Our news editors obtained a quote from the research from Sungkyunkwan University, "Transwell culture method was used to develop a novel tetra-culture system consisting of tri-cultures (one lung epithelial and two immune cell lines) in the apical chamber and endothelial cells in the basolateral chamber. Tri-cultures were exposed to standard reference material (SRM) 1648a, an urban PM. SRM 1648a did not show cytotoxic effects; however, it increased IL-6 level in apical and basolateral chambers. The cells in the basolateral chamber showed increased monocyte adhesion. Furthermore, exposure of tri-cultured cells to SRM 1648a in the apical chamber induced ICAM-1 expression-in endothelial cells in the basolateral chamber by activating the IL-6/STAT3 pathway."

According to the news editors, the research concluded: "A tetra-culture system was established to facilitate the identification of cellular adhesion molecule expression induced by the interaction between pulmonary epithelial and endothelial cells. The tetra-culture system will contribute to elucidation of the relationships between inhalable PM and cardiovascular diseases."

The news editors report that additional information may be obtained by contacting K.H. Chung, Sungkyunkwan University Sch Pharm, Suwon 16419, Gyeonggi Do, South Korea. Additional authors for this research include H.S. Cho, D.Y. Shin and K.H. Chung.

New Cardiovascular Research Study Findings Have Been Reported by M. Cruz-Lemini and Colleagues (Fetal cardiovascular remodeling persists at 6 months in infants with intrauterine growth restriction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Research is the subject of a report. According to news originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Intrauterine growth restriction is associated with increased cardiovascular risk later in life but the link between fetal disease and postnatal risk is not well-documented. We evaluated longitudinally the association between cardiovascular remodeling in small-for-gestational-age (SGA) fetuses and at 6 months of age."

Our news journalists obtained a quote from the research, "A cohort of 80 SGA fetuses (defined by estimated fetal and birth weights <10th centile) delivered >34 weeks' gestation was compared with 80 normally grown age-matched control fetuses, with follow-up at 6 months of corrected age (i.e. 6 months from estimated date of delivery according to first-trimester crown-rump length). Cardiovascular evaluation included a comprehensive echocardiographic assessment in both fetuses and infants and blood pressure and aortic intima-media thickness (aIMT) measurement in infants. Parameters were adjusted by linear regression analysis for gender, gestational age at delivery, pre-eclampsia, prenatal glucocorticoid exposure, Cesarean delivery, admission to neonatal intensive care unit and body surface area. Both pre- and postnatally, when compared with controls, the SGA group showed a more globular cardiac shape (left sphericity index: controls 2.06 vs SGA 1.87 (P = 0.022) prenatally and 1.92 vs 1.67 (P=0.007) postnatally), as well as signs of systolic longitudinal dysfunction (systolic annular peak velocity (S'): 7.2 vs 6.3 cm/s (P=0.003) prenatally and 7.9 vs 6.4 cm/s (P <0.001) postnatally; tricuspid annular plane systolic excursion: 7.2 vs 6.8mm (P=0.015) prenatally and 16.0 vs 14.2mm (P <0.001) postnatally) and diastolic dysfunction (left isovolumetric relaxation time: 46 vs 52 ms (P < 0.001) prenatally and 50 vs 57 ms (P=0.034) postnatally). In addition, infants in the SGA group had increased mean blood pressure (mean: 61 vs 70 mmHg, P<0.001) and maximum aIMT (0.57 vs 0.66 mm; P< 0.001). Primary cardiovascular changes are already present in the SGA fetus and persist at 6 months of age."

According to the news editors, the research concluded: "These data support prenatal cardiovascular remodeling as a mechanistic pathway of increased risk later in life in cases of SGA, regardless of Doppler abnormalities."

The news correspondents report that additional information may be obtained from E. Gratacos, Center Biomed Res Rare Dis CIBER ER, Barcelona, Spain. Additional authors for this research include F. Crispi, B. Valenzuela-Alcaraz, F. Figueras, M. Sitges, B. Bijnens and E. Gratacos.
New Cardiovascular Research Study Findings Recently Were Reported by Researchers at Anjo-Kosei Hospital (Efficacy of Tolvaptan on Fluid Management After Cardiovascular Surgery Using Cardiopulmonary Bypass)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Research. According to news originating from Aichi, Japan, by NewsRx correspondents, research stated, "To investigate the efficacy of the selective vasopressin V-2-receptor antagonist tolvaptan in postoperative fluid management after cardiovascular surgery using cardiopulmonary bypass. A retrospective cohort study."

Our news journalists obtained a quote from the research from Anjo-Kosei Hospital, "A tertiary care center. The study comprised 99 patients undergoing cardiovascular surgery using cardiopulmonary bypass. Oral tolvaptan was administered after surgery. Fifty-one patients treated with tolvaptan were compared with 48 patients treated with intravenous diuretics. Urine volume, the time interval until the patients' body weight returned to the preoperative value, and the length of oxygen dependency after extubation were assessed as surrogate markers for resolution of fluid overload. Urine output on postoperative days 1 and 2 was significantly higher in the tolvaptan-treated patients (29.2 v 20.1 mL/kg/day, p = 0.001; 43.0 v 27.4 mL/kg/day, p< 0.001, respectively). Postoperative body weight returned to baseline in 49 tolvaptan-treated patients compared with 33 patients treated with intravenous diuretics (96.1% v 68.8%, p< 0.001). Among those with successful body weight reduction, the time interval was shorter in the tolvaptan-treated patients (5 v 7 days, p = 0.006). The length of oxygen dependency after extubation also was shorter in the tolvaptan-treated patients (2 v 3 days, p = 0.006). The urine osmolarity reduction rate before and 4 hours after the first dose of tolvaptan emerged as a significant predictor of its efficacy with a cutoff point of 33.7%, sensitivity of 0.73, and specificity of 0.67 (p = 0.030)."

According to the news editors, the research concluded: "Tolvaptan facilitated early improvement of postoperative fluid overload after cardiovascular surgery."

The news correspondents report that additional information may be obtained from H. Ito, Anjo Kosei Hosp, Dept. of Cardiothorac Surg, Anjo City, Aichi, Japan. Additional authors for this research include T. Mizumoto, H. Tempaku, K. Fujinaga, Y. Sawada and H. Shimpo.

New Cardiovascular Research Study Results from University of Copenhagen Described (SuPAR Predicts Cardiovascular Events and Mortality in Patients With Asymptomatic Aortic Stenosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Research have been published. According to news originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "Soluble urokinase plasminogen activator receptor (suPAR) is an inflammatory marker associated with subclinical cardiovascular damage and cardiovascular events. Whether suPAR is of prognostic value in asymptomatic patients with aortic stenosis (AS) remains unknown."

Our news journalists obtained a quote from the research from the University of Copenhagen, "Plasma suPAR levels were measured in 1503 patients with a mean age of 68 years who were recruited in the Simvastatin and Ezetimibe in Aortic Stenosis (SEAS) study. Cox regression analysis was performed to evaluate associations between suPAR and the composite end points of ischemic cardiovascular events (ICEs), aortic valve events (AVEs), cardiovascular and all-cause mortality after adjusting for traditional cardiovascular risk factors, and allocation to treatment. The multivariate adjusted hazard ratio (HR) (95% confidence interval [CI]) per unit log2 ng/mL increase in suPAR was HR, 1.5; 95% CI, 1.2-1.9; P = 0.002 for ICEs; HR, 1.2; 95% CI, 0.9-1.5; P = 0.071) for AVEs; HR, 2.0; 95% CI, 1.2-3.3; P = 0.007) for cardiovascular mortality, and HR, 2.0; 95% CI, 1.4-2.9; P< 0.001 for all-cause mortality."

According to the news editors, the research concluded: "In patients with mild-moderate AS, suPAR is independently associated with the incidence of ICEs, cardiovascular mortality, and all-cause mortality."

The news correspondents report that additional information may be obtained from G.W. Hodges, University of Copenhagen, Dept. of Med, Glostrup Amager & Hvidovre Hosp, Copenhagen, Denmark. Additional authors for this research include C.N. Bang, J. Eugen-Olsen, M.H. Olsen, K. Boman, S. Ray, C. Gohlke-Barwolf, Y.A. Kesaniemi, J.L. Jeppesen and K. Wachtell.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cjca.2016.04.012. This DOI is a link to an online electronic
document that is either free or for purchase.

**Surgery - Cardiovascular and Thoracic Surgery**

**New Cardiovascular and Thoracic Surgery Study Findings Recently Were Reported by Researchers at University of Ottawa (Identifying Patients at Higher Risk of Prolonged Air Leak After Lung Resection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Surgery - Cardiovascular and Thoracic Surgery have been published. According to news reporting originating from Ottawa, Canada, by NewsRx correspondents, research stated, "Predictive models of prolonged air leak have relied on information not always available preoperatively (eg, extent of resection, pleural adhesions). Our objective was to construct a model to identify patients at increased risk of prolonged air leak using preoperative factors exclusively."

Our news editors obtained a quote from the research from the University of Ottawa, "From 2012 to 2014, data on consecutive patients undergoing pulmonary resection were collected prospectively. Prolonged air leak was defined as lasting longer than 7 days and requiring hospitalization. Factors associated with the primary outcome (p < 0.2) were included in a multivariate model. Regression coefficients were used to develop a weighted risk score for prolonged air leak. Of 225 patients, 8% (18/225) experienced a prolonged air leak. Male gender (p = 0.08), smoking history (p = 0.03), body mass index (BMI) 25 or below (p < 0.01), Medical Research Council (MRC) dyspnea score above 1 (p = 0.06), and diffusion capacity for carbon monoxide below 80% (DLCO) (p = 0.01) were selected for inclusion in the final model. Weighted scores were male gender (1 point), BMI 25 or below (0.5 point), smoker (2 points), DLCO% below 80% (2 points), and MRCdyspnea score above 1 (1 point). The area under the receiver operating characteristic curve was 0.8 (95% confidence interval [CI] = 0.7 to 0.9). An air leak score above 4 points offered the best combination of sensitivity (83% [95% CI = 58 to 96]) and specificity (65% [95% CI = 58 to 71]). A subgroup of lung resection patients at higher risk for a prolonged air leak can be effectively identified with the use of widely available, preoperative factors."

According to the news editors, the research concluded: "The proposed scoring system is simple, is clinically relevant to the informed consent, and allows preoperative patient selection for interventions to reduce the risk of prolonged air leak."

The news editors report that additional information may be obtained by contacting S. Gilbert, University of Ottawa, Fac Med, Ottawa, ON, Canada. Additional authors for this research include S. Maghera, A.J. Seely, D.E. Maziak, F.M. Shamji, S.R. Sundaresan and P.J.
New Carotid Stenosis Findings from Jena University Hospital Discussed (Autonomic outcome is better after endarterectomy than after stenting in patients with asymptomatic carotid stenosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Carotid Stenosis. According to news reporting originating in Jena, Germany, by NewsRx journalists, research stated, "Carotid endarterectomy and stenting have comparable efficacy in stroke prevention in asymptomatic carotid stenosis. In patients with carotid stenosis, cardiac events have a more than threefold higher incidence than cerebrovascular events."

The news reporters obtained a quote from the research from Jena University Hospital, "Autonomic dysfunction predicts cardiovascular morbidity and mortality, and carotid stenosis interferes with baroreceptor and chemoreceptor function. We assessed the effect of elective carotid revascularization (endarterectomy vs stenting) on autonomic function as a major prognostic factor of cardiovascular health. In 42 patients with >= 70% asymptomatic extracranial carotid stenosis, autonomic function was determined by analysis of heart rate variability (total band power [TP], high frequency band power [HF], low-frequency band power [LF], very low frequency band power [VLF]), baroreflex sensitivity (alpha HF, alpha LF), respiratory chemoreflex sensitivity (central apnea-hypopnea index), and cardiac chemoreflex sensitivity (hyperoxic TP, HF, LF, and VLF ratios) before and 30 days after revascularization. Patients with endarterectomy were older than patients with stenting (69 +/- 7 vs 62 +/- 7 years; P <= .008) but did not differ in gender distribution and preintervention autonomic function. Compared with stenting, postintervention heart rate variability was higher (ln TP, 6.7 [95% confidence interval (CI), 6.3-7.0] vs 6.1 [95% CI, 5.8-6.5; P<= .009]; ln HF, 4.5 [95% CI, 4.1-5.0] vs 4.0 [95% CI, 3.4-4.5; P<= .05]; ln VLF, 6.0 [95% CI, 5.7-6.4] vs 5.5 [95% CI, 5.2-5.9; P <= .02]); respiratory chemoreflex sensitivity (central apnea-hypopnea index, 5.5 [95% CI, 2.8-8.2] vs 10.0 [95% CI, 6.9-13.1; P<= .01]) and cardiac chemoreflex sensitivity (TP ratio, 1.2 [95% CI, 1.1-1.3] vs 1.0 [95% CI, 0.9-1.0; P<= .0001]; HF ratio, 1.4 [95% CI, 1.2-1.5] vs 0.9 [95% CI, 0.8-1.1; P<= .001]; LF ratio, 1.5 [95% CI, 1.3-1.6] vs 1.0 [95% CI, 0.8-1.1; P<= .0001]; VLF ratio, 1.2 [95% CI, 1.1-1.3] vs 1.0 [95% CI, 0.9-1.1; P<= .002]) were lower after endarterectomy. Postintervention baroreflex sensitivity did not differ after endarterectomy and stenting. Autonomic function was better after endarterectomy than after stenting."

According to the news reporters, the research concluded: "Better autonomic function after endarterectomy was based on restoration of chemoreceptor but not baroreceptor function and may improve cardiovascular long-term outcome."

For more information on this research see: Autonomic outcome is better after endarterectomy than after stenting in patients with asymptomatic carotid stenosis. *Journal of Vascular Surgery*, 2016;64(4):975-984. *Journal of Vascular Surgery* can be contacted at: Mosby-Elsevier, 360 Park Avenue South, New York, NY 10010-1710, USA. New Carotid Stenosis Study Results Reported from Ningxia Medical University (The association between ankle-brachial index and asymptomatic cranial-carotid stenosis: a population-based, cross-sectional study of 5440 Han Chinese)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Carotid Stenosis. According to news reporting originating from Yinchuan, People's Republic of China, by NewsRx correspondents, research stated, "Routine screening for asymptomatic cranial-carotid stenosis (ACCS) is controversial and recommendation in clinical practice is vague. The ankle-brachial index (ABI) is reported as a predictor for cardiovascular disease."

Financial supporters for this research include Ministry of Science and Technology, National Natural Science Foundation of China, Edith Cowan University Industry Collaboration Scheme 2013, Edith Cowan University Strategic Research Fund, Importation and Development of High-Calibre Talents Project of Beijing Municipal Institutions.

Our news editors obtained a quote from the research from Ningxia Medical University, "However, there is a scarcity of data about the association between abnormal ABI and ACCS. A population-based cross-sectional study was conducted to explore the relationship between ABI and ACCS. A sample of 5440 Chinese adults aged 40-94 years old was recruited from 2010 to 2011. The ABI was measured using a portable Doppler device and ACCS was evaluated by bilateral carotid duplex ultrasound and portable examination devices. A logistic regression model was used to analyse the association between ABI and ACCS after adjusting for potential confounding factors. A low ABI was associated with ACCS [odds ratio (OR) 1.95, 95% confidence interval (CI) 1.42-2.67] after adjusting for potential confounders. When the data were stratified by age and sex, the correlation remained statistically significant in the male
(OR 2.32, 95% CI 1.60-3.37) and elderly (OR 3.07, 95% CI 1.97-4.78) subgroups compared to the female (OR 1.26, 95% CI 0.67-2.39) and middle-aged groups (OR 1.27, 95% CI 0.77-2.12), respectively."

According to the news editors, the research concluded: "This study demonstrated that low ABI is a significant risk factor for ACCS in male and elderly Chinese adults."

The news editors report that additional information may be obtained by contacting J. Qiu, School of Public Health, Ningxia Medical University, Yinchuan, People's Republic of China. Additional authors for this research include Y. Zhou, X. Yang, Y. Zhang, Z. Li, N. Yan, Y. Wang, S. Ge, S. Wu, X. Zhao and W. Wang.

Catecholamines

New Catecholamines Findings from University of Wollongong Described (Early Antipsychotic Treatment in Juvenile Rats Elicits Long-Term Alterations to the Dopamine Neurotransmitter System)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Catecholamines. According to news originating from Wollongong, Australia, by NewsRx correspondents, research stated, "Prescription of antipsychotic drugs (APDs) to children has substantially increased in recent years. Whilst current investigations into potential long-term effects have uncovered some alterations to adult behaviours, further investigations into potential changes to neurotransmitter systems are required."

Our news journalists obtained a quote from the research from the University of Wollongong, "The current study investigated potential long-term changes to the adult dopamine (DA) system following aripiprazole, olanzapine and risperidone treatment in female and male juvenile rats. Levels of tyrosine hydroxylase (TH), phosphorylated-TH (p-TH), dopamine active transporter (DAT), and D-1 and D-2 receptors were measured via Western blot and/or receptor autoradiography. Aripiprazole decreased TH and D-1 receptor levels in the ventral tegmental area (VTA) and p-TH levels in the prefrontal cortex (PFC) of females, whilst TH levels decreased in the PFC of males. Olanzapine decreased PFC p-TH levels and increased D-2 receptor expression in the PFC and nucleus accumbens (NAc) in females only. Additionally,
risperidone treatment increased D1 receptor levels in the hippocampus of females, whilst, in males, p-TH levels increased in the PFC and hippocampus, D-1 receptor expression decreased in the NAc, and DAT levels decreased in the caudate putamen (CPu), and elevated in the VTA."

According to the news editors, the research concluded: "These results suggest that early treatment with various APDs can cause different long-term alterations in the adult brain, across both treatment groups and genders."

For more information on this research see: Early Antipsychotic Treatment in Juvenile Rats Elicits Long-Term Alterations to the Dopamine Neurotransmitter System. *International Journal of Molecular Sciences*, 2016;17(11):2538-2557. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news correspondents report that additional information may be obtained from M. De Santis, University of Wollongong, Sch Med, Wollongong, NSW 2522, Australia. Additional authors for this research include J.M. Lian, X.F. Huang and C. Deng.

Keywords for this news article include: Wollongong, Australia, Australia and New Zealand, Dopamine Hydrochloride, Organic Chemicals, Pharmaceuticals, Biogenic Amines, Antipsychotics, Catecholamines, Mental Health, University of Wollongong.

**Drugs and Therapies - Celecoxib Therapy**

**New Celecoxib Therapy Study Findings Have Been Reported by Researchers at University of Antioquia (Chitosan/OA nanoparticle as delivery system for celecoxib: Parameters affecting the particle size, encapsulation, and release)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Celecoxib Therapy is now available. According to news reporting originating from Medellin, Colombia, by NewsRx correspondents, research stated, "Self-assembled nanoparticles prepared from amphiphilic chitosan/oleic acid (Ch/OA) have shown antibacterial activity and potential application as a carrier for hydrophobic anticancer drugs. In this study, a low molecular weight chitosan was modified with oleic acid obtaining a degree of substitution (DS) of 12%."

Our news editors obtained a quote from the research from the University of Antioquia, "The critical aggregation concentration (CAC) of the Ch/OA polymer obtained (0.025 mgmL(-1)) is lower in comparison with some systems of chitosan-fatty acids. The self-assembled Ch/OA nanoparticle size was optimized by changing polymer concentration, solvent, method, and time of homogenization to obtain particles with sizes around 300 nm and positive zeta potential. The drug loading about 7 gmL(-1) and encapsulation efficiency of 75.8 +/- 3.6% for Celecoxib was affected by the drug concentration. In vitro release behavior performed in (PBS, pH 7.4) and MES buffer (pH 6) indicated a pH-dependent drug release behavior."

According to the news editors, the research concluded: "The self-assembled systems show stability during 4 weeks after the encapsulation of the hydrophobic drug."

For more information on this research see: Chitosan/OA nanoparticle as delivery system for celecoxib: Parameters affecting the particle size, encapsulation, and release. *Journal of Applied Polymer Science*, 2017;134(7):143-153. *Journal of Applied Polymer Science* can be
New Cell Adhesion Molecules Study Results from Peking Union Medical College Described (Honokiol inhibits EMT-mediated motility and migration of human non-small cell lung cancer cells in vitro by targeting c-FLIP)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cell Research - Cell Adhesion Molecules have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Honokiol (HNK) is a natural compound isolated from the magnolia plant with numerous pharmacological activities, including inhibiting epithelial-mesenchymal transition (EMT), which has been proposed as an attractive target for anti-tumor drugs to prevent tumor migration. In this study we investigated the effects of HNK on EMT in human NSCLC cells in vitro and the related signaling mechanisms."

The news reporters obtained a quote from the research from Peking Union Medical College, "TNF-alpha (25 ng/mL) in combination with TGF-beta 1 (5 ng/mL) was used to stimulate EMT of human NSCLC A549 and H460 cells. Cell proliferation was analyzed using a sulforhodamine B assay. A wound-healing assay and a transwell assay were performed to examine cell motility. Western blotting was used to detect the expression levels of relevant proteins. siRNAs were used to knock down the gene expression of c-FLIP and N-cadherin. Stable overexpression of c-FLIP L (H157-FLIP L) or Lac Z (H157-Lac Z) was also performed. Treatment with TNF-alpha+TGF-beta 1 significantly enhanced the migration of A549 and H460 cells, increased c-FLIP, N-cadherin (a mesenchymal marker), snail (a transcriptional modulator) and p-Smad2/3 expression, and decreased I kappa B levels in the cells; these changes were abrogated by co-treatment with HNK (30 μmol/L). Further studies demonstrated that expression level of c-FLIP was highly correlated with the movement and migration of NSCLC cells, and the downstream effectors of c-FLIP signaling were NF-kappa B signaling and N-cadherin/snail signaling, while Smad signaling might lie upstream of c-FLIP."

According to the news reporters, the research concluded: "HNK inhibits EMT-mediated motility and migration of human NSCLC cells in vitro by targeting c-FLIP, which can be utilized as a promising target for cancer therapy, while HNK may become a potential anti-metastasis drug or lead compound."

For more information on this research see: Honokiol inhibits EMT-mediated

**Life Science Research - Cell Biology**

**New Cell Biology Findings from Karolinska Institute Described (Lgr6 labels a rare population of mammary gland progenitor cells that are able to originate luminal mammary tumours)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Life Science Research - Cell Biology. According to news reporting from Huddinge, Sweden, by NewsRx journalists, research stated, "The mammary gland is composed of a complex cellular hierarchy with unusual postnatal plasticity. The identities of stem/progenitor cell populations, as well as tumour-initiating cells that give rise to breast cancer, are incompletely understood."

The news correspondents obtained a quote from the research from Karolinska Institute, "Here we show that Lgr6 marks rare populations of cells in both basal and luminal mammary gland compartments in mice. Lineage tracing analysis showed that Lgr6(+) cells are unipotent progenitors, which expand clonally during puberty but diminish in adulthood. In pregnancy or following stimulation with ovarian hormones, adult Lgr6(+) cells regained proliferative potency and their progeny formed alveoli over repeated pregnancies. Oncogenic mutations in Lgr6(+) cells resulted in expansion of luminal cells, culminating in mammary gland tumours. Conversely, depletion of Lgr6(+) cells in the MMTV-PyMT model of mammary tumorigenesis significantly impaired tumour growth."

According to the news reporters, the research concluded: "Thus, Lgr6 marks mammary gland progenitor cells that can initiate tumours, and cells of luminal breast tumours required for efficient tumour maintenance."

Our news journalists report that additional information may be obtained by
New Cell Science Study Findings Reported from Osaka University (ARHGEF10 directs the localization of Rab8 to Rab6-positive executive vesicles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Science - Cell Science have been presented. According to news reporting from Osaka, Japan, by NewsRx journalists, research stated, "The function of ARHGEF10, a known guanine nucleotide exchange factor (GEF) for RhoA with proposed roles in various diseases, is poorly understood. To understand the precise function of this protein, we raised a monoclonal antibody against ARHGEF10 and determined its localization in HeLa cells."

The news correspondents obtained a quote from the research from Osaka University, "ARHGEF10 was found to localize to vesicles containing Rab6 (of which there are three isoforms, Rab6a, Rab6b and Rab6c), Rab8 (of which there are two isoforms, Rab8a and Rab8b), and/or the secretion marker neuropeptide Y (NPY)-Venus in a Rab6-dependent manner. These vesicles were known to originate from the Golgi and contain secreted or membrane proteins. Ectopic expression of an N-terminal-truncated ARHGEF10 mutant led to the generation of large vesicle-like structures containing both Rab6 and Rab8. Additionally, small interfering (si) RNA-mediated knockdown of ARHGEF10 impaired the localization of Rab8 to these exocytotic vesicles. Furthermore, the invasiveness of MDA-MB231 cells was markedly decreased by knockdown of ARHGEF10, as well as of Rab8."

According to the news reporters, the research concluded: "From these results, we propose that ARHGEF10 acts in exocytosis and tumor invasion in a Rab8-dependent manner."

Our news journalists report that additional information may be obtained by contacting S. Shibata, Osaka University, Grad Sch Med, Div Hlth Sci, Neurobiol Grp, Osaka 5650871, Japan. Additional authors for this research include T. Kawanai, T. Hara, A. Yamamoto, T. Chaya, Y. Tokuhara, C. Tsuji, M. Sakai, T. Tachibana and S. Inagaki.

The direct object identifier (DOI) for that additional information is:
Transplant Medicine - Cell Transplants

New Cell Transplants Findings from D. Planelles and Co-Researchers Reported (Report From the First and Second Spanish Killer Immunoglobulin-Like Receptor Genotyping Workshops: External Quality Control for Natural Killer Alloreactive Donor Selection in Haploidentical Stem Cell Transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Cell Transplants have been published. According to news reporting out of Valencia, Spain, by NewsRx editors, research stated, "An important factor affecting the success in the setting of related haploidentical hematopoietic stem cell transplantation (HSCT) is the graft-versus-leukemia effect mediated by natural killer (NK) cells when the donor displays NK alloreactivity versus the recipient. NK cell function is regulated by killer immunoglobulin-like receptors (KIR) and it has been described that donor KIR genotype influences transplantation outcome."

Our news journalists obtained a quote from the research, "This has led to a requirement of laboratories to have a quality assurance program for validation and control of their KIR genotyping methods. The goal of the 1st and 2nd Spanish KIR Genotyping Workshops was to provide an external proficiency testing program in KIR genotyping for Spanish immunology and transplant laboratories. These workshops were conducted during the years 2014-2016 and consisted of 17 participating laboratories typing a set of 20 samples. The presence/absence of 16 mandatory KIR loci (2DL1, 2DL2, 2DL3, 2DL4, 2DL5, 2DS1, 2DS2, 2DS3, 2DS4, 2DS5, 2DP1, 3DL1, 3DL2, 3DL3, 3DS1, and 3DP1) was evaluated per sample. Methods for KIR genotyping included polymerase chain reaction with the use of sequence-specific primers and sequence-specific oligoprobes. Consensus typing was reached in all samples, and the performance of laboratories in external proficiency testing was satisfactory in all cases."

According to the news editors, the research concluded: "The polymorphism detected in the small sample studied in both workshops is indicative of an ample variety of KIR gene profiles in the Spanish population."

Transplant Medicine - Cell Transplants

New Cell Transplants Study Findings Have Been Reported by Investigators at University Hospital (ABO blood group antigen mismatch has an impact on outcome after allogeneic peripheral blood stem cell transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Transplant Medicine - Cell Transplants is the subject of a report. According to news reporting from Regensburg, Germany, by NewsRx journalists, research stated, "ABO blood group antigen incompatibility (ABO mismatch) is not an obstacle to allogeneic stem cell transplantation (allo-SCT). However, the impact on clinical outcome after allo-SCT remains controversial."

The news correspondents obtained a quote from the research from University Hospital, "We analyzed 512 patients after allogeneic peripheral blood SCT (allo-PBSCT) for an association of ABO mismatch with transfusion requirements, myeloid and platelet engraftment, the incidence of GvHD, relapse, transplant-related mortality (TRM), and overall survival (OS). A total of 260 patients underwent ABO-mismatched transplantation and the control group consisted of 252 patients with ABO-matched allo-PBSCT. We found a significant association between major-0 ABO mismatch (group 0 recipient/group A, B, or AB donor) and increased red blood cell (RBC) and platelet transfusion requirements (both P<.001) as well as delayed platelet engraftment (P <.001). Minor-A (group A recipient/group 0 donor) and minor-AB (group AB recipient/group 0, A, or B donor) ABO mismatch was significantly associated with an increased TRM after allo-PBSCT (P=.001 and P=.02). In multivariate analysis performed using Cox regression, minor ABO mismatch appeared as independent risk factor for TRM after allo-PBSCT. No association was found for ABO mismatch with the incidence of GvHD, relapse, and OS."

According to the news reporters, the research concluded: "Our results suggest that ABO blood group mismatch has a significant impact on the outcome and that minor-A and minor-AB ABO mismatch represents a risk factor for increased TRM after allo-PBSCT."

Our news journalists report that additional information may be obtained by contacting M. Grube, Univ Hosp Regensburg, Dept. of Internal Med Hematol & Oncol 3, Regensburg, Germany. Additional authors for this research include D. Wolff, N. Ahrens, P.Y. Herzberg, W. Herr and E. Holler.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ctr.12840. This DOI is a link to an online electronic document that is either free or for purchase.

Transplant Medicine - Cell Transplants

New Cell Transplants Study Findings Recently Were Reported by Researchers at University of Edinburgh (Re-implantation of cryopreserved ovarian cortex resulting in restoration of ovarian function, natural conception and successful pregnancy ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Cell Transplants have been published. According to news originating from Edinburgh, United Kingdom, by NewsRx correspondents, research stated, "With the improvement of long-term cancer survival rates, growing numbers of female survivors are suffering from treatment-related premature ovarian insufficiency (POI). Although pre-treatment embryo and oocyte storage are effective fertility preservation strategies, they are not possible for pre-pubertal girls or women who cannot delay treatment."

Financial support for this research came from Medical Research Council. Our news journalists obtained a quote from the research from the University of Edinburgh, "In these cases, the only available treatment option is ovarian cortex cryopreservation and subsequent re-implantation. A 32-year-old woman had ovarian cortex cryopreserved 10 years previously before commencing high-dose chemotherapy and undergoing a haematopoietic stem cell transplant for recurrent adult Wilms tumour, which resulted in POI. She underwent laparoscopic orthotopic transplantation of cryopreserved ovarian cortex to the original site of biopsy on the left ovary. She ovulated at 15 and 29 weeks post-re-implantation with AMH detectable, then rising, from 21 weeks, and conceived naturally following the second ovulation. The pregnancy was uncomplicated and a healthy male infant was born by elective Caesarean section at 36(+4) weeks gestation. This is the first report of ovarian cortex re-implantation in the UK."

According to the news editors, the research concluded: "Despite the patient receiving low-risk chemotherapy prior to cryopreservation and the prolonged tissue storage duration, the re-implantation resulted in rapid restoration of ovarian function and natural conception with successful pregnancy."

For more information on this research see: Re-implantation of cryopreserved

The news correspondents report that additional information may be obtained from C.E. Dunlop, University of Edinburgh, MRC Center Reprod Hlth, Edinburgh EH16 4TJ, Midlothian, United Kingdom. **Cellular Structures**

### New Cellular Structures Study Findings Recently Were Reported by Researchers at University of North Carolina (Dual Targeting of Cell Wall Precursors by Teixobactin Leads to Cell Lysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cellular Structures is the subject of a report. According to news reporting originating from Chapel Hill, North Carolina, by NewsRx correspondents, research stated, "Teixobactin represents the first member of a newly discovered class of antibiotics that act through inhibition of cell wall synthesis. Teixobactin binds multiple bactoprenol-coupled cell wall precursors, inhibiting both peptidoglycan and teichoic acid synthesis."

Financial supporters for this research include HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID), Charles A. King Trust.

Our news editors obtained a quote from the research from the University of North Carolina, "Here, we show that the impressive bactericidal activity of teixobactin is due to the synergistic inhibition of both targets, resulting in cell wall damage, delocalization of autolysins, and subsequent cell lysis. We also find that teixobactin does not bind mature peptidoglycan, further increasing its activity at high cell densities and against vancomycin-intermediate Staphylococcus aureus (VISA) isolates with thickened peptidoglycan layers."

According to the news editors, the research concluded: "These findings add to the attractiveness of teixobactin as a potential therapeutic agent for the treatment of infection caused by antibiotic-resistant Gram-positive pathogens."

For more information on this research see: Dual Targeting of Cell Wall Precursors by Teixobactin Leads to Cell Lysis. *Antimicrobial Agents and Chemotherapy*, 2016;60 (11):6510-6517. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for
New Central Nervous System Agents Data Have Been Reported by Investigators at Macquarie University (The neurocircuitry involved in oxytocin modulation of methamphetamine addiction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Central Nervous System Agents is now available. According to news originating from North Ryde, Australia, by NewsRx correspondents, research stated, "The role of oxytocin in attenuating the abuse of licit and illicit drugs, including the psychostimulant methamphetamine, has been examined with increased ferocity in recent years. This is largely driven by the potential application of oxytocin as a pharmacotherapy."

Our news journalists obtained a quote from the research from Macquarie University, "However, the neural mechanisms by which oxytocin modulates methamphetamine abuse are not well understood. Recent research identified an important role for the accumbens core and subthalamic nucleus in this process, which likely involves an interaction with dopamine, glutamate, GABA, and vasopressin. In addition to providing an overview of methamphetamine, the endogenous oxytocin system, and the effects of exogenous oxytocin on drug abuse, we propose a neural circuit through which exogenous oxytocin modulates methamphetamine abuse, focusing on its interaction with neurochemicals within the accumbens core and subthalamic nucleus."

According to the news editors, the research concluded: "A growing understanding of exogenous oxytocin effects at a neurochemical and neurobiological level will assist in its evaluation as a pharmacotherapy for drug addiction."

The news correspondents report that additional information may be obtained from S.J. Baracz, Macquarie University, Dept. of Psychol, N Ryde, NSW 2109, Australia.

The direct object identifier (DOI) for that additional information is:
New Central Nervous System Agents Findings from University of California Described (Prefrontal glutamate correlates of methamphetamine sensitization and preference)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Central Nervous System Agents. According to news reporting from Santa Barbara, California, by NewsRx journalists, research stated, "Methamphetamine (MA) is a widely misused, highly addictive psychostimulant that elicits pronounced deficits in neurocognitive function related to hypo-functioning of the prefrontal cortex (PFC). Our understanding of how repeated MA impacts excitatory glutamatergic transmission within the PFC is limited, as is information about the relationship between PFC glutamate and addiction vulnerability/resiliency."

Financial supporters for this research include National Institutes of Health, Department of Veterans Affairs and NIDA.

The news correspondents obtained a quote from the research from the University of California, "In vivo microdialysis and immunoblotting studies characterized the effects of MA (ten injections of 2 mg/kg, i.p.) upon extracellular glutamate in C57BL/6J mice and upon glutamate receptor and transporter expression, within the medial PFC. Glutamatergic correlates of both genetic and idiopathic variance in MA preference/intake were determined through studies of high vs. low MA-drinking selectively bred mouse lines (MAHDR vs. MALDR, respectively) and inbred C57BL/6J mice exhibiting spontaneously divergent place-conditioning phenotypes. Repeated MA sensitized drug-induced glutamate release and lowered indices of N-methyl-d-aspartate receptor expression in C57BL/6J mice, but did not alter basal extracellular glutamate content or total protein expression of Homer proteins, or metabotropic or a-amino-3-hydroxy-5-methyl-4-isoxazolepropionic acid glutamate receptors. Elevated basal glutamate, blunted MA-induced glutamate release and ERK activation, as well as reduced protein expression of mGlu2/3 and Homer2a/b were all correlated biochemical traits of selection for high vs. low MA drinking, and Homer2a/b levels were inversely correlated with the motivational valence of MA in C57BL/6J mice."

According to the news reporters, the research concluded: "These data provide novel evidence that repeated, low-dose MA is sufficient to perturb pre- and post-synaptic aspects of glutamate transmission within the medial PFC and that glutamate anomalies within this region may contribute to both genetic and idiopathic variance in MA addiction vulnerability/resiliency."

Our news journalists report that additional information may be obtained by contacting K.D. Lominac, Dept. of Psychological and Brain Sciences and the Neuroscience Research Institute, University of California at Santa Barbara, Santa Barbara, CA, 93106-9660, United States. Drugs and Therapies - Central Nervous System Agents

**New Central Nervous System Agents Study Results from University College Described (2016 Updated MASCC/ESMO consensus recommendations: Management of nausea and vomiting in advanced cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Central Nervous System Agents are presented in a new report. According to news reporting originating from Dublin, Ireland, by NewsRx correspondents, research stated, "The aim of this paper is to review the existing literature related to the management of nausea and vomiting (N & V) in advanced cancer and derive clinical evidence-based recommendations for its management. Available systematic reviews on antiemetic drug effectiveness were used."

Our news editors obtained a quote from the research from University College, "One generic systematic review of antiemetics in advanced cancer (to 2009) was updated to February 2016. Agreement on recommendations was reached between panel members, and these were voted in favor unanimously by the larger antiemetic committee membership (n = 37). The evidence base in this field is minimal with largely poor quality trials or uncontrolled trials and case studies. The level of evidence in most studies is low. The drug of choice for managing N & V in advanced cancer is metoclopramide titrated to effect. Alternative options include haloperidol, levomepromazine, or olanzapine. For bowel obstruction, the recommendation is to use octreotide given alongside an antiemetic (haloperidol) and where octreotide is not an option to use an anticholinergic antisecretory agent. For opioid-induced N & V, no recommendation could be made."

According to the news editors, the research concluded: "These new guidelines, based
on the existing (but poor) evidence, could help clinicians manage more effectively the complex and challenging symptoms of N & V in advanced cancer.

For more information on this research see: 2016 Updated MASCC/ESMO consensus recommendations: Management of nausea and vomiting in advanced cancer. Supportive Care in Cancer, 2017;25(1):333-340. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Supportive Care in Cancer - www.springerlink.com/content/0941-4355/)

Central Nervous System

New Central Nervous System Data Have Been Reported by Investigators at University of Porto (Flavonoids in Neurodegeneration: Limitations and Strategies to Cross CNS Barriers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System are presented in a new report. According to news reporting originating from Oporto, Portugal, by NewsRx correspondents, research stated, "The central nervous system (CNS) is a mythical target for drug delivery. There is an ongoing debate over the brain accessibility of flavonoids, a group of plant-derived secondary metabolites widely known by their multifarious bioactivities achieved by distinct mechanisms."

Our news editors obtained a quote from the research from the University of Porto, "Recently, their applicability in the management of neurologic and psychiatric disorders, such as Alzheimer's and Parkinson's diseases, and major depression, has received particular attention. To reach their target, flavonoids must cross over the ultimate obstacle the blood-brain barrier - at pharmacologically effective concentrations. This review addresses the low brain-bioavailability issue, based on in vitro and in vivo evidences. Besides the lipophilic character of the flavonoids, their permeability will depend upon the role of membrane transporters, especially those from the ABC superfamily. The enzymatic elements, namely beta-glucuronidase, can induce a transient deconjugation process and affect permeability, as well. Novel drug delivery systems are successful strategies to overcome the low bioavailability issue, and redirect the native forms to CNS-targets."

According to the news editors, the research concluded: "This work bridges a solid opinion over this hot topic of medicinal chemistry and natural products research."

For more information on this research see: Flavonoids in Neurodegeneration: Limitations and Strategies to Cross CNS Barriers. Current Medicinal Chemistry, 2016;23
New Central Nervous System Depressants Findings from Mayo Clinic Described (Anesthetic implications for patients with Segawa syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Central Nervous System Depressants are discussed in a new report. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "To characterize the perioperative course of patients with Segawa syndrome undergoing anesthetic management. Retrospective observational case study."

Our news editors obtained a quote from the research from Mayo Clinic, "Large tertiary medical center. Patients with Segawa syndrome who underwent procedures requiring anesthetic management at our institution from January 1, 2004, through July 31, 2015. The health records of patients with Segawa syndrome. Twelve patients with Segawa syndrome underwent 25 procedures requiring anesthetic management, including 20 operations with general anesthesia. Succinylcholine was administered in 6 cases and nondepolarizing neuromuscular blockers in 5 cases, all without adverse effects. Perioperative complications were unrelated to anesthetic management or underlying neurologic condition. In 16 operations, the patients were receiving levodopa therapy at the time of the procedure. In this cohort, patients with Segawa syndrome tolerated the anesthetic management, including neuromuscular blocker administration."

According to the news editors, the research concluded: "Although these patients are frequently receiving levodopa therapy, no associated complications were noted."

The news editors report that additional information may be obtained by contacting T.N. Weingarten, Mayo Clinic, Dept. of Anesthesiol, Rochester, MN 55905, United States. Additional authors for this research include N.D. Will, B.T. Klassen, J. Sprung and T.N.
New Central Sleep Apnea Study Findings Have Been Reported by Researchers at Vanderbilt Eye Institute (Congenital Tonic Pupils Associated With Congenital Central Hypoventilation Syndrome and Hirschsprung Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Respiratory Tract Diseases and Conditions - Central Sleep Apnea have been published. According to news originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "Autonomic dysfunction can be associated with pupillary abnormalities. We describe a rare association of tonic pupils, congenital central hypoventilation syndrome, and Hirschsprung disease in a newborn with a mutation in the PHOX2B gene, a key regulator of neural crest cells."

Our news journalists obtained a quote from the research from Vanderbilt Eye Institute, "Hirschsprung disease is characterized by the congenital absence of neural crest-derived intrinsic ganglion cells. Tonic pupils may result from an abnormality of the ciliary ganglion, another structure of neural crest origin."

According to the news editors, the research concluded: "The close association of these conditions in this child suggests a common abnormality in neural crest migration and differentiation."

The news correspondents report that additional information may be obtained from S.P. Donahue, Vanderbilt Eye Inst, Dept. of Ophthalmol, Nashville, TN 37232, United States. Additional authors for this research include J.J. Ling, E.G. Martinez, A.C. Reddy and S.P. Donahue.

Keywords for this news article include: Nashville, Tennessee, United States, North and Central America, Congenital Central Hypoventilation Syndrome, Respiratory Tract Diseases and Conditions, Digestive System Diseases and Conditions, Gastrointestinal Diseases and Conditions, Colonic Diseases and Conditions, Digestive System Abnormalities, Respiratory Insufficiency, Congenital Abnormalities, Respiration Disorders, Hirschsprung Disease, Central Sleep Apnea, Gastroenterology, Sleep Disorders, Megacolon, Genetics,
New Cerebral Infarction Findings from University Medical Center Described (Diagnostic performance of peroxiredoxin 1 to determine time-of-onset of acute cerebral infarction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Cerebral Infarction are discussed in a new report. According to news reporting originating from Geneva, Switzerland, by NewsRx correspondents, research stated, "Accurately determining time-of-onset of cerebral infarction is important to clearly identify patients who could benefit from reperfusion therapies. We assessed the kinetics of peroxiredoxin 1 (PRDX1), a protein involved in oxidative stress during the acute phase of ischemia, and its ability to determine stroke onset in a population of patients with known onset of less than 24 hours and in a control group."

Our news editors obtained a quote from the research from University Medical Center, "Median PRDX1 levels were significantly higher in stroke patients compared to controls. PRDX1 levels were also higher from blood samples withdrawn before vs. after 3 hours following stroke onset, and before vs. after 6 hours. ROC analysis with area under the curve (AUC), sensitivity (Se) and specificity (Sp) determined from the Youden index was performed to assess the ability of PRDX1 levels to determine onset. Diagnostic performances of PRDX1 levels were defined by an AUC of 69%, Se of 53% and Sp of 86% for identifying cerebral infarction occurring <3 hours, and an AUC of 68%, Se of 49% and Sp of 88% for cerebral infarction occurring <6 hours."

According to the news editors, the research concluded: "These first results suggest that PRDX1 levels could be the basis of a new method using biomarkers for determining cerebral infarction onset."

For more information on this research see: Diagnostic performance of peroxiredoxin 1 to determine time-of-onset of acute cerebral infarction. Scientific Reports, 2016;6():1-10. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting S. Richard, University Medical Center, Dept. of Human Prot Sci. CH-1206 Geneva, Switzerland. Additional authors for this research include V. Lapiere, N. Girerd, M. Bonnerot, P.R. Burkhard, L. Lagerstedt, S. Bracard, M. Debouverie, N. Turck and J.C. Sanchez.

New Cervical Cancer Findings Reported from University of Nevada (Quantitative and mixed analyses to identify factors that affect cervical cancer screening uptake among lesbian and bisexual women and transgender men)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Cervical Cancer are presented in a new report. According to news reporting originating from Las Vegas, Nevada, by NewsRx correspondents, research stated, "Aims and objectives. The purposes of this study were to measure the prevalence of, and identify factors associated with, cervical cancer screening among a sample of lesbian, bisexual and queer women, and transgender men."

Our news editors obtained a quote from the research from the University of Nevada, "Past research has found that lesbian, bisexual and queer women underuse cervical screening service. Because deficient screening remains the most significant risk factor for cervical cancer, it is essential to understand the differences between routine and nonroutine screeners. A convergent-parallel mixed methods design. A convenience sample of 21- to 65-year-old lesbian and bisexual women and transgender men were recruited in the USA from August-December 2014. Quantitative data were collected via a 48-item Internet questionnaire (N = 226), and qualitative data were collected through in-depth telephone interviews (N = 20) and open-ended questions on the Internet questionnaire. Seventy-three per cent of the sample was routine cervical screeners. The results showed that a constellation of factors influence the use of cervical cancer screening among lesbian, bisexual and queer women. Some of those factors overlap with the general female population, whereas others are specific to the lesbian, bisexual or queer identity. Routine screeners reported feeling more welcome in the health care setting, while nonroutine screeners reported more discrimination related to their sexual orientation and gender expression. Routine screeners were also more likely to 'out' to their provider. The quantitative and qualitative factors were also compared and contrasted. Many of the factors identified in this study to influence cervical cancer screening relate to the health care environment and to interactions between the patient and provider. Relevance to clinical practice. Nurses should be involved with creating welcoming environments for lesbian, bisexual and queer women and their partners."

According to the news editors, the research concluded: "Moreover, nurses play a large role in patient education and should promote self-care behaviours among lesbian women and transgender men."

The news editors report that additional information may be obtained by contacting M.J. Johnson, Univ Nevada Las Vegas, Sch Nursing, Las Vegas, NV 89154, United States. Additional authors for this research include M. Mueller, M.J. Eliason, G. Stuart and L.S. Nemeth.

New Chagas Disease Data Have Been Reported by Researchers at Federal University (Efficacy of Lychnopholide Polymeric Nanocapsules after Oral and Intravenous Administration in Murine Experimental Chagas Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Chagas disease are discussed in a new report. According to news reporting originating in Ouro Preto, Brazil, by NewsRx journalists, research stated, "The etiological treatment of Chagas disease remains neglected. The compounds available show several limitations, mainly during the chronic phase."

The news reporters obtained a quote from the research from Federal University, "Lychnopholide encapsulated in polymeric nanocapsules (LYC-NC) was efficacious in mice infected with Trypanosoma cruzi and treated by intravenous administration during the acute phase (AP). As the oral route is preferred for treatment of chronic infections, such as Chagas disease, this study evaluated the use of oral LYC-NC in the AP and also compared it with LYC-NC administered to mice by the oral and intravenous routes during the chronic phase (CP). The therapeutic efficacy was evaluated by fresh blood examination, hemoculture, PCR, and enzyme-linked immunosorbent assay (ELISA). The cure rates in the AP and CP were 62.5% and 55.6%, respectively, upon oral administration of LYC-poly(D, L-lactide)-polyethylene glycol nanocapsules (LYC-PLA-PEG-NC) and 57.0% and 30.0%, respectively, with LYC-poly-epsilon-caprolactone nanocapsules (LYC-PCL-NC). These cure rates were significantly higher than that of free LYC, which did not cure any animals. LYC-NC formulations administered orally during the AP showed cure rates similar to that of benznidazole, but only LYC-NC cured mice in the CP. Similar results were achieved with intravenous treatment during the CP. The higher cure rates obtained with LYC loaded in PLA-PEG-NC may be due to the smaller particle size of these NC and the presence of PEG, which influence tissue diffusion and the controlled release of LYC. Furthermore, PLA-PEG-NC may improve the stability of the drug in the gastrointestinal tract. This work is the first report of cure of experimental Chagas disease via oral administration during the CP."

According to the news reporters, the research concluded: "These findings represent a new and important perspective for oral treatment of Chagas disease."

For more information on this research see: Efficacy of Lychnopholide Polymeric Nanocapsules after Oral and Intravenous Administration in Murine Experimental Chagas Disease. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5215-5222. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Parasitic Diseases and Conditions - Chagas Disease

New Chagas Disease Study Findings Recently Were Reported by Researchers at Federal University (Nelfinavir and lopinavir impair Trypanosoma cruzi trypomastigote infection in mammalian host cells and show anti-amastigote activity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Parasitic Diseases and Conditions - Chagas Disease. According to news reporting out of Rio de Janeiro, Brazil, by NewsRx editors, research stated, "There is an urgent need to implement new strategies and to search for new chemotherapeutic targets to combat Chagas' disease. In this context, repositioning of clinically approved drugs appears as a viable tool to combat this and several other neglected pathologies."

Funders for this research include Fundacao Carlos Chagas Filho de Amparo a Pesquisa do Estado do Rio de Janeiro (FAPERJ), Conselho Nacional de Desenvolvimento Cientifico e Tecnologico (CNPq), Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior (CAPES), Fundacao Oswaldo Cruz (FIOCRUZ).

Our news journalists obtained a quote from the research from Federal University, "An example is the use of aspartic peptidase inhibitors (PIs) currently applied in human immunodeficiency virus (HIV) treatment against different infectious agents. Therefore, the main objective of this work was to verify the effects of the HIV-PIs nelfinavir and lopinavir against Trypanosoma cruzi using in vitro models of infection. Cytotoxicity assays with LLC-MK2 epithelial cells and RAWmacrophages allowed an evaluation of the effects of HIV-PIs on the interaction between trypomastigotes and these cells as well as the survival of intracellular amastigotes. Pretreatment of trypomastigotes with nelfinavir and lopinavir inhibited the association index with LLC-MK2 cells and RAWmacrophages in a dose-and time-dependent manner. In addition, nelfinavir and lopinavir also significantly reduced the number of intracellular amastigotes in both mammalian cell lineages, particularly when administered in daily doses. Both compounds had no effect on nitric oxide production in infected RAW macrophages. These results open the possibility for the use of HIV-PIs as a tangible alternative in the treatment of Chagas' disease."

According to the news editors, the research concluded: "However, the main
mechanism of action of nelfinavir and lopinavir has yet to be elucidated, and more studies using in vivo models must be conducted."

Our news journalists report that additional information may be obtained by contacting M.H. Branquinha, Univ Fed Rio de Janeiro UFRJ, Inst Microbiol Paulo de Goes IMPG, Lab Invest Peptidases, Dept. of Microbiol Geral, Rio De Janeiro, Brazil. Additional authors for this research include C.M. d'Avila-Levy, M.H. Branquinha and A.L.S. Santos.

Computation - Chemical Theory and Computation

New Chemical Theory and Computation Study Results Reported from National Center for Scientific Research (CNRS) (Coarse-Grained Simulations Complemented by Atomistic Molecular Dynamics Provide New Insights into Folding and Unfolding of Human ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Computation - Chemical Theory and Computation. According to news originating from Paris, France, by NewsRx correspondents, research stated, "G-quadruplexes are the most important non canonical DNA architectures. Many quadruplex-forming sequences, including the human telomeric sequence d(GGGTTA)(n), have been investigated due to their implications in cancer and other diseases, and because of their potential in DNA-based nanotechnology."

Financial supporters for this research include Agence Nationale de la Recherche, Ministerstvo školstvi, Mladež ř telovýchovy, Grantova Agentura Ceske Republiky, Akademie Ved Ceske Republiky, Institut Universitaire de France.

Our news journalists obtained a quote from the research from National Center for Scientific Research (CNRS), "Despite the availability of atomistic structural studies of folded G-quadruplexes, their folding pathways remain mysterious, and mutually contradictory models of folding coexist in the literature. Recent experiments convincingly demonstrated that G-
quadruplex folding often takes days to reach thermodynamic equilibrium. Based on atomistic simulations of diverse classes of intermediates in G-quadruplex folding, we have suggested that the folding is an extremely multipathway process combining a kinetic partitioning mechanism with conformational diffusion. However, complete G-quadruplex folding is far beyond the time scale of atomistic simulations. Here we use high-resolution coarse-grained simulations to investigate potential unfolding intermediates, whose structural dynamics are then further explored with all-atom simulations. This multiscale approach indicates how various pathways are interconnected in a complex network. Spontaneous conversions between different folds are observed. We demonstrate the inability of simple order parameters, such as radius of gyration or the number of native H-bonds, to describe the folding landscape of the G-quadruplexes.

According to the news editors, the research concluded: "Our study also provides information relevant to further development of the coarse grained force field."

The news correspondents report that additional information may be obtained from S. Pasquali, Univ Sorbonne Paris Cite, CNRS UPR9080, IBPC, Lab Biochim Theor, F-75005 Paris, France. Additional authors for this research include L. Mazzanti, T. Cragnolini, D.J. Wales, P. Derreumaux, S. Pasquali and J. Sponer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.jctc.6b00667. This DOI is a link to an online electronic document that is either free or for purchase.

Chemical Research - Chemical and Biological... New Chemical and Biological Interactions Findings from Kazan Federal University Outlined (Emergence of catalytic bioscavengers against organophosphorus agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Chemical Research - Chemical and Biological Interactions have been presented. According to news reporting out of Kazan, Russia, by NewsRx editors, research stated, "Bioscavengers are an effective alternative approach for pre- and post-exposure treatments of nerve agent (NA) poisoning. Bioscavengers are natural or recombinant enzymes, reactive proteins, and antibodies that neutralize NAs before they reach their physiological targets."

Funders for this research include Kazan Federal University, Russian Science Foundation.
Our news journalists obtained a quote from the research from Kazan Federal University. "They are administered by injection (protein or gene delivery vector) and react with NAs in the bloodstream. Other ways of delivery can be used: inhalation for pulmonary delivery, topical creams for skin protection, etc. Operational bioscavengers must be producible at low cost, not susceptible to induce immune response and adverse effects, and stable in the bloodstream, upon storage, and under field conditions. First generation bioscavengers, cholinesterases and carboxylesterases, are stoichiometric bioscavengers. However, stoichiometric neutralization of NAs needs administration of huge doses of costly biopharmaceuticals. Second generation bioscavengers are catalytic bioscavengers. These are capable of detoxifying organophosphates regeneratively. By virtue of high turnover, much lower doses are needed for rapid neutralization of toxicants. The most promising catalytic bioscavengers are evolved mutants of phosphotriesterases (bacterial enzymes, mammalian paraoxonases), displaying enantiomeric preference for toxic NA isomers. However, engineering of cholinesterases, carboxylesterases, prolidases and other enzymes, e.g. phosphotriesterases-lactonases from extremophiles is of interest. In particular, association of cholinesterase mutants (not susceptible to age after phosphorylation) with fast-reactivating oximes leads to pseudocatalytic bioscavengers."

According to the news editors, the research concluded: "Thus, catalytic and pseudocatalytic bioscavengers are an improvement of bioscavenger-based medical countermeasures in terms of efficacy and cost."

For more information on this research see: Emergence of catalytic bioscavengers against organophosphorus agents. Chemico-Biological Interactions, 2016;259():319-326. **Drugs and Therapies - Chemotherapy**

**New Chemotherapy Data Have Been Reported by Investigators at Changchun Institute of Applied Chemistry (Self-Assembly of Amphiphilic Drug-Dye Conjugates into Nanoparticles for Imaging and Chemotherapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Chemotherapy is the subject of a report. According to news reporting from Changchun, People's Republic of China, by NewsRx journalists, research stated, "An amphiphilic drug-dye conjugate (PTX-Pt-BDP) was designed and synthesized with a platinum compound as the hydrophilic head. The precursor of PTX-Pt-
BDP was obtained under mild conditions by means of a three-component Passerini reaction."

The news correspondents obtained a quote from the research from the Changchun Institute of Applied Chemistry, "PTX-Pt-BDP could self-assemble into nanoparticles (PTX-Pt-BDP NPs) in aqueous solution via a nanoprecipitation method. The obtained nanoparticles exhibited favorable structural stability in both water and physiological environment. PTX-Pt-BDP NPs could be endocytosed by cancer cells as revealed by confocal laser scanning microscopy and exert potent cytotoxicity."

According to the news reporters, the research concluded: "This work highlights the potential of nanomedicines from amphiphilic drug-dye conjugates for cancer cell imaging and chemotherapy."

Our news journalists report that additional information may be obtained by contacting Z.G. Xie, Chinese Academy Sci, State Key Lab Polymer Phys & Chem, Changchun Inst Appl Chem, Changchun 130022, People's Republic of China. Additional authors for this research include W.H. Lin, W. Zhang and Z.G. Xie.

Drugs and Therapies - Chemotherapy

New Chemotherapy Findings Reported from Barbara Ann Karmanos Cancer Institute (Managing Chemotherapy Side Effects: Achieving Reliable and Equitable Outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Chemotherapy. According to news reporting out of Detroit, Michigan, by NewsRx editors, research stated, "Receiving information about treatment-related side effects is a high priority for patients receiving chemotherapy. Infusion nurses typically assume responsibility for teaching patients how to manage treatment-related side effects, but providing reliable and equitable information across visits and across different infusion centers can present a problem."

Our news journalists obtained a quote from the research from Barbara Ann Karmanos Cancer Institute, "Implementing a standardized, patient-centered, departure encounter checklist can help ensure that nurses consistently provide patients with targeted, timely, and regimen-specific information about treatment-related side effects. At a Glance A structured discharge and departure process can help nurses in delivering high-quality patient-centered care. Providing nurses with a checklist with cues reinforces a standardized encounter with each patient."
According to the news editors, the research concluded: "Developing interventions that the nursing staff 'own' allows for easier adoption."

Our news journalists report that additional information may be obtained by contacting C.C. Beaver, Barbara Ann Karmanos Canc Inst, Ambulatory Operat, Detroit, MI 48201, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1188/16.CJON.589-591. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Chemotherapy**

**New Chemotherapy Findings from Hasselt University Described** *(Outcome after PORT in ypN2 or R1/R2 versus no PORT in ypNO Stage III-N2 NSCLC after Induction Chemotherapy and Resection)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Chemotherapy. According to news reporting originating in Hasselt, Belgium, by NewsRx journalists, research stated, "We investigated patients with contemporarily staged and treated stage III-N2 NSCLC treated with induction chemotherapy and surgery with or without postoperative radiotherapy (PORT). We focused on survival and toxicity and investigated what additional PORT may offer in patients with ypN2 status or incomplete resection."

The news reporters obtained a quote from the research from Hasselt University, "We identified 161 patients with pathologically proven, resectable stage III-N2 NSCLC from our prospective database who were treated between 1998 and 2012. Of these patients, 150 without progressive disease after chemotherapy underwent resection. Patients with ypN2 status or R1/2 resection received three-dimensional PORT (n = 70) to a dose of 50 to 66 Gy in 2-Gy fractions. The mean follow-up time was 49 months. The 5-year overall survival (OS) rate was 35.1% in intention to -treat analysis; relapse-free survival was 31.8%, the cumulative local recurrence (LR) rate was 50.9%, and the distant metastasis rate was 63.4%. The 5-year OS, relapse free survival, and cumulative LR and distant metastasis rates were 32.0%, 32.9%, 47.0%, and 63.9% in the PORT group versus 38.1%, 30.7%, 54.1%, and 63.2% in the non-PORT group. These results were not significantly different, even though patients in the PORT group had worse prognostic features. Cardiac toxicity was higher in the non PORT group (p = 0.02), but pulmonary toxicity was similar (p = 0.15). There was no difference between the two groups regarding dyspnea (p = 0.32), cough (p = 0.37), forced expiratory volume in 1 second (p = 0.30), and diffusing capacity of the lung for carbon monoxide (p = 0.61). A similar outcome (OS, LR, and toxicity) was seen in both patient groups (PORT versus non-PORT group)."
According to the news reporters, the research concluded: "Despite the limitations of this retrospective study, PORT can be both effective and safe for patients with stage III-N2 NSCLC with an R1/R2 resection or yN2 after induction chemotherapy and surgery."

For more information on this research see: Outcome after PORT in ypN2 or R1/R2 versus no PORT in ypNO Stage III-N2 NSCLC after Induction Chemotherapy and Resection. Journal of Thoracic Oncology, 2016;11(11):1940-1953. Journal of Thoracic Oncology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Drugs and Therapies - Chemotherapy

New Chemotherapy Findings from Inje University Outlined (Inhibitory Interaction Potential of 22 Antituberculosis Drugs on Organic Anion and Cation Transporters of the SLC22A Family)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Chemotherapy is now available. According to news reporting out of Busan, South Korea, by NewsRx editors, research stated, "Twenty-two currently marketed antituberculosis drugs were comprehensively evaluated for their inhibitory effect on organic anionic transporter (OAT)-and organic cation transporter (OCT)-mediated uptake using stably transfected HEK293 cells in vitro. We observed moderate to strong inhibitory effects on OAT1-and OAT3-mediated para-aminohippurate (PAH) uptake and OCT1- and OCT2-mediated N-methyl-4-phenylpyridinium acetate (MPP+) uptake."

Our news journalists obtained a quote from the research from Inje University, "Ciprofloxacin, linezolid, para-aminosalicylic acid (PAS), and rifampin were observed to have strong inhibitory effects, with the concentrations for a 50% inhibitory effect (IC50s) being 35.1, 31.1, 37.6, and 48.1 μM, respectively, for OAT1 and > 100, 21.9, 24.6, and 30.2 μM, respectively, for OAT3. Similarly, pyrazinamide, rifabutin, and levofloxacin were observed to have inhibitory effects, with IC50 values being 36.5, 42.7, and 30.3 μM, respectively, for OCT1 and with the IC50 value for PAS being 94.2 μM for OCT2. In addition, we used zidovudine and metformin as clinically prescribed substrates of OATs and OCTs, respectively, and zidovudine and metformin uptake was also strongly inhibited by the antituberculosis drugs. Among the tested drugs, the highest drug-drug interaction (DDI) indexes were found for PAS, which were 9.3 to 13.9 for OAT1 and 12.0 to 17.7 for OAT3, and linezolid, which were 1.18 to 2.15 for OAT1 and 1.7 to 3.01 for OAT3. Similarly, the DDI indexes of pyrazinamide and levofloxacin were 0.57 and 0.30, respectively, for OCT1, and the DDI index of PAS was 3.8 for OCT2, suggesting a stronger possibility (DDI index value cutoff, >0.1) of in vivo DDIs."

According to the news editors, the research concluded: "This is the first
comprehensive report of the inhibitory potential of anti-TB drugs on OAT- and OCT-mediated uptake of prototype and clinically prescribed substrate drugs in vitro, providing an ability to predict DDIs between anti-TB drugs and other coprescribed drugs in clinical studies in vivo."

For more information on this research see: Inhibitory Interaction Potential of 22 Antituberculosis Drugs on Organic Anion and Cation Transporters of the SLC22A Family. Antimicrobial Agents and Chemotherapy, 2016;60(11):6558-6567. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news journalists report that additional information may be obtained by contacting J.G. Shin, Inje Univ, Busan Paik Hosp, Dept. of Clin Pharmacol, Busan, South Korea. Additional authors for this research include N. Kaisar, H.J. Shin, J.A. Jung and J.G. Shin.

Drugs and Therapies - Chemotherapy

New Chemotherapy Study Findings Have Been Reported by Investigators at University Hospital (Effectiveness and failures of a fast track protocol after cytoreduction and hyperthermic intraoperative intraperitoneal chemotherapy in patients with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Chemotherapy is now available. According to news reporting from Murcia, Spain, by NewsRx journalists, research stated, "The aim of this study was to analyze the results short term perioperative of patients with peritoneal surface malignancies undergoing cytoreduction with peritonectomy and HIPEC under a controlled fast track protocol and evaluate the factors related to the failure of implementation of the protocol. Patients and method: We prospectively analyzed a consecutive series of patients (N = 156) with peritoneal surface malignancies treated by cytoreductive surgery with peritonectomy procedures and HIPEC from September 2008 until December 2014, in whom a fast track protocol was implemented."

The news correspondents obtained a quote from the research from University Hospital, "We limited the protocol to patients who had optimal cytoreduction, HIPEC administration, and not more than one digestive anastomosis. All patients signed informed consent for surgery and the perioperative multi-modal recovery program. A total of 156 consecutive patients, with a median age of 57 years were included in the study. Median PCI was 8 (IQR: 0-32). Morbidity rate (Clavien-Dindo) was 25.6%, with a major morbidity rate (Clavien-Dindo III-IV) of 11.5%. One hundred and three patients (66%) completed the protocol."

According to the news reporters, the research concluded: "Multivariate analysis
identified the following independent factors, which were related to failure of the protocol: age over 57 years (OR = 3.159, 95% CI: 1.286-7.758, p<0.05), the realization of a digestive anastomosis (OR = 3.834, 95% CI: 1.562-9.414, p<0.005) and occurrence of postoperative complications (OR = 18.704, 95% CI: 6.888-50.790, p<0.001). Conclusions: Our data support the idea that in selected patients undergoing cytoreductive surgery and HIPEC, with a low PCI and especially no necessity to perform a digestive anastomosis, the implementation of a fast track program is feasible."

Our news journalists report that additional information may be obtained by contacting P.A. Cascales-Campos, Hosp Clin Univ Virgen de la Arrixaca, IMIB Arrixaca, Peritoneal Carcinomatosis Unit, Dept. of Surg, Murcia, Spain. Additional authors for this research include P.A. Sanchez-Fuentes, J. Gil, E. Gil, V. Lopez-Lopez, N.R. Gomez-Hidalgo, D. Fuentes and P. Parrilla.

**Drugs and Therapies - Chemotherapy**

**New Chemotherapy Study Findings Have Been Reported by Researchers at Tianjin University (A Protein-Polymer Bioconjugate-Coated Upconversion Nanosystem for Simultaneous Tumor Cell Imaging, Photodynamic Therapy, and Chemotherapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Chemotherapy. According to news reporting from Tianjin, People's Republic of China, by NewsRx journalists, research stated, "Combined cancer therapy possesses many advantages including improved tumoricidal efficacy, reduced side effects, and retarded drug resistance. Herein, a protein-polymer bioconjugate-coated multifunctional upconversion nanosystem, consisting of upconversion nanoparticles (UCNs) core, tailored amphiphilic protein-polymer bioconjugate shell, and photosensitizer zinc phthalocyanine (ZnPc) and antitumor drug doxorubicin coloaded inside, was elaborately developed for combined photodynamic therapy (PDT) and chemotherapy."

The news correspondents obtained a quote from the research from Tianjin University, "In this system, UCNs core could convert deep penetrating near infrared light to visible light for simultaneous cell fluorescence imaging and photodynamic therapy by activating ZnPc to generate cytotoxic ROS, while the protective shell of bovine serum albumin-poly(e-caprolactone) (BSA-PCL) offered excellent water solubility, good stability, and low
The ROS production test showed that this nanosystem could successfully generate singlet oxygen under NIR irradiation. A cellular uptake study demonstrated that intense fluorescence emission of the UCNs could be observed in HeLa cells, indicating their outstanding real-time imaging capability. More importantly, compared with single PDT or chemotherapy systems, the constructed combined therapy UCNs system demonstrated significantly enhanced tumor cell killing efficiency.

According to the news reporters, the research concluded: "On the basis of our findings, this multifunctional UCNs nanosystem could be a promising versatile theranostic nanoplatform for image-guided combined cancer therapy."

Keywords for this news article include: Tianjin, People's Republic of China, Asia, Drugs and Therapies, Biotechnology, Photodynamics, Chemotherapy, Therapy, Tianjin University.
significant related to the control group. However, older adults undergoing cyto-reductive surgery and HIPEC consistently had lower survival rates across all study settings and procedure types than younger individuals. In studies that stratified for elderly patients, PCI, completeness of cytoreduction, tumor histology and albumin levels were predictive factors of survival. None of these studies examined quality of life, which precludes including functional outcomes in this review."

According to the news reporters, the research concluded: "Differences in exposures, outcomes, and data presented in the studies did not allow for quantification of association using a meta analysis."

Our news journalists report that additional information may be obtained by contacting P.A. Cascales-Campos, Univ Clin Hosp Virgen de la Arrixaca, Dept. of Surg, Peritoneal Carcinomatosis Unit, IMIB, Murcia, Arrixaca, Spain. Additional authors for this research include P.A. Cascales-Campos, M.A. Schneider, J. Gil, E. Gil, N.R. Gomez-Hidalgo and P. Parrilla.

**Drugs and Therapies - Chemotherapy**

New Chemotherapy Study Findings Recently Were Reported by M. Chasen and Co-Researchers (Rolapitant improves quality of life of patients receiving highly or moderately emetogenic chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Chemotherapy is now available. According to news originating from Brampton, Canada, by NewsRx correspondents, research stated, "Addition of rolapitant to standard antiemetic therapy improved protection against chemotherapy-induced nausea and vomiting (CINV) in phase 3 trials of patients receiving highly emetogenic chemotherapy (HEC) or moderately emetogenic chemotherapy (MEC). Here, we assessed the impact of CINV on the daily lives of patients receiving HEC or MEC using the Functional Living Index-Emesis (FLIE)."

Our news journalists obtained a quote from the research, "In three double-blind phase 3 studies, patients receiving HEC or MEC were randomized 1:1 to receive oral rolapitant 180 mg or placebo prior to chemotherapy plus 5-hydroxytryptamine type 3 receptor antagonist and dexamethasone therapy. Patients completed the FLIE questionnaire on day 6 of cycle 1. Endpoints included FLIE total score, nausea and vomiting domain scores, and the proportion of patients with no impact on daily life (total score > 108 [range 18-126]). We performed a
prespecified analysis of the MEC/anthracycline-cyclophosphamide (AC) study and a post hoc analysis of two pooled cisplatin-based HEC studies. In the pooled HEC studies, rolapitant significantly improved the FLIE total score (114.5 vs 109.3, p< 0.001), nausea score (55.3 vs 53.5, p< 0.05), and vomiting score (59.2 vs 55.8, p< 0.001) versus control; similar results were observed in the MEC/AC study for FLIE total score (112.7 vs 108.6, p< 0.001), nausea score (54.1 vs 52.3, p< 0.05), and vomiting score (58.6 vs 56.3, p< 0.001). A higher proportion of patients reported no impact on daily life with rolapitant than with control in the MEC/AC study (73.2 vs 67.4, p = 0.027).

According to the news editors, the research concluded: "Compared with control, rolapitant improved quality of life in patients receiving HEC or MEC."

For more information on this research see: Rolapitant improves quality of life of patients receiving highly or moderately emetogenic chemotherapy. *Supportive Care in Cancer*, 2017;25(1):85-92. *Supportive Care in Cancer* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Drugs and Therapies - Chemotherapy**

**New Chemotherapy Study Findings Reported from Kovai Medical Center (Post chemotherapy extravasation injuries: Hypogastric flap for reconstruction of wounds over dorsum of hand)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Chemotherapy. According to news originating from Coimbatore, India, by NewsRx correspondents, research stated, "Management of extravasation injuries over the dorsum of hand after administration of chemotherapeutic agents. To study the results of hypogastric flap reconstruction in chemotherapy extravasation wounds over dorsum of hand. Retrospective study."

Our news journalists obtained a quote from the research from Kovai Medical Center, "At our center over 3-years period, 32 patients were treated for chemotherapy extravasation wounds. Out of these 32 patients, seven had wound over dorsum of hand. There were five males and two females, and their mean age was 45 years (range, 19 -64 years). These patients with wound over the dorsum of hand were treated with multiple debridements and hypogastric flap reconstruction. The mean interval between extravasation wound and surgical treatment was 6.28 days (range, 4 -10). The mean size of extravasation wound defect was 14 ? 8 (range, 12 ? 7 to 18 ? 8). Non-dominant hand was involved in six patients and dominant hand in one patient. In four
patients, the hypogastric flap was supplemented with skin graft. The hypogastric flap settled well in all patients and enabled a good wound cover. Complete division of the flap and final insetting was done under local anesthesia after 3 weeks; this was followed by limb mobilization exercises. Contour difference over the dorsum of hand was present in all the cases. The range of movement of the hand was functionally restricted in one patient. No patient in current series developed wound infection."

According to the news editors, the research concluded: "Hypogastric flap is a reliable flap to cover wound over dorsum of hand after extravasation of chemotherapeutic agents."

The news correspondents report that additional information may be obtained from G.I. Nambi, Plastic and Reconstructive Microvascular Services, Kovai Medical Center and Hospital, Coimbatore, Tamil Nadu, India. Additional authors for this research include G.I. Nambi and N. Sudhakar.

**Chlorinated Hydrocarbons**

**New Chlorinated Hydrocarbons Study Findings Have Been Reported by Investigators at Texas A&M University (Target Organ Metabolism, Toxicity, and Mechanisms of Trichloroethylene and Perchloroethylene: Key Similarities, Differences, and Data Gaps)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Chlorinated Hydrocarbons is the subject of a report. According to news reporting originating in College Station, Texas, by NewsRx journalists, research stated, "Trichloroethylene (TCE) and perchloroethylene or tetrachloroethylene (PCE) are high-production volume chemicals with numerous industrial applications. As a consequence of their widespread use, these chemicals are ubiquitous environmental contaminants to which the general population is commonly exposed."

The news reporters obtained a quote from the research from Texas A&M University, "It is widely assumed that TCE and PCE are toxicologically similar; both are simple olefins with three (TCE) or four (PCE) chlorines. Nonetheless, despite decades of research on the adverse health effects of TCE or PCE, few studies have directly compared these two toxicants. Although the metabolic pathways are qualitatively similar, quantitative differences in the flux and yield of metabolites exist. Recent human health assessments have uncovered some overlap in target organs that are affected by exposure to TCE or PCE, and divergent species and sex-specificity with regard to cancer and noncancer hazards. The objective of this minireview is to highlight key similarities, differences, and data gaps in target organ metabolism and mechanism of toxicity."

According to the news reporters, the research concluded: "The main anticipated outcome of this review is to encourage research to 1) directly compare the responses to TCE and PCE using more sensitive biochemical techniques and robust statistical comparisons; 2) more closely examine interindividual variability in the relationship between toxicokinetics and toxicodynamics for TCE and PCE; 3) elucidate the effect of coexposure to these two toxicants; and 4) explore new mechanisms for target organ toxicity associated with TCE and/or PCE exposure."

For more information on this research see: Target Organ Metabolism, Toxicity, and Mechanisms of Trichloroethylene and Perchloroethylene: Key Similarities, Differences, and Data Gaps. *Journal of Pharmacology and Experimental Therapeutics*, 2016;359(1):110-123. *Journal of Pharmacology and Experimental Therapeutics* can be contacted at: Amer Soc Pharmacology Experimental Therapeutics, 9650 Rockville Pike, Bethesda, MD 20814-3995, USA.

**Oncology - Cholangiocarcinoma**

**New Cholangiocarcinoma Findings from China Medical University and Hospital Outlined (The anticancer effects of Resina Draconis extract on cholangiocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Cholangiocarcinoma have been presented. According to news reporting out of Shenyang, People's Republic of China, by NewsRx editors, research stated, "Cholangiocarcinoma (CCA) is a relatively rare, heterogeneous malignant tumor with poor clinical outcomes. Because of high insensitivity to chemotherapy and radiotherapy, there are no effective treatment options."

Our news journalists obtained a quote from the research from China Medical University and Hospital, "Efforts to identify and develop new agents for prevention and treatment of this deadly disease are urgent. Here, we assessed the apoptotic cytotoxicity of Resina Draconis extract (RDE) using in vitro and in vivo assays and identified the mechanisms underlying antitumor effects of RDE. RDE was obtained via vacuum distillation of Resina Draconis with 75% ethanol. The ethanol extract could inhibit CCA cell proliferation and trigger apoptotic cell death in both QBC939 and HCCC9810 cell lines in a time-and concentration-dependent manner. RDE treatment resulted in intracellular caspase-8 and poly (ADP-ribose) polymerase protease activation. RDE significantly downregulated antiapoptotic protein survivin
expression and upregulated proapoptotic protein Bak expression. RDE also inhibited CCA tumor growth in vivo. We observed that human CCA tissues had much higher survivin expression than did paired adjacent normal tissue."

According to the news editors, the research concluded: "Taken together, the current data suggested that RDE has anticancer effects on CCA, and that RDE could function as a novel anticancer agent to benefit patients with CCA."

For more information on this research see: The anticancer effects of Resina Draconis extract on cholangiocarcinoma. Tumor Biology, 2016;37(11):15203-15210. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Oncology - Cholangiocarcinoma

New Cholangiocarcinoma Findings from Taishan Medical University Reported [Identification of transcription factors (TFs) and targets involved in the cholangiocarcinoma (CCA) by integrated analysis]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Cholangiocarcinoma. According to news originating from Shandong, People's Republic of China, by NewsRx correspondents, research stated, "The present study was designed to investigate the upstream transcription factors (TFs) and the signature genes in cholangiocarcinoma (CCA), providing better clues on the regulatory mechanisms and therapeutic applications. Gene expression data sets of CCA were searched in the Gene Expression Omnibus database for integrated analysis."

Our news journalists obtained a quote from the research from Taishan Medical University, "Functional annotation of differently expressed genes (DEGs) was then conducted and the TFs were identified. Moreover, a global transcriptional regulatory network of TFs targets was constructed. Integrated analysis of five eligible Gene Expression Omnibus data sets led to a set of 993 DEGs and 48 TFs in CCA. The constructed TFs targets regulatory network consisted of 697 TF target interactions between 41 TFs and 436 DEGs. The top 10 TFs covering the most downstream DEGs were NFATC2, SOX10, ARID3A, ZNF263, NR4A2, GATA3, EGR1, PLAG1, STAT3 and FOSL1, which may have important roles in the tumorigenesis of CCA. Supporting the fact that defects of cell-cycle surveillance mechanism were closely related to various cancers, we found that cell cycle was the most significantly enriched pathway. KCNN2 and ADCY6 were involved in the bile secretion. Thus, their aberrant expression may be
closely related to the pathogenesis of CCA."

According to the news editors, the research concluded: "Particularly, we found that upregulation of EZH2 in CCA is a powerful potential marker for CCA."

The news correspondents report that additional information may be obtained from L. Yang, Taishan Med Univ, Affiliated Hosp, Dept. of Gen Surg, Tai An 271000, Shandong, People's Republic of China. Additional authors for this research include S. Feng and Y. Yang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/cgt.2016.64. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Cholangiocarcinoma**

**New Cholangiocarcinoma Study Results from University of Nebraska Medical Center Described [Delivery of miR-200c Mimic with Poly(amido amine) CXCR4 Antagonists for Combined Inhibition of Cholangiocarcinoma Cell Invasiveness]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Cholangiocarcinoma have been presented. According to news reporting originating from Omaha, Nebraska, by NewsRx correspondents, research stated, "Cholangiocarcinoma is the second most common primary liver malignancy with extremely poor prognosis due to early invasion and widespread metastasis. The invasion and metastasis are regulated by multiple factors including CXCR4 chemokine receptor and multiple microRNAs."

Funders for this research include National Institute of Biomedical Imaging and Bioengineering, University of Nebraska Medical Center, National Institute of General Medical Sciences.

Our news editors obtained a quote from the research from the University of Nebraska Medical Center, "The goal of this study was to test the hypothesis that inhibition of CXCR4 combined with the action of miR-200c mimic will cooperatively enhance the inhibition of the invasion of human cholangiocarcinoma cells. The results show that CXCR4-inhibition polycation PCX can effectively deliver miR-200c mimic and that the combination treatment consisting of PCX and miR-200c results in cooperative antimigration activity, most likely by coupling the CXCR4 axis blockade with epithelial-to-mesenchymal transition inhibition in the cholangiocarcinoma cells."

According to the news editors, the research concluded: "The ability of the combined
PCX/miR-200c treatment to obstruct two migratory pathways represents a promising antimetastatic strategy in cholangiocarcinoma."

For more information on this research see: Delivery of miR-200c Mimic with Poly (amido amine) CXCR4 Antagonists for Combined Inhibition of Cholangiocarcinoma Cell Invasiveness. Molecular Pharmaceutics, 2016;13(3):1073-80. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

New Cholera Study Findings Recently Were Reported by Researchers at Yonsei University College of Medicine (Cholera Toxin Production Induced upon Anaerobic Respiration is Suppressed by Glucose Fermentation in Vibrio cholerae)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Digestive System Diseases and Conditions - Cholera. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "The causative agent of pandemic cholera, Vibrio cholerae, infects the anaerobic environment of the human intestine. Production of cholera toxin (CT), a major virulence factor of V. cholerae, is highly induced during anaerobic respiration with trimethylamine N-oxide (TMAO) as an alternative electron acceptor."

Our news journalists obtained a quote from the research from the Yonsei University College of Medicine, "However, the molecular mechanism of TMAO-stimulated CT production is not fully understood. Herein, we reveal that CT production during anaerobic TMAO respiration is affected by glucose fermentation. When the seventh pandemic V. cholerae O1 strain N16961 was grown with TMAO and additional glucose, CT production was markedly reduced. Furthermore, an N16961 Dcrp mutant, devoid of cyclic AMP receptor protein (CRP), was defective in CT production during growth by anaerobic TMAO respiration, further suggesting a role of glucose metabolism in regulating TMAO-mediated CT production. TMAO reductase activity was noticeably decreased when grown together with glucose or by mutation of the crp gene. A CRP binding region was identified in the promoter region of the torD gene, which encodes a structural subunit of the TMAO reductase. Gel shift assays further confirmed the binding of purified CRP to the torD promoter sequence. Together, our results suggest that the bacterial ability to respire using TMAO is controlled by CRP, whose activity is dependent on glucose availability."
According to the news editors, the research concluded: "Our results reveal a novel mechanism for the regulation of major virulence factor production by _V. cholerae_ under anaerobic growth conditions."

For more information on this research see: Cholera Toxin Production Induced upon Anaerobic Respiration is Suppressed by Glucose Fermentation in _Vibrio cholerae_. *Journal of Microbiology and Biotechnology*, 2016;26(3):627-36.

Our news journalists report that additional information may be obtained by contacting Y.T. Oh, Dept. of Microbiology and Immunology, Yonsei University College of Medicine, Seoul 03722, South Korea. Additional authors for this research include K.M. Lee, W. Bari, H.Y. Kim, H.J. Kim and S.S Yoon.

**Chromosome Structures**

**New Chromosome Structures Findings from Harvard School of Medicine Outlined (EPOP Interacts with Elongin BC and USP7 to Modulate the Chromatin Landscape)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Chromosome Structures have been published. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Gene regulatory networks are pivotal for many biological processes. In mouse embryonic stem cells (mESCs), the transcriptional network can be divided into three functionally distinct modules: Polycomb, Core, and Myc."

Funders for this research include National Cancer Institute, German Research Foundation.

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "The Polycomb module represses developmental genes, while the Myc module is associated with proliferative functions, and its mis-regulation is linked to cancer development. Here, we show that, in mESCs, the Polycomb repressive complex 2 (PRC2)-associated protein EPOP (Elongin BC and Polycomb RepressiveComplex 2-associated protein; a. k. a. C17orf96, esPRC2p48, and E130012A19Rik) co-localizes at chromatin with members of the Myc and Polycomb module. EPOP interacts with the transcription elongation factor Elongin BC and the H2B deubiquitinase USP7 to modulate transcriptional processes in mESCs similar to MYC. EPOP is commonly upregulated in human cancer, and its loss impairs the proliferation of several human cancer cell lines."

According to the news editors, the research concluded: "Our findings establish EPOP as a transcriptional modulator, which impacts both Polycomb and active gene transcription in mammalian cells."
For more information on this research see: EPOP Interacts with Elongin BC and USP7 to Modulate the Chromatin Landscape. *Molecular Cell*, 2016;64(4):659-672. *Molecular Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. **New Chromosome Structures Study Findings Recently Were Reported by Researchers at Drexel University College of Medicine (Swi1Timeless Prevents Repeat Instability at Fission Yeast Telomeres)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Chromosome Structures have been published. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "Genomic instability associated with DNA replication stress is linked to cancer and genetic pathologies in humans. If not properly regulated, replication stress, such as fork stalling and collapse, can be induced at natural replication impediments present throughout the genome."

Our news journalists obtained a quote from the research from the Drexel University College of Medicine, "The fork protection complex (FPC) is thought to play a critical role in stabilizing stalled replication forks at several known replication barriers including eukaryotic rDNA genes and the fission yeast mating-type locus. However, little is known about the role of the FPC at other natural impediments including telomeres. Telomeres are considered to be difficult to replicate due to the presence of repetitive GT-rich sequences and telomere-binding proteins. However, the regulatory mechanism that ensures telomere replication is not fully understood. Here, we report the role of the fission yeast Swi1(Timeless), a subunit of the FPC, in telomere replication. Loss of Swi1 causes telomere shortening in a telomerase-independent manner. Our epistasis analyses suggest that heterochromatin and telomere-binding proteins are not major impediments for telomere replication in the absence of Swi1. Instead, repetitive DNA sequences impair telomere integrity in swi1D mutant cells, leading to the loss of repeat DNA. In the absence of Swi1, telomere shortening is accompanied with an increased recruitment of Rad52 recombinase and more frequent amplification of telomere/subtelomeres, reminiscent of tumor cells that utilize the alternative lengthening of telomeres pathway (ALT) to maintain telomeres. These results suggest that Swi1 ensures telomere replication by suppressing
recombination and repeat instability at telomeres."

According to the news editors, the research concluded: "Our studies may also be relevant in understanding the potential role of Swi1(Timeless) in regulation of telomere stability in cancer cells."

Our news journalists report that additional information may be obtained by contacting M.C. Gadaleta, Dept. of Biochemistry and Molecular Biology, Drexel University College of Medicine, Philadelphia, Pennsylvania, United States. Additional authors for this research include M.M. Das, H. Tanizawa, Y.T. Chang, K. Noma, T.M. Nakamura and E. Noguchi.

**Disease Attributes - Chronic Disease**

**New Chronic Disease Findings from Kansas State University Discussed (Summation of blood glucose and TAG to characterise the 'metabolic load index')**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Disease Attributes - Chronic Disease have been published. According to news reporting originating in Manhattan, Kansas, by NewsRx journalists, research stated, "Research points to postprandial glucose and TAG measures as preferable assessments of cardiovascular risk as compared with fasting values. Although elevated postprandial glycaemic and lipaemic responses are thought to substantially increase chronic disease risk, postprandial glycaemia and lipaemia have historically only been considered separately."

The news reporters obtained a quote from the research from Kansas State University, "However, carbohydrates and fats can generally 'compete' for clearance from the stomach, small intestine, bloodstream and within the peripheral cell. Further, there are previous data demonstrating that the addition of carbohydrate to a high-fat meal blunts the postprandial lipaemic response, and the addition of fat to a high-carbohydrate meal blunts the postprandial glycaemic response. Thus, postprandial glycaemia and lipaemia are interrelated. The purpose of this brief review is 2-fold: first, to review the current evidence implicating postprandial glycaemia and lipaemia in chronic disease risk, and, second, to examine the possible utility of a single postprandial glycaemic and lipaemic summative value, which will be referred to as the metabolic load index."

According to the news reporters, the research concluded: "The potential benefits of the metabolic load index extend to the clinician, patient and researcher."
For more information on this research see: Summation of blood glucose and TAG to characterise the 'metabolic load index'. *British Journal of Nutrition*, 2016;116(9):1553-1563. *British Journal of Nutrition* can be contacted at: Cambridge Univ Press, Edinburgh Bldg, Shaftesbury Rd, CB2 8RU Cambridge, England. **Disease Attributes - Chronic Disease**

**New Chronic Disease Study Findings Recently Were Reported by Researchers at Robert Koch-Institute (Changes in physical functioning among men and women aged 50-79 years in Germany: an analysis of National Health Interview and Examination ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Disease Attributes - Chronic Disease have been presented. According to news reporting out of Berlin, Germany, by NewsRx editors, research stated, "This study examines changes in physical functioning among adults aged 50-79 years in Germany based on data from two German National Health Interview and Examination Surveys conducted in 1997-1999 (GNHIES98) and 2008-2011 (DEGS1). Using cross-sectional data from the two surveys (GNHIES98, n = 2884 and DEGS1, n = 3732), we examined changes in self-reported physical functioning scores (Short Form-36 physical functioning subscale (SF-36 PF)) by sex and age groups (50-64 and 65-79 years)."

Our news journalists obtained a quote from the research from Robert Koch-Institute, "Covariables included educational level, living alone, nine chronic diseases, polypharmacy (>= 5 prescribed medicines), body mass index, sports activity, smoking and alcohol consumption. Multimorbidity was defined as >= 2 chronic diseases. Multivariable models were fitted to examine consistency of changes in physical functioning among certain subgroups and to assess changes in mean SF-36 PF scores, adjusting for changes in covariables between surveys. Mean physical functioning increased among adults aged 50-79 years between surveys in unadjusted analyses, but this change was not as marked among men aged 65-79 years who experienced rising obesity (20.6 to 31.5%, p = 0.004) and diabetes (13.0 to 20.0%, p = 0.014). Prevalence of multimorbidity and polypharmacy use increased among men and women aged 65-79 years. In sex and age specific multivariable analyses, changes in physical functioning over time were consistent across subgroups. Gains in physical functioning were explained by improved education, lower body mass index and improved health-related behaviours (smoking, alcohol consumption, sports activity) in women, but less so among men. Physical functioning improved in Germany among adults aged 50-79 years. Improvements in the population 65-79 years were
less evident among men than women, despite increases in multimorbidity prevalence among both sexes. Changes in health behaviours over time differed between sexes and help explain variations in physical functioning."

According to the news editors, the research concluded: "Targeted health behaviour interventions are indicated from this study."

For more information on this research see: Changes in physical functioning among men and women aged 50-79 years in Germany: an analysis of National Health Interview and Examination Surveys, 1997-1999 and 2008-2011. Disease Attributes - Chronic Disease

New Chronic Disease Study Findings Reported from Barwon Health (Non-medical prescribing versus medical prescribing for acute and chronic disease management in primary and secondary care)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Disease Attributes - Chronic Disease have been published. According to news reporting originating from Geelong, Australia, by NewsRx correspondents, research stated, "A range of health workforce strategies are needed to address health service demands in low-, middle- and high-income countries. Non-medical prescribing involves nurses, pharmacists, allied health professionals, and physician assistants substituting for doctors in a prescribing role, and this is one approach to improve access to medicines."

Our news editors obtained a quote from the research from Barwon Health, "To assess clinical, patient-reported, and resource use outcomes of non-medical prescribing for managing acute and chronic health conditions in primary and secondary care settings compared with medical prescribing (usual care). Search methods We searched databases including CENTRAL, MEDLINE, Embase, and five other databases on 19 July 2016. We also searched the grey literature and handsearched bibliographies of relevant papers and publications. Selection criteria Randomised controlled trials (RCTs), cluster-RCTs, controlled before-and-after (CBA) studies (with at least two intervention and two control sites) and interrupted time series analysis (with at least three observations before and after the intervention) comparing: 1. nonmedical prescribing versus medical prescribing in acute care; 2. non-medical prescribing versus medical prescribing in chronic care; 3. non-medical prescribing versus medical prescribing in secondary care; 4 non-medical prescribing versus medical prescribing in primary care; 5. comparisons between different non-medical prescriber groups; and 6. non-medical healthcare providers with formal
prescribing training versus those without formal prescribing training. Data collection and analysis We used standard methodological procedures expected by Cochrane. Two review authors independently reviewed studies for inclusion, extracted data, and assessed study quality with discrepancies resolved by discussion. Two review authors independently assessed risk of bias for the included studies according to EPOC criteria. We undertook meta-analyses using the fixed-effect model where studies were examining the same treatment effect and to account for small sample sizes. We compared outcomes to a random-effects model where clinical or statistical heterogeneity existed. We included 46 studies (37,337 participants); non-medical prescribing was undertaken by nurses in 26 studies and pharmacists in 20 studies. In 45 studies non-medical prescribing as a component of care was compared with usual care medical prescribing. A further study compared nurse prescribing supported by guidelines with usual nurse prescribing care. No studies were found with non-medical prescribing being undertaken by other health professionals.

The education requirement for non-medical prescribing varied with country and location. A meta-analysis of surrogate markers of chronic disease (systolic blood pressure, glycated haemoglobin, and low-density lipoprotein) showed positive intervention group effects. There was a moderate-certainty of evidence for studies of blood pressure at 12 months (mean difference (MD) -5.31 mmHg, 95% confidence interval (CI) -6.46 to -4.16; 12 studies, 4229 participants) and low-density lipoprotein (MD -0.21, 95% CI -0.29 to -0.14; 7 studies, 1469 participants); we downgraded the certainty of evidence from high due to considerations of serious inconsistency (considerable heterogeneity), multifaceted interventions, and variable prescribing autonomy. A high-certainty of evidence existed for comparative studies of glycated haemoglobin management at 12 months (MD -0.62, 95% CI 0.85 to -0.38; 6 studies, 775 participants). While there appeared little difference in medication adherence across studies, a meta-analysis of continuous outcome data from four studies showed an effect favouring patient adherence in the non-medical prescribing group (MD 0.15, 95% CI 0.00 to 0.30; 4 studies, 700 participants). We downgraded the certainty of evidence for adherence to moderate due to the serious risk of performance bias. While little difference was seen in patient-related adverse events between treatment groups, we downgraded the certainty of evidence to low due to indirectness, as the range of adverse events may not be related to the intervention and selective reporting failed to adequately report adverse events in many studies. Patients were generally satisfied with non-medical prescriber care (14 studies, 7514 participants). We downgraded the certainty of evidence from high to moderate due to indirectness, in that satisfaction with the prescribing component of care was only addressed in one study, and there was variability of satisfaction measures with little use of validated tools. A meta-analysis of health-related quality of life scores (SF-12 and SF-36) found a difference favouring usual care for the physical component score (MD 1.17, 95% CI 0.16 to 2.17), but not the mental component score (MD 0.58, 95% CI -0.40 to 1.55). However, the quality of life measurement may more appropriately reflect composite care rather than the prescribing component of care, and for this reason we downgraded the certainty of evidence to moderate due to indirectness of the measure of effect. A wide variety of resource use measures were reported across studies with little difference between groups for hospitalisations, emergency department visits, and outpatient visits. In the majority of studies reporting medication use, non-medical prescribers prescribed more drugs, intensified drug doses, and used a greater variety of drugs compared to usual care medical prescribers. The risk of bias across studies was generally low for selection bias (random sequence generation), detection bias (blinding of outcome assessment), attrition bias (incomplete outcome data), and reporting bias (selective reporting). There was an unclear risk of selection bias (allocation concealment) and for other biases. A high risk of performance bias (blinding of participants and personnel) existed. Authors’ conclusions The findings suggest that non-medical prescribers, practising with varying but high levels of prescribing autonomy, in a range of settings, were as effective as usual care medical prescribers. Non-medical prescribers
can deliver comparable outcomes for systolic blood pressure, glycated haemoglobin, low-density lipoprotein, medication adherence, patient satisfaction, and health-related quality of life. It was difficult to determine the impact of non-medical prescribing compared to medical prescribing for adverse events and resource use outcomes due to the inconsistency and variability in reporting across studies."

According to the news editors, the research concluded: "Future efforts should be directed towards more rigorous studies that can clearly identify the clinical, patient-reported, resource use, and economic outcomes of non-medical prescribing, in both high-income and low-income countries."

**Liver Diseases and Conditions - Chronic Hepatitis B...**

**New Chronic Hepatitis B Virus Findings from G. Kockaya and Co-Authors Described (Cost-effectiveness analysis of oral anti-viral drugs used for treatment of chronic hepatitis B in Turkey)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Chronic Hepatitis B Virus. According to news reporting out of Ankara, Turkey, by NewsRx editors, research stated, "All international guidelines suggested that Tenofovir and Entecavir are the primary drugs at the first line therapy for the treatment of chronic hepatitis B (CHB). However, in Turkey these medications reimbursed at the second line therapy according to the Healthcare Implementation Notification."

Our news journalists obtained a quote from the research, "The aim of this study is to compare the cost effectiveness of oral anti-viral treatment strategies in CHB for Turkey using lamivudine, telbuvidine, entecavir, and tenofovir as medications. The analysis was conducted using Markov models. The analysis scenarios based on first line treatment options with Lamivudine, Telbuvidine, Entecavir, and Tenofovir as the medications. In the analysis, inadequate response or resistance after receiving 12 months of the treatment with Entecavir and Telbivudine were compared to the results found from switching from Entecavir to Tenofovir or from switching from Telbivudine to Tenofovir. In additional, inadequate response or resistance after receiving 6 months of the treatment for Lamivudine was compared to the results found from switching from Lamivudine to Tenofovir. The study population included men and women,"
who were 40 years of age. The patients compliance was estimated 100 % for all of the therapy options. The model duration was constructed to evaluate, treatment strategy duration of 40 years. The cost of medications, examinations/follow-ups and complications were included in the model. Years of Potential Life Lost was used as the health outcome. An incremental cost-effectiveness ratio analysis has been conducted. While the minimum years of life lost was found as 0.22 with tenofovir treatment in 5 years, treatment cost was calculated as 12,169 TL. These values were detected as 0.56 years and 7727 TL, 0.37 years and 12,770 TL, respectively for lamuvudine and telbuvidine treatments. The maximum years of life lost and treatment cost was with lamuvudine treatment were detected as 1.60 years and 18,813 TL and, secondly 0.89 years and 24,007 TL for lamuvudine-tenofovir treatment during 10 years. The minimum years of life lost and cost are 0.54 year and 35,821 TL for tenofovir treatment during 10 years. The minimum years of life lost and cost were determined as 1.21 years and 52,839 TL for tenofovir treatment strategy during 20 years. During 30 years period, tenofovir treatment was found to have the minimum years of life lost (1.73 years) and minimum cost (84,149 TL). When the results of 40 years period were analyzed, years of life lost and costs are 2.06 years and 119,604 TL, 2.13 years and 162,115 TL, 2.13 years and 161,642 TL, 6.52 years and 147,245 TL, 3.20 years and 132,157 TL, 4.10 years and 151,059 TL and 3.05 years and 138,182 TL for tenofovir, entecavir, entecavir-tenofovir, lamuvudine, lamuvudine-tenofovir, teltbudine and teltbudine-tenofovir. In the model presented in this study, in cost effectiveness analysis about CHB treatments, Tenofovir was found to be one of the cost effective methods in comparison with other treatment strategies different time intervals.

According to the news editors, the research concluded: "Beyond this achievement Tenofovir has shown to reduce cumulative treatment cost in first line CHB treatment when compared with regard to 40 year cumulative treatment cost." For more information on this research see: Cost-effectiveness analysis of oral anti-viral drugs used for treatment of chronic hepatitis B in Turkey. Cost Effectiveness and Resource Allocation, 2015;13():1-10. Cost Effectiveness and Resource Allocation can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. Liver Diseases and Conditions - Chronic Hepatitis B…

New Chronic Hepatitis B Virus Findings from Istanbul University Described (Predictors of treatment requirement in HBeAg-negative chronic hepatitis B patients with persistently normal alanine aminotransferase and high serum HBV DNA levels)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Chronic Hepatitis B Virus. According to news originating from Istanbul, Turkey, by NewsRx correspondents, research stated, "Serum alanine aminotransferase (ALT) is a controversial marker for disease monitoring in hepatitis B e antigen (HBeAg)-negative chronic hepatitis B (CHB) patients. The aim of this study was to determine the fibrosis stage and histological activity index (HAI) in HBeAg-negative CHB patients with persistently normal ALT (PNALT) and high serum HBV DNA (>= 2000 IU/ml) and to investigate clinical risk factors for the requirement of treatment through the examination of liver biopsy specimens."

Our news journalists obtained a quote from the research from Istanbul University, "HBeAg-negative CHB patients with PNALT (<= 40 IU/l) and high serum HBV DNA (>= 2000 IU/ml) were included. HBV fibrosis stage and HAI were scored according to the Ishak system. Multivariate logistic regression analysis was used to estimate the independent risk factors for fibrosis stage >= 2 and/or HAI >= 6. Receiver operating characteristic curve analysis was used to determine an optimal age cut-off for liver biopsy. A total 120 patients were enrolled. These patients had a mean HBV DNA level of 123 680 +/- 49 450 IU/ml; the HBV DNA load was 2000-20 000 IU/ml in 68 patients (56.6%) and >= 20 000 IU/ml in 52 (43.4%). Eighteen patients (15%) had moderate-to-severe histological activity (HAI >= 6). Forty-three patients (35.9%) had a fibrosis stage >= 2, Forty-eight patients (40%) had a fibrosis stage >= 2 and/or HAI >= 6. On multivariate logistic regression analysis, independent variables associated with fibrosis stage >= 2 and/or HAI >= 6 included age and HBV DNA viral load. Patients with HBV DNA 2000-20 000 IU/ml were more likely to require treatment compared to those with a viral load >= 20 000 IU/ml. The optimal age cut-off to predict fibrosis stage >= 2 and/or HAI >= 6 was 46 years. Significant liver damage was detected in 40% of CHB patients with PNALT and high HBV DNA upon biopsy. Age and HBV DNA viral load were independent predictors of significant liver damage."

According to the news editors, the research concluded: "A biopsy to determine the degree of liver damage is advisable for CHB patients older than 46 years."

New Chronic Hepatitis B Virus Study Findings Have Been Reported by Investigators at Military Hospital (Comparison of relationship between histopathological, serological and biochemical parameters in patients with chronic hepatitis B infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Chronic Hepatitis B Virus have been published. According to news reporting originating from Bitlis, Turkey, by NewsRx correspondents, research stated, "To demonstrate the relationship between liver histology, alanine aminotransferase (ALT)/aspartate aminotransferase (AST) and hepatitis B virus (HBV) DNA levels based on hepatitis B e antigen (HBeAg) seropositivity status in naive patients with chronic hepatitis B (CHB). Materials and method Naive patients with CHB admitted to our hospital between January 2012 and April 2014 were evaluated retrospectively."

Our news editors obtained a quote from the research from Military Hospital, "The patients were allocated into one of two groups based on HBeAg-seropositivity status. Two hundred and fourteen patients were enrolled in the study. Of these 214 patients, 103 (48.1%) were HBeAg-positive and 111 (51.9%) were HBeAg-negative. In the HBeAg-positive group, positive correlations were found between histologic activity index (HAI) scores and ALT (t=3.3, r=0.31, p=0.001), AST (t=2.8, r=0.27, p=0.005) and HBV DNA load (t=2.5, r=0.24, p=0.014). Additionally, in this group, fibrosis scores had positive correlations with ALT (t=3.3, r=0.32, p=0.001) and AST (t=2.7, r=0.26, p=0.008). In the HBeAg-negative group, positive correlations were found between HAI scores and ALT (t=3, r=0.28, p=0.003), AST (t=3, r=0.28, p=0.003) and HBV DNA (t=5.3, r=0.45, p=0). In this same group, fibrosis scores had a positive correlation with HBV DNA (t=2.2, r=0.21, p=0.024). Multivariate logistic regression analysis showed a positive relationship between fibrosis and ALT in the HBeAg-positive group and a positive relationship between fibrosis and HBV DNA load in the HBeAg-negative group. This study showed that HBV DNA load is an independent predictive factor for evaluating HAI and fibrosis in the HBeAg-negative group."

According to the news editors, the research concluded: "Also, ALT is an independent predictive factor for evaluating fibrosis in the HBeAg-positive group."

The news editors report that additional information may be obtained by contacting H. Diktas, Tatvan Military Hosp, Dept. of Infect Dis & Clin Microbiol, Bitlis, Turkey. Additional authors for this research include Z. Karacaer, I.I. Ozturk and H. Cicek.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1136/postgradmedj-2016-134069. This DOI is a link to an online electronic document that is either free or for purchase.
New Chronic Hepatitis B Virus Study Findings Have Been Reported by Researchers at Yonsei University College of Medicine (A 96-week randomized trial of switching to entecavir in patients who achieved virological suppression on lamivudine therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Chronic Hepatitis B Virus. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "There are limited data assessing whether patients who achieved virological suppression on lamivudine but remain hepatitis B 'e' antigen-positive should be switched to a more potent antiviral with a high genetic barrier to resistance or continue with lamivudine. We compared the safety and efficacy of switching with entecavir versus continuing lamivudine."

Financial support for this research came from Korean Health Technology Research and Development Project; Ministry of Health and Welfare, Republic of Korea.

Our news journalists obtained a quote from the research from the Yonsei University College of Medicine, "This was a Phase IV, randomized, open-label, prospective study in a tertiary care setting. Seventy-three chronic hepatitis B patients who achieved virological suppression on lamivudine (serum hepatitis B virus DNA <60 International Unit (IU)/mL) were enrolled. Entecavir or lamivudine were administered orally for up to 96 weeks. Virologic and serologic responses were measured throughout the study. A significantly higher proportion of patients in the entecavir group achieved hepatitis B virus DNA <60 IU/mL at Weeks 48 (100% [38/38] vs 62.8% [22/35]; p<0.001) and 96 (97.4% [37/38] vs 57.1% [20/35]; p<0.001). A greater number of patients had virologic breakthrough (Week 96 cumulative incidence 42.9% vs 2.6%; p<0.001) and genotypic lamivudine resistance (28.6% [10/35] vs 0% [0/38]; p<0.001) in the lamivudine group. No serious adverse events or laboratory abnormalities were reported. Even after achieving virological suppression on lamivudine therapy, the risk of emergent lamivudine resistance increases over time. Switching to entecavir resulted in a maintained virologic response and superior serologic responses versus continued lamivudine therapy."

According to the news editors, the research concluded: "This study supports a rationale for switching to entecavir in chronic hepatitis B patients with virological suppression on lamivudine."

Our news journalists report that additional information may be obtained by contacting S.H. Ahn, Dept. of Internal Medicine, Yonsei University College of Medicine, Seoul, South Korea. Additional authors for this research include J. Heo, J.Y. Park, H.Y. Woo, H.J. Lee, W.Y. Tak, S.H. Um, K.T. Yoon, S.Y. Park, C.W. Kim, H.H. Kim, K.H. Han and M. Cho.

Liver Diseases and Conditions - Chronic Hepatitis C...

**New Chronic Hepatitis C Virus Study Results Reported from Department of Gastroenterology & Hepatology (Safety and Effectiveness of Direct-Acting Antiviral Agents for Treatment of Patients With Chronic Hepatitis C Virus Infection and Cirrhosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Chronic Hepatitis C Virus. According to news reporting out of Rotterdam, Netherlands, by NewsRx editors, research stated, "Direct-acting antivirals (DAAs) have revolutionized treatment for patients with chronic hepatitis C virus (HCV) infection, leading to a high rates of sustained virologic response. This study assessed the real-world safety and effectiveness of DAA-based antiviral therapy for the treatment of cirrhotic patients with chronic HCV infection."

Our news journalists obtained a quote from the research from the Department of Gastroenterology & Hepatology, "This international, multicenter cohort study included all consecutive patients with chronic HCV infection and cirrhosis who underwent antiviral therapy with second-generation DAAs. Data on all patients were analyzed to assess treatment response. Predictors of hepatic decompensation during antiviral therapy were assessed using Cox proportional hazards regression analyses. Until June 2015, 433 cirrhotic patients with chronic HCV infection started DAA-based treatment. Their mean age was 57.8 (+/- 8.7) years, 277 (64.0%) patients were male, and 114 (26.3%) had a Child-Pugh (CP) score of B/C cirrhosis. The sustained virologic response rate at 12 weeks was similar among patients with a CP score of A (261 of 304 [85.9%]) and a CP score of B/C (83 of 101 [82.2%]; P = .37). A baseline albumin level less than 35 g/L (hazard ratio [HR], 3.11; 95% confidence interval [CI], 1.23-7.84; P = .005), baseline MELD score of 14 or higher (HR, 1.63; 95% CI, 1.03-2.61; P = .037), and HCV genotype 3 (HR, 2.05; 95% CI, 1.09-3.88; P = .033) were associated independently with hepatic decompensation during antiviral treatment among patients with a CP score of B/C. This large cohort study showed that therapy is safe and effective in patients with compensated (CP score of A) cirrhosis. For patients with decompensated (CP score of B/C) cirrhosis, albumin level less than 35 g/L, MELD score of 14 or greater, and HCV genotype 3 are important risk factors for hepatic decompensation during DAA-based treatment."

According to the news editors, the research concluded: "Therefore, these patients
require close monitoring during antiviral therapy or treatment should be deferred until after transplantation."

Our news journalists report that additional information may be obtained by contacting R. Maan, Erasmus MC Univ, Medical Center Rotterdam, Dept. of Gastroenterol & Hepatol, Rotterdam, Netherlands. Additional authors for this research include M. van Tilborg, K. Deterding, A. Ramji, A.J. van der Meer, F. Wong, S. Fung, M. Sherman, M.P. Manns, M. Cornberg, B.E. Hansen, H. Wedemeyer, H.L.A. Janssen, R.J. de Knekt and J.J. Feld.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cgh.2016.07.001. This DOI is a link to an online electronic document that is either free or for purchase.

Kidney Diseases and Conditions - Chronic Kidney…

New Chronic Kidney Disease Data Have Been Reported by Investigators at Chang Gung University (Acute Kidney Injury in Asians With Atrial Fibrillation Treated With Dabigatran or Warfarin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Kidney Diseases and Conditions - Chronic Kidney Disease have been presented. According to news originating from Taoyuan, Taiwan, by NewsRx correspondents, research stated, "Whether dabigatran is associated with a lower risk of acute kidney injury (AKI) in patients with nonvalvular atrial fibrillation (NVAF) remains unknown. The authors compared the risk of AKI in Asians with NVAF who were prescribed dabigatran versus warfarin."

Our news journalists obtained a quote from the research from Chang Gung University, "The authors analyzed patients enrolled in the Taiwan nationwide retrospective cohort study from June 1, 2012, to December 31, 2013. Dabigatran and warfarin were taken by 7,702 and 7,885 NVAF patients without a history of chronic kidney disease (CKD) and 2,256 and 2,089 NVAF patients with a history of CKD, respectively. A propensity-score weighted method was used to balance covariates across study groups. A total of 6,762 (88%) and 940 (12%) CKD-free patients and 2,025 (90%) and 231 (10%) CKD patients took dabigatran 110 mg and 150 mg twice daily, respectively. Dabigatran was associated with a lower risk of AKI
than warfarin for either the CKD-free (hazard ratio [HR]: 0.62; 95% confidence interval [CI]: 0.49 to 0.77; p < 0.001) or CKD (HR: 0.56; 95% CI: 0.46 to 0.69; p < 0.001) cohort. As the increment in CHA(2)DS(2)-VASc score (a risk score based on congestive heart failure, hypertension, age 75 years or older, diabetes mellitus, previous stroke/transient ischemic attack, vascular disease, aged 65 to 74 years, and female sex) increased from 0/1 to 6+ points, the incidence of AKI for the dabigatran group was relatively stable (1.87% to 2.91% per year for the CKD-free cohort; 7.31% to 13.15% per year for the CKD cohort) but increased obviously for patients taking warfarin for either CKD-free (2.00% to 6.16% per year) or CKD cohorts (6.82 to 26.03% per year). The warfarin group had a significantly higher annual risk of AKI than the dabigatran group for those with a high CHA2DS2-VASc score (>= 4 for the CKD-free cohort and >= 3 for the CKD cohort). Subgroup analysis revealed that among dabigatran users, those taking either low-dose or standard-dose dabigatran, those with a warfarin-naive warfarin-experienced history, those with or without diabetes, and those with CHA(2)DS(2)-VASc >= 4 or HAS-BLED >= 3 (risk score based on hypertension, abnormal renal and liver function, stroke, prior major bleeding, labile international normalized ratios, age 65 years or older, drugs or alcohol usage history) all had a lower risk of AKI than those taking warfarin."

According to the news editors, the research concluded: "Among Asians with NVAF, dabigatran is associated with a lower risk of AKI than warfarin."

For more information on this research see: Acute Kidney Injury in Asians With Atrial Fibrillation Treated With Dabigatran or Warfarin. Journal of the American College of Cardiology, 2016;68(21):2272-2283. Journal of the American College of Cardiology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.

Kidney Diseases and Conditions - Chronic Kidney...

New Chronic Kidney Disease Data Have Been Reported by Researchers at School of Medicine (The prognostic impact of uric acid in patients with severely decompensated acute heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Kidney Diseases and Conditions - Chronic Kidney Disease. According to news reporting from Chiba, Japan, by NewsRx journalists, research stated, "The serum level of uric acid (UA) is a well-known prognostic factor for heart failure (HF) patients. However, the prognostic impact of hyperuricemia and the
factors that induce hyperuricemia in acute I-IF (AHF) patients are not well understood."

The news correspondents obtained a quote from the research from the School of Medicine, "Eight hundred eighty-nine AHF patients were enrolled in this study. The patients were assigned into a low UA group (UA <= 7.0 mg/dl, n = 495) or a high UA group (UA > 7.0 mg/dl, n = 394) according to their UA level on admission. A Kaplan-Meier curve showed that the survival rate of the low UA group was significantly higher than that of the high UA group. A multivariate Cox regression model identified that a high UA level (HR: 1.192, 95%CI 1.112-1.277) was an independent predictor of 180-day mortality. A multivariate logistic regression model for a high serum UA level on admission indicated that chronic kidney disease (CKD) (OR: 2.030, 95%CI: 1.298-3.176, p = 0.002) and the administration of loop diuretics before admission (OR: 1.556, 95%CI: 1.010-2.397, p = 0.045) were independent factors. The prognosis, including all-cause death and HF events, was significantly poorer among patients who had a high UA level who had previously used loop diuretics and among CKD patients with a high UA level than among other patients. The serum UA level was an independent predictor in patients who were hospitalized during an emergent situation for AHF. An elevated serum UA level on admission was associated with the presence of CKD and the use of loop diuretics."

According to the news reporters, the research concluded: "These factors were also associated with adverse outcomes in hyperuricemic patients with AHF."

For more information on this research see: The prognostic impact of uric acid in patients with severely decompensated acute heart failure. Journal of Cardiology, 2016;68(5-6):384-391. Journal of Cardiology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Cardiology - www.journals.elsevier.com/journal-of-cardiology/)

Kidney Diseases and Conditions - Chronic Kidney Disease - 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Kidney Diseases and Conditions - Chronic Kidney Disease have been published. According to news reporting originating from Hannover,
Germany, by NewsRx correspondents, research stated, "The quest for the ideal therapeutic target in chronic kidney disease (CKD) has been riddled with many obstacles stemming from the molecular complexity of the disease and its co-morbidities. Recent advances in omics technologies and the resulting amount of available data encompassing genomics, proteomics, peptidomics, transcriptomics and metabolomics has created an opportunity for integrating omics datasets to build a comprehensive and dynamic model of the molecular changes in CKD for the purpose of biomarker and drug discovery."

Our news editors obtained a quote from the research, "This article reviews relevant concepts in omics data integration using systems biology, a mathematical modelling method that globally describes a biological system on the basis of its modules and the functional connections that govern their behaviour. The review describes key databases and bioinformatics tools, as well as the challenges and limitations of the current state of the art, along with practical application to CKD therapeutic target discovery."

According to the news editors, the research concluded: "Moreover, it describes how systems biology and visualization tools can be used to generate clinically relevant molecular models with the capability to identify specific disease pathways, recognize key events in disease development and track disease progression."

The news editors report that additional information may be obtained by contacting K. Cisek, Mosaiques Diagnostics GmbH, Hannover, Germany. Additional authors for this research include M. Krochmal, J. Klein and H. Mischak.

New Chronic Kidney Disease Study Findings Recently Were Reported by Researchers at Chugai Pharmaceutical (A prospective observational study of early intervention with erythropoietin therapy and renal survival in non-dialysis chronic kidney ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Kidney Diseases and Conditions - Chronic Kidney Disease. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "There is limited data showing that early treatment for anemia could prolong renal survival in non-dialysis chronic kidney disease (CKD) patients. We therefore investigated the relationship between hemoglobin (Hb) levels at initiation of epoetin beta therapy and renal outcome in non-dialysis CKD patients with anemia."

Our news journalists obtained a quote from the research from Chugai Pharmaceutical, "In this prospective, multi-center, observational study, non-dialysis CKD patients with anemia who were naïve to erythropoiesis-stimulating agents (ESAs) were divided into three groups based on their Hb levels at initiation of epoetin beta therapy (Group I:
10 currency Hb < 11 g/dL, Group II: 9 currency Hb < 10 g/dL, and Group III: Hb < 9 g/dL). The primary endpoint was time to first occurrence of any renal event. For the primary analysis, an inverse probability weighted Cox regression model was used to adjust time-dependent selection bias in the artificially censored data. A total of 1113 patients were eligible for primary endpoint analysis. Risk of renal events was significantly higher in Group III compared with Group I (HR, 2.52; 95 % CI, 1.98-3.21; P< 0.0001); although not significant, the risk was also higher in Group II compared with Group I (HR, 1.48; 95 % CI, 0.91-2.40; P = 0.11)."

According to the news editors, the research concluded: "Initiation of ESA therapy when Hb levels decreased below 11 g/dL but not below 10 g/dL could be more effective at reducing the risk of renal events in non-dialysis CKD patients with anemia compared with initiation of ESA therapy at below 9 g/dL or even 10 g/dL."

Our news journalists report that additional information may be obtained by contacting M. Kumagai, Chugai Pharmaceut Co Ltd, Pharmacovigilance Department, Chuo Ku, Tokyo 1038324, Japan. Additional authors for this research include Y. Tsubakihara, H. Hirakata, Y. Watanabe, H. Hase, S. Nishi, T. Babazono, M. Kumagai, S. Katakura, Y. Uemura and Y. Ohashi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s10157-015-1225-9. This DOI is a link to an online electronic document that is either free or for purchase.

Kidney Diseases and Conditions - Chronic Kidney...

New Chronic Kidney Disease Study Findings Recently Were Reported by Researchers at School of Medicine (Illness Perceptions, Medication Beliefs, and Adherence to Antiretrovirals and Medications for Comorbidities in Adults With HIV Infection and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Kidney Diseases and Conditions - Chronic Kidney Disease is the subject of a report. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Mortality in patients with HIV infection is increasingly due to comorbid medical conditions. Research on how adherence to medications for comorbidities relates to antiretroviral (ARV) medication adherence and how interrelations
between illness perceptions and medication beliefs about HIV and comorbidities affect medication adherence is needed to inform adherence interventions."

The news reporters obtained a quote from the research from the School of Medicine, "HIV-infected adults with hypertension (HTN) (n = 151) or chronic kidney disease (CKD; n = 41) were recruited from ambulatory practices at an academic medical center. Illness perceptions and medication beliefs about HIV and HTN or CKD were assessed and adherence to one ARV medication and one medication for either HTN or CKD was electronically monitored for 10 weeks. Rates of taking, dosing, and timing adherence to ARV medication did not differ from adherence to medication for HTN or CKD, with the exception that patients were more adherent to the timing of their ARV (78%) than to the timing of their antihypertensive (68%; P = 0.01). Patients viewed HIV as better understood, more chronic, having more negative consequences, and eliciting more emotions, compared with HTN. Patients viewed ARVs as more necessary than medication for HTN or CKD. Having a realistic view of the efficacy of ARVs (r = 0.20; P <0.05) and a high level of perceived HIV understanding (r = 0.21; P<0.05) correlated with better ARV adherence. Patients with HIV showed similar rates of adherence to ARVs as to medications for comorbidities, despite perceiving HIV as more threatening and ARVs as more important."

According to the news reporters, the research concluded: "This can be used in adapting existing interventions for ARV adherence to encompass adherence to medications for comorbid conditions."

For more information on this research see: Illness Perceptions, Medication Beliefs, and Adherence to Antiretrovirals and Medications for Comorbidities in Adults With HIV Infection and Hypertension or Chronic Kidney Disease. *Jaids-Journal of Acquired Immune Deficiency Syndromes*, 2016;73(4):403-410. *Jaids-Journal of Acquired Immune Deficiency Syndromes* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Kidney Diseases and Conditions - Chronic Kidney...

New Chronic Kidney Disease Study Findings Reported from University of Paris-Sud (Neurological complications in chronic kidney disease patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Kidney Diseases and Conditions - Chronic Kidney
Disease have been published. According to news reporting originating from Villejuif, France, by NewsRx correspondents, research stated, "Chronic kidney disease (CKD) is associated with a high prevalence of cerebrovascular disorders such as stroke, white matter diseases, intracerebral microbleeds and cognitive impairment. This situation has been observed not only in end-stage renal disease patients but also in patients with mild or moderate CKD."

Our news editors obtained a quote from the research from the University of Paris-Sud, "The occurrence of cerebrovascular disorders may be linked to the presence of traditional and non-traditional cardiovascular risk factors in CKD. Here, we review current knowledge on the epidemiological aspects of CKD-associated neurological and cognitive disorders and discuss putative causes and potential treatment. CKD is associated with traditional (hypertension, hypercholesterolaemia, diabetes etc.) and non-traditional cardiovascular risk factors such as elevated levels of oxidative stress, chronic inflammation, endothelial dysfunction, vascular calcification, anaemia and uraemic toxins. Clinical and animal studies indicate that these factors may modify the incidence and/or outcomes of stroke and are associated with white matter diseases and cognitive impairment. However, direct evidence in CKD patients is still lacking. A better understanding of the factors responsible for the elevated prevalence of cerebrovascular diseases in CKD patients may facilitate the development of novel treatments. Very few clinical trials have actually been performed in CKD patients, and the impact of certain treatments is subject to debate. Treatments that lower LDL cholesterol or blood pressure may reduce the incidence of cerebrovascular diseases in CKD patients, whereas treatment with erythropoiesis-stimulating agents may be associated with an increased risk of stroke but a decreased risk of cognitive disorders."

According to the news editors, the research concluded: "The impact of therapeutic approaches that reduce levels of uraemic toxins has yet to be evaluated."

The news editors report that additional information may be obtained by contacting B. Stengel, Univ Paris Sud, UMRS 1018, Villejuif, France. Additional authors for this research include Z.A. Massy and B. Stengel.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/ndt/gfv315. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Chronic Lymphocytic Leukemia

New Chronic Lymphocytic Leukemia Findings from University Hospital Outlined (Concepts of Chronic Lymphocytic Leukemia Pathogenesis: DNA Damage Response and Tumor Microenvironment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Chronic Lymphocytic Leukemia. According to news reporting originating from Cologne, Germany, by NewsRx correspondents, research stated, "Pathogenesis of chronic lymphocytic leukemia (CLL) is characterized by specific genetic aberrations and alterations of cellular signaling pathways. In particular, a disturbed DNA damage response (DDR) and an activated B-cell receptor signaling pathway play a major role in promoting CLL cell survival."

Our news editors obtained a quote from the research from University Hospital, "External stimuli are similarly essential for CLL cell survival and lead to activation of the PI3K/AKT and MAPK pathways. Activation of nuclear factor-kappa B (NF-kB) influences the disturbed anti-apoptotic balance of CLL cells. Losses or disabling mutations in TP53 and ATM are frequent events in chemotherapy-na?ve patients and are further enriched in chemotherapy-resistant patients. As these lesions define key regulatory elements of the DDR pathway, they also determine treatment response to genotoxic therapy. Novel therapeutic strategies therefore try to circumvent defective DDR signaling and to suppress the pro-survival stimuli received from the tumor microenvironment."

According to the news editors, the research concluded: "With increasing knowledge on specific genetic alterations of CLL, we may be able to target CLL cells more efficiently even in the situation of mutated DDR pathways or protection by microenvironmental stimuli."

For more information on this research see: Concepts of Chronic Lymphocytic Leukemia Pathogenesis: DNA Damage Response and Tumor Microenvironment. Oncology Research and Treatment, 2016;39(1-2):9-16.

The news editors report that additional information may be obtained by contacting L.P. Frenzel, Dept. of I of Internal Medicine, University Hospital of Cologne, Cologne, Germany. Additional authors for this research include H.C. Reinhardt and C.P Pallasch. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000443820. Oncology - Chronic Myeloid Leukemia

New Chronic Myeloid Leukemia Findings from A. Hochhaus et al Outlined (Frontline nilotinib in patients with chronic myeloid leukemia in chronic phase: results from the European ENEST1st study)
The Evaluating Nilotinib Efficacy and Safety in Clinical Trials as First-Line Treatment (ENEST1st) study included 1089 patients with newly diagnosed chronic myeloid leukemia in chronic phase. The rate of deep molecular response (MR(4) (BCR-ABL1 \(\leq 0.01\%\) on the International Scale or undetectable BCR-ABL1 with \(\leq 10,000\) ABL1 transcripts)) at 18 months was evaluated as the primary end point, with molecular responses monitored by the European Treatment and Outcome Study network of standardized laboratories.

The news reporters obtained a quote from the research, "This analysis was conducted after all patients had completed 24 months of study treatment (80.9\% of patients) or discontinued early. In patients with typical BCR-ABL1 transcripts and \(\leq 3\) months of prior imatinib therapy, 38.4\% (404/1052) achieved MR(4) at 18 months. Six patients (0.6\%) developed accelerated or blastic phase, and 13 (1.2\%) died. The safety profile of nilotinib was consistent with that of previous studies, although the frequencies of some nilotinib-associated adverse events were lower (for example, rash, 21.4\%). Ischemic cardiovascular events occurred in 6.0\% of patients. Routine monitoring of lipid and glucose levels was not mandated in the protocol."

According to the news reporters, the research concluded: "These results support the use of frontline nilotinib, particularly when achievement of a deep molecular response (a prerequisite for attempting treatment-free remission in clinical trials) is a treatment goal."

For more information on this research see: Frontline nilotinib in patients with chronic myeloid leukemia in chronic phase: results from the European ENEST1st study. *Leukemia*, 2015;30(1):57-64. (Nature Publishing Group - www.nature.com/; Leukemia - www.nature.com/leu/)

& Wellness Week -- A new study on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease is now available. According to news originating from Kharagpur, India, by NewsRx correspondents, research stated, "Serum metabolic profiling can identify the metabolites responsible for discrimination between doxycycline treated and untreated chronic obstructive pulmonary disease (COPD) and explain the possible effect of doxycycline in improving the disease conditions. H-1 nuclear magnetic resonance (NMR)-based metabolomics was used to obtain serum metabolic profiles of 60 add-on doxycycline treated COPD patients and 40 patients receiving standard therapy."

Financial support for this research came from Government of India.

Our news journalists obtained a quote from the research from the School of Medicine, "The acquired data were analyzed using multivariate principal component analysis (PCA), partial least-squares-discriminant analysis (PLS-DA), and orthogonal projection to latent structure with discriminant analysis (OPLS-DA). A clear metabolic differentiation was apparent between the pre and post doxycycline treated group. The distinguishing metabolites lactate and fatty acids were significantly down-regulated and formate, citrate, imidazole and L-arginine upregulated. Lactate and folate are further validated biochemically. Metabolic changes, such as decreased lactate level, inhibited arginase activity and lowered fatty acid level observed in COPD patients in response to add-on doxycycline treatment, reflect the anti-inflammatory action of the drug."

According to the news editors, the research concluded: "Doxycycline as a possible therapeutic option for COPD seems promising."

For more information on this research see: Metabolomic profiling of doxycycline treatment in chronic obstructive pulmonary disease. Journal of Pharmaceutical and Biomedical Analysis, 2017;132():103-108. New Chronic Obstructive Pulmonary Disease Findings from W.H. van Geffen and Co-Authors Described (Bronchodilators delivered by nebuliser versus pMDI with spacer or DPI for exacerabtions of COPD)
A new study on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease is now available. According to news reporting from Leeuwarden, Netherlands, by NewsRx journalists, research stated, "Bronchodilators are a central component for treating exacerbations of chronic obstructive pulmonary disease (COPD) all over the world. Clinicians often use nebulisers as a mode of delivery, especially in the acute setting, and many patients seem to benefit from them."

The news correspondents obtained a quote from the research, "However, evidence supporting this choice from systematic analysis is sparse, and available data are frequently biased by the inclusion of asthma patients. Therefore, there is little or no formal guidance regarding the mode of delivery, which has led to a wide variation in practice between and within countries and even among doctors in the same hospital. We assessed the available randomised controlled trials (RCTs) to help guide practice in a more uniform way. To compare the effects of nebulisers versus pressurised metered dose inhalers (pMDI) plus spacer or dry powder inhalers (DPI) in bronchodilator therapy for exacerbations of COPD. Search methods We searched the Cochrane Airways Group Trial Register and reference lists of articles up to 1 July 2016. Selection criteria RCTs of both parallel and cross-over designs. We included RCTs during COPD exacerbations, whether measured during hospitalisation or in an outpatient setting. We excluded RCTs involving mechanically ventilated patients due to the different condition of both patients and airways in this setting. Data collection and analysis Two review authors independently assessed studies for inclusion, extracted data and assessed the risk of bias. We report results with 95% confidence intervals (CIs). This review includes eight studies with a total of 250 participants comparing nebuliser versus pMDI plus spacer treatment. We identified no studies comparing DPI with nebulisers. We found two studies assessing the primary outcome of 'change in forced expiratory volume in one second (FEV1) one hour after dosing'. We could not pool these studies, but both showed a non-significant difference in favour of the nebuliser group, with similar frequencies of serious adverse events. For the secondary outcome, 'change in FEV1 closest to one hour after dosing': we found a significant difference of 83 ml (95% CI 10 to 156, P = 0.03) in favour of nebuliser treatment. For the secondary outcome of adverse events, we found a non-significant odds ratio of 1.65 (95% CI 0.42 to 6.48) in favour of the pMDI plus spacer group. Authors’ conclusions There is a lack of evidence in favour of one mode of delivery over another for bronchodilators during exacerbations of COPD. We found no difference between nebulisers versus pMDI plus spacer regarding the primary outcomes of FEV1 at one hour and safety. For the secondary outcome 'change in FEV1 closest to one hour after dosing' during an exacerbation of COPD, we found a greater improvement in FEV1 when treating with nebulisers than with pMDI plus spacers. A limited amount of data are available (eight studies involving 250 participants). These studies were difficult to pool, of low quality and did not provide enough evidence to favour one mode of delivery over another. No data of sufficient quality have been published comparing nebulisers versus DPIs in this setting."

According to the news reporters, the research concluded: "More studies are required to assess the optimal mode of delivery during exacerbations of COPD."

For more information on this research see: Bronchodilators delivered by nebuliser versus pMDI with spacer or DPI for exacerbations of COPD. *Cochrane Database of Systematic Reviews*, 2016;(8):2578-2624. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by contacting W.H. van Geffen, Medical Center Leeuwarden, Dept. of Pulm Dis, Leeuwarden, Netherlands. Additional authors for this research include W.R. Douma, D.J. Slebos and H.A.M. Kerstjens.

**Lung Diseases and Conditions - Chronic Obstructive...**

**New Chronic Obstructive Pulmonary Disease Study Findings Recently Were Reported by Researchers at Asan Medical Center (Gene Profiles in a Smoke-Induced COPD Mouse Lung Model Following Treatment with Mesenchymal Stem Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Mesenchymal stem cells (MSCs) effectively reduce airway inflammation and regenerate the alveolus in cigarette-and elastase-induced chronic obstructive pulmonary disease (COPD) animal models. The effects of stem cells are thought to be paracrine and immune-modulatory because very few stem cells remain in the lung one day after their systemic injection, which has been demonstrated previously."

The news correspondents obtained a quote from the research from Asan Medical Center, "In this report, we analyzed the gene expression profiles to compare mouse lungs with chronic exposure to cigarette smoke with non-exposed lungs. Gene expression profiling was also conducted in a mouse lung tissue with chronic exposure to cigarette smoke following the systemic injection of human cord blood-derived mesenchymal stem cells (hCB-MSCs). Globally, 834 genes were differentially expressed after systemic injection of hCB-MSCs. Seven and 21 genes, respectively, were up-and down-regulated on days 1, 4, and 14 after HCB-MSC injection. The Hbb and Hba, genes with oxygen transport and antioxidant functions, were increased on days 1 and 14. A serine protease inhibitor was also increased at a similar time point after injection of hCB-MSCs. Gene Ontology analysis indicated that the levels of genes related to immune responses, metabolic processes, and blood vessel development were altered, indicating host responses after hCB-MSC injection. These gene expression changes suggest that MSCs induce a regeneration mechanism against COPD induced by cigarette smoke."

According to the news reporters, the research concluded: "These analyses provide basic data for understanding the regeneration mechanisms promoted by hCB-MSCs in cigarette smoke-induced COPD."

For more information on this research see: Gene Profiles in a Smoke-Induced COPD Mouse Lung Model Following Treatment with Mesenchymal Stem Cells. *Molecules and Cells*, 2016;39(10):728-733. *Molecules and Cells* can be contacted at: Korean Soc Molecular & Cellular Biology, 635-4, Yucksam-Dong, Gangnam-Gu, Seoul 135-703, South Korea. (Springer - www.springer.com; Molecules and Cells - www.springerlink.com/content/1016-8478/)

Our news journalists report that additional information may be obtained by contacting Y.M. Oh, Asan Med Center, Dept. of Pulm & Crit Care Med, Seoul 05505, South Korea. Additional authors for this research include N. Kokturk, J.Y. Kim, S.W. Lee, J. Lim, S.J. Choi, W. Oh and Y.M. Oh.

The direct object identifier (DOI) for that additional information is:
New Cleft Lip and Palate Study Findings Have Been Reported by Investigators at University of Groningen (Prevalence, diagnosis and outcome of cleft lip with or without cleft palate in The Netherlands)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mouth Disease and Conditions - Cleft Lip and Palate is the subject of a report. According to news reporting originating in Groningen, Netherlands, by NewsRx journalists, research stated, "To examine the accuracy and timing of diagnosis of fetal cleft lip with or without cleft palate (CL +/- P) in the years following the introduction of a national screening program, and to assess the completeness and accuracy of information in The Netherlands Perinatal Registry. A list was obtained of cases with a prenatal or postnatal diagnosis of CL +/- P from two fetal medicine units between 2008 and 2012."

The news reporters obtained a quote from the research from the University of Groningen, "All cases of CL +/- P were included irrespective of the presence or absence of additional anomalies. Cases were included if the estimated date of delivery was between 1 January 2008 and 31 December 2012. During the study period, 330 cases of CL +/- P were identified, with a prevalence of 15 per 10 000 pregnancies. The number of cases that were detected before 24 weeks' gestation increased during the study period, while the rate of termination of pregnancy did not change significantly (P=0.511). CL +/- P was isolated in 217 (66%) cases and karyotype was abnormal in 69 (21%) cases. In 5% of the cases in which CL +/- P seemed to be isolated during the 18-23-week anomaly scan, postnatal array comparative genomic hybridization (array-CGH) revealed an abnormal karyotype and 50% of these cases had major additional anomalies. Examination of data from The Netherlands Perinatal Registry demonstrated that in 37% of cases CL +/- P was not recorded in the pregnancy records. CL +/- P is increasingly being diagnosed prenatally, without a significant effect on the rate of pregnancy termination. Further improvement in the diagnostic accuracy may be achieved by advocating prenatal array-CGH to reduce the frequency of unexpected anomalies being diagnosed after birth."

According to the news reporters, the research concluded: "It is important that healthcare providers register accurately the presence or absence of anomalies in the birth records to ensure that, in the future, data from The Netherlands Perinatal Registry can be relied upon to monitor prevalence."

For more information on this research see: Prevalence, diagnosis and outcome of cleft lip with or without cleft palate in The Netherlands. Ultrasound in Obstetrics & Gynecology, 2016;48(4):458-463. Ultrasound in Obstetrics & Gynecology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com/; Ultrasound in Obstetrics & Gynecology -
Our news correspondents report that additional information may be obtained by contacting J.H. Fleurke-Rozema, University of Groningen, Groningen University Medical Center, Dept. of Obstet, NL-9700 RB Groningen, Netherlands. Additional authors for this research include K.V. De Kamp, M.K. Nursing - Clinical Nursing

New Clinical Nursing Data Have Been Reported by Investigators at Gachon University (Middle East respiratory syndrome-related knowledge, preventive behaviours and risk perception among nursing students during outbreak)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nursing - Clinical Nursing. According to news reporting originating from Inchon, South Korea, by NewsRx correspondents, research stated, "Aims and objectives. The aim of this study was to survey nursing students' Middle East respiratory syndrome-related knowledge, preventive behaviours and risk perception to examine the correlations among the variables during a Middle East respiratory syndrome outbreak."

Our news editors obtained a quote from the research from Gachon University, "Middle East respiratory syndrome is a new viral respiratory illness. Nursing students who engage in clinical practice at hospitals may have been exposed to Middle East respiratory syndrome infection during the Middle East respiratory syndrome outbreak. This study was a descriptive cross-sectional survey. Participants (n = 249) were nursing students in their third or fourth year of the programme who were engaged in clinical practice for eight hours per day at the tertiary hospitals with Middle East respiratory syndrome patients. Knowledge, preventive behaviours and risk perception related to Middle East respiratory syndrome were measured using scales developed through a preliminary survey and validity testing. The subjects' knowledge level of Middle East respiratory syndrome was 84.4%; their practice of preventive behaviours was rated at 44.5%; and their risk perception rating was 2.4 out of 5. Middle East respiratory syndrome-related risk perception was significantly different according to gender and Middle East respiratory syndrome education. Middle East respiratory syndrome-related knowledge was significantly correlated with preventive behaviours and risk perception. Considering the low scores for items regarding knowledge and preventive behaviours, it is necessary to develop effective and systematic publicity and education programmes for nursing students. Enhancing Middle East respiratory syndrome-related knowledge by considering cooperation between hospitals and universities will sharpen nursing students' risk perception of..."
the disease and effectively increase their preventive behaviours. Relevance to clinical practice. Similar to other emerging infectious diseases, Middle East respiratory syndrome outbreaks may occur in other countries."

According to the news editors, the research concluded: "The results of this study can be used to develop and apply efficient and feasible Middle East respiratory syndrome education programmes for nursing students during Middle East respiratory syndrome outbreaks."

The news editors report that additional information may be obtained by contacting J.S. Choi, Gachon Univ, Coll Nursing, Inchon 406799, South Korea.

**Clinical Oncology**

**New Clinical Oncology Findings Has Been Reported by Researchers at University of Barcelona (The evolving role of biosimilars in haematology-oncology: a practical perspective)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Oncology. According to news reporting from Barcelona, Spain, by NewsRx editors, the research stated, "The loss of patents covering many biopharmaceutical/biological agents in the mid 1990s led to the introduction of a new generation of drugs: biosimilars. These new agents, produced by living cells just as the originator drugs, are chemically highly similar to endogenous human proteins; characterized by three-dimensionally complex, high molecular weight compounds."

The news correspondents obtained a quote from the research from the University of Barcelona, "Among the first biosimilars used in haematology-oncology were erythropoietin and granulocyte colony-stimulating factor. After five years of use in clinical practice, the efficacy and safety profile of biosimilars approved by the European Medicines Agency is excellent. Over the next year or two, biosimilar monoclonal antibodies (MoAbs) will become available; the first will be rituximab and trastuzumab. Not only are MoAbs more complex in terms of molecular weight and number of amino acids than the first biosimilars, but they are also anticancer drugs, not merely supportive treatments like their predecessors. This opens up important questions. How are regulatory agencies to assess their clinical efficacy, immunogenicity and safety? Is the neoadjuvant clinical setting the best to evaluate them? What will regulatory agencies decide in terms of switching an originator molecule for a biosimilar or extrapolating efficacy results from one pathology to another? Once biosimilars of rituximab and trastuzumab are approved, several
challenging issues will need to be addressed such as how to maintain appropriate pharmacovigilance, how to extrapolate across indications, and issues concerning automatic substitution. There is currently no consensus in any of these areas."

According to the news reporters, the research concluded: "This review addresses all these issues: new challenges that the oncology community will face in the near future."

For more information on this research see: The evolving role of biosimilars in haematology-oncology: a practical perspective. Therapeutic Advances In Hematology, 2015;6 (6):267-81. (Sage Publications - www.sagepub.com/; Therapeutic Advances In Hematology - tah.sagepub.com)

Clinical Research - Clinical Trials and Studies

New Clinical Trials and Studies Findings from Buddhist Tzu Chi General Hospital Reported (OnabotulinumtoxinA Urethral Sphincter Injection as Treatment for Non-neurogenic Voiding Dysfunction - A Randomized, Double-Blind, Placebo-Controlled Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Clinical Research - Clinical Trials and Studies is now available. According to news reporting from Hualien, Taiwan, by NewsRx journalists, research stated, "Non-neurogenic voiding dysfunction including dysfunctional voiding and detrusor underactivity caused by a spastic or non-relaxing external urethral sphincter can theoretically be treated by injections of botulinum A toxin into the external urethral sphincter. This randomized, double-blind, placebo-controlled trial was designed to determine the clinical efficacy of onabotulinumtoxinA urethral sphincter injections in patients with dysfunctional voiding or detrusor underactivity."

The news correspondents obtained a quote from the research from Buddhist Tzu Chi General Hospital, "Patients with medically refractory dysfunctional voiding (n = 31) or detrusor underactivity (n = 31) were randomly allocated in a 2:1 ratio to receive either onabotulinumtoxinA (100 U) (n = 38) or placebo (normal saline) (n = 24). There were no significant differences in subjective or objective parameters between patients who received onabotulinumtoxinA and those who received saline injection therapy, and the overall success rate was 43.5% (reduction in Patient perception of Bladder Condition by >= 2: onabotulinumtoxinA 36.8% vs placebo 54.2%, p = 0.114). The results were similar between the dysfunctional voiding and detrusor underactivity subgroups; however, a significant reduction in detrusor voiding pressure was only observed in dysfunctional voiding patients who received
onabotulinumtoxinA. Repeat urethral sphincter onabotulinumtoxinA injections offered greater therapeutic effects in both dysfunctional voiding and detrusor underactivity patients."

According to the news reporters, the research concluded: "For patients with non-neurogenic voiding dysfunction, the success rate of onabotulinumtoxinA urethral sphincter injection was not superior to placebo."

For more information on this research see: OnabotulinumtoxinA Urethral Sphincter Injection as Treatment for Non-neurogenic Voiding Dysfunction - A Randomized, Double-Blind, Placebo-Controlled Study. Scientific Reports, 2016;6():1-9. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Clinical Research - Clinical Trials and Studies

New Clinical Trials and Studies Findings from Burnet Institute Discussed [Polymorphisms in the CD14 and TLR4 genes independently predict CD4(+) T-cell recovery in HIV-infected individuals on antiretroviral therapy]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "Chronic HIV infection leads to marked depletion of CD4(+) T cells in the gastrointestinal tract and increased microbial translocation measured by an increase in circulating lipopolysaccharide (LPS) levels. Here, we hypothesized that single-nucleotide polymorphisms (SNPs) in genes encoding the Toll-like receptor 4 (TLR4) and CD14, the principal receptors for LPS, were associated with CD4(+) T-cell recovery postantiretroviral therapy (ART)."

The news correspondents obtained a quote from the research from Burnet Institute, "Prospective study of predominantly white HIV-infected participants receiving suppressive ART for at least 12 months. We analysed the CD14 SNPs C-260T and the TLR4 SNPs A+896G, C+1196T. We also determined the levels of LPS and soluble CD14 in plasma samples collected pre-ART and post-ART initiation. CD4(+) T-cell recovery was assessed by linear mixed models. Following ART, individuals with a TT genotype compared with a CT or CC genotype for CD14 C-260T SNP showed higher levels of soluble CD14 (P = 0.008 and 0.003, respectively). The CC genotype for the CD14 C-260T SNP, compared with CT or TT, and the TLR4 SNP (AC/GT), compared with the homozygous genotype (AA/CC), were both independently associated with enhanced long-term CD4(+) T-cell recovery (>3 months; P<
According to the news reporters, the research concluded: "Polymorphisms in CD14 and TLR4 are independently associated with long-term CD4(+) T-cell recovery in HIV-infected individuals post-ART."

For more information on this research see: Polymorphisms in the CD14 and TLR4 genes independently predict CD4(+) T-cell recovery in HIV-infected individuals on antiretroviral therapy. *Aids*, 2016;30(14):2159-2168. *Aids* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **New Clinical Trials and Studies Findings from Peking University Reported (Low-dose Dexmedetomidine Improves Sleep Quality Pattern in Elderly Patients after Noncardiac Surgery in the Intensive Care Unit A Pilot Randomized Controlled Trial)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Research - Clinical Trials and Studies. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Patients admitted to the intensive care unit (ICU) after surgery often develop sleep disturbances. The authors tested the hypothesis that low-dose dexmedetomidine infusion could improve sleep architecture in nonmechanically ventilated elderly patients in the ICU after surgery."

Our news editors obtained a quote from the research from Peking University, "This was a pilot, randomized controlled trial. Seventy-six patients age 65 yr or older who were admitted to the ICU after noncardiac surgery and did not require mechanical ventilation were randomized to receive dexmedetomidine (continuous infusion at a rate of 0.1 mu g kg(-1) h(-1); n = 38) or placebo (n = 38) for 15 h, i.e., from 5:00 pm on the day of surgery until 8:00 am on the first day after surgery. Polysomnogram was monitored during the period of study-drug infusion. The primary endpoint was the percentage of stage 2 non-rapid eye movement (stage N2) sleep. Complete polysomnogram recordings were obtained in 61 patients (30 in the placebo group and 31 in the dexmedetomidine group). Dexmedetomidine infusion increased the percentage of stage N2 sleep from median 15.8% (interquartile range, 1.3 to 62.8) with placebo to 43.5% (16.6 to 80.2) with dexmedetomidine (difference, 14.7%; 95% CI, 0.0 to 31.9; P =
0.048); it also prolonged the total sleep time, decreased the percentage of stage N1 sleep, increased the sleep efficiency, and improved the subjective sleep quality. Dexmedetomidine increased the incidence of hypotension without significant intervention."

According to the news editors, the research concluded: "In nonmechanically ventilated elderly patients who were admitted to the ICU after noncardiac surgery, the prophylactic low-dose dexmedetomidine infusion may improve overall sleep quality."

For more information on this research see: Low-dose Dexmedetomidine Improves Sleep Quality Pattern in Elderly Patients after Noncardiac Surgery in the Intensive Care Unit A Pilot Randomized Controlled Trial. 0.0786 for single dose and 0.0532 for multiple dose administration. On Day 28, pre-dose and maximum inhibition of Lp-PLA2 activity was approximately 70% and 75% relative to the baseline value, respectively and was dependent of darapladib concentration. The most common adverse events (>=21% subjects) were abnormal faeces, abnormal urine odour, diarrhoea and nasopharyngitis. Darapladib 160 mg single and repeat doses were profiled in healthy Chinese subjects. Single dose systemic exposure to darapladib in healthy Chinese subjects was consistent with that observed previously in Western subjects whereas steady-state systemic exposure was approximately 65% higher in Chinese than Western subjects. The Lp-PLA2 activity and adverse event profile were similar in healthy Chinese and previous reports in Western subjects.

According to the news editors, the research concluded: "Ethnic-specific dose adjustment of darapladib is not considered necessary for the Chinese population."

Our news journalists report that additional information may be obtained by contacting C. Hu, Phase I Clinical Research Unit, Shanghai Xuhui Central Hospital, Shanghai, People's Republic of China. **Clinical Research - Clinical Trials and Studies**

**New Clinical Trials and Studies Findings from University College Outlined (Effect of Remote Ischaemic Conditioning in Oncology Patients Undergoing Chemotherapy: Rationale and Design of the ERIC-ONC Study--A Single-Center, Blinded, Randomized ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Cancer survival continues to improve, and thus cardiovascular consequences of chemotherapy are increasingly important determinants of long-term morbidity and mortality. Conventional strategies to protect the heart from chemotherapy have important hemodynamic or myelosuppressive side effects."

Financial support for this research came from National Institute of Health Research, Biomedical Research Centre.

Our news editors obtained a quote from the research from University College,
Remote ischemic conditioning (RIC) using intermittent limb ischemia-reperfusion reduces myocardial injury in the setting of percutaneous coronary intervention. Anthracycline cardiotoxicity and ischemia-reperfusion injury share common biochemical pathways in cardiomyocytes. The potential for RIC as a novel treatment to reduce subclinical myocyte injury in chemotherapy has never been explored and will be investigated in the Effect of Remote Ischaemic Conditioning in Oncology (ERIC-ONC) trial (clinicaltrials.gov NCT 02471885). The ERIC-ONC trial is a single-center, blinded, randomized, sham-controlled study. We aim to recruit 128 adult oncology patients undergoing anthracycline-based chemotherapy treatment, randomized in a 1:1 ratio into 2 groups: (1) sham procedure or (2) RIC, comprising 4, 5-minute cycles of upper arm blood pressure cuff inflations and deflations, immediately before each cycle of chemotherapy. The primary outcome measure, defining cardiac injury, will be high-sensitivity troponin-T over 6 cycles of chemotherapy and 12 months follow-up. Secondary outcome measures will include clinical, electrical, structural, and biochemical endpoints comprising major adverse cardiovascular clinical events, incidence of cardiac arrhythmia over 14 days at cycle 5/6, echocardiographic ventricular function, N-terminal pro-brain natriuretic peptide levels at 3 months follow-up, and changes in mitochondrial DNA, micro-RNA, and proteomics after chemotherapy.

According to the news editors, the research concluded: "The ERIC-ONC trial will determine the efficacy of RIC as a novel, noninvasive, nonpharmacological, low-cost cardioprotectant in cancer patients undergoing anthracycline-based chemotherapy."

The news editors report that additional information may be obtained by contacting R. Chung, The Hatter Cardiovascular Institute, University College London, London, UK. Additional authors for this research include A. Maulik, A. Hamarneh, D. Hochhauser, D.J. Hausenloy, J.M. Walker and D.M Yellon.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "The prevalence of left ventricular diastolic dysfunction (LVDD) sharply increases in women after their 50s and may contribute to the high prevalence of diastolic heart failure in elderly women. A decrease in estrogen levels after menopause is postulated to be one of the mechanisms responsible for this phenomenon."

Our news journalists obtained a quote from the research from Tokyo University Hospital, "However, there is a paucity of data on the relationship between the timing of menopause and the progression of LVDD in the clinical setting; thus, we investigated this relationship in healthy postmenopausal women. We enrolled 115 women and divided them into two groups according to median menopause age: 61 who experienced menopause at <= 50 years (early menopause group), and 54 who experienced menopause at >50 years (late menopause group). We compared the echocardiographic and clinical characteristics between the two groups. There were no significant differences in LV diastolic parameters (mitral E/A, p= 0.561; e', p= 0.052; Ele', p = 0.081; DCT, p= 0.082; prevalence of LVDD class, p = 0.801), as well as other echocardiographic parameters and clinical characteristics between the two groups. Multivariate linear regression analysis showed that the independent determinants of LVDD were age and body mass index, but not the timing of menopause. Early menopause did not influence the progression of LVDD in postmenopausal women."

According to the news editors, the research concluded: "The sharp progression of LVDD in elderly women is complex and probably influenced by multiple factors."

For more information on this research see: Early menopause does not influence left ventricular diastolic dysfunction: A clinical observational study in healthy subjects. Journal of Cardiology, 2016;68(5-6):548-553. Journal of Cardiology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Cardiology - www.journals.elsevier.com/journal-of-cardiology/)

The news correspondents report that additional information may be obtained from M. Daimon, Tokyo Univ Hosp, Dept. of Clin Lab, Tokyo, Japan. Additional authors for this research include M. Daimon, S.L. Lee, T. Nakao, T. Kawata, K. Kimura, T.S. Kato, Y. Mizuno, M. Watanabe, Y. Yatomi, T. Yamazaki and I. Komuro.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Clinical Research - Clinical Trials and Studies is the subject of a report. According to news reporting originating in Kenilworth, New Jersey, by NewsRx journalists, research stated, "Relebactam (REL [MK-7655]) is a novel class A/C beta-lactamase inhibitor intended for use with imipenem for the treatment of Gram-negative bacterial infections. REL restores imipenem activity against some resistant strains of Klebsiella and Pseudomonas."

The news reporters obtained a quote from the research from Merck & Company, "In this multicenter, double-blind, controlled trial (NCT01506271), subjects who were >= 18 years of age with complicated intra-abdominal infection were randomly assigned (1: 1: 1) to receive 250 mg REL, 125 mg REL, or placebo, each given intravenously (i.v.) with 500 mg imipenem-cilastatin (IMI) every 6 h (q6h) for 4 to 14 days. The primary efficacy endpoint was the proportion of microbiologically evaluable (ME) subjects with a favorable clinical response at discontinuation of i.v. therapy (DCIV). A total of 351 subjects were randomized, 347 (99%) were treated, and 255 (73%) were ME at DCIV (55% male; mean age, 49 years). The most common diagnoses were complicated appendicitis (53%) and complicated cholecystitis (17%). Thirty-six subjects (13%) had imipenem-resistant Gram-negative infections at baseline. Both REL doses plus IMI were generally well tolerated and demonstrated safety profiles similar to that of IMI alone. Clinical response rates at DCIV were similar in subjects who received 250 mg REL plus IMI (96.3%) or 125 mg REL plus IMI (98.8%), and both were noninferior to IMI alone (95.2%; one-sided P< 0.001). The treatment groups were also similar with respect to clinical response at early and late follow-up and microbiological response at all visits."

According to the news reporters, the research concluded: "Pharmacokinetic/pharmacodynamic simulations show that imipenem exposure at the proposed dose of 500 mg IMI with 250 mg REL q6h provides coverage of > 90% of carbapenem-resistant bacterial strains."

For more information on this research see: Phase 2, Dose-Ranging Study of Relebactam with Imipenem-Cilastatin in Subjects with Complicated Intra-abdominal Infection. Antimicrobial Agents and Chemotherapy, 2016;60(10):6234-6243. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. New Clinical Trials and Studies Study Findings Have Been Reported by Researchers at University of Calgary (Preoperative single-dose methylprednisolone versus placebo after major liver resection in adults: protocol for a randomised controlled ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Research - Clinical Trials and Studies. According to news reporting out of Calgary, Canada, by NewsRx editors, research stated, "Although randomised controlled trials have demonstrated that preoperative glucocorticoids may improve postoperative surrogate outcomes among patients undergoing major liver resection, evidence supporting improved patient-important outcomes is lacking. This superiority trial aims to evaluate the effect of administration of a bolus of the glucocorticoid methylprednisolone versus placebo during induction of anaesthesia on postoperative morbidity among adults undergoing elective major liver resection."

Our news journalists obtained a quote from the research from the University of Calgary, "This will be a randomised, dual-arm, parallel-group, superiority trial. All consecutive adults presenting to a large Canadian tertiary care hospital who consent to undergo major liver resection will be included. Patients aged <18 years and those currently receiving systemic corticosteroid therapy will be excluded. We will randomly allocate participants to a preoperative 500 mg intravenous bolus of methylprednisolone versus placebo. Surgical team members and outcome assessors will be blinded to treatment allocation status. The primary outcome measure will be postoperative complications. Secondary outcome measures will include mortality, the incidence of several specific postoperative complications, and blood levels of select proinflammatory cytokines, acute-phase proteins, and laboratory liver enzymes or function tests on postoperative days 0, 1, 2 and 5. The incidence of postoperative complications and mortality will be compared using Fisher's exact test, while the above laboratory measures will be compared using mixed-effects models with a subject-specific random intercept. This trial will evaluate the protective effect of a single preoperative dose of methylprednisolone on the hazard of postoperative complications."

According to the news editors, the research concluded: "A report releasing study results will be submitted for publication in an appropriate journal, approximately 3 months after finishing the data collection."

For more information on this research see: Preoperative single-dose methylprednisolone versus placebo after major liver resection in adults: protocol for a randomised controlled trial. Bmj Open, 2015;5(10):e008948. (BMJ Publishing Group - group.bmj.com/; Bmj Open - bmjopen.bmj.com/)

**Clinical Research - Clinical Trials and Studies**

**New Clinical Trials and Studies Study Findings Have Been Reported by Researchers at University of Padua (Efficacy and safety of sugammadex compared to neostigmine for reversal of neuromuscular blockade: a meta-analysis of randomized controlled ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news originating from Padua, Italy, by NewsRx correspondents, research stated, "Sugammadex has been introduced for reversal of rocuronium (or vecuronium) induced neuromuscular blockade (NMB). Although its efficacy has been established, data are conflicting whether it is safer than neostigmine traditionally used for reversing NMB."

Our news journalists obtained a quote from the research from the University of Padua, "Meta-analysis of data about effectiveness and safety of sugammadex compared to neostigmine for reversing NMB in adults was performed using the PRISMA methodology. University medical hospital. A comprehensive search was conducted using PubMed, Web of Science, and Cochrane Library electronic databases to identify English-language randomized controlled trials. Two reviewers independently selected the trials; extracted data on reversal times, incomplete reversals of NMB, and adverse events (AEs); and assessed the trials' methodological quality and evidence level. Only AEs that were related to study drug by a blinded safety assessor were considered for meta-analysis. A total of 1384 patients from 13 articles were included in this meta-analysis. Compared to neostigmine, sugammadex was faster in reversing NMB (P < .0001) and more likely to be associated with higher train-of-four ratio values at extubation (mean difference, 0.18; 95% confidence interval [CI], 0.14-0.22; P < .0001) and lower risk of postoperative residual curarization after extubation (odds ratio [OR], 0.05; 95% CI, 0.01-0.43; P = .0068). Compared to neostigmine, sugammadex was associated with a significantly lower likelihood of global AEs (OR, 0.47; 95% CI, 0.34-0.66; P < .0001), respiratory AEs (OR, 0.36; 95% CI, 0.14-0.95; P = .0386), cardiovascular AEs (OR, 0.23; 95% CI, 0.08-0.61; P = .0036), and postoperative weakness (OR, 0.45; 95% CI, 0.21-0.97; P = .0409). Sugammadex and neostigmine were associated with a similar likelihood of postoperative nausea and vomiting (OR, 1.23; 95% CI, 0.70-2.15; P = .4719), pain (OR, 1.06; 95% CI, 0.15-7.36; P = .9559), neurologic AEs (OR, 1.47; 95% CI, 0.52-4.17; P = .4699), general AEs (OR, 0.75; 95% CI, 0.47-1.21; P = .2448), and changes in laboratory tests' values (OR, 0.57; 95% CI, 0.18-1.78; P = .3368)."

According to the news editors, the research concluded: "Results from this meta-analysis suggest that sugammadex is superior to neostigmine, as it reverses NMB faster and more reliably, with a lower risk of AEs."

For more information on this research see: Efficacy and safety of sugammadex compared to neostigmine for reversal of neuromuscular blockade: a meta-analysis of randomized controlled trials. *Journal of Clinical Anesthesia, 2016;35():1-12. Journal of Clinical Anesthesia* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York,
New Clinical Trials and Studies Study Findings Have Been Reported from Poznan University of Medical Sciences (New Molecular Targets of Anticancer Therapy - Current Status and Perspectives)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news originating from Poznan, Poland, by NewsRx correspondents, research stated, "Molecularly targeted anticancer therapy involves the use of drugs or other substances affecting specific molecular targets that play a part in the development, progression and spread of a given neoplasm. By contrast, the majority of classical chemotherapeutics act on all rapidly proliferating cells, both healthy and cancerous ones."

Our news journalists obtained a quote from the research from the Poznan University of Medical Sciences, "Target anticancer drugs are designed to achieve a particular aim and they usually act cytostatically, not cytotoxically like classical chemotherapeutics. At present, more than 300 biological molecular targets have been identified. The proteins involved in cellular metabolism include (among others) receptor proteins, signal transduction proteins, mRNA thread matrix synthesis proteins participating in neoplastic transformation, cell cycle control proteins, functional and structural proteins. The receptor proteins that are targeted by currently used anticancer drugs comprise the epithelial growth factor receptor (EGFR), platelet-derived growth factor receptor (PDGFR) and vascular endothelial growth factor receptor (VEGFR). Target anticancer drugs may affect extracellular receptor domains (antibodies) or intracellular receptor domains (tyrosine kinase inhibitors). The blocking of the mRNA thread containing information about the structure of oncogenes (signal transduction proteins) is another molecular target of anticancer drugs. That type of treatment, referred to as antisense therapy, is in clinical trials. When the synthesis of genetic material is disturbed, in most cases the passage to the next cycle phase is blocked. The key proteins responsible for the blockage are cyclines and cycline-dependent kinases (CDK). Clinical trials are focused on natural and synthetic substances capable of blocking various CDKs."

According to the news editors, the research concluded: "The paper discusses the molecular targets and chemical structure of target anticancer drugs that have been approved for
and currently applied in antineoplastic therapy together with indications and contraindications for their application."

Clinical Research - Clinical Trials and Studies

New Clinical Trials and Studies Study Findings Recently Were Reported by Researchers at Brown University (A Randomized Trial of an Acceptance-Based Behavioral Intervention for Weight Loss in People with High Internal Disinhibition)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting originating from Providence, Rhode Island, by NewsRx correspondents, research stated, "To determine whether an acceptance-based behavioral intervention (ABBI) produces better weight losses than standard behavioral treatment (SBT) among individuals reporting high internal disinhibition. Participants were 162 adults with overweight or obesity (mean BMI 37.6 kg/m(2)) randomly assigned to ABBI or SBT."

Our news editors obtained a quote from the research from Brown University, "Both interventions provided the same calorie intake target, exercise goal, and self-monitoring skills training. SBT incorporated current best practice interventions for addressing problematic thoughts and emotions. ABBI utilized acceptance-based techniques based on Acceptance and Commitment Therapy. ABBI and SBT were compared on weight change and internal disinhibition change over 24 months. Mixed models analysis showed mean weight loss at 24 months was -4.1% (SE = 0.88) for ABBI and -2.4% (SE = 0.87) for SBT (P = 0.204). Secondary analyses showed that the ABBI group regained less weight from the end of treatment to the final follow-up (4.6 vs. 7.1 kg; P = 0.005), and that a significantly higher proportion of ABBI participants achieved a 5% weight loss (38% vs. 25%; P = 0.038) at 24 months."

According to the news editors, the research concluded: "Results suggest that ABBI could be helpful for improving the maintenance of weight loss for individuals who report high internal disinhibition."

For more information on this research see: A Randomized Trial of an Acceptance-Based Behavioral Intervention for Weight Loss in People with High Internal Disinhibition.
New Cockayne Syndrome Study Findings Have Been Reported from Kyushu University Hospital (Discrepancy between electroencephalography and hemodynamics in a patient with Cockayne syndrome during general anesthesia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neurodegenerative Diseases and Conditions - Cockayne Syndrome. According to news reporting originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "Cockayne syndrome is a kind of progeria with autosomal chromosome recessiveness described first by Cockayne in 1936. Patients with this syndrome were characterized by retarded growth, cerebral atrophy, and mental retardation."

Our news editors obtained a quote from the research from Kyushu University Hospital, "We experienced an anesthetic management of a patient with Cockayne syndrome, who underwent dental treatment twice. The primary concern was discrepancy between electroencephalography and hemodynamics. The values of bispectral index showed a sharp fall to 1 digit and suppression ratio more than 40, while hemodynamics was stable during induction of anesthesia with sevoflurane 8%. We should pay attention to anesthetic depth in the central nervous system in patients with Cockayne syndrome."

According to the news editors, the research concluded: "Titration of anesthetics should be performed by the information from electroencephalography."

Surgery - Colectomy

**New Colectomy Study Findings Reported from Department of Gastroenterology (Lanreotide Autogel in the Treatment of Persistent Diarrhea following a Total Colectomy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Surgery - Colectomy have been published. According to news reporting from Herentals, Belgium, by NewsRx journalists, research stated, "Diarrhea is one of the most common complications following colectomy in patients with slow transit constipation (STC). Early postoperative diarrhea is usually treated with opioid agonists; however, to date, published data on the management of persistent diarrhea after colectomy for STC are scarce."

Financial support for this research came from Ipsen NV.

