older Population With Heart Failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Failure is now available. According to news reporting originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "Cardiac rehabilitation (CR) is a comprehensive lifestyle program that can have particular benefit for older patients with heart failure (HF). Prevalence of HF is increasingly common among older adults."

Our news editors obtained a quote from the research from the University of Pittsburgh, "Mounting effects of cardiovascular risk factors in older age as well as the added effects of geriatric syndromes such as multimorbidity, frailty, and sedentariness contribute to the high incidence of HF as well as to management difficulty. CR can play a decisive role in improving function, quality of life, symptoms, morbidity, and mortality, and also address the idiosyncratic complexities of care that often arise in old age. Unfortunately, the current policies and practices regarding CR for patients with HF are limited to HF with reduced ejection fraction and do not extend to HF with preserved ejection fraction, which is likely undercutting its full potential to improve care for today's aging population. Despite the strong rationale for CR on important clinical outcomes, it remains underused, particularly among older patients with HF."

According to the news editors, the research concluded: "In this review, we discuss both the potential and the limitations of contemporary CR for older adults with HF."

For more information on this research see: Growing Relevance of Cardiac Rehabilitation for an Older Population With Heart Failure. *Journal of Cardiac Failure*, 2016;22Q(12):1015-1022. *Journal of Cardiac Failure* can be contacted at: Churchill Livingstone Inc Medical Publishers, Curtis Center, Independence Square West, Philadelphia, PA 19106-3399, USA. Human Papillomavirus

Report Summarizes Human Papillomavirus Study Findings from J.R. Beadle and Co-Researchers [Synthesis and Antiviral Evaluation of Octadecyloxyethyl Benzyl 9-[(2-Phosphonomethoxy)ethyl]guanine (ODE-Bn-PMEG), a Potent Inhibitor of Transient HPV DNA ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Human Papillomavirus. According to news originating from San Francisco, California, by NewsRx correspondents, research stated, "Human papillomavirus (HPV) high-risk genotypes such as HPV-16 and HPV-18 cause the majority of anogenital tract carcinomas, including cervical cancer, the second most common malignancy in women worldwide. Currently there are no approved antiviral agents that reduce or eliminate HPV and reverse virus associated pathology."

Financial support for this research came from National Institute of Allergy and Infectious Diseases.

Our news journalists obtained a quote from the research, "We synthesized and evaluated several alkoxyalkyl acyclic nucleoside phosphonate diesters and identified octadecyloxyethyl benzyl 9-[(2-phosphonomethoxy)ethyl]guanine (ODE-Bn-PMEG) as an active compound which strongly inhibited transient amplification of HPV-11, -16, and -18 origin containing plasmid DNA in transfected cells at concentrations well below its cytotoxic concentrations. ODE-Bn-PMEG demonstrated increased uptake in human foreskin fibroblast cells and was readily converted in-vitro to the active antiviral metabolite, PMEG diphosphate. The P-chiral enantiomers of ODE-Bn-PMEG were obtained and appeared to have equivalent antiviral activities against HPV."

According to the news editors, the research concluded: "ODE-Bn-PMEG is a promising candidate for the local treatment of HPV-16 and HPV-18 and other high-risk types, an important unmet medical need."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.jmedchem.6b00659. This DOI is a link to an online electronic document that is either free or for purchase.

Central Nervous System Diseases and Conditions -

Report Summarizes Intracranial Aneurysm Study Findings from University Hospital (Unruptured intracranial aneurysms: development, rupture and preventive management)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Intracranial Aneurysm have been published. According to news reporting from Mannheim, Germany, by NewsRx journalists, research stated, "Saccular unruptured intracranial aneurysms (UIAs) have a prevalence of 3% in the adult population, and are being increasingly detected because of improved quality and higher frequency of cranial imaging. Large amounts of data, providing varying levels of evidence, have been published on aneurysm development, progression and rupture, but less information is available on the risks and efficacy of preventive treatment."

The news correspondents obtained a quote from the research from University Hospital, "When deciding how to best manage UIAs, clinicians must consider the age and life expectancy of the patient, the estimated risk of rupture, the risk of complications attributed to preventive treatment, and the level of anxiety caused by the awareness of having an aneurysm. This Review highlights the latest human data on the formation, progression and rupture of intracranial aneurysms, as well as risks associated with preventive treatment. Considering these we discuss the implication for clinical management. Furthermore, we highlight pivotal questions arising from current data on intracranial aneurysms and the implications the data have for future experimental or clinical research. We also discuss data on novel radiological surrogates for rupture for those aneurysms that do not require preventive occlusion."

According to the news reporters, the research concluded: "Finally, we provide guidance for clinicians who are confronted with patients with incidentally detected UIAs."

Our news journalists report that additional information may be obtained by contacting N. Etminan, Heidelberg Univ, Univ Hosp Mannheim, Dept. of Neurosurg, Fac Med, D-68167 Mannheim, Germany.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrneurol.2016.150. This DOI is a link to an online electronic document that is either free or for purchase.

Ischemia

Report Summarizes Ischemia Study Findings from Catholic University of Leuven (Steroids can reduce warm ischemic reperfusion injury in a porcine donation after circulatory death model with ex vivo lung perfusion evaluation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Ischemia is the subject of a report. According to news originating from Leuven, Belgium, by NewsRx correspondents, research stated, "Donation after circulatory death (DCD) is being used to increase the number of transplantable organs. The role and timing of steroids in DCD donation and ex vivo lung perfusion (EVLP) has not been thoroughly investigated."

Financial support for this research came from Clinical Research Fund of the University Hospitals Leuven (Leuven, Belgium).

Our news journalists obtained a quote from the research from the Catholic University of Leuven, "In this study, we investigated the effect of steroids on warm ischemic injury in a porcine model (n = 6/group). Following cardiac arrest, grafts were left untouched in the donor (90-min warm ischemia). Graft function was assessed after 6 h of EVLP. In the MP group, 500 mg methyl-prednisolone was given prior to cardiac arrest and during EVLP. In the CONTR group, no steroids were added. Median lung compliance (13 ml/cmH(2)0) was significantly better preserved in the CONTR group than in the MP group (30.5 ml/cmH(2)0). Also, median wet-to-dry weight (6.11 vs. 6.94) and CT density (182.5 vs. 352.9 g/l) were significantly better in the MP group than in the CONTR group, respectively. There was no difference in oxygenation and pulmonary vascular resistance. Perfusate cytokine analysis showed a significant reduction in IL-1 beta, IL-8, IFN-alpha, IL-10, TNF-alpha, and IFN-gamma in MP. Cytokines in bronchoalveolar lavage were not decreased except for IFN-gamma. We demonstrated that warm ischemic injury in DCD donation can be attenuated by steroids when given prior to warm ischemia and during EVLP."

According to the news editors, the research concluded: "Ethical context of donor preconditioning should be discussed further."

The news correspondents report that additional information may be obtained from A.P. Neyrinck, Catholic University of Leuven, Leuven Lung Transplant Unit, Leuven, Belgium. Additional authors for this research include M. Boada, B.M. Vanaudenaerde, S.E. Verleden, R. Vos, G.M. Verleden, E.K. Verbeken, D. Van Raemdonck, D. Schols, S. Claes and A.P. Neyrinck.

Oncology - Liver Cancer

Report Summarizes Liver Cancer Study Findings from University of Franche-Comte (Tumor control by human cytomegalovirus in a murine model of hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting originating in Besancon, France, by NewsRx journalists, research stated, "Although viruses can cause cancer, other studies reported the regression of human tumors upon viral infections. We investigated the cytoreductive potential of human cytomegalovirus (HCMV) in a murine model of human hepatocellular carcinoma (HCC) in severe-immunodeficient mice."

The news reporters obtained a quote from the research from the University of Franche-Comte, "Infection of HepG2 cells with HCMV resulted in the absence of tumor or in a limited tumor growth following injection of cells subcutaneously. By contrast all mice injected with uninfected HepG2 cells and with HepG2 cells infected with UV-treated HCMV did develop tumors without any significant restriction. Analysis of tumors indicated that in mice injected with HCMV-infected-HepG2 cells, but not in controls, a restricted cellular proliferation was observed parallel to a limited activation of the STAT3-cyclin D1 axis, decreased formation of colonies in soft agar, and activation of the intrinsic apoptotic pathway."

According to the news reporters, the research concluded: "HCMV can provide antitumoral effects in a murine model of HCC which requires replicative virus at some stages that results in limitation of tumor cell proliferation and enhanced apoptosis mediated through the intrinsic caspase pathway."

For more information on this research see: Tumor control by human cytomegalovirus in a murine model of hepatocellular carcinoma. Molecular Therapy-Oncolytics, 2016;3():1-10. Molecular Therapy-Oncolytics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

Our news correspondents report that additional information may be obtained by contacting G. Herbein, COMUE Bourgogne Franche Comte Univ, UPRES EA4266, SFR FED 4234, CHRU Besancon, Besancon, France. Report Summarizes Lung Cancer Study Findings from Fujita Health University (Classification of 27 Tumor-Associated Antigens by Histochemical Analysis of 36 Freshly Resected Lung Cancer Tissues)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news originating from Aichi, Japan, by NewsRx correspondents, research stated, "In previous studies, we identified 29 tumor-associated antigens (TAAs) and isolated 488 human monoclonal antibodies (mAbs) that specifically bind to one of the 29 TAAs. In the present study, we performed histochemical analysis of 36 freshly resected lung cancer tissues by using 60 mAbs against 27 TAAs."

Our news journalists obtained a quote from the research from Fujita Health University, "Comparison of the staining patterns of tumor cells, bronchial epithelial cells, and normal pulmonary alveolus cells and interalveolar septum allowed us to determine the type and location of cells that express target molecules, as well as the degree of expression. The patterns were classified into 7 categories. While multiple Abs were used against certain TAAs, the differences observed among them should be derived from differences in the binding activity and/or the epitope. Thus, such data indicate the versatility of respective clones as anti-cancer drugs. Although the information obtained was limited to the lung and bronchial tube, bronchial epithelial cells represent normal growing cells, and therefore, the data are informative. The results indicate that 9 of the 27 TAAs are suitable targets for therapeutic Abs."

