2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cell Research - Blood Cells. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Fatty acids, which are well-known for their influence on human metabolism and signal transduction, are also a substantial component of cellular membranes and regulate the basic properties and functions of membranes. Owing to their multiple functions, fatty acid profiles of cell membranes are of great interest to those who are studying the relationship between membrane biochemical compositions and functions."

Our news journalists obtained a quote from the research from the Beijing University of Chemical Technology. "A HCl-catalyzed derivation method and a gas chromatography with mass spectrometry analysis method were developed to accurately profile the fatty acids in cell membranes of erythrocytes, leukocytes, and platelets. The detection limits of all 35 fatty acids ranged from 0.58 to 22 ng/mL and the limits of quantitation were between 2.1 and 72 ng/mL. Finally, the established method was used to profile the membrane fatty acids of 44 healthy volunteers from the north and south of China. Results revealed significant differences in the fatty acid profiles from the two regions, particularly those of the erythrocytes."

According to the news editors, the research concluded: "This technique may be applied to cell membrane studies to generate new biological hypotheses concerning fatty acid composition and membrane functions as well as to construct related disease profiles."

Blood Pressure

Reports on Blood Pressure Findings from University College Cork Provide New Insights (Correlation between short-term blood pressure variability and left-ventricular mass index: a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Pressure have been published. According to news reporting originating in Cork, Ireland, by NewsRx journalists, research stated, "Long-term blood pressure variability (BPV) has been associated with cardiovascular events but the prognostic significance of short-term BPV remains uncertain, including its influence on the presence of target-organ damage, specifically left-ventricular hypertrophy. A meta-analysis exploring the correlation between short-term BPV and left-ventricular mass index was performed."

The news reporters obtained a quote from the research from University College Cork, "Studies were identified by systematic searches in Pubmed and EMBASE. Any summary measure of short-term BPV obtained from ambulatory blood pressure monitoring was included. Twelve studies were included. Average real variability (ARV), s.d., weighted s.d. and coefficient of variation across 24 h/day/night periods were identified as measures of variability. Meta-analysis showed the pooled subgroup correlation coefficients of LVMI with 24 h systolic blood pressure (SBP) s.d., day SBP s.d., weighted s.d. SBP and 24 h ARV SBP were 0.22 (95% confidence interval (CI): 0.12-0.31), 0.19 (95% CI: 0.15-0.25), 0.23 (95% CI: 0.13-0.33), 0.37 (95% CI: 0.01-0.65), respectively."

According to the news reporters, the research concluded: "This meta-analysis suggests there is a weak positive correlation, between BPV and LVMI."

For more information on this research see: Correlation between short-term blood pressure variability and left-ventricular mass index: a meta-analysis. Hypertension Research, 2015;39(3):171-7. (Nature Publishing Group - www.nature.com/; Hypertension Research - www.nature.com/hr/)

Reports on Bone Research Findings from Nagasaki University Provide New Insights (Overexpression of BCLXL in Osteoblasts Inhibits Osteoblast Apoptosis and Increases Bone Volume and Strength)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Bone Research is now available. According to news reporting out of Nagasaki, Japan, by NewsRx editors, research stated, "The Bcl2 family proteins, Bcl2 and BclXL, suppress apoptosis by preventing the release of caspase activators from mitochondria through the inhibition of Bax subfamily proteins. We reported that BCL2 overexpression in osteoblasts using the 2.3 kb Col1a1 promoter increased osteoblast proliferation, failed to reduce osteoblast apoptosis, inhibited osteoblast maturation, and reduced the number of osteocyte processes, leading to massive osteocyte death."

Our news journalists obtained a quote from the research from Nagasaki University, "We generated BCLXL (BCL2L1) transgenic mice using the same promoter to investigate BCLXL functions in bone development and maintenance. Bone mineral density in the trabecular bone of femurs was increased, whereas that in the cortical bone was similar to that in wild-type mice. Osteocyte process formation was unaffected and bone structures were similar to those in wild-type mice. A micro-CT analysis showed that trabecular bone volume in femurs and vertebrae and the cortical thickness of femurs were increased. A dynamic bone histomorphometric analysis revealed that the mineralizing surface was larger in trabecular bone, and the bone-formation rate was increased in cortical bone. Serum osteocalcin but not TRAP5b was increased, BrdU-positive osteoblastic cell numbers were increased, TUNEL-positive osteoblastic cell numbers were reduced, and osteoblast marker gene expression was enhanced in BCLXL transgenic mice. The three-point bending test indicated that femurs were stronger in BCLXL transgenic mice than in wild-type mice. The frequency of TUNEL-positive primary osteoblasts was lower in BCLXL transgenic mice than in wild-type mice during cultivation, and osteoblast differentiation was enhanced but depended on cell density, indicating that enhanced differentiation was mainly owing to reduced apoptosis. Increased trabecular and cortical bone volumes were maintained during aging in male and female mice."

According to the news editors, the research concluded: "These results indicate that BCLXL overexpression in osteoblasts increased the trabecular and cortical bone volumes with normal structures and maintained them majorly by preventing osteoblast apoptosis, implicating BCLXL as a therapeutic target of osteoporosis."

Our news journalists report that additional information may be obtained by contacting T. Komori, Nagasaki University, Dept. of Cell Biol, Grad Sch Biomed Sci, Nagasaki, Japan. Additional authors for this research include R. Fukuyama, T. Miyazaki, T. Furuichi, M.
Ito and T. Komori.

Oncology - Breast Cancer

Reports on Breast Cancer Findings from Guangdong University of Technology Provide New Insights (Moment Stability For Nonlinear Stochastic Growth Kinetics Of Breast Cancer Stem Cells With Time-delays)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Solid tumors are heterogeneous in composition. Cancer stem cells (CSCs) are a highly tumorigenic cell type found in developmentally diverse tumors that are believed to be resistant to standard chemotherapeutic drugs and responsible for tumor recurrence."

Our news journalists obtained a quote from the research from the Guangdong University of Technology, "Thus understanding the tumor growth kinetics is critical for development of novel strategies for cancer treatment. In this paper, the moment stability of nonlinear stochastic systems of breast cancer stem cells with time-delays has been investigated. First, based on the technique of the variation-of-constants formula, we obtain the second order moment equations for the nonlinear stochastic systems of breast cancer stem cells with time-delays. By the comparison principle along with the established moment equations, we can get the comparative systems of the nonlinear stochastic systems of breast cancer stem cells with time-delays. Then moment stability theorems have been established for the systems with the stability properties for the comparative systems. Based on the linear matrix inequality (LMI) technique, we next obtain a criteria for the exponential stability in mean square of the nonlinear stochastic systems for the dynamics of breast cancer stem cells with time-delays."

According to the news editors, the research concluded: "Finally, some numerical examples are presented to illustrate the efficiency of the results."

For more information on this research see: Moment Stability For Nonlinear Stochastic Growth Kinetics Of Breast Cancer Stem Cells With Time-delays. Discrete and Continuous Dynamical Systems-Series B, 2016;21(8):2473-2489. Reports on Breast Cancer Findings from United BioSource Corporation Provide New Insights (A time and motion study of subcutaneous versus intravenous trastuzumab in patients with HER2-positive early breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting from Barcelona, Spain, by NewsRx journalists, research stated, "Within PrefHer (NCT01401166), patients and healthcare professionals (HCPs) preferred subcutaneous (SC) over intravenous (IV) trastuzumab. We undertook a prospective, observational time and motion study to quantify patients' time in infusion chairs and active HCP time in PrefHer."

Financial support for this research came from F. Hoffmann-La Roche Ltd, Basel, Switzerland.

The news correspondents obtained a quote from the research from United BioSource Corporation, "Patients with HER2-positive early breast cancer received four adjuvant cycles of SC trastuzumab (600 mg fixed dose via SC single-use injection device [SID, Cohort 1] or SC handheld syringe [HHS, Cohort 2]) then four cycles of standard IV trastuzumab or the reverse sequence. Generic case report forms for IV and SC management, both in the treatment room and the drug preparation area, were tailored to reflect center practices. Patient chair time and active HCP time were recorded. We compared pooled Cohort 1 + 2 IV with Cohort 1 SC SID and Cohort 2 SC HHS mean times across eight countries and individually within them utilizing a random intercept generalized linear mixed-effects model. Per session, the SC SID saved a mean of 57 min of patient chair time versus IV (range across countries: 47-86; p<0.0001); the SC HHS saved 55 min (40-81; p<0.0001). Active HCP time was reduced by a mean of 13 min per session with the SC SID (range across countries: 4-16; p<0.0001) and 17 min with the SC HHS (5-28; p<0.0001) versus IV."

According to the news reporters, the research concluded: "SC trastuzumab, delivered via SID or HHS, saved patient chair and active HCP times versus IV infusion, supporting a transition to either SC method."

Our news journalists report that additional information may be obtained by contacting E. De Cock, United BioSource Corporation, Barcelona, Spain. Additional authors for this research include X. Pivot, N. Hauser, S. Verma, P. Kritikou, D. Millar and A. Knoop.

Reports on Cancer Risk Findings from University of Turin Provide New Insights (Skin phenotypes can offer some insight about the association between telomere length and cancer susceptibility)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Cancer Risk is the subject of a report. According to news reporting originating in Turin, Italy, by NewsRx journalists, research stated, "The role of telomere biology in cancer has been studied for a wide variety of different cancers but the association with telomere length has been controversial. This is because some cancers have been found to be associated with longer telomeres in circulating white cells whilst other cancer types are more common in individuals with shorter telomeres."

The news reporters obtained a quote from the research from the University of Turin, "Hence, there has been some skepticism as to whether telomere length may be helpful in estimating cancer risk. For melanoma, however, results have been fairly consistent showing that longer telomeres are associated with an increased risk. This link was first discovered because of a link between longer telomeres and a high number of naevi. In contrast, for cutaneous squamous cell carcinomas, the relationship is reversed with higher risk in individuals with shorter telomeres. Differences in skin phenotypes with the presence of high number of naevi versus photoageing with solar elastosis and solar keratoses have already been valuable for dermatologists as the former phenotype is associated with melanoma whilst the latter is more common in patients with squamous cell carcinoma of the skin. The hypothesis is that the differences in cutaneous phenotypes already observed by dermatologists for skin cancers may, in fact, be useful as well for cancer prediction in general as it may reflect underlying telomere biology."

According to the news reporters, the research concluded: "This manuscript will address the evidence for links between telomere biology, skin phenotypes and cancer risk."

For more information on this research see: Skin phenotypes can offer some insight about the association between telomere length and cancer susceptibility. Medical Hypotheses, 2016;97():7-10. Medical Hypotheses can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. Enzymes and Coenzymes - Carboxy-Lyases

Reports on Carboxy-Lyases Findings from Jichi Medical University Provide New Insights (A female case of aromatic L-amino acid decarboxylase deficiency responsive to MAO-B inhibition)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - Carboxy-Lyases. According to news reporting originating in Tochigi, Japan, by NewsRx journalists, research stated, "Aromatic L-amino acid decarboxylase (AADC) deficiency is an autosomal recessive disorder, caused by defects in the DDC gene. AADC catalyzes the synthesis of the neurotransmitters dopamine and serotonin from L-dopa and 5-HT respectively."

Funders for this research include Agency of Medical Research and Development, JSPS.

The news reporters obtained a quote from the research from Jichi Medical University, "Most patients are bed ridden for life, with little response to treatment. We now report one female patient who improved her motor and cognitive function after being prescribed a MAO-B inhibitor. A five years old female presented with the typical clinical features of AADC deficiency. She was floppy, with no head control, had intermittent limb dystonia, and an upward deviation of the eyes (oculogyric crisis). This patient possessed compound heterozygous mutations in DDC (p.Trp105Cys, p.Pro129Ser), with a CSF draw indicating abnormal patterns of biogenic amine metabolites, compatible with AADC deficiency. After her diagnosis at 3 years of age, medication with levodopa and vitamin B6 failed to show any efficacy. Subsequent administration with a MAO-B inhibitor improved her psychomotor functions to the extent that at 5 years of age she could walk several meters with support. Our analyses of chemical findings, together with in silica structure predictions, lead us to hypothesize that this patient retained some AADC activity."

According to the news reporters, the research concluded: "In these cases, accurate diagnosis and early treatment should improve patient outcome."

For more information on this research see: A female case of aromatic L-amino acid decarboxylase deficiency responsive to MAO-B inhibition. Brain & Development, 2016;38 (10):959-963. Brain & Development can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Reports on Carcinomas Findings from Department of Surgery Provide New Insights (Systemic treatment of patients with metachronous peritoneal carcinomatosis of colorectal origin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Carcinomas. According to news reporting out of Eindhoven, Netherlands, by NewsRx editors, research stated, "Combining chemotherapy and targeted therapies has resulted in an enhanced survival in metastatic colorectal cancer (mCRC) patients. However, the result of this palliative treatment in patients with metachronous peritoneal carcinomatosis (PC) remains unknown."

Our news journalists obtained a quote from the research from the Department of Surgery, "The current population-based study aims to investigate the use and effect of palliative systemic treatment in patients with metachronous PC of colorectal origin. Data on metachronous PC were collected between 2010 and 2011 for all patients who were diagnosed with M0 colorectal cancer between 2003 and 2008 in the Dutch Eindhoven Cancer Registry. Patient demographics and detailed data on chemotherapeutic treatment were collected and compared. Ninety-two patients with metachronous PC received chemotherapy in a palliative setting compared to 94 patients without treatment. In 36 patients, Bevacizumab was added to the treatment (39%). Overall survival was 3.4, 13, and 20.3 months in the no treatment, systemic treatment and systemic treatment + Bevacizumab respectively (p <0.001). Male gender was a positive predictor and right sided primary tumor location a negative predictor of receiving bevacizumab. Approximately 40% of patients with metachronous PC received bevacizumab in addition to chemotherapy."

According to the news editors, the research concluded: "Treatment with systemic chemotherapy in combination with bevacizumab may increase survival in a patients with metachronous colorectal PC."

For more information on this research see: Systemic treatment of patients with metachronous peritoneal carcinomatosis of colorectal origin. Scientific Reports, 2015;5();18632. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Cardiology

Reports on Cardiology Findings from University of Helsinki Provide New Insights (Simvastatin Treatment Upregulates Anti-Fibrotic Bone Morphogenetic Protein-7 Expression at Rat Cardiac Allograft Rejection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting from Helsinki, Finland, by NewsRx journalists, research stated, "Bone morphogenetic protein (BMP)-7 mediates ischemic tolerance and anti-fibrotic effects in various organs such as kidney and heart. Recently, reno- and podocyte-protective effects of a potent HMG-CoA reductase inhibitor, pitavastatin, were accompanied by BMP-7 upregulation."

The news correspondents obtained a quote from the research from the University of Helsinki, "Here, we investigated the effect of simvastatin treatment on BMP-7 expression in major MHC-mismatched rat cardiac allografts subjected to ischemia-reperfusion injury and adaptive immune activation at 10 days. We localized Smad2 activity and Reca-1(+) fibroblast specific protein-1(+) immunoreactivity, suggesting endothelial-to-mesenchymal transition, at fibrotic borderline of cardiac allografts at 10 days. Simvastatin donor and recipient combination treatment significantly upregulated cardiac allograft BMP-7 expression when compared to nontreated controls at 10 days."

According to the news reporters, the research concluded: "The beneficial effect of statin treatment on cardiac allograft may in part be mediated through the upregulation of BMP-7."

For more information on this research see: Simvastatin Treatment Upregulates Anti-Fibrotic Bone Morphogenetic Protein-7 Expression at Rat Cardiac Allograft Rejection. Pharmacology, 2016;98(5-6):204-208. Pharmacology can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. Reports on Cardiology from University of Bergen Provide New Insights (Natriuretic peptide levels taken following unplanned admission to a cardiology department predict the duration of hospitalization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting originating in Bergen, Norway, by NewsRx journalists, research stated, "Natriuretic peptide (NP) levels are routinely employed as useful diagnostic and prognostic tools in the evaluation of patients with heart failure (HF). As hospitalization is the major consumer of healthcare resources, the prognostic power of admission NPs with regard to the duration of hospitalization deserves further investigation."

The news reporters obtained a quote from the research from the University of Bergen, "We assessed retrospectively the association between NP values sampled shortly following unplanned admission and the duration of hospitalization in 2978 patients admitted to a cardiology department. Duration of hospitalization (hours) and survival were determined by interrogation of the electronic medical records system. Associations with peptide levels were estimated using regression models and receiver operating characteristic (ROC) analysis. The results demonstrate a significant positive relationship between NP levels and the duration of hospitalization, after adjusting for age (P < 0.001). The median duration of hospitalization for the lowest BNP and NT-proBNP quintiles were 80 and 97 h, respectively, vs. 224.5 and 236 h for the highest quintiles. Using cut-off levels of 115 pmol/L for BNP and 390 pmol/L for NT-proBNP, the peptides have a positive predictive value of 78% and 85% for a stay > 4 days. During follow-up, NP levels were strongly predictive of all-cause mortality. The results quantify the strong relationship between NP levels taken following an unplanned admission to a cardiology department and the duration of hospitalization. This information permits improved identification of a patient population likely to require a prolonged hospital stay and consume more healthcare resources."

According to the news reporters, the research concluded: "Such patients may require a more aggressive diagnostic, treatment, and management strategy."

For more information on this research see: Natriuretic peptide levels taken following unplanned admission to a cardiology department predict the duration of hospitalization. European Journal of Heart Failure, 2016;18(12):1499-1505. European Journal of Heart Failure can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Cardiovascular Research

Reports on Cardiovascular Research Findings from National Institutes of Health Provide New Insights [Pharmacological mechanisms underlying the cardiovascular effects of the "bath salt" constituent 3,4-methylenedioxypyrovalerone (MDPV)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Research. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "Background and Purpose3,4-Methylenedioxypyrovalerone (MDPV) is a synthetic cathinone with stimulatory cardiovascular effects that can lead to serious medical complications. Here, we examined the pharmacological mechanisms underlying these cardiovascular actions of MDPV in conscious rats."

The news reporters obtained a quote from the research from the National Institutes of Health, "Experimental ApproachMale Sprague-Dawley rats had telemetry transmitters surgically implanted for the measurement of BP and heart rate (HR). On test days, rats were placed individually in standard isolation cubicles. Following drug treatment, cardiovascular parameters were monitored for 3h sessions. Key ResultsRacemic MDPV (0.3-3.0mgkg(-1)) increased BP and HR in a dose-dependent manner. The S(+) enantiomer (0.3-3.0mgkg(-1)) of MDPV produced similar effects, while the R(-) enantiomer (0.3-3.0mgkg(-1)) had no effects. Neither of the hydroxylated phase I metabolites of MDPV altered cardiovascular parameters significantly from baseline. Pretreatment with the ganglionic blocker chlorisondamine (1 and 3mgkg(-1)) antagonized the increases in BP and HR produced by 1mgkg(-1) MDPV. The (1)-adrenoceptor antagonist prazosin (0.3mgkg(-1)) attenuated the increase in BP following MDPV, while the -adrenoceptor antagonists propranolol (1mgkg(-1)) and atenolol (1 and 3mgkg(-1)) attenuated the HR increases. Conclusions and ImplicationsThe S(+) enantiomer appeared to mediate the cardiovascular effects of MDPV, while the metabolites of MDPV did not alter BP or HR significantly; MDPV increased BP and HR through activation of central sympathetic outflow."

According to the news reporters, the research concluded: "Mixed-action /-adrenoceptor antagonists may be useful as treatments in counteracting the adverse cardiovascular effects of MDPV."

Our news correspondents report that additional information may be obtained by contacting C.W. Schindler, NIDA, Preclin Pharmacol Sect, National Institutes of Health, Intramural Res Program, Baltimore, MD 21224, United States. Additional authors for this research include E.B. Thorndike, M. Suzuki, K.C. Rice and M.H. Baumann.

Reports on Cardiovascular Research Findings from University of Florida Provide New Insights (Angiotensin type 1a receptors in the paraventricular nucleus of the hypothalamus control cardiovascular reactivity and anxiety-like behavior in male ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Research is the subject of a report. According to news reporting originating in Gainesville, Florida, by NewsRx journalists, research stated, "This study tested the hypothesis that deletion of angiotensin type 1a receptors (AT(1a)) from the paraventricular nucleus of hypothalamus (PVN) attenuates anxiety-like behavior, hypothalamic-pituitary-adrenal (HPA) axis activity, and cardiovascular reactivity. We used the Cre/LoxP system to generate male mice with AT(1a) specifically deleted from the PVN."

Financial support for this research came from HHS | NIH | National Heart, Lung, and Blood Institute (NHBLI).

The news reporters obtained a quote from the research from the University of Florida, "Deletion of the AT(1a) from the PVN reduced anxiety-like behavior as indicated by increased time spent in the open arms of the elevated plus maze. In contrast, PVN AT(1a) deletion had no effect on HPA axis activity subsequent to an acute restraint challenge but did reduce hypothalamic mRNA expression for corticotropin-releasing hormone (CRH). To determine whether PVN AT(1a) deletion inhibits cardiovascular reactivity, we measured systolic blood pressure, heart rate, and heart rate variability (HRV) using telemetry and found that PVN AT(1a) deletion attenuated restraint-induced elevations in systolic blood pressure and elicited changes in HRV indicative of reduced sympathetic nervous activity. Consistent with the decreased HRV, PVN AT(1a) deletion also decreased adrenal weight, suggestive of decreased adrenal sympathetic outflow. Interestingly, the altered stress responsivity of mice with AT(1a) deleted from the PVN was associated with decreased hypothalamic microglia and proinflammatory cytokine expression."

According to the news reporters, the research concluded: "Collectively, these results suggest that deletion of AT(1a) from the PVN attenuates anxiety, CRH gene transcription, and cardiovascular reactivity and reduced brain inflammation may contribute to these effects."

For more information on this research see: Angiotensin type 1a receptors in the paraventricular nucleus of the hypothalamus control cardiovascular reactivity and anxiety-like behavior in male mice. *Physiological Genomics*, 2016;48(9):667-676. *Physiological Genomics* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

**Reports on Cardiovascular Research Findings from University of Geneva Provide New Insights (Wanting and liking in dysphoria: Cardiovascular and facial EMG responses during incentive processing)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Research is now available. According to news reporting out of Geneva, Switzerland, by NewsRx editors, research stated, "Theories and research on depression point to reduced responsiveness during reward anticipation and in part also during punishment anticipation. They also suggest weaker affective responses to reward consumption and unchanged affective responses to punishment consumption." Financial support for this research came from Swiss National Science Foundation.

Our news journalists obtained a quote from the research from the University of Geneva, "However, studies investigating incentive anticipation using effort mobilization and incentive consumption using facial expressions are scarce. The present studies tested reward and punishment responsiveness in a subclinically depressed sample, manipulating a monetary reward (Study 1) and a monetary punishment (Study 2). Effort mobilization was operationalized as cardiovascular reactivity, while facial expressions were measured by facial electromyographic reactivity. Compared to nondysphorics, dysphorics showed reduced pre-ejection period (PEP) reactivity and blunted self-reported wanting during reward anticipation but reduced PEP reactivity and normal self-reported wanting during punishment anticipation."

According to the news editors, the research concluded: "Compared to nondysphorics, dysphorics showed reduced zygomaticus major muscle reactivity and blunted self reported liking during reward consumption but normal corrugator supercillii muscle reactivity and normal self-reported disliking during punishment consumption."

For more information on this research see: Wanting and liking in dysphoria: Cardiovascular and facial EMG responses during incentive processing. *Biological Psychology, 2016;121():19-29*. Reports on Cell Science Findings from Nanyang Technological University Provide New Insights (A ternary complex comprising transportin1, Rab8 and the ciliary targeting signal directs proteins to ciliary membranes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science - Cell Science have been published. According to news reporting out of Singapore, Singapore, by NewsRx editors, research stated, "The sensory functions of cilia are dependent on the enrichment of cilium-resident proteins. Although it is known that ciliary targeting signals (CTSs) specifically target ciliary proteins to cilia, it is still unclear how CTSs facilitate the entry and retention of cilium-resident proteins at the molecular level."

Funders for this research include National Medical Research Council, Ministry of Education - Singapore.

Our news journalists obtained a quote from the research from Nanyang Technological University, "We found that non-ciliary membrane reporters can passively diffuse into cilia through the lateral transport pathway, and the translocation of membrane reporters through the ciliary diffusion barrier is facilitated by importin binding motifs and domains. Screening known CTSs of ciliary membrane residents uncovered that fibrocystin, photoreceptor retinol dehydrogenase, rhodopsin and retinitis pigmentosa 2 interact with transportin1 (TNPO1) through previously identified CTSs. We further discovered that a new ternary complex, comprising TNPO1, Rab8 and a CTS, can assemble or disassemble under the guanine nucleotide exchange activity of Rab8."

According to the news editors, the research concluded: "Our study suggests a new mechanism in which the TNPO1-Rab8-CTS complex mediates selective entry into and retention of cargos within cilia."

Our news journalists report that additional information may be obtained by contacting L. Lu, Nanyang Technological University, Sch Biol Sci, Singapore 637551, Singapore.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1242/jcs.194019. This DOI is a link to an online electronic document that is either free or for purchase.

Reports on Cell Transplants from Mossakowski Medical Research Center Provide New Insights (Induction of Endothelial Phenotype From Wharton's Jelly-Derived MSCs and Comparison of Their Vasoprotective and Neuroprotective Potential With Primary ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Transplant Medicine - Cell Transplants are discussed in a new report. According to news originating from Warsaw, Poland, by NewsRx correspondents, research stated, "Ischemic stroke results in violent impairment of tissue homeostasis leading to severe perturbation within the neurovascular unit (NVU) during the recovery period. The aim of this study was to assess the potential of mesenchymal stem cells (MSCs) originating from Wharton's jelly (WJ) to differentiate into functionally competent cells of endothelial lineage (WJ-EPCs)."

Our news journalists obtained a quote from the research from Mossakowski Medical Research Center, "The protective effect(s) of either primary WJ-MSCs or induced WJ-EPCs was investigated and compared after oxygen-glucose deprivation (OGD) of hippocampal organotypic slices (OHC) in the indirect coculture model. WJ-MSCs, primed in EGM-2 (Lonza commercial medium) under 5% O2, acquired cobblestone endothelial-like morphology, formed capillary-like structures and actively took up DiI-Ac-LDL. Both cell types (WJ-MSCs and WJ-EPCs) were positive for CD73, CD90, CD105, VEGFR-2, and VEGF, but only endothelial-like culture expressed vWF and PECAM-1 markers at significant levels. In the presence of either WJ-MSCs or WJ-EPCs in the compartment below OGD-injured slices, cell death and vascular atrophy in the hypoxia-sensitive CA1 region were substantially decreased. This suggests that a paracrine mechanism may mediate WJ-MSC-and WJ-EPC-dependent protection. Thus, finally, we estimated secretion of the neuro/angio/immunomodulatory molecules IL-6, TGF-b1, and VEGF by these cell cultures. We have found that release of TGF-b1 and IL-6 was TLR ligand [LPS and Poly(I:C)] concentration dependent and stronger in WJ-EPC than WJ-MSC cultures."

According to the news editors, the research concluded: "Simultaneously, the uneven pattern of TLR receptors and modulatory cytokine gene expression was confirmed also on qRT-PCR level, but no significant differences were noticed between WJ-EPC and primary WJ-MSC cultures."

For more information on this research see: Induction of Endothelial Phenotype From Wharton's Jelly-Derived MSCs and Comparison of Their Vasoprotective and Neuroprotective Potential With Primary WJ-MSCs in CA1 Hippocampal Region Ex Vivo. Cell Transplantation, 2015;25(4):715-27.

The news correspondents report that additional information may be obtained from P. Obtulowicz, Mossakowski Medical Research Centre, Polish Academy of Sciences, Warsaw, Poland. Additional authors for this research include W. Lech, L. Strojek, A. Sarnowska and K. Domanska-Janik.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3727/096368915X690369. This DOI is a link to an online electronic document that is either free or for purchase.

Reports on Cholinergic Receptors from University of Shizuoka Provide New Insights (Urinary Excretion Contributes to Long-Lasting Blockade of Bladder Muscarinic Receptors by Imidafenacin: Effect of Bilateral Ureteral Ligation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Membrane Proteins - Cholinergic Receptors. According to news reporting originating in Shizuoka, Japan, by NewsRx journalists, research stated, "Imidafenacin is a potent and selective antagonist of M-1 and M-3 muscarinic receptors that is safe, efficacious, and well tolerated for controlling the symptoms of overactive bladder (OAB). However, the precise mechanisms responsible for the bladder-selective pharmacological effects of this agent remain unclear."

The news reporters obtained a quote from the research from the University of Shizuoka, "The in vivo pharmacologic effects of imidafenacin result from receptor occupancy. Therefore, the present study was performed to characterize in vivo muscarinic receptor binding by tritium-labeled imidafenacin with high specific activity ([H-3]imidafenacin) in the bladder and other tissues of mice, and to clarify the mechanisms underlying selective binding of imidafenacin to bladder muscarinic receptors. After intravenous injection of [H-3] imidafenacin, its binding to muscarinic receptors in the bladder and other tissues of mice was assessed by a radioligand binding assay. [H-3] Imidafenacin showed a significantly longer duration of binding to muscarinic receptors in the bladder than in other tissues, and muscarinic receptor binding of [H-3] imidafenacin was markedly suppressed in the bladder alone after bilateral ligation of the ureters. After intravenous injection, the [H-3] imidafenacin concentration was markedly higher in the urine than in the plasma, suggesting that urinary excretion may contribute significantly to the selective and long-lasting binding of imidafenacin to bladder muscarinic receptors. These findings suggest that the intra-vesicular concentration of an antimuscarinic agent and its active metabolites may have a substantial influence on its pharmacological effect and duration of action in patients with OAB."

According to the news reporters, the research concluded: "In addition, factors that modulate urine production may influence the efficacy and safety of antimuscarinic agents."

Our news correspondents report that additional information may be obtained by contacting S. Yamada, University of Shizuoka, Grad Sch Pharmaceut Sci, Center Pharma Food Res, Suruga Ku, Shizuoka 4228526, Japan. Additional authors for this research include S. Kuraoka, S. Endo, A. Takahashi, S. Onoue and S. Yamada.

**Clinical Research - Clinical Trials and Studies**

**Reports on Clinical Trials and Studies Findings from Genentech, Inc. Provide New Insights (Two Phase 1, Randomized, Double-Blind, Placebo-Controlled, Single-Ascending-Dose Studies To Investigate the Safety, Tolerability, and Pharmacokinetics of ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Research - Clinical Trials and Studies. According to news reporting from San Francisco, California, by NewsRx journalists, research stated, "Hospitalized patients with severe influenza are at significant risk for morbidity and mortality. MHAA4549A is a human monoclonal immunoglobulin (Ig) G1 antibody that binds to a highly conserved stalk region of the influenza A virus hemagglutinin protein and neutralizes all tested seasonal human influenza A virus strains."

Financial support for this research came from Genentech (Genentech, Inc.).

The news correspondents obtained a quote from the research from Genentech, Inc., "Two phase 1 trials examined the safety, tolerability, and pharmacokinetics of MHAA4549A in healthy volunteers. Both single ascending-dose trials were randomized, double blinded, and placebo controlled. Trial 1 randomized 21 healthy adults into four cohorts receiving a single intravenous dose of 1.5, 5, 15, or 45 mg/kg MHAA4549A or placebo. Trial 2 randomized 14 healthy adults into two cohorts receiving a single intravenous fixed dose of 8,400 mg or 10,800 mg of MHAA4549A or placebo. Subjects were followed for 120 days after dosing. No subject was discontinued in either trial, and no serious adverse events were reported. The most common adverse event in both studies was mild headache (trial 1, 4/16 subjects receiving MHAA4549A and 1/5 receiving placebo; trial 2, 4/8 subjects receiving MHAA4549A and 2/6 receiving placebo). MHAA4549A produced no relevant time-or dose-related changes in laboratory values or vital signs compared to those with placebo. No subjects developed an antitherapeutic antibody response following MHAA4549A administration. MHAA4549A showed linear serum pharmacokinetics, with a mean half-life of 22.5 to 23.7 days."

According to the news reporters, the research concluded: "MHAA4549A is safe and well tolerated in healthy volunteers up to a single intravenous dose of 10,800 mg and demonstrates linear serum pharmacokinetics consistent with those of a human IgG1 antibody lacking known endogenous targets in humans."

For more information on this research see: Two Phase 1, Randomized, Double-Blind, Placebo-Controlled, Single-Ascending-Dose Studies To Investigate the Safety, Tolerability, and Pharmacokinetics of an Anti-Influenza A Virus Monoclonal Antibody, MHAA4549A, in Healthy Volunteers. *Antimicrobial Agents and Chemotherapy*, 2016;60 (9):5437-5444. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Oncology - Colon Cancer

Reports on Colon Cancer Findings from Tokyo Medical and Dental University Provide New Insights (Overexpression of the S100A2 protein as a prognostic marker for patients with stage II and III colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "We aimed to identify a novel prognostic biomarker related to recurrence in stage II and III colorectal cancer (CRC) patients. Stage II and III CRC tissue mRNA expression was profiled using an Affymetrix Gene Chip, and copy number profiles of 125 patients were generated using an Affymetrix 250K Sty array."

The news correspondents obtained a quote from the research from Tokyo Medical and Dental University, "Genes showing both upregulated expression and copy number gains in cases involving recurrence were extracted as candidate biomarkers. The protein expression of the candidate gene was assessed using immunohistochemical staining of tissue from 161 patients. The relationship between protein expression and clinicopathological features was also examined. We identified 9 candidate genes related to recurrence of stage II and III CRC, whose mRNA expression was significantly higher in CRC than in normal tissue. Of these proteins, the S100A2 calcium-binding protein A2 (S100A2) has been observed in several human cancers. S100A2 protein overexpression in CRC cells was associated with significantly worse overall survival and relapse-free survival, indicating that S100A2 is an independent risk factor for stage II and III CRC recurrence."

According to the news reporters, the research concluded: "S100A2 overexpression in cancer cells could be a biomarker of poor prognosis in stage II and III CRC recurrence and a target for treatment of this disease."

For more information on this research see: Overexpression of the S100A2 protein as a prognostic marker for patients with stage II and III colorectal cancer. International Journal of Oncology, 2016;48(3):975-82.

Our news journalists report that additional information may be obtained by contacting T. Masuda, Dept. of Surgical Oncology, Tokyo Medical and Dental University Graduate School of Medicine, Tokyo 113-8510, Japan. Additional authors for this research include T. Ishikawa, K. Mogushi, S. Okazaki, M. Ishiguro, S. Iida, H. Mizushima, H. Tanaka, H. Uetake and K. Sugihara.

Oncology - Colon Cancer

Reports on Colon Cancer from Kyushu University Provide New Insights (High expression of the Notch ligand Jagged-1 is associated with poor prognosis after surgery for colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "The importance of Notch signaling in colorectal cancer (CRC) carcinogenesis and progression has previously been presented. Increased expression of Jagged-1 (JAG1), a Notch ligand, in CRC has been revealed, but the detailed prognostic significance of JAG1 in CRC has not been determined."

Our news journalists obtained a quote from the research from Kyushu University, "Protein expression of JAG1 was examined using immunohistochemistry in 158 CRC specimens. Expression of JAG1 and E-cadherin and their associations with clinicopathologic characteristics, overall survival (OS) and relapse-free survival (RFS) were evaluated. Invitro studies using compounds to regulate intracellular signaling and small interfering RNA to silence JAG1 were performed in a colon cancer cell line. JAG1 expression in cancerous tissues was weak, moderate or strong in 32%, 36% and 32% of specimens, respectively, and correlated with histologic type and T stage. In multivariate analysis, JAG1 expression, histologic type and lymphatic invasion independently correlated with OS and RFS. The combination of high JAG1 expression and low E-cadherin expression had an additive effect toward poorer OS and RFS compared with the low JAG1/high E-cadherin expression subtype. A significant correlation between JAG1 expression and KRAS status was detected in groups stratified as high E-cadherin expression. Invitro studies suggested that RAS-MEK-MAP kinase and the Wnt pathways positively regulated JAG1 expression. Gene silencing with siJAG1 indicated that JAG1 promotes the transition from epithelial to mesenchymal characteristics and cell growth."

According to the news editors, the research concluded: "High expression of JAG1 is regulated by various pathways and is associated with poor prognosis through promoting the epithelial to mesenchymal transition and cell proliferation or maintaining cell survival in CRC."

The news correspondents report that additional information may be obtained from E. Oki, Kyushu University, Grad Sch Med Sci, Dept. of Surg & Sci, Fukuoka, Japan. Additional
Connective Tissue Cells

Reports on Connective Tissue Cells Findings from Yale University Provide New Insights (Skin Adipocyte Stem Cell Self-Renewal Is Regulated by a PDGFA/AKT-Signaling Axis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Connective Tissue Cells. According to news originating from New Haven, Connecticut, by NewsRx correspondents, research stated, "Tissue growth and maintenance requires stem cell populations that self-renew, proliferate, and differentiate. Maintenance of white adipose tissue (WAT) requires the proliferation and differentiation of adipocyte stem cells (ASCs) to form postmitotic, lipid-filled mature adipocytes."

Our news journalists obtained a quote from the research from Yale University, "Here we use the dynamic adipogenic program that occurs during hair growth to uncover an unrecognized regulator of ASC self-renewal and proliferation, PDGFA, which activates AKT signaling to drive and maintain the adipogenic program in the skin. Pdgfa expression is reduced in aged ASCs and is required for ASC proliferation and maintenance in the dermis, but not in other WATs. Our molecular and genetic studies uncover PI3K/AKT2 as a direct PDGFA target that is activated in ASCs during WAT hyperplasia and is functionally required for dermal ASC proliferation."

According to the news editors, the research concluded: "Our data therefore reveal active mechanisms that regulate ASC self-renewal in the skin and show that distinct regulatory mechanisms operate in different WAT depots."

The news correspondents report that additional information may be obtained from V. Horsley, Yale University, Dept. of Dermatol, Yale Sch Med, New Haven, CT 06520, United States. Additional authors for this research include B.A. Shook, J. Andrae, B. Holtrup, K. Bollag, C. Betsholtz, M.S. Rodeheffer and V. Horsley.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.stem.2016.09.002. This DOI is a link to an online electronic
Our news editors obtained a quote from the research from the University of Ottawa, "In 2014, we conducted a 3-contact, bilingual (English-French) mailed survey to assess the coverage of, time dedicated to and barriers to inclusion of 17 different areas of reproductive health, including abortion. We also asked respondents to speculate on whether or not mifepristone would be incorporated into the curriculum if approved by Health Canada for early abortion. We analyzed our results with descriptive statistics and used inductive techniques to analyze the open-ended questions for content and themes. Sixteen of 23 (70%) program directors or their designees returned our survey. In general, abortion-related topics received less coverage than contraception, ectopic pregnancy management and miscarriage management. Fifty-six percent of respondents reported that their program did not offer information about first-trimester abortion procedures and/or post-abortion care in the didactic curriculum. Respondents expressed interest in incorporating mifepristone/misoprostol into NP education and training. Reproductive health issues receive uneven and often inadequate curricular coverage in Canadian NP programs. Identifying avenues to expand education and training on abortion appears warranted."

According to the news editors, the research concluded: "Embarking on curricular reform efforts is especially important given the upcoming introduction of mifepristone into the Canadian health system for early abortion."

For more information on this research see: Assessing abortion coverage in nurse practitioner programs in Canada: a national survey of program directors. Contraception, 2016;94(5):483-488. Contraception can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www Elsevier.com; Contraception - www journals elsevier com/contraception/)

The news editors report that additional information may be obtained by contacting A.M. Foster, University of Ottawa, Inst Populat Hlth, Ottawa, ON, Canada. Additional authors for this research include G. Arnot, J. El-Haddad and A.M. Foster.

Reports on Cytomegalovirus Findings from National Research Center Provide New Insights [Recombinant MHC tetramers for isolation of virus-specific CD8(+) cells from healthy donors: Potential approach for cell therapy of posttransplant ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Herpesvirus Diseases and Conditions - Cytomegalovirus have been presented. According to news reporting out of Moscow, Russia, by NewsRx editors, research stated, "Patients undergoing allogeneic hematopoietic stem cell transplantation have a high risk of cytomegalovirus reactivation, which in the absence of T-cell immunity can result in the development of an acute inflammatory reaction and damage of internal organs. Transfusion of the virus-specific donor T-lymphocytes represents an alternative to a highly toxic and often ineffective antiviral therapy."

Our news journalists obtained a quote from the research from National Research Center, "Potentially promising cell therapy approach comprises transfusion of cytotoxic T-lymphocytes, specific to the viral antigens, immediately after their isolation from the donor's blood circulation without any in vitro expansion. Specific T-cells could be separated from potentially alloreactive lymphocytes using recombinant major histocompatibility complex (MHC) multimers, carrying synthetic viral peptides. Rapid transfusion of virus-specific T-cells to patients has several crucial advantages in comparison with methods based on the in vitro expansion of the cells. About 30% of hematopoietic stem cell donors and 46% of transplant recipients at the National Research Center for Hematology were carriers of the HLA-A*02 allele. Moreover, 94% of Russian donors have an immune response against the cytomegalovirus (CMV). Using recombinant HLA-A*02 multimers carrying an immunodominant cytomegalovirus peptide (NLV), we have shown that the majority of healthy donors have pronounced T-cell immunity against this antigen, whereas shortly after the transplantation the patients do not have specific T-lymphocytes. The donor cells have the immune phenotype of memory cells and can be activated and proliferate after stimulation with the specific antigen. Donor lymphocytes can be substantially enriched to significant purity by magnetic separation with recombinant MHC multimers and are not activated upon cocultivation with the antigen-presenting cells from HLA-incompatible donors without addition of the specific antigen. This study demonstrated that strong immune response to CMV of healthy donors and prevalence of HLA-A*02 allele in the Russian population make it possible to isolate a significant number of virus-specific cells using HLA-A*02-NLV multimers."

According to the news editors, the research concluded: "After the transfusion, these cells should protect patients from CMV without development of allogeneic immune response."

For more information on this research see: Recombinant MHC tetramers for isolation of virus-specific CD8(+) cells from healthy donors: Potential approach for cell therapy..."

Our news journalists report that additional information may be obtained by contacting G.A. Efimov, Minist Healthcare Russian Federat, Natl Res Center Hematol, Moscow 125167, Russia. **Musculoskeletal Diseases and Conditions**

**Reports on Dermatomyositis Findings from University of Suleyman Demirel Provide New Insights (A case of Amyopathic Dermatomyositis associated with Interstitial Pulmonary Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Musculoskeletal Diseases and Conditions - Dermatomyositis is the subject of a report. According to news originating from Isparta, Turkey, by NewsRx correspondents, research stated, "Inflammatory myopathies are a heterogeneous group of diseases with unknown etiology characterized by inflammation of the skeletal muscles and proximal muscle weakness. Dermatomyositis (DM) is an idiopathic inflammatory myopathy with characteristic cutaneous findings such as heliotrope rash, Gottron's sign, Gottron's papules, shawl sign and machinist hand."

Our news journalists obtained a quote from the research from the University of Suleyman Demirel, "Amyopathic dermatomyositis (ADM) is a rare but well-recognized clinical subtype of DM, constituting approximately 10-20% of patients with this disease. It generally manifests only pathognomonic skin findings without clinical and laboratory evidence of muscle involvement."

According to the news editors, the research concluded: "In this report, we present a rare case of ADM associated with interstitial pulmonary disease."

For more information on this research see: A case of Amyopathic Dermatomyositis associated with Interstitial Pulmonary Disease. *La Clinica Terapeutica*, 2015;166(6):253-5.

The news correspondents report that additional information may be obtained from Y. Ugan, Departments of Internal Medicine, Division of Rheumatology Suleyman Demirel University Faculty of Medicine, Isparta, Turkey. Additional authors for this research include M. Sahin, A. Dogru, D. Bayram, A.M. Ceyhan and S.E Tunc.

Reports on Diabetes Findings from University of Porto Provide New Insights (The role of prenatal exposures on body fat patterns at 7 years: Intrauterine programming or birthweight effects?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Diabetes is now available. According to news reporting out of Oporto, Portugal, by NewsRx editors, research stated, "It remains unknown whether the effects of prenatal exposures on child's adiposity reflect entirely intrauterine programming. We aimed to assess the effects of maternal gestational weight gain, diabetes and smoking on the child's body fat patterns, disentangling the direct (through intrauterine programming) and indirect (through birthweight) effects."

Funders for this research include Foundation for Science and Technology, Caloust Gulbenkian Foundation, Epidemiology Research Unit.

Our news journalists obtained a quote from the research from the University of Porto, "We included 4747 singleton 7-year-old children from the Generation XXI birth cohort (Porto, Portugal). At birth, maternal and newborn's characteristics were obtained. Anthropometrics were measured at age 7 years and body fat patterns were identified by principal component analysis. Path analysis was used to quantify direct, indirect and total effects of gestational weight gain, diabetes and smoking on body fat patterns. Pattern 1 was characterized by strong factor loadings with body mass index, fat mass index and waist-to-height ratio (fat quantity) and pattern 2 with waist-to-hip ratio, waist-to-thigh ratio, and waist-to-weight ratio (fat distribution). The positive total effect of maternal gestational weight gain and diabetes on the child's fat quantity was mainly through a direct pathway, responsible for 91.7% and 83.7% of total effects, respectively (beta = 0.022; 95% Confidence Interval (CI): 0.017, 0.027; beta = 0.041; 95% CI: -0.011, 0.093). No effects on fat distribution were found. Maternal prenatal smoking had a positive direct effect on patterns 1 and 2, explaining 94.9% and 76.1% of total effects, respectively. The effects of maternal gestational weight gain, diabetes and smoking on a child's fat quantity seem to be mainly through intrauterine programming."

According to the news editors, the research concluded: "Maternal smoking also showed a positive direct effect on child's fat distribution."

For more information on this research see: The role of prenatal exposures on body fat patterns at 7 years: Intrauterine programming or birthweight effects? *Nutrition Metabolism and Cardiovascular Diseases*, 2016;26(11):1004-1010. *Nutrition Metabolism and Cardiovascular Diseases* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England.

**Dimethylamines**

**Reports on Dimethylamines Findings from University of Oxford Provide New Insights (Single fixed-dose oral dexketoprofen plus tramadol for acute postoperative pain in adults)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Dimethylamines. According to news reporting originating in Oxford, United Kingdom, by NewsRx journalists, research stated, "Combining two different analgesics in fixed doses in a single tablet can provide better pain relief than either drug alone in acute pain. This appears to be broadly true across a range of different drug combinations, in postoperative pain and migraine headache."

The news reporters obtained a quote from the research from the University of Oxford, "A new combination of dexketoprofen (a nonsteroidal anti-inflammatory drug) plus tramadol (an opioid) has been tested in acute postoperative pain conditions. It is not yet licensed for use. This review is one of a series on oral analgesics for acute postoperative pain. Individual reviews have been brought together in two overviews to provide information about the relative efficacy and harm of the different interventions. To assess the analgesic efficacy and adverse effects of a single fixed-dose of oral dexketoprofen plus tramadol, compared with placebo, for moderate to severe postoperative pain in adults, using methods that permit comparison with other analgesics evaluated in standardised trials using almost identical methods and outcomes. A secondary objective was to compare the combination with the individual analgesics alone.

Search methods We searched the Cochrane Central Register of Controlled Trials (CENTRAL) via CRSO, MEDLINE via Ovid, and Embase via Ovid from inception to 31 May 2016. We also searched the reference lists of retrieved studies and reviews, and two online clinical trial registries. Selection criteria Randomised, double-blind trials of oral dexketoprofen plus tramadol administered as a single oral dose, for the relief of acute postoperative pain in adults, and compared to placebo. Data collection and analysis Two review authors independently considered trials for inclusion in the review, examined issues of study quality and potential bias, and extracted data. For dichotomous outcomes, we calculated risk ratio (RR) and number needed to treat for an additional beneficial outcome (NNT) for dexketoprofen plus tramadol, compared with placebo with 95% confidence intervals (CI). We collected information on the number of participants with at least 50% of the maximum possible pain relief over six hours, the median time to use of rescue medication, and the proportion of participants requiring rescue medication. We also collected information on adverse events and withdrawals. We assessed the quality of the evidence using GRADE and created a 'Summary of findings' table. We also collected information on the number of participants with at least 50% of the maximum possible pain relief over six hours for dexketoprofen alone and tramadol alone. We included three studies with 1853 participants who had undergone surgical removal of impacted wisdom teeth, hip replacement, or hysterectomy. The overall risk of bias across the three included studies was low,
with unclear risk of bias in relation to the size of the three studies. Two studies did not report all our prespecified outcomes, which limited the analyses we could do. The proportion of participants achieving at least 50% pain relief over six hours with dexketoprofen 25 mg plus tramadol 75 mg was 66%, compared to 32% with placebo, giving an NNT of 3.0 (95% CI 2.5 to 3.7) (RR 2.1 (95% CI 1.7 to 2.4); 748 participants; 3 studies) (moderate quality evidence). The response rate with dexketoprofen 25 mg alone was 53% (RR 1.3 (95% CI 1.1 to 1.4); 744 participants; 3 studies) and with tramadol alone was 45% (RR 1.5 (95% CI 1.3 to 1.7); 741 participants; 3 studies) (moderate quality evidence). We downgraded the evidence because of some inconsistency in the results. The median time to use of rescue medication could not be estimated exactly, but was probably eight hours or more, indicating a long duration of effect (moderate quality evidence). We downgraded the evidence because it was not possible to estimate the effect exactly in the two multiple dose studies, resulting in imprecision. Fewer participants used rescue medication with higher doses of active treatment (summary statistic not calculated; 123 participants; 1 study) (very low quality evidence). We downgraded the evidence because the data came from a single study with few participants and events. Adverse events and serious adverse events were not reported consistently for the single dose phase of the studies. In the single dose study, 11% of participants experienced adverse events with dexketoprofen 25 mg plus tramadol 75 mg, which were mostly mild or moderate nausea, vomiting, or dizziness, and typical with these medicines. Rates were lower with placebo and lower doses (very low quality evidence). We downgraded the evidence because the data came from a single study with few participants and events. Information on multiple dosing over three and five days supported a low event rate with the combination. Overall, rates were generally low in all treatment arms, as they were for withdrawals for adverse events or other reasons. Authors' conclusions A single oral dose of dexketoprofen 25 mg plus tramadol 75 mg provided good levels of pain relief with long duration of action to more people than placebo or the same dose of dexketoprofen or tramadol alone. The magnitude of the effect was similar to other good analgesics. Adverse event rates were low."

According to the news reporters, the research concluded: "There is modest uncertainty about the precision of the point estimate for efficacy, but the NNT of 3 is consistent with other analgesics considered effective and commonly used."

For more information on this research see: Single fixed-dose oral dexketoprofen plus tramadol for acute postoperative pain in adults. *Cochrane Database of Systematic Reviews*, 2016;(9):2606-2644. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Reports on Drug Delivery Systems Findings from Tezpur University Provide New Insights (Effect of crosslinker on drug delivery properties of curcumin loaded starch coated iron oxide nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news reporting originating in Tezpur, India, by NewsRx journalists, research stated, "Aminated starch coated iron oxide magnetic nanoparticles loaded with curcumin were synthesized via coprecipitation technique. The nanoparticles were crosslinked by using three different crosslinkers: glutaraldehyde, genipin and citric acid and the effect of crosslinking on different properties of the nanoparticles was evaluated."

The news reporters obtained a quote from the research from Tezpur University, "Characterisation of the nanoparticles was done with FTIR (Fourier Transform Infrared spectroscopy) and XRD (X-Ray Diffraction). Magnetic property study using VSM (Vibrating Sample Magnetometer) showed their superparamagnetic nature. Morphology of the nanoparticles was studied by SEM (Scanning Electron Microscopy) and TEM (Transmission Electron Microscopy). Zeta potential values showed that crosslinking imparted stability to the system. Crosslinking also enhanced drug loading and encapsulation efficiency of the system. Swelling and in vitro studies of the nanoparticles showed that the release of drug was dependent on time, crosslinker nature, crosslinker concentration and pH of the medium. The aminated starch coated nanoparticles also showed good mucoadhesive character. The cell viability assessment by MTT study revealed their compatibility with human lymphocytes cells and their considerable cell growth inhibiting properties with MCF7 and HepG2 cells."

According to the news reporters, the research concluded: "The nanoparticles showed good internalization in HepG2 cells along with considerable ROS formation."

Our news correspondents report that additional information may be obtained by contacting T.K. Maji, Tezpur University, Dept. of Chem Sci, Tezpur 784028, Assam, India. Additional authors for this research include M.K. Das, A. Ramteke and T.K. Maji.

Reports on Drug Research Findings from Y.Y. Syed and Co-Researchers Provide New Insights (Eteplirsen: First Global Approval)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Research have been published. According to news originating from Auckland, New Zealand, by NewsRx editors, the research stated, "Eteplirsen (Exondys 51) is an antisense oligonucleotide designed to induce exon 51 skipping that is developed by Sarepta Therapeutics. Intravenous eteplirsen has received accelerated approval from the US FDA for the treatment of Duchenne muscular dystrophy (DMD) in patients with a confirmed mutation of the DMD gene amenable to exon 51 skipping."

Our news journalists obtained a quote from the research, "Eteplirsen has orphan drug designation in the USA and EU, and rare paediatric disease designation in the USA for use in DMD. In the phase III PROMOVI trial, eteplirsen significantly increased dystrophin levels from baseline in muscle tissues of 12 evaluable patients with DMD after 48 weeks of treatment. This finding is supported by data from phase II trials. Long-term treatment with eteplirsen was associated with a decrease in the rate of decline in ambulation and pulmonary function in an open-label extension of a phase II trial. Eteplirsen was generally well tolerated in clinical trials."

According to the news editors, the research concluded: "This article summarizes the milestones in the development of eteplirsen leading to this first approval for DMD."

The news correspondents report that additional information may be obtained from Y.Y. Syed, Springer, Auckland 0754, New Zealand.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s40265-016-0657-1. This DOI is a link to an online electronic document that is either free or for purchase.

Emphysema

Reports on Emphysema from Central Hospital Provide New Insights (The impact of emphysema on dosimetric parameters for stereotactic body radiotherapy of the lung)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Emphysema have been presented. According to news reporting out of Mie, Japan, by NewsRx editors, research stated, "The purpose of this study was to evaluate the impact of emphysematous changes in lung on dosimetric parameters in stereotactic body radiation therapy (SBRT) for lung tumor. A total of 72 treatment plans were reviewed, and dosimetric factors [including homogeneity index (HI) and conformity index (CI)]
were evaluated."

Financial support for this research came from Matsusaka Central Hospital.

Our news journalists obtained a quote from the research from Central Hospital, "Emphysematous changes in lung were observed in 43 patients (60%). Patients were divided into three groups according to the severity of emphysema: no emphysema (n = 29), mild emphysema (n = 22) and moderate to severe emphysema groups (n = 21). The HI (P < 0.001) and the CI (P = 0.029) were significantly different in accordance with the severity of emphysema in one-way analysis of variance (ANOVA). The HI value was significantly higher in the moderate to severe emphysema group compared with in the no emphysema (Tukey, P < 0.001) and mild emphysema groups (P = 0.002). The CI value was significantly higher in the moderate to severe emphysema group compared with in the no emphysema group (P = 0.044). In multiple linear regression analysis, the severity of emphysema (P < 0.001) and the mean material density of the lung within the PTV (P < 0.001) were significant factors for HI, and the mean density of the lung within the PTV (P = 0.005) was the only significant factor for CI. The mean density of the lung within the PTV was significantly different in accordance with the severity of emphysema (one-way ANOVA, P = 0.008) and the severity of emphysema (P < 0.001) was one of the significant factors for the density of the lung within the PTV in multiple linear regression analysis."

According to the news editors, the research concluded: "Our results suggest that emphysematous changes in the lung significantly impact on several dosimetric parameters in SBRT, and they should be carefully evaluated before treatment planning."

Our news journalists report that additional information may be obtained by contacting S. Ochiai, Matsusaka Cent Hosp, Dept. of Radiat Oncol, Matsusaka, Mie 5158566, Japan. Additional authors for this research include Y. Nomoto, Y. Yamashita, T. Inoue, S. Murashima, D. Hasegawa, Y. Kurita, Y. Watanabe, Y. Toyomasu, T. Kawamura, A. Takada, N. Li, S. Kobayashi and H. Sakuma.

**Epidemiology**

**Reports on Epidemiology from Erasmus MC University Medical Center Provide New Insights (Epidemiological trends among the population with chronic HCV infection in the Netherlands)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Epidemiology have been published. According to
news originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "As the field of antiviral therapy for chronic HCV infection is rapidly evolving, this study aimed to assess the epidemiological changes in patient and disease characteristics among individuals with chronic HCV infection. This study included all consecutive patients with chronic HCV monoinfection who were referred between 1990 and 2013 to the Erasmus MC University Medical Center Rotterdam, a large tertiary centre in the Netherlands."

Our news journalists obtained a quote from the research from Erasmus MC University Medical Center, "To identify trends over time, the study population was divided into six equal eras based on date of first visit to the outpatient clinic. A total of 1,779 patients were diagnosed with chronic HCV infection. Mean age increased over time from 43.6 (SD 13.8) years to 51.7 (SD 11.2) years (P <0.001). The number of patients who were referred with cirrhosis increased over time, from 31 (25%) patients in Era 1 to 118 (42%) patients in Era 6 (P <0.001), respectively. More patients were referred with HCV genotype 1a and 3 in the last era, with 27 (48.2%) and 15 (14.0%) patients in Era 1 and 58 (54.2%) and 60 (21.8%) patients in Era 6 (P <0.001 both), respectively. The vast majority of patients (69.5%) were born between 1950 to 1975, with 62.5% of the patients being born between 1945 and 1965. The HCV-infected population is ageing and is more often referred with severe liver disease."

According to the news editors, the research concluded: "This study stresses the importance of urgently implementing national HCV screening programmes in order to be able to decrease the future burden of chronic HCV infection in the Netherlands."

The news correspondents report that additional information may be obtained from R. Maan, Erasmus MC Univ Med Center Rotterdam, Dept. of Gastroenterol & Hepatol, Rotterdam, Netherlands. Additional authors for this research include E. Toes-Zoutendijk, B.J. Veldt, B.E. Hansen, A.J. van der Meer and R.J. de Knegt.

Keywords for this news article include: Rotterdam, Netherlands, Europe, Epidemiology, Erasmus MC University Medical Center.

Central Nervous System Diseases and Conditions -

Reports on Epilepsy Findings from College of Pharmaceutical Sciences Provide New Insights (Effects of UGT1A6 and GABRA1 on Standardized Valproic Acid Plasma Concentrations and Treatment Effect in Children With Epilepsy in China)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Epilepsy have been published. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Valproic acid (VPA) is a widely used antiepileptic drug with acceptable safety and efficacy in treating pediatric patients with various kinds of seizures. However, interindividual variations in plasma concentrations and treatment effects of patients with epilepsy treated with VPA are observed."
Our news journalists obtained a quote from the research from the College of Pharmaceutical Sciences, "This study aimed to evaluate the effects of various genetic variations on normalized plasma concentration of VPA (NCVPA) and the treatment response in Chinese children with epilepsy administered with VPA. Pediatric patients (3 months to 18 years old) with epilepsy, taking VPA therapy, were enrolled in the study. Important genetic variations of the pharmacokinetic and pharmacodynamic pathways of VPA were evaluated using the MassARRAY system (Sequenom). The associations of genetic variations with NCVPA/drug response and the mean value of NCVPA in responsive and resistant patients were evaluated using SPSS (17.0) and Plink (1.07) software. A total of 111 children with epilepsy (80 responsive and 31 resistant) were enrolled. rs28898617 (UGT1A6, A> G) was associated with an increase in NCVPA (beta = 5.31, 95% confidence interval = 0.78-9.83, P = 0.024); therefore, patients with this variation need a lower dose of VPA. rs2279020 (GABRA1, G> A) was associated with a decreased risk of developing VPA-resistant epilepsy (odds ratio = 0.42, 95% confidence interval = 0.21-0.84, P = 0.014). Similar NCVPA was observed in resistant and responsive patients (P = 0.257). rs28898617 (UGT1A6, A> G) variation was associated with an increase in NCVPA. rs2279020 (GABRA1, G> A) variation was associated with a decreased risk of developing VPA-resistant epilepsy. Resistant and responsive patients to VPA treatment had a similar mean value of NCVPA."

According to the news editors, the research concluded: "The findings may help clinicians to adjust the dose and predict treatment effect for children with epilepsy receiving VPA treatment."

For more information on this research see: Effects of UGT1A6 and GABRA1 on Standardized Valproic Acid Plasma Concentrations and Treatment Effect in Children With Epilepsy in China. *Therapeutic Drug Monitoring*, 2016;38(6):738-743. *Therapeutic Drug Monitoring* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Therapeutic Drug Monitoring - journals.lww.com/drug-monitoring/pages/default.aspx)

**Central Nervous System Diseases and Conditions**

**Reports on Epilepsy Findings from Wenzhou Medical University Provide New Insights (Risk of seizure relapse after antiepileptic drug withdrawal in adult patients with focal epilepsy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System Diseases and Conditions - Epilepsy
are presented in a new report. According to news reporting originating from Zhejiang, People's Republic of China, by NewsRx correspondents, research stated, "The objective of this study was to estimate the risk of a seizure relapse and the high-risk period of recurrence after antiepileptic drug (AED) withdrawal and to determine the predictive factors for a seizure relapse in adult patients with focal epilepsy who were seizure-free for more than 2 years. Using the Wenzhou Epilepsy Follow-Up Registry Database, 200 adult patients with focal epilepsy were recruited, who were undergoing follow-up, met the inclusion criteria of this study, were seizure-free for more than 2 years, began withdrawing between June 2003 and June 2014, and were followed up prospectively for at least 1 year or until a seizure relapse."

Funders for this research include Wenzhou Medical Association, Zhejiang Provincial Key Discipline-Neurobiology.

Our news editors obtained a quote from the research from Wenzhou Medical University, "The risk of recurrence and the time to seizure relapse were analyzed by the Kaplan-Meier method, and the predictive factors were identified by the Cox proportional hazard regression model. A total of 99 patients had an unprovoked relapse during the follow-up period. The relapse rate was 49.5%, and each year, the recurrence probability of 12, 24, 36, 48, 60, 72, and 84 months after AED withdrawal was 24.0%, 20.4%, 83%, 2.7%, 4.6%, 0.97%, and 0.98%, respectively. The two independent risk factors for recurrence after withdrawal in adult patients with focal epilepsy were a longer duration of active epilepsy and a shorter seizure-free period before withdrawal. The high-risk period of a seizure relapse in adult patients with focal epilepsy is the first 2 years after withdrawal, and beyond 5 years after withdrawal, seizures rarely relapse (relapse rate < 1%)."

According to the news editors, the research concluded: "A seizure-free period for less than 4 years before withdrawal is a predictive factor of risk for seizure recurrence after AED withdrawal in adult patients with focal epilepsy."

For more information on this research see: Risk of seizure relapse after antiepileptic drug withdrawal in adult patients with focal epilepsy. Epilepsy & Behavior, 2016;64():233-238. Epilepsy & Behavior can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Epilepsy & Behavior - www.journals.elsevier.com/epilepsy-and-behavior/)

The news editors report that additional information may be obtained by contacting R.Y. Zheng, Wenzhou Med Univ, Dept. of Neurol, Affiliated Hosp 1, Wenzhou City 325015, Zhejiang, People's Republic of China. Additional authors for this research include Q.Y. Zeng, P. Zhu, Y.X. Bao, R.Y. Zheng and H.Q. Xu.

Oncology - Epithelial Ovarian Cancer

Reports on Epithelial Ovarian Cancer Findings from University Medical Center Provide New Insights (E-Cadherin fragments as potential mediators for peritoneal metastasis in advanced epithelial ovarian cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Epithelial Ovarian Cancer have been published. According to news reporting originating in Hamburg, Germany, by NewsRx journalists, research stated, "Peritoneal dissemination and retroperitoneal lymph node involvement are main routes for tumor spread of epithelial ovarian cancer (EOC), possibly determined by the intercellular connecting protein E-Cadherin (E-Cad) and its fragments. Tumour tissue of 105 advanced EOC patients was evaluated for protein expression of E-Cad, b-Catenin and Calpain by western blotting and immunohistochemistry."

The news reporters obtained a quote from the research from University Medical Center, "Expression patterns were compared between tumours with solely intraperitoneal (pT3c, pN0; n=41) and tumours with retroperitoneal metastases (pT1a-3c, pN1; n=64). Lysates of the EOC cell line SKOV3 and tumor tissue from the intraperitoneal group were tested for E-Cad expression following Calpain treatment. E-Cad full-length (E-Cad-FL, 120 kDa) and two major fragments at 85 kDa (E-Cad-85) and 23 kDa (E-Cad-23) were detected by western blotting. E-Cad-85 expression was significantly higher in tumours with solely intraperitoneal metastases and correlated strongly with E-Cad-23 and the protease Calpain. Calpain-mediated cleavage was identified as a potential mechanism to generate E-Cad-85 from E-Cad-FL by treating lysates from SKOV3 cells and tumor tissue with this enzyme. Increased cytoplasmic localisation of b-Catenin in tumours with high E-Cad-85 expression corroborates that E-Cad-85 loses the binding site for b-Catenin after fragmentation, enabling tumor cluster formation and peritoneal dissemination. Calpain-mediated E-Cad fragmentation appears to promote intraperitoneal EOC progression."

According to the news reporters, the research concluded: "Understanding these mechanisms might eventually lead to new tailored subtype-specific diagnostic and therapeutic interventions."

For more information on this research see: E-Cadherin fragments as potential mediators for peritoneal metastasis in advanced epithelial ovarian cancer. British Journal of Cancer, 2016;114(2):213-20. (Nature Publishing Group - www.nature.com/; British Journal of Cancer - www.nature.com/bjc/)

Our news correspondents report that additional information may be obtained by contacting F. Trillsch, Dept. of Gynaecology and Gynaecologic Oncology, University Medical Centre Hamburg-Eppendorf, Martinistr 52, Hamburg 20246, Germany. Additional authors for this research include S. Kuerti, C. Eulenburg, E. Burandt, L. Woelber, K. Prieske, K. Eylmann, L. Oliveira-Ferrer, K. Milde-Langosch and S. Mahner.

Reports on Exopeptidases from National Human Genome Research Institute Provide New Insights [A single endoplasmic reticulum aminopeptidase-1 protein allotype is a strong risk factor for Behcet's disease in HLA-B(\textstar)51 carriers]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - Exopeptidases. According to news originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "Endoplasmic reticulum aminopeptidase-1 (ERAP1) protein is highly polymorphic with numerous missense amino acid variants. We sought to determine the naturally occurring ERAP1 protein allotypes and their contribution to Behcet's disease."

Our news journalists obtained a quote from the research from National Human Genome Research Institute, "Genotypes of all reported missense ERAP1 gene variants with 1000 Genomes Project EUR superpopulation frequency $\geq$ 1% were determined in 1900 Behcet's disease cases and 1779 controls from Turkey. ERAP1 protein allotypes and their contributions to Behcet's disease risk were determined by haplotype identification and disease association analyses. One ERAP1 protein allotype with five nonancestral amino acids was recessively associated with disease ($p=3.13 \times 10^{-6}$, OR 2.55, 95% CI 1.70 to 3.82). The ERAP1 association was absent in individuals who lacked HLA-B(\textstar)51. Individuals who carry HLA-B(\textstar)51 and who are also homozygous for the haplotype had an increased disease odds compared with those with neither risk factor ($p=4.80 \times 10^{-20}$, OR 10.96, 95% CI 5.91 to 20.32). The Behcet's disease-associated ERAP1 protein allotype was previously shown to have poor peptide trimming activity."

According to the news editors, the research concluded: "Combined with its requirement for HLA-B(\textstar)51, these data suggest that a hypoactive ERAP1 allotype contributes to Behcet's disease risk by altering the peptides available for binding to HLA-B(\textstar)51."

The news correspondents report that additional information may be obtained from E.F. Remmers, NHGRI, Inflammatory Dis Sect, Bethesda, MD 20892, United States. Additional authors for this research include M.J. Ombrello, Y. Kirino, B. Erer, I. Tugal-Tutkun, E. Seyahi, Y. Ozyazgan, N.R. Watts, A. Gul, D.L. Kastner and E.F. Remmers.

Keywords for this news article include: Bethesda, Maryland, United States, North and Central America, Hydrolases, Risk and Prevention, Enzymes and Coenzymes, Aminopeptidases, Exopeptidases, National Human Genome Research Institute.

Facial Diseases and Conditions - Facial Nerve Injuries

Reports on Facial Nerve Injuries from Kagawa Prefectural Central Hospital Provide New Insights (Does a Retromandibular Transparotid Approach for the Open Treatment of Condylar Fractures Result in Facial Nerve Injury?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Facial Diseases and Conditions - Facial Nerve Injuries. According to news reporting from Takamatsu, Japan, by NewsRx journalists, research stated, "The retromandibular transparotid approach (RMA) to condylar fractures of the mandible provides excellent access, but can increase the risk of complications. The aim of this study was to estimate the frequency of facial nerve paralysis (FNP) and associated postoperative complications after open reduction and rigid internal fixation (ORIF) of subcondylar fractures through the RMA."

The news correspondents obtained a quote from the research from Kagawa Prefectural Central Hospital, "This was a retrospective cohort study of patients with condylar fractures requiring ORIF through the RMA. The inclusion criteria were 1) a medical record of surgical treatment of a subcondylar fracture by RMA; 2) preoperative and postoperative radiographs; 3) mental status permitting an adequate neuromotor examination; 4) absence of a post-injury or pretreatment functional facial nerve deficit; and 5) regular postoperative follow-up longer than 6 months with documentation of complications, functional results, and fixation stability. The predictive variables were age, gender, fracture site, fracture pattern, concomitant fractures, etiology, and plate types. The outcome variable was FNP. Univariate, bivariate, and multiple logistic regression statistics were computed. Fifty patients with 55 displaced mandibular subcondylar fractures (35 men, 15 women; mean age, 44.5 yr; range, 17 to 87 yr) met the inclusion criteria. The condylar fracture involved the neck in 35 patients (63.6%) and the base in 20 patients (36.4%). The fracture pattern was deviation in 11 patients (20.0%), displacement in 23 (41.8%), and dislocation in 21 (38.2%). Precise ORIF with double-buttress fixation resulted in immediate functional recovery in all patients. Seven fractures (12.7%) were associated with FNP that resolved completely within 6 months. Further statistical analysis showed that dislocated and displaced condylar neck fractures were significant risk factors for postoperative FNP (P <.05). Other postoperative complications were minimal. The RMA for subcondylar fractures is feasible and safe."

According to the news reporters, the research concluded: "Dislocated condylar neck fractures are associated with a highly increased risk of temporary postoperative FNP as a surgical complication."

Reports on Gastrointestinal Bleeding from University Hospital Provide New Insights (Spontaneous retroperitoneal hematoma in a patient under anticoagulant agents presenting as upper gastrointestinal bleeding)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Digestive System Diseases and Conditions - Gastrointestinal Bleeding are presented in a new report. According to news reporting out of Murcia, Spain, by NewsRx editors, research stated, "We present the case of a 44-year-old woman with past history of repeated miscarriage and Budd-Chiari syndrome secondary to primary myelofibrosis. Because of this she was under treatment with oral anticoagulant agents."

Our news journalists obtained a quote from the research from University Hospital, "The patient was admitted in hospital as she presented with gastrointestinal bleeding (melena), asthenia and progressive anemia. In an initial upper endoscopy an extrinsic duodenal compression associated with an ulcer on the posterior face of the first portion of duodenum and upper duodenal knee was observed. In the following days a huge spontaneous retroperitoneal hematoma due to anticoagulation was diagnosed by computed tomography. This was treated with a percutaneous drainage and withdrawal of the antithrombotic drugs."

According to the news editors, the research concluded: "The evolution of the patient was initially satisfactory but she suffered subclavian and jugular vein thrombosis, and reintroduction of anticoagulant agents at the lowest therapeutic doses was required."

For more information on this research see: Spontaneous retroperitoneal hematoma in a patient under anticoagulant agents presenting as upper gastrointestinal bleeding. Revista Espanola De Enfermedades Digestivas, 2016;108(12):817-818. Revista Espanola De Enfermedades Digestivas can be contacted at: Aran Ediciones, S A, Castello, 128, 1O, 28006 Madrid, Spain.

Reports on Genetics from Northwestern University Feinberg School of Medicine Provide New Insights (Role of miR-182 in response to oxidative stress in the cell fate of human fallopian tube epithelial cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Genetics are presented in a new report. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "High grade serous ovarian carcinoma (HGSC) is a DNA instable tumor and its precursor is commonly found originating from the fimbriated end of the fallopian tube secretory epithelial (FTSE) cells. The local stresses via ovulation and related inflammation are risks for HGSC."

Our news journalists obtained a quote from the research from the Northwestern University Feinberg School of Medicine, "In this study, we examined the cellular and molecular responses of FTSE cells to stress. We found that excess intracellular reactive oxygen species (ROS) in normal FTSE cells upregulated a subset of microRNA expression (defined as ROSmiRs). Most ROSmiRs' expression and function were influenced and regulated by p53, and together they drove the cells into stress-induced premature senescence (SIPS). However, ROS-induced miR-182 is regulated by b-catenin, not by p53. In normal FTSE cells, miR-182 overexpression triggers cellular senescence by p53-mediated upregulation of p21. Conversely, in cells with p53 mutations, miR-182 overexpression no longer enhances p21 but functions as an 'Onco-miR'. p53 dysfunction is a prerequisite for miR-182-mediated tumorigenesis. In addition, we found that human follicular fluid could significantly induce intracellular ROS in normal FTSE cells."

According to the news editors, the research concluded: "These findings suggest that ROS and p53 mutations may trigger a series of events, beginning with overexpressing miR-182 by ROS and b-catenin, impairing the DNA damage response, promoting DNA instability, bypassing senescence and eventually leading to DNA instable tumors in FTSE cells."

For more information on this research see: Role of miR-182 in response to oxidative stress in the cell fate of human fallopian tube epithelial cells. Oncotarget, 2015;6(36):38983-98.

Reports on Genomics Findings from Fred Hutchinson Cancer Research Center Provide New Insights (Translational plasticity facilitates the accumulation of nonsense genetic variants in the human population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biotechnology - Genomics is the subject of a report. According to news reporting out of Seattle, Washington, by NewsRx editors, research stated, "Genetic variants that disrupt protein-coding DNA are ubiquitous in the human population, with about 100 such loss-of-function variants per individual. While most loss-of-function variants are rare, a subset have risen to high frequency and occur in a homozygous state in healthy individuals."

Funders for this research include Ellison Medical Foundation, FSH Society.

Our news journalists obtained a quote from the research from Fred Hutchinson Cancer Research Center, "It is unknown why these common variants are well tolerated, even though some affect essential genes implicated in Mendelian disease. Here, we combine genomic, proteomic, and biochemical data to demonstrate that many common nonsense variants do not ablate protein production from their host genes. We provide computational and experimental evidence for diverse mechanisms of gene rescue, including alternative splicing, stop codon readthrough, alternative translation initiation, and C-terminal truncation."

According to the news editors, the research concluded: "Our results suggest a molecular explanation for the mild fitness costs of many common nonsense variants and indicate that translational plasticity plays a prominent role in shaping human genetic diversity."

For more information on this research see: Translational plasticity facilitates the accumulation of nonsense genetic variants in the human population. *Genome Research*, 2016;26(12):1639-1650. *Genome Research* can be contacted at: Cold Spring Harbor Lab Press, Publications Dept, 1 Bungtown Rd, Cold Spring Harbor, NY 11724, USA.

Reports on Geriatrics and Gerontology Findings from University of California Provide New Insights (Detained and Distressed: Persistent Distressing Symptoms in a Population of Older Jail Inmates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Aging Research - Geriatrics and Gerontology are presented in a new report. According to news reporting out of San Francisco, California, by NewsRx editors, research stated, "Distressing symptoms are associated with poor function, acute care use, and mortality in older adults. The number of older jail inmates is increasing rapidly, prompting calls to develop systems of care to meet their healthcare needs, yet little is known about multidimensional symptom burden in this population."

Funders for this research include Medical Student Training in Aging Research Program, National Palliative Care Research Center, Department of Medicine, University of California, San Francisco, National Institute on Aging, University of California, University of California, San Francisco.

Our news journalists obtained a quote from the research from the University of California, "This cross-sectional study describes the prevalence and factors associated with distressing symptoms and the overlap between different forms of symptom distress in 125 older jail inmates in an urban county jail. Physical distress was assessed using the Memorial Symptom Assessment Scale. Several other forms of symptom distress were also examined, including psychological (Generalized Anxiety Disorder Scale, Patient Health Questionnaire), existential (Patient Dignity Inventory), and social (Three Item Loneliness Scale). Information was collected on participant sociodemographic characteristics, multimorbidity, serious mental illness (SMI), functional impairment, and behavioral health risk factors through self-report and chart review. Chi-square tests were used to identify factors associated with physical distress. Overlap between forms of distress was evaluated using set theory analysis. Overall, many participants (74%) reported distressing symptoms, including having one or more physical (44%), psychological (37%), existential (54%), or social (45%) symptoms. Physical distress was associated with poor health (multimorbidity, functional impairment, SMI) and low income. Of the 93 participants with any symptom, 49% reported three or more forms of distress."

According to the news editors, the research concluded: "These findings suggest that an optimal model of care for this population would include a geriatrics-palliative care approach that integrates the management of all forms of symptom distress into a comprehensive treatment paradigm stretching from jail to the community."

Our news journalists report that additional information may be obtained by contacting B. Williams, University of California, Div Geriatr, Dept. of Med, San Francisco, CA, United States. Additional authors for this research include C. Ahalt, C. Ritchie, I. Stijacic-Cenzer and B. Williams.

Reports on Gliomas Findings from People’s Hospital Provide New Insights (B-cell CLL/lymphoma 3 promotes glioma cell proliferation and inhibits apoptosis through the oncogenic STAT3 pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gliomas is the subject of a report. According to news originating from Guangdong, People’s Republic of China, by NewsRx correspondents, research stated, "Aberrant expression of oncogenes and/or tumor suppressors play fundamental roles in the pathogenesis of glioma. B-cell CLL/lymphoma 3 (BCL3) was previously found to be a putative proto-oncogene in human cancers and the decoy receptor DcR1 is induced in a p50/Bcl3-dependent manner and attenuates the efficacy of temozolomide in glioblastoma cells."

Our news journalists obtained a quote from the research from People's Hospital, "However, its expression status, clinical significance and biological functions in glioma remain largely unknown. In the present study, the levels of BCL3 were overexpressed in glioma compared to normal brain tissues. Furthermore, high expression of BCL3 protein was confirmed by immunoblotting in glioma cells as compared with normal human astrocyte cell line. The positive expression of BCL3 was correlated with adverse prognostic features and reduced overall survival rate of glioma patients. BCL3 silencing resulted in prominent decreased proliferation, cell cycle arrest in G1 phase and increased apoptosis in U251 cells. In contrast, BCL3 overexpression in U87 cells remarkably facilitated proliferative ability and cell cycle progression and induced apoptosis. In vivo studies showed that BCL3 knockdown inhibited the tumor growth of U251 cells in a mouse xenograft model. Mechanistically, BCL3 positively regulated the abundance of STAT3, p-STAT3 and the downstream targets of STAT3 pathway including BCL2, MCL-1 and cyclin D1 in glioma cells. Furthermore, a positive correlation between BCL3 and STAT3 expression was observed in glioma specimens. Notably, we confirmed that STAT3 knockdown abolished the oncogenic roles of BCL3 in glioma."

According to the news editors, the research concluded: "We suggest that BCL3 serves as an oncogene in glioma by modulating proliferation, cell cycle progression and apoptosis, and its oncogenic effects are mediated by the STAT3 signaling pathway."

For more information on this research see: B-cell CLL/lymphoma 3 promotes glioma cell proliferation and inhibits apoptosis through the oncogenic STAT3 pathway. *International Journal of Oncology*, 2016;49(6):2471-2479. *International Journal of Oncology* can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

The news correspondents report that additional information may be obtained from L.F. Li, Peoples Hosp Gaozhou, Dept. of Neurosurg, Gaozhou 525200, Guangdong, People's Republic of China. Additional authors for this research include L.F. Li, G.Y. Jiang, H. Zhan and N.N. Wang.
Oncology - Gliomas

Reports on Gliomas from Methodist Hospital Provide New Insights (Monoamine oxidase B levels are highly expressed in human gliomas and are correlated with the expression of HiF-1a and with transcription factors Sp1 and Sp3)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gliomas. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Monoamine oxidases A and B (MAOA and MAOB) are highly expressed in many cancers. Here we investigated the level of MAOB in gliomas and confirmed its high expression."

The news correspondents obtained a quote from the research from Methodist Hospital, "We found that MAOB levels correlated with tumor grade and hypoxia-inducible factor 1-alpha (HiF-1a) expression. HiF-1a was localized to the nuclei in high-grade gliomas, but it was primarily cytosolic in low-grade gliomas and normal human astrocytes. Expression of both glial fibrillary acidic protein (GFAP) and MAOB are correlated to HiF-1a expression levels. Levels of MAOB are correlated by the levels of transcription factor Sp3 in the majority of GBM examined, but this control of MAOB expression by Sp3 in low grade astrocytic gliomas is significantly different from control in the in the majority of glioblastomas. The current findings support previous suggestions that MAOB can be exploited for the killing of cancer cells."

According to the news reporters, the research concluded: "Selective cell toxicity can be achieved by designing non-toxic prodrugs that require MAOB for their catalytic conversion into mature cytotoxic chemotherapeutics."

For more information on this research see: Monoamine oxidase B levels are highly expressed in human gliomas and are correlated with the expression of HiF-1a and with transcription factors Sp1 and Sp3. Oncotarget, 2016;7(3):3379-93.

Reports on HIV/AIDS Findings from University of Milan Provide New Insights (T-cell phenotype and function following a first cART regimen containing either a protease inhibitor or a non-nucleoside reverse transcriptase inhibitor in HIV-infected ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immune System Diseases and Conditions - HIV/AIDS have been presented. According to news originating from Milan, Italy, by NewsRx correspondents, research stated, "We aimed to comparatively assess darunavir/ritonavir (DRV/r) and efavirenz (EFV)-based first-line cART regimens in the reconstitution of T-cell phenotype and function in HIV-infected, late presenter subjects. Retrospective, ex vivo study on stored peripheral blood mononuclear cell samples of cART-naïve, HIV-infected individuals with CD4 (+) T-cell counts <50 >250/mu l upon cART initiation with either DRV/r or EFV as third drugs of standard antiretroviral regimens."

Our news journalists obtained a quote from the research from the University of Milan, "CD4(+) and CD8(+) T-cell maturation (CCR7/CD45RA) and proliferation (Ki67), CD8 (+) T-cell activation (CD38/HLA-DR) as well as HIV-and cytomegalovirus (CMV)-specific responses (CD4/CD8/IL-2/IFN-gamma) were studied by flow cytometry at baseline (T0), T3, T6 and T12 months. Soluble inflammatory markers (IL-6 and sCD14) were measured in plasma at T0 and T12. Wilcoxon and Mann-Whitney tests were used for statistics. A total of 19 patients started DRV/r and 15 EFV. Both regimens accounted for suppression of the HIV RNA load (<40 copies/ml), reconstitution of absolute CD4(+) T-cells and CD4(+)/CD8(+) T-cell ratio. All study participants displayed a significant decrease of activated HLA-DR(+)CD38(+) CD8(+) T-cells at all study time points, yet no differences were found between study groups in T-cell activation and maturation phenotype. From a functional standpoint, only individuals receiving DRV/r displayed transitory recovery of HIV-specific IL-2(+) IFN-gamma(-)CD4(+) T-cells (T3: P=0.006) and IL-2-IFN-gamma(+) CD8(+) T-cells (T3: P=0.032). DRV/r- and EFV-based regimens have an equal effect on T-cell phenotype and function in HIV late presenters."

According to the news editors, the research concluded: "A temporary restoration of HIV-specific T-cell immunity early in the course of therapy with DRV/r possibly implies a more effective control over HIV in the first months following a PI/r-based regimen, even at late stage of disease."

For more information on this research see:  T-cell phenotype and function following a first cART regimen containing either a protease inhibitor or a non-nucleoside reverse transcriptase inhibitor in HIV-infected late presenters: results from a retrospective, ex vivo study. Antiviral Therapy, 2016;21(2):133-142. Antiviral Therapy can be contacted at: Int Medical Press Ltd, 2-4 Idol Lane, London EC3R 5DD, England.

The news correspondents report that additional information may be obtained from G. Marchetti, University of Milan, Dept. of Hlth Sci, Clin Infect Dis, San Paolo Hopsital, Milan, Italy. Additional authors for this research include A. Savoldi, E.S. Cannizzo, G.M. Bellistri, R. Termini, M. Garau, D. Mancusi, A.D. Monforte and G. Marchetti.

Reports on Head and Neck Cancer Findings from University Medical Center Provide New Insights (Effect of sorafenib on cisplatin-based chemoradiation in head and neck cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Head and Neck Cancer have been published. According to news reporting from Hamburg, Germany, by NewsRx journalists, research stated, "Despite aggressive chemoradiation (CRT) protocols in the treatment of patients with head and neck squamous cell carcinomas (HNSCC), the outcome is still unfavorable. To improve therapy efficacy we had already successfully tested the multikinase inhibitor sorafenib in combination with irradiation (IR) in previous studies on HNSCC cell lines."

The news correspondents obtained a quote from the research from University Medical Center, "In this study we investigated its effect on combined CRT treatment using cisplatin. Radio-and chemosensitivity with and without sorafenib was measured in four HNSCC cell lines and normal fibroblasts (NF) by colony formation assay. Apoptosis and cell cycle analysis were performed by flow cytometry. In HNSCC cells, sorafenib enhanced the antiproliferative effect of cisplatin without affecting apoptosis induction and with only minor effects on cell inactivation. Sorafenib added prior to irradiation enhanced cellular radiosensitivity in three of the tested HNSCC cell lines and caused massive overall cell inactivation when combined with CRT. In contrast, sorafenib did not radiosensitize NF and reduced cisplatin-induced cell inactivation. Cell inactivation by IR and cisplatin is further increased by the addition of sorafenib in HNSCC, but not in NF cells."

According to the news reporters, the research concluded: "Therefore, sorafenib is a promising candidate to improve therapy efficacy for HNSCC."

For more information on this research see: Effect of sorafenib on cisplatin-based chemoradiation in head and neck cancer cells. Oncotarget, 2016;7(17):23542-51.

Our news journalists report that additional information may be obtained by contacting N. Mockelmann, Head and Neck Cancer Center of The University Cancer Center Hamburg (UCCH), Dept. of Otorhinolaryngology and Head and Neck Surgery, University Medical Center Hamburg-Eppendorf, Hamburg, Germany. Reports on Hearing Loss from University of Helsinki Central Hospital Provide New Insights (Spondyloocular Syndrome: Novel Mutations in XYLT2 Gene and Expansion of the Phenotypic Spectrum)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hearing Diseases and Conditions - Hearing Loss have been published. According to news reporting originating in Helsinki, Finland, by NewsRx journalists, research stated, "Spondyloocular syndrome is an autosomal-recessive disorder with spinal compression fractures, osteoporosis, and cataract. Mutations in XYLT2, encoding isoform of xylosyltransferase, were recently identified as the cause of the syndrome."

The news reporters obtained a quote from the research from the University of Helsinki Central Hospital, "We report on 4 patients, 2 unrelated patients and 2 siblings, with spondyloocular syndrome and novel mutations in XYLT2. Exome sequencing revealed a homozygous nonsense mutation, NM_022167.3(XYLT2): c.2188C >T, resulting in a premature stop codon (p.Arg730*) in a female patient. The patient presents visual impairment, generalized osteoporosis, short stature with short trunk, spinal compression fractures, and increased intervertebral disc space and hearing loss. We extended our XYLT2 analysis to a cohort of 22 patients with generalized osteoporosis, mostly from consanguineous families. In this cohort, we found by Sanger sequencing 2 siblings and 1 single patient who were homozygous for missense mutations in the XYLT2 gene (p.Arg563Gly and p.Leu605Pro). The patients had osteoporosis, compression fractures, cataracts, and hearing loss. Bisphosphonate treatment in 1 patient resulted in almost complete normalization of vertebral structures by adolescence, whereas treatment response in the others was variable."

According to the news reporters, the research concluded: "This report together with a previous study shows that mutations in the XYLT2 gene result in a variable phenotype dominated by spinal osteoporosis, cataract, and hearing loss."

Our news correspondents report that additional information may be obtained by contacting O. Makitie, Helsinki Univ Hosp, Helsinki, Finland. Additional authors for this research include A. Costantini, N. Coles, M. Pekkinen, E. Heon, Z. Siklar, M. Berberoglu, A. Kampe, E. Kiykim, G. Grigelioniene, B. Tuysuz and O. Makitie.

Heart Disorders and Diseases - Heart Disease

Reports on Heart Disease from Emory University Provide New Insights [Circulating progenitor cells and coronary microvascular dysfunction: Results from the NHLBI-sponsored Women's Ischemia Syndrome Evaluation - Coronary Vascular Dysfunction Study ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Disease. According to news reporting originating in Atlanta, Georgia, by NewsRx journalists, research stated, "Ischemia stimulates a reparative response resulting in mobilization of circulating progenitor cells (CPCs). We hypothesized that women with chronic myocardial ischemia from coronary microvascular disease (CMD) will mobilize CPCs."

The news reporters obtained a quote from the research from Emory University, "In 123 women with ischemic symptoms and signs but no obstructive coronary artery disease (CAD) enrolled in the Women's Ischemia Syndrome Evaluation - Coronary Vascular Dysfunction Study (WISE-CVD), we measured coronary flow reserve (CFR) in response to intracoronary adenosine. Peripheral blood CPCs were measured using flow cytometry for expression of CD34, CD133, CXCR4, and VEGFR2. Subjects were 53 +/- 11 years, BMI 30 +/- 8; 44% hypertensive, 11% diabetic, 23% hyperlipidemic and 7% smokers. Lower CFR correlated inversely with higher levels of hematopoietic-enriched CD34 +/- (r = 0.23, p = 0.011), CD34 vertical bar/CD133 vertical bar (r = 0.24, p = 0.008), and CD34 vertical bar/CXCR4 vertical bar (r = 0.19, p = 0.036) cells. In multivariable regression analyses, after adjusting for traditional cardiovascular risk factors, lower CFR remained significantly associated with elevated levels of CD34+ (beta = -0.18, p = 0.042), CD34+/CD133+ (beta = -0.24, p = 0.036), and CD34+/CXCR4+ (beta = -0.22, p = 0.050) cells. We found no association between CFR and CD34+/VEGFR2+ cells. In women with non-obstructive CAD, impaired CFR is associated with higher levels of CPCs, suggesting that chronic myocardial ischemia from CMD stimulates CPC mobilization."

According to the news reporters, the research concluded: "The functional significance of elevated CPCs in these subjects requires further investigation as a potential biomarker and treatment target."

For more information on this research see: Circulating progenitor cells and coronary microvascular dysfunction: Results from the NHLBI-sponsored Women's Ischemia Syndrome Evaluation - Coronary Vascular Dysfunction Study (WISE-CVD). Atherosclerosis, 2016;253 ():111-117. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Our news correspondents report that additional information may be obtained by contacting A.A. Quyyumi, Emory University, Sch Med, Atlanta, GA, United States. Additional authors for this research include S.S. Hayek, P.K. Mehta, Q. Li, E. Mahar, L. Mou, T.S. Kenkre, J.W. Petersen, B. Azarbal, B. Samuels, R.D. Anderson, T. Sedlak, M. Zaya, M. Agarwal, A.
Reports on Heart Failure Findings from Heart and Vascular Institute Provide New Insights (Biomarkers: Their potential in the diagnosis and treatment of heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Failure are presented in a new report. According to news reporting out of Cleveland, Ohio, by NewsRx editors, research stated, "The increasing use of cardiac biomarkers in the diagnosis and management of heart failure (HF) has led to their inclusion in clinical practice guidelines. Studies have demonstrated that natriuretic peptides and cardiac troponins are useful adjuncts in identifying patients with HF at high risk, and we now know that a number of factors influence biomarker levels, including age, renal failure, obesity, and comorbid conditions, and that these factors as well as biomarker assay variability need to be considered when interpreting the results of biomarker testing."

Our news journalists obtained a quote from the research from Heart and Vascular Institute, "The broader use of cardiac biomarker testing has been limited by the lack of consistent data to support a benefit of their use in triaging management decisions, and the majority of drug therapies and titration schedules for HF were developed prior to the availability of biomarkers. Nevertheless, natriuretic peptide testing has been widely adopted, with recent guidelines supporting its use in the diagnosis of acute HF, especially in the setting of clinical uncertainty, as well as in assessing disease severity and prognosis."

According to the news editors, the research concluded: "This review summarizes the data on traditional cardiac biomarkers and describes how the latest investigations have shaped the recommendations in the latest clinical practice guidelines."

For more information on this research see: Biomarkers: Their potential in the diagnosis and treatment of heart failure. Cleveland Clinic Journal of Medicine, 2015;82(12 Suppl 2):S28-35.

Our news journalists report that additional information may be obtained by contacting B. Heil, Dept. of Cardiovascular Medicine, Heart and Vascular Institute, Cleveland Clinic, Cleveland, OH, United States.

Drugs and Therapies - Hematologic Agents

Reports on Hematologic Agents from University of Debrecen Provide New Insights (A Modular Synthetic Approach to Isosteric Sulfonic Acid Analogues of the Anticoagulant Pentasaccharide Idraparinux)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Hematologic Agents have been presented. According to news reporting out of Debrecen, Hungary, by NewsRx editors, research stated, "Heparin-based anticoagulants are drugs of choice in the therapy and prophylaxis of thromboembolic diseases. Idraparinux is a synthetic anticoagulant pentasaccharide based on the heparin antithrombin-binding domain."

Our news journalists obtained a quote from the research from the University of Debrecen, "In the frame of our ongoing research aimed at the synthesis of sulfonic acid-containing heparinoid anticoagulants, we elaborated a modular pathway to obtain a series of idraparinux-analogue pentasaccharides bearing one or two primary sulfonic acid moieties. Five protected pentasaccharides with different C-sulfonation patterns were prepared by two subsequent glycosylation reactions, respectively, using two monosaccharide and four disaccharide building blocks."

According to the news editors, the research concluded: "Transformation of the protected derivatives into the fully O-sulfated, O-methylated sulfonic acid end-products was also studied."

For more information on this research see: A Modular Synthetic Approach to Isosteric Sulfonic Acid Analogues of the Anticoagulant Pentasaccharide Idraparinux. Molecules, 2016;21(11):1116-1134. Molecules can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. (Springer - www.springer.com; Molecules - www.springerlink.com/content/1420-3049/)

Our news journalists report that additional information may be obtained by contacting E. Mezo, Univ Debrecen, Dept. of Pharmaceut Chem, H-4032 Debrecen, Hungary. Additional authors for this research include D. Eszenyi, E. Varga, M. Herczeg and A. Borbas.

Liver Diseases and Conditions - Hepatitis C Virus

Reports on Hepatitis C Virus from University of Alberta Provide New Insights [Prevention of hepatitis C virus infection using a broad cross-neutralizing monoclonal antibody (AR4A) and epigallocatechin gallate]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Hepatitis C Virus is now available. According to news originating from Edmonton, Canada, by NewsRx correspondents, research stated, "The anti-hepatitis C virus (HCV) activity of a novel monoclonal antibody
(mAb; AR4A) and epigallocatechin gallate (EGCG) were studied in vitro using a HCV cell culture system and in vivo using a humanized liver mouse model capable of supporting HCV replication. Alone, both exhibit reliable cross-genotype HCV inhibition in vitro, and combination therapy completely prevented HCV infection."

Financial supporters for this research include Canada Excellence in Research Chair program, Swiss National Fund, Lichtenstein Foundation, M.L. and D.R.B. (to M.L.) (to D.R.B), National Institute for Allergy and Infectious Disease, CIHR (D.L.J.T.).

Our news journalists obtained a quote from the research from the University of Alberta, "In vitro AR4A mAb (alone and combined with EGCG) robustly protects against the establishment of HCV genotype 1a infection. EGCG alone fails to reliably protect against an HCV challenge."

According to the news editors, the research concluded: "AR4A mAb represents a safe and efficacious broadly neutralizing antibody against HCV applicable to strategies to safely prevent HCV reinfection following liver transplantation, and it lends further support to the concept of HCV vaccine development. The poor bioavailability of EGCG limits HCV antiviral activity in vitro."

The news correspondents report that additional information may be obtained from D. O'Shea, Transplant Infectious Diseases, Alberta Transplant Institute, Dept. of Medicine, University of Alberta, Edmonton, Alberta, Canada. Additional authors for this research include J. Law, A. Egli, D. Douglas, G. Lund, S. Forester, J. Lambert, M. Law, D.R. Burton, D.L. Tyrrell, M. Houghton, A. Humar and N. Kneteman.

**Hepatocytes**

**Reports on Hepatocytes from Amway Corp. Provide New Insights [Magnolia officinalis (Hou Po) bark extract stimulates the Nrf2-pathway in hepatocytes and protects against oxidative stress]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hepatocytes have been published. According to news originating from Ada, Michigan, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: The highly aromatic bark of Magnolia officinalis Rehder and EH Wilson, (magnolia bark) has been widely used in traditional Chinese medicine where it is known as Hou Po. Historically the bark of the tree has been used for treating variety of disorders
the most common use of magnolia bark in traditional prescription has been to treat stress and anxiety disorders."

Our news journalists obtained a quote from the research from Amway Corp., "Till date it is not clear regarding the fundamental cellular pathway it modulates. NRF2 signaling has emerged as the central pathway that protects cells from variety of stressors this led us to hypothesize that basis for magnolia bark's effects could be via activating NRF2 pathway. We utilized variety of biochemical procedures like luciferase reporter assay, enzyme induction, gene expression to determine NRF2 inducing activity by magnolia bark extract and its significance. Further we identified the phytochemicals inducing this activity using bio-directed fractionation procedure. In this study, we demonstrate that magnolia bark extract activates Nrf2-dependent gene expression and protects against hydrogen peroxide mediated oxidative stress in hepatocytes. We further identified through HPLC fractionation and mass spectroscopy that magnolol, 4-methoxy honokiol and honokiol are the active phytochemicals inducing the Nrf2-mediated activity."

According to the news editors, the research concluded: "This could be the molecular basis for its numerous beneficial activity."

The news correspondents report that additional information may be obtained from A. Rajgopal, Amway Corp, Analyt Sci, Ada, MI 49355, United States. Additional authors for this research include S.R. Missler and J.D. Scholten.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jep.2016.10.016. This DOI is a link to an online electronic document that is either free or for purchase.

**Hybridomas**

**Reports on Hybridomas from University of Massachusetts Provide New Insights (Effect of amino acid supplementation on titer and glycosylation distribution in hybridoma cell culturesSystems biology-based interpretation using genome-scale ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hybridomas. According to news originating from Lowell, Massachusetts, by NewsRx correspondents, research stated, "Genome-scale flux balance analysis (FBA) is a powerful systems biology tool to characterize intracellular reaction fluxes during cell cultures. FBA estimates intracellular reaction rates by optimizing an objective function, subject to the constraints of a metabolic model and media uptake/excretion rates."
Our news journalists obtained a quote from the research from the University of Massachusetts. "A dynamic extension to FBA, dynamic flux balance analysis (DFBA), can calculate intracellular reaction fluxes as they change during cell cultures. In a previous study by Read et al. (2013), a series of informed amino acid supplementation experiments were performed on twelve parallel murine hybridoma cell cultures, and this data was leveraged for further analysis (Read et al., Biotechnol Prog. 2013;29:745-753). In order to understand the effects of media changes on the model murine hybridoma cell line, a systems biology approach is applied in the current study. Dynamic flux balance analysis was performed using a genome-scale mouse metabolic model, and multivariate data analysis was used for interpretation. The calculated reaction fluxes were examined using partial least squares and partial least squares discriminant analysis. The results indicate media supplementation increases product yield because it raises nutrient levels extending the growth phase, and the increased cell density allows for greater culture performance. At the same time, the directed supplementation does not change the overall metabolism of the cells. This supports the conclusion that product quality, as measured by glycoform assays, remains unchanged because the metabolism remains in a similar state."

According to the news editors, the research concluded: "Additionally, the DFBA shows that metabolic state varies more at the beginning of the culture but less by the middle of the growth phase, possibly due to stress on the cells during inoculation."

The news correspondents report that additional information may be obtained from S. Yoon, Univ Massachusetts Lowell, Dept. of Chem Eng, Lowell, MA 01854, United States. Additional authors for this research include S.Y. Park, C.D. Agarabi, K.A. Brorson and S. Yoon.

Immunology - Immunoglobulins

Reports on Immunoglobulins Findings from University of Sydney Provide New Insights (Aptamers: A promising chemical antibody for cancer therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immunology - Immunoglobulins are discussed in a new report. According to news reporting originating from Westmead, Australia, by NewsRx correspondents, research stated, "Aptamers, also known as chemical antibodies, are single-stranded nucleic acid oligonucleotides which bind to their targets with high specificity and affinity. They are typically selected by repetitive in vitro process termed systematic evolution of
ligands by exponential enrichment (SELEX).

Our news editors obtained a quote from the research from the University of Sydney, "Owing to their excellent properties compared to conventional antibodies, notably their smaller physical size and lower immunogenicity and toxicity, aptamers have recently emerged as a new class of agents to deliver therapeutic drugs to cancer cells by targeting specific cancer-associated hallmarks. Aptamers can also be structurally modified to make them more flexible in order to conjugate other agents such as nano-materials and therapeutic RNA agents, thus extending their applications for cancer therapy."

According to the news editors, the research concluded: "This review presents the current knowledge on the practical applications of aptamers in the treatment of a variety of cancers."

For more information on this research see: Aptamers: A promising chemical antibody for cancer therapy. Oncotarget, 2016;7(12):13446-63.

The news editors report that additional information may be obtained by contacting G. Zhou, Storr Liver Centre, Westmead Millennium Institute for Medical Research, University of Sydney and Westmead Hospital, Westmead, NSW, Australia. Additional authors for this research include G. Wilson, L. Hebbard, W. Duan, C. Liddle, J. George and L. Qiao.

Lung Diseases and Conditions - Interstitial Lung Disease from University of Lille Provide New Insights (Cardiorespiratory Response to Different Exercise Tests in Interstitial Lung Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lung Diseases and Conditions - Interstitial Lung Disease have been presented. According to news reporting from Lille, France, by NewsRx journalists, research stated, "The 6-min stepper test (6MST) has been used as an alternative to the 6-min walk test (6MWT) to assess exercise tolerance in patients with interstitial lung disease (ILD). Recent data suggest that the tests may involve different energy pathways and cardiorespiratory responses."

The news correspondents obtained a quote from the research from the University of Lille, "We thus aimed to compare the cardiorespiratory responses of ILD patients during the 6MWT and the 6MST. Thirty-one patients with ILD were randomized to perform both tests in the order 6MST -> 6MWT (n = 16) or 6MWT -> 6MST (n = 15). Gas exchange, HR, and pulse O-2 saturation (SpO(2)) were measured continuously, and dyspnoea, leg discomfort, and blood lactate concentration were assessed before and immediately after each test. Oxygen uptake ((V) over dotO(2)) was lower (P = 0.002) and respiratory equivalent ratio for O-2 ((V) over dot(E)/ (V) over dotO(2)) and RER were higher (both P< 0.001) during the 6MST compared with the..."
6MWT. The 6MST was also associated with higher blood lactate concentrations (6MST, 4.16 +/- 1.95 mmol.L-1; 6MWT, 2.84 +/- 1.17 mmol.L-1; P = 0.01), higher leg discomfort scores (6MST 5 +/- 3 points, 6MWT 3 +/- 2 points; P < 0.001), and smaller decreases in SpO(2) (6MST -5% +/- 5%, 6MWT -9% +/- 6%; P < 0.001). ILD patients exhibited greater ventilatory responses and lower arterial O-2 desaturation during the 6MST compared with the 6MWT.

According to the news reporters, the research concluded: "The higher lactate concentrations and perceived muscle fatigue observed during the 6MST may indicate the presence of intertest differences in active muscle metabolism that could contribute to the distinct cardiorespiratory responses."

For more information on this research see: Cardiorespiratory Response to Different Exercise Tests in Interstitial Lung Disease. Medicine and Science in Sports and Exercise, 2016;48(12):2345-2352. Medicine and Science in Sports and Exercise can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. death within 30 days of surgery based on the American College of Surgeons National Surgical Quality Improvement Program-defined events. A total of 140,754 anesthetics were identified for the primary analysis. The number of anesthesia handovers was not found to be associated ($P = 0.19$) with increased odds of postoperative mortality and serious complications, as measured by the collapsed composite, with odds ratio for a one unit increase in handovers of 0.957; 95% CI, 0.895 to 1.022, when controlled for potential confounding variables. A total of 8,404 anesthetics were identified for the NSQIP analysis (collapsed composite odds ratio, 0.868; 95% CI, 0.718 to 1.049 for handovers).

According to the news reporters, the research concluded: "In the analysis of intraoperative handovers, anesthesia care transitions were not associated with an increased risk of postoperative adverse outcomes."

For more information on this research see: Intraoperative Care Transitions Are Not Associated with Postoperative Adverse Outcomes. Anesthesiology, 2016;125(4):690-699.

Reports on Ion Channels Findings from L. Lara-Valderrabano and Co-Researchers Provide New Insights (Propylparaben reduces the excitability of hippocampal neurons by blocking sodium channels)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Membrane Proteins - Ion Channels have been published. According to news reporting originating in Mexico City, Mexico, by NewsRx journalists, research stated, "Propylparaben (PPB) is an antimicrobial preservative widely used in food, cosmetics, and pharmaceutics. Virtual screening methodologies predicted anticonvulsant activity of PPB that was confirmed in vivo."

The news reporters obtained a quote from the research, "Thus, we explored the effects of PPB on the excitability of hippocampal neurons by using standard patch clamp techniques. Bath perfusion of PPB reduced the fast-inactivating sodium current (I-Na) amplitude, causing a hyperpolarizing shift in the inactivation curve of the INa, and markedly delayed the sodium channel recovery from the inactivation state. Also, PPB effectively suppressed the riluzole-sensitive, persistent sodium current (I-NaP). PPB perfusion also modified the action potential kinetics, and higher concentrations of PPB suppressed the spike activity. Nevertheless, the modulatory effects of PPB did not occur when PPB was internally applied by whole-cell dialysis. These results indicate that PPB reduces the excitability of CA1
pyramidal neurons by modulating voltage-dependent sodium channels. The mechanistic basis of this effect is a marked delay in the recovery from inactivation state of the voltage sensitive sodium channels."

According to the news reporters, the research concluded: "Our results indicate that similar to local anesthetics and anticonvulsant drugs that act on sodium channels, PPB acts in a use-dependent manner."

For more information on this research see: Propylparaben reduces the excitability of hippocampal neurons by blocking sodium channels. *Neurotoxicology*, 2016;57():183-193. *Neurotoxicology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Ischemia**

**Reports on Ischemia Findings from Heart Institute Provide New Insights**

(Subacute limb ischemia induces skeletal muscle injury in genetically susceptible mice independent of vascular density)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Ischemia. According to news reporting from Greenville, North Carolina, by NewsRx journalists, research stated, "The primary preclinical model of peripheral artery disease, which involves acute limb ischemia (ALI), can result in appreciable muscle injury that is attributed to the acuity of the ischemic injury. A less acute model of murine limb ischemia using ameroid constrictors (ACs) has been developed in an attempt to mimic the chronic nature of human disease."

The news correspondents obtained a quote from the research from Heart Institute, "However, there is currently little understanding of how genetics influence muscle injury following subacute arterial occlusion in the mouse. We investigated the influence of mouse genetics on skeletal muscle tissue survival, blood flow, and vascular density by subjecting two different mouse strains, C57BL/6 (BL6) and BALB/c, to ALI or subacute limb ischemia using single (1AC) or double (2AC) AC placement on the femoral artery. Similar to ALI, the 2AC model resulted in significant tissue necrosis and limb perfusion deficits in genetically susceptible BALB/c but not BL6 mice. In the 1AC model, no outward evidence of tissue necrosis was observed, and there were no differences in limb blood flow between BL6 and BALB/c. However, BALB/c mice displayed significantly greater muscle injury, as evidenced by increased inflammation and myofiber atrophy, despite having no differences in CD31(+) and
SMA(+) vascular density and area. BALB/c mice also displayed significantly greater centralized myonuclei, indicating increased muscle regeneration. The susceptibility of skeletal muscle to ischemia-induced injury is at least partly independent of muscle blood flow and vascular density, consistent with a muscle cell autonomous response that is genetically determined."

According to the news reporters, the research concluded: "Further development of preclinical models of peripheral artery disease that more accurately reflect the nature of the human disease may allow more accurate identification of genetic targets for therapeutic intervention."

Our news journalists report that additional information may be obtained by contacting J.M. McClung, Brody Med Center, Diabet & Obes Inst, East Carolina Heart Inst, Greenville, NC, United States. Additional authors for this research include T.J. McCord, K. Southerland, C.A. Schmidt, M.E. Padgett, T.E. Ryan and C.D. Kontos.

Oncology - Liver Cancer

Reports on Liver Cancer from Nantong University Provide New Insights (Modification of p27 with O-linked N-acetylglucosamine regulates cell proliferation in hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "The tumor suppressor p27, which is a member of the Cip/Kip family of Cyclin-dependent kinase inhibitory proteins (CKIs), controls anti-proliferative events. The post-translational addition of O-GlcNAc to p27 occurs in HEK293T and HCC (hepatocellular carcinoma) cell lines, and we identified Ser2, Ser106, Ser110, Thr157, and Thr198 as the glycosylation sites of p27 based on the Q-TOF spectrum."

Our news editors obtained a quote from the research from Nantong University, "Here, immunoprecipitation analysis showed that Ser2 was O-GlcNAcylated and that this modification was associated with the increased phosphorylation of p27 at Ser10, ultimately resulting in p27 accumulation in the cytoplasm and increased p27 ubiquitination. In addition, O-GlcNAcylation at Ser2 suppressed Cyclin/CDK complex-p27 interactions by promoting the nuclear export of p27, thus facilitating cell cycle progression. Cell proliferation was negatively
regulated when Ser2 of p27 was replaced with Ala. Furthermore, western blot and immunohistochemical analyses of HCC tissues and their corresponding nontumorous tissues were performed, and we found that O-GlcNAcylated p27 correlated with cell proliferation in HCC.”

According to the news editors, the research concluded: "Together, our results indicate that the dynamic interplay between O-GlcNAcylation and p27 phosphorylation coordinates and regulates cell proliferation in hepatocellular carcinoma."

The news editors report that additional information may be obtained by contacting R.Z. Ni, Nantong University, Jiangsu Prov Key Lab Inflammat & Mol Drug Target, Nantong 226001, Jiangsu, People's Republic of China. Additional authors for this research include F. Liu, T. Tao, D.M. Zhang, X.J. Liu, G.Z. Zhu, Z.W. Xu, R.Z. Ni and A.G. Shen.

**Oncology - Lung Cancer**

**Reports on Lung Cancer from Zhejiang University Provide New Insights [Costunolide induces lung adenocarcinoma cell line A549 cells apoptosis through ROS (reactive oxygen species)-mediated endoplasmic reticulum stress]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news reporting originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Costunolide is an active sesquiterpene lactone derived from many herbal medicines. It has a broad spectrum of bioactivities, including anti-inflammatory and potential anti-tumor effects."

Financial supporters for this research include Key Laboratory of Microbial Biochemistry, Metabolism Engineering of Zhejiang Province, State Agricultural S&T Result Transforming Fund, the Ministry of Science and Technology of China.

Our news editors obtained a quote from the research from Zhejiang University, "The aims of the present study were to evaluate the inhibitory effects of costunolide on A549 cell growth and to explore the underlying molecular mechanisms. Annexin V-FITC/PI flow cytometry analysis revealed that costunolide induced apoptosis. To study the mechanism, we found that costunolide exposure activated the unfolded protein response (UPR) signaling pathways, as shown by the up-regulation of GRP78 and IRE1a and the activation of ASK1 and JNK. Meanwhile, siRNA knockdown of IRE1a significantly attenuated costunolide-induced apoptosis and partly restored the mitochondrial membrane potential. ER stress-activated JNK phosphorylated Bcl-2 at Ser70, which changes the anti-apoptotic function of Bcl-2, resulting in
mitochondrial dysfunction and leading to mitochondrial activation of apoptosis. Furthermore, costunolide induced ROS generation, while the antioxidant N-acetyl cysteine (NAC) effectively blocked ER stress and apoptosis activation, suggesting that ROS acts as an upstream signaling molecule in triggering ER stress and mitochondrial apoptotic pathways. Taken together, our research demonstrates that costunolide exhibits its anti-tumor activity though inducing apoptosis, which is mediated by ER stress."

According to the news editors, the research concluded: "We further confirm that Bcl-2 is a key molecule connecting the ER stress and mitochondrial pathways."

The news editors report that additional information may be obtained by contacting Z. Wang, Institute of Biochemistry, Zhejiang University, Room 345, Hangzhou, 310058, People's Republic of China. Additional authors for this research include X. Zhao and X. Gong.

**Oncology - Melanoma**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Melanoma have been presented. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "To evaluate frequency of conjunctival tumors in all ages and compare benign vs malignant counterparts. Retrospective series. SETTING: Tertiary referral center."

Our news editors obtained a quote from the research from Thomas Jefferson University, "Total of 5002 patients. Clinical features. Differentiation of benign from malignant counterparts. The tumor was benign (52%), premalignant (18%), or malignant (30%). Malignant tumors included melanoma (12%), squamous cell carcinoma (SCC) (9%), lymphoma (7%), and others. Comparison of primary acquired melanosis vs melanoma revealed melanoma with greater median patient age (54 vs 61 years, P< .0001), male sex (35% vs 49%, P< .0001), location in fornix (2% vs 6%, P = .0016) and tarsus (1% vs 4%, P = .0018), larger median basal diameter (6 vs 8 mm, P< .0001) and thickness (< 1 vs 1 mm, P< .0001), and intralesional cysts (0% vs 7%, P< .0001), feeder vessels (10% vs 48%, P< .0001), intrinsic vessels (4% vs 33%, P < .0001), and hemorrhage (< 1% vs 3%, P = .0001). Comparison of conjunctival intraepithelial
neoplasia (CIN) vs SCC revealed SCC with greater diffuse involvement (1% vs 8%, P < .0001) and larger median basal diameter (7 vs 8 mm, P < .0001) and thickness (1 mm vs 2 mm, P < .0001). Comparison of benign reactive lymphoid hyperplasia vs lymphoma revealed lymphoma with greater median patient age (50 vs 61 years, P < .0001), fornix location (32% vs 54%, P < .0001), larger median basal diameter (10 vs 20 mm, P < .0001), and less involvement of nasal region (50% vs 23%, P < .0001). In an ocular oncology practice, conjunctival tumors are benign (52%), premalignant (18%), or malignant (30%).”

According to the news editors, the research concluded: "Malignant tumors tend to occur in older patients and demonstrate greater basal diameter and thickness, compared with benign counterparts."

The news editors report that additional information may be obtained by contacting C.L. Shields, Thomas Jefferson University, Wills Eye Hosp, Ocular Oncol Serv, Philadelphia, PA 19107, United States. Biological Factors - Metalloporphyrins

Reports on Metalloporphyrins Findings from University of Illinois Provide New Insights (Nrf2-AKT interactions regulate heme oxygenase 1 expression in kidney epithelia during hypoxia and hypoxia-reoxygenation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Biological Factors - Metalloporphyrins are presented in a new report. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "Ischemia-reperfusion (IR)-induced kidney injury is a major clinical problem, but the underlying mechanisms remain unclear. The transcription factor known as nuclear factor, erythroid 2-like 2 (NFE2L2 or Nrf2) is crucial for protection against oxidative stress generated by prooxidant insults."

Our news journalists obtained a quote from the research from the University of Illinois, "We have previously shown that Nrf2 deficiency enhances susceptibility to IR-induced
kidney injury in mice and that its upregulation is protective. Here, we examined Nrf2 target antioxidant gene expression and the mechanisms of its activation in both human and murine kidney epithelia following acute (2 h) and chronic (12 h) hypoxia and reoxygenation conditions. We found that acute hypoxia modestly stimulates and chronic hypoxia strongly stimulates Nrf2 putative target HMOX1 expression, but not that of other antioxidant genes. Inhibition of AKT1/2 or ERK1/2 signaling blocked this induction; AKT1/2 but not ERK1/2 inhibition affected Nrf2 levels in basal and acute hypoxia-reoxygenation states. Unexpectedly, chromatin immunoprecipitation assays revealed reduced levels of Nrf2 binding at the distal AB1 and SX2 enhancers and proximal promoter of HMOX1 in acute hypoxia, accompanied by diminished levels of nuclear Nrf2. In contrast, Nrf2 binding at the AB1 and SX2 enhancers significantly but differentially increased during chronic hypoxia and reoxygenation, with reaccumulation of nuclear Nrf2 levels. Small interfering-RNA-mediated Nrf2 depletion attenuated acute and chronic hypoxia-inducible HMOX1 expression, and primary Nrf2-null kidney epithelia showed reduced levels of HMOX1 induction in response to both acute and chronic hypoxia.

According to the news editors, the research concluded: "Collectively, our data demonstrate that Nrf2 upregulates HMOX1 expression in kidney epithelia through a distinct mechanism during acute and chronic hypoxia reoxygenation, and that both AKT1/2 and ERK1/2 signaling are required for this process."

For more information on this research see: Nrf2-AKT interactions regulate heme oxygenase 1 expression in kidney epithelia during hypoxia and hypoxia-reoxygenation. Mononuclear Leukocytes
Reports on Mononuclear Leukocytes Findings from Juntendo University Provide New Insights (Pathology of healing: what else might we look at?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mononuclear Leukocytes are presented in a new report. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Several aspects of the article by Morita et al. (Cancer Medicine 5: 1607-18, 2016), examining the spontaneous healing phenomenon with reference to tumor infiltrating lymphocytes (TILs), require clarification. The concept of 'healing', which can perhaps be more accurately termed 'regressive change', remains controversial due to a lack of concrete evidence."

The news correspondents obtained a quote from the research from Juntendo
University, "Since regressive change is characterized by fibrosis and lymphocytes, a cancer nest that appears to lack a distinct basement membrane, surrounded only by lymphocytes, as in Morita et al’s Figure 2F, should be meticulously examined because the appearance may correspond to a tumor having just completed the process of invasion. In our experience, a layer of myoepithelial cells in such foci is often difficult to detect even with immunohistochemistry. Thus, we suggest evaluating the viability of cancer cells within the nest by employing several markers, such as Ki67 and apoptotic markers, to judge whether the tumor is intraductal. It might also be useful to compare cases with versus without regressive change to elucidate the biology of such tumors."

According to the news reporters, the research concluded: "For these reasons, a tumor, floating within a pool of TILs and lacking obvious fibrous bands, might be an interesting material to examine in future studies."

Our news journalists report that additional information may be obtained by contacting Y. Horimoto, Juntendo University, Dept. of Pathol & Oncol, Sch Med, Tokyo, Japan. Additional authors for this research include T. Hayashi and A. Arakawa.

Kidney Diseases and Conditions - Multicystic…

Reports on Multicystic Dysplastic Kidney Findings from Guangzhou Medical University Provide New Insights (Prenatal diagnosis of fetal multicystic dysplastic kidney via high-resolution whole-genome array)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Kidney Diseases and Conditions - Multicystic Dysplastic Kidney are discussed in a new report. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Women with fetal multicystic dysplastic kidneys (MCDK) are commonly referred for genetic counseling, for which identification of the correct etiology is a prerequisite. A total of 72 women with fetal MCDK at Guangzhou Women and Children's Medical Center were examined via invasive prenatal diagnosis from May 2010 to June 2015."

Funders for this research include National Natural Science Foundation of China, Department of Science and Technology of Guangdong Province, Bureau of Science and Technology of Guangzhou Municipal.

The news reporters obtained a quote from the research from Guangzhou Medical
University, "Standard karyotyping analysis was provided to all fetuses, and chromosomal microarray with Affymetrix CytoSan HD arrays was offered to cases whose DNA samples were available. Abnormal karyotypes were detected in 3 of 72 (4.17%) fetuses. Of the 69 (95.8%, 69/72) fetuses with normal karyotypes, 30 (42%, 30/69) underwent chromosome microarray analysis (CMA) testing. The CMA identified pathogenic copy number variations in five fetuses, leading to a pathogenic detection rate of 16.7% (5/30). Well-known microdeletion or microduplication syndromes including renal cysts and diabetes (RCAD) syndrome and Williams-Beuren syndrome (WBS) were identified in three cases. Moreover, four chromosomal imbalanced regions were also identified in our MCDK fetuses: 22q11.1 duplication, 4q35.2 deletion, 22q13.33 duplication and 1p33 duplication. Genes PEX26, ELN, HNF1B, ALG12, FRG1, FRG2 and CYP4A11 were possible candidates for fetal MCDK. The proportions of variants of unknown significance before and after parental analysis were 13.3% (4/30) and 3.3% (1/30), respectively. In the present study, the frequency of chromosomal abnormalities in MCDK fetuses was 4.17% and all rearrangements were imbalanced aberrations. CMA was able to increase the pathogenic detection rate to 16.7% in MCDK fetuses with normal karyotype. Critical regions for RCAD syndrome, WBS and copy number variants of 22q11.1 duplication, 4q35.2 deletion, 22q13.33 duplication and 1p33 duplication were associated with fetal MCDK.

According to the news reporters, the research concluded: "Genes PEX26, ELN, HNF1B, ALG12, FRG1, FRG2 and CYP4A11 were possible candidates for fetal MCDK."

Our news correspondents report that additional information may be obtained by contacting C. Liao, Guangzhou Med Univ, Dept. of Prenatal Diagnost Center, Guangzhou Women & Childrens Med Center, Guangzhou, Guangdong, People's Republic of China. Additional authors for this research include F.F. Chen, R. Li, Y.L. Zhang, M. Pan, D.Z. Li and C. Liao.

Nephrology

Reports on Nephrology Findings from University Hospital Provide New Insights (Therapeutic nuclear shuttling of YB-1 reduces renal damage and fibrosis)
Research findings on Nephrology are discussed in a new report. According to news reporting from Aachen, Germany, by NewsRx journalists, research stated, "Virtually all chronic kidney diseases progress towards tubulointerstitial fibrosis. In vitro, Y-box protein-1 (YB-1) acts as a central regulator of gene transcription and translation of several fibrosis-related genes."

The news correspondents obtained a quote from the research from University Hospital, "However, it remains to be determined whether its pro- or antifibrotic propensities prevail in disease. Therefore, we investigated the outcome of mice with half-maximal YB-1 expression in a model of renal fibrosis induced by unilateral ureteral obstruction. Yb1(+/-) animals displayed markedly reduced tubular injury, immune cell infiltration and renal fibrosis following ureteral obstruction. The increase in renal YB-1 was limited to a YB-1 variant nonphosphorylated at serine 102 but phosphorylated at tyrosine 99. During ureteral obstruction, YB-1 localized to the cytoplasm, directly stabilizing Collal mRNA, thus promoting fibrosis. Conversely, the therapeutic forced nuclear compartmentalization of phosphorylated YB-1 by the small molecule HSc025 mediated repression of the Collal promoter and attenuated fibrosis following ureteral obstruction. Blunting of these effects in Yb1(+/-) mice confirmed involvement of YB-1. HSc025 even reduced tubulointerstitial damage when applied at later time points during maximum renal damage. Thus, phosphorylation and subcellular localization of YB-1 determines its effect on renal fibrosis in vivo."

According to the news reporters, the research concluded: "Hence, induced nuclear YB-1 shuttling may be a novel antifibrotic treatment strategy in renal diseases with the potential of damage reversal."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.kint.2016.07.008. This DOI is a link to an online electronic document that is either free or for purchase.

Reports on Neurochemistry Findings from Technical University Provide New Insights (Chronic consumption of Annona muricata juice triggers and aggravates cerebral tau phosphorylation in wild-type and MAPT transgenic mice)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neuroscience - Neurochemistry. According to news reporting out of Munich, Germany, by NewsRx editors, research stated, "In the pathogenesis of tauopathies, genetic and environmental factors have been identified. While familial clustering led to the identification of mutations in MAPT encoding the microtubule-associated protein tau, the high incidence of a sporadic tauopathy endemic in Guadeloupe was linked to the plant-derived mitochondrial complex I inhibitor annonacin."

Funders for this research include Deutsche Forschungsgemeinschaft, Marie Curie Incoming Fellowship, French Ministry of Research, Forderverein Neurologie Marburg, Gemeinnutzige Hertie-Stiftung.

Our news journalists obtained a quote from the research from Technical University, "The interaction of both factors was studied in the present work in a realistic paradigm over a period of 12months. Mice over-expressing either human wild-type tau or R406W mutant tau as well as non-transgenic mice received either regular drinking water or commercially available tropical fruit juice made of soursop (Annona muricata L.) as dietary source of neurotoxins. HPLC-MS analysis of this juice identified several Annonaceous acetogenins, mainly annonacin (16.2mg/L), and 41 isoquinoline alkaloids (18.0mg/L, mainly asimilobine and reticuline). After 12month of juice consumption, several brain regions showed an increased number of neurons with phosphorylated tau in the somatodendritic compartment of R406W mice and, to a much lesser extent, of non-transgenic mice and mice over-expressing human wild-type tau. Moreover, juice drinking was associated with a reduction in synaptophysin immunoreactivity, as well as an increase in 3-nitrotyrosine (3NT) reactivity in all three genotypes. The increase in 3NT suggests that Annona muricata juice promotes the generation of reactive nitrogen species."

According to the news editors, the research concluded: "This study provides first experimental evidence that long-lasting oral ingestion of a widely consumed environmental factor can induce somatodendritic accumulation of hyperphosphorylated tau in mice expressing rodent or human wild-type tau, and can accelerate tau pathology in R406W-MAPT transgenic mice."

Our news journalists report that additional information may be obtained by contacting G.U. Hoglinger, Technical University of Munich, Dept. of Neurol, Munich, Germany. Additional authors for this research include M. Haegel, B. Jainsch, H. Xu, G. Respondek, M. Hollerhage, T.W. Rosler, E. Bony, J. Le Ven, V. Guerineau, I. Schmitz-Afonso, P. Champy, W.H. Oertel, E.S. Leukocyte Diseases and Conditions - Neutropenia

Reports on Neutropenia from Erasmus University Provide New Insights (Role of genetic variation in docetaxel-induced neutropenia and pharmacokinetics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Leukocyte Diseases and Conditions - Neutropenia are discussed in a new report. According to news reporting originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "Docetaxel is used for treatment of several solid malignancies. In this study, we aimed for predicting docetaxel clearance and docetaxel-induced neutropenia by developing several genetic models."

Our news editors obtained a quote from the research from Erasmus University, "Therefore, pharmacokinetic data and absolute neutrophil counts (ANCs) of 213 docetaxel-treated cancer patients were collected. Next, patients were genotyped for 1936 single nucleotide polymorphisms (SNPs) in 225 genes using the drug-metabolizing enzymes and transporters platform and thereafter split into two cohorts. The combination of SNPs that best predicted severe neutropenia or low clearance was selected in one cohort and validated in the other. Patients with severe neutropenia had lower docetaxel clearance than patients with ANCs in the normal range (P = 0.01). Severe neutropenia was predicted with 70% sensitivity. True low clearance (1 s.d. < mean clearance) was identified in 80% of cases. These models however did not reach statistical significance."

According to the news editors, the research concluded: "To improve the predictive value of these models, the addition of non-genetic influencing factors is needed."

The news editors report that additional information may be obtained by contacting R.H.N. van Schaik, Erasmus University, Medical Center, Dept. of Clin Chem, Rotterdam, Netherlands. Additional authors for this research include M. Smid, A.J. de Graan, S. Elbouazzaoui, P. de Bruijn, F. Eskens, P. Hamberg, J.W.M. Martens, A. Sparreboom, R. de Wit, R.H.N. van Schaik and R.H.J. Mathijssen.

Oncology - Non-Small Cell Lung Cancer

Reports on Non-Small Cell Lung Cancer Findings from Wake Forest Baptist Medical Center Provide New Insights (Recurrence and Survival After Segmentectomy in Patients With Prior Lung Resection for Early-Stage Non-Small Cell Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news reporting originating from Winston Salem, North Carolina, by NewsRx correspondents, research stated, "Lobectomy is the standard of care for patients with early-stage non-small cell lung cancer (NSCLC). However, the treatment of choice for patients with prior lung resection and a second primary NSCLC has not been established."

Our news editors obtained a quote from the research from Wake Forest Baptist Medical Center, "We compared rates and patterns of recurrence and survival in patients with and without prior lung resection treated by segmentectomy and determined predictors of recurrence. This was a retrospective cohort study of 90 patients who underwent 91 consecutive segmentectomies for early-stage NSCLC between April 2004 and December 2014. Logistic regression was used to determine predictors of recurrence, and Kaplan-Meier curves were used to determine survival. Of the 91 segmentectomies, 21 (23%) had a prior lung cancer resection and 70 (77%) were primary resections. There were 18 recurrences (20%): 9 of 21 (43%) in those with prior lung resection and 9 of 70 (13%) in those without. The 90-day mortality was 0%. The recurrence-free survival and 5-year survival were 61% and 55% in those with prior lung resection and 9 of 70 (13%) in those without. The 90-day mortality was 0%. The recurrence-free survival and 5-year survival were 61% and 55% in those with prior lung resection (p = 0.09) and 84% and 65% in those without (p = 0.4). Close parenchymal margin and number of lymph nodes examined were significant modifiable predictors of recurrence. Segmentectomy is a reasonable option for patients with early-stage NSCLC who have had a prior lung resection."

According to the news editors, the research concluded: "It results in similar survival but trends toward lower recurrence-free survival compared with patients undergoing primary resection."

The news editors report that additional information may be obtained by contacting B.E. Louie, Wake Forest Baptist Med Center, Dept. of Cardiothorac Surg, Winston Salem, NC, United States. Additional authors for this research include B.E. Louie, N. Jackson, A.S. Farivar, R.W. Aye and E. Vallieres.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.04.037. This DOI is a link to an online electronic document that is either free or for purchase.

Reports on Non-Small Cell Lung Cancer from Hebei Medical University Provide New Insights (Detection of cancer specific mutations in early-stage non-small cell lung cancer using cell-free DNA by targeted sequencing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news reporting out of Shijiazhuang, People's Republic of China, by NewsRx editors, research stated, "Non-small cell lung cancer (NSCLC) is a major public health problem worldwide and leads to a high mortality. NSCLC is always diagnosed in late stages because of its unapparent symptoms."

Our news journalists obtained a quote from the research from Hebei Medical University, "However, cell-free DNA (cfDNA) may serve as a new potential biomarker to detect early stage of non-small cell lung cancer. Here we recruited 10 non-small cell lung cancer patients to obtain fresh tumor tissue, peripheral blood lymphocytes (PBLs), and plasma. CfDNAs from 13 elderly people and 7 middle-age smokers were also extracted as controls. Illumina HiSeq X10 was used to perform next generation sequencing to evaluate differences in mutations among different samples. The result indicated that tumor DNA and its matched plasma cfDNA samples showed high concordance in their mutation patterns. Mutation rate of cfDNA was generally lower than that of tumor tissue and higher than that of PBLs. The plasma cfDNA concentration of NSCLC patients (69.2 +/- 46.9 ng/ml) is significantly higher than that of elderly people (32.5 +/- 5.2 ng/ml, t=2.96, p=0.007) and middle-aged smokers (17.9 9.1 ng/ml, t=2.83, p=0.013). Five mutations (PTEN_c.1375A >G, TP53_c.94G >A, STK11_c.816C >T, PIK3CA_c.1633 G>A, PIK3CA_c.2038G >C) were only identified in NSCLC patients but not in healthy people. Our conclusion was that cfDNA has a similar mutation pattern with its matched tumor tissue DNA."

According to the news editors, the research concluded: "A high concentration of cfDNA and tumor specific mutations in cfDNA may serve as potential non-invasive biomarkers to detect early-stage non-small cell lung cancer."

Our news journalists report that additional information may be obtained by contacting B.E. Shan, Hebei Medical University, Hosp 4, Tumor Hosp Hebei Prov, Shijiazhuang 050011, Hebei, People's Republic of China. Additional authors for this research include X.Y. Zhang, L.Q. Wang, Z.Q. Tian, Q.Y. Liu, J.F. Yao, Y.P. Liu, C.B. Li, L. Min and B.E. Shan.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Orlistat Therapy have been published. According to news reporting out of Omaha, Nebraska, by NewsRx editors, research stated, "Fatty acid synthase (FASN), the enzyme that catalyzes de novo synthesis of fatty acids, is expressed in many cancer types. Its potential as a therapeutic target is well recognized, but inhibitors of FASN have not yet been approved for cancer therapy."

Funders for this research include National Cancer Institute, National Center for Research Resources, National Heart, Lung, and Blood Institute, National Institute of Biomedical Imaging and Bioengineering.

Our news journalists obtained a quote from the research from the University of Nebraska Medical Center, "Orlistat (ORL), an FDA-approved lipase inhibitor, is also an effective inhibitor of FASN. However, ORL is extremely hydrophobic and has low systemic uptake after oral administration. Thus, new strategies are required to formulate ORL for cancer treatment as a FASN inhibitor. Here, we report the development of a nanoparticle (NP) formulation of ORL using amphiphilic bioconjugates that are derived from hyaluronic acid (HA), termed Nano-ORL. The NPs were loaded with up to 20 wt % weight of ORL at greater than 95% efficiency. The direct inhibition of the human recombinant thioesterase domain of FASN by ORL extracted from Nano-ORL was similar to that of stock ORL. Nano-ORL demonstrated a similar ability to inhibit cellular FASN activity when compared to free ORL, as demonstrated by analysis of (14)C-acetate incorporation into lipids. Nano-ORL treatment also disrupted mitochondrial function similarly to ORL by reducing adenosine triphosphate turnover in MDA-MB-231 and LNCaP cells. Nano-ORL demonstrated increased potency compared to ORL toward prostate and breast cancer cells. Nano-ORL decreased viability of human prostate and breast cancer cell lines to 55 and 57%, respectively, while free ORL decreased viability to 71 and 79% in the same cell lines. Moreover, Nano-ORL retained cytotoxic activity after a 24 h preincubation in aqueous conditions. Preincubation of ORL dramatically reduced the efficacy of ORL as indicated by high cell viability (>85%) in both breast and prostate cell lines."

According to the news editors, the research concluded: "These data demonstrate that NP formulation of ORL using HA-derived polymers retains similar levels of FASN, lipid synthesis, and ATP turnover inhibition while significantly improving the cytotoxic activity against cancer cell lines."

Our news journalists report that additional information may be obtained by contacting T.K. Hill, Dept. of Pharmaceutical Sciences, Biochemistry and Molecular Biology and the Fred and Pamela Buffett Cancer Center, University of Nebraska Medical Center.
Omaha, Nebraska 68198, United States. Additional authors for this research include A.L. Davis, F.B. Wheeler, S.S. Kelkar, E.C. Freund, W.T. Lowther, S.J. Kridel and A.M Mohs.

Musculoskeletal Diseases and Conditions - …

Reports on Osteoarthritis Findings from University of Bristol Provide New Insights (Differential effects of altered patterns of movement and strain on joint cell behaviour and skeletal morphogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Musculoskeletal Diseases and Conditions - Osteoarthritis are discussed in a new report. According to news reporting from Bristol, United Kingdom, by NewsRx journalists, research stated, "There is increasing evidence that joint shape is a potent predictor of osteoarthritis (OA) risk; yet the cellular events underpinning joint morphogenesis remain unclear. We sought to develop a genetically tractable animal model to study the events controlling joint morphogenesis."

Financial supporters for this research include Wellcome Trust Dynamic Cell, MRC project, ARUK.

The news correspondents obtained a quote from the research from the University of Bristol, "Zebrafish larvae were subjected to periods of flaccid paralysis, rigid paralysis or hyperactivity. Immunohistochemistry and transgenic reporters were used to monitor changes to muscle and cartilage. Finite Element Models were generated to investigate the mechanical conditions of rigid paralysis. Principal component analysis was used to test variations in skeletal morphology and metrics for shape, orientation and size were applied to describe cell behaviour. We show that flaccid and rigid paralysis and hypermobility affect cartilage element and joint shape. We describe differences between flaccid and rigid paralysis in regions showing high principal strain upon muscle contraction. We identify that altered shape and high strain occur in regions of cell differentiation and we show statistically significant changes to cell maturity occur in these regions in paralysed and hypermobile zebrafish. While flaccid and rigid paralysis and hypermobility affect skeletal morphogenesis they do so in subtly different ways. We show that some cartilage regions are unaffected in conditions such as rigid paralysis where static force is applied, whereas joint morphogenesis is perturbed by both flaccid and rigid paralysis; suggesting that joints require dynamic movement for accurate morphogenesis."

According to the news reporters, the research concluded: "A better understanding of how biomechanics impacts skeletal cell behaviour will improve our understanding of how foetal mechanics shape the developing joint."

For more information on this research see: Differential effects of altered patterns of movement and strain on joint cell behaviour and skeletal morphogenesis. Osteoarthritis and Cartilage, 2016;24(11):1940-1950. Osteoarthritis and Cartilage can be contacted at: Elsevier
Reports on Palliative and Supportive Care Findings from J. Lambden and Co-Researchers Provide New Insights (Accuracy of Oncologists' Life-Expectancy Estimates Recalled by Their Advanced Cancer Patients: Correlates and Outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Palliative and Supportive Care. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Oncologists are often reluctant to discuss life-expectancy estimates with their patients because of concerns about their inaccuracy and limited evidence regarding benefits. Determine oncologist accuracy in predicting their advanced cancer patients' life expectancy and correlates associated with accuracy."

The news correspondents obtained a quote from the research, "Multicenter prospective, longitudinal study of patients with advanced cancer, assessed once at baseline and followed to death. At baseline, patients were asked whether their oncologist had provided them with a life-expectancy estimate. Setting/Subjects: Eighty-five patients with advanced cancer recruited from outpatient cancer clinics. Patients' baseline sociodemographic and time to death, and clinical characteristics were examined to determine their associations with the accuracy of the oncologists' life-expectancy estimates as recalled by their patients. Seventy-four percent (63/85) of patients recalled that physician life-expectancy estimates were accurate to within a year; estimates were most accurate when patients had 9-12 months to live. Factors significantly (p <0.05) positively associated with oncologists' greater accuracy to within a year were the patient's age, recruitment from a community-based oncology clinic, poor performance status, and quality-of-life at baseline. Oncologists' prognoses that were accurate to within a year were associated with greater likelihood of patients, at baseline, acknowledging that they were terminally ill (OR=12.20, 95% CI=2.24-66.59), engaging in an end-of-life discussion (OR=4.22, 95% CI=1.45-12.29), completing a do-not-resuscitate (DNR) order (OR=2.94, 95% CI=1.03-8.41), a lower likelihood of using palliative chemotherapy (OR=0.30, 95% CI=0.11-0.85), and clinical trial enrollment (OR=0.09, 95% CI=0.02-0.50). Oncologists are able to estimate their patients' life expectancy to within a year."
According to the news reporters, the research concluded: "Accuracy to within a year is associated with higher rates of DNR order completion, advance care planning, and lower likelihood of chemotherapy use near death."

Our news journalists report that additional information may be obtained by contacting H.G. Prigerson, Weill Cornell Med, Center Res End Of Life Care, New York, NY 10065, United States. Additional authors for this research include B.H. Zhang, R. Friedlander and H.G. Prigerson.

**Oncology - Pancreatic Cancer**

**Reports on Pancreatic Cancer Findings from M.D. Anderson Cancer Center Provide New Insights (Benefit and risk of primary thromboprophylaxis in ambulatory patients with advanced pancreatic cancer receiving chemotherapy: a systematic review and ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Pancreatic Cancer have been published. According to news originating from Brooklyn, New York, by NewsRx correspondents, research stated, "As vascular thromboembolism (VTE) is a leading cause of death in cancer patients, it has been postulated that primary thromboprophylaxis (PTP) in cancer patients might improve survival by reducing VTE occurrence. We performed a systemic review and meta-analysis of randomized controlled trials (RCTs) to investigate the benefit and risk of PTP with low-molecular-weight heparins (LMWHs) in ambulatory advanced pancreatic cancer (APC) patients receiving chemotherapy."