The news correspondents obtained a quote from the research from the Department of Gastroenterology, "Here, we report a case of severe diarrhea after a total colectomy with ileorectal anastomosis. One year after the surgery, the patient presented with persistent diarrhea. Treatment with a long-acting somatostatin analogue, lanreotide Autogel, was initiated. One month after the first injection of lanreotide Autogel the diarrhea was resolved. The patient's stool transit was markedly improved (type 4 or type 5 according to the Bristol Stool Chart compared to type 7 before the treatment), positively affecting the patient's quality of life (mean score of 2.1 on the Irritable Bowel Syndrome Quality of Life questionnaire compared to 3.9 before the treatment)."

According to the news reporters, the research concluded: "This case report describes a successful use of lanreotide Autogel in a patient with persistent diarrhea after a total colectomy."

For more information on this research see: Lanreotide Autogel in the Treatment of Persistent Diarrhea following a Total Colectomy. *Case Reports In Gastrointestinal Medicine*, 2015;2015():686120. New Colitis Study Results Reported from Portuguese Institute of Oncology (Eosinophilic colitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Digestive System Diseases and Conditions - Colitis. According to news reporting originating from Coimbra, Portugal, by NewsRx correspondents, research stated, "A 57-year-old man, diagnosed with colon cancer stage III in July/2010, underwent surgery and received adjuvant chemotherapy with FOLFOX 4 (5-fluorouracil; calcium folinate and oxaliplatin), which ended in March/2011 after 12-cycles. It was then decided to maintain periodical surveillance."

Our news editors obtained a quote from the research from the Portuguese Institute of Oncology, "About 1 year later, the patient developed several episodes of diarrhoea, mainly during the night, and presented persistent peripheral eosinophilia in the blood count (range 585-1300 eosinophils/?L). Colonoscopy was performed, with the histological result showing eosinophilic infiltration of the colon, compatible with eosinophilic colitis."

According to the news editors, the research concluded: "The patient was treated with a short course of budesonide, achieving resolution of symptoms, and has remained asymptomatic."

For more information on this research see: Eosinophilic colitis. *Bmj Case Reports*, 2016;2016():. (BMJ Publishing Group - group.bmj.com; Bmj Case Reports - casereports.bmj.com/)

New Colon Cancer Data Have Been Reported by Researchers at University of Burgundy (Folfirinox in elderly patients with pancreatic or colorectal cancer-tolerance and efficacy)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Colon Cancer are presented in a new report. According to news originating from Dijon, France, by NewsRx correspondents, research stated, "To study the tolerance and the efficiency of FOLFIRINOX in elderly patients diagnosed with colorectal or pancreatic cancer. This retrospective study included elderly patients aged over 70 years of age treated at Georges-Francois Leclerc Center by FOLFIRINOX for histological proved colorectal or pancreatic cancer between January 2009 and January 2015."

Our news journalists obtained a quote from the research from the University of Burgundy, "Chemotherapies regimen consisted of oxaliplatin (85 mg/m2 in over 120 min) followed by leucovorin (400 mg/m2 in over 120 min), with the addition, after 30 min of irinotecan (180 mg/m2 in over 90 min) then 5 fluorouracil (5FU) (400 mg/m2 administrated intravenous bolus), followed by 5FU (2400 mg/m2 intravenous infusion over 46 h) repeated every 2 wk. Geriatric parameters were recorded at the beginning. Toxicities were evaluated with the Common Terminology Criteria for Adverse Events 4.03. Tumor response was evaluated by CT scan. Treatment continued until disease progression, unacceptable toxicities or patient refusal. Fifty-two patients aged from 70 to 87 years were treated by FOLFIRINOX, 34 had colorectal cancer and 18 had pancreatic cancer. Most of them were in good general condition, 82.7% had a 0-1 performance status and 61.5% had a Charlson Comorbidity Index < 10. The most frequent severe toxicities were neutropenia (17 patients, n = 32.7%) and diarrhea (35 patients n = 67.3%); 10 of the case of neutropenia and 5 of diarrhea registered a grade 4 toxicity. Thirty-nine patients (75%) initially received an adapted dose of chemotherapy. The dosage was adjusted for 26% of patients during the course of treatment. Tumor response evaluated by RECIST criteria showed a controlled disease for 25 patients (48.1%), a stable disease for 13 and a partial response for 12 patients. Time under treatment was higher for colorectal cancer with a median time of 2.44 mo (95% CI: 1.61-3.25). Overall survival was 43.88 mo for colorectal cancer and 12.51 mo for pancreatic cancer. In univariate or multivariate analysis, none of geriatric parameters were linked to overall survival. Only the type of tumor (pancreatic/colorectal) was linked in both analysis."

According to the news editors, the research concluded: "For people over 70 years old, FOLFIRINOX regimen seems to induce manageable toxicities but similar, even higher, median survival rates compared to younger people."

The news correspondents report that additional information may be obtained from F. Ghiringhelli, Univ Burgundy, Inst Natl Sante & Rech Med, F-21078 Dijon, France. New Colon Cancer Findings Has Been Reported by Investigators at Research Institute (Somatostatin signaling via SSTR1 contributes to the quiescence of colon cancer stem cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Colon Cancer are presented in a new report. According to news reporting from Newark, Delaware, by NewsRx journalists, research stated, "Neuroendocrine cells (NECs) reside adjacent to colonic stem cells (SCs) in the crypt stem cell (SC) niche, but how NECs are involved in regulation of SCs is unclear. We investigated NECs expressing somatostatin (SST) and somatostatin receptor type 1 (SSTR1) because SST inhibits intestinal proliferation."

The news correspondents obtained a quote from the research from Research Institute, "SSTR1 cells maintain SCs in a quiescent state, and aberrant SST signaling contributes to SC overpopulation in colorectal cancer (CRC). The proportion of SCs to NECs cells was quantified, by flow cytometry, in CRC cell lines and primary normal/tumor tissues based on cellular ALDH and SSTR1 levels, respectively. Doubling time and sphere-formation was used to evaluate cell proliferation and stemness. CRC cell lines were treated with exogenous SST and SST inhibitor cyclosomatostatin (cycloSST) and analyzed for changes in SCs and growth rate. Paracrine signaling between NECs and SCs was ascertained using transwell cultures of ALDH+ and SSTR1+ cells. In CRC cell lines, the proportion of ALDH+ cells inversely correlates with proportion of SSTR1+ cells and with rate of proliferation and sphere-formation. While primary normal tissue shows SST and SSTR1 expression, CRC shows only SSTR1 expression. Moreover, ALDH+ cells did not show SST or SSTR1 expression. Exogenous SST suppressed proliferation but not ALDH+ population size or viability. Inhibition of SSTR1 signaling, via cycloSST treatment, decreased cell proliferation, ALDH+ cell population size and sphere-formation. When co-cultured with SSTR1+ cells, sphere-formation and cell proliferation of ALDH+ cells was inhibited. That each CRC cell line has a unique ALDH+/SSTR1+ ratio which correlates with its growth dynamics, suggests feedback mechanisms exist between SCs and NECs that contribute to regulation of SCs. The growth suppression by both SST and cycloSST treatments suggests that SST signaling modulates this feedback mechanism. The ability of SSTR1+ cells to decrease sphere formation and proliferation of ALDH+ cells in transwell cultures indicates that the ALDH subpopulation is regulated by SSTR1 via a paracrine mechanism."

According to the news reporters, the research concluded: "Since ALDH+ cells lack SST and SSTR1 expression, we conjecture that SST signaling controls the rate of NEC maturation as SCs mature along the NEC lineage, which contributes to quiescence of SCs and inhibition of proliferation."

For more information on this research see: Somatostatin signaling via SSTR1 contributes to the quiescence of colon cancer stem cells. *BMC Cancer*, 2016;16():25-36. *BMC Cancer* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. New Colon Cancer Findings Reported from Prince of Wales Clinical School (Integrated Genetic, Epigenetic, and Transcriptional Profiling Identifies Molecular Pathways in the Development of Laterally Spreading Tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "Laterally spreading tumors (LST) are colorectal adenomas that develop into extremely large lesions with predominantly slow progression to cancer, depending on lesion subtype. Comparing and contrasting the molecular profiles of LSTs and colorectal cancers offers an opportunity to delineate key molecular alterations that drive malignant transformation in the colorectum."

The news reporters obtained a quote from the research from the Prince of Wales Clinical School, "In a discovery cohort of 11 LSTs and paired normal mucosa, we performed a comprehensive and unbiased screen of the genome, epigenome, and transcriptome followed by bioinformatics integration of these data and validation in an additional 84 large, benign colorectal lesions. Mutation rates in LSTs were comparable with microsatellite-stable colorectal cancers (2.4 vs. 2.6 mutations per megabase); however, copy number alterations were infrequent (averaging only 1.5 per LST). Frequent genetic, epigenetic, and transcriptional alterations were identified in genes not previously implicated in colorectal neoplasia (ANO5, MED12L, EPB41L4A, RGMB, SLITRK1, SLITRK5, NRXN1, ANK2). Alterations to pathways commonly mutated in colorectal cancers, namely, the p53, PI3K, and TGFβ pathways, were rare. Instead, LST-altered genes converged on axonal guidance, Wnt, and actin cytoskeleton signaling."

According to the news reporters, the research concluded: "These integrated omics data identify molecular features associated with noncancerous LSTs and highlight that mutation load, which is relatively high in LSTs, is a poor predictor of invasive potential."

For more information on this research see: Integrated Genetic, Epigenetic, and Transcriptional Profiling Identifies Molecular Pathways in the Development of Laterally Spreading Tumors. *Molecular Cancer Research*, 2016;14(12):1217-1228. *Molecular Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Oncology - Colon Cancer

**New Colon Cancer Findings Reported from University Hospital (Ovarian metastases from colorectal cancer: prognostic role of prophylactic oophorectomy. A single center experience)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting originating from Parma, Italy, by NewsRx correspondents, research stated, "The incidence of ovarian metastases (OM) from colorectal cancer (CRC) is uncommon but women with OM from CRC had poorer quality of life and decreased survival. The authors retrospectively categorized women submitted to surgery for CRC from January 2004 to December 2012 considering previous mono-or bilateral-oophorectomy, oophorectomy performed during colorectal resection, and oophorectomy performed after surgery for CRC and its cause."

Our news editors obtained a quote from the research from University Hospital, "The analysis focused on two groups: women who underwent surgery for CRC before menopause and after menopause. Survival outcome in terms of overall survival (OS) and disease free survival (DFS) were assessed and appearance of OM was also evaluated. In postmenopausal women with CRC who underwent left hemicolectomy or anterior resection of the rectum the incidence of OM was 4 % with a statistical significance (p < 0.05). The mean OS of patients with metachronous OM was 26 months and the patients' age ranged from 60 to 70 years."

According to the news editors, the research concluded: "The authors suggest prophylactic oophorectomy in postmenopausal women with an age between 60 and 70 years with cancer of left colon or rectum; in these patients there was an increased risk of metachronous OM with related decrease of OS."

The news editors report that additional information may be obtained by contacting E. Bertocchi, University Hospital Parma, Dept. of Surg Sci, OU Gen Surg & Organ Transplantat, I-43100 Parma, Italy. Additional authors for this research include E. Bertocchi, M. Rossini, P. Del
Oncology - Colon Cancer

New Colon Cancer Findings Reported from University of Sannio (The miR-27a-calreticulin axis affects drug-induced immunogenic cell death in human colorectal cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting out of Benevento, Italy, by NewsRx editors, research stated, "Immunogenic cell death (ICD) evoked by chemotherapeutic agents implies emission of selected damage-associated molecular patterns (DAMP) such as cell surface exposure of calreticulin, secretion of ATP and HMGB1. We sought to verify whether miR-27a is implicated in ICD, having demonstrated that it directly targets calreticulin."

Our news journalists obtained a quote from the research from the University of Sannio, "To this goal, we exposed colorectal cancer cell lines, genetically modified to express high or low miR-27a levels, to two bona fide ICD inducers (mitoxantrone and oxaliplatin). Low miR-27a-expressing cells displayed more ecto-calreticulin on the cell surface and increased ATP and HMGB1 secretion than high miR-27a-expressing ones in time-course experiments upon drug exposure. A calreticulin target protector counteracted the miR-27a effects while specific siRNAs mimicked them, confirming the results reported. In addition, miR-27a negatively influenced the PERK-mediated route and the late PI3K-dependent secretory step of the unfolded protein response to endoplasmic reticulum stress, suggesting that miR-27a modulates the entire ICD program. Interestingly, upon chemotherapeutic exposure, low miR-27a levels associated with an earlier and stronger induction of apoptosis and with morphological and molecular features of autophagy. Remarkably, in ex vivo setting, under the same chemotherapeutic induction, the conditioned media from high miR-27a-expressing cells impeded dendritic cell maturation while increased the secretion of specific cytokines (interleukin (IL)-4, IL-6, IL-8) and negatively influenced CD4(+) T-cell interferon g production and proliferation, all markers of a tumor immunoevasion strategy."

According to the news editors, the research concluded: "We provide the first evidence that miR-27a impairs the cell response to drug-induced ICD through the regulatory axis with calreticulin."

For more information on this research see: The miR-27a-calreticulin axis affects drug-induced immunogenic cell death in human colorectal cancer cells. *Cell Death & Disease*, 2016;7(7):e2108. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

**Oncology - Colon Cancer**

**New Colon Cancer Findings from Department of Gastroenterology & Hepatology Described (Effects of Increasing Screening Age and Fecal Hemoglobin Cutoff Concentrations in a Colorectal Cancer Screening Program)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Colon Cancer is the subject of a report.

According to news reporting out of Rotterdam, Netherlands, by NewsRx editors, research stated, "Several countries have implemented programs to screen for colorectal cancer (CRC) by using the fecal immunochemical test (FIT). These programs vary considerably in age of the population screened and the cutoff concentration of fecal hemoglobin (Hb) used to identify candidates for further evaluation; these variations are usually based on a country's colonoscopy resources."

Our news journalists obtained a quote from the research from the Department of Gastroenterology & Hepatology, "We calculated how increasing the Hb cutoff concentration and screening age affects colonoscopy yield, missed lesions, and demand. We collected data from 10,008 average-risk individuals in The Netherlands, 50-74 years old, who were invited for an FIT in the first round of a population-based CRC screening program from November 2006 through December 2008. Fecal samples were collected, and levels of Hb were measured by using the OC-sensor Micro analyzer; concentrations >= 10 mu g Hb/g feces were considered positive. Subjects with a positive FIT were scheduled for colonoscopy within 4 weeks. Logistic regression analysis was performed to evaluate the association between age and detection of advanced neoplasia. In total, 5986 individuals (62%) participated in the study; 503 (8.4%) had a positive test result. Attendance, positive test results, detection of advanced neoplasia, and the FIT's positive predictive value all increased significantly with age (P <.001). Detection of advanced neoplasia ranged from 1.3% in the youngest age group to 6.2% in the oldest group; the positive predictive value of the FIT was 26% in the youngest group and 47% in the oldest group. Increasing the starting age of invitees from 50-74 years to 55-74 years reduced the proportion of subjects who underwent colonoscopy evaluation by 14% and resulted in 9% more subjects with advanced neoplasia being missed. Increasing the cutoff concentration from 10 to 15 mu g Hb/g feces reduced the proportion of subjects who underwent colonoscopy evaluation by 11% and resulted in 6% of advanced neoplasia being missed. In an analysis of an average-risk screening population in The Netherlands, we found that detection of advanced neoplasia by FIT increases significantly with age and fecal Hb cutoff concentration. Increasing the cutoff concentration or screening age reduces the numbers of patients who undergo colonoscopy evaluation in FIT-based CRC screening programs."
According to the news editors, the research concluded: "Our findings provide insight in these effects per age category and cutoff concentration and the consequences in terms of missed lesions."

For more information on this research see: Effects of Increasing Screening Age and Fecal Hemoglobin Cutoff Concentrations in a Colorectal Cancer Screening Program. *Clinical Gastroenterology and Hepatology, 2016;14(12):1771-1777. **Oncology - Colon Cancer**

**New Colon Cancer Findings from Hebrew University Hadassah Medical School and Hospital Described (Unemployment risk at 2 and 4 years following colorectal cancer diagnosis: a population based study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news originating from Jerusalem, Israel, by NewsRx correspondents, research stated, "About half of colorectal patients are diagnosed less than 65 years of age and they have a relatively high cure rate. However, little is known about their employment and related risk factors."

Our news journalists obtained a quote from the research from Hebrew University Hadassah Medical School and Hospital, "The aim of the current study was to clarify the association between colorectal cancer (CRC) and subsequent risk of being unemployed. A historical prospective cohort study included baseline socio-demographic measurements of age, sex, ethnicity, residential socio-economic position and education from the 1995 Israeli National Census, cancer incidence between 2000 and 2007 and employment data between 1998 and 2011. Binary logistic regression analyses were used to assess odds ratios for unemployment, while controlling for socio-economic measurements and employment status at 2 years prior to diagnosis. The final study population included 885 colorectal patients and 2646 healthy controls. After controlling for confounders, positive associations were found between stages II (odds ratio [OR] = 1.91, 95% confidence interval [CI]: 1.31-2.76 or III (OR=1.70, 95% CI: 1.13-2.54) and
increased risk for unemployment at 2 years. At 4 years follow-up, stages I (OR=1.56, 95% CI: 1.11-2.19), II (OR=1.57, 95% CI: 1.09-2.26) and III (OR=2.28, 95% CI: 1.55-3.37) were associated with increased risk for unemployment. Higher risk was seen among rectal cancer patients and among patients aged <= 50 years old at the time of cancer diagnosis. CRC patients are at increased long-term risk for unemployment, especially among rectal cancer and younger patients.

According to the news editors, the research concluded: "The clinical ramifications of our findings emphasise the importance of an accurate evaluation and attention to unemployment status during the care of these patients."

The news correspondents report that additional information may be obtained from Y. Rottenberg, Hebrew Univ Jerusalem Hadassah Hosp & Med Sch, Sch Med, Jerusalem, Israel. Additional authors for this research include N.Z. Ratzon, M. Cohen, A. Hubert, B. Uziely and A. de Boer.

either DerSimonian-Laird method or Mantel-Haenszel method according to the heterogeneity of included articles. The risk of mortality, therapeutic efficacy, and adverse effect were meta-analyzed. In total, 6 RCTs including 2165 participants (1109 in the treatment group, 1056 in the control group) were included in this metaanalysis. Compared with FOLFIRI-panitumumab/cetuximab, the bevacizumab addition significantly reduced the complete response (CR) rate (RR [95% CI]=0.31[0.11, 0.89], P=0.03) and the risk of grade 3/4 adverse event (RR [95% CI]=0.89[0.80, 0.98], P=0.01). Compared with FOLFIRI and IFL alone, the addition of bevacizumab significantly increased the partial response (PR) and objective response (OR) rates. Compared with IFL alone, the addition of bevacizumab significantly reduced the mortality risk of PFS (RR [95% CI]=0.53[0.42, 0.66], P<0.00001) and OS (RR[95% CI]=0.70[0.60, 0.82], P <0.00001), but increased the risk of adverse events (RR[95% CI]=1.14[1.06, 1.21], P=0.0002).

According to the news editors, the research concluded: "Combination chemotherapy of bevacizumab plus FOLFIRI or IFL had a relative high efficacy and acceptable safety for treatment of mCRC."

For more information on this research see: Efficacy and safety of addition of bevacizumab to FOLFIRI or irinotecan/bolus 5-FU/LV (IFL) in patients with metastatic colorectal cancer A meta-analysis. Oncology - Colon Cancer

New Colon Cancer Findings from S. Lonardi et al Outlined (Phase III trial comparing 3-6 months of adjuvant FOLFOX4/XELOX in stage II-III colon cancer: safety and compliance in the TOSCA trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Bergamo, Italy, by NewsRx journalists, research stated, "Six months of oxaliplatin-based adjuvant chemotherapy is standard of care for radically resected stage III colon cancer and an accepted option for high-risk stage II. A shorter duration of therapy, if equally efficacious, would be advantageous for patients and Health-Care Systems."

The news reporters obtained a quote from the research, "TOSCA ['Randomized trial investigating the role of FOLFOX-4 or XELOX (3 versus 6 months) regimen duration and bevacizumab as adjuvant therapy for patients with stage II/III colon cancer] is an open-label,
phase III, multicenter, noninferiority trial randomizing patients with high-risk stage II or stage III radically resected colon cancer to receive 3 months (arm 3 m) versus 6 months (arm 6 m) of FOLFOX4/XELOX. Primary end-point was relapse-free survival. We present here safety and compliance data. From June 2007 to March 2013, 3759 patients were accrued from 130 Italian sites, 64% receiving FOLFOX4 and 36% XELOX in either arm. Treatment completion rate without any modification was 35% versus 12% and with delays or dose reduction 52% versus 44% in arm 3 and 6 m. Treatment was permanently discontinued in 8% (arm 3 m) and 33% (arm 6 m). In arm 6 m, 50% of patients discontinuing treatment did so after completing 80% of planned program. Grade 3+ toxicities were higher in arm 6 m than that in 3 m. Grade 2+ neuropathy was 31.2% versus 8.8% (P < 0.0001) while grade 3+ was 8.4 versus 1.3 (P < 0.0001), in arm 3 and 6 m. Seven deaths within 30 days from last treatment administration in arm 6 m and three deaths in arm 3 m were observed (0.3% versus 0.1%, P = 0.34). TOSCA is the first trial comparing 3 versus 6 months of adjuvant chemotherapy completing accrual within the international initiative of treatment duration evaluation (International Duration Evaluation of Adjuvant, IDEA)."

According to the news reporters, the research concluded: "High compliance to treatment in control arm will allow a correct assessment of potential differences between the two treatment durations. NCT00646607."

Oncology - Colon Cancer

New Colon Cancer Findings from University of Bologna Described (Inflammation increases NOTCH1 activity via MMP9 and is counteracted by Eicosapentaenoic Acid-free fatty acid in colon cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news reporting originating in Bologna, Italy, by NewsRx journalists, research stated, "Aberrant NOTCH1 signalling is critically involved in multiple models of colorectal cancer (CRC) and a prominent role of NOTCH1 activity during inflammation has emerged. Epithelial to Mesenchymal Transition (EMT), a crucial event promoting malignant transformation, is regulated by inflammation and Metalloproteinase-9 (MMP9) plays an important role in this
The news reporters obtained a quote from the research from the University of Bologna, "Eicosapentaenoic Acid (EPA), an omega-3 polyunsaturated fatty acid, was shown to prevent colonic tumors in different settings. We recently found that an extra-pure formulation of EPA as Free Fatty Acid (EPA-FFA) protects from colon cancer development in a mouse model of Colitis-Associated Cancer (CAC) through modulation of NOTCH1 signalling. In this study, we exposed colon cancer cells to an inflammatory stimulus represented by a cytokine-enriched Conditioned Medium (CM), obtained from THP1-differentiated macrophages. We found, for the first time, that CM strongly up-regulated NOTCH1 signalling and EMT markers, leading to increased invasiveness. Importantly, NOTCH1 signalling was dependent on MMP9 activity, upon CM exposure. We show that a non-cytotoxic pre-treatment with EPA-FFA antagonizes the effect of inflammation on NOTCH1 signalling, with reduction of MMP9 activity and invasiveness."

According to the news reporters, the research concluded: "Our data suggest that, in CRC cells, inflammation induces NOTCH1 activity through MMP9 up-regulation and that this mechanism can be counteracted by EPA-FFA."

For more information on this research see: Inflammation increases NOTCH1 activity via MMP9 and is counteracted by Eicosapentaenoic Acid-free fatty acid in colon cancer cells. Scientific Reports, 2016;6():20670. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting C. Fazio, Dept. of Surgical and Medical Sciences, University of Bologna, Bologna, Italy. population-based cancer registries in 13 countries, as well as cancer deaths from the WHO mortality database for 18 countries. We estimated world population age-standardized incidence (ASR) and mortality (ASMR) rates per 100,000 person-years for 2003-2007 and the estimated annual percentage change for 1997-2008. The CRC rate in males was 1-2 times higher than that in females. In 2003-2007, the highest ASRs were seen in Uruguayan, Brazilian and Argentinian males (25.2-34.2) and Uruguayan and Brazilian females (21.5-24.7), while El Salvador had the lowest ASR in both sexes (males: 1.5, females: 1.3). ASMRs were < 10 for both sexes, except in Uruguay, Cuba and Argentina (10.0-17.7 and 11.3-12.0). CRC incidence is increasing in Chilean males. Most countries have national screening guidelines. Uruguay and Argentina have implemented national screening programs. Geographic variation in CRC and sex gaps may be explained by differences in the prevalence of obesity, physical inactivity, diet, smoking and alcohol consumption, early detection, and cancer registration practices. Establishing optimal CRC screening programs is challenging due to lack of healthcare access and coverage, funding, regional differences and inadequate infrastructure, and may not be feasible."

According to the news editors, the research concluded: "Given the current status of CRC in the region, data generated by population-based cancer registries is crucial for cancer control planning."

For more information on this research see: Burden of colorectal cancer in Central and South America. *Cancer Epidemiology*, 2016;44():S74-S81. *Cancer Epidemiology* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Oncology - Colon Cancer

**New Colon Cancer Study Findings Have Been Reported by Investigators at University of Rome (Overcoming dynamic molecular heterogeneity in metastatic colorectal cancer: Multikinase inhibition with regorafenib and the case of rechallenge with ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news reporting originating from Rome, Italy, by NewsRx correspondents, research stated, "In metastatic colorectal cancer (mCRC), fluorouracil-based combination therapy with oxaliplatin or irinotecan is the mainstay of first-line treatment. Patient survival has been significantly improved with the introduction of monoclonal antibodies against VEGF (bevacizumab), VEGFR2 (ramucirumab) or EGFR (cetuximab or panitumumab) in first- and second-line..."
therapies."

Our news editors obtained a quote from the research from the University of Rome, "However, all patients treated with chemotherapy and targeted therapies will eventually relapse, and recently the emergence of alterations in EGFR, RAS, BRAF, ERB-B2, MET and possibly in other genes has been shown to jeopardize response to EGFR blockade. In chemorefractory patients, multikinase inhibition with regorafenib has proved to be effective and rechallenge with chemotherapy or anti-EGFR agents is empirically pursued."

According to the news editors, the research concluded: "This review will critically discuss how the evolving knowledge of mechanisms of resistance driven by intratumoural dynamic molecular heterogeneity can impact on rational choice of treatments in this setting."

The news editors report that additional information may be obtained by contacting D. Santini, Campus Biomed Univ Rome, Dept. of Med Oncol, I-00128 Rome, Italy. Additional authors for this research include S. Siena, G. Tonini, A. Bardelli and D. Santini.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ctrv.2016.10.006. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Colon Cancer

New Colon Cancer Study Findings Have Been Reported by Researchers at University of Malaya (Chemopreventive effect of Phaleria macrocarpa on colorectal cancer aberrant crypt foci in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting from Kuala Lumpur, Malaysia, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Natural products are important ingredients for pharmaceutical applications specifically new entities for treating cancer and other diseases. Phaleria macrocarpa is native of Indonesia and considered as a prolific source of bioactive substances useful for chemoprevention."

The news correspondents obtained a quote from the research from the University of Malaya, "Aim of the study: To investigate the chemopreventive properties of Phaleria macrocarpa on azoxymethane (AOM)-induced aberrant crypt foci (ACF) in rats. The biological activities of the ethanol extract of P. macrocarpa fruits were evaluated both in vitro and in vivo. First the extract was investigated for its in vitro antioxidant activity by the total phenolic content and ferric reducing antioxidant power assay. Then the chemopreventive effect of P. macrocarpa
was performed on AOM-induced aberrant crypt foci as colorectal carcinoma model in rats. The crude ethanolic extract of P. macrocarpa has high antioxidant activity and modulated the oxidative stress as proved by the up-regulation of glutathione-s-transferase and superoxide dismutase. Immunohistochemical staining of the treated sections showed overexpression of PCNA and Bax, reduced crypt sizes and numbers, indicating the characteristic feature of apoptotic cancer cells. PCNA is a landmark of cell damage and turn-over and can be associated with clinical cancer mutation. The most potent doses were 250 mg/kg and 500 mg/kg as compared to 35 mg/kg 5-fluorouracil.

According to the news reporters, the research concluded: "In this sense, the potential modulation of the colorectal pathophysiological pathway by P. macrocarpa natural compounds mostly flavonoids offer a great possibility for the discovery of new leads towards the colorectal cancer."

Our news journalists report that additional information may be obtained by contacting A.N. Shwter, Univ Malaya, Dept. of Biomed Sci, Fac Med, Kuala Lumpur 50603, Malaysia. Additional authors for this research include N.A. Abdullah, M.A. Alshawsh, H.R. El-Seedi, N.A. Al-Henhena, S.A.M. Khalifa and M.A. Abdulla.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jep.2016.08.002. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Colon Cancer**

**New Colon Cancer Study Findings Have Been Reported from Queen's University (Delivery of Adjuvant Oxaliplatin for Colon Cancer: Insights From Routine Clinical Practice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Colon Cancer is the subject of a report. According to news reporting originating from Kingston, Canada, by NewsRx correspondents, research stated, "Adjuvant oxaliplatin is now a standard treatment option for patients with early-stage colon cancer. However, treatment delivery and outcomes achieved in routine practice are not well described."

Our news editors obtained a quote from the research from Queen's University, "All cases of colon cancer diagnosed in Ontario from 2002 to 2008 were identified using the Ontario Cancer Registry. Pathology reports were obtained for a 25% random sample to identify stage II and III cases; patients treated with adjuvant oxaliplatin were included in this analysis. Treatment
records were reviewed to identify oxaliplatin dose reductions or omissions. Modified Poisson regression was used to evaluate factors associated with dose reduction/omission. Cox proportional hazards model was used to explore factors associated with cancer-specific survival (CSS) and overall survival (OS). The study population included 532 patients; 88% (469/532) had stage III disease. The mean/median number of oxaliplatin cycles delivered was 10/12. A dose reduction/omission of oxaliplatin occurred in 54% of cases (288/532), and the dose was subsequently escalated in 34% of these (97/288). Women were more likely than men to have dose reduction/omission (relative risk, 1.29; 95% CI, 1.10-1.51). Dose reduction/omission was not associated with inferior CSS (hazard ratio [HR], 0.76; 95% CI, 0.51-1.14) or OS (HR, 0.81; 95% CI, 0.59-1.13). Five-year CSS and OS of all cases were 77% (95% CI, 72-81) and 72% (95% CI, 68-76), respectively. On-treatment mortality rates were 1% and 3% within 30 and 90 days of oxaliplatin, respectively. Dose reductions of adjuvant oxaliplatin are common in routine practice but are not associated with inferior survival.

According to the news editors, the research concluded: "Long-term survival achieved in the general population is comparable to the results of clinical trials."

For more information on this research see: Delivery of Adjuvant Oxaliplatin for Colon Cancer: Insights From Routine Clinical Practice. Journal of the National Comprehensive Cancer Network, 2016;14(12):1548-1554. Journal of the National Comprehensive Cancer Network can be contacted at: Harborside Press, 37 Main St, Cold Spring Harbor, NY 11724, USA.

The news editors report that additional information may be obtained by contacting C.M. Booth, Queen's University, Dept. of Public Hlt H, Kingston, ON, Canada. Additional authors for this research include X.J. Wei, J.J. Biagi, S. Nanji and C.M. Booth.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
mice. In addition, altered levels of CD8(+) cells, and changes in CD8(+) production of IFN- and granzyme B were observed. These T-cell alterations did modify tumor immunosurveillance, as the adoptive transfer of splenocytes from Apc(Min/+ ) animals into a chemically induced CRC model resulted in the inability to prevent epithelial dysplasia."

According to the news editors, the research concluded: "These results suggest an altered T-cell balance in Apc(Min/+ ) mice may disrupt intestinal homeostasis, consequently limiting intestinal tumor immunosurveillance."

Our news journalists report that additional information may be obtained by contacting R.G. Lorenz, Univ Alabama Birmingham, Dept. of Surg, Div Pediat Surg, Birmingham, AL 35294, United States. Additional authors for this research include J.G. Daft, S.A. Hill, C.A. Martin and R.G. Lorenz.

**Oncology - Colon Cancer**

**New Colon Cancer Study Findings Recently Were Reported by Researchers at Coventry University (Diagnostic accuracy of faecal biomarkers in detecting colorectal cancer and adenoma in symptomatic patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting from Coventry, United Kingdom, by NewsRx journalists, research stated, "The diagnosis of colorectal cancer (CRC) can be difficult as symptoms are variable with poor specificity. Thus, there is a quest for simple, non-invasive testing that can help streamline those with significant colonic pathology."

Funders for this research include Bowel Disease Research Foundation, Alpha Laboratories Ltd.

The news correspondents obtained a quote from the research from Coventry University. "To assess using faecal immunochemical test for haemoglobin (FIT) or faecal calprotectin (FCP) to detect CRC and adenoma in symptomatic patients referred from primary care. A total of 799 referred for urgent lower gastrointestinal investigations were prospectively recruited. Of these, 430 completed colonic investigations and returned stool samples, and were included in the final statistical analysis. Faecal immunochemical test for haemoglobin was
performed on HM-JACKarc analyser (Kyowa Medex, Tokyo, Japan), and FCP by the EliA Calprotectin immunoassay (Thermo Fisher Scientific, Waltham, United States). The negative predictive value (NPV) using FIT alone or both markers (FIT and FCP) in combination was similar at 99% for CRC, with a sensitivity and specificity of 84% and 93%, respectively. FIT measurements were significantly higher in left-sided colonic lesions compared with the right side; 713 vs. 94; P = 0.0203). For adenoma, the NPV using FIT alone, or both markers (FIT and FCP) in combination, was similar at 94% with a sensitivity and specificity of 69% and 56%, respectively. Undetectable faecal immunochemical test for haemoglobin is sufficiently sensitive to exclude colorectal cancer, with higher values in left-sided lesions. FCP in combination does not appear to provide additional diagnostic information."

According to the news reporters, the research concluded: "Further studies to determine the health economic benefits of implementing faecal immunochemical test for haemoglobin in primary care are required."

Our news journalists report that additional information may be obtained by contacting R.P. Arasaradnam, Coventry University, Appl Biol & Expt Sci, Coventry, W Midlands, United Kingdom. **Oncology - Colon Cancer**

**New Colon Cancer Study Findings Recently Were Reported by Researchers at Paris-Descartes University (A Study of Hypermethylated Circulating Tumor DNA as a Universal Colorectal Cancer Biomarker)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "Circulating tumor DNA (ctDNA) has emerged as a good candidate for tracking tumor dynamics in different cancer types, potentially avoiding repeated tumor biopsies. Many different genes can be mutated within a tumor, complicating procedures for tumor monitoring, even with highly sensitive next-generation sequencing (NGS) strategies."

Our news editors obtained a quote from the research from Paris-Descartes
University, "Droplet-based digital PCR (dPCR) is a highly sensitive and quantitative procedure, allowing detection of very low amounts of circulating tumor genetic material, but can be limited in the total number of target loci monitored. We analyzed hypermethylation of 3 genes, by use of droplet-based dPCR in different stages of colorectal cancer (CRC), to identify universal markers for tumor follow-up. Hypermethylation of WIF1 (WNT inhibitory factor 1) and NPY (neuropeptide Y) genes was significantly higher in tumor tissue compared to normal tissue, independently of tumor stage. All tumor tissues appeared positive for one of the 2 markers. Methylated ctDNA (MetctDNA) was detected in 80% of metastatic CRC and 45% of localized CRC. For samples with detectable mutations in ctDNA, MetctDNA and mutant ctDNA (MutctDNA) fractions were correlated. During follow-up of different stage CRC patients, MetctDNA changes allowed monitoring of tumor evolution."

According to the news editors, the research concluded: "These results indicate that MetctDNA could be used as a universal surrogate marker for tumor follow-up in CRC patients, and monitoring MetctDNA by droplet-based dPCR could avoid the need for monitoring mutations."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1373/clinchem.2015.253609. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Colon Cancer

New Colon Cancer Study Findings Recently Were Reported by Researchers at Southeast University (FAS rs2234767 and rs1800682 polymorphisms jointly contributed to risk of colorectal cancer by affecting SP1/STAT1 complex recruitment to chromatin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news originating from Nanjing, People's Republic of China, by NewsRx correspondents, research stated, "FAS rs2234767 (-1377 G>A), rs1800682 (-670 A>G) and FASLG rs763110 (-844 C>T) promoter polymorphisms can influence transcriptional activities of the genes and thus multiple tumors susceptibility. To investigate their association with risk of colorectal cancer
(CRC), the three SNPs were genotyped in 878 cases and 884 controls and the results showed that the FAS rs2234767 and rs1800682 were in a high linkage disequilibrium (LD) with each other (D' = 0.994) and jointly contributed to an increased risk of CRC (without vs. with rs2234767 GG/rs1800682 AA genotypes, adjusted OR = 1.30, 95% CI = 1.05 - 1.61).

Our news journalists obtained a quote from the research from Southeast University, "In vivo ChIP assays evaluated the effect of rs2234767 and rs1800682 on recruitment of SP1 and STAT1, respectively, to chromatin. The results showed SP1 interacting specifically with STAT1 recruited to their respective motifs for transcriptional activation. The mutant alleles rs2234767 A and rs1800682 G jointly affected coupled SP1 and STAT1 recruitment to chromatin. The interplay between SP1 and STAT1 was critical for the functional outcome of rs2234767 and rs1800682 in view of their high LD."

According to the news editors, the research concluded: "The FAS rs2234767 and rs1800682 polymorphisms were in high LD with each other, and they jointly contributed to an increased risk of CRC by altering recruitment of SP1/STAT1 complex to the FAS promoter for transcriptional activation."

For more information on this research see: FAS rs2234767 and rs1800682 polymorphisms jointly contributed to risk of colorectal cancer by affecting SP1/STAT1 complex recruitment to chromatin. Scientific Reports, 2016;6():19229. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Oncology - Colon Cancer

New Colon Cancer Study Findings Recently Were Reported by Researchers at University of Tokushima (Propensity score-matched study of laparoscopic and open surgery for colorectal cancer in rural hospitals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news reporting originating in Tokushima, Japan, by NewsRx journalists, research stated, "Various randomized clinical studies have suggested that short-and long-term outcomes of laparoscopic surgery (LAP) for colorectal cancer are comparable with those of open surgery (OP). However, these studies were performed in high-volume hospitals."

The news reporters obtained a quote from the research from the University of Tokushima, "The aim of the present study was to compare the outcomes of LAP versus OP for
colorectal cancer in rural hospitals. This was a multicenter retrospective propensity score-matched case-control study of patients who underwent colorectal surgery from January 2004 to April 2009 in 10 hospitals in Japan. All patients underwent curative surgery for pathologically diagnosed stage II or III colorectal cancer. The primary end point was 5-year overall survival (OS). The secondary end points were disease-free survival (DFS) and postoperative complications. In total, 319 patients who underwent LAP and 1020 patients who underwent OP were balanced to 261 pairs. There was no significant difference in the OS and DFS between two groups. The operation time was significantly shorter for OP than for LAP. Blood loss was significantly lower in LAP than in OP. There was no difference in intraoperative morbidity between the two groups. The postoperative morbidity was significantly lower in LAP than in OP. The hospital stay was significantly shorter in LAP than in OP. There was no significant difference in 90-day postoperative mortality."

According to the news reporters, the research concluded: "Laparoscopic surgery may be a feasible option for colorectal cancer in rural hospitals."

Our news correspondents report that additional information may be obtained by contacting T. Nakao, University of Tokushima, Dept. of Surg, Tokushima 7708503, Japan. Additional authors for this research include M. Shimada, K. Yoshikawa, J. Higashijima, T. Tokunaga, M. Nishi, C. Takasu, H. Kashihara, I. Suzuka, T. Nishizaki, H. Okitsu, T. Yagi, H. Miyake, M. Miura, M. Fukuyama, D. Wada and Y. Bando.

in vivo conditions and, thereby, predict effective drugs in vivo. This study aimed to perform drug selection using our recently developed 3D culture system in a human colon cancer HCT116 cell line stably expressing red fluorescent protein (HCT116-RFP), to determine the most effective agent in a selection of clinically used antitumor agents for colon cancer. In addition, we confirmed the efficacy of the selected drug regorafenib, in vivo using a mouse model of disseminated small tumors. HCT116-RFP cells were cultured using a nanoimprinting 3D culture and in vitro drug selection was performed with 8 clinically used drugs [bevacizumab, capecitabine, cetuximab, 5-fluorouracil (5-FU), irinotecan, oxaliplatin, panitumumab and regorafenib]. An in vivo study was performed in mice bearing HCT116-RFP intraperitoneally disseminated small tumors using 3’-[18F]-fluoro-3’-deoxythymidine-positron emission tomography and fluorescence microscopy imaging to evaluate the therapeutic effects. Regorafenib was determined to be the most effective drug in the 3D culture, and significantly inhibited tumor growth in vivo, compared to the untreated control and 5-FU-treated group. The drug 5-FU is commonly used in colon cancer treatment and was used as a reference."

According to the news reporters, the research concluded: "Our results demonstrate that regorafenib is a potentially efficacious adjuvant chemotherapeutic agent for the treatment of disseminated small colon cancer and, therefore, warrants further preclinical and clinical studies."

For more information on this research see: Regorafenib as a potential adjuvant chemotherapy agent in disseminated small colon cancer: Drug selection outcome of a novel screening system using nanoimprinting 3-dimensional culture with HCT116-RFP cells. *International Journal of Oncology*, 2016;48(4):1477-84.

Oncology - Colon Cancer

New Colon Cancer Study Findings Reported from Xinxiang Medical University (Treating Colon Cancer Cells with FK228 Reveals a Link between Histone Lysine Acetylation and Extensive Changes in the Cellular Proteome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news reporting originating in Xinxiang, People's Republic of China, by NewsRx journalists, research stated, "The therapeutic value of FK228 as a cancer treatment option is well known, and various types of cancer have been shown to respond to this drug. However, the complete
mechanism of FK228 and the affect it has on histone lysine acetylation and the colon cancer cell proteome are largely unknown.

The news reporters obtained a quote from the research from Xinxiang Medical University, "In the present study, we used stable isotope labeling by amino acids in cell culture (SILAC) and affinity enrichment followed by high-resolution liquid chromatograph-mass spectrometer (LC-MS)/MS analysis to quantitate the changes in the lysine acetylome in HCT-8 cells after FK228 treatment. A total of 1,194 lysine acetylation sites in 751 proteins were quantified, with 115 of the sites in 85 proteins being significantly upregulated and 38 of the sites in 32 proteins being significantly downregulated in response to FK228 treatment. Interestingly, 47 histone lysine acetylation sites were identified in the core histone proteins. We also found a novel lysine acetylation site on H2BK121. These significantly altered proteins are involved in multiple biological functions as well as a myriad of metabolic and enzyme-regulated pathways."

According to the news reporters, the research concluded: "Taken together, the link between FK228 function and the downstream changes in the HCT-8 cell proteome observed in response to FK228 treatment is established."

For more information on this research see: Treating Colon Cancer Cells with FK228 Reveals a Link between Histone Lysine Acetylation and Extensive Changes in the Cellular Proteome. Scientific Reports, 2015;5():18443. (Nature Publishing Group - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting T.Y. Wang, Dept. of Biochemistry and Molecular Biology, Xinxiang Medical University, Xinxiang 453003, Henan, People's Republic of China. Additional authors for this research include Y.L. Jia, X. Zhang, Q.L. Sun, Y.C. Li, J.H. Zhang, C.P. Zhao, X.Y. Wang and L. Wang.

Oncology - Colon Cancer

New Colon Cancer Study Results Reported from Institute for Cancer Research and Treatment (IRCCS) (CT colonography for population screening of colorectal cancer: hints from European trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Turin, Italy, by NewsRx journalists, research stated, "CT colonography (CTC) is a minimally invasive radiological investigation of the colon. Robust evidence indicates that CTC is safe, well tolerated and highly accurate for the detection of colorectal cancer (CRC) and large polyps, which are the targets of screening."

The news reporters obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Randomized controlled trials were carried out in Europe to
evaluate CTC as the primary test for population screening of CRC in comparison with faecal immunochemical test (FIT), sigmoidoscopy and colonoscopy. Main outcomes were participation rate and detection rate. Participation rate for screening CTC was in the range of 25-34%, whereas the detection rate of CTC for CRC and advanced adenoma was in the range of 5.1-6.1%. Participation for CTC screening was lower than that for FIT, similar to that for sigmoidoscopy and higher than that for colonoscopy. The detection rate of CTC was higher than that of one FIT round, similar to that of sigmoidoscopy and lower than that of colonoscopy. However, owing to the higher participation rate in CTC screening with respect to colonoscopy screening, the detection rates per invitee of CTC and colonoscopy would be comparable. These results justify consideration of CTC in organized screening programmes for CRC."

According to the news reporters, the research concluded: "However, assessment of other factors such as polyp size threshold for colonoscopy referral, management of extracolonic findings and, most importantly, the forthcoming results of cost-effectiveness analyses are crucial to define the role of CTC in primary screening."

Our news correspondents report that additional information may be obtained by contacting D. Regge, IRCCS, Candiolo Canc Inst FPO, Turin, Italy.

Keywords for this news article include: Turin, Italy, Europe, Cancer, Article Review, Diagnostics and Screening, Colorectal Research, Gastroenterology, Colon Cancer, Oncology, Institute for Cancer Research and Treatment (IRCCS).

**Oncology - Colon Cancer**

**New Colon Cancer Study Results Reported from Mercy Medical Center**

*Prognosis of patients with peritoneal metastatic colorectal cancer given systemic therapy: an analysis of individual patient data from prospective randomised trials from the ...]*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news reporting originating from Des Moines, Iowa, by NewsRx correspondents, research stated, "Patients with peritoneal metastatic colorectal cancer have reduced overall survival compared with patients with metastatic colorectal cancer without peritoneal involvement. Here we further investigated the effect of the number and location of metastases in patients receiving first-line systemic chemotherapy."

Our news editors obtained a quote from the research from Mercy Medical Center, "We analysed individual patient data for previously untreated patients enrolled in 14 phase 3 randomised trials done between 1997 and 2008. Trials were included if protocols explicitly pre-specified and solicited for patients with peritoneal involvement in the trial data collection process or had done a formal peritoneum-focused review of individual pre-treatment scans. We used stratified multivariable Cox models to assess the prognostic associations of peritoneal metastatic colorectal cancer with overall survival and progression-free survival, adjusting for
other key clinical-pathological factors (age, sex, Eastern Cooperative Oncology Group (ECOG) performance score, primary tumour location [colon vs rectum], previous treatment, and baseline BMI). The primary endpoint was difference in overall survival between populations with and without peritoneal metastases. Individual patient data were available for 10,553 patients. 9,178 (87%) of 10,553 patients had non-peritoneal metastatic colorectal cancer (4,385 with one site of metastasis, 4,793 with two or more sites of metastasis), 194 (2%) patients had isolated peritoneal metastatic colorectal cancer, and 1,181 (11%) had peritoneal metastatic colorectal cancer and other organ involvement. These groups were similar in age, ethnic origin, and use of targeted treatment. Patients with peritoneal metastatic colorectal cancer were more likely than those with non-peritoneal metastatic colorectal cancer to be women (565 [41%] of 1,371 vs 3,312 [36%] of 9,169 patients; p = 0.0003), have colon primary tumours (1,116 [84%] of 1,334 patients vs 5,603 [66%]; p < 0.0001), and have performance status of 2 (136 [10%] vs 521 [6%]; p < 0.0001). We recorded a higher proportion of patients with mutated BRAF in patients with peritoneal-only (eight [18%] of 44 patients with available data) and peritoneal metastatic colorectal cancer with other sites of metastasis (34 [12%] of 289), compared with patients with non-peritoneal metastatic colorectal cancer (194 [9%] of 2,230; p = 0.028 comparing the three groups). Overall survival (adjusted HR 0.75, 95% CI 0.63-0.91; p = 0.003) was better in patients with isolated non-peritoneal sites than in those with isolated peritoneal metastatic colorectal cancer. Overall survival of patients with two of more non-peritoneal sites of metastasis (adjusted HR 1.04, 95% CI 0.86-1.25, p = 0.69) and those with peritoneal metastatic colorectal cancer plus one other site of metastasis (adjusted HR 1.10, 95% CI 0.89-1.37, p = 0.37) was similar to those with isolated peritoneal metastases. Compared with patients with isolated peritoneal metastases, those with peritoneal metastases and two or more additional sites of metastasis had the shortest survival (adjusted HR 1.40; CI 1.14-1.71; p = 0.0011). Patients with peritoneal metastatic colorectal cancer have significantly shorter overall survival than those with other isolated sites of metastases. In patients with several sites of metastasis, poor survival is a function of both increased number of metastatic sites and peritoneal involvement."

According to the news editors, the research concluded: "The pattern of metastasis and in particular, peritoneal involvement, results in prognostic heterogeneity of metastatic colorectal cancer."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/S1470-2045%2816%2930500-9. This DOI is a link to an online electronic document that is either free or for purchase.

New Colorectal Research Findings from Yonsei University Reported (Molecular characteristics of colorectal serrated polyps and hyperplastic polyps A STROBE compliant article)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gastroenterology - Colorectal Research have been presented. According to news reporting originating from Wonju, South Korea, by NewsRx correspondents, research stated, "The serrated neoplasia pathway of colorectal carcinogenesis is characterized by BRAF mutation and aberrant DNA methylation, which have not been reported on Korean patients. The aim of this study was to investigate BRAF mutation and DNA methylation in colorectal serrated polyps and the right colon."

Our news editors obtained a quote from the research from Yonsei University, "Between 2005 and 2013, 146 colon polyps (47 tubular adenomas [TAs], 53 traditional serrated adenomas [TSAs], 17 sessile serrated adenomas/polyps [SSAs], and 29 hyperplastic polyps in the proximal colon [PHPs]) were collected from patients. Paraffin-embedded colon polyp tissue was used for DNA extraction. BRAF V600E mutation was identified through polymerase chain reaction (PCR) and pyrosequencing assay. The methylation status of the long interspersed nucleotide element-1, insulin-like growth factor binding protein 7 (IGFBP7), mutL homolog 1 (hMLH1), and CD133 genes were evaluated through disulfite conversion, PCR, and pyrosequencing assay. BRAF V600E mutation was found in 2.1% of TAs, 47.2% of TSAs, 41.2% of SSAs, and 20.7% of PHPs. TSA and SSA had higher BRAF mutation rates than did TA (P <0.0001). TSA had higher BRAF mutation rates than did PHP (P=0.018). IGFBP7 hypermethylation was found in 17% of TAs, 37.7% of TSAs, 88.2% of SSAs, and 37.5% of PHPs. TSA and SSA had higher hypermethylation of IGFBP7 than did TA (P=0.021 and P <0.0001, respectively). SSA had higher hypermethylation of IGFBP7 than did PHP (P=0.002). hMLH1 hypermethylation was found in 2.1% of TAs, 5.7% of TSAs, 0% of SSAs, and 0% of PHPs. CD133 hypermethylation was found in 21.3% of TAs, 9.4% of TSAs, 35.3% of SSAs, and 17.4% of PHPs. BRAF mutation and methylation in TSA and SSA are different from those in PHP in Koreans."

According to the news editors, the research concluded: "These findings suggested that PHP may have different molecular characteristics compared with other serrated polyps."

For more information on this research see: Molecular characteristics of colorectal serrated polyps and hyperplastic polyps A STROBE compliant article. Medicine, 2016;95 (49):521-526. New Colorectal Research Study Results Reported from National Institutes of Health (The B-cell tumor promoter Bcl-3 suppresses inflammation associated colon tumorigenesis in epithelial cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gastroenterology - Colorectal Research is now available. According to news reporting from Bethesda, Maryland, by NewsRx journalists, research stated, "Bcl-3 is an atypical member of the inhibitor of kappa light polypeptide gene enhancer in B-cells (I.B) family. It associates with p50/nuclear factor-kappa B1 (NF-kappa B1) and p52/NF-kappa B2 homodimers in nuclei where it modulates transcription in a context-dependent manner."

The news correspondents obtained a quote from the research from the National Institutes of Health, "A subset of B-cell tumors exhibits recurrent translocations of Bcl-3, resulting in overexpression. Elevated expression without translocations is also observed in various B-cell lymphomas and even some solid tumors. Here we investigated the role of Bcl-3 in azoxymethane/dextran sulfate sodium (AOM/DSS)-induced colon tumors, a mouse model for colitis-associated colorectal cancers in humans. Contrary to expectations, Bcl-3 suppressed colorectal tumor formation: Bcl-3-deficient mice were relatively protected from DSS-induced epithelial damage and developed more polyps after AOM/DSS treatment, although polyp size was unaffected. DSSchallenged mutant mice exhibited increased recruitment of myeloid-derived suppressor cells, consistent with protection of the epithelium. Loss of Bcl-3 in intestinal epithelial cells was sufficient to increase tumorigenesis. The added tumor burden in mutant mice was dependent on tumor necrosis factor-a (TNF alpha), a tumorigenic, NF-kappa B-mediated signaling pathway that was dampened by Bcl-3. These findings reveal a tumor-suppressive role for Bcl-3 in this inflammation-associated cancer model."

According to the news reporters, the research concluded: "Bcl-3 thus functions as a tumor promoter or suppressor, depending on the cellular and environmental context."

Our news journalists report that additional information may be obtained by contacting U. Siebenlist, NIAID, Lab Mol Immunol, National Institutes of Health, Bethesda, MD 20892, United States. Additional authors for this research include H. Wang, H.L. Ha, I. Tassi, R. Bhardwaj, E. Claudio and U. Siebenlist.

New Congenital Heart Defects Data Have Been Reported by Researchers at Center for Disease Control and Prevention (Proportion of selected congenital heart defects attributable to recognized risk factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Congenital Diseases and Conditions - Congenital Heart Defects have been published. According to news reporting out of Atlanta, Georgia, by NewsRx editors, research stated, "To assess the contribution of multiple risk factors for two congenital heart defects hypoplastic left heart syndrome (HLHS) and tetralogy of Fallot (TOF). We used data from the National Birth Defects Prevention Study (1997-2011) to estimate average adjusted population attributable fractions for several recognized risk factors, including maternal prepregnancy overweight-obesity, pregestational diabetes, age, and infant sex."

Our news journalists obtained a quote from the research from Center for Disease Control and Prevention, "There were 594 cases of isolated simple HLHS, 971 cases of isolated simple TOF, and 11,829 controls in the analysis. Overall, 57.0% of HLHS cases and 37.0% of TOF cases were estimated to be attributable to risk factors included in our model. Among modifiable HLHS risk factors, maternal pre-pregnancy overweight-obesity accounted for the largest proportion of cases (6.5%). Among modifiable TOF risk factors, maternal prepregnancy overweight-obesity and maternal age of 35 years or older accounted for the largest proportions of cases (8.3% and 4.3%, respectively). Approximately half of HLHS cases and one-third of TOF cases were estimated to be attributable to risk factors included in our models. Interventions targeting factors that can be modified may help reduce the risk of HLHS and TOF development."

According to the news editors, the research concluded: "Additional research into the etiology of HLHS and TOF may reveal other modifiable risk factors that might contribute to primary prevention efforts."

Our news journalists report that additional information may be obtained by contacting R.M. Simeone, Center Dis Control & Prevent, Div Congenital & Dev Disorders, Natl Center Birth Defects & Dev Disabil, Atlanta, GA, United States. Additional authors for this research include S.C. Tinker, S.M. Gilboa, A.J. Agopian, M.E. Oster, O.J. Devine and M.A. Honein.

New Congenital Heart Defects Findings from Institute for Cancer Research and Treatment (IRCCS) Discussed (Serum NT-proBNP Levels Are Not Related to Vitamin D Status in Young Patients with Congenital Heart Defects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Congenital Diseases and Conditions - Congenital Heart Defects. According to news reporting from San Donato Milanese, Italy, by NewsRx journalists, research stated, "Hypovitaminosis D frequently occurs in early life and increases with age. Vitamin D has been suggested to influence cardiac performance and N-terminal-pro-type B natriuretic peptide (NT-proBNP) release in adults with heart failure."

Financial support for this research came from IRCCS Policlinico San Donato Ricerca Corrente Fund.

The news correspondents obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "To assess the vitamin D status and the impact of hypovitaminosis D on circulating NT-proBNP levels in young patients with congenital heart defects (CHD). This cross-sectional study included the assessment of serum 25-hydroxyvitamin D (25OHD), parathyroid function markers, and NT-proBNP levels in a series of 230 young in-patients (117 females, 113 males; 6.4 (4.0-9.1) years (median, interquartile range)) with CHD. Serum 25OHD levels <20 ng/mL were detected in 55.3% of patients. Optimal 25OHD levels (>30 ng/mL) occurred in 25% of patients. Serum 25OHD levels inversely correlated with age (r=-0.169, p=0.013) and height standard deviation score (r=-0.269, p=0.001). After correction for age, 25OHD negatively correlated with serum PTH levels (b=-0.200, p=0.002). PTH levels above the upper quartile (44 pg/mL) occurred in 32% of hypovitaminosis D patients. Serum NT-proBNP levels were not correlated with 25OHD and PTH levels. Half of the young CHD patients were diagnosed with 25OHD deficiency and a third of hypovitaminosis D patients experienced hyperparathyroidism."

According to the news reporters, the research concluded: "Nonetheless, serum NT-proBNP levels were not associated with hypovitaminosis D as well as hyperparathyroidism."

For more information on this research see: Serum NT-proBNP Levels Are Not Related to Vitamin D Status in Young Patients with Congenital Heart Defects. Disease Markers, 2016;2016():3970284. Disease Markers can be contacted at: IOS Press, Nieuwe Hemweg 6B, 1013 BG Amsterdam, The Netherlands.

New Congenital Heart Disease Data Have Been Reported by Researchers at National Taiwan University (Postnatal cumulative incidence of supraventricular tachycardia in a general pediatric population: A national birth cohort database study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Congenital Diseases and Conditions - Congenital Heart Disease. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "Supraventricular tachycardia (SVT) is a common pediatric tachycardia, but the true incidence is unknown. We sought to investigate the true postnatal incidence and its medical needs."

The news reporters obtained a quote from the research from National Taiwan University, "We derived a birth cohort comprised children born between 2000 and 2008 who had complete postnatal medical data in the Taiwan National Health Insurance Database for the period from 2000 to 2014. From 1,967,911 live births, we identified 2021 patients with SVT (51.6% men), accounting for an overall incidence of 1.03 per 1000 patient-years (Wolff-Parkinson-White syndrome accounted for 16.2%). The cumulative incidence was 0.06, 0.25, 0.45, 0.88, and 1.39 per 1000 patient-years by the age of 1 month, 1 year, 5 years, 10 years, and 15 years, respectively. Major congenital heart disease (5.3%; hazard ratio 6.66; 95% confidence interval 2.98-14.87) and cardiomyopathy (0.9%; hazard ratio 8.78; 95% confidence interval 3.39-22.78) were associated with mortality. In patients without major congenital heart disease, the cumulative incidence of SVT was 0.05, 0.22, 0.41, 0.84, and 1.33 per 1000 patient-years by the age of 1 month, 1 year, 5 years, 10 years, and 15 years, respectively. By the age of 15 years, the annual risk of death and sudden death was 0.13% and 0.010/0 per patient-year, respectively. Radiofrequency catheter ablation was performed in 173 patients at the median age of 11 years: 1.7% during infancy, 5.8% by the age of 5 years, and 31.8% by the age of 10 years. The probability of being free from receiving ablation by the age of 15 years was 83.4%.

According to the news reporters, the research concluded: "This birth cohort study provides the true incidence of pediatric SVT and indicates that almost one-fifth of the patients with SVT have already received ablation in the pediatric ages."

Our news correspondents report that additional information may be obtained by contacting M.H. Wu, National Taiwan University, Academy Sinica, Genom Res Center, Taiwan Adm Natl Hlth InsuranceMed College, Taipei, Taiwan. Additional authors for this research.

Congenital Diseases and Conditions - Congenital...

New Congenital Heart Disease Findings Has Been Reported by
Investigators at Children's Hospital (Combined blood pool and
extracellular contrast agents for pediatric and young adult
cardiovascular magnetic resonance imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Congenital Diseases and Conditions -
Congenital Heart Disease. According to news reporting originating in Chicago, Illinois, by
NewsRx journalists, research stated, "A comprehensive cardiac magnetic resonance (cardiac
MR) study including both late gadolinium enhancement (LGE) and MR angiography may be
indicated for patients with a history of acquired or congenital heart disease. To study the novel
use of an extracellular agent for assessment of LGE combined with a blood pool contrast agent
for detailed MR angiography evaluation to yield a comprehensive cardiac MR study in these
patients."

The news reporters obtained a quote from the research from Children's Hospital,
"We reviewed clinical cardiac MR studies utilizing extracellular and blood pool contrast agents
and noted demographics, clinical data and adverse events. We rated LGE image quality and MR
angiography image quality for each vascular segment and calculated inter-rater variability. We
also quantified contrast-to-noise ratio (CNR). Thirty-three patients (mean age 13.9 +/- 3 years)
received an extracellular contrast agent (10 gadobenate dimeglumine, 23 gadopentetate
dimeglumine) and blood pool contrast agent (33 gadofosveset trisodium). No adverse events
were reported. MRI indications included Kawasaki disease (8), cardiomyopathy and coronary
anatomy (15), repaired congenital heart disease (8), and other (2). Mean LGE quality was 2.6 +/-
0.6 with 97% diagnostic imaging. LGE quality did not vary by type of contrast agent given (P =
0.07). Mean MR angiography quality score was 4.7 +/- 0.6, with high inter-rater agreement (k =
0.6-0.8, P< 0.002). MR angiography quality did not vary by type of contrast agent used (P =
0.6). Cardiac MR studies utilizing both extracellular and blood pool contrast agents are feasible
and safe and provide excellent-quality LGE and MR angiography images."

According to the news reporters, the research concluded: "The use of two contrast
agents allows for a comprehensive assessment of both myocardial viability and vascular
anatomy during the same exam."

For more information on this research see: Combined blood pool and extracellular
contrast agents for pediatric and young adult cardiovascular magnetic resonance imaging.

Congenital Diseases and Conditions - Congenital...

New Congenital Hypothyroidism Study Findings Have Been Reported by Investigators at Turku University Hospital (Detection of Novel Gene Variants Associated with Congenital Hypothyroidism in a Finnish Patient Cohort)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Congenital Diseases and Conditions - Congenital Hypothyroidism have been published. According to news reporting out of Turku, Finland, by NewsRx editors, research stated, "Congenital hypothyroidism (CH) is defined as the lack of thyroid hormones at birth. Mutations in at least 15 different genes have been associated with this disease."

Our news journalists obtained a quote from the research from Turku University Hospital, "While up to 20% of CH cases are hereditary, the majority of cases are sporadic with unknown etiology. Apart from a monogenic pattern of inheritance, multigenic mechanisms have been suggested to play a role in CH. The genetics of CH has not been studied in Finland so far. Therefore, multigenic sequencing of CH candidate genes was performed in a Finnish patient cohort with both familial and sporadic CH. A targeted next-generation sequencing (NGS) panel, covering all exons of the major CH genes, was applied for 15 patients with sporadic and 11 index cases with familial CH. Among the familial cases, six pathogenic mutations were found in the TPO, PAX8, and TSHR genes. Furthermore, pathogenic NKX2.1 and TG mutations were identified from sporadic cases, together with likely pathogenic variants in the TG, NKX2.5, SLC26A4, and DUOX2 genes. All identified novel pathogenic mutations were confirmed by Sanger-sequencing and characterized in silico and/or in vitro. In summary, the CH panel provides an efficient, cost-effective, and multigenic screening tool for both known and novel CH gene mutations."

According to the news editors, the research concluded: "Hence, it may be a useful method to identify accurately the genetic etiology for dyshormogenic, familial, or syndromic forms of CH."
For more information on this research see: Detection of Novel Gene Variants Associated with Congenital Hypothyroidism in a Finnish Patient Cohort. *Thyroid*, 2016;26(9):1215-1224. *Thyroid* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. **Immunization and Public Health - Conjugate Vaccines**

**New Conjugate Vaccines Data Have Been Reported by Investigators at Federal University (Streptococcus pneumoniae Serotypes 9 and 14 Circulating in Brazil over a 23-Year Period Prior to Introduction of the 10-Valent Pneumococcal Conjugate ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immunization and Public Health - Conjugate Vaccines. According to news reporting originating in Rio de Janeiro, Brazil, by NewsRx journalists, research stated, "Antimicrobial-resistant pneumococcal strains have been detected worldwide since the 1960s. In Brazil, the first penicillin-nonsusceptible pneumococci (PNSP) were reported in the 1980s, and their emergence and dissemination have been mainly attributed to serogroup 9 and serotype 14 strains, especially those highly related to recognized international clones."

The news reporters obtained a quote from the research from Federal University, "In the present study, antimicrobial susceptibility testing and multilocus sequence typing were performed on 315 pneumococcal isolates belonging to serogroup 9 (n = 99) or serotype 14 (n = 216), recovered from patients or asymptomatic carriers between 1988 and 2011 in Brazil, in order to trace changes in antimicrobial resistance and genotypes prior to the full introduction of the pneumococcal conjugate vaccine in the country. Over the 23-year study period, the PNSP levels increased, and four clonal complexes (CC156, CC66, CC15, and CC5401) have played important roles in the evolution and dissemination of pneumococcal isolates belonging to serogroup 9 and serotype 14, as well as in the emergence of antimicrobial resistance, in the pre-pneumococcal-vaccination era. The earliest PNSP strains detected in this study belonged to serotype 9N/ ST66 and were single locus variants of the international clone Tennessee(14)- 18
ST67 (CC66). The first serotype 14 PNSP isolates were identified in 1990 and were related to the England(14)-9 ST9 (CC15) clone. Serotype 14 PNSP variants of the Spain(9V)-3 ST156 clone with elevated penicillin MICs and nonsusceptibility to other beta-lactams were detected in 1995 and showed an increasing trend over the years. The results also indicated that introduction of ST156 in our region was preceded by the emergence of trimethoprim-sulfamethoxazole resistance and by the dissemination of ST162.

According to the news reporters, the research concluded: "In addition to the presence of successful international clones, a novel regional serotype 14 genotype (CC5401) has emerged in 1996."

Connective Tissue Cells

New Connective Tissue Cells Findings from Wuhan University Reported (Autophagy regulates odontoblast differentiation by suppressing NF-kB activation in an inflammatory environment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Connective Tissue Cells are discussed in a new report. According to news reporting from Wuhan, People's Republic of China, by NewsRx journalists, research stated, "Odontoblasts are derived from dental papilla mesenchymal cells and have an important role in defense against bacterial infection, whereas autophagy can recycle long-lived proteins and damaged organelles to sustain cellular homeostasis. Thus, this study explores the role of autophagy in odontoblast differentiation with lipopolysaccharide (LPS) stimulation in vitro and the colocalization of p-NF-kB and LC3 in caries teeth."

The news correspondents obtained a quote from the research from Wuhan University, "The odontoblasts differentiation was enhanced through LPS stimulation, and this outcome was reflected in the increased number of mineralized nodules and alkaline phosphatase (ALP) activity. The expression levels of the autophagy markers LC3, Atg5, Beclin1 and TFE3..."
increased time dependently, as well along with the amount of autophagosomes and autophagy fluxes. This result suggests that autophagy was enhanced in odontoblasts cultured with mineralized-induced media containing LPS. To confirm the role of autophagy in differentiated odontoblasts with LPS stimulation, chloroquine (CQ) or rapamycin were used to either block or enhance autophagy. The number of mineralized nodules decreased when autophagy was inhibited, but this number increased with rapamycin treatment. Phosphorylated nuclear factor-kB (NF-kB) expression was negatively related to autophagy and could inhibit odontoblast differentiation. Furthermore, p-NF-kB and LC3 colocalization could be detected in cells stimulated with LPS. The nucleus translocation of p-NF-kB in odontoblasts was enhanced when autophagy was inhibited by Atg5 small interfering RNA. In addition, the colocalization of p-NF-kB and LC3 in odontoblasts and sub-odontoblastic layers was observed in caries teeth with reactionary dentin."

According to the news reporters, the research concluded: "Therefore, our findings provide a novel insight into the role of autophagy in regulating odontoblast differentiation by suppressing NF-kB activation in inflammatory environments."

For more information on this research see: Autophagy regulates odontoblast differentiation by suppressing NF-kB activation in an inflammatory environment. Cell Death & Disease, 2016;7():e2122. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

Corneal Dystrophies

New Corneal Dystrophies Study Findings Reported from Hanyang University (Sensitive Surface Enhanced Raman Scattering-Based Detection of a BIGH3 Point Mutation Associated with Avellino Corneal Dystrophy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Corneal Dystrophies is now available. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Surface enhanced Raman scattering (SERS) is highly useful for sensitive analytical sensing; however, its practical availability for detecting a point mutation associated with disease in clinical sample was rarely proved. Herein, we present a toehold-mediated, DNA displacement-based, SERS sensor for detecting point mutations in the BIGH3 gene associated with the most common corneal dystrophies (CDs) in a clinical setting."
Financial supporters for this research include Ministry of Health and Welfare, National Research Foundation of Korea.

The news correspondents obtained a quote from the research from Hanyang University, "To diagnose Avellino corneal dystrophy (ACD), selectivity was ensured by exploring optimal DNA displacement conditions such as length of toehold and hybridization temperature. A SERS-efficient Ag@Au bimetallic nano dendrite was employed to ensure sensitivity. Optimization for a clinical setting showed that discrimination was maximized when toehold length was 6-mer (T6), and hybridization temperature was 36 degrees C. On the basis of tests that used clinical homozygous and heterozygous CD samples, a single-base mismatched DNA sequence was identifiable within 30 min with a limit of detection (LOD) of 400 fM."

According to the news reporters, the research concluded: "From the results, we conclude that our toehold-mediated, DNA displacement-based, SERS sensor allows a rapid and sensitive detection of a BIGH3 gene point mutation associated with Avellino corneal dystrophy, indicating the practical ability of the method to diagnose genetic diseases caused by point mutations."

For more information on this research see: Sensitive Surface Enhanced Raman Scattering-Based Detection of a BIGH3 Point Mutation Associated with Avellino Corneal Dystrophy. Analytical Chemistry, 2016;88(23):11288-11292. Analytical Chemistry can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. Digestive System Diseases and Conditions - Crohn's

New Crohn's Disease Findings Reported from University of Pittsburgh (A Pleiotropic Missense Variant in SLC39A8 Is Associated With Crohn's Disease and Human Gut Microbiome Composition)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Digestive System Diseases and Conditions - Crohn's Disease. According to news originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "Genome-wide association studies have identified 200 inflammatory bowel disease (IBD) loci, but the genetic architecture of Crohn's disease (CD) and ulcerative colitis remain incompletely defined. Here, we aimed to identify novel associations between IBD and functional genetic variants using the Illumina ExomeChip (San Diego, CA)."

Our news journalists obtained a quote from the research from the University of Pittsburgh, "Genotyping was performed in 10,523 IBD cases and 5726 non-IBD controls. There
were 91,713 functional single-nucleotide polymorphism loci in coding regions analyzed. A novel identified association was replicated further in 2 independent cohorts. We further examined the association of the identified single-nucleotide polymorphism with microbiota from 338 mucosal lavage samples in the Mucosal Luminal Interface cohort measured using 16S sequencing. We identified an association between CD and a missense variant encoding alanine or threonine at position 391 in the zinc transporter solute carrier family 39, member 8 protein (SLC39A8 alanine 391 threonine, rs13107325) and replicated the association with CD in 2 replication cohorts (combined meta-analysis P = 5.55 x 10(-13)). This variant has been associated previously with distinct phenotypes including obesity, lipid levels, blood pressure, and schizophrenia. We subsequently determined that the CD risk allele was associated with altered colonic mucosal microbiome composition in both healthy controls (P =.009) and CD cases (P =.0009). Moreover, microbes depleted in healthy carriers strongly overlap with those reduced in CD patients (P = 9.24 x 10(-16)) and overweight individuals (P = 6.73 x 10(-16)).

According to the news editors, the research concluded: "Our results suggest that an SLC39A8-dependent shift in the gut microbiome could explain its pleiotropic effects on multiple complex diseases including CD."

The news correspondents report that additional information may be obtained from R.H. Duerr, University of Pittsburgh, Grad Sch Public Hlth, Dept. of Human Genet, Pittsburgh, PA 15261, United States. Additional authors for this research include J.P. Achkar, T. Haritunians, J.P. Jacobs, K.Y. Hui, M. D'Amato, S. Brand, G. Radford-Smith, J. Halfvarson, J.H. Niess, S. Kugathasan, C. Buning, L.P. Schumm, L. Klei, A. Ananthakrishnan, G. Aumais, L. Baidoo, M. Dubinsky and Fiocc.

New Crohn's Disease Study Findings Reported from Catholic University of Korea (The importance of the Crohn's disease activity index in surgery for small bowel Crohn's disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Crohn's Disease. According to news originating from Suwon, South Korea, by NewsRx correspondents, research stated, "Aim of the study: Compared with patients with other benign intestinal conditions, patients with CD are at increased risk of developing postoperative complications following intestinal resection. We searched for useful tools for predicting postoperative complication in patients with CD by comparing the relationship between
postoperative morbidity in these patients as measured by three different scoring tools: general surgical risk (POSSUM score), disease activity (CDAI), and nutritional screening (nutritional prognostic index)."

Our news journalists obtained a quote from the research from the Catholic University of Korea, "We performed a retrospective review of 50 patients with small bowel CD who underwent surgical resection and primary anastomosis between 1999 and 2014. This study enrolled 34 men and 16 women. The mean age was 38.4 years (range: 20-81 years). There was no postoperative mortality. The overall postoperative morbidity rate (33.7%) predicted by POSSUM was similar to the rate in the study patients (36.0%). Although POSSUM score predicted higher postoperative morbidity rates in patients who underwent emergency surgery (estimated morbidity: 52.8%), the actual postoperative morbidity rate in the emergency surgery group (26.7%) was smaller than in the elective surgery group (40.0%). In addition, neither preoperative nutritional status nor POSSUM score was related to the severity of postoperative complications. CDAI score was significantly related to the severity of postoperative complications (P = 0.032). Based on the above results, a high preoperative CDAI score can predict negative postoperative outcomes."

According to the news editors, the research concluded: "We believe that disease activity should be controlled using various treatment modalities, such as enteral or total parenteral nutrition as well as medication, before performing surgery in patients with CD." For more information on this research see: The importance of the Crohn's disease activity index in surgery for small bowel Crohn's disease. Journal of Visceral Surgery, 2016;153(5):339-345. Journal of Visceral Surgery can be contacted at: Elsevier Masson, Via Paleocapa 7, 20121 Milano, Italy. New Cushing Syndrome Study Results Reported from Corpect Therapeutics (Mifepristone Improves Octreotide Efficacy in Resistant Ectopic Cushing's Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Adrenal Gland Diseases and Conditions - Cushing Syndrome have been published. According to news reporting out of Menlo Park, California, by
NewsRx editors, research stated, "A 30-year-old Caucasian man presented with severe Cushing's syndrome (CS) resulting from ectopic adrenocorticotropic syndrome (EAS) from a metastatic pancreatic neuroendocrine tumor. The patient remained hypercortisolemic despite treatment with steroidogenesis inhibitors, chemotherapy, and octreotide long-acting release (LAR) and was enrolled in a 24-week, phase 3 clinical trial of mifepristone for inoperable hypercortisolism."

Funders for this research include MedVal Scientific Information Services, LLC, Corcept Therapeutics.

Our news journalists obtained a quote from the research from Corcept Therapeutics, "After mifepristone was added to ongoing octreotide LAR treatment, EAS symptoms essentially resolved. Cortisol decreased dramatically, despite mifepristone's competitive glucocorticoid receptor antagonist effects. The clinical and biochemical effects reversed upon mifepristone discontinuation despite the continued use of octreotide LAR therapy."

According to the news editors, the research concluded: "Substantial improvement in octreotide LAR efficacy with mifepristone use was noted in this patient with ectopic CS, consistent with upregulation of somatostatin receptors previously downregulated by hypercortisolism."

For more information on this research see: Mifepristone Improves Octreotide Efficacy in Resistant Ectopic Cushing's Syndrome. Case Reports In Endocrinology, 2016;2016 ():8453801. (Hindawi Publishing - www.hindawi.com; Case Reports In Endocrinology - www.hindawi.com/crim/endocrinology/)

Our news journalists report that additional information may be obtained by contacting A.G. Moraitis, Corcept Therapeutics, 149 Commonwealth Drive, Menlo Park, CA 94025, United States.

Intracellular Signaling Peptides and Proteins - Cyclin D

New Cyclin D Study Results Reported from Ajou University
(Cannabinoids Regulate Bcl-2 and Cyclin D2 Expression in Pancreatic b Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Intracellular Signaling Peptides and Proteins - Cyclin D. According to news originating from Suwon, South Korea, by NewsRx correspondents, research stated, "Recent reports have shown that cannabinoid 1 receptors (CB1Rs) are expressed in pancreatic b cells, where they induce cell death and cell cycle arrest by directly inhibiting insulin receptor activation. Here, we report that CB1Rs regulate the expression of the anti-apoptotic protein Bcl-2 and cell cycle regulator cyclin D2 in pancreatic b
Our news journalists obtained a quote from the research from Ajou University, "Treatment of MIN6 and bTC6 cells with a synthetic CB1R agonist, WIN55,212-2, led to a decrease in the expression of Bcl-2 and cyclin D2, in turn inducing cell cycle arrest in G0/G1 phase and caspase-3-dependent apoptosis. Additionally, genetic deletion and pharmacological blockade of CB1Rs after injury in mice led to increased levels of Bcl-2 and cyclin D2 in pancreatic b cells."

According to the news editors, the research concluded: "These findings provide evidence for the involvement of Bcl-2 and cyclin D2 mediated by CB1Rs in the regulation of b-cell survival and growth, and will serve as a basis for developing new therapeutic interventions to enhance b-cell function and growth in diabetes."

For more information on this research see: Cannabinoids Regulate Bcl-2 and Cyclin D2 Expression in Pancreatic b Cells. Plos One, 2016;11(3):e0150981. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

**Cyclohexanes**

**New Cyclohexanes Study Findings Recently Were Reported by Researchers at University of Maryland (Effects of Ketamine and Ketamine Metabolites on Evoked Striatal Dopamine Release, Dopamine Receptors, and Monoamine Transporters)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cyclohexanes is now available. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "Following administration at subanesthetic doses, (R,S)-ketamine (ketamine) induces rapid and robust relief from symptoms of depression in treatment-refractory depressed patients. Previous studies suggest that ketamine's antidepressant properties involve enhancement of dopamine (DA) neurotransmission."

The news reporters obtained a quote from the research from the University of Maryland, "Ketamine is rapidly metabolized to (2S,6S)- and (2R,6R)-hydroxynorketamine (HNK), which have antidepressant actions independent of N-methyl-D-aspartate glutamate receptor inhibition. These antidepressant actions of (2S, 6S; 2R, 6R)- HNK, or other metabolites, as well as ketamine's side effects, including abuse potential, may be related to direct effects on components of the dopaminergic (DAergic) system. Here, brain and blood
distribution/clearance and pharmacodynamic analyses at DA receptors (D1-D5) and the DA, norepinephrine, and serotonin transporters were assessed for ketamine and its major metabolites (norketamine, dehydronortketamine, and HNKs). Additionally, we measured electrically evoked mesolimbic DA release and decay using fast-scan cyclic voltammetry following acute administration of subanesthetic doses of ketamine (2, 10, and 50 mg/kg, i.p.). Following ketamine injection, ketamine, norketamine, and multiple hydroxynorketamines were detected in the plasma and brain of mice. Dehydronortketamine was detectable in plasma, but concentrations were below detectable limits in the brain. Ketamine did not alter the magnitude or kinetics of evoked DA release in the nucleus accumbens in anesthetized mice. Neither ketamine's enantiomers nor its metabolites had affinity for DA receptors or the DA, noradrenaline, and serotonin transporters (up to 10 μM). These results suggest that neither the side effects nor antidepressant actions of ketamine or ketamine metabolites are associated with direct effects on mesolimbic DAergic neurotransmission."

According to the news reporters, the research concluded: "Previously observed in vivo changes in DAergic neurotransmission following ketamine administration are likely indirect."

For more information on this research see: Effects of Ketamine and Ketamine Metabolites on Evoked Striatal Dopamine Release, Dopamine Receptors, and Monoamine Transporters. *Journal of Pharmacology and Experimental Therapeutics*, 2016;359(1):159-170. *Journal of Pharmacology and Experimental Therapeutics* can be contacted at: Amer Soc Pharmacology Experimental Therapeutics, 9650 Rockville Pike, Bethesda, MD 20814-3995, USA.

**Lung Diseases and Conditions - Cystic Fibrosis**

**New Cystic Fibrosis Study Findings Have Been Reported by Researchers at Catholic University of Louvain (Antimicrobial Susceptibility of Pseudomonas aeruginosa Isolated from Cystic Fibrosis Patients in Northern Europe)**
"Pseudomonas aeruginosa is a major cause of morbidity and mortality in cystic fibrosis patients. This study compared the antimicrobial susceptibilities of 153 P. aeruginosa isolates from the United Kingdom (UK) (n = 58), Belgium (n = 44), and Germany (n = 51) collected from 118 patients during routine visits over the period from 2006 to 2012."

Funders for this research include Region Wallonne, Innoviris (Institut Bruxellois pour la Recherche et l’Innovation/Brussels Instituu t voor Onderzoek en Innovatie).

The news correspondents obtained a quote from the research from the Catholic University of Louvain, "MICs were measured by broth microdilution. Genes encoding extended-spectrum beta-lactamases (ESBL), metallo- beta-lactamases, and carbapenemases were detected by PCR. Pulsed-field gel electrophoresis and multilocus sequence typing were performed on isolates resistant to >= 3 antibiotic classes among the penicillins/cephalosporins, carbapenems, fluoroquinolones, aminoglycosides, and polymyxins. Based on EUCAST/ CLSI breakpoints, susceptibility rates were < 30%/ < 40% (penicillins, ceftazidime, amikacin, and ciprofloxacin), 44 to 48%/ 48 to 63% (carbapenems), 72%/ 72% (tobramycin), and 92%/ 78% (colistin) independent of patient age. Sixty percent of strains were multidrug resistant (MDR; European Centre for Disease Prevention and Control criteria). Genes encoding the most prevalent ESBL (BEL, PER, GES, VEB, CTX-M, TEM, SHV, and OXA), metallo- beta-lactamases (VIM, IMP, and NDM), or carbapenemases (OXA-48 and KPC) were not detected. The Liverpool epidemic strain (LES) was prevalent in UK isolates only (75% of MDR isolates). Four MDR sequence type 958 (ST958) isolates were found to be spread over the three countries. The other MDR clones were evidenced in <= 3 isolates and localized in a single country. A new sequence type (ST2254) was discovered in one MDR isolate in Germany. Clonal and nonclonal isolates with different susceptibility profiles were found in 20 patients."

According to the news reporters, the research concluded: "Thus, resistance and MDR are highly prevalent in routine isolates from 3 countries, with meropenem, tobramycin, and colistin remaining the most active drugs."

For more information on this research see: Antimicrobial Susceptibility of Pseudomonas aeruginosa Isolated from Cystic Fibrosis Patients in Northern Europe. New Cystic Fibrosis Study Results Reported from Griffith University
(Singing as an adjunct therapy for children and adults with cystic fibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Cystic Fibrosis have been published. According to news originating from Brisbane, Australia, by NewsRx correspondents, research stated, "Cystic fibrosis is a genetically inherited, life-threatening condition that affects major organs. The management of cystic fibrosis involves a multi-faceted daily treatment regimen that includes airway clearance techniques, pancreatic enzymes and other medications."

Our news journalists obtained a quote from the research from Griffith University, "Previous studies have found that compliance with this intensive treatment is poor, especially among adolescents. Because of both the nature and consequences of the illness and the relentless demands of the treatment, many individuals with cystic fibrosis have a poor quality of life. Anecdotal reports suggest that singing may provide both appropriate exercise for the whole respiratory system and a means of emotional expression which may enhance quality of life. This is an update of a previously published review. To evaluate the effects of singing as an adjunct therapy to standard treatment on the quality of life, morbidity, respiratory muscle strength and pulmonary function of children and adults with cystic fibrosis. Search methods We searched the Group's Cystic Fibrosis Trials Register and the Cochrane Central Register of Controlled Trials. Date of latest search: 18 February 2016. We also searched major allied complementary data bases, and clinical trial registers. Additionally, we handsearched relevant conference proceedings and journals. Date of latest search: 18 February 2016. Selection criteria Randomised controlled trials in which singing (as an adjunct intervention) is compared with either a control intervention (for example, playing computer games or doing craft activities) or no singing in people with cystic fibrosis. Data collection and analysis Results of searches were reviewed against pre-determined criteria for inclusion. Only one eligible trial was available for analysis. Since only one small study (n = 40) was included, no meta-analysis could be performed. The included randomised controlled study was of parallel design and undertaken at two paediatric hospitals in Australia. The study evaluated the effects of a singing program on the quality of life and respiratory muscle strength of hospitalised children with cystic fibrosis (mean age 11.6 years, 35% male). While the singing group received eight individual singing sessions, the control group participated in preferred recreational activities, such as playing computer games or watching movies. This study was limited by a small sample size (51 participants) and a high drop-out rate (21%). There were no significant differences between the groups at either post-intervention or follow up; although by the end of treatment there were some within-group statistically significant increases for both singing and control groups in some of the domains of the quality of life questionnaire Cystic Fibrosis Questionnaire-Revised (e.g. emotional, social and vitality domains). For the respiratory muscle strength indices, maximal expiratory pressure at follow up (six to eight weeks post-intervention) was higher in the singing group, mean
difference 25.80 (95% confidence interval 5.94 to 45.66). There was no significant difference between groups for any of the other respiratory function parameters (maximal inspiratory pressure, spirometry) at either post-intervention or follow up. Authors' conclusions There is insufficient evidence to determine the effects of singing on quality of life or on the respiratory parameters in people with cystic fibrosis."

According to the news editors, the research concluded: "However, there is growing interest in non-medical treatments for cystic fibrosis and researchers may wish to investigate the impact of this inexpensive therapy on respiratory function and psychosocial well-being further in the future."

For more information on this research see: Singing as an adjunct therapy for children and adults with cystic fibrosis. *Cochrane Database of Systematic Reviews*, 2016; (9):2502-2535. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news correspondents report that additional information may be obtained from J.Y. Irons, Griffith University, Queensland Conservatorium Res Center, Brisbane, Qld 4101, Australia. Additional authors for this research include P. Petocz, D.T. Kenny and A.B. Chang.

**Intercellular Signaling Peptides and Proteins -...**

**New Cytokines Findings Reported from University of Auckland (Plasmin and regulators of plasmin activity control the migratory capacity and adhesion of human T cells and dendritic cells by regulating cleavage of the chemokine CCL21)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Intercellular Signaling Peptides and Proteins - Cytokines have been presented. According to news reporting out of Auckland, New Zealand, by NewsRx editors, research stated, "The homeostatic chemokine CCL21 has a pivotal role in lymphocyte homing and compartment localisation within the lymph node, and also affects adhesion between immune cells. The effects of CCL21 are modulated by its mode of presentation, with different cellular responses seen for surface-bound and soluble forms."

Our news journalists obtained a quote from the research from the University of Auckland, "Here we show that plasmin cleaves surface-bound CCL21 to release the C-terminal peptide responsible for CCL21 binding to glycosaminoglycans on the extracellular matrix and cell surfaces, thereby generating the soluble form. Loss of this anchoring peptide enabled the chemotactic activity of CCL21 and reduced cell tethering. Tissue plasminogen activator did not cleave CCL21 directly but enhanced CCL21 processing through generation of plasmin from plasminogen. The tissue plasminogen activator inhibitor neuroserpin prevented processing of CCL21 and blocked the effects of soluble CCL21 on cell migration. Similarly, the plasmin-specific inhibitor alpha(2)-antiplasmin inhibited CCL21-mediated migration of human T cells..."
and dendritic cells and tethering of T cells to APCs."

According to the news editors, the research concluded: "We conclude that the plasmin system proteins plasmin, tissue plasminogen activator and neuroserpin regulate CCL21 function in the immune system by controlling the balance of matrix-and cell-bound CCL21."

For more information on this research see: Plasmin and regulators of plasmin activity control the migratory capacity and adhesion of human T cells and dendritic cells by regulating cleavage of the chemokine CCL21. *Immunology and Cell Biology*, 2016;94(10):955-963. *Immunology and Cell Biology* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. *Intercellular Signaling Peptides and Proteins -...*

**New Cytokines Findings from University of California Described (Gestational food restriction decreases placental interleukin-10 expression and markers of autophagy and endoplasmic reticulum stress in murine intrauterine growth restriction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Intercellular Signaling Peptides and Proteins - Cytokines have been published. According to news reporting originating from Los Angeles, California, by NewsRx correspondents, research stated, "Intrauterine growth restriction (IUGR) affects up to 10% of pregnancies and often results in short- and long-term sequelae for offspring. The mechanisms underlying IUGR are poorly understood, but it is known that healthy placenta is essential for nutrient provision to fuel fetal growth, and is regulated by immunologic inputs."

Our news editors obtained a quote from the research from the University of California, "We hypothesized that in pregnancy, maternal food restriction (FR) resulting in IUGR would decrease the overall immunotolerant milieu in the placenta, leading to increased cellular stress and death. Our specific objectives were to evaluate (1) key cytokines (eg, IL-10)
that regulate maternal-fetal tolerance, (2) cellular processes (autophagy and endoplasmic reticulum [ER] stress) that are immunologically mediated and important for cellular survival and functioning, and (3) the resulting IUGR phenotype and placental histopathology in this animal model. After subjecting pregnant mice to mild and moderate FR from gestational day 10 to 19, we collected placentas and embryos at gestational day 19. We examined RNA sequencing data to identify immunologic pathways affected in IUGR-associated placentas and validated messenger RNA expression changes of genes important in cellular integrity. We also evaluated histopathologic changes in vascular and trophoblastic structures as well as protein expression changes in autophagy, ER stress, and apoptosis in the mouse placentas. Several differentially expressed genes were identified in FR compared with control mice, including a considerable subset that regulates immune tolerance, inflammation, and cellular integrity.

According to the news editors, the research concluded: "In summary, maternal FR decreases the anti-inflammatory effect of IL-10 and suppresses placental autophagic and ER stress responses, despite evidence of dysregulated vascular and trophoblast structures leading to IUGR."

The news editors report that additional information may be obtained by contacting A. Chu, University of California, David Geffen Sch Med, Neonatal Res Center Div Neonatol & Dev Biol, UCLA Childrens Discovery & Innovat Inst Dept Pedi, Los Angeles, CA, United States. Additional authors for this research include S. Thamotharan, A. Ganguly, M. Wadehra, M. Pellegrini and S.U. Devaskar.

**New Cytokines Study Findings Have Been Reported from Sookmyung Women's University [Essential role of interferon regulatory factor 4 (IRF4) in immune cell development]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Intercellular Signaling Peptides and Proteins - Cytokines. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The family of interferon regulatory factors, which includes nine mammalian members (IRF1-IRF9), acts as transcription factors for interferons and thus
exerts regulatory functions in the immune system and in oncogenesis. Among these members, IRF4 expression is restricted to immune cells such as T and B lymphocytes, macrophages, and dendritic cells where it is a key factor in the regulation of differentiation and is required during the immune response for lymphocyte activation and the generation of immunoglobulin-secreting plasma cells."

Financial support for this research came from National Research Foundation of Korea.

Our news journalists obtained a quote from the research from Sookmyung Women's University, "Consequently, dysregulation of IRF4 is associated with many lymphoid malignancies. Recent studies have demonstrated that depending on the context and stage of hematopoietic cell differentiation in which its expression is dysregulated, IRF4 may act as either an oncogene or a tumor-suppressor-like factor. In addition, it has been shown that IRF4 plays a pivotal role in the development and function of several autoimmun-associated cells. Various genetic and functional studies have also pointed to IRF4 as a master regulator for autoimmunity."

According to the news editors, the research concluded: "In this review, the roles of IRF4 in the immune response are briefly summarized and discussed, with particular focus on its essential and distinct functions in immune cell development."

For more information on this research see: Essential role of interferon regulatory factor 4 (IRF4) in immune cell development. Archives of Pharmacal Research, 2016;39 (11):1548-1555. Archives of Pharmacal Research can be contacted at: Pharmaceutical Soc Korea, 1489-3 Suhcho-Dong, Suhcho-Ku, Seoul 137-071, South Korea. Herpesvirus Diseases and Conditions --

New Cytomegalovirus Data Have Been Reported by Researchers at University College (Cytomegalovirus latency and reactivation: recent insights into an age old problem)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Herpesvirus Diseases and Conditions - Cytomegalovirus are presented in a new report. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Human cytomegalovirus (HCMV) infection remains a major
cause of morbidity in patient populations. In certain clinical settings, it is the reactivation of the pre-existing latent infection in the host that poses the health risk.”

Funders for this research include Royal Free Charity Bursary, MRC CDA Fellowship.

Our news journalists obtained a quote from the research from University College, "The prevailing view of HCMV latency was that the virus was essentially quiescent in myeloid progenitor cells and that terminal differentiation resulted in the initiation of the lytic lifecycle and reactivation of infectious virus. However, our understanding of HCMV latency and reactivation at the molecular level has been greatly enhanced through recent advancements in systems biology approaches to perform global analyses of both experimental and natural latency. These approaches, in concert with more classical reductionist experimentation, are furnishing researchers with new concepts in cytomegalovirus latency and suggest that latent infection is far more active than first thought. In this review, we will focus on new studies that suggest that distinct sites of cellular latency could exist in the human host, which, when coupled with recent observations that report different transcriptional programmes within cells of the myeloid lineage, argues for multiple latent phenotypes that could impact differently on the biology of this virus in vivo."

According to the news editors, the research concluded: "Finally, we will also consider how the biology of the host cell where the latent infection persists further contributes to the concept of a spectrum of latent phenotypes in multiple cell types that can be exploited by the virus."

Our news journalists report that additional information may be obtained by contacting L. Dupont, Institute of Immunity and Transplantation, University College London, London, UK.

DNA Research

New DNA Research Data Have Been Reported by Researchers at Center for Molecular Discovery (Characterization of Cardiac Glycoside Natural Products as Potent Inhibitors of DNA Double-Strand Break Repair by a Whole-Cell Double Immunofluorescence ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on DNA Research have been published. According to news reporting originating in West Haven, Connecticut, by NewsRx journalists, research stated,
Small-molecule inhibitors of DNA repair pathways are being intensively investigated as primary and adjuvant chemotherapies. We report the discovery that cardiac glycosides, natural products in clinical use for the treatment of heart failure and atrial arrhythmia, are potent inhibitors of DNA double-strand break (DSB) repair.

Financial supporters for this research include CureSearch for Children's Cancer, National Institutes of Health, Yale Center for Molecular Discovery.

The news reporters obtained a quote from the research from Center for Molecular Discovery, "Our data suggest that cardiac glycosides interact with phosphorylated mediator of DNA damage checkpoint protein 1 (phospho-MDC1) or E3 ubiquitin-protein ligase ring finger protein 8 (RNF8), two factors involved in DSB repair, and inhibit the retention of p53 binding protein 1 (53BP1) at the site of DSBs. These observations provide an explanation for the anticancer activity of this class of compounds, which has remained poorly understood for decades, and provide guidance for their clinical applications. This discovery was enabled by the development of the first high-throughput unbiased cellular assay to identify new small-molecule inhibitors of DSB repair. Our assay is based on the fully automated, time-resolved quantification of phospho-SER139-H2AX (gH2AX) and 53BP1 foci, two factors involved in the DNA damage response network, in cells treated with small molecules and ionizing radiation (IR). This primary assay is supplemented by robust secondary assays that establish lead compound potencies and provide further insights into their mechanisms of action. Although the cardiac glycosides were identified in an evaluation of 2366 small molecules, the assay is envisioned to be adaptable to larger compound libraries."

According to the news reporters, the research concluded: "The assay is shown to be compatible with small-molecule DNA cleaving agents, such as bleomycin, neocarzinostatin chromophore, and lomaiviticin A, in place of IR."

Our news correspondents report that additional information may be obtained by contacting Y.V. Surovtseva, Yale Center for Molecular Discovery, West Haven, Connecticut 06516, United States. Additional authors for this research include V. Jairam, A.F. Salem, R.K. Sundaram, R.S. Bindra and S.B Herzon.

Missense Mutations in MECP2

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on DNA Research is now available. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "Mutations in the MECP2 gene cause Rett syndrome (RTT). MeCP2 binds to chromocentric DNA through its methyl CpG-binding domain (MBD) to regulate gene expression."

Our news editors obtained a quote from the research from the University of Toronto, "In heterozygous females the variable phenotypic severity is modulated by non-random X-inactivation, thus making genotype-phenotype comparisons unreliable. However, genotype-phenotype correlations in males with hemizygous MECP2 mutations can provide more accurate insights into the true biological effect of specific mutations. Here, we compared chromatin organization and binding dynamics for twelve MeCP2 missense mutations (including two novel and the five most common MBD missense RTT mutations) and identified a correlation with phenotype in hemizygous males. We observed impaired interaction of MeCP2-DNA for mutations around the MBD-DNA binding interface, and defective chromatin clustering for distal MBD mutations. Furthermore, binding and mobility dynamics show a gradient of impairment depending on the amino acid properties and tertiary structure within the MBD. Interestingly, a wide range of phenotypic/clinical severity, ranging from neonatal encephalopathy to mild psychiatric abnormalities were observed and all are consistent with our functional/molecular results. Overall, clinical severity showed a direct correlation with the functional impairment of MeCP2."

According to the news editors, the research concluded: "These mechanistic and phenotypic correlations of MeCP2 mutations will enable improved and individualized diagnostics, and may lead to personalized therapeutic interventions."

For more information on this research see: From Function to Phenotype: Impaired DNA Binding and Clustering Correlates with Clinical Severity in Males with Missense Mutations in MECP2. Scientific Reports, 2016;6():1-13. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting J.B. Vincent, University of Toronto, Dept. of Psychiat, Toronto, ON, Canada. New DNA Research Findings Reported from School of Medicine
(Intracellular mitochondrial DNA transfers to the nucleus in human cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on DNA Research. According to news originating from Daejeon, South Korea, by NewsRx editors, the research stated, "Genome
instability is a well-known hallmark of cancer cells. With the revolution of high-throughput sequencing technologies, our knowledge of somatically acquired genome structural variation (SV) has greatly improved over the last decade."

Financial support for this research came from KAIST.

Our news journalists obtained a quote from the research from the School of Medicine, "Remarkably, surveys of thousands of human whole cancer genomes have shown that chromosomal rearrangements are frequently combined with mitochondrial DNA (mtDNA) fragments somatically transferred to the nucleus. The high transfer rate and features of integration breakpoints provide clues for understanding the potential mechanisms underlying these events and provide insights into the role of mtDNA segments transferred into the nucleus."

According to the news editors, the research concluded: "In this review, I discuss our current understanding of somatic nuclear transfer of mitochondrial DNA into the nuclear genome of human cancer cells."

The news correspondents report that additional information may be obtained from Y.S. Ju, Korea Adv Inst Sci & Technol, Grad Sch Med Sci & Engn, Daejeon 34141, South Korea.

DNA Research

New DNA Research Findings from Saha Institute of Nuclear Physics Described (Spectroscopic studies on the interaction of DNA with the copper complexes of NSAIDs lornoxicam and isoxicam)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on DNA Research is the subject of a report. According to news reporting from Kolkata, India, by NewsRx journalists, research stated, "Non Steroidal Anti-inflammatory Drugs (NSAIDs) form the most common class of anti-inflammatory and analgesic agents. They also show anticancer properties for which they exert their effects by interacting at the protein but not at the genomic level."

Financial support for this research came from Department of Atomic Energy.

The news correspondents obtained a quote from the research from the Saha Institute of Nuclear Physics, "This is because most NSAIDs are anions at physiological pH, which prohibit their approach to the polyanionic DNA backbone. Complexing NSAIDs with bioactive metal like copper obliterates this disadvantage. Here, copper complexes of two oxicam NSAIDs,
Lornoxicam (Lx) and Isoxicam (Isx) have been chosen to study their interaction with calf thymus (ct) DNA and have been synthesized as per reported protocols. UV-vis absorption showed that DNA binding to Cu(II)-Lx complex alters the absorption spectra indicating changes in the electronic environment of the complex, whereas, for Cu(II)-Isx there was only small changes. Hence, UV-vis absorption was used to determine the binding constant, stoichiometry and thermodynamic parameters of Cu(II)-Lx. However, UV-melting studies and CD difference spectra showed that both Cu(II)-Lx and Cu(II)-Isx can interact with the DNA backbone albeit with different binding modes. The probable binding mode was determined by kinetics of EtBr displacement and viscosity measurements.

According to the news reporters, the research concluded: "Our results point to an intercalative mode of binding for Cu(II)-Lx and external groove binding for Cu(II)-Isx."

For more information on this research see: Spectroscopic studies on the interaction of DNA with the copper complexes of NSAIDs lornoxicam and isoxicam. *International Journal of Biological Macromolecules*, 2016;93():47-56. *International Journal of Biological Macromolecules* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; International Journal of Biological Macromolecules - www.journals.elsevier.com/international-journal-of-biological-macromolecules/)

Our news journalists report that additional information may be obtained by contacting M. Sarkar, Saha Inst Nucl Phys, Div Chem Sci, Kolkata 700064, India. Additional authors for this research include S. Ray and M. Sarkar.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijbiomac.2016.08.025. This DOI is a link to an online electronic document that is either free or for purchase.

**DNA Research**

**New DNA Research Study Findings Have Been Reported by Investigators at Harvard School of Medicine (A high-throughput small molecule screen identifies synergism between DNA methylation and Aurora kinase pathways for X reactivation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in DNA Research. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "X-chromosome inactivation is a mechanism of dosage compensation in which one of the two X chromosomes in female mammals is transcriptionally silenced. Once established, silencing of the inactive X (Xi) is robust and difficult to reverse pharmacologically."

Funders for this research include HHS | National Institutes of Health (NIH), Howard Hughes Medical Institute (HHMI).

The news reporters obtained a quote from the research from the Harvard School of Medicine, "However, the Xi is a reservoir of > 1,000 functional genes that could be potentially tapped to treat X-linked disease. To identify compounds that could reactivate the Xi, here we..."
screened similar to 367,000 small molecules in an automated high-content screen using an Xi-linked GFP reporter in mouse fibroblasts. Given the robust nature of silencing, we sensitized the screen by 'priming' cells with the DNA methyltransferase inhibitor, 5-aza-2'-deoxycytidine (5azadC). Compounds that elicited GFP activity include VX680, MLN8237, and 5azadC, which are known to target the Aurora kinase and DNA methylation pathways. We demonstrate that the combinations of VX680 and 5azadC, as well as MLN8237 and 5azadC, synergistically up-regulate genes on the Xi."

According to the news reporters, the research concluded: "Thus, our work identifies a synergism between the DNA methylation and Aurora kinase pathways as being one of interest for possible pharmacological reactivation of the Xi."

For more information on this research see: A high-throughput small molecule screen identifies synergism between DNA methylation and Aurora kinase pathways for X reactivation. Proceedings of the National Academy of Sciences of the United States of America, 2016;113 (50):14366-14371. Proceedings of the National Academy of Sciences of the United States of America can be contacted at: Natl Acad Sciences, 2101 Constitution Ave NW, Washington, DC 20418, USA. Genetics - DNA Research

New DNA Research Study Findings Have Been Reported by Researchers at University of Geneva (Alternative lengthening of human telomeres is a conservative DNA replication process with features of break-induced replication)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Genetics - DNA Research is the subject of a report. According to news reporting from Geneva, Switzerland, by NewsRx journalists, research stated, "Human malignancies overcome replicative senescence either by activating the reverse-transcriptase telomerase or by utilizing a homologous recombination-based mechanism, referred to as alternative lengthening of telomeres (ALT). In budding yeast, ALT exhibits features of break-induced replication (BIR), a repair pathway for one-ended DNA double-strand breaks (DSBs) that requires the non-essential subunit Pol32 of DNA polymerase delta and leads to
conservative DNA replication."

The news correspondents obtained a quote from the research from the University of Geneva, "Here, we examined whether ALT in human cancers also exhibits features of BIR. A telomeric fluorescence in situ hybridization protocol involving three consecutive staining steps revealed the presence of conservatively replicated telomeric DNA in telomerase-negative cancer cells. Furthermore, depletion of PolD3 or PolD4, two subunits of human DNA polymerase delta that are essential for BIR, reduced the frequency of conservatively replicated telomeric DNA ends and led to shorter telomeres and chromosome end-to-end fusions."

According to the news reporters, the research concluded: "Taken together, these results suggest that BIR is associated with conservative DNA replication in human cells and mediates ALT in cancer."

For more information on this research see: Alternative lengthening of human telomeres is a conservative DNA replication process with features of break-induced replication. *EMBO Reports*, 2016;17(12):1731-1737. *EMBO Reports* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. **DNA Research**

**New DNA Research Study Findings Recently Were Reported by Researchers at School of Medicine (Aldo-keto reductase 1B10 protects human colon cells from DNA damage induced by electrophilic carbonyl compounds)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on DNA Research are discussed in a new report. According to news reporting from Springfield, Illinois, by NewsRx journalists, research stated, "Electrophilic carbonyl compounds are highly cytotoxic and genotoxic. Aldo-keto reductase 1B10 (AKR1B10) is an enzyme catalyzing reduction of carbonyl compounds to less toxic alcoholic forms."

The news correspondents obtained a quote from the research from the School of Medicine, "This study presents novel evidence that AKR1B10 protects colon cells from DNA damage induced by electrophilic carbonyl compounds. AKR1B10 is specifically expressed in epithelial cells of the human colon, but this study found that AKR1B10 expression was lost or markedly diminished in colorectal cancer, precancerous tissues, and a notable portion of normal adjacent tissues (NAT). SiRNA-mediated silencing of AKR1B10 in colon cancer cells HCT-8 enhanced cytotoxicity of acrolein and HNE, whereas ectopic expression of AKR1B10 in colon
cancer cells RKO prevented the host cells against carbonyl cytotoxicity. Furthermore, siRNA-mediated AKR1B10 silencing led to DNA breaks and activation of -H2AX protein, a marker of DNA double strand breaks, particularly in the exposure of HNE (10M). In the AKR1B10 silenced HCT-8 cells, hypoxanthine-guanine phosphoribosyl transferase (HPRT) mutant frequency increased by 26.8 times at basal level and by 33.5 times in the presence of 10M HNE when compared to vector control cells. In these cells, the cyclic acrolein-deoxyguanosine adducts levels were increased by over 10 times. These findings were confirmed by pharmacological inhibition of AKR1B10 activity by Epalrestat. Taken together, these data suggest that AKR1B10 is a critical protein that protects host cells from DNA damage induced by electrophilic carbonyl compounds.

According to the news reporters, the research concluded: "AKR1B10 deficiency in the colon may be an important pathogenic factor in disease progression and carcinogenesis."

**Proteins - DNA-Binding Proteins**

**New DNA-Binding Proteins Data Have Been Reported by Researchers at Zhejiang Chinese Medical University (Bufalin inhibits pancreatic cancer by inducing cell cycle arrest via the c-Myc/NF-kappa B pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - DNA-Binding Proteins. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Bufalin, a cardiotonic steroid isolated from toad venom (bufo garnarizans Cantor or B. melanoticus Schneider), has widely demonstrated antitumor effects and exhibits potential antitumor activity in various human cancer cells lines. Aims of the study: The main characteristic of cancers including pancreatic cancer is the ability of uncontrolled proliferation."

The news reporters obtained a quote from the research from Zhejiang Chinese Medical University, "The aim of this study is to clarify the underlying mechanism by which bufalin inhibits pancreatic cancer cell proliferation. The effect of bufalin on the suppression of tumor growth in vivo was studied in a bioluminescent mouse model generated using the
pancreatic cancer cell line BxPC3-luc2 and the cytotoxicity was evaluated in BcPc3 and Sw1990 cells with MTT. Flow cytometry and western blotting analyses were utilized to detect the effect of bufalin on the cell cycle and to detect the cell cycle-related proteins, respectively. Then, a luciferase reporter assay was applied to screen the activity of potent transcription factors following bufalin exposure and their expression was detected by western blotting. Bufalin suppressed tumor growth in a bioluminescence mouse model generated using BxPC3-luc2 cells and inhibited cell proliferation in vitro through inducing cell cycle arrest at S phase. Bufalin treatment inhibited cyclin D1 and cyclin E1 expression and therefore increased expression of p27, a regulatory molecular that controls cell cycle transition from S to G2 phase. Furthermore, luciferase reporter screening studies revealed that bufalin inhibited the expression and activity of the transcription factors c-Myc and NF-kappa B, which might cause cell cycle arrest at S phase and the inhibition of cell proliferation."

According to the news reporters, the research concluded: "Taken together, our results indicate that bufalin can inhibit pancreatic cancer by targeting c-Myc, thus suggesting that the mechanism of c-Myc regulation by bufalin might be worthy of further study regarding its potential as a therapeutic target for pancreatic cancer treatment." For more information on this research see: Bufalin inhibits pancreatic cancer by inducing cell cycle arrest via the c-Myc/NF-kappa B pathway. *Journal of Ethnopharmacology*, 2016;193():538-545. *Journal of Ethnopharmacology* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. *Drugs and Therapies - Toxicology and Pharmacology*

**New Data from A. Aigner et al Illuminate Findings in Toxicology and Pharmacology (Advancing the use of noncoding RNA in regulatory toxicology: Report of an ECETOC workshop)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Toxicology and Pharmacology are discussed in a new report. According to news originating from Brussels, Belgium, by NewsRx correspondents, research stated, "The European Centre for the Ecotoxicology and Toxicology of Chemicals (ECETOC) organised a workshop to discuss the state-of-the-art research on noncoding RNAs (ncRNAs) as biomarkers in regulatory toxicology and as analytical and therapeutic agents. There was agreement that ncRNA expression profiling data requires careful evaluation to determine the utility of specific ncRNAs as biomarkers."
Financial supporters for this research include European Centre for Ecotoxicology and Toxicology of Chemicals, Long-range Research Initiative of the European Chemical Industry Council.

Our news journalists obtained a quote from the research, "To advance the use of ncRNA in regulatory toxicology, the following research priorities were identified: (1) Conduct comprehensive literature reviews to identify possibly suitable ncRNAs and areas of toxicology where ncRNA expression profiling could address prevailing scientific deficiencies. (2) Develop consensus on how to conduct ncRNA expression profiling in a toxicological context. (3) Conduct experimental projects, including, e.g., rat (90-day) oral toxicity studies, to evaluate the toxicological relevance of the expression profiles of selected ncRNAs. Thereby, physiological ncRNA expression profiles should be established, including the biological variability of healthy individuals. To substantiate the relevance of key ncRNAs for cell homeostasis or pathogenesis, molecular events should be dose-dependently linked with substance induced apical effects."

According to the news editors, the research concluded: "Applying a holistic approach, knowledge on ncRNAs, 'omics and epigenetics technologies should be integrated into adverse outcome pathways to improve the understanding of the functional roles of ncRNAs within a regulatory context."

For more information on this research see: Advancing the use of noncoding RNA in regulatory toxicology: Report of an ECETOC workshop. Regulatory Toxicology and Pharmacology, 2016;82():127-139. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Regulatory Toxicology and Pharmacology - www.journals.elsevier.com/regulatory-toxicology-and-pharmacology/)

Musculoskeletal Diseases and Conditions –...

New Data from Aarhus University Illuminate Findings in Osteogenesis Imperfecta (Skeletal phenotypes in adult patients with osteogenesis imperfecta-correlations with COL1A1/COL1A2 genotype and collagen structure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Musculoskeletal Diseases and Conditions - Osteogenesis Imperfecta. According to news reporting from Aarhus, Denmark, by NewsRx journalists, research stated, "Osteogenesis imperfecta (OI) is characterized by a high fracture
rate and great heterogeneity. This cross-sectional study presents skeletal investigations and protein analyses in 85 adult OI patients."

The news correspondents obtained a quote from the research from Aarhus University, "We find significant differences in bone mass, architecture, and fracture rate that correlate well with the underlying biochemical and molecular abnormalities. OI is a hereditary disease characterized by compromised connective tissue predominantly caused by mutations in collagen type 1 (COL-1) encoding genes. Widespread symptoms reflect the ubiquity of COL-1 throughout the body. The purpose of this study was to improve our understanding of clinical manifestations by investigating anthropometry and skeletal phenotypes (DXA, HRpQCT) in an adult OI population and compare the findings to underlying COL-1 genotype and structure. The study comprised 85 OI patients aged 45 (1978) years, Sillence type I (n = 58), III (n = 12), and IV (n = 15). All patients underwent DXA, HRpQCT, spine X-ray, biochemical testing, and anthropometry. COL1A1 and COL1A2 were sequenced and 68 OI causing mutations identified (46 in COL1A1, 22 in COL1A2). Analysis of COL-1 structure (quantitative/qualitative defect) by SDS-PAGE was performed in a subset (n = 67). A qualitative collagen defect predisposed to a more severe phenotype with reduced aBMD, more fractures, and affected anthropometry compared to patients with a quantitative COL-1 defect (p < 0.05). HRpQCT revealed significant differences between patients with OI type I and IV. Patients with type I had lower vBMD (p < 0.005), thinner cortexes (p < 0.001), and reduced trabecular number (p < 0.005) compared to patients with type IV indicating that HRpQCT may distinguish type I from type IV better than DXA. The defective collagen in patients with OI has pronounced effects on the skeleton."

According to the news reporters, the research concluded: "The classical OI types based on the clinical classification show profound differences in bone mass and architecture and the differences correlate well with the underlying biochemical and molecular collagen abnormalities."

For more information on this research see: Skeletal phenotypes in adult patients with osteogenesis imperfecta-correlations with COL1A1/COL1A2 genotype and collagen structure. Osteoporosis International, 2016;27(11):3331-3341. Osteoporosis International can be contacted at: Springer London Ltd, 236 Grays Inn Rd, 6TH Floor, London WC1X 8HL, England. New Data from Ain Shams University Illuminate Findings in Non-Small Cell Lung Cancer (S-1-based regimens for locally advanced/metastatic non-small-cell lung cancer: a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Non-Small Cell Lung Cancer is now available. According to news reporting originating from Cairo, Egypt, by NewsRx correspondents, research stated, "We performed a meta-analysis of S-1-containing regimens versus control in the management of locally advanced/metastatic non-small-cell lung cancer. Eligible studies included randomized studies evaluating S-1-containing regimens in the settings of locally advanced, first-line metastatic or second-line metastatic non-small-cell lung cancer."

Our news editors obtained a quote from the research from Ain Shams University, "Pooled odds ratio for overall response rate was 1.09 (95% CI: 0.85-1.38; p=0.2), the pooled hazard ratio for progression-free survival was 0.98 (95% CI: 0.88-1.09; p=0.69) and the pooled hazard ratio for overall survival was 0.98 (95% CI: 0.88-1.10; p=0.75) for S-1-based regimens versus control. Moreover, the relative risk of febrile neutropenia was 0.34 (95% CI: 0.20-0.59; p=0.0001)."

According to the news editors, the research concluded: "Our meta-analysis has demonstrated that S-1-based regimens are associated with similar efficacy outcomes and better hematological tolerability."

The news editors report that additional information may be obtained by contacting O. Abdel-Rahman, Clinical Oncology Department, Faculty of Medicine, Ain Shams University, Cairo, Egypt.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2217/fon.15.338. This DOI is a link to an online electronic document that is either free or for purchase.

New Data from Ataturk Teaching and Research Hospital Illuminate Findings in Antipsychotics (A Case of Ileus in a Patient with Schizophrenia Under Paliperidone Palmitate Treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antipsychotics have been published. According to news reporting out of Ankara, Turkey, by NewsRx editors, research stated, "Constipation is a side effect of antipsychotic drugs that have high affinity for muscarinic..."
Our news journalists obtained a quote from the research from Ataturk Teaching and Research Hospital, "In addition, ileus is an important side effect of antipsychotic treatment, with potentially morbid and mortal consequences if early detection fails. In this report, a colonic ileus case is described in a patient with schizophrenia under the treatment of paliperidone palmitate."

According to the news editors, the research concluded: "Consequently, complete physical examination and dose screening of side effects are recommended when antipsychotics are prescribed."

For more information on this research see: A Case of Ileus in a Patient with Schizophrenia Under Paliperidone Palmitate Treatment. Psychiatry Investigation, 2016;13 (6):665-667. Psychiatry Investigation can be contacted at: Korean Neuropsychiatric Assoc, Rn 522, G-Five Central Plaza 1685-8 Seocho 4-Dong, Seocho-Gu, Seoul, 137-882, South Korea.

Our news journalists report that additional information may be obtained by contacting S.S. Can, Ankara Ataturk Training & Res Hosp, Dept. of Psychiat, TR-06800 Ankara, Turkey.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4306/pi.2016.13.6.665. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions - Fat Embolism (Cerebral Fat Embolism After Video-Assisted Thoracic Surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Fat Embolism. According to news originating from Florence, Italy, by NewsRx correspondents, research stated, "Cerebral fat embolism (CFE) is an uncommon disease occurring mainly after traumatic lower limb long bone fractures. A 64-year-old woman with pneumonia and bilateral pleural effusion underwent video-assisted thoracic surgery (VATS)."

Our news journalists obtained a quote from the research from Azienda Ospedaliera University, "After 3 days, the patient had an acute decrease in consciousness level followed by the onset of seizures and right hemiparesis. Brain computed tomography and magnetic resonance imaging showed findings suggestive of CFE. CFE occurring after an uncommon nontraumatic cause of fat embolism, such as VATS, is a rare clinical event whose diagnosis could be challenging."

According to the news editors, the research concluded: "Neuroimaging can hasten diagnosis and prevent other unnecessary investigations and treatments."

Inflammation

New Data from Bar-Ilan University Illuminate Findings in Inflammation (Differentiating Between Cancer and Inflammation: A Metabolic-Based Method for Functional Computed Tomography Imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Inflammation. According to news reporting out of Ramat Gan, Israel, by NewsRx editors, research stated, "One of the main limitations of the highly used cancer imaging technique, PET-CT, is its inability to distinguish between cancerous lesions and post treatment inflammatory conditions. The reason for this lack of specificity is that [(18)F]FDG-PET is based on increased glucose metabolic activity, which characterizes both cancerous tissues and inflammatory cells."

Financial supporters for this research include Israel Science Foundation, Ministry of Science, Technology and Space, Israel Cancer Research Fund.

Our news journalists obtained a quote from the research from Bar-Ilan University, "To overcome this limitation, we developed a nanoparticle-based approach, utilizing glucose-functionalized gold nanoparticles (GF-GNPs) as a metabolically targeted CT contrast agent. Our approach demonstrates specific tumor targeting and has successfully distinguished between cancer and inflammatory processes in a combined tumor-inflammation mouse model, due to dissimilarities in angiogenesis occurring under different pathologic conditions."

According to the news editors, the research concluded: "This study provides a set of capabilities in cancer detection, staging and follow-up, and can be applicable to a wide range of cancers that exhibit high metabolic activity."

Our news journalists report that additional information may be obtained by contacting M. Motiei, Faculty of Engineering and the Institutes of Nanotechnology & Advanced Materials, Bar-Ilan University, Ramat-Gan 5290002, Israel. Additional authors for this research include T. Dreifuss, O. Betzer, H. Panet, A. Popovtzer, J. Santana, G. Abourbeh, E. Mishani and...
Gram-Negative Bacteria - Enterobacteriaceae

New Data from Brown University Illuminate Findings in Enterobacteriaceae (Colonisation with extended-spectrum beta-lactamase-producing Enterobacteriaceae and risk for infection among patients with solid or haematological malignancy: a ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Enterobacteriaceae have been published. According to news originating from Providence, Rhode Island, by NewsRx correspondents, research stated, "Cancer patients are vulnerable to infections, including those with extended-spectrum beta-lactamase-producing Enterobacteriaceae (ESBL-PE), and most of these infections are associated with colonisation of the gastrointestinal tract. The aim of this study was to estimate the prevalence of gastrointestinal colonisation with ESBL-PE cancer populations and to determine the risk for subsequent bloodstream infection (BSI) with these pathogens."

Our news journalists obtained a quote from the research from Brown University, "PubMed and EMBASE databases were searched from 1 January 1991 to 1 March 2016 to identify studies regarding ESBL-PE colonisation among patients with malignancies. Ten studies (out of 561 non-duplicate articles) were included, providing data on 2211 patients. The pooled prevalence of ESBL-PE colonisation was 19% [95% confidence interval (CI) 8-32%]. Stratifying per region, the pooled prevalence in Europe was 15% (95% CI 10-21%), whereas in Asia the pooled prevalence was 31% (95% CI 4-69%). In addition, the pooled prevalence was 15% (95% CI 7-24%) among patients with haematological malignancy, whereas no studies were identified that included solely patients with solid tumours. Notably, cancer patients with ESBL-PE colonisation were 12.98 times (95% CI 3.91-43.06) more likely to develop a BSI with ESBL-PE during their hospitalisation compared with non-colonised patients. We found that, overall, one in five patients with cancer is colonised with ESBL-PE and the incidence can be as high as one in three in Asia. This is important because colonisation was associated with an almost 13 times higher risk for developing BSI with ESBL-PE."

According to the news editors, the research concluded: "Screening measures should be evaluated to identify their clinical benefit in patients with malignancy."

For more information on this research see: Colonisation with extended-spectrum beta-lactamase-producing Enterobacteriaceae and risk for infection among patients with solid or haematological malignancy: a systematic review and meta-analysis. International Journal of Antimicrobial Agents, 2016;48(6):647-654. International Journal of Antimicrobial Agents can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; International Journal of Antimicrobial Agents -
The news correspondents report that additional information may be obtained from E. Mylonakis, Brown University, Rhode Island Hospital, Warren Alpert Med Sch, Div Infect Dis, Providence, RI 02903, United States. Additional authors for this research include S. Karanika, M. Detsis and E. Mylonakis.

**Uterine Diseases and Conditions - Endometriosis**

**New Data from Capital Medical University Illuminate Findings in Endometriosis (Prognostic value of endometriosis in patients with stage I ovarian clear cell carcinoma: Experiences at three academic institutions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Uterine Diseases and Conditions - Endometriosis. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "To investigate the prognostic value of endometriosis in patients with stage I ovarian clear cell carcinoma (OCCC). The medical records of patients with stage I OCCC who had undergone complete staging surgery followed by systemic chemotherapy were retrospectively reviewed."

Funders for this research include Foreign Cooperation Projects of China Science and Technology Ministry, China Postdoctoral Science Foundation, Beijing Postdoctoral Research Foundation.

The news reporters obtained a quote from the research from Capital Medical University, "A total of 237 women were included in this study. Univariate analysis revealed that the patients with endometriosis-associated ovarian carcinoma (EAOC) had significantly improved recurrence-free survival (RFS) and overall survival (OS) than those without EAOC (5-year RFS: 91.4% vs. 73.0%, respectively, and 5-year OS: 97.5% vs. 89.9%). However, EAOC was not identified as a significant prognostic predictor in multivariate analysis. The potential risk factors determined to be associated with EAOC included the pretreatment CA-125 level, FIGO stage, lymphovascular space invasion (LVS1), and menopausal status (P < 0.001, P = 0.0031, P = 0.020, and P = 0.038, respectively)."

According to the news reporters, the research concluded: "Endometriosis was not independently associated with the prognosis of the OCCC patients, even when the tumor was confined to stage I. However, the intrinsic relationship between endometriosis and OCCC warrants further investigation."

For more information on this research see: Prognostic value of endometriosis in patients with stage I ovarian clear cell carcinoma: Experiences at three academic institutions. *Gynecologic Oncology*, 2016;143(3):526-531. *Gynecologic Oncology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA.

Bone Marrow Diseases and Conditions - Aplastic…

New Data from Catholic University of Korea Illuminate Findings in Aplastic Anemia (Impact of pretransplant red cell transfusion on outcome after allogeneic stem cell transplantation in adult patients with severe aplastic anemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Bone Marrow Diseases and Conditions - Aplastic Anemia. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "The aim of this study was to evaluate the impact of pretransplant transfusion of packed red cells (PRCs) on outcome after allogeneic stem cell transplantation (SCT) in severe aplastic anemia (SAA). A total of 221 adult SAA patients receiving allogeneic SCT were analyzed."

Our news journalists obtained a quote from the research from the Catholic University of Korea, "The patients were divided into two groups according to the amount of pretransplant transfusion before SCT: the low transfusion group (> 32 PRCunits, n = 164) and the high transfusion group (432 PRC units, n = 57). The incidence of engraftment failure was not different between the two groups. The incidence of acute GvHD (grades II-IV) was higher in the high transfusion group than in the low transfusion group (P = 0.04), and the incidences of chronic extensive GVHD were not significantly different (P = 0.136). The high transfusion group had higher 5-year transplant-related mortality (TRM) (24.8% vs 6.8%, P<0.001) and lower overall survival (OS) (72.3% vs 91.9%, P<0.001) than those in the low transfusion group. Multivariate analysis revealed that the high transfusion group and unrelated donor type were independent prognostic factors affecting OS."

According to the news editors, the research concluded: "These results indicate that a history of higher pretransplant transfusion of PRCs was associated with increased TRM and decreased OS, suggesting that iron overload had a negative impact on outcome after SCT in SAA."

For more information on this research see: Impact of pretransplant red cell transfusion on outcome after allogeneic stem cell transplantation in adult patients with severe
aplastic anemia. *Bone Marrow Transplantation*, 2016;51(10):1323-1329. *Bone Marrow Transplantation* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Bone Marrow Transplantation - www.nature.com/bmt/)

**Mosquito-Borne Diseases - Dengue Hemorrhagic Fever**

**New Data from Center for Research and Advanced Studies of the National Polytechnic Institute (CINVESTAV) Illuminate Findings in Dengue Hemorrhagic Fever (No Evidence of Dengue Virus Infections in Several Species of Bats Captured in Central and ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mosquito-Borne Diseases - Dengue Hemorrhagic Fever. According to news originating from Mexico City, Mexico, by NewsRx correspondents, research stated, "Bats are reservoirs for viruses with zoonotic potential in the Americas, and scattered evidence exists suggesting that bats may act as reservoirs for dengue virus (DENV). To explore further the role of bats as part of DENV sylvatic cycles, 240 bats of 18 species were captured in 2 states of Mexico with contrasting ecological characteristics but concurrent DENV activity in humans."

Funders for this research include Miguel Aleman Foundation (Mexico), DGAPA-PAPIIT, Consejo Nacional de Ciencia y Tecnologia.

Our news journalists obtained a quote from the research from the Center for Research and Advanced Studies of the National Polytechnic Institute (CINVESTAV), "RT-PCR analysis of RNA extracted from liver or spleen tissue from de bats failed to show evidence for the presence of DENV nucleic acids in these organs. In addition, plasma assayed by plaque reduction neutralization test showed no evidence of neutralizing anti-DENV antibodies."

According to the news editors, the research concluded: "These results suggest that American bats may not be reservoirs or amplification host for DENV infection."

The news correspondents report that additional information may be obtained from J.E. Ludert, Center Res & Adv Studies CINVESTAV IPN, Dept. of Infect & Mol Pathogenesis, Mexico City, DF, Mexico. Additional authors for this research include C.M. Ramirez, B. Recio-Totoro, J. Tolentino-Chi, H. Lanz, R.M. del Angel, V. Sanchez-Cordero, A. Rodriguez- Moreno and J.E. Ludert.

Oncology - Gliomas

New Data from Central South University Illuminate Findings in Gliomas (PPIC, EMP3 and CHI3L1 Are Novel Prognostic Markers for High Grade Glioma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Gliomas. According to news reporting from Changsha, People's Republic of China, by NewsRx journalists, research stated, "Current treatment methods for patients diagnosed with gliomas have shown limited success. This is partly due to the lack of prognostic genes available to accurately predict disease outcomes."

The news correspondents obtained a quote from the research from Central South University, "The aim of this study was to investigate novel prognostic genes based on the molecular profile of tumor samples and their correlation with clinical parameters. In the current study, microarray data (GSE4412 and GSE7696) downloaded from Gene Expression Omnibus were used to identify differentially expressed prognostic genes (DEPGs) by significant analysis of microarray (SAM) between long-term survivors (>2 years) and short-term survivors (<= 2 years). DEPGs generated from these two datasets were intersected to obtain a list of common DEPGs. The expression of a subset of common DEPGs was then independently validated by real-time reverse transcription quantitative PCR (qPCR). Survival value of the common DEPGs was validated using known survival data from the GSE4412 and TCGA dataset. After intersecting DEPGs generated from the above two datasets, three genes were identified which may potentially be used to determine glioma patient prognosis. Independent validation with glioma patients tissue (n = 70) and normal brain tissue (n = 19) found PPIC, EMP3 and CHI3L1 were up-regulated in glioma tissue."

According to the news reporters, the research concluded: "Survival value validation showed that the three genes correlated with patient survival by Kaplan-Meir analysis, including grades, age and therapy."

For more information on this research see: PPIC, EMP3 and CHI3L1 Are Novel Prognostic Markers for High Grade Glioma. International Journal of Molecular Sciences,
2016;17(11):739-751. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

**Oncology - Liver Cancer**

**New Data from Chinese Academy of Sciences Illuminate Findings in Liver Cancer (LncBRM initiates YAP1 signalling activation to drive self-renewal of liver cancer stem cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Liver cancer stem cells (CSCs) may contribute to the high rate of recurrence and heterogeneity of hepatocellular carcinoma (HCC). However, the biology of hepatic CSCs remains largely undefined."

The news correspondents obtained a quote from the research from the Chinese Academy of Sciences, "Through analysis of transcriptome microarray data, we identify a long noncoding RNA (lncRNA) called LncBRM, which is highly expressed in liver CSCs and HCC tumours. LncBRM is required for the self-renewal maintenance of liver CSCs and tumour initiation. In liver CSCs, LncBRM associates with BRM to initiate the BRG1/BRM switch and the BRG1-embedded BAF complex triggers activation of YAP1 signalling. Moreover, expression levels of LncBRM together with YAP1 signalling targets are positively correlated with tumour severity of HCC patients."

According to the news reporters, the research concluded: "Therefore, LncBRM and YAP1 signalling may serve as biomarkers for diagnosis and potential drug targets for HCC."

Our news journalists report that additional information may be obtained by contacting Z.S. Fan, Univ Chinese Academy Sci, Beijing 100049, People's Republic of China. Additional authors for this research include Y.Y. Wang, J.Y. Wu, G.L. Huang, B.Y. Liu, B.Q. Ye, Y. Du, G.X. Gao, Y. Tian, L. He and Z.S. Fan.

**New Data from Copenhagen University Hospital Illuminate Findings in Immunosuppressive Agents (Early safety and efficacy of fingolimod treatment in Denmark)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Immunosuppressive Agents are presented in a new report. According to news reporting from Copenhagen, Denmark, by NewsRx journalists, research stated, "Initiation of fingolimod treatment is associated with a transient decrease of heart rate, and atrioventricular (AV) conduction block may occur. To evaluate the therapeutic effect and safety of fingolimod treatment in MS patients in Denmark with focus on cardiac and pulmonary side effects at treatment onset."

The news correspondents obtained a quote from the research from Copenhagen University Hospital, "We analysed data from the first 496 fingolimod-treated Danish patients, observed for at least 3 months. In a subset of 204 patients, we monitored cardiac and pulmonary adverse effects following treatment initiation. The overall annualized relapse rate (ARR) was 0.37 (95% CI 0.31-0.44); 0.22 (95% CI 0.03-0.81) in de novo-treated patients, 0.29 (95% CI; 0.23-0.37) in patients switching from IFN-beta or GA and 0.46 (95% CI 0.34-0.60) after natalizumab. In the subset of 204 patients, 8 (3.9%) required prolonged cardiac monitoring due to bradycardia and/or second-degree AV block type I. All patients recovered spontaneously. Two patients discontinued fingolimod. Eleven (5.4%) patients reported respiratory complaints and two of these patients discontinued treatment. Fingolimod appears to be safe and effective in MS patients in a clinical setting."

According to the news reporters, the research concluded: "Mild cardiac adverse effects occurred at a similar rate as in clinical trials."

Our news journalists report that additional information may be obtained by contacting A. Voldsgaard, Rigshospitalet, Copenhagen Univ Hosp, Dept. of Neurol, Danish Multiple Sclerosis Center, Copenhagen, Denmark. Additional authors for this research include N. Koch-Henriksen, M. Magyari, F. Sellebjerg, P.S. Sorensen and A.B. Oturai.

New Data from Department of Nursing Illuminate Findings in Oncology Nursing (Opioid-taking self-efficacy as influencing emotional status in patients with cancer pain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nursing - Oncology Nursing is the subject of a report. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "The purpose of this study was to evaluate how much of the variance in emotional status amongst Taiwanese cancer patients could be accounted for by opioid-taking self-efficacy. This cross-sectional study included 109 cancer patients who had taken prescribed opioid analgesics for cancer related pain in the past week and completed the Opioid-Taking Self-Efficacy Scale-CA (OTSES-CA) and Hospital Anxiety and Depression Scale."

The news reporters obtained a quote from the research from the Department of Nursing, "There was a significant and negative correlation between scores on anxiety and self-efficacy total scale (r = 0.29, p< 0.01), self-efficacy communication subscale (r = 0.37, p< 0.01), self efficacy acquiring help subscale (r = 0.22, p< 0.05) and self-efficacy managing treatment related concerns subscale (r = 0.32, p< 0.01). However, the correlation between scores on depression and the self-efficacy total scale was not significant (r = 0.18, p> 0.05); only the self-efficacy communication subscale was significantly and negatively associated with depression (r = 0.27, p< 0.01). The opioid-taking self-efficacy total scale accounted for 8% of predicting the patients' anxiety. Opioid-taking self efficacy subscales accounted for 20% (R-2 = 0.20, p = 0.000) of the variance in predicting anxiety and 10% (R-2 = 0.10, p = 0.02) of the variance in predicting depression."

According to the news reporters, the research concluded: "This study highlights the potential importance of a patient's opioid-talking self-efficacy beliefs in their emotional status, which is relevant to cancer pain."

Our news correspondents report that additional information may be obtained by contacting S.A. Ding, Koo Founding Sun Yat Sen Canc Center, Dept. of Nursing, Taipei 112, Taiwan. Additional authors for this research include S.Y. Liang, W.W. Wu, C.Y. Liu and S.F. Cheng.

Health and Medicine - Medical Science

New Data from Ewha Woman’s University Illuminate Findings in Medical Science (The Radiation Problem and Its Solution from a Health Communication Perspective)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Health and Medicine - Medical Science are discussed in a new report. According to news reporting out of Seoul, South Korea, by NewsRx editors, the research stated, "This paper observes both foreign and national discussions on preexisting radiation communication and attempts to find out what it takes to ensure that discussion concerning radiation leads to participation of and trust-building with members of society while considering cultural aspects. When analyzing Korean studies on health risk communication concerning radiation which utilize the frame of foreign literature, Korean studies can be categorized into one of the following themes: different risk perceptions between experts and the general public, discussion on the effects of the framing of radiation messages and media coverage, and research discussing the social implications of the dangers of radiation and the need for effective communication."

Our news journalists obtained a quote from the research from Ewha Woman's University, "These study results can be better explained when integrated with Korean social cultural dimensions. The 'boiling pot effect' towards risk issues, egalitarian perceptions, escalation of ideological opposition and biased reasoning, and so on are especially major influences. Communication addressing radiological risks must foremost be open and able to mitigate distrust, must give the general public a chance to judge for themselves to prevent stigmatization, and, through the use of media and public education, must make efforts to prevent the proliferation of needless anxiety."

According to the news editors, the research concluded: "Using literature research, this paper discusses possible ways to improve the effect of future health risk communication concerning radiation."

For more information on this research see: The Radiation Problem and Its Solution from a Health Communication Perspective. Journal of Korean Medical Science, 2016;31 Suppl 1():S88-98.

Our news journalists report that additional information may be obtained by contacting Y. Kim, School of Communication and Media, Ewha Womans University, Seoul, South Korea.

New Data from First Affiliated Hospital Illuminate Findings in Angiology (A Giant Right Coronary Artery of Diffuse Ectasia Induced by a Right Ventricular Fistula)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Angiology is now available. According to news originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Coronary artery fistula (CAF) is a rare entity. Sometimes it may associate with mild diffuse or segmental coronary ectasia."

Our news journalists obtained a quote from the research from First Affiliated Hospital, "CAF with giant coronary artery is exceptionally rare. We present a unique case of a 49-year-old female patient with a giant right coronary artery of diffuse ectasia coexisting with a fistula draining into the right ventricle. To our best knowledge, CAF with diffuse coronary ectasia of such giant size has never been reported."

According to the news editors, the research concluded: "The patient was treated successfully by resection of the dilated right coronary artery, fistula closure, and coronary artery bypass grafting."

For more information on this research see: A Giant Right Coronary Artery of Diffuse Ectasia Induced by a Right Ventricular Fistula. The Heart Surgery Forum, 2015;18(6):E253-4.

The news correspondents report that additional information may be obtained from R. Li, Dept. of Cardiothoracic Surgery, First Affiliated Hospital of Zhejiang University, Hangzhou, People's Republic of China. Additional authors for this research include Y. Ni, P. Teng and W. Li.

New Data from Georgetown University Illuminate Findings in Biological and Medical Science (INDEED: Integrated differential expression and differential network analysis of omic data for biomarker discovery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Biological and Medical Science. According to news reporting out of Washington, District of Columbia, by NewsRx editors, research stated, "Differential expression (DE) analysis is commonly used to identify biomarker candidates that have significant changes in their expression levels between distinct biological groups. One drawback of DE analysis is that it only considers the changes on single biomolecule level."
Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from Georgetown University, "Recently, differential network (DN) analysis has become popular due to its capability to measure the changes on biomolecular pair level. In DN analysis, network is typically built based on correlation and biomarker candidates are selected by investigating the network topology. However, correlation tends to generate over-complicated networks and the selection of biomarker candidates purely based on network topology ignores the changes on single biomolecule level. In this paper, we propose a novel approach, INDEED, that builds sparse differential network based on partial correlation and integrates DE and DN analyses for biomarker discovery. We applied this approach on real proteomic and glycomic data generated by liquid chromatography coupled with mass spectrometry for hepatocellular carcinoma (HCC) biomarker discovery study. For each omic data, we used one dataset to select biomarker candidates, built a disease classifier and evaluated the performance of the classifier on an independent dataset. The biomarker candidates, selected by INDEED, were more reproducible across independent datasets, and led to a higher classification accuracy in predicting HCC cases and cirrhotic controls compared with those selected by separate DE and DN analyses. INDEED also identified some candidates previously reported to be relevant to HCC, such as intercellular adhesion molecule 2 (ICAM2) and c4b-binding protein alpha chain (C4BPA), which were missed by both DE and DN analyses. In addition, we applied INDEED for survival time prediction based on transcriptomic data acquired by analysis of samples from breast cancer patients. We selected biomarker candidates and built a regression model for survival time prediction based on a gene expression dataset and patients' survival records. We evaluated the performance of the regression model on an independent dataset."

According to the news editors, the research concluded: "Compared with the biomarker candidates selected by DE and DN analyses, those selected through INDEED led to more accurate survival time prediction."

Our news journalists report that additional information may be obtained by contacting Y.M. Zuo, Georgetown University, Lombardi Comprehens Canc Center, Washington, DC 20007, United States. New Data from Georgia Institute of Technology Illuminate Findings in Pancreatic Cancer (Acquired resistance of pancreatic cancer cells to cisplatin is multifactorial with cell context-dependent involvement of resistance genes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Pancreatic Cancer.

According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "Pancreatic ductal adenocarcinoma (PDAC) is one of the most lethal of malignancies, in large measure, due to the propensity of PDAC cells to acquire resistance to chemotherapeutic agents. A better understanding of the molecular basis of acquired resistance is a Major focus of contemporary PDAC research."

The news correspondents obtained a quote from the research from the Georgia Institute of Technology, "We report here the results of a study to independently develop cisplatin resistance in two distinct parental PDAC cell lines, AsPC1 and BxPC3, and to subsequently examine the molecular mechanisms associated with the acquired resistance. Cisplatin resistance in both resistant cell lines was found to be multifactorial and to be associated with mechanisms related to drug transport, drug inactivation, DNA damage response, DNA repair and the modulation of apoptosis. Our results demonstrate that the two resistant cell lines employed alternative molecular strategies in acquiring resistance dictated, in part, by pre-existing molecular differences between the parental cell lines."

According to the news reporters, the research concluded: "Collectively, our findings, indicate that strategies to inhibit or reverse acquired resistance of PDAC cells to cisplatin, and perhaps other chemotherapeutic agents, may not be generalized but will require individual molecular profiling and analysis to be effective."

Our news journalists report that additional information may be obtained by contacting R. Mezencev, Georgia Inst Technol, Parker H Petit Inst Bioengn & Biosci, 315 Ferst Dr, Atlanta, GA 30332, United States. Additional authors for this research include L.V. Matyunina, G.T. Wagner and J.F. McDonald.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/cgt.2016.71. This DOI is a link to an online electronic document that is either free or for purchase.

New Data from Giannina Gaslini Institute Illuminate Findings in Poland Syndrome (Assessment of copy number variations in 120 patients with Poland syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Musculoskeletal Diseases and Conditions - Poland Syndrome. According to news reporting from Genoa, Italy, by NewsRx journalists, research stated, "Poland Syndrome (PS) is a rare congenital disorder presenting with agenesis/hypoplasia of the pectoralis major muscle variably associated with thoracic and/or upper limb anomalies. Most cases are sporadic, but familial recurrence, with different inheritance patterns, has been observed."

The news correspondents obtained a quote from the research from Giannina Gaslini Institute, "The genetic etiology of PS remains unknown. Karyotyping and array-comparative genomic hybridization (CGH) analyses can identify genomic imbalances that can clarify the genetic etiology of congenital and neurodevelopmental disorders. We previously reported a chromosome 11 deletion in twin girls with pectoralis muscle hypoplasia and skeletal anomalies, and a chromosome six deletion in a patient presenting a complex phenotype that included pectoralis muscle hypoplasia. However, the contribution of genomic imbalances to PS remains largely unknown. To investigate the prevalence of chromosomal imbalances in PS, standard cytogenetic and array-CGH analyses were performed in 120 PS patients. Following the application of stringent filter criteria, 14 rare copy number variations (CNVs) were identified in 14 PS patients in different regions outside known common copy number variations: seven genomic duplications and seven genomic deletions, enclosing the two previously reported PS associated chromosomal deletions. These CNVs ranged from 0.04 to 4.71 Mb in size. Bioinformatic analysis of array-CGH data indicated gene enrichment in pathways involved in cell-cell adhesion, DNA binding and apoptosis processes. The analysis also provided a number of candidate genes possibly causing the developmental defects observed in PS patients, among others REV3L, a gene coding for an error-prone DNA polymerase previously associated with Mobius Syndrome with variable phenotypes including pectoralis muscle agenesis. A number of rare CNVs were identified in PS patients, and these involve genes that represent candidates for further evaluation."

According to the news reporters, the research concluded: "Rare inherited CNVs may contribute to, or represent risk factors of PS in a multifactorial mode of inheritance."

For more information on this research see: Assessment of copy number variations in 120 patients with Poland syndrome. *BMC Medical Genetics*, 2016;17():1-8. *BMC Medical Genetics* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. Gram-Negative Bacteria - Salmonella enterica

New Data from Graduate School of Agriculture Illuminate Findings in Salmonella enterica (In vivo cloning of large chromosomal segments into a BAC derivative by generalized transduction and recombineering in Salmonella enterica)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Salmonella enterica have been published. According to news reporting out of Nara, Japan, by NewsRx editors, the research stated, "Recombineering has been used to facilitate the development of in vivo cloning methods. However, the method relies heavily on PCR, which still generates a much higher error rate than DNA replication in vivo, even when amplifying large DNA inserts."

Our news journalists obtained a quote from the research from the Graduate School of Agriculture, "Here, a precise technique is reported in Salmonella enterica that enables the cloning of up to at least 19 kb target chromosomal DNA segments that had been marked by FRTs, which were derived from two consecutive lambda Red-mediated recombination events. P22 phage was utilized to transduce the target DNA segments from donor strains to recipient strains harboring a derivative of bacterial artificial chromosome (BAC) containing a FRT and a plasmid expressing Flp recombinase. This method was successful in cloning a gene cluster responsible for lipopolysaccharide (LPS) modifications that confer polymyxin B resistance and in complementing its mutant."

According to the news editors, the research concluded: "Further optimized procedures should be widely applicable because large insert fragments are precise clones of the wildtype genome."

Our news journalists report that additional information may be obtained by contacting A. Kato, Kindai Univ, Grad Sch Agr, Dept. of Adv Biosci, Nara, Nara 6318505, Japan.

Liver Diseases and Conditions - Chronic Hepatitis B…

New Data from Guangzhou University Illuminate Findings in Chronic Hepatitis B Virus (Identification of UQCRB as an oxymatrine recognizing protein using a T7 phage display screen)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Chronic Hepatitis B Virus are presented in a new report. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: Sophora flavescens Aiton (Radix Sophorae Flavescentis, Kushen) is used in traditional Chinese medicine to treat chronic hepatitis B (CHB), and has the ability to clear heat and dampness from the body. Oxymatrine is one of the major bioactive compounds extracted from Sophora flavescens Aiton and constitutes more than 90% of the oxymatrine injection commonly used for CHB treatment in clinics in China."

Financial supporters for this research include National Natural Science Foundation of China, Youth Elite Project of GUCM.

Our news editors obtained a quote from the research from Guangzhou University, "Aim of the study: We aim to analyze the protein binding target of oxymatrine in treating CHB by screening a T7 phage display cDNA library of human CHB and examine the biochemistry of protein-ligand binding between oxymatrine and its ligands. A T7 phage cDNA library of human CHB was biopanned by affinity selection using oxymatrine as bait. The interaction of oxymatrine with its candidate binding protein was investigated by affinity assay, molecular docking, Isothermal Titration Calorimetry (ITC) and Surface Plasmon Resonance (SPR). A library of potential oxymatrine binding peptides was generated. Ubiquinol-cytochrome c reductase binding protein (UQCRB) was one of the candidate binding proteins of oxymatrine. UQCRB-displaying T7 phage binding numbers in the oxymatrine group were significantly higher than that in the control group, biotin group, and matrine group (p < 0.05 or p< 0.01). Three-dimensional structure modeling of the UQCRB with oxymatrine showed that their binding interfaces matched and oxymatrine inserted into a deeper pocket of UQCRB, which mainly involved amino acid residues Tyr21, Arg33, Tyr83, Glu84, Asp86, Pro88, and G1u91. The binding affinity constant (Kb) from SPR was 4.2 mM. The Kb from ITC experiment was 3.9 mM and stoichiometry was fixed as 1, which fit very well with the result of SPR The binding of oxymatrine to UQCRB was driven by strong enthalpy forces such as hydrogen bonds and polar interactions as the heat released was about 157 kcal/mol and Delta G was less than zero. In this study, using the 17 phage display system, we have identified UQCRB as a direct binding protein of oxymatrine. Furthermore, the specificity and molecular interaction of oxymatrine with UQCRB were also determined. The binding of UQCRB to oxymatrine suggests that UQCRB is a potential target of oxymatrine in treating CHB."

According to the news editors, the research concluded: "These results provide new understanding into the mechanism of oxymatrine and insights into the strategy on the treatment of CHB."

Lung Diseases and Conditions - Acute Respiratory...

New Data from Harvard School of Medicine Illuminate Findings in Acute Respiratory Distress Syndrome (Lung Metabolic Activation as an Early Biomarker of Acute Respiratory Distress Syndrome and Local Gene Expression Heterogeneity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lung Diseases and Conditions - Acute Respiratory Distress Syndrome. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Acute respiratory distress syndrome (ARDS) is an inflammatory condition comprising diffuse lung edema and alveolar damage. ARDS frequently results from regional injury mechanisms."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "However, it is unknown whether detectable inflammation precedes lung edema and opacification and whether topographically differential gene expression consistent with heterogeneous injury occurs in early ARDS. The authors aimed to determine the temporal relationship between pulmonary metabolic activation and density in a large animal model of early ARDS and to assess gene expression in differentially activated regions. The authors produced ARDS in sheep with intravenous lipopolysaccharide (10 ng. kg(-1). h(-1)) and mechanical ventilation for 20 h. Using positron emission tomography, the authors assessed regional cellular metabolic activation with 2-deoxy-2-[(18)F]fluoro-D-glucose, perfusion and ventilation with (NN)-N-13-saline, and aeration using transmission scans. Species-specific microarray technology was used to assess regional gene expression. Metabolic activation preceded detectable increases in lung density (as required for clinical diagnosis) and correlated with subsequent histologic injury, suggesting its predictive value for severity of disease progression. Local time courses of metabolic activation varied, with highly perfused and less aerated dependent lung regions activated earlier than nondependent regions. These regions of distinct metabolic trajectories demonstrated differential gene expression for known and potential novel candidates for ARDS pathogenesis. Heterogeneous lung metabolic activation precedes increases in lung density in the development of ARDS due to endotoxemia and mechanical ventilation."

According to the news editors, the research concluded: "Local differential gene
expression occurs in these early stages and reveals molecular pathways relevant to ARDS biology and of potential use as treatment targets."

For more information on this research see: Lung Metabolic Activation as an Early Biomarker of Acute Respiratory Distress Syndrome and Local Gene Expression Heterogeneity. *Anesthesiology*, 2016;125(5):992-1004. *Anesthesiology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Suicide

**New Data from Health Science Center Illuminate Findings in Suicide (Comorbidity Correlates of Death Among New Veterans of Iraq and Afghanistan Deployment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Suicide. According to news reporting originating in San Antonio, Texas, by NewsRx journalists, research stated, "Veterans of the wars in Iraq and Afghanistan who receive care in the Veterans Health Administration (VA) have high disease burden. Distinct comorbidity patterns have been shown to be differentially associated with adverse outcomes, including death."

The news reporters obtained a quote from the research from Health Science Center, "This study determined correlates of 5-year mortality. VA demographic, military, homelessness, and clinical measures informed this retrospective analysis. Previously constructed comorbidity classifications over 3 years of care were entered into a Cox proportional hazards model of death. There were 164,933 veterans in the cohort, including African Americans (16%), Hispanics (11%), and whites (65%). Most were in their 20s at baseline (60%); 12% were women; 4% had attempted suicide; 4% had been homeless. Having clustered disorders of pain, posttraumatic stress disorder, and traumatic brain injury was associated with death [hazard ratio (HR)=2.0]. Mental disorders including substance abuse were similarly associated (HR=2.1). Prior suicide attempt (HR=2.2) or drug overdose (HR=3.0) considerably increased risk of death over 5 years."

According to the news reporters, the research concluded: "As congressional actions such as Veterans Choice Act offer more avenues to seek care outside of VA, coordination of care, and suicide prevention outreach for recent veterans may require innovative approaches to preserve life."

For more information on this research see: Comorbidity Correlates of Death Among New Veterans of Iraq and Afghanistan Deployment. *Medical Care*, 2016;55(12):1078-1081.
New Data from Huazhong Agricultural University Illuminate Findings in Escherichia coli (Differential transcription profiles of long non-coding RNAs in primary human brain microvascular endothelial cells in response to meningitic Escherichia coli)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Negative Bacteria - Escherichia coli. According to news reporting originating from Hunan, People's Republic of China, by NewsRx correspondents, research stated, "Accumulating studies have indicated the influence of long non-coding RNAs (lncRNAs) on various biological processes as well as disease development and progression. However, the lncRNAs involved in bacterial meningitis and their regulatory effects are largely unknown."

Our news editors obtained a quote from the research from Huazhong Agricultural University, "By RNA-sequencing, the transcriptional profiles of host lncRNAs in primary human brain microvascular endothelial cells (hBMECs) in response to meningitic Escherichia coli were demonstrated. Here, 25,257 lncRNAs were identified, including 24,645 annotated lncRNAs and 612 newly found ones. A total of 895 lncRNAs exhibited significant differences upon infection, among which 382 were upregulated and 513 were downregulated (≥ 2-fold, p < 0.05). Via bioinformatic analysis, the features of these lncRNAs, their possible functions, and the potential regulatory relationships between lncRNAs and mRNAs were predicted. Moreover, we compared the transcriptional specificity of these differential lncRNAs among hBMECs, human astrocyte cell U251, and human umbilical vein endothelial cells, and demonstrated the novel regulatory effects of proinflammatory cytokines on these differential lncRNAs."

According to the news editors, the research concluded: "To our knowledge, this is the first time the transcriptional profiles of host lncRNAs involved in E. coli-induced meningitis have been reported, which shall provide novel insight into the regulatory mechanisms behind bacterial meningitis involving lncRNAs, and contribute to better prevention and therapy of CNS infection."

For more information on this research see: Differential transcription profiles of long non-coding RNAs in primary human brain microvascular endothelial cells in response to meningitic Escherichia coli. Lung Diseases and Conditions - Pneumonia

New Data from Idaho State University Illuminate Findings in Pneumonia (Total Duration of Antimicrobial Therapy in Veterans Hospitalized With Uncomplicated Pneumonia: Results of a National Medication Utilization Evaluation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lung Diseases and Conditions - Pneumonia. According to news reporting originating from Meridian, Idaho, by NewsRx correspondents, research stated, "Practice guidelines recommend the shortest duration of antimicrobial therapy appropriate to treat uncomplicated pneumonia be prescribed to reduce the emergence of resistant pathogens. A national evaluation was conducted to assess the duration of therapy for pneumonia."

Our news editors obtained a quote from the research from Idaho State University, "Retrospective medication utilization evaluation. Thirty Veterans Affairs medical centers. Inpatients discharged with a diagnosis of pneumonia. A manual review of electronic medical records of inpatients discharged with uncomplicated community-acquired pneumonia (CAP) or healthcare-associated pneumonia (HCAP) was conducted. Appropriate CAP therapy duration was defined as at least 5 days, and up to 3 additional days beginning the first day the patient achieved clinical stability criteria; the appropriate HCAP therapy duration was defined as 8 days. The duration of antimicrobial therapy for intravenous (IV) and oral (PO) inpatient administration, PO therapy dispensed upon discharge, Clostridium difficile infection (CDI), hospital readmission, and death rates were measured. Of 3881 pneumonia admissions, 1739 met inclusion criteria (CAP [n = 1195]; HCAP [n = 544]). Overall, 13.9% of patients (CAP [6.9%], HCAP [29.0%]) received therapy duration consistent with guideline recommendations. The median (interquartile range) days of therapy were 4 days (3-6 days), 1 day (0-3 days), and 6 days (4-8 days) for inpatient IV, inpatient PO, and outpatient PO antimicrobials, respectively. CDI was rare but more common in patients who received therapy duration consistent with guidelines. Therapy duration was not associated with the readmission or mortality rate. Antimicrobials were commonly prescribed for a longer duration than guidelines recommend."

According to the news editors, the research concluded: "The majority of excessive therapy was completed upon discharge, identifying the need for strategies to curtail unnecessary
use postdischarge."

The news editors report that additional information may be obtained by contacting K.J. Madaras-Kelly, Idaho State University, Coll Pharm, Dept. of Pharm Practice, Meridian, ID, United States. Additional authors for this research include M. Burk, C. Caplinger, J.G. Bohan, M.M. Neuhauser, M.B. Goetz, R. Zhang and F.E. Cunningham.

**Oncology - Breast Cancer**

**New Data from Indian Institute of Science Illuminate Findings in Breast Cancer (Triple Block Nanocarrier Platform for Synergistic Cancer Therapy of Antagonistic Drugs)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting from Maharashtra, India, by NewsRx journalists, research stated, "A unique biodegradable triple block nanocarrier (TBN) is designed and developed for synergistic combination therapy of antagonistic drugs for cancer treatment. The TBN was built with hydrophilic polyethylene glycol (PEG) outer shell; a middle hydrophobic and biodegradable polycaprolactone (PCL) block for encapsulating anthracycline anticancer drug like doxorubicin (DOX), and an inner carboxylic-functionalized polycapro lactone (CPCL) core for cisplatin (CP) drug conjugation."

Financial support for this research came from Department of Science and Technology, Ministry of Science and Technology.

The news correspondents obtained a quote from the research from the Indian Institute of Science, "TBN-cisplatin drug conjugate self assembled as stable nanoparticles in saline (also in PBS) wherein the hydrophobic PCL block functions as a shield for Pt-drug stability against GSH detoxification. Enzymatic-biodegradation of TBN exclusively occurred at the intracellular environment to deliver both cisplatin (CP) and doxorubicin (DOX) simultaneously to the nucleus. As a result, the TBN-cisplatin conjugate and its DOX-loaded nanoparticles accomplished 100% cell growth inhibition in GSH overexpressed breast cancer cells. Combination therapy revealed that free drugs were antagonistic to each other, whereas the dual drug-loaded TBN exhibited excellent synergistic cell killing at much lower drug concentrations in breast cancer cells. Confocal microscopic analysis confirmed the localization of drugs in the cytoplasm and at peri-nuclear site. Flow cytometry analysis revealed that the drugs were taken up 4-fold better while delivering them from TBN platform compared to free
According to the news reporters, the research concluded: "The TBNs approach is a perfect platform to overcome the GSH detoxification in Pt-drugs and enable the codelivery of antagonistic drugs like cisplatin and DOX from single polymer dose to accomplish synergistic killing in breast cancer cells."

For more information on this research see: Triple Block Nanocarrier Platform for Synergistic Cancer Therapy of Antagonistic Drugs. Biomacromolecules, 2016;17(12):4075-4085. Oncology - Multiple Myeloma

New Data from Institute of Cancer Research Illuminate Findings in Multiple Myeloma (Genetic factors influencing the risk of multiple myeloma bone disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Multiple Myeloma are discussed in a new report. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "A major complication of multiple myeloma (MM) is the development of osteolytic lesions, fractures and bone pain. To identify genetic variants influencing the development of MM bone disease (MBD), we analyzed MM patients of European ancestry (totaling 3774), which had been radiologically surveyed for MBD."

Our news editors obtained a quote from the research from the Institute of Cancer Research, "Each patient had been genotyped for ~6 00 000 single-nucleotide polymorphisms with genotypes for six million common variants imputed using 1000 Genomes Project and UK10K as reference. We identified a locus at 8q24.12 for MBD (rs4407910, OPG/TNFRSF11B, odds ratio=1.38, p=4.09 × 10(-9)) and a promising association at 19q13.43 (rs74676832, odds ratio=1.97, p=9.33 × 10(-7)). Our findings demonstrate that germline variation influences MBD and highlights the importance of RANK/RANKL/OPG pathway in MBD development."

According to the news editors, the research concluded: "These findings will contribute to the development of future strategies for prevention of MBD in the early
precancerous phases of MM."

**Oncology - Colon Cancer**

**New Data from Institute of Oncology Illuminate Findings in Colon Cancer (Post-Operative Infection Is an Independent Risk Factor for Worse Long-Term Survival after Colorectal Cancer Surgery)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news reporting from Ljubljana, Slovenia, by NewsRx journalists, research stated, "Colorectal cancer surgery is associated with a high incidence of post-operative infections, the outcome of which may be improved if diagnosed and treated early enough. We compared white blood cell (WBC) count, C-reactive protein (CRP), and procalcitonin (PCT) as predictors of post-operative infections and analyzed their impact on long-term survival."

The news correspondents obtained a quote from the research from the Institute of Oncology, "This retrospective study included 186 patients undergoing colorectal surgery. Post-operative values of WBC, CRP, and PCT were analyzed by the receiver operating characteristic (ROC) analysis. We followed infections 30 d after the surgery. A five-year survival was analyzed by Kaplan-Meier method and prognostic factors by Cox regression model. Fifty-five patients (29.5%) developed post-operative infection, the most frequent of which was surgical site infection (SSI). C-reactive protein on post-operative day three and PCT on post-operative day two demonstrated the highest diagnostic accuracy for infection (area under the curve [AUC] 0.739 and 0.735). C-reactive protein on post-operative day three was an independent predictor of infection. Five-year survival was higher in the non-infected group (70.8%), compared with the infected group (52.1%). The worst survival (40.9%) was identified in patients with organ/space SSI. Post-operative infection and tumor stage III-IV were independent predictors of a worse five-year survival. C-reactive protein on post-operative day three and PCT on post-operative day two may be early predictors of infection after colorectal cancer surgery."

According to the news reporters, the research concluded: "Post-operative infections
in particular organ/space SSI have a negative impact on long-term survival."

For more information on this research see: Post-Operative Infection Is an Independent Risk Factor for Worse Long-Term Survival after Colorectal Cancer Surgery. *Surgical Infections*, 2016;17(6):700-712. *Surgical Infections* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. **Proteomics**

**New Data from Institute of Radiology Illuminate Findings in Proteomics**

(2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Proteomics. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Since checkpoint kinase 1 (Chk1) is an essential factor for cell viability following DNA damage, the inhibition of Chk1 has been a major focus of pharmaceutical development to enhance the sensitivity of tumor cells to chemo- and radiotherapy that damage DNA. However, due to the off-target effects of conventional Chk1-targeting strategies and the toxicity of Chk1 inhibitors, alternative strategies are required to target Chk1."

Our news journalists obtained a quote from the research from the Institute of Radiology, "To facilitate such efforts, in this study, we identified a specific Chk1-binding 12-mer peptide from the screening of a phage display library and characterized the peptide in terms of cellular cytotoxicity, and in terms of its effect on Chk1 activity and sensitivity to genotoxic agents. This peptide, named N-terminal Chk1-binding peptide (Chk1-NP), bound the kinase domain of Chk1. Simulation of the binding revealed that the very N-terminus of the Chk1 kinase domain is the potential peptide binding site. Of note, the polyarginine-mediated internalization of Chk1-NP redistributed nuclear Chk1 with a prominent decrease in the nucleus in the absence of DNA damage. Treatment with Chk1-NP peptide alone decreased the viability of p53-defective HeLa cells, but not that of p53-functional NCI-H460 cells under normal conditions. The treatment of HeLa or NCI-H460 cells with the peptide significantly enhanced radiation sensitivity following ionizing radiation (IR) with a greater enhancement observed in HeLa cells. Moreover, the IR-induced destabilization of Chk1 was aggravated by treatment with..."
Chk1-NP. Therefore, the decreased nuclear localization and protein levels of Chk1 seem to be responsible for the enhanced cancer cell killing following combined treatment with IR and Chk1-NP."

According to the news editors, the research concluded: "The approach using the specific Chk1-binding peptide may facilitate the mechanistic understanding and potential modulation of Chk1 activities and may provide a novel rationale for the development of specific Chk1-targeting agents."

For more information on this research see: A novel Chk1-binding peptide that enhances genotoxic sensitivity through the cellular redistribution of nuclear Chk1. *International Journal of Molecular Medicine*, 2016;38(5):1490-1498. *International Journal of Molecular Medicine* can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

The news correspondents report that additional information may be obtained from S. Bae, Korea Inst Radiol & Med Sci, Div Radiat Effects, Seoul 139706, South Korea. Additional authors for this research include K.J. Choi and S. Bae.

Keywords for this news article include: Seoul, South Korea, Asia, Enzymes and Coenzymes, Proteomics, Genetics, p53 Gene, Proteins, Peptides, Kinase, Institute of Radiology.

Oncology - Breast Cancer

**New Data from K. Froehlich et al Illuminate Findings in Breast Cancer (Generation of Multicellular Breast Cancer Tumor Spheroids: Comparison of Different Protocols)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Jena, Germany, by NewsRx correspondents, research stated, "Multicellular tumor spheroids are widely used models in tumor research. Because of their three dimensional organization they can simulate avascular tumor areas comprising proliferative and necrotic cells."

Financial supporters for this research include Wilhelm Sander-Stiftung (DE), Evangelisches Studienwerk Villigst (DE), German Academic Exchange Service (DE), Thuringer Ministerium fur Bildung, Wissenschaft und Kultur (DE).