According to the news editors, the research concluded: "These 9 Ags include EGFR, HER2, TfR, and integrin alpha 6 beta 4. Based on our findings, a pharmaceutical company has started to develop anti-cancer drugs by using Abs to TfR and integrin alpha 6 beta 4. HGFR, PTP-LAR, CD147, CDCP1, and integrin alpha v beta 3 are also appropriate targets for therapeutic purposes."

For more information on this research see: Classification of 27 Tumor-Associated Antigens by Histochemical Analysis of 36 Freshly Resected Lung Cancer Tissues. *International Journal of Molecular Sciences*, 2016;17(11):1506-1513. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news correspondents report that additional information may be obtained from G. Kurosawa, Fujita Hlth Univ, Inst Comprehens Med Sci, Div Antibody Project, Toyoake, Aichi 4701192, Japan. Additional authors for this research include M. Sugiura, Y. Hattori, H. Tsuda and Y. Kurosawa.

Keywords for this news article include: Aichi, Japan, Asia, Immunologic Receptors, Biological Factors, Membrane Proteins, Lung Neoplasms, Lung Cancer, Immunology, Integrins, Oncology, Antigens, Fujita Health University.

Report Summarizes Lymphopenia Study Findings from IDIBAPS
(Selective Sphingosine 1-Phosphate Receptor 1 Agonist Is Protective Against Ischemia/Reperfusion in Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - Lymphopenia. According to news reporting originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Growing evidence supports that the immunomodulatory drug fingolimod is protective in stroke. Fingolimod binds to 4 of 5 sphingosine-1-phosphate (S1P) receptors and, among other actions, it induces lymphopenia."

Our news editors obtained a quote from the research from IDIBAPS, "In this study, we investigated whether a selective S1P1 agonist is protective in experimental stroke. Drug selectivity was studied in vitro in cells overexpressing the human S1P receptors. Mice (n= 54) received different doses of LASW1238 (3 or 10 mg/kg), fingolimod (1 mg/kg), or the vehicle intraperitoneal, and lymphopenia was studied at different time points. After intraluminal middle cerebral artery occlusion for 45 minutes and immediately after reperfusion, mice (n= 56) received the drug treatment. At 24 hours, a neurological test was performed and infarct volume was measured. Treatment and all the analyses were performed in a blind fashion. In vitro functional assays showed that LASW1238 is a selective agonist of the S1P1 receptor. At 10 mg/kg, this compound induced sustained lymphopenia in mice comparable with fingolimod, whereas at 3 mg/kg it induced shortlasting lymphopenia. After ischemia, both LASW1238 (10 mg/kg) and fingolimod reduced infarct volume, but only LASW1238 (10 mg/kg) showed statistically significant differences versus the vehicle. The neurological function and plasma cytokine levels were not different between groups. The selective S1P1 agonist LASW1238 reduces infarct volume after ischemia/reperfusion in mice, but only when lymphopenia is sustained for at least 24 hours. S1P1 and lymphocytes are potential targets for drug treatment in stroke."

According to the news editors, the research concluded: "Defining the best drug dosing regimens to control the extent and duration of lymphopenia is critical to achieve the desired effects."

For more information on this research see: Selective Sphingosine 1-Phosphate Receptor 1 Agonist Is Protective Against Ischemia/Reperfusion in Mice. Stroke, 2016;47 (12):3053-3056. Stroke can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Stroke - stroke.ahajournals.org/)

Oncology - Melanoma

Report Summarizes Melanoma Study Findings from University of California (Inhibition of oncogenic BRAF activity by indole-3-carbinol disrupts microphthalmia-associated transcription factor expression and arrests melanoma cell proliferation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Melanoma have been presented. According to news originating from Berkeley, California, by NewsRx correspondents, research stated, "Indole-3-carbinol (I3C), an anti-cancer phytochemical derived from cruciferous vegetables, strongly inhibited proliferation and down-regulated protein levels of the melanocyte master regulator microphthalmia-associated transcription factor (MITF-M) in oncogenic BRAF-V600E expressing melanoma cells in culture as well as in vivo in tumor xenografted athymic nude mice. In contrast, wild type BRAF-expressing melanoma cells remained relatively insensitive to I3C anti-proliferative signaling."

Our news journalists obtained a quote from the research from the University of California, "In BRAF-V600E-expressing melanoma cells, I3C treatment inhibited phosphorylation of MEK and ERK/MAPK, the down stream effectors of BRAF. The I3C anti-proliferative arrest was concomitant with the down-regulation of MITF-M transcripts and promoter activity, loss of endogenous BRN-2 binding to the MITF-M promoter, and was strongly attenuated by expression of exogenous MITF-M. Importantly, in vitro kinase assays using immunoprecipitated BRAF-V600E and wild type BRAF demonstrated that I3C selectively inhibited the enzymatic activity of the oncogenic BRAF-V600E but not of the wild type protein. In silico modeling predicted an I3C interaction site in the BRAF-V600E protomer distinct from where the clinically used BRAF-V600E inhibitor Vemurafenib binds to BRAF-V600E. Consistent with this prediction, combinations of I3C and Vemurafenib more potently inhibited melanoma cell proliferation and reduced MITF-M levels in BRAF-V600E expressing melanoma cells compared to the effects of each compound alone."

According to the news editors, the research concluded: "Thus, our results demonstrate that oncogenic BRAF-V600E is a new cellular target of I3C that implicate this indolecarbinol compound as a potential candidate for novel single or combination therapies for melanoma."

The news correspondents report that additional information may be obtained from G.L. Firestone, University of California, Dept. of Mol & Cell Biol, Berkeley, CA 94720, United
Hematologic Diseases and Conditions --

Report Summarizes Myelodysplastic Syndromes Study Findings from University of Texas [Efficacy and safety of extended dosing schedules of CC-486 (oral azacitidine) in patients with lower-risk myelodysplastic syndromes]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hematologic Diseases and Conditions - Myelodysplastic Syndromes are presented in a new report. According to news reporting out of Houston, Texas, by NewsRx editors, research stated, "CC-486, the oral formulation of azacitidine (AZA), is an epigenetic modifier and DNA methyltransferase inhibitor in clinical development for treatment of hematologic malignancies. CC-486 administered for 7 days per 28-day treatment cycle was evaluated in a phase 1 dose-finding study."

Our news journalists obtained a quote from the research from the University of Texas, "AZA has a short plasma half-life and DNA incorporation is S-phase-restricted; extending CC-486 exposure may increase the number of AZA-affected diseased target cells and maximize therapeutic effects. Patients with lower-risk myelodysplastic syndromes (MDS) received 300 mg CC-486 once daily for 14 days (n=28) or 21 days (n=27) of repeated 28-day cycles. Median patient age was 72 years (range 31-87) and 75% of patients had International Prognostic Scoring System Intermediate-1 risk MDS. Median number of CC-486 treatment cycles was 7 (range 2-24) for the 14-day dosing schedule and 6 (1-24) for the 21-day schedule. Overall response (complete or partial remission, red blood cell (RBC) or platelet transfusion independence (TI), or hematologic improvement) (International Working Group 2006) was attained by 36% of patients receiving 14-day dosing and 41% receiving 21-day dosing. RBC TI rates were similar with both dosing schedules (31% and 38%, respectively). CC-486 was generally well-tolerated."

According to the news editors, the research concluded: "Extended dosing schedules of oral CC-486 may provide effective long-term treatment for patients with lower-risk MDS."

For more information on this research see: Efficacy and safety of extended dosing schedules of CC-486 (oral azacitidine) in patients with lower-risk myelodysplastic syndromes. Leukemia, 2015;30(4):889-96. (Nature Publishing Group - www.nature.com/; Leukemia - www.nature.com/leu/)

Our news journalists report that additional information may be obtained by contacting G. Garcia-Manero, Dept. of Leukemia, University of Texas MD Anderson Cancer Center, Houston, TX, United States. Additional authors for this research include S.D. Gore, S. Kambhampati, B. Scott, A. Tefferi, C.R. Cogle, W.J. Edenfield, J. Hetzer, K. Kumar, E. Laille, T. Shi, K.J. MacBeth and B. Skikne.

Heart Disorders and Diseases - Myocardial Ischemia

Report Summarizes Myocardial Ischemia Study Findings from Shanghai Jiao-Tong University (The nuclear melatonin receptor RORa is a novel endogenous defender against myocardial ischemia/reperfusion injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Myocardial Ischemia. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Circadian rhythm disruption or decrease in levels of circadian hormones such as melatonin increases ischemic heart disease risk. The nuclear melatonin receptors RORs are pivotally involved in circadian rhythm regulation and melatonin effects mediation."

Funders for this research include National Natural Science Foundation of China, Key Basic Research Program of Shanghai Committee of Science and Technology, Ministry of Education of China, Shanghai Shuguang Program, Shanghai Municipal Education Commission, Shanghai Jiaotong University, Shanghai Jiaotong University School of Medicine.

Our news editors obtained a quote from the research from Shanghai Jiao-Tong University, "However, the functional roles of RORs in the heart have never been investigated and were therefore the subject of this study on myocardial ischemia/reperfusion (MI/R) injury pathogenesis. RORa and RORg subtypes were detected in the adult mouse heart, and RORa but not RORg was downregulated after MI/R. To determine the pathological consequence of MI/R-induced reduction of RORa, we subjected RORa-deficient staggerer mice and wild-type (WT) littermates to MI/R injury, resulting in significantly increased myocardial infarct size, myocardial apoptosis and exacerbated contractile dysfunction in the former. Mechanistically, RORa deficiency promoted MI/R-induced endoplasmic reticulum stress, mitochondrial impairments, and autophagy dysfunction. Moreover, RORa deficiency augmented MI/R-induced oxidative/nitrative stress. Given the emerging evidence of RORa as an essential melatonin effects mediator, we further investigated the RORa roles in melatonin-exerted cardioprotection, in particular against MI/R injury, which was significantly attenuated in RORa-deficient mice, but negligibly affected by cardiac-specific silencing of RORg. Finally, to determine cell type-specific effects of RORa, we generated mice with cardiomyocyte-specific RORa overexpression and they were less vulnerable to MI/R injury."

According to the news editors, the research concluded: "In summary, our study provides the first direct evidence that the nuclear melatonin receptor RORa is a novel endogenous protective receptor against MI/R injury and an important mediator of melatonin-exerted cardioprotection; melatonin-RORa axis signaling thus appears important in protection against ischemic heart injury."