Our news journalists obtained a quote from the research from M.D. Anderson Cancer Center, "We undertook a literature search using MEDLINE and EMBASE databases through May 2015. RCTs with reduction in symptomatic VTE as a primary or secondary endpoints were included. Mantel-Haenszel method was used to estimate the pooled event-based risk ratio as well as the pooled absolute risk difference with 95% confidence interval (CI). Seven hundred and thirty-eight APC patients were eligible for analysis. PTP lasted 3-6 months. The crude VTE incidence was 2.1 and 11.2% in LMWH and in control groups, respectively (risk ratio, 0.18; 95% CI, 0.083-0.39; p<0.0001). The absolute risk difference in VTE was -0.092 (95% CI, -0.127 to -0.057; p<0.0001), with an estimated number needed to treat of 11 patients to prevent
one symptomatic VTE event. The pooled risk ratio for major bleeding was 1.25 (95% CI, 0.48-3.3, p=0.65). Although these findings are encouraging to deploy PTP in APC patients receiving chemotherapy, uncertainties remain as to its survival benefit, optimal PTP duration, type and dose of LMWH, and costs of care."

According to the news editors, the research concluded: "Therefore, adequately powered randomized phase III studies are warranted to address these questions."

For more information on this research see: Benefit and risk of primary thromboprophylaxis in ambulatory patients with advanced pancreatic cancer receiving chemotherapy: a systematic review and meta-analysis of randomized controlled trials. Blood Coagulation & Fibrinolysis, 2016;27(3):270-4. (Lippincott Williams and Wilkins - www.lww.com; Blood Coagulation & Fibrinolysis - journals.lww.com/bloodcoagulation/pages/default.aspx)

**Peptides and Proteins**

**Reports on Peptides and Proteins Findings from State University of New York Provide New Insights (The DNA Damage Transducer RNF8 Facilitates Cancer Chemoresistance and Progression through Twist Activation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Peptides and Proteins are presented in a new report.

According to news reporting originating in Stony Brook, New York, by NewsRx journalists, research stated, "Twist has been shown to cause treatment failure, cancer progression, and cancer-related death. However, strategies that directly target Twist are not yet conceivable."

The news reporters obtained a quote from the research from the State University of New York, "Here we reveal that K63-linked ubiquitination is a crucial regulatory mechanism for Twist activation. Through an E3 ligase screen and biochemical studies, we unexpectedly identified that RNF8 functions as a direct Twist activator by triggering K63-linked ubiquitination of Twist. RNF8-promoted Twist ubiquitination is required for Twist localization to the nucleus for subsequent EMT and CSC functions, thereby conferring chemoresistance. Our histological analyses showed that RNF8 expression is upregulated and correlated with disease progression, EMT features, and poor patient survival in breast cancer. Moreover, RNF8
regulates cancer cell migration and invasion and cancer metastasis, recapitulating the effect of Twist."

According to the news reporters, the research concluded: "Together, our findings reveal a previously unrecognized tumor-promoting function of RNF8 and provide evidence that targeting RNF8 is an appealing strategy to tackle tumor aggressiveness and treatment resistance."

For more information on this research see: The DNA Damage Transducer RNF8 Facilitates Cancer Chemoresistance and Progression through Twist Activation. Molecular Cell, 2016;63(6):1021-1033. Molecular Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Molecular Cell - www.journals.elsevier.com/molecular-cell/)

Peptides and Proteins

Reports on Peptides and Proteins from University of Kent Provide New Insights (Efficient targeting of recombinant proteins to the thylakoid lumen in Chlamydomonas reinhardtii using a bacterial Tat signal peptide)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Peptides and Proteins is the subject of a report. According to news originating from Kent, United Kingdom, by NewsRx correspondents, research stated, "Interest in the exploitation of microalgae for biotechnological applications has increased over the last decade, and microalgae are now viewed as offering a sustainable alternative to traditionally used host chassis. A number of recombinant proteins have been expressed in genetically modified algal strains, with the green alga Chlamydomonas reinhardtii being a particularly popular host strain."

Our news journalists obtained a quote from the research from the University of Kent, "While nuclear transformation is possible with this organism, chloroplast transformation offers more reliable expression, and several proteins have been expressed in the stroma. Here, we present the first utilisation of the thylakoid lumen for recombinant protein production in microalgae. A bacterial export signal peptide was used to efficiently translocate two recombinant proteins, a fluorescent reporter protein (pHRed) and a biopharmaceutical model substrate (scFv) into the thylakoid lumen."

According to the news editors, the research concluded: "This approach expands the
algal chloroplast genetic toolkit and offers a means of expressing proteins that are difficult to
express in the stroma for reasons of toxicity, stability or a requirement for disulphide bonding."

For more information on this research see: Efficient targeting of recombinant
proteins to the thylakoid lumen in Chlamydomonas reinhardtii using a bacterial Tat signal
peptide. *Algal Research-Biomass Biofuels and Bioproducts*, 2016;19():57-62. *Algal Research-

**Periodontal Diseases and Conditions - Periodontitis**

**Reports on Periodontitis Findings from Okayama University Provide
New Insights (Visualization of Oxidative Stress Induced by
Experimental Periodontitis in Keap1-Dependent Oxidative Stress
Detector-Luciferase Mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- New research on Periodontal Diseases and Conditions - Periodontitis is the
subject of a report. According to news reporting originating in Okayama, Japan, by NewsRx
journalists, research stated, "The aim of this study was to investigate whether a Keap1-
dependent oxidative stress detector-luciferase (OKD-LUC) mouse model would be useful for
the visualization of oxidative stress induced by experimental periodontitis. A ligature was
placed around the mandibular first molars for seven days to induce periodontitis."

The news reporters obtained a quote from the research from Okayama University,
"Luciferase activity was measured with an intraperitoneal injection of D-luciferin on days 0, 1,
and 7. The luciferase activity in the periodontitis group was significantly greater than that in the
control group at seven days. The expressions of heme oxygenase-1 (HO-1) and malondialdehyde
in periodontal tissue were significantly higher in the periodontitis group than in the control
group. Immunofluorescent analysis confirmed that the nuclear translocation of nuclear factor
erythroid 2-related factor 2 (Nrf2) occurred more frequently in the periodontitis group than in the
control group. This study found that under oxidative stress induced by experimental
periodontitis, the Nrf2/antioxidant defense pathway was activated and could be visualized from
the luciferase activity in the OKD-LUC model."

According to the news reporters, the research concluded: "Thus, the OKD-LUC
mouse model may be useful for exploring the mechanism underlying the relationship between
the Nrf2/antioxidant defense pathway and periodontitis by enabling the visualization of
oxidative stress over time."
For more information on this research see: Visualization of Oxidative Stress Induced by Experimental Periodontitis in Keap1-Dependent Oxidative Stress Detector-Luciferase Mice. *International Journal of Molecular Sciences*, 2016;17(11):2128-2138. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Our news correspondents report that additional information may be obtained by contacting K. **Reports on Peroxisome Proliferator-Activated Receptors Findings from Harvard School of Medicine Provide New Insights (Molecular Pathways: Dietary Regulation of Stemness and Tumor Initiation by the PPAR-delta Pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Proteins - Peroxisome Proliferator-Activated Receptors are presented in a new report. According to news reporting from Boston, Massachussets, by NewsRx journalists, research stated, "Peroxisome proliferator-activated receptor delta (PPAR-delta) is a nuclear receptor transcription factor that regulates gene expression during development and disease states, such as cancer. However, the precise role of PPAR-delta during tumorigenesis is not well understood."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "Recent data suggest that PPAR-delta may have context-specific oncogenic and tumor-suppressive roles depending on the tissue, cell-type, or diet-induced physiology in question. For example, in the intestine, pro-obesity diets, such as a high-fat diet (HFD), are associated with increased colorectal cancer incidence. Interestingly, many of the effects of an HFD in the stem and progenitor cell compartment are driven by a robust PPAR-delta program and contribute to the early steps of intestinal tumorigenesis. Importantly, the PPAR-delta pathway or its downstream mediators may serve as therapeutic intervention points or biomarkers in colon cancer that arise in patients who are obese."

According to the news reporters, the research concluded: "Although potent PPAR-delta agonists and antagonists exist, their clinical utility may be enhanced by uncovering how PPAR-delta mediates tumorigenesis in diverse tissues and cell types as well as in response to diet."

For more information on this research see: Molecular Pathways: Dietary Regulation of Stemness and Tumor Initiation by the PPAR-delta Pathway. *Clinical Cancer Research*, 2016;22(23):5636-5641. *Clinical Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. (American
Reports on Pharmacokinetics Findings from Central University Provide New Insights (Promises of a biocompatible nanocarrier in improved brain delivery of quercetin: Biochemical, pharmacokinetic and biodistribution evidences)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Pharmacokinetics. According to news reporting out of Rajasthan, India, by NewsRx editors, research stated, "In various neurological disorders, antioxidants are frequently prescribed along with the specific treatment modalities. One such promising natural flavonoid is quercetin, offering better outcomes than established vitamins E and C. Though with immense promises, various challenges like poor oral-bioavailability (<2%), extensive first-pass metabolism, poor brain permeability, hydrophobic nature and physiological pH instability hinder its proper usage."

Our news journalists obtained a quote from the research from Central University, "Hence, it was planned to prepare quercetin-loaded nano lipidic carriers (NLCs) employing biocompatible components like phospholipids and tocopherol acetate for enhanced brain delivery. The outcomes were also compared with solid lipid nanoparticles (SLNs) of comparable composition. Both the nanocolloids offered better drug loading and controlled drug release with appreciable stability. In vitro antioxidant performance was improved after encapsulation in nanoparticles and the nanoparticles were substantially uptaken by Caco-2 cells. The difference in outcomes was vivid in pharmacokinetic studies, where nanoparticles, esp. NLCs substantially enhanced the relative bioavailability (approx. 6 folds), biological residence (2.5 times) and appreciably retarded the drug clearance (approx. 6 folds). On the other hand, both nanoparticles were able to substantially deliver the drug to brain. NLCs were observed to enhance the brain permeability of drug in a noticeable manner."

According to the news editors, the research concluded: "SLNs/NLCs can offer a better-platform for brain-delivery of quercetin."

Our news journalists report that additional information may be obtained by
contacting K. Raza, Cent Univ Rajasthan, Sch Chem Sci & Pharm, Dept. of Pharm, Bandar Sindri 305817, Rajasthan, India. Additional authors for this research include G. Sharma, R. Kumar, B. Singh, R. Malik, O.P. Katare and K. Raza.

Pharmacokinetics

Reports on Pharmacokinetics Findings from Shenyang Pharmaceutical University Provide New Insights (Pharmacokinetic parameters of three active ingredients hederacoside C, hederacoside D, and alpha-hederin in Hedera helix in rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Pharmacokinetics. According to news reporting from Shenyang, People's Republic of China, by NewsRx journalists, research stated, "In Hedera helix hederacoside C, hederacoside D, and alpha-hederin are three major bioactive saponins and play pivotal roles in the overall biological activity. In this study, a specific and sensitive ultra-high performance liquid chromatography with tandem mass spectrometry method has been developed and validated for the quantification of three major bioactive saponins in rat plasma."

The news correspondents obtained a quote from the research from Shenyang Pharmaceutical University, "Chromatographic separation was performed on a reversed-phase Thermo Hypersil GOLD C-18 column (2.1 mm x 50 mm, 1.9 mu m) using a gradient mobile phase system of acetonitrile-water containing 0.1% formic acid. The assay was successfully applied to study the pharmacokinetic behavior of the three analytes in rats after oral and intravenous administration of a mixture of saponins (hederacoside C, hederacoside D, and.-hederin). Further research was performed to compare the pharmacokinetic behavior of the three analytes after the oral administration of a mixture of saponins and an extract of saponins from Hedera helix, and results showed that double peaks were evident on concentration-time profile for each of the three saponins."

According to the news reporters, the research concluded: "The difference in the pharmacokinetic characteristics of three saponins between a mixture of saponins and an extract of saponins from Hedera helix was found in rat, which would be beneficial for the preclinical research and clinical use of Hedera helix."

Our news journalists report that additional information may be obtained by contacting Z.G. Yu, Shenyang Pharmaceutical University, Sch Pharm, Shenyang 110016, People's Republic of China. Additional authors for this research include J.X. Liu, L. Li, H.Y. Xu, Y.Y. Xing, Y.L. Zhao and Z.G. Yu.

Pharmacokinetics

Reports on Pharmacokinetics from Center for Disease Control and Prevention Provide New Insights (Co-administration of St. John's wort and hormonal contraceptives: a systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pharmacokinetics have been published. According to news originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "St. John's wort (SJW) is a known strong inducer of the cytochrome P450 (CYP) 3 A4 enzyme, and both the ethinyl estradiol and progestin components of hormonal contraceptives are substrates of CYP3A4."

Our news journalists obtained a quote from the research from Center for Disease Control and Prevention, "This systematic review examined whether the co-administration of SJW and hormonal contraceptives leads to significant safety or efficacy concerns. Systematic review. PubMed and Cochrane Library databases were searched for articles of any comparative study design (clinical or pharmacokinetic) that examined potential interactions between SJW and hormonal contraceptives in women of reproductive age. Of the 48 identified articles, four studies met inclusion criteria and compared use of combined oral contraceptives (COCs) alone to the use of COCs co-administered with SJW. Two studies demonstrated no change in markers of ovulation, but one study demonstrated increased follicular growth and probable ovulation when COCs were co-administered with SJW. Three studies demonstrated an increased risk of breakthrough bleeding with COCs and SJW. Three studies showed changes in at least one pharmacokinetic parameter that suggested a significantly decreased exposure to hormone concentrations when COCs were co-administered with SJW. The only study that did not demonstrate any significant pharmacokinetic differences examined a SJW product containing a low amount of hypericin. Limited evidence showing increased risk of ovulation and breakthrough bleeding raises concern for decreased contraceptive efficacy when COCs are co-administered with SJW."

According to the news editors, the research concluded: "The pharmacokinetic evidence is mixed but suggests that SJW administration may be associated with weak to moderate induction of the metabolism of COCs."

The news correspondents report that additional information may be obtained from
E.N. Berry-Bibee, Center Dis Control & Prevent, Div Reprod Hlth, Atlanta, GA 30333, United States. Additional authors for this research include M.J. Kim, N.K. Tepper, H.E.M. Riley and K.M. Curtis.

Pharmacology

Reports on Pharmacology from Jagiellonian University Provide New Insights (The unethical use of ethical rhetoric: the case of flibanserin and pharmacologisation of female sexual desire)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacology have been presented. According to news reporting from Krakow, Poland, by NewsRx journalists, research stated, "The current debate around sexual dysfunctions focuses mostly on the pharmacological regulation of lowered sexual desire in women. The Food and Drug Administration approval of the first drug-Addyi-to treat this condition was preceded by a campaign, in which ethically saturated arguments were used to lobby policy makers."

The news correspondents obtained a quote from the research from Jagiellonian University, "This article provides a critical evaluation of these arguments. In particular, we focus our attention on deceitful and unethical use of moral arguments and concepts. First, we present the context in which hypoactive sexual desire disorder is defined as a serious medical condition, showing how non-medical and non-scientific influences shaped the understanding of the problem. Further, we demonstrate how in current discussions regarding lower sexual interest attention has been shifted from psychosocial to pharmacological solutions and we trace the ethical consequences of such a change. We argue that, in addition to typical detrimental effects of overmedicalisation, there are new serious perils. In particular, we demonstrate that it is highly probable that pharmacologisation of female desire-contrary to the emancipatory declarations of the drug proponents-exerts pressure on women and narrows the range of potential choices they can make."

According to the news reporters, the research concluded: "As a result, it is inconsistent with the very idea of free choice."

For more information on this research see: The unethical use of ethical rhetoric: the case of flibanserin and pharmacologisation of female sexual desire. Journal of Medical Ethics, 2016;42(11):701-704. Journal of Medical Ethics can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. Reports on Physiology from University of Melbourne Provide New Insights (Programming of maternal and offspring disease: impact of growth restriction, fetal sex and transmission across generations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Life Science Research - Physiology. According to news originating from Parkville, Australia, by NewsRx correspondents, research stated, "Babies born small are at an increased risk of developing myriad adult diseases. While growth restriction increases disease risk in all individuals, often a second hit is required to unmask 'programmed' impairments in physiology."

Our news journalists obtained a quote from the research from the University of Melbourne, "Programmed disease outcomes are demonstrated more commonly in male offspring compared with females, with these sex-specific outcomes partly attributed to different placenta-regulated growth strategies of the male and female fetus. Pregnancy is known to be a major risk factor for unmasking a number of conditions and can be considered a 'second hit' for women who were born small. As such, female offspring often develop impairments of physiology for the first time during pregnancy that present as pregnancy complications. Numerous maternal stressors can further increase the risk of developing a maternal complication during pregnancy. Importantly, these maternal complications can have long-term consequences for both the mother after pregnancy and the developing fetus. Conditions such as preeclampsia, gestational diabetes and hypertension as well as thyroid, liver and kidney diseases are all conditions that can complicate pregnancy and have long-term consequences for maternal and offspring health. Babies born to mothers who develop these conditions are often at a greater risk of developing disease in adulthood. This has implications as a mechanism for transmission of disease across generations."

According to the news editors, the research concluded: "In this review, we discuss the evidence surrounding long-term intergenerational implications of being born small and/or experiencing stress during pregnancy on programming outcomes."

The news correspondents report that additional information may be obtained from M.E. Wlodek, University of Melbourne, Sch Biomed Sci, Fac Med Dental & Hlth Sci, Dept. of Physiol, Parkville, Vic 3010, Australia. Additional authors for this research include M.E. Wlodek, K.M. Moritz and J.S.M. Cuffe.

Platinum Compounds

Reports on Platinum Compounds from All India Institute of Medical Sciences Provide New Insights (Safety assessment and attenuation of cisplatin induced nephrotoxicity by tuberous roots of Boerhaavia diffusa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Platinum Compounds have been presented. According to news originating from New Delhi, India, by NewsRx correspondents, research stated, "Cisplatin (Cis-diaminedichloroplatinum II) is a chemotherapeutic agent having well documented adverse effect as nephrotoxicity. This study was designed to evaluate the nephroprotective role of Boerhaavia diffusa in cisplatin-induced acute kidney injury."

Our news journalists obtained a quote from the research from the All India Institute of Medical Sciences, "Wistar rats (n = 6) were allocated into six groups constituting normal control, cisplatin-induced, Boerhaavia diffusa root extract in doses 50, 100 and 200 mg/kg and Boerhaavia diffusa per se group, administered orally for a period of ten days. Intraperitoneal injection of cisplatin was administered on day 7, to all groups except normal control and Boerhaavia diffusa per se group. On day 10, cisplatin resulted in substantial nephrotoxicity in Wistar rats with significant (p < 0.001) elevation in serum creatinine and blood urea nitrogen, decline in the concentrations of reduced glutathione and superoxide dismutase, elevation in TNF-alpha level in renal tissues. Boerhaavia diffusa at a dose of 200 mg/kg body weight significantly (p < 0.001) ameliorates increased in serum creatinine, blood urea nitrogen, oxidative stress and inflammatory markers. In parallel to this, it also exhibits antiapoptotic activity through the reduction of active caspase-3 expression in kidneys. Findings indicate that Boerhaavia diffusa is effective in mitigating cisplatin-induced nephrotoxicity and thus, for this the acute and sub-acute toxicity studies conducted to evaluate the safety profile of Boerhaavia diffusa."

According to the news editors, the research concluded: "The no-observed adverse effect level (NOAEL) of tuberous roots of Boerhaavia diffusa root extract was 1000 mg/kg."

For more information on this research see: Safety assessment and attenuation of cisplatin induced nephrotoxicity by tuberous roots of Boerhaavia diffusa. Regulatory Toxicology and Pharmacology, 2016;81():341-352. Reports on Pneumococcal Disease from University of Bern Provide New Insights (Polysaccharide Capsule Composition of Pneumococcal Serotype 19A Subtypes Is Unaltered among Subtypes and Independent of the Nutritional Environment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pneumococcal Disease have been published. According to news originating from Bern, Switzerland, by NewsRx correspondents, research stated, "Serotype 19A strains have emerged as a cause of invasive pneumococcal disease after the introduction of the 7-valent pneumococcal conjugate vaccine (PCV7), and serotype 19A has now been included in the recent 13-valent vaccine (PCV13). Genetic analysis has revealed at least three different capsular serotype 19A subtypes, and nutritional environment-dependent variation of the 19A capsule structure has been reported."

Financial support for this research came from Swiss National Science Foundation.

Our news journalists obtained a quote from the research from the University of Bern, "Pneumococcal vaccine effectiveness and serotyping accuracy might be impaired by structural differences in serotype 19A capsules. We therefore analyzed the distribution of 19A subtypes collected within a Swiss national surveillance program and determined capsule composition under different nutritional conditions with high-performance liquid chromatography (HPLC), gas chromatography-mass spectrometry (GC-MS), and nuclear magnetic resonance (NMR) spectroscopy. After the introduction of PCV7, a significant relative increase of subtype 19A-II and decrease of 19A-I occurred. Chemical analyses showed no difference in the composition as well as the linkage of 19A subtype capsular saccharides grown in defined and undefined growth media, which is consistent with a trisaccharide repeat unit composed of rhamnose, N-acetyl-mannosamine, and glucose. In summary, our study suggests that no structural variance dependent of the nutritional environment or the subtype exists. The serotype 19A subtype shift observed after the introduction of the PCV7 can therefore not be explained by selection of a capsule structure variant."

According to the news editors, the research concluded: "However, capsule composition analysis of emerging 19A clones is recommended in cases where there is no other explanation for a selective advantage, such as antibiotic resistance or loss or acquisition of other virulence factors."

For more information on this research see: Polysaccharide Capsule Composition of Pneumococcal Serotype 19A Subtypes Is Unaltered among Subtypes and Independent of the Nutritional Environment. Infection and Immunity, 2016;84(11):3152-3160. Infection and Immunity can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Hematologic Diseases and Conditions - Polycythemia

Reports on Polycythemia Findings from Tel Aviv University Provide New Insights (Can middle cerebral artery peak systolic velocity predict polycythemia in monochorionic-diamniotic twins? Evidence from a prospective cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematologic Diseases and Conditions - Polycythemia. According to news reporting originating in Tel Aviv, Israel, by NewsRx journalists, research stated, "The antenatal diagnosis of twin anemia-polycythemia sequence (TAPS) in monochorionic-diamniotic (MCDA) twin pregnancies is based on elevated peak systolic velocity in the middle cerebral artery (MCA-PSV) in the donor twin and decreased MCA-PSV in the recipient twin. However, the association between these parameters and polycythemia has not yet been established."

The news reporters obtained a quote from the research from Tel Aviv University, "The aim of this study was to determine whether MCA-PSV can predict polycythemia in MCDA pregnancies. This was a prospective cohort study of MCDA pregnancies recruited at 14-18 weeks' gestation from a single tertiary care center between January 2011 and June 2014. Fetal MCA Doppler waveforms were recorded every 2 weeks from 18 weeks' gestation until delivery. Only those with an MCA-PSV measurement within 1 week of delivery were included in the analysis. Neonatal hematocrit level was determined in all twins from venous blood obtained within 4 h of delivery. Polycythemia was defined as a hematocrit of > 65%, and anemia as a hematocrit of < 45%. TAPS was diagnosed when an intertwin hemoglobin difference of > 8 g/dL and reticulocyte count ratio of > 1.7 were observed. Of 162 MCDA pregnancies followed during the study period, 69 had an MCA-PSV measurement within 1 week of delivery and were included in the study. Twenty-five neonates were diagnosed with polycythemia and nine twin pairs met the criteria for TAPS. In a pooled analysis, MCA-PSV was negatively correlated with neonatal hematocrit (P = 0.017, r = -0.215) and was significantly higher in anemic fetuses than in normal controls (1.15 multiples of the median (MoM) vs 1.02 MoM, respectively; P = 0.001). However, MCA-PSV was similar among polycythemic and normal fetuses (0.95 MoM vs 1.02 MoM, respectively; P = 0.47). Intertwin difference in MCA-PSV (delta MCA-PSV) was positively correlated with intertwin hematocrit difference (P = 0.002, r = 0.394). Moreover, twin pregnancies with an intertwin hematocrit difference of > 24% had a significantly greater delta
MCA-PSV than did those with an intertwin hematocrit difference of = 24% (delta MCA-PSV, 19 vs 5 cm/s; P< 0.001). MCA-PSV is not significantly decreased in polycythemic MCDA twins."

According to the news reporters, the research concluded: "However, delta MCA-PSV is associated with a large intertwin difference in hematocrit, and its use may be better than conventional methods for the risk assessment of TAPS."

Our news correspondents report that additional information may be obtained by contacting Y. Yinon, Tel Aviv University, Tel Hashomer Sackler Sch Med, Sheba Med Center, Dept. of Obstet & Gynecol, Tel Aviv, Israel. Additional authors for this research include B. Weisz, S. Mazaki-Tovi, E. Ashwal, B. Chayen, S. Lipitz and Y. Yinon.

Oncology - Prostate Cancer

Reports on Prostate Cancer Findings from National Cancer Institute Provide New Insights (ABO blood type correlates with survival on prostate cancer vaccine therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Prostate Cancer have been presented. According to news reporting originating in Frederick, Maryland, by NewsRx journalists, research stated, "Immunotherapies for cancer are transforming patient care, but clinical responses vary considerably from patient to patient. Simple, inexpensive strategies to target treatment to likely responders could substantially improve efficacy while simultaneously reducing health care costs, but identification of reliable biomarkers has proven challenging."

The news reporters obtained a quote from the research from National Cancer Institute, "Previously, we found that pre-treatment serum IgM to blood group A (BG-A) correlated with survival for patients treated with PROSTVAC-VF, a therapeutic cancer vaccine in phase III clinical trials for the treatment of prostate cancer. These results suggested that ABO blood type might influence efficacy. Unfortunately, blood types were not available in the clinical records for all but 8 patients and insufficient amounts of sera were left for standard blood typing methods. To test the hypothesis, therefore, we developed a new glycan microarray-based method for determining ABO blood type. The method requires only 4 mL of serum, provides 97% accuracy, and allows simultaneous profiling of many other serum anti-glycan antibodies. After validation with 220 healthy subjects of known blood type, the method was then applied to 74 PROSTVAC-VF patients and 37 control patients from a phase II trial. In this retrospective
study, we found that type B and O PROSTVAC-VF patients demonstrated markedly improved clinical outcomes relative to A and AB patients, including longer median survival, longer median survival relative to Halabi predicted survival, and improved overall survival via Kaplan-Meier survival analysis (p=0.006).

According to the news reporters, the research concluded: "Consequently, blood type may provide an inexpensive screen to pre-select patients likely to benefit from PROSTVAC-VF therapy."

For more information on this research see: ABO blood type correlates with survival on prostate cancer vaccine therapy. Oncotarget, 2015;6(31):32244-56.

**Oncology - Prostate Cancer**

**Reports on Prostate Cancer from Huazhong University of Science and Technology Provide New Insights [miR-34C Disrupts the Stemness of Purified CD133(+) Prostatic Cancer Stem Cells]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting originating in Wuhan, People's Republic of China, by NewsRx journalists, research stated, "To find the potential micro-RNA (miRNA) that could determine the fate of prostate cancer stem cells. We compared miRNA expression between our purified CD133(+) prostatic cancer stem cells (PCSCs) and CD133-cells."

The news reporters obtained a quote from the research from the Huazhong University of Science and Technology, "Sphere formation assay and matrigel-based cell invasion assay were applied to determine the stemness of CD133(+) PCSCs after our manipulation of miRNA using miRNA mimic or miRNA inhibitor. In this study, we identified that miR-34C was under-expressed in the purified CD133(+) PCSCs and enforced introduction of miR-34C attenuated the stemness of CD133(+) PCSCs. Clinically, we also observed a negative correlation between miR-34C and CD133."

According to the news reporters, the research concluded: "Our data strongly suggest that miR-34C may play essential role in conferring castration resistance by equilibrating PSCS population."

For more information on this research see: miR-34C Disrupts the Stemness of

**Gram-Negative Bacteria - Pseudomonas aeruginosa**

**Reports on Pseudomonas aeruginosa Findings from Spanish National Research Council (CSIC) Provide New Insights (Purification and characterization of Pseudomonas aeruginosa LasR expressed in acyl-homoserine lactone free Escherichia coli cultures)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Pseudomonas aeruginosa are presented in a new report. According to news originating from Granada, Spain, by NewsRx correspondents, research stated, "Quorum sensing systems are essential for bacterial communication. We report here the purification and characterization of the Pseudomonas aeruginosa LasR quorum sensing regulator purified from lysates of E. coil cultures grown in the absence of added acyl-homoserine lactones (AHL)."

Our news journalists obtained a quote from the research from Spanish National Research Council (CSIC), "We show by isothermal titration calorimetry that LasR recognizes different AHLs with an affinity of approximately 1 mu M. The affinity of LasR for its cognate 3-Oxo-C12-AHL was similar to that of other AHLs, indicating that this regulator has not evolved to preferentially recognize its cognate AHL. The alpha-helical content as determined by CD spectroscopy was found to be in agreement with the corresponding value derived from the homology model. Analytical ultracentrifugation studies show that LasR is a mixture of monomers and dimers and that AHL binding does not alter its oligomeric state. Thermal unfolding studies indicate that LasR has a significant thermal stability and that AHL binding does not significantly alter the unfolding temperature. Two LasR-DNA complexes were observed in electrophoretic mobility shift assays using the hcnABC promoter that has two lux boxes. Taken together, data indicate that the presence of AHLs is not a requisite for correct LasR protein folding. The protein is able to bind AHL ligands in a reversible manner, revising initial concepts of this regulator."

According to the news editors, the research concluded: "The availability of AHL-free protein will permit further studies to determine more precisely its mode of action."

For more information on this research see: Purification and characterization of Pseudomonas aeruginosa LasR expressed in acyl-homoserine lactone free Escherichia coli cultures. *Protein Expression and Purification*, 2017;130():107-114. *Protein Expression and Purification* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San
Reports on Pseudomonas aeruginosa from University of Manitoba Provide New Insights [The role of the temperature-regulated acyltransferase (PA3242) on growth, antibiotic resistance and virulence in Pseudomonas aeruginosa]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Pseudomonas aeruginosa is now available. According to news reporting from Winnipeg, Canada, by NewsRx journalists, research stated, "Pseudomonas aeruginosa (PAO1) is an important opportunistic pathogen that thrives in various environments. It is known that the structural variations of the lipopolysaccharide (LPS), including lipid A moiety play an important role in encountering environmental changes."

Funders for this research include NSFC, PCSIRT.

The news correspondents obtained a quote from the research from the University of Manitoba, "Genes PA3242 and PA0011 have recently been reported to be responsible for secondary-acylation of lipid A in P. aeruginosa. In this study, we confirmed that the PA3242-dependant secondary acylation affects the growth, antibiotic resistance and virulence of PAO1 and functions as a more predominant acyltransferase than PA0011. PA3242 mutant showed inhibited growth at 37 degrees C and inviability at 28 degrees C in rich medium LB. The inactivation of PA3242 leads to more sensitivity to a wide range of antibiotics than PAO1(Delta PA0011). Moreover, the virulence of PAO1(Delta PA3242) was attenuated more significantly than that of PAO1 and PAO1(Delta PA0011). The outer membrane integrity and stability of PAO1(Delta PA3242) were seriously compromised. Furthermore, PAO1(Delta PA3242) lost most of pilus and exhibited severely damaged cell envelope, which is probably responsible for the deficiency of swimming, swarming and twitching. These results partially explained the decreased antibiotic resistance and attenuated virulence of PAO1(Delta PA3242) compared to PAO1(Delta PA0011) and PAO1."

According to the news reporters, the research concluded: "Our study demonstrated that PA3242-dependent secondary acylation of lipid A plays a predominant role in growth,
antibiotic resistance and virulence of PAO1 than PA0011."

Our news journalists report that additional information may be obtained by contacting K.M. Duan, University of Manitoba, Fac Hlth Sci, Dept. of Oral Biol, Winnipeg, MB R3E 0W2, Canada. Additional authors for this research include Z.S. Guo, L. Gao, Q.Q. Guo, L.Y. Wang, Y. Han, K.M. Duan and L.X. Shen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.micpath.2016.09.019. Lung Diseases and Conditions - Pulmonary Fibrosis

Reports on Pulmonary Fibrosis Findings from China Pharmaceutical University Provide New Insights (Madecassoside ameliorates bleomycin-induced pulmonary fibrosis in mice through promoting the generation of hepatocyte growth factor via PPAR-g in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lung Diseases and Conditions - Pulmonary Fibrosis have been presented. According to news originating from Nanjing, People's Republic of China, by NewsRx correspondents, research stated, "Madecassoside has potent anti-pulmonary fibrosis (PF) effects when administered p.o., despite having extremely low oral bioavailability. Herein, we explored the mechanism of this anti-PF effect with regard to gut hormones."

Funders for this research include National Natural Science Foundation of China, Priority Academic Program Development of Jiangsu Higher Education Institutions.

Our news journalists obtained a quote from the research from China Pharmaceutical University, "A PF model was established in mice by intratracheal instillation of bleomycin. Haematoxylin and eosin stain and Masson's trichrome stain were used to assess histological changes in the lung. Quantitative-PCR and Western blot detected mRNA and protein levels, respectively, and cytokines were measured by ELISA. Small interfering RNA was used for gene-silencing. EMSA was applied to detect DNA-binding activity. Administration of madecassoside, p.o., but not its main metabolite madecassic acid, exhibited a direct anti-PF effect in mice. However, i.p. madecassoside had no anti-PF effect. Madecassoside increased the expression of hepatocyte growth factor (HGF) in colon tissues, and HGF receptor antagonists attenuated its anti-PF effect. Madecassoside facilitated the secretion of HGF from colonic
epithelial cells by activating the PPAR-g pathway, as shown by an up-regulation of PPAR-g mRNA expression, nuclear translocation and DNA-binding activity both in vitro and in vivo. Also GW9662, a selective PPAR-g antagonist, almost completely prevented the madecassoside-induced increased expression of HGF and amelioration of PF. The potent anti-PF effects induced by p.o. madecassoside in mice are not mediated by its metabolites or itself after absorption into blood. Instead, madecassoside increases the activity of PPAR-g, which subsequently increases HGF expression in colonic epithelial cells."

According to the news editors, the research concluded: "HGF then enters into the circulation and lung tissue to exert an anti-PF effect."

The news correspondents report that additional information may be obtained from Y. Xia, Jiangsu Key Laboratory of Drug Discovery for Metabolic Diseases, Dept. of Pharmacology of Chinese Materia Medica, China Pharmaceutical University, 24 Tong Jia Xiang, Nanjing, 210009, People's Republic of China. Additional authors for this research include Y.F. Xia, Q. Lv, M.F. Yue, S.M. Qiao, Y. Yang, Z.F. Wei and Y. Dai.

administered enterally. Arthritis-susceptible HLA-DQ8 mice were immunized with type II collagen and treated with P. histicola. Disease incidence, onset, and severity were monitored. Changes in gut epithelial proteins and immune response as well as systemic cellular and humoral immune responses were studied in treated mice. When treated with P. histicola in prophylactic or therapeutic protocols, DQ8 mice exhibited significantly decreased incidence and severity of arthritis compared to controls. The microbial mucosal modulation of arthritis was dependent on regulation by CD103+ dendritic cells and myeloid suppressors (CD11b+Gr-1 + cells) and by generation of Treg cells (CD4+CD25+FoxP31) in the gut, resulting in suppression of antigen-specific Th17 responses and increased transcription of interleukin-10. Treatment with P. histicola led to reduced intestinal permeability by increasing expression of enzymes that produce antimicrobial peptides as well as tight junction proteins (zonula occludens 1 and occludin). However, the innate immune response via Toll-like receptor 4 (TLR-4) and TLR-9 was not affected in treated mice. Our results demonstrate that enteral exposure to P. histicola suppresses arthritis via mucosal regulation.

According to the news reporters, the research concluded: "P. histicola is a unique commensal that can be explored as a novel therapy for RA and may have few or no side effects."

For more information on this research see: Suppression of Inflammatory Arthritis by Human Gut-Derived Prevotella histicola in Humanized Mice. Arthritis & Rheumatology, 2016;68(12):2878-2888. Arthritis & Rheumatology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists obtained a quote from the research from Marshall University, "The compounds were first screened against newly transformed schistosomula (NTS) of harvested Schistosoma mansoni cercariae, then against adult worms, and finally, in vivo using the mouse model of S. mansoni infection. At a concentration of 33 μM, incubation with a total of 12 compounds resulted in the mortality of NTS at the 62% to 100% level. Five of these showing 100% inhibition of viability of NTS at 10 μM were selected for further screening for determination of the 50 inhibitory concentrations (IC(50)s) against both NTS and adult worms. Against NTS, all 5 compounds showed IC(50)s comparable to the IC50 of the standard drug, PZQ (0.87 to 9.65 μM for the 5 compounds versus 2.20 μM for PZQ). Three of these, which are the bisquinoline derivative of cyclen and its Fe2+ and Mn2+ complexes, showed micromolar IC(50)s (1.62 μM, 1.34 μM, and 4.12 μM, respectively, versus 0.10 μM for PZQ) against adult worms. In vivo, the worm burden reductions were 12.3%, 88.4%, and 74.5%, respectively, at a single oral dose of 400 mg/kg of body weight."

According to the news editors, the research concluded: "The Fe2+ complex exhibited activity in vivo comparable to that of PZQ, pointing to the discovery of a novel drug lead for schistosomiasis."

For more information on this research see: Discovery of Antischistosomal Drug Leads Based on Tetraazamacrocyclic Derivatives and Their Metal Complexes. Antimicrobial Agents and Chemotherapy, 2016;60(9):5331-5336. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Science

Reports on Science from Zuse Institute Berlin Provide New Insights (Acfs: accurate circRNA identification and quantification from RNA-Seq data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Science. According to news reporting originating from Berlin, Germany, by NewsRx correspondents, research stated, "Circular RNAs..."
(circRNAs) are a group of single-stranded RNAs in closed circular form. They are splicing-generated, widely expressed in various tissues and have functional implications in development and diseases.

Our news editors obtained a quote from the research from Zuse Institute Berlin, "To facilitate genome-wide characterization of circRNAs using RNA-Seq data, we present a freely available software package named acfs. Acfs allows de novo, accurate and fast identification and abundance quantification of circRNAs from single-and paired-ended RNA-Seq data. On simulated datasets, acfs achieved the highest F1 accuracy and lowest false discovery rate among current state-of-the-art tools. On real-world datasets, acfs efficiently identified more bona fide circRNAs. Furthermore, we demonstrated the power of circRNA analysis on two leukemia datasets. We identified a set of circRNAs that are differentially expressed between AML and APL samples, which might shed light on the potential molecular classification of complex diseases using circRNA profiles. Moreover, chromosomal translocation, as manifested in numerous diseases, could produce not only fusion transcripts but also fusion circRNAs of clinical relevance."

According to the news editors, the research concluded: "Featured with high accuracy, low FDR and the ability to identify fusion circRNAs, we believe that acfs is well suited for a wide spectrum of applications in characterizing the landscape of circRNAs from non-model organisms to cancer biology."

For more information on this research see: Acfs: accurate circRNA identification and quantification from RNA-Seq data. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. people with sickle cell disease suffering from community-acquired pneumonia. This is an update of a previously published Cochrane Review. To determine the efficacy and safety of the antibiotic treatment approaches (monotherapy or combined) for people with sickle cell disease suffering from community-acquired pneumonia. Search methods We searched The Group's Haemoglobinopathies Trials Register (01 September 2016), which comprises references identified from comprehensive electronic database searches and handsearching of relevant journals and abstracts of conference proceedings. We also searched LILACS (1982 to 01 September 2016), African Index Medicus (1982 to 20 October 2016) and WHO ICT Registry (20 October 2016). Selection criteria We searched for published or unpublished randomized controlled trials. Data collection and analysis We intended to summarise data by standard Cochrane methodologies, but no eligible randomized controlled trials were identified. We were unable to find any randomized controlled trials on antibiotic treatment approaches for community-acquired pneumonia in people with sickle cell disease. Authors' conclusions The updated review was unable to identify randomized controlled trials on efficacy and safety of the antibiotic treatment approaches for people with sickle cell disease suffering from community-acquired pneumonia. Randomized controlled trials are needed to establish the optimum antibiotic treatment for this condition. The trials regarding this issue should be structured and reported according to the CONSORT statement for improving the quality of reporting of efficacy and improved reports of harms in clinical research. Trialists should consider including the following outcomes in new trials: number of days to become afebrile; mortality; onset of pain crisis or complications of sickle cell disease following community-acquired pneumonia; diagnosis; hospitalization (admission rate and length of hospital stay); respiratory failure rate; and number of participants receiving a blood transfusion. There are no trials included in the review and we have not identified any relevant trials up to September 2016. According to the news reporters, the research concluded: "We therefore do not plan to update this review until new trials are published."

For more information on this research see: Antibiotics for treating community-acquired pneumonia in people with sickle cell disease. Cochrane Database of Systematic Reviews, 2016;(11):1664-1683. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Sinus Arrhythmia have been presented. According to news originating from Moscow, Russia, by NewsRx correspondents, research stated, "In this study, we were focused on the differences between certain circulating cytokine levels in patients with or without sinus arrhythmia, according to the median IL-6 level. All patients were stable with regards to symptoms and therapy for at least one month prior to the measurements conducted within this study."

Our news journalists obtained a quote from the research, "Exclusion criteria were: patients with sleep apnea, asthma, respiratory insufficiency of any genesis, active infection, allergy, inflammatory diseases, cancer, diabetes of any type and treatment with anti-inflammatory drugs. The study was approved by the Institutional Review Board. All recruited patients gave their verbal and written consent for participation in the study. The study group consisted of 74 patients divided into two groups: with (38) and without sinus arrhythmia but with diagnosed coronary artery disease (36). Sinus arrhythmia was confirmed by 24 h Holter monitoring. From all test parameters only cytokines IL-2, IL-8, IL-10, IL-17 and IL-18, showed statistically significant increasing in patients with statistically higher IL-6 levels. It is possible that IL-6 may not be a marker for the selection of patients with sinus arrhythmia or coronary artery disease. The findings indicate that IL-6 represents a reliable indicator for increased expression of IL-2, IL-8, IL-10, IL-17 and IL-18 in patients with sinus arrhythmia or coronary artery disease."

According to the news editors, the research concluded: "Further studies in a large number of patients would be necessary to confirm our observations."

For more information on this research see: Serum interleukin-6: Association with circulating cytokine serum levels in patients with sinus arrhythmia and patients with coronary artery disease. *Cellular Immunology*, 2016;310():178-183. *Cellular Immunology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Reports on Spinal Cord Compression from Academy of Military Medical Sciences Provide New Insights (A validated preoperative score predicting survival and functional outcome in lung cancer patients operated with posterior decompression and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions - Spinal Cord Compression have been presented. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "This study aims to create and validate a score for survival and functional outcome of lung cancer patients with metastatic spinal cord compression (MSCC) after posterior decompressive surgery. The entire cohort of 73 consecutive patients was randomly assigned to a test group (N = 37) and a validation group (N = 36).

Financial support for this research came from Application Study of Capital Clinical Characteristics of China.

Our news journalists obtained a quote from the research from the Academy of Military Medical Sciences, "In the test group, we retrospectively analyzed 10 preoperative characteristics. Characteristics significantly associated with survival on multivariate analysis were included in the score. Patients in the validation group were used to confirm whether the score was reproducible. Postoperative functional outcome was analyzed both in the test and validation groups. On multivariate analysis, preoperative ambulatory status (P = 0.0017), visceral metastases (P = 0.0002), and time developing motor deficits (P = 0.0004) had significant impact on survival and were included in the scoring system. According to the prognostic scores, which ranged from 0 to 6 points, two risk groups were designed: 0-2 and 3-6 points and the median survival was 2.6 months (95 % CI, 1.0-3.8 months) and 10.7 months (95 % CI, 7.1-13.7 months), respectively (P < 0.0001). In the validation group, the corresponding median survival was 2.7 months (95 % CI, 1.6-5.5 months) and 10.8 months (5.8-13.6 months), respectively (P < 0.0001). In addition, the functional outcome was worse in patients with 0-2 points than in patients with 3-6 points both in the test (P = 0.0023) and validation groups (P = 0.0298). Patients with scores of 0-2 points, who have short survival time (life expectancy less than 3 months) and poor functional outcome, appear best treated with radiotherapy or best supportive care alone. Surgery may be no longer in consideration in most of the patients in this group."

According to the news editors, the research concluded: "Patients with score of 3-6 points should be surgical candidates, because survival prognosis (life expectancy more than 10 months) and functional outcome are favorable after surgery."

For more information on this research see: A validated preoperative score predicting survival and functional outcome in lung cancer patients operated with posterior decompression and stabilization for metastatic spinal cord compression. European Spine Journal, 2016;25 (12):3971-3978. European Spine Journal can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; European Spine Journal - www.springerlink.com/content/0940-6719/)

Oncology - Squamous Cell Carcinoma

Reports on Squamous Cell Carcinoma from Kyoto Pharmaceutical University Provide New Insights (Effects of bisphosphonates on human esophageal squamous cell carcinoma cell survival)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Squamous Cell Carcinoma have been presented. According to news reporting out of Kyoto, Japan, by NewsRx editors, research stated, "Esophageal squamous cell carcinoma (ESCC) is one of the most malignant cancers in Japan. Anticancer chemotherapy has been useful for ESCC treatment."

Our news journalists obtained a quote from the research from Kyoto Pharmaceutical University, "However, therapeutic options are limited. Recently, bisphosphonates (BPs), which are osteoporosis drugs, have shown anticancer effects in several cancer cell lines, but the effects against ESCC cell lines are unknown. In this study, we examined the cytotoxic effects of BPs and their mechanisms of cytotoxicity in human ESCC cell lines. A first-generation BP (etidronate), two second-generation BPs (alendronate and pamidronate), and two third-generation BPs (risedronate and zoledronate) were used in this study. All BPs, except etidronate, were cytotoxic, as indicated by increased caspase-3/7 activity and numbers of Annexin-fluorescein isothiocyanate positive cells in ESCC cell lines. From cell cycle analysis, G0/G1-phase arrest was observed upon treatment with second-and third-generation BPs. In addition, Cyclin D1 protein expression levels were decreased by second-and third-generation BP treatment. Although squalene and trans, trans-farnesol minimally affected BP cytotoxicity, treatment with geranylgeraniol inhibited BP cytotoxicity almost completely. We concluded that second-and third-generation BPs are cytotoxic to ESCC cell lines as they induce apoptosis and inhibit the cell cycle through mevalonate pathway inhibition."

According to the news editors, the research concluded: "Therefore, BP treatment may be a beneficial therapy in ESCC patients."

Our news journalists report that additional information may be obtained by contacting T. Minegaki, Kyoto Pharmaceutical University, Fac Pharmaceut Sci, Dept. of Clin Pharm, Kyoto, Japan. Additional authors for this research include S. Fukushima, C. Morioka, H.
Stainless Steel

Reports on Stainless Steel Findings from Northeastern University Provide New Insights (Biological behaviour of human umbilical artery smooth muscle cell grown on nickel-free and nickel-containing stainless steel for stent implantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stainless Steel. According to news originating from Shenyang, People's Republic of China, by NewsRx correspondents, research stated, "To evaluate the clinical potential of high nitrogen nickel-free austenitic stainless steel (HNNF SS), we have compared the cellular and molecular responses of human umbilical artery smooth muscle cells (HUASMCs) to HNNF SS and 316L SS (nickel-containing austenitic 316L stainless steel). CCK-8 analysis and flow cytometric analysis were used to assess the cellular responses (proliferation, apoptosis, and cell cycle), and quantitative real-time PCR (qRT-PCR) was used to analyze the gene expression profiles of HUASMCs exposed to HNNF SS and 316L SS, respectively."

Our news journalists obtained a quote from the research from Northeastern University, "CCK-8 analysis demonstrated that HUASMCs cultured on HNNF SS proliferated more slowly than those on 316L SS. Flow cytometric analysis revealed that HNNF SS could activate more cellular apoptosis. The qRT-PCR results showed that the genes regulating cell apoptosis and autophagy were up-regulated on HNNF SS. Thus, HNNF SS could reduce the HUASMC proliferation in comparison to 316L SS." According to the news editors, the research concluded: "The findings furnish valuable information for developing new biomedical materials for stent implantation."

For more information on this research see: Biological behaviour of human umbilical artery smooth muscle cell grown on nickel-free and nickel-containing stainless steel for stent implantation. Scientific Reports, 2016;6():18762. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Gram-Positive Bacteria - Staphylococcus aureus**

**Reports on Staphylococcus aureus Findings from Rush University Provide New Insights (Empirical therapy in Methicillin-resistant Staphylococcus Aureus infections: An Up-To-Date approach)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Gram-Positive Bacteria - Staphylococcus aureus is the subject of a report. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "Methicillin-resistant Staphylococcus aureus (MRSA) continues to be an important pathogen worldwide, with high prevalence of infection in both community and hospital settings. Timely and appropriate choice of empirical therapy in the setting of MRSA infection is imperative due to the high rate of associated morbidity and mortality with MRSA infections."

Our news journalists obtained a quote from the research from Rush University, "Initial choices should be made based on the site and severity of the infection, most notably moderate skin and soft tissue infections which may be treated with oral antibiotics (trimethoprim-sulfamethoxazole, clindamycin, doxycycline/minocycline, linezolid) in the outpatient setting, versus choice of parenteral therapy in the inpatient setting of more invasive or severe disease. Though the current recommendations continue to strongly rely on vancomycin as a standard empiric choice in the setting of severe/invasive infections, alternative therapies exist with studies supporting their non-inferiority. This includes the use of linezolid in pneumonia and severe skin and skin structure infections (SSSI) and daptomycin for MRSA bacteremia, endocarditis, SSSIs and bone/joint infections. Additionally, concerns continue to arise in regards to vancomycin, such as increasing isolate MICs, and relatively high rates of clinical failures with vancomycin."

According to the news editors, the research concluded: "Thus, the growing interest in vancomycin alternatives, such as ceftaroline, ceftobiprole, dalbavancin, oritavancin, and tedizolid, and their potential role in treating MRSA infections."

For more information on this research see: Empirical therapy in Methicillin-resistant Staphylococcus Aureus infections: An Up-To-Date approach. *Journal of Infection and Chemotherapy*, 2016;22(6):351-359. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Gram-Positive Bacteria - *Staphylococcus aureus*

**Reports on *Staphylococcus aureus* from Gifu University Provide New Insights (Development of a rapid diagnostic method for identification of *Staphylococcus aureus* and antimicrobial resistance in positive blood culture bottles using a ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - *Staphylococcus aureus*. According to news originating from Gifu, Japan, by NewsRx correspondents, research stated, "Blood culturing and the rapid reporting of results are essential for infectious disease clinics to obtain bacterial information that can affect patient prognosis. When gram-positive coccoid cells are observed in blood culture bottles, it is important to determine whether the strain is *Staphylococcus aureus* and whether the strain has resistance genes, such as mecA and blaZ, for proper antibiotic selection."

Our news journalists obtained a quote from the research from Gifu University, "Previous work led to the development of a PCR method that is useful for rapid identification of bacterial species and antimicrobial susceptibility. However, that method has not yet been adopted in community hospitals due to the high cost and methodological complexity. We report here the development of a quick PCR and DNA-chromatography test, based on single-tag hybridization chromatography, that permits detection of *S. aureus* and the mecA and blaZ genes; results can be obtained within 1 h for positive blood culture bottles. We evaluated this method using 42 clinical isolates. Detection of *S. aureus* and the resistance genes by the PCR-DNA-chromatography method was compared with that obtained via the conventional identification method and actual antimicrobial susceptibility testing. Our method had a sensitivity of 97.0% and a specificity of 100% for the identification of the bacterial species. For the detection of the mecA gene of *S. aureus*, the sensitivity was 100% and the specificity was 95.2%. For the detection of the blaZ gene of *S. aureus*, the sensitivity was 100% and the specificity was 88.9%.”

According to the news editors, the research concluded: "The speed and simplicity of this PCR-DNA-chromatography method suggest that our method will facilitate rapid diagnoses."

For more information on this research see: Development of a rapid diagnostic method for identification of *Staphylococcus aureus* and antimicrobial resistance in positive blood culture bottles using a PCR-DNA-chromatography method. *Journal of Infection and Chemotherapy*, 2016;22(6):372-376. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Springer - www.springer.com; Journal of Infection and Chemotherapy - www.springerlink.com/content/1341-321x/)

**Stem Cell Research - Stem Cell Factors**

**Reports on Stem Cell Factors from Ahvaz Jundishapur University Provide New Insights (Role of stem cell factor in the placental niche)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stem Cell Research - Stem Cell Factors. According to news originating from Ahwaz, Iran, by NewsRx correspondents, research stated, "Stem cell factor (SCF) is a cytokine found in hematopoietic stem cells (HSCs) and causes proliferation and differentiation of cells by binding to its receptor (c-kit). It is produced in the yolk sac, fetal liver and bone marrow during the development of the fetus and, together with its signaling pathway, plays an important role in the development of these cells." Our news journalists obtained a quote from the research from Ahvaz Jundishapur University, "The placenta, an important hematopoiesis site before the entry of cells into the liver, is rich in HSCs, with definitive hematopoiesis in a variety of HSC types and embryonic stem cells. Chorionic-plate-derived mesenchymal stem cells (CP-MSCs) isolated from the placenta show stem cell markers such as CD41 and cause the self-renewal of cells under hypoxic conditions. In contrast, hypoxia can result in apoptosis and autophagy via oxidative stress in stem cells. As a hypoxia-induced factor, SCF causes a balance between cell survival and death by autophagy in CP-MSCs. Stromal cells and MSCs have a crucial function in the development of HSCs in the placenta via SCF expression in the placental vascular niche. Defects in hematopoietic growth factors (such as SCF and its signaling pathways) lead to impaired hematopoiesis, resulting in fetal death and abortion. Therefore, an awareness of the role of the SCF/c-kit pathway in the survival, apoptosis and development of stem cells can significantly contribute to the exploration of stem cell production pathways during the embryonic period and in malignancies and in the further generation of these cells to facilitate therapeutic approaches."

According to the news editors, the research concluded: "In this review, we discuss the role of SCF in the placental niche."

For more information on this research see: Role of stem cell factor in the placental niche. *Cell and Tissue Research*, 2016;366(3):523-531. *Cell and Tissue Research* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Cell and Tissue Research - www.springerlink.com/content/0302-766x/)

Central Nervous System Diseases and Conditions –…

Reports on Subarachnoid Hemorrhage from University of Heidelberg Provide New Insights (Use of GABAergic sedatives after subarachnoid hemorrhage is associated with worse outcome-preliminary findings)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage are discussed in a new report. According to news reporting out of Heidelberg, Germany, by NewsRx editors, research stated, "Recent experimental evidence identified GABAergic sedation as a possible cause for deprived neuroregeneration and poor outcome after acute brain injury. Patients with aneurysmal subarachnoid hemorrhage are often sedated, and GABAergic sedation, such as midazolam and propofol, is commonly used."

Our news journalists obtained a quote from the research from the University of Heidelberg, "Retrospective cohort study based on a prospectively established database. Single-center neurointensive care unit. Twenty-nine patients after subarachnoid hemorrhage. Noninterventional study. The relationship between mean GABAergic sedative dose during the acute phase and outcome after 6 months according to the Glasgow Outcome Scale, and initial Glasgow Coma Scale was investigated. Use of GABAergic sedatives was negatively correlated with Glasgow Outcome Scale ($\text{r}^2 = 0.267; \text{P} = .008$). Administration of sedatives was independent of the initial Glasgow Coma Scale. GABAergic sedatives flunitrazepam, midazolam, and propofol were used differently during the first 10 days after ictus. Administration of GABAergic sedation was associated with an unfavorable outcome after 6 months."

According to the news editors, the research concluded: "To avoid bias (mainly through the indication to use sedation), additional experimental and comparative clinical investigation of, for example, non-GABAergic sedation, and clinical protocols of no sedation is necessary."

Our news journalists report that additional information may be obtained by contacting D.N. Hertle, Heidelberg Univ, Dept. of Neurosurg, D-69120 Heidelberg, Germany.
Additional authors for this research include C. Beynon, J.O. Neumann, E. Santos, R. Sanchez-Porras, A.W. Unterberg and O.W. Sakowitz.

Sulfides

Reports on Sulfides Findings from Research Hospital Provide New Insights (Plasma thiols and thiol-disulfide homeostasis in patients with isolated coronary artery ectasia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Sulfides. According to news reporting originating from Ankara, Turkey, by NewsRx correspondents, research stated, "Thiol/disulfide homeostasis has an important role in the antioxidant defense system. Oxidative stress may contribute to the pathogenesis of coronary artery ectasia."

Our news editors obtained a quote from the research from Research Hospital, "The aim of this study was to evaluate plasma thiol levels and thiol/disulfide homeostasis in patients with isolated coronary artery ectasia. Forty-one patients with isolated coronary artery ectasia and 72 patients with normal coronary arteries were included in the study. Markis classification and number of ectatic coronary arteries were recorded. Plasma total thiol levels, native thiol levels and disulfide levels were measured. Thiol/disulfide homeostasis was appraised by calculating thiol/disulfide ratio. Plasma native thiol levels were significantly lower (336.9 (252.9-374.1) vs. 353.1 (327.0-380.0), p = 0.041) and disulfide levels were significantly higher (18.9 +/- 6.3 vs. 16.6 +/- 3.4, p = 0.014) in patients with coronary artery ectasia than control patients. Both native thiol/disulfide and total thiol/disulfide ratio was significantly lower in the coronary artery ectasia group (p < 0.001). Multivariate logistic regression analysis revealed that native thiol levels, disulfide levels and native thiol/disulfide ratio were independently associated with the presence of coronary artery ectasia. Thiol/disulfide ratio was not different according to number of ectatic coronary arteries and there was no association between thiol/ disulfide ratio and Markis classification."

The news editors report that additional information may be obtained by contacting E. Kiziltunc, Numune Educ & Res Hosp, Dept. of Cardiol, TR-06100 Ankara, Turkey. Additional authors for this research include M. Gok, H. Kundi, M. Cetin, C. Topcuoglu, B. Gulkan, H. Cicekcioglu and E. Ornek.

Systemic Lupus Erythematosus

Reports on Systemic Lupus Erythematosus from Aarhus University Provide New Insights (Follicular T helper cells and IL-21 in Rheumatic Diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Systemic Lupus Erythematosus are discussed in a new report. According to news originating from Aarhus, Denmark, by NewsRx editors, the research stated, "Rheumatoid arthritis (RA) and systemic lupus erythematosus (SLE) are lifelong diseases with increased mortality and chronic pains. They are both characterized by immunological imbalances causing the immune system attack and destroy the bodies own tissues (called autoimmune disease)."

Our news journalists obtained a quote from the research from Aarhus University, "The best treatment, we are currently able to offer these patients, cause significant side-effects and can not prevent significant loss of quality of life. At the heart of the disease mechanisms in RA and SLE are subsets of immune cells called T and B cells. These cell types produce proteins (called antibodies), which under normal circumstances protect the body against disease. In RA and SLE these cells produce antibodies that are directed at the bodies own tissues (called autoantibodies), causing inflammation and tissue damage. The cause of this loss of tolerance is still unknown. Interleukin 21 (IL-21) and is thought to exert key functions in controlling and directing the T and B cell responses leading to formation of antibodies and autoantibodies alike. IL-21 is a signaling molecule secreted by a subpopulation of T cells called follicular T helper (Tfh) cells. IFN alpha is another signaling molecule of key importance in autoimmune disease. Stratification of SLE patients by their responsiveness to IFNa has proven a crucial tool in stratifying patients in terms of disease development and treatment response. The aim of this PhD study is to investigate the role of IL-21 and IFNa, and their effects on Tfh cells and B cells and the formation of autoantibodies in RA and SLE. The first part of this PhD addresses whether plasma levels of IL-21 influence disease activity in rheumatic disease. We further investigate the distribution of IL-21-producing Tfh cells in these patients. We find that IL-21 plasma levels correlate to disease activity and radiological progression in RA, and that the IL-21-producing Tfh cell are increased in the blood and synovial fluid of these patients. These findings support the idea that IL-21 and Tfh cells are linked to the development and perpetuation of these diseases. In the second part of this PhD we investigate how small RNA molecules, called microRNAs, can regulate immunological processes. We find that microRNA-155 can regulate IL-21's capacity to signal, while microRNA-21 is important for survival of T cells. The third, and last part of this PhD, concerns IFNa signaling and its impact on the development of SLE and the formation of autoantibodies. We find that IFNa signaling is altered in a murine model of SLE, and that inhibition of this signaling pathway leads to severe kidney disease. The latter is of key importance as inhibition of IFNa is currently in early trial as a new treatment form for SLE.
patients. In SLE patients, we find that IFNa responsiveness, as measured by a so-called 'IFN signature', is crucial in terms of development of the disease as well as serious complications such as kidney disease and involvement of the central nervous system (CNS). Interferon alpha does this by affecting intracellular signaling responses and the formation of autoantibodies. The data presented in this thesis supports that IL-21 and Tfh cells have a key role in the disease processes characterizing RA and SLE. We further describe a novel mechanism for microRNA-155 and microRNA-21 in regulating immunological processes in these diseases. Finally we show, that IFNa has important functions in the formation of autoantibodies in SLE.

According to the news editors, the research concluded: "This thesis adds new and important knowledge on the interplay between Tfh cells and B cells and their formation of autoantibodies in rheumatic disease. This knowledge will guide and further the development of new treatment strategies to better patient outcome."

For more information on this research see: Follicular T helper cells and IL-21 in Rheumatic Diseases. *Danish Medical Journal*, 2016;63(10):218-236. *Danish Medical Journal* can be contacted at: Danish Medical Assoc, Trondhjemsgade 9, Dk-2100 Copenhagen, Denmark.

**Cardiovascular Diseases and Conditions - Thrombosis**

**Reports on Thrombosis Findings from Ain Shams University Provide New Insights (Circulating Fibroblast Growth Factor-23 Level and Paraoxonase-1 Lactonase Activity in Chronic Hemodialysis Patients: Their Impact on the Incidence of Native AV ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Thrombosis have been presented. According to news reporting originating from Cairo, Egypt, by NewsRx correspondents, research stated, "Thrombosis of native arteriovenous (AV) fistula is an important cause of complications in hemodialysis (HD) patients. The purpose of this study was to investigate the usefulness of measuring circulating fibroblast growth factor-23 (FGF-23) level and paraoxonase-1 (PON1) lactonase activity as potential predictors of native AV fistula thrombosis in chronic HD patients."

Our news editors obtained a quote from the research from Ain Shams University, "This study included 83 HD patients (48 with thrombosed and 35 with non-thrombosed native AV fistulas) and 38 healthy volunteers. Serum FGF-23 level was measured using the ELISA technique, while serum PON1 lactonase activity was measured spectrophotometrically using gamma-thiobutyrolactone as a substrate. FGF-23 was significantly increased while PON1 lactonase was markedly decreased in both thrombosed and non-thrombosed HD patients."
compared with controls (P < 0.001). FGF-23 was elevated whereas PON1 lactonase was decreased in HD patients with thrombosed native AV fistulas compared with HD patients with non-thrombosed native AV fistulas (P = 0.001 and 0.002, respectively). A significant negative correlation was found between FGF-23 and PON1 lactonase in HD patients with thrombosed native AV fistulas (r = -0.342, P = 0.017).

According to the news editors, the research concluded: "This study shows a potential value of FGF-23 and PON1 lactonase as predictors of native AV fistula thrombosis in HD patients."

The news editors report that additional information may be obtained by contacting S.F. Zohny, Ain Shams University, Dept. of Biochem, Fac Sci, Cairo 11566, Abbassia, Egypt. Additional authors for this research include M. Abd El-Fattah and J.A. Khan.

**Biomedical Engineering - Tissue Engineering**

**Reports on Tissue Engineering Findings from University of Pecs Provide New Insights (Increased Wnt5a in squamous cell lung carcinoma inhibits endothelial cell motility)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biomedical Engineering - Tissue Engineering have been published. According to news originating from Pecs, Hungary, by NewsRx correspondents, research stated, "Angiogenesis is important both in normal tissue function and disease and represents a key target in lung cancer (LC) therapy. Unfortunately, the two main subtypes of non-small-cell lung cancers (NSCLC) namely, adenocarcinoma (AC) and squamous cell carcinoma (SCC) respond differently to anti-angiogenic e. g. anti-vascular endothelial growth factor (VEGF)-A treatment with life-threatening side effects, often pulmonary hemorrhage in SCC."

Our news journalists obtained a quote from the research from the University of Pecs, "The mechanisms behind such adverse reactions are still largely unknown, although peroxisome proliferator activator receptor (PPAR) gamma as well as Wnt-s have been named as molecular regulators of the process. As the Wnt microenvironments in NSCLC subtypes are drastically different, we hypothesized that the particularly high levels of non-canonical Wnt5a in SCC might be responsible for alterations in blood vessel growth and result in serious adverse reactions. PPARgamma, VEGF-A, Wnt5a, miR-27b and miR-200b levels were determined in resected adenocarcinoma and squamous cell carcinoma samples by qRT-PCR and TaqMan microRNA assay. The role of PPARgamma in VEGF-A expression, and the role of Wnts in
overall regulation was investigated using PPARgamma knock-out mice, cancer cell lines and fully human, in vitro 3 dimensional (3D), distal lung tissue aggregates. PPARgamma mRNA and protein levels were tested by qRT-PCR and immunohistochemistry, respectively. PPARgamma activity was measured by a PPRE reporter system. The tissue engineered lung tissues expressing basal level and lentivirally delivered VEGF-A were treated with recombinant Wnts, chemical Wnt pathway modifiers, and were subjected to PPARgamma agonist and antagonist treatment. PPARgamma down-regulation and VEGF-A up-regulation are characteristic to both AC and SCC. Increased VEGF-A levels are under direct control of PPARgamma. PPARgamma levels and activity, however, are under Wnt control. Imbalance of both canonical (in AC) and non-canonical (in SCC) Wnts leads to PPARgamma downregulation. While canonical Wnts down-regulate PPARgamma directly, non-canonical Wnt5a increases miR27b that is known regulator of PPARgamma. During carcinogenesis the Wnt microenvironment alters, which can downregulate PPARgamma leading to increased VEGF-A expression."

According to the news editors, the research concluded: "Differences in the Wnt microenvironment in AC and SCC of NSCLC lead to PPARgamma decrease via mechanisms that differentially alter endothelial cell motility and branching which in turn can influence therapeutic response."

For more information on this research see: Increased Wnt5a in squamous cell lung carcinoma inhibits endothelial cell motility. *BMC Cancer*, 2016;16():1-16. *BMC Cancer* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. people at high risk is recommended by many organizations. The aim of this study was to analyse all-cause mortality and cardiovascular disease (CVD) outcomes in patients with Type 2 diabetes detected by screening or diagnosed clinically.

Financial supporters for this research include Primary Health Care Research Unit, Orebro County Council Research Unit, Family Medicine Research Centre, Orebro Universitet, Akademiska Sjukhuset.

Our news editors obtained a quote from the research from Uppsala University, "A diabetes register was established at the primary healthcare centre in Lax?, Sweden beginning in 1972. The register was based on data from clinical records with information on medical treatment and laboratory data, as well as all-cause mortality, CVD, myocardial infarction and stroke events from national registers until 31 December 2013. A total of 740 patients with new-onset Type 2 diabetes were registered between 1972 and 2001. In addition, an opportunistic diabetes-screening programme involving people aged 35-79 years started in 1983 and was repeated onwards in 5-year cycles. Baseline characteristics showed a significantly higher CVD risk, mainly depending on more prevalent CVD events in the screened compared with the clinically detected group (propensity score 0.59 vs. 0.46, p<0.0001). After mean follow-up periods of 12.9 and 13.6 years for screening detected vs. clinically detected patients, respectively, hazard ratios were as follows: all-cause mortality, 0.99 (p=0.89); CVD, 1.17 (p=0.10); myocardial infarction, 1.08 (p=0.49); and stroke, 1.03 (p=0.83)."

According to the news editors, the research concluded: "No reduction in total mortality or CVD outcomes was found in patients with Type 2 diabetes that was detected by screening compared with those diagnosed clinically."

The news editors report that additional information may be obtained by contacting S.P. Jansson, Dept. of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden. Additional authors for this research include D.K. Andersson and K. Svardsudd.

According to news reporting from New Delhi, India, by NewsRx journalists, research stated, "Verrucous carcinoma (VC) is a well-differentiated form of squamous cell carcinoma (SCC) with better prognosis. Differences in molecular pathogenesis between the 2 have not been well-characterized."

The news correspondents obtained a quote from the research from the All India Institute of Medical Sciences, "We conducted this study to evaluate immunohistochemical expression of cell-cycle regulatory proteins p53, pRb, p16, and p27 in SCC and VC, compare the expression in these 2 neoplasms, and assess if these markers have any diagnostic or prognostic value. Sixty cases of SCC with and without lymph node metastasis and 31 cases of VC were studied. Immunohistochemical analysis for p53, pRb, p16, and p27 was performed and the results were analyzed. SCC was most frequent in tongue (52%), whereas VC in buccal mucosa (81%). Mean age of SCC patients was significantly lower than in VC. Majority of SCCs were in stage III and IV (63%), whereas VCs were in stage I and II (84%). p53 immunopositivity was more frequent in SCC (65%) than in VC (23%) (P (<=)0.001). VC had lower p53 as compared with well-differentiated SCC and SCC without lymph node metastasis. No significant difference was seen in pRb, p16, and p27 expression. Disease-free survival (DFS) at 1 year for SCC was 57% whereas it was 80% for VC (p=0.02). DFS and overall survival of SCC correlated with nodal status and stage; cell-cycle-associated protein expression had no association with DFS. To conclude, p53 immunexpression differs in SCC and VC, suggesting different pathogenesis, and it may have some utility as an adjunct to morphology to differentiate between the 2."

According to the news reporters, the research concluded: "Expression of cell-cycle-associated proteins does not influence survival in SCC."

Our news journalists report that additional information may be obtained by contacting A.G. Vallonthaiel, *Departments of Pathology †Otorhinolaryngology ‡Biotechnology, All India Institute of Medical Sciences, New Delhi, India. Additional authors for this research include M.K. Singh, A.K. Reports on Vertebral Artery Dissection Findings from Jena University Hospital Provide New Insights (Clinical Presentation, Magnetic Resonance Angiography, Ultrasound Findings, and Stroke Patterns in Patients with Vertebral Artery Dissection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Vertebral Artery Dissection are discussed in a new report. According to news reporting out of Jena, Germany, by NewsRx editors, research stated, "Vertebral artery dissection (VAD) is an important cause of ischemic stroke. In this observational study, clinical data, magnetic resonance (MR) and ultrasound (US) imaging findings and ischemic patterns were analyzed."

Our news journalists obtained a quote from the research from Jena University Hospital, "Forty-seven patients with a diagnosis of VAD underwent clinical examination, US, MR of the brain and neck and MR angiography (MRA) of the cervical arteries. Vascular abnormalities and ischemic brain lesions were noted. Data were evaluated separately and compared for spontaneous and traumatic VAD subgroups. The most common overall clinical symptom was vertigo followed by neck pain. In the traumatic subgroup, vertigo was relatively rare (p = 0.022). Most common MRA findings were vessel irregularity and vessel occlusions. Ischemic lesions occurred significantly more frequently after spontaneous than after traumatic VAD (p = 0.009). Unilateral VAD was significantly more common in non-dominant vertebral arteries (p < 0.001). Mortality after trauma was not only due to VAD complications but also due to other trauma-related injuries. The variability of MR and US imaging findings in patients with VAD is illustrated. The algorithm of management should be based on a multimodality approach involving patient history and clinical neurological examination."

According to the news editors, the research concluded: "Several types of vessel abnormalities and ischemic lesion in diverse locations may point to arterial dissection, and the differential diagnosis of VAD must be kept in mind."

Our news journalists report that additional information may be obtained by contacting A. Gunther, Jena Univ Hosp, Hans Berger Clin Neurol, DE-07740 Jena, Germany. Additional authors for this research include O.W. Witte, M. Freesmeyer and R. Drescher.

Enzymes and Coenzymes - Oxidoreductases

Research Conducted at Asahikawa Medical University Has Provided New Information about Oxidoreductases (P450 oxidoreductase deficiency with maternal virilization during pregnancy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Enzymes and Coenzymes - Oxidoreductases are presented in a new report. According to news reporting originating in Asahikawa, Japan, by NewsRx journalists, research stated, "The authors report on a rare case of maternal virilization during pregnancy caused by autosomal recessive P450 oxidoreductase (POR) deficiency. A 24-year-old primigravida developed a deepening voice and hirsutism in the second trimester."

The news reporters obtained a quote from the research from Asahikawa Medical University, "Prenatal ultrasonography failed to detect any fetal abnormality and fetal growth was normal. POR deficiency was suspected, but the mother declined fetal genetic testing. A female neonate was delivered by cesarean section at 41 weeks’ gestation. The neonate had skeletal abnormalities. Mutational analysis of the POR gene demonstrated homozygosity for c.1370 G>A and p.R457H in the patient and heterozygosity in her parents. POR deficiency was confirmed in the neonate. POR deficiency should be suspected in cases of maternal virilization. Maternal urinary estriol, fetal magnetic resonance imaging, and parental genetic testing should be performed."

According to the news reporters, the research concluded: "Parental consent for fetal genetic testing should be sought to ensure prompt diagnosis and early treatment."

Our news correspondents report that additional information may be obtained by contacting T. Miyamoto, Asahikawa Med Univ, Dept. of Obstet & Gynecol, Asahikawa, Hokkaido 0788510, Japan. Additional authors for this research include A. Yamashita, T. Miyamoto, R. Takeguchi, A. Furuya, K. Matsuo, Y. Tanahashi, M. Kawamura and K. Sengoku.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Care have been published. According to news reporting originating in Pisa, Italy, by NewsRx journalists, research stated, "Supportive care in oncology is a primary need for every oncology department nowadays. In 2012, in our institution, a dedicated supportive care service (SCS) was created in order to deal with any need our on-treatment patients might have (e.g. tumor-related or treatment-related symptoms)."

The news reporters obtained a quote from the research from Azienda Ospedaliera University, "We hypothesized that this service had a positive impact on the number of unplanned hospitalizations; to confirm our hypothesis, we decided to review admission data in 2011 and 2012. Using our internal software, we compared admission data in 2011 (that is, the year before the dedicated service was created) and 2012 (when such service began, that is April of that year). We also made an evaluation of the costs of these hospitalizations. Despite an increase of the number of patients treated in our day hospital (+6.5 %), the number of unplanned hospital admissions decreased by 3.2 % (from 17.3 to 14.1 %). The number of patients accessing to emergency room went from 66 to 61 % (a reduction of 5 %)."

According to the news reporters, the research concluded: "The costs of these hospitalizations were reduced by 2.2 %. The introduction of the dedicated SCS in our oncology department caused a net reduction by 3.2 % of the number of unplanned hospitalizations of on-treatment cancer patients."

For more information on this research see: Impact of a supportive care service for cancer outpatients: management and reduction of hospitalizations. Preliminary results of an integrated model of care. Supportive Care in Cancer, 2017;25(1):209-212. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Transplant Medicine - Kidney Transplants

Research Conducted at Barts Health NHS Trust Has Updated Our Knowledge about Kidney Transplants (The characteristics and outcome of bacteraemia in renal transplant recipients and non-transplant renal patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Kidney
Transplants. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "There is lack of outcome data for bacteraemic patients on specialist renal units. We described demographic, clinical, microbiological data and outcomes for bacteraemic adult renal transplant and non-transplant patients at a London Teaching Hospital."

The news correspondents obtained a quote from the research from Barts Health NHS Trust, "We also assessed the appropriateness of empirical antibiotic policy. From December 2012 to November 2013, demographic, clinical and microbiological data were collected on consecutive patients with bacteraemia on a specialist UK renal unit. Empirical anti-microbial policy, based upon sites of infection, was piperacillin/tazobactam and amikacin, or meropenem for graft pyelonephritis, and vancomycin and gentamicin for suspected central venous catheter (CVC) associated infection. Results 113 bacteraemic episodes occurred in 83 patients. One patient had two bacteraemic episodes, one on haemodialysis and another after transplantation so appear in both groups. In the non-transplant group, 30-day mortality was 4/59 (6.8 %), more than the renal transplant group, 0/25 (0 %). While graft pyelonephritis was the predominant cause of bacteraemic episodes in renal transplant patients, 25/36 (69.4 %), there were a variety of other causes in the non-transplant group including uncomplicated line associated bacteraemia, 36/77 (46.8 %), complicated line associated bacteraemia, 11/77 (14.3 %) and bacteraemia unrelated to vascular access sites 19/77 (24.7 %). Overall, commonest isolates were Methicillin-sensitive Staphylococcus aureus 20/77 (26.3 %), and Escherichia coli 28/113 (24.8 %). There were no Methicillin-resistant Staphylococcus aureus isolates and, among Enterobacteriaceae, 15/57 (26.3 %) were extended spectrum beta-lactamase producers. Death only occurred in the non-transplant renal group. Empirical antibiotic treatment with either piperacillin/tazobactam or meropenem was appropriate for renal transplant recipients as most bacteraemic episodes were secondary to graft pyelonephritis."

According to the news reporters, the research concluded: "Vancomycin and gentamicin was appropriate empirical antibiotic treatment for non-transplant patients with CVC associated infections, but not optimal for other sites of infection."

For more information on this research see: The characteristics and outcome of bacteraemia in renal transplant recipients and non-transplant renal patients. Infection, 2016;44 (5):617-622. Infection can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. (Springer - www.springer.com; Infection - www.springerlink.com/content/0300-8126/)

Our news journalists report that additional information may be obtained by contacting M. Melzer, Barts Hlth NHS Trust, Royal London Hospital, London E1 2ES, United Kingdom. Additional authors for this research include T. Santhakumaran and C. Welch.

Research Conducted at Beth Israel Deaconess Medical Center and Harvard University School of Medicine Has Updated Our Knowledge about Androgens (Protein phosphatase 1 suppresses androgen receptor ubiquitylation and degradation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Androgens. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "The phosphoprotein phosphatases are emerging as important androgen receptor (AR) regulators in prostate cancer (PCa). We reported previously that the protein phosphatase 1 catalytic subunit (PP1a) can enhance AR activity by dephosphorylating a site in the AR hinge region (Ser650) and thereby decrease AR nuclear export."

Our news journalists obtained a quote from the research from the Beth Israel Deaconess Medical Center and Harvard University School of Medicine, "In this study we show that PP1a increases the expression of wildtype as well as an S650A mutant AR, indicating that it is acting through one or more additional mechanisms. We next show that PP1a binds primarily to the AR ligand binding domain and decreases its ubiquitylation and degradation. Moreover, we find that the PP1a inhibitor tautomycin increases phosphorylation of AR ubiquitin ligases including SKP2 and MDM2 at sites that enhance their activity, providing a mechanism by which PP1a may suppress AR degradation. Significantly, the tautomycin mediated decrease in AR expression was most pronounced at low androgen levels or in the presence of the AR antagonist enzalutamide. Consistent with this finding, the sensitivity of LNCaP and C4-2 PCa cells to tautomycin, as assessed by PSA synthesis and proliferation, was enhanced at low androgen levels or by treatment with enzalutamide."

According to the news editors, the research concluded: "Together these results indicate that PP1a may contribute to stabilizing AR protein after androgen deprivation therapies, and that targeting PP1a or the AR-PP1a interaction may be effective in castration-resistant prostate cancer (CRPC)."

For more information on this research see: Protein phosphatase 1 suppresses androgen receptor ubiquitylation and degradation. Oncotarget, 2016;7(2):1754-64.

The news correspondents report that additional information may be obtained from X. Liu, Hematology-Oncology Division, Dept. of Medicine, Beth Israel Deaconess Medical Center and Harvard Medical School, Boston, Massachusetts 02215, United States. Research Conducted at Boston University Has Provided New Information about Drug Delivery Systems (Microvessels-on-a-Chip to Assess Targeted Ultrasound-Assisted Drug Delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Drug Delivery Systems. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Microbubbles have been used in ultrasound-assisted drug delivery to help target solid tumors via blood vessels in vivo; however, studies to understand the phenomena at the cellular level and to optimize parameters for ultrasound or microbubbles in vivo are challenging and expensive to perform. Here, we utilize microfluidic microvessels-on-a-chip that enable visualization of microbubble/ultrasound-dependent drug delivery to microvasculature."

The news correspondents obtained a quote from the research from Boston University, "When exposed to pulsed ultrasound, microbubbles perfused through microvessels-on-a-chip were observed to stably oscillate. Minimal cellular damage was observed for both microbubbles and untargeted doxorubicin-encapsulating liposomes (DOX-liposomes) perfused through chip microvessels. In contrast, passive and ultrasound-assisted perfusion of integrin-targeted DOX-liposomes induced cytotoxicity, which was only significantly enhanced for ultrasound-assisted perfusion when microbubbles were coperfused. These results suggest that stably oscillating microbubbles enhance targeted DOX-liposome internalization/cytotoxicity largely by stimulating integrin receptor endocytosis."

According to the news reporters, the research concluded: "Furthermore, our study demonstrates the utility of our microvessels-on-a-chip as a screening platform for optimizing drug dosage, targeting ligands and drugs."

Our news journalists report that additional information may be obtained by contacting J.Y. Wong, Boston University, Div Mat Sci & Engn, Boston, MA 02215, United States. Atrial Fibrillation

Research Conducted at Broad Institute of MIT and Harvard Has Updated Our Knowledge about Atrial Fibrillation (A Functional Variant Associated with Atrial Fibrillation Regulates PITX2c Expression through TFAP2a)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Atrial Fibrillation is the subject of a report. According to news reporting from Cambridge, Massachusetts, by NewsRx journalists, research stated, "The most significantly associated genetic locus for atrial fibrillation (AF) is in chromosomal region 4q25, where four independent association signals have been identified. Although model-system studies suggest that altered PITX2c expression might underlie the association, the link between specific variants and the direction of effect on gene expression remains unknown for all four signals."

Financial supporters for this research include NIH, George L. Nardi, MD, Memorial Research Fund, People Programme (Marie Curie Actions) of the European Union’s Seventh Framework Programme, Research Executive Agency, German Centre for Cardiovascular Research (DZHK), Doris Duke Charitable Foundation, NIH NHLBI, American Heart Association, Fondation Leducq.

The news correspondents obtained a quote from the research from the Broad Institute of MIT and Harvard, "In the present study, we analyzed the AF-associated region most proximal to PITX2 at 4q25. First, we identified candidate regulatory variants that might confer AF risk through a combination of mammalian conservation, DNase hypersensitivity, and histone modification from ENCODE and the Roadmap Epigenomics Project, as well as through in vivo analysis of enhancer activity in embryonic zebrafish. Within candidate regions, we then identified a single associated SNP, rs2595104, which displayed dramatically reduced enhancer activity with the AF risk allele. CRISPR-Cas9-mediated deletion of the rs2595104 region and editing of the rs2595104 risk allele in human stem-cell-derived cardiomyocytes resulted in diminished PITX2c expression in comparison to that of the non-risk allele. This differential activity was mediated by activating enhancer binding protein 2 alpha (TFAP2a), which bound robustly to the non-risk allele at rs2595104, but not to the risk allele, in cardiomyocytes. In sum, we found that the AF-associated SNP rs2595104 altered PITX2c expression via interaction with TFAP2a."

According to the news reporters, the research concluded: "Such a pathway could ultimately contribute to AF susceptibility at the PITX2 locus associated with AF."

Our news journalists report that additional information may be obtained by contacting P.T. Ellinor, Broad Inst Harvard & MIT, Program Med & Populat Genet, Cambridge, MA 02142, United States. Additional authors for this research include N.R. Tucker, L.C. Weng, S. Clauss, S.A. Lubitz and P.T. Ellinor.

Research Conducted at CIBERER Has Provided New Information about Pheochromocytomas (ATRX driver mutation in a composite malignant pheochromocytoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pheochromocytomas have been published. According to news originating from Madrid, Spain, by NewsRx correspondents, research stated, "Pheochromocytomas (PCCs) and paragangliomas (PGLs) are tumors arising from the adrenal medulla and sympathetic/parasympathetic paraganglia, respectively. Approximately 40% of PCCs/PGLs are due to germline mutations in one of 16 susceptibility genes, and a further 30% are due to somatic alterations in 5 main genes."

Our news journalists obtained a quote from the research from CIBERER, "Recently, somatic ATRX mutations have been found in succinate dehydrogenase (SDH)-associated hereditary PCCs/PGLs. In the present study we applied whole-exome sequencing to the germline and tumor DNA of a patient with metastatic composite PCC and no alterations in known PCC/PGL susceptibility genes. A somatic loss-of-function mutation affecting ATRX was identified in tumor DNA. Transcriptional profiling analysis classified the tumor within cluster 2 of PCCs/PGLs (without SDH gene mutations) and identified downregulation of genes involved in neuronal development and homeostasis (NLGN4, CD99 and CSF2RA) as well as upregulation of Drosha, an important gene involved in miRNA and rRNA processing. CpG island methylator phenotype typical of SDH gene-mutated tumors was ruled out, and SNP array data revealed a unique profile of gains and losses. Finally, we demonstrated the presence of alternative lengthening of telomeres in the tumor, probably associated with the failure of ATRX functions."

According to the news editors, the research concluded: "Somatic variants affecting ATRX may play a driver role in sporadic PCC/PGL."

The news correspondents report that additional information may be obtained from A. Cascon, Center Invest Biomed Red Enfermedades Raras CIBERER, Madrid, Spain. Additional authors for this research include A.M. Tejera, M. Curras-Freixes, L. Remacha, P. Gonzalvo, R. Tonda, R. Leton, M.A. Blasco, M. Robledo and A. Cascon.

Diseases and Conditions - Russell Silver Syndrome

Research Conducted at California State University Has Updated Our Knowledge about Russell Silver Syndrome (Twin Legacies: Victor and Vincent McKusick/Twin Studies: Twinning Rates I; Twinning Rates II; MZ Twin Discordance for Russell-Silver ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Diseases and Conditions - Russell Silver Syndrome have been published. According to news reporting originating in Fullerton, California, by NewsRx editors, the research stated, "The lives of the illustrious monozygotic (MZ) twins, Victor A. and Vincent L. McKusick, are described."

The news reporters obtained a quote from the research from California State University, "Victor earned the distinction as the 'Father of Medical Genetics', while Vincent was a legendary Chief Justice of the Maine Supreme Court. This dual biographical account is followed by two timely reports of twinning rates, a study of MZ twin discordance for Russell-Silver Syndrome (RSS) and a study of twins' language skills."

According to the news reporters, the research concluded: "Twin stories in the news include babies born to identical twin couples, a case of switched identity, the death of Princess Ashraf (Twin) and a new mother of twins who is also Yahoo's CEO."

Our news correspondents report that additional information may be obtained by contacting N.L. Segal, Dept. of Psychology, California State University, Fullerton, CA, United States.

Nanotechnology - Nanomedicine

Research Conducted at Catholic University of Louvain Has Provided New Information about Nanomedicine (To exploit the tumor microenvironment: Since the EPR effect fails in the clinic, what is the future of nanomedicine?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nanotechnology - Nanomedicine. According to news reporting originating from Brussels, Belgium, by NewsRx editors, the research stated, "Tumor targeting by nanomedicine-based therapeutics has emerged as a promising approach to overcome the lack of specificity of conventional chemotherapeutic agents and to provide clinicians the ability to overcome shortcomings of current cancer treatment."

Financial support for this research came from Fonds National de la recherche Scientifique (F.R.S.-FNRS).

Our news editors obtained a quote from the research from the Catholic University of Louvain, "The major underlying mechanism of the design of nanomedicines was the Enhanced Permeability and Retention (EPR) effect, considered as the 'royal gate' in the drug delivery field. However, after the publication of thousands of research papers, the verdict has been handed down: the EPR effect works in rodents but not in humans! Thus the basic rationale of the design and development of nanomedicines in cancer therapy is failing making it necessary to stop claiming efficacy gains via the EPR effect, while tumor targeting cannot be proved in the clinic."

According to the news editors, the research concluded: "It is probably time to dethrone the EPR effect and to ask the question: what is the future of nanomedicines without the EPR effect? The aim of this review is to provide a general overview on (i) the current state of the EPR effect, (ii) the future of nanomedicine and (iii) the strategies of modulation of the tumor microenvironment to improve the delivery of nanomedicine."

For more information on this research see: To exploit the tumor microenvironment: Since the EPR effect fails in the clinic, what is the future of nanomedicine? Journal of Controlled Release, 2016;244():108-121. Journal of Controlled Release can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Controlled Release - www.journals.elsevier.com/journal-of-controlled-release/)

Research Conducted at Central South University Has Provided New Information about Congenital Heart Disease (Reduced fetal brain fissures depth in fetuses with congenital heart diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Congenital Diseases and Conditions - Congenital Heart Disease have been presented. According to news reporting originating in Changsha, People's Republic of China, by NewsRx journalists, research stated, "To screen and detect cortex gyration in fetuses with congenital heart disease (CHD) using Ultrasonography (US) during routine obstetric scans. The depth of the Sylvian fissure (SF), parieto-occipital fissure (POF), and calcarine (CF) fissure were prospectively serially measured and compared in 45 fetuses with CHD and 45 normal fetuses."

The news reporters obtained a quote from the research from Central South University, "Cardiac hemodynamic parameters, including aortic valve diameter (AV), pulmonary valve diameter (PV), velocity time integral of the aortic valve (VTIav), and velocity time integral of the pulmonary valve (VTIpv), were recorded. Correlations between the fissure depths and the prenatal cardiac hemodynamic parameters and postnatal neurodevelopmental scores were assessed. SF, POF, and CF were decreased in CHD fetuses compared with the controls in late of pregnancy (P <0.01). The diagnostic category was independently associated with smaller fissure depths in fetuses with CHD (adjusted R-2 = 0.472 for SF, 0.465 for POF, and 0.425 for CF). Correlations were observed between small fissure depths and decreased left heart hemodynamic parameters (AV and VTIav) in fetuses with CHD. The SF depth was positively correlated with the neurodevelopmental scores (P <0.01)."

According to the news reporters, the research concluded: "US can be used to screen for abnormal fetal brain cortex development during routine obstetric scans and to evaluate the maturation progress during close follow-up." For more information on this research see: Reduced fetal brain fissures depth in fetuses with congenital heart diseases. *Prenatal Diagnosis*, 2016;36(11):1047-1053. *Prenatal Diagnosis* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com/; Prenatal Diagnosis - onlinelibrary.wiley.com/journal/10.1002/(ISSN)1097-0223)

Our news correspondents report that additional information may be obtained by contacting S. Zeng, Central South University, Xiangya Hosp 2, Dept. of Ultrasound Diag, Changsha, Hunan, People's Republic of China. Additional authors for this research include Q.C. Zhou, M. Zang, J.W. Zhou, R. Xu, T. Wang and S. Zeng.

Research Conducted at Central South University Has Provided New Information about Phlebitis (Peripheral intravenous catheters in situ for more than 96h in adults: What factors affect removal?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Phlebitis have been presented. According to news reporting out of Changsha, People's Republic of China, by NewsRx editors, research stated, "Peripheral intravenous catheters (PIVC) are widely used in clinical nursing, but indwelling time remains a subject of debate. This study aimed to assess the risk factors for PIVC phlebitis in adults and provide a basis for indwelling time decisions."

Our news journalists obtained a quote from the research from Central South University, "A total of 189 first-time PIVC patients in the emergency ward were assessed between May and October 2015. Data were retrieved for patient characteristics and PIVC assessment records. This study showed that over two-thirds (67.72%) of PIVCs were removed because of phlebitis, including oedema (37.57%), rubefaction (33.33%), pain (32.28%), slow infusion speed (13.23%) and accidental extrusion (2.12%). PIVC indwelling time in the planned removal group was higher than that obtained for the unplanned removal group: 152.42 (74.58) vs. 94.64 (50.15) h, P<0.001. At indwelling times >96h, 28.57% (n=54) of catheters caused phlebitis, although 23.28% (n=44) showed no phlebitis. PIVC phlebitis was associated with treatment with compound amino acid infusion (OR: 2.624), site at the elbow joint (OR: 3.049), haemoglobin level (OR: 2.492), white cell count (OR: 2.196) and catheter size (OR: 1.837)."

According to the news editors, the research concluded: "Study findings suggest that PIVC might be used for longer durations based on nursing assessments and health education."

Our news journalists report that additional information may be obtained by contacting A.Q. Zhu, Central South University, Dept. of Emergency, Xiangya Hosp 2, Changsha 410011, Hunan, People's Republic of China. Additional authors for this research include T. Wang and S.L. Wen.

Keywords for this news article include: Changsha, People's Republic of China, Asia, Cardiovascular Diseases and Conditions, Risk and Prevention, Vascular Diseases and Conditions, Peripheral Artery Disease, Vasculitis, Phlebitis, Central South University.

Research Conducted at Chiang Mai University Has Updated Our Knowledge about Hydrops Fetalis [Ventricular Diastolic Function in Normal Fetuses and Fetuses with Hb Bart’s Disease Assessed by Color M-Mode Propagation Velocity using Cardio-STIC-M ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Pregnancy Complications - Hydrops Fetalis. According to news reporting from Chiang Mai, Thailand, by NewsRx journalists, research stated, "To determine whether ventricular diastolic dysfunction contributes to the pathogenesis of fetal cardiac failure due to fetal anemia using fetal Hb Bart's disease as a live model and cardio-STIC-M as a diagnostic tool. Color cardio-STIC volume datasets were acquired from fetuses at risk for Hb Bart's disease during 18 - 22 weeks of gestation and normal pregnancies and pregnancies with hydrops fetalis caused by Hb Bart's disease at 28 - 32 weeks."

The news correspondents obtained a quote from the research from Chiang Mai University, "The volumes were analyzed off-line for velocity propagation (Vp) of the right and left ventricles to assess ventricular diastolic function using color cardio-STIC-M. The Vp for the right and left ventricles was studied in fetuses at 18 - 22 weeks, including 64 normal fetuses (group 1) and 22 fetuses with Hb Bart's disease (group 2), and in fetuses at 28 - 32 weeks, including 22 normal fetuses (group 3) and 16 fetuses with Hb Bart's hydrops fetalis (group 4). The Vp of the fetuses in group 1 and group 2 was not significantly different. However, the Vp for the right and left ventricles in group 4 was significantly lower than in group 3 (19.02 vs. 9.78, p< 0.001; and 20.24 vs. 13.40, p< 0.001, respectively). The inter-observer variability had fair agreement with the intra-class correlation coefficient of 0.531 (95 % CI 0.393 - 0.646, p< 0.001)."

According to the news reporters, the research concluded: "Hydrops fetalis secondary to fetal anemia is initially caused by hypervolemia rather than ventricular diastolic dysfunction while ventricular diastolic compromise is a late occurring consequence of persistent hypervolemia, different from the mechanism of hydropic changes caused by cardiac causes."

For more information on this research see: Ventricular Diastolic Function in Normal Fetuses and Fetuses with Hb Bart's Disease Assessed by Color M-Mode Propagation Velocity using Cardio-STIC-M (Spatio-Temporal Image Correlation M-Mode). Ultraschall in Der Medizin, 2016;37(5):492-496. Ultraschall in Der Medizin can be contacted at: Georg Thieme Verlag Kg, Rudigerstr 14, D-70469 Stuttgart, Germany.

Research Conducted at China Medical University and Hospital Has Provided New Information about Colon Cancer (Efficacy of Bevacizumab in the First-Line Treatment of Patients with RAS Mutations Metastatic Colorectal Cancer: a Systematic Review ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating from Shenyang, People's Republic of China, by NewsRx correspondents, research stated, "Whether patients with RAS mutation metastatic colorectal cancer (mCRC) obtain benefits from bevacizumab added to first-line chemotherapy remains unclear. PubMed, Cochrane Systematic Reviews, the Cochrane Collaboration Central Register of Controlled Clinical Trials, ClinicalTrials.gov, and the American Society of Clinical Oncology and European Society for Medical Oncology databases were searched to identify abstracts for randomized controlled trials (RCTs) evaluating the efficacy of bevacizumab for the first-line treatment of patients with RAS mutations mCRC from inception to the end of April 2016."

Our news editors obtained a quote from the research from China Medical University and Hospital, "Hazard ratios (HRs) for overall survival (OS) and progression-free survival (PFS) were estimated. Ten eligible papers reporting six RCTs were included. In the network meta-analysis of patients with RAS mutations, bevacizumab + chemotherapy prolonged PFS compared with chemotherapy alone (HR 0.75, 95% CI 0.51-1.10), but the difference was not statistically significant. Bevacizumab + chemotherapy did not prolong OS compared with chemotherapy alone (HR 1.10, 95% CI 0.73-1.66)."

According to the news editors, the research concluded: "There was insufficient evidence to definitively state that patients with RAS mutations mCRC could benefit from bevacizumab combined with chemotherapy as first-line treatment."

The news editors report that additional information may be obtained by contacting J.D. Zhang, China Med Univ, Canc Hosp, Liaoning Canc Hosp & Inst, Dept. of Med Oncol, Shenyang 110042, Liaoning Provin, People's Republic of China. Additional authors for this research include P. Yu, J.L. Qu, Y. Chen, Y. Zhou, L.Y. Fu and J.D. Zhang.

Research Conducted at Chinese Academy of Medical Sciences Has Provided New Information about Breast Cancer (Functions of miR-146a and miR-222 in Tumor-associated Macrophages in Breast Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Tumor-associated macrophages (TAMs) play critical roles in promoting tumor progression and invasion. However, the molecular mechanisms underlying TAM regulation remain to be further investigated and may make significant contributions to cancer treatment."

Our news journalists obtained a quote from the research from the Chinese Academy of Medical Sciences, "Mammalian microRNAs (miRNAs) have recently been identified as important regulators of gene expression that function by repressing specific target genes mainly at the post-transcriptional level. However, systematic studies of the functions and mechanisms of miRNAs in TAMs in tumor tissues are rare. In this study, miR-146a and miR-222 were shown to be significantly decreased in TAMs associated with the up-regulated NF-kB p50 subunit. miR-146a promoted the expression of some M2 macrophage phenotype molecules, and miR-146a antagonist transfected RAW264.7 monocyte-macrophage cells inhibited 4T1 tumor growth in vivo. Meanwhile, overexpression of miR-222 inhibited TAM chemotaxis, and miR-222 in TAMs inhibited 4T1 tumor growth by targeting CXCL12 and inhibiting CXCR4. These data revealed that miRNAs influence breast tumor growth by promoting the M2 type polarization or regulating the recruitment of TAMs."

According to the news editors, the research concluded: "These observations suggest that endogenous miRNAs may exert an important role in controlling the polarization and function of TAMs in breast cancer."

For more information on this research see: Functions of miR-146a and miR-222 in Tumor-associated Macrophages in Breast Cancer. *Scientific Reports*, 2015;5():18648. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Research Conducted at Chinese People's Liberation Army General Hospital Has Updated Our Knowledge about Conductive Hearing Loss (SIX2 haploinsufficiency causes conductive hearing loss with ptosis in humans)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hearing Diseases and Conditions - Conductive Hearing Loss is now available. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The ossicles represent one of the most fundamental morphological features in evolutionary biology of the mammalians. The mobile ossicular morphology abnormalities result in the severe conductive hearing loss."

Our news editors obtained a quote from the research from Chinese People's Liberation Army General Hospital, "Development and patterning of the middle ear malformation depend on genetic and environmental causes. However, the genetic basis for the risk of congenital ossicle malformation is poorly understood. We show here nine affected individuals in a Chinese pedigree who had bilateral conductive hearing loss with ptosis. We performed whole-genome sequencing and array comparative genomic hybridization (CGH) analysis on DNA samples from the Chinese pedigree. We confirmed the presence of a novel 60 kb heterozygous deletion in size, encompassing SIX2 in our family. Mutation screening in 169 sporadic cases with external ear and middle ear malformations identified no pathogenic variant or polymorphism. We suggest SIX2 haploinsufficiency as a potential congenital factor could be attributed to developmental malformation of the middle ear ossicles and upper eyelid."

According to the news editors, the research concluded: "To the best of our knowledge, this is the first report to provide a description of copy number variation in the SIX2 gene resulting in syndromic conductive hearing loss."

For more information on this research see: SIX2 haploinsufficiency causes conductive hearing loss with ptosis in humans. Journal of Human Genetics, 2016;61(11):917-922. Journal of Human Genetics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. Research Conducted at Dana-Farber Cancer Institute Has Updated Our Knowledge about Health and Medicine (Targeting EZH2 in cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Health and Medicine is now available. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Recent genomic studies have resulted in an emerging understanding of the role of chromatin regulators in the development of cancer. EZH2, a histone methyl transferase subunit of a Polycomb repressor complex, is recurrently mutated in several forms of cancer and is highly expressed in numerous others."

The news reporters obtained a quote from the research from Dana-Farber Cancer Institute, "Notably, both gain-of-function and loss-of-function mutations occur in cancers but are associated with distinct cancer types. Here we review the spectrum of EZH2-associated mutations, discuss the mechanisms underlying EZH2 function, and synthesize a unifying perspective that the promotion of cancer arises from disruption of the role of EZH2 as a master regulator of transcription."

According to the news reporters, the research concluded: "We further discuss EZH2 inhibitors that are now showing early signs of promise in clinical trials and also additional strategies to combat roles of EZH2 in cancer."

For more information on this research see: Targeting EZH2 in cancer. *Nature Medicine*, 2016;22(2):128-34. (Nature Publishing Group - www.nature.com/nm/)

Our news correspondents report that additional information may be obtained by contacting K.H. Kim, Dept. of Pediatric Oncology, Dana-Farber Cancer Institute, Boston, Massachusetts, United States.

Research Conducted at Eastern Virginia School of Medicine Has Provided New Information about Tissue Plasminogen Activator (The Effect of Levonorgestrel on Fibrinolytic Factors in Human Endometrial Endothelial Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Enzymes and Coenzymes - Tissue Plasminogen Activator. According to news reporting originating in Norfolk, Virginia, by
NewsRx journalists, research stated, "The levonorgestrel-releasing intrauterine system is considered a highly effective treatment of heavy menstrual bleeding (HMB). While LNG has established effects on the stromal and glandular compartments of the endometrial tissue, its effect on the endometrial endothelial cells has not been investigated."

The news reporters obtained a quote from the research from the Eastern Virginia School of Medicine, "We examined whether LNG regulates fibrinolytic factors, tissue plasminogen activator (tPA), and urokinase plasminogen activator (uPA) secreted by human endometrial endothelial cells (HEECs) and determined the steroid receptor through which LNG exerts its effect on the endothelium. The HEECs were treated with LNG or progesterone and levels of tPA and plasminogen activator inhibitor 1 (PAI-1) measured. The HEECs were specifically examined for the presence of androgen receptors through Western blot. Levonorgestrel flutamide were added to HEECs and the levels of tPA and uPA were examined. An enzyme-linked immunosorbsent assay performed on culture media confirmed a statistically significant decrease in tPA levels in cells treated with LNG (77.80% +/- 8.0% of control; n = 5, P< .05 vs control) but not progesterone. The androgen receptor (110 kDa) was detected in HEEC lysates. The decrease in tPA was blocked by the addition of flutamide (101.3% +/- 16% of control), a classic nonsteroidal androgen receptor blocker. There was no change in uPA or PAI-1 levels in cells treated with LNG. Levonorgestrel decreases tPA levels through the androgen receptor in HEECs. Thus, LNG inhibits tPA secretion by the endometrial endothelial cell."

According to the news reporters, the research concluded: "This response suggests reduction in HMB with LNG-IUS could reflect an LNG-mediated promotion of hemostasis."

Our news correspondents report that additional information may be obtained by contacting T. Pakrashi, Eastern Virginia Med Sch, Jones Inst Reprod Med, Dept. of Obstet & Gynecol, Norfolk, VA 23507, United States. Additional authors for this research include J.E. Taylor, A. Nelson, D.F. Archer and T. Jacob.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/1933719116645193. This DOI is a link to an online electronic document that is either free or for purchase.

Physical Fitness

Research Conducted at Faculty of Physical Education Has Provided New Information about Physical Fitness (Biological Aging and Physical Fitness in Men Aged 20-70 Years from Krakow, Poland)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Physical Fitness. According to news reporting originating from Krakow, Poland, by NewsRx correspondents, research stated, "The increasing problem of population aging requires appropriate economic and health-related measures to mitigate its negative effects. The aim was to categorize the biological age of men between 20 and 70 years of age and assess its relationship to their physical activity and fitness."

Our news editors obtained a quote from the research from the Faculty of Physical Education, "Data included morphological variables, total body water, the results of five Eurofit motor tests and the percentage of maximum heart rate (HR%), during a cardiovascular test of more than 1,400 20-70 year-old men living in Krakow. Biological age was estimated with regression equations. There were significant and consistent differences in physical fitness profiles between the three established groups of relations between biological and chronological age (biologically younger, equal, and older). These three categories of biological age were generally consistent with the regression analysis of physical fitness results, although declared physical activity seemed to be an independent factor. The selected morphological variables represent a set of characteristics useful for the determination of the biological age."

According to the news editors, the research concluded: "The existing relationship between physical activity and biological age indicates that physical activity may contribute to the inhibition of involutional changes, even if it had only been performed regularly in the past."

The news editors report that additional information may be obtained by contacting L. Kryst, Univ Phys Educ, Dept. of Anthropol, Fac Phys Educ, Krakow, Poland. Additional authors for this research include A. Woronkowicz and L. Kryst.

Keywords for this news article include: Krakow, Poland, Europe, Physical Fitness, Exercise, Faculty of Physical Education.

Biological Factors - Autacoids

Research Conducted at Federal University Has Provided New Information about Autacoids (Cyclo-Gly-Pro, a cyclic dipeptide, attenuates nociceptive behaviour and inflammatory response in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biological Factors - Autacoids have been presented.
According to news reporting originating in Maceio, Brazil, by NewsRx journalists, research stated, "The present study aimed to investigate the antinociceptive and anti-inflammatory effects of the cyclic dipeptide cyclo-Gly-Pro (CGP) in mice. Antinociceptive activity was assessed by employing different pain models, such as formalin test, acetic acid-induced writhing, hot plate test, and carrageenan-induced hyperalgesia, in mice."

Financial supporters for this research include Conselho Nacional de Desenvolvimento Científico e Tecnológico, Coordenação de Aperfeiçoamento de Pessoal de Nível Superior, Fundação de Amparo a Pesquisa do Estado de Alagoas.

The news reporters obtained a quote from the research from Federal University, "The number of c-Fos-immunoreactive cells in the periaqueductal gray (PAG) was evaluated in CGP-treated mice. Anti-inflammatory activity was evaluated using paw oedema induced by carrageenan, compound 48/80, serotonin, and prostaglandin E2 (PGE2) and analyzed by plethysmometry. Quantitation of myeloperoxidase (MPO) in the paw was carried out to analyze the presence of neutrophils in the tissue. Intraperitoneal injection of CGP produced a significant inhibition in both neurogenic and inflammatory phases of formalin-induced pain. The antinociceptive effect of CGP, evaluated in the acetic acid-induced writhing test, was detected for up to 6 h after treatment. Further, in the hot plate test, antinociceptive behaviour was evoked by CGP, and this response was inhibited by naloxone. Animals treated with CGP did not present changes in motor performance. In CGP-treated mice there was an increase in the number of c-Fos-positive neurons in the periaqueductal gray. In another set of experiments, CGP attenuated the hyperalgesic response induced by carrageenan. Furthermore, CGP also reduced the carrageenan-increased MPO activity in paws. In addition, CGP also reduced the paw oedema evoked by compound 48/80, serotonin, and PGE2."

According to the news reporters, the research concluded: "Taken together, these results may support a possible therapeutic application of the cyclic dipeptide cyclo-Gly-Pro toward alleviating nociception and damage caused by inflammation conditions."

Our news correspondents report that additional information may be obtained by contacting J.N. Ferro, Laboratory of Cell Biology, Federal University of Alagoas, Maceio, Brazil. Additional authors for this research include F.L. de Aquino, R.G. de Brito, P.L. dos Santos, J.de S. Quintans, L.C. de Souza, A.F. de Araujo, B.L. Diaz, W. Lucca-Junior, L.J. Quintans-Junior and E. Barreto.

Drugs and Therapies - Aerosol Medicine and…

Research Conducted at Free University Has Provided New Information about Aerosol Medicine and Pulmonary Drug Delivery (Inhaled Aerosol Distribution in Human Airways: A Scintigraphy-Guided Study in a 3D Printed Model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Aerosol Medicine and Pulmonary Drug Delivery have been published. According to news reporting from Brussels, Belgium, by NewsRx journalists, research stated, "While it is generally accepted that inertial impaction will lead to particle loss as aerosol is being carried into the pulmonary airways, most predictive aerosol deposition models adopt the hypothesis that the inhaled particles that remain airborne will distribute according to the gas flow distribution between airways downstream. Using a 3D printed cast of human airways, we quantified particle deposition and distribution and visualized their inhaled trajectory in the human lung."

The news correspondents obtained a quote from the research from Free University, "The human airway cast was exposed to 6 μm monodisperse, radiolabeled aerosol particles at distinct inhaled flow rates and imaged by scintigraphy in two perpendicular planes. In addition, we also imaged the distribution of aerosol beyond the airways into the five lung lobes. The experimental aerosol deposition patterns could be mimicked by computational fluid dynamic (CFD) simulation in the same 3D airway geometry. It was shown that for particles with a diameter of 6 μm inhaled at flows up to 60 L/min, the aerosol distribution over both lungs and the individual five lung lobes roughly followed the corresponding distributions of gas flow. While aerosol deposition was greater in the main bronchi of the left versus right lung, distribution of deposited and suspended particles toward the right lung exceeded that of the left lung. The CFD simulations also predict that for both 3 and 6 μm particles, aerosol distribution between lung units subtending from airways in generation 5 did not match gas distribution between these units and that this effect was driven by inertial impaction. We showed combined imaging experiments and CFD simulations to systematically study aerosol deposition patterns in human airways down to generation 5, where particle deposition could be spatially linked to the airway geometry."

According to the news reporters, the research concluded: "As particles are negotiating an increasing number of airways in subsequent branching generations, CFD predicts marked deviations of aerosol distribution with respect to ventilation distribution, even in the normal human lung."

Our news journalists report that additional information may be obtained by contacting S. Verbanck, Vrije Univ Brussel, Univ Hosp UZ Brussel, Div Resp, Brussels, Belgium. Additional authors for this research include G. Ghorbaniasl, M.F. Biddiscombe, D. Dragojlovic, N. Ricks, C. Lacor, B. Ilsen, J. de Mey, D. Schuermans, S.R. Underwood, P.J.
Research Conducted at Friedrich-Alexander-University Has Updated Our Knowledge about Inflammatory Bowel Disease (Molecular mechanism of action of anti-tumor necrosis factor antibodies in inflammatory bowel diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Digestive System Diseases and Conditions - Inflammatory Bowel Disease is now available. According to news reporting out of Erlangen, Germany, by NewsRx editors, research stated, "Anti-tumor necrosis factor (TNF) antibodies are successfully used in the therapy of inflammatory bowel diseases (IBD). However, the molecular mechanism of action of these agents is still a matter of debate."

Our news journalists obtained a quote from the research from Friedrich-Alexander-University, "Apart from neutralization of TNF, influence on the intestinal barrier function, induction of apoptosis in mucosal immune cells, formation of regulatory macrophages as well as other immune modulating properties have been discussed as central features. Nevertheless, clinically effective anti-TNF antibodies were shown to differ in their mode-of-action in vivo and in vitro. Furthermore, the anti-TNF agent etanercept is effective in the treatment of rheumatoid arthritis but failed to induce clinical response in Crohn's disease patients, suggesting different contributions of TNF in the pathogenesis of these inflammatory diseases. In the following, we will review different aspects regarding the mechanism of action of anti-TNF agents in general and analyze comparatively different effects of each anti-TNF agent such as TNF neutralization, modulation of the immune system, reverse signaling and induction of apoptosis. We discuss the relevance of the membrane-bound form of TNF compared to the soluble form for the immunopathogenesis of IBD."

According to the news editors, the research concluded: "Furthermore, we review reports that could lead to personalized medicine approaches regarding treatment with anti-TNF antibodies in chronic intestinal inflammation, by predicting response to therapy."

Our news journalists report that additional information may be obtained by contacting R. Atreya, Friedrich Alexander Univ Erlangen Nurnberg, Medical Clin 1, D-91054 Erlangen, Germany. Additional authors for this research include W. Dieterich, M.F. Neurath and...
Research Conducted at Fudan University Has Provided New Information about Ring Cell Cancer (Younger Age Is Associated with Poorer Survival in Patients with Signet-Ring Cell Carcinoma of the Colon without Distant Metastasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Ring Cell Cancer have been published. According to news reporting from Shanghai, People’s Republic of China, by NewsRx journalists, research stated, "In general, younger age is associated with better survival in patients with colon cancer. In this study, we aim to analyze the impact of age on cancer-specific survival (CSS) in patients with signet-ring cell carcinoma (SRCC) of the colon, a particularly aggressive type of colon cancer."

The news correspondents obtained a quote from the research from Fudan University, "Information on patients with SRCC of the colon with no distant metastasis was extracted from the US Surveillance, Epidemiology, and End Results (SEER) database. An X-tile plot was used to determine the optimal cutoff age at diagnosis. A total of 776 patients were included in data analysis. The X-tile program revealed an optimal cutoff at 35 years of age. A higher percentage of stage III disease and a higher percentage of N2 disease were observed in patients <= 35 years of age. The multivariate Cox proportional model demonstrated that patients <= 35 years of age were more likely to have a poorer survival outcome compared with patients aged > 35 years (HR 1.411, 95% CI 1.032-1.929, and P = 0.031)."

According to the news reporters, the research concluded: "In contrast to the association of younger age with better survival in colon cancer patients, younger age (<= 35 years) is associated with poorer survival outcome in patients with SRCC of the colon without distant metastasis."

Our news journalists report that additional information may be obtained by
Oncology - Solid Cancer

Research Conducted at Genentech, Inc. Has Updated Our Knowledge about Solid Cancer (Safety of Onartuzumab in Patients with Solid Tumors: Experience to Date from the Onartuzumab Clinical Trial Program)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Solid Cancer. According to news reporting out of South San Francisco, California, by NewsRx editors, research stated, "Onartuzumab, a recombinant humanized monovalent monoclonal antibody directed against MET, the receptor for the hepatocyte growth factor, has been investigated for the treatment of solid tumors. This publication describes the safety profile of onartuzumab in patients with solid tumors using data from the global onartuzumab clinical development program."

Our news journalists obtained a quote from the research from Genentech, Inc., "Adverse event (AE) and laboratory data from onartuzumab phase II/III studies were analyzed and coded into standardized terms according to industry standards. The severity of AEs was assessed using the NCI Common Toxicity Criteria, Version 4. Medical Dictionary for Regulatory Activities (MedDRA) AEs were grouped using the standardized MedDRA queries (SMQs) 'gastrointestinal (GI) perforation', 'embolic and thrombotic events, venous (VTE)', and 'embolic and thrombotic events, arterial (ATE)', and the Adverse Event Group Term (AEGT) 'edema.' The safety evaluable populations (patients who received at least one dose of study treatment) for each study were included in this analysis. A total of 773 onartuzumab-treated patients from seven studies (phase II, n=6; phase III, n=1) were included. Edema and VTEs were reported in onartuzumab-treated patients in all seven studies. Edema events in onartuzumab arms were generally grade 1-2 in severity, observed more frequently than in control arms and at incidences ranging from 25.4-65.7% for all grades and from 1.2-14.1% for grade 3. Hypoalbuminemia was also more frequent in onartuzumab arms and observed at frequencies between 77.8% and 98.3%. The highest frequencies of all grade and grade (>=)3 VTE events were 30.3% and 17.2%, respectively in onartuzumab arms. The cumulative incidence of all grade ATE events ranged from 0-5.6% (grade (>=)3, 0-5.1%) in onartuzumab arms. The frequency of GI perforation was below 10% in all studies; the highest estimates were observed in studies with onartuzumab plus bevacizumab for all grades (0-6.2%) and grade (>=)3 (0-6.2%)."

According to the news editors, the research concluded: "The frequencies of VTE,
ATE, GI perforation, hypoalbuminemia, and edema in clinical studies were higher in patients receiving onartuzumab than in control arms; these are considered to be expected events in patients receiving onartuzumab."

For more information on this research see: Safety of Onartuzumab in Patients with Solid Tumors: Experience to Date from the Onartuzumab Clinical Trial Program. *Plos One*, 2015;10(10):e0139679. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news journalists report that additional information may be obtained by contacting R. Morley, Genentech Inc, South San Francisco, CA, United States. Additional authors for this research include A. **Peptides and Proteins**

**Research Conducted at Georg-August-University Has Updated Our Knowledge about Peptides and Proteins [The Oncogenic Fusion Proteins SET-Nup214 and Sequestosome-1 (SQSTM1)-Nup214 Form Dynamic Nuclear Bodies and Differentially Affect Nuclear ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptides and Proteins. According to news reporting originating from Gottingen, Germany, by NewsRx correspondents, research stated, "Genetic rearrangements are a hallmark of several forms of leukemia and can lead to oncogenic fusion proteins. One example of an affected chromosomal region is the gene coding for Nup214, a nucleoporin that localizes to the cytoplasmic side of the nuclear pore complex (NPC)."

Our news editors obtained a quote from the research from Georg-August-University, "We investigated two such fusion proteins, SET-Nup214 and SQSTM1 (sequestosome)Nup214, both containing C-terminal portions of Nup214. SETNup214 nuclear bodies containing the nuclear export receptor CRM1 were observed in the leukemia cell lines LOUCY and MEGAL. Overexpression of SET-Nup214 in HeLa cells leads to the formation of similar nuclear bodies that recruit CRM1, export cargo proteins, and certain nucleoporins and concomitantly affect nuclear protein and poly(A)(+ ) RNA export. SQSTM1-Nup214, although mostly cytoplasmic, also forms nuclear bodies and inhibits nuclear protein but not poly(A)(+) RNA export. The interaction of the fusion proteins with CRM1 is RanGTP-dependent, as shown in co-immunoprecipitation experiments and binding assays. Further analysis revealed that the Nup214 parts mediate the inhibition of nuclear export, whereas the SET or SQSTM1 part determines the localization of the fusion protein and therefore the extent of the effect. SETNup214 nuclear bodies are highly mobile structures, which are in equilibrium with the nucleoplasm in interphase..."
and disassemble during mitosis or upon treatment of cells with the CRM1-inhibitor leptomycin B. Strikingly, we found that nucleoporins can be released from nuclear bodies and reintegrated into existing NPC."

According to the news editors, the research concluded: "Our results point to nuclear bodies as a means of preventing the formation of potentially insoluble and harmful protein aggregates that also may serve as storage compartments for nuclear transport factors."

The news editors report that additional information may be obtained by contacting R.H. Kehlenbach, Georg August Univ, Gottingen Center Mol Biosci GZMB, D-37073 Gottingen, Germany. Additional authors for this research include A. Mendes, C. Valkova, C. Spillner, B. Fahrenkrog, C. Kaether and R.H. Kehlenbach.

Keywords for this news article include: Gottingen, Germany, Europe, Peptides and Proteins, Nuclear Proteins, Fusion Proteins, Amino Acids, Peptides, Genetics, Georg-August-University.

**Oncology - Breast Cancer**

**Research Conducted at German Institute of Human Nutrition Potsdam-Rehbrucke Has Provided New Information about Breast Cancer (Evaluating the Applicability of Data-Driven Dietary Patterns to Independent Samples with a Focus on Measurement Tools ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news originating from Nuthetal, Germany, by NewsRx correspondents, research stated, "Diet is a key modifiable risk for many chronic diseases, but it remains unclear whether dietary patterns from one study sample are generalizable to other independent populations. The primary objective of this study was to assess whether data-driven dietary patterns from one study sample are applicable to other populations."

Our news journalists obtained a quote from the research from the German Institute of Human Nutrition Potsdam-Rehbrucke, "The secondary objective was to assess the validity of two criteria of pattern similarity. Six dietary patterns-Western (n = 3), Mediterranean, Prudent, and Healthy from three published studies on breast cancer were reconstructed in a case-control study of 973 breast cancer patients and 973 controls. Three more internal patterns (Western, Prudent, and Mediterranean) were derived from this case-control study's own data. Statistical analysis Applicability was assessed by comparing the six reconstructed patterns with the three internal dietary patterns, using the congruence coefficient (CC) between pattern loadings. In cases where any pair met either of two commonly used criteria for declaring patterns similar (CC >= 0.85 or a statistically significant [P < 0.05] Pearson correlation), then the true similarity
of those two dietary patterns was doublechecked by comparing their associations to risk for breast cancer, to assess whether those two criteria of similarity are actually reliable. Five of the six reconstructed dietary patterns showed high congruence (CC > 0.9) to their corresponding dietary pattern derived from the case-control study's data. Similar associations with risk for breast cancer were found in all pairs of dietary patterns that had high CC but not in all pairs of dietary patterns with statistically significant correlations. Similar dietary patterns can be found in independent samples. The P value of a correlation coefficient is less reliable than the CC as a criterion for declaring two dietary patterns similar."

According to the news editors, the research concluded: "This study shows that diet scores based on a particular study are generalizable to other populations."

The news correspondents report that additional information may be obtained from A. Castello, German Inst Human Nutr Potsdam Rehbrucke, Dept. of Epidemiol, Nuthetal, Germany. Additional authors for this research include B. Buijsse, M. Martin, A. Ruiz, A.M. Casas, J.M. Baena-Canada, R. Pastor-Barriuso, S. Antolin, M. Ramos, M. Munoz, A. Lluch, A. de Juan-Ferre, C. Jara, V. the labile beta-diketone moiety in curcumin. Previous work revealed that novel N-alkyl beta-enaminones showed a similar water solubility as compared to curcumin, accompanied by a stronger antiproliferative activity. To extend this beta-enaminone compound library, new analogues were prepared in this work using more polar amines (hydroxyalkylamines and methoxyalkylamines instead of alkylamines) with the main purpose to improve the water solubility without compromising the biological activity of the resulting curcuminoids. Compared to their respective parent compounds, i.e. curcumin and bisdemethoxycurcumin, the bisdemethoxycurcumin N-(hydroxy/methoxy) alkyl enaminone analogues showed better water solubility, antioxidant and anti-proliferative activities. In addition, the curcumin enaminones displayed activities comparable to or better than curcumin, and the water solubility was improved significantly."

According to the news reporters, the research concluded: "The constructed new analogues may thus be of interest for further exploration concerning their impact on oxidative stress related diseases such as cancer."

Our news journalists report that additional information may be obtained by contacting J. Van Camp, University of Ghent, Fac Biosci Engn, Dept. of Food Safety & Food Qual, B-9000 Ghent, Belgium. **Intracellular Membranes**

**Research Conducted at Graduate School of Biomedical Sciences Has Provided New Information about Intracellular Membranes (The deadly landscape of pro-apoptotic BCL-2 proteins in the outer mitochondrial membrane)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Intracellular Membranes are presented in a new report. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Apoptosis is a biological process that removes damaged, excess or infected cells through a genetically controlled mechanism. This process plays a crucial role in organismal development, immunity and tissue homeostasis, and alterations in apoptosis contribute to human diseases including cancer and auto-immunity."

Financial supporters for this research include National Institutes of Health, JJR Foundation, William A. Spivak Fund, Fridolin Charitable Trust, American Cancer Society, Irma T. Hirschl Trust, March of Dimes Foundation, Developmental Research Pilot Program
within the Department of Oncological Sciences at Mount Sinai.

Our news journalists obtained a quote from the research from the Graduate School of Biomedical Sciences, "In the past two decades, significant efforts have focused on understanding the function of the BCL-2 proteins, a complex family of pro-survival and pro-apoptotic alpha-helical proteins that directly control the mitochondrial pathway of apoptosis. Diverse structural investigations of the BCL-2 family members have broadened our mechanistic understanding of their individual functions. However, an often over-looked aspect of the mitochondrial pathway of apoptosis is how the BCL-2 family specifically interacts with and targets the outer mitochondrial membrane to initiate apoptosis. Structural information on the relationship between the BCL-2 family and the outer mitochondrial membrane is missing; likewise, knowledge of the biophysical mechanisms by which the outer mitochondrial membrane affects and effects apoptosis is lacking."

According to the news editors, the research concluded: "In this mini-review, we provide a current overview of the BCL-2 family members and discuss the latest structural insights into BAK/BAX activation and oligomerization in the context of the outer mitochondrial membrane and mitochondrial biology."

The news correspondents report that additional information may be obtained from J.E. Chipuk, Icahn Sch Med Mt Sinai, Grad Sch Biomed Sci, New York, NY 10029, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/febs.13624. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Diseases and Conditions - Thrombosis**

**Research Conducted at Guy's and St. Thomas' NHS Foundation Trust Has Provided New Information about Thrombosis (Sudden death of a patient with polycystic kidneys due to acute inferior vena cava thrombosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Thrombosis have been published. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "A management algorithm for large renal cyst in autosomal dominant polycystic kidney disease (ADPKD) is lacking despite the potential to cause widespread medical and surgical complications."

Our news journalists obtained a quote from the research from Guy's and St. Thomas'...
NHS Foundation Trust, "We report the case of a 37-year-old gentleman with ADPKD and large (>5 cm diameter) cysts who suffered sudden death due to autopsy-proven inferior vena cava and pulmonary arterial thrombosis. In this article, we discuss the possible pathophysiological factors at play in this catastrophic complication of ADPKD."

According to the news editors, the research concluded: "We also review available literature to establish the prevalence of such a complication and also establish current thoughts and opinions as to the optimal management strategy for giant cysts in the context of ADPKD."

Our news journalists report that additional information may be obtained by contacting R. Tamburrini, Guys & St Thomas Hosp NHS Fdn Trust, London, United Kingdom. Additional authors for this research include Z. Ahmed, J. van der Walt and D. Goldsmith.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/0036933014567050. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Antibiotics**

**Research Conducted at Hartford Hospital Has Updated Our Knowledge about Antibiotics (Continuous and Prolonged Intravenous beta-Lactam Dosing: Implications for the Clinical Laboratory)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antibiotics have been presented. According to news reporting out of Hartford, Connecticut, by NewsRx editors, research stated, "Beta-lactam antibiotics serve as a cornerstone in the management of bacterial infections because of their wide spectrum of activity and low toxicity."

Our news journalists obtained a quote from the research from Hartford Hospital, "Since resistance rates among bacteria are continuously on the rise and the pipeline for new antibiotics does not meet this trend, an optimization of current beta-lactam treatment is needed. This review provides an overview of optimization through use of prolonged-and continuous-infusion dosing strategies compared with more traditional intermittent infusions."

According to the news editors, the research concluded: "Included is an overview of the scientific basis for using these nontraditional prolonged- and continuous-infusion-based regimens, with a focus on major areas in which the clinical laboratory can support the clinical use of these regimens."

For more information on this research see: Continuous and Prolonged Intravenous beta-Lactam Dosing: Implications for the Clinical Laboratory. *Clinical Microbiology Reviews*, 2016;29(4):759-772. *Clinical Microbiology Reviews* can be contacted at: Amer Soc...
Heart Disorders and Diseases - Heart Disease

Research Conducted at Heart Hospital Has Provided New Information about Heart Disease (The relationship between heart rate and mortality of patients with acute coronary syndromes in the coronary intervention era Meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Disease. According to news reporting from Hubei, People's Republic of China, by NewsRx journalists, research stated, "Most of acute coronary syndromes (ACS) were receiving intervention treatment a high overall rate of coronary angiography in the modern medical practice. Consequently, we conduct a review to determine the heart rate (HR) on the prognosis of ACS in the coronary intervention era."

The news correspondents obtained a quote from the research from Heart Hospital, "PubMed, EMBASE, MEDLINE, and the Cochrane Library was systematically searched up to May 2016 using the search terms 'heart rate,' 'acute coronary syndrome,' 'acute myocardial infarction,' 'ST-elevation myocardial infarction,' 'non-ST-segment elevation.' The outcome of interest was all-cause mortality. All analyses were performed using Review Manager. Database searches retrieved 2324 citations. Eleven studies enrolling 156,374 patients were included. In-hospital mortality was significantly higher in the elevated HR group compared to the lower HR group (pooled RR 2.04, 95% CI 1.80-2.30, P<0.0001). Individuals with elevated admission HR had increased risk of long-term mortality (Pooled RR=1.63, 95% CI 1.27-2.10, P=0.008) compared to lower admission HR. The pooled results showed elevated discharge and resting HR were related to increased mortality of patients with ACS (pooled RR 1.88, 95% CI 1.02-3.47, P=0.04; pooled RR 2.14, 95% CI 1.37-3.33, P<0.0001, respectively)."

According to the news reporters, the research concluded: "Elevated HR may increase the mortality of ACS patients in the percutaneous coronary intervention era."

For more information on this research see: The relationship between heart rate and mortality of patients with acute coronary syndromes in the coronary intervention era Meta-analysis. Medicine, 2016;95(46):266-272. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Research Conducted at Henry Ford Hospital Has Provided New Information about Type 2 Diabetes (White matter changes after stroke in type 2 diabetic rats measured by diffusion magnetic resonance imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting originating from Detroit, Michigan, by NewsRx correspondents, research stated, "Diffusion-related magnetic resonance imaging parametric maps may be employed to characterize white matter of brain. We hypothesize that entropy of diffusion anisotropy may be most effective for detecting therapeutic effects of bone marrow stromal cell treatment of ischemia in type 2 diabetes mellitus rats."

Our news editors obtained a quote from the research from Henry Ford Hospital, "Type 2 diabetes mellitus was induced in adult male Wistar rats. These rats were then subjected to 2 h of middle cerebral artery occlusion, and received bone marrow stromal cell (5 x 10(6), n = 8) or an equal volume of saline (n = 8) via tail vein injection at three days after middle cerebral artery occlusion. Magnetic resonance imaging was performed on day one and then weekly for five weeks post middle cerebral artery occlusion. The diffusion metrics complementarily permitted characterization of axons and axonal myelination. All six magnetic resonance imaging diffusion metrics, confirmed by histological measures, demonstrated that bone marrow stromal cell treatment significantly (p < 0.05) improved magnetic resonance imaging diffusion indices of white matter in type 2 diabetes mellitus rats after middle cerebral artery occlusion compared with the saline-treated rats."

According to the news editors, the research concluded: "Superior to the fractional anisotropy metric that provided measures related to organization of neuronal fiber bundles, the entropy metric can also identify microstructures and low-density axonal fibers of cerebral tissue after stroke in type 2 diabetes mellitus rats."

The news editors report that additional information may be obtained by contacting Q. Jiang, Henry Ford Hospital, Dept. of Neurol, Detroit, MI 48202, United States. Additional authors for this research include J.L. Chen, M. Chopp, L. Li, T. Yan, E. Davoodi-Bojd, Q.J. Li, S.P.N. Davarani and Q. Jiang.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/0271678X15622464. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Cancer Risk

Research Conducted at Instituto de Salud Carlos III Has Provided New Information about Cancer Risk (Association Between Western and Mediterranean Dietary Patterns and Mammographic Density)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Cancer Risk is the subject of a report. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "To examine the association between two dietary patterns (Western and Mediterranean), previously linked to breast cancer risk, and mammographic density. This cross-sectional study included 3,584 women attending population-based breast cancer screening programs and recruited between October 7, 2007, and July 14, 2008 (participation rate 74.5%)."

The news reporters obtained a quote from the research from Instituto de Salud Carlos III, "Collected data included anthropometric measurements; demographic, obstetric, and gynecologic characteristics; family and personal health history; and diet in the preceding year. Mammographic density was blindly assessed by a single radiologist and classified into four categories: less than 10%, 10-25%, 25-50%, and greater than 50%. The association between adherence to either a Western or a Mediterranean dietary pattern and mammographic density was explored using multivariable ordinal logistic regression models with random center-specific intercepts. Models were adjusted for age, body mass index, parity, menopause, smoking, family history, hormonal treatment, and calorie and alcohol intake. Differences according to women's characteristics were tested including interaction terms. Women with a higher adherence to the Western dietary pattern were more likely to have high mammographic density (n=242 [27%]) than women with low adherence (n=169 [19%]) with a fully adjusted odds ratio (ORQ4vsQ1) of 1.25 (95% confidence interval [CI] 1.03-1.52). This association was confined to over-weight-obese women (adjusted ORQ4vsQ1 [95% CI] 1.41 [1.13-1.76]). No association between Mediterranean dietary pattern and mammographic density was observed. The Western dietary pattern was associated with increased mammographic density among overweight-obese women."

According to the news reporters, the research concluded: "Our results might inform specific dietary recommendations for women with high mammographic density."

For more information on this research see: Association Between Western and Mediterranean Dietary Patterns and Mammographic Density. Obstetrics and Gynecology, 2016;128(3):574-581. Obstetrics and Gynecology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott

Nutritional and Metabolic Diseases and Conditions –

Research Conducted at International Islamic University Has Updated Our Knowledge about Type 2 Diabetes (Safety profiling of pioglitazone and telmisartan combination by sub-chronic toxicity study in rat)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is the subject of a report. According to news reporting out of Kuala Lumpur, Malaysia, by NewsRx editors, research stated, “It has been reported that the major cause of mortality in diabetes is cardiovascular diseases and contribution of hypertension is significant in this context. Pioglitazone, a thiazolidinedione class of therapeutic agent is used to treat type 2 diabetes mellitus.”

Financial supporters for this research include Ministry of Higher Education, Lincoln University, International Islamic University Malaysia.

Our news journalists obtained a quote from the research from International Islamic University, "Telmisartan, an angiotensin receptor blocker antihypertensive has been reported to have beneficial effect if co-administered with pioglitazone for the management of diabetes complications. The present research work aims to evaluate the safety/toxicity profile of this combination in rat model. The investigation was carried out after co-administering the drugs to the rats for 28 days at three dose levels of 50, 100 and 150 mg/kg covering low to high dose ranges. Various hematological and biochemical parameters were studied in addition to the histopathology of the major organs in order to evaluate the toxicity profile of the combination. Absence of mortality and histopathological changes as well as unaltered hematological and biochemical parameters was observed. This preliminary investigation concludes that the combination of pioglitazone and telmisartan can primarily be stated as safe in animals, even at the dose level which is several folds higher than the intended human dose."

According to the news editors, the research concluded: "Thus, this combination can be explored in future to develop a rational therapy regimen to treat hypertensive diabetic patients." For more information on this research see: Safety profiling of pioglitazone and telmisartan combination by sub-chronic toxicity study in rat. Regulatory Toxicology and Pharmacology, 2016;81():155-161. Regulatory Toxicology and Pharmacology can be contacted
Research Conducted at Johannes Gutenberg-University Has Provided New Information about Granuloma (DNA Damage Signaling Instructs Polyploid Macrophage Fate in Granulomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lymphoproliferative Diseases and Conditions - Granuloma. According to news reporting from Mainz, Germany, by NewsRx journalists, research stated, "Granulomas are immune cell aggregates formed in response to persistent inflammatory stimuli. Granuloma macrophage subsets are diverse and carry varying copy numbers of their genomic information."

Funders for this research include European Union’s Seventh Framework Programme, Research Committee of the Medical Faculty, DFG, German Centre for Infection Research, BMBF, European Research Council, Danish Council for Independent Research, Greek GSRT program of Excellence II, Agence Nationale de la Recherche’, Fondation pour la Recherche Medicale, InCA.

The news correspondents obtained a quote from the research from Johannes Gutenberg-University, "The molecular programs that control the differentiation of such macrophage populations in response to a chronic stimulus, though critical for disease outcome, have not been defined. Here, we delineate a macrophage differentiation pathway by which a persistent Toll-like receptor (TLR)2 signal instructs polyploid macrophage fate by inducing replication stress and activating the DNA damage response. Polyploid granuloma-resident macrophages formed via modified cell divisions and mitotic defects and not, as previously thought, by cell-to-cell fusion. TLR2 signaling promoted macrophage polyploidy and suppressed genomic instability by regulating Myc and ATR."

According to the news reporters, the research concluded: "We propose that, in the presence of persistent inflammatory stimuli, pathways previously linked to oncogene-initiated..."
carcinogenesis instruct a long-lived granuloma-resident macrophage differentiation program that regulates granulomatous tissue remodeling."

For more information on this research see: DNA Damage Signaling Instructs Polyploid Macrophage Fate in Granulomas. Cell, 2016;167(5):1264-1280,236-252. Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell - www.journals.elsevier.com/cell/)

**Clinical Research - Clinical Trials and Studies**

**Research Conducted at Johns Hopkins University School of Medicine Has Provided New Information about Clinical Trials and Studies (Recruitment techniques for alcohol pharmacotherapy clinical trials: A cost-benefit analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Alcohol use disorders (AUDs) represent a large public health burden with relatively few efficacious pharmacotherapies. Randomized controlled trials (RCTs) for new AUD therapies can be hampered by ineffective recruitment, leading to increased trial costs."

Our news journalists obtained a quote from the research from the Johns Hopkins University School of Medicine, "The current analyses examined the effectiveness of recruitment efforts during two consecutive outpatient RCTs of novel AUD pharmacotherapies conducted between 2009 and 2012. During an initial phone screen, participants identified an ad source for learning about the study. Qualified persons were then scheduled for in-person screens. The present analyses examined demographic differences amongst the eight ad sources utilized. Recruitment effectiveness was determined by dividing the number of persons meeting criteria for an in-person screen by the total number of callers from each ad source. Cost-effectiveness was determined by dividing total ad source cost by number of screens, participants randomized, and completers. 1,813 calls resulted in 1,005 completed phone screens. The most common ad source was TV (34%), followed by print (29%), word-of-mouth (11%), flyer (8%), internet (5%), radio (5%), bus ad (2%), and billboard (1%). Participants reporting bus ads (46%), billboard (44%), or print ads (34%) were significantly more likely than the other sources to meet criteria to be scheduled for in-person screens. The most cost-effective ad source was print ($2,506 per completer), while bus ad was the least cost-effective ($13,376 per completer). Recruitment in AUD RCTs can be successful using diverse advertising methods."
According to the news editors, the research concluded: "The present analyses favored use of print ads as most cost-effective."

For more information on this research see: Recruitment techniques for alcohol pharmacotherapy clinical trials: A cost-benefit analysis. Addictive Disorders & Their Treatment, 2015;14(4):211-219. (Lippincott Williams and Wilkins - www.lww.com; Addictive Disorders & Their Treatment - journals.lww.com/addictiondisorders/pages/default.aspx)

The news correspondents report that additional information may be obtained from D.A. Tompkins, Johns Hopkins University School of Medicine, Dept. of Psychiatry and Behavioral Sciences, Behavioral Pharmacology Research Unit, Baltimore, MD, United States. Oncology - Prostate Cancer

Research Conducted at Kaiser Permanente Has Provided New Information about Prostate Cancer (5-Alpha Reductase Inhibitors and the Risk of Prostate Cancer Mortality in Men Treated for Benign Prostatic Hyperplasia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Prostate Cancer. According to news originating from Pasadena, California, by NewsRx correspondents, research stated, "To compare the risk of prostate cancer mortality among men treated with 5- alpha reductase inhibitors (5-ARIs) with those treated with alpha-adrenergic blockers (ABs) in community practice settings. A retrospective matched cohort (N = 174,895) and nested case-control study (N = 18,311) were conducted in 4 regions of an integrated health care system."

Our news journalists obtained a quote from the research from Kaiser Permanente, "Men 50 years and older who initiated pharmaceutical treatment for benign prostatic hyperplasia between January 1, 1992, and December 31, 2007, and had at least 3 consecutive prescriptions were followed through December 31, 2010. Adjusted subdistribution hazard ratios, accounting for competing risks of death, and matched odds ratios were used to estimate prostate cancer mortality associated with 5-ARI use (with or without concomitant ABs) as compared with AB use. In the cohort study, 1,053 men died of prostate cancer (mean follow-up, 3 years), 15% among 5-ARI users (N = 25,388) and 85% among AB users (N = 149,507) (unadjusted mortality rate ratio, 0.80). After accounting for competing risks, it was found that 5-ARI use was not associated with prostate cancer mortality when compared with AB use (adjusted subdistribution hazard ratio, 0.85; 95% CI, 0.72-1.01). Similar results were observed in the case-control study (adjusted matched odds ratio, 0.95; 95% CI, 0.78-1.17). Among men being pharmacologically treated for benign prostatic hyperplasia, 5-ARI use was not associated with an increased risk of prostate cancer mortality when compared with AB use."

According to the news editors, the research concluded: "The increased prevalence of high-grade lesions at the time of diagnosis noted in our study and the chemoprevention trials may not result in increased prostate cancer mortality."