Our news journalists obtained a quote from the research, "Nonetheless, protocols for spheroid generation are still inconsistent. Therefore, in this study the breast cancer cell lines MCF-7, MDA-MB-231 and SK-BR-3 have been used to compare different spheroid generation models including hanging drop, liquid overlay and suspension culture techniques, each under several conditions. Experimental approaches differed in cell numbers (400-10,000), media and additives (25 % methocel, 25 % methocel plus 1 % Matrigel, 3.5 % Matrigel). In total, 42 different experimental setups have been tested. Generation of spheroids was evaluated by light microscopy and the structural composition was assessed immunohistochemically by means of Ki-67, cleaved poly (ADP-ribose) polymerase (cPARP) and mucin-1 (MUC-1) expression. Although the tested cell lines diverged widely in their capacity of forming spheroids we recommend hanging drops supplemented with 25 % methocel as the most reliable and efficient
method with regard to success of generation of uniform spheroids, costs, experimental complexity and time expenditure in the different cell lines. MCF-7 cells formed spheroids under almost all analyzed conditions, and MDA-MB-231 cells under only one protocol (liquid overlay technique, 3.5 % Matrigel), while SK-BR-3 did not under neither condition."

According to the news editors, the research concluded: "Therefore, we outline specific methods and recommend the use of adapted and standardized spheroid generation protocols for each cell line."

The news correspondents report that additional information may be obtained from U.R. Markert, Placenta Lab, Dept. of Obstet, D-07743 Jena, Germany. Additional authors for this research include J.D. Haeger, J. Heger, J. Pastuschek, S.M. Photini, Y. Yan, A. Lupp, C. Pfarrer, R. Mrowka, E. Schleussner, U.R. Markert and A. Schmidt.

Lymphocytes

**New Data from Karolinska Institute Illuminate Findings in Lymphocytes**

[S-2-hydroxyglutarate regulates CD8(+) T-lymphocyte fate]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lymphocytes is the subject of a report. According to news reporting from Stockholm, Sweden, by NewsRx journalists, research stated, "R-2-hydroxyglutarate accumulates to millimolar levels in cancer cells with gain-of-function isocitrate dehydrogenase 1/2 mutations. These levels of R-2-hydroxyglutarate affect 2-oxoglutarate-dependent dioxygenases."

The news correspondents obtained a quote from the research from Karolinska Institute, "Both metabolite enantiomers, R- and S-2-hydroxyglutarate, are detectible in healthy individuals, yet their physiological function remains elusive. Here we show that 2-hydroxyglutarate accumulates in mouse CD8(+) T cells in response to T-cell receptor triggering, and accumulates to millimolar levels in physiological oxygen conditions through a hypoxia-inducible factor 1-alpha (HIF-1 alpha)-dependent mechanism. S-2-hydroxyglutarate predominates over R-2-hydroxyglutarate in activated T cells, and we demonstrate alterations in markers of CD8(+) T-cell differentiation in response to this metabolite. Modulation of histone and DNA demethylation, as well as HIF-1 alpha stability, mediate these effects. S-2-hydroxyglutarate treatment greatly enhances the in vivo proliferation, persistence and anti-tumour capacity of adoptively transferred CD8(+) T cells."
According to the news reporters, the research concluded: "Thus, S-2-hydroxyglutarate acts as an immunometabolite that links environmental context, through a metabolic-epigenetic axis, to immune fate and function."

Keywords for this news article include: Stockholm, Sweden, Europe, Hemic and Immune Systems, Mononuclear Leukocytes, T-Lymphocytes, Blood Cells, Immunology, Genetics, Karolinska Institute.

**Eye Diseases and Conditions - Retinal...**

**New Data from Kyushu University Illuminate Findings in Retinal Neovascularization (Different roles played by periostin splice variants in retinal neovascularization)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Eye Diseases and Conditions - Retinal Neovascularization have been presented. According to news originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "Retinal neovascularization (NV) due to retinal ischemia is one of the major causes of vision reduction in patients with different types of retinal diseases although anti-vascular endothelial growth factor (anti-VEGF) therapy can partially reduce the size of the retinal NV. We recently reported that periostin plays an important role in the development of NV and the formation of preretinal fibrovascular membranes, but the role of the splice variants of periostin on retinal NV has not been determined."

Financial supporters for this research include JSPS KAKENHI, Takeda Science Foundation, Japan Society for the Promotion of Science.

Our news journalists obtained a quote from the research from Kyushu University, "We examined the expressions of periostin splice variants in the ischemic retinas of a mouse model of oxygen-induced retinal NV. We also studied the function of periostin splice variants on retinal NV using periostin knock out mice, and the effects of anti-periostin antibodies on retinal NV. Our results showed that the expressions of the periostin splice variants were increased in ischemic retinas. The degree of increase of periostin lacking exon 17 was the highest among the periostin splice variants examined. Both genetic ablation of periostin exons 17 and 21 and antibodies for periostin exons 17 and 21 affected preretinal pathological NV. Inhibition of exon 17 of periostin had the greatest effect in reducing preretinal pathological NV."

According to the news editors, the research concluded: "These findings suggest a causal link between periostin splice variants and retinal NV, and an intravitreal injection of
antibody for exon 17 and exon 21 of periostin should be considered to inhibit preretinal pathological NV."

The news correspondents report that additional information may be obtained from S. Yoshida, Kyushu University, Grad Sch Med Sci, Dept. of Ophthalmol, Fukuoka 8128582, Japan. Additional authors for this research include S. Yoshida, K. Ishikawa, Y. Kobayashi, T. Abe, H. Kiyonari, G. Shioi, N. Katsuragi, T. Ishibashi, R. Morishita and Y. Taniyama.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.exer.2016.10.012. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Prostate Cancer

New Data from La Trobe University Illuminate Findings in Prostate Cancer (Which coping strategies can predict beneficial feelings associated with prostate cancer?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "Aims and objectives. This study aimed to identify the extent to which different coping strategies can predict benefit finding in prostate cancer experiences."

The news correspondents obtained a quote from the research from La Trobe University, "Although beginning evidence suggests that the capacity to find positives in adversity and find some benefit from cancer-associated experiences may be influenced by coping, little is known about which coping strategies can predict benefit finding in prostate cancer. Cross-sectional. Data from men (n = 209) diagnosed with prostate cancer receiving hormone suppression therapy were analysed using descriptive statistics, bivariate correlations and backward stepwise multiple linear regression. Sociodemographic and clinical data, and self-report scales (17-item Benefit Finding Scale and Brief COPE) were used. Bivariate analyses showed significant correlations between 14 coping strategies and benefit finding in prostate cancer. Multiple linear regression modelling showed that the predictor variables 'acceptance', 'positive reframing' and 'turning to religion' explained 35% of the variance in dependant variable benefit finding when the other variables were controlled for. Of the three predictor variables, acceptance and positive reinterpretation were most strongly related to benefit finding. The self-reported coping strategies 'acceptance' and 'positive reframing' emerged as being most significantly predictive of benefit finding in this sample. 'Turning to religion' was also significant, but to a somewhat lesser extent in predicting benefit finding in the disruptive
experience of prostate cancer. Relevance to clinical practice. The use of positively oriented emotional coping strategies of 'acceptance', 'positive reframing' and 'turning to religion' are influential to benefit finding in prostate cancer."

According to the news reporters, the research concluded: "An understanding of the coping strategies that are predictive to benefit finding can assist clinicians to discern and target men who are more or less likely to find benefit, and to develop person-centred support strategies and interventions with an aim to optimising positive emotional states throughout the cancer journey."

Our news journalists report that additional information may be obtained by contacting E.C. Pascoe, La Trobe University, Sch Nursing & Midwifery, Postgraduate Canc Courses, Melbourne, Vic 3085, Australia.

**Gram-Positive Bacteria - Streptomyces**

**New Data from Louisiana State University Illuminate Findings in Streptomyces (Genome Content and Phylogenomics Reveal both Ancestral and Lateral Evolutionary Pathways in Plant-Pathogenic Streptomyces Species)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - Streptomyces. According to news reporting originating from Baton Rouge, Louisiana, by NewsRx correspondents, research stated, "Streptomyces spp. are highly differentiated actinomycetes with large, linear chromosomes that encode an arsenal of biologically active molecules and catalytic enzymes. Members of this genus are well equipped for life in nutrient-limited environments and are common soil saprophytes."

Our news editors obtained a quote from the research from Louisiana State University, "Out of the hundreds of species in the genus Streptomyces, a small group has evolved the ability to infect plants. The recent availability of Streptomyces genome sequences, including four genomes of pathogenic species, provided an opportunity to characterize the gene content specific to these pathogens and to study phylogenetic relationships among them. Genome sequencing, comparative genomics, and phylogenetic analysis enabled us to discriminate pathogenic from saprophytic Streptomyces strains; moreover, we calculated that the pathogen-specific genome contains 4,662 orthologs."
According to the news editors, the research concluded: "Phylogenetic reconstruction suggested that Streptomyces scabies and S. ipomoeae share an ancestor but that their biosynthetic clusters encoding the required virulence factor thaxtomin have diverged. In contrast, S. turgidiscabies and S. acidiscabies, two relatively unrelated pathogens, possess highly similar thaxtomin biosynthesis clusters, which suggests that the acquisition of these genes was through lateral gene transfer."

For more information on this research see: Genome Content and Phylogenomics Reveal both Ancestral and Lateral Evolutionary Pathways in Plant-Pathogenic Streptomyces Species. Applied and Environmental Microbiology, 2016;82(7):2146-55. (American Society for Microbiology - www.asm.org; Applied and Environmental Microbiology - aem.asm.org)

The news editors report that additional information may be obtained by contacting G.S. Pettis, Dept. of Biological Sciences, Louisiana State University, Baton Rouge, Louisiana USA. Dept. of Plant Pathology and Crop Physiology, Louisiana State University Agricultural Center, Baton Rouge, Louisiana, United States. Additional authors for this research include T. Lefebure, J.H. Badger, D. Guan, G.S. Pettis, M.J. Stanhope and R. Loria.

Heart Disorders and Diseases - Heart Attack

New Data from Lund University Illuminate Findings in Heart Attack (Critical Care Management after Cardiac Arrest)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting originating in Lund, Sweden, by NewsRx journalists, research stated, "Sudden cardiac arrest is a devastating event with high mortality and, substantial morbidity among survivors. Early recognition and intervention to restore circulation is the primary goal; once that is achieved, the path toward a meaningful recovery starts."

The news reporters obtained a quote from the research from Lund University, "Initial in-hospital care is focused on emergency cardiac care, but soon there is a change to a more brain-oriented critical care including targeted temperature management, brain monitoring, sedation, and repeated neurologic assessments. In patients who show early signs of awakening from coma once sedation has been stopped, the prognosis is generally good. In patients with early seizures and prolonged coma after sedation has been weaned, the prognosis is often poor. A structured model for neuroprognostication using several prognostication tools such as imaging, neurophysiology, biomarkers, and above all repeated clinical investigations is fundamental for the ability to properly assess the comatose cardiac arrest patient and to enable accurate and trustworthy decisions on level of care."

According to the news reporters, the research concluded: "The authors present a model for critical care management after cardiac arrest and a neuroprognostication algorithm,
both in use at their institution."

For more information on this research see: Critical Care Management after Cardiac Arrest. Seminars in Neurology, 2016;36(6):542-549. Seminars in Neurology can be contacted at: Thieme Medical Publ Inc, 333 Seventh Ave, New York, NY 10001, USA. (Thieme - www.thieme.com)

Our news correspondents report that additional information may be obtained by contacting H. Friberg, Lund University, Div Anesthesiol & Intens Care, Dept. of Clin Sci, Lund, Sweden.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1055/s-0036-1592168. This DOI is a link to an online electronic document that is either free or for purchase.

Nutritional and Metabolic Diseases and Conditions - …

New Data from Mahidol University Illuminate Findings in Type 2 Diabetes (Adipoq Polymorphisms Among Thais With Pre-diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting from Bangkok, Thailand, by NewsRx journalists, research stated, "Studies have shown that polymorphisms of adiponectin gene (ADIPOQ) are associated with risk of developing type 2 diabetes mellitus (T2DM). However, no studies have investigated the association between genetic variants of ADIPOQ and pre-diabetes, a group at higher risk for developing T2DM."

The news correspondents obtained a quote from the research from Mahidol University, "A total of 75 pre-diabetes and 130 normal subjects were recruited from volunteers in Bangkok, Thailand. Individuals with pre-diabetes were selected based on American Diabetes Association diagnostic criteria. Six ADIPOQ polymorphisms were genotyped using polymerase chain reaction-restriction fragment length polymorphism technique. ADIPOQ polymorphism rs266729 C>G is significantly associated with pre-diabetes (p = 0.006). CG/GG genotypes were found among 60% and 40% of pre-diabetes and normal subjects, respectively. SNP rs266729 C>G was associated with increased pre-diabetes risk (OR = 2.64; 95% CI: 1.18-5.89, p = 0.018). No significant differences were found between pre-diabetes and normal subjects for other ADIPOQ polymorphisms. However, haplotype analysis revealed that haplotype GGTAAT is significantly associated with pre-diabetes when compared with GCGAAC reference haplotype (OR = 22.31; 95% CI: 1.37-361.93, p = 0.03).

According to the news reporters, the research concluded: "Our data indicate that ADIPOQ rs266729 C>G polymorphism may contribute to the genetic risk of pre-diabetes and provide preliminary data useful in genetic screening for pre-diabetes among Thais."

For more information on this research see: Adipoq Polymorphisms Among Thais With Pre-diabetes. Southeast Asian Journal of Tropical Medicine and Public Health, 2016;47
New Data from Ministry of Health Illuminate Findings in Genitourinary Tract Agents (Effects of chronic restraint stress on social behaviors and the number of hypothalamic oxytocin neurons in male rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Genitourinary Tract Agents. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Oxytocin (OXT) and vasopressin (AVP) are considered to be related to mammalian social behavior and the regulation of stress responses. The present study investigated the effects of chronic homotypic restraint stress (CHRS) on social behaviors and anxiety, as well as its repercussions on OXT-and AVP-positive neurons in the paraventricular nucleus (PVN) and supraoptic nucleus (SON) nuclei in rat."

Financial support for this research came from Department of Health.

The news reporters obtained a quote from the research from the Ministry of Health, "Male Sprague-Dawley rats receiving CHRS were exposed to repeated restraint stress of 30 min per day for 10 days. Changes in social approach behaviors were evaluated with the three-chambered social approach task. Changes in anxiety-like behaviors were evaluated in the light-dark box test. The number of neurons expressing oxytocin and/or vasopressin in PVN and SON were examined by immunohistochemistry techniques. The results demonstrated that social approach was increased and anxiety was decreased following 10-day exposure to CHRS. Furthermore, the number of OXT-immunoreactive cells in PVN was increased significantly, whereas no change in SON was seen. The number of AVP immunoreactive cells either in PVN or SON was unaffected. The results of this study suggest that certain types of stress could be effective in the treatment of social dysfunction in persons with mental disorders such as autism, social anxiety disorder."

According to the news reporters, the research concluded: "The therapeutic effects may be mediated by changes in the function of OXT neurons in PVN."

For more information on this research see: Effects of chronic restraint stress on social behaviors and the number of hypothalamic oxytocin neurons in male rats. *Neuropeptides*, 2016;60(6):21-28. *Neuropeptides* can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. New Data from National Research Center Illuminate Findings in Down Syndrome (Genotype/phenotype correlation in a female patient with 21q22.3 and 12p13.33 duplications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Genetic Diseases and Conditions - Down Syndrome are presented in a new report. According to news originating from Cairo, Egypt, by NewsRx correspondents, research stated, "Many chromosomal rearrangements that lead to copy-number gains or losses have been shown to cause distinctive and recognizable clinical phenotypes. Conventional cytogenetic analysis can detect many, but not all, rearrangements depending on its power of resolution."

Our news journalists obtained a quote from the research from National Research Center, "The wide use of whole-genome array-based comparative genomic hybridization (array CGH) techniques has allowed the detection of novel syndromes and to establish genotype-phenotype correlations by delineating at high resolution the regions involved in specific chromosomal aberrations. We report on a two and half-year-old female patient with intellectual disability and distinctive phenotypic features resulting from a de novo duplication of about 0.3 Mb in 21q22.3 associated with duplication of about 0.3 Mb in 12p13.33. The patient's chromosomal abnormalities were identified at the cytogenetic molecular level, using SNP array analysis, while GTG banding technique revealed a normal karyotype. Clinical findings of the patient were compared with Down syndrome and 12p duplication syndrome."

According to the news editors, the research concluded: "This study suggests that an area of contiguous genes on the distal part of chromosome 21 (21q22.3) contribute to the Down syndrome phenotype and indicates that genes in the distal region of 12p (12p13.33) account for many facial characteristics and hypotonia of trisomy 12p syndrome."

New Data from Nippon School of Medicine Illuminate Findings in Endoscopy (Retrieval of Retained Capsule Endoscopy at Small Bowel Stricture by Double-Balloon Endoscopy Significantly Decreases Surgical Treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Surgical Procedures - Endoscopy. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "The aim is to elucidate the efficacy and safety of double-balloon endoscopy (DBE) for small bowel capsule endoscopy (SBCE) retrieval from small bowel stricture and to follow the outcome of the stricture where the SBCE was entraped. The retention of SBCE is a serious adverse event and most retained capsules are retrieved by surgery."

Our news journalists obtained a quote from the research from the Nippon School of Medicine, "There is still no report analyzing the follow-up of patients with stricture after retrieval of entrapped SBCEs by DBE. This study was designed a retrospective cohort study. Subjects were 12 consecutive patients with small bowel stricture where retrieval of entrapped SBCE was attempted using DBE. Success rate of the SBCE retrieval by DBE, surgical rate of the small bowel stricture, adverse events of DBE, and outcomes in the follow-up period were evaluated. Diagnoses were Crohn's disease, nonsteroidal anti-inflammatory drugs-induced enteropathy, ischemic enteritis, and carcinoma in 8, 2, 1, and 1 patients, respectively. SBCE was successfully retrieved in 11 of the 12 patients (92%). No adverse events were encountered in all endoscopic procedures such as retrieval of SBCEs and dilation of the strictures. Nine of the 12 patients (75%) did not undergo surgical treatment for the stricture where SBCE was entrapped through the follow-up period (mean, 1675±847 d). Retrieval of SBCEs using DBE was safe, had a high success rate, and was useful to evaluate the need for surgery."

According to the news editors, the research concluded: "Seventy-five percent of patients with small bowel stricture where the SBCE was entrapped did not require surgery through approximately 5 years."

For more information on this research see: Retrieval of Retained Capsule Endoscopy at Small Bowel Stricture by Double-Balloon Endoscopy Significantly Decreases Surgical Treatment. Journal of Clinical Gastroenterology, 2016;50(2):141-6. (Lippincott Williams and Wilkins - www.lww.com; Journal of Clinical Gastroenterology -

New Data from Oregon Health and Science University Illuminate Findings in Mycotoxins (DNA polymerase zeta limits chromosomal damage and promotes cell survival following aflatoxin exposure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Biological Factors - Mycotoxins is now available. According to news reporting originating in Portland, Oregon, by NewsRx journalists, research stated, "Routine dietary consumption of foods that contain aflatoxins is the second leading cause of environmental carcinogenesis worldwide. Aflatoxin-driven mutagenesis is initiated through metabolic activation of aflatoxin B-1 (AFB(1)) to its epoxide form that reacts with N7 guanine in DNA."

The news reporters obtained a quote from the research from Oregon Health and Science University, "The resulting AFB(1)-N7-dG adduct undergoes either spontaneous depurination or imidazole-ring opening yielding formamidopyrimidine AFB(1) (AFB(1)-Fapy-dG). Because this latter adduct is known to persist in human tissues and contributes to the high frequency G-to-T mutation signature associated with many hepatocellular carcinomas, we sought to establish the identity of the polymerase(s) involved in processing this lesion. Although our previous biochemical analyses demonstrated the ability of polymerase zeta (pol zeta) to incorporate an A opposite AFB(1)-Fapy-dG and extend from this mismatch, biological evidence supporting a unique role for this polymerase in cellular tolerance following aflatoxin exposure has not been established. Following challenge with AFB1, survival of mouse cells deficient in pol zeta (Rev3L(-/-)) was significantly reduced relative to Rev3L(+/-) cells or Rev3L(-/-) cells complemented through expression of the wild-type human REV3L. Furthermore, cell-cycle progression of Rev3L(-/-) mouse embryo fibroblasts was arrested in late S/G2 following AFB(1) exposure. These Rev3L(-/-) cells showed an increase in replication-dependent formation of gamma-H2AX foci, micronuclei, and chromosomal aberrations (chromatid breaks and radials) relative to Rev3L(+/-) cells."

According to the news reporters, the research concluded: "These data suggest that pol zeta is essential for processing AFB(1)-induced DNA adducts and that, in its absence, cells do not have an efficient backup polymerase or a repair/tolerance mechanism facilitating survival."

Our news correspondents report that additional information may be obtained by contacting R.S. Lloyd, Oregon Health Sciences University, Dept. of Physiol & Pharmacol, Portland, OR 97239, United States. Additional authors for this research include N. Owen, I.G. Minko, S.S. Lange, L. Li, M.P. Stone, R.D. Wood, A.K. McCullough and R.S. Lloyd.

**Pelvic Organ Prolapse**

**New Data from Peking Union Medical College Hospital Illuminate Findings in Pelvic Organ Prolapse (Proteomic Analysis of the Uterosacral Ligament in Postmenopausal Women with and without Pelvic Organ Prolapse)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Pelvic Organ Prolapse are presented in a new report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Pelvic organ prolapse (POP) is a major health problem in adult women that involves many factors. No proteomic analysis has been conducted exclusively in POP patients."

Our news journalists obtained a quote from the research from Peking Union Medical College Hospital, "This study aimed to identify the differential expression of proteins that may be involved in POP by proteomic analysis. Samples of the uterosacral ligament (USL) were collected from five POP patients and five non-POP patients matched according to age, parity, and menopausal status and analyzed using two-dimensional electrophoresis and matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF-MS). Quantitative real-time polymerase chain reaction (qRT-PCR) was used to verify the mRNA expression of proteins that showed differential expression in the proteomic analyses. Proteins differentially expressed between POP and non-POP patients were detected. Eight proteins that were down-regulated in the POP group were identified by MALDI-TOF-MS. These proteins included electron transfer flavoprotein, apolipoprotein A-I, actin, transgelin, coflin-1, cyclophilin A, myosin, and galectin-1, and their expression was verified by qRT-PCR."

According to the news editors, the research concluded: "Using comparative proteomics, we identified eight differentially expressed proteins (including four cytoskeleton proteins and three proteins related to apoptosis) in the USL that may be involved in apoptosis associated with the tissue effects in POP pathophysiology."

For more information on this research see: Proteomic Analysis of the Uterosacral

The news correspondents report that additional information may be obtained from L. Zhu, Dept. of Obstetrics and Gynecology, Peking Union Medical College Hospital, Peking Union Medical College, Chinese Academy of Medical Sciences, Beijing 100730, People's Republic of China. **New Data from Pennsylvania State University Illuminate Findings in Obesity (Effects of Canola and High-Oleic-Acid Canola Oils on Abdominal Fat Mass in Individuals with Central Obesity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting from University Park, Pennsylvania, by NewsRx journalists, research stated, "To determine the effect of diets low in saturated fatty acids and high in monounsaturated fatty acids (MUFA) or polyunsaturated fatty acids on body composition in participants at risk for metabolic syndrome (MetS). This study was a randomized, crossover, controlled feeding study."

The news correspondents obtained a quote from the research from Pennsylvania State University, "Participants (n=101, ages 49.5+/−1.2, BMI 29.4+/−0.4 kg/m(2)) were randomized to five isocaloric diets containing treatment oils: Canola, CanolaOleic, CanolaDHA, Corn/Safflower, and Flax/Safflower. Each diet period was 4 weeks followed by a 2- to 4-week washout period. Canola (3.1 kg, P = 0.026) and CanolaOleic oil diets (3.09 kg, P = 0.03) reduced android fat mass compared with the Flax/Safflower oil diet (3.2 kg), particularly in men. The decrease in abdominal fat mass was correlated with the reduction in blood pressure after the Canola (systolic blood pressure: r = 0.26, P = 0.062; diastolic blood pressure: r = 0.38, P = 0.0049) and CanolaOleic oil diets (systolic blood pressure: r = 0.39 P = 0.004; diastolic blood pressure: r = 0.45, P = 0.0006). The decrease in abdominal fat mass also was associated with a reduction in triglyceride levels after the CanolaOleic oil diet (r = 0.42, P = 0.002). Diets high in MUFA (compared with PUFA) reduced central obesity with an accompanying improvement in MetS risk factors."

According to the news reporters, the research concluded: "Diets high in MUFA may
be beneficial for treating and perhaps preventing MetS."

For more information on this research see: Effects of Canola and High-Oleic-Acid Canola Oils on Abdominal Fat Mass in Individuals with Central Obesity. *Obesity*, 2016;24 (11):2261-2268. *Obesity* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. **Digestive System Diseases and Conditions** - …

**New Data from R.B. Pinto et al Illuminate Findings in Hirschsprung Disease (Hirschsprung disease and hepatoblastoma: case report of a rare association)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Hirschsprung Disease have been published. According to news reporting originating in Porto Alegre, Brazil, by NewsRx journalists, research stated, "Hirschsprung disease is a developmental disorder of the enteric nervous system that is characterized by absence of ganglion cells in the distal intestine, and it occurs in approximately 1 in every 500,000 live births. Hepatoblastoma is a malignant liver neoplasm that usually occurs in children aged 6 months to 3 years, with a prevalence of 0.54 cases per 100,000."

The news reporters obtained a quote from the research, "A boy diagnosed with intestinal atresia in the first week of life progressed to a diagnosis of comorbid Hirschsprung disease. Congenital cataracts and sensorineural deafness were diagnosed. A liver mass developed and was subsequently confirmed to be a hepatoblastoma, which was treated by means of surgical resection of 70% of the liver volume and neoadjuvant chemotherapy (ifosfamide, cisplatin and doxorubicin). It is known that Hirschsprung disease may be associated with syndromes predisposing towards cancer, and that hepatoblastoma may also be associated with certain congenital syndromes. However, co-occurrence of hepatoblastoma and Hirschsprung disease has not been previously described."

According to the news reporters, the research concluded: "We have reported a case of a male patient born with ileal atresia, Hirschsprung disease and bilateral congenital cataract who was later diagnosed with hepatoblastoma."

Our news correspondents report that additional information may be obtained by

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1590/1516-3180.2014.9200311. This DOI is a link to an online electronic document that is either free or for purchase.

Skin Diseases and Conditions - Atopic Dermatitis

New Data from Ruhr University Illuminate Findings in Atopic Dermatitis (Trying to understand the genetics of atopic dermatitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases and Conditions - Atopic Dermatitis are presented in a new report. According to news reporting out of Bochum, Germany, by NewsRx editors, research stated, "Atopic dermatitis (AD) is a common and complex skin disease associated with both genetic and environmental factors. Loss-of-function mutations in the filaggrin gene, encoding a structural protein with an important role in epidermal barrier function, constitutes a well recognised susceptibility locus for AD."

Our news journalists obtained a quote from the research from Ruhr University, "Further, genome-wide association studies (GWAS), including large meta-analyses, have discovered 38 additional susceptibility loci with genome-wide significance. However, the reported variations only explain a fraction of the overall heritability of AD. Here, we summarize the current knowledge of the role of filaggrin and the epidermal differentiation complex as well as the results of GWAS, with an emphasis on novel findings and observations made in the past two years."

According to the news editors, the research concluded: "Additionally, we present first results of exome sequencing for AD and discuss novel therapeutic strategies."

Our news journalists report that additional information may be obtained by contacting S. Stemmler, Ruhr Univ, Dept. of Human Genet, Bochum, Germany.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mcp.2016.10.004. This DOI is a link to an online electronic document that is either free or for purchase.

New Data from Sapienza-University Illuminate Findings in Mesotheliomas (Mesothelioma families without inheritance of a BAP1 predisposing mutation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mesotheliomas have been published. According to news reporting originating in Rome, Italy, by NewsRx journalists, research stated, "Familial malignant mesothelioma clusters are ideal candidates to explore BAP1 genomic status as a predisposing risk factor. We report data on BAP1 analysis in four families with multiple mesothelioma cases to investigate possible BAP1 alterations associated with an inherited cancer syndrome."

Financial supporters for this research include Lazio Region, University of Turin, Ministry of Health to the Piemonte Region.

The news reporters obtained a quote from the research from Sapienza-University, "We also recorded family history of cancer and assessed asbestos exposure. By genomic direct sequencing, we found no evidence of a BAP1 germline mutation in tumor DNA samples (one mesothelioma per family: n = 3 epithelioid; n = 1 biphasic). On the other hand, we identified a novel BAP1 somatic alteration (c.329_335delinsTC) in exon 5 (n = 1 biphasic), and we hypothesized the occurrence of somatic inactivating events not identifiable by sequencing in the other cases (n = 3 epithelioid), as demonstrated by the loss of nuclear BAP1 immunostaining. History of other cancers was in sites not typical of the BAP1 cancer syndrome. Asbestos exposure was occupational (n = 2 clusters), household (n = 1), and unknown (n = 1). These family units without inheritance of a BAP1 predisposing mutation expand the number of unmutated germline BAP1 families with multiple mesothelioma cases."

According to the news reporters, the research concluded: "This suggests that besides the exposure to asbestos other currently unknown genetic or epigenetic factors may be responsible for the high incidence of mesothelioma in BAP1-unmutated families."

For more information on this research see: Mesothelioma families without inheritance of a BAP1 predisposing mutation. Cancer Genetics, 2016;209(9):381-387. Cancer Genetics can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. New Data from Scripps Research Institute Illuminate Findings in Small Molecule Inhibitors [Identification of Neutrophil Exocytosis Inhibitors (Nexinhibs), Small Molecule Inhibitors of Neutrophil Exocytosis and Inflammation DRUGGABILITY OF THE ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Small Molecule Inhibitors have been presented. According to news reporting from La Jolla, California, by NewsRx journalists, research stated, "Neutrophils constitute the first line of cellular defense in response to bacterial and fungal infections and rely on granular proteins to kill microorganisms, but uncontrolled secretion of neutrophil cargos is injurious to the host and should be closely regulated. Thus, increased plasma levels of neutrophil secretory proteins, including myeloperoxidase and elastase, are associated with tissue damage and are hallmarks of systemic inflammation."

The news correspondents obtained a quote from the research from Scripps Research Institute, "Here, we describe a novel high-throughput screening approach to identify small molecule inhibitors of the interaction between the small GTPase Rab27a and its effector JFC1, two central regulators of neutrophil exocytosis. Using this assay, we have identified small molecule inhibitors of Rab27a-JFC1 binding that were also active in cell-based neutrophil-specific exocytosis assays, demonstrating the druggability of Rab GTPases and their effectors. These compounds, named Nexinhibs (neutrophil exocytosis inhibitors), inhibit exocytosis of azurophilic granules in human neutrophils without affecting other important innate immune responses, including phagocytosis and neutrophil extracellular trap production. Furthermore, the compounds are reversible and potent inhibitors of the extracellular production of superoxide anion by preventing the up-regulation of the granule membrane-associated subunit of the NADPH oxidase at the plasma membrane. Nexinhibs also inhibit the upregulation of activation signature molecules, including the adhesion molecules CD11b and CD66b. Importantly, by using a mouse model of endotoxin-induced systemic inflammation, we show that these inhibitors have significant activity in vivo manifested by decreased plasma levels of neutrophil secretory proteins and significantly decreased tissue infiltration by inflammatory neutrophils."

According to the news reporters, the research concluded: "Altogether, our data present the first neutrophil exocytosis-specific inhibitor with in vivo anti-inflammatory activity, supporting its potential use as an inhibitor of systemic inflammation."

Our news journalists report that additional information may be obtained by

New Data from Second Military Medical University Illuminate Findings in Embryonic Stem Cells (Induction of site-specific chromosomal translocations in embryonic stem cells by CRISPR/Cas9)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Stem Cell Research - Embryonic Stem Cells have been published. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Chromosomal translocation is the most common form of chromosomal abnormality and is often associated with congenital genetic disorders, infertility, and cancers. The lack of cellular and animal models for chromosomal translocations, however, has hampered our ability to understand the underlying disease mechanisms and to develop new therapies."

Our news editors obtained a quote from the research from Second Military Medical University, "Here, we show that site-specific chromosomal translocations can be generated in mouse embryonic stem cells (mESCs) via CRISPR/Cas9. Mouse ESCs carrying translocated chromosomes can be isolated and expanded to establish stable cell lines. Furthermore, chimeric mice can be generated by injecting these mESCs into host blastocysts."

According to the news editors, the research concluded: "The establishment of ESC-based cellular and animal models of chromosomal translocation by CRISPR/Cas9 provides a powerful platform for understanding the effect of chromosomal translocation and for the development of new therapeutic strategies."

For more information on this research see: Induction of site-specific chromosomal translocations in embryonic stem cells by CRISPR/Cas9. Scientific Reports, 2016;6():21918. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting J. Jiang, Research Center of Developmental Biology, Histology and Embryology Department, Second Military Medical University, Shanghai, 200433, People's Republic of China. New Data from Second Military Medical University Illuminate Findings in Osteosarcomas (Parthenolide Induces Reactive Oxygen Species-Mediated Autophagic Cell Death in Human Osteosarcoma Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Osteosarcomas. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Osteosarcoma is a devastating tumor of bone, primarily affecting adolescents. Parthenolide, a naturally occurring small molecule that interferes with NF-kappa B signaling, has recently attracted considerable attention because of its pharmacological action involving anti-cancer effects."

Our news editors obtained a quote from the research from Second Military Medical University, "However, the mechanism of the cytotoxic effect exerted by parthenolide on tumor cells is not clearly defined today. In this study, the effects of parthenolide were evaluated and characterized in human osteosarcoma cancer cell. Cell viability was assessed by CCK-8. Apoptosis was assessed by Annexin V-FITC/PI Flow cytometry assay. Relative quantitative real-time PCR and western blot were used to determine the expressions of genes and proteins. Our results suggest that parthenolide did not cause caspase-dependent cell death in osteosarcoma cancer cells, as indicated by the absence of significant early apoptosis as well as caspase-3 cleavage. Instead, parthenolide increased the autophagy and mitophagy, as characterized by increased PINK1 and Parkin translocation to mitochondria and enhanced autophagy proteins. The induction of autophagy by parthenolide was associated with the increase of reactive oxygen species (ROS). ROS antioxidants N-acetylcysteine (NAC) attenuated parthenolide-induced autophagy activity."

According to the news editors, the research concluded: "Our findings unveil a novel mechanism of drug action by parthenolide in osteosarcoma cancer cells and suggest a potential value of treating osteosarcoma cancer through a caspase-independent autophagic cell death by ROS activation."

The news editors report that additional information may be obtained by contacting W. Yuan, Second Military Med Univ, Changzheng Hosp, Dept. of Orthoped Surg, Shanghai 200003, People's Republic of China. Additional authors for this research include Q.O. Yang, Q.J. Kong, W. Yuan and Y.P.O. Yang.

Cardiovascular Diseases and Conditions - Hyperemia

New Data from Sichuan University Illuminate Findings in Hyperemia (Short-Term Efficacy of Pudilan Keyanning Toothpaste in Treatment of Minor Recurrent Aphthous Ulcers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hyperemia. According to news reporting from Chengdu, People's Republic of China, by NewsRx journalists, research stated, "To examine the potential of Pudilan Keyanning toothpaste (PKT) to treat minor aphthous ulcers (MiAU). A doubleblind clinical trial was conducted in which 80 volunteers were randomly assigned to the PKT group (N = 40) or the control group (N = 40)."

The news correspondents obtained a quote from the research from Sichuan University, "The control group used a placebo toothpaste containing no Pudilan extract. At baseline, after 3 days, and after 6 days the following parameters were recorded for the target ulcers: healing rate, healing period, pain (visual analogue scale, VAS), areas of the target ulcerated lesions, degree of exudation, and hyperemia. At the end of the study, the healing rate in the PKT group was 80%, compared to 50% in the control group (p < 0.05). At day 6, the VAS scores, ulcer area, degree of exudation, and hyperemia were significantly different between the two groups, with better performance observed in the PKT group (p < 0.05)."

According to the news reporters, the research concluded: "PKT toothpaste appears to promote effective healing of MiAU."

For more information on this research see: Short-Term Efficacy of Pudilan Keyanning Toothpaste in Treatment of Minor Recurrent Aphthous Ulcers. Evidence-Based Complementary and Alternative Medicine, 2016();1-7. Heart Disorders and Diseases - Endocarditis

New Data from State University of New York Illuminate Findings in Endocarditis (Neisseria elongata endocarditis of a native aortic valve)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Endocarditis have been presented. According to news reporting from Buffalo, New York, by NewsRx journalists, research stated, "Neisseria elongata is a part of the common bacterial flora of the oropharynx but has caused sepsis, osteomyelitis and infective endocarditis on rare occasions. We report the case of a 56-year-old Caucasian woman who was admitted to hospital with a 5-week history of fever, malaise and fatigue."

The news correspondents obtained a quote from the research from the State University of New York, "Two blood cultures grew Gram-negative rods which were confirmed to be N. elongata subspecies nitroreducens via bacterial DNA sequence analysis. An echocardiogram showed a large mobile vegetation on the right and non-coronary cusps of the aortic valve. The patient underwent aortic valve replacement and antibiotic therapy for 6 weeks."

According to the news reporters, the research concluded: "We suggest that clinicians should consider extended antibiotic treatment and early surgical evaluation based on the nature and aggressiveness of N."

For more information on this research see: Neisseria elongata endocarditis of a native aortic valve. Bmj Case Reports, 2016:2016():. (BMJ Publishing Group - group.bmj.com/; Bmj Case Reports - casereports.bmj.com/)

Science

New Data from Technical University Illuminate Findings in Science (Recognition of the 3' splice site RNA by the U2AF heterodimer involves a dynamic population shift)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Science are presented in a new report. According to news reporting originating from Garching, Germany, by NewsRx correspondents, research stated, "An essential early step in the assembly of human spliceosomes onto pre-mRNA involves the
recognition of regulatory RNA cis elements in the 3' splice site by the U2 auxiliary factor (U2AF). The large (U2AF65) and small (U2AF35) subunits of the U2AF heterodimer contact the polypyrimidine tract (Py-tract) and the AG-dinucleotide, respectively."

Our news editors obtained a quote from the research from Technical University, "The tandem RNA recognition motif domains (RRM1,2) of U2AF65 adopt closed/inactive and open/active conformations in the free form and when bound to bona fide Py-tract RNA ligands. To investigate the molecular mechanism and dynamics of 3' splice site recognition by U2AF65 and the role of U2AF35 in the U2AF heterodimer, we have combined single-pair FRET and NMR experiments. In the absence of RNA, the RRM1,2 domain arrangement is highly dynamic on a submillisecond time scale, switching between closed and open conformations. The addition of Py-tract RNA ligands with increasing binding affinity (strength) gradually shifts the equilibrium toward an open conformation. Notably, the protein-RNA complex is rigid in the presence of a strong Py-tract but exhibits internal motion with weak Py-tracts. Surprisingly, the presence of U2AF35, whose UHM domain interacts with U2AF65 RRM1, increases the population of the open arrangement of U2AF65 RRM1,2 in the absence and presence of a weak Py-tract. These data indicate that the U2AF heterodimer promotes spliceosome assembly by a dynamic population shift toward the open conformation of U2AF65 to facilitate the recognition of weak Py-tracts at the 3' splice site."

According to the news editors, the research concluded: "The structure and RNA binding of the heterodimer was unaffected by cancer-linked myelodysplastic syndrome mutants."

For more information on this research see: Recognition of the 3' splice site RNA by the U2AF heterodimer involves a dynamic population shift. *Proceedings of the National Academy of Sciences of the United States of America*, 2016;113(46):E7169-E7175.

**Peptides and Proteins**

**New Data from Tokai University Illuminate Findings in Peptides and Proteins [The Bromodomain and Extra-Terminal Domain (BET) Family: Functional Anatomy of BET Paralogous Proteins]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Peptides and Proteins are discussed in a new report. According to news reporting originating from Kanagawa, Japan, by NewsRx editors, the research stated, "The Bromodomain and Extra-Terminal Domain (BET) family of proteins is
characterized by the presence of two tandem bromodomains and an extra-terminal domain. The mammalian BET family of proteins comprises BRD2, BRD3, BRD4, and BRDT, which are encoded by paralogous genes that may have been generated by repeated duplication of an ancestral gene during evolution."

Our news editors obtained a quote from the research from Tokai University, "Bromodomains that can specifically bind acetylated lysine residues in histones serve as chromatin-targeting modules that decipher the histone acetylation code. BET proteins play a crucial role in regulating gene transcription through epigenetic interactions between bromodomains and acetylated histones during cellular proliferation and differentiation processes. On the other hand, BET proteins have been reported to mediate latent viral infection in host cells and be involved in oncogenesis. Human BRD4 is involved in multiple processes of the DNA virus life cycle, including viral replication, genome maintenance, and gene transcription through interaction with viral proteins. Aberrant BRD4 expression contributes to carcinogenesis by mediating hyperacetylation of the chromatin containing the cell proliferation-promoting genes. BET bromodomain blockade using small-molecule inhibitors gives rise to selective repression of the transcriptional network driven by c-MYC These inhibitors are expected to be potential therapeutic drugs for a wide range of cancers."

According to the news editors, the research concluded: "This review presents an overview of the basic roles of BET proteins and highlights the pathological functions of BET and the recent developments in cancer therapy targeting BET proteins in animal models."

The news editors report that additional information may be obtained by contacting Y. Taniguchi, Tokai University, Sch Med, Div Basic Mol Sci & Mol Med, Isehara, Kanagawa 2591193, Japan.

Cardiology

New Data from UC Davis Medical Center Illuminate Findings in Cardiology (Getting a better look: Outcomes of laparoscopic versus transdiaphragmatic pericardial window for penetrating thoracoabdominal trauma at a Level I trauma center)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news originating from Sacramento, California, by NewsRx correspondents, research stated, "In penetrating thoracoabdominal trauma, it is necessary to evaluate both the pericardial fluid and the diaphragm directly. Transdiaphragmatic pericardial windows (TDWs) provide direct access to the pericardium and diaphragm but expose the patient to the risks of laparotomy."

Our news journalists obtained a quote from the research from UC Davis Medical
Center, "We hypothesize that transabdominal laparoscopic pericardial windows (LPWs) are a safe and effective alternative to TDWs in stable patients. This is a retrospective observational study of stable patients with thoracoabdominal penetrating trauma at a level I trauma center between January 2007 and June 2015, comparing outcomes after TDW versus LPW. A total of 99 patients with penetrating trauma had a diagnostic pericardial window, 33 of which were laparoscopic. Stab wounds were most common (80, 80.8%) compared with gunshot wounds (19, 19.2%). Of 11 patients who had a positive pericardial window, 10 (90.9%) were associated with a cardiac injury. There was no difference in the ratio of positive pericardial windows for patients who had TDW versus LPW (8/66, 12.1% vs. 3/33, 9.1%; p = 0.651). One patient had a complication related to a negative pericardial window in the laparoscopic group. There was no difference in complication rates between TDW and LPW (p = 0.155). Mean length of stay was longer in TDW compared with LPW (12 vs. 5 days, p = 0.046). One patient died during index admission in the TDW group, but there was no difference in mortality rates between TDW and LPW during the index admission (p = 0.477). Median length of follow-up was 29 days (range, 0-2,709). On long-term follow-up, there was also no difference in mortality rates between TDW and LPW (2/66, 3.0% vs. 2/33, 6.1%; p = 0.470). In hemodynamically stable patients with thoracoabdominal injuries, LPW is a safe and effective technique in evaluating both pericardial fluid and the diaphragm."

According to the news editors, the research concluded: "LPW is a viable alternative to exploratory laparotomy and TDWs."

For more information on this research see: Getting a better look: Outcomes of laparoscopic versus transdiaphragmatic pericardial window for penetrating thoracoabdominal trauma at a Level I trauma center. Journal of Trauma and Acute Care Surgery, 2016;81 (6):1035-1038. Oncology - Solid Cancer

New Data from University College Illuminate Findings in Solid Cancer (ADD-ASPIRIN: A phase III, double-blind, placebo controlled, randomised trial assessing the effects of aspirin on disease recurrence and survival after primary therapy in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Solid Cancer. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "There is a considerable body of pre-clinical, epidemiological and randomised data to support the hypothesis that aspirin has the potential to be an effective adjuvant cancer therapy. Add-
Aspirin is a phase III, multi-centre, double-blind, placebo-controlled randomised trial with four parallel cohorts."

Our news journalists obtained a quote from the research from University College, "Patients who have undergone potentially curative treatment for breast (n = 3100), colorectal (n = 2600), gastro-oesophageal (n = 2100) or prostate cancer (n = 2120) are registered into four tumour specific cohorts. All cohorts recruit in the United Kingdom, with the breast and gastro-oesophageal cohort also recruiting in India. Eligible participants first undertake an active run-in period where 100 mg aspirin is taken daily for approximately eight weeks. Participants who are able to adhere and tolerate aspirin then undergo a double-blind randomisation and are allocated in a 1:1:1 ratio to either 100 mg aspirin, 300 mg aspirin or a matched placebo to be taken daily for at least five years. Those participants 75 years old are only randomised to 100 mg aspirin or placebo due to increased toxicity risk. The primary outcome measures are invasive disease-free survival for the breast cohort, disease-free survival for the colorectal cohort, overall survival for the gastro-oesophageal cohort, and biochemical recurrence-free survival for the prostate cohort, with a co-primary outcome of overall survival across all cohorts. Secondary outcomes include adherence, toxicity including serious haemorrhage, cardiovascular events and some cohort specific measures."

According to the news editors, the research concluded: "The Add-Aspirin trial investigates whether regular aspirin use after standard therapy prevents recurrence and prolongs survival in participants with four non-metastatic common solid tumours."

For more information on this research see: ADD-ASPIRIN: A phase III, double-blind, placebo controlled, randomised trial assessing the effects of aspirin on disease recurrence and survival after primary therapy in common non-metastatic solid tumours. Contemporary Clinical Trials, 2016;51():56-64. Contemporary Clinical Trials can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Contemporary Clinical Trials - www.journals.elsevier.com/contemporary-clinical-trials/)

The news correspondents report that additional information may be obtained from R.E. Langley, UCL, MRC Clin Trials Unit, London WC2B 6NH, United Kingdom. Additional authors for this research include F.H. Cafferty, S. Rowley, M. MacKenzie, L. Berkman, S. Gupta, C.S. Pramesh, D. Gilbert, H. Kynaston, D. Cameron, R.H. Wilson, A. Ring and R.E. Langley.

Oncology - Liver Cancer

New Data from University Hospital Illuminate Findings in Liver Cancer (Recurrent Hepatocellular Carcinoma After Liver Transplantation: Analysis of Risk Factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting originating in Seville, Spain, by NewsRx journalists, research stated, "Survival after orthotopic liver transplantation (LT) for hepatocellular carcinoma (HCC) is influenced by tumor recurrence. This study examines the survival of patients who underwent LT for HCC and developed recurrence of tumor after transplantation."

The news reporters obtained a quote from the research from University Hospital, "A retrospective analysis was performed of the 200 patients who underwent LT secondary to HCC from 1990 to 2014. We excluded 19 patients from the study owing to early postoperative deaths in the 1st month. We divided our sample into 2 groups according to the presence of recurrence. We performed a univariate analysis to identify variables that are significantly associated with the risk of recurrence. Afterward we use multivariate analysis regression analysis to find independent significance. Univariate analysis shows significant relationship between high Edmondson-Steiner grades (G3-G4) and the development of tumor recurrence. Tumor size, vascular invasion, and capsular invasion were found to be independent risk factors of tumor recurrence in the multivariate analysis. Tumor recurrence defines survival of patients who underwent LT for HCC."

According to the news reporters, the research concluded: "In this study we discuss which histologic factor are associated with higher risk of tumor recurrence, and therefore a negative the impact on patient's survival."

For more information on this research see: Recurrent Hepatocellular Carcinoma After Liver Transplantation: Analysis of Risk Factors. Transplantation Proceedings, 2016;48 (9):2990-2993. Transplantation Proceedings can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Pharmacokinetics

New Data from University of Alexandria Illuminate Findings in Pharmacokinetics (A Validated HPLC Method for the Determination of Linagliptin in Rat Plasma. Application to a Pharmacokinetic Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacokinetics have been presented. According to news originating from Alexandria, Egypt, by NewsRx correspondents, research stated, "A sensitive and reproducible HPLC method for the determination of linagliptin (LNG) in rat plasma was developed and validated using pinodolol (PIN) as the internal standard. Both LNG and PIN were separated on a Zorbax Eclipse XDB C-18 column kept at ambient temperature using as mobile phase a combination of 75% methanol: 25% formic acid 0.1% pH 4.1 at a flow rate of 1.0 mL min(-1)."

Our news journalists obtained a quote from the research from the University of Alexandria, "UV detection was performed at 254 nm. The method was validated in compliance with ICH guidelines and found to be linear in the range of 5-1,000 ng mL(-1). The limit of quantification (LOQ) was found to be 5 ng mL(-1) based on 100 µL of plasma. The variations for intra-and inter-assay precision were <10%, and the accuracy values were ranged between 93.3 and 102.5%. The extraction recovery (R%) was >83%. The assay was successfully applied to an in vivo pharmacokinetic study of LNG in rats that were administered a single oral dose of 10 mg kg(-1) LNG."

According to the news editors, the research concluded: "The maximum concentration (C-max) and the area under the plasma concentration-time curve (AUC(0-72)) were 927.5 +/- 23.9 and 18,285.02 +/- 605.76 ng mL(-1), respectively."

The news correspondents report that additional information may be obtained from H. Mahgoub, University of Alexandria, Fac Pharm, Dept. of Pharmaceut Analty Chem, Alexandria 21521, Egypt.

New Data from University of G. d'Annunzio Illuminate Findings in Clinical Trials and Studies (How Technology Can Impact Surgeon Performance: A Randomized Trial Comparing 3-Dimensional versus 2-Dimensional Laparoscopy in Gynecology Oncology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting originating from Chieti, Italy, by NewsRx correspondents, research stated, "This randomized clinical trial (Canadian Task Force classification I) aimed to compare 2-dimension (2-D) versus 3 dimensional (3-D) laparoscopic hysterectomy and pelvic lymphadenectomy in endometrial and cervical cancer patients. Between December 2014 and March 2015, 90 patients were enrolled: 29 (32.2%) with early or locally advanced cervical cancer after neoadjuvant treatment and 61 (67.8%) with early-stage endometrial cancer."

Our news editors obtained a quote from the research from the University of G. d'Annunzio, "Patients were randomly assigned to undergo 2-D (Group A, n = 48 [53.3%]) or 3-D (Group B, n = 42 [46.7%]) laparoscopy. Baseline characteristics were superimposable in the 2 groups. Median operative time was similar in the 2 groups. Median estimated blood loss during lymphadenectomy was significantly lower in Group B than in Group A (38 mL [range, 0-450] vs 65 mL [range, 0-200]; p = 3.033). In cervical cancer patients operative time of pelvic lymphadenectomy performed by 'novice' surgeons (those with <10 procedures performed) was statistically significantly lower in Group B (p =.047). No differences in perioperative outcomes and postoperative complications were observed between the 2 groups. The 2-D and 3-D systems can be used safely in laparoscopic hysterectomy."

According to the news editors, the research concluded: "However, the 3-D system could provide key benefits to intraoperative techniques and postoperative outcomes in reducing operative time for 'expert' surgeons and in enhancing surgical precision for 'novice' surgeons."

The news editors report that additional information may be obtained by contacting F. Fanfani, Univ G dAnnunzio, Dept. of Med & Aging Sci, Chieti, Italy. Additional authors for this research include C. Rossitto, S. Restaino, A. Ercoli, V. Chiantera, G. Monterossi, G. Barbati and G. Scambia.

New Data from University of Kashmir Illuminate Findings in Squamous Cell Carcinoma (Genotypes of CYP1A1,SULT1A1 and SULT1A2 and risk of squamous cell carcinoma of esophagus: outcome of a case-control study from Kashmir, India)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Squamous Cell Carcinoma. According to news reporting originating in Jammu Kashmir, India, by NewsRx journalists, research stated, "Studies on associations of various polymorphism in xenobiotic metabolizing genes with different cancers including esophageal squamous cell carcinoma (ESCC) are mixed and inconclusive. To evaluate the association of CYP1A1*4,SULT1A1*2 and SULT1A2*2 genotypes with ESCC risk and their modifying effects on different risk factors of ESCC, we conducted a case-control study in Kashmir, India, an area with relative high incidence of ESCC."

The news reporters obtained a quote from the research from the University of Kashmir, "We recruited 404 histopathologically confirmed ESCC cases, and equal number of controls, individually matched for sex, age and district of residence to respective case. Information was obtained on various dietary, lifestyle and environmental factors in face-to-face interviews, using a structured questionnaire, from each subject. Genotypes were analyzed by polymerase chain reaction, restriction fragment length polymorphism and direct sequencing. Conditional logistic regression models were used to calculate odds ratios (ORs) and 95% confidence intervals (95% CIs). A higher risk was observed in the subjects who harbored variant genotype of CYP1A1*4 (OR = 2.06; 95% CI: 1.28-3.32); and the risk was further enhanced in ever smokers (OR = 3.47; 95% CI: 1.62-7.42), adobe dwellers (OR = 6.71; 95% CI: 3.02-14.89), and biomass fuel users (OR = 5.11; 95% CI: 1.34-19.50). We did not find any significant differences in the polymorphic variants of SULT1A1*2 and SULT1A2*2 between cases and controls. The study indicates that, unlike SULT1A1*2 and SULT1A2*2, the polymorphism of CYP1A1*4 is associated with ESCC risk."

According to the news reporters, the research concluded: "However, replicative studies with larger sample size are needed to substantiate our findings."

Our news correspondents report that additional information may be obtained by contacting N.A. Dar, University of Kashmir, Dept. of Biochem, Srinagar 190006, Jammu & Kashmir, India. Additional authors for this research include G.A. Bhat, P. Mehta, M.M. Lone and N.A. Dar.

Keywords for this news article include: Jammu Kashmir, India, Asia, Oncology, Risk and Prevention, Epidemiology, Squamous Cell Carcinoma, Carcinomas, Genetics, University of Kashmir.

Drugs and Therapies - Angiotensin II Inhibitors

New Data from University of Lincoln Illuminate Findings in Angiotensin II Inhibitors (Comparative biodistribution and safety profiling of olmesartan medoxomil oil-in-water oral nanoemulsion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Angiotensin II Inhibitors. According to news reporting from Kuala Lumpur, Malaysia, by NewsRx journalists, research stated, "Poor aqueous solubility and unfavourable de-esterification of olmesartan medoxomil (a selective angiotensin II receptor blocker), results in low oral bioavailability of less than 26%. Improvement of oral bioavailability with prolonged pharmacodynamics activity of olmesartan in Wistar rats had been approached by nanoemulsification strategy in our previous article [Colloid Surface B, 115, 2014: 286]."

Financial support for this research came from Indian Council of Medical Research, New Delhi, India.

The news correspondents obtained a quote from the research from the University of Lincoln, "In continuation to that work, we herewith report the biodistribution behaviour and 28-day repeated dose sub-chronic toxicity of olmesartan medoxomil nanoemulsion in Wistar rats following oral administration. The levels of olmesartan in collected biological samples were estimated using our validated LC-MS/MS technique. Our biodistribution study showed significantly higher brain concentrations of olmesartan (0.290 +/- 0.089 μg/mL, 0.333 +/- 0.071 μg/mL and 0.217 +/- 0.062 μg/mL at 0.5, 2.0 and 8.0 h post dosing, respectively) when administered orally as nanoemulsion formulation as compared to the aqueous suspension. In addition, the olmesartan nanoemulsion was found to be safe and non-toxic, as it neither produced any lethality nor remarkable haematological, biochemical and structural adverse effects as observed during the 28-days sub-chronic toxicity studies in experimental Wistar rats."

According to the news reporters, the research concluded: "It is herewith envisaged that the developed nanoemulsion formulation approach for the delivery of olmesartan medoxomil via oral route can further be explored in memory dysfunction and brain ischemia, for better brain penetration and improved clinical application in stroke patients."

For more information on this research see: Comparative biodistribution and safety profiling of olmesartan medoxomil oil-in-water oral nanoemulsion. Regulatory Toxicology and Pharmacology, 2016;82():20-31. New Data from University of Paris Illuminate Findings in Enterococcus
(First nosocomial outbreak of vanA-type vancomycin-resistant Enterococcus raffinosus in France)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Gram-Positive Bacteria - Enterococcus is the subject of a report. According to news reporting out of Creteil, France, by NewsRx editors, research stated, "Vancomycin-resistant Enterococcus raffinosus has rarely been associated with nosocomial infection and outbreaks. To report the successful control of a nosocomial outbreak of vanA-type vancomycin-resistant E. raffinosus in a surgical intensive care unit."

Our news journalists obtained a quote from the research from the University of Paris, "The investigation of the outbreak is reported with control measures taken. Molecular typing of vancomycin-resistant E. raffinosus isolates was performed by repetitive sequence-based polymerase chain reaction (PCR). Between September and October 2014, vancomycin-resistant E. raffinosus isolates were isolated from four patients. The index patient had been hospitalized previously in Portugal, and was not found to be colonized by vancomycin-resistant enterococci on screening cultures obtained at admission. However, vancomycin-resistant E. raffinosus was isolated from a bile sample 19 days after hospital admission. All four isolates were resistant to both vancomycin and teicoplanin due to the presence of the vanA gene, while remaining susceptible to daptomycin and linezolid. Repetitive sequence-based PCR confirmed the spread of a single vanA-positive E. raffinosus clone. Infection control measures including direct PCR screening on rectal specimens, contact precautions, and cohorting of patients and personnel led to successful control of the outbreak. This is the first reported outbreak of vanA-type vancomycin-resistant E. raffinosus in France in both clinical and screening specimens among hospitalized patients."

According to the news editors, the research concluded: "The inability of routine selective screening media to detect the vancomycin-resistant E. raffinosus in the index case likely contributed to the outbreak."

Our news journalists report that additional information may be obtained by contacting S. Jolivet, UPEC Univ Paris Est Creteil Val Marne, Creteil, France. Additional authors for this research include M. Fines-Guyon, B. Nebbad, J.C. Merle, D. Le Pluart, C. Brun-Buisson, J.W. Decousser and V. Cattoir.

Drugs and Therapies - Immunotherapy

New Data from University of Paris Illuminate Findings in Immunotherapy (Co-stimulation Blockade Plus T-Cell Depletion in Transplant Patients: Towards a Steroid- and Calcineurin Inhibitor-Free Future?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Immunotherapy. According to news originating from Paris, France, by NewsRx correspondents, research stated, "Long-term survival of solid allografts depends on both immunosuppressive efficacy and reducing the side effects associated with these therapies. Immunotherapies developed over the past 15 years to prevent organ rejection have greatly improved cardiovascular and renal function compared with classical therapies, such as calcineurin inhibitors and corticosteroids."

Our news journalists obtained a quote from the research from the University of Paris, "Immunotherapies that target T cells through the co-stimulation blockade (CTLA-4-Ig) improve renal function and the survival of grafts and patients, but are associated with higher rates of T-cell-mediated acute rejection. Improvements to safe and efficacious therapeutic options could combine a co-stimulation blockade with a depleting immunotherapy. Herein, we describe the clinical outcomes and the likely causes of defects in the co-stimulation blockade, and comment on new therapeutic strategies to overcome these."

According to the news editors, the research concluded: "Great progress has been made to optimize immunotherapy using the co-stimulation blockade, but the therapeutic combinations should be assessed further."

The news correspondents report that additional information may be obtained from A. Durrbach, University of Paris, Le Kremlin Bicetre Hosp, IFRNT, Dept. of Nephrol, Paris, France. Additional authors for this research include M. Brunel, N. Roders and A. Durrbach. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s40265-016-0656-2. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Breast Cancer

New Data from University of Sheffield Illuminate Findings in Breast Cancer [Goserelin, as an ovarian protector during (neo)adjuvant breast cancer chemotherapy, prevents long term altered bone turnover]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting out of Sheffield, United Kingdom, by NewsRx editors, research stated, "The Ovarian Protection Trial In Premenopausal Breast Cancer Patients 'OPTION' trial (NCT00427245) was a prospective, multicenter, randomised, open label study evaluating the frequency of primary ovarian insufficiency (POI) at 12 months in women randomised to 6-8 cycles of (neo)adjuvant chemotherapy (CT) (plusminus)goserelin (G). Here we report the results of a secondary endpoint analysis of the effects of CT(plusminus)G on markers of bone turnover."

Our news journalists obtained a quote from the research from the University of Sheffield, "Serum for bone alkaline phosphatase (BALP) and urine for N-terminal telopeptide (NTX) were collected at baseline, 6, 12, 18, 24 and 36 months. Changes in median levels of bone turnover markers were evaluated for the overall population, according to age stratification at randomisation ( (<=)40 vs >40 years) and with exploratory analysis according to POI rates at 12 months. In the overall population, there was a significant increase in NTX at 6 months compared to baseline in patients treated with CT+G (40.81 vs 57.82 p=0.0074) with normalisation of levels thereafter. BALP was significantly increased compared to baseline at 6 months and 12 months in those receiving CT+G, but normalised thereafter. BALP remained significantly higher compared to baseline at 12, 24 and 36 months in patients receiving CT, resulting in a significant difference between treatment groups at 36 months (CT+G 5.845 vs CT 8.5 p=0.0006). These changes were predominantly seen in women >40 years. Women with POI at 12 months showed altered bone formation compared to baseline levels for a longer duration than women who maintained menses."

According to the news editors, the research concluded: "Addition of G to CT increases bone turnover during treatment with normalisation after cessation of treatment suggesting G may offer sufficient ovarian protection against CT induced POI to negate longstanding altered bone turnover associated with POI."

Our news journalists report that additional information may be obtained by contacting C. Wilson, Academic Unit of Clinical Oncology, Weston Park Hospital, University of Sheffield, Sheffield, UK. Additional authors for this research include F. Gossiel, R. Leonard, R.A. Anderson, D.J. Adamson, G. Thomas and R.E Coleman.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jbo.2016.02.003. This DOI is a link to an online electronic document that is either free or for purchase.

New Data from University of Tokyo Illuminate Findings in Estrogen
(Protective effects of estrogen against vascular calcification via estrogen receptor alpha-dependent growth arrest-specific gene 6 transactivation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hormones - Estrogen is now available. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "Vascular calcification is one of the major complications of cardiovascular disease and is an independent risk factor for myocardial infarction and cardiac death. Postmenopausal women have a higher prevalence of vascular calcification compared with premenopausal women, suggesting protective effects of estrogen (E2)."

The news reporters obtained a quote from the research from the University of Tokyo, "However, the underlying mechanisms of its beneficial effects remain unclear. In the present study, we examined the inhibitory effects of E2 on vascular smooth muscle cell (VSMC) calcification, and found that growth arrest-specific gene 6 (Gas6), a crucial molecule in vascular calcification, is transactivated by estrogen receptor a (ER alpha) in response to E2. In human aortic smooth muscle cells, physiological levels of E2 inhibited inorganic phosphate (Pi)-induced calcification in a concentration-dependent manner. This inhibitory effect was significantly abolished by MPP, an ERa-selective antagonist, and ER alpha siRNA, but not by PHTPP, an ER beta-selective antagonist, and ER beta siRNA, implicating an ER alpha-dependent action. Apoptosis, an essential process for Pi-induced VSMC calcification, was inhibited by E2 in a concentration-dependent manner and further, MPP abolished this inhibition. Mechanistically, E2 restored the inhibited expression of Gas6 and phospho-Akt in Pi-induced apoptosis through ERa. Furthermore, E2 significantly activated Gas6 transcription, and MPP abrogated this E2-dependent Gas6 transactivation. E2-BSA failed to activate Gas6 transcription and to inhibit Ca deposition in VSMC, suggesting beneficial actions of genomic signaling by E2/nuclear ERa. Taken together, these results indicate that E2 exerts inhibitory effects on VSMC apoptosis and calcification through ER alpha-mediated Gas6 transactivation."

According to the news reporters, the research concluded: "These findings indicate a potential therapeutic strategy for the prevention of vascular calcification, especially in postmenopausal women."

For more information on this research see: Protective effects of estrogen against vascular calcification via estrogen receptor alpha-dependent growth arrest-specific gene 6 transactivation. Biochemical and Biophysical Research Communications, 2016;480(3):429-435. Chemistry - Biochemistry

New Data from University of Victoria Illuminate Findings in Biochemistry [Molecular Basis for Recognition of the Cancer Glycobiomarker, LacdiNAc (GalNAc[14]GlcNAc), by Wisteria floribunda Agglutinin]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Chemistry - Biochemistry is now available. According to news reporting out of Victoria, Canada, by NewsRx editors, research stated, "Aberrant glycosylation and the overexpression of specific carbohydrate epitopes is a hallmark of many cancers, and tumor-associated oligosaccharides are actively investigated as targets for immunotherapy and diagnostics. Wisteria floribunda agglutinin (WFA) is a legume lectin that recognizes terminal N-acetylgalactosaminides with high affinity."

Our news journalists obtained a quote from the research from the University of Victoria, "WFA preferentially binds the disaccharide LacdiNAc (-d-GalNAc-[14]-d-GlcNAc), which is associated with tumor malignancy in leukemia, prostate, pancreatic, ovarian, and liver cancers and has shown promise in cancer glycobiomarker detection. The mechanism of specificity for WFA recognition of LacdiNAc is not fully understood. To address this problem, we have determined affinities and structure of WFA in complex with GalNAc and LacdiNAc. Affinities toward Gal, GalNAc, and LacdiNAc were measured via surface plasmon resonance, yielding K-D values of 4.67 x 10(-4) m, 9.24 x 10(-5) m, and 5.45 x 10(-6) m, respectively. Structures of WFA in complex with LacdiNAc and GalNAc have been determined to 1.80-2.32 angstrom resolution. These high resolution structures revealed a hydrophobic groove complementary to the GalNAc and, to a minor extent, to the back-face of the GlcNAc sugar ring. Remarkably, the contribution of this small hydrophobic surface significantly increases the observed affinity for LacdiNAc over GalNAc. Tandem MS sequencing confirmed the presence of two isolectin forms in commercially available WFA differing only in the identities of two amino acids."

According to the news editors, the research concluded: "Finally, the WFA carbohydrate binding site is similar to a homologous lectin isolated from Vatairea macrocarpa in complex with GalNAc, which, unlike WFA, binds not only GalNAc but also terminal Ser/Thr O-linked GalNAc (Tn antigen)."

Musculoskeletal Diseases and Conditions —

New Data from University of the Western Cape Illuminate Findings in Tendinopathy (Semantic interrogation of a multi knowledge domain ontological model of tendinopathy identifies four strong candidate risk genes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Musculoskeletal Diseases and Conditions - Tendinopathy have been presented. According to news reporting originating in Bellville, South Africa, by NewsRx journalists, research stated, "Tendinopathy is a multifactorial syndrome characterised by tendon pain and thickening, and impaired performance during activity. Candidate gene association studies have identified genetic factors that contribute to intrinsic risk of developing tendinopathy upon exposure to extrinsic factors."

The news reporters obtained a quote from the research from the University of the Western Cape, "Bioinformatics approaches that data-mine existing knowledge for biological relationships may assist with the identification of candidate genes. The aim of this study was to data-mine functional annotation of human genes and identify candidate genes by ontology-seeded queries capturing the features of tendinopathy. Our BioOntological Relationship Graph database (BORG) integrates multiple sources of genomic and biomedical knowledge into an on-disk semantic network where human genes and their orthologs in mouse and rat are central concepts mapped to ontology terms. The BORG was used to screen all human genes for potential links to tendinopathy. Following further prioritisation, four strong candidate genes (COL11A2, ELN, ITGB3, LOX) were identified. These genes are differentially expressed in tendinopathy, functionally linked to features of tendinopathy and previously implicated in other connective tissue diseases."

According to the news reporters, the research concluded: "Cross-domain semantic integration of multiple sources of biomedical knowledge, and interrogation of phenotypes and gene functions associated with disease, may significantly increase the probability of identifying strong and unobvious candidate genes in genetic association studies."

For more information on this research see: Semantic interrogation of a multi knowledge domain ontological model of tendinopathy identifies four strong candidate risk genes. *Scientific Reports*, 2016;6():19820. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Optic Nerve Diseases

New Data from Wenzhou Medical University Illuminate Findings in Optic Nerve Diseases (Three-dimensional Characteristics Of Four Macular Intraretinal Layer Thicknesses In Symptomatic And Asymptomatic Carriers Of G11778a Mutation With Leber's ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Optic Nerve Diseases have been presented. According to news originating from Zhejiang, People's Republic of China, by NewsRx correspondents, research stated, "To characterize by spectral domain optical coherence tomography the three-dimensional thicknesses of four macular intraretinal layers in symptomatic and asymptomatic carriers of G11778A mutation with Leber's hereditary optic neuropathy. Twenty-five eyes (7 symptomatic eyes and 18 asymptomatic eyes) of patients with Leber's hereditary optic neuropathy from one Chinese family and 16 normal eyes were enrolled."

Our news journalists obtained a quote from the research from Wenzhou Medical University, "Macular radial scans by spectral domain optical coherence tomography and custom software produced intraretinal three-dimensional thickness maps. The macula was divided into nine regions, and each region included four intraretinal layers: nerve fiber layer, ganglion cell layer and inner plexiform layer, inner nuclear layer and outer plexiform layer, and the outer retinal layer. Nerve fiber layer in the symptomatic eyes was significantly thinner than in normal eyes for most of the macular regions; however in the asymptomatic eyes, it was increased in three regions. Ganglion cell layer and inner plexiform layers in all regions of symptomatic eyes were significant thinner than in asymptomatic eyes and controls. Inner nuclear layer and outer plexiform layers in six regions of symptomatic and asymptomatic eyes were significantly thicker than in controls. The outer retinal layer of asymptomatic eyes was thicker than in most control regions."

According to the news editors, the research concluded: "Intraretinal thickness changes in asymptomatic patients could be prodromal events that indicate the imminent conversion to symptomatic patients with Leber's hereditary optic neuropathy."

For more information on this research see: Three-dimensional Characteristics Of Four Macular Intraretinal Layer Thicknesses In Symptomatic And Asymptomatic Carriers Of G11778a Mutation With Leber's Hereditary Optic Neuropathy. Retina-The Journal of Retinal and Vitreous Diseases, 2016;36(12):2409-2418. Cardiovascular Diseases and Conditions - Deep Vein...

New Deep Vein Thrombosis Study Findings Have Been Reported by B. Du Pont and Colleagues (Right-sided Cockett's syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Deep Vein Thrombosis have been published. According to news reporting from Bonheiden, Belgium, by NewsRx journalists, research stated, "Cockett and Thomas described and named Cockett's syndrome in 1965, commonly referred to as iliac vein compression syndrome (IVCS). It is often found as underlying cause in iliofemoral deep venous thrombosis (DVT)."

The news correspondents obtained a quote from the research, "They described the syndrome mostly seen on the left side and predominantly in women during the second to the fourth decade of life. In this article, we present a patient with a Cockett's syndrome on the right side. Case presentation Our patient is a 52-year old female with edema of the right leg since 4 months. She had no signs of a DVT and did not benefit from a 3-month compression therapy. She was diagnosed using a CT-scan. Endovascular treatment was performed with a venous stent in the right common iliac vein (CIV). No postoperative complications were seen. After a 6-month follow-up, patient was free of pain and had no residual edema of the right leg. Our patient presented with a non-complicated right-sided Cockett's syndrome. She was successfully treated with balloon dilatation and additional stenting of the right common iliac vein."

According to the news reporters, the research concluded: "Because of the clinical improvement of the patient together with the excellent long-term results and good patency results of the stenting, guidelines nowadays advise more and more venous stenting to prevent DVT and to relieve symptoms in case of vein compression syndromes."

Our news journalists report that additional information may be obtained by contacting B. Du Pont, Imelda Hosp Bonheiden, Dept. of Cardiovasc & Thorac Surg, Bonheiden, Belgium. Additional authors for this research include J. Verbist, W. Van den Eynde and P. Peeters.

New Delayed Hypersensitivity Findings from Rambam Health Care Campus Outlined (The use of patch tests in the diagnosis of delayed hypersensitivity drug eruptions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immune System Diseases and Conditions - Delayed Hypersensitivity. According to news reporting from Haifa, Israel, by NewsRx journalists, research stated, "Adverse drug reactions (ADRs) are common. In the absence of a sufficiently sensitive and specific laboratory test, identification of the culprit drug remains a diagnostic challenge."

The news correspondents obtained a quote from the research from Rambam Health Care Campus, "Patch tests have recently been advocated as a means of detecting drug sensitivity. To further elucidate the usefulness of patch tests in revealing the causative drugs of cutaneous ADRs (CADRs). We conducted a non-blinded, prospective, controlled clinical trial. Twenty-five patients with a history of CADRs were patch tested, and 25 healthy subjects who had never experienced CADRs served as controls. A morbilliform eruption was the most frequent skin reaction. Patch tests were positive in eight of the 25 patients with CADR (32%). Specifically, five of the 13 patients with morbilliform drug eruption (38.4%) tested positive, as did one of the four patients with erythema multiforme/Stevens-Johnson syndrome (25%), and one of the two patients with the drug reaction with eosinophilia and systemic symptoms syndrome. Antibiotics and anticonvulsants resulted in positive patch tests most often. Patch test sensitivity was 32%, specificity was 92%, and negative and positive predictive values were 57.5% and 80%, respectively. Significant correlation was found between the patch test result and the clinical probability of a CADR according to the imputability score of the drug. Patch testing for drugs causing ADRs shows high specificity rates even though the sensitivity is low."

According to the news reporters, the research concluded: "Such tests may therefore be useful in supporting the diagnosis of delayed-type CADRs, particularly when antibiotics or anticonvulsants are involved and the cutaneous reaction is a morbilliform rash."

Our news journalists report that additional information may be obtained by contacting S. Weltfriend, Rambam Hlth Care Campus, Dept. of Dermatol, Haifa, Israel. Additional authors for this research include R. Bergman and S. Weltfriend.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ijd.13306. This DOI is a link to an online electronic document that is either free or for purchase.

New Dementia Study Findings Have Been Reported by Researchers at School of Medicine (Aberrant Spontaneous Brain Activity in Patients with Mild Cognitive Impairment and concomitant Lacunar Infarction: A Resting-State Functional MRI Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Dementia have been published. According to news originating from Nanjing, People's Republic of China, by NewsRx correspondents, research stated, "Lacunar infarctions (LI) have been associated with a cognitive decline and an increased risk of dementia. Whether and how the pattern of spontaneous brain activity in patients with mild cognitive impairment (MCI) differs in subjects with and without concomitant LI remains unclear."

Our news journalists obtained a quote from the research from the School of Medicine, "To compare the pattern of spontaneous brain activity in MCI patients with versus those without LI using resting-state functional magnetic resonance imaging (rs-fMRI). Forty-eight MCI patients, including 22 with LI [MCI-LI] and 26 without LI [MCI-no LI], and 28 cognitive normal subjects underwent rs-fMRI post-processed using regional homogeneity (ReHo) and the amplitude of low-frequency fluctuation (ALFF) methods. Compared with cognitively normal subjects, the MCI-LI patients had decreased ReHo in the precuneus/cuneus (Pcu/CU) and insula; decreased ALFF in the Pcu/CU and frontal lobe; and increased ALFF and ReHo in the temporal lobe. While the MCI-no LI group had increased ReHo and ALFF in the bilateral hippocampus and parahippocampal gyrus, frontal lobe, and decreased ALFF and ReHo in the temporal lobe. Compared with the MCI-no LI patients, those with MCI-LI had decreased ALFF in the frontal lobe; decreased ReHo in the Pcu/CU and insula; and increased ALFF and ReHo in the temporal lobe (p <0.05, AlphaSim corrected). In MCI-LI patients, the MOCA scores showed a relatively weak correlation with ALFF values in the medial frontal gyrus (r=0.432, p=0.045) (of borderline significance after Bonferroni correction). The spontaneous brain activities in MCI-LI were distinct from MCI-no LI."

According to the news editors, the research concluded: "The probable compensatory mechanism observed in MCI-no LI might be disrupted in MCI with LI due to vascular damage."

Mosquito-Borne Diseases - Dengue Hemorrhagic Fever

New Dengue Hemorrhagic Fever Study Findings Have Been Reported by Investigators at University of Rhode Island (Dengue virus induces mitochondrial elongation through impairment of Drp1-triggered mitochondrial fission)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mosquito-Borne Diseases - Dengue Hemorrhagic Fever are presented in a new report. According to news reporting originating from Providence, Rhode Island, by NewsRx correspondents, research stated, "Mitochondria are highly dynamic organelles that undergo continuous cycles of fission and fusion to maintain essential cellular functions. An imbalance between these two processes can result in many pathophysiological outcomes."

Our news editors obtained a quote from the research from the University of Rhode Island, "Dengue virus (DENV) interacts with cellular organelles, including mitochondria, to successfully replicate in cells. This study used live-cell imaging and found an increase in mitochondrial length and respiration during DENV infection. The level of mitochondrial fission protein, Dynamin-related protein 1 (Drp1), was decreased on mitochondria during DENV infection, as well as Drp1 phosphorylated on serine 616, which is important for mitochondrial fission. DENV proteins NS4b and NS3 were also associated with subcellular fractions of mitochondria. Induction of fission through uncoupling of mitochondria or over expression of Drp1 wild-type and Drp1 with a phosphomimetic mutation (S616D) significantly reduced viral replication."

According to the news editors, the research concluded: "These results demonstrate that DENV infection causes an imbalance in mitochondrial dynamics by inhibiting Drp1-triggered mitochondrial fission, which promotes viral replication."

For more information on this research see: Dengue virus induces mitochondrial elongation through impairment of Drp1-triggered mitochondrial fission. Virology, 2017;500 ():149-160. Virology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Virology - www.journals.elsevier.com/virology/)

The news editors report that additional information may be obtained by contacting C.L. Medin, University of Rhode Island, Inst Immunol & Informat, Dept. of Cell & Mol Biol, Providence, RI 02903, United States. Additional authors for this research include D. Lang, S. Valois, A.L. Rothman and C.L. Medin.

The direct object identifier (DOI) for that additional information is:
New Dental Fluorosis Study Findings Recently Were Reported by Researchers at Paris Diderot University (Chronic Exposure to Bisphenol A Exacerbates Dental Fluorosis in Growing Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Dental Diseases and Conditions - Dental Fluorosis. According to news reporting out of Paris, France, by NewsRx editors, research stated, "Enamel defects resulting from environmental conditions and way of life are public health concerns because of their high prevalence. Because their etiology is unclear, the aim of this study was to analyze the various forms of enamel hypomineralization, and to characterize the genes involved in this process to determine the mechanisms involved in disruptions of amelogenesis."

Our news journalists obtained a quote from the research from Paris Diderot University, "We used bisphenol A (BPA) and fluoride as models; both are commonly encountered in human populations and utilized in dentistry. Wistar rats were chronically exposed to 5 μg/kg/day BPA from day 1 of gestation to day 65 after birth (P65) and 5 mM fluoride from P21 to P65. Resulting enamel defects were comparable to the human enamel pathologies molar incisor hypomineralization (MIH) and dental fluorosis (DF) respectively, and were more severe in rats exposed to both agents than to each agent alone. Large-scale transcriptomic analysis of dental epithelium showed a small group of genes the expression of which was affected by exposure to BPA or NaF. Among the most modulated, many are directly involved in amelogenesis (Amelx, Enam, Klk4, Mmp12, Slc26a4, and Slc5a8), and can be regrouped as forming the 'hypomineralization enameloma.' Each of these gene expression perturbations may contribute to enamel defects. Exposure to BPA weakens enamel, making it more prone to generate frequent mineralization defects MIH and DF."

According to the news editors, the research concluded: "Our study identifies hypomineralization genes that may enable the use of dental enamel as an early marker of exposure to environmental toxins because of its unique ability to retrospectively record ameloblast pathophysiology."

New Depression Study Results Reported from National Institute for Health and Welfare [PRKCDBP (CAVIN3) and CRY2 associate with major depressive disorder]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mental Health Diseases and Conditions - Depression are presented in a new report. According to news reporting originating from Helsinki, Finland, by NewsRx correspondents, research stated, "Dysfunctions in the intrinsic clocks are suggested in patients with depressive disorders. The cryptochrome circadian clocks 1 and 2 (CRY1 and CRY2) proteins modulate circadian rhythms in a cell and influence emotional reactions and mood in an individual."

Our news editors obtained a quote from the research from National Institute for Health and Welfare, "The protein kinase C delta binding protein (PRKCDBP, or CAVIN3), similar to the serum deprivation response protein (SDPR, or CAVIN2), reduce metabolic stability of the PER2-CRY2 transcription factor complex that plays a role in the circadian rhythm synchronization. Our aim was to study SDPR, PRKCDBP, CRY1 and CRY2 genetic variants in depressive disorders. The sample included 5910 Finnish individuals assessed with the Munich-Composite International Diagnostic Interview (M-CIDI) in year 2000. In year 2011, 3424 individuals were assessed again. After genotype quality control, there were 383 subjects with major depressive disorder, 166 with dysthymia, and 479 with depressive disorders (major depressive disorder, dysthymia or both), and 4154 healthy controls. A total of 48 single-nucleotide polymorphisms from SDPR, PRKCDBP, CRY1 and CRY2 genes were analyzed using logistic regression models controlling for age and gender. The earlier reported association of CRY2 variants with dysthymia was confirmed and extended to major depressive disorder (q < 0.05). In addition, novel associations of PRKCDBP rs1488864 with depressive disorders (q=0.02) and with major depressive disorder in specific (q=0.007) were found. Limitations: The number of cases was moderate and coverage of PRKCDB was limited."

According to the news editors, the research concluded: "CRY2 and PRKCDBP variants may be risk factors of major depressive disorder and provide information for diagnosis."

For more information on this research see: PRKCDBP (CAVIN3) and CRY2 associate with major depressive disorder. *Journal of Affective Disorders*, 2017:207():136-140. *Journal of Affective Disorders* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Affective Disorders - www.journals.elsevier.com/journal-of-affective-disorders/)

The news editors report that additional information may be obtained by contacting L.
Kovanen, Natl Inst Hlth & Welf THL, Dept. of Hlth, Helsinki, Finland. Additional authors for this research include K. Donner, M. Kaunisto and T. Partonen.

Drugs and Therapies - Dexrazoxane Therapy

New Dexrazoxane Therapy Study Findings Have Been Reported by Researchers at Ohio State University (Quantifying Drug-Induced Nanomechanics and Mechanical Effects to Single Cardiomyocytes for Optimal Drug Administration To Minimize Cardiotoxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Dexrazoxane Therapy are presented in a new report. According to news reporting out of Columbus, Ohio, by NewsRx editors, research stated, "Contrary to the well-studied dynamics and mechanics at organ and tissue levels, there is still a lack of good understanding for single cell dynamics and mechanics. Single cell dynamics and mechanics may act as an interface to provide unique information reflecting activities at the organ and tissue levels."

Financial support for this research came from College of Engineering, Ohio State University.

Our news journalists obtained a quote from the research from Ohio State University, "This research was aimed at quantifying doxorubicin-and dexrazoxane-induced nanomechanics and mechanical effects to single cardiomyocytes, to reveal the therapeutic effectiveness of drugs at the single cell level and to optimize drug administration for reducing cardiotoxicity. This work employed a nanoinstrumentation platform, including a digital holographic microscope combined with an atomic force microscope, which can characterize cell stiffness and beating dynamics in response to drug exposures in real time and obtain time-dose-dependent effects of cardiotoxicity and protection. Through this research, an acute increase and a delayed decrease of surface beating force induced by doxorubicin was characterized. Dexrazoxane treated cells maintained better beating force and mechanical functions than cells without any treatment, which demonstrated cardioprotective effects of dexrazoxane. In addition, combined drug effects were quantitatively evaluated following various drug administration protocols. Preadministration of dexrazoxane was demonstrated to have protective effects against doxorubicin, which could lead to better strategies for cardiotoxicity prevention and anticancer drug administration."

According to the news editors, the research concluded: "This study concluded that quantification of nanomechanics and mechanical effects at the single cell level could offer unique insights of molecular mechanisms involved in cellular activities influencing organ and tissue level responses to drug exposure, providing a new opportunity for the development of effective and time-dose-dependent strategies of drug administration."

Our news journalists report that additional information may be obtained by contacting T. Yue, Dept. of Biomedical Engineering, The Ohio State University, Columbus, Ohio 43210, United States. Additional authors for this research include K.H. Park, B.E. Reese, H. Zhu, S. Lyon, J. Ma, P.J. Mohler and M. Zhang.

**Diabetes**

**New Diabetes Study Findings Have Been Reported by Investigators at Second Military Medical University (Reintervention after endovascular repair for aortic dissection: A systematic review and meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Diabetes. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Thoracic endovascular aortic repair has been chosen as a less-invasive alternative to open surgery for the treatment of aortic dissections; however, the advantages have been challenged by the postoperative reintervention during the follow-up period. This study aimed at evaluating the incidence, reasons, and potential risk factors for reintervention."

Our news journalists obtained a quote from the research from Second Military Medical University, "Studies reporting reintervention after endovascular repair were identified by searching PubMed and Embase in accordance with preferred reporting items for systematic reviews and meta-analyses guidelines, and by reviewing the reference lists of retrieved articles. Sensitivity analysis and subgroup analyses were performed to determine the sources of heterogeneity. Funnel plot and Egger's test were used to determine the publication bias. A total of 27 studies encompassing 2403 patients with aortic dissection were identified. The pooled incidence of reintervention after endovascular repair was 15% (95% confidence interval, 12-19) during 33.7 months of follow-up. The 3 most common reasons for reintervention were endoleak (33.2%), false lumen perfusion and aortic dilation (19.8%), and new dissection (6.9%). The potential factors for reintervention were the mean age of onset and diabetes mellitus determined by performing a single meta-regression analysis (P <.001 and .044, respectively). Current data suggest that the incidence of reintervention after endovascular therapy is relatively high during midterm follow-up. Advanced age of onset is a risk factor and diabetes mellitus is a protective factor of reintervention after endovascular therapy."

According to the news editors, the research concluded: "The possible mechanism that diabetes mellitus protects patients from reintervention should be explored further."

Our news journalists report that additional information may be obtained by contacting Z.P. Jing, Second Military Med Univ, Changhai Hosp, Dept. of Vasc Surg, Shanghai, People's Republic of China. Additional authors for this research include Z.Q. Zhao, Y.Q. Chen, Y.D. Sun, J.M. Bao, Z.P. Jing and J. Zhou.

Diabetes

**New Diabetes Study Findings Recently Were Reported by Researchers at Research Hospital (The Emerging Role of Sirtuin 1 in Cellular Metabolism, Diabetes Mellitus, Diabetic Kidney Disease and Hypertension)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Diabetes. According to news reporting out of Kirsehir, Turkey, by NewsRx editors, research stated, 'Despite diagnostic and therapeutic approaches, diabetic kidney disease (DKD) is the most common cause of end-stage renal disease worldwide. Sirtuins, a group of nicotinamid adenine dinucleotide (NAD) dependent enzymes, can deacetylase target enzymes that regulate a wide variety of cellular processes regarding protein, carbohydrate and lipid metabolism, mitochondrial homeostasis and programmed cell death mechanisms including autophagy and apoptosis.'

Our news journalists obtained a quote from the research from Research Hospital, "Among sirtuins, sirtuin 1 (SIRT1) has been the most studied one in the pathogenesis and progression of DKD. In recent years, the relation between SIRT1 and hypertension was also evaluated. In the present review, we aimed to represent the mechanisms of SIRT1 in glucose and lipid metabolism and in the pathogenesis of diabetes mellitus."

According to the news editors, the research concluded: "We also sought to highlight the emerging role of SIRT1 in the pathogenesis and treatment of DKD and hypertension."

For more information on this research see: The Emerging Role of Sirtuin 1 in Cellular Metabolism, Diabetes Mellitus, Diabetic Kidney Disease and Hypertension. *Experimental and Clinical Endocrinology & Diabetes*, 2015;124(3):131-9. (Thieme -

Diabetes

New Diabetes Study Results Reported from Second Military Medical University (Topical administration of cryopreserved living micronized amnion accelerates wound healing in diabetic mice by modulating local micro environment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Diabetes. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Approximately 25% of diabetic patients suffer from diabetic lower-extremity ulcer throughout their lives and 7%-20% of patients will eventually need an amputation despite standard care treatment. The development of new therapies to treat diabetic wounds is urgent."

Our news journalists obtained a quote from the research from Second Military Medical University, "In this study, we used cryopreserved living micronized amnion (300-600 μm) to treat wounds in diabetic mice. Post-thaw micronized amnion retained high cell viability, as well as intact cell morphology and membrane structure. When transplanted onto the wounds of db/db mice, the cryopreserved living micronized amnion greatly promoted wound healing in diabetic mice mainly by secreting growth, inflammation, and chemotaxis-related factors that regulated macrophage migration and phenotype switch, recruited CD34(+) progenitor cells, and increased neovascularization. In addition, the micronized amnion matrix can exist in the dermis and serve as a long-term dermal scaffold."

According to the news editors, the research concluded: "These results demonstrated the potential of the cryopreserved living micronized amnion as a ready-to-use living dermal substitute that addresses multiple defective physiological processes of impaired wounds to treat diabetic ulcers and other chronic wounds in clinics."

For more information on this research see: Topical administration of cryopreserved living micronized amnion accelerates wound healing in diabetic mice by modulating local micro environment. Biomaterials, 2017;113():56-67. Biomaterials can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Biomaterials - www.journals.elsevier.com/biomaterials/)

**Diabetes**

**New Diabetes Study Results Reported from University of Iowa (P66Shc-Induced MicroRNA-34a Causes Diabetic Endothelial Dysfunction by Downregulating Sirtuin1)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Diabetes are presented in a new report. According to news reporting originating in Iowa City, Iowa, by NewsRx journalists, research stated, "Diabetes mellitus causes vascular endothelial dysfunction and alters vascular microRNA expression. We investigated whether endothelial microRNA-34a (miR-34a) leads to diabetic vascular dysfunction by targeting endothelial sirtuin1 (Sirt1) and asked whether the oxidative stress protein p66Shc governs miR-34a expression in the diabetic endothelium."

The news reporters obtained a quote from the research from the University of Iowa, "Approach and Results-MiR-34a is upregulated, and Sirt1 downregulated, in aortic endothelium of db/db and streptozotocin-induced diabetic mice. Systemic administration of miR-34a inhibitor, or endothelium-specific knockout of miR-34a, prevents downregulation of aortic Sirt1 and rescues impaired endothelium-dependent aortic vasorelaxation induced by diabetes mellitus. Moreover, overexpression of Sirt1 mitigates impaired endothelium-dependent vasorelaxation caused by miR-34a mimic ex vivo. Systemic infusion of miR-34a inhibitor or genetic ablation of endothelial miR-34a prevents downregulation of endothelial Sirt1 by high glucose. MiR-34a is upregulated, Sirt1 is downregulated, and oxidative stress (hydrogen peroxide) is induced in endothelial cells incubated with high glucose or the free fatty acid palmitate in vitro. Increase of hydrogen peroxide and induction of endothelial miR-34a by high glucose or palmitate in vitro is suppressed by knockdown of p66shc. In addition, overexpression of wild-type but not redox-deficient p66Shc upregulates miR-34a in endothelial cells. P66Shc-stimulated upregulation of endothelial miR-34a is suppressed by cell-permeable antioxidants. Finally, mice with global knockdown of p66Shc are protected from diabetes mellitus-induced upregulation of miR-34a and downregulation of Sirt1 in the endothelium."

According to the news reporters, the research concluded: "These data show that hyperglycemia and elevated free fatty acids in the diabetic milieu recruit p66Shc to upregulate endothelial miR-34a via an oxidant-sensitive mechanism, which leads to endothelial dysfunction by targeting Sirt1."

For more information on this research see: P66Shc-Induced MicroRNA-34a Causes Diabetic Endothelial Dysfunction by Downregulating Sirtuin1. *Arteriosclerosis Thrombosis and Vascular Biology*, 2016;36(12):2394-2403. *Arteriosclerosis Thrombosis and Vascular Biology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.
Our news correspondents report that additional information may be obtained by contacting Q.X. Li, University of Iowa, Dept. of Internal Med, Abboud Cardiovasc Res Center, Div CardiovascCarver Coll Med, Iowa City, IA 52242, United States. Additional authors for this research include Y.R. **New Diabetic Foot Findings from Tufts University Discussed** (Altered ECM deposition by diabetic foot ulcer-derived fibroblasts implicates fibronectin in chronic wound repair)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Diabetic Foot. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Current chronic wound treatments often fail to promote healing of diabetic foot ulcers (DFU), leading to amputation and increased patient morbidity. A critical mediator of proper wound healing is the production, assembly, and remodeling of the extracellular matrix (ECM) by fibroblasts."

The news correspondents obtained a quote from the research from Tufts University, "However, little is known about how these processes are altered in fibroblasts within the DFU microenvironment. Thus, we investigated the capacity of multiple, primary DFU-derived fibroblast strains to express, produce, and assemble ECM proteins compared to diabetic patient-derived fibroblasts and healthy donor-derived fibroblasts. Gene expression microarray analysis showed differential expression of ECM and ECM-regulatory genes by DFU-derived fibroblasts which translated to functional differences in a 3D in vitro ECM tissue model. DFU-derived fibroblasts produced thin, fibronectin-rich matrices, and responded abnormally when challenged with transforming growth factor-beta, a key regulator of matrix production during healing."

According to the news reporters, the research concluded: "These results provide novel evidence that DFU-derived fibroblasts contribute to the defective matrices of DFUs and chronic wound pathogenesis."

Our news journalists report that additional information may be obtained by contacting J.A. Garlick, Tufts University, Sch Dental Med, Dept. of Oral & Maxillofacial Pathol Oral Med & Crani, Boston, MA 02111, United States. Additional authors for this research include A. Smith, O. Kashpur, V. Yanez, E. Knight, D.J. Mooney, A.V. Md, M. Tomic-Canic
New Diabetic Nephropathy Study Results from Nanjing University Described (Terpene glycoside component from Moutan Cortex ameliorates diabetic nephropathy by regulating endoplasmic reticulum stress-related inflammatory responses)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Diabetic Nephropathy are presented in a new report. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Multiple lines of evidences have suggested that endoplasmic reticulum (ER) stress-related inflammatory responses play a critical role in the pathogenesis of diabetic nephropathy (DN). Moutan Cortex (MC), the root bark of Paeonia suffruticosa Andr., is a well-known traditional Chinese medicine (TCM), which has been used clinically for treating inflammatory diseases in China."

Financial supporters for this research include National Natural Science Foundation of China, Jiangsu Province.

The news correspondents obtained a quote from the research from Nanjing University, "The findings from our previous research suggested that terpene glycoside (TG) component of MC possessed favorable anti-inflammatory properties in curing DN. However, the underlying mechanisms of MC-TG for treating DN are still unknown. Aim of the study: To explore the role of ER stress-related inflammatory responses in the progression of DN, and to investigate the underlying protective mechanisms of MC-TG in kidney damage. DN rats and advanced glycation end-products (AGEs) induced HBZY-1 cell dysfunction were established to evaluate the protective effect of MC-TG on ameliorating renal injury. Evaluation of pathological lesions was performed by Masson staining and transmission electron microscopy (TEM). Interleukin-6 (IL-6), monocyte chemoattractant protein-1 (MCP-1), glucose regulated protein 78 (GRP78/Bip), as well as spliced X box binding protein 1(XBP-1(s)) levels in rat serum were detected by an enzyme-linked immunosorbent assay (ELISA). Furthermore, western blotting (WB) was applied to detect the protein expressions including IL-6, MCP-1, intercellular cell adhesion molecule-1 (ICAM-1), GRP78/Bip, XBP-1 (s), phosphorylated inositol-requiring enzyme-1 alpha (p-IRE1 alpha), cleaved activating transcription factor 6 (ATF6), phosphorylated PKR-like endoplasmic reticulum kinase (p-PERK), and phosphorylated nuclear factor kappa B p65 (p-NF-kappa B p65) in vivo and in vitro. Immunohistochemistry (IHC) was
carried out to determine the phosphorylation of IRE1 alpha and NF-kappa B p65 in kidney tissues. Pretreatment with MC-TG could markedly improve renal insufficiency and pathologic changes. It could down-regulate ER stress-related factors GRP78/Bip, XBP-1(s) levels, and also reduce the pro-inflammatory molecules IL-6, MCP-1, and ICAM-1 expressions. Furthermore, a significant decrease in phosphorylation of IRE1 alpha and NF-kappa B p65 by the treatment of MC-TG. These findings indicated that MC-TG ameliorated ER stress-related inflammation in the pathogenesis of DN, wherein the protective mechanism might be associated with the inhibition of IRE1/NF-kappa B activation."

According to the news reporters, the research concluded: "Thus, MC-TG might be a potential therapeutic candidate for the prevention and treatment of DN."

**Heart Disorders and Diseases - Dilated...**

**New Dilated Cardiomyopathy Findings from Soonchunhyang University Discussed (Genetic Variations Leading to Familial Dilated Cardiomyopathy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Dilated Cardiomyopathy are discussed in a new report. According to news originating from Cheonan, South Korea, by NewsRx correspondents, research stated, "Cardiomyopathy is a major cause of death worldwide. Based on pathohistological abnormalities and clinical manifestation, cardiomyopathies are categorized into several groups: hypertrophic, dilated, restricted, arrhythmogenic right ventricular, and unclassified."

Our news journalists obtained a quote from the research from Soonchunhyang University, "Dilated cardiomyopathy, which is characterized by dilation of the left ventricle and
systolic dysfunction, is the most severe and prevalent form of cardiomyopathy and usually requires heart transplantation. Its etiology remains unclear. Recent genetic studies of single gene mutations have provided significant insights into the complex processes of cardiac dysfunction. To date, over 40 genes have been demonstrated to contribute to dilated cardiomyopathy. With advances in genetic screening techniques, novel genes associated with this disease are continuously being identified. The respective gene products can be classified into several functional groups such as sarcomere proteins, structural proteins, ion channels, and nuclear envelope proteins. Nuclear envelope proteins are emerging as potential molecular targets in dilated cardiomyopathy. Because they are not directly associated with contractile force generation and transmission, the molecular pathways through which these proteins cause cardiac muscle disorder remain unclear. However, nuclear envelope proteins are involved in many essential cellular processes. Therefore, integrating apparently distinct cellular processes is of great interest in elucidating the etiology of dilated cardiomyopathy.

According to the news editors, the research concluded: "In this mini review, we summarize the genetic factors associated with dilated cardiomyopathy and discuss their cellular functions."

The news correspondents report that additional information may be obtained from Y. Kim, Soonchunhyang Univ, Soonchunhyang Inst Medibio Sci, Cheonan 31151, South Korea. Additional authors for this research include J. Lee and Y. Kim.

Keywords for this news article include: Cheonan, South Korea, Asia, Cardiovascular Diseases and Conditions, Nuclear Envelope, Article Review, Heart Disorders and Diseases, Cell Membrane Structures, Cell Nucleus Structures, Intracellular Membranes, Dilated Cardiomyopathy, Cellular Structures, Intracellular Space, Cardiomyopathies, Heart Disease, Cardiology, Genetics, Soonchunhyang University.

**Heart Disorders and Diseases - Dilated...**

**New Dilated Cardiomyopathy Findings from University of Leipzig Discussed (Endomyocardial miR-133a levels correlate with myocardial inflammation, improved left ventricular function, and clinical outcome in patients with inflammatory ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Dilated Cardiomyopathy. According to news originating from Leipzig, Germany, by NewsRx correspondents, research stated, "Inflammatory heart disease represents an important cause of chronic dilated cardiomyopathy (DCM). Predicting the clinical course of patients with inflammatory cardiomyopathy (iCMP) is difficult, and the prognostic value of current biological markers remains controversial."

Our news journalists obtained a quote from the research from the University of
Leipzig, "We tested whether expression of selected microRNAs in endomyocardial biopsies (EMBs) is related to LV functional recovery and clinical events in iCMP patients. EMBs were obtained from patients with iCMP (n = 76) and non-inflammatory DCM (n = 22). A set of six microRNAs implicated in inflammation (miR-155 and miR-146b), heart failure (miR-21 and miR-133a), and endothelial cell (miR-126) and skeletal muscle function (miR-206) was predefined. Endomyocardial expression of miR-155 and miR-133a, as quantified by reverse transcription-PCR (RT-PCR), was up-regulated in patients with iCMP as compared with patients with DCM. Levels of miR-133a (R = 0.73, P<0.01) and miR-155 (R = 0.63, P<0.01) correlated with inflammatory cell count on EMBs from patients with iCMP. Patients with iCMP and preserved LV function at study entry demonstrated higher expression of miR-133a than patients with reduced LV function. Also, increased expression of miR-133a was associated with less fibrosis and myocyte necrosis on EMB, and LV functional recovery during a mean follow-up of 3.1 years. Importantly, patients with iCMP and miR-133a levels in the upper tertile showed longer survival free of death, malignant arrhythmias, and hospitalizations for heart failure."

According to the news editors, the research concluded: "The present study demonstrates that miR-133a levels correlate with macrophage infiltration, cardiac injury, improved LV function, and clinical outcome in patients with iCMP. miR-133a may serve as a potential novel biomarker and therapeutic target in human iCMP."

For more information on this research see: Endomyocardial miR-133a levels correlate with myocardial inflammation, improved left ventricular function, and clinical outcome in patients with inflammatory cardiomyopathy. European Journal of Heart Failure, 2016;18(12):1442-1451. European Journal of Heart Failure can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. autofluorescence and spectral-domain optical coherence tomography (OCT). Methods A single-centre retrospective cohort study was carried out on 42 eyes of 21 patients with birdshot disease, using a multimodal imaging approach including fundus autofluorescence, OCT, fluorescein angiography and indocyanine green angiography in combination with a patient chart review.

Financial supporters for this research include Foundation Fighting Blindness, Columbia, Maryland, Gelderse Blindenstichting, Velp, the Netherlands.

Our news editors obtained a quote from the research from Radboud University, "The patients' overall clinical activity of retinal vasculitis during the follow-up period was determined by periods of clinical activity as indicated by fluorescein angiography and associated treatment decisions. Image analysis was performed to examine the spatial correspondence between autofluorescence changes and disruption of the photoreceptor inner segment ellipsoid zone on OCT. Results Three common types of outer retinal lesions were observed in fovea-centred images of 43% of patients: circular patches of chorioretinal atrophy, ellipsoid zone disruption on OCT, and outer retinal atrophy on autofluorescence and OCT. There was good spatial correspondence between ellipsoid zone disruption and areas of diffuse hyper-autofluorescence outside the fovea. Interestingly, the ellipsoid zone disruption recovered in four out of seven patients upon intensified therapeutic immunosuppression. Conclusion Most patients only developed peripapillary atrophy and occasional perivascular hypo-autofluorescence. A multimodal imaging approach with autofluorescence imaging and OCT may help to detect ellipsoid zone disruption in the central retina of patients with birdshot disease."

According to the news editors, the research concluded: "Our results suggest that ellipsoid zone disruption may be related to both the activity and duration of retinal vasculitis, and could help to determine therapeutic success in birdshot disease."

The news editors report that additional information may be obtained by contacting T. Theelen, Radboud University, Medical Center, Dept. of Ophthmol, NL-6525 EX Nijmegen, Netherlands. Additional authors for this research include P. Veld, L.A.M. de Vries, C.B. Hoyng, B.J. Klevering and T. Theelen.

Disease Attributes - Disease Progression

New Disease Progression Study Findings Recently Were Reported by Researchers at Medical College of Wisconsin (Protease-activated receptors in kidney disease progression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Disease Attributes - Disease Progression. According to news originating from Milwaukee, Wisconsin, by NewsRx correspondents, research stated, "Protease-activated receptors (PARs) are members of a well-known family of transmembrane G protein-coupled receptors (GPCRs). Four PARs have been identified to date, of which PAR1 and PAR2 are the most abundant receptors, and have been shown to be expressed in the kidney vascular and tubular cells."

Our news journalists obtained a quote from the research from the Medical College of Wisconsin, "PAR signaling is mediated by an N-terminus tethered ligand that can be unmasked by serine protease cleavage. The receptors are activated by endogenous serine proteases, such as thrombin (acts on PARs 1, 3, and 4) and trypsin (PAR2). PARs can be involved in glomerular, microvascular, and inflammatory regulation of renal function in both normal and pathological conditions. As an example, it was shown that human glomerular epithelial and mesangial cells express PARs, and these receptors are involved in the pathogenesis of crescentic glomerulonephritis, glomerular fibrin deposition, and macrophage infiltration. Activation of these receptors in the kidney also modulates renal hemodynamics and glomerular filtration rate. Clinical studies further demonstrated that the concentration of urinary thrombin is associated with glomerulonephritis and type 2 diabetic nephropathy; thus, molecular and functional mechanisms of PARs activation can be directly involved in renal disease progression."

According to the news editors, the research concluded: "We briefly discuss here the recent literature related to activation of PAR signaling in glomeruli and the kidney in general and provide some examples of PAR1 signaling in glomeruli podocytes."

The news correspondents report that additional information may be obtained from O. Palygin, Medical College of Wisconsin, Dept. of Physiol, Milwaukee, WI 53226, United States. Additional authors for this research include D.V. Ilatovskaya and A. Staruschenko.

**Disease Attributes - Disease Progression**

**New Disease Progression Study Findings Reported from Yang Ming National University (Erlotinib Salvage Therapy in Pulmonary Adenocarcinoma Patients With Disease Progression After Previous EGFR-TKI Treatment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Disease Attributes - Disease Progression are presented in a new report. According to news reporting out of Taipei, Taiwan, by NewsRx editors, research stated. "Erlotinib is an epidermal growth factor receptor (EGFR) tyrosine kinase inhibitor (TKI) with promising efficacy in treating pulmonary adenocarcinoma. Treatment choices are few when patients with pulmonary adenocarcinoma have failed both EGFR-TKI and chemotherapy."

Our news journalists obtained a quote from the research from Yang Ming National University. "The purpose of this study was to demonstrate the efficacy of erlotinib as salvage treatment for these nonresponsive patients. We retrospectively reviewed the chart records of our stage IV pulmonary adenocarcinoma patients who were diagnosed and treated between July 2004 and June 2013. Clinical data, including type of response to treatment, time to disease progression, duration between the end of first-line EGFR-TKI treatment and starting erlotinib treatment, and overall survival time, were collected. A total of 98 patients were enrolled, and all had been treated with EGFR-TKI, either as a first-line therapy or following platinum based chemotherapy; of them, 60 patients had a response to initial EGFR-TKI treatment. All received erlotinib as salvage treatment after their disease had progressed following EGFR-TKI treatment. Ninety-three (93.3%) patients had also received previous platinum-based chemotherapy. The median progression-free survival with erlotinib as salvage treatment for patients with and without a response to front-line EGFR-TKI was 4.9 and 3.4 months (P = 0.869), respectively. The progression-free survival with erlotinib treatment in the sensitizing EGFR mutation group was 4.3 months, and in the EGFR wild-type group it was 2.6 months (P=0.22)."

According to the news editors, the research concluded: "In pulmonary adenocarcinoma patients who had been heavily treated, erlotinib could still be a choice, regardless of the EGFR mutation status, or whether the patients had responded to previous EGFR-TKI treatment."

For more information on this research see: Erlotinib Salvage Therapy in Pulmonary Adenocarcinoma Patients With Disease Progression After Previous EGFR-TKI Treatment. *American Journal of Clinical Oncology-Cancer Clinical Trials*, 2016;39(6):556-562. *American Journal of Clinical Oncology-Cancer Clinical Trials* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

New Disease Progression Study Results Reported from University of Turin (Pembrolizumab Cutaneous Adverse Events and Their Association With Disease Progression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Disease Attributes - Disease Progression have been published. According to news reporting originating in Turin, Italy, by NewsRx journalists, research stated, "Immunomodulatory anticancer drugs, such as the anti-programmed death-1 drug pembrolizumab, have shown promising results in trials, and more patients will receive such treatments. Little is known about cutaneous adverse events (AEs) caused by these drugs and their possible correlation with treatment response."

The news reporters obtained a quote from the research from the University of Turin, "To describe the frequency and spectrum of cutaneous AEs linked with pembrolizumab and their possible correlation with treatment response. A single-institution, retrospective medical record review was conducted of patients with cancer who were treated with pembrolizumab from March 1, 2011, to May 28, 2014. The review comprised 83 consecutive patients who were enrolled in 2 clinical trials, received at least 1 dose of pembrolizumab, and had at least 1 follow-up visit. Patients were grouped according to the following therapeutic regimen for pembrolizumab: 43 received 10 mg/kg every 3 weeks, 24 received 10 mg/kg every 2 weeks, and 16 received 2 mg/kg every 3 weeks. Sixty-six patients were treated for melanoma, 15 patients for lung cancer, 1 patient for prostate cancer, and 1 patient for Merkel cell carcinoma. Median follow-up was 15 weeks (range, 2-105 weeks). The analysis was conducted from March 1 to September 30, 2014. Occurrence, severity, and type of cutaneous AEs, as well as disease progression and response to pembrolizumab treatment. Thirty-five patients (42%) developed cutaneous AEs attributed to pembrolizumab. The most common cutaneous AEs were macular papular eruption (24 [29%]), pruritus (10 [12%]), and hypopigmentation (7 [8%]). All 7 patients who developed hypopigmentation were treated for melanoma. Survival analyses showed that patients who developed cutaneous AEs had significantly longer progression-free intervals in all 3 groups (pembrolizumab, 10 mg/kg, every 3 weeks, p=.001; pembrolizumab, 10 mg/kg, every 2 weeks, p=.003; pembrolizumab, 2 mg/kg, every 3 weeks, p=.009) compared with patients who did not develop cutaneous AEs. Pembrolizumab therapy was associated with cutaneous AEs in 42% of patients."

According to the news reporters, the research concluded: "The development of cutaneous AEs, especially of hypopigmentation in patients with melanoma, could point toward better treatment response."

For more information on this research see: Pembrolizumab Cutaneous Adverse Events and Their Association With Disease Progression. *Jama Dermatology*, 2015;151 (11):1206-12.

**Hematologic Diseases and Conditions -...**

**New Disseminated Intravascular Coagulation Study Results Reported from Nanjing Medical University (Efficacy evaluation of D-dimer and modified criteria in overt and nonovert disseminated intravascular coagulation diagnosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hematologic Diseases and Conditions - Disseminated Intravascular Coagulation are presented in a new report. According to news originating from Suzhou, People's Republic of China, by NewsRx correspondents, research stated, "D-dimer (D-D) was shown to be an important indicator for the diagnosis of overt disseminated intravascular coagulation (DIC) and nonovert DIC. However, its diagnostic cutoff value in the clinic is not clearly defined."

Our news journalists obtained a quote from the research from Nanjing Medical University, "D-D, fibrinogen degradation products (FDP), prothrombin time (PT), activated partial thromboplastin time (APTT), fibrinogen (Fg), thrombin time (TT), antithrombin (AT), and blood platelet count (PLT) of 360 cases were used to assess the diagnostic efficacy of D-D (InnovanceR reagent) for the diagnosis of DIC and nonovert DIC, compared to, or combined with, other DIC coagulation indicators. When D-D >3.0 mg/mL was used as the cutoff, the sum of diagnostic sensitivity and specificity reached maximum values for DIC and nonovert DIC, whereas the sum of misdiagnoses and missed diagnosis rate was minimal. Excluding D-D, AT, or Fg, but not TT, from the test combination reduced the diagnostic sensitivity of DIC or nonovert DIC by various degrees. The area under the receiver-operating characteristic curve of D-D for diagnosing DIC and nonovert DIC was 0.97 and 0.98, respectively. Combining two factors, D-D >3.0 mg/mL and FDP >10 mg/L, increased the sensitivity and specificity for the diagnosis of DIC and nonovert DIC."

According to the news editors, the research concluded: "The cutoff value of D-D is >3.0 mg/mL; combined testing of D-D and FDP could be used as primary screening for diagnosing DIC and nonovert DIC in clinical practice."

Drugs and Therapies - Drug Delivery Systems

New Drug Delivery Systems Findings Reported from Max-Planck-Institute for Polymer Research (The pro-active payload strategy significantly increases selective release from mesoporous nanocapsules)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news reporting originating in Mainz, Germany, by NewsRx journalists, research stated, "The controlled release of payloads from mesoporous silica nanocapsules (SiNCs) consisting of stimulus-responsive shells is of considerable interest in applications such as self-healing materials and drug delivery. However, the release of payloads from SiNCs before application of external triggers (i.e. non-selective release) remains a formidable challenge."

The news reporters obtained a quote from the research from Max-Planck-Institute for Polymer Research, "In fact, the non-selective release of payloads from SiNCs occurs because of the mesoporous nature of the silica shell that cannot trap payloads in the core of SiNCs perfectly. We establish an efficient and straightforward strategy based on the encapsulation of a pro-active payload to hinder the non-selective release of small payloads from mesoporous capsules. A pro-active payload is defined as a compound that is converted to an active functional molecule in the environment where it is needed. In this sense, it is a generalization of a prodrug. Encapsulating a pro-active payload instead of a payload allowed hindering the non-selective release of the payload from SiNCs. A selective release of the payload could be achieved upon reduction of the encapsulated pro-active payload. Furthermore, the total amount of released substance is significantly enhanced by introducing responsive groups in the silica shell."

According to the news reporters, the research concluded: "These results show that the pro-active payload strategy combined with the use of stimulus-responsive materials can be successfully exploited to achieve selective release of cargo from mesoporous nanocapsules."
For more information on this research see: The pro-active payload strategy significantly increases selective release from mesoporous nanocapsules. *Journal of Controlled Release, 2016;242():119-125.* *Journal of Controlled Release* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Drugs and Therapies - Drug Delivery Systems**

**New Drug Delivery Systems Findings from Hong Kong University of Science and Technology Outlined (Theranostic hyaluronic acid prodrug micelles with aggregation-induced emission characteristics for targeted drug delivery)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news reporting from Hong Kong, People's Republic of China, by NewsRx journalists, research stated, "Theranostic hyaluronic acid (HA) prodrug micelles with pH-responsive drug release and aggregation-induced emission (AIE) properties were prepared by chemical graft of biomimetic phosphorylcholine (PC), anticancer drug doxorubicin (DOX) and AIE fluorogen tetraphenylene (TPE) to the HA backbone. DOX was conjugated to the HA backbone by a hydrazone bond which can be hydrolyzed under acidic environment and result in pH-triggered smart release of DOX."

The news correspondents obtained a quote from the research from the Hong Kong University of Science and Technology, "The TPE units with typical AIE characteristics were applied for real time drug tracking in cancer cells. The HA-based prodrugs could self-assemble into micelles in aqueous solution as confirmed by the dynamic light scattering (DLS) and transmission electron microscopy (TEM). The intracellular distribution of HA prodrug micelles could be clearly observed by fluorescence microscopy based on the strong fluorescence of TPE. Moreover, after treated with the micelles, stronger fluorescence of TPE in CD44 overexpressed MDA-MB-231 cancer cells was observed, compared to the CD44 negative cell line, NIH3T3 cells, suggesting efficient cell uptake of HA prodrug micelles by receptor-mediated endocytosis. The cell viability results indicated that the prodrug micelles could inhibit the proliferation of the cancer cells effectively."

According to the news reporters, the research concluded: "Such pH-triggered theranostic drug delivery system with AIE features can provide a new platform for targeted and image-guided cancer therapy."
For more information on this research see: Theranostic hyaluronic acid prodrug micelles with aggregation-induced emission characteristics for targeted drug delivery. Science China-Chemistry. 2016;59(12):1609-1615. Science China-Chemistry can be contacted at: Science Press, 16 Donghuangchenggen North St, Beijing 100717, Peoples R China.

Drugs and Therapies - Drug Delivery Systems

New Drug Delivery Systems Findings from University of Twente Described (Targeting distinct myeloid cell populations in vivo using polymers, liposomes and microbubbles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Drug Delivery Systems. According to news reporting from Enschede, Netherlands, by NewsRx journalists, research stated, "Identifying intended or accidental cellular targets for drug delivery systems is highly relevant for evaluating therapeutic and toxic effects. However, limited knowledge exists on the distribution of nano- and micrometer-sized carrier systems at the cellular level in different organs."

The news correspondents obtained a quote from the research from the University of Twente, "We hypothesized that clinically relevant carrier materials, differing in composition and size, are able to target distinct myeloid cell subsets that control inflammatory processes, such as macrophages, neutrophils, monocytes and dendritic cells. Therefore, we analyzed the biodistribution and in vivo cellular uptake of intravenously injected poly(N-(2-hydroxypropyl) methacrylamide) polymers, PEGylated liposomes and poly(butyl cyanoacrylate) microbubbles in mice, using whole-body imaging (computed tomography - fluorescence-mediated tomography), intra-organ imaging (intravital multi-photon microscopy) and cellular analysis (flow cytometry of blood, liver, spleen, lung and kidney). While the three carrier materials shared accumulation in tissue macrophages in liver and spleen, they notably differed in uptake by other myeloid subsets. Kupffer cells and splenic red pulp macrophages rapidly take up microbubbles. Liposomes efficiently reach dendritic cells in liver, lung and kidney. Polymers exhibit the longest circulation half-life and target endothelial cells in the liver, neutrophils and alveolar macrophages."

According to the news reporters, the research concluded: "The identification of such previously unrecognized target cell populations might open up new avenues for more efficient drug delivery."

Our news journalists report that additional information may be obtained by contacting T. Lammers, University of Twente, Dept. of Targeted Therapeut, MIRA Inst Biomed Technol & Technical Med, Enschede, Netherlands. Additional authors for this research include F. Heymann, W. Al Rawashdeh, F. Gremse, M. Bartneck, U. Panzer, R. Pola, M. Pechar, G. Storm, N. Mohr, M. Barz, R. Zentel, F. Kiessling, C. Trautwein, T. Lammers and F. Tacke.

**Drugs and Therapies - Drug Delivery Systems**

**New Drug Delivery Systems Findings from University of Valencia Reported (Aptamers as smart ligands for nano-carriers targeting)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Drug Delivery Systems is the subject of a report. According to news originating from Burjassot, Spain, by NewsRx correspondents, research stated, "The development of enhanced drug delivery systems is one of the most attractive fields of pharmaceutical sciences, as some of the highly effective chemo/biotherapeutics for cancer treatment can not be administrated due to their high toxicities for normal cells or low stability in physiological media. However, drugs that are currently not administrable will become valuable if specific cell-targeted drug carriers can protect the normal cells from adverse effects and also improve drug pharmacokinetics."

Our news journalists obtained a quote from the research from the University of Valencia, "Aptamers are attractive and promising biomaterials developed with high affinity and specificity against numerous valuable targets. They could act similar to monoclonal antibodies (mAbs), and offer significant advantages. Combined with aptamers, nanostructures are smart veicles with remarkable properties for drug delivery. Combination of aptamer and nanotechnology has resulted in the production of various targeted drug delivery systems which are highly efficient in therapeutic and diagnostic applications."

According to the news editors, the research concluded: "In this review, some of the efforts related to design and development of aptamer-targeted nanocarriers have been summarized considering: i) Aptamer importance as smart ligands and the aptamer development methods ii) Types of nanostructures combined with aptamers as targeting agent proposed in the literature iii) Cancer specific aptamers evaluated in combination with nanocarriers for diagnostic and therapeutic applications and iv) Discussion of aptamers-based smart nanocarriers according to the trend of related research works."

For more information on this research see: Aptamers as smart ligands for nanocarriers targeting. *Trac-Trends in Analytical Chemistry*, 2016;82():316-327. *Trac-Trends in Analytical Chemistry* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane,

Drugs and Therapies - Drug Delivery Systems

New Drug Delivery Systems Study Findings Have Been Reported by Researchers at Tianjin University (Zwitterionic-Modified Starch-Based Stealth Micelles for Prolonging Circulation Time and Reducing Macrophage Response)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Drug Delivery Systems is the subject of a report. According to news reporting originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "Over the last few decades, nanoparticles have been emerging as useful means to improve the therapeutic efficacy of drug delivery and medical diagnoses. However, the heterogeneity and complexity of blood as a medium is a fundamental problem; large amounts of protein can be adsorbed onto the surface of nanoparticles and cause their rapid clearance before reaching their target sites, resulting in the failure of drug delivery."

Our news editors obtained a quote from the research from Tianjin University, "To overcome this challenge, we present a rationally designed starch derivative (SB-ST-OC) with both a superhydrophilic moiety of zwitterionic sulfobetaine (SB) and a hydrophobic segment of octane (OC) as functional groups, which can self-assemble into 'stealth' micelles (SSO micelles). The superhydrophilic SB kept the micelles stable against aggregation in complex media and imbued them with 'stealth' properties, eventually extending their circulation time in blood. In stability and hemolysis tests the SSO micelles showed excellent protein resistance properties and hemocompatibility. Moreover, a phagocytosis test and cytokine secretion assay confirmed that the SSO micelles had less potential to trigger the activation of macrophages and were more suitable as a drug delivery candidate in vivo. On the basis of these results, doxorubicin (DOX), a hydrophobic drug, was used to investigate the potential application of this novel starch derivative in vivo. The results of the pharmacokinetic study showed that the values of the plasma area under the concentration curve (AUC) and elimination half-life (T1/2) of the SSO micelles were higher than those of micelles without SB modifications."

According to the news editors, the research concluded: "The combination of excellent protein resistance, lower macrophage activation, and longer circulation time in vivo makes this synthesized novel starch derivative a promising candidate as a hydrophobic drug
carrier for long-term circulation in vivo."

The news editors report that additional information may be obtained by contacting L. Ye, School of Chemical Engineering and Technology, Tianjin University, Tianjin 300072, People's Republic of China. Additional authors for this research include Y. Zhang, B. Yang, X. Zhou, J. Li, Z. Qin, D. Dong, Y. Cui and F. Yao.

Drugs and Therapies - Drug Delivery Systems

New Drug Delivery Systems Study Findings Reported from University of Sassari (Immune cell impact of three differently coated lipid nanocapsules: pluronic, chitosan and polyethylene glycol)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Drug Delivery Systems is the subject of a report. According to news reporting originating from Sassari, Italy, by NewsRx correspondents, research stated, "Lipid nanocapsules (NCs) represent promising tools in clinical practice for diagnosis and therapy applications. However, the NC appropriate functionalization is essential to guarantee high biocompatibility and molecule loading ability."

Our news editors obtained a quote from the research from the University of Sassari, "In any medical application, the immune system-impact of differently functionalized NCs still remains to be fully understood. A comprehensive study on the action exerted on human peripheral blood mononuclear cells (PBMCs) and major immune subpopulations by three different NC coatings: pluronic, chitosan and polyethylene glycol-polyactic acid (PEG) is reported. After a deep particle characterization, the uptake was assessed by flow-cytometry and confocal microscopy, focusing then on apoptosis, necrosis and proliferation impact in T cells and monocytes. Cell functionality by cell diameter variations, different activation marker analysis and cytokine assays were performed. We demonstrated that the NCs impact on the immune cell response is strongly correlated to their coating. Pluronic-NCs were able to induce immunomodulation of innate immunity inducing monocyte activations. Immunomodulation was observed in monocytes and T lymphocytes treated with Chitosan-NCs. Conversely, PEG-NCs were completely inert."

According to the news editors, the research concluded: "These findings are of particular value towards a pre-selection of specific NC coatings depending on biomedical purposes for pre-clinical investigations; i.e. the immune-specific action of particular NC coating can be excellent for immunotherapy applications."
For more information on this research see: Immune cell impact of three differently coated lipid nanocapsules: pluronic, chitosan and polyethylene glycol. *Scientific Reports*, 2016;6 ():18423. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Drug Resistance**

**New Drug Resistance Findings from Roswell Park Cancer Institute Outlined (The Challenges of Modeling Drug Resistance to Antiangiogenic Therapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drug Resistance. According to news reporting from Buffalo, New York, by NewsRx journalists, research stated, "Drug resistance remains an ongoing challenge for the majority of patients treated with inhibitors of the vascular endothelial growth factor (VEGF) pathway, a key regulator of tumor angiogenesis. Preclinical models have played a significant role in identifying multiple complex mechanisms of antiangiogenic treatment failure."

The news correspondents obtained a quote from the research from Roswell Park Cancer Institute, “Yet questions remain about the optimal methodology to study resistance that may assist in making clinically relevant choices about alternative or combination treatment strategies. The origins of antiangiogenic treatment failure may stem from the tumor vasculature, the tumor itself, or both together, and preclinical methods that define resistance are diverse and rarely compared. We performed a literature search of the preclinical methodologies used to examine resistance to VEGF pathway inhibitors and identified 109 papers from more than 400 that use treatment failure as the starting point for mechanistic study. We found that definitions of resistance are broad and inconsistent, involve only a small number of reagents, and derive mostly from in vitro and in vivo methodologies that often do not represent clinically relevant disease stages or progression."

According to the news reporters, the research concluded: "Together, this literature analysis highlights the challenges of studying inhibitors of the tumor microenvironment in the preclinical setting and the need for improved methodology to assist in qualifying (and quantifying) treatment failure to identify mechanisms that will help predict alternative strategies
in patients."

Our news journalists report that additional information may be obtained by contacting J.M. Ebos, Dept. of Cancer Genetics and Medicine, Roswell Park Cancer Institute, Elm & Carlton Streets, Buffalo, NY 142631, United States. Additional authors for this research include S. Rosario, A. Tracz, R.E. Frink, R.A. Brekken and J.M. Ebos.

**Drug Resistance**

**New Drug Resistance Study Findings Reported from Okayama University (Low frequency of drug-resistant virus did not affect the therapeutic efficacy in daclatasvir plus asunaprevir therapy in patients with chronic HCV genotype-1 infection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drug Resistance. According to news reporting out of Okayama, Japan, by NewsRx editors, research stated, "The efficacy of a direct-acting antiviral agent (DAA) is compromised by the development of drug resistance. The associations between resistance-associated virus (RAV) and therapeutic outcomes have not been well-understood."

Our news journalists obtained a quote from the research from Okayama University, "A total of 30 patients with HCV genotype-1b were enrolled and treated for 24 weeks with asunaprevir (ASV) and daclatasvir (DCV). Viral sequences in non-structural (NS) regions 3 and 5A in serum and liver tissue before treatment were examined with direct sequencing, next-generation sequencing (NGS) and the PCR-invader method to evaluate the importance of drug-resistance in the prediction of the outcomes of ASV plus DCV therapy. Of 30 patients (22 treatment-naive patients, 2 interferon-intolerant patients and 6 non-responders), 25 patients (83.3%) achieved sustained virological response (SVR) 24 weeks after the treatment. Viral breakthrough occurred in three treatment-naive patients and one non-responder. One treatment-naive patient experienced viral relapse. Among 25 patients without RAV, 24 obtained SVR, whereas 5 patients had RAV with a 1.3 to 88% frequency, resulting in various therapeutic outcomes. As for HCV compartments, similar RAVs were detected in serum and liver tissue for a patient obtaining SVR despite HCV NS5A Y93H and another developed viral breakthrough although no RAV was detected. Direct sequencing could not detect RAVs in low frequency (1.3 to 12%) for three of four patients. Low frequency of RAVs might not affect the outcomes of ASV plus DCV therapy."

According to the news editors, the research concluded: "Deep sequencing and PCR-
invader methods can detect clinically significant RAVs for ASV plus DCV therapy.”

For more information on this research see: Low frequency of drug-resistant virus did not affect the therapeutic efficacy in daclatasvir plus asunaprevir therapy in patients with chronic HCV genotype-1 infection. *Antiviral Therapy*, 2016;21(1):37-44. *Antiviral Therapy* can be contacted at: Int Medical Press Ltd, 2-4 Idol Lane, London EC3R 5DD, England.

**New Dyslipidemias Study Findings Recently Were Reported by Researchers at General University Hospital (Statin-Induced Changes in Mitochondrial Respiration in Blood Platelets in Rats and Human With Dyslipidemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Dyslipidemias is now available. According to news reporting from Prague, Czech Republic, by NewsRx journalists, research stated, "3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) reductase inhibitors (statins) are widely used drugs for lowering blood lipid levels and preventing cardiovascular diseases. However, statins can have serious adverse effects, which may be related to development of mitochondrial dysfunctions."

The news correspondents obtained a quote from the research from General University Hospital, "The aim of study was to demonstrate the in vivo effect of high and therapeutic doses of statins on mitochondrial respiration in blood platelets. Model approach was used in the study. Simvastatin was administered to rats at a high dose for 4 weeks. Humans were treated with therapeutic doses of rosvastatin or atorvastatin for 6 weeks. Platelet mitochondrial respiration was measured using highresolution respirometry. In rats, a significantly lower physiological respiratory rate was found in intact platelets of simvastatin-treated rats compared to controls. In humans, no significant changes in mitochondrial respiration were detected in intact platelets; however, decreased complex I-linked respiration was observed after statin treatment in permeabilized platelets. We propose that the small in vivo effect of statins on platelet energy metabolism can be attributed to drug effects on complex I of the electron transport system."

According to the news reporters, the research concluded: "Both intact and permeabilized platelets can be used as a readily available biological model to study changes in cellular energy metabolism in patients treated with statins."

For more information on this research see: Statin-Induced Changes in Mitochondrial Respiration in Blood Platelets in Rats and Human With Dyslipidemia. *Physiological Research*, 2016;65(5):777-788. *Physiological Research* can be contacted at: Acad Sciences Czech Republic, Inst Physiology, Videnska 1083, Prague 4 142 20, Czech Republic.

Diseases of the Esophagus and Conditions - Dysphagia

New Dysphagia Study Findings Have Been Reported by Researchers at Vanderbilt University (Randomized controlled trial comparing esophageal dilation to no dilation among adults with esophageal eosinophilia and dysphagia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Digestive System Diseases and Conditions - Dysphagia are presented in a new report. According to news reporting originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "The role of esophageal dilation in patients with esophageal eosinophilia with dysphagia remains unknown. The practice of dilation is currently based on center preferences and expert opinion."

Our news editors obtained a quote from the research from Vanderbilt University, "The aim of this study is to determine if, and to what extent, dysphagia improves in response to initial esophageal dilation followed by standard medical therapies. We conducted a randomized, blinded, controlled trial evaluating adult patients with dysphagia and newly diagnosed esophageal eosinophilia from 2008 to 2013. Patients were randomized to dilation or no dilation at time of endoscopy and blinded to dilation status. Endoscopic features were graded as major and minor. Subsequent to randomization and endoscopy, all patients received fluticasone and dexlansoprazole for 2 months. The primary study outcome was reduction in overall dysphagia score, assessed at 30 and 60 days post-intervention. Patients with severe strictures (less than 7-mm esophageal diameter) were excluded from the study. Thirty-one patients were randomized and completed the protocol: 17 randomized to dilation and 14 to no dilation. Both groups were similar with regard to gender, age, eosinophil density, endoscopic score, and baseline dysphagia score. The population exhibited moderate to severe dysphagia and moderate esophageal stricturing at baseline. Overall, there was a significant (P <0.001) but similar reduction in mean dysphagia score at 30 and 60 days post-randomization compared with baseline in both groups. No significant difference in dysphagia scores between treatment groups after 30 (P=0.93) or 60 (P=0.21) days post-intervention was observed. Esophageal dilation did not result in additional improvement in dysphagia score compared with treatment with proton pump inhibitor and fluticasone alone."

According to the news editors, the research concluded: "In patients with symptomatic esophageal eosinophilia without severe stricture, dilation does not appear to be a necessary initial treatment strategy."

For more information on this research see: Randomized controlled trial comparing esophageal dilation to no dilation among adults with esophageal eosinophilia and dysphagia. Diseases of the Esophagus, 2016;29(8):983-991. Diseases of the Esophagus can be contacted
New Ebola Virus Study Findings Have Been Reported from J.W. Benzine et al (Molecular Diagnostic Field Test for Point-of-Care Detection of Ebola Virus Directly From Blood)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Ebola Virus is now available. According to news originating from Middleton, Wisconsin, by NewsRx correspondents, research stated, "A molecular diagnostic method for robust detection of Ebola virus (EBOV) at the point of care (POC) directly from blood samples is described. This assay is based on reverse transcriptase loop-mediated isothermal amplification (RT-LAMP) of the glycoprotein gene of EBOV."

Funders for this research include National Institutes of Health, National Institute of Allergy And Infectious Diseases, Galveston National Laboratory.

Our news journalists obtained a quote from the research, "Complete reaction formulations were lyophilized in 0.2-mL polymerase chain reaction tubes. RT-LAMP reactions were performed on a battery-operated isothermal instrument. Limit of detection of this RT-LAMP assay was 2.8 x 10(2) plaque-forming units (PFU)/test and 1 x 10(3) PFU/test within 40 minutes for EBOV-Kikwit and EBOV-Makona, respectively. This assay was found to be specific for the detection of EBOV, as no nonspecific amplification was detected in blood samples spiked with closely related viruses and other pathogens."

According to the news editors, the research concluded: "These results showed that this diagnostic test can be used at the point of care for rapid and specific detection of EBOV directly from blood with high sensitivity within 40 minutes."

The news correspondents report that additional information may be obtained from Y. Chander, Lucigen Corp, Middleton, WI 53562, United States. Additional authors for this

Ebola Virus

New Ebola Virus Study Findings Have Been Reported from University of Manitoba (Inactivation of Zaire ebolavirus Variant Makona in Human Serum Samples Analyzed by Enzyme-Linked Immunosorbent Assay)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Ebola Virus. According to news reporting out of Winnipeg, Canada, by NewsRx editors, research stated, "Personnel deployed to remote areas during infectious disease outbreaks have limited access to mechanical and chemical inactivation resources. The inactivation of infectious agents present in diagnostic samples is critical to ensure the safety of personnel and the containment of the disease."

Our news journalists obtained a quote from the research from the University of Manitoba, "We evaluated the efficacy of thermal inactivation (exposure to 56A degrees C for 1 hour) and chemical inactivation with 0.5% Tween-20 against a high titer of Ebola virus (species Zaire ebolavirus) variant Makona in spiked human serum samples. No surviving virus was revealed by a 50% tissue culture infective dose assay after the combined treatment under laboratory conditions."

According to the news editors, the research concluded: "In-field use of this inactivation protocol during the 2013-2016 West Africa Ebola outbreaks demonstrated readily detectable levels of immunoglobulin G and/or immunoglobulin M in human plasma samples after treatment."

Our news journalists report that additional information may be obtained by contacting S.S. Theriault, University of Manitoba, Dept. of Microbiol, Winnipeg, MB. Canada. Additional authors for this research include A. Grolla, S. Jones, B.W.M. Cook, X.G. Qiu and S.S. Theriault.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/infdis/jiw289. This DOI is a link to an online electronic document that is either free or for purchase.

Ebola Virus

New Ebola Virus Study Findings Recently Were Reported by Researchers at Harvard School of Medicine (Strengthening Health Systems While Responding to a Health Crisis: Lessons Learned by a Nongovernmental Organization During the Ebola Virus ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Ebola Virus is now available. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "An epidemic of Ebola virus disease (EVD) beginning in 2013 has claimed an estimated 11,310 lives in West Africa. As the EVD epidemic subsides, it is important for all who participated in the emergency Ebola response to reflect on strengths and weaknesses of the response."

Financial supporters for this research include United Kingdom Department for International Development, US Office of Foreign Disaster Assistance, Open Society Foundations, Abundance Foundation, Paul Allen Family Foundation.

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Such reflections should take into account perspectives not usually included in peer-reviewed publications and after-action reports, including those from the public sector, nongovernmental organizations (NGOs), survivors of Ebola, and Ebola-affected households and communities. In this article, we first describe how the international NGO Partners In Health (PIH) partnered with the Government of Sierra Leone and Wellbody Alliance (a local NGO) to respond to the EVD epidemic in 4 of the country's most Ebola-affected districts. We then describe how, in the aftermath of the epidemic, PIH is partnering with the public sector to strengthen the health system and resume delivery of regular health services. PIH's experience in Sierra Leone is one of multiple partnerships with different stakeholders. It is also one of rapid deployment of expatriate clinicians and logistics personnel in health facilities largely deprived of health professionals, medical supplies, and physical infrastructure required to deliver health services effectively and safely."

According to the news editors, the research concluded: "Lessons learned by PIH and its partners in Sierra Leone can contribute to the ongoing discussion within the international community on how to ensure emergency preparedness and build resilient health systems in settings without either."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/infdis/jiw345. This DOI is a link to an online electronic document that is either free or for purchase.

**Eye Diseases and Conditions - Ectopia Lentis**

**New Ectopia Lentis Study Findings Have Been Reported from University of Utah (Capsular bag stabilization during lens extraction and intraocular lens implantation in cases of Marfan syndrome with ectopia lentis using ultra-high-viscosity ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Eye Diseases and Conditions - Ectopia Lentis are discussed in a new report. According to news reporting originating from Salt Lake City, Utah, by NewsRx correspondents, research stated, "Capsule-sparing lens surgery in the setting of compromised zonular support presents several surgical challenges. One challenge has been achieving early stabilization of the capsular bag prior to cataract removal."

Our news editors obtained a quote from the research from the University of Utah, "We developed a technique that uses a high-molecular-weight viscoadaptive substance to distend and stabilize the capsular bag from within,. with or without early insertion of a capsular tension ring, during lens extraction and intraocular lens (IOL) implantation in cases of zonular insufficiency. The technique obviates the use of capsule hooks or similar devices that have been used traditionally for early stabilization of the capsular bag."

According to the news editors, the research concluded: "It has also resulted in immediate and long-term stability of the IOL-zonule-capsular bag complex, with excellent visual outcomes in both pediatric and adult patients."

The news editors report that additional information may be obtained by contacting K.J. Rosenthal, University of Utah, Sch Med, John A Moran Eye Center, Salt Lake City, UT,
New Embolism Study Findings Have Been Reported from Second Military Medical University [Usefulness of CHA(2)DS(2)-VASc Scoring Systems for Predicting Risk of Perioperative Embolism in Patients of Cardiac Myxomas Underwent Surgical Treatment]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Embolism have been presented. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Cardiac myxomas are rare but manifested with risk of embolism and often cause unexpected symptoms or sudden death. We retrospectively collected the medical records of patients diagnosed of cardiac myxomas at the cardiac center of our university."

Our news journalists obtained a quote from the research from Second Military Medical University, "Overall 465 patients were included in this study, patients in the embolism group had significantly higher CHA(2)DS(2)-VASc scores (P = 0.005). In embolic group, stroke was recorded in 110 (77.14%) patients, while embolic events in the limbs were observed in 10 (2.15%) and 9 (1.93%) developed splenic infarction. Patients in embolism group had older age (P = 0.021) and higher BMI (P < 0.001) than those in non-embolism group. There was no significant difference between two groups in terms of time of mechanical ventilation (P = 0.065), ICU stay (P = 0.053), hospital stay (P = 0.071) and volume of drainage (P = 0.083), blood transfusions (P = 0.060) except that patients with embolic events had significantly higher incidence of postoperative atrial fibrillation (P = 0.032) and lower survival rate (P < 0.001). Furthermore, the CHA2DS2-VASc score was a significant predictor of embolism in patients with cardiac myxomas (P = 0.015; P = 0.003) and the Kaplan-Meier analysis obtained a higher rate of embolism in patients with higher stratification of CHA(2)DS(2)-VASc scores (P = 0.002)."

According to the news editors, the research concluded: "CHA(2)DS(2)-VASc scoring scheme was strongly predictive of stroke and embolic events in patients with cardiac myxomas."

For more information on this research see: Usefulness of CHA(2)DS(2)-VASc Scoring Systems for Predicting Risk of Perioperative Embolism in Patients of Cardiac Myxomas Underwent Surgical Treatment. *Scientific Reports*, 2016;6():1-8. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Health and Medicine - Emergency Medicine

New Emergency Medicine Findings from Beth Israel Deaconess Medical Center Discussed (Platypnea-orthodeoxia syndrome: a simple clinical observation that heralds critical but treatable disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Health and Medicine - Emergency Medicine have been presented. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Platypnea-orthodeoxia syndrome is a rare clinical diagnosis characterized by dyspnea which is improved by the supine position (platypnea) and oxygenation which is worsened with upright posture (orthodeoxia). Platypnea-orthodeoxia syndrome has several possible causes."

The news reporters obtained a quote from the research from Beth Israel Deaconess Medical Center, "It may result from right to left intra-cardiac shunting, an atypical pulmonary ventilation-perfusion mismatch or vascular shunting that might occur with pulmonary AV malformations. We present a case of a 52-year-old female with the platypnea-orthodeoxia syndrome possibly due to an atrial septal defect with right to left shunting worsened by pulmonary hypertension. It is most likely that she also exhibited concurrent vascular shunting and ventilation perfusion mismatch due to the hepatopulmonary syndrome. Our patient demonstrates the complexity of determining the etiology of platypnea-orthodeoxia syndrome when more than one well established cause (atrial septal defect and advanced hepatic disease) are both present."

According to the news reporters, the research concluded: "Emergency clinicians must be aware of the platypnea-orthodeoxia syndrome as this simple clinical observation will almost invariably suggest at least one important and potentially treatable condition."

Our news correspondents report that additional information may be obtained by contacting M. Heller, Icahn Sch Med Mt Sinai, Emergency Med, Beth Israel Med Center, New York, NY 10003, United States. Additional authors for this research include N. Zapolsky, N. Nembhard, J. Rose, M. Heller and C. Hsu.

Endocytosis

New Endocytosis Data Have Been Reported by Investigators at University of Southern Denmark (AQP2 Plasma Membrane Diffusion Is Altered by the Degree of AQP2-S256 Phosphorylation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Endocytosis have been published. According to news reporting originating from Odense, Denmark, by NewsRx correspondents, research stated, "Fine tuning of urine concentration occurs in the renal collecting duct in response to circulating levels of arginine vasopressin (AVP). AVP stimulates intracellular cAMP production, which mediates exocytosis of sub-apical vesicles containing the water channel aquaporin-2 (AQP2)."

Our news editors obtained a quote from the research from the University of Southern Denmark, "Protein Kinase A (PKA) phosphorylates AQP2 on serine-256 (S256), which triggers plasma membrane accumulation of AQP2. This mediates insertion of AQP2 into the apical plasma membrane, increasing water permeability of the collecting duct. AQP2 is a homotetramer. When S256 on all four monomers is changed to the phosphomimic aspartic acid (S256D), AQP2-S256D localizes to the plasma membrane and internalization is decreased. In contrast, when S256 is mutated to alanine (S256A) to mimic non-phosphorylated AQP2, AQP2-S256A localizes to intracellular vesicles as well as the plasma membrane, with increased internalization from the plasma membrane. S256 phosphorylation is not necessary for exocytosis and dephosphorylation is not necessary for endocytosis, however, the degree of S256 phosphorylation is hypothesized to regulate the kinetics of AQP2 endocytosis and thus, retention time in the plasma membrane. Using k-space Image Correlation Spectroscopy (kICS), we determined how the number of phosphorylated to non-phosphorylated S256 monomers in the AQP2 tetramer affects diffusion speed of AQP2 in the plasma membrane. When all four monomers mimicked constitutive phosphorylation (AQP2-S256D), diffusion was faster than when all four were non-phosphorylated (AQP2-S256A). AQP2-WT diffused at a speed similar to that of AQP2-S256D. When an average of two or three monomers in the tetramer were constitutively phosphorylated, the average diffusion coefficients were not significantly different to that of AQP2-S256D. However, when only one monomer was phosphorylated, diffusion was slower and similar to AQP2-S256A. Thus, AQP2 with two to four phosphorylated monomers has faster plasma membrane kinetics, than the tetramer which contains just one or no phosphorylated monomers."

According to the news editors, the research concluded: "This difference in diffusion rate may reflect behavior of AQP2 tetramers destined for either plasma membrane retention or endocytosis."

For more information on this research see: AQP2 Plasma Membrane Diffusion Is Altered by the Degree of AQP2-S256 Phosphorylation. *International Journal of Molecular Sciences*, 2016;17(11):684-695. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Albam-Anlage 66, Ch-4052 Basel, Switzerland.

The news editors report that additional information may be obtained by contacting E.C. Arnspang, Univ Southern Denmark, Dept. of Chem Engn Biotechnol & Environm
New Endometrial Cancer Findings Has Been Reported by Investigators at University of Southern Denmark (The nature of early-stage endometrial cancer recurrence-A national cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Endometrial Cancer are presented in a new report. According to news reporting out of Odense, Denmark, by NewsRx editors, research stated, "The aim of the study was to present a comprehensive analysis of disease recurrence in a large Danish cohort of women with early-stage endometrial cancer treated according to national guidelines. All women diagnosed with stage I or II endometrial cancer in 2005-2009 were included in a population-based historical cohort derived from the Danish Gynaecological Cancer Database."

Our news journalists obtained a quote from the research from the University of Southern Denmark, "Disease recurrence up to 3 years after the primary diagnosis was identified using national registers and hospital charts. Follow-up on survival ended on 31st December 2014. We evaluated the predictive value of clinico-pathological and sociodemographic variables using multivariate logistic regression. Recurrence within 3 years of the primary treatment was diagnosed in 183 (7%) of the included 2612 women. Site of recurrence significantly impacted on overall survival as the 5-year survival rate was 64.8% for women with vaginal recurrence and 17.5% in women with distant recurrence. Factors predictive of recurrence included the International Federation of Gynaecology and Obstetrics (FIGO) stage (OR: IB = 1.91, stage II = 3.91), Charlson comorbidity index of 3 (OR 1.86), non-endometrioid histology (OR 1.81) and being outside of the workforce (OR 1.81). Vaginal recurrence was predicted by FIGO stage only (OR: IB = 1.88, II = 2.79), while extra-vaginal recurrence was predicted by FIGO stage (OR: IB=2.12, II = 3.31), Charlson comorbidity index of 3 (OR 1.88) and non-endometrioid histology (OR 2.51)."

According to the news editors, the research concluded: "Future research should seek to understand the underlying mechanisms of the identified predictive factors to improve recurrence prediction and to reduce morbidity and mortality."

Our news journalists report that additional information may be obtained by contacting M.M. Jeppesen, Univ Southern Denmark, Dept. of Obstet & Gynaecol, Fac Hlth Sci, Odense Univ HospClin Inst, DK-5000 Odense C, Denmark. Additional authors for this research include P.T. Jensen, D.G. Hansen, M. Iachina and O. Mogensen.
New Endometrial Cancer Study Findings Recently Were Reported by Researchers at Radboud University (Atypical Endometrial Polyps and Concurrent Endometrial Cancer A Systematic Review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Endometrial Cancer. According to news reporting originating from Nijmegen, Netherlands, by NewsRx correspondents, research stated, "To estimate the risk of concurrent endometrial cancer in nonpolypoid endometrium when atypia was diagnosed within an endometrial polyp. MEDLINE, EMBASE, Web of Science, and ClinicalTrials.gov were searched for studies published between 1990 and January 2015 in which 1) women with atypical hyperplastic endometrial polyps underwent a consecutive hysterectomy; or 2) the natural behavior of endometrium with concurrent atypical endometrial polyps underwent a consecutive hysterectomy; or 2) the natural behavior of endometrium with concurrent atypical endometrial polyps was evaluated."

Our news editors obtained a quote from the research from Radboud University, "OF SELECTION: Studies were selected when at least one patient within each study was initially diagnosed with an atypical endometrial polyp for which follow-up pathology was available. Broad searches yielded 2,922 authentic citations, 307 met criteria for full-text evaluation, and 10 met inclusion criteria. Two authors independently reviewed articles and consensus was reached. The final selection included eight retrospective studies reporting on concurrent endometrial cancer in case of atypical endometrial polyps and two follow-up studies on patients conserving their uterus after hysteroscopic resection of atypical endometrial polyps. In total, 127 patients were included with an initial diagnosis of atypical endometrial hyperplasia within polyps. Meta-analysis showed a pooled risk estimate of 5.6% (95% confidence interval [CI] 0.2-17.6%) on concurrent endometrial cancer after resection of an atypical endometrial polyp. The pooled risk estimate of 5.6% (95% CI 0.2-17.6%) on endometrial cancer when atypia is found within an endometrial polyp differs from the well-established risk of nonpolypoid atypical endometrial hyperplasia on endometrial cancer of up to 42%." According to the news editors, the research concluded: "This risk of endometrial cancer is important in the process of shared decision-making regarding follow-up and further treatment."

For more information on this research see: Atypical Endometrial Polyps and Concurrent Endometrial Cancer A Systematic Review. Obstetrics and Gynecology, 2016;128 (3):519-525. Bacterial Infections and Mycoses - Endotoxemia

New Endotoxemia Study Findings Have Been Reported by Investigators at Istanbul University (Amelioration of Energy Metabolism by Melatonin in Skeletal Muscle of Rats With LPS Induced Endotoxemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Bacterial Infections and Mycoses - Endotoxemia is the subject of a report. According to news reporting out of Istanbul, Turkey, by NewsRx editors, research stated, "In the literature, few studies have investigated the effects of melatonin on energy metabolism in skeletal muscle in endotoxemia. We investigated the effects of melatonin on tissue structure, energy metabolism in skeletal muscle, and antioxidant level of rats with endotoxemia."

Our news journalists obtained a quote from the research from Istanbul University, "We divided rats into 4 groups, control, lipopolysaccharide (LPS) (20 mg/kg, i.p., single dose), melatonin (10 mg/kg, i.p., three times), and melatonin + LPS. Melatonin was injected i.p. 30 min before and after the 2nd and 4th hours of LPS injection. Antioxidant status was determined by glutathione (GSH) measurement in the blood. Muscle tissue was stained using modified Gomori trichrome (MGT), succinic dehydrogenase (SDH), and cytochrome oxidase (COX) and histological scored. Also the sections were then stained with hematoxylin and eosin. The stained sections were visualized and photographed. Creatine, creatine phosphate, adenosine triphosphate (ATP), adenosine diphosphate (ADP), and adenosine monophosphate (AMP) levels were investigated using high performance liquid chromatography (HPLC) in muscle tissue. In the Melatonin + LPS group, blood GSH levels were increased compared with the LPS group (P <0.01). Melatonin reduced myopathic changes in the LPS group according to the histopathologic findings. In addition, ATP values were increased compared with the LPS group (P <0.05)."

According to the news editors, the research concluded: "Our findings showed melatonin treatment prevented muscle damage by increasing ATP and GSH levels in rats with LPS induced endotoxemia."

For more information on this research see: Amelioration of Energy Metabolism by Melatonin in Skeletal Muscle of Rats With LPS Induced Endotoxemia. *Physiological Research*, 2016;65(5):833-842. *Physiological Research* can be contacted at: Acad Sciences Czech Republic, Inst Physiology, Videnska 1083, Prague 4 142 20, Czech Republic.

Our news journalists report that additional information may be obtained by contacting E. Ozkok, Istanbul University, Inst Expt Med, Dept. of Neurosci, TR-34280 Istanbul, Turkey. Additional authors for this research include H. Yorulmaz, G. Ates, A. Aksu, N. Balkis, O. Sahin and S. Tamer.

New Enterobacter aerogenes Findings from B.B. Flury and Co-Researchers Described (The differential importance of mutations within AmpD in cephalosporin resistance of Enterobacter aerogenes and Enterobacter cloacae)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Enterobacter aerogenes have been presented. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Mechanisms leading to carbapenem and cephalosporin resistance were sought in Enterobacter aerogenes isolates that were highly resistant to carbapenems but had no known carbapenemase. Results were compared with recent work examining carbapenem-resistant Enterobacter cloacae. Eighteen carbapenem-resistant E. aerogenes were screened for known beta-lactamase and carbapenemase genes, and novel carbapenemases were sought in whole-genome sequencing (WGS) data of the three most resistant isolates."

Financial supporters for this research include Prof. Dr Max Cloetta and Uniscienta Foundation, Margarete and Walter Lichtenstein Foundation, University of Basel.

The news correspondents obtained a quote from the research, "For all isolates, ampC, ampR, ampD and the porin genes omp35 and omp36 were investigated by Sanger sequencing or from available WGS data. Expression of ampC and porin genes was measured in comparison with cephalosporin-and carbapenem-susceptible control strains by reverse transcriptase PCR, with porin translation also detected by SDS-PAGE. Loss of Omp35, primarily due to decreased transcription (up to 250x), was observed in ertapenem-resistant isolates (MICs >= 2 mg/L), whereas meropenem resistance (MICs >= 4 mg/L) was observed in those isolates also showing decreased or no production of Omp36. Loss of Omp36 was due to combinations of premature translation termination or reduced transcription. In contrast to E. cloacae, cephalosporin resistance in E. aerogenes was not associated with lesions in AmpD. High-level cefepime resistance (MIC = 32 mg/L) was caused by a novel modification in the H-10 helix of AmpC in one isolate. The differential importance of AmpD lesions in cephalosporin resistance in E. cloacae and E. aerogenes underlines the differences between these contrasting members of the Enterobacter genus."

According to the news reporters, the research concluded: "Porin loss resulted in high-level carbapenem resistance with gradual loss of Omp36, which led to high-level meropenem resistance."

Our news journalists report that additional information may be obtained by

**Gram-Positive Bacteria - Enterococcus faecalis**

**New Enterococcus faecalis Findings from CSIR Reported (Assessment of virulence potential of uncharacterized Enterococcus faecalis strains using pan genomic approach - Identification of pathogen-specific and habitat-specific genes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - Enterococcus faecalis. According to news originating from Kolkata, India, by NewsRx correspondents, research stated, "Enterococcus faecalis, a leading nosocomial pathogen and yet a prominent member of gut microbiome, lacks clear demarcation between pathogenic and non-pathogenic strains at genome level. Here we present the comparative genome analysis of 36 E. faecalis strains with different pathogenic features and from different body-habitats."

Our news journalists obtained a quote from the research from CSIR, "This study begins by addressing the genome dynamics, which shows that the pan-genome of E. faecalis is still open, though the core genome is nearly saturated. We identified eight uncharacterized strains as potential pathogens on the basis of their co-segregation with reported pathogens in gene presence-absence matrix and Pathogenicity Island (PAI) distribution. A similar to 7.4 kb genomic-cassette, which is itself a part of PAI, is found to exist in all reported and potential pathogens, but not in commensals and other uncharacterized strains. This region encodes four genes and among them, products of two hypothetical genes are predicted to be intrinsically disordered that may serve as novel targets for therapeutic measures."

According to the news editors, the research concluded: "Exclusive existence of 215, 129, 4 and 1 genes in the blood, gastrointestinal tract, urogenital tract, oral cavity and lymph node derived E. faecalis genomes respectively suggests possible employment of distinct habitat-specific genetic strategies in the adaptation of E. faecalis in human host."

For more information on this research see: Assessment of virulence potential of uncharacterized Enterococcus faecalis strains using pan genomic approach - Identification of pathogen-specific and habitat-specific genes. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **New Enterovirus Study Findings Reported from University of Thessaly**

(Enterovirus Study Findings Reported from University of Thessaly)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enterovirus. According to news reporting originating in Larisa, Greece, by NewsRx journalists, research stated, "Mutations and recombination events have been identified in enteroviruses. Point mutations accumulate with a frequency of 6.3 x 10(-4) per base pair per replication cycle affecting the fitness, the circulation, and the infectivity of enteroviral strains."

The news reporters obtained a quote from the research from the University of Thessaly, "In the present report, the serological status of the Central and Western Greek population (Larissa and Ioannina, respectively) in the 1-10-year, 11-20-year, 21-30-year, and 31-40-year age groups against six non-polio enterovirus strains, their respective echovirus prototypes, and Sabin 1, 2, and 3 vaccine strains was evaluated, through serum-neutralization assay. In the Western Greek population, antibody levels were detected only for clinical isolates of E30 serotype in all age groups, and for environmental isolate LR61G3 (E6 serotype) only in the 31-40 age group, whereas an immunity level was observed in the Central Greek population, against all strains, except for ELS6B (E3 serotype). Amino acid substitutions were encountered across the structural region of the capsid, between the prototypes and the respective isolates. These substitutions may alter the antigenicity of each strain and may explain the variations observed in the neutralization titers of the different strains. As a consequence, these substitutions severely affect antibody binding and increase the ability of the virus to escape the immune response. It is tempting to assume that changes in the antigenic properties observed in circulating echoviruses represent a selection of viral variants that are less prone to be neutralized by human antibodies."

According to the news reporters, the research concluded: "These facts argue for the need of immunological studies to the population to avoid epidemics due to the circulation of highly evolved derivatives."

For more information on this research see: Serum Neutralization Assay for the Determination of Antibody Levels Against Non-Polio Enterovirus Strains in Central and Western Greece. *Viral Immunology*, 2016;29(7):444-450. *Viral Immunology* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Enterovirus

New Enterovirus Study Results from French National Institute of Health and Medical Research (INSERM) Described (Exchanges of genomic domains between poliovirus and other cocirculating species C enteroviruses reveal a high degree of plasticity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Enterovirus. According to news reporting from Paris, France, by NewsRx journalists, research stated, "The attenuated Sabin strains contained in the oral poliomyelitis vaccine are genetically unstable, and their circulation in poorly immunized populations can lead to the emergence of pathogenic circulating vaccine-derived polioviruses (cVDPVs). The recombinant nature of most cVDPV genomes and the preferential presence of genomic sequences from certain cocirculating non-polio enteroviruses of species C (EV-Cs) raise questions about the permissiveness of genetic exchanges between EV-Cs and the phenotypic impact of such exchanges."

The news correspondents obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "We investigated whether functional constraints limited genetic exchanges between Sabin strains and other EV-Cs. We bypassed the natural recombination events by constructing 29 genomes containing a Sabin 2 capsid-encoding sequence and other sequences from Sabin 2 or from non-polio EV-Cs. Most genomes were functional. All recombinant viruses replicated similarly in vitro, but recombination modulated plaque size and temperature sensitivity. All viruses with a 5'UTR from Sabin 2 were attenuated in mice, whereas almost all viruses with a non-polio 5'UTR caused disease. These data highlight the striking conservation of functional compatibility between different genetic domains of cocirculating EV-Cs."

According to the news reporters, the research concluded: "This aspect is only one of the requirements for the generation of recombinant cVDPVs in natural conditions, but it may facilitate the generation of viable intertypic recombinants with diverse phenotypic features, including pathogenicity."

For more information on this research see: Exchanges of genomic domains between poliovirus and other cocirculating species C enteroviruses reveal a high degree of plasticity.
New Environmental Research Findings from School of Medicine Outlined (Identifying sensitive windows for prenatal particulate air pollution exposure and mitochondrial DNA content in cord blood)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Environmental Research are presented in a new report. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Changes in mitochondrial DNA (mtDNA) can serve as a marker of cumulative oxidative stress (OS) due to the mitochondria's unique genome and relative lack of repair systems. In utero particulate matter <= 2.5 µm (PM2.5) exposure can enhance oxidative stress."

Financial support for this research came from Ministry of Health.

The news correspondents obtained a quote from the research from the School of Medicine, "Our objective was to identify sensitive windows to predict mtDNA damage experienced in the prenatal period due to PM2.5 exposure using mtDNA content measured in cord blood. Material and methods: Women affiliated with the Mexican social security system were recruited during pregnancy in the Programming Research in Obesity, Growth, Environment and Social Stressors (PROGRESS) study. Mothers with cord blood collected at delivery and complete covariate data were included (n = 456). Mothers' prenatal daily exposure to PM2.5 was estimated using a satellite-based spatio-temporally resolved prediction model and place of residence during pregnancy. DNA was extracted from umbilical cord leukocytes. Quantitative real-time polymerase chain reaction (qPCR) was used to determine mtDNA content. A distributive lag regression model (DLM) incorporating weekly averages of daily PM2.5 predictions was constructed to plot the association between exposure and OS over the length of pregnancy. In models that included child's sex, mother's age at delivery, prenatal environmental tobacco smoke exposure, birth year, maternal education, and assay batch, we found significant associations between higher PM2.5 exposure during late pregnancy (35-40 weeks) and lower mtDNA content in cord blood."

According to the news reporters, the research concluded: "Increased PM2.5 during a specific prenatal window in the third trimester was associated with decreased mtDNA content suggesting heightened sensitivity to PM-induced OS during this life stage."

For more information on this research see: Identifying sensitive windows for prenatal particulate air pollution exposure and mitochondrial DNA content in cord blood.
New Environmental Research and Public Health Findings from Sylvester Comprehensive Cancer Center Described (Racial/Ethnic Differences in Electronic Cigarette Use and Reasons for Use among Current and Former Smokers: Findings from a ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Environmental Health - Environmental Research and Public Health. According to news originating from Miami, Florida, by NewsRx correspondents, research stated, "The prevalence of e-cigarette use is increasing, yet few studies have focused on its use in racial/ethnic minority populations. We examined associations between race/ethnicity and e-cigarette use, plans to continue using e-cigarettes, and reasons for use among current/former smokers."

Our news journalists obtained a quote from the research from Sylvester Comprehensive Cancer Center, "Participants (285 in total; 29% non-Hispanic White, 42% African American/Black, and 29% Hispanic) were recruited between June and November 2014. Telephone-administered surveys assessed demographics, cigarette smoking, e-cigarette use, plans to continue using, and reasons for use. Analyses of covariance (ANCOVAs) and multivariable logistic regressions were conducted. African Americans/Blacks were significantly less likely to report ever-use compared to Whites and Hispanics (50% vs. 71% and 71%, respectively; p < 0.001). However, African American/Black ever users were more likely to report plans to continue using e-cigarettes compared to Whites and Hispanics (72% vs. 53% and 47%, respectively, p = 0.01). African American/Black participants were more likely to use e-cigarettes as a cessation aid compared to both Whites (p = 0.03) and Hispanics (p = 0.48). White participants were more likely to use e-cigarettes to save money compared to Hispanics (p = 0.02)."

According to the news editors, the research concluded: "Racial/ethnic differences in e-cigarette use, intentions, and reasons for use emerged in our study. African American ever
users may be particularly vulnerable to maintaining their use, particularly to try to quit smoking. These findings have implications for cigarette smoking and e-cigarette dual use, continued e-cigarette use, and potentially for smoking-related disparities."

The news correspondents report that additional information may be obtained from M.W. Hooper, Sylvester Comprehensive Cancer Center, Miami, FL 33136, United States.

Keywords for this news article include: Miami, Florida, United States, North and Central America, Environmental Research and Public Health, Environmental Health, Sylvester Comprehensive Cancer Center.

**Enzymes and Coenzymes**

**New Enzymes and Coenzymes Findings from Brandeis University Outlined (Enzyme-Instructed Self-Assembly of Small D-Peptides as a Multiple-Step Process for Selectively Killing Cancer Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes have been published. According to news originating from Waltham, Massachusetts, by NewsRx correspondents, research stated, "Selective inhibition of cancer cells remains a challenge in chemotherapy. Here we report the molecular and cellular validation of enzyme-instructed self-assembly (EISA) as a multiple step process for selectively killing cancer cells that overexpress alkaline phosphatases (ALPs)."

Funders for this research include U.S. Department of Health and Human Services, W.M. Keck Foundation, National Science Foundation.

Our news journalists obtained a quote from the research from Brandeis University, "We design and synthesize two kinds of D-tetrapeptide containing one or two phosphotyrosine residues and with the N-terminal capped by a naphthyl group. Upon enzymatic dephosphorylation, these D-tetrapeptides turn into self-assembling molecules to form nanofibers in water. Incubating these D-tetrapeptides with several cancer cell lines and one normal cell line, the unphosphorylated D-tetrapeptides are innocuous to all the cell lines, the monophosphorylated D-tetrapeptides selectively inhibit the cancer cells, but not the normal cell. The monophosphorylated D-tetrapeptides exhibit more potent inhibitory activity than the diphosphorylated D-tetrapeptides do; the cancer cell lines express higher level of ALPs are more susceptible to inhibition by the phosphorylated D-tetrapeptides; the precursors of D-tetrapeptides that possess higher self-assembling abilities exhibit higher inhibitory activities. These results confirm the important role of enzymatic reaction and self-assembly. Using uncompetitive inhibitors of ALPs and fluorescent D-tetrapeptides, we delineate that the enzyme catalyzed dephosphorylation and the self-assembly steps, together, result in the localization of the nanofibers of D-tetrapeptides for killing the cancer cells. We find that the cell death modality likely associates with the cell type and prove the interactions between nanofibers and..."
the death receptors."