The news editors report that additional information may be obtained by contacting B. He, Dept. of Cardiology, Ren Ji Hospital, School of Medicine, Shanghai Jiao Tong University, Shanghai, People's Republic of China. Additional authors for this research include Y. Zhao, L. Xu, L. Gao, Y. Su, N. Lin and J. Pu.

**Nutritional and Metabolic Diseases and Conditions**

**Report Summarizes Obesity Study Findings from University of Verona (Considerations for Systemic Treatment of Psoriasis in Obese Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news originating from Verona, Italy, by NewsRx correspondents, research stated, "Psoriasis is an immune-mediated inflammatory skin disease frequently associated with metabolic disorders, including diabetes, dyslipidaemia and metabolic syndrome. Moreover, a growing number of studies confirm the association between psoriasis and obesity."

Our news journalists obtained a quote from the research from the University of Verona, "It has been found that obesity, as measured by body mass index > 30 kg/m(2), can double the risk of incident psoriasis. A positive correlation between different measures of adiposity and the severity of psoriasis has also been reported. Epidemiologic studies have also provided robust evidence confirming the association between obesity and psoriatic arthritis. Genetic, metabolic and environmental factors are all likely to contribute to these associations. Adipose tissue is an active endocrine and paracrine organ that has a key role in lipid and glucose metabolism as well as inflammation. Fat tissue is traditionally distributed into two main compartments with different metabolic characteristics, i.e. the subcutaneous and visceral adipose tissue. Particular attention has been devoted to visceral adiposity because of its contribution to inflammation and atherosclerosis. The association between psoriasis and obesity should be properly considered when choosing a systemic treatment, because it could exert negative effects on metabolic parameters, including liver enzymes, serum lipids and renal function. Obesity may increase the risk of liver and renal toxicity from methotrexate and cyclosporine. Moreover, obesity can compromise the effectiveness of systemic treatments for psoriasis (conventional and biological therapies)."

According to the news editors, the research concluded: "Dermatologists are also
expected to promote a healthy lifestyle and weight loss for obese patients because they could improve metabolic parameters and responsiveness to psoriasis therapies."

The news correspondents report that additional information may be obtained from P. Gisondi, University of Verona, Sect Dermatol & Venereol, Dept. of Med, I-37126 Verona, Italy. Additional authors for this research include M. Del Giglio and G. Girolomoni.

Oncology - Pancreatic Cancer

Report Summarizes Pancreatic Cancer Study Findings from University of Southern Denmark (Lipid-modified G4-decoy oligonucleotide anchored to nanoparticles: delivery and bioactivity in pancreatic cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Pancreatic Cancer are presented in a new report. According to news originating from Odense, Denmark, by NewsRx correspondents, research stated, "KRAS is mutated in >90% of pancreatic ductal adenocarcinomas. As its inactivation leads to tumour regression, mutant KRAS is considered an attractive target for anticancer drugs."

Our news journalists obtained a quote from the research from the University of Southern Denmark, "In this study we report a new delivery strategy for a G4-decoy oligonucleotide that sequesters MAZ, a transcription factor essential for KRAS transcription. It is based on the use of palmitoyl-oleyl-phosphatidylcholine (POPC) liposomes functionalized with lipid-modified G4-decoy oligonucleotides and a lipid-modified cell penetrating TAT peptide."

According to the news editors, the research concluded: "The potency of the strategy in pancreatic cancer cells is demonstrated by cell cytometry, confocal microscopy, clonogenic and qRT-PCR assays."

For more information on this research see: Lipid-modified G4-decoy oligonucleotide anchored to nanoparticles: delivery and bioactivity in pancreatic cancer cells. Scientific Reports, 2016;6():1-13. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group
Personalized Medicine

Report Summarizes Personalized Medicine Study Findings from L. Zhang and Co-Researchers (Personalized medicine and blood disorders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Personalized Medicine. According to news reporting originating from Cambridge, Massachusetts, by NewsRx editors, the research stated, "Personalized medicine has been using genomics approaches to elucidate the etiology of a disease as well as to personalize the management for patients of a particular disease based on that individual's genetic features. It benefits patients across a multitude of therapeutic areas and advancements are particularly evident in hematology/oncology."

Our news editors obtained a quote from the research, "The importance of genomics discoveries and development in nonmalignant blood disorders generally goes unrecognized, but it becomes critical now due to the global disease burden and a high mortality. This paper focuses on the exploration of personalized medicine applications in hemoglobin diseases, and thrombotic and bleeding disorders. It discusses the challenges which slow down the implementation as well."

According to the news editors, the research concluded: "The available data suggest that the ability to understand the clinical features of a patient's genetic profile and the knowledge of disease mechanisms are the keys to facilitate new diagnosis, new therapies, new prescriptions and better healthcare."

For more information on this research see: Personalized medicine and blood disorders. Personalized Medicine, 2016;13(6):587-596. Personalized Medicine can be contacted at: Future Medicine Ltd, Unitec House, 3RD Floor, 2 Albert Place, Finchley Central, London, N3 1QB, England.

Report Summarizes Pharmacoepidemiology and Drug Safety Study Findings from Brown University (Consensus of recommendations guiding comparative effectiveness research methods)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Pharmacoepidemiology and Drug Safety have been published. According to news reporting originating from Providence, Rhode Island, by NewsRx correspondents, research stated, "Because of an increasing demand for quality comparative effectiveness research (CER), methods guidance documents have been published, such as those from the Agency for Healthcare Research and Quality (AHRQ) and the Patient-Centered Outcomes Research Institute (PCORI). Our objective was to identify CER methods guidance documents and compare them to produce a summary of important recommendations which could serve as a consensus of CER method recommendations."

Our news editors obtained a quote from the research from Brown University, "We conducted a systematic literature review to identify CER methods guidance documents published through 2014. Identified documents were analyzed for methods guidance recommendations. Individual recommendations were categorized to determine the degree of overlap. We identified nine methods guidance documents, which contained a total of 312 recommendations, 97% of which were present in two or more documents. All nine documents recommended transparency and adaptation for relevant stakeholders in the interpretation and dissemination of results. Other frequently shared CER methods recommendations included: study design and operational definitions should be developed a priori and allow for replication (n = 8 documents); focus on areas with gaps in current clinical knowledge that are relevant to decision-makers (n = 7); validity of measures, instruments, and data should be assessed and discussed (n = 7); outcomes, including benefits and harms, should be clinically meaningful, and objectively measured (n = 7). Assessment for and strategies to minimize bias (n = 6 documents), confounding (n = 6), and heterogeneity (n = 4) were also commonly shared recommendations between documents."

According to the news editors, the research concluded: "We offer a field-consensus guide based on nine CER methods guidance documents that will aid researchers in designing CER studies and applying CER methods."

The news editors report that additional information may be obtained by contacting A.R. Caffrey, Brown University, Sch Public Hlth, Providence, RI 02912, United States. Additional authors for this research include R. McConeghy, K. Heinrich, N.M. Gatto and A.R. Caffrey.

Report Summarizes Pharmacy Practice Study Findings from C.K. Frail and Co-Researchers (Experience with technology-supported transitions of care to improve medication use)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Pharmacy Practice is now available. According to news originating from Jackson Center, Ohio, by NewsRx correspondents, research stated, "To describe an innovative community pharmacy-based pilot program using technology to support transitions of care for patients living in rural areas. This service occurred through a partnership between 1 independent community pharmacy organization with 5 locations in Ohio and Indiana and one 92-bed general medical and surgical county hospital during May 2014 to May 2015."

Our news journalists obtained a quote from the research, "Practice description and innovation: Community pharmacists worked with patients immediately following discharge to reconcile their medications and make recommendations to optimize therapy. The pharmacy packaged their new medication regimen in clear, individual dose adherence packaging. Medications were delivered by a staff driver to the patient's home within 72 hours of discharge. Patients consulted with the pharmacist by videoconference using a computer tablet device. Patients received telephone follow-up shortly before their medication supply was to run out, and additionally as needed on an individual basis. Evaluation: Self-reported hospital readmissions were collected at 30 and 180 days after enrollment. Patient satisfaction data were also collected at 30 and 180 days using a tool modified from the 5-item Transition Measure (15-item Care Transitions Measure). Eighteen patients participated in the evaluation of the pilot. Three patients were readmitted within 30 days (17%), and 2 additional patients were readmitted within 180 days (11%). Patient satisfaction results were positive overall. Lessons learned relate to establishing partnerships, logistics, and patient engagement. These lessons will assist future community pharmacies in implementing a transition of care service."

According to the news editors, the research concluded: "This pharmacist care model may offer a solution to increase access to pharmacy services for patients in rural areas during a critical transition in care."

The news correspondents report that additional information may be obtained from A.L. Haas, Jackson Pharm & Wellness Center, Jackson Center, OH 45334, United States. Additional authors for this research include O.W. Garza and A.L. Haas.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.japh.2016.04.565. This DOI is a link to an online electronic document that is either free or for purchase.
Hematology - Plasma

Report Summarizes Plasma Study Findings from Second Military Medical University (Analysis of amino acids in human blood using UHPLC-MS/MS: Potential interferences of storage time and vacutainer tube in pre-analytical procedure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematology - Plasma is now available. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "To investigate potential interferences of two pre-analytical variables, the storage time and the vacutainer tube, on the quantification of 20 amino acids using a UHPLC-MS/MS method. Blood samples from 25 apparently healthy subjects were collected into duplicate sets of EDTA-2K, EDTA-3K, coagulation, heparin and citrate tubes, and stored in capped vacutainer tubes at 4 degrees C for 6 h, 12 h and 24 h before sample analysis."

Our news journalists obtained a quote from the research from Second Military Medical University, "A UHPLC-MS/MS method was established for simultaneous quantification of 20 amino acids. ANOVA for repeated measurement was conducted based on the model of Mauchly's test of Sphericity. Student's t-test was applied for comparison between amino acid concentrations obtained from different vacutainer tubes, and consistency of the results was checked through Bland-Altman difference plots and Passing-Bablok regression analysis. Most of the 20 amino acids showed a least concentration fluctuation with storage time in heparin plasma, followed by EDTA-3K and citrate plasma. The amino acid concentrations were significantly lower in citrate plasma and slightly higher in serum, compared with those in heparin plasma. No fixed bias was observed for amino acid concentrations in EDTA and heparin plasma, but the differences were mostly of statistical significance. Amino acid concentrations in EDTA-3K plasma achieved a good consistency with those in heparin plasma by UHPLC-MS/MS analysis. Storage time and vacutainer tube were important variables for amino acid analysis."