For more information on this research see: 5-Alpha Reductase Inhibitors and the

The news correspondents report that additional information may be obtained from L.P. Wallner, Kaiser Permanente Southern Calif, Dept. of Res & Evaluat, Pasadena, CA 91125, United States. **Hematologic Diseases and Conditions - Fanconi...**

**Research Conducted at King Saud University Has Updated Our Knowledge about Fanconi Anemia (Clinical characteristics and genetic subtypes of Fanconi anemia in Saudi patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematologic Diseases and Conditions - Fanconi Anemia. According to news reporting originating from Riyadh, Saudi Arabia, by NewsRx correspondents, research stated, "We reviewed our institutional experience from 2011 to 2015 on new cases of Fanconi anemia (FA). Ten unrelated cases were diagnosed during this period."

Our news editors obtained a quote from the research from King Saud University, "Four patients with severe aplastic anemia (SAA) had c.2392C > T (p.Arg798( Star )) BRIPl/FANCI mutation. Another child with SAA had novel c.1475T > C (p.Leu492Pro) FANCC mutation. One individual with SAA and acute myeloid leukemia had c.637_643del ( p.Tyr213Lysfs( Star )6 ) FANCG mutation. Three patients presented with early onset of cancer, two had BRCA2 mutation c.7007G > A (p.Arg2336His) and one had a novel c.3425del ( p.Leu1142Tyrfs( Star )21 ) PALB2 mutation. Another infant with c.3425del PALB2 mutation had clonal aberration with partial trisomy of the long arm of chromosome 17. Mutations in FA downstream pathway genes are more frequent in our series than expected."

According to the news editors, the research concluded: "Our preliminary observation will be confirmed in a large multi-institutional study."

For more information on this research see: Clinical characteristics and genetic subtypes of Fanconi anemia in Saudi patients. *Cancer Genetics*, 2016;209(4):171-176. *Cancer Genetics* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-
Neoplasms

Research Conducted at Korea University Guro Hospital Has Updated Our Knowledge about Neoplasms (Guidelines for the management of myeloproliferative neoplasms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neoplasms. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Polycythemia vera, essential thrombocythemia, and primary myelofibrosis are collectively known as 'Philadelphia-negative classical myeloproliferative neoplasms (MPNs). The discovery of new genetic aberrations such as Janus kinase 2 (JAK2) have enhanced our understanding of the pathophysiology of MPNs. Currently, the JAK2 mutation is not only a standard criterion for diagnosis but is also a new target for drug development."

Our news editors obtained a quote from the research from Korea University Guro Hospital, "The JAK1/2 inhibitor, ruxolitinib, was the first JAK inhibitor approved for patients with intermediate-to high-risk myelofibrosis and its effects in improving symptoms and survival benefits were demonstrated by randomized controlled trials. In 2011, the Korean Society of Hematology MPN Working Party devised diagnostic and therapeutic guidelines for Korean MPN patients. Subsequently, other genetic mutations have been discovered and many kinds of new drugs are now under clinical investigation. In view of recent developments, we have revised the guidelines for the diagnosis and management of MPN based on published evidence and the experiences of the expert panel."

According to the news editors, the research concluded: "Here we describe the epidemiology, new genetic mutations, and novel therapeutic options as well as diagnostic criteria and standard treatment strategies for MPN patients in Korea."

For more information on this research see: Guidelines for the management of myeloproliferative neoplasms. The Korean Journal of Internal Medicine, 2015;30(6):771-88.

The news editors report that additional information may be obtained by contacting C.W. Choi, Division of Oncology-Hematology, Dept. of Internal Medicine, Korea University.
Research Conducted at Kyung Hee University Has Provided New Information about Keratinocytes [Protection on Skin Aging Mediated by Antiapoptosis Effects of the Water Lily (Nymphaea Tetragona Georgi) via Reactive Oxygen Species Scavenging in Human ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Keratinocytes. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The water lily (WL) is found in Europe, Asia, and North America. WL reportedly has various pharmacological activities that improve the activities of daily life in humans."

Our news journalists obtained a quote from the research from Kyung Hee University, "To our knowledge, no previous study has investigated about the aspect of protection on skin aging due to the mitochondria-mediated antiapoptosis effects of WL rhizome extract (WLRE) on human epidermal keratinocytes. Human epidermal keratinocytes cells were treated with WLRE (100, 200, and 400 mg/ml) for 1 h and then with ultraviolet radiation B (UVB) (50 mJ/cm²) for another 23 h. The levels of lactate dehydrogenase, reactive oxygen species (ROS), MitoTracker, caspase-3, and glutathione were analyzed spectrophotometrically. Also, the levels of B-cell lymphoma 2 (Bcl-2) family proteins were determined with immunohistochemistry or western blotting. We investigated the protective effects of WLRE against UVB-induced mitochondria-mediated apoptosis. WLRE significantly and concentrations-dependently reduced UVB-induced apoptotic cytotoxicity. Furthermore, WLRE decreased ROS generation, mitochondrial dysfunction, Bcl-2-associated X protein levels, and cytochrome c release from mitochondria while increasing Bcl-2 protein levels as assessed. Moreover, WLRE inhibited caspase-3 activity and expression, indicating the inhibition of the apoptotic cascade, and induced increased levels of total glutathione, heme oxygenase 1, and radical-scavenging activity."

According to the news editors, the research concluded: "Together, these results demonstrate that WLRE can protect human epidermal keratinocytes against UVB-induced mitochondria-mediated apoptosis by regulating ROS-eliminating pathways."

The news correspondents report that additional information may be obtained from G. Park, Dept. of Life and Nanopharmaceutical Science, Graduates School and Kyung Hee East-
Research Conducted at Leiden University Has Updated Our Knowledge about Cerebral Amyloid Angiopathy (Early Magnetic Resonance Imaging and Cognitive Markers of Hereditary Cerebral Amyloid Angiopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Central Nervous System Diseases and Conditions - Cerebral Amyloid Angiopathy. According to news reporting from Leiden, Netherlands, by NewsRx journalists, research stated, "Early markers for cerebral amyloid angiopathy are largely unknown. We aimed to identify which magnetic resonance imaging (MRI) (performed at 7 and 3T) and cognitive markers are an early sign in (pre)symptomatic subjects with hereditary cerebral hemorrhage with amyloidosis-Dutch type."

The news correspondents obtained a quote from the research from Leiden University, "Twenty-seven DNA-proven Dutch-type mutation carriers (15 symptomatic and 12 presymptomatic) (mean age of 45.9 years) and 33 controls (mean age of 45.6 years) were included. 7T and 3T MRI was performed, cerebral amyloid angiopathy and small-vessel disease type MRI markers were estimated, and cognitive performance was assessed. Univariate general linear modeling analysis was used to assess the association between MRI markers and cognitive performance on the one hand and on the other, mutation status, adjusted for age, sex, and education. In symptomatic patients, all established cerebral amyloid angiopathy MRI markers (microbleeds, intracerebral hemorrhages, subarachnoid hemorrhages, superficial siderosis, microinfarcts, volume of white matter hyperintensities, and dilated perivascular spaces in centrum semiovale) were increased compared with controls (P < 0.05). In presymptomatic subjects, the prevalence of microinfarcts and median volume of white matter hyperintensities were increased in comparison to controls (P < 0.05). Symptomatic patients performed worse on all cognitive domains, whereas presymptomatic subjects did not show differences in comparison with controls (P < 0.05)."

According to the news reporters, the research concluded: "White matter hyperintensities and microinfarcts are more prevalent among presymptomatic subjects and precede cognitive and neuropsychiatric symptoms and intracerebral hemorrhages."

For more information on this research see: Early Magnetic Resonance Imaging and Cognitive Markers of Hereditary Cerebral Amyloid Angiopathy. Stroke, 2016;47(12):3041-3044. Stroke can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com;

Drugs and Therapies - Central Nervous System Agents

Research Conducted at London Health Sciences Center Has Provided New Information about Central Nervous System Agents (Real-World, Long-Term Quality of Life Following Therapeutic OnabotulinumtoxinA Treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Central Nervous System Agents. According to news reporting from London, Canada, by NewsRx journalists, research stated, "OnabotulinumtoxinA is an efficacious treatment option for patients with various conditions. Although studies have reported on the efficacy of onabotulinumtoxinA, quality of life (QoL) data are limited."

The news correspondents obtained a quote from the research from London Health Sciences Center, "This study evaluated QoL in patients treated with onabotulinumtoxinA across various therapeutic indications. MDs on BOTOX Utility (MOBILITY) was a prospective, multicenter, observational Canadian study in patients initiating (naive) or receiving ongoing (maintenance) onabotulinumtoxinA treatment. Health utility was the primary outcome measure and was obtained from the Short Form-12 Health Survey using the Short Form-6D at baseline, week 4 posttreatment, and up to five subsequent treatment visits. The safety cohort included patients who received 1 onabotulinumtoxinA treatment. The efficacy cohort included 1062 patients; the majority were Caucasian, female, and on maintenance onabotulinumtoxinA treatment. Adult focal spasticity (n=398), blepharospasm (n=81), cerebral palsy (n=22), cervical dystonia (n=234), hemifacial spasm (n=116), and hyperhidrosis (n=211) patients were included. Baseline health utility was generally higher in maintenance versus naïve patients; however, naïve patients showed the greatest improvements over time. Health utility was generally maintained or trended toward improvement across all cohorts, including maintenance patients who had been treated for up to 22 years before study entry. Eighteen of 1222 patients (2%) in the safety cohort reported 28 treatment-related adverse events; eight were serious in four
patients. MOBILITY is the largest prospective study to date to provide QoL data over a variety of therapeutic indications following treatment with onabotulinumtoxinA."

According to the news reporters, the research concluded: "Although the QoL burden varies by disease, data suggest that long-term treatment may help improve or maintain QoL over time."

For more information on this research see: Real-World, Long-Term Quality of Life Following Therapeutic OnabotulinumtoxinA Treatment. Canadian Journal of Neurological Sciences, 2016;43(5):687-696. Canadian Journal of Neurological Sciences can be contacted at: Cambridge Univ Press, 32 Avenue Of The Americas, New York, NY 10013-2473, USA.

Our news journalists report that additional information may be obtained by contacting M. Jog, London Hlth Sci Center, London, ON, Canada. Additional authors for this research include T. Wein, M. Bhogal, S. Dhani, R. Miller, F. Ismail, R. Beauchamp and G. Trentin.

Oncology - Breast Cancer

Research Conducted at Ludwig-Maximilians-University Has Updated Our Knowledge about Breast Cancer (Metastatic mammary carcinoma despite histologically negative sentinel lymph nodes: are there any indicators for estimating recurrence and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting originating from Munich, Germany, by NewsRx correspondents, research stated, "This study aimed to identify indicators for an increased frequency of recurrent or metastatic disease in women with mammary carcinoma staged negative for nodal involvement. 202/270 patients (age: mean 57.5, range 24-83 years) with histologically confirmed early stage mammary carcinoma negative for metastasis to the sentinel lymph nodes (SLN) were observed with respect to their clinical course for a mean period of 3.6 years following SLN extirpation."

Our news editors obtained a quote from the research from Ludwig-Maximilians-University, "Forty of 202 patients with negative SLN underwent chemotherapy (38/188 in the recurrence-free group vs. 2/14 in the group with progressive disease) and 79% of both subcollectives did not undergo chemotherapy. Seven of 188 of patients in the recurrence-free group received immunotherapy and none of the patients in the group with disease progression were treated with this modality. One hundred sixty-two of 202 patients with negative SLN underwent hormone therapy, 157/188 in the recurrence-free group and 5/14 in the group with disease progression. One hundred sixty-four of 202 patients with negative nodal status received adjuvant radiation therapy of the affected breast, 156/188 in the recurrence-free group and 8/14
in the group with disease progression. When assessing the risk profile for disease recurrence or the occurrence of metastatic disease, statistically significant differences with respect to disease progression were identified for the parameters chemo-, antibody, hormone, and radiation therapy."

According to the news editors, the research concluded: "The preliminary observations of this study show that even those patients in an early disease stage and with negative SLNs profit from these adjuvant non-surgical therapy options."

For more information on this research see: Metastatic mammary carcinoma despite histologically negative sentinel lymph nodes: are there any indicators for estimating recurrence and metastasis rates? European Journal of Gynaecological Oncology, 2016;37(6):820-826. European Journal of Gynaecological Oncology can be contacted at: IROG Canada, Inc, 4900 Cote St-Luc, Apt#212, Montreal, Quebec H3W 2H3, Canada.

The news editors report that additional information may be obtained by contacting M. Weiss, Ludwig Maximilian Univ Munich, Dept. of Nucl Med, Munich, Germany. Additional authors for this research include S. Siegert, P. Bartenstein and A. Rominger.

Our news journalists obtained a quote from the research from the Malaghan Institute of Medical Research, "However, and rather unexpectedly, recent research has demonstrated horizontal cell-to-cell transfer of mitochondria and mitochondrial DNA in several mammalian cell culture systems. Furthermore, unequivocal evidence that mitochondrial DNA transfer occurs in vivo has now been published."

According to the news editors, the research concluded: "While these studies show horizontal transfer of mitochondrial DNA in pathological settings, it is also possible that intercellular mitochondrial transfer is a fundamental physiological process with a role in development and tissue homeostasis."

Our news journalists report that additional information may be obtained by contacting M.V. Berridge, Malaghan Inst Med Res, Canc Cell & Mol Biol Grp, Wellington 6012, New Zealand. Additional authors for this research include M.J. McConnell, C. Grasso, M. Bajzikova, J. Kovarova and J. Neuzil.

Heart Disorders and Diseases - Myocarditis

**Research Conducted at Mayo Clinic Has Provided New Information about Myocarditis (The Quest for New Approaches in Myocarditis and Inflammatory Cardiomyopathy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Myocarditis have been published. According to news reporting out of Jacksonville, Florida, by NewsRx editors, research stated, "Myocarditis is a diverse group of heart-specific immune processes classified by clinical and histopathological manifestations. Up to 40% of dilated cardiomyopathy is associated with inflammation or viral infection."

Our news journalists obtained a quote from the research from Mayo Clinic, "Recent experimental studies revealed complex regulatory roles for several microribonucleic acids and T-cell and macrophage subtypes. Although the prevalence of myocarditis remained stable between 1990 and 2013 at about 22 per 100,000 people, overall mortality from cardiomyopathy and myocarditis has decreased since 2005. The diagnostic and prognostic value of cardiac magnetic resonance has increased with new, higher-sensitivity sequences. Positron emission tomography has emerged as a useful tool for diagnosis of cardiac sarcoidosis. The sensitivity of endomyocardial biopsy may be increased, especially in suspected sarcoidosis, by the use of electrogram guidance to target regions of abnormal signal. Investigational treatments on the basis of mechanistic advances are entering clinical trials."

According to the news editors, the research concluded: "Revised management recommendations regarding athletic participation after acute myocarditis have heightened the importance of early diagnosis."

For more information on this research see: The Quest for New Approaches in Myocarditis and Inflammatory Cardiomyopathy. *Journal of the American College of Cardiology*, 2016;68(21):2348-2364. *Journal of the American College of Cardiology* can be
Research Conducted at Nantong University Has Provided New Information about Plasma (Diagnostic accuracy of peripheral blood Kisspeptin mRNA and plasma CA125 protein for detection of epithelial ovarian cancer in patients who have ever been ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematology - Plasma. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "To evaluate the diagnostic accuracy of peripheral blood kisspeptin (KISS1) mRNA and plasma cancer antigen 125 (CA125) protein of epithelial ovarian cancer (EOC) in previously pregnant patients, we prospectively enrolled 40 EOC patients as cases and 20 uterine fibroids patients with normal ovary as controls. Levels of peripheral blood KISS1 mRNA and plasma CA125 protein was respectively measured by RT-PCR and electrochemiluminescent method, respectively."

Our news journalists obtained a quote from the research from Nantong University, "Receiver operating characteristic curves with area under curve (AUC) were used to evaluate the diagnostic accuracy. Logistic regression analysis was used to obtain a prediction model for combined diagnosis of KISS1 mRNA and CA125 protein. Both KISS1 mRNA and CA125 protein and had good diagnostic accuracy for EOC, early EOC and advanced EOC (AUC > 0.5, P< 0.05). The CA125 protein had higher diagnostic accuracy than KISS1 mRNA for advanced EOC (P = 0.0009). Moreover, the combination of KISS1 mRNA and CA125 protein had higher diagnostic accuracy for EOC than them alone (P < 0.05). However, this combined diagnosis was more effective than KISS1 mRNA alone for the diagnosis of advanced EOC (P = 0.0001), but similar with CA125 protein alone (P = 0.3125). In addition, there was similar diagnostic accuracy among KISS1 mRNA, CA125 protein and prediction model for early EOC (P > 0.05). Peripheral blood KISS1 mRNA was a novel biomarker for detecting EOC in previously pregnant patients."

According to the news editors, the research concluded: "Combination application of KISS1 mRNA and CA125 protein was recommended for the diagnosis of EOC, but not for advanced and early EOC."

For more information on this research see: Diagnostic accuracy of peripheral blood Kisspeptin mRNA and plasma CA125 protein for detection of epithelial ovarian cancer in patients who have ever been pregnant. Neoplasma, 2016;63(6):999-1006. Neoplasma can be contacted at: Aepress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

Research Conducted at National Taiwan University Hospital and School of Medicine Has Updated Our Knowledge about Hepatitis C Virus (A phase 3b study of sofosbuvir plus ribavirin in Taiwanese patients with chronic genotype 2 hepatitis C virus ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Hepatitis C Virus. According to news reporting out of Taipei, Taiwan, by NewsRx editors, research stated, "In Taiwan, patients with chronic hepatitis C virus (HCV) infection are currently treated with pegylated interferon-alpha plus ribavirin, but interferon-based regimens can be poorly tolerated, especially by those with advanced liver disease and the elderly. Sofosbuvir, an oral nucleotide analogue inhibitor of HCV NS5B polymerase, is approved in Europe, the USA and Japan for treating chronic HCV infection."

Financial support for this research came from Gilead Sciences.

Our news journalists obtained a quote from the research from the National Taiwan University Hospital and School of Medicine, "This phase 3b study examined the efficacy and safety of sofosbuvir plus ribavirin in Taiwanese patients with chronic genotype 2 HCV infection ? compensated cirrhosis. In this multicentre, open-label, phase 3b (NCT02021643) study, 87 patients (n=43, treatment-naive; n=44, treatment-experienced) received 12 weeks of treatment with sofosbuvir plus weight-based ribavirin. The primary efficacy endpoint was the proportion of patients with sustained virological response 12 weeks after treatment discontinuation (SVR12). Safety and pharmacokinetic data were also collected. All 87 patients (100%; 95% confidence interval, 92-100%) achieved SVR12, including the 13 patients with compensated cirrhosis. The most common treatment-emergent adverse events (AEs) were insomnia (16%, 14/87) and upper respiratory tract infection (16%, 14/87). No grade 3 or grade 4 AE was reported. There was one serious AE (biliary colic), which was deemed unrelated to study treatment. Laboratory abnormalities other than ribavirin-related reductions in haemoglobin were uncommon."

According to the news editors, the research concluded: "The results from this phase 3b study demonstrate that 12 weeks of treatment with the interferon-free regimen sofosbuvir plus ribavirin is effective and well tolerated in both treatment-naive and treatment-experienced Taiwanese patients with chronic genotype 2 HCV infection."

For more information on this research see: A phase 3b study of sofosbuvir plus

**Oncology - Ewing Sarcoma**

**Research Conducted at Nemours Has Provided New Information about Ewing Sarcoma (Vorinostat Enhances Cytotoxicity of SN-38 and Temozolomide in Ewing Sarcoma Cells and Activates STAT3/AKT/MAPK Pathways)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Ewing Sarcoma have been published. According to news reporting from Wilmington, Delaware, by NewsRx journalists, research stated, "Histone deacetylase inhibitors (HDACi) have been evaluated in patients with Ewing sarcoma (EWS) but demonstrated limited activity. To better understand the potential for HDACi in EWS, we evaluated the combination of the HDACi vorinostat, with DNA damaging agents SN-38 (the active metabolite of irinotecan and topoisomerase 1 inhibitor) plus the alkylating agent temozolomide (ST)."

The news correspondents obtained a quote from the research from Nemours, "Drugs were evaluated in sequential and simultaneous combinations in two EWS cell lines. Results demonstrate that cell viability, DNA damage and reactive oxygen species (ROS) production are dependent on the sequence of drug administration. Enhanced cytotoxicity is exhibited in vitro in EWS cell lines treated with ST administered before vorinostat, which was modestly higher than concomitant treatment and superior to vorinostat administered before ST. Drug combinations downregulate cyclin D1 to induce G0/G1 arrest and promote apoptosis by cleavage of caspase-3 and PARP. When ST is administered before or concomitantly with vorinostat there is activation of STAT3, MAPK and the p53 pathway. In contrast, when vorinostat is administered before ST,
there is DNA repair, increased AKT phosphorylation and reduced H2B acetylation. Inhibition of AKT using the small molecule inhibitor MK-2206 did not restore H2B acetylation. Combining ST with the dual ALK and IGF-1R inhibitor, AZD3463 simultaneously inhibited STAT3 and AKT to enhance the cytotoxic effects of ST and further reduce cell growth suggesting that STAT3 and AKT activation were in part mediated by ALK and IGF-1R signaling. In summary, potent antiproliferative and proapoptotic activity were demonstrated for ST induced DNA damage before or simultaneous with HDAC inhibition and cell death was mediated through the p53 pathway."

According to the news reporters, the research concluded: "These observations may aid in designing new protocols for treating pediatric patients with high-risk EWS."

Our news journalists report that additional information may be obtained by contacting V.B. Sampson, Nemours Center for Cancer and Blood Disorders, Nemours, AI duPont Hospital for Children, Wilmington, Delaware, United States. Additional authors for this research include N.S. Vetter, D.F. Kamara, A.B. Collier, R.C. Gresh and E.A Kolb.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1371/journal.pone.0142704. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Glioblastomas

Research Conducted at Neurological Institute Has Provided New Information about Glioblastomas (Phenethyl isothiocyanate alters the gene expression and the levels of protein associated with cell cycle regulation in human glioblastoma GBM 8401 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Glioblastomas. According to news reporting out of Taichung, Taiwan, by NewsRx editors, research stated, "Glioblastoma is the most common and aggressive primary brain malignancy. Phenethyl isothiocyanate (PEITC), a member of the isothiocyanate family, can induce apoptosis in many human cancer cells."

Financial support for this research came from Taichung Veterans General Hospital, Taichung, Taiwan.

Our news journalists obtained a quote from the research from Neurological Institute, "Our previous study disclosed that PEITC induces apoptosis through the extrinsic pathway, dysfunction of mitochondria, reactive oxygen species (ROS)-induced endoplasmic reticulum (ER) stress, and intrinsic (mitochondrial) pathway in human brain glioblastoma multiforme (GBM) 8401 cells. To the best of our knowledge, we first investigated the effects of PEITC on
the genetic levels of GBM 8401 cells in vitro. PEITC may induce G0/G1 cell-cycle arrest through affecting the proteins such as cdk2, cyclin E, and p21 in GBM 8401 cells. Many genes associated with cell-cycle regulation of GBM 8401 cells were changed after PEITC treatment: 48 genes were upregulated and 118 were downregulated. The cell-division cycle protein 20 (CDC20), Budding uninhibited by benzimidazole 1 homolog beta (BUB1B), and cyclin B1 were downregulated, and clusterin was upregulated in GBM 8401 cells treated with PEITC."

According to the news editors, the research concluded: "These changes of gene expression can provide the effects of PEITC on the genetic levels and potential biomarkers for glioblastoma. ? 2015 Wiley Periodicals, Inc. Environ Toxicol 32:176-187,."

Our news journalists report that additional information may be obtained by contacting Y.C. Chou, Division of Neurosurgical Oncology, Neurological Institute, Taichung Veterans General Hospital, Taichung, 407, Taiwan. Additional authors for this research include M.Y. Chang, M.J. Wang, H.C. Liu, S.J. Chang, T. Harnod, C.H. Hung, H.T. Lee, C.C. Shen and J.G Chung.

Nervous System Diseases and Conditions --

Research Conducted at New York University Has Provided New Information about Headache and Migraine [How Well Does the ICHD 3 (Beta) Help in Real-Life Migraine Diagnosis and Management?]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nervous System Diseases and Conditions - Headache and Migraine have been published. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Classification has played a major role in the diagnosis of primary headache conditions including migraine with and without aura. With many updates and changes, the International Classification of Headache Disorders (ICHD)-3 beta is currently considered as the gold standard for classification of migraine and other headaches."

Our news editors obtained a quote from the research from New York University, "Correct diagnosis of migraine and its subtypes is a first step toward appropriate treatment and crucial to minimizing disability and optimizing health-related quality of life. The ICHD-3 beta version represents the state of the art in migraine diagnosis but is expected to evolve as biological knowledge advances."

According to the news editors, the research concluded: "Future research should focus
Research Conducted at Northwestern University Feinberg School of Medicine Has Updated Our Knowledge about Atrial Fibrillation (Simulation of Daily Snapshot Rhythm Monitoring to Identify Atrial Fibrillation in Continuously Monitored Patients ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "New technologies are diffusing into medical practice swiftly. Hand-held devices such as smartphones can record short-duration (e.g., 1-minute) ECGs, but their effectiveness in identifying patients with paroxysmal atrial fibrillation (AF) is unknown."

Our news journalists obtained a quote from the research from the Northwestern University Feinberg School of Medicine, "We used data from the TRENDS study, which included 370 patients (mean age 71 years, 71% men. CHADS2 score (≥)1 point: mean 2.3 points) who had no documentation of atrial tachycardia (AT)/AF or antiarrhythmic or anticoagulant drug use at baseline. All were subsequently newly diagnosed with AT/AF by a cardiac implantable electronic device (CIED) over one year of follow-up. Using a computer simulation approach (5,000 repetitions), we estimated the detection rate for paroxysmal AT/AF via daily snapshot ECG monitoring over various periods, with the probability of detection equal to the percent AT/AF burden on each day. The estimated AT/AF detection rates with snapshot monitoring periods of 14, 28, 56, 112, and 365 days were 10%, 15%, 21%, 28%, and 50% respectively. The detection rate over 365 days of monitoring was higher in those with CHADS2 scores (≥)2 than in those with CHADS2 scores of 1 (53% vs. 38%), and was higher in those with AT/AF burden (≥)0.044 hours/day compared to those with AT/AF burden <0.044 hours/day (91% vs. 14%; both p<0.05). Daily snapshot ECG monitoring over 365 days detects half of patients who developed AT/AF as detected by CIED, and shorter intervals of monitoring detected fewer AT/AF patients."
According to the news editors, the research concluded: "The detection rate was associated with individual CHADS2 score and AT/AF burden."

Our news journalists report that additional information may be obtained by contacting Y. Yano, Dept. of Preventive Medicine, Northwestern University Feinberg School of Medicine, Chicago, Illinois, United States. Additional authors for this research include P. Greenland, D.M. Lloyd-Jones, E.G. Daoud, J.L. Koehler and P.D Ziegler.

**Mycobacterium Infections - Tuberculosis**

**Research Conducted at Norwegian Institute of Public Health Has Provided New Information about Tuberculosis (Armed conflict and population displacement as drivers of the evolution and dispersal of Mycobacterium tuberculosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mycobacterium Infections - Tuberculosis are presented in a new report. According to news originating from Oslo, Norway, by NewsRx correspondents, research stated, "The 'Beijing' Mycobacterium tuberculosis (MtB) lineage 2 (L2) is spreading globally and has been associated with accelerated disease progression and increased antibiotic resistance. Here we performed a phylodynamic reconstruction of one of the L2 sublineages, the central Asian clade (CAC), which has recently spread to western Europe."

Our news journalists obtained a quote from the research from the Norwegian Institute of Public Health, "We find that recent historical events have contributed to the evolution and dispersal of the CAC. Our timing estimates indicate that the clade was likely introduced to Afghanistan during the 1979-1989 Soviet-Afghan war and spread further after population displacement in the wake of the American invasion in 2001. We also find that drug resistance mutations accumulated on a massive scale in MtB isolates from former Soviet republics after the fall of the Soviet Union, a pattern that was not observed in CAC isolates from Afghanistan."

According to the news editors, the research concluded: "Our results underscore the detrimental effects of political instability and population displacement on tuberculosis control and demonstrate the power of phylodynamic methods in exploring bacterial evolution in space and time."

For more information on this research see: Armed conflict and population displacement as drivers of the evolution and dispersal of Mycobacterium tuberculosis.

Eye Diseases and Conditions - Retinitis Pigmentosa

Research Conducted at Oregon Health and Science University Has Provided New Information about Retinitis Pigmentosa (Structure-Function Modeling of Optical Coherence Tomography and Standard Automated Perimetry in the Retina of Patients with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Eye Diseases and Conditions - Retinitis Pigmentosa have been published. According to news reporting out of Portland, Oregon, by NewsRx editors, research stated, "To assess relationships between structural and functional biomarkers, including new topographic measures of visual field sensitivity, in patients with autosomal dominant retinitis pigmentosa. Spectral domain optical coherence tomography line scans and hill of vision (HOV) sensitivity surfaces from full-field standard automated perimetry were semi-automatically aligned for 60 eyes of 35 patients."

Our news journalists obtained a quote from the research from Oregon Health and Science University, "Structural biomarkers were extracted from outer retina b-scans along horizontal and vertical midlines. Functional biomarkers were extracted from local sensitivity profiles along the b-scans and from the full visual field. These included topographic measures of functional transition such as the contour of most rapid sensitivity decline around the HOV, herein called HOV slope for convenience. Biomarker relationships were assessed pairwise by coefficients of determination (R2) from mixed-effects analysis with automatic model selection. Structure-function relationships were accurately modeled (conditional R(2) >0.8 in most cases). The best-fit relationship models and correlation patterns for horizontally oriented biomarkers were different than vertically oriented ones. The structural biomarker with the largest number of significant functional correlates was the ellipsoid zone (EZ) width, followed by the total photoreceptor layer thickness. The strongest correlation observed was between EZ width and HOV slope distance (marginal R(2)=0.85, p<10(-10)). The mean sensitivity defect at the EZ
edge was 7.6 dB. Among all functional biomarkers, the HOV slope mean value, HOV slope mean distance, and maximum sensitivity along the b-scan had the largest number of significant structural correlates. Topographic slope metrics show promise as functional biomarkers relevant to the transition zone."

According to the news editors, the research concluded: "EZ width is strongly associated with the location of most rapid HOV decline."

Our news journalists report that additional information may be obtained by contacting T.B. Smith, Casey Eye Institute, Oregon Health & Science University, Portland, Oregon, United States. Additional authors for this research include M. Parker, P.N. Steinkamp, R.G. Weleber, N. Smith and D.J Wilson.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1371/journal.pone.0148022. This DOI is a link to an online electronic document that is either free or for purchase.

Life Science Research - Botany

Research Conducted at Osaka Prefecture University Has Provided New Information about Botany (Diversification of sterol methyltransferase enzymes in plants and a role for b-sitosterol in oriented cell plate formation and polarized growth)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Botany.

According to news reporting out of Sakai, Japan, by NewsRx editors, research stated, "Phytosterols are classified into C24-ethylsterols and C24-methylsterols according to the different C24-alkylation levels conferred by two types of sterol methyltransferases (SMTs). The first type of SMT (SMT1) is widely conserved, whereas the second type (SMT2) has diverged in charophytes and land plants."

Financial support for this research came from Grants-in-Aid for Scientific Research. Our news journalists obtained a quote from the research from Osaka Prefecture University, "The Arabidopsis smt2 smt3 mutant is defective in the SMT2 step, leading to deficiency in C24-ethylsterols while the C24-methylsterol pathway is unchanged. smt2 smt3 plants exhibit severe dwarfism and abnormal development throughout their life cycle, with irregular cell division followed by collapsed cell files. Preprophase bands are occasionally formed in perpendicular directions in adjacent cells, and abnormal phragmoplasts with mislocalized KNOLLE syntaxin and tubulin are observed. Defects in auxin-dependent processes are exemplified by mislocalizations of the PIN2 auxin efflux carrier due to disrupted cell
division and failure to distribute PIN2 asymmetrically after cytokinesis. Although endocytosis of PIN2-GFP from the plasma membrane (PM) is apparently unaffected in smt2 smt3, strong inhibition of the endocytic recycling is associated with a remarkable reduction in the level of PIN2-GFP on the PM. Aberrant localization of the cytoplasmic linker associated protein (CLASP) and microtubules is implicated in the disrupted endocytic recycling in smt2 smt3. Exogenous C24-ethylsterols partially recover lateral root development and auxin distribution in smt2 smt3 roots. These results indicate that C24-ethylsterols play a crucial role in division plane determination, directional auxin transport, and polar growth."

According to the news editors, the research concluded: "It is proposed that the divergence of SMT2 genes together with the ability to produce C24-ethylsterols were critical events to achieve polarized growth in the plant lineage."

For more information on this research see: Diversification of sterol methyltransferase enzymes in plants and a role for \(\beta\)-sitosterol in oriented cell plate formation and polarized growth. *The Plant Journal*, 2015;84(5):860-74.

Our news journalists report that additional information may be obtained by contacting M. Nakamoto, Graduate School of Life and Environmental Sciences, Osaka Prefecture University, 599-8531, Sakai, Japan. Additional authors for this research include A.C. Schmit, D. Heintz, H. Schaller and D. Ohta.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/tpj.13043. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antiinfectives

**Research Conducted at Pasteur Institute Has Provided New Information about Antiinfectives (Antileishmanial Mechanism of Diamidines Involves Targeting Kinetoplasts)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antiinfectives is now available. According to news reporting originating in Gyeonggi Do, South Korea, by NewsRx journalists, research stated, "Leishmaniasis is a disease caused by pathogenic Leishmania parasites; current treatments are toxic and expensive, and drug resistance has emerged. While pentamidine, a diamidine-type compound, is one of the treatments, its antileishmanial mechanism of action has not been investigated in depth."

Financial support for this research came from National Research Foundation of Korea (NRF).

The news reporters obtained a quote from the research from Pasteur Institute, "Here we tested several diamidines, including pentamidine and its analog DB75, against Leishmania donovani and elucidated their antileishmanial mechanisms. We identified three promising new antileishmanial diamidine compounds with 50% effective concentrations (EC(50)s) of 3.2, 3.4, and 4.5 \(\mu\)M, while pentamidine and DB75 exhibited EC(50)s of 1.46 and 20 \(\mu\)M, respectively. The most potent antileishmanial inhibitor, compound 1, showed strong DNA
binding properties, with a shift in the melting temperature (Delta T-m) of 24.2 degrees C, whereas pentamidine had a Delta T-m value of 2.1 degrees C, and DB75 had a Delta T-m value of 7.7 degrees C. Additionally, DB75 localized in L. donovani kinetoplast DNA (kDNA) and mitochondria but not in nuclear DNA (nDNA). For 2 new diamidines, strong localization signals were observed in kDNA at 1 mu M, and at higher concentrations, the signals also appeared in nuclei. All tested diamidines showed selective and dose-dependent inhibition of kDNA, but not nDNA, replication, likely by inhibiting L. donovani topoisomerase IB."

According to the news reporters, the research concluded: "Overall, these results suggest that diamidine antileishmanial compounds exert activity by accumulating toward and blocking replication of parasite kDNA."

For more information on this research see: Antileishmanial Mechanism of Diamidines Involves Targeting Kinetoplasts. Antimicrobial Agents and Chemotherapy, 2016;60 (11):6828-6836. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting J.H. No, Inst Pasteur Korea, Leishmania Res Lab, Seongnam Si, Gyeonggi Do, South Korea. Additional authors for this research include G. Choi and J.H. No.

Research Conducted at Pfizer Has Provided New Information about Type 2 Diabetes (Benefits and challenges of a QSP approach through case study: Evaluation of a hypothetical GLP-1/GIP dual agonist therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting originating in Cambridge, Massachusetts, by NewsRx journalists, research stated, "Quantitative Systems Pharmacology (QSP) is an emerging science with increasing application to pharmaceutical research and development paradigms."

The news reporters obtained a quote from the research from Pfizer, "Through case study we provide an overview of the benefits and challenges of applying QSP approaches to inform program decisions in the early stages of drug discovery and development."

According to the news reporters, the research concluded: "Specifically, we describe the use of a type 2 diabetes systems model to inform a No-Go decision prior to lead development for a potential GLP-1/GIP dual agonist program, enabling prioritization of..."
exploratory programs with higher probability of clinical success."

Our news correspondents report that additional information may be obtained by contacting C.J. Musante, Pfizer Worldwide Res & Dev, Cardiovasc & Metab Dis Res Unit, Cambridge, MA 02139, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejps.2016.05.006. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Drug Resistance

Research Conducted at Pusan National University Has Provided New Information about Drug Resistance (Autotaxin Regulates Maintenance of Ovarian Cancer Stem Cells through Lysophosphatidic Acid-Mediated Autocrine Mechanism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Drug Resistance. According to news originating from Yangsan, South Korea, by NewsRx correspondents, research stated, "Ovarian cancer shows high mortality due to development of resistance to chemotherapy and relapse. Cancer stem cells (CSCs) have been suggested to be a major contributor in developing drug resistance and relapse in ovarian cancer."

Our news journalists obtained a quote from the research from Pusan National University, "In this study, we isolated CSCs through sphere culture of A2780, SKOV3, OVCAR3 epithelial ovarian cancer cells and primary ovarian cancer cells from patients. We identified heat-stable factors secreted from ovarian CSCs stimulated migration and proliferation of CSCs. Mass spectrometry and ELISA analysis revealed that lysophosphatidic acid (LPA) was significantly elevated in CSC culture media compared with non-CSC culture media. Treatment of CSCs with LPA resulted in augmented CSC characteristics such as sphere-forming ability, resistance to anticancer drugs, tumorigenic potential in xenograft transplantation, and high expression of CSC-associated genes, including OCT4, SOX2, and aldehyde dehydrogenase 1. Treatment of CSCs with LPA receptor 1-specific inhibitors or silencing of LPA receptor 1 expression abrogated the LPA-stimulated CSC properties. Autotaxin, an LPA-producing enzyme, is highly secreted from ovarian CSCs, and pharmacological inhibition or knockdown of autotaxin markedly attenuated the LPA-producing, tumorigenic, and drug resistance potentials of CSCs. Clinicopathological analysis showed a significant survival disadvantage of patients with positive staining of autotaxin. In addition, we further identified that AKT1 activity was
upregulated in ovarian CSCs through an LPA-dependent mechanism and silencing of AKT1 expression led to suppression of CSC characteristics."

According to the news editors, the research concluded: "These results suggest that autotaxin-LPA-LPA receptor 1-AKT1 signaling axis is critical for maintaining CSC characteristics through an autocrine loop and provide a novel therapeutic target for ovarian CSCs."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/stem.2279. This DOI is a link to an online electronic document that is either free or for purchase.

*Kidney Diseases and Conditions - Gitelman Syndrome*

**Research Conducted at Radboud University Has Provided New Information about Gitelman Syndrome (Functionomics of NCC mutations in Gitelman syndrome using a novel mammalian cell-based activity assay)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Kidney Diseases and Conditions - Gitelman Syndrome have been published. According to news reporting originating in Nijmegen, Netherlands, by NewsRx journalists, research stated, "Gitelman syndrome (GS) is an autosomal recessive salt-wasting tubular disorder resulting from loss-of-function mutations in the thiazide-sensitive NaCl cotransporter (NCC). Functional analysis of these mutations has been limited to the use of Xenopus laevis oocytes."

The news reporters obtained a quote from the research from Radboud University, "The aim of the present study was, therefore, to analyze the functional consequences of NCC mutations in a mammalian cell-based assay, followed by analysis of mutated NCC protein expression as well as glycosylation and phosphorylation profiles using human embryonic kidney (HEK) 293 cells. NCC activity was assessed with a novel assay based on thiazide-sensitive iodide uptake in HEK293 cells expressing wild-type or mutant NCC (N59I, R83W, I360T, C421Y, G463R, G731R, L859P, or R861C). All mutations caused a significantly lower NCC activity. Immunoblot analysis of the HEK293 cells revealed that 1) all NCC mutants have decreased NCC protein expression; 2) mutant N59I, R83W, I360T, C421Y, G463R, and L859P have decreased NCC abundance at the plasma membrane; 3) mutants C421Y and L859P display
impaired NCC glycosylation; and 4) mutants N59I, R83W, C421Y, C731R, and L859P show affected NCC phosphorylation."

According to the news reporters, the research concluded: "We developed a mammalian cell-based assay in which NCC activity assessment together with a profiling of mutated protein processing aid our understanding of the pathogenic mechanism of the NCC mutations."

Our news correspondents report that additional information may be obtained by contacting R.J.M. Bindels, Radboud University, Medical Center, Radboud Inst Mol Life Sci, Dept. of Physiol, Nijmegen, Netherlands. Additional authors for this research include R. Vargas-Poussou, S. Verkaart, O.A.Z. Tutakhel, A. Valdez-Ortiz, A. Blanchard, C. Treard, J.G.J. Hoenderop, R.J.M. Bindels and S. Jelen.

**Radiology - Neuroradiology**

**Research Conducted at School of Medicine Has Provided New Information about Neuroradiology (Safety and efficacy of antiplatelet response assay and drug adjustment in coil embolization: a propensity score analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Radiology - Neuroradiology have been presented. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The purpose of this study was to explore the safety and efficacy of an antiplatelet response assay and drug adjustment to prevent delayed thromboembolic events after stent-assisted coil embolization. A total of 370 patients were enrolled in this study between December 2005 and July 2014."

Our news editors obtained a quote from the research from the School of Medicine, "Of these, 124 patients were placed into the drug resistance test (DRT) group with drug adjustment according to response to an antiplatelet agent, and 246 patients comprised the control group with a standard antiplatelet regimen. The response to the antiplatelet agent was evaluated with the VerifyNow Rapid Platelet Function Assay. Propensity score matching analysis was performed with one-to-multiple matching. Among 370 patients, delayed thromboembolic events occurred in 28 (7.6 %) patients including 25 (10.2 %) in the control group and three (2.4 %) in the DRT group. Antiplatelet response test (p = 0.012), diabetes mellitus (DM) (p = 0.014), and hypertension (HTN) (p < 0.001) were associated with delayed infarction in multivariate analysis. In propensity score matching analysis, 331 patients were
matched (control group (n = 229) vs. DRT group (n = 103)), and antiplatelet response (hazard ratio 0.247, 95% confidence interval 0.070-0.868, p = 0.029) was correlated with delayed infarction. Conversely, the two groups were not significantly different with regard to total (p = 0.368) or major hemorrhagic complications (p = 0.108)."

According to the news editors, the research concluded: "Antiplatelet drug adjustment according to the results of an antiplatelet response assay might be associated with a decreased risk of delayed thromboembolic infarction compared with the standard antiplatelet regimen."

The news editors report that additional information may be obtained by contacting S.C. Hong, Sungkyunkwan University Dept. of Neurosurg, Samsung Med Center, Sch Med, Seoul 135710, South Korea. Additional authors for this research include K.I. Jo, J.Y. Yeon, J.S. Kim, K.H. Kim, P. Jeon and S.C. Hong.

Cardiovascular Diseases and Conditions - ...

Research Conducted at School of Medicine Has Updated Our Knowledge about Hypertension (An augmented CO2 chemoreflex and overactive orexin system are linked with hypertension in young and adult spontaneously hypertensive rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news originating from Lebanon, New Hampshire, by NewsRx correspondents, research stated, "Activation of central chemoreceptors by CO2 increases arterial blood pressure (ABP), sympathetic nerve activity and breathing. In spontaneously hypertensive rats (SHRs), high ABP is associated with enhanced sympathetic nerve activity and peripheral chemoreflexes."

Our news journalists obtained a quote from the research from the School of Medicine, "We hypothesized that an augmented CO2 chemoreflex and overactive orexin system are linked with high ABP in both young (postnatal day 30-58) and adult SHRs (4-6 months). Our main findings are as follows. (i) An augmented CO2 chemoreflex and higher ABP in SHRs are measureable at a young age and increase in adulthood. In wakefulness, the ventilatory response to normoxic hypercapnia is higher in young SHRs (mean +/- SEM: 179 +/- 11% increase) than in age-matched normotensive Wistar-Kyoto rats (114 +/- 9% increase), but lower than in adult SHRs (226 +/- 10% increase; P < 0.05). The resting ABP is higher in young SHRs (122 +/- 5 mmHg) than in age-matched Wistar-Kyoto rats (99 +/- 5 mmHg), but lower than in
adult SHRs (152 +/- 4 mmHg; P< 0.05). (ii) Spontaneously hypertensive rats have more orexin neurons and more CO2-activated orexin neurons in the hypothalamus. (iii) Antagonism of orexin receptors with a dual orexin receptor antagonist, almorexant, normalizes the augmented CO2 chemoreflex in young and adult SHRs and the high ABP in young SHRs and significantly lowers ABP in adult SHRs. (iv) Attenuation of peripheral chemoreflexes by hyperoxia does not abolish the augmented CO2 chemoreflex (breathing and ABP) in SHRs, which indicates an important role for the central chemoreflex."

According to the news editors, the research concluded: "We suggest that an overactive orexin system may play an important role in the augmented central CO2 chemoreflex and in the development of hypertension in SHRs."

The news correspondents report that additional information may be obtained from A.H. Li, Geisel Sch Med Dartmouth, Dept. of Physiol & Neurobiol, Lebanon, NH 03756, United States. Additional authors for this research include S.H. Roy and E.E. Nattie.

**Oncology - Breast Cancer**

**Research Conducted at Second Military Medical University Has Updated Our Knowledge about Breast Cancer (Long noncoding RNA linc00617 exhibits oncogenic activity in breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Protein-coding genes account for only 2% of the human genome, whereas the vast majority of transcripts are noncoding RNAs including long noncoding RNAs. LncRNAs are involved in the regulation of a diverse array of biological processes, including cancer progression."

Our news editors obtained a quote from the research from Second Military Medical University, "An evolutionarily conserved lncRNA TUNA, was found to be required for pluripotency of mouse embryonic stem cells. In this study, we found the human ortholog of TUNA, linc00617, was upregulated in breast cancer samples. Linc00617 promoted motility and invasion of breast cancer cells and induced epithelial-mesenchymal-transition (EMT), which was accompanied by generation of stem cell properties. Moreover, knockdown of linc00617 repressed lung metastasis in vivo. We demonstrated that linc00617 upregulated the expression of stemness factor Sox2 in breast cancer cells, which was shown to promote the oncogenic activity of breast cancer cells by stimulating epithelial-to-mesenchymal transition and enhancing the tumor-initiating capacity. Thus, our data indicate that linc00617 functions as an important
regulator of EMT and promotes breast cancer progression and metastasis via activating the transcription of Sox2."

According to the news editors, the research concluded: "Together, it suggests that linc00617 may be a potential therapeutic target for aggressive breast cancer."

The news editors report that additional information may be obtained by contacting Y. Sheng, Second Military Med Univ, Changhai Hosp, Dept. of Breast & Thyroid Surg, Gen Surg, Shanghai 200433, People's Republic of China. Additional authors for this research include L. Zhu, L. Xu, K.Y. Qin, C.Q. Liu, Y. Yu, D.W. Su, K.N. Wu and Y. Sheng.

Keywords for this news article include: Shanghai, People's Republic of China, Asia, Women's Health, Breast Cancer, Oncology, Genetics, Second Military Medical University.

**Drugs and Therapies - Chemotherapy**

**Research Conducted at Soochow University Has Provided New Information about Chemotherapy (Tie2 Expression on Macrophages Is Required for Blood Vessel Reconstruction and Tumor Relapse after Chemotherapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Chemotherapy are discussed in a new report. According to news reporting out of Suzhou, People's Republic of China, by NewsRx editors, research stated, "Tumor relapse after chemotherapy is a major hurdle for successful cancer therapy. Chemotherapeutic drugs select for resistant tumor cells and reshape tumor microenvironment, including the blood supply system."

Our news journalists obtained a quote from the research from Soochow University, "Using animal models, we observed on macrophages in tumor tissue a close correlation between upregulated Tie2 expression and tumor relapse upon chemotherapy. Conditional deletion of Tie2 expression in macrophages significantly prohibited blood supply and regrowth of tumors. Tie2(+) macrophages were derived from tumor-infiltrating Tie2(+)CD11b(+) cells and hypoxia-induced Tie2 expression on these cells. Mechanistically, expression of Tie2 prevented macrophages from apoptosis in stress conditions via the AKT-dependent signaling pathway."

According to the news editors, the research concluded: "Together, these results demonstrate that Tie2 expression by macrophages is necessary and sufficient to promote the reconstruction of blood vessels after chemotherapy, shedding new light on developing novel strategies to inhibit tumor relapse."

For more information on this research see: Tie2 Expression on Macrophages Is Required for Blood Vessel Reconstruction and Tumor Relapse after Chemotherapy. *Cancer Research, 2016;76(23):6828-6838. Research Conducted at Soochow University Has Updated Our Knowledge about Adenosine Therapy [Ubiquitin-dependent Turnover of Adenosine Deaminase Acting on RNA 1 (ADAR1) Is Required for Efficient Antiviral Activity of Type I Interferon]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Adenosine Therapy are discussed in a new report. According to news reporting originating from Suzhou, People's Republic of China, by NewsRx correspondents, research stated, "Adenosine deaminase acting on RNA 1 (ADAR1) catalyzes RNA editing of cellular and viral RNAs. Besides RNA editing, ADAR1 has recently been shown to play important roles in maintaining the body balance, including tissue homoeostasis, organ development, and autoimmune regulations, by inhibiting both IFN production and subsequent IFN-activated pathways."

Funders for this research include National Natural Science Foundation of China, The Program of 1000 Young Talents, Jiangsu Provincial Distinguished Young Scholars, Jiangsu Provincial Innovative Research Team, Changjiang scholars and Innovative Research Team in University of Ministry of Education of China, Priority Academic Program Development of Jiangsu Higher Education Institutions.

Our news editors obtained a quote from the research from Soochow University, "Accordingly, the question was raised how IFN signaling induced by viral infections overcomes the inhibitory effect of constitutively expressed ADAR1 (ADAR1-P110) to execute efficient antiviral activity. Here we unexpectedly found that IFN signaling promoted Lys(48)-linked ubiquitination and degradation of ADAR1-P110. Furthermore, we identified the E3 ligase beta transducin repeat-containing protein responsible for IFN-mediated ADAR1-P110 down-regulation. IFN signaling promoted the interaction between beta transducin repeat-containing protein and ADAR1-P110 as well as protein turnover of ADAR1-P110. Moreover, we found that both lysine 574 and 576 are essential for ADAR1-P110 ubiquitination. Critically, we demonstrated that down-regulation of ADAR1-P110 is required for IFN signaling to execute efficient antiviral activity during viral infections."
According to the news editors, the research concluded: "These findings renew the understanding of the mechanisms by which IFN signaling acts to achieve antiviral functions and may provide potential targets for IFN-based antiviral therapy."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.737098. This DOI is a link to an online electronic document that is either free or for purchase.

**Kidney Diseases and Conditions - Lupus Nephritis**

**Research Conducted at Sun Yat Sen University Has Updated Our Knowledge about Lupus Nephritis (Nuclear Factor Erythroid 2-related Factor 2 Deficiency Exacerbates Lupus Nephritis in B6/lpr mice by Regulating Th17 Cell Function)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Kidney Diseases and Conditions - Lupus Nephritis. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Lupus nephritis (LN) is the major clinical manifestation of systemic lupus erythematosus. LN is promoted by T helper 17 (Th17) cells, which are the major pro-inflammatory T cell subset contributing to autoimmunity regulation."

The news correspondents obtained a quote from the research from Sun Yat Sen University, "Nuclear factor erythroid 2-related factor 2 (NRF2) is critical for suppressing reactive oxygen species (ROS) and relieving oxidant stress by regulating antioxidant gene expression. Previous studies have demonstrated that Nrf2 deficiency promotes drug-induced or spontaneous LN. However, whether NRF2 regulates Th17 function during LN development is still unclear. In this study, we introduced Nrf2 deficiency into a well-known LN model, the B6/lpr mouse strain, and found that it promoted early-stage LN with altered Th17 activation. Th17 cells and their relevant cytokines were dramatically increased in these double-mutant mice. We also demonstrated that naive T cells from the double-mutant mice showed
significantly increased differentiation into Th17 cells in vitro, with decreased expression of the Th17 differentiation suppressor Socs3 and increased phosphorylation of STAT3. Our results demonstrated that Nrf2 deficiency promoted Th17 differentiation and function during LN development."

According to the news reporters, the research concluded: "Moreover, our results suggested that the regulation of Th17 differentiation via NRF2 could be a therapeutic target for the treatment of subclinical LN patients."

Our news journalists report that additional information may be obtained by contacting Z.F. Huang, Sun Yat Sen UniversityZhongshan Sch Med, Dept. of Biochem, Guangzhou, Guangdong, People's Republic of China. Additional authors for this research include H.P. Chen, Q.F. Ding, X.X. Xu, B.L. Yu and Z.F. Huang.

**Drugs and Therapies - Antirheumatics**

**Research Conducted at Tel Aviv University Has Updated Our Knowledge about Antirheumatics (Addition of an immunomodulator can reverse antibody formation and loss of response in patients treated with adalimumab)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antirheumatics is now available. According to news reporting originating in Tel Aviv, Israel, by NewsRx journalists, research stated, "Anti-adalimumab antibodies (AAA) are associated with loss of clinical response (LOR). Addition of an immunomodulator has been shown to reverse immunogenicity and regain response with infliximab monotherapy."

Financial supporters for this research include The Chaim Sheba Medical Center, Rambam Health Care Center, Leona M. and Harry B. Helmsley Charitable Trust.

The news reporters obtained a quote from the research from Tel Aviv University, "Similar data on adalimumab are lacking. To study the impact of immunomodulator addition on the emergence of AAA and LOR among adalimumab therapy patients. The databases of three tertiary medical centres were reviewed to identify patients who developed AAA during adalimumab monotherapy with resultant LOR, and received an immunomodulator as a salvage combination therapy. All sera were prospectively analysed using previously described ELISA assays. Clinical response was determined using appropriate clinical scores. Elimination of AAA, designated as 'sero-reversal', elevation of drug levels and regained clinical response were the sought outcomes. Twenty-three patients (21 Crohn's disease, and 2 ulcerative colitis) developed
AAA with subsequent LOR and were thereafter prescribed an immunomodulator as salvage therapy (thiopurine n = 14, methotrexate n = 9). Eleven patients (48%) underwent sero-reversal with gradual elimination of AAA, increase in drug trough levels and restoration of clinical response (median time to sero-reversal 5 months). In 12 patients (52%), immunogenicity and loss of response could not be reversed. There was no difference between responders and nonresponders in the type of immunomodulators used or baseline clinical characteristics. In almost half of inflammatory bowel disease patients developing anti-adalimumab antibodies and loss of response, established immunogenicity of adalimumab can be gradually reversed by the addition of immunomodulator therapy with restoration of a clinico-biological response."

According to the news reporters, the research concluded: "However, these observations need to be confirmed with larger studies."

Our news correspondents report that additional information may be obtained by contacting B. Ungar, Tel Aviv University, Sheba Med Center Tel Hashomer, Sackler Sch Med, Dept. of Gastroenterol, Tel Aviv, Israel. Additional authors for this research include U. Kopylov, T. Engel, M. Yavzori, E. Fudim, O. Picard, A. Lang, N. Williet, S. Paul, Y. Chowers, A.B.G. Shitrit, R. Eliakim, S. Ben-Horin and X. Roblin.

Environmental Health - Environmental Research and...
Our news editors obtained a quote from the research from Tsinghua University, "This model classifies noise-induced health impairments into four categories: cardiovascular disease, cognitive impairment, sleep disturbance, and annoyance, and uses disability-adjusted life years (DALYs) as an indicator of damage. Furthermore, the value of a statistical life (VSL) is used to transform DALYs into a monetary value based on the affected demographic characteristics, thereby offering policy makers a reliable theoretical foundation for establishing reasonable standards to compensate residents suffering from construction noise. A practical earthwork project in Beijing is used as a case study to demonstrate the applicability of the proposed model. The results indicate that construction noise could bring significant health risks to the neighboring resident community, with an estimated 34.51 DALYs of health damage and 20.47 million yuan in social costs."

According to the news editors, the research concluded: "In particular, people aged 45-54 are most vulnerable to construction noise, with the greatest health risks being caused by sleep disturbance."

For more information on this research see: DALY-Based Health Risk Assessment of Construction Noise in Beijing, China. *International Journal of Environmental Research and Public Health*, 2016;13(11):105-122. *International Journal of Environmental Research and Public Health* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news editors report that additional information may be obtained by contacting J. Xiao, Tsinghua Univ, Sch Civil Engn, Beijing 100084, People's Republic of China. Additional authors for this research include X.D. Li and Z.H. Zhang.

**Optic Nerve Diseases**

**Research Conducted at University College Has Provided New Information about Optic Nerve Diseases (A neurodegenerative perspective on mitochondrial optic neuropathies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Optic Nerve Diseases have been published. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Mitochondrial optic neuropathies constitute an important cause of chronic visual morbidity and registrable blindness in both the paediatric and adult population. It is a genetically heterogeneous group of disorders caused by both mitochondrial DNA (mtDNA) mutations and a growing list of nuclear genetic defects that invariably affect a critical component of the mitochondrial machinery."

Financial supporters for this research include Medical Research Council, National Institute for Health Research, Wellcome Trust.

Our news journalists obtained a quote from the research from University College, "The two classical paradigms are Leber hereditary optic neuropathy (LHON), which is a primary mtDNA disorder, and autosomal dominant optic atrophy (DOA) secondary to pathogenic mutations within the nuclear gene OPA1 that encodes for a mitochondrial inner membrane RNA."
protein. The defining neuropathological feature is the preferential loss of retinal ganglion cells (RGCs) within the inner retina but, rather strikingly, the smaller calibre RGCs that constitute the papillomacular bundle are particularly vulnerable, whereas melanopsin-containing RGCs are relatively spared. Although the majority of patients with LHON and DOA will present with isolated optic nerve involvement, some individuals will also develop additional neurological complications pointing towards a greater vulnerability of the central nervous system (CNS) in susceptible mutation carriers. These so-called 'plus' phenotypes are mechanistically important as they put the loss of RGCs within the broader perspective of neuronal loss and mitochondrial dysfunction, highlighting common pathways that could be modulated to halt progressive neurodegeneration in other related CNS disorders.

According to the news editors, the research concluded: "The management of patients with mitochondrial optic neuropathies still remains largely supportive, but the development of effective disease-modifying treatments is now within tantalising reach helped by major advances in drug discovery and delivery, and targeted genetic manipulation."

Our news journalists report that additional information may be obtained by contacting P. Yu-Wai-Man, UCL Inst Ophthalmol, London EC1V 2PD, United Kingdom. Additional authors for this research include M. Votrub, F. Burte, C. La Morgia, P. Barboni and V. Carelli.

Heart Disorders and Diseases - Hypertrophic...

Research Conducted at University Hospital Has Updated Our Knowledge about Hypertrophic Cardiomyopathy (Comparison of hypertrophic cardiomyopathy in Afro-Caribbean versus white patients in the UK)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Hypertrophic Cardiomyopathy are discussed in a new report. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "This study investigated the influence of African/Afro-Caribbean (black) ethnicity on the clinical profile and outcomes in hypertrophic cardiomyopathy (HCM). Methods 425 consecutive patients with HCM (163 black and 262 Caucasians (white); mean age 52.5 +/- 16.6 years) were assessed at three cardiomyopathy centres."
Our news editors obtained a quote from the research from University Hospital, "Repeat assessments were performed every 6-12 months and mean follow-up was 4.3 +/- 3.0 years. The primary outcome was a composite of cardiovascular death, cardiac arrest or appropriate device therapy. A fortuitous diagnosis of HCM was more commonly made in black compared with white patients (31.3% vs 19.1%, p=0.004). An abnormal ECG at presentation was more frequent in black patients (98.2% vs 90.5%, p=0.002), with T-wave inversion being a common feature (91.4% vs 73.0%, p<0.001). Asymmetric septal hypertrophy was the predominant pattern in both ethnic groups; however, apical (22.2% vs 10.7%, p<0.001) and concentric (9.3% vs 1.5%, p<0.001) patterns were more prevalent in black patients. Hypertension was more frequent in black patients (58.3% vs 31.7%, p<0.001). There were no ethnic differences in risk factor profile or primary outcome. Independent predictors of the primary outcome were non-sustained ventricular tachycardia (HR 6.03, 95% CI 3.06 to 11.91, p=0.001) and hypertension at presentation (HR 2.02, 95% CI 1.05 to 3.88, p=0.036), with an additive effect. Black ethnicity is an important determinant of the phenotypic expression of HCM but does not adversely affect outcomes. Apical and concentric hypertrophy are common in black patients and may hinder the identification of HCM in this cohort."

According to the news editors, the research concluded: "Hypertension has an adverse effect on outcome, irrespective of ethnicity."

For more information on this research see: Comparison of hypertrophic cardiomyopathy in Afro-Caribbean versus white patients in the UK. Heart, 2016;102(22):1797-1804. Heart can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. (BMJ Publishing Group - group.bmj.com/; Heart - heart.bmj.com/)

Oncology - Melanoma

Research Conducted at University Hospital Has Updated Our Knowledge about Melanoma (Analysis of BRAF and NRAS Mutation Status in Advanced Melanoma Patients Treated with Anti-CTLA-4 Antibodies: Association with Overall Survival?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Melanoma. According to
news reporting out of Zurich, Switzerland, by NewsRx editors, research stated, "Ipilimumab and tremelimumab are human monoclonal antibodies (Abs) against cytotoxic T-lymphocyte antigen-4 (CTLA-4). Ipilimumab was the first agent to show a statistically significant benefit in overall survival in advanced melanoma patients."

Our news journalists obtained a quote from the research from University Hospital, "Currently, there is no proven association between the BRAFV600 mutation and the disease control rate in response to ipilimumab. This analysis was carried out to assess if BRAFV600 and NRAS mutation status affects the clinical outcome of anti-CTLA-4-treated melanoma patients. This is a retrospective multi-center analysis of 101 patients, with confirmed BRAF and NRAS mutation status, treated with anti-CTLA-4 antibodies from December 2006 until August 2012. The median overall survival, defined from the treatment start date with the anti-CTLA-4. Abs-treatment to death or till last follow up, of BRAFV600 or NRAS mutant patients (n=62) was 10.12 months (95% CI 6.78-13.2) compared to 8.26 months (95% CI 6.02-19.9) in BRAFV600/NRASwt subpopulation (n=39) (p=0.67). The median OS of NRAS mutated patients (n=24) was 12.1 months and although was prolonged compared to the median OS of BRAF mutated patients (n=38, mOS=8.03 months) or BRAFV600/NRASwt patients (n=39, mOS=8.26 months) the difference didn't reach statistical significance (p=0.56). 69 patients were able to complete 4 cycles of anti-CTLA-4 treatment. Of the 24 patients treated with selected BRAF-or MEK-inhibitors, 16 patients received anti-CTLA 4 Abs following either a BRAF or MEK inhibitor with only 8 of them being able to finish 4 cycles of treatment."

According to the news editors, the research concluded: "Based on our results, there is no difference in the median OS in patients treated with anti-CTLA-4 Abs implying that the BRAF/NRAS mutation status alone is not sufficient to predict the outcome of patients treated with anti-CTLA-4 Abs."

For more information on this research see: Analysis of BRAF and NRAS Mutation Status in Advanced Melanoma Patients Treated with Anti-CTLA-4 Antibodies: Association with Overall Survival? Plos One, 2015;10(10):e0139438. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Oncology - Penile Cancer

Research Conducted at University Hospital Has Updated Our Knowledge about Penile Cancer (Racial Disparities Differ for African Americans and Hispanics in the Diagnosis and Treatment of Penile Cancer)
Researchers detail new data in Oncology - Penile Cancer. According to news reporting from Cleveland, Ohio, by NewsRx journalists, research stated, "To evaluate racial disparities in the diagnosis and treatment of penile cancer among a contemporary series of men from a large diverse national data base. Using the 1998-2012 National Cancer Data Base, all men with squamous cell carcinoma (SCC) were stratified by race and ethnicity."

The news correspondents obtained a quote from the research from University Hospital, "Demographic and disease characteristics were compared between groups. Likelihood of undergoing surgery and type of surgery were compared among patients with nonmetastatic disease. Factors influencing disease stage and treatment type were analyzed with univariate and multivariable logistic regressions. Overall survival was examined with Kaplan-Meier and adjusted Cox proportional hazard models. We identified 12,090 men with penile SCC with median age 66 years (range 18-90). Distribution of patients is as follows: 76.8% Caucasian, 10.2% African American (AA), 8.7% Hispanic. On multivariable analysis, Hispanic men are more likely to present with high-risk (>= T1G3) penile SCC (odds ratio [OR] 1.6; confidence interval [CI] 1.20-2.00; P = .001) and tend to undergo penectomy rather than penile-sparing surgery (OR 1.46; CI 1.15-1.85; P = .002) for equal stage SCC compared to Caucasian patients. Whereas AA men are less likely to undergo surgery of any type (OR 0.67; CI 0.51-0.87; P = .003) and have higher mortality rates than Caucasian patients (hazard ratio 1.25; CI 1.10-1.42; P < .001). Hispanic men with penile SCC are more likely to present with high-risk disease and undergo more aggressive treatment than Caucasian patients but have comparable survival."

According to the news reporters, the research concluded: "AA men are less likely to undergo surgical management of their disease and have higher mortality rates."

Our news journalists report that additional information may be obtained by contacting E.A. Slopnick, University Hospital, Case Med Center, Inst Urol, Cleveland, OH 44106, United States. Additional authors for this research include S.P. Kim, J.E. Kiechle, C.M. Gonzalez, H. Zhu and R. Abouassaly.

Neuropathy

Research Conducted at University Medical Center Has Updated Our Knowledge about Neuropathy (Auditory neuropathy--neural and synaptic mechanisms)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neuropathy. According to news reporting out of Gottingen, Germany, by NewsRx editors, research stated, "Sensorineural hearing impairment is the most common form of hearing loss, and encompasses pathologies of the cochlea and the auditory nerve. Hearing impairment caused by abnormal neural encoding of sound stimuli despite preservation of sensory transduction and amplification by outer hair cells is known as 'auditory neuropathy'."

Our news journalists obtained a quote from the research from University Medical Center, "This term was originally coined for a specific type of hearing impairment affecting speech comprehension beyond changes in audibility: patients with this condition report that they 'can hear but cannot understand'. This type of hearing impairment can be caused by damage to the sensory inner hair cells (IHCs), IHC ribbon synapses or spiral ganglion neurons. Human genetic and physiological studies, as well as research on animal models, have recently shown that disrupted IHC ribbon synapse function--resulting from genetic alterations that affect presynaptic glutamate loading of synaptic vesicles, Ca(2+) influx, or synaptic vesicle exocytosis--leads to hearing impairment termed 'auditory synaptopathy'. Moreover, animal studies have demonstrated that sound overexposure causes excitotoxic loss of IHC ribbon synapses. This mechanism probably contributes to hearing disorders caused by noise exposure or age-related hearing loss."

According to the news editors, the research concluded: "This Review provides an update on recently elucidated sensory, synaptic and neural mechanisms of hearing impairment, their corresponding clinical findings, and discusses current rehabilitation strategies as well as future therapies."

Our news journalists report that additional information may be obtained by contacting T. Moser, Institute for Auditory Neuroscience and InnerEarLab, University Medical Center Gottingen, 37099 Gottingen, Germany.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrneurol.2016.10. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Electroconvulsive Therapy

Research Conducted at University of Aberdeen Has Updated Our Knowledge about Electroconvulsive Therapy (Differences in Cognitive Outcomes After ECT Depending on BDNF and COMT Polymorphisms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Electroconvulsive Therapy are discussed in a new report. According to news reporting originating in Aberdeen, United Kingdom, by NewsRx journalists, research stated, "The study aimed to explore cognitive
outcomes after electroconvulsive therapy (ECT) depending on which version of common single nucleotide polymorphisms the patient expressed for brain-derived neurotrophic factor (BDNF) and catechol-O-methyltransferase (COMT). A total of 87 patients from the clinical ECT service in Aberdeen, Scotland, were included in the study."

The news reporters obtained a quote from the research from the University of Aberdeen, "Cognitive function testing (using Spatial Recognition Memory task from the Cambridge Neuropsychological Test Automated Battery and Mini-Mental State Examination) and mood ratings (Montgomery-sberg Depression Rating Scale) were performed before ECT, after 4 treatments, at the end of ECT and 1 and 3 months after the end of treatment. These scores were compared depending on BDNF and COMT variant at each time point using the Student t test and using a time series generalized least squares random effects model. No differences were found between the val and met versions of the BDNF or COMT polymorphism in either cognitive or mood outcomes at any time point during ECT treatment or up to 3 months of follow-up. This study did not detect significant differences in cognitive or mood outcomes between patients who have the val66val or met versions of the BDNF polymorphism."

According to the news reporters, the research concluded: "Our results suggest that these polymorphisms will not be helpful in clinical practice for predicting cognitive outcomes after ECT."

For more information on this research see: Differences in Cognitive Outcomes After ECT Depending on BDNF and COMT Polymorphisms. Journal of ECT, 2016;32(4):243-250. Journal of ECT can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Journal of ECT - journals.lww.com/ectjournal/pages/default.aspx)

Our news correspondents report that additional information may be obtained by contacting D.M. Bennett, University of Aberdeen, Div Appl Med Psychiat, Aberdeen, United Kingdom. Additional authors for this research include J. Currie, G. Fernie, J.S. Perrin and I.C. Reid.

Keywords for this news article include: Aberdeen, United Kingdom, Europe, Electroconvulsive Therapy, Drugs and Therapies, Genetics, University of Aberdeen.

Hematology - Plasma

Research Conducted at University of Agder Has Updated Our Knowledge about Plasma [In vivo effect of N-ethylmaleimide (NEM) on the measurement of nitrate in plasma]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematology - Plasma. According to news originating from Kristiansand, Norway, by NewsRx correspondents, research stated, "Bioavailability of nitric oxide in the body may be estimated by measuring the concentration of nitrate in plasma. However, it has not been reported whether sequestering of aminothiols in plasma affects the concentration of nitrate in the samples."

Financial support for this research came from University of Agder, Norway Department of Natural Sciences.

Our news journalists obtained a quote from the research from the University of
Agder, "N-ethylmaleimide (NEM) sequesters aminothiols in plasma therefore we tested the in vivo effect of NEM on the concentration nitrate in plasma. Blood samples were collected from 56 healthy subjects in EDTA vials, EDTA vials containing PBS (pH 7.4) and EDTA vials containing NEM dissolved in PBS. Nonparametric statistical tests were used to study the effect of NEM on the concentration of nitrate in plasma measured by the Griess reagent assay and by an HPLC method. The concentration of nitrate in plasma containing NEM dissolved in PBS was lower than plasma containing PBS and plasma without any reagent measured by the Griess reagent assay (p < 0.001 and p< 0.001). Similarly, the concentration of nitrate in plasma containing NEM measured by the Griess reagent assay was significantly lower than nitrate concentration in plasma measured by the HPLC method (p < 0.001)."

According to the news editors, the research concluded: "Our findings suggest that plasma, which contains NEM, may not be suitable for the measurement of nitrate by the Griess reagent assay."

The news correspondents report that additional information may be obtained from M.A. Mansoor, Univ Agder, Dept. of Nat Sci, N-4604 Kristiansand, Norway.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.clinbiochem.2016.07.006. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Agalsidase Beta Therapy

Research Conducted at University of Alabama Has Updated Our Knowledge about Agalsidase Beta Therapy (Antiproteinuric therapy and Fabry nephropathy: factors associated with preserved kidney function during agalsidase-beta therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Agalsidase Beta Therapy are discussed in a new report. According to news originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "Nephropathy is an important feature of classical Fabry disease, which results in alpha-galactosidase A deficiency and cellular globotriaosylceramide accumulation. We report the safety and efficacy of antiproteinuric therapy with ACE inhibitors or angiotensin II receptor blockers (ARBs) in a study of classical Fabry patients receiving recombinant agalsidase-beta therapy."

Our news journalists obtained a quote from the research from the University of Alabama, "The goal was maintenance of urine protein to creatinine ratio (UPCR) <0.5 g/g or a 50% reduction in baseline UPCR for 24 patients at eight study sites. The change in estimated glomerular filtration rate (eGFR) was assessed over 21 months of treatment. 18 out of 24
patients achieved the UPCR goal with eGFR slopes that were significantly better than six patients who did not achieve the UPCR goal (-3.6 (-4.8 to -1.1) versus -7.0 (-9.0 to -5.6) mL/min/1.73 m(2)/year, respectively, p=0.018). Despite achieving the UPCR goal, 67% (12/18 patients) still progressed with an eGFR slope <-2 mL/min/1.73 m(2)/year. Regression analysis showed that increased age at initiation of agalsidase-beta therapy was significantly associated with worsened kidney outcome. Hypotension and hyperkalaemia occurred in seven and eight patients, respectively, which required modification of antiproteinuric therapy but was not associated with serious adverse events. This study documents the effectiveness of agalsidase-beta (1 mg/kg/2 weeks) and antiproteinuric therapy with ACE inhibitors and/or ARB in patients with severe Fabry nephropathy."

According to the news editors, the research concluded: "Patients had preservation of kidney function if agalsidase-beta treatment was initiated at a younger age, and UPCR maintained at or below 0.5 g/g with antiproteinuric therapy."

For more information on this research see: Antiproteinuric therapy and Fabry nephropathy: factors associated with preserved kidney function during agalsidase-beta therapy. Journal of Medical Genetics, 2015;52(12):860-6. (BMJ Publishing Group - group.bmj.com/; Journal of Medical Genetics - jmg.bmj.com/)

The news correspondents report that additional information may be obtained from D.G. Warnock, Division of Nephrology, Dept. of Medicine, University of Alabama at Birmingham, Birmingham, Alabama, United States. Additional authors for this research include C.P. Thomas, B. Vujkovac, R.C. Campbell, J. Charrow, D.A. Laney, L.L. Jackson, W.R. Wilcox and C. Wanner.

Lung Diseases and Conditions - Lung Injury

Research Conducted at University of Arizona Has Provided New Information about Lung Injury (Bixin protects mice against ventilation-induced lung injury in an NRF2-dependent manner)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Lung Injury have been published. According to news reporting originating in Tucson, Arizona, by NewsRx journalists, research stated, "Mechanical ventilation (MV) is a therapeutic intervention widely used in the clinic to assist patients that have difficulty breathing due to lung edema, trauma, or general anesthesia. However, MV causes ventilator-induced lung injury (VILI), a condition characterized by increased permeability of the alveolar-capillary barrier that results in edema, hemorrhage, and neutrophil infiltration, leading to exacerbated lung inflammation and oxidative stress."

The news reporters obtained a quote from the research from the University of
Arizona, "This study explored the feasibility of using bixin, a canonical NRF2 inducer identified during the current study, to ameliorate lung damage in a murine VILI model. In vitro, bixin was found to activate the NRF2 signaling pathway through blockage of ubiquitylation and degradation of NRF2 in a KEAP1-C151 dependent manner; intraperitoneal (IP) injection of bixin led to pulmonary upregulation of the NRF2 response in vivo. Remarkably, IP administration of bixin restored normal lung morphology and attenuated inflammatory response and oxidative DNA damage following MV. This observed beneficial effect of bixin derived from induction of the NRF2 cytoprotective response since it was only observed in Nrf2(+/+) but not in Nrf2(-/-) mice."

According to the news reporters, the research concluded: "This is the first study providing proof-of-concept that NRF2 activators can be developed into pharmacological agents for clinical use to prevent patients from lung injury during MV treatment."

For more information on this research see: Bixin protects mice against ventilation-induced lung injury in an NRF2-dependent manner. Scientific Reports, 2016;6():18760. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting S. Tao, Dept. of Pharmacology and Toxicology, University of Arizona, Tucson, AZ 85721, United States. Coagulation
Research Conducted at University of Birmingham Has Provided New Information about Coagulation [Determinants of Time in Therapeutic Range in Patients Receiving Oral Anticoagulants (A Substudy of IMPACT)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Coagulation are discussed in a new report. According to news reporting originating from Birmingham, United Kingdom, by NewsRx correspondents, research stated, "Implanted cardiac arrhythmia devices can detect atrial tachyarrhythmias (atrial high-rate episodes [AHREs]) that are considered to correlate with atrial fibrillation and risk of stroke. In the IMPACT trial, oral anticoagulation was initiated when AHREs were detected by implanted cardioverter-defibrillators. and withdrawn when they abated, according to a protocol accounting both for AHRE duration as detected by remote device monitoring and stroke risk assessment."

Our news editors obtained a quote from the research from the University of Birmingham, "In this analysis, we ascertained determinants of time in therapeutic range (TTR) among protocol-determined vitamin K antagonist-treated patients during the trial. We enrolled
2,718 patients with at least 1 additional stroke risk factor (CHADS2 score >= 1) at 104 arrhythmia centers. The sex, age <60, medical history, treatments interacting with VKA, tobacco use (2 points) and race (2 points for non-Caucasian) (SAMe-TT2R2) score is a simple clinical-derived score designed to aid decision-making on whether a patient is likely to achieve good anticoagulation control on vitamin K antagonist (e.g., warfarin), which was calculated and related to TTR achieved using the Rosendaal method. We analyzed 229 patients (mean age 66.7 years; mean CHADS(2) score 2.85 [SD 1.11] with mean TTR of 0.536 [SD 0.23] overall. Univariate analysis identified 5 variables associated with differences in mean TTR. Mean TTR was lower in those who were women (p = 0.031), of black race (p = 0.005) and in New York Heart Association class IV (p = 0.014), whereas hemoglobin >13.5 g/dl (p = 0.010) and New York Heart Association class I (p = 0.037) were associated with higher mean TTR. There was a significant difference in mean TTR value between US and non-US sites (Canada and Germany) (mean TTR for US: 0.513 vs non-US: 0.686; p<0.0001). Mean TTR was significantly lower (i = 0.1382, 95% CI 0.0382 to 0.2382) for patients with SAMe-TT2R2 scores of 4 (p = 0.007) and higher (A = 0.0612, 95% CI 0.0005 to 0.1219) for patients with SAMe-TT2R2 scores of 1 (p = 0.048). Linear regression confirmed a significant association between lower SAMe-TT2R2 score and improved anticoagulation control (p = 0.0021) with a 1-unit decrease in SAMe-TT2R2 score associated with an increase in TTR of 0.0404 (95% CI 0.0149 to 0.0659)."

According to the news editors, the research concluded: "Clinical, geographical, and demographic factors were associated with the quality of anticoagulation control as reflected by TTR. Although overall TTR in this population was poor, lower SAMe-TT2R2 scores were associated with better TTR."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.amjcard.2016.08.047. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antivirals

Research Conducted at University of Bologna Has Updated Our Knowledge about Antivirals (Plants Producing Ribosome-Inactivating Proteins in Traditional Medicine)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antivirals. According to news reporting out of Bologna, Italy, by NewsRx editors, research stated, "Ribosome-inactivating proteins (RIPs) are enzymes that deadenylate nucleic acids and are broadly distributed in the plant kingdom. Many plants that contain RIPs are listed in the pharmacopoeias of folk medicine all over the world, mostly because of their toxicity."

Our news journalists obtained a quote from the research from the University of Bologna, "This review analyses the position occupied in traditional medicine by plants from which RIPs have been isolated. The overview starts from the antique age of the Mediterranean area with ancient Egypt, followed by the Greek and Roman classic period. Then, the ancient oriental civilizations of China and India are evaluated. More recently, Unani medicine and European folk medicine are examined. Finally, the African and American folk medicines are taken into consideration."

According to the news editors, the research concluded: "A list of RIP-expressing plants, which have been used in folk medicine, is provided with the geographical distribution and the prescriptions that are recommended by traditional healers. Some final considerations are provided on the present utilization of such herbal treatments, both in developing and developed countries, often in the absence of scientific validation. The most promising prospect for the medicinal use of RIP-expressing plants is the conjugation of purified RIPs to antibodies that recognise tumour antigens for cancer therapy."

For more information on this research see: Plants Producing Ribosome-Inactivating Proteins in Traditional Medicine. *Molecules*, 2016;21(11):2074-2100. Molecules can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. (Springer - www.springer.com; Molecules - www.springerlink.com/content/1420-3049/)

Our news journalists report that additional information may be obtained by contacting L. Polito, University of Bologna, Dept. of Expt Diagnost & Specialty Med DIMES, Alma Mater Studiorum, I-40126 Bologna, Italy. Additional authors for this research include M. Bortolotti, S. Maiello, M.G. Battelli and A. Bologna.

Environmental Polution

**Research Conducted at University of Bourgogne Has Provided New Information about Environmental Polution (Occurrence of pharmaceuticals in WWTP effluents and their impact in a karstic rural catchment of Eastern France)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Environmental Polution have been published. According to news reporting out of Besancon, France, by NewsRx editors, research stated, "The occurrence of pharmaceuticals in freshwater ecosystems provokes increasing concern due to their potential risk to non-target organisms and to human health. Pharmaceuticals are used in both human and veterinary medicine and are essentially released into the environment via
wastewater treatment plants (WWTPs) and from livestock."

Our news journalists obtained a quote from the research from the University of Bourgogne, "In this study, 31 pharmaceuticals were analyzed in effluent and surface water upstream and downstream of two WWTPs in the Loue-Doubs rural karstic catchment in Eastern France. Diclofenac (965 and 2476 ng L-1), sulfamethoxazole (655 and 1380 ng L-1) and carbamazepine (566 and 1007 ng L-1) displayed the highest levels in the effluents of both WWTPs. Diclofenac levels were also high in surface water samples 300 and 166 ng L-1 in the River Doubs and the River Loue, respectively, followed by paracetamol (273 and 158 ng L-1) and sulfamethoxazole (126 and 73 ng L-1). In both rivers, the most critical compounds were found to be the antibiotic sulfamethoxazole (risk quotient (RQ) from 23.7 to 51.1) and ofloxacin (RQ from 1.1 to 18.9), which reached levels inducing toxic effects in aquatic organisms. This study showed that WWTP effluents are the major sources of the pharmaceuticals, but raw discharges from human residences, pastures and livestock manure represent significant sources of contamination of surface water and groundwater."

According to the news editors, the research concluded: "The aim of this study was to assist scientists and authorities in understanding occurrence and sources of pharmaceuticals in order to improve water quality management in chalk streams."

For more information on this research see: Occurrence of pharmaceuticals in WWTP effluents and their impact in a karstic rural catchment of Eastern France. *Environmental Science and Pollution Research*, 2016;23(24):25427-25441. Environmental Science and Pollution Research can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. (Springer - www.springer.com; Environmental Science and Pollution Research - www.springerlink.com/content/0944-1344/)

Our news journalists report that additional information may be obtained by contacting P.M. Badot, Univ Bourgogne Franche Comte, UMR UFC CNRS Usc INRA 6249, Chrono Environm, F-25030 Besancon, France. Additional authors for this research include F. Degiorgi, A. Bulete, L. Spinner and P.M. Badot.

Kidney Diseases and Conditions - Chronic Kidney...

Research Conducted at University of California Has Updated Our Knowledge about Chronic Kidney Disease (Effects of dietary iron intake and chronic kidney disease on fibroblast growth factor 23 metabolism in wild-type and hepcidin knockout mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Kidney Diseases and Conditions - Chronic Kidney Disease. According to news reporting originating in Los Angeles, California, by NewsRx journalists, research stated, "In the setting of normal kidney function, iron deficiency is associated with increased FGF23 production and cleavage, altering circulating FGF23 levels. Our objective was to determine how chronic kidney disease (CKD) and dietary iron intake affect FGF23 production and metabolism in wildtype (WT) and hepcidin knockout (HKO) mice."

The news reporters obtained a quote from the research from the University of
California, "For 8 wk, the mice were fed diets that contained adenine (to induce CKD) or no adenine (control group), with either low-iron (4 ppm) or standard-iron (335 ppm) concentrations. The low-iron diet induced iron deficiency anemia in both the WT and HKO mice. Among the WT mice, in both the control and CKD groups, a low-iron compared with a standard-iron diet increased bone Fgf23 mRNA expression, C-terminal FGF23 (cFGF23) levels, and FGF23 cleavage as manifested by a lower percentage intact FGF23 (iFGF23). Independent of iron status, CKD was associated with inhibition of FGF23 cleavage. Similar results were observed in the HKO control and CKD groups. Dietary iron content was more influential on FGF23 parameters than the presence or absence of hepcidin. In the CKD mice (WT and HKO, total n = 42), independent of the effects of serum phosphate, iron deficiency was associated with increased FGF23 production but also greater cleavage, whereas worse kidney function was associated with increased FGF23 production but decreased cleavage."

According to the news reporters, the research concluded: "Therefore, in both the WT and HKO mouse models, dietary iron content and CKD affected FGF23 production and metabolism."

Our news correspondents report that additional information may be obtained by contacting M.R. Hanudel, University of California, David Geffen Sch Med, Dept. of Pediat, Los Angeles, CA 90095, United States. Additional authors for this research include K. Chua, M. Rappaport, V. Gabayan, E. Valore, D. Goltzman, T. Ganz, E. Nemeth and I.B. Salusky.

**DNA Research**

**Research Conducted at University of California Has Updated Our Knowledge about DNA Research (Structural basis for DNA recognition by STAT6)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in DNA Research. According to news reporting originating from Los Angeles, California, by NewsRx correspondents, research stated, "STAT6 participates in classical IL-4/IL-13 signaling and stimulator of interferon genes-mediated antiviral innate immune responses. Aberrations in STAT6-mediated signaling are linked to development of asthma and diseases of the immune system."

Financial supporters for this research include National Natural Science Foundation of China (NSFC), Ministry of Science and Technology (MOST), Youth Innovation Promotion Association of the Chinese Academy of Sciences (Youth Innovation Promotion Association CAS).
Our news editors obtained a quote from the research from the University of California, "In addition, STAT6 remains constitutively active in multiple types of cancer. Therefore, targeting STAT6 is an attractive proposition for treating related diseases. Although a lot is known about the role of STAT6 in transcriptional regulation, molecular details on how STAT6 recognizes and binds specific segments of DNA to exert its function are not clearly understood. Here, we report the crystal structures of a homodimer of phosphorylated STAT6 core fragment (STAT6(CF)) alone and bound with the N3 and N4 DNA binding site. Analysis of the structures reveals that STAT6 undergoes a dramatic conformational change on DNA binding, which was further validated by performing molecular dynamics simulation studies and small angle X-ray scattering analysis. Our data show that a larger angle at the intersection where the two protomers of STAT meet and the presence of a unique residue, H415, in the DNA-binding domain play important roles in discrimination of the N4 site DNA from the N3 site by STAT6. H415N mutation of STAT6CF decreased affinity of the protein for the N4 site DNA, but increased its affinity for N3 site DNA, both in vitro and in vivo."

According to the news editors, the research concluded: "Results of our structure-function studies on STAT6 shed light on mechanism of DNA recognition by STATs in general and explain the reasons underlying STAT6's preference for N4 site DNA over N3."

Mosquito-Borne Diseases - Malaria

**Research Conducted at University of Delhi Has Provided New Information about Malaria (Stearylamine Liposomal Delivery of Monensin in Combination with Free Artemisinin Eliminates Blood Stages of Plasmodium falciparum in Culture and P. berghei ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mosquito-Borne Diseases - Malaria is the subject of a report. According to news reporting originating in New Delhi, India, by NewsRx journalists,
research stated, "The global emergence of drug resistance in malaria is impeding the therapeutic
efficacy of existing antimalarial drugs. Therefore, there is a critical need to develop an efficient
drug delivery system to circumvent drug resistance."

The news reporters obtained a quote from the research from the University of Delhi,
"The anticoccidial drug monensin, a carboxylic ionophore, has been shown to have antimalarial
properties. Here, we developed a liposome-based drug delivery of monensin and evaluated its
antimalarial activity in lipid formulations of soya phosphatidylcholine (SPC) cholesterol (Chol)
containing either stearylamine (SA) or phosphatidic acid (PA) and different densities of
These formulations were found to be more effective than a comparable dose of free monensin in
Plasmodium falciparum (3D7) cultures and established mouse models of Plasmodium berghei
strains NK65 and ANKA. Parasite killing was determined by a radiolabeled [(3)H]hypoxanthine
incorporation assay (in vitro) and microscopic counting of Giemsa-stained infected erythrocytes
(in vivo). The enhancement of antimalarial activity was dependent on the liposomal lipid
composition and preferential uptake by infected red blood cells (RBCs). The antiplasmodial
activity of monensin in SA liposome (50% inhibitory concentration [IC[50], 0.74 nM) and
SPC:Chol-liposome with 5 mol% DSPE-mPEG 2000 (IC[50], 0.39 nM) was superior to that of
free monensin (IC[50], 3.17 nM), without causing hemolysis of erythrocytes. Liposomes
exhibited a spherical shape, with sizes ranging from 90 to 120 nm, as measured by dynamic
light scattering and high-resolution electron microscopy. Monensin in long-circulating
liposomes of stearylamine with 5 mol% DSPE-mPEG 2000 in combination with free
artemisinin resulted in enhanced killing of parasites, prevented parasite recrudescence, and
improved survival."

According to the news reporters, the research concluded: "This is the first report to
demonstrate that monensin in PEGylated stearylamine (SA) liposome has therapeutic potential
against malaria infections."

Research Conducted at University of Dresden Has Provided New Information about Gastric Cancer (Free intraperitoneal tumor cells and outcome in gastric cancer patients: a systematic review and meta-analysis)

Oncology - Gastric Cancer

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news reporting out of Dresden, Germany, by NewsRx editors, research stated, "Despite continuously improving therapies, gastric cancer still shows poor survival in locally advanced stages with local recurrence rates of up to 50% and peritoneal recurrence rates of 17% after curative surgery. We performed a systematic review with meta-analyses to clarify whether positive intraperitoneal cytology (IPC) indicates a high risk of disease recurrence and poor overall survival in gastric cancer."

Our news journalists obtained a quote from the research from the University of Dresden, "Multiple databases were searched in December 2014 to identify studies on the prognostic significance of positive intraperitoneal cytology in gastric cancer, including: Medline, Biosis, Science Citation Index, Embase, CC Med and publisher databases. Hazard ratios (HR) and associated 95% confidence intervals (CI) were extracted from the identified studies. A meta-analysis was performed using a random-effects model on overall survival, disease-free survival and peritoneal recurrence free survival. A total of 64 studies with a cumulative sample size of 12,883 patients were included. Cytology, quantitative real time polymerase chain reaction (PCR) or both were performed in 35; 21 and 8 studies, respectively. Meta analyses revealed free intraperitoneal tumor cells (FITC) to be associated with poor overall survival in univariate (HR 3.27; 95% CI 2.82 -3.78]) and multivariate (HR 2.45; 95% CI 2.04 -2.94) analysis and poor peritoneal recurrence free survival in univariate (4.15; 95% CI 3.10 -5.57) and multivariate (3.09; 95% CI 2.02 -4.71) analysis. Subgroup analysis showed this effect to be independent of the detection method, Western or Asian origin or the time of publication."

According to the news editors, the research concluded: "FITC oder positive peritoneal cytology is associated with poor survival and increased peritoneal recurrence in gastric cancer."

For more information on this research see: Free intraperitoneal tumor cells and outcome in gastric cancer patients: a systematic review and meta-analysis. Oncotarget, 2015;6 (34):35564-78.

Our news journalists report that additional information may be obtained by contacting M. Pecqueux, Dept. of for Visceral, Thoracic and Vascular Surgery, University of Dresden, Dresden, Germany. Research Conducted at University of Faisalabad Has Updated Our Knowledge about Ethnopharmacology (Anti-cholinergic and Ca2+-antagonist mechanisms explain the pharmacological basis for folkloric use of Sisymbrium irio Linn. in gastrointestinal, ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Ethnopharmacology. According to news reporting originating in Faisalabad, Pakistan, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Seeds of Sisymbrium irio Linn has been used traditionally in different regions of Pakistan for the treatment of gastrointestinal, airways and vascular system ailments. To insight the pharmacological basis, in vitro study was conducted in order to validate its folkloric uses."

The news reporters obtained a quote from the research from the University of Faisalabad, "70% aqueous-methanolic extract of seeds from S. irio (Si.MEs) was tested on isolated rabbit aorta, jejunum and trachea strip hanged in tissue bath having physiological solutions aerated with carbogen and their responses were measured and recorded via Power Lab. The Si.MEs exhibited the transient spasmogenic effect (0.01-1.0 mg/mL) on spontaneous jejunum contractions, followed by the spasmolytic effect. The addition of atropine resulted in blocking in spasmogenic effect while the spasmolytic effect was originated, suggesting the presence of an antimuscarinic effect. Likewise verapamil, Si.MEs (0.03-5 mg/mL) repressed the high concentration K+(80 mM)-induced contraction and also drifted the Ca2+ concentration-response curves toward right (0.3-3.0 mg/mL), possibly signifying the Ca2+ channel blockade. Furthermore, Si.MEs exhibited nonspecific relaxant effect on carbachol (1 mu M)- and high concentration K+(80 mM)-induced tracheal contractions in a way comparable to dicyclomine, suggesting the coexistence of Ca2+-antagonistic and/or antimuscarinic properties. Additionally, Si.MEs also relaxed the phenylephrine(1 mu M)- and high concentration K+(80 mM)-induced aortic contraction (0.01-3 mg/mL), suggesting blockade of Ca2+ channel. Moreover, oral administration of Si.MEs, as high as 6 g per kg, did not produce lethality among the treated groups of mice."

According to the news reporters, the research concluded: "Aqueous-methanolic extract of seeds from S. irio (Si.MEs) exhibited the bronchodilator and gut modulator (spasmogenic and spasmolytic) activities, probably through dual blockade of muscarinic receptors and Ca2+ channels, whereas, vasodilator effect may be due to Ca2+ channels blockade."

Our news correspondents report that additional information may be obtained by contacting M. Hussain, Univ Faisalabad, Sch Pharm, Faisalabad, Pakistan. Additional authors for this research include H.M. Waqas, S.M. Raza, U. Farooq, M.M. Ahmed and A. Majeed.

The direct object identifier (DOI) for that additional information is:
Research Conducted at University of Giessen Has Provided New Information about Streptococcus pneumoniae (Host-derived extracellular RNA promotes adhesion of Streptococcus pneumoniae to endothelial and epithelial cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Positive Bacteria - Streptococcus pneumoniae have been published. According to news reporting from Giessen, Germany, by NewsRx journalists, research stated, "Streptococcus pneumoniae is the most frequent cause of community-acquired pneumonia. The infection process involves bacterial cell surface receptors, which interact with host extracellular matrix components to facilitate colonization and dissemination of bacteria."

The news correspondents obtained a quote from the research from the University of Giessen, "Here, we investigated the role of host-derived extracellular RNA (eRNA) in the process of pneumococcal alveolar epithelial cell infection. Our study demonstrates that eRNA dose-dependently increased S. pneumoniae invasion of alveolar epithelial cells. Extracellular enolase (Eno), a plasminogen (Plg) receptor, was identified as a novel eRNA-binding protein on S. pneumoniae surface, and six Eno eRNA-binding sites including a C-terminal 15 amino acid motif containing lysine residue 434 were characterized. Although the substitution of lysine 434 for glycine (K434G) markedly diminished the binding of eRNA to Eno, the adherence to and internalization into alveolar epithelial cells of S. pneumoniae strain carrying the C-terminal lysine deletion and the mutation of internal Plg-binding motif were only marginally impaired. Accordingly, using a mass spectrometric approach, we identified seven novel eRNA-binding proteins in pneumococcal cell wall. Given the high number of eRNA-interacting proteins on pneumococci, treatment with RNase1 completely inhibited eRNA-mediated pneumococcal alveolar epithelial cell infection."

According to the news reporters, the research concluded: "Our data support further efforts to employ RNase1 as an antimicrobial agent to combat pneumococcal infectious diseases."

Our news journalists report that additional information may be obtained by contacting D. Zakrzewicz, Univ Giessen & Marburg Lung Center, Fac Med, Dept. of Biochem, D-35392 Giessen, Germany. Additional authors for this research include S. Bergmann, M. Didiasova, B.D. Giaimo, T. Borggrefe, M. Mieth, A.C. Hocke, G. Lochnit, L. Schaefer, S.
Smoking

Research Conducted at University of Hawaii Cancer Center Has Updated Our Knowledge about Smoking (Longitudinal study of e-cigarette use and onset of cigarette smoking among high school students in Hawaii)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Smoking have been presented. According to news reporting from Honolulu, Hawaii, by NewsRx journalists, research stated, "Use of electronic cigarettes (e-cigarettes) is prevalent among adolescents, but there is little knowledge about the consequences of their use. We examined, longitudinally, how e-cigarette use among adolescents is related to subsequent smoking behaviour."

The news correspondents obtained a quote from the research from the University of Hawaii Cancer Center, "Longitudinal school-based survey with a baseline sample of 2338 students (9th and 10th graders, mean age 14.7 years) in Hawaii surveyed in 2013 (time 1, T1) and followed up 1 year later (time 2, T2). We assessed e-cigarette use, tobacco cigarette use, and psychosocial covariates (demographics, parental support and monitoring, and sensation seeking and rebelliousness). Regression analyses including the covariates tested whether e-cigarette use was related to the onset of smoking among youth who had never smoked cigarettes, and to change in smoking frequency among youth who had previously smoked cigarettes. Among T1 never-smokers, those who had used e-cigarettes at T1 were more likely to have smoked cigarettes at T2; for a complete-case analysis, adjusted OR=2.87, 95% CI 2.03 to 4.05, p <0.0001. Among ever-smokers at T1, using e-cigarettes was not related to significant change in their frequency of smoking at T2. Uptake of e-cigarette use among T1 never-users of either product was predicted by age, Caucasian or Native Hawaiian (vs Asian-American) ethnicity, lower parental education and parental support, higher rebelliousness, and perception of e-cigarettes as healthier. Adolescents who use e-cigarettes are more likely to start smoking cigarettes."

According to the news reporters, the research concluded: "This result together with other findings suggests that policies restricting adolescents' access to e-cigarettes may have a rationale from a public health standpoint."

For more information on this research see: Longitudinal study of e-cigarette use and onset of cigarette smoking among high school students in Hawaii. Tobacco Control, 2016;26 (1):34-39. (BMJ Publishing Group - group.bmj.com; Tobacco Control - tobaccocontrol.bmj.com/)

Our news journalists report that additional information may be obtained by contacting T.A. Wills, Prevention and Control Program, University of Hawaii Cancer Center,
Honolulu, Hawaii, United States. Additional authors for this research include R. Knight, J.D. Sargent, F.X. Gibbons, I. Pagano and R.J Williams.

Research Conducted at University of Hawaii Has Provided New Information about Gynecologic Oncology (Long non-coding RNAs, ASAP1-IT1, FAM215A, and LINC00472, in epithelial ovarian cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gynecologic Oncology. According to news reporting out of Honolulu, Hawaii, by NewsRx editors, research stated, "Long non-coding RNAs (lncRNAs) are a class of non-protein coding transcripts that has gained significant attention lately due to their important biological actions and potential involvement in cancer. Ovarian cancer is a devastating disease with poor prognosis, and our understanding of IncRNA's involvement in the malignancy is limited."

Our news journalists obtained a quote from the research from the University of Hawaii, "To further our knowledge, we measured the expression of three IncRNAs, ASAP1-IT1, FAM215A, and LINC00472, in tumor samples, and analyzed their associations with disease characteristics and patient survival. Two hundred sixty-six patients diagnosed with primary epithelial ovarian cancers were recruited for the study. Fresh-frozen tumor samples were obtained from the patients at tumor resection and analyzed by RT-qPCR for expression of ASAP1-IT1, FAM215A, and LINC00472. Associations of IncRNA expression with patient survival were determined using Cox proportional hazards regression models. We observed high expression of ASAP1-IT1, FAM215A and LINC00472 more frequently in low grade tumors and early stage disease compared to high grade tumors and late stage disease, respectively. High expression of ASAP1-IT1 and FAM215A were associated with favorable overall survival, and the survival association with ASAP1-IT1 was independent of tumor grade and disease stage. Analyses of online data also demonstrated similar survival associations with ASAP1-IT1 and FAM215A, suggesting that these lncRNAs may be involved in ovarian cancer progression."

According to the news editors, the research concluded: "lncRNAs may play appreciable roles in ovarian cancer and more research is needed to elucidate their biological mechanisms and clinical implications in tumor characterization as well as disease prognosis and treatment."

For more information on this research see: Long non-coding RNAs, ASAP1-IT1, FAM215A, and LINC00472, in epithelial ovarian cancer. Gynecologic Oncology, 2016;143 (3):642-649. (Elsevier - www.elsevier.com; Gynecologic Oncology - www.journals.elsevier.com/gynecologic-oncology/)

Our news journalists report that additional information may be obtained by
Research Conducted at University of Lyon Has Updated Our Knowledge about Neutral Amino Acids (A Eukaryotic-like Serine/Threonine Kinase Protects Staphylococci against Phages)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neutral Amino Acids have been published. According to news reporting originating in Villeurbanne, France, by NewsRx journalists, research stated, "Organisms from all domains of life are infected by viruses. In eukaryotes, serine/threonine kinases play a central role in antiviral response."

The news reporters obtained a quote from the research from the University of Lyon, "Bacteria, however, are not commonly known to use protein phosphorylation as part of their defense against phages. Here we identify Stk2, a staphylococcal serine/threonine kinase that provides efficient immunity against bacteriophages by inducing abortive infection. A phage protein of unknown function activates the Stk2 kinase. This leads to the Stk2-dependent phosphorylation of several proteins involved in translation, global transcription control, cell-cycle control, stress response, DNA topology, DNA repair, and central metabolism. Bacterial host cells die as a consequence of Stk2 activation, thereby preventing propagation of the phage to the rest of the bacterial population."

According to the news reporters, the research concluded: "Our work shows that mechanisms of viral defense that rely on protein phosphorylation constitute a conserved antiviral strategy across multiple domains of life."

Our news correspondents report that additional information may be obtained by contacting B. Duclos, University of Lyon, Inst Mol & Supramol Chem & Biochem, CNRS, F-69100 Villeurbanne, France. Additional authors for this research include J.P. Didier, A. Bernheim, A. Sherlock, H. Molina, B. Duclos and D. Bikard.

Research Conducted at University of Maryland School of Medicine Has Provided New Information about Brain Injuries (miR-711 upregulation induces neuronal cell death after traumatic brain injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Central Nervous System Diseases and Conditions - Brain Injuries is the subject of a report. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "Traumatic brain injury (TBI) is a leading cause of mortality and disability. MicroRNAs (miRs) are small noncoding RNAs that negatively regulate gene expression at post-transcriptional level and may be key modulators of neuronal apoptosis, yet their role in secondary injury after TBI remains largely unexplored."

The news reporters obtained a quote from the research from the University of Maryland School of Medicine, "Changes in miRs after controlled cortical impact (CCI) in mice were examined during the first 72 h using miR arrays and qPCR. One selected miR (711) was examined with regard to its regulation and relation to cell death; effects of miR-711 modulation were evaluated after CCI and using in vitro cell death models of primary cortical neurons. Levels of miR-711 were increased in the cortex early after TBI and in vitro models through rapid upregulation of miR-711 transcription (pri-miR-711) rather than catabolism. Increases coincided with downregulation of the pro-survival protein Akt, a predicted target of miR-711, with sequential activation of forkhead box O3 (FoxO3)a/glycogen synthase kinase 3 (GSK3)a/b, pro-apoptotic BH3-only molecules PUMA (Bcl2-binding component 3) and Bim (Bcl2-like 11 (apoptosis facilitator)), and mitochondrial release of cytochrome c and AIF. miR-711 and Akt (mRNA) co-immunoprecipitated with the RNA-induced silencing complex (RISC). A miR-711 hairpin inhibitor attenuated the apoptotic mechanisms and decreased neuronal death in an Akt-dependent manner. Conversely, a miR-711 mimic enhanced neuronal apoptosis. Central administration of the miR-711 hairpin inhibitor after TBI increased Akt expression and attenuated apoptotic pathways."

According to the news reporters, the research concluded: "Treatment reduced cortical lesion volume, neuronal cell loss in cortex and hippocampus, and long-term neurological dysfunction. miR-711 changes contribute to neuronal cell death after TBI, in part by inhibiting Akt, and may serve as a novel therapeutic target."

For more information on this research see: miR-711 upregulation induces neuronal cell death after traumatic brain injury. Cell Death and Differentiation, 2015;23(4):654-68. (Nature Publishing Group - www.nature.com/; Cell Death and Differentiation - www.nature.com/cdd/)

Nutritional and Metabolic Diseases and Conditions ...

Research Conducted at University of Milan Has Provided New Information about Hypercholesterolemia (Drug treatment and adherence of subjects < 40 years with diagnosis of heterozygous familial hypercholesterolemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Hypercholesterolemia. According to news reporting from Milan, Italy, by NewsRx journalists, research stated, "We aimed at describing the therapeutic approach in young adult patients diagnosed with heterozygous familial hypercholesterolemia (HeFH) and their adherence and persistence to treatment. From regional administrative databases, individuals aged <= 40 years, who received exemption for HeFH between January 1, 2003 and December 31, 2011, and concomitantly started statin treatment, were identified."

The news correspondents obtained a quote from the research from the University of Milan, "Within the first year of treatment, we evaluated therapeutic changes, adherence as MPR (medication possession ratio), persistence as continuous drug coverage without gaps >= 60 days, and influencing factors using log binomial models. Of 1404 patients, 42.4% were initially treated with a high-efficacy statin. 23.4% of patients showed at least one treatment change. Mean MPR was 68.7% (29.9), and patients showing continued statin use were 47.0%. Therapy modification was significantly associated with a past cardiovascular event (relative risk, RR [95% confidential interval] 2.28 [1.69-3.09]) and at least one lipid test (RR 1.82 [1.31-2.53]). MPR >= 80% was significantly associated with the first statin prescribed (atorvastatin RR 1.28 [1.09-1.51] and rosuvastatin RR 1.21 [1.01-1.44], vs. simvastatin), a past cardiovascular event (RR 1.33 [1.12-1.59]), at least one therapy change (RR 1.28 [1.15-1.43]), at least a lipid test (RR 1.26 [1.07-1.49]). A similar pattern was observed for persistence. This analysis of young adult HeFH patients showed that therapy change was quite frequent, and probably reflected adjustments according to individual response."

According to the news reporters, the research concluded: "Adherence and persistence were inadequate, even in this population at high cardiovascular risk, and they need to be improved through proper patient education and shared treatment decision-making approach."

For more information on this research see: Drug treatment and adherence of subjects < 40 years with diagnosis of heterozygous familial hypercholesterolemia. *Atherosclerosis*, 2016;254():172-178. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Oncology - Melanoma

Research Conducted at University of Minho Has Updated Our Knowledge about Melanoma (Fluorescent quantification of melanin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Melanoma have been published.

According to news reporting originating in Braga, Portugal, by NewsRx journalists, research stated, "Melanin quantification is reportedly performed by absorption spectroscopy, commonly at 405nm. Here, we propose the implementation of fluorescence spectroscopy for melanin assessment."

Funders for this research include Fundacao para a Ciencia e a Tecnologia, COMPETE 2020, BioTecNorte Operation, European Regional Development Fund.

The news reporters obtained a quote from the research from the University of Minho, "In a typical invitro assay to assess melanin production in response to an external stimulus, absorption spectroscopy clearly overvalues melanin content. This method is also incapable of distinguishing non-melanotic/amelanotic control cells from those that are actually capable of performing melanogenesis. Therefore, fluorescence spectroscopy is the best method for melanin quantification as it proved to be highly specific and accurate, detecting even small variations in the synthesis of melanin."

According to the news reporters, the research concluded: "This method can also be applied to the quantification of melanin in more complex biological matrices like zebrafish embryos and human hair."

Our news correspondents report that additional information may be obtained by contacting T. Matama, University of Minho, CBMA Center Mol & Environm Biol, Braga, Portugal. Additional authors for this research include T. Matama, D. Guimaraes, A. Gomes and A. Cavaco-Paulo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/pcmr.12535. This DOI is a link to an online electronic document that is either free or for purchase.

Research Conducted at University of Oxford Has Provided New Information about Ataxia Telangiectasia (MEK inhibitors block growth of lung tumours with mutations in ataxia-telangiectasia mutated)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Ataxia Telangiectasia have been published. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "Lung cancer is the leading cause of cancer deaths, and effective treatments are urgently needed. Loss-of-function mutations in the DNA damage response kinase ATM are common in lung adenocarcinoma but directly targeting these with drugs remains challenging."

Our news journalists obtained a quote from the research from the University of Oxford, "Here we report that ATM loss-of-function is synthetic lethal with drugs inhibiting the central growth factor kinases MEK1/2, including the FDA-approved drug trametinib. Lung cancer cells resistant to MEK inhibition become highly sensitive upon loss of ATM both in vitro and in vivo. Mechanistically, ATM mediates crosstalk between the prosurvival MEK/ERK and AKT/mTOR pathways. ATM loss also enhances the sensitivity of KRAS- or BRAF-mutant lung cancer cells to MEK inhibition."

According to the news editors, the research concluded: "Thus, ATM mutational status in lung cancer is a mechanistic biomarker for MEK inhibitor response, which may improve patient stratification and extend the applicability of these drugs beyond RAS and BRAF mutant tumours."

Research Conducted at University of Pittsburgh Has Provided New Information about Hot Flashes (Menopausal Hot Flashes and Carotid Intima Media Thickness Among Midlife Women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hot Flashes have been presented. According to news reporting out of Pittsburgh, Pennsylvania, by NewsRx editors, research stated, "There has been a longstanding interest in the role of menopause and its correlates in the development of cardiovascular disease (CVD) in women. Menopausal hot flashes are experienced by most midlife women; emerging data link hot flashes to CVD risk indicators."

Our news journalists obtained a quote from the research from the University of Pittsburgh, "We tested whether hot flashes, measured via state-of-the-art physiologic methods, were associated with greater subclinical atherosclerosis as assessed by carotid ultrasound. We considered the role of CVD risk factors and estradiol concentrations in these associations. A total of 295 nonsmoking women free of clinical CVD underwent ambulatory physiologic hot flash assessments; a blood draw; and carotid ultrasound measurement of intima media thickness and plaque. Associations between hot flashes and subclinical atherosclerosis were tested in regression models controlling for CVD risk factors and estradiol. More frequent physiologic hot flashes were associated with higher carotid intima media thickness (for each additional hot flash: beta [SE]=0.004 [0.001]; P=0.0001; reported hot flash: beta [SE]=0.008 [0.002]; P=0.002, multivariable) and plaque (eg, for each additional hot flash, odds ratio [95% confidence interval] plaque index >= 2=1.07 [1.003-1.14]; P=0.04, relative to no plaque, multivariable] among women reporting daily hot flashes; associations were not accounted for by CVD risk factors or by estradiol. Among women reporting hot flashes, hot flashes accounted for more variance in intima media thickness than most CVD risk factors. Among women reporting daily hot flashes, frequent hot flashes may provide information about a woman's vascular status beyond standard CVD risk factors and estradiol."

According to the news editors, the research concluded: "Frequent hot flashes may mark a vulnerable vascular phenotype among midlife women."

Research Conducted at University of Queensland Has Updated Our Knowledge about Atrial Fibrillation (The State of the Art: Atrial Fibrillation Epidemiology, Prevention, and Treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Atrial Fibrillation is now available. According to news reporting from New Orleans, Louisiana, by NewsRx journalists, research stated, "As the most common sustained arrhythmia in adults, atrial fibrillation (AF) is an established and growing epidemic. To provide optimal patient care, it is important for clinicians to be aware of AF's epidemiological trends, methods of risk reduction, and the various available treatment modalities."

The news correspondents obtained a quote from the research from the University of Queensland, "Our understanding of AF's pathophysiology has advanced, and with this new understanding has come advancements in prevention strategies as well as pharmacological and nonpharmacological treatment options. Following PubMed and MEDLINE searches for AF risk factors, epidemiology, and therapies, we reviewed relevant articles (and bibliographies of those articles) published from 2000 to 2016."

According to the news reporters, the research concluded: "This 'state-of-the-art' review provides a comprehensive update on the understanding of AF in the world today, contemporary therapeutic options, and directions of ongoing and future study."

Our news journalists report that additional information may be obtained by contacting D.P. Morin, University of Queensland, Sch Med, Ochsner Clin Sch, New Orleans, LA, United States. Additional authors for this research include M.L. Bernard, C. Madias, P.A. Rogers, S. Thihalolipavan and N.A.M. Estes.

Research Conducted at University of Sassari Has Provided New Information about Query Fever (Mediterranean spotted fever-like illness in Sardinia, Italy: a clinical and microbiological study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Query Fever are presented in a new report. According to news originating from Sassari, Italy, by NewsRx correspondents, research stated, "Rickettioses represent a group of emerging infectious diseases in Europe. Climate changes and the anthropization of rural environment have favored vectors' biological cycle and geographic spread."

Our news journalists obtained a quote from the research from the University of Sassari, "In Sardinia, Mediterranean spotted fever (MSF) is endemic and represents an important public health problem. We investigated the etiology and the clinical presentation of MSF-like illness in northern Sardinia by enrolling patients admitted to the Infectious Disease Unit of the University of Sassari. Diagnostic tests included ELISA, Indirect immunofluorescence (IFI), DNA isolation from blood and from eschar samples with real-time PCR and genotyping. Eighty-seven patients with a mean age of 53 +/- 14 years, of whom 65 (75 %) males, were included in the study. The most common diagnosis was MSF (79 %), followed by Q fever (8 %), and anaplasmosis (2 %). A tache noire was found in 58 % of rickettioses and 28 % of Coxiella burnetii infections. MSF was confirmed in 47 % of the cases by IFI and 43 % by ELISA antibody tests. The isolation of rickettsial DNA from the eschar was positive in 10/13 (77 %) of the cases due to Rickettsia conorii. Using this method, we identified the first case of R. monacensis infection in Italy. In conclusion, antibody-based tests confirmed the diagnosis in less than 50 % of the cases, whereas DNA isolation confirmed the diagnosis in 77 % of tested cases and allowed the identification of a new pathogenic species in Italy."

According to the news editors, the research concluded: "Therefore, DNA isolation should be implemented to better identify the etiology of MSF-like illnesses and help the clinician in the management of patients."

For more information on this research see: Mediterranean spotted fever-like illness in Sardinia, Italy: a clinical and microbiological study. Infection, 2016;44(6):733-738. Infection can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. (Springer - www.springer.com; Infection - www.springerlink.com/content/0300-8126/)

The news correspondents report that additional information may be obtained from G. Madeddu, University of Sassari, Dept. of Clin & Expt Med, Infect Dis Unit, I-07100 Sassari, Italy. Enzymes and Coenzymes - Cysteine Endopeptidases

Research Conducted at University of Sonora Has Provided New Information about Cysteine Endopeptidases (Apoptotic activities of cardenolide glycosides from Asclepias subulata)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Cysteine Endopeptidases have been published. According to news reporting from Hermosillo, Mexico, by NewsRx journalists, research stated, "Ethnopharmaceutical relevance: Asclepias subulata Decne. (Apocynaceae) is a shrub occurring in Sonora Arizona desert. The ethnic groups of Sonora, Mexico, Seris and Pimas, use this plant for the treatment of sore eyes, gastrointestinal disorders and cancer."

Financial support for this research came from Consejo Nacional de Ciencia y Tecnología.

The news correspondents obtained a quote from the research from the University of Sonora, "Aim of the study: To determine the cell death pathways that the cardenolide glycosides with anti proliferative activity found in the methanol extract of A. subulata are able to activate. The effect of cardenolide glycosides isolated of A. subulata on induction of apoptosis in cancer cells was evaluated through the measuring of several key events of apoptosis. A549 cells were treated for 12 h with doses of 3.0, 0.2, 3.0 and 1.0 μM of 12, 16-dihydroxicalotropin, calotropin, corotoxigenin 3-O-glucopyranoside and desglucouzarin, respectively. Apoptotic and necrotic cell levels were measured by double staining with annexin V-FITC/PI. Mitochondrial membrane depolarization was examined through JC-1 staining. Apoptosis cell death and the apoptosis pathways activated by cardenolide glycosides isolated of A. subulata were further characterized by the measurement of caspase-3, caspase-8 and caspase-9 activity. Apoptotic assays showed that the four cardenolide glycosides isolated of A. subulata induced apoptosis in A549 cells, which was being evidenced by phosphatidylserine externalization in 18.2%, 17.0%, 23.9% and 22.0% for 12, 16-dihydroxicalotropin, calotropin, corotoxigenin 3-O-glucopyranoside and desglucouzarin, respectively, compared with 4.6% of control cells. Cell death was also associated with a decrease in mitochondrial membrane potential, which was more than 75% in the treated cultures respect to control. The activation of caspase-3 was observed in all cardenolide glycosides-treated cancer cells indicating the caspase-dependent apoptosis of A549 cells. Extrinsic and intrinsic apoptosis pathways were activated by cardenolide glycosides treatment at the doses tested."

According to the news reporters, the research concluded: "In this study was found that cardenolide glycosides, 12, 16-dihydroxicalotropin, calotropin, corotoxigenin 3-O-glucopyranoside and desglucouzarin, isolated from A. subulata induced the cell death trough caspase-dependent apoptosis, which was activated, preferably, by extrinsic pathway."

Our news journalists report that additional information may be obtained by contacting C. Velazquez, Univ Sonora, Div Ciencias Biol & Salud, Dept. of Ciencias Quim Biol, Hermosillo 83000, Sonora, Mexico. Additional authors for this research include C. Velazquez, A. Garibay-Escobar, W. Vilegas, L.A.M. Juarez, N. Gamez-Meza and R.E. Robles-
Zepeda.

Proteomics
Research Conducted at University of Technology Has Updated Our Knowledge about Proteomics (Systematic Analysis of Protein Interaction Network Associated with Azoospermia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Proteomics are presented in a new report. According to news originating from Johor Baharu, Malaysia, by NewsRx correspondents, research stated, "Non-obstructive azoospermia is a severe infertility factor. Currently, the etiology of this condition remains elusive with several possible molecular pathway disruptions identified in the post-meiotic spermatozoa."

Our news journalists obtained a quote from the research from the University of Technology, "In the presented study, in order to identify all possible candidate genes associated with azoospermia and to map their relationship, we present the first protein-protein interaction network related to azoospermia and analyze the complex effects of the related genes systematically. Using Online Mendelian Inheritance in Man, the Human Protein Reference Database and Cytoscape, we created a novel network consisting of 209 protein nodes and 737 interactions. Mathematical analysis identified three proteins, ar, dazap2, and esr1, as hub nodes and a bottleneck protein within the network. We also identified new candidate genes, CREBBP and BCAR1, which may play a role in azoospermia. The gene ontology analysis suggests a genetic link between azoospermia and liver disease. The KEGG analysis also showed 45 statistically important pathways with 31 proteins associated with colorectal, pancreatic, chronic myeloid leukemia and prostate cancer."

According to the news editors, the research concluded: "Two new genes and associated diseases are promising for further experimental validation."

For more information on this research see: Systematic Analysis of Protein Interaction Network Associated with Azoospermia. International Journal of Molecular Sciences, 2016;17(11):1456-1465. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Research Conducted at University of Texas Has Provided New Information about B-Cell Lymphoma (Prognostic significance of baseline peripheral absolute neutrophil, monocyte and serum 2-microglobulin level in patients with diffuse large b-cell ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - B-Cell Lymphoma is now available. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "There are limited reports that baseline peripheral absolute neutrophil count (ANC), absolute monocyte count (AMC), absolute lymphocyte count (ALC) and serum 2-microglobulin level independently predict survival in patients with diffuse large B-cell lymphoma (DLBCL). To confirm these findings, we analysed these parameters together with components of the International Prognostic Index (IPI) in patients with newly-diagnosed DLBCL."

The news reporters obtained a quote from the research from the University of Texas, "We evaluated baseline clinical features for their ability to predict survival in 817 newly diagnosed, previously untreated patients with DLBCL who received frontline treatments between October 2001 and December 2011. The median age at diagnosis was 58 years. Multivariate analysis identified elevated baseline ANC (P=0.036), AMC (P=0.028) and serum 2-microglobulin level (P <0.001), poor performance status (P <0.001) and high number of extranodal disease sites (P=0.00497) as independent unfavourable predictors of OS; serum 2-microglobulin level was the strongest predictor of survival outcomes among all the parameters. High baseline serum 2-microglobulin, ANC and AMC levels are independent prognostic factors for short overall survival in patients with newly diagnosed DLBCL."

According to the news reporters, the research concluded: "Our new model, based on the above five parameters, better stratifies patients into various risk categories than the IPI for newly diagnosed DLBCL."

Our news correspondents report that additional information may be obtained by contacting A. Rodriguez, Univ Texas MD Anderson Canc Center, Dept. of Lymphoma & Myeloma, Houston, TX, United States. Additional authors for this research include S. Neelapu, L. Feng, W.Q. Bi, T.H. Yang, M. Wang, M.A. Fanale, J.R. Westin, F.B. Hagemeister, L.E. Fayad, J.E. Romaguera, F. Samaniego, F. Turturro, N.H. Fowler, P. McLaughlin, F. Cabanillas, Y. Oki, L.J. Nastoupil and Rodriguez.

Research Conducted at University of Texas Has Provided New Information about Urothelial Cancer [Nivolumab monotherapy in recurrent metastatic urothelial carcinoma (CheckMate 032): a multicentre, open-label, two-stage, multi-arm, phase 1/2 trial]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Urothelial Cancer is now available. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Few effective treatments exist for patients with advanced urothelial carcinoma that has progressed after platinum-based chemotherapy. We assessed the activity and safety of nivolumab in patients with locally advanced or metastatic urothelial carcinoma whose disease progressed after previous platinum-based chemotherapy."

Financial support for this research came from NIH/NCI Cancer Center Support.

Our news editors obtained a quote from the research from the University of Texas, "In this phase 1/2, multicentre, open-label study, we enrolled patients (age >= 18 years) with urothelial carcinoma of the renal pelvis, ureter, bladder, or urethra at 16 sites in Finland, Germany, Spain, the UK, and the USA. Patients were not selected by PD-L1 expression, but tumour PD-L1 membrane expression was assessed retrospectively. Patients received nivolumab 3 mg/kg intravenously every 2 weeks until disease progression or treatment discontinuation because of unacceptable toxicity or other protocol-defined reasons, whichever occurred later. The primary endpoint was objective response by investigator assessment. All patients who received at least one dose of the study drug were included in the analyses. We report an interim analysis of this ongoing trial. CheckMate 032 is registered with ClinicalTrials.gov, NCT01928394. Between June 5, 2014, and April 24, 2015, 86 patients with metastatic urothelial carcinoma were enrolled in the nivolumab monotherapy group and 78 received at least one dose of treatment. At data cutoff(March 24, 2016), the minimum follow-up was 9 months (median 15.2 months, IQR 12.9-16.8). A confirmed investigator-assessed objective response was achieved in 19 (24.4%, 95% CI 15.3-35.4) of 78 patients. Grade 3-4 treatment-related adverse events occurred in 17 (22%) of 78 patients; the most common were elevated lipase (four [5%]), elevated amylase (three [4%]), and fatigue, maculopapular rash, dyspnoea, decreased lymphocyte count, and decreased neutrophil count (two [3%] each). Serious adverse events were reported in 36 (46%) of 78 patients and eight (10%) had a serious adverse event judged to be treatment related. Two (3%) of 78 patients discontinued because of treatment-related adverse events (grade 4 pneumonitis and grade 4 thrombocytopenia) and subsequently died. Nivolumab monotherapy was associated with a substantial and durable clinical response and a manageable safety profile in previously treated patients with locally advanced or metastatic urothelial carcinoma."

According to the news editors, the research concluded: "These data support further investigation of nivolumab monotherapy in advanced urothelial carcinoma."

For more information on this research see: Nivolumab monotherapy in recurrent metastatic urothelial carcinoma (CheckMate 032): a multicentre, open-label, two-stage, multi-arm, phase 1/2 trial. *Lancet Oncology*, 2016;17(11):1590-1598. *Lancet Oncology* can be

Myeloid Cells

Research Conducted at University of Tokyo Has Updated Our Knowledge about Myeloid Cells (Conditional Rod Photoreceptor Ablation Reveals Sall1 as a Microglial Marker and Regulator of Microglial Morphology in the Retina)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Myeloid Cells have been published. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Neurodegeneration has been shown to induce microglial activation and the infiltration of monocyte-derived macrophages into the CNS, resulting in the coexistence of these two populations within the same lesion, though their distinct features remain elusive. To investigate the impact of rod photoreceptor degeneration on microglial activation, we generated a toxin-mediated genetic model of rod degeneration."

Our news editors obtained a quote from the research from the University of Tokyo, "Rod injury induced microglial proliferation and migration toward the photoreceptors. Bone marrow transplantation revealed the invasion of monocyte-derived macrophages into the retina, with microglia and the infiltrating macrophages showing distinct distribution patterns in the retina. By comparing the gene expression profiles of the activated microglia and infiltrating macrophages, we identified microglia-specific genes, including Ak1, Ctsf, Sall1, Phlda3, and Spns2. An analysis of Sall1gfp knock-in mice showed GFP expression in the microglia of developing and mature healthy retinas. DTA injury induced the expansion of Sall1gfp 1 microglia, whereas Ly6C(+) monocyte-derived macrophages were mostly Sall1gfp(-), supporting the idea that Sall1 is exclusively expressed in microglia within the retinal phagocyte pool. We evaluated the contribution of microglia to the phagocyte pool in rd1 mutant retinas and found that Sall1gfp 1 microglia constituted the majority of phagocytes. A Sall1 deficiency did not affect microglial colonization of the retina and the cortex, but it did change their morphology from a ramified to a more amoeboid appearance. The morphological defects observed in Sall1-deficient microglia were not rescued by the presence of wild-type non-
microglial cells, suggesting that Sall1 functions cell-autonomously in microglia.”

According to the news editors, the research concluded: "Taken together, our data indicate that Sall1 regulates microglial morphology during development."

The news editors report that additional information may be obtained by contacting S. Watanabe, University of Tokyo, Inst Med Sci, Div Mol & Dev Biol, Tokyo, Japan. Additional authors for this research include A. Tsuhako, C.Y. Lai, Y. Baba, M. Otsu, K. Ueno, M. Nagasaki, Y. Suzuki and S. Watanabe.

**Heart Disorders and Diseases - Ebstein Anomaly**

**Research Conducted at University of Toronto Has Updated Our Knowledge about Ebstein Anomaly (Contemporary Outcomes and Factors Associated With Mortality After a Fetal or Neonatal Diagnosis of Ebstein Anomaly and Tricuspid Valve Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Ebstein Anomaly have been presented. According to news reporting originating in Toronto, Canada, by NewsRx journalists, research stated, "Ebstein anomaly (EA) and tricuspid valve dysplasia (TVD) are rare anomalies and data on outcomes after a fetal or neonatal EA/TVD diagnosis are conflicting. To examine the outcome and identify markers predictive of mortality, we reviewed our single-centre experience from 2000-2014."

The news reporters obtained a quote from the research from the University of Toronto, "Variables were analyzed separately for cases diagnosed in utero without pregnancy termination and for all live-born patients. Of 47 fetal cases, 8 (17%) died in utero and 10 (21%) as neonates. Independent predictors associated with fetal demise included severe tricuspid regurgitation with a Doppler gradient < 40 mm Hg (odds ratio, 1.22 per mm Hg deduction; P = 0.003) and pulmonary regurgitation (odds ratio, 11.4; P = 0.03) at the baseline examination. A novel prognostic score (range, 0-10) combining the severity of 5 echocardiographic findings was independently associated with overall mortality (hazard ratio [HR], 1.39 per point increase; P = 0.01). Survival rates of 66 live births at 1 month, 1 year, and 5 years were 86%, 82%, and 80% respectively, and 75%, 60%, and 55% remained free from surgery at the same points in time. Factors associated with postnatal death in multivariate analysis included a younger gestational age at birth (HR per week, 1.59; P< 0.001), tricuspid annulus diameter (HR per z-score increase, 1.76; P = 0.004), and no pulmonary forward flow (HR, 4.63; P = 0.03). Our experience with fetal and neonatal EA/TVD shows better survival rates than previously reported."
According to the news reporters, the research concluded: "Mortality after a fetal diagnosis was significantly associated with hemodynamic changes indicative of a circular shunt, including pulmonary and tricuspid regurgitation severe enough to cause diastolic umbilical arterial flow reversal."

Our news correspondents report that additional information may be obtained by contacting M. Jaeggi, University of Toronto, Hospital for Sick Children, Dept. of Paediat, Labatt Family Heart Center, Toronto, ON, Canada. Additional authors for this research include C. Manlhiot, M. Jaeggi, M. Seed, A. Dragulescu, S.M. Schwartz, G. van Arsdell and E.T. Jaeggi.

**Heart Disorders and Diseases - Heart Attack**

**Research Conducted at University of Toronto Has Updated Our Knowledge about Heart Attack (Anesthesia Technique and Mortality after Total Hip or Knee Arthroplasty A Retrospective, Propensity Score-matched Cohort Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Attack are presented in a new report. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "This propensity score-matched cohort study evaluates the effect of anesthetic technique on a 30-day mortality after total hip or knee arthroplasty. All patients who had hip or knee arthroplasty between January 1, 2003, and December 31, 2014, were evaluated."

Our news editors obtained a quote from the research from the University of Toronto, "The principal exposure was spinal versus general anesthesia. The primary outcome was 30-day mortality. Secondary outcomes were (1) perioperative myocardial infarction; (2) a composite of major adverse cardiac events that includes cardiac arrest, myocardial infarction, or newly diagnosed arrhythmia; (3) pulmonary embolism; (4) major blood loss; (5) hospital length of stay; and (6) operating room procedure time. A propensity score-matched-pair analysis was performed using a nonparsimonious logistic regression model of regional anesthetic use. We identified 10,868 patients, of whom 8,553 had spinal anesthesia and 2,315 had general
anesthesia. Ninety-two percent (n = 2,135) of the patients who had general anesthesia were matched to similar patients who did not have general anesthesia. In the matched cohort, the 30-day mortality rate was 0.19% (n = 4) in the spinal anesthesia group and 0.8% (n = 17) in the general anesthesia group (risk ratio, 0.42; 95% CI, 0.21 to 0.83; P = 0.0045). Spinal anesthesia was also associated with a shorter hospital length of stay (5.7 vs. 6.6 days; P < 0.001).

According to the news editors, the research concluded: "The results of this observational, propensity score-matched cohort study suggest a strong association between spinal anesthesia and lower 30-day mortality, as well as a shorter hospital length of stay, after elective joint replacement surgery."

For more information on this research see: Anesthesia Technique and Mortality after Total Hip or Knee Arthroplasty A Retrospective, Propensity Score-matched Cohort Study. Anesthesiology. 2016;125(4):724-731. Anesthesiology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Anesthesiology - journals.lww.com/anesthesiology/pages/default.aspx)

The news editors report that additional information may be obtained by contacting A. Perlas, University of Toronto, Univ Hlth Network, Toronto Western Hosp, Dept. of Anesthesia, Toronto, ON M5T 2S8, Canada. Additional authors for this research include V.W.S. Chan and S. Beattie.

Cardiology

Research Conducted at University of Tours Has Updated Our Knowledge about Cardiology (Position paper for management of elderly patients with pacemakers and implantable cardiac defibrillators: Groupe de Rythmologie et Stimulation Cardiaque de la ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting originating from Tours, France, by NewsRx correspondents, research stated, "Despite the increasingly high rate of implantation of pacemakers (PMs) and implantable cardioverter defibrillators (ICDs) in elderly patients, data supporting their clinical and cost-effectiveness in this age stratum are ambiguous and contradictory. We reviewed the data regarding the applicability, safety and effectiveness of conventional pacing, ICDs and cardiac resynchronization therapy (CRT) in elderly patients."

Our news editors obtained a quote from the research from the University of Tours, "Although periprocedural risk may be slightly higher in the elderly, the implantation procedure for PMs and ICDs is still relatively safe in this age group. In older patients with sinus node disease, the general consensus is that DDD pacing with the programming of an algorithm to minimize ventricular pacing is preferred. In very old patients presenting with intermittent or"
suspected atroventricular block, WI pacing may be appropriate. In terms of correcting potentially life-threatening arrhythmias, the effectiveness of ICD therapy is similar in older and younger individuals. However, the assumption of persistent ICD benefit in the elderly population is questionable, as any advantageous effect of the device on arrhythmic death may be attenuated by higher total non-arrhythmic mortality. While septuagenarians and octogenarians have higher annual all-cause mortality rates, ICD therapy may remain effective in selected patients at high risk of arrhythmic death and with minimum comorbidities despite, advanced age. ICD implantation among the elderly, as a group, may not be cost-effective, but the procedure may reach cost-effectiveness in those expected to live more than 5-7 years after implantation. Elderly patients usually experience significant functional improvement after CRT, similar to that observed in middle-aged patients. Management of CRT non-responders remains globally the same, while considering a less aggressive approach in terms of reinterventions (revision of left ventricular [LV] lead placement, addition of a right ventricular or LV lead, LV endocardial pacing configuration)."

According to the news editors, the research concluded: "Overall, physiological age, general status and comorbidities rather than chronological age per se should be the decisive factors in making a decision about device implantation selection for survival and well-being benefit in elderly patients."

Genetics - Medical Genetics

Research Conducted at University of Washington Has Provided New Information about Medical Genetics (CADD score has limited clinical validity for the identification of pathogenic variants in noncoding regions in a hereditary cancer panel)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Genetics - Medical Genetics are discussed in a new
According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "Several in silico tools have been shown to have reasonable research sensitivity and specificity for classifying sequence variants in coding regions. The recently developed combined annotation dependent depletion (CADD) method generates predictive scores for single-nucleotide variants (SNVs) in all areas of the genome, including noncoding regions."

Our news journalists obtained a quote from the research from the University of Washington, "We sought for non-coding variants to determine the clinical validity of common CADD scores. We evaluated 12,391 unique SNVs in 624 patient samples submitted for germline mutation testing in a cancer-related gene panel. Stratifying by genomic region, we compared the distributions of CADD scores of rare SNVs, SNVs common in our patient population, and the null distribution of all possible SNVs. The median CADD scores of intronic and nonsynonymous variants were significantly different between rare and common SNVs (P < 0.0001). Despite these different distributions, no individual variants could be identified as plausibly causative among the rare intronic variants with the highest scores. The receiver-operating characteristics (ROC) area under the curve (AUC) for noncoding variants is modest, and the positive predictive value of CADD for intronic variants in panel testing was found to be 0.088."

According to the news editors, the research concluded: "Focused in silico scoring systems with much higher predictive value will be necessary for clinical genomic applications."

For more information on this research see: CADD score has limited clinical validity for the identification of pathogenic variants in noncoding regions in a hereditary cancer panel. Genetics in Medicine, 2016;18(12):1269-1275. Genetics in Medicine can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. Enzymes and Coenzymes - Cholinesterases

Research Conducted at University of Zagreb Has Updated Our Knowledge about Cholinesterases (A comprehensive evaluation of novel oximes in creation of butyrylcholinesterase-based nerve agent bioscavengers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Enzymes and Coenzymes - Cholinesterases are presented in a new report. According to news reporting originating from Zagreb, Croatia, by NewsRx
correspondents, research stated, "A well-considered treatment of acute nerve agents poisoning involves the exogenous administration of butyrylcholinesterase (BChE, EC 3.1.1.8) as a stoichiometric bioscavenger efficient in preventing cholinergic crises caused by acetylcholinesterase (AChE, EC 3.1.1.7) inhibition. An additional improvement in medical countermeasures would be to use oximes that could reactivate BChE as well to upgrade bioscavenging from stoichiometric to oxime-assisted catalytic."

Funders for this research include Ministry of Science, Education and Sports of the Republic of Croatia, Croatian Science Foundation.

Our news editors obtained a quote from the research from the University of Zagreb, "Therefore, in this paper we investigated the potency of 39 imidazolium and benzimidazolium oximes (36 compounds synthesized for the first time) to be considered as the reactivators specifically designed for reactivation of phosphorylated human BChE. Their efficiency in the reactivation of paraoxon-, VX-, and tabun-inhibited human BChE, as well as human AChE was tested and compared with the efficiencies of HI-6 and obidoxime, used in medical practice today. A comprehensive analysis was performed for the most promising oximes defining kinetic parameters of reactivation as well as interactions with uninhibited BChE. Furthermore, experimental data were compared with computational studies (docking, QSAR analysis) as a starting point in future oxime structure refinement. Considering the strict criteria set for in vivo applications, we determined the cytotoxicity of lead oximes on two cell lines. Among the tested oxime library, one imidazolium compound was selected for preliminary in vivo antidotal study in mice."

According to the news editors, the research concluded: "The obtained protection in VX poisoning outlines its potential in development oxime-assisted OP-bioscavenging with BChE."

The news editors report that additional information may be obtained by contacting I. Primozic, University of Zagreb, Dept. of Chem, Fac Sci, HR-10001 Zagreb, Croatia. Additional authors for this research include N.M. Hrvat, K. Baumann, S.M. Pipercic, S. Makaric, S. Tomic, O. Jovic, T. Hrenar, A. Milicevic, D. Jelic, S. Zunec, I. Primozic and Z. Kovarik.

Drugs and Therapies - Chemotherapy

Research Conducted at Wellesley College Has Provided New Information about Chemotherapy (Bacterial Spheroplasts as a Model for Visualizing Membrane Translocation of Antimicrobial Peptides)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Chemotherapy are presented in a new report. According to news reporting originating in Wellesley, Massachusetts, by NewsRx journalists, research stated, "Studies attempting to characterize the membrane translocation of antimicrobial and cell-penetrating peptides are frequently limited by the resolution of conventional light microscopy."

Financial support for this research came from HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID).

The news reporters obtained a quote from the research from Wellesley College, "This study shows that spheroplasts provide a valuable approach to overcome these limits. Spheroplasts produce less ambiguous images and allow for more systematic analyses of localization."

According to the news reporters, the research concluded: "Data collected with spheroplasts are consistent with studies using normal bacterial cells and imply that a particular peptide may not always follow the same mechanism of action."

For more information on this research see: Bacterial Spheroplasts as a Model for Visualizing Membrane Translocation of Antimicrobial Peptides. Antimicrobial Agents and Chemotherapy, 2016;60(10):6350-6352. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting L.E.O. Darling, Wellesley College, Dept. of Biol Sci, Wellesley, MA 02181, United States. Additional authors for this research include M.A. LaBouyer, L.E.O. Darling and D.E. Elmore.

Intranuclear Space

Research Conducted at Wistar Institute Has Updated Our Knowledge about Intranuclear Space (EBNA2 Drives Formation of New Chromosome Binding Sites and Target Genes for B-Cell Master Regulatory Transcription Factors RBP-jk and EBF1)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Intranuclear Space are presented in a new report. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "Epstein-Barr Virus (EBV) transforms resting B-lymphocytes into proliferating lymphoblasts to establish latent infections that can give rise to malignancies. We show here that EBV-encoded transcriptional regulator EBNA2 drives the cooperative and combinatorial genome-wide binding of two master regulators of B-cell fate, namely EBF1 and RBP-jk."

Our news journalists obtained a quote from the research from Wistar Institute, "Previous studies suggest that these B-cell factors are statically bound to target gene promoters. In contrast, we found that EBNA2 induces the formation of new binding for both RBP-jk and EBF1, many of which are in close physical proximity in the cellular and viral genome. These newly induced binding sites co-occupied by EBNA2-EBF1-RBP-jk correlate strongly with transcriptional activation of linked genes that are important for B-lymphoblast function. Conditional expression or repression of EBNA2 leads to a rapid alteration in RBP-jk and EBF1 binding. Biochemical and shRNA depletion studies provide evidence for cooperative assembly at co-occupied sites."

According to the news editors, the research concluded: "These findings reveal that EBNA2 facilitate combinatorial interactions to induce new patterns of transcription factor occupancy and gene programming necessary to drive B-lymphoblast growth and survival."

Our news journalists report that additional information may be obtained by contacting F. Lu, The Wistar Institute, Philadelphia, Pennsylvania, United States. Additional authors for this research include H.S. Chen, A.V. Kossenkov, K. DeWispeleare, K.J. Won and P.M Lieberman.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1371/journal.ppat.1005339. This DOI is a link to an online electronic document that is either free or for purchase.

Naphthaleneacetic Acids

Research Conducted at Wroclaw University Has Updated Our Knowledge about Naphthaleneacetic Acids (Synthesis and Formulation of Thermosensitive Drug Carrier for Temperature Triggered Delivery of Naproxen Sodium)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Naphthaleneacetic Acids is the subject of a report. According to news reporting originating in Wroclaw, Poland, by NewsRx journalists, research stated, "Nanospheres and microspheres are known as a multipurpose compounds and are used in
various branches of science. Recent controlled delivery systems for drugs are also based on poly-micro and nanospheres."