According to the news editors, the research concluded: "This work illustrates a paradigm-shifting and biomimetic approach and contributes useful molecular insights for the development of spatiotemporal defined supramolecular processes/assemblies as potential anticancer therapeutics."

The news correspondents report that additional information may be obtained from J. Zhou, Dept. of Chemistry, Brandeis University, 415 South Street, Waltham, Massachusetts 02453, United States. Additional authors for this research include X. Du, N. Yamagata and B. Xu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/jacs.5b13541. This DOI is a link to an online electronic document that is either free or for purchase.

**Enzymes and Coenzymes**

**New Enzymes and Coenzymes Findings from Leibniz University Outlined (PvdN Enzyme Catalyzes a Periplasmic Pyoverdine Modification)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Enzymes and Coenzymes are presented in a new report. According to news reporting from Hannover, Germany, by NewsRx journalists, research stated, "Pyoverdines are high affinity siderophores produced by a broad range of pseudomonads to enhance growth under iron deficiency. They are especially relevant for pathogenic and mutualistic strains that inhabit iron-limited environments."

The news correspondents obtained a quote from the research from Leibniz University, "Pyoverdines are generated from non-ribosomally synthesized highly modified peptides. They all contain an aromatic chromophore that is formed in the periplasm by intramolecular cyclization steps. Although the cytoplasmic peptide synthesis and side-chain modifications are well characterized, the periplasmic maturation steps are far from understood. Out of five periplasmic enzymes, PvdM, PvdN, PvdO, PvdP, and PvdQ, functions have been attributed only to PvdP and PvdQ. The other three enzymes are also regarded as essential for siderophore biosynthesis. The structure of PvdN has been solved recently, but no function could be assigned. Here we present the first in-frame deletion of the PvdN-encoding gene. Unexpectedly, PvdN turned out to be required for a specific modification of pyoverdine, whereas the overall amount of fluorescent pyoverdines was not altered by the mutation. The mutant strain grew normally under iron-limiting conditions. Mass spectrometry identified the PvdN-dependent modification as a transformation of the N-terminal glutamic acid to a
succinamide."

According to the news reporters, the research concluded: "We postulate a pathway for this transformation catalyzed by the enzyme PvdN, which is most likely functional in the case of all pyoverdines."

Our news journalists report that additional information may be obtained by contacting T. Bruser, Leibniz Univ Hannover, Inst Microbiol, Herrenhauser Str 2, D-30419 Hannover, Germany. Additional authors for this research include G. Drager and T. Bruser.

**New Epilepsy Data Have Been Reported by Researchers at McGill University (Epileptic Encephalopathy Caused by Mutations in the Guanine Nucleotide Exchange Factor DENND5A)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting originating from Montreal, Canada, by NewsRx correspondents, research stated, "Epileptic encephalopathies are a catastrophic group of epilepsies characterized by refractory seizures and cognitive arrest, often resulting from abnormal brain development. Here, we have identified an epileptic encephalopathy additionally featuring cerebral calcifications and coarse facial features caused by recessive loss-of-function mutations in DENND5A."

Funders for this research include Canadian Institutes for Health Research, German Academic Exchange Service, German-Arab Transformation Program Line4, Ontario Brain Institute and Genome Canada, Fonds de Recherche du Quebec - Sante.

Our news editors obtained a quote from the research from McGill University. "DENND5A contains a DENN domain, an evolutionarily ancient enzymatic module conferring guanine nucleotide exchange factor (GEF) activity to multiple proteins serving as GEFs for Rabs, which are key regulators of membrane trafficking. DENND5A is detected predominantly in neuronal tissues, and its highest levels occur during development. Knockdown of DENND5A leads to striking alterations in neuronal development. Mechanistically, these changes appear to result from upregulation of neurotrophin receptors, leading to enhanced downstream signaling."

According to the news editors, the research concluded: "Thus, we have identified a link between a DENN domain protein and neuronal development, dysfunction of which is
responsible for a form of epileptic encephalopathy."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajhg.2016.10.006. This DOI is a link to an online electronic document that is either free or for purchase.

New Epilepsy Findings from All India Institute of Medical Sciences Discussed (A case of recurrent status epilepticus and successful management with progesterone)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting originating in New Delhi, India, by NewsRx journalists, research stated, "Catamenial epilepsy (CE) is a commonly observed phenomenon among women with epilepsy, the management of which is both hormonal and non-hormonal. Progesterone therapy has been tried in these patients, as the possible mechanism of CE is withdrawal of progesterone and a higher oestrogen/progesterone ratio in the perimenstrual and periovulatory periods."

The news reporters obtained a quote from the research from the All India Institute of Medical Sciences, "Here, we describe a 24-year-old lady with multiple seizure types since childhood, which were refractory to adequate antiepileptic drug therapy after menarche with catamenial clustering of seizures. She went on to have several episodes of non-convulsive status epilepticus also with similar periodicity, which would abate only with midazolam infusion, without the need for ventilatory support."

According to the news reporters, the research concluded: "She was tried on acetazolamide, progesterone vaginal pessaries, and maximum tolerated doses of antiepileptic medications, but finally responded to intramuscular and oral progesterone, and has been seizure-free for more than a year."
For more information on this research see: A case of recurrent status epilepticus and successful management with progesterone. *Epileptic Disorders*, 2016;18(1):101-5. (Springer - www.springer.com; Epileptic Disorders - www.springerlink.com/content/1950-6945/)

**New Epilepsy Findings from Institute of Neurology Discussed**

**(Brivaracetam: review of its pharmacology and potential use as adjunctive therapy in patients with partial onset seizures)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting originating from Catanzaro, Italy, by NewsRx correspondents, research stated, "Brivaracetam (BRV), a high-affinity synaptic vesicle protein 2A ligand, reported to be 10-30-fold more potent than levetiracetam (LEV), is highly effective in a wide range of experimental models of focal and generalized seizures. BRV and LEV similarly bind to synaptic vesicle protein 2A, while differentiating for other pharmacological effects; in fact, BRV does not inhibit high voltage Ca(2+) channels and AMPA receptors as LEV."

Our news editors obtained a quote from the research from the Institute of Neurology, "Furthermore, BRV apparently exhibits inhibitory activity on neuronal voltage-gated sodium channels playing a role as a partial antagonist. BRV is currently waiting for approval both in the United States and the European Union as adjunctive therapy for patients with partial seizures. In patients with photosensitive epilepsy, BRV showed a dose-dependent effect in suppressing or attenuating the photoparoxysmal response. In well-controlled trials conducted to date, adjunctive BRV demonstrated efficacy and good tolerability in patients with focal epilepsy. BRV has a linear pharmacokinetic profile. BRV is extensively metabolized and excreted by urine (only 8%-11% unchanged). The metabolites of BRV are inactive, and hydrolysis of the acetamide group is the mainly involved metabolic pathway; hepatic impairment probably requires dose adjustment. BRV does not seem to influence other antiepileptic drug plasma levels. Six clinical trials have so far been completed indicating that BRV is effective in controlling seizures when used at doses between 50 and 200 mg/d. The drug is generally well-tolerated with only mild-to-moderate side effects; this is confirmed by the low discontinuation rate observed in these clinical studies. The most common side effects are related to central nervous system and include fatigue, dizziness, and somnolence; these apparently disappear during treatment. In this review, we analyzed BRV, focusing on the current evidences from experimental animal models to clinical studies with particular interest on potential use in clinical practice."

According to the news editors, the research concluded: "Finally, pharmacological
properties of BRV are summarized with a description of its pharmacokinetics, safety, and potential/known drug-drug interactions."

For more information on this research see: Brivaracetam: review of its pharmacology and potential use as adjunctive therapy in patients with partial onset seizures. Drug Design, Development and Therapy, 2015;9():5719-25.

Central Nervous System Diseases and Conditions -

New Epilepsy Findings from Research Institute Described (MED23-Associated Refractory Epilepsy Successfully Treated with the Ketogenic Diet)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Epilepsy have been published. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "We report a new patient with refractory epilepsy associated with a novel pathogenic homozygous MED23 variant. This 7.5-year-old boy from consanguineous parents had infantile onset global developmental delay and refractory epilepsy."

Our news journalists obtained a quote from the research from Research Institute, "He was treated with the ketogenic diet at 2.5 years of age and became seizure free on the first day. He had microcephaly and truncal hypotonia. His brain MRI showed delayed myelination and thin corpus callosum. He was enrolled in a whole exome sequencing research study, which identified a novel, homozygous, likely pathogenic (c.1937A >G; p.Gln646Arg) variant in MED23. MED23 is a regulator of energy homeostasis and glucose production. Liver-specific Med23-knockout mice showed reduced liver gluconeogenesis and lower blood glucose levels compared to control mice. This is the first patient with documented refractory epilepsy caused by a novel homozygous pathogenic variant in MED23 expanding the phenotypic spectrum."

According to the news editors, the research concluded: "Identification of the underlying genetic defect in MED23 sheds light on the possible mechanism of complete response to the ketogenic diet in this child."

For more information on this research see: MED23-Associated Refractory Epilepsy Successfully Treated with the Ketogenic Diet. American Journal of Medical Genetics Part A, 2016;170(9):2421-2425. American Journal of Medical Genetics Part A can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell -
New Epistaxis Data Have Been Reported by Investigators at University of Maryland (Role of topical tranexamic acid in the management of idiopathic anterior epistaxis in adult patients in the emergency department)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nose Diseases and Conditions - Epistaxis are discussed in a new report. According to news reporting originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "The role of topical tranexamic acid in the management of anterior epistaxis in adult patients in the emergency department (ED) is examined. The use of alternative agents for the treatment of epistaxis before the use of nasal packing may be reasonable due to patient discomfort, potential complications, and the need for follow-up with a healthcare provider for packing removal."

Our news editors obtained a quote from the research from the University of Maryland, "One such agent is tranexamic acid. Two published studies evaluated the off-label use of topical tranexamic acid for the treatment of epistaxis. The first trial compared the efficacy of a topical gel containing 10% tranexamic acid with a placebo gel containing glycerin for the treatment of epistaxis. The percentage of patients whose bleeding ceased within 30 minutes of the intervention did not significantly differ between the tranexamic acid and placebo groups (p = 0.16). The second trial compared the efficacy of cotton pledgets soaked in the i.v. formulation of tranexamic acid inserted into the bleeding naris with standard nasal packing therapy. Bleeding cessation occurred within 10 minutes in 71% of the tranexamic acid group versus 31.2% of the standard treatment group (odds ratio, 2.28; 95% confidence interval, 1.68-3.09; p< 0.001). Additional information is necessary to fully evaluate the role of topical tranexamic acid in treatment algorithms; however, the use of topical tranexamic acid may be beneficial in select populations."

According to the news editors, the research concluded: "Topical tranexamic acid may have a role in the treatment of anterior epistaxis in select ED patients, though additional studies are needed to confirm its role in treatment algorithms."

For more information on this research see: Role of topical tranexamic acid in the management of idiopathic anterior epistaxis in adult patients in the emergency department. *American Journal of Health-System Pharmacy*, 2016;73(21):1755-1759. *American Journal of Health-System Pharmacy* can be contacted at: Amer Soc Health-System Pharmacists, 7272

Human Herpesvirus Diseases and Conditions -…

New Epstein-Barr Virus Findings from Harvard School of Medicine Discussed (Epstein-Barr virus super-enhancer eRNAs are essential for MYC oncogene expression and lymphoblast proliferation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Human Herpesvirus Diseases and Conditions - Epstein-Barr Virus have been published. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Epstein-Barr virus (EBV) super-enhancers (ESEs) are essential for lymphoblastoid cell (LCL) growth and survival. Reanalyses of LCL global run-on sequencing (Gro-seq) data found abundant enhancer RNAs (eRNAs) being transcribed at ESEs."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "Inactivation of ESE components, EBV nuclear antigen 2 (EBNA2) and bromodomain-containing protein 4 (BRD4), significantly decreased eRNAs at ESEs -428 and -525 kb upstream of the MYC oncogene transcription start site (TSS). shRNA knockdown of the MYC -428 and -525 ESE eRNA caused LCL growth arrest and reduced cell growth. Furthermore, MYC ESE eRNA knockdown also significantly reduced MYC expression, ESE H3K27ac signals, and MYC ESEs looping to MYC TSS."

According to the news reporters, the research concluded: "These data indicate that ESE eRNAs strongly affect cell gene expression and enable LCL growth."

Our news journalists report that additional information may be obtained by contacting E. Kieff, Harvard Med Sch, Dept. of Microbiol & Immunobiol, Program Virol,
New Epstein-Barr Virus Study Findings Recently Were Reported by Researchers at Midwestern University [Epstein-Barr Virus Latent Membrane Protein 2A (LMP2A) enhances IL-10 production through the activation of Bruton's tyrosine kinase and STAT3]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Human Herpesvirus Diseases and Conditions - Epstein-Barr Virus. According to news reporting out of Downers Grove, Illinois, by NewsRx editors, research stated, "Previous data demonstrate that Epstein-Barr Virus Latent Membrane Protein 2A (LMP2A) enhances IL-10 to promote the survival of LMP2A-expressing B cell lymphomas. Since STAT3 is an important regulator of IL-10 production, we hypothesized that LMP2A activates a signal transduction cascade that increases STAT3 phosphorylation to enhance IL-10."

Financial supporters for this research include NIH, United States, College of Health Sciences, Midwestern University.

Our news journalists obtained a quote from the research from Midwestern University, "Using LMP2A-negative and -positive B cell lines, the data indicate that LMP2A requires the early signaling molecules of the Syk/RAS/PI3K pathway to increase IL-10. Additional studies indicate that the PI3K-regulated kinase, BTK, is responsible for phosphorylating STAT3, which ultimately mediates the LMP2A-dependent increase in IL-10. These data are the first to show that LMP2A signaling results in STAT3 phosphorylation in B cells through a PI3K/BTK-dependent pathway."

According to the news editors, the research concluded: "With the use of BTK and STAT3 inhibitors to treat B cell lymphomas in clinical trials, these findings highlight the possibility of using new pharmaceutical approaches to treat EBV-associated lymphomas that express LMP2A."

For more information on this research see: Epstein-Barr Virus Latent Membrane Protein 2A (LMP2A) enhances IL-10 production through the activation of Bruton's tyrosine kinase and STAT3. Nutritional and Metabolic Diseases and Conditions - …

New Erythropoietic Protoporphyrinia Study Findings Have Been Reported by Researchers at University of Toyama (Incomplete erythropoietic protoporphyria caused by a splice site modulator homozygous IVS3-48C polymorphism in the ferrochelatase gene)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Erythropoietic Protoporphyrinia is the subject of a report. According to news reporting from Toyama, Japan, by NewsRx journalists, research stated, "Erythropoietic protoporphyria (EPP) is an inherited cutaneous porphyria caused by both the partial deficiency of ferrochelatase (FECH) and the existence of cytosine at IVS3-48 in trans to a mutated FECH allele. However, physicians occasionally encounter patients with EPP with a mild phenotype associated with a slight increase in the erythrocyte-free protoporphyrin concentration and no FECH gene mutations."

The news correspondents obtained a quote from the research from the University of Toyama, "In this study, genetic analyses were performed on three patients with a mild phenotype of EPP, with photosensitivity, slightly increased erythrocyte-free protoporphyrin concentrations and only a few fluorocytes in the peripheral blood. After obtaining the patients' and their parents' informed consent, a direct sequence analysis of the FECH gene and a restriction fragment length polymorphism analysis were performed on samples from the patients. The FECH gene mutation was not detected in the direct sequence analyses in any of the patients. However, all three patients had the homozygous IVS3-48C polymorphism."

According to the news reporters, the research concluded: "These findings suggest that homozygous IVS3-48C polymorphism of the FECH gene is associated with a slight elevation of the protoporphyrin level in erythrocytes, resulting in a mild EPP phenotype."

Our news journalists report that additional information may be obtained by contacting M. Mizawa, Dept. of Dermatology, Graduate School of Medicine and Pharmaceutical Sciences, University of Toyama, Sugitani, Toyama, 930-0194, Japan. Additional authors for this
research include T. Makino, H. Nakano, D. Sawamura and T. Shimizu.

Gram-Negative Bacteria - Escherichia coli

New Escherichia coli Data Have Been Reported by Investigators at University of California (Mutational Consequences of Ciprofloxacin in Escherichia coli)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Escherichia coli. According to news originating from Los Angeles, California, by NewsRx correspondents, research stated, "We examined the mutagenic specificity of the widely used antibiotic ciprofloxacin (CPR), which displays weak to moderate mutagenic activity in several bacteria and generates short in-frame deletions in rpoB in Staphylococcus aureus. To determine the spectrum of mutations in a system where any gene knockout would result in a recovered mutant, including frameshifts and both short and long deletions, we examined CPR-induced mutations in the thymidylate synthase-encoding thyA gene."

Financial support for this research came from UCLA Faculty Research Grant.

Our news journalists obtained a quote from the research from the University of California, "Here, any mutation resulting in loss of thymidylate synthase activity generates trimethoprim (Trm) resistance. We found that deletions and insertions in all three reading frames predominated in the spectrum. They tend to be short deletions and cluster in two regions, one being a GC-rich region with potential extensive secondary structures. We also exploited the well-characterized rpoB-Rifr system in Escherichia coli to determine that cells grown in the presence of sublethal doses of CPR not only induced short in-frame deletions in rpoB, but also generated base substitution mutations resulting from induction of the SOS system. Some of the specific point mutations prominent in the spectrum of a strain that overproduces the dinB-encoded Pol IV were also present after growth in CPR. However, these mutations disappeared in CPR-treated dinB mutants, whereas the deletions remained. Moreover, CPR-induced deletions also occurred in a strain lacking all three SOS-induced polymerases."

According to the news editors, the research concluded: "We discuss the implications of these findings for the consequences of overuse of CPR and other antibiotics."

For more information on this research see: Mutational Consequences of Ciprofloxacin in Escherichia coli. Antimicrobial Agents and Chemotherapy, 2016;60(10):6165-6172. **Gram-Negative Bacteria - *Escherichia coli***

**New Escherichia coli Data Have Been Reported by Researchers at Nara Women's University (Natural Escherichia coli strains undergo cell-to-cell plasmid transformation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - *Escherichia coli*. According to news reporting out of Nara, Japan, by NewsRx editors, research stated, "Horizontal gene transfer is a strong tool that allows bacteria to adapt to various environments. Although three conventional mechanisms of horizontal gene transfer (transformation, transduction, and conjugation) are well known, new variations of these mechanisms have also been observed."

Financial support for this research came from JSPS KAKENHI.

Our news journalists obtained a quote from the research from Nara Women's University, "We recently reported that DNase-sensitive cell-to-cell transfer of nonconjugative plasmids occurs between laboratory strains of *Escherichia coli* in co-culture. We termed this phenomenon 'cell-to-cell transformation.' In this report, we found that several combinations of *Escherichia coli* collection of reference (ECOR) strains, which were co-cultured in liquid media, resulted in DNase-sensitive cell-to-cell transfer of antibiotic resistance genes. Plasmid isolation of these new transformants demonstrated cell-to-cell plasmid transfer between the ECOR strains. Natural transformation experiments, using a combination of purified plasmid DNA and the same ECOR strains, revealed that cell-to-cell transformation occurs much more frequently than natural transformation under the same culture conditions. Thus, cell-to-cell transformation is both unique and effective."

According to the news editors, the research concluded: "This study is the first to demonstrate cell-to-cell plasmid transformation in natural *E. coli* strains."

For more information on this research see: Natural Escherichia coli strains undergo cell-to-cell plasmid transformation. *Biochemical and Biophysical Research Communications*, 2016;481(1-2):59-62. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Biochemical and Biophysical Research Communications - www.journals.elsevier.com/biochemical-and-biophysical-research-communications/)

Our news journalists report that additional information may be obtained by

Gram-Negative Bacteria - Escherichia coli

New Escherichia coli Study Findings Have Been Reported from University of Bourgogne (Trends of extended-spectrum beta-lactamase-producing Escherichia coli sequence type 131 and its H30 subclone in a French hospital over a 15-year period)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gram-Negative Bacteria - Escherichia coli. According to news originating from Besancon, France, by NewsRx correspondents, research stated, "Sequence type 131 (ST131) is a predominant lineage among extraintestinal pathogenic Escherichia coli. It plays a major role in the worldwide dissemination of E. coli producing extended-spectrum beta-lactamases (ESBLs)."

Our news journalists obtained a quote from the research from the University of Bourgogne, "Here we describe the long-term epidemiology of this clonal group in a French university hospital, where the incidence of ESBL-producing E. coli has increased from 0.018 case per 1000 patient-days in the year 2000 to 0.50 case per 1000 patient-days in 2014. The first of the 141 ST131 isolates was recovered in 2006, and the ST131 clonal group accounted for 18.1% of total ESBL-producing E. coli over the whole period (2000-2014). Subclonal typing showed that 75.9% (107/141) of ST131 isolates were H30, of which 81.3% (87/107) were H30-Rx. The large majority (137/141) of ESBLs produced were of the CTX-M group, with 94 CTX-M-15, 19 CTX-M-1, 10 CTX-M-27, 8 CTX-M-14 and four other CTX-M types (n = 6). Pulsed-field gel electrophoresis (PFGE) analysis showed high diversity, which increased during the course of the study. The 141 ST131 isolates clustered in 53 pulsotypes (PTs), with 2 dominant PTs (PT14 and PT13) with 36 and 17 isolates, respectively. These findings showed that ST131 was a predominant clone among ESBL-producing E. coli in our hospital, even though it only accounted for <20%.

According to the news editors, the research concluded: "Moreover, ST131 should be regarded not as a unified entity but as a cluster of distinct clonal subsets even if the increase in resistance within ST131 has a strong clonal basis, being attributable mainly to the spread of C1/H30-R and C2/H30-Rx clades."

PO Box 211, 1000 AE Amsterdam, Netherlands.  (Elsevier - www.elsevier.com; International Journal of Antimicrobial Agents - www.journals.elsevier.com/international-journal-of-antimicrobial-agents/)

Gram-Negative Bacteria - Escherichia coli

New Escherichia coli Study Findings Recently Were Reported by Researchers at King Abdullah University of Science and Technology (Isolation and Characterization of NDM-Positive Escherichia coli from Municipal Wastewater in Jeddah, Saudi Arabia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Escherichia coli have been published. According to news reporting from Thuwal, Saudi Arabia, by NewsRx journalists, research stated, "The emergence of resistance to last-resort antibiotics is a public health concern of global scale. Besides direct person-to-person propagation, environmental pathways might contribute to the dissemination of antibiotic-resistant bacteria and antibiotic resistance genes (ARGs)."

The news correspondents obtained a quote from the research from the King Abdullah University of Science and Technology, "Here, we describe the incidence of bla(NDM-1), a gene conferring resistance to carbapenems, in the wastewater of the city of Jeddah, Saudi Arabia, over a 1-year period. bla(NDM-1) was detected at concentrations ranging from 10(4) to 10(5) copies/ m(3) of untreated wastewater during the entire monitoring period. These results indicate the ubiquity and high incidence of bla(NDM-1) in the local wastewater. To track the bacteria carrying bla(NDM-1), we isolated Escherichia coli PI7, a strain of sequence type 101 (ST101), from wastewater around the Hajj event in October 2013. Genome sequencing of this strain revealed an extensive repertoire of ARGs as well as virulence and invasive traits. These traits were further confirmed by antibiotic resistance profiling and in vitro cell internalization in HeLa cell cultures. Given that this strain remains viable even after a certain duration in the sewerage, and that Jeddah lacks a robust sanitary infrastructure to fully capture all generated sewage, the presence of this bacterium in the untreated wastewater represents a potential hazard to the local public health."

According to the news reporters, the research concluded: "To the best of our knowledge, this is the first report of a bla(NDM-1)-positive E. coli strain isolated from a nonnosocomial environment in Saudi Arabia and may set a priority concern for the need to establish improved surveillance for carbapenem-resistant E. coli in the country and nearby regions."

Our news journalists report that additional information may be obtained by contacting P.Y. Hong, King Abdullah Univ Sci & Technol, Water Desalinat & Reuse Center, Biol & Environm Sci & Engn Div BESE, Thuwal, Saudi Arabia. Additional authors for this research include M.R. Jumat, T. Wang, P. Ganesan, N. Al-Jassim and P.Y. Hong.

**Gram-Negative Bacteria - Escherichia coli**

**New Escherichia coli Study Findings Recently Were Reported by Researchers at University Hospital (Real-Time Genome Sequencing of Resistant Bacteria Provides Precision Infection Control in an Institutional Setting)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Escherichia coli is now available. According to news reporting originating in Munster, Germany, by NewsRx journalists, research stated, "The increasing prevalence of multidrug-resistant (MDR) bacteria is a serious global challenge. Here, we studied prospectively whether bacterial whole-genome sequencing (WGS) for real-time MDR surveillance is technical feasible, returns actionable results, and is cost-beneficial."

Financial supporters for this research include Medical Faculty of the University of Muenster, Germany, Deutsche Forschungsgemeinschaft (DFG), Bundesministerium fur Bildung und Forschung (BMBF), EC | Seventh Framework Programme (FP7).

The news reporters obtained a quote from the research from University Hospital, "WGS was applied to all MDR isolates of four species (methicillin-resistant Staphylococcus aureus [MRSA], vancomycin-resistant Enterococcus faecium, MDR Escherichia coli, and MDR Pseudomonas aeruginosa) at the University Hospital Muenster, Muenster, Germany, a tertiary care hospital with 1,450 beds, during two 6-month intervals. Turnaround times (TAT) were measured, and total costs for sequencing per isolate were calculated. After cancelling prior policies of preemptive isolation of patients harboring certain Gram-negative MDR bacteria in risk areas, the second interval was conducted. During interval I, 645 bacterial isolates were sequenced. From culture, TATs ranged from 4.4 to 5.3 days, and costs were (sic) 202.49 per isolate. During interval II, 550 bacterial isolates were sequenced. Hospital-wide transmission rates of the two most common species (MRSA and MDR E. coli) were low during interval I.
(5.8% and 2.3%, respectively) and interval II (4.3% and 5.0%, respectively). Cancellation of isolation of patients infected with non-pan-resistant MDR E. coli in risk wards did not increase transmission. Comparing sequencing costs with avoided costs mostly due to fewer blocked beds during interval II, we saved in excess of (sic) 200,000.

According to the news reporters, the research concluded: "Real-time microbial WGS in our institution was feasible, produced precise actionable results, helped us to monitor transmission rates that remained low following a modification in isolation procedures, and ultimately saved costs."

For more information on this research see: Real-Time Genome Sequencing of Resistant Bacteria Provides Precision Infection Control in an Institutional Setting. *Journal of Clinical Microbiology*, 2016;54(12):2874-2881. *Journal of Clinical Microbiology* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

**Oncology - Esophageal Cancer**

**New Esophageal Cancer Findings Reported from Shandong University**

**(Predictive Effects of Lung function test on Postoperative Pneumonia in Squamous Esophageal Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Esophageal Cancer are discussed in a new report. According to news reporting out of Jinan, People’s Republic of China, by NewsRx editors, research stated, "Pulmonary function tests had prospective implications for postoperative pneumonia, which occurred frequently after esophagectomy. Understanding factors that were associated with pulmonary infection may help in patient selection and postoperative management."

Our news journalists obtained a quote from the research from Shandong University, "We performed a retrospective review of 2 independent cohorts including 216 patients who underwent esophagectomy between November 2011 and May 2014, aiming at identifying predictors of primary pneumonia. Univariate analysis was used to identify potential covariates for the development of primary pneumonia. Adjustments for multiple comparisons were made using False Discovery Rate (FDR) (Holm-Bonferroni method). Multivariable logistic regression analysis was used to identify independent predictors and construct a regression model based on a training cohort (n=166) and then the regression model was validated using an independent cohort (n=50). It showed that low PEF (hazard ratio 0.97, p=0.009) was independent risk factors..."
for the development of primary pneumonia in multivariate analyses and had a predictive effect for primary pneumonia (AUC=0.691 and 0.851 for training and validation data set, respectively)."

According to the news editors, the research concluded: "Therefore, PEF has clinical value in predicting postoperative pneumonia after esophagectomy and it may serve as an indicator of preoperative lung function training."

For more information on this research see: Predictive Effects of Lung function test on Postoperative Pneumonia in Squamous Esophageal Cancer. Scientific Reports, 2016;6 ():23636. (Nature Publishing Group - www.nature.com; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting R. Wei, Dept. of Thoracic Surgery, Shandong Provincial Hospital Affiliated to Shandong University, Shandong University, Jinan, 250021, People's Republic of China. Additional authors for this research include W. Dong, H. Shen, Y. Ni, T. Zhang, Y. Wang and J. Du.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/srep23636. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Esophageal Cancer

New Esophageal Cancer Findings from First Hospital Described (Hormonal and reproductive factors and risk of esophageal cancer in women: a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Esophageal Cancer have been presented. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Currently published studies on the relationship between hormonal and reproductive factors and esophageal cancer (EC) risk in women have yielded contradictory findings. For a better understanding of this relationship, we first performed this meta-analysis by pooling all available publications."

The news correspondents obtained a quote from the research from First Hospital, "Sixteen independent studies were retrieved after a comprehensive search in PubMed and Embase databases. The pooled relative risks (RRs) with 95% confidence intervals (95% CIs) were calculated. The pooled RRs implicated that hormone replacement therapy was negatively associated with the risk of EC (RR = 0.72, 95% CI 0.60-0.86, P< 0.001) and esophageal squamous cell carcinoma (RR = 0.68, 95% CI 0.48-0.97, P = 0.031). Menopausal women were at an increased risk of EC (RR = 1.47, 95% CI 1.07-2.03, P = 0.018), particularly esophageal squamous cell carcinoma (RR = 1.66, 95% CI 1.12-2.48, P = 0.012). Additionally, decreased risk of EC (RR = 0.79, 95% CI 0.68-0.92, P = 0.003) and esophageal adenocarcinoma (RR =
0.66, 95% CI 0.53-0.82, P< 0.001) was demonstrated among women with breast-feeding history. Moreover, such associations were more significant among Caucasians, but not Asians. Our study suggests that menopause is an independent risk factor for EC, while hormone replacement therapy and breast-feeding history play a protective role against EC, particularly among Caucasians."

According to the news reporters, the research concluded: "All results are consistent with the hypothesis that effects of estrogen may lower the risk of EC in women."

**Oncology - Esophageal Cancer**

**New Esophageal Cancer Findings from Mie University Hospital Reported (Preliminary treatment results of proton beam therapy with chemoradiotherapy for stage I-III esophageal cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Esophageal Cancer. According to news reporting out of Mie, Japan, by NewsRx editors, research stated, "The effect of proton beam therapy (PBT) on various cancers is controversial. We aimed to evaluate the efficacy and safety of PBT with alternating chemoradiotherapy (ACRT) for patients with stage I-III esophageal cancer."

Our news journalists obtained a quote from the research from Mie University Hospital, "Two cycles of systemic chemotherapy with a continuous infusion of 5-fluorouracil (5-FU) on days 1-5 and a 5h infusion of nedaplatin (NDP) on day 6 were accompanied by thoracic irradiation using X-ray therapy and PBT. During the first half of the treatment, X-rays were delivered to the prophylactic area. During the second half of the treatment, proton beams were used to irradiate the involved field. To reduce the dose of cardiac irradiation, proton beams were delivered with posterior and posterior oblique angles. Between January 2009 and December 2012, 47 patients were enrolled in this study. The median follow-up duration was 29 months for all patients and 40 months for survivors. The 3 year overall survival rate, progression-free survival rate, and local control rate were 59.2%, 56.3%, and 69.8%, respectively. With respect to grade 3-4 late toxicities, there were no pleural or pericardial effusions, but two patients (4.3%) had esophageal stenosis, one patient (2.1%) had fistula, and
two patients (4.3%) developed radiation pneumonitis."

According to the news editors, the research concluded: "PBT with ACRT might have the potential to reduce the risk of cardiac damage and might become one of the primary methods of esophageal cancer treatment."

Our news journalists report that additional information may be obtained by contacting A. Takada, Dept. of Radiation Oncology, Mie University Hospital, Tsu, Mie, Japan. Additional authors for this research include T. Nakamura, K. Takayama, C. Makita, M. Suzuki, Y. Azami, T. Kato, I. Tsukiyama, M. Hareyama, Y. Kikuchi, T. Daimon, Y. Toyomasu, N. Ii, Y. Nomoto, H. Sakuma and N. Fuwa.

Oncology - Esophageal Cancer

New Esophageal Cancer Findings from Tianjin Medical University Reported (Clinical significance of preoperative and postoperative cytokeratin 19 messenger RNA level in peripheral blood of esophageal cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Esophageal Cancer is now available. According to news reporting originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "The purpose of this study is to analyze the correlation between preoperative/postoperative Cytokeratin 19 (CK19) messenger RNA (mRNA) level in peripheral blood (PB) and the clinical significance in esophageal cancer patients with different clinicopathological factors. We detected the preoperative and postoperative CK19mRNA level in the PB of 139 esophageal cancer patients who underwent complete resection and evaluated its clinical significance."

Our news editors obtained a quote from the research from Tianjin Medical University, "We found that both the preoperative and postoperative CK19mRNA level increased in the esophageal cancer patients with lymph node metastasis, relapse or distant metastasis compared with that in cancers without lymph node metastasis, relapse or distant metastasis. High postoperative CK19mRNA levels indicate a short disease-free survival (DFS) for the whole cohort esophageal cancer patients, whereas the high preoperative CK19mRNA levels only indicate a short DFS for the esophageal cancer patients with squamous cell carcinoma, TNM III stage, and lymph node metastasis. The dynamic change of CK19mRNA levels could indicate the prognosis of esophageal cancer patients. The patients with decreasing CK19mRNA level after surgery had good prognosis, and the patients with changeless CK19mRNA level had
poor prognosis."

According to the news editors, the research concluded: "Taken together, CK19mRNA levels could be a promising marker in assessing prognosis or assigning treatment for the esophageal cancer patients according to different clinicopathological factors."

The news editors report that additional information may be obtained by contacting Z.T. Yu, Tianjin Med Univ, Key Lab Canc Prevent & Therapy Tianjin, Natl Clin Res Center Canc, Dept. of Esophageal Canc Inst & Hosp, Tianjin 300060, People's Republic of China. Oncology - Esophageal Cancer

New Esophageal Cancer Study Findings Have Been Reported by Researchers at Cancer Hospital (Radiation dose escalation by simultaneous modulated accelerated radiotherapy combined with chemotherapy for esophageal cancer: a phase II study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Esophageal Cancer. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "The outcomes for patients with esophageal cancer (EC) underwent standard-dose radical radiotherapy were still disappointing. This phase II study investigated the feasibility, safety and efficacy of radiation dose escalation using simultaneous modulated accelerated radiotherapy (SMART) combined with chemotherapy in 60 EC patients."

Our news journalists obtained a quote from the research from Cancer Hospital, "Radiotherapy consisted of 66Gy at 2.2 Gy/fraction to the gross tumor and 54Gy at 1.8 Gy/fraction to subclinical diseases simultaneously. Chemotherapy including cisplatin and 5fluorouracil were administered to all patients during and after radiotherapy. The data showed that the majority of patients (98.3%) completed the whole course of radiotherapy and concurrent chemotherapy. The most common (>=) grade 3 acute toxicities were neutropenia (16.7%), followed by esophagitis (6.7%) and thrombopenia (5.0%). With a median follow-up of 24 months (5-38) for all patients and 30 months (18-38) for those still alive, 11 patients (18.3%) developed (>=) Grade 3 late toxicities and 2 (3.3%) of them died subsequently due to esophageal hemorrhage. The 1-and 2-year local-regional control, distant metastasis-free survival, disease-free survival and overall survival rates were 87.6% and 78.6%, 86.0% and 80.5%, 75.6% and 64.4%, 86.7% and 72.7%, respectively. SMART combined with concurrent chemotherapy is feasible in EC patients with tolerable acute toxicities. They showed a trend of
significant improvements in local-regional control and overall survival."

According to the news editors, the research concluded: "Further follow-up is needed to evaluate the late toxicities."

The news correspondents report that additional information may be obtained from J. Chen, Dept. of Radiation Oncology, Cancer Hospital of Shantou University Medical College, Shantou, Guangdong, People's Republic of China. Additional authors for this research include H. Guo, T. Zhai, D. Chang, Z. Chen, R. Huang, W. Zhang, K. Lin, L. Guo, M. Zhou, D. Li, D. Li and C. Chen.

**Oncology - Esophageal Cancer**

**New Esophageal Cancer Study Findings Have Been Reported from Stanford University (Dynamic Microenvironment Induces Phenotypic Plasticity of Esophageal Cancer Cells Under Flow)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Esophageal Cancer. According to news reporting out of Palo Alto, California, by NewsRx editors, research stated, "Cancer microenvironment is a remarkably heterogeneous composition of cellular and noncellular components, regulated by both external and intrinsic physical and chemical stimuli. Physical alterations driven by increased proliferation of neoplastic cells and angiogenesis in the cancer microenvironment result in the exposure of the cancer cells to elevated levels of flow-based shear stress."

Our news journalists obtained a quote from the research from Stanford University, "We developed a dynamic microfluidic cell culture platform utilizing esophagael cancer cells as model cells to investigate the phenotypic changes of cancer cells upon exposure to fluid shear stress. We report the epithelial to hybrid epithelial/mesenchymal transition as a result of decreasing E-Cadherin and increasing N-Cadherin and vimentin expressions, higher clonogenicity and ALDH positive expression of cancer cells cultured in a dynamic microfluidic chip under laminar flow compared to the static culture condition. We also sought regulation of chemotherapeutics in cancer microenvironment towards phenotypic control of cancer cells."

According to the news editors, the research concluded: "Such in vitro microfluidic system could potentially be used to monitor how the interstitial fluid dynamics affect cancer microenvironment and plasticity on a simple, highly controllable and inexpensive bioengineered platform."

For more information on this research see: Dynamic Microenvironment Induces

Our news journalists report that additional information may be obtained by contacting U. Demirci, Stanford Sch Med, Bioacoust MEMS Med Lab, Canary Center Stanford Early Canc Detect, Dept. of RadiolDept Elect Engn, Palo Alto, CA 94304, United States. **Hormones - Estradiol Congeners**

**New Estradiol Congeners Data Have Been Reported by Investigators at Ocean University of China (An in vivo assay performed using multiple biomarkers related to testosterone synthesis and conversion for assessing the androgenic potency of refuse ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hormones - Estradiol Congeners. According to news reporting originating in Qingdao, People's Republic of China, by NewsRx journalists, research stated, "Refuse leachate is likely an important source of androgens. However, common in vitro bioassays underestimate the potential androgenic activity of leachate, owing to non-receptor-mediated mechanisms that modify the balance of sex hormones and promote the accumulation of endogenous androgens."

Funders for this research include Natural Science Foundation of Shandong Province, National Natural Science Foundation of China.

The news reporters obtained a quote from the research from the Ocean University of China, "This study aimed to develop an in vivo assay by using multiple biomarkers related to testosterone synthesis and conversion for assessing the potential androgenic activity of refuse leachate sampled from a municipal solid waste treatment plant in Qingdao, China. The results indicated that exposure to leachate increased the levels of testosterone and luteinizing hormone, but decreased those of 17 beta-estradiol in both male and female goldfish (Carassius auratus), suggesting a potential androgenic activity. Further, Leydig cell hyperplasia and decreased gonadal P450 aromatase mRNA levels were observed; these alterations might promote the biosynthesis of testosterone and hinder the conversion of testosterone to 17 beta-estradiol, which in turn enhance testosterone accumulation. Exposure to leachate also resulted in reproductive impairments, including decreased gonadosomatic index and plasma vitellogenin levels of female goldfish, as well as decreased testicular enzyme activities in male goldfish. The integrated use of biochemical, molecular, and histological markers not only improved our understanding of the androgenic effects of leachate but also verified the reliability and validity of the results."

According to the news reporters, the research concluded: "Therefore, the in vivo bioassay described in this study might allow the investigation of the androgenic effects of other complex contaminant mixtures in the future."
For more information on this research see: An in vivo assay performed using multiple biomarkers related to testosterone synthesis and conversion for assessing the androgenic potency of refuse leachate. *Ecotoxicology and Environmental Safety*, 2017;135 ():82-89. **Hormones - Estradiol Congeners**

**New Estradiol Congeners Findings Has Been Reported by Researchers at University of Gothenburg (High Serum SHBG Predicts Incident Vertebral Fractures in Elderly Men)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hormones - Estradiol Congeners. According to news reporting from Gothenburg, Sweden, by NewsRx journalists, research stated, "Previous prospective cohort studies have shown that serum levels of sex steroids and sex hormone-binding globulin (SHBG) associate with nonvertebral fracture risk in men. The predictive value of sex hormones and SHBG for vertebral fracture risk specifically is, however, less studied."

Financial support for this research came from Swedish Research Council Formas.

The news correspondents obtained a quote from the research from the University of Gothenburg, "Elderly men (aged (>=) 65 years) from Sweden and Hong Kong participating in the Osteoporotic Fractures in Men (MrOS) study had baseline estradiol and testosterone analyzed by gas chromatography-mass spectrometry (GC-MS) and SHBG by immunoradiometric assay (IRMA). Incident clinical vertebral fractures (n=242 cases) were evaluated in 4324 men during an average follow-up of 9.1 years. In a subsample of these men (n=2256), spine X-rays were obtained at baseline and after an average follow-up of 4.3 years to identify incident radiographic vertebral fractures (n=157 cases). The likelihood of incident clinical and radiographic vertebral fractures was estimated by Cox proportional hazards models and logistic regression models, respectively. Neither serum estradiol (hazard ratio [HR] per SD increase=0.93, 95% confidence interval [CI] 0.80-1.08) nor testosterone (1.05, 0.91-1.21) predicted incident clinical vertebral fractures in age-adjusted models in the combined data set. High serum SHBG, however, associated with increased clinical vertebral fracture risk (1.24, 1.12-1.37). This association remained significant after further adjustment for FRAX with or
without bone mineral density (BMD). SHBG also associated with increased incident radiographic vertebral fracture risk (combined data set; odds ratio [OR] per SD increase=1.23, 95% CI 1.05-1.44). This association remained significant after adjustment for FRAX with or without BMD."

According to the news reporters, the research concluded: "High SHBG predicts incident clinical and radiographic vertebral fractures in elderly men and adds moderate information beyond FRAX with BMD for vertebral fracture risk prediction."

Our news journalists report that additional information may be obtained by contacting L. Vandenput, Centre for Bone and Arthritis Research, Dept. of Internal Medicine and Clinical Nutrition, Institute of Medicine, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden. Additional authors for this research include D. Mellstrom, A. Kindmark, H. Johansson, M. Lorentzon, J. Leung, I. Redlund-Johnell, B.E. Rosengren, M.K. Karlsson, Y.X. Wang, T. Kwok and C. Ohlsson.

**Hormones - Estradiol Congeners**

**New Estradiol Congeners Findings from G.A. Partsinevelos and Colleagues Discussed (Addition of low-dose hCG to rFSH during ovarian stimulation for IVF/ICSI: is it beneficial?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hormones - Estradiol Congeners is now available. According to news reporting originating from Athens, Greece, by NewsRx correspondents, research stated, "The aim of the study was to assess the effect of the addition of low-dose human chorionic gonadotropin (hCG) to ovarian stimulation with recombinant follicle stimulating hormone (rFSH) on in vitro fertilization/intracytoplasmic sperm injection (IVF/ICSI) outcome. This retrospective clinical study was conducted on 141 women undergoing ICSI through a short GnRH-agonist protocol with rFSH and the addition of low-dose (100 IU/day) hCG."

Our news editors obtained a quote from the research, "The control group consisted of 124 women undergoing ovarian stimulation with a similar protocol devoid of hCG. Statistical analysis in the study population along with a subgroup analysis for age >= 35 years and >= 36 years was performed. Women in hCG group were statistically significant older and with higher basal FSH compared to control group. This can be attributed to the Centre's latent tendency to add hCG in the stimulation protocol in poor prognosis patients. Despite this fact and the fact that several ovarian stimulation parameters, such as peak estradiol levels, number of oocytes retrieved, number of mature oocytes, and fertilization rates were in favor of the control group,
the quality of transferred embryos and pregnancy rates were in favor of hCG group. Similar results were obtained in the subgroup analyses apart from peak estradiol levels, which did not differ among the study groups."

According to the news editors, the research concluded: "The addition of hCG to rFSH may be associated with better quality embryos and higher pregnancy rates, even in women of advanced reproductive age with higher basal FSH levels, which are often considered to have poorer ovarian reserve."

The news editors report that additional information may be obtained by contacting D. Loutradis, Diagnost & Therapeut Center SA, Fertil Inst, Athens, Greece. Additional authors for this research include N. Antonakopoulos, K. Kallianidis, P. Drakakis, E. Anagnostou, R. Bletsa and D. Loutradis.

Keywords for this news article include: Athens, Greece, Europe, Estradiol Congeners, Gonadal Hormones, Women's Health, Gynecology.

**Hormones - Estradiol Congeners**

**New Estradiol Congeners Findings from Zhejiang University Described**

(Chloramines in a pilot-scale water distribution system: Transformation of 17 beta-estradiol and formation of disinfection byproducts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hormones - Estradiol Congeners. According to news reporting from Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "The degradation and transformation products of 17 beta-estradiol (E2) by chloramines in a pilot-scale water distribution system (1A/DS) were investigated using varying conditions including multiple mass ratios of chlorine to nitrogen (Cl/N), changing concentrations of chloramines, and different pH and pipe materials. The degradation of E2 was complete in <= 9 h in both deionized water (DW) and in the WDS under studied conditions."

The news correspondents obtained a quote from the research from Zhejiang University, "When the degradation rate of E2 was compared in WDS and DW, the degradation rate was appreciably greater in the WDS than in the DW at Cl/N mass ratios of 3, 4 and 6. However, at Cl/N mass ratios of 8 and 9, degradation was faster in the DW than in the WDS. The degradation rate of E2 was greatly affected by the initial total chloramine concentration, and the degradation of E2 in DW was consistent with second-order kinetics. The degradation rate of E2 in both the DW and the WDS increased with increasing pH. The order of degradation rate of E2 in different pipes was: ductile iron loop (loop A) > polyethylene (PE) loop (loop B) > stainless steel loop (loop C). Ten specific degradation products of E2, produced by chloramination, were identified. Most of the degradation products of E2 chloramination were stable for more than 10 h. The degradation pathways of E2 in the WDS are proposed and briefly discussed."
According to the news reporters, the research concluded: "The concentrations of trihalomethanes (THMs), haloacetic acids (HAAs), and halogenated nitromethane (HNMs) during the degradation E2 in WDS were also determined."

Our news journalists report that additional information may be obtained by contacting C. Li, Zhejiang University, Coll Civil Engn & Architecture, Hangzhou 310027, Zhejiang, People's Republic of China. Additional authors for this research include C. Li, F.L. Dong, T.Q. Zhang, L. Chen, L. Cizmas and V.K. Sharma.

Drugs and Therapies - Ethnopharmacology

New Ethnopharmacology Findings Reported from University of Nairobi
[Freeze dried extracts of Bidens biternata (Lour.) Men. and Sheriff. show significant anti diarrheal activity in in-vivo models of diarrhea]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Ethnopharmacology. According to news originating from Nairobi, Kenya, by NewsRx correspondents, research stated, "Ethnopharmacological relevance of the study: Diarrhea remains one of the main killers of children aged below five years. Traditional antidiarrheal remedies form a potentially viable source of novel low cost efficacious treatments in low resource settings."

Our news journalists obtained a quote from the research from the University of Nairobi, "There is therefore a pressing need to scientifically evaluate these remedies. Aim of the study: This study aimed to investigate the in vivo and in vitro antidiarrheal activity of freeze dried Bidens biternata, a herb used in traditional Ayurvedic medicine in the management of diarrhea. In the castor oil test, twenty (20) adult Sprague-Dawley rats were randomized to a negative control (normal saline, n=5), a positive control (5 mg/kg loperamide, n=5), and two test groups. The low dose test group received 200 mg/kg Bidens biternata extract (n=5) while the high dose test group received 400 mg/kg B. biternata extract (n=5). Castor oil (4 ml/kg) was then administered to the animals one hour after administration of the respective treatments after which the total mass of fecal output excreted after four (4) hours was determined. In the charcoal meal test fifteen (15) Sprague Dawley rats were randomized to a control group (normal saline 5 ml/kg orally, n=5), a positive control group (atropine sulfate 0.1 mg/kg i.p., n=5) and a test group (400 mg/kg B. biternata extract, n=5). Charcoal meal was then administered via oral gavage to each rat thirty (30) minutes after the administration of the various treatments. The distance covered by the charcoal meal from the pylorus was then determined after sacrifice of the animals thirty minutes after the meal. In the enteropooling test twenty (20) Sprague-Dawley
rats were randomized to a control group (5% v/v ethanol in normal saline, n=5), a positive control group (5 mg/kg loperamide, n=5) and a test group (400 mg/kg B. biternata extract, n=5). For each group prostaglandin E2 (PGE2) (100 µg/kg) was administered immediately after the treatments. The animals were then sacrificed half an hour later and the volume of the small intestine contents determined. The effects of different concentrations of B. biternata extract (0.5, 1.0, 2.0, 3.0 and 5.0 mg/ml) on jejunal contraction were investigated and a dose-response curve constructed using the experimental data after which The ED50 dose was determined. The effect of tamsulosin (alpha 1 adrenergic blocker), yohimbine (alpha 2 adrenergic blocker), propranolol (beta adrenergic blocker) and naloxone (mu opioid blocker) on the contractile activity of the extract were also investigated. The experimental data were expressed as mean +/- standard error of mean (SEM) and then analyzed using one-way ANOVA followed by Tukey's post hoc test in cases of significance (set at p< 0.05). The freeze dried extracts of B. biternata had significant antidiarrheal effects in the castor oil induced diarrhea model (p < 0.01) with the highest activity being observed at the 400 mg/kg dosage level (1.66 +/- 0.81 g vs. 4.54 +/- 0.51 g control, p= 0.01). B. biternata extract had significant effects on intestinal motility in the charcoal meal test compared to the control group (43.61 +/- 4.42% vs. 60.54 +/- 3.33%; p< 0.05). B. biternata extract had a significant effect on PGE2 induced enteropooling (3.06 +/- 0.07 ml vs. 4.74 +/- 0.10 ml; p< 0.001). The freeze dried extracts of B. biternata had a significant negative effect on the contractility of the isolated rabbit jejunum (p < 0.001). The effects of the extract were significantly attenuated by tamsulosin (53.94 +/- 4.20% vs. 80.57 +/- 4.09%; p< 0.01) and naloxone (53.94 +/- 4.20% vs. 73.89 +/- 7.26%; p< 0.05). Yohimbine (p > 0.05) and propranolol (p > 0.05) however did not have any significant effect on the contractile activity of the extract. The freeze dried extract of B. biternata possess significant antidiarrheal activity in both in vitro and in vivo models which appears to be mediated by modulating both the intestinal motility as well as the secretory activity."

According to the news editors, the research concluded: "The results of this study also validate its traditional use as an antidiarrheal remedy."

**Drugs and Therapies - Ethnopharmacology**

**New Ethnopharmacology Findings from University of Kragujevac Discussed [In vitro and in vivo assessment of meadowsweet (Filipendula ulmaria) as anti-inflammatory agent]**
Ethnopharmacological relevance: Meadowsweet (Filipendula ulmaria (L.) Maxim, Rosaceae) has been traditionally used in most European countries for the treatment of inflammatory diseases due to its antipyretic, analgesic, astringent, and anti-rheumatic properties. However, there is little scientific evidence on F. ulmaria anti-inflammatory effects regarding its impact on cyclooxygenases enzymatic activity and in vivo assessment of anti-inflammatory potential.

Funders for this research include Ministry of Education, Science and Technological Development of the Republic of Serbia, World University Service.

Our news editors obtained a quote from the research from the University of Kragujevac, "This study aims to reveal the anti-inflammatory activity of methanolic extracts from the aerial parts (FUA) and roots (FUR) of F. ulmaria, both in in vitro and in vivo conditions. The characteristic phenolic compounds in F. ulmaria extracts were monitored via high performance thin layer chromatography (HPTLC). The in vitro anti-inflammatory activity of F. ulmaria extracts was evaluated using cyclooxygenase-1 (COX-1) and cyclooxygenase-2 (COX-2) enzyme assays, and an assay for determining COX-2 gene expression. The in vivo anti-inflammatory effect of F. ulmaria extracts was determined in two doses (100 and 200 mg/kg b.w.) with hot plate test and carrageenan-induced paw edema test in rats. Inflammation was also evaluated by histopathological and immunohistochemical analysis. FUA extract showed the presence of rutoside, spiraeoside, and isoquercitrin. Both F. ulmaria extracts at a concentration of 50 μg/mL were able to inhibit COX-1 and -2 enzyme activities, whereby FUA extract (62.84% and 46.43% inhibition, respectively) was double as effective as the root extract (32.11% and 20.20%, respectively). Extracts hardly inhibited the level of COX-2 gene expression in THP-1 cells at a concentration of 25 μg/mL (10.19% inhibition by FUA and 8.54% by FUR). In the hot plate test, both extracts in two doses (100 and 200 mg/kg b.w.), exhibited an increase in latency time when compared with the control group (p < 0.05). In the carrageenan-induced acute inflammation test, FUA at doses of 100 and 200 mg/kg b.w., and FUR at 200 mg/kg, were able to significantly reduce the mean maximal swelling of rat paw until 6 h of treatment. Indomethacin, FUA, and FUR extracts significantly decreased inflammation score and this effect was more pronounced after 24 h, compared to the control group (p < 0.05). The observed results of in vitro and, for the first time, in vivo anti-inflammatory activity of meadowsweet extracts, provide support of the traditional use of this plant in the treatment of different inflammatory conditions."

According to the news editors, the research concluded: "Further investigation of the anti-inflammatory compounds could reveal the mechanism of anti-inflammatory action of these extracts."

The news editors report that additional information may be obtained by contacting J. Katanic, University of Kragujevac, Fac Sci, Dept. of Chem, Kragujevac 34000, Serbia. Drugs and Therapies - Ethnopharmacology

New Ethnopharmacology Study Findings Recently Were Reported by Researchers at University of Technology (Phytochemical and ethnomedicinal study of Huperzia species used in the traditional medicine of Saraguros in Southern Ecuador; AChE and MAO ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Ethnopharmacology are discussed in a new report. According to news reporting from Loja, Ecuador, by NewsRx journalists, research stated, "Ethnobotanical and ethnomedicinal relevance: This study concerns seven Huperzia species (Lycopodiaceae), namely H. brevifolia, H. columnaris, H. compacta, H. crassa, H. espinosana, H. tetragona, H. weberbaueri, which are considered sacred plants by the Saraguro community, living in the Southern Andes of Ecuador; these plants are widely used in traditional medicine and ritual ceremonies. The plants were selected on the basis of written interviews with 10 visionary healers (yachak) (2 women, 8 men), indicated as the most credible by the Saraguro Healers Council."

Funders for this research include SENESCYT, Universidad Tecnica Particular de Loja, University of Pavia, CISTRE, Republica del Ecuador.

The news correspondents obtained a quote from the research from the University of Technology, "The Informant Consensus Factor (Fie) was determined. The first phytochemical study of the plants was performed by standard procedures, while the AChE and MAO-A inhibition by fractions enriched in high MW alkaloids, was measured in vitro. Aims of the study: i) to investigate the uses of some Huperzia plants in healing and magical-religious practices of Saraguros; ii) to identify the main components of plant hydromethanolic extracts; iii) to test the effects of alkaloidal fractions on the activity of two enzymes linked to mental health. All the interviewed Saraguro yachak showed a high consensus about the uses of the seven Huperzia plants as purgatives and against supernatural diseases, such as the 'espanto' (startle). In admixtures with other plants, some species also induce a state of trance or hallucinations in participants in magical-religious rituals. GC MS of the volatile alkaloid fractions allowed the identification of some Ýcodyine-type and lycopodine-type alkaloids (1-5) in H. compacta, H. columnaris, and H. tetragona. The flavones selgin) (6) and tricin (7) were isolated from H. brevifolia and H. espinosana. Tricin (7) was also detected in the other five species. The rare serratene triterpenes serratenediol (8) serratenediol-3-O-acetate (9), 21-episerratenediol (10), and 21-episerratenediol-3-O-acetate (11) were isolated from H. crassa. In addition, the presence of an unprecedented group of high molecular weight alkaloids has been determined. Alkaloid fractions of H. brevifolia, H. compacta, H. espinosana, and H. tetragona significantly inhibited AChE and MAO-A activities in vitro. The first phytochemical and
ethnopharmacological study of seven Huperzia plants, widely used by Saraguro healers, led to
the identification of several alkaloids and triterpenoids with different remarkable biological
activities. In addition, alkaloid fractions exhibited a significant AChE and MAO-A inhibitory
activity. These results may support the use of these plants in brews prepared for inducing
psychoactive effects in participants in magical-religious ceremonies."

According to the news reporters, the research concluded: "This study confirms the
rich traditional medical knowledge of Saraguro healers which must be documented and
preserved for future generations."

For more information on this research see: Phytochemical and ethnomedicinal study
of Huperzia species used in the traditional medicine of Saraguros in Southern Ecuador; AChE

Evolution

New Evolution Findings from Alfred-Wegener Institute for Polar and
Marine Research Reported (Transgenerational effects persist down the
maternal line in marine sticklebacks: gene expression matches
physiology in a warming ocean)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Researchers detail new data in Evolution. According to news originating
from List Auf Sylt, Germany, by NewsRx correspondents, research stated, "Transgenerational
effects can buffer populations against environmental change, yet little is known about
underlying mechanisms, their persistence or the influence of environmental cue timing. We
investigated mitochondrial respiratory capacity (MRC) and gene expression of marine
sticklebacks that experienced acute or developmental acclimation to simulated ocean warming
(21 degrees C) across three generations."

Funders for this research include California Department of Fish and Game,
Bundesministerium fur Bildung und Forschung, Schweizerischer Nationalfonds zur Forderung
der Wissenschaftlichen Forschung, PACES Research Programme, Alfred-Wegener-Institute
Helmholtz-Zentrum fur Polar- und Meeresforschung, European Nucleotide Archive.

Our news journalists obtained a quote from the research from Alfred-Wegener
Institute for Polar and Marine Research, "Previous work showed that acute acclimation of
grandmothers to 21 degrees C led to lower (optimized) offspring MRCs. Here, developmental acclimation of mothers to 21 degrees C led to higher, but more efficient offspring MRCs. Offspring with a 21 degrees C x 17 degrees C grandmother-mother environment mismatch showed metabolic compensation: their MRCs were as low as offspring with a 17 degrees C thermal history across generations. Transcriptional analyses showed primarily maternal but also grandmaternal environment effects: genes involved in metabolism and mitochondrial protein biosynthesis were differentially expressed when mothers developed at 21 degrees C, whereas 21 degrees C grandmothers influenced genes involved in hemostasis and apoptosis. Genes involved in mitochondrial respiration all showed higher expression when mothers developed at 21 degrees and lower expression in the 21 degrees C x 17 degrees C group, matching the phenotypic pattern for MRCs."

According to the news editors, the research concluded: "Our study links transcriptomics to physiology under climate change, and demonstrates that mechanisms underlying transgenerational effects persist across multiple generations with specific outcomes depending on acclimation type and environmental mismatch between generations."

The news correspondents report that additional information may be obtained from L.N.S. Shama, Alfred Wegener Inst Helmholtz Zentrum Polar & Mee, Wadden Sea Stn Sylt, Coastal Ecol Sect, List Auf Sylt, Germany. Additional authors for this research include F.C. Mark, A. Strobel, A. Lokmer, U. John and K.M. Wegner.

Autoinflammatory Diseases and Conditions - Familial...

New Familial Mediterranean Fever Data Have Been Reported by Investigators at Istanbul University (Approach to the patients with inadequate response to colchicine in familial Mediterranean fever)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Autoinflammatory Diseases and Conditions - Familial Mediterranean Fever. According to news reporting out of Istanbul, Turkey, by NewsRx editors, the research stated, "Familial Mediterranean fever (FMF) is the most common form of monogenic autoinflammatory conditions, and response to colchicine has been considered as one of its distinctive features among other hereditary periodic fever disorders. Prophylactic colchicine has been shown to be effective in the prevention of inflammatory attacks and development of amyloidosis."
Our news journalists obtained a quote from the research from Istanbul University, "However, the highest tolerable doses of colchicine may not be adequate enough to manage these goals in approximately 5% of FMF patients. Inadequate response to colchicine in fully compliant FMF patients may be associated with genetic and/or environmental factors affecting disease severity and colchicine bioavailability. Clarification of the molecular pathogenic mechanisms of FMF has revealed that interleukin-1 beta (IL-1 beta) cytokine is the most likely target to attack, and several case reports and case series have already documented the efficacy and safety of available anti-IL-1 agents, such as analdnra, rilonacept, and canakinumab in those patients inadequately responding to colchicine."

According to the news editors, the research concluded: "Characterization and early identification of those FMF patients with uncontrolled inflammatory activity have become more important after the availability of new treatment options for the prevention of disease-associated complications and permanent damages."

Our news journalists report that additional information may be obtained by contacting A. Gul, Istanbul University, Istanbul Fac Med, Dept. of Internal Med, Div Rheumatol, TR-34093 Istanbul, Turkey.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.berh.2016.09.001. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Fatty Liver

New Fatty Liver Data Have Been Reported by Researchers at Samsung Medical Center (Non-alcoholic fatty liver diseases and risk of colorectal neoplasia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Fatty Liver are presented in a new report. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "Non-alcoholic fatty liver disease (NAFLD) is associated with colorectal neoplasia. Yet, NAFLD ranges from simple steatosis to steatohepatitis with advanced fibrosis."

The news reporters obtained a quote from the research from Samsung Medical Center, "To investigate the risk of colorectal neoplasia according to the presence and severity of NAFLD. A total of 26 540 asymptomatic adults who underwent same day first-time colonoscopy and abdominal ultrasonography as a health check-up programme were analysed. NAFLD was diagnosed by ultrasonography. Advanced colorectal neoplasia was defined as an
invasive cancer or adenoma that was at least 10 mm in diameter, had high-grade dysplasia, or had villous histological characteristics or any combination thereof. NAFLD patients had a higher prevalence of any colorectal neoplasia (38.0% vs. 28.9%) and advanced colorectal neoplasia (2.8% vs. 1.9%) compared to those without NAFLD. In a multivariable model adjusted for age, sex, smoking, alcohol, body mass index, first-degree family history of colorectal cancer, aspirin use and metabolic factors, the odd ratios comparing patients with NAFLD to those without were 1.10 [95% confidence interval (CI): 1.03-1.17] for any colorectal neoplasia and 1.21 (95% CI: 0.99-1.47) for advanced colorectal neoplasia. When NAFLD patients were further stratified according to the non-invasive parameters of liver disease severity, the risk of any colorectal neoplasia or advanced colorectal neoplasia was higher for those with severe liver diseases than those with mild liver diseases."

According to the news reporters, the research concluded: "The presence and severity of NAFLD were closely associated with any colorectal neoplasia and advanced colorectal neoplasia, suggesting that clinicians should be aware of the increased risk of colorectal neoplasia in patients with NAFLD."

For more information on this research see: Non-alcoholic fatty liver diseases and risk of colorectal neoplasia. *Alimentary Pharmacology & Therapeutics*, 2017;45(2):345-353. *Alimentary Pharmacology & Therapeutics* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Liver Diseases and Conditions - Fatty Liver

**New Fatty Liver Findings from Medical University Reported (Nuclear Receptor Modulation for the Treatment of Nonalcoholic Fatty Liver Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Fatty Liver is now available. According to news reporting out of Vienna, Austria, by NewsRx editors, research stated, "Nuclear receptors (NRs) are ligand-activated transcriptional regulators of several key metabolic processes including hepatic lipid and glucose metabolism, bile acid homeostasis, and energy expenditure as well as inflammation, fibrosis, and cellular proliferation in the liver. Dysregulation of these processes contributes to the pathogenesis and progression of nonalcoholic fatty liver disease (NAFLD)."
Our news journalists obtained a quote from the research from Medical University, "This places NRs at the forefront of novel therapeutic approaches for NAFLD. Some NRs are already pharmacologically targeted in metabolic disorders such as hyperlipidemia (peroxisomal proliferator-activated receptor a [PPARa], fibrates) and diabetes (PPARg, glitazones) with potential applications for NAFLD. Other NRs with potential therapeutic implications are the vitamin D receptor (VDR) and xenobiotic sensors such as constitutive androstane receptor (CAR) and pregnane X receptor (PXR). Further new perspectives include combined ligands for NR isoforms such as PPARa/d ligands. Other novel key players represent the nuclear bile acid receptor farnesoid X receptor (FXR; targeted by synthetic FXR ligands such as obeticholic acid) and RAR-related orphan receptor gamma two (RORgt)."

According to the news editors, the research concluded: "In this review the authors provide an overview of the preclinical and clinical evidence of current and future treatment strategies targeting NRs in metabolism, inflammation, and fibrogenesis of NAFLD."

For more information on this research see: Nuclear Receptor Modulation for the Treatment of Nonalcoholic Fatty Liver Disease. Seminars In Liver Disease, 2016;36(1):69-86. (Thieme - www.thieme.com)

Our news journalists report that additional information may be obtained by contacting C.D. Fuchs, Hans Popper Laboratory of Molecular Hepatology, Division of Gastroenterology and Hepatology, Dept. of Internal Medicine III, Medical University of Vienna, Vienna, Austria. Additional authors for this research include S.A. Trauernigg and M. Trauner.

Liver Diseases and Conditions - Fatty Liver

New Fatty Liver Findings from University of Toledo Discussed
[Biliverdin Reductase A Attenuates Hepatic Steatosis by Inhibition of Glycogen Synthase Kinase (GSK) 3 beta Phosphorylation of Serine 73 of Peroxisome Proliferator-activated Receptor ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Fatty Liver have been published. According to news reporting out of Toledo, Ohio, by NewsRx editors, research stated, "Non-alcoholic fatty liver disease is the most rapidly growing form of liver disease and if left untreated can result in non-alcoholic steatohepatitis, ultimately resulting in liver cirrhosis and failure. Biliverdin reductase A (BVRA) is a multifunctioning protein primarily responsible for the reduction of biliverdin to bilirubin."

Our news journalists obtained a quote from the research from the University of Toledo, "Also, BVRA functions as a kinase and transcription factor, regulating several cellular functions. We report here that liver BVRA protects against hepatic steatosis by inhibiting glycogen synthase kinase 3 beta (GSK3 beta) by enhancing serine 9 phosphorylation, which
inhibits its activity. We show that GSK3 beta phosphorylates serine 73 (Ser(P)(73)) of the peroxisome proliferator-activated receptor alpha (PPAR alpha), which in turn increased ubiquitination and protein turnover, as well as decreased activity. Interestingly, liver-specific BVRA KO mice had increased GSK3 beta activity and Ser(P)(73) of PPAR alpha, which resulted in decreased PPAR alpha protein and activity. Furthermore, the liver-specific BVRA KO mice exhibited increased plasma glucose and insulin levels and decreased glycogen storage, which may be due to the manifestation of hepatic steatosis observed in the mice.

According to the news editors, the research concluded: "These findings reveal a novel BVRA-GSK beta-PPAR alpha axis that regulates hepatic lipid metabolism and may provide unique targets for the treatment of non-alcoholic fatty liver disease."

Our news journalists report that additional information may be obtained by contacting T.D. Hinds, University of Toledo, Coll Med & Life Sci, Dept. of Physiol & Pharmacol, Center Hypertens & Personalized Med, Toledo, OH 43614, United States. Additional authors for this research include K.A. Burns, P.A. Hosick, L. McBeth, A. Nestor-Kalinoski, H.A. Drummond, A.A. AlAmodi, M.W. Hankins, J.P.V. Heuvel and D.E. Stec.

Liver Diseases and Conditions - Fatty Liver

**New Fatty Liver Study Findings Recently Were Reported by Researchers at University of Malaya (Phosphatidylethanolamine N-methyltransferase gene rs7946 polymorphism plays a role in risk of nonalcoholic fatty liver disease: evidence from ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Liver Diseases and Conditions - Fatty Liver are discussed in a new report. According to news reporting from Kuala Lumpur, Malaysia, by NewsRx journalists, research stated, "Phosphatidylethanolamine N-methyltransferase (PEMT) governs the secretion of hepatic triglycerides in the form of very low-density lipoprotein and has been implicated in nonalcoholic fatty liver disease (NAFLD). Studies on the role of the PEMT
rs7946 polymorphism as a genetic modifier of NAFLD have reported inconsistent results."

The news correspondents obtained a quote from the research from the University of Malaya, "This meta-analysis was carried out to evaluate and summarize the association of PEMT rs7946 with susceptibility to NAFLD. A comprehensive literature search in Scopus, PubMed, Embase, Science Direct and Google Scholar was performed up to 31 August 2015, followed by data extraction and examination of summary estimates. Six independent studies with a total of 792 NAFLD cases and 2722 controls fulfilled the inclusion criteria. Pooled results indicated that the rs7946 A-allele was associated significantly with an increased risk of NAFLD [odds ratio (OR) 1.55, 95% confidence interval (CI) 1.14-2.11, p=0.005]. A significant association was also found in alternative genetic models of inheritance: dominant, recessive and homozygote (OR 1.62, 95% CI 1.10-2.39, p=0.01; OR 1.42, 95% CI 1.12-1.81, p=0.003; and OR 1.64, 95% CI 1.18-2.29, p=0.004, respectively). Subgroup analysis by ethnicity indicated a significant association only in the East-Asians in the additive (OR=2.08, 95% CI 1.12-3.86, p=0.02), recessive (OR=2.94, 95% CI 1.60-5.37, p=0.0005) and homozygote (OR=1.86, 95% CI 1.15-3.01, p=0.01) models."

According to the news reporters, the research concluded: "This study provides evidence of a significant association between the PEMT rs7946 A-allele and a risk of NAFLD, with the effect being more prominent in East-Asians, but not in non-Asians."

For more information on this research see: Phosphatidylethanolamine N-methyltransferase gene rs7946 polymorphism plays a role in risk of nonalcoholic fatty liver disease: evidence from meta-analysis. Pharmacogenetics and Genomics, 2016;26(2):88-95. (Lippincott Williams and Wilkins - www.lww.com; Pharmacogenetics and Genomics - journals.lww.com/jpharmacogenetics/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting H.L. Tan, aThe Pharmacogenomics Laboratory, Dept. of Pharmacology, Faculty of Medicine, University of Malaya bDept. of Medicine, Faculty of Medicine, University of Malaya, Kuala Lumpur, Malaysia. Additional authors for this research include R. Mohamed, Z. Mohamed and S.M Zain.

Fertilization in Vitro

New Fertilization in Vitro Study Findings Have Been Reported by Investigators at Kagoshima University (Developmental ability of embryos produced from oocytes with fragile oolemma by intracytoplasmic sperm injection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Fertilization in Vitro. According to
news reporting originating from Kagoshima, Japan, by NewsRx correspondents, research stated, "In intracytoplasmic sperm injection (ICSI) of oocytes with a fragile oolemma (fragile oocytes), breakage can occur at injection. In this study, we produced embryos from oocytes with a fragile and normal oolemma (normal oocytes) by ICSI and compared their ability to be fertilized and develop in vitro."

Our news editors obtained a quote from the research from Kagoshima University, "We also investigated whether fragile oocyte-derived embryos could implant after blastocyst transfer to determine whether fragile oocytes should be used for assisted reproductive technology treatment. Oocytes were divided into three groups-normal oocytes from cycles containing no fragile oocytes (group A), normal oocytes from cycles containing at least one fragile oocyte (group B), and fragile oocytes (group C), and their fertilization abilities after ICSI and the developmental abilities of resultant embryos were compared. The fertilization rate in group C (65.3 %) was significantly (P < 0.01) lower than those in groups A (84.6 %) and B (86.9 %), and the degeneration rate in group C (24.2 %) was significantly (P < 0.01) higher than those in groups A (0.71 %) and B (0.28 %). However, there were no significant differences in the blastocyst formation rates (59.7-67.5 %) of embryos among the different groups. In addition, the pregnancy rate after transfer of blastocysts in group C (50.0 %) was not significantly different from those in groups A (35.6 %) and B (45.8 %)."

According to the news editors, the research concluded: "The fertilization ability after ICSI of fragile oocytes is lower than that of normal oocytes but the resultant embryos have the same developmental ability as those of normal oocyte-derived embryos."

The news editors report that additional information may be obtained by contacting Y. Mizobe, Kagoshima University, United Grad Sch Agr Sci, Kagoshima 8900065, Japan. Additional authors for this research include N. Oya, R. Iwakiri, N. Yoshida, Y. Sato, N. Onoue, K. Miyoshi, M. Tokunaga and Y. Ezono.

& Wellness Week -- Investigators discuss new findings in Fibrous Dysplasia. According to news reporting out of Lyon, France, by NewsRx editors, research stated, "Fibrous dysplasia of bone (FD) is a rare genetic but sporadic bone disease that can be responsible for bone pain, fracture, and bone deformity. The prognosis may be difficult to establish because of the wide spectrum of disease severity."

Our news journalists obtained a quote from the research from Edouard Herriot Hospital, "We have analyzed the data from the French National Reference center for FD. We have established a database from standardized medical records. We have made descriptive statistics of the various forms of FD and examined the prognostic factors by multivariable logistic regression analysis, with a parsimonious stepwise method. The primary outcome was a clinically relevant composite index combining bone pain (visual analogic scale >3) and/or incident fracture. In our modern cohort of 372 patients, the median age at diagnosis was 23 years. The revealing symptom (at a median age of 18 years) was bone pain in 44% of patients and a fracture in 9%, but the diagnosis was fortuitous in 25% of cases. Monostotic forms represented 58% of patients and polyostotic forms 42%. The femur was the most commonly affected bone (44% of patients), followed by the skull (38%). Twelve percent of patients had McCune-Albright syndrome (MAS). With a median duration of follow-up of 7 years among 211 patients, we observed an incidence of fracture of 17% and 51% of patients had no bone pain at the end of follow-up (with or without bisphosphonate therapy). In univariate analysis, younger age at diagnosis, renal phosphate wasting, a polyostotic form, prevalent fracture, and bisphosphonate use were significant predictors. In the multivariate model, the polyostotic form and bisphosphonate use remained significant predictors."

According to the news editors, the research concluded: "In a national referral center for FD, one patient on follow-up out of six had incident fracture. A polyostotic form was the main risk factor of a poorer outcome."

Our news journalists report that additional information may be obtained by contacting J. Benhamou, Hospital Edouard Herriot, Dept. of Rheumatol, Lyon, France. Additional authors for this research include D. Gensburger, C. Messiaen and R. Chapurlat.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Genetics - Medical Genetics. According to news reporting originating in Chicago, Illinois, by NewsRx journalists, research stated, "The Center for Jewish Genetics provides genetic education and carrier screening to individuals of Jewish descent. Carrier screening has traditionally been performed by targeted mutation analysis for founder mutations with an enzyme assay for Tay-Sachs carrier detection."

The news reporters obtained a quote from the research, "The development of next-generation sequencing (NGS) allows for higher detection rates regardless of ethnicity. Here, we explore differences in carrier detection rates between genotyping and NGS in a primarily Jewish population. Peripheral blood samples or saliva samples were obtained from 506 individuals. All samples were analyzed by sequencing; targeted genotyping, triplet-repeat detection, and copy-number analysis; the analyses were carried out at Counsyl. Of 506 individuals screened, 288 were identified as carriers of at least 1 condition and 8 couples were carriers for the same disorder. A total of 434 pathogenic variants were identified. Three hundred twelve variants would have been detected via genotyping alone. Although no additional mutations were detected by NGS in diseases routinely screened for in the Ashkenazi Jewish population, 26.5% of carrier results and 2 carrier couples would have been missed without NGS in the larger panel."

According to the news reporters, the research concluded: "In a primarily Jewish population, NGS reveals a larger number of pathogenic variants and provides individuals with valuable information for family planning."

For more information on this research see: Carrier screening in the era of expanding genetic technology. Genetics in Medicine, 2016;18(12):1214-1217. **Drugs and Therapies - Transdermal Delivery**

**New Findings Reported from A. Shah and Co-Authors Describe Advances in Transdermal Delivery (Support vector regression to estimate the permeability enhancement of potential transdermal enhancers)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Transdermal Delivery is the subject of a report. According to news originating from Montreal, Canada, by NewsRx correspondents, research stated, "Searching for chemicals that will safely enhance transdermal
drug delivery is a significant challenge. This study applies support vector regression (SVR) for the first time to estimating the optimal formulation design of transdermal hydrocortisone formulations.

Our news journalists obtained a quote from the research, "The aim of this study was to apply SVR methods with two different kernels in order to estimate the enhancement ratio of chemical enhancers of permeability. A statistically significant regression SVR model was developed. It was found that SVR with a nonlinear kernel provided the best estimate of the enhancement ratio for a chemical enhancer. Support vector regression is a viable method to develop predictive models of biological processes, demonstrating improvements over other methods."

According to the news editors, the research concluded: "In addition, the results of this study suggest that a global approach to modelling a biological process may not necessarily be the best method and that a 'mixed-methods' approach may be best in optimising predictive models."

For more information on this research see: Support vector regression to estimate the permeability enhancement of potential transdermal enhancers. The Journal of Pharmacy and Pharmacology, 2016;68(2):170-84.

The news correspondents report that additional information may be obtained from A. Shah, Dept. of Software Engineering and IT, Ecole de Technologie Superieure, Montreal, QC, Canada. Additional authors for this research include Y. Sun, R.G. Adams, N. Davey, S.C. Wilkinson and G.P Moss.

Drugs and Therapies - Cancer Therapy

New Findings Reported from Al Quds University Describe Advances in Cancer Therapy (Anticancer Activity, Antioxidant Activity, and Phenolic and Flavonoids Content of Wild Tragopogon porrifolius Plant Extracts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Cancer Therapy is now available. According to news reporting originating in Jerusalem, Israel, by NewsRx journalists, research stated, "Tragopogon porrifolius, commonly referred to as white salsify, is an edible herb used in folk medicine to treat cancer. Samples of Tragopogon porrifolius plant grown wild in Palestine were extracted with different solvents: water, 80% ethanol, and 100% ethanol."

The news reporters obtained a quote from the research from Al Quds University, "The extracts were analyzed for their total phenolic content (TPC), total flavonoid content (TFC), and antioxidant activity (AA). Four different antioxidant assays were used to evaluate AA of the extracts: two measures the reducing power of the extracts (ferric reducing antioxidant power (FRAP) and cupric reducing antioxidant power (CUPRAC)), while two other assays
measure the scavenging ability of the extracts (2,2-azino-di-(3-ethylbenzothialozine-sulphonic acid (ABTS)) and 2,2-diphenyl-1-pircylhydrazyl (DPPH)). Anticancer activity of the plant extracts were also tested on HOS and KHOS osteosarcoma cell lines. The results revealed that the polarity of the extraction solvent affects the TPC, TFC, and AA. It was found that both TPC and AA are highest for plant extracted with 80% ethanol, followed by water, and finally with 100% ethanol. TFC however was the highest in the following order: 80% ethanol > 100% ethanol > water.

According to the news reporters, the research concluded: "The plant extracts showed anticancer activities against KHOS cancer cell lines; they reduced total cell count and induced cell death in a drastic manner."

For more information on this research see: Anticancer Activity, Antioxidant Activity, and Phenolic and Flavonoids Content of Wild Tragopogon porrifolius Plant Extracts. Evidence-Based Complementary and Alternative Medicine, 2016;():1-7. Eye Diseases and Conditions - Miosis

New Findings Reported from AstraZeneca Describe Advances in Miosis (The effect of quinidine, a strong P-glycoprotein inhibitor, on the pharmacokinetics and central nervous system distribution of naloxegol)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Eye Diseases and Conditions - Miosis. According to news originating from Waltham, Massachusetts, by NewsRx correspondents, research stated, "Naloxegol is a PEGylated, oral, peripherally acting m-opioid receptor antagonist approved in the United States for treatment of opioid-induced constipation in patients with noncancer pain. Naloxegol is metabolized by CYP3A, and its properties as a substrate for the P-glycoprotein (PGP) transporter limit its central nervous system (CNS) permeability."

Financial support for this research came from AstraZeneca Pharmaceuticals LP.

Our news journalists obtained a quote from the research from AstraZeneca, "This double-blind, randomized, 2-part, crossover study in healthy volunteers evaluated the effect of
quinidine (600 mg PO), a CYP3A/PGP transporter inhibitor, on the pharmacokinetics and CNS distribution of naloxegol (25 mg PO). In addition, the effects of quinidine on morphine (5 mg/70 kg IV)-induced miosis and exposure to naloxegol were assessed. Coadministration of quinidine and naloxegol increased naloxegol's AUC 1.4-fold and Cmax 2.5-fold but did not antagonize morphine-induced miosis, suggesting that PGP inhibition does not increase the CNS penetration of naloxegol. Naloxegol pharmacokinetics was unaltered by coadministration of morphine and either quinidine or placebo; conversely, pharmacokinetics of morphine and its metabolites (in the presence of quinidine) were unaltered by coadministration of naloxegol. Naloxegol was safe and well tolerated, alone or in combination with quinidine, morphine, or both."

According to the news editors, the research concluded: "The observed increase in exposure to naloxegol in the presence of quinidine is primarily attributed to quinidine's properties as a weak CYP3A inhibitor."

For more information on this research see: The effect of quinidine, a strong P-glycoprotein inhibitor, on the pharmacokinetics and central nervous system distribution of naloxegol. Journal of Clinical Pharmacology, 2015;56(4):497-505. Journal of Clinical Pharmacology can be contacted at: SAGE Publications, USA, 2455 Teller Road, Thousand Oaks, CA 91320, USA. (Sage Publications - www.sagepub.com/; Journal of Clinical Pharmacology - jcp.sagepub.com)

Oncology - Gastric Cancer

New Findings Reported from Azienda Ospedaliera University Describe Advances in Gastric Cancer (Third-Line Chemotherapy with irinotecan plus 5-Fluorouracil in Caucasian Metastatic Gastric Cancer Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Gastric Cancer are discussed in a new report. According to news reporting out of Pisa, Italy, by NewsRx editors, research stated, "The aim of this study was to evaluate the activity of the combination of 5-fluorouracil/folinic acid and irinotecan (FOLFIRI) as third-line chemotherapy (CT) in metastatic gastric cancer (mGC) patients pretreated with platinum derivatives, fluoropyrimidines, and taxanes. We prospectively collected data of mGC patients treated with third-line FOLFIRI at our institution from 2009 to 2014."
Our news journalists obtained a quote from the research from Azienda Ospedaliera University. "Eligible patients should be treated with a fluoropyrimidine-platinum first-line CT and a subsequent taxane-based second-line CT. FOLFIRI consisted of irinotecan 180 mg/m2 and leucovorin 200 mg/m2, followed by 5-fluorouracil 2,800 mg/m2 (administered as 48-hour i.v. continuous infusion from day 1 to 3), with cycles repeated every 2 weeks. Response rate (RR) was evaluated according to RECIST version 1.0, while progression-free (PFS) and overall survival (OS) were estimated using the Kaplan Meier method. A total of 33 patients were included. The majority (97%) had good performance status (0-1 according to ECOG), while median PFS after first-line and second-line CT was 5.2 and 4.4 months, respectively. Two patients experienced an objective response (RR: 6%), while 14 patients achieved disease stabilization (disease control rate: 42%). Median PFS and OS from the start of third-line CT were 3.3 and 7.5 months, respectively. Hematological and nonhematological grade 3-4 toxicities were uncommon and included neutropenia (6.1%), diarrhea (9.1%), vomiting (3%), and asthenia (3%). Febrile neutropenia was not reported. Third-line CT with FOLFIRI may be an option in heavily pretreated mGC patients with preserved performance status and organ function."

According to the news editors, the research concluded: "This regimen has a favorable safety profile, and signs of activity have been observed after standard first- and second-line CT."

For more information on this research see: Third-Line Chemotherapy with irinotecan plus 5-Fluorouracil in Caucasian Metastatic Gastric Cancer Patients. Oncology, 2016;91(6):311-316. Oncology can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. (Karger - www.karger.com/; Oncology - content.karger.com/ProdukteDB/produkte.asp?Aktion=JournalHome&ProduktNr=223857)

Our news journalists report that additional information may be obtained by contacting E. Vasile, Azienda Ospedaliera Universitaria Pisana, Polo Oncol, IT-56126 Pisa, Italy. Oncology - Lung Cancer

New Findings Reported from B.J. Page and Co-Authors Describe Advances in Lung Cancer (A survey of lung cancer in rural and remote Aboriginal and Torres Strait Islander communities in Queensland: health views that impact on early diagnosis and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting out of Brisbane, Australia, by NewsRx editors, research stated, "Lung cancer incidence, mortality and hospitalisation rates are higher for Indigenous Australians compared with non-Indigenous Australians and increase again when living in more remote areas. If Indigenous Australians are made more aware of lung cancer through better access to
health services and programmes, lung cancer outcomes might improve."

Our news journalists obtained a quote from the research, "We aimed to survey the level of lung cancer awareness in rural and remote Aboriginal and Torres Strait Islander communities and discover perceived barriers to timely diagnosis and treatment of lung cancer. Interviews were conducted in three discrete outer regional and remote Aboriginal communities and one urban setting in Queensland. Participants included Aboriginal and Torres Strait Islander peoples from three target population groups: patients referred for medical treatment with symptoms suspicious of lung cancer or confirmed lung cancer; Indigenous health workers; community members aged 18 years and over. Participants gave written, informed consent. Of 51 community members and 14 Indigenous health workers, 32 reflected they knew very little about lung cancer, 60 cited smoking as the cause of lung cancer and 54 recognised warning symptoms as a prompt to seek healthcare. Indigenous health workers were not able to describe a healthcare pathway that would apply to a patient with suspected lung cancer. The two main barriers identified as impacting on quality healthcare were communication and follow-up processes."

According to the news editors, the research concluded: "These could be addressed by service improvement activities."

Our news journalists report that additional information may be obtained by contacting B.J. Page, Central Integrated Regional Cancer Service, Queensland Health, Brisbane, Queensland, Australia. Additional authors for this research include R.V. Bowman, I.A. Yang and K.M Fong.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/imj.12948. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Brisbane, Oncology, Lung Cancer, Lung Neoplasms, Australia and New Zealand.

**New Findings Reported from Beckman Research Institute Describe Advances in Diabetic Nephropathy (Inhibition of the processing of miR-25 by HIPK2-Phosphorylated-MeCP2 induces NOX4 in early diabetic nephropathy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Diabetic Nephropathy is now available. According to news reporting originating from Duarte, California, by NewsRx correspondents, research stated, "Phosphorylated methyl-CpG binding protein2 (p-MeCP2) suppresses the processing of several microRNAs (miRNAs). Homeodomain interacting protein kinase2 (HIPK2) phosphorylates MeCP2, a known transcriptional repressor."
Our news editors obtained a quote from the research from Beckman Research Institute, "However, it is not known if MeCP2 and HIPK2 are involved in processing of miRNAs implicated in diabetic nephropathy. p-MeCP2 and HIPK2 levels were significantly increased, but Seven in Absentia Homolog1 (SIAH1), which mediates proteasomal degradation of HIPK2, was decreased in the glomeruli of streptozotocin injected diabetic mice. Among several miRNAs, miR-25 and its precursor were significantly decreased in diabetic mice, whereas primary miR-25 levels were significantly increased. NADPH oxidase4 (NOX4), a target of miR-25, was significantly increased in diabetic mice. Protein levels of p-MeCP2, HIPK2, and NOX4 were increased in high glucose (HG)- or TGF-beta-treated mouse glomerular mesangial cells (MMCs). miR-25 (primary, precursor, and mature) and mRNA levels of genes indicated in the in vivo study showed similar trends of regulation in MMCs treated with HG or TGF-beta. The HG- or TGF-beta-induced upregulation of p-MeCP2, NOX4 and primary miR-25, but downregulation of precursor and mature miR-25, were attenuated by Hipk2 siRNA."

According to the news editors, the research concluded: "These results demonstrate a novel role for the SIAH1/HIPK2/MeCP2 axis in suppressing miR-25 processing and thereby upregulating NOX4 in early diabetic nephropathy."

For more information on this research see: Inhibition of the processing of miR-25 by HIPK2-Phosphorylated-MeCP2 induces NOX4 in early diabetic nephropathy. Scientific Reports, 2016;6():1-14. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Liver Diseases and Conditions - Hepatitis E Virus

New Findings Reported from Blood Center Describe Advances in Hepatitis E Virus (Hepatitis E virus infection in the Irish blood donor population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Hepatitis E Virus. According to news originating from Dublin, Ireland, by NewsRx correspondents, research stated, "Hepatitis E virus (HEV) Genotype 3 (G3) infection is a zoonosis that may be transmitted during the acute phase by transfusion. The aim of this study was to determine the incidence of HEV and seroprevalence among Irish blood donors."

Our news journalists obtained a quote from the research from Blood Center, "Anonymized samples from 1076 donations collected in 2012 were tested for HEV immunoglobulin (Ig)G using the Wantai enzyme-linked immunosorbent assay. A total of 24,985"
anonymized donations collected between December 2013 and June 2014 were individually tested for HEV RNA using the Procleix HEV assay; reactive donations were confirmed by an in-house real-time polymerase chain reaction (PCR) test. Seroprevalence for anti-IgG was 5.3% (95% confidence interval [CI], 4.0%-6.8%), ranging from 1.1% in the 18- to 29-years age group to 33.3% in males over 60 years. HEV RNA screening of 24,985 samples yielded five PCR-confirmed donations (1: 4997, 0.02%; 95% CI, 0.0065%-0.0467%), only one of which was serologically reactive (HEV IgM reactive only). Viral loads ranged from 10 to 44,550 IU/mL. Genotype analysis on three samples identified HEV G3 virus. Four of the five viremic donations were from donors in the 18-to 29-years age group (p = 0.01). Seroprevalence for anti-HEV IgG was low compared to some European countries, but 1 in 5000 donations was viremic. Viremia was predominantly in younger Irish donors.

According to the news editors, the research concluded: "After Department of Health approval the Irish Blood Transfusion Service implemented individual blood donation HEV RNA screening initially for a 3-year period from January 2016."

The news correspondents report that additional information may be obtained from J. O'Riordan, Natl Blood Center, Irish Blood Transfus Serv, Dublin 8, Ireland. Additional authors for this research include F. Boland, P. Williams, J. Donnellan, B.M. Hogema, S. Ijaz and W.G. Murphy.

For more information on this news article include: Dublin, Ireland, Europe, Viral RNA, Diagnostics and Screening, Epidemiology, Digestive System Diseases and Conditions, Infectious Disease and Conditions, Liver Diseases and Conditions, Hepatitis E Virus, Hepatitis Viruses, Gastroenterology, RNA Viruses, Hepatology, Hepevirus, Genetics, Virology, HEV, Blood Center.

**Oncology - Liver Cancer**

**New Findings Reported from Chinese Academy of Medical Sciences Describe Advances in Liver Cancer (A novel anti-cancer agent Icaritin suppresses hepatocellular carcinoma initiation and malignant growth through the IL-6/Jak2/Stat3 pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Tumor-initiating cell (TIC) is a subpopulation of cells in tumors that are responsible for tumor initiation and progression. Recent studies indicate that hepatocellular carcinoma-initiating cells (HCICs) confer the high malignancy, recurrence and multi-drug resistance in hepatocellular carcinoma (HCC)."

The news correspondents obtained a quote from the research from the Chinese Academy of Medical Sciences, "In this study, we found that Icaritin, a prenylflavonoid derivative from Epimedium Genus, inhibited malignant growth of HCICs. Icaritin decreased the
proportion of EpCAM-positive (a HCICs marker) cells, suppressed tumorsphere formation in vitro and tumor formation in vivo. We also found that Icaritin reduced expression of Interleukin-6 Receptors (IL-6Rs), attenuated both constitutive and IL-6-induced phosphorylation of Janus-activated kinases 2 (Jak2) and Signal transducer and activator of transcription 3 (Stat3), and inhibited Stat3 downstream genes, such as Bmi-1 and Oct4."

According to the news reporters, the research concluded: "The inhibitory activity of Icaritin in HCICs was augmented by siRNA-mediated silencing of Stat3 but attenuated by constitutive activation of Stat3. Taken together, our results indicate that Icaritin is able to inhibit malignant growth of HCICs and suggest that Icaritin may be developed into a novel therapeutic agent for effective treatment of HCC."

For more information on this research see: A novel anti-cancer agent Icaritin suppresses hepatocellular carcinoma initiation and malignant growth through the IL-6/Jak2/Stat3 pathway. Oncotarget, 2015;6(31):31927-43.

Our news journalists report that additional information may be obtained by contacting H. Zhao, Dept. of Abdominal Surgical Oncology, Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing, People's Republic of China. Science

New Findings Reported from Chinese Academy of Sciences Describe Advances in Science (Antiproliferative activities of Amaryllidaceae alkaloids from Lycoris radiata targeting DNA topoisomerase I)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news reporting originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "Crude Amaryllidaceae alkaloids (AAs) extracted from Lycoris radiata are reported to exhibit significant anti-cancer activity. However, the specific alkaloids responsible for the pharmacodynamic activity and their targets still remain elusive."

Our news editors obtained a quote from the research from the Chinese Academy of Sciences, "In this context, we strived to combine affinity ultrafiltration with topoisomerase I (Top I) as a target enzyme aiming to fish out specific bioactive AAs from Lycoris radiata. 11 AAs from Lycoris radiata were thus screened out, among which hippeastrine (peak 5) with the highest Enrichment factor (EF) against Top I exhibited good dose-dependent inhibition with IC50 at 7.25 +/- 0.20 mu g/mL comparable to camptothecin (positive control) at 6.72 +/- 0.23 mu g/mL. The molecular docking simulation further indicated the inhibitory mechanism between Top I and hippeastrine. The in vitro antiproliferation assays finally revealed that
hippeastrine strongly inhibited the proliferation of HT-29 and Hep G2 cells in an intuitive dose-dependent manner with the IC50 values at 3.98 +/- 0.29 μg/mL and 11.85 +/- 0.20 μg/mL, respectively, and also induced significant cellular morphological changes, which further validated our screening method and the potent antineoplastic effects."

According to the news editors, the research concluded: "Collectively, these results suggested that hippeastrine could be a very promising anticancer candidate for the therapy of cancer in the near future."

For more information on this research see: Antiproliferative activities of Amaryllidaceae alkaloids from Lycoris radiata targeting DNA topoisomerase I. Scientific Reports, 2016;6():1-10. New Findings Reported from Chongqing Medical University Describe Advances in Liver Cancer (The prognostic value of a classification system for centrally located liver tumors in the setting of hepatocellular carcinoma after mesohepatectomy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Liver Cancer is the subject of a report. According to news reporting originating in Chongqing, People's Republic of China, by NewsRx journalists, research stated, "A classification system of centrally located liver tumors (CLLTs) was proposed by our group in 2013, which divided CLLTs into four subtypes by focusing on the involvement of resected segments and the anatomical location of lesions relative to the principal hepatic vascular structures. The current study aimed to analyze the clinical characteristics and compare the surgical outcomes of the different CLLTs classification system for patients with hepatocellular carcinoma (HCC) underwent mesohepatectomy (MH)."

The news reporters obtained a quote from the research from Chongqing Medical University, "Moreover, we sought to validate the prognostic value of the new classification system. Data from 353 consecutive patients with centrally located HCC who were treated with MH between 2005 and 2013 were prospectively collected and retrospectively reviewed. The 1-, 3-, and 5-y overall recurrence rates were 21.4%, 41.3%, and 55.6%, respectively. The 1-, 3-, and 5-y overall (OS) and corresponding recurrence-free survival rates (RFS) were 82.5%, 61.6%, 40.2%, and 68.8%, 42.5%, 30.7%, respectively. According the CLLTs classification system, 106 patients were classified as type I, 68 as type II, 94 as type III and 85 as type IV. There were no significant differences in RFS rate among the CLLTs groups, however, a significant decrease in OS rates was observed in the type IV classification, respectively. Multivariate analysis reveal
that patients with microvascular invasion, portal vein thrombosis, the largest tumor size $\geq 5$ cm, tumor number $\geq 3$, liver cirrhosis, hepatic inflow occlusion $\geq 60$ min, intraoperative blood loss $\geq 1500$ ml, pTNM staging and CLLTs classification of Type IV to be independent adverse factors for long-term survivals. The classification system of CLLTs is meant to help clinicians in defining the extent of resection, providing a risk assessment and predicting prognosis."

According to the news reporters, the research concluded: "However, it is need to be validated in more HCC patients and medical centers."

Our news correspondents report that additional information may be obtained by contacting J.G. Qiu, Chongqing Med Univ, Affiliated Hosp 1, Dept. of Hepatobiliary Surg, Chongqing 400016, People's Republic of China. Additional authors for this research include S.T. Chen, H. Wu and C.Y. Du.

**Oncology - Colon Cancer**

**New Findings Reported from Christchurch Hospital Describe Advances in Colon Cancer (Follow-up strategies for patients treated for non-metastatic colorectal cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news originating from Christchurch, New Zealand, by NewsRx correspondents, research stated, "It is common clinical practice to follow patients with colorectal cancer (CRC) for several years following their curative surgery or adjuvant therapy, or both. Despite this widespread practice, there is considerable controversy about how often patients should be seen, what tests should be performed, and whether these varying strategies have any significant impact on patient outcomes."

Our news journalists obtained a quote from the research from Christchurch Hospital, "This is the second update of a Cochrane Review first published in 2002 and first updated in 2007. To assess the effects of intensive follow-up for patients with non-metastatic colorectal cancer treated with curative intent. Search methods For this update, we searched CENTRAL (2016, Issue 3), MEDLINE (1950 to May 20th, 2016), Embase (1974 to May 20th, 2016), CINAHL (1981 to May 20th, 2016), and Science Citation Index (1900 to May 20th, 2016). We also searched reference lists of articles, and handsearched the Proceedings of the American Society for Radiation Oncology (2011 to 2014). In addition, we searched the following trials
registries (May 20th, 2016): ClinicalTrials.gov and the World Health Organization International Clinical Trials Registry Platform. We further contacted study authors. No language or publication restrictions were applied to the search strategies. Selection criteria We included only randomised controlled trials comparing different follow-up strategies for participants with non-metastatic CRC treated with curative intent. Data collection and analysis Two authors independently determined trial eligibility, performed data extraction, and assessed methodological quality. We studied 5403 participants enrolled in 15 studies. (We included two new studies in this second update.) Although the studies varied in setting (general practitioner (GP)-led, nurse-led, or surgeon-led) and 'intensity' of follow-up, there was very little inconsistency in the results. Overall survival: we found no evidence of a statistical effect with intensive follow-up (hazard ratio (HR) 0.90, 95% confidence interval (CI) 0.78 to 1.02; I-2 = 4%; P = 0.41; high-quality evidence). There were 1098 deaths among 4786 participants enrolled in 12 studies. Colorectal cancer-specific survival: this did not differ with intensive follow-up (HR 0.93, 95% CI 0.78 to 1.12; I-2 = 0%; P = 0.45; moderate-quality evidence). There were 432 colorectal cancer deaths among 3769 participants enrolled in seven studies. Relapse-free survival: we found no statistical evidence of effect with intensive follow-up (HR 1.03, 95% CI 0.90 to 1.18; I-2 = 5%; P = 0.39; moderate-quality evidence). There were 1416 relapses among 5253 participants enrolled in 14 studies. Salvage surgery with curative intent: this was more frequent with intensive follow-up (risk ratio (RR) 1.98, 95% CI 1.53 to 2.56; I-2 = 31%; P = 0.14; high-quality evidence). There were 457 episodes of salvage surgery in 5157 participants enrolled in 13 studies. Interval (symptomatic) recurrences: these were less frequent with intensive follow-up (RR 0.59, 95% CI 0.41 to 0.86; I-2 = 66%; P = 0.007; moderate-quality evidence). Three hundred and seventy-six interval recurrences were reported in 3933 participants enrolled in seven studies. Intensive follow-up did not appear to affect quality of life, anxiety, nor depression (reported in three studies). Harms from colonoscopies did not differ with intensive follow-up (RR 2.08, 95% CI 0.11 to 40.17; moderate-quality evidence). In two studies, there were seven colonoscopic complications in 2112 colonoscopies. Authors' conclusions The results of our review suggest that there is no overall survival benefit for intensifying the follow-up of patients after curative surgery for colorectal cancer. Although more participants were treated with salvage surgery with curative intent in the intensive follow-up group, this was not associated with improved survival.

According to the news editors, the research concluded: "Harms related to intensive follow-up and salvage therapy were not well reported."

For more information on this research see: Follow-up strategies for patients treated for non-metastatic colorectal cancer. Cochrane Database of Systematic Reviews, 2016; (11):384-480. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Heart Disorders and Diseases - Heart Attack

New Findings Reported from Cleveland Clinic Describe Advances in Heart Attack (Therapeutic hypothermia after cardiac arrest: A systematic review/meta-analysis exploring the impact of expanded criteria and targeted temperature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Attack are presented in a new report. According to news reporting originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Aims of the study: We aimed to determine the benefit of an expanded use of TH. We also described the impact of a targeted temperature management on outcomes at discharge."

Our news editors obtained a quote from the research from Cleveland Clinic, "We identified studies by searching MEDLINE, EMBASE and Cochrane Library databases. We included RCTs and observational studies restricted to those reporting achieved temperature during TH after OHCA. No other patient, cardiac arrest or hypothermia protocol restrictions were applied. Outcomes of interest were hospital mortality and neurological outcome at discharge. Appropriate risk of bias assessment for meta-analyzed studies was conducted. Studies contrasting hypothermia and normothermia outcomes were meta-analyzed using a random-effect model. Outcomes of cooling arms, obtained from enrolled studies, were pooled and compared across achieved temperatures. Search strategy yielded 32,275 citations of which 24 articles met inclusion criteria. Eleven studies were meta-analyzed. The use of TH after OHCA, even within an expanded use, decreased the mortality (OR 0.51, 95% CI [0.41-0.64]) and improved the odds of good neurological outcome (OR 2.48, 95% CI [1.91-3.22]). No statistical heterogeneity was found for either mortality (I-2 = 4.0%) or neurological outcome (I-2 = 0.0%). No differences in hospital mortality (p = 0.86) or neurological outcomes at discharge (p = 0.32) were found when pooled outcomes of 34 hypothermia arms grouped by cooling temperature were compared. The use of TH after OHCA is associated with a survival and neuroprotective benefit, even when including patients with non-shockable rhythms, more lenient downtimes, unwitnessed arrest and/or persistent shock."

According to the news editors, the research concluded: "We found no evidence to support one specific temperature over another during hypothermia."

For more information on this research see: Therapeutic hypothermia after cardiac arrest: A systematic review/meta-analysis exploring the impact of expanded criteria and targeted temperature. Heart Disorders and Diseases - Heart Disease

New Findings Reported from Copenhagen University Hospital Describe Advances in Heart Disease (Short Telomere Length and Ischemic Heart Disease: Observational and Genetic Studies in 290 022 Individuals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Disease. According to news reporting out of Copenhagen, Denmark, by NewsRx editors, research stated, "Short telomeres are associated with aging and have been associated with a high risk of ischemic heart disease in observational studies; however, the latter association could be due to residual confounding and/or reverse causation. We wanted to test the hypothesis that short telomeres are associated with high risk of ischemic heart disease using a Mendelian randomization approach free of reverse causation and of most confounding."

Our news journalists obtained a quote from the research from Copenhagen University Hospital, "We genotyped 3 genetic variants in OBFC1 (oligonucleotide/oligosaccharide binding fold containing 1), TERT (telomerase reverse transcriptase), and TERC (telomerase RNA component), which code for proteins and RNA involved in telomere maintenance. We studied 105 055 individuals from Copenhagen; 17 235 of these individuals were diagnosed with ischemic heart disease between 1977 and 2013, and 66 618 had telomere length measured. For genetic studies, we further included the Coronary Artery Disease Genome wide Replication and Meta-analysis (CARDIoGRAM) consortium dataset, which included up to 184 967 participants and 60 837 cases of ischemic heart disease. We conducted multivariable adjusted Cox proportional hazard models for observational estimates, using logistic and instrumental variable analysis for genetic estimates. Observationally, a 200-bp-shorter telomere length was associated with a multivariable adjusted hazard ratio for ischemic heart disease of 1.02 (95% CI, 1.01-1.03). Per allele, telomeres were shorter by 67 bp (73-60). In meta-analyses of all 4 studies combined, odds ratios for ischemic heart disease were 1.05 (1.03-1.08) for OBFC1, 1.04 (1.02-1.06) for TERT, and 1.01 (0.99 - 1.03) for TERC. A genetically determined 200-bp-shorter telomere length was associated with an odds ratio for ischemic heart disease of 1.10 (1.06 -1.14)."

According to the news editors, the research concluded: "Shorter telomeres were associated with a higher risk of ischemic heart disease, both observationally and genetically."

For more information on this research see: Short Telomere Length and Ischemic Heart Disease: Observational and Genetic Studies in 290 022 Individuals. Clinical Chemistry, 2016;62(8):1140-1149. Clinical Chemistry can be contacted at: Amer Assoc Clinical Chemistry, 2101 L Street NW, Suite 202, Washington, DC 20037-1526, USA.

New Findings Reported from Department of Neurochemistry Describe Advances in Alzheimer Disease (Tau and neurodegenerative disease: the story so far)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Alzheimer Disease have been published. According to news originating from Staten Island, New York, by NewsRx correspondents, research stated, "In 1975, tau protein was isolated as a microtubule-associated factor from the porcine brain. In the previous year, a paired helical filament (PHF) protein had been identified in neurofibrillary tangles in the brains of individuals with Alzheimer disease (AD), but it was not until 1986 that the PHF protein and tau were discovered to be one and the same."

Our news journalists obtained a quote from the research from the Department of Neurochemistry, "In the AD brain, tau was found to be abnormally hyperphosphorylated, and it inhibited rather than promoted in vitro microtubule assembly. Almost 80 disease-causing exonic missense and intronic silent mutations in the tau gene have been found in familial cases of frontotemporal dementia but, to date, no such mutation has been found in AD. The first phase I clinical trial of an active tau immunization vaccine in patients with AD was recently completed. Assays for tau levels in cerebrospinal fluid and plasma are now available, and tau radiotracers for PET are under development. In this article, we provide an overview of the pivotal discoveries in the tau research field over the past 40 years."

According to the news editors, the research concluded: "We also review the current status of the field, including disease mechanisms and therapeutic approaches."

The news correspondents report that additional information may be obtained from K. Iqbal, Dept. of Neurochemistry, New York State Institute for Basic Research in Developmental Disabilities, Inge Grundke-Iqbal Research Floor, 1050 Forest Hill Road, Staten Island, New York 10314, United States. Additional authors for this research include F. Liu and C.X Gong.

Oncology - Ovarian Cancer

New Findings Reported from Department of Obstetrics & Gynecology Describe Advances in Ovarian Cancer (Synergistic effect of piperine and paclitaxel on cell fate via cyt-c, Bax/Bcl-2-caspase-3 pathway in ovarian adenocarcinomas SKOV-3 cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Ovarian Cancer. According to news reporting out of Uttar Pradesh, India, by NewsRx editors, research stated, "Ovarian cancer is fourth most common and lethal among all gynecologic malignancies. The chemotherapy usually requires in all stages of ovarian cancer but drugs have several side effects."

Financial support for this research came from Council of Scientific & Industrial Research and ICMR.

Our news journalists obtained a quote from the research from the Department of Obstetrics & Gynecology, "We hypothesized that use of combination therapy of paclitaxel (PTX) and phytochemical piperine (PIP) may reduce the PTX dose as well as toxicity. The human ovarian adenocarcinomas SKOV3 cell treated with PTX-5 nM and PIP-10 mu m after determination of IC50 by MTT assay. Reactive oxygen species generation, mitochondrial membrane potential (MMP), DNA damage, cell death pathway markers as release of cyt-c, Bax/Bcl2-caspase-3 and cell cycle arrest were analyzed. The dose dependent treatment of SKOV-3 cells showed IC50 and synergism at combination of 5 nM-PTX and 10 mu m-PIP in cell viability assay. PTX and PIP increases the accumulation of reactive oxygen species which subsequently leading to increase in JC-1 and fragmented nuclei in mitotracker/DAPI staining. Comet assay showed 4.4-fold increase of tail formation in combined treated cells as compared to control. PTX-PIP arrests the cell cycle in sub-G1 phase. Immunocytochemistry of Bax showed increase in red fluorescence intensity whereas decrease in green fluorescence i.e Bax/Bcl-2 ratio increased. Moreover morphological EB/AO and Hoechst staining confirmed the enhanced apoptosis in combined treatment. Significant upregulation of apoptotic genes, cyt-c (3.4 fold) Bax (2.8 fold), caspase-3 (3.6 fold) whereas no change occurred in Bcl2 mRNA expression and protein expressions."

According to the news editors, the research concluded: "The combination of PTX with PIP produces synergistic effects in SKOV-3 cells via the modulation of pro and anti-apoptotic gene and may compensate the toxicity and side effects of PTX."

For more information on this research see: Synergistic effect of piperine and paclitaxel on cell fate via cyt-c, Bax/Bcl-2-caspase-3 pathway in ovarian adenocarcinomas SKOV-3 cells. *European Journal of Pharmacology, 2016;791():751-762. New Findings Reported from Federal University Describe Advances in Thyroid Cancer (M918V RET mutation causes familial medullary thyroid carcinoma: study of 8 affected kindreds)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Thyroid Cancer have been published. According to news reporting originating in Sao Paulo, Brazil, by NewsRx journalists, research stated, "Germline mutations in codon 918 of exon 16 of the RET gene (M918T) are classically associated with multiple endocrine neoplasia type 2B (MEN 2B) with highly aggressive medullary thyroid cancer (MTC), pheochromocytoma and a unique phenotype. The objectives of this study are to describe the rare M918V RET mutation discovered in 8 MTC kindreds from Brazil lacking the MEN 2B phenotype classically observed in M918T patients and to investigate the presence of a founder effect for this germline mutation."

The news reporters obtained a quote from the research from Federal University, "Eight apparently sporadic MTC cases were diagnosed with the germline M918V RET mutation. Subsequently, their relatives underwent clinical and genetic assessment (n = 113), and M918V was found in 42 of them. Until today, 20/50 M918V carriers underwent thyroidectomy and all presented MTC/C-cell hyperplasia; the remainder carriers are on clinical follow-up. None of the M918V carriers presented clinical features of MEN 2B. Their clinical presentation was heterogeneous, and the age at tumor diagnosis ranged from 24 to 59 years. Lymph node metastases were present in 12/20 patients, and presumable distant metastases in 2/20; in contrast, we observed a carrier of up to 87 years of age without evidence of MTC. Ethnographic fieldwork and haplotype analyses suggested that the founder mutation first settled in that area fifteen generations ago and originated from Portugal. Our study is the first to demonstrate the RET M918V mutation co-segregating in 8 familial MTC kindreds with validated evidence of a founder effect."

According to the news reporters, the research concluded: "We suggest that M918V MTC should be clinically considered an American Thyroid Association (ATA) moderate-risk category."

For more information on this research see: M918V RET mutation causes familial medullary thyroid carcinoma: study of 8 affected kindreds. Endocrine-Related Cancer, 2016;23 (12):909-920. Endocrine-Related Cancer can be contacted at: Bioscientifica Ltd, Euro House, 22 Apex Court Woodlands, Bradley Stoke, Bristol BS32 4JT, England.

DNA Research

New Findings Reported from First Affiliated Hospital Describe Advances in DNA Research (Direct ultrasensitive electrochemical biosensing of pathogenic DNA using homogeneous target-initiated transcription amplification)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in DNA Research. According to news reporting originating in Chongqing, People's Republic of China, by NewsRx journalists, research stated, "Sensitive and specific methodologies for detection of pathogenic gene at the point-of-care are still urgent demands in rapid diagnosis of infectious diseases. This work develops a simple and pragmatic electrochemical biosensing strategy for ultrasensitive and specific detection of pathogenic nucleic acids directly by integrating homogeneous target-initiated transcription amplification (HTITA) with interfacial sensing process in single analysis system."

The news reporters obtained a quote from the research from First Affiliated Hospital, "The homogeneous recognition and specific binding of target DNA with the designed hairpin probe triggered circular primer extension reaction to form DNA double-strands which contained T7 RNA polymerase promoter and served as templates for in vitro transcription amplification. The HTITA protocol resulted in numerous single-stranded RNA products which could synchronously hybridized with the detection probes and immobilized capture probes for enzyme-amplified electrochemical detection on the biosensor surface. The proposed electrochemical biosensing strategy showed very high sensitivity and selectivity for target DNA with a dynamic response range from 1 fM to 100 pM. Using salmonella as a model, the established strategy was successfully applied to directly detect invA gene from genomic DNA extract."

According to the news reporters, the research concluded: "This proposed strategy presented a simple, pragmatic platform toward ultrasensitive nucleic acids detection and would become a versatile and powerful tool for point-of-care pathogen identification."

For more information on this research see: Direct ultrasensitive electrochemical biosensing of pathogenic DNA using homogeneous target-initiated transcription amplification. Scientific Reports, 2016;6():18810. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Heart Disorders and Diseases - Atrial Fibrillation

New Findings Reported from Gangnam Severance Hospital Describe Advances in Atrial Fibrillation (The safety and efficacy of vitamin K antagonist in atrial fibrillation patients with previous ulcer bleeding Long-term results from a multicenter ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Fibrillation have been presented. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "This study aimed to evaluate the safety and efficacy of vitamin K antagonist (VKA) in atrial fibrillation (AF) patients with previous ulcer bleeding. In this multicenter, retrospective analysis, clinical outcomes of 754 AF patients with a history of ulcer bleeding were evaluated."

Our news journalists obtained a quote from the research from Gangnam Severance Hospital, "After ulcer treatment, 458 patients (61%) were treated with VKA, and the outcomes were compared to 296 patients (39%) without VKA. VKA treatment significantly increased major bleeding (7.3%/year vs 3.2%/year, P<0.001), and reduced major adverse cardiac events (MACE) (5.4%/year vs 10.0%/year, P<0.001). Specifically, risk of gastrointestinal bleeding was significantly higher in the VKA group than no-VKA group (5.7%/year vs 2.6%/year, P<0.001). Consequently, there was no difference in the incidence of composite of a MACE and major bleeding, between the 2 groups. In patients with time in the therapeutic range (TTR) >= 65%, VKA significantly decreased MACE (2.8%/year vs 10.0%/year, P<0.001) without increasing major bleeding. Net clinical benefit model showed beneficial effects of VKA in patients with TTR >= 65%, and harmful effects in those with TTR <55%.

According to the news editors, the research concluded: "In AF patients with previous ulcer bleeding, VKA treatment did not improve clinical outcomes unless the international normalized ratio level was constantly maintained (TTR >= 65%), as the gastrointestinal bleeding (GIB) risk significantly increased."

For more information on this research see: The safety and efficacy of vitamin K antagonist in atrial fibrillation patients with previous ulcer bleeding Long-term results from a multicenter study. Medicine, 2016;95(47):255-261. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Cardiology

New Findings Reported from Hiroshima University Describe Advances in Cardiology (Coronary CT angiography in patients with implanted cardiac devices: initial experience with the metal artefact reduction technique)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting originating from Hiroshima, Japan, by NewsRx correspondents, research stated, "Single-energy metal artefact reduction (SEMAR), a new technique that can now be used in routine CT examinations, has recently become applicable to volume data acquired with electrocardiography gating. We evaluated the effect of this technique on the visualization of the coronary arteries in patients harboring cardiac devices."

Our news editors obtained a quote from the research from Hiroshima University, "We subjected 8 patients (7 males, 1 female; mean age 65.5 +/- 11.3 years) with implanted cardiac devices to coronary CT angiography on a 320-slice CT scanner (Aquilion ONE Vision™; Toshiba Medical Systems Corp., Tokyo, Japan). Image data sets were reconstructed with and without SEMAR. Two radiologists visually evaluated the image quality based on metal artefacts from the electronic device leads using a four-point scale (1=vessel not visible to 4 =minimal or no metal artefacts). Images with a score of 3 or 4 were considered diagnostic. In both SEMAR and non-SEMAR data sets, 94 coronary artery segments were available for evaluation. Without SEMAR, 11 segments (11.7%) were rated as non-diagnostic; SEMAR improved the image quality of 9 of the 11 segments (81.8%), and the images became diagnostic. SEMAR reduced metal artefacts from the electronic device leads and improved the image quality of the coronary arteries in patients with cardiac devices. Advances in knowledge: SEMAR has recently become applicable to volume data acquired with electrocardiography gating."

According to the news editors, the research concluded: "SEMAR reduces metal artefacts elicited by electronic device leads and improves the image quality of the coronary arteries in patients with cardiac devices."

The news editors report that additional information may be obtained by contacting F.
New Findings Reported from Indian Institute of Technology Describe Advances in Salicylic Acid (Carbon Bead-Supported Ethylene Diamine-Functionalized Carbon Nanofibers: An Efficient Adsorbent for Salicylic Acid)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Salicylic Acid are discussed in a new report. According to news reporting out of Uttar Pradesh, India, by NewsRx editors, research stated, "The present study describes the removal of salicylic acid (SA) from water by adsorption using ethylene diamine (EDA)-functionalized carbon nanofibers (CNFs)-containing porous carbon beads (similar to 0.5 mm). Briefly, the phenolic beads, separately synthesized using suspension polymerization, were carbonized and activated."

Our news journalists obtained a quote from the research from the Indian Institute of Technology, "The CNFs were grown on the carbon beads, using chemical vapor deposition, and the prepared fibrous beads functionalized with EDA were used as an adsorbent for SA. The prepared materials were characterized by their physico-chemical properties, including specific surface area, surface morphology, and surface functional groups. The adsorption tests performed over the initial SA concentration range of 100-1500 mg/L revealed the adsorption capacity of the materials to be similar to 682 mg/g, which was considerably larger than that of the adsorbents discussed in the literature for SA. The zeta-potential analysis attributed enhanced adsorption to the electrostatic interaction and hydrogen bonding between the solute molecules and the EDA-functionalized surface of the CNFs."

According to the news editors, the research concluded: "The material and method developed in this study for the remediation of the SA-laden wastewater may be extended to other acidic pollutants present in pharmaceutical effluents."

For more information on this research see: Carbon Bead-Supported Ethylene Diamine-Functionalized Carbon Nanofibers: An Efficient Adsorbent for Salicylic Acid. Clean-Soil Air Water, 2016;44(11):37-46. Clean-Soil Air Water can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by contacting N. Verma, Indian Inst Technol Kanpur, Dept. of Chem Engn, Kanpur, Uttar Pradesh, India. Additional authors for this research include N. Verma and D. Kumar.

Musculoskeletal Diseases and Conditions - …

New Findings Reported from Indiana University School of Medicine Describe Advances in Osteopetrosis [Phenotypic severity of autosomal dominant osteopetrosis type II (ADO2) mice on different genetic backgrounds recapitulates the features of human ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Musculoskeletal Diseases and Conditions - Osteopetrosis have been presented. According to news originating from Indianapolis, Indiana, by NewsRx correspondents, research stated, "Autosomal dominant osteopetrosis type II (ADO2) is a heritable osteosclerotic bone disorder due to dysfunctional osteoclast activity. ADO2 is caused by missense mutations in the chloride channel 7 (CLCN7) gene characterized by osteosclerosis with multiple fractures."

Financial support for this research came from Valley of Indianapolis foundation.

Our news journalists obtained a quote from the research from the Indiana University School of Medicine, "ADO2 can result in osteomyelitis, visual loss and bone marrow failure. Currently, there is no cure for ADO2, and until recently no appropriate animal model of ADO2 existed to understand better the pathogenesis of this disease and to test new therapies. Therefore, we created ADO2 knock-in mouse model with a G213R (human homolog of G215R) missense mutation in the Clcn7 gene on 129S1 background, and demonstrated that this mouse model phenocopies human ADO2. As ADO2 gives rise to incomplete penetrance (66%) in human and marked phenotypic variability is observed among patients with the same mutation, we hypothesized that the severity and penetrance of ADO2 will also vary in mouse models on different genetic backgrounds. To test this, we created ADO2 mouse models in DBA/D2, C57BL/6J/B6 and Balb/c strains, and compared bone phenotypes and performed serum biochemical analysis between strain- and age-matched wild type (WT) and ADO2 mice. At 3 months of age, whole body aBMD was higher (4-7% in male; 1-5% in female) in the ADO2 mice compared to their wild-type littermates. In addition, ADO2 male mice on 129 background displayed highest percent increase of BV/TV (106%), followed by D2 (92%), B6 (46%), and Balb/c (33%) compared to strain-matched wild-type mice. We observed similar differences for BV/TV between ADO2 and wild-type mice on different genetic backgrounds in female: 129 (96%) > D2 (73%) > Balb/c (39%) and B6 (36%). Serum calcium, phosphorus, alkaline phosphatase and P1NP levels were similar in the WT and ADO2 mice on all genetic backgrounds but TRAP was higher (76% to 220% in male; 33-95% in female) and CTX/TRAP ratio was lower (39-65% in male and 3-41% in female) in the ADO2 mice compared to their strain-matched wild-type littermates. We also found that young (3 months) ADO2 mice on 129S1 background exhibited 200% higher trabecular BV/TV whereas old (18 months) ADO2 mice displayed 400-700% higher BV/TV compared to their age-matched wild-type controls. In summary, phenotypic severity in ADO2 mice varied markedly on different genetic backgrounds (129 > D2 > Balb/c > B6) and became more pronounced with age, which resembles the wide variations in phenotype observed in ADO2 patients."

According to the news editors, the research concluded: "These mouse models will help us to identify genes/factors that influence severity and penetrance of ADO2, and test
innovative therapies to treat this disease."

For more information on this research see: Phenotypic severity of autosomal dominant osteopetrosis type II (ADO2) mice on different genetic backgrounds recapitulates the features of human disease. Oncology - Colon Cancer

New Findings Reported from Institute of General Surgery Describe Advances in Colon Cancer (Arsenic trioxide inhibits lung metastasis of mouse colon cancer via reducing the infiltration of regulatory T cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "The purpose of this study was to investigate the effects of arsenic trioxide (As2O3) on the infiltration of regulatory T cells (Tregs) in the local lung metastasis of mouse colon cancer in vivo and the regulation of Tregs in cytokine-induced killer cells (CIKs) in vitro. A high Tregs infiltration mouse colon cancer lung metastasis model was established by intravenous injection of CT26 murine colon carcinoma cells."

Financial supporters for this research include Dalian Municipal Science and Technology project, Liaoning Provincial Department of Education Science Research general project, Natural Science Fund Project of the Department of Science and Technology of Liaoning Province.

The news correspondents obtained a quote from the research from the Institute of General Surgery, "Tumor-bearing mice were randomly divided into three groups: control group, low-dose As2O3 group, and high-dose As2O3 group. For in vitro studies, CIKs were treated with vehicle control or 0.1, 1, or 5 µM As2O3. The level of Tregs was detected via flow cytometry, Foxp3 expression was assessed by immunohistochemistry and reverse transcription-polymerase chain reaction (RT-PCR), the level of interferon gamma (IFN-gamma) was evaluated by enzyme-linked immunoassay (ELISA), and the cytotoxic activity of As2O3 treated CIKs was assessed through a lactate dehydrogenase (LDH) release assay. Obvious lung metastasis was observed 3 days after CT26 murine colon carcinoma cell injection. The numbers
of Tregs in the lungs and spleens of tumor-bearing mice were significantly higher than those of the normal group (p < 0.01). As2O3 treatment increased the mouse weight as well as reduced the number of metastatic lung nodules and the lung/body weight ratio (p < 0.01). Moreover, As2O3 treatment significantly reduced the Tregs proportion and the Foxp3 messenger RNA (mRNA) levels in metastatic lung tissues (p < 0.01). In vitro, As2O3 significantly reduced the Tregs proportion and the Foxp3 mRNA levels (p < 0.01) and significantly increased the cytotoxic activity of CIKs and the IFN-gamma levels in the supernatant of cultured CIKs (p < 0.01).

According to the news reporters, the research concluded: "As2O3 might inhibit lung metastasis of colon cancer by reducing the local infiltration of Tregs and increase the cytotoxic activity of CIKs by suppressing Tregs."

Our news journalists report that additional information may be obtained by contacting Y.X. Xu, Chinese Peoples Liberat Army Gen Hosp, Inst Gen Surg, Beijing 100853, People's Republic of China. Additional authors for this research include X. Hu, Y.X. Xu and Z. Liu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13277-016-5377-3. This DOI is a link to an online electronic document that is either free or for purchase.

**Central Nervous System Diseases and Conditions** -

**New Findings Reported from Institute of Oncology Describe Advances in Meningeal Neoplasms (Aberrant DNA methylation of alternative promoter of DLC1 isoform 1 in meningiomas)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System Diseases and Conditions - Meningeal Neoplasms are presented in a new report. According to news reporting originating from Warsaw, Poland, by NewsRx correspondents, research stated, "DLC1 encodes GTPase-activating protein with a well-documented tumor suppressor activity. This gene is downregulated in various tumors through aberrant promoter hypermethylation."

Financial support for this research came from Narodowe Centrum Nauki.

Our news editors obtained a quote from the research from the Institute of Oncology, "Five different DLC1 isoforms can be transcribed from alternative promoters. Tumor-related DNA methylation of the DLC1 isoform 1 alternative promoter was identified as being hypermethylated in meningiomas in genome-wide DNA methylation profiling. We determined the methylation pattern of this region in 50 meningioma FFPE samples and sections of 6 normal
meninges, with targeted bisulfite sequencing. All histopathological subtypes of meningiomas showed similar and significant increase of DNA methylation levels. High DNA methylation was associated with lack of DLC1 protein expression in meningiomas as determined by immunohistochemistry. mRNA expression levels of 5 isoforms of DLC1 transcript were measured in an additional series of meningiomas and normal meninges. The DLC1 isoform 1 was found as the most expressed in normal control tissue and was significantly downregulated in meningiomas. Transfection of KT21 meningioma cell line with shRNA targeting DLC1 isoform 1 resulted in increased activation of RHO-GTPases assessed with pull-down assay, enhanced cell migration observed in scratch assay as well as slight increase of cell metabolism determined by MTT test. Results indicate that isoform 1 represents the main pool of DLC1 protein in meninges and its downregulation in meningiomas is associated with hypermethylation of CpG dinucleotides within the corresponding promoter region."

According to the news editors, the research concluded: "This isoform is functional GAP protein and tumor suppressor and targeting of its expression results in the increase of DLC1 related cell processes: RHO activation and cell migration."

For more information on this research see: Aberrant DNA methylation of alternative promoter of DLC1 isoform 1 in meningiomas. *Journal of Neuro-Oncology*, 2016;130(3):473-484. *Journal of Neuro-Oncology* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. made to improve coverage in the last decade.

Our news editors obtained a quote from the research from International Agency for Research on Cancer, "The aim of this study is to describe geographical patterns and trends in cancer incidence and mortality in Central and South America in the 21st century. The primary objective was to obtain the best quality cancer data available from each country within the region. Cancer incidence data were obtained from population-based cancer registries within the region and, in countries where these did not exist, from hospital-based registries; national mortality data were obtained from the World Health Organization mortality database. Given the variability in data quality - mainly due to the age and development in maturity of the registries, an exhaustive review of the data was necessary in order to appropriately analyze, describe and interpret patterns of cancer incidence and mortality between countries and within cancer-specific sites."

According to the news editors, the research concluded: "This paper presents the methods employed in the collection, quality control and analysis of the datasets received for the project."

For more information on this research see: Cancer in Central and South America: Methodology. Cancer Epidemiology, 2016;44():S11-S22. Oncology - Breast Cancer

New Findings Reported from J. Taradaj and Co-Authors Describe Advances in Breast Cancer (The influence of Kinesiology Taping on the volume of lymphoedema and manual dexterity of the upper limb in women after breast cancer treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news originating from Katowice, Poland, by NewsRx correspondents, research stated, "The aim of our study was to evaluate the effect of Kinesiology Taping (KT) on the size of lymphoedema and manual dexterity of the upper limb in women after breast cancer treatment. We also examined whether the application of KT can replace the traditional and standard multilayered bandaging in the treatment of upper extremity lymphoedema."

Financial supporters for this research include Polish Society of Lymphology,
European Pressure Ulcer Advisory Panel (EPUAP).

Our news journalists obtained a quote from the research, "Group A comprised of 22 patients who underwent KT as well as pneumatic and manual lymphatic drainage. Then, group B comprised of 23 patients who were treated with quasi-KT as well as pneumatic and manual lymphatic drainage. In contrast, group C had 25 patients subjected only to the standard procedure - pneumatic and manual lymphatic drainage and multilayered bandaging. Patient evaluation items included limb size, grip strength and range of motion. After 4-week therapy, we observed that KT is not an effective method of reducing lymphoedema II and III0 in women after breast cancer treatment."

According to the news editors, the research concluded: "At this moment, the taping cannot replace the traditional and standard multilayered bandaging in the treatment of upper extremity lymphoedema."

The news correspondents report that additional information may be obtained from J. Taradaj, Academy Sch Phys Educ Katowice, Dept. of Physiotherapy Basics, PL-40065 Katowice, Poland. Additional authors for this research include T. Halski, J. Rosinczuk, R. Dymarek, A. Laurowski and A. Smykla.

**Drugs and Therapies - Pharmacoepidemiology**

**New Findings Reported from K. Kubota and Co-Authors Describe Advances in Pharmacoepidemiology (Symmetry analysis for monitoring safety of newly marketed drugs)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmacoepidemiology. According to news reporting from Tokyo, Japan, by NewsRx editors, the research stated, "A postmarketing study without a comparator group has been recognized as a problem as it provides no measure of association. Nevertheless, the design is sometimes used in company postmarketing studies particularly when the study involves the primary data collection."

The news correspondents obtained a quote from the research, "In this report, the 'Symmetry Analysis Cohort Design' without a comparator group but with a control period is proposed. In the proposed design, the rate ratio is estimated using the method of prescription sequence symmetry analysis with slight modification so that the rate ratio can be estimated using..."
data on subjects who have started the drug during the study period but no data on other subjects. The proposed design has an advantage that it can provide the measure of association. Another advantage common to all self-controlled methods is that the effect of the measured and unmeasured confounders is automatically canceled out when the effect is stable over the study period. Compared with the standard design with a comparator group, the proposed design also has weaknesses. For example, adjustment of confounding by the indication may be difficult when the indication is an acute condition. In addition, the rate ratio is not valid when the probability of the prescription of the drug is dependent on the occurrence of the outcome in the unexposed (pre-dose) period.

According to the news reporters, the research concluded: "The design may be used to evaluate the need for further studies although its real usefulness is to be determined in the future."

Our news journalists report that additional information may be obtained by contacting K. Kubota, NPO Drug Safety Research Unit, Tokyo, Japan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/pds.3886. This DOI is a link to an online electronic document that is either free or for purchase.

Immune System Diseases and Conditions - Chediak-

New Findings Reported from Kuwait University Describe Advances in Chediak-Higashi Syndrome (Oral rehabilitation of patients with Chediak-Higashi syndrome using zygoma and root form implant-supported fixed prostheses: A report of two patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - Chediak-Higashi Syndrome. According to news originating from Kuwait, Kuwait, by NewsRx correspondents, research stated, "Chediak-Higashi syndrome (CH-S) is a rare genetic immunodeficiency disorder. Fewer than 500 individuals with CH-S have been reported worldwide in the past 20 years."

Our news journalists obtained a quote from the research from Kuwait University, "The dental management of patients in whom CH-S has been diagnosed has been rarely reported and only in the form of a case report. All reports addressed the severe periodontal disease found in those patients, and most studies concluded that periodontal treatment had an unfavorable prognosis. As a result, complete edentulism at an early age because of severe periodontal disease is expected. The purpose of this report was to present 2 patients with CH-S seeking oral rehabilitation after early tooth loss and severe bone resorption as a manifestation of severe periodontal disease. The treatment used bilateral zygoma implants and an all-on-4 concept."
According to the news editors, the research concluded: "The complications encountered and management with a 5-year post-surgery follow-up are also presented."

The news correspondents report that additional information may be obtained from F. Alzoubi, Kuwait University, Dept. of Gen Dental Practice, Fac Dental, Kuwait, Kuwait. Additional authors for this research include E. Bedrossian and A. Wong.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.prosdent.2016.07.002. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Liver Cancer

New Findings Reported from Madurai Kamaraj University Describe Advances in Liver Cancer (NF kappa B activation demarcates a subset of hepatocellular carcinoma patients for targeted therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Liver Cancer have been presented. According to news reporting originating from Tamil Nadu, India, by NewsRx correspondents, research stated, "Hepatocellular carcinoma (HCC) is the fifth most common cancer and the third leading cause of cancer death worldwide. It is a heterogeneous disorder and > 80 % of the tumors develop in patients with liver cirrhosis, resulting from chronic inflammation and/or fibrosis."

Our news editors obtained a quote from the research from Madurai Kamaraj University, "Here, we set out to identify novel targets for HCC therapy and to define a subgroup of patients that might benefit most from it. Cellular pathway activation profiling of 45 transcription factors in a HCC-derived cell line (HEP3B), in vitro analysis of NF kappa B reporter activity in additional HCC-derived cell lines and pathway-focused integrative analyses of publicly available primary HCC-derived expression profiling data (GSE6764, GSE9843, E-TABM-36 and E-TABM-292) were employed to reveal a role of NF kappa B in HCC development. In order to identify potential targeting agents, a luciferase-based NF kappa B reporter screening assay was established in HEP3B cells. After screening of a drug library through this assay, a potent NF kappa B pathway inhibitor was identified and characterized using an array of additional in vitro assays. Using cellular pathway activation profiling, we found a high activation of NF kappa B-mediated signaling in HCC-derived cell lines and in
primary HCC tumors. Through NF kappa B inhibitor screening we observed a highly efficacious NF kappa B pathway inhibitory potential of ornithogalum in HCC-derived HEP3B cells. Although its active component still remains to be defined, ornithogalum has been found to inhibit endoplasmic reticulum (ER) and oxidative stress responses. ER stress, oxidative stress and NF kappa B signaling were found to be enhanced in a subset of HCCs, as well as in (precancerous) liver cirrhosis tissues. From our data we conclude that NF kappa B signaling is activated in precancerous cirrhosis tissues and in a subset of HCCs. We found that ornithogalum exhibits NF kappa B targeting and stress relieving activities. NF kappa B inhibitors, including the active component of ornithogalum, may serve as putative preventive and targeted therapeutic agents for at least a subset of HCCs in which the NF kappa B pathway is activated.

According to the news editors, the research concluded: "These latter notions require further investigation in a translational context."

For more information on this research see: NF kappa B activation demarcates a subset of hepatocellular carcinoma patients for targeted therapy. *Cellular Oncology*, 2016;39 (6):523-536. *Cellular Oncology* can be contacted at: Springer, Van Godewijkstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Cellular Oncology - www.springerlink.com/content/2211-3428/)

**Autoimmune Diseases and Conditions - Multiple...**

**New Findings Reported from McGill University Describe Advances in Multiple Sclerosis (Geographic associations between lactase phenotype, multiple sclerosis, and inflammatory bowel diseases; Does obesity trump geography?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Autoimmune Diseases and Conditions - Multiple Sclerosis. According to news reporting originating in Montreal, Canada, by NewsRx journalists, research stated, "Geographic patterns with diminishing rates from north to south toward the equator have been described for a number of diseases, putatively related largely to 'western' lifestyle. Among these the inflammatory bowel diseases; Crohn's (CD) and Ulcerative colitis (UC) have been prominent in sharing distributions with a number of autoimmune diseases."

The news reporters obtained a quote from the research from McGill University, "One of the interesting associations is the epidemiologic similarity with multiple sclerosis (MS). However, in addition, at least some of these diseases also correlated inversely with lactase non persistent population (LNP) distributions. It is hypothesized that MS should also have an inverse
relationship with LNP. We provide support for this by comparing published MS, CD, UC and LNP national rates to the beginning of the new millennium. Possible links among these diseases may be an evolutionary signature of new genes which may have accompanied emergence of lactase persistence millennia ago. The emergent phenotypic dichotomy also forced different assimilation responses to lactase digestion. While intestinal retention of lactase results in direct host enzymatic digestion, in LNP persons intestinal bacterial metabolism of lactose impacts on the host micro-flora. These microbial changes may play some role in altering rates of diseases including IBD and MS. However, since the late 20th century previously observed patterns are changing."

According to the news reporters, the research concluded: "Although industrialization is considered to play an important modifying role, the rising rates of obesity with an emphasis on diet, and microfloral pathogenesis, but with an independent geographic pattern may also facilitate altering rates and geographic distributions of both of these and other diseases."

For more information on this research see: Geographic associations between lactase phenotype, multiple sclerosis, and inflammatory bowel diseases; Does obesity trump geography? Medical Hypotheses, 2016;96():68-72. Lung Diseases and Conditions - Chronic Obstructive...

New Findings Reported from National Heart and Lung Institute Describe Advances in Chronic Obstructive Pulmonary Disease (The MIF Antagonist ISO-1 Attenuates Corticosteroid-Insensitive Inflammation and Airways Hyperresponsiveness in an ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Macrophage migration inhibitory factor..."
(MIF) is an inflammatory cytokine associated with acute and chronic inflammatory disorders and corticosteroid insensitivity. Its expression in the airways of patients with chronic obstructive pulmonary disease (COPD), a relatively steroid insensitive inflammatory disease is unclear, however.

The news correspondents obtained a quote from the research from National Heart and Lung Institute, "Sputum, bronchoalveolar lavage (BAL) macrophages and serum were obtained from non-smokers, smokers and COPD patients. To mimic oxidative stress-induced COPD, mice were exposed to ozone for six-weeks and treated with ISO-1, a MIF inhibitor, and/or dexamethasone before each exposure. BAL fluid and lung tissue were collected after the final exposure. Airway hyperresponsiveness (AHR) and lung function were measured using whole body plethysmography. HIF-1a binding to the Mif promoter was determined by Chromatin Immunoprecipitation assays. MIF levels in sputum and BAL macrophages from COPD patients were higher than those from non-smokers, with healthy smokers having intermediate levels. MIF expression correlated with that of HIF-1a in all patients groups and in ozone-exposed mice. BAL cell counts, cytokine mRNA and protein expression in lungs and BAL, including MIF, were elevated in ozone-exposed mice and had increased AHR. Dexamethasone had no effect on these parameters in the mouse but ISO-1 attenuated cell recruitment, cytokine release and AHR. MIF and HIF-1a levels are elevated in COPD BAL macrophages and inhibition of MIF function blocks corticosteroid-insensitive lung inflammation and AHR."

According to the news reporters, the research concluded: "Inhibition of MIF may provide a novel anti-inflammatory approach in COPD."

For more information on this research see: The MIF Antagonist ISO-1 Attenuates Corticosteroid-Insensitive Inflammation and Airways Hyperresponsiveness in an Ozone-Induced Model of COPD. *Plos One*, 2016;11(1):e0146102. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Kidney Diseases and Conditions - Chronic Kidney...

New Findings Reported from O. Akchurin and Co-Authors Describe Advances in Chronic Kidney Disease (Lack of hepcidin ameliorates anemia and improves growth in an adenine-induced mouse model of chronic kidney disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Kidney Diseases and Conditions - Chronic Kidney Disease. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Growth delay is common in children with chronic kidney disease (CKD), often associated with poor quality of life. The role of anemia in uremic growth delay is poorly understood."

Our news journalists obtained a quote from the research, "Here we describe an induction of uremic growth retardation by a 0.2% adenine diet in wild-type (WT) and hepcidin gene (Hamp) knockout (KO) mice, compared with their respective littermates fed a regular diet. Experiments were started at weaning (3 wk). After 8 wk, blood was collected and mice were euthanized. Adenine-fed WT mice developed CKD (blood urea nitrogen 82.8 +/- 11.6 mg/dl and creatinine 0.57 +/- 0.07 mg/dl) and were 2.1 cm shorter compared with WT controls. WT adenine-fed mice were anemic and had low serum iron, elevated Hamp, and elevated IL6 and TNF-alpha. WT adenine-fed mice had advanced mineral bone disease (serum phosphorus 16.9 +/- 3.1 mg/dl and FGF23 204.0 +/- 115.0 ng/ml) with loss of cortical and trabecular bone volume seen on microcomputed tomography. Hamp disruption rescued the anemia phenotype resulting in improved growth rate in mice with CKD, thus providing direct experimental evidence of the relationship between Hamp pathway and growth impairment in CKD. Hamp disruption ameliorated CKD-induced growth hormone-insulin-like growth factor 1 axis derangements and growth plate alterations. Disruption of Hamp did not mitigate the development of uremia, inflammation, and mineral and bone disease in this model. Taken together, these results indicate that an adenine diet can be successfully used to study growth in mice with CKD."

According to the news editors, the research concluded: "Hepcidin appears to be related to pathways of growth retardation in CKD suggesting that investigation of hepcidin-lowering therapies in juvenile CKD is warranted."

The news correspondents report that additional information may be obtained from O. Akchurin, Weill Cornell Med, New York, NY, United States. Additional authors for this research include A. Sureshbabu, S.B. Doty, Y.S. Zhu, E. Patino, S. Cunningham-Rundles, M.E. Choi, A. Boskey and S. Rivella.

Mycobacterium Infections - Tuberculosis

New Findings Reported from Oswaldo Cruz Foundation Describe Advances in Tuberculosis (Occult hepatitis B virus infection: clinical implications in tuberculosis treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news reporting originating from Rio de Janeiro, Brazil, by NewsRx correspondents, research stated, "Occult hepatitis B virus infection (OBI) is characterized by the absence of HBsAg and persistence of the virus genome (HBV-DNA) in liver tissue and/or blood. OBI has been reported in several clinical contexts."

Financial support for this research came from Fundacao Carlos Chagas Filho de Amparo a Pesquisa do Estado do Rio de Janeiro.

Our news editors obtained a quote from the research from Oswaldo Cruz Foundation, "However, the clinical significance of OBI in tuberculosis (TB) treatment is unknown. We investigated the OBI prevalence and its impact on the risk of drug-induced liver injury (DILI) during TB treatment. This was a prospective cohort study with one hundred patients who were treated for TB from 2008 to 2015. Laboratory, clinical and demographic data of TB patients were extracted from medical records. Based on HBV-DNA testing of serum samples, an OBI prevalence of 12% was established: almost half of these patients had both anti-HBc and anti-HBs serological markers. Low CD4(+) cell counts have been shown to be a risk factor for OBI among TB patients co-infected with HIV (P=.036). High DILI incidence was observed in this study. A multivariable Cox proportional hazard model was conducted and identified OBI (HR 2.98, 95% CI 1.30-6.86) as the strongest predictor for DILI when adjusted to CD4(+) cell count (HR 0.38, 95% CI 0.17-0.90), ALT before TB treatment (HR 1.37, 95% CI 0.81-2.32) and TB extrapulmonary clinical form (HR 2.91, 95% CI 1.75-7.21). The main aim of this study was to highlight DILI as a clinical outcome during treatment of TB patients with OBI."

According to the news editors, the research concluded: "Therefore, HBV-DNA testing should be considered routinely in monitoring DILI, and also in other clinical implications associated with OBI, reduce morbidity and mortality."

The news editors report that additional information may be obtained by contacting L. de Castro, Oswaldo Cruz Fdn FIOCRUZ, Pharmacogenet Res Lab, Evandro Chagas Nat Inst Infect Dis, Rio De Janeiro, Brazil. Additional authors for this research include P. do Brasil, M.J.M. Costa and L. de Castro.

Ebola Virus

New Findings Reported from Public Health Agency of Canada Describe Advances in Ebola Virus (Laboratory Response to 2014 Ebola Virus Outbreak in Mali)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Ebola Virus. According to news reporting out of Winnipeg, Canada, by NewsRx editors, research stated, "Aware of the rapid spread of Ebola virus (EBOV) during the current West African epidemic, Mali took several proactive steps to rapidly identify cases within its borders. Under the Mali International Center for Excellence in Research program, a collaboration between the National Institute of Allergy and Infectious Diseases and the Malian Ministry of Higher Education and Scientific Research established a national EBOV diagnostic site at the University of Sciences, Techniques and Technologies of Bamako in the SEREFO Laboratory."

Financial supporters for this research include National Institute of Allergy and Infectious Diseases [NIAID], National Institutes of Health, NIH, NIAID, Intramural Research Program of the NIAID, Mali International Center of Excellence in Research Program.

Our news journalists obtained a quote from the research from the Public Health Agency of Canada, "Two separate introductions of EBOV occurred in Mali from neighboring Guinea, but both chains of transmission were quickly halted, and Mali was declared 'Ebola free' on 18 January 2015 and has remained so since. The SEREFO Laboratory was instrumental in the success of Mali's Ebola response by providing timely and accurate diagnostics. As of today, the SEREFO Laboratory has tested 103 samples from 88 suspected cases, 10 of which were EBOV positive, since the Ebola diagnostics unit started in April 2014."

According to the news editors, the research concluded: "The establishment of Ebola diagnostics in the SEREFO Laboratory, safety precautions, and diagnostics are described."

The direct object identifier (DOI) for that additional information is:
New Findings Reported from Pusan National University Hospital Describe Advances in Breast Cancer (Tumor Heterogeneity Assessed by 18F-FDG PET/CT Is Not Significantly Associated with Nodal Metastasis in Breast Cancer Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news originating from Busan, South Korea, by NewsRx correspondents, research stated, "The purpose of this study was to evaluate the association of tumor heterogeneity as assessed by positron emission tomography/computed tomography (PET/CT) with pathological factors of breast cancer, and the prediction of nodal metastasis through tumor heterogeneity. From January 2013 to December 2013, 102 patients with invasive ductal carcinoma of the breast were enrolled into this study."

Our news journalists obtained a quote from the research from Pusan National University Hospital, "[18F]Fluorodeoxyglucose PET/CT was performed before surgery. The metabolic tumor volume (MTV) of each lesion was calculated and a series of standardized uptake value (SUV) thresholds (e.g. 40%, 50%, 60%, 70%, and 80% of SUVmax) was obtained. A threshold-volume (dV/dT) curve was acquired by plotting thresholds to MTV values automatically calculated with these thresholds. Tumor heterogeneity was calculated from the slope of the threshold-volume curve and defined as heterogeneity factor (HF). HF differed significantly according to T stage (p <0.0001), N stage (p=0.0131) and American Joint Committee on Cancer (AJCC) stage (p=0.0006). Among the pathological parameters, dermal lymphatic involvement (p=0.0039) showed the significant correlations with HF. Lymphovascular invasion (p=0.0005) was the only independent factor for predicting nodal metastasis. Tumor heterogeneity measured by 18F-FDG PET/CT is significantly associated with dermal lymphatic involvement."

According to the news editors, the research concluded: "However, PET might not be able to predict nodal metastasis in breast cancer."

For more information on this research see: Tumor Heterogeneity Assessed by 18F-FDG PET/CT Is Not Significantly Associated with Nodal Metastasis in Breast Cancer Patients. Oncology Research and Treatment, 2015;39(1-2):61-6.

Heart Disorders and Diseases - Hypertrophic…

New Findings Reported from R. Mormile and Co-Authors Describe Advances in Hypertrophic Cardiomyopathy (Neonates of diabetic mothers: The starting point for developing novel therapeutic approaches to ischemic heart and brain?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Hypertrophic Cardiomyopathy have been published. According to news reporting originating from Aversa, Italy, by NewsRx editors, the research stated, "Diabetes mellitus represents the most common medical condition causing complications during pregnancy. However, there is still some controversy surrounding complications."

Our news editors obtained a quote from the research, "Maternal hyperglycemia leads to fetal hyperglycemia. Offspring of diabetic mothers compensate excess glucose concentrations by producing higher levels of insulin causing transient hyperinsulinemia. Infants of diabetic mothers are at risk for congenital cardiac malformations, of which 40% are with hypertrophic cardiomyopathy. However, regardless of severity, cardiac hypertrophy is transient with echocardiographic resolution within the first months after birth. Neonates of diabetic mothers are more likely to suffer from macrosomia that predisposes the infant to birth asphyxia brain damage. However, there is no evidence for an increase in the incidence of brain injury from perinatal asphyxia in macrosomic babies of diabetic mothers in comparison to macrosomic newborns of non-diabetic mothers."

According to the news editors, the research concluded: "We hypothesize that infants of diabetic mother may represent the starting point for developing novel approaches to the treatment and prevention of obstructive hypertrophic cardiomyopathy, AMI and stroke at every age."

For more information on this research see: Neonates of diabetic mothers: The starting point for developing novel therapeutic approaches to ischemic heart and brain? Medical Hypotheses, 2016;96():75-77. Heart Disorders and Diseases - Heart Failure

New Findings Reported from Sao Paulo State University Describe Advances in Heart Failure (Beneficial Effects of Physical Exercise on Functional Capacity and Skeletal Muscle Oxidative Stress in Rats with Aortic Stenosis-Induced Heart Failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Failure have been presented. According to news reporting originating in Botucatu, Brazil, by NewsRx journalists, research stated, "We evaluated the influence of exercise on functional capacity, cardiac remodeling, and skeletal muscle oxidative stress, MAPK, and NF-kB pathway in rats with aortic stenosis-(AS-) induced heart failure (HF). Eighteen weeks after AS induction, rats were assigned into sedentary control (C-Sed), exercised control (C-Ex), sedentary AS (AS-Sed), and exercised AS (AS-Ex) groups."

Funders for this research include Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Fundacao de Amparo a Pesquisa do Estado de Sao Paulo, Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior, Sao Paulo State University.

The news reporters obtained a quote from the research from Sao Paulo State University, "Exercise was performed on treadmill for eight weeks. Statistical analyses were performed with Goodman and ANOVA or Mann-Whitney. HF features frequency and mortality did not differ between AS groups. Exercise improved functional capacity, assessed by maximal exercise test on treadmill, without changing echocardiographic parameters. Soleus cross-sectional areas did not differ between groups. Lipid hydroperoxide concentration was higher in AS-Sed than C-Sed and AS-Ex. Activity of antioxidant enzymes superoxide dismutase and glutathione peroxidase was changed in AS-Sed and restored in AS-Ex. NADPH oxidase activity and gene expression of its subunits did not differ between AS groups. Total ROS generation was lower in AS-Ex than C-Ex. Exercise modulated MAPK in AS-Ex and did not change NF-kB pathway proteins. Exercise improves functional capacity in rats with AS-induced HF regardless of echocardiographic parameter changes."

According to the news reporters, the research concluded: "In soleus, exercise reduces oxidative stress, preserves antioxidant enzyme activity, and modulates MAPK expression."

For more information on this research see: Beneficial Effects of Physical Exercise on Functional Capacity and Skeletal Muscle Oxidative Stress in Rats with Aortic Stenosis-Induced Heart Failure. Oxidative Medicine and Cellular Longevity, 2016;2016():8695716. (Hindawi Publishing - www.hindawi.com; Oxidative Medicine and Cellular Longevity - www.hindawi.com/journals/oximed/)

Our news correspondents report that additional information may be obtained by contacting M.J. Gomes, Botucatu Medical School, Internal Medicine Department, Sao Paulo State University (UNESP), Botucatu, SP, Brazil. Additional authors for this research include P.F. Martinez, D.H. Campos, L.U. Pagan, C. Bonomo, A.R. Lima, R.L. Damatto, M.D. Cezar, F.C. Damatto, C.M. Rosa, C.M. Garcia, D.R. Reyes, A.A. Fernandes, D.C. Fernandes, F.R.
New Findings Reported from School of Medicine Describe Advances in Type 2 Diabetes (Serum Irisin Level is Higher and Related with Insulin in Acanthosis Nigricans-related Obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are presented in a new report. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Acanthosis nigricans (AN) is proved to be a skin phenotype of hyperinsulinemia especially in obese patients. Irisin is a new myokine which plays an important role in metabolic disorders, such as obesity, insulin resistance, and type 2 diabetes."

The news correspondents obtained a quote from the research from the School of Medicine, "The role of irisin in the development of AN-related obesity is not yet understood. In this study, we aimed to investigate the relationship between irisin and AN-related obesity. 30 obese patients without AN (OB group), 30 obese patients with AN (AN group), and 20 age-matched healthy volunteers (control group, CON) were included in this study. Weight, BMI, lipid profile, FFA, UA, and CRP were measured in all participants. Oral Glucose Tolerance tests (OGTT) were performed and serum glucose and plasma insulin were measured at 0, 30, 60, 120 and 180 min. The AUC (area under curve) of glucose and insulin was calculated. Serum irisin was measured by ELISA. Hyperinsulinemia is found in both AN and OB groups. The AN group had higher levels of insulin but better blood glucose tolerance and insulin response. The difference in irisin levels between the 3 groups was statistically significant, with the AN group showing the highest serum level of irisin. Serum irisin levels were positively correlated with BMI, and fasting insulin. AN is a state of hyperinsulinemia and has better insulin response and glucose tolerance compared to obese patients without AN."

According to the news reporters, the research concluded: "Serum irisin may be a protective factor against impaired beta cell function in obesity with AN."

Our news journalists report that additional information may be obtained by contacting J.Q. Chen, Dept. of Endocrinology and Metabolism, Shanghai Tenth People's Hospital, School of Medicine Tongji University, Shanghai, People's Republic of China. Additional authors for this research include L.J. Fang, K.X. Song, X.C. Wang, Y.Y. Huang, S.Y. Chai, L. Bu and S. Qu.

Drugs and Therapies - Pharmacology and...

New Findings Reported from Semmelweis University Describe Advances in Pharmacology and Experimental Therapeutics (New Morphine Analogs Produce Peripheral Antinociception within a Certain Dose Range of Their Systemic Administration)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Pharmacology and Experimental Therapeutics. According to news reporting originating from Budapest, Hungary, by NewsRx correspondents, research stated, "Growing data support peripheral opioid antinociceptive effects, particularly in inflammatory pain models. Here, we examined the antinociceptive effects of subcutaneously administered, recently synthesized 14-O-methylmorphine-6-O-sulfate (14-O-MeM6SU) compared with morphine-6-O-sulfate (M6SU) in a rat model of inflammatory pain induced by an injection of complete Freund's adjuvant and in a mouse model of visceral pain evoked by an injection of complete Freund's adjuvant and in a mouse model of visceral pain evoked by acetic acid."

Our news editors obtained a quote from the research from Semmelweis University, "Subcutaneous doses of 14-O-MeM6SU and M6SU up to 126 and 547 nmol/kg, respectively, produced significant and subcutaneous or intraplantar naloxone methiodide (NAL-M)-reversible antinociception in inflamed paws compared with noninflamed paws. Neither of these doses significantly affected thiobutabarbital-induced sleeping time or rat pulmonary parameters. However, the antinociceptive effects of higher doses were only partially reversed by NAL-M, indicating contribution of the central nervous system. In the mouse writhing test, 14-O-MeM6SU was more potent than M6SU after subcutaneous or intracerebroventricular injections. Both displayed high subcutaneous/intracerebroventricular ED50 ratios. The antinociceptive effects of subcutaneous 14-O-MeM6SU and M6SU up to 136 and 3043 nmol/kg, respectively, were fully antagonized by subcutaneous NAL-M. In addition, the test compounds inhibited mouse gastrointestinal transit in antinociceptive doses. Taken together, these findings suggest that systemic administration of the novel compound 14-O-MeM6SU similar to M6SU in specific dose ranges shows peripheral antinociception in rat and mouse inflammatory pain models without central adverse effects. These findings apply to male animals and must be confirmed in female animals."

According to the news editors, the research concluded: "Therefore, titration of systemic doses of opioid compounds with limited access to the brain might offer peripheral antinociception of clinical importance."

For more information on this research see: New Morphine Analogs Produce

**Musculoskeletal Diseases and Conditions - Chronic...**

**New Findings Reported from Shaanxi Normal University Describe Advances in Chronic Fatigue Syndrome (Metabolic mechanism of a polysaccharide from Schisandra chinensis to relieve chronic fatigue syndrome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Musculoskeletal Diseases and Conditions - Chronic Fatigue Syndrome. According to news reporting originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "Schisandra chinensis fruits are a famous traditional Chinese medicine to treat all kinds of fatigue. This study aimed to investigate the therapeutic effect and metabolic mechanism of a polysaccharide (SCP) from Schisandra chinensis fruits on chronic fatigue syndrome (CFS)."

Financial supporters for this research include Graduate student innovation funds, Fundamental Research Funds for the Central Universities.

Our news editors obtained a quote from the research from Shaanxi Normal University, "SCP was isolated and the physicochemical properties were analyzed. A CFS model of rats was established and the urinary metabolomic studies were performed using gas chromatography time-of-flight mass spectrometry (GC-TOF-MS) in combination with multivariate statistical analysis. The results showed that SCP is a protein-bound polysaccharide. The amino acid composition of SCP consisted of 12 amino acids. The growth and the behaviors of the rats in the CFS model group were worse than those in the control group and improved after SCP treatment. Analysis of the GC-TOF-MS revealed that twelve metabolites were significantly changed, and six metabolites were oppositely and significantly changed after the SCP treatment. The TCA cycle metabolic pathways and the alanine, aspartate and glutamate metabolism were identified as significant metabolic pathways involved with SCP."

According to the news editors, the research concluded: "The therapeutic mechanism of SCP against CFS was partially due to the restoration of these disturbed pathways."

For more information on this research see: Metabolic mechanism of a

The news editors report that additional information may be obtained by contacting A.P. Chi, Shaanxi Normal Univ, Lab Nutr & Hyg, Xian 710119, People's Republic of China. Additional authors for this research include Y. Zhang, Y.J. Kang and Z.M. Shen.

**Genetics - Assisted Reproduction and Genetics**

**New Findings Reported from Smithsonian Describe Advances in Assisted Reproduction and Genetics [Carbonyl cyanide 4-(trifluoromethoxy)phenylhydrazone (FCCP) pre-exposure ensures follicle integrity during in vitro culture of ovarian tissue but not ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics - Assisted Reproduction and Genetics is now available. According to news reporting originating in Washington, District of Columbia, by NewsRx journalists, research stated, "Temporary and reversible downregulation of metabolism may improve the survival of tissues exposed to non-physiological conditions during transport, in vitro culture, and cryopreservation. The objectives of the study were to (1) optimize the concentration and duration of carbonyl cyanide 4-(trifluoromethoxy)phenylhydrazone (FCCP-a mitochondrial uncoupling agent) exposures for biopsies of domestic cat ovarian tissue and (2) examine the effects of FCCP pre-exposures on follicle integrity after tissue culture and/or cryopreservation."

The news reporters obtained a quote from the research from Smithsonian, "Biopsies of cat ovarian tissue were first treated with various concentrations of FCCP (0, 10, 40, or 200 nM) for 10 or 120 min to determine the most suitable pre-exposure conditions. Based on these results, tissues were pre-exposed to 200 nM FCCP for 120 min for the subsequent studies on culture and cryopreservation. In all experiments and for each treatment group, tissue activity and integrity were measured by mitochondrial membrane potential (relative optical density of rhodamine 123 fluorescence), follicular viability (calcein assay), follicular morphology (histology), granulosa cell proliferation (Ki-67 immunostaining), and follicular density. Ovarian tissues incubated with 200 nM FCCP for 120 min led to the lowest mitochondrial activity (1.17 +/- 0.09; P< 0.05) compared to control group (0 nM; 1.30 +/- 0.12) while maintaining a constant percentage of viable follicles (75.3 +/- 7.8 %) similar to the control group (71.8 +/- 11.7 %; P> 0.05). After 2 days of in vitro culture, percentage of viable follicles (78.8 +/- 8.9 %) in similar
pre-exposure conditions was higher (P < 0.05) than in the absence of FCCP (61.2 +/- 12.0 %) with percentages of morphologically normal follicles (57.6 +/- 17.3 %) not different from the fresh tissue (70.2 +/- 7.1 %; P> 0.05). Interestingly, percentages of cellular proliferation and follicular density were unaltered by the FCCP exposures. Based on the indicators mentioned above, the FCCP-treated tissue fragments did not have a better follicle integrity after freezing and thawing. Pre-exposure to 200 nM FCCP during 120 min protects and enhances the follicle integrity in cat ovarian tissue during short-term in vitro culture."

According to the news reporters, the research concluded: "However, FCCP does not appear to exert a beneficial or detrimental effect during ovarian tissue cryopreservation."

Our news correspondents report that additional information may be obtained by contacting P. Comizzoli, Smithsonian Conservat Biol Inst, Natl Zool Pk, Washington, DC 20008, United States. Additional authors for this research include K. Chatdarong and P. Comizzoli.

**Oncology - Gastric Cancer**

**New Findings Reported from Sungkyunkwan University Describe Advances in Gastric Cancer (Diabetic biomarkers and the risk of proximal or distal gastric cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Gastric Cancer. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "The role of diabetes mellitus as a risk factor for gastric cancer has been controversial. We studied the association between diabetic biomarkers and the risk of gastric cancer and whether these associations depend on cancer location."

The news correspondents obtained a quote from the research from Sungkyunkwan University, "In this retrospective cohort study with subjects with negative initial esophagogastroduodenoscopy findings (n = 23 218) during a routine health checkup, we measured fasting glucose and insulin levels, calculated the homeostatic model assessment insulin resistance (HOMA-IR) values, and analyzed the risk of gastric cancer in relation to diabetic biomarker tertiles and the presence of diabetes mellitus. The incidence rate of gastric
cancer was 9.7 per 10,000 person-years during the mean 6.8-year follow-up. Patients with diabetes, higher fasting glucose levels, or higher HOMA-IR levels were older; men, current smokers, and heavy alcohol consumers represented larger proportions of these groups. They also had high body mass index and hemoglobin A1c more often. In the multivariate-adjusted Cox regression analyses, the incidence of gastric cancer was not significantly associated with diabetes mellitus or higher diabetic biomarker levels. Compared with normal glucose levels, lower glucose levels were significantly associated with an increased risk of distal gastric cancer. The hazard ratio for fasting glucose level tertile 1 was 2.39 (95% confidence interval, 1.48-3.85) (reference, tertile 2). Lower glucose levels were not associated with a risk of proximal gastric cancer, compared with a normal glucose level.

According to the news reporters, the research concluded: "Our findings suggest that fasting glucose levels have a different effect on distal and proximal gastric cancers."

**Oncology - Lymphoma**

**New Findings Reported from Tongji University Describe Advances in Lymphoma (The role of HGF/c-MET signaling pathway in lymphoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lymphoma. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Inappropriate activation of c-mesenchymal-epithelial transition (MET), the receptor tyrosine kinase (RTK) for hepatocyte growth factor (HGF), has been implicated in tumorigenesis and represented a promising therapeutic target for developing anticancer agents."

Our news journalists obtained a quote from the research from Tongji University, "In contrast to other solid tumors, there are limited data describing the functional role of HGF/c-MET signaling pathway in lymphoma. In the current review, we summarize recent findings about the expression, cellular mechanisms/functions, and therapeutic application of HGF/c-MET in different types of lymphoma, especially B cell lymphoma, T and NK cell lymphoma, and Hodgkin lymphoma."

According to the news editors, the research concluded: "We also discuss the existing
problems and future directions about studying the HGF/c-MET pathway in lymphoma cells."

Our news journalists report that additional information may be obtained by contacting Z.Q. Qin, Tongji Univ, Sch Med, Key Lab Arrhythmias, East Hosp, Shanghai 200120, People's Republic of China. Additional authors for this research include L. Dai and Z.Q. Qin.

**Hereditary Angioedema**

**New Findings Reported from University Medical Center Describe Advances in Hereditary Angioedema (Plasmin is a natural trigger for bradykinin production in patients with hereditary angioedema with factor XII mutations)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hereditary Angioedema. According to news reporting from Utrecht, Netherlands, by NewsRx journalists, research stated, "Patients with angioedema experience unpredictable attacks of tissue swelling in which bradykinin is implicated. Several distinct mutations in Factor XII (FXII) are associated with hereditary angioedema (HAE) in the presence of normal C1 esterase inhibitor activity (FXII-HAE)."