According to the news editors, the research concluded: "They should draw researchers' attention and then be controlled in good laboratory practice to reduce pre-analytical errors."

Our news journalists report that additional information may be obtained by contacting W.S. Chen, Second Military Med Univ, Changzheng Hosp, Dept. of Pharm, Shanghai 200003, People's Republic of China. Additional authors for this research include S.H. Gao, C. Shu, Y. Wen, Y.L. Yun, X. Tao, W.S. Chen and F. Zhang.

Peptide Proteins - Proinsulin

Report Summarizes Proinsulin Study Findings from Baylor University College of Medicine (The History Of Insulin Technology: A Brief Review Of The Updates In Basal Insulin Therapy Through The Years)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptide Proteins - Proinsulin. According to news reporting originating in Houston, Texas, by NewsRx editors, the research stated, "Recent advances in insulin pharmacology, metallurgy, and insulin delivery technology have largely remediated the difficulties associated with insulin injection circa 1925."

The news reporters obtained a quote from the research from the Baylor University College of Medicine, "Each generation of basal insulin has offered incremental improvements in safety and convenience over the previous generation. Ultralong-acting basal insulin analogues are notable for their very long duration of action (>24 hours), flatter pharmacodynamic profiles, and more consistent pharmacodynamic action throughout the day, on different days, and in different patients, relative to long-acting basal insulin analogues."

According to the news reporters, the research concluded: "These characteristics yield basal insulins with more predictable actions that are more forgiving of variations in injection frequency, potentially with a lower risk of overall, nocturnal, and severe hypoglycemia."

For more information on this research see: The History Of Insulin Technology: A Brief Review Of The Updates In Basal Insulin Therapy Through The Years. *Endocrine Practice*, 2016;22():7-9. *Endocrine Practice* can be contacted at: Amer Assoc Clinical Endocrinologists, 245 Riverside Avenue, Ste 200, Jacksonville, FL 32202, USA.

Report Summarizes Prostate Cancer Study Findings from T. Todenhofe

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "The expression of AR-V7 (androgen receptor splice variant) in circulating tumor cells has been associated with resistance to abiraterone and enzalutamide in patients with metastatic castration resistant prostate cancer. We used a sensitive, whole blood reverse transcriptase-polymerase chain reaction assay that does not require circulating tumor cell enrichment to correlate outcomes of abiraterone with whole blood expression of AR-V7 and other prostate cancer associated transcripts."

Our news journalists obtained a quote from the research, "We assessed the expression of AR-V7, FOXA1, GRHL2, HOXB13, KLK2, KLK3 and TMPRSS2: ERG mRNA in 2.5 ml whole blood from each of 27 patients with metastatic castration resistant prostate cancer and 33 controls without cancer as the discovery cohort. Cycle threshold values of controls with the highest gene expression were set as the threshold for a positive test. Thresholds were then applied to a validation cohort of 37 patients with metastatic castration resistant prostate cancer who were commencing abiraterone. Gene expression was correlated with the prostate specific antigen response rate using the chi-square test, and with time to prostate specific antigen progression and overall survival using the log rank test. In the discovery cohort 3 of 27 patients (11.1%) with metastatic castration resistant prostate cancer were AR-V7 positive vs 4 of 37 (10.8%) in the validation cohort. In the validation cohort patients with a positive AR-V7 test had a lower prostate specific antigen response rate (0% vs 42%, p = 0.27) together with shorter median prostate specific antigen progression (0.7 vs 4.0 months, p < 0.001) and median overall survival (5.5 vs 22.1 months, p < 0.001). Reverse transcriptase-polymerase chain reaction detection of AR-V7 transcripts in whole blood was associated with inferior outcomes in patients treated with abiraterone."

According to the news editors, the research concluded: "These results reinforce the potential usefulness of AR-V7 as a prognostic and predictive biomarker for metastatic castration resistant prostate cancer."

The news correspondents report that additional information may be obtained from K.N. Chi, British Columbia, Toronto, ON, Canada. Additional authors for this research include A. Azad, C. Stewart, J. Gao, B.J. Eigl, M.E. Gleave, A.M. Joshua, P.C. Black and K.N. Chi.

Oncology - Renal Cell Carcinoma

Report Summarizes Renal Cell Carcinoma Study Findings from Veterans Affairs Medical Center (An Empiric Evaluation of the Effect of Variation in Intensity of Followup for Surgically Treated Renal Neoplasms on Cancer Specific Survival)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Renal Cell Carcinoma have been published. According to news originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "Followup protocols after the surgical management of renal cell carcinoma lack clear evidence linking the intensity of imaging surveillance to improved outcomes. In this context we characterized the relationship between surveillance imaging intensity and cancer specific survival."

Our news journalists obtained a quote from the research from Veterans Affairs Medical Center, "Using SEER-Medicare data we identified 7,603 men with renal cell carcinoma treated surgically between 2004 and 2009. Multivariable negative binomial regression analysis was performed to assess the relationship between patient level characteristics and the variation in imaging intensity. We modeled the association between kidney cancer specific mortality and imaging intensity using Fine and Gray proportional subdistribution hazards regression with other cause death treated as a competing risk for 2 separate followup periods (15 and 36 months). More than 40% of patients in the short interval cohort and more than 50% in the intermediate interval group underwent no chest imaging during the evaluated survivorship period. More than 30% of patients in both followup periods had no abdominal imaging tests performed. Overall, followup imaging did not appear to confer an improvement in disease specific survival compared to undergoing no imaging in the 2 survivorship periods. There remains considerable variation in the post-treatment surveillance regimen for patients with renal cell carcinoma in the United States."

According to the news editors, the research concluded: "More importantly, this study raises important questions regarding the link between posttreatment surveillance imaging and survival."

The news correspondents report that additional information may be obtained from M.J. Resnick, Tennessee Valley VA Hlth Care Syst, Geriatr Res Educ & Clin Center, Nashville,
TN, United States. Additional authors for this research include A.J. Graves, M.D. Tyson, B. O'Neil, S.S. Chang, S.H. Ni, D.A. Barocas, D.F. Penson and M.J. Resnick.

Salicylic Acid

Report Summarizes Salicylic Acid Study Findings from University of Pisa (Experimental and DFT Characterization of Halloysite Nanotubes Loaded with Salicylic Acid)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Salicylic Acid are presented in a new report. According to news reporting out of Pisa, Italy, by NewsRx editors, research stated, "Halloysite nanotubes (HNTs) and salicylic acid (SA) are natural substances widely used in different fields. HNTs are very promising as nanocarriers because of their biocompatibility, atoxicity, anti-inflammatory properties and capacity to maintain the biological activity of immobilized enzymes."

Our news journalists obtained a quote from the research from the University of Pisa, "Because of its bactericidal and antiseptic properties, salicylic acid (SA) is used in pharmaceutical formulations, and as an additive for preserving foods and cosmetics. In this study, we set up a procedure for the loading of HNTs with SA for their possible application in active food packaging. Pristine HNTs were studied together with acidic etched HNTs with enlarged internal lumen, and various pH values for the loading solutions were tested in order to obtain the maximum loading. The HNTs-empty and loaded with SA-were characterized by TG-FTIR, FTIR SEM, STEM, and nitrogen adsorption/desorption isotherms measurements. We obtained a maximum loading of 10.5% (w/w), using HNTs pretreated with H2SO4 2 M at 25 degrees C for 48h and a solution of sodium salicylate at pH 8. We also characterized the interaction of SA-HNTs at a molecular level by combining ATR-FTIR measurements and periodic density functional theory (DFT) calculations. We believe that the information on the SA-HNT complexes derived from our research should help to improve the current knowledge of SA clay interactions."

According to the news editors, the research concluded: "In addition, it should be of interest for environmental and earth sciences since SA is used to model natural organic matter (NOM) in both experimental and theoretical studies of NOM adsorption on different kinds of mineral surfaces."

Our news journalists report that additional information may be obtained by contacting C. Duce, University of Pisa, Chem & Ind Chem Department, I-56124 Pisa, Italy. Additional authors for this research include C. Duce, A. Pedone, D. Presti, J.G. Rivera, V. Ierardi and M.R. Tine.

Salicylic Acids

Report Summarizes Salicylic Acids Study Findings from Harbin Medical University (Anti-cancer activity and potential mechanism of a novel aspirin derivative)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Salicylic Acids is the subject of a report. According to news reporting from Daqing, People's Republic of China, by NewsRx journalists, research stated, "Aspirin has been used in the treatment and chemoprevention of many malignant cancers. The mechanism of its anti-cancer activity mainly involves the inhibition of cyclooxygenase-2 (COX-2)."

Financial support for this research came from Scientific Research Fund of Postgraduates Innovation of Heilongjiang Province.

The news correspondents obtained a quote from the research from Harbin Medical University, "However, the application of aspirin is limited by the serious gastric mucosal damage that accompanies its usage. We have previously reported the preparation of a novel aspirin derivative that we named Ca-Asp, and showed that it causes less damage to gastric mucosa of rat and inhibits the expression of COX-2 to higher degree than Asp. However, the anti-cancer effect and mechanism of Ca-Asp was not demonstrated. In this study, the anti-cancer effect of Ca-Asp was investigated and compared with those of Asp and Hydroxyapatite (Hap) at the cell level. The results showed that treatment of SGC-7901 cells (human gastric cancer cell line) with 200-400 μg/ml Ca-Asp resulted in significant reduction in cell viability, compared to treatment with either Asp or Hap, and at a higher concentration (500 μg/ml). Subsequent investigation into the possible underlying mechanism showed that Ca-Asp induced apoptosis and caused cell cycle arrest at the G1 phase. Ca-Asp also up regulated the levels of caspase-3 and p53, but down regulated the level of cyclin D1, NF-kappa beta, COX-2 and PGE(2). Furthermore, simultaneous treatment of SGC-7901 cells with Ca-Asp and exogenous PGE(2) reduced the anti-proliferative effect of Ca-Asp on the cells."

According to the news reporters, the research concluded: "Taken together, the results suggested that Ca-Asp might act as a potential anti-cancer drug, and that its suppression of PGE(2) production might constitute an important part of its anti-cancer activity."