The news reporters obtained a quote from the research from Wroclaw University, "In our study we describe an investigation of the influence of thermosensitive polymer N-isopropylacrylamide (NIPA) on the release of the drug naproxen sodium (NS) with a hydrogel hydroxypropyl methylcellulose (HPMC) base. The hydrodynamic diameter (DH) of the obtained polymer was measured by using dynamic light scattering (DLS) at a wavelength of 678 nm. Hydrogel formulations of NS were prepared in a specific way ex tempore. NS was sprinkled on the surface of a distilled water, then polymer soluted in water was added. Afterward, HPMC was affixed to the solution. Prepared samples were stored at room temperature for 24 h. Release tests showed that modification of the cross-linker type influenced the properties of synthesized polymeric particles. The NIPA derivatives obtained via surfactant free precipitation polymerization (SFPP) may be formulated as hydrogel preparations using HPMC. The obtained formulations presented varied half-release times, depending on the type of applied NIPA derivatives in hydrogel formulations. At 18 degrees C, the release rates were lower comparing to the reference HPMC hydrogel, whereas at 42 degrees C, the release rates were significantly higher.""

According to the news reporters, the research concluded: "The synthesized thermosensitive polymers enabled temperature-triggered release of NS."

For more information on this research see: Synthesis and Formulation of Thermosensitive Drug Carrier for Temperature Triggered Delivery of Naproxen Sodium. Molecules, 2016;21(11):781-791. Molecules can be contacted at: Mdp Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. (Springer - www.springer.com; Molecules - www.springerlink.com/content/1420-3049/)

Oncology - Esophageal Cancer

Research Conducted at Yokohama City University Has Provided New Information about Esophageal Cancer (Evaluation of the Glasgow Prognostic Score in patients receiving chemoradiotherapy for stage III and IV esophageal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Esophageal Cancer. According to news reporting originating from Kanagawa, Japan, by NewsRx correspondents, research stated, "High Glasgow Prognostic scores (GPSs) have been associated with poor outcomes in various tumors, but the values of GPS and modified GPS (mGPS) in patients with
advanced esophageal cancer receiving chemoradiotherapy (CRT) has not yet been reported. We have evaluated these with respect to predicting responsiveness to CRT and long-term survival.

According to the news editors, the research concluded: "However, a multicenter study as same regime with large number of patients will be needed to confirm these outcomes."

The news editors report that additional information may be obtained by contacting J. Kimura, Yokohama City University, Medical Center, Gastroenterol Center, Dept. of Surg, Yokohama, Kanagawa, Japan. Additional authors for this research include C. Kunisaki, H. Makino, T. Oshima, M. Ota, M. Oba, R. Takagawa, T. Kosaka, H.A. Ono, H. Akiyama and I. Endo.

Drugs and Therapies - Antibiotics

Research Conducted at Zagazig University Has Provided New Information about Antibiotics (Rifaximin and midodrine improve clinical outcome in refractory ascites including renal function, weight loss, and short-term survival)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a new report. According to news reporting originating from Zagazig, Egypt, by NewsRx correspondents, research stated, "Backgrounds and aims The occurrence of refractory ascites in nearly 17% of patients with decompensated cirrhosis is an unresolved issue. Advanced liver disease, functional renal impairment, and vascular insensitivity to vasopressors are the main causes of its refractoriness."

Our news editors obtained a quote from the research from Zagazig University, "Therefore, the aim of this study was to evaluate the impact on diuresis, weight loss, and short-
term survival if midodrine and rifaximin were added to the diuretic therapy (DT).

Materials and methods

The study evaluated the eligibility of 650 patients with cirrhosis and refractory ascites who were selected during the period from November 2011 to May 2015. A total of 50 patients were excluded and finally 600 were selected and divided into the following groups: patients exposed to DT (n=200) as a control group, or DT with midodrine and rifaximin group (n=400). Body weight, mean arterial pressure, and glomerular filtration rate were determined. Plasma renin and aldosterone were also determined. Follow-up was performed after 2, 6, and 12 weeks, and then every 2 months for 24 months. Results

The mean arterial pressure was significantly higher in the midodrine and rifaximin group (P=0.000), and there was a highly significant weight loss after 12 weeks (12.5kg) (P=0.000), a highly significant increase in serum sodium, urine output, and urinary sodium excretion (P=0.000), and creatinine clearance was more reduced in the control group. With rifaximin and midodrine, a complete response occurred in 310 (78%) patients, a partial response in 72 (18%), and no response in 18 (4%) versus 30 (15%), 110 (55%), and 60 (30%) in the control group, respectively (P=0.000).

According to the news editors, the research concluded: "Midodrine and rifaximin significantly reduced paracentesis needs when compared with the controls (18 study patients vs. 75 DT-only patients, P=0.000). Conclusion

Adding rifaximin and midodrine to DT enhanced diuresis in refractory ascites with improved systemic, renal hemodynamics and short-term survival."

For more information on this research see: Rifaximin and midodrine improve clinical outcome in refractory ascites including renal function, weight loss, and short-term survival. European Journal of Gastroenterology & Hepatology, 2016;28(12):1455-1461. Hematologic Diseases and Conditions - Anemia

Research Conducted by C. von Heymann and Co-Researchers Has Updated Our Knowledge about Anemia (Does the severity of preoperative anemia or blood transfusion have a stronger impact on long-term survival after cardiac surgery?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematologic Diseases and Conditions - Anemia have been published. According to news reporting out of Berlin, Germany, by NewsRx editors, research stated, "Preoperative anemia and transfusion are associated with increased morbidity
and mortality in cardiac surgery patients. It is unclear which of these factors plays the leading role in poor outcomes after cardiac surgery."

Our news journalists obtained a quote from the research, "The goal of this study was to analyze the influence of anemias of varying severity and intraoperative transfusion on long-term survival, and to characterize their interaction in cardiac surgery patients. This was an observational cohort study conducted at a German university hospital. All patients undergoing cardiac surgery between 2006 and 2011 were screened for eligibility; duration of follow-up was 3 years. A total of 4494 patients were suitable for analysis; data on long-term survival were available for 3131 of these patients. The main outcome measure was survival at the 3-year follow-up. Length of stay and in-hospital mortality were assessed as secondary outcomes. Multivariate Cox regression analyses indicated that both the severity of preoperative anemia (mild anemia: hazard ratio [HR], 1.441; 95% confidence interval [CI], 1.201-1.728; severe anemia: HR, 1.805; 95% CI, 1.336-2.440) and intraoperative transfusion (HR, 1.340; 95% CI, 1.109-1.620) were associated with decreased long-term survival. Long-term survival was worse in anemic patients who received an intraoperative transfusion compared with those who did not receive an intraoperative transfusion. Both preoperative anemia and transfusion are by themselves and in combination associated with decreased long-term survival."

According to the news editors, the research concluded: "When anemic patients require transfusion, our results provide evidence that the risk of death after cardiac surgery may depend to a considerable extent on the severity of preoperative anemia."

Our news journalists report that additional information may be obtained by contacting C. von Heymann, Vivantes Klinikum Friedrichshain, Dept. of Anesthesiol Intens Care Med Emergency Med & Intens, D-10249 Berlin, Germany. Additional authors for this research include L. Kaufner, M. Sander, C. Spies, K. Schmidt, H. Gombotz, K.D. Wernecke and F. Balzer.

Drugs and Therapies - Drug Resistance

Research Conducted by E. Jagielska and Co-Researchers Has Updated Our Knowledge about Drug Resistance (LytM Fusion with SH3b-Like Domain Expands Its Activity to Physiological Conditions)
New research on Drugs and Therapies - Drug Resistance is the subject of a report. According to news reporting out of Warsaw, Poland, by NewsRx editors, research stated, "Staphylococcus aureus remains one of the most common and at the same time the most dangerous bacteria. The spreading antibiotic resistance calls for intensification of research on staphylococcal physiology and development of new strategies for combating this threatening pathogen."

Our news journalists obtained a quote from the research, "We have engineered new chimeric enzymes comprising the enzymatically active domain (EAD) of autolysin LytM from S. aureus and the cell wall binding domain (CBD) from bacteriocin lysostaphin. They display potent activity in extended environmental conditions. Our results exemplify the possibility of exploring autolytic enzymes in engineering lysins with desired features."

According to the news editors, the research concluded: "Moreover, they suggest a possible mechanism of autolysin physiological activity regulation by local ionic environments in the cell wall."

For more information on this research see: LytM Fusion with SH3b-Like Domain Expands Its Activity to Physiological Conditions. Microbial Drug Resistance, 2016;22(6):461-469. Microbial Drug Resistance can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Research Conducted by G. Choi and Co-Researchers Has Updated Our Knowledge about Nanoparticles (A cost-effective chemiluminescent biosensor capable of early diagnosing cancer using a combination of magnetic beads and platinum nanoparticles)

Nanotechnology - Nanoparticles

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nanotechnology - Nanoparticles. According to news reporting originating from Hagerstown, Maryland, by NewsRx correspondents, research stated, "Using thyroid stimulant hormone (TSH) detection antibody-conjugated horseradish peroxidase (HRP) immobilized on platinum (Pt) nanoparticle, a highly sensitive biosensor designed based on the principle of 1,1'-oxalylidimidazole chemiluminescent enzyme immune assay (ODI CLEIA) was developed for the early diagnosis of thyroid cancer. Trace levels of TSH in human serum was rapidly quantified with the highly sensitive
biosensor.

Our news editors obtained a quote from the research, "The time necessary for the quantification of TSH using the biosensor with ODI CL detection was at least 3 times more rapid than commercially available enzyme immunoassay with colorimetric detection. The linear calibration curve (0.013-12 mU L-1) of biosensor obtained with 3-6% coefficient of variation was wider than that of the commercial product. Also, the limit of detection (LOD=background+3 sigma, 0.005 mU L-1) of biosensor was about 100-fold lower than that of commercial enzyme immunoassay."

According to the news editors, the research concluded: "We expect that the newly developed biosensor, which has excellent accuracy, precision, and reproducibility, can be applied as a new method for the early diagnosis of thyroid cancer."

For more information on this research see: A cost-effective chemiluminescent biosensor capable of early diagnosing cancer using a combination of magnetic beads and platinum nanoparticles. *Talanta*, 2017;162():38-45. *Talanta* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Hearing Diseases and Conditions - Hearing Loss**

**Research Conducted by G. Girotto and Co-Authors Has Provided New Information about Hearing Loss (PSIP1/LEDGF: a new gene likely involved in sensorineural progressive hearing loss)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hearing Diseases and Conditions - Hearing Loss. According to news reporting originating in Trieste, Italy, by NewsRx journalists, research stated, "Hereditary Hearing Loss (HHL) is an extremely heterogeneous disorder. Approximately 30 out of 80 known HHL genes are associated with autosomal dominant forms."

The news reporters obtained a quote from the research, "Here, we identified PSIP1/LEDGF (isoform p75) as a novel strong candidate gene involved in dominant HHL. Using exome sequencing we found a frameshift deletion (c.1554_1555del leading to p.E518Dfs*2) in an Italian pedigree affected by sensorineural mild-to-moderate HHL but also showing a variable eye phenotype (i.e. uveitis, optic neuropathy). This deletion led to a premature stop codon (p.T519X) with truncation of the last 12 amino acids. PSIP1 was recently described as a transcriptional co-activator regulated by miR-135b in vestibular hair cells of the..."
mouse inner ear as well as a possible protector against photoreceptor degeneration. Here, we demonstrate that it is ubiquitously expressed in the mouse inner ear. The PSIP1 mutation is associated with a peculiar audiometric slope toward the high frequencies."

According to the news reporters, the research concluded: "These findings indicate that PSIP1 likely plays an important role in HHL."

For more information on this research see: PSIP1/LEDGF: a new gene likely involved in sensorineural progressive hearing loss. Scientific Reports, 2015;5():18568. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting G. Girotto, University of Trieste-Dept. of Med, Surgical and Health Sciences, Trieste, Italy. Additional authors for this research include D.I. Scheffer, A. Morgan, D. Vozzi, E. Rubinato, M. Di Stazio, E. Muzzi, S. Pensiero, A.B. Giersch, D.P. Corey and P. Gasparini.

**Pheochromocytomas**

**Research Conducted by L.A. Guardo and Co-Authors Has Provided New Information about Pheochromocytomas (Known difficult airway in a patient with pheochromocytoma: a case report)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Pheochromocytomas is now available. According to news reporting from Salamanca, Spain, by NewsRx journalists, research stated, "The manipulation of an airway is always a critical moment in the anesthetic management of patients with pheochromocytoma due to the high incidence of undesirable hemodynamic events in relation with the stimulus represented by the laryngoscopy."

The news correspondents obtained a quote from the research, "A known difficult airway in which it is necessary to carry out an orotracheal intubation while preserving spontaneous ventilation subjects the patient to a stressful situation. The objective is to obtain an acceptable level of comfort and sedation avoiding respiratory depression (Anesthesiol Clin 2015;33:233-40). In this case, we describe the management of a known difficult airway in a patient with a pheochromocytoma and a personal history of arterial hypertension and chronic obstructive pulmonary disease who underwent orotracheal intubation with spontaneous ventilation with Airtraq and with dexmedetomidine as the only sedative agent."

According to the news reporters, the research concluded: "Dexmedetomidine is a useful drug for sedation during orotracheal intubation with spontaneous ventilation in a patient with pheochromocytoma and a chronic respiratory pathology."

For more information on this research see: Known difficult airway in a patient with pheochromocytoma: a case report. Journal of Clinical Anesthesia, 2016;35():411-414. Journal
Blood Pressure

Research Conducted by Q. Wang and Co-Authors Has Provided New Information about Blood Pressure (Environmental ambient temperature and blood pressure in adults: A systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Pressure have been published. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Although many individual studies have examined the association between temperature and blood pressure (BP), they used different methods and also their results were somewhat inconsistent. The aims of this study are to quantitatively summarize previous studies and to systematically assess the methodological issues to make recommendations for future research."

Our news journalists obtained a quote from the research, "We searched relevant empirical studies published before January 2016 concerning temperature and BP among adults using the MEDLINE, Embase and PubMed databases. Mean changes in systolic (SBP) and diastolic blood pressure (DBP) per 1 degrees C reduction in temperature were pooled using a random-effects meta-analysis. Of 23 studies included, 14 were used for meta-analysis. Consistent, statistically significant, inverse associations were observed between ambient temperature (mean, maximum, minimum outdoor temperature and indoor temperature) and BP. An 1 degrees C decrease in mean daily outdoor temperature was associated with an increase in SBP and DBP of 0.26 mm Hg (95% CI: 0.18-0.33) and 0.13 (95% CI: 0.11-0.16), respectively. The increase was greater in people with conditions related to cardiovascular disease. An 1 degrees C decrease in indoor temperature was associated with 0.38 mm Hg (0.18-0.58) increase in SBP, while the effects on DBP were not estimated due to limited studies. Among the previous studies on temperature-BP relationship, temperature and BP measurements are not accurate enough and statistical methods need to be improved. Lower ambient temperatures seem to increase adults' BP and people with conditions related to cardiovascular disease are more susceptible to drops in temperature. Indoor temperature appeared to have a stronger effect on BP than outdoor temperature."

According to the news editors, the research concluded: "To understand temperature-
BP relationship well, a study combining repeated personal temperature exposure and ambulatory BP monitoring, applying improved statistical methods to examine potential non-linear relationship is warranted."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.scitotenv.2016.10.019. This DOI is a link to an online electronic document that is either free or for purchase.

**Research Conducted by R.V. Soares and Co-Researchers Has Updated Our Knowledge about Epilepsy (Ontogeny of ABC and SLC transporters in the microvessels of developing rat brain)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions - Epilepsy have been presented. According to news reporting from Paris, France, by NewsRx journalists, research stated, "The blood-brain barrier (BBB) is responsible for the control of solutes' concentration in the brain. Tight junctions and multiple ATP-binding cassette (ABC) and SoLute Carrier (SLC) efflux transporters protect brain cells from xenobiotics, therefore reducing brain exposure to intentionally administered drugs."

Financial support for this research came from French Agence Nationale de Recherche.

The news correspondents obtained a quote from the research, "In epilepsy, polymorphisms and overexpression of efflux transporters genes could be associated with pharmacoresistance. The ontogeny of these efflux transporters should also be addressed because their expression during development may be related to different brain exposure to antiepileptic drugs in the immature brain. We detected statistically significant higher expression of Abcb1b and Slc16a1 genes, and lower expression of Abcb1a and Abcg2 genes between the post-natal day 14 (P14) and the adult rat microvessels. P-gP efflux activity was also shown to be lower in P14 rats when compared with the adults. The P-gP proteins coded by rodent genes Abcb1a and Abcb1b are known to have different substrate affinities. The role of the Abcg2 gene is less clear in pharmacoresistance in epilepsy, nonetheless the coded protein Bcrp is frequently associated
with drug resistance. Finally, we observed a higher expression of the Mct1 transporter gene in
the P14 rat brain microvessels."

According to the news reporters, the research concluded: "Accordingly to our results,
we suppose that age may be another factor influencing brain exposure to antiepileptics as a
consequence of different expression patterns of efflux transporters between the adult and
immature BBB."

For more information on this research see: Ontogeny of ABC and SLC transporters
in the microvessels of developing rat brain. Fundamental & Clinical Pharmacology, 2016;30
onlinelibrary.wiley.com/journal/10.1111/(ISSN)1472-8206)

Autoimmune Diseases and Conditions - Sjogren's…

Research Conducted by S. Haskett and Co-Researchers Has Updated
Our Knowledge about Sjogren's Syndrome [Identification of Novel CD4
(+) T Cell Subsets in the Target Tissue of Sjogren's Syndrome and Their
Differential Regulation by the ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Autoimmune Diseases and Conditions - Sjogren's
Syndrome are discussed in a new report. According to news originating from Cambridge,
Massachusetts, by NewsRx correspondents, research stated, "Despite being one of the most
common rheumatologic diseases, there is still no disease-modifying drug for primary Sjogren's
syndrome (pSS). Advancing our knowledge of the target tissue has been limited by the low
dimensionality of histology techniques and the small size of human salivary gland biopsies."

Our news journalists obtained a quote from the research, "In this study, we took
advantage of a molecularly validated mouse model of pSS to characterize tissue-infiltrating CD4
(+) T cells and their regulation by the lymphotxin/LIGHT signaling axis. Novel cell subsets
were identified by combining highly dimensional flow and mass cytometry with transcriptomic
analyses. Pharmacologic modulation of the LT beta R signaling pathway was achieved by
treating mice with LTbR-Ig, a therapeutic intervention currently being tested in pSS patients
(Baminercept trial NCT01552681). Using these approaches, we identified two novel CD4(+) T
cell subsets characterized by high levels of PD1: Prdm1(+) effector regulatory T cells expressing
immunoregulatory factors, such as Il10, Areg, Fgl2, and Itgb8, and Il21(+) effector conventional
T cells expressing a pathogenic transcriptional signature. Mirroring these observations in mice,
large numbers of CD4(+)PD1(+) T cells were detected in salivary glands from Sjogren's patients
but not in normal salivary glands or kidney biopsies from lupus nephritis patients."
Unexpectedly, LTB-R-Ig selectively halted the recruitment of PD1(-) naive, but not PD1(+), effector T cells to the target tissue, leaving the cells with pathogenic potential unaffected."

According to the news editors, the research concluded: "Altogether, this study revealed new cellular players in pSS pathogenesis, their transcriptional signatures, and differential dependency on the lymphotixin/LIGHT signaling axis that help to interpret the negative results of the Baminercept trial and will guide future therapeutic interventions."

For more information on this research see: Identification of Novel CD4(+) T Cell Subsets in the Target Tissue of Sjogren's Syndrome and Their Differential Regulation by the Lymphotixin/LIGHT Signaling Axis. *Journal of Immunology*, 2016;197(10):3806-3819. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. (The American Association of Immunologists - www.aai.org; Journal of Immunology - www.jimmunol.org)

The news correspondents report that additional information may be obtained from M. Mingueneau, Biogen, Immunol Res, Cambridge, MA 02142, United States. Additional authors for this research include J. Ding, W. Zhang, A. Thai, P. Cullen, S.Q. Xu, B. Petersen, G. Kuznetsov, L. Jandreski, S. Hamann, T.L. Reynolds, N. Allaire, T.S. Zheng and M. Mingueneau.

**Ebola Virus**

**Research Conducted by S.J. Smither and Co-Authors Has Provided New Information about Ebola Virus (Ebola Virus Makona Shows Reduced Lethality in an Immune-deficient Mouse Model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Ebola Virus. According to news originating from Salisbury, United Kingdom, by NewsRx correspondents, research stated, "Ebola virus Makona (EBOV-Makona; from the 2013-2016 West Africa outbreak) shows decreased virulence in an immune-deficient mouse model, compared with a strain from 1976. Unlike other filoviruses tested, EBOV-Makona may be slightly more virulent by the aerosol route than by the injected route, as 2 mice died following aerosol exposure, compared with no mortality among mice that received intraperitoneal injection of equivalent or higher doses."

Financial support for this research came from United Kingdom Ministry of Defence.

Our news journalists obtained a quote from the research, "Although most mice did not succumb to infection, the detection of an immunoglobulin G antibody response along with observed clinical signs suggest that the mice were infected but able to clear the infection and recover. We hypothesize that this may be due to the growth rates and kinetics of the virus, which appear slower than that for other filoviruses and consequently give more time for an immune
response that results in clearance of the virus."

According to the news editors, the research concluded: "In this instance, the immune-deficient mouse model is unlikely to be appropriate for testing medical countermeasures against this EBOV-Makona stock but may provide insight into pathogenesis and the immune response to virus."

The news correspondents report that additional information may be obtained from M.S. Lever, Dstl, Chem Biol & Radiol Div, Salisbury, Wilts, United Kingdom. Additional authors for this research include L. Eastaugh, S. Ngugi, L. O'Brien, A. Phelps, J. Steward and M.S. Lever.

**Oncology - Breast Cancer**

**Research Conducted by S.S. Tiong and Co-Researchers Has Updated Our Knowledge about Breast Cancer (An e-health strategy to facilitate care of breast cancer survivors: A pilot study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting out of Sydney, Australia, by NewsRx editors, research stated, "Innovative e-health strategies are emerging, to tailor and provide convenient, systematic and high-quality survivorship care for an expanding cancer survivor population. This pilot study tests the application of an e-health platform, 'Healthy.me,' in a breast cancer survivor cohort at Liverpool and Macarthur Cancer Therapy Centres, New South Wales, Australia."

Our news journalists obtained a quote from the research, "Fifty breast cancer patients were recruited to use the Healthy.me website, designed by the Centre of Health Informatics at the University of New South Wales, over a 4-month period. Telephone and online questionnaires were used at 1 and 4 months and a face-to-face feedback at study completion, to gather qualitative and quantitative data regarding feasibility of Healthy.me. Healthy.me was reported to be a useful online resource by most users. Usage declined from 76% at 1 month to 48% at 4 months. Breast cancer survivors enjoyed a variety of tailored information regarding health and life-style issues. Positive aspects of Healthy.me were the convenient access to trusted information, and interaction with their peers and healthcare professionals. Barriers to usage contributing to usage decline were lack of reported patient time to re-access information, limited content updates and technical factors. This pilot study suggested the potential of an e-health strategy to facilitate care of breast cancer survivors."
strategy such as Healthy.me in addressing the needs of a growing breast cancer survivor population."

According to the news editors, the research concluded: "Ongoing development of a more robust e-health resource and integration with primary care models is warranted."

Our news journalists report that additional information may be obtained by contacting S.S. Tiong, Cancer Therapy Centre, Liverpool and Campbelltown Hospitals, Sydney, NSW, Australia. Additional authors for this research include E.S. Koh, G. Delaney, A. Lau, D. Adams, V. Bell, P. Sapkota, T. Harris, A. Girgis, A. Przezdziecki, D. Lonergan and E. Coiera.

Skin Diseases

Research Data from Boston University Update Understanding of Skin Diseases (A Proteome-Derived Longitudinal Pharmacodynamic Biomarker for Diffuse Systemic Sclerosis Skin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Skin Diseases have been published. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "In this study we systematically investigated alterations in the serum proteome of patients with diffuse cutaneous systemic sclerosis and identified differentially expressed proteins that correlated with disease severity. Our goal was to identify a combination of serum proteins that would provide a biological measure for the extent of skin disease and that could be combined into a longitudinal pharmacodynamic biomarker."

The news correspondents obtained a quote from the research from Boston University, "We found that 16% of the sera proteins analyzed by SOMAscan aptamer technology, from two cohorts of patients with diffuse cutaneous systemic sclerosis, were identified as differentially regulated between diffuse cutaneous systemic sclerosis and controls and correlated with modified Rodnan skin score. This dataset showed tumor necrosis factor-alpha, IFN-gamma, transforming growth factor-beta, and IL-13 as potential upstream regulators of the serum protein patterns in the sera of patients with diffuse cutaneous systemic sclerosis. By ELISA, two analytes (ST2 and Spondin-1) best described longitudinal change in modified Rodnan skin score, using linear mixed models. This model was then validated in three independent cohorts. In this study we discovered a large array of proteins not previously
associated with systemic sclerosis that provide insight into pathogenesis and potential targets for therapeutic intervention."

According to the news reporters, the research concluded: "Furthermore, we show that two of these proteins can be combined to form a robust longitudinal biomarker that might be used in clinical trials to assess changes in diffuse cutaneous systemic sclerosis skin disease over time."

Our news journalists report that additional information may be obtained by contacting L.M. Rice, Boston University, Sch Med, Boston, MA, United States. Additional authors for this research include J.C. Mantero, G. Stifano, J. Ziemek, R.W. Simms, J. Gordon, R. Domsic and R. Lafyatis.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jid.2016.08.027. This DOI is a link to an online electronic document that is either free or for purchase.

**Abdominal Aortic Aneurysm**  
**Research Data from CNIC Update Understanding of Abdominal Aortic Aneurysm (Quantitative HDL Proteomics Identifies Peroxiredoxin-6 as a Biomarker of Human Abdominal Aortic Aneurysm)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Abdominal Aortic Aneurysm. According to news reporting out of Madrid, Spain, by NewsRx editors, research stated, "High-density lipoproteins (HDLs) are complex protein and lipid assemblies whose composition is known to change in diverse pathological situations. Analysis of the HDL proteome can thus provide insight into the main mechanisms underlying abdominal aortic aneurysm (AAA) and potentially detect novel systemic biomarkers."

Our news journalists obtained a quote from the research from CNIC, "We performed a multiplexed quantitative proteomics analysis of HDLs isolated from plasma of AAA patients (N = 14) and control study participants (N = 7). Validation was performed by western-blot (HDL), immunohistochemistry (tissue), and ELISA (plasma). HDL from AAA patients showed elevated expression of peroxiredoxin-6 (PRDX6), HLA class I histocompatibility antigen (HLA-I), retinol-binding protein 4, and paraoxonase/arylesterase 1 (PON1), whereas alpha-2 macroglobulin and C4b-binding protein were decreased. The main pathways associated with HDL alterations in AAA were oxidative stress and immune-inflammatory responses. In AAA
tissue, PRDX6 colocalized with neutrophils, vascular smooth muscle cells, and lipid oxidation. Moreover, plasma PRDX6 was higher in AAA (N = 47) than in controls (N = 27), reflecting increased systemic oxidative stress. Finally, a positive correlation was recorded between PRDX6 and AAA diameter."

According to the news editors, the research concluded: "The analysis of the HDL proteome demonstrates that redox imbalance is a major mechanism in AAA, identifying the antioxidant PRDX6 as a novel systemic biomarker of AAA."

For more information on this research see: Quantitative HDL Proteomics Identifies Peroxiredoxin-6 as a Biomarker of Human Abdominal Aortic Aneurysm. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/srep/)

Oncology - Gastric Cancer

Research Data from Cancer Institute Update Understanding of Gastric Cancer (Cytoreductive surgery and hyperthermic intraperitoneal chemotherapy in gastric cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gastric Cancer have been presented. According to news reporting originating from Chennai, India, by NewsRx correspondents, research stated, "Gastric cancer associated peritoneal carcinomatosis (GCPC) has a poor prognosis with a median survival of less than one year. Systemic chemotherapy including targeted agents has not been found to significantly increase the survival in GCPC."

Our news editors obtained a quote from the research from Cancer Institute, "Since recurrent gastric cancer remains confined to the abdominal cavity in many patients, regional therapies like aggressive cytoreductive surgery (CRS) and hyperthermic intraperitoneal chemotherapy (HIPEC) have been investigated for GCPC. HIPEC has been used for three indications in GC-as an adjuvant therapy after a curative surgery, HIPEC has been shown to improve survival and reduce peritoneal recurrences in many randomised trials in Asian countries; as a definitive treatment in established PC, HIPEC along with CRS is the only therapeutic modality that has resulted in long-term survival in select groups of patients; as a palliative treatment in advanced PC with intractable ascites, HIPEC has been shown to control ascites and reduce the need for frequent paracentesis."

According to the news editors, the research concluded: "While the results of randomised trials of adjuvant HIPEC from western centres are awaited, the role of HIPEC in the
The treatment of GCPC is still evolving and needs larger studies before it is accepted as a standard of care."

The news editors report that additional information may be obtained by contacting R.A. Seshadri, Ramakrishnan Ayloor Seshadri, Dept. of Surgical Oncology, Cancer Institute (WIA), Chennai 600036, India.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i3.1114. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Lung Cancer**

**Research Data from China Medical University and Hospital Update Understanding of Lung Cancer (Antitumor effects of deguelin on H460 human lung cancer cells in vitro and in vivo: Roles of apoptotic cell death and H460 tumor xenografts model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Lung Cancer is the subject of a report. According to news reporting originating in Taichung, Taiwan, by NewsRx journalists, research stated, "Deguelin, a naturally occurring rotenoid of the flavonoid family, is known to be an Akt inhibitor, to have chemopreventive activities and anti-tumor effect on several cancers. In this study, investigation to elucidate the effect of deguelin on apoptotic pathways in human lung cancer cells and on the anti-tumor effect in lung cancer xenograft nu/nu mice was performed."

Financial support for this research came from Research grant from China Medical University.

The news reporters obtained a quote from the research from China Medical University and Hospital, "In vitro studies, found that deguelin induced cell morphological changes, and decreased the percentage of viability through the induction of apoptosis in H460 lung cancer cells. Deguelin triggered apoptosis in H460 cells was also confirmed by DAPI staining, DNA gel electrophoresis, and Annexin V-FITC staining and these effects are dose-dependent manners. It was also found that deguelin promoted the Ca production and activation of caspase-3 but decreased the level of DPS in H460 cells. Western blots indicated that the protein levels of cytochrome c, AIF, and pro-apoptotic Bax and Bak protein were increased, but the anti-apoptotic Bcl-2 and Bcl-x were decreased that may have led to apoptosis in H460 cells after exposure to deguelin. It was also confirmed by confocal laser microscope examination that deguelin promoted the release of AIF from mitochondria to cytosol. In vivo studies, found that in immunodeficient nu/nu mice bearing H460 tumor xenografts showed that the deguelin significantly suppressed tumor growth. Deguelin might be a potential therapeutic agent for the treatment of lung cancer in the future."
According to the news reporters, the research concluded: "This finding might fully support a critical event for deguelin via induction of apoptotic cell death and H460 tumor xenografts model against human lung cancer. 2015 Wiley Periodicals, Inc. Environ Toxicol 32:84-98."

Our news correspondents report that additional information may be obtained by contacting Y.C. Hsu, Dept. of Biological Science and Technology, China Medical University, Taichung, 404, Taiwan. **Oncology - Breast Cancer**

**Research Data from China Pharmaceutical University Update**

**Understanding of Breast Cancer (Wogonoside Inhibits Angiogenesis in Breast Cancer Via Suppressing Wnt/beta-Catenin Pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Wogonoside, a main flavonoid component derived from the root of *Scutellaria baicalensis* Georgi, has been reported to have anti-angiogenesis and anti-leukemia activities. However, whether it can inhibit tumor angiogenesis is unclear."

Our news editors obtained a quote from the research from China Pharmaceutical University. "In this study, we investigate the inhibitory effect of wogonoside on angiogenesis in breast cancer and its underlying mechanisms. ELISA assay shows that wogonoside (25, 50, and 100 µM) decreases the secretion of VEGF in MCF-7 cells by 30.0%, 35.4%, and 40.1%, respectively. We find it inhibits angiogenesis induced by the conditioned media from MCF-7 cells in vitro and in vivo by migration, tube formation, rat aortic ring, and chicken chorioallantoic membrane (CAM) assay. Meanwhile, wogonoside can inhibit the growth and angiogenesis of MCF-7 cells xenografts in nude mice. The reduction of tumor weight can be found both in wogonoside (80 mg/kg) and bevacizumab (20 mg/kg) treated group, and the tumor inhibition rate is 42.1% and 48.7%, respectively. In addition, mechanistic studies demonstrate that wogonoside suppresses the activation of Wnt/beta-catenin pathway in MCF-7 cells. Wogonoside (100mM) decreases the intracellular level of Wnt3a, increases the expression of GSK-3 beta, AXIN, and promotes the phosphorylation of beta-catenin for proteasome
degradation significantly. Furthermore, the nuclear accumulation of beta-catenin and the DNA-binding activity of beta-catenin/TCF/Lef complex are inhibited by 49.2% and 28.7%, respectively, when treated with 100mM wogonoside.

According to the news editors, the research concluded: "Taken together, our findings demonstrate that wogonoside is a potential inhibitor of tumor angiogenesis and can be developed as a therapeutic agent for breast cancer."

The news editors report that additional information may be obtained by contacting Q.L. Guo, China Pharmaceutical University, State Key Lab Nat Med, Jiangsu Key Lab Carcinogenesis & Intervent, Nanjing, Jiangsu, People's Republic of China. Additional authors for this research include K. Zhao, Y. Hu, Y.X. Zhou, X.W. Luo, X.R. Li, L.B. Wei, Z.Y. Li, Q.D. You, Q.L. Guo and N. Lu.

Liver Diseases and Conditions - Portal Hypertension

Research Data from Chongqing Medical University Update Understanding of Portal Hypertension (Balloon-occluded retrograde transvenous obliteration versus transjugular intrahepatic portosystemic shunt for treatment of gastric varices due to ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Liver Diseases and Conditions - Portal Hypertension. According to news originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "The aim of this study was to compare the feasibility and safety of both balloon-occluded retrograde transvenous obliteration (BRTO) versus transjugular intrahepatic portosystemic shunt (TIPS) for treatment of gastric varices due to portal hypertension through the method of meta-analysis. PubMed, Embase, and Cochrane Library were searched for both randomized controlled trials and cohort studies concerning BRTO compared with TIPS in the treatment of gastric varices from their inception to April 26, 2015."

Our news journalists obtained a quote from the research from Chongqing Medical University, "The Cochrane network RevMan 5.3 software was used for statistic analysis. The primary markers that need to be evaluated contained technical success rate, hemostasis rate, incidence rate of postoperative rebleeding, incidence rate of hepatic encephalopathy, and postoperative procedure-related complication. Study-specific odds ratios (ORs) were combined to calculate pooled value by using random effects model. Five original studies were included in total. Meta-analysis showed that BRTO and TIPS had no difference in aspects of technical success rate (OR, 0.19; 95% confidence interval [CI], 0.03-1.08; p=0.06), hemostasis rate (OR,
3.41; 95% CI, 0.33-35.40; p=0.30), and incidence rate of postoperative procedure-related complication (OR, 1.98; 95% CI, 0.44-8.84; p=0.37). However, BRTO had a lower incidence rate of post-operative rebleeding (OR, 0.27; 95% CI, 0.09-0.81; p=0.02) and a lower incidence rate of postoperative encephalopathy (OR, 0.05; 95% CI, 0.02-0.13; p<0.00001). Balloon-occluded retrograde transvenous obliteration was a technically feasible as well as a secure method for the treatment of gastric varices originated from portal hypertension.

According to the news editors, the research concluded: "It may have the potential to be an alternative shunt approach of TIPS, when suitable patients selected."

Cardiovascular Diseases and Conditions - No-Reflow…

Research Data from Department of Cardiology Update Understanding of No-Reflow Phenomenon (A simple and rapid method for identification of lesions at high risk for the no-reflow phenomenon immediately before elective coronary stent implantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - No-Reflow Phenomenon are discussed in a new report. According to news reporting out of Miyagi, Japan, by NewsRx editors, research stated, "We aimed to design a rapid and reliable method to identify coronary lesions at high risk for the no-reflow phenomenon before elective coronary stent implantation using integrated backscatter intravascular ultrasound (IB-IVUS). The no-reflow phenomenon occurring during elective percutaneous coronary intervention (PCI) worsens patient prognosis, regardless of whether the phenomenon is transient or persistent."

Our news journalists obtained a quote from the research from the Department of Cardiology, "We retrospectively studied 353 coronary lesions to identify factors potentially promoting the no-reflow phenomenon, including lesion location and severity. We also performed component analysis by two- and three-dimensional IB-IVUS before elective stent implantation. The cutoff values of the true lipid volume and estimated lipid volume (lipid area at the minimal lumen diameter site x total stent length) for the no-reflow phenomenon were determined by receiver operating curve analysis. Type C lesions, regardless of location and a thrombolysis in myocardial flow grade of 0, were risk factors for the no-reflow phenomenon during PCI. The estimated lipid volume was significantly correlated with the true lipid volume (R² = 0.778, p < 0.0001). The cutoff value of the estimated lipid volume for the no-reflow phenomenon was 132.6 mm³ (area under the curve = 0.719), and the predictive value was equivalent to that of the true lipid volume. Lesions with an estimated lipid volume of < 132.6 mm³ had a significantly higher risk of the no-reflow phenomenon during elective stent implantation (odds ratio, 4.35; 95 % confidence interval, 1.67-12.7; p = 0.0024)."
According to the news editors, the research concluded: "The simple and rapid measurement of the estimated lipid volume immediately before stenting during PCI constitutes a reliable predictor of lesions at high risk for the no-reflow phenomenon."

For more information on this research see: A simple and rapid method for identification of lesions at high risk for the no-reflow phenomenon immediately before elective coronary stent implantation. *Heart and Vessels*, 2016;31(12):1904-1914. *Heart and Vessels* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Drugs and Therapies - Paracetamol Therapy**

**Research Data from Department of Emergency Medicine Update Understanding of Paracetamol Therapy (Evidence for the changing regimens of acetylcysteine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Paracetamol Therapy are presented in a new report. According to news reporting originating from Randwick, Australia, by NewsRx correspondents, research stated, "Paracetamol overdose prior to the introduction of acetylcysteine was associated with significant morbidity. Acetylcysteine is now the mainstay of treatment for paracetamol poisoning and has effectively reduced rates of hepatotoxicity and death."

Our news editors obtained a quote from the research from the Department of Emergency Medicine, "The current three-bag intravenous regimen with an initial high loading dose was empirically derived four decades ago and has not changed since. This regimen is associated with a high rate of adverse effects due mainly to the high initial peak acetylcysteine concentration. Furthermore, there are concerns that the acetylcysteine concentration is not adequate for 'massive' overdoses and that the dose and duration may need to be altered. Various novel regimens have been proposed, looking to address these issues. Many of these modified regimens aim to decrease the rate of adverse reactions by slowing the loading dose and thereby decrease the peak concentration. We used a published population pharmacokinetic model of acetylcysteine to simulate these modified regimens. We determined mean peak and 20?h acetylcysteine concentrations and area under the under the plasma concentration-time curve to compare these regimens. Those regimens that resulted in a lower peak acetylcysteine
concentration have been shown in studies to have a lower rate of adverse events. However, these studies were too small to show whether they are as effective as the traditional regimen. Further research is still needed to determine the optimum dose and duration of acetylcysteine that results in the fewest side-effects and treatment failures."

According to the news editors, the research concluded: "Indeed, a more patient-tailored approach might be required, whereby the dose and duration are altered depending on the paracetamol dose ingested or paracetamol concentrations."

The news editors report that additional information may be obtained by contacting A.L. Chiew, Clinical and Experimental Toxicology Unit, Dept. of Emergency Medicine, Prince of Wales Hospital, Randwick, NSW, Australia. Additional authors for this research include G.K. Isbister, S.B. Duffull and N.A Buckley.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bcp.12789. This DOI is a link to an online electronic document that is either free or for purchase.

**Bacterial Infections and Mycoses - Bacteremia**

**Research Data from Division of Infectious Diseases Update**

**Understanding of Bacteremia (Risk factors for persistent bacteremia in infants with catheter-related bloodstream infection due to coagulase-negative Staphylococcus in the neonatal ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Bacterial Infections and Mycoses - Bacteremia are presented in a new report. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Coagulase-negative Staphylococcus (CoNS) is the predominant cause of catheter-related bloodstream infections (CRBSI). Infants in neonatal intensive care units (NICU) often suffer from CoNS CRBSI, which are often refractory to treatment."

Our news journalists obtained a quote from the research from the Division of Infectious Diseases, "We sought to evaluate risk factors for developing persistent bacteremia due to CoNS CRBSI in infants, in order to identify those who require early aggressive management. We conducted a retrospective case-control study of infants in the NICU who developed CRBSI due to CoNS. Patient demographics, condition and management of CRBSI were compared between those with persistent and non-persistent bacteremia. Furthermore, prognosis of infants in the NICU after CoNS CRBSI was evaluated. Seventy six episodes of CRBSI, including 17 persistent bacteremia and 59 non-persistent bacteremia, were analyzed. In univariate analyses, persistent bacteremia was significantly associated with corrected age equivalent to gestational age of 22-28 weeks at onset of CRBSI [Odds ratio (OR) = 4.33; P =
According to the news editors, the research concluded: "Early CVC removal should be considered for the treatment of CRBSI due to CoNS in infants with platelet counts of less than 100,000/mu L."

For more information on this research see: Risk factors for persistent bacteremia in infants with catheter-related bloodstream infection due to coagulase-negative Staphylococcus in the neonatal intensive care unit. Journal of Infection and Chemotherapy, 2016;22(12):785-789. The news correspondents report that additional information may be obtained from M. Furuichi, Natl Center Child Hlth & Dev, Dept. of Med Subspecialties, Div Infect Dis, Setagaya Ku, Tokyo 1578535, Japan.

Cardiovascular Diseases and Conditions - Venous...

Research Data from Faculty of Health Sciences Update Understanding of Venous Thromboembolism (The Role of Platelets in Venous Thromboembolism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Venous Thromboembolism have been presented. According to news originating from Murcia, Spain, by NewsRx correspondents, research stated, "Multiple factors contribute to the risk of venous thromboembolism (VTE). Platelets have attracted much interest in arterial cardiovascular disease, whereas their role in VTE has received much less attention."

Our news journalists obtained a quote from the research from the Faculty of Health Sciences, "Recent evidence suggests that platelets may play a more important role in VTE than previously anticipated. This review discusses the mechanisms that link platelets with venous thrombotic disease and their potential applications as novel risk factors for VTE. In addition, animal studies and randomized clinical trials that highlight the potential effect of antiplatelet therapy in venous thrombosis are evaluated to assess the role of platelets in VTE. The clinical
significance of platelets for VTE risk assessment in specific patient cohorts and their role as a suitable therapeutic target for VTE prevention is acknowledged."

According to the news editors, the research concluded: "The role of platelets in VTE is a promising field for future research."

For more information on this research see: The Role of Platelets in Venous Thromboembolism. *Seminars In Thrombosis and Hemostasis*, 2016;42(3):242-51. (Thieme - www.thieme.com)

The news correspondents report that additional information may be obtained from S. Montoro-Garcia, Dept. of Cardiovascular Risk, Faculty of Health Sciences, UCAM Universidad Catolica San Antonio de Murcia, Campus de los Jeronimos, Guadalupe, Murcia, Spain. **Research Data from George Washington University Update**

**Understanding of Alpha Thalassemia (Homozygous alpha-thalassemia: Challenges surrounding early identification, treatment, and cure)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematologic Diseases and Conditions - Alpha Thalassemia are discussed in a new report. According to news reporting out of Washington, District of Columbia, by NewsRx editors, research stated, "The prognosis for homozygous -thalassemia is changing. Prenatal diagnosis and intrauterine transfusions (IUT) reduce maternofetal morbidity and mortality; hematopoietic stem cell transplant (HSCT) is curative."

Our news journalists obtained a quote from the research from George Washington University, "Empiric evidence to support IUT and HSCT to treat homozygous -thalassemia is lacking. The first case of curative HSCT for homozygous -thalassemia was reported in 1997. Nearly 20 years later, five additional reports are published. We review the literature and report an institutional experience with three homozygous -thalassemia patients. The first died shortly after birth. The second underwent HSCT after years of chronic transfusion therapy. The third benefited from IUT and HSCT."

According to the news editors, the research concluded: "These cases exemplify the varied outcomes associated with this condition."

Clinical Research - Clinical Trials and Studies

Research Data from Harvard School of Medicine Update Understanding of Clinical Trials and Studies (Carbon Dioxide-Based versus Saline Tissue Expansion for Breast Reconstruction: Results of the XPAND Prospective, Randomized Clinical Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "AeroForm is a new type of remote-controlled, needle-free, carbon dioxide-based expander involving a potentially faster method of tissue expansion. Results are presented here from the AirXpanders Patient Activated Controlled Tissue Expander pivotal trial comparing AeroForm to saline tissue expanders."

Our news editors obtained a quote from the research from the Harvard School of Medicine, "Women undergoing two-stage breast reconstruction were randomized at 17 U.S. sites in this U.S. Food and Drug Administration-approved investigational device exemption trial. Expansion in the investigational arm was performed by the patient in 10-cc increments up to 30 cc/day of carbon dioxide and in the control arm by the physician with periodic bolus injections of saline. Safety endpoints, expansion and reconstruction times, pain, and satisfaction were assessed. One hundred fifty women were treated: 98 with carbon dioxide expanders (n = 168) and 52 with saline expanders (n = 88). The treatment success rate (all breasts exchanged successfully excluding non-device-related failures) was 96.1 percent for carbon dioxide and 98.8 percent for saline. Median time to full expansion and completion of the second-stage operation was 21.0 and 108.5 days (carbon dioxide) versus 46.0 and 136.5 days (saline), respectively, with a similar rate of overall complications. Ease of use for the carbon dioxide expander was rated high by patients (98 percent) and physicians (90 percent)."

According to the news editors, the research concluded: "The AirXpanders Patient Activated Controlled Tissue Expander trial results demonstrate that a carbon dioxide-based expander is an effective method of tissue expansion with a similar overall adverse event rate compared to saline expanders, and provides a more convenient and expedient expansion."

For more information on this research see: Carbon Dioxide-Based versus Saline Tissue Expansion for Breast Reconstruction: Results of the XPAND Prospective, Randomized Clinical Trial. Plastic and Reconstructive Surgery, 2016;138(6):1161-1170. Plastic and Reconstructive Surgery can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins -
Potassium Compounds

Research Data from Harvard-MIT Division of Health Sciences and Technology Update Understanding of Potassium Compounds (Broad-Spectrum Antimicrobial Effects of Photocatalysis Using Titanium Dioxide Nanoparticles Are Strongly Potentiated by ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Potassium Compounds. According to news reporting out of Cambridge, Massachusetts, by NewsRx editors, research stated, "Photocatalysis describes the excitation of titanium dioxide nanoparticles (a wide-band gap semiconductor) by UVA light to produce reactive oxygen species (ROS) that can destroy many organic molecules. This photocatalysis process is used for environmental remediation, while antimicrobial photocatalysis can kill many classes of microorganisms and can be used to sterilize water and surfaces and possibly to treat infections."

Financial supporters for this research include HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID), National Science Foundation (NSF).

Our news journalists obtained a quote from the research from the Harvard-MIT Division of Health Sciences and Technology, "Here we show that addition of the nontoxic inorganic salt potassium iodide to TiO2 (P25) excited by UVA potentiated the killing of Gram-positive bacteria, Gram-negative bacteria, and fungi by up to 6 logs. The microbial killing depended on the concentration of TiO2, the fluence of UVA light, and the concentration of KI (the best effect was at 100 mM). There was formation of long-lived antimicrobial species (probably hypiodite and iodine) in the reaction mixture (detected by adding bacteria after light), but short-lived antibacterial reactive species (bacteria present during light) produced more killing. Fluorescent probes for ROS (hydroxyl radical and singlet oxygen) were quenched by iodide. Tri-iodide (which has a peak at 350 nm and a blue product with starch) was produced by TiO2-UVA-KI but was much reduced when methicillin-resistant Staphylococcus aureus (MRSA) cells were also present. The model tyrosine substrate N-acetyl tyrosine ethyl ester was iodinated in a light dose-dependent manner."

According to the news editors, the research concluded: "UVA-excited TiO2 in the presence of iodide produces reactive iodine intermediates during illumination that kill microbial cells and long-lived oxidized iodine products that kill after light has ended."

For more information on this research see: Broad-Spectrum Antimicrobial Effects of Photocatalysis Using Titanium Dioxide Nanoparticles Are Strongly Potentiated by Addition of

Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news journalists report that additional information may be obtained by contacting M.R. Hamblin, Harvard MIT Div Hlth Sci & Technol, Cambridge, MA 02139, United States. Additional authors for this research include H.J. Choi, Y. Kushida, B. Bhayana, Y.G. Wang and M.R. Hamblin.

Drugs and Therapies - Cancer Therapy

Research Data from Inje University Update Understanding of Cancer Therapy (An alpha-quaternary chiral lactam derivative, YH-304 as a novel broad-spectrum anticancer agent)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Cancer Therapy are presented in a new report. According to news reporting originating from Gyeongnam, South Korea, by NewsRx correspondents, research stated, "Previously, we reported that alpha-quaternary chiral lactam derivatives have broad spectrum anticancer activity. However, the underlying molecular mechanisms and its relevance are largely unknown."

Our news editors obtained a quote from the research from Inje University, "In the present study, we report progress on alpha-quaternary chiral lactam analogues that address this, focusing on the novel analogue YH-304 as a candidate to broadly target human cancer cells. The effect of YH-304 on cell transformation was assessed by clonogenic assay in non-small cell lung cancer cells (NSCLCs) A549 and 226B. Proapoptotic activity of YH-304 was determined by TUNEL assay and cleaved PARP, cleaved caspase-9, and Bax as markers for apoptosis. The p53-dependency and therapeutic spectrum of YH-304 was assessed by western blot analysis, real-time PCR, and cell viability assays in cells expressing endogenous wild or mutant p53. The effect of YH-304 on angiogenesis in vivo was examined by bFGF-mediated angiogenesis assay in zebrafish. Finally, the effect of YH-304 on AKT and ERK activation (phosphorylation) as a putative mechanism underlying the effect of YH-304 on bFGF-mediated angiogenesis was assessed using western blotting. We found that YH-304 significantly decreases the colony-forming activities of both A549 and 226B cells, inducing cellular apoptosis. Unlike nutlin-3 (p53 pathway activator), YH-304 did not affect the expression levels of p53 and its target gene such as p21 and thus showed p53-independent anticancer activity with broad spectrum. In addition, YH-304 inhibited bFGF-induced angiogenesis in vivo through mediating AKT and ERK signaling pathway, which plays an important role in bFGF activation and angiogenesis."
According to the news editors, the research concluded: "Taken together, our data indicate that YH-304 may represent a novel therapeutic option for the treatment of cancer in a p53-independent manner."

The news editors report that additional information may be obtained by contacting Y. Park, Inje Univ, U Healthcare & Antiaging Research Center uHARC, Gimhae 621749, Gyeongnam, South Korea. Additional authors for this research include H.G. Park, Y. Park and H.J. Lee.

Keywords for this news article include: Gyeongnam, South Korea, Asia, Drugs and Therapies, Cancer Therapy, Angiogenesis, Oncology, Genetics, p53 Gene, Inje University.

**Research Data from Johns Hopkins University Update Understanding of Hypertension [Effects of the Dietary Approaches to Stop Hypertension (DASH) Diet and Sodium Intake on Serum Uric Acid]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "Randomized trial data guiding dietary recommendations to lower serum uric acid (UA), the etiologic precursor of gout, are scarce. We undertook this study to examine the effects of the Dietary Approaches to Stop Hypertension (DASH) diet (a well-established diet that lowers blood pressure) and levels of sodium intake on serum UA."

The news reporters obtained a quote from the research from Johns Hopkins University, "We conducted an ancillary study of a randomized, crossover feeding trial in 103 adults with prehypertension or stage I hypertension. Participants were randomly assigned to receive either the DASH diet or a control diet (typical of the average American diet) and were further fed low, medium, and high levels of sodium for 30 days, each in random order. Body weight was kept constant. Serum UA levels were measured at baseline and following each feeding period. Trial participants were 55% women and 75% black with a mean +/- SD age of 51.5 +/- 9.7 years and a mean +/- SD serum UA level of 5.0 +/- 1.3 mg/dl. The DASH diet reduced serum UA (-0.35 mg/dl [95% confidence interval (95% CI) -0.65, -0.05], P = 0.02), with a higher effect (-1.29 mg/dl [95% CI -2.50, -0.08]) among participants (n = 8) with a baseline serum UA level of >= 7 mg/dl. Increasing sodium intake from the low level decreased serum UA during the medium sodium intake period (-0.3 mg/dl [95% CI -0.5, -0.2], P< 0.001) and during the high sodium intake period (-0.4 mg/dl [ 95% CI -0.6, -0.3], P< 0.001). The DASH diet lowered serum UA, and this effect was greater among participants with hyperuricemia."

According to the news reporters, the research concluded: "Moreover, we found that higher sodium intake decreased serum UA, which enhances our knowledge of urate pathophysiology and risk factors for hyperuricemia."
For more information on this research see: Effects of the Dietary Approaches to Stop Hypertension (DASH) Diet and Sodium Intake on Serum Uric Acid. *Arthritis & Rheumatology*, 2016;68(12):3002-3009. *Arthritis & Rheumatology* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news correspondents report that additional information may be obtained by contacting S.P. Juraschek, Johns Hopkins University, Baltimore, MD, United States. Additional authors for this research include A.C. Gelber, H.K. Choi, L.J. Appel and E.R. Miller.

**Heart Disorders and Diseases - Heart Failure**

**Research Data from Maastricht University Update Understanding of Heart Failure (Metabolic support for the heart: complementary therapy for heart failure?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Failure are presented in a new report. According to news originating from Maastricht, Netherlands, by NewsRx correspondents, research stated, "The failing heart has an increased metabolic demand and at the same time suffers from impaired energy efficiency, which is a detrimental combination. Therefore, therapies targeting the energy-deprived failing heart and rewiring cardiac metabolism are of great potential, but are lacking in daily clinical practice."

Our news journalists obtained a quote from the research from Maastricht University, "Metabolic impairment in heart failure patients has been well characterized for patients with reduced ejection fraction, and is coming of age in patients with 'preserved' ejection fraction. Targeting cardiomyocyte metabolism in heart failure could complement current heart failure treatments that do improve cardiovascular haemodynamics, but not the energetic status of the heart."

According to the news editors, the research concluded: "In this review, we discuss the hallmarks of normal cardiac metabolism, typical metabolic disturbances in heart failure, and past and present therapeutic targets that impact on cardiac metabolism."

The news correspondents report that additional information may be obtained from S. Heymans, Maastricht University, Cardiovasc Res Inst Maastricht, NL-6200 MD Maastricht, Netherlands. Additional authors for this research include A.P. Papageorgiou, S. Heymans and M. van Bilsen.

Research Data from Mahidol University Update Understanding of Pharmacology (Morus alba L. Stem Extract Attenuates Pain and Articular Cartilage Damage in the Anterior Cruciate Ligament Transection-Induced Rat Model of Osteoarthritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Pharmacology is now available. According to news reporting originating in Bangkok, Thailand, by NewsRx journalists, research stated, "This study was designed to investigate the anti-nociceptive effect of Morus alba stem extract as well as its cartilage protective effect in the anterior cruciate ligament transection (ACLT)-induced rat model of osteoarthritis (OA). The anti-nociceptive effect of this plant extract was determined by measuring hind limb weight bearing, while the severity of cartilage damage to the knee joints was evaluated using the modified Mankin grading system."

The news reporters obtained a quote from the research from Mahidol University, "Oral administration of M. alba stem extract (56 and 560 mg/kg) significantly attenuated joint pain as indicated by a significant (p < 0.05) increase in the values of percent weight borne on the operated hind limb for the OA-induced groups that received M. alba stem extract at 56 and 560 mg/kg when compared to those of the vehicle-treated OA-induced group. In addition, a significant improvement in the Mankin score was also observed in rats treated with 560 mg/kg M. alba stem extract, which was in agreement with its pain-relieving effect."

According to the news reporters, the research concluded: "The results showed that M. alba stem extract exhibited an anti-nociceptive effect as well as cartilage protection in the ACLT-induced rat model of OA, supporting its potential use as a therapeutic treatment for OA."

Our news correspondents report that additional information may be obtained by contacting W. Hemstapat, Mahidol University, Dept. of Pharmacol, Fac Sci, Bangkok 10400, Thailand. Additional authors for this research include S. Lekmeechai, P.P. Pham, W. Himakoun, T. Pitaksuteepong, N.P. Morales and W. Hemstapat.

Research Data from Manipal University Update Understanding of Type 1 Diabetes Mellitus (Small molecules exert anti-apoptotic effect and reduce oxidative stress augmenting insulin secretion in stem cells engineered islets against hypoxia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus have been published. According to news reporting originating in Bangalore, India, by NewsRx journalists, research stated, "Transplantation of pancreatic islets is the most reliable treatment for Type 1 diabetes. However cell death mediated by hypoxia is considered as one of the main difficulties hindering success in islet transplantation."

Financial support for this research came from Manipal University.

The news reporters obtained a quote from the research from Manipal University, "The aim of our experiment was to investigate the role of small molecules in survival of Islet like cell aggregates (ICAs) engineered from umbilical cord matrix under oxygen deprived condition (< 5% O2). ICAs were analyzed for cell death via fluorescein diacetate/propidium iodide (FDA/PI) staining, estimation of Caspase 3 and free radical release in presence and absence of small molecules. The samples were also analyzed for the presence of hypoxia inducible factor 1alpha (HIF1 alpha) at both transcriptional and translational level. The addition of small molecules showed profound defensive effect on ICAs under hypoxic environment as evidenced by their viability and insulin secretion compared to untreated ICAs. The combinations of Eicosapentaenoic acid (EPA), Docosahexaenoic acid(DHA) and metformin and EPA, DHAand gamma amino butyric acid (GABA) acted as anti-apoptotic agents for human ICAs when exposed to 1% O2 for 48 h. The combinations of the small molecules reduced the total reactive oxygen species and malonaldehyde (MDA) levels and enhanced the production of glutathione peroxidise (GPx) enzyme under hypoxic conditions. Finally the increase in HIF1 alpha at both protein and gene level confirmed the defensive effect of the additives in hypoxia."

According to the news reporters, the research concluded: "These results suggest that the combination of small molecules maintained the viability and functionality of the ICAs in hypoxia by up-regulating HIF1 alpha expression and down regulating the Caspase 3 activity."

For more information on this research see: Small molecules exert anti-apoptotic effect and reduce oxidative stress augmenting insulin secretion in stem cells engineered islets against hypoxia. Transfusion Medicine - Blood Transfusion

Research Data from McGill University Update Understanding of Blood Transfusion (Role of the deubiquitinating enzyme ubiquitin-specific protease-14 in proteostasis in renal cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transfusion Medicine - Blood Transfusion. According to news reporting originating in Montreal, Canada, by NewsRx journalists, research stated, "Kidney cell injury may be associated with protein misfolding and induction of endoplasmic reticulum (ER) stress. Examples include complement-induced glomerular epithelial cell (GEC)/podocyte injury in membranous nephropathy and ischemia-reperfusion injury."

The news reporters obtained a quote from the research from McGill University, "Renal cell injury can also result from mutations in integral proteins, which lead to their misfolding and accumulation. Certain nephrin missense mutants misfold, accumulate in the ER, and induce ER stress. We examined if enhancement of ubiquitin-proteasome system function may facilitate proteostasis and confer protection against injury. Ubiquitin-specific protease 14 (Usp14) is reported to retard proteasomal protein degradation. Thus inhibition of Usp14 may enhance degradation of misfolded proteins and attenuate cell injury. In GEC, the reporter proteins GFP(u) (a 'misfolded' protein) and CD3 delta (an ER-associated degradation substrate) undergo time-dependent proteasomal degradation. Complement did not affect degradation of CD3 delta-yellow fluorescent protein (YFP), but accelerated degradation of GFP(u), and the Usp14-directed inhibitor IU1 further accelerated this degradation. Conversely, overexpression of Usp14 reduced degradation of GFPu and CD3 delta-YFP. In 293T cells, IU1 did not enhance degradation of disease-associated nephrin missense mutants I171N and S724C, whereas overexpression of Usp14 reduced degradation. IU1 was cyto-protective after injury induced by the ER stressor tunicamycin and in vitro ischemia-reperfusion, but did not affect complement-induced cytotoxicity."

According to the news reporters, the research concluded: "Usp14 controls proteasomal degradation of some misfolded proteins. In addition, a Usp14-directed inhibitor reduces cytotoxicity in the context of global protein misfolding during certain types of renal cell injury."

For more information on this research see: Role of the deubiquitinating enzyme ubiquitin-specific protease-14 in proteostasis in renal cells. American Journal of Physiology-Renal Physiology, 2016;311(5):F1035-F1046. American Journal of Physiology-Renal Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Research Data from Nanjing Medical University Update Understanding of Alzheimer Disease (Different Expression Patterns of Amyloid-b Protein Precursor Secretases in Human and Mouse Hippocampal Neurons: A Potential Contribution to Species ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting originating in Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Extensive loss of hippocampal neurons serves a pathological basis for irreversible cognitive impairment in patients with Alzheimer's disease (AD). However, this characteristic cannot be replicated by transgenic mouse models, and its underlying mechanisms are unclear."

The news reporters obtained a quote from the research from Nanjing Medical University, "Here, we present evidence that different expression patterns of amyloid-b protein precursor (AbPP) secretases in human and mouse hippocampal neurons are a decisive cause of species difference in the susceptibility to Ab pathogenesis. Cell bodies of both pyramidal and granular neurons did not appear to undergo Ab deposits in the 10-month-old transgenic mutant human AbPP/presenilin-1 (PS1) mice. They expressed high levels of non-amyloidogenic a-secretase, and its neuroprotective products soluble AbPPa, but low levels of amyloidogenic b-secretase and g-secretase, and a neurotoxic product, Ab42 peptide. Unlike those found in the mouse, human hippocampal neuronal cell bodies expressed b-secretase and g-secretase, but not a-secretase, which could increase Ab generation, thus undergoing death in response to various pathological conditions. Increased hippocampal neuronal apoptosis at 48 h following local microinjection of a-secretase antibody ADAM10 into the hippocampus of AbPP/PS1 mice further suggests that high a-secretase expression in mouse neuronal cell bodies is a factor in the paucity of neuronal loss in AD-like pathology."

According to the news reporters, the research concluded: "Therefore, selective down-regulation of brain a-secretase in transgenic AD models will better replicate the disease spectrum, including decreased brain soluble AbPPa levels and massive neuronal loss in AD patients, and be beneficial for preclinical therapeutic evaluation of AD."

Our news correspondents report that additional information may be obtained by contacting Z.Q. Xu, Jiangsu Province Key Laboratory of Neurodegeneration, Nanjing Medical
University, Nanjing, Jiangsu, People's Republic of China. Additional authors for this research include H. Huang, Y.L. Chen, Y.Y. Gao, J. Xu, C. Marshall, Z.Y. Cai and M. Xiao.

**Chemical Research**

**Research Data from National Center for Radiation Research and Technology Update Understanding of Chemical Research (Novel Sulfonamide Derivatives Carrying a Biologically Active 3,4-Dimethoxyphenyl Moiety as VEGFR-2 Inhibitors)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Chemical Research is the subject of a report. According to news reporting originating in Cairo, Egypt, by NewsRx journalists, research stated, "Novel sulfonamides 3-19 with a biologically active 3,4-dimethoxyphenyl moiety were designed and synthesized. The structures of the synthesized compounds were established using elemental analyses, IR, H-1-NMR, C-13-NMR spectral data and mass spectroscopy."

The news reporters obtained a quote from the research from National Center for Radiation Research and Technology, "All the synthesized compounds were evaluated for their in vitro anticancer activity against four cancer cell lines, namely human hepatocellular carcinoma (HepG2), human medulloblastoma (Daoy), human cervical cancer (HeLa), and human colon cancer (HT-29), by using a 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) assay and dasatinib as the reference drug. Among the tested derivatives, compounds 4, 10, 16, and 19 showed good activity as cytotoxic agents. The most active derivatives were evaluated for their ability to inhibit vascular endothelial growth factor receptor (VEGFR)-2. Compounds Z-4-(3-(3,4-dimethoxyphenyl)-3-oxoprop-1-enylamino)-N-(5-methyl-1,3,4-thiadiazol-2-yl)-benzenesulfonamide 10 and Z-4-(3-(3,4-dimethoxyphenyl)-3-oxoprop-1-enylamino)-N-(1H-indazol-6-yl)-benzenesulfonamide 19 were more active as VEGFR-2 inhibitors than dasatinib."

According to the news reporters, the research concluded: "Molecular docking of the most active derivatives on the active site of VEGFR-2 revealed that compound 19 exhibited favorable and promising results."

Our news correspondents report that additional information may be obtained by
Drugs and Therapies - Cancer Therapy

Research Data from National Center for Scientific Research (CNRS)
Update Understanding of Cancer Therapy (The anti-tumor NC1 domain of collagen XIX inhibits the FAK/PI3K/Akt/mTOR signaling pathway through avb3 integrin interaction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Cancer Therapy are presented in a new report. According to news reporting originating in Reims, France, by NewsRx journalists, research stated, "Type XIX collagen is a minor collagen associated with basement membranes. It was isolated for the first time in a human cDNA library from rhabdomyosarcoma and belongs to the FACITs family (Fibril Associated Collagens with Interrupted Triple Helices)."

The news reporters obtained a quote from the research from National Center for Scientific Research (CNRS), "Previously, we demonstrated that the NC1 domain of collagen XIX (NC1(XIX)) exerts anti-tumor properties on melanoma cells by inhibiting their migration and invasion. In the present work, we identified for the first time the integrin avb3 as a receptor of NC1(XIX). Moreover, we demonstrated that NC1(XIX) inhibits the FAK/PI3K/Akt/mTOR pathway, by decreasing the phosphorylation and activity of the major proteins involved in this pathway. On the other hand, NC1(XIX) induced an increase of GSK3b activity by decreasing its degree of phosphorylation. Treatments targeting this central signaling pathway in the development of melanoma are promising and new molecules should be developed."

According to the news reporters, the research concluded: "NC1(XIX) seems to have the potential for the design of new anti-cancer drugs."

For more information on this research see: The anti-tumor NC1 domain of collagen XIX inhibits the FAK/PI3K/Akt/mTOR signaling pathway through avb3 integrin interaction. Oncotarget, 2016;7(2):1516-28.

**Lung Diseases and Conditions - Cystic Fibrosis**

**Research Data from National Health Service Lothian Update**

**Understanding of Cystic Fibrosis (Eradication therapy for Burkholderia cepacia complex in people with cystic fibrosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Cystic Fibrosis have been published. According to news reporting originating from Midlothian, United Kingdom, by NewsRx correspondents, research stated, "Chronic infection with Burkholderia cepacia complex species remains a significant problem for clinicians treating people with cystic fibrosis. Colonisation with Burkholderia cepacia complex species is linked to a more rapid decline in lung function and increases morbidity and mortality."

Our news editors obtained a quote from the research from National Health Service Lothian, "There remain no objective guidelines for strategies to eradicate Burkholderia cepacia complex in cystic fibrosis lung disease, as these are inherently resistant to the majority of antibiotics and there has been very little research in this area. This review aims to examine the current treatment options for people with cystic fibrosis with acute of Burkholderia cepacia complex and to identify an evidence-based strategy that is both safe and effective. This is an updated version of the review. To identify whether treatment of Burkholderia cepacia complex infections can achieve eradication, or if treatment can prevent or delay the onset of chronic infection. To establish whether following eradication, clinical outcomes are improved and if there are any adverse effects. Search methods We searched the Cochrane Cystic Fibrosis Trials Register, compiled from electronic database searches and handsearching of journals and conference abstract books. We also searched the reference lists of relevant articles and reviews. Last search: 14 July 2016. We also searched electronic clinical trials registers for the USA and Europe. Date of last search: 14 July 2016. Selection criteria Randomised or quasi-randomised studies in people with cystic fibrosis of antibiotics or alternative therapeutic agents used alone or in combination, using any method of delivery and any treatment duration, to eradicate Burkholderia cepacia complex infections compared to another antibiotic, placebo or no treatment. Data collection and analysis Two authors independently assessed for inclusion in the review the eligibility of 50 studies (70 references) identified by the search of the Group's Trial Register and the other electronic searches. No studies looking at the eradication of Burkholderia cepacia complex species were identified. Authors' conclusions The authors have concluded that there was an extreme lack of evidence in this area of treatment management for people with cystic fibrosis. Without further comprehensive studies, it is difficult to draw conclusions about a safe and effective management strategy for Burkholderia cepacia complex eradication in cystic fibrosis."

According to the news editors, the research concluded: "Thus, while the review could not offer clinicians evidence of an effective eradication protocol for Burkholderia cepacia complex, it has highlighted an urgent need for exploration and research in this area, specifically the need for well-designed multi-centre randomised controlled studies of a variety of (novel)
antibiotic agents.”

For more information on this research see: Eradication therapy for Burkholderia cepacia complex in people with cystic fibrosis. Cochrane Database of Systematic Reviews, 2016;(11):607-630. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Oncology - Rectal Cancer
Research Data from New York University Update Understanding of Rectal Cancer (Role of belly board device in the age of intensity modulated radiotherapy for pelvic irradiation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Rectal Cancer is now available. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Small bowel dose often represents a limiting factor for radiation treatment of pelvic malignancies. To reduce small bowel toxicity, a belly board device (BBD) with a prone position is often recommended."

The news reporters obtained a quote from the research from New York University, "Intensity modulated radiotherapy (IMRT) could reduce dose to small bowel based on the desired dose volume constraints. We investigated the efficacy of BBD in conjunction with IMRT. A total of 11 consecutive patients with the diagnosis of rectal cancer, who were candidates for definitive therapy, were selected. Patients were immobilized with BBD in prone position for simulation and treatment. Supine position computed tomography (CT) data were either acquired at the same time or during a diagnostic scan, and if existed was used. Target volumes (TV) as well as organs at risk (OAR) were delineated in both studies. Three-dimensional conformal treatment (3DCRT) and IMRT plans were made for both scans. Thus for each patient, 4 plans were generated. Statistical analysis was conducted for maximum, minimum, and mean dose to each structure. When comparing the normalized mean Gross TV dose for the different plans, there was no statistical difference found between the planning types. There was a significant difference in small bowel sparing when using prone position on BBD comparing 3DCRT and IMRT plans, favoring IMRT with a 29.6% reduction in dose (p = 0.007). There was also a statistically significant difference in small bowel sparing when comparing supine position IMRT to prone-BBD IMRT favoring prone-BBD IMRT with a reduction of 30.3% (p = 0.002). For rectal cancer when small bowel could be a limiting factor, prone position using BBD along with IMRT provides the best sparing."
According to the news reporters, the research concluded: "We conclude that whenever a dose escalation in rectal cancer is desired where small bowel could be limiting factor, IMRT in conjunction with BBD should be selected."

For more information on this research see: Role of belly board device in the age of intensity modulated radiotherapy for pelvic irradiation. *Medical Dosimetry*, 2016;41(4):300-304. *Medical Dosimetry* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Digestive System Diseases and Conditions**

**Research Data from Oita University Update Understanding of Duodenal Ulcers (Vonoprazan, a novel potassium-competitive acid blocker, as a component of first-line and second-line triple therapy for Helicobacter pylori eradication: a phase III, ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Duodenal Ulcers have been published. According to news reporting originating from Oita, Japan, by NewsRx correspondents, research stated, "The objective of this study was to assess the efficacy, safety and tolerability of vonoprazan, a novel potassium-competitive acid blocker, as a component of *Helicobacter pylori* eradication therapy. A randomised, double-blind, multicentre, parallel-group study was conducted to verify the non-inferiority of vonoprazan 20 mg to lansoprazole 30 mg as part of first-line triple therapy (with amoxicillin 750 mg and clarithromycin 200 or 400 mg) in *H pylori*-positive patients with gastric or duodenal ulcer history."

Financial support for this research came from Takeda Pharmaceutical Company.

Our news editors obtained a quote from the research from Oita University, "The first 50 patients failing first-line therapy with good compliance also received second-line vonoprazan-based triple therapy (with amoxicillin 750 mg and metronidazole 250 mg) as an open-label treatment. Of the 650 subjects randomly allocated to either first-line triple therapy, 641 subjects completed first-line therapy and 50 subjects completed second-line therapy. The first-line eradication rate (primary end point) was 92.6% (95% CI 89.2% to 95.2%) with vonoprazan versus 75.9% (95% CI 70.9% to 80.5%) with lansoprazole, with the difference being 16.7% (95% CI 11.2% to 22.1%) in favour of vonoprazan, thus confirming the non-
inferiority of vonoprazan (p <0.0001). The second-line eradication rate (secondary end point) was also high (98.0%; 95% CI 89.4% to 99.9%) in those who received second-line therapy (n=50). Both first-line triple therapies were well tolerated with no notable differences. Second-line triple therapy was also well tolerated."

According to the news editors, the research concluded: "Vonoprazan is effective as part of first-line triple therapy and as part of second-line triple therapy in H pylori-positive patients with a history of gastric or duodenal ulcer."

For more information on this research see: Vonoprazan, a novel potassium-competitive acid blocker, as a component of first-line and second-line triple therapy for Helicobacter pylori eradication: a phase III, randomised, double-blind study. Gut, 2016;65 (9):1439-46. (BMJ Publishing Group - group.bmj.com/; Gut - gut.bmj.com/)

The news editors report that additional information may be obtained by contacting K. Murakami, Dept. of Gastroenterology, Faculty of Medicine, Oita University, Oita, Japan. Additional authors for this research include Y. Sakurai, M. Shiino, N. Funao, A. Nishimura and M. Asaka.

Biomedical Engineering - Tissue Engineering

Research Data from Polytechnic University Update Understanding of Tissue Engineering (Physical properties imparted by genipin to chitosan for tissue regeneration with human stem cells: A review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biomedical Engineering - Tissue Engineering. According to news reporting originating in Ancona, Italy, by NewsRx journalists, research stated, "Genipin is a fully assessed non-cytotoxic crosslinking compound. The chitosan I genipin physical properties such as morphology, roughness, porosity, hydrophilicity, zeta-potential, surface area and surface energy exert control over cell adhesion, migration, phenotype maintenance and intracellular signaling in vitro, and cell recruitment at the tissue-scaffold interface in vivo."

The news reporters obtained a quote from the research from Polytechnic University, "For example a therapy using fucose vertical bar chitosan vertical bar genipin nanoparticles encapsulating amoxicillin, based on the recognition of fucose by H. pylori, leads to sharply improved clinical results. A bioactive scaffold sensitive to environmental stimuli provides an alternative approach for inducing adipose stem cell chondrogenesis: the expression of specific genes, the accumulation of cartilage-related macromolecules and the mechanical properties are comparable to the original cartilage-derived matrix (CDM), thus making the CDM vertical bar genipin a contraction-free biomaterial suitable for cartilage tissue engineering. For the
regeneration of the cartilage, chitosan vertical bar genipin permits to modulate matrix synthesis and proliferation of chondrocytes by dynamic compression; chondrocytes cultured on the composite substrate produce much more collagen-II and sulfated GAG."

According to the news reporters, the research concluded: "The main advantages gained in the bone regeneration area with chitosan vertical bar genipin are: acceleration of mineral deposition; enhancement of adhesion, proliferation and differentiation of osteoblasts; promotion of the expression of osteogenic differentiation markers; greatly improved viability of human adipose stem cells."

Our news correspondents report that additional information may be obtained by contacting R.A.A. Muzzarelli, Polytechnic Univ Marche, Enzymol, Fac Med, IT-60100 Ancona, Italy. Additional authors for this research include M. El Mehtedi, C. Bottegoni and A. Gigante.

Drugs and Therapies - Antiretrovirals

Research Data from Radboud University Update Understanding of Antiretrovirals (Pharmacokinetic drug-drug interaction study between raltegravir and citalopram)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antiretrovirals. According to news reporting from Nijmegen, Netherlands, by NewsRx journalists, research stated, "Depression is the most common mental health disorder among HIV-infected patients. When treating HIV-infected patients with a selective serotonin reuptake inhibitor (SSRI), potential drug-drug interactions with antiretroviral agents have to be taken into account."

The news correspondents obtained a quote from the research from Radboud University. "We investigated the two-way pharmacokinetic drug-drug interaction and tolerability of concomitant administration of the SSRI citalopram and the HIV-1 integrase inhibitor raltegravir in healthy volunteers. An open-label, crossover, two-period trial was conducted in 24 healthy volunteers. Subjects received the following treatments: citalopram 20 mg once daily for 2 weeks followed by the combination with raltegravir 400 mg twice daily for 5 days and after a washout period raltegravir 400 mg twice daily for 5 days. Intensive steady-state pharmacokinetic blood sampling was performed. Geometric mean ratios (GMRs) of the
combination versus the reference treatment and 90% CIs were calculated for the area under the plasma concentration-time curve (AUC). CYP2C19 genotyping was performed because it influences N-demethylation of citalopram to desmethylicitalopram. A total of 22 healthy volunteers completed the trial. GMRs (90% CI) were 1.00 (0.98, 1.03) for citalopram AUC(0-24) (h), 0.99 (0.88, 1.12) for desmethylicitalopram AUC(0-24 h) and 0.77 (0.50, 1.19) for raltegravir AUC(0-12) (h). Raltegravir plasma concentration 12 h after intake (C-12 (h)) did not change with concomitant use of citalopram. Within each CYP2C19 phenotype subgroup the citalopram metabolite-to-parent ratio, which is a measure for metabolic enzyme activity, was not influenced by concomitant raltegravir use. Raltegravir does not influence the pharmacokinetics of citalopram and desmethylicitalopram. Citalopram did not change the pharmacokinetics of raltegravir in a clinically meaningful way."

According to the news reporters, the research concluded: "The combination was well tolerated and can be administered without dose adjustments."

Our news journalists report that additional information may be obtained by contacting M.I. Blonk, Radboud University, Dept. of Pharm, Medical Center, Nijmegen, Netherlands. Additional authors for this research include C.C.A. Langemeijer, A.P.H. Colbers, K.E.J. Hootganders, R.H.N. van Schaik and B. Schouwenberg.

**Oncology - Rectal Cancer**

**Research Data from Research Institute and Hospital Update**

**Understanding of Rectal Cancer (Adjuvant radiotherapy for the treatment of stage IV rectal cancer after curative resection A propensity score-matched analysis and meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Rectal Cancer have been published. According to news originating from Goyang, South Korea, by NewsRx correspondents, research stated, "The role of pelvic radiotherapy (RT) in stage IV rectal cancer with total mesorectal excision (TME) has not been defined. We evaluated the impact of RT on oncologic outcomes among patients with stage IV rectal cancer who underwent TME and performed a meta-analysis of published studies."

Our news journalists obtained a quote from the research from Research Institute and Hospital, "The records of stage IV rectal cancer patients who underwent TME between August
2001 and December 2011 were reviewed. Patients who received pelvic RT (RT group) and those who did not (non-RT group) were matched using a propensity score. Oncologic outcomes were compared between the groups. A systematic literature search and meta-analysis was conducted. One hundred seventy-six patients were matched with propensity score matching, resulting in 39 patients in each group. The local recurrence-free survival (LRFS) of the RT group was significantly higher than that of the non-RT group (2-year LRFS: 100% vs 83.6%, respectively, P=0.038). The overall survival, disease-free survival, and systemic recurrence were not significantly different between the groups. In the meta-analysis, the RT group had a reduced risk for loco-regional recurrence than the non-RT group (RR: 0.48, 95% confidence interval: 0.29-0.79).

According to the news editors, the research concluded: "Pelvic RT might have benefits for loco-regional control in patients with stage IV rectal cancer who undergo TME."

For more information on this research see: Adjuvant radiotherapy for the treatment of stage IV rectal cancer after curative resection: A propensity score-matched analysis and meta-analysis. Medicine, 2016;95(47):20-26. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Transplant Medicine - Liver Transplants

Research Data from Royal Infirmary Edinburgh NHS Trust Update Understanding of Liver Transplants (Preformed donor-specific HLA antibodies are associated with increased risk of early mortality after liver transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Transplant Medicine - Liver Transplants are presented in a new report. According to news reporting out of Midlothian, United Kingdom, by NewsRx editors, research stated, "There is limited evidence for a negative impact of preformed, donor-specific HLA antibodies (DSA) identified by cross-matching on outcomes after liver transplantation. Three recent studies have suggested an association between preformed DSA detected by Luminex and reduced graft or recipient survival in liver transplant cohorts with a high prevalence of hepatitis C. This study investigated the impact of preformed DSA identified by Luminex in the Scottish liver transplant population."

Financial support for this research came from The Edinburgh Health Foundation.

Our news journalists obtained a quote from the research from Royal Infirmary Edinburgh NHS Trust, "All recipients of liver transplants in Scotland between 2007 and 2015 with samples available for day of transplant antibody testing and donor HLA typing were
included (n=459); 96% of the cohort were white and 19% had a primary diagnosis of hepatitis C. The median follow-up time was 36 months. Preformed DSA were detected in 88 recipients. In multivariate analysis, preformed DSA with a median fluorescent intensity $\geq 10,000$ were associated with recipient mortality at 1 year. There was no association between DSA and overall graft or recipient survival."

According to the news editors, the research concluded: "This study adds to the growing body of evidence supporting a detrimental impact of preformed, high-level DSA in a subset of liver transplant recipients by identifying an association in an ethnically and demographically distinct liver transplant population."

Our news journalists report that additional information may be obtained by contacting J.A. McCaughan, Royal Infirmary Edinburgh NHS Trust, Histocompatibil & Immunogenet Lab, Edinburgh, Midlothian, United Kingdom. Additional authors for this research include V. Robertson, S.J. Falconer, C. Cryer, D.M. Turner and G.C. Oniscu. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ctr.12851. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Colon Cancer**

**Research Data from Second Military Medical University Update Understanding of Colon Cancer (Colonoscopy Reduces Colorectal Cancer Incidence and Mortality in Patients With Non-Malignant Findings: A Meta-Analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Colon Cancer are presented in a new report. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Observational studies have shown that colonoscopy reduces colorectal cancer (CRC) incidence and mortality in the general population. We aimed to conduct a meta-analysis quantifying the magnitude of protection by colonoscopy, with screening and diagnostic indications, against CRC in patients with non-malignant findings and demonstrating the potentially more marked effect of screening over diagnostic colonoscopy."

Our news journalists obtained a quote from the research from Second Military Medical University, "PubMed, EMBASE, and conference abstracts were searched through 30
April 2015. The primary outcomes were overall CRC incidence and mortality. Pooled relative risks (RRs) and 95% confidence intervals (CIs) were calculated using random-effect models. Eleven observational studies with a total of 1,499,521 individuals were included. Pooled analysis showed that colonoscopy was associated with a 61% RR reduction in CRC incidence (RR: 0.39; 95% CI: 0.26-0.60; I(2)=93.6%) and a 61% reduction in CRC mortality (RR: 0.39; 95% CI: 0.35-0.43; I(2)=12.0%) in patients with non-malignant findings, although there was high heterogeneity for the outcome of CRC incidence. After excluding one outlier study, there was low heterogeneity for the outcome of incidence (I(2)=44.7%). Subgroup analysis showed that the effect of screening colonoscopy was more prominent, corresponding to an 89% reduction in CRC incidence (RR: 0.11; 95% CI: 0.08-0.15), in comparison with settings involving diagnostic colonoscopy (RR: 0.51; 95% CI: 0.43-0.59; p<0.001). On the basis of this meta-analysis of observational studies, CRC incidence and mortality in patients with non-malignant findings are significantly reduced after colonoscopy."

According to the news editors, the research concluded: "The effect of screening colonoscopy on CRC incidence is more marked than diagnostic colonoscopy."

Our news journalists report that additional information may be obtained by contacting J. Pan, Dept. of Gastroenterology, Digestive Endoscopy Center, Changhai Hospital, Second Military Medical University, Shanghai, People's Republic of China. Additional authors for this research include L. Xin, Y.F. Ma, L.H. Hu and Z.S Li.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/ajg.2015.418. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Asia, Shanghai, Oncology, Colon Cancer, Article Review, Gastroenterology, Colorectal Research, Diagnostics and Screening, People's Republic of China.

**Oncology - Melanoma**

**Research Data from Sharett Institute of Oncology Update**

**Understanding of Melanoma [Clinical Significance of Circulating CD33 (+) CD11b(+)HLA-DR- Myeloid Cells in Patients with Stage IV Melanoma Treated with Ipilimumab]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Melanoma. According to news reporting out of Jerusalem, Israel, by NewsRx editors, research stated, "High levels of circulating myeloid-derived suppressor cells (MDSCs) in various cancer types, including melanoma, were shown to correlate with poor survival. We investigated whether frequencies of circulating CD33(+) CD11b(+)HLA-DR- MDSCs could be used as immune system monitoring biomarkers to predict response and survival of patients with stage IV melanoma treated with anti-CTLA4 (ipilimumab) therapy."

Our news journalists obtained a quote from the research from the Sharett Institute of
Oncology, "Peripheral blood samples from 56 patients and 50 healthy donors (HDs) were analyzed for CD33(+)CD11b(+)HLA-DR- MDSC percentage, NO-, and hROS levels by flow cytometry. We determined whether MDSC levels and suppressive features detected before anti-CTLA4 therapy correlate with the patients' response and overall survival (OS). Patients with melanoma had significantly higher levels of circulating CD33(+)CD11b(+)HLA-DR- MDSCs with suppressive phenotype when compared with HDs. Low levels of MDSCs before CTLA-4 therapy correlated with an objective clinical response, long-term survival, increased CD247 expression in T cells, and an improved clinical status. No predictive impact was observed for lactate dehydrogenase (LDH). Kaplan-Meier and log-rank tests performed on the 56 patients showed that the presence of more than 55.5% of circulating CD33(+)CD11b(+) out of the HLA-DR- cells, were associated with significant short OS (P < 0.003), a median of 6.5 months, in comparison with the group showing lower MDSC frequencies, with a median survival of 15.6 months. Our study suggests the use of CD33(+) CD11b(+)HLA-DR- cells as a predictive and prognostic biomarker in patients with stage IV melanoma treated with anti-CTLA4 therapy."

According to the news editors, the research concluded: "This monitoring system may aid in the development of combinatorial modalities, targeting the suppressive environment in conjunction with ipilimumab, toward facilitating better disease outcomes."

For more information on this research see: Clinical Significance of Circulating CD33(+) CD11b(+)HLA-DR- Myeloid Cells in Patients with Stage IV Melanoma Treated with Ipilimumab. Clinical Cancer Research, 2016;22(23):5661-5672. Clinical Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. (American Association for Cancer Research - www.aacr.com; Clinical Cancer Research - clincancerres.aacrjournals.org/)

Our news journalists report that additional information may be obtained by contacting M. Baniyash, Hadassah Med Organization, Sharett Inst Oncol, Jerusalem, Israel. Additional authors for this research include J. Kanterman, Y. Klieger, E. Ish-Shalom, M. Olga, A. Saragovi, H. Shtainberg, M. Lotem and M. Baniyash.

Keywords for this news article include: Jerusalem, Israel, Asia, Myeloid Cells, Diagnostics and Screening, Monoclonal Antibodies, Drugs and Therapies, Biotechnology, Immunotherapy, Ipilimumab, Oncology, Melanoma, Therapy, Sharett Institute of Oncology.

Arrhythmia

Research Data from Shiga University of Medical Sciences Update Understanding of Arrhythmia (Phenotypic Variability of ANK2 Mutations in Patients With Inherited Primary Arrhythmia Syndromes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Arrhythmia are discussed in a new report. According to news reporting from Shiga, Japan, by NewsRx journalists, research stated, "Mutations in ANK2 have been reported to cause various arrhythmia phenotypes. The prevalence of ANK2 mutation carriers in inherited primary arrhythmia syndrome (IPAS), however, remains unknown in Japanese."

The news correspondents obtained a quote from the research from the Shiga University of Medical Sciences, "Using a next-generation sequencer, we aimed to identify
ANK2 mutations in our cohort of IPAS patients, in whom conventional Sanger sequencing failed to identify pathogenic mutations in major causative genes, and to assess the clinical characteristics of ANK2 mutation carriers. We screened 535 probands with IPAS and analyzed 46 genes including whole ANK2 exons using a bench-top NGS (MiSeq, Illumina) or performed whole-exome-sequencing using HiSeq2000 (Illumina). As a result, 12 of 535 probands (2.2%, aged 0-61 years, 5 males) were found to carry 7 different heterozygous ANK2 mutations. ANK2-W1535R was identified in 5 LQTS patients and 1 symptomatic BrS and was predicted as damaging by multiple prediction software. In total, as to phenotype, there were 8 LQTS, 2 BrS, 1 IVF, and 1 SSS/AF. Surprisingly, 4/8 LQTS patients had the acquired type of LQTS (aLQTS) and suffered torsades de pointes. A total of 7 of 12 patients had documented malignant ventricular tachyarrhythmias.

According to the news reporters, the research concluded: "Various ANK2 mutations are associated with a wide range of phenotypes, including aLQTS, especially with ventricular fibrillation, representing ‘ankyrin-B’ syndrome."

Our news journalists report that additional information may be obtained by contacting S. Ohno, Shiga University of Medical Sciences, Center Epidemiol Res Asia, Otsu, Shiga, Japan. Additional authors for this research include T. Aiba, S. Ohno, D. Shigemizu, J. Ozawa, K. Sonoda, M. Fukuyama, H. Itoh, Y. Miyamoto, T. Tsunoda, T. Makiyama, T. Tanaka, W. Shimizu and M. Horie.

**Oncology - Breast Cancer**

**Research Data from Sungkyunkwan University Update Understanding of Breast Cancer (High Ki67/BCL2 index is associated with worse outcome in early stage breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Breast cancers are heterogeneous, making it essential to recognise several biomarkers for cancer outcome predictions. Ki67 proliferation index and B cell lymphoma 2 (BCL2) proteins are widely used as prognostic indicators in many types of malignancies."

Our news journalists obtained a quote from the research from Sungkyunkwan University, "While Ki67 is a marker of normal or tumour cell proliferation, BCL2 plays a central role in antiproliferative activities. A combination of these two biomarkers with contrary purposes can provide enhanced prognostic accuracy than an analysis using a single biomarker. We evaluated Ki67 and BCL2 expression with 203 cases of breast cancer. The relative expression of each biomarker named as Ki67/BCL2 index was divided into two groups (low vs
high) with the use of area under receiver operating characteristic curves. There were significant correlations between Ki67/BCL2 index and clinicopathological findings such as age, tumour stage, size and necrosis, histological grade, extensive intraductal component, lymphatic and vascular invasion, oestrogen receptor, progesterone receptor, human epithelial growth factor receptor 2 and p53 expression (all p<0.05). In univariate and multivariate analyses, high Ki67/BCL2 index correlated with shorter disease-free survival and overall survival in patients with early stage invasive ductal carcinoma (all p<0.05).

According to the news editors, the research concluded: "The Ki67/BCL2 index should be considered as a prognostic predictor in patients with early stage invasive ductal carcinoma."

For more information on this research see: High Ki67/BCL2 index is associated with worse outcome in early stage breast cancer. *Postgraduate Medical Journal*, 2016;92 (1094):707-714. *Postgraduate Medical Journal* can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. Oncology - Squamous Cell Carcinoma

Research Data from Sungkyunkwan University Update Understanding of Squamous Cell Carcinoma (Overexpression of beta-Catenin and Cyclin D1 is Associated with Poor Overall Survival in Patients with Stage IA-IIA Squamous Cell Lung Cancer ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Squamous Cell Carcinoma. According to news reporting originating from Suwon, South Korea, by NewsRx correspondents, research stated, "This study was aimed at understanding the effect of beta-catenin and cyclin D1 on overall survival in patients with early-stage NSCLC and at evaluating if the prognostic effect can be modified by adjuvant chemotherapy. We retrospectively analyzed the expression of beta-catenin and cyclin D1 using immunohistochemistry in formalin-fixed paraffin-embedded tissues from 576 patients with early-stage NSCLC."

Our news editors obtained a quote from the research from Sungkyunkwan University, "The median duration of follow-up was 5.1 years. Overexpression of beta-catenin and cyclin D1 was found in 56% and 50% of 576 cases, respectively. Overexpression of 0-
catenin and cyclin D1 was significantly associated with poor overall survival (p = 0.003 and p = 0.0009, respectively; log rank test) in squamous cell carcinomas, not in adenocarcinomas. The prognostic significance of each protein in the squamous cell carcinomas was limited to stages IA, IB, and IIA. In addition, simultaneous overexpression of beta-catenin and cyclin D1 in the squamous cell carcinomas synergistically increased hazard ratios (HRs) 15.79 (95% confidence interval [CI] = 1.09-51.23; p=0.04) for stage IA, 10.30 (95% CI = 2.29-46.41; p = 0.002) for stage 1B, and 3.55 (95% CI = 1.22-10.36; p = 0.02) times for stage 2A compared to those without overexpression of the two proteins, after adjusting for confounding factors. In addition, the effect was not dependent on adjuvant chemotherapy."

According to the news editors, the research concluded: "The present study suggests that simultaneous overexpression of beta-catenin and cyclin D1 may be associated with poor overall survival irrespective of platinum-based adjuvant chemotherapy in stage IA-IIA squamous cell carcinoma of the lung."

For more information on this research see: Overexpression of beta-Catenin and Cyclin D1 is Associated with Poor Overall Survival in Patients with Stage IA-IIA Squamous Cell Lung Cancer Irrespective of Adjuvant Chemotherapy. Journal of Thoracic Oncology, 2016;11(12):2193-2201. Journal of Thoracic Oncology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Lippincott Williams and Wilkins - www.lww.com; Journal of Thoracic Oncology - journals.lww.com/jto/pages/default.aspx)

The news editors report that additional information may be obtained by contacting D.H. Kim, Sungkyunkwan UniversitySch Med, Samsung Biomed Res Inst, Dept. of Mol Cell Biol, Suwon 440746, South Korea. **Cardiovascular Diseases and Conditions - Vasculitis**

**Research Data from Tallaght Hospital Update Understanding of Vasculitis (Changes in urinary metabolomic profile during relapsing renal vasculitis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Vasculitis. According to news reporting from Dublin, Ireland, by NewsRx journalists, research stated, "Current biomarkers of renal disease in systemic vasculitis lack predictive value and are insensitive to early damage. To identify novel biomarkers of renal vasculitis flare, we analysed the longitudinal urinary metabolomic profile of a rat model of anti-neutrophil cytoplasmic antibody (ANCA) vasculitis."

The news correspondents obtained a quote from the research from Tallaght Hospital, "Wistar-Kyoto (WKY) rats were immunised with human myeloperoxidase (MPO). Urine was
obtained at regular intervals for 181 days, after which relapse was induced by re-challenge with MPO. Urinary metabolites were assessed in an unbiased fashion using nuclear magnetic resonance (NMR) spectroscopy, and analysed using partial least squares discriminant analysis (PLS-DA) and partial least squares regression (PLS-R). At 56 days post-immunisation, we found that rats with vasculitis had a significantly different urinary metabolite profile than control animals; the observed PLS-DA clusters dissipated between 56 and 181 days, and re-emerged with relapse. The metabolites most altered in rats with active or relapsing vasculitis were trimethylamine N-oxide (TMAO), citrate and 2-oxoglutarate. Myo-inositol was also moderately predictive. The key urine metabolites identified in rats were confirmed in a large cohort of patients using liquid chromatography-mass spectrometry (LC-MS).

According to the news reporters, the research concluded: "Hypocitraturia and elevated urinary myo-inositol remained associated with active disease, with the urine myo-inositol: citrate ratio being tightly correlated with active renal vasculitis."

Keywords for this news article include: Dublin, Ireland, Europe, Cardiovascular Diseases and Conditions, Kidney, Diagnostics and Screening, Nephrology, Vasculitis, Tallaght Hospital.

**Hematology - Blood Coagulation Factors**

**Research Data from Tel Aviv University Update Understanding of Blood Coagulation Factors (Thrombin And Protein C Pathway In Peripheral Nerve Schwann Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hematology - Blood Coagulation Factors. According to news reporting out of Tel Aviv, Israel, by NewsRx editors, research stated, "Thrombin and activated protein C (aPC) bound to the endothelial protein C receptor (EPCR) both activate protease-activated receptor 1 (PAR1) generating either harmful or protective signaling respectively. In the present study we examined the localization of PAR-1 and EPCR and thrombin activity in Schwann glial cells of normal and crushed peripheral nerve and in Schwannoma cell lines."

Our news journalists obtained a quote from the research from Tel Aviv University, "In the sciatic crush model nerves were excised 1 h, 1, 4, and 7 days after the injury. Schwannoma cell lines produced high levels of prothrombin which is converted to active thrombin and expressed both EPCR and PAR-1 which co localized. In the injured sciatic nerve
thrombin levels were elevated as early as 1 h after injury, reached their peak 1 day after injury which was significantly higher (24.4 +/- 4.1 mU/ml) compared to contralateral uninjured nerves (2.6 +/- 7 mU/ml, t-test p< 0.001) and declined linearily reaching baseline levels by day 7. EPCR was found to be located at the microvilli of Schwann cells at the node of Ranvier and in cytoplasm surrounding the nucleus. Four days after sciatic injury, EPCR levels increased significantly (57,785 +/- 16602AU versus 4790 +/- 1294AU in the contralateral uninjured nerves, p< 0.001 by t-test) mainly distal to the site of injury, where axon degeneration is followed by proliferation of Schwann cells which are diffusely stained for EPCR."

According to the news editors, the research concluded: "EPCR seems to be located to cytoplasmic component of Schwann cells and not to compact myelin component, and is highly increased following injury."

Our news journalists report that additional information may be obtained by contacting O. Gera, Tel Aviv University, Dept. of Phys Therapy, Sackler Fac Med, Tel Aviv, Israel. Additional authors for this research include E. Shavit-Stein, D. Bushi, S. Harnof, M. Ben Shimon, R. Weiss, V. Golderman, A. Dori, N. Maggio, K. Finegold and J. Chapman.

Musculoskeletal Diseases and Conditions - Arthritis

Research Data from Tokyo University of Pharmacy and Life Sciences Update Understanding of Arthritis (Systemic delivery of small interfering RNA targeting nuclear factor kappa B in mice with collagen-induced arthritis using ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Arthritis have been published. According to news reporting from Hachioji, Japan, by NewsRx journalists, research stated, "This study aimed to build an innovative system to deliver a systemic small interfering RNA (siRNA) treatment for rheumatoid arthritis. We combined arginine-histidine-cysteine based oligopeptide-modified polymer micelles with siRNA targeting the nuclear factor kappa B subunit, RelA (siRelA)."

The news correspondents obtained a quote from the research from the Tokyo University of Pharmacy and Life Sciences, "This is a key molecule in the control of inflammation. We tested the cellular uptake of siRNA and its effects on inflammatory cytokine..."
levels in vitro using synoviocytes, and siRNA distribution and therapeutic effects in vivo in mice with collagen-induced arthritis (CIA). These studies showed that arginine-histidine based oligopeptide modified micelles produced effective cellular siRNA uptake and suppressed inflammatory cytokine levels in synoviocytes. In vivo, these micelles produced marked accumulation of siRNAs in arthritic paws in CIA mice, with much less accumulation in healthy mice.”

According to the news reporters, the research concluded: "The siRelA-polymer micelle complexes also produced more effective suppression of RelA mRNA expression and inflammatory cytokine levels in the arthritic paws of CIA mice and reduced their clinical symptom scores and paw thickness."

Our news journalists report that additional information may be obtained by contacting T. Kanazawa, Tokyo Univ Pharm & Life Sci, Sch Pharm, Hachioji, Tokyo 1920392, Japan. Additional authors for this research include T. Endo, N. Arima, H. Ibaraki, Y. Takashima and Y. Seta.

**Adenocarcinomas**

**Research Data from University Hospital Update Understanding of Adenocarcinomas (Positioning of second-line treatment for advanced gastric and gastroesophageal junction adenocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Adenocarcinomas. According to news originating from Sabadell, Spain, by NewsRx correspondents, research stated, "Tumors of the upper gastrointestinal tract are increasing in incidence; yet, approaches to the treatment of advanced gastric and/or gastroesophageal junction cancer vary widely, with no internationally agreed first-line regimens."

Financial support for this research came from Eli Lilly and Company.

Our news journalists obtained a quote from the research from University Hospital, "Recent clinical trials have shown that second-line treatment is now possible for selected patients with advanced disease, and current data suggest that the combination of ramucirumab..."
plus paclitaxel may become a standard of care in the second-line setting for metastatic gastric cancer. Several prognostic factors have been identified for overall survival in the second-line setting; this emphasizes the need for careful sequencing of all treatments to ensure that individual patients receive optimum care."

According to the news editors, the research concluded: "This article reviews published data on the treatment of advanced gastric cancer, with a particular emphasis on second-line chemotherapy, and suggests treatment sequences based on current understanding."

The news correspondents report that additional information may be obtained from C. Pericay, Sabadell Univ Hosp, Dept. of Oncol, Sabadell, Spain. Additional authors for this research include F. Rivera, C. Gomez-Martin, I. Nunez, A. Cassinello and E.R. Imedio.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cam4.941. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Sabadell, Spain, Europe, Adenocarcinomas, Cancer, Article Review, Adenocarcinoma, Oncology, University Hospital.

**DNA Research**

**Research Data from University Hospital Update Understanding of DNA Research (DNA Damage-Induced HSPC Malfunction Depends on ROS Accumulation Downstream of IFN-1 Signaling and Bid Mobilization)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on DNA Research have been published. According to news reporting out of Ulm, Germany, by NewsRx editors, research stated, "Mouse mutants with an impaired DNA damage response frequently exhibit a set of remarkably similar defects in the HSPC compartment that are of largely unknown molecular basis. Using Mixed-Lineage-Leukemia-5 (Mll5)-deficient mice as prototypical examples, we have identified a mechanistic pathway linking DNA damage and HSPC malfunction."

Our news journalists obtained a quote from the research from University Hospital, "We show that Mll5 deficiency results in accumulation of DNA damage and reactive oxygen species (ROS) in HSPCs. Reduction of ROS efficiently reverses hematopoietic defects, establishing ROS as a major cause of impaired HSPC function. The Ink4a/Arf locus also contributes to HSPC phenotypes, at least in part via promotion of ROS. Strikingly, toxic ROS levels in Mll5(-/-) mice are critically dependent on type 1 interferon (IFN-1) signaling, which triggers mitochondrial accumulation of full-length Bid. Genetic inactivation of Bid diminishes ROS levels and reverses HSPC defects in Mll5(-/-) mice."

According to the news editors, the research concluded: "Overall, therefore, our findings highlight an unexpected IFN-1 > Bid > ROS pathway underlying DNA damage-associated HSPC malfunction."
For more information on this research see: DNA Damage-Induced HSPC Malfunction Depends on ROS Accumulation Downstream of IFN-1 Signaling and Bid Mobilization. *Cell Stem Cell*, 2016;19(6):752-767. *Cell Stem Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell Stem Cell - www.journals.elsevier.com/cell-stem-cell/)

**Breast Diseases and Conditions - Gynecomastia**

**Research Data from University Hospital Update Understanding of Gynecomastia (Endocrine and molecular investigations in a cohort of 25 adolescent males with prominent/persistent pubertal gynecomastia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Breast Diseases and Conditions - Gynecomastia is now available. According to news reporting originating in Montpellier, France, by NewsRx journalists, research stated, "Pubertal gynecomastia is a common condition observed in up to 65% of adolescent males. It is usually idiopathic and tends to regress within 1-2 years."

The news reporters obtained a quote from the research from University Hospital, "In this descriptive cross-sectional study, we investigated 25 adolescent males with prominent (> B3) and/or persistent (>2 years) pubertal gynecomastia (P/PPG) to determine whether a hormonal/genetic defect might underline this condition. Endocrine investigation revealed the absence of hormonal disturbance for 18 boys (72%). Three patients presented Klinefelter syndrome and three a partial androgen insensitivity syndrome (PAIS) as a result of p.Ala646Asp and p.Ala45Gly mutations of the androgen receptor gene. The last patient showed a 17a-hydroxylase/17,20-lyase deficiency as a result of a compound heterozygous mutation of the CYP17A1 gene leading to p.Pro35Thr(P35T) and p.Arg239Stop(R239X) in the P450c17 protein. Enzymatic activity was analyzed: the mutant protein bearing the premature stop codon R239X showed a complete loss of 17a-hydroxylase and 17,20-lyase activity. The mutant P35T seemed to retain 15-20% of 17a-hydroxylase and about 8-10% of 17,20-lyase activity. This work demonstrates that P/PPG had an endocrine/genetic cause in 28% of our cases. PAIS may be expressed only by isolated gynecomastia as well as by 17a-hydroxylase/17,20-lyase deficiency."

According to the news reporters, the research concluded: "Isolated P/PPG is not always a 'physiological' condition and should thus be investigated through adequate endocrine and genetic investigations, even though larger studies are needed to better determine the real
prevalence of genetic defects in such patients."

Our news correspondents report that additional information may be obtained by contacting F. Paris, Unite d'Endocrinologie-Gynecologie Pediatriques, Departement de Pediatrie, Hopital Arnaud-de-Villeneuve, CHU Montpellier et Universite Montpellier 1, Montpellier, France. Additional authors for this research include L. Gaspari, F. Mrou, P. Philibert, F. Audran, Y. Morel, A. Biaso-Lauber and C. Sultan.

**Enterovirus**

**Research Data from University of Agriculture Update Understanding of Enterovirus (Enterovirus 71 inhibits cellular type I interferon signaling by inhibiting host RIG-I ubiquitination)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enterovirus. According to news reporting from Daqing, People's Republic of China, by NewsRx journalists, research stated, "Enterovirus 71 (EV71) is a human pathogen that induces hand, foot, and mouth disease (HFMD) and fatal neurological diseases in young children and infants. Pathogenicity of EV71 is likely related to its ability to evade host innate immunity through inhibiting cellular type I interferon signaling."

Financial supporters for this research include National Natural Science Foundation of China, Technology Research Foundation of Education Department of HeiLongJiang Province, China, China Postdoctoral Science Foundation, Postdoctoral Foundation of HeiLongJiang Provincial Government, Doctor's Research Foundation, HeiLongJiang BaYi Agricultural University, Scientific and Technological Projects from Heilongjiang Agriculture and Reclamation Bureau, Postgraduate Innovation Science Research Project, HeiLongJiang BaYi Agricultural University.

The news correspondents obtained a quote from the research from the University of Agriculture, "However, it is less well understood the molecular events governing this process. In this study, we found that EV71 infection suppressed the induction of antiviral immunity by inhibiting the expression levels of IFN-beta and IFN-stimulated genes (ISGs), such as ISG54 and ISG56, at the late stage of viral infection. At the same time, our results showed that EV71 infection significantly inhibited ubiquitination of RIG-I. In contrast, up regulation of RIG-I ubiquitination promoted expression of IFN-beta and ISGs, suggesting that inhibition of cellular type I interferon signaling was caused by down-regulation of RIG-I ubiquitination during EV71 infection."
According to the news reporters, the research concluded: "These results suggest that inhibition of RIG-I-mediated type I IFN responses by EV71 may contribute to the pathogenesis of viral infection."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.micpath.2016.09.001. This DOI is a link to an online electronic document that is either free or for purchase.

**Immune System Diseases and Conditions - HIV/AIDS**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immune System Diseases and Conditions - HIV/AIDS have been presented. According to news reporting out of San Francisco, California, by NewsRx editors, research stated, "The Food and Drug Administration approved pre-exposure prophylaxis (PrEP) to prevent HIV infection, and the Centers for Disease Control and Prevention has presented PrEP as a prevention option for groups at high risk such as men who have sex with men (MSM). Intervention data provide some information on how PrEP affects sexual behavior of MSM in trials, open label extensions, or clinics."

Our news journalists obtained a quote from the research from the University of California, "However, it is unclear whether sexual risk and preventive behavioral patterns are changing in the population as a whole as PrEP becomes more widely available, whether due to PrEP use or other factors. We examined trends in PrEP use, numbers of condomless anal sex partners, consistent condom use, and seroadaptive strategies in San Francisco-a city which has actively promoted PrEP-using data from National HIV Behavioral Surveillance (NHBS). NHBS recruited 1211, 383, 373, and 268 HIV-negative MSM in 2004, 2008, 2011, and 2014, respectively. PrEP use increased from zero in 2004, 2008, and 2011 to 9.6 % in 2014. The proportion of men with no condomless anal sex partners dropped from 60.6 % in 2004, to 58.2 % in 2008, to 54.2 % in 2011, to 40.2 % in 2014. Consistent condom use decreased from 36.8 %
in 2004, and 30.5% in 2008 and 2011, to 18.3% in 2014. PrEP's introduction and scale-up enters in a pre-existing trend of decreasing condom use and increasing sexually transmitted infections among MSM which may be accelerating in recent years."

According to the news editors, the research concluded: "While PrEP use should be scaled up as a prevention option among those who would benefit most, we believe that public health officials need to be realistic about the possibility that condom use could very well continue to decline as PrEP use increases, and to an extent that may not be directly or indirectly offset by PrEP."

Our news journalists report that additional information may be obtained by contacting H.F. Raymond, University of California, Epidemiol & Biostat, San Francisco, CA 94158, United States. Additional authors for this research include J.M. Snowden, W. McFarland and H.F. Raymond.

Keywords for this news article include: San Francisco, California, United States, North and Central America, Immune System Diseases and Conditions, Epidemiology, Viral Sexually Transmitted Diseases and Conditions, Primate Lentiviruses, Risk and Prevention, Vertebrate Viruses, HIV Infections, Retroviridae, RNA Viruses, HIV/AIDS, University of California.

**Peptide Proteins - Proinsulin**

**Research Data from University of California Update Understanding of Proinsulin (Circadian variation of the pancreatic islet transcriptome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Peptide Proteins - Proinsulin are presented in a new report. According to news originating from Los Angeles, California, by NewsRx correspondents, research stated, "Pancreatic islet failure is a characteristic feature of impaired glucose control in diabetes mellitus. Circadian control of islet function is essential for maintaining proper glucose homeostasis."

Financial support for this research came from HHS | NIH | National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK).

Our news journalists obtained a quote from the research from the University of California, "Circadian variations in transcriptional pathways have been described in diverse cell types and shown to be critical for optimization of cellular function in vivo. In the current study, we utilized Short Time Series Expression Miner (STEM) analysis to identify diurnally expressed transcripts and biological pathways from mouse islets isolated at 4 h intervals throughout the 24 h light-dark cycle. STEM analysis identified 19 distinct chronological model profiles, and genes belonging to each profile were subsequently annotated to significantly enriched Kyoto Encyclopedia of Genes and Genomes biological pathways. Several transcriptional pathways essential for proper islet function (e.g., insulin secretion, oxidative phosphorylation), cell survival (e.g., insulin signaling, apoptosis) and cell proliferation (DNA
replication, homologous recombination) demonstrated significant time-dependent variations. Notably, KEGG pathway analysis revealed 'protein processing in endoplasmic reticulum - mmu04141' as one of the most enriched time-dependent pathways in islets."

According to the news editors, the research concluded: "This study provides unique data set on time-dependent diurnal profiles of islet gene expression and biological pathways, and suggests that diurnal variation of the islet transcriptome is an important feature of islet homeostasis, which should be taken into consideration for optimal experimental design and interpretation of future islet studies."

For more information on this research see: Circadian variation of the pancreatic islet transcriptome. Physiological Genomics, 2016;48(9):677-687. Physiological Genomics can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

The news correspondents report that additional information may be obtained from A.V. Matveyenko, University of California, David Geffen Sch Med, Div Endocrinol, Dept. of Med, Los Angeles, CA 90095, United States. Additional authors for this research include J.Y. Qian, J. Ernst and A.V. Matveyenko.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1152/physiolgenomics.00019.2016. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Los Angeles, California, United States, North and Central America, Gastroenterology, Peptide Proteins, Peptide Hormones, Proinsulin, Pancreas, Genetics, University of California.

Our news editors obtained a quote from the research from the University of Chile, "For this, TM4 cells were incubated with different concentrations of these metabolites for 24 h to then evaluate the viability and DNA integrity by MTS and TUNEL assay respectively. The participation of classical oestrogen receptors and the involvement of oxidative stress and apoptotic mechanisms were also evaluated co-incubating TM4 cells with these estradiol metabolites and with the drugs ICI182780, N-acetylcyesteine and Z-VAD-FMK respectively."

Funders for this research include CONICYT/FONDECYT from Chilean Government, Program U-apoya University of Chile.
Only high concentrations of 2OHE(2) and 2ME(2) decreased cell viability inducing DNA fragmentation. In addition, ICI182780 did not block the effect of 2OHE(2) and 2ME(2), while N-Acetylcycteine and Z-VAD-FMK only blocked the effect of 2OHE(2). Moreover, 2OHE(2) but not 2ME(2) induced PARP and caspase-3 cleavage. Finally, lower 2OHE(2) and 2ME(2) concentrations (0.01-0.1-1.0 μmol l(-1)) decreased Sertoli cell viability 48 h post-treatment.

According to the news editors, the research concluded: "Our results support the hypothesis that elevated intratesticular 2OHE(2) or 2ME(2) concentrations could be related to male infertility since 2OHE(2) by apoptosis and 2ME(2) by undetermined mechanisms induce DNA fragmentation in Sertoli cells."

For more information on this research see: 2-hydroxyoestradiol and 2-methoxyoestradiol, two endogenous oestradiol metabolites, induce DNA fragmentation in Sertoli cells.  

The news editors report that additional information may be obtained by contacting A. Parada-Bustamante, University of Chile, Fac Med, Inst Invest Materno Infantil, Santiago 8360160, Chile. Additional authors for this research include C. Molina, M. Florez, J. Bunay, R.D. Moreno, P.A. Orihuela, A. Castro and A. Parada-Bustamante.

**Oncology - Colon Cancer**

**Research Data from University of Colorado Update Understanding of Colon Cancer (Topoisomerase Ila mediates TCF-dependent epithelial-mesenchymal transition in colon cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting from Aurora, Colorado, by NewsRx journalists, research stated, "Aberrant T-cell factor (TCF) transcription is implicated in the majority of colorectal cancers (CRCs). TCF transcription induces epithelial-mesenchymal transition (EMT), promoting a tumor-initiating cell (TIC) phenotype characterized by increased proliferation, multidrug resistance (MDR), invasion and metastasis."

The news correspondents obtained a quote from the research from the University of Colorado, "The data presented herein characterize topoisomerase Ila (TopoIla) as a required component of TCF transcription promoting EMT. Using chromatin immunoprecipitation (ChIP) and protein co-immunoprecipitation (co-IP) studies, we show that TopoIla forms protein-protein interactions with b-catenin and TCF4 and interacts with Wnt response elements (WREs) and promoters of direct target genes of TCF transcription, including: MYC, vimentin, AXIN2 and LEF1. Moreover, both TopoIla and TCF4 ChIP with the N-cadherin promoter, which is a new discovery indicating that TCF transcription may directly regulate N-cadherin expression."
TopoIIα N-terminal ATP-competitive inhibitors, exemplified by the marine alkaloid neoamphimedine (neo), block TCF activity in vitro and in vivo. Neo effectively inhibits TopoIIα and TCF4 from binding WREs/promoter sites, whereas protein-protein interactions remain intact. Neo inhibition of TopoIIα-dependent TCF transcription also correlates with significant antitumor effects in vitro and in vivo, including the reversion of EMT, the loss of TIC-mediated clonogenic colony formation, and the loss of cell motility and invasion. Interestingly, non-ATP-competitive inhibitors of TopoIIα, etoposide and merbarone, were ineffective at preventing TopoIIα-dependent TCF transcription. Thus, we propose that TopoIIα participation in TCF transcription may convey a mechanism of MDR to conventional TopoIIα inhibitors. However, our results indicate that TopoIIα N-terminal ATP-binding sites remain conserved and available for drug targeting.

According to the news reporters, the research concluded: "This article defines a new strategy for targeted inhibition of TCF transcription that may lead to effective therapies for the treatment of CRC and potentially other Wnt-dependent cancers."

For more information on this research see: Topoisomerase IIA mediates TCF-dependent epithelial-mesenchymal transition in colon cancer. Oncogene, 2016;35(38):4990-9. (Nature Publishing Group - www.nature.com/; Oncogene - www.nature.com/onc/)

Our news journalists report that additional information may be obtained by contacting Q. Zhou, Dept. of Pharmaceutical Sciences, Skaggs School of Pharmacy and Pharmaceutical Sciences, University of Colorado Anschutz Medical Campus, Aurora, CO, United States. Cardiovascular Diseases and Conditions -...

Research Data from University of Genoa School of Medicine Update Understanding of Atherosclerosis (Role of neutrophils in atherogenesis: an update)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Atherosclerosis is now available. According to news originating from Genoa, Italy, by NewsRx correspondents, research stated, "The role of neutrophils in the beginning and the progression of the atherosclerotic process did not receive much attention until the last years. On the contrary, recent data, in both the experimental animals and humans, suggest important effects of these cells with possible clinical consequences."

Funders for this research include Universita degli Studi di Genova, European Commission FP7-Research and Innovation I Health.
Our news journalists obtained a quote from the research from the University of Genoa School of Medicine, "This narrative review was based on the papers found on PubMed and MEDLINE up to July 2015. The search terms used were 'neutrophil, atherosclerosis' in combination with 'recruitment, chemokine, plaque destabilization and pathophysiology'. Different models demonstrate the presence and the actions of neutrophils in the early steps of the atherogenesis confirming the fundamental role of these cells in the response of the innate immune system to different pathogens (in this context the modified lipoproteins). However, also the late phases of the atherosclerotic process, in particular the destabilization of a mature plaque, seem to be modulated by the neutrophils, possibly through the interaction with recently discovered biological systems such as the endocannabinoids. The understanding of the mechanisms involved in the modulation exerted by neutrophils in atherosclerosis is pivotal in terms of the complete definition of the overall picture."

According to the news editors, the research concluded: "This approach will certainly give us new targets and new pharmacological opportunities for the anti-inflammatory strategy of the cardiovascular prevention."

The news correspondents report that additional information may be obtained from A. Pende, Clinic of Internal Medicine 1, Dept. of Internal Medicine, University of Genoa School of Medicine, IRCCS Azienda Ospedaliera Universitaria San Martino - IST, Genoa, Italy. Additional authors for this research include N. Artom, M. Bertolotto, F. Montecucco and F. Dallegri.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/eci.12566. This DOI is a link to an online electronic document that is either free or for purchase.

Myeloid Cells

Research Data from University of Guadalajara Update Understanding of Myeloid Cells (Culture supernatants of cervical cancer cells induce an M2 phenotypic profile in THP-1 macrophages)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Myeloid Cells have been published. According to news reporting from Guadalajara, Mexico, by NewsRx journalists, research stated, "Patients with cervical cancer (CxCa) typically present an infiltrate of tumor-associated macrophages, which is associated with a poor prognosis. We found that CxCa cell lines (HeLa, SiHa, and C-33A) secreted factors involved in regulating tumor growth including IL-6, IL-4, PDGF(AA), HGF, VEGF, ANG-2, and TGF-beta 3. We assessed the effects of culture supernatants from
these cell lines on macrophages derived from the THP-1 cell line."

The news correspondents obtained a quote from the research from the University of Guadalajara, "Macrophages treated with culture supernatants from CxCa cells developed an M2-like phenotype with expression of CD163, low nitric oxide release, and high secretion of IL-6, PDGF(AA), HGF, ANG-2, and VEGF. The macrophages continued to produce PDGF(AA), PDGF(BB), and VEGF 48 h after the CxCa cell culture supernatants were removed. The induction of M2 macrophages in vivo favors tumor growth, angiogenesis, tissue remodeling, and metastasis."

According to the news reporters, the research concluded: "These results demonstrated that factors secreted by CxCa cells induced a stable M2 phenotype in THP-1 macrophages."

For more information on this research see: Culture supernatants of cervical cancer cells induce an M2 phenotypic profile in THP-1 macrophages. Cellular Immunology, 2016;310 ():42-52. Cellular Immunology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Autoimmune Diseases and Conditions - Experimental…

Research Data from University of New Mexico Update Understanding of Experimental Autoimmune Encephalomyelitis (Nrf2-dysregulation correlates with reduced synthesis and low glutathione levels in experimental autoimmune encephalomyelitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Autoimmune Diseases and Conditions - Experimental Autoimmune Encephalomyelitis are discussed in a new report. According to news reporting originating from Albuquerque, New Mexico, by NewsRx correspondents, research stated, "This study investigates the possible mechanism(s) underlying glutathione (GSH) deficiency in the mouse spinal cord during the course of myelin oligodendrocyte glycoprotein
(35-55) peptide-induced experimental autoimmune encephalomyelitis (EAE), a commonly used animal model of multiple sclerosis. Using the classical enzymatic recycling method and a newly developed immunodot assay, we first demonstrated that total GSH levels (i.e. free GSH plus all its adducts) are reduced in EAE, suggesting an impaired synthesis."

Financial support for this research came from National Institutes of Health.

Our news editors obtained a quote from the research from the University of New Mexico, "The decline in the levels of this essential antioxidant tripeptide in EAE coincides temporally and in magnitude with a reduction in the amount of gamma-glutamylcysteine ligase, the rate-limiting enzyme in GSH synthesis. Other enzymes involved in GSH biosynthesis, whose genes also contain antioxidant-response elements, including glutathione synthetase, cystine/glutamate antiporter, and gamma-glutamyl transpeptidase (gamma-GT) are diminished in EAE as well. Low levels of gamma-glutamylcysteine ligase, glutathione synthetase, and gamma-GT are the consequence of reduced mRNA expression, which correlates with diminished expression of the nuclear factor (erythroid-derived 2)-like 2 (Nrf2) in both the cytosol and nucleus. Interestingly, the low Nrf2 expression does not seem to be caused by increased degradation via Kelch-like ECH-associated protein 1-dependent or Kelch-like ECH-associated protein 1-independent mechanisms (such as glycogen synthetase kinase-3 beta activation), or by reduced levels of Nrf2 mRNA. This suggests that translation of this important transcription factor and/or other still unidentified post-translational processes are altered in EAE."

According to the news editors, the research concluded: "These novel findings are central toward understanding how critical antioxidant and protective responses are lost in inflammatory demyelinating disorders."

The news editors report that additional information may be obtained by contacting O.A. Bizzozero, University of New Mexico, Hlth Sci Center, Dept. of Cell Biol & Physiol, Albuquerque, NM 87131, United States. Additional authors for this research include C.L. Hu, N.I. Perrone-Bizzozero, J.Z. Zheng and O.A. Bizzozero.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jnc.13837. This DOI is a link to an online electronic document that is either free or for purchase.

Research Data from University of Padua Update Understanding of Angiology (PCSK9 knock-out mice are protected from neointimal formation in response to perivascular carotid collar placement)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Angiology have been published. According to news reporting out of Padua, Italy, by NewsRx editors, research stated, "Proprotein convertase subtilisin kexin type 9 (PCSK9) induces degradation of the low-density lipoprotein-receptor (LDLR). Smooth muscle cells (SMCs) in human atherosclerotic plaques and cultured SMCs express PCSK9."

Our news journalists obtained a quote from the research from the University of Padua, "The present study aimed at defining the role of PCSK9 on vascular response to injury. Carotid neointimal lesions were induced by positioning a non-occlusive collar in PCSK9 knockout (PCSK9(-/-)) and wild type littermate (PCSK9(+/+)) mice. In PCSK9(-/-) mice, we observed a significantly less intimal thickening (p < 0.05), a lower intimal media ratio (p < 0.02), and a tendency to higher lumen area, compared to PCSK9(+/+) mice. When compared with PCSK9(-/-), lesions of PCSK9(+/+) mice had a higher content of SMCs (p < 0.05) and collagen (p < 0.05), while no difference was observed in the accumulation of macrophages. PCSK9 was detectable in both left and right carotids artery in regions occupied by medial and neointimal SMCs. SMCs freshly isolated from PCSK9(-/-), when compared to PCSK9(+/+) cells, showed higher levels of alpha-smooth muscle actin (alpha-SMA; 2.24 +/- 0.36 fold; p< 0.01) and myosin heavy chain II (MHC-II; 8.65 +/- 1.55 fold; p< 0.01), and lower levels of caldesmon mRNA (-54 +/- 14%; p< 0.01). PCSK9(-/-) cells also showed a slower proliferation rate, and an impaired migratory capacity and G1/S progression of the cell cycle. The reconstitution of PCSK9 expression, by retroviral infection of PCSK9(-/-) SMCs, led to a downregulation of a-SMA (-56 +/- 2%; p< 0.01), MHC-II(-45% +/- 25.5 fold: p = 0.06) and calponin (-25% +/- 0.8 fold: p< 0.05) and induction of caldesmon mRNA (1.46 +/- 0.3 fold; p< 0.05). Proliferation rate of SMCs PCSK9(-/-) was significantly lower compared to PCSK9 reconstituted cells."

According to the news editors, the research concluded: "Taken together, the present results suggest that PCSK9, by sustaining SMC synthetic phenotype, proliferation, and migration, may play a pro-atherogenic role in the arterial wall."

For more information on this research see: PCSK9 knock-out mice are protected from neointimal formation in response to perivascular carotid collar placement. Atherosclerosis, 2016;253():214-224. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Research Data from University of Pannonia Update Understanding of Ion Channels (Potential L-Type Voltage-Operated Calcium Channel Blocking Effect of Drotaverine on Functional Models)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Membrane Proteins - Ion Channels are presented in a new report. According to news originating from Veszprem, Hungary, by NewsRx correspondents, research stated, "Drotaverine is considered an inhibitor of cyclic-3’,5’-nucleotide-phosphodiesterase (PDE) enzymes; however, published receptor binding data also support the potential L-type voltage-operated calcium channel (L-VOCC) blocking effect of drotaverine. Hence, in this work, we focus on the potential L-VOCC blocking effect of drotaverine by using L-VOCC-associated functional in vitro models."

Our news journalists obtained a quote from the research from the University of Pannonia, "Accordingly, drotaverine and reference agents were tested on KCl-induced guinea pig tracheal contraction. Drotaverine, like the L-VOCC blockers nifedipine or diltiazem, inhibited the KCl-induced inward Ca2+ - induced contraction in a concentration-dependent fashion. The PDE inhibitor theophylline had no effect on the KCl-evoked contractions, indicating its lack of inhibition on inward Ca2+ flow. Drotaverine was also tested on the L-VOCC-mediated resting Ca2+ refill model. In this model, the extracellular Ca2+ enters the cells to replenish the emptied intracellular Ca2+ stores. Drotaverine and L-VOCC blocker reference molecules inhibited Ca2+ replenishment of Ca2+ -depleted preparations detected by agonist-induced contractions in post-Ca2+ replenishment Ca2+ -free medium. Theophylline did not modify the Ca2+ store replenishment after contraction. It seems that drotaverine, but not theophylline, inhibits inward Ca2+ flux. The addition of CaCl2 to Ca2+ -free medium containing the agonist induced inward Ca2+ flow and subsequent contraction of Ca2+ -depleted tracheal preparations. Drotaverine, similar to the L-VOCC blockers, inhibited inward Ca2+ flow and blunted the slope of CaCl2-induced contraction in agonist containing Ca2+ -free medium with Ca2+ -depleted tracheal preparations."

According to the news editors, the research concluded: "These results show that drotaverine behaves like L-VOCC blockers but, unlike PDE inhibitors using L-VOCC associated in vitro experimental models."

The news correspondents report that additional information may be obtained from A. Guttman, Univ Pannonia, MTA Translat Glyc Res Grp, MUKKI, Veszprem, Hungary. Additional authors for this research include A. Guttman and E.G. Mikus.

Whipple's Disease

Research Data from University of Paris Update Understanding of Whipple's Disease (Whipple's arthritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Whipple's disease have been presented. According to news reporting originating from Paris, France, by NewsRx editors, the research stated, "Whipple's disease is a chronic systemic infection that is due to the bacterial agent Tropheryma whippelii and can be cured by appropriate antibiotic therapy. The typical patient is a middle-aged man."

Our news editors obtained a quote from the research from the University of Paris, "Rheumatologists are in a prime position to handle Whipple's disease. The classical presentation combines weight loss and diarrhea, preceded in three-quarters of patients by a distinctive pattern of joint manifestations that run an intermittent course, at least initially. The mean time from joint symptom onset to the diagnosis of Whipple's disease is 6 years. Either oligoarthritis or chronic polyarthritis with negative tests for rheumatoid factors (RFs) develops. If the diagnosis is missed, progression to chronic septic destructive polyarthritis may occur. Spondyloarthritis has also been reported, as well as a few cases of diskitis or, even more rarely, of hypertrophic osteoarthritis. In most patients with the classical form of Whipple's disease, periodic acid-Schiff (PAS) staining of duodenal and jejunal biopsies shows macrophagic inclusions that contain bacteria. However, the involvement of the bowel may be undetectable clinically or, less often, histologically, and even PCR testing of bowel biopsies may be negative. Therefore, when nothing points to bowel disease, rheumatologists should consider T. whipplei infection in middle-aged men with unexplained intermittent oligoarthritis. PCR testing allows the detection of T. whipplei genetic material in joint fluid, saliva, and feces. This test is now a first-line diagnostic investigation, although T. whipplei is a rare cause of unexplained RF-negative oligoarthritis or polyarthritis in males."

According to the news editors, the research concluded: "PCR testing can provide an early diagnosis before the development of severe systemic complications, which are still fatal in some cases."

The news editors report that additional information may be obtained by contacting X. Puechal, University of Paris, Hopital Cochin, Center Reference Malad Autoimmunes Syst Rares, Inst CochinInsermU1016, F-75014 Paris, France.

Central Nervous System Diseases and Conditions - …

Research Data from University of Pavia Update Understanding of Epilepsy (Development and Validation of an HPLC-UV Assay for the Therapeutic Monitoring of the New Antiepileptic Drug Perampanel in Human Plasma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions - Epilepsy have been presented. According to news reporting originating in Pavia, Italy, by NewsRx journalists, research stated, "Perampanel, a new specific non-competitive alpha-amino-3-hydroxy-5-methyl-4-isoxazole-propionic acid receptor antagonist, has been recently approved in the United States and the European Union for the adjunctive treatment of focal seizures and primary generalized tonic-clonic seizures associated with idiopathic generalized epilepsy. A positive relationship between plasma perampanel concentration and improvement in seizure control has been identified in regulatory trials, suggesting that therapeutic drug monitoring could be useful in optimizing clinical response in patients with epilepsy treated with perampanel."

The news reporters obtained a quote from the research from the University of Pavia, "The development of a simple and broadly applicable method for measuring plasma perampanel concentrations is desirable to permit the use of TDM for this drug in clinical practice. A high-performance liquid chromatographic method with ultraviolet detection for the quantitative determination of perampanel in small aliquots of human plasma (200 μL) has been developed and validated. Sample preparation involves a simple precipitation step followed by solvent evaporation. High-performance liquid chromatographic separation is achieved on 2 reverse-phase monolithic columns in sequence connected to an ultraviolet detector (320 nm), using as mobile phase water/acetonitrile (60: 40 vol/vol) mixed with 1 mL/L phosphoric acid, at a flow rate of 1.5 mL/min. Promethazine hydrochloride is used as internal standard. Calibration curves were linear over a perampanel concentration range of 25-1000 ng/mL, with correlation coefficients equal or greater than 0.998 +/- 0.001 and a limit of quantitation set at 25 ng/mL. Intra-and inter-day coefficients of variation did not exceed 7.4%, and the accuracy ranged from 96.4% to 113.3%. No interference was observed from commonly coprescribed drugs."

According to the news reporters, the research concluded: "The present assay is simple, specific, and cost effective with performance characteristics suitable for TDM use."

For more information on this research see: Development and Validation of an HPLC-UV Assay for the Therapeutic Monitoring of the New Antiepileptic Drug Perampanel in Human Plasma. Therapeutic Drug Monitoring, 2016;38(6):744-750. Therapeutic Drug Monitoring can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Research Data from University of Pisa Update Understanding of Primary Ciliary Dyskinesia (Gene editing of DNAH11 restores normal cilia motility in primary ciliary dyskinesia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Respiratory Tract Diseases and Conditions - Primary Ciliary Dyskinesia is now available. According to news reporting originating from Pisa, Italy, by NewsRx correspondents, research stated, "Primary ciliary dyskinesia (PCD) is a rare autosomal recessive genetic disorder characterised by dysfunction of motile cilia. Ciliary dysmotility causes poor mucociliary clearance and leads to impairment of pulmonary function and severe respiratory infections."

Our news editors obtained a quote from the research from the University of Pisa, "PCD has no specific therapy. With the aim to permanently restore gene function and normalise ciliary motility, we used gene editing to replace mutated with wild-type sequence in defective cells. The target gene was dynein heavy chain 11 (DNAH11), an essential component of ciliary structure. Airway ciliated cells were collected from two patients with PCD with DNAH11 nonsense mutations and altered ciliary beating and pattern. Repair of the genetic defect was performed ex vivo by site-specific recombination using transcription activator-like effector nucleases (TALENs). In an epithelial cell line engineered to contain the DNAH11 target site, TALENs cleaved over 80% of the mutated DNAH11 sequence and replaced the mutated sequence with wild-type sequence in about 50% of cells. In airway ciliated cells of patients with PCD, site-specific recombination and normalisation of ciliary beating and pattern occurred in 33% and 29% of cells, respectively."

According to the news editors, the research concluded: "This study demonstrates that gene editing can rescue ciliary beating ex vivo, opening up new avenues for treating PCD."

For more information on this research see: Gene editing of DNAH11 restores normal cilia motility in primary ciliary dyskinesia. Journal of Medical Genetics, 2016;53(4):242-9. (BMJ Publishing Group - group.bmj.com/; Journal of Medical Genetics - jmg.bmj.com/)

Lung Diseases and Conditions - Chronic Obstructive...

Research Data from University of Rochester Update Understanding of Chronic Obstructive Pulmonary Disease (Gene expression profiling of epigenetic chromatin modification enzymes and histone marks by cigarette smoke: implications for COPD and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease. According to news reporting originating in Rochester, New York, by NewsRx journalists, research stated, "Chromatin-modifying enzymes mediate DNA methylation and histone modifications on recruitment to specific target gene loci in response to various stimuli. The key enzymes that regulate chromatin accessibility for maintenance of modifications in DNA and histones, and for modulation of gene expression patterns in response to cigarette smoke (CS), are not known."

Financial supporters for this research include NIH NHLBI, American Lung Association.

The news reporters obtained a quote from the research from the University of Rochester, "We hypothesize that CS exposure alters the gene expression patterns of chromatin-modifying enzymes, which then affects multiple downstream pathways involved in the response to CS. We have, therefore, analyzed chromatin-modifying enzyme profiles and validated by quantitative real-time PCR (qPCR). We also performed immunoblot analysis of targeted histone marks in C57BL/6J mice exposed to acute and subchronic CS, and of lungs from nonsmokers, smokers, and patients with chronic obstructive pulmonary disease (COPD). We found a significant increase in expression of several chromatin modification enzymes, including DNA methyltransferases, histone acetyltransferases, histone methyltransferases, and SET domain proteins, histone kinases, and ubiquitinases. Our qPCR validation data revealed a significant downregulation of Dnmt1, Dnmt3a, Dnmt3b, Hdac2, Hdac4, Hat1, Prmt1, and Aurkb. We identified targeted chromatin histone marks (H3K56ac and H4K12ac), which are induced by CS. Thus CS-induced genotoxic stress differentially affects the expression of epigenetic modulators that regulate transcription of target genes via DNA methylation and site-specific histone modifications."

According to the news reporters, the research concluded: "This may have implications in devising epigenetic-based therapies for COPD and lung cancer."

Our news correspondents report that additional information may be obtained by contacting I. Rahman, University of Rochester, Medical Center, Dept. of Environm Med, Rochester, NY 14642, United States.

Musculoskeletal Diseases and Conditions -

Research Data from University of Southampton Update Understanding of Osteoarthritis (Demethylation of an NF-kappa B enhancer element orchestrates iNOS induction in osteoarthritis and is associated with altered chondrocyte cell cycle)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Osteoarthritis have been published. According to news originating from Southampton, United Kingdom, by NewsRx correspondents, research stated, "To examine the methylation profile of the nuclear factor (NF)-kappa B enhancer region at -5.8 kb of inducible nitric oxide synthase (iNOS) and the subsequent role in the induction of osteoarthritis (OA) via cell cycle regulation. Percentage methylation was determined by pyrosequencing, gene expression by qRT-PCR and cell proliferation was determined using the 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) assay."

Our news journalists obtained a quote from the research from the University of Southampton, "Transient transfections were induced to determine the effect of the NF-kappa B enhancer region on cell proliferation and the influence of DNA methylation. In vitro demethylation with 5-aza-dC showed decreased levels of DNA methylation at CpG sites localised at -5.8 kb, which correlated with higher levels of iNOS expression. In vitro methylation of the NF-kappa B enhancer region at -5.8 kb increased the percentage of cells at G0/G1 cell cycle phase. Loss of methylation within this region correlated with, enhanced proliferation and increased number of cells at G2/M phase. OA chondrocytes demonstrated up-regulation of the G0/G1 cell cycle progression markers Cyclin D1 and CDK6 in contrast to control cells. We demonstrate the loss of methylation that occurs at specific CpG sites localised at the -5.8 kb NF-kappa B enhancer region of the iNOS gene in OA chondrocytes permits the binding of this transcription factor activating the expression of iNOS. This results in subsequent altered cell cycle regulation, altered proliferative phenotype and transmission of the pathogenic phenotype to daughter cells."

According to the news editors, the research concluded: "This study indicates that inhibition of cell cycle progression by iNOS enhancer hyper-methylation is capable of reducing pro-inflammatory responses via down-regulation of NF-kappa B with important therapeutic implications in OA."

The news correspondents report that additional information may be obtained from R.O.C. Oreffo, University of Southampton, Sch Med, Bone & Joint Res Grp, Center Human Dev Stem Cells & RegeneratInst Dev Sci, Southampton, Hants, United Kingdom. Additional authors for this research include A. Takahashi and R.O.C. Oreffo.

**Research Data from University of Southern Florida Update**

**Understanding of Neonatal Abstinence Syndrome (Neonatal abstinence syndrome and the gastrointestinal tract)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Infant, Newborn Diseases and Conditions - Neonatal Abstinence Syndrome are presented in a new report. According to news reporting originating from Tampa, Florida, by NewsRx correspondents, research stated, "Development of a healthy gut microbiome is essential in newborns to establish immunity and protection from pathogens. Recent studies suggest that infants who develop dysbiosis may be at risk for lifelong adverse health consequences."

Our news editors obtained a quote from the research from the University of Southern Florida, "Exposure to opioid drugs during pregnancy is a factor of potential importance for microbiome health that has not yet been investigated. Since these infants are born after an entire gestation exposed to mu opioid receptor agonists and have severe gastrointestinal and neurological symptoms, we hypothesize that these infants are at risk for dysbiosis."

According to the news editors, the research concluded: "We speculate that opioid exposure during gestation and development of NAS at birth may lead to a dysbiotic gut microbiome, which may impair normal microbiome succession and development, and impact future health of these children."

The news editors report that additional information may be obtained by contacting D. Maguire, University of Southern Florida, Coll Nursing, Tampa, FL 33612, United States.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mehy.2016.10.006. This DOI is a link to an online electronic document that is either free or for purchase.

**Immunology - Granulocytes**

**Research Data from University of Sydney Update Understanding of Granulocytes (Neutrophils recruited to the myocardium after acute experimental myocardial infarct generate hypochlorous acid that oxidizes cardiac myoglobin)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - Granulocytes have been presented. According to news reporting from Sydney, Australia, by NewsRx journalists, research stated, "Myocardial inflammation following acute myocardial infarct (AMI) is associated with risk of congestive heart failure. Pro-inflammatory neutrophils were recruited to the damaged myocardium 24 h after permanent coronary ligation in rats to induce AMI as judged by the presence of immune-positive myeloperoxidase (MPO) in the tissues; MPO generates the oxidant hypochlorous acid (HOCl)."