The news correspondents obtained a quote from the research from University Medical Center, "The underlying disease mechanisms are unclear, which complicates diagnosis and treatment. We sought to identify the natural trigger for FXII activation, which causes uncontrolled bradykinin production in patients with FXII-HAE. We generated recombinant variants of FXII, representing health and disease, and studied their behavior in functional studies. We investigated bradykinin-forming pathways in blood plasma with newly developed nanobody-based analytic methods. We here report that FXII-HAE mutations collectively introduce new sites that are sensitive to enzymatic cleavage by plasmin. These FXII mutants rapidly activate after cleavage by plasmin, escape from inhibition through C1 esterase inhibitor, and elicit excessive bradykinin formation. Furthermore, our findings indicate that plasmin modulates disease activity in patients with FXII-HAE. Finally, we show that soluble lysine analogs attenuate this mechanism, explaining their therapeutic value in patients with HAE. Our findings indicate a new pathway for bradykinin formation in patients with HAE, in which FXII is cleaved and activated by plasmin."

According to the news reporters, the research concluded: "This should lead to the identification of new markers for diagnosis and targets for treatment."

For more information on this research see: Plasmin is a natural trigger for...

**Analgesics**

New Findings Reported from University of Alberta Describe Advances in Analgesics (Interventions for the Treatment of Pain in Nursing Home Residents: A Systematic Review and Meta-Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Analgesics have been published. According to news reporting from Edmonton, Canada, by NewsRx journalists, research stated, "More than one-half of nursing home residents experience a complex mix of pain. Despite this, assessment and treatment of pain remain inadequate."

The news correspondents obtained a quote from the research from the University of Alberta, "Using techniques of the Cochrane Collaboration and Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines, we assessed efficacy of interventions aimed at reducing chronic pain in nursing home residents > 65 years of age. We searched for controlled trials comparing and measuring pain interventions using standardized pain scales. Two reviewers independently selected included studies, abstracted data, and assessed risk of bias. We performed meta-analyses calculating standardized mean differences (SMDs) using random effect models. Fourteen trials (n = 2293) were included in the meta-analysis: 7 reported nonanalgesic treatments, 4 reported analgesic treatments, 5 reported system modifications, and 2 reported educational interventions. A variety of pain scales were used, reporting outcome measures from 1 week to 1 year. Pooled results at trial completion revealed a statistically significant small treatment effect [SMD -0.33, 95% confidence interval (CI) -0.51, -0.14]. Further subgroup analysis revealed that residents receiving analgesic interventions benefited most (SMD -0.65, 95% CI -1.07, -0.23), followed by those receiving educational..."
interventions (SMD -0.40, 95% CI -0.59, -0.21), and those receiving system modification interventions (SMD -0.26, 95% CI -0.51, -0.02). Nonanalgesic treatment and control groups showed no statistical differences. Our findings suggest that analgesics are the most effective pain intervention and should be considered first-line therapy."

According to the news reporters, the research concluded: "Caution should be used in interpreting findings as few trials were included, risk of bias was variable, sample sizes were small, and pooled treatment effects were small to moderate."

Our news journalists report that additional information may be obtained by contacting J.A. Knopp-Sihota, University of Alberta, Fac Nursing, Edmonton, AB, Canada. Additional authors for this research include P. Patel and C.A. Estabrooks.

Keywords for this news article include: Edmonton, Alberta, Canada, North and Central America, Analgesics, Article Review, Pain Medicine, University of Alberta.

**Lung Diseases and Conditions - Pulmonary Fibrosis**

**New Findings Reported from University of Colorado Describe Advances in Pulmonary Fibrosis (Pulmonary fibrosis in the era of stratified medicine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Pulmonary Fibrosis are discussed in a new report. According to news reporting out of Denver, Colorado, by NewsRx editors, research stated, "Both common and rare variants contribute to the genetic architecture of pulmonary fibrosis. Genome-wide association studies have identified common variants, or those with a minor allele frequency of >5%, that are linked to pulmonary fibrosis."

Financial supporters for this research include U.S. Department of Veterans Affairs, National Institutes of Health.

Our news journalists obtained a quote from the research from the University of Colorado, "The most widely replicated variant (rs35705950) is located in the promoter region of the MUC5B gene and has been strongly associated with idiopathic pulmonary fibrosis (IPF) and familial interstitial pneumonia (FIP) across multiple different cohorts. However, many more common variants have been identified with disease risk and in aggregate account for approximately one-third of the risk of IPF. Moreover, several of these common variants appear to have prognostic potential. Next generation sequencing technologies have facilitated the identification of rare variants. Recent whole exome sequencing studies have linked pathogenic rare variants in multiple new genes to FIP. Compared with common variants, rare variants have lower population allele frequencies and higher effect sizes. Pulmonary fibrosis rare variants genes can be subdivided into two pathways: telomere maintenance and surfactant metabolism."
Heterozygous rare variants in telomere-related genes co-segregate with adult-onset pulmonary fibrosis with incomplete penetrance, lead to reduced protein function, and are associated with short telomere lengths. Despite poor genotype-phenotype correlations, lung fibrosis associated with pathogenic rare variants in different telomere genes is progressive and displays similar survival characteristics. In contrast, many of the heterozygous rare variants in the surfactant genes predict a gain of toxic function from protein misfolding and increased endoplasmic reticulum (ER) stress. Evidence of both telomere shortening and increased ER stress have been found in sporadic IPF patients, suggesting that the mechanisms identified from rare variant genetic studies in unique individuals and families are applicable to a wider spectrum of patients. The ability to sequence large cohorts of individuals rapidly has the potential to further our understanding of the relative contributions of common and rare variants in the pathogenesis of pulmonary fibrosis.

According to the news editors, the research concluded: "The UK 100,000 Genomes Project will provide opportunities to interrogate both common and rare variants and to investigate how these biological signals provide diagnostic and prognostic information in the era of stratified medicine."

Gram-Positive Bacteria - Bacillus subtilis

New Findings Reported from University of Groningen Describe Advances in Bacillus subtilis (Regulatory RNAs in Bacillus subtilis: a Gram-Positive Perspective on Bacterial RNA-Mediated Regulation of Gene Expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Positive Bacteria - Bacillus subtilis are presented in a new report. According to news reporting originating in Groningen, Netherlands, by NewsRx journalists, research stated, "Bacteria can employ widely diverse RNA molecules to regulate their gene expression. Such molecules include trans-acting small regulatory RNAs, antisense RNAs, and a variety of transcriptional attenuation mechanisms in the 5′= untranslated region."
The news reporters obtained a quote from the research from the University of Groningen. "Thus far, most regulatory RNA research has focused on Gram-negative bacteria, such as Escherichia coli and Salmonella. Hence, there is uncertainty about whether the resulting insights can be extrapolated directly to other bacteria, such as the Gram-positive soil bacterium Bacillus subtilis. A recent study identified 1,583 putative regulatory RNAs in B. subtilis, whose expression was assessed across 104 conditions. Here, we review the current understanding of RNA-based regulation in B. subtilis, and we categorize the newly identified putative regulatory RNAs on the basis of their conservation in other bacilli and the stability of their predicted secondary structures. Our present evaluation of the publicly available data indicates that RNA-mediated gene regulation in B. subtilis mostly involves elements at the 5' ends of mRNA molecules. These can include 5' secondary structure elements and metabolite-, tRNA-, or protein-binding sites. Importantly, sense-independent segments are identified as the most conserved and structured potential regulatory RNAs in B. subtilis."

According to the news reporters, the research concluded: "Altogether, the present survey provides many leads for the identification of new regulatory RNA functions in B. subtilis."

**Immune System Diseases and Conditions - HIV/AIDS**

**New Findings Reported from University of Louisville Describe Advances in HIV/AIDS (Griffithsin-Modified Electrospun Fibers as a Delivery Scaffold To Prevent HIV Infection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - HIV/AIDS are presented in a new report. According to news reporting out of Owensboro, Kentucky, by NewsRx editors, research stated, "Despite current prophylactic strategies, sexually transmitted infections (STIs) remain significant contributors to global health challenges, spurring the development of new multipurpose delivery technologies to protect individuals from and treat virus infections. However, there are few methods currently available to prevent and no method to date that cures human immunodeficiency virus (HIV) infection or combinations of STIs."
Financial support for this research came from HHS | National Institutes of Health (NIH).

Our news journalists obtained a quote from the research from the University of Louisville, "While current oral and topical preexposure prophylaxes have protected against HIV infection, they have primarily relied on antiretrovirals (ARVs) to inhibit infection. Yet continued challenges with ARVs include user adherence to daily treatment regimens and the potential toxicity and antiviral resistance associated with chronic use. The integration of new biological agents may avert some of these adverse effects while also providing new mechanisms to prevent infection. Of the biologic-based antivirals, griffithsin (GRFT) has demonstrated potent inhibition of HIV-1 (and a multitude of other viruses) by adhering to and inactivating HIV-1 immediately upon contact. In parallel with the development of GRFT, electrospun fibers (EFs) have emerged as a promising platform for the delivery of agents active against HIV infection. In the study described here, our goal was to extend the mechanistic diversity of active agents and electrospun fibers by in-corporating the biologic GRFT on the EF surface rather than within the EFs to inactivate HIV prior to cellular entry. We fabricated and characterized GRFT-modified EFs (GRFT-EFs) with different surface modification densities of GRFT and demonstrated their safety and efficacy against HIV-1 infection in vitro."

According to the news editors, the research concluded: "We believe that EFs are a unique platform that may be enhanced by incorporation of additional antiviral agents to prevent STIs via multiple mechanisms."

For more information on this research see: Griffithsin-Modified Electrospun Fibers as a Delivery Scaffold To Prevent HIV Infection. Antimicrobial Agents and Chemotherapy, 2016;60(11):6518-6531. Drugs and Therapies - Antiinfectives

New Findings Reported from University of Melbourne Describe Advances in Antiinfectives (Divergent Transcriptional Responses to Physiological and Xenobiotic Stress in Giardia duodenalis)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiinfectives have been published. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "Understanding how parasites respond to stress can help to identify essential biological processes. Giardia duodenalis is a parasitic protist that infects the human gastrointestinal tract and causes 200 to 300 million cases of diarrhea annually."

Financial support for this research came from Australian Research Council (ARC).

The news correspondents obtained a quote from the research from the University of Melbourne, "Metronidazole, a major anti- giardial drug, is thought to cause oxidative damage within the infective trophozoite form. However, treatment efficacy is suboptimal, due partly to metronidazole-resistant infections. To elucidate conserved and stress-specific responses, we calibrated sublethal metronidazole, hydrogen peroxide, and thermal stresses to exert approximately equal pressure on trophozoite growth and compared transcriptional responses after 24 h of exposure. We identified 252 genes that were differentially transcribed in response to all three stressors, including glycolytic and DNA repair enzymes, a mitogen-activated protein (MAP) kinase, high-cysteine membrane proteins, flavin adenine dinucleotide (FAD) synthetase, and histone modification enzymes. Transcriptional responses appeared to diverge according to physiological or xenobiotic stress. Downregulation of the antioxidant system and alpha-giardins was observed only under metronidazole-induced stress, whereas upregulation of GARP-like transcription factors and their subordinate genes was observed in response to hydrogen peroxide and thermal stressors."

According to the news reporters, the research concluded: "Limited evidence was found in support of stress-specific response elements upstream of differentially transcribed genes; however, antisense derepression and differential regulation of RNA interference machinery suggest multiple epigenetic mechanisms of transcriptional control."

For more information on this research see: Divergent Transcriptional Responses to Physiological and Xenobiotic Stress in Giardia duodenalis. Antimicrobial Agents and Chemotherapy, 2016;60(10):6034-6045. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AAC.00977-16. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings Reported from University of Oregon Describe Advances in Blood Transfusion (Acute hot water immersion is protective against impaired vascular function following forearm ischemia-reperfusion in young healthy humans)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Transfusion Medicine - Blood Transfusion is the subject of a report. According to news originating from Eugene, Oregon, by NewsRx correspondents, research stated, "Ischemia-reperfusion (I/R) injury is a primary cause of poor outcomes following ischemic cardiovascular events. We tested whether acute hot water immersion protects against forearm vascular I/R."

Financial support for this research came from American Heart Association (AHA).

Our news journalists obtained a quote from the research from the University of Oregon, "Ten (5 male, 5 female) young (23 +/- 2 yr), healthy subjects participated in two trials in random order 7-21 days apart, involving: 1) 60 min of seated rest (control), or 2) 60 min of immersion in 40.5 degrees C water (peak rectal temperature: 38.9 +/- 0.2 degrees C). I/R was achieved 70 min following each intervention by inflating an upper arm cuff to 250 mmHg for 20 min followed by 20 min of reperfusion. Brachial artery flow-mediated dilation (FMD) and forearm postocclusive reactive hyperemia (RH) were measured as markers of macrovascular and microvascular function at three time points: 1) pre intervention, 2) 60 min postintervention, and 3) post-I/R. Neither time control nor hot water immersion alone affected FMD (both, P> 0.99). I/R reduced FMD from 7.4 +/- 0.7 to 5.4 +/- 0.6% (P = 0.03), and this reduction was prevented following hot water immersion (7.0 +/- 0.7 to 7.7 +/- 1.0%; P< 0.99). I/R also impaired RH (peak vascular conductance: 2.6 +/- 0.5 to 2.0 +/- 0.4 ml.min(-1).mmHg(-1), P = 0.003), resulting in a reduced shear stimulus (SRAUC .10(-3): 22.5 +/- 2.4 to 16.9 +/- 2.4, P = 0.04). The post-I/R reduction in peak RH was prevented by hot water immersion (2.5 +/- 0.4 to 2.3 +/- 0.4 ml.min(-1).mmHg(-1); P = 0.33). We observed a decline in brachial artery dilator function post-I/R, which may be (partly) related to damage incurred downstream in the microvasculature, as indicated by impaired RH and shear stimulus."

According to the news editors, the research concluded: "Hot water immersion was protective against reductions in FMD and RH post-I/R, suggesting heat stress induces vascular changes consistent with reducing I/R injury following ischemic events."

For more information on this research see: Acute hot water immersion is protective against impaired vascular function following forearm ischemia-reperfusion in young healthy humans. American Journal of Physiology-Regulatory Integrative and Comparative Physiology, 2016;311(6):R1060-R1067. American Journal of Physiology-Regulatory Integrative and Comparative Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

The news correspondents report that additional information may be obtained from C.T. Minson, University of Oregon, Dept. of Human Physiol, Eugene, OR 97403, United States. Additional authors for this research include A.T. Jeckell, B.R. Ely, M.J. Howard, D.H.J. Thijssen and C.T. Minson.

Campylobacter

New Findings Reported from University of Oxford Describe Advances in Campylobacter (Exploiting Bacterial Whole-Genome Sequencing Data for Evaluation of Diagnostic Assays: Campylobacter Species Identification as a Case Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Campylobacter. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "The application of whole-genome sequencing (WGS) to problems in clinical microbiology has had a major impact on the field. Clinical laboratories are now using WGS for pathogen identification, antimicrobial susceptibility testing, and epidemiological typing."

Financial supporters for this research include Merton College Oxford, Clarendon Fund, Funds for Women Graduates, Wellcome Trust, DH | National Institute for Health Research (NIHR).

Our news journalists obtained a quote from the research from the University of Oxford, "WGS data also represent a valuable resource for the development and evaluation of molecular diagnostic assays, which continue to play an important role in clinical microbiology. To demonstrate this application of WGS, this study used publicly available genomic data to evaluate a duplex real-time PCR (RT-PCR) assay that targets mapA and ceuE for the detection of Campylobacter jejuni and Campylobacter coli, leading global causes of bacterial gastroenteritis. In silico analyses of mapA and ceuE primer and probe sequences from 1,713 genetically diverse C. jejuni and C. coli genomes, supported by RT-PCR testing, indicated that the assay was robust, with 1,707 (99.7%) isolates correctly identified. The high specificity of the mapA-ceuE assay was the result of interspecies diversity and intraspecies conservation of the target genes in C. jejuni and C. coli. Rare instances of a lack of specificity among C. coli isolates were due to introgression in mapA or sequence diversity in ceuE."

According to the news editors, the research concluded: "The results of this study illustrate how WGS can be exploited to evaluate molecular diagnostic assays by using publicly available data, online databases, and open-source software."

For more information on this research see: Exploiting Bacterial Whole-Genome Sequencing Data for Evaluation of Diagnostic Assays: Campylobacter Species Identification as a Case Study. *Journal of Clinical Microbiology*, 2016;54(12):2882-2890. *Journal of Clinical Microbiology* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

The news correspondents report that additional information may be obtained from M.C.J. Maiden, University of Oxford, NIHR Hlth Protect Res Unit Gastrointestinal Infec, Oxford, United Kingdom. Additional authors for this research include C. Swift, A.J. Cody, C. Jenkins and M.C.J. Maiden.

Heart Research

New Findings Reported from University of Queensland Describe Advances in Heart Research (Crim1 has cell-autonomous and paracrine roles during embryonic heart development)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Research is now available. According to news reporting from Brisbane, Australia, by NewsRx journalists, research stated, "The epicardium has a critical role during embryonic development, contributing epicardium-derived lineages to the heart, as well as providing regulatory and trophic signals necessary for myocardial development. Crim1 is a unique trans-membrane protein expressed by epicardial and epicardially-derived cells but its role in cardiogenesis is unknown."

The news correspondents obtained a quote from the research from the University of Queensland, "Using knockout mouse models, we observe that loss of Crim1 leads to congenital heart defects including epicardial defects and hypoplastic ventricular compact myocardium. Epicardium-restricted deletion of Crim1 results in increased epithelial-to-mesenchymal transition and invasion of the myocardium in vivo, and an increased migration of primary epicardial cells. Furthermore, Crim1 appears to be necessary for the proliferation of epicardium-derived cells (EPDCs) and for their subsequent differentiation into cardiac fibroblasts. It is also required for normal levels of cardiomyocyte proliferation and apoptosis, consistent with a role in regulating epicardium-derived trophic factors that act on the myocardium. Mechanistically, Crim1 may also modulate key developmentally expressed growth factors such as TGFbs, as changes in the downstream effectors phospho-SMAD2 and phospho-ERK1/2 are observed in the absence of Crim1."

According to the news reporters, the research concluded: "Collectively, our data demonstrates that Crim1 is essential for cell-autonomous and paracrine aspects of heart development."

For more information on this research see: Crim1 has cell-autonomous and paracrine roles during embryonic heart development. Scientific Reports, 2016;6():19832. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting S. Iyer, School of Biomedical Sciences, The University of Queensland, Brisbane, 4072, Australia. Additional authors for this research include F.Y. Chou, R. Wang, H.S. Chiu, V.K. Raju, M.H. Little, W.G. Thomas, M. Piper and D.J Pennisi.

New Findings Reported from University of Rijeka Describe Advances in Peripheral T-Cell Lymphoma (Rapid Fatal Acute Peripheral T-Cell Lymphoma Associated With IgG Plasma Cell Leukemia and IgA Hypergammaglobulinemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Peripheral T-Cell Lymphoma is the subject of a report. According to news reporting originating in Rijeka, Croatia, by NewsRx journalists, research stated, "Simultaneous occurrence of T-cell and B-cell neoplasms is rare, and etiologic relationships between these 2 malignancies are poorly understood. We describe the case of a 66-year-old woman who was admitted to the hospital because of fever, hemoptysis, lymphadenopathy, and skin rash."

The news reporters obtained a quote from the research from the University of Rijeka, "Enlarged lymph nodes in axillary, pectoral, paratracheal, and periportal regions as well as slight hepatomegaly and splenomegaly were confirmed. A peripheral blood smear revealed rouleaux formation and numerous circulating plasma cells, with plasmacytoid lymphocytes. Immunofixation-electrophoresis detected a monoclonal band defined as immunoglobulin (IgG)-lambda light chains with broad-band polyclonal IgA. The patient died from abrupt splenic rupture before diagnostic work-up was finished. Postmortem examination revealed infiltration of atypical lymphoid cells exhibiting high proliferative activity admixed with typical and atypical plasma cells in several organs."

According to the news reporters, the research concluded: "Thus, plasma cell leukemia (IgG-lambda) as a rare and aggressive variant of plasma cell myeloma in the present case was associated with aggressive peripheral T-cell lymphoma and polyclonal (IgA) plasmacytosis."

For more information on this research see: Rapid Fatal Acute Peripheral T-Cell Lymphoma Associated With IgG Plasma Cell Leukemia and IgA Hypergammaglobulinemia. New Findings Reported from University of Rostock Describe Advances in Algorithms (On generalized Borgen plots II: The line-moving algorithm and its numerical implementation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Algorithms are presented in a new report. According to news reporting originating from Rostock, Germany, by NewsRx correspondents, research stated, "Borgen plots are geometric constructions that represent the set of all nonnegative factorizations of spectral data matrices for three-component systems. The classical construction by Borgen and Kowalski (Anal. Chim.)" Our news editors obtained a quote from the research from the University of Rostock, "Acta 174, 1-26 (1985)) is limited to nonnegative data and results in nonnegative factorizations. The new approach of generalized Borgen plots allows factors with small negative entries. This makes it possible to construct Borgen plots for perturbed or noisy spectral data and stabilizes the computation. In the first part of this paper, the mathematical theory of generalized Borgen plots has been introduced. This second part presents the line-moving algorithm for the construction of generalized Borgen plots."

According to the news editors, the research concluded: "The algorithm is justified, and the implementation in the FACPACK software is validated."

The news editors report that additional information may be obtained by contacting K. Neymeyr, University of Rostock, Leibniz Inst Katalyse eV, Rostock, Germany. Additional authors for this research include M. Sawall and K. Neymeyr.

Keywords for this news article include: Rostock, Germany, Europe, Algorithms, University of Rostock.

New Findings Reported from University of Rouen Describe Advances in Nasal Lubricants and Irrigations (Impact of sodium chloride on the expansion of a liquid-liquid miscibility gap in an API/water system. Case study of Brivaracetam)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Nasal Lubricants and Irrigations. According to news reporting from Mont St. Aignan, France, by NewsRx journalists, research stated, "Brivaracetam, or (2S)-2-[(4R)-2-oxo-4-propyl-pyrrolidin-1-yl] butanamide, is an active pharmaceutical ingredient designed for the treatment of epilepsy."

The news correspondents obtained a quote from the research from the University of Rouen, "During the development of the IV administration mode, a liquid-liquid miscibility gap has been observed with pure water, isotonic and hypertonic solutions (vehicle at 0.9% w/w and 5% w/w NaCl respectively). The study reveals that the NaCl concentration has a direct impact on the extent of the demixing domain; from a sub-micronic demixing in pure water towards a macroscopic miscibility gap in hypertonic aqueous solutions."

According to the news reporters, the research concluded: "The thorough exploration of these heterogeneous equilibria led to define experimental parameters for safe IV injections without risk of liquid - liquid miscibility gap at 37 degrees C."

Our news journalists report that additional information may be obtained by contacting N. Couvrat, University of Rouen, Normandie Univ, Lab SMS EA3233, F-76821 Mont St Aignan, France. Additional authors for this research include J. Mahieux, B. Fours, Y. Cartigny, E. Schenkel, L. Aerts, L. Quere and G. Coquerel.

Nutritional and Metabolic Diseases and Conditions -...

New Findings Reported from University of Saskatchewan Describe Advances in Dyslipidemias (The Different Facets of Dyslipidemia and Hypertension in Atherosclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Dyslipidemias is the subject of a report. According to news originating from Saskatoon, Canada, by NewsRx correspondents, research stated, "Atherosclerosis is the narrowing of arteries due to the accumulation of macrophages overloaded with lipids resulting in foam cell formation, and these events occur preferentially at the branching points of arteries which are particularly susceptible to hyperlipidemic stress-induced inflammation and oxidative stress. The different stages of atherogenesis rely on oxidative stress, endothelial dysfunction, and inflammation, and
hypertension or dyslipidemia can independently trigger these stages."

Our news journalists obtained a quote from the research from the University of Saskatchewan, "Dyslipidemia and hypertension are pathological conditions that damage the endothelium, triggering cell proliferation, vascular remodeling, apoptosis, and increased cellular permeability with increased adhesion molecules that bind monocytes and T lymphocytes to create a vicious cocktail of pathophysiological factors. Correspondingly, the factors are redirected by chemo-attractants and pro-inflammatory cytokines into the intima of the vasculature, where monocytes differentiate into macrophages taking up oxidized LDL uncontrollably to form foam cells and atherosclerotic lesions. Moreover, endothelial damage also causes loss of vasomotor activity, disproportionate vascular contractility, and elevation of blood pressure in dyslipidemic patients, while in hypertensive patients, further elevation of blood pressure occurs, creating a self-perpetuating vicious cycle that aggravates the development and progression of atherosclerotic lesions."

According to the news editors, the research concluded: "This review offers an in-depth analysis of atherosclerosis and the related interplay between dyslipidemia/hypertension and critically appraises the current diagnosis, etiology, and therapeutic options."

For more information on this research see: The Different Facets of Dyslipidemia and Hypertension in Atherosclerosis. Current Atherosclerosis Reports, 2016;18(12):114-125. Current Atherosclerosis Reports can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. (Springer - www.springer.com; Current Atherosclerosis Reports - www.springerlink.com/content/1523-3804/)

The news correspondents report that additional information may be obtained from J.F. Ndisang, University of Saskatchewan, Coll Med, Dept. of Physiol, Saskatoon, SK S7N 5E5, Canada. Additional authors for this research include K. McLellan, K. Durr, O. Onasanya, D. Nwabuko and J.F. Ndisang.

Drugs and Therapies - Thioredoxin Therapy

New Findings Reported from University of Science and Technology Describe Advances in Thioredoxin Therapy (Thioredoxin-interacting protein regulates haematopoietic stem cell ageing and rejuvenation by inhibiting p38 kinase activity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Thioredoxin Therapy is the subject of a report. According to news reporting from Daejeon, South Korea, by NewsRx journalists, research stated, "Ageing is a natural process in living organisms throughout their lifetime, and most elderly people suffer from ageing-associated diseases. One suggested way to tackle such diseases is to rejuvenate stem cells, which also undergo ageing."
The news correspondents obtained a quote from the research from the University of Science and Technology, "Here we report that the thioredoxin-interacting protein (TXNIP)-p38 mitogen-activated protein kinase (p38) axis regulates the ageing of haematopoietic stem cells (HSCs), by causing a higher frequency of long-term HSCs, lineage skewing, a decrease in engraftment, an increase in reactive oxygen species and loss of Cdc42 polarity. TXNIP inhibits p38 activity via direct interaction in HSCs. Furthermore, cell-penetrating peptide (CPP)-conjugated peptide derived from the TXNIP-p38 interaction motif inhibits p38 activity via this docking interaction. This peptide dramatically rejuvenates aged HSCs in vitro and in vivo."

According to the news reporters, the research concluded: "Our findings suggest that the TXNIP-p38 axis acts as a regulatory mechanism in HSC ageing and indicate the potent therapeutic potential of using CPP-conjugated peptide to rejuvenate aged HSCs."

Keywords for this news article include: Daejeon, South Korea, Asia, Enzymes and Coenzymes, Drugs and Therapies, Thioredoxin Therapy, Stem Cell Research, Rejuvenation, Thioredoxins, Proteins, Kinase, University of Science and Technology.

Cardiology

**New Findings Reported from University of Toronto Describe Advances in Cardiology (Sex Differences in Cardiac Rehabilitation Adherence: A Meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiology are discussed in a new report. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "Cardiac rehabilitation (CR) participation is associated with significantly lower mortality, and this benefit has been established as dose-dependent. Because it has been suggested that women are adherent to CR programs less than men, the objective of this study was to review CR adherence among women and men, and to determine whether a sex difference exists."

Our news journalists obtained a quote from the research from the University of Toronto, "MedLine, CINAHL, EMBASE, PsycINFO, and the Cochrane databases were systematically searched. Titles and abstracts were screened, and selected full-text articles were independently considered on the basis of predefined inclusion/exclusion criteria. Data from included articles were extracted by 2 authors independently and assessed for quality. The meta-analysis was undertaken with predefined subgroup analyses. The search identified 5148 articles, of which 149 were fully examined for inclusion consideration. Fourteen studies reporting data
on 8176 participants (2234 [27.3%] women) were included. Overall, CR adherence ranged from 36.7% to 84.6% of sessions, with a mean of 66.5 +/- 18.2% (median, 72.5%). Men and women enrolled in CR adhered to 68.6% and 64.2% of prescribed sessions, respectively (mean difference = -3.6; 95% confidence interval, -6.9 to -0.3). The sex difference persisted in studies of high quality, that were undertaken in Canada, published since 2010, and where programs were longer than 12 weeks' duration and offered fewer than 3 sessions per week. To our knowledge, this is the first meta-analysis to systematically report CR adherence rates, and results suggest that patients adhere to more than two-thirds of prescribed sessions. CR adherence is significantly lower among women than men."

According to the news editors, the research concluded: "Identified strategies to promote adherence need to be tested among women."

Our news journalists report that additional information may be obtained by contacting S.L. Grace, University of Toronto, Toronto, ON, Canada. Additional authors for this research include R.P. Marinho, J. Zhang, S. Marzolini, T.J.F. Colella, M. Pakosh and S.L. Grace.

**Arteriovenous Malformation**

**New FindingsReported from University of Virginia Describe Advances in Arteriovenous Malformation (Dosimetric effects of Onyx embolization on Gamma Knife arteriovenous malformation dose distributions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Arteriovenous Malformation have been published. According to news reporting out of Charlottesville, Virginia, by NewsRx editors, research stated, "Patients with arteriovenous malformations (AVMs) treated with Gamma Knife radiosurgery (GKRS) subsequent to embolization suffer from elevated local failure rates and differences in adverse radiation effects. Onyx is a common embolic material for AVMs."

Our news journalists obtained a quote from the research from the University of Virginia, "Onyx is formulated with tantalum, a high atomic number (Z = 73) element that has been investigated as a source of dosimetric uncertainty contributing to the less favorable clinical results. However, prior studies have not modeled the complicated anatomical and beam geometries characteristic of GKRS. This study investigated the magnitude of dose perturbation that can occur due to Onyx embolization using clinically realistic anatomical and Gamma Knife beam models. Leksell GammaPlan (LGP) was used to segment the AVM nidus and areas of Onyx from postcontrast stereotactic MRI for 7 patients treated with GKRS postembolization. The resulting contours, skull surface, and clinically selected dose distributions were exported from LGP in DICOM-RT (Digital Imaging and Communications in Medicine -radiotherapy) format. Isocenter locations and dwell times were recorded from the LGP database. Contours were converted into 3D mesh representations using commercial and in-house mesh-editing software. The resulting data were imported into a Monte Carlo (MC) dose calculation engine (Pegasos, Elekta Instruments AB) with a beam geometry for the Gamma Knife Perfexion. The MC-predicted dose distributions were calculated with Onyx assigned manufacturer reported physical constants (MC-Onyx), and then compared with corresponding distributions in which Onyx was reassigned constants for water (MC-water). Differences in dose metrics were determined, including minimum, maximum, and mean dose to the AVM nidus; selectivity index; and target coverage. Combined differences in dose magnitude and distance to agreement were calculated as 3D Gamma analysis passing rates using tolerance criteria of 0.5%/0.5 mm, 1.0%/1.0 mm, and 3.0%/3.0 mm. Overall, the mean percentage differences in dose metrics for MC-Onyx relative to MC-water were as follows; all data are reported as mean (SD): minimum...
dose to AVM = -0.7% (1.4%), mean dose to AVM = 0.1% (0.2%), maximum dose to AVM = 2.9% (5.0%), selectivity = 0.1% (0.2%), and coverage = -0.0% (0.2%). The mean percentage of voxels passing at each Gamma tolerance were as follows: 99.7% (0.1%) for 3.0%/3.0 mm, 98.2% (0.7%) for 1.0%/1.0 mm, and 52.1% (4.4%) for 0.5%/0.5 mm. Onyx embolization appears to have a detectable effect on the delivered dose distribution. However, the small changes in dose metrics and high Gamma passing rates at 1.0%/1.0 mm tolerance suggest that these changes are unlikely to be clinically significant."

According to the news editors, the research concluded: "Additional sources of delivery and biological uncertainty should be investigated to determine the root cause of the observed less favorable postembolization GKRS outcomes."

For more information on this research see: Dosimetric effects of Onyx embolization on Gamma Knife arteriovenous malformation dose distributions. Journal of Neurosurgery, 2016;125():114-122. Journal of Neurosurgery can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

Mycobacterium Infections - Tuberculosis

New Findings Reported from Vanderbilt University Describe Advances in Tuberculosis (Fluoroquinolones for the treatment and prevention of multidrug-resistant tuberculosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Mycobacterium Infections - Tuberculosis have been presented. According to news reporting originating from Nashville, Tennessee, by NewsRx editors, the research stated, "Although fluoroquinolones (FQs) play an important role in the treatment of multidrug-resistant tuberculosis (MDR-TB), there are several issues that need to be addressed to optimize their effectiveness and minimize toxicity."

Our news editors obtained a quote from the research from Vanderbilt University, "This includes identification of the optimal dose of FQs such as levofloxacin (LVX) and moxifloxacin, and the optimal role of FQs in combination with other anti-tuberculosis drugs, particularly those with overlapping toxicity, such as QT prolongation. While the ability of FQs to penetrate into cavities and granulomas is likely beneficial, suboptimal sensitivity of genotypic tests to detect FQ resistance could negatively affect treatment outcomes of FQ-containing regimens."

According to the news editors, the research concluded: "Several trials are underway to evaluate the safety and effectiveness of FQs as part of combination MDR-TB therapy; there are also two planned studies of LVX to prevent tuberculosis among close contacts of MDR-TB."

The news editors report that additional information may be obtained by contacting T.R. Sterling, Vanderbilt University, Sch Med, Vanderbilt TB Center, Nashville, TN 37212, United States.

**Heart Disorders and Diseases - Heart Attack**

**New Findings Reported from Wakayama Medical University Describe Advances in Heart Attack (Local Matrix Metalloproteinase 9 Level Determines Early Clinical Presentation of ST-Segment-Elevation Myocardial Infarction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting from Wakayama, Japan, by NewsRx journalists, research stated, "Early clinical presentation of ST-segment-elevation myocardial infarction (STEMI) and non-ST-segment-elevation myocardial infarction affects patient management. Although local inflammatory activities are involved in the onset of MI, little is known about their impact on early clinical presentation."

The news correspondents obtained a quote from the research from Wakayama Medical University, "This study aimed to investigate whether local inflammatory activities affect early clinical presentation. Approach and Results-This study comprised 94 and 17 patients with MI (STEMI, 69; non-STEMI, 25) and stable angina pectoris, respectively. We simultaneously investigated the culprit lesion morphologies using optical coherence tomography and inflammatory activities assessed by shedding matrix metalloproteinase 9 (MMP-9) and myeloperoxidase into the coronary circulation before and after stenting. Prevalence of plaque rupture, thin-cap fibroatheroma, and lipid arc or macrophage count was higher in patients with STEMI and non-STEMI than in those with stable angina pectoris. Red thrombus was frequently observed in STEMI compared with others. Local MMP-9 levels were significantly higher than systemic levels (systemic, 42.0 [27.9-73.2] ng/mL versus prestenst local, 69.1 [32.2-152.3] ng/mL versus poststenst local, 68.0 [35.6-133.3] ng/mL; P<0.01). Poststenst local MMP-9 level was significantly elevated in patients with STEMI (STEMI, 109.9 [54.5-197.8] ng/mL versus non-STEMI: 52.9 [33.0-79.5] ng/mL; stable angina pectoris, 28.3 [14.2-40.0] ng/mL; P<0.01), whereas no difference was observed in the myeloperoxidase level. Poststenst local MMP-9 and the presence of red thrombus are the independent determinants for STEMI in multivariate analysis. Local MMP-9 level could determine the early clinical presentation in patients with...
According to the news reporters, the research concluded: "Local inflammatory activity for atherosclerosis needs increased attention."

For more information on this research see: Local Matrix Metalloproteinase 9 Level Determines Early Clinical Presentation of ST-Segment-Elevation Myocardial Infarction. *Arteriosclerosis Thrombosis and Vascular Biology*, 2016;36(12):2460-2467. *Arteriosclerosis Thrombosis and Vascular Biology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

**Cytokines**

**New Findings Reported from Wright State University Describe Advances in Cytokines (Hydroxyurea Induces Cytokinesis Arrest in Cells Expressing a Mutated Sterol-14 alpha-Demethylase in the Ergosterol Biosynthesis Pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cytokines. According to news reporting originating in Dayton, Ohio, by NewsRx journalists, research stated, "Hydroxyurea (HU) has been used for the treatment of multiple diseases, such as cancer. The therapeutic effect is generally believed to be due to the suppression of ribonucleotide reductase (RNR), which slows DNA polymerase movement at replication forks and induces an S phase cell cycle arrest in proliferating cells."

The news reporters obtained a quote from the research from Wright State University, "Although aberrant mitosis and DNA damage generated at collapsed forks are the likely causes of cell death in the mutants with defects in replication stress response, the mechanism underlying the cytotoxicity of HU in wild-type cells remains poorly understood. While screening for new fission yeast mutants that are sensitive to replication stress, we identified a novel mutation in the erg11 gene encoding the enzyme sterol-14 alpha-demethylase in the ergosterol biosynthesis pathway that dramatically sensitizes the cells to chronic HU treatment. Surprisingly, HU mainly arrests the erg11 mutant cells in cytokinesis, not in S phase. Unlike the reversible S phase arrest in wild-type cells, the cytokinesis arrest induced by HU is relatively stable and occurs at low doses of the drug, which likely explains the remarkable sensitivity of
the mutant to HU. We also show that the mutation causes sterol deficiency, which may predispose the cells to the cytokinesis arrest and lead to cell death. We hypothesize that in addition to the RNR, HU may have a secondary unknown target(s) inside cells.

According to the news reporters, the research concluded: "Identification of such a target(s) may greatly improve the chemotherapies that employ HU or help to expand the clinical usage of this drug for additional pathological conditions."

For more information on this research see: Hydroxyurea Induces Cytokinesis Arrest in Cells Expressing a Mutated Sterol-14 alpha-Demethylase in the Ergosterol Biosynthesis Pathway. Genetics, 2016;204(3):959-973,169-183. Genetics can be contacted at: Genetics Society America, 9650 Rockville Ave, Bethesda, MD 20814, USA. Gram-Positive Bacteria - Clostridium beijerinckii

New Findings Reported from Xi'an Jiao Tong University Describe Advances in Clostridium beijerinckii [Transcriptional analysis of degenerate strain Clostridium beijerinckii DG-8052 reveals a pleiotropic response to CaCO(3)associated recovery of ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Positive Bacteria - Clostridium beijerinckii have been presented. According to news originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "Degenerate Clostridium beijerinckii strain (DG-8052) can be partially recovered by supplementing CaCO3 to fermentation media. Genome resequencing of DG-8052 showed no general regulator mutated."

Our news journalists obtained a quote from the research from Xi'an Jiao Tong University, "This study focused on transcriptional analysis of DG-8052 and its response to CaCO3 treatment via microarray. The expressions of 5168 genes capturing 98.6% of C. beijerinckii NCIMB 8052 genome were examined. The results revealed that with addition of CaCO3 565 and 916 genes were significantly upregulated, and 704 and 1044 genes significantly down-regulated at acidogenic and solventogenic phase of DG-8052, respectively. These genes are primarily responsible for glycolysis to solvent/acid production (poR, pfo), solventogenesis (buk, ctf, adh, bcd) and sporulation (spo0A, sigE, sigma-70, bofA), cell motility and division (ftsA, ftsK, ftsY, ftsH, ftsE, mreB, mreC, mreD, rodA), and molecular chaperones (grpE, dnaK, dnaJ, hsp20, hsp90), etc. The functions of some altered genes in DG-8052, totalling 5.7% at acidogenisis and 8.0% at sovlento genisis, remain unknown. The response of the degenerate strain to CaCO3 was suggested significantly pleiotropic. This study reveals the
multitude of regulatory function that CaCO3 has in clostridia and provides detailed insights into
degeneration mechanisms at gene regulation level."

According to the news editors, the research concluded: "It also enables us to develop
effective strategies to prevent strain degeneration in future."

For more information on this research see: Transcriptional analysis of degenerate
strain Clostridium beijerinckii DG-8052 reveals a pleiotropic response to CaCO(3)associated
recovery of solvent production. Scientific Reports, 2016;6():1-14. Scientific Reports can be

Oncology - Breast Cancer

New Findings Reported from Zhejiang University Describe Advances in
Breast Cancer (MicroRNA-200c delivered by solid lipid nanoparticles
enhances the effect of paclitaxel on breast cancer stem cell)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to
news reporting originating from Hangzhou, People's Republic of China, by NewsRx
 correspondents, research stated, "One of the major obstacles in the treatment of breast cancer is
breast cancer stem cells (BCSC) which are resistant to standard chemotherapeutic drugs. It has
been proven that microRNA-200c (miR-200c) can restore sensitivity to microtubule-targeting
chemothera-peutic drugs by reducing the expression of class III beta-tubulin."

Our news editors obtained a quote from the research from Zhejiang University, "In
this study, combination therapy with miR-200c and paclitaxel (PTX) mediated by lipid
nanoparticles was investigated as an alternative strategy against BCSC. A cationic lipid 1,2-
dioleoyl-3-trimethylammonium-propane was strategically selected to formulate solid lipid
nanoparticles (SLN) for miR-200c delivery. Nanostructured lipid carriers (NLC) with 20 wt%
oleic acid were prepared for PTX delivery. Mammospheres, which gained the characteristics of
BCSC, were used as a cell model to evaluate the efficiency of combination therapy. The cationic
SLN could condense anionic miRNA to form SLN/miRNA complexes via charge interactions
and could protect miRNA from degradation by ribonuclease. SLN/miR-200c complexes
achieved 11.6-fold expression of miR-200c after incubation for 24 hours, compared with that of
Lipofectamine T 2000/miR-200c complexes (*P <0.05). Intracellular drug release assay proved
that miRNA can be released from SLN/miRNA complexes efficiently in 12 hours after cellular
uptake. After BCSC were transfected with SLN/miR-200c, the expression of class III beta-
tubulin was effectively downregulated and the cellular cytotoxicity of PTX-loaded NLC (NLC/PTX) against BCSC was enhanced significantly (*P <0.01). The results indicated that the cationic SLN could serve as a promising carrier for miRNA delivery.

According to the news editors, the research concluded: "In addition, the combination therapy of miR-200c and PTX revealed a novel therapeutic strategy for the treatment of BCSC."

For more information on this research see: MicroRNA-200c delivered by solid lipid nanoparticles enhances the effect of paclitaxel on breast cancer stem cell. International Journal of Nanomedicine, 2016;11():6713-6725. International Journal of Nanomedicine can be contacted at: Dove Medical Press Ltd, PO Box 300-008, Albany, Auckland 0752, New Zealand.

Oncology - Lung Cancer

New Findings from A. Sayar and Co-Researchers in the Area of Lung Cancer Described (The incidence of hoarseness after mediastinoscopy and outcome of video-assisted versus conventional mediastinoscopy in lung cancer staging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting originating from Istanbul, Turkey, by NewsRx correspondents, research stated, "Theoretically, video-assisted mediastinoscopy (VM) should provide a decrease in the incidence of hoarseness in comparison with conventional mediastinoscopy (CM). An investigation of 448 patients with the NSCLC who underwent mediastinoscopy (n = 261 VM, n = 187 CM) between 2006 and 2010."

Our news editors obtained a quote from the research, "With VM, the mean number of sampled LNs and of stations per case were both significantly higher (n = 7.91 +/- 1.97 and n = 4.296 +/- 0.81) than they were for CM (n = 6.65 +/- 1.79 and n = 4.14 +/- 0.84) (p < 0.001 and p = 0.06). Hoarseness was reported in 24 patients (5.4%) with VM procedures resulting in a higher incidence of hoarseness than did CM procedures (6.9% and 3.2%) (p = 0.08). The incidence of hoarseness was observed to be more frequent in patients with left- lung carcinoma who had undergone a mediastinoscopy (p = 0.03). Hoarseness developed in 6% of the patients sampled at station 4L, whereas this ratio was 0% in patients who were not sampled at 4L (p =
A multivariate analysis showed that the presence of a tumor in the left lung is the only independent risk factor indicating hoarseness (p = 0.09). The sensitivity, NPV, and accuracy of VM were calculated as to be 0.87, 0.95, and 0.96, respectively. The same staging values for CM were 0.83, 0.94, and 0.95, respectively. VM, the presence of a tumor in the left-lung, and 4L sampling via mediastinoscopy are risk factors for subsequent hoarseness.

According to the news editors, the research concluded: "Probably due to a wider area of dissection, VM can lead to more frequent hoarseness."

The news editors report that additional information may be obtained by contacting N. Citak, Res & Educ Hosp, Yedikule Thorac Surg & Chest Dis, Istanbul, Turkey. Additional authors for this research include N. Citak, S. Buyukkale, M. Metin, A. Kok, A. Celikten and A. Gurses.

Oncology - Prostate Cancer

New Findings from A.J. Lomax and Co-Authors in the Area of Prostate Cancer Reported ('First, do no harm': managing the metabolic impacts of androgen deprivation in men with advanced prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Prostate Cancer. According to news reporting originating from Melbourne, Australia, by NewsRx correspondents, research stated, "Androgen deprivation therapy (ADT) is a standard systemic treatment for men with prostate cancer. Men on ADT may be elderly and have comorbidities that are exacerbated by ADT, such as cardiovascular disease, diabetes, obesity, sedentary lifestyle and osteoporosis."

Our news editors obtained a quote from the research, "Studies on managing the impacts of ADT have focused on men with non-metastatic disease, where ADT is given for a limited duration. However, some men with advanced or metastatic prostate cancer will achieve long-term survival with palliative ADT and therefore also risk morbidity from prolonged ADT. Furthermore, ADT is continued during the use of other survival-prolonging therapies for men with advanced disease, and there is a general trend to use ADT earlier in the disease course. As survival improves, management of the metabolic effects of ADT becomes important for maintaining both quality and quantity of life."

According to the news editors, the research concluded: "This review will outline the current data, offer perspectives for management of ADT complications in men with advanced prostate cancer and discuss avenues for further research."

For more information on this research see: 'First, do no harm': managing the

Blood Diseases and Conditions - Sepsis

New Findings from A.J. Rahbar and Co-Authors in the Area of Sepsis Reported (Pharmacokinetic and Pharmacodynamic Evaluation of Doripenem in Critically Ill Trauma Patients with Sepsis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Blood Diseases and Conditions - Sepsis. According to news reporting from Las Vegas, Nevada, by NewsRx journalists, research stated, "Doripenem is approved by the Food and Drug Administration for the treatment of patients with complicated intra-abdominal infections and complicated urinary tract infections. While studies have described the pharmacokinetics/pharmacodynamics (PK/PD) of doripenem in the critically ill, no study has described the probability of target attainment profile among trauma patients with sepsis."

The news correspondents obtained a quote from the research, "This study was a prospective, open-label, pharmacokinetic study in the surgical intensive care unit (SICU) at Grady Health System. Thirty trauma patients with sepsis admitted to the SICU received doripenem 1g infused over 4hours every 8hours for three doses. Blood samples were taken just before and after the third dose. A two-compartment model was fit to the data using non-parametric population PK modeling software. Embedded with the final PK model, a Monte Carlo Simulations (MCS) was performed to determine the PK/PD profile of doripenem 1g, infused over 4hours, every 8hours after administration of the first and fourth doses. Overall, the model fit the data well, and mean (standard deviation) clearance and volume of the central compartment were 16.9 (11.4) L/h and 28.5 (16.0) L, respectively. In the MCS analyses, doripenem 1g, infused over 4hours, administered every 8hours, conferred >90% probabilities of achieving 30-50% time greater than the minimum inhibitory concentration (30-50% T>MIC) for MICs 2mg/L after infusion of both the first and fourth doses. The MCS indicated that more intensive doripenem dosing schemes should be considered for organisms with MIC values in excess of 2mg/L. This is the first study to describe the doripenem PK/PD in critically ill patients with trauma."

According to the news reporters, the research concluded: "Among these patients, the MCS analyses suggest that current dosing strategies may be ineffective when the MIC value for
the infecting pathogen is expected to be above 2mg/L."

For more information on this research see: Pharmacokinetic and Pharmacodynamic Evaluation of Doripenem in Critically Ill Trauma Patients with Sepsis. Surgical Infections, 2016;17(6):675-682. significant predictor for MACE-free survival (p=0.010). CCTA revealed obstructive CAD in 11.7% of patients, with no significant difference between patients with a low and intermediate/high HEART score, respectively 10.7% and 13.2% (p=0.29). The ability of the HEART score to identify obstructive CAD was poor with an AUC of the receiver operating characteristics curve of 0.53. The HEART score does not adequately identify patients with obstructive CAD at CCTA. It does however predict occurrence of MACE in medium-term follow-up. Excluding patients from additional testing based solely on a low HEART score may lead to suboptimal patient management.”

According to the news editors, the research concluded: "CCTA had important implications on patient management and may be a more appropriate tool to further stratify risk in ED chest pain patients.”

For more information on this research see: Discriminative Power of the HEART Score for Obstructive Coronary Artery Disease in Acute Chest Pain Patients Referred for CCTA. Critical Pathways In Cardiology, 2016;15(1):6-10. (Lippincott Williams and Wilkins - www.lww.com; Critical Pathways In Cardiology - journals.lww.com/critpathcardio/pages/default.aspx)

Angiology

New Findings from Academic Medical Center in Angiology Provides New Insights (Carotid plaque fissure: An underestimated source of intraplaque hemorrhage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Angiology are presented in a new report. According to news reporting from Amsterdam, Netherlands, by NewsRx journalists, research stated, "Plaque fissuring, a phenomenon morphologically distinct from the classical rupture of a thinned fibrous cap, has not been well characterized in carotid atherosclerosis. The aim of this study was to establish the prevalence of plaque fissures in advanced carotid plaques with an otherwise intact luminal surface, and to determine whether they might be a source of intraplaque hemorrhage (IPH).”

The news correspondents obtained a quote from the research from Academic Medical Center, "We evaluated 244 surgically intact, 'en bloc' embedded, serially sectioned carotid endarterectomy specimens and included only those plaques with a grossly intact luminal
surface. Among the 67 plaques with grossly intact luminal surface, cap fissure was present in 39 (58%) plaques. A total of 60 individual fissures were present, and longitudinally mean fissure length was 1.3 mm. Most fissures were found distal to the bifurcation (63%), proximal to the stenosis (88%), and in the posterior (opposite the flow divider) or lateral quadrants (80%). 36% of the fissures remained in the superficial third of the plaque. 52% extended from the lumen surface to the middle third of the plaque and 12% reached the outer third of the plaque on cross section. Fissures often occurred between two tissue planes and were connected to IPH (fresh: 63%; any type: 92%) and calcifications (43%). No correlation was found with patient characteristics such as symptom status, carotid stenosis, hypertension, diabetes, smoking and medications (statins or antiplatelet agents). Plaque fissures are common in advanced carotid plaques with an otherwise grossly intact luminal surface and are associated with fresh intraplaque hemorrhage.

According to the news reporters, the research concluded: "As they occur on the interface between plaque components with different mechanical properties, further biomechanical studies are needed to unravel the underlying failure mechanisms."

Our news journalists report that additional information may be obtained by contacting M.J. Daemen, Academy Med Center, Dept. of Pathol, NL-1105 AZ Amsterdam, Netherlands. Drugs and Therapies - Anxiolytics Sedatives and…

**New Findings from Affiliated Hospital Update Understanding of Anxiolytics Sedatives and Hypnotics (Chloral Hydrate Treatment Induced Apoptosis of Macrophages via Fas Signaling Pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Anxiolytics Sedatives and Hypnotics have been published. According to news reporting originating in Guangdong, People’s Republic of China, by NewsRx journalists, research stated, "There are recent reports on several anesthetics that have anti-inflammatory and anti-infective effects apart from their uses for pain relief and muscle relaxation. Chloral hydrate is a clinical anesthetic drug and sedative that has also been reported to attenuate inflammatory response, but the mechanisms are not clearly understood."

The news reporters obtained a quote from the research from Affiliated Hospital,
"This study investigated the effect of chloral hydrate treatment on the apoptosis of macrophages and explored the underlying mechanisms. RAW264.7 macrophages were treated with various concentrations of chloral hydrate for various lengths of time. Morphological changes were observed under a light microscope and apoptosis was detected with annexin-V-FITC/PI double-staining assay, Hoechst 33258 and DNA ladder assay, the expression of Fas/FasL was detected with a flow cytometer, and the Fas signaling pathway was assessed by Western blotting. The results showed that chloral hydrate treatment induced the morphology of RAW264.7 macrophages to change shape from typical fusiform to round in a concentration-and time-dependent manner, and was finally suspended in the supernatant. For the induction of apoptosis, chloral hydrate treatment induced the apoptosis of RAW264.7 macrophages from early-to-late stage apoptosis in a concentration-and time-dependent manner. For the mechanism, chloral hydrate treatment induced higher expression of Fas on RAW264.7 macrophages, and was also associated with changes in the expression of proteins involved in Fas signaling pathways."

According to the news reporters, the research concluded: "Chloral hydrate treatment can induce the apoptosis of RAW264.7 macrophages through the Fas signaling pathway, which may provide new options for adjunctive treatment of acute inflammation."

For more information on this research see: Chloral Hydrate Treatment Induced Apoptosis of Macrophages via Fas Signaling Pathway. *Medical Science Monitor*, 2016;22 ():4836-4843. *Medical Science Monitor* can be contacted at: Int Scientific Literature, Inc, 361 Forest Lane, Smithtown, NY 11787, USA.

b-catenin to participate in these pro-metastatic protein/protein interactions has been proposed in this work."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the Affiliated Hospital of Nanjing University School of Medicine, "This method employs cost-effective peptide-based protein targeting ligands, while the electrochemical catalytic cross-linking in this method also 'finalize' the noncovalent molecular recognition, so that the robustness can be improved to enable detection of relatively more complex biosamples. In studying clinical samples with the proposed method, the cellular distribution and overall expression of b-catenin show a parallel with the pathological grade of the sample, particularly, nuclear translocation. The pro-metastatic activation of b-catenin can also be observed as evidently correlated with higher-grade cases, suggesting the active role of b-catenin in promoting metastasis."

According to the news editors, the research concluded: "According to these results, the proposed method may have the prospective use as a prognostic tool for evaluating the potential of invasion and metastasis in cancer."

For more information on this research see: Electrochemical Detection and Distribution Analysis of b-Catenin for the Evaluation of Invasion and Metastasis in Hepatocellular Carcinoma. *Analytical Chemistry*, 2016;88(7):3879-84. *Digestive System Diseases and Conditions - Crohn's. . .

**New Findings from Ain Shams University in the Area of Crohn's Disease Reported (Does Helicobacter pylori eradication therapy trigger or protect against Crohn's disease?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Crohn's Disease. According to news reporting out of Cairo, Egypt, by NewsRx editors, the research stated, "Helicobacter pylori (H. pylori) infection is involved in multiple gastrointestinal and extra-gastrointestinal disorders. This review focuses on possible link between H. pylori eradication and Crohn's disease (CD) which is a chronic inflammatory bowel disease (IBD)."

Our news journalists obtained a quote from the research from Ain Shams University, "Fecal calprotectin and; to lesser extent; fecal lactoferrin are sensitive and specific markers for
monitoring CD activity. Data about link between H. pylori eradication and CD are limited and inconclusive. The infection likely shifts equilibrium between T helper 1 (Th1) and Th2 immune responses to the Th2 pattern. In subjects genetically predisposed to CD (a Th1-related disease), H. pylori eradication increases Th1 proinflammatory cytokines causing development of CD. In contrast, clarithromycin and/or proton pump inhibitors that are used to eradicate H. pylori can suppress Th1 factors, and theoretically can protect against CD, but there are no data to support this supposition. This Th1/Th2 approach seems very simplistic. Another theory is that alterations in gut microbiota form 'continuous antigenic stimulation' predisposing to IBD. H. pylori infection can inhibit such stimulation through activation of regulatory T cells, and thus eradication may predispose to CD. Probiotics weren't found useful in treatment of CD. The reported data about link between H. pylori eradication and CD are currently limited."

According to the news editors, the research concluded: "Case reports, suggesting a positive association between both conditions, provide a very little evidence. On eradicating H. pylori in CD patients and/or patients with high risk for CD, patient counseling and follow-up in addition to measuring fecal calprotectin may help monitor CD activity."

Our news journalists report that additional information may be obtained by contacting H.A. Murad, Ain Shams University, Cairo, Egypt.

Keywords for this news article include: Cairo, Egypt, Africa, Inflammatory Bowel Diseases and Conditions, Digestive System Diseases and Conditions, Gastrointestinal Diseases and Conditions, Parasitic Diseases and Conditions, Therapy, Article Review, Gram-Negative Bacteria, Epsilonproteobacteria, Helicobacter pylori, Gastroenterology, Crohn's Disease, Gastroenteritis, Proteobacteria, Genetics, Ain Shams University.

Oncology - Ovarian Cancer

New Findings from Ajou University Update Understanding of Ovarian Cancer (Total parietal peritonectomy with en bloc pelvic resection for advanced ovarian cancer with peritoneal carcinomatosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Ovarian Cancer. According to news reporting from Suwon, South Korea, by NewsRx journalists, research stated, "The majority of advanced ovarian cancer patients have peritoneal carcinomatosis involving from the pelvis to upper abdomen, which is a major obstacle to optimal cytoreduction. Since total parietal peritonectomy was introduced for treating peritoneal carcinomatosis from colorectal cancer [3], similar surgical techniques including pelvic peritonectomy have been applied in advanced ovarian cancer with peritoneal carcinomatosis [1], and these can increase the rate of complete cytoreduction up to 60% [2]."

The news correspondents obtained a quote from the research from Ajou University, "However, there are few reports on total parietal peritonectomy for ovarian cancer patients. In this surgical film, we showed total parietal peritonectomy with en bloc pelvic resection for
treating advanced ovarian cancer with peritoneal carcinomatosis. A 43 years-old woman was diagnosed with high-grade serous carcinoma of the ovary after right adnexectomy. Computed tomography demonstrated subdiaphragmatic involvements, omental cake, lymph node metastases and huge pelvic mass infiltrating the uterus, cul-de-sac, and pelvic peritoneum. Primary debulking surgery was considered because of a high likelihood for complete cytoreduction. First, the whole abdomen and pelvis were adequately exposed and the visceral organs thoroughly mobilized. Then, the parietal peritoneum was dissected from the subdiaphragmatic, paracolic and pelvic areas. Tumor-infiltrated visceral organs such as the uterus, adnexae, rectosigmoid colon and cul-de-sac were resected en bloc with the parietal peritoneum (Fig. 1)."

According to the news reporters, the research concluded: "Total parietal peritoneectomy with en bloc pelvic resection is a feasible procedure for removing peritoneal metastasis in advanced ovarian cancer patients, which contributes to optimal cytoreduction improving prognosis."

For more information on this research see: Total parietal peritoneectomy with en bloc pelvic resection for advanced ovarian cancer with peritoneal carcinomatosis. *Gynecologic Oncology*, 2016;143(3):688-689. *Gynecologic Oncology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Oncology - Breast Cancer

**New Findings from Alexandra Hospital in Breast Cancer Provides New Insights (Adding the power of iodinated contrast media to the credibility of mammography in breast cancer diagnosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting from Athens, Greece, by NewsRx journalists, research stated, "Dual-energy contrast-enhanced spectral mammography (CESM) represents a relatively new diagnostic tool adjunct to mammography. The aim of this study was to strengthen the breast imaging-reporting and data system (BIRADS) classification score in order to improve early breast cancer diagnosis."

The news correspondents obtained a quote from the research from Alexandra Hospital, "For this reason, we propose a sum score, termed malignancy potential score (MPS),
incorporating the standard BIRADS score and our proposed CESM score. From September 2014 to September 2015, 216 females (age range, 26-85 years; mean age 54.6 years) underwent CESM evaluation of mammographic findings that were primarily assessed as BIRADS 2-5. 10 of these patients had bilateral findings; a total of 226 lesions were examined. High-energy image evaluation was based on the intensity of contrast enhancement of the lesion compared with background enhancement, categorized as Type -1, 0, 1 or 2 enhancement. Histopathology reports were compared with imaging assessment. 98 of 226 lesions were malignant and 128 of 226 lesions were benign. The area under the curve was 0.843, 0.888 and 0.917 for mammographic BIRADS score, CESM score and MPS, respectively, with p-value < 0.05. The sensitivity, specificity and accuracy rates were 91.83, 80.47 and 85.40%, respectively, when a best MPS cut-off point of 4 was used. The malignancy potential score (MPS) has higher diagnostic performance than digital mammography or CESM alone."

According to the news reporters, the research concluded: "MPS empowers the credibility of the digital mammography BIRADS score and our proposed type of enhancement in dual-energy CESM and is a diagnostic tool that increases the accuracy rate in early breast cancer diagnosis."

Our news journalists report that additional information may be obtained by contacting C. Gkali, Alexandra Hosp, Dept. of Radiol, Athens, Greece. Additional authors for this research include C. Gkali, A. Chalazonitis, E. Feida, D.E. Vlachos, F. Zagouri, I. Rellias and C. Dimitrakakis.

Keywords for this news article include: Athens, Greece, Europe, Contrast Media, Article Review, Diagnostics and Screening, Breast Cancer Screening, Carcinoma Diagnostics, Risk and Prevention, Cancer Diagnostics, Women's Health, Mammography, Mammogram, Oncology, Alexandra Hospital.

Blood Diseases and Conditions - Sepsis

New Findings from Alice Springs Hospital in Sepsis Provides New Insights (Optimising meropenem dosing in critically ill Australian Indigenous patients with severe sepsis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Blood Diseases and Conditions - Sepsis. According to news reporting out of Alice Springs, Australia, by NewsRx editors, research stated, "Currently there are no pharmacokinetic (PK) data to guide antibiotic dosing in critically ill Australian Indigenous patients with severe sepsis. This study aimed to determine whether the population pharmacokinetics of meropenem were different between critically ill Australian Indigenous and critically ill Caucasian patients."

Funders for this research include National Health and Medical Research Council of Australia, Australian Academy of Science's Douglas and Lola Douglas Scholarship, Alice Springs Specialists' Private Practice Trust Fund, Australian National Health and Medical...
Research Council Fellowship, Australian National Health and Medical Research Council for the Centres of Research Excellence.

Our news journalists obtained a quote from the research from Alice Springs Hospital, "Serial plasma and urine samples as well as clinical and demographic data were collected over two dosing intervals from critically ill Australian Indigenous patients. Plasma meropenem concentrations were assayed by validated chromatography. Concentration-time data were analysed with data from a previous PK study in critically ill Caucasian patients using Pmetrics. The population PK model was subsequently used for Monte Carlo dosing simulations to describe optimal doses for these patients. Six Indigenous and five Caucasian subjects were included. A two-compartment model described the data adequately, with meropenem clearance and volume of distribution of the central compartment described by creatinine clearance (CLCr) and patient weight, respectively. Patient ethnicity was not supported as a covariate in the final model. Significant differences were observed for meropenem clearance between the Indigenous and Caucasian groups [median 11.0 (range 3.0-14.1) L/h vs. 17.4 (4.3-30.3) L/h, respectively; \( P < 0.01 \)]. Standard dosing regimens (1 g intravenous every 8 h as a 30-min infusion) consistently achieved target exposures at the minimum inhibitory concentration breakpoint in the absence of augmented renal clearance."

According to the news editors, the research concluded: "No significant interethnic differences in meropenem pharmacokinetics between the Indigenous and Caucasian groups were detected and CLCr was found to be the strongest determinant of appropriate dosing regimens."

Our news journalists report that additional information may be obtained by contacting D. Tsai, Alice Springs Hosp, Dept. of Pharm, Alice Springs, NT, Australia. **Central Nervous System Diseases and Conditions**

**New Findings from All India Institute of Medical Sciences Describe Advances in Epilepsy (Behavioral effects and somnolence due to levetiracetam versus oxcarbazepine - a retrospective comparison study of North Indian patients with refractory ...)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions - Epilepsy have been presented. According to news reporting from New Delhi, India, by NewsRx journalists, research stated, "Levetiracetam (LEV) is often chosen early in the treatment of refractory epilepsy; however, its adverse effects have largely been studied as part of clinical trials. Oxcarbazepine and valproate (VPA) are the other commonly used AEDs and, hence, serve as good comparators."

The news correspondents obtained a quote from the research from the All India Institute of Medical Sciences, "This study was conducted to evaluate behavioral abnormalities and somnolence among patients with epilepsy being treated with LEV and/or OXC compared with those receiving VPA. Data of consecutive patients attending our intractable epilepsy clinic over a 2 1/2-year period were reviewed, and patients with at least one seizure a month, who had been initiated on either or a combination of LEV, VPA, or OXC, were included for analysis. Data regarding behavioral adverse effects, daytime somnolence (EDS), and weight changes were collected apart from those regarding any major effect necessitating dose reduction or discontinuation of the AED. Among a total of 445 patients screened, 292 (93 F, median age: 21 years [range: 8-54]; 237 focal and 55 generalized epilepsy) fulfilled inclusion criteria. Median epilepsy duration was 11 years. Levetiracetam had been introduced in 114 patients, VPA in 134, and OXC in 151 during the study period. Twenty-three were on LEV + OXC, 27 on LEV + VPA, and 33 on VPA + OXC. Behavioral disturbances (irritability, obsessive manifestations, aggressiveness, and frank psychosis) were observed in 43 patients; 23 on introduction of LEV (20.2%); LEV was discontinued in 10 (9%). Daytime somnolence was reported by 28 patients, 15 on OXC (10%); 8 received oral modafinil for the same, while none discontinued this AED. Only one patient on LEV and 3 on VPA reported EDS. Menstrual disturbances were reported by 9, weight gain by 3, and severe hair loss by 2 females on VPA. Behavioral disturbances with levetiracetam are common among patients with refractory epilepsy while somnolence is common with oxcarbazepine."

According to the news reporters, the research concluded: "Antiepileptic drugs should be selected with this in perspective."

For more information on this research see: Behavioral effects and somnolence due to levetiracetam versus oxcarbazepine - a retrospective comparison study of North Indian patients with refractory epilepsy. *Epilepsy & Behavior*, 2016;64():216-218. *Epilepsy & Behavior* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Epilepsy & Behavior - www.journals.elsevier.com/epilepsy-and-behavior/)

Eye Diseases and Conditions - Retinoblastoma

New Findings from All India Institute of Medical Sciences in Retinoblastoma Provides New Insights (Epigenetic regulation of human retinoblastoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Eye Diseases and Conditions - Retinoblastoma is the subject of a report. According to news reporting originating in New Delhi, India, by NewsRx journalists, research stated, "Retinoblastoma is a rare type of eye cancer of the retina that commonly occurs in early childhood and mostly affects the children before the age of 5. It occurs due to the mutations in the retinoblastoma gene (RB1) which inactivates both alleles of the RB1. RB1 was first identified as a tumor suppressor gene, which regulates cell cycle components and associated with retinoblastoma."

The news reporters obtained a quote from the research from the All India Institute of Medical Sciences, "Previously, genetic alteration was known as the major cause of its occurrence, but later, it is revealed that besides genetic changes, epigenetic changes also play a significant role in the disease. Initiation and progression of retinoblastoma could be due to independent or combined genetic and epigenetic events. Remarkable work has been done in understanding retinoblastoma pathogenesis in terms of genetic alterations, but not much in the context of epigenetic modification. Epigenetic modifications that silence tumor suppressor genes and activate oncogenes include DNA methylation, chromatin remodeling, histone modification and noncoding RNA-mediated gene silencing. Epigenetic changes can lead to altered gene function and transform normal cell into tumor cells. This review focuses on important epigenetic alteration which occurs in retinoblastoma and its current state of knowledge."

According to the news reporters, the research concluded: "The critical role of epigenetic regulation in retinoblastoma is now an emerging area, and better understanding of epigenetic changes in retinoblastoma will open the door for future therapy and diagnosis."

For more information on this research see: Epigenetic regulation of human retinoblastoma. Tumor Biology, 2016;37(11):14427-14441. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

New Findings from Almirall S.A. in the Area of Structural Biology Reported
(Biphenyl Pyridazinone Derivatives as Inhaled PDE4 Inhibitors: Structural Biology and Structure-Activity Relationships)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Structural Biology are discussed in a new report. According to news reporting from Barcelona, Spain, by NewsRx journalists, research stated, "Cyclic nucleotide cAMP is a ubiquitous secondary messenger involved in a plethora of cellular responses to biological agents involving activation of adenylyl cyclase. Its intracellular levels are tightly controlled by a family of cyclic nucleotide degrading enzymes, the PDEs."

The news correspondents obtained a quote from the research from Almirall S.A., "In recent years, cyclic nucleotide phosphodiesterase type 4 (PDE4) has aroused scientific attention as a suitable target for anti-inflammatory therapy in respiratory diseases, particularly in the management of asthma and COPD. Here we describe our efforts to discover novel, highly potent inhaled inhibitors of PDE4. Through structure based design, with the inclusion of a variety of functional groups and physicochemical profiles in order to occupy the solvent filled pocket of the PDE4 enzyme, we modified the structure of our oral PDE4 inhibitors to reach compounds down to picomolar enzymatic potencies while at the same time tackling successfully an uncovered selectivity issue with the adenosine receptors."

According to the news reporters, the research concluded: "In vitro potencies were demonstrated in a rat lung neutrophilia model by administration of a suspension with a Penn-Century Micro Sprayer Aerosolizer."

Our news journalists report that additional information may be obtained by contacting J. Gracia, Almirall SA, Center Invest & Desarrollo, Medical Chem & Screening, Barcelona 08980, Spain. Additional authors for this research include M.A. Buil, J. Castro, P. Eichhorn, M. Ferrer, A. Gavalda, B. Hernandez, V. Segarra, M.D. Lehner, I. Moreno, L. Pages, R.S. Roberts, J. Serrat, S. New Findings from Amiens University Hospital Update Understanding of Antibiotics (Tolerability and Plasma Drug Level Monitoring of Prolonged Subcutaneous Teicoplanin Treatment for Bone and Joint Infections)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antibiotics.

According to news reporting out of Amiens, France, by NewsRx editors, research stated, "Teicoplanin is a key drug for the treatment of multiresistant staphylococcal bone and joint infections (BJI), yet can only be administered via a parenteral route. The objective of this study was to evaluate the safety and tolerability of subcutaneous (s.c.) teicoplanin for that indication over 42 days."

Our news journalists obtained a quote from the research from Amiens University Hospital, "Thirty patients with Gram-positive cocci BJI were included. Once the target of 25 to 40 mg/liter trough serum concentration was achieved, treatment was switched from an intravenous to an s.c. route. No discontinuation of teicoplanin related to injection site reaction and no severe local adverse event were observed."

According to the news editors, the research concluded: "On multivariate analysis, better tolerability was observed at the beginning of treatment, in patients over 70 years old, and for dosages less than 600 mg. we recommend s.c. administration of teicoplanin when needed."

For more information on this research see: Tolerability and Plasma Drug Level Monitoring of Prolonged Subcutaneous Teicoplanin Treatment for Bone and Joint Infections. Antimicrobial Agents and Chemotherapy, 2016;60(10):6365-6368. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news journalists report that additional information may be obtained by contacting Y. El Samad, Amiens Univ Hosp, Dept. of Infect Dis, Amiens, France. New Findings from Anna University in Plethysmography Provides New Insights (An adaptive delineator for photoplethysmography waveforms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Plethysmography. According to news originating from Tamil Nadu, India, by NewsRx correspondents, research stated, "Photoplethysmography (PPG) waveforms are rich in cardiovascular information, and hence, their analysis is significant in the diagnosis and prevention of cardiovascular diseases (CVDs). The second derivative of photoplethysmography (SDPPG) analysis for the accurate detection of significant points in characterising the PPG waveform is challenging."

Our news journalists obtained a quote from the research from Anna University, "In this paper, a SDPPG analysis algorithm is proposed based on a resampling technique which normalises the signal and ensures the presence of all significant points of interest in all its recurrences. The proposed delineator detects a, b and e waves in SDPPG, which are based on the combined analysis of PPG waveforms and their second derivatives, characterising them beat-by-beat by electrocardiogram (ECG) signals. Experiments have been conducted on 46 PPG signal records, each of 10-s duration with low and varying amplitudes, and regular and irregular heart rhythms for healthy adults, as well as unhealthy and aged patients obtained from the large-scale openly available database PhysioNet."

According to the news editors, the research concluded: "Based on the experiments conducted, it is found that the proposed algorithm performs better than existing methods in terms of sensitivity and positive predictivity with a highest sensitivity of 99.84% with respect to a (onset) and b waves, 99.67% for e waves (dicrotic notch), and 100% of positive predictivity for a and b waves and 99.82% in case of e waves."

The news correspondents report that additional information may be obtained from M. Soundararajan, Anna University, Chennai, Tamil Nadu, India. Additional authors for this research include S. Arunagiri and S. Alagala.

Keywords for this news article include: Tamil Nadu, India, Asia, Diagnostic Techniques and Procedures, Photoplethysmography, Cardiovascular, Cardiology, Diagnosis, Anna University.

New Findings from Aristotle University in the Area of Skin Cancer Reported (Skin cancer risk in outdoor workers: a European multicenter case-control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Skin Cancer are presented in a new report.
According to news reporting originating from Thessaloniki, Greece, by NewsRx correspondents, research stated, "Exposure to ultraviolet radiation (UVR) is the most important external risk factor for skin cancer. Outdoor workers, who are exposed to high ambient UVR levels are at increased risk."

Financial supporters for this research include European Commission, Leo Pharma, European Public Health Agency.

Our news editors obtained a quote from the research from Aristotle University, "To compare outdoor with indoor workers in terms of: (i) skin cancer risk factors, and (ii) risk of developing skin cancer. Using descriptive methods and a large multicenter European case-control study, we compared risk factor patterns between outdoor (N=1416) and indoor workers (N=1863). Risk of developing basal cell carcinoma (BCC), squamous cell carcinoma (SCC), melanoma and actinic keratosis (AK) were analysed by type of work using multivariate logistic regression models, for three categories of work: indoor; farming/construction; other outdoor work. Although skin phototype was equally distributed by type of work, significantly less outdoor than indoor workers used sunscreen in their own country (44.3% vs. 60.2%), but had more outdoor hobbies (66.2% vs. 58.2%). Outdoor workers had lower educational levels, and felt less confident in understanding medical information and filling medical forms (all p<0.001). Outdoor workers had more signs of photodamage (78.1% vs. 65.5%) and among the skin cancer patients, 37.7% of outdoor workers vs. 28.6% of indoor workers had (>=)2 skin cancers diagnosed during their lifetime. Multivariate logistic regression models showed significantly increased risk of outdoor vs. indoor work for AK (ORother outdoor=1.55, ORfarming/construction=2.58), SCC (ORother outdoor=1.32, ORfarming/construction=2.77) and BCC (ORother outdoor=1.53, ORfarming/construction=1.83). No significant associations were found for melanoma. The risk of all types of skin cancer and AK was significantly increased for workers with (>=)5 years of outdoor work. Outdoor workers had more risk behaviour with similar constitutional skin cancer risk factors: more UV exposure (both occupational and leisure) and less sunscreen use and lower health literacy."

According to the news editors, the research concluded: "This results in higher exposure, more photodamage and an increased risk of developing AK, BCC and SCC."

The news editors report that additional information may be obtained by contacting M. Trakatelli, Dept. of Dermatology, Papageorgiou Hospital, Aristotle University of Thessaloniki, Thessaloniki, Greece. Additional authors for this research include K. Barkitzi, C. Apap, S. Majewski and E. De Vries.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jdv.13603. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Greece, Europe, Oncology, Cancer Risk, Skin Cancer, Thessaloniki, Skin Neoplasms, Basal Cell Cancer, Risk and Prevention, Basal Cell Carcinoma, Squamous Cell Carcinoma, Diagnostics and Screening.

Immune System Diseases and Conditions - HIV/AIDS

New Findings from Autonomous University Describe Advances in HIV/AIDS (Vulvar intraepithelial neoplasia: clinical presentation, management and outcomes in women infected with HIV)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immune System Diseases and Conditions - HIV/AIDS is the subject of a report. According to news reporting originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Immunocompromised patients are at increased risk of developing preinvasive lesions of the lower genital tract. There are a limited number of studies on vulvar intraepithelial neoplasia (VIN) in HIV-positive women."

Our news editors obtained a quote from the research from Autonomous University, "We aimed to review the clinical presentation of VIN, management and survival outcomes in this group of patients. Observational cohort study. Data was collected from women diagnosed with VIN at the Hospital Vall d'Hebron between September 1994 and October 2011. The main outcome measures were recurrence-free survival (RFS) and progression-free survival (PFS). Risk factors for recurrence and progression were assessed using univariate and multivariate analyses. Thirty-seven out of 107 women were HIV positive (34.6%). The median follow-up time was 32 (range 12-179) months. Compared with the HIV-negative group, HIV-positive women were younger (median age 37 vs. 44 years, p=0.003) and presented with multifocal and multicentric disease more frequently (63.6 vs. 22.2% and 84.8 vs. 43.3%, respectively, p <0.0001). RFS and PFS were lower in the HIV-positive group (42.4 vs. 71.4% p=0.043 and 69.7 vs. 95.2% p=0.006, respectively). RFS was significantly associated to multicentric and multifocal disease on multivariate analysis. PFS was associated to HIV infection on univariate analysis. HIV-positive women are at increased risk of developing VIN and frequently present at a younger age with multifocal and multicentric disease. They have shorter RFS and PFS compared with HIV-negative women. Close surveillance of the lower genital tract is mandatory to enable early recognition and treatment of any suspicious lesions."

According to the news editors, the research concluded: "Close follow-up after treatment of VIN is essential to exclude early recurrence or progression."

For more information on this research see: Vulvar intraepithelial neoplasia: clinical presentation, management and outcomes in women infected with HIV. Aids, 2016;30(6):859-68. (Lippincott Williams and Wilkins - www.lww.com; Aids - journals.lww.com/aidsonline/pages/default.aspx)

The news editors report that additional information may be obtained by contacting M. Bradbury, aDept. of Gynecological Oncology bDept. of Pathology, Hospital Vall d'Hebron, Universitat Autonoma de Barcelona, Barcelona, Spain. Additional authors for this research include S. Cabrera, A. Garcia-Jimenez, S. Franco-Camps, J.L. Sanchez-Iglesias, B. Diaz-Feijoo, A. Perez-Benavente, A. Gil-Moreno and C. Centeno-Mediavilla.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1097/QAD.0000000000000984. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Hepatitis C Virus

New Findings from Autonomous University Update Understanding of Hepatitis C Virus (New real-time-PCR method to identify single point mutations in hepatitis C virus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Hepatitis C Virus are presented in a new report. According to news reporting originating from Barcelona, Spain, by NewsRx correspondents, research stated, "To develop a fast, low-cost diagnostic strategy to identify single point mutations in highly variable genomes such as hepatitis C virus (HCV). In patients with HCV infection, resistance-associated amino acid substitutions within the viral quasispecies prior to therapy can confer decreased susceptibility to direct-acting antiviral agents and lead to treatment failure and virological relapse."

Our news editors obtained a quote from the research from Autonomous University, "One such naturally occurring mutation is the Q80K substitution in the HCV-NS3 protease gene, which confers resistance to PI inhibitors, particularly simeprevir. Low-cost, highly sensitive techniques enabling routine detection of these single point mutations would be useful to identify patients at a risk of treatment failure. LightCycler methods, based on real-time PCR with sequence-specific probe hybridization, have been implemented in most diagnostic laboratories. However, this technique cannot identify single point mutations in highly variable genetic environments, such as the HCV genome. To circumvent this problem, we developed a new method to homogenize all nucleotides present in a region except the point mutation of interest. Using nucleotide-specific probes Q, K, and R substitutions at position 80 were clearly identified at a sensitivity of 10% (mutations present at a frequency of at least 10% were detected). The technique was successfully applied to identify the Q80K substitution in 240 HCV G1 serum samples, with performance comparable to that of direct Sanger sequencing, the current standard procedure for this purpose. The new method was then validated in a Catalanian population of 202 HCV G1-infected individuals. Q80K was detected in 14.6% of G1a patients and 0% of G1b in our setting. A fast, low-cost diagnostic strategy based on real-time PCR and fluorescence resonance energy transfer probe melting curve analysis has been successfully developed to identify single point mutations in highly variable genomes such as hepatitis C virus."

According to the news editors, the research concluded: "This technique can be adapted to detect any single point mutation in highly variable genomes."

The news editors report that additional information may be obtained by contacting F. Rodriguez-Frias, Autonomous University of Barcelona, E-08193 Barcelona, Spain. Additional authors for this research include I. Belmonte, M. Buti, L. Nieto, D. Garcia-Cechic, J. Gregori, C. Perales, L. Ordeig, M. Llorens, M.E. Soria, R. Esteban, J.I. Esteban, F. Rodriguez-Frias and J.
New Findings from B. Montaruli et al Broadens Understanding of Immunoglobulins (Analytical and clinical comparison of different immunoassay systems for the detection of antiphospholipid antibodies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immunoglobulins have been published. According to news reporting originating from Torino, Italy, by NewsRx correspondents, research stated, "We evaluated analytical and clinical performances of IgG and IgM anticardiolipin (aCL) antibodies and anti-b2-glycoprotein I (a-b2GpI) antibodies and upper limit reference ranges (99th percentiles) in comparison with manufacturer's cutoff values with different commercial methods. We assayed aCL and a-b2GpI in serum samples from 30 healthy individuals, 77 patients with antiphospholipid syndrome (APS) diagnosed according to the Sydney criteria, 51 patients with autoimmune diseases, eight patients with previous thrombotic events, six patients with other diseases, and 18 patients with infectious diseases, using ELISA Inova Diagnostics; EliA Phadia Laboratory Systems; CliA Zenit-RA; and CliA Bio-Flash."

Our news editors obtained a quote from the research, "Anticardiolipin and a-b2GpI IgG and IgM immunoassays showed good analytic performances with both 99th percentile and manufacturer's cutoff reference values. Our results showed fair to moderate agreement among assays. In-house cutoff values gave significantly better performances only for a-b2GpI IgG with all the immunoassays analyzed with the exception of Inova CliA Bio-Flash where we obtained the same performances with in-house and manufacturer's cutoffs. By guidelines, all laboratories are strongly advised to validate/verify the manufacturer's cutoff values."

According to the news editors, the research concluded: "We recommend establishing low-positive, medium-/high-positive, and high-positive CliA IgG aCL and a-b2GpI ranges in order to help clinicians in the diagnosis and treatment of APS."

The news editors report that additional information may be obtained by contacting B. Montaruli, Laboratory Analysis, AO Ordine Mauriziano, Torino, Italy. Additional authors for
this research include E. De Luna, L. Erroi, C. Marchese, G. Mengozzi, P. Napoli, C. Nicolo', A. Romito, M.T. Bertero, P. Sivera and M. Migliardi.

Immune System Diseases and Conditions - Graft-…

New Findings from B. Van Aelst and Co-Authors in the Area of Graft-Versus-Host Disease Reported (Psoralen and Ultraviolet A Light Treatment Directly Affects Phosphatidylinositol 3-Kinase Signal Transduction by Altering Plasma Membrane Packing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - Graft-Versus-Host Disease are presented in a new report. According to news originating from Ghent, Belgium, by NewsRx correspondents, research stated, "Psoralen and ultraviolet A light (PUNTA) are used to kill pathogens in blood products and as a treatment of aberrant cell proliferation in dermatitis, cutaneous T-cell lymphoma, and graft versus-host disease. DNA damage is well described, but the direct effects of PUVA on cell signal transduction are poorly understood."

Our news journalists obtained a quote from the research, "Because platelets are anucleate and contain archetypal signal transduction machinery, they are ideally suited to address this. Lipidomics on platelet membrane extracts showed that psoralen forms adducts with unsaturated carbon bonds of fatty acyls in all major phospholipid classes after PUVA. Such adducts increased lipid packing as measured by a blue shift of an environment-sensitive fluorescent probe in model liposomes. Furthermore, the interaction of these liposomes with lipid order-sensitive proteins like amphipathic lipid-packing sensor and a-synuclein was inhibited by PUVA. In platelets, PUVA caused poor membrane binding of Akt and Bruton's tyrosine kinase effectors following activation of the collagen glycoprotein VI and thrombin protease-activated receptor (PAR) 1. This resulted in defective Akt phosphorylation despite unaltered phosphatidylinositol 3,4,5-trisphosphate levels. Downstream integrin activation was furthermore affected similarly by PUVA following PAR1 (effective half-maximal concentration (EC), 8.4 +/- 1.1 versus 4.3 +/- 1.1 mu M) and glycoprotein VI (EC50, 1.61 +/- 0.85 versus 0.26 +/- 0.21 mu g/ml) but not PAR4 (EC50, 50 +/- 1 versus 58 +/- 1 mu m) signal transduction. Our findings were confirmed in T-cells from graft-versus-host disease patients treated with extracorporeal photopheresis, a form of systemic PUVA."

According to the news editors, the research concluded: "PUVA increases the order of lipid phases by covalent modification of phospholipids, thereby inhibiting membrane recruitment of effector kinases."

For more information on this research see: Psoralen and Ultraviolet A Light

The news correspondents report that additional information may be obtained from H.B. Feys, Belgian Red Cross Flanders, Transfus Res Center, B-9000 Ghent, Belgium. **Drugs and Therapies - Androgens**

**New Findings from Baylor University College of Medicine Describe Advances in Androgens (Non-Cell-Autonomous Regulation of Prostate Epithelial Homeostasis by Androgen Receptor)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Androgens have been presented. According to news reporting out of Houston, Texas, by NewsRx editors, research stated, "Prostate inflammation has been suggested as an etiology for benign prostatic hyperplasia (BPH). We show that decreased expression of the androgen receptor (AR) in luminal cells of human BPH specimens correlates with a higher degree of regional prostatic inflammation."

Our news journalists obtained a quote from the research from the Baylor University College of Medicine, "However, the cause-and-effect relationship between the two events remains unclear. We investigated specifically whether attenuating AR activity in prostate luminal cells induces inflammation. Disrupting luminal cell AR signaling in mouse models promotes cytokine production cell-autonomously, impairs epithelial barrier function, and induces immune cell infiltration, which further augments local production of cytokines and chemokines including IL-1 and Ccl2. This inflammatory microenvironment promotes AR-independent prostatic epithelial proliferation, which can be abolished by ablating IL-1 signaling or depleting its major cellular source, the macrophages."

According to the news editors, the research concluded: "This study demonstrates that disrupting luminal AR signaling promotes prostate inflammation, which may serve as a mechanism for resistance to androgen-targeted therapy for prostate-related diseases."

For more information on this research see: Non-Cell-Autonomous Regulation of Prostate Epithelial Homeostasis by Androgen Receptor. *Molecular Cell*, 2016;63(6):976-989. *Molecular Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. Nutritional and Metabolic Diseases and Conditions - …

New Findings from Baylor University College of Medicine in the Area of Type 2 Diabetes Reported (A Plethora of GLP-1 Agonists: Decisions About What to Use and When)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been presented. According to news reporting out of Houston, Texas, by NewsRx editors, research stated, "Incretin-based therapies are important addition to our armamentarium for the treatment of type 2 diabetes (T2DM). There are six Glucagon-like peptide-1 receptor agonists (GLP-1RAs) which have received regulatory approval for clinical use."

Our news journalists obtained a quote from the research from the Baylor University College of Medicine, "The short-acting GLP-1RAs include exenatide twice daily, liraglutide once daily, and lixisenatide once daily. The approved long-acting GLP-1RAs are administered weekly and are exenatide, albiglutide, and dulaglutide. Although all of these therapies lower hemoglobin A1C (HbA1C), there also are unique features of GLP-1RAs that have been made manifest from clinical trial data with regard to weight-loss efficacy, fasting and post-prandial glucose control, cardiovascular safety and protection, and gastrointestinal and injection adverse effects."

According to the news editors, the research concluded: "It is imperative to consider these features when tailoring the choice of a GLP-1RA to patient specific characteristics."

For more information on this research see: A Plethora of GLP-1 Agonists: Decisions About What to Use and When. Current Diabetes Reports, 2016;16(12):16-28. Current Diabetes Reports can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. (Springer - www.springer.com; Current Diabetes Reports - www.springerlink.com/content/1534-4827/)

New Findings from Beijing Academy of Agriculture and Forestry Science Update Understanding of Circovirus (Induction of a Cellular DNA Damage Response by Porcine Circovirus Type 2 Facilitates Viral Replication and Mediates Apoptotic Responses)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on DNA Viruses - Circovirus is the subject of a report. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Cellular DNA damage response (DDR) triggered by infection of DNA viruses mediate cell cycle checkpoint activation, DNA repair, or apoptosis induction. In the present study, infection of porcine circovirus type 2 (PCV2), which serves as a major etiological agent of PCV2-associated diseases (PCVAD), was found to elicit a DNA damage response (DDR) as observed by the phosphorylation of H2AX and RPA32 following infection."

Our news editors obtained a quote from the research from the Beijing Academy of Agriculture and Forestry Science, "The response requires active viral replication, and all the ATM (ataxia telangiectasia-mutated kinase), ATR (ATM-and Rad3-related kinase), and DNA-PK (DNA-dependent protein kinase) are the transducers of the DDR signaling events in the PCV2-infected cells as demonstrated by the phosphorylation of ATM, ATR, and DNA-PK signalings as well as reductions in their activations after treatment with specific kinase inhibitors. Inhibitions of ATM, ATR, and DNA-PK activations block viral replication and prevent apoptotic responses as observed by decreases in cleaved poly-ADP ribose polymerase (PARP) and caspase-3 as well as fragmented DNA following PCV2 infection."

According to the news editors, the research concluded: "These results reveal that PCV2 is able to exploit the cellular DNA damage response machinery for its own efficient replication and for apoptosis induction, further extending our understanding for the molecular mechanism of PCV2 infection."

For more information on this research see: Induction of a Cellular DNA Damage Response by Porcine Circovirus Type 2 Facilitates Viral Replication and Mediates Apoptotic Responses. Scientific Reports, 2016;6():1-12. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Drugs and Therapies - Drug Delivery Systems

New Findings from Beijing University of Chemical Technology Describe Advances in Drug Delivery Systems (Microneedles with Controlled Bubble Sizes and Drug Distributions for Efficient Transdermal Drug Delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Drug Delivery Systems is now available. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Drug loaded dissolving microneedles (DMNs) fabricated with water soluble polymers have received increasing attentions as a safe and efficient transdermal drug delivery system. Usually, to reach a high drug delivery efficiency, an ideal drug distribution is gathering more drugs in the tip or the top part of DMNs."

Our news journalists obtained a quote from the research from the Beijing University of Chemical Technology, "In this work, we introduce an easy and new method to introduce a bubble with controlled size into the body of DMNs. The introduction of bubbles can prevent the drug diffusion into the whole body of the MNs. The heights of the bubbles are well controlled from 75 μm to 400 μm just by changing the mass concentrations of polymer casting solution from 30 wt% to 10 wt%. The drug-loaded bubble MNs show reliable mechanical properties and successful insertion into the skins. For the MNs prepared from 15 wt% PVA solution, bubble MNs achieve over 80% of drug delivery efficiency in 20 seconds, which is only 10% for the traditional solid MNs. Additionally, the bubble microstructures in the MNs are also demonstrated to be consistent and identical regardless the extension of MN arrays."

According to the news editors, the research concluded: "These scalable bubble MNs may be a promising carrier for the transdermal delivery of various pharmaceuticals."

For more information on this research see: Microneedles with Controlled Bubble Sizes and Drug Distributions for Efficient Transdermal Drug Delivery. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from X.D. Guo, Beijing University of Chemical Technology, Coll Mat Sci & Engn, Beijing Lab Biomed Mat, Beijing, People's Republic of China. Additional authors for this research include D.D. Zhu, X.B. Liu, B.Z. New Findings from Boehringer Ingelheim Pharmaceuticals Update Understanding of Coagulation Modifiers (Idarucizumab, a specific reversal agent for dabigatran: mode of action, pharmacokinetics and pharmacodynamics, and safety and efficacy in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Coagulation Modifiers is the subject of a report. According to news reporting originating in Ridgefield, Connecticut, by NewsRx journalists, research stated, "The direct oral anticoagulants (DOACs) provide a number of clinical advantages over vitamin K antagonists for the treatment of thromboembolism, including improved efficacy and safety, as well as no need for regular monitoring of anticoagulant effect. However, as with all anticoagulants, bleeding complications may occur, and anticoagulant reversal may be required in specific clinical situations, such as in patients experiencing spontaneous or traumatic bleeds, or in anticoagulated patients requiring emergency surgery or other invasive procedures."

The news reporters obtained a quote from the research from Boehringer Ingelheim Pharmaceuticals, "Therefore, several reversal agents for the DOACs are in development. This includes the specific reversal agent idarucizumab, which has been approved by the U.S. Food and Drug Administration and the European Medicines Agency for use in patients treated with dabigatran when urgent reversal of its anticoagulant effects is needed. Idarucizumab is a humanized monoclonal antibody fragment that binds with high affinity to free and thrombin-bound dabigatran, resulting in an almost irreversibly bound idarucizumab-dabigatran complex and thereby neutralizing dabigatran's anticoagulant activity. The reversal of the anticoagulant effects of dabigatran by idarucizumab has been demonstrated in animal bleeding models, in healthy volunteers with a range of ages and renal function, and in anticoagulated patients. In the phase 1 trials, at doses of 2 g or greater, idarucizumab resulted in immediate and complete reversal of the dabigatran anticoagulant effects and was well tolerated. In the absence of dabigatran, idarucizumab showed no effect on coagulation parameters or thrombin formation."

According to the news reporters, the research concluded: "These findings provide initial evidence that idarucizumab could provide a safe and effective means of reversing anticoagulant activity in patients treated with dabigatran in need of emergency surgery or in emergency bleeding situations."

Our news correspondents report that additional information may be obtained by contacting P.A. Reilly, Boehringer Ingelheim Pharmaceuticals Inc, Clin Dev, Cardiol, Ridgefield, CT 06877, United States. Additional authors for this research include J. van Ryn, O. Grottke, S. Glund and J. Stangier.

Bone Research

New Findings from Brussels Free University Describe Advances in Bone Research (Bone health in the elderly cancer patient: A SIOG position paper)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Bone Research have been published. According to news reporting originating in Brussels, Belgium, by NewsRx journalists, research stated, "More than a third of cancers are diagnosed in people over the age of 75. Androgen deprivation for prostate cancer and aromatase inhibitors in breast cancer accelerate age-related bone loss and increase fracture rates."

The news reporters obtained a quote from the research from Brussels Free University, "BMD should be checked by dual energy X-ray absorptiometry at baseline and, dependent on risk, every 12-24 months. Sufficient calcium, vitamin D and exercise are part of primary fracture prevention. Resistance exercise in particular may improve functional activity and bone density. In men at increased fracture risk and women with postmenopausal early breast cancer, antiresorptive treatment is warranted to reduce fracture rate and to increase overall survival in breast cancer. Bone metastases (BM) are common in breast and prostate cancer ancytic bone lesions typical of multiple myeloma. They can cause fractures, pain and spinal cord compression, require surgery or radiation for symptom relief, and lead to hypercalcaemia. Multidisciplinary working with patients and carers can improve quality of life for elderly patients with BM and mitigate the adverse consequences of therapy. Bisphosphonates and other osteoclast inhibitors such as denosumab reduce this morbidity, improve quality of life and reduce pain. Especially in the elderly, attention should be paid to renal function and to risk factors for osteonecrosis with bone-modifying agents. Attention should also be paid to hypocalcaemia risk, which can be considerable in elderly men with metastatic prostate cancer and vitamin.D deficiency."

According to the news reporters, the research concluded: "We urgently need further research specifically directed at assessing risks and benefits of bone targeted treatments in the growing population of elderly cancer patients."

Our news correspondents report that additional information may be obtained by contacting J.J. Body, Brussels Free University, CHU Brugmann, Brussels, Belgium. Additional authors for this research include E. Terpos, B. Tombal, P. Hadji, A. Arif, A. Young, M. Aapro and R. Coleman.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ctrv.2016.10.004. This DOI is a link to an online electronic document that is either free or for purchase.

Aldehydes

New Findings from C. Van Landingham and Colleagues Has Provided New Data on Aldehydes (The need for transparency and reproducibility in documenting values for regulatory decision making and evaluating causality: The example of formaldehyde)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Aldehydes have been published. According to news reporting originating in Monroe, Louisiana, by NewsRx journalists, research stated, "Reproducibility and transparency in scientific reporting is paramount to advancing science and providing the foundation required for sound regulation. Recent examples demonstrate that pivotal scientific findings cannot be replicated, due to poor documentation or methodological bias, sparking debate across scientific and regulatory communities."

Financial support for this research came from Research Foundation for Health and Environmental Effects.

The news reporters obtained a quote from the research, "However, there is general agreement that improvements in communicating and documenting research and risk assessment methods are needed. In the case of formaldehyde, the peer-review conducted by a National Academy of Sciences (NAS) Committee questioned the approaches used by the Integrated Risk Information System (IRIS) in developing draft unit risk values. Using the original data from the key study (Beane Freeman et al., 2009) and documentation provided in the draft IRIS profile, we attempted to duplicate the reported inhalation unit risk values and address the NAS Committee's questions regarding application of the appropriate dose-response model. Overall, documentation of the methods lacked sufficient detail to allow for replication of the unit risk estimates, specifically for Hodgkin lymphoma and leukemias, the key systemic endpoints selected by IRIS."

According to the news reporters, the research concluded: "The lack of apparent exposure-response relationships for selected endpoints raises the question whether quantitative analyses are appropriate for these endpoints, and if so, how results are to be interpreted."

Our news correspondents report that additional information may be obtained by contacting P.R. Gentry, Ramboll Environ US Corp, Monroe, LA 71201, United States.
Additional authors for this research include K.A. Mundt, B.C. Allen and P.R. Gentry.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.yrtph.2016.10.011. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Monroe, Louisiana, United States, North and Central America, Aldehydes, Formaldehyde.

Hormones

New Findings from CHA University Describe Advances in Hormones (Melatonin prevents cisplatin-induced primordial follicle loss via suppression of PTEN/AKT/FOXO3a pathway activation in the mouse ovary)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hormones. According to news reporting originating from Gyeonggi Do, South Korea, by NewsRx correspondents, research stated, "Premature ovarian failure (POF) is a major side effect of chemotherapy in young cancer patients. To develop pharmaceutical agents for preserving fertility, it is necessary to understand the mechanisms responsible for chemotherapy-induced follicle loss."

Financial supporters for this research include Korean Healthcare Technology R&D Project, Basic Science Research and Priority Research Centers Program, National Research Foundation of Korea, Ministry of Education, Bio & Medical Technology Development Program of NRF, Ministry of Education, Science and Technology.

Our news editors obtained a quote from the research from CHA University, "Here, we show that treatment with cisplatin, a widely used anticancer drug, depleted the dormant follicle pool in mouse ovaries by excessive activation of the primordial follicles, without inducing follicular apoptosis. Moreover, we show that co-treatment with the antioxidant melatonin prevented cisplatin-induced disruption of the follicle reserve. We quantified the various stages of growing follicles, including primordial, primary, secondary, and antral, to demonstrate that cisplatin treatment alone significantly decreased, whereas melatonin co-treatment preserved, the number of primordial follicles in the ovary. Importantly, analysis of the PTEN/AKT/FOXO3a pathway demonstrated that melatonin significantly decreased the cisplatin-mediated inhibitory phosphorylation of PTEN, a key negative regulator of dormant follicle activation. Moreover, melatonin prevented the cisplatin-induced activating phosphorylation of AKT, GSK3b, and FOXO3a, all of which trigger follicle activation. Additionally, we show that melatonin inhibited the cisplatin-induced inhibitory phosphorylation and nuclear export of FOXO3a, which is required in the nucleus to maintain dormancy of the primordial follicles."

According to the news editors, the research concluded: "These findings demonstrate that melatonin attenuates cisplatin-induced follicle loss by preventing the phosphorylation of PTEN/AKT/FOXO3a pathway members; thus, melatonin is a potential therapeutic agent for ovarian protection and fertility preservation during chemotherapy in female cancer patients."

For more information on this research see: Melatonin prevents cisplatin-induced primordial follicle loss via suppression of PTEN/AKT/FOXO3a pathway activation in the

**Clinical Research - Clinical Trials and Studies**

**New Findings from CIBERESP Describe Advances in Clinical Trials and Studies (Chronotherapy versus conventional statins therapy for the treatment of hyperlipidaemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Clinical Research - Clinical Trials and Studies is the subject of a report. According to news originating from Madrid, Spain, by NewsRx correspondents, research stated, "Elevated levels of total cholesterol and low-density lipoprotein play an important role in the development of atheromas and, therefore, in cardiovascular diseases. Cholesterol biosynthesis follows a circadian rhythm and is principally produced at night (between 12:00 am and 6:00 am)."

Our news journalists obtained a quote from the research from CIBERESP, "The adjustment of hypolipaemic therapy to biologic rhythms is known as chronotherapy. Chronotherapy is based on the idea that medication can have different effects depending on the hour at which it is taken. Statins are one of the most widely used drugs for the prevention of cardiovascular events. In usual clinical practice, statins are administered once per day without specifying the time when they should be taken. It is unknown whether the timing of statin administration is important for clinical outcomes. To critically evaluate and analyse the evidence available from randomised controlled trials regarding the effects of chronotherapy on the effectiveness and safety of treating hyperlipidaemia with statins. Search methods We searched the CENTRAL, MEDLINE, Embase, LILACS, ProQuest Health & Medical Complete, OpenSIGLE, Web of Science Conference Proceedings, and various other resources including clinical trials registers up to November 2015. We also searched the reference lists of relevant reviews for eligible studies. Selection criteria We included randomised controlled trials (RCTs), enrolling people with primary or secondary hyperlipidaemia. To be included, trials must have compared any chronotherapeutic lipid-lowering regimen with statins and any other statin lipid-lowering regimen not based on chronotherapy. We considered any type and dosage of statin as eligible, as long as the control and experimental arms differed only in the timing of the..."
administration of the same statin. Quasi-randomised studies were excluded. Data collection and analysis We used the standard methodological procedures expected by Cochrane. We extracted the key data from studies in relation to participants, interventions, and outcomes for safety and efficacy. We calculated odds ratios (OR) for dichotomous data and mean differences (MD) for continuous data with 95% confidence intervals (CI). Using the GRADE approach, we assessed the quality of the evidence and we used the GRADEproGuideline Development Tool to import data from Review Manager to create 'Summary of findings' tables. This review includes eight RCTs (767 participants analysed in morning and evening arms). The trials used different lipid-lowering regimens with statins (lovastatin: two trials; simvastatin: three trials; fluvastatin: two trials; pravastatin: one trial). All trials compared the effects between morning and evening statin administration. Trial length ranged from four to 14 weeks. We found a high risk of bias in the domain of selective reporting in three trials and in the domain of incomplete outcome data in one trial of the eight trials included. None of the studies included were judged to be at low risk of bias. None of the included RCTs reported data on cardiovascular mortality, cardiovascular morbidity, incidence of cardiovascular events, or deaths from any cause. Pooled results showed no evidence of a difference in total cholesterol (MD 4.33, 95% CI -1.36 to 10.01), 514 participants, five trials, mean follow-up 9 weeks, low-quality evidence), low-density lipoprotein cholesterol (LDL-C) levels (MD 4.85 mg/dL, 95% CI -0.87 to 10.57, 473 participants, five trials, mean follow-up 9 weeks, low-quality evidence), high-density lipoprotein cholesterol (HDL-C) (MD 0.54, 95% CI -1.08 to 2.17, 514 participants, five trials, mean follow-up 9 weeks, low-quality evidence) or triglycerides (MD -8.91, 95% CI -22 to 4.17, 510 participants, five trials, mean follow-up 9 weeks, low-quality evidence) between morning and evening statin administration. With regard to safety outcomes, five trials (556 participants) reported adverse events. Pooled analysis found no differences in statins adverse events between morning and evening intake (OR 0.71, 95% CI 0.44 to 1.15, 556 participants, five trials, mean follow-up 9 weeks, low-quality evidence). Authors’ conclusions Limited and low-quality evidence suggested that there were no differences between chronomodulated treatment with statins in people with hyperlipidaemia as compared to conventional treatment with statins, in terms of clinically relevant outcomes. Studies were short term and therefore did not report on our primary outcomes, cardiovascular clinical events or death. The review did not find differences in adverse events associated with statins between both regimens. Taking statins in the evening does not have an effect on the improvement of lipid levels with respect to morning administration."

According to the news editors, the research concluded: "Further high-quality trials with longer-term follow-up are needed to confirm the results of this review."

For more information on this research see: Chronotherapy versus conventional statins therapy for the treatment of hyperlipidaemia. *Cochrane Database of Systematic Reviews*, 2016;(11):389-467. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Oncology - Ring Cell Cancer

New Findings from Cancer Hospital Update Understanding of Ring Cell Cancer (A nomogram for predicting the likelihood of lymph node metastasis in early gastric signet ring cell carcinoma A single center retrospective analysis with external ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Ring Cell Cancer. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Treatment algorithm has not been established for early gastric cancer with signet ring cell carcinoma (SRC), which has a reported low rate of lymph node metastasis (LNM) similar to differentiated cancer. A cohort of 256 patients with early gastric SRC at our center between January 2002 and December 2015 were retrospectively reviewed."

The news correspondents obtained a quote from the research from Cancer Hospital, "Multivariate logistic regression analysis was used to determine the independent factors of LNM. A nomogram for predicting LNM was constructed and internally validated. Additional external validation was performed using the database from Cancer Institute Ariake Hospital in Tokyo (n = 1273). Clinical performance of the model was assessed by decision analysis of curve. The overall LNM incidence was 12.9% (33/256). The multivariate logistic model identified sex, tumor size, and LVI as covariates associated with LNM. Subsequently, a nomogram consisting of sex, tumor size, and depth of invasion was established. The model showed qualified discrimination ability both in internal validation (area under curve, 0.801; 95% confidence interval [CI], 0.729-0.873) and in external dataset (area under curve, 0.707; 95% CI, 0.657-0.758). Based on the nomogram, treatment algorithm for early gastric SRC was proposed to assist clinicians in making better decisions."

According to the news reporters, the research concluded: "We developed a nomogram predicting risk of LNM for early gastric SRC, which should be helpful for patient counseling and surgical decision-making."

For more information on this research see: A nomogram for predicting the likelihood of lymph node metastasis in early gastric signet ring cell carcinoma A single center retrospective analysis with external validation. Medicine, 2016;95(46):295-300. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. New Findings from Cancer Institute Hospital in the Area of Gastric Cancer Reported (Prognostic impact of KRAS mutant type and MET amplification in metastatic and recurrent gastric cancer patients treated with first-line S-1 plus cisplatin ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gastric Cancer. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Receptor tyrosine kinase (RTK)-related genes, including HER2, EGFR, MET, FGFR2 and KRAS, are target molecules that are clinically beneficial in gastric cancer (GC). We investigated the correlation between RTK-related genes and the curative effect of first-line S-1 plus cisplatin (SP) combination chemotherapy in metastatic and recurrent GC."

The news correspondents obtained a quote from the research from Cancer Institute Hospital, "We enrolled 150 patients with histopathologically confirmed metastatic and recurrent GC treated with SP. KRAS mutation was detected using direct sequencing. DNA copy number was measured by real-time PCR. Formalin-fixed paraffin-embedded specimens were examined immunohistochemically for HER2, EGFR, FGFR2 and MET. Among 144 patients, KRAS mutation was detected in five (3.5%) at codon 12 and one (0.7%) at codon 13. FGFR2, EGFR, HER2, MET and KRAS gene amplification was suggested in 4.4%, 5.9%, 9%, 3.7% and 10.3% of patients, respectively. KRAS mutation, but not KRAS amplification, was associated with significantly shorter overall and progression-free survival. MET membranous overexpression was associated with a significantly higher tumor response. MET amplification was associated with significantly shorter overall survival. We show for the first time that KRAS mutation and MET amplification are promising predictive markers in metastatic and recurrent GC patients treated with SP."

According to the news reporters, the research concluded: "KRAS status may be a useful prognostic marker in patients treated with SP."

For more information on this research see: Prognostic impact of KRAS mutant type and MET amplification in metastatic and recurrent gastric cancer patients treated with first-line S-1 plus cisplatin chemotherapy. Genes & Cancer, 2016;7(1-2):27-35. (Sage Publications - www.sagepub.com/; Genes & Cancer - gan.sagepub.com)

Connective Tissue Cells

New Findings from Capital Medical University in the Area of Connective Tissue Cells Described (Brown adipogenic potential of brown adipocytes and peri-renal adipocytes from human embryo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Connective Tissue Cells is now available. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Both brown adipocytes (BAC) and beige cells hold therapeutic potential for the treatment of metabolic disorders. Unfortunately, the amount and activity of these cells are limited in adults."

The news reporters obtained a quote from the research from Capital Medical University, "Although BAC marker expression has been shown in peri-renal adipose tissues in children and adults, functional assessment is lacking. Furthermore, it is entirely unknown whether adipose progenitors are present in human embryo and able to give rise to BAC in situ during evolution. Therefore, adipose tissues in the interscapular and peri-renal regions were dissected from human embryo and subcutaneous white adipose tissues (sWAT) were obtained from an adult. After subjected to differentiation in vitro, adipocyte progenitors were detected present in all these adipose tissues. When stimulated for adipogenesis, differentiated adipocytes in the intercapular and peri-renal regions showed similar features: (1) induced BAC and beige cell marker expression including UCP1 and PRDM16 and comparable mitochondrion copy number; (2) similar gene expression patterns by RNA-Seq analysis; and (3) similar maximal oxygen consumption rates examined by respirometry. Nevertheless, stimulation of adipocyte progenitors in sWAT induces neither BAC and beige cell marker expression nor any change of oxygen consumption."

According to the news reporters, the research concluded: "Peri-renal adipocyte progenitors in human embryo hold browning potential for BAC production."

For more information on this research see: Brown adipogenic potential of brown adipocytes and peri-renal adipocytes from human embryo. Scientific Reports, 2016;6():12-23. New Findings from Careggi Hospital Describe Advances in Cardiovascular Research (Which is the main molecular target responsible for the cardiovascular benefits in the EMPA-REG OUTCOME trial? A journey through the kidney, the heart and other ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Research. According to news originating from Florence, Italy, by NewsRx correspondents, research stated, "The results of the EMPA-REG-trial on type 2 diabetic patients at high risk for prior cardiovascular events showed that empagliflozin produces a remarkable reduction in the rates of hospitalization for heart failure (35%), cardiovascular death (38%), and all-cause death (32%). This unexpected cardio-protective action cannot be accounted for by the improvement of 'classical' cardiovascular risk factors."

Our news journalists obtained a quote from the research from Careggi Hospital, "This review aims at summarizing current knowledge on the cardiovascular action of SGLT2 inhibitors and discuss the different hypotheses formulated to explain the results of the EMPA-REG-OUTCOME-study. Data synthesis: We discuss in detail the major cardiovascular outcomes of the study in the light of the potential systemic and myocardial mechanisms of action of the drug. In addition, we propose and speculate on a direct effect of empagliflozin on cardiomyocytes. The available evidence is insufficient to establish any of the proposed mechanisms of cardiovascular action of empagliflozin."

According to the news editors, the research concluded: "While awaiting for the results of ongoing clinical studies with other SGLT2 inhibitors, the most promising putative mechanisms still deserve to be confirmed with specifically designed, yet unavailable, pre-clinical studies."

For more information on this research see: Which is the main molecular target responsible for the cardiovascular benefits in the EMPA-REG OUTCOME trial? A journey through the kidney, the heart and other interesting places. Nutrition Metabolism and Cardiovascular Diseases, 2016;26(12):1071-1078. New Findings from Catholic University in Prostate Cancer Provides New Insights (MALAT1 and HOTAIR Long Non-Coding RNAs Play Opposite Role in Estrogen-Mediated Transcriptional Regulation in Prostate Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to news originating from Rome, Italy, by NewsRx correspondents, research stated, "In the complex network of nuclear hormone receptors, the long non-coding RNAs (lncRNAs) are emerging as critical determinants of hormone action. Here we investigated the involvement of selected cancer-associated lncRNAs in Estrogen Receptor (ER) signaling."

Our news journalists obtained a quote from the research from Catholic University, "Prior studies by Chromatin Immunoprecipitation (ChIP) Sequencing showed that in prostate cancer cells ERs form a complex with the endothelial nitric oxide synthase (eNOS) and that in turn these complexes associate with chromatin in an estrogen-dependent fashion. Among these associations (peaks) we focused our attention on those proximal to the regulatory region of HOTAIR and MALAT1. These transcripts appeared regulated by estrogens and able to control ERs function by interacting with ER alpha/ER beta as indicated by RNA-ChIP. Further studies performed by ChIRP revealed that in unstimulated condition, HOTAIR and MALAT1 were present on pS2, hTERT and HOTAIR promoters at the ERE/ eNOS peaks. Interestingly, upon treatment with 17 beta-estradiol HOTAIR recruitment to chromatin increased significantly while that of MALAT1 was reduced, suggesting an opposite regulation and function for these lncRNAs. Similar results were obtained in cells and in an ex vivo prostate organotypic slice cultures."

According to the news editors, the research concluded: "Overall, our data provide evidence of a crosstalk between lncRNAs, estrogens and estrogen receptors in prostate cancer with important consequences on gene expression regulation."

For more information on this research see: MALAT1 and HOTAIR Long Non-Coding RNAs Play Opposite Role in Estrogen-Mediated Transcriptional Regulation in Prostate Cancer Cells. *Scientific Reports, 2016;6():1-11. Autoimmune Diseases and Conditions

New Findings from Catholic University of Korea in the Area of Autoimmune Diseases and Conditions Reported (Gut microbiota in autoimmunity: potential for clinical applications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Autoimmune Diseases and Conditions are presented in a new report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Microbial habitation in the human body begins immediately after birth, and adults are colonized by microbes outnumbering human cells by a factor of ten. Especially, intestinal track is a living space for diverse microbial species that have coevolved symbiotically."

Financial support for this research came from National Research Foundation of Korea.

Our news editors obtained a quote from the research from the Catholic University of Korea, "A principal function of the gut microbiota is to protect the host from harmful bacteria and to provide benefits for the host through several mechanisms, including direct competition for limited nutrients, training of host immune systems to recognize specifically foreign materials and conversion of otherwise indigestible food into energy and absorbable nutrients. Therefore, gut dysbiosis, a bacterial imbalance state, is related with the pathogenesis of various host diseases including autoimmune diseases. In the current review, we highlight the importance of gut microbiota in the normal health and autoimmune diseases."

According to the news editors, the research concluded: "We also discuss regulation of gut dysbiosis and future direction for potential clinical applications, including treatment and diagnostics of autoimmune diseases."

For more information on this research see: Gut microbiota in autoimmunity: potential for clinical applications. Archives of Pharmacal Research, 2016;39(11):1565-1576. Archives of Pharmacal Research can be contacted at: Pharmaceutical Soc Korea, 1489-3 Suhcho-Dong, Suhcho-Ku, Seoul 137-071, South Korea. New Findings from Catholic University of Korea in the Area of Rheumatoid Arthritis Described (MIF allele-dependent regulation of the MIF coreceptor CD44 and role in rheumatoid arthritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Autoimmune Diseases and Conditions - Rheumatoid Arthritis have been published. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Fibroblast-like synoviocytes mediate joint destruction in rheumatoid arthritis and exhibit sustained proinflammatory and invasive properties. CD44 is a polymorphic transmembrane protein with defined roles in matrix interaction and tumor invasion that is also a signaling coreceptor for macrophage migration inhibitory factor (MIF), which engages cell surface CD74."

Our news editors obtained a quote from the research from the Catholic University of Korea, "High-expression MIF alleles (rs5844572) are associated with rheumatoid joint erosion, but whether MIF signaling through the CD74/CD44 receptor complex promotes upstream autoimmune responses or contributes directly to synovial joint destruction is unknown. We report here the functional regulation of CD44 by an autocrine pathway in synovial fibroblasts that is driven by high-expression MIF alleles to up-regulate an inflammatory and invasive phenotype. MIF increases CD44 expression, promotes its recruitment into a functional signal transduction complex, and stimulates alternative exon splicing, leading to expression of the CD44v3-v6 isoforms associated with oncogenic invasion. CD44 recruitment into the MIF receptor complex, downstream MAPK and RhoA signaling, and invasive phenotype require MIF and CD74 and are reduced by MIF pathway antagonists."

According to the news editors, the research concluded: "These data support a functional role for high-MIF expression alleles and the two-component CD74/CD44 MIF receptor in rheumatoid arthritis and suggest that pharmacologic inhibition of this pathway may offer a specific means to interfere with progressive joint destruction."

Keywords for this news article include: Seoul, South Korea, Asia, Musculoskeletal Diseases and Conditions, Autoimmune Diseases and Conditions, Joint Diseases and Conditions, Rheumatoid Arthritis, Genetics, Catholic University of Korea.

Vascular Endothelial Growth Factor

New Findings from Central Hospital in Vascular Endothelial Growth Factor Provides New Insights (Correlation Analysis of the STAT3 Polymorphism and Transcription of Survivin and VEGF in Missed Abortion Experience Among Women of the Chinese Han ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Vascular Endothelial Growth Factor is the subject of a report. According to news reporting out of Tianjin, People's Republic of China, by NewsRx editors, research stated, "To investigate the relationship between STAT3 gene polymorphism and missed abortion (MA), and the influence of STAT3 gene polymorphism on the expression of VEGF and survivin. The missed abortion group included 188 cases of MA."

Our news journalists obtained a quote from the research from Central Hospital, "The control group consisted of 200 cases of surgically induced abortion in normal pregnancy. All patients were of Han ethnicity from P.R. China. STAT3 gene from patients' peripheral blood was detected using fluorescent probe real-time quantitative polymerase chain reaction (PCR), which was further analyzed to clarify genotype frequency. Survivin and VEGF mRNA levels in particular genotypes were also detected using qPCR. The STAT3 rs1053004 C/C genotype incidence in the MA group was significantly higher than that in the control group (p < 0.05), while the STAT3 rs1053004 T/T and T/C genotypes showed no significant difference between the 2 groups (p > 0.05). The STAT3 gene locus rs1053023 genotypes of the 2 groups were not significantly different, either (p >0.05). Furthermore, survivin and VEGF mRNA levels in the peripheral blood of the patients with STAT3 gene loci rs1053004 C/C were significantly decreased as compared to the control group (p < 0.05)."

According to the news editors, the research concluded: "Our study identified, the STAT3 rs1053004 C/C as a high-risk genotype in MA with lower survivin and VEGF transcription levels in the peripheral blood."

For more information on this research see: Correlation Analysis of the STAT3 Polymorphism and Transcription of Survivin and VEGF in Missed Abortion Experience Among Women of the Chinese Han Population. Journal of Reproductive Medicine, 2016;61(11-12):552-556. Journal of Reproductive Medicine can be contacted at: Sci Printers & Publ Inc, Po Drawer 12425 8342 Olive Blvd, St Louis, MO 63132, USA.

New Findings from Central University in the Area of Oral Cancer Reported (Reversion-inducing cysteine-rich protein with Kazal motifs and its regulation by glycogen synthase kinase 3 signaling in oral cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Oral Cancer are discussed in a new report. According to news reporting from Jharkhand, India, by NewsRx journalists, research stated, "The reversion-inducing cysteine-rich protein with Kazal motifs (RECK) and glycogen synthase kinase (GSK3) are novel tumor suppressors, and emerging evidence has suggested their active role in oral cancer pathogenesis. In the present study, 112 human samples, including 55 fresh samples of 14 adjacent normal tissues, 25 noninvasive oral tumors, and 18 invasive tumors, were included."

Financial supporters for this research include Department of Biotechnology, Govt. of India, Department of Biotechnology, Govt of India.

The news correspondents obtained a quote from the research from Central University, "The messenger RNA (mRNA) expression, protein expression, and promoter methylation of the RECK gene, as well as the expression of GSK3 beta, phospho/total beta-catenin, and c-myc, were measured by RT-PCR, bisulphate modification-PCR, immunohistochemistry, and Western blot analysis. Additionally, ectopic expression of in/active GSK3 beta was performed in cell culture experiments. This study provided information on the progressive silencing of RECK gene expression at the protein and mRNA levels paralleled with promoter hypermethylation at various stages of oral tumor invasion. RECK expression and the hypermethylation of the RECK gene promoter were negatively and positively correlated with pS(9)GSK3 beta/c-myc expression, respectively. Further, a negative trend of RECK protein expression with nuclear beta-catenin expression was observed. Induced expression of active GSK3 beta reversed the RECK silencing in SCC9 cells."

According to the news reporters, the research concluded: "Collectively, our results demonstrated that the silencing of the RECK gene, possibly regulated by the GSK3 beta pathway, is an important event in oral cancer invasion and this pathway could be exploited for therapeutic interventions."

New Findings from Charite University Hospital and School of Medicine Describe Advances in Hypertension (Long-Term Donor Outcomes after Pure Laparoscopic versus Open Living Donor Nephrectomy: Focus on Pregnancy Rates, Hypertension and Quality of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating from Berlin, Germany, by NewsRx correspondents, research stated, "The aim of the present study was to compare long-term donor outcomes after open and laparoscopic living donor nephrectomy. The focus was on pregnancy rates, hypertension and quality of life parameters."

Our news editors obtained a quote from the research from the Charite University Hospital and School of Medicine, "Data were retrospectively collected using our institution's electronic database and a structured questionnaire. The study included 30 donors after open donor nephrectomy (ODN) and 131 donors after laparoscopic donor nephrectomy (LDN). Demographic data did not differ between groups. When asked for their preference, significantly more donors in the LDN group would choose the same surgical approach again. The overall frequency of postoperative complications was significantly lower in the LDN group. The incidence of grade III complications was 2% after LDN and 10% after ODN (p = 0.79). Only 2 out of 15 female donors aged between 18 and 45 years delivered a healthy child after DN. On interview, only 4 out of 15 female donors declared the desire to have children after DN. From the donor perspective, long-term outcomes after LDN are more favorable than after ODN."

According to the news editors, the research concluded: "To ensure favorable functional outcomes, strict preoperative donor selection and diligent long-term donor follow-up are required."

The news editors report that additional information may be obtained by contacting F. Friedersdorff, Charite, Dept. of Urol, DE-10117 Berlin, Germany. Additional authors for this research include L. Kothmann, P. Manus, J. Roigas, C. Kempkensteffen, A. Magheli, J. Busch, L. Liefeldt, M. Giessing, S. Deger, M. Schostak, K. Miller and T.F. Fuller.

Heart Disorders and Diseases - Heart Failure

New Findings from Charles University in the Area of Heart Failure Reported (Beneficial Effect of Continuous Normobaric Hypoxia on Ventricular Dilatation in Rats With Post-Infarction Heart Failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting from Prague, Czech Republic, by NewsRx journalists, research stated, "Adaptation to continuous normobaric hypoxia (CNH) protects the heart against ischemia/reperfusion injury but much less is known about its potential therapeutic effects. The aim of this study was to find out whether post-infarction exposure to CNH can attenuate the progression of heart failure."

The news correspondents obtained a quote from the research from Charles University, "Ten-week-old male rats underwent myocardial infarction (MI) or sham operation. MI was induced by 60-min coronary artery occlusion. Seven days post-MI, the rats were randomly assigned to two groups: i) sedentary controls kept at room air and ii) rats exposed to CNH (12 % O-2, 3 weeks). Echocardiographic examination of the left ventricle (LV) was performed 3 days before surgery and 7, 14 and 28 days post-MI. MI resulted in a gradual increase in LV end-diastolic diameter (LVDd) compared to sham-operated animals. Fractional shortening (FS) decreased from 42.8 % before MI to 15.1 % on day 28 post-MI. CNH significantly attenuated ventricular dilatation without affecting scar area and FS."

According to the news reporters, the research concluded: "Our data suggest that prolonged exposure to CNH has certain potential to attenuate the progression of unfavorable changes in ventricular geometry induced by MI in rats."

For more information on this research see: Beneficial Effect of Continuous Normobaric Hypoxia on Ventricular Dilatation in Rats With Post-Infarction Heart Failure. Physiological Research, 2016;65(5):867-870. Physiological Research can be contacted at: Acad Sciences Czech Republic, Inst Physiology, Videntska 1083, Prague 4 142 20, Czech Republic.

Our news journalists report that additional information may be obtained by contacting J. Hrdlicka, Charles Univ Prague, Dept. of Physiol, Fac Sci, Prague, Czech Republic. Additional authors for this research include J. Neckar, F. Papousek, J. Vasinova, P. Alanova and F. Kolar.

Heart Disorders and Diseases - Bundle-Branch Block

New Findings from Children's Mercy Hospital in the Area of Bundle-Branch Block Described (Frequent Activation Delay-Induced Mechanical Dyssynchrony and Dysfunction in the Systemic Right Ventricle)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Bundle-Branch Block. According to news reporting originating in Kansas City, Missouri, by NewsRx journalists, research stated, "Patients with systemic right ventricles frequently experience progressive heart failure and conduction abnormalities leading to abnormal ventricular activation. Activation delay-induced mechanical dyssynchrony can contribute to ventricular failure and is identified by a classic strain pattern of paradoxical opposing wall motion that is an excellent predictor of response to cardiac resynchronization therapy in adults with left bundle branch block."

The news reporters obtained a quote from the research from Children's Mercy Hospital, "The specific aims of this study were to compare right ventricular (RV) mechanics in an adult systemic right ventricle population versus control subjects, evaluate the feasibility of this RV strain pattern analysis, and determine the frequency of the classic pattern. Young adults (n = 25) with d-transposition of the great arteries, status post Mustard or Senning palliation (TGA-MS), were ambispectively enrolled and compared with healthy young adults (n = 30) who were prospectively enrolled. All subjects were imaged using novel three-apical view (18-segment) RV longitudinal speckle-tracking strain analysis (EchoPAC) and electrocardiographic data. Patients with TGA-MS had diminished RV global peak systolic strain compared with control subjects (-12.0 +/- 4.0% vs -23.3 +/- 2.3%, P< .001). Most patients with TGA-MS had intrinsic or left ventricular paced right bundle branch block. A classic pattern was present in 11 of 25 subjects (44%), but this pattern would have been missed in four of 11 based only on the RV four-chamber (six-segment) model. Only three subjects underwent cardiac resynchronization therapy. Both subjects who had the classic pattern responded to cardiac resynchronization therapy, whereas the one nonresponder did not have the classic pattern. Systemic right ventricles demonstrated decreased function and increased mechanical dyssynchrony. The classic pattern of activation delay-induced mechanical dyssynchrony was frequently seen in this TGA-MS population and associated with activation delays."

According to the news reporters, the research concluded: "This comprehensive RV approach demonstrated incremental value."

Our news correspondents report that additional information may be obtained by contacting D. Forsha, Childrens Mercy Hosp, Ward Family Heart Center, Kansas City, MO 64108, United States. Additional authors for this research include N. Risum, B. Smith, R.J. Kanter, Z. Samad, P. Barker and J. Kisslo.

Heart Disorders and Diseases - Atrial Fibrillation

New Findings from China Medical University and Hospital Update Understanding of Atrial Fibrillation (Chronic Osteomyelitis Is Associated With Increased Risk of New-Onset Atrial Fibrillation: Evidence From a Nationwide Cohort of 23 Million People)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Atrial Fibrillation is now available. According to news reporting from Taichung, Taiwan, by NewsRx journalists, research stated, "The objective of the study was to determine whether chronic osteomyelitis (COM) is associated with increased risk of newonset atrial fibrillation (AF). A national insurance claim data set of 23 million enrollees was used to identify 19,002 patients with newly-diagnosed COM and 76,008 randomly selected age-and sex-matched control subjects between January 1, 2000 and December 31, 2009 for comparing the risk and incidence of AF."

The news correspondents obtained a quote from the research from China Medical University and Hospital, "The study end point was defined as the first diagnosis of AF, death, withdrawal from the insurance program, or the end of 2010. During a follow-up period of 91,927 person-years, the incidence of new-onset AF in COM cohort was 1.42-fold higher than for the non-COM cohort (4.54 vs 3.19 per 1000 person-years). After adjusting for age, sex, and classical AF risk factors such as hypertension, diabetes, heart failure, coronary artery disease, and valvular heart disease, the risk of newonset AF remained significantly higher in the COM cohort (hazard ratio [HR], 1.33; 95% confidence interval [CI], 1.18-1.49; P< 0.0001). In age-stratified analysis, the younger population carried a higher risk for incident AF than the elderly population (from HR 2.05; 95% CI, 1.12-3.74 in age younger than 50 years to HR 1.19; 95% CI, 0.95-1.49 in age 80 years and older). The adjusted Kaplan-Meier analysis showed a lower AF-free survival rate in the COM group compared with the control group (log-rank P< 0.0001) during the follow-up period. This study showed that patients with COM carry an increased risk for developing new-onset AF, particularly in the younger population."

According to the news reporters, the research concluded: "Further studies are required to explore the underlying mechanisms that link COM and AF."

Our news journalists report that additional information may be obtained by contacting C.H. Tseng, China Med Univ Hosp, Dept. of Neurol, Taichung 40402, Taiwan. Additional authors for this research include C.H. Muo, C.Y. Chou, C.H. Tseng, M.F. Chen and K.C. Chang.

New Findings from Chinese People's Liberation Army General Hospital in Tissue Engineering Provides New Insights (Suppression of MicroRNA-219-5p Activates Keratinocyte Growth Factor to Mitigate Severity of Experimental Cirrhosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biomedical Engineering - Tissue Engineering have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Keratinocyte growth factor (KGF) plays a critical role in prevention of cirrhosis and enhancement of liver regeneration. However, the molecular regulation of KGF in liver is unknown."

The news reporters obtained a quote from the research from Chinese People's Liberation Army General Hospital, "MicroRNAs (miRNAs) control the pathogenesis of cirrhosis, whereas the exact involved miRNAs and molecular signaling pathways remain ill-defined. Here we addressed these questions. We examined the correlation of the levels of miR-219-5p and KGF in the liver biopsies from patients with liver diseases. The effects of overexpression or suppression of miR-219-5p on KGF were examined in both human and mouse hepatic stellate cells (HSCs). Bioinformatics analysis was applied to examine the binding of human/mouse miR-219-5p to the 3'-UTR of human/mouse KGF mRNA, respectively. Finally, adenoviruses carrying antisense of miR-219-5p were infused into the liver from the mice that had developed cirrhosis by carbon tetrachloride (CCI4), and the effects on KGF levels and liver damage and function were examined. The levels of miR-219-5p and KGF in the liver biopsies were inversely correlated. MiR-219-5p inhibited KGF expression in both human and mouse HSCs, through directly binding the 3'-UTR of KGF mRNA. Expression of antisense of miR-219-5p significantly attenuated the levels of liver fibrosis, portal hypertension and sodium retention caused by CCI4."

According to the news reporters, the research concluded: "Suppression of miR-219-5p may benefit the liver regeneration and prevent cirrhosis through increasing KGF."

Our news correspondents report that additional information may be obtained by contacting T.S. Li, Chinese Peoples Liberation Army Gen Hosp, Emergency Department, Beijing.

Tryptamines

New Findings from Chungnam National University in the Area of Tryptamines Reported (Anti-Inflammatory and Antioxidant Actions of N-Arachidonoyl Serotonin in RAW264.7 Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Tryptamines. According to news reporting originating in Daejeon, South Korea, by NewsRx journalists, research stated, "The purpose of this study is to evaluate the effect of N-arachidonoyl serotonin (NA-5HT) on inflammatory response or oxidative stress in RAW264.7 cells exposed to lipopolysaccharide (LPS). When RAW264.7 cells were pre-incubated with NA-5HT before LPS treatment, NA-5HT was found to suppress LPS-induced formation of nitric oxide (NO), tumor necrosis factor-a or interleukins as well as expression of inducible NO synthase and cyclooxygenase-2 at non-cytotoxic concentrations."

The news reporters obtained a quote from the research from Chungnam National University, "Consistent with this, NA-5HT efficiently reversed LPS-induced phosphorylative activation of nuclear factor-kB pathway probably through the suppression of mitogen-activated protein kinases (MAPKs) pathway or phosphatidylinositol 3-kinase (PI3K)/protein kinase B (Akt) pathway. Separately, NA-5HT enhanced the antioxidant capacity accompanied by nuclear translocation of nuclear factor-E2-related factor-2 (Nrf2) in RAW264.7 cells. Additionally, NA-5HT-induced nuclear translocation of Nrf2 was suppressed significantly by the inhibition of c-Jun N-terminal kinase1/2 or PI3K/Akt pathways, although NA-5HT phosphorylated signal molecules in MAPKs and PI3K/Akt pathways."

According to the news reporters, the research concluded: "Taken together, NA-5HT is proposed to exert anti-inflammatory and antioxidant actions in RAW264." For more information on this research see: Anti-Inflammatory and Antioxidant Actions of N-Arachidonoyl Serotonin in RAW264.7 Cells. Pharmacology, 2016;97(3-4):195-206. (Karger - www.karger.com/; Pharmacology - content.karger.com/ProdukteDB/produkte.asp?Aktion=JournalHome&ProduktNr=224274)

**Heart Disorders and Diseases - Heart Attack**

**New Findings from Complejo Hospital Describe Advances in Heart Attack (Mortality benefit of long-term angiotensin-converting enzyme inhibitors or angiotensin receptor blockers after successful percutaneous coronary intervention in non-ST ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Attack is the subject of a report. According to news reporting originating in Pontevedra, Spain, by NewsRx journalists, research stated, "Introduction and objectives: Angiotensin-converting enzyme inhibitors (ACEIs) and angiotensin receptor blockers (ARBs) have been shown to reduce mortality after myocardial infarction (MI). Current guidelines recommend their prescription in all patients after MI."

The news reporters obtained a quote from the research from Complejo Hospital, "Limited data are available on whether ACEIs/ARBs still improve prognosis in the contemporary era of non-ST elevation MI (NSTEMI) management. We aimed to evaluate the mortality benefit of ACEIs/ARBs in NSTEMI patients treated successfully with percutaneous coronary intervention (PCI). We analyzed 2784 patients with NSTEMI treated successfully with in-hospital PCI. Two groups were formed based on ACEI/ARB prescription at discharge. Two propensity score (PS) analyses were performed to control for differences in covariates: one with adjustment among the entire cohort, and the other with PS matching (n=1626). The outcome variable was all-cause mortality at four-year follow-up. There were 1902 (68.3%) patients prescribed ACEIs/ARBs at discharge. When adjusted by PS, ACEI/ARB use was associated with a hazard ratio (HR) for mortality of 0.75 (0.60-0.94; absolute risk reduction [ARR] 4.0%) in the whole cohort (p=0.01). After one-to-one PS matching (n=813 in each group), the mortality rate was significantly lower in patients prescribed ACEIs/ARBs, with HR of 0.77 (0.63-0.94; ARR 3.8%) (p=0.03)."

According to the news reporters, the research concluded: "In this observational study of patients with NSTEMI, all of them treated successfully by PCI, the use of ACEIs/ARBs was significantly associated with a lower risk of four-year all-cause mortality."

Our news correspondents report that additional information may be obtained by
contacting M.C. Gonzalez-Cambeiro, Complejo Hosp Pontevedra, Coronary Care Unit, Pontevedra, Spain. Additional authors for this research include A. Lopez-Lopez, E. Abu-Assi, S. Raposeiras-Roubin, C. Pena-Gil, J. Garcia-Acuna and R. Gonzalez-Juanatey.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.repc.2016.07.003. This DOI is a link to an online electronic document that is either free or for purchase.

Breast Diseases and Conditions - Mastitis

New Findings from Council of Scientific and Industrial Research (CSIR) in Mastitis Provides New Insights (Isolation and characterization of three benzylisoquinoline alkaloids from Thalictrum minus L. and their antibacterial activity against ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Breast Diseases and Conditions - Mastitis. According to news originating from Jammu Kashmir, India, by NewsRx correspondents, research stated, "Ethno-pharmacological relevance: The roots of Thalictrum minus are traditionally used in the treatment of inflammation and infectious diseases such as bovine mastitis. However, there are no reports available in literature till date regarding the antibacterial studies of T. minus against bovine mastitis."

Financial supporters for this research include University Grants Commission, UGC. Our news journalists obtained a quote from the research from the Council of Scientific and Industrial Research (CSIR), "Aim of the study: The present study was undertaken to evaluate the antibacterial potential of crude extract of T. minus (root) and some of its isolated constituents against bovine mastitis in order to scientifically validate its traditional use. A total of three alkaloid compounds were isolated from the DCM: MeOH extract of roots of T minus using silica gel column chromatography. Structural elucidation of the isolated compounds was done by using spectroscopic techniques like mass spectrometry and NMR spectroscopy. Pathogens were isolated from cases of bovine mastitis and identified by using 16S rRNA gene sequencing. The broth micro-dilution method was used to evaluate the antibacterial activities of DCM: MeOH extract and isolated compounds against mastitis pathogens. The three isolated compounds were identified as benzylisoquinoline alkaloids (1) 5'-Hydroxythalidasine, (2) Thalrugosaminine and (3) O-Methylthalicberine. Compounds (2) and (3) are reported for the first time from the roots of T minus. Five mastitis pathogens viz., Staphylococcus xylosus, Staphylococcus lentus, Staphylococcus equorum, Enterococcus faecalis and Pantoea agglomerans were identified on the basis of sequence analysis of isolates using the nucleotide BLAST algorithm. This study reports for the first time the isolation and molecular
characterization of mastitis pathogens from Kashmir valley, India. The DCM: MeOH extract exhibited broad spectrum antibacterial activities that varied between the bacterial species (MIC=250-500 μg/ml). 5'-Hydroxythalidasine and Thalrugosaminine showed promising antibacterial activity with MIC values of 64-128 μg/ml while Staphylococcus species were found to be the most sensitive strains.

According to the news editors, the research concluded: "The antibacterial activities of the DCM: MeOH extract and isolated compounds support the traditional use of T minus in the treatment of bovine mastitis."

The news correspondents report that additional information may be obtained from P.H. Qazi, CSIR, Indian Inst Integrat Med, Div Biotechnol, Srinagar 190005, Jammu & Kashmir, India. Additional authors for this research include M.A. Rather, P.H. Qazi, M.A. Aga, A.M. Shah, A. Shah and M.N. Ali.

**Nanotechnology - Nanoparticles**

**New Findings from Dalian University of Technology Update Understanding of Nanoparticles (Construction of A Triple-Stimuli-Responsive System Based on Cerium Oxide Coated Mesoporous Silica Nanoparticles)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nanotechnology - Nanoparticles are discussed in a new report. According to news originating from Dalian, People's Republic of China, by NewsRx correspondents, research stated, "In this work, a triple-stimuli (GSH, pH and light irradiation) responsive system were designed based on CeO2 nanoparticles (CeO2 NPs) coated doxorubicin (DOX) and photosensitizer hematoporphyrin (HP) dual-loaded mesoporous silica nanoparticles (MSN). Upon entering into cancer cells, both high concentration of intracellular GSH and low pH environment would reduce CeO2 NPs to cerium ions, accompanied with the degradation of CeO2 NPs and the conformational change of HP under light irradiation, the preloaded DOX are thus released from the nanocarrier, resulting in a contrast fluorescence enhancement."

Our news journalists obtained a quote from the research from the Dalian University
of Technology, "Meanwhile, O-1(2) generated from HP for potential photodynamic therapy (PDT) upon light irradiation. In comparison, not much influence can be observed for normal cells."

According to the news editors, the research concluded: "This nanosystem not only has a significantly enhanced efficacy for cancer cells but also broad the scope for the future design and applications of multifunctional platforms for synergetic chemotherapy and PDT."

For more information on this research see: Construction of A Triple-Stimuli-Responsive System Based on Cerium Oxide Coated Mesoporous Silica Nanoparticles. Scientific Reports, 2016;6():1-10. Oncology - Astroblastomas

New Findings from Dana-Farber Cancer Institute in Astroblastomas Provides New Insights (Genomic characterization of recurrent high-grade astroblastoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Astroblastomas. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Astroblastomas are rare primary brain tumors, diagnosed based on histologic features. Not currently assigned a WHO grade, they typically display indolent behavior, with occasional variants taking a more aggressive course."

Financial support for this research came from King Abdulaziz City for Science and Technology.

Our news journalists obtained a quote from the research from Dana-Farber Cancer Institute, "We characterized the immunohistochemical characteristics, copy number (high-resolution array comparative genomic hybridization, OncoCopy) and mutational profile (targeted next-generation exome sequencing, OncoPanel) of a cohort of seven biopsies from four patients to identify recurrent genomic events that may help distinguish astroblastomas from other more common high-grade gliomas. We found that tumor histology was variable across patients and between primary and recurrent tumor samples. No common molecular features were identified among the four tumors. Mutations commonly observed in astrocytic tumors (IDH1/2, TP53, ATRX, and PTEN) or ependymoma were, not identified. However one case with rapid clinical progression displayed mutations more commonly associated with GBM (NF1 (N1054H/K63 star), PIK3CA(R38H) and ERG(A403T)). Conversely, another case, originally classified as glioblastoma with nine-year survival before recurrence, lacked a GBM mutational
profile. Other mutations frequently seen in lower grade gliomas (BCOR, BCORL1, ERBB3, MYB, ATM) were also present in several tumors. Copy number changes were variable across tumors. Our findings indicate that astroblastomas have variable growth patterns and morphologic features, posing significant challenges to accurate classification in the absence of diagnostically specific copy number alterations and molecular features. Their histopathologic overlap with glioblastoma will likely confound the observation of long-term GBM "survivors."

According to the news editors, the research concluded: "Further genomic profiling is needed to determine whether these tumors represent a distinct entity and to guide management strategies."

The news correspondents report that additional information may be obtained from K.L. Ligon, Dana Farber Canc Inst, Center Mol Oncol Pathol, Boston, MA 02115, United States. Additional authors for this research include M. Abedalthagafi, W.L. Bi, Y.J. Kang, P. Merrill, I.F. Dunn, A. Dubuc, S.K. Charbonneau, L. Brown, A.H. Ligon, S.H. Ramkissoon and K.L. Ligon.

Drugs and Therapies - Antibiotics

New Findings from Danube University Describe Advances in Antibiotics (Adsorption of Selected Antibiotics to Resins in Extracorporeal Blood Purification)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antibiotics have been presented. According to news reporting originating in Krems, Austria, by NewsRx journalists, research stated, "Extracorporeal blood purification systems (EBS) use specific adsorbents for the elimination of toxins and cytokines. The aim of this study was to test different adsorbents for their ability to reduce antibiotics in parallel to extracorporeal blood purification therapy."

The news reporters obtained a quote from the research from Danube University, "The in vitro adsorption experiments were carried out in human plasma with a newly established hydrophobic resin (Amberchrom CG161c) and adsorbents commercially available and approved in the clinics. The concentration of antibiotic was chosen equivalent to the recommended therapeutic dosage applied intravenously and was measured in plasma using ELISA test kits and high-performance liquid chromatography methods. The adsorbent that reduced all tested antibiotics in plasma close to the detection limit was the dia MARS AC250, which is an activated charcoal involved in the Molecular Adsorbents Recirculation System."
According to the news reporters, the research concluded: "For better antibiotic monitoring in sepsis treatment, further investigations have to be performed to determine the clearance rate of antibiotics by different EBS devices."

Our news correspondents report that additional information may be obtained by contacting S. Harm, Dept. of for Health Sciences and Biomedicine, Danube University Krems, Krems, Austria. Additional authors for this research include A. Gruber, F. Gabor and J. Hartmann.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000440973. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiology**

**New Findings from Department of Biomedical Sciences and Public Health Describe Advances in Cardiology (The role of cardiac dysfunction in multiorgan dysfunction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news originating from Ancona, Italy, by NewsRx correspondents, research stated, "The aim of this review was to examine the main determinants of cardiac dysfunction in critically ill patients, as well as how a reduction in cardiac performance influences other organ function. Cardiac dysfunction is a frequent complication in critically ill patients and contributes to organ hypoperfusion and poor outcome."

Our news journalists obtained a quote from the research from the Department of Biomedical Sciences and Public Health, "Pathophysiological determinants may include a primary ischaemia/reperfusion injury of the heart, effects of systemic inflammatory and adrenergic responses of the body to a variety of acute insults, as well as cardiovascular effects of commonly applied intensive respiratory or haemodynamic treatments. A strict connection exists between cardiac and other organ function, mediated by haemodynamic, humoral, and immune mechanisms. Heart, lungs, kidneys, and other splanchnic organs such as gut and liver influence each other function in a bidirectional way: this organ crosstalk must be regarded as a key aspect in multiorgan dysfunction. The heart should never be regarded as an isolated organ."

According to the news editors, the research concluded: "When dealing with cardiac dysfunction, clinicians must consider the underlying pathophysiology, potential myocardial depressant effects of intensive treatments, and the complex interaction with other organ function."

For more information on this research see: The role of cardiac dysfunction in multiorgan dysfunction. *Current Opinion In Anaesthesiology*, 2016;29(2):172-7.
New Findings from Department of Orthopedics in the Area of Atrial Fibrillation Reported (Impact of atrial fibrillation on postoperative outcomes after total knee arthroplasty-A retrospective study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Atrial Fibrillation are presented in a new report. According to news reporting originating from Baoding, People's Republic of China, by NewsRx correspondents, research stated, "Total knee arthroplasty (TKA) is primarily preformed among the elderly population who is commonly affected by cardiovascular and cerebrovascular diseases. Atrial fibrillation (AF) is a very common heart disease and its prevalence increases significantly with age."

Our news editors obtained a quote from the research from the Department of Orthopedics, "Therefore, we decided to evaluate the outcomes of patients with AF following TKA and analyze the risk factors of AF patients who underwent postoperative complication. We designed a retrospective cohort study using data from three institutions in China. We evaluated a total of 453 AF patients who received primary TKA and 453 matched control patients. Comparisons of specific parameters between AF and non-AF cohorts were performed. Our results demonstrated that AF patients had significantly higher odds of more intraoperative bleeding, periprosthetic joint infection (PJI), post-operative cerebral stroke (POCS), post-operative cardiovascular events (POCE) and worse SF-36 physical component score and mental score at mean 24-month after surgery, but had no increased incidence of post-operative gastrointestinal events, DVT and PE in comparison to patients without AF than those without AF disease. Additionally, multivariate logistic regression analysis was used to identify risk factors of patients who underwent severe complication. Smoking, diabetes mellitus and persistent AF were common risk factors of PJI, POCS, and POCE. Heart rate > 70/min and absence of Beta blocker use were common risk factors of POCS and POCE. Absence of LMWH bridging was risk factor of POCS. BMI > 25 kg/m2 and hypertension were risk factors of POCE. These findings should be taken into consideration when discussing the expected outcomes of AF patients after TKA."

According to the news editors, the research concluded: "AF disease impaired SF-36 physical component score (PCS) and mental component score (MCS) of patient after TKA."

For more information on this research see: Impact of atrial fibrillation on postoperative outcomes after total knee arthroplasty-A retrospective study. Journal of...

The news editors report that additional information may be obtained by contacting L. Gong, 252 Hosp Chinese PLA, Dept. of Orthoped, Baoding 071000, Hebei, People's Republic of China. Additional authors for this research include S.Q. Sun, L. Geng, W.H. Yang and Z.H. Wang.

Drugs and Therapies - Chemotherapy

New Findings from Department of Pharmacy in the Area of Chemotherapy Described (Infusion reactions are common after high-dose carmustine in BEAM chemotherapy and are not reduced by lengthening the time of administration)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Chemotherapy. According to news originating from New Haven, Connecticut, by NewsRx correspondents, research stated, "Carmustine (BCNU) is used in the conditioning regimens BEAM and CBV for autologous stem cell transplantation. Carmustine-related infusion reactions, while not described in the BEAM literature, occurred in 95 % of patients who received CBV."

Our news journalists obtained a quote from the research from the Department of Pharmacy, "The most common symptoms include flushing, facial pain, headache, and hypotension. These reactions have been attributed to the absolute ethanol that is used in the reconstitution process or alternatively by a direct effect of carmustine. It is currently recommended that carmustine 300 mg/m² be infused over at least 100 min (3-5 mg/m²/min). Prior to October 2014, carmustine infusions were given over 90 min but were changed to 120 min based on the above recommendation. We compared the two infusion rates in patients receiving BEAM to see if lengthening the infusion decreased the frequency of reactions. Overall, 100 patients received BCNU as part of BEAM or Zevalin BEAM and were equally divided between 90 and 120 min infusion times. The primary outcome was the incidence of infusion-related reactions which were graded based on CTCAE 4.03 descriptions of flushing and infusion-related reactions. We also evaluated the impact of premedication as well as the efficacy of medications used to treat infusion reactions. Between the years 2013-2016, there were 50 patients who received BCNU over 90 min and 50 patients over 120 min. There were no significant differences observed for diagnosis, age and gender between the two groups. Twenty-eight (56 %) in the 90-min and 26 (52 %) in the 120-min infusion intervals developed a reaction (p = 0.6882). Of the patients that developed a reaction, 19 patients (67 %) in the 90-min and all 26 patients (100 %) in the 120-min infusion were given premedications predominately
acetaminophen, in addition to dexamethasone. Among reacting patients, 57% of the 90-min and 65% of the 120-min groups received additional intervention (p = 0.53)."

According to the news editors, the research concluded: "Infusion reactions during high-dose BCNU are common and are not clearly reduced by modestly extending the duration of infusion or giving premedications."

For more information on this research see: Infusion reactions are common after high-dose carmustine in BEAM chemotherapy and are not reduced by lengthening the time of administration. Supportive Care in Cancer, 2017;25(1):205-208. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Supportive Care in Cancer - www.springerlink.com/content/0941-4355/)

New Findings from Department of Surgery in the Area of Aortic Rupture Described (Plug the Hole-A Bailout Option for Acute Focal Aortic Rupture)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Aortic Rupture have been published. According to news originating from St. Louis, Missouri, by NewsRx correspondents, research stated, "Focal aortic rupture may result from expanding aneurysms, penetrating aortic wall ulcerations, or virulent infections. An urgent repair of paravisceral focal aortic rupture is associated with high morbidity."

Our news journalists obtained a quote from the research from the Department of Surgery, "A staged repair approach may provide an alternative option. A 64-year-old woman presented with acute focal rupture of the posterior paravisceral aortic wall and was progressing to hemorrhagic shock and mesenteric ischemia. Given the patient's dire condition, an endovascular approach was used to plug her focal aortic wall defect using a ventricular septal defect occluder device. Subsequently, the patient underwent resuscitation, stabilization, and operative exploration. Postoperatively, she recovered well from this staged approach. This case provides an example of a staged endovascular plugging of an acute paravisceral focal aortic rupture."

According to the news editors, the research concluded: "In select cases, this type of repair strategy is feasible, until off-the-shelf endovascular repair options become a reality."

For more information on this research see: Plug the Hole-A Bailout Option for
New Findings from Division of Surgery and Oncology in the Area of Colon Cancer Reported (Management of para-aortic lymph node metastasis in colorectal patients: A systemic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Para-aortic lymph node (PALN) involvement occurs in up to 2% of colorectal cancer (CRC) patients. While resection for isolated hepatic and pulmonary metastases in colorectal cancer is standard practice, the role of PALN dissection (PALND) in CRC has not been established and remains a controversy."

Our news editors obtained a quote from the research from the Division of Surgery and Oncology, "We aim to perform a systematic review of the literature to determine if extensive lymphadenectomy improves survival, and is an acceptable strategy for PALN metastasis (PALNM). A systematic search of PubMed and Embase databases for studies reporting on patients with isolated PALNM in CRC was performed. Studies including patients with synchronous and metachronous PALN were included, and studies including patients with other metastases were excluded. Eighteen retrospective, single-centre studies were included in the final analysis. The reported incidence of isolated PALNM ranged from 1.3 to 1.7%. A total of 370 patients with PALNM were evaluated, of which 145 had synchronous, and 225 had metachronous PALNM. For synchronous PALNM, the 5-year overall survival (OS) after metastatectomy, ranged from 22.7% to 33.9%. For metachronous PALNM, the 5-year OS ranged from 15 to 60%; median OS was 34-40 months in the PALND versus 3-14 months for patients who did not undergo PALND. There were no reported surgery related mortalities, and overall surgical morbidity was 7.8-33%.

According to the news editors, the research concluded: "PALND for isolated PALNM from colorectal cancer can be performed with minimal morbidity and confers a survival advantage, in comparison with conventional palliative chemotherapy or chemoradiation therapy."

New Findings from Duke University in the Area of Cardiology Reported (Multicolor mapping of the cardiomyocyte proliferation dynamics that construct the atrium)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting from Durham, North Carolina, by NewsRx journalists, research stated, "The orchestrated division of cardiomyocytes assembles heart chambers of distinct morphology. To understand the structural divergence of the cardiac chambers, we determined the contributions of individual embryonic cardiomyocytes to the atrium in zebrafish by multicolor fate-mapping and we compare our analysis to the established proliferation dynamics of ventricular cardiomyocytes."

Funders for this research include National Heart, Lung, and Blood Institute, American Heart Association, March of Dimes Foundation, National Science Foundation, National Institutes of Health.

The news correspondents obtained a quote from the research from Duke University, "We find that most atrial cardiomyocytes become rod-shaped in the second week of life, generating a single-musclecell-thick myocardial wall with a striking webbed morphology. Inner pectinate myofibers form mainly by direct branching, unlike delamination events that create ventricular trabeculae. Thus, muscle clones assembling the atrial chamber can extend from wall to lumen. As zebrafish mature, atrial wall cardiomyocytes proliferate laterally to generate cohesive patches of diverse shapes and sizes, frequently with dominant clones that comprise 20-30% of the wall area. A subpopulation of cardiomyocytes that transiently express atrial myosin heavy chain (amhc) contributes substantially to specific regions of the ventricle, suggesting an unappreciated level of plasticity during chamber formation."

According to the news reporters, the research concluded: "Our findings reveal proliferation dynamics and fate decisions of cardiomyocytes that produce the distinct architecture of the atrium."

For more information on this research see: Multicolor mapping of the cardiomyocyte proliferation dynamics that construct the atrium. Development, 2016;143 (10):1688-1696. Development can be contacted at: Company Of Biologists Ltd, Bidder
New Findings from Duke University in the Area of Endocarditis
Described (Antistaphylococcal beta-Lactams versus Vancomycin for Treatment of Infective Endocarditis Due to Methicillin-Susceptible Coagulase-Negative Staphylococci: a Prospective ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Endocarditis is the subject of a report. According to news originating from Durham, North Carolina, by NewsRx correspondents, research stated, "The phenotypic expression of methicillin resistance among coagulase-negative staphylococci (CoNS) is heterogeneous regardless of the presence of the meca gene. The potential discordance between phenotypic and genotypic results has led to the use of vancomycin for the treatment of CoNS infective endocarditis (IE) regardless of methicillin MIC values."

Our news journalists obtained a quote from the research from Duke University, "In this study, we assessed the outcome of methicillin-susceptible CoNS IE among patients treated with antistaphylococcal beta-lactams (ASB) versus vancomycin (VAN) in a multicenter cohort study based on data from the International Collaboration on Endocarditis (ICE) Prospective Cohort Study (PCS) and the ICE-Plus databases. The ICE-PCS database contains prospective data on 5,568 patients with IE collected between 2000 and 2006, while the ICE-Plus database contains prospective data on 2,019 patients with IE collected between 2008 and 2012. The primary endpoint was in-hospital mortality. Secondary endpoints were 6-month mortality and survival time. Of the 7,587 patients in the two databases, there were 280 patients with methicillin-susceptible CoNS IE. Detailed treatment and outcome data were available for 180 patients. Eighty-eight patients received ASB, while 36 were treated with VAN. In-hospital mortality (19.3% versus 11.1%; P = 0.27), 6-month mortality (31.6% versus 25.9%; P = 0.58), and survival time after discharge (P = 0.26) did not significantly differ between the two cohorts. Cox regression analysis did not show any significant association between ASB use and the survival time (hazard ratio, 1.7; P = 0.22); this result was not affected by adjustment for confounders."

According to the news editors, the research concluded: "This study provides no
evidence for a difference in outcome with the use of VAN versus ASB for methicillin-susceptible CoNS IE."

For more information on this research see: Antistaphylococcal beta-Lactams versus Vancomycin for Treatment of Infective Endocarditis Due to Methicillin-Susceptible Coagulase-Negative Staphylococci: a Prospective Cohort Study from the International Collaboration on Endocarditis. Antimicrobial Agents and Chemotherapy, 2016;60(10):6341-6349. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news correspondents report that additional information may be obtained from M. Carugati, Duke University, Medical Center, Div Infect Dis, Durham, NC, United States. New Findings from Eunice Kennedy Shriver National Institute of Child Health and Human Development in the Area of Pediatric Obesity Described (Cortisol response to an induction of negative affect among adolescents with and without loss of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Pediatric Obesity is now available. According to news reporting originating in Bethesda, Maryland, by NewsRx journalists, research stated, "Adults with binge eating disorder may have an exaggerated or blunted cortisol response to stress. Yet, limited data exist among youth who report loss of control (LOC) eating, a developmental precursor to binge eating disorder."

Financial supporters for this research include NIH National Research Service Award, Pathway to Independence Award, NIH Intramural Research Program.

The news reporters obtained a quote from the research from the Eunice Kennedy Shriver National Institute of Child Health and Human Development, "We studied cortisol reactivity among 178 healthy adolescents with and without LOC eating. Following a buffet lunch meal adolescents were randomly assigned to watch a neutral or sad film clip. After, they were offered snacks from a multi-item array to assess eating in the absence of hunger. Salivary cortisol was collected at -80, 0, 30 and 50 min relative to film administration, and state mood ratings were reported before and after the film. Adolescents with LOC had greater increases in negative affect during the experimental paradigm in both conditions (ps >0.05). Depressive symptoms, but not LOC, related to a greater cortisol response in the sad film condition (ps >
Depressive symptoms and state LOC were related to different aspects of eating behaviour, independent of film condition or cortisol response (ps > 0.05). A film clip that induced depressed state affect increased salivary cortisol only in adolescents with more elevated depressive symptoms. Adolescents with and without LOC were differentiated by greater increases in state depressed affect during laboratory test meals but had no difference in cortisol reactivity. According to the news reporters, the research concluded: "Future studies are required to determine if adolescents with LOC manifest alterations in stress reactivity to alternative stress-inducing situations."

Our news correspondents report that additional information may be obtained by contacting R.M. Radin, Section on Growth and Obesity, Program in Developmental Endocrinology and Genetics, Eunice Kennedy Shriver National Institute of Child Health and Human Development (NICHD), National Institutes of Health (NIH), DHHS, Bethesda, MD, 20892, United States. Additional authors for this research include L.B. Shomaker, N.R. Kelly, C.K. Pickworth, K.A. Thompson, S.M. Brady, A. Demidowich, O. Galescu, A.M. Altschul, L.M. Shank, S.Z. Yanovski, M. Nephrology

New Findings from Faculty of Medicine Yields New Data on Nephrology (Angio-embolization of a renal pseudoaneurysm complicating a percutaneous renal biopsy: a case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nephrology are presented in a new report. According to news reporting out of Rabat, Morocco, by NewsRx editors, research stated, "We report the treatment of a bleeding renal pseudoaneurysm by angio-embolization. A 21 years old woman developed macroscopic haematuria following renal biopsy."

Our news journalists obtained a quote from the research from the Faculty of Medicine, "Renal angio-scan showed a 1.4 cm renal pseudoaneurysm in the left kidney. The presence of pseudoaneurysm was confirmed by selective renal angiography."

According to the news editors, the research concluded: "Successful embolization was performed using gelatine sponge particles."

Our news journalists report that additional information may be obtained by
contacting H. Rafik, Dept. of Nephrology, Mohammed V Military Hospital, Faculty of Medicine and Pharmacy University Mohammed V-Souissi, Rabat, Morocco. Additional authors for this research include M. Azizi, D. El Kabbaj and M. Benyahia.

Skin Diseases and Conditions - Acne Vulgaris

New Findings from Federal University in the Area of Acne Vulgaris Reported (Observational retrospective study evaluating the effects of oral isotretinoin in keloids and hypertrophic scars)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases and Conditions - Acne Vulgaris are presented in a new report. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "Acne vulgaris is a chronic inflammatory disease characterized by noninflammatory and inflammatory lesions that can cause scarring. Oral isotretinoin is the current recommended treatment for moderate and severe cases; however, there are reports of possible influences on the healing process of the skin, leading to an increase in the risk for hypertrophic scars and keloids."

Our news journalists obtained a quote from the research from Federal University, "This hypothesis, although unproven, represents a contraindication to the treatment of acne scars during the 6-12 months after the cessation of isotretinoin. The aim of this study was to investigate the prevalences of hypertrophic scars and keloids in acne patients treated with oral isotretinoin. Three data collection strategies were used: (i) clinical examination of patients with acne vulgaris, exposed or unexposed to oral isotretinoin, focusing on the occurrence of hypertrophic scars and/or keloids; (ii) telephone interviews of patients using oral isotretinoin to treat acne vulgaris on the occurrence or worsening of keloids; and (iii) clinical examination of patients with previous use of oral isotretinoin followed at a specific keloid treatment clinic. The resulting data showed no differences in wound healing."

According to the news editors, the research concluded: "These findings may indicate that the occurrence of hypertrophic scars or keloids in patients using oral isotretinoin is an undesirable event arising from an individual response and may be related to inflammatory acne evolution."

The news correspondents report that additional information may be obtained from L.R.S. Guadanhim, Federal University of Sao Paulo, Sao Paulo, SP, Brazil. Additional authors
for this research include R.G. Goncalves and E. Bagatin. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ijd.13317. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Antimicrobials**

**New Findings from Federal University in the Area of Antimicrobials Described (Adverse events caused by potential drug-drug interactions in an intensive care unit of a teaching hospital)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antimicrobials have been published. According to news originating from Juiz de Fora, Brazil, by NewsRx correspondents, research stated, "To evaluate the incidence of potential drug-drug interactions in an intensive care unit of a hospital, focusing on antimicrobial drugs. This cross-sectional study analyzed electronic prescriptions of patients admitted to the intensive care unit of a teaching hospital between January 1 and March 31, 2014 and assessed potential drug-drug interactions associated with antimicrobial drugs."

Our news journalists obtained a quote from the research from Federal University, "Antimicrobial drug consumption levels were expressed in daily doses per 100 patient-days. The search and classification of the interactions were based on the Micromedex? system. The daily prescriptions of 82 patients were analyzed, totaling 656 prescriptions. Antimicrobial drugs represented 25% of all prescription drugs, with meropenem, vancomycin and ceftriaxone being the most prescribed medications. According to the approach of daily dose per 100 patient-days, the most commonly used antimicrobial drugs were cefepime, meropenem, sulfamethoxazole + trimethoprim and ciprofloxacin. The mean number of interactions per patient was 2.6. Among the interactions, 51% were classified as contraindicated or significantly severe. Highly significant interactions (clinical value 1 and 2) were observed with a prevalence of 98%.

According to the news editors, the research concluded: "The current study demonstrated that antimicrobial drugs are frequently prescribed in intensive care units and present a very high number of potential drug-drug interactions, with most of them being considered highly significant."

The news correspondents report that additional information may be obtained from M.M. Alvim, Universidade Federal de Juiz de Fora, Juiz de Fora, MG, Brazil. Additional authors for this research include L.A. Silva, I.C. Leite and M.S Silverio.

The direct object identifier (DOI) for that additional information is:
New Findings from Federal University in the Area of Type 2 Diabetes Reported (The contribution of protein intrinsic disorder to understand the role of genetic variants uncovered by autism spectrum disorders exome studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting out of Porto Alegre, Brazil, by NewsRx editors, research stated, "Several autism spectrum disorders (ASD) exome studies suggest that coding single nucleotide variants (SNVs) play an important role on ASD etiology. Usually, the pathogenic effect of missense mutations is estimated through predictors that lose accuracy for those SNVs placed in intrinsically disordered regions of protein."