For more information on this research see: Anti-cancer activity and potential

Our news journalists report that additional information may be obtained by contacting S. Li, Harbin Med Univ, Daqing Branch, Dept. of Pharmaceut, Daqing 163319, People's Republic of China. **Oncology - Squamous Cell Carcinoma**

**Report Summarizes Squamous Cell Carcinoma Study Findings from Institute for Cancer Research and Treatment (IRCCS) (Whole exome sequencing of independent lung adenocarcinoma, lung squamous cell carcinoma, and malignant peritoneal mesothelioma A ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Squamous Cell Carcinoma. According to news reporting out of Genoa, Italy, by NewsRx editors, research stated, "The presence of multiple primary tumors (MPT) in a single patient has been identified with an increasing frequency. A critical issue is to establish if the second tumor represents an independent primary cancer or a metastasis."

Our news journalists obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Therefore, the assessment of MPT clonal origin might help understand the disease behavior and improve the management/prognosis of the patient. Herein, we report a 73-year-old male smoker who developed 2 primary lung cancers (adenocarcinoma and squamous cell carcinoma) and a malignant peritoneal mesothelioma (PM). Whole exome sequencing (WES) of the 3 tumors and of germline DNA was performed to determine the clonal origin and identify genetic cancer susceptibility. Both lung cancers were characterized by a high mutational rate with distinct mutational profiles and activation of tumor-specific pathways. Conversely, the PM harbored a relative low number of genetic variants and a novel mutation in the WT1 gene that might be involved in the carcinogenesis of nonasbestos-related mesothelioma. Finally, WES of the germinial DNA displayed several single nucleotide polymorphisms in DNA repair genes likely conferring higher cancer susceptibility. Overall, WES did not disclose any somatic genetic variant shared across the 3 tumors, suggesting their clonal independency: however, the carcinogenic effect of smoke combined with a deficiency in DNA repair genes and the patient advanced age might have been responsible for the MPT"
development."

According to the news editors, the research concluded: "This case highlights the WES importance to define the clonal origin of MPT and susceptibility to cancer."

For more information on this research see: Whole exome sequencing of independent lung adenocarcinoma, lung squamous cell carcinoma, and malignant peritoneal mesothelioma A case report. Medicine, 2016;95(48):108-115. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Oncology - Testicular Cancer

Report Summarizes Testicular Cancer Study Findings from K. Litchfield and Co-Researchers (Rare disruptive mutations in ciliary function genes contribute to testicular cancer susceptibility)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Testicular Cancer have been presented. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "Testicular germ cell tumour (TGCT) is the most common cancer in young men. Here we sought to identify risk factors for TGCT by performing whole-exome sequencing on 328 TGCT cases from 153 families, 634 sporadic TGCT cases and 1,644 controls."

Our news journalists obtained a quote from the research, "We search for genes that are recurrently affected by rare variants (minor allele frequency <0.01) with potentially damaging effects and evidence of segregation in families. A total of 8.7% of TGCT families carry rare disruptive mutations in the cilia-microtubule genes (CMG) as compared with 0.5% of controls (P = 2.1 x 10(-8)). The most significantly mutated CMG is DNAAF1 with biallelic inactivation and loss of DNAAF1 expression shown in tumours from carriers. DNAAF1 mutation as a cause of TGCT is supported by a dnaaf1(hu255h)(+/-) zebrafish model, which has a 94% risk of TGCT."

According to the news editors, the research concluded: "Our data implicate cilia-microtubule inactivation as a cause of TGCT and provide evidence for CMGs as cancer susceptibility genes."

For more information on this research see: Rare disruptive mutations in ciliary function genes contribute to testicular cancer susceptibility. Nature Communications, 2016;7 ():1-8. Oncology - Thyroid Cancer

Report Summarizes Thyroid Cancer Study Findings from Cancer Hospital (Association between neutrophil-to-lymphocyte ratio and differentiated thyroid cancer: a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Thyroid Cancer. According to news reporting out of Chengdu, People's Republic of China, by NewsRx editors, research stated, "The association between neutrophil-to-lymphocyte ratio (NLR) and differentiated thyroid cancer (DTC) is undecided. To rectify this question, we conducted a systematic meta-analysis based on 7 prospective cohort studies published between 2013 and 2015, comprising 7349 patients."

Our news journalists obtained a quote from the research from Cancer Hospital, "Six of these cohorts included pretreatment (baseline) NLR data for patients with thyroid nodules. The meta-analysis of these 6 cohorts showed that the NLR of patients with DTC (4617 cases) was statistically similar to patients with benign nodules only (1666 cases), with a mean difference (MD) of 0.19 (95% CI: -0.09 to 0.46; I-2 = 93%; P< 0.001). No significant difference in NLR was found between patients with DTC and patients with benign nodules. Two studies addressed an association between NLR and papillary thyroid carcinoma in patients stratified by age < 45 and >= 45 years (496 and 891 cases, respectively); the pooled MD was 0.09 (95% CI: -0.37 to 0.55; I-2 = 92.2%, P< 0.001). An elevated NLR seems not a reliable indicator of progressing DTC in patients with goiters, and there was no difference in NLR between patients aged < 45 years and those aged >= 45 years."

According to the news editors, the research concluded: "Well-designed and large-scale investigations are warranted to understand the value of NLR in the prognosis of DTC."

For more information on this research see: Association between neutrophil-to-lymphocyte ratio and differentiated thyroid cancer: a meta-analysis. Scientific Reports, 2016;6 ():1-7. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Drugs and Therapies - Toxicology and Pharmacology

Report Summarizes Toxicology and Pharmacology Study Findings from Procter & Gamble (Exposure Factor considerations for safety evaluation of modern disposable diapers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Toxicology and Pharmacology are discussed in a new report. According to news originating from Cincinnati, Ohio, by NewsRx correspondents, research stated, "Modern disposable diapers are complex products and ubiquitous globally. A robust safety assessment for disposable diapers include two important exposure parameters, i) frequency of diaper use & ii) constituent transfer from diaper to skin from direct and indirect skin contact materials."

Our news journalists obtained a quote from the research from Procter & Gamble, "This article uses published information and original studies to quantify the exposure parameters for diapers. Using growth tables for the first three years of diapered life, an average body weight of 10-11 kg can be calculated, with a 10th percentile for females (8.5-8.8 kg). Data from surveys and diary studies were conducted to determine the frequency of use of diapers. The overall mean in the US is 4.7 diapers per day with a 75th, 90th, and 95th percentile of 5.0, 6.0, and 7.0 respectively. Using diaper topsheet-lotion transfer as a model, direct transfer to skin from the topsheet was 3.0-4.3% of the starting amount of lotion. Indirect transfer of diaper core materials as a measure of re-wetting of the skin via urine resurfacing back to the topsheet under pressure was estimated at a range of 0.32-0.66% averaging 0.46%.

According to the news editors, the research concluded: "As described, a thorough data-based understanding of exposure is critical for a robust exposure based safety assessment of disposable diapers."

For more information on this research see: Exposure Factor considerations for safety evaluation of modern disposable diapers. Regulatory Toxicology and Pharmacology, 2016;81 ():183-193. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Nutritional and Metabolic Diseases and Conditions -…

Report Summarizes Type 2 Diabetes Study Findings from Mahidol University (PAX4 R192H and P321H polymorphisms in type 2 diabetes and their functional defects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting originating from Bangkok, Thailand, by NewsRx correspondents, research stated, "We have previously identified PAX4 mutations causing MODY9 and a recent genome-wide association study reported a susceptibility locus of type 2 diabetes (T2D) near PAX4. In this study, we aim to investigate the association between PAX4 polymorphisms and T2D in Thai patients and examine functions of PAX4 variant proteins."

Our news editors obtained a quote from the research from Mahidol University, "PAX4 rs2233580 (R192H) and rs712701 (P321H) were genotyped in 746 patients with T2D and 562 healthy normal control subjects by PCR and restriction-fragment length polymorphism method. PAX4 variant proteins were investigated for repressor function on human insulin and glucagon promoters and for cell viability and apoptosis upon high glucose exposure. Genotype and allele frequencies of PAX4 rs2233580 were more frequent in patients with T2D than in control subjects (P=0.001 and 0.0006, respectively) with odds ratio of 1.66 (P=0.001; 95% confidence interval, 1.22-2.27). PAX4 rs712701 was not associated with T2D but it was in linkage disequilibrium with rs2233580. The 192H/321H (A/A) haplotype was more frequent in T2D patients than in controls (9.5% vs 6.6%; P=0.009). PAX4 R192H, but not PAX4 P321H, impaired repression activities on insulin and glucagon promoters and decreased transcript levels of genes required to maintain beta-cell function, proliferation and survival. Viability of a-cell was reduced under glucotoxic stress condition for the cells overexpressing either PAX4 R192H or PAX4 P321H or both."

According to the news editors, the research concluded: "Thus these PAX4 polymorphisms may increase T2D risk by defective transcription regulation of target genes and/or decreased a-cell survival in high glucose condition."

The news editors report that additional information may be obtained by contacting N. Plengvidhya, Mahidol University, Fac Med, Div Endocrinol & Metab, Dept. of MedSiriraj Hosp, Bangkok 10700, Thailand. Additional authors for this research include S. Kooptiwut, N. Chongjaroen, N. Semprasert, W. Hanchang, K. Chanprasert, W. Tangjittipokin, P.T. Yenchitsomanus and N. Plengvidhya.

Gram-Negative Bacteria - Acinetobacter baumannii

Reports Outline Acinetobacter baumannii Study Findings from Institute for Biology Research (Wide spread of OXA-23-producing carbapenem-resistant Acinetobacter baumannii belonging to clonal complex II in different hospitals in Lebanon)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Acinetobacter baumannii. According to news reporting from Angers, France, by NewsRx journalists, research stated, "To investigate the molecular epidemiology of Acinetobacter baumannii strains isolated from different hospitals in Lebanon. A total of 119 non-duplicate Acinetobacter strains were identified using matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF MS) and partial rpoB gene sequencing."