The news correspondents obtained a quote from the research from the University of Sydney, "Neutrophils were absent in hearts from Control (untreated) and surgical Sham. Similarly, rats exposed to 1 h coronary ligation (Ischemia) showed no neutrophil infiltrate. Concomitantly, MPO activity increased in left ventricular (LV) homogenates prepared from the AMI group and this was inhibited by paracetamol and the nitroxide TEMPO. The same LV-homogenates showed increased 3-chlorotyrosine/tyrosine ratios (biomarker for MPO-activity). Combined 2D gel/Western blot indicated cardiac myoglobin (Mb) was modified after AMI. Subsequent MALDI-TOF and LC-MS/MS analysis of isolated protein spots revealed increased Mb oxidation in hearts from the AMI group relative to Control, Sham and Ischemia groups. Peptide mass mapping revealed oxidation of Met9 and Met132 to the corresponding sulfoxides yet Cys67 remained unmodified."

According to the news reporters, the research concluded: "Therefore, neutrophil-generated HOCl can oxidize cardiac Mb after AMI and this may impact on its function within the affected myocardium: oxidized Mb maybe a useful marker of myocardial inflammation."

For more information on this research see: Neutrophils recruited to the myocardium after acute experimental myocardial infarct generate hypochlorous acid that oxidizes cardiac myoglobin. *Archives of Biochemistry and Biophysics*, 2016;612():103-114. *Archives of Biochemistry and Biophysics* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Gram-Positive Bacteria - Staphylococcus aureus

Research Data from University of the Pacific Update Understanding of Staphylococcus aureus (Impact of Infectious Diseases Consultation on Clinical Outcomes of Patients with Staphylococcus aureus Bacteremia in a Community Health System)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Positive Bacteria - Staphylococcus aureus are discussed in a new report. According to news reporting originating from Hillsboro, Oregon, by NewsRx correspondents, research stated, "Staphylococcus aureus bacteremia (SAB) causes high rates of morbidity and death. Several studies in academic health settings have demonstrated that consultations from infectious diseases specialists improve the quality of care and clinical outcomes for SAB."

Our news editors obtained a quote from the research from the University of the Pacific, "Few data that describe the impact in resource-limited settings such as community hospitals are available. This retrospective cohort study evaluated the adherence to quality-of-care indicators and the clinical outcomes for SAB in a five-hospital community health system (range of 95 to 272 available beds per hospital), for patients with versus without infectious diseases consultation (IDC). IDC was provided if requested by the attending physician. The primary outcome was the incidence of treatment failure, defined as 30-day in-hospital death or 90-day SAB recurrence. Other outcomes included adherence to quality-of-care indicators. A total of 473 adult patients with SAB were included, with 369 (78%) receiving IDC. We identified substantial differences in baseline characteristics between the IDC group and the no-IDC group, including greater incidences of complicated bacteremia and intravenous drug users in the IDC group, with similar rates of severe illness (measured by Pitt bacteremia scores). Adherence to quality-of-care indicators was greater for patients with IDC (P < 0.001). After adjustment for other predicting variables, IDC was associated with a lower rate of treatment failure (adjusted odds ratio, 0.42 [95% confidence interval, 0.20 to 0.86]; P = 0.018)."

According to the news editors, the research concluded: "IDC provided better quality of care and better clinical outcomes for patients with SAB who were treated at small, resource-limited, community hospitals."

For more information on this research see: Impact of Infectious Diseases Consultation on Clinical Outcomes of Patients with Staphylococcus aureus Bacteremia in a Community Health System. Antimicrobial Agents and Chemotherapy, 2016;60(10):5682-5687.
Research Data from Victoria University Update Understanding of Alkylating Agents (Role of oxidative stress in oxaliplatin-induced enteric neuropathy and colonic dysmotility in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Alkylating Agents are discussed in a new report. According to news reporting originating from Melbourne, Australia, by NewsRx correspondents, research stated, "Background and PurposeOxaliplatin is a platinum-based chemotherapeutic drug used as a first-line therapy for colorectal cancer. However, its use is associated with severe gastrointestinal side-effects resulting in dose limitations and/or cessation of treatment."

Our news editors obtained a quote from the research from Victoria University, "In this study, we tested whether oxidative stress, caused by chronic oxaliplatin treatment, induces enteric neuronal damage and colonic dysmotility. Experimental ApproachOxaliplatin (3mg kg(-1) per day) was administered in vivo to Balb/c mice intraperitoneally three times a week. The distal colon was collected at day 14 of treatment. Immunohistochemistry was performed in wholemount preparations of submucosal and myenteric ganglia. Neuromuscular transmission was studied by intracellular electrophysiology. Circular muscle tone was studied by force transducers. Colon propulsive activity studied in organ bath experiments and faeces were collected to measure water content. Key ResultsChronic in vivo oxaliplatin treatment resulted in increased formation of reactive oxygen species (O-2-), nitration of proteins, mitochondrial membrane depolarisation resulting in the release of cytochrome c, loss of neurons, increased inducible NOS expression and apoptosis in both the submucosal and myenteric plexuses of the colon. Oxaliplatin treatment enhanced NO-mediated inhibitory junction potentials and altered the response of circular muscles to the NO donor, sodium nitroprusside. It also reduced the frequency of colonic migrating motor complexes and decreased circular muscle tone, effects reversed by the NO synthase inhibitor, N-Nitro-L-arginine."

According to the news editors, the research concluded: "Conclusion and
Implications: Our study is the first to provide evidence that oxidative stress is a key player in enteric neuropathy and colonic dysmotility leading to symptoms of chronic constipation observed in oxaliplatin-treated mice.

The news editors report that additional information may be obtained by contacting K. Nurgali, Victoria Univ, Center Chron Dis, Coll Hlth & Biomed, Melbourne, Vic, Australia. **Oncology - Solid Cancer**

**Research Data from Wake Forest University Update Understanding of Solid Cancer (Conservation of immune gene signatures in solid tumors and prognostic implications)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Solid Cancer is now available. According to news reporting out of Winston Salem, North Carolina, by NewsRx editors, research stated, "Tumor-infiltrating leukocytes can either limit cancer growth or facilitate its spread. Diagnostic strategies that comprehensively assess the functional complexity of tumor immune infiltrates could have wide-reaching clinical value."

Our news journalists obtained a quote from the research from Wake Forest University, "In previous work we identified distinct immune gene signatures in breast tumors that reflect the relative abundance of infiltrating immune cells and exhibited significant associations with patient outcomes. Here we hypothesized that immune gene signatures agnostic to tumor type can be identified by de novo discovery of gene clusters enriched for immunological functions and possessing internal correlation structure conserved across solid tumors from different anatomic sites. We assembled microarray expression datasets encompassing 5,295 tumors of the breast, colon, lung, ovarian and prostate. Unsupervised clustering methods were used to determine number and composition of gene clusters within each dataset. Immune-enriched gene clusters (signatures) identified by gene ontology enrichment were analyzed for internal correlation structure and conservation across tumors then compared against expression profiles of: 1) flow-sorted leukocytes from peripheral blood and 2) > 300 cancer cell lines from solid and hematologic cancers. Cox regression analysis was used to identify signatures with significant associations with clinical outcome. We identified nine distinct immune-enriched gene signatures conserved across all five tumor types. The signatures differentiated specific leukocyte lineages with moderate discernment overall, and naturally organized into six discrete groups indicative of admixed lineages. Moreover, seven of the
signatures exhibit minimal and uncorrelated expression in cancer cell lines, suggesting that these signatures derive predominantly from infiltrating immune cells. All nine immune signatures achieved statistically significant associations with patient prognosis (p < 0.05) in one or more tumor types with greatest significance observed in breast and skin cancers. Several signatures indicative of myeloid lineages exhibited poor outcome associations that were most apparent in brain and colon cancers. These findings suggest that tumor infiltrating immune cells can be differentiated by immune-specific gene expression patterns that quantify the relative abundance of multiple immune infiltrates across a range of solid tumor types."

According to the news editors, the research concluded: "That these markers of immune involvement are significantly associated with patient prognosis in diverse cancers suggests their clinical utility as pan-cancer markers of tumor behavior and immune responsiveness."

For more information on this research see: Conservation of immune gene signatures in solid tumors and prognostic implications. *BMC Cancer*, 2016;16():1-17. *BMC Cancer* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. **Oncology - Liver Cancer**

**Research Data from Wuhan University Update Understanding of Liver Cancer (Reanalysis of microRNA expression profiles identifies novel biomarkers for hepatocellular carcinoma prognosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Liver Cancer is the subject of a report. According to news reporting originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "The aim of our study is to identify microRNAs (miRNAs) that have significance in the prognosis and pathogenesis of hepatocellular carcinoma (HCC). The miRNAs differentially expressed in HCC were examined by using a human miRNA microarray dataset, and then the acquired candidates were screened by another microarray dataset."

Financial support for this research came from The Natural Science Foundation of China.

Our news editors obtained a quote from the research from Wuhan University, "As a result, we got 25 miRNAs which were aberrantly expressed in cancer and meanwhile predicated distinct prognosis. Among them, miR-139-5p was down-regulated in HCC and its low expression in cancer tissue meant poor prognosis. Additionally, we demonstrated that its low expression was also related to several clinicopathologic characteristics such as vein invasion,
BCLC stage, p-AKT expression, and pIGFR1 expression. In vitro, it has been discovered that treatment of HCC cells with a miR-139-5p mimic lead to inhibition of cell growth and migration. Moreover, luciferase assay showed that KPNA4 was not the direct target of miR-139-5p. Ectopic expression of miR-139-5p has not repressed the expression of KPNA4, but inhibited the nuclear import of NF-kappa B and phosphorylation of Akt."

According to the news editors, the research concluded: "For the first time, we identify 25 deregulated miRNAs that are associated with prognosis and prove that miR-139-5p functions as a tumor suppressor in HCC and its low expression predicts poor prognosis."

For more information on this research see: Reanalysis of microRNA expression profiles identifies novel biomarkers for hepatocellular carcinoma prognosis. Tumor Biology, 2016;37(11):14779-14787. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

The news editors report that additional information may be obtained by contacting Z.Q. Wang, Wuhan University, Renmin Hosp, Dept. of Gastroenterol, Wuhan 430060, People's Republic of China. Additional authors for this research include Q.S. Ding, Y.X. Li, Q.Q. Liu, W. Wu, L. Wu and H.G. Yu.

Keywords for this news article include: Wuhan, People's Republic of China, Asia, Liver Cancer, Carcinomas, Oncology, Wuhan University.

Our news journalists obtained a quote from the research from Zhengzhou University, "A total of 329 patients with BCS and an obstructed IVC were endovascularly treated with balloon dilation and/or stent placement. All patients underwent a CTA examination prior to endovascular treatment, and the data were retrospectively reviewed. The presence of a round, oval, irregular shape or jet sign low-density area without enhancement within the enhanced proximal IVC was considered a sign of a partially obstructed IVC. Digital subtraction angiography was used as the gold standard. The results from the digital subtraction angiography revealed a partially obstructed IVC in 108 BCS patients and a complete obstruction in 221
patients. The CTA discovered a partially obstructed IVC in 99 patients and a completely obstructed IVC in 230 patients. From the CTA results, 15 were false negatives, and six were false positives. The patient-based evaluation yielded an accuracy of 93.6%, a sensitivity of 86.1%, specificity of 97.3%, positive predictive value of 93.9%, and negative predictive value of 93.5% for the detection of BCS patients with a partial IVC obstruction. Computed tomographic angiography offered a high diagnostic accuracy and sensitivity in BCS patients with a partially obstructed IVC.

According to the news editors, the research concluded: "The low-density area within the enhanced proximal IVC above the membrane in artery phase can be considered a reliable indicator of a stenotic IVC in BCS patients."

For more information on this research see: Accuracy of computed tomographic angiography in the diagnosis of patients with inferior vena cava partial obstruction in Budd-Chiari syndrome. *Journal of Gastroenterology and Hepatology*, 2016;31(12):1933-1939.

The news correspondents report that additional information may be obtained from S.Y. Liu, Zhengzhou Univ, Dept. of Intervent, Henan Prov Peoples Hosp, Zhengzhou, People's Republic of China. Additional authors for this research include P. Xiao, H.C. Cao, H.S. Jiang and T.X. Li.

**Oncology - Non-Small Cell Lung Cancer**

**Research Institute and Hospital Details Findings in Non-Small Cell Lung Cancer (Prognostic Differences in Subgroups of Patients With Surgically Resected T3 Non-Small Cell Lung Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news reporting out of Gyeonggi Do, South Korea, by NewsRx editors, research stated, "This study determined the characteristics and prognosis of each descriptor of T3 non-small cell lung cancer (NSCLC). A total of 3,241 patients underwent an operation for NSCLC between 2001 and 2013, and this study included 461 patients who received complete anatomic resection of T3 NSCLC."

Our news journalists obtained a quote from the research from Research Institute and Hospital, "The T3 descriptors were coded as follows: tumor invading main bronchus within 2 cm of the carina (T3-cent), tumor invading beyond visceral pleura (T3-inv), tumor larger than 7 cm (T3-size), separate tumor nodules (T3-sep), or tumor with combined T3 descriptors (T3-comb). The T3 distribution was as follows: T3-cent, 75 patients (16.3%); T3-inv, 157 patients
(34.1%); T3-size, 132 patients (28.6%); T3-sep, 34 patients (7.4%); and T3comb, 63 patients (13.7%). Subgroup analyses revealed a significant survival benefit in the T3-cent group compared with the other groups (all p < 0.05). The 5-year disease-free survival (DFS) values were 55.4%, 36.7%, 40.9%, 30.3%, and 32.0% in the T3-cent, T3-inv, T3-size, T3-sep, and T3-comb subgroups, respectively. Multivariable analyses revealed that age (p = 0.019), N status (p = 0.001), adjuvant chemotherapy (p < 0.001), and T3 descriptors (T3-cent versus others, p < 0.001) were the most important independent prognostic factors for DFS. Additional analyses were performed to evaluate prognostic factors for DFS in the T3-cent group. Multivariable analysis revealed that bronchoplastic procedures (p = 0.004) was an independent prognostic factor for DFS. Survival for centrally located T3 NSCLC is better than other types of T3 NSCLC.

According to the news editors, the research concluded: "Lung-preserving operations such as bronchoplastic procedures might result in improved survival of these patients."

Our news journalists report that additional information may be obtained by contacting M.S. Kim, Natl Canc Center, Res Inst & Hosp, Center Lung Canc, Goyang 410769, Gyeonggi, South Korea. Additional authors for this research include M.S. Kim, D.H. Moon, H.C. Yang, B. Hwangbo, H.Y. Kim, J.M. Lee and G.K. Lee.

**Oncology - MALT Lymphoma**

**Research Results from Aga Khan University Hospital Update**

**Understanding of MALT Lymphoma (MALT lymphoma of the base of the tongue: a rare case entity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - MALT Lymphoma. According to news reporting originating from Karachi, Pakistan, by NewsRx correspondents, research stated, "Lymphoma is a malignant tumor arising from lymphoid tissue, with the majority of cases being in the lymph nodes, however, in 1/4th of cases, these tumours are found in extralymphoid tissue. Lymphoid tissue is also found in organs having mucosa, such as the digestive tract, salivary gland and in tracheal tissue."

Our news editors obtained a quote from the research from Aga Khan University Hospital, "This collection of lymphoid tissue is known as mucosa-associated lymphoid tissue (MALT), and non-Hodgkin lymphoma involving this extralymphoidal lymph tissue is known as
MALT lymphoma. It was first reported by Isaacson and Wright in 1983, however, it was not included as a working diagnosis in clinical use until it was reclassified as 'marginal zone B-cell lymphoma' in a 1994 Revised European American Lymphoma (REAL) classification. It is rarely seen in the head and neck region, and we report the sixth case of MALT lymphoma of the base of the tongue.

According to the news editors, the research concluded: "A 61-year-old man presented with dysphagia and the feeling of a lump in his throat for 5 months."

For more information on this research see: MALT lymphoma of the base of the tongue: a rare case entity. *Bmj Case Reports*, 2016;2016():. (BMJ Publishing Group - group.bmj.com/; Bmj Case Reports - casereports.bmj.com/)

The news editors report that additional information may be obtained by contacting H. Iftikhar, Section of Otolaryngology, Dept. of Surgery, Aga Khan University Hospital, Karachi, Pakistan. Additional authors for this research include M.I. Siddiqui and K. Minhas.

**Oncology - Glioblastomas**

**Research Results from Columbia University Medical Center Update Knowledge of Glioblastomas (Reassessing the Role of Intra-Arterial Drug Delivery for Glioblastoma Multiforme Treatment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Glioblastomas are discussed in a new report. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Effective treatment for glioblastoma (GBM) will likely require targeted delivery of several specific pharmacological agents simultaneously. Intra-arterial (IA) delivery is one technique for targeting the tumor site with multiple agents."

Our news journalists obtained a quote from the research from Columbia University Medical Center, "Although IA chemotherapy for glioblastoma (GBM) has been attempted since the 1950s, the predicted benefits remain unproven in clinical practice. This review focuses on innovative approaches to IA drug delivery in treating GBM. Guided by novel in vitro and in vivo optical measurements, newer pharmacokinetic models promise to better define the complex relationship between background cerebral blood flow and drug injection parameters. Advanced optical technologies and tracers, unique nanoparticles designs, new cellular targets, and rational drug formulations are continuously modifying the therapeutic landscape for GBM. Personalized treatment approaches are emerging; however, such tailored approaches will largely depend on effective drug delivery techniques and on the ability to simultaneously deliver multidrug regimens. These new paradigms for tumor-selective drug delivery herald dramatic improvements in the effectiveness of IA chemotherapy for GBM."
According to the news editors, the research concluded: "Therefore, within this context of so-called 'precision medicine,' the role of IA delivery for GBM is thoroughly reassessed."

Our news journalists report that additional information may be obtained by contacting J.A. Ellis, Dept. of Neurological Surgery, Columbia University Medical Center, New York, NY 10032, United States. Additional authors for this research include M. Banu, S.S. Hossain, R. Singh-Moon, S.D. Lavine, J.N. Bruce and S. Joshi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1155/2015/405735. This DOI is a link to an online electronic document that is either free or for purchase.

**Respiratory Tract Diseases and Conditions -…**

**Research Results from Complutense University Update Understanding of Respiratory Acidosis (Readmissions following an initial hospitalization by COPD exacerbation in Spain from 2006 to 2012)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Respiratory Tract Diseases and Conditions - Respiratory Acidosis have been presented. According to news reporting out of Madrid, Spain, by NewsRx editors, research stated, "Hospitalizations are not isolated events in COPD patients. A significant percentage of patients are readmitted during the first month after their discharge."

Our news journalists obtained a quote from the research from Complutense University, "The aim of this study was to elucidate changes in the incidence, comorbidity, length of hospital stay (LOHS), costs and in-hospital mortality (IHM) of patients readmitted following an initial hospitalization by acute exacerbation of COPD (AE-COPD). We selected all patients (>=40 years, hospitalized for AE-COPD between 2006 and 2012 in Spain using the National Hospital Discharge Database. Patient readmissions were defined as inpatient re-hospitalization within 30 days of discharge for AE-COPD. We identified 301 794 discharges of patients having hospital admissions for AE-COPD as their primary diagnosis (82.47% first admissions, 17.53% hospital readmissions). The risk of re-hospitalization was higher in patients aged 65 to 84 years, males, with comorbidities, malnutrition, not obese, respiratory acidosis, treated with non-invasive ventilation (NIV) or discharged to a health/social institutions. Factors associated with IHM among patients readmitted were: older age, increased Charlson Index, malnutrition, not being obese, respiratory acidosis and treatment with NIV. The IHM and hospital costs were significantly higher in readmissions compared with first admissions. We observed that the incidence and mortality of readmissions had significantly decreased from 2006 to 2012. Hospital readmissions within 30 days of discharge for AE-COPD are common in Spain. They have a high..."
impact for COPD patients and health system."

According to the news editors, the research concluded: "However, we have found a downward trend in incidence and mortality of readmissions from 2006 to 2012."

Our news journalists report that additional information may be obtained by contacting J. de Miguel-Diez, Pneumology Department, Hospital General Universitario Gregorio Maranon, Universidad Complutense de Madrid, Madrid, Spain. Additional authors for this research include R. Jimenez-Garcia, V. Hernandez-Barrera, P. Carrasco-Garrido, L. Puente Maestu, L. Ramírez García and A. Lopez de Andres.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/resp.12705. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Acute Myeloid Leukemia

Research Results from Department of Internal Medicine III Update Knowledge of Acute Myeloid Leukemia (IL-8 as mediator in the microenvironment-leukaemia network in acute myeloid leukaemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Myeloid Leukemia. According to news reporting originating in Munich, Germany, by NewsRx journalists, research stated, "The bone marrow microenvironment is physiologically hypoxic with areas being as low as 1% O2, e.g. the stem cell niche. Acute myeloid leukaemia (AML) blasts misuse these bone marrow niches for protection by the local microenvironment, but also might create their own microenvironment."

The news reporters obtained a quote from the research from the Department of Internal Medicine III, "Here we identify IL-8 as a hypoxia-regulated cytokine in both AML cell lines and primary AML samples that is induced within 48 hours of severe hypoxia (1% O2). IL-8 lacked effects on AML cells but induced migration in mesenchymal stromal cells (MSC), an integral part of the bone marrow. Accordingly, MSC were significantly increased in AML bone marrow as compared to healthy bone marrow. Interestingly, mononuclear cells obtained from healthy bone marrow displayed both significantly lower endogenous and hypoxia-induced production of IL-8. IL-8 mRNA expression in AML blasts from 533 patients differed between genetic subgroups with significantly lower expression of IL-8 in acute promyelocytic leukaemia (APL), while in non APL-AML patients with FLT ITD had the highest IL-8 expression. In this subgroup, high IL-8 expression was also prognostically unfavourable."

According to the news reporters, the research concluded: "Hypoxia as encountered in the bone marrow specifically increases IL-8 expression of AML, which in turn impacts niche
formation. High IL-8 expression might be correlated with poor prognosis in certain AML subsets."

For more information on this research see: IL-8 as mediator in the microenvironment-leukaemia network in acute myeloid leukaemia. Scientific Reports, 2015;5 ():18411. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting A. Kuett, Dept. of Internal Medicine III, Klinikum der Universitat Munchen, Munich, Germany. Additional authors for this research include C. Rieger, D. Perathoner, T. Herold, M. Wagner, S. Sironi, K. Sotlar, H.P. Horny, C. Deniffel, H. Drolle and M. Fiegl.

Cardiology

Research Results from Dongguk University Ilsan Hospital Update Understanding of Cardiology (Diastolic Dysfunction and Outcome in Acute Ischemic Stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting out of Goyang, South Korea, by NewsRx editors, research stated, "Left ventricular diastolic dysfunction (DD) is associated with an increased mortality in general population and patients with myocardial infarct. In the present study, we investigated whether DD is associated with outcomes after ischemic stroke."

Our news journalists obtained a quote from the research from Dongguk University Ilsan Hospital, "Five hundred and three acute ischemic stroke patients with normal left ventricular ejection fraction ( (>=)50%) were retrospectively included. Echocardiography and tissue Doppler imaging were used to evaluate and grade diastolic function. Ordinal logistic and Cox regression analyses were used to examine relations between DD and modified Rankin Scale (mRS) score at 3 months and mortality after stroke, respectively. Mean age was 67.2 ? 11.8 years and 63% were men. Among parameters of diastolic function, early mitral inflow velocity/early diastolic mitral annulus velocity (E/e') was independently related with higher mRS score at 3 months and mortality after ischemic stroke. The highest quartile of E/e' (>14) was independently associated with higher mRS score (adjusted OR 3.86, 95% CI 2.27-6.54) as well as with mortality (hazards ratio [HR] 2.87, 95% CI 1.17-7.04) as compared to the lowest quartile of E/e' (<8.8). In addition, moderate-to-severe DD grade was related to higher mRS score (adjusted OR 2.41, 95% CI 1.15-5.06) and mortality (HR 6.63, 95% CI 1.80-24.43) compared to the normal diastolic function. In patients with ischemic stroke, DD is associated with functional outcome at 3 months and mortality."

According to the news editors, the research concluded: "Our data suggest that more
attention should be given to DD in patients with ischemic stroke."

For more information on this research see: Diastolic Dysfunction and Outcome in Acute Ischemic Stroke. *Cerebrovascular Diseases*, 2016;41(3-4):148-55. (Karger - www.karger.com; Cerebrovascular Diseases - content.karger.com/ProdukteDB/produkte.asp?Aktion=JournalHome&ProduktNr=224153)

Our news journalists report that additional information may be obtained by contacting W.S. Ryu, Dept. of Neurology, Dongguk University Ilsan Hospital, Goyang, South Korea. Additional authors for this research include J.B. Park, S.B. Ko, S.S. Hwang, Y.J. Kim, D.E. Kim, S.H. Lee and B.W Yoon.

**Oncology - Malignant Pleural Effusion**

**Research Results from Fudan University Update Understanding of Malignant Pleural Effusion (Potential diagnostic value of serum/pleural fluid IL-31 levels for tuberculous pleural effusion)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Malignant Pleural Effusion. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to explore the diagnostic value of IL-31 levels in the pleural fluid and plasma to differentially diagnose tuberculous and malignant pleural effusion. We enrolled 91 cases, including tuberculous pleural effusion (TPE, n=50), malignant pleural effusion (MPE, n=41), other cases including pneumonia with pleural fluid, pulmonary tuberculosis and healthy people as controls."

The news correspondents obtained a quote from the research from Fudan University, "Whole blood was stimulated with the *M. tuberculosis*-specific antigens and plasma was collected. The multiplex bead-based cytokine immunoassay was employed to measure the levels of various cytokines. IL-31 was found to be the most prominent cytokine (p <0.0001), and with an optimal cut-off value of 67.5 pg/mL, the sensitivity and specificity for the diagnosis of TPE were 86% and 100%, respectively. Furthermore, the tuberculosis-specific IL-31 levels in the plasma of TPE patients were higher than that of MPE patients (p=0.0002). At an optimal cut-off value of 23.9 pg/mL, the sensitivity and specificity for the diagnosis of TPE were 92.9% and 85.7%, respectively. Ultimately, the combination of pleural fluid with the plasma tuberculosis-specific IL-31 levels improved the sensitivity and specificity to 94.0% and 95.1%, respectively."

According to the news reporters, the research concluded: "Thus, we identified a novel biomarker for the diagnosis of TPE for clinical application."

For more information on this research see: Potential diagnostic value of serum/pleural fluid IL-31 levels for tuberculous pleural effusion. *Scientific Reports*, 2016;6 ():20607. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by
contacting Y. Gao, Dept. of Infectious Diseases, Huashan Hospital, Fudan University, Shanghai 200040, People's Republic of China. Additional authors for this research include Q. Ou, J. Wu, B. Zhang, L. Shen, S. Chen, X. Weng, Y. Zhang, W. Zhang and L. Shao.

Herpesvirus Diseases and Conditions - Herpes...

Research Results from Graduate School Update Knowledge of Herpes Simplex Virus (OASL1 deficiency promotes antiviral protection against genital herpes simplex virus type 2 infection by enhancing type I interferon production)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Herpesvirus Diseases and Conditions - Herpes Simplex Virus is the subject of a report. According to news reporting originating in Daejeon, South Korea, by NewsRx journalists, research stated, "Type I interferon (IFN) interferes with virus replication, promotes antiviral responses, and controls innate and adaptive immune responses to certain viruses. Recently, we reported that 2’-5’oligoadenylate synthetase-like 1 (OASL1) negatively regulates type I IFN production by inhibiting the translation of the type I IFN-regulating master transcription factor, IRF7."

The news reporters obtained a quote from the research from Graduate School, "Notably, while OASL1-deficient mice induce robust production of type I IFN and are resistant to systemic viral infection, the effects of OASL1 during localized viral infection have not been studied. To this end, we investigated the role of OASL1 during mucosal HSV-2 infection of the genital tract. Oasl1(-/-) mice exhibited better survival rates than wild type (WT) mice following intravaginal HSV-2 infection, and suppressed virus replication more efficiently despite comparable recruitment of effector immune cells. Moreover, Ly6C(high) monocytes, and not pDCs or other cell types, displayed enhanced production of type I IFNs in Oasl1(-/-) mice in response to HSV-2 infection. Furthermore, cytotoxic T cell responses including IFN-g production were accelerated in Oasl1(-/-) mice after mucosal HSV-2 infection."

According to the news reporters, the research concluded: "Collectively, these results demonstrate that OASL1 deficiency promotes antiviral immunity against local mucosal viral infection and suggest that OASL1 could be a therapeutic target for treatment of HSV-2 infection of the genital mucosa."

For more information on this research see: OASL1 deficiency promotes antiviral protection against genital herpes simplex virus type 2 infection by enhancing type I interferon production. Scientific Reports, 2016;6():19089. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting J.E. Oh, Laboratory of Host Defenses, Graduate School of Medical Science and
Pregnancy Complications - Preeclampsia

Research Results from Harvard School of Medicine Update Knowledge of Preeclampsia (Analysis of changes in maternal circulating angiogenic factors throughout pregnancy for the prediction of preeclampsia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pregnancy Complications - Preeclampsia. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "To assess whether changes in maternal angiogenic factors throughout pregnancy predict the development of preeclampsia. Placental growth factor (PlGF) and soluble fms-like tyrosine kinase 1 receptor (sFlt-1) were measured in 2355 women at 10, 18, 26 and 35 weeks gestation."

The news reporters obtained a quote from the research from the Harvard School of Medicine, "Receiver operator characteristic analysis was used to calculate test characteristics for changes in analytes between time points. Linear mixed-effects models generated slopes of analytes throughout pregnancy, which in turn were used as predictors in adjusted logistic regression models. Changes in analytes yielded positive predictive values of 9 to 19% and negative predictive values of 93 to 97%. Individuals with lowest quartile slopes in PlGF had sixfold greater odds (95% confidence interval (CI): 3.5, 10.2) of preeclampsia compared with individuals in the highest quartile. With respect to sFlt-1, the highest quartile had 5.1 times greater odds (95% CI: 3.1, 8.4) than the lowest quartile. Measuring the trend in PlGF and sFlt-1 across pregnancy segregates women at increased risk of preeclampsia."

According to the news reporters, the research concluded: "However, changes in these factors throughout pregnancy lack clinically useful predictive power."

Our news correspondents report that additional information may be obtained by contacting M.C. Honigberg, Dept. of Medicine, Brigham and Women's Hospital, Harvard Medical School, Boston, MA, United States. Additional authors for this research include D.E. Cantonwine, A.M. Thomas, K.H. Lim, S.I. Parry and T.F McElrath.

Oncology - Small Cell Lung Cancer

Research Results from Henan University Update Understanding of Small Cell Lung Cancer (Association between polymorphisms in the XRCC1 gene and the risk of non-small cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Small Cell Lung Cancer is now available. According to news reporting originating in Kaifeng, People's Republic of China, by NewsRx journalists, research stated, "Here, we have reported a case-control study investigating the association between XRCC1 codons Arg194Trp, Arg280His, and Arg399Gln and the development of NSCLC. NSCLC patients (N=245) and healthy controls (N=257) were randomly selected from the Huaihe Hospital between March 2012 and August 2014."

The news reporters obtained a quote from the research from Henan University, "DNA extracted from the patient and control blood samples were subjected to polymerase chain reaction-restriction fragment length polymorphism (PCR-RFLP) to assess the genotyping of XRCC1 Arg194Trp, Arg280His, and Arg399Gln. Multivariate logistic regression analyses revealed an association between the expression of the AA genotype and A allele genotypes and a significantly increased risk of NSCLC, compared to the GG genotype [95% confidence interval (CI); Odd's ratio (OR)=2.82 (1.141-5.86) and 1.67 (1.17-2.37), respectively]. The potential association between the A allele of XRCC1 Arg399Gln and the risk of NSCLC was more evident in smokers (95%CI; OR=1.70; 1.11-2.63)."

According to the news reporters, the research concluded: "The XRCC1 Arg399Gln polymorphism was found to be associated with increased risk of NSCLC, especially in tobacco smokers."

Our news correspondents report that additional information may be obtained by contacting J.C. Han, Dept. of Respiration Medicine, Huaihe Hospital of Henan University, Kaifeng, People's Republic of China. Additional authors for this research include Y.J. Zhang and X.D Li.

Oncology - Lung Cancer

Research Results from Kaohsiung Medical University Update
Knowledge of Lung Cancer (Distinct CPT-induced deaths in lung cancer cells caused by clathrin-mediated internalization of CP micelles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news reporting originating from Kaohsiung, Taiwan, by NewsRx correspondents, research stated, "We previously synthesized a chondroitin sulfate-graft-poly(e-caprolactone) copolymer (H-CP) with a high content of poly(e-caprolactone) (18.7 mol%), which self-assembled in water into a rod-like micelle to encapsulate hydrophobic camptothecin (CPT) in the core (micelle/CPT) for tumor-targeted drug delivery. As a result of the recognition of the micelle by CD44, the micelle/CPT entered CRL-5802 cells efficiently and released CPT efficaciously, resulting in higher tumor suppression than commercial CPT-11."

Our news editors obtained a quote from the research from Kaohsiung Medical University, "In this study, H1299 cells were found to have a higher CD44 expression than CRL-5802 cells. However, the lower CD44-expressing CRL-5802 cells had a higher percentage of cell death and higher cellular uptake of the micelle/CPT than the higher CD44-expressing H1299 cells. Examination of the internalization pathway of the micelle/CPT in the presence of different endocytic chemical inhibitors showed that the CRL-5802 cells involved clathrin-mediated endocytosis, which was not found in the H1299 cells. Analysis of the cell cycle of the two cell lines exposed to the micelle/CPT revealed that the CRL-5802 cells arrested mainly in the S phase and the H1299 cells arrested mainly in the G2-M phase. A consistent result was also found in the evaluation of g-H2AX expression, which was about three-fold higher in the CRL-5802 cells than in the H1299 cells. A near-infrared dye, IR780, was encapsulated into the micelle to observe the in vivo biodistribution of the micelle/IR780 in tumor-bearing mice. The CRL-5802 tumor showed a higher fluorescence intensity than the H1299 tumor at any tracing time after 1 h."

According to the news editors, the research concluded: "Thus we tentatively concluded that CRL-5802 cells utilized the clathrin-mediated internalization pathway and arrested in the S phase on exposure to the micelle/CPT; all are possible reasons for the better therapeutic outcome in CRL-5802 cells than in H1299 cells."

The news editors report that additional information may be obtained by contacting Y.S. Liu, School of Pharmacy, Kaohsiung Medical University, Kaohsiung 807, Taiwan. Additional authors for this research include R.Y. Cheng, Y.L. Lo, C. Hsu, S.H. Chen, C.C. Chiu and L.F Wang.

Research Results from Monash University Update Understanding of Polycystic Ovary Syndrome (Polycystic Ovary Syndrome, Obesity, and Pregnancy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Endocrine System Diseases and Conditions - Polycystic Ovary Syndrome. According to news reporting originating in Clayton, Australia, by NewsRx journalists, research stated, "Polycystic ovary syndrome (PCOS) is a common endocrine disorder affecting up to one in five reproductive-aged women. It is underpinned by insulin resistance and hyperandrogenism and is associated with metabolic, reproductive, and psychological features."

The news reporters obtained a quote from the research from Monash University, "Women with PCOS have higher rates of obesity and central adiposity compared with women without PCOS, and weight strongly influences prevalence and clinical severity of PCOS. Women with PCOS may have subfertility and women should be aware of factors affecting fertility, in particular the impact of obesity and age. Once pregnant, women with PCOS have significantly increased risk of pregnancy-related complications including gestational diabetes, hypertensive disorders, premature delivery, and delivery by cesarean section. The offspring of women with PCOS may have increased risk of congenital abnormalities and hospitalization in childhood."

According to the news reporters, the research concluded: "Clinicians should be aware of the increased risk and screen, prevent, and manage accordingly."

For more information on this research see: Polycystic Ovary Syndrome, Obesity, and Pregnancy, Seminars In Reproductive Medicine, 2016;34(2):93-101. (Thieme - www.thieme.com)

Our news correspondents report that additional information may be obtained by contacting A.E. Joham, Monash Centre for Health Research and Implementation, School of Public Health and Preventive Medicine, Monash University, Clayton, Victoria, Australia. Additional authors for this research include S. Palomba and R. Hart.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1055/s-0035-1571195. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Angina Pectoris

Research Results from Morbid Obesity Center Update Knowledge of Angina Pectoris (Association between Body Mass Index, Asymmetric Dimethylarginine and Risk of Cardiovascular Events and Mortality in Norwegian Patients with Suspected Stable Angina Pectoris ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Angina Pectoris is the subject of a report. According to news originating from Tonsberg, Norway, by NewsRx correspondents, research stated, "Asymmetric dimethylarginine (ADMA) is associated with increased risk of atherosclerotic cardiovascular disease and mortality through inhibition of nitrogen oxide (NO) synthesis. As positive correlations between serum concentrations of NO and body mass index (BMI) have been observed, we aimed to explore whether the potential associations between plasma ADMA levels and the risk of acute myocardial infarction (AMI) and mortality were modified by BMI."

Our news journalists obtained a quote from the research from Morbid Obesity Center, "Multivariable Cox proportional hazard models were used to estimate the hazard ratios (HR) for AMI, cardiovascular death and all-cause mortality according to baseline plasma ADMA levels in 4122 patients with suspected stable angina pectoris. Analyses were subsequently repeated in patients with BMI below (low BMI) or above (high BMI) median. A total of 2982 patients (72%) were men. Median (range) age, plasma ADMA level and BMI were 62 (21-88) years, 0.54 (0.10-1.25) mmol/L and 26.3 (18.5-54.3) kg/m2, respectively. During a mean (standard deviation) follow-up time of 4.7 (1.4) years, 337 (8%) patients suffered from an AMI, 300 (7%) died, whereof 165 (55%) due to cardiovascular disease. Each 0.1 mmol/L increment in plasma ADMA level was associated with an increased risk of AMI (HR (95% CI) 1.21 (1.08, 1.35) and cardiovascular death 1.30 (1.13, 1.49) in participants with low BMI only. Interactions were significant for AMI (p=0.04) and CV death (p=0.03). BMI did not modify the association between plasma ADMA levels and all-cause mortality."

According to the news editors, the research concluded: "Plasma ADMA levels were associated with risk of AMI and cardiovascular death among patients with low BMI only."

For more information on this research see: Association between Body Mass Index, Asymmetric Dimethylarginine and Risk of Cardiovascular Events and Mortality in Norwegian Patients with Suspected Stable Angina Pectoris. Plos One, 2016;11(3):e0152029. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

The news correspondents report that additional information may be obtained from H. Borgeraas, Morbid Obesity Center, Vestfold Hospital Trust, Tonsberg, Norway. Additional authors for this research include J.K. Hertel, G.F. Svingen, E.R. Pedersen, R. Seifert, O. Nygard and J. Hjelmesath.

Research Results from Newcastle University Update Knowledge of Obesity (Physical activity attenuates the effect of the FTO genotype on obesity traits in European adults: The Food4Me study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting out of Newcastle upon Tyne, United Kingdom, by NewsRx editors, research stated, "To examine whether the effect of FTO loci on obesity-related traits could be modified by physical activity (PA) levels in European adults. Of 1,607 Food4Me participants randomized, 1,280 were genotyped for FTO (rs9939609) and had available PA data."

Our news journalists obtained a quote from the research from Newcastle University, "PA was measured objectively using accelerometers (TracmorD, Philips), whereas anthropometric measures [BMI and waist circumference (WC)] were self-reported via the Internet. FTO genotype was associated with a higher body weight [b: 1.09 kg per risk allele, (95% CI: 0.14-2.04), p=0.024], BMI [b: 0.54 kg?m(-2) , (0.23-0.83), p<0.0001], and WC [b: 1.07 cm, (0.24-1.90), p=0.011]. Moderate-equivalent PA attenuated the effect of FTO on BMI (P[interaction]=0.020). Among inactive individuals, FTO increased BMI by 1.06 kg?m(-2) per allele (p=0.024), whereas the increase in BMI was substantially attenuated among active individuals (0.16 kg?m(-2) , p=0.388). We observed similar effects for WC (P[interaction]= 0.005): the FTO risk allele increased WC by 2.72 cm per allele among inactive individuals but by only 0.49 cm in active individuals. PA attenuates the effect of FTO genotype on BMI and WC."

According to the news editors, the research concluded: "This may have important public health implications because genetic susceptibility to obesity in the presence of FTO variants may be reduced by adopting a physically active lifestyle."

For more information on this research see: Physical activity attenuates the effect of the FTO genotype on obesity traits in European adults: The Food4Me study. Obesity, 2016;24 (4):962-9. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

Our news journalists report that additional information may be obtained by contacting C. Research Results from Seoul National University Update Knowledge of Carcinomas (Mica Nanoparticle, STB-HO Eliminates the Human Breast Carcinoma Cells by Regulating the Interaction of Tumor with its Immune Microenvironment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Carcinomas. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Mica, an aluminosilicate mineral, has been proven to possess anti-tumor and immunostimulatory effects. However, its efficacy and mechanisms in treating various types of tumor are less verified and the mechanistic link between anti-tumor and immunostimulatory effects has not been elucidated."

The news correspondents obtained a quote from the research from Seoul National University, "We sought to investigate the therapeutic effect of STB-HO (mica nanoparticles) against one of the most prevalent cancers, the breast cancer. STB-HO was orally administered into MCF-7 xenograft model or directly added to culture media and tumor growth was monitored. STB-HO administration exhibited significant suppressive effects on the growth of MCF-7 cells in vivo, whereas STB-HO did not affect the proliferation and apoptosis of MCF-7 cells in vitro. To address this discrepancy between in vivo and in vitro results, we investigated the effects of STB-HO treatment on the interaction of MCF-7 cells with macrophages, dendritic cells (DCs) and natural killer (NK) cells, which constitute the cellular composition of tumor microenvironment. Importantly, STB-HO not only increased the susceptibility of MCF-7 cells to immune cells, but also stimulated the immunocytes to eliminate cancer cells."

According to the news reporters, the research concluded: "Our study highlights the possible role of STB-HO in the suppression of MCF-7 cell growth via the regulation of interactions between tumor cells and anti-tumor immune cells."

For more information on this research see: Mica Nanoparticle, STB-HO Eliminates the Human Breast Carcinoma Cells by Regulating the Interaction of Tumor with its Immune Microenvironment. Scientific Reports, 2015;5():17515. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting T.W. Kang, Adult Stem Cell Research Center, College of Veterinary Medicine, Seoul National University, Seoul 151-742, South Korea. Additional authors for this research include H.S. Kim, B.C. Lee, T.H. Shin, S.W. Choi, Y.J. Kim, H.Y. Lee, Y.K. Jung, K.W. Seo and K.S Kang.

Research Results from Toronto Western Hospital Update
Understanding of Biological Therapy (A Systematic Study of the Effect of Different Molecular Weights of Hyaluronic Acid on Mesenchymal Stromal Cell-Mediated Immunomodulation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biological Therapy is the subject of a report. According to news reporting from Toronto, Canada, by NewsRx journalists, research stated, "Osteoarthritis (OA) is associated with chronic inflammation, and mesenchymal stromal cells (MSCs) have been shown to provide pain relief and reparative effects in clinical investigations. MSCs are often delivered with hyaluronic acid (HA), although the combined mechanism of action is not fully understood; we thus investigated the immunomodulatory effects of combining MSCs with different molecular weights (MW) of HA."

The news correspondents obtained a quote from the research from Toronto Western Hospital, "HAs with MWs of 1.6 MDa (hHA), 150 kDa or 7.5 kDa, were added to MSCs alone or MSC-immune cell co-cultures. Gene expression analyses, flow cytometry and cytokine measurements were assessed to determine the effect of HAs on the MSC interactions with immune cells. MSCs in the presence of HAs, in both normal and lymphocyte-conditioned medium, showed negligible changes in gene expression. While addition of hHA resulted in increased proliferation of activated lymphocytes, both in the presence and absence of MSCs, the overall combined effect was a more regulated, homeostatic one; this was supported by higher ratios of secreted IL10/IFNg and IL10/IL2, in lymphocyte cultures, than with lower MW HAs or no HA, both in the presence and absence of MSCs. In addition, examination of monocyte-derived macrophages showed an increased M2 macrophage frequency (CD14+CD163+CD206+) in the presence of hHA, both with and without MSCs. hHA produces a less pro-inflammatory environment than lower MW HAs."

According to the news reporters, the research concluded: "Moreover, combining hHA with MSCs has an additive effect on the MSC-mediated immunomodulation, suggestive of a more potent combination treatment modality for OA."

Our news journalists report that additional information may be obtained by contacting A. Gomez-Aristizabal, The Arthritis Program, Toronto Western Hospital, Toronto, ON, Canada. Additional authors for this research include K.P. Kim and S. Viswanathan.

Research Results from University Hospital Update Understanding of Iron Deficiency (A fast-track anaemia clinic in the Emergency Department: feasibility and efficacy of intravenous iron administration for treating sub-acute iron deficiency ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Iron Deficiency. According to news reporting out of Madrid, Spain, by NewsRx editors, research stated, "Clinically significant anaemia, requiring red blood cell transfusions, is frequently observed in Emergency Departments (ED). To optimise blood product use, we developed a clinical protocol for the management of iron-deficiency anaemia in a fast-track anaemia clinic within the ED."

Our news journalists obtained a quote from the research from University Hospital, "From November 2010 to January 2014, patients presenting with sub-acute, moderate-to-severe anaemia (haemoglobin [Hb] <11 g/dL) and confirmed or suspected iron deficiency were referred to the fast-track anaemia clinic. Those with absolute or functional iron deficiency were given intravenous (IV) ferric carboxymaltose 500-1,000 mg/week and were reassessed 4 weeks after receiving the total iron dose. The primary study outcome was the haematological response (Hb (>=)12 g/dL and/or Hb increment (>=)2 g/dL). Changes in blood and iron parameters, transfusion rates and IV iron-related adverse drug effects were secondary outcomes. Two hundred and two anaemic patients with iron deficiency (150 women/52 men; mean age, 64 years) were managed in the fast-track anaemia clinic, and received a median IV iron dose of 1,500 mg (1,000-2,000 mg). Gastro-intestinal (44%) or gynaecological (26%) bleeding was the most frequent cause of the anaemia. At follow-up (183 patients), the mean Hb increment was 3.9?2.2 g/dL; 84% of patients were classified as responders and blood and iron parameters normalised in 90%. During follow-up, 35 (17%) patients needed transfusions (2 [range: 1-3] units per patient) because they had low Hb levels, symptoms of anaemia and/or were at risk. Eight mild and one moderate, self-limited adverse drug effects were witnessed. Our data support the feasibility of a clinical protocol for management of sub-acute anaemia with IV iron in the ED. IV iron was efficacious, safe and well tolerated."

According to the news editors, the research concluded: "Early management of anaemia will improve the use of blood products in the ED."

Our news journalists report that additional information may be obtained by contacting M. Quintana-Diaz, Emergency Department, University Hospital La Paz, Madrid, Spain. Additional authors for this research include S. Fabra-Cadenas, S. Gomez-Ramirez, A. Martinez-Virto, J.A. Garcia-Erce and M. Munoz.

Keywords for this news article include: Spain, Madrid, Europe, Hematology, Iron Deficiency, Nutritional and Metabolic Diseases and Conditions.

Heart Disorders and Diseases - Heart Failure

Research Results from University of Antwerp Update Knowledge of Heart Failure (Circulating Stromal Cell-Derived Factor 1a Levels in Heart Failure: A Matter of Proper Sampling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Failure have been presented. According to news reporting from Antwerp, Belgium, by NewsRx journalists, research stated, "The chemokine Stromal cell-derived factor 1a (SDF1a, CXCL12) is currently under investigation as a biomarker for various cardiac diseases. The correct interpretation of SDF1a levels is complicated by the occurrence of truncated forms that possess an altered biological activity."

The news correspondents obtained a quote from the research from the University of Antwerp, "We studied the immunoreactivities of SDF1a forms and evaluated the effect of adding a DPP4 inhibitor in sampling tubes on measured SDF1a levels. Using optimized sampling, we measured DPP4 activity and SDF1a levels in patients with varying degrees of heart failure. The immunoreactivities of SDF1a and its degradation products were determined with three immunoassays. A one hour incubation of SDF1a with DPP4 at 37°C resulted in 2/3 loss of immunoreactivity in each of the assays. Incubation with serum gave a similar result. Using appropriate sampling, SDF1a levels were found to be significantly higher in those heart failure patients with a severe loss of left ventricular function. DPP4 activity in serum was not altered in the heart failure population. However, the DPP4 activity was found to be significantly decreased in patients with high SDF1a levels. We propose that all samples for SDF1a analysis should be collected in the presence of at least a DPP4 inhibitor. In doing so, we found higher SDF1a levels in subgroups of patients with heart failure."

According to the news reporters, the research concluded: "Our work supports the need for further research on the clinical relevance of SDF1a levels in cardiac disease."

Our news journalists report that additional information may be obtained by contacting L. Baerts, Laboratory of Medical Biochemistry, University of Antwerp, Antwerp, Belgium. Additional authors for this research include Y. Waumans, I. Brandt, W. Jungraithmayr, P. Van der Veken, M. Vanderheyden and I. De Meester.

Research Results from University of Bologna Update Understanding of Oxidoreductases (Xanthine oxidoreductase in cancer: more than a differentiation marker)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Enzymes and Coenzymes - Oxidoreductases is now available. According to news originating from Bologna, Italy, by NewsRx correspondents, research stated, "Human xanthine oxidoreductase (XOR) catalyzes the last two steps of purine catabolism and is present in two interconvertible forms, which may utilize O2 or NAD(+) as electron acceptors. In addition to uric acid, XOR products may comprise reactive oxygen and nitrogen species that have many biologic effects, including inflammation, endothelial dysfunction, and cytotoxicity, as well as mutagenesis and induction of proliferation."

Financial support for this research came from Pallotti Legacies for Cancer Research. Our news journalists obtained a quote from the research from the University of Bologna, "XOR is strictly modulated at the transcriptional and post-translational levels, and its expression and activity are highly variable in cancer. Xanthine oxidoreductase (XOR) expression has been negatively associated with a high malignity grade and a worse prognosis in neoplasms of the breast, liver, gastrointestinal tract, and kidney, which normally express a high level of XOR protein. However, the level of XOR expression may be associated with a worse outcome in cancer of low XOR-expressing cells, in relation to the inflammatory response elicited through the tissue damage induced by tumor growth. Xanthine oxidoreductase (XOR) has been implicated in the process of oncogenesis either directly because it is able to catalyze the metabolic activation of carcinogenic substances or indirectly through the action of XOR-derived reactive oxygen and nitrogen species."

According to the news editors, the research concluded: "The role of uric acid is characterized by both oxidant and antioxidant action; thus, it is still debatable whether control of uricemia may be helpful to improve the outcomes of tumor illness."

The news correspondents report that additional information may be obtained from M.G. Battelli, Dept. of Experimental, Diagnostic and Specialty Medicine - DIMES, Alma Mater Studiorum - University of Bologna, General Pathology Unit, Via S Giacomo 14, 40126, Bologna, Italy. Additional authors for this research include L. Polito, M. Bortolotti and A. Bolognesi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cam4.601. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Italy, Europe, Cancer, Bologna, Oncology, Article Review, Oxidoreductases, Enzymes and Coenzymes.

Environmental Microbiology

Research Results from University of Cambridge Update Understanding of Environmental Microbiology (Molecular genetic and physical analysis of gas vesicles in buoyant enterobacteria)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Environmental Microbiology. According to news reporting originating from Cambridge, United Kingdom, by NewsRx correspondents, research stated, "Different modes of bacterial taxis play important roles in environmental adaptation, survival, colonization and dissemination of disease. One mode of taxis is flotation due to the production of gas vesicles."

Financial supporters for this research include BBSRC, Japan Society for the Promotion of Sciences, Cambridge University.

Our news editors obtained a quote from the research from the University of Cambridge, "Gas vesicles are proteinaceous intracellular organelles, permeable only to gas, that enable flotation in aquatic niches. Gene clusters for gas vesicle biosynthesis are partially conserved in various archaea, cyanobacteria, and some proteobacteria, such as the *Enterobacterium*, Serratia sp. ATCC 39006 (S39006). Here we present the first systematic analysis of the genes required to produce gas vesicles in S39006, identifying how this differs from the archaeon Halobacterium salinarum. We define 11 proteins essential for gas vesicle production. Mutation of gvpN or gvpV produced small bicone gas vesicles, suggesting that the cognate proteins are involved in the morphogenetic assembly pathway from bicones to mature cylindrical forms. Using volumetric compression, gas vesicles were shown to comprise 17% of S39006 cells, whereas in *Escherichia coli* heterologously expressing the gas vesicle cluster in a deregulated environment, gas vesicles can occupy around half of cellular volume."

According to the news editors, the research concluded: "Gas vesicle production in S39006 and *E. coli* was exploited to calculate the instantaneous turgor pressure within cultured bacterial cells; the first time this has been performed in either strain."

The news editors report that additional information may be obtained by contacting Y. Tashiro, Dept. of Biochemistry, University of Cambridge, Cambridge, CB2 1QW, UK. Additional authors for this research include R.E. Monson, J.P. Ramsay and G.P Salmond.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1462-2920.13203. This DOI is a link to an online electronic document that is either free or for purchase.

Research Results from University of Dschang Update Knowledge of Vaccines [Improving community based AEFI (Adverse Events Following Immunization) reporting rate through telephone "beep" in a Cameroon health district: a randomized field trial]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immunization - Vaccines is now available. According to news reporting originating in Dschang, Cameroon, by NewsRx journalists, research stated, "AEFIs underreporting is one of different barriers to achieving objectives of pharmaco vigilance of vaccine worldwide. Studies describe it as being related to limited awareness of health personnel and of vaccinees or of their parents."

The news reporters obtained a quote from the research from the University of Dschang, "The objective was to assess the effect of telephone 'beep' on community based reporting rates of AEFIs during routine immunization sessions in a Cameroon Health District. It was a randomized control trial implemented during routine EPI in Biyem-Assi health district (Cameroon). Parents of vaccinated children were randomly assigned: i) to receive the telephone contact of the investigation team and was advised to 'beep'(short phone call not picked up) the investigators team in the case any medical incidence occurs within the 30 days following the immunization (intervention group) or; ii) to return to the health facility in case any medical incidence occurs within the same period (control group). The main outcome was AEFI incidence rate. 236 parents were assigned to the intervention group and 235 to the control group. Of 1192 doses of EPI vaccines administered, 20 AEFIs (392 AEFIs/100000 doses/week) were reported within 30 days after vaccine administration. These included 19 (829 AEFIs/100000 doses/week) AEFIs in the intervention group and 1 (43 AEFIs/100000 doses/week) AEFI in the control group. The AEFIs reporting rate in the intervention group was significantly higher than that in the control group [RR=18.9; CI95 (2.5; 140.0) (p=0.0004)]."

According to the news reporters, the research concluded: "The use of telephone 'beep' significantly increases at affordable cost community based AEFI reporting rate in routine EPI."

For more information on this research see: Improving community based AEFI (Adverse Events Following Immunization) reporting rate through telephone "beep" in a Cameroon health district: a randomized field trial. The Pan African Medical Journal, 2015;22 ():351.

Cardiology

Research Results from University of Melbourne Update Understanding of Cardiology [CaMKIIId and cardiomyocyte Ca(2+) signalling new perspectives on splice variant targeting]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news originating from Victoria, Australia, by NewsRx correspondents, research stated, "Control of cardiomyocyte cytosolic Ca(2+) levels is crucial in determining inotropic status and ischemia/reperfusion stress response. Responsive to fluctuations in cellular Ca(2+), Ca(2+)/calmodulin-dependent protein kinase II (CaMKII) is a serine/threonine kinase integral to the processes regulating cardiomyocyte Ca(2+) channels/transporters."

Our news journalists obtained a quote from the research from the University of Melbourne, "CaMKII is primarily expressed either in the dB or dC splice variant forms, which may mediate differential influences on cardiomyocyte function and pathological response mechanisms. Increases in myocyte Ca(2+) levels promote the binding of a Ca(2+)/calmodulin complex to CaMKII, to activate the kinase. Activity is also maintained through a series of post-translational modifications within a critical region of the regulatory domain of the protein. Recent data indicate that the post-translational modification status of CaMKIIIdB/dC variants may have an important influence on reperfusion outcomes. This study provided the first evidence that the specific type of CaMKII post-translational modification has a role in determining target selectivity of downstream Ca(2+) transporters. The study was also able to demonstrate that the phosphorylated form of CaMKII closely co-localizes with CaMKIIIdB in the nuclear/myofilament fraction, contrasting with a co-enrichment of oxidized CaMKII in the membrane fraction with CaMKIIIdC. It has also been possible to conclude that a hyper-phosphorylation of CaMKII (Thr287) in reperfused hearts represents a hyper-activation of the CaMKIIIdB, which exerts anti-arrhythmic actions through an enhanced capacity to selectively increase sarcoplasmic reticulum Ca(2+) uptake and maintain cytosolic Ca(2+) levels."

According to the news editors, the research concluded: "This suggests that suppression of global CaMKIIId may not be an efficacious approach to developing optimal pharmacological interventions for the vulnerable heart."

The news correspondents report that additional information may be obtained from J.R. Bell, Dept. of Physiology, University of Melbourne, Victoria, Australia. Additional authors for this research include A.J. Raaijmakers, J.V. Janssens and L.M Delbridge.

Research Results from University of Milan Update Knowledge of Science (Embelin binds to human neuroserpin and impairs its polymerisation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news originating from Milan, Italy, by NewsRx correspondents, research stated, "Neuroserpin (NS) is a serpin inhibitor of tissue plasminogen activator (tPA) in the brain. The polymerisation of NS pathologic mutants is responsible for a genetic dementia known as familial encephalopathy with neuroserpin inclusion bodies (FENIB)."

Our news journalists obtained a quote from the research from the University of Milan, "So far, a pharmacological treatment of FENIB, i.e. an inhibitor of NS polymerisation, remains an unmet challenge. Here, we present a biophysical characterisation of the effects caused by embelin (EMB a small natural compound) on NS conformers and NS polymerisation. EMB destabilises all known NS conformers, specifically binding to NS molecules with a 1:1 NS:EMB molar ratio without unfolding the NS fold. In particular, NS polymers disaggregate in the presence of EMB, and their formation is prevented. The NS/EMB complex does not inhibit tPA proteolytic activity."

According to the news editors, the research concluded: "Both effects are pharmacologically relevant: firstly by inhibiting the NS polymerisation associated to FENIB, and secondly by potentially antagonizing metastatic processes facilitated by NS activity in the brain."

For more information on this research see: Embelin binds to human neuroserpin and impairs its polymerisation. Scientific Reports, 2016;6():18769. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Research Results from University of Texas Health Science Center
Update Knowledge of B-Cell Lymphoma (A phosphodiesterase 4B-dependent interplay between tumor cells and the microenvironment regulates angiogenesis in B-cell lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - B-Cell Lymphoma have been published. According to news reporting out of San Antonio, Texas, by NewsRx editors, research stated, "Angiogenesis associates with poor outcome in diffuse large B-cell lymphoma (DLBCL), but the contribution of the lymphoma cells to this process remains unclear. Addressing this knowledge gap may uncover unsuspecting proangiogenic signaling nodes and highlight alternative antiangiogenic therapies."

Our news journalists obtained a quote from the research from the University of Texas Health Science Center, "Here, we identify the second messenger cyclic-AMP (cAMP) and the enzyme that terminates its activity, phosphodiesterase 4B (PDE4B), as regulators of B-cell lymphoma angiogenesis. We first show that cAMP, in a PDE4B-dependent manner, suppresses PI3K/AKT signals to downmodulate vascular endothelial growth factor (VEGF) secretion and vessel formation in vitro. Next, we create a novel mouse model that combines the lymphomagenic Myc transgene with germline deletion of Pde4b. We show that lymphomas developing in a Pde4b-null background display significantly lower microvessel density (MVD) in association with lower VEGF levels and PI3K/AKT activity. We recapitulate these observations by treating lymphoma-bearing mice with the FDA-approved PDE4 inhibitor, Roflumilast. Lastly, we show that primary human DLBCLs with high PDE4B expression display significantly higher MVD. Here, we defined an unsuspected signaling circuitry in which the cAMP generated in lymphoma cells downmodulates PI3K/AKT and VEGF secretion to negatively influence vessel development in the microenvironment."

According to the news editors, the research concluded: "These data identify PDE4 as an actionable antiangiogenic target in DLBCL."

For more information on this research see: A phosphodiesterase 4B-dependent interplay between tumor cells and the microenvironment regulates angiogenesis in B-cell lymphoma. Leukemia, 2015;30(3):617-26. (Nature Publishing Group - www.nature.com/; Leukemia - www.nature.com/leu/)

Our news journalists report that additional information may be obtained by contacting A.N. Suhasini, Division of Hematology and Medical Oncology, Dept. of Medicine, University of Texas Health Science Center at San Antonio, San Antonio, TX, United States. Oncology - Acute Myeloid Leukemia

Research Results from University of Toronto Update Understanding of Acute Myeloid Leukemia (Targeting mitochondrial RNA polymerase in acute myeloid leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Myeloid Leukemia. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "Acute myeloid leukemia (AML) cells have high oxidative phosphorylation and mitochondrial mass and low respiratory chain spare reserve capacity. We reasoned that targeting the mitochondrial RNA polymerase (POLRMT), which indirectly controls oxidative phosphorylation, represents a therapeutic strategy for AML."

Our news journalists obtained a quote from the research from the University of Toronto, "POLRMT-knockdown OCI-AML2 cells exhibited decreased mitochondrial gene expression, decreased levels of assembled complex I, decreased levels of mitochondrially-encoded Cox-II and decreased oxidative phosphorylation. POLRMT-knockdown cells exhibited an increase in complex II of the electron transport chain, a complex comprised entirely of subunits encoded by nuclear genes, and POLRMT-knockdown cells were resistant to a complex II inhibitor theonyltrifluoroacetone. POLRMT-knockdown cells showed a prominent increase in cell death. Treatment of OCI-AML2 cells with 10-50 ?M 2-C-methyladenosine (2-CM), a chain terminator of mitochondrial transcription, reduced mitochondrial gene expression and oxidative phosphorylation, and increased cell death in a concentration-dependent manner. Treatment of normal human hematopoietic cells with 2-CM at concentrations of up to 100 ?Mdid not alter clonogenic growth, suggesting a therapeutic window. In an OCI-AML2 xenograft model, treatment with 2-CM (70 mg/kg, i.p., daily) decreased the volume and mass of tumours to half that of vehicle controls. 2-CM did not cause toxicity to major organs."

According to the news editors, the research concluded: "Overall, our results in a preclinical model contribute to the functional validation of the utility of targeting the mitochondrial RNA polymerase as a therapeutic strategy for AML."

Our news journalists report that additional information may be obtained by contacting F.N. Bralha, Dept. of Pharmacology and Toxicology, Faculty of Medicine, University of Toronto, Toronto, Ontario, Canada. Additional authors for this research include S.U. Liyanage, R. Hurren, X. Wang, M.H. Son, T.A. Fung, F.B. Chingcuanco, A.Y. Tung, A.C. Andreazza, P. Psarianos, A.D. Schimmer, L. Salmena and R.R Laposa.

Research Results from Wayne State University Update Knowledge of Molecular Pharmaceutics [Poly(amidoamine) Dendrimer-Doxorubicin Conjugates: In Vitro Characteristics and Pseudosolution Formulation in Pressurized Metered-Dose Inhalers]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biotechnology - Molecular Pharmaceutics have been presented. According to news originating from Detroit, Michigan, by NewsRx correspondents, research stated, "Lung cancers are the leading cause of cancer death for both men and women. A series of PEGylated poly(amidoamine) dendrimer-based doxorubicin (DOX) nanocarriers (G3NH2-mPEG-nDOX) were synthesized and their chemistry tailored for the development of novel pseudosolution formulations in propellant-based metered-dose inhalers (pMDIs) with enhanced aerosol characteristics."

Financial supporters for this research include National Cancer Institute, National Institute of Child Health and Human Development, Wayne State University, Division of Materials Research.

Our news journalists obtained a quote from the research from Wayne State University, "A pH-labile bond was used to conjugate DOX to dendrimer for controlled intracellular release. We employed a two-step PEGylation strategy to cover a range of DOX loading and PEGylation density. We investigated the impact of pH, PEGylation density, and DOX payload on the release of DOX from the conjugate. We also determined the cellular internalization of the conjugate, the intracellular release kinetics of DOX from the conjugate, and their ability to kill human alveolar carcinoma cells (A549). The acid-labile conjugates sustained the release of DOX in acidic medium, and also intracellularly, as determined by nuclear colocalization studies with confocal microscopy. Meanwhile, DOX was retained in the conjugate at extracellular physiological conditions, indicating their potential to achieve spatial and temporal controlled release profiles. We also observed that the kinetics of cellular entry of the conjugates with DOX increased significantly compared to free DOX. Due to controlled release, the G3NH2-mPEG-nDOX conjugates showed time-dependent cell kill, but their cell kill ability was comparable to free DOX, which suggests their potential in vivo as compared to free DOX. The conjugates were formulated in pMDIs as pseudosolution formulations, with the help of a minimum amount of cosolvent (ethanol; <0.4%; v/v)."

According to the news editors, the research concluded: "The physical stability and aerosol characteristics of the conjugates were controlled by the PEGylation density of the carriers: the higher the PEG density, the better the dispersibility and the better the deep lung deposition of the conjugates (fine particle fraction up to ca."

Drugs and Therapies - Immunosuppressive Agents

Research Results from Wright State University Boonshoft School of Medicine Update Knowledge of Immunosuppressive Agents (A Randomized 2x2 Factorial Clinical Trial of Renal Transplantation: Steroid-Free Maintenance Immunosuppression with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Immunosuppressive Agents. According to news reporting out of Dayton, Ohio, by NewsRx editors, research stated, "The two most significant impediments to renal allograft survival are rejection and the direct nephrotoxicity of the immunosuppressant drugs required to prevent it. Calcineurin inhibitors (CNI), a mainstay of most immunosuppression regimens, are particularly nephrotoxic."

Our news journalists obtained a quote from the research from the Wright State University Boonshoft School of Medicine, "Until less toxic antirejection agents become available, the only option is to optimize our use of those at hand. To determine whether intensive rabbit anti-thymocyte globulin (rATG) induction followed by CNI withdrawal would individually or combined improve graft function and reduce graft chronic histopathology-surrogates for graft and, therefore, patient survival. As previously reported, a single large rATG dose over 24 hours was well-tolerated and associated with better renal function, fewer infections, and improved patient survival. Here we report testing whether complete CNI discontinuation would improve renal function and decrease graft pathology. Between April 20, 2004 and 4-14-2009 we conducted a prospective, randomized, non-blinded renal transplantation trial of two rATG dosing protocols (single dose, 6 mg/kg vs. divided doses, 1.5 mg/kg every other day x 4; target enrollment=180). Subsequent maintenance immunosuppression consisted of tacrolimus, a CNI, and sirolimus, a mammalian target of rapamycin inhibitor. We report here the outcome of converting patients after six months either to minimized tacrolimus/sirolimus or mycophenolate mofetil/sirolimus. Primary endpoints were graft function and chronic histopathology from protocol kidney biopsies at 12 and 24 months. CNI withdrawal (on-treatment analysis) associated with better graft function (p <0.001) and lower chronic histopathology composite scores in protocol biopsies at 12 (p=0.003) and 24 (p=0.013) months, without affecting patient (p=0.81) or graft (p=0.93) survival, or rejection rate (p=0.17)."

According to the news editors, the research concluded: "CNI (tacrolimus) withdrawal at six months may provide a strategy for decreased nephrotoxicity and improved long-term function in steroid-free low immunological risk renal transplant patients."

For more information on this research see: A Randomized 2x2 Factorial Clinical Trial of Renal Transplantation: Steroid-Free Maintenance Immunosuppression with Calcineurin

Our news journalists report that additional information may be obtained by contacting R.B. Stevens, Dept. of Surgery, Wright State University Boonshoft School of Medicine, Dayton, Ohio, United States. Additional authors for this research include K.W. Foster, C.D. Miles, A.C. Kalil, D.F. Florescu, J.P. Sandoz, T.H. Rigley, T. Malik and L.E Wrenshall.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1371/journal.pone.0139247. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Ohio, Dayton, Esterases, Sirolimus, Hydrolases, Tacrolimus, Calcineurin, United States, Drugs and Therapies, Enzymes and Coenzymes, Immunosuppressive Agents, North and Central America, Phosphoprotein Phosphatases, Intracellular Signaling Peptides and Proteins.

Our news editors obtained a quote from the research from Xinxiang Medical University, "The control group comprised sham-operated rats. The rats in the low-and high-dose quercetin groups were administered 100 and 400 mg/kg quercetin, respectively, by gavage. The rats in the control and model groups were administered isometric normal saline once daily for one week. The mRNA and protein levels of TNF-a and IL-1b in the myocardial tissue of rats were detected in each group by real time polymerase chain reaction and enzyme-linked immunosorbent assay. Malondialdehyde (MDA) content in the myocardial tissue and superoxide dismutase (SOD) and catalase (CAT) activities were detected using a colorimetric method. The level of apoptosis was detected by terminal deoxynucleotidyl transferase dUTP nick end labeling. Compared with those in the control group, the mRNA and protein levels of TNF-a, IL-1b and MDA content in the model, low-, and high-dose groups significantly increased. SOD and CAT activities decreased significantly. The cell apoptosis index increased significantly (p <0.05). Compared with those in the model group, the mRNA and protein levels of TNF-a and IL-1b and MDA content in myocardial tissue of rats in the low-dose and high-dose groups decreased significantly. SOD and CAT activities increased significantly. The cell apoptosis index significantly reduced (p <0.05)."
According to the news editors, the research concluded: "Quercetin has significant anti-inflammatory, antioxidant, and anti-apoptotic effects on AMI rats and can effectively protect against myocardium damage."

The news editors report that additional information may be obtained by contacting B. Li, Dept. of Cardiology II, The Third Affiliated Hospital of Xinxiang Medical University, Xinxiang, People's Republic of China. Additional authors for this research include M. Yang, J.W. Liu and G.T Yin.

Neurologic Manifestations - Pain

Research Results from Zhejiang University Update Understanding of Pain (Oral Administration of Pregabalin in Rats before or after Nerve Injury Partially Prevents Spontaneous Neuropathic Pain and Long Outlasts the Treatment Period)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurologic Manifestations - Pain have been published. According to news reporting out of Zhejiang, People's Republic of China, by NewsRx editors, research stated, "Pregabalin alleviates stimulus-evoked neuropathic pain (NeuP) in some pain patients and rodents in models of painful neuropathies. But it is not known if pregabalin can also alleviate spontaneous NeuP."

Our news journalists obtained a quote from the research from Zhejiang University, "Sciatic and saphenous neurectomy in rats elicits spontaneous self-mutilation of the denervated hindpaw, a behavior that models spontaneous NeuP. We tested if pregabalin (20 or 30 mg/kg/day; twice daily, per os) for 7 days before denervation, or 42 days thereafter, can suppress this behavior. Compared with the vehicle, pregabalin administered in both treatment regimens markedly and significantly delayed autotomy onset and suppressed its levels for weeks after treatment cessation."

According to the news editors, the research concluded: "At doses known to effectively suppress stimulus-evoked pain in rats, pregabalin can prevent development of spontaneous NeuP and suppress it postoperatively."

Our news journalists report that additional information may be obtained by contacting R.R. Wang, Dept. of Pharmacology, School of Basic Medical Sciences, Zhejiang University, Zhejiang, People's Republic of China. Additional authors for this research include G.D. Lou, J. Yu, T.T. Hu, W.W. Hou, Z. Chen, S.H. Zhang and Z. Seltzer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000444329. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiology

Research from Chinese Academy of Medical Sciences Yields New Findings on Cardiology (Multiple Intercostal Space Electrocardiogram Allows Accurate Localization of Outflow Tract Ventricular Arrhythmia Origin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiology. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Multiple intercostal recordings were supposed to get a more comprehensive view of the depolarization vector of the outflow tract ventricular arrhythmia (OT-VA), which may help to identify the OT-VA more accurately. This study was undertaken to develop a more accurate electrocardiogram (ECG) criterion for differentiating between left and right OT-VA origins."

The news correspondents obtained a quote from the research from the Chinese Academy of Medical Sciences, "We studied OT-VA with a left bundle branch block pattern and inferior axis QRS morphology in 47 patients with successful catheter ablation in the right ventricular OT (RVOT; n=37) or aortic coronary cusp (ACC; n=10). Superior and inferior precordial leads were taken together with the routine 12-lead ECG. The ECG during the OT-VA and during sinus beats were analyzed. Transition ratio, transition zone (TZ) index, R/S amplitude ratio, and R-wave duration ratio were measured in the regular, superior, and inferior precordial leads. The combined TZ index, TZ index inferior was significantly smaller, while the V2 inferior transition ratio was significantly larger for ACC origins than RVOT origins (p <0.05). The area under the curve for the combined TZ index by a receiver operating characteristic analysis was 0.974, which was significantly larger than other parameters. A cutoff value (<=0.25 predicted an ACC origin with 94% sensitivity and 100% specificity. This advantage of the parameter over others also held true for a subanalysis of OT-VAs with a lead V3 precordial transition or TZ index=0."

According to the news reporters, the research concluded: "The combined TZ index outperformed other ECG criteria to differentiate left from right OT-VA origins."

Our news journalists report that additional information may be obtained by contacting Z. Liu, Cardiac Arrhythmia Center, State Key Laboratory of Cardiovascular Disease, Fuwai Hospital, National Center for Cardiovascular Diseases, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing, People's Republic of China. **Drugs and Therapies - Electrochemotherapy**

**Research from Copenhagen University Hospital Reveals New Findings on Electrochemotherapy (Calcium Electroporation: Evidence for Differential Effects in Normal and Malignant Cell Lines, Evaluated in a 3D Spheroid Model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Electrochemotherapy. According to news reporting originating from Herlev, Denmark, by NewsRx correspondents, research stated, "Calcium electroporation describes the use of high voltage electric pulses to introduce supraphysiological calcium concentrations into cells. This promising method is currently in clinical trial as an anti-cancer treatment."

Our news editors obtained a quote from the research from Copenhagen University Hospital, "One very important issue is the relation between tumor cell kill efficacy-and normal cell sensitivity. Using a 3D spheroid cell culture model we have tested the effect of calcium electroporation and electrochemotherapy using bleomycin on three different human cancer cell lines: a colorectal adenocarcinoma (HT29), a bladder transitional cell carcinoma (SW780), and a breast adenocarcinoma (MDA-MB231), as well as on primary normal human dermal fibroblasts (HDF-n). The results showed a clear reduction in spheroid size in all three cancer cell spheroids three days after treatment with respectively calcium electroporation (p <0.0001) or electrochemotherapy using bleomycin (p <0.0001). Strikingly, the size of normal fibroblast spheroids was neither affected after calcium electroporation nor electrochemotherapy using bleomycin, indicating that calcium electroporation, like electrochemotherapy, will have limited adverse effects on the surrounding normal tissue when treating with calcium electroporation. The intracellular ATP level, which has previously been shown to be depleted after calcium electroporation, was measured in the spheroids after treatment. The results showed a dramatic decrease in the intracellular ATP level (p <0.01) in all four spheroid types-malignant as well as normal. In conclusion, calcium electroporation seems to be more effective in inducing cell death in cancer cell spheroids than in a normal fibroblast spheroid, even though intracellular ATP level is depleted in all spheroid types after treatment."

According to the news editors, the research concluded: "These results may indicate an important therapeutic window for this therapy; although further studies are needed in vivo and in patients to investigate the effect of calcium electroporation on surrounding normal tissue..."
when treating tumors."

The news editors report that additional information may be obtained by contacting S.K. Frandsen, Center for Experimental Drug and Gene Electrotransfer, Dept. of Oncology, Copenhagen University Hospital Herlev, 2730 Herlev, Denmark. Additional authors for this research include L. Gibot, M. Madi, J. Gehl and M.P Rols.

**Enzymes and Coenzymes - Glucosyltransferases**

**Research from Department of Radiology Reveals New Findings on Glucosyltransferases [Glycogen Synthase Kinase-3 (GSK-3)-Targeted Therapy and Imaging]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - Glucosyltransferases. According to news originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Glycogen synthase kinase-3 (GSK-3) is associated with various key biological processes, including glucose regulation, apoptosis, protein synthesis, cell signaling, cellular transport, gene transcription, proliferation, and intracellular communication. Accordingly, GSK-3 has been implicated in a wide variety of diseases and specifically targeted for both therapeutic and imaging applications by a large number of academic laboratories and pharmaceutical companies."

Our news journalists obtained a quote from the research from the Department of Radiology, "Here, we review the structure, function, expression levels, and ligand-binding properties of GSK-3 and its connection to various diseases. A selected list of highly potent GSK-3 inhibitors, with IC[50] <20 nM for adenosine triphosphate (ATP)-competitive inhibitors and IC[50] <5 mM for non-ATP-competitive inhibitors, were analyzed for structure activity relationships. Furthermore, ubiquitous expression of GSK-3 and its possible impact on therapy and imaging are also highlighted."

According to the news editors, the research concluded: "Finally, a rational perspective and possible route to selective and effective GSK-3 inhibitors is discussed."

For more information on this research see: Glycogen Synthase Kinase-3 (GSK-3)-Targeted Therapy and Imaging. *Theranostics*, 2016;6(4):571-93.

The news correspondents report that additional information may be obtained from M.K. Pandey, Dept. of Radiology, Mayo Clinic, Rochester, MN, United States.

Epidemiology

Research from Fourth Military Medical University Reveals New Findings on Epidemiology (Epidemiological characteristics of the carriers with coexistence of HBsAg and anti-HBs based on a community cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Epidemiology is the subject of a report. According to news reporting from Shaanxi, People's Republic of China, by NewsRx journalists, research stated, "The coexistence of HBsAg and anti-HBs is an atypical serological pattern in HBV infection. There is no epidemiological characteristics of this serological pattern in the community and there is controversy over the molecular mechanisms underlying this pattern."

Funders for this research include China Special Grant for the Prevention and Control of Infection Diseases, National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from Fourth Military Medical University, "We investigated the epidemiological characteristics of the carriers with HBsAg and anti-HBs in a longitudinal community cohort study. The prevalence of this atypical serological pattern was 2.93% (122/4169) in HBsAg-positive populations. The prevalence progressively increased with age from 40 to 70 years old. The rate of HBeAg positive and detectable HBV DNA were both significantly higher in carriers with this pattern than in carriers who were HBsAg positive but anti-HBs negative (26/122 verse 598/4047, p=0.046; 86/122 verse 275/529, p <0.001). After 1 year of follow-up, 85.19% of the carriers still had coexistence HBsAg and anti-HBs, 14.81% of the carriers lost their anti-HBs. Viral sequencing showed that carriers with coexistence of HBsAg and anti-HBs had higher numbers of residue changes within the S gene than carriers who were HBsAg positive but anti-HBs negative (2.42 verse 1.33 changes per 100 residues, p<0.05)."

According to the news reporters, the research concluded: "Hence, the coexistence of HBsAg and anti-HBs is a unique serological pattern which may be associated with an increased risk of adverse clinical outcome and may be related to HBsAg immune variants which have genotypic heterogeneity."

For more information on this research see: Epidemiological characteristics of the carriers with coexistence of HBsAg and anti-HBs based on a community cohort study. Journal of Viral Hepatitis, 2015;23(4):286-93. (Wiley-Blackwell - www.wiley.com/; Journal of Viral Hepatitis - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1365-2893)

Neurology - Neurodegeneration

Research from Genome Institute Reveals New Findings on Neurodegeneration (MiR-375 is Essential for Human Spinal Motor Neuron Development and May Be Involved in Motor Neuron Degeneration)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurology - Neurodegeneration are presented in a new report. According to news originating from Singapore, Singapore, by NewsRx correspondents, research stated, "The transcription factor REST is a key suppressor of neuronal genes in non-neuronal tissues. REST has been shown to suppress proneuronal microRNAs in neural progenitors indicating that REST-mediated neurogenic suppression may act in part via microRNAs."

Financial support for this research came from A*STAR, Singapore.

Our news journalists obtained a quote from the research from Genome Institute, "We used neural differentiation of Rest-null mouse ESC to identify dozens of microRNAs regulated by REST during neural development. One of the identified microRNAs, miR-375, was upregulated during human spinal motor neuron development. We found that miR-375 facilitates spinal motor neurogenesis by targeting the cyclin kinase CCND2 and the transcription factor PAX6. Additionally, miR-375 inhibits the tumor suppressor p53 and protects neurons from apoptosis in response to DNA damage. Interestingly, motor neurons derived from a spinal muscular atrophy patient displayed depressed miR-375 expression and elevated p53 protein levels."

According to the news editors, the research concluded: "Importantly, SMA motor neurons were significantly more susceptible to DNA damage induced apoptosis suggesting that miR-375 may play a protective role in motor neurons."

The news correspondents report that additional information may be obtained from A. Bhinge, Stem Cell and Developmental Biology, Genome Institute of Singapore, Singapore, Singapore. Additional authors for this research include S.C. Namboori, A. Bithell, C. Soldati, N.J. Buckley and L.W Stanton.

Nutritional and Metabolic Diseases and Conditions —

Research from King Saud University Yields New Findings on Type 2 Diabetes (Ischemic Stroke and Its Risk Factors in a Registry-Based Large Cross-Sectional Diabetic Cohort in a Country Facing a Diabetes Epidemic)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news reporting out of Riyadh, Saudi Arabia, by NewsRx editors, research stated, "The main aim of this study is to determine the prevalence and risk factors of ischemic stroke among diabetic patients registered in the Saudi National Diabetes Registry (SNDR) database. A cross-sectional sample of 62,681 diabetic patients aged (>=)25 years was used to calculate ischemic stroke prevalence and its risk factors."

Financial support for this research came from King Abdulaziz City for Science and Technology.

Our news journalists obtained a quote from the research from King Saud University, "Univariate and multivariate logistic regression analyses were used to assess the roles of different risk factors. The prevalence of ischemic stroke was 4.42% and was higher in the older age group with longer diabetes duration. Poor glycemic control and the presence of chronic diabetes complications were associated with a high risk of ischemic stroke. History of smoking and type 2 diabetes were more frequent among stroke patients. Obesity significantly decreased the risk for ischemic stroke. Regression analysis for ischemic stroke risk factors proved that age (>=)45 years, male gender, hypertension, coronary artery disease (CAD), diabetes duration (>=)10 years, insulin use, and hyperlipidemia were significant independent risk factors for ischemic stroke. We conclude that ischemic stroke is prevalent among diabetic individuals, particularly among those with type 2 diabetes."

According to the news editors, the research concluded: "Good glycemic, hypertension, and hyperlipidemia control, in addition to smoking cessation, are the cornerstones to achieve a significant reduction in ischemic stroke risk."

For more information on this research see: Ischemic Stroke and Its Risk Factors in a Registry-Based Large Cross-Sectional Diabetic Cohort in a Country Facing a Diabetes Epidemic. Journal of Diabetes Research, 2016;2016():4132589.

Our news journalists report that additional information may be obtained by contacting K. Al-Rubeaan, University Diabetes Center, College of Medicine, King Saud University, PO Box 18397, Riyadh 11415, Saudi Arabia. Additional authors for this research include F. Al-Hussain, A.M. Youssef, S.N. Subhani, A.H. Al-Sharqawi and H.M Ibrahim.

Oncology - Breast Cancer

Research from Lund University Yields New Findings on Breast Cancer (Contrasting breast cancer molecular subtypes across serial tumor progression stages: biological and prognostic implications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting originating in Lund, Sweden, by NewsRx journalists, research stated, "The relevance of the intrinsic subtypes for clinical management of metastatic breast cancer is not comprehensively established. We aimed to evaluate the prevalence and prognostic significance of drifts in tumor molecular subtypes during breast cancer progression."

The news reporters obtained a quote from the research from Lund University, "A well-annotated cohort of 304 women with advanced breast cancer was studied. Tissue microarrays of primary tumors and synchronous lymph node metastases were constructed. Conventional biomarkers were centrally assessed and molecular subtypes were assigned following the 2013 St Gallen guidelines. Fine-needle aspirates of asynchronous metastases were transcriptionally profiled and subtyped using PAM50. Discordant expression of individual biomarkers and molecular subtypes was observed during tumor progression. Primary luminal-like tumors were relatively unstable, frequently adopting a more aggressive subtype in the metastases. Notably, loss of ER expression and a luminal to non-luminal subtype conversion was associated with an inferior post-recurrence survival. In addition, ER and molecular subtype assessed at all tumor progression stages were independent prognostic factors for post-recurrence breast cancer mortality in multivariable analyses."

According to the news reporters, the research concluded: "Our results demonstrate that drifts in tumor molecular subtypes may occur during tumor progression, conferring adverse consequences on outcome following breast cancer relapse."

Our news correspondents report that additional information may be obtained by contacting S. Kimbung, Division of Oncology and Pathology, Dept. of Clinical Sciences, Lund University, Lund, Sweden. Additional authors for this research include A. Kovacs, A. Danielsson, P.O. Bendahl, K. Lovgren, M. Frostvik Stolt, N.P. Tobin, L. Lindstrom, J. Bergh, Z. Einbeigi, M. Ferno, T. Hatschek and I. Hedenfalk.

Research from Medical University Reveals New Findings on Butyrophenones (Long-term treatment with haloperidol affects neuropeptide S and NPSR mRNA levels in the rat brain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Butyrophenones is the subject of a report. According to news reporting from Katowice, Poland, by NewsRx journalists, research stated, "The brainstem-derived neuropeptide S (NPS) has a multidirectional regulatory activity, especially as a potent anxiolytic factor. Accumulating data suggests that neuroleptics affect peptidergic signalling in various brain structures."

The news correspondents obtained a quote from the research from Medical University, "However, there is no information regarding the influence of haloperidol on NPS and NPS receptor (NPSR) expression. We assessed NPS and NPSR mRNA levels in brains of rats treated with haloperidol using quantitative real-time polymerase chain reaction. Chronic haloperidol treatment (4 weeks) led to a striking upregulation of NPS and NPSR expression in the rat brainstem. Conversely, the NPSR mRNA expression was decreased in the hippocampus and striatum. This stark increase of NPS in response to haloperidol treatment supports the hypothesis that this neuropeptide is involved in the dopamine-dependent anxiolytic actions of neuroleptics and possibly also in the pathophysiology of mental disorders."

According to the news reporters, the research concluded: "Furthermore, our findings underline the complex nature of potential interactions between dopamine receptors and brain peptidergic pathways, which has potential clinical applications."

Our news journalists report that additional information may be obtained by contacting A. Palasz, 1Dept. of Histology, School of Medicine in Katowice, Medical University of Silesia, Katowice, Poland. Additional authors for this research include E. Rojczyk, M. Golyszyń, L. Filipczyk, J.J. Worthington and R. Wiaderkiewicz.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1017/neu.2015.56. This DOI is a link to an online electronic document that is either free or for purchase.

Research from Medical University Reveals New Findings on Colon Cancer (Colorectal cancer tumour markers and biomarkers: Recent therapeutic advances)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news reporting from Warsaw, Poland, by NewsRx journalists, research stated, "Colorectal cancer (CRC) is the second most commonly diagnosed cancer among females and third among males worldwide. It also contributes significantly to cancer-related deaths, despite the continuous progress in diagnostic and therapeutic methods."

The news correspondents obtained a quote from the research from Medical University, "Biomarkers currently play an important role in the detection and treatment of patients with colorectal cancer. Risk stratification for screening might be augmented by finding new biomarkers which alone or as a complement of existing tests might recognize either the predisposition or early stage of the disease. Biomarkers have also the potential to change diagnostic and treatment algorithms by selecting the proper chemotherapeutic drugs across a broad spectrum of patients. There are attempts to personalise chemotherapy based on presence or absence of specific biomarkers. In this review, we update review published last year and describe our understanding of tumor markers and biomarkers role in CRC screening, diagnosis, treatment and follow-up."

According to the news reporters, the research concluded: "Goal of future research is to identify those biomarkers that could allow a non-invasive and cost-effective diagnosis, as well as to recognise the best prognostic panel and define the predictive biomarkers for available treatments."

Our news journalists report that additional information may be obtained by contacting G. Lech, Gustaw Lech, Maciej Slodkowski, Ireneusz Wojciech Krasnodebski, Dept. of General, Gastroenterological and Oncological Surgery, Medical University of Warsaw, 02097 Warsaw, Poland. Additional authors for this research include R. Slotwinski, M. Slodkowski and I.W Krasnodebski.

Research from Michigan State University Reveals New Findings on Diabetic Angiopathies (Role of Acid Sphingomyelinase in Shifting the Balance Between Proinflammatory and Reparative Bone Marrow Cells in Diabetic Retinopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Diabetic Angiopathies. According to news reporting from East Lansing, Michigan, by NewsRx journalists, research stated, "The metabolic insults associated with diabetes lead to low-grade chronic inflammation, retinal endothelial cell damage, and inadequate vascular repair. This is partly due to the increased activation of bone marrow (BM)-derived proinflammatory monocytes infiltrating the retina, and the compromised function of BM-derived reparative circulating angiogenic cells (CACs), which home to sites of endothelial injury and foster vascular repair."

Financial supporters for this research include National Institutes of Health (NIH), NIH.

The news correspondents obtained a quote from the research from Michigan State University, "We now propose that a metabolic link leading to activated monocytes and dysfunctional CACs in diabetes involves upregulation of a central enzyme of sphingolipid signaling, acid sphingomyelinase (ASM). Selective inhibition of ASM in the BM prevented diabetes-induced activation of BM-derived microglia-like cells and normalized proinflammatory cytokine levels in the retina. ASM upregulation in diabetic CACs caused accumulation of ceramide on their cell membrane, thereby reducing membrane fluidity and impairing CAC migration. Replacing sphingomyelin with ceramide in synthetic membrane vesicles caused a similar decrease in membrane fluidity. Inhibition of ASM in diabetic CACs improved membrane fluidity and homing of these cells to damaged retinal vessels."

According to the news reporters, the research concluded: "Collectively, these findings indicate that selective modulation of sphingolipid metabolism in BM-derived cell populations in diabetes normalizes the reparative/proinflammatory cell balance and can be explored as a novel therapeutic strategy for treating diabetic retinopathy."

Our news journalists report that additional information may be obtained by contacting H. Chakravarthy, Dept. of Physiology, Michigan State University, East Lansing, Michigan, United States. Additional authors for this research include S. Navitskaya, S. O'Reilly, J. Gallimore, H. Mize, E. Beli, Q. Wang, N. Kady, C. Huang, G.J. Blanchard, M.B. Grant and J.V Busik.

Research from Military Medical Academy Reveals New Findings on Antibiotics (Cardiac troponin-I, brain natriuretic peptide and endothelin-1 levels in a rat model of doxorubicin-induced cardiac injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news originating from Etlik, Turkey, by NewsRx correspondents, research stated, "Cardiotoxicity, during or after therapy, is the most serious side effect of doxorubicin (DXR). The risk of developing cardiac impairment increases concomitantly with an increase in the cumulative dose of DXR."

Our news journalists obtained a quote from the research from Military Medical Academy, "The aim was to evaluate the levels of cardiac troponin-I (cTnI), brain natriuretic peptide (BNP) and endothelin-1 (ET-1) in DXR induced cardiac injury. Thirty-nine Wistar albino rats were divided into three groups; a control group and two-study groups that received low-dose DXR (LDD) and high-dose DXR (HDD) in a weekly schedule for reaching a cumulative dose. Serum cTnI level was significantly increased in both LDD and HDD-treated groups. Although serum BNP was not significantly increased either LDD or HDD-treated groups, ET-1 levels was significantly increased in only HDD-treated groups. Histopathologic injury was more evident in HDD-treated group. Serum cTnI was increased even in LDD and parallel to it low cardiac injury induced by DXR. In the low-dose group, BNP and ET-1 levels were not elevated significant as cTnI despite cardiac injury."

According to the news editors, the research concluded: "Thus, cTnI may be a predictive marker in of DXR-induced cardiotoxicity."

The news correspondents report that additional information may be obtained from E. Atas, Dept. of Pediatric Oncology, Gulhane Military Medical Academy, Etlik, 06018, Turkey. Additional authors for this research include E. Kismet, V. Kesik, B. Karaoglu, G. Aydemir, N. Korkmazer, E. Demirkaya, Y. Karsioglu, N. Yurttutan, B. Unay, V. Koseoglu and E. Gokcay.

Research from Moorfields Eye Hospital Yields New Findings on Age-Related Macular Degeneration (A retrospective study of the real-life utilization and effectiveness of ranibizumab therapy for neovascular age-related macular degeneration in the UK)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Eye Diseases and Conditions - Age-Related Macular Degeneration. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "AURA was an international, retrospective, observational study that monitored the real-life use and effectiveness of ranibizumab injections in patients with neovascular age-related macular degeneration (nAMD). This paper reports the findings from the UK."

The news reporters obtained a quote from the research from Moorfields Eye Hospital, "Patients who started treatment with ranibizumab between January 1, 2009, and August 31, 2009, and had documented follow-up to the end of their treatment and/or monitoring or until August 31, 2011, were retrospectively monitored; the diagnosis and subsequent decision to treat was made by the patient's own physician. Assessments included the change in visual acuity (standardized letter count) during the first and second years after start of ranibizumab therapy and resource utilization. Four hundred and ten patients from 13 UK centers were analyzed. The mean (standard deviation [SD]) letter score at baseline was 55.0 (17.8). The mean (SD) change in visual acuity from baseline was +6.0 (15.4) letters at year 1 and +4.1 (16.9) at year 2. Most of the patients (86.6%) completed a 3-month loading phase; the visual improvements were numerically higher in these patients. Over 2 years, the mean (SD) number of clinic visits and injections was 18.4 (5.0) and 9.0 (4.7), respectively. Resource use and visual acuity gains were greater than those observed in the global population, which included other countries enrolled in AURA (Canada, France, Germany, Ireland, Italy, the Netherlands, and Venezuela). When patients were stratified according to severity of nAMD (based on letter count at baseline), the mean change in visual acuity score at years 1 and 2 was also higher for the UK than for the global population across all subgroups. Monitoring and treatment rates were high in the UK, resulting in better visual acuity outcomes compared with other included countries."

According to the news reporters, the research concluded: "This suggests that translation of clinical study outcomes into real-life settings is achievable, but at the expense of higher resource utilization than is currently the norm in most developed countries."

For more information on this research see: A retrospective study of the real-life utilization and effectiveness of ranibizumab therapy for neovascular age-related macular degeneration in the UK. Clinical Ophthalmology, 2016;10():87-96.

Our news correspondents report that additional information may be obtained by contacting P. Hykin, National Institute for Health Research Biomedical Research Centre in Ophthalmology, Moorfields Eye Hospital, London, UK. Additional authors for this research include U. Chakravarthy, A. Lotery, M. McKibbin, J. Napier and S. Sivaprasad.

Addiction Research

Research from National Institute on Drug Abuse Reveals New Findings on Addiction Research (A role for sigma receptors in stimulant self-administration and addiction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Addiction Research is now available. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Sigma-1 receptors (s1Rs) are structurally unique intracellular proteins that function as chaperones. s1Rs translocate from the mitochondria-associated membrane to other subcellular compartments, and can influence a host of targets, including ion channels, G-protein-coupled receptors, lipids, and other signaling proteins. Drugs binding to sRs can induce or block the actions of sRs."

Our news journalists obtained a quote from the research from National Institute on Drug Abuse, "Studies indicate that stimulant self-administration induces the reinforcing effects of sR agonists, because of dopamine transporter actions. Once established, the reinforcing effects of sR agonists are independent of dopaminergic mechanisms traditionally thought to be critical to the reinforcing effects of stimulants. Self-administered doses of sR agonists do not increase dopamine concentrations in the nucleus accumbens shell, a transmitter and brain region considered important for the reinforcing effects of abused drugs. However, self-administration of sR agonists is blocked by sR antagonists. Several effects of stimulants have been blocked by sR antagonists, including the reinforcing effects, assessed by a place-conditioning procedure. However, the self-administration of stimulants is largely unaffected by sR antagonists, indicating fundamental differences in the mechanisms underlying these two procedures used to assess the reinforcing effects. When sR antagonists are administered in combination with dopamine uptake inhibitors, an effective and specific blockade of stimulant self-administration is obtained. Actions of stimulant drugs related to their abuse induce unique changes in sR activity and the changes induced potentially create redundant and, once established, independent reinforcement pathways."

According to the news editors, the research concluded: "Concomitant targeting of both dopaminergic pathways and sR proteins produces a selective antagonism of stimulant self-administration, suggesting new avenues for combination chemotherapies to specifically combat stimulant abuse."

For more information on this research see: A role for sigma receptors in stimulant self-administration and addiction. Behavioural Pharmacology, 2016;27(2-3 Spec I):100-15. (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology - journals.lww.com/behaviouralpharm/pages/default.aspx)

Nephrology

Research from Novartis Pharma Yields New Findings on Nephrology (Pharmacokinetics of serelaxin in patients with severe renal impairment or end-stage renal disease requiring hemodialysis: A single-dose, open-label, parallel-group study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nephrology are discussed in a new report. According to news originating from Basel, Switzerland, by NewsRx correspondents, research stated, "Serelaxin, a recombinant human relaxin-2 hormone, is in clinical development for treating acute heart failure. This open-label, parallel-group study investigated serelaxin pharmacokinetics (PK) after a single 4-hour intravenous infusion (10 ?g/kg) in patients with severe renal impairment (n=6) or end-stage renal disease (ESRD) requiring hemodialysis (PK on the day of dialysis [n=6] or during dialysis-free interval [n=6]), compared with matched healthy subjects (n=18)."

Financial support for this research came from Novartis Pharma AG, Basel, Switzerland.

Our news journalists obtained a quote from the research from Novartis Pharma, "In all participants, serum serelaxin concentration peaked at the end of infusion and subsequently declined with mean terminal elimination half-life of 6.5-8.8 hours. Compared with healthy subjects, a moderate decrease in serelaxin systemic clearance (37%-52%) and increase in its exposure (30%-115%) were observed in all patients. During the 4-hour hemodialysis in ESRD patients, 30% serelaxin was removed, with hemodialysis clearance constituting approximately 52% of total systemic clearance. Serelaxin was well tolerated with no deaths, serious adverse events (AE), or AE-related discontinuations. Antiserelaxin antibodies were not detected in any participant."

According to the news editors, the research concluded: "Given the shallow dose-response relationship observed with serelaxin in clinical studies and its wide therapeutic window, the observed PK differences in patients with severe renal impairment compared with healthy subjects are unlikely to pose a safety risk and do not warrant a predefined dosage adjustment in such patients."

For more information on this research see: Pharmacokinetics of serelaxin in patients with severe renal impairment or end-stage renal disease requiring hemodialysis: A single-dose, open-label, parallel-group study. Journal of Clinical Pharmacology, 2015;56(4):474-83.

Oncology - Breast Cancer

Research from Peking Union Medical College Hospital Yields New Findings on Breast Cancer (Ultrasound-Assisted Thoracic Paravertebral Block Reduces Intraoperative Opioid Requirement and Improves Analgesia after Breast Cancer Surgery: A ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The contribution of ultrasound-assisted thoracic paravertebral block to postoperative analgesia remains unclear. We compared the effect of a combination of ultrasound assisted-thoracic paravertebral block and propofol general anesthesia with opioid and sevoflurane general anesthesia on volatile anesthetic, propofol and opioid consumption, and postoperative pain intensity in patients having breast cancer surgery."

Our news journalists obtained a quote from the research from Peking Union Medical College Hospital, "Patients undergoing breast cancer surgery were randomly assigned to ultrasound-assisted paravertebral block with propofol general anesthesia (PPA group, n=121) or fentanyl with sevoflurane general anesthesia (GA group, n=126). Volatile anesthetic, propofol and opioid consumption, and postoperative pain intensity were compared between the groups using noninferiority and superiority tests. Patients in the PPA group required less sevoflurane than those in the GA group (median [interquartile range] of 0 [0, 0] vs. 0.4 [0.3, 0.6] minimum alveolar concentration [MAC]-hours), less intraoperative fentanyl requirements (100 [50, 100] vs. 250 [200, 300] mg), less intense postoperative pain (median visual analog scale score 2 [1, 3.5] vs. 3 [2, 4.5]), but more propofol (median 529 [424, 672] vs. 100 [100, 130] mg). Noninferiority was detected for all four outcomes; one-tailed superiority tests for each outcome were highly significant at p<0.001 in the expected directions."

According to the news editors, the research concluded: "The combination of propofol anesthesia with ultrasound-assisted paravertebral block reduces intraoperative volatile anesthetic and opioid requirements, and results in less post operative pain in patients undergoing breast cancer surgery."

For more information on this research see: Ultrasound-Assisted Thoracic...

The news correspondents report that additional information may be obtained from L. Pei, Dept. of Anesthesiology, Peking Union Medical College Hospital, Chinese Academy of Medical Sciences, Beijing, People's Republic of China. Additional authors for this research include Y. Zhou, G. **Blood Pressure**

**Research from Peking University People's Hospital Reveals New Findings on Blood Pressure (Efficacy and Safety of Fixed-Dose Perindopril Arginine/Amlodipine in Hypertensive Patients Not Adequately Controlled with Amlodipine 5 mg or Perindopril ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Blood Pressure is now available. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "To assess the blood pressure-lowering efficacy and tolerability of perindopril/amlodipine fixed-dose combinations in Chinese patients with mild-to-moderate essential hypertension not adequately controlled with monotherapy alone. In 2 separate double-blind studies, patients received a 4-week run-in monotherapy of amlodipine 5 mg or perindopril 4 mg, respectively."

Our news journalists obtained a quote from the research from Peking University People's Hospital, "Those whose blood pressure was uncontrolled were then randomized to receive the fixed-dose combination of perindopril 5 mg/amlodipine 5 mg (Per/Amlo group) or remain on the monotherapy for 8 weeks. Patients who were uncontrolled at the week 8 (W8) visit were up-titrated for the Per/Amlo combination, or received additional treatment if on monotherapy, for a further 4 weeks. The main efficacy assessment was at 8 weeks. After 8 weeks, systolic blood pressure (SBP; primary criterion) was statistically significantly lower in the Per/Amlo group (vs. Amlo 5 mg, p=0.0095; vs. Per 4 mg, p<0.0001). Uncontrolled patients at W8 who received an up-titration of the Per/Amlo combination showed a further SBP reduction. These changes were mirrored by reassuring reductions in diastolic blood pressure. The fixed-dose combinations were well tolerated."

According to the news editors, the research concluded: "Single-pill combinations of perindopril and amlodipine provide hypertensive patients with a convenient and effective method of reducing blood pressure."

For more information on this research see: Efficacy and Safety of Fixed-Dose

**Oncology - Colon Cancer**

**Research from Shanghai Jiao-Tong University Yields New Findings on Colon Cancer (LncRNA-ATB mediated E-cadherin repression promotes the progression of colon cancer and predicts poor prognosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Colon Cancer is the subject of a report. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Long non-coding RNA-activated by TGF-b (lncRNA-ATB) promotes the invasion-metastasis cascade in hepatocellular carcinoma via downregulating E-cadherin (E-cad) and inducing epithelial-to-mesenchymal transition (EMT) and is clinically significant in human colon cancer. However, its molecular mechanisms in colon cancer progression remain unclear."

Financial supporters for this research include National Natural Science Foundation of China, Medical Guidance Project of Shanghai Science and Technology Commission.

Our news editors obtained a quote from the research from Shanghai Jiao-Tong University, "This study aimed to elucidate the role of lncRNA-ATB and its clinical value in colon cancer. Expression levels of lncRNA-ATB in colon cancer tissues and colon cancer cell lines were evaluated using quantitative real-time polymerase chain reaction. The clinicopathological significance and prognostic value of lncRNA-ATB were investigated, and roles of lncRNA-ATB in regulating E-cad and other EMT-related markers expression and colon cancer progression were evaluated in vitro. Expression levels of lncRNA-ATB and E-cad in human plasma were evaluated. Long non-coding RNA-activated by TGF-b was upregulated in colon cancer tissues compared with adjacent mucosa (p <0.001). LncRNA-ATB levels were also higher in metastatic cancer tissues (p <0.001). Among the three highly invasive colon cancer cell lines, lncRNA-ATB levels were relatively higher with concurrent low levels of E-cad
compared with levels in the three low-invasive cell lines. LncRNA-ATB expression correlated with pN stage (p < 0.01) and American Joint Committee on Cancer stage (p < 0.01). Striking differences were observed in overall survival and disease-free survival in cases with both high LncRNA-ATB expression and low E-cad expression. Reduction of LncRNA-ATB increased expression of epithelial markers E-cad, ZO-1, and decreased expression of mesenchymal markers ZEB1 and N-cadherin (N-cad), and significantly influenced colon cancer cell progression. Plasma LncRNA-ATB was upregulated in colon cancer patients one month after surgery (p < 0.05).

According to the news editors, the research concluded: "Long non-coding RNA-activated by TGF-b may act on colon tumorigenesis by suppressing E-cad expression and promoting EMT process, and LncRNA-ATB inhibition may provide a promising therapeutic option for suppressing colon cancer progression."

For more information on this research see: Long non-coding RNA-activated by TGF-b may act on colon tumorigenesis by suppressing E-cad expression and promoting EMT process, and LncRNA-ATB inhibition may provide a promising therapeutic option for suppressing colon cancer progression.

Liver Diseases and Conditions - Hepatitis B Virus
Research from Southern Medical University Yields New Findings on Hepatitis B Virus (A comparison of lamivudine vs entecavir for prophylaxis of hepatitis B virus reactivation in allogeneic hematopoietic stem cell transplantation recipients: a ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Hepatitis B Virus have been presented. According to news reporting from Guangzhou, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to compare the efficacy of lamivudine vs entecavir in the prevention of hepatitis B virus (HBV) reactivation in HBV surface Ag (HBsAg)-positive patients undergoing allogeneic hematopoietic stem cell transplantation (allo-HSCT). A total of 216 consecutive patients were enrolled and retrospectively reviewed."

The news correspondents obtained a quote from the research from Southern Medical University, "Of these patients, 119 received lamivudine and 97 received entecavir. The median
treatment duration to complete virological response in patients with baseline HBV-DNA levels >10(5) copies/mL was 2.0 months in the entecavir group, significantly shorter than that of the lamivudine group. After a median follow-up of 24 months post transplantation, the cumulative incidence rates of HBV reactivation at 6, 12 and 24 months following transplantation were 3.0%, 7.0% and 24.0% in the lamivudine group, and 0%, 0% and 2.0% in the entecavir group, respectively. In addition, entecavir treatment was associated with lower cumulative incidence rates of severe hepatitis caused by HBV reactivation. Mutations leading to drug resistance were detected in 25 patients in the lamivudine group and in only one patient in the entecavir group."

According to the news reporters, the research concluded: "Our data indicate that compared with lamivudine, entecavir has more potent antiviral efficacy and may be a better choice for prophylaxis of HBV reactivation in HBsAg-positive allo-HSCT recipients."

For more information on this research see: A comparison of lamivudine vs entecavir for prophylaxis of hepatitis B virus reactivation in allogeneic hematopoietic stem cell transplantation recipients: a single-institutional experience. Oncology - Colon Cancer

Research from Sun Yat-sen University Cancer Center Reveals New Findings on Colon Cancer (Downregulation of CDC27 inhibits the proliferation of colorectal cancer cells via the accumulation of p21Cip1/Waf1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting originating from Guangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Dysregulated cell cycle progression has a critical role in tumorigenesis. Cell division cycle 27 (CDC27) is a core subunit of the anaphase-promoting complex/cyclosome, although the specific role of CDC27 in cancer remains unknown."
Our news editors obtained a quote from the research from Sun Yat-sen University Cancer Center, "In our study, we explored the biological and clinical significance of CDC27 in colorectal cancer (CRC) growth and progression and investigated the underlying molecular mechanisms. CDC27 expression is significantly correlated with tumor progression and poor patient survival. Functional assays demonstrated that overexpression of CDC27 promoted proliferation in DLD1 cells, whereas knockdown of CDC27 in HCT116 cells inhibited proliferation both in vitro and in vivo. Further mechanistic investigation showed that CDC27 downregulation resulted in G1/S phase transition arrest via the significant accumulation of p21 in HCT116 cells, and the upregulation of CDC27 promoted G1/S phase transition via the attenuation of p21 in DLD1 cells. Furthermore, we also demonstrated that CDC27 regulated inhibitor of DNA binding 1 (ID1) protein expression in DLD1 and HCT116 cells, and rescue assays revealed that CDC27 regulated p21 expression through modulating ID1 expression. Taken together, our results indicate that CDC27 contributes to CRC cell proliferation via the modulation of ID1-mediated p21 regulation, which offers a novel approach to the inhibition of tumor growth."

According to the news editors, the research concluded: "Indeed, these findings provide new perspectives for the future study of CDC27 as a target for CRC treatment."

For more information on this research see: Downregulation of CDC27 inhibits the proliferation of colorectal cancer cells via the accumulation of p21Cip1/Waf1. *Cell Death & Disease*, 2016;7():e2074. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

Environmental Epidemiology

**Research from Taipei Medical University Reveals New Findings on Environmental Epidemiology (Soil ingestion rates for children under 3 years old in Taiwan)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Environmental Epidemiology is now available. According to news reporting from Taipei, Taiwan, by NewsRx journalists, research stated, "Soil and dust ingestion rates by children are among the most critical exposure factors in determining risks to children from exposures to environmental contaminants in soil and dust. We believe this is the first published soil ingestion study for children in Taiwan using tracer element methodology."
The news correspondents obtained a quote from the research from Taipei Medical University. "In this study, 66 children under 3 years of age were enrolled from Taiwan. Three days of fecal samples and a 24-h duplicate food sample were collected. The soil and household dust samples were also collected from children's homes. Soil ingestion rates were estimated based on silicon (Si) and titanium (Ti). The average soil ingestion rates were 9.6?19.2 mg/day based on Si as a tracer. The estimated soil ingestion rates based on Si did not have statistically significant differences by children's age and gender, although the average soil ingestion rates clearly increased as a function of children's age category. The estimated soil ingestion rates based on Si was significantly and positively correlated with the sum of indoor and outdoor hand-to-mouth frequency rates. The average soil ingestion rates based on Si were generally lower than the results from previous studies for the US children. Ti may not be a suitable tracer for estimating soil ingestion rates in Taiwan because the Ti dioxide is a common additive in food. To the best of our knowledge, this is the first study that investigated the correlations between soil ingestion rates and mouthing behaviors in Taiwan or other parts of Asia. It is also the first study that could compare available soil ingestion data from different countries and/or different cultures. The hand-to-mouth frequency and health habits are important to estimate the soil ingestion exposure for children."

According to the news reporters, the research concluded: "The results in this study are particularly important when assessing children’s exposure and potential health risk from nearby contaminated soils in Taiwan."

Our news journalists report that additional information may be obtained by contacting L.C. Chien, School of Public Health, Taipei Medical University, Taipei, Taiwan. Additional authors for this research include M.C. Tsou, H.C. Hsi, P. Beamer, K. Bradham, Z.Y. Hseu, S.H. Jien, C.B. Jiang, W. Dang and H. Ozkaynak.

Cardiovascular Diseases and Conditions -

Research from University Hospital Reveals New Findings on Hypertension (Investigating kidney donation as a risk factor for hypertension and microalbuminuria: findings from the Swiss prospective follow-up of living kidney donors)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news reporting originating in Basel, Switzerland, by NewsRx journalists, research stated, "To assess the role of nephrectomy as a risk factor for the development of hypertension and microalbuminuria. Prospective, long-term follow-up study."

The news reporters obtained a quote from the research from University Hospital, "Swiss Organ Living-Donor Health Registry. All living kidney donors in Switzerland between 1993 and 2009. Data on health status and renal function before 1 year and biennially after donation were collected. Comparison of 1-year and 5-year occurrences of hypertension among normotensive donors with 1-year and 5-year estimates from the Framingham hypertension risk score. Multivariate random intercept models were used to investigate changes of albumin excretion after donation, correcting for repeated measurements and cofactors such as age, male gender and body mass index. A total of 1214 donors contributed 3918 data entries with a completed biennial follow-up rate of 74% during a 10-year period. Mean (SD) follow-up of donors was 31.6 months (34.4). Median age at donation was 50.5 years (IQR 42.2-58.8); 806 donors (66.4%) were women. Donation increased the risk of hypertension after 1 year by 3.64 (95% CI 3.52 to 3.76; p<0.001). Those participants remaining normotensive 1 year after donation return to a risk similar to that of the healthy Framingham population. Microalbuminuria before donation was dependent on donor age but not on the presence of hypertension. After nephrectomy, hypertension became the main driver for changes in albumin excretion (OR 1.19; 95% CI 0.13 to 2.25; p=0.03) and donor age had no effect."

According to the news reporters, the research concluded: "Nephrectomy propagates hypertension and increases susceptibility for the development of hypertension-induced microalbuminuria."

For more information on this research see: Investigating kidney donation as a risk factor for hypertension and microalbuminuria: findings from the Swiss prospective follow-up of living kidney donors. Bmj Open, 2016;6(3):e010869. (BMJ Publishing Group - group.bmj.com/; Bmj Open - bmjopen.bmj.com/)

Our news correspondents report that additional information may be obtained by contacting G.T. Thiel, SOL-DHR (Swiss Organ Living Donor Health Registry), University Hospital in Basel, Switzerland, Basel, Switzerland. Additional authors for this research include C. Nolte, D. Tsinalis, J. Steiger and L.M Bachmann.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1136/bmjopen-2015-010869. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions - Aneurysm

Research from University of Arizona Reveals New Findings on Aneurysm (2-Photon Characterization of Optical Proteolytic Beacons for Imaging Changes in Matrix-Metalloprotease Activity in a Mouse Model of Aneurysm)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Aneurysm is the subject of a report. According to news reporting originating in Tucson, Arizona, by NewsRx journalists, research stated, "Abdominal aortic aneurysm is a multifactorial disease that is a leading cause of death in developed countries. Matrix-metalloproteases (MMPs) are part of the disease process, however, assessing their role in disease initiation and progression has been difficult and animal models have become essential."

The news reporters obtained a quote from the research from the University of Arizona, "Combining F?rster resonance energy transfer (FRET) proteolytic beacons activated in the presence of MMPs with 2-photon microscopy allows for a novel method of evaluating MMP activity within the extracellular matrix (ECM). Single and 2-photon spectra for proteolytic beacons were determined in vitro. Ex vivo experiments using the apolipoprotein E knockout angiotensin II-infused mouse model of aneurysm imaged ECM architecture simultaneously with the MMP-activated FRET beacons. 2-photon spectra of the two-color proteolytic beacons showed peaks for the individual fluorophores that enable imaging of MMP activity through proteolytic cleavage. Ex vivo imaging of the beacons within the ECM revealed both microstructure and MMP activity. 2-photon imaging of the beacons in aneurysmal tissue showed an increase in proteolytic cleavage within the ECM (p <0.001), thus indicating an increase in MMP activity."

According to the news reporters, the research concluded: "Our data suggest that FRET-based proteolytic beacons show promise in assessing MMP activity within the ECM and will therefore allow future studies to identify the heterogeneous distribution of simultaneous ECM remodeling and protease activity in aneurysmal disease."

For more information on this research see: 2-Photon Characterization of Optical Proteolytic Beacons for Imaging Changes in Matrix-Metalloprotease Activity in a Mouse Model of Aneurysm. Microscopy and Microanalysis, 2016;22(2):349-60. (Cambridge University Press - www.cambridge.org; Microscopy and Microanalysis - journals.cambridge.org/action/displayJournal?jid=MAM)

Our news correspondents report that additional information may be obtained by contacting D.G. Oncology

Research from University of Cincinnati Yields New Findings on Oncology (Impact of molecular profiling on overall survival of patients with advanced ovarian cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology. According to news originating from Cincinnati, Ohio, by NewsRx correspondents, research stated, "Patients with recurrent epithelial ovarian cancer (EOC) have limited treatment options. Studies have reported that biomarker profiling may help predict patient response to available treatments."

Our news journalists obtained a quote from the research from the University of Cincinnati, "This study sought to determine the value of biomarker profiling in recurrent EOC. Patients in the Matched cohort had a median OS of 36 months compared to 27 months for patients in the Unmatched cohort (HR 0.62, 95% CI 0.41-0.96; p<0.03). Individual biomarkers were analyzed, with TUBB3, and PGP prognostic for survival. Biomarker analysis also identified a molecular subtype (positive for at least two of the following markers: ERCC1, RRM1, TUBB3, PGP) with particularly poor overall survival. 224 patients from a commercial registry (NCT02678754) with stage IIIC/IV EOC at diagnosis, or restaged to IIIC/IV EOC at the time of molecular profiling, were retrospectively divided into two cohorts based on whether or not the drugs they received matched their profile recommendations. The Matched cohort received no drugs predicted to be lack-of-benefit while the Unmatched cohort received at least one drug predicted to be lack-of-benefit. Profile biomarker/drug associations were based on multiple test platforms including immunohistochemistry, fluorescent in situ hybridization and DNA sequencing. This report demonstrates the ability of multi-platform molecular profiling to identify EOC patients at risk of inferior survival."

According to the news editors, the research concluded: "It also suggests a potential beneficial role of avoidance of lack-of-benefit therapies which, when administered, resulted in decreased survival relative to patients who received only therapies predicted to be of benefit."

The news correspondents report that additional information may be obtained from T.J. Herzog, University of Cincinnati Cancer Institute, Cincinnati, OH, United States. Additional authors for this research include D. Spetzler, N. Xiao, K. Burnett, T. Maney, A. Voss, S. Reddy, R. Burger, T. Krivak, M. Powell, M. Friedlander and W. McGuire.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18632/oncotarget.7835. This DOI is a link to an online electronic document that is either free or for purchase.

Research from University of Erlangen Yields New Findings on Helicobacter pylori (Characterisation of worldwide Helicobacter pylori strains reveals genetic conservation and essentiality of serine protease HtrA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Helicobacter pylori. According to news reporting from Erlangen, Germany, by NewsRx journalists, research stated, "HtrA proteases and chaperones exhibit important roles in periplasmic protein quality control and stress responses. The genetic inactivation of htrA has been described for many bacterial pathogens."

Financial supporters for this research include German Science Foundation, Austrian Science Fund (FWF).

The news correspondents obtained a quote from the research from the University of Erlangen, "However, in some cases such as the gastric pathogen Helicobacter pylori, HtrA is secreted where it cleaves the tumour-suppressor E-cadherin interfering with gastric disease development, but the generation of htrA mutants is still lacking. Here, we show that the htrA gene locus is highly conserved in worldwide strains. HtrA presence was confirmed in 992 H. pylori isolates in gastric biopsy material from infected patients. Differential RNA-sequencing (dRNA-seq) indicated that htrA is encoded in an operon with two subsequent genes, HP1020 and HP1021. Genetic mutagenesis and complementation studies revealed that HP1020 and HP1021, but not htrA, can be mutated. In addition, we demonstrate that suppression of HtrA proteolytic activity with a newly developed inhibitor is sufficient to effectively kill H. pylori, but not other bacteria. We show that Helicobacter htrA is an essential bifunctional gene with crucial intracellular and extracellular functions. Thus, we describe here the first microbe in which htrA is an indispensable gene, a situation unique in the bacterial kingdom."

According to the news reporters, the research concluded: "HtrA can therefore be considered a promising new target for anti-bacterial therapy."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/mmi.13276. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Europe, Serine, Germany, Erlangen, Genetics, Protease, Helicobacter pylori, Neutral Amino Acids, Enzymes and Coenzymes, Epsilonproteobacteria, Gram Negative Bacteria, Gram-Negative Bacteria, Parasitic Diseases and Conditions.
Liver Diseases and Conditions - Hepatitis C Virus

Research from University of Paris Yields New Findings on Hepatitis C Virus (ITPA Genotypes Predict Anemia but Do Not Affect Virological Response with Interferon-Free Faldaprevir, Deleobuvir, and Ribavirin for HCV Infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Hepatitis C Virus. According to news reporting out of Clichy, France, by NewsRx editors, research stated, "Whether inosine triphosphatase (ITPA) gene polymorphisms predict anemia during interferon-free therapy in chronic hepatitis C virus (HCV)-infected patients is unknown. We examined the relationship between two ITPA polymorphisms, anemia, and sustained virological response 12 weeks post-treatment (SVR12) in patients receiving the NS3/4A protease inhibitor faldaprevir, the non-nucleoside polymerase inhibitor deleobuvir, and ribavirin."

Our news journalists obtained a quote from the research from the University of Paris, "HCV genotype 1-infected, treatment-na?ve patients (N=362) were randomized and treated in one of five treatment arms with faldaprevir and deleobuvir with or without ribavirin. Two ITPA polymorphisms (rs1127354 and rs6051702) were genotyped and defined as ITPA-deficient (rs1127354 AA or AC; rs6051702 CC or CA) or ITPA-non-deficient (rs1127354 CC; rs6051702 AA) according to their association with ITPA deficiency. Baseline and on-treatment variables associated with anemia and SVR12 were identified using logistic regression. In the pooled ribavirin-containing arms, 10.1% (32/316) of patients experienced on-treatment hemoglobin <10 g/dL, and 32.6% (103/316) experienced on-treatment hemoglobin <10 g/dL or a change from baseline (>=)3.5 g/dL. Of the latter group, 99% (102/103) had the ITPA-non-deficient rs1127354 genotype. Other variables associated with on-treatment hemoglobin <10 g/dL or a decrease (>=)3.5 g/dL were age, baseline hemoglobin, rs6051702 genotype, and plasma ribavirin concentration. In a multivariate analysis, high plasma ribavirin concentration, low baseline hemoglobin, HCV genotype 1b, and IL28B genotype CC were associated with higher SVR12. The ITPA rs1127354 CC and rs6051702 AA genotypes may predict ribavirin-induced anemia during treatment with interferon-free, ribavirin-containing regimens."

According to the news editors, the research concluded: "With this interferon-free regimen, SVR was associated with ribavirin levels, but not with anemia or ITPA genotypes."

For more information on this research see: ITPA Genotypes Predict Anemia but Do Not Affect Virological Response with Interferon-Free Faldaprevir, Deleobuvir, and Ribavirin for HCV Infection. Plos One, 2015;10(12):e0144004. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Life Science Research

Research from University of Rostock Reveals New Findings on Life Science Research (Functional Characterization and Drug Response of Freshly Established Patient-Derived Tumor Models with CpG Island Methylator Phenotype)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research have been published. According to news reporting originating from Rostock, Germany, by NewsRx correspondents, research stated, "Patient-individual tumor models constitute a powerful platform for basic and translational analyses both in vitro and in vivo. However, due to the labor-intensive and highly time-consuming process, only few well-characterized patient-derived cell lines and/or corresponding xenografts exist."

Our news editors obtained a quote from the research from the University of Rostock, "In this study, we describe successful generation and functional analysis of novel tumor models from patients with sporadic primary colorectal carcinomas (CRC) showing CpG island methylator phenotype (CIMP). Initial DNA fingerprint analysis confirmed identity with the patient in all four cases. These freshly established cells showed characteristic features associated with the CIMP-phenotype (HROC40: APCwt, TP53 mut, KRAS mut; 3/8 marker methylated; HROC43: APC mut, TP53 mut, KRAS mut; 4/8 marker methylated; HROC60: APCwt, TP53 mut, KRASwt; 4/8 marker methylated; HROC183: APC mut, TP53 mut, KRAS mut; 6/8 marker methylated). Cell lines were of epithelial origin (EpCAM+) with distinct morphology and growth kinetics. Response to chemotherapeutics was quite individual between cells, with stage I-derived cell line HROC60 being most susceptible towards standard clinically approved chemotherapeutics (e.g. 5-FU, Irinotecan). Of note, most cell lines were sensitive towards 'non-classical' CRC standard drugs (sensitivity: Gemcitabin >Rapamycin >Nilotinib)."

According to the news editors, the research concluded: "This comprehensive analysis of tumor biology, genetic alterations and assessment of chemosensitivity towards a broad range of (chemo-) therapeutics helps bringing forward the concept of personalized tumor therapy."

The news editors report that additional information may be obtained by contacting C. Maletzki, Molecular Oncology and Immunotherapy, University of Rostock, Rostock, Germany.

Addiction Research

Research from University of Sao Paulo Yields New Findings on Addiction Research (Early social isolation increases persistence of alcohol-seeking behavior in alcohol-related contexts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Addiction Research have been published. According to news reporting out of Sao Paulo, Brazil, by NewsRx editors, research stated, "Social conditions during rearing are well known to affect adult alcohol consumption, but few experiments have explored the effects of social conditions on behaviors that are related to alcohol dependence, such as the persistence of alcohol seeking. This study compared the effects of isolation (ISO) and interaction (INT) rearing on the persistence of alcohol-seeking behavior."

Our news journalists obtained a quote from the research from the University of Sao Paulo, "Rats were trained to lever press for a solution of 10% alcohol diluted in water. They were then exposed to a two-component multiple schedule of reinforcement (baseline). Responses in one component were reinforced by a higher rate of alcohol delivery (rich component, variable interval 15 s) and responses in the other component were reinforced by a lower rate of delivery (lean component, variable interval 45 s). The persistence of lever pressing in the presence of each stimulus was then assessed during extinction. The results from baseline showed that response rates in rats in both groups were higher in the rich component than in the lean component, but ISO rats responded significantly more than INT rats in both components. The persistence of responding during extinction in ISO rats in both components was also higher than that in INT rats."

According to the news editors, the research concluded: "The results show that effects of ISO are not restricted to alcohol consumption, but also affect persistence of alcohol-seeking behavior, which may reflect differences in the value of drug-related stimuli."

For more information on this research see: Early social isolation increases persistence of alcohol-seeking behavior in alcohol-related contexts. Behavioural Pharmacology, 2016;27(2-3 Spec I):185-91. (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology - journals.lww.com/behaviouralpharm/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting D.M. Cortes-Patino, Experimental Psychology Department, Institute of Psychology, University of Sao Paulo, Sao Paulo, Brazil. Additional authors for this research include C. Serrano and M. Garcia-Mijares.

Stem Cell Research - Hematopoietic Stem Cells

Research from University of Ulsan Reveals New Findings on Hematopoietic Stem Cells (Evaluation of parameters obtained from the Sysmex XN-2000 for predicting the recovery of the absolute neutrophil count and platelets after hematopoietic stem ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stem Cell Research - Hematopoietic Stem Cells. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "We analyzed abilities of parameters from Sysmex XN-2000 (Sysmex, Kobe, Japan) to predict absolute neutrophil count (ANC) and platelet recovery after hematopoietic stem cell transplantation (HSCT) in patients with hematologic malignancies. We prospectively analyzed 911 follow-up peripheral blood samples from 44 HSCT-performed patients and evaluated the performances of the following parameters: WBC, immature granulocyte (IG), hematopoietic stem and progenitor cells (HPC), immature reticulocyte fraction (IRF), immature platelet fraction (IPF), platelet distribution width (PDW), mean platelet volume (MPV), and platelet larger cell ratio (P-LCR)."

The news correspondents obtained a quote from the research from the University of Ulsan, "When compared to four other parameters, the identification of initiation in IG (%)/HPC (%) increase enabled earlier prediction of ANC recovery to >500/mL and >1000/mL with more time benefit of 3.5-6.5 days/2.0-5.0 days and 3.0-6.0 days/2.0-5.0 days, respectively. When compared to IPF (%), the identification of initiation in PDW, MPV, and P-LCR (%) increase enabled earlier prediction of platelet recovery to >20 000/mL and >50 000/mL with more time benefit of 2.5-3.5 days and 2.0-3.0 days, respectively. However, the standard deviation of time benefit obtained from IG (%)//HPC (%)//PDW//MPV//P-LCR (%) was consistently large (3.0-4.3 days). There is a systematic pattern where a rise in most of the studied parameters can be observed in most patients before ANC/platelet recovery."

According to the news reporters, the research concluded: "However, the interindividual variation between the time of rise of these parameters and ANC/platelet recovery is large, and therefore, using these parameters to predict recovery in the individual patient is probably not meaningful in the clinical setting."

Our news journalists report that additional information may be obtained by contacting S.H. Park, Dept. of Laboratory Medicine, University of Ulsan, College of Medicine
Research from University of Ulster Reveals New Findings on Inflammatory Bowel Disease (Natural Nuclear Factor Kappa Beta Inhibitors: Safe Therapeutic Options for Inflammatory Bowel Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Inflammatory Bowel Disease. According to news originating from Coleraine, United Kingdom, by NewsRx editors, the research stated, "Inflammatory bowel disease (IBD) is a chronic and debilitating condition classified as ulcerative colitis and Crohn's disease. IBD usually happens as result of immune dysfunction in the intestinal mucosa resulting in epithelial barrier dysfunction, which leads to exposure of the mucosal immune system to luminal antigenic material."

Our news journalists obtained a quote from the research from the University of Ulster, "This results in activation of inflammation, which is our bodies natural defense system; however, chronic inflammation leads to barrier dysfunction, which triggers a cycle of inflammation and further barrier dysfunction. This barrier breakdown results in the uncontrolled progression of IBD throughout the intestine. Despite the therapeutic advances made over the last decade, the current first line of treatment of IBD is limited to immunosuppressive and anti-inflammatory drugs, which need to be taken regularly and have significant side effects to the patients. Prolonged inflammation may increase the risk of intestinal malignancy. The role of nuclear factor kappa beta (NF-kb) has been established in the regulation of innate immunity and inflammation. NF-kb has also shown to be involved in critical events linking inflammation and cancer development. Recent investigations suggest that the NF-kb signaling cascade may be the central mediator of gastrointestinal inflammation in IBD and malignancies including esophageal, gastric, and colorectal cancers."

According to the news editors, the research concluded: "In this review, the therapeutic potential of natural NF-kb inhibitors as safe therapeutic options for the treatment of IBD will be discussed."

For more information on this research see: Natural Nuclear Factor Kappa Beta Inhibitors: Safe Therapeutic Options for Inflammatory Bowel Disease. *Inflammatory Bowel*
Research from Virginia Commonwealth University Yields New Findings on Lung Cancer (The afatinib resistance of in vivo generated H1975 lung cancer cell clones is mediated by SRC/ERBB3/c-KIT/c-MET compensatory survival signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Lung Cancer are presented in a new report. According to news reporting originating from Richmond, Virginia, by NewsRx correspondents, research stated, "We generated afatinib resistant clones of H1975 lung cancer cells by transient exposure of established tumors to the drug and collected the re-grown tumors. Afatinib resistant H1975 clones did not exhibit any additional mutations in proto-oncogenes when compared to control clones."

Our news editors obtained a quote from the research from Virginia Commonwealth University, "Afatinib resistant H1975 tumor clones expressed less PTEN than control clones and in afatinib resistant clones this correlated with increased basal SRC Y416, ERBB3 Y1289, AKT T308 and mTOR S2448 phosphorylation, decreased expression of ERBB1, ERBB2 and ERBB3 and increased total expression of c-MET, c-KIT and PDGFRb. Afatinib resistant clones were selectively killed by knock down of [ERBB3 + c-MET + c-KIT] but not by the individual or doublet knock down combinations. The combination of the ERBB1/2/4 inhibitor afatinib with the SRC family inhibitor dasatinib killed afatinib resistant H1975 cells in a greater than additive fashion; other drugs used in combination with dasatinib such as sunitinib, crizotinib and amufatinib were less effective. [Afatinib + dasatinib] treatment profoundly inactivated ERBB3, AKT and mTOR in the H1975 afatinib resistant clones and increased ATG13 S318 phosphorylation. Knock down of ATG13, Beclin1 or eIF2a strongly suppressed killing by [ERBB3 + c-MET + c-KIT] knock down, but were only modestly protective against [afatinib + dasatinib] lethality. Thus afatinib resistant H1975 NSCLC cells rely on ERBB1-and SRC-dependent hyper-activation of residual ERBB3 and elevated signaling, due to elevated protein expression, from wild type c-MET and c-KIT to remain alive."

According to the news editors, the research concluded: "Inhibition of ERBB3 signaling via both blockade of SRC and ERBB1 results in tumor cell death."

The news editors report that additional information may be obtained by contacting L. Booth, Departments of Biochemistry and Molecular Biology, Virginia Commonwealth University, Richmond, VA 23298, United States. Additional authors for this research include J.L. Roberts, M. Tavallai, T. Webb, D. Leon, J. Chen, W.P. McGuire, A. Poklepovic and P. Dent.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18632/oncotarget.7746. This DOI is a link to an online electronic document that is either free or for purchase.

**Immunization - Vaccines**

**Research from Xiamen University Yields New Findings on Vaccines (Functional assessment and structural basis of antibody binding to human papillomavirus capsid)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immunization - Vaccines is the subject of a report. According to news reporting out of Fujian, People's Republic of China, by NewsRx editors, research stated, "Persistent high-risk human papillomavirus (HPV) infection is linked to cervical cancer. Two prophylactic virus-like particle (VLP)-based vaccines have been marketed globally for nearly a decade."

Financial supporters for this research include National 863 Program of China, National Natural Science Fund, Fujian Provincial Program for Construction Plan of Science and Technology Innovation Platform, Welcome Trust.

Our news journalists obtained a quote from the research from Xiamen University, "Here, we review the HPV pseudovirion (PsV)-based assays for the functional assessment of the HPV neutralizing antibodies and the structural basis for these clinically relevant epitopes. The PsV-based neutralization assay was developed to evaluate the efficacy of neutralization antibodies in sera elicited by vaccination or natural infection or to assess the functional characteristics of monoclonal antibodies. Different antibody binding modes were observed when an antibody was complexed with virions, PsVs or VLPs. The neutralizing epitopes are localized on surface loops of the L1 capsid protein, at various locations on the capsomere. Different neutralization antibodies exert their neutralizing function via different mechanisms. Some antibodies neutralize the virions by inducing conformational changes in the viral capsid, which can result in concealing the binding site for a cellular receptor like 1A1D-2 against dengue virus, or inducing premature genome release like E18 against enterovirus 71. Higher-resolution details on the epitope composition of HPV neutralizing antibodies would shed light on the structural basis of the highly efficacious vaccines and aid the design of next generation vaccines. In-depth understanding of epitope composition would ensure the development of function-
indicating assays for the comparability exercise to support process improvement or process scale up."

According to the news editors, the research concluded: "Elucidation of the structural elements of the type-specific epitopes would enable rational design of cross-type neutralization via epitope re-engineering or epitope grafting in hybrid VLPs."

Our news journalists report that additional information may be obtained by contacting X. Zhang, State Key Laboratory of Molecular Vaccinology and Molecular Diagnostics, National Institute of Diagnostics and Vaccine Development in Infectious Diseases, Xiamen University, Xiamen, Fujian, People's Republic of China. Additional authors for this research include S. Li, Y. Modis, Z. Li, J. Zhang, N. Xia and Q. Zhao.

**Heart Disorders and Diseases - Atrial Fibrillation**

**Researchers at AEMPS Target Atrial Fibrillation (Causes of Death in Anticoagulated Patients With Atrial Fibrillation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "Oral anticoagulation reduces the risk of mortality in atrial fibrillation (AF), but examination of the causes of death is essential to design new strategies to further reduce the high mortality rates observed in this population. The authors sought to analyze and compare causes of death in patients receiving direct oral anticoagulants (DOAC) or warfarin for prevention of stroke and systemic embolism (SE) in AF."

The news reporters obtained a quote from the research from AEMPS, "The authors systematically searched for randomized trials of DOAC versus warfarin for prevention of stroke/SE in AF. The main outcome was mortality and independently adjudicated specific causes of death. The authors used the random effects model of meta-analysis to combine the studies. 71,683 patients from 4 trials were included (134,046 patient-years of follow-up). A total of 6,206 patients (9%) died during follow-up. Adjusted mortality rate was 4.72%/year (95% confidence interval [CI]: 4.19 to 5.28). Cardiac deaths accounted for 46% of all deaths, whereas nonhemorrhagic stroke/SE and hemorrhage-related deaths represented 5.7% and 5.6% of the total mortality, respectively. Compared with patients who were alive, those who died had more frequent history of heart failure (odds ratio [OR]: 1.75; 95% CI: 1.25 to 2.44), permanent/persistent AF (OR: 1.38; 95% CI: 1.25 to 1.52) and diabetes (OR: 1.37; 95% CI:
1.11 to 1.68); were more frequently male (OR: 1.24; 95% CI: 1.13 to 1.37) and older (mean difference 3.2 years; 95% CI: 1.6 to 4.8); and had a lower creatinine clearance (-9.9 ml/min; 95% CI: -11.3 to -8.4). There was a small, but significant, reduction in all-cause mortality with the DOAC versus warfarin (difference -0.42%/year; 95% CI: -0.66 to -0.18), mainly driven by a reduction in fatal bleedings. In contemporary AF trials, most deaths were cardiac-related, whereas stroke and bleeding represented only a small subset of deaths."

According to the news reporters, the research concluded: "Interventions beyond anticoagulation are needed to further reduce mortality in AF."

For more information on this research see: Causes of Death in Anticoagulated Patients With Atrial Fibrillation. *Journal of the American College of Cardiology*, 2016;68(23):2508-2521. *Journal of the American College of Cardiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.

*Intercellular Signaling Peptides and Proteins - ...*

**Researchers at APHP Release New Data on Cytokines (Interferon-alpha for the therapy of myeloproliferative neoplasms: targeting the malignant clone)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Intercellular Signaling Peptides and Proteins - Cytokines. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "Interferon alpha (IFN-a) has been used for over 30 years to treat myeloproliferative neoplasms (MPNs). IFN-a was shown to induce clinical, hematological, molecular and histopathological responses in small clinical studies."

Our news editors obtained a quote from the research from APHP, "Such combined efficacy has never been achieved with any other drug to date in such a significant proportion of patients. However, toxicity remains a limitation to its broader use despite the development of pegylated forms with better tolerance. Several on going phase 3 studies of peg-IFN-a versus hydroxyurea will help to define its exact place in MPN management. IFN-a efficacy is likely the consequence of a broad range of biological properties, including enhancement of immune response, direct effects on malignant cells and ability to cycle dormant malignant stem cells. However, comprehensive elucidation of its mechanism of action is still lacking. Sustained clinical, molecular and morphological responses after IFN-a discontinuation raised the hope that this drug could eradicate MPN. There is now consistent evidence showing that IFN-a is able to..."
eliminate malignant clones harboring JAK2V617F or Calreticulin mutations. However, the molecular complexity of these diseases could hamper IFN-a efficacy, as the presence of additional non-driver mutations, like in the TET2 gene, could be associated with resistance to IFN-a."

According to the news editors, the research concluded: "Therefore, combined therapy with another targeted agent could be required to eradicate MPN, and the best IFN-a companion for achieving this challenge remains to be determined."

For more information on this research see: Interferon-alpha for the therapy of myeloproliferative neoplasms: targeting the malignant clone. *Leukemia*, 2015;30(4):776-81. (Nature Publishing Group - www.nature.com/; Leukemia - www.nature.com/leu/)

Cardiovascular Research

Researchers at Aalborg University Target Cardiovascular Research (Cardiovascular control during whole body exercise)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Research is now available. According to news reporting originating in Aalborg, Denmark, by NewsRx journalists, research stated, "It has been considered whether during whole body exercise the increase in cardiac output is large enough to support skeletal muscle blood flow. This review addresses four lines of evidence for a flow limitation to skeletal muscles during whole body exercise."

The news reporters obtained a quote from the research from Aalborg University, "First, even though during exercise the blood flow achieved by the arms is lower than that achieved by the legs (similar to 160 vs. similar to 385 ml.min(-1).100 g(-1)), the muscle mass that can be perfused with such flow is limited by the capacity to increase cardiac output (42 l/min, highest recorded value). Secondly, activation of the exercise pressor reflex during fatiguing work with one muscle group limits flow to other muscle groups. Another line of evidence comes from evaluation of regional blood flow during exercise where there is a discrepancy between flow to a muscle group when it is working exclusively and when it works together with other muscles. Finally, regulation of peripheral resistance by sympathetic vasoconstriction in active muscles by the arterial baro-reflex is critical for blood pressure regulation during exercise."

According to the news reporters, the research concluded: "Together, these findings indicate that during whole body exercise muscle blood flow is subordinate to the control of blood pressure."
For more information on this research see: Cardiovascular control during whole body exercise. *Journal of Applied Physiology*, 2016;121(2):376-390. *Journal of Applied Physiology* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Our news correspondents report that additional information may be obtained by contacting S. Volianitis, Aalborg Univ, Dept. of Hlth Sci & Technol, DK-9220 Aalborg Ø, Denmark.

Researchers at Aarhus University have reported new data on obesity and diabetes (Effects of insulin-induced hypoglycaemia on lipolysis rate, lipid oxidation and adipose tissue signalling in human volunteers: a randomised clinical study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Obesity and Diabetes is now available. According to news reporting originating in Aarhus, Denmark, by NewsRx journalists, research stated, "The aims of this study were to determine the role of lipolysis in hypoglycaemia and define the underlying intracellular mechanisms. Nine healthy volunteers were randomised to treatment order of three different treatments (crossover design)."