Financial support for this research came from Conselho Nacional de Desenvolvimento Cientifico e Tecnologico (CNPq, Brazil).

Our news journalists obtained a quote from the research from Federal University, "Here, we used bioinformatics tools to investigate the effect of mutations described in ASD published exome studies (549 mutations) in protein disorder, considering post-translational modification, PEST and Molecular Recognition Features (MoRFs) motifs. Schizophrenia and type 2 diabetes (T2D) datasets were created for comparison purposes. The frequency of mutations predicted as disordered was comparable among the three datasets (38.1% in ASD, 35.7% in schizophrenia, 46.4% in T2D). However, the frequency of SNVs predicted to lead a gain or loss of functional sites or change intrinsic disorder tendencies was higher in ASD and schizophrenia than T2D (46.9%, 36.4%, and 23.1%, respectively). The results obtained by SIFT and PolyPhen-2 indicated that 38.9% and 34.4% of the mutations predicted, respectively, as tolerated and benign showed functional alterations in disorder properties. Given the frequency of mutations placed in IDRs and their functional impact, this study suggests that alterations in intrinsic disorder properties might play a role in ASD and schizophrenia etiologies. They should be taken into consideration when researching the pathogenicity of mutations in neurodevelopmental and psychiatric diseases."

According to the news editors, the research concluded: "Finally, mutations with functional alterations in disorder properties must be potential targets for in vitro and in vivo functional studies."

Our news journalists report that additional information may be obtained by contacting J.B. Schuch, Dept. of Genetics, Federal University of Rio Grande do Sul (UFRGS), Porto Alegre, Rio Grande do Sul, Brazil. Additional authors for this research include V.R. Paixao-Cortes, D.C. Friedrich and L. Tovo-Rodrigues.

Atrial Fibrillation

New Findings from First Affiliated Hospital in the Area of Atrial Fibrillation Reported (One-Year Clinical Outcome of Pulmonary Vein Isolation Using the Second-Generation Cryoballoon: A Meta-Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Atrial Fibrillation. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "The second-generation cryoballoon (CB-2G) is a promising technique to treat atrial fibrillation (AF). It is necessary to summarize and analyze the available data on 1-year clinical outcome of pulmonary vein isolation (PVI) with CB-2G."

The news correspondents obtained a quote from the research from First Affiliated Hospital, "PubMed and the Web of Science were searched in May 2015. Studies that reported the 1-year clinical success rates after PVI using CB-2G were included. The 1-year clinical success rates were pooled using the random-effect model. Complication rates and acute success rates were also analyzed. Subgroup analyses were conducted based on AF type and ablation strategy. Fifteen studies involving 2,363 AF patients met the inclusion criteria. The overall clinical success rate of PVI using CB-2G was 81%. A total of 82% of paroxysmal AF patients and 70% of persistent AF patients were in stable sinus rhythm 1 year after the procedure. The clinical success rates of the 'no-bonus' strategy were 81% in all patients, 82% in paroxysmal AF patients, and 73% in persistent AF patients. The corresponding success rates of the 'bonus' strategy were 81%, 83%, and 63%. Acute success rate was high. The overall rates of phrenic nerve palsy (PNP) and other procedure-related complications were 5.8% and 1.5%, respectively. Compared with 'bonus' strategy, there was a trend of fewer PNPs in 'no-bonus' strategy (4.6% vs 6.5%). CB-2G is highly effective in the treatment of both paroxysmal AF and persistent AF."

According to the news reporters, the research concluded: "The 'no-bonus' strategy is as effective as the 'bonus' strategy in terms of 1-year clinical outcome."

Our news journalists report that additional information may be obtained by
contacting X. He, Dept. of Cardiology, The First Affiliated Hospital of Sun Yat-sen University, Yuexiu District, Guangzhou, Guangdong, People's Republic of China. Additional authors for this research include Y. Chen, Y. Zhou, Y. Huang and J. He.

U.S. Food and Drug Administration

New Findings from Food and Drug Administration in the Area of U.S. Food and Drug Administration Reported (Advancing pharmaceutical quality: An overview of science and research in the US FDA's Office of Pharmaceutical Quality)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on U.S. Food and Drug Administration is the subject of a report. According to news reporting from Silver Spring, Maryland, by NewsRx journalists, research stated, "Failures surrounding pharmaceutical quality, particularly with respect to product manufacturing issues and facility remediation, account for the majority of drug shortages and product recalls in the United States. Major scientific advancements pressure established regulatory paradigms, especially in the areas of biosimilars, precision medicine, combination products, emerging manufacturing technologies, and the use of real-world data."

The news correspondents obtained a quote from the research from Food and Drug Administration, "Pharmaceutical manufacturing is increasingly globalized, prompting the need for more efficient surveillance systems for monitoring product quality. Furthermore, increasing scrutiny and accelerated approval pathways provide a driving force to be even more efficient with limited regulatory resources. To address these regulatory challenges, the Office of Pharmaceutical Quality (OPQ) in the Center for Drug Evaluation and Research (CDER) at the U.S. Food and Drug Administration (FDA) harbors a rigorous science and research program in core areas that support drug quality review, inspection, surveillance, standards, and policy development. Science and research is the foundation of risk-based quality assessment of new drugs, generic drugs, over-the-counter drugs, and biotechnology products including biosimilars."

According to the news reporters, the research concluded: "This is an overview of the science and research activities in OPQ that support the mission of ensuring that safe, effective, and high-quality drugs are available to the American public."

Our news journalists report that additional information may be obtained by contacting S.L. Lee, Food & Drug Administration, Center Drug Evaluat & Res, Off Pharmacut
New Findings from Fourth Military Medical University Describe Advances in Immunoglobulins (Expression and purification of mouse Ttyh1 fragments as antigens to generate Ttyh1-specific monoclonal antibodies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - Immunoglobulins have been presented. According to news reporting originating in Xi'an, People's Republic of China, by NewsRx journalists, research stated, "Ttyh1 is a murine homolog of the Drosophila Tweety and is predicted as a five-pass transmembrane protein. The Ttyh1 mRNA is expressed in mouse brain tissues with a restricted pattern and in human glioma cells."

Funders for this research include Ministry of Science and Technology of China, National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Fourth Military Medical University, "Ttyh1 protein may function as a large-conductance chloride channel, however, the role of Ttyh1 in normal neural development and tumorigenesis has been largely unknown, at least partially due to the lack of effective antibodies. Here we report the expression in E. coli and purification of two recombinant Ttyh1 protein fragments corresponding to one of the predicted extracellular domains and the carboxyl terminus of the mouse Ttyh1. With these Ttyh1 protein products, a set of monoclonal antibodies (mAbs) against the mouse Ttyh1 protein was established by using conventional hybridoma techniques. The specificity of the anti-Ttyh1 mAbs was determined based on their activities in Western blotting and immunofluorescent analysis using embryonic brain tissues and cultured mouse neural stem cells (NSCs). We also show that the mouse Ttyh1 protein was expressed in cultured NSCs, most likely in membrane and cytoplasm. In mouse embryonic brains, it appeared that the Ttyh1 protein was specifically expressed in the apical edge of the ventricular zone as puncta-like structures, as determined by using immunofluorescence."

According to the news reporters, the research concluded: "Taken together, our study provided a useful tool for further exploration of the biological functions and pathological significance of Ttyh1 in mice."

For more information on this research see: Expression and purification of mouse Ttyh1 fragments as antigens to generate Ttyh1-specific monoclonal antibodies. Protein Expression and Purification, 2017;130():81-89. Protein Expression and Purification can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Immune System Diseases and Conditions - HIV/AIDS

New Findings from Free University Update Understanding of HIV/AIDS (Top-down and bottom-up modeling in system pharmacology to understand clinical efficacy: An example with NRTIs of HIV-1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - HIV/AIDS have been published. According to news reporting out of Berlin, Germany, by NewsRx editors, research stated, "A major aim of Systems Pharmacology is to understand clinically relevant mechanisms of action (MOA) of drugs and to use this knowledge in order to optimize therapy. To enable this mission it is necessary to obtain knowledge on how in vitro testable insights translate into clinical efficacy."

Financial support for this research came from BMBF e:Bio junior research group ‘Systems Pharmacology & Disease Control’.

Our news journalists obtained a quote from the research from Free University, "Mathematical modeling and data integration are essential components to achieve this goal. Two modeling philosophies are prevalent, each of which in isolation is not sufficient to achieve the above described: In a 'top-down' approach, a minimal pharmacokinetic-pharmacodynamic (PK-PD) model is derived from- and fitted to available clinical data. This model may lack interpretability in terms of mechanisms and may only be predictive for scenarios already covered by the data used to derive it. A 'bottom-up' approach builds on mechanistic insights derived from in vitro/ex vivo experiments, which can be conducted under controlled conditions, but may not be fully representative for the in vivo/clinical situation. In this work, we employ both approaches side-by-side to predict the clinical potency (IC50 values) of the nucleoside reverse transcriptase inhibitors (NRTIs) lamivudine, emtricitabine and tenofovir. In the 'top-down' approach, this requires to establish the dynamic link between the intracellularly active NRTI-triphosphates (which exert the effect) and plasma prodrug PK and to subsequently link this composite PK model to viral kinetics. The 'bottom-up' approach assesses inhibition of reverse transcriptase-mediated viral DNA polymerization by the intracellular, active NRTI-triphosphates, which has to be brought into the context of target cell infection. By using entirely disparate sets of data to derive and parameterize the respective models, our approach serves as a means to assess the clinical relevance of the 'bottom-up' approach. We obtain very good qualitative and quantitative agreement between 'top-down' vs. 'bottom-up' predicted IC50 values, arguing for the validity of the 'bottom-up' approach. We noted, however, that the 'top-
down' approach is strongly dependent on the sparse and noisy intracellular pharmacokinetic data. All in all, our work provides confidence that we can translate in vitro parameters into measures of clinical efficacy using the 'bottom-up' approach."

According to the news editors, the research concluded: "This may allow to infer the potency of various NRTIs in inhibiting e.g. mutant viruses, to distinguish sources of interaction of NRTI combinations and to assess the efficacy of different NRTIs for repurposing, e.g. for pre-exposure prophylaxis."

For more information on this research see: Top-down and bottom-up modeling in system pharmacology to understand clinical efficacy: An example with NRTIs of HIV-1. European Journal of Pharmaceutical Sciences, 2016;94():72-83. European Journal of Pharmaceutical Sciences can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; European Journal of Pharmaceutical Sciences - www.journals.elsevier.com/european-journal-of-pharmaceutical-sciences/)

Our news journalists report that additional information may be obtained by contacting S. Duwal, Free University of Berlin, Syst Pharmacol & Dis Control Grp, Dept. of Math & Comp Sci, D-14195 Berlin, Germany.

Drugs and Therapies - Toxicology and Pharmacology

New Findings from Free University Update Understanding of Toxicology and Pharmacology (Printed paper and board food contact materials as a potential source of food contamination)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Toxicology and Pharmacology. According to news originating from Brussels, Belgium, by NewsRx correspondents, research stated, "Food contact materials (FCM) are estimated to be the largest source of food contamination. Apart from plastics, the most commonly used FCM are made of printed paper and board."

Financial support for this research came from Belgian Scientific Institute of Public Health.

Our news journalists obtained a quote from the research from Free University, "Unlike their plastic counterparts, these are not covered by a specific European regulation. Several contamination issues have raised concerns towards potential adverse health effects caused by exposure to substances migrating from printed paper and board FCM. In the current study, an inventory combining the substances which may be used in printed paper and board FCM, was created. More than 6000 unique compounds were identified, the majority (77%)

considered non-evaluated in terms of potential toxicity. Based on a preliminary study of their physicochemical properties, it is estimated that most of the non-evaluated single substances have the potential to migrate into the food and become bioavailable after oral intake. Almost all are included in the FACET tool, indicating that their use in primary food packaging has been confirmed by industry. Importantly, 19 substances are also present in one of the lists with substances of concern compiled by the European Chemicals Agency (ECHA)."

According to the news editors, the research concluded: "To ensure consumer safety, the actual use of these substances in printed paper and board FCM should be investigated urgently."

For more information on this research see: Printed paper and board food contact materials as a potential source of food contamination. Regulatory Toxicology and Pharmacology. 2016;81():10-19. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Regulatory Toxicology and Pharmacology - www.journals.elsevier.com/regulatory-toxicology-and-pharmacology/)

The news correspondents report that additional information may be obtained from M. Van Bossuyt, Vrije Univ Brussel, Dept. of Vitro Toxicol & Dermato Cosmetol, Brussels, Belgium. Additional authors for this research include E. Van Hoeck, T. Vanhaecke, V. Rogiers and B. Mertens.

Oncology - Colon Cancer

New Findings from French National Institute of Health and Medical Research (INSERM) in the Area of Colon Cancer Reported (Does bevacizumab impact anti-EGFR therapy efficacy in metastatic colorectal cancer?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Dijon, France, by NewsRx journalists, research stated, "Anti-EGFR therapy and antiangiogenic therapies are used alone or in combination with chemotherapies to improve survival in metastatic colorectal cancer. However, it is unknown whether pretreatment with antiangiogenic therapy could impact on the efficacy of anti-EGFR therapy."

The news reporters obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "We selected one hundred and twenty eight patients diagnosed with advanced colorectal cancer with a KRAS and NRAS unmutated tumor. These patients were treated with cetuximab or panitumumab alone or with chemotherapy as second or third-line. Univariate and multivariate Cox model analysis were performed to estimate the effect of a previous bevacizumab regimen on progression free survival and on
overall survival during anti-EGFR therapy. In vitro studies using wild type KRAS and NRAS colon cancer cells were performed to evaluate the impact of VEGF-A on cetuximab-induced cell death. The median progression free survival (PFS) during anti-EGFR treatment was significantly different between the bevacizumab group and the non-bevacizumab group (2.8 and 4 months respectively; \( p=0.003 \)). The median overall survival from the beginning of the metastatic disease was similar in the two groups (41.3 and 42 months respectively; \( p=0.7 \)). In vitro, VEGF-A induced a resistance toward cetuximab cytotoxicity on three KRAS and NRAS wild type colon cancer cell lines in a VEGFR2 and Stat-3-dependent manner. All in all, our clinical data, supported by in vitro procedures, suggest that a previous anti-VEGF therapy decreases anti-EGFR efficacy."

According to the news reporters, the research concluded: "Although these results are observed in a limited cohort, they could be taken into consideration for a better strategy of care for patient suffering from metastatic colorectal cancer."

For more information on this research see: "Does bevacizumab impact anti-EGFR therapy efficacy in metastatic colorectal cancer?" *Oncotarget*, 2016;7(8):9309-21.

Our news correspondents report that additional information may be obtained by contacting V. Derangere, INSERM, U866, Faculté de Médecine, Université de Bourgogne, Dijon, France. **Eye Diseases and Conditions - Glaucoma**

**New Findings from Friedrich-Alexander-University in the Area of Glaucoma Described (Ensemble Pruning for Glaucoma Detection in an Unbalanced Data Set)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Eye Diseases and Conditions - Glaucoma have been published. According to news reporting originating in Erlangen, Germany, by NewsRx journalists, research stated, "Random forests are successful classifier ensemble methods consisting of typically 100 to 1000 classification trees. Ensemble pruning techniques reduce the computational cost, especially the memory demand, of random forests by reducing the number of trees without relevant loss of performance or even with increased performance of the sub-ensemble."

The news reporters obtained a quote from the research from Friedrich-Alexander-University, "The application to the problem of an early detection of glaucoma, a severe eye
disease with low prevalence, based on topographical measurements of the eye background faces specific challenges. We examine the performance of ensemble pruning strategies for glaucoma detection in an unbalanced data situation. The data set consists of 102 topographical features of the eye background of 254 healthy controls and 55 glaucoma patients. We compare the area under the receiver operating characteristic curve (AUC), and the Brier score on the total data set, in the majority class, and in the minority class of pruned random forest ensembles obtained with strategies based on the prediction accuracy of greedily grown sub-ensembles, the uncertainty weighted accuracy, and the similarity between single trees. To validate the findings and to examine the influence of the prevalence of glaucoma in the data set, we additionally perform a simulation study with lower prevalences of glaucoma. In glaucoma classification all three pruning strategies lead to improved AUC and smaller Brier scores on the total data set with sub-ensembles as small as 30 to 80 trees compared to the classification results obtained with the full ensemble consisting of 1000 trees. In the simulation study, we were able to show that the prevalence of glaucoma is a critical factor and lower prevalence decreases the performance of our pruning strategies."

According to the news reporters, the research concluded: "The memory demand for glaucoma classification in an unbalanced data situation based on random forests could effectively be reduced by the application of pruning strategies without loss of performance in a population with increased risk of glaucoma."

Our news correspondents report that additional information may be obtained by contacting W. Adler, Friedrich Alexander Univ Erlangen Nuremberg, Inst Med Informat Biometry & Epidemiol, D-91054 Erlangen, Germany. Additional authors for this research include O. Gefeller, A. Gul, F.K. Horn, Z. Khan and B. Lausen.

**Drugs and Therapies - Ethnopharmacology**

**New Findings from Fudan University Update Understanding of Ethnopharmacology (Structure characterization of two novel polysaccharides isolated from the spikes of Prunella vulgaris and their anticomplement activities)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Ethnopharmacology. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Ethnopharmacological relevance: The spikes of Prunella vulgaris have long been used as a traditional Chinese medicine to treat various inflammation-related diseases. The aim of this study was to isolate and characterize homogenous polysaccharides from this herb and to evaluate their anticomplement activity."

Funders for this research include National Natural Science Foundation of China,
Ministry of Education of China, Ministry of Science and Technology of China.

The news correspondents obtained a quote from the research from Fudan University, "Anticomplement activity-guided fractionation of the hot water extract of P. vulgaris was performed by DEAE-cellulose and size-exclusion chromatography, yielding two homogeneous polysaccharides PW-PS1 and PW-PS2. The homogeneity, molecular weight, monosaccharide composition and linkage of the two polysaccharides were determined in addition to other chemical characterizations. The anticomplement activity of the polysaccharides was evaluated and expressed as 50% hemolytic inhibition concentration through the classical pathway (CH50 value) and alternative pathway (AP(50) value). The preliminary mechanism for the complement activation cascade was also assessed. PW-PS1 and PW-PS2 were both branched acidic polysaccharides. PW-PS1 was composed of Ara, Xyl, and 4-methoxy-Glc A in a ratio of 1.0:2.6:0.8. The main linkages of the sugar residues of PW-PS1 included terminal beta-D-Xylp, 1,4-linked beta-D-Xylp, 1,3-linked alpha-D-Arap, 1,3,5-linked alpha-D-Arap, and terminal 4-methoxy-alpha-D-Glcp A. PW-PS2 was composed of Rha, Ara, Xyl, Gal, and Gal A in a ratio of 0.6:1.0:1.3:1.8:3.4. The main linkages between the sugar residues of PW-PS2 included terminal Araf, 1,4-linked beta-D-Xylp, 1,3-linked alpha-D-Rhap, terminal alpha-D-Galp, and 1,4,6-linked alpha-D-Galp. PW-PS1 and PW-PS2 inhibited complement activation through both the classical and alternative pathways with CH50 values of 0.28 and 0.13 mg/mL, respectively, and AP(50) values of 0.40 and 0.35 mg/mL, respectively. Preliminary mechanism studies using complement component-depleted sera showed that PW-PS1 acted on the C1q, C3, and C9 components and that PW-PS2 acted on the C1q, C2, C3, C5, and C9 components."

According to the news reporters, the research concluded: "Our study suggested that PW-PS1 and PW-PS2 could be valuable for the treatment of diseases associated with the excessive activation of the complement system."

According to the news reporters, the research concluded: "Our study suggested that PW-PS1 and PW-PS2 could be valuable for the treatment of diseases associated with the excessive activation of the complement system."

Our news journalists report that additional information may be obtained by contacting Z.H. Cheng, Fudan University, Sch Pharm, Dept. of Pharmacognosy, Shanghai 201203, People's Republic of China. Additional authors for this research include Y. Lu, Z.H. Cheng and D.F. Chen.

New Findings from Fudan University Update Understanding of Uropathogenic Escherichia coli (Disruption of Membrane by Colistin Kills Uropathogenic Escherichia coli Persisters and Enhances Killing of Other Antibiotics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Uropathogenic Escherichia coli. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Persisters are small populations of quiescent bacterial cells that survive exposure to bactericidal antibiotics and are responsible for many persistent infections and posttreatment relapses. However, little is known about how to effectively kill persister bacteria."

Our news editors obtained a quote from the research from Fudan University, "In the work presented here, we found that colistin, a membrane-active antibiotic, was highly active against Escherichia coli persisters at high concentrations (25 or 50 μg/ml). At a clinically relevant lower concentration (10 μg/ml), colistin alone had no apparent effect on E. coli persisters. In combination with other drugs, this concentration of colistin enhanced the antipersister activity of gentamicin and ofloxacin but not that of ampicillin, nitrofurans, and sulfadiazine in vitro. The colistin enhancement effect was most likely due to increased uptake of the other antibiotics, as demonstrated by increased accumulation of fluorescence-labeled gentamicin. Interestingly, colistin significantly enhanced the activity of ofloxacin and nitrofurantoin but not that of gentamicin or sulfadiazine in the murine model of urinary tract infection."

According to the news editors, the research concluded: "Our findings suggest that targeting bacterial membranes is a valuable approach to eradicating persisters and should have implications for more effective treatment of persistent bacterial infections."

For more information on this research see: Disruption of Membrane by Colistin Kills Uropathogenic Escherichia coli Persisters and Enhances Killing of Other Antibiotics. Antimicrobial Agents and Chemotherapy, 2016;60(11):6867-6871. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Oncology - Pancreatic Cancer

New Findings from Fudan University Yields New Data on Pancreatic Cancer (HEATR1 Negatively Regulates Akt to Help Sensitize Pancreatic Cancer Cells to Chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Elucidating mechanisms of chemoresistance is critical to improve cancer therapy, especially for the treatment of pancreatic ductal adenocarcinoma (PDAC). Genome-wide association studies have suggested the less studied gene HEAT repeat-containing protein 1 (HEATR1) as a possible determinant of cellular sensitivity to different chemotherapeutic drugs."

Our news journalists obtained a quote from the research from Fudan University, "In this study, we assessed this hypothesized link in PDAC, where HEATR1 expression is downregulated significantly. HEATR1 silencing in PDAC cells increased resistance to gemcitabine and other chemotherapeutics, where this effect was associated with increased AKT kinase phosphorylation at the Thr308 regulatory site. Mechanistically, HEATR1 enhanced cell responsiveness to gemcitabine by acting as a scaffold to facilitate interactions between AKT and the protein phosphatase PP2A, thereby promoting Thr308 dephosphorylation. Consistent with these findings, treatment with the AKT inhibitor triciribine sensitized HEATR1-depleted PDAC cells to gemcitabine, suggesting that this therapeutic combination may overcome gemcitabine resistance in patients with low HEATR1 expression. Clinically, we found that HEATR1 downregulation in PDAC patients was associated with increased AKT phosphorylation, poor response to tumor resection plus gemcitabine standard-of-care treatment, and shorter overall survival."

According to the news editors, the research concluded: "Collectively, our findings establish HEATR1 as a novel regulator of AKT and a candidate predictive and prognostic indicator of drug responsiveness and outcome in PDAC patients."

For more information on this research see: HEATR1 Negatively Regulates Akt to Help Sensitize Pancreatic Cancer Cells to Chemotherapy. Cancer Research, 2015;76(3):572-81. (American Association for Cancer Research - www.aacr.com; Cancer Research - cancerres.aacrjournals.org/)

New Findings from General Hospital in the Area of Colon Cancer Described (Is estimated intra-operative blood loss a reliable predictor of surgical outcomes in laparoscopic colorectal cancer surgery?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news reporting from Northampton, United Kingdom, by NewsRx journalists, research stated, "Studies have shown that laparoscopic surgery for colorectal cancer is often associated with significantly reduced intra-operative blood loss compared to the corresponding open procedures. Increased intra-operative blood loss can be associated with increased risk of post-operative morbidity and mortality."

The news correspondents obtained a quote from the research from General Hospital, "We sought to determine whether estimated intra-operative blood loss was a reliable predictor of post-operative surgical outcomes. Prospective data were collected for patients undergoing elective laparoscopic colorectal cancer resections from July 2011 to November 2013. Weighing swabs and measuring blood volume in suction devices calculated the estimated intra-operative blood loss. The operative outcome data including post-operative 30 day morbidity and mortality, length of hospital stay, re-admission and re-operation within 30 days were collected. The operative blood loss was grouped into Group 1 (less than 50 ml, Group 2 (50-150 ml) and Group 3 (over 150 ml). Patients who underwent open operations and laparoscopic conversions were excluded. The median age, length of hospital stay, male to female ratio and body mass index were similar in the three groups. There was no 30-day mortality in any of the groups. The number of re-admissions within 30 days was similar in all groups. The re-operation rates within 30 days were higher in Groups 2 and 3 at 11% and 8.6%, respectively. The postoperative complications were 12.5%, 16.7%, and 26% in groups 1, 2 and 3, respectively. There were no anastomotic leaks requiring re-operation noted in Group 3. This study has shown that intra-operative blood loss was not associated with increased median length of stay nor did it increase the 30 day re-admission rate."

According to the news reporters, the research concluded: "However, increased intra-operative blood loss was associated with increased incidence of post-operative morbidity and risk of re-operation within 30 days."

Our news journalists report that additional information may be obtained by contacting U. Ihedioha, Northampton Gen Hosp NHS Trust, Dept. of Gen Surg, Northampton, United Kingdom. Additional authors for this research include U. Ihedioha, B. Babu, J. Evans and P. Kang.

Drugs and Therapies - Cardiovascular Agents

New Findings from George Washington University in the Area of Cardiovascular Agents Described (Tamsulosin for urolithiasis: a review of the recent literature and current controversies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Cardiovascular Agents is now available. According to news reporting originating from Washington, District of Columbia, by NewsRx correspondents, research stated, "In the United States, urolithiasis affects approximately 1 in 11 people, and there is evidence that the prevalence is increasing. A relatively recent treatment strategy for urolithiasis involves using medical expulsive therapy (MET) to increase the likelihood of spontaneous passage of ureteral stones."

Our news editors obtained a quote from the research from George Washington University, "The 2 leading drug classes for MET are alpha-1-andrenergic receptor blockers and calcium channel blockers. Tamsulosin, an alpha-1-adrenoceptor blocking agent, is thought to induce spontaneous stone passage by relaxing ureteral smooth muscle tone. However, tamsulosin has not been proven effective for increasing ureteral stone passage and is not approved by the Food and Drug Administration for this indication. There is a relative paucity of data on the efficacy of tamsulosin for urolithiasis, and of the published results, there are conflicting conclusions from the data. Because of the acute and often severe nature of symptoms from urolithiasis, emergency medicine physicians are frequently the first to diagnose and treat this condition. This has led to tamsulosin being frequently prescribed from the emergency department (ED) for off-label use without the support of high-quality evidence. If tamsulosin is proven effective, its use in the treatment of urolithiasis could offer several important advantages. The number of procedures, length of hospital stay, and health care costs after the initial ED visit could potentially be reduced. Tamsulosin may also increase patient satisfaction by reducing the invasive treatment and decreasing the time to stone passage."

According to the news editors, the research concluded: "This review focuses on the efficacy of tamsulosin based on stone location, after shock wave lithotripsy, compared with other MET drugs and in the acute setting of the ED."

The news editors report that additional information may be obtained by contacting A. Pourmand, George Washington University, Dept. of Emergency Med, Washington, DC, United States. Additional authors for this research include R. Nadendla, M. Mazer-Amirshahi and F.
Membrane Proteins - G-Protein-Coupled Receptors

New Findings from George Washington University in the Area of G-Protein-Coupled Receptors Reported (Bonobo personality traits are heritable and associated with vasopressin receptor gene 1a variation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Membrane Proteins - G-Protein-Coupled Receptors have been published. According to news reporting out of Washington, District of Columbia, by NewsRx editors, research stated, "Despite being closely related, bonobos and chimpanzees show remarkable behavioral differences, the proximate origins of which remain unknown. This study examined the link between behavioral variation and variation in the vasopressin 1a receptor gene (Avpr1a) in bonobos."

Our news journalists obtained a quote from the research from George Washington University, "Chimpanzees are polymorphic for a similar to 360 bp deletion (DupB), which includes a microsatellite (RS3) in the 5' promoter region of Avpr1a. In chimpanzees, the DupB deletion has been linked to lower sociability, lower social sensitivity, and higher anxiety. Chimpanzees and bonobos differ on these traits, leading some to believe that the absence of the DupB deletion in bonobos may be partly responsible for these differences, and to the prediction that similar associations between Avpr1a genotypes and personality traits should be present in bonobos. We identified bonobo personality dimensions using behavioral measures (Sociability (B), Boldness(B), Openness(B), Activity(B)) and trait ratings (Assertiveness®, Conscientiousness®, Openness®, Agreeableness®, Attentiveness®, Extraversion®). In the present study we found that all 10 dimensions have nonzero heritabilities, indicating there is a genetic basis to personality, and that bonobos homozygous for shorter RS3 alleles were lower in AttentivenessR and higher in OpennessB."

According to the news editors, the research concluded: "These results suggest that variations in Avpr1a genotypes explain both within and between species differences in personality traits of bonobos and chimpanzees."

For more information on this research see: Bonobo personality traits are heritable and associated with vasopressin receptor gene 1a variation. Scientific Reports, 2016:6():1-8. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting N. Staes, George Washington University, Dept. of Anthropol, Center Adv Study

Central Nervous System Diseases and Conditions -

New Findings from Gifu Pharmaceutical University in Intracranial Hemorrhages Provides New Insights (Cilostazol ameliorates collagenase-induced cerebral hemorrhage by protecting the blood-brain barrier)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions - Intracranial Hemorrhages have been presented. According to news reporting from Gifu, Japan, by NewsRx journalists, research stated, "Intracranial hemorrhage remains a devastating disease. Among antiplatelet drugs, cilostazol, a phosphodiesterase 3 inhibitor, was recently reported to prevent secondary hemorrhagic stroke in patients in a clinical trial."

The news correspondents obtained a quote from the research from Gifu Pharmaceutical University, "The aim of this study was to evaluate whether pre-treatment with cilostazol could decrease the intracranial hemorrhage volume and examine the protective mechanisms of cilostazol. We evaluated the pre-treatment effects of the antiplatelet drug cilostazol on the collagenase-induced intracranial hemorrhage volume and neurological outcomes in mice. To estimate the mechanism of collagenase injury, we evaluated various vascular components in vitro, including endothelial cells, vascular smooth muscle cells, pericytes, and a blood-brain barrier model. Cilostazol pre-treatment reduced the intracranial hemorrhage volume with sufficient inhibition of platelet aggregation, and motor function was improved by cilostazol treatment. Blood-brain barrier permeability was increased by collagenase-induced intracranial hemorrhage, and cilostazol attenuated blood-brain barrier leakage. Terminal deoxynucleotidyl transferase dUTP nick-end labeling and western blot analysis showed that cilostazol prevented pericyte cell death by inducing cyclic adenosine monophosphate-responsive element-binding protein phosphorylation. Cilostazol also prevented endothelial cell death and protected collagen type 4, laminin, and vascular endothelial-and N-cadherins from collagenase injury."

According to the news reporters, the research concluded: "Cilostazol reduced collagenase-induced intracranial hemorrhage volume by protecting the blood-brain barrier."

Neuroticism

New Findings from Graduate Institute of Medical Science in Neuroticism Provides New Insights [Gender-specific association between serotonin transporter polymorphisms (5-HTTLPR and rs25531) and neuroticism, anxiety and depression in well-defined ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Neuroticism is now available. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "A tri-allelic serotonin transporter promoter polymorphism (5-HTTLPR/rs25531) more effectively determines the levels of transcriptional efficacy than that with the bi-allelic 5-HTTLPR polymorphism in vitro. Both are reportedly associated with personality traits of negative emotionality, but with conflicting findings."

The news reporters obtained a quote from the research from the Graduate Institute of Medical Science, "One explanation for this is that a gender difference may play a role in genetic contribution. Here, we hypothesized that the tri-allelic genotype of the serotonin transporter is more closely linked to neuroticism, an anxiety- and depression-related trait, than the bi-allelic variation, particularly in a gender-dependent way. The genotypes of the 5-HTTLPR and rs25531 loci were determined in 1139 well-defined physically and mentally healthy Han Chinese (550 men, 589 women; mean age 38.3 +/- 10.3 years). All participants completed the neuroticism measure of the short-form Maudsley Personality Inventory (MPI). The levels of anxiety and depression were assessed by the Beck Anxiety Inventory (BAI) and the Beck Depression Inventory (BDI), respectively. A significant tri-allelic genotype-by-gender interaction effect was found in the MPI-neuroticism measure. S’S’ homozygotes were associated with higher neuroticism than L’ allele carriers in men. Also, both the BAI and BDI scores were higher in the S’S’ homozygotic men. In the bi-allelic analyses, however, there was only an association between SS genotype and MPI-neuroticism in men. Limitations: Sub-analyses by gender-stratification may reduce the statistical power. Our findings confirm that gender differences exist in the genetic contributions of the serotonin transporter in human neuroticism, and anxiety/depression."
According to the news reporters, the research concluded: "Our data provide further support for rs25531 strengthening the effects of 5-HTTLPR."

For more information on this research see: Gender-specific association between serotonin transporter polymorphisms (5-HTTLPR and rs25531) and neuroticism, anxiety and depression in well-defined healthy Han Chinese. *Journal of Affective Disorders*, 2017;207 ():422-428. *Journal of Affective Disorders* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Oncology - Bowel Cancer**

**New Findings from Griffith University in the Area of Bowel Cancer Reported (Modulatory roles of microRNAs in the regulation of different signalling pathways in large bowel cancer stem cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Bowel Cancer is now available. According to news reporting originating in Gold Coast, Australia, by NewsRx journalists, research stated, "There are emerging data to suggest that microRNAs (miRNAs) have significant roles in regulating the function of normal cells and cancer stem cells (CSCs). This review aims to analyse the roles of miRNAs in the regulation of colon CSCs through their interaction with various signalling pathways."

The news reporters obtained a quote from the research from Griffith University, "Studies showed a large number of miRNAs that are reported to be deregulated in colon CSCs. However, few of the studies available were able to outline the function of miRNAs in colon CSCs and uncover their signalling pathways. From those miRNAs, which are better described, miR-21 followed by miR-34, miR-200 and miR-215 are the most reported miRNAs to have roles in colon CSC regulation. In particular, miRNAs have been reported to regulate the stemness features of colon CSCs mainly via Wnt/B-catenin and Notch signalling pathways. Additionally, miRNAs have been reported to act on processes involving CSCs through cell cycle regulation genes and epithelial-mesenchymal transition. The relative paucity of data available on the significance of miRNAs in CSCs means that new studies will be of great importance to determine their roles and to identify the signalling pathways through which they operate."

According to the news reporters, the research concluded: "Such studies may in future guide further research to target these genes for more effective cancer treatment. miRNAs were
shown to regulate the function of cancer stem cells in large bowel cancer by targeting a few key signalling pathways in cells."

Our news correspondents report that additional information may be obtained by contacting A. Mamoori, Cancer Molecular Pathology, School of Medicine, Menzies Health Institute Queensland, Griffith University, Gold Coast, Queensland, Australia. Additional authors for this research include V. Gopalan, R.A. Smith and A.K. Lam.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/boc.201500062. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings from Gyeongsang National University in the Area of Neurodegenerative Diseases and Conditions Described (Flavonoids Isolated from Flowers of Lonicera japonica Thunb. Inhibit Inflammatory Responses in BV2 Microglial Cells by ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Neurodegenerative Diseases and Conditions have been presented. According to news reporting out of Jinju, South Korea, by NewsRx editors, research stated, "Decoctions of the dried flowers of Lonicera japonica Thunb. (Indongcho) have been utilized in folk remedies against various inflammatory diseases, and it is reported neuroprotective effects. The cytokines release from microglia is closely linked to various chronic neurodegenerative diseases like Alzheimer's disease and Parkinson's disease."

Our news journalists obtained a quote from the research from Gyeongsang National University, "It is still unknown whether the neuroprotective effects are associated with the antinflammatory effects. Here, we determined whether polyphenols extracted from lyophilized Lonicera japonica Thunb. (PELJ) would inhibit inflammatory cytokines and mediators. We stimulated microglia with lipopolysaccharide (LPS) to produce inflammatory cytokines, and then assessed the effects of PELJ on these cytokines. PELJ significantly inhibited LPS-induced interleukin-1 beta and tumor necrosis factor-alpha expressions and LPS-induced nitric oxide (NO) and prostaglandin E-2 expressions by down-regulating inducible enzyme NO synthase and cyclooxygenase-2 at the protein and mRNA levels. All the suppression of these mediators did not cause any significant cytotoxicity. PELJ also inhibited the nuclear translocation of nuclear factor-kappa B and phosphorylated Akt."

According to the news editors, the research concluded: "These findings suggest that PELJ may offer substantial therapeutic potential for treating inflammatory and neurodegenerative diseases by inhibiting pro-inflammatory cytokines through inhibiting
phosphoinositol 3-kinase /Akt/nuclear factor-kappa B signaling pathway."

Keywords for this news article include: Jinju, South Korea, Asia, Neurodegenerative Diseases and Conditions, Cytokines, Genetics, Gyeongsang National University.

DNA Research

New Findings from Hainan University Update Understanding of DNA Research (DNA methylation patterns of banana leaves in response to Fusarium oxysporum f. sp. cubense tropical race 4)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on DNA Research. According to news reporting out of Haikou, People's Republic of China, by NewsRx editors, research stated, "Fusarium wilt of banana, which is caused by Fusarium oxysporum f. sp. cubense tropical race 4 (Foc TR4), is a serious soil-borne fungal disease. Now, the epigenetic molecular pathogenic basis is elusive."

Our news journalists obtained a quote from the research from Hainan University, "In this study, with methylation-sensitive amplification polymorphism (MSAP) technique, DNA methylation was compared between the leaves inoculated with Foc TR4 and the mock-inoculated leaves at different pathogenic stages. With 25 pairs of primers, 1 144 and 1255 fragments were amplified from the infected and mock-inoculated leaves, respectively. DNA methylation was both changed and the average methylated CCGG sequences were 34.81 and 29.26% for the infected and the mock-inoculated leaves. And DNA hypermethylation and hypomethylation were induced by pathogen infection during all pathogenic stages. Further, 69 polymorphic fragments were sequenced and 29 of them showed sequence similarity to genes with known functions. And RT-PCR results of four genes indicated that their expression patterns were consistent with their methylation patterns."

According to the news editors, the research concluded: "Our results suggest that DNA methylation plays important roles in pathogenic response to Foc TR4 for banana."

New Findings from Hamad Medical Corporation Describe Advances in Kidney Function (Do directly acting antiviral agents for HCV increase the risk of hepatic decompensation and decline in renal function? Results from ERCHIVES)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gastroenterology - Kidney Function are presented in a new report. According to news reporting from Doha, Qatar, by NewsRx journalists, research stated, "Directly acting antiviral agents (DAA) have been associated with hepatic decompensation, especially in patients with pre-treatment cirrhosis, but this risk is not well defined. To determine the incidence of hepatic decompensation, liver transplantation, death and worsening renal function in patients treated with a Paritaprevir/ritonavir, Ombitasvir, Dasabuvir (PrOD), sofosbuvir/simeprevir or sofosbuvir/ledipasvir regimen."

Funders for this research include AbbVie, Gilead Sciences, Anadys, Genentech, Merck, Novartis, Vertex.

The news correspondents obtained a quote from the research from Hamad Medical Corporation, "We followed ERCHIVES participants treated with the above regimens for up to 12 weeks post-treatment. We excluded those with HIV, HBsAg+ and pre-existing diagnosis of hepatic decompensation and hepatocellular carcinoma. Of 3728 persons on PrOD, 1578 on sofosbuvir/simeprevir and 10 440 on sofosbuvir/ledipasvir, incidence rates (95% CI) of hepatic decompensation/1000 patient-years were 10.6 (5.89-17.36) for the PrOD, 32.4 (20.74-48.16) for the sofosbuvir/simeprevir and 13.0 (9.74-17.10) for the sofosbuvir/ledipasvir. Among those with baseline cirrhosis, these rates were 36.9 (19.1-64.5), 61.8 (38.2-94.5) and 41.1 (29.9-55.2) respectively, while among those without cirrhosis at baseline, these rates were 2.7 (0.6-8.0), 7.5 (1.5-21.8) and 2.7 (1.2-5.4). Advanced fibrosis was associated with increased risk of hepatic decompensation in all groups [HR (95% CI) per 0.5 unit increase in FIB-4 score: PrOD 1.11 (1.07-1.16); sofosbuvir/simeprevir 1.03 (1.01-1.05); sofosbuvir/ledipasvir 1.02 (1.01-1.03)]. There were no deaths. Proportion of persons with eGFR decrease >30 ml/min/1.73 m(2) was higher among the PrOD group, but presence of cirrhosis did not appear to affect this. The incidence of hepatic decompensation in persons treated with PrOD, up to 12 weeks after completion of treatment, was comparable to those treated with sofosbuvir/ledipasvir regimen, and was lower than among those treated with a sofosbuvir/simeprevir regimen."

According to the news reporters, the research concluded: "Such risk was predominantly observed in those with pre-treatment cirrhosis."
For more information on this research see: Do directly acting antiviral agents for HCV increase the risk of hepatic decompensation and decline in renal function? Results from ERCHIVES. *Alimentary Pharmacology & Therapeutics*, 2017;45(1):150-159. *Alimentary Pharmacology & Therapeutics* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Autoimmune Diseases and Conditions - Rheumatoid...

**New Findings from Hanyang University Hospital in the Area of Rheumatoid Arthritis Described (A phase III, multicentre, randomised, double-blind, active-controlled, parallel-group trial comparing safety and efficacy of HD203, with innovator ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Autoimmune Diseases and Conditions - Rheumatoid Arthritis is now available. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "To evaluate equivalence in efficacy for rheumatoid arthritis (RA) and compare the safety of the biosimilar HD203 with innovator etanercept (ETN) plus methotrexate (MTX) (ClinicalTrials.gov NCT01270997). Patients with active RA received 25 mg HD203 or ETN subcutaneously twice-weekly with MTX for 48 weeks in a phase III, multicentre, randomised, double-blind, parallel-group design."

Our news editors obtained a quote from the research from Hanyang University Hospital, "The primary end point was the proportion of patients achieving the American College of Rheumatology 20% response (ACR20) at week 24 for per-protocol study completer set (PPS). Secondary end points included ACR response criteria, ACRn, European League against Rheumatism (EULAR) response, change in Disease Activity Score 28 (DAS28), patient-reported outcomes, safety and immunogenicity. Of the 294 randomised patients (HD203, n=147; ETN, n=147), 233 comprised the 24-week PPS (n=115 and 118, respectively). ACR20 at week 24 was achieved by 83.48% and 81.36% of PPS patients, respectively, demonstrating equivalent efficacy within predefined margins of ?20% (treatment difference 2.12%, 95% CI -7.65% to 11.89%). Outcomes for secondary end points were consistent with the primary efficacy findings. Groups were comparable for overall incidences of treatment-emergent (all-causality) adverse events (AEs) (HD203 113 (76.9%) vs ETN 114 (78.1%) (p=0.804), adverse drug reactions, serious AEs and discontinuations due to AEs. Few patients (HD203, n=8; ETN, n=3) tested positive for anti-drug antibodies. The study met the primary objective of demonstrating..."
equivalent efficacy of HD203 and ETN."

According to the news editors, the research concluded: "HD203 was well tolerated, with safety comparable with ETN in this population of patients with RA."

The news editors report that additional information may be obtained by contacting S.C. Bae, Hanyang University Hospital for Rheumatic Diseases, Seoul, South Korea. Additional authors for this research include J. Kim, J.Y. Choe, W. Park, S.H. Lee, Y.B. Park, S.C. Shim, S.S. Lee, Y.K. Sung, C.B. Choi, S.R. Lee, H. Park and Y. Ahn.

Drugs and Therapies - Antibiotics

New Findings from Harvard School of Medicine Describe Advances in Antibiotics (An Autotaxin/Lysophosphatidic Acid/Interleukin-6 Amplification Loop Drives Scleroderma Fibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antibiotics have been presented. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "We previously implicated the lipid mediator lysophosphatidic acid (LPA) as having a role in dermal fibrosis in systemic sclerosis (SSc). The aim of this study was to identify the role of the LPA-producing enzyme autotaxin (ATX), and to connect the ATX/LPA and interleukin-6 (IL-6) pathways in SSc."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "We evaluated the effect of a novel ATX inhibitor, PAT-048, on fibrosis and IL-6 expression in the mouse model of bleomycin-induced dermal fibrosis. We used dermal fibroblasts from SSc patients and control subjects to evaluate LPA-induced expression of IL-6, and IL-6-induced expression of ATX. We next evaluated whether LPA-induced ATX expression is dependent on IL-6, and whether baseline IL-6 expression in fibroblasts from SSc patients is dependent on ATX. Finally, we compared ATX and IL-6 expression in the skin of patients with SSc and healthy control subjects. PAT-048 markedly attenuated bleomycin-induced dermal fibrosis when treatment was initiated before or after the development of fibrosis. LPA stimulated expression of IL-6 in human dermal fibroblasts, and IL-6 stimulated fibroblast expression of ATX, connecting the ATX/LPA and IL-6 pathways in an amplification loop. IL-6 knockdown abrogated LPA-induced ATX expression in fibroblasts, and ATX inhibition
attenuated IL-6 expression in fibroblasts and the skin of bleomycin-challenged mice. Expression of both ATX and IL-6 was increased in SSc skin, and LPA-induced IL-6 levels and IL-6-induced ATX levels were increased in fibroblasts from SSc patients compared with controls. ATX is required for the development and maintenance of dermal fibrosis in a mouse model of bleomycin-induced SSc and enables 2 major mediators of SSc fibrogenesis, LPA and IL-6, to amplify the production of each other."

According to the news reporters, the research concluded: "Our results suggest that concurrent inhibition of these 2 pathways may be an effective therapeutic strategy for dermal fibrosis in SSc."

For more information on this research see: An Autotaxin/Lysophosphatidic Acid/Interleukin-6 Amplification Loop Drives Scleroderma Fibrosis. Arthritis & Rheumatology, 2016;68(12):2964-2974. Arthritis & Rheumatology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Essential Amino Acids

New Findings from Harvard School of Medicine in the Area of Essential Amino Acids Reported [Tryptophan-rich basic protein (WRB) mediates insertion of the tail-anchored protein otoferlin and is required for hair cell exocytosis and hearing]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Essential Amino Acids. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "The transmembrane recognition complex (TRC40) pathway mediates the insertion of tail-anchored (TA) proteins into membranes. Here, we demonstrate that otoferlin, a TA protein essential for hair cell exocytosis, is inserted into the endoplasmic reticulum (ER) via the TRC40 pathway."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "We mutated the TRC40 receptor tryptophan-rich basic protein (Wrb) in hair cells of zebrafish and mice and studied the impact of defective TA protein insertion. Wrb disruption reduced otoferlin levels in hair cells and impaired hearing, which could be restored in zebrafish by transgenic Wrb rescue and otoferlin overexpression. Wrb-deficient mouse inner hair cells (IHCs) displayed normal numbers of afferent synapses, Ca2+ channels, and membrane-proximal vesicles, but contained fewer ribbon-associated vesicles. Patch-clamp of IHCs revealed impaired synaptic vesicle replenishment. In vivo recordings from postsynaptic spiral ganglion neurons showed a use-dependent reduction in sound-evoked spiking, corroborating the notion of impaired IHC vesicle replenishment. A human mutation affecting the transmembrane domain of
otoferlin impaired its ER targeting and caused an auditory synaptopathy."

According to the news editors, the research concluded: "We conclude that the TRC40 pathway is critical for hearing and propose that otoferlin is an essential substrate of this pathway in hair cells."

**Stem Cell Research**

**New Findings from Harvard School of Medicine in the Area of Stem Cell Research Reported** [Alteration in cellular turnover and progenitor cell population in lacrimal glands from thrombospondin 1(-/-) mice, a model of dry eye]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stem Cell Research. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "The purpose of this study was to investigate the changes that occur in the lacrimal glands (LGs) in female thrombospondin 1 knockout (TSP1(-/-)) mice, a mouse model of the autoimmune disease Sjogren's syndrome. The LGs of 4, 12, and 24 week-old female TSP1(-/-) and C57BL/6J (wild type, WT) mice were used. qPCR was performed to measure cytokine expression."

Our news editors obtained a quote from the research from the Harvard School of Medicine, "To study the architecture, LG sections were stained with hematoxylin and eosin. Cell proliferation was measured using bromo-deoxyuridine and immunohistochemistry. Amount of CD47 and stem cell markers was analyzed by western blot analysis and location by immunofluorescence microscopy. Expression of stem cell transcription factors was performed using Mouse Stem Cell Transcription Factors RT2 Profiler PCR Array. Cytokine levels significantly increased in LGs of 24 week-old TSP1(-/-) mice while morphological changes were detected at 12 weeks. Proliferation was decreased in 12 week-old TSP1(-/-) mice. Three transcription factors were overexpressed and eleven underexpressed in TSP1(-/-) compared to WT LGs. The amount of CD47, Musashi1, and Sox2 was decreased while the amount of ABCG2 was increased in 12 week-old TSP1(-/-)mice."

According to the news editors, the research concluded: "TSP1 is necessary for
maintaining normal LG homeostasis. Absence of TSP1 alters cytokine levels and stem cell transcription factors, LG cellular architecture, decreases cell proliferation, and alters amount of stem cell markers."

Keywords for this news article include: Boston, Massachusetts, United States, North and Central America, Intercellular Signaling Peptides and Proteins, Membrane Glycoproteins, Transcription Factors, Cell Proliferation, Stem Cell Research, Membrane Proteins, Thrombospondin 1, Thrombospondins, Cytokines, Genetics, Harvard School of Medicine.

**Heart Disorders and Diseases - Atrial Fibrillation**

**New Findings from Heart Center in the Area of Atrial Fibrillation Reported (Renal sympathetic denervation for treatment of patients with atrial fibrillation: Reappraisal of the available evidence)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting out of Pori, Finland, by NewsRx editors, research stated, "Afferent renal sympathetic nerve signaling regulates central sympathetic outflow. In this regard, renal sympathetic denervation has emerged as a novel interventional strategy for treatment of patients with resistant hypertension."

Our news journalists obtained a quote from the research from Heart Center, "Despite the disappointing results of the Simplicity HTN-3 randomized controlled trial, promoters of renal denervation argue that the negative results were due to ineffective denervation technique and poor patient selection. Yet, long-term 'pathologic' increase of efferent sympathetic nerve activity is observed in many chronic disease states characterized by sympathetic overactivity, such as arrhythmia, heart failure, insulin resistance, and chronic kidney disease."

According to the news editors, the research concluded: "In this review, we highlight the contemporary evidence on the safety/efficacy of renal denervation in the treatment of patients with atrial fibrillation."

Our news journalists report that additional information may be obtained by contacting P.P. Karjalainen, Satakunta Cent Hosp, Center Heart, F1N-28500 Pori, Finland. Additional authors for this research include J.K.E. Airaksinen, T. Paana and P.P. Karjalainen.

**Immunology - Antigen-Presenting Cells**

**New Findings from Hospital Clinic in the Area of Antigen-Presenting Cells Reported (GATA1-Deficient Dendritic Cells Display Impaired CCL21-Dependent Migration toward Lymph Nodes Due to Reduced Levels of Polysialic Acid)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Antigen-Presenting Cells have been published. According to news originating from Madrid, Spain, by NewsRx correspondents, research stated, "Dendritic cells (DCs) play a pivotal role in the regulation of the immune response. DC development and activation is finely orchestrated through transcriptional programs."

Our news journalists obtained a quote from the research from Hospital Clinic, "GATA1 transcription factor is required for murine DC development, and data suggest that it might be involved in the fine-tuning of the life span and function of activated DCs. We generated DC-specific Gatal knockout mice (Gatal-KODc), which presented a 20% reduction of splenic DCs, partially explained by enhanced apoptosis. RNA sequencing analysis revealed a number of deregulated genes involved in cell survival, migration, and function. DC migration toward peripheral lymph nodes was impaired in Gatal-KODc mice. Migration assays performed in vitro showed that this defect was selective for CCL21, but not CCL19."

According to the news editors, the research concluded: "Interestingly, we show that Gatal-KODc DCs have reduced polysialic acid levels on their surface, which is a known determinant for the proper migration of DCs toward CCL21."

For more information on this research see: GATA1-Deficient Dendritic Cells Display Impaired CCL21-Dependent Migration toward Lymph Nodes Due to Reduced Levels of Polysialic Acid. *Journal of Immunology*, 2016;197(11):4312-4324. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Apoptosis

New Findings from Howard Hughes Medical Institute in Apoptosis Provides New Insights (Cyclin F-Mediated Degradation of SLBP Limits H2A.X Accumulation and Apoptosis upon Genotoxic Stress in G2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Apoptosis. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "SLBP (stem-loop binding protein) is a highly conserved factor necessary for the processing, translation, and degradation of H2AFX and canonical histone mRNAs. We identified the F-box protein cyclin F, a substrate recognition subunit of an SCF (Skp1-Cul1-F-box protein) complex, as the G2 ubiquitin ligase for SLBP."

The news reporters obtained a quote from the research from Howard Hughes Medical Institute, "SLBP interacts with cyclin F via an atypical CY motif, and mutation of this motif prevents SLBP degradation in G2. Expression of an SLBP stable mutant results in increased loading of H2AFX mRNA onto polyribosomes, resulting in increased expression of H2A.X (encoded by H2AFX). Upon genotoxic stress in G2, high levels of H2A.X lead to persistent gamma H2A.X signaling, high levels of H2A.X phosphorylated on Tyr142, high levels of p53, and induction of apoptosis."

According to the news reporters, the research concluded: "We propose that cyclin F co-evolved with the appearance of stem-loops in vertebrate H2AFX mRNA to mediate SLBP degradation, thereby limiting H2A.X synthesis and cell death upon genotoxic stress."

For more information on this research see: Cyclin F-Mediated Degradation of SLBP Limits H2A.X Accumulation and Apoptosis upon Genotoxic Stress in G2. Molecular Cell, 2016;64(3):507-519. Molecular Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Molecular Cell - www.journals.elsevier.com/molecular-cell/)

New Findings from Huazhong University of Science and Technology Describe Advances in Cancer Therapy (Geldanamycin, an inhibitor of Hsp90, increases paclitaxel-mediated toxicity in ovarian cancer cells through sustained activation of the ...)
New Findings from Huazhong University of Science and Technology

Describe Advances in Liver Cancer (Notch and Wnt/b-catenin signaling pathway play important roles in activating liver cancer stem cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Liver Cancer. According to news originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "Human hepatocellular carcinoma (HCC) is driven and maintained by liver cancer stem cells (LCSCs) that display stem cell properties. These LCSCs are promoted by the intersecting of Notch and Wnt/b-Catenin signaling pathways."

Our news journalists obtained a quote from the research from the Huazhong University of Science and Technology, "In this study, we demonstrate that LCSCs with markers CD90, CD24, CD13, and CD133 possess stem properties of self-renewal and tumorigenicity in NOD/SCID mice. The increased expression of these markers was correlated with advanced disease stage, larger tumors, and worse overall survival in 61 HCC cases. We also found that both Notch and Wnt/b-catenin signaling pathways played important roles in increasing the stemness characteristics of LCSCs. Our data suggested that Notch1 was downstream of Wnt/b-catenin. The active form of Notch1 intracellular domain (NICD) expression depended on Wnt/b-catenin pathway activation. Moreover, Notch1 negatively contributed to Wnt/b-catenin signaling modulation. Knock down of Notch1 with lentivirus N1ShRNA up-regulated the active form of b-catenin. Ectopic expression of NICD with LV-Notch1 in LCSCs attenuated b-catenin/TCF dependent luciferase activity significantly. In addition, there was a non-proteasome mediated feedback loop between Notch1 and Wnt/b-catenin signaling in LCSCs."

According to the news editors, the research concluded: "The central role of Notch and the Wnt/b-catenin signaling pathway in LCSCs may provide an attractive therapeutic strategy against HCC."

For more information on this research see: Notch and Wnt/b-catenin signaling pathway play important roles in activating liver cancer stem cells. Oncotarget, 2016;7(5):5754-68.

Stem Cell Research - Mesenchymal Stem Cells

New Findings from Huazhong University of Science and Technology in Mesenchymal Stem Cells Provides New Insights (Role of the ER/NO/cGMP Signaling Pathway in the Promotion of Osteogenic Differentiation of Rat Bone Marrow Mesenchymal Stem Cells ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Stem Cell Research - Mesenchymal Stem Cells is the subject of a report. According to news reporting from Hubei, People's Republic of China, by NewsRx journalists, research stated, "To investigate the effect of Actaea racemosa (AR) extract on in vitro osteogenic differentiation of rat bone marrow mesenchymal stem cells (BMSCs) via the ER/NO/cGMP signaling pathway. Rat BMSCs were treated with osteogenic differentiation-inducing medium containing AR; estrogen receptor antagonist, ICI 182,780 (10(-6) mol/L); and nitric oxide synthase inhibitor, L-nitro arginine methyl ester (L-NAME, 6 x 10(-3) mol/L)."

Financial support for this research came from National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from the Huazhong University of Science and Technology, "Markers of osteogenic differentiation (alkaline phosphatase [ALP] activity, osteocalcin secretion, and calcium ion deposit levels) and the levels of key signaling molecules (nitric oxide synthase [NOS], nitric oxide [NO], and cyclic guanosinemonophosphate [cGMP]) were assessed. AR (10(-1) - 10(-6) g/L) increased ALP activity in a dose-dependent manner, and the highest ALP, osteocalcin, and osteoprotegerin activities were achieved at an AR concentration of 10(-4) g/L. Therefore, the concentration of 10(-4) g/L was used for promoting osteogenic differentiation of BMSCs in subsequent analyses. At this concentration, AR increased the levels of NO and cGMP, and such effects could be blocked by the estrogen receptor antagonist (ICI 182,780) and nitric oxide synthase inhibitor (L-NAME). AR induced osteogenic differentiation of rat BMSCs through the ER/NO/cGMP signaling pathway."

According to the news reporters, the research concluded: "This finding provides the theoretical foundation for the mechanism of AR in the treatment of postmenopausal osteoporosis."

For more information on this research see: Role of the ER/NO/cGMP Signaling Pathway in the Promotion of Osteogenic Differentiation of Rat Bone Marrow Mesenchymal Stem Cells by Actaea racemosa Extract. Evidence-Based Complementary and Alternative Medicine, 2016;():1-10. New Findings from Humboldt University Update Understanding of Drug Delivery Systems (Intradermal drug delivery by nanogel-peptide conjugates; specific and efficient transport of temoporfin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Drug Delivery Systems. According to news reporting originating in Berlin, Germany, by NewsRx journalists, research stated, "Nanogels offer many unique features rendering them as very attractive candidates for drug delivery. However, for their applications the loading capacity and specific encapsulation, in particular for hydrophobic drugs, in a complex media are two critical factors."

Funders for this research include German Science Foundation, European Union Seventh Framework Programme, ERC.

The news reporters obtained a quote from the research from Humboldt University, "In this work, we report for the first time on the preparation of nanogel-peptide conjugates with the ability of specific encapsulation of temoporfin (m-THPC). The peptide was selected based on combinatorial means and it was conjugated to polyglycerol as the nanogel precursor. We observed that the loading capacity of nanogels improved 16 times upon peptide conjugation. Skin penetrations tests in barrier deficient skins showed that nanogel-peptide conjugates enhance the penetration of m-THPC in the viable skin layers efficiently."

According to the news reporters, the research concluded: "This study indicates that nanogel-peptide conjugates could be used as unique carriers with high loading capacity for hydrophobic compounds, which provides the basis for the design of advanced topical drug delivery systems."

For more information on this research see: Intradermal drug delivery by nanogel-peptide conjugates; specific and efficient transport of temoporfin. Journal of Controlled Release, 2016;242():35-41. Journal of Controlled Release can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Controlled Release - www.journals.elsevier.com/journal-of-controlled-release/)

Peptides - Cyclic Peptides

New Findings from Hunan Normal University in the Area of Cyclic Peptides Described [Hepatoprotective Effects and Mechanisms of Action of Triterpenoids from Lingzhi or Reishi Medicinal Mushroom Ganoderma lucidum (Agaricomycetes) on ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Peptides - Cyclic Peptides. According to news reporting from Changsha, People's Republic of China, by NewsRx journalists, research stated, "Most fatal mushroom poisonings are caused by species of the genus Amanita; the amatoxins are responsible for acute liver failure and death in humans. Ganoderma lucidum is a well-known traditional medicinal mushroom that has been shown to have obvious hepatoprotective effects."

The news correspondents obtained a quote from the research from Hunan Normal University, "This study evaluated the hepatoprotective effects of triterpenoids from G. lucidum on liver injury induced by a-amanitin (alpha-AMA) in mice and the mechanisms of action of these triterpenoids, including radical scavenging and antiapoptosis activities. Mice were treated with a-AMA, followed by G. lucidum total triterpenoids or individual triterpenoids, and their hepatoprotective effects were compared with those of the reference drug silibinin (SIL). Treatment with SIL, G. lucidum total triterpenoids, and each of the 5 individual triterpenoids significantly reduced serum alanine aminotransaminase and aspartate aminotransaminase concentrations and reduced mortality rates 20 L.10%. Moreover, triterpenoids and SIL significantly enhanced superoxide dismutase and catalase activity and reduced malondialdehyde content in livers. Treatment with ganoderic acid C2 significantly inhibited DNA fragmentation and decreased caspase-3, -8, and -9 activities."

According to the news reporters, the research concluded: "The results demonstrated that triterpenoids have hepatoprotective effects on alpha-AMA-induced liver injury and that their hepatoprotective mechanisms may be the result of their antioxidative and radical scavenging activities and their inhibition of apoptosis."

For more information on this research see: Hepatoprotective Effects and Mechanisms of Action of Triterpenoids from Lingzhi or Reishi Medicinal Mushroom Ganoderma lucidum (Agaricomycetes) on alpha-Amanitin-Induced Liver Injury in Mice. International Journal of Medicinal Mushrooms, 2016;18(9):841-850. International Journal of Medicinal Mushrooms can be contacted at: Begell House Inc, 50 North St, Danbury, CT 06810, USA.

New Findings from Institute for Cancer Research and Treatment (IRCCS) Describe Advances in Liver Cancer (Molecular alterations in hepatocellular carcinoma associated with hepatitis B and hepatitis C infections)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Liver Cancer is now available. According to news reporting originating in Naples, Italy, by NewsRx journalists, research stated, "Chronic infections with hepatitis B (HBV) and hepatitis C viruses (HCV) are the leading cause of cirrhosis and hepatocellular carcinoma (HCC) worldwide. Both viruses encode multifunctional regulatory proteins activating several oncogenic pathways, which induce accumulation of multiple genetic alterations in the infected hepatocytes."

The news reporters obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Gene mutations in HBV-and HCV-induced HCCs frequently impair the TP53, Wnt/b-catenin, RAS/RAF/MAPK kinase and AKT/mTOR pathways, which represent important anti-cancer targets. In this review, we highlight the molecular mechanisms underlying the pathogenesis of primary liver cancer, with particular emphasis on the host genetic variations identified by high-throughput technologies."

According to the news reporters, the research concluded: "In addition, we discuss the importance of genetic alterations, such as mutations in the telomerase reverse transcriptase (TERT) promoter, for the diagnosis, prognosis, and tumor stratification for development of more effective treatment approaches."

Our news correspondents report that additional information may be obtained by contacting M.L. Tornesello, Molecular Biology and Viral Oncology Unit, Dept. of Research, Istituto Nazionale Tumori Fondazione G Pascale - IRCCS, Napoli, Italy. Additional authors for this research include L. Buonaguro, F. Izzo and F.M Buonaguro.

Clinical Research - Clinical Trials and Studies

New Findings from Institute for Cancer Research and Treatment (IRCCS) in the Area of Clinical Trials and Studies Reported

(Antiretroviral therapy affects the z-score index of deviant cortical EEG rhythms in naive HIV individuals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news reporting originating in Rome, Italy, by NewsRx journalists, research stated, "Here we tested the effect of combined antiretroviral therapy (cART) on deviant electroencephalo-graphic (EEG) source activity in treatment-naive HIV individuals. Resting state eyes-closed EEG data were recorded before and after 5 months of cART in 48 male HIV subjects, who were naive at the study start."

Funders for this research include Fondazione SDN of Naples (Italy), ViiV Healthcare (Italy).

The news reporters obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "The EEG data were also recorded in 59 age-and sex-matched healthy subjects as a control group. Frequency bands of interest included delta, theta, alpha1, alpha2 and alpha3, based on alpha frequency peak specific to each individual. They also included beta1 (13-20 Hz) and beta2 (20-30 Hz). Low-resolution brain electromagnetic tomography (LORETA) estimated EEG cortical source activity in frontal, central, temporal, parietal, and occipital regions. Before the therapy, the HIV group showed greater parietal delta source activity and lower spatially diffuse alpha source activity compared to the control group. Thus, the ratio of parietal delta and alpha3 source activity served as an EEG marker. The z-score showed a statistically deviant EEG marker (EEG+) in 50% of the HIV individuals before therapy (p < 0.05). After 5 months of cART, delta source activity decreased, and alpha3 source activity increased in the HIV subjects with EEG+ (about 50% of them showed a normalized EEG marker). This procedure detected a deviant EEG marker before therapy and its post-therapy normalization in naive HIV single individuals."

According to the news reporters, the research concluded: "The parietal delta/alpha3 EEG marker may be used to monitor cART effects on brain function in such individuals."

For more information on this research see: Antiretroviral therapy affects the z-score index of deviant cortical EEG rhythms in naive HIV individuals. Neuroimage-Clinical, 2016;12 ():144-156. Neuroimage-Clinical can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England.

Life Science Research - Cell Biology

New Findings from Institute for Health Update Understanding of Cell Biology (A Dietary Fiber-Deprived Gut Microbiota Degrades the Colonic Mucus Barrier and Enhances Pathogen Susceptibility)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Life Science Research - Cell Biology is the subject of a report. According to news reporting originating in Esch sur Alzette, Luxembourg, by NewsRx journalists, research stated, "Despite the accepted health benefits of consuming dietary fiber, little is known about the mechanisms by which fiber deprivation impacts the gut microbiota and alters disease risk. Using a gnotobiotic mouse model, in which animals were colonized with a synthetic human gut microbiota composed of fully sequenced commensal bacteria, we elucidated the functional interactions between dietary fiber, the gut microbiota, and the colonic mucus barrier, which serves as a primary defense against enteric pathogens."

Financial supporters for this research include Luxembourg National Research Fund (FNR) INTER Mobility, CORE, Luxembourg Ministry of Higher Education and Research, FNR ATTRACT, European Union Joint Programming in Neurodegenerative Diseases, NIH R01, University of Michigan Host Microbiome Initiative and Center for Gastrointestinal Research.

The news reporters obtained a quote from the research from Institute for Health, "We show that during chronic or intermittent dietary fiber deficiency, the gut microbiota resorts to host-secreted mucus glycoproteins as a nutrient source, leading to erosion of the colonic mucus barrier. Dietary fiber deprivation, together with a fiber-deprived, mucus-eroding microbiota, promotes greater epithelial access and lethal colitis by the mucosal pathogen, Citrobacter rodentium."

According to the news reporters, the research concluded: "Our work reveals intricate pathways linking diet, the gut microbiome, and intestinal barrier dysfunction, which could be exploited to improve health using dietary therapeutics."

For more information on this research see: A Dietary Fiber-Deprived Gut Microbiota Degrades the Colonic Mucus Barrier and Enhances Pathogen Susceptibility. Cell, 2016;167(5):1339-1353,391-411. Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell - www.journals.elsevier.com/cell/)

New Findings from Institute for Health Update Understanding of Neuropeptides (Vasopressin lowers renal epoxyeicosatrienoic acid levels by activating soluble epoxide hydrolase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Proteins - Neuropeptides have been presented. According to news reporting originating from Berlin, Germany, by NewsRx correspondents, research stated, "Activation of the thick ascending limb (TAL) Na+-K+-2Cl(-) cotransporter (NKCC2) by the antidiuretic hormone arginine vasopressin (AVP) is an essential mechanism of renal urine concentration and contributes to extracellular fluid and electrolyte homeostasis. AVP effects in the kidney are modulated by locally and/or by systemically produced epoxyeicosatrienoic acid derivates (EET)."

Our news editors obtained a quote from the research from Institute for Health, "The relation between AVP and EET metabolism has not been determined. Here, we show that chronic treatment of AVP-deficient Brattleboro rats with the AVP V2 receptor analog desmopressin (dDAVP; 5 ng/h, 3 days) significantly lowered renal EET levels (-56 +/- 3% for 5,6-EET, -50 +/- 3.4% for 11,12-EET, and -60 +/- 3.7% for 14,15-EET). The abundance of the principal EET-degrading enzyme soluble epoxide hydrolase (sEH) was increased at the mRNA (+160 +/- 37%) and protein levels (+120 +/- 26%). Immunohistochemistry revealed dDAVP-mediated induction of sEH in connecting tubules and cortical and medullary collecting ducts, suggesting a role of these segments in the regulation of local interstitial EET signals. Incubation of murine kidney cell suspensions with 1 mu M 14,15-EET for 30 min reduced phosphorylation of NKCC2 at the AVP-sensitive threonine residues T96 and T101 (-66 +/- 5%; P< 0.05), while 14,15-DHET had no effect. Concomitantly, isolated perfused cortical thick ascending limb pretreated with 14,15-EET showed a 30% lower transport current under high and a 70% lower transport current under low symmetric chloride concentrations. In summary, we have shown that activation of AVP signaling stimulates renal sEH biosynthesis and enzyme activity."

According to the news editors, the research concluded: "The resulting reduction of EET tissue levels may be instrumental for increased NKCC2 transport activity during AVP-induced antidiuresis."

For more information on this research see: Vasopressin lowers renal epoxyeicosatrienoic acid levels by activating soluble epoxide hydrolase. American Journal of Physiology-Renal Physiology, 2016;311(6):F1198-F1210. American Journal of Physiology-Renal Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

New Findings from Institute for Neuroscience in the Area of Glaucoma Described (Clinical Characteristics and Risk Factors of Extensive Macular Atrophy with Pseudodrusen The EMAP Case-Control National Clinical Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Glaucoma. According to news reporting originating from Montpellier, France, by NewsRx correspondents, research stated, "To assess the association of clinical and biological factors with extensive macular atrophy with pseudodrusen (EMAP) characterized by bilateral macular atrophy occurring in patients aged 50 to 60 years and a rapid progression to legal blindness within 5 to 10 years. A national matched case-control study."

Our news editors obtained a quote from the research from Institute for Neuroscience, "Participants were recruited in 10 French Departments of Ophthalmology and their associated clinical investigation centers. All 115 patients with EMAP had symptoms before the age of 55 years due to bilateral extensive macular atrophy with a larger vertical axis and diffuse pseudodrusen. Three controls without age-related macular degeneration (AMD) or retinal disease at fundus examination were matched for each patient with EMAP by gender, age, and geographic area (in total 415). Subjects and controls underwent an eye examination including color, red-free autofluorescent fundus photographs and spectral-domain optical coherence tomography with macular analysis. The interviews collected demographic, lifestyle, family and personal medical history, medications, and biological data. Associations of risk factors were estimated using conditional logistic regression. Extensive macular atrophy with pseudodrusen status (cases vs. controls). Extensive macular atrophy with pseudodrusen most frequently affected women (70 women, 45 men). After multivariate adjustment, family history of glaucoma or AMD was strongly associated with EMAP (odds ratio [OR], 2.3, P = 0.008 and OR, 1.5, P = 0.01, respectively). No association was found with cardiac diseases or their risk factors. Mild and moderate kidney disease and higher neutrophil rate were associated with a reduced risk of EMAP (OR, 0.58, P = 0.04; OR, 0.34, P = 0.01; and OR, 0.59, P = 0.003, respectively). On the contrary, eosinophilia (OR, 1.6; P = 0.0002), lymphocytosis (OR, 1.84; P = 0.0002), increased erythrocyte sedimentation rate (OR, 6.5; P = 0.0005), decreased CH50 (P = 0.001), and high plasma C3 level (P = 0.023) were significantly associated with a higher risk of EMAP. This study documents an association between EMAP and family history of AMD and glaucoma, a clear female predominance, and a systemic inflammatory profile. The reduced CH50 and increased C3 plasma values could reflect a more severe complement pathway dysfunction than in AMD, leading to early pseudodrusen and rapid development of geographic atrophy."

According to the news editors, the research concluded: "There is no association of EMAP with AMD cardiac diseases or cardiac risks, including cigarette smoking."

For more information on this research see: Clinical Characteristics and Risk Factors

The news editors report that additional information may be obtained by contacting I. Meunier, INSERM, U1051, Inst Neurosci Montpellier, Montpellier, France. Additional authors for this research include M.C. Picot, C. Delcourt, A. Lacroux, X. Zanlonghi, B. Puech, S. Defoort-Dhelemmes, I. Drumare, E. Jozefowicz, B. Bocquet, C. Baudoin, N.A.D. Marzouka, S. Perez-Roustit, S. Arsene, V. Gissot, F. Devin, C. Arndt, B. Wolff and M.

Environmental Pollution

**New Findings from Institute of Applied Ecology in the Area of Environmental Pollution Reported (The accumulation and health risk of heavy metals in vegetables around a zinc smelter in northeastern China)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Environmental Pollution have been presented. According to news reporting originating from Shenyang, People's Republic of China, by NewsRx correspondents, research stated, "Mining and smelting activities engender soil contamination by metals severely. A field survey was conducted to investigate the present situation and health risk of heavy metals (Cd, Pb, Zn, Cu, Cr, As, and Hg) in soils and vegetables in the surrounding area of an 80-year-old zinc smelter in northeastern China."

Our news editors obtained a quote from the research from the Institute of Applied Ecology, "Soil pH, organic matter (SOM), and cation exchange capacity (CEC) were determined, and their relations with heavy metal contents in edible parts of vegetables were analyzed. Results showed that the smelting had led to the significant contamination of the local soils by Cd and Zn, with average concentrations of 3.88 and 403.89 mg kg(-1), respectively. Concentrations of Cd and Zn in greenhouse soils were much lower than those in open farmland soils. Cd concentrations in vegetable edible parts exceeded the permissible limits severely, while other metal concentrations were much lower than the corresponding standards. Leaf and root vegetables had higher concentrations and bioaccumulation factors (BCFs) of Cd than fruit vegetables. Hazard quotient and hazard index showed that cadmium is imposing a health risk to local residents via vegetable consumption. Cd uptake of some vegetables can be predicted by empirical models with the following parameters: soil pH, SOM, CEC, Zn concentrations, and Cd concentrations."

According to the news editors, the research concluded: "Vegetables such as cabbage, Chinese cabbage, tomato, cucumber, and green bean were screened out as being suitable to grow in the studied area."

For more information on this research see: The accumulation and health risk of

**Oncology - Prostate Cancer**

**New Findings from Institute of Cancer Research in the Area of Prostate Cancer Reported (Castration-Resistant Prostate Cancer Tissue Acquisition From Bone Metastases for Molecular Analyses)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news originating from Surrey, United Kingdom, by NewsRx correspondents, research stated, "We analyzed 115 iliac crest bone marrow biopsy specimens from 101 patients with metastatic castration resistant prostate cancer, divided into a test (n = 57) and a validation (n = 58) set. We developed a score based on computed tomography Hounsfield units and lactate dehydrogenase levels, which were associated with a positive biopsy result."

Our news journalists obtained a quote from the research from the Institute of Cancer Research, "The score can be used to select patients for whom a bone marrow biopsy will provide tissue for molecular characterization. The urgent need for castration-resistant prostate cancer molecular characterization to guide treatment has been constrained by the disease's predilection to metastasize primarily to bone. We hypothesized that the use of clinical and imaging criteria could maximize tissue acquisition from bone marrow biopsies (BMBs). We aimed to develop a score for the selection of patients undergoing BMB. A total of 115 BMBs were performed in 101 patients: 57 were included in a derivation set and 58 were used as the validation set. The clinical and laboratory data and prebiopsy computed tomography parameters (Hounsfield units [HU]) were determined. A score for the prediction of biopsy positivity was developed from logistic regression analysis of the derivation set and tested in the validation set. Of the 115 biopsy specimens, 75 (62.5%) were positive; 35 (61.4%) in the test set and 40 (69%) in the validation set. On univariable analysis, hemoglobin (P = .019), lactate dehydrogenase (P = .003), prostate specific antigen (P = .005), and mean HUs (P = .004) were selected. A score based on the LDH level (>= 225 IU/L) and mean HUs (>= 125) was developed in multivariate analysis and was associated with BMB positivity in the validation set (odds ratio, 5.1; 95% confidence interval, 1.9%-13.4%; P = .001). The area under the curve of the score was 0.79 in the test set and 0.77 in the validation set. BMB of the iliac crest is a feasible technique for obtaining tumor tissue for genomic analysis in patients with castration-resistant prostate cancer metastatic to the bone. A signature based on the mean HUs and LDH level can predict a positive yield with acceptable internal validity."
According to the news editors, the research concluded: "Prospective studies of independent cohorts are needed to establish the external validity of the score."

For more information on this research see: Castration-Resistant Prostate Cancer Tissue Acquisition From Bone Metastases for Molecular Analyses. Clinical Genitourinary Cancer, 2016;14(6):485-493. Cardiovascular Diseases and Conditions -...

New Findings from Institute of Chemistry in the Area of Atherosclerosis Described (MRI/optical dual-modality imaging of vulnerable atherosclerotic plaque with an osteopontin-targeted probe based on Fe3O4 nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Atherosclerosis are discussed in a new report. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Rupture of vulnerable atherosclerotic plaque is the major pathological cause of luminal thrombosis in acute coronary syndromes. Since foamy macrophages have been identified as a prominent component in vulnerable atherosclerotic lesions and osteopontin (OPN) is reported to be highly expressed in foamy macrophages, OPN could be a potential target for vulnerable atherosclerotic plaque imaging."

Funders for this research include National Key Research Program of China, National Funds for Distinguished Young Scientists of China, National Nature Science Foundation of China, Beijing Nature Science Foundation, China Postdoctoral Science Foundation.

Our news journalists obtained a quote from the research from the Institute of Chemistry. "The current study designed an OPN-specific MRI/optical dual-modality probe to detect vulnerable plaques. Fluorescence imaging revealed that 24 h after injection of the Cy5.5-OPN-DMSA-MNPs (COD-MNPs), the atherosclerotic plaques in carotid artery exhibited significant higher signals in high fat diet (HFD) fed mice in comparison to the group injected
with Cy5.5-IgG-DMSA-MNPs (CID-MNPs) or normal diet fed group injected with COD-MNPs (1.87 +/- 0.19 x 10(10) vs. 0.74 +/- 0.04 x 10(10), 0.73 +/- 0.03 x 10(10) p/sec/cm(2)/sr, P< 0.05). Meanwhile, MRI displayed stronger T-2 contrast enhancement 24 h post-injection at the area of atherosclerotic plaques in the carotid of HFD fed group injected with COD-MNPs than group injected with CID-MNPs or normal diet fed group injected with COD-MNPs (post/pre signal ratio: 0.64 +/- 0.04 vs. 0.95 +/- 0.02, 0.98 +/- 0.01, P< 0.05)."

According to the news editors, the research concluded: "As a dual-modality molecular probe, the resulting COD-MNPs conjugates exhibit promising potentials for noninvasive detection of vulnerable atherosclerotic plaque in vivo."

For more information on this research see: MRI/optical dual-modality imaging of vulnerable atherosclerotic plaque with an osteopontin-targeted probe based on Fe3O4 nanoparticles. *Biomaterials*, 2017;112():336-345. *Biomaterials* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. **Oncology - Breast Cancer**

**New Findings from International Agency for Research on Cancer in the Area of Breast Cancer Reported (Female breast cancer in Central and South America)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting originating in Lyon, France, by NewsRx journalists, research stated, "Rationale and objective: The burden of breast cancer has increased worldwide. Breast cancer mortality has been increasing in Central and South America (CSA) in the last few decades."

The news reporters obtained a quote from the research from International Agency for Research on Cancer, "We describe the current burden of breast cancer in CSA and review the current status of disease control. We obtained regional-and national-level incidence data from 48 population-based cancer registries in 13 countries and cancer deaths from the WHO mortality database for 18 countries. We estimated world population age-standardized incidence and mortality rates per 100,000 person-years for 2003-2007 and the estimated annual percentage change to describe time trends. In the most recent 5-year period, Argentina, Brazil, and Uruguay
had the highest incidence rates (67.7-71.9) and Bolivia and El Salvador had the lowest (7.9-12.7). For most countries, mortality rates were <= 12.3, except in Uruguay, Argentina and Cuba (14.9-20.5). Age-specific rates increased after the age of 40-50 years and reached a maximum after age 65 years (mean age at diagnosis 56-62 years). Most countries have developed national screening guidelines; however, there is limited capacity for screening. The geographic variation of breast cancer rates may be explained by differences in the prevalence of reproductive patterns, lifestyle factors, early detection, and healthcare access. Extending early-detection programs is challenging because of inequalities in healthcare access and coverage, limited funding, and inadequate infrastructure, and thus it may not be feasible."

According to the news reporters, the research concluded: "Given the current status of breast cancer in CSA, data generated by population-based cancer registries is urgently needed for effective planning for cancer control."

For more information on this research see: Female breast cancer in Central and South America. Cancer Epidemiology, 2016;44():S110-S120. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Cancer Epidemiology - www.journals.elsevier.com/cancer-epidemiology/)

Our news correspondents report that additional information may be obtained by contacting M.S. Sierra, Int Agcy Res Canc, Sect Canc Surveillance, Lyon, France. Additional authors for this research include G. Abriata, D. Forman and M.S. Sierra.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.canep.2016.08.010. This DOI is a link to an online electronic document that is either free or for purchase.

**Biological Factors - Mycotoxins**

**New Findings from International Crops Research Institute for the Semi-Arid Tropics in the Area of Mycotoxins Reported (Oxidative stress and carbon metabolism influence Aspergillus flavus transcriptome composition and secondary metabolite ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Biological Factors - Mycotoxins are discussed in a new report. According to news originating from Hyderabad, India, by NewsRx correspondents, research stated, "Contamination of crops with aflatoxin is a serious global threat to food safety. Aflatoxin production by Aspergillus flavus is exacerbated by drought stress in the field and by oxidative stress in vitro."

Our news journalists obtained a quote from the research from International Crops Research Institute for the Semi-Arid Tropics, "We examined transcriptomes of three toxigenic and three atoxigenic isolates of A. flavus in aflatoxin conducive and non-conducive media with varying levels of H2O2 to investigate the relationship of secondary metabolite production, carbon source, and oxidative stress. We found that toxigenic and atoxigenic isolates employ
distinct mechanisms to remediate oxidative damage, and that carbon source affected the isolates' expression profiles. Iron metabolism, monooxygenases, and secondary metabolism appeared to participate in isolate oxidative responses. The results suggest that aflatoxin and aflatrem biosynthesis may remediate oxidative stress by consuming excess oxygen and that kojic acid production may limit iron-mediated, non-enzymatic generation of reactive oxygen species.

According to the news editors, the research concluded: "Together, secondary metabolite production may enhance A. flavus stress tolerance, and may be reduced by enhancing host plant tissue antioxidant capacity though genetic improvement by breeding selection."

**Heart Disorders and Diseases - Heart Disease**

**New Findings from Iran University of Medical Sciences in the Area of Heart Disease Reported (Nanotechnology in diagnosis and treatment of coronary artery disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Disease are discussed in a new report. According to news reporting out of Tehran, Iran, by NewsRx editors, research stated, "Nanotechnology could provide a new complementary approach to treat coronary artery disease (CAD) which is now one of the biggest killers in the Western world. The course of events, which leads to atherosclerosis and CAD, involves many biological factors and cellular disease processes which may be mitigated by therapeutic methods enhanced by nanotechnology."

Our news journalists obtained a quote from the research from the Iran University of Medical Sciences, "Nanoparticles can provide a variety of delivery systems for cargoes such as drugs and genes that can address many problems within the arteries. In order to improve the performance of current stents, nanotechnology provides different nanomaterial coatings, in addition to controlled-release nanocarriers, to prevent in-stent restenosis. Nanotechnology can increase the efficiency of drugs, improve local and systematic delivery to atherosclerotic plaques and reduce the inflammatory or angiogenic response after intravascular intervention. Nanocarriers have potential for delivery of imaging and diagnostic agents to precisely targeted destinations."
According to the news editors, the research concluded: "This review paper will cover the current applications and future outlook of nanotechnology, as well as the main diagnostic methods, in the treatment of CAD."

Our news journalists report that additional information may be obtained by contacting M. Karimi, Dept. of Medical Nanotechnology, Faculty of Advanced Technologies in Medicine, Iran University of Medical Sciences, Tehran, Iran. Additional authors for this research include H. Zare, A. Bakhshian Nik, N. Yazdani, M. Hamrang, E. Mohamed, P. Sahandi Zangabad, S.M. Moosavi Basri, L. Bakhtiari and M.R Hamblin.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2217/nnm.16.3. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Iran, Asia, Tehran, Genetics, Angiology, Cardiology, Nanocarriers, Heart Disease, Article Review, Nanotechnology, Arteriosclerosis, Myocardial Ischemia, Emerging Technologies, Coronary Artery Disease, Diagnostics and Screening, Arterial Occlusive Diseases, Heart Disorders and Diseases, Cardiovascular Diseases and Conditions.

Musculoskeletal Diseases and Conditions - …

New Findings from J.E. Compston and Co-Authors Describe Advances in Osteoporosis (Increase in Fracture Risk Following Unintentional Weight Loss in Postmenopausal Women: The Global Longitudinal Study of Osteoporosis in Women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Musculoskeletal Diseases and Conditions - Osteoporosis are discussed in a new report. According to news originating from Cambridge, United Kingdom, by NewsRx correspondents, research stated, "Increased fracture risk has been associated with weight loss in postmenopausal women, but the time course over which this occurs has not been established. The aim of this study was to examine the effects of unintentional weight loss of >= 10 lb (4.5 kg) in postmenopausal women on fracture risk at multiple sites up to 5 years after weight loss."

Our news journalists obtained a quote from the research, "Using data from the Global Longitudinal Study of Osteoporosis in Women (GLOW), we analyzed the relationships between self-reported unintentional weight loss of >= 10 lb at baseline, year 2, or year 3 and incident clinical fracture in the years after weight loss. Complete data were available in 40,179 women (mean age +/- SD 68 +/- 8.3 years). Five-year cumulative fracture rate was estimated using the Kaplan-Meier method, and adjusted hazard ratios for weight loss as a time-varying covariate were calculated from Cox multiple regression models. Unintentional weight loss at baseline was associated with a significantly increased risk of fracture of the clavicle, wrist, spine, rib, hip, and pelvis for up to 5 years after weight loss. Adjusted hazard ratios showed a
significant association between unintentional weight loss and fracture of the hip, spine, and clavicle within 1 year of weight loss, and these associations were still present at 5 years. These findings demonstrate increased fracture risk at several sites after unintentional weight loss in postmenopausal women."

According to the news editors, the research concluded: "This increase is found as early as 1 year after weight loss, emphasizing the need for prompt fracture risk assessment and appropriate management to reduce fracture risk in this population."

Keywords for this news article include: Cambridge, United Kingdom, Europe, Musculoskeletal Diseases and Conditions, Risk and Prevention, Metabolic Bone Diseases and Conditions, Women's Health, Osteoporosis.

standard deviation of day-by-day home systolic BP and the maximum home systolic BP were also significantly reduced, and these effects were similar regardless of the treatment timing. The N-terminal pro-brain natriuretic peptide level was significantly decreased only in the bedtime administration group."

According to the news editors, the research concluded: "A larger study will demonstrate whether the bedtime administration of telmisartan/amlodipine combination tablets maximizes the risk-lowering effect against AF recurrence in paroxysmal AF hypertensive patients."

The news correspondents report that additional information may be obtained from K. Kario, Jichi Med Univ, Sch Med, Dept. of Sleep & Circadian Cardiol, Shimotsuke, Tochigi, Japan. Additional authors for this research include S. Hoshide, K. Uchiyama, T. Yoshida, O. Okazaki, T. Noshiro, H. Aoki, H. Mizuno and Y. Matsumoto.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jch.12814. This DOI is a link to an online electronic document that is either free or for purchase.

Eye Diseases and Conditions - Retinitis Pigmentosa

New Findings from Johns Hopkins University in the Area of Retinitis Pigmentosa Described [Safety and Proof-of-Concept Study of Oral QLT091001 in Retinitis Pigmentosa Due to Inherited Deficiencies of Retinal Pigment Epithelial 65 Protein (RPE65) ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Eye Diseases and Conditions - Retinitis Pigmentosa. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "Restoring vision in inherited retinal degenerations remains an unmet medical need. In mice exhibiting a genetically engineered block of the visual cycle, vision was recently successfully restored by oral administration of 9-cis-retinyl acetate (QLT091001)."

The news reporters obtained a quote from the research from Johns Hopkins University, "Safety and visual outcomes of a once-daily oral dose of 40 mg/m2/day QLT091001 for 7 consecutive days was investigated in an international, multi-center, open-label, proof-of-
concept study in 18 patients with RPE65-or LRAT-related retinitis pigmentosa. Eight of 18 patients (44%) showed a (>=)20% increase and 4 of 18 (22%) showed a (>=)40% increase in functional retinal area determined from Goldmann visual fields; 12 (67%) and 5 (28%) of 18 patients showed a (>=)5 and (>=)10 ETDRS letter score increase of visual acuity, respectively, in one or both eyes at two or more visits within 2 months of treatment. In two patients who underwent fMRI, a significant positive response was measured to stimuli of medium contrast, moving, pattern targets in both left and right hemispheres of the occipital cortex. There were no serious adverse events. Treatment-related adverse events were transient and the most common included headache, photophobia, nausea, vomiting, and minor biochemical abnormalities. Measuring the outer segment length of the photoreceptor layer with high-definition optical coherence tomography was highly predictive of treatment responses with responders having a significantly larger baseline outer segment thickness (11.7 ? 4.8 mm, mean ? 95% CI) than non-responders (3.5 ? 1.2 mm)."

According to the news reporters, the research concluded: "This structure-function relationship suggests that treatment with QLT091001 is more likely to be efficacious if there is sufficient photoreceptor integrity."

For more information on this research see: Safety and Proof-of-Concept Study of Oral QLT091001 in Retinitis Pigmentosa Due to Inherited Deficiencies of Retinal Pigment Epithelial 65 Protein (RPE65) or Lecithin:Retinol Acyltransferase (LRAT). Plos One, 2015;10 (12):e0143846. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news correspondents report that additional information may be obtained by contacting H.P. Scholl, Wilmer Eye Institute, Johns Hopkins University, Baltimore, MD, United States. Pharmacology

New Findings from Josai University in Pharmacology Provides New Insights (Fatty Acid beta-Oxidation Plays a Key Role in Regulating cis-Palmitoleic Acid Levels in the Liver)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacology. According to news originating from Saitama, Japan, by NewsRx correspondents, research stated, "Different monounsaturated fatty acid (MUFA) species have distinct pathophysiological activities. cis-Palmitoleic acid (16:1n-7) was previously reported to improve insulin sensitivity in animal studies. The proportions of hepatic MUFAs are generally considered to reflect changes in the
activities of fatty acid modifications (Delta 9 desaturation and fatty acid elongation)."

Our news journalists obtained a quote from the research from Josai University, "However, hepatic levels of 16:1n-7 are markedly lower than those of oleic acid (18:1n-9). Nevertheless, no convincing explanation has yet been provided for the low level of 16:1n-7. We hypothesized that fatty acid degradation plays a key role in maintaining a low 16:1n-7 proportion in the liver. In order to corroborate the link between beta-oxidation and the proportion of 16:1n-7, rats were fed a control diet, fed a fat-free diet to up-regulate fatty acid modifications, but not beta-oxidation, or treated with clofibric acid to up-regulate fatty acid modifications and beta-oxidation. The nutritional manipulation markedly increased the proportions of 16:1n-7, 18:1n-9, and cis-vaccenic acid (18:1n-7). Although the pharmacological manipulation enhanced fatty acid modifications to largely the same extent as the nutritional manipulation and markedly elevated the proportion of 18:1n-9, those of 16:1n-7 and 18:1n-7 remained largely unchanged. The oxidation rates of 16:1n-7, 18:1n-9, and 18:1n-7 in liver slices were in the following order: 16:1n-7 > 18:1n-7 (sic) 18:1n-9 in control livers, and were increased by the pharmacological manipulation and decreased by the nutritional manipulation."

According to the news editors, the research concluded: "These results strongly suggest that beta-oxidation, in concert with fatty acid modifications, plays a key role in regulating the MUFA profile and is crucially involved in maintaining low 16:1n-7 levels in the liver."

The news correspondents report that additional information may be obtained from N. Kudo, Josai Univ, Sch Pharmaceut Sci, Sakado, Saitama 3500295, Japan. Additional authors for this research include M. Karahashi, T. Sakamoto, Y. Tsuji, T. Yamazaki, M. Okazaki, A. Mitsumoto, N. Kudo and Y. Kawashima.

Oncology - Glioblastomas

New Findings from Justus-Liebig-University in the Area of Glioblastomas Described (High-mobility group AT-hook protein 2 expression and its prognostic significance in MGMT methylated and unmethylated glioblastoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Glioblastomas. According to news reporting out of Giessen, Germany, by NewsRx editors, research stated, "High-mobility group AT-hook protein 2 (HMGA 2) is a transcription factor associated with malignancy and poor prognosis in a variety of human cancers. We correlated HMGA 2 expression with clinical parameters, survival, and O-6-methylguanine-DNA methyltransferase methylation status (MGMT) in glioblastoma patients."

Our news journalists obtained a quote from the research from Justus-Liebig-
University, "HMGA 2 expression was determined by performing quantitative real-time polymerase chain reaction (qPCR) and immunohistochemistry (IHC) in 44 glioblastoma patients and 5 non-tumorous brain specimens as controls. Gene expression levels of MGMT methylated vs. unmethylated patients, and gene expression levels between patient groups, both for qPCR and IHC data were compared using the Mann-Whitney U test. The relationship between HMGA 2 expression, progression-free survival and overall survival was analyzed using the Kaplan-Meier method and the log-rank test. P-values of <0.05 were considered statistically significant throughout the analyses. The mean age of patients at diagnosis was 57.4 ± 15.7 years, and the median survival was 16 months (SE 2.8; 95% CI, 10.6-21.4). HMGA 2 gene expression was significantly higher in glioblastoma compared to normal brain tissue on qPCR (mean, 0.35; SD, 0.27 vs. 0.03, SD, 0.05) and IHC levels (IRS mean, 17.21; SD, 7.43 vs. 3.20; SD, 1.68) (p=0.001). Survival analysis revealed that HMGA 2 overexpression was associated with a shorter progression-free and overall survival time in patients with methylation (n=24). The present study shows a tendency that HMGA 2 overexpression correlates with a poor prognosis of glioblastoma patients independent of MGMT methylation status."

According to the news editors, the research concluded: "The results suggest that HMGA 2 could play an important role in the treatment of glioblastoma and could have a function in prognosis of this type of cancer."

For more information on this research see: High-mobility group AT-hook protein 2 expression and its prognostic significance in MGMT methylated and unmethylated glioblastoma. *International Journal of Oncology*, 2016;48(4):1485-92. Our news journalists report that additional information may be obtained by contacting F.P. Schwarm, Dept. of Neurosurgery, Justus-Liebig University Giessen, Giessen, Germany. **Immune System Diseases and Conditions - IgA...**

**New Findings from Kagoshima University Describe Advances in IgA Deficiency (Immunoglobulin A deficiency following treatment with lamotrigine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immune System Diseases and Conditions - IgA Deficiency. According to news reporting originating in Kagoshima, Japan, by NewsRx journalists, research stated, "Lamotrigine (LTG) is an anti-epileptic drug and mood-stabilizing agent, whose adverse effects include skin rash and dizziness. Interactions with the immune system are rare, and only a few cases linking hypogammaglobulinemia to LTG treatment have been previously described."

The news reporters obtained a quote from the research from Kagoshima University,
"In this report, we describe a case in which a patient developed hypogammaglobulinemia, and a subsequent immunoglobulin A (IgA) deficiency, following LTG treatment. As a result of her immunodeficiency, the patient presented with a severe urinary tract infection and required intravenous immunoglobulin. Serum levels of immunoglobulin G and M had recovered by seven months and one month after the discontinuation of LTG, respectively; however, IgA levels remained low (less than 4 mg/dL) two years post-treatment."

According to the news reporters, the research concluded: "While previous reports have demonstrated IgA deficiencies in patients prescribed other antiepileptic drugs, this is the first case of an IgA deficiency following LTG administration."

For more information on this research see: Immunoglobulin A deficiency following treatment with lamotrigine. *Brain & Development*, 2016;38(10):947-949. *Brain & Development* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Brain & Development - www.journals.elsevier.com/brain-and-development/)

Our news correspondents report that additional information may be obtained by contacting S. Maruyama, Kagoshima Univ Hosp, Epilepsy Center, Kagoshima, Japan. Additional authors for this research include Y. Okamoto, M. Toyoshima, R. Hanaya and Y. Kawano.

**Genetics - Medical Genetics**

**New Findings from Kaiser Permanente in the Area of Medical Genetics Described (A standardized, evidence-based protocol to assess clinical actionability of genetic disorders associated with genomic variation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics - Medical Genetics. According to news reporting from Portland, Oregon, by NewsRx journalists, research stated, "Genome and exome sequencing can identify variants unrelated to the primary goal of sequencing. Detecting pathogenic variants associated with an increased risk of a medical disorder enables clinical interventions to improve future health outcomes in patients and their at-risk relatives."

The news correspondents obtained a quote from the research from Kaiser Permanente, "The Clinical Genome Resource, or ClinGen, aims to assess clinical actionability of genes and associated disorders as part of a larger effort to build a central resource of information regarding the clinical relevance of genomic variation for use in precision medicine."
and research. We developed a practical, standardized protocol to identify available evidence and
generate qualitative summary reports of actionability for disorders and associated genes. We
applied a semi-quantitative metric to score actionability. We generated summary reports and
actionability scores for the 56 genes and associated disorders recommended by the American
College of Medical Genetics and Genomics for return as secondary findings from clinical
genome-scale sequencing. We also describe the challenges that arose during the development of
the protocol that highlight important issues in characterizing actionability across a range of
disorders."

According to the news reporters, the research concluded: "The ClinGen framework
for actionability assessment will assist research and clinical communities in making clear,
efficient, and consistent determinations of actionability based on transparent criteria to guide
analysis and reporting of findings from clinical genome-scale sequencing."

For more information on this research see: A standardized, evidence-based protocol
to assess clinical actionability of genetic disorders associated with genomic variation. Genetics
in Medicine, 2016;18(12):1258-1268. Genetics in Medicine can be contacted at: Nature
Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature

Drugs and Therapies - Antifungals

New Findings from Keio University Yields New Data on Antifungals
(Impact of cytochrome P450 2C19 polymorphisms on the
pharmacokinetics of tacrolimus when coadministered with
voriconazole)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Drugs and Therapies - Antifungals.
According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "This
study evaluated the effects of cytochrome P450 (CYP) 2C19 polymorphisms on tacrolimus
pharmacokinetics when coadministered with voriconazole. Eighteen healthy volunteers,
including 6 individuals in each CYP2C19 genotype (extensive metabolizers [EMs], intermediate
metabolizers [IMs], and poor metabolizers [PMs]), received a single oral dose of 3 mg
tacrolimus alone or in combination with 200 mg voriconazole twice daily at steady state."

Our news journalists obtained a quote from the research from Keio University,
"When tacrolimus was coadministered with voriconazole, a significant increase in area under its concentration-time curve (AUC0-24) was observed for all genotypes. AUC0-12 of voriconazole in IMs and PMs were significantly higher than that in EMs (p < .05 and p<.01, respectively). Consequently, AUC0-24 of tacrolimus in combination with voriconazole in IMs and PMs were also significantly higher than that in EMs (p <.05)."

According to the news editors, the research concluded: "These results demonstrate that CYP2C19 genotypes influenced the exposure of tacrolimus when coadministered with voriconazole, although tacrolimus is mainly metabolized by CYP3A."

Our news journalists report that additional information may be obtained by contacting C.K. Imamura, Dept. of Clinical Pharmacokinetics and Pharmacodynamics, School of Medicine, Keio University, Tokyo, Japan. Additional authors for this research include K. Furihata, S. Okamoto and Y. Tanigawara.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/jcph.605. This DOI is a link to an online electronic document that is either free or for purchase.

Publisher contact information for the Journal of Clinical Pharmacology is: SAGE Publications, USA, 2455 Teller Road, Thousand Oaks, CA 91320, USA.

Oncology - Non-Small Cell Lung Cancer

New Findings from Keio University in Non-Small Cell Lung Cancer Provides New Insights (Prognostic value of tumor-infiltrating lymphocytes differs depending on histological type and smoking habit in completely resected non-small-cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "T-cell infiltration in tumors has been used as a prognostic tool in non-small-cell lung cancer (NSCLC). However, the influence of smoking habit and histological type on tumor-infiltrating lymphocytes (TILs) in NSCLC remains unclear."

The news correspondents obtained a quote from the research from Keio University, "We evaluated the prognostic significance of TILs (CD4(+), CD8(+), CD20(+), and FOXP3(+)) according to histological type and smoking habit using automatic immunohistochemical staining and cell counting in 218 patients with NSCLC. In multivariate survival analyses of clinical, pathological, and immunological factors, a high ratio of FOXP3(+) to CD4(+) T cells
(FOXP3/CD4) [hazard ratio (HR): 4.46, P< 0.01 for overall survival (OS); HR: 1.96, P< 0.05 for recurrence-free survival (RFS)] and a low accumulation of CD20(+) B cells (HR: 2.45, P = 0.09 for OS; HR: 2.86, P< 0.01 for RFS) were identified as worse prognostic factors in patients with adenocarcinoma (AD). In non-AD, a low number of CD8(+) T cells were correlated with an unfavorable outcome (HR: 7.69, P< 0.01 for OS; HR: 3.57, P< 0.02 for RFS). Regarding smoking habit in AD, a high FOXP3/CD4 ratio was poorly prognostic with a smoking history (HR: 5.21, P< 0.01 for OS; HR: 2.38, P< 0.03 for RFS), whereas a low accumulation of CD20 (+) B cells (HR: 4.54, P = 0.03 for OS; HR: 2.94, P< 0.01 for RFS) was confirmed as an unfavorable factor in non-smokers with AD. A low number of CD20(+) B cells in non-AD, a high FOXP3/CD4 ratio in smokers with AD, and a low number of CD20(+) B cells in non-smokers with AD were identified as independent unfavorable prognostic factors in resected NSCLC."

According to the news reporters, the research concluded: "Evaluating the influence of histological type and smoking habit on the immunological environment may lead to the establishment of immunological diagnosis and appropriate individualized immunotherapy for NSCLC."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/annonc/mdw319. This DOI is a link to an online electronic document that is either free or for purchase.

Fibrosarcomas

New Findings from Kinki University Describe Advances in Fibrosarcomas (Negative Effects of G-Protein-Coupled Free Fatty Acid Receptor GPR40 on Cell Migration and Invasion in Fibrosarcoma HT1080 Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Fibrosarcomas. According to news reporting originating in Higashiosaka, Japan, by NewsRx journalists, research stated, "G-protein-coupled receptor 40 (GPR40) and GPR120 mediate a variety of biological functions by the binding of long and medium chain free fatty acids. In the present study, we investigated a
The role of GPR40 in the pathogenesis of fibrosarcoma HT1080 cells."

The news reporters obtained a quote from the research from Kinki University, "The GPR40 gene expression was detected in HT1080 cells, but not the GPR120 gene. The cell motile and invasive activities were markedly enhanced by GPR40 knockdown, compared with control cells. To evaluate whether GPR40 is involved in the cellular functions of HT1080 cells during anticancer drug treatment, HT1080 cells were maintained in condition medium containing cisplatin (CDDP) (0.01-1.0 µM) for 6 mo. The expression levels of the GPR40 gene was elevated by the long-term CDDP treatment in HT1080 cells, while the GPR120 gene expression remained unchanged. The cell motile and invasive activities of HT1080 cells treated with CDDP were significantly lower than those of untreated cells. In gelatin zymography, the activities of matrix metalloproteinase-2 (MMP-2) and MMP-9 of HT1080 cells were enhanced by the long-term CDDP treatment. In addition, GW9508 which is an agonist of GPR40 and GPR120 suppressed the cell motile and invasive activities of HT1080 cells treated with CDDP as well as the MMP activation."

According to the news reporters, the research concluded: "These results suggest that GPR40 negatively regulates the tumor progression of fibrosarcoma cells."

Our news correspondents report that additional information may be obtained by contacting T. Tsujiuchi, Kinki University, Fac Sci & Engn, Dept. of Life Sci, Div Mol Oncol, Higashiosaka, Osaka 5778502, Japan. Additional authors for this research include Y. Kitamura, M. Hirane, A. Tomimatsu, K. Fukushima, K. Takahashi, N. Fukushima, K. Honoki and T. Tsujiuchi.

Science

New Findings from Konkuk University Describe Advances in Science (Identification of disease comorbidity through hidden molecular mechanisms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science have been published. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Despite multiple diseases co-occur, their underlying common molecular mechanisms remain elusive. Identification of comorbid diseases by considering the interactions between molecular components is a key to understand the underlying disease mechanisms."

Our news journalists obtained a quote from the research from Konkuk University, "Here, we developed a novel approach utilizing both common disease-causing genes and underlying molecular pathways to identify comorbid diseases. Our approach enables the analysis..."
of common pathologies shared by comorbid diseases through molecular interaction networks. We found that the integration of direct genetic sharing and indirect high-level molecular associations revealed significantly strong consistency with known comorbid diseases. In addition, neoplasm-related diseases showed high comorbidity patterns within themselves as well as with other diseases, indicating severe complications."

According to the news editors, the research concluded: "This study demonstrated that molecular pathway information could be used to discover disease comorbidity and hidden biological mechanism to understand pathogenesis and provide new insight on disease pathology."

For more information on this research see: Identification of disease comorbidity through hidden molecular mechanisms. *Scientific Reports*, 2016;6():1-8. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **Oncology - Breast Cancer**

**New Findings from Korea University School of Medicine Describe Advances in Breast Cancer (Resistin, a fat-derived secretory factor, promotes metastasis of MDA-MB-231 human breast cancer cells through ERM activation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Resistin, an adipocyte-secreted factor, is known to be elevated in breast cancer patients. However, the molecular mechanism by which resistin acts is not fully understood."

The news correspondents obtained a quote from the research from the Korea University School of Medicine, "The aim of this study was to investigate whether resistin could stimulate invasion and migration of breast cancer cells. Here, we report that resistin stimulated invasion and migration of breast cancer cells as well as phosphorylation of c-Src. Inhibition of c-Src blocked resistin-induced breast cancer cell invasion. Resistin increased intracellular calcium concentration, and chelation of intracellular calcium blocked resistin-mediated activation of Src. Resistin also induced phosphorylation of protein phosphatase 2A (PP2A). Inhibition of c-Src blocked resistin-mediated PP2A phosphorylation. In addition, resistin increased phosphorylation of PKCa. Inhibition of PP2A enhanced resistin-induced PKCa phosphorylation, demonstrating that PP2A activity is critical for PKCa phosphorylation. Resistin also increased phosphorylation of ezrin, radixin, and moesin (ERM). Additionally, ezrin interacted with PKCa, and resistin promoted co-localization of ezrin and PKCa. Either inhibition of c-Src and PKCa or knock-down of ezrin blocked resistin-induced breast cancer
cells invasion. Moreover, resistin increased expression of vimentin, a key molecule for cancer cell invasion. Knock-down of ezrin abrogated resistin-induced vimentin expression."

According to the news reporters, the research concluded: "These results suggest that resistin play as a critical regulator of breast cancer metastasis."

For more information on this research see: Resistin, a fat-derived secretory factor, promotes metastasis of MDA-MB-231 human breast cancer cells through ERM activation. *Scientific Reports*, 2016;6():18923. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Clinical Research - Clinical Trials and Studies**

**New Findings from Kyoto Pharmaceutical University in the Area of Clinical Trials and Studies Described (Transport of Azithromycin into Extravascular Space in Rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news reporting from Kyoto, Japan, by NewsRx journalists, research stated, "Recent clinical trials showed a prolonged retention of subinhibitory concentrations of unbound azithromycin in the interstitial fluid of soft tissues despite the fact that azithromycin is extensively distributed in tissues. In these clinical trials, interstitial fluid samples were obtained by using the microdialysis method, and it was established that drug concentrations represent protein-unbound drug concentrations."

The news correspondents obtained a quote from the research from Kyoto Pharmaceutical University, "The present study was designed to measure total azithromycin concentrations in the interstitial fluid of the skin of rats by directly collecting interstitial fluid samples from a pore formed on the skin by a dissolving microneedle array. The total azithromycin concentrations in interstitial fluid of the skin were about 4 to 5 times higher than those in plasma throughout the experimental period, and stasis of the azithromycin concentration in interstitial fluid was observed when the concentration of azithromycin in plasma was at the lower limit of quantification. In addition, the skin/plasma concentration ratio transiently increased after dosing (from 4.3 to 83.1). Our results suggest that azithromycin was trapped inside white blood cells and/or phagocytic cells in not only blood but also interstitial fluid, resulting in a high total azithromycin concentration and the retention of its antimicrobial activity at the primary infection site."
According to the news reporters, the research concluded: "The stasis of azithromycin in interstitial fluid and skin would lead to long-lasting pharmacological effects (including those against skin infection) at concentrations exceeding the MIC."

For more information on this research see: Transport of Azithromycin into Extravascular Space in Rats. *Antimicrobial Agents and Chemotherapy*, 2016;60(11):6823-6827. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Enzymes and Coenzymes - Amidohydrolases**

**New Findings from Kyoto University Describe Advances in Amidohydrolases [Interspecies Dissemination of a Mobilizable Plasmid Harboring bla(IMP-19) and the Possibility of Horizontal Gene Transfer in a Single Patient]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Enzymes and Coenzymes - Amidohydrolases are discussed in a new report. According to news reporting out of Kyoto, Japan, by NewsRx editors, research stated, "Carbapenemase-producing Gram-negative bacilli have been a global concern over the past 2 decades because these organisms can cause severe infections with high mortality rates. Carbapenemase genes are often carried by mobile genetic elements, and resistance plasmids can be transferred through conjugation."

Our news journalists obtained a quote from the research from Kyoto University, "We conducted whole-genome sequencing (WGS) to demonstrate that the same plasmid harboring a metallo-beta-lactamase gene was detected in two different species isolated from a single patient. Metallo-beta-lactamase-producing Achromobacter xylosoxidans (KUN4507), non-metallo-beta-lactamase-producing Klebsiella pneumoniae (KUN4843), and metallo-beta-lactamase-producing K. pneumoniae (KUN5033) were sequentially isolated from a single patient and then analyzed in this study. Antimicrobial susceptibility testing, molecular typing (pulsed-field gel electrophoresis and multilocus sequence typing), and conjugation analyses were performed by conventional methods. Phylogenetic and molecular clock analysis of K. pneumoniae isolates were performed with WGS, and the nucleotide sequences of plasmids detected from these isolates were determined using WGS. Conventional molecular typing revealed that KUN4843
and KUN5033 were identical, whereas the phylogenetic tree analysis revealed a slight difference. These two isolates were separated from the most recent common ancestor 0.74 years before they were isolated. The same resistance plasmid harboring bla(IMP-19) was detected in metallo-beta-lactamase-producing A. xylosoxidans and K. pneumoniae. Although this plasmid was not self-transferable, the conjugation of this plasmid from A. xylosoxidans to non-metallo-beta-lactamase-producing K. pneumoniae was successfully performed. The susceptibility patterns for metallo-beta-lactamase-producing K. pneumoniae and the transconjugant were similar.

According to the news editors, the research concluded: "These findings supported the possibility of the horizontal transfer of plasmid-borne bla(IMP-19) from A. xylosoxidans to K. pneumoniae in a single patient."

For more information on this research see: Interspecies Dissemination of a Mobilizable Plasmid Harboring bla(IMP-19) and the Possibility of Horizontal Gene Transfer in a Single Patient. Antimicrobial Agents and Chemotherapy, 2016;60(9):5412-5419. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Environmental Research

New Findings from Kyoto University in Environmental Research Provides New Insights (Assessing the population equivalent and performance of wastewater treatment through the ratios of pharmaceuticals and personal care products present in a river ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Environmental Research. According to news originating from Shiga, Japan, by NewsRx correspondents, research stated, "The quality of surface waters in lowland rivers is largely dependent on the efficiency of wastewater treatment. Even in the developed countries, there have been difficulties in evaluating the effectiveness of wastewater management and the proportion of wastewater content (WWC) in the river, as well as in estimating the contributing human population."

Financial supporters for this research include Japanese Ministry of the Environment and DEFRA-supported UK/Japan Cooperation, Japan Society for the Promotion of Science, Natural Environment Research Council.

Our news journalists obtained a quote from the research from Kyoto University, "This study aimed to develop a wastewater quality and quantity assessment based on the occurrence of pharmaceuticals in the receiving waters. A survey of 53 pharmaceuticals in 324
samples (river water and influent and effluent of sewage (wastewater) treatment plants) was carried out in southern England in the River Thames catchment over four years. Carbamazepine was selected as a stable marker and from its concentration WWC in the rivers and cumulative human populations along the catchment were estimated. The estimated population had a strong relationship (R^2 = 0.94) with that reported by the local water company. The concentration ratio of the labile marker caffeine to carbamazepine indicated the efficiency of wastewater treatment in the different treatment systems (i.e. trickling filter or activated sludge) and in the receiving waters. The ratio in some river samples revealed unexpected discharges of untreated or poorly treated wastewater, with a total concentration of the analytes (up to 20 μg/L) five times higher than that in treated wastewater.

According to the news editors, the research concluded: "Such information could be valuable to estimate the discharge or occurrence of not only non-targeted chemicals, but also pathogens within the basin."

For more information on this research see: Assessing the population equivalent and performance of wastewater treatment through the ratios of pharmaceuticals and personal care products present in a river basin: Application to the River Thames basin, UK. *Science of the Total Environment*, 2017;575():1100-1108. *Science of the Total Environment* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Cardiovascular Diseases and Conditions - Abdominal…**

**New Findings from Leicester Royal Infirmary Update Understanding of Abdominal Aortic Aneurysm (Late Survival in Nonoperated Patients with Infrarenal Abdominal Aneurysm)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm is the subject of a report. According to news reporting out of Leicester, United Kingdom, by NewsRx editors, research stated, "Objective/Background: Historical studies report high rupture rates in patients with nonoperated abdominal aortic aneurysms (AAAs) of > 5.5 cm diameter, although a recent audit has questioned this. This was a retrospective review of 138/764 (18%) patients with AAAs evaluated in a preassessment anaesthetic clinic (PAC) between 2006 and 2012, who either did not undergo elective AAA repair or who underwent deferred repair."
Our news journalists obtained a quote from the research from Leicester Royal Infirmary, "The remaining 626 underwent repair. Patients with severe comorbidities (dementia, advanced malignancy, life-expectancy < 1 year) and not referred to PAC were excluded. At a median of 27 months, 71 (52%) died, 36 (51%) following rupture. Cumulative survival, free from rupture or surgery for acute symptoms, was 96% at 1 year, 84% at 3 years, and 64% at 5 years, where baseline AAA diameters were 5.5-6.9 cm. For diameters > 7 cm, survival, free from rupture, was 65% at 1 year, 29% at 3 years, and 0% at 5 years. Median interval to rupture was 47 months (AAA diameter 5.5-6.9 cm) and 21 months where baseline diameters were > 7 cm. Rupture accounted for 32% of late deaths in patients with AAAs of 5.55.9 cm diameter, 46% in those with AAAs measuring 6.0-6.9 cm in diameter, and 71% in patients with AAA measuring > 7 cm in diameter. Approximately half of all late deaths in this nonoperated cohort were not AAA related, suggesting that even had repair been undertaken, it would not have prolonged patient survival. The incidence of rupture in 'high-risk' patients with an AAA < 7 cm diameter was < 5% at 1 year, thereby giving ample time to optimise risk factors and improve pre-existing medical conditions prior to undertaking a deferred intervention. Even if these patients did not undergo surgical repair, the risk of late rupture was relatively low."

According to the news editors, the research concluded: "By contrast, nonoperated patients with AAAs > 7 cm in diameter face a very high risk of rupture and will probably benefit from elective surgery, with the caveat that a higher procedural risk might have to be incurred."

Our news journalists report that additional information may be obtained by contacting A.J. Batchelder, Leicester Royal Infirmary, Dept. of Vasc Anaesthesia & Vasc Surg, Leicester, Leics, United Kingdom. Additional authors for this research include A.J. Batchelder, D. Kirkbride, A.R. Naylor and J.P. Thompson.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejvs.2016.05.008. This DOI is a link to an online electronic document that is either free or for purchase.

Disease Attributes - Disease Progression

New Findings from Leiden University in the Area of Disease Progression Described (Systems pharmacology - Towards the modeling of network interactions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Disease Attributes - Disease Progression have been
presented. According to news reporting from Leiden, Netherlands, by NewsRx editors, the research stated, "Mechanism-based pharmacokinetic and pharmacodynamics (PKPD) and disease system (DS) models have been introduced in drug discovery and development research, to predict in a quantitative manner the effect of drug treatment in vivo in health and disease. This requires consideration of several fundamental properties of biological systems behavior including: hysteresis, non-linearity, variability, interdependency, convergence, resilience, and multi-stationarity."

The news correspondents obtained a quote from the research from Leiden University, "Classical physiology-based PKPD models consider linear transduction pathways, connecting processes on the causal path between drug administration and effect, as the basis of drug action. Depending on the drug and its biological target, such models may contain expressions to characterize i) the disposition and the target site distribution kinetics of the drug under investigation, ii) the kinetics of target binding and activation and iii) the kinetics of transduction. When connected to physiology-based DS models, PKPD models can characterize the effect on disease progression in a mechanistic manner. These models have been found useful to characterize hysteresis and non-linearity, yet they fail to explain the effects of the other fundamental properties of biological systems behavior. Recently systems pharmacology has been introduced as novel approach to predict in vivo drug effects, in which biological networks rather than single transduction pathways are considered as the basis of drug action and disease progression. These models contain expressions to characterize the functional interactions within a biological network. Such interactions are relevant when drugs act at multiple targets in the network or when homeostatic feedback mechanisms are operative. As a result systems pharmacology models are particularly useful to describe complex patterns of drug action (i.e. synergy, oscillatory behavior) and disease progression (i.e. episodic disorders). In this contribution it is shown how physiology-based PKPD and disease models can be extended to account for internal systems interactions. It is demonstrated how SP models can be used to predict the effects of multi-target interactions and of homeostatic feedback on the pharmacological response. In addition it is shown how DS models may be used to distinguish symptomatic from disease modifying effects and to predict the long term effects on disease progression, from short term biomarker responses."

According to the news reporters, the research concluded: "It is concluded that incorporation of expressions to describe the interactions in biological network analysis opens new avenues to the understanding of the effects of drug treatment on the fundamental aspects of biological systems behavior."

Our news journalists report that additional information may be obtained by contacting M. Danhof, Leiden University, Syst Pharmacol, Leiden Academy Center Drug Res, NL-2300 RA Leiden, Netherlands.

Mycobacterium Infections - Tuberculosis

New Findings from Leiden University in the Area of Tuberculosis
Reported (Mechanisms of Phenotypic Rifampicin Tolerance in
Mycobacterium tuberculosis Beijing Genotype Strain B0/W148 Revealed
by Proteomics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Mycobacterium Infections -
Tuberculosis. According to news originating from Leiden, Netherlands, by NewsRx
correspondents, research stated, "The 'successful' Russian clone B0/W148 of Mycobacterium
tuberculosis Beijing is well-known for its capacity to develop antibiotic resistance. During
treatment, resistant mutants can occur that have inheritable resistance to specific antibiotics."

Financial support for this research came from Rijksinstituut voor Volksgezondheid
en Milieu.

Our news journalists obtained a quote from the research from Leiden University,
"Next to mutations, M. tuberculosis has several mechanisms that increase their tolerance to a
variety of antibiotics. Insights in the phenotypic mechanisms that contribute to drug tolerance
will increase our understanding of how antibiotic resistance develops in M. tuberculosis. In this
study, we examined the (phospho)proteome dynamics in M. tuberculosis Beijing strain
B0/W148 when exposed to a high dose of rifampicin; one of the most potent first-line
antibiotics. A total of 2,534 proteins and 191 phosphorylation sites were identified, and revealed
the differential regulation of DosR regulon proteins, which are necessary for the development of
a dormant phenotype that is less susceptible to antibiotics. By examining independent
phenotypic markers of dormancy, we show that persisters of in vitro rifampicin exposure
entered a metabolically hypoactive state, which yields rifampicin and other antibiotics largely
ineffective."

According to the news editors, the research concluded: "These new insights in the
role of protein regulation and post-translational modifications during the initial phase of
rifampicin treatment reveal a shortcoming in the antituberculosis regimen that is administered to
8-9 million individuals annually."

For more information on this research see: Mechanisms of Phenotypic Rifampicin
Tolerance in Mycobacterium tuberculosis Beijing Genotype Strain B0/W148 Revealed by
- www.acs.org; Journal of Proteome Research - www.pubs.acs.org/journal/jprobs)

The news correspondents report that additional information may be obtained from J.
de Keijzer, Dept. of Immunohematology and Blood Transfusion, Leiden University Medical
Center (LUMC) , Leiden 2300 RC, Netherlands. Additional authors for this research include A.
Mulder, J. de Beer, A.H. de Ru, P.A. van Veelen and D. van Soolingen.

New Findings from Linkoping University Describe Advances in Cardiology (Patient-Specific Simulation of Cardiac Blood Flow From High-Resolution Computed Tomography)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiology. According to news reporting out of Linkoping, Sweden, by NewsRx editors, research stated, "Cardiac hemodynamics can be computed from medical imaging data, and results could potentially aid in cardiac diagnosis and treatment optimization. However, simulations are often based on simplified geometries, ignoring features such as papillary muscles and trabeculae due to their complex shape, limitations in image acquisitions, and challenges in computational modeling."

Our news journalists obtained a quote from the research from Linkoping University, "This severely hampers the use of computational fluid dynamics in clinical practice. The overall aim of this study was to develop a novel numerical framework that incorporated these geometrical features. The model included the left atrium, ventricle, ascending aorta, and heart valves. The framework used image registration to obtain patient-specific wall motion, automatic remeshing to handle topological changes due to the complex trabeculae motion, and a fast interpolation routine to obtain intermediate meshes during the simulations. Velocity fields and residence time were evaluated, and they indicated that papillary muscles and trabeculae strongly interacted with the blood, which could not be observed in a simplified model."

According to the news editors, the research concluded: "The framework resulted in a model with outstanding geometrical detail, demonstrating the feasibility as well as the importance of a framework that is capable of simulating blood flow in physiologically realistic hearts."

Our news journalists report that additional information may be obtained by contacting J. Lantz, Linkoping University, Dept. of Med & Hlth Sci, Center Med Image Sci & Visualizat CMIV, SE-58183 Linkoping, Sweden. Additional authors for this research include L. Henriksson, A. Persson, M. Karlsson and T. Ebbers.

Diabetes

New Findings from M. Rizzi and Co-Authors Describe Advances in Diabetes (Genitourinary infections in diabetic patients in the new era of diabetes therapy with sodium-glucose cotransporter-2 inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Diabetes are presented in a new report. According to news reporting out of Bergamo, Italy, by NewsRx editors, research stated, "To review prevalence and significance of urinary tract (UTI) and genital infections (GI) in diabetes and the effects of sodium glucose cotransporter 2 (SGLT-2) inhibitors on these complications. Data synthesis: The prevalence of asymptomatic bacteriuria (ASB) is 2-3 times higher in diabetic than in non-diabetic women."

Financial support for this research came from Eli Lilly Italia SpA.

Our news journalists obtained a quote from the research, "The treatment of ASB has no impact on the development of UTIs and/or a decline in renal function. Therefore, there is no indication for screening for and/or treatment of ASB. The incidence of UTI is higher and frequently complicated in diabetic patients, particularly in those with longer duration of disease and of older age. There is no consistent evidence of an association between A1c levels, glycosuria and the risk of ASB and/or UTIs. Diabetes is a known risk factor for Candida colonization and GI, and a poor glycemic control is associated with a higher risk. While patients treated with SGLT-2 inhibitors may have a non-significant increased risk of UTI, they have a clearly increased risk of GI; most of these infections are mild, easy to treat, and the rate of recurrence is low. Diabetic patients are at high risk of UTIs and of GI. Only GI are associated with poor glycemic control."

According to the news editors, the research concluded: "Although patients treated with SGLT-2 inhibitors have an increased 3-5 fold risk of GI, proper medical education can reduce this risk."

Our news journalists report that additional information may be obtained by contacting R. Trevisan, ASST Papa Giovanni XXIII, Endocrinol & Diabet Unit, I-24127 Bergamo, Italy.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.numecd.2016.07.006. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings from M.D. Anderson Cancer Center in the Area of Hereditary Nonpolyposis Colorectal Cancer Described (Genetic predisposition in gynecologic cancers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Hereditary Nonpolyposis Colorectal Cancer. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "This review article discusses the diagnosis and management of hereditary ovarian cancer and hereditary uterine cancer. The key recommendations highlighted are: All women with high grade non-mucinous epithelial ovarian cancer should be offered at least BRCA1 and BRCA2 genetic testing."

Our news editors obtained a quote from the research from M.D. Anderson Cancer Center, "The care of women with BRCA-associated ovarian cancer should be tailored to their mutation status. Risk-reducing bilateral salpingo-oophorectomy is recommended for women with BRCA1/2 mutations. Women with endometrial cancer should be assessed for the possibility of Lynch syndrome. Individuals with Lynch syndrome should undergo screening colonoscopy every 1-2 years."

According to the news editors, the research concluded: "Lynch syndrome causes a high risk of endometrial cancer, and women with Lynch syndrome should consult with a gynecologic specialist to formulate a plan for managing this risk."

For more information on this research see: Genetic predisposition in gynecologic cancers. Seminars in Oncology, 2016;43(5):543-547. Seminars in Oncology can be contacted at: W B Saunders Co-Elsevier Inc, 1600 John F Kennedy Boulevard, Ste 1800, Philadelphia, PA 19103-2899, USA. New Findings from M.S. Duh and Co-Researchers in the Area of Central Nervous System Agents Described (Can social media data lead to earlier detection of drug-related adverse events?)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Central Nervous System Agents is now available. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "To compare the patient characteristics and the inter-temporal reporting patterns of adverse events (AEs) for atorvastatin (Lipitor ®) and sibutramine (Meridia ®) in social media (AskaPatient.com) versus the FDA Adverse Event Reporting System (FAERS). We identified clinically important AEs associated with atorvastatin (muscle pain) and sibutramine (cardiovascular AEs), compared their patterns in social media postings versus FAERS and used Granger causality tests to assess whether social media postings were useful in forecasting FAERS reports."

Our news journalists obtained a quote from the research, "We analyzed 998 and 270 social media postings between 2001 and 2014, 69 003 and 7383 FAERS reports between 1997 and 2014 for atorvastatin and sibutramine, respectively. Social media reporters were younger (atorvastatin: 53.9 vs. 64.0 years, p< 0.001; sibutramine: 36.8 vs. 43.8 years, p< 0.001). Social media reviews contained fewer serious AEs (atorvastatin, pain: 2.5% vs. 38.2%; sibutramine, cardiovascular issues: 7.9% vs. 63.0%; p< 0.001 for both) and concentrated on fewer types of AEs (proportion comprising the top 20 AEs: atorvastatin, 88.7% vs. 55.4%; sibutramine, 86.3% vs. 65.4%) compared with FAERS. While social media sibutramine reviews mentioning cardiac issues helped predict those in FAERS 11 months later (p < 0.001), social media atorvastatin reviews did not help predict FAERS reports. Social media AE reporters were younger and focused on less-serious and fewer types of AEs than FAERS reporters. The potential for social media to provide earlier indications of AEs compared with FAERS is uncertain."

According to the news editors, the research concluded: "Our findings highlight some of the promises and limitations of online social media versus conventional pharmacovigilance sources and the need for careful interpretation of the results."

The news correspondents report that additional information may be obtained from M.S. Duh, Anal Grp Inc, Boston, MA 02199, United States. Additional authors for this research include P. Cremieux, M. Van Audenrode, F. Vekeman, P. Karner, H.M. Zhang and P. Greenberg.

New Findings from Maastricht University in the Area of Breast Cancer Described (Routine use of standard breast MRI compared to axillary ultrasound for differentiating between no, limited and advanced axillary nodal disease in newly diagnosed ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting from Maastricht, Netherlands, by NewsRx journalists, research stated, "To compare standard breast MRI to dedicated axillary ultrasound (with or without tissue sampling) for differentiating between no, limited and advanced axillary nodal disease in breast cancer patients. All patients who underwent breast MRI and dedicated axillary ultrasound between 2009 and 2014 were eligible."

The news correspondents obtained a quote from the research from Maastricht University, "Exclusion criteria were recurrent disease, neoadjuvant systemic therapy and not receiving completion axillary lymph node dissection after positive sentinel lymph node biopsy (SLNB). Two radiologists independently reassessed all MRI exams. Axillary ultrasound findings were retrospectively collected. Probability of advanced axillary nodal disease (pN2-3) given clinically node negative (cN0) or limited (cN1) findings was calculated, with corresponding negative predictive value (NPV) to exclude pN2-3 and positive predictive value (PPV) to identify axillary nodal disease. Histopathology served as gold standard. A total of 377 cases resulted in 81.4% no, 14.4% limited and 4.2% advanced axillary nodal disease at final histopathology. Probability of pN2-3 given cN0 for breast MRI and axillary ultrasound was 0.7-0.9% versus 1.5% and probability of pN2-3 given cN1 was 11.6-15.4% versus 29.0%. When cN1 on breast MRI was observed, PPV to identify positive axillary nodal disease was 50.7% and 59.0%. Evaluation of axillary nodal status on standard breast MRI is comparable to dedicated axillary ultrasound in breast cancer patients."

According to the news reporters, the research concluded: "In patients who underwent preoperative standard breast MRI, axillary ultrasound is only required in case of suspicious nodal findings on MRI."

New Findings from Mashhad University of Medical Sciences Update Understanding of Blood Transfusion (RISK pathway is involved in oxytocin postconditioning in isolated rat heart)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transfusion Medicine - Blood Transfusion is now available. According to news reporting originating from Mashhad, Iran, by NewsRx correspondents, research stated, "The reperfusion injury salvage kinase (RISK) pathway is a fundamental signal transduction cascade in the cardioprotective mechanism of ischemic postconditioning. In the present study, we examined the cardioprotective role of oxytocin as a postconditioning agent via activation of the RISK pathway (PI3K/Akt and ERK1/2)."

Financial support for this research came from Mashhad University of Medical Sciences and Golestan University of Medical Sciences.

Our news editors obtained a quote from the research from the Mashhad University of Medical Sciences, "Animals were randomly divided into 6 groups. The hearts were subjected under 30 minutes (min) ischemia and 100 min reperfusion. OT was perfused 15 min at the early phase of reperfusion. RISK pathway inhibitors (Wortmannin; an Akt inhibitor, PD98059; an ERK1/2 inhibitor) and Atosiban (an OT receptor antagonist) were applied either alone 10 min before the onset of the ischemia or in the combination with OT during early reperfusion phase. Myocardial infarct size, hemodynamic factors, ventricular arrhythmia, coronary flow and cardiac biochemical marker were measured at the end of reperfusion. OT postconditioning (OTpost), significantly decreased the infarct size, arrhythmia score, incidence of ventricular fibrillation, Lactate dehydrogenase and it increased coronary flow. The cardioprotective effect of OTpos was abrogated by PI3K/Akt, ERK1/2 inhibitors and Atosiban."

According to the news editors, the research concluded: "Our data have shown that OTPost can activate RISK pathway mostly via the PI3K/Akt and ERK1/2 signaling cascades during the early phase of reperfusion."

The news editors report that additional information may be obtained by contacting V. Khor, Mashhad Univ Med Sci, Biotechnol Res Center, Mashhad, Iran. Additional authors for this research include K. Jamialahmadi, V. Khor, A.M. Alizadeh, M. Saeidi, M. Ghayour-Mobarhan, Y. Jand, M.H. Ghaahremani and Y. Yazdani.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.peptides.2016.10.001. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - B-Cell Lymphoma

New Findings from Mayo Clinic Describe Advances in B-Cell Lymphoma (T-Cell/Histiocyte-Rich Large B-Cell Lymphoma Presenting as a Primary Central Nervous System Lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - B-Cell Lymphoma are discussed in a new report. According to news reporting originating from Jacksonville, Florida, by NewsRx correspondents, research stated, "Primary central nervous system (PCNSL) lymphoma is an aggressive extranodal non-Hodgkin lymphoma, and most cases are classified as diffuse large B-cell lymphoma (DLBCL) by histology. T-cell/histiocyte-rich large B-cell lymphoma (TCRLBCL) represents a distinct subtype of diffuse large B-cell lymphoma and is characterized by the presence of scattered large neoplastic B-cells in a background of abundant T-cells and histiocytes."

Our news editors obtained a quote from the research from Mayo Clinic, "This is in contrast to the dense perivascular cuffing of neoplastic B-cells in classic DLBCL. T-cell/histiocyte-rich large B-cell lymphoma should be considered in PCNSL cases in which neoplastic B-cells are sparse and scattered. Immunohistochemistry will help identify the B-cells and surrounding infiltrate rich in T lymphocytes and histiocytes."

According to the news editors, the research concluded: "Future studies exploring the biology of TCRLBCL and the crosstalk between the neoplastic cells and the surrounding inflammatory infiltrate may provide exciting prospects for future therapies for TCRLBCL."

For more information on this research see: T-Cell/Histiocyte-Rich Large B-Cell Lymphoma Presenting as a Primary Central Nervous System Lymphoma. Rare Tumors, 2015;7 (4):6084.

The news editors report that additional information may be obtained by contacting P. Advani, Division of Hematology and Oncology, Dept. of Internal Medicine, Mayo Clinic, Jacksonville, FL, United States. Additional authors for this research include J. Starr, A. Swaika, L. Jiang, Y. Qiu, Z. Li and H.W Tun.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4081/rt.2015.6084. This DOI is a link to an online electronic document that is either free or for purchase.

**New Findings from Mayo Clinic Describe Advances in Sepsis (Pre- and Postoperative Predictors of Infection-Related Complications in Patients Undergoing Percutaneous Nephrolithotomy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Blood Diseases and Conditions - Sepsis. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "We aim to describe pre- and postoperative predictors of infection-related complications in individuals undergoing percutaneous nephrolithotomy (PCNL). Patients treated with PCNL from 2009 to 2013 were reviewed."

The news correspondents obtained a quote from the research from Mayo Clinic, "Patients with positive urine or stone cultures received extended antimicrobial treatment. All others received 7 days of empirical therapy preoperatively and postoperatively. Pre- and postoperative predictors of infectious complication were identified. We identified 227 patients who underwent primary PCNL with infectious complications occurring in 37 (16%): 11 (5%) urinary tract infection/pyelonephritis, 21 (9%) systemic inflammatory response syndrome (SIRS), and 2 (0.9%) sepsis. There were no significant differences between those with and without infectious complication with regard to age, gender, stone size, presence of diabetes, or procedure duration. Those with infectious complication were more likely to have a positive intraoperative stone culture (p = 0.01), struvite stone composition (p < 0.01), staghorn calculi (p < 0.001), and multiple stones (p = 0.02). Preoperatively, on multivariable analysis, only the presence of a staghorn calculus remained independently associated with increased risks of fever/SIRS/sepsis (odds ratio [OR] 3.14; p = 0.02) and total infectious complications (OR 2.53; p = 0.02) following PCNL. After controlling for pre- and post-PCNL risk factors, again, only staghorn calculi remained significantly associated with fever/SIRS/sepsis (OR 3.41; p = 0.01) and total infectious complications (OR 2.91; p = 0.01), with presence of multiple stones approaching significance (OR 4.2, confidence interval [CI]: 0.96, 18.6; p = 0.06). In individuals undergoing PCNL on preoperative antibiotics, risk of SIRS/sepsis was low. The presence of a staghorn calculus confers a greater than threefold increased risk of postoperative infection with multiple stones approaching a significant risk."

According to the news reporters, the research concluded: "Patients with large stone burdens should be counseled appropriately regarding these risks."

Our news journalists report that additional information may be obtained by contacting M. Rivera, Mayo Clinic, Dept. of Urol, Rochester, MN 55905, United States. Additional authors for this research include B. Viers, P. Cockerill, D. Agarwal, R. Mehta and A. Krambeck.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1089/end.2016.0191. This DOI is a link to an online electronic document that is either free or for purchase.

**Nervous System Diseases and Conditions - Dystonia**

**New Findings from Mayo Clinic in Dystonia Provides New Insights (A novel ANO3 variant identified in a 53-year-old woman presenting with hyperkinetic dysarthria, blepharospasm, hyperkinesias, and complex motor tics)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nervous System Diseases and Conditions - Dystonia is now available. According to news originating from Jacksonville, Florida, by NewsRx correspondents, research stated, "Cervical dystonias have a variable presentation and underlying etiology, but collectively represent the most common form of focal dystonia. There are a number of known genetic forms of dystonia (DYT1-27); however the heterogeneity of disease presentation does not always make it easy to categorize the disease by phenotype-genotype comparison."

Our news journalists obtained a quote from the research from Mayo Clinic, "Case presentation: In this report, we describe a 53-year-old female who presented initially with hand tremor following a total hip arthroplasty. The patient developed a mixed hyperkinetic disorder consisting of chorea, dystonia affecting the upper extremities, dysarthria, and blepharospasm. Whole exome sequencing of the patient revealed a novel heterozygous missense variant (Chr11 (GRCh38): g.26525644C > G; NM_031418.2(ANO3): c.702 C > G; NP_113606.2. p.C234W) in exon 7 in the ANO3 gene. ANO3 encodes anoctamin-3, a Ca2+-dependent phospholipid scramblase expressed in striatal-neurons, that has been implicated in autosomal dominant cranio cervical dystonia (Dystonia-24, DYT24, MIM# 615034). To date, only a handful of cases of DYT-24 have been described in the literature. The complex clinical presentation of the patient described includes hyperkinesias, complex motor movements, and vocal tics, which have not been reported in other patients with DYT24."

According to the news editors, the research concluded: "This report highlights the utility of using clinical whole exome sequencing in patients with complex neurological phenotypes that would not normally fit a classical presentation of a defined genetic disease."

The news correspondents report that additional information may be obtained from P.S. Atwal, Mayo Clinic, Dept. of Clin Genom, Jacksonville, FL 32224, United States. Additional authors for this research include M.T. Zimmermann, J.M. Gass, K.G. Harris, M.A. Cousin, N.J. Boczek, O.A. Ross, E.W. Klee, P.W. Brazis, J.A. Van Gerpen and P.S. Atwal.
New Findings from Mayo Clinic in the Area of Heart Failure Described (Differentiation of Constriction and Restriction Complex Cardiovascular Hemodynamics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Failure. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "Differentiation of constrictive pericarditis (CP) from restrictive cardiomyopathy (RCM) is a complex and often challenging process. Because CP is a potentially curable cause of heart failure and therapeutic options for RCM are limited, distinction of these 2 conditions is critical."

The news correspondents obtained a quote from the research from Mayo Clinic, "Although different in regard to etiology, prognosis, and treatment, CP and RCM share a common clinical presentation of predominantly right-sided heart failure, in the absence of significant left ventricular systolic dysfunction or valve disease, due to impaired ventricular diastolic filling. Fundamental to the diagnosis of either condition is a clear understanding of the underlying hemodynamic principles and pathophysiology."

According to the news reporters, the research concluded: "We present a contemporary review of the pathophysiology, hemodynamics, diagnostic assessment, and therapeutic approach to patients presenting with CP and RCM."

For more information on this research see: Differentiation of Constriction and Restriction Complex Cardiovascular Hemodynamics. Journal of the American College of Cardiology, 2016;68(21):2329-2347. Journal of the American College of Cardiology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.

Our news journalists report that additional information may be obtained by contacting J.B. Geske, Mayo Clinic, Dept. of Cardiovasc Dis, Rochester, MN 55905, United States. Additional authors for this research include N.S. Anavekar, R.A. Nishimura, J.K. Oh and B.J. Gersh.

New Findings from Mazandaran University of Medical Sciences Update Understanding of Radiation Therapy (The paradox role of caspase cascade in ionizing radiation therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Radiation Therapy. According to news reporting originating from Sari, Iran, by NewsRx correspondents, research stated, "Radiotherapy alone or in combination with chemotherapy/surgery is widely used for treatment of cancers."

Our news editors obtained a quote from the research from the Mazandaran University of Medical Sciences, "It reduces tumor growth and prevents metastasis. While ionizing radiation activates caspase cascade resulted in apoptosis in cancer cells, it also stimulates tumor cell re-population that leads to reduce the effectiveness of the radiation therapy."

According to the news editors, the research concluded: "This review describes the mechanisms for paradox role of caspase cascade in cancer therapy and discusses the logical and practical strategies for improvement the therapeutic index of radiotherapy through enhancement of radiosensitivity and decreasing the rate of tumor recurrence."

The news editors report that additional information may be obtained by contacting S.J. Hosseinimehr, Mazandaran Univ Med Sci, Fac Pharm, Dept. of Radiopharm, Sari, Iran. Additional authors for this research include S.J. Hosseinimehr and A. Khalaj.

Keywords for this news article include: Sari, Iran, Asia, Therapy, Article Review, Cysteine Endopeptidases, Enzymes and Coenzymes, Drugs and Therapies, Peptide Hydrolases, Radiation Therapy, Radiotherapy, Caspases, Mazandaran University of Medical Sciences.

New Findings from Medical University of South Carolina Describe Advances in Clinical Trials and Studies (Effects Of Liraglutide 3.0 Mg On Weight And Risk Factors In Hispanic Versus Non-hispanic Populations: Subgroup Analysis From Scale ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Research - Clinical Trials and Studies. According to news reporting from Charleston, South Carolina, by NewsRx journalists, research stated, "Scarce data exist on pharmacotherapy for obesity in Hispanic individuals. This
post hoc analysis of pooled data from 4 phase 3a trials compared the efficacy and safety of liraglutide 3.0 mg versus placebo, as adjunct to a reduced-calorie diet and physical activity, in Hispanic versus non-Hispanic subgroups."

The news correspondents obtained a quote from the research from the Medical University of South Carolina, "We conducted the double-blind randomized, placebo-controlled trials in adults with a minimum body mass index (BMI) of 27 kg/m(2) with at least 1 comorbidity, or a minimum BMI of 30 kg/m(2), at clinical research sites worldwide. In this analysis, we investigated possible differences in treatment effects between 534 Hispanics (10.4% of the population) and 4,597 non-Hispanics (89.6%) through statistical tests of interaction between subgroups and treatment. Variables examined included mean and categorical weight change, cardiovascular risk markers, and safety data. Both subgroups achieved clinically significant mean weight loss at end-of-treatment with liraglutide 3.0 mg versus placebo: Hispanics 7.0% versus 1.5%, treatment difference -5.1% (95% CI, -6.2 to -4.0); non-Hispanics 7.5% versus 2.3%, -5.2% (95% CI, -5.5 to -4.8). More individuals in both subgroups lost >= 5%, >10%, and >15% of their baseline weight with liraglutide 3.0 mg than with placebo. Efficacy endpoints generally did not vary with ethnicity (P >.05). Adverse events were comparable between ethnic subgroups, with more gastrointestinal disorders reported with liraglutide 3.0 mg than placebo. Efficacy and safety were largely similar between Hispanic and non-Hispanic subgroups."

According to the news reporters, the research concluded: "Results support that liraglutide 3.0 mg, used with a reduced-calorie diet and physical activity, can facilitate weight loss in Hispanic individuals."

For more information on this research see: Effects Of Liraglutide 3.0 Mg On Weight And Risk Factors In Hispanic Versus Non-hispanic Populations: Subgroup Analysis From Scale Randomized Trials. Endocrine Practice, 2016;22(11):1277-1287. Endocrine Practice can be contacted at: Amer Assoc Clinical Endocrinologists, 245 Riverside Avenue, Ste 200, Jacksonville, FL 32202, USA.

Our news journalists report that additional information may be obtained by contacting P.M. O'Neil, Medical University of South Carolina, Charleston, SC 29425, United States. Additional authors for this research include W.T. Garvey, J.M. Gonzalez-Campoy, P. Mora, R.V. Ortiz, G. Guerrero, B. Claudius and X. Pi-Sunyer.

Keywords for this news article include: Charleston, South Carolina, United States, North and Central America, Clinical Trials and Studies, Risk and Prevention, Clinical Research, Medical University of South Carolina.

Hematopoietic

New Findings from Medical University of South Carolina in the Area of Hematopoietic Described (Contributions of Mouse and Human Hematopoietic Cells to Remodeling of the Adult Auditory Nerve After Neuron Loss)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematopoietic. According to news reporting originating from Charleston, South Carolina, by NewsRx correspondents, research
stated, "The peripheral auditory nerve (AN) carries sound information from sensory hair cells to the brain. The present study investigated the contribution of mouse and human hematopoietic stem cells (HSCs) to cellular diversity in the AN following the destruction of neuron cell bodies, also known as spiral ganglion neurons (SGNs)."

Our news editors obtained a quote from the research from the Medical University of South Carolina, "Exposure of the adult mouse cochlea to ouabain selectively killed type I SGNs and disrupted the blood-labyrinth barrier. This procedure also resulted in the upregulation of genes associated with hematopoietic cell homing and differentiation, and provided an environment conducive to the tissue engraftment of circulating stem/progenitor cells into the AN. Experiments were performed using both a mouse-mouse bone marrow transplantation model and a severely immune-incompetent mouse model transplanted with human CD34(+) cord blood cells. Quantitative immunohistochemical analysis of recipient mice demonstrated that ouabain injury promoted an increase in the number of both HSC-derived macrophages and HSC-derived nonmacrophages in the AN. Although rare, a few HSC-derived cells in the injured AN exhibited glial-like qualities."

According to the news editors, the research concluded: "These results suggest that human hematopoietic cells participate in remodeling of the AN after neuron cell body loss and that hematopoietic cells can be an important resource for promoting AN repair/regeneration in the adult inner ear."

For more information on this research see: Contributions of Mouse and Human Hematopoietic Cells to Remodeling of the Adult Auditory Nerve After Neuron Loss. Molecular Therapy, 2016;24(11):2000-2011. Molecular Therapy can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

The news editors report that additional information may be obtained by contacting H.N. Lang, Medical University of South Carolina, Dept. of Pathol & Lab Med, Charleston, SC 29425, United States. Additional authors for this research include E. Nishimoto, Y.Z. Xing, L.N. Brown, K.V. Noble, J.L. Barth, A.C. LaRue, K. Ando and B.A. Schulte.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/mt.2016.174. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology**

**New Findings from Memorial Hospital Yields New Data on Oncology (Double autophagy modulators reduce 2-deoxyglucose uptake in sarcoma patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology have been published. According to news originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "According to the metabolic symbiosis model, cancer stromal fibroblasts could be hijacked by surrounding cancer
cells into a state of autophagy with aerobic glycolysis to help provide recycled nutrients. The purpose of this study was to investigate whether combined treatment with the autophagy inhibitor: hydroxychloroquine (HCQ) and the autophagy inducer: sirolimus (rapamycin, Rapa) would reduce glucose utilization in sarcoma patients."

Our news journalists obtained a quote from the research from Memorial Hospital, "Ten sarcoma patients who failed first-line treatment were enrolled in this study. They were treated with 1 mg of Rapa and 200 mg of HCQ twice daily for two weeks. The standardized uptake values (SUV) from pretreatment and posttreatment [18F]-fluorodeoxyglucose positron emission tomography (FDG PET) scans were reviewed, and changes from the baseline SUVmax were evaluated. Based on FDG PET response criteria, six patients had a partial response; three had stable disease, and one had progressive disease. Nevertheless, none of them showed a reduction in tumor volume. The mean SUVmax reduction in the 34 lesions evaluated was -19.6% (95% CI=-30.1% to -9.1%), while the mean volume change was +16.4% (95% CI=+5.8% to +27%). Only grade 1 toxicities were observed. Elevated serum levels of lactate dehydrogenase were detected after treatment in most metabolic responders."

According to the news editors, the research concluded: "The results of reduced SUVmax without tumor volume reduction after two weeks of Rapa and HCQ treatment may indicate that non-proliferative glycolysis occurred mainly in the cancer associated fibroblast compartment, and decreased glycolytic activity was evident from Rapa + HCQ double autophagy modulator treatment."

For more information on this research see: Double autophagy modulators reduce 2-deoxyglucose uptake in sarcoma patients. Oncotarget, 2015;6(30):29808-17.

The news correspondents report that additional information may be obtained from M.S. Chi, Dept. of Radiation Therapy and Oncology, Shin Kong Wu Ho-Su Memorial Hospital, Taipei, Taiwan. Additional authors for this research include C.Y. Lee, S.C. Huang, K.L. Yang, H.L. Ko, Y.K. Chen, C.H. Chung, K.W. Liao and K.H Chi.

Pharmacology

New Findings from Merck Research Labs Describe Advances in Pharmacology [Discovery of highly potent and selective orexin 1 receptor antagonists (1-SORAs) suitable for in vivo interrogation of orexin 1 receptor pharmacology]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacology have been presented. According to news originating from West Point, Pennsylvania, by NewsRx correspondents, research stated, "While a correlation between blockade of the orexin 2 receptor (OX2R) with either a dual orexin receptor antagonist (DORA) or a selective orexin 2 receptor antagonist (2-SORA) and a decrease of wakefulness is well established, less is known about selective blockade of the orexin
1 receptor (OX1R). Therefore, a highly selective orexin 1 antagonist (1-SORA) with suitable properties to allow in vivo interrogation of OX1R specific pharmacology in preclinical species remains an attractive target."

Our news journalists obtained a quote from the research from Merck Research Labs, "Herein, we describe the discovery of an optimized 1-SORA series in the piperidine ether class. Notably, a 4,4-difluoropiperidine core coupled with a 2-quinoline ether linkage provides OX1R selective compounds. The combination with an azabenzimidazole or imidazopyridine amide substituent leads to analogs 47 and 51 with > 625-fold functional selectivity for OX1R over OX2R in rat."

According to the news editors, the research concluded: "Compounds 47 and 51 possess clean off-target profiles and the required pharmacokinetic and physical properties to be useful as 1-SORA tool compounds."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.bmcl.2016.10.019. This DOI is a link to an online electronic document that is either free or for purchase.

---

**Drugs and Therapies - Antiretrovirals**

New Findings from Merck Research Labs in the Area of Antiretrovirals Reported (Atazanavir increases the plasma concentrations of 1200 mg raltegravir dose)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antiretrovirals is now available. According to news reporting out of Kenilworth, New Jersey, by NewsRx editors, research stated, "Raltegravir is a human immunodeficiency virus (HIV)-1 integrase strand transfer inhibitor currently marketed at a dose of 400 mg twice-daily (b.i.d.). Raltegravir 1200 mg once-daily (q.d.) (investigational q.d. formulation of 2 x 600 mg tablets; q.d."

Our news journalists obtained a quote from the research from Merck Research Labs, "RAL) was found to be generally well tolerated and non-inferior to the marketed 400 mg b.i.d. dose at 48 weeks in a phase 3 trial. Since raltegravir is eliminated mainly by metabolism via a
uridine diphosphate glucuronosyltransferase (UGT) 1A1-mediated glucuronidation pathway, co-administration of UGT1A1 inhibitors may increase the plasma levels of q.d. RAL. To assess this potential, the drug interaction of 1200 mg raltegravir using atazanavir, a known UGT1A1 inhibitor, was studied. An open-label, randomized, 2-period, fixed-sequence phase 1 study was performed in adult healthy male and female (non-childbearing potential) subjects 19 and 55 years of age, with a body mass index (BMI) 18.5 and 32.0 kg/m(2). Subjects (n = 14) received a single oral dose of 1200 mg raltegravir in period 1. After a washout period of at least 7 days, the subjects received oral doses of 400 mg atazanavir q.d. for 9 consecutive days, with a single oral dose of 1200 mg raltegravir co-administered on day 7 of period 2. Serial blood samples were collected for 72 h following raltegravir dosing and analysed using a validated bioanalytical method to quantify raltegravir plasma concentrations. Co-administration with atazanavir yielded GMRs (90% CIs) for raltegravir AUC(0-), C-max and C-24 of 1.67 (1.34, 2.10), 1.16 (1.01, 1.33) and 1.26 (1.08, 1.46), respectively. There was no effect of raltegravir on serum total bilirubin. In contrast, atazanavir increased the mean bilirubin by up to 200%, an effect that was preserved in the atazanavir/raltegravir treatment group. Administration of single q.d. RAL alone and co-administered with multiple oral doses of atazanavir were generally well tolerated in healthy subjects."

According to the news editors, the research concluded: "The results show that atazanavir increased the PK exposure of raltegravir; therefore, co-administration of atazanavir with raltegravir q.d. is not recommended."

Our news journalists report that additional information may be obtained by contacting R. Krishna, Merck & Co Inc, Merck Res Labs, Kenilworth, NJ, United States. **Hematology - Blood Coagulation Factors**

**New Findings from Mie University in Blood Coagulation Factors Provides New Insights (Hypofibrinogenemia and the -Fibrinogen Thr312Ala Polymorphism may be Risk Factors for Early Pregnancy Loss)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematology - Blood Coagulation Factors. According to news reporting originating from Mie, Japan, by NewsRx correspondents, research
stated, "We analyzed a cohort of 36 females with pregnancy loss."

Our news editors obtained a quote from the research from Mie University, "In addition to 11 patients with antiphospholipid antibody syndrome and 2 patients with congenital antithrombin (AT) or protein C deficiency, we identified 5 patients with low fibrinogen levels (median 110 mg/dL) prior to 10 weeks of gestation. Four of these 5 patients underwent a fibrinogen gene analysis, and all 4 were found to be heterozygotes for the -fibrinogen (FGA) Thr321Ala polymorphism. One female without hypofibrinogenemia with a history of 8 pregnancy losses was found to be homozygous for the same polymorphism, and she also showed hypercoagulability without thrombosis."

According to the news editors, the research concluded: "There was a relatively high frequency of pregnancy loss in the setting of hypofibrinogenemia and/or the FGA Thr312Ala polymorphism, and this may be an important risk factor for pregnancy loss and a hypercoagulable state in later pregnancy."

The news editors report that additional information may be obtained by contacting H. Wada, Mie Univ, Dept. of Mol & Lab Med, Grad Sch Med, Tsu, Mie 5148507, Japan. Additional authors for this research include H. Wada, M. Ikejiri, K. Nakatani, T. Sugiyama, K. Osato, N. Murabayashi, K. Habe, H. Mizutani, T. Matsumoto, K. Ohishi and T. Ikeda.

Keywords for this news article include: Mie, Japan, Asia, Blood Coagulation Factors, Acute-Phase Proteins, Risk and Prevention, Protein Precursors, Fibrinogen, Hematology, Genetics, Mie University.

Transplant Medicine - Liver Transplants

New Findings from Misericordia University in the Area of Liver Transplants Reported (Impact of new treatment options for hepatitis C virus infection in liver transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Transplant Medicine - Liver Transplants have been presented. According to news reporting originating in Udine, Italy, by NewsRx journalists, research stated, "Liver transplant candidates and recipients with hepatitis C virus (HCV)-related liver disease greatly benefit from an effective antiviral therapy. The achievement of a sustained virological response before transplantation can prevent the recurrence of post-transplant HCV disease that occurs universally and correlates with enhanced progression to graft cirrhosis."

The news reporters obtained a quote from the research from Misericordia University, "Previous standard-of-care regimens (e.g., pegylated-interferon plus ribavirin with or without first generation protease inhibitors, boceprevir and telaprevir) displayed suboptimal results and poor tolerance in liver transplant recipients. A new class of potent direct-acting antiviral agents (DAA) characterized by all-oral regimens with minimal side effects has been approved and included in the recent guidelines for the treatment of liver transplant recipients with recurrent HCV disease. Association of sofosbuvir with ribavirin and/or ledipasvir is recommended in
liver transplant recipients and patients with decompensated cirrhosis. Other regimens include simeprevir, daclatasvir, and combination of other DAA."

According to the news reporters, the research concluded: "Possible interactions should be monitored, especially in coinfected human immunodeficiency virus/HCV patients receiving antiretrovirals."

Our news correspondents report that additional information may be obtained by contacting E. Righi, Elda Righi, Angela Londero, Alessia Carnelutti, Matteo Bassetti, Infectious Diseases Division, Santa Maria della Misericordia University Hospital, 33100 Udine, Italy. Additional authors for this research include A. Londero, A. Carnelutti, U. Baccarani and M. Bassetti.

Genetics - Medical Genetics

New Findings from Murdoch Children's Research Institute in Medical Genetics Provides New Insights (Parents' experiences with requesting carrier testing for their unaffected children)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics - Medical Genetics is now available. According to news originating from Parkville, Australia, by NewsRx correspondents, research stated, "International guidelines generally recommend delaying genetic carrier testing in children until the child reaches the age of majority or is mature enough to be involved in the decision. Several studies have shown that carrier testing of children does occur in some instances, particularly in siblings of a child affected with a genetic condition."

Our news journalists obtained a quote from the research from Murdoch Children's Research Institute, "However, little research has explored parents' experiences with the testing process, the impact of knowing a child's carrier status, and whether parents communicate carrier information to their children. Semistructured interviews were conducted with 33 parents of children who had one of three genetic conditions (cystic fibrosis, hemophilia, and Duchenne muscular dystrophy). Inductive content analysis was used to analyze the data. Eight distinct pathways to carrier testing were distinguishable. While some parents had requested testing, others had been offered testing and some had received carrier results incidentally following testing to exclude affected status. Some patents were discouraged from testing, which led to frustration. Overall, 67% of the parents had received carrier results for at least one child, and
parents were happy to have results, even if their children were carriers."

According to the news editors, the research concluded: "Despite recommendations against carrier testing, this study provides evidence of varying practices and highlights a need to review the guidelines."

For more information on this research see: Parents' experiences with requesting carrier testing for their unaffected children. Genetics in Medicine, 2016;18(12):1199-1205. ### Ebola Virus

**New Findings from Nagasaki University in the Area of Ebola Virus Reported (Deployment of a Reverse Transcription Loop-Mediated Isothermal Amplification Test for Ebola Virus Surveillance in Remote Areas in Guinea)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Ebola Virus have been published. According to news reporting originating in Nagasaki, Japan, by NewsRx journalists, research stated, "To strengthen the laboratory diagnostic capacity for Ebola virus disease (EVD) in the remote areas of Guinea, we deployed a mobile field laboratory and implemented reverse transcription loop-mediated isothermal amplification (RT-LAMP) for postmortem testing. We tested 896 oral swab specimens and 21 serum samples, using both RT-LAMP and reverse transcription-polymerase chain reaction (RT-PCR)."

Financial support for this research came from Japan Agency for Medical Research and Development.

The news reporters obtained a quote from the research from Nagasaki University, "Neither test yielded a positive result, and the results from RT-LAMP and RT-PCR were consistent. More than 95% of the samples were tested within 2 days of sample collection."

According to the news reporters, the research concluded: "These results highlight the usefulness of the RT-LAMP assay as an EVD diagnostic testing method in the field or remote areas."

Our news correspondents report that additional information may be obtained by contacting J. Yasuda, Nagasaki University, Grad Sch Biomed Sci, Nagasaki, Japan. Additional authors for this research include N. Magassouba, H.A. Bah, B. Soropogui, A. Dore, F. Kourouma, M.S. Cherif, S. Keita and J. Yasuda.

Chemistry - Cell Biochemistry

New Findings from Nanjing University Update Understanding of Cell Biochemistry [The Emerging Roles of Long Noncoding RNA ROR (lincRNA-ROR) and its Possible Mechanisms in Human Cancers]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Chemistry - Cell Biochemistry. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "To date, there is only up to 2% of protein-coding genes that are stably transcribed, whereas the vast majority are non-coding RNAs (ncRNAs). These ncRNAs, also known as non messenger RNAs (nmRNAs) or functional RNAs (fRNAs), include transfer RNAs, ribosomal RNAs, microRNAs and long non-coding RNAs (IncRNAs)."

Our news journalists obtained a quote from the research from Nanjing University, "With the advance of high-resolution microarrays and massively parallel sequencing technology, IncRNAs have gained extended attentions nowadays and are found to play important roles in tumorigenesis and progression of human cancers. Long intergenic non-protein coding RNA, regulator of reprogramming (linc-ROR), was first discovered in induced pluripotent stem cells (iPSCs), where it was controlled by the key pluripotency factors Oct4, Sox2 and Nanog. Linc-ROR has been shown to be dysregulated in many types of cancers, including breast cancer (BC), pancreatic cancer (PC), hepatocellular cancer (HCC), endometrial cancer (EC), and nasopharyngeal carcinoma (NPC). Also, linc-ROR functions as regulatory molecule in a large amount of biological processes. However, the underlying mechanisms of its contribution to carcinogenesis remain to be elucidated."

According to the news editors, the research concluded: "In this review, we will emphasize on the characteristics of linc-ROR and their roles in different types of human cancers."

The news correspondents report that additional information may be obtained from R.
Central Nervous System Diseases and Conditions…

New Findings from Nanjing University Update Understanding of Subarachnoid Hemorrhage (Increased Expression of Caspase-12 After Experimental Subarachnoid Hemorrhage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage. According to news reporting originating in Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Convincing evidences have proved that apoptosis plays a vital role in the pathogenesis of early and delayed brain injury following subarachnoid hemorrhage (SAH). Recently, a novel caspase-12-mediated apoptotic pathway has been reported to be induced by excess endoplasmic reticulum (ER) stress."

Financial supporters for this research include National Natural Science Foundation of China, Natural Science Foundation of Jiangsu Province.

The news reporters obtained a quote from the research from Nanjing University, "Extensive protein damage occurs after SAH, which may trigger ER stress-associated apoptotic pathway. Thus, we hypothesized that caspase-12, as the major molecular marker of this novel apoptotic pathway, may be activated and involved in the pathogenesis of apoptotic injury after SAH. This study sought to investigate the changes of caspase-12 expressions in both in vitro and in vivo SAH models. Western blot analysis found significantly increased protein expressions of both pro- and active forms of caspase-12 after SAH. Quantitative real-time PCR and immunohistochemistry assays confirmed elevated caspase-12 level after SAH in vivo. Further, double immunofluorescence staining revealed obvious caspase-12 over-expression in both cortical neurons and astrocytes. Moreover, immunofluorescent co-staining in vivo demonstrated that neural cells with high immunoreactivity of caspase-12 also expressed caspase-3, and dual-immunofluorescent staining for caspase-12 and TUNEL in vitro showed that TUNEL-positive cells were more likely to exhibit higher caspase-12 immunoreactivity, indicating a potential contribution of caspase-12 activation to apoptosis in SAH. Collectively, our results showed significant upregulation of caspase-12 expression after experimental SAH."

According to the news reporters, the research concluded: "These findings also offer important implications for further investigations of the therapeutic potential of caspase-12 associated apoptosis in SAH."

For more information on this research see: Increased Expression of Caspase-12

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s11064-016-2076-9. This DOI is a link to an online electronic document that is either free or for purchase.