The news correspondents obtained a quote from the research from Institute for Biology Research, "Antibiotic susceptibility testing was performed by disc diffusion method and all identified carbapenem-resistant isolates were investigated by PCR assays for the presence of the carbapenemase-encoding genes. Multilocus sequence typing (MLST) and pulsed-field gel electrophoresis (PFGE) were used for molecular typing. Of the 119 A. baumannii isolates, 76.5% were resistant to carbapenems. The most common carbapenemase was the OXA-23-type, found in 82 isolates. The study of population structure using MLST revealed the presence of 30 sequence types (STs) including 18 new ones, with ST2 being the most commonly detected, accounting for 61% of the isolates typed. PFGE performed on all strains of ST2 identified a major cluster of 53 isolates, in addition to three other minor clusters and ten unique profiles. This study highlights the wide dissemination of highly related OXA-23-producing carbapenem-resistant A. baumannii belonging to the international clone II in Lebanon."

According to the news reporters, the research concluded: "Thus, appropriate infection control measures are recommended in order to control the geographical spread of this clone in this country."

Our news journalists report that additional information may be obtained by contacting M. Kempf, Center Hosp Univ Angers, Inst Biol Sante, Lab Bacteriol, F-49933 Angers, France. Additional authors for this research include M. Hamze, T. Jisr, C. Lemarie, M. Eveillard, M.L. Joly-Guillou and M. Kempf.

Reports Outline Adipokines Study Results from V. Mela et al (Blockage of neonatal leptin signaling induces changes in the hypothalamus associated with delayed pubertal onset and modifications in neuropeptide expression during adulthood in male ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Intercellular Signaling Peptides and Proteins - Adipokines. According to news reporting from Madrid, Spain, by NewsRx journalists, research stated, "The neonatal leptin surge, occurring from postnatal day (PND) 5 to 13 and peaking at PND9 in rodents, is important for the development of neuroendocrine circuits involved in metabolic control and reproductive function. We previously demonstrated that treatment with a leptin antagonist from PND 5 to 9, coincident with peak leptin levels in the neonatal surge, modified trophic factors and markers of cell turnover and neuronal maturation in the hypothalamus of peri-pubertal rats."

The news correspondents obtained a quote from the research, "The kisspeptin system and metabolic neuropeptide and hormone levels were also modified. Here our aim was to investigate if the timing of pubertal onset is altered by neonatal leptin antagonism and if the previously observed peripubertal modifications in hormones and neuropeptides persist into adulthood and affect male sexual behavior. To this end, male Wistar rats were treated with a pegylated super leptin antagonist (5 mg/kg, s.c.) from PND 5 to 9 and killed at PND102-103. The appearance of external signs of pubertal onset was delayed. Hypothalamic kissl mRNA levels were decreased in adult animals, but sexual behavior was not significantly modified. Although there was no effect on body weight or food intake, circulating leptin, insulin and triglyceride levels were increased, while hypothalamic leptin receptor, POMC and AgRP mRNA levels were decreased."

According to the news reporters, the research concluded: "Alteration of the neonatal leptin surge can modify the timing of pubertal onset and have long-term effects on hypothalamic expression of reproductive and metabolic neuropeptides."

Our news journalists report that additional information may be obtained by contacting J.A. Chowen, Inst Carlos III, CIBER Fisiopatol Obesidad & Nutr, Madrid, Spain. Additional authors for this research include S. Jimenez, A. Freire-Regatillo, V. Barrios, E.M.
Drugs and Therapies - Alendronate Therapy

Reports Outline Alendronate Therapy Study Findings from Kyoto Pharmaceutical University (Enhanced oral delivery of alendronate by sucrose fatty acids esters in rats and their absorption-enhancing mechanisms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Alendronate Therapy. According to news reporting originating in Kyoto, Japan, by NewsRx journalists, research stated, "Oral delivery is the most fascinating route for interminable drug remedy. However, the intestinal absorption of alendronate (ALN), a bisphosphonate drug after oral administration is very poor."

Financial support for this research came from Al-Baath University (Syria).

The news reporters obtained a quote from the research from Kyoto Pharmaceutical University, "Absorption enhancers, which help to achieve the efficiency-safety balance, are considered one of the most promising agents for the improvement the intestinal absorption of drugs. In the current study, we focused on using sucrose fatty acid esters (SEs) as promising absorption enhancers to enhance the intestinal absorption of alendronate using an in situ closed-loop method in rats. The intestinal absorption of alendronate was significantly enhanced in the presence of SEs, especially L-1695. In addition, no considerable increase was observed in the activity of lactate dehydrogenase (LDH) or in protein release from the intestinal epithelium in the presence of sugar esters at concentrations equivalent to or lower than 1.0% (w/v), suggesting that these compounds are safe. Furthermore, mechanistic studies revealed increased membrane fluidity and loosening of the tight junctions (TJs) might be the underlying mechanism by which SEs improve the intestinal intake of alendronate, via transcellular and paracellular routes, respectively."

According to the news reporters, the research concluded: "These findings suggest that SEs are effective absorption enhancers for improving the intestinal absorption of alendronate, without causing serious damage to the enteric epithelium."

Our news correspondents report that additional information may be obtained by contacting A. Yamamoto, Kyoto Pharmaceutical University, Dept. of Biopharmaceut,

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.046. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Alkylating Agents

Reports Outline Alkylating Agents Study Findings from University of Yamanashi (AMPK Suppresses Connexin43 Expression in the Bladder and Ameliorates Voiding Dysfunction in Cyclophosphamide-induced Mouse Cystitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Alkylating Agents. According to news reporting from Yamanashi, Japan, by NewsRx journalists, research stated, "Bladder voiding dysfunction is closely related to local oxidation, inflammation, and enhanced channel activities. Given that the AMP-activated protein kinase (AMPK) has anti-oxidative, anti-inflammatory and channel-inhibiting properties, we examined whether and how AMPK affected bladder activity."

The news correspondents obtained a quote from the research from the University of Yamanashi, "AMPK activation in rat bladder smooth muscle cells (BSMCs) using three different AMPK agonists resulted in a decrease in connexin43 (Cx43) expression and function, which was associated with reduced CREB phosphorylation, Cx43 promoter activity and mRNA expression, but not Cx43 degradation. Downregulation of CREB with siRNA increased Cx43 expression. A functional analysis revealed that AMPK weakened BSMC contraction and bladder capacity. AMPK also counteracted the IL-1b- and TNFa-induced increase in Cx43 in BSMCs. In vivo administration of the AMPK agonist AICAR attenuated cyclophosphamide-initiated bladder oxidation, inflammation, Cx43 expression and voiding dysfunction. Further analysis comparing the responses of the wild-type (Cx43(+/+)) and heterozygous (Cx43((plusminus))) Cx43 mice to cyclophosphamide revealed that the Cx43((plusminus)) mice retained a relatively normal micturition pattern compared to the Cx43(+/+) mice. Taken together, our results indicate that AMPK inhibits Cx43 in BSMCs and improves bladder activity under pathological conditions."

According to the news reporters, the research concluded: "We propose that strategies that target AMPK can be developed as novel therapeutic approaches for treating bladder dysfunction."

For more information on this research see: AMPK Suppresses Connexin43 Expression in the Bladder and Ameliorates Voiding Dysfunction in Cyclophosphamide-induced Mouse Cystitis. Scientific Reports, 2016;6():19708. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)
Our news journalists report that additional information may be obtained by contacting X. Zhang, Dept. of Molecular Signaling, Interdisciplinary Graduate School of Medicine and Engineering, University of Yamanashi, Yamanashi, Japan. Additional authors for this research include J. Yao, K. Gao, Y. Chi, T. Mitsui, T. Ihara, N. Sawada, M. Kamiyama, J. Fan and M. Takeda.

Neurodegenerative Diseases and Conditions -...

Reports Outline Alzheimer Disease Findings from Johns Hopkins University (Cortical thickness in relation to clinical symptom onset in preclinical AD)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurodegenerative Diseases and Conditions - Alzheimer Disease are presented in a new report. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Mild cognitive impairment (MCI) and Alzheimer's disease (AD) dementia are preceded by a phase of disease, referred to as 'preclinical AD', during which cognitively normal individuals have evidence of AD pathology in the absence of clinical impairment. This study examined whether a magnetic resonance imaging (MRI) measure of cortical thickness in brain regions, collectively known as 'AD vulnerable' regions, predicted the time to onset of clinical symptoms associated with MCI and whether cortical thickness was similarly predictive of clinical symptom onset within 7 years post baseline versus progression at a later point in time."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from Johns Hopkins University, "These analyses included 240 participants from the BIOCARD study, a cohort of longitudinally followed individuals who were cognitively normal at the time of their MRI (mean age = 56 years). Participants have been followed for up to 18 years (M follow-up = 11.8 years) and 50 participants with MRIs at baseline have developed MCI or dementia over time (mean time to clinical symptom onset = 7 years). Cortical thickness in AD vulnerable regions was based on the mean thickness of eight cortical regions. Using Cox regression models, we found that lower mean cortical thickness was associated with an increased risk of progression from normal cognition to clinical symptom onset within 7 years of baseline (p=0.03), but not with progression >7 years from baseline (p=0.30). Lower cortical thickness was also associated with higher levels of phosphorylated tau, measured in cerebrospinal fluid at baseline."

According to the news editors, the research concluded: "These results suggest that cortical thinning in AD vulnerable regions is detectable in cognitively normal individuals several years prior to the onset of clinical symptoms that are a harbinger of a diagnosis of MCI, and that the changes are more likely to be evident in the years proximal to clinical symptom
onset, consistent with hypothetical AD biomarker models."

The news correspondents report that additional information may be obtained from C. Pettigrew, Johns Hopkins University, Sch Med, Dept. of Neurol, Baltimore, MD 21224, United States. Additional authors for this research include A. Soldan, Y. Zhu, M.C. Wang, A. Moghekar, T. Brown, M. Miller and M. Albert.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.nicl.2016.06.010. This DOI is a link to an online electronic document that is either free or for purchase.

**Reports Outline Alzheimer Disease Study Results from Institute for Cancer Research and Treatment (IRCCS) (Tackling amyloidogenesis in Alzheimer's disease with A2V variants of Amyloid-b)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Alzheimer Disease have been published. According to news reporting out of Milan, Italy, by NewsRx editors, research stated, "We developed a novel therapeutic strategy for Alzheimer's disease (AD) exploiting the properties of a natural variant of Amyloid-b (Ab) carrying the A2V substitution, which protects heterozygous carriers from AD by its ability to interact with wild-type Ab, hindering conformational changes and assembly thereof. As prototypic compound we designed a six-mer mutated peptide (Ab1-6A2V), linked to the HIV-related TAT protein, which is widely used for brain delivery and cell membrane penetration of drugs."