Financial support for this research came from Aarhus University, the Novo Nordisk Foundation and the KETO Study Group/the Danish Agency for Science Technology and Innovation.

The news reporters obtained a quote from the research from Aarhus University, "Treatments were: (1) saline control; (2) hyperinsulinaemic hypoglycaemia (HH; i.v. bolus of 0.1 U/kg insulin); and (3) hyperinsulinaemic euglycaemia (HE; i.v. bolus of 0.1 U/kg insulin and 20% glucose). Inclusion criteria were that volunteers were healthy, aged > 18 years, had a BMI between 19 and 26 kg/m2, and provided both written and oral informed consent. Exclusion criteria were the presence of a known chronic disease (including diabetes mellitus, epilepsy, ischaemic heart disease and cardiac arrhythmias) and regular use of prescription medication. The data was collected at the medical research facilities at Aarhus University Hospital, Denmark. The primary outcome was palmitic acid flux. Participants were blinded to intervention order, but caregivers were not. Adrenaline (epinephrine) and glucagon concentrations were higher during HH than during both HE and control treatments. NEFA levels and lipid oxidation rates (determined by indirect calorimetry) returned to control levels after 105 min. Palmitate flux was increased to control levels during HH (p = NS) and was more than twofold higher than during HE (overall mean difference between HH vs HE, 114 [95% CI 64, 165 μmol/min]; p< 0.001). In subcutaneous adipose tissue biopsies, we found elevated levels
of hormone-sensitive lipase (HSL) and perilipin-1 phosphorylation 30 min after insulin injection during HH compared with both control and HE. There were no changes in the levels of adipose triglyceride lipase (ATGL), comparative gene identification-58 (CGI-58) or G(0)/G(1) switch gene 2 (G0S2) proteins. Insulin-stimulated phosphorylation of Akt and mTOR were unaffected by hypoglycaemia. Expression of the G0S2 gene increased during HE and HH compared with control, without changes in ATGL (also known as PNPLA2) or CGI-58 (also known as ABHD5) mRNA levels. These findings suggest that NEFAs become a major fuel source during insulin-induced hypoglycaemia and that lipolysis may be an important component of the counter-regulatory response. These effects appear to be mediated by rapid stimulation of protein kinase A (PKA) and HSL, compatible with activation of the beta-adrenergic catecholamine signalling pathway."

According to the news reporters, the research concluded: "ClinicalTrials.gov NCT01919788 The study was funded by Aarhus University, the Novo Nordisk Foundation and the KETO Study Group/Danish Agency for Science Technology and Innovation (grant no. 0603-00479, to NM)."

For more information on this research see: Effects of insulin-induced hypoglycaemia on lipolysis rate, lipid oxidation and adipose tissue signalling in human volunteers: a randomised clinical study. Diabetologia, 2017;60(1):143-152. Diabetologia can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Researchers at Academic Medical Center Have Reported New Data on Vesicular Transport Proteins (Helium postconditioning regulates expression of caveolin-1 and-3 and induces RISK pathway activation after ischaemia/reperfusion in cardiac tissue of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Membrane Proteins - Vesicular Transport Proteins have been presented. According to news reporting out of Amsterdam, Netherlands, by NewsRx editors, research stated, "Caveolae, lipid enriched invaginations of the plasma membrane, are epicentres of cellular signal transduction. The structural proteins of caveolae, caveolins, regulate effector pathways in anaesthetic-induced cardioprotection, including the RISK pathway."

Our news journalists obtained a quote from the research from Academic Medical
Center, "Helium (He) postconditioning (HePoc) is known to mimic anaesthetic conditioning and to prevent damage from myocardial infarction. We hypothesize that HePoc regulates caveolin-1 and caveolin-3 (Cav-1 and Cav-3) expression in the rat heart and activates the RISK pathway. Male Wistar rats (n=8, each group) were subjected to 25 min of cardiac ischaemia followed by reperfusion (I/R) for 5, 15 or 30 min (I/R 5/15/30). The HePoc groups underwent I/R with 70% helium ventilation during reperfusion (IR+He 5/15/30 min). Sham animals received surgical treatment without I/R. After each protocol blood and hearts were retrieved. Tissue was obtained from the area-at-risk (AAR) and non-area-at-risk (NAAR) and processed for western blot analyses and reverse-transcription-real-time-polymerase-chain-reaction (RT-qPCR). Protein analyses revealed increased amounts of Cav-1 and Cav-3 in the membrane of I/R+He15 (AAR: Cav1, P< 0.05; Cav-3, P< 0.05; both vs. I/R15). In serum, Cav-3 was found to be elevated in I/R+He15 (P < 0.05 vs. I/R15). RT-qPCR showed increased expression of Cav-1 in IR+He15 in AAR tissue (P < 0.05 vs. I/R15). Phosphorylation of RISK pathway proteins pERK1/2 (AAR: P < 0.05 vs. I/R15) and pAKT (AAR: P < 0.05; NAAR P< 0.05; both vs. I/R15) was elevated in the cytosolic fraction of I/R+ He15. These results suggest that 15 min of HePoc regulates Cav-1 and Cav-3 and activates RISK pathway kinases ERK1/2 and AKT."

According to the news editors, the research concluded: "These processes might be crucially involved in HePoc mediated cardioprotection."

Our news journalists report that additional information may be obtained by contacting N.C. Weber, Academy Med Center, Lab Expt Intens Care & Anaesthesiol, Dept. of Anaesthesiol, NL-1100 DD Amsterdam, Netherlands. Additional authors for this research include M. Albrecht, G. Oei, R. Steenstra, R.P. Kerindongo, C.J. Zuurbier, H.H. Patel, M.W. Hollmann, B. Preckel and N.C. Weber.

**Oncology - T-Cell Lymphoma**

**Researchers at Aichi Cancer Center Hospital Release New Data on T-Cell Lymphoma [Anti-CCR4 Monoclonal Antibody Mogamulizumab Followed by the GDP (Gemcitabine, Dexamethasone and Cisplatin) Regimen in Primary Refractory Angioimmunoblastic T-Cell ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - T-Cell Lymphoma.
According to news reporting originating in Nagoya, Japan, by NewsRx journalists, research stated, "There are few effective options for salvage therapy in elderly patients with relapsed or refractory angioimmunoblastic T-cell lymphoma (AITL). The anti-CCR4 antibody mogamulizumab works via antibody-dependent cytotoxic activity, reduces regulatory T cells, and evokes antitumor immunity in cancer patients."

The news reporters obtained a quote from the research from Aichi Cancer Center Hospital, "We report a 78-year-old patient with refractory AITL receiving a new immunochemotherapy consisting of sequential mogamulizumab administration followed by the GDP (gemcitabine, dexamethasone and cisplatin) regimen. A favorable consolidative effect of the GDP regimen could be observed in the patient who had partial remission after administration of mogamulizumab monotherapy. The regimen showed an acceptable toxicity profile without serious autoimmunity and an expected treatment response for the elderly patient with primary refractory AITL."

According to the news reporters, the research concluded: "This clinical case is the first report of salvage chemotherapy including mogamulizumab for primary refractory AITL described in the literature."

Our news correspondents report that additional information may be obtained by contacting T. Kinoshita, Aichi Canc Center Hosp, Dept. of Hematol & Cell Therapy, Nagoya, Aichi, Japan. Additional authors for this research include K. Yamamoto, Y. Higuchi, H. Yamamoto, T. Saito, H. Taji, Y. Yatabe, S. Nakamura and T. Kinoshita.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000444518. This DOI is a link to an online electronic document that is either free or for purchase.

**Gram-Negative Bacteria - Pseudomonas aeruginosa**

Researchers at Aichi Prefectural Institute of Public Health Report Findings in Pseudomonas aeruginosa (Applying a PCR-based open-reading frame typing method for easy genotyping and molecular epidemiological analysis of Pseudomonas aeruginosa)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Pseudomonas aeruginosa are presented in a new report. According to news reporting out of Nagoya, Japan, by NewsRx editors, research stated, "Molecular epidemiological techniques, such as pulsed-field gel electrophoresis (PFGE), or multilocus sequence typing (MLST) have facilitated our understanding of the transmission routes of nosocomial infections by "Pseudomonas aeruginosa. However, they are time consuming and technically demanding."

Financial support for this research came from Ministry of Health, Labour and Welfare.

Our news journalists obtained a quote from the research from the Aichi Prefectural Institute of Public Health, "To perform molecular epidemiological analysis in a standard microbiology laboratory, we aimed to develop a simpler and effective molecular epidemiological technique based on the open-reading frame (ORF) distribution patterns detected by PCR, which we call PCR-based ORF typing (POT). Ten ORFs from genomic islets, five ORFs from genomic islands, and the metallo-b-lactamases (MBLs) blalMP and blavIM were selected by comparing the whole-genome sequences of different Ps. aeruginosa strains (PAO1, PA7, UCBPP-PA14 and LESB58). These 17 ORFs were detected, along with a Ps. aeruginosa marker, using 9-plex and 10-plex PCR systems. The genotypes in the POT were compared to those obtained by using PFGE and MLST. Using the POT method, molecular epidemiological analyses of Ps. aeruginosa can be completed in 4 h."

According to the news editors, the research concluded: "Since this method is very easy to perform, even in standard clinical laboratories, it could be a valuable tool for monitoring daily infection control measures."

Our news journalists report that additional information may be obtained by contacting M. Suzuki, Laboratory of Bacteriology, Aichi Prefectural Institute of Public Health, Nagoya, Japan. Additional authors for this research include K. Yamada, M. Aoki, E. Hosoba, M. Matsumoto, H. Baba and Y. Iinuma.

Researchers at Albert Einstein College of Medicine Report New Data on Thrombocytopenia (Thrombocytopenia in MDS: epidemiology, mechanisms, clinical consequences and novel therapeutic strategies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hematologic Diseases and Conditions - Thrombocytopenia have been presented. According to news reporting originating from Bronx, New York, by NewsRx correspondents, research stated, "Thrombocytopenia is commonly seen in myelodysplastic syndrome (MDS) patients, and bleeding complications are a major cause of morbidity and mortality. Thrombocytopenia is an independent factor for decreased survival and has been incorporated in newer prognostic scoring systems."

Our news editors obtained a quote from the research from the Albert Einstein College of Medicine, "The mechanisms of thrombocytopenia are multifactorial and involve a differentiation block of megakaryocytic progenitor cells, leading to dysplastic, hypolobated and microscopic appearing megakaryocytes or increased apoptosis of megakaryocytes and their precursors. Dysregulated thrombopoietin (TPO) signaling and increased platelet destruction through immune or nonimmune mechanisms are frequently observed in MDS. The clinical management of patients with low platelet counts remains challenging and approved chemotherapeutic agents such as lenalidomide and azacytidine can also lead to a transient worsening of thrombocytopenia. Platelet transfusion is the only supportive treatment option currently available for clinically significant thrombocytopenia. The TPO receptor agonists romiplostim and eltrombopag have shown clinical activity in clinical trials in MDS. In addition to thrombopoietic effects, eltrombopag can inhibit leukemic cell proliferation via TPO receptor-independent effects. Other approaches such as treatment with cytokines, immunomodulating drugs and signal transduction inhibitors have shown limited activity in selected groups of MDS patients."

According to the news editors, the research concluded: "Combination trials of approved agents with TPO agonists are ongoing and hold promise for this important clinical problem."

For more information on this research see: Thrombocytopenia in MDS: epidemiology, mechanisms, clinical consequences and novel therapeutic strategies. Leukemia, 2015;30(3):536-44. (Nature Publishing Group - www.nature.com/; Leukemia - www.nature.com/leu/)

The news editors report that additional information may be obtained by contacting W. Li, Dept. of Medicine, Albert Einstein College of Medicine, Jacobi Medical Center, Bronx, NY, United States. Additional authors for this research include K. Morrone, S. Kambhampati, B. Will, U. Steidl and A. Verma.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/leu.2015.297. This DOI is a link to an online electronic document that is either free or for purchase.

Researchers at Amphia Hospital Target Colon Cancer (What is the Risk of Colorectal Cancer After an Episode of Acute Diverticulitis in Conservatively Treated Patients?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting from Breda, Netherlands, by NewsRx journalists, research stated, "The goal is to find the risk of colorectal cancer after an episode of acute diverticulitis in conservatively treated patients. Secondly, to determine the benefit of colonoscopy in these patients."

The news correspondents obtained a quote from the research from Amphia Hospital, "In the Netherlands, it is a common practice to routinely perform a colonoscopy after an episode of conservatively treated diverticulitis to exclude a malignancy. Yet according to the Dutch guidelines, these patients should not undergo a colonoscopy on a routine basis. The aim of this study is to determine the benefit of a colonoscopy in patients who have been treated for diverticulitis conservatively. This retrospective study includes patients who were diagnosed with acute diverticulitis (Hinchey 0 and I) and were treated conservatively, with or without antibiotics. Only patients who underwent colonoscopy were included for analysis. In addition, the outcome (yes or no colorectal cancer) of colonoscopy was analyzed according to patients' presentation of alarm symptoms for colorectal cancer. Between January 2008 and June 2013, 977 patients were treated conservatively for an episode of acute diverticulitis. Of those, 645 underwent colonoscopy during follow-up. Alarm symptoms for colorectal cancer were present in 205 patients. Nine of them were diagnosed with colorectal cancer (4.4%) versus 1 patient (0.2%, p=0.0002) in the group without alarm symptoms (N=440). This study confirms that routine colonoscopy is not indicated after acute diverticulitis which has been treated conservatively in a large series."

According to the news reporters, the research concluded: "Only in case of alarm symptoms a colonoscopy is mandatory, but even then the actual finding of a colorectal cancer is rare."

Our news journalists report that additional information may be obtained by contacting W. Ramphal, Departments of *Surgery†Gastroenterology, Amphia Hospital, Breda, Netherlands. Additional authors for this research include J.M. Schreinemakers, T.C. Seerden, R.M. Crolla, A.M. Rijken and P.D Gobardhan.

Researchers at Arizona State University Target Amphetamines (Early life stress and chronic variable stress in adulthood interact to influence methamphetamine self-administration in male rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Amphetamines. According to news reporting from Tempe, Arizona, by NewsRx journalists, research stated, "Early life stress interacts with adult stress to differentially modulate neural systems and vulnerability to various psychiatric illnesses. However, the effects of early life stress and adult stress on addictive behaviors have not been sufficiently investigated."

The news correspondents obtained a quote from the research from Arizona State University, "We examined the effects of early life stress in the form of prolonged maternal separation, followed in early adulthood by either 10 days of chronic variable stress or no stress, on methamphetamine self-administration, extinction, and cue-induced reinstatement. We observed that chronic variable stress in adulthood reduced methamphetamine self-administration in rats with a history of early life stress."

According to the news reporters, the research concluded: "These findings add to an emerging body of literature suggesting interactions between early life and early adulthood stressors on adult behavioral phenotypes."

For more information on this research see: Early life stress and chronic variable stress in adulthood interact to influence methamphetamine self-administration in male rats. Behavioural Pharmacology, 2016;27(2-3 Spec 1):182-4. (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology - journals.lww.com/behaviouralpharm/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting C.R. Lewis, Dept. of Psychology, Arizona State University, Tempe, Arizona, United States. Additional authors for this research include K. Staudinger, S.E. Tomek, R. Hernandez, T. Manning and M.F Olive.

Researchers at Autonomous University Detail Findings in Alzheimer Disease (PTEN recruitment controls synaptic and cognitive function in Alzheimer’s models)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Alzheimer Disease have been published. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "Dyshomeostasis of amyloid-b peptide (Ab) is responsible for synaptic malfunctions leading to cognitive deficits ranging from mild impairment to full-blown dementia in Alzheimer’s disease. Ab appears to skew synaptic plasticity events toward depression."

The news reporters obtained a quote from the research from Autonomous University, "We found that inhibition of PTEN, a lipid phosphatase that is essential to long-term depression, rescued normal synaptic function and cognition in cellular and animal models of Alzheimer’s disease. Conversely, transgenic mice that overexpressed PTEN displayed synaptic depression that mimicked and occluded Ab-induced depression. Mechanistically, Ab triggers a PDZ-dependent recruitment of PTEN into the postsynaptic compartment. Using a PTEN knock-in mouse lacking the PDZ motif, and a cell-permeable interfering peptide, we found that this mechanism is crucial for Ab-induced synaptic toxicity and cognitive dysfunction."

According to the news reporters, the research concluded: "Our results provide fundamental information on the molecular mechanisms of Ab-induced synaptic malfunction and may offer new mechanism-based therapeutic targets to counteract downstream Ab signaling."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nn.4225. This DOI is a link to an online electronic document that is either free or for purchase.

Researchers at Bassett Medical Center Have Reported New Data on Fatty Liver (Short sleep duration and risk of nonalcoholic fatty liver disease: A systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Liver Diseases and Conditions - Fatty Liver are discussed in a new report. According to news reporting out of Cooperstown, New York, by NewsRx editors, research stated, "Nonalcoholic fatty liver disease (NAFLD) is one of the most common causes of chronic liver disease worldwide. Several studies have suggested that short sleep duration could be a risk factor for NAFLD."

Our news journalists obtained a quote from the research from Bassett Medical Center, "However, results of those reports are inconsistent. This meta-analysis was conducted with an attempt to summarize all available data. A comprehensive literature review was performed using MEDLINE and EMBASE database. Studies that reported relative risks, odd ratios or hazard ratios comparing the risk of NAFLD among participants who had short sleep duration versus those with longer sleep duration were included. Pooled risk ratios and 95% confidence interval were calculated using a random-effect, generic inverse variance method. Six studies met the eligibility criteria and were included in the meta-analysis. The risk of NAFLD in participants who had short sleep duration was significantly higher than participants with longer sleep duration with pooled risk ratios of 1.19 (95% confidence interval, 1.04-1.36, I-2 = 0%)."

According to the news editors, the research concluded: "Our study demonstrated a small but significantly increased risk of NAFLD among participants who had short sleep duration."

Our news journalists report that additional information may be obtained by contacting K. Wijarnpreecha, Bassett Med Center, Dept. of Internal Med, Cooperstown, NY, United States. Additional authors for this research include C. Thongprayoon, P. Panjawatanan and P. Ungprasert.

Keywords for this news article include: Cooperstown, New York, United States, North and Central America, Fatty Liver Disease, Article Review, Risk and Prevention, Digestive System Diseases and Conditions, Liver Diseases and Conditions, Bassett Medical Center.

Researchers at Bayer Pharma AG Target Hormones (Pharmacokinetics, safety and tolerability of the novel, selective mineralocorticoid receptor antagonist finerenone - results from first-in-man and relative bioavailability studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Hormones. According to news reporting originating in Wuppertal, Germany, by NewsRx journalists, research stated, "The safety, tolerability and pharmacokinetics of the selective nonsteroidal mineralocorticoid receptor antagonist finerenone were evaluated in healthy male volunteers in two randomized, single-centre studies. Study 1 was a first-in-man, single-blinded, placebo-controlled, parallel-group, dose-escalation study."

Financial support for this research came from Bayer HealthCare. The news reporters obtained a quote from the research from Bayer Pharma AG, "Fasted participants (n=45) received single oral doses of finerenone 1-40 mg polyethylene glycol (PEG) solution or placebo. Study 2 was a relative bioavailability study comparing a finerenone 10 mg immediate-release (IR) tablet with finerenone 10 mg PEG solution in the fasted state, investigating the effect of a high-fat/high-calorie meal on the pharmacokinetics of the IR tablet and assessing a further dose escalation to finerenone 80 mg (eight finerenone 10 mg IR tablets), in an open-label, fourfold crossover design (n=15). Finerenone was rapidly absorbed from PEG solution (median time to maximum plasma concentration [tmax]: 0.500-1.00 h), exhibited dose-linear pharmacokinetics and was rapidly eliminated from plasma (geometric mean terminal half-life [t\text{\gamma}] : 1.70-2.83 h). Finerenone IR tablets demonstrated similar pharmacokinetics (median tmax : 0.750-2.50 h; geometric mean t\text{\gamma} : 1.89-4.29 h) with, however, enhanced bioavailability versus PEG solution (least-squares mean tablet/solution ratio of 187\% for area under the plasma-concentration curve [AUC] and maximum plasma concentration [Cmax]). High-fat/high-calorie food affected the rate but not the extent of finerenone absorption. Finerenone was well tolerated and did not influence clinical laboratory parameters, blood pressure, heart rate, urinary electrolytes or neurohormones, including serum aldosterone and angiotensin II."

According to the news reporters, the research concluded: "Finnenone has favourable pharmacokinetics and tolerability in healthy men, and is suitable for dosing independent of food intake."

Our news correspondents report that additional information may be obtained by contacting S. Lentini, Clinical Sciences, Clinical Pharmacology, Cardiovascular and Hematology, Bayer Pharma AG, Pharma Research Centre, 42096, Wuppertal, Germany. Additional authors for this research include R. Heinig, N. Kimmeskamp-Kirschbaum and G. Wensing.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/fcp.12170. This DOI is a link to an online electronic document that is
either free or for purchase.

Oncology - Oropharyngeal Cancer

Researchers at Baylor University College of Medicine Target Oropharyngeal Cancer (Racial disparities in incidence of human papillomavirus-associated oropharyngeal cancer in an urban population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Oropharyngeal Cancer. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "Recent studies suggest that rates of human papillomavirus related oropharyngeal cancer (HPVOPC) in the US are higher in Caucasians than minorities. We hypothesized that this disparity would be less marked in a racially and ethnically diverse population from New York City."

Our news journalists obtained a quote from the research from the Baylor University College of Medicine, "This is a retrospective chart review of 210 patients with biopsied or surgically treated OPC at the Icahn School of Medicine at Mount Sinai (ISMMS) between 1999 and 2013. Polymerase chain reaction (PCR) was used to detect the presence of HPV-DNA in paraffin-embedded tumor blocks. Incidence of HPV-positive cancers was compared between Caucasians and minorities (defined as African Americans, Asians, and Hispanics) using Fisher's exact test. We found a higher incidence of HPV-positive OPC in Caucasians than racial minorities within the ISMMS population (p = 0.002). HPV incidence detected by PCR was 139/165 [84.2%] for Caucasians and 28/45 [62.2%] for minorities. Specifically, there was a higher rate in Caucasians compared to African Americans (p = 0.017), but no significant difference between Caucasians and Hispanics (p = 0.087). We documented a disparity in incidence of HPVOPC amongst racial groups, consistent with previously reported trends from study populations in less urbanized areas."

According to the news editors, the research concluded: "Thus we conclude that the factors underlying racial/ethnic disparities in HPVOPC incidence are likely to be similar across communities with different levels of urbanization and population diversity."

The news correspondents report that additional information may be obtained from A.G. Sikora, Baylor College of Medicine, Dept. of Otolaryngol Head & Neck Surg, Houston, TX 77030, United States. Additional authors for this research include I. Varier, D. Zhang, E.G. Demicco, M.R. Posner, K. Misiukiewicz, E.M. Genden, B.A. Miles, M.S. Teng and A.G. Sikora.
Researchers at Bern University Hospital Target Narcolepsy (Post-H1N1 Flu Vaccination Narcolepsy in Switzerland: A Retrospective Survey in the 30 Sleep-Certified Swiss Centers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nervous System Diseases and Conditions - Narcolepsy is the subject of a report. According to news reporting originating in Bern, Switzerland, by NewsRx journalists, research stated, "Narcolepsy-cataplexy is a sleep-wake disorder and suggested to be immune-mediated, involving genetic and environmental factors. The autoimmune process eventually leads to a loss of hypocretin neurons in the lateral hypothalamus."

The news reporters obtained a quote from the research from Bern University Hospital, "Epidemiological studies in several countries proved an increased incidence of narcolepsy after H1N1 flu vaccination and infection. This survey in 30 sleep centers in Switzerland led to the identification of 9 H1N1-vaccinated children and adults as newly diagnosed narcolepsy."

According to the news reporters, the research concluded: "Clinical features included the abrupt and severe onset of sleepiness, cataplexy and sleep fragmentation."

Our news correspondents report that additional information may be obtained by contacting U. Kallweit, Dept. of Neurology, Bern University Hospital, Bern, Switzerland. Additional authors for this research include J. Mathis, O.G. Jenni, R. Heinzer, J. Haba-Rubio, C.R. Baumann, K. Cervena and C.L Bassetti.

Researchers at Boston University Have Reported New Data on Obesity (A Randomized Trial Examining the Impact of Communicating Genetic and Lifestyle Risks for Obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Genetic testing for obesity is available directly to consumers, yet little is understood about its behavioral impact and its added value to nongenetic risk communication efforts based on lifestyle factors. A randomized trial examined the short-term impact of providing personalized obesity risk information, using a 2 x 2 factorial design."

Our news journalists obtained a quote from the research from Boston University, "Participants were recruited from the Coriell Personalized Medicine Collaborative (CPMC) and randomized to receive (1) no risk information (control), (2) genetic risk, (3) lifestyle risk, or (4) combined genetic/lifestyle risks. Baseline and 3-month follow-up survey data were collected. Analyses examined the impact of risk feedback on intentions to lose weight and self-reported weight. A total of 696 participants completed the study. A significant interaction effect was observed for genetic and lifestyle information on intent to lose weight (P = 0.0150). Those who received genetic risk alone had greater intentions at follow-up, compared with controls (P = 0.0034). The impact of receiving elevated risk information on intentions varied by source and combination of risks presented. Non-elevated genetic risk did not lower intentions. No group differences were observed for self-reported weight."

According to the news editors, the research concluded: "Genetic risk information for obesity may add value to lifestyle risk information depending on the context in which it is presented."

For more information on this research see: A Randomized Trial Examining the Impact of Communicating Genetic and Lifestyle Risks for Obesity. Obesity, 2016;24(12):2481-2490. Obesity can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

The news correspondents report that additional information may be obtained from C. Wang, Boston University, Sch Public Hlth, Dept. of Community Hlth Sci, Boston, MA, United States. Researchers at Brigham and Women's Hospital Have Reported New Data on Tuberculosis [(Re)moving the needle: prospects for all-oral treatment for multidrug-resistant tuberculosis]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mycobacterium Infections - Tuberculosis is now available. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Currently recommended regimens for multidrug-resistant tuberculosis (MDR-TB) contain painful daily injections and are unsuccessful in approximately half of patients. Removal of the injectable agent to fashion all-oral regimens could transform MDR-TB treatment and access to care."

The news reporters obtained a quote from the research from Brigham and Women's Hospital, "To explore evidence for all-oral treatment regimens. We review evidence on drugs that could be included in injection-free MDR-TB regimens. The oral drugs considered have an indication for or are recommended for off-label use for TB or MDR-TB, and have demonstrated bactericidal activity. Drugs with weak bactericidal activity should have limited prior population exposure and evidence of effectiveness in MDR-TB regimens. Bedaquiline, delamanid, and linezolid all display strong bactericidal activity, while clofazimine has weak bactericidal activity. They all have limited prior population exposure and demonstrated effectiveness in MDR-TB regimens. Despite widespread exposure to pyrazinamide and late-generation fluoroquinolones in the population, all are bactericidal and have shown great value when included in treatment regimens for MDR-TB. The evidence supports the use of all oral regimens comprising new and existing drugs for MDR-TB treatment. Existing evidence of bactericidal activity and efficacy for these drugs provides a convincing argument for transitioning MDR-TB treatment towards all-oral regimens."

According to the news reporters, the research concluded: "These new regimens could mitigate the delivery, cost, and adherence challenges inherent to the current standard."

Our news correspondents report that additional information may be obtained by contacting C.D. Mitnick, Brigham & Women's Hospital, Div Global Hlth Equ, Boston, MA 02115, United States. Additional authors for this research include A. Brzezinski, F. Varaine and C.D. Mitnick.

Researchers at Brown University Have Reported New Data on Obesity (Inflammatory Obesity Phenotypes, Gender Effects, and Subclinical Atherosclerosis in African Americans The Jackson Heart Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating in Providence, Rhode Island, by NewsRx journalists, research stated, "Reasons for variations in atherosclerotic burden among individuals with similar levels of obesity are poorly understood, especially in African Americans. This study examines whether high-sensitivity C-reactive protein (hsCRP) is useful for discriminating between benign and high-risk obesity phenotypes for subclinical atherosclerosis in African Americans."

The news reporters obtained a quote from the research from Brown University, "Approach and Results-Participants from the Jackson Heart Study (n=4682) were stratified into 4 phenotypes based on the presence of National Heart and Lung and Blood Institute definition of obesity or obesity-equivalent (body mass index >= 30 or body mass index 25-30 with waist circumference >102 cm in men and >88 cm in women) and inflammation by hsCRP >= 2 mg/L. Using multivariate regression models, we conducted cross-sectional analyses of the association between inflammatory obesity phenotypes and subclinical atherosclerosis determined by carotid intima-media thickness or coronary artery calcium scores. Sex-specific analyses were conducted given significant interaction for gender (P=0.03). The prevalence of obesity or equivalent was 65%, of which 30% did not have inflammation. Conversely, 37% of nonobese individuals had inflammation. Among nonobese men, hsCRP >= 2 mg/L identified a subset of individuals with higher carotid intima-media thickness (adjusted mean difference =0.05, 95% confidence interval 0.02, 0.08 mm) compared with their noninflammatory counterparts. Among obese men, hsCRP <2 mg/L identified a subset of individuals with lower coronary artery calcium compared with their inflammatory counterparts. Among women, associations between hsCRP and carotid intima-media thickness or coronary artery calcium were not found."

According to the news reporters, the research concluded: "In the largest African American population-based cohort to date, hsCRP was useful in identifying a subset of nonobese men with higher carotid intima-media thickness, but not in women. hsCRP did not identify a subset of obese individuals with less subclinical atherosclerosis."

For more information on this research see: Inflammatory Obesity Phenotypes, Gender Effects, and Subclinical Atherosclerosis in African Americans The Jackson Heart Study. Arteriosclerosis Thrombosis and Vascular Biology, 2016;36(12):2431-2438. Researchers at CNIC Target Cardiomegaly (p38g and d promote heart hypertrophy by targeting the mTOR-inhibitory protein DEPTOR for degradation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Cardiomegaly. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "Disrupted organ growth leads to disease development. Hypertrophy underlies postnatal heart growth and is triggered after stress, but the molecular mechanisms involved in these processes are largely unknown."

The news reporters obtained a quote from the research from CNIC, "Here we show that cardiac activation of p38g and p38d increases during postnatal development and by hypertrophy-inducing stimuli. p38g/d promote cardiac hypertrophy by phosphorylating the mTORC1 and mTORC2 inhibitor DEPTOR, which leads to its degradation and mTOR activation. Hearts from mice lacking one or both kinases are below normal size, have high levels of DEPTOR, low activity of the mTOR pathway and reduced protein synthesis. The phenotype of p38g/d(-/-) mice is reverted by overactivation of mTOR with amino acids, shRNA-mediated knockdown of Deptor, or cardiomyocyte overexpression of active p38g and p38d. Moreover, in WT mice, heart weight is reduced by cardiac overexpression of DEPTOR."

According to the news reporters, the research concluded: "Our results demonstrate that p38g/d control heart growth by modulating mTOR pathway through DEPTOR phosphorylation and subsequent degradation."

For more information on this research see: p38g and d promote heart hypertrophy by targeting the mTOR-inhibitory protein DEPTOR for degradation. *Nature Communications*, 2016;7():10477. (Nature Publishing Group - www.nature.com/; Nature Communications - www.nature.com/ncomms/)

Our news correspondents report that additional information may be obtained by contacting B. Gonzalez-Teran, Fundacion Centro Nacional de Investigaciones Cardiovasculares Carlos III, CNIC, 28029 Madrid, Spain. Additional authors for this research include J.A. Lopez, E. Rodriguez, L. Leiva, S. Martinez-Martinez, J.A. Bernal, L.J. Jimenez-Borreguero, J.M. Redondo, J. Vazquez and G. Sabio.

Researchers at CSIR Target Breast Cancer (Centchroman Altered the Expressions of Tumor-Related Genes Through Active Chromatin Modifications in Mammary Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting from Uttar Pradesh, India, by NewsRx journalists, research stated, "Centchroman (CC), a female oral contraceptive, has been shown to possess breast anti-cancer activities. Recently, we have shown CC-mediated antimetastatic effect through reversal of epithelial-to-mesenchymal transition (EMT) in breast cancer."

The news correspondents obtained a quote from the research from CSIR, "The loss of tumor suppressor genes (TSGs) has been shown to promote EMT in breast cancer. Therefore, in the present study, we investigated the effect of CC-treatment on the expression of tumor-related genes including both tumor suppressor-and tumor promoter genes in breast cancer. CC treatment resulted in G(0)/G(1) phase cell cycle arrest in human breast cancer MDA-MB-231, SK-BR-3, and ZR-75-1 cells with the concomitant induction of TSGs such as p21 (WAF1/CIP1), p16(INK4a), and p27(Kip1). In addition, CC treatment also resulted in the downregulation of tumor promoter gene, human telomerase reverse transcriptase (hTERT). The induction of TSGs and downregulation of hTERT was found to be correlated with decreased expression levels of histone deacetylases (HDACs) and DNA methyltransferases (DNMTs). Further, mechanistic studies revealed CC-induced global DNA demethylation and alterations in the enrichment of chromatin modification markers at the promoters of p21 and hTERT. These in vitro results were corroborated with in vivo findings in 4T1-syngeneic mouse model, where CC-treatment resulted in tumor growth reduction accompanied with the induction of TSGs and alterations in the expression levels of HDACs, DNMT1, and histone modification markers. Overall, our findings suggest that CC-treatment induces the expression of TSGs and downregulates hTERT through histone modifications and DNA methylation changes."

According to the news reporters, the research concluded: "Therefore, CC could be further developed into a promising drug candidate against breast cancer."

Our news journalists report that additional information may be obtained by contacting S.M. Meeran, CSIR Cent Drug Res Inst, Lab Canc Epigenet, Div Endocrinol, Lucknow 226031, Uttar Pradesh, India. Additional authors for this research include S. Shukla, S. Sinha and S.M. Meeran.

Liver Diseases and Conditions - Hepatitis

Researchers at California Institute of Technology Release New Data on Hepatitis (Reading Out Single-Molecule Digital RNA and DNA Isothermal Amplification in Nanoliter Volumes with Unmodified Camera Phones)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Liver Diseases and Conditions - Hepatitis are discussed in a new report. According to news reporting originating from Pasadena, California, by NewsRx correspondents, research stated, "Digital single-molecule technologies are expanding diagnostic capabilities, enabling the ultrasensitive quantification of targets, such as viral load in HIV and hepatitis C infections, by directly counting single molecules. Replacing fluorescent readout with a robust visual readout that can be captured by any unmodified cell phone camera will facilitate the global distribution of diagnostic tests, including in limited-resource settings where the need is greatest."

Funders for this research include U.S. Department of Defense, U.S. Department of Health and Human Services, Burroughs Wellcome Fund, National Science Foundation.

Our news editors obtained a quote from the research from the California Institute of Technology, "This paper describes a methodology for developing a visual readout system for digital single-molecule amplification of RNA and DNA by (i) selecting colorimetric amplification-indicator dyes that are compatible with the spectral sensitivity of standard mobile phones, and (ii) identifying an optimal ratiometric image-process for a selected dye to achieve a readout that is robust to lighting conditions and camera hardware and provides unambiguous quantitative results, even for colorblind users. We also include an analysis of the limitations of this methodology, and provide a microfluidic approach that can be applied to expand dynamic range and improve reaction performance, allowing ultrasensitive, quantitative measurements at volumes as low as 5 nL. We validate this methodology using SlipChip-based digital single-molecule isothermal amplification with lDNA as a model and hepatitis C viral RNA as a clinically relevant target. The innovative combination of isothermal amplification chemistry in the presence of a judiciously chosen indicator dye and ratiometric image processing with SlipChip technology allowed the sequence-specific visual readout of single nucleic acid molecules in nanoliter volumes with an unmodified cell phone camera."

According to the news editors, the research concluded: "When paired with devices that integrate sample preparation and nucleic acid amplification, this hardware-agnostic approach will increase the affordability and the distribution of quantitative diagnostic and environmental tests."

The news editors report that additional information may be obtained by contacting J. Rodriguez-Manzano, Division of Chemistry and Chemical Engineering, California Institute of Technology, 1200 East California Boulevard, Pasadena, California 91125, United States. Additional authors for this research include M.A. Karymov, S. Begolo, D.A. Selck, D.V. Zhukov, E. Jue and R.F Ismagilov.

Drugs and Therapies - Antineoplastics

Researchers at Cambridge University Hospitals NHS Foundation Trust Target Antineoplastics (Photodynamic therapy: current role in the treatment of chorioretinal conditions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antineoplastics have been presented. According to news reporting originating from Cambridge, United Kingdom, by NewsRx editors, the research stated, "Verteporfin photodynamic therapy (vPDT) is a selective vaso-occlusive treatment that targets choroidal vascular abnormalities."

Our news editors obtained a quote from the research from Cambridge University Hospitals NHS Foundation Trust, "It was initially developed to treat neovascular age-related macular degeneration using the 'standard' vPDT protocol (verteporfin 6 mg/m(2), vPDT laser fluence 50 J/cm(2)). vPDT therapy has subsequently evolved as an important treatment modality for a range of other chorioretinal conditions including choroidal haemangioma, central serous chorioretinopathy, polypoidal choroidal vasculopathy, and peripapillary choroidal neovascularisation. Various 'safety-enhanced' vPDT protocols have been devised to optimise treatment outcomes, typically using reduced dose verteporfin (verteporfin 3 mg/m(2)) or reduced fluence vPDT (vPDT laser fluence 25 J/cm(2))."

According to the news editors, the research concluded: "This paper reviews the current role of vPDT therapy in the treatment of chorioretinal conditions."

For more information on this research see: Photodynamic therapy: current role in the treatment of chorioretinal conditions. Eye, 2016;30(2):202-10. Researchers at Cancer Center Describe Findings in Gastric Cancer (Subgroup analysis of East Asians in RAINBOW: A phase 3 trial of ramucirumab plus paclitaxel for advanced gastric cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gastric Cancer have been presented. According to news reporting originating from Nagoya, Japan, by NewsRx correspondents, research stated, "East Asia has higher gastric cancer incidence and mortality rates than other regions. We present a subgroup analysis of East Asians in the positive study RAINBOW."

Financial support for this research came from Eli Lilly and Company.

Our news editors obtained a quote from the research from Cancer Center, "Patients with advanced gastric or gastroesophageal junction adenocarcinoma previously treated with platinum and fluoropyrimidine received ramucirumab 8 mg/kg or placebo on days 1 and 15 plus paclitaxel 80 mg/m(2) on days 1, 8, and 15 of a 28-day cycle. Of 665 intention-to-treat patients, 223 were East Asian. Median overall survival was 12.1 months for ramucirumab plus paclitaxel and 10.5 months for placebo plus paclitaxel (hazard ratio: 0.986, 95% confidence interval: 0.727-1.337, p=0.929). Median progression-free survival was 5.5 months for ramucirumab plus paclitaxel and 2.8 months for placebo plus paclitaxel (hazard ratio: 0.628, 95% confidence interval: 0.473-0.834, p=0.001). Objective response rates were 34% for ramucirumab plus paclitaxel and 20% for placebo plus paclitaxel. Grade (>=) 3 neutropenia (60% vs 28%) and leukopenia (34% vs 13%) were higher for ramucirumab plus paclitaxel. The rate of febrile neutropenia was low (4% vs 4%). Special interest adverse events included any grade bleeding/hemorrhage (55% vs 25%), proteinuria (27% vs 7%), and hypertension (22% vs 2%)."

According to the news editors, the research concluded: "Ramucirumab plus paclitaxel significantly improves progression-free survival and response rate, with prolonged median overall survival and an acceptable safety profile in East Asians with advanced gastric cancer."

The news editors report that additional information may be obtained by contacting K. Muro, Dept. of Clinical Oncology, Aichi Cancer Center Hospital, Nagoya, Japan. Additional authors for this research include S.C. Oh, Y. Shimada, K.W. Lee, C.J. Yen, Y. Chao, J.Y. Cho, R. Cheng, R. Carlesi, K. Chandrawansa, M. Orlando and A. Ohtsu.

Researchers at Cancer Center Describe Findings in Pathology
[Pathology of advanced buccal mucosa cancer involving masticator space (T4b)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pathology have been published. According to news reporting originating from Bangalore, India, by NewsRx correspondents, research stated, "Buccal mucosa cancer involving masticator space is classified as very advanced local disease (T4b). The local recurrence rate is very high due to poor understanding of the extent of tumor spread in masticator space and technically difficult surgical clearance."

Our news editors obtained a quote from the research from Cancer Center, "The objective of this study is to understand the extent of tumor spread in masticator space to form basis for appropriate surgical resection. All consecutive patients with T4b-buccal cancer underwent compartment resection, with complete anatomical removal of involved soft-tissue structures. Specimens were systematically studied to understand the extent of invasion of various structures. The findings of clinical history, imaging and pathologic evaluation were compared and the results were evaluated. A total of 45 patients with advanced buccal cancer (T4b) were included in this study. The skin, mandible and lymph nodes were involved in 30, 24 and 17 cases respectively. The pterygoid muscles were involved in 34 cases (medial-pterygoid in 12 and both pterygoids in 22 cases) and masseter-muscle in 32 cases. Average distance for soft-tissue margins after compartment surgery was 2 cm and the margins were positive in 3 cases. The group with involvement of medial pterygoid muscle had safest margin with compartment surgery while it was also possible to achieve negative margins for group involving lateral pterygoid muscle and plates. The involvement of pterygomaxillary fissure was area of concern and margin was positive in 2 cases with one patient developing local recurrence with intracranial extension. At 21 months median follow-up (13-35 months), 38 patients were alive without disease while two developed local recurrence at the skull base. T4b buccal cancers have significant soft-tissue involvement in the masticator space. En bloc removal of all soft-tissues in masticator space is advocated to remove tumor contained within space."

According to the news editors, the research concluded: "The compartment surgery provides an opportunity to achieve negative margins for cancers actually contained within masticator space. It is inappropriate to club all patients with masticator space involvement in one group."

For more information on this research see: Pathology of advanced buccal mucosa cancer involving masticator space (T4b). *Indian Journal of Cancer*, 2015;52(4):611-5.

The news editors report that additional information may be obtained by contacting N.P. Trivedi, Dept. of Head and Neck Oncology, Mazumdar-Shaw Cancer Center, Narayana Hrudayalaya, Bangalore, Karnataka, India. Additional authors for this research include V.D. Kekatpure, G. Shetkar, A. Gangoli and M.A Kuriakose.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0019-509X.178410. This DOI is a link to an online electronic document that is either free or for purchase.

Researchers at Cancer Center Report Findings in Chemotherapy (Does the use of induction chemotherapy in oral cavity cancer compromise subsequent loco-regional treatment delivery: Results from a matched pair analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Chemotherapy are presented in a new report. According to news reporting originating in Kerala, India, by NewsRx journalists, research stated, "Neoadjuvant chemotherapy is being increasingly used in patients with unresectable oral cavity cancers to make them resectable. However, its impact on locoregional treatment delivery in such setting remains poorly studied."

The news reporters obtained a quote from the research from Cancer Center, "To evaluate the impact of neoadjuvant chemotherapy on delivery of further locoregional treatment. Mono institutional retrospective audit of patients with oral cavity squamous cell cancers treated with neoadjuvant triplet chemotherapy in India. Patients receiving neoadjuvant chemotherapy (n=14) from May 2012 to April 2014 were matched 1:2 to patients undergoing upfront surgery (n=28) based on age (>60 or 60 and less), gender (male or female) and subsite site (tongue and floor of mouth or buccal vestibular complex). Data regarding factors related to the delivery of locoregional treatment and toxicities were compiled. Descriptive analysis in the form of median (range) for continuous variables and frequencies for categorical variables. Patients undergoing neoadjuvant chemotherapy required more extensive resections and had greater operative time (460 vs. 415 min, p<0.001). A greater incidence of locoregional wound complications was seen as a consequence (57.1% vs. 14.3%, P, 0.01). However, toxicities during radiotherapy were not substantially different between the two groups and compliance to radiation was also similar. Total package time of 100 days or less, was maintained in 90% of patients in both groups."

According to the news reporters, the research concluded: "Delivery of neoadjuvant chemotherapy does not impair the ability to deliver locoregional treatment."

For more information on this research see: Does the use of induction chemotherapy in oral cavity cancer compromise subsequent loco-regional treatment delivery: Results from a matched pair analysis. Indian Journal of Cancer, 2015;52(4):632-6.

Researchers at Capital Normal University Release New Data on Bovine Serum Albumin (Artificially controlled degradable inorganic nanomaterial for cancer theranostics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Proteins - Bovine Serum Albumin is now available. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Multifunctional nanomaterials for cancer diagnosis and therapy have recently prompted widespread concern. To avoid nanotoxicity, the development of novel degradable functional materials must be our main focus."

Funders for this research include National Natural Science Foundation of China, Scientific Research Base Development Program of the Beijing Municipal Commission of Education, Beijing Municipal Science & Technology Commission, Project of Construction of Innovative Teams and Teacher Career Development for Universities and Colleges under Beijing Municipality, Beijing talent foundation outstanding young individual project, Opening Project of Shanghai Key Laboratory of Magnetic Resonance.

Our news editors obtained a quote from the research from Capital Normal University, "In this study, we firstly developed ethylenediaminetetraacetic acid calcium disodium salt (EDTA)- and bovine serum albumin (BSA)-capped Mn3O4 nanoparticles (MONPs-BSA-EDTA) as a novel inorganic nanomaterials for multifunctional imaging-guided photothermal therapy, which can be degraded in a progress-controlled way by artificially introduced ascorbic acid. The degradation products can also be captured and their excretion accelerated. Careful studies suggested that the toxicity of the MONPs-BSA-EDTA and its degradation products is low. The degradation mechanism also suggests a new method of controlled drug release."

According to the news editors, the research concluded: "The development of artificially controlled degradable inorganic nanomaterials also provides a new way to degrade nanomaterials and minimize ion release, which may have potential applications in cancer theranostics without nanotoxicity."

For more information on this research see: Artificially controlled degradable inorganic nanomaterial for cancer theranostics. *Biomaterials*, 2017;112():204-217. *Biomaterials* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Researchers at Cardiff University Target Polymer Therapy (A New Class of Safe Oligosaccharide Polymer Therapy To Modify the Mucus Barrier of Chronic Respiratory Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Polymer Therapy. According to news reporting originating from Cardiff, United Kingdom, by NewsRx correspondents, research stated, "The host-and bacteria-derived extracellular polysaccharide coating of the lung is a considerable challenge in chronic respiratory disease and is a powerful barrier to effective drug delivery. A low molecular weight 12-15-mer alginate oligosaccharide (OligoG CF-5/20), derived from plant biopolymers, was shown to modulate the polyanionic components of this coating."

Funders for this research include European Commission, Cystic Fibrosis Foundation, European Social Fund, AlgiPharma AS.

Our news editors obtained a quote from the research from Cardiff University, "Molecular modeling and Fourier transform infrared spectroscopy demonstrated binding between OligoG CF-5/20 and respiratory mucins. Ex vivo studies showed binding induced alterations in mucin surface charge and porosity of the three-dimensional mucin networks in cystic fibrosis (CF) sputum. Human studies showed that OligoG CF-5/20 is safe for inhalation in CF patients with effective lung deposition and modifies the viscoelasticity of CF-sputum."

According to the news editors, the research concluded: "OligoG CF-5/20 is the first inhaled polymer therapy, represents a novel mechanism of action and therapeutic approach for the treatment of chronic respiratory disease, and is currently in Phase IIb clinical trials for the treatment of CF."

For more information on this research see: A New Class of Safe Oligosaccharide Polymer Therapy To Modify the Mucus Barrier of Chronic Respiratory Disease. Molecular Pharmaceutics, 2016;13(3):863-72. Hematopoietic Research

Researchers at Case Western Reserve University Have Reported New Data on Hematopoietic (Comparison of two apheresis systems during hematopoietic progenitor stem cell collections at a tertiary medical center)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematopoietic. According to news reporting from Cleveland, Ohio, by NewsRx journalists, research stated, "The Spectra Optia is a newer apheresis system developed based on the COBE Spectra platform. COBE Spectra requires more manual control, while Spectra Optia offers greater automation."

The news correspondents obtained a quote from the research from Case Western Reserve University, "The purpose of this study was to compare the two systems during hematopoietic progenitor stem cell (HPSC) collections. A retrospective review of 41 collections performed in 26 subjects at a tertiary medical center between June 1, 2013, and December 31, 2013, was conducted, 11 with the Spectra Optia and 30 with the COBE Spectra. Six patients underwent two consecutive daily collections, first on the Spectra Optia followed by the COBE Spectra. Procedure run time with the Spectra Optia was considerably longer than with the COBE Spectra (283 +/- 11 min vs. 217 +/- 2 min, respectively; p< 0.01). Mean CD34+ cell yields with the Spectra Optia were comparable with those of the COBE Spectra. Products collected with the Spectra Optia had less red blood cell contamination. However, platelet (PLT) attrition was greater with the Spectra Optia. Similar results were obtained in patients who were collected on consecutive days in both systems."

According to the news reporters, the research concluded: "Collections with the Spectra Optia take longer and lead to greater PLT losses during HPSC collections."

Our news journalists report that additional information may be obtained by contacting R.W. Maitta, Case Western Reserve University, Sch Med, Cleveland, OH, United States. Additional authors for this research include J. Li, H.M. Reeves, R. Reyes and R.W. Maitta.

Researchers at Case Western Reserve University Report New Data on Pancreatic Cancer (The role of neoadjuvant therapy in pancreatic cancer: a review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Pancreatic Cancer. According to news reporting originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Controversy remains regarding neoadjuvant approaches in the treatment of pancreatic cancer. Neoadjuvant therapy has several potential advantages over adjuvant therapy including earlier delivery of systemic treatment, in vivo assessment of response, increased resectability rate in borderline resectable patients and increased margin-negative resection rate."

Our news editors obtained a quote from the research from Case Western Reserve University, "At present, there are no randomized data favoring neoadjuvant over adjuvant therapy and multiple neoadjuvant approaches are under investigation. Combination chemotherapy regimens including 5-fluorouracil, irinotecan and oxaliplatin, gemcitabine with or without abraxane, or docetaxel and capecitabine have been used in the neoadjuvant setting. Radiation and chemoradiation have also been incorporated into neoadjuvant strategies, and delivery of alternative fractionation regimens is being explored."

According to the news editors, the research concluded: "This review provides an overview of neoadjuvant therapies for pancreatic cancer."

For more information on this research see: The role of neoadjuvant therapy in pancreatic cancer: a review. Future Oncology, 2016;12(5):669-85.

The news editors report that additional information may be obtained by contacting S. Russo, Dept. of Radiation Oncology, University Hospitals Seidman Cancer Center, Case Comprehensive Cancer Center, Case Western Reserve University, 10900 Euclid Ave, Cleveland, OH 44106, United States. Researchers at Cedars-Sinai Medical Center Release New Data on Gastrointestinal Hormones (Simultaneous blockade of interacting CK2 and EGFR pathways by tumor-targeting nanobioconjugates increases therapeutic efficacy against glioblastoma ...)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hormones - Gastrointestinal Hormones are discussed in a new report. According to news originating from Los Angeles, California, by NewsRx correspondents, research stated, "Glioblastoma multiforme (GBM) remains the deadliest brain tumor in adults. GBM tumors are also notorious for drug and radiation resistance."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from Cedars-Sinai Medical Center, "To inhibit GBMs more effectively, polymalic acid-based blood-brain barrier crossing nanobioconjugates were synthesized that are delivered to the cytoplasm of cancer cells and specifically inhibit the master regulator serine/threonine protein kinase CK2 and the wild-type/mutated epidermal growth factor receptor (EGFR/EGFRvIII), which are overexpressed in gliomas according to The Cancer Genome Atlas (TCGA) GBM database. Two xenogeneic mouse models bearing intracranial human GBMs from cell lines LN229 and U87MG that expressed both CK2 and EGFR at different levels were used. Simultaneous knockdown of CK2 alpha and EGFR/EGFRvIII suppressed their downstream prosurvival signaling. Treatment also markedly reduced the expression of programmed death-ligand 1 (PD-L1), a negative regulator of cytotoxic lymphocytes. Downregulation of CK2 and EGFR also caused deactivation of heat shock protein 90 (Hsp90) co-chaperone Cdc37, which may suppress the activity of key cellular kinases. Inhibition of either target was associated with downregulation of the other target as well, which may underlie the increased efficacy of the dual nanobioconjugate that is directed against both CK2 and EGFR. Importantly, the single nanodrugs, and especially the dual nanodrug, markedly suppressed the expression of the cancer stem cell markers c-Myc, CD133, and nestin, which could contribute to the efficacy of the treatments. In both tumor models, the nanobioconjugates significantly increased (up to 2-fold) animal survival compared with the PBS-treated control group."

According to the news editors, the research concluded: "The versatile nanobioconjugates developed in this study, with the abilities of anticancer drug delivery across biobarriers and the inhibition of key tumor regulators, offer a promising nanotherapeutic approach to treat GBMs, and to potentially prevent drug resistance and retard the recurrence of brain tumors."

For more information on this research see: Simultaneous blockade of interacting CK2 and EGFR pathways by tumor-targeting nanobioconjugates increases therapeutic efficacy against glioblastoma multiforme. *Journal of Controlled Release*, 2016;244():14-23. *Journal of Controlled Release* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Researchers at Center for Regenerative Therapies Dresden Release New Data on Bone Research (Increased EPO Levels Are Associated With Bone Loss in Mice Lacking PHD2 in EPO-Producing Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Bone Research is now available. According to news reporting from Dresden, Germany, by NewsRx journalists, research stated, "The main oxygen sensor hypoxia inducible factor (HIF) prolyl hydroxylase 2 (PHD2) is a critical regulator of tissue homeostasis during erythropoiesis, hematopoietic stem cell maintenance, and wound healing. Recent studies point toward a role for the PHD2-erythropoietin (EPO) axis in the modulation of bone remodeling, even though the studies produced conflicting results."

The news correspondents obtained a quote from the research from Center for Regenerative Therapies Dresden, "Here, we used a number of mouse strains deficient of PHD2 in different cell types to address the role of PHD2 and its downstream targets HIF-1 alpha and HIF-2 alpha in bone remodeling. Mice deficient for PHD2 in several cell lineages, including EPO-producing cells, osteoblasts, and hematopoietic cells (CD68:cre-PHD2(f/f)) displayed a severe reduction of bone density at the distal femur as well as the vertebral body due to impaired bone formation but not bone resorption. Importantly, using osteoblast-specific (Osx:cre-PHD2(f/f)) and osteoclast-specific PHD2 knock-out mice (Vav:cre-PHD2(f/f)), we show that this effect is independent of the loss of PHD2 in osteoblast and osteoclasts. Using different in vivo and in vitro approaches, we show here that this bone phenotype, including the suppression of bone formation, is directly linked to the stabilization of the alpha-subunit of HIF-2, and possibly to the subsequent moderate induction of serum EPO, which directly influenced the differentiation and mineralization of osteoblast progenitors resulting in lower bone density. Taken together, our data identify the PHD2: HIF-2 alpha: EPO axis as a so far unknown regulator of osteohematology by controlling bone homeostasis."

According to the news reporters, the research concluded: "Further, these data suggest that patients treated with PHD inhibitors or EPO should be monitored with respect to their bone status."

Researchers at Central Hospital Report Findings in Restenosis
(Paclitaxel-coated balloon catheter compared with drug-eluting stent for drug-eluting stent restenosis in routine clinical practice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Restenosis is now available. According to news reporting from Kurashiki, Japan, by NewsRx journalists, research stated, "The aim of this study was to compare the efficacy between paclitaxel-coated balloon (PCB) and drug-eluting stent (DES) implantation for the treatment of DES restenosis in complex situations. Data of patients who received revascularisation for DES restenosis between 2004 and 2011 were collected."

The news correspondents obtained a quote from the research from Central Hospital, "A total of 683 patients with 777 lesions were analysed in this study (306 lesions treated by PCB, 471 lesions by DES). The use of PCB or DES was at the discretion of the operator. Angiographic outcomes at six to eight months and clinical outcomes at 12-month follow-up were compared between groups. The primary outcome was binary restenosis. Cox regression analysis with propensity score adjustment suggested that there were no significant differences between the two groups with respect to binary restenosis, target lesion revascularisation (TLR), and major adverse cardiac events. As for the angiographic endpoints, subgroup analysis was performed for several parameters. There was a significant trend favouring PCB with respect to binary restenosis and TLR in non-focal type lesions and bifurcation lesions. Angiographic and clinical outcomes in the PCB group were similar to those in the repeat DES group."

According to the news reporters, the research concluded: "PCB seemed to offer more favourable results in non-focal type lesions and bifurcation lesions."

For more information on this research see: Paclitaxel-coated balloon catheter compared with drug-eluting stent for drug-eluting stent restenosis in routine clinical practice. *Eurointervention*, 2016;11(10):1098-105.

Researchers at Central Hospital Target Lung Cancer (Drug interaction between erlotinib and phenytoin for brain metastases in a patient with nonsmall cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Lung Cancer are discussed in a new report. According to news reporting originating from Ibaraki, Japan, by NewsRx correspondents, research stated, "Erlotinib, a substrate drug metabolized by the CYP3A4 enzyme, is an epidermal growth factor receptor tyrosine kinase inhibitor used to treat nonsmall cell lung cancer (NSCLC). Concomitant use of erlotinib and the antiepileptic drug phenytoin, an inducer of CYP3A4, may result in a drug-drug interaction accompanied by changes in the blood concentrations of both drugs."

Our news editors obtained a quote from the research from Central Hospital, "We determined the blood concentration of each drug to confirm the interaction between phenytoin and erlotinib in a case of NSCLC with brain metastases. The phenytoin blood concentration (8.2-10.0 µg/mL) gradually increased 3-fold (to 24.2 µg/mL) 7 months after the start of erlotinib (150 mg/d) co-administration. The erlotinib blood concentration which was maintained at 0.15-0.37 µg/mL under phenytoin co-administration, increased 12-fold (to 1.77 µg/mL) after the stoppage of phenytoin co-administration."

According to the news editors, the research concluded: "The present case revealed that blood phenytoin increased and blood erlotinib decreased subsequent to the interaction of the 2 drugs in the CYP3A4 metabolic enzyme system."

The news editors report that additional information may be obtained by contacting M. Ohgami, Ibaraki Cent Hosp, Dept. of Pharm, Kasama, Ibaraki 3091793, Japan. Additional authors for this research include T. Kaburagi, A. Kurosawa and M. Homma.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.lungcan.2016.08.009. This DOI is a link to an online electronic document that is either free or for purchase.

Researchers at Central South University Discuss Findings in Gastric Cancer (Repertaxin, an inhibitor of the chemokine receptors CXCR1 and CXCR2, inhibits malignant behavior of human gastric cancer MKN45 cells in vitro and in vivo and enhances ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gastric Cancer have been presented. According to news reporting originating in Changsha, People's Republic of China, by NewsRx journalists, research stated, "Chemokine-mediated activation of G protein-coupled receptors CXCR1/2 promotes tumor growth, invasion, inflammation and metastasis. Repertaxin, a CXCR1/2 small-molecule inhibitor, has been shown to attenuate many of these tumor-associated processes."

The news reporters obtained a quote from the research from Central South University, "The present study aimed to investigate the effects of repertaxin alone and in combination with 5-fluorouracil (5-FU) on the malignant behavior of gastric cancer and the potential mechanisms. Gastric cancer MKN45 cells were treated in vitro with repertaxin and 5-FU, either alone or in combination. Cell cycle progression and apoptosis was completed by flow cytometry. Migration and invasion were also assessed by transwell and wound-healing assay. Western blot analysis and quantitative RT-PCR were performed to determine expression of signaling molecules. MKN45 cells were also grown as xenografts in nude mice. Mice were treated with repertaxin and 5-FU, and tumor volume and weight, angiogenesis, proliferation and apoptosis were monitored. Combination of repertaxin and 5-FU inhibited MKN45 cell proliferation and increased apoptosis better than either agent alone. Similarly, enhanced effect of the combination was also observed in migration and invasion assays. The improved effect of repertaxin and 5-FU was also observed in vivo, as xenograft models treated with both compounds exhibited significantly decreased tumor volume and increased apoptosis."

According to the news reporters, the research concluded: "Repertaxin inhibited malignant behavior of human gastric cancer MKN45 cells in vitro and in vivo and enhances efficacy of 5-fluorouracil. These data provide rationale that targeting CXCR1/2 with small molecule inhibitors may enhance chemotherapeutic efficacy for the treatment of gastric cancer."

For more information on this research see: Repertaxin, an inhibitor of the chemokine receptors CXCR1 and CXCR2, inhibits malignant behavior of human gastric cancer MKN45 cells in vitro and in vivo and enhances efficacy of 5-fluorouracil. International Journal of Oncology, 2016;48(4):1341-52.

Researchers at Central South University Target Liver Cancer (Hypoxia-induced NIPP1 activation enhances metastatic potential and predicts poor prognosis in hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Liver Cancer are presented in a new report. According to news originating from Changsha, People's Republic of China, by NewsRx correspondents, research stated, "Hypoxia is known to promote hepatocellular carcinoma (HCC) invasion and metastasis and nuclear inhibitor of protein phosphatase 1 (NIPP1) overexpression contributes to the malignant phenotype in HCC. The aim of this study was to investigate the role of NIPP1 in HCC development under hypoxia."

Financial support for this research came from National Nature Science Foundation of China.

Our news journalists obtained a quote from the research from Central South University, "We first conducted a study with 106 cases to explore the association of NIPP1 and/or enhancer of zeste homolog 2 (EZH2) expression with poor prognosis in HCC. Then additional 352 independent cases were recruited to validate the results in the first stage. Hypoxia was induced by culturing HCC cells in 1% O2 or of the treatment with hypoxic agent. The expression levels of NIPP1/EZH2 in both HCC tissues and HCC cell lines were detected by RT-PCR, Western blot, or immunohistochemistry. We also studied the effects of the loss of function of NIPP1 and EZH2 on malignant phenotypes, downstream pathway, and inflammatory factors activities using gene silencing strategy. Overall, we found that NIPP1 and EZH2 were overexpressed in both HCC tissue samples and HCC cell lines. High expression of HIPP1 was associated with poor prognosis and clinicopathological features in patients with advanced HCC. HIPP1 expression positively correlated with the expression of hypoxia marker (carbonic anhydrase IX). Hypoxia induced high expression of NIPP1. NIPP1/EZH2 knockdown in HCC cell lines under hypoxia suppressed the malignant phenotypes, reduced the expression of hypoxia-inducible Factor 1 alpha, downstream molecules of EZH2, and inhibit the activity of inflammatory factors."

According to the news editors, the research concluded: "We found that NIPP1 could be activated by hypoxia and contributed to hypoxia-induced invasive and metastatic potential in HCC."

For more information on this research see: Hypoxia-induced NIPP1 activation enhances metastatic potential and predicts poor prognosis in hepatocellular carcinoma. Tumor Biology, 2016;37(11):14903-14914. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. Biomedical Engineering - Tissue Engineering

Researchers at Changchun Institute of Applied Chemistry Have
Reported New Data on Tissue Engineering (Injectable Polypeptide
Hydrogels with Tunable Microenvironment for 3D Spreading and
Chondrogenic Differentiation of Bone-Marrow-Derived ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Current study results on Biomedical Engineering - Tissue Engineering have
been published. According to news originating from Changchun, People's Republic of China, by
NewsRx correspondents, research stated, "Bone-marrow-derived mesenchymal stem cells
(BMSCs) possess vast potential for tissue engineering and regenerative medicine. In this study,
an injectable hydrogel comprising poly(L-glutamic acid)-graft-tyramine (PLG-g-TA) with
tunable microenvironment was developed via enzyme-catalyzed cross-linking and used as an
artificial extracellular matrix (ECM) to explore the behaviors of BMSCs during three-
dimensional (3D) culture."

Financial support for this research came from National Natural Science Foundation
of China.

Our news journalists obtained a quote from the research from the Changchun
Institute of Applied Chemistry, "It was found that the mechanical property, porous structure as
well as degradation process of the hydrogels could be tuned by changing the copolymer
concentration. The PLG-g-TA hydrogels showed good cytocompatibility in vitro. After being
subcutaneously injected into the back of rats, the hydrogels degraded gradually within 8 weeks
and exhibited good biocompatibility in vivo. BMSCs were then encapsulated in the polypeptide-
based hydrogels with different copolymer concentration to investigate the influence of 3D
matrix microenvironment on stem cell behaviors. It is intriguing to note that the BMSCs within
the 2% hydrogel showed a well-spread morphology after 24 h and a higher proliferation rate
during 7 days of culture, in contrast to a rounded morphology and lower proliferation rate of
BMSCs in the 4% hydrogel. Furthermore, the hydrogels with different microenvironment also
regulated the matrix biosynthesis and the gene expression of BMSCs. After incubation in the
2% hydrogel for 4 weeks, the BMSCs produced more type II collagen and expressed higher
amounts of chondrogenic markers, compared to the cells in the 4% hydrogel."

According to the news editors, the research concluded: "Therefore, the PLG-g-TA
hydrogels with tunable microenvironment may serve as an efficient 3D platform for guiding the
lineage specification of BMSCs."

For more information on this research see: Injectable Polypeptide Hydrogels with
Tunable Microenvironment for 3D Spreading and Chondrogenic Differentiation of Bone-
Researchers at Changhua Christian Hospital Detail Findings in Liver Cancer (Dioscorea nipponica Attenuates Migration and Invasion by Inhibition of Urokinase-Type Plasminogen Activator through Involving PI3K/Akt and Transcriptional Inhibition of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Liver Cancer have been presented. According to news reporting originating in Changhua, Taiwan, by NewsRx journalists, research stated, "High mortality and morbidity rates for hepatocellular carcinoma (HCC) in Taiwan primarily result from uncontrolled tumor metastasis. In our previous studies, we have reported that Dioscorea nipponica Makino extract (DNE) has anti-metastasis effects on human oral cancer cells."

The news reporters obtained a quote from the research from Changhua Christian Hospital, "However, the effect of DNE on hepatoma metastasis have not been thoroughly investigated and remains poorly understood. To determine the effects of DNE on the migration and invasion in HCC cells we used a wound healing model, Boyden chamber assays, gelatin/casein zymography and Western blotting. Transcriptional levels of matrix metalloproteinase-9 (MMP-9) and urokinase-type plasminogen activator (u-PA) were detected by real-time PCR and promoter assays. In this study, DNE treatment significantly inhibited the migration/invasion capacities of Huh7 cell lines. The results of gelatin/casein zymography and Western blotting revealed that the activities and protein levels of the MMP-9 and u-PA were inhibited by DNE. Tests of the mRNA levels, real-time PCR, and promoter assays evaluated the inhibitory effects of DNE on u-PA expression in human hepatoma cells. A chromatin immunoprecipitation (ChIP) assay showed not only that DNE inhibits u-PA expression, but also the inhibitory effects were associated with the down-regulation of the transcription factors of NF-[Formula: see text]B and SP-1 signaling pathways. Western blot analysis also showed that DNE inhibits PI3K and phosphorylation of Akt."
According to the news reporters, the research concluded: "These results show that u-PA expression may be a potent therapeutic target in the DNE-mediated suppression of HCC invasion/migration. DNE may have potential use as a chemo-preventive agent against liver cancer metastasis."

For more information on this research see: Dioscorea nipponica Attenuates Migration and Invasion by Inhibition of Urokinase-Type Plasminogen Activator through Involving PI3K/Akt and Transcriptional Inhibition of NF-κB and SP-1 in Hepatocellular Carcinoma. The American Journal of Chinese Medicine, 2016;44(1):177-95. The American Journal of Chinese Medicine can be contacted at: World Scientific Publishing Co. Pte. Ltd., 5 Toh Tuck Link, Singapore 596224.

Our news correspondents report that additional information may be obtained by contacting M.J. Hsieh, *Cancer Research Center, Changhua Christian Hospital, Changhua 50006, Taiwan. Additional authors for this research include C.B. Yeh, H.L. Chiou, M.C. Hsieh and S.F. Yang.

**Oncology - Pancreatic Cancer**

**Researchers at Chiba University Report Findings in Pancreatic Cancer**

(2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Pancreatic Cancer have been published. According to news reporting from Chiba, Japan, by NewsRx journalists, research stated, "Excessive stroma is a unique property of cancer tissue of the pancreas. The aim of this study was to analyze the relationship of cancer stromal area (SA) and tumor microvessel density (MVD) with prognostic and clinicopathological findings."

The news correspondents obtained a quote from the research from Chiba University, "Pancreatic adenocarcinoma tissues obtained from 104 patients were subjected to cytokeratin 19 and CD31 double immunostaining to identify cancer cells and endothelial cells simultaneously. Stromal area and MVD were assessed in the same sections. Patients were divided into 2 groups for each analysis by the median value of the respective measure. Stromal area negatively correlated with MVD. The low SA group harbored more poorly differentiated carcinoma than the high SA group. Patients of the low SA group showed a higher incidence of hematogenous recurrence. As a consequence, patients in the low SA and the high MVD groups had poorer
prognosis in terms of both disease-free survival and overall survival than their respective groups. Multivariate analysis showed that a low SA was an independent prognostic factor for disease-free and overall survival. Our data indicate that the stroma of pancreatic cancer may play an auxiliary role as a barrier to cancer cell invasion.

According to the news reporters, the research concluded: "The depletion of tumor stroma alone does not suppress pancreatic cancer progression."

For more information on this research see: Low Stromal Area and High Stromal Microvessel Density Predict Poor Prognosis in Pancreatic Cancer. Pancreas, 2016;45(4):593-600. (Lippincott Williams and Wilkins - www.lww.com; Pancreas - journals.lww.com/pancreasjournal/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting T. Nishida, From the Dept. of General Surgery, Graduate School of Medicine, Chiba University, Chiba City, Chiba, Japan. Additional authors for this research include H. Yoshitomi, S. Takano, S. Kagawa, H. Shimizu, M. Ohtsuka, A. Kato, K. Furukawa and M. Miyazaki.

Clinical Research - Clinical Trials and Studies

Researchers at China Academy of Chinese Medical Sciences Have Reported New Data on Clinical Trials and Studies (Acupuncture for Smoking Cessation in Hong Kong: A Prospective Multicenter Observational Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Clinical Research - Clinical Trials and Studies are presented in a new report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "This was a prospective multicenter observational study, aiming to explore the effects of acupuncture on smoking cessation in Hong Kong. From March of 2010 to August of 2015, a total of 5202 smokers were recruited based on inclusion criteria and treated with acupuncture for 8 weeks."

Financial supporters for this research include Traditional Chinese Medicine Profession of China, Department of Health of Hong Kong Special Administrative Region.

Our news journalists obtained a quote from the research from the China Academy of Chinese Medical Sciences, "As a result, 2940 subjects finished the study with a drop-out rate of 43.48%. The self-reported 7-day point abstinence rate was 34.00% in Week 8 and 18.40% in Week 52. The exhaled carbon monoxide level and the number of cigarettes smoked per day were reduced significantly after treatment. The time to relapse was calculated to be 38.71 days. In addition, 'cigarettes smoked per day,' 'Fagerstrom Test for Nicotine Dependence,' 'total sessions of acupuncture,' 'whether finished 8 acupuncture treatments in the first month,' and 'total sessions of acupuncture' were believed to be essential factors for abstinence success. It was concluded that acupuncture was a safe method for smoking cessation and was effective in
helping smokers to quit; therefore, acupuncture could be considered as one of the methods to help smokers quit."

According to the news editors, the research concluded: "Further studies regarding the effect differences between acupuncture and medications were needed to clarify the overall benefits of acupuncture."

For more information on this research see: Acupuncture for Smoking Cessation in Hong Kong: A Prospective Multicenter Observational Study. Evidence-Based Complementary and Alternative Medicine, 2016();1-8. Oncology - Breast Cancer

Researchers at China Medical University and Hospital Detail Findings in Breast Cancer (Lapatinib increases motility of triple-negative breast cancer cells by decreasing miRNA-7 and inducing Raf-1/MAPK-dependent interleukin-6)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting from Taichung, Taiwan, by NewsRx journalists, research stated, "Lapatinib, a dual epidermal growth factor receptor (EGFR) and HER2 tyrosine kinase inhibitor (TKI), has been approved for HER2-positive breast cancer patients. Nevertheless, its inhibitory effect on EGFR did not deliver clinical benefits for triple-negative breast cancer (TNBC) patients even EGFR overexpression was frequently found in this disease."

The news correspondents obtained a quote from the research from China Medical University and Hospital, "Moreover, lapatinib was unexpectedly found to enhance metastasis of TNBC cells, but the underlying mechanisms are not fully understood. In this study, we explored that the level of interleukin-6 (IL-6) was elevated in lapatinib-treated TNBC cells. Treatment with IL-6 antibody abolished the lapatinib-induced migration. Mechanistically, the signaling axis of Raf-1/mitogen-activated protein kinases (MAPKs), c-Jun N-terminal kinases (JNKs), p38 MAPK, and activator protein 1 (AP-1) was activated in response to lapatinib treatment to induce IL-6 expression. Furthermore, our data showed that microRNA-7 directly binds and inhibits Raf-1 3’UTR activity, and that down-regulation of miR-7 by lapatinib contributes to the
activation of Raf-1 signaling pathway and the induction of IL-6 expression."

According to the news reporters, the research concluded: "Our results not only revealed IL-6 as a key regulator of lapatinib-induced metastasis, but also explored the requirement of miR7/Raf-1/MAPK/AP-1 axis in lapatinib-induced IL-6 expression."

For more information on this research see: Lapatinib increases motility of triple-negative breast cancer cells by decreasing miRNA-7 and inducing Raf-1/MAPK-dependent interleukin-6. Oncotarget, 2015;6(35):37965-78.

Our news journalists report that additional information may be obtained by contacting Y.C. Hsiao, The PhD program for Cancer Biology and Drug Discovery, China Medical University and Academia Sinica, Taichung, Taiwan. Additional authors for this research include M.H. Yeh, Y.J. Chen, J.F. Liu, C.H. Tang and W.C Huang.

**Apoptosis**

**Researchers at China Pharmaceutical University Report New Data on Apoptosis (Effect of CPU-XT-008, a combretastatin A-4 analogue, on the proliferation, apoptosis and expression of vascular endothelial growth factor and basic fibroblast growth ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Apoptosis is the subject of a report. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "The present study investigated the effect of the combretastatin A-4 analogue CPU-XT-008 on the proliferation, apoptosis and expression of vascular endothelial growth factor (VEGF) and basic fibroblast growth factor (FGF-2) in human umbilical vein endothelial cells (HUVECs). The proliferation capacity of HUVECs was analyzed with a cell viability assay, while their apoptosis and migration abilities were evaluated via flow cytometry and monolayer denudation assay, respectively."

The news correspondents obtained a quote from the research from China Pharmaceutical University, "The mRNA and protein expression levels of VEGF and FGF-2 in these cells were determined by reverse transcription-polymerase chain reaction, and cell-based ELISA, western blotting and immunocytochemistry, respectively. The results demonstrated that CPU-XT-008 inhibited proliferation and migration, and induced apoptosis in HUVECs in a dose-dependent manner. In addition, CPU-XT-008 downregulated the mRNA and protein expression levels of VEGF and FGF-2 in these cells."

According to the news reporters, the research concluded: "These findings suggest that CPU-XT-008 exerts anti-angiogenic effects in HUVECs, which may explain the inhibition of cell proliferation and migration, induction of apoptosis, and reduction in the mRNA and
protein expression levels of VEGF and FGF-2 observed in the present study."

For more information on this research see: Effect of CPU-XT-008, a combretastatin A-4 analogue, on the proliferation, apoptosis and expression of vascular endothelial growth factor and basic fibroblast growth factor in human umbilical vein endothelial cells. Oncology Letters, 2015;11(1):491-499.

Our news journalists report that additional information may be obtained by contacting R. Xiong, School of Life Science and Technology, China Pharmaceutical University, Nanjing, Jiangsu 211198, People's Republic of China. Additional authors for this research include J. Sun, K. Liu, Y. Xu and S. He.

Clinical Research - Clinical Trials and Studies

Researchers at Chinese Academy of Medical Sciences Report Findings in Clinical Trials and Studies (Open three-stage transthoracic oesophagectomy versus minimally invasive thoraco-laparoscopic oesophagectomy for oesophageal cancer: protocol for ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Clinical Research - Clinical Trials and Studies are presented in a new report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Oesophageal cancer is the eighth most common cause of cancer worldwide. In 2009 in China, the incidence and death rate of oesophageal cancer was 22.14 per 100 000 person-years and 16.77 per 100 000 person-years, respectively, the highest in the world."

Our news journalists obtained a quote from the research from the Chinese Academy of Medical Sciences, "Minimally invasive oesophagectomy (MIO) was introduced into clinical practice with the aim of reducing the morbidity rate. The mechanisms of MIO may lie in minimising the reaction to surgical injury and inflammation. There are some randomised trials regarding minimally invasive versus open oesophagectomy, with 100-850 subjects enrolled. To date, no large randomised controlled trial comparing minimally invasive versus open oesophagectomy has been reported in China, where squamous cell carcinoma predominated over adenocarcinoma of the oesophagus. This is a 3 year multicentre, prospective, randomised, open and parallel controlled trial, which aims to compare the effectiveness of minimally invasive thoraco-laparoscopic oesophagectomy to open three-stage transthoracic oesophagectomy for resectable oesophageal cancer. Group A patients receive MIO which involves thoracoscopic oesophagectomy and laparoscopic gastric mobilisation with cervical anastomosis. Group B patients receive the open three-stage transthoracic oesophagectomy which involves a right thoracotomy and laparotomy with cervical anastomosis. Primary endpoints include respiratory complications within 30 days after operation. The secondary endpoints include other postoperative complications, influences on pulmonary function, intraoperative data including blood loss, operative time, the number and location of lymph nodes dissected,
Researchers at Chinese Academy of Medical Sciences Report Findings in Porphyrins (Real-Time Fluorescence Tracking of Protoporphyrin Incorporated Thermosensitive Hydrogel and Its Drug Release in Vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Biological Factors - Porphyrins are presented in a new report. According to news originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "Fluorescence imaging in vivo will pave an important way for the evaluation of biomaterials. The major advantage of fluorescence imaging compared to other imaging modalities is the possibility of tracking two or more fluorescence probes simultaneously with multispectral fluorescence imaging."

Financial supporters for this research include Natural Science Foundation of Tianjin City, National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the Chinese Academy of Medical Sciences, "It is essential to elucidate the location, erosion, drug release and resection of implanted biomaterials in vivo. Herein, a thermosensitive hydrogel with a protoporphyrin core based on a PEG and PCL copolymer (PCL-PEG-PPOR-PEG-PCL) was synthesized by ring-opening polymerization using protoporphyrin as a fluorescence tag. The optical properties

Biological Factors - Porphyrins

Researchers at Chinese Academy of Medical Sciences Report Findings in Porphyrins (Real-Time Fluorescence Tracking of Protoporphyrin Incorporated Thermosensitive Hydrogel and Its Drug Release in Vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Biological Factors - Porphyrins are presented in a new report. According to news originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "Fluorescence imaging in vivo will pave an important way for the evaluation of biomaterials. The major advantage of fluorescence imaging compared to other imaging modalities is the possibility of tracking two or more fluorescence probes simultaneously with multispectral fluorescence imaging."

Financial supporters for this research include Natural Science Foundation of Tianjin City, National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the Chinese Academy of Medical Sciences, "It is essential to elucidate the location, erosion, drug release and resection of implanted biomaterials in vivo. Herein, a thermosensitive hydrogel with a protoporphyrin core based on a PEG and PCL copolymer (PCL-PEG-PPOR-PEG-PCL) was synthesized by ring-opening polymerization using protoporphyrin as a fluorescence tag. The optical properties...
of the hydrogel were investigated by UV-vis and fluorescence spectroscopy in vitro and by fluorescence imaging system in vivo. The hydrogel erosion and drug delivery in vivo were monitored and tracked by multispectral fluorescence imaging system in nude mice. The results show that the thermosensitive hydrogel exhibits fluorescence and injectability in vivo with good biocompatibility. Through the modality of fluorescence imaging, the status of the hydrogel is reflected in situ in vivo including its location and erosion. Multispectral analysis separates the autofluorescence signals from the specific label and provides the ability to locate the drug and carrier.

According to the news editors, the research concluded: "The protoporphyrin incorporated thermosensitive hydrogel can be a potential visible biomedical implant for tissue repair or drug delivery."

The news correspondents report that additional information may be obtained from X. Dong, Tianjin Key Laboratory of Biomedical Materials, Institute of Biomedical Engineering, Chinese Academy of Medical Sciences & Peking Union Medical College, Tianjin 300192, People's Republic of China. **Oncology - Non-Small Cell Lung Cancer**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Non-Small Cell Lung Cancer have been presented. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Inhibition of heat shock protein (Hsp90) has been proven to be effective in overriding primary and acquired resistance of kinase inhibitors. In this study, we investigated the role of FS-108, a newly developed Hsp90 inhibitor, to overcome gefitinib resistance in EGFR mutant non-small cell lung cancer cells."

Our news editors obtained a quote from the research from the Chinese Academy of Sciences, "Cell proliferation was assessed using the SRB assay. Cell cycle distribution and apoptosis were analyzed by flow cytometry. Protein expression was examined by Western blotting. The in vivo effectiveness of FS-108 was determined in an NCI-H1975 subcutaneous xenograft model. FS-108 triggered obvious growth inhibition in gefitinib-resistant
HCC827/GR6, NCI-H1650 and NCI-H1975 cells through inducing G(2)/M phase arrest and apoptosis. FS-108 treatment resulted in a remarkable degradation of key client proteins involved in gefitinib resistance and further abrogated their downstream signaling pathways. Interestingly, FS-108 alone exerted an identical or superior effect on circumventing gefitinib resistance compared to combined kinase inhibition. Finally, the ability of FS-108 to overcome gefitinib resistance in vivo was validated in an NCI-H1975 xenograft model.

According to the news editors, the research concluded: "FS-108 is a powerful agent that impacts the survival of gefitinib-resistant cells in vitro and in vivo through targeting Hsp90."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/aps.2016.85. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Phytotherapy

Researchers at College of Pharmacy Release New Data on Phytotherapy (Novel Compounds with new Anti-Ulcergenic Activity from Convolvulus pilosellifolius Using Bio-Guided Fractionation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Phytotherapy is the subject of a report. According to news originating from Al Kharj, Saudi Arabia, by NewsRx correspondents, research stated, "Oral administration of the total alcohol extract of Convolvulus pilosellifolius Desr. (250 and 500 md/kg) showed potent anti-ulcergenic activity in absolute ethanol-induced ulcer model in rats; it showed percent protection of control ulcer by 69.2 and 84.6%, respectively, while standard ranitidine (100 mg/kg) exhibited 46.2%. Bio-guided work leads to isolation of two novel compounds (1 and 2), which were identified through H-1, C-13 NMR, HMPC, HMQC and DEPT as: methyl 2-(hydroxymethyl) octanoate, named as amanitate, and 16-amino-9,13-dimethyl-17-(prop-1-en-2-yl)-hexadecahydro-1H-cyclopenta[a]phenanthren-3-ol, named as asmatol."

Our news journalists obtained a quote from the research from the College of Pharmacy, "Both compounds (50 mg/kg) possessed anti-ulcergenic activity with 95.4% and
55.84% protection, respectively. Two known compounds (3 and 4) were also isolated and identified through comparison with authentic samples and confirmed through different NMR techniques as kampeferol and quercetin. These compounds also showed anti-ulcerogenic activity with 78.38% and 5.38% protection, respectively. The cytoprotective mechanism explains the potent anti-ulcerogenic activity of the total alcohol extract and the isolated compounds. The extract was highly safe as the LD50 was more than 5000 mg/kg.

According to the news editors, the research concluded: "These results were well supported by the sub-chronic toxicity study, as the extract (500 mg/kg) administrated orally to rats for 35 consecutive days showed no alteration in the liver and kidney functions."

The news correspondents report that additional information may be obtained from A.S. Awaad, Prince Sattam Bin Abdulaziz Univ, Coll Pharm, Dept. of Pharmacognosy, Al Kharj, Saudi Arabia. Additional authors for this research include A. Al-Refaie, R. El-Meligy, M. Zain, H. Soliman, M.S. Marzoke and N. El-Sayed.

Inflammation

Researchers at Columbia University Have Reported New Data on Inflammation (A Novel Link between Inflammation and Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Inflammation. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Immune checkpoint-blockade treatments targeting PD-1/PD-L1 have revolutionized cancer therapy."

Our news journalists obtained a quote from the research from Columbia University, "Hence, understanding the regulation of PD-L1 expression has major clinical relevance."

According to the news editors, the research concluded: "In this issue of Cancer Cell, Lim et al. report that inflammation-induced and NF-kappa B-driven expression of deubiquitinating enzyme CSN5 leads to PD-L1 stabilization and immune suppression in tumors."

For more information on this research see: A Novel Link between Inflammation and Cancer. Cancer Cell, 2016;30(6):829-830. Cancer Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cancer Cell - www.journals.elsevier.com/cancer-cell/)

Researchers at Creighton University School of Medicine Release New Data on Type 2 Diabetes (FOXO1 Mediates Vitamin D Deficiency-Induced Insulin Resistance in Skeletal Muscle)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news reporting originating from Omaha, Nebraska, by NewsRx correspondents, research stated, "Prospective epidemiological studies have consistently shown a relationship between vitamin D deficiency, insulin resistance, and type 2 diabetes mellitus (DM2). This is supported by recent trials showing that vitamin D supplementation in prediabetic or insulin-resistant patients with inadequate vitamin D levels improves insulin sensitivity."

Financial support for this research came from National Institutes of Health.

Our news editors obtained a quote from the research from the Creighton University School of Medicine, "However, the molecular mechanisms underlying vitamin D deficiency-induced insulin resistance and DM2 remain unknown. Skeletal muscle insulin resistance is a primary defect in the majority of patients with DM2. Although sustained activation of forkhead box O1 (FOXO1) in skeletal muscle causes insulin resistance, a relationship between vitamin D deficiency and FOXO1 activation in muscle is unknown. We generated skeletal muscle-specific vitamin D receptor (VDR)-null mice and discovered that these mice developed insulin resistance and glucose intolerance accompanied by increased expression and activity of FOXO1. We also found sustained FOXO1 activation in the skeletal muscle of global VDR-null mice. Treatment of C2C12 muscle cells with 1,25-dihydroxyvitamin D (VD3) reduced FOXO1 expression, nuclear translocation, and activity. The VD3-dependent suppression of FOXO1 activation disappeared by knockdown of VDR, indicating that it is VDR-dependent. Taken together, these results suggest that FOXO1 is a critical target mediating VDR-null signaling in skeletal muscle."

According to the news editors, the research concluded: "The novel findings provide the conceptual support that persistent FOXO1 activation may be responsible for insulin resistance and impaired glucose metabolism in vitamin D signaling-deficient mice, as well as evidence for the utility of vitamin D supplementation for intervention in DM2."

The news editors report that additional information may be obtained by contacting S. Chen, Center for Clinical & Translational Science, Creighton University School of Medicine, Omaha, NE, United States. Additional authors for this research include S.A. Villalta and D.K
Researchers at Cukurova University Report New Data on Metabolic Syndrome (Carotid Intima-Media Thickness as the Cardiometabolic Risk Indicator in Patients with Nonfunctional Adrenal Mass and Metabolic Syndrome Screening)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Metabolic Syndrome. According to news originating from Adana, Turkey, by NewsRx correspondents, research stated, "Our purpose was to show the association of adrenal incidentaloma and metabolic syndrome in consideration of the studies and to detect the increase in the carotid intima-media thickness which is regarded as the precursor of atherosclerosis. Eighty-one patients who were diagnosed with adrenal mass were included in the study."

Our news journalists obtained a quote from the research from Cukurova University, "Hormonal evaluation, insulin resistance measurement with the HOMA-IR and 1-mg DST were performed of all patients. The patients were classified as follows: mass size <3 cm (K1) and mass size of at least 3 cm (K2). Echocardiography and carotid intima-media thickness of the patients were measured using B-mode ultrasound. Thirty-three healthy individuals were enrolled as the control group. Mass size of 64.19% K1, while mass size of the remainder (35.81%) K2 was calculated. Five of the patients with adrenal mass were detected to have subclinical Cushing syndrome. The remaining 76 patients were accepted as nonfunctional. It was seen with regard to metabolic and biochemical parameters that plasma glucose (p=0.01), insulin (p=0.00) and triglyceride (p=0.012) values of all patients were significantly high compared to those of the control group. It was detected that measured heart rate (p=0.00), end-diastolic diameter (p=0.02), end-systolic diameter (p=0.014) and carotid intima-media thickness (p=0.00) values of the patients with adrenal mass were significantly higher than those of the healthy control group."

According to the news editors, the research concluded: "We found that the increased insulin resistance, increased risk of cardiovascular disease with the increase in the thickness of carotid intima-media and diastolic disfunction parameters, although the patients with adrenal incidentaloma are nonfunctional."

For more information on this research see: Carotid Intima-Media Thickness as the Cardiometabolic Risk Indicator in Patients with Nonfunctional Adrenal Mass and Metabolic Syndrome Screening. Medical Science Monitor, 2016;22():991-7.

The news correspondents report that additional information may be obtained from M. Evran, Dept. of Internal Medicine, Division of Endocrinology, Cukurova University,
Researchers at Daiichi Sankyo Have Reported New Data on Type 2 Diabetes (A thorough QTc study demonstrates that olmesartan medoxomil does not prolong the QTc interval)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is now available. According to news originating from Edison, New Jersey, by NewsRx correspondents, research stated, "Two studies (ROADMAP and ORIENT) evaluating the renoprotective effects of olmesartan medoxomil (OM) in patients with type 2 diabetes suggested OM is associated with increased cardiovascular mortality. We conducted a thorough QTc study to evaluate the effects of OM on cardiac repolarization."

Our news journalists obtained a quote from the research from Daiichi Sankyo, "A randomized, double-blind, phase 1 study was conducted per E14 Guidance to assess the effects of single doses of OM therapeutic dose (40 mg), OM supratherapeutic dose (160 mg), placebo, or moxifloxacin (MOXI; 400 mg) on QTc in 56 healthy subjects. The primary endpoint was the baseline-adjusted, placebo-corrected QTc interval using Fridericia's formula (DDQTcF) for OM and MOXI. Assay sensitivity was concluded if lower limit of 1-sided 95%CI >5 milliseconds of DDQTcF for MOXI. No threshold pharmacologic effect for OM was concluded if upper limit of 1-sided 95%CI <10 milliseconds for DDQTcF at any timepoint. Pharmacokinetics, ECGs, and safety were assessed. Assay sensitivity was demonstrated. The largest upper limit of the 1-sided 95%CI for DDQTcF was <5 milliseconds for OM. No clinically significant changes were observed in ECGs. Pharmacokinetics and safety profile were consistent with previous data."

According to the news editors, the research concluded: "Therapeutic and supratherapeutic OM doses had no clinically significant effect on cardiac repolarization and were well tolerated."

For more information on this research see: A thorough QTc study demonstrates that olmesartan medoxomil does not prolong the QTc interval. Journal of Clinical Pharmacology, 2015;56(4):484-91. Journal of Clinical Pharmacology can be contacted at: SAGE Publications, USA , 2455 Teller Road, Thousand Oaks, CA 91320, USA. (Sage Publications - www.sagepub.com/; Journal of Clinical Pharmacology - jcp.sagepub.com)

The news correspondents report that additional information may be obtained from J. Mendell, Daiichi Sankyo Pharma Development, Edison, NJ, United States. Additional authors for this research include N. Matsushima, T.E. O'Reilly and J. Lee.

Researchers at Daini Hospital Target Chronic Kidney Disease (Association between 1,25-dihydroxyvitamin D and left atrial diameter in pre-dialysis chronic kidney disease patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Kidney Diseases and Conditions - Chronic Kidney Disease. According to news reporting out of Nagoya, Japan, by NewsRx editors, research stated, "To investigate the correlation between serum 1,25-dihydroxyvitamin D (1,25D) levels and left atrial diameter (LAD) using echocardiography in pre-dialysis chronic kidney disease (CKD). From an initial population of 487 patients (109 met the exclusion criteria), a total of 378 patients with CKD stage 3a - 5 who had not undergone dialysis or kidney transplantation were included in the study."

Our news journalists obtained a quote from the research from Daini Hospital, "The relationship between serum 1,25D levels and LAD was examined. Moreover, factors that impacted LAD were extracted through stepwise multiple regression analyses. Serum 1,25D levels correlated negatively with LAD, left ventricular end-diastolic diameter, interventricular septum thickness, end-diastolic volume, stroke volume, left ventricular mass index (LVMI), and E/e'. Stepwise multiple regression analyses revealed there was a significant relationship between serum 1,25D levels and LAD (regression coefficient = -0.070, p = 0.001). In the stratified analysis, serum 1,25D levels were associated with LAD in the LVMI < 125 g/m(2) (regression coefficient = -0.067, p = 0.038) and ejection fraction (EF) > 60% groups (regression coefficient = -0.080, p = 0.004)."

According to the news editors, the research concluded: "Serum 1,25D levels were independently associated with LAD in CKD patients; however, the association was not significant in patients with an EF < 60% and LVMI > 125 g/m(2)."

For more information on this research see: Association between 1,25-dihydroxyvitamin D and left atrial diameter in pre-dialysis chronic kidney disease patients. *Clinical Nephrology*, 2016;86(5):229-235. *Clinical Nephrology* can be contacted at: Dustri-Verlag Dr Karl Feistle, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

Our news journalists report that additional information may be obtained by contacting D. Inaguma, Japanese Red Cross Nagoya Daini Hosp, Dept. of Nephrol, Nagoya, Aichi, Japan. Additional authors for this research include H. Shinjo, A. Tanaka, E. Ito, N. Kamegai, A. Kato, M. Mizutani, H. Shimogushi, Y. Otuka, A. Takeda, M. Hasegawa and Y.
Researchers at Department of Hematology Release New Data on Acute Leukemia (Influence of pre-existing invasive aspergillosis on allo-HSCT outcome: a retrospective EBMT analysis by the Infectious Diseases and Acute Leukemia Working Parties)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Acute Leukemia have been published. According to news reporting originating from Berlin, Germany, by NewsRx correspondents, research stated, "Historically, invasive aspergillosis (IA) has been a major barrier for allogeneic hematopoietic stem cell transplantation (allo-HSCT). The influence of invasive IA on long-term survival and on transplant-related complications has not been investigated in a larger patient cohort under current conditions."

Our news editors obtained a quote from the research from the Department of Hematology, "Our aim was to analyze the long-term outcome of patients undergoing allo-HSCT with a history of prior IA. We used European Society for Blood and Marrow Transplantation database data of first allo-HSCTs performed between 2005 and 2010 in patients with acute leukemia. One thousand one hundred and fifty patients with data on IA before allo-HSCT were included in the analysis. The median follow-up time was 52.1 months. We found no significant impact of IA on major transplant outcome variables such as overall survival, relapse-free survival, non-relapse mortality, cumulative incidence of acute GvHD grade II-IV, chronic GvHD, pulmonary complications and leukemia relapse. However, we found a trend toward lower overall survival (p=0.078, hazard ratio (HR) (95% confidence interval (CI)): 1.16 (0.98, 1.36)) and higher non-relapse mortality (p=0.150, HR (95% CI): 1.19 (0.94, 1.50)) in allo-HSCT recipients with pre-existing IA."

According to the news editors, the research concluded: "Our data suggest that a history of IA should not generally be a contraindication when considering the performance of allo-HSCT in patients with acute leukemia."

For more information on this research see: Influence of pre-existing invasive aspergillosis on allo-HSCT outcome: a retrospective EBMT analysis by the Infectious Diseases and Acute Leukemia Working Parties. Bone Marrow Transplantation, 2015;51(3):418-23. Bone Marrow Transplantation can be contacted at: Nature Publishing Group, 345 Park Avenue South, New York, NY 10010-1707, USA. (Nature Publishing Group - www.nature.com/; Bone Marrow Transplantation - www.nature.com/bmt/)

The news editors report that additional information may be obtained by contacting O. Penack, Dept. of Hematology, Oncology and Tumorimmunology, Charite University Medicine Berlin, Campus Virchow Klinikum, Allogeneic Stem Cell Transplantation Service, Berlin, Germany. Additional authors for this research include G. Tridello, J. Hoek, G. Socie, D. Blaise, J. Passweg, P. Chevallier, C. Craddock, N. Milpied, H. Veelken, J. Maertens, P. Ljungman, J. Cornelissen, A. Thiebaut-Bertrand, B. Lioure, M. Michallet, S. Iacobelli and.
Researchers at Department of Oral Pathology Discuss Findings in Cancer Risk (Role of podoplanin in potentially malignant disorders and oral squamous cell carcinoma and its correlation with lymphangiogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Cancer Risk have been presented. According to news reporting out of Panchkula, India, by NewsRx editors, research stated, "Oral squamous cell carcinoma (OSCC) ranks as one of the most common types of cancer and oral potentially malignant lesions (OPMLs) provides with an overall increased risk for development of carcinoma. As podoplanin expression is attracting interest as a marker for cancer diagnosis and prognosis, this study assesses the role of podoplanin expression in such lesions."

Our news journalists obtained a quote from the research from the Department of Oral Pathology, "Podoplanin expression and lymphatic vessel density (LVD) was determined using D2-40, a marker for podoplanin, in 70 diagnosed cases of potentially malignant lesions and OSCC. Normal epithelium showed negligible podoplanin expression, whereas the expression extended predominantly at the basal layer and the suprabasal layer or above at one or multiple areas in potentially malignant lesions. Podoplanin expression in OSCC showed two different patterns-diffuse and focal. A statistically significant increase in mean LVD was seen from normal epithelium to potentially malignant lesions (p<0.001) and to OSCC (p<0.022) while a non-significant increase was seen (p<0.594) between OPMLs and OSCC. Overall no significant correlation was found between D2-40 epithelial positivity and LVD (p=0.122). This study suggests the utility of podoplanin as a biomarker for cancer risk assessment as it detects the early changes and thus provides an additional value beyond current clinical and histopathological evaluations."

According to the news editors, the research concluded: "Hence, podoplanin is suggested to be a marker of tumor initiation and to a lesser extent of tumor progression."

For more information on this research see: Role of podoplanin in potentially malignant disorders and oral squamous cell carcinoma and its correlation with lymphangiogenesis, Indian Journal of Cancer, 2015;52(4):617-22.

Our news journalists report that additional information may be obtained by contacting S. Parhar, Dept. of Oral Pathology, Swami Devi Dyal Hospital and Dental College, Barwala, Panchkula, India. Additional authors for this research include H. Kaur, A. Vashist and S. Verma.

Researchers at Department of Pediatrics Have Reported New Data on Medical Research [The FTO rs9939609 and LEPR rs1137101 mothers-newborns gene polymorphisms and maternal fat mass index effects on anthropometric characteristics in newborns A ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Health and Medicine - Medical Research have been presented. According to news reporting out of Targu Mures, Romania, by NewsRx editors, research stated, "The aim of this study was to assess the impact of mothers' and newborns' fat mass and obesity-associated gene (FTO) rs9939609 and leptin receptor (LEPR) rs1137101 gene polymorphisms on neonatal anthropometric parameters in order to identify a potential risk for developing obesity. We performed a cross-sectional study on 355 mother-newborn couples in an Obstetrics Gynecology Tertiary Hospital from Romania, evaluated with regard to anthropometric parameters, clinical and laboratory parameters besides 2 genetic polymorphisms (FTO rs9939609 and LEPR rs1137101)."

Our news journalists obtained a quote from the research from the Department of Pediatrics, "Newborns with mothers carrying variant AT or AA genotype for FTO rs9939609 presented lower BMI (P=0.012) and lower MUAC (P=0.029). There was a significant interaction effect between newborn and mother LEPR rs1137101 polymorphism on birth weight (P=0.009) and BMI (P=0.007). We noticed significantly increased birth weight and BMI in newborns carriers of AG + GG genotype, coming from mothers with AA genotype (P=0.006). There was no evidence of significant interaction effect between newborn and mother FTO rs9939609 polymorphism on the studied anthropometrical data (P >0.05). In addition, lower BMI scores (P=0.042) were observed in newborns carriers of TT genotype whose mothers had AA + AT genotype. Lower MUAC scores (P=0.041) were noticed in newborns carriers of AA + AT genotype whose mothers had AA + AT genotype for FTO rs9939609 gene polymorphism. Newborns carriers of the AG + GG genotype (P=0.003) of LEPR rs1137101 coming from mothers with increased FMI (upper tertile) had significantly increased BMIs. Presence of the variant A allele of FTO rs9939609 polymorphism in mothers decreased BMI and MUAC in newborns. The impact of LEPR rs1137101 polymorphism on BMI and birth weight in newborns differed depending on the presence/absence of the dominant LEPR allele in mothers. In addition, we noticed that maternal FMI presented a significant positive effect on newborns' BMI by changing the effect of LEPR rs1137101."

According to the news editors, the research concluded: "We can conclude that mothers' FTO rs9939609 and LEPR rs1137101 gene polymorphisms presented an impact on birth weight and newborns' BMI, therefore being involved in the newborns' nutritional status and in the design of a potential protocol."

For more information on this research see: The FTO rs9939609 and LEPR
rs1137101 mothers-newborns gene polymorphisms and maternal fat mass index effects on anthropometric characteristics in newborns A cross-sectional study on mothers-newborns gene polymorphisms-The FTO-LEPR Study (STROBE-compl. Drugs and Therapies - Drug Delivery Systems

Researchers at Department of Pharmaceuticals Target Drug Delivery Systems (Citric acid crosslinked cyclodextrin/hydroxypropylmethylcellulose hydrogel films for hydrophobic drug delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Drug Delivery Systems are discussed in a new report. According to news originating from Maharashtra, India, by NewsRx correspondents, research stated, "The present communication deals with preparation of beta-cyclodextrin (beta CD) grafted hydroxypropylmethylcellulose (HPMC) hydrogel films using citric acid as crosslinking agent with the aim of improving the loading and achieving controlled release of hydrophobic weak base (ketoconazole). The hydrogel films were characterized by attenuated total reflectance-fourier transform infrared (ATR-FTIR) spectroscopy, solid state C-13-nuclear magnetic resonance (C-13 NMR) spectroscopy, thermal analysis and scanning electron microscopy (SEM)."

Our news journalists obtained a quote from the research from the Department of Pharmaceuticals, "The films were evaluated for p) content, carboxyl content, swelling ratio, drug loading, drug release and hemolytic assay. ATR-FTIR spectra indicated crosslinking via ester formation whereas C-13 NMR, thermal analysis and SEM confirmed beta CD grafting. The beta CD grafted hydrogel films with high carboxyl content showed maximum swelling and high drug loading. The presence of grafted beta CD helped to retard the release of ketoconazole from the hydrogel films. The hemolytic assay suggested the biocompatible nature of the hydrogel films."

According to the news editors, the research concluded: "Altogether, beta CD grafted HPMC hydrogel films were found to be suitable for delivery of poorly soluble weak bases."

For more information on this research see: Citric acid crosslinked cyclodextrin/hydroxypropylmethylcellulose hydrogel films for hydrophobic drug delivery. International Journal of Biological Macromolecules, 2016;93():75-86. International Journal of Biological Macromolecules can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae
Researchers at Department of Pharmacology Target HIV/AIDS (Prime, Shock, and Kill: Priming CD4 T Cells from HIV Patients with a BCL-2 Antagonist before HIV Reactivation Reduces HIV Reservoir Size)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immune System Diseases and Conditions - HIV/AIDS. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "Understanding how some HIV-infected cells resist the cytotoxicity of HIV replication is crucial to enabling HIV cure efforts. HIV killing of CD4 T cells that replicate HIV can involve HIV protease-mediated cleavage of procaspase 8 to generate a fragment (Casp8p41) that directly binds and activates the mitochondrial proapoptotic protein BAK."

Funders for this research include HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID), HHS | NIH | National Center for Advancing Translational Sciences (NCATS), HHS | NIH | National Cancer Institute (NCI).

The news correspondents obtained a quote from the research from the Department of Pharmacology, "Here, we demonstrate that Casp8p41 also binds with nanomolar affinity to the antiapoptotic protein Bcl-2, which sequesters Casp8p41 and prevents apoptosis. Further, we show that central memory CD4 T cells (TCM) from HIV-infected individuals have heightened expression of BCL-2 relative to procaspase 8, possibly explaining the persistence of HIV-infected TCMdespite generation of Casp8p41. Consistent with this hypothesis, the selective BCL-2 antagonist venetoclax induced minimal killing of uninfected CD4 T cells but markedly increased the death of CD4 T cells and diminished cell-associated HIV DNA when CD4 T cells from antiretroviral therapy (ART)-suppressed HIV patients were induced with aCD3/aCD28 to reactivate HIVex vivo Thus, priming CD4 T cells from ART suppressed HIV patients with a BCL-2 antagonist, followed by HIV reactivation, achieves reductions in cell-associated HIV DNA, whereas HIV reactivation alone does not. HIV infection is incurable due to a long-lived reservoir of HIV(+)+memory CD4 T cells, and no clinically relevant interventions have been identified that reduce the number of these HIV DNA-containing cells. Since postintegration HIV replication can result in HIV protease generation of Casp8p41, which activates BAK, causing
infected CD4 T cell death, we sought to determine whether this occurs in memory CD4 T cells. Here, we demonstrate that memory CD4 T cells can generate Casp8p41 and yet are intrinsically resistant to death induced by diverse stimuli, including Casp8p41. Furthermore, BCL-2 expression is relatively increased in these cells and directly binds and inhibits Casp8p41's proapoptotic effects. Antagonizing BCL-2 with venetoclax derepresses this antagonism, resulting in death, preferentially in HIV DNA containing cells, since only these cells generate Casp8p41."

According to the news reporters, the research concluded: "Thus, BCL-2 antagonism is a clinically relevant intervention with the potential to reduce HIV reservoir size in patients."

Our news journalists report that additional information may be obtained by contacting S.H. Kaufmann, Dept. of Pharmacology, Mayo Clinic, Rochester, Minnesota USA. Division of Oncology Research, Mayo Clinic, Rochester, Minnesota, United States. Additional authors for this research include A.M. Sainski, H. Dai, S. Natesampillai, Y.P. Pang, G.D. Bren, M.C. de Araujo Correia, R. Sampath, S.A. Rizza, D. O'Brien, J.D. Yao, S.H. Kaufmann and A.D Badley.

Immunology - Lymphoid Tissue

Researchers at Department of Respiratory Release New Data on Lymphoid Tissue (Endobronchial Ultrasound Elastography for Diagnosing Mediastinal and Hilar Lymph Nodes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Lymphoid Tissue. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Pathophysiologica processes, such as malignancy, can lead to the formation of stiffer tissue in lung cancers. Endobronchial ultrasound (EBUS) elastography is a novel technique for measuring tissue stiffness during EBUS-guided transbronchial needle aspiration (EBUS-TBNA)."

Our news journalists obtained a quote from the research from the Department of Respiratory, "The current study was conducted to investigate the diagnostic value of EBUS elastography for mediastinal and hilar lymph node metastasis in lung cancers. From January 2014 to January 2015, 40 patients suspected of lung cancer were enrolled, and a total of 68 lymph nodes were evaluated by EBUS-TBNA. EBUS-guided elastography of lymph nodes was performed prior to EBUS-TBNA. Standard EBUS characteristics were also described."
Pathological determination of malignant or benign lymph nodes was used as the gold standard for this study. If EBUS-TBNA did not result in a formal pathological diagnosis of malignancy, patients were referred for a surgical procedure. Comparisons of elastography and standard EBUS characteristics were made between benign and malignant lymph nodes. Elastography grading scores and strain ratios showed significant differences between benign and malignant lymph nodes (p=0.000). The elastography strain ratio was more sensitive and specific for determining malignant lymph nodes than elastography grading score or standard EBUS criteria. The receiver operating characteristic curve for the elastography strain ratio showed an area under the curve of 0.933. The best cut-off point of the strain ratio for differentiating malignant from benign lymph nodes was 32.07. The elastography strain ratio had a sensitivity of 88.1%, the specificity of 80.8%, positive predictive value of 88.1%, and negative predictive value of 80.8% for distinguishing malignant from benign nodes. The overall accuracy of elastography strain ratio was 85.3%. The strain ratio of malignant and benign lymph nodes positively correlated with the elastography grading score (r=0.561, p=0.000). EBUS elastography can be effectively used to predict mediastinal and hilar lymph node metastases in lung cancer.

According to the news editors, the research concluded: "This noninvasive technique may thus complement standard EBUS and help guide EBUS-TBNA procedures."

The news correspondents report that additional information may be obtained from X.D. Lyu, Dept. of Respiratory, The First People's Hospital of Nantong, Nantong, Jiangsu 226001, People's Republic of China. Additional authors for this research include M. Huang, J. Zhu, H. Ma and X.D Lyu.

has been previously shown to stimulate pellicle formation and cellulose biosynthesis. A screen for genes involved in cellulose production under high c-di-GMP intracellular levels led to the identification of insertions in two genes, wssB and wssE, belonging to the Pto DC3000 cellulose biosynthesis operon wssABCDEFGH.

Financial supporters for this research include Spanish Ministerio de Economía y Competitividad (MINECO), Junta de Andalucía, European Regional Development Fund, JAE-doc CSIC contract, Andalusian Knowledge Agency, European Union's Seventh Framework Program, Marie Skłodowska-Curie actions.

The news reporters obtained a quote from the research from the Department of Soil Microbiology and Symbiotic Systems, "Interestingly, beside cellulose-deficient mutants, colonies with a rougher appearance than the wild type also arouse among the transposants. Those mutants carry insertions in amrZ, a gene encoding a transcriptional regulator in different Pseudomonas. Here, we provide evidence that AmrZ is involved in the regulation of bacterial cellulose production at transcriptional level by binding to the promoter region of the wssABCDEFGH operon and repressing cellulose biosynthesis genes. Mutation of amrZ promotes wrinkly colony morphology, increased cellulose production and loss of motility in Pto DC3000. AmrZ regulon includes putative c-di-GMP metabolising proteins, like AdcA and MorA, which may also impact those phenotypes."

According to the news reporters, the research concluded: "Furthermore, an amrZ but not a cellulose-deficient mutant turned out to be impaired in pathogenesis, indicating that AmrZ is a key regulator of Pto DC3000 virulence probably by controlling bacterial processes other than cellulose production."

For more information on this research see: AmrZ regulates cellulose production in Pseudomonas syringae pv. tomato DC3000. Molecular Microbiology, 2015;99(5):960-77. (Wiley-Blackwell - www.wiley.com; Molecular Microbiology - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1365-2958)

Oncology - Acute Myeloid Leukemia

Researchers at Department of Specialty Medicine Target Acute Myeloid Leukemia (Stem Cell Modeling of Core Binding Factor Acute Myeloid Leukemia)
Data detailed on Oncology - Acute Myeloid Leukemia have been presented. According to news reporting from Treviso, Italy, by NewsRx journalists, research stated, "Even though clonally originated from a single cell, acute leukemia loses its homogeneity soon and presents at clinical diagnosis as a hierarchy of cells endowed with different functions, of which only a minority possesses the ability to recapitulate the disease. Due to their analogy to hematopoietic stem cells, these cells have been named 'leukemia stem cells,' and are thought to be chiefly responsible for disease relapse and ultimate survival after chemotherapy."

The news correspondents obtained a quote from the research: "Core Binding Factor (CBF) Acute Myeloid Leukemia (AML) is cytogenetically characterized by either the t(8;21) or the inv(16)/t(16;16) chromosomal abnormalities, which, although being pathognomonic, are not sufficient per se to induce overt leukemia but rather determine a preclinical phase of disease when preleukemic subclones compete until the acquisition of clonal dominance by one of them. In this review we summarize the concepts regarding the application of the 'leukemia stem cell' theory to the development of CBF AML; we will analyze the studies investigating the leukemogenetic role of t(8;21) and inv (16)/t(16;16), the proposed theories of its clonal evolution, and the role played by the hematopoietic niches in preserving the disease."

According to the news reporters, the research concluded: "Finally, we will discuss the clinical implications of stem cell modeling of CBF AML for the therapy of the disease."

For more information on this research see: Stem Cell Modeling of Core Binding Factor Acute Myeloid Leukemia. Stem Cells International, 2016;2016():7625827. (Hindawi Publishing - www.hindawi.com; Stem Cells International - www.hindawi.com/journals/sci/)

Researchers at Department of Surgery Detail Findings in Post-Trial Research (The relationship between serum vitamin D and chronic rhinosinusitis: A systematic review)

Researchers at Department of Surgery Detail Findings in Post-Trial Research (The relationship between serum vitamin D and chronic rhinosinusitis: A systematic review)
respiratory epithelium."

The news correspondents obtained a quote from the research from the Department of Surgery, "Chronic rhinosinusitis (CRS) places a relatively large socioeconomic burden on developed nations, yet remains a difficult disease to treat. VD3, therefore, has become an area of clinical interest because it may provide an adjunctive drug therapy option in CRS, thereby potentially improving the quality of life of these patients. A systematic review of the relationship among serum VD3 levels, CRS phenotype, and disease severity by using outcome assessments. A systematic search was performed by using the PubMed, MEDLINE, and EMBASE databases. The Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidelines were followed. Studies that measured serum VD3 levels and correlated the measurements to any subtype of CRS (with or without nasal polyps) were included for qualitative analysis. Seven articles were included (four prospective and three retrospective studies), with a total of 539 patients. There were significantly lower VD3 levels in the polypoid phenotypes of CRS compared with controls. Low VD3 levels were often associated with an increased degree of inflammation. The available evidence indicated that there is a significant relationship between low VD3 levels and polypoid CRS phenotypes."

According to the news reporters, the research concluded: "The association between VD3 levels and disease severity and VD3 potential for drug therapy remains unclear, which warrants further research in the area."

Our news journalists report that additional information may be obtained by contacting P.J. Stokes, Dept. of Surgery, South West Healthcare, Warrnambool, Australia.

**Drugs and Therapies - Heparin Therapy**

**Researchers at Department of Veterans Affairs Target Heparin Therapy (Specific endothelial heparin-binding EGF-like growth factor deletion ameliorates renal injury induced by chronic angiotensin II infusion)***

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Heparin Therapy are discussed in a new report. According to news reporting originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "Transactivation of EGF receptor (EGFR) by angiotensin II (Ang II) plays important roles in the initiation and progression of chronic kidney diseases. Studies suggest that heparin-binding EGF-like factor (HB-EGF) may be a critical mediator in this process, but its role in vivo has not been investigated."

Our news editors obtained a quote from the research from the Department of Veterans Affairs, "In the current study, we found that in response to Ang II infusion, kidneys
from endothelial HB-EGF deletion mice had significantly reduced EGFR activation compared with controls. Meanwhile, deletion of endothelial HB-EGF expression decreased Ang II infusion related renal injury, as demonstrated by 1) less albuminuria; 2) less glomerulosclerosis; 3) preserved endothelial integrity and decreased podocyte injury, as shown by greater glomerular tuft area and WT1-positive cells, and fewer apoptotic cells measured by cleaved caspase 3 staining; 4) reduced inflammation in the perivascular area and interstitium measured by F4/80 and CD3 immunostaining; and 5) reduced renal fibrosis."

According to the news editors, the research concluded: "Our results suggest that shedding of HB-EGF from endothelium plays an important role in Ang II-induced renal injury by linking Ang II-AT1R with EGFR transactivation. Inhibition of HB-EGF shedding could be a potential therapeutic strategy for chronic kidney disease."

The news editors report that additional information may be obtained by contacting R.C. Harris, Dept. of Vet Affairs, Nashville, TN, United States. Additional authors for this research include L.A. Kloepfer, C. Finney, A. Diedrich and R.C. Harris.

Keywords for this news article include: Nashville, Tennessee, United States, North and Central America, Nerve Tissue Proteins, Drugs and Therapies, Biological Factors, Peptide Proteins, Peptide Hormones, Heparin Therapy, Angiotensin II, Oligopeptides, Neuropeptides, Angiotensins, Nephrology, Autacoids, Peptides, Kidney, Department of Veterans Affairs.

Cardiovascular Diseases and Conditions...

Researchers at Drexel University Target Hypertension (Changes in the prevalence of hospitalization and comorbidity in US adults with stroke: A three decade cross-sectional and birth cohort analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Little attention was paid to the transition of care for stroke that may partially explain the long-term trend of stroke rates. We aimed to test the trend of hospitalization attributable to stroke in US adults."

Our news editors obtained a quote from the research from Drexel University, "Data from National Hospital Discharge Surveys 1980-2010 in patients aged >= 18 (n = 6,527,304) were analyzed to examine the trend of patients with first-list diagnoses of stroke. Stroke comorbidities were classified in stroke patients with second-to seven-listed diagnoses of coronary heart disease, hypertension, diabetes, arrhythmias, or hyperlipidemia. Stroke trends by survey years and birth cohorts were analyzed using univariate, multivariate, and birth cohorts methods. Of the total study sample, the prevalence of hospitalization due to stroke was 22.99%, 30.00%, and 27.03% in years of 1980-1989, 1990-1999, and 2000-2010 in males, and 17.30%, 22.04%, and 19.34% in females, respectively. Overall, hospitalization rates in stroke patients..."
significantly increased among adults aged <65, and decreased in adults aged >= 65. There was an increase in stroke hospitalization rate in the old adults aged >= 65 in recent birth cohorts. Significant increased trends of comorbid hypertension, diabetes, arrhythmias, and hyperlipidemia were observed from 1980 to 2010. A significant increase in stroke hospitalization rate was observed in adults aged <65 in the past three decades, and in old adults in recent years. Increases in stroke comorbidity rates were observed in all age groups."

According to the news editors, the research concluded: "Findings from the study highlight that both public health and clinical practices face a serious challenge in controlling this unwelcome increased stroke trend."

The news editors report that additional information may be obtained by contacting L.J. Liu, Drexel University, Dept. of Epidemiol & Biostat, Dornsife Sch Public Hlth, Philadelphia, PA 19104, United States. Additional authors for this research include X. Yang, Y. Long, A.K. Mallhi, K. Mehta, E. Veznedaroglu and X.Y. Yin.

Oncology - Liver Cancer

Researchers at Edith Cowan University Release New Data on Liver Cancer (Nurse-led hepatocellular carcinoma surveillance clinic provides an effective method of monitoring patients with cirrhosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting originating from Joondalup, Australia, by NewsRx correspondents, research stated, "The aim of this study is to examine the acceptability and effectiveness of a nurse-led hepatocellular carcinoma (HCC) surveillance clinic in high-risk patients with cirrhosis/advanced fibrosis. Early detection of HCC is associated with better treatment outcomes and improved survival."

Our news editors obtained a quote from the research from Edith Cowan University, "International guidelines recommend 6-monthly surveillance of patients at risk of developing HCC. A nurse-led HCC surveillance protocol was established to support patients in adherence to surveillance protocols. The design used was retrospective document analysis. Retrospective analysis of healthcare records of patients referred to the clinic between August 2009 and December 2015. Extracted data included attendance of clinic visits, blood testing, ultrasound or
other imaging, and outcomes. Ultrasound was attended within 6 months in 30.3% of cases and within 7 months in 71.2% of cases. The median time between Nurse-Led Clinic appointments, ultrasound scans and blood testing did not exceed 9 months. First year FibroScans were attended by 82.9% (63/76) patients; endoscopy was indicated for 42 and attended by 35 (83.3%) patients. Lesions were identified in 16 patients (21.5%) and HCC diagnosed in two patients. One patient died because of HCC and one to sub-dural haematoma. Nurse-led HCC surveillance was an effective method of monitoring patients with cirrhosis at high risk of developing HCC. Well-defined protocols enable timely identification of patients with HCC or hepatic decompensation so that management strategies can be implemented without delay."

According to the news editors, the research concluded: "The potential benefits identified by this study warrant further, rigorous evaluation." For more information on this research see: Nurse-led hepatocellular carcinoma surveillance clinic provides an effective method of monitoring patients with cirrhosis. *International Journal of Nursing Practice*, 2016;22():3-10. *International Journal of Nursing Practice* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. **Drugs and Therapies - Vancomycin Resistance**

**Researchers at Edouard Herriot Hospital Report Findings in Vancomycin Resistance (Outbreaks of Vancomycin-Resistant Enterococci in Hospital Settings: A Systematic Review and Calculation of the Basic Reproductive Number)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Vancomycin Resistance. According to news reporting originating in Lyon, France, by NewsRx journalists, research stated, "Vancomycin-resistant enterococci (VRE) have spread worldwide. To systematically review VRE outbreaks and estimate the pooled basic reproductive rate (R0) of VRE."

The news reporters obtained a quote from the research from Edouard Herriot Hospital, "Eligible studies criteria were (1) published within 10 years, (2) report outbreak details, (3) involve 1 center, (4) estimate epidemic duration, and (5) concern adults. Descriptive analysis included number of index cases, secondary cases, and screened patients; infection control measures; and definition of contact patients. R0 was estimated by the equation R 0=(ln2) D/t d+1, with D as the generation time and t d as the doubling time. Thirteen VRE outbreaks were retained from 180 articles and, among them, 10 were kept for R0 calculation. The mean
(range) number of index cases was 2.3 (1-8) and the mean (range) number of secondary cases was 15 (3-56). The mean (range) number of screened patients was 174 (32-509), with pooled VRE prevalence of 5.4% (95% CI, 4.5%-6.3%). Contact precautions were reported in 12 studies (92%), wards were closed in 7 (54%), with cohorting in 6 (46%). Two major screening policies were implemented: (1) a surveillance program in the unit or hospital (7 studies [54%]) and (2) screening of selected contact patients (6 studies [46%]). The pooled R0 of VRE was 1.32 (interquartile range, 1.03-1.46). We discerned considerable heterogeneity in screening policies during VRE outbreaks."

According to the news reporters, the research concluded: "Pooled R0 was higher than 1, confirming the epidemic nature of VRE."

For more information on this research see: Outbreaks of Vancomycin-Resistant Enterococci in Hospital Settings: A Systematic Review and Calculation of the Basic Reproductive Number. Infection Control and Hospital Epidemiology, 2015;37(3):289-94. (University of Chicago Press - press.uchicago.edu; Infection Control and Hospital Epidemiology - /ucp/journals/journal/iche.html)

Hemophilia

Researchers at Erasmus University Medical Center Release New Data on Hemophilia (Perioperative treatment of hemophilia A patients: blood group O patients are at risk of bleeding complications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hemophilia. According to news originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "ESSENTIALS: Targeting of factor VIII values is a challenge during perioperative replacement therapy in hemophilia. This study aims to identify the extent and predictors of factor VIII underdosing and overdosing."

Financial supporters for this research include Bayer, Baxter International, Pfizer, CSL Behring, Novo Nordisk, Bayer Schering, Novartis.

Our news journalists obtained a quote from the research from Erasmus University Medical Center, "Blood group O predicts underdosing and is associated with perioperative bleeding. To increase quality of care and cost-effectiveness of treatment, refining of dosing is obligatory. Perioperative administration of factor VIII (FVIII) concentrate in hemophilia A may result in both underdosing and overdosing, leading to respectively a risk of bleeding
complications and unnecessary costs. This retrospective observational study aims to identify the extent and predictors of underdosing and overdosing in perioperative hemophilia A patients (FVIII levels <0.05 IU mL(-1)). One hundred nineteen patients undergoing 198 elective, minor, or major surgical procedures were included (median age 40 years, median body weight 75 kg). Perioperative management was evaluated by quantification of perioperative infusion of FVIII concentrate and achieved FVIII levels. Predictors of underdosing and (excessive) overdosing were analyzed by logistic regression analysis. Excessive overdosing was defined as upper target level plus (>=) 0.20 IU mL(-1). Depending on postoperative day, 7-45% of achieved FVIII levels were under and 33-75% were above predefined target ranges as stated by national guidelines. A potential reduction of FVIII consumption of 44% would have been attained if FVIII levels had been maintained within target ranges. Blood group O and major surgery were predictive of underdosing (odds ratio [OR] 6.3, 95% confidence interval [CI] 2.7-14.9; OR 3.3, 95% CI 1.4-7.9). Blood group O patients had more bleeding complications in comparison to patients with blood group non-O (OR 2.02, 95% CI 1.00-4.09). Patients with blood group non-O were at higher risk of overdosing (OR 1.5, 95% CI 1.1-1.9). Additionally, patients treated with bolus infusions were at higher risk of excessive overdosing (OR 1.8, 95% CI 1.3-2.4)."

According to the news editors, the research concluded: "Quality of care and cost-effectiveness can be improved by refining of dosing strategies based on individual patient characteristics such as blood group and mode of infusion."

Blood Pressure

Researchers at FUMEC University Report New Data on Blood Pressure (Methods for reliable estimation of pulse transit time and blood pressure variations using smartphone sensors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Pressure have been published. According to news originating from Belo Horizonte, Brazil, by NewsRx correspondents, research stated, "Hypertension is known to affect around one third of adults globally and early diagnosis is
essential to reduce the effects of this affliction. Today's Blood Pressure (BP) monitoring cuffs are obtrusive and inconvenient for performing regular measurements, and continuous non-invasive blood pressure devices are too complex and expensive for ambulatory use."

Financial support for this research came from CAPES.

Our news journalists obtained a quote from the research from FUMEC University, "Hence, there is a strong need for affordable systems that can measure blood pressure (BP) variations throughout the day as this will allow to monitor, diagnose and follow-up not only patients at risk, but also healthy population in general for early diagnosis. A promising method for arterial BP estimation is to measure the Pulse Transit Time (PTT) and derive pressure values from it. However, current methods for measuring this surrogate maker of BP require complex sensing and analysis circuitry and the related medical devices are expensive and inconvenient for the user. In this paper, we present new methods to estimate PIT reliably and subsequently BP, from the baseline sensors of smartphones. This new approach involves determining PIT by simultaneously measuring the time the blood leaves the heart, by recording the heart sound using the standard microphone of the phone, and the time it reaches the finger, by measuring the pulse wave using the phone's camera. We present algorithms that can be executed directly on current smartphones to obtain clean and robust heart sound signals and to extract the pulse wave characteristics. We also present methods to ensure a synchronous capture of the waveforms, which is essential to obtain reliable PIT values with inexpensive sensors. Additionally, we combine Autocorrelation and Fast Fourier Transform (FFT)-based methods for reliably estimating the user heart rate (HR) from his/her heart sounds, and describe how to use the calculate HR to compensate for the camera frame rate variations and to improve the robustness of PTT estimation."

According to the news editors, the research concluded: "Our experiments show that the computational overhead of the proposed processing methods is minimum, which allows real-time feedback to the user, and that the PTT values are fully accurate (beat-to-beat), thereby enabling state-of-the-art smartphones to be used as affordable medical devices."

For more information on this research see: Methods for reliable estimation of pulse transit time and blood pressure variations using smartphone sensors. Researchers at Federal University Detail Findings in Sulfur Amino Acids [Ligand Exchange Reaction of Au(I) R-N-Heterocyclic Carbene Complexes with Cysteine]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Sulfur Amino Acids. According to news reporting from Juiz de Fora, Brazil, by NewsRx journalists, research stated, "The chemotherapy with gold complexes has been attempted since the 90s after the clinical success of auranofin, a gold(I) coordination complex. Currently, the organometallics compounds have shown promise in cancer therapy, mainly in those complexes containing N-heterocyclic carbenes (NHC) as a ligand."

Financial support for this research came from Conselho Nacional de Desenvolvimento Cientifico e Tecnologico.

The news correspondents obtained a quote from the research from Federal University, "The present study shows a kinetic analysis of the reaction of six alkyl-substituted NHC with cysteine (Cys), which is taken as an important bionucleophile representative. The first and second ligand exchange processes were analyzed with the complete description of the mechanism and energy profiles. For the first reaction step, which is the rate-limiting step of the whole substitution reaction, the activation enthalpy follows the order 1/Me2 <2/Me3Et <4/n-Bu2 <3/i-Pr2 <6/Cy2 <5/t-Bu2, which is fully explained by steric and electronic features. From a steric point of view, the previous reactivity order is correlated with the r(Au-S) calculated for the transition state structures where S is the sulfur ligand from the Cys entering group. This means that longer r(Au-S) leads to higher activation enthalpy and is consistent with the effectiveness of gold shielding from nucleophile attack by bulkier alkyl-substituted NHC ligand. When electronic effect was addressed we found that higher activation barrier was predicted for strongly electron-donating NHC ligand, represented by the eigenvalue of s-HOMO orbital of the free ligands. The molecular interpretation of the electronic effects is that strong donating NHC forms strong metal-ligand bond."

According to the news reporters, the research concluded: "For the second reaction step, similar structure-reactivity relationships were obtained, however the activation energies are less sensitive to the structure."

Our news journalists report that additional information may be obtained by contacting H.F. Dos Santos, Dept. of Chemistry, NEQC: Nucleo de Estudos em Quimica Computacional, Federal University of Juiz de Fora , Campus Universitario Martelos, 36036-900, Juiz de Fora, Brazil. Researchers at Federal University Have Reported New Data on Asthma
(The tyrosine kinase inhibitor dasatinib reduces lung inflammation and remodelling in experimental allergic asthma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Asthma is now available. According to news originating from Rio de Janeiro, Brazil, by NewsRx correspondents, research stated, "Asthma is characterized by chronic lung inflammation and airway hyperresponsiveness. Despite recent advances in understanding of its pathophysiology, asthma remains a major public health problem, and new therapeutic strategies are urgently needed."

Funders for this research include European Community's Seventh Framework Programme, Coordination for the Improvement of Higher Level Personnel (CAPES), Carlos Chagas Filho Rio de Janeiro State Research Foundation (FAPERJ), Brazilian Council for Scientific and Technological Development (CNPq).

Our news journalists obtained a quote from the research from Federal University, "In this context, we sought to ascertain whether treatment with the TK inhibitor dasatinib might repair inflammatory and remodelling processes, thus improving lung function, in a murine model of asthma. Animals were sensitized and subsequently challenged, with ovalbumin (OVA) or saline. Twenty-four hours after the last challenge, animals were treated with dasatinib, dexamethasone, or saline, every 12?h for 7 consecutive days. Twenty-four hours after the last treatment, the animals were killed, and data were collected. Lung structure and remodelling were evaluated by morphometric analysis, immunohistochemistry, and transmission electron microscopy of lung sections. Inflammation was assessed by cytometric analysis and ELISA, and lung function was evaluated by invasive whole-body plethysmography. In OVA mice, dasatinib, and dexamethasone led to significant reductions in airway hyperresponsiveness. Dasatinib was also able to attenuate alveolar collapse, contraction index, and collagen fibre deposition, as well as increasing elastic fibre content, in OVA mice. Concerning the inflammatory process, dasatinib reduced inflammatory cell influx to the airway and lung-draining mediastinal lymph nodes, without inducing the thymic atrophy promoted by dexamethasone."

According to the news editors, the research concluded: "In this model of allergic asthma, dasatinib effectively blunted the inflammatory and remodelling processes in asthmatic lungs, enhancing airway repair and thus improving lung mechanics."

The news correspondents report that additional information may be obtained from A.L. da Silva, Laboratory of Pulmonary Investigation, Carlos Chagas Filho Institute of Biophysics, Federal University of Rio de Janeiro, Rio de Janeiro, Brazil. Additional authors for this research include R.F. Magalhaes, V.C. Branco, J.D. Silva, F.F. Cruz, P.S. Marques, T.P. Ferreira, M.M. Morales, M.A. Martins, P.C. Olsen and P.R Rocco.

Granulosa Cells

Researchers at Federal University Have Reported New Data on Granulosa Cells (Protein expression in human cumulus cells as an indicator of blastocyst formation and pregnancy success)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Granulosa Cells are presented in a new report. According to news reporting out of Sao Paulo, Brazil, by NewsRx editors, research stated, "The goal for the present study was to implement a technique for protein extraction and identification in human cumulus cells (CCs). Forty samples of CCs were collected after ovum pick-up from patients undergoing intracytoplasmic sperm injection (ICSI)."

Financial support for this research came from Fundacao de Amparo a Pesquisa do Estado de Sao Paulo - FAPESP.

Our news journalists obtained a quote from the research from Federal University, "Samples were split into the blastocyst group (n = 10), including patients in which all embryos converted into blastocysts, and the non-blastocyst group (n = 10), including patients in which none of the embryos reached the blastocyst stage or the positive-pregnancy (n = 10) and negative-pregnancy group (n = 10). Proteins were extracted and injected into a liquid chromatography system coupled to a mass spectrometer. The spectra were processed and used to search a database. There were 87 different proteins in samples from the blastocyst and non-blastocyst groups, in which 30 were exclusively expressed in the blastocyst group and 17 in the non-blastocyst group. Among the 72 proteins detected in the pregnancy groups, 19 were exclusively expressed in the positive, and 16 were exclusively expressed in the negative-pregnancy group."

According to the news editors, the research concluded: "CC proteomics may be useful for predicting pregnancy success and the identification of patients that should be included in extended embryo culture programs."

Our news journalists report that additional information may be obtained by contacting E. Borges, Univ Fed Sao Paulo UNIFESP, Dept. of Cirurgia, Disciplina Urol Area Reproducao Humana, BR-04039060 Sao Paulo, SP, Brazil. Additional authors for this research include A.S. Setti, E.G. Lo Turco, F.B. Cordeiro, E.C. Cabral, S.S. Cortezzi, E. Ono, R.C.S. Figueira, M.N. Eberlin and E. Borges.

Hormones

Researchers at First Affiliated Hospital Release New Data on Hormones (Melatonin inhibits AP-2b/hTERT, NF-kB/COX-2 and Akt/ERK and activates caspase/Cyto C signaling to enhance the antitumor activity of berberine in lung cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hormones. According to news reporting out of Guangzhou, People's Republic of China, by NewsRx editors, research stated, "Melatonin, a molecule produced throughout the animal and plant kingdoms, and berberine, a plant derived agent, both exhibit antitumor and multiple biological and pharmacological effects, but they have never been combined altogether for the inhibition of human lung cancers. In this study, we investigated the role and underlying mechanisms of melatonin in the regulation of antitumor activity of berberine in lung cancer cells."

Our news journalists obtained a quote from the research from First Affiliated Hospital, "Treatment with melatonin effectively increased the berberine-mediated inhibitions of cell proliferation, colony formation and cell migration, thereby enhancing the sensitivities of lung cancer cells to berberine. Melatonin also markedly increased apoptosis induced by berberine. Further mechanism study showed that melatonin promoted the cleavage of caspase-9 and PARP, enhanced the inhibition of Bcl2, and triggered the releasing of cytochrome C (Cyto C), thereby increasing the berberine-induced apoptosis. Melatonin also enhanced the berberine-mediated inhibition of telomerase reverses transcriptase (hTERT) by down-regulating the expression of AP-2b and its binding on hTERT promoter. Moreover, melatonin enhanced the berberine-mediated inhibition of cyclooxygenase 2 (COX-2) by inhibiting the nuclear translocation of NF-kB and its binding on COX-2 promoter. Melatonin also increased the berberine-mediated inhibition of the phosphorylated Akt and ERK. Collectively, our results demonstrated that melatonin enhanced the antitumor activity of berberine by activating caspase/Cyto C and inhibiting AP-2b/hTERT, NF-kB/COX-2 and Akt/ERK signaling pathways."

According to the news editors, the research concluded: "Our findings provide new insights in exploring the potential therapeutic strategies and novel targets for lung cancer treatment."
For more information on this research see: Melatonin inhibits AP-2b/hTERT, NF-kB/COX-2 and Akt/ERK and activates caspase/Cyto C signaling to enhance the antitumor activity of berberine in lung cancer cells. Oncotarget, 2016;7(3):2985-3001.

Oncology - Pancreatic Cancer

Researchers at Florida Hospital Release New Data on Pancreatic Cancer (Intraprocedural increase in heart rate during EUS-guided celiac plexus neurolysis: Clinically relevant or just a physiologic change?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Pancreatic Cancer are presented in a new report. According to news reporting originating in Orlando, Florida, by NewsRx journalists, research stated, "Although EUS-guided celiac plexus neurolysis (EUS-CPN) is performed frequently for palliation of pain in pancreatic cancer, response to treatment is variable. Although intraprocedural increases in heart rate during alcohol injection are observed frequently, their significance and relationship to treatment outcome are unknown."

The news reporters obtained a quote from the research from Florida Hospital, "The objective of this study was to examine whether a correlation exists between an increase in heart rate and treatment outcomes in patients undergoing EUS-CPN for pain relief in pancreatic cancer. This is a prospective observational study of patients with abdominal pain caused by inoperable pancreatic cancer who underwent EUS-CPN. Heart rate change was defined as an increase of >= 15 beats per minute (bpm) for >= 30 seconds during alcohol injection. Main outcome measures were to compare pain, quality of life, opioid use, and survival between heart rate change and no-change groups. Heart rate change was observed in 25 of 51 patients (49.0%) who underwent EUS-CPN over a 12-month period. Although the heart rate change cohort had significantly better adjusted scores for pain (60 vs 73; P = .042) and components of quality of life such as nausea and/or vomiting (65 vs 81; P = .004), financial difficulties (41 vs 57; P = .02), weight loss (45 vs 65; P = .007), and satisfaction with body image (52 vs 62; P = .035), there was no significant difference in postprocedural opioid use or survival between groups."

According to the news reporters, the research concluded: "Because patients with an increase in intraprocedural heart rate experienced significant improvement in pain and quality of life components, this observation must be further explored in order to improve the technique and outcomes of EUS-CPN."

For more information on this research see: Intraprocedural increase in heart rate
Researchers at Florida International University Have Reported New Data on Type 2 Diabetes (Biologic activity of cyclic and caged phosphates: a review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is now available. According to news reporting originating from Miami, Florida, by NewsRx correspondents, research stated, "The recognition in the early 1960s by Morifusa Eto that tri-o-cresyl phosphate (TOCP) is hydroxylated by the cytochrome P450 system to an intermediate that spontaneously cyclizes to a neurotoxic phosphate (saligenin phosphate ester) ignited the interest in this group of compounds. Only the ortho isomer can cyclize and clinically cause OrganoPhosphateInducedDelayedNeurotoxicity (OPIDN); the meta and para isomers of tri-cresyl phosphate are not neuropathic because they are unable to form stable cyclic saligenin phosphate esters."

Our news editors obtained a quote from the research from Florida International University. "This review identifies the diverse biological effects associated with various cyclic and caged phosphates and phosphonates and their possible use. Cyclic compounds that inhibit acetylcholine esterase (AChE), such as salithion, can be employed as pesticides. Others are neurotoxic, most probably because of inhibition of neuropathy target esterase (NTE). Cyclic phosphates that inhibit lipases, the cyclipostins, possibly represent promising therapeutic avenues for the treatment of type 2 diabetes mellitus and/or microbial infections; those compounds inhibiting -lactamase may prevent bacterial resistance against -lactam antibiotics. Naturally occurring cyclic phosphates, such as cyclic AMP, cyclic phosphatidic acid and the ryanodine receptor modulator cyclic adenosine diphosphate ribose, play an important physiological role in signal transduction. Moreover, some cyclic phosphates are GABA-antagonists, while others are an essential component of Molybdenum-containing enzymes. Some cyclic phosphates (cyclophosphamide, ifosfamide) are clinically used in tumor therapy, while the coupling of therapeutic agents with other cyclic phosphates (HepDirect ® Technology) allows drugs to be targeted to specific organs."

According to the news editors, the research concluded: "Possible clinical
applications of these compounds are considered."

The news editors report that additional information may be obtained by contacting G.A. Petroianu, Florida International University, Dept. of Cellular Biol & Pharmacol, Herbert Wertheim Coll Med, Miami, FL 33199, United States. Additional authors for this research include A. Stegmeier-Petroianu and G.A. Petroianu.

*Heart Disorders and Diseases - Heart Failure*

**Researchers at Florida International University Target Heart Failure (Left ventricular area on non-contrast cardiac computed tomography as a predictor of incident heart failure The Multi-Ethnic Study of Atherosclerosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Failure. According to news reporting out of Miami, Florida, by NewsRx editors, research stated, "The use of non-contrast cardiac computed tomography measurements to predict heart failure (HF) has not been studied. In the present study we evaluated the prognostic value of left ventricular area adjusted for the body surface area (LVA-BSA) measured by non-contrast cardiac CT to predict incident HF and cardiovascular disease (CVD) events."