**Eye Diseases and Conditions - Glaucoma**

**New Findings from Nanyang Technological University Describe Advances in Glaucoma (Progress in anterior chamber angle imaging for glaucoma risk prediction - A review on clinical equipment, practice and research)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Eye Diseases and Conditions - Glaucoma have been published. According to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "The visualization capabilities of various ocular imaging instruments can generally be categorized into photographic (e.g. gonioscopy, Pentacam, RetCam) and optical tomographic (e.g. optical coherence tomography (OCT), photoacoustic (PA) imaging, ultrasound biomicroscopy (UBM)) methods."

Our news editors obtained a quote from the research from Nanyang Technological University, "These imaging instruments allow vision researchers and clinicians to visualize the iridocorneal angle, and are essential in the diagnosis and management of glaucoma. Each of these imaging modalities has particular benefits and associated drawbacks in obtaining repeatable and reliable measurement in the evaluation of the angle."

According to the news editors, the research concluded: "This review article in this context summarized recent progresses in anterior chamber imaging techniques in glaucoma diagnosis and follow-up procedures."

For more information on this research see: Progress in anterior chamber angle imaging for glaucoma risk prediction - A review on clinical equipment, practice and research. *Medical Engineering & Physics*, 2016;38(12):1383-1391. *Medical Engineering & Physics* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. New Findings from National Cancer Center Hospital in the Area of Colon Cancer Described (Biomarkers of skin toxicity induced by anti-epidermal growth factor receptor antibody treatment in colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "Skin toxicity is a common symptom of anti-epidermal growth factor receptor (EGFR) antibody treatment and is also a predictive marker of its efficacy in colorectal cancer patients. However, severe skin disorders induced by such antibodies negatively impact on the quality of life of patients and decreases drug compliance during treatment."

The news reporters obtained a quote from the research from National Cancer Center Hospital, "If we can predict the high-risk group susceptible to severe skin toxicity before treatment, we can undertake the early management of any arising skin disorders and formulate a more accurate prognosis for anti-EGFR antibody treatment. Previous studies have identified molecular markers of skin toxicity induced by anti-EGFR antibody, such as EGFR polymorphisms, the expression of inflammatory chemokines and serum levels of EGFR ligands. A clinical trial was undertaken involving the escalation of cetuximab doses, guided by the grade of skin toxicity observed, such as no or low-grade, in metastatic colorectal cancer (the EVEREST study). The dose escalation of cetuximab was confirmed by a safety profile and had the tendency to achieve a higher response rate in KRAS wild-type patients."

According to the news reporters, the research concluded: "A large, prospective randomized trial is now ongoing (EVEREST 2) and the results of this trial may contribute to personalized medicine in KRAS wild-type colorectal cancer patients."

Our news correspondents report that additional information may be obtained by contacting A. Kubo, Akiko Kubo, Hironobu Hashimoto, Division of Pharmacy, National Cancer Center Hospital, Tokyo 104-0045, Japan. Additional authors for this research include H. Hashimoto, N. Takahashi and Y. Yamada.

Oncology - Cancer Research

New Findings from National Chung Hsing University Update Understanding of Cancer Research [Cdk5 Directly Targets Nuclear p21 (CIP1) and Promotes Cancer Cell Growth]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Research have been published. According to news reporting out of Taichung, Taiwan, by NewsRx editors, research stated, "The significance of Cdk5 in cell-cycle control and cancer biology has gained increased attention. Here we report the inverse correlation between the protein levels of Cdk5 and p21(CIP1) from cell-based and clinical analysis."

Our news journalists obtained a quote from the research from National Chung Hsing University, "Mechanistically, we identify that Cdk5 overexpression triggers the proteasome-dependent degradation of p21(CIP1) through a S130 phosphorylation in a Cdk2-independent manner. Besides, the evidence from cell-based and clinical analysis shows that Cdk5 primarily regulates nuclear p21(CIP1) protein degradation. S130A-p21(CIP1) mutant enables to block either its protein degradation or the increase of cancer cell growth caused by Cdk5. Notably, Cdk5-triggered p21(CIP1) targeting primarily appears in S-phase, while Cdk5 overexpression increases the activation of Cdk2 and its interaction with DNA polymerase delta. The in vivo results show that Cdk2 might play an important role in the downstream signaling to Cdk5."

According to the news editors, the research concluded: "In summary, these findings suggest that Cdk5 in a high expression status promotes cancer growth by directly and rapidly releasing p21(CIP1)-dependent cell-cycle inhibition and subsequent Cdk2 activation, which illustrates an oncogenic role of Cdk5 potentially applied for future diagnosis and therapy."

For more information on this research see: Cdk5 Directly Targets Nuclear p21 (CIP1) and Promotes Cancer Cell Growth. Cancer Research, 2016;76(23):6888-6900. Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. New Findings from National Hospital Organization Describe Advances in Hypertension (Rapid and high-dose titration of epoprostenol improves pulmonary hemodynamics and clinical outcomes in patients with idiopathic and heritable pulmonary arterial hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating from Okayama, Japan, by NewsRx correspondents, research stated, "Intravenous epoprostenol is an effective treatment for idiopathic and heritable pulmonary arterial hypertension. We aimed to clarify factors that determine the survival of patients with severe pulmonary hypertension who received epoprostenol treatment."

Our news editors obtained a quote from the research from National Hospital Organization, "This is a retrospective observational study consisting of 46 patients with idiopathic and heritable pulmonary arterial hypertension in World Health Organization (WHO) functional class III or IV and undergoing intravenous epoprostenol treatment. We compared the following factors between survivors and non-survivors: clinical characteristics, exercise capacity, hemodynamics, interval between diagnosis and treatment initiation, concomitant pulmonary arterial hypertension-targeted drugs, maximum dose of epoprostenol, and the speed of up-titration. We defined a rapid increase group as those receiving epoprostenol >= 20 ng/kg/min at 3 months and >= 45 ng/kg/min at 1 year of treatment. Thirty-two patients (70%) survived and 14 patients died during an average follow-up period of 2100 days. Mean pulmonary artery pressure, concomitant pulmonary arterial hypertension-targeted drugs, and the maximum epoprostenol dose were comparable between the two subsets of patients. WHO functional class III was more common than class IV, and the 6-min walking distance was longer in the survivor than the non-survivor group. The survivors typically showed a rapid increase in epoprostenol dose during the first year of treatment. This rapid increase group was associated with a continuous reduction in mean pulmonary artery pressure during the follow-up period, whereas the slow increase group showed no reduction in mean pulmonary artery pressure after 6 months of treatment. The 9.5-year survival rate was also significantly better in the rapid increase group compared with the slow increase group (100% vs. 64%, p = 0.022)."

According to the news editors, the research concluded: "In idiopathic and heritable pulmonary arterial hypertension patients, a rapid increase in epoprostenol dose soon after the initiation of treatment seems to be important to achieve a continuous reduction in mean pulmonary artery pressure and to improve survival."

For more information on this research see: Rapid and high-dose titration of epoprostenol improves pulmonary hemodynamics and clinical outcomes in patients with idiopathic and heritable pulmonary arterial hypertension. *Journal of Cardiology*, 2016;68(5-6):542-547. *Journal of Cardiology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Cardiology - www.journals.elsevier.com/journal-of-cardiology/)

Hormones - Gonadal Hormones

New Findings from National Institutes of Health Describe Advances in Gonadal Hormones (Immunoregulation by members of the TGF beta superfamily)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hormones - Gonadal Hormones have been published. According to news reporting originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "The transforming growth factor-beta (TGF beta) superfamily is encoded by 33 genes and includes TGF beta, bone morphogenetic proteins (BMPs) and activins."

Our news editors obtained a quote from the research from the National Institutes of Health, "Although TGF beta is well recognized as a crucial regulator of immune responses, the immunoregulatory functions of other TGF beta family members are less clear. However, recent evidence suggests that BMPs and activins have important roles in regulating immune responses."

According to the news editors, the research concluded: "In this Review, we briefly outline the signalling pathways of the TGF beta superfamily and discuss new insights into the immunoregulatory functions of BMPs and activins in the context of infection, inflammation and cancer."

The news editors report that additional information may be obtained by contacting W.J. Chen, Natl Inst Dental & Craniofacial Res, Mucosal Immunol Sect, National Institutes of Health, Bethesda, MD 20892, United States.

New Findings from National Institutes of Health Update Understanding of Pharmacogenomics (Pharmacogenomic incidental findings in 308 families: The NIH Undiagnosed Diseases Program experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biotechnology - Pharmacogenomics have been published. According to news reporting out of Bethesda, Maryland, by NewsRx editors, research stated, "Using single-nucleotide polymorphism (SNP) chip and exome sequence data from individuals participating in the National Institutes of Health (NIH) Undiagnosed Diseases Program (UDP), we evaluated the number and therapeutic informativeness of incidental pharmacogenetic variants. Pharmacogenomics Knowledgebase (PharmGKB) annotated sequence variants were identified in 1,101 individuals."

Our news journalists obtained a quote from the research from the National Institutes of Health, "Medication records of participants were used to identify individuals prescribed medications with a genetic variant that might alter efficacy. A total of 395 sequence variants, including 19 PharmGKB 1A and 1B variants, were identified in SNP chip sequence data, and 388 variants, including 21 PharmGKB 1A and 1B variants, were identified in the exome sequence data. Nine participants had incidental pharmacogenetic variants associated with altered efficacy of a prescribed medication. Despite the small size of the NIH UDP patient cohort, we identified pharmacogenetic incidental findings potentially useful for guiding therapy."

According to the news editors, the research concluded: "Consequently, groups conducting clinical genomic studies might consider reporting of pharmacogenetic incidental findings."

For more information on this research see: Pharmacogenomic incidental findings in 308 families: The NIH Undiagnosed Diseases Program experience. Genetics in Medicine, 2016;18(12):1303-1307. **Mouth Diseases and Conditions - Stomatitis**

**New Findings from National Institutes of Health in Stomatitis Provides New Insights (Efficacy of Vesicular Stomatitis Virus-Ebola Virus Postexposure Treatment in Rhesus Macaques Infected With Ebola Virus Makona)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mouth Diseases and Conditions - Stomatitis are presented in a new report. According to news reporting originating in Hamilton, Montana, by NewsRx journalists, research stated, "The Ebola virus (EBOV) epidemic in West Africa increased the focus on vaccine development against this hemorrhagic fever-causing pathogen, and as a consequence human clinical trials for a few selected platforms were accelerated. One of these vaccines is vesicular stomatitis virus (VSV)-EBOV, also known as rVSV-ZEBOV, a fast-acting vaccine against EBOV and so far the only vaccine with reported efficacy against EBOV infections in humans in phase III clinical trials."

The news reporters obtained a quote from the research from the National Institutes of Health, "In this study, we analyzed the potential of VSV-EBOV for postexposure treatment of rhesus macaques infected with EBOV-Makona. We treated groups of animals with 1 dose of VSV-EBOV either in a single injection at 1 or 24 hours after EBOV exposure or with 2 injections, half the dose at each time point; 1 control group received the same dose of the VSV-based Marburg virus vaccine at both time points; another group remained untreated. Although all untreated animals succumbed to EBOV infection, 33%-67% of the animals in each treatment group survived the infection, including the group treated with the VSV-based Marburg virus vaccine. This result suggests that protection from postexposure vaccination may be antigen unspecific and due rather to an early activation of the innate immune system."

According to the news reporters, the research concluded: "VSV-EBOV remains a potent and fast-acting prophylactic vaccine but demonstrates only limited efficacy in postexposure treatment."

Our news correspondents report that additional information may be obtained by contacting A. Marzi, NIAID, Lab Virol, Rocky Mt Labs, National Institutes of Health, Hamilton, MT, United States. Additional authors for this research include P.W. Hanley, E. Haddock, C. Martellaro, G. Kobinger and H. Feldmann.

**Gram-Positive Bacteria - Enterococcus faecium**

**New Findings from National Taiwan University in the Area of Enterococcus faecium Reported (Novel Structure of Enterococcus faecium-Originated ermB-Positive Tn1546-Like Element in Staphylococcus aureus)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Positive Bacteria - Enterococcus faecium. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "We determined the resistance determinants in 274 erythromycin-resistant methicillin-susceptible Staphylococcus aureus (MSSA) isolates during a 13-year period, 2000 to 2012. The resistance phenotypes, inducible macrolide-lincosamide-streptogramin (iMLS), constitutive MLS (cMLS), and macrolide-streptogramin (MS) resistance phenotypes, were examined by a double-disk diffusion D test."

The news reporters obtained a quote from the research from National Taiwan University, "The ermB gene was more frequent (35%; 97/274) than ermC (27%; 75/274) or ermA (21%; 58/274). All 97 ermB-positive isolates harbored Tn551 and IS1216V. The majority (89/97) of ermB-positive isolates displayed the cMLS phenotype and carried mobile element structure (MES)-like structures, which has been previously reported in sequence type 59 (ST59) methicillin-resistant S. aureus (MRSA). The remaining 8 ermB-carrying isolates, belonging to ST7 (n = 4), ST5 (n = 3), and ST59 (n = 1), were sasK intact and did not carry MES-like structures. Unlike a MES-like structure that was located on the chromosome, the ermB elements on sasK-intact isolates were located on plasmids by S1 nuclease pulsed-field gel electrophoresis (PFGE) analysis and conjugation tests. Sequence data for the ermB-containing region (14,566 bp) from ST59 NTUH_3874 revealed that the best match was a Tn1546-like element in plasmid pMCCL2 DNA (GenBank accession number AP009486) of Macrococcus caseolyticus. Tn1546 is recognized as an enterococcal transposon and was known from the vancomycin resistance gene cluster in vancomycin-resistant Enterococcus (VRE). So far, acquisitions of Tn1546 in S. aureus have occurred in clonal complex 5 (CC5) MRSA, but not in MSSA."

According to the news reporters, the research concluded: "This is the first report that MSSA harbors an Enterococcus faecium-originated ermB-positive Tn1546-like element located on a plasmid."

Our news correspondents report that additional information may be obtained by contacting L.J. Teng, National Taiwan University, Dept. of Lab Med, Taipei, Taiwan. Additional authors for this research include W.C. Hung, J.C. Tsai, Y.T. Lin, H. Lee, P.R. Hsueh, T.F. Lee and L.J. Teng.

Hormones - Estradiol Congeners

New Findings from National University in the Area of Estradiol Congeners Described (Role of Estradiol in the Regulation of Prolactin Secretion During Late Pregnancy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hormones - Estradiol Congeners are presented in a new report. According to news reporting out of Mendoza, Argentina, by NewsRx editors, research stated, "Estrogen action is necessary for evidencing the stimulatory action of mifepristone and naloxone on prolactin (PRL) secretion during late pregnancy. Our aim is to determine the mechanism mediating this facilitator action of estrogens."

Funders for this research include Universidad Nacional de Cuyo, CONICET.

Our news journalists obtained a quote from the research from National University, "To investigate the hypothalamic mechanisms involved in estrogen actions in PRL secretion at the end of pregnancy, we measured the effect of pretreatment with the estrogen antagonist tamoxifen on the expression of tyrosine hydroxylase (TH), hormone receptors (ER alpha and beta, PRs, PRLR(long)), and mu- and kappa- opioid receptors (ORs) at mRNA (by semiquantitative RT-PCR) and protein (by western blot for TH, PRLR(long), ER alpha, PRs, mu- and ORs) levels in extracts of medial basal hypothalamus (MBH) and serum PRL, E-2 and P-4 levels (by RIA) in mifepristone- and naloxone-treated rats. Tamoxifen administration partially prevented PRL release induced by the combined treatment. TH expression diminished and ER alpha expression increased in mifepristone-treated rats at mRNA and protein levels and tamoxifen partially prevented these changes with no effect on PRs expression. Mifepristone increased PRLR(long) mRNA levels; this increase was blocked by tamoxifen. Combined tamoxifen and mifepristone treatment decreased mu- and k-ORs mRNA but not protein levels."

According to the news editors, the research concluded: "E-2 induces neuroadaptive mechanisms necessary to facilitate PRL release preceding delivery. Acting through ER alpha, E-2 modulates hypothalamic dopaminergic neurons activity, regulating TH, mu- and kappa-ORs and PRLR(long) expression, and is necessary for evidencing the effects of P-4 withdrawal. Its presence on days 14 and 15 of pregnancy is crucial to facilitate the opioid system modulation of PRL secretion at the end of pregnancy in the rat."

For more information on this research see: Role of Estradiol in the Regulation of Prolactin Secretion During Late Pregnancy. *Neurochemical Research*, 2016;41(12):3344-3355. *Neurochemical Research* can be contacted at: Springer, Plenum Publishers, 233 Spring St, New York, NY 10013, USA. Musculoskeletal Diseases and Conditions …

New Findings from Ningxia Medical University in the Area of Osteoarthritis Reported (Sclerostin expression in the subchondral bone of patients with knee osteoarthritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Osteoarthritis have been published. According to news reporting originating in Ningxia, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to assess the expression of -catenin, transcription factor-4 (TCF-4) and sclerostin in the subchondral bone of patients with primary knee osteoarthritis (OA). Tibial plateau specimens from patients with OA who underwent total knee arthroplasty were classified into the early stage (n=15), intermediate stage (n=13) and late stage (n=17) groups using the Mankin score."

The news reporters obtained a quote from the research from Ningxia Medical University, "Structural parameters, including total articular cartilage (TAC), subchondral bone plate (SCP) thickness and trabecular bone volume (BV/TV), were assessed using Image-Pro Plus 6.0 analysis software. Subsequently, -catenin and sclerostin expression levels in subchondral bone were determined by immunohistochemistry. In addition, the mRNA and protein levels of -catenin, TCF-4 and sclerostin were evaluated by RT-qPCR and western blot analysis, respectively. As regards the cartilage and subchondral bone structural parameters, TAC was reduced, while SCP thickness and BV/TV were increased due to OA, with significant differences observed among the different stages (all P<0.05). The results of immunohistochemistry revealed that the -catenin levels in the intermediate- and late-stage samples were significantly increased, while the levels of sclerostin were markedly decreased compared with the values in the early-stage samples (all P<0.05). Compared with the intermediate-stage samples, the sclerostin levels were decreased, and SCP thickness and the -catenin levels were increased in the late-stage samples (all P<0.05). The results of RT-qPCR and western blot analysis revealed that the -catenin and TCF-4 mRNA and protein levels in the intermediate- and late-stage samples were significantly increased, while sclerostin expression was significantly decreased compared with the early-stage samples; a similar trend was observed between the intermediate- and late-stage samples (all P<0.05). Finally, the -catenin and TCF-4 levels positively correlated with the Mankin scores, while there was a negative correlation with sclerostin expression."

According to the news reporters, the research concluded: "Our findings demonstrate that sclerostin expression is closely associated with the degree of joint damage in patients with OA, confirming its involvement in the development of OA."

For more information on this research see: Sclerostin expression in the subchondral bone of patients with knee osteoarthritis. International Journal of Molecular Medicine, 2016;38 (5):1395-1402. International Journal of Molecular Medicine can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

Oncology - Mullerian Adenosarcoma

New Findings from Northwestern University in the Area of Mullerian Adenosarcoma Described (Survival of women with Mullerian adenosarcoma: A National Cancer Data Base study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Mullerian Adenosarcoma are presented in a new report. According to news originating from Chicago, Illinois, by NewsRx correspondents, research stated, "To determine overall survival (OS) and factors associated with OS of women with Mullerian adenosarcoma. Women with adenosarcoma of the uterus, cervix or ovary (n = 2205) were identified from the 1998-2011 National Cancer Data Base."

Financial support for this research came from Northwestern University.

Our news journalists obtained a quote from the research from Northwestern University, "Kaplan-Meier and multivariate Cox proportional-hazards survival analyses were performed to test for associations of potential explanatory variables with OS. A subset analysis of women with uterine adenosarcoma was also performed. Analyzed confounders included age, insurance status, income, race, surgical margin status, nodal and distant metastasis, surgical procedure type, and treatment with radiation and/or chemotherapy. Primary sites were uterus (n = 1884), cervix (n = 229) and ovary (n = 92), representing 0.43% of uterine, 0.16% of cervical, and 0.04% of ovarian cancers in the NCDB. Only 36/1176 (3.1%) and 2.5% (33/1,342) had nodal and/or distant metastasis, respectively, at diagnosis. Distant metastasis, positive surgical margin, increased age, higher composite comorbidity score and adjuvant radiotherapy were independently associated with decreased OS. Primary site, lymph node status, surgical procedure, chemotherapy use, race, insurance status and income quartiles were not significantly associated with OS. Each 1 cm increase in tumor size was associated with increased hazard for death (HR (95% CI) 1.06 (1.01-1.12), p = 0.018) among women with uterine adenosarcoma. Complete surgical resection remains the only treatment with well-evidenced OS benefit among women with Mullerian adenosarcoma."

According to the news editors, the research concluded: "Early surgical resection may increase survival of Mullerian adenosarcoma."

For more information on this research see: Survival of women with Mullerian adenosarcoma: A National Cancer Data Base study. Gynecologic Oncology, 2016;143(3):636-641. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Gynecologic Oncology - www.journals.elsevier.com/gynecologic-oncology/)

The news correspondents report that additional information may be obtained from
New Findings from Norwegian University of Science and Technology (NTNU) in the Area of Atopic Dermatitis Reported (Human Breast Milk miRNA, Maternal Probiotic Supplementation and Atopic Dermatitis in Offspring)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Skin Diseases and Conditions - Atopic Dermatitis have been published. According to news reporting originating in Trondheim, Norway, by NewsRx journalists, research stated, "Perinatal probiotic ingestion has been shown to prevent atopic dermatitis (AD) in infancy in a number of randomised trials. The Probiotics in the Prevention of Allergy among Children in Trondheim (ProPACT) trial involved a probiotic supplementation regime given solely to mothers in the perinatal period and demonstrated a ~40% relative risk reduction in the cumulative incidence of AD at 2 years of age."

The news reporters obtained a quote from the research from the Norwegian University of Science and Technology (NTNU), "However, the mechanisms behind this effect are incompletely understood. Micro-RNAs (miRNA) are abundant in mammalian milk and may influence the developing gastrointestinal and immune systems of newborn infants. The objectives of this study were to describe the miRNA profile of human breast milk, and to investigate breast milk miRNAs as possible mediators of the observed preventative effect of probiotics. Small RNA sequencing was conducted on samples collected 3 months postpartum from 54 women participating in the ProPACT trial. Differential expression of miRNA was assessed for the probiotic vs placebo and AD vs non-AD groups. The results were further analysed using functional prediction techniques. Human breast milk samples contain a relatively stable core group of highly expressed miRNAs, including miR-148a-3p, miR-22-3p, miR-30d-5p, let-7b-5p and miR-200a-3p. Functional analysis of these miRNAs revealed enrichment in a broad range of biological processes and molecular functions. Although several miRNAs were found to be differentially expressed on comparison of the probiotic vs placebo and AD vs non-AD groups, none had an acceptable false discovery rate and their biological significance in the development of AD is not immediately apparent from their predicted functional consequences."

According to the news reporters, the research concluded: "Whilst breast milk miRNAs have the potential to be active in a diverse range of tissues and biological process, individual miRNAs in breast milk 3 months postpartum are unlikely to play a major role in the prevention of atopic dermatitis in infancy by probiotics ingestion in the perinatal period."

Our news correspondents report that additional information may be obtained by contacting M.R. Simpson, Dept. of Public Health and General Practice, Norwegian University of Science and Technology, Trondheim, Norway. Additional authors for this research include G. Brede, J. Johansen, R. Johnsen, O. Storro, P. Satrom and T. 0ien.

Mosquito-Borne Diseases - Zika Virus

**New Findings from Novartis Institute for Biomedical Research Describe Advances in Zika Virus (Genetic Ablation of AXL Does Not Protect Human Neural Progenitor Cells and Cerebral Organoids from Zika Virus Infection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mosquito-Borne Diseases - Zika Virus have been published. According to news reporting out of Cambridge, Massachusetts, by NewsRx editors, research stated, "Zika virus (ZIKV) can cross the placental barrier, resulting in infection of the fetal brain and neurological defects including microcephaly. The cellular tropism of ZIKV and the identity of attachment factors used by the virus to gain access to key cell types involved in pathogenesis are under intense investigation."

Funders for this research include Stanley Center for Psychiatric Research, Harvard Stem Cell Institute.

Our news journalists obtained a quote from the research from Novartis Institute for Biomedical Research, "Initial studies suggested that ZIKV preferentially targets neural progenitor cells (NPCs), providing an explanation for the developmental phenotypes observed in some pregnancies. The AXL protein has been nominated as a key attachment factor for ZIKV in several cell types including NPCs. However, here we show that genetic ablation of AXL has no effect on ZIKV entry or ZIKV-mediated cell death in human induced pluripotent stem cell (iPSC)-derived NPCs or cerebral organoids."

According to the news editors, the research concluded: "These findings call into question the utility of AXL inhibitors for preventing birth defects after infection and suggest that further studies of viral attachment factors in NPCs are needed."

New Findings from Obafemi Awolowo University in the Area of Malaria Reported [Evaluation of the combination of Uvaria chamae (P. Beauv.) and amodiaquine in murine malaria]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mosquito-Borne Diseases - Malaria. According to news reporting out of Ife, Nigeria, by NewsRx editors, research stated, "Ethnopharmacological relevance: The leaf and fruit of Uvaria chamae P. Beauv (Annonaceae) are used in antimalarial ethnomedical preparations. Therefore, they were investigated for antimalarial activities as well as possible herb-drug interaction with amodiaquine (AQ)."

Financial support for this research came from University of Ibadan.

Our news journalists obtained a quote from the research from Obafemi Awolowo University. "The methanol extracts of the leaf (UCL) and fruit (UCF) were administered orally at 100-800 mg/kg/day in mice infected with chloroquine (CQ)-sensitive Plasmodium berghei NK65 using the four-day, curative and prophylactic antimalarial test models. The UCL was further evaluated at 100-800 mg/kg as twice-daily doses and combinations of UCL+AQ using the four-day test. Mice infected with CQ-resistant P. berghei ANKA were treated with UCL at 400 mg/kg and AQ at 10 mg/kg [UCL400+AQ10] mg/kg in the four-day and curative test models. At 800 mg/kg/day, UCL, UCF gave chemosuppression of 42, 28% (four-day test), parasite clearance of 36.3, 49.5% on day 5 (curative test) and 64.3, 82.6% (prophylactic test), respectively. The twice-daily dose of UCL at 800 mg/kg showed activity of 51.50% while the combination of [UCL200-FAQ5] mg/kg exhibited chemosuppression of 91.66%, which was not significantly different (p > 0.05) from AQ at 10 mg/kg (85.41%). In the CQ-resistant P. berghei experiment, the combination gave a chemosuppression of 45.80%, significantly lower (p < 0.05) than AQ (78.40%) while the parasite clearance was not significantly different from AQ (curative test). The leaf extract showed moderate chemosuppressive activity. The lower-dose combination of the leaf extract and amodiaquine had better antimalarial activity in CQ-sensitive murine malaria."

According to the news editors, the research concluded: "However, the tested combination had no beneficial antimalarial effect in CQ-resistant murine malaria."

Our news journalists report that additional information may be obtained by contacting A.O. Adepiti, Obafemi Awolowo University, Dept. of Pharmacognosy, Ife, Nigeria.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jep.2016.07.035. This DOI is a link to an online electronic document that is either free or for purchase.

**New Findings from Okayama University Graduate School of Medicine Yields New Data on Diabetic Nephropathy (Innate immunity in diabetes and diabetic nephropathy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Diabetic Nephropathy are presented in a new report. According to news reporting originating from Okayama, Japan, by NewsRx correspondents, research stated, "The innate immune system includes several classes of pattern recognition receptors (PRRs), including membrane-bound Toll-like receptors (TLRs) and nucleotide-binding oligomerization domain (NOD)-like receptors (NLRs). These receptors detect pathogen-associated molecular patterns (PAMPs) and danger-associated molecular patterns (DAMPs) in the extracellular and intracellular space."

Our news editors obtained a quote from the research from the Okayama University Graduate School of Medicine, "Intracellular NLRs constitute inflammasomes, which activate and release caspase-1, IL-1b, and IL-18 thereby initiating an inflammatory response. Systemic and local low-grade inflammation and release of proinflammatory cytokines are implicated in the development and progression of diabetes mellitus and diabetic nephropathy. TLR2, TLR4, and the NLRP3 inflammasome can induce the production of various proinflammatory cytokines and are critically involved in inflammatory responses in pancreatic islets, and in adipose, liver and kidney tissues. This Review describes how innate immune system-driven inflammatory processes can lead to apoptosis, tissue fibrosis, and organ dysfunction resulting in insulin resistance, impaired insulin secretion, and renal failure."

According to the news editors, the research concluded: "We propose that careful targeting of TLR2, TLR4, and NLRP3 signalling pathways could be beneficial for the treatment of diabetes mellitus and diabetic nephropathy."

The news editors report that additional information may be obtained by contacting J. Wada, Dept. of Nephrology, Rheumatology, Endocrinology and Metabolism, Okayama University Graduate School of Medicine, Dentistry and Pharmaceutical Sciences, 2-5-1 Shikata-cho, Kita-ku, Okayama 700-8558, Japan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrneph.2015.175. This DOI is a link to an online electronic document that is either free or for purchase.

**Musculoskeletal Diseases and Conditions - Hand-and-Foot Syndrome**

**New Findings from Osaka University Hospital in Hand-and-Foot Syndrome Provides New Insights (Hemoglobin Value Is the Most Important Factor in the Development of Hand-Foot Syndrome under the Capecitabine Regimen)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Musculoskeletal Diseases and Conditions - Hand-and-Foot Syndrome is the subject of a report. According to news reporting from Osaka, Japan, by NewsRx journalists, research stated, "Hand-foot syndrome (HFS) is a common side effect that has a high occurrence rate with capecitabine (Cape) chemotherapy. However, little is known about the risk factors of developing HFS under the Cape regimen."

The news correspondents obtained a quote from the research from Osaka University Hospital, "Our aim was to examine these risk factors. A univariate analysis was used to determine the risk factors associated with developing HFS, and we calculated the effect sizes between the patients who developed HFS compared to those who did not. Of the 52 patients enrolled in our research, 24 (46.2%) developed HFS. This group was significantly associated with hemoglobin (Hb) values (p < 0.001), and the effect size (1.21) was more than moderate. The receiver operating characteristic curve analysis confirmed 12 mg/dl Hb as the best diagnostic cut-off value for developing HFS. The sensitivity and specificity were 75.5 and 88.2%, respectively. Patients who had Hb values of 12 or below who developed HFS had longer median times without HFS compared to patients with high Hb values (115 vs. 75 days, p = 0.30, hazard ratio = 1.42, 95% CI 0.73-2.76) and a greater area under the Kaplan-Meier curves (p < 0.05)."

According to the news reporters, the research concluded: "This research suggests that the Hb value is an important factor for developing HFS."

New Findings from P. Adamson and Co-Authors Describe Advances in Angiogenic Proteins (Single ocular injection of a sustained-release anti-VEGF delivers 6 months pharmacokinetics and efficacy in a primate laser CNV model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Intercellular Signaling Peptides and Proteins - Angiogenic Proteins. According to news reporting out of Herts, United Kingdom, by NewsRx editors, research stated, "A potent anti-vascular endothelial growth factor (VEGF) biologic and a compatible delivery system were co-evaluated for protection against wet age-related macular degeneration (AMD) over a 6 month period following a single intravitreal (IVT) injection. The anti-VEGF molecule is dimeric, containing two different anti-VEGF domain antibodies (dAb) attached to a human IgG1 Fc region: a dual dAb."

Our news journalists obtained a quote from the research, "The delivery system is based on microparticles of PolyActive™ hydrogel co-polymer. The molecule was evaluated both in vitro for potency against VEGF and in ocular VEGF-driven efficacy models in vivo. The dual dAb is highly potent, showing a lower IC50 than aflibercept in VEGF receptor binding assays (RBAs) and retaining activity upon release from microparticles over 12 months in vitro. Microparticles released functional dual dAb in rabbit and primate eyes over 6 months at sufficient levels to protect Cynomolgus against laser-induced grade IV choroidal neovascularisation (CNV). This demonstrates proof of concept for delivery of an anti-VEGF molecule within a sustained-release system, showing protection in a preclinical primate model of wet AMD over 6 months."

According to the news editors, the research concluded: "Polymer breakdown and movement of microparticles in the eye may limit development of particle-based approaches for sustained release after IVT injection."

For more information on this research see: Single ocular injection of a sustained-release anti-VEGF delivers 6 months pharmacokinetics and efficacy in a primate laser CNV model. Journal of Controlled Release, 2016;244():1-13. Journal of Controlled Release can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Controlled Release - www.journals.elsevier.com/journal-of-controlled-release/)

Oncology - Cancer Research

New Findings from P. Soubeyran and Co-Researchers in the Area of Cancer Research Described (Role of geriatric intervention in the treatment of older patients with cancer: rationale and design of a phase III multicenter trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Cancer Research are presented in a new report. According to news reporting originating from Bordeaux, France, by NewsRx correspondents, research stated, "In the general geriatric population, programs linking geriatric evaluation with interventions are effective for improving functional status and survival of the patients. Whether or not these interventions improve health related quality of life (HRQoL) or overall survival (OS) in older patients with cancer is not yet clear."

Our news editors obtained a quote from the research, "Indeed, randomized data on the effect of such interventions on survival and HRQoL are rare and conflicting. We describe the rationale and design of a phase III multicenter trial aimed at assessing the efficacy of geriatric intervention in the management of elderly patients with cancer. Approximately 1200 patients, 70 years and older, considered in need of a geriatric intervention based on the G8 screening tool will be randomized into two intervention arms. The 'Usual-care' arm involves standard oncological care based on pre-defined oncological protocols. In addition to the standard oncological care, the management' arm involves a multidimensional geriatric assessment and interventions tailored for the patient. Efficacy will be assessed using a co-primary endpoint encompassing OS and HRQoL."

According to the news editors, the research concluded: "This trial has been designed to assess whether focused geriatric case management can either improve OS or HRQoL in elderly cancer patients considered in need of geriatric assessment."

For more information on this research see: Role of geriatric intervention in the treatment of older patients with cancer: rationale and design of a phase III multicenter trial. *BMC Cancer*, 2016;16():34-44. *BMC Cancer* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. (BioMed Central - www.biomedcentral.com/; BMC Cancer - www.biomedcentral.com/bmcancer/)

The news editors report that additional information may be obtained by contacting P. Soubeyran, Inst Bergonie, Center Comprehens Canc, Medical Oncol, F-33076 Bordeaux, France. New Findings from Palmer College of Chiropractic in the Area of Complementary and Alternative Medicine Reported (Antinociceptive Effects of Spinal Manipulative Therapy on Nociceptive Behavior of Adult Rats during the Formalin Test)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Complementary and Alternative Medicine. According to news reporting originating in Davenport, Iowa, by NewsRx journalists, research stated, "Optimizing pain relief resulting from spinal manipulative therapies, including low velocity variable amplitude spinal manipulation (LVVA-SM), requires determining their mechanisms. Pain models that incorporate simulated spinal manipulative therapy treatments are needed for these studies."

Financial support for this research came from National Center for Research Resources.

The news reporters obtained a quote from the research from the Palmer College of Chiropractic, "The antinociceptive effects of a single LVVA-SM treatment on rat nociceptive behavior during the commonly used formalin test were investigated. Dilute formalin was injected subcutaneously into a plantar hindpaw. Licking behavior was video-recorded for 5 minutes. Ten minutes of LVVA-SM at 20° flexion was administered with a custom-made device at the lumbar (L5) vertebra of isoflurane-anesthetized experimental rats (n=12) beginning 10 minutes after formalin injection. Hindpaw licking was video-recorded for 60 minutes beginning 5 minutes after LVVA-SM. Control rats (n=12) underwent the same methods except for LVVA-SM. The mean times spent licking the formalin-injected hindpaw of both groups 1-5 minutes after injection were not different. The mean licking time during the first 20 minutes post-LVVA-SM of experimental rats was significantly less than that of control rats (p <0.001). The mean licking times of both groups during the second and third 20 minutes post-LVVA-SM were not different. Administration of LVVA-SM had a short-term, remote antinociceptive effect similar to clinical findings."

According to the news reporters, the research concluded: "Therefore, mechanistic investigations using this experimental approach are warranted."

Our news correspondents report that additional information may be obtained by contacting S.M. Onifer, Palmer Center for Chiropractic Research, Palmer College of Chiropractic, 741 Brady Street, Davenport, IA 52803-5214, United States. Additional authors for this research include W.R. Reed, R.S. Sozio and C.R Long.

**Oncology - Carcinoma Ex Pleomorphic Adenoma**

**New Findings from Peking University Describe Advances in Carcinoma Ex Pleomorphic Adenoma (Carcinoma Ex Pleomorphic Adenoma: Is It a High-Grade Malignancy?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Carcinoma Ex Pleomorphic Adenoma is now available. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The objective of this study was to investigate the clinicopathologic features of carcinoma ex pleomorphic adenoma (CXPA) and comprehensively improve an understanding of this disease. This retrospective study investigated 151 cases of histologically confirmed CXPA."

Our news editors obtained a quote from the research from Peking University, "Disease-specific survival, local recurrence, and regional and distant metastases were analyzed. Most cases were classed as frankly invasive CXPA (135 of 151). More than half these cases (73 of 135; 54.1%) developed local recurrence; 25 (18.5%) developed cervical metastasis; 21 (15.6%) developed distant metastasis; and 60 patients (55.6%) died during follow-up. In contrast, only 1 patient in the noninvasive CXPA group (n = 10) died after treatment for lung metastasis and 1 patient developed cervical metastasis. Similarly, only 1 patient in the minimally invasive CXPA group (n = 6) died of lung metastasis and the remaining 5 patients had an uneventful recovery after treatment. Frankly invasive CXPA was a high-grade malignancy with an unfavorable prognosis. Elective neck dissection should be performed in cases of frankly invasive CXPA that originate in the submandibular gland."

According to the news editors, the research concluded: "Patients with minimally invasive and noninvasive CXPA should be followed closely after primary treatment because regional or distant metastasis can occur."

The news editors report that additional information may be obtained by contacting X. Peng, Peking University, Sch & Hosp Stomatol, Dept. of Oral & Maxillofacial Surg, Beijing,

Restenosis

New Findings from Peking University People's Hospital Describe Advances in Restenosis (Open and Endovascular Treatment of Trans-Atlantic Inter-Society Consensus II D Aortoiliac Occlusive Lesions: What Determines the Rate of Restenosis?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Restenosis are presented in a new report. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Open surgery is the preferred approach for the treatment of type D lesions according to the Trans-Atlantic Inter-Society Consensus (TASC) II guideline, but endovascular solutions also appear to be a valid option in selected patients. The study aimed to identify the risk factors of restenosis after open and endovascular reconstruction of symptomatic TASC II D aortoiliac occlusive lesions (AIOLs)."

Our news editors obtained a quote from the research from Peking University People's Hospital, "Fifty-six patients (82 limbs) who underwent open repair and endovascular treatment (ET) for symptomatic TASC II D AIOLs between March 2005 and December 2012 were retrospectively reviewed. Baseline characteristics, preoperative and postoperative imaging, and operation procedure reports were reviewed and analyzed. Restenosis after revascularization was assessed by duplex ultrasound or computed tomography angiogram. Kaplan-Meier survival analysis, Log-rank test, and multivariate Cox regression were used to evaluate the relevance between risk factors and patency. The mean duration of follow-up was 42.8 ± 23.5 months (ranging from 3 to 90 months). Primary patency rates at 1-, 3-, 5-, and 7-year were 93.6%, 89.3%, 87.0%, and 70.3%, respectively. Restenosis after revascularization occurred in 11 limbs. Kaplan-Meier survival analysis and the Log-rank test revealed that diabetes, Rutherford classification (≥5 th) and concurrent femoropopliteal TASC II type C/D lesions were significantly related to the duration of primary patency. According to the result of Cox regression, diabetes and femoropopliteal TASC II type C/D lesions were identified as the risk factors for restenosis after revascularization."

According to the news editors, the research concluded: "This study demonstrated that diabetes and femoropopliteal TASC II type C/D lesions are risk factors associated with restenosis after open and ET of TASC II D AIOLs."

For more information on this research see: Open and Endovascular Treatment of Trans-Atlantic Inter-Society Consensus II D Aortoiliac Occlusive Lesions: What Determines the Rate of Restenosis? Chinese Medical Journal, 2015;128(22):3035-42. Chinese Medical Journal
Physiology - Applied Physiology

New Findings from Penn State Heart and Vascular Institute in Applied Physiology Provides New Insights (Whole body heat stress attenuates the pressure response to muscle metaboreceptor stimulation in humans)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Physiology - Applied Physiology have been published. According to news reporting out of Hershey, Pennsylvania, by NewsRx editors, research stated, "The effects of whole body heat stress on sympathetic and cardiovascular responses to stimulation of muscle metaboreceptors and mechanoreceptors remains unclear. We examined the muscle sympathetic nerve activity (MSNA), blood pressure, and heart rate in 14 young healthy subjects during fatiguing isometric handgrip exercise, postexercise circulatory occlusion (PECO), and passive muscle stretch during PECO."

Funders for this research include American Heart Association (AHA), HHS | NIH | National Heart, Lung, and Blood Institute (NHBLI), HHS | NIH | National Center for Advancing Translational Sciences (NCATS).

Our news journalists obtained a quote from the research from Penn State Heart and Vascular Institute, "The protocol was performed under normothermic and whole body heat stress (increase internal temperature similar to 0.6 degrees C via a heating suit) conditions. Heat stress increased the resting MSNA and heart rate. Heat stress did not alter the mean blood pressure (MAP), heart rate, and MSNA responses (i.e., changes) to fatiguing exercise. During PECO, whole body heat stress accentuated the heart rate response [change (Delta) of 5.8 +/- 1.5 to Delta 10.0 +/- 2.1 beats/min, P = 0.03], did not alter the MSNA response (Delta 16.4 +/- 2.8 to Delta 17.3 +/- 3.8 bursts/min, P = 0.74), and lowered the MAP response (Delta 20 +/- 2 to Delta 12 +/- 1 mmHg, P< 0.001). Under normothermic conditions, passive stretch during PECO evoked significant increases in MAP and MSNA (both P< 0.001). Of note, heat stress prevented the MAP and MSNA responses to stretch during PECO (both P> 0.05)."
According to the news editors, the research concluded: "These data suggest that whole body heat stress attenuates the pressor response due to metaboreceptor stimulation, and the sympathetic nerve response due to mechanoreceptor stimulation."

For more information on this research see: Whole body heat stress attenuates the pressor response to muscle metaboreceptor stimulation in humans. *Journal of Applied Physiology*, 2016;121(5):1178-1186. *Journal of Applied Physiology* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Nutritional and Metabolic Diseases and Conditions -...

New Findings from Pennington Biomedical Research Center in the Area of Type 2 Diabetes Reported (Effect of serial cell passaging in the retention of fiber type and mitochondrial content in primary human myotubes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is now available. According to news originating from Baton Rouge, Louisiana, by NewsRx correspondents, research stated, "The purpose of the study was to determine the effects of passaging on retention of donor phenotypic characteristics in primary human myotubes. Primary muscle cultures and serial passaged myotubes from physically active, sedentary lean, and individuals with type 2 diabetes were established."

Financial supporters for this research include Novartis, Novartis Clinical Innovation Fund, Takeda Pharmaceuticals North America, NIH, NORC Center, NIDDK and COBRE, COBRE, NORC.

Our news journalists obtained a quote from the research from Pennington Biomedical Research Center, "Maximal ATP synthesis capacity (ATPmax) and resting ATP flux (ATPase) in vivo were measured by (31) P magnetic resonance spectroscopy, type-I fibers and intramyocellular lipid (IMCL) in vastus lateralis tissue were determined using immunohistochemistry techniques, and oxidative phosphorylation complexes (OXPHOS) were measured by Western immunoblotting. Similar in vitro measures for lipid and type-I fibers were made in myotubes, along with mitochondrial content measured by MitoTracker. Passage 4 and 5 measures for myotubes correlated positively with in vivo measurements for percent type-I fibers (P4: R(2)=0.39, p=0.02; P5: R(2)=0.48, p=0.01), ATPmax (P4: R(2)=0.30, p=0.03; P5: R(2)=0.22, p=0.05), and OXPHOS (P4: R(2)=0.44, p=0.04; P5: R(2)=0.59, p=0.006). No correlations were observed for IMCL. However, passage 4 measures for myotubes correlated with passage 5
measures for percent type-I fibers \( R(2)=0.49, p=0.01 \), IMCL \( R(2)=0.80, p<0.001 \), and mitochondrial content \( R(2)=0.26, p=0.03 \)."

According to the news editors, the research concluded: "Myotubes through the first two passages following immunopurification (referred to as passage 4 and 5) reflect the mitochondrial and type-I fiber content in vivo phenotype of the donor."

For more information on this research see: Effect of serial cell passaging in the retention of fiber type and mitochondrial content in primary human myotubes. *Obesity*, 2015;23(12):2414-20. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

The news correspondents report that additional information may be obtained from J.D. Covington, Laboratory of Skeletal Muscle Physiology, Pennington Biomedical Research Center, Baton Rouge, Louisiana, United States. Additional authors for this research include C.K. Myland, A.C. Rustan, E. Ravussin, S.R. Smith and S. Bajpeyi.

**Biological Factors - Autacoids**

**New Findings from Pennsylvania State University Update**

**Understanding of Autacoids (Calcium Signaling Is Dispensable for Receptor Regulation of Endothelial Barrier Function)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Biological Factors - Autacoids. According to news reporting from Hershey, Pennsylvania, by NewsRx journalists, research stated, "Endothelial barrier function is tightly regulated by plasma membrane receptors and is crucial for tissue fluid homeostasis; its dysfunction causes disease, including sepsis and inflammation. The ubiquitous activation of Ca2+ signaling upon phospholipase C-coupled receptor ligation leads quite naturally to the assumption that Ca2+ signaling is required for receptor-regulated endothelial barrier function."

Financial support for this research came from American Heart Association.

The news correspondents obtained a quote from the research from Pennsylvania State University, "This widespread hypothesis draws analogy from smooth muscle and proposes the requirement of G protein-coupled receptor (GPCR)-generated Ca2+ signaling in activating the endothelial contractile apparatus and generating interendothelial gaps. Notwithstanding endothelia being non-excitable in nature, the hypothesis of Ca2+-induced endothelial contraction has been invoked to explain actions of GPCR agonists that either disrupt or stabilize endothelial barrier function. Here, we challenge this correlative hypothesis by showing a lack of causal link between GPCR-generated Ca2+ signaling and changes in human microvascular endothelial barrier function. We used three endogenous GPCR agonists: thrombin and histamine, which disrupt endothelial barrier function, and sphingosine-1-phosphate, which stabilizes barrier function. The qualitatively different effects of these three agonists on
endothelial barrier function occur independently of Ca2+ entry through the ubiquitous store-operated Ca2+ entry channel Orai1, global Ca2+ entry across the plasma membrane, and Ca2+ release from internal stores. However, disruption of endothelial barrier function by thrombin and histamine requires the Ca2+ sensor stromal interacting molecule-1 (STIM1), whereas sphingosine-1-phosphate-mediated enhancement of endothelial barrier function occurs independently of STIM1. We conclude that although STIM1 is required for GPCR-mediated disruption of barrier function, a causal link between GPCR-induced cytoplasmic Ca2+ increases and acute changes in barrier function is missing.

According to the news reporters, the research concluded: "Thus, the cytosolic Ca2+ induced endothelial contraction is a cum hoc fallacy that should be abandoned."

For more information on this research see: Calcium Signaling Is Dispensable for Receptor Regulation of Endothelial Barrier Function. Journal of Biological Chemistry, 2016;291(44):22894-22912. Journal of Biological Chemistry can be contacted at: Amer Soc Biochemistry Molecular Biology Inc, 9650 Rockville Pike, Bethesda, MD 20814-3996, USA.

Our news journalists report that additional information may be obtained by contacting M. Trebak, Pennsylvania State University, Coll Med, Dept. of Cellular & Mol Physiol, Hershey, PA 17033, United States. Additional authors for this research include X.X. Zhang, M. Gueguinou, W. Zhang, K. Matrougui, C. Renken and M. Trebak.

Medical Imaging - Neuroimaging

New Findings from People's Hospital Describe Advances in Neuroimaging (Effects of outcome on the covariance between risk level and brain activity in adolescents with internet gaming disorder)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Medical Imaging - Neuroimaging have been published. According to news originating from Shandong, People's Republic of China, by NewsRx correspondents, research stated, "Individuals with internet gaming disorder (IGD) often have impaired risky decision-making abilities, and IGD-related functional changes have been observed during neuroimaging studies of decision-making tasks. However, it is still unclear how feedback (outcomes of decision-making) affects the subsequent risky decision-making in individuals with IGD."

Our news journalists obtained a quote from the research from People's Hospital, "In this study, twenty-four adolescents with IGD and 24 healthy controls (HCs) were recruited and underwent functional magnetic resonance imaging while performing the balloon analog risk task (BART) to evaluate the effects of prior outcomes on brain activity during subsequent risky decision-making in adolescents with IGD. The covariance between risk level and activation of..."
the bilateral ventral medial prefrontal cortex, left inferior frontal cortex, right ventral striatum (VS), left hippocampus/parahippocampus, right inferior occipital gyrus/fusiform gyrus and right inferior temporal gyrus demonstrated interaction effects of group by outcome (P < 0.05, AlphaSim correction). The regions with interactive effects were defined as ROI, and ROI-based inter-group comparisons showed that the covariance between risk level and brain activation was significantly greater in adolescents with IGD compared with HCs after a negative outcome occurred (P < 0.05)."

According to the news editors, the research concluded: "Our results indicated that negative outcomes affected the covariance between risk level and activation of the brain regions related to value estimation (prefrontal cortex), anticipation of rewards (VS), and emotional-related learning (hippocampus/parahippocampus), which may be one of the underlying neural mechanisms of disadvantageous risky decision-making in adolescents with IGD."

The news correspondents report that additional information may be obtained from X.D. Li, Linyi Peoples Hosp, Dept. of Radiol, Linyi 276003, Shandong, People's Republic of China. Additional authors for this research include Y.X. Yang, S.P. Dai, P.H. Gao, X. Du, Y. Zhang, G.J. Du, X.D. Li and Q. Zhang.

Intracellular Signaling Peptides and Proteins - RHOβ...

New Findings from Polytechnic Institute Update Understanding of RHO-Associated Kinases (TGF beta 2-induced outflow alterations in a bioengineered trabecular meshwork are offset by a rho-associated kinase inhibitor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Intracellular Signaling Peptides and Proteins - RHO-Associated Kinases are presented in a new report. According to news reporting originating from Albany, New York, by NewsRx correspondents, research stated, "Members of the transforming growth factor beta (TGF beta) cytokine family have long been associated with affecting several cellular functions, including cell proliferation, differentiation and extracellular matrix (ECM) turnover. Of particular interest to this work, TGF beta 2 has been linked to most types of glaucomas as a potential fibrotic agent that can cause elevation of intraocular pressure (IOP)."

Our news editors obtained a quote from the research from Polytechnic Institute, "Given that the trabecular meshwork ™ provides most of aqueous humor outflow resistance in the eye, an in vitro bioengineered human TM (HTM) model has been created and validated by analyzing effects of TGF beta 2 on transcellular pressure changes and outflow facility. These
changes were correlated with several biological alterations induced by this cytokine, including ECM production and overexpression of HTM-marker myocillin. Furthermore, this TM model has been used to extend current knowledge of gene expression of cytokines involved in TGF beta-induced ECM turnover over time. In particular, the ability for a ROCK-inhibitor to diminish the effect of TGF beta on TM was demonstrated."

According to the news editors, the research concluded: "This work supports the notion that anti-fibrotic activities of ROCK-inhibitors could counteract the elevation of IOP and increased strain observed in glaucomatous TM."

For more information on this research see: TGF beta 2-induced outflow alterations in a bioengineered trabecular meshwork are offset by a rho-associated kinase inhibitor. Scientific Reports, 2016;6():1-12. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com; Scientific Reports - www.nature.com/srep/)

Liver Diseases and Conditions - Hepatitis C Virus

New Findings from Queen Mary University in the Area of Hepatitis C Virus Described (Open-label study of faldaprevir plus peginterferon and ribavirin in hepatitis C virus genotype 1-infected patients who failed placebo plus peginterferon and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Hepatitis C Virus. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Faldaprevir, a hepatitis C virus (HCV) NS3/4A protease inhibitor, was evaluated in HCV genotype 1-infected patients who failed peginterferon and ribavirin (PegIFN/RBV) treatment during one of three prior faldaprevir trials. Patients who received placebo plus PegIFN/RBV and had virological failure during a prior trial were enrolled and treated in two cohorts: prior relapsers (n=43) and prior nonresponders (null responders, partial responders and patients with breakthrough; n=75)."

Financial supporters for this research include Jennifer Tobin of Choice Healthcare Solutions, Boehringer Ingelheim, Roche, Gilead Sciences.

Our news editors obtained a quote from the research from Queen Mary University, "Both cohorts received faldaprevir 240 mg once daily plus PegIFN/RBV for 24 weeks. Prior relapers with early treatment success (ETS; HCV RNA <25 IU/mL detectable or undetectable at week 4 and <25 IU/mL undetectable at week 8) stopped treatment at week 24. Others received PegIFN/RBV through week 48. The primary efficacy endpoint was sustained virological response (HCV RNA <25 IU/mL undetectable) 12 weeks post treatment (SVR12)."
More prior nonresponders than prior relapsers had baseline HCV RNA (>=) 800,000 IU/mL (80% vs 58%) and a non-CC IL28B genotype (91% vs 70%). Rates of SVR12 (95% CI) were 95.3% (89.1, 100.0) among prior relapsers and 54.7% (43.4, 65.9) among prior nonresponders; corresponding ETS rates were 97.7% and 65.3%. Adverse events led to faldaprevir discontinuations in 3% of patients. The most common Division of AIDS Grade (>=) 2 adverse events were anaemia (13%), nausea (10%) and hyperbilirubinaemia (9%)."

According to the news editors, the research concluded: "Faldaprevir plus PegIFN/RBV achieved clinically meaningful SVR12 rates in patients who failed PegIFN/RBV in a prior trial, with response rates higher among prior relapsers than among prior nonresponders. The adverse event profile was consistent with the known safety profile of faldaprevir."

The news editors report that additional information may be obtained by contacting G.R. Foster, Dept. of Hepatology, Barts and the London School of Medicine and Dentistry, Queen Mary University of London, London, UK. Additional authors for this research include P. Ferenci, T. Asselah, P. Mantry, J.F. Dufour, M. Bourliere, D. Forton, M. Maevskaya, D. Wright, E.M. Yoshida, J. Garcia-Samaniego, C. Oliveira, M. Wright, N. Warner, N. Sha, A.M. Quinson and J.O Stern. **Neoplasms**

**New Findings from Queen's University Describe Advances in Neoplasms (Minor allele frequency of myeloproliferative neoplasm mutations in the Irish blood donor population)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neoplasms. According to news reporting from Belfast, United Kingdom, by NewsRx journalists, research stated, "Myeloproliferative neoplasms (MPNs) are rare diseases that include classic entities; polycythaemia vera, essential thrombocythaemia and primary myelofibrosis."

The news correspondents obtained a quote from the research from Queen's University, "In this short report, minor allele frequencies of common MPN mutations are compared between the Irish blood donor population and other populations of European descent using data from the Haploptype Map project. The Affymetrix array 6.0 platform was utilised"
identifying nine single nucleotide polymorphisms (SNPs) and six proxy SNPs."

According to the news reporters, the research concluded: "The variability of allele frequencies for MPN mutations could account for the different incidence rates seen between populations of European ancestry, giving a better understanding of the genetic predisposition to MPNs."

Our news journalists report that additional information may be obtained by contacting M.F. McMullin, Queen's University Belfast, Center Canc Res & Cell Biol, Belfast BT9 7AE, Antrim, United Kingdom. Additional authors for this research include G.J. Mcckay, M. Lawler, L.A. Anderson and M.F. McMullin.

Keywords for this news article include: Belfast, United Kingdom, Europe, Neoplasms, Genetics, Queen's University.

development of self-assembling peptides are paving the way for sustained release peptide formulations and already two such licensed examples exist, lanreotide and octreotide. The versatility and tunability of peptide-based products is resulting in increased translation of peptide therapies, however significant challenges remain with regard to their wider implementation."

According to the news editors, the research concluded: "This review highlights some of the notable peptide therapeutics discovered to date and the difficulties encountered by the pharmaceutical industry in translating these molecules to the clinical setting for patient benefit, providing some possible solutions to the most challenging barriers."

Oncology - Breast Cancer

New Findings from R. Singh and Co-Authors in the Area of Breast Cancer Reported (MicroRNA-195 inhibits proliferation, invasion and metastasis in breast cancer cells by targeting FASN, HMGCR, ACACA and CYP27B1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news originating from Delhi, India, by NewsRx correspondents, research stated, "De novo lipogenesis, a hallmark for cancers is required for cellular transformation. Further it is believed that resistance to apoptosis and epithelial-to-mesenchymal-transition(EMT) facilitates metastasis via over-expression of anti-apoptotic Bcl-2."

Our news journalists obtained a quote from the research, "Previously we demonstrated that hsa-miR-195 targets BCL2, induces apoptosis and augmented the effect of etoposide in breast cancer cells. However, the mechanism behind its function remains elusive. Herein gene expression profiling was done in presence/absence of hsa-miR-195 in Breast cancer cells. IPA revealed mitochondrial dysfunction, fatty acid metabolism and xenobiotic metabolism
signalling among the top processes being affected. For the first time we herein identified ACACA, FASN (the key enzymes of de novo fatty acid synthesis), HMGCR (the key enzyme of de novo cholesterol synthesis) and CYP27B1 as direct targets of hsa-miR-195. We further showed that ectopic expression of hsa-miR-195 in MCF-7 and MDA-MB-231 cells not only altered cellular cholesterol and triglyceride levels significantly but also resulted in reduced proliferation, invasion and migration. We further demonstrated that over expression of hsa-miR-195 decreased the Mesenchymal markers expression and enhanced Epithelial markers.

According to the news editors, the research concluded: "In conclusion we say that hsa-miR-195 targets the genes of de novo lipogenesis, inhibits cell proliferation, migration, and invasion which potentially opens new avenues for the treatment of breast cancer."

For more information on this research see: MicroRNA-195 inhibits proliferation, invasion and metastasis in breast cancer cells by targeting FASN, HMGCR, ACACA and CYP27B1. Scientific Reports, 2015;5():17454. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from R. Singh, Functional Genomics Unit, CSIR-Institute of Genomics and Integrative Biology (IGIB) Council of Scientific &Industrial Research (CSIR), Delhi, India. Additional authors for this research include V. Yadav, S. Kumar and N. Saini.

Central Nervous System Diseases and Conditions –…

New Findings from R. Surges and Co-Authors in the Area of Epilepsy Reported (Changes in serum miRNAs following generalized convulsive seizures in human mesial temporal lobe epilepsy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Epilepsy are discussed in a new report. According to news reporting originating from Monheim, Germany, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) are key regulators of gene expression and are involved in the pathomechanisms of epilepsy. MiRNAs may also serve as peripheral biomarkers of epilepsy."

Financial support for this research came from Federal Ministry of Education and Research (Neuroallianz Consortium, project D9).

Our news editors obtained a quote from the research, "We investigated the miRNA profile in the blood serum of patients suffering from mesial temporal lobe epilepsy (mTLE) following a single focal seizure evolving to a bilateral convulsive seizure (BCS) during video-EEG monitoring. Data of 15 patients were included in the final analysis. MiRNA expression was determined using Real Time-PCR followed by thorough bioinformatical analysis of expression levels. We found that more than 200 miRNAs were differentially expressed in the serum of patients within 30 min after a single seizure. Validation of the 20 top miRNA
candidates confirmed that 4 miRNAs (miR-143, miR-145, miR-532, miR-365a) were significantly deregulated. Interestingly, in a sub-group of patients with seizures occurring during sleep, we found 10 miRNAs to be deregulated up to 20-28 h after the seizure. In this group of patients, miR-663b was significantly deregulated. We conclude that single seizures are associated with detectable transient miRNA alterations in blood serum in the early postictal phase.

According to the news editors, the research concluded: "The significant upregulation of miR-663b following BCS arising during sleep indicates potential suitability of this miRNA as a potential biomarker for seizure diagnostics."

For more information on this research see: Changes in serum miRNAs following generalized convulsive seizures in human mesial temporal lobe epilepsy. Biochemical and Biophysical Research Communications, 2016;481(1-2):13-18. Our news journalists obtained a quote from the research, "How the activity of the START domain is regulated remains unknown for most of these proteins. The Plasmodium falciparum START protein PFA0210c (PF3D7_0104200) is a broad-spectrum phospholipid transfer protein that is conserved in all sequenced Plasmodium species and is most closely related to the mammalian START proteins STARD2 and STARD7. PFA0210c is unusual in that it contains a signal sequence and a PEXEL export motif that together mediate transfer of the protein from the parasite to the host erythrocyte. The protein also contains a C-terminal extension, which is very uncommon among mammalian START proteins. Whereas the biochemical properties of PFA0210c have been characterized, the function of the protein remains unknown. Here, we provide evidence that the unusual C-terminal extension negatively regulates phospholipid transfer activity. Furthermore, we use the genetically tractable Plasmodium knowlesi model and recently developed genetic technology in P. falciparum to show that the protein is essential for growth of the parasite during the clinically relevant asexual blood stage life cycle. Finally, we show that the regulation of phospholipid transfer by PFA0210c is required in vivo, and we identify a potential second regulatory domain."

According to the news editors, the research concluded: "These findings provide insight into a novel mechanism of regulation of phospholipid transfer in vivo and may have important implications for the interaction of the malaria parasite with its host cell."

Our news journalists report that additional information may be obtained by contacting C. van Ooij, Francis Crick Inst, Mill Hill Lab, London NW7 1AA, United Kingdom. Additional authors for this research include A. Ringel, E. Knuepfer, R.W. Moon, M.J. Blackman and C. van Ooij.

**Digestive System Diseases and Conditions - …**

**New Findings from RIKEN in Inflammatory Bowel Disease Provides New Insights (Tranexamic Acid and Supportive Measures to Treat Wasting Marmoset Syndrome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Digestive System Diseases and Conditions - Inflammatory Bowel Disease. According to news reporting originating in Saitama,
Japan, by NewsRx journalists, research stated, "Wasting marmoset syndrome (WMS) has high incidence and mortality rates and is one of the most important problems in captive common marmoset (Callithrix jacchus) colonies. Despite several reports on WMS, little information is available regarding its reliable treatment."

The news reporters obtained a quote from the research from RIKEN, "We previously reported that marmosets with WMS had high serum levels of matrix metalloproteinase 9 (MMP9). MMP9 is thought to be a key enzyme in the pathogenesis of inflammatory bowel disease, the main disease state of WMS, and is activated by plasmin, a fibrinolytic factor. In a previous study, treating mice with an antibody to inhibit plasmin prevented the progression of inflammatory bowel disease. Here we examined the efficacy of tranexamic acid, a commonly used plasmin inhibitor, for the treatment of WMS, with supportive measures including amino acid and iron formulations. Six colony marmosets with WMS received tranexamic acid therapy with supportive measures for 8 wk. The body weight, Hct, and serum albumin levels of these 6 marmosets were increased and serum MMP9 levels decreased after this regimen."

According to the news reporters, the research concluded: "Therefore, tranexamic acid therapy may be a new and useful treatment for WMS."

For more information on this research see: Tranexamic Acid and Supportive Measures to Treat Wasting Marmoset Syndrome. Comparative Medicine, 2016;66(6):468-473. Comparative Medicine can be contacted at: Amer Assoc Laboratory Animal Science, 9190 Crestwyn Hills Dr, Memphis, TN 38125, USA.

Our news correspondents report that additional information may be obtained by contacting K. Niimi, RIKEN Brain Sci Inst, Res Resources Center, Saitama, Japan. Additional authors for this research include K. Niimi and E. Takahashi.

Cytoskeleton
New Findings from RWTH Aachen University in Cytoskeleton Provides New Insights (A novel function for the MAP kinase SMA-5 in intestinal tube stability)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cytoskeleton. According to news reporting originating from Aachen, Germany, by NewsRx correspondents, research stated, "Intermediate filaments are major cytoskeletal components whose assembly into complex networks and isotype-specific functions are still largely unknown. Caenorhabditis elegans provides an excellent model system to study intermediate filament organization and function in vivo."

Our news editors obtained a quote from the research from RWTH Aachen University. "Its intestinal intermediate filaments localize exclusively to the endotube, a circumferential sheet just below the actin-based terminal web. A genetic screen for defects in
the organization of intermediate filaments identified a mutation in the catalytic domain of the MAP kinase 7 orthologue sma-5(kc1). In sma-5(kc1) mutants, pockets of lumen penetrate the cytoplasm of the intestinal cells. These membrane hernias increase over time without affecting epithelial integrity and polarity. A more pronounced phenotype was observed in the deletion allele sma-5(n678) and in intestine-specific sma-5(RNAi). Besides reduced body length, an increased time of development, reduced brood size, and reduced life span were observed in the mutants, indicating compromised food uptake. Ultrastructural analyses revealed that the luminal pockets include the subapical cytoskeleton and coincide with local thinning and gaps in the endotube that are often enlarged in other regions.

According to the news editors, the research concluded: "Increased intermediate filament phosphorylation was detected by two-dimensional immunoblotting, suggesting that loss of SMA-5 function leads to reduced intestinal tube stability due to altered intermediate filament network phosphorylation."

The news editors report that additional information may be obtained by contacting O. Bossinger, Rhein Westfal TH Aachen, Inst Mol & Cellular Anat, D-52074 Aachen, Germany. Additional authors for this research include H. Gerhardus, K. Carberry, W. Davis, E. Jorgensen, C. Richardson, O. Bossinger and R.E. Leube.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1091/mbc.E16-02-0099. This DOI is a link to an online electronic document that is either free or for purchase.

**RNA Viruses - Rotavirus**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on RNA Viruses - Rotavirus have been presented. According to news reporting out of Leuven, Belgium, by NewsRx editors, research stated, "P[6] rotaviruses have been circulating with a high prevalence in African and, to a more limited extent, Asian countries, but they have not been highly prevalent in other parts of the world. To investigate the genomic relationship between African and Asian human P[6] rotaviruses and P[4] and P[8] rotaviruses circulating worldwide, we sequenced 39 P[6] strains, collected in Ghana, Mali, Kenya and Bangladesh, providing the largest data set of P[6] rotavirus genomes isolated in low-income countries or anywhere else in the world that has been published thus far."

Financial support for this research came from Promotion of Innovation through
Science and Technology in Flanders.

Our news journalists obtained a quote from the research from Rega Institute for Medical Research, "Overall, the data indicate that the genetic backbone of human P[6] strains from the low-income countries are similar to those of P[4] or P[8] strains circulating worldwide. The observation that gene segment 4 is the main differentiator between human P[6] and non-P[6] strains suggests that the VP4 spike protein is most likely one of the main reasons preventing the rapid spread of P[6] strains to the rest of the world despite multiple introductions."

According to the news editors, the research concluded: "These observations reinforce previous findings about the receptor specificity of P[6] rotavirus strains."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/infdis/jiw247. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Leuven, Belgium, Europe, RNA Viruses, Reoviridae, Rotavirus, Genetics, Virology, Viral, Rega Institute for Medical Research.

**Oncology - Prostate Cancer**

**New Findings from Research Center in the Area of Prostate Cancer Reported (Novel Bispecific PSMA/GRPr Targeting Radioligands with Optimized Pharmacokinetics for Improved PET Imaging of Prostate Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Prostate Cancer is the subject of a report. According to news reporting out of Heidelberg, Germany, by NewsRx editors, research stated, "A new series of bispecific radioligands (BRLs) targeting prostate-specific membrane antigen (PSMA) and gastrin releasing peptide receptor (GRPr), both expressed on prostate cancer cells, was developed. Their design was based on the bombesin (BN) analogue, H2N-PEG2-[D-Tyr (6),b-Ala(11),Thi(13),Nle(14)]BN(6-14), which binds to GRPr with high affinity and specificity, and the peptidomimetic urea-based pseudoirreversible inhibitor of PSMA, Glu-ureido-Lys."

Our news journalists obtained a quote from the research from Research Center, "The two pharmacophores were coupled through copper(I)-catalyzed azide-alkyne cycloaddition to the bis(tetrafluorophenyl) ester of the chelating agent HBED-CC via amino acid linkers made of positively charged His (H) and negatively charged Glu (E): -(HE)n-(n=0-3). The BRLs were
labeled with (68)Ga, and their preliminary pharmacological properties were evaluated in vitro (competitive and time kinetic binding assays) on prostate cancer (PC-3, LNCaP) and rat pancreatic (AR42J) cell lines and in vivo by biodistribution and small animal PET imaging studies in both normal and tumor-bearing mice. The IC[50]/Ki values determined for all BRLs essentially matched those of the respective monomers. The maximal cellular uptake of the BLRs was observed between 20 and 30 min. The BRLs showed a synergistic ability in vivo by targeting both PSMA (LNCaP) and GRPr (PC-3) positive tumors, whereas the charged -(HE)n-(n=1-3) linkers significantly reduced the kidney and spleen uptake.

According to the news editors, the research concluded: "The bispecific (PSMA and GRPr) targeting ability and optimized pharmacokinetics of the compounds developed in this study could lead to their future application in clinical practice as more sensitive radiotracers for noninvasive imaging of prostate cancer (PCa) by PET/CT and PET/MRI."

Our news journalists report that additional information may be obtained by contacting C. Liolios, Division of Radiopharmaceutical Chemistry, German Cancer Research Center (DKFZ), 69120 Heidelberg, Germany. Additional authors for this research include M. Schafer, U. Haberkorn, M. Eder and K. Kopka.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.bioconjchem.5b00687. This DOI is a link to an online electronic document that is either free or for purchase.

Nutritional and Metabolic Diseases and Conditions - …

New Findings from Research Hospital in the Area of Type 2 Diabetes Reported (Exenatide Treatment Causes Suppression of Serum Ghrelin Levels following Mixed Meal Test in Obese Diabetic Women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting originating from Bursa, Turkey, by NewsRx correspondents, research stated, "To investigate the effect of exenatide treatment on serum ghrelin levels in obese female patients with type 2 diabetes mellitus. Fourteen female patients with type 2 diabetes mellitus being treated with metformin and exenatide were enrolled."

Our news editors obtained a quote from the research from Research Hospital, "A mixed meal test was applied to the patients while continuing with their daily medications. Blood samples were taken before and at 60, 120, and 180 minutes following mixed meal test to measure serum total ghrelin, glucose, and insulin levels. The following week, exenatide treatment of the patients was paused for 24 hours and the same experimental procedures were repeated. Serum ghrelin levels were suppressed significantly at 180 minutes with exenatide
treatment compared with baseline (294.4 ± 57.5 versus 234.5 ± 59.4 pg/mL) (p <0.001). Serum ghrelin levels at 180 minutes were statistically different when percentage change in serum ghrelin levels after mixed meal tests with and without exenatide usage were compared (p=0.001). Estimated total area under the curve values for serum ghrelin concentrations was also significantly lower with exenatide compared with omitted treatment (p=0.035).

According to the news editors, the research concluded: "These results suggest that the effect of exenatide on weight loss may be related with the suppression of serum ghrelin levels, which is an orexigenic peptide."

For more information on this research see: Exenatide Treatment Causes Suppression of Serum Ghrelin Levels following Mixed Meal Test in Obese Diabetic Women. Journal of Diabetes Research, 2016;2016():1309502.

The news editors report that additional information may be obtained by contacting F. Topyildiz, Bursa Yuksek Ihtisas Education and Research Hospital, Dept. of Internal Medicine, 16330 Bursa, Turkey. Oncology - Lymphoma

New Findings from Roma Tor Vergata University Describe Advances in Lymphoma (Technical solutions to reduce mediastinal irradiation in young patients undergoing treatment for lymphomas: Preliminary experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Lymphoma are presented in a new report. According to news reporting from Rome, Italy, by NewsRx journalists, research stated, "This study aims at optimizing treatment planning in young patients affected by lymphoma (Stage II to III) by using an inclined board (IB) that allows reducing doses to the organs at risk. We evaluated 19 young patients affected by stage I to III lymphomas, referred to our Department for consolidation radiotherapy (RT) treatment on the mediastinum."

The news correspondents obtained a quote from the research from Roma Tor Vergata University, "Patients underwent 2 planning computed tomography (CT) scans performed in different positions: flat standard position and inclined position. A direct comparison between the different treatment plans was carried out analyzing dosimetric parameters obtained from dose-volume histograms generated for each plan. Comparison was performed to evaluate the sparing obtained on breast and heart. Dosimetric evaluation was performed for the following organs at risk (OARs): mammary glands, lungs, and heart. A statistically significant advantage was
reported for V-5, V-20, and V-30 for the breast when using the inclined board. A similar result was obtained for V-5 and V-10 on the heart. No advantage was observed in lung doses."

According to the news reporters, the research concluded: "The use of a simple device, such as an inclined board, allows the optimization of treatment plan, especially in young female patients, by ensuring a significant reduction of the dose delivered to breast and heart."

Our news journalists report that additional information may be obtained by contacting B. Tolu, Roma Tor Vergata University, Radiat Therapy Unit, Dept. of Diagnost Imaging Mol Imaging Intervent Radio, Rome, Italy. Additional authors for this research include L. Di Murro, B. Tolu, E. Ponti, M.D. Falco, C. Rossi, P. Bagala, D. di Cristino, A. Murgia, S. Cicchetti, C. Bruni, P. Morelli, A. Lancia and R. Santoni.

Oncology - Glioblastomas

New Findings from Roma Tor Vergata University in the Area of Glioblastomas Described (Resetting cancer stem cell regulatory nodes upon MYC inhibition)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Glioblastomas is the subject of a report. According to news reporting originating in Rome, Italy, by NewsRx journalists, research stated, "MYC deregulation is common in human cancer and has a role in sustaining the aggressive cancer stem cell populations. MYC mediates a broad transcriptional response controlling normal biological programmes, but its activity is not clearly understood."

Funders for this research include Consiglio Nazionale delle Ricerche, Fondazione Umberto Veronesi, Associazione Italiana per la Ricerca sul Cancro, Ministero dell'Istruzione, dell'Universita e della Ricerca.

The news reporters obtained a quote from the research from Roma Tor Vergata University, "We address MYC function in cancer stem cells through the inducible expression of Omomyca MYC-derived polypeptide interfering with MYC activitytaking as model the most lethal brain tumour, glioblastoma. Omomyc bridges the key cancer stemlike cell features and affects the tumour microenvironment, inhibiting angiogenesis. This occurs because Omomyc interferes with proper MYC localization and itself associates with the genome, with a preference for sites occupied by MYC. This is accompanied by selective repression of master transcription factors for glioblastoma stemlike cell identity such as OLIG2, POU3F2, SOX2, upregulation of
effectors of tumour suppression and differentiation such as ID4, MIAT, PTEN, and modulation of the expression of microRNAs that target molecules implicated in glioblastoma growth and invasion such as EGFR and ZEB1."

According to the news reporters, the research concluded: "Data support a novel view of MYC as a network stabilizer that strengthens the regulatory nodes of gene expression networks controlling cell phenotype and highlight Omomyc as model molecule for targeting cancer stem cells."

Our news correspondents report that additional information may be obtained by contacting S.A. Ciafre, Roma Tor Vergata University, Biomed & Prevent Department, Rome, Italy. Additional authors for this research include M. Savino, F. Scagnoli, S. Pellegatta, F. Pisati, F. Zambelli, B. Illi, D. Annibali, S. Beji, E. Orecchini, M.A. Alberelli, C. Apicella, R.A. Fontanella, A. Michienzi, G. Finocchiaro, M.G. Farace, G. Pavesi, S.A. Ciafre and Nas.

**Oncology - Colon Cancer**

**New Findings from Royal College of Surgeons in Ireland Yields New Data on Colon Cancer (Low levels of Caspase-3 predict favourable response to 5FU-based chemotherapy in advanced colorectal cancer: Caspase-3 inhibition as a therapeutic approach)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Colon Cancer are presented in a new report. According to news reporting originating from Dublin, Ireland, by NewsRx correspondents, research stated, "Colorectal cancer (CRC) is one of the most common cancers in the Western world. 5-Fluorouracil (5FU)-based chemotherapy (CT) remains the mainstay treatment of CRC in the advanced setting, and activates executioner caspases in target cells. Executioner caspases are key proteins involved in cell disassembly during apoptosis."

Our news editors obtained a quote from the research from the Royal College of Surgeons in Ireland, "Activation of executioner caspases also has a role in tissue regeneration and repopulation by stimulating signal transduction and cell proliferation in neighbouring, non-apoptotic cells as reported recently. Tissue microarrays (TMAs) consisting of tumor tissue from 93 stage II and III colon cancer patients were analysed by immunohistochemistry. Surprisingly, patients with low levels of active Caspase-3 had an increased disease-free survival time. This was particularly pronounced in patients who received 5FU-based adjuvant CT. In line with this observation, lower serum levels of active Caspase-3 were found in patients with metastasised CRC who revealed stable disease or tumor regression compared with those with disease..."
progression. The role of Caspase-3 in treatment responses was explored further in primary human tumor explant cultures from fresh patient tumor tissue. Exposure of explant cultures to 5FU-based CT increased the percentage of cells positive for active Caspase-3 and Terminal Deoxynucleotidyl Transferase dUTP Nick end Labelling (TUNEL), but also the expression of regeneration and proliferation markers b-Catenin and Ki-67, as well as cyclooxygenase-2 (COX-2). Of note, selective inhibition of Caspase-3 with Ac-DNLD-CHO, a selective, reversible inhibitor of Caspase-3, significantly reduced the expression of proliferation markers as well as COX-2. Inhibition of COX-2 with aspirin or celecoxib did not affect Caspase-3 levels but also reduced Ki-67 and b-Catenin levels, suggesting that Caspase-3 acted via COX-2 to stimulate cell proliferation and tissue regeneration.

According to the news editors, the research concluded: "This indicates that low levels of active Caspase-3 may represent a new predictor of CT responsiveness, and inhibition of Caspase-3, or antagonising downstream effectors of Caspase-3 paracrine signalling, such as COX-2 may improve patient outcomes following CT in advanced CRC."

For more information on this research see: Low levels of Caspase-3 predict favourable response to 5FU-based chemotherapy in advanced colorectal cancer: Caspase-3 inhibition as a therapeutic approach. Cell Death & Disease, 2016;7():e2087. (Nature Publishing Group - www.nature.com/cddis/)

The news editors report that additional information may be obtained by contacting L. Flanagan, Dept. of Physiology and Medical Physics, Royal College of Surgeons in Ireland, Dublin, Ireland. Additional authors for this research include M. Meyer, J. Fay, S. Curry, O. Bacon, H. Duessmann, K. John, K.C. Boland, D.A. McNamara, E.W. Kay, H. Bantel, H. Schulze-Bergkamen and J.H Prehn.

Genetics - Assisted Reproduction and Genetics

New Findings from Royal Women's Hospital in Assisted Reproduction and Genetics Provides New Insights (What is the contribution of embryo-endometrial asynchrony to implantation failure?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Genetics - Assisted Reproduction and Genetics is the subject of a report. According to news reporting originating from Parkville, Australia, by NewsRx correspondents, research stated, "The synchronized development of a viable embryo and a receptive endometrium is critical for successful implantation to take place. The aim of this paper is to review current thinking about the importance of embryo-endometrial synchrony in in vitro fertilization (IVF)."
Financial support for this research came from National Health and Medical Research Council.

Our news editors obtained a quote from the research from Royal Women's Hospital, "Detailed review of the literature on embryo-endometrial synchrony. By convention, the time when the blastocyst first attaches and starts to invade into the endometrium has been defined as the 'window of implantation'. The term window of implantation can be misleading when it is used to imply that there is a single critical window in time that determines whether implantation will be successful or not. Embryo maturation and endometrial development are two independent continuous processes. Implantation occurs when the two tissues fuse and pregnancy is established. A key concept in understanding this event is developmental 'synchrony', defined as when the early embryo and the uterus are both developing at the same rate such that they will be ready to commence and successfully continue implantation at the same time. Many different events, including controlled ovarian hyperstimulation as routinely used in IVF, can potentially disrupt embryo-endometrial synchrony. There is some evidence in humans that implantation rates are significantly reduced when embryo-endometrial development asynchrony is greater than 3 days (+/- 1.5 days). Embryo-endometrial synchrony is critical for successful implantation."

According to the news editors, the research concluded: "There is an unmet need for improved precision in the evaluation of endometrial development to permit better synchronization of the embryo and the endometrium prior to implantation."

The news editors report that additional information may be obtained by contacting W.T. Teh, Royal Womens Hosp, Reprod Serv, Parkville, Vic, Australia. Additional authors for this research include J. McBain and P. Rogers.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s10815-016-0773-6. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Lobular Cancer**

**New Findings from Rush University in the Area of Lobular Cancer Reported (Prognostic Value of Coexisting Lobular Carcinoma In Situ With Invasive Lobular Carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Lobular Cancer have been presented. According to news originating from Chicago, Illinois, by NewsRx correspondents, research
stated, "Recent studies show that lobular carcinoma in situ (LCIS) and invasive lobular carcinoma (ILC) share similar genetic molecular biology. There are increasing concerns regarding the biological significance of LCIS."

Our news journalists obtained a quote from the research from Rush University, "The aim of this study is to investigate whether the presence of coexisting LCIS in ILC affects tumor biology and behavior and to correlate it with other clinicopathologic parameters. In this study, 254 cases of ILC were included. Clinicopathologic parameters and immunohistochemical stains for estrogen receptor (ER), progesterone receptor (PR), E-cadherin, human epidermal growth factor receptor (HER2), and MIB-1 of 254 ILC cases were retrieved. The patient with ILC and coexisting LCIS were compared with pure ILC cases with respect to different clinicopathologic parameters. Of the 254 cases, 107 cases were pure ILC and 147 cases were ILC with coexisting LCIS. Seventy-six (76/184, 41.32%) cases showed axillary lymph node metastases. Lymph node metastasis was absent in 108 cases, micrometastasis was present in 5 cases, and stage N1, N2, N3 in 51, 5, and 15 cases, respectively. Nodal involvement, locoregional and distant recurrence of ILC with LCIS were less frequent compared with ILC without LCIS with P-value of 0.034 and 0.007, respectively. The presence of coexisting LCIS in ILC predicted higher disease-free survival (DFS) compared with pure ILC (P=0.034, log-rank test). When divided into different strata, ER-positive ILC cases with associated LCIS cases showed better DFS than ER-positive pure ILC cases (P=0.021, log-rank test). Similarly, ILC cases with LCIS in patient less than 50 years showed better DFS than the patient less than 50 years with pure ILC (P=0.045, log-rank test). In conclusion, ILC coexisting with lobular carcinoma in situ (ILC+LCIS) is characterized by less nodal involvement, lower locoregional, and distant recurrence and better DFS than pure ILC. When divided into different strata, ER-positive and less than 50-year groups with ILC+LCIS show even significant better DFS than pure ILC."

According to the news editors, the research concluded: "These findings suggest that there is biological significance of coexisting LCIS in ILC and that this may have more effect on tumor aggressiveness in certain strata of ILC."

For more information on this research see: Prognostic Value of Coexisting Lobular Carcinoma In Situ With Invasive Lobular Carcinoma. Applied Immunohistochemistry & Molecular Morphology, 2016;24(10):738-743. Applied Immunohistochemistry & Molecular Morphology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. New Findings from Russian Academy of Science Update Understanding of Microtubule-Organizing Center (Nuclear alignment in myotubes requires centrosome proteins recruited by nesprin-1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Microtubule-Organizing Center is now available. According to news reporting out of Vladivostok, Russia, by NewsRx editors, research stated, "Myotubes are syncytial cells generated by fusion of myoblasts. Among the numerous nuclei in myotubes of skeletal muscle fibres, the majority are equidistantly positioned at the periphery, except for clusters of multiple nuclei underneath the motor endplate."

Financial support for this research came from Association Francaise contre les Myopathies.

Our news journalists obtained a quote from the research from the Russian Academy of Science, "The correct positioning of nuclei is thought to be important for muscle function and requires nesprin-1 (also known as SYNE1), a protein of the nuclear envelope. Consistent with this, mice lacking functional nesprin-1 show defective nuclear positioning and present aspects of Emery-Dreifuss muscular dystrophy. In this study, we perform small interfering RNA (siRNA) experiments in C2C12 myoblasts undergoing differentiation, demonstrating that the positioning of nuclei requires PCM-1, a protein of the centrosome that relocates to the nuclear envelope at the onset of differentiation in a manner that is dependent on the presence of nesprin-1. PCM-1 itself is required for recruiting proteins of the dynein-dynactin complex and of kinesin motor complexes."

According to the news editors, the research concluded: "This suggests that microtubule motors that are attached to the nuclear envelope support the movement of nuclei along microtubules, to ensure their correct positioning in the myotube."

Our news journalists report that additional information may be obtained by contacting A. Merdes, Russian Academy Sci, Far Eastern Branch, Natl Sci Center Marine Biol, Vladivostok 690041, Russia. Additional authors for this research include V. Dyachuk, C. Chemin, L. Emorine and A. Merdes.

Lung Diseases and Conditions - Chronic Obstructive...

New Findings from S. Roversi and Co-Authors in the Area of Chronic Obstructive Pulmonary Disease Reported (Chronic Obstructive Pulmonary Disease and Cardiac Diseases An Urgent Need for Integrated Care)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease. According to news reporting originating in Modena, Italy, by NewsRx journalists, research stated, "Chronic obstructive pulmonary disease (COPD) is a global health issue with high social and economic costs. Concomitant chronic cardiac disorders are frequent in patients with COPD, likely owing to shared riskfactors (e.g., aging, cigarette smoke, inactivity, persistent low-grade pulmonary and systemic inflammation) and add to the overall morbidity and mortality of patients with COPD."

The news reporters obtained a quote from the research, "The prevalence and incidence of cardiac comorbidities are higher in patients with COPD than in matched control subjects, although estimates of prevalence vary widely. Furthermore, cardiac diseases contribute to disease severity in patients with COPD, being a common cause of hospitalization and a frequent cause of death. The differential diagnosis may be challenging, especially in older and smoking subjects complaining of unspecific symptoms, such as dyspnea and fatigue. The therapeutic management of patients with cardiac and pulmonary comorbidities maybe similarly challenging: bronchodilators may have cardiac side effects, and, vice versa, some cardiac medications should be used with caution in patients with lung disease. The aim of this review is to summarize the evidence of the relationship between COPD and the three most frequent and important cardiac comorbidities in patients with COPD: ischemic heart disease, heart failure, and atrial fibrillation."

According to the news reporters, the research concluded: "We have chosen a practical approach, first summarizing relevant epidemiological and clinical data, then discussing the diagnostic and screening procedures, and finally evaluating the impact of lung-heart comorbidities on the therapeutic management of patients with COPD and heart diseases."

For more information on this research see: Chronic Obstructive Pulmonary Disease and Cardiac Diseases An Urgent Need for Integrated Care. American Journal of Respiratory and Critical Care Medicine, 2016;194(11):1319-1336. New Findings from S.E. Al-Batran et al Broadens Understanding of Chemotherapy [Histopathological regression after neoadjuvant docetaxel, oxaliplatin, fluorouracil, and leucovorin versus epirubicin, cisplatin, and fluorouracil or capecitabine in ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Chemotherapy. According to news reporting out of Frankfurt, Germany, by NewsRx editors, research stated, "Docetaxel-based chemotherapy is effective in metastatic gastric and gastro-oesophageal junction adenocarcinoma, but has not yet been evaluated in the context of resectable patients. Here we report findings from the phase 2 part of the phase 2/3 FLOT4 trial, which compared histopathological regression in patients treated with a docetaxel-based triplet chemotherapy versus an anthracycline-based triplet chemotherapy before surgical resection."

Our news journalists obtained a quote from the research, "In this randomised, open-label, phase 2/3 study, eligible participants were recruited from 28 German oncology centres. Patients with resectable gastric or gastro-oesophageal junction cancer who had clinical stage cT2 or higher, nodal positive (cN+) disease, or both were randomly assigned (1:1) to either three preoperative and three postoperative 3-week cycles of intravenous epirubicin 50 mg/m(2) on day 1, intravenous cisplatin 60 mg/m(2) on day 1, and either fluorouracil 200 mg/m(2) as continuous intravenous infusion or capecitabine 1250 mg/m(2) orally (two doses of 625 mg/m(2) per day) on days 1 to 21 (ECF/ECX group) or four preoperative and four postoperative 2-week cycles of docetaxel 50 mg/m(2), intravenous oxaliplatin 85 mg/m(2), intravenous leucovorin 200 mg/m(2), and fluorouracil 2600 mg/m(2) as a 24 h infusion, all on day 1 (FLOT group). Randomisation was done centrally with an interactive web-response system based on a sequence generated with blocks (block size 2) stratified by Eastern Cooperative Oncology Group performance status, location of primary tumour, age, and nodal status. No masking was done. Central assessment of pathological regression was done according to the Becker criteria. The primary endpoint was pathological complete regression (tumour regression grade TRG1a) and was analysed in the modified intention-to-treat population, defined as all patients who were randomly assigned to treatment excluding patients who had surgery but did not provide resection specimens for central evaluation. The study (including the phase 3 part) has completed enrolment, but follow-up is ongoing and this is an interim analysis. The trial is registered with ClinicalTrials.gov, number NCT01216644. Between Aug 18, 2010, and Aug 10, 2012, 300 patients (152 patients in the ECF/ECX group; 148 patients in the FLOT group) were enrolled into the phase 2 part of the study, 265 of whom (137 in the ECF/ECX group; 128 in the FLOT group) were assessable on a modified intention-to-treat basis. 119 (93%) of 128 patients in the FLOT group and 126 (92%) of 137 patients in the ECF/ECX group were given all planned preoperative cycles of treatment. FLOT was associated with significantly higher proportions of patients achieving pathological complete regression than was ECF/ECX (20 [16%; 95% CI 10-23] of 128 patients vs eight [6%; 3-11] of 137 patients; p=0.02). 44 (40%) of 111 patients in the ECF/ECX group and 30 (25%) of 119 patients in the FLOT group had at least one serious adverse event involving a perioperative medical or surgical complication. The most common non-surgical grade 3-4 adverse events were neutropenia (52 [38%] of 137 patients in the ECF/ECX group vs 67 [52%] of 128 patients in the FLOT group), leucopenia (28 [20%] vs 36 [28%]), nausea (23 [17%] vs 12 [9%]), infection (16 [12%] vs 15 [12%]), fatigue (19 [14%] vs 11 [9%]), and vomiting (13 [10%] vs four [3%])."
According to the news editors, the research concluded: "Perioperative FLOT was active and feasible to administer, and might represent an option for patients with locally advanced, resectable gastric or gastro-oesophageal junction adenocarcinoma."

For more information on this research see: Histopathological regression after neoadjuvant docetaxel, oxaliplatin, fluorouracil, and leucovorin versus epirubicin, cisplatin, and fluorouracil or capecitabine in patients with resectable gastric or gastro-oesophageal junction adenocarcinoma (FLOT. \textit{Lancet Oncology}. 2016;17(12):1697-1708. \textit{Lancet Oncology} can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. \textbf{Oncology - Lymphoblastic Lymphoma}

\textbf{New Findings from Saitama Medical University in the Area of Lymphoblastic Lymphoma Described [Lineage switch with t(6;11)(q27;q23) from T-cell lymphoblastic lymphoma to acute monoblastic leukemia at relapse]}

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Lymphoblastic Lymphoma are discussed in a new report. According to news reporting originating from Saitama, Japan, by NewsRx correspondents, research stated, "We present a patient with T-cell lymphoblastic lymphoma (T-LBL) harboring t(6;11)(q27;q23) that converted to acute monoblastic leukemia at relapse. A 27-year-old man developed T-LBL with a mediastinal mass."

Our news editors obtained a quote from the research from Saitama Medical University, "He exhibited several recurrences in the central nervous system and marrow. A fifth relapse occurred in the marrow, with 42.8% blasts with CD4, CD5, CD7, CD10, CD33, CD34, HLA-DR and cytoplasmic (cy) CD3. While achieving complete remission with nelarabine, sixth relapse occurred in the marrow with 6.8% blasts, which had characteristics of monoblastic features, 2 months later. Marrow blasts were positive for myeloperoxidase, CD4, CD33, CD56, CD64, and HLA-DR, but were negative for cyCD3, CD5, CD7, CD10, and CD34. Marrow cells at both the 5th lymphoid and 6th myeloid relapses had t(6;11)(q27;q23) and the same MLL-MLLT4 fusion transcript. In addition, the MLL-MLLT4 fusion sequences documented in the initial mediastinal cells were the same as seen in peripheral blood cells at the 6th relapse. The patient continues 7th remission after one course of gemtuzumab ozogamicin therapy followed by cord blood transplantation for more than 3 years."
According to the news editors, the research concluded: "Sequential phenotypic and cytogenetic studies may yield valuable insights into the mechanism of leukemic recurrence and possible implications for treatment selection."

The news editors report that additional information may be obtained by contacting N. Asou, Saitama Med Univ, Int Med Center, Dept. of Hematol, Saitama, Japan. Additional authors for this research include K. Tokunaga, Y. Watanabe, T. Kawakita, N. Harada, S. Yamaguchi, K. Nosaka, H. Mitsuya and N. Asou.

**Oncology - Prostate Cancer**

**New Findings from Sansom Institute for Health Research in the Area of Prostate Cancer Reported (Targeting CDK9: a promising therapeutic opportunity in prostate cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting originating in Adelaide, Australia, by NewsRx journalists, research stated, "Cyclin-dependent kinase 9 (CDK9) is a key transcriptional regulator and a lucrative target for cancer treatment. Targeting CDK9 can effectively confine the hyperactivity of androgen receptor and the constitutive expression of anti-apoptotic proteins; both being main causes of prostate cancer (PCa) development and progression."

The news reporters obtained a quote from the research from Sansom Institute for Health Research, "In castrate-resistant PCa, traditional therapies that only target androgen receptor (AR) have become obsolete due to reprogramming in AR activity to make the cells independent of androgen. CDK9 inhibitors may provide a new and better therapeutic opportunity over traditional treatment options by targeting both androgen receptor activity and antiapoptotic proteins, improving the chances of positive outcomes, especially in patients with the advanced disease."

According to the news reporters, the research concluded: "This review focuses on biological functions of CDK9, its involvement with AR and the potential for therapeutic opportunities in PCa treatment."

For more information on this research see: Targeting CDK9: a promising therapeutic opportunity in prostate cancer. *Endocrine-Related Cancer*, 2016;23(12):T211-T226.

**Human Herpesvirus Diseases and Conditions --**

**New Findings from School of Medicine Describe Advances in Epstein-Barr Virus [Diagnostic dilemma: Epstein-Barr virus (EBV) infectious mononucleosis with lung involvement or co-infection with Legionnaire's disease?]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Human Herpesvirus Diseases and Conditions - Epstein-Barr Virus. According to news reporting out of Stony Brook, New York, by NewsRx editors, research stated, "Hospitalized adults with fever and 'pneumonia' can be a difficult diagnostic challenge particularly when the clinical findings may be due to different infectious diseases. We recently had an elderly female who presented with fever, fatigue and dry cough with elevated serum transaminases and lung infiltrates."

Our news journalists obtained a quote from the research from the School of Medicine, "The diagnosis of Epstein Barr virus (EBV) infectious mononucleosis (IM) was made based on a positive Monospot test, elevated EBV VCA IgM titer, and highly elevated EBV viral load. Her chest infiltrates were not accompanied by hilar adenopathy which may occur with EBV IM. Her dry cough persisted and she developed abdominal pain. Legionnaire's disease was considered because she had extra-pulmonary findings characteristic of Legionnaire's disease, e.g., relative bradycardia, abdominal pain, hyponatremia, hypophosphatemia, elevated ferritin levels, microscopic hematuria. Legionella titers were negative, but Legionella (serogroup 1) urinary antigen was positive."

According to the news editors, the research concluded: "We present a diagnostic dilemma in an elderly female with both Legionnaire's disease and Epstein Barr virus infectious mononucleosis with pulmonary involvement."

For more information on this research see: Diagnostic dilemma: Epstein-Barr virus (EBV) infectious mononucleosis with lung involvement or co-infection with Legionnaire's disease? *Heart & Lung*, 2016;45(6):563-566. *Heart & Lung* can be contacted at: Mosby-Elsevier, 360 Park Avenue South, New York, NY 10010-1710, USA. Oncology - Lung Cancer

New Findings from School of Medicine Update Understanding of Lung Cancer (The potential utility of re-mining results of somatic mutation testing: KRAS status in lung adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Lung Cancer have been presented. According to news reporting originating in Hanover, New Hampshire, by NewsRx journalists, research stated, "KRAS mutant non-small cell lung cancers (NSCLCs) vary in clinical outcome depending on which specific KRAS mutation is present. Shorter progression free survival has been associated with KRAS variants G12C and G12V."

The news reporters obtained a quote from the research from the School of Medicine, "Cell lines with these variants depend to a greater extent on the RAS/RAF/MEK/ERK signaling pathway and become more susceptible to MEK inhibition. Because different KRAS mutations may lead to altered drug sensitivity, we aimed to determine specific KRAS mutation status in a NSCLC patient cohort at our institution. A total of 502 NSCLC samples were screened for somatic mutations using the 50 gene AmpliSeg™ Cancer Hotspot Panel v2 (CHPv2). However only samples positive for variants in the KRAS gene were included in this study. Variants identified in the KRAS genes were curated using publicly available databases. The overall mutation rate in the KRAS gene was 32.7% (164/502). The most common KRAS mutations were G12C (41%), G12V (19%), and G12D (14%) along with less frequent variants. After re-mining our sequencing data, we found that more than a half of our KRAS mutant NSCLC patients could potentially benefit from the addition of a MEK inhibitor such as selumetinib to standard chemotherapeutic agents."

According to the news reporters, the research concluded: "Due to mutated KRAS, these patients will likely fail traditional anti-EGFR therapies but be eligible for newer combination therapies."

Our news correspondents report that additional information may be obtained by contacting G.J. Tsongalis, Geisel Sch Med Dartmouth, Hanover, NH 03755, United States. Additional authors for this research include P.D. Tsongalis, J.D. Peterson, F.B. de Abreu, C.C. Black, E.J. Gutmann, X.Y. Liu, L.J. Tafe, C.I. Amos and G.J. Tsongalis.

Biotechnology - Molecular Pharmaceutics

New Findings from School of Pharmacy in the Area of Molecular Pharmaceutics Reported (Role of Molecular Interactions for Synergistic Precipitation Inhibition of Poorly Soluble Drug in Supersaturated Drug-Polymer-Polymer Ternary Solution)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Biotechnology - Molecular Pharmaceutics are presented in a new report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "We are reporting a synergistic effect of combined Eudragit E100 and PVP K90 in precipitation inhibition of indomethacin (IND) in solutions at low polymer concentration, a phenomenon that has significant implications on the usefulness of developing novel ternary solid dispersion of poorly soluble drugs. The IND supersaturation was created by cosolvent technique, and the precipitation studies were performed in the absence and the presence of individual and combined PVP K90 and Eudragit E100."

Our news journalists obtained a quote from the research from the School of Pharmacy, "The studies were also done with PEG 8000 as a noninteracting control polymer. A continuous UV recording of the IND absorption was used to observe changes in the drug concentration over time. The polymorphic form and morphology of precipitated IND were characterized by Raman spectroscopy and scanning electron microscopy. The change in the chemical shift in solution (1)H NMR was used as novel approach to probe IND-polymer interactions. Molecular modeling was used for calculating binding energy between IND-polymer as another indication of IND-polymer interaction. Spontaneous IND precipitation was observed in the absence of polymers. Eudragit E100 showed significant inhibitory effect on nuclei formation due to stronger interaction as reflected in higher binding energy and greater change in chemical shift by NMR. PVP K90 led to significant crystal growth inhibition due to adsorption on growing IND crystals as confirmed by modified crystal habit of precipitate in the presence of PVP K90. Combination of polymers resulted in a synergistic precipitation inhibition and extended supersaturation. The NMR confirmed interaction between IND-Eudragit E100 and IND-PVP K90 in solution. The combination of polymers showed similar peak shift albeit using lower polymer concentration indicating stronger interactions."

According to the news editors, the research concluded: "The results established the significant synergistic precipitation inhibition effect upon combining Eudragit E100 and PVP
K90 due to drug-polymer interaction."

For more information on this research see: Role of Molecular Interactions for Synergistic Precipitation Inhibition of Poorly Soluble Drug in Supersaturated Drug-Polymer-Polymer Ternary Solution. *Molecular Pharmaceutics*, 2016;13(3):756-65. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

**Lung Diseases**

**New Findings from School of Public Health in the Area of Lung Diseases Reported (High risks of lung disease associated with early-life and moderate lifetime arsenic exposure in northern Chile)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases have been published. According to news originating from Berkeley, California, by NewsRx correspondents, research stated, "Arsenic in drinking water has been associated with increases in lung disease, but information on the long-term impacts of early-life exposure or moderate exposure levels are limited. We investigated pulmonary disease and lung function in 795 subjects from three socio-demographically similar areas in northern Chile: Antofagasta, which had a well-described period of high arsenic water concentrations (860 μg/L) from 1958 to 1970; Iquique, which had long-term water concentrations near 60 μg/L; and Arica, with long-term water concentrations <= 10 μg/L."

Our news journalists obtained a quote from the research from the School of Public Health, "Compared to adults never exposed >10 μg/g/L, adults born in Antofagasta during the high exposure period had elevated odds ratios (OR) of respiratory symptoms (e.g., OR for shortness of breath = 5.56, 90% confidence interval (CI): 2.68-11.5), and decreases in pulmonary function (e.g., 224 mL decrease in forced vital capacity in nonsmokers, 90% CI: 97-351 mL). Subjects with long-term exposure to arsenic water concentrations near 60 μg/g/L also had increases in some pulmonary symptoms and reduced lung function. Overall, these findings provide new evidence that in utero or childhood arsenic exposure is associated with non-malignant pulmonary disease in adults."

According to the news editors, the research concluded: "They also provide preliminary new evidence that longterm exposures to moderate levels of arsenic may be associated with lung toxicity, although the magnitude of these latter findings were greater than expected and should be confirmed."

For more information on this research see: High risks of lung disease associated

The news correspondents report that additional information may be obtained from C. Steinmaus, UC Berkeley Sch Public Hlth, Arsen Hlth Effects Res Program, Berkeley, CA, United States. Additional authors for this research include C. Ferreccio, J. Acevedo, J.R. Balmes, J. Liaw, P. Troncoso, D.C. Dauphine, A. Nardone and A.H. Smith.

Drugs and Therapies - Ethnopharmacology

New Findings from Second Military Medical University Describe Advances in Ethnopharmacology [Toxic polyacetylenes in the genus Bupleurum (Apiaceae) - Distribution, toxicity, molecular mechanism and analysis]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Ethnopharmacology. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Ethnopharmacological relevance: The genus Bupleurum includes approximately 200 species that are widely distributed in the Northern Hemisphere, Eurasia and North Africa. Certain species of this genus have long been used as antiphlogistic, antipyretic and analgesic agents in traditional folk medicine."

The news correspondents obtained a quote from the research from Second Military Medical University, "As described in the Chinese Pharmacopoeia, the roots of Bupleurum chinense DC. and B. scorzonerifolium Willd. are the herbal materials that compose Chaihu (Radix Bupleuri), a well-known TCM herb. Aim of the review: This review aims to provide up-to-date and comprehensive information regarding the distribution, toxicity, molecular mechanism and relatively new methods for the qualitative and quantitative determination of polyacetylenes in different Bupleurum species. The information needed for this paper were sourced from publishing sites such as Elsevier, science Direct, PubMed; electronic search engines such as Scopus and Web of Science, Google scholar; other scientific database sites for chemicals such as ChemSpider, PubChem, SciFinder, and also from on line books.

Polyacetylenes, which are widely distributed in genus Bupleurum of the Apiaceae family, have high toxicity. Among polyacetylenes, bupleurotoxin, acetylbupleurotoxin and oenanthotoxin have strong neurotoxicity. Through previous research, it was found that the toxicity of Bupleurum polyacetylenes manifested as epileptic seizures, with the target of toxicity being the brain. The neurotoxicity of polyacetylenes exhibits a relationship with the gamma-aminobutyric
acid (GABA) receptor pathway, and polyacetylenes have been shown to inhibit GABA-induced currents (I-GABA) in a competitive manner. The plants of genus Bupleurum have been used in traditional medicine for thousands of years. However, certain species of this genus are poisonous, and it was attributed to the high content of polyacetylenes. The present review indicates that certain polyacetylenes in the genus Bupleurum have highly neurotoxic effects. The major challenge with regard to toxic polyacetylenes is to test their neurotoxic effects in vivo as well as in further preclinical studies, which will require large amounts of purified polyacetylenes. More reference substances should be prepared, and sophisticated analytical technologies should be developed to comprehensively assess the quality of Radix Bupleuri herbs."

According to the news reporters, the research concluded: "These investigations will be helpful for further utilization of the plants of genus Bupleurum."

Our news journalists report that additional information may be obtained by contacting J. Su, Second Military Med Univ, Sch Pharm, Shanghai 200433, People's Republic of China. Additional authors for this research include W.D. Zhang and J. Su.

Keywords for this news article include: Shanghai, People's Republic of China, Asia, Ethnopharmacology, Drugs and Therapies, Article Review, Second Military Medical University.

**Drugs and Therapies - Adverse Drug Reactions**

**New Findings from Seoul National University Update Understanding of Adverse Drug Reactions (Risk Factors for the Adverse Events after Conversion from Twice-Daily to Once-Daily Tacrolimus in Stable Liver Transplantation Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Adverse Drug Reactions is the subject of a report. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Despite the therapeutic equivalence between twice-daily and once-daily tacrolimus, patient safety after conversion is still a concern. We reviewed 218 liver transplantation (LT) patients who converted twice-daily to once-daily tacrolimus between May 2011 and January 2014."

The news correspondents obtained a quote from the research from Seoul National University, "Thirty (13.8%) patients had adverse events after conversion, with a liver function test (LFT) abnormality being the most common adverse event (n = 17). Despite the decrease in serum tacrolimus of > 30% after conversion, none of the patients who were converted to a dosage ratio (once-daily tacrolimus dosage: twice-daily tacrolimus dosage) > 1 had an LFT abnormality. Most patients with an LFT abnormality improved after increasing the once-daily
tacrolimus dosage (n = 2), returned to a previous medication, and/or added another immunosuppressant (n = 15). One patient had acute cellular rejection, which improved after steroid pulse treatment, and another patient had graft failure. In patients with a dosage ratio <= 1, the conversion time within 5 years after LT was the only significant risk factor for an LFT abnormality after conversion (odds ratio: 11.850, 95% confidence interval: 1.321-106.325, P = 0.027)."

According to the news reporters, the research concluded: "The dosage ratio and time after LT should be carefully considered during conversion from twice-daily to once-daily tacrolimus."

For more information on this research see: Risk Factors for the Adverse Events after Conversion from Twice-Daily to Once-Daily Tacrolimus in Stable Liver Transplantation Patients. Journal of Korean Medical Science, 2016;31(11):1711-1716. Journal of Korean Medical Science can be contacted at: Korean Acad Medical Sciences, 302 75 Dong Du Ichon, Dong Yongsan Ku, Seoul 140 031, South Korea.

Our news journalists report that additional information may be obtained by contacting K.W. Lee, Seoul National University, Dept. of Surg, Coll Med, Seoul 03080, South Korea. Additional authors for this research include K.W. Lee, J. Jeong, H. Kim, N.J. Yi and K.S. Suh.

**Oncology - Thyroid Cancer**

**New Findings from Seoul National University in the Area of Thyroid Cancer Reported (Recurrence and Survival After Gross Total Removal of Resectable Undifferentiated or Poorly Differentiated Thyroid Carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Thyroid Cancer are presented in a new report. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "This study aimed to evaluate the recurrence and survival after initial curative-intent surgery of resectable anaplastic thyroid cancer (ATC) and poorly differentiated thyroid cancer (PDTC). A retrospective analysis was conducted on patients with ATC and PDTC who had been treated between 1985 and 2013."

The news reporters obtained a quote from the research from Seoul National University, "Among them, 119 patients who had undergone surgery with curative intent were included in this study. The outcome measures included the clinical response to treatment and the recurrence rates of three separate thyroid cancer groups: ATC, differentiated thyroid cancer (DTC) with anaplastic foci, and PDTC. Initial remission was achieved in 100 (84.0%) patients, with higher percentages in patients with DTC with anaplastic foci (97.8%) and PDTC (96.7%) compared with ATC (60.5%). The overall recurrence rate after initial remission was 30.8% in ATC, 25.9% in PDTC, and 6.7% in DTC with anaplastic foci. Pathologic diagnosis, preexisting goiter or tumors, along with tracheal and lymphatic/vascular invasion were correlated with
recurrence ($p < 0.001$; $p = 0.001, 0.006, 0.003,$ and $0.016,$ respectively). All patients without initial remission died due to local failure, and most patients with recurrence, apart from two PDTC patients, had distant metastasis. Overall mortality after initial curative-intent surgery was $58.1\%$ in ATC, $8.7\%$ in DTC with anaplastic foci, and $20\%$ in PDTC. The initial remission of resectable tumors was higher and the recurrence rate was lower in DTC with anaplastic foci and PDTC compared with ATC."

According to the news reporters, the research concluded: "Careful monitoring of the development of distant metastasis is necessary, especially in patients with aggressive pathology with tracheal and lymphovascular invasion."

For more information on this research see: Recurrence and Survival After Gross Total Removal of Resectable Undifferentiated or Poorly Differentiated Thyroid Carcinoma. *Thyroid, 2016;26(9):1259-1268.* *Thyroid* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. **Drugs and Therapies - Drug Delivery Systems**

**New Findings from Shandong University Describe Advances in Drug Delivery Systems (Redox-sensitive mPEG-SS-PTX/TPGS mixed micelles: An efficient drug delivery system for overcoming multidrug resistance)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news reporting originating in Shandong, People's Republic of China, by NewsRx journalists, research stated, "The main cause of multidrug resistance (MDR) is overexpression of active efflux transporters, such as P-glycoprotein (P-gp). To reverse MDR and improve the chemotherapy effect of paclitaxel (PTX), we propose a new drug delivery system based on mixed micelles constructed with D-a-tocopheryl poly (ethylene glycol) 1000 succinate (TPGS) and the mPEG-SS-PTX conjugate with consideration that TPGS is a P-gp inhibitor that can block the cancer cell action of pumping drugs outside of cells and can enhance the anticancer effect. mPEG-SS-PTX is synthesized by conjugating hydrophilic mPEG with a hydrophobic drug, PTX, via a redox-sensitive disulfide bond."

Financial support for this research came from National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Shandong University,
"The mPEG-SS-PTX conjugate is amphiphilic and can self-assemble in water. Mixed micelles formed by the mPEG-SS-PTX conjugate and TPGS have a low critical micelle concentration (CMC, similar to 1.05 x 10 (3) mg/mL) and high drug loading content (similar to 19.6%). The disulfide bond in the mPEG-SS-PTX conjugate can be broken in cancer cells (a reductive environment) and release PTX to kill cancer cells. In vitro cytotoxicity and cell uptake suggest that mixed micelles can effectively improve the accumulation of PTX in multidrug-resistant MCF-7 cells."

According to the news reporters, the research concluded: "Therefore, the present as-prepared mixed micelles very effectively reverse the MDR and enhance the therapeutic effect."

For more information on this research see: Redox-sensitive mPEG-SS-PTX/TPGS mixed micelles: An efficient drug delivery system for overcoming multidrug resistance. 

Our news correspondents report that additional information may be obtained by contacting Y.X. Luan, Shandong University, Sch Pharmaceut Sci, Jinan 250012, Shandong, People's Republic of China. Additional authors for this research include H.Y. Zhang, S.F. Yang, W.X. He and Y.X. Luan.

Heart Disorders and Diseases - Heart Failure

New Findings from Shanghai Jiao-Tong University School of Medicine in the Area of Heart Failure Described (Sildenafil ameliorates left ventricular T-tubule remodeling in a pressure overload-induced murine heart failure model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Sildenafil, a phosphodiesterase 5 (PDE5) inhibitor, has been shown to exert beneficial effects in heart failure. The purpose of this study was to test whether sildenafil suppressed transverse-tubule (T-tubule) remodeling in left ventricular (LV) failure and thereby providing the therapeutic benefits."

The news reporters obtained a quote from the research from the Shanghai Jiao-Tong University School of Medicine, "A pressure overload-induced murine heart failure model was established in mice by thoracic aortic banding (TAB). One day after TAB, the mice received sildenafil (100 mg?kg(-1)?d(-1), sc) or saline for 5 weeks. At the end of treatment, echocardiography was used to examine LV function. Then the intact hearts were dissected out
and placed in Langendorff-perfusion chamber for in situ confocal imaging of T-tubule ultrastructure from epicardial myocytes. TAB surgery resulted in heart failure accompanied by remarkable T-tubule remodeling. Sildenafil treatment significantly attenuated TAB-induced cardiac hypertrophy and congestive heart failure, improved LV contractile function, and preserved T-tubule integrity in LV cardiomyocytes. But sildenafil treatment did not significantly affect the chamber dilation. The integrity of LV T-tubule structure was correlated with cardiac hypertrophy ($R^2=0.74$, $p<0.01$) and global LV function ($R^2=0.47$, $p<0.01$).

According to the news reporters, the research concluded: "Sildenafil effectively ameliorates LV T-tubule remodeling in TAB mice, revealing a novel mechanism underlying the therapeutic benefits of sildenafil in heart failure."

Our news correspondents report that additional information may be obtained by contacting C.K. Huang, Shanghai General Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai 200080, People's Republic of China. Additional authors for this research include B.Y. Chen, A. Guo, R. **Cell Research - Blood Cells**

**New Findings from Shanghai Ocean University Update Understanding of Blood Cells (Characterization of allograft inflammatory factor-1 in Hyriopsis cumingii and its expression in response to immune challenge and pearl sac formation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cell Research - Blood Cells have been published. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The allograft inflammatory factor-1 (AIF-1) is one of the key factors associated with inflammatory response and immune defense. In the present study, we report the identification and characterization of AIF-1 from triangle sail mussel Hyriopsis cumingii (HcAIF-1)."

Financial supporters for this research include National Natural Science Foundation of China, National Science and Technology Support Program, Shanghai Collaborative Innovation Center for Aquatic Animal Genetics and Breeding, Project of Shanghai Engineering and Technology Center for Promoting Ability.
Our news editors obtained a quote from the research from Shanghai Ocean University. "The full-length cDNA of HcAIF-1 consisted of a 5'-terminal untranslated region (UTR) of 80 bp, a 3'-UTR of 420 bp with a poly (A) tail, and an open reading frame of 444 bp encoding a polypeptide of 147 amino acids with two conserved EF-hand Ca2+-binding motifs. HcAIF-1 mRNA and protein were expressed in all examined tissues and showed higher mRNA expression levels were observed in immune tissues, especially hemocytes and mantle, and the highest protein expression level was in mantle. The expression level of HcAIF-1 mRNA was significantly upregulated in hemocytes 12-48 h after lipopolysaccharide challenge. After mantle tissue implantation, the expression level of this gene in pearl sac decreased significantly at 3-48 h (P < 0.01), and then was significantly upregulated at 96 h (P < 0.05) and recovered to the control level at 21-28 d. There was significant increase HcAIF-1 transcript abundance in hemocytes 96 h (P < 0.05) after mantle tissue implantation. The phagocytosis rate was significantly enhanced in hemocytes 3-24 h (P < 0.01) after the injection of recombinant HcAIF-1 protein."

According to the news editors, the research concluded: "These findings suggest that HcAIF-1 is important in the underlying mechanism of the innate immune responses and pearl sac formation of H. cumingii."

The news editors report that additional information may be obtained by contacting J.L. Li, Shanghai Ocean Univ, Shanghai Engn Res Center Aquaculture, Shanghai 201306, People's Republic of China. Additional authors for this research include Z.Y. Bai, L.T. Zhao and J.L. Li.

Lymphatic Diseases and Conditions - Lymphedema

**New Findings from Shanghai University in the Area of Lymphedema Described (Total saponins of panaxnotoginseng promotes lymphangiogenesis by activation VEGF-C expression of lymphatic endothelial cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lymphatic Diseases and Conditions - Lymphedema. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Lymphatic system plays an important role in maintaining the fluid homeostasis and normal immune responses,
anatomic or functional obstruction of which leads to lymphedema, and treatments for therapeutic lymphangiogenesis are efficiency for secondary lymphedema. Total saponins of panaxnotoginseng (PNS) are a mixture isolated from Panaxnotoginseng (Burkill) F.H.Chen, which has been used as traditional Chinese medicine in China for treatment of cardio- and cerebro-vascular diseases.

Financial supporters for this research include National Natural Science Foundation, National Outstanding Doctoral Dissertation, NIH.

The news reporters obtained a quote from the research from Shanghai University, "The aim of this study was to determine the effect and mechanism of PNS on lymphangiogenesis. The Tg (fli1: egfp; gata1: dsred) transgenic zebrafish embryos were treated with different concentrations of PNS (10, 50, 100 mu M) for 48 h with or without the 6 h pretreatment of the 30 ISM Vascular endothelial growth factors receptor (VEGFR)-3 kinase inhibitor, followed with morphological observation and lymphangiogenesis of thoracic duct assessment. The effect of PNS on cell viability, migration, tube formation and Vascular endothelial growth factors (VEGF)-C mRNA and protein expression of lymphatic endothelial cells (LECs) were determined. The role of phosphatidylinositol-3 (PI-3)-kinase (PI3K), extracellular signal-regulated kinase (ERK)1/2 pathways, c-Jun N-terminal kinase (JNK) and P38 mitogen activated protein kinases (MAPK) signaling in PNS-induced VEGF-C expression of LECs by using pharmacological agents to block each signal. PNS promotes lymphangiogenesis of thoracic duct in zebrafish with or without VEGFR3 Kinase inhibitor pre-impairment. PNS promotes proliferation, migration and tube formation of LECs. The tube formation induced by PNS could be blocked by VEGFR3 Kinase inhibitor. PNS induce VEGF-C expression of LEC, which could be blocked by ERK1/2, PI3K and P38MAPK signaling inhibitors. PNS activates lymphangiogenesis both in vivo and in vitro by up-regulating VEGF-C expression and activation of ERK1/2, PI3K and P38MAPK signaling."

According to the news reporters, the research concluded: "These findings provide a novel insight into the role of PNS in lymphangiogenesis and suggest that it might be an attractive and suitable therapeutic agent for treating secondary lymphedema or other lymphatic system impairment related disease."

Our news correspondents report that additional information may be obtained by contacting J.L. Li, Shanghai Univ Tradit Chinese Med, Longhua Hosp, Dept. of Orthopaed, Shanghai 200032, People's Republic of China. Additional authors for this research include Y. Chen, L. Zhang, L.P. Xing, H. Xu, Y.J. Wang, Q. Shi and Q.Q. Liang.

New Findings from ShanghaiTech University in the Area of Controlled Release Research Described (Delivery methods for site-specific nucleases: Achieving the full potential of therapeutic gene editing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Controlled Release Research are presented in a new report. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The advent of site-specific nucleases, particularly CRISPR/Cas9, provides researchers with the unprecedented ability to manipulate genomic sequences. These nucleases are used to create model cell lines, engineer metabolic pathways, produce transgenic animals and plants, perform genome-wide functional screen and, most importantly, treat human diseases that are difficult to tackle by traditional medications."

Financial supporters for this research include Natural Science Foundation of China, ShanghaiTech University.

Our news journalists obtained a quote from the research from ShanghaiTech University, "Considerable efforts have been devoted to improving the efficiency and specificity of nucleases for clinical applications. However, safe and efficient delivery methods remain the major obstacle for therapeutic gene editing."

According to the news editors, the research concluded: "In this review, we summarize the recent progress on nuclease delivery methods, highlight their impact on the outcomes of gene editing and discuss the potential of different delivery approaches for therapeutic gene editing."

For more information on this research see: Delivery methods for site-specific nucleases: Achieving the full potential of therapeutic gene editing. Journal of Controlled Release, 2016;244():83-97. New Findings from Sichuan University Describe Advances in Atherosclerosis (Liver function may play an uneven role in haemorrhagic transformation for stroke subtypes after acute ischaemic stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting out of Chengdu, People's Republic of China, by NewsRx editors, research stated, "Haemorrhagic transformation (HT) is common after acute ischaemic stroke. Whether liver function plays a role in HT remains an open question."

Financial supporters for this research include National Natural Science Foundation of China, National Key Technology R&D Program for the 12th Five-Year Plan of the People's Republic of China.

Our news journalists obtained a quote from the research from Sichuan University, "Acute ischaemic stroke patients within 7 days from stroke onset were included. Baseline data including liver function tests were collected. An independent association between liver function and HT was identified by multivariate regression analysis for stroke overall and stroke subtypes. A total of 2788 patients were included. HT occurred in 277 patients (9.9%), with 32 patients (1.1%) with symptomatic HT and 245 patients (8.8%) with asymptomatic HT. On multivariate regression analysis, aspartate aminotransferase (AST) and bilirubin (BILI) were independently associated with HT for stroke overall. In different stroke subtypes, AST was independently associated with HT for cardioembolic stroke, BILI for stroke of undetermined aetiology, and no liver function indicators for stroke of large-artery atherosclerosis and small-artery occlusion. Liver function played an uneven role in HT for different stroke subtypes."

According to the news editors, the research concluded: "Indicators of liver function independently associated with HT were AST for cardioembolic stroke, BILI for stroke of undetermined aetiology and none for stroke of large-artery atherosclerosis and small-artery occlusion."

Our news journalists report that additional information may be obtained by contacting G. Tan, Stroke Clinical Research Unit, Dept. of Neurology, West China Hospital, Sichuan University, Chengdu, People's Republic of China. Additional authors for this research include C. Lei, Z. Hao, Y. Chen, R. Yuan and M. Liu.

New Findings from Southeast University Describe Advances in Nanotechnology (Biosynthesized Gold Nanoclusters and Iron Complexes as Scaffolds for Multimodal Cancer Bioimaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nanotechnology have been published. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "Cancer treatment has a far greater chance of success if the neoplasm is diagnosed before the onset of metastasis to vital organs. Hence, cancer early diagnosis is extremely important and remains a major challenge in modern therapeutics."

Funders for this research include National High Technology Research & Development Program of China, National Natural Science Foundation of China, Fundamental Research Funds.

Our news journalists obtained a quote from the research from Southeast University, "In this contribution, facile and new method for rapid multimodal tumor bioimaging is reported by using biosynthesized iron complexes and gold nanoclusters via simple introduction of AuCl4- and Fe2+ ions. The observations demonstrate that the biosynthesized Au nanoclusters may act as fluorescent and computed tomography probes for cancer bioimaging while the iron complexes behave as effective contrast agent for magnetic resonance imaging. The biosynthesized iron complexes and gold nanoclusters are found biocompatible in vitro (MTT (3-(4, 5-dimethylthiazol-2-yl)-2, 5-diphenyltetrazolium bromide) assay) and in vivo for all the vital organs of circulatory and excretory system."

According to the news editors, the research concluded: "These observations raise the possibility that the biosynthesized probes may find applications in future clinical diagnosis for deep seated early neoplasms by multimodal imaging."

New Findings from Southern Medical University in Nanoparticles Provides New Insights (Recent Advances on Inorganic Nanoparticle-Based Cancer Therapeutic Agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nanotechnology - Nanoparticles are presented in a new report. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Inorganic nanoparticles have been widely investigated as therapeutic agents for cancer treatments in biomedical fields due to their unique physical/chemical properties, versatile synthetic strategies, easy surface functionalization and excellent biocompatibility. This review focuses on the discussion of several types of inorganic nanoparticle-based cancer therapeutic agents, including gold nanoparticles, magnetic nanoparticles, upconversion nanoparticles and mesoporous silica nanoparticles."

Our news journalists obtained a quote from the research from Southern Medical University, "Several cancer therapy techniques are briefly introduced at the beginning. Emphasis is placed on how these inorganic nanoparticles can provide enhanced therapeutic efficacy in cancer treatment through site-specific accumulation, targeted drug delivery and stimulated drug release, with elaborations on several examples to highlight the respective strategies adopted."

According to the news editors, the research concluded: "Finally, a brief summary and future challenges are included."

For more information on this research see: Recent Advances on Inorganic Nanoparticle-Based Cancer Therapeutic Agents. *International Journal of Environmental Research and Public Health*, 2016;13(12):163-177. *International Journal of Environmental Research and Public Health* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news correspondents report that additional information may be obtained from F.L. Wang, Southern Med Univ, Sch Lab Med & Biotechnol, Guangzhou 510515, Guangdong, People's Republic of China. Additional authors for this research include C.Y. Li, J. Cheng and Z.Q. Yuan.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Health and Medicine - Urology are discussed in a new report. According to news reporting originating in Bristol, United Kingdom, by NewsRx journalists, research stated, "Mirabegron is a b3 adrenoceptor agonist licensed for the treatment of overactive bladder symptoms, such as urinary urgency or urgency incontinence. b3 adrenoceptor activation causes detrusor muscle relaxation, but mirabegron may also act by binding other targets in the bladder, and it may also reduce activity in sensory nerves. Phase III clinical trials (SCORPIO, ARIES, and CAPRICORN) evaluated mirabegron at various doses, demonstrating reduction from baseline to endpoint in mean incontinence episodes and mean number of micturitions per 24 h (coprimary endpoints), along with health-related quality of life and a range of secondary measures."

The news reporters obtained a quote from the research from Southmead Hospital, "Efficacy was seen in many patients who had previously discontinued antimuscarinic therapy on the grounds of lack of efficacy or poor tolerability. Treatment emergent adverse effects were documented in a long-term study (TAURUS), mostly being of mild or moderate severity. The most frequent adverse effects were hypertension, dry mouth, constipation, and headache, with a lower incidence of dry mouth than for the antimuscarinic active comparator. Efficacy and safety are not substantially different in older patients. A urodynamic safety study in men showed no consistent effect on voiding function, but a small increase in postvoid residual. Use of mirabegron in combination with a-adrenergic blockers does not appear to increase adverse effects. Dose reduction is needed in people with severe renal failure, or moderate hepatic failure. Dose adjustment is not needed in relation to food intake."

According to the news reporters, the research concluded: "Ongoing research is evaluating the potential for combination therapy with antimuscarinics."

For more information on this research see: Clinical use of the b3 adrenoceptor agonist mirabegron in patients with overactive bladder syndrome. Therapeutic Advances In Urology, 2015;7(5):241-8. (Sage Publications - www.sagepub.com/; Therapeutic Advances In Urology - tau.sagepub.com)

Chemistry - Biochemistry

New Findings from St. Jude Children's Research Hospital in the Area of Biochemistry Described (Attacking cancer's Achilles heel: antagonism of antiapoptotic BCL-2 family members)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Chemistry - Biochemistry is the subject of a report. According to news reporting out of Memphis, Tennessee, by NewsRx editors, the research
stated, "Malignant cells routinely violate cellular checkpoints that should initiate cell death in normal cells by triggering pro-apoptotic members of the BCL2 family of proteins. To escape such death inducing signals, cancer cells often select for upregulation of anti-apoptotic BCL-2 family members including BCL-2, BCL-XL, BFL-1, BCL-W and MCL-1."

Our news journalists obtained a quote from the research from St. Jude Children's Research Hospital, "These family members prevent death by sequestering pro-apoptotic molecules. To counter this resistance mechanism, small molecule inhibitors of anti-apoptotic BCL-2 family members have been under development. These molecules have shown promise in pre-clinical and clinical testing to overcome apoptotic resistance, prompting cancer cells to undergo apoptosis. Alternatively, other strategies have taken advantage of the normal regulatory machinery controlling anti-apoptotic molecules and have used inhibitors of signaling pathways to down-modulate the expression of anti-apoptotic molecules, thus tilting the balance in cancer cells to cell death."

According to the news editors, the research concluded: "This review explores recent developments and strategies aimed at antagonizing anti-apoptotic BCL-2 family member action to promote the induction of cell death in cancer therapy."

Our news journalists report that additional information may be obtained by contacting J.T. Opferman, St Jude Childrens Res Hosp, Dept. of Cell & Mol Biol, Memphis, TN 38105, United States.

Keywords for this news article include: Memphis, Tennessee, United States, North and Central America, Biochemistry, Chemistry, Cancer, Article Review, Oncology, St. Jude Children's Research Hospital.

Cardiology

**New Findings from St. Thomas' Hospital Yields New Data on Cardiology**  
(In vitro evaluation of valve-in-valve combinations using a SAPIEN XT valve implanted within PERIMOUNT and Magna Ease pericardial bioprostheses)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "Implantation of a transcatheter heart valve to treat valve failure is an attractive option which is being used more frequently. Despite large clinical experience there is a paucity of in vitro data to support this treatment."

Our news journalists obtained a quote from the research from St. Thomas' Hospital, "Our aim was to provide in vitro performance data on the SAPIEN XT transcatheter heart valve implanted within two types of pericardial surgical heart valve. A SAPIEN XT was implanted within multiple sizes, i.e., 21, 23, 25 of Magna Ease and explanted calcified PERIMOUNT
valves. Each combination underwent in vitro testing according to the ISO 5840 guidance. Combinations were evaluated for embolisation and acute and long-term haemodynamic performance. All combinations met the ISO 5840 minimum requirements for effective orifice area (EOA) and regurgitant fraction at the initiation of the study, after 20 million and 200 million cycles. EOA was above 1.4 cm² for all valve combinations with Magna Ease and above 1.22 cm² with PERIMOUNT combinations. Regurgitant fraction was (<=)7% for SAPIEN XT-Magna Ease combinations and was (<=)10% for SAPIEN XT-PERIMOUNT combinations, which also met the ISO requirements. No embolisation was observed. The largest migration was 1.2 mm.

According to the news editors, the research concluded: "In vitro tests demonstrate excellent haemodynamic performance and durability in the six VIV combinations which are commonly seen in clinical practice."

For more information on this research see: In vitro evaluation of valve-in-valve combinations using a SAPIEN XT valve implanted within PERIMOUNT and Magna Ease pericardial bioprostheses. Eurointervention, 2016;11(11):e1291-301.

The news correspondents report that additional information may be obtained from V. Bapat, Dept. of Cardiothoracic Surgery, Guy’s and St Thomas’ Hospital, London, UK.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4244/EIJV11I11A251. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: London, Europe, Angiology, Cardiology, Pericardial, Embolization, United Kingdom.

Our news editors obtained a quote from the research from Stanford University, "Human ulcerative colitis (UC), UC-associated CRC, and sporadic CRC specimens have similar alterations in atRA metabolic enzymes, consistent with reduced colonic atRA. Inhibition of atRA signaling promoted tumorigenesis, whereas atRA supplementation reduced tumor burden. The benefit of atRA treatment was mediated by cytotoxic CD8(+) T cells, which were activated due to MHCI upregulation on tumor cells. Consistent with these findings, increased colonic expression of the atRA-catabolizing enzyme, CYP26A1, correlated with reduced frequencies of tumoral cytotoxic CD8(+) T cells and with worse disease prognosis in human CRC."

Oncology - Colon Cancer

New Findings from Stanford University in the Area of Colon Cancer Reported [Normalizing Microbiota-Induced Retinoic Acid Deficiency Stimulates Protective CD8(+) T Cell-Mediated Immunity in Colorectal Cancer]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Colon Cancer are presented in a new report. According to news reporting originating from Palo Alto, California, by NewsRx correspondents, research stated, "Although all-trans-retinoic acid (atRA) is a key regulator of intestinal immunity, its role in colorectal cancer (CRC) is unknown. We found that mice with colitis-associated CRC had a marked deficiency in colonic atRA due to alterations in atRA metabolism mediated by microbiota-induced intestinal inflammation."

Our news editors obtained a quote from the research from Stanford University, "Human ulcerative colitis (UC), UC-associated CRC, and sporadic CRC specimens have similar alterations in atRA metabolic enzymes, consistent with reduced colonic atRA. Inhibition of atRA signaling promoted tumorigenesis, whereas atRA supplementation reduced tumor burden. The benefit of atRA treatment was mediated by cytotoxic CD8(+) T cells, which were activated due to MHCI upregulation on tumor cells. Consistent with these findings, increased colonic expression of the atRA-catabolizing enzyme, CYP26A1, correlated with reduced frequencies of tumoral cytotoxic CD8(+) T cells and with worse disease prognosis in human CRC."
According to the news editors, the research concluded: "These results reveal a mechanism by which microbiota drive colon carcinogenesis and highlight atRA metabolism as a therapeutic target for CRC."

For more information on this research see: Normalizing Microbiota-Induced Retinoic Acid Deficiency Stimulates Protective CD8(+) T Cell-Mediated Immunity in Colorectal Cancer. *Immunity*, 2016;45(3):641-655. *Immunity* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Immunity - www.journals.elsevier.com/immunity/)

**Dimethylamines**

**New Findings from State University in the Area of Dimethylamines Reported (Impact of fraction unbound, CYP3A, and CYP2D6 in vivo activities, and other potential covariates to the clearance of tramadol enantiomers in patients with neuropathic ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Dimethylamines is now available. According to news reporting out of Araraquara, Brazil, by NewsRx editors, research stated, "The pharmacokinetics of tramadol is characterized by a large interindividual variability, which is partially attributed to polymorphic CYP2D6 metabolism. The contribution of CYP3A, CYP2B6, fraction unbound, and other potential covariates remains unknown."

Financial supporters for this research include Financiadora de Estudos e Projetos, Fundacao de Apoio ao Ensino e Assistencia do HCFMRP-USP (FAEPA), Conselho Nacional de Desenvolvimento Cientifico e Tecnologico.

Our news journalists obtained a quote from the research from State University, "This study aimed to investigate the contribution of in vivo activities of cytochrome P450 (CYP) 2D6 and 3A as well as other potential covariates (CYP2B6 genotype to the SNP g.15631G >T, fraction unbound, age, body weight, creatinine clearance) to the enantiomeric pharmacokinetics of tramadol. Thirty patients with neuropathic pain and phenotyped as CYP2D6 extensive metabolizers were treated with a single oral dose of 100 mg tramadol. Multiple linear regressions were performed to determine the contribution of CYP activities and other potential covariates to the clearance of tramadol enantiomers. The apparent total clearances were 44.9 (19.1-102.2) L/h and 55.2 (14.8-126.0) L/h for (+)- and (-)-tramadol, respectively [data presented as median (minimum-maximum)]. Between 79 and 83% of the
overall variation in apparent clearance of tramadol enantiomers was explained by fraction unbound, CYP2D6, and CYP3A in vivo activities and body weight. Fraction unbound explained 47 and 41% of the variation in clearance of (+)-tramadol and (-)-tramadol, respectively. Individually, CYP2D6 and CYP3A activities were shown to have moderate contribution on clearance of tramadol enantiomers (11-16% and 11-18%, respectively).

According to the news editors, the research concluded: "Factors affecting fraction unbound of drugs (such as hyperglycemia or co-administration of drugs highly bound to plasma proteins) should be monitored, because this parameter dominates the elimination of tramadol enantiomers."

Our news journalists report that additional information may be obtained by contacting N.V. de Moraes, Faculdade de Ciencias Farmaceuticas, Universidade Estadual Paulista, ZIP 14801-902, Araraquara, SP, Brazil. Additional authors for this research include G.R. Lauretti, E.B. Coelho, A.L. Godoy, D.V. Neves and V.L Lanchote.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/fcp.12168. This DOI is a link to an online electronic document that is either free or for purchase.

Diarylheptanoids

New Findings from State University of New Jersey Describe Advances in Diarylheptanoids (Epigenetics Reactivation of Nrf2 in Prostate TRAMP C1 Cells by Curcumin Analogue FN1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Diarylheptanoids are presented in a new report. According to news reporting from Piscataway, New Jersey, by NewsRx journalists, research stated, "It has previously been shown that curcumin can effectively inhibit prostate cancer proliferation and progression in TRAMP mice, potentially acting through the hypomethylation of the Nrf2 gene promoter and hence activation of the Nrf2 pathway to enhance cell antioxidative defense. FN1 is a synthetic curcumin analogue that shows stronger anticancer activity than curcumin in other reports."

Financial supporters for this research include National Center for Complementary and Alternative Medicine, Office of Dietary Supplements.

The news correspondents obtained a quote from the research from the State University of New Jersey, "We aimed to explore the epigenetic modification of FN1 that restores Nrf2 expression in TRAMP-C1 cells. Stably transfected HepG2-C8 cells were used to investigate the effect of FN1 on the Nrf2-antioxidant response element (ARE) pathway. Real-
time quantitative PCR and Western blotting were applied to study the influence of FN1 on endogenous Nrf2 and its downstream genes. Bisulfite genomic sequencing (BGS) and methylated DNA immunoprecipitation (MeDIP) were then performed to examine the methylation profile of the Nrf2 promoter. An anchorage-independent colony-formation analysis was conducted to examine the tumor inhibition activity of FN1. Epigenetic modification enzymes, including DNMTs and HDACs, were investigated by Western blotting. The luciferase reporter assay indicated that FN1 was more potent than curcumin in activating the Nrf2-ARE pathway. FN1 increased the expression of Nrf2 and its downstream detoxifying enzymes. FN1 significantly inhibited the colony formation of TRAMP-C1 cells. BGS and MeDIP assays revealed that FN1 treatment (250 nM for 3 days) reduced the percentage of CpG methylation of the Nrf2 promoter. FN1 also downregulated epigenetic modification enzymes.

According to the news reporters, the research concluded: "Our results suggest that FN1 is a novel anticancer agent for prostate cancer. In the TRAMP-C1 cell line, FN1 can increase the level of Nrf2 and downstream genes via activating the Nrf2-ARE pathway and inhibit the colony formation potentially through the decreased expression of keap1 coupled with CpG demethylation of the Nrf2 promoter. This CpG demethylation effect may come from decreased epigenetic modification enzymes, such as DNMT1, DNMT3a, DNMT3b, and HDAC4."

For more information on this research see: Epigenetics Reactivation of Nrf2 in Prostate TRAMP C1 Cells by Curcumin Analogue FN1. *Chemical Research In Toxicology*, 2016;29(4):694-703. (American Chemical Society - www.acs.org; Chemical Research In Toxicology - www.pubs.acs.org/journal/crtoec)

Our news journalists report that additional information may be obtained by contacting W. Li, Center for Phytochemical Epigenome Studies, Ernest Mario School of Pharmacy, Rutgers, The State University of New Jersey, Piscataway, New Jersey 08854, United States. **Oncology - Breast Cancer**

**New Findings from Sun Yat Sen University Describe Advances in Breast Cancer (RING1 and YY1 binding protein suppresses breast cancer growth and metastasis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Evidence suggests that RING1 and YY1 binding protein (RYBP) functions as a tumor suppressor. However, its role in breast cancer remains unclear."
The news correspondents obtained a quote from the research from Sun Yat Sen University. "In the present study, the expression of RYBP was assessed in breast cancer patients and cell lines. Disease-free survival durations of breast cancer patients with high RYBP expression were determined based on the ATCG dataset. The effects of RYBP overexpression on cell growth, migration and invasive potency were also assessed. Nude mouse xenograft and lung metastasis models were also used to confirm the role of RYBP. The involvement of SRRM3 in RYBP-mediated breast cancer suppression was explored using SRRM3 siRNA. The potential relationship between RYBP, SRRM3, and REST-003 was examined by qPCR. The results showed that RYBP was downregulated in breast cancer patients and in several breast cancer cell lines. Breast cancer patients with high expression levels of RYBP displayed better disease-free survival. Overexpression of RYBP in MDA-MB-231 and SK-BR-3 cells significantly decreased cell proliferation, migration, and invasion ability, and increased the proportion of cells arrested in S-phase compared with the negative control cells. Additionally, upregulation of proliferation-related cell cycle proteins (cyclin A and cyclin B1) and E-cadherin, and downregulation of snail were observed in RYBP-overexpressing cells. Overexpression of RYBP reduced tumor volume and weight as well as metastatic foci in the lungs of nude mice. SRRM3 knockdown by siRNA, which is downregulated after RYBP overexpression, suppressed cell growth and metastasis in MDA-MB-231 and SK-BR-3 cells. Furthermore, qPCR analysis revealed that REST-003 ncRNA was downregulated in cells overexpressing RYBP and in SRRM3-inhibited cells. Moreover, cell invasion ability and growth were increased after SRRM3 upregulation in RYBP-overexpressing cells, but they were decreased following si-REST-003 transfection."

According to the news reporters, the research concluded: "Overexpression of RYBP suppresses breast cancer growth and metastasis both in vitro and in vivo. SRRM3 and REST-003, which are down regulated in cells overexpressing RYBP, may be involved in RYBP-mediated breast cancer progression."

Our news journalists report that additional information may be obtained by contacting T.Y. Cheang, Sun Yat Sen University Affiliated Hosp 1, Lab Gen Surg, Guangzhou 510080, Guangdong, People's Republic of China. Additional authors for this research include J. Li, Z.Q. Zhang, R.Y. Ye, N. Shao, T.Y. Cheang and S.M. Wang.

**Hormones**

**New Findings from Sun Yat-sen University Cancer Center Describe Advances in Hormones (Melatonin overcomes gemcitabine resistance in pancreatic ductal adenocarcinoma by abrogating nuclear factor-kB activation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Current study results on Hormones have been published. According to news reporting out of Guangzhou, People's Republic of China, by NewsRx editors, research stated, "Constitutive activation and gemcitabine induction of nuclear factor-kB (NF-kB) contribute to the aggressive behavior and chemotherapeutic resistance of pancreatic ductal adenocarcinoma (PDAC). Thus, targeting the NF-kB pathway has proven an insurmountable challenge for PDAC therapy."

Funders for this research include National High Technology Research and Development Program of China, National Natural Science Foundation of China, China Postdoctoral Science Foundation.

Our news journalists obtained a quote from the research from Sun Yat-sen University Cancer Center, "In this study, we investigated whether the inhibition of NF-kB signaling pathway by melatonin might lead to tumor suppression and overcome gemcitabine resistance in pancreatic tumors. Our results showed that melatonin inhibited activities of NF-kB by suppressing IkBa phosphorylation and decreased the expression of NF-kB response genes in MiaPaCa-2, AsPc-1, Panc-28 cells and gemcitabine resistance MiaPaCa-2/GR cells. Moreover, melatonin not only inhibited cell proliferation and invasion in a receptor-independent manner, but also enhanced gemcitabine cytotoxicity at pharmacologic concentrations in these PDAC cells. In vivo, the mice treated with both agents experienced a larger reduction in tumor burden than the single drug-treated groups in an orthotopic xenograft mouse model. Taken together, these results indicate that melatonin inhibits proliferation and invasion of PDAC cells and overcomes gemcitabine resistance of pancreatic tumors through NF-kB inhibition."

According to the news editors, the research concluded: "Our findings therefore provide novel preclinical knowledge about melatonin inhibition of NF-kB in PDAC and suggest that melatonin should be investigated clinically, alone or in combination with gemcitabine for PDAC treatment."

Our news journalists report that additional information may be obtained by contacting H.Q. Ju, Sun Yat-sen University Cancer Center, State Key Laboratory of Oncology in South China, Collaborative Innovation Center for Cancer Medicine, Guangzhou, People's Republic of China. Additional authors for this research include H. Li, T. Tian, Y.X. Lu, L. Bai, L.Z. Chen, H. Sheng, H.Y. Mo, J.B. Zeng, W. Deng, P.J. Chiao and R.H Xu.

Mental Health Diseases and Conditions - Schizophrenia

New Findings from Sungkyunkwan University School of Medicine in the Area of Schizophrenia Described (Association Study of 60 Candidate Genes with Antipsychotic-induced Weight Gain in Schizophrenia Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mental Health Diseases and Conditions - Schizophrenia. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "This study aimed to investigate the association of multiple candidate genes with weight gain and appetite change during antipsychotic treatment. A total of 233 single nucleotide polymorphisms (SNPs) within 60 candidate genes were genotyped."

Our news editors obtained a quote from the research from the Sungkyunkwan University School of Medicine, "BMI changes for up to 8 weeks in 84 schizophrenia patients receiving antipsychotic medication were analyzed using a linear mixed model. In addition, we assessed appetite change during antipsychotic treatment in a different group of 46 schizophrenia patients using the Drug-Related Eating Behavior Questionnaire. No SNP showed a statistically significant association with BMI or appetite change after correction for multiple testing. We observed trends of association (p <0.05) between 19 SNPs of 11 genes and weight gain, and between 7 SNPs of 5 genes and appetite change. In particular, rs696217 in GHRL showed suggestive evidence of association with not only weight gain (p=0.001) but also appetite change (p=0.042). Patients carrying the GG genotype of rs696217 exhibited higher increase in both BMI and appetite compared to patients carrying the GT/TT genotype."

According to the news editors, the research concluded: "Our findings suggested the involvement of a GHRL polymorphism in weight gain, which was specifically mediated by appetite change, during antipsychotic treatment in schizophrenia patients."

For more information on this research see: Association Study of 60 Candidate Genes with Antipsychotic-induced Weight Gain in Schizophrenia Patients. Pharmacopsychiatry, 2016;49(2):51-6. (Thieme - www.thieme.com)

New Findings from Sungkyunkwan University in Lung Diseases Provides New Insights (Clinical Characteristics, Treatment Outcomes, and Resistance Mutations Associated with Macrolide-Resistant Mycobacterium avium Complex Lung Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lung Diseases. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Macrolide antibiotics are key components of the multidrug treatment regimen for treating lung disease (LD) due to Mycobacterium avium complex (MAC). Despite the emergence of macrolide resistance, limited data are available on macrolide-resistant MAC-LD."

Financial supporters for this research include National Research Foundation of Korea (NRF), Korea Health Industry Development Institute (KHIDI).

The news correspondents obtained a quote from the research from Sungkyunkwan University, "This study evaluated the clinical features and treatment outcomes of patients with macrolide-resistant MAC-LD and the molecular characteristics of the macrolide-resistant isolates. A retrospective review of the medical records of 34 patients with macrolide-resistant MAC-LD who were diagnosed between January 2002 and December 2014 was performed, along with genetic analysis of 28 clinical isolates. Nineteen (56%) patients had the fibrocavitary form of MAC-LD, and 15 (44%) had the nodular bronchiectatic form. M. intracellulare was the etiologic organism in 21 (62%) patients. Approximately two-thirds (22/34 [65%]) of the patients had been treated with currently recommended multidrug regimens that included macrolide, ethambutol, and rifamycin prior to the emergence of macrolide resistance, and none had been treated with macrolide monotherapy. The median duration of treatment after the detection of macrolide resistance was 23.0 months (interquartile range, 16.8 to 45.3 months). Treatment outcomes were poor after the development of macrolide resistance, with favorable treatment outcomes achieved in only five (15%) patients, including two patients who underwent surgical resection. One-, 3-, and 5-year mortality rates were 9, 24, and 47%, respectively. Molecular analysis of 28 clinical isolates revealed that 96% (27/28) had point mutations at position 2058 or 2059 of the 23S rRNA gene."

According to the news reporters, the research concluded: "Our analyses indicate that more effective therapy is needed to treat macrolide-resistant MAC-LD and prevent its development."

For more information on this research see: Clinical Characteristics, Treatment Outcomes, and Resistance Mutations Associated with Macrolide-Resistant Mycobacterium avium Complex Lung Disease. Antimicrobial Agents and Chemotherapy, 2016;60(11):6758-6765. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Cardiovascular Research

New Findings from Sungkyunkwan University Kangbuk Samsung Hospital in the Area of Cardiovascular Research Described (Association of Physical Activity and Inflammation With All-Cause, Cardiovascular-Related, and Cancer-Related Mortality)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Research. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "To investigate the association between physical activity (PA) and risk of mortality in a large middle-aged cohort stratified by inflammatory status. A total of 336,560 individuals (mean age, 39.7 years; 58% male) who underwent comprehensive health screenings were enrolled in this prospective cohort study."

The news correspondents obtained a quote from the research from Sungkyunkwan University Kangbuk Samsung Hospital, "They were grouped according to self-reported PA level using a questionnaire: no regular PA with a sedentary lifestyle, regular but insufficient PA (below the guidelines), sufficient PA (concordant with the guidelines), and health-enhancing PA. Inflammation was assessed via high-sensitivity C-reactive protein (hsCRP) level. Study end points were all-cause, cardiovascular-related, and cancer-related mortality. During the 1,976,882 person-years of follow-up (median follow-up duration, 6.17 years), 2062 deaths occurred. Compared with a sedentary lifestyle, the hazard ratios (95% CIs) on the multivariable Cox proportional hazards regression analyses for all-cause mortality by PA level were 0.95 (0.84-1.07), 0.85 (0.72-0.99), and 0.75 (0.60-0.93) (P for trend =.003), and those for cardiovascular- and cancer-related mortality were 0.95, 0.80, and 0.55 (P for trend =.05) and 0.82, 0.83, and 0.78 (P for trend =.01), respectively. Compared with participants with low hsCRP levels and any regular PA, those with high hsCRP levels and no regular PA had a significantly higher risk of mortality (1.59 [1.38-1.84]). Higher PA levels were associated with a dose-dependent reduced risk of cardiovascular-related, cancer-related, and all-cause mortality."

According to the news reporters, the research concluded: "Individuals with high hsCRP levels and no regular PA had the highest risk of mortality."

Our news journalists report that additional information may be obtained by contacting K.C. Sung, Sungkyunkwan University Kangbuk Samsung Hosp, Dept. of Med, Div Cardiol, Seoul, South Korea. Additional authors for this research include S. Ryu, E. Cheong and K.C. Sung.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mayocp.2016.08.003. This DOI is a link to an online electronic document that is either free or for purchase.

Central Nervous System - Telencephalon

New Findings from Tel Aviv University Describe Advances in Telencephalon (Thick corpus callosum in the second trimester can be transient and is of uncertain significance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System - Telencephalon. According to news reporting from Tel Aviv, Israel, by NewsRx journalists, research stated, "Depiction of a thick corpus callosum (CC) in utero is rare, and is generally associated with severe brain anomalies. Our aim was to describe a group of fetuses diagnosed during second-trimester ultrasound examination as having an apparently isolated thick CC, which normalized subsequently in the cases followed to term."

The news correspondents obtained a quote from the research from Tel Aviv University, "Among 59 fetuses referred to the Ob-Gyn Ultrasound Division of Lis Maternity Hospital with suspected callosal anomalies between January 2013 and June 2014, we identified nine cases with an apparently isolated thick CC for inclusion in this retrospective cohort study. Length and body thickness of the CC were compared with previously published nomograms. Fetuses with a suspected isolated thick CC were identified and followed until delivery or termination of pregnancy (TOP). Evaluation consisted of chromosomal analysis, at least one magnetic resonance imaging (MRI) examination and repeat ultrasound examinations. Postnatal evaluation included brain ultrasound examination, MRI when indicated and neurodevelopmental assessment through validated pediatric questionnaires. The nine fetuses were diagnosed with an apparently isolated thick CC at a mean gestational age of 23+5 (range, 21-29) weeks. Eight exhibited a CC body thickness >= 2SD above the mean for gestational age and one exhibited only a thickened genu. Six also exhibited a relatively short CC. Two patients opted for TOP but declined autopsy. In five of the seven remaining fetuses, the CC thickness normalized during follow-up. In the remaining two, the increased CC thickness was a variant of the cingulate sulcus. The CC length remained <= 2SD in five of the six fetuses with a short CC. Fetal MRI was performed and confirmed the diagnosis in six fetuses. The karyotype was normal in all fetuses. Short-term neurodevelopmental outcome was reported as normal in all six children with complete follow-up. Although the number of fetuses in our study is relatively small, it seems that an apparently isolated thick CC is not necessarily associated with poor prognosis."

According to the news reporters, the research concluded: "In such cases, a definitive diagnosis should not be reached based on a single measurement and repeat follow-up.
examinations during the third trimester are recommended."

Our news journalists report that additional information may be obtained by contacting G. Malinger, Tel Aviv University, Sackler Sch Med, Tel Aviv, Israel. Additional authors for this research include J. Har-Toov, T. Lerman-Sagie and G. Malinger.

Keywords for this news article include: Tel Aviv, Israel, Asia, Central Nervous System, Corpus Callosum, Telencephalon, Genetics, Brain, Tel Aviv University.

Drugs and Therapies - Phytotherapy

**New Findings from Tianjin Medical University Update Understanding of Phytotherapy [The Inhibition of UDP-Glucuronosyltransferase (UGT) Isoforms by Praeruptorin A and B]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Phytotherapy have been published. According to news reporting from Tianjin, People's Republic of China, by NewsRx journalists, research stated, "Praeruptorin A (PA) and B (PB) are two important compounds isolated from Bai-hua Qian-hu and have been reported to exert multiple biochemical and pharmacological activities. The present study aims to determine the inhibition of PA and PB on the activity of important phase II drug-metabolizing enzymes uridine 5'-diphosphoglucuronosyltransferase (UGTs) isoforms."

The news correspondents obtained a quote from the research from Tianjin Medical University. "In vitro UGT incubation system was used to determine the inhibition potential of PA and PB on the activity of various UGT isoforms. In silico docking was performed to explain the inhibition difference between PA and PB towards the activity of UGT1A6. Inhibition behaviour was determined, and in vitro-in vivo extrapolation was performed by using the combination of in vitro inhibition kinetic parameter (K-i) and in vivo exposure level of PA. Praeruptorin A (100 mu M) exhibited the strongest inhibition on the activity of UGT1A6 and UGT2B7, with 97.8% and 90.1% activity inhibited by 100 mu M of PA, respectively. In silico docking study indicates the significant contribution of hydrogen bond interaction towards the stronger inhibition of PA than PB towards UGT1A6. Praeruptorin A noncompetitively inhibited the activity of UGT1A6 and competitively inhibited the activity of UGT2B7. The inhibition kinetic parameter (K-i) of PA towards UGT1A6 and UGT2B7 was calculated to be 1.2 and 3.3 mu M, respectively. The [I]/K-i value was calculated to be 15.8 and 5.8 for the inhibition of PA on UGT1A6 and UGT2B7, indicating high inhibition potential of PA towards these two UGT isoforms in vivo."

According to the news reporters, the research concluded: "Therefore, closely monitoring the interaction between PA and drugs mainly undergoing UGT1A6 or UGT2B7-catalyzed metabolism is very necessary."

Keywords for this news article include: Tianjin, People's Republic of China, Asia, Phytotherapy, Drugs and Therapies, Glucuronosyltransferase, Enzymes and Coenzymes, Tianjin Medical University.

**Oncology - Lung Cancer**

**New Findings from Tisch Cancer Institute Describe Advances in Lung Cancer (A mortality study of beryllium workers)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Lung Cancer have been presented. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "We aimed at investigating mortality among beryllium-exposed workers, according to solubility of beryllium and beryllium compounds. We conducted an historical cohort study of 16,115 workers employed during 1925-2008 in 15 facilities, including eight entailing exposure to insoluble beryllium and seven entailing exposure to soluble/mixed beryllium compounds, who were followed up for mortality until 2011."

Financial support for this research came from Materion Brush Inc.

Our news journalists obtained a quote from the research from Tisch Cancer Institute, "Data were analyzed using indirect standardization and Cox regression modeling. Lung cancer standardized mortality ratio (SMR, national reference rates) was 1.02 (95% confidence interval [CI]: 0.94-1.10) in the whole cohort, 0.88 (95% CI: 0.75-1.03) in the insoluble beryllium subcohort, and 1.09 (95% CI: 0.99-1.09) in the soluble/mixed beryllium subcohort. For lung cancer, there was an association with period of hire in soluble/mixed beryllium plants but not in insoluble plants, and, conversely, employment in soluble/mixed plants was associated with increased mortality only among workers hired before 1955. There was no trend with duration of employment. Mortality from chronic beryllium disease increased, in particular, among workers hired before 1955 in soluble/mixed beryllium facilities."

According to the news editors, the research concluded: "There was no increase in lung cancer mortality in the entire cohort and lung cancer mortality was not increased among beryllium workers hired in 1955 or later in soluble/mixed beryllium facilities, or at any time among those employed in insoluble beryllium facilities."

Clinical Research - Clinical Trials and Studies

New Findings from Tokyo Medical and Dental University Describe Advances in Clinical Trials and Studies (Effects of Miconazole Oral Gel on Blood Concentrations of Tacrolimus and Cyclosporine: A Retrospective Observational Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Clinical Research - Clinical Trials and Studies is now available. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Although azole antifungal agents have been shown to affect the pharmacokinetics of calcineurin inhibitors such as tacrolimus (TAC) and cyclosporine (CyA) by inhibiting drug metabolism, there are few clinical reports on drug interactions between miconazole (MCZ) oral gel and calcineurin inhibitors. In this study, the effects of MCZ oral gel on the blood concentrations of TAC and CyA were investigated."

Our news journalists obtained a quote from the research from Tokyo Medical and Dental University, "In this retrospective study, 18 patients concomitantly administered MCZ oral gel and TAC (9 for dermatomyositis, 3 for myasthenia gravis, 2 for systemic lupus erythematosus, 2 for rheumatoid arthritis, 1 for polymyositis, 1 for prevention of graft-versus-host disease after bone marrow transplantation), and 15 patients concomitantly administered MCZ oral gel and CyA (11 for interstitial pneumonia, 2 for pemphigus, 1 for eosinophilic granulomatosis with polyangiitis, 1 for systemic lupus erythematosus) were evaluated. The dose-adjusted blood concentrations of TAC or CyA were compared before and after the initiation of MCZ oral gel. The trough blood concentration/dose (C/D) ratios of TAC and CyA increased significantly with the administration of MCZ oral gel. The median C/D ratios of TAC and CyA increased by 108% (range: -44% to 216%) and 44% (range: -34% to 195%), respectively. These results suggest that MCZ oral gel affects the pharmacokinetics of TAC and CyA."

According to the news editors, the research concluded: "Detailed monitoring of the blood concentrations of these drugs, followed by dose adjustments, is needed for each patient because of the difficulties associated with accurately predicting the degree of the effects of MCZ oral gel."

For more information on this research see: Effects of Miconazole Oral Gel on Blood Concentrations of Tacrolimus and Cyclosporine: A Retrospective Observational Study.

**Clinical Research - Clinical Trials and Studies**

**New Findings from UCL Hospitals in the Area of Clinical Trials and Studies Described (Overall survival in patients with platinum-sensitive recurrent serous ovarian cancer receiving olaparib maintenance monotherapy: an updated analysis from a ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "In patients with platinum-sensitive recurrent serous ovarian cancer, maintenance monotherapy with the PARP inhibitor olaparib significantly improves progression-free survival versus placebo. We assessed the effect of maintenance olaparib on overall survival in patients with platinum-sensitive recurrent serous ovarian cancer, including those with BRCA1 and BRCA2 mutations (BRCAm)."

Our news journalists obtained a quote from the research from UCL Hospitals, "In this randomised, placebo-controlled, double-blind, phase 2 trial involving 82 sites across 16 countries, patients with platinum-sensitive recurrent serous ovarian cancer who had received two or more courses of platinum-based chemotherapy and had responded to their latest regimen were randomly assigned (1:1) using a computer-generated sequence to receive oral maintenance olaparib (as capsules; 400 mg twice a day) or a matching placebo by an interactive voice response system. Patients were stratified by ancestry, time to progression on penultimate platinum, and response to most recent platinum. Patients and investigators were masked to treatment assignment by the use of unique identifiers generated during randomisation. The primary endpoint of the trial was progression-free survival. In this updated analysis, we present data for overall survival, a secondary endpoint, from the third data analysis after more than 5 years' follow-up (intention-to-treat population). We did the updated overall survival analysis, described in this Article at 77% data maturity, using a two-sided a of 0.95%. As the study was not powered to assess overall survival, this analysis should be regarded as descriptive and the p values are nominal. We analysed randomly assigned patients for overall survival and all patients
who received at least one dose of treatment for safety. This trial is ongoing and is registered with ClinicalTrials.gov, number NCT00753545. Between Aug 28, 2008, and Feb 9, 2010, 265 patients were randomly assigned to olaparib (n=136) or placebo (n=129). 136 patients had deleterious BRCAm. The data cutoff for this analysis was Sept 30, 2015. An overall survival advantage was seen with maintenance olaparib versus placebo in all patients (hazard ratio [HR] 0.73 [95% CI 0.55-0.96]; nominal p=0.025, which did not meet the required threshold for statistical significance [p <0.0095]; median overall survival was 29.8 months [95% CI 26.9-35.7] for those treated with olaparib vs 27.8 months [24.9-33.7] for those treated with placebo), and in patients with BRCAm (HR 0.62 [95% CI 0.41-0.94] nominal p=0.025; 34.9 months [95% CI 29.2-54.6] vs 30.2 months [23.1-40.7]). The overall survival data in patients with BRCA wild-type were HR 0.83 (95% CI 0.55-1.24, nominal p=0.37; 24.5 months [19.8-35.0] for those treated with olaparib vs 26.6 months [23.1-32.5] for those treated with placebo). 11 (15%) of 74 patients with BRCAm received maintenance olaparib for 5 years or more. Overall, common grade 3 or worse adverse events in the olaparib and placebo groups were fatigue (11 [8%] of 136 patients vs four [3%] of 128) and anaemia (eight [6%] vs one [1%]). 30 (22%) of 136 patients in the olaparib group and 11 (9%) of 128 patients in the placebo group reported serious adverse events. In patients treated for 2 years or more, adverse events in the olaparib and placebo groups included low-grade nausea (24 [75%] of 32 patients vs two [40%] of five), fatigue (18 [56%] of 32 vs two [40%] of five), vomiting (12 [38%] of 32 vs zero), and anaemia (eight [25%] of 32 vs one [20%] of five); generally, events were initially reported during the first 2 years of treatment. Despite not reaching statistical significance, patients with BRCA-mutated platinum-sensitive recurrent serous ovarian cancer receiving olaparib maintenance monotherapy after platinum-based chemotherapy appeared to have longer overall survival, supporting the reported progression-free survival benefit. Clinically useful long-term exposure to olaparib was seen with no new safety signals.

According to the news editors, the research concluded: "Taken together, these data support both the long-term clinical benefit and tolerability of maintenance olaparib in patients with BRCA-mutated platinum-sensitive recurrent serous ovarian cancer."

Immunology - Lymphoid Tissue

New Findings from Uniformed Services University of the Health Sciences Describe Advances in Lymphoid Tissue (An algorithm for expanding the TNM staging system)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immunology - Lymphoid Tissue are discussed in a new report. According to news reporting originating in Bethesda, Maryland, by NewsRx journalists, research stated, "We describe a new method to expand the tumor, lymph node, metastasis (TNM) staging system using a clustering algorithm. Cases of breast cancer were used for demonstration."

The news reporters obtained a quote from the research from the Uniformed Services University of the Health Sciences, "An unsupervised ensemble-learning algorithm was used to create dendrograms. Cutting the dendrograms produced prognostic systems. Prognostic systems contained groups of patients with similar outcomes. The prognostic systems based on tumor size and lymph node status recapitulated the general structure of the TNM for breast cancer. The prognostic systems based on tumor size, lymph node status, histologic grade and estrogen receptor status revealed a more detailed stratification of patients when grade and estrogen receptor status were added."

According to the news reporters, the research concluded: "Prognostic systems from cutting the dendrogram have the potential to improve and expand the TNM."

For more information on this research see: An algorithm for expanding the TNM staging system. Future Oncology, 2016;12(8):1015-24.

Our news correspondents report that additional information may be obtained by contacting D. Chen, Dept. of Preventive Medicine & Biostatistics, The Uniformed Services University of the Health Sciences, 4301 Jones Bridge Rd, Bethesda, MD 20814, United States. Myeloid Cells

New Findings from University College in the Area of Myeloid Cells Described (Cell-type-specific modulation of innate immune signalling by vitamin D in human mononuclear phagocytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Myeloid Cells. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Vitamin D is widely
reported to inhibit innate immune signalling and dendritic cell (DC) maturation as a potential immunoregulatory mechanism. It is not known whether vitamin D has global or gene-specific effects on transcriptional responses downstream of innate immune stimulation, or whether vitamin D inhibition of innate immune signalling is common to different cells."