Our news journalists obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "The resulting molecule [Ab1-6A2VTAT(D)] revealed strong anti-amyloidogenic effects in vitro and protected human neuroblastoma cells from Ab toxicity. Preclinical studies in AD mouse models showed that short-term treatment with Ab1-6A2VTAT(D) inhibits Ab aggregation and cerebral amyloid deposition, but a long treatment schedule unexpectedly increases amyloid burden, although preventing cognitive deterioration. Our data support the view that the AbA2V-based strategy can be successfully used for the development of treatments for AD, as suggested by the natural protection against the disease in human A2V heterozygous carriers."

According to the news editors, the research concluded: "The undesirable outcome of the prolonged treatment with Ab1-6A2VTAT(D) was likely due to the TAT intrinsic attitude to increase Ab production, avidly bind amyloid and boost its seeding activity, warning against the use of the TAT carrier in the design of AD therapeutics."

For more information on this research see: Tackling amyloidogenesis in Alzheimer's disease with A2V variants of Amyloid-b...

**Life Science Research - Amino Acids Research**

**Reports Outline Amino Acids Research Study Results from Ulm University Hospital (CK1d activity is modulated by CDK2/E- and CDK5/p35-mediated phosphorylation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Life Science Research - Amino Acids Research. According to news reporting from Ulm, Germany, by NewsRx journalists, research stated, "CK1 protein kinases form a family of serine/threonine kinases which are highly conserved through different species and ubiquitously expressed. CK1 family members can phosphorylate numerous substrates thereby regulating different biological processes including membrane trafficking, cell cycle regulation, circadian rhythm, apoptosis, and signal transduction."

Financial support for this research came from Deutsche Krebshilfe.

The news correspondents obtained a quote from the research from Ulm University Hospital, "Deregulation of CK1 activity and/or expression contributes to the development of neurological diseases and cancer. Therefore, CK1 became an interesting target for drug development and it is relevant to further understand the mechanisms of its regulation. In the present study, Cyclin-dependent kinase 2/Cyclin E (CDK2/E) and Cyclin-dependent kinase 5/p35 (CDK5/p35) were identified as cellular kinases able to modulate CK1d activity through site-specific phosphorylation of its C-terminal domain. Furthermore, pre-incubation of CK1d with CDK2/E or CDK5/p35 reduces CK1d activity in vitro, indicating a functional impact of the interaction between CK1d and CDK/cyclin complexes. Interestingly, inhibition of Cyclin-dependent kinases by Dinaciclib increases CK1d activity in pancreatic cancer cells. In summary, these results suggest that CK1d activity can be modulated by the interplay between CK1d and CDK2/E or CDK5/p35."

According to the news reporters, the research concluded: "These findings extend our knowledge about CK1d regulation and may be of use for future development of CK1-related therapeutic strategies in the treatment of neurological diseases or cancer."

Our news journalists report that additional information may be obtained by contacting C. Ianes, Dept. of General and Visceral Surgery, Surgery Centre, Ulm University Hospital, Albert-Einstein-Allee 23, 89081 Ulm, Germany. Additional authors for this research include P. Xu, N. Werz, Z. Meng, D. Henne-Bruns, J. Bischof and U. Knippschild.

**Amino Acids**

**Reports Outline Amino Acids Study Findings from Medical University (Design, Synthesis, and Antimycobacterial Activity of Novel Theophylline-7-Acetic Acid Derivatives With Amino Acid Moieties)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Amino Acids. According to news reporting out of Sofia, Bulgaria, by NewsRx editors, research stated, "The theophylline-7-acetic acid (7-TAA) scaffold is a promising novel lead compound for antimycobacterial activity. Here, we derive a model for antitubercular activity prediction based on 14 7-TAA derivatives with amino acid moieties and their methyl esters."

Our news journalists obtained a quote from the research from Medical University, "The model is applied to a combinatorial library, consisting of 40 amino acid and methyl ester derivatives of 7-TAA. The best three predicted compounds are synthesized and tested against *Mycobacterium tuberculosis* H37Rv."

According to the news editors, the research concluded: "All of them are stable, non-toxic against human cells and show antimycobacterial activity in the nanomolar range being 60 times more active than ethambutol."

Our news journalists report that additional information may be obtained by contacting G. Stavrakov, Faculty of Pharmacy, Medical University of Sofia, 2 Dunav St, Sofia, 1000, Bulgaria. Additional authors for this research include V. Valcheva, Y. Voynikov, I. Philipova, M. Atanasova, S. Konstantinov, P. Peikov and I. Doytchinova.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/cbdd.12676. This DOI is a link to an online electronic document that is either free or for purchase.
Oncology - Anal Cancer

Reports Outline Anal Cancer Findings from Wake Forest University
(Early dose-dependent cortical thinning of the femoral neck in anal cancer patients treated with pelvic radiation therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Anal Cancer have been published. According to news reporting originating from Winston Salem, North Carolina, by NewsRx correspondents, research stated, "Anal cancer patients treated with radiation therapy (RT) have an increased risk of hip fractures after treatment. The mechanism of these fractures is unknown; however, femoral fractures have been correlated with cortical bone thinning."

Our news editors obtained a quote from the research from Wake Forest University, "The objective of this study was to assess early changes in cortical bone thickness at common sites of femoral fracture in anal cancer patients treated with intensity modulated radiation therapy (IMRT). RT treatment plans and computed tomography (CT) scans from 23 anal cancer patients who underwent IMRT between November 2012 and December 2014 were retrospectively reviewed. Cortical thickness (Ct.Th) was mapped at homologous vertices within the proximal femur using pre-RT and post-RT (<= 4 months) CT scans. The bone attenuation measurements were collected at homologous locations within the trabecular bone of the right femoral neck (FN). The percent change in Ct.Th and trabecular bone mineral density (trBMD) were assessed. FN cortical thinning was correlated to RT dose using linear regression. A logistic model for dose dependent cortical thinning was constructed. Twenty-two patients were analyzed. Significant post-treatment cortical thinning was observed in the intertrochanteric crest, subcapital and inferior FN (p < 0.05). FN volume receiving >= 40Gy (V40Gy) was a significant predictor of focal cortical thinning >= 30% (p = 0.03). A significant decrease in FN trBMD was observed (-6.4% [range -34.4 to 33%]; p = 0.01). Significant early decrease in Ct.Th and trBMD occurs at the FN in patients treated with RT for anal cancer."

According to the news editors, the research concluded: "FN V40Gy was predictive of clinically significant focal FN cortical thinning."

For more information on this research see: Early dose-dependent cortical thinning of the femoral neck in anal cancer patients treated with pelvic radiation therapy. Bone, 2017;94 ():84-89. Reports Outline Antiarrhythmic Agents Study Results from Adnan Menderes University (Phenytoin intoxication with no symptoms correlated with serum drug level: a case study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antiarrhythmic Agents have been presented. According to news reporting originating from Aydin, Turkey, by NewsRx correspondents, research stated, "In high-dose intake of phenytoin, which is used frequently to treat epilepsy, nystagmus, diplopia, nausea-vomiting, lethargy, confusion, seizure, and coma can be observed. In recent studies on phenytoin intoxication, in which seizure and coma were observed in drug levels greater than 50 ug/mL."

Our news editors obtained a quote from the research from Adnan Menderes University, "The serum phenytoin level of a patient, who consumed approximately 100 pcs of 100 mg phenytoin tablets in an effort to commit suicide, and who had no pathological finding in her neurologic examination, was 124 ug/mL. High drug level and the absence of toxic effect (or the absence of toxic effect correlated with the drug level) indicates that cytochrome P450 is functioning, but there can be a mutation in the MDR1 gene."

According to the news editors, the research concluded: "In our case study, we report on phenytoin intoxication in a patient having a high level of phenytoin but no symptoms correlated with serum drug level, as supported by the findings in the literature."

For more information on this research see: Phenytoin intoxication with no symptoms correlated with serum drug level: a case study. The Pan African Medical Journal, 2015;22 ():297.

The news editors report that additional information may be obtained by contacting M. Avcil, Adnan Menderes University, Dept. of Emergency Medicine, Aydin, Turkey. Additional authors for this research include A. Duman, K.A. Turkdogan, M. Kapci, A. Akoz, S.E. Canakci and Y.E Ozluer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.11604/pamj.2015.22.297.7956. This DOI is a link to an online electronic document that is either free or for purchase.

Reports Outline Antibiotics Study Findings from Soochow University (Enhanced Cellular Internalization and On-Demand Intracellular Release of Doxorubicin by Stepwise pH-/Reduction-Responsive Nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a new report. According to news reporting out of Suzhou, People's Republic of China, by NewsRx editors, research stated, "The efficient delivery of antitumor agents to tumor sites faces numerous obstacles, such as poor cellular uptake and slow intracellular drug release. In this regard, smart nanoparticles (NPs) that respond to the unique microenvironment of tumor tissues have been widely used for drug delivery."

Financial supporters for this research include National Natural Science Foundation projects of China, Priority Academic Program Development of Jiangsu Higher Education Institutions (PAPD).

Our news journalists obtained a quote from the research from Soochow University, "In this study, novel charge-reversal and reduction-responsive histidine-grafted chitosan-lipoic acid NPs (HCSL-NPs) were selected for efficient therapy of breast cancer by enhancing cell internalization and intracellular pH- and reduction-triggered doxorubicin (DOX) release. The surface charge of HCSL-NPs presented as negative at physiological pH and reversed to positive at the extracellular and intracellular pH of the tumor. In vitro release investigation revealed that DOX/HCSL-NPs demonstrated a sustained drug release under the physiological condition, whereas rapid DOX release was triggered by both endolysosome pH and high-concentration reducing glutathione (GSH). These NPs exhibited enhanced internalization at extracellular pH, rapid intracellular drug release, and improved cytotoxicity against 4T1 cells in vitro. Excellent tumor penetrating efficacy was also found in 4T1 tumor spheroids and solid tumor slices. In vivo experiments demonstrated that HCSL-NPs exhibited excellent tumor-targeting ability in tumor tissues as well as excellent antitumor efficacy and low systemic toxicity in breast tumor-bearing BALB/c mice."