Our news journalists obtained a quote from the research from Florida International University, "We studied left ventricular dimensions and calculated LVA-BSA in 6781 participants of the MESA study (mean age: was 62 +/- 10 years, 53% females; 62% non-white) free from prior HF who underwent non-contrast cardiac CT to evaluate the coronary artery calcium score (CAC) at baseline and were followed up for a median of 10.2 years. During follow up, 237 (3.5%) incident HF and 475 (7.0%) CVD events occurred. After adjustment for clinical variables and CAC, LVA-BSA was significantly associated with incident HF (hazard ratio [HR]: 1.10 per 100 mm²/m², p < 0.001) and CVD events (HR: 1.07 per 100 mm²/m², p < 0.001). The area under the ROC curve for the prediction of incident HF improved from 0.787 on a model including only risk factors to 0.798 when CAC was added (p = 0.02), and to 0.816 with the additional inclusion of LVA-BSA (p = 0.007). Similar improvements for the prediction of CVD events were noted."

According to the news editors, the research concluded: "In an ethnically diverse population of asymptomatic individuals free from baseline CVD or HF, the left ventricular area measured by non-contrast cardiac CT is a strong predictor of incident HF events beyond
traditional risk factors and CAC score."

Our news journalists report that additional information may be obtained by contacting K. Nasir, Florida International University, Robert Stempel Coll Public Hlth & Social Work, Dept. of Epidemiol, Miami, FL 33199, United States. Additional authors for this research include R. **Lung Diseases and Conditions - Pulmonary...**

**Researchers at Fourth Military Medical University Report New Data on Pulmonary Hypertension (Role of dynorphin in hypoxic pulmonary hypertension)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Pulmonary Hypertension have been published. According to news originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "Previously study showed kappa-opioid receptor stimulation with exogenous kappa-opioid receptor agonist elicited a protective effect against hypoxic pulmonary hypertension (HPH). However, the effect of endogenous kappa-opioid receptor agonist dynorphin A on HPH remains unclear."

Funders for this research include National Natural Science Foundation of China, Shaanxi Province.

Our news journalists obtained a quote from the research from Fourth Military Medical University, "This study was to determine the role of dynorphin in HPH. Hypoxia for 2 weeks induced HPH. Compared with the HPH group, the HPH + nor-BNI (a selective kappa-opioid receptor antagonist) group showed a significant increase in mean pulmonary arterial pressure (mPAP). Exogenous treatment with dynorphin A 1-13 significantly decreased mPAP in HPH rat. In addition, we evaluated the effect of exogenous kappa-opioid receptor agonist dynorphin A on HPH remains unclear."

Funders for this research include National Natural Science Foundation of China, Shaanxi Province.
that of U50,488H. Dynorphin A 1-13 inhibited the proliferation of pulmonary artery smooth muscle cells (PASMCs) during hypoxia, which was blocked by nor-BNI. kappa-opioid receptor expression increased in PASMCs in both normoxia exposed to dynorphin A 1-13 and during hypoxia. Hypoxia-induced increase was enhanced by dynorphin A 1-13 and abolished by nor-BNI."

According to the news editors, the research concluded: "Endogenous dynorphin A released in the early stage of hypoxia plays a protective effect against HPH via stimulation of kappa-opioid receptor."

For more information on this research see: Role of dynorphin in hypoxic pulmonary hypertension. European Journal of Pharmacology, 2016;791():78-84. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Oncology - Glioblastomas

Researchers at Fourth Military Medical University Target Glioblastomas (Toosendanin Exerts an Anti-Cancer Effect in Glioblastoma by Inducing Estrogen Receptor beta-and p53-Mediated Apoptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Glioblastomas. According to news reporting originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "Glioblastoma (GBM) is the most common primary brain tumor with median survival of approximately one year. This dismal poor prognosis is due to resistance to currently available chemotherapeutics; therefore, new cytotoxic agents are urgently needed."

Our news editors obtained a quote from the research from Fourth Military Medical University, "In the present study, we reported the cytotoxicity of toosendanin (TSN) in the GBM U87 and C6 cell lines in vitro and in vivo. By using the MTT (3-(4,5-dimethyl-2-thiazolyl)-2,5-diphenyl-2-H-tetrazolium bromide) assay, flow cytometry analysis, and Western blot, we found that TSN inhibited U87 and C6 cell proliferation and induced apoptosis at a concentration as
low as 10 nM. Administration of TSN also reduced tumor burden in a xenograft model of athymic nude mice. Pharmacological and molecular studies suggested that estrogen receptor beta (ER beta) and p53 were prominent targets for TSN. GBM cell apoptosis induced by TSN was a stepwise biological event involving the upregulation of ER beta and contextual activation of functional p53. Collectively, our study indicates, for the first time, that TSN is a candidate of novel anti-cancer drugs for GBM."

According to the news editors, the research concluded: "Furthermore, ER beta and p53 could act as predictive biomarkers for the sensitivity of cancer to TSN."

For more information on this research see: Toosendanin Exerts an Anti-Cancer Effect in Glioblastoma by Inducing Estrogen Receptor beta-and p53-Mediated Apoptosis. International Journal of Molecular Sciences, 2016;17(11):2331-2345. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news editors report that additional information may be obtained by contacting L. Cao, Fourth Military Medical University, Xijing Hosp, Dept. of Tradit Chinese Med, Xian 710032, People's Republic of China. Additional authors for this research include D.D. Qu, H. Wang, S.M. Oncology - Cancer Epidemiology

Researchers at Free University Have Reported New Data on Cancer Epidemiology (Quantitative and qualitative assessment of real world data comparative effectiveness research of systemic therapies in lung oncology: A systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Epidemiology. According to news reporting from Amsterdam, Netherlands, by NewsRx journalists, research stated, "The growing interest in comparative effectiveness research (CER) based on data from routine clinical practice also extends towards lung oncology. Although CER studies using real world data (RWD) have the potential to assist clinical decision-making, concerns about the quality and validity of studies with observational data persist."

The news correspondents obtained a quote from the research from Free University, "The primary objective of the present study is to assess the current status of observational CER in the field of lung oncology, both quantitatively as qualitatively. We performed a systematic electronic literature database search in MEDLINE and EMBASE (up to 1 July 2015). The quality of all selected studies was assessed according to the Good ReseArch for Comparative Effectiveness (GRACE) checklist. The first selection included 657 publications. After screening the corresponding abstracts and full-text papers, 38 studies remained. A total of 36 studies included patients with advanced NSCLC. The comparison of the effectiveness of gefitinib versus erlotinib was the main objective in 22% of the studies. The median number of patients

Oncology - Chronic Myelomonocytic Leukemia

Researchers at French National Institute of Health and Medical Research (INSERM) Describe Findings in Chronic Myelomonocytic Leukemia (Mutation allele burden remains unchanged in chronic myelomonocytic leukaemia responding to hypomethylating ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Chronic Myelomonocytic Leukemia is the subject of a report. According to news reporting originating from Villejuif, France, by NewsRx correspondents, research stated, "The cytidine analogues azacytidine and 5-aza-2'-deoxycytidine (decitabine) are commonly used to treat myelodysplastic syndromes, with or without a myeloproliferative component. It remains unclear whether the response to these hypomethylating agents results from a cytotoxic or an epigenetic effect."

Our news editors obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "In this study, we address this question in chronic myelomonocytic leukaemia. We describe a comprehensive analysis of the mutational landscape of these tumours, combining whole-exome and whole-genome sequencing. We identify an average of 14?5 somatic mutations in coding sequences of sorted monocyte DNA and the signatures of three mutational processes. Serial sequencing demonstrates that the response to hypomethylating agents is associated with changes in DNA methylation and gene
expression, without any decrease in the mutation allele burden, nor prevention of new genetic alteration occurrence."

According to the news editors, the research concluded: "Our findings indicate that cytosine analogues restore a balanced haematopoiesis without decreasing the size of the mutated clone, arguing for a predominantly epigenetic effect."

For more information on this research see: Mutation allele burden remains unchanged in chronic myelomonocytic leukaemia responding to hypomethylating agents. Nature Communications, 2016;7():10767. (Nature Publishing Group - www.nature.com/; Nature Communications - www.nature.com/ncomms/)

Nephrology

Researchers at French National Institute of Health and Medical Research (INSERM) Report New Data on Nephrology (Treatment of Acute Renal Colic in US and French EDs: Simulated Cases and Real Cases in Acute Pain Management)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nephrology is the subject of a report. According to news reporting out of Toulouse, France, by NewsRx editors, research stated, "To assess the prescribing patterns in acute renal colic in emergency departments in US and France, by comparing physicians' intended prescription practices with actual prescription data in a sample of emergency practitioners. Pharmaco-epidemiological international study in two phases."

Our news journalists obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "First, we surveyed emergency physicians in US and France as to what analgesics they would use for simulated cases of renal colic. We then conducted a retrospective review of actual cases of emergency department patients with pain scores \( \geq 6/10 \) with acute renal colic during a period of 6 months before the survey. We compared nonsteroidal anti-inflammatory drugs (NSAIDs) and opioids used for pain treatment in the two groups, and the differences between the two countries. One hundred six prescribers and 100 patients were included in the study. Comparison between simulated and real cases showed that NSAIDs and opioids were less frequently prescribed in real life (78% vs 99% and 51% vs 100% respectively). Morphine was the most prescribed opioid (96% of simulated cases and 34% of real ones). Acetaminophen use was increased in real life cases (58% vs 0%). Concerning the differences between countries, US physicians are more likely to administer
morphine (64% vs 38%) and French physicians NSAIDs (88% vs 68%). The NSAIDs used are ketorolac in the United States (94% of simulated cases vs 64%) and ketoprofen in France (94% and 88% respectively). We showed clear differences between intended and real analgesic prescription practices for patients suffering from renal colic."

According to the news editors, the research concluded: "Some differences exist for pain perceptions and treatments between US and France."

Our news journalists report that additional information may be obtained by contacting V. Bounes, INSERM UMR 1027 Toulouse, Unite Rech Pharmacoepidemiol, Toulouse, France. Additional authors for this research include B. Valle, F. Concina, D. Lauque, J.L. Ducasse and J.A. Edlow.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajem.2016.06.107. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Liver Cancer**

**Researchers at Fudan University Describe Findings in Liver Cancer (Shizukaol D, a Dimeric Sesquiterpene Isolated from Chloranthus serratus, Represses the Growth of Human Liver Cancer Cells by Modulating Wnt Signalling Pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Natural products have become sources of developing new drugs for the treatment of cancer. To seek candidate compounds that inhibit the growth of liver cancer, components of Chloranthus serratus were tested."

The news correspondents obtained a quote from the research from Fudan University, "Here, we report that shizukaol D, a dimeric sesquiterpene from Chloranthus serratus, exerted a growth inhibition effect on liver cancer cells in a dose-and time-dependent manner. We demonstrated that shizukaol D induced cells to undergo apoptosis. More importantly, shizukaol D attenuated Wnt signalling and reduced the expression of endogenous Wnt target genes, which resulted in decreased expression of b-catenin."

According to the news reporters, the research concluded: "Collectively, this study demonstrated that shizukaol D inhibited the growth of liver cancer cells by modulating Wnt
pathway."

Our news journalists report that additional information may be obtained by contacting L. Tang, State Key Laboratory of Genetic Engineering, School of Life Sciences, Fudan University, Shanghai, People's Republic of China. Additional authors for this research include H. Zhu, X. Yang, F. Xie, J. Peng, D. Jiang, J. Xie, M. Qi and L. Yu.

**Oncology - Pancreatic Cancer**

**Researchers at Fudan University Discuss Findings in Pancreatic Cancer (Nab-Paclitaxel Plus S-1 Shows Increased Antitumor Activity in Patient-Derived Pancreatic Cancer Xenograft Mouse Models)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Pancreatic Cancer.

According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "To investigate the antitumor activity of nanoparticle albumin-bound paclitaxel (nab-paclitaxel) plus S-1 in patient-derived pancreatic cancer xenograft mouse models and to explore biomarkers that could predict drug efficacy. Ten patient-derived xenograft models were established."

The news reporters obtained a quote from the research from Fudan University, "The third-generation tumor-bearing mice were randomized into 4 treatment groups: (1) control; (2) S-1; (3) nab-paclitaxel; (4) S-1 plus nab-paclitaxel. Resected tumors were tested by immunohistochemistry for the expression of thymidylate synthase, orotate phosphoribosyltransferase (OPRT), dihydropyrimidine dehydrogenase (DPD), secreted protein that is acidic and rich in cysteine, human epidermal growth factor receptor 2 (HER2), collagen-1, and CD31. Tumor growth inhibition of the S-1 group, nab-paclitaxel group, and combination group was 69.52%, 86.63%, 103.56%, respectively (p <0.05). The efficacy of S-1 is better in thymidylate synthase-negative, OPRT-positive, and DPD-negative tumors. The efficacy of nab-paclitaxel is better in HER2-positive tumors. Collagen-1 was decreased and CD31 was increased in tumors treated with nab-paclitaxel and S-1 plus nab-paclitaxel compared with control or S-1. This preclinical study showed that S-1 plus nab-paclitaxel exerted significantly better antitumor activity than S-1 or nab-paclitaxel alone."

According to the news reporters, the research concluded: "Thymidylate synthase, OPRT, and DPD were possibly biomarkers of S-1 and HER2 of nab-paclitaxel."

For more information on this research see: Nab-Paclitaxel Plus S-1 Shows Increased Antitumor Activity in Patient-Derived Pancreatic Cancer Xenograft Mouse Models. *Pancreas,*
Researchers at Fudan University Release New Data on Atrial Fibrillation (Contact force-guided catheter ablation for the treatment of atrial fibrillation: a meta-analysis of randomized, controlled trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Atrial Fibrillation are presented in a new report. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Contact force (CF) sensing technology allows real-time monitoring during catheter ablation for atrial fibrillation (AF). However, the effect of CF sensing technology on procedural parameters and clinical outcomes still needs clarification."

The news correspondents obtained a quote from the research from Fudan University, "Because of the inconsistent results thus far in this area, we performed a meta-analysis to determine whether CF sensing technology can improve procedural parameters and clinical outcomes for the treatment of AF. Studies examining the benefits of CF sensing technology were identified in English-language articles by searching the MEDLINE, Web of Science, and Cochrane Library databases (inception to May 2015). Ten randomized, controlled trials involving 1834 patients (1263 males, 571 females) were included in the meta-analysis (681 in the CF group, 1153 in the control group). Overall, the ablation time was significantly decreased by 7.34 min (95%CI=-12.21 to -2.46; p=0.003, Z test) in the CF group compared with the control group. CF sensing technology was associated with significantly improved freedom from AF after 12 months (OR=1.55, 95%CI=1.20 to 1.99; p=0.0007) and complications were significantly lower in the CF group than in the control group (OR=0.50, 95%CI=0.29 to 0.87; p=0.01). However, fluoroscopy time analysis showed no significantly decreased trend associated with CF-guided catheter ablation (weighted mean difference: -2.59; 95%CI=-9.06 to 3.88; p=0.43). The present meta-analysis shows improvement in ablation time and freedom from AF after 12 months in AF patients treated with CF-guided catheter ablation."

According to the news reporters, the research concluded: "However, CF-guided catheter ablation does not decrease fluoroscopy time."
For more information on this research see: Contact force-guided catheter ablation for the treatment of atrial fibrillation: a meta-analysis of randomized, controlled trials. *Brazilian Journal of Medical and Biological Research*, 2016;49(3):

Our news journalists report that additional information may be obtained by contacting Z. Qi, Dept. of Cardiology, Huashan Hospital, Fudan University, Shanghai, People's Republic of China. Additional authors for this research include X. Luo, B. Wu, H. Shi, B. Jin and Z. Wen.

**Chemistry - Cell Biochemistry**

**Researchers at Fudan University Release New Data on Cell Biochemistry (Imbalance of Th17/Treg in Different Subtypes of Autoimmune Thyroid Diseases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Chemistry - Cell Biochemistry are discussed in a new report. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "To clarify the imbalance of Th17/Treg in different subtypes of autoimmune thyroid diseases (AITDs) including Graves' disease(GD), Hashimoto's thyroiditis (HT) and Graves' ophthalmopathy (GO). 47 patients with AITD (including 16 GD, 15 HT, and 16 GO) and 12 healthy controls were enrolled in this study."

The news correspondents obtained a quote from the research from Fudan University, "The percentages of Th17 and Treg cells, the ratio of Th17/Treg, as well as their related transcription factors RORyt and Foxp3 mRNA in peripheral blood mononuclear cells (PBMCs) were measured by flow cytometry and real-time quantitative PCR Results: Compared with those in control group, the percentage of CD41L-17'T cell(Th17) and the mRNA expression of its transcription factor RORyt were higher in PBMCs of AITDs (P <0.05), particularly in HT subgroup (P <0.01). The percentage of CD4+ Foxp(3+) T (Treg) cells and its transcription factor Foxp3 mRNA were significantly decreased in PBMCs of GD (P <0.05). In addition, the ratio of Th17/Treg was elevated in AITD group and GO subgroup (P <0.01). In GO subgroup, the patients with clinical activity score (CAS) above 4.5 had higher percentages of Th17 than those with CAS ranging from 3 to 4.5 (P <0.05)."

According to the news reporters, the research concluded: "Increased Th17 lymphocytes may play a more important role in the pathogenesis of HT and GO while decreased Treg may be greatly involved in GD."

For more information on this research see: Imbalance of Th17/Treg in Different Subtypes of Autoimmune Thyroid Diseases. *Cellular Physiology and Biochemistry*, 2016;40(1-2):245-252. *Cellular Physiology and Biochemistry* can be contacted at: Karger,
Researchers at Fudan University Release New Data on Gliomas (Amino Acid Metabolism Abnormality and Microenvironment Variation Mediated Targeting and Controlled Glioma Chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Gliomas. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Energy metabolism abnormality is one of the most significant hallmarks of cancer. As a result, large amino acid transporter 1 (LAT1) is remarkably overexpressed in both blood-brain-barrier and glioma tumor cells, leading a rapid and sufficient substrate transportation. 3CDIT and 4CDIT are originally synthesized by modifying the existing most potent LAT1 substrate. 3CDIT is selected as its higher glioma-targeting ability."

Funders for this research include National Basic Research Program of China, Distinguished Young Scholars, National Natural Science Foundation of China.

Our news editors obtained a quote from the research from Fudan University, "Since the microenvironment variation in tumor cells is another important feature of cancer, a great disparity in adenosine-5'-triphosphate (ATP) and glutathione (GSH) levels between extracellular and intracellular milieu can provide good possibilities for dual-responsive drug release in tumor cells. Doxorubicin (DOX) is successfully intercalated into the ATP aptamer DNA scaffolds, compressed by GSH-responsive polymer pOEI, and modified with 3CDIT to obtain 3CDIT-targeting pOEI/DOX/ATP aptamer nanoparticles (NPs). Enhanced NP accumulation and rapid GSH & ATP dual-responsive DOX release in glioma are demonstrated both in vitro and in vivo. More efficient therapeutic effects are shown with 3CDIT-targeting pOEI/DOX/ATP aptamer NPs than free DOX and no systemic toxicity is observed."

According to the news editors, the research concluded: "Therefore, glioma-targeting delivery and GSH & ATP dual-responsive release guarantee an adequate DOX accumulation within tumor cells and ensure a safe and efficient chemotherapy for glioma."

For more information on this research see: Amino Acid Metabolism Abnormality and Microenvironment Variation Mediated Targeting and Controlled Glioma Chemotherapy. Small, 2016;12(40):5633-5645. Small can be contacted at: Wiley-V C H Verlag GmbH, Postfach
Researchers at Fudan University Report New Data on Cancer Risk
(Protective effect of mild endoplasmic reticulum stress on radiation-induced bystander effects in hepatocyte cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Risk. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Radiation-induced bystander effect (RIBE) has important implications for secondary cancer risk assessment during cancer radiotherapy, but the defense and self-protective mechanisms of bystander normal cells are still largely unclear. The present study found that micronuclei (MN) formation could be induced in the non-irradiated HL-7702 hepatocyte cells after being treated with the conditioned medium from irradiated hepatoma HepG2 cells under either normoxia or hypoxia, where the ratio of the yield of bystander MN induction to the yield of radiation-induced MN formation under hypoxia was much higher than that of normoxia."

Our news journalists obtained a quote from the research from Fudan University, "Nonetheless, thapsigargin induced endoplasmic reticulum (ER) stress and dramatically suppressed this bystander response manifested as the decrease of MN and apoptosis inductions. Meanwhile, the interference of BiP gene, a major ER chaperone, amplified the detrimental RIBE. More precisely, thapsigargin provoked ER sensor of PERK to initiate an instantaneous and moderate ER stress thus defensed the hazard form RIBE, while BiP depletion lead to persistently destroyed homeostasis of ER and exacerbated cell injury."

According to the news editors, the research concluded: "These findings provide new insights that the mild ER stress through BiP-PERK-p-eIF2 alpha signaling pathway has a profound role in protecting cellular damage from RIBE and hence may decrease the potential secondary cancer risk after cancer radiotherapy."

Researchers at Fundeni Clinical Institute Have Reported New Data on
Cell Transplants (Haploidentical Donors: Can Faster Transplantation Be
Life-Saving for Patients with Advanced Disease?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Cell Transplants. According to news reporting out of Bucharest, Romania, by NewsRx editors, research stated, "Haploidentical stem cell transplantation is a therapeutic option for patients without an HLA-matched donor. It is increasingly being used worldwide due to the application of posttransplantation cyclophosphamide and is associated with lower incidence of graft-versus-host disease and treatment-related mortality."

Our news journalists obtained a quote from the research from Fundeni Clinical Institute, "Haploidentical donors are generally available for most patients and stem cells can be rapidly obtained. Delays in transplantation while waiting for unrelated donor cells can be potentially problematic for patients with advanced disease at risk for progression; thus, the use of haploidentical donors, especially in this setting, can be life-saving."

According to the news editors, the research concluded: "Here we reviewed the literature on haploidentical stem cell transplantation performed with posttransplantation cyclophosphamide."

Our news journalists report that additional information may be obtained by contacting A. Tanase, Dept. of Stem Cell Transplantation, Fundeni Clinical Institute, Bucharest, Romania. Additional authors for this research include C. Tomuleasa, A. Marculescu, A. Bardas, A. Colita, C. Orban and S.O Ciurea.

Researchers at General Hospital Report New Data on Clinical Therapeutics (Nemonoxacin has potent activity against gram-positive, but not gram-negative clinical isolates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Clinical Therapeutics are discussed in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "The aim of the current study was to analyze the susceptibility of gram-positive and -negative clinical isolates to a novel des-F(6)-quinolone (nemonoxacin) and other selected antimicrobial agents. Minimal inhibitory concentrations (MICs) were determined by the agar plate dilution method according to NCCLs."

The news correspondents obtained a quote from the research from General Hospital, "Nemonoxacin exhibited greater antimicrobial activity than other quinolones, such as ciprofloxacin, levofloxacin, and moxifloxacin, and other antimicrobials when tested against selected gram-positive organisms. This non-fluorinated quinolone was especially active against streptococci and staphylococci, including multi-resistant Streptococcus pneumoniae and methicillin-resistant Staphylococcus aureus (MRSA). Compared with ciprofloxacin, levofloxacin, and moxifloxacin, and other antimicrobials, nemonoxacin was not highly active against all tested gram-negative clinical isolates, with an MIC90 of 8-32 mg/mL. Nemonoxacin has powerful antibacterial activity against gram-positive strains and has value in treating quinolone-resistant clinical isolates of MSSA, MRSA, and S. pneumoniae infections."

According to the news reporters, the research concluded: "Nemonoxacin should not be the first choice to treat gram-negative clinical isolate infections."

For more information on this research see: Nemonoxacin has potent activity against gram-positive, but not gram-negative clinical isolates. La Clinica Terapeutica, 2015;166 (6):e374-80.

Our news journalists report that additional information may be obtained by contacting Z.X. Li, Dept. of Respiratory Diseases, Second Artillery General Hospital, Beijing 100088, People's Republic of China. Additional authors for this research include Y.N. Liu, R. Wang and A.M Li.

Keywords for this news article include: Asia, Beijing, Drugs and Therapies, Clinical Therapeutics, People's Republic of China.

Bone Research

Researchers at Goethe-University Have Reported New Data on Bone Research (Low-dose irradiation prior to bone marrow transplantation results in ATM activation and increased lethality in Atm-deficient mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Bone Research is the subject of a report. According to news reporting originating in Frankfurt, Germany, by NewsRx journalists, research stated,
"Ataxia telangiectasia is a genetic instability syndrome characterized by neurodegeneration, immunodeficiency, severe bronchial complications, hypersensitivity to radiotherapy and an elevated risk of malignancies. Repopulation with ATM-competent bone marrow-derived cells (BMDCs) significantly prolonged the lifespan and improved the phenotype of Atm-deficient mice."

The news reporters obtained a quote from the research from Goethe-University, "The aim of the present study was to promote BMDC engraftment after bone marrow transplantation using low-dose irradiation (IR) as a co-conditioning strategy. Atm-deficient mice were transplanted with green fluorescent protein-expressing, ATM-positive BMDCs using a clinically relevant non-myeloablative host-conditioning regimen together with TBI (0.2-2.0 Gy). IR significantly improved the engraftment of BMDCs into the bone marrow, blood, spleen and lung in a dose-dependent manner, but not into the cerebellum. However, with increasing doses, IR lethality increased even after low-dose IR. Analysis of the bronchoalveolar lavage fluid and lung histochemistry revealed a significant enhancement in the number of inflammatory cells and oxidative damage. A delay in the resolution of g-H2AX-expression points to an insufficient double-strand break repair capacity following IR with 0.5 Gy in Atm-deficient splenocytes. Our results demonstrate that even low-dose IR results in ATM activation."

According to the news reporters, the research concluded: "In the absence of ATM, low-dose IR leads to increased inflammation, oxidative stress and lethality in the Atm-deficient mouse model."

For more information on this research see: Low-dose irradiation prior to bone marrow transplantation results in ATM activation and increased lethality in Atm-deficient mice. *Bone Marrow Transplantation*, 2016;51(4):560-7. *Bone Marrow Transplantation* can be contacted at: Nature Publishing Group, 345 Park Avenue South, New York, NY 10010-1707, USA. **Oncology - Non-Small Cell Lung Cancer**

**Researchers at Graduate School of Medicine Report New Data on Non-Small Cell Lung Cancer (miR-200/ZEB axis regulates sensitivity to nintedanib in non-small cell lung cancer cells)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Non-Small Cell Lung Cancer. According to news reporting out of Bunkyo ku, Japan, by NewsRx editors, research stated, "Nintedanib (BIBF1120) is a multi-targeted angiokinase inhibitor and has been evaluated in idiopathic pulmonary fibrosis and advanced non-small cell lung cancer (NSCLC) patients in clinical studies. In the present study, we evaluated the antitumor effects of nintedanib in 16 NSCLC cell lines and tried to identify microRNA (miRNA) associated with sensitivity to nintedanib."

Our news journalists obtained a quote from the research from the Graduate School of Medicine, "No correlations between FGFR, PDGFR and VEGFR family activation and sensitivity to nintedanib were found. The difference in miRNA expression profiles between 5 nintedanib-sensitive and 5 nintedanib-resistant cell lines was evaluated by miRNA array and quantitative RT-PCR analysis (qRT-PCR). Expression of miR-200b, miR-200a and miR-141 belonging to the miR-200 family which contributes to epithelial-mesenchymal transition (EMT), was significantly lower in 5 nintedanib-resistant than in 5 nintedanib-sensitive cell lines. We examined the protein expression of EMT markers in these 10 NSCLC cell lines. E-cadherin expression was lower, and vimentin and ZEB1 expression were higher in 5 nintedanib-resistant cell lines. PC-1 was the most sensitive of the NSCLC cell lines to nintedanib. We established nintedanib-resistant PC-1 cells (PC-1R) by the stepwise method. PC-1R cells also showed decreased expression of miR-200b, miR-141 and miR-429 and increased expression of ZEB1 and ZEB2. We confirmed that induction of miR-200b or miR-141 enhanced sensitivity to nintedanib in nintedanib-resistant A549 and PC1-R cells. In addition, we evaluated the response to gefitinib in combination with nintedanib after TGF-b1 exposure of A549 cells. Nintedanib was able to reverse TGF-b1-induced EMT and resistance to gefitinib caused by miR-200b and miR-141 upregulation and ZEB1 downregulation. These results suggested that the miR-200/ZEB axis might be predictive biomarkers for sensitivity to nintedanib in NSCLC cells."

According to the news editors, the research concluded: "Furthermore, nintedanib combined with gefitinib might be a novel therapeutic strategy for NSCLC cells with EMT phenotype and resistance to gefitinib."

For more information on this research see: miR-200/ZEB axis regulates sensitivity to nintedanib in non-small cell lung cancer cells. International Journal of Oncology, 2016;48 (3):937-44.

Researchers at Guilin Medical University Report New Data on Apoptosis (Bauhinia championii Flavone Attenuates Hypoxia-Reoxygenation Induced Apoptosis in H9c2 Cardiomyocytes by Improving Mitochondrial Dysfunction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Apoptosis. According to news reporting out of Guangxi, People's Republic of China, by NewsRx editors, research stated, "This study aimed to determine the effects of Bauhinia championii flavone (BCF) on hypoxia-reoxygenation (H/R) induced apoptosis in H9c2 cardiomyocytes and to explore potential mechanisms. The H/R model in H9c2 cardiomyocytes was established by 6 h of hypoxia and 12 h of reoxygenation."

Our news journalists obtained a quote from the research from Guilin Medical University, "Cell viability was detected by CCK-8 assay. Apoptotic rate was measured by Annexin V/PI staining. Levels of mitochondria-associated ROS, mitochondrial transmembrane potential (Delta Psi m) and mitochondrial permeability transition pores (MPTP) opening were assessed by fluorescent probes. ATP production was measured by ATP assay kit. The release of cytochrome c, translocation of Bax, and related proteins were measured by western blotting. Our results showed that pretreatment with BCF significantly improved cell viability and attenuated the cardiomyocyte apoptosis caused by H/R. Furthermore, BCF increased ATP production and inhibited ROS-generating mitochondria, depolarization of Delta Psi m, and MPTP opening. Moreover, BCF pretreatment decreased Bax mitochondrial translocation, cytochrome c release, and activation of caspase-3, as well as increased the expression of p-PI3K, p-Akt, and the ratio of Bcl-2 to Bax. Interestingly, a specific inhibitor of phosphatidylinositol 3-kinase, LY294002, partly reversed the anti-apoptotic effect of BCF."

According to the news editors, the research concluded: "These observations indicated that BCF pretreatment attenuates H/R-induced myocardial apoptosis strength by improving mitochondrial dysfunction via PI3K/Akt signaling pathway."

For more information on this research see: Bauhinia championii Flavone Attenuates Hypoxia-Reoxygenation Induced Apoptosis in H9c2 Cardiomyocytes by Improving Mitochondrial Dysfunction. Molecules, 2016;21(11):736-747. Molecules can be contacted at: Mdpí Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. Researchers at Hallym University Report Findings in Clinical Trial Research (PLK-1 Targeted Inhibitors and Their Potential against Tumorigenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Trial Research. According to news reporting originating from Gangwon Do, South Korea, by NewsRx correspondents, research stated, "Mitotic kinases are the key components of the cell cycle machinery and play vital roles in cell cycle progression. PLK-1 (Polo-like kinase-1) is a crucial mitotic protein kinase that plays an essential role in both the onset of G2/M transition and cytokinesis."

Funders for this research include National Research Foundation of Korea, Hallym University.

Our news editors obtained a quote from the research from Hallym University, "The overexpression of PLK-1 is strongly correlated with a wide spectrum of human cancers and poor prognosis. The (si)RNA-mediated depletion of PLK-1 arrests tumor growth and triggers apoptosis in cancer cells without affecting normal cells. Therefore, PLK-1 has been selected as an attractive anticancer therapeutic drug target. Some small molecules have been discovered to target the catalytic and noncatalytic domains of PLK-1. These domains regulate the catalytic activation and subcellular localization of PLK-1. However, while PLK-1 inhibitors block tumor growth, they have been shown to cause severe adverse complications, such as toxicity, neutropenia, and bone marrow suppression during clinical trials, due to a lack of selectivity and specificity within the human kinome. To minimize these toxicities, inhibitors should be tested against all protein kinases in vivo and in vitro to enhance selectivity and specificity against targets."

According to the news editors, the research concluded: "Here, we discuss the potency and selectivity of PLK-1-targeted inhibitors and their molecular interactions with PLK-1 domains."

For more information on this research see: PLK-1 Targeted Inhibitors and Their Potential against Tumorigenesis. Biomed Research International, 2015;2015():705745.

The news editors report that additional information may be obtained by contacting S. Kumar, Dept. of Biochemistry, Institute of Cell Differentiation and Aging, College of Medicine, Hallym University, Chuncheon, Gangwon-do 200-702, South Korea.

Oncology - Breast Cancer

Researchers at Harbin Medical University Describe Findings in Breast Cancer (Identifying the crosstalk of dysfunctional pathways mediated by lncRNAs in breast cancer subtypes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting from Harbin, People's Republic of China, by NewsRx journalists, research stated, "Crosstalk among abnormal pathways widely occurs in human cancer and generally leads to insensitivity to cancer treatment. How long non-coding RNAs (lncRNAs) participate in the regulation of an abnormal pathway crosstalk in human cancer is largely unknown."

The news correspondents obtained a quote from the research from Harbin Medical University, "Here, we proposed a strategy that integrates mRNA and lncRNA expression profiles for systematic identification of lncRNA-mediated crosstalk among risk pathways in different breast cancer subtypes. We identified 12 to 44 crosstalking pathway pairs mediated by 28 to 49 lncRNAs in four breast cancer subtypes. An LncRNA-mediated crosstalking pathway network in each breast cancer subtype was then constructed. We observed a number of breast cancer subtype-specific crosstalks of risk pathways. These subtype-specific lncRNA-mediated pathway crosstalks largely determined subtype-selective functions. Notably, we observed that lncRNAs mediated the crosstalk of pathways by cooperating with known important protein-coding genes, which play core roles in the deterioration of breast cancer. And we also identified key lncRNAs contributing to the crosstalk network in each subtype. As an example, the low expression of LIFR-AS1 was associated with poor survival in LumB subtype, and its cooperated genes IL1R and TGFBR located at the most upstream of the MAPK signaling pathway shared a common cascade path (p38 MAPKs-MEF2C) that can result in proliferation, differentiation and apoptosis."

According to the news reporters, the research concluded: "In summary, we offer an effective way to characterize complex crosstalks mediated by lncRNAs in breast cancer subtypes, which can be applied to other diseases and provide useful information for understanding the pathogenesis of human cancer."

For more information on this research see: Identifying the crosstalk of dysfunctional pathways mediated by lncRNAs in breast cancer subtypes. Molecular Biosystems, 2016;12 (3):711-20. (Royal Society of Chemistry - pubs.rsc.org/en/journals/journalissues/mb)

Researchers at Hartford Hospital Release New Data on Antibiotics
(Pharmacodynamic and pharmacokinetic profiling of delafloxacin in a murine lung model against community-acquired respiratory tract pathogens)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antibiotics is now available. According to news reporting from Hartford, Connecticut, by NewsRx journalists, research stated, "Increasing antimicrobial resistance in community-acquired pneumonia (CAP) pathogens has contributed to infection-related morbidity and mortality. Delafloxacin is a novel fluoroquinolone with broadspectrum activity against Gram-positive and-negative organisms, including Streptococcus pneumoniae and methicillin-resistant Staphylococcus aureus (MRSA)."

The news correspondents obtained a quote from the research from Hartford Hospital, "This study aimed to define the pharmacodynamic profile of delafloxacin against CAP pathogens using a neutropenic murine lung infection model. Five S. pneumoniae, 2 methicillin-susceptible S. aureus (MSSA), 2 MRSA and 2 Klebsiella pneumoniae isolates were studied. Delafloxacin doses varied from 0.5 mg/kg/day to 640 mg/kg/day and were given as once-daily to every 3 h regimens over the 24-h treatment period. Efficacy was measured as the change in log(10) CFU at 24 h compared with 0-h controls. Plasma and bronchopulmonary pharmacokinetic studies were conducted. Delafloxacin demonstrated potent in vitro and in vivo activity. Delafloxacin demonstrated high penetration into the lung compartment, as epithelial lining fluid concentrations were substantially higher than free drug in plasma. The ratio of the area under the free drug concentration-time curve to the minimum inhibitory concentration of the infecting organism (fAUC/MIC) was the parameter that best correlated with the efficacy of the drug, and the magnitude required to achieve 1 log(10) CFU reduction was 31.8, 24.7, 0.4 and 9.6 for S. pneumoniae, MRSA, MSSA and K. pneumoniae, respectively. The observed in vivo efficacy of delafloxacin was supported by the high pulmonary disposition of the compound."

According to the news reporters, the research concluded: "The results derived from this pre-clinical lung model support the continued investigation of delafloxacin for the treatment of community-acquired lower respiratory tract infections."

Researchers at Harvard School of Medicine Have Reported New Data on Eosinophilic Esophagitis (Allergic skin sensitization promotes eosinophilic esophagitis through the IL-33-basophil axis in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Eosinophilic Esophagitis. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Eosinophilic esophagitis (EoE) is an allergic inflammatory disorder characterized by accumulation of eosinophils in the esophagus. EoE often coexists with atopic dermatitis, a chronic inflammatory skin disease."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "The impaired skin barrier in patients with atopic dermatitis has been suggested as an entry point for allergic sensitization that triggers development of EoE. We sought to define the mechanisms whereby epicutaneous sensitization through a disrupted skin barrier induces development of EoE. To elicit experimental EoE, mice were epicutaneously sensitized with ovalbumin (OVA), followed by intranasal OVA challenge. Levels of esophageal mRNA for T(H)2 cytokines and the IL-33 receptor II1rl1 (St2) were measured by using quantitative PCR. Esophageal eosinophil accumulation was assessed by using flow cytometry and hematoxylin and eosin staining. In vivo basophil depletion was achieved with diphtheria toxin treatment of Mcpt8(DTR) mice, and animals were repopulated with bone marrow basophils. mRNA analysis of esophageal biopsy specimens from patients with EoE was used to validate our findings in human subjects. Epicutaneous sensitization and intranasal challenge of wild-type mice resulted in accumulation of eosinophils and upregulation of T(H)2 cytokines and St2 in the esophagus. Disruption of the IL-33-ST2 axis or depletion of basophils reduced these features. Expression of ST2 on basophils was required to accumulate in the esophagus and transfer experimental EoE. Expression of IL1RL1/ST2 mRNA was increased in esophageal biopsy specimens from patients with EoE. Topical OVA application on unstripped skin induced experimental EoE in filaggrin-deficient flaky tail (ft/ft) mice but not in wild-type control or ft/ft.St2(-/-) mice."

According to the news editors, the research concluded: "Epicutaneous allergic sensitization promotes EoE, and this is critically mediated through the IL-33-ST2-basophil axis."

For more information on this research see: Allergic skin sensitization promotes eosinophilic esophagitis through the IL-33-basophil axis in mice. Journal of Allergy and Clinical Immunology, 2016;138(5):1367-1380,687-691. Researchers at Harvard School of Medicine Release New Data on Chronic Kidney Disease (Exploring the genetic basis of early-onset chronic kidney disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Kidney Diseases and Conditions - Chronic Kidney Disease have been published. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "The primary causes of chronic kidney disease (CKD) in children differ from those of CKD in adults. In the USA the most common diagnostic groups of renal disease that manifest before the age of 25 years are congenital anomalies of the kidneys and urinary tract, steroid-resistant nephrotic syndrome, chronic glomerulonephritis and renal cystic ciliopathies, which together encompass >70% of early-onset CKD diagnoses."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "Findings from the past decade suggest that early-onset CKD is caused by mutations in any one of over 200 different monogenic genes. Developments in high-throughput sequencing in the past few years has rendered identification of causative mutations in this high number of genes feasible. Use of genetic analyses in patients with early onset-CKD will provide patients and their families with a molecular genetic diagnosis, generate new insights into disease mechanisms, facilitate aetiology-based classifications of patient cohorts for clinical studies, and might have consequences for personalized approaches to the prevention and treatment of CKD. In this Review, we discuss the implications of next-generation sequencing in clinical genetic diagnostics and the discovery of novel genes in early-onset CKD."

According to the news reporters, the research concluded: "We also delineate the resulting opportunities for deciphering disease mechanisms and the therapeutic implications of these findings."

Our news journalists report that additional information may be obtained by contacting A. Vivante, Dept. of Medicine, Boston Children's Hospital, Harvard Medical School, 300 Longwood Avenue, Boston, Massachusetts 02115, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrneph.2015.205. This DOI is a link to an online electronic document that is either free or for purchase.
Researchers at Harvard School of Medicine Report New Data on Nucleoproteins (Toward development of epigenetic drugs for central nervous system disorders: Modulating neuroplasticity via H3K4 methylation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Proteins - Nucleoproteins is now available. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "The mammalian brain dynamically activates or silences gene programs in response to environmental input and developmental cues. This neuroplasticity is controlled by signaling pathways that modify the activity, localization, and/or expression of transcriptional-regulatory enzymes in combination with alterations in chromatin structure in the nucleus."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Consistent with this key neurobiological role, disruptions in the fine-tuning of epigenetic and transcriptional regulation have emerged as a recurrent theme in studies of the genetics of neurodevelopmental and neuropsychiatric disorders. Furthermore, environmental factors have been implicated in the increased risk of heterogeneous, multifactorial, neuropsychiatric disorders via epigenetic mechanisms. Aberrant epigenetic regulation of gene expression thus provides an attractive unifying model for understanding the complex risk architecture of mental illness. Here, we review emerging genetic evidence implicating dysregulation of histone lysine methylation in neuropsychiatric disease and outline advancements in small-molecule probes targeting this chromatin modification. The emerging field of neuroepigenetic research is poised to provide insight into the biochemical basis of genetic risk for diverse neuropsychiatric disorders and to develop the highly selective chemical tools and imaging agents necessary to dissect dynamic transcriptional-regulatory mechanisms in the nervous system."

According to the news editors, the research concluded: "On the basis of these findings, continued advances may lead to the validation of novel, disease-modifying therapeutic targets for a range of disorders with aberrant chromatin-mediated neuroplasticity."

The news correspondents report that additional information may be obtained from S.J. Haggarty, Harvard Med Sch, Massachusetts General Hospital, Center Human Genet Res, Dept. of PsychiatChem Neurobiol Lab, Boston, MA 02114, United States. Additional authors for this research include J.M. Hooker and S.J. Haggarty.
Researchers at Harvard School of Medicine Target Atherosclerosis (Dendritic Cell KLF2 Expression Regulates T Cell Activation and Proatherogenic Immune Responses)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Dendritic cells (DCs) have been implicated as important regulators of innate and adaptive inflammation in many diseases, including atherosclerosis. However, the molecular mechanisms by which DCs mitigate or promote inflammatory pathogenesis are only partially understood."

Our news editors obtained a quote from the research from the Harvard School of Medicine, "Previous studies have shown an important anti-inflammatory role for the transcription factor Kruppel-like factor 2 (KLF2) in regulating activation of various cell types that participate in atherosclerotic lesion development, including endothelial cells, macrophages, and T cells. We used a pan-DC, CD11c-specific cre-lox gene knockout mouse model to assess the role of KLF2 in DC activation, function, and control of inflammation in the context of hypercholesterolemia and atherosclerosis. We found that KLF2 deficiency enhanced surface expression of costimulatory molecules CD40 and CD86 in DCs and promoted increased T cell proliferation and apoptosis. Transplant of bone marrow from mice with KLF2-deficient DCs into Ldlr(-/-) mice aggravated atherosclerosis compared with control mice, most likely due to heightened vascular inflammation evidenced by increased DC presence within lesions, enhanced T cell activation and cytokine production, and increased cell death in atherosclerotic lesions."

According to the news editors, the research concluded: "Taken together, these data indicate that KLF2 governs the degree of DC activation and hence the intensity of proatherogenic T cell responses."

For more information on this research see: Dendritic Cell KLF2 Expression Regulates T Cell Activation and Proatherogenic Immune Responses. Journal of Immunology, 2016;197(12):4651-4662. Researchers at Health Center Target Heart Attack (Sleep Disruption is Associated with Increased Ventricular Ectopy and Cardiac Arrest in Hospitalized Adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting originating in Newmarket, Canada, by NewsRx journalists, research stated, "To determine whether sleep disruption increases ventricular ectopy and the risk of cardiac arrest in hospitalized patients. Hospital emergency codes (HEC) trigger multiple hospital-wide overhead announcements."

The news reporters obtained a quote from the research from Health Center, "In 2014 an electronic 'code white' program was instituted to protect staff from violent patients. This resulted in an increase in nocturnal HEC. Telemetry data was examined between September 14 and October 2, 2014. The frequency of nocturnal announcements was correlated with changes in frequency of premature ventricular complexes per hour (PVC/h). Cardiac arrest data were examined over a 3-y period. All HEC were assumed to have triggered announcements. The relationship between nocturnal HEC and the incidence of subsequent cardiac arrest was examined. 2,603 hours of telemetry were analyzed in 87 patients. During nights with two or fewer announcements, PVC/h decreased 33% and remained 30% lower the next day. On nights with four or more announcements, PVC/h increased 23% (p <0.001) and further increased 85% the next day (p=0.001). In 2014, following the introduction of the code white program, the frequency of all HEC increased from 1.1/day to 6.2/day (p <0.05). The frequency of cardiac arrest/24 h rose from 0.46/day in 2012-2013 to 0.62/day in 2014 (p=0.001). During daytime hours (06:00-22:00), from 2012 through 2014, the frequency of cardiac arrest following zero, one or at least two nocturnal HEC were 0.331 ± 0.03, 0.396 ± 0.04 and 0.471 ± 0.09 respectively (R(2)=0.99, p=0.03)."

According to the news reporters, the research concluded: "Sleep disruption is associated with increased ventricular ectopy and increased frequency of cardiac arrest."

Our news correspondents report that additional information may be obtained by contacting S.E. Miner, Southlake Regional Health Center, Newmarket, Ontario, Canada. Additional authors for this research include D. Pahal, L. Nichols, A. Darwood, L.E. Nield and Z. Wulffhart.

Researchers at Health Science Center Release New Data on Polycythemia Vera [Diagnosis and Management of Polycythemia Vera in a Ferret (Mustela putorius faro)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Myeloproliferative Diseases and Conditions - Polycythemia Vera. According to news reporting originating from Guelph, Canada, by NewsRx correspondents, research stated, "A 5-y-old female ferret (Mustela putorius faro) was evaluated for diarrhea, anorexia, and lethargy for 1 wk. Only mild dehydration was detected on physical examination."

Our news editors obtained a quote from the research from Health Science Center, "CBC analysis revealed marked erythrocytosis with an unremarkable plasma biochemistry panel; follow-up CBC analyses revealed a consistent primary erythrocytosis. Whole-body radiographs and abdominal ultrasonography were unremarkable except for a small nephrolith in the right kidney and a small cyst in the left kidney. The plasma erythropoietin level was 17.0 mIU/mL and considered normal. In light of the diagnostic work-up and consistent erythrocytosis, a diagnosis of polycythemia vera (primary erythrocytosis) was made. The initial presentation of diarrhea resolved after treatment with oral metronidazole (20 mg/kg PO BID for 7 d). Treatment for the polycythemia consisted of a phlebotomy initially followed by chemotherapy with hydroxyurea (10 mg/kg PO BID). During the subsequent 12 mo, the hydroxyurea dose adjusted according to follow-up CBC results, and finding an optimal dosage regimen proved to be challenging. One year after the initial diagnosis, the ferret presented to an emergency clinic for acute and severe hemorrhagic diarrhea and died shortly thereafter. The postmortem diagnosis was acute venous infarction of the small and large intestine."

According to the news editors, the research concluded: "To our knowledge, this report is the first to describe the diagnosis and long-term management of polycythemia vera in a ferret and the use of hydroxyurea for this purpose."

For more information on this research see: Diagnosis and Management of Polycythemia Vera in a Ferret (Mustela putorius faro). Comparative Medicine, 2016;66(6):463-467. Comparative Medicine can be contacted at: Amer Assoc Laboratory Animal Science, 9190 Crestwyn Hills Dr, Memphis, TN 38125, USA.

The news editors report that additional information may be obtained by contacting H. Beaufrere, Ontario Vet College, Hlth Sci Center, Guelph, ON, Canada. Additional authors for this research include H. Beaufrere, L.L. Bassel, S. Wills, D. Laniesses, S.L. Blois and D.A. Smith.

Keywords for this news article include: Guelph, Ontario, Canada, North and Central America, Heart Disorders and Diseases.
Researchers at Heart Center Report New Data on Acute Coronary Syndrome (Cardiovascular Mortality in Chest Pain Patients: Comparison of Natriuretic Peptides With Novel Biomarkers of Cardiovascular Stress)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Acute Coronary Syndrome is now available. According to news reporting from Hamburg, Germany, by NewsRx journalists, research stated, "Natriuretic peptides are the standard biomarker for risk stratification in cardiovascular disease. Novel biomarkers of cardiovascular stress might allow refinement in risk stratification for patients with acute coronary syndrome (ACS)."

The news correspondents obtained a quote from the research from Heart Center, "We tested the performance of these novel biomarkers for cardiovascular risk stratification in patients who presented with ACS. In the AtheroGene study, 873 patients presented with ACS in the emergency department. Biomarkers measured were: B-type natriuretic peptide (BNP), N-terminal pro BNP (NT-proBNP), midregional proatrial natriuretic peptide, midregional proadrenomedullin (MR-proADM), copeptin, and troponin I. The median follow-up time was 4 years and during this time 50 patients died from cardiac causes. Cox regression analysis for the continuous variables NT-proBNP and BNP showed a hazard ratio (HR) of 1.9 and 1.8, respectively, for 1 SD increase (P < 0.001 and P = 0.003) in the fully adjusted model. Novel biomarkers with MR-proADM had an HR of 3.2, followed by midregional proatrial natriuretic peptide with an HR of 1.9 (both P< 0.001), and copeptin with an HR of 1.6 (P < 0.001). C-index revealed MR-proADM as the best discriminator for identifying patients with the outcome with a C-index = 0.8, and C-index was 0.72 for NT-proBNP (P for comparison = 0.017). Integrated discrimination improvement for MR-proADM was 0.059 compared with NT-proBNP (P = 0.016), thus providing background that MR-proADM was better to identify persons with the outcome. Troponin I levels at the time of admission were not significant for risk stratification. In patients who present with ACS the novel biomarker, MR-proADM was the best predictor for outcome."

According to the news reporters, the research concluded: "MR-proADM adds modest information and is useful for risk prediction in ACS patients."

Our news journalists report that additional information may be obtained by contacting D. Westermann, Univ Heart Center, Dept. of Gen & Intervent Cardiol, Hamburg,
Germany. Additional authors for this research include F. Ojeda, T. Zeller, E. Zengin, H.J. Rupprecht, K.J. Lackner, C. Bickel, S. Blankenberg, R.B. Schnabel and D. Westermann.

Hormones - Gastrointestinal Hormones

**Researchers at Hebei Medical University Target Gastrointestinal Hormones (Cholecystokinin-8 inhibits methamphetamine-induced neurotoxicity via an anti-oxidative stress pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hormones - Gastrointestinal Hormones have been published. According to news originating from Shijiazhuang, People's Republic of China, by NewsRx correspondents, research stated, "As a powerful addictive psychostimulant drug, coupled with its neurotoxicity, methamphetamine (METH) abuse may lead to long-lasting abnormalities in brain structure and function. We found that pretreatment of cholecystokinin-8 (CCK-8) inhibited METH-induced brain cellular dopaminergic (DA) damage in the striatum and substantia nigra, and related behavioural deficits and hyperthermia."

Funders for this research include National Natural Science Foundation of China, Training funds for Talent Project in Hebei Province, Natural Science Foundation of Hebei Province.

Our news journalists obtained a quote from the research from Hebei Medical University, "However, the mechanism of CCK-8 action on METH-induced toxicity is not clear. The aim of this study was to explore whether the possible protective effect of CCK-8 on METH-induced neurotoxicity involved anti-oxidative stress mechanisms. The subtypes of CCK receptors mediating the regulatory action of CCK-8 were also investigated. The present results revealed that CCK-8 dose-dependently inhibited METH induced cytotoxic effect by activating the CCK2 receptor subtype in PC12 cells and CCK2 receptor stable transfected-HEK293 cells. Pre-treatment of CCK-8 before METH stimulation significantly attenuated the generation of reactive oxygen species and NADPH oxidase activation in PC12 cells."

According to the news editors, the research concluded: "Our study demonstrated a protective effect of CCK-8 on METH-induced neurotoxicity in vitro and suggested that a possible mechanism of this action was dependent on the activation of the CCK2 receptor to reduce the neurotoxicity and oxidative stress induced by METH stimulation."

For more information on this research see: Cholecystokinin-8 inhibits methamphetamine-induced neurotoxicity via an anti-oxidative stress pathway. *Neurotoxicology*, 2016;57(3):31-38. *Neurotoxicology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Pharmacology

Researchers at Hebrew University Detail Findings in Pharmacology (Comparing Class A GPCRs to bitter taste receptors: Structural motifs, ligand interactions and agonist-to-antagonist ratios)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pharmacology have been published. According to news reporting originating in Rehovot, Israel, by NewsRx journalists, research stated, "G protein-coupled receptors (GPCRs) are seven transmembrane proteins that play a key role in human physiology. The GPCR superfamily comprises about 800 members, classified into several classes, with rhodopsin-like Class A being the largest and most studied thus far."

The news reporters obtained a quote from the research from Hebrew University, "A huge component of the human repertoire consists of the chemosensory GPCRs, including 400 odorant receptors, 25 bitter taste receptors (TAS2Rs), which are thought to guard the organism from consuming poisons, and sweet and umami TAS1R heteromers, which indicate the nutritive value of food. The location of the binding site of TAS2Rs is similar to that of Class A GPCRs. However, most of the known bitter ligands are agonists, with only a few antagonists documented thus far. The agonist-to-antagonist ratios of Class A GPCRs vary, but in general are much lower than for TAS2Rs. For a set of well-studied GPCRs, a gradual change in agonists-to-antagonists ratios is observed when comparing low (10 mM)-and high (10 nM)-affinity ligand sets from ChEMBL and the DrugBank set of drugs. This shift reflects pharmaceutical bias toward the therapeutically desirable pharmacology for each of these GPCRs, while the 10 mM sets possibly represent the native tendency of the receptors toward either agonists or antagonists. Analyzing ligand-GPCR interactions in 56 X-ray structures representative of currently available structural data, we find that the N-terminus, TM1 and TM2 are more involved in binding of antagonists than of agonists. On the other hand, ECL2 tends to be more involved in binding of agonists. This is of interest, since TAS2Rs harbor variations on the typical Class A sequence motifs, including the absence of the ECL2-TM3 disulfide bridge. This suggests an alternative mode of regulation of conformational states for TAS2Rs, with potentially less stabilized inactive state."

According to the news reporters, the research concluded: "The comparison of TAS2Rs and Class A GPCRs structural features and the pharmacology of their ligands
highlights the intricacies of GPCR architecture and provides a framework for rational design of new ligands."

For more information on this research see: Comparing Class A?GPCRs to bitter taste receptors: Structural motifs, ligand interactions and agonist-to-antagonist ratios. *Methods In Cell Biology*, 2015;132():401-27.

**Drugs and Therapies - Pharmaceutical Research**

**Researchers at Heinrich-Heine-University Target Pharmaceutical Research (Impact of sodium lauryl sulfate in oral liquids on e-tongue measurements)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Pharmaceutical Research have been presented. According to news reporting out of Dusseldorf, Germany, by NewsRx editors, research stated, "During development of oral liquid medicines taste assessment is often required to evaluate taste and taste masking. Electronic tongue analysis can provide taste assessment of medicinal products but should only be conducted with medicines that interact with the instrument without damaging the sensor membranes or interfering with their electrical output so that robust data is generated."

Our news journalists obtained a quote from the research from Heinrich-Heine-University, "To explore the impact of a substance deemed unsuitable for electronic tongue analysis the influence of the anionic surfactant sodium lauryl sulfate (SLS), on the performance of the electronic tongue was conducted using electronic tongues equipped with self-developed PVC based sensors. The results showed a significant impact of SLS on all applied sensor types and an alteration of the sensor's sensitivity. Nevertheless, concentration dependent sensor responses could still be obtained and the sensor performance was not impacted negatively."

According to the news editors, the research concluded: "Assessment of unsuitable substances should therefore be evaluated prior to performing electronic tongue analysis so that their impact is understood fully."

Our news journalists report that additional information may be obtained by contacting L.I. Immohr, Heinrich Heine Univ Duesseldorf, Inst Pharmaceut & Biopharmaceut, D-40225 Dusseldorf, Germany. Additional authors for this research include R. Turner and M. Pein-Hackelbusch.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.045. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Prostate Cancer

Researchers at Henry Ford Hospital Target Prostate Cancer (Do Sociodemographic Factors Influence Outcome in Prostate Cancer Patients Treated With External Beam Radiation Therapy?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting originating in Detroit, Michigan, by NewsRx journalists, research stated, "The purpose of this study was to analyze the prognostic significance of sociodemographic factors on biochemical control (bNED) and overall survival (OS) in patients with prostate cancer. Prostate cancer patients treated with definitive external beam radiation therapy (EBRT) +/- hormone therapy from 1997 to 2006 were analyzed in this IRB-approved study."

The news reporters obtained a quote from the research from Henry Ford Hospital, "Patient demographics, treatment (Tx), and clinical outcome were obtained from electronic medical records. Median household income (mHHI) at the census block group level was obtained from the 2000 census data. Data on disease and Tx parameters included Gleason score, pre-Tx prostate specific antigen (PSA), T stage, year of Tx, EBRT dose, and use of hormone therapy. Patients were categorized as having low-risk, intermediate-risk, or high-risk disease. Sociodemographic factors included age, race, marital status, and mHHI. Biochemical failure was defined as nadir PSA + 2 ng/mL. OS was based on death from any cause. A total of 788 consecutive patients were studied with a median follow-up of 7 years (range, 0.4 to 15 y). African Americans comprised 48% of the patients, whereas 46% of patients were white and 6% were other races. Whites had an average mHHI of $60,190 compared with $36,917 for African Americans (P <0.001). After multivariable modeling, only radiation dose was predictive for bNED (P=0.004) or OS (P=0.008). No sociodemographic factors were predictive for either outcome. Higher radiation dose predicted for better biochemical control and OS."

According to the news reporters, the research concluded: "This analysis suggests that sociodemographic factors are not important prognostic factors in determining outcome after EBRT for prostate cancer."

For more information on this research see: Do Sociodemographic Factors Influence Outcome in Prostate Cancer Patients Treated With External Beam Radiation Therapy? American Journal of Clinical Oncology-Cancer Clinical Trials, 2016;39(6):563-567. American Journal of Clinical Oncology-Cancer Clinical Trials can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.
Researchers at Hirosaki University School of Medicine Have Reported New Data on Cytokines (Interferon-Stimulated Gene 15, a Type I Interferon-Dependent Transcript, Is Involved in a Negative Feedback Loop in Innate Immune Reactions in Human ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Intercellular Signaling Peptides and Proteins - Cytokines have been published. According to news originating from Hirosaki, Japan, by NewsRx correspondents, research stated, "Since innate immunity plays a pivotal role in the pathogenesis of glomerulonephritis, the activation of toll-like receptor (TLR) 3/type I interferon (IFN) cascades is important in glomerular inflammation. However, the role of IFN-stimulated gene 15 (ISG15), a type IFN-dependent transcript, in glomerular inflammation is unclear."

Our news journalists obtained a quote from the research from the Hirosaki University School of Medicine, "We, therefore, examined the role of ISG15 in innate immune reactions induced by TLR3 signaling in cultured human mesangial cells (MCs). We treated MCs with polyinosinic-polycytidylic acid (poly IC), an authentic double-stranded RNA, and analyzed the ISG15 expression by reverse transcription-polymerase chain reaction and western blotting. To examine the regulation of ISG15 expression, we subjected MCs to RNA interference (siRNA) against TLR3, IFN-b, ISG56, and melanoma differentiation-associated gene 5 (MDA5). ISG15 expression induced by poly IC in MCs was inhibited by siRNA against TLR3 and IFN-b, whereas silencing of ISG56 or MDA5 had no effect. A knockdown of ISG15 upregulated the expression of ISG56, MDA5, CXCL10 and phosphorylated signal transducers and activators of transcription protein 1 (P-STAT1), while a knockdown of ubiquitin-like modifier activating enzyme 7, a key enzyme that conjugates ISG15 to target proteins, did not affect the expression. Knockdown of ubiquitin specific protease 18, an ISG15 isopeptidase, also upregulated P-STAT1, ISG56, MDA5 and CXCL10. Since unconjugated free ISG15 negatively regulates the phosphorylation of STAT1 and its downstream reactions, ISG15 dysregulation may be involved in the pathogenesis of glomerular inflammation."

According to the news editors, the research concluded: "We believe that suitable interventions in these innate immune cascades is desirable for the future therapeutic strategies for glomerulonephritis."

For more information on this research see: Interferon-Stimulated Gene 15, a Type I Interferon-Dependent Transcript, Is Involved in a Negative Feedback Loop in Innate Immune

**Peptide Proteins - Proinsulin**

**Researchers at Hiroshima University Have Reported New Data on Proinsulin (Metabolomic profiling reveals differential effects of glucagon-like peptide-1 and insulin on nutrient partitioning in ovine liver)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Peptide Proteins - Proinsulin have been presented. According to news reporting from Higashi Hiroshima, Japan, by NewsRx journalists, research stated, "This study was conducted to identify the insulin-independent actions of glucagon-like peptide-1 (GLP-1 (7-36 amide)) in partitioning nutrient metabolism in ovine liver. Four Suffolk wethers (60.0 +/- 6.7kg body weight (BW)) were used in a repeated-measure design under euglycemic--hyperinsulinemic and hyper -GLP-1 clamps for 150min with intravenous infusion of insulin (0.5mU/kg BW/min; from 0 to 90min), GLP-1 (0.5 mu g/kg BW/min; from 60 to 150min) and both hormones co-administered from 60 to 90min."

The news correspondents obtained a quote from the research from Hiroshima University, "Liver biopsies were collected at 0, 60, 90 and 150 min to represent the metabolomic profiling of baseline, insulin, insulin plus GLP-1, and GLP-1, respectively, and were analyzed for metabolites using Capillary Electrophoresis Time-of-Flight Mass Spectrometer. Metabolomics analysis reveals 51 metabolites as being significantly altered (\(P <0.05\)) by insulin and GLP-1 infusion compared to baseline values. Insulin infusion enhanced glycolysis, lipogenesis, oxidative stress defense and cell proliferation pathways, but reduced protein breakdown, gluconeogenesis and ketogenesis pathways. Conversely, GLP-1 infusion promoted lipolytic and ketogenic pathways accompanied by a lowered lipid clearance from the liver as well as elevated oxidative stress defense and nucleotide degradation."

According to the news reporters, the research concluded: "Despite further research
still being warranted, our data suggest that GLP-1 may exert insulin-antagonistic effects on hepatic lipid and nucleotide metabolism in ruminants.”

Our news journalists report that additional information may be obtained by contacting T. Sugino, Hiroshima University, Grad Sch Biosphere Sci, Res Center Anim Sci, Higashihiroshima, Japan. Additional authors for this research include D. Taniguchi, T. Sugino and T. Obitsu.

Amyotrophic Lateral Sclerosis

Researchers at Hokkaido University Release New Data on Amyotrophic Lateral Sclerosis (Interaction of RNA with a C-terminal fragment of the amyotrophic lateral sclerosis-associated TDP43 reduces cytotoxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Amyotrophic Lateral Sclerosis are discussed in a new report. According to news reporting originating in Sapporo, Japan, by NewsRx journalists, research stated, "A hallmark of amyotrophic lateral sclerosis (ALS), a devastating neurodegenerative disease, is formation of inclusion bodies (IBs) from misfolded proteins in neuronal cells. TAR RNA/DNA-binding protein 43 kDa (TDP43) is an ALS-causative protein forming IBs in ALS patients."

The news reporters obtained a quote from the research from Hokkaido University, "The relation between localization of the IBs and neurotoxicity remains largely unknown. We characterized aggregation of fluorescently tagged TDP43 and its carboxyl-terminal fragments (CTFs) by analytical fluorescence imaging techniques. Quantitative time-lapse analysis in individual live cells showed that fluorescent-protein-tagged TDP43 was cleaved and a 35 kDa TDP43 CTF (TDP35) formed ubiquitin (Ub)-negative cytoplasmic IBs. Although TDP35 formed mildly toxic Ub-negative IBs in the cytoplasm, TDP25, another type of a TDP43 CTF, efficiently formed sufficiently toxic Ub-positive IBs. One-or two-color fluorescence correlation spectroscopy (FCS/FCCS) revealed that coaggregation of TDP25 with TDP43 was initiated by depletion of the RNA that binds to TDP25. Moreover, nuclear localization tagging TDP25 reduced the rate of neuronal cell death."

According to the news reporters, the research concluded: "These observations point to the need to elucidate the novel sequestration mechanism and details of the toxicity of the misfolded and aggregation-prone TDP43 CTFs (as well as the RNA binding and nuclear retention) in order to identify possible preventive interventions against ALS."

For more information on this research see: Interaction of RNA with a C-terminal
fragment of the amyotrophic lateral sclerosis-associated TDP43 reduces cytotoxicity. Scientific Reports, 2016;6():19230. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Researchers at Hokkaido University Release New Data on Liposomes (Topology of Surface Ligands on Liposomes: Characterization Based on the Terms, Incorporation Ratio, Surface Anchor Density, and Reaction Yield)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biotechnology - Liposomes have been presented. According to news reporting out of Hokkaido, Japan, by NewsRx editors, research stated, "The surface topology of ligands on liposomes is an important factor in active targeting in drug delivery systems. Accurately evaluating the density of anchors and bioactive functional ligands on a liposomal surface is critical for ensuring the efficient delivery of liposomes."

Our news journalists obtained a quote from the research from Hokkaido University, "For evaluating surface ligand density, it is necessary to clarify that on the ligand-modified liposomal surfaces, some anchors are attached to ligands but some are not. To distinguish between these situations, a key parameter, surface anchor density, was introduced to specify amount of total anchors on the liposomal surface. Second, the parameter reaction yield was introduced to identify the amount of ligand-attached anchors among total anchors, since the conjugation efficiency is not always the same nor 100%. Combining these independent parameters, we derived: incorporation ratio=surface anchor densityxreaction yield. The term incorporation ratio defines the surface ligand density. Since the surface anchor density represents the density of polyethylene glycol (PEG) on the surfaces in most cases, it also determines liposomal function. It is possible to accurately characterize various PEG and ligand densities and to define the surface topologies."

According to the news editors, the research concluded: "This quantitative methodology can standardize the liposome preparation process and qualify the modified liposomal surfaces."

For more information on this research see: Topology of Surface Ligands on

**Digestive System Diseases and Conditions - Colitis**

**Researchers at Hong Kong Baptist University Detail Findings in Colitis (Addition of Berberine to 5-Aminosalicylic Acid for Treatment of Dextran Sulfate Sodium-Induced Chronic Colitis in C57BL/6 Mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Colitis. According to news reporting originating in Hong Kong, People's Republic of China, by NewsRx journalists, research stated, "Ulcerative colitis (UC) is a common chronic remitting disease but without satisfactory treatment. Alternative medicine berberine has received massive attention for its potential in UC treatment."

The news reporters obtained a quote from the research from Hong Kong Baptist University, "Conventional therapies with the addition of berberine are becoming attractive as novel therapies in UC. In the present study, we investigated the preclinical activity of a conventional oral 5-aminosalicylic acid (5-ASA) therapy plus berberine in experimental colitis. A subclinical dose of 5-ASA (200 mg/kg/day) alone or 5-ASA plus berberine (20 mg/kg/day) was orally administered for 30 days to C57BL/6 mice with colitis induced by three cycles of 2% dextran sulfate sodium (DSS). The disease severity, inflammatory responses, drug accumulation and potential toxicity of colitis mice were examined. The results showed that comparing to 5-ASA alone, 5-ASA plus berberine more potently ameliorated DSS-induced disease severity, colon shortening, and colon histological injury. Further, the up-regulation in mRNA level of colonic TNF-a as well as NF-kB and JAK2 phosphorylation caused by DSS were more pronouncedly reversed in animals treated with the combination therapy than those treated with 5-ASA alone. Moreover, the addition of berberine to 5-ASA more significantly inhibited lymphocyte TNF-a secretion of DSS mice than 5-ASA alone. In the meanwhile, no extra drug accumulation or potential toxicity to major organs of colitis mice was observed with this combination treatment."

According to the news reporters, the research concluded: "In summary, our studies provide preclinical rationale for the addition of berberine to 5-ASA as a promising therapeutic strategy in clinic by reducing dose of standard therapy."

Researchers at Hospital Italiano Release New Data on Cholecystitis [Protocol for extended antibiotic therapy after laparoscopic cholecystectomy for acute calculous cholecystitis (Cholecystectomy Antibiotic Randomised Trial, CHART)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Digestive System Diseases and Conditions - Cholecystitis. According to news reporting originating from Buenos Aires, Argentina, by NewsRx correspondents, research stated, "Acute calculous cholecystitis represents one of the most common complications of cholelithiasis. While laparoscopic cholecystectomy is the standard treatment in mild and moderate forms, the need for antibiotic therapy after surgery remains undefined."

Our news editors obtained a quote from the research from Hospital Italiano, "The aim of the randomised controlled Cholecystectomy Antibiotic Randomised Trial (CHART) is therefore to assess if there are benefits in the use of postoperative antibiotics in patients with mild or moderate acute cholecystitis in whom a laparoscopic cholecystectomy is performed. A single-centre, double-blind, randomised trial. After screening for eligibility and informed consent, 300 patients admitted for acute calculus cholecystitis will be randomised into two groups of treatment, either receiving amoxicillin/clavulanic acid or placebo for 5 consecutive days. Postoperative evaluation will take place during the first 30 days. Postoperative infectious complications are the primary end point. Secondary end points are length of hospital stay, readmissions, need of reintervention (percutaneous or surgical reinterventions) and overall mortality. The results of this trial will provide strong evidence to either support or abandon the use of antibiotics after surgery, impacting directly in the incidence of adverse events associated with the use of antibiotics, the emergence of bacterial resistance and treatment costs. This study..."
and informed consent sheets have been approved by the Research Projects Evaluating Committee (CEPI) of Hospital Italiano de Buenos Aires (protocol N? 2111)."

According to the news editors, the research concluded: "The results of the trial will be reported in a peer-reviewed publication."

For more information on this research see: Protocol for extended antibiotic therapy after laparoscopic cholecystectomy for acute calculous cholecystitis (Cholecystectomy Antibiotic Randomised Trial, CHART). *Bmj Open*, 2015;5(11):e009502. **Transplant Medicine - Liver Transplants**

**Researchers at Hospital Universitario 12 de Octubre Target Liver Transpls (Trabecular bone score in patients with liver transplants after 1 year of risedronate treatment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Liver Transplants. According to news reporting originating from Madrid, Spain, by NewsRx correspondents, research stated, "The aim of this study was to analyse the effect of risedronate on Trabecular Bone Score in liver transplant patients with low bone mass, during 1-year follow-up. In this retrospective cohort study, trabecular bone score (TBS) was calculated from dual X-ray absorptiometry images of the lumbar spine (LS), collected from a prospective randomized open-label 1-year trial performed in liver recipient patients."

Financial support for this research came from Fundacion Mutua Madrilena.

Our news editors obtained a quote from the research from Hospital Universitario 12 de Octubre, "A total of 89 patients with osteopenia or osteoporosis were randomized to receive RIS plus calcium and vitamin D3 or calcium and vitamin D3. TBS was low in both groups at baseline, 6 and 12 months. Baseline TBS at the LS showed degraded microarchitecture in 22.8% of patients, partially degraded in 40.3%, and normal values in 36.8% of the patients. After 1 year of treatment, no difference in TBS was observed between both groups. No correlations were found between bone mineral density (BMD) and TBS values at any follow-up time point. No relationship was found between BMD, TBS or immunosuppressive drugs with incidental fracture. No significant effect in TBS was observed in liver transplant patients treated with RIS..."
or calcium and vitamin D3 after 1 year of follow-up."

According to the news editors, the research concluded: "In these patients, the clinical usefulness of this new tool should be established."

The news editors report that additional information may be obtained by contacting M.S. Librizzi, Metabolic Bone Disease Unit, Endocrinology Service, Hospital Universitario 12 de Octubre, Madrid, Spain. Additional authors for this research include S. Guadalix, G. Health and Medicine - Urology

Researchers at Human Oncology and Pathogenesis Program Have Reported New Data on Urology (A river model to map convergent cancer evolution and guide therapy in RCC)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Health and Medicine - Urology are discussed in a new report. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Intratumoural heterogeneity in clear cell renal cell carcinoma (ccRCC) complicates identification and validation of biomarkers and thwarts attempts to improve precision medicine. Efforts to depict intratumoural heterogeneity and to pinpoint strategies for disease control resulted in the creation of the trunk-branch model of mutational cancer evolution, which emphasizes targeting trunk mutations."

The news correspondents obtained a quote from the research from Human Oncology and Pathogenesis Program, "However, most patients with ccRCC receiving current therapeutics that target these mutations, such as inhibitors of vascular endothelial growth factors, eventually develop resistance. A novel paradigm might improve depiction of cancer evolution and advise therapeutic selection: the river model is based on findings from multiregion sequencing in samples from exceptional responders to mTOR inhibitors. The accumulating data on genotypic and phenotypic convergence in renal cell carcinoma and other malignancies can be used to examine how a mutable river model might best describe clinically significant phenotype-convergent events that could guide effective cancer control."
According to the news reporters, the research concluded: "This model originates from studying exceptional responders and its generalizability awaits validation."

Our news journalists report that additional information may be obtained by contacting E.Y. Wei, Human Oncology and Pathogenesis Program, 1275 York Avenue, Box 20, New York, NY 10065, United States.

**Digestive System Diseases and Conditions**

**Researchers at Imperial College Target Inflammatory Bowel Disease (Dendritic Cell-T-Cell Circuitry in Health and Changes in Inflammatory Bowel Disease and Its Treatment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Inflammatory Bowel Disease have been published. According to news reporting out of London, United Kingdom, by NewsRx editors, the research stated, "Dendritic, antigen-presenting cells (DCs) determine not only whether lymphocytes produce different types of immune response but also tissue-homing profiles of lymphocytes they stimulate. For example, in health, mucosal DC stimulate T cells focused to home to the mucosa; DC/T-cell circuitry thus targets immune responses to specific tissue locations."

Our news journalists obtained a quote from the research from Imperial College, "Therapies being introduced for inflammatory bowel disease (IBD) include antibodies to gut-homing molecules such as a4b7 (Vedolizumab) used ostensibly to block gut-homing lymphocytes. However, such lymphocytes are dependent on the tissue specificity of DC that stimulated them. In health, blood DCs have the potential to home to multiple tissues including gut (a4b7+) and skin (CLA+). DCs have become gut-specific within the intestinal microenvironment stimulated partially by local retinoid to express a4b7 (mucosal homing marker) and/or CCR9 (ileal homing marker) in the absence of skin-specific indicators. They spread veiled extensions, sample their environment, acquire/process antigens, produce cytokines and initiate innate immunity. Myeloid DC also traffic to draining lymph nodes where compartmentalization of adaptive immune responses is determined by DCs from the site of antigen exposure which dictate the homing profiles of lymphocytes they stimulate. In IBD, site and activity of disease are reflected in changes in homing/activation of gut DCs and T-cells they stimulate and also, in greater gut specificity and activation of blood DC. Homing potential of DC can be modulated toward mucosa or skin by vitamins A and D, respectively. Infliximab or interleukin-6 can divert homing profiles toward skin, perhaps predisposing to skin involvement.
in IBD. Probiotic bacteria or their products can also change homing profiles of gut DC toward skin homing and away from gut."

According to the news editors, the research concluded: "Development of gut focused inflammation and its treatment relies on changes in DC tissue specificity; therefore, removal or diversion of gut-homing DC as well as T-cells is likely to be critical in prevention of gut-focused inflammation in IBD."

Our news journalists report that additional information may be obtained by contacting S.C. Knight, Imperial College London, Antigen Presentation Research Group, London, UK.

Researchers at Imperial College Target Pharmacoepidemiology (Literature review of visual representation of the results of benefit-risk assessments of medicinal products)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Pharmacoepidemiology is now available. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "The PROTECT Benefit-Risk group is dedicated to research in methods for continuous benefit-risk monitoring of medicines, including the presentation of the results, with a particular emphasis on graphical methods. A comprehensive review was performed to identify visuals used for medical risk and benefit-risk communication."

Funders for this research include Innovative Medicines Initiative Joint Undertaking, European Union's Seventh Framework Programme, EFPIA.

Our news journalists obtained a quote from the research from Imperial College, "The identified visual displays were grouped into visual types, and each visual type was appraised based on five criteria: intended audience, intended message, knowledge required to understand the visual, unintentional messages that may be derived from the visual and missing information that may be needed to understand the visual. Sixty-six examples of visual formats were identified from the literature and classified into 14 visual types. We found that there is not one single visual format that is consistently superior to others for the communication of benefit-risk information. In addition, we found that most of the drawbacks found in the visual formats could be considered general to visual communication, although some appear more relevant to specific
formats and should be considered when creating visuals for different audiences depending on the exact message to be communicated. We have arrived at recommendations for the use of visual displays for benefit-risk communication. The recommendation refers to the creation of visuals. We outline four criteria to determine audience-visual compatibility and consider these to be a key task in creating any visual."

According to the news editors, the research concluded: "Next we propose specific visual formats of interest, to be explored further for their ability to address nine different types of benefit-risk analysis information."

The news correspondents report that additional information may be obtained from C.E. Hallgreen, School of Public Health, Imperial College London, London, UK. Additional authors for this research include S. Mt-Isa, A. Lieftucht, L.D. Phillips, D. Hughes, S. Talbot, A. Asiimwe, G. Downey, G. Genov, R. Hermann, R. Noel, R. Peters, A. Micaleff, I. Tzoulaki and D. Ashby.

**Chemistry**

**Researchers at Indian Institute of Technology Have Reported New Data on Chemistry (Metal Ion Ornamented Ultrafast Light-Sensitive Nanogel for Potential in Vivo Cancer Therapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Chemistry is the subject of a report. According to news reporting originating in Kharagpur, India, by NewsRx journalists, research stated, "A smart, ultrafast, light-responsive nanogel is a potential carrier for on-demand and immediate delivery of therapeutic agents. Here, a novel branched pentaerythritol poly(caprolactone)-b-poly(acrylic acid)-based smart, light-responsive nanogel has been fabricated by using ferric ion (Fe3+) as a cross-linker."

Financial supporters for this research include University Grants Commission, Board of Research in Nuclear Sciences.

The news reporters obtained a quote from the research from the Indian Institute of Technology, "The mentioned block copolymer has been synthesized by combining both the ring opening and atom transfer radical polymerization techniques. Branched structure of the polymer offers a minute amount (1.5 mol %) of Fe3+ sufficient for nanogel formation. The nanogel looks like a spherically shaped human brain holding the water molecule as like cerebrospinal fluid in the brain. The particle size of the nanogel has been tailored (between 30 and 450 nm) by separately varying both the molar concentration of Fe3+ and polymer chain length. The highly
negative zeta potential (-46 mV) of the nanogel promotes its impressive colloidal stability and prolongs the circulation vivo. Nanogels securely hold the DOX molecules (maximum drug loading capacity: 26.2%). Exposure of light onto the nanogel (in the presence of lactic acid) produces immediate initiation of de-cross-linking followed by the release of DOX molecules (85.2% at 120 min). The nanogel shows significantly high uptake and acute toxicity against a cancerous cell line (C6 glioma) in vitro."

According to the news reporters, the research concluded: "Administration of the DOX-loaded nanogel on the C6 glioma rat model (in vivo) offered tremendous inhibition (similar to 91%) of tumor growth without any toxic side effects (confirmed by histopathology)."

Our news correspondents report that additional information may be obtained by contacting S. Chattopadhyay, Indian Inst Technol, Rubber Technol Center, Kharagpur, W Bengal 721302, India. Additional authors for this research include G. Dey, R. Bharti, P. Mandal, M. Mandal and S. Chattopadhyay.

high proportion of 17 b-estradiol-treated HaCaT cells in S phase compared with vehicle-treated cells. Western blot analysis demonstrated the activation of Akt, Erk and upregulation of PCNA in HaCaT cells treated with 17 b-estradiol. Interestingly, Erk activation occurred prior to Akt activation. Upregulation of PCNA expression, elevated proliferation and high S phase fraction of HaCaT cell by 17 b-estradiol could be reversed by an Akt or Erk inhibitor. Moreover, Erk inhibition reversed 17 b-estradiol-induced Akt activation, whereas an Akt inhibitor exhibited no effect on Erk, further suggesting that Erk was on the upstream while Akt on the downstream of the signaling pathway.

According to the news reporters, the research concluded: "This study demonstrates that one of the critical mechanisms underlying 17 b-estradiol promoting skin wound healing is through regulation of keratinocyte proliferation via Erk/Akt signaling pathway."

Our news journalists report that additional information may be obtained by contacting T. Zhou, State Key Laboratory of Trauma, Burns and Combined Injury, Chongqing Key Laboratory for Proteomics Disease, Institute of Burn Research, Southwest Hospital, the Third Military Medical University, Chongqing, People's Republic of China. carcinoma (FaDu) cells and nonmalignant epithelial cells, demonstrating that the presence of additional a-TOS significantly enhances its antiproliferative activity; however, a range of selective concentrations is observed. These NPs induce apoptosis of FaDu cells by activating the mitochondria death pathway (via caspase-9). Both loaded and unloaded NPs act via complex II and produce high levels of reactive oxygen species that trigger apoptosis. Additionally, these NPs effectively suppress the vascular endothelial growth factor (VEGF) expression of human umbilical vein endothelial cells (HUVECs).

According to the news reporters, the research concluded: "These results open the possibility to use this promising nanoformulation as an a-TOS delivery system for the effective cancer treatment, effectively resolving the current limitations of free a-TOS administration."

Our news journalists report that additional information may be obtained by contacting R. Palao-Suay, Group of Biomaterials, Dept. of Polymeric Nanomaterials and Biomaterials, Institute of Polymer Science and Technology, CSIC, C, Juan de la Cierva, 3, 28006, Madrid, Spain. Neuroinflammation

Researchers at Institute of Science and Technology Discuss Findings in Neuroinflammation (Extracts from Dendropanax morbifera Leaves Have Modulatory Effects on Neuroinflammation in Microglia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neuroinflammation. According to news reporting from Daegu, South Korea, by NewsRx journalists, research stated, "Dendropanax morbifera (D. morbifera), a species endemic to Korea, is largely distributed throughout the southern part of the country. Its leaves, stems, roots, and seeds have been used as a form of alternative medicine for various diseases and neurological disorders including paralysis, stroke, and migraine."

The news correspondents obtained a quote from the research from the Institute of Science and Technology, "However, the molecular mechanisms that underlie the remedial effects of D. morbifera remain largely unknown. In this paper, extracts from D. morbifera leaves were prepared using ethyl acetate as a solvent (abbreviated as DMLE). The modulatory effects of DMLE on neuroinflammation were studied in a lipopolysaccharide (LPS)-stimulated BV2 murine microglial cell line. Production of pro-inflammatory cytokines, activation of mitogen-
activated protein kinases (MAPKs) and nuclear factor-kappa B (NF-κB), and different M1/M2 activation states of microglia were examined. DMLE treatment suppressed the production of pro-inflammatory cytokines including tumor necrosis factor (TNF-α), interleukin-6 (IL-6), and nitric oxide (NO) in LPS-stimulated BV2 cells. DMLE treatment also attenuated the activation of MAPKs and NF-κB. In a novel discovery, we found that DMLE up-regulated the marker genes representing an alternative, anti-inflammatory M2 polarization, while suppressing the expression of the classical, pro-inflammatory M1 activation state genes. Here, we uncovered the cellular mechanisms underlying the beneficial effects of D. morbifera against neuroinflammation using BV2 microglia cells. These results strongly suggest that DMLE was able to counter the effects of LPS on BV2 cells via control of microglia polarization states."

According to the news reporters, the research concluded: "Additionally, study results indicated that DMLE may have therapeutic potential as a neuroinflammation-suppressing treatment for neurodegenerative diseases."

Our news journalists report that additional information may be obtained by contacting H.J. Shim, * Dept. of Brain and Cognitive Sciences, Daeug Gyeongbuk Institute of Science and Technology (DGIST), Daegu 711-873, South Korea. Additional authors for this research include S. Park, J.W. Lee, H.J. Park, S.H. Baek, E.K. Kim and S.W Yu.

**Mycobacterium Infections - Tuberculosis**

**Researchers at International Center for Genetic Engineering and Biotechnology Target Tuberculosis (Global Urine Metabolomics in Patients Treated with First-Line Tuberculosis Drugs and Identification of a Novel Metabolite of Ethambutol)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mycobacterium Infections - Tuberculosis is the subject of a report. According to news reporting originating in New Delhi, India, by NewsRx journalists, research stated, "Population level variation of drug metabolism phenotype (DMP) has great implications in treatment outcome, drug-related side effects, and resistance development. In this study, we used a gas chromatography-time of flight-mass spectrometry (GC-TOF-MS)-based untargeted urine metabolomics approach to understand the DMP of a tuberculosis (TB) patient cohort (n=20) from Tripura, a state in the northeastern part of India."
The news reporters obtained a quote from the research from International Center for Genetic Engineering and Biotechnology. "Urine samples collected at different postdose time points (2 h, 6 h, 12 h, 24 h, 36 h, and 48 h) from these newly diagnosed TB patients receiving first-line anti-TB drugs were analyzed, and we have successfully detected three of the four first-line drugs, viz, isoniazid (INH), ethambutol (ETB), and pyrazinamide (PZA). The majority of their known metabolites, acetyl-isoniazid (AcINH), isonicotinic acid (INA), isonicotinuric acid (INTA), 2,2’-(ethylenediimino)-dibutyric acid (EDBA), 5-hydroxyprazinamide (5OH-PZA), pyrazinoic acid (POA), and 5-hydroxypyrazinoic acid (5OH-POA), were also detected. Analyzing the variation in abundances of drugs and their known metabolites and calculating the metabolic ratios in these samples, we offer comprehensive DMP information on this small patient cohort that represents Tripura, India. The majority (75%) of these patients are found to be slow acetylators of INH. The average metabolic ratios of POA/PZA and 5OH-POA/POA are 3.16 ± 3.03 and 6.09 ± 6.15, respectively. Employing correlation analysis of the metabolomics metadata and a manual prediction of drug catabolism, we have proposed 2-aminobutyric acid (AABA) as a novel metabolite of ETB."

According to the news reporters, the research concluded: "These observations indicate the usefulness of GC-MS-based metabolomics to characterize the DMP at a population level and also to identify novel drug metabolites."

For more information on this research see: Global Urine Metabolomics in Patients Treated with First-Line Tuberculosis Drugs and Identification of a Novel Metabolite of Ethambutol. Antimicrobial Agents and Chemotherapy, 2016;60(4):2257-64. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting M.K. Das, Immunology group, International Centre for Genetic Engineering and Biotechnology (ICGEB), New Delhi, India. Additional authors for this research include R. Arya, S. Debnath, R. Debnath, A. Lodh, S.C. Bishwal, A. Das and R.K Nanda.

**Biotechnology - Genomics**

**Researchers at Iwate University Target Genomics (Effects of dietary forage and calf starter on ruminal pH and transcriptomic adaptation of the rumen epithelium in Holstein calves during the weaning transition)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology - Genomics. According to news reporting from Morioka, Japan, by NewsRx journalists, research stated, "We investigated the relationship between ruminal pH and transcriptomic adaptation of the rumen epithelium (RE) of calves fed calf starter with and without forage during the weaning transition."
Holstein calves were assigned to groups fed calf starter either with forage (HAY group, n< 3) or without forage (CON group, n< 4).

Financial support for this research came from a KAKENHI Grant-in-Aid for Scientific Research from the Japan Society for the Promotion of Science.

The news correspondents obtained a quote from the research from Iwate University, "Ruminal pH was measured continuously, and rumen fluid and epithelium were collected 3 wk after weaning. mRNA expression profiles of the RE were examined by one-color microarray. Differentially expressed genes (DEGs) were investigated using the Ingenuity Pathway Analysis (IPA). Mean and maximum ruminal pH were significantly (P < 0.05) higher, and the duration of pH < 5.8 during 1 day was significantly (P < 0.05) shorter, in the HAY group. The proportion of ruminal acetate and the acetate-to-propionate ratio were significantly (P < 0.05) lower in the CON group. DEGs encoding transcription regulators (SREBP1), insulin-like growth factor binding proteins (IGFBP7 and CTGF), ketogenic enzymes (HMGCL, BDH1, and BDH2), and a transporter (SLC16A3) were identified (P < 0.05) between the two groups. A growth factor (TGFβ1) and signaling pathway (EGF and EGFR) were activated as upstream regulators. These results suggest that dietary forage alleviates ruminal acidosis, and the decrease in ruminal pH may damage the RE, leading to changes in gene expression to repair the damage."

According to the news reporters, the research concluded: "Furthermore, rumen development may be regulated by growth factor (TGFβ1) and signaling pathways (EGF and IGFBP) for adaptation to feeding on calf starter with and without forage during the weaning transition."

For more information on this research see: Effects of dietary forage and calf starter on ruminal pH and transcriptomic adaptation of the rumen epithelium in Holstein calves during the weaning transition. **Physiological Genomics**, 2016;48(11):803-809. Physiological Genomics can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Heart Disorders and Diseases - Atrial Fibrillation

Researchers at Jikei University Target Atrial Fibrillation (Filling defects of the left atrial appendage on multidetector computed tomography: their disappearance following catheter ablation of atrial fibrillation and the detection of LAA ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation
have been published. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "Filling defects of the left atrial appendage (LAA) on multidetector computed tomography (MDCT) are known to occur, not only due to LAA thrombi formation, but also due to the disturbance of blood flow in the LAA of patients with atrial fibrillation (AF). The purpose of this study was to evaluate the impact of the maintenance of sinus rhythm via ablation on the incidence of LAA filling defects on MDCT in patients with AF."

The news reporters obtained a quote from the research from Jikei University, "A total of 459 consecutive patients were included in the present study. Prior to ablation, MDCT and transesophageal echocardiography (TEE) were performed. AF ablation was performed in patients without LAA thrombi confirmed on TEE. The LAA filling defects were evaluated on MDCT at 3 months after ablation. LAA filling defects were detected on MDCT in 51 patients (11.1 %), among whom the absence of LAA thrombi was confirmed in 42 patients using TEE. The LAA Doppler velocity in patients with LAA filling defects was lower than that of patients without filling defects (0.61 +/- A 0.19 vs. 0.47 +/- A 0.21 m/s; P< 0.0001). The sensitivity, specificity and negative predictive value of MDCT in the detection of thrombi were 100, 91 and 100 %, respectively. No LAA filling defects were observed on MDCT at 3 months after ablation in any of the patients, including the patients in whom filling defects were noted prior to the procedure. MDCT is useful for evaluating the presence of LAA thrombi and the blood flow of the LAA."

According to the news reporters, the research concluded: "The catheter ablation of AF not only suppresses AF, but also eliminates LAA filling defect on MDCT suggesting the improvement of LAA blood flow."

For more information on this research see: Filling defects of the left atrial appendage on multidetector computed tomography: their disappearance following catheter ablation of atrial fibrillation and the detection of LAA thrombi by MDCT. Researchers at Jilin University Report Findings in Antiepileptics
(Simultaneous determination of ten antiepileptic drugs in human plasma by liquid chromatography and tandem mass spectrometry with positive/negative ion-switching electrospray ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antiepileptics have been presented. According to news reporting from Changchun, People's Republic of China, by NewsRx journalists, research stated, "A simple, rapid, and high-throughput liquid chromatography with tandem mass spectrometry method for the simultaneous quantitation of ten antiepileptic drugs in human plasma has been developed and validated. The method required only 10 mL of plasma."

The news correspondents obtained a quote from the research from Jilin University, "After simple protein precipitation using acetonitrile, the analytes and internal standard diphenhydramine were separated on a Zorbax SB-C18 column (50 ? 4.6 mm, 2.7 mm) using acetonitrile/water as the mobile phase at a flow rate of 0.9 mL/min. The total run time was 6 min for each sample. The validation results of specificity, matrix effects, recovery, linearity, precision, and accuracy were satisfactory. The lower limit of quantification was 0.04 mg/mL for carbamazepine, 0.02 mg/mL for lamotrigine, 0.01 mg/mL for oxcarbazepine, 0.4 mg/mL for 10-hydroxycarbazepine, 0.1 mg/mL for carbamazepine-10,11-epoxide, 0.15 mg/mL for levetiracetam, 0.06 mg/mL for phenytoin, 0.3 mg/mL for valproic acid, 0.03 mg/mL for topiramate, and 0.15 mg/mL for phenobarbital. The intraday precision and interday precision were less than 7.6%, with the accuracy ranging between -8.1 and 7.9%. The method was successfully applied to therapeutic drug monitoring of 1237 patients with epilepsy after administration of standard antiepileptic drugs."

According to the news reporters, the research concluded: "The method has been proved to meet the high-throughput requirements in therapeutic drug monitoring."

Our news journalists report that additional information may be obtained by contacting L. Yin, School of Life Science, Jilin University, Changchun, People's Republic of China. Additional authors for this research include T. Wang, M. Shi, Y. Zhang, X. Zhao, Y. Yang and J. Gu.

Researchers at Johns Hopkins University Have Reported New Data on Cystic Fibrosis (Sources of Variation in Sweat Chloride Measurements in Cystic Fibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cystic Fibrosis are discussed in a new report. According to news reporting originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Expanding the use of cystic fibrosis transmembrane conductance regulator (CFTR) potentiators and correctors for the treatment of cystic fibrosis (CF) requires precise and accurate biomarkers. Sweat chloride concentration provides an in vivo assessment of CFTR function, but it is unknown the degree to which CFTR mutations account for sweat chloride variation."

Our news editors obtained a quote from the research from Johns Hopkins University, "To estimate potential sources of variation for sweat chloride measurements, including demographic factors, testing variability, recording biases, and CFTR genotype itself. A total of 2,639 sweat chloride measurements were obtained in 1,761 twins/siblings from the CF Twin-Sibling Study, French CF Modifier Gene Study, and Canadian Consortium for Genetic Studies. Variance component estimation was performed by nested mixed modeling. Across the tested CF population as a whole, CFTR gene mutations were found to be the primary determinant of sweat chloride variability (56.1% of variation) with contributions from variation over time (e.g., factors related to testing on different days; 13.8%), environmental factors (e.g., climate, family diet; 13.5%), other residual factors (e.g., test variability; 9.9%), and unique individual factors (e.g., modifier genes, unique exposures; 6.8%) (likelihood ratio test, P<0.001). Twin analysis suggested that modifier genes did not play a significant role because the heritability estimate was negligible (H^2 = 0; 95% confidence interval, 0.0-0.35). For an individual with CF, variation in sweat chloride was primarily caused by variation over time (58.1%) with the remainder attributable to residual/random factors (41.9%). Variation in the CFTR gene is the predominant cause of sweat chloride variation; most of the non-CFTR variation is caused by testing variability and unique environmental factors."

According to the news editors, the research concluded: "If test precision and accuracy can be improved, sweat chloride measurement could be a valuable biomarker for assessing response to therapies directed at mutant CFTR."

The news editors report that additional information may be obtained by contacting J.M. Collaco, Johns Hopkins University, Sch Med, Baltimore, MD 21287, United States. Additional authors for this research include S.M. Blackman, K.S. Raraigh, H. Corvol, J.M. Rommens, R.G. Pace, P.Y. Boelle, J. McGready, P.R. Sosnay, L.J. Strug, M.R. Knowles and G.R. Cutting.

Researchers at Johns Hopkins University Report New Data on Proinsulin (The TORC1-activated Proteins, p70S6K and GRB10, Regulate IL-4 Signaling and M2 Macrophage Polarization by Modulating Phosphorylation of Insulin Receptor Substrate-2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptide Proteins - Proinsulin.

According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "Lung M2 macrophages are regulators of airway inflammation, associated with poor lung function in allergic asthma. Previously, we demonstrated that IL-4-induced M2 gene expression correlated with tyrosine phosphorylation of the insulin receptor substrate-2 (IRS-2) in macrophages."

Financial support for this research came from National Heart, Lung, and Blood Institute.

The news correspondents obtained a quote from the research from Johns Hopkins University, "We hypothesized that negative regulation of IRS-2 activity after IL-4 stimulation is dependent upon serine phosphorylation of IRS-2. Herein, we describe an inverse relationship between tyrosine phosphorylation (Tyr(P)) and serine phosphorylation (Ser(P)) of IRS-2 after IL-4 stimulation. Inhibiting serine phosphatase activity increased Ser(P)-IRS-2 and decreased Tyr(P)-IRS-2 leading to reduced M2 gene expression (CD200R, CCL22, MMP12, andTGM2).

We found that inhibition of p70S6K, downstream of TORC1, resulted in diminished Ser(P)-IRS-2 and prolonged Tyr(P)IRS-2 as well. Inhibition of p70S6K increased expression of CD200R and CCL22 indicating that p70S6K negatively regulates some, but not all, human M2 genes. Knocking down GRB10, another negative regulatory protein downstream of TORC1, enhanced both Tyr(P)-IRS-2 and increased expression of all four M2 genes. Furthermore, GRB10 associated with IRS-2, NEDD4.2 (an E3-ubiquitin ligase), IL-4R alpha, and gamma C after IL-4 stimulation. Both IL-4R alpha and gamma C were ubiquitinated after 30 min of IL-4 treatment, suggesting that GRB10 may regulate degradation of the IL-4 receptor-signaling complex through interactions with NEDD4.2."

According to the news reporters, the research concluded: "Taken together, these data highlight two novel regulatory proteins that could be therapeutically manipulated to limit IL-4-induced IRS-2 signaling and polarization of M2 macrophages in allergic inflammation."

Our news journalists report that additional information may be obtained by contacting N.M. Heller, Johns Hopkins University, Sch Med, Dept. of Anesthesiol & Crit Care
Researchers at Johns Hopkins University Target Solid Cancer
(Association of PD-1/PD-L axis expression with cytolytic activity, mutational load, and prognosis in melanoma and other solid tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Solid Cancer have been published. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Programmed cell death protein-1 (PD-1)/programmed death ligand-1 (PD-L1) checkpoint blockade has led to remarkable and durable objective responses in a number of different tumor types. A better understanding of factors associated with the PD-1/PD-L axis expression is desirable, as it informs their potential role as prognostic and predictive biomarkers and may suggest rational treatment combinations."

Funders for this research include W. W. Smith Charitable Trust, Melanoma Research Alliance (MRA), Bristol-Myers Squibb (BMS), 5 Diagnostics, Sidney Kimmel Cancer Center, National Cancer Institute NIH, The Commonwealth Foundation, Moving for Melanoma of Delaware, Stand Up to Cancer.

Our news journalists obtained a quote from the research from Johns Hopkins University, "In the current study, we analyzed PD-L1, PD-L2, PD-1, and cytolytic activity (CYT) expression, as well as mutational density from melanoma and eight other solid tumor types using The Cancer Genome Atlas database. We found that in some tumor types, PD-L2 expression is more closely linked to Th1/IFNG expression and PD-1 and CD8 signaling than PD-L1. In contrast, mutational load was not correlated with a Th1/IFNG gene signature in any tumor type. PD-L1, PD-L2, PD-1, CYT expression, and mutational density are all positive prognostic features in melanoma, and conditional inference modeling revealed PD-1/CYT expression (i.e., an inflamed tumor microenvironment) as the most impactful feature, followed by mutational density."

According to the news editors, the research concluded: "This study elucidates the highly interdependent nature of these parameters, and also indicates that future biomarkers for antiPD-1/PD-L1 will benefit from tumor-type-specific, integrated, mRNA, protein, and genomic approaches."

For more information on this research see: Association of PD-1/PD-L axis

The news correspondents report that additional information may be obtained from J.M. Taube, Johns Hopkins University, Sch Med, Sidney Kimmel Comprehens Canc Center, Dept. of Pathol, Baltimore, MD 21287, United States. Additional authors for this research include H. Wang, J. Sunshine, G.J. Kaunitz, T.R. Cottrell, H. Xu, J. Esandrio, R.A. Anders, L. Cope, D.M. Pardoll, C.G. Drake and J.M. Taube.

**Oncology - Non-Small Cell Lung Cancer**

**Researchers at Juntendo University Target Non-Small Cell Lung Cancer**

(The impact on the prognosis of unsuspected N2 disease in non-small-cell lung cancer: indications for thorough mediastinal staging in the modern era)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Non-Small Cell Lung Cancer. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Predicting the prognosis of advanced non-small-cell lung cancer (NSCLC) patients who present with clinically unsuspected N2 is very different due to the heterogeneity of this cohort. Thus, this study was undertaken to identify the clinicopathological features and survival of patients with clinical N0 or N1 and pathological N2, namely, unsuspected N2."

The news correspondents obtained a quote from the research from Juntendo University, "Among 239 patients with pathological N2 NSCLC, we reviewed the cases of 92 (38.5 %) patients who showed unsuspected N2. The prognosis was investigated using the Kaplan-Meier method and a Cox regression model. The 5-year overall survival (5yOS) of the patients with unsuspected N2 was 51.2 %. Based on a multivariate analysis, age and 18F-fluorodeoxyglucose (FDG) uptake in the lymph nodes were significant prognostic factors of unsuspected N2 (p = 0.0081, 0.0228, respectively). The 5yOS of PET-negative unsuspected N2 (n = 68) was 58.9 %, whereas that of PET-positive unsuspected N2 (n = 24) was 29.7 % (p = 0.0026). Furthermore, the 5yOS of PET-negative unsuspected N2 was significantly better than that of both clinical and pathological N2 s (i.e., suspected N2; n = 60; 5yOS, 42.1 %; p = 0.0051), while no significant difference was observed between PET-positive unsuspected N2 and suspected N2 (p = 0.6325). A preoperative evaluation of the lymph nodes by PET/CT has a
potential benefit in predicting the prognosis.'"

According to the news reporters, the research concluded: "A thorough evaluation of the lymph nodes is, therefore, needed if the lymph nodes show an FDG uptake, even in cases that show a clinical N0 status on thin section CT scans.'"

Our news journalists report that additional information may be obtained by contacting K. Suzuki, Juntendo University, Sch Med, Dept. of Gen Thorac Surg, Bunkyo Ku, Tokyo 1138431, Japan. Additional authors for this research include A. Hattori, T. Matsunaga, K. Takamochi, S. Oh and K. Suzuki.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s00595-016-1372-y. This DOI is a link to an online electronic document that is either free or for purchase.

**Bacterial RNA**

**Researchers at KRIIBB Report New Data on Bacterial RNA (Bacterial RNAs activate innate immunity in Arabidopsis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Bacterial RNA have been published. According to news reporting originating in Daejeon, South Korea, by NewsRx journalists, research stated, "The common molecular patterns of microbes play a critical role in the regulation of plant innate immunity. However, little is known about the role of nucleic acids in this process in plants.'"

Financial supporters for this research include BioNano Health-Guard Research Center, Ministry of Science, ICT and Future Planning, Rural Development Administration, Korea Research Institute of Bioscience and Biotechnology.

The news reporters obtained a quote from the research from KRIIBB, "We pre-infiltrated Arabidopsis leaves with total RNAs from Pseudomonas syringae pv. tomato DC3000 (Pto DC3000) and subsequently inoculated these plants with the same bacterial cells. Total Pto DC3000 RNAs pre-infiltrated into Arabidopsis leaves elicited plant immune responses against Pto DC3000. However, sheared RNAs and RNase A application failed to induce immunity, suggesting that intact bacterial RNAs function in plant innate immunity. This notion was supported by the positive regulation of superoxide anion levels, callose deposition, two mitogen-activated protein kinases and defense-related genes observed in bacterial RNA-pre-treated leaves. Intriguingly, the Pto DC3000 population was not compromised in known pattern recognition receptor mutants for chitin, flagellin and elongation factor-Tu (EF-Tu). Plant defense-related mutant analyses further revealed that bacterial RNA-elicited innate immunity was normally required for salicylic and jasmonic acid signaling. Notably, among total RNAs,
the abundant bacterial RNA species 16S and 23S ribosomal RNAs were the major determinants of this response."

According to the news reporters, the research concluded: "Our findings provide evidence that bacterial RNA serves as a microbe-associated molecular pattern in plants."

Our news correspondents report that additional information may be obtained by contacting B. Lee, Molecular Phytophagy Laboratory, Superbacteria Research Center, KRIIB, Daejeon, 305-806, South Korea. Additional authors for this research include Y.S. Park, S. Lee, G.C. Song and C.M Ryu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/nph.13717. This DOI is a link to an online electronic document that is either free or for purchase.

**Nervous System Diseases and Conditions - Seizures**

**Researchers at Kangwon National University School of Medicine Target Seizures (Inflammatory markers associated with seizures)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nervous System Diseases and Conditions - Seizures are presented in a new report. According to news reporting out of Chuncheon, South Korea, by NewsRx editors, research stated, "Seizures can produce systemic changes, including elevated body temperature, white blood cell count, and C-reactive protein levels, which raises concern for potential infection. We describe seizure-induced inflammation-like responses and discuss how these changes may be distinguished from those associated with infection."

Our news journalists obtained a quote from the research from the Kangwon National University School of Medicine, "We prospectively investigated 140 consecutive visits to the emergency room, in which patients presented with seizures. We defined elevated body temperature, white blood cell count, or C-reactive protein levels as inflammation-like responses. We investigated the occurrence of inflammation-like responses, characteristics of the seizures, neurological status at the initial visit, outcomes, and clinical findings to determine the presence of infection. We ascertained whether the patients had infection or not based on the overall information post-discharge. An inflammation-like response was observed in 56.3% of all visits and 19.3% were diagnosed with concurrent infection. Among the visits with inflammation-like response, 34.7% were shown to have an infection. Increases in body temperature and C-reactive protein levels were milder (<39°C and <6?mg/dl, respectively) in patients without infection compared to those with infection, whereas there was no difference in leukocytosis, with regard to the presence or absence of infection. Increased body temperature occurred only in cases of generalized tonic-clonic seizures, whereas leukocytosis and elevated C-reactive protein levels were reported in patients with any type of seizure. Body temperatures returned to normal within eight hours in uncomplicated cases. Seizures frequently induce an increase in body temperature, white blood cell count, or C-reactive protein levels, making it challenging to distinguish these
changes from those associated with infection."

According to the news editors, the research concluded: "Nonetheless, elevated body temperature in the absence of generalized tonic-clonic seizures, above 39.7°C, or persisting for more than eight hours after recovery of consciousness, and C-reactive protein levels above 6?mg/dl warrant close observation and consideration for concurrent infection."

Our news journalists report that additional information may be obtained by contacting H.S. Sohn, Dept. of Neurology, Kangwon National University School of Medicine, Chuncheon, South Korea. Additional authors for this research include S.K. Kim and S.Y Lee.

Keywords for this news article include: Asia, Albumins, Seizures, Chuncheon, Immunology, Proteomics, South Korea, Blood Cells, Inflammation, Immunoproteins, C Reactive Protein, Acute Phase Proteins, Neurologic Manifestations, Nervous System Diseases and Conditions.

**Obstructive Sleep Apnea**

**Researchers at Kaohsiung Chang Gung Memorial Hospital Target Obstructive Sleep Apnea (Whole Genome DNA Methylation Analysis of Obstructive Sleep Apnea: IL1R2, NPR2, AR, SP140 Methylation and Clinical Phenotype)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Obstructive Sleep Apnea. According to news reporting originating from Kaohsiung, Taiwan, by NewsRx correspondents, research stated, "We hypothesized that DNA methylation patterns may contribute to disease severity or the development of hypertension and excessive daytime sleepiness (EDS) in patients with obstructive sleep apnea (OSA). Illumina’s (San Diego, CA, USA) DNA methylation 27-K assay was used to identify differentially methylated loci (DML)."

Our news editors obtained a quote from the research from Kaohsiung Chang Gung Memorial Hospital, "DNA methylation levels were validated by pyrosequencing. A discovery cohort of 15 patients with OSA and 6 healthy subjects, and a validation cohort of 72 patients with sleep disordered breathing (SDB). Microarray analysis identified 636 DMLs in patients with OSA versus healthy subjects, and 327 DMLs in patients with OSA and hypertension versus those without hypertension. In the validation cohort, no significant difference in DNA methylation levels of six selected genes was found between the primary snoring subjects and OSA patients (primary outcome). However, a secondary outcome analysis showed that interleukin-1 receptor 2 (IL1R2) promoter methylation (-114 cytosine followed by guanine dinucleotide sequence [CpG] site) was decreased and IL1R2 protein levels were increased in the patients with SDB with an oxygen desaturation index >30. Androgen receptor (AR) promoter methylation (-531 CpG site) and AR protein levels were both increased in the patients with SDB with an oxygen desaturation index >30. Natriuretic peptide receptor 2 (NPR2) promoter methylation (-608/-618 CpG sites) were decreased, whereas levels of both NPR2 and serum C type natriuretic peptide protein were increased in the SDB patients with EDS. Speckled protein..."
140 (SP140) promoter methylation (-194 CpG site) was increased, and SP140 protein levels were decreased in the patients with SDB and EDS. IL1R2 hypomethylation and AR hypermethylation may constitute an important determinant of disease severity, whereas NPR2 hypomethylation and SP140 hypermethylation may provide a biomarker for vulnerability to EDS in OSA."

According to the news editors, the research concluded: "A commentary on this article appears in this issue on page 723."

The news editors report that additional information may be obtained by contacting Y.C. Chen, Division of Pulmonary and Critical Care Medicine, Kaohsiung Chang Gung Memorial Hospital and Chang Gung University College of Medicine, Kaohsiung, Taiwan. Additional authors for this research include T.W. Chen, M.C. Su, K.D. Chen, C.W. Liou, P. Tang, T.Y. Wang, J.C. Chang, C.C. Wang, H.C. Lin, C.H. Chin, K.T. Huang, M.C. Lin and C.C Hsiao.

**Autoimmune Diseases and Conditions - Rheumatoid...**

**Researchers at Karolinska University Hospital Discuss Findings in Rheumatoid Arthritis (Is rheumatoid arthritis an autoimmune disease?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Autoimmune Diseases and Conditions - Rheumatoid Arthritis. According to news originating from Stockholm, Sweden, by NewsRx correspondents, research stated, "Rheumatoid arthritis (RA) is not a homogenous disease entity but a syndrome with different causes and abnormalities with shared clinical manifestations. One major subset is anticitrullinated protein antibody (ACPA)-positive RA, which represents the larger fraction of RA patients and where autoantibodies and HLA class II association implicate an autoimmune condition."

Our news journalists obtained a quote from the research from Karolinska University Hospital, "In the past few years, the specificity of the ACPA response and the possibility to subdivide patients based on ACPA subgroups have received much attention whereas the effector functions of the autoantibodies and underlying lymphocytes have not. The review, based on HLA, will discuss the generation of the autoreactive citrulline-specific T-cell repertoire, highlight our current understanding of T-cell specificities and effector functions of both the T cells and ACPAs. Dividing RA into subsets has only influenced clinical practice to a limited degree, that is, by indicating a better response to therapies modulating adaptive immunity, such
as rituximab, in the ACPA+ disease subset."

According to the news editors, the research concluded: "A more detailed understanding of the immune reactions underlying various subsets of RA may, however, change our view on RA therapeutics and prevention with the assumption that autoimmune variants of RA should be both curable and preventable."

For more information on this research see: Is rheumatoid arthritis an autoimmune disease? *Current Opinion In Rheumatology*, 2016;28(2):181-8. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Rheumatology - journals.lww.com/co-rheumatology/pages/default.aspx)

The news correspondents report that additional information may be obtained from K. Chemin, Rheumatology Unit, Dept. of Medicine, Karolinska University Hospital Solna, Karolinska Institutet, Stockholm, Sweden. Additional authors for this research include L. Klareskog and V. Malmstrom.

**Heart Disorders and Diseases - Heart Failure**

**Researchers at Karolinska University Hospital Have Reported New Data on Heart Failure (Cardioprotection and lifespan extension by the natural polyamine spermidine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Failure. According to news reporting originating in Stockholm, Sweden, by NewsRx journalists, research stated, "Aging is associated with an increased risk of cardiovascular disease and death. Here we show that oral supplementation of the natural polyamine spermidine extends the lifespan of mice and exerts cardioprotective effects, reducing cardiac hypertrophy and preserving diastolic function in old mice."

The news reporters obtained a quote from the research from Karolinska University Hospital, "Spermidine feeding enhanced cardiac autophagy, mitophagy and mitochondrial respiration, and it also improved the mechano-elastic properties of cardiomyocytes in vivo, coinciding with increased titin phosphorylation and suppressed subclinical inflammation. Spermidine feeding failed to provide cardioprotection in mice that lack the autophagy-related protein Atg5 in cardiomyocytes. In Dahl salt-sensitive rats that were fed a high-salt diet, a model for hypertension-induced congestive heart failure, spermidine feeding reduced systemic blood pressure, increased titin phosphorylation and prevented cardiac hypertrophy and a decline in diastolic function, thus delaying the progression to heart failure. In humans, high levels of dietary spermidine, as assessed from food questionnaires, correlated with reduced blood pressure and a lower incidence of cardiovascular disease."
According to the news reporters, the research concluded: "Our results suggest a new and feasible strategy for protection against cardiovascular disease."

For more information on this research see: Cardioprotection and lifespan extension by the natural polyamine spermidine. *Nature Medicine*, 2016;22(12):1428-1438,91-96. *Nature Medicine* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. **Oncology - Kidney Cancer**

**Researchers at Keimyung University Report Findings in Kidney Cancer (Galangin sensitizes TRAIL-induced apoptosis through down-regulation of anti-apoptotic proteins in renal carcinoma Caki cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Kidney Cancer. According to news reporting originating in Daegu, South Korea, by NewsRx journalists, research stated, "Galangin, bioflavonoids, has been shown anti-cancer properties in various cancer cells. In this study, we investigated whether galangin could enhance TRAIL-mediated apoptosis in TRAIL resistant renal carcinoma Caki cells."

The news reporters obtained a quote from the research from Keimyung University, "Galangin alone and TRAIL alone had no effect on apoptosis, while combined treatment with galangin and TRAIL significantly induced apoptosis in renal carcinoma (Caki, ACHN and A498) but not normal cells (normal mouse kidney cells and human normal mesangial cells). Galangin induced down-regulation of Bcl-2 protein at the transcriptional level via inhibition of NF-kB activation but not p53 pathway. Furthermore, galangin induced down-regulation of cFLIP, Mcl-1 and survivin expression at the post-translational levels, and the over-expression of Bcl-2, cFLIP, Mcl-1 and survivin markedly reduced galangin-induced TRAIL sensitization. In addition, galangin increased proteasome activity, but galangin had no effect on expression of proteasome subunits (PSMA5 and PSMD4)."

According to the news reporters, the research concluded: "Our investigation suggests
that galangin is a potent candidate for sensitizer of TRAIL resistant cancer cell therapy."

For more information on this research see: Galangin sensitizes TRAIL-induced apoptosis through down-regulation of anti-apoptotic proteins in renal carcinoma Caki cells. *Scientific Reports*, 2016;6():18642. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Nutritional and Metabolic Diseases and Conditions**

**Researchers at King Saud University Report New Data on Diabetic Nephropathy (Ruboxistaurin attenuates diabetic nephropathy via modulation of TGF-b1/Smad and GRAP pathways)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Diabetic Nephropathy have been published. According to news reporting from Riyadh, Saudi Arabia, by NewsRx journalists, research stated, "To investigate whether ruboxistaurin (a selective PKC-b inhibitor) mediates renoprotective effect via interference with TGF-b1/Smad-GRAP cross-signalling. Diabetes was induced in rats by a single intraperitoneal injection of streptozotocin (55 mg/kg)."

Financial supporters for this research include King Abdulaziz City for Science and Technology, Research Center of the Center for Female Scientific and Medical Colleges, Deanship of Scientific Research, King Faisal Specialist Hospital and Research Centre.

The news correspondents obtained a quote from the research from King Saud University, "Then, the diabetic rats were treated with ruboxistaurin (10 mg/kg, p.o) for 6 weeks. Valsartan (15 mg/kg, p.o) was used as a positive control. After 6 weeks of treatment, diabetic nephropathy biomarkers were assessed. TGF-b1, Smad2, and Smad3 mRNA and protein levels were detected using qPCR and western blot analysis. Data showed that serum creatinine, kidney/body weight ratio and urinary albumin excretion significantly increased in diabetic rats. These changes were significantly attenuated by treatment with ruboxistaurin. A significant up-regulation of TGF-b1, Smad2 and Smad3 mRNA expression was observed in diabetic rats, which was alleviated by administration of ruboxistaurin. Furthermore, immunoblotting showed a significant improvement in protein levels of TGF-b1 (p <0.01), Smad2/3 (p <0.01) and p-Smad3 (p <0.001) in diabetic rats treated with ruboxistaurin compared to untreated. Importantly, the reduction in GRAP protein expression in diabetic kidney was prevented by treatment with ruboxistaurin."
According to the news reporters, the research concluded: "These data suggest that the renoprotective effect of ruboxistaurin is possibly due to down-regulation of TGF-b1/Smad pathway and normalization of GRAP protein expression."

Our news journalists report that additional information may be obtained by contacting A.S. Al-Onazi, Dept. of Pharmacology and Toxicology, College of Pharmacy, King Saud University, Riyadh, Saudi Arabia. Additional authors for this research include N.M. Al-Rasheed, H.A. Attia, N.M. Al-Rasheed, R.M. Ahmed, M.A. Al-Amin and C. Poizat.

**Health and Medicine - Sexual and Reproductive Health**

**Researchers at Kirby Institute Report New Data on Sexual and Reproductive Health (Is sexual content in new media linked to sexual risk behaviour in young people? A systematic review and meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Health and Medicine - Sexual and Reproductive Health have been presented. According to news reporting out of Sydney, Australia, by NewsRx editors, research stated, "Social networking and digital media increasingly have an impact on the lives of young people. We undertook a systematic review and meta-analysis of studies that examined the relationship between exposure to sexually explicit websites (SEWs) and 'sexting' (i.e. sending semi-nude or nude photos from a mobile phone) and the sexual attitudes and practices of young people."

Our news journalists obtained a quote from the research from Kirby Institute, "In accordance with the Preferred Reporting Items for Systematic Reviews and Meta Analyses statement, Medline, EMBASE and PsycINFO were searched for papers that described the statistical association between viewing SEWs or sexting by young people (defined as 10-24 years) and their sexual attitudes and behaviours. Fourteen studies, all cross-sectional in design, met the inclusion criteria. Six studies (10 352 participants) examined young people's exposure to SEWs and eight (10 429 participants) examined sexting. There was substantial variation across studies in exposure and outcome definitions. Meta-analyses found that SEW exposure was correlated with condomless sexual intercourse (odds ratio (OR) 1.23, 95% confidence interval (CI): 1.08-1.38, two studies); sexting was correlated with ever having had sexual intercourse (OR 5.58, 95% CI: 4.46-6.71, five studies), recent sexual activity (OR 4.79, 95% CI: 3.55-6.04, two studies), alcohol and other drug use before sexual intercourse (OR 2.65, 95% CI: 1.99-3.32, two studies) and multiple recent sexual partners (OR 2.79, 95% CI: 1.95-3.63, two studies)."
Most studies had limited adjustment for important potential confounders. Cross-sectional studies show a strong association between self-reported exposure to sexual content in new media and sexual behaviours in young people."

According to the news editors, the research concluded: "Longitudinal studies would provide a greater opportunity to adjust for confounding, and better insight into the causal pathways underlying the observed associations."

Our news journalists report that additional information may be obtained by contacting L.W. Smith, Univ New South Wales, Kirby Inst, Sydney, NSW 2052, Australia. Neuropathic Pain

Researchers at Kitasato University School of Medicine Target Neuropathic Pain (Elevation of Microglial Basic Fibroblast Growth Factor Contributes to Development of Neuropathic Pain after Spinal Nerve Ligation in Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Neuropathic Pain are discussed in a new report. According to news reporting originating from Sagamihara, Japan, by NewsRx correspondents, research stated, "Reverse transcriptase-polymerase chain reaction (RT-PCR) and immunohistological analysis of spinal cord and pain behavior analysis in a rat neuropathic pain model were conducted to examine the function of microglial basic fibroblast growth factor (bFGF) in the development of neuropathic pain. To investigate the role of bFGF in spinal microglia during the development of allodynia following spinal nerve ligation in rats."

Our news editors obtained a quote from the research from the Kitasato University School of Medicine, "Evidence suggests that the production of bFGF by spinal cord glial cells is increased in response to peripheral nerve injury. Although an association between bFGF and astrocytes has been widely reported, the relationship between bFGF and microglia, particularly with respect to the development of neuropathic pain, remains poorly understood. Spinal nerve ligation rats were used. After surgery, bFGF expression in the spinal cord was investigated using RT-PCR and immunohistochemistry. Neutralizing antibodies to bFGF were injected intrathecally into rats after spinal nerve ligation. Spinal cords were used for RT-PCR analysis and pain behavior was analyzed using the von Frey test. bFGF mRNA expression was significantly increased in the spinal cord 6 hours after spinal nerve ligation compared with untreated rats. Immunohistochemical analysis revealed that bFGF co-localized with ionized calcium-binding adaptor molecule 1, a microglial marker, and myeloperoxidase. Neutralizing
antibodies to bFGF attenuated mechanical allodynia and myeloperoxidase mRNA expression. bFGF increased in spinal microglia during the development allodynia after spinal nerve ligation."

According to the news editors, the research concluded: "Thus, controlling bFGF release from microglia during the acute stage of peripheral nerve injury may suppress the progression of allodynia."

For more information on this research see: Elevation of Microglial Basic Fibroblast Growth Factor Contributes to Development of Neuropathic Pain after Spinal Nerve Ligation in Rats. Spine, 2016;41(3):E108-15. (Lippincott Williams and Wilkins - www.lww.com; Spine - journals.lww.com/spinejournal/pages/default.aspx)

Angiogenesis

Researchers at Kobe University Report New Data on Angiogenesis (PKN3 is the major regulator of angiogenesis and tumor metastasis in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Angiogenesis is now available. According to news reporting out of Kobe, Japan, by NewsRx editors, research stated, "PKN, a conserved family member related to PKC, was the first protein kinase identified as a target of the small GTPase Rho. PKN is involved in various functions including cytoskeletal arrangement and cell adhesion."

Furthermore, the enrichment of PKN3 mRNA in some cancer cell lines as well as its requirement in malignant prostate cell growth suggested its involvement in oncogenesis. Despite intensive research efforts, physiological as well as pathological roles of PKN3 in vivo remain elusive. Here, we generated mice with a targeted deletion of PKN3. The PKN3 knockout (KO) mice are viable and develop normally. However, the absence of PKN3 had an impact on angiogenesis as evidenced by marked suppressions of micro-vessel sprouting in ex vivo aortic ring assay and in vivo corneal pocket assay. Furthermore, the PKN3 KO mice exhibited an impaired lung metastasis of melanoma cells when administered from the tail vein. Importantly, PKN3 knock-down by small interfering RNA (siRNA) induced a glycosylation defect of cell-
surface glycoproteins, including ICAM-1, integrin b1 and integrin a5 in HUVECs."

According to the news editors, the research concluded: "Our data provide the first in vivo genetic demonstration that PKN3 plays critical roles in angiogenesis and tumor metastasis, and that defective maturation of cell surface glycoproteins might underlie these phenotypes."

For more information on this research see: PKN3 is the major regulator of angiogenesis and tumor metastasis in mice. Scientific Reports, 2016;6():18979. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting H. Mukai, Biosignal Research Center, Kobe University, Kobe 657-8501, Japan. Diarylethanoloids

Researchers at Konkuk University Have Reported New Data on Diarylethanoloids (Complexation of curcumin with 2-aminoethyl diphenyl borate and implications for spatiotemporal fluorescence monitoring)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Diarylethanoloids have been presented. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "In this study, we successfully determined spatiotemporal distribution of curcumin in mice via simple and fast fluorescence detection of native curcumin and stabilized curcumin. We used 2-aminoethyl diphenyl borate (DPBA) as a stabilizer of curcumin, which binds to curcumin and enhances its aqueous stability."

Financial supporters for this research include Ministry of Education, Science and Technology, Agri-Bio Industry Technology Development Program.

Our news journalists obtained a quote from the research from Konkuk University, "After intravenous injection, curcumin and DPBA-curcumin complexes showed similar fluorescence intensities in the brain, pancreas, lungs, and kidneys at 15 min. However, stabilized DPBA-curcumin complexes exhibited much stronger fluorescent signals at metabolically active sites such as liver tissues than native curcumin. After incubation for 1-3 h, native curcumin showed significantly rapid reduction of fluorescent signals, compared to DPBA-curcumin complexes, probably due to degradation and reduction. In addition, complicate extraction procedures inhibited precise fluorescent monitoring of unstable curcumin, which result in different biodistribution of curcumin before and after extraction."

According to the news editors, the research concluded: "Direct fluorescent
monitoring could allow evaluation of in vivo distribution and fate of curcumin, which could be also applied to diverse natural polyphenols with fluorescent signals."

The news correspondents report that additional information may be obtained from H. Mok, Konkuk University, Dept. of Biosci & Biotechnol, Seoul 143701, South Korea. Additional authors for this research include H. Jung, G. Yu, Y. Chong and H. Mok.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.073. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Seoul, South Korea, Asia, Organic Chemicals, Diarylheptanoids, Hydrocarbons, Catechols, Curcumin, Alkanes, Konkuk University.

Hematology - Plasma

Researchers at Korea Basic Science Institute Target Plasma [Investigation of relative metabolic changes in the organs and plasma of rats exposed to X-ray radiation using HR-MAS (1)H NMR and solution (1)H NMR]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematology - Plasma are discussed in a new report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Excess exposure to ionizing radiation generates reactive oxygen species and increases the cellular inflammatory response by modifying various metabolic pathways. However, an investigation of metabolic perturbations and organ-specific responses based on the amount of radiation during the acute phase has not been conducted."

Funders for this research include Korea Basic Science Institute, National Research Council of Science and Technology, Ministry of Science, ICT and Future Planning, Korea.

Our news editors obtained a quote from the research from Korea Basic Science Institute, "In this study, high-resolution magic-angle-spinning (HR-MAS) NMR and solution NMR-based metabolic profiling were used to investigate dose-dependent metabolic changes in multiple organs and tissues--including the jejunum, spleen, liver, and plasma--of rats exposed to X-ray radiation. The organs, tissues, and blood samples were obtained 24, 48, and 72 h after exposure to low-dose (2 Gy) and high-dose (6 Gy) X-ray radiation and subjected to metabolite profiling and multivariate analyses. The results showed the time course of the metabolic responses, and many significant changes were detected in the high-dose compared with the low-dose group. Metabolites with antioxidant properties showed acute responses in the jejunum and spleen after radiation exposure. The levels of metabolites related to lipid and protein metabolism were decreased in the jejunum. In addition, amino acid levels increased consistently at all post-
irradiation time points as a consequence of activated protein breakdown. Consistent with these changes, plasma levels of tricarboxylic acid cycle intermediate metabolites decreased. The liver did not appear to undergo remarkable metabolic changes after radiation exposure.

According to the news editors, the research concluded: "These results may provide insight into the major metabolic perturbations and mechanisms of the biological systems in response to pathophysiological damage caused by X-ray radiation."

The news editors report that additional information may be obtained by contacting W.G. Jang, Integrated Metabolomics Research Group, Western Seoul Center, Korea Basic Science Institute, Seoul, South Korea. Additional authors for this research include J.Y. Park, J. Lee, E. Bang, S.R. Kim, E.K. Lee, H.J. Yun, C.M. Kang and G.S Hwang.

Oncology - Liver Cancer

Researchers at Korea University School of Medicine Target Liver Cancer (The management and prognosis of patients with hepatocellular carcinoma: what has changed in 20 years?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "There has been remarkable progress in the management of hepatocellular carcinoma (HCC) during the last several decades, but its effect on the prognosis of HCC patient needs clarification. We analysed the changes that affected prognosis of HCC patients diagnosed over two different eras."

Funders for this research include Korea Healthcare Technology R&D Project, Ministry of Health and Welfare.

Our news editors obtained a quote from the research from the Korea University School of Medicine, "A retrospective study of 1318 patients diagnosed with HCC from 1986 to 2012 was conducted. Analysis was done according to two cohorts, cohort 1 (patients diagnosed with HCC from 1986 to 1992) and cohort 2 (patients diagnosed from 2006 to 2012). Hepatitis B virus was the most common cause of liver disease for both cohorts (66.2% and 66.0%). The proportion of patients with Barcelona Clinic Liver Cancer stage 0/A was significantly lower in cohort 1 than in cohort 2 (14.4% vs. 39.5%, p<0.001). The proportions of patients diagnosed during surveillance and general health check-up were significantly higher in cohort 2 than in cohort 1 (28.6% vs. 10.6% and 26.3% vs. 7.9%, respectively) while those diagnosed during
symptomatic evaluation was significantly higher in cohort 1 than in cohort 2 (45.1 vs. 81.4%, p <0.001). Surgical resection rate was similar between the two cohorts (26.1% vs 26%) while the transcatheter arterial chemoembolization rate which was the highest in cohort 1 (40.6%) was overtaken by radiofrequency ablation in cohort 2 (55%) at BCLC stage 0/A. Median survival duration in cohort 2 was significantly longer than cohort 1 (65.0 vs. 7.9 months, p<0.001)."

According to the news editors, the research concluded: "Implementation of national cancer surveillance and the advancement of treatment modalities have likely led to early detection of HCC and improvements in prognosis over the last 20 years."

The news editors report that additional information may be obtained by contacting S.Y. Yim, Division of Gastroenterology and Hepatology, Dept. of Internal Medicine, Korea University College of Medicine, Seoul, South Korea. Additional authors for this research include Y.S. Seo, C.H. Jung, T.H. Kim, J.M. Lee, E.S. Kim, B. Keum, Y.K. Jong, H. An, J.H. Kim, H.J. Yim, D.S. Kim, Y.T. Jeen, J.E. Yeon, H.S. Lee, H.J. Chun, K.S. Byun, S.H. Um, C.D. Kim and H.S Ryu.

Aromatic Amino Acids

Researchers at Kumamoto University Target Aromatic Amino Acids (Nuclear magnetic resonance analysis of the conformational state of cancer mutant of fibroblast growth factor receptor 1 tyrosine kinase domain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Aromatic Amino Acids. According to news reporting originating in Kumamoto, Japan, by NewsRx journalists, research stated, "Tyrosine kinases are key enzymes that play critical roles in growth signaling, the abnormal activation of which is associated with various human cancers. Activation of tyrosine kinases is mediated by tyrosine phosphorylation in the activation-loop, which transforms the catalytic domain to the active state conformation."

Funders for this research include Scientific Research on Innovative Areas, Creation of Innovation Centers for Advanced Interdisciplinary Research Areas Program, JSPS KAKENHI, Takeda Science Foundation.
The news reporters obtained a quote from the research from Kumamoto University, "Cancer mutations are supposed to transform the conformation of the catalytic domain into the active-form independent of the phosphorylation state of the activation-loop. Here, we report structural and biophysical analyses of cancer mutations of the tyrosine kinase domain of fibroblast growth factor receptor 1 (FGFR1)."

According to the news reporters, the research concluded: "Based on the nuclear magnetic resonance analyses, phosphorylation of the activation-loop exhibited cooperative structural transition in the activation-loop, C-helix and P-loop regions, whereas cancer mutations induced structural transformation at either one or two of these regions."

For more information on this research see: Nuclear magnetic resonance analysis of the conformational state of cancer mutant of fibroblast growth factor receptor 1 tyrosine kinase domain. Genes To Cells, 2016;21(4):350-7. (Wiley-Blackwell - www.wiley.com/; Genes To Cells - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1365-2443)

Our news correspondents report that additional information may be obtained by contacting Y. Kobashigawa, Dept. of Analytical and Biophysical Chemistry, Faculty of Life Sciences, Kumamoto University, Kumamoto, 862-0973, Japan. Additional authors for this research include S. Amano, K. Yōza, R. Himeno, S. Amemiya, H. Morioka, M. Yokogawa, H. Kumeta, J. Schlessinger and F. Inagaki.

Apoptosis
Researchers at Kyung Hee University Release New Data on Apoptosis (Blockage of STAT3 Signaling Pathway by Morusin Induces Apoptosis and Inhibits Invasion in Human Pancreatic Tumor Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Apoptosis have been published. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Signal transducer and activator of transcription 3 (STAT3) is an oncogenic transcription factor implicated in carcinogenesis. Here, we investigated the role of morusin, the major prenylfлавonoid, isolated from Chinese herbal medicine in abrogating the constitutive STAT3 activation in human pancreatic tumor cells."

Our news journalists obtained a quote from the research from Kyung Hee University, "The effect of morusin on STAT3 activation, associated protein kinases, STAT3-regulated gene products, cellular proliferation, and apoptosis was examined. Morusin specifically inhibited constitutive STAT3 activation both at tyrosine residue 705 and serine residue 727 in 4 pancreatic tumor cells. The inhibition of STAT3 was mediated through the suppression of activation of upstream JAK1, JAK2, and c-Src kinases. Morusin led to the accumulation of the
cells in different phases of the cell cycle and caused induction of apoptosis and loss of mitochondrial membrane potential. Morusin downregulated the expression of various STAT3-regulated gene products; this correlated with induction of caspase-3 activation and anti-invasive effects. Treatment with the protein tyrosine phosphatase inhibitor pervanadate reversed the morusin-induced downregulation of STAT3, thereby suggesting the involvement of a protein tyrosine phosphatase."

According to the news editors, the research concluded: "Morusin is a novel blocker of STAT3 activation and thus may have potential in negative regulation of growth and metastasis of pancreatic tumor cells."

For more information on this research see: Blockage of STAT3 Signaling Pathway by Morusin Induces Apoptosis and Inhibits Invasion in Human Pancreatic Tumor Cells. Pancreas, 2016;45(3):409-19. (Lippincott Williams and Wilkins - www.lww.com; Pancreas - journals.lww.com/pancreasjournal/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting C. Kim, From the College of Korean Medicine, Kyung Hee University, Seoul, South Korea. Additional authors for this research include J.H. Kim, E.Y. Oh, D. Nam, S.G. Lee, J. Lee, S.H. Kim, B.S. Shim and K.S. Ahn.

Macropinocytosis

Researchers at Lanzhou Veterinary Research Institute Target Macropinocytosis (Productive Entry of Foot-and-Mouth Disease Virus via Macropinocytosis Independent of Phosphatidylinositol 3-Kinase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Macropinocytosis have been presented. According to news originating from Lanzhou, People's Republic of China, by NewsRx correspondents, research stated, "Virus entry is an attractive target for therapeutic intervention. Here, using a combination of electron microscopy, immunofluorescence assay, siRNA interference, specific pharmacological inhibitors, and dominant negative mutation, we demonstrated that the entry of foot-and-mouth disease virus (FMDV) triggered a substantial amount of plasma membrane ruffling."

Our news journalists obtained a quote from the research from Lanzhou Veterinary Research Institute, "We also found that the internalization of FMDV induced a robust increase in fluid-phase uptake, and virions internalized within macropinosomes colocalized with phase uptake marker dextran. During this stage, the Rac1-Pak1 signaling pathway was activated. After specific inhibition on actin, Na(+)/H(+) exchanger, receptor tyrosine kinase, Rac1, Pak1, myosin II, and protein kinase C, the entry and infection of FMDV significantly decreased. However, inhibition of phosphatidylinositol 3-kinase (PI3K) did not reduce FMDV internalization but increased the viral entry and infection to a certain extent, implying that FMDV entry did not
require PI3K activity. Results showed that internalization of FMDV exhibited the main hallmarks of macropinocytosis. Moreover, intracellular trafficking of FMDV involves EEA1/Rab5-positive vesicles. The present study demonstrated macropinocytosis as another endocytic pathway apart from the clathrin-mediated pathway."

According to the news editors, the research concluded: "The findings greatly expand our understanding of the molecular mechanisms of FMDV entry into cells, as well as provide potential insights into the entry mechanisms of other picornaviruses."

For more information on this research see: Productive Entry of Foot-and-Mouth Disease Virus via Macropinocytosis Independent of Phosphatidylinositol 3-Kinase. Scientific Reports, 2016;6():19294. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from S.C. Han, State Key Laboratory of Veterinary Etiological Biology and OIE, National Foot and Mouth Disease Reference Laboratory, Lanzhou Veterinary Research Institute, Chinese Academy of Agricultural Sciences, Lanzhou, Gansu, People's Republic of China. DNA Research

Researchers at Lipscomb University Release New Data on DNA Research [Examination of the Impact of Copper(II) a-(N)-Heterocyclic Thiosemicarbazone Complexes on DNA Topoisomerase Ila]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on DNA Research are presented in a new report. According to news reporting originating in Nashville, Tennessee, by NewsRx journalists, research stated, "Type II DNA topoisomerases resolve topological knots and tangles in DNA that result from routine cellular processes and are effective targets for anticancer therapeutics. To this end, thiosemicarbazones have been identified as having the ability to kill cancer cells from several cell lines."

Financial supporters for this research include College of Pharmacy and Health Sciences, Lipscomb University, Office of the Provost, Tennessee Technological University.

The news reporters obtained a quote from the research from Lipscomb University, "Literature evidence suggests that at least some thiosemicarbazones have an impact on topoisomerase II activity. However, the mechanism is not as clearly defined. Therefore, we set out to analyze the activity of four a-(N)-heterocyclic thiosemicarbazone compounds against topoisomerase Ila. The ligands, acetylpyridine-ethylthiosemicarbazone (APY-ETSC) and acetylpyrazine-methylthiosemicarbazone (APZ-MTSC), and their copper(II) [Cu(II)] complexes
[Cu(APY-ETSC)Cl] and [Cu(APZ-MTSC)Cl] were examined for the ability to impact the catalytic cycle of human topoisomerase IIa. Both [Cu(APY-ETSC)Cl] and [Cu(APZ-MTSC)Cl] were more effective at inhibiting DNA relaxation compared with the ligands alone. Further, both [Cu(APY-ETSC)Cl] and [Cu(APZ-MTSC)Cl] increased double-stranded DNA cleavage levels without inhibiting topoisomerase IIa-mediated DNA ligation. The Cu(II) complexes inactivate enzyme activity over time suggesting a critical interaction with the enzyme. Additionally, we found that the Cu(II)-thiosemicarbazone complexes do not significantly impact DNA cleavage by the catalytic core of the enzyme. This evidence is supported by the fact that both [Cu(APY-ETSC)Cl] and [Cu(APZ-MTSC)Cl], and to a lesser extent the ligands, inhibit topoisomerase IIa-mediated ATP hydrolysis. Based upon kinetic analysis, the Cu(II) complexes appear to be noncompetitive inhibitors of the ATPase domain of topoisomerase IIa.

According to the news reporters, the research concluded: "Taken together, our results provide evidence that Cu(II) complexes of a-(N)-heterocyclic thiosemicarbazones catalytically inhibit the enzyme through the ATPase domain but also promote double-stranded DNA cleavage by the enzyme."

For more information on this research see: Examination of the Impact of Copper(II) a-(N)-Heterocyclic Thiosemicarbazone Complexes on DNA Topoisomerase IIa. Chemical Research In Toxicology, 2016;29(4):649-58. (American Chemical Society - www.acs.org; Chemical Research In Toxicology - www.pubs.acs.org/journal/crtoec)

Oncology - Prostate Cancer

Researchers at Lister Hospital Release New Data on Prostate Cancer [The Role of Positron Emission Tomography With (68)Gallium (Ga)-Labeled Prostate-specific Membrane Antigen (PSMA) in the Management of Patients With Organ-confined and Locally ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to news originating from Stevenage, United Kingdom, by NewsRx correspondents, research stated, "The role of positron emission tomography (PET) with (68)Gallium (Ga)-labeled prostate-specific membrane antigen (PSMA) imaging for prostate cancer is gaining prominence. Current imaging strategies, despite having progressed significantly, have limitations, in particular their ability to diagnose metastatic lymph node involvement."

Our news journalists obtained a quote from the research from Lister Hospital,
"Preliminary results of PET with Ga-68-labeled PSMA have shown encouraging results, particularly in the recurrent prostate cancer setting. Furthermore, the ability of PET with Ga-68-labeled PSMA of playing a dual diagnostic and therapeutic setting (theranostics) is currently being investigated as well."

According to the news editors, the research concluded: "PET with Ga-68-labeled PSMA certainly has a role to play in bridging some of the voids in contemporary prostate cancer imaging tools."