Funders for this research include Rosetrees Trust, UK NIHR Biomedical Research Centre, UK Medical Research Council, British Heart Foundation.

Our news journalists obtained a quote from the research from University College, "We confirmed vitamin D inhibition of nuclear factor-jB (NF-kappa B) and p38 mitogen-activated protein kinase (MAPK) signalling in monocyte-derived DC (MDDC) stimulated with lipopolysaccharide (LPS). This was associated with global but modest attenuation of LPS-induced transcriptional changes at genome-wide level. Surprisingly, vitamin D did not inhibit innate immune NF-kappa B activation in monocyte-derived macrophages. Consistent with our findings in MDDC, ex vivo vitamin D treatment of primary peripheral blood myeloid DC also led to significant inhibition of LPS-inducible NF-kappa B activation. Unexpectedly, in the same samples, vitamin D enhanced activation of both NF-kappa B and MAPK signalling in primary peripheral blood monocytes. In a cross-sectional clinical cohort, we found no relationship between peripheral blood vitamin D levels and LPS-inducible activation of NF-kappa B and MAPK pathways in monocytes of myeloid DC. Remarkably, however, in vivo supplementation of people with vitamin D deficiency in this clinical cohort also enhanced LPS-inducible MAPK signalling in peripheral blood monocytes. Therefore, we report that vitamin D differentially modulates the molecular response to innate immune stimulation in monocytes, macrophages and dendritic cells."

According to the news editors, the research concluded: "These results are of importance in the design of studies on vitamin D supplementation in infectious and immunological diseases."

For more information on this research see: Cell-type-specific modulation of innate immune signalling by vitamin D in human mononuclear phagocytes. Immunology, 2017;150 (1):55-63. Immunology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com; Immunology - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1365-2567)

Heart Disorders and Diseases - Dilated...

New Findings from University Hospital Describe Advances in Dilated Cardiomyopathy (Reversible Dilated Cardiomyopathy Caused by a High Burden of Ventricular Arrhythmias in Andersen-Tawil Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Dilated Cardiomyopathy is now available. According to news originating from Wurzburg, Germany, by NewsRx correspondents, research stated, "Andersen-Tawil syndrome (ATS) is caused by mutations in KCNJ2 (Kir2.1). It remains unclear whether dilated cardiomyopathy (DCM) is a primary feature of ATS."

Our news journalists obtained a quote from the research from University Hospital, "We studied a proband with typical physical features of ATS plus DCM and moderate to severe left ventricular dysfunction (left ventricular ejection fraction = 30.5%). Genetic screening revealed a novel mutation in Kir2.1 (c.665T >C, p.L222S). Functional studies showed that this mutation reduced ionic currents in a dominant-negative manner. Suppression of ventricular arrhythmias with bisoprolol led to normalization of left ventricular size and function."

According to the news editors, the research concluded: "DCM is likely a secondary phenotype in ATS and is caused by high ventricular arrhythmia burden."

The news correspondents report that additional information may be obtained from B. Gerull, Univ Hosp Wurzburg, Dept. of Med 1, Wurzburg, Germany. Additional authors for this research include J.Q. Guo, H.J. Duff, R.A. Ferrier and B. Gerull.

Keywords for this news article include: Wurzburg, Germany, Europe, Cardiovascular Diseases and Conditions, Heart Disorders and Diseases, Andersen-Tawil Syndrome, Dilated Cardiomyopathy, Cardiomyopathies, Heart Disease, Arrhythmia, Cardiology, Neurology, Genetics, University Hospital.

Oncology - Lung Cancer

New Findings from University Hospital Describe Advances in Lung Cancer (Evaluation of the relevance of surgery in a retrospective case series of patients who underwent the surgical treatment of a symptomatic spine metastasis from lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lung Cancer. According to news reporting originating in Lille, France, by NewsRx journalists, research stated, "The
management of spine metastases is an increasing concern for spine surgeons. When considering surgery, it is crucial to ensure that its iatrogenic effects will not exceed its potential benefits, particularly in frail patients with short life expectancy."

The news reporters obtained a quote from the research from University Hospital, "Among all prognostic factors, the primary site of cancer is the most important, lung cancer being the poorest. Although surgery has shown its effectiveness in the management of spine metastases, there is a lack of studies focusing on lung cancer alone. To assess the effectiveness and safety of surgery in the management of symptomatic spine metastases from lung cancer. We retrospectively reviewed all patients (n = 53) who underwent surgery for spine metastasis from lung cancer at the Lille University Hospital between January 2005 and December 2011. Patients for whom surgery was effective to restore or preserve ambulation, to relieve pain, and to ensure stability without severe complication were considered 'surgical success'. No patient was lost to follow-up and vital status data were available for all patients. The median survival was 2.1 months and was not influenced by the surgical success (p = 0.1766). We reported seven major complications in seven patients, including three epidural haematoma, two massive pulmonary embolisms and two deaths from cardiopulmonary failure. The surgical success rate was 49 % and on univariate analysis, the factors that have influenced the postoperative outcome were the KPS (p < 0.001), the Frankel grade (p = 0.0217) and the delay between the cancer diagnosis and the occurrence of spine metastases (p = 0.0216)."

According to the news reporters, the research concluded: "A strict patient selection is required to limit the iatrogenic effect of surgery, which may alter the quality of life of these frail patients with limited life expectancy."

For more information on this research see: Evaluation of the relevance of surgery in a retrospective case series of patients who underwent the surgical treatment of a symptomatic spine metastasis from lung cancer. European Spine Journal, 2016;25(12):4052-4059. European Spine Journal can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; European Spine Journal - www.springerlink.com/content/0940-6719/)

Cardiovascular Diseases and Conditions - Aneurysm

New Findings from University Hospital Yields New Data on Aneurysm (A rare case of a giant saphenous vein graft aneurysm with right atrial fistula formation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Aneurysm have been published. According to news reporting originating in Cardiff, United Kingdom, by NewsRx journalists, research stated, "A 57-year-old hypertensive and dyslipidaemic man with a history of coronary artery bypass graft 19 years previously, presented with severe exertional angina and dyspnoea despite optimal anti-ischaemic pharmacological therapy and previous percutaneous coronary intervention to the left circumflex artery. CT revealed an aneurysm of the saphenous vein graft to the posterior left ventricular branch of the right coronary artery."

The news reporters obtained a quote from the research from University Hospital, "The aneurysm had formed a fistulous connection with the right atrium. Initially, luminal reconstruction with serial stents was deemed the most appropriate treatment strategy. However, the procedure was abandoned due to the inability to visualise the graft distal to the aneurysm and the significant shunt to the right atrium."

According to the news reporters, the research concluded: "Surgical correction of the right atrial wall defect and replacement of the diseased grafts led to complete resolution of the patient's symptoms."

For more information on this research see: A rare case of a giant saphenous vein graft aneurysm with right atrial fistula formation. Bmj Case Reports, 2016:2016():. (BMJ Publishing Group - group.bmj.com/; Bmj Case Reports - casereports.bmj.com/)

Drugs and Therapies - Antimicrobial Agents and …

New Findings from University Hospital in the Area of Antimicrobial Agents and Chemotherapy Reported (Preventing Implant-Associated Infections by Silver Coating)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antimicrobial Agents and Chemotherapy. According to news reporting out of Basel, Switzerland, by NewsRx editors, research stated, "Implant-associated infections (IAIs) are a dreaded complication mainly caused by biofilm-forming staphylococci. Implant surfaces preventing microbial colonization would be desirable."

Financial supporters for this research include Swiss National Foundation, Commission for Technology and Innovation.

Our news journalists obtained a quote from the research from University Hospital,
"We examined the preventive effect of a silver-coated titanium-aluminum-niobium (TiAlNb) alloy. The surface elicited a strong, inoculum-dependent activity against *Staphylococcus epidermidis* and *Staphylococcus aureus* in an agar inhibition assay. Gamma sterilization and alcohol disinfection did not alter the effect. In a tissue cage mouse model, silver coating of TiAlNb cages prevented perioperative infections in an inoculum-dependent manner and led to a 100% prevention rate after challenge with $2 \times 10^6$ CFU of *S. epidermidis* per cage. In *S. aureus* infections, silver coating had only limited effect. Similarly, daptomycin or vancomycin prophylaxis alone did not prevent *S. aureus* infections. However, silver coating combined with daptomycin or vancomycin prophylaxis thwarted methicillin-resistant *S. aureus* infections at a prevention rate of 100% or 33%, respectively. Moreover, silver release from the surface was independent of infection and occurred rapidly after implantation. On day 2, a peak of 82 mg Ag/ml was reached in the cage fluid, corresponding to almost 6? the MIC of the staphylococci. Cytotoxicity toward leukocytes in the cage was low and temporary. Surrounding tissue did not reveal histological signs of silver toxicity. In vitro, no emergence of silver resistance was observed in several clinical strains of staphylococci upon serial subinhibitory silver exposures."

According to the news editors, the research concluded: "Our data demonstrate that silver-coated TiAlNb is potent for prevention of IAIs and thus can be considered for clinical application."

For more information on this research see: Preventing Implant-Associated Infections by Silver Coating. *Antimicrobial Agents and Chemotherapy*, 2016;60(4):2467-75. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news journalists report that additional information may be obtained by contacting R. Kuehl, Infection Biology Laboratory, Dept. of Biomedicine, University and University Hospital of Basel, Basel, Switzerland Division of Infectious Diseases and Hospital Epidemiology, University Hospital of Basel, Basel, Switzerland. Cardiovascular Diseases

**New Findings from University Hospital in the Area of Cardiovascular Diseases Described (New concepts in the management of dyslipidaemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases are discussed in a new report. According to news reporting originating from Geneva, Switzerland, by NewsRx correspondents, research stated, "Recently, the European Society of Cardiology (ESC) and the European Atherosclerosis Society (EAS) published a consensus paper giving guidance on the
definition and management of statin-associated muscle symptoms (SAMS), as well as the use of proprotein convertase subtilisin kexin 9 (PCSK9) inhibitors in very high-risk patients. The occurrence of SAMS can have a major negative impact on treatment adherence and, consequently, on the prognosis of cardiovascular diseases."

Our news editors obtained a quote from the research from University Hospital, "In addition, both the ESC guidelines on the prevention of cardiovascular disease (CVD) in clinical practice with sections addressing global strategies to minimise the burden of CVD at population and individual levels, and the 2016 ESC/EAS guideline for the management of dyslipidaemias, focus on evaluation and treatment of SAMS. The release of these guidelines was a source of great interest to clinicians, as new emergent therapies, such as the PCSK9 inhibitors, have been approved for the treatment of dyslipidaemias: recently, both the US Food and Drugs Administration (FDA) and the European Medicines Agency (EMA) approved the use of PCSK9 inhibitors as add-ons for the treatment of hypercholesterolaemia in cases where low-density lipoprotein cholesterol (LDL-C) target levels could not be reached with maximum tolerated statin doses alone, or instead of statins in the event of SAMS. Because of the relatively high cost of these new therapies, physicians need to justify the use of PCSK9 inhibitors by demonstrating that their high-risk patients' LDL-C levels have remained high (1) despite a well-conducted, but insufficiently effective high-intensity statin therapy (e.g. rosuvastatin 10-20 mg or atorvastatin 40-80 mg), or (2) in the event of the patient developing side effects, in particular severe SAMS, during treatment with at least three statins."

According to the news editors, the research concluded: "In addition to SAMS, the use of PCSK9 inhibitors may be considered in patients with documented atherosclerotic cardiovascular disease or in patients with familial hypercholesterolaemia and poorly controlled LDL-C under the combination of maximum tolerated statin and ezetimibe."

For more information on this research see: New concepts in the management of dyslipidaemia. Swiss Medical Weekly, 2016;146():54-61. Swiss Medical Weekly can be contacted at: E M H Swiss Medical Publishers Ltd, Farnburgerstr 8, Ch-4132 Muttenz, Switzerland.

The news editors report that additional information may be obtained by contacting B. Gencer, University Hospital Geneva, Div Cardiol, Dept. of Med, Geneva, Switzerland. Additional authors for this research include N. Rodondi and F. Mach.

Oncology - Gastric Cancer

New Findings from University Hospital in the Area of Gastric Cancer Reported (Advanced gastric cancer: Current treatment landscape and future perspectives)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Gastric Cancer is now available. According to news reporting out of Lausanne, Switzerland, by NewsRx editors, research stated, "Gastric cancer currently ranks fourth in cancer-related mortality worldwide. In the western world, it is most often diagnosed at an advanced stage, after becoming metastatic at distant sites."
Our news journalists obtained a quote from the research from University Hospital, "Patients with advanced disease (locally advanced or metastatic) have a somber prognosis, with a median overall survival of 10-12 mo, and palliative chemotherapy is the mainstay of treatment. In recent years, novel approaches using inhibition of human epidermal growth factor receptor 2 (HER2) have demonstrated significant improvements in progression-free and overall survival, compared with chemotherapy alone, in first-line treatment of patients with overexpression of HER2. In addition, both second-line chemotherapy and treatment with the vascular endothelial growth factor receptor-inhibitor ramucirumab demonstrated significant benefits in terms of overall survival, compared with best supportive care, in randomized studies. Moreover, ramucirumab in combination with chemotherapy demonstrated further significant benefits in terms of progression-free and overall survival, compared with chemotherapy alone, in second-line treatment for patients with metastatic gastric cancer. A recently published molecular classification of gastric cancer is expected to improve patient stratification and selection for clinical trials and provide a roadmap for future drug development. Nevertheless, despite these developments the prognosis of patients with advanced gastric cancer remains poor."

According to the news editors, the research concluded: "In this review we discuss current standards of care and outline major topics of drug development in gastric cancer."

Our news journalists report that additional information may be obtained by contacting A. Digklia, Antonia Digklia, Anna Dorothea Wagner, Departement d'Oncologie, Centre Hospitalier Universitaire Vaudois, 1011 Lausanne, Switzerland.

Mycobacterium Infections - Tuberculosis

New Findings from University Hospital in the Area of Tuberculosis Reported (Early Bactericidal Activity of AZD5847 in Patients with Pulmonary Tuberculosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news reporting out of Cleveland, Ohio, by NewsRx editors, research stated, "AZD5847 is an oxazolidinone antibiotic with in vitro activity against Mycobacterium tuberculosis. The objective of this study was to evaluate the antimycobacterial activity, safety, and pharmacokinetics of AZD5847 in patients with pulmonary tuberculosis."

Financial support for this research came from HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID).
Our news journalists obtained a quote from the research from University Hospital, "Groups of 15 treatment-naive, sputum smear-positive adults with pulmonary tuberculosis were randomly assigned to receive AZD5847 at one of four doses (500 mg once daily, 500 mg twice daily, 1,200 mg once daily, and 800 mg twice daily) or daily standard chemotherapy. The primary efficacy endpoint was the mean daily rate of change in the log(10) number of CFU of M. tuberculosis per milliliter of sputum, expressed as the change in log(10) number of CFU per milliliter of sputum per day. The mean 14-day activity of the combination of isoniazid, rifampin, ethambutol, and pyrazinamide (-0.163 log(10) CFU/ml sputum/day; 95% confidence interval [CI], -0.193,-0.133 log(10) CFU/ml sputum/day) was consistent with that found in previous studies. AZD5847 at 500 mg twice daily significantly decreased the number of CFU on solid medium (-0.039; 95% CI, -0.069,-0.009; P = 0.0048). No bactericidal activity was detected at doses of AZD5847 of 500 mg once daily (mean early bactericidal activity [EBA], 0.02 [95% CI, -0.01, 0.05]), 1,200 mg once daily (mean EBA, 0.02 [95% CI, -0.01, 0.05]), and 800 mg twice daily (mean EBA, 0.02 [95% CI, -0.01, 0.05]). AZD5847 at doses of both 500 mg and 800 mg twice daily also showed an increase in the time to a positive culture in MGIT liquid culture medium. Two serious adverse events (grade 4 thrombocytopenia and grade 4 hyperbilirubinemia) occurred in patients receiving AZD5847 at higher doses."

According to the news editors, the research concluded: "AZD5847 dosed twice daily kills tubercle bacilli in the sputum of patients with pulmonary tuberculosis and has modest early bactericidal activity."

For more information on this research see: Early Bactericidal Activity of AZD5847 in Patients with Pulmonary Tuberculosis. *Antimicrobial Agents and Chemotherapy*, 2016;60 (11):6591-6599. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Oncology - Breast Cancer**

**New Findings from University of Adelaide in Breast Cancer Provides New Insights (The safety and effectiveness of liver resection for breast cancer liver metastases: A systematic review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting from Adelaide, Australia, by NewsRx journalists, research stated, "Breast cancer liver metastases have traditionally been considered incurable and any treatment given therefore palliative. Liver resections for breast cancer metastases are being performed, despite there being no robust evidence for which patients benefit."

The news correspondents obtained a quote from the research from the University of Adelaide, "This review aims to determine the safety and effectiveness of liver resection for breast cancer metastases. A systematic literature review was performed and resulted in 33 papers being assembled for analysis. All papers were case series and data extracted was heterogeneous so a meta-analysis was not possible. Safety outcomes were mortality and morbidity (in hospital and 30-day). Effectiveness outcomes were local recurrence, re-hepatectomy, survival (months), 1-, 2-, 3-, 5- year overall survival rate (%), disease free survival (months) and 1-, 2-, 3-, 5- year disease free survival rate (%). Overall median figures were calculated using unweighted median data given in each paper. Results demonstrated that mortality was low across all studies with a median of 0% and a maximum of 5.9%. The median morbidity rate was 15%. Overall survival was a median of 35.1 months and a median 1-, 2-, 3- and 5-year survival of 84.55%, 71.4%, 52.85% and 33% respectively. Median disease free survival was 21.5 months with a 3- and 5-year median disease free survival of 36% and 18%. Whilst the results demonstrate seemingly satisfactory levels of overall survival and disease free survival, the data are of poor quality with multiple confounding variables and small study populations."

According to the news reporters, the research concluded: "Recommendations are for extensive pilot and feasibility work with the ultimate aim of conducting a large pragmatic randomised control trial to accurately determine which patients benefit from liver resection for breast cancer liver metastases."

Our news journalists report that additional information may be obtained by contacting K. Fairhurst, University of Adelaide, Discipline Surg, Queen Elizabeth Hospital, Adelaide, SA 5011, Australia. Additional authors for this research include L. Leopardi, T. Satyadas and G. Maddern.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.breast.2016.09.011. This DOI is a link to an online electronic document that is either free or for purchase.

Mosquito-Borne Diseases - Zika Virus

New Findings from University of Alberta in Zika Virus Provides New Insights (Zika virus inhibits type-I interferon production and downstream signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Mosquito-Borne Diseases - Zika Virus are discussed in a new report. According to news reporting originating in Edmonton, Canada, by NewsRx journalists, research stated, "Zika virus is an emerging mosquito-borne pathogen that is associated with Guillain-Barre syndrome in adults and microcephaly and other neurological defects in newborns. Despite being declared an international emergency by the World Health Organization, comparatively little is known about its biology."

The news reporters obtained a quote from the research from the University of Alberta, "Here, we investigate the strategies employed by the virus to suppress the host antiviral response. We observe that once established, Zika virus infection is impervious to interferon treatment suggesting that the virus deploys effective countermeasures to host cell defences. This is confirmed by experiments showing that Zika virus infection impairs the induction of type-I interferon as well as downstream interferon-stimulated genes. Multiple viral proteins affect these processes. Virus-mediated degradation of STAT2 acts to reduce type-I and type-III interferon-mediated signaling. Further, the NS5 of Zika virus binds to STAT2, and its expression is correlated with STAT2 degradation by the proteasome. Together, our findings provide key insights into how Zika virus blocks cellular defense systems."

According to the news reporters, the research concluded: "This in turn is important for understanding pathogenesis and may aid in designing antiviral therapies."

For more information on this research see: Zika virus inhibits type-I interferon production and downstream signaling. *EMBO Reports*, 2016;17(12):1766-1775. *EMBO Reports* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; EMBO Reports - www.nature.com/embor/)

Nervous System Diseases and Conditions -...

New Findings from University of Belgrade Update Understanding of Hyperalgesia (Participation Of Peripheral Trpv1, Trpv4, Trpa1 And Asic In A Magnesium Sulfate-induced Local Pain Model In Rat)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nervous System Diseases and Conditions - Hyperalgesia are discussed in a new report. According to news reporting originating from Belgrade, Serbia, by NewsRx correspondents, research stated, "We previously showed that magnesium sulfate (MS) has systemic antinociceptive and local peripheral pronociceptive effects. The role of transient receptor potential (TRP) channels and acid-sensing ion channels (ASICs) in the mechanism of action of MS has not been investigated in detail."

Financial support for this research came from Ministry of Education, Science and Technological Development.

Our news editors obtained a quote from the research from the University of Belgrade, "The aim of this study was to explore the participation of TRP channels in the pronociceptive action of MS in rats after its intraplantar injection. The paw withdrawal threshold (PWT) to mechanical stimuli was measured by the electronic von Frey test. Drugs that were tested were either co-administered with an isotonic pH-unadjusted or pH-adjusted solution of MS intraplantarily, or to the contralateral paw to exclude systemic effects. We found that the subcutaneous administration of both pH-adjusted (7.4) and pH-unadjusted (about 6.0) isotonic (6.2% w/v in water) solutions of MS induce the pain at the injection site. The pH-unadjusted MS solution-induced mechanical hyperalgesia decreased in a dose-dependent manner as a consequence of co-injection of capsazepine, a selective TRPV1 antagonist (20, 100 and 500 pmol/paw), RN-1734, a selective TRPV4 antagonist (1.55, 3.1 and 6.2 timol/paw), HC-030031, a selective TRPA1 antagonist (5.6, 28.1 and 140 nmol/paw), and amiloride hydrochloride, a non-selective ASIC inhibitor (0.83, 2.5 and 7.55 mol/paw). In pH-adjusted MS-induced hyperalgesia, the highest doses of TRPV1, TRPV4 and TRPA1 antagonists displayed effects that were, respectively, either similar, less pronounced or delayed in comparison to the effect induced by administration of the pH-unadjusted MS solution; the ASIC antagonist did not have any effect. These results suggest that the MS induced local peripheral mechanical hyperalgesia is mediated via modulation of the activity of peripheral TRPV1, TRPV4, TRPA1 and ASICs."

According to the news editors, the research concluded: "Specific local inhibition of TRP channels represents a novel approach to treating local injection-related pain."

For more information on this research see: Participation Of Peripheral Trpv1, Trpv4, Trpa1 And Asic In A Magnesium Sulfate-induced Local Pain Model In Rat. Neuroscience, 2016;339():1-11. Neuroscience can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. (Elsevier - www.elsevier.com; Neuroscience - www.journals.elsevier.com/neuroscience/)

The news editors report that additional information may be obtained by contacting D. Srebro, University of Belgrade, Fac Med, Dept. of Pharmacol Clin Pharmacol & Toxicol, Belgrade 11129, Serbia. Additional authors for this research include S. Vuckovic and M. Prostran.

New Findings from University of Brescia in the Area of Dementia Described (Looking for Neuroimaging Markers in Frontotemporal Lobar Degeneration Clinical Trials: A Multi-Voxel Pattern Analysis Study in Granulin Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neurodegenerative Diseases and Conditions - Dementia. According to news reporting from Brescia, Italy, by NewsRx journalists, research stated, "In light of future pharmacological interventions, neuroimaging markers able to assess the response to treatment would be crucial. In Granulin (GRN) disease, preclinical data will prompt pharmacological trials in the future."

The news correspondents obtained a quote from the research from the University of Brescia, "Two main points need to be assessed: (1) to identify target regions in different disease stages and (2) to determine the most accurate functional and structural neuroimaging index to be used. To this aim, we have taken advantage of the multivariate approach of multi-voxel pattern analysis (MVPA) to explore the information of brain activity patterns in a cohort of GRN Thr272fs carriers at different disease stages (14 frontotemporal dementia (FTD) patients and 17 asymptomatic carriers) and a group of 33 healthy controls. We studied structural changes by voxel-based morphometry (VBM), functional connectivity by assessing salience, default mode, fronto-parietal, dorsal attentional, executive networks, and local connectivity by regional homogeneity, amplitude of low frequency fluctuations (ALFF), fractional ALFF (fALFF), degree centrality, and voxel-mirrored homotopic connectivity. In FTD patients with GRN mutation, the most predictive measure was VBM structural analysis, while in asymptomatic carriers the best predictor marker was the local connectivity measure (fALFF). Altogether, all indexes demonstrated fronto-temporo-parietal damage in GRN pathology, with widespread structural damage of fronto-parietal and temporal regions when disease is overt. MVPA could be of aid in identifying the most accurate neuroimaging marker for clinical trials. This approach was able to identify both the target region and the best neuroimaging approach, which would be specific in the different disease stages."

According to the news reporters, the research concluded: "Further studies are needed to simultaneously integrate multimodal indexes in a classifier able to trace the disease progression moving from preclinical to clinical stage of the disease."

Our news journalists report that additional information may be obtained by contacting E. Premi, Centre for Ageing Brain and Neurodegenerative Disorders, Neurology Unit, Dept. of Clinical and Experimental Sciences, University of Brescia, Brescia, Italy. Additional authors for this research include F. Cauda, T. Costa, M. Diano, S. Gazzina, V. Gualeni, A. Alberici, S. Archetti, M. Magoni, R. Gasparotti, A. Padovani and B. Borroni.

The direct object identifier (DOI) for that additional information is:
Understanding of Cerebral Infarction (Dissociation of Early and Delayed Cerebral Infarction After Aneurysmal Subarachnoid Hemorrhage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Cerebral Infarction are discussed in a new report. According to news originating from Vancouver, Canada, by NewsRx correspondents, research stated, "Cerebral infarction after aneurysmal subarachnoid hemorrhage is a significant cause of substantial morbidity and mortality. Because early and delayed cerebral infarction after aneurysmal subarachnoid hemorrhage may be mediated by different processes, we evaluated whether aneurysm-securing methods contributed to infarcts and whether long-term outcomes differ between early and delayed infarcts."

Our news journalists obtained a quote from the research from the University of British Columbia, "A post hoc analysis of the CONSCIOUS-1 study (Clazosentan to Overcome Neurological Ischemia and Infarction Occurring After Subarachnoid Hemorrhage) was performed. Using multivariate logistic regression analysis and propensity matching, independent clinical risk factors associated with infarctions were identified, and the contribution of cerebral infarcts to long-term outcomes was evaluated. Within the cohort of 413 subjects, early infarcts were present in 76 subjects (18%), whereas delayed infarcts occurred in 79 subjects (19%), and 36 subjects (9%) had new infarctions that were present on both early and delayed imaging. Propensity score matching revealed a significantly higher proportion of early infarcts after clipping (odds ratio, 4.62; 95% confidence interval, 1.99-11.57; P=0.00012). Multivariate logistic regressions identified clipping as an independent risk factor for early cerebral infarction (odds ratio, 0.26; 95% confidence interval, 0.15-0.48; P<0.001), and angiographic vasospasm was an independent risk factor for delayed cerebral infarction (odds ratio, 1.79; 95% confidence interval, 1.03-3.13; P=0.039). Early infarcts were a significant independent risk factor for poor long-term outcomes at 3 months (odds ratio, 2.34; 95% confidence interval, 1.18-4.67; P=0.015). Clipping is an independent risk factor for the development of early cerebral infarcts, whereas delayed cerebral infarcts are associated with angiographic vasospasm."

According to the news editors, the research concluded: "Early cerebral infarcts are stronger predictors of worse outcome than delayed infarction."

For more information on this research see: Dissociation of Early and Delayed
Cerebral Infarction After Aneurysmal Subarachnoid Hemorrhage. *Stroke*, 2016;47(12):2945-2951. *Stroke* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Hematologic Diseases and Conditions - Anemia

**New Findings from University of British Columbia in the Area of Anemia Reported (Spine tumor resection among patients who refuse blood product transfusion: a retrospective case series)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematologic Diseases and Conditions - Anemia have been published. According to news reporting out of Vancouver, Canada, by NewsRx editors, research stated, "To describe the perioperative blood conservation strategies and postoperative outcomes in patients who undergo complex spinal surgery for tumor resection and who also refuse blood product transfusion. A retrospective case series."

Our news journalists obtained a quote from the research from the University of British Columbia, "A single-center, tertiary care and academic teaching hospital in Canada. All adult patients undergoing elective major spine tumor resection and refusing blood product transfusion who were referred to our institutional Blood Utilization Program between June 1, 2004, and May 9, 2014. Data on the use of iron, erythropoietin, preoperative autologous blood donation, acute normovolemic hemodilution, antifibrinolytic therapy, cell salvage, intraoperative hypotension, and active warming techniques were collected. Data on perioperative hemoglobin nadir, adverse outcomes, and hospital length of stay were also collected. Four patients who refused blood transfusion (self-identified as Jehovah's Witnesses) underwent non-emergent complex spine surgery for recurrent chondrosarcoma, meningioma, metastatic adenocarcinoma, and metastatic malignant melanoma. All patients received 1 or more perioperative blood conservation strategy including preoperative iron and/or erythropoietin, intraoperative antifibrinolytic therapy, and cell salvage. No patients experienced severe perioperative anemia (average hemoglobin nadir, 124 g/L) or anemia-related postoperative complications. Patients who decline blood product transfusion can successfully undergo major spine tumor resection."
According to the news editors, the research concluded: "Careful patient selection and timely referral for perioperative optimization such that the risk of severe anemia is minimized are important for success."

**Toxicology - Ecotoxicology**

**New Findings from University of Buenos Aires Update Understanding of Ecotoxicology [Toxicity and genotoxicity assessment in sediments from the Matanza-Riachuelo river basin (Argentina) under the influence of heavy metals and organic contaminants]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Toxicology - Ecotoxicology. According to news originating from Buenos Aires, Argentina, by NewsRx correspondents, research stated, "The aim of this study was to investigate the parameters of chemical extraction associated with the detection of toxicity and genotoxicity in sediment sample extracts. Quantitative analysis of metals and polycyclic aromatic hydrocarbons (PAHs), together with a battery of four bioassays, was performed in order to evaluate the extraction efficiency of inorganic and organic toxicants."

Financial support for this research came from Buenos Aires University.

Our news journalists obtained a quote from the research from the University of Buenos Aires, "The extracts were carried out using two inorganic solvents, two organic solvents and two extraction methodologies, making a total of five extracts. Two toxicity tests, the algal growth inhibition of Pseudokirchneriella subcapitata and the root elongation inhibition of Lactuca sativa, and two genotoxicity tests, the analysis of revertants of Salmonella typhimurium and the analysis of micronuclei and chromosomal aberrations in Allium cepa, were performed. According to the chemical analysis, the acidic solution extracted more heavy metal
concentrations than distilled water, and dichloromethane extracted more but fewer concentrations of PAH compounds than methanol. Shaker extracts with distilled water were non-toxic to P. subcapitata, but were toxic to L. saliva. The acidic extracts were more toxic to P. subcapitata than to L. sativa. The methanolic organic extracts were more toxic to the alga than those obtained with dichloromethane. None of these extracts resulted toxic to L. saliva. Mutagenic effects were only detected in the organic dichloromethane extracts in the presence of metabolic activation. All the inorganic and organic extracts were genotoxic to A. cepa."

According to the news editors, the research concluded: "This study showed that the implementation of different extraction methods together with a battery of bioassays could be suitable tools for detecting toxicity and genotoxicity in sediment samples."

For more information on this research see: Toxicity and genotoxicity assessment in sediments from the Matanza-Riachuelo river basin (Argentina) under the influence of heavy metals and organic contaminants. *Ecotoxicology and Environmental Safety*, 2017;135():302-311. *Ecotoxicology and Environmental Safety* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **New Findings from University of Cairo Update Understanding of Gastric Ulcers (Combined effect of bone marrow derived mesenchymal stem cells and nitric oxide inducer on injured gastric mucosa in a rat model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Digestive System Diseases and Conditions - Gastric Ulcers are presented in a new report. According to news reporting originating in Cairo, Egypt, by NewsRx journalists, research stated, "To study the effect of intravenous injection of bone marrow mesenchymal stem cells (BMMSCs), alone and combined with NO inducer in gastric ulcer healing in a rat model. Rats were divided into controls, gastric ulcer, gastric ulcer receiving mesenchymal stem cells (MSCs), gastric ulcer receiving NO inducer (L-Arginine), gastric ulcer receiving MSCs plus NO inducer (L-Arginine) groups."

Financial support for this research came from Faculty of Medicine, Cairo University. The news reporters obtained a quote from the research from the University of Cairo, "MSCs were given in a dose of (10(6)cells) by intravenous injection. L-Arginine was given 300 mg/kg body weight intraperitoneally. 24 h and 7 days after BMMSCs and NO inducer injection,
VEGF, PGE, TNF-alpha were assessed by ELISA. Gene expression of HGF, caspase-3, eNOS and BAX/Bcl-2 in gastric tissues were studied by real time PCR. Histopathology staining of gastric tissues was performed. Injection of MSCs or NO inducer or both to the gastric ulcer group significantly decreased caspase-3 and BAX genes expression (apoptotic factors) and increased Bcl-2 gene expression (anti-apoptotic factor) compared to that of the gastric ulcer group after both 24 h and 7 days with more significant results in the gastric group received both MSCs and NO inducer. HGF gene expression was significantly increased in the groups injected with MSCs or NO inducer or both compared with the corresponding gastric ulcer group (p < 0.05, p< 0.05 & p< 0.001 respectively). There was a significant decrease in the mean PGE2 and TNF-alpha levels in the gastric ulcer group receiving MSCs, the gastric ulcer group receiving NO and the gastric ulcer group receiving both MSCs and NO compared to the gastric ulcer group after both 24 h and 7 days. Histopathological examination of gastric tissue of groups that received stem cells or NO alone, showed mucosal regenerative changes with increased thickness together with reduced inflammatory cellular infiltrate in the submucosa and decreased congestion. There was complete restoration in gastric mucosa in the group that received both stem cells and NO."

According to the news reporters, the research concluded: "Administration of MSCs, NO, or MSCs plus NO may exert a therapeutic effect on the mucosal lesion in gastric ulcer through their anti-inflammatory, angiogenic and antiapoptotic actions."

Our news correspondents report that additional information may be obtained by contacting D.M. Gharib, Cairo University, Fac Med, Dept. of Med Biochem & Mol Biol, Cairo 11562, Egypt. Additional authors for this research include D.M. Gharib, R.E. Hussein, O. Tork and A. Abusree.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.tice.2016.09.006. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings from University of California Describe Advances in Lung Cancer (Dacomitinib in lung cancer: a "lost generation" EGFR tyrosine-kinase inhibitor from a bygone era?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting from Orange, California, by NewsRx journalists, research stated, "EGFR tyrosine-kinase inhibitors (TKIs) have now been firmly established as the first-line treatment for non-small-cell lung cancer (NSCLC) patients harboring activating EGFR mutations, based on seven prospective randomized Phase III trials. However, despite significantly improved overall response rate and improved median progression-free survival when compared to platinum-doublet chemotherapy, EGFR-mutant NSCLC patients treated with EGFR TKIs invariably progress due to the emergence of acquired resistances, with the gatekeeper T790M mutation accounting for up to 60% of the resistance mechanisms."

The news correspondents obtained a quote from the research from the University of California, "Second-generation irreversible EGFR TKIs were developed in part to inhibit the T790M mutation, in addition to the common activating EGFR mutations. Dacomitinib is one such second-generation EGFR TKI designed to inhibit both the wild-type (WT) EGFR and EGFR T790M. Afatinib is another second-generation EGR TKI that has been now been approved for the first-line treatment of EGFR-mutant NSCLC patients, while dacomitinib continues to undergo clinical evaluation. We will review the clinical development of dacomitinib from Phase I to Phase III trials, including the two recently published negative large-scale randomized Phase III trials (ARCHER 1009, NCIC-BR-26). Results from another large-scale randomized trial (ARCHER 1050) comparing dacomitinib to gefitinib as first-line treatment of advanced treatment-naïve EGFR-mutant NSCLC patients will soon be available and will serve as the lynchpin trial for the potential approval of dacomitinib in NSCLC. Meanwhile, third-generation EGFR TKIs (eg, CO-1686 [rociletinib], AZ9291, HM61713, EGF816, and ASP8273) that preferentially and potently inhibit EGFR T790M but not WT EGFR are in full-scale clinical development, and some of these EGFR TKIs have received 'breakthrough' designation by the US Food and Drug Administration and will likely be approved in late 2015."

According to the news reporters, the research concluded: "Given the rapid development of third-generation EGFR TKIs and the approval of gefitinib, erlotinib, and afatinib as first-line treatment of EGFR-mutant NSCLC patients, the future role of dacomitinib in the treatment of NSCLC seems to be limited."

For more information on this research see: Dacomitinib in lung cancer: a "lost generation" EGFR tyrosine-kinase inhibitor from a bygone era? Drug Design, Development and Therapy, 2015;9():5641-53.

Our news journalists report that additional information may be obtained by contacting S.H. Ou, Chao Family Comprehensive Cancer Center, Division of Hematology, Oncology, Dept. of Medicine, University of California, Irvine School of Medicine, Orange, CA, United States.

Nanotechnology

New Findings from University of California Yields New Data on Nanotechnology (Single Cell "Glucose Nanosensor" Verifies Elevated Glucose Levels in Individual Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nanotechnology have been published. According to news originating from Santa Cruz, California, by NewsRx correspondents, research stated, "Because the transition from oxidative phosphorylation to anaerobic glycolytic metabolism is a hallmark of cancer progression, approaches to identify single living cancer cells by their unique glucose metabolic signature would be useful. Here, we present nanopipettes specifically developed to measure glucose levels in single cells with temporal and spatial resolution, and we use this technology to verify the hypothesis that individual cancer cells can indeed display higher intracellular glucose levels."

Financial supporters for this research include National Institute of Neurological Disorders and Stroke, National Human Genome Research Institute.

Our news journalists obtained a quote from the research from the University of California, "The nanopipettes were functionalized as glucose nanosensors by immobilizing glucose oxidase (GOx) covalently to the tip so that the interaction of glucose with GOx resulted in a catalytic oxidation of b-d-glucose to d-gluconic acid, which was measured as a change in impedance due to drop in pH of the medium at the nanopipette tip. Calibration studies showed a direct relationship between impedance changes at the tip and glucose concentration in solution. The glucose nanosensor quantified single cell intracellular glucose levels in human fibroblasts and the metastatic breast cancer lines MDA-MB-231 and MCF7 and revealed that the cancer cells expressed reproducible and reliable increases in glucose levels compared to the nonmalignant cells. Nanopipettes allow repeated sampling of the same cell, as cells remain viable during and after measurements. Therefore, nanopipette-based glucose sensors provide an approach to compare changes in glucose levels with changes in proliferative or metastatic state."

According to the news editors, the research concluded: "The platform has great promise for mechanistic investigations, as a diagnostic tool to distinguish cancer cells from nonmalignant cells in heterogeneous tissue biopsies, as well as a tool for monitoring cancer progression in situ."

The news correspondents report that additional information may be obtained from R.A. Nascimento, Biomolecular Engineering Department, University of California Santa Cruz, 1156 High Street, Santa Cruz, California 95064, United States. Additional authors for this
New Findings from University of California in Neoplasms Provides New Insights (Role of serial EUS-guided FNA on pancreatic cystic neoplasms: a retrospective analysis of repeat carcinoembryonic antigen measurements)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neoplasms. According to news reporting out of Orange, California, by NewsRx editors, research stated, "Pancreatic cystic neoplasms (PCNs) often need interval surveillance, including repeat EUS, but the role of repeat FNA with fluid analysis is poorly defined. The aim of this analysis is to evaluate the potential clinical significance of serial carcinoembryonic antigen (CEA) measurements by EUS-guided FNA (EUS-FNA) in the surveillance for PCNs."

Our news journalists obtained a quote from the research from the University of California, "Patients who underwent EUS-FNA for PCNs were studied retrospectively. EUS-FNA findings were compared between index and prior procedures among patients who underwent repeat EUS-FNA. A total of 400 patients with PCNs underwent EUS-FNA. Eighty-seven of those patients had prior EUS-FNA with cyst fluid analysis. Patients with repeat FNA were significantly more likely to have multiple cysts (57% vs 41%; P = .008), multilocular cysts (75% vs 62%; P = .042), connection to pancreatic duct (33% vs 18%; P = .005), and higher initial CEA levels (94.8 vs 25.6 ng/mL; P = .003) compared with patients who had only a single FNA. A comparison of prior and index FNAs did not show significant differences in EUS or cyst fluid analysis findings. After log transformation, the association between CEA level at prior and index FNA was moderate (R-2 = 0.626; P< .001), but cystic fluid CEA classification with a cutoff value of 192 ng/mL changed in 17 patients (20%), without significant changes in EUS findings. Repeat surveillance EUS-FNA resulted in stable CEA levels in the majority of patients, with spurious fluctuations of CEA in approximately 20% of patients."

According to the news editors, the research concluded: "These data call into question any clinical significance attributed to an isolated interval rise in CEA level, especially in light of a stable EUS examination."

Our news journalists report that additional information may be obtained by
Oncology - Acute Lymphoblastic Leukemia

New Findings from University of California in the Area of Acute Lymphoblastic Leukemia Reported (PTEN opposes negative selection and enables oncogenic transformation of pre-B cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Acute Lymphoblastic Leukemia. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "Phosphatase and tensin homolog (PTEN) is a negative regulator of the phosphatidylinositol 3-kinase (PI3K) and protein kinase B (AKT) signaling pathway and a potent tumor suppressor in many types of cancer. To test a tumor suppressive role for PTEN in pre-B acute lymphoblastic leukemia (ALL), we induced Cre-mediated deletion of Pten in mouse models of pre-B ALL."

Our news editors obtained a quote from the research from the University of California, "In contrast to its role as a tumor suppressor in other cancers, loss of one or both alleles of Pten caused rapid cell death of pre-B ALL cells and was sufficient to clear transplant recipient mice of leukemia. Small-molecule inhibition of PTEN in human pre-B ALL cells resulted in hyperactivation of AKT, activation of the p53 tumor suppressor cell cycle checkpoint and cell death. Loss of PTEN function in pre-B ALL cells was functionally equivalent to acute activation of autoreactive pre-B cell receptor signaling, which engaged a deletional checkpoint for the removal of autoreactive B cells."

According to the news editors, the research concluded: "We propose that targeted inhibition of PTEN and hyperactivation of AKT triggers a checkpoint for the elimination of autoreactive B cells and represents a new strategy to overcome drug resistance in human ALL."

For more information on this research see: PTEN opposes negative selection and enables oncogenic transformation of pre-B cells. Nature Medicine, 2016;22(4):379-87. (Nature Publishing Group - www.nature.com/nm/)

Stem Cell Research - Mesenchymal Stem Cells

New Findings from University of Cincinnati Medical Center in the Area of Mesenchymal Stem Cells Reported (Abrogation of Age-Induced MicroRNA-195 Rejuvenates the Senescent Mesenchymal Stem Cells by Reactivating Telomerase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Stem Cell Research - Mesenchymal Stem Cells. According to news reporting out of Cincinnati, Ohio, by NewsRx editors, research stated, "Previously, we reported that a novel subpopulation of young mesenchymal stem cells (YMSCs) existed in old bone marrow, which possessed high antiaging properties as well as excellent efficacy for cardiac repair. MicroRNAs (miRNAs) have emerged as key regulators in post-transcriptional gene expression programs, and however, it is unknown whether miRNAs directly control stem cell senescence."

Financial support for this research came from National Heart, Lung and Blood Institute.

Our news journalists obtained a quote from the research from the University of Cincinnati Medical Center, "Here we present the first evidence that miR-195 overexpressed in old MSCs (OMSCs) induces stem cell senescence deteriorating their regenerative ability by directly deactivating telomerase reverse transcriptase (Tert), and abrogation of miR-195 can reverse stem cell aging. MiRNAs profiling analysis in YMSCs and OMSCs by microarray showed that miR-140, miR-146a/b, and miR-195 were significantly upregulated in OMSCs, which led us to hypothesize that these are age-induced miRNAs involved in stem cell senescence. Of these miRNAs, we found miR-195 directly targeted 3'-untranslated region of Tert gene by computational target prediction analysis and luciferase assay, and knockdown of miR-195 significantly increased Tert expression in OMSCs. Strikingly, miR-195 inhibition significantly induced telomere relengthening in OMSCs along with reduced expression of senescence-associated b-galactosidase. Moreover, silencing miR-195 in OMSCs by transfection of miR-195 inhibitor significantly restored antiaging factors expression including Tert and Sirt1 as well as phosphorylation of Akt and FOXO1. Notably, abrogation of miR-195 markedly restored proliferative abilities in OMSCs. Transplantation of OMSCs with knocked out miR-195 reduced infarction size and improved LV function."

According to the news editors, the research concluded: "Rejuvenation of aged stem cells by miR-195 inhibition would be a promising autologous therapeutic strategy for cardiac repair in the elderly patients."

Our news journalists report that additional information may be obtained by

Heart Disorders and Diseases - Endocarditis

New Findings from University of Cologne in the Area of Endocarditis Described (Three-dimensional compared to two-dimensional transesophageal echocardiography for diagnosis of infective endocarditis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Endocarditis is the subject of a report. According to news reporting out of Cologne, Germany, by NewsRx editors, research stated, "Transesophageal echocardiography is crucial for the diagnosis of infective endocarditis (IE). Use of three-dimensional transesophageal echocardiography (3D-TEE) could improve the reliability of echocardiographic findings."

Our news journalists obtained a quote from the research from the University of Cologne, "This study sought to determine the value of 3D-TEE in the diagnosis of IE in comparison to two-dimensional (2D)-TEE and 2D transthoracic echocardiography (2D-TTE). In this prospective cohort study in a tertiary care university hospital 144 consecutive patients with clinically suspected IE were included. The patients were subjected to clinical, microbiological and echocardiographic evaluation (2D-TTE, 2D-TEE and 3D-TEE) and their clinical history evaluated retrospectively to establish a reference diagnosis of IE in accordance to current guideline recommendations. In 48 (33 %) patients the diagnosis of IE was established. 2D-TEE and 3D-TEE showed a sensitivity, specificity, positive and negative predictive value for diagnosis of IE of 94 % and 63, 90 and 95 %, 82 and 86 % and 97 and 83 %, respectively, with similar results in patients with native and prosthetic valves. Vegetations and abscess were detected in 43 and 5 patients with final diagnosis of IE by any of the assessed echocardiographic modalities, with only one case of vegetation detected by 3D-TEE only and not by 2D-TEE."

According to the news editors, the research concluded: "In this cohort of patients with suspected IE, 3D-TEE showed substantial lower sensitivity and negative predictive value for diagnosis of IE when compared to 2D-TEE. 3D-TEE might provide additive diagnostic information with impact on clinical decisions only in individual cases."

For more information on this research see: Three-dimensional compared to two-dimensional transesophageal echocardiography for diagnosis of infective endocarditis. Infection, 2016;44(6):725-731. Infection can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. (Springer - www.springer.com; Infection -
www.springerlink.com/content/0300-8126/)

Oncology - Hereditary Nonpolyposis Colorectal Cancer

New Findings from University of Colorado Describe Advances in Hereditary Nonpolyposis Colorectal Cancer (Knowledge and Uptake of Genetic Counseling and Colonoscopic Screening Among Individuals at Increased Risk for Lynch Syndrome and their ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Hereditary Nonpolyposis Colorectal Cancer. According to news reporting out of Aurora, Colorado, by NewsRx editors, research stated, "Individuals whose families meet the Amsterdam II clinical criteria for hereditary non-polyposis colorectal cancer are recommended to be referred for genetic counseling and to have colonoscopic screening every 1-2 years. To assess the uptake and knowledge of guideline-based genetic counseling and colonoscopic screening in unaffected members of families who meet Amsterdam II criteria and their treating endoscopists."

Our news journalists obtained a quote from the research from the University of Colorado, "Participants in the Family Health Promotion Project who met the Amsterdam II criteria were surveyed regarding their knowledge of risk-appropriate guidelines for genetic counseling and colonoscopy screening. Endoscopy/pathology reports were obtained from patients screened during the study to determine the follow-up recommendations made by their endoscopists. Survey responses were compared using Fisher's Exact and the ch(2) test. Concordance in participant/provider-reported surveillance interval was assessed using the kappa statistic. Of the 165 participants, the majority (98%) agreed that genetics and family history are important predictors of CRC, and 63% had heard of genetic testing for CRC, although only 31% reported being advised to undergo genetic counseling by their doctor, and only 7% had undergone genetic testing. Only 26% of participants reported that they thought they should have colonoscopy every 1-2 years and 30% of endoscopists for these participants recommended 1-2-year follow-up colonoscopy. There was a 65% concordance (weighted kappa 0.42, 95% CI 0.24-0.61) between endoscopist recommendations and participant reports regarding screening intervals. A minority of individuals meeting Amsterdam II criteria in this series have had genetic testing and reported accurate knowledge of risk-appropriate screening, and only a small percentage of their endoscopists provided them with the appropriate screening."
recommendations."

According to the news editors, the research concluded: "There was moderate concordance between endoscopist recommendations and participant knowledge suggesting that future educational interventions need to target both health-care providers and their patients."

For more information on this research see: Knowledge and Uptake of Genetic Counseling and Colonoscopic Screening Among Individuals at Increased Risk for Lynch Syndrome and their Endoscopists from the Family Health Promotion Project. *The American Journal of Gastroenterology*, 2016;111(2):285-93.

Our news journalists report that additional information may be obtained by contacting S.G. Patel, Dept. of Medicine, Division of Gastroenterology & Hepatology, University of Colorado Anschutz Medical Center, Aurora, Colorado, United States. Additional authors for this research include D.J. Ahnen, A.Y. Kinney, N. Horick, D.M. Finkelstein, D.A. Hill, N.M. Lindor, F. MaCrae and J.T Lowery.

Membrane Proteins - Ion Channels

New Findings from University of Copenhagen in the Area of Ion Channels Reported (The Volume Activated Potassium Channel KCNK5 is Up-Regulated in Activated Human T Cells, but Volume Regulation is Impaired)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Membrane Proteins - Ion Channels have been presented. According to news reporting originating in Copenhagen, Denmark, by NewsRx journalists, research stated, "The potential role of the two-pore domain potassium channel KCNK5 (also known as TASK-2 and K(2P)5.1) in activated T cell physiology has only recently been described. So far KCNK5 has been described to be up-regulated in T cells in multiple sclerosis patients and to be implicated in the volume regulatory mechanism regulatory volume decrease (RVD) in T cells."

The news reporters obtained a quote from the research from the University of Copenhagen, "We investigated the time-dependent expression pattern of KCNK5 in CD3/CD28 activated human T cells using qPCR and Western blotting and its role in RVD using a Coulter Counter. KCNK5 is highly up-regulated in CD3/CD28 activated T cells both at mRNA (after 24 h) and protein level (72 and 144 h), but despite this up-regulation the RVD response is inhibited. Furthermore, the swelling-activated Cl-permeability in activated T cells is strongly decreased, and the RVD inhibition is predominantly due to the decreased Cl-permeability. The up-regulated KCNK5 in activated human T cells does not play a volume regulatory role, due to decreased Cl-permeability."

According to the news reporters, the research concluded: "We speculate that the
KCNK5 up-regulation might play a role in hyperpolarization of the cell membrane leading to increased Ca2+ influx and proliferation of T cells."

For more information on this research see: The Volume Activated Potassium Channel KCNK5 is Up-Regulated in Activated Human T Cells, but Volume Regulation is Impaired. *Cellular Physiology and Biochemistry*, 2016;38(3):883-92. (Karger - www.karger.com; Cellular Physiology and Biochemistry - content.karger.com/ProdukteDB/produkte.asp?Aktion=JournalHome&ProduktNr=224332)

**Neuropeptides**

**New Findings from University of G. d'Annunzio Describe Advances in Neuropeptides (Central inhibitory effects on feeding induced by the adipo-myokine irisin)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neuropeptides have been published. According to news reporting from Chieti, Italy, by NewsRx journalists, research stated, "Irinin, the soluble secreted form of fibronectin type III domain containing 5 (FNDC5)-cleaved product, is a recently identified adipo-myokine that has been indicated as a possible link between physical exercise and energetic homeostasis. The co-localization of irisin with neuropeptide Y in hypothalamic sections of paraventricular nucleus, which receives NPY/AgRP projections from the arcuate nucleus, suggests a possible role of irisin in the central regulation of energy balance."

Financial support for this research came from Italian Ministry of University (far 2015).

The news correspondents obtained a quote from the research from the University of G. d'Annunzio, "In this context, in the present work we studied the effects of intra-hypothalamic irisin (1 μl, 50-200 nmol/l) administration on feeding and orexigenic [agouti-related peptide (AgRP), neuropeptide Y (NPY) and orexin-A] and anorexigenic [cocaine and amphetamine-regulated transcript (CART) and proopiomelanocortin (POMC)] peptides in male Sprague-Dawley rats. Furthermore, we evaluated the effects of irisin on hypothalamic dopamine (DA), norepinephrine (NE) and serotonin (5-hydroxytryptamine, 5-HT) concentrations and plasma NE levels. Compared to vehicle, irisin injected rats showed decreased food intake, possibly mediated by stimulated CART and POMC and inhibited DA, NE and orexin-A, in the hypothalamus."

According to the news reporters, the research concluded: "We also found increased plasma NE levels, supporting a role for sympathetic nervous system stimulation in mediating..."
increased oxygen consumption by irisin."

For more information on this research see: Central inhibitory effects on feeding induced by the adipo-myokine irisin. European Journal of Pharmacology, 2016;791():389-394. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Autoimmune Diseases and Conditions - Rheumatoid...

New Findings from University of Glasgow in the Area of Rheumatoid Arthritis Described (Effect of IL-6 receptor blockade on high-sensitivity troponin T and NT-proBNP in rheumatoid arthritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autoimmune Diseases and Conditions - Rheumatoid Arthritis have been presented. According to news reporting out of Glasgow, United Kingdom, by NewsRx editors, research stated, "Observational associations between inflammation and cardiovascular disease are interesting, but randomised experimental data are lacking. We investigated the effect of the IL-6 receptor blocker tocilizumab on N terminal pro B type natriuretic peptide (NT-proBNP) and high sensitivity troponin T (hsTnT) in rheumatoid arthritis (RA) patients."

Our news journalists obtained a quote from the research from the University of Glasgow, "A post-hoc study was performed in a subset of patients with moderate to severe RA participating in a randomised controlled trial. The effect of tocilizumab on cardiac biomarkers was determined using stored serum (baseline and 24 weeks) in recipients of tocilizumab (8 mg/kg every 4 weeks plus DMARDs; n = 225) or placebo (every 4 weeks plus DMARDs; n = 132). Median NT-proBNP and hsTnT concentrations at baseline were 100 pg/ml and 5.7 pg/ml, respectively. NT-proBNP decreased in both study arms (median at 24 weeks 77 pg/ml in the placebo arm, 79 pg/ml in the tocilizumab arm; p< 0.001 for the decrease in both arms), and decreased to a similar extent comparing study arms (tocilizumab effect: -5.5%, p = 0.55). hsTnT also decreased in both study arms (median at 24 weeks 3.1 pg/ml in the placebo arm, 4.4 pg/ml in the tocilizumab arm; p< 0.001 for the decrease in both arms). The extent of the reduction in hsTnT was greater in the placebo group (tocilizumab effect: +23.3%, p = 0.002). Change in NT-proBNP, but not hsTnT, correlated modestly with change in CRP (r = 0.17, p = 0.013)."

According to the news editors, the research concluded: "These data argue against a rapid preferential benefit of IL-6 blockade on these specific surrogate markers of cardiovascular
risk, but may be consistent with a general cardiovascular benefit of improved RA treatment."

For more information on this research see: Effect of IL-6 receptor blockade on high-sensitivity troponin T and NT-proBNP in rheumatoid arthritis. *Atherosclerosis*, 2016;254 ():167-171. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Oncology - Lymphoma**

New Findings from University of Groningen in the Area of Lymphoma Reported (Biomarkers for evaluation of treatment response in classical Hodgkin lymphoma: comparison of sGalectin-1, sCD163 and sCD30 with TARC)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lymphoma. According to news reporting originating from Groningen, Netherlands, by NewsRx correspondents, research stated, "Soluble Galectin-1 (sGal-1, also termed LGALS1), soluble CD163 (sCD163) and soluble CD30 (sCD30) have been reported to be elevated in plasma or serum of patients with classical Hodgkin lymphoma (cHL). We aimed to determine the clinical utility of these biomarkers for evaluation of treatment response compared to thymus and activation regulated chemokine (TARC, also termed CCL17)."

Funders for this research include Dutch Organization of Scientific Research, KWF Kankerbestrijding.

Our news editors obtained a quote from the research from the University of Groningen, "Plasma or serum samples were prospectively collected among 103 newly diagnosed cHL patients before and after treatment. Levels of sGal-1, sCD163, sCD30 and TARC were correlated with disease characteristics and clinical treatment response. Elevated plasma levels of sGal-1, sCD163, sCD30 and TARC were found in 67%, 21%, 91% and 93% of cHL patients respectively. Mean plasma levels of sGal-1 and sCD30 decreased after treatment but sCD163 did not decrease after treatment. There was no correlation with change of these markers and clinical treatment response in individual patients. TARC levels strongly correlated with disease characteristics and metabolic volume. TARC remained high in 6 out of 7 non-responsive
patients and dramatically decreased in 95 out of 96 responsive patients. In summary, elevated pre-treatment levels of sGal-1, sCD163, sCD30 and TARC can be found in patients with cHL."

According to the news editors, the research concluded: "However, only plasma TARC accurately reflects disease activity and correlates with clinical treatment response."

The news editors report that additional information may be obtained by contacting W.J. Plattel, University of Groningen, Groningen University Medical Center, Dept. of Haematol, Groningen, Netherlands. Additional authors for this research include Z.N.D. Alsada, G.W. van Imhoff, A. Diepstra, A. van den Berg and L. Visser.

Nutritional and Metabolic Diseases and Conditions -…

New Findings from University of Guelph in the Area of Obesity Reported (Randomized trial of a prevention intervention that embeds weight-related messages within a general parenting program)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting out of Guelph, Canada, by NewsRx editors, research stated, "To assess the extent to which an obesity prevention intervention that embeds obesity-related messages within a parenting program, compared with controls who received weekly mailings, resulted in a smaller increase in children's BMI (primary outcome) and improvements in weight-related behaviors from baseline to 9-month follow-up. Fifty-six families were randomly assigned to the intervention and 56 to control."

Our news journalists obtained a quote from the research from the University of Guelph, "Children were primarily Hispanic (58%) or Black/African American (23%). Intervention included nine weekly: group parenting sessions, children's sessions, and homework assignments. At baseline, post-intervention, and 9-month follow-up, staff assessed children's weight and height. Parents completed surveys assessing parenting skills, feeding behaviors, and children's weight-related behaviors. From baseline to 9-month follow-up, BMI decreased by a mean of 0.13 kg m(-2) among children in the intervention and increased by 0.21 kg m(-2) among children in the control, resulting in a nonsignificant difference (multivariate adjusted difference=-0.36; 95% confidence interval [CI] -1.23, 0.51; p=0.41). Parents in the intervention decreased restrictive feeding practices relative to control (-0.30; 95% CI -0.53, -0.07; p=0.01)."
Intervention and control arms showed similar changes in children's weight-related behaviors."

According to the news editors, the research concluded: "The intervention improved restrictive feeding but did not influence children's BMI or weight-related behaviors compared to controls who received weekly mailings."

For more information on this research see: Randomized trial of a prevention intervention that embeds weight-related messages within a general parenting program. Obesity, 2015;24(1):191-9. (Nature Publishing Group - www.nature.com/oby/)

Digestive System Diseases and Conditions -…

New Findings from University of Hong Kong in the Area of Hemoperitoneum Described (Successful Treatment of a Pararenal Pregnancy Using High-Dose Methotrexate Regimen A Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Hemoperitoneum have been published. According to news reporting from Hong Kong, People's Republic of China, by NewsRx journalists, research stated, "Upper abdominal pregnancy is rare. Most patients present with hemoperitoneum, requiring emergency laparotomy."

The news correspondents obtained a quote from the research from the University of Hong Kong, "A 32-year-old woman presented with acute abdominal pain and an elevated beta human chorionic gonadotropin (beta-hCG) level. Ultrasound, computerized tomography (CT) scans, and laparoscopy failed to locate the source of elevated hCG. Subsequent positron emission tomography (PET) CT demonstrated a cystic mass in the left pararenal region with no increased uptake. Repeated ultrasound scan revealed a live fetus implanted laterally to the abdominal aorta. After failing to respond to methotrexate at the usual dosage, a regimen used in gestational trophoblastic neoplasia was given. The pregnancy underwent miscarriage afterwards, and the hCG level gradually returned to normal. The site of an ectopic pregnancy should be sought thoroughly to avoid missing an abdominal pregnancy and hence disastrous hemoperitoneum."

According to the news reporters, the research concluded: "While medical therapy with high-dose methotrexate is not a standard treatment, it can be considered after failing traditional therapy, provided that there is adequate treatment monitoring and expertise in handling the side effects of the medication."

Our news journalists report that additional information may be obtained by contacting K.Y. Tse, University of Hong Kong, Queen Mary Hospital, Dept. of Radiol, Pokfulam, Hong Kong, People's Republic of China. Additional authors for this research include V.Y.T. Cheung, C. Lam, E.Y.P. Lee, P.L. Khong and H.Y.S. Ngan.

**Science - Materials Science**

**New Findings from University of Illinois in Materials Science Provides New Insights (Cancer Cell Hyperactivity and Membrane Dipolarity Monitoring via Raman Mapping of Interfaced Graphene: Toward Non-Invasive Cancer Diagnostics)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science - Materials Science. According to news originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Ultrasensitive detection, mapping, and monitoring of the activity of cancer cells is critical for treatment evaluation and patient care. Here, we demonstrate that a cancer cell's glycolysis-induced hyperactivity and enhanced electronegative membrane (from sialic acid) can sensitively modify the second-order overtone of in-plane phonon vibration energies (2D) of interfaced graphene via a hole doping mechanism."

Financial support for this research came from University of Illinois at Chicago.

Our news journalists obtained a quote from the research from the University of Illinois, "By leveraging ultrathin graphene's high quantum capacitance and responsive phononics, we sensitively differentiated the activity of interfaced Glioblastoma Multi forme (GBM) cells, a malignant brain tumor, from that of human astrocytes at a single-cell resolution. GBM cell's high surface electronegativity (potential similar to 310 mV) and hyperacidic-release induces hole-doping in graphene with a 3-fold higher 2D vibration energy shift of approximately 6 +/- 0.5 cm(-1) than astrocytes. From molecular dipole-induced quantum coupling, we estimate that the sialic acid density on the cell membrane increases from one molecule per similar to 17 nm(2) to one molecule per similar to 7 nm(2). Furthermore, graphene phononic response also identified enhanced acidity of cancer cell's growth medium."

According to the news editors, the research concluded: "Graphene's phonon-sensitive platform to determine interfaced cell's activity/chemistry will potentially open avenues for studying activity of other cancer cell types, including metastatic tumors, and characterizing different grades of their malignancy."

For more information on this research see: Cancer Cell Hyperactivity and Membrane Dipolarity Monitoring via Raman Mapping of Interfaced Graphene: Toward Non-

The news correspondents report that additional information may be obtained from A. Mehta, University of Illinois, Dept. of Neurosurg, Chicago, IL 60612, United States. Additional authors for this research include A. Cole, P. Nguyen, A. Mehta and V. Berry.

Musculoskeletal Diseases and Conditions - Myotonic...

**New Findings from University of Iowa Update Understanding of Myotonic Dystrophy (Myotonic Dystrophy Type 1 Management and Therapeutics)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Musculoskeletal Diseases and Conditions - Myotonic Dystrophy have been presented. According to news reporting originating in Iowa City, Iowa, by NewsRx journalists, research stated, "Myotonic dystrophy (DM1) is the most common form of adult muscular dystrophy. It is a multisystem disorder with a complex pathophysiology."

The news reporters obtained a quote from the research from the University of Iowa, "Although inheritance is autosomal dominant, disease variability is attributed to anticipation, a maternal expansion bias, variable penetrance, somatic mosaicism, and a multitude of aberrant pre-mRNA splicing events. Patient presentations range from asymptomatic or mild late onset adult to severe congenital forms. Multiple organ systems may be affected. Patients may experience early cataracts, myotonia, muscle weakness/atrophy, fatigue, excessive daytime sleepiness, central/obstructive apnea, respiratory failure, cardiac arrhythmia, insulin resistance, dysphagia, GI dysmotility, cognitive impairment, Cluster C personality traits, and/or mood disorders. At present, there is no curative or disease-modifying treatment, although clinical treatment trials have become more promising. Management focuses on genetic counseling, preserving function and independence, preventing cardiopulmonary complications, and symptomatic treatment (e.g., pain, myotonia, hypersomnolence, etc.)."

According to the news reporters, the research concluded: "Currently, there is an increasing international consensus on monitoring and treatment options for these patients which necessitates a multidisciplinary team to provide comprehensive, coordinated clinical care."

For more information on this research see: Myotonic Dystrophy Type 1 Management and Therapeutics. *Current Treatment Options in Neurology*, 2016;18(12):11-25. *Current Treatment Options in Neurology* can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. Our news correspondents report that additional information may be obtained by
Public Health

New Findings from University of Jordan in the Area of Public Health Described (Integrating the Principles of Evidence Based Medicine and Evidence Based Public Health: Impact on the Quality of Patient Care and Hospital Readmission Rates in Jordan)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Public Health are presented in a new report. According to news reporting out of Irbid, Jordan, by NewsRx editors, research stated, "Hospital readmissions impose not only an extra burden on health care systems but impact patient health outcomes. Identifying modifiable behavioural risk factors that are possible causes of potentially avoidable readmissions can lower readmission rates and healthcare costs."

Our news journalists obtained a quote from the research from the University of Jordan, "Using the core principles of evidence based medicine and public health, the purpose of this study was to develop a heuristic guide that could identify what behavioural risk factors influence hospital readmissions through adopting various methods of analysis including regression models, t-tests, data mining, and logistic regression. This study was a retrospective cohort review of internal medicine patients admitted between December 1, 2012 and December 31, 2013 at King Abdullah University Hospital, in Jordan. 29% of all hospitalized patients were readmitted during the study period. Among all readmissions, 44% were identified as potentially avoidable. Behavioural factors including smoking, unclear follow-up and discharge planning, and being non-compliant with treatment regimen as well as discharge against medical advice were all associated with increased risk of avoidable readmissions."

According to the news editors, the research concluded: "Implementing evidence based health programs that focus on modifiable behavioural risk factors for both patients and clinicians would yield a higher response in terms of reducing potentially avoidable readmissions, and could reduce direct medical costs."

Our news journalists report that additional information may be obtained by contacting M.S. Alyahya, Jordan University of Science & Technology, Fac Med, Dept. of Hlth Management & Policy, Irbid 22110, Jordan. Additional authors for this research include H.H.
New Findings from University of Kentucky in Alzheimer Disease Provides New Insights (Genomics and CSF analyses implicate thyroid hormone in hippocampal sclerosis of aging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting originating in Lexington, Kentucky, by NewsRx journalists, research stated, "We report evidence of a novel pathogenetic mechanism in which thyroid hormone dysregulation contributes to dementia in elderly persons. Two single nucleotide polymorphisms (SNPs) on chromosome 12p12 were the initial foci of our study: rs704180 and rs73069071."

Funders for this research include National Institutes of Health (US), NIH, National Institute on Aging.

The news reporters obtained a quote from the research from the University of Kentucky, "These SNPs were identified by separate research groups as risk alleles for non-Alzheimer's neurodegeneration. We found that the rs73069071 risk genotype was associated with hippocampal sclerosis (HS) pathology among people with the rs704180 risk genotype (National Alzheimer's Coordinating Center/Alzheimer's Disease Genetic Consortium data; n = 2113, including 241 autopsy-confirmed HS cases). Furthermore, both rs704180 and rs73069071 risk genotypes were associated with widespread brain atrophy visualized by MRI (Alzheimer's Disease Neuroimaging Initiative data; n = 1239). In human brain samples from the Braineac database, both rs704180 and rs73069071 risk genotypes were associated with variation in expression of ABCC9, a gene which encodes a metabolic sensor protein in astrocytes. The rs73069071 risk genotype was also associated with altered expression of a nearby astrocyte-expressed gene, SLCO1C1. Analyses of human brain gene expression databases indicated that the chromosome 12p12 locus may regulate particular astrocyte-expressed genes induced by the active form of thyroid hormone, triiodothyronine (T3). This is informative biologically, because the SLCO1C1 protein transports thyroid hormone into astrocytes from blood. Guided by the genomic data, we tested the hypothesis that altered thyroid hormone levels could be detected in cerebrospinal fluid (CSF) obtained from persons with HS pathology. Total T3 levels in CSF were elevated in HS cases (p < 0.04 in two separately analyzed groups), but not in Alzheimer's disease cases, relative to controls. No change was detected in the serum levels of thyroid hormone (T3 or T4) in a subsample of HS cases prior to death."

According to the news reporters, the research concluded: "We conclude that brain thyroid hormone perturbation is a potential pathogenetic factor in HS that may also provide the basis for a novel CSF-based clinical biomarker."

For more information on this research see: Genomics and CSF analyses implicate thyroid hormone in hippocampal sclerosis of aging. *Acta Neuropathologica*, 2016;132(6):841-858. *Acta Neuropathologica* can be contacted at: Springer, 233 Spring St, New York, NY
10013, USA. (Springer - www.springer.com; Acta Neuropathologica - www.springerlink.com/content/0001-6322/)

Drugs and Therapies - Hormone Replacement Therapy

New Findings from University of Kragujevac in the Area of Hormone Replacement Therapy Reported (Cytogenetic biomarkers in detection of genotoxic effects of gestagens in peripheral blood lymphocytes in vitro and in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Hormone Replacement Therapy are presented in a new report. According to news originating from Kragujevac, Serbia, by NewsRx correspondents, research stated, "Gestagens are the most frequently used steroid hormones in hormone-replacement therapy in the treatment of threatened miscarriage during the first trimester of pregnancy. This therapy has been applied in a large number of women with threatened abortion, despite various degrees of success of its efficacy."

Our news journalists obtained a quote from the research from the University of Kragujevac, "Genetic factors play a key role in miscarriages, especially in the initial stages. Cytogenetic biomarkers such as micronucleus (MN) test, chromosomal aberrations (CAs), and sister chromatid exchanges (SCEs) provide information on DNA damage. Cytogenetic markers detecting DNA damage have become very popular and useful in analysing genetic risk associated with hormone-replacement therapy. Cytogenetic studies presented heterogenous information. In many in vitro studies synthetic gestagens have been shown to induce genotoxic effects, and it was evaluated using three cytogenetic biomarkers. Genotoxic effects of gestagens have also been confirmed in in vivo studies that were conducted involving patients who received gestagen therapy during pregnancy and their newborns. However, some studies have shown that hormone-replacement therapy does not have genotoxic effects. In this paper, we summarize the results from previous studies."

According to the news editors, the research concluded: "We also describe the usefulness of these biomarkers in the detection of genotoxic effects of hormone-replacement therapy."

For more information on this research see: Cytogenetic biomarkers in detection of genotoxic effects of gestagens in peripheral blood lymphocytes in vitro and in vivo. European
Journal of Medical Genetics, 2016;59(12):624-633. European Journal of Medical Genetics can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Cardiovascular Diseases and Conditions -...

New Findings from University of KwaZulu-Natal in the Area of Atherosclerosis Described (Linkage and Association Analysis Identifies TRAF1 Influencing Common Carotid Intima-Media Thickness)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news originating from Pietermaritzburg, South Africa, by NewsRx correspondents, research stated, "Carotid intima-media thickness is a marker for subclinical atherosclerosis that predicts subsequent clinical cardiovascular events. The aim of this study was to identify chromosomal loci with linkage or association to common carotid intima-media thickness."

Our news journalists obtained a quote from the research from the University of KwaZulu-Natal, "Nuclear families were recruited using the single parental proband sib-pair design. Genotype data were available for 546 individuals from 132 nuclear families of the Bonn IMT Family Study using the Affymetrix GeneChip Human Mapping 250K Sty chip. Multipoint logarithm of the odds (LOD) scores were determined with the quantitative trait locus statistic implemented in multipoint engine for rapid likelihood. Linkage analysis and family-based association tests were conducted. Data from 2471 German participants from the HNR (Heinz Nixdorf Recall) Study were used for subsequent replication. Two new genomic regions with suggestive linkage (LOD >2) were identified on chromosome 4 (LOD=2.26) and on chromosome 17 (LOD=2.01). Previously reported linkage findings were replicated on chromosomes 13 and 14. Fifteen single nucleotide polymorphisms, located on chromosomes 4, 6, and 9, revealed P<10(-4) in the family-based association analyses. One of these signals was replicated in HNR (rs2416804, 1-sided P=1.60x10(-3), located in the gene TRAF1). This study presents the first genome-wide linkage and association study of common carotid intima-media thickness in the German population. Alleles of rs2416804 in TRAF1 were identified as being linked and associated with carotid intima-media thickness."

According to the news editors, the research concluded: "Further studies are needed to evaluate the contribution of this locus to the development of atherosclerosis."

For more information on this research see: Linkage and Association Analysis Identifies TRAF1 Influencing Common Carotid Intima-Media Thickness. Stroke, 2016;47
New Findings from University of Leipzig Update Understanding of Cardiology (Neuroprotective Strategies during Cardiac Surgery with Cardiopulmonary Bypass)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news originating from Leipzig, Germany, by NewsRx correspondents, research stated, "Aortocoronary bypass or valve surgery usually require cardiac arrest using cardioplegic solutions. Although, in principle, in a number of cases beating heart surgery (so-called off-pump technique) is possible, aortic or valve surgery or correction of congenital heart diseases mostly require cardiopulmonary arrest."

Our news journalists obtained a quote from the research from the University of Leipzig, "During this condition, the heart-lung machine also named cardiopulmonary bypass (CPB) has to take over the circulation. It is noteworthy that the invention of a machine bypassing the heart and lungs enabled complex cardiac operations, but possible negative effects of the CPB on other organs, especially the brain, cannot be neglected. Thus, neuroprotection during CPB is still a matter of great interest."

According to the news editors, the research concluded: "In this review, we will describe the impact of CPB on the brain and focus on pharmacological and non-pharmacological strategies to protect the brain."

For more information on this research see: Neuroprotective Strategies during Cardiac Surgery with Cardiopulmonary Bypass. *International Journal of Molecular Sciences*, 2016;17(11):2558-2573. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

New Findings from University of Lille in Polycystic Ovary Syndrome Provides New Insights (Interactions between androgens, FSH, anti-Mullerian hormone and estradiol during folliculogenesis in the human normal and polycystic ovary)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Endocrine System Diseases and Conditions - Polycystic Ovary Syndrome. According to news originating from Lille, France, by NewsRx correspondents, research stated, "Androgens, FSH, anti-Mullerian hormone (AMH) and estradiol (E2) are essential in human ovarian folliculogenesis. However, the interactions between these four players is not fully understood."

Our news journalists obtained a quote from the research from the University of Lille, "The purpose of this review is to highlight the chronological sequence of the appearance and function of androgens, FSH, AMH and E2 and to discuss controversies in the relationship between FSH and AMH. A better understanding of this interaction could supplement our current knowledge about the pathophysiology of the polycystic ovary syndrome (PCOS). A literature review was performed using the following search terms: androgens, FSH, FSH receptor, anti-Mullerian hormone, AMHRII, estradiol, follicle, ovary, PCOS, aromatase, granulosa cell, oocyte. The time period searched was 1980-2015 and the databases interrogated were PubMed and Web of Science. During the pre-antral ('gonadotropin-independent') follicle growth, FSH is already active and promotes follicle growth in synergy with theca cell-derived androgens. Conversely, AMH is inhibitory by counteracting FSH. We challenge the hypothesis that AMH is regulated by androgens and propose rather an indirect effect through an androgen-dependent amplification of FSH action on granulosa cells (GCs) from small growing follicles. This hypothesis implies that FSH stimulates AMH expression. During the antral ('gonadotropin-dependent') follicle growth, E2 production results from FSH-dependent activation of aromatase. Conversely, AMH is inhibitory but the decline of its expression, amplified by E2, allows full expression of aromatase, characteristic of the large antral follicles. We propose a theoretical scheme made up of two triangles that follow each other chronologically. In PCOS, pre-antral follicle growth is excessive (triangle 1) because of intrinsic androgen excess that renders GCs hypersensitive to FSH, with consequently excessive AMH expression. Antral follicle growth and differentiation are disturbed (triangle 2) because of the abnormally persisting inhibition of FSH effects by AMH that blocks aromatase. Beside anovulation, this scenario may also serve to explain the higher receptiveness to gonadotropin therapy and the increased risk of ovarian hyperstimulation syndrome (OHSS) in patients with PCOS. Within GCs, the balance between FSH and AMH effects is pivotal in the shift from androgen- to oestrogen-driven follicles. Our two triangles hypothesis, based on updated data from the literature, offers a pedagogic template for the understanding of folliculogenesis in the normal and polycystic ovary."

According to the news editors, the research concluded: "It opens new avenues for the treatment of anovulation due to PCOS."

For more information on this research see: Interactions between androgens, FSH, anti-Mullerian hormone and estradiol during folliculogenesis in the human normal and polycystic ovary. Human Reproduction Update, 2016;22(6):709-724. Human Reproduction

Proteins - DNA-Binding Proteins

New Findings from University of Magdeburg Update Understanding of DNA-Binding Proteins (GSK-3 beta controls NF-kappaB activity via IKK gamma/NEMO)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Proteins - DNA-Binding Proteins is now available. According to news reporting originating in Magdeburg, Germany, by NewsRx journalists, research stated, "The NF-kappa B signaling pathway is central for the innate immune response and its deregulation is found in multiple disorders such as autoimmune, chronic inflammatory and metabolic diseases. IKK gamma/NEMO is essential for NF-kappa B activation and NEMO dysfunction in humans has been linked to so-called progeria syndromes, which are characterized by advanced ageing due to age-dependent inflammatory diseases."

The news reporters obtained a quote from the research from the University of Magdeburg, "It has been suggested that glycogen synthase kinase-3 beta (GSK-3 beta) participates in NF-kappa B regulation but the exact mechanism remained incompletely understood. In this study, we identified NEMO as a GSK-3 beta substrate that is phosphorylated at serine 8, 17, 31 and 43 located within its N-terminal domain. The kinase forms a complex with wild-type NEMO while point mutations of NEMO at the specific serines abrogated GSK-3 beta binding and subsequent phosphorylation of NEMO resulting in its destabilization. However, K63-linked polyubiquitination was augmented in mutated NEMO explaining an increased binding to IKK alpha and IKK beta. Even I kappa B alpha was found degraded. Still, TNF alpha-stimulated NF-kappa B activation was impaired pointing towards an un-controlled signalling process."

According to the news reporters, the research concluded: "Our data suggest that GSK-3 beta is critically important for ordered NF-kappa B signalling through modulation of
NEMO phosphorylation."

For more information on this research see: GSK-3 beta controls NF-kappaB activity via IKK gamma/NEMO. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England.

Our news correspondents report that additional information may be obtained by contacting S. Medunjanin, Univ Magdeburg, Internal Med Cardiol & Angiol, Magdeburg, Germany. Additional authors for this research include L. Schleithoff, C. Fiegehenn, S. Weinert, W. Zuschratter and R.C. Braun-Dullaeus.

Peripheral Neuropathy

New Findings from University of Malaya Update Understanding of Peripheral Neuropathy (Mutation analysis of genes within the dynactin complex in a cohort of hereditary peripheral neuropathies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Peripheral Neuropathy is now available. According to news reporting from Kuala Lumpur, Malaysia, by NewsRx journalists, research stated, "The cytoplasmic dynein-dynactin genes are attractive candidates for neurodegenerative disorders given their functional role in retrograde transport along neurons. The cytoplasmic dynein heavy chain (DYNC1H1) gene has been implicated in various neurodegenerative disorders, and dynactin 1 (DCTN1) genes have been implicated in a wide spectrum of disorders including motor neuron disease, Parkinson's disease, spinobulbar muscular atrophy and hereditary spastic paraplegia."

The news correspondents obtained a quote from the research from the University of Malaya, "However, the involvement of other dynactin genes with inherited peripheral neuropathies (IPN) namely, hereditary sensory neuropathy, hereditary motor neuropathy and Charcot-Marie-Tooth disease is under reported. We screened eight genes; DCTN1-6 and ACTR1A and ACTR1B in 136 IPN patients using whole-exome sequencing and high-resolution melt (HRM) analysis. Eight non-synonymous variants (including one novel variant) and three synonymous variants were identified. Four variants have been reported previously in other studies, however segregation analysis within family members excluded them from causing IPN in these families. No variants of disease significance were identified in this study suggesting the dynactin genes are unlikely to be a common cause of IPNs."

According to the news reporters, the research concluded: "However, with the ease of querying gene variants from exome data, these genes remain worthwhile candidates to assess unsolved IPN families for variants that may affect the function of the proteins."

For more information on this research see: Mutation analysis of genes within the dynactin complex in a cohort of hereditary peripheral neuropathies. Clinical Genetics, 2016;90 (2):127-133. Oncology - Small Cell Lung Cancer

New Findings from University of Manitoba Describe Advances in Small Cell Lung Cancer (A 10-Gene Yin Yang Expression Ratio Signature for Stage IA and IB Non-Small Cell Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Small Cell Lung Cancer. According to news reporting originating in Winnipeg, Canada, by NewsRx journalists, research stated, "Lung cancer is the leading killer cancer worldwide. There is an urgent need for easy-to-use and robust clinical gene signatures for improved prognosis and treatment prediction."

The news reporters obtained a quote from the research from the University of Manitoba, "We used a gene expression signature termed the Yin and Yang mean ratio (YMR), which is based on two groups of genes with opposing function, to determine lung cancer prognosis. The YMR signature represents the relative state of an individual tumor on a gene expression spectrum ranging from malignancy to the normal healthy lung. The genes in the YMR signature have therefore been determined independently of survival time, which is different from previous regression models. We then leveraged the cross platform utility of the YMR signature to optimize the signature into a smaller set of genes that validated the robustness of the signature in many independent lung cancer expression data sets. Four Yin and six Yang genes were optimized using 741 NSCLC cases from diverse platforms, including micro array and RNA sequencing. The 10-gene signature demonstrated significant differences in survival in eight individual independent data sets and a larger combined 1346-patient data set. When multivariate analysis taking into account other common predictors of survival was used, the 5-year recurrence-free rate of YMR (p = 6.4 x 10(-6), HR =1.71 [1.36-2.16]) was secondary only to stage. The YMR signature significantly separated high- and low-risk patients with stage IA or IB adenocarcinoma and squamous cell carcinomas of all stages. The YMR signature can also predict the benefit of adjuvant chemotherapy in high-risk patients with stage I NSCLC. The YMR signature has great potential for guiding clinical management for NSCLC, particularly early stage disease."

According to the news reporters, the research concluded: "The signature appears more reproducible than older signatures and functions using a variety of common gene expression platforms."

New Findings from University of Massachusetts Describe Advances in Obesity (Economic preferences and obesity among a low-income African American community)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Obesity are discussed in a new report. According to news reporting from Amherst, Massachusetts, by NewsRx journalists, research stated, "Obesity has reached epidemic proportions in the US, with a significantly higher fraction of African Americans who are obese than whites. Yet there is little understanding of why some individuals become obese while others do not."

Financial support for this research came from National Science Foundation.

The news correspondents obtained a quote from the research from the University of Massachusetts, "We conduct a lab-in-field experiment in a low-income African American community to investigate whether risk and time preferences play a role in the tendency to become obese. We examine the relationship between incentivized measures of risk and time preferences and weight status (BMI), and find that individuals who are more tolerant of risk are more likely to have a higher BMI. This result is driven by the most risk tolerant individuals."

According to the news reporters, the research concluded: "Patience is not independently statistically related to BMI in this sample, but those who are more risk averse and patient are less likely to be obese."

Our news journalists report that additional information may be obtained by contacting A.C.M. de Oliveira, University of Massachusetts, Dept. of Resource Econ, Amherst, MA 01003, United States. Additional authors for this research include T.C.M. Leonard, K. Shuval, C.S. Skinner, C. Eckel and J.C. Murdoch.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jebo.2015.11.002. This DOI is a link to an online electronic document that is either free or for purchase.
New Findings from University of Massachusetts in the Area of Sickle Cell Anemia Reported (Exploring Transition to Self-Management Within the Culture of Sickle Cell Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hematologic Diseases and Conditions - Sickle Cell Anemia have been presented. According to news reporting originating in Lowell, Massachusetts, by NewsRx journalists, research stated, "The aim of this study was to explore the meaning of transition to self-management in sickle cell disease. Design/Method: Twelve audio-recorded semistructured interviews were conducted with a sample of 21- to 25-year-olds recruited from a comprehensive sickle cell center in the northeast region of the United States."

The news reporters obtained a quote from the research from the University of Massachusetts, "Data were analyzed using an existential framework according to van Manen's phenomenological method. The meaning of transition to self-management was found in lived time, space, body, and human relationship. The emerging themes highlighted in this article include: Best Mother Ever, Growing up in the Hospital, I'm Not Trying that Again, Doing it on My Own, Living Day-by-Day, and Not a Kid any Longer. The themes reflected meaning and insight into this unique experience."

According to the news reporters, the research concluded: "Conclusion/Practice Implications: Study results emphasize the culturally constructed meaning of transition to sickle cell disease self-management and need to integrate transcultural perspectives into nursing practice to support this emerging phenomenon."

Our news correspondents report that additional information may be obtained by contacting N. Labore, Univ Massachusetts Lowell, Lowell, MA, United States. Additional authors for this research include B. Mawn, J. Dixon and B. Andemariam.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/1043659615609404. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Prostate Cancer

New Findings from University of Medicine and Pharmacy Describe Advances in Prostate Cancer (Replication study of 34 common SNPs associated with prostate cancer in the Romanian population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting originating from Bucharest, Romania, by NewsRx correspondents, research stated, "Prostate cancer is the third-most common form of cancer in men in Romania. The Romanian unscreened population represents a good sample to study common genetic risk variants."

Financial supporters for this research include Seventh Framework Programme, Executive Office of Energy and Environmental Affairs.

Our news editors obtained a quote from the research from the University of Medicine and Pharmacy, "However, a comprehensive analysis has not been conducted yet. Here, we report our replication efforts in a Romanian population of 979 cases and 1027 controls, for potential association of 34 literature-reported single nucleotide polymorphisms (SNPs) with prostate cancer. We also examined whether any SNP was differentially associated with tumor grade or stage at diagnosis, with disease aggressiveness, and with the levels of PSA (prostate specific antigen). In the allelic analysis, we replicated the previously reported risk for 19 loci on 4q24, 6q25.3, 7p15.2, 8q24.21, 10q11.23, 10q26.13, 11p15.5, 11q13.2, 11q13.3. Statistically significant associations were replicated for other six SNPs only with a particular disease phenotype: low-grade tumor and low PSA levels (rs1512268), high PSA levels (rs401681 and rs11649743), less aggressive cancers (rs1465618, rs721048, rs17021918). The strongest association of our tested SNP's with PSA in controls was for rs2735839, with 29% increase for each copy of the major allele G, consistent with previous results. Our results suggest that rs4962416, previously associated only with prostate cancer, is also associated with PSA levels, with 12% increase for each copy of the minor allele C. The study enabled the replication of the effect for the majority of previously reported genetic variants in a set of clinically relevant prostate cancers."

According to the news editors, the research concluded: "This is the first replication study on these loci, known to associate with prostate cancer, in a Romanian population."

For more information on this research see: Replication study of 34 common SNPs associated with prostate cancer in the Romanian population. Journal of Cellular and Molecular Medicine, 2016;20(4):594-600. Journal of Cellular and Molecular Medicine can be contacted at: Blackwell Publishing Inc, 350 Main St, Malden, MA 02148, USA. (Wiley-Blackwell - www.wiley.com; Journal of Cellular and Molecular Medicine - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1582-4934)

The news editors report that additional information may be obtained by contacting V. Jinga, Prof Dr Th Burghele Clinical Hospital, Urology Department, University of Medicine and Pharmacy Carol Davila, Bucharest, Romania. Additional authors for this research include I.E. Csiki, A. Manolescu, P. Iordache, I.N. Mates, D. Radavoi, S. Rascu, D. Badescu, P. Badea and D. Mates.

New Findings from University of Melbourne Describe Advances in Antigens (Lack of Heterologous Cross-reactivity toward HLA-A*02:01 Restricted Viral Epitopes Is Underpinned by Distinct alpha beta T Cell Receptor Signatures)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Antigens. According to news originating from Parkville, Australia, by NewsRx correspondents, research stated, "Alpha beta T cell receptor (TCR) genetic diversity is outnumbered by the quantity of pathogenic epitopes to be recognized. To provide efficient protective anti-viral immunity, a single TCR ideally needs to cross-react with a multitude of pathogenic epitopes."

Our news journalists obtained a quote from the research from the University of Melbourne, "However, the frequency, extent, and mechanisms of TCR cross reactivity remain unclear, with conflicting results on anti-viral T cell cross-reactivity observed in humans. Namely, both the presence and lack of T cell cross-reactivity have been reported with HLA-A*02:01-restricted epitopes from the Epstein-Barr and influenza viruses (BMIT-1 and M1(58), respectively) or with the hepatitis C and influenza viruses (NS3(1073) and NA(231), respectively). Given the high sequence similarity of these paired viral epitopes (56 and 88%, respectively), the ubiquitous nature of the three viruses, and the high frequency of the HLA-A*02:01 allele, we selected these epitopes to establish the extent of T cell cross reactivity. We combined ex vivo and in vitro functional assays, single-cell alpha beta TCR repertoire sequencing, and structural analysis of these four epitopes in complex with HLA-A*02:01 to determine whether they could lead to heterologous T cell cross-reactivity. Our data show that sequence similarity does not translate to structural mimicry of the paired epitopes in complexes with HLA-A*02:01, resulting in induction of distinct alpha beta TCR repertoires. The differences in epitope architecture might be an obstacle for TCR recognition, explaining the lack of T cell cross-reactivity observed."

According to the news editors, the research concluded: "Sequence similarity does not necessarily result in structural mimicry, and despite the need for cross-reactivity, antigen-specific TCR repertoires can remain highly specific."

The news correspondents report that additional information may be obtained from K. Kedzierska, University of Melbourne, Dept. of Microbiol & Immunol, Peter Doherty Inst Infect
Oncology - Colon Cancer

New Findings from University of Melbourne in the Area of Colon Cancer Reported (Regulation of colorectal cancer cell epithelial to mesenchymal transition by the renin angiotensin system)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "Epithelial to mesenchymal transition (EMT) is implicated in tumor progression. We aimed to determine if the renin angiotensin system has a role in colorectal cancer (CRC) cell EMT."

The news correspondents obtained a quote from the research from the University of Melbourne, "Human CRC cell lines DLD-1 and LIM2405 were used in wound scratch migration assays where they were treated with renin angiotensin system peptide ANG II alone or with blockers of ANG II type 1 or 2 receptors (AT1R and AT2R). Levels of epithelial (E-cadherin), mesenchymal (ZEB1, Vimentin) markers, inducible nitric oxide synthase (iNOS), and MMP9 were determined by flow cytometry. Mice bearing CRC liver metastases and treated with blockers for AT1R or AT2R were examined for ZEB1 and iNOS by immunohistochemistry. ANG II increased in-vitro CRC cell migration in both cell lines, this was inhibited by AT1R (IRB) or AT2R blockade (PD123319). DLD-1 cells treated with AT1R blocker resulted in increased E-cadherin, reduced ZEB1, and Vimentin expression compared with ANG II-treated cells. Treatment with AT2R blocker decreased E-cadherin, no change in ZEB1 or Vimentin expression. AT1R blockade increased iNOS and decreased MMP9 expression in DLD-1 and LIM2405 cells. AT2R blockade decreased iNOS and MMP9 expression in both cell lines. In vivo, ZEB1 staining was higher in ANG II-treated animals compared with control and AT1R blockade treated animals, while activation of the AT2R led to an increase in iNOS compared with control and AT1R blockade."

According to the news reporters, the research concluded: "ANG II-induced migration of CRC cells via both AT1 and AT2 receptors; the AT1R-mediated effects were associated with changes typical of EMT."

Our news journalists report that additional information may be obtained by contacting L. Nguyen, University of Melbourne, Dept. of Surg, Austin Hlth, Melbourne, Vic, Australia. Additional authors for this research include E.I. Ager, J. Neo and C. Christophi.

Cardiovascular Diseases and Conditions - Venous...

New Findings from University of Miami in Venous Thromboembolism Provides New Insights (Anti-Xa-guided enoxaparin thromboprophylaxis reduces rate of deep venous thromboembolism in high-risk trauma patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Venous Thromboembolism. According to news reporting from Miami, Florida, by NewsRx journalists, research stated, "Appropriate prophylaxis against venous thromboembolism (VTE) remains undefined. This study evaluated an anti-Xa-guided enoxaparin thromboprophylaxis (TPX) protocol on the incidence of VTE in high-risk trauma patients based on Greenfield's Risk Assessment Profile (RAP) score."

The news correspondents obtained a quote from the research from the University of Miami, "This is a retrospective observational study of patients admitted to a trauma intensive care unit over a 12-month period. Patients were included if they received anti-Xa-guided enoxaparin TPX. Dosage was adjusted to a prophylactic peak anti-Xa level of 0.2 to 0.4 IU/mL. Subgroup analysis was performed on high-risk patients (RAP score >= 10) who received lower-extremity duplex ultrasound surveillance for deep vein thrombosis (DVT). Data are expressed as mean +/- SD. Significance was assessed at p < 0.05. One hundred thirty-one patients received anti-Xa-guided enoxaparin TPX. Four patients were excluded for age or acute VTE on admission. Fifty-six patients with RAP score of >= 10 and surveillance duplex evaluations were included in the subgroup analysis with mean age 43 +/- 20 years, Injury Severity Score of 25 +/- 10, and RAP score of 16 +/- 4. Prophylactic anti-Xa levels were initially achieved in 34.6% of patients. An additional 25.2% required 40 to 60 mg twice daily to reach prophylactic levels; 39.4% never reached prophylactic levels. Weight, body mass index, ISS, and RAP score were significantly higher with subprophylactic anti-Xa levels. One patient developed bleeding complications (0.8%). No patient developed intracerebral bleeding or heparin-induced thrombocytopenia. Nine VTE events occurred in the high-risk subgroup, including four DVT (7.1%), all asymptomatic, and five pulmonary emboli (8.9%). The historical rate of DVT in similar patients (ISS 31 +/- 12 and RAP score 16 +/- 5) was 20.5%, a significant decrease (p = 0.031). Mean chest Abbreviated Injury Scale scores were significantly higher for patients developing pulmonary emboli than DVT, 3.0 +/- 1.1 vs. 0.0 (p < 0.001). Mean chest Abbreviated Injury Scale score was higher in patients developing pulmonary embolism. Increased weight, body mass index, ISS, and RAP score are associated with subprophylactic anti-Xa levels."

According to the news reporters, the research concluded: "Anti-Xa-guided
enoxaparin dosing reduced the rate of DVT from 20.5% to 7.1% in high-risk trauma patients."

For more information on this research see: Anti-Xa-guided enoxaparin thromboprophylaxis reduces rate of deep venous thromboembolism in high-risk trauma patients. *Journal of Trauma and Acute Care Surgery*, 2016;81(6):1101-1108. *Journal of Trauma and Acute Care Surgery* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **New Findings from University of Michigan Update Understanding of Pneumonia (Electroporation-mediated delivery of the FER gene in the resolution of trauma-related fatal pneumonia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lung Diseases and Conditions - Pneumonia are presented in a new report. According to news reporting originating in Ann Arbor, Michigan, by NewsRx journalists, research stated, "Injured patients with lung contusion (LC) are at risk of developing bacterial pneumonia (PNA) followed by sepsis and death. A recent genome-wide association study (GWAS) showed FER gene expression positively correlating with survival rates among individuals with above conditions."

The news reporters obtained a quote from the research from the University of Michigan, "We sought to determine whether electroporation (EP)-mediated delivery of FER gene could indeed improve survival, in a lethal model of combined LC and PNA. C57BL/6 mice sustained unilateral LC, which preceded a 500 Klebsiella colony forming unit (CFU) inoculation by 6 h. In-between these insults, human FER plasmid (pFER) was introduced into the lungs followed by eight EP pulses applied externally (10 ms at 200 V cm(-1)). Control groups included EP of empty vector (pcDNA3) or Na+/ K+-ATPase genes (pPump) and no treatment (LC+PNA). We recorded survival, histology, lung mechanics, bronchial alveolar lavage (BAL) fluid, FER and inflammatory gene expression and bacteriology. The data show that 7-day survival was significantly improved by pFER compared with control groups. pFER increased BAL monocytes and activated antibacterial response genes (nitric oxide synthase (NOS), Fizz). pFER treatment showed decreased lung and blood Klebsiella counts reaching, in some cases, complete sterilization."

According to the news reporters, the research concluded: "FER gene delivery
promoted survival in LC+ PNA mice via recruitment of activated immune cells, improving efficiency of bacterial clearance within contused lung."

Our news correspondents report that additional information may be obtained by contacting D. Machado-Aranda, University of Michigan, Dept. of Surg, Div Acute Care Surg, Ann Arbor, MI 48109, United States. Additional authors for this research include R. Goldberg, M.V. Suresh, B. Thomas, N. Cardiovascular Diseases and Conditions - Thrombosis

New Findings from University of Milan Describe Advances in Thrombosis (Resistance to thrombomodulin is associated with de novo portal vein thrombosis and low survival in patients with cirrhosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Thrombosis have been presented. According to news originating from Milan, Italy, by NewsRx correspondents, research stated, "Portal vein thrombosis (PVT) is frequently observed in cirrhosis and may be a clinically important complication. In vitro assays for endogenous thrombin potential (ETP) demonstrated that in cirrhosis plasma has intrinsic resistance to the anticoagulant action of thrombomodulin (TM-R)."

Financial support for this research came from Italian Ministry of Health.

Our news journalists obtained a quote from the research from the University of Milan, "This study retrospectively explores the association of TM-R with de novo PVT and its clinical impact on cirrhosis. Fifty-three patients with cirrhosis were tested for ETP-ratio with/without thrombomodulin. Clinical, endoscopic variables, presence/absence of PVT by Doppler-US and/or CT examination were collected at baseline and up to 4 years from baseline. The de novo PVT was the primary clinical end-point. Portal hypertension (PHT)-related complications and transplantation free survival were secondary end-points. ETP-ratio higher than the 95 degrees percentile of the distribution in 173 healthy controls defined TM-R. During 48 months of follow-up, 11 patients developed de novo PVT, with preference for the 36 patients with TM-R after adjusting for Child-Pugh class (HR: 8.354; 90% CI: 1.475 -47.305; P = 0.009). Seventeen patients experienced PHT-related complications, 23 either died or underwent liver
transplantation. PHT complications and transplantation free survival were associated with TM-R, but were independently predicted by Child-Pugh class, only. Same results were obtained by considering the MELD score.

According to the news editors, the research concluded: "Owing to PVT results from the pro-coagulant imbalance occurring in patients with advanced cirrhosis, TM-R might serve as a predictor and could possibly be a biological mediator of adverse outcome in patients with advanced cirrhosis."

The news correspondents report that additional information may be obtained from V. La Mura, University of Milan, Internal Med, IRCCS San Donato, Dept. of Biomed Sci Hlth, Milan, Italy. Additional authors for this research include A. Tripodi, G. Tosetti, F. Cavallaro, V. Chantarangkul, M. Colombo and M. Primignani.

Duchenne Muscular Dystrophy

New Findings from University of Milan in Duchenne Muscular Dystrophy Provides New Insights (Therapeutic Potential of Immunoproteasome Inhibition in Duchenne Muscular Dystrophy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Duchenne Muscular Dystrophy. According to news reporting from Milan, Italy, by NewsRx journalists, research stated, "Duchenne muscular dystrophy is an inherited fatal genetic disease characterized by mutations in dystrophin gene, causing membrane fragility leading to myofiber necrosis and inflammatory cell recruitment in dystrophic muscles. The resulting environment enriched in proinflammatory cytokines, like IFN-gamma and TNF-alpha, determines the transformation of myofiber constitutive proteasome into the immunoproteasome, a multisubunit complex involved in the activation of cell-mediate immunity."

The news correspondents obtained a quote from the research from the University of Milan, "This event has a fundamental role in producing peptides for antigen presentation by MHC class I, for the immune response and also for cytokine production and T-cell differentiation. Here, we characterized for the first time the presence of T-lymphocytes activated against revertant dystrophin epitopes, in the animal model of Duchenne muscular dystrophy, the
mdx mice. Moreover, we specifically blocked i-proteasome subunit LMP7, which was up-regulated in dystrophic skeletal muscles, and we demonstrated the rescue of the dystrophin expression and the amelioration of the dystrophic phenotype. The i-proteasome blocking lowered myofiber MHC class I expression and self-antigen presentation to T cells, thus reducing the specific antidystrophin T cell response, the muscular cell infiltrate, and proinflammatory cytokine production, together with muscle force recovery.

According to the news reporters, the research concluded: "We suggest that i-proteasome inhibition should be considered as new promising therapeutic approach for Duchenne muscular dystrophy pathology."

For more information on this research see: Therapeutic Potential of Immunoproteasome Inhibition in Duchenne Muscular Dystrophy. Molecular Therapy, 2016;24 (11):1898-1912. Molecular Therapy can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. **Pregnancy Complications - Spontaneous Abortion**

**New Findings from University of Milan in the Area of Spontaneous Abortion Described (The impact of thyroid autoimmunity on IVF/ICSI outcome: a systematic review and meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pregnancy Complications - Spontaneous Abortion. According to news reporting originating in Milan, Italy, by NewsRx journalists, research stated, "Thyroid autoimmunity (TAI) is the most frequent autoimmune condition and the first cause of thyroid dysfunction among women of reproductive age. Notably, it has been associated with adverse obstetric outcomes during all trimesters of pregnancy."

The news reporters obtained a quote from the research from the University of Milan, "Furthermore, since most studies show an increased prevalence of TAI among women attending infertility clinics, a detrimental impact of this condition on natural fertility and on the rate of success of assisted reproductive techniques has been suggested. However, to date, the results
have been inconsistent. The objective of this study was to define the relation between TAI per se and the outcome of in vitro fertilisation (IVF)/intracytoplasmic sperm injection (ICSI) cycles. A systematic literature review and meta-analysis were conducted. A Medline search was performed to identify all the comparative studies published from January 1990 to November 2015 in the English language literature on IVF/ICSI outcome in women with and without TAI, using combinations of the medical subject heading terms 'thyroid autoimmunity', 'thyroid autoantibodies', TVF, 'ICSI', 'pregnancy', 'miscarriage' and 'delivery'. The primary outcome was live birth rate (LBR). Our secondary outcomes were number of oocytes retrieved (NOR), fertilisation rate (FR), implantation rate (IR), clinical pregnancy rate (CPR) and miscarriage rate (MR). We also extracted data on mean age and basal serum concentrations of thyroid stimulating hormone (TSH) and performed a meta-regression analysis to assess the effect of these two covariates on CPR and MR. We selected 12 studies for the meta-analysis. Six of the included studies were prospective cohort studies, and six were retrospective cohort studies. Compared with women with negative TAI, women with positive TAI had a lower LBR (odds ratio (OR) 0.73; 95% confidence interval (CI) [0.54-0.99]; P = 0.04; 9 studies; 4396 women; I² = 41%), a higher MR (OR 1.44; 95% CI [1.06-1.95]; P = 0.02; 12 studies; 4876 women; I² = 35%), a similar CPR (OR 0.90; 95% CI [0.77-1.06]; P = 0.22; 12 studies; 4876 women; I² = 7%), a similar number of oocytes (standardized mean difference [SMD] 0.10; 95% CI [-0.09 to 0.29]; P = 0.28; 5 studies; 1506 women; I² = 47%), a similar FR (OR 1.11; 95% CI [0.97-1.27]; P = 0.13; 3 studies; 1082 women; I² = 0%) and a similar IR (OR 0.98; 95% CI [0.73-1.32]; P = 0.91; 2 studies; 918 women; I² = 0%). Both mean age (SMD 0.96; 95% CI [0.66-1.27]; P< 0.00001; 9 studies; 3256 women; I² = 85%) and serum TSH (SMD 0.24; 95% CI [0.15-0.34]; P< 0.00001; 6 studies; 2098 women; I² = 59%) were higher in women with TAI. However, neither of these two covariates were significantly associated with CPR or MR. TAI does not impact on IVF/ICSI outcome in terms of NOR and likelihood of fertilisation, implantation and clinical pregnancy. On the contrary, the presence of thyroid autoantibodies may have a detrimental effect on the course of a pregnancy, determining an increased risk of miscarriage and a decreased chance of live birth."

According to the news reporters, the research concluded: "However, given the possible modifying effects of age and serum TSH, further evidence is warranted prior to drawing inferences on causality."

Our news correspondents report that additional information may be obtained by contacting A. Busnelli, University of Milan, I-20122 Milan, Italy. Additional authors for this research include A. Paffoni, L. Fedele and E. Somigliana.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/humupd/dmw019. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings from University of Montreal Update Understanding of Prostate Cancer (Lessons learned using an MRI-only workflow during high-dose-rate brachytherapy for prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Prostate Cancer. According to news reporting from Montreal, Canada, by NewsRx journalists, research stated, "We report clinical observations of a technique using an MRI-only workflow for catheter insertion and treatment planning in patients receiving standard-care high-dose-rate brachytherapy before external beam radiotherapy for prostate cancer. Forty patients with intermediate or high-risk prostate cancer were enrolled on a prospective clinical trial approved by our institution's research ethics board."

The news correspondents obtained a quote from the research from the University of Montreal, "Multiparametric MRI with stereotactic navigation was used to guide insertion of brachytherapy catheters, followed by MRI-based treatment planning. Sixty-two implants were performed. Median catheter insertion + imaging time was 100 minutes, and overall anesthesia time was 4.0 hours (range, 2.1-6.9 hours). MRI at the time of brachytherapy restaged 14 patients (35%) who were found to have a higher stage of disease. In 6 patients, this translated in directed insertion of brachytherapy catheters outside the prostate boundary (extracapsular disease [n = 2] or seminal vesicle invasion [n = 4]). Most patients (80%) had gross tumor visible on MRI, which influenced catheter insertion and treatment planning. MRI depicted post implant anatomic boundaries clearly, with the exception of the apical prostate which was blurred by trauma after catheter insertion. Conventional dose-planning objectives for the rectum (V-75 < 1.0 cc) were difficult to achieve, but toxicities were low (acute grade >= 2 genitourinary = 20%, late grade >= 2 genitourinary = 15%, and late grade >= 2 gastrointestinal = 7%). Urethral trauma visualized on MRI led to two transient Grade 3 events. Despite a standard-care approach, MRI acquired throughout the procedure altered catheter insertion and dose-planning strategies."

According to the news reporters, the research concluded: "An MRI-only workflow is feasible but must be streamlined for broader acceptance."

Our news journalists report that additional information may be obtained by contacting C. Menard, Center Hosp Univ Montreal CHUM, Dept. of Radiooncol, Montreal, PQ H2L 4M1, Canada. Additional authors for this research include P. Chung, A. Berlin, A. Bayley, P. Warde, C. Catton, A. Simeonov, J. Abed, G. O'Leary, A. Rink and C. Menard.

New Findings from University of Munster in Atomic Force Microscopy Provides New Insights (AFM visualization of sub-50 nm polyplex disposition to the nuclear pore complex without compromising the integrity of the nuclear envelope)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Atomic Force Microscopy have been published. According to news reporting from Munster, Germany, by NewsRx journalists, research stated, "It has been questioned as to whether polyplexes in the cytoplasm can reach the nuclear compartment and if so in what form. By applying atomic force microscopy (AFM) to the nuclear envelope and the nuclear pore complexes, we demonstrate that disposition of polyethylenimine (PEI)/DNA polyplexes that were microinjected into the oocytes of Xenopus laevis, as an example of a non-dividing cell, is exclusive to the nuclear pore complex (NPC)."

The news correspondents obtained a quote from the research from the University of Munster, "AFM images show NPCs clogged only with sub-50 nm polyplexes. This mode of disposition neither altered the morphology/integrity of the nuclear membrane nor the NPC. AFM images further show polyplexes on the nucleoplasmic side of the envelope, presumably indicating species in transit."

According to the news reporters, the research concluded: "Transmission electron microscopy studies of ruptured nuclei from transfected human cell lines demonstrate the presence of sub-50 nm particles resembling polyplexes in morphology compared with control preparations."

For more information on this research see: AFM visualization of sub-50 nm polyplex disposition to the nuclear pore complex without compromising the integrity of the nuclear envelope. *Journal of Controlled Release*, 2016;244():24-29. *Journal of Controlled Release* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Controlled Release - www.journals.elsevier.com/journal-of-controlled-release/)

Our news journalists report that additional information may be obtained by contacting V. Shahin, University of Munster, Inst Physiol 2, D-48149 Munster, Germany. Additional authors for this research include L. Parhamifar, A.C. Hunter, V. Shahin and S.M. Moghimii.

**Oncology - Lung Cancer**

**New Findings from University of Naples Federico II in the Area of Lung Cancer Described (rpL3 promotes the apoptosis of p53 mutated lung cancer cells by down-regulating CBS and NF kappa B upon 5-FU treatment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lung Cancer. According to news reporting originating from Naples, Italy, by NewsRx correspondents, research stated, "5-FU is a chemotherapy drug commonly used for the treatment of human cancers; however drug resistance represents a major challenge for its clinical application. In the present study, we report that rpL3 induced by 5-FU treatment in Calu-6 cells represses CBS transcription and reduces CBS protein stability leading to a decrease of CBS protein levels. rpL3 also regulates negatively the activation of NF kappa B by preventing NF kappa B nuclear translocation through I kappa B-alpha up-regulation."

Our news editors obtained a quote from the research from the University of Naples Federico II, "Furthermore, we demonstrate that rpL3 significantly enhances the apoptosis of 5-FU treated Calu-6 cells promoting the overexpression of the pro-apoptotic proteins Bax and the inhibition of the anti-apoptotic protein Bcl-2. We finally demonstrate that rpL3 potentiates 5-FU efficacy inhibiting cell migration and invasion."

According to the news editors, the research concluded: "Our results suggest that combination of rpL3 and 5-FU is a promising strategy for chemotherapy of lung cancers lacking functional p53 that are resistant to 5-FU."

The news editors report that additional information may be obtained by contacting A. Russo, University of Naples Federico II, Dept. of Pharm, I-80131 Naples, Italy. Additional authors for this research include A. Saide, R. Cagliani, M. Cantile, G. Botti and G. Russo.

Keywords for this news article include: Naples, Italy, Europe, Transcription Factors, DNA-Binding Proteins, Nuclear Proteins, Lung Neoplasms, Lung Cancer, NF-kappa B, Apoptosis, Oncology, Genetics, p53 Gene, University of Naples Federico II.

**Pediatrics**

**New Findings from University of New Mexico Describe Advances in Pediatrics (Proteinuria and hematuria in the neonate)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Pediatrics is the subject of a report. According to news reporting originating in Albuquerque, New Mexico, by NewsRx journalists, research stated,
"Neonatal proteinuria and hematuria while not common can have potentially devastating consequences if left undiagnosed and untreated. It is important to distinguish between inherited and acquired causes of proteinuria to initiate appropriate and timely treatment."

The news reporters obtained a quote from the research from the University of New Mexico, "With regards to hematuria, it is critical to identify true hematuria from pseudo-hematuria to balance between thorough investigation and unnecessary laboratory work up. This review provides an overview of the common causes of hematuria and proteinuria in a neonate. The identification of genetic mutations in nephrotic syndrome has improved our understanding of the role of various proteins that play an important role in maintaining the glomerular filtration barrier. With the advancement in our ability to provide care for extreme premature neonates, the incidence of acute kidney injury has increased in these neonates along with proteinuria and hematuria."

According to the news reporters, the research concluded: "Persistent proteinuria after neonatal acute kidney injury would be of interest in regards to the risk of developing future chronic kidney disease and hypertension."

For more information on this research see: Proteinuria and hematuria in the neonate. Current Opinion In Pediatrics, 2016;28(2):202-8. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Pediatrics - journals.lww.com/co-pediatrics/pages/default.aspx)

Kidney Diseases and Conditions - Chronic Kidney…

New Findings from University of North Carolina Describe Advances in Chronic Kidney Disease (Smoking patterns and chronic kidney disease in US Hispanics: Hispanic Community Health Study/Study of Latinos)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Kidney Diseases and Conditions - Chronic Kidney Disease is the subject of a report. According to news reporting originating from Chapel Hill, North Carolina, by NewsRx correspondents, research stated, "Intermittent smoking is prevalent among Hispanics, but little is known about whether this smoking pattern associates with increased chronic kidney disease (CKD) risk in this population. The objective of the present study is to identify patterns of exposure associated with CKD in US Hispanics."

Funders for this research include National Heart, Lung, and Blood Institute (NHLBI), University of North Carolina, University of Miami, Albert Einstein College of Medicine, Northwestern University, San Diego State University, National Center on Minority Health and
Our news editors obtained a quote from the research from the University of North Carolina, "We used cross-sectional data on 15,410 participants of the Hispanics Community Health Study/the Study of Latinos, a population-based study of individuals aged 18-74 years, recruited in 2008 to 2011 from four US field centers (Bronx, NY; Chicago, IL; Miami, FL; San Diego, CA). Smoking exposure was obtained through a questionnaire. CKD was defined by an estimated glomerular filtration rate of < 60 mL/min/1.73 m(2) or a urine albumin-to-creatinine ratio of a parts per thousand yen30 mg/g. Approximately 14% of individuals were daily and 7% were intermittent smokers, and 16% were past smokers. There was a significant interaction between smoking status and pack-years of exposure (\(P = 0.0003\)). In adjusted models, there was an increased odds of CKD among daily, intermittent and past smokers by pack-years compared with never smokers. The association of intermittent smokers was significant at 10 pack-years [odds ratio (OR) = 1.38, 95% confidence intervals (CI) 1.06, 1.81], whereas for daily smokers this association was observed at 40 pack-years (OR = 1.43, 95% CI 1.09, 1.89). Our findings of increased risk of CKD among Hispanics who are intermittent smokers support screening and smoking cessation interventions targeted to this population for the prevention of CKD."

According to the news editors, the research concluded: "It also suggests novel mechanistic pathways for kidney toxicity that should be further explored in future studies."

The news editors report that additional information may be obtained by contacting N. Franceschini, University of North Carolina, Dept. of Epidemiol, Chapel Hill, NC 27514, United States. Additional authors for this research include Y. Deng, M.F. Flessner, J.H. Eckfeldt, H.J. Kramer, J.P. Lash, D.J. Lee, M.L. Melamed, A.E. Moncrieff, A.C. Ricardo, S.E. Rosas, R.C. Kaplan, L. Raij and J.W. Cai.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Failure are presented in a new report. According to news reporting originating in Chapel Hill, North Carolina, by NewsRx journalists, research stated, "Factors that precipitate hospitalization for exacerbation of heart failure provide targets for intervention to prevent hospitalizations. To describe demographic, clinical, behavioral, and psychosocial factors that precipitate admission for exacerbation of heart failure and assess the relationships between precipitating factors and delay before hospitalization, and between delay time and length of hospital stay."

The news reporters obtained a quote from the research from the University of North Carolina, "All admissions in 12 full months to a tertiary medical center were reviewed if the patient had a discharge code related to heart failure. Data on confirmed admissions for exacerbation of heart failure were included in the study. Electronic and paper medical records were reviewed to identify how long it took patients to seek care after they became aware of signs and symptoms, factors that precipitated exacerbation, and discharge details. Exacerbation of heart failure was confirmed in 482 patients. Dyspnea was the most common symptom (92.5% of patients), and 20.3% of patients waited until they were severely dyspneic before seeking treatment. The most common precipitating factor was poor medication adherence. Delay times from symptom awareness to seeking treatment were shorter in patients who had a recent change in medicine for heart failure, renal failure, or poor medication adherence and longer in patients with depressive symptoms and hypertension."

According to the news reporters, the research concluded: "Depressive symptoms, recent change in heart failure medicine, renal failure, poor medication adherence, and hypertension are risk factors for hospitalizations for exacerbation of heart failure."

Our news correspondents report that additional information may be obtained by contacting J.R. Wu, University of North Carolina, Sch Nursing, Chapel Hill, NC 27599, United States. Additional authors for this research include K.S. Lee, R.D. Dekker, J.D. Welsh, E.K. Song, D.A. Abshire, T.A. Lennie and D.K. Moser.

**Proteins - Transcription Factors**

**New Findings from University of North Carolina in the Area of Transcription Factors Described (Environmental contaminants and microRNA regulation: Transcription factors as regulators of toxicant-altered microRNA expression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Transcription Factors.
According to news reporting from Chapel Hill, North Carolina, by NewsRx journalists, research stated, "MicroRNAs (miRNAs) regulate gene expression by binding mRNA and inhibiting translation and/or inducing degradation of the associated transcripts. Expression levels of miRNAs have been shown to be altered in response to environmental toxicants, thus impacting cellular function and influencing disease risk."

Financial support for this research came from National Institute of Environmental Health Sciences.

The news correspondents obtained a quote from the research from the University of North Carolina, "Transcription factors (TFs) are known to be altered in response to environmental toxicants and play a critical role in the regulation of miRNA expression. To date, environmentally-responsive TFs that are important for regulating miRNAs remain understudied. In a state-of-the-art analysis, we utilized an in silico bioinformatic approach to characterize potential transcriptional regulators of environmentally-responsive miRNAs. Using the miRStart database, genomic sequences of promoter regions for all available human miRNAs (n = 847) were identified and promoter regions were defined as -1000/+500 base pairs from the transcription start site. Subsequently, the promoter region sequences of environmentally-responsive miRNAs (n = 128) were analyzed using enrichment analysis to determine overrepresented TF binding sites (TFBS). While most (56/73) TFs differed across environmental contaminants, a set of 17 TFs was enriched for promoter binding among miRNAs responsive to numerous environmental contaminants. Of these, one TF was common to miRNAs altered by the majority of environmental contaminants, namely SWI/SNF-related, matrix-associated, actin-dependent regulator of chromatin, subfamily A, member 3 (SMARCA3)."

According to the news reporters, the research concluded: "These identified TFs represent candidate common transcriptional regulators of miRNAs perturbed by environmental toxicants."

Our news journalists report that additional information may be obtained by contacting R.C. Fry, University of North Carolina, Sch Med, Curriculum Toxicol, Chapel Hill, NC, United States. Additional authors for this research include E. Martin, P. Sethupathy and R.C. Fry.

Pharmacology

New Findings from University of Nottingham School of Medicine Yields New Data on Pharmacology (The Concise Guide to PHARMACOLOGY 2015/16: Overview)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacology have been presented. According to news reporting originating from Nottingham, United Kingdom, by NewsRx correspondents, research stated, "The Concise Guide to PHARMACOLOGY 2015/16 provides concise overviews of the key properties of over 1750 human drug targets with their pharmacology, plus links to an open access knowledgebase of drug targets and their ligands (www.guidetopharmacology.org), which provides more detailed views of target and ligand properties. The full contents can be found at http://onlinelibrary.wiley.com/doi/10.1111/bph.13347/full."

Our news editors obtained a quote from the research from the University of Nottingham School of Medicine, "This compilation of the major pharmacological targets is divided into eight areas of focus: G protein-coupled receptors, ligand-gated ion channels, voltage-gated ion channels, other ion channels, nuclear hormone receptors, catalytic receptors, enzymes and transporters. These are presented with nomenclature guidance and summary information on the best available pharmacological tools, alongside key references and suggestions for further reading. The Concise Guide is published in landscape format in order to facilitate comparison of related targets. It is a condensed version of material contemporary to late 2015, which is presented in greater detail and constantly updated on the website www.guidetopharmacology.org, superseding data presented in the previous Guides to Receptors & Channels and the Concise Guide to PHARMACOLOGY 2013/14. It is produced in conjunction with NC-IUPHAR and provides the official IUPHAR classification and nomenclature for human drug targets, where appropriate."

According to the news editors, the research concluded: "It consolidates information previously curated and displayed separately in IUPHAR-DB and GRAC and provides a permanent, citable, point-in-time record that will survive database updates."

The news editors report that additional information may be obtained by contacting S.P. Alexander, School of Biomedical Sciences, University of Nottingham Medical School, Nottingham, NG7 2UH, UK. **Drugs and Therapies - Viscosupplementation Agents**

**New Findings from University of Occupational and Environmental Health Yields New Data on Viscosupplementation Agents (Targeting hyaluronan for the treatment of pancreatic ductal adenocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Viscosupplementation Agents have been published. According to news originating from Kitakyushu, Japan, by NewsRx correspondents, research stated, "Progression of cancer is often associated with interactions between cancer cells and extracellular matrix (ECM) surrounding them. Increasing evidence has suggested that accumulation of hyaluronan (HA), a major component of ECM, provides a favorable microenvironment for cancer progression."

Our news journalists obtained a quote from the research from the University of Occupational and Environmental Health, "Pancreatic ductal adenocarcinoma (PDAC) is characterized typically by a dense desmoplastic stroma with a large amount of HA, making this molecule an attractive target for therapy. Several studies have shown efficacy of inhibitors of HA synthesis or signaling for the treatment of PDAC. Recent studies have also demonstrated substantial improvements in the effects of chemotherapy by a targeted depletion of stromal HA in PDAC using an enzymatic agent. Thus, targeting HA has been recognized as a promising therapeutic strategy to treat this highly aggressive neoplasm."

According to the news editors, the research concluded: "In this review article, we summarize our current understanding of the role of HA in the progression of PDAC and discuss possible therapeutic approaches targeting HA."

The news correspondents report that additional information may be obtained from N. Sato, Dept. of Surgery 1, School of Medicine, University of Occupational and Environmental Health, Kitakyushu 807-8555, Japan. Additional authors for this research include X.B. Cheng, S. Kohi, A. Koga and K. Hirata.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.apsb.2016.01.002. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings from University of Oklahoma Update Understanding of Type 2 Diabetes (Interaction of PPAR alpha With the Canonic Wnt Pathway in the Regulation of Renal Fibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is the subject of a report. According to news reporting originating in Oklahoma City, Oklahoma, by NewsRx journalists, research stated, "Peroxisome proliferator-activated receptor-alpha (PPAR alpha) displays renoprotective effects with an unclear mechanism. Aberrant activation of the canonical Wnt pathway plays a key role in renal fibrosis."

The news reporters obtained a quote from the research from the University of Oklahoma, "Renal levels of PPAR alpha were downregulated in both type 1 and type 2 diabetes models. The PPAR alpha agonist fenofibrate and overexpression of PPAR alpha both attenuated the expression of fibrotic factors, and suppressed high glucose-induced or Wnt3a-induced Wnt signaling in renal cells. Fenofibrate inhibited Wnt signaling in the kidney of diabetic rats. A more renal prominent activation of Wnt signaling was detected both in PPAR alpha(-/-) mice with diabetes or obstructive nephropathy and in PPAR alpha(-/-) tubular cells treated with Wnt3a. PPAR alpha did not block the transcriptional activity of beta-catenin induced by a constitutively active mutant of lipoprotein receptor-related protein 6 (LRP6) or beta-catenin. LRP6 stability was decreased by overexpression of PPAR alpha and increased in PPAR alpha (-/-) tubular cells, suggesting that PPAR alpha interacts with Wnt signaling at the Wnt coreceptor level. 4-Hydroxynonenal-induced reactive oxygen species production, which resulted in LRP6 stability, was suppressed by overexpression of PPAR alpha and dramatically enhanced in PPAR alpha(-/-) tubular cells. Diabetic PPAR alpha(-/-) mice showed more prominent NADPH oxidase-4 overexpression compared with diabetic wild-type mice, suggesting that the inhibitory effect of PPAR on Wnt signaling may be ascribed to its antioxidant activity."

According to the news reporters, the research concluded: "These observations identified a novel interaction between PPAR alpha and the Wnt pathway, which is responsible, at least partially, for the therapeutic effects of fenofibrate on diabetic nephropathy."

For more information on this research see: Interaction of PPAR alpha With the Canonic Wnt Pathway in the Regulation of Renal Fibrosis. Diabetes, 2016;65(12):3730-3743. Diabetes can be contacted at: Amer Diabetes Assoc, 1701 N Beauregard St, Alexandria, VA 22311-1717, USA. **Oncology - Non-Small Cell Lung Cancer**

**New Findings from University of Paris-Sud Update Understanding of Non-Small Cell Lung Cancer (Predictors of chemotherapy efficacy in non-small-cell lung cancer: a challenging landscape)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Non-Small Cell Lung Cancer is the subject of a report. According to news reporting originating from Le Kremlin Bicetre, France, by NewsRx correspondents, research stated, "Conventional cytotoxic chemotherapy (CCC) is the backbone of non-small-cell lung cancer (NSCLC) treatment since decades and still represents a key element of the therapeutic armamentarium. Contrary to molecularly targeted therapies and immune therapies, for which predictive biomarkers of activity have been actively looked for and developed in parallel to the drug development process ('companion biomarkers'), no patient selection biomarker is currently available for CCC, precluding customizing treatment."

Funders for this research include 'Etablissement Public Chancellerie des Universites de Paris (Legs Poix)', Fondation de France, Fondation ARC pour la Recherche sur le Cancer, Agence National de la Recherche, Institut National du Cancer.

Our news editors obtained a quote from the research from the University of Paris-Sud, "We reviewed preclinical and clinical studies that assessed potential predictive biomarkers of CCC used in NSCLC (platinum, antimetabolites, topoisomerase inhibitors, and spindle poisons). Biomarker evaluation method, analytical validity, and robustness are described and challenged for each biomarker. The best-validated predictive biomarkers for efficacy are currently ERCC1, RRM1, and TS for platinum agents, gemcitabine and pemetrexed, respectively. Other potential biomarkers include hENT1 for gemcitabine, class III beta-tubulin for spindle poisons, TOP2A expression and CEP17 duplication (mostly studied for predicting anthracyclines efficacy) whose applicability concerning etoposide would deserve further evaluation. However, none of these biomarkers has till now been validated prospectively in an appropriately designed and powered randomised trial, and none of them is currently ready for implementation in routine clinical practice. The search for predictive biomarkers to CCC has been proven challenging. If a plethora of biomarkers have been evaluated either in the preclinical or in the clinical setting, none of them is ready for clinical implementation yet."

According to the news editors, the research concluded: "Considering that most mechanisms of resistance or sensitivity to CCC are multifactorial, a combinatorial approach might be relevant and further efforts are required."

The news editors report that additional information may be obtained by contacting K.A. Olaussen, Univ Paris Saclay, Univ Paris Sud, Fac Med, Le Kremlin Bicetre, France.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/annonc/mdw321. This DOI is a link to an online electronic document.
that is either free or for purchase.

Life Science Research - Plant Physiology

New Findings from University of Pennsylvania in Plant Physiology Provides New Insights (Codon Optimization to Enhance Expression Yields Insights into Chloroplast Translation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Plant Physiology have been published. According to news reporting originating in Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Codon optimization based on psbA genes from 133 plant species eliminated 105 (human clotting factor VIII heavy chain [FVIII HC]) and 59 (polio VIRAL CAPSID PROTEIN1 [VP1]) rare codons; replacement with only the most highly preferred codons decreased transgene expression (77-to 111-fold) when compared with the codon usage hierarchy of the psbA genes. Targeted proteomic quantification by parallel reaction monitoring analysis showed 4.9- to 7.1-fold or 22.5- to 28.1-fold increase in FVIII or VP1 codon-optimized genes when normalized with stable isotope-labeled standard peptides (or housekeeping protein peptides), but quantitation using western blots showed 6.3- to 8-fold or 91- to 125-fold increase of transgene expression from the same batch of materials, due to limitations in quantitative protein transfer, denaturation, solubility, or stability."

Funders for this research include National Institute of Health, National Institutes of Health, Bill and Melinda Gates Foundation.

The news reporters obtained a quote from the research from the University of Pennsylvania, "Parallel reaction monitoring, to our knowledge validated here for the first time for in planta quantitation of biopharmaceuticals, is especially useful for insoluble or multimeric proteins required for oral drug delivery. Northern blots confirmed that the increase of codon-optimized protein synthesis is at the translational level rather than any impact on transcript abundance. Ribosome footprints did not increase proportionately with VP1 translation or even decreased after FVIII codon optimization but is useful in diagnosing additional rate-limiting steps. A major ribosome pause at CTC leucine codons in the native gene of FVIII HC was eliminated upon codon optimization. Ribosome stalls observed at clusters of serine codons in the codon-optimized VP1 gene provide an opportunity for further optimization."

According to the news reporters, the research concluded: "In addition to increasing our understanding of chloroplast translation, these new tools should help to advance this concept toward human clinical studies."

For more information on this research see: Codon Optimization to Enhance Expression Yields Insights into Chloroplast Translation. Plant Physiology, 2016;172(1):62-77. Plant Physiology can be contacted at: Amer Soc Plant Biologists, 15501 Monona Drive, Rockville, MD 20855, USA. (Elsevier - www.elsevier.com; Plant Physiology - www.journals.elsevier.com/plant-physiology-and-biochemistry/)
New Findings from University of Pittsburgh in the Area of Acetaminophen Therapy Reported (An acetaminophen icon helps reduce medication decision errors in an experimental setting)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Acetaminophen Therapy is now available. According to news reporting originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "To assess the effect of adding an acetaminophen ingredient icon to acetaminophen medication labels on consumer decision making about concomitant use of acetaminophen medications to avoid overdose, which is associated with liver injury. Parallel-group randomized study."

Our news editors obtained a quote from the research from the University of Pittsburgh, "Consumer research facilities in Indianapolis, Baltimore, and Los Angeles. A total of 517 adults (30% with limited health literacy) recruited at 3 consumer research sites. Participants were randomized to a non-icon condition in which medications carried current labeling or an icon condition in which all acetaminophen medications were additionally marked with an icon. Participants were presented with a medicine cabinet containing 12 diverse prescription and non-prescription medications, one-half containing acetaminophen, and made decisions about which medications were appropriate to take after an acetaminophen medication had already been taken. Outcome measures were errors in medication decisions and response time. The icon reduced the odds of participants making medication-decision errors by 53% (CI 31%-68%), with effects evident across medication categories. The icon eliminated a trend for those with lower health literacy or less education to have a greater likelihood of making errors. The icon also reduced response times, indicating reduced cognitive load for decisions."

According to the news editors, the research concluded: "An icon can improve decision making regarding acetaminophen-containing medications, particularly among individuals with limited health literacy or education."

The news editors report that additional information may be obtained by contacting S. Shiffman, University of Pittsburgh, Pittsburgh, PA, United States. Additional authors for this research include H. Cotton, C. Jessurun, J.M. Rohay and M.A. Sembower.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.japh.2016.04.560. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Pittsburgh, Pennsylvania, United States, North and Central America, Acetaminophen Therapy, Drugs and Therapies, Pharmaceuticals, Acetanilides, University of Pittsburgh.

Oncology - Breast Cancer

New Findings from University of Queensland in the Area of Breast Cancer Described (The Biodistribution and Immune Suppressive Effects of Breast Cancer-Derived Exosomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating in Brisbane, Australia, by NewsRx journalists, research stated, "Small membranous secretions from tumor cells, termed exosomes, contribute significantly to intercellular communication and subsequent reprogramming of the tumor microenvironment. Here, we use optical imaging to determine that exogenously administered fluorescently labeled exosomes derived from highly metastatic murine breast cancer cells distributed predominantly to the lung of syngeneic mice, a frequent site of breast cancer metastasis."

The news reporters obtained a quote from the research from the University of Queensland, "At the sites of accumulation, exosomes were taken up by CD45(+) bone marrow-derived cells. Subsequent long-term conditioning of naïve mice with exosomes from highly metastatic breast cancer cells revealed the accumulation of myeloid-derived suppressor cells in the lung and liver. This favorable immune suppressive microenvironment was capable of promoting metastatic colonization in the lung and liver, an effect not observed from exosomes derived from nonmetastatic cells and liposome control vesicles. Furthermore, we determined that breast cancer exosomes directly suppressed T-cell proliferation and inhibited NK cell cytotoxicity, and hence likely suppressed the anticancer immune response in premetastatic organs."

According to the news reporters, the research concluded: "Together, our findings provide novel insight into the tissue-specific outcomes of breast cancer-derived exosome accumulation and their contribution to immune suppression and promotion of metastases."

For more information on this research see: The Biodistribution and Immune Suppressive Effects of Breast Cancer-Derived Exosomes. Cancer Research, 2016;76(23):6816-6827. Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. (American Association for Cancer Research - www.aacr.com; Cancer Research - cancerres.aacrjournals.org/)

Our news correspondents report that additional information may be obtained by contacting A. Moller, University of Queensland, Sch Med, Brisbane, Qld, Australia. Additional authors for this research include J. Sceneay, L.G. Lima, C.S.F. Wong, M. Becker, S. Krumreich,
Gram-Negative Bacteria - Pseudomonas aeruginosa

New Findings from University of Rome in the Area of Pseudomonas aeruginosa Reported (Novel genetic tools to tackle c-di-GMP-dependent signalling in Pseudomonas aeruginosa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Pseudomonas aeruginosa have been published. According to news originating from Rome, Italy, by NewsRx correspondents, research stated, "To develop new genetic tools for studying 3',5'-cyclic diguanylic acid (c-di-GMP) signalling in Pseudomonas aeruginosa. Plasmid pPcdrA::lux, carrying a transcriptional fusion between the c-di-GMP responsive promoter PcdrA and the luxCDABE reporter genes, has been generated and validated in purpose-built P.?aeruginosa strains in which c-di-GMP levels can be increased or reduced upon arabinose-dependent induction of c-di-GMP synthetizing or degrading enzymes."

Financial supporters for this research include Italian Cystic Fibrosis Research Foundation, Ministero dell’Istruzione, dell’ Universita e della Ricerca.

Our news journalists obtained a quote from the research from the University of Rome, "The reporter systems described so far were able to detect a decrease in the c-di-GMP levels only in engineered strains overproducing c-di-GMP. Conversely, pPcdrA::lux could be used for studying any process or chemical compound expected to cause both an increase or a decrease with respect to the c-di-GMP levels produced by wild type P.?aeruginosa. Another relevant aspect of this study has been the development of novel and improved genetic devices for the fine arabinose-dependent control of c-di-GMP levels in P.?aeruginosa."

According to the news editors, the research concluded: "The genetic tools developed and validated in this study could facilitate investigations tackling the c-di-GMP signalling process on different fields, from cellular physiology to drug-discovery research."

The news correspondents report that additional information may be obtained from S.V. Pawar, Dept. of Science, University Roma Tre, Rome, Italy. Additional authors for this research include M. Messina, S. Rinaldo, F. Cutruzzola, V. Kaever, G. Rampioni and L. Leoni.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jam.12984. This DOI is a link to an online electronic document that is either free or for purchase.
Keywords for this news article include: Rome, Italy, Europe, Genetics, Pseudomonadaceae, Gammaproteobacteria, Gram Negative Bacteria, Gram-Negative Bacteria, Pseudomonas aeruginosa, Gram Negative Aerobic Bacteria, Gram Negative Aerobic Rods and Cocci.

Nutritional and Metabolic Diseases and Conditions - …

New Findings from University of South Carolina in Obesity Provides New Insights (Do Individual, Online Motivational Interviewing Chat Sessions Enhance Weight Loss in a Group-Based, Online Weight Control Program?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news originating from Columbia, South Carolina, by NewsRx correspondents, research stated, "To examine whether the addition of online motivational interviewing (MI) chats to a Web-based, group behavioral obesity treatment program augments weight loss outcomes relative to the Web-based weight control program alone. Healthy individuals (N = 398, 24% minority) with overweight/obesity were randomized to a 36-session group Internet behavioral weight control treatment (BT) or the same group Internet treatment plus six individual MI chat sessions (BT + MI)."

Our news journalists obtained a quote from the research from the University of South Carolina, "Both conditions received weekly synchronous online chat group sessions for 6 months followed by 12 monthly group chats. Participants in both groups received identical behavioral lessons and individualized therapist feedback on progress toward meeting exercise and calorie goals. BT + MI also received six individual MI sessions delivered by a separate MI counselor via Web chat. Weight loss was measured at 6 and 18 months. There were no significant differences in weight loss between BT (-5.5+/−6.0 kg) and BT + MI (-5.1+/−6.3 kg) at 6 months or at 18 months (-3.3+/−7.1 kg vs. -3.5+/−7.7 kg for BT and BT+MI, respectively). Attendance at group chats did not differ between groups, nor did self-monitoring patterns, suggesting comparable engagement in the weight control program in both conditions."

According to the news editors, the research concluded: "Online MI chat sessions were not a viable strategy to enhance Web-based weight control treatment outcomes."

For more information on this research see: Do Individual, Online Motivational Interviewing Chat Sessions Enhance Weight Loss in a Group-Based, Online Weight Control Program? Obesity, 2016;24(11):2334-2340. Obesity can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

The news correspondents report that additional information may be obtained from D.S. West, University of South Carolina, Arnold Sch Public Hlth, Dept. of Exercise Sci, Columbia, SC 29208, United States. Additional authors for this research include J.R. Harvey, R.A. Krukowski, T.E. Prewitt, J. Priest and T. Ashikaga.

New Findings from University of Southern California Yields New Data on Bipolar Disorders (Mechanisms underlying the benefits of anticonvulsants over lithium in the treatment of bipolar disorder)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mental Health Diseases and Conditions - Bipolar Disorders is the subject of a report. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "Close to 3% of the world's population suffers from bipolar disease (I and II). Of this 3%, bipolar disease affects largely women (∼ 3:2 compared with men)." Our news journalists obtained a quote from the research from the University of Southern California, "The median age of diagnosis is 25 in women and even lower in men. A diagnosis of bipolar disease is an expensive psychiatric diagnosis, costing patients more than twice as much money as a diagnosis of unipolar depression. Bipolar I is characterized by one or more manic or mixed episodes, with both mania and depression occurring each day for at least 1 week, whereas bipolar II is characterized by one or more major depressive episode and at least one episode of hypomania. Bipolar I is the more severe diagnosis. A wide range of medications are available to help patients maintain a healthy lifestyle, including lithium, antidepressants, and anticonvulsants. Improved methods for identifying bipolar disease, including a more structured approach and a more complete use of medical records, have increased the rate of diagnosis, especially in children, which underscores the need for innovation in development and in practice of new treatment options for treating bipolar disease. Although lithium has been the 'gold standard' for treating bipolar disorder for decades, new research into other forms of treatment has shown anticonvulsants to be a particularly useful therapy for treating bipolar disease. Anticonvulsants have remarkable mood-stabilization abilities and they do not lead to serious side effects, which increases the tolerability, and consequently, patient adherence to this form of treatment."

According to the news editors, the research concluded: "Recent studies have shown that anticonvulsants improve behavior in bipolar disease by modulating the balance of excitatory and inhibitory synapses through a number of complementary molecular cascades that affect gene expression and cell survival."

For more information on this research see: Mechanisms underlying the benefits of anticonvulsants over lithium in the treatment of bipolar disorder. *Neuroreport*, 2016;27(3):131-5. (Lippincott Williams and Wilkins - www.lww.com; Neuroreport - journals.lww.com/neuroreport/pages/default.aspx)

New Findings from University of Sydney in the Area of Lung Injury Described (Atomized Human Amniotic Mesenchymal Stromal Cells for Direct Delivery to the Airway for Treatment of Lung Injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lung Diseases and Conditions - Lung Injury. According to news reporting out of Sydney, Australia, by NewsRx editors, research stated, "Current treatment regimens for inhalation injury are mainly supportive and rely on self-regeneration processes for recovery. Cell therapy with mesenchymal stromal cells (MSCs) is increasingly being investigated for the treatment of inhalation injury."

Our news journalists obtained a quote from the research from the University of Sydney, "Human amniotic MSCs (hAMSCs) were used in this study due to their potential use in inflammatory and fibrotic conditions of the lung. This study aimed at demonstrating that hAMSCs can be atomized with high viability, for the purpose of achieving a more uniform distribution of cells throughout the lung. Another aim of this study was to set ground for future application to healthy and diseased lungs by demonstrating that hAMSCs were able to survive after being sprayed onto substrates with different stiffness. Two methods of atomization were evaluated, and the LMA MAD780 device was selected for atomizing hAMSCs for optimized delivery. To mimic the stiffness of healthy and diseased lungs, gelatin gel (10% w/v) and tissue culture plastic were used as preliminary models. Poly-l-lysine (PLL) and collagen I coatings were used as substrates on which the hAMSCs were cultured after being sprayed. The feasibility of atomizing hAMSCs was demonstrated with high cell viability (81 +/- 3.1% and 79 +/- 11.6% for cells sprayed onto plastic and gelatin, respectively, compared with 85 +/- 4.8% for control/non-sprayed cells) that was unaffected by the different stiffness of substrates. The presence of the collagen I coating on which the sprayed cells were cultured yielded higher cell proliferation compared with both PLL and no coating. The morphology of sprayed cells was minimally compromised in the presence of the collagen I coating."

According to the news editors, the research concluded: "This study demonstrated that hAMSCs are able to survive after being sprayed onto substrates with different stiffness, especially in the presence of collagen I. Further studies may advance the effectiveness of cell therapy for lung regeneration."

Our news journalists report that additional information may be obtained by contacting W. Chrzanowski, University of Sydney, Australian Inst Nanoscale Sci & Technol, Sydney, NSW 2006, Australia. Additional authors for this research include J.K. Burgess, Y.W.

**Drugs and Therapies - Drug Delivery Systems**

**New Findings from University of Tennessee Update Understanding of Drug Delivery Systems (Current Advances of Tubulin Inhibitors in Nanoparticle Drug Delivery and Vascular Disruption/Angiogenesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Drug Delivery Systems are discussed in a new report. According to news reporting from Memphis, Tennessee, by NewsRx journalists, research stated, "Extensive research over the last decade has resulted in a number of highly potent tubulin polymerization inhibitors acting either as microtubule stabilizing agents (MSAs) or microtubule destabilizing agents (MDAs). These inhibitors have potent cytotoxicity against a broad spectrum of human tumor cell lines."

The news correspondents obtained a quote from the research from the University of Tennessee, "In addition to cytotoxicity, a number of these tubulin inhibitors have exhibited abilities to inhibit formation of new blood vessels as well as disrupt existing blood vessels. Tubulin inhibitors as a vascular disrupting agents (VDAs), mainly from the MDA family, induce rapid tumor vessel occlusion and massive tumor necrosis. Thus, tubulin inhibitors have become increasingly popular in the field of tumor vasculature. However, their pharmaceutical application is halted by a number of limitations including poor solubility and toxicity. Thus, recently, there has been considerable interests in the nanoparticle drug delivery of tubulin inhibitors to circumvent those limitations."

According to the news reporters, the research concluded: "This article reviews recent advances in nanoparticle based drug delivery for tubulin inhibitors as well as their tumor vasculature disruption properties."

For more information on this research see: Current Advances of Tubulin Inhibitors in Nanoparticle Drug Delivery and Vascular Disruption/Angiogenesis. *Molecules*, 2016;21(11):717-735. *Molecules* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. (Springer - www.springer.com; Molecules - www.springerlink.com/content/1420-3049/)

Our news journalists report that additional information may be obtained by contacting S. Banerjee, University of Tennessee, Hlth Sci Center, Dept. of Pharmaceut Sci, Memphis, TN 38163, United States. Additional authors for this research include D.J. Hwang, W. Li and D.D. Miller.

Cardiology

New Findings from University of Tennessee in the Area of Cardiology Described (Ventricular catheter development: past, present, and future)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiology. According to news originating from Knoxville, Tennessee, by NewsRx correspondents, research stated, "Cerebrospinal fluid diversion via ventricular shunting is the prevailing contemporary treatment for hydrocephalus."

Our news journalists obtained a quote from the research from the University of Tennessee, "The CSF shunt appeared in its current form in the 1950s, and modern CSF shunts are the result of 6 decades of significant progress in neurosurgery and biomedical engineering. However, despite revolutionary advances in material science, computational design optimization, manufacturing, and sensors, the ventricular catheter (VC) component of CSF shunts today remains largely unchanged in its functionality and capabilities from its original design, even though VC obstruction remains a primary cause of shunt failure."

According to the news editors, the research concluded: "The objective of this paper is to investigate the history of VCs, including successful and failed alterations in mechanical design and material composition, to better understand the challenges that hinder development of a more effective design."

For more information on this research see: Ventricular catheter development: past, present, and future. Journal of Neurosurgery, 2016;125(6):1504-1512. Journal of Neurosurgery can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

The news correspondents report that additional information may be obtained from S.H. Weisenberg, University of Tennessee, Inst Biomed Engn, Knoxville, TN 37996, United States. Additional authors for this research include S.C. TerMaath, C.E. Seaver and J.A. Killeffer.

**Immunology - Immunoglobulins**

**New Findings from University of Texas Describe Advances in Immunoglobulins (Paraprotein-Related Kidney Disease: Evaluation and Treatment of Myeloma Cast Nephropathy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Immunoglobulins. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "Nearly 50% of patients with multiple myeloma develop renal disease, most commonly from AKI caused by cast nephropathy. Development of AKI is associated with poor 1-year survival and reduces the therapeutic options available to patients."

The news reporters obtained a quote from the research from the University of Texas, "There is a great need for more effective therapies. Cast nephropathy is caused by the interaction and aggregation of filtered free light chains and Tamm Horsfall protein causing intratubular obstruction and damage. The key to treating cast nephropathy is rapid lowering of free light chains, because this correlates with renal recovery. Newer chemotherapy agents rapidly lower free light chains and have been referred to as renoprotective. There is additional great interest in using extracorporeal therapies to remove serum free light chains. Small trials initially showed benefit of therapeutic plasma exchange to improve renal outcomes in cast nephropathy, but a large randomized trial of therapeutic plasma exchange failed to show benefit. A newer technique is extended high cutoff hemodialysis. This modality uses a high molecular weight cutoff filter to remove free light chains. To date, trials of high cutoff hemodialysis use in patients with cast nephropathy have been encouraging. However, there are no randomized trials showing the benefit of high-cutoff hemodialysis when used in addition to newer chemotherapeutic regimens."

According to the news reporters, the research concluded: "Until these studies are available, high-cutoff hemodialysis cannot be recommended as standard of care."

Our news correspondents report that additional information may be obtained by contacting K.W. Finkel, Univ Texas MD Anderson Canc Center, Dept. of Gen Internal Med, Nephrol Sect, Houston, TX 77030, United States. Additional authors for this research include E.P. Cohen, A. Shirali and A. Abudayyeh.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2215/CJN.01640216. This DOI is a link to an online electronic document that is either free or for purchase.

New Findings from University of Texas Describe Advances in Smoking Cessation Agents (Attenuated nicotine-like effects of varenicline but not other nicotinic ACh receptor agonists in monkeys receiving nicotine daily)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Smoking Cessation Agents. According to news reporting originating from San Antonio, Texas, by NewsRx correspondents, research stated, "Background and PurposeChronic treatment can differentially impact the effects of pharmacologically related drugs that differ in receptor selectivity and efficacy. Experimental ApproachThe impact of daily nicotine treatment on the effects of nicotinic ACh receptor (nAChR) agonists was examined in two groups of rhesus monkeys discriminating nicotine (1.78mgkg(-1) base weight) from saline."

Our news editors obtained a quote from the research from the University of Texas, "One group received additional nicotine treatment post-session (1.78mgkg(-1) administered five times daily, each dose 2h apart; i.e. Daily group), and the second group did not (Intermittent group). Key ResultsDaily repeated nicotine treatment produced a time-related increase in saliva cotinine. There was no significant difference in the ED50 values of the nicotine discriminative stimulus between the Daily and Intermittent group. Mecamylamine antagonized the effects of nicotine, whereas dihydro--erythroidine did not. Midazolam produced 0% nicotine-lever responding. The nAChR agonists epibatidine, RTI-36, cytisine and varenicline produced >96% nicotine-lever responding in the Intermittent group. The respective maximum effects in the Daily group were 100, 72, 59 and 28%, which shows that the ability of varenicline to produce nicotine-like responding was selectively decreased in the Daily as compared with the Intermittent group. When combined with nicotine, both varenicline and cytisine increased the potency of nicotine to produce discriminative stimulus effects. Conclusion and ImplicationsNicotine treatment has a greater impact on the sensitivity to the effects of varenicline as compared with some other nAChR agonists."

According to the news editors, the research concluded: "Collectively, these results strongly suggest that varenicline differs from nicotine in its selectivity for multiple nAChR subtypes."

The news editors report that additional information may be obtained by contacting L.R. McMahon, Univ Texas Hlth Sci Center San Antonio, Dept. of Pharmacol, San Antonio, TX 78229, United States. Additional authors for this research include M.J. Moerke, M.A. Javors, F.I. Carroll and L.R. McMahon.

Keywords for this news article include: San Antonio, Texas, United States, North and Central America, Smoking Cessation Agents, Drugs and Therapies, Varenicline, University of Texas.

New Findings from University of Texas Health Science Center in the Area of Prostate Cancer Reported (Histone deacetylase inhibitors in castration-resistant prostate cancer: molecular mechanism of action and recent clinical trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Prostate Cancer. According to news originating from San Antonio, Texas, by NewsRx correspondents, research stated, "Historically, androgen-deprivation therapy has been the cornerstone for treatment of metastatic prostate cancer. Unfortunately, nearly majority patients with prostate cancer transition to the refractory state of castration-resistant prostate cancer (CRPC)."

Our news journalists obtained a quote from the research from the University of Texas Health Science Center, "Newer therapeutic agents are needed for treating these CRPC patients that are unresponsive to androgen deprivation and/or chemotherapy. The histone deacetylase (HDAC) family of enzymes limits the expression of genomic regions by improving binding between histones and the DNA backbone. Modulating the role of HDAC enzymes can alter the cell's regulation of proto-oncogenes and tumor suppressor genes, thereby regulating potential neoplastic proliferation. As a result, histone deacetylase inhibitors (HDACi) are now being evaluated for CRPC or chemotherapy-resistant prostate cancer due to their effects on the expression of the androgen receptor gene. In this paper, we review the molecular mechanism and functional target molecules of different HDACi as applicable to CRPC as well as describe recent and current clinical trials involving HDACi in prostate cancer. To date, four HDAC classes comprising 18 isoenzymes have been identified. Recent clinical trials of vorinostat, romidepsin, and panobinostat have provided cautious optimism towards improved outcomes using these novel therapeutic agents for CPRC patients. Nevertheless, no phase III trial has been conducted to cement one of these drugs as an adjunct to androgen-deprivation therapy."

According to the news editors, the research concluded: "Consequently, further investigation is necessary to delineate the benefits and drawbacks of these medications."

For more information on this research see: Histone deacetylase inhibitors in castration-resistant prostate cancer: molecular mechanism of action and recent clinical trials. Therapeutic Advances In Urology, 2015;7(6):388-95. (Sage Publications - www.sagepub.com; Therapeutic Advances In Urology - tau.sagepub.com)

New Findings from University of Texas in the Area of Endometrial Cancer Reported (Prospective evaluation of the molecular effects of metformin on the endometrium in women with newly diagnosed endometrial cancer: A window of opportunity study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Endometrial Cancer.

According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Metformin reduces cancer incidence and improves overall survival in diabetic patients. In preclinical studies, metformin decreases endometrial cancer (EC) cell growth by activation of AMPK/mTOR inhibition."

The news correspondents obtained a quote from the research from the University of Texas, "We sought to determine the effects of metformin on serum/tumor biomarkers in women with EC. In this prospective trial, newly diagnosed EC patients underwent pre-treatment blood draw/endometrial biopsy, were administered oral metformin 850 mg daily for >= 7 days, and underwent post-treatment blood draw/definitive surgery. Pre- and post- serum analyses were performed. Tumor samples were evaluated for changes in AMPK, PI3K/AKT pathway, proliferation, and apoptosis by immunohistochemistry. Twenty patients completed the trial. Median age and BMI were 57 years (range: 27-67) and 34.5 kg/m(2) (range: 21.9-50.0). Median duration of metformin was 9.5 days (range: 7-24). A majority of women had endometrioid adenocarcinomas (90%) and were early stage (85%). After metformin, there were significant decreases in serum IGF-1 (p = 0.046), omentin (p = 0.007), insulin (p = 0.012), C-peptide (p = 0.018), and leptin (p = 0.0035). Compared to baseline, post-treatment tissue showed decreased phospho-AKT in 18/20 patients (90%, p = 0.0002), decreased phospho-S6rp in 14/20 patients (70%, p = 0.057), and decreased phospho-p44/42MAPK in 15/18 patients (833%, p = 0.0038). There was no difference in Ki67, phospho-ACC, or caspase 3. Changes did not correlate with BMI, grade, or KRAS mutation."

According to the news reporters, the research concluded: "In this prospective window of opportunity study, we demonstrated that relevant serum and molecular changes occur in patients with newly diagnosed EC after a short course of metformin."

For more information on this research see: Prospective evaluation of the molecular effects of metformin on the endometrium in women with newly diagnosed endometrial cancer: A window of opportunity study. Gynecologic Oncology, 2016;143(3):466-471. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Soliman, Univ Texas MD Anderson Canc Center, Dept. of Gynecol Oncol & Reprod Med, Houston, TX 77030, United States. Additional authors for this research include Q. Zhang, R.R. Broaddus, S.N. Westin, D. Iglesias, M.F. Munsell, R. Schmandt, M. Yates, L. Ramondetta and K.H. Lu.
New Findings from University of Texas in the Area of School Health Reported (Health Promotion Efforts as Predictors of Physical Activity in Schools: An Application of the Diffusion of Innovations Model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Education - School Health. According to news reporting out of Austin, Texas, by NewsRx editors, research stated, "Implementing a comprehensive school physical activity program (CSPAP) effectively addresses public health issues by providing opportunities for physical activity (PA). Grounded in the Diffusion of Innovations model, the purpose of this study was to identify how health promotion efforts facilitate opportunities for PA."

Financial support for this research came from SHAPE America. Our news journalists obtained a quote from the research from the University of Texas, "Physical and health education teachers (N = 256) nationwide were surveyed using a CSPAP Index to identify teacher's efforts for providing opportunities for PA within a school setting. A hierarchical regression analysis revealed total number of PA opportunities was significantly predicted by teachers' health promotion efforts, p< .001. Sex and years of experience were not significant covariates, p = .35, in the final step of the model. Accounting for teaching environments, the model was significant, p< .001. The strongest predictors were the promotional efforts of PA for family and community, p< .001, PA for staff members, p< .01, PA during the school day, p< .05, and PA before school, p< .05. To increase PA opportunities for children in schools, emphasis should be placed on health promotion."

According to the news editors, the research concluded: "This study confirms the importance of teachers involving family, community, and staff members as co-health promoters when trying to increase PA engagement surrounding schools."

Our news journalists report that additional information may be obtained by contacting E.M. Glowacki, Univ Texas Austin, Center Hlth Commun, Dept. of Commun Studies, Austin, TX 78712, United States. Additional authors for this research include E.E. Centeio, D.J. Van Dongen, R.L. Carson and D.M. Castelli.

Enzymes and Coenzymes - One-Carbon Group ...

New Findings from University of Toronto in the Area of One-Carbon Group Transferases Reported (A Potent, Selective, and Cell-Active Inhibitor of Human Type I Protein Arginine Methyltransferases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Enzymes and Coenzymes - One-Carbon Group Transferases are presented in a new report. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "Protein arginine methyltransferases (PRMTs) play a crucial role in a variety of biological processes. Overexpression of PRMTs has been implicated in various human diseases including cancer."

Financial supporters for this research include European Commission, Wellcome Trust, American Cancer Society, National Institute of General Medical Sciences, Structural Genomics Consortium, European Federation of Pharmaceutical Industries and Associations.

Our news journalists obtained a quote from the research from the University of Toronto, "Consequently, selective small-molecule inhibitors of PRMTs have been pursued by both academia and the pharmaceutical industry as chemical tools for testing biological and therapeutic hypotheses. PRMTs are divided into three categories: type I PRMTs which catalyze mono- and asymmetric dimethylation of arginine residues, type II PRMTs which catalyze mono- and symmetric dimethylation of arginine residues, and type III PRMT which catalyzes only monomethylation of arginine residues. Here, we report the discovery of a potent, selective, and cell-active inhibitor of human type I PRMTs, MS023, and characterization of this inhibitor in a battery of biochemical, biophysical, and cellular assays. MS023 displayed high potency for type I PRMTs including PRMT1, -3, -4, -6, and -8 but was completely inactive against type II and type III PRMTs, protein lysine methyltransferases and DNA methyltransferases. A crystal structure of PRMT6 in complex with MS023 revealed that MS023 binds the substrate binding site. MS023 potently decreased cellular levels of histone arginine asymmetric dimethylation. It also reduced global levels of arginine asymmetric dimethylation and concurrently increased levels of arginine monomethylation and symmetric dimethylation in cells. We also developed MS094, a close analog of MS023, which was inactive in biochemical and cellular assays, as a negative control for chemical biology studies."

According to the news editors, the research concluded: "MS023 and MS094 are useful chemical tools for investigating the role of type I PRMTs in health and disease."

For more information on this research see: A Potent, Selective, and Cell-Active Inhibitor of Human Type I Protein Arginine Methyltransferases. Acs Chemical Biology, 2015;11 (3):772-81. (American Chemical Society - www.acs.org; Acs Chemical Biology - www.pubs.acs.org/journal/acbcct)

New Findings from University of Toronto in the Area of Subarachnoid Hemorrhage Reported (Clinical characteristics and outcome of aneurysmal subarachnoid hemorrhage with intracerebral hematoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "Intracerebral hematoma (ICH) with subarachnoid hemorrhage (SAH) indicates a unique feature of intracranial aneurysm rupture since the aneurysm is in the subarachnoid space and separated from the brain by pia mater. Broad consensus is lacking regarding the concept that ultra-early treatment improves outcome."

Our news journalists obtained a quote from the research from the University of Toronto, "The aim of this study is to determine the associative factors for ICH, ascertain the prognostic value of ICH, and investigate how the timing of treatment relates to the outcome of SAH with concurrent ICH. The study data were pooled from the SAH International Trialists repository. Logistic regression was applied to study the associations of clinical and aneurysm characteristics with ICH. Proportional odds models and dominance analysis were applied to study the effect of ICH on 3-month outcome (Glasgow Outcome Scale) and investigate the effect of time from ictus to treatment on outcome. Of the 5362 SAH patients analyzed, 1120 (21%) had concurrent ICH. In order of importance, neurological status, aneurysm location, aneurysm size, and patient ethnicity were significantly associated with ICH. Patients with ICH experienced poorer outcome than those without ICH (OR 1.58; 95% CI 1.37-1.82). Treatment within 6 hours of SAH was associated with poorer outcome than treatment thereafter (adjusted OR 1.67; 95% CI 1.04-2.69). Subgroup analysis with adjustment for ICH volume, location, and midline shift resulted in no association between time from ictus to treatment and outcome (OR 0.99; 95% CI 0.94-1.07). The most important associative factor for ICH is neurological status on admission."

According to the news editors, the research concluded: "The finding regarding the value of ultra-early treatment suggests the need to more robustly reevaluate the concept that hematoma evacuation of an ICH and repair of a ruptured aneurysm within 6 hours of ictus is the most optimal treatment path."

For more information on this research see: Clinical characteristics and outcome of aneurysmal subarachnoid hemorrhage with intracerebral hematoma. Journal of Neurosurgery,
Phenypropionates

New Findings from University of Turku Update Understanding of Phenypropionates (Influence of Surface Chemistry on Ibuprofen Adsorption and Confinement in Mesoporous Silicon Microparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Phenypropionates are presented in a new report. According to news originating from Turku, Finland, by NewsRx correspondents, research stated, "The effect of adsorption and confinement on ibuprofen was studied by immersion loading the molecules into porous silicon (PSi) microparticles. The PSi micro particles were modified into thermally oxidized PSi (TOPSi) and thermally hydrocarbonized PSi (THCPSi) to evaluate the effects of the loading solvent and the surface chemistry on the obtainable drug payloads."

Financial supporters for this research include European Commission, Suomen Akatemia.

Our news journalists obtained a quote from the research from the University of Turku, "The payloads, location, and the molecular state of the adsorbed drug were evaluated using thermal analysis. The results showed that after the adsorption of similar to 800 mg/cm(3) (w(drug)/v(pores)) of drug into the mesopores, depending on the solvent used in the immersion, the drug began to rapidly recrystallize on the external surface of the particles. Moderate concentrations, however, enabled payloads of 800-850 mg/cm(3) without excessive surface crystallization, and thus, there was no need for rinsing the samples to remove the externally crystallized portion. The results showed that the confined ibuprofen forms nanocrystals inside of the mesopores after approximately 200 mg/cm(3) payloads were obtained, accounting for half of the adsorbed drug amount. The presence of both crystalline and noncrystalline phases was further characterized using variable temperature solid-state nuclear magnetic resonance (NMR) measurements. The interactions between the drug molecules and the pore walls of TOPSi and THCPSi were observed using Fourier transform infrared and H-1 NMR spectroscopies, and the hydrogen bonding between the silanol groups of TOPSi and the adsorbed ibuprofen was confirmed, but having only limited effect on the overall state of the confined drug."

According to the news editors, the research concluded: "In vitro drug permeation studies in Caco-2 and Caco-2/HT29 cocultures showed that the adsorption onto hydrophilic or
hydrophobic PSi microparticles had no significant effects on the ibuprofen permeation, whether the drug was partially nanocrystalline or completely in a liquidlike state."

The news correspondents report that additional information may be obtained from J. Salonen, University of Turku, Dept. of Phys & Astron, Lab Ind Phys, FI-20014 Turku, Finland. Additional authors for this research include H. Kivela, N. Shrestha, A. Correia, M. Kaasalainen, E. Kukk, J. Hirvonen, H.A. Santos and J. Salonen.

**Oncology - Breast Cancer**

**New Findings from University of Ulsan College of Medicine Describe Advances in Breast Cancer (Docetaxel-based adjuvant therapy for breast cancer patients in Asia-Pacific region: Results from 5 years follow-up on Asia-Pacific Breast Initiative-I)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "To acquire patient characteristics, safety, relapse and survival outcomes of early-stage breast cancer patients receiving docetaxel (Taxotere®)-based regimen in adjuvant setting from the Asia-Pacific region. This was an open-label, international, longitudinal, multicenter, observational, prospective cohort of consecutive early breast cancer (EBC) patients with a high risk of recurrence being treated with various docetaxel-containing anthracycline and non-anthracycline adjuvant regimens during 2006-2013."

Financial support for this research came from Sanofi Aventis.

Our news journalists obtained a quote from the research from the University of Ulsan College of Medicine, "In this study, 1542 patients were enrolled. Anthracycline-containing regimens were administered in 92% of patients, while 8% of patients received non-anthracycline-containing docetaxel-based regimens. The mean dose intensity of docetaxel was 25.8, 22.4 and 25.4 mg/m(2) /week among patients receiving docetaxel-based monotherapy, combination and sequential therapy, respectively. Adverse events were reported in 94.9% of patients (anthracycline vs non-anthracycline regimen; 95.1% vs 93.5%). Serious adverse events were reported in 12.6% of patients (12.4% vs 14.6%). Grade 4 neutropenia was reported in 25.2% of patients (24.7% vs 30.9%) and febrile neutropenia in 1.9% of patients (2% vs 0.8%). Only 7% of patients had a relapse or a second primary malignancy. At 5-year follow-up, there
were 127 (8.3%) deaths (8.4% vs 6.5%)."

According to the news editors, the research concluded: "The Asia-Pacific Breast Initiative-I registry highlights the important patient and treatment characteristics of EBC patients treated with adjuvant docetaxel chemotherapy from the Asia-Pacific region that will help physicians to understand the impact of different docetaxel treatments on the clinical outcomes in this population."