According to the news editors, the research concluded: "These results indicated that the novel charge reversal and reduction-responsive HCSL-NPs have great potential for targeted and efficient delivery of chemotherapeutic drugs in cancer treatments."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acsami.6b09604. This DOI is a link to an online electronic document that is either free or for purchase.
Reports Outline Antidiabetic Agents Study Results from Jiangsu University (Pioglitazone inhibits EGFR/MDM2 signaling-mediated PPAR gamma degradation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antidiabetic Agents. According to news reporting originating from Changzhou, People's Republic of China, by NewsRx correspondents, research stated, "Aberrant activation of the epidermal growth factor receptor (EGFR) signaling is involved in many cancer events. Although peroxisome proliferator-activated receptor gamma (PPAR gamma) has been implicated in inhibition of inflammation and cancer, EGFR/MDM2 signaling induces PPAR gamma phosphorylation and degradation."

Our news editors obtained a quote from the research from Jiangsu University, "Here we found that cancer cells in response to EGF reduced PPAR gamma protein levels by inducing its phosphorylation, ubiquitination and degradation, but PPAR gamma agonist pioglitazone reversed this event. More importantly, pioglitazone increased cancer cell sensitivity to chemotherapy drugs."

According to the news editors, the research concluded: "Therefore, our study revealed a novel mechanism that pioglitazone inhibited EGFR/MDM2-mediated cancer cell chemoresistance, which provides a novel strategy for cancer treatment."

The news editors report that additional information may be obtained by contacting J.H. Jin, Jiangsu Univ, Affiliated Wujin Hosp, Dept. of Oncol, Changzhou, Jiangsu, People's Republic of China. Additional authors for this research include W.B. Zhang, M.L. You, Y. Xu, Y.Z. Hou and J.H. Jin.

Keywords for this news article include: Changzhou, People's Republic of China, Asia, Intercellular Signaling Peptides and Proteins, Peroxisome Proliferator-Activated Receptors, Gastrointestinal Hormone Receptors, Pioglitazone Therapy Hydrochloride, Receptor Protein-Tyrosine Kinases, Epidermal Growth Factor Receptor, Gastrointestinal Hormones, Epidermal Growth Factors, Growth Factor Receptors, Transcription Factors, DNA-Binding Proteins, Phosphotransferases, Drugs and Therapies, Antidiabetic Agents, Thiazolidinediones, Membrane Proteins, Protein Kinases, Pharmaceuticals, PPAR gamma, Oncology, Cancer, Jiangsu University.
Reports Outline Antifungals Findings from University of Medicine and Dentistry of New Jersey (UMDNJ) (Rapid Detection of FKS-Associated Echinocandin Resistance in Candida glabrata)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antifungals. According to news reporting originating in Newark, New Jersey, by NewsRx journalists, research stated, "A novel and highly accurate diagnostic assay platform was established for rapid identification of FKS mutations associated with echinocandin resistance in Candida glabrata. The assay platform uses allele-specific molecular beacon and DNA melt analysis following asymmetric PCR."

The news reporters obtained a quote from the research from the University of Medicine and Dentistry of New Jersey (UMDNJ), "A dual assay for FKS1 and FKS2 was developed to identify within 3 h the most common and clinically relevant resistance-associated mutations, including 8 FKS1 HS1 (wild type [WT], S629P, F625S, D632Y, D632E [T1896G], D632E [T1896A], I634V, and F625F) and 7 FKS2 HS1 (WT, F659del, F659S, F659V, F659L, S663P, and S663F) genotypes. A blinded panel of 188 C. glabrata clinical isolates was tested by both assays. The molecular diagnostic results from the dual assay were 100% concordant with data obtained from DNA sequencing."

According to the news reporters, the research concluded: "This platform has the potential to overcome the deficiencies of existing in vitro susceptibility-based assays to identify echinocandin-resistant C. glabrata and holds promise as a surrogate diagnostic method to better direct echinocandin therapy."

Keywords for this news article include: Newark, New Jersey, United States, North and Central America, Drugs and Therapies, Cyclic Peptides, Echinocandins, Antifungals, University of Medicine and Dentistry of New Jersey (UMDNJ).

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antiinfectives. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Carbapenem-resistant Acinetobacter baumannii (CRAB) is an important clinical threat. Combination therapy that exerts a synergistic effect has become a potential solution to combat CRAB."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research, "However, choosing an optimal combination regimen is challenging. A dynamic in vitro pharmacokinetic/pharmacodynamic (PK/PD) model that can simulate the pharmacokinetic profiles of antibiotics provides a powerful tool to compare antibacterial responses to different clinical dosage regimens. In this study, the synergistic effect of the combination of meropenem and colistin was tested in 12 clinical CRAB isolates from Chinese patients using the chequerboard technique. The antibacterial effect was investigated in an in vitro PK/PD diffusion model by simulating different dosage regimens: meropenem monotherapy (0.5 g with 0.5-h infusion or 1 g with 3-h infusion); colistin monotherapy (fixed unbound concentration maintained at 0.25, 0.5 or 1 mg/L); and combination of meropenem and colistin. The chequerboard method showed that the combination of meropenem and colistin had synergistic effects against all 12 isolates, with fractional inhibitory concentration indices (FICIs) of <0.5. Moreover, the dynamic in vitro PK/PD model demonstrated that for clinical CRAB isolates with a meropenem MIC of 128 mg/L, the combination (meropenem 1 g with 3-h infusion combined with colistin maintained at 1 mg/L) could achieve 3.8 log(10) killing after 24 h, whereas monotherapy was unable to provide such an antibacterial effect."

According to the news editors, the research concluded: "Taken together, these results suggest that the combination of meropenem and colistin might be a promising therapy against CRAB."

The news correspondents report that additional information may be obtained from J. Zhang, Natl Populat & Family Planning Commiss, Key Lab Clin Pharmacol Antibiot, Shanghai 200040, People's Republic of China. Additional authors for this research include M. Zhao, Y.C. Chen, X.C. Bian, Y.F. Li, J. Shi and J. Zhang.

Drugs and Therapies - Antimicrobials

Reports Outline Antimicrobials Study Findings from Institute for Physical Science and Technology Center (Size-dependent antimicrobial properties of the cobalt ferrite nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antimicrobials is the subject of a report. According to news reporting originating in Vilnius, Lithuania, by NewsRx journalists, research stated, "The growing resistance of bacteria to conventional antibiotics elicited considerable interest to non-typical drugs. In this study, antimicrobial investigations were performed on low-size dispersion cobalt ferrite nanoparticles (Nps) fabricated by co-precipitation approach in several average sizes, in particular, 15.0, 5.0, and 1.65 nm."

The news reporters obtained a quote from the research from Institute for Physical Science and Technology Center, "A variety of experimental tests demonstrated that the size of these Nps is determinant for antimicrobial efficiency against S. cerevisiae and several Candida species, in particular, C. parapsilosis, C. krusei, and C. albicans. The small and ultra-small fractions of CoFe2O4 Nps possess especially strong antimicrobial activity against all tested microorganisms. The possible reasons are discussed."

According to the news reporters, the research concluded: "Nps were characterized by means of transmission and high-resolution transmission electron microscopy, X-ray diffraction, energy dispersive X-ray spectroscopy and atomic force microscopy, chemical analysis and magnetic measurements."

Our news correspondents report that additional information may be obtained by contacting A. Jagminas, State Res Inst, Center Phys Sci & Technol, LT-10257 Vilnius, Lithuania. Additional authors for this research include A. Paskevicius, M. Kartinaitiene and A. Jagminas.

Keywords for this news article include: Vilnius, Lithuania, Europe, Emerging Technologies, Transition Elements, Drugs and Therapies, Antimicrobials, Nanotechnology, Nanoparticle, Cobalt, Institute for Physical Science and Technology Center.

Drugs and Therapies - Antirheumatics

Reports Outline Antirheumatics Findings from Pfizer (Monoclonal Antibody and Fusion Protein Biosimilars Across Therapeutic Areas: A Systematic Review of Published Evidence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antirheumatics.
According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Despite regulatory efforts to formalize guidance policies on biosimilars, there remains a need to educate healthcare stakeholders on the acknowledged definition of biosimilarity and the data that underpin it. The objectives of the study were to systematically collate published data for monoclonal antibodies and fusion protein biosimilars indicated for cancer, chronic inflammatory diseases, and other indications, and to explore differences in the type and weight (quantity and quality) of available evidence."

Financial support for this research came from Pfizer.

Our news journalists obtained a quote from the research from Pfizer, "MEDLINE, Embase, and ISI Web of Science were searched to September 2015. Conference proceedings (n = 17) were searched 2012 to July 2015. Included studies were categorized by originator, study type, and indication. To assess data strength and validity, risk of bias assessments were undertaken. Across therapeutic areas, 43 named (marketed or proposed) biosimilars were identified for adalimumab, abciximab, bevacizumab, etanercept, infliximab, omalizumab, ranibizumab, rituximab, and trastuzumab originators. Infliximab CT-P13, SB2, and etanercept SB4 biosimilars have the greatest amount of published evidence of similarity with their originators, based on results of clinical studies involving larger numbers of patients or healthy subjects (N = 1405, 743, and 734, respectively). Published data were also retrieved for marketed intended copies of etanercept and rituximab."

According to the news editors, the research concluded: "This unbiased synthesis of the literature exposed significant differences in the extent of published evidence between molecules at preclinical, clinical, and post-marketing stages of development, providing clinicians and payers with a consolidated view of the available data and remaining gaps."

The news correspondents report that additional information may be obtained from I. Jacobs, Pfizer Inc, Global Established Pharma Medicines Dev Grp, New York, NY 10017, United States. Additional authors for this research include D. Petersel, L.G. Shane, C.K. Ng, C. Kirchhoff, G. Finch and S. Lula.

**Drugs and Therapies - Antirheumatics**

**Reports Outline Antirheumatics Findings from William Harvey Research Institute (Rational design of antirheumatic prodrugs specific for sites of inflammation)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antirheumatics is the subject of a report. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Biologic drugs, such as the anti-tumor necrosis factor (anti-TNF) antibody adalimumab, have represented a breakthrough in the treatment of rheumatoid arthritis. Yet, concerns remain over their lack of efficacy in a sizable proportion of patients and their potential for systemic side effects such as infection."

Financial supporters for this research include Arthritis Research UK, Nuffield Foundation (Oliver Bird Rheumatism Programme PhD Studentship to Dr. Ferrari).