For more information on this research see: The Role of Positron Emission Tomography With (68)Gallium (Ga)-Labeled Prostate-specific Membrane Antigen (PSMA) in the Management of Patients With Organ-confined and Locally Advanced Prostate Cancer Prior to Radical Treatment and After Radical Prost. Oncology - Leukemia

Researchers at Loma Linda University School of Medicine Target Leukemia (Fine-tuning patient-derived xenograft models for precision medicine approaches in leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Leukemia have been published. According to news reporting from Loma Linda, California, by NewsRx journalists, research stated, "Many leukemias are characterized by well-known mutations that drive oncogenesis. Mice engineered with these mutations provide a foundation for understanding leukemogenesis and identifying therapies."

The news correspondents obtained a quote from the research from the Loma Linda University School of Medicine, "However, data from whole genome studies provide evidence that malignancies are characterized by multiple genetic alterations that vary between patients, as well as inherited genetic variation that can also contribute to oncogenesis. Improved outcomes will require precision medicine approaches-targeted therapies tailored to malignancies in each patient. Preclinical models that reflect the range of mutations and the genetic background present in patient populations are required to develop and test the combinations of therapies that will be used to provide precision medicine therapeutic strategies. Patient-derived xenografts (PDX) produced by transplanting leukemia cells from patients into immune deficient mice provide preclinical models where disease mechanisms and therapeutic efficacy can be studied in vivo in context of the genetic variability present in patient tumors. PDX models are possible because many elements in the bone marrow microenvironment show cross-species activity between mice and humans. However, several cytokines likely to impact leukemia cells are
species-specific with limited activity on transplanted human leukemia cells. In this review we discuss the importance of PDX models for developing precision medicine approaches to leukemia treatment."

According to the news reporters, the research concluded: "We illustrate how PDX models can be optimized to overcome a lack of cross-species cytokine activity by reviewing a recent strategy developed for use with a high-risk form of B-cell acute lymphoblastic leukemia (B-ALL) that is characterized by overexpression of CRLF2, a receptor component for the cytokine, TSLP."

For more information on this research see: Fine-tuning patient-derived xenograft models for precision medicine approaches in leukemia. Journal of Investigative Medicine, 2016;64(3):740-4. (Lippincott Williams and Wilkins - www.lww.com; Journal of Investigative Medicine - journals.lww.com/jinvestigativemed/pages/default.aspx)

Researchers at Los Angeles Biomedical Research Institute Detail Findings in Hypertriglyceridemia (Effects of eicosapentaenoic acid and docosahexaenoic acid on lipoproteins in hypertriglyceridemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Hypertriglyceridemia. According to news reporting out of Torrance, California, by NewsRx editors, research stated, "The treatment of hypertriglyceridemia (HTG) with o-3 fatty acid preparations adds a novel therapy to reduce cardiovascular disease. This review examines the effects of eicosapentaenoic acid (EPA) and docosahexaenoic acid on lipoproteins and the cardioprotective effects in HTG."

Our news journalists obtained a quote from the research from Los Angeles Biomedical Research Institute, "The evidence that o-3 fatty acid therapy at prescription strength is effective and safe at lowering triglyceride levels is growing. Although EPA/docosahexaenoic acid formulations did lower triglyceride levels, an increase in low-density lipoproteins was observed and outcome data were mixed. More recent trials have shown that decreased levels of low-density lipoprotein can be achieved with EPA preparations. Although the cardiovascular outcomes data are not fully available, meta-analysis of available data reports protection against vascular disease. The addition of o-3 fatty acid treatment should be considered in patients with
severe HTG as well as high-risk patients for atherosclerotic disease."

According to the news editors, the research concluded: "Emerging data are supportive, but long-term outcome studies are still underway."

For more information on this research see: Effects of eicosapentaenoic acid and docosahexaenoic acid on lipoproteins in hypertriglyceridemia. Current Opinion In Endocrinology, Diabetes, and Obesity, 2016;23(2):145-9.

Our news journalists report that additional information may be obtained by contacting A.A. Patel, Los Angeles Biomedical Research Institute, Harbor-UCLA Medical Center, Torrance, California, United States.

Lung Diseases and Conditions - Asthma

Researchers at Lund University Release New Data on Asthma (Osteopontin binds and modulates functions of eosinophil-recruiting chemokines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Asthma. According to news reporting out of Lund, Sweden, by NewsRx editors, research stated, "Allergic asthma is characterized by eosinophilic inflammation and airway obstruction. There is also an increased risk of pulmonary infection caused by Streptococcus pneumoniae, in particular during severe asthma where high levels of the glycoprotein, osteopontin (OPN), are present in the airways."

Financial supporters for this research include Vetenskapsradet, Swedish Heart and Lung Foundation, Medical Faculty of Lund University, Swedish Government Funds for Clinical Research (ALF), Stiftelsen for Strategisk Forskning, Fysiografen Sallskapet, Foundations of Th. C. Bergh, and Alfred Osterlund.

Our news journalists obtained a quote from the research from Lund University, "Eosinophils can be recruited by chemokines activating the receptor CCR3 including eotaxin-1/CCL11, eotaxin-2/CCL24, eotaxin-3/CCL26, RANTES/CCL5, and MEC/CCL28. In addition to inducing chemotaxis, several of these molecules have defensin-like antibacterial properties. This study set out to elucidate the functional consequences of OPN binding to eosinophil-recruiting chemokines. Antibacterial activities of the chemokines were investigated using viable count assays and electron microscopy. Binding studies were performed by means of surface plasmon resonance. The potential interference of OPN with antibacterial, receptor-activating, and lipopolysaccharide-neutralizing abilities of these chemokines was investigated. We found that OPN bound all eosinophil-recruiting chemokines with high affinity except for CCL5. The eosinophil-recruiting chemokines all displayed bactericidal activity against S. pneumoniae, but
only CCL26 and CCL28 retained high antibacterial activity in the presence of sodium chloride at physiologic concentrations. Preincubation of the chemokines with OPN strongly inhibited their antibacterial activity against S. pneumoniae but did not affect their ability to activate CCR3. All chemokines investigated showed LPS-neutralizing activity that was impaired by OPN only in the case of CCL24. The data suggest that OPN may impair host defense activities of the chemokines without affecting their eosinophil-recruiting properties."

According to the news editors, the research concluded: "This could be one mechanism explaining the increased vulnerability to acquire pneumococcal infection in parallel with sustained allergic inflammation in asthma."

Our news journalists report that additional information may be obtained by contacting A. Gela, Division of Respiratory Medicine & Allergology, Dept. of Clinical Sciences, Skane University Hospital, Lund University, Lund, Sweden. Additional authors for this research include G. Kasetty, M. Morgelin, A. Bergqvist, J.S. Erjefalt, J.E. Pease and A. Egesten.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/all.12771. This DOI is a link to an online electronic document that is either free or for purchase.

**Intracellular Signaling Peptides and Proteins**

**Researchers at M.D. Anderson Cancer Center Target Apoptosis Regulatory Proteins (Genetic characterization of two gain-of-function alleles of the effector caspase DrICE in Drosophila)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Intracellular Signaling Peptides and Proteins - Apoptosis Regulatory Proteins are presented in a new report. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Caspases are the executioners of apoptosis. Although much is known about their physiological roles and structures, detailed analyses of missense mutations of caspases are lacking."

Our news editors obtained a quote from the research from M.D. Anderson Cancer Center, "As mutations within caspases are identified in various human diseases, the study of caspase mutants will help to elucidate how caspases interact with other components of the apoptosis pathway and how they may contribute to disease. DrICE is the major effector caspase in Drosophila required for developmental and stress-induced cell death. Here, we report the isolation and characterization of six de novo drICE mutants, all of which carry point mutations affecting amino acids conserved among caspases in various species. These six mutants behave
as recessive loss-of-function mutants in a homozygous condition. Surprisingly, however, two of the newly isolated drICE alleles are gain-of-function mutants in a heterozygous condition, although they are loss-of-function mutants homozygously. Interestingly, they only behave as gain-of-function mutants in the presence of an apoptotic signal. These two alleles carry missense mutations affecting conserved amino acids in close proximity to the catalytic cysteine residue. This is the first time that viable gain-of-function alleles of caspases are described in any intact organism and provides a significant exception to the expectation that mutations of conserved amino acids always abolish the pro-apoptotic activity of caspases."

According to the news editors, the research concluded: "We discuss models about how these mutations cause the gain-of-function character of these alleles."

For more information on this research see: Genetic characterization of two gain-of-function alleles of the effector caspase DrICE in Drosophila. *Cell Death and Differentiation*, 2015;23(4):723-32. (Nature Publishing Group - www.nature.com/; Cell Death and Differentiation - www.nature.com/cdd/)

**Implantable Cardioverter Defibrillator**

**Researchers at Marche Polytechnic University Report New Data on Implantable Cardioverter Defibrillator [Implantable cardioverter-defibrillator programming and electrical storm: Results of the OBSERVational registry On long-term outcome of ICD ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Implantable Cardioverter Defibrillator. According to news originating from Ancona, Italy, by NewsRx correspondents, research stated, "Electrical storm (ES) is defined as 3 or more episodes of ventricular fibrillation (VF) or ventricular tachycardia (VT) within 24 hours and is associated with increased cardiac and all-cause mortality. The purpose of this study was to test whether aggressive implantable cardioverter-defibrillator (ICD) programming can be associated with ES."

Our news journalists obtained a quote from the research from Marche Polytechnic University. "The OBSERVational registry On long-term outcome of ICD patients (OBSERO-ICD) is a multicenter, retrospective registry enrolling all consecutive patients undergoing ICD implantation from 2010 to 2012 in 5 Italian high-volume arrhythmia centers. Clinical history and risk factors were collected for all patients, as were ICD therapy-related variables such as
detection zones and delays. The total number of arrhythmic episodes and therapies delivered by the ICD were collected throughout out-of-hospital visits and remote monitoring. The registry enrolled 1319 consecutive patients, of whom 62 (4.7%) experienced at least 1 ES during follow-up (median 39 months). Patients who experienced ES had a significantly lower VF detection zone (P = .002), more frequently had antitachycardia pacing therapies programmed off during capacitor charge (P = .001), and less frequently had an ICD set with delayed therapies for VT zones (P = .042) and VF zone (P = .036). Patients who experienced ES had a significantly higher incidence of death and heart failure-related death compared to patients with no ventricular arrhythmias and patients with unclustered VTs/VFs (P = .025 and P < .001, respectively). Patients with ES had a more aggressive ICD programming setup, including lower VF detection rates, shorter detection times, and no antitachycardia pacing therapies during capacitor charge.

According to the news editors, the research concluded: "This kind of ICD programming potentially could increase the likelihood of ES and the related risk of death."

The news correspondents report that additional information may be obtained from F. Guerra, Marche Polytechnic Univ, Univ Hosp Umberto I Lancisi Salesi, Cardiol & Arrhythmol Clin, Ancona, Italy. Additional authors for this research include P. Palmisano, G. Dell’Era, M. Ziacchi, E. Ammendola, P. Bonelli, F. Patani, C. Cupido, C. Devecchi, M. Accogli, E. Occhetta, L. Santangelo, M. Biffi, G. Boriani and A. Capucci.

Atrial Fibrillation

Researchers at Massachusetts General Hospital Have Reported New Data on Atrial Fibrillation (Atrial Fibrillation Genetics: Is There a Practical Clinical Value Now or in the Future?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Atrial Fibrillation. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Atrial fibrillation (AF) is the most common sustained arrhythmia and has significant clinical impact. Over the last decade, our understanding of the genetics of AF has expanded dramatically."

Our news journalists obtained a quote from the research from Massachusetts General Hospital, "After a heritable predisposition for AF was identified, many investigators have in turn identified both common and rare variants associated with AF. Ongoing work is focused on
translating these variants into disease pathways and novel therapeutic modalities."

According to the news editors, the research concluded: "In this review, we focus on our understanding of the current concepts behind the genetics of AF and outline a vision for the incorporation of genetic data into clinical practice."

The news correspondents report that additional information may be obtained from W.J. Hucker, Massachusetts General Hospital, Cardiovasc Res Center, Boston, MA 02114, United States. Additional authors for this research include H. Saini, S.A. Lubitz and P.T. Ellinor.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cjca.2016.02.032. This DOI is a link to an online electronic document that is either free or for purchase.

**Nanotechnology and Microtechnology**

**Researchers at Massachusetts General Hospital Have Reported New Data on Nanotechnology and Microtechnology (A Size-Selective Intracellular Delivery Platform)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nanotechnology and Microtechnology have been presented. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Identifying and separating a subpopulation of cells from a heterogeneous mixture are essential elements of biological research. Current approaches require detailed knowledge of unique cell surface properties of the target cell population."

Funders for this research include National Institutes of Health, National Cancer Institute.

The news correspondents obtained a quote from the research from Massachusetts General Hospital, "A method is described that exploits size differences of cells to facilitate selective intracellular delivery using a high throughput microfluidic device. Cells traversing a constriction within this device undergo a transient disruption of the cell membrane that allows for cytoplasmic delivery of cargo. Unique constriction widths allow for optimization of delivery to cells of different sizes. For example, a 4 µm wide constriction is effective for delivery of cargo to primary human T-cells that have an average diameter of 6.7 µm. In contrast, a 6 or 7 µm wide constriction is best for large pancreatic cancer cell lines BxPc3 (10.8 µm) and PANC-1 (12.3 µm). These small differences in cell diameter are sufficient to allow for selective delivery of cargo to pancreatic cancer cells within a heterogeneous mixture containing T-cells."
According to the news reporters, the research concluded: "The application of this approach is demonstrated by selectively delivering dextran-conjugated fluorophores to circulating tumor cells in patient blood allowing for their subsequent isolation and genomic characterization."

Our news journalists report that additional information may be obtained by contacting A.S. Liss, Massachusetts General Hospital, Dept. of Surg, Boston, MA 02114, United States. Additional authors for this research include A. Sharei, V.A. Adalsteinsson, N. Cho, T. Kamath, C. Ruiz, J. Kirkpatrick, N. Patel, M. Mino-Kenudson, S.P. Thayer, R. Langer, K.F. Jensen, A.S. Liss and J.C. Love.

RNA Viruses - Mosaic Viruses

Researchers at Massachusetts Institute of Technology Release New Data on Mosaic Viruses (Tobacco Mosaic Virus Delivery of Phenanthriplatin for Cancer therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on RNA Viruses - Mosaic Viruses. According to news reporting from Cambridge, Massachusetts, by NewsRx journalists, research stated, "Phenanthriplatin, cis-[Pt(NH3)2Cl(phenanthridine)](NO3), is a cationic monofunctional DNA-binding platinum(II) anticancer drug candidate with unusual potency and cellular response profiles. Its in vivo efficacy has not yet been demonstrated, highlighting the need for a delivery system."

Financial supporters for this research include Division of Chemistry, National Center for Advancing Translational Sciences, National Cancer Institute, National Institute of General Medical Sciences, Mt. Sinai Health Care Foundation.

The news correspondents obtained a quote from the research from the Massachusetts Institute of Technology, "Here we report tobacco mosaic virus (TMV) as a delivery system for phenanthriplatin. TMV forms hollow nanotubes with a polyanionic interior surface; capitalizing on this native structure, we developed a one-step phenanthriplatin loading protocol. Phenanthriplatin release from the carrier is induced in acidic environments. This delivery system, designated PhenPt-TMV, exhibits matched efficacy in a cancer cell panel compared to free phenanthriplatin. In vivo tumor delivery and efficacy were confirmed by using a mouse model of triple negative breast cancer. Tumors treated with PhenPt-TMV were 4? smaller than tumors treated with free phenanthriplatin or cisplatin, owing to increased accumulation of
phenanthriplatin within the tumor tissue."

According to the news reporters, the research concluded: "The biology-derived TMV delivery system may facilitate translation of phenanthriplatin into the clinic."

Our news journalists report that additional information may be obtained by contacting Y.R. Zheng, Dept. of Chemistry, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139, United States. Additional authors for this research include Y.R. Zheng, I.A. Riddell, S. Shukla, S.G. Awuah, S.J. Lippard and N.F Steinmetz.

**Cardiovascular Diseases and Conditions - Aneurysm**

**Researchers at Mayo Clinic Have Reported New Data on Aneurysm (Clinical interpretation of high-resolution vessel wall MRI of intracranial arterial diseases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Aneurysm have been published. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Intracranial arterial pathology has traditionally been evaluated with luminal imaging. Recently, high-resolution vessel wall imaging (HR-VWI) with MRI has facilitated submillimetre evaluation of the arterial walls."

Our news editors obtained a quote from the research from Mayo Clinic, "This technique can help differentiate various causes of intracranial steno-occlusive disease, identify culprit atherosclerotic plaques with a recent cerebral infarct, locate vessel wall pathology in areas with minimal or no narrowing on luminal imaging, predict aneurysm stability and identify a ruptured aneurysm when multiple aneurysms are present. Interpretation of HR-VWI examinations requires a solid understanding of the pathophysiology, clinical features, serum and cerebrospinal fluid laboratory findings, treatment administered and fundamental patterns of VWI abnormalities that may be encountered with the intracranial vasculopathies."

According to the news editors, the research concluded: "This pictorial essay aimed to illustrate the essential findings of common conditions encountered with HR-VWI including intracranial atherosclerosis, moyamoya disease, intracranial vasculitis, varicella zoster vasculopathy, reversible cerebral vasoconstriction syndrome and aneurysms."

The news editors report that additional information may be obtained by contacting V.T. Lehman, Mayo Clin College, Dept. of Radiol, Grad Med Educ, Rochester, MN, United States. Additional authors for this research include W. Brinjikji, D.F. Kallmes, J. Huston, G. Lanzino, A.A. Rabinstein, A. Makol and M. Mossa-Bosha.

Keywords for this news article include: Rochester, Minnesota, United States, North and Central America, Cardiovascular Diseases and Conditions, Pathology, Aneurysm, Mayo Clinic.

Oncology

Researchers at Mayo Clinic Release New Data on Oncology
(Chromoplectic TPM3-ALK rearrangement in a patient with inflammatory myofibroblastic tumor who responded to ceritinib after progression on crizotinib)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "Inflammatory myofibroblastic tumors (IMTs) are rare sarcomas that can occur at any age. Surgical resection is the primary treatment for patients with localized disease; however, these tumors frequently recur."

Our news journalists obtained a quote from the research from Mayo Clinic, "Less commonly, patients with IMTs develop or present with metastatic disease. There is no standard of care for these patients and traditional cytotoxic therapy is largely ineffective. Most IMTs are associated with oncogenic ALK, ROS1 or PDGFR beta fusions and may benefit from targeted therapy. We sought to understand the genomic abnormalities of a patient who presented for management of metastatic IMT after progression of disease on crizotinib and a significant and durable partial response to the more potent ALK inhibitor ceritinib. The residual IMT was resected based on the recommendations of a multidisciplinary tumor sarcoma tumor board and analyzed by whole-genome mate pair sequencing. Analysis of the residual, resected tumor identified a chromoplectic TPM3-ALK rearrangement that involved many other known oncogenes and was confirmed by rtPCR. In our analysis of the treatment-resistant, residual IMT, we identified a complex pattern of genetic rearrangements consistent with chromoplexy. Although it is difficult to know for certain if these chromoplectic rearrangements preceded treatment, their presence suggests that chromoplexy has a role in the oncogenesis of IMTs."

According to the news editors, the research concluded: "Furthermore, this patient's remarkable response suggests that ceritinib should be considered as an option after progression on crizotinib for patients with metastatic or unresectable IMT and ALK mutations."

Our news journalists report that additional information may be obtained by
Researchers at Mayo Clinic Report New Data on DNA Research (Epigenetic Studies Point to DNA Replication/Repair Genes as a Basis for the Heritable Nature of Long Term Complications in Diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics - DNA Research is now available. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "Metabolic memory (MM) is defined as the persistence of diabetic (DM) complications even after glycemic control is pharmacologically achieved. Using a zebrafish diabetic model that induces a MM state, we previously reported that, in this model, tissue dysfunction was of a heritable nature based on cell proliferation studies in limb tissue and this correlated with epigenetic DNA methylation changes that paralleled alterations in gene expression."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from Mayo Clinic, "In the current study, control, DM, and MM excised fin tissues were further analyzed by MeDIP sequencing and microarray techniques. Bioinformatics analysis of the data found that genes of the DNA replication/DNA metabolism process group (with upregulation of the apex1, mcm2, mcm4, orc3, lig1, and dnmt1 genes) were altered in the DM state and these molecular changes continued into MM. Interestingly, DNA methylation changes could be found as far as 6-13 kb upstream of the transcription start site for these genes suggesting potential higher levels of epigenetic control."

According to the news editors, the research concluded: "DNA methylation changes in members of the DNA replication/repair process group best explain the heritable nature of cell proliferation impairment found in the zebrafish DM/MM model. These results are consistent with human diabetic epigenetic studies and provide one explanation for the persistence of long term tissue complications as seen in diabetes."

For more information on this research see: Epigenetic Studies Point to DNA Replication/Repair Genes as a Basis for the Heritable Nature of Long Term Complications in Diabetes. *Journal of Diabetes Research*, 2016;2016():2860780.

Our news journalists report that additional information may be obtained by contacting A.A. Leontovich, Division of Biomedical Statistics and Informatics, Mayo Clinic, 200 First Street SW, Rochester, MN 55905, United States. Additional authors for this research include R.V. Intine and M.P Sarras.

Researchers at Mayo Graduate School Release New Data on Dementia (MAPT haplotype H1G is associated with increased risk of dementia with Lewy bodies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Dementia have been published. According to news reporting out of Jacksonville, Florida, by NewsRx editors, research stated, "The MAPT H1 haplotype has been associated with several neurodegenerative diseases. We were interested in exploring the role of MAPT haplotypic variation in risk of dementia with Lewy bodies (DBL)."

Financial supporters for this research include Little Family Foundation, Mangurian Foundation, NINDS, Alzheimer's Disease Research Center, Mayo Clinic Study of Aging.

Our news journalists obtained a quote from the research from Mayo Graduate School, "We genotyped six MAPT haplotype tagging SNPs and screened 431 clinical DBL cases, 347 pathologically defined high-likelihood DBL cases, and 1049 controls. We performed haplotypic association tests and detected an association with the protective H2 haplotype in our combined series (odds ratio [OR] = 0.75). We fine-mapped the locus and identified a relatively rare haplotype, H1G, that is associated with an increased risk of DBL (OR = 3.30, P = .0017). This association was replicated in our pathologically defined series (OR = 2.26, P = .035). These results support a role for H1 and specifically H1G in susceptibility to DBL."

According to the news editors, the research concluded: "However, the exact functional variant at the locus is still unknown, and additional studies are warranted to fully explain genetic risk of DBL at the MAPT locus."

For more information on this research see: MAPT haplotype H1G is associated with increased risk of dementia with Lewy bodies. *Alzheimers & Dementia*, 2016;12(12):1297-1304. *Alzheimers & Dementia* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.

Researchers at McGill University Report New Data on HIV/AIDS (The M184I/V and K65R nucleoside resistance mutations in HIV-1 prevent the emergence of resistance mutations against dolutegravir)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immune System Diseases and Conditions - HIV/AIDS is now available. According to news reporting from Montreal, Canada, by NewsRx journalists, research stated, "Recommended treatments for newly diagnosed HIV-positive individuals now focus on the integrase strand transfer inhibitors, raltegravir (RAL), elvitegravir (EVG) and dolutegravir (DTG). In treatment-naive individuals, cases of RAL-based and EVG-based virological failure, although rare, are associated with the occurrence of resistance mutations in integrase and/or reverse transcriptase coding sequences."

The news correspondents obtained a quote from the research from McGill University, "In such cases, common resistance substitutions in reverse transcriptase that were associated with nucleos(t)ide reverse transcriptase inhibitors included M184I/V and K65R and these occurred together with various mutations in integrase. In some instances, these mutations in reverse transcriptase preceded the emergence of mutations in integrase. In contrast, no resistance substitutions in either integrase or reverse transcriptase have been observed to date in viruses isolated from treatment-naive individuals who experienced treatment failure with DTG-based regimens. The objective of this study was to determine the effects of the M184I/V and K65R substitutions in reverse transcriptase on the ability of HIV-1 to become resistant against RAL, EVG or DTG. We performed tissue culture selection experiments using reverse transcriptase inhibitor-resistant viruses containing resistance substitutions at positions K65R, M184I or M184V in the presence of increasing concentrations of RAL, EVG or DTG and monitored changes in integrase sequences by genotyping. Selections using EVG and RAL led to the emergence of resistance mutations in integrase. In contrast, only the wild-type virus was able to acquire resistance mutations for DTG."

According to the news reporters, the research concluded: "Resistance mutations against nucleos(t)ide reverse transcriptase inhibitors antagonized the development of HIV-1 resistance against DTG but not RAL or EVG."

For more information on this research see: The M184I/V and K65R nucleoside resistance mutations in HIV-1 prevent the emergence of resistance mutations against dolutegravir. *Aids*, 2016;30(15):2267-2273. *Aids* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Researchers at Medical College Release New Data on Cancer Research (Increasing Role of Image-Guided Ablation in the Treatment of Musculoskeletal Tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Research have been published. According to news originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "In the last decade, percutaneous treatment of musculoskeletal (MSK) tumors has become more established in routine clinical care while also undergoing a number of advancements. Ablative techniques to palliate painful skeletal metastases have gained wide acceptance, while goals for ablation have evolved to include local control of oligometastases and desmoid tumors."

Our news journalists obtained a quote from the research from Medical College, "Bone consolidation or augmentation is now frequently used in conjunction with or instead of ablation of skeletal tumors to stabilize pathologic fractures or prevent further morbidity that could result from fractures caused by tumor progression. These procedures have traditionally been performed with cement injection, although additional percutaneous consolidation or stabilization devices have been developed. Techniques to monitor the ablation zone and adjacent structures intraprocedurally are now applied to increase the number of tumors amenable to treatment. These include methods to depict, displace, or monitor critical structures adjacent to targeted MSK tumors."

According to the news editors, the research concluded: "Finally, the role of ablation in the comprehensive care of patients with MSK tumors continues to change with the evolving triage of patients between radiation therapy, surgical resection and stabilization, and percutaneous ablative and consolidative management."

For more information on this research see: Increasing Role of Image-Guided Ablation in the Treatment of Musculoskeletal Tumors. *Cancer Journal*, 2016;22(6):401-410. *Cancer Journal* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

The news correspondents report that additional information may be obtained from A.N. Kurup, Mayo Clinic, Coll Med, Dept. of Radiol, Rochester, MN 55905, United States.

Researchers at Medical University Report Findings in Opioid Dependence (DISC1 as a Possible Genetic Contribution to Opioid Dependence in a Polish Sample)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Opioid Dependence is the subject of a report. According to news reporting from Warsaw, Poland, by NewsRx journalists, research stated, "Disrupted-in-schizophrenia 1 (DISC1) has been linked to vulnerability to a variety of psychiatric disorders and neuropsychiatric phenotypes. However, DISC1 has not been frequently examined as a potential risk factor for substance dependence."

The news correspondents obtained a quote from the research from Medical University, "An association between opioid dependence and DISC1 rs2738888 polymorphism has been recently reported. In addition, opioid dependence was associated with rs6419156 located close to the protein phosphatase 3 catalytic subunit alpha isoform (PPP3CA) gene. The aim of the present study was to examine the associations between opioid dependence with rs2738888 and rs6419156 in an independent sample. The selected polymorphisms were genotyped in a sample of 392 individuals (69.9% male) diagnosed as alcohol-and/or opioid-dependent. A control group (n=257; 67.7% male) was derived from the Polish National Health Survey (N=14,350). The frequency of rs2738888 C allele was higher in controls than in opioid-dependent cases (OR=0.65, p=.045). Phenotypic-oriented analyses performed within opioid-dependent individuals revealed the association between lifetime suicide attempt and rs2738888. The C allele of rs2738888 had a protective effect on lifetime suicide attempt in opioid-dependent patients (OR=0.25, p=.003). Rs6419156 was not associated with substance dependence in the examined sample. The DISC1 may play an important role in vulnerability to opioid dependence."

According to the news reporters, the research concluded: "In addition, DISC1 may also be a genetic risk factor for suicide attempt in opioid-dependent individuals."

For more information on this research see: DISC1 as a Possible Genetic Contribution to Opioid Dependence in a Polish Sample. Journal of Studies On Alcohol and Drugs, 2016;77 (2):220-6.

Our news journalists report that additional information may be obtained by contacting S. Fudalej, Dept. of Psychiatry, Medical University of Warsaw, Warsaw, Poland. Transplant Medicine - Liver Transplants

Researchers at Medical University Report New Data on Liver Transplts (The use of nonsteroidal anti-inflammatory drugs and analgesics by liver transplant recipients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Transplant Medicine - Liver Transplants. According to news reporting originating in Warsaw, Poland, by NewsRx journalists, research stated, "This study aimed to assess the reasons and the frequency of the use of over-the-counter (OTC) nonsteroidal anti-inflammatory drugs (NSAIDs) or analgesics by liver transplant recipients (LTR). Patient awareness of possible drug-related side-effects was also assessed."

The news reporters obtained a quote from the research from Medical University, "NSAIDs and analgesics available without prescription belong to the most commonly used class of drugs. However, use of these drugs might be complicated by toxic adverse effects (AEs). Patients at risk for AEs include the transplant recipients. This was a descriptive study. An anonymous survey was carried out in 73 randomly selected LTR, who represented 10% of all LTR at our centre. There were 64% of the patients who confirmed taking NSAIDs or analgesics; 16% of these patients took these drugs at least several times a week and 10% took them daily. For 39% of patients, the only way to manage their pain were OTC NSAIDs or analgesics. As many as 36% of patients were unaware of the risks associated with the use of these drugs. Ninety per cent of LTR consider physicians the most trusted source of drugs information. Our study shows that two-thirds of LTR take OTC NSAIDs or analgesics and one-third are unaware of the AEs associated with these drugs. Therefore, both transplant nurses and doctors should educate their patients about the use and possible AE of these drugs. Considering the high NSAIDs consumption rates, the side effects of these drugs should always be suspected. Especially in patients taking these drugs and referring to medical advisors with specific symptoms, such as: abdominal pain, anaemia, elevated serum creatinine concentration or liver enzymes activity. Awareness of the scale of the problem enables health professionals to cooperate in educating patients."

According to the news reporters, the research concluded: "Such practices may reduce uncontrolled abuse of these drugs and related health care costs."

Our news correspondents report that additional information may be obtained by contacting M. Mulka-Gierek, Dept. of Immunology, Transplantology and Internal Diseases, Medical University of Warsaw, Warsaw, Poland. Additional authors for this research include B. Foroncvez, M. Florczak, L. Paczek, M. Krawczyk and K. Mucha.

Researchers at Medical University Target Enzymes and Coenzymes (Effect of Evodiamine on CYP Enzymes in Rats by a Cocktail Method)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Enzymes and Coenzymes are presented in a new report. According to news reporting originating in Wenzhou, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to assess the influence of evodiamine on the activities of the drug-metabolizing enzymes cytochrome P450 (CYP) 1A2, CYP2C9, CYP2C19, CYP2D6 and CYP3A4 in rats. The activities of CYP1A2, CYP2C9, CYP2C19, CYP2D6 and CYP3A4 were measured using specific probe drugs."

The news reporters obtained a quote from the research from Medical University, "After pretreatment for 1 week with evodiamine or physiological saline (control group) by oral administration, probe drugs phenacetin (5.0 mg/kg; CYP1A2 activity), tolbutamide (1.0 mg/kg; CYP2C9 activity), omeprazole (10 mg/kg; CYP2C19 activity), metoprolol (20 mg/kg; CYP2D6 activity) and midazolam (10 mg/kg; CYP3A4 activity) were administered to rats by oral administration. The blood was then collected at different times for ultra-performance liquid chromatography-tandem mass spectrometry analysis. The data showed that evodiamine exhibits an inhibitory effect on CYP1A2, CYP2C9 and CYP2D6 by increasing t(1/2), Cmax and AUC (0-∞), and decreasing CL/F compared with those of the control group. However, no significant changes in CYP2C19 and CYP3A4 activities were observed."

According to the news reporters, the research concluded: "The results indicated that evodiamine could inhibit CYP1A2, CYP2C9 and CYP2D6, which may affect the disposition of medicines primarily dependent on these pathways. Our work may be the basis of related herb-drug interactions in the clinic."

Our news correspondents report that additional information may be obtained by contacting Y.T. Zhang, The Second Affiliated Hospital & Yuying Children's Hospital of Wenzhou Medical University, Wenzhou, People's Republic of China. Additional authors for this research include D.F. Zhang, N.Y. Ge, G.H. Zhu, C. Hao, Y. Zhang and R.J Chen.

Researchers at Medical University Target Heart Attack (Interindividual variability of atorvastatin treatment influence on the MPO gene expression in patients after acute myocardial infarction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Attack. According to news reporting originating from Warsaw, Poland, by NewsRx correspondents, research stated, "Myeloperoxidase (MPO) and C-reactive protein (CRP) may play critical roles in generation of oxidative stress and the development of the systemic inflammatory response. The aim of the study was to determine the effect of atorvastatin therapy on the MPO gene expression and its plasma level in relation to lipids level lowering and an anti-inflammatory response in patients after acute myocardial infarction."

Our news editors obtained a quote from the research from Medical University, "The research material was represented by 112 samples. Thirty-eight patients with first AMI receiving atorvastatin therapy (40 mg/day) and followed up for one month were involved in the study. The relative MPO gene expression in peripheral blood mononuclear cells (PBMCs) was examined using RT-qPCR in 38 patients before-, 38 patients after-therapy and in 36 patients as the control group. The plasma concentrations of MPO and serum concentrations of biochemical parameters were determined using commercially available diagnostic tests. After one month of atorvastatin therapy, in 60.5% patients a decrease of MPO gene expression, whereas in 39.5% patients an increase, was observed. The plasma MPO levels behaved in the same way as the MPO gene expression. However, the serum lipids and CRP concentrations were significantly lower after one month of atorvastatin therapy in both groups of patients -with decreased and increased MPO gene expression. Atorvastatin exhibited a different effect on MPO gene expression and its plasma level. Short-term atorvastatin therapy resulted in lipid lowering and anti-inflammatory activity in patients after AMI, independently of its effect on MPO gene expression."

According to the news editors, the research concluded: "The molecular mechanisms of this phenomenon are not yet defined and require further research."

The news editors report that additional information may be obtained by contacting G. Sygitowicz, Dept. of Medical Laboratory Diagnostics, Medical University of Warsaw, Warsaw, Poland. Additional authors for this research include A. Maciejak, J. Piniewska-Juraszek, M. Pawlak, M. Gora, B. Burzynska, M. Dluzniewski, G. Opolski and D. Sitkiewicz.

Researchers at Medical University of South Carolina Report New Data on Multiple Myeloma (Systemic therapy with oncolytic myxoma virus cures established residual multiple myeloma in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Multiple Myeloma. According to news originating from Charleston, South Carolina, by NewsRx correspondents, research stated, "Multiple myeloma is an incurable malignancy of plasma B-cells. Traditional chemotherapeutic regimes often induce initial tumor regression; however, virtually all patients eventually succumb to relapse caused by either reintroduction of disease during autologous transplant or expansion of chemotherapy resistant minimal residual disease."

Our news journalists obtained a quote from the research from the Medical University of South Carolina, "It has been previously demonstrated that an oncolytic virus known as myxoma can completely prevent myeloma relapse caused by reintroduction of malignant cells during autologous transplant. The ability of this virus to treat established residual disease in vivo, however, remained unknown. Here we demonstrate that intravenous administration of myxoma virus into mice bearing disseminated myeloma results in the elimination of 70-90% of malignant cells within 24 hours. This rapid debulking was dependent on direct contact of myxoma virus with residual myeloma and did not occur through destruction of the hematopoietic bone marrow niche. Importantly, systemic myxoma therapy also induced potent antimyeloma CD8(+) T cell responses which localized to the bone marrow and were capable of completely eradicating established myeloma in some animals."

According to the news editors, the research concluded: "These results demonstrate that oncolytic myxoma virus is not only effective at preventing relapse caused by reinfusion of tumor cells during stem cell transplant, but is also potentially curative for patients bearing established minimal residual disease."

For more information on this research see: Systemic therapy with oncolytic myxoma virus cures established residual multiple myeloma in mice. Molecular Therapy-Oncolytics, 2016;3():1-8. Molecular Therapy-Oncolytics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

The news correspondents report that additional information may be obtained from E. Bartee, Medical University of South Carolina, Dept. of Microbiol & Immunol, Charleston, SC 29425, United States. Additional authors for this research include M.Y. Bartee, B. Bogen and X.Z. Yu.

Researchers at Memorial Hospital Detail Findings in Head and Neck Cancer (Efficacy of second-line erlotinib in patients postprogression of first-line chemotherapy in head and neck cancers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Head and Neck Cancer is the subject of a report. According to news reporting out of Maharashtra, India, by NewsRx editors, research stated, "Oral tyrosine kinase inhibitor (gefitinib and erlotinib) have been used in the palliative treatment of head and neck cancers with limited success. In this report, we aim to quantify the symptomatic benefit, progression-free survival (PFS) and overall survival (OS) when erlotinib is given as second-line treatment in Head and neck cancers."

Our news journalists obtained a quote from the research from Memorial Hospital, "This was a post-hoc retrospective analysis of a randomized study comparing metronomic chemotherapy with cisplatin. A patient who progressed on chemotherapy and had a PS0-2 were offered second-line chemotherapy. Patients who had received erlotinib (150 mg PO OD) as second line treatment were selected for this analysis. Erlotinib was discontinued in case of either progression of disease or if the patient had intolerable side effects. Patient were monitored 1-week after the start of erlotinib and subsequently at monthly intervals. The toxicity was recorded in accordance with CTCAE version 4.02 (NCI,USA) and the response were graded in accordance with RECIST version 1.1. All of these patients were followed-up till death. Twenty-three patients were identified. The median age of these patients at the start of the second line was 47 years (interquartile range 40.5-51.75 years). The primary site of distribution was oral cavity primary in 17 patients (77.3%) and nonoral cavity primary in 05 (22.7%) patients. The immediate last chemotherapy regimen received was cisplatin in 9 patients (40.9%) and metronomic chemotherapy in 13 patients (59.1%). Symptomatic benefits post second-line erlotinib was seen in 18 patients (81.8%). The most common adverse events (any grade) seen were anemia in 20 patients (90.9%), rash in 10 patients (45.5%) and diarrhea in 7 patients (31.8%).The best radiological response documented were a partial response in 04 patients (19.2%). The median estimated PFS and OS were 110 days (95% confidence interval [CI]: 61-175 days) and 156 days (95% CI: 126-185 days) respectively."

According to the news editors, the research concluded: "Erlotinib single agent has promising activity in the second line and needs to be explored in future studies."

Our news journalists report that additional information may be obtained by contacting V. Noronha, Dept. of Medical Oncology, Tata Memorial Hospital, Mumbai, Maharashtra, India. Additional authors for this research include A. Karpe, V. Noronha, A. Joshi, V. Muddu, A. Bhattacharjee, S. Dhumal and K. Prabhash.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0019-509X.178374. This DOI is a link to an online electronic document that is either free or for purchase.

Researchers at Memorial Sloan-Kettering Cancer Center Target Angiosarcomas (Targeted massively parallel sequencing of angiosarcomas reveals frequent activation of the mitogen activated protein kinase pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Angiosarcomas is now available. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Angiosarcomas are rare malignant mesenchymal tumors of endothelial differentiation. The clinical behavior is usually aggressive and the prognosis for patients with advanced disease is poor with no effective therapies."

Our news journalists obtained a quote from the research from Memorial Sloan-Kettering Cancer Center, "The genetic bases of these tumors have been partially revealed in recent studies reporting genetic alterations such as amplifications of MYC (primarily in radiation-associated angiosarcomas), inactivating mutations in PTPRB and R707Q hotspot mutations of PLCG1. Here, we performed a comprehensive genomic analysis of 34 angiosarcomas using a clinically-approved, hybridization-based targeted next-generation sequencing assay for 341 well-established oncogenes and tumor suppressor genes. Over half of the angiosarcomas (n=18, 53%) harbored genetic alterations affecting the MAPK pathway, involving mutations in KRAS, HRAS, NRAS, BRAF, MAPK1 and NF1, or amplifications in MAPK1/CRKL, CRAF or BRAF. The most frequently detected genetic aberrations were mutations in TP53 in 12 tumors(35%) and losses of CDKN2A in9 tumors (26%). MYC amplifications were generally mutually exclusive of TP53 alterations and CDKN2A loss and were identified in 8 tumors (24%), most of which (n=7, 88%) arose post-irradiation. Previously reported mutations in PTPRB (n=10, 29%) and one (3%) PLCG1 R707Q mutation were also identified. Our results demonstrate that angiosarcomas are a genetically heterogeneous group of tumors, harboring a wide range of genetic alterations."

According to the news editors, the research concluded: "The high frequency of genetic events affecting the MAPK pathway suggests that targeted therapies inhibiting MAPK signaling may be promising therapeutic avenues in patients with advanced angiosarcomas."

For more information on this research see: Targeted massively parallel sequencing of angiosarcomas reveals frequent activation of the mitogen activated protein kinase pathway. Oncotarget, 2015;6(34):36041-52.

The news correspondents report that additional information may be obtained from R. Murali, Dept. of Pathology, Memorial Sloan Kettering Cancer Center, New York, NY, United States. Trimethyl Ammonium Compounds

Researchers at Memorial Sloan-Kettering Cancer Center Target Trimethyl Ammonium Compounds (L-Carnitine for Treatment of Pegasparaginase-Induced Hepatotoxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Trimethyl Ammonium Compounds have been published. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Similar to pediatric regimens, multiple doses of L-asparaginase (PEG-Asp) are being increasingly used in adults with newly diagnosed acute lymphoblastic leukemia (ALL) with promising results. One of the most common side effects of the drug in adults is high-grade hyperbilirubinemia and transaminitis."

The news reporters obtained a quote from the research from Memorial Sloan-Kettering Cancer Center, "Despite being almost always reversible and may not recur, clinicians may still be reluctant to continue with PEG-Asp in patients with liver toxicity, losing the benefit from multiple doses of the drug. We describe a case of adult ALL who developed PEG-Asp-related high grade liver toxicity. The rising hyperbilirubinemia and transaminitis rapidly and permanently reversed using the amino-acid derivative L-carnitine. This case goes in line with similar observations in animal models and humans."

According to the news reporters, the research concluded: "L-Carnitine may show therapeutic benefit in PEG-Asp-related hepatotoxicity and should be considered in clinical trials of the drug."

Our news correspondents report that additional information may be obtained by contacting R. Alshiekh-Nasany, Memorial Sloan Kettering Cancer Center, New York, NY, United States.

Researchers at Merck & Company Have Reported New Data on Clostridium difficile (Disease Progression and Resolution in Rodent Models of Clostridium difficile Infection and Impact of Antitoxin Antibodies and Vancomycin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Positive Bacteria - Clostridium difficile have been published. According to news originating from Kenilworth, New Jersey, by NewsRx correspondents, research stated, "Clostridium difficile causes infections of the colon in susceptible patients. Specifically, gut dysbiosis induced by treatment with broad-spectrum antibiotics facilitates germination of ingested C. difficile spores, expansion of vegetative cells, and production of symptom-causing toxins TcdA and TcdB."

Our news journalists obtained a quote from the research from Merck & Company, "The current standard of care for C. difficile infections (CDI) consists of administration of antibiotics such as vancomycin that target the bacterium but also perpetuate gut dysbiosis, often leading to disease recurrence. The monoclonal antitoxin antibodies actoxumab (anti-TcdA) and bezlotoxumab (anti-TcdB) are currently in development for the prevention of recurrent CDI. In this study, the effects of vancomycin or actoxumab/bezlotoxumab treatment on progression and resolution of CDI were assessed in mice and hamsters. Rodent models of CDI are characterized by an early severe phase of symptomatic disease, associated with high rates of morbidity and mortality; high intestinal C. difficile burden; and a disrupted intestinal microbiota. This is followed in surviving animals by gradual recovery of the gut microbiota, associated with clearance of C. difficile and resolution of disease symptoms over time. Treatment with vancomycin prevents disease initially by inhibiting outgrowth of C. difficile but also delays microbiota recovery, leading to disease relapse following discontinuation of therapy. In contrast, actoxumab/bezlotoxumab treatment does not impact the C. difficile burden but rather prevents the appearance of toxin-dependent symptoms during the early severe phase of disease, effectively preventing disease until the micro-biota (the body's natural defense against C. difficile) has fully recovered."

According to the news editors, the research concluded: "These data provide insight into the mechanism of recurrence following vancomycin administration and into the mechanism of recurrence prevention observed clinically with actoxumab/bezlotoxumab."

For more information on this research see: Disease Progression and Resolution in Rodent Models of Clostridium difficile Infection and Impact of Antitoxin Antibodies and Vancomycin. Antimicrobial Agents and Chemotherapy, 2016;60(11):6471-6482. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Researchers at Mie University School of Medicine Have Reported New Data on Soft Tissue Sarcomas (The value of trabectedin in the treatment of soft tissue sarcoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Soft Tissue Sarcomas have been presented. According to news reporting out of Mie, Japan, by NewsRx editors, research stated, "Soft tissue sarcomas (STSs) are a group of rare tumors accounting for less than 1% of all adult malignant tumors, a heterogeneous group of more than 50 histological subtypes. Five percent to 30% of STS patients experience local recurrence and 10%-38% present with clinically detectable metastases."

Our news journalists obtained a quote from the research from the Mie University School of Medicine, "Doxorubicin either alone or in combination with ifosfamide has been used as first-line chemotherapy for advanced disease. After failure of first-line chemotherapy, high-dose ifosfamide, gemcitabine + docetaxel, and dacarbazine may be applicable, although high-level evidence is lacking. Trabectedin is a synthetic, marine-derived alkylating agent derived from the Caribbean tunicate, Ecteinascidia turbinata. Several clinical trials have shown that trabectedin has a favorable toxicity profile and is an alternative therapeutic option in adult patients with advanced STS who have not responded to treatment with doxorubicin and ifosfamide. Several clinical trials also recommend the 24-hour intravenous infusion every 3 weeks regimen. The most frequently reported grade 3/4 adverse events were neutropenia and elevated serum levels of AST/ALT. Steroid pretreatment is an effective way of reducing the extent of hepatotoxicity, and steroids are now given routinely before trabectedin administration."

According to the news editors, the research concluded: "Further studies are ongoing to evaluate the efficacy and safety of combination therapy of trabectedin with other agents."

Our news journalists report that additional information may be obtained by contacting T. Nakamura, Dept. of Orthopaedic Surgery, Mie University Graduate School of Medicine, Mie, Japan. Additional authors for this research include A. Matsumine and A. Sudo.

Researchers at Mustafa Kemal University Have Reported New Data on Herpes Simplex Virus (Antiviral Activity of Hatay Propolis Against Replication of Herpes Simplex Virus Type 1 and Type 2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Herpesvirus Diseases and Conditions - Herpes Simplex Virus. According to news reporting originating in Hatay, Turkey, by NewsRx journalists, research stated, "Propolis is a bee product widely used in folk medicine and possessing many pharmacological properties. In this study we aimed to investigate: i) the antiviral activities of Hatay propolis samples against HSV-1 and HSV-2 in HEp-2 cell line, and ii) the presence of the synergistic effects of propolis with acyclovir against these viruses."

The news reporters obtained a quote from the research from Mustafa Kemal University, "All experiments were carried out in HEp-2 cell cultures. Proliferation assays were performed in 24-well flat bottom microplates. We inoculated 1x10^5 cells per ml and RPMI 1640 medium with 10% fetal calf serum into each well. Studies to determine cytotoxic effect were performed. To investigate the presence of antiviral activity of propolis samples, different concentrations of propolis (3200, 1600, 800, 400, 200, 100, 75, 50, and 25 mg/mL) were added into the culture medium. The amplifications of HSV-1 and HSV-2 DNA were performed by real-time PCR method. Acyclovir (Sigma, USA) was chosen as a positive control. Cell morphology was evaluated by scanning electron microscopy (SEM). The replication of HSV-1 and HSV-2 was significantly suppressed in the presence of 25, 50, and 100 mg/mL of Hatay propolis. We found that propolis began to inhibit HSV-1 replication after 24 h of incubation and propolis activity against HSV-2 was found to start at 48 h following incubation. The activity of propolis against both HSV-1 and HSV-2 was confirmed by a significant decrease in the number of viral copies. We determined that Hatay propolis samples have important antiviral effects compared with acyclovir."

According to the news reporters, the research concluded: "In particular, the synergy produced by antiviral activity of propolis and acyclovir combined had a stronger effect against HSV-1 and HSV-2 than acyclovir alone."

For more information on this research see: Antiviral Activity of Hatay Propolis Against Replication of Herpes Simplex Virus Type 1 and Type 2. Medical Science Monitor, 2016;22():422-30.

Our news correspondents report that additional information may be obtained by contacting A. Yildirim, Dept. of Histology and Embryology, Mustafa Kemal University, Medical Faculty, Hatay, Turkey. Researchers at Nagoya University Have Reported New Data on Atrial Fibrillation (An ECG Index of P-Wave Force Predicts the Recurrence of Atrial Fibrillation after Pulmonary Vein Isolation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Atrial Fibrillation are presented in a new report. According to news reporting originating in Nagoya, Japan, by NewsRx journalists, research stated, "Although several prognostic factors of atrial fibrillation (AF) recurrence after pulmonary vein isolation (PVI) have been investigated, the accurate prediction of AF recurrence remains difficult. We propose an electrocardiogram (ECG) index, the P-wave force (PWF), which is the product of the amplitude of the negative terminal phase of the P wave in the V1 electrode and the filtered P-wave duration, obtained by a signal-averaged P-wave analysis."

The news reporters obtained a quote from the research from Nagoya University, "This study was conducted to evaluate the impact of the PWF on the recurrence of AF after PVI. We retrospectively evaluated 79 paroxysmal AF patients (64 +/- 9 years, 56 males) who underwent PVI by cryoballoon ablation. Standard 12-lead ECG and a P-wave signal-averaged electrocardiogram (SAECG) were recorded the day before and 1 month after the PVI procedure. During the mean follow-up of 10.2 months, AF recurred in 11 (14%) patients. The PWF 1 month after ablation was significantly higher in the recurrence group compared to that in the nonrecurrence group (8.8 +/- 3.1 mVms vs 6.5 +/- 2.9 mVms, P = 0.017). The patients with a PWF value >= 9.3 mVms had a significantly greater risk of recurrence after the ablation compared to the patients with a PWF value <9.3 mVms (log-rank test, P<0.001). Higher PWF after cryoballoon ablation was associated with poor prognosis during follow-up."

According to the news reporters, the research concluded: "The PWF may be a useful and noninvasive marker to predict the recurrence of AF.""

For more information on this research see: An ECG Index of P-Wave Force Predicts the Recurrence of Atrial Fibrillation after Pulmonary Vein Isolation. PACE-Pacing and Clinical Electrophysiology, 2016;39(11):1191-1197. PACE-Pacing and Clinical Electrophysiology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Researchers at Nagoya University Target Caenorhabditis elegans
(Chaperone complex BAG2-HSC70 regulates localization of
Caenorhabditis elegans leucine-rich repeat kinase LRK-1 to the Golgi)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Caenorhabditis elegans are discussed in a new report.
According to news originating from Nagoya, Japan, by NewsRx correspondents, research stated,
"Mutations in LRRK2 are linked to autosomal dominant forms of Parkinson's disease. We
identified two human proteins that bind to LRRK2: BAG2 and HSC70, which are known to
form a chaperone complex."

Financial supporters for this research include Ministry of Education, Culture and
Science of Japan, Daiko Foundation.

Our news journalists obtained a quote from the research from Nagoya University,
"We characterized the role of their Caenorhabditis elegans homologues, UNC-23 and HSP-1, in
the regulation of LRK-1, the sole homologue of human LRRK2. In C.elegans, LRK-1
determines the polarized sorting of synaptic vesicle (SV) proteins to the axons by excluding SV
proteins from the dendrite-specific transport machinery in the Golgi. In unc-23 mutants, SV
proteins are localized to both presynaptic and dendritic endings in neurons, a phenotype also
observed in lrk-1 deletion mutants. Furthermore, we isolated mutations in the hsp-1 gene that
can suppress the unc-23, but not the lrk-1 defect. We show that UNC-23 determines LRK-1
localization to the Golgi apparatus in cooperation with HSP-1."

According to the news editors, the research concluded: "These results describe a
chaperone-dependent mechanism through which LRK-1 localization is regulated."

For more information on this research see: Chaperone complex BAG2-HSC70
regulates localization of Caenorhabditis elegans leucine-rich repeat kinase LRK-1 to the Golgi.

Researchers at Nanjing Medical University Report Findings in Oncology (Tumor-derived exosomes in cancer progression and treatment failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology. According to news originating from Nanjing, People's Republic of China, by NewsRx correspondents, research stated, "Exosomes have diameter within the range of 30-100 nm and spherical to cup-shaped nanoparticles with specific surface molecular characteristics, such as CD9 and CD63. These vesicles are present in nearly all human body fluids, including blood plasma/serum, saliva, breast milk, cerebrospinal fluid, urine, semen, and particularly enriched in tumor microenvironment."

Our news journalists obtained a quote from the research from Nanjing Medical University, "Exosomes contain multiple proteins, DNA, mRNA, miRNA, long non-coding RNA, and even genetic materials of viruses/prions. These materials are biochemically and functionally distinct and can be transferred to a recipient cell where they regulate protein expression and signaling pathways. Recently, exosomes are demonstrated to have a close relationship with tumor development and metastasis. Exosomes influence therapeutic effect in cancer patients. In this review, we describe the biogenesis, composition, and function of exosomes."

According to the news editors, the research concluded: "The mechanism on how tumor-derived exosomes contribute to cancer progression and clinical treatment failure is also described, with special focus on their potential applications in cancer therapy."

For more information on this research see: Tumor-derived exosomes in cancer progression and treatment failure. Oncotarget, 2015;6(35):37151-68.

The news correspondents report that additional information may be obtained from S. Yu, Research Center for Clinical Oncology, Nanjing Medical University Affiliated Cancer Hospital, Jiangsu Cancer Hospital and Jiangsu Institute of Cancer Research, Nanjing, Jiangsu Province, People's Republic of China. 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Multiple Myeloma have been published. According to news reporting originating from Nantong, People's Republic of China, by NewsRx correspondents, research stated, "Cell adhesion-mediated drug resistance (CAM-DR) is one of the mechanisms underlying the drug resistance in multiple myeloma (MM). Ubiquitin-specific protease 14 (USP14) is downregulated in the apoptotic model and upregulated in the adhesive model of MM."

Financial supporters for this research include National Natural Science Foundation of China, Natural Science Foundation of Jiangsu Province.

Our news editors obtained a quote from the research from Nantong University, "This study was undertaken to determine the role of USP14 in CAM-DR of MM cells. We examined the expression of USP14 in the apoptotic model of MM. The mechanism of USP14 in the process of apoptosis was further explored by flow cytometry assay and co-immunoprecipitation. We then performed the cell co-culture and adhesion assay and cell viability assay to investigate the effect of USP14 on adhesive rate and drug resistance in MM. We discovered that USP14 played a negative role in cell apoptosis, which is correlated with Bcl-xl. Moreover, overexpression of USP14 in MM cell adhesion model could enhance the ability of cell adhesion by regulating Wnt-signaling pathways, thereby promoting the CAM-DR in MM."

According to the news editors, the research concluded: "USP14 participates in CAM-DR of MM through acting as a bridge between Bcl-xl apoptotic pathway and Wnt-signaling pathways and may be represented as a good candidate for pursuing clinical trials in MM."

The news editors report that additional information may be obtained by contacting X. Xu, Dept. of Pathology, Affiliated Cancer Hospital of Nantong University, Nantong, Jiangsu Province, People's Republic of China. Additional authors for this research include J. Liu, C. Shen, L. Ding, F. Zhong, Y. Ouyang, Y. Wang and S. He.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ejh.12729. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Epithelial Ovarian Cancer

Researchers at Nantong University Release New Data on Epithelial Ovarian Cancer (Expression of preoperative KISS1 gene in tumor tissue with epithelial ovarian cancer and its prognostic value)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Oncology - Epithelial Ovarian Cancer are discussed
in a new report. According to news originating from Jiangsu, People's Republic of China, by
NewsRx correspondents, research stated, "Our study aimed to elucidate the role of Kisspeptin
(KISS1) in tumor tissues of patients with epithelial ovarian cancer (EOC) and investigate the
prognostic value of this biomarker. Forty EOC patients and 20 uterine fibroids female patients
with healthy ovaries undergoing cytoreductive surgery between January 2010 and January 2014
in our hospital were enrolled in this study."

Our news journalists obtained a quote from the research from Nantong University,
"KISS1 expression in tumor and normal tissues was detected. Correlations between clinic-
pathologic variables and KISS1 expression in EOC tissues and the prognostic value of KISS1
for overall survival were evaluated. During the follow-up of 11.2 to 62.1 months, the overall
survival rate and mean survival time were 28.9% (11/38) and 38.35 +/- 2.84 months.
Preoperative KISS1 mRNA was higher in tumor tissue than in normal tissue (P <0.001), and it
was associated with histologic grade of tumor, surgical FIGO stage, metastasis, and residual
tumor size (all P<0.05). Multivariate survival analysis indicated significant influence of residual
tumor size (HR=2.357, P=0.039) and preoperative KISS1 mRNA (HR= 0.0001, P<0.001) on
mean survival time. Patients with low KISS1 mRNA expression had shorter survival time than
those with high expression (P=0.001)."

According to the news editors, the research concluded: "Preoperative KISS1 mRNA
was a potential prognostic biomarker for EOC, and high preoperative KISS1 expression
indicated a favorable prognosis."

For more information on this research see:  Expression of preoperative KISS1 gene
in tumor tissue with epithelial ovarian cancer and its prognostic value. Medicine, 2016;95
(46):176-179. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce
Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine -

Connective Tissue Cells

Researchers at Nanyang Technological University Release New Data on
Connective Tissue Cells (Conditional knockout of N-WASP in mouse
fibroblast caused keratinocyte hyper proliferation and enhanced wound
closure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- New research on Connective Tissue Cells is the subject of a report.
According to news reporting originating from Singapore, Singapore, by NewsRx
correspondents, research stated, "Neural-Wiskott Aldrich Syndrome Protein (N-WASP) is expressed ubiquitously, regulates actin polymerization and is essential during mouse development. We have previously shown that N-WASP is critical for cell-ECM adhesion in fibroblasts."

Our news editors obtained a quote from the research from Nanyang Technological University, "To characterize the role of N-WASP in fibroblast for skin development, we generated a conditional knockout mouse model in which fibroblast N-WASP was ablated using the Cre recombinase driven by Fibroblast Specific Protein promoter (Fsp-Cre). N-WASP(FKO) (N-WASP(fl/fl); Fsp-cre) were born following Mendelian genetics, survived without any visible abnormalities for more than 1 year and were sexually reproductive, suggesting that expression of N-WASP in fibroblast is not critical for survival under laboratory conditions. Histological sections of N-WASP(FKO) mice skin (13 weeks old) showed thicker epidermis with higher percentage of cells staining for proliferation marker (PCNA), suggesting that N-WASP deficient fibroblasts promote keratinocyte proliferation. N-WASP(FKO) mice skin had elevated collagen content, elevated expression of FGF7 (keratinocyte growth factor) and TGF beta signaling proteins. Wound healing was faster in N-WASP(FKO) mice compared to control mice and N-WASP deficient fibroblasts were found to have enhanced collagen gel contraction properties."

According to the news editors, the research concluded: "These results suggest that N-WASP deficiency in fibroblasts improves wound healing by growth factor-mediated enhancement of keratinocyte proliferation and increased wound contraction in mice."

For more information on this research see: Conditional knockout of N-WASP in mouse fibroblast caused keratinocyte hyperproliferation and enhanced wound closure. Scientific Reports, 2016;6():1-13. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting T. Thanabalu, Nanyang Technological University, Sch Biol Sci, Singapore 637551, Singapore. Hematologic Diseases and Conditions - Sideroblastic

Researchers at National Center for Nanoscience and Technology Release New Data on Sideroblastic Anemia (Functional Analysis of GLRX5 Mutants Reveals Distinct Functionalities of GLRX5 Protein)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hematologic Diseases and Conditions - Sideroblastic Anemia are presented in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Glutaredoxin 5 (GLRX5) is a 156 amino acid mitochondrial protein that plays an essential role in mitochondrial iron-sulfur cluster transfer. Mutations in this protein were reported to result in sideroblastic anemia and variant nonketotic hyperglycinemia in human."
Financial supporters for this research include National Basic Research Program of China, MoST 973 program, National Distinguished Youth Scholar Grant of China.

The news correspondents obtained a quote from the research from National Center for Nanoscience and Technology, "Recently, we have characterized a Chinese congenital sideroblastic anemia patient who has two compound heterozygous missense mutations (c. 301 A>C and c. 443 T>C) in his GLRX5 gene. Herein, we developed a GLRX5 knockout K562 cell line and studied the biochemical functions of the identified pathogenic mutations and other conserved amino acids with predicted essential functions. We observed that the K101Q mutation (due to c. 301 A>C mutation) may prevent the binding of [Fe-S] to GLRX5 protein, while L148S (due to c. 443 T>C mutation) may interfere with [Fe-S] transfer from GLRX5 to iron regulatory protein 1 (IRP1), mitochondrial aconitase (m-aconitase) and ferrochelatase. We also demonstrated that L148S is functionally complementary to the K51del mutant with respect to Fe/S-ferrochelatase, Fe/S-IRP1, Fe/S-succinate dehydrogenase, and Fe/S-m-aconitase biosynthesis and lipoylation of pyruvate dehydrogenase complex and a-ketoglutarate dehydrogenase complex. Furthermore, we demonstrated that the mutations of highly conserved amino acid residues in GLRX5 protein can have different effects on downstream Fe/S proteins."

According to the news reporters, the research concluded: "Collectively, our current work demonstrates that GLRX5 protein is multifunctional in [Fe-S] protein synthesis and maturation and defects of the different amino acids of the protein will lead to distinct effects on downstream Fe/S biosynthesis."

Our news journalists report that additional information may be obtained by contacting G. Liu, CAS Key Laboratory for Biomedical Effects of Nanomaterials and Nanosafety, National Center for Nanoscience and Technology, No11 Zhongguancun Beiyitiao, Beijing, 100190, People's Republic of China. Additional authors for this research include Y. Wang, G.J. Anderson, C. Camaschella, Y. Chang and G. Nie.

Researchers at National Central University Target Acidosis
(Involvement of TRPV1 and TDAG8 in Pruriception Associated with Noxious Acidosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Acidosis have been presented. According to news reporting from Taoyuan, Taiwan, by NewsRx
journalists, research stated, "Itch and pain are closely related but are distinct sensations. Intradermal injection of acid generates pain in both rodents and humans; however, few studies have addressed the intriguing question of whether acid (protons) can evoke itch like other algogens by spatial contrast activation of single nociceptors."

The news correspondents obtained a quote from the research from National Central University, "Here, we report that (i) citric acid (0.2 mol/L) pH-dependently induced a scratching response in mice when applied intradermally to nape or cheek skin, (ii) acidified buffer elevated intracellular calcium levels in dorsal root ganglion pruriceptors, and (iii) injection of intradermal citric acid (pH 3.0) into the nape induced a pruritogen-like but not algogen-like c-Fos immunoreactivity pattern in the cervical spinal cord. Using pharmacological and genetic approaches, we identified potential acid-sensing channels/receptors involved in acidic citrate-evoked itch. TRPV1, but neither ASIC3 nor TRPA1, is involved in the acidic citrate-induced scratching response. Furthermore, one of the proton-sensing G-protein-coupled receptors, TDAG8, was highly (similar to 71%) expressed in Nppb(+) dorsal root ganglion pruriceptors. Itch induced by acidic citrate, but not alpha-methyl-5-hydroxytryptamine, chloroquine, compound 48/80, or bile acid, was markedly decreased in TDAG8(-/-) mice. In a heterologous expression system, TDAG8 potentiated the acid-induced calcium response by regulating TRPV1."

According to the news reporters, the research concluded: "Thus, protons could evoke pruriception by acting on TDAG8 to regulate TRPV1 activation with its mechanism of future therapeutic relevance."

Our news journalists report that additional information may be obtained by contacting W.H. Sun, Natl Cent Univ, Dept. of Life Sci, Taoyuan, Taiwan. Additional authors for this research include M. Steinhoff, A. Ikoma, Y.C. Chang, Y.R. Cheng, R.C. Kopparaju, S. Ishii, W.H. Sun and C.C. Chen.

Keywords for this news article include: Taoyuan, Taiwan, Asia, Nutritional and Metabolic Diseases and Conditions, Acid-Base Imbalance, Acidosis, Genetics, National Central University.

Diabetes

Researchers at National Heart Lung and Blood Institute Target Diabetes (Identifying Probable Diabetes Mellitus Among Hispanics/latinos From Four Us Cities: Findings From The Hispanic Community Health Study/study of Latinos)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Diabetes is the subject of a report. According to news reporting originating in Bethesda, Maryland, by NewsRx journalists, research stated, "The aim of this study was to compare the ability of American Diabetes Association (ADA) diagnostic
criteria to identify U.S. Hispanics/Latinos from diverse heritage groups with probable diabetes mellitus and assess cardiovascular risk factor correlates of those criteria."

The news reporters obtained a quote from the research from National Heart Lung and Blood Institute, "Cross-sectional analysis of data from 15,507 adults from 6 Hispanic/Latino heritage groups, enrolled in the Hispanic Community Health Study/Study of Latinos. The prevalence of probable diabetes mellitus was estimated using individual or combinations of ADA-defined cut points. The sensitivity and specificity of these criteria at identifying diabetes mellitus from ADA-defined prediabetes and normoglycemia were evaluated. Prevalence ratios of hypertension, abnormal lipids, and elevated urinary albumin-creatinine ratio for unrecognized diabetes mellitus-versus prediabetes and normoglycemia were calculated. Among Hispanics/Latinos (mean age, 43 years) with diabetes mellitus, 39.4% met laboratory test criteria for probable diabetes, and the prevalence varied by heritage group. Using the oral glucose tolerance test as the gold standard, the sensitivity of fasting plasma glucose (FPG) and hemoglobin A1c-alone or in combination-was low (18, 23, and 33%, respectively) at identifying probable diabetes mellitus. Individuals who met any criterion for probable diabetes mellitus had significantly higher (P <.05) prevalence of most cardiovascular risk factors than those with normoglycemia or prediabetes, and this association was not modified by Hispanic/Latino heritage group. FPG and hemoglobin A1c are not sensitive (but are highly specific) at detecting probable diabetes mellitus among Hispanics/Latinos, independent of heritage group."

According to the news reporters, the research concluded: "Assessing cardiovascular risk factors at diagnosis might prompt multitarget interventions and reduce health complications in this young population."

For more information on this research see: Identifying Probable Diabetes Mellitus Among Hispanics/Latinos From Four Us Cities: Findings From The Hispanic Community Health Study/study Of Latinos. Endocrine Practice, 2016;22(10):1151-1160. Endocrine Practice can be contacted at: Amer Assoc Clinical Endocrinologists, 245 Riverside Avenue, Ste 200, Jacksonville, FL 32202, USA.

Oncology - Breast Cancer

Researchers at National Hospital Organization Target Breast Cancer (Impact of Expression of Vimentin and Axl in Breast Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting from Fukuoka, Japan, by NewsRx journalists, research stated, "The
receptor tyrosine kinase Axl has been reported to be a downstream effector of epithelial-to-mesenchymal transition and to be regulated by vimentin expression in preclinical models. Coexistence of vimentin-positive and Axl-high expression was significantly associated with triple-negative breast cancer and poor prognosis."

Financial support for this research came from Ministry of Education, Culture, Sports, Science, and Technology.

The news correspondents obtained a quote from the research from National Hospital Organization, "Vimentin and AA expression might contribute to the aggressive phenotype in breast cancer patients. The association between Axl and vimentin protein expression has been observed in several cell lines. However, the clinical importance of Axl and vimentin expression in breast cancer have not been fully determined. The expressions of Axl and vimentin were evaluated by immunohistochemistry in a total of 343 patients with invasive ductal carcinoma. The relationships between expression of Axl and vimentin and clinicopathologic characteristics and prognosis were analyzed. Axl expression was classified into high (n = 170) and low (n = 173) expression groups. Axl expression alone was not associated with any clinicopathologic factor or prognosis. Coexistence of vimentin-positive and Axl-high expression was observed in 10.5% (n = 36). Vimentin-positive and AA-high tumors were associated with triple-negative breast cancers (P = .0396) and with poor prognosis in terms of both recurrence-free survival (P = .0126) and overall survival (P = .0005) compared to the other groups, including vimentin-positive and Axl-low tumors, vimentin-negative and Axl-high tumors, and vimentin-negative and Axl-low tumors. Multivariate analysis showed that coexistence of vimentin-positive and Axl-high expression was an independent poor prognostic factor for recurrence-free survival (hazard ratio, 2.78; 95% confidence interval, 1.23-5.68; P = .0158) and overall survival (hazard ratio, 3.72; 95% confidence interval, 1.51-8.47; P = .0059). Coexistence of vimentin-positive and Axl-high expression is a poor prognostic factor for primary breast cancer."

According to the news reporters, the research concluded: "Vimentin and Axl expression might contribute to the aggressive phenotype in breast cancer."

Researchers at National Hospital for Neurology and Neurosurgery Release New Data on Guillain-Barre Syndrome (Pharmacological treatment other than corticosteroids, intravenous immunoglobulin and plasma exchange for Guillain-Barre syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Autoimmune Diseases and Conditions - Guillain-Barre Syndrome are discussed in a new report. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Plasma exchange and intravenous immunoglobulin, but not corticosteroids, are beneficial in Guillain-Barre syndrome (GBS). The efficacy of other pharmacological agents is unknown."

Our news editors obtained a quote from the research from National Hospital for Neurology and Neurosurgery, "This review was first published in 2011 and updated in 2013 and 2016. To assess the effects of pharmacological agents other than plasma exchange, intravenous immunoglobulin and corticosteroids for GBS. Search methods On 18 January 2016, we searched the Cochrane Neuromuscular Specialised Register, Cochrane Central Register of Controlled Trials, MEDLINE, and Embase for treatments for GBS. We also searched clinical trials registries. Selection criteria We included all randomised controlled trials (RCTs) or quasi-RCTs of acute GBS (within four weeks from onset) of all types and degrees of severity, and in individuals of all ages. We discarded trials that investigated only corticosteroids, intravenous immunoglobulin or plasma exchange. We included other pharmacological treatments or combinations of treatments compared with no treatment, placebo or another treatment. We also identified a number of non-randomised studies during the search, the results of which we considered in the Discussion. Data collection and analysis We followed standard Cochrane methodology. We identified no new trials during this update of the review. In previous versions of this review we identified only very low quality evidence for four different interventions published in four studies. Each study had a high risk of bias in at least one respect. One RCT with 19 participants comparing interferon beta-1a and placebo showed no clinically important difference in any outcome between groups. Another with 10 participants comparing brain-derived neurotrophic factor and placebo showed no clinically important difference in any outcome between groups. A third with 37 participants comparing cerebrospinal fluid filtration and plasma exchange also showed no clinically important difference in any outcome between groups. In a fourth with 43 participants, the risk ratio for an improvement by one or more disability grade after eight weeks was greater with the Chinese herbal medicine tripterygium polyglycoside than with corticosteroids (risk ratio 1.47; 95% confidence interval 1.02 to 2.11); other outcomes in this trial showed no difference. Serious adverse events were uncommon with each of these treatments and in the control groups. Authors' conclusions The quality of the evidence was very low. Three small RCTs, comparing interferon beta-1a or brain-derived neurotrophic factor with placebo, and cerebrospinal fluid filtration with plasma exchange, showed no significant benefit or harm for any of the interventions. A fourth small trial showed that the Chinese herbal medicine, tripterygium polyglycoside, hastened recovery in people with GBS to a greater extent than corticosteroids, but this result needs confirmation."

According to the news editors, the research concluded: "We were unable to draw any useful conclusions from the few observational studies we identified."

For more information on this research see: Pharmacological treatment other than corticosteroids, intravenous immunoglobulin and plasma exchange for Guillain-Barre syndrome.

**Ebola Virus**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Ebola Virus is the subject of a report. According to news reporting out of Hamilton, Montana, by NewsRx editors, research stated, "Antiviral therapeutics with existing clinical safety profiles would be highly desirable in an outbreak situation, such as the 2013-2016 emergence of Ebola virus (EBOV) in West Africa. Although, the World Health Organization declared the end of the outbreak early 2016, sporadic cases of EBOV infection have since been reported."

Financial supporters for this research include National Institute of Allergy and Infectious Diseases, National Institutes of Health.

Our news journalists obtained a quote from the research from the National Institutes of Health, "Alisporivir is the most clinically advanced broad-spectrum antiviral that functions by targeting a host protein, cyclophilin A (CypA). A modest antiviral effect of alisporivir against contemporary (Makona) but not historical (Mayinga) EBOV strains was observed in tissue culture. However, this effect was not comparable to observations for an alisporivir-susceptible virus, the flavivirus tick-borne encephalitis virus."

According to the news editors, the research concluded: "Thus, EBOV does not depend on (CypA) for replication, in contrast to many other viruses pathogenic to humans."

Our news journalists report that additional information may be obtained by
Researchers at National Institutes of Health Sciences Report New Data on Myeloid Cells (Cell Type-Specific Responses of Peripheral Blood CD14-Positive Monocytes to Liposome-Encapsulated Immunostimulatory siRNA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Myeloid Cells. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "RNA interference via small interfering RNA (siRNA) has many potential therapeutic applications, and liposomal-based systems are useful for improving the pharmacokinetics of siRNAs, including their intracellular release and distribution. However, for the successful translation of this technology into clinical applications, it is important to understand how liposomal encapsulation changes the cellular uptake and immunostimulatory adverse effects of siRNAs."

Our news editors obtained a quote from the research from the National Institutes of Health Sciences, "Here we evaluated the cellular uptake and innate immune activation by an immunostimulatory siRNA encapsulated within a liposome carrier in commercially available human peripheral blood mononuclear cells (PBMCs). We found considerable lot-to-lot variation in cytokine production by the PBMCs. Flow cytometric analysis in conjunction with intracellular staining of tumor necrosis factor-alpha (TNF-alpha) revealed that after treating PBMCs with the liposomal siRNA, approximately 5% of the cells produced TNF-alpha and more than 90% of the TNF-alpha-producing cells were positive for CD14 expression. We also showed that peripheral blood CD14(+) monocytes in the cytokine release assay had low inter-lot variabilities in TNF-alpha production, suggesting that the peripheral blood CD14(+) monocyte-based cytokine release assay is a specific means of alleviating the lot-to-lot variability in the cytokine release profiles of commercially available PBMCs."

According to the news editors, the research concluded: "Our results also show that the peripheral blood CD14(+) monocyte-based cytokine release assay can be used to identify the siRNA recognition receptors that mediate individual cytokine production."

For more information on this research see: Cell Type-Specific Responses of Peripheral Blood CD14-Positive Monocytes to Liposome-Encapsulated Immunostimulatory siRNA. Biological & Pharmaceutical Bulletin, 2016;39(11):1859-1867. Biological & Pharmaceutical Bulletin can be contacted at: Pharmaceutical Soc Japan, 2-12-15 Shibuya,
Researchers at National Sun Yat Sen University Target Hepatitis C Virus
(Four weeks of paritaprevir/ritonavir/ombitasvir plus dasabuvir encountering dengue fever resulted in sustained virological response in an HCV patient A case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Hepatitis C Virus is now available. According to news originating from Kaohsiung, Taiwan, by NewsRx correspondents, research stated, "Direct antiviral agent (DAA) has been the standard of care for patients with hepatitis C virus (HCV) infection. Twelve weeks of paritaprevir/ritonavir/ombitasvir plus dasabuvir (PROD) with or without ribavirin has shown to have a sustained virological response at post-treatment 12 weeks (SVR12) rate of > 90% in HCV genotype 1 (HCV-1) patients."

Our news journalists obtained a quote from the research from National Sun Yat Sen University, "We report a HCV-1b patient who received only 25 days of PROD treatment. The patient early terminated treatment due to dengue fever but eventually achieved SVR12. It may attribute to low baseline viral loads and extraordinarily rapid suppression of HCV after treatment day1. The finding may shed light for possible response-guided-therapy for so-called ultra-super-responders in the DAA era."

According to the news editors, the research concluded: "Whether the dengue virus, the Flaviviridae family as with HCV, enhanced the HCV clearance remains unclear and needs further exploration."

For more information on this research see: Four weeks of paritaprevir/ritonavir/ombitasvir plus dasabuvir encountering dengue fever resulted in sustained virological response in an HCV patient A case report. Medicine, 2016;95(47):101-102.

Researchers at National University Report New Data on Proinsulin

( Targeting genes in insulin-associated signalling pathway, DNA damage, cell proliferation and cell differentiation pathways by tocotrienol-rich fraction in preventing cellular ... )

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptide Proteins - Proinsulin. According to news originating from Kuala Lumpur, Malaysia, by NewsRx correspondents, research stated, "Tocotrienols have been known for their antioxidant properties besides their roles in cellular signalling, gene expression, immune response and apoptosis. This study aimed to determine the molecular mechanism of tocotrienol-rich fraction (TRF) in preventing cellular senescence of human diploid fibroblasts (HDFs) by targeting the genes in senescence-associated signalling pathways."

Our news journalists obtained a quote from the research from National University, "Real time quantitative PCR (qRT-PCR) was utilized to evaluate the expression of genes involved in these pathways. Our findings showed that SOD1 and CCS-1 were significantly down-regulated in pre-senescent cells while CCS-1 and PRDX6 were up-regulated in senescent cells (p <0.05). Treatment with TRF significantly down-regulated SOD1 in pre-senescent and senescent HDFs, up-regulated SOD2 in senescent cells, CAT in young HDFs, GPX1 in young and pre-senescent HDFs, and CCS-1 in young, pre-senescent and senescent HDFs (p <0.05). TRF treatment also caused up-regulation of FOXO3A in all age groups of cells (p <0.05). The expression of TP53, PAK2 and CDKN2A was significantly increased in senescent HDFs and treatment with TRF significantly down-regulated TP53 in senescent cells (p <0.05). MAPK14 was significantly up-regulated (p <0.05) in senescent HDFs while no changes was observed on the expression of JUN. TRF treatment, however, down-regulated MAPK14 in young and senescent cells and up-regulated JUN in young and pre-senescent HDFs (p <0.05)."

According to the news editors, the research concluded: "TRF modulated the expression of genes involved in senescence-associated signalling pathways during replicative senescence of HDFs."

For more information on this research see: Targeting genes in insulin-associated signalling pathway, DNA damage, cell proliferation and cell differentiation pathways by tocotrienol-rich fraction in preventing cellular senescence of human diploid fibroblasts. La Clinica Terapeutica, 2015;166(6):e365-73.

Researchers at Netherlands Cancer Institute Discuss Findings in Nuclear Medicine (Intraoperative 3D Navigation for Single or Multiple 125I-Seed Localization in Breast-Preserving Cancer Surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Nuclear Medicine have been published. According to news originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Mammographic screening has led to the identification of more women with nonpalpable breast cancer, many of them to be treated with breast-preserving surgery. To accomplish radical tumor excision, adequate localization techniques such as radioactive seed localization (RSL) are required."

Our news journalists obtained a quote from the research from Netherlands Cancer Institute, "For RSL, a radioactive I-seed is implanted central in the tumor to enable intraoperative localization using a g-probe. In case of extensive tumor or multifocal carcinoma, multiple I-seeds can be used to delineate the involved area. Preoperative imaging is performed different from surgical positioning; therefore, exact I-seed depth remains unknown during surgery. Twenty patients (mean age, 56.8 years) with 25 implanted I-seeds scheduled for RSL were included. Sixteen patients had 1 I-seed implanted in the primary lesion, 3 patients had 2 I-seeds, and 1 patient had 3 I-seeds. Freehand SPECT localized I-seeds by measuring g-counts from different directions, all registered by an optical tracking system. A reconstruction and visualization algorithm enabled 3-dimensional (3D) navigation toward the I-seeds. Freehand SPECT visualized all I-seeds in primary tumors and provided preincision depth information. The deviation, mean (SD), between the freehand SPECT depth and the surgical depth estimation was 1.9 (2.1) mm (range, 0-7 mm). Three-dimensional freehand SPECT was especially useful identifying multiple implanted I-seeds because the conventional g-probe has more difficulty discriminating I-seeds transcutaneous. Freehand SPECT with 3D navigation is a valuable tool in RSL for both single and multiple implanted I-seeds in breast-preserving cancer surgery."

According to the news editors, the research concluded: "Freehand SPECT provides continuous updating 3D imaging with information about depth and location of the I-seeds contributing to adequate excision of nonpalpable breast cancer."

The news correspondents report that additional information may be obtained from B. Pouw, From the Departments of *Nuclear Medicine and †Surgical Oncology, Netherlands
Researchers at Northern Hospital Report New Data on Heart Disease
(Radiation dose difference between state of the art myocardial perfusion scintigraphy and computed tomography coronary angiography in patients undergoing evaluation for suspected ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Disease. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "Minimisation of radiation exposure with cardiac imaging reduces the potential of secondary side effects. Radiation exposure from myocardial perfusion scintigraphy and computed tomography coronary angiography (CTCA) was compared."

The news correspondents obtained a quote from the research from Northern Hospital, "Overall doses were low with both modalities. Doses were lower in the CTCA group, but by only a small difference of 1.1 mSv."

According to the news reporters, the research concluded: "Radiation exposure should not be the primary consideration when choosing between these two modalities."

Our news journalists report that additional information may be obtained by contacting I.M. Tsay, Cardiology Department, The Northern Hospital, Melbourne, Victoria, Australia. Additional authors for this research include I. Subiakto, M. Asrar Ul Haq, A.V. Castles, K. Allman, U. Hayat, N. Rudd, P. Barlis and W. van Gaal.

Researchers at Northwick Park Hospital Report New Data on Genitourinary Tract Agents (The role of carbetocin in the prevention and management of postpartum haemorrhage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Genitourinary Tract Agents have been published. According to news reporting out of Harrow, United Kingdom, by NewsRx editors, research stated, “Carbetocin is a new synthetic analogue of oxytocin.”

Our news journalists obtained a quote from the research from Northwick Park Hospital, "It has a longer half life than oxytocin."

According to the news editors, the research concluded: "This review examines the current evidence for the use of carbetocin as an alternative to oxytocin, as a first-line agent in the pharmacological management of the third stage of labour."

Our news journalists report that additional information may be obtained by contacting D.N. Lucas, Northwick Park Hospital, Dept. of Anaesthet, Harrow, Middx, United Kingdom. Additional authors for this research include M.R. Nel and D.N. Lucas.

Researchers at Norwegian University of Science and Technology (NTNU) Report Findings in Ulcerative Colitis (Expression of CCL20 and Its Corresponding Receptor CCR6 Is Enhanced in Active Inflammatory Bowel Disease, and TLR3 Mediates CCL20 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Inflammatory Bowel Diseases and Conditions - Ulcerative...
Colitis have been presented. According to news reporting from Trondheim, Norway, by NewsRx journalists, research stated, "The chemokine CCL20 and its receptor CCR6 are putative drug targets in inflammatory bowel disease, and CCL20 is a novel IBD predilection gene. Previous findings on the CCL20 response in these diseases are divergent."

The news correspondents obtained a quote from the research from the Norwegian University of Science and Technology (NTNU), "This study was undertaken to examine CCL20 and CCR6 during active and inactive disease, and mechanisms for CCL20 regulation by the innate immune system. As TLR3 has recently emerged as a possible mediator of CCL20 production, we hypothesised that this TLR plays an important role in enterocytic CCL20 production. A large microarray study on colonic pinch biopsies from active and inactive ulcerative colitis and Crohn's disease provided background information. CCL20 and CCR6 were localized and their expression levels assessed in biopsies using in situ hybridization and immunohistochemistry. Regulation of CCL20 was studied in the HT29 cell line using a panel of pattern recognition receptor ligands followed by a TLR3 siRNA assay. CCL20 and CCR6 mRNA abundances were increased during active inflammation (CCL20 5.4-fold in ulcerative colitis and 4.2-fold in Crohn's disease; CCR6 1.8 and 2.0, respectively). CCL20 and CCR6 mRNA positive immune cells in lamina propria were more numerous, and CCL20 immunoreactivity increased massively in the epithelial cells during active inflammation for both diseases. TLR3 stimulation potently induced upregulation and release of CCL20 from HT29 cells, and TLR3 silencing reduced CCL20 mRNA and protein levels. The CCL20-CCR6 axis is involved during active inflammation in both ulcerative colitis and Crohn's disease."

According to the news reporters, the research concluded: "The epithelial cells seem particularly involved in the CCL20 response, and results from this study strongly suggest that the innate immune system is important for activation of the epithelium, especially through TLR3."

For more information on this research see: Expression of CCL20 and Its Corresponding Receptor CCR6 Is Enhanced in Active Inflammatory Bowel Disease, and TLR3 Mediates CCL20 Expression in Colonic Epithelial Cells. *Plos One*, 2015;10(11):e0141710. Researchers at Ohio State University Have Reported New Data on Human Genetics (Noncoding RNA: Current Deep Sequencing Data Analysis Approaches and Challenges)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Genetics - Human Genetics are discussed in a new report. According to news reporting out of Columbus, Ohio, by NewsRx editors, research stated, "One of the most significant biological discoveries of the last decade is represented by the reality that the vast majority of the transcribed genomic output comprises diverse classes of noncoding RNAs (ncRNAs) that may play key roles and/or be affected by many biochemical cellular processes (i.e., RNA editing), with implications in human health and disease."

Our news journalists obtained a quote from the research from Ohio State University, "With 90% of the human genome being transcribed and novel classes of ncRNA emerging (tRNA-derived small RNAs and circular RNAs among others), the great majority of the human transcriptome suggests that many important ncRNA functions/processes are yet to be discovered. An approach to filling such vast void of knowledge has been recently provided by the increasing application of next-generation sequencing (NGS), offering the unprecedented opportunity to obtain a more accurate profiling with higher resolution, increased throughput, sequencing depth, and low experimental complexity, concurrently posing an increasing challenge in terms of efficiency, accuracy, and usability of data analysis software."

According to the news editors, the research concluded: "This review provides an overview of ncRNAs, NGS technology, and the most recent/popular computational approaches and the challenges they attempt to solve, which are essential to a more sensitive and comprehensive ncRNA annotation capable of furthering our understanding of this still vastly uncharted genomic territory."

Our news journalists report that additional information may be obtained by contacting D. Veneziano, Ohio State University, Dept. of Canc Biol & Genet, Center Comprehens Canc, Columbus, OH 43210, United States. Additional authors for this research include S. Di Bella, G. Nigita, A. Researchers at Ohio State University Have Reported New Data on Molecular Oral Microbiology (Periodontal and peri-implant diseases: identical or fraternal infections?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Molecular Oral Microbiology have been published. According to news reporting originating from Columbus, Ohio, by NewsRx correspondents, research stated, "Peri-implant diseases (peri-implantitis and peri-implant mucositis) are bacterially driven infections. Peri-implantitis leads to aggressive bone resorption and eventual loss of the implant."

Our news editors obtained a quote from the research from Ohio State University, "Traditionally, peri-implantitis was regarded as microbially similar to periodontitis, and translocation of periodontal pathogens into the peri-implant crevice was considered as a critical factor in disease causation. However, evidence is emerging to suggest that the peri-implant and periodontal ecosystems differ in many important ways. The purpose of this review is to examine the evidence supporting microbial congruence and discordance in these two communities. Current evidence suggests that osseointegrated implants truly create unique microenvironments that force microbial adaptation and selection."

According to the news editors, the research concluded: "Further studies that revisit the 'microbial reservoir' hypothesis and identify species that play an etiologic role in peri-implant disease and examine their transmission from teeth are needed."

For more information on this research see: Periodontal and peri-implant diseases: identical or fraternal infections? Molecular Oral Microbiology, 2016;31(4):285-301.

The news editors report that additional information may be obtained by contacting P.S. Kumar, Ohio State University, Coll Dental, Div Periodontol, Columbus, OH 43210, United States. Additional authors for this research include D.N. Reed, J.D. Walters and P.S. Kumar.

Biotechnology - Biologics

Researchers at Okayama University Target Biologics (Tumor-specific delivery of biologics by a novel T-cell line HOZOT)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biotechnology - Biologics. According
to news reporting from Okayama, Japan, by NewsRx journalists, research stated, "Cell-in-cell' denotes an invasive phenotype in which one cell actively internalizes in another. The novel human T-cell line HOZOT, established from human umbilical cord blood, was shown to penetrate a variety of human cancer cells but not normal cells."

The news correspondents obtained a quote from the research from Okayama University, "Oncolytic viruses are emerging as biological therapies for human cancers; however, efficient viral delivery is limited by a lack of tumor-specific homing and presence of pre-existing or therapy-induced neutralizing antibodies. Here, we report a new, intriguing approach using HOZOT cells to transmit biologics such as oncolytic viruses into human cancer cells by cell-in-cell invasion. HOZOT cells were successfully loaded via human CD46 antigen with an attenuated adenovirus containing the fiber protein of adenovirus serotype 35 (OBP-401/F35), in which the telomerase promoter regulates viral replication. OBP-401/F35-loaded HOZOT cells were efficiently internalized into human cancer cells and exhibited tumor-specific killing by release of viruses, even in the presence of anti-viral neutralizing antibodies. Moreover, intraperitoneal administration of HOZOT cells loaded with OBP-401/F35 significantly suppressed peritoneally disseminated tumor growth in mice."

According to the news reporters, the research concluded: "This unique cell-in-cell property provides a platform for selective delivery of biologics into human cancer cells, which has important implications for the treatment of human cancers."

For more information on this research see: Tumor-specific delivery of biologics by a novel T-cell line HOZOT. Scientific Reports, 2016;6():1-10. clinical outcomes for patients with moderate-advanced chronic periodontitis treated with: scaling and root planing (SRP), SRP with amoxicillin and metronidazole (A+M), SRP with Azithromycin (Az)."

Financial support for this research came from Australian Periodontology Research Foundation (APRF).

The news reporters obtained a quote from the research from Oral Health Center, "Thirty-seven non-smokers with generalized moderate to advanced chronic periodontitis were divided into three treatment groups: SRP, A+M and Az. Patients received the medications after the last SRP session and were reviewed three months later. Changes in clinical parameters were compared between the groups. Separate analyses were executed for: 'all sites', 'molar sites', 'sites with different PPD severities' and 'number of sites with shallow, moderate and deep PPD'. The three groups exhibited improvements in most clinical parameters. At three months, A+M showed a higher reduction in PPD compared to Az in the 'all sites analysis'. Molars exhibited better reduction in BOP and PPD with A+M than SRP. Pocket depth of the 4-6 mm category reduced more in the A+M than SRP. A+M experienced a higher increase in the number of sites with PPD 1-3 mm than Az."

According to the news reporters, the research concluded: "Adjunctive systemic antibiotics in the initial phase of treatment may result in improved clinical outcomes."

Inflammation

Researchers at Osaka University Graduate School of Medicine Discuss Findings in Inflammation (Placental examination: prognosis after delivery of the growth-restricted fetus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Inflammation have been published. According to
news reporting out of Osaka, Japan, by NewsRx editors, research stated, "This article describes the role of placental examination in the prognostic evaluation of fetal growth restriction (FGR) infants. A new comprehensive placental classification system was reported."

Our news journalists obtained a quote from the research from the Osaka University Graduate School of Medicine, "Maternal underperfusion, fetal thrombotic vasculopathy (FTV), villitis (including villitis of unknown etiology and infectious villitis), inflammation, and immature/dysmature villi are important factors affecting FGR prognosis, whereas genomic imprinting is a key factor affecting growth and diseases, as well as placental abnormality. We discuss the role of placental examination in determining FGR prognosis. Maternal underperfusion, fetal thrombotic vasculopathy, and villitis (including villitis of unknown etiology and infectious villitis) are the most important findings affecting FGR prognosis. Although limited, data have suggested an association of inflammation and immature/dysmature villi with postnatal growth in FGR infants. Placental size also contributes postnatally through fetal programming."

According to the news editors, the research concluded: "In addition, placental imprinting can be a key of pre and postnatal growth and diseases, including imprinting disorders, as well as placental abnormalities such as placental mesenchymal dysplasia."

For more information on this research see: Placental examination: prognosis after delivery of the growth-restricted fetus. Current Opinion In Obstetrics & Gynecology, 2016;28 (2):95-100. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Obstetrics & Gynecology - journals.lww.com/co-obgyn/pages/default.aspx)

Researchers at Osaka University Graduate School of Medicine Report Findings in Stem Cell Research (A glycoproteomic approach to identify novel glycomarkers for cancer stem cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Stem Cell Research have been published. According to news reporting out of Suita, Japan, by NewsRx editors, research stated, "Most cancers consist of heterogeneous populations of cells with substantial differences in tumorigenicity. Cells that possess self-renewal and tumor-initiating properties are often called cancer stem cells (CSCs)."

Our news journalists obtained a quote from the research from the Osaka University
Graduate School of Medicine, "Since CSCs underlie tumor recurrence and metastasis and are resistant to current anti-cancer therapies, novel therapeutic strategies to efficiently target this subset of cells are needed. Aberrant glycosylation is one of the hallmarks of cancer. Many cancer-associated glycans have been reported to be involved in tumor progression and metastasis, and are used as tumor markers. Over the past several years, we have identified characteristic glycans on CSCs by utilizing recent advances in glycoproteomic technologies."

According to the news editors, the research concluded: "In this review, we would like to summarize a series of our recent studies and discuss possible applications of glycomarkers for CSCs."

Our news journalists report that additional information may be obtained by contacting A. Sawanobori, Dept. of Molecular Biochemistry & Clinical Investigation, Osaka University Graduate School of Medicine, Suita, Japan. Additional authors for this research include K. Moriwaki, S. Takamatsu, Y. Kamada and E. Miyoshi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/pmic.201500472. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Breast Cancer

Researchers at Oxford Brookes University Release New Data on Breast Cancer (Breast cancer osteomimicry and its role in bone specific metastasis; an integrative, systematic review of preclinical evidence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "Metastasis accounts for most of the deaths from breast cancer and the preference of invasive breast cancer metastasising to bone has been widely reported. However, the biological basis of breast cancer osteotropism is not fully understood."

Our news journalists obtained a quote from the research from Oxford Brookes University, "This paper provides, for the first time, an integrative, systematic review of evidence of molecular factors that have functional roles in the homing of metastatic breast cancer to the bone. Pubmed, Web of Science and EBSCOhost were searched using keywords and synonyms for molecular, metastasis, breast cancer and bone to identify articles published between January 2004 and August 2016. 4491 potentially relevant citations were retrieved. 63 articles met the inclusion criteria, which were primary studies reporting evidence of molecular factors that have functional roles in predisposing breast cancer bone metastasis in vivo. 12 of those 63 articles that additionally met quality criteria were included in the review. Extracted data were tabulated and key findings that indicated biological mechanisms involved in breast cancer metastasis to..."
bone were synthesised. 15 proteins expressed by breast cancer cells were identified as factors that mediate breast cancer bone metastasis: ICAM-1, cadherin-11, osteoactivin, bone sialoprotein, CCN3, IL-11, CCL2, CITED2, CXCR4, CTGF, OPN, CX(3)CR1, TWIST1, adrenomedullin and Enpp1. Upregulation or overexpression of one or more of them by breast cancer cells resulted in increased breast cancer metastasis to bone in vivo, except for CCL2 where bone-metastatic cells showed a reduced expression of this factor. All factors identified, here expressed by breast cancer cells, are proteins that are normally expressed in the bone microenvironment and linked to physiologic bone functions. All have a functional role in one of more of the following: cell proliferation and differentiation, bone mineralization and remodelling, cell adhesion and/or chemokine signalling. Six of them (cadherin-11, ICAM-1, OPN, CX3CR1, CCN3 and osteoactivin) have a reported function in cell adhesion and another eight (CCN3, osteoactivin, Enpp1, IL-11, CTGF, TWIST1, adrenomedullin and CITED2) are reported to be involved in cell proliferation and differentiation. This review collates and synthesises published evidence to increase our understanding of the biology of breast cancer osteomimicry in the development of bone metastasis.

According to the news editors, the research concluded: "Findings of this review suggest that changes in expression of proteins in breast cancer cells that confer osteomimicry facilitate homing to bone to enable the development of bone metastasis."

The news correspondents report that additional information may be obtained from S.A. Brooks, Oxford Brookes University, Dept. of Biol & Med Sci, Oxford OX3 0BP, United Kingdom. Additional authors for this research include S.A. Brooks and V. Lavender.

Keywords for this news article include: Oxford, United Kingdom, Europe, Cell Proliferation, Article Review, Women's Health, Bone Research, Breast Cancer, Oncology, Oxford Brookes University.

Eye Diseases and Conditions - Optic Atrophy

Researchers at Paracelsus Medical University Report New Data on Optic Atrophy (Disturbed mitochondrial and peroxisomal dynamics due to loss of MFF causes Leigh-like encephalopathy, optic atrophy and peripheral neuropathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Eye Diseases and Conditions - Optic Atrophy have been published. According to news originating from Salzburg, Austria, by NewsRx correspondents, research stated, "Mitochondria are dynamic organelles which undergo continuous fission and fusion to maintain their diverse cellular functions. Components of the fission machinery are partly shared between mitochondria and peroxisomes, and inherited defects in two such components (dynamin-related protein (DRP1) and ganglioside-induced
differentiation-associated protein 1 (GDAP1)) have been associated with human disease."

Our news journalists obtained a quote from the research from Paracelsus Medical University, "Deficiency of a third component (mitochondrial fission factor, MFF) was recently reported in one index patient, rendering MFF another candidate disease gene within the expanding field of mitochondrial and peroxisomal dynamics. Here we investigated three new patients from two families with pathogenic mutations in MFF. The patients underwent clinical examination, brain MRI, and biochemical, cytological and molecular analyses, including exome sequencing. The patients became symptomatic within the first year of life, exhibiting seizures, developmental delay and acquired microcephaly. Dysphagia, spasticity and optic and peripheral neuropathy developed subsequently. Brain MRI showed Leigh-like patterns with bilateral changes of the basal ganglia and subthalamic nucleus, suggestive of impaired mitochondrial energy metabolism. However, activities of mitochondrial respiratory chain complexes were found to be normal in skeletal muscle. Exome sequencing revealed three different biallelic loss-of-function variants in MFF in both index cases. Western blot studies of patient-derived fibroblasts indicated normal content of mitochondria and peroxisomes, whereas immunofluorescence staining revealed elongated mitochondria and peroxisomes. Furthermore, increased mitochondrial branching and an abnormal distribution of fission-mediating DRP1 were observed. Our findings establish MFF loss of function as a cause of disturbed mitochondrial and peroxisomal dynamics associated with early-onset Leigh-like basal ganglia disease."

According to the news editors, the research concluded: "We suggest that, even if laboratory findings are not indicative of mitochondrial or peroxisomal dysfunction, the co-occurrence of optic and/or peripheral neuropathy with seizures warrants genetic testing for MFF mutations."

For more information on this research see: Disturbed mitochondrial and peroxisomal dynamics due to loss of MFF causes Leigh-like encephalopathy, optic atrophy and peripheral neuropathy. Journal of Medical Genetics, 2016;53(4):270-8. (BMJ Publishing Group - group.bmj.com/; Journal of Medical Genetics - jmg.bmj.com/)

The news correspondents report that additional information may be obtained from J. Koch, Dept. of Pediatrics, Paracelsus Medical University Salzburg, Salzburg, Austria. Additional authors for this research include R.G. Feichtinger, P. Freisinger, M. Pies, F. Schrodol, A. Iuso, W. Sperl, J.A. Mayr, H. Prokisch and T.B Haack.

Researchers at Pediatric Research Institute Have Reported New Data on Neuroblastomas (Combating autophagy is a strategy to increase cytotoxic effects of novel ALK inhibitor entrectinib in neuroblastoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Neuroblastomas. According to news reporting originating in Padua, Italy, by NewsRx journalists, research stated, "Neuroblastoma (NB) is a threatening childhood malignancy. Its prognosis is affected by several morphological, and biological characteristics, including the constitutive expression of ALK tyrosine kinase."

The news reporters obtained a quote from the research from Pediatric Research Institute, "In this study we examined the therapeutic potential of a novel ALK inhibitor, entrectinib, in obliterating NB tumor cells. Entrectinib showed the growth-inhibitory effects on NB cells with a 50% inhibitory concentration range of 0.03-5 mM. In the ALK-dependent cells, entrectinib mediated G1-arrest, which was associated with modified expression of multiple cell-cycle regulators. Down-regulation of Ki-67, and attenuated phosphorylation of ERK1/2, and STAT3, correlated with observed antiproliferative capacity of entrectinib. Initial cytostatic activity of entrectinib was followed by concentration-dependent apoptotic cell death, and Caspase-3 activation. However, we delineated a reduced sensitivity of ALK mutated NB cells to entrectinib, and demonstrated strong activation of autophagy in SH-SY5YF1174L NB cell line. Abrogation of autophagy by chloroquine increased significantly the toxicity of entrectinib, as confirmed by enhanced death rate, and PARP protein cleavage in SH-SY5YF1174L cells. In aggregate, our data show that entrectinib inhibits proliferation, and induces G1-arrest, and apoptosis in NB cells."

According to the news reporters, the research concluded: "We propose entrectinib for further consideration in treatment of NB, and recommend pharmacological inhibition of autophagy to be explored for a combined therapeutic approach in NB patients that might develop resistance to entrectinib."

For more information on this research see: Combating autophagy is a strategy to increase cytotoxic effects of novel ALK inhibitor entrectinib in neuroblastoma cells. Oncotarget, 2016;7(5):5646-63.

Our news correspondents report that additional information may be obtained by contacting S. Aveic, Neuroblastoma Laboratory, Pediatric Research Institute, Citta della Speranza, Padua, Italy. Researchers at Peking Union Medical College Hospital Release New Data on Non-Small Cell Lung Cancer (Relationship between circulating tumour cell count and prognosis following chemotherapy in patients with advanced non-small-cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "This study investigated whether circulating tumor cells (CTC) are detectable in patients with non-small cell lung cancer (NSCLC) and whether CTC count could provide prognostic information or serve as an indicator of patient response to chemotherapy. We enrolled 46 patients with newly diagnosed or recurrent NSCLC."

Financial support for this research came from Peking Union Medical College Hospital.

Our news journalists obtained a quote from the research from Peking Union Medical College Hospital, "CTC were measured at baseline in all patients and in 23 patients, CTC were also measured before every chemotherapy cycle. The relationship between CTC count and tumor size was analysed. CTC were present in 40 patients (87%); among them, 29 (63%) had a CTC count of (>=)3 cells/3.2 mL, 17 (37%) had a CTC count of (>=)5 cells/3.2 mL and 7 (15.2%) had a CTC count of (>=)8 cells/3.2 mL. The median progression-free survival (PFS) and overall survival (OS) were 7.3 months and 16 months, respectively. A CTC count of more than eight prior to chemotherapy was a strong predictor of reduced PFS (p=0.018) and OS (p=0.026). A multivariate analysis indicated that baseline CTC count was an independent negative prognostic factor for survival. However, no correlation was observed between CTC count and tumor size after two chemotherapy cycles, its relationship with chemotherapy response still needs to be defined."

According to the news editors, the research concluded: "Baseline CTC count is an independent negative prognostic factor for NSCLC; The relationship of CTC and survival after chemotherapy still needs to be defined."

Our news journalists report that additional information may be obtained by contacting Z. Zhang, Dept. of Respiratory Medicine, Peking Union Medical College Hospital, Peking Union Medical College, Chinese Academy of Medical Sciences, Beijing, People's Republic of China. Additional authors for this research include Y. Xiao, J. Zhao, M. Chen, Y. Xu, W. Zhong, J. Xing and M. Wang.

Researchers at Peking Union Medical College Hospital Report Findings in Colon Cancer (Molecular spectrum of KRAS, NRAS, BRAF and PIK3CA mutations in Chinese colorectal cancer patients: analysis of 1,110 cases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Mutations in genes such as KRAS, NRAS, BRAF and PIK3CA have become an important part of colorectal carcinoma evaluation. The aim of this study was to screen for mutations in these genes in Chinese patients with colorectal cancer (CRC) and to explore their correlations with certain clinicopathological parameters."

Our news journalists obtained a quote from the research from Peking Union Medical College Hospital, "We tested mutations in the KRAS (exons 2, 3 and 4), NRAS (exons 2, 3 and 4), PIK3CA (exon 20) and BRAF (exon 15) genes using reverse transcriptase-polymerase chain reaction (RT-PCR) and Sanger sequencing in a large cohort of 1,110 Chinese CRC patients who underwent surgical resection at one of three major teaching hospitals located in different regions of China. The prevalence rates of KRAS, NRAS, BRAF and PIK3CA mutations were 45.4%, 3.9%, 3.1% and 3.5%, respectively. Mutant KRAS was associated with the mucinous subtype and greater differentiation, while mutant BRAF was associated with right-sided tumors and poorer differentiation."

According to the news editors, the research concluded: "Our results revealed differences in the genetic profiles of KRAS, NRAS, PIK3CA and BRAF at mutation hotspots between Chinese CRC patients and those of Western countries, while some of these gene features were shared among patients from other Asian countries."

For more information on this research see: Molecular spectrum of KRAS, NRAS, BRAF and PIK3CA mutations in Chinese colorectal cancer patients: analysis of 1,110 cases. Scientific Reports, 2015;5():18678. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting J. Zhang, Dept. of Pathology, Peking Union Medical College Hospital, Chinese Academy of Medical Science, Beijing, People's Republic of China. Additional authors for this research include J. Zheng, Y. Yang, J. Lu, J. Gao, T. Lu, J. Sun, H. Jiang, Y. Zhu, Y. Zheng, Z. Liang and T. Liu.

Researchers at Peking Union Medical College Target Pheochromocytomas (The Roles of PI3K/AKT/mTOR and MAPK/ERK Signaling Pathways in Human Pheochromocytomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pheochromocytomas. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "The roles of PI3K/AKT/mTOR and MAPK/ERK pathways involved in the pathogenesis of pheochromocytoma and paraganglioma (PPGL) were demonstrated mostly by in vitro studies with rat or mouse cells and were mainly studied at transcriptional level. This study aimed to investigate the effect of these pathways on the proliferation of human PPGL cells and the activation of these pathways in PPGLs."

Financial supporters for this research include National Key Program of Clinical Science of China, Scientific Research Foundation for the Returned Overseas Chinese Scholars.

The news correspondents obtained a quote from the research from Peking Union Medical College, "Human PPGL cells were treated with sunitinib and inhibitors of PI3K (LY294002), MEK1/2 (U0126), and mTORC1/2 (AZD8055). Cell proliferation was detected by MTT assay. Protein phosphorylation was detected by Western blotting. Inmost PPGLs, AKT, ERK1/2, and mTOR were activated. LY294002 (10 mu M), U0126 (10 mu M), AZD8055 (1 mu M), and sunitinib (1 mu M) inhibited PPGL cell proliferation in ten primary cultures of tissues, including four from patients with gene mutations. MEK1/2 inhibitor decreased mTOR phosphorylation. Inhibition of mTOR reduced phosphorylation of AKT and ERK1/2. Sunitinib inhibited phospho-ERK1/2 and phospho-mTOR. Our study suggested that PI3K/AKT/mTOR and MAPK/ERK signaling pathways play vital roles in human PPGL and are activated in most PPGLs."

According to the news reporters, the research concluded: "Inhibiting multiple pathways might be a novel therapeutic approach for PPGLs."

Our news journalists report that additional information may be obtained by contacting A.L. Tong, Peking Union Med College, Beijing 100730, People's Republic of China. Additional authors for this research include A.L. Tong, F. Wang, Y.Y. Cui, C.Y. Li, Y.S. Zhang and Z.L. Yan.

Researchers at Peking University Describe Findings in Antipsychotics
(A pharmacogenomic study revealed an association between SLC6A4 and risperidone-induced weight gain in Chinese Han population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antipsychotics. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "We carried out a pharmacogenomic study in order to identify susceptible genes for antipsychotics induced weight gain within the Chinese Han population. We enrolled 216 patients with schizophrenia in our study."

Our news editors obtained a quote from the research from Peking University, "All of them underwent risperidone monotherapy, and fulfilled 4-week follow-up. Weight gain was measured before treatment and 4 weeks later. Seven hundred and sixty-eight SNPs from 85 genes were calculated for association with weight gain percentage. Fifty-seven SNPs located at 16 genes with a p-value less than 0.05.4 SNPs located on serotonin transporter gene (solute carrier family 6, member 4, SLC6A4) remained significant after multistest correction (rs3813034, p=0.000357, q=0.08, rs1042173, rs4325622, rs9303628, p=0.000451, q=0.08)."

According to the news editors, the research concluded: "SLC6A4 might be susceptible gene for risperidone-induced weight gain within the Chinese Han population."

For more information on this research see: A pharmacogenomic study revealed an association between SLC6A4 and risperidone-induced weight gain in Chinese Han population. Pharmacogenomics, 2015;16(17):1943-9. (Nature Publishing Group - www.nature.com/tpj/)

The news editors report that additional information may be obtained by contacting F. Wang, Peking University Sixth Hospital (Institute of Mental Health), Beijing 100191, People's Republic of China. Drugs and Therapies - Radiotherapy

Researchers at Peking University Report New Data on Radiotherapy (I-125 interstitial brachytherapy for the treatment of myoepithelial carcinoma of the oral and maxillofacial region)
According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "This study evaluated the treatment of myoepithelial carcinoma (MC) of the oral and maxillofacial region with radioactive iodine (I-125) seed implantation. Twenty-seven patients with MC in the oral and maxillofacial region were treated with I-125 seed implantation between March 2006 and October 2012."

Our news journalists obtained a quote from the research from Peking University, "Thirteen of the 27 patients (8/8 patients with primary disease and 5/19 patients with recurrent disease) were treated on an adjuvant setting after resections, and the other 14 patients were treated by brachytherapy after a recurrence precluding a surgical resection for salvage. The sites of the MC were the parotid for 18 patients, oral cavity for 2 patients, and base of skull for 7 patients. Recurrence-free survival (RFS), overall survival (OS) rates, and side effects were retrospectively reviewed. Patients were followed for 6-105 months (median 37 months). The 3- and 5-year RFS rates were 51.9% and 46.1%, respectively. The 3- and 5-year OS rates were 68.6% and 51.5%, respectively. The OS and RFS were significantly better among the 8 patients treated upfront in comparison with the 19 patients treated for salvage at relapse. The OS was worst for the 7 patients with base of skull region disease. No severe complications were observed during followup. This study showed I-125 brachytherapy is a feasible and effective modality for the treatment of MC."

According to the news editors, the research concluded: "These findings should be interpreted cautiously due to the small number of patients and the relatively short followup."

The news correspondents report that additional information may be obtained from J.G. Zhang, Peking University, Sch & Hosp Stomatol, Dept. of Oral & Maxillofacial Surg, Beijing, People's Republic of China. Additional authors for this research include X.M. Lv, Y. Shi, Y. Zhang, G.Y. Yu and J.G. Zhang.

Oncology - Esophageal Cancer

Researchers at People's Hospital Release New Data on Esophageal Cancer (miR-200a-3p promotes the proliferation of human esophageal cancer cells by post-transcriptionally regulating cytoplasmic collapsin response mediator protein-1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Esophageal Cancer have been published. According to news reporting originating in Zhengzhou, People's Republic of China, by NewsRx journalists, research stated, "The dysregulation of cytoplasmic collapsin response
mediator protein 1 (CRMP1) has been reported in lung cancer, medulloblastoma and esophageal cancer. However, the role of CRMP1 and its regulatory mechanisms in esophageal cancer remain unclear."

The news reporters obtained a quote from the research from People's Hospital, "In this study, we demonstrated that CRMP1 expression was downregulated in esophageal cancer tissues and that there were differences in its expression levels in different esophageal cancer cell lines. We found that CRMP1 overexpression inhibited the proliferation of esophageal cancer cells, whereas the silencing of CRMP1 promoted cell proliferation. We performed an analysis of potential microRNA (miRNA or miR) target sites using a commonly used prediction algorithm (TargetScan). The algorithm predicted that miR-200a-3p targets the 3 untranslated region (3UTR) of CRMP1. Further experiments confirmed this prediction. In addition, we found that miR-200a-3p promoted the proliferation of esophageal cancer cells."

According to the news reporters, the research concluded: "Thus, our findings indicate that miR-200a-3p promotes the proliferation of human esophageal cancer cells by post-transcriptionally regulating CRMP1."

Our news correspondents report that additional information may be obtained by contacting Y.Z. Zang, Peoples Hosp Henan Prov, Dept. of Otolaryngol, Zhengzhou 450003, Henan, People's Republic of China. Additional authors for this research include Y. Tai, B.L. Wan and X.D. Jia.

samples were obtained pre-and post-treatment to analyse pharmacokinetics and pharmacodynamic changes in CD14(+) CD16(+) monocytes, urinary N-terminal telopeptide (uNTX), alanine/aspartate aminotransferases (ALT/AST) and creatine kinase (CK); tissue biopsy samples were taken to evaluate macrophage populations and T cells using immunohistochemistry. Clinical efficacy assessments included the Cutaneous Lupus Erythematosus Disease Area and Severity Index (CLASI). Among 28 randomized/analysed patients, peak/trough plasma concentrations increased in a greater-than-dose-proportional manner with dose increases from 100 to 150 mg. Statistically significant differences were observed between active treatment and placebo groups in changes from baseline in CD14(+) CD16(+) cells, uNTX, ALT, AST and CK levels at most time-points. The numbers, density and activation states of tissue macrophages and T cells did not change from baseline to treatment end. No between-group differences were seen in CLASI. Patients receiving PD-0360324 reported significantly more adverse events than those receiving placebo, but no serious adverse events."

According to the news reporters, the research concluded: "In patients with CLE, 100 and 150 mg PD-0360324 every 2 weeks for 3 months suppressed a subset of circulating monocytes and altered activity of some tissue macrophages without affecting cell populations in CLE skin lesions or improving clinical end-points."

For more information on this research see: Monoclonal antibody against macrophage colony-stimulating factor suppresses circulating monocytes and tissue macrophage function but does not alter cell infiltration/activation in cutaneous lesions or clinical outcomes in patients with cutaneous lupus er. *Clinical & Experimental Immunology*, 2015;183(2):258-70. **Disease Attributes - Chronic Disease**

**Researchers at Public Health Agency of Canada Describe Findings in Chronic Disease (Advancing health equity to improve health: the time is now)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Current study results on Disease Attributes - Chronic Disease have been published. According to news reporting from Ottawa, Canada, by NewsRx journalists, research stated, "Health inequities, or avoidable inequalities in health between groups of people, are increasingly recognized and tackled to improve public health. Canada's interest in health inequities goes back over 40 years, with the landmark 1974 Lalonde report, and continues with the 2011 Rio Political Declaration on Social Determinants of Health, which affirmed a global political commitment to implementing a social determinants of health approach to reducing health inequities."

The news correspondents obtained a quote from the research from the Public Health Agency of Canada, "Research in this area includes documenting and tracking health inequalities, exploring their multidimensional causes, and developing and evaluating ways to address them. Inequalities can be observed in who is vulnerable to infectious and chronic diseases, the impact of health promotion and disease prevention efforts, how disease progresses, and the outcomes of treatment. Many programs, policies and projects with potential impacts on health equity and determinants of health have been implemented across Canada. Recent theoretical and methodological advances in the areas of implementation science and population health intervention research have strengthened our capacity to develop effective interventions."

According to the news reporters, the research concluded: "With the launch of a new health equity series this month, the journals Canada Communicable Disease Report and Health Promotion and Chronic Disease Prevention in Canada will continue to reflect and foster analysis of social determinants of health and focus on intervention studies that advance health equity."

For more information on this research see: Advancing health equity to improve health: the time is now. Health Promotion and Chronic Disease Prevention In Canada, 2016;36 (2):17-20.

Our news journalists report that additional information may be obtained by contacting B. Jackson, Social Determinants and Science Integration Directorate, Health Promotion and Chronic Disease Prevention Branch, Public Health Agency of Canada, Ottawa, Ontario, Canada.

**Acetanilides**

**Researchers at Qinghai University Discuss Findings in Acetanilides (Pharmacokinetics of Lidocaine Hydrochloride Metabolized by CYP3A4 in Chinese Han Volunteers Living at Low Altitude and in Native Han and Tibetan Chinese Volunteers Living at ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Acetanilides have been presented. According to news originating from Xining, People's Republic of China, by NewsRx correspondents, research stated, "To investigate the pharmacokinetics of lidocaine hydrochloride metabolized by cytochrome P450 3A4 (CYP3A4) in Chinese Han volunteers living at low altitude (LA) and in native Han and Tibetan Chinese volunteers living at high altitude, lidocaine hydrochloride 10 mg was given by intramuscular injection to 3 groups: Han volunteers living at LA, and native
Han and Tibetan volunteers living at a high altitude. Blood samples were collected before the (baseline) study drug was given and at 0.25, 0.5, 1.0, 1.5, 2.0, 3.0, 4.0, 6.0, 8.0 h after study drug administration."

Our news journalists obtained a quote from the research from Qinghai University, "Lidocaine hydrochloride in plasma was determined by RP-HPLC. Pharmacokinetics parameters of lidocaine hydrochloride showed that there were no significant difference between the native Han and Tibetan volunteers, but the t(1/2) was 29.8 and 29.8% higher in 2 groups, respectively, than in the LA group. To study related mechanism, the effects of exposure to chronic high-altitude hypoxia (CHH) on the activity and expression of CYP3A1 were examined in rats. Rats were divided into LA, chronic moderate altitude hypoxia, and CHH groups. CHH caused significant decreases in the activity and protein and mRNA expression of rat CYP3A1 in vivo."

According to the news editors, the research concluded: "This study found significant changes in the disposition of lidocaine hydrochloride in native healthy Tibetan and Han Chinese subjects living at a high altitude in comparison to healthy Han Chinese subjects living at LA, it might be due to significant decreases in the activity and protein and mRNA expression of CYP3A4 under CHH condition."

The news correspondents report that additional information may be obtained from J. Zhang, College of Eco-Environmental Engineering, Qinghai University, Xining, People's Republic of China. Additional authors for this research include J. Zhu, X. Yao, Y. Duan, X. Zhou, M. Yang and X. Li.

Transplant Medicine - Kidney Transplants

Researchers at Queen Elizabeth Hospital Target Kidney Transplants (Cardiovascular, muscular and perceptual contributions to physical fatigue in prevalent kidney transplant recipients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Transplant Medicine - Kidney Transplants are presented in a new report. According to news reporting from Birmingham, United Kingdom, by NewsRx journalists, research stated, "Physical fatigue is debilitating and common among kidney transplant recipients (KTRs). This study investigated the mechanistic aetiology of physical fatigue in this setting through examinations of muscle mass, muscular and cardiovascular
function, and perceived exertion."

Funders for this research include British Renal Society, West Midlands Strategic Health Authority.

The news correspondents obtained a quote from the research from Queen Elizabeth Hospital, "The incidence of physical fatigue, its association with quality of life (QoL), and the predictors of perceived exertion, were evaluated. This single-centre observational cross-sectional study enrolled 55 KTRs. Muscle mass was quantified using dual-energy x-ray absorptiometry. Muscular function was assessed by jumping mechanography. Cardiovascular function (maximal oxygen consumption and oxygen pulse) was estimated during submaximal exercise testing, with perceived exertion determined using age-adjusted Borg scale-ratings. Physical fatigue was measured using Multi-Dimensional Fatigue Inventory-20. QoL was assessed using Medical Outcomes Study Short Form-36. Demographic, clinical, nutritional, psychosocial and behavioural predictors of perceived exertion were assessed. Of clinical importance, increased perceived exertion was the only independent predictor of physical fatigue (p=0.001), with no association found between physical fatigue and muscular or cardiovascular parameters. Physical fatigue occurred in 22% of KTRs, and negatively impacted on QoL (p <0.001). Predictors of heightened perception included anxiety (p <0.05) and mental fatigue (p <0.05)."

According to the news reporters, the research concluded: "Perception is a key determinant of physical fatigue in KTRs, paving the way for future interventions."

Our news journalists report that additional information may be obtained by contacting W. Chan, Dept. of Nephrology & Kidney Transplantation, Queen Elizabeth Hospital Birmingham, Birmingham, UK. Additional authors for this research include D. Jones, J.A. Bosch, J. McPhee, N. Crabtree, P.G. McTernan, O. Kaur, N. Inston, S. Moore, A. McClean, L. Harper, A.C. Phillips and R. Borrows.

Speech, Language and Learning Disabilities and…

Researchers at Radboud University Medical Center Discuss Findings in Learning Disorders (Healthy living according to adults with intellectual disabilities: towards tailoring health promotion initiatives)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Speech, Language and Learning Diseases and Conditions - Learning Disorders is now available. According to news reporting out of Nijmegen, Netherlands, by NewsRx editors, research stated, "A healthy lifestyle can prevent several health problems experienced by adults with intellectual disabilities (ID). For the development of effective and usable health promoting interventions for people with ID, the perspective of the intended audience should be taken into account."

Our news journalists obtained a quote from the research from Radboud University Medical Center, "The aim of this qualitative study was to gain insight into the perspectives of people with mild to moderate ID on healthy living. Qualitative study. Five semi-structured focus groups were conducted with a total of 21 adults with mild to moderate ID in the Netherlands. Discussions focused on three main themes: (1) perceptions of own health, (2) what participants consider as healthy living and (3) factors experienced to be related to the ability to live healthily. Interviews were analysed thematically resulting in two main domains: (1) perceptions of what is healthy and unhealthy and (2) factors that participants experience to be related to their ability to live healthily. For participants, healthy living entails more than healthy food and exercising: feeling healthy, happiness and level of independence are perceived as important as well. Factors experienced to relate to their ability to live healthily were (a lack of) motivation, support from others and environmental factors such as available health education, (a lack of) facilities and a (n) (dis)advantageous location of work or residence. This qualitative study shows that adults with mild to moderate ID have a good understanding of what being healthy and living healthily constitute. As they face several difficulties in their attempts to live healthily, existing health promotion programmes for people with ID must be tailored to individual preferences and motivations and adapted for individual physical disabilities."

According to the news editors, the research concluded: "Moreover, because of their dependency on others, tailoring should also be focused on the resources and hindering factors in their physical and social environment."

Our news journalists report that additional information may be obtained by contacting N.M. Kuijken, Radboud University Medical Center, Radboud Institute for Health Sciences, Dept. of Primary and Community Care, Nijmegen, Netherlands. Additional authors for this research include J. Naaldenberg, M.W. Nijhuis-van der Sanden and H.M van Schrojenstein-Lantman de Valk.

Researchers at Radboud University Report New Data on Breast Cancer (Health risks for ataxia-telangiectasia mutated heterozygotes: a systematic review, meta-analysis and evidence-based guideline)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting originating from Nijmegen, Netherlands, by NewsRx correspondents, research stated, "Ataxia-telangiectasia (AT) is an autosomal recessive neurodegenerative disorder with immunodeficiency and an increased risk of developing cancer, caused by mutations in the ataxia-telangiectasia mutated (ATM) gene. Logically, blood relatives may also carry a pathogenic ATM mutation."

Our news editors obtained a quote from the research from Radboud University, "Female carriers of such a mutation have an increased risk of breast cancer. Other health risks for carriers are suspected but have never been studied systematically. Consequently, evidence-based guidelines for carriers are not available yet. We systematically analyzed all literature and found that ATM mutation carriers have a reduced life expectancy because of mortality from cancer and ischemic heart diseases (RR 1.7, 95% CI 1.2-2.4) and an increased risk of developing cancer (RR 1.5, 95% CI 0.9-2.4), in particular breast cancer (RR women 3.0, 95% CI 2.1-4.5), and cancers of the digestive tract. Associations between ATM heterozygosity and other health risks have been suggested, but clear evidence is lacking. Based on these results, we propose that all female carriers of 40-50 years of age and female ATM c.7271T >G mutation carriers from 25 years of age onwards be offered intensified surveillance programs for breast cancer."

According to the news editors, the research concluded: "Furthermore, all carriers should be made aware of lifestyle factors that contribute to the development of cardiovascular diseases and diabetes."

The news editors report that additional information may be obtained by contacting M. Willemsen, Radboud University, Medical Center, Donders Inst Brain Cognit & Behav, Dept. of Neurol Pediat Neurol, Nijmegen, Netherlands. Additional authors for this research include N. Roeleveld, C.M.R. Weemaes, M.C.J. Jongmans, G.O. Janssens, A.M.R. Taylor, N. Hoogerbrugge and M. Willemsen.

Researchers at Radboud University Target Nephrology (International Multi-Specialty Delphi Survey: Identification of Diagnostic Criteria for Hepatic and Renal Cyst Infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nephrology is now available. According to news reporting originating in Nijmegen, Netherlands, by NewsRx journalists, research stated, "Cyst infection is one of the complications of autosomal dominant polycystic kidney disease and polycystic liver disease. The diagnosis is typically made on a mix of clinical, laboratory and imaging abnormalities but the importance of individual items is uncertain."

The news reporters obtained a quote from the research from Radboud University, "We aimed to perform a Delphi survey amongst physicians to achieve consensus on diagnostic criteria. We retrieved diagnostic items from the literature and conducted physician and patient interviews. All items were combined to create the online questionnaire. Participants rated each item during 3 consecutive rounds. Items were rated for diagnostic helpfulness for hepatic and renal cyst infection on a 9-point scale with anchors, from extremely unimportant (n = 1) to extremely important (n = 9). We determined consensus with the disagreement index. The median rating of each item was calculated and categorized into inappropriate (<= 3.4), uncertain (3.5-6.4) or appropriate (>= 6.5). By combining all items that reached an appropriate consensus rating, we developed a diagnostic algorithm based on expert consensus. We invited 58 physicians to participate in the survey. In total, 35 (60%) responded to round 1 of which 91% (n = 32) and 86% (n = 30) responded to round 2 and 3, respectively. The final panel included 23 nephrologists, 5 hepatologists, a nuclear medicine specialist and an infectious disease physician from 11 countries (male 67%, mean age 47 +/- 11 years, median clinical experience 21 years).

The panel rated the diagnostic helpfulness of 59 potential items. Ultimately, 22 hepatic and 26 renal items were rated appropriate, including positive blood cultures and fluorodeoxyglucose positron-emission CT imaging. Ultrasonography and absence of intracystic bleeding were amongst those deemed uncertain or inappropriate. Subsequently, by combining items rated appropriate, we developed a clinical tool to diagnose hepatic and renal cyst infection. We identified diagnostic items for hepatic and renal cyst infection and developed an expert-based diagnostic algorithm, which may aid physicians in the diagnostic work-up."

According to the news reporters, the research concluded: "A prospective study is necessary to validate this algorithm."

Our news correspondents report that additional information may be obtained by contacting J.P.H. Drenth, Radboud University, Medical Center, Dept. of Gastroenterol & Hepatol, NL-6500 HB Nijmegen, Netherlands. Additional authors for this research include A.J.M. Darding, R.G.L. de Sevaux, A. Alam, C.P. Bleeker-Rovers, M. Bobot, E. Corneec-Le Gall, T.J.G. Gevers, Z. Hassoun, E. Meijer, M. Mrug, F. Nevens, L.F. Onuchic, Y. Pei, G.B.
Researchers at Radboud University Target Noonan Syndrome
(Perceived Motor Problems in Daily Life: Focus Group Interviews with People with Noonan Syndrome and Their Relatives)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Noonan Syndrome have been published. According to news reporting out of Nijmegen, Netherlands, by NewsRx editors, research stated, "Studies from a patient perspective on motor performance problems in Noonan syndrome in daily life are lacking. The aims of this study were to provide insight into the motor performance problems that people with Noonan syndrome and/or their relatives experienced, the major consequences they suffered, the benefits of interventions they experienced, and the experiences with healthcare professionals they mentioned."

Our news journalists obtained a quote from the research from Radboud University, "We interviewed 10 adults with Noonan syndrome (two were joined by their parent), and 23 mothers (five of whom had Noonan syndrome), nine fathers (one of whom had Noonan syndrome) and one cousin who reported on 28 children with Noonan syndrome. People with Noonan syndrome reported particular problems related to pain, decreased muscle strength, fatigue, and clumsiness, which had an evident impact on functioning in daily life. Most participants believed that problems with motor performance improved with exercise, appropriate physiotherapy guidance, and other supportive interventions. Nevertheless, people with Noonan syndrome and/or their relatives did not feel heard and supported and experienced no understanding of their problems by healthcare professionals. This was the first study from a patient perspective that described the motor performance problems in people with Noonan syndrome, the major consequences in daily life, the positive experiences of interventions and the miscommunication with healthcare professionals. To achieve optimal support, healthcare professionals, as well as people with Noonan syndrome and/or their relatives themselves, should be aware of these frequently presented problems with motor performance."

According to the news editors, the research concluded: "Research on these different aspects is needed to better understand and support people with Noonan syndrome."

Researchers at Razi University Have Reported New Data on Gastric Cancer (PIGF knockdown inhibited tumor survival and migration in gastric cancer cell via PI3K/Akt and p38MAPK pathways)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gastric Cancer. According to news reporting from Kermanshah, Iran, by NewsRx journalists, research stated, "The molecular signalling of placental growth factor (PIGF), a member of the vascular endothelial growth factor family, was not uncovered in human adenocarcinoma gastric cell line (AGS). The purpose of this study was to examine the inhibitory effects of PIGF knockdown on cell proliferation, apoptosis and migration through p38 mitogen-activated protein kinase (p38MAPK) and PI3K pathways in human adenocarcinoma gastric cell line (AGS)."

The news correspondents obtained a quote from the research from Razi University, "To study PIGF knockdown effect, AGS cells were treated with 40 pmol of small interfering RNA (siRNA) related to PIGF gene and also a scrambled siRNA as control. Trypan Blue and Anexin V staining of AGS cells treated with PIGF-specific siRNA showed induction of apoptosis. Wound healing assay and zymography indicated that cellular migration and matrix metalloproteinases activities were reduced in response to PIGF knockdown. Phosphorylation of Akt and p38MAPK was reduced in AGS cells treated with PIGF-specific siRNA, PIGF knockdown decreased transcripts of PI3K, Akt, p38MAPK, PCNA, Caspase-3, OCT3/OCT4 and CD44, but elevated p53 and SOX2 transcripts."

According to the news reporters, the research concluded: "Our results indicated that PIGF knockdown decreased migration and induced apoptosis through PI3K/Akt1 and p38MAPK signal transduction in AGS cells."

Our news journalists report that additional information may be obtained by contacting H. Akrami, Dept. of Biology, Faculty of Science, Razi University, Kermanshah, Iran.
Additional authors for this research include F. Mahmoodi, S. Havasi and A. Sharifi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cbf.3176. This DOI is a link to an online electronic document that is either free or for purchase.

**Parkinson's Disease**

**Researchers at Research Foundation Describe Findings in Parkinson's Disease (Autophagy and Alpha-Synuclein: Relevance to Parkinson's Disease and Related Synucleopathies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Parkinson's disease are presented in a new report. According to news reporting originating from Athens, Greece, by NewsRx correspondents, research stated, "Evidence from human postmortem material, transgenic mice, and cellular/animal models of PD link alpha-synuclein accumulation to alterations in the autophagy lysosomal pathway. Conversely, alpha-synuclein mutations related to PD pathogenesis, as well as post-translational modifications of the wild-type protein, result in the generation of aberrant species that may impair further the function of the autophagy lysosomal pathway, thus generating a vicious cycle leading to neuronal death."

Financial support for this research came from ARISTEIA I (GSRT) grant.

Our news editors obtained a quote from the research from Research Foundation, "Moreover, PD-linked mutations in lysosomal-related genes, such as glucocerebrosidase, have been also shown to contribute to alpha-synuclein accumulation and related toxicity, indicating that lysosomal dysfunction may, in part, account for the neurodegeneration observed in synucleinopathies. In the current review, we summarize findings related to the inter-relationship between alpha-synuclein and lysosomal proteolytic pathways, focusing especially on recent experimental strategies based on the manipulation of the autophagy lysosomal pathway to counteract alpha-synuclein-mediated neurotoxicity in vivo."

According to the news editors, the research concluded: "Pinpointing the factors that regulate alpha-synuclein association to the lysosome may represent potential targets for therapeutic interventions in PD and related synucleinopathies."

The news editors report that additional information may be obtained by contacting M. Xilouri, Division of Basic Neurosciences, Biomedical Research Foundation of the Academy of Athens, Athens, Greece. Additional authors for this research include O.R. Brekk and L. Stefanis.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/mds.26477. This DOI is a link to an online electronic document that is either free or for purchase.
Keywords for this news article include: Athens, Greece, Europe, Genetics, Article Review, alpha Synuclein, Movement Disorders, Parkinson's Disease, Nerve Tissue Proteins, Parkinsonian Disorders, Brain Diseases and Conditions, Basal Ganglia Diseases and Conditions, Neurodegenerative Diseases and Conditions, Central Nervous System Diseases and Conditions.

Adrenal Gland Diseases and Conditions -

Researchers at Research Hospital Report Findings in Hypoaldosteronism (Relative hypoaldosteronism in a patient with Wolcott-Rallison syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Adrenal Gland Diseases and Conditions - Hypoaldosteronism are presented in a new report. According to news reporting originating in Istanbul, Turkey, by NewsRx journalists, research stated, "Wolcott-Rallison syndrome is an autosomal recessive, multisystem disorder with onset of diabetes in the neonatal period or early infancy. A 9-year-old girl with diabetes and growth failure from 2 months of age presented with ketoacidosis and multiple organ failure."

Financial support for this research came from Wellcome Trust.

The news reporters obtained a quote from the research from Research Hospital, "Evaluation for short stature revealed epiphyseal dysplasia. A homozygous mutation in the EIF2AK3 gene confirmed the clinical diagnosis of Wolcott-Rallison syndrome. She was euthyroid. Biochemical evaluation for potential adrenal dysfunction because of persistently elevated serum potassium (range 5.9-6.3 meq/l) and low serum sodium levels (range 128-130 meq/l) 2 weeks after resolution of ketoacidosis yielded normal findings with respect to basal corticotropin (31 pg/ml) and cortisol (18.7 mg/dl) levels. Estimated GFR-Schwartz (36.9 ml/min/1.73 m(2) ) was consistent with stage 3 chronic renal failure. The transtubular potassium gradient was 1.39 (normal value in hyperkalemic states: >4.1). The plasma aldosterone (upright: 241.3 pmol/l) was within normal ranges, and plasma renin [39 pg/ml (range 5.41-34.53 pg/ml)] was slightly elevated. The patient was diagnosed as having relative hypoaldosteronism and was started on a sodium-rich diet and low potassium. Failure to respond to the dietary intervention prompted a trial of oral fludrocortisone with subsequent normalization of electrolyte levels. This is the first case report of Wolcott-Rallison syndrome complicated with relative hypoaldosteronism."

According to the news reporters, the research concluded: "Further research is needed to probe the causal inference of relative hypoaldosteronism with chronic renal failure in patients with Wolcott-Rallison syndrome."

Our news correspondents report that additional information may be obtained by contacting A. Ucar, Dept. of Pediatric Endocrinology and Diabetes, Sisli Etfal Training and Research Hospital, Istanbul, Turkey. Additional authors for this research include Y. Aydemir, A. Dogan and E. Tuncez.
Researchers at Research Institute Discuss Findings in Cell Biology (Tango assay for ligand-induced GPCR-b-arrestin2 interaction: Application in drug discovery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Cell Biology. According to news reporting originating from Uttar Pradesh, India, by NewsRx correspondents, research stated, "G protein-coupled receptors (GPCRs) are widely known to modulate almost all physiological functions and have been demonstrated over the time as therapeutic targets for wide gamut of diseases. The design and implementation of high-throughput GPCR-based assays that permit the efficient screening of large compound libraries to discover novel drug candidates are essential for a successful drug discovery endeavor."

Our news editors obtained a quote from the research from Research Institute, "Usually, GPCR-based functional assays depend primarily on the measurement of G protein-mediated second messenger generation. However, with advent of advanced molecular biology tools and increased understanding of GPCR signal transduction, many G protein-independent pathways such as b-arrestin translocation are being utilized to detect the activity of GPCRs. These assays provide additional information on functional selectivity (also known as biased agonism) of compounds that could be harnessed to develop pathway-selective drug candidates to reduce the adverse effects associated with given GPCR target."

According to the news editors, the research concluded: "In this chapter, we describe the basic principle, detailed methodologies and assay setup, result analysis and data interpretations of the b-arrestin2 Tango assay, and its comparison with cell-based G protein-dependent GPCR assays, which could be employed in a simple academic setup to facilitate GPCR-based drug discovery."

The news editors report that additional information may be obtained by contacting S. Dogra, Division of Pharmacology, CSIR-Central Drug Research Institute, Lucknow, Uttar Pradesh, India. Additional authors for this research include C. Sona, A. Kumar and P.N Yadav.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/bs.mcb.2015.11.001. This DOI is a link to an online electronic document that is either free or for purchase.

Researchers at Research Institute Have Reported New Data on Hematopoietic (Hematopoietic derived cells do not contribute to osteogenesis as osteoblasts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematopoietic is now available. According to news reporting from Columbus, Ohio, by NewsRx journalists, research stated, "Despite years of extensive investigation, the cellular origin of heterotopic ossification (HO) has not been fully elucidated. We have previously shown that circulating bone marrow-derived osteoblast progenitor cells, characterized by the immunophenotype CD45-/CD44+/CXCR4+, contributed to the formation of heterotopic bone induced by bone morphogenetic protein (BMP)-2."

The news correspondents obtained a quote from the research from Research Institute, "In contrast, other reports have demonstrated the contribution of CD45+ hematopoietic derived cells to HO. Therefore, in this study, we developed a novel triple transgenic mouse strain that allows us to visualize CD45+ cells with red fluorescence and mature osteoblasts with green fluorescence. These mice were generated by crossing CD45-Cre mice with Z/RED mice that express DsRed, a variant of red fluorescent protein, after Cre-mediated recombination, and then crossing with Co12.3GFP mice that express green fluorescent protein (GFP) in mature osteoblasts. Utilizing this model, we were able to investigate if hematopoietic derived cells have the potential to give rise to mature osteoblasts. Analyses of this triple transgenic mouse model demonstrated that DsRed and GFP did not co-localize in either normal skeletogenesis, bone regeneration after fracture, or HO. This indicates that in these conditions hematopoietic derived cells do not differentiate into mature osteoblasts. Interestingly, we observed the presence of previously unidentified DsRed positive bone lining cells (red BLCs) which are derived from hematopoietic cells but lack CD45 expression. These red BLCs fail to produce GFP even under in vitro osteogenic conditions."

According to the news reporters, the research concluded: "These findings indicate that, even though both osteoblasts and hematopoietic cells are developmentally derived from mesoderm, hematopoietic derived cells do not contribute to osteogenesis in fracture healing or HO."

For more information on this research see: Hematopoietic derived cells do not contribute to osteogenesis as osteoblasts. Bone, 2017;94():1-9. Researchers at Research Institute Report New Data on Parkinson's Disease (Medical Management of Parkinson's Disease after Initiation of Deep Brain Stimulation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Parkinson's disease are presented in a new report. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "In this review, we have gathered all the available evidence to guide medication management after deep brain stimulation (DBS) in Parkinson's disease (PD). Surprisingly, we found that almost no study addressed drug-based management in the postoperative period."

Our news editors obtained a quote from the research from Research Institute, "Dopaminergic medications are usually reduced, but whether the levodopa or dopamine agonist is to be reduced is left to the personal preference of the treating physician. We have summarized the pros and cons of both approaches. No study on the management of cognitive problems after DBS has been done, and only a few studies have explored the pharmacological management of such DBS-resistant symptoms as voice (amantadine), balance (donepezil) or gait disorders (amantadine, methylphenidate). As for the psychiatric problems so frequently reported in PD patients, researchers have directed their attention to the complex interplay between stimulation and reduction of dopaminergic drugs only recently."

According to the news editors, the research concluded: "Studies addressing medical management following DBS are still needed and will certainly contribute to the ultimate success of DBS procedures."

For more information on this research see: Medical Management of Parkinson's Disease after Initiation of Deep Brain Stimulation. *Canadian Journal of Neurological Sciences*, 2016;43(5):626-634. *Canadian Journal of Neurological Sciences* can be contacted at: Cambridge Univ Press, 32 Avenue Of The Americas, New York, NY 10013-2473, USA.

The news editors report that additional information may be obtained by contacting A. Fasano, Krembil Res Inst, Toronto, ON, Canada. Additional authors for this research include S. Appel-Cresswell, M. Jog, M. Zurowski, S. Duff-Canning, M. Cohn, M. Picillo, C.R. Honey, M. Panisset and R.P. Munhoz.

Researchers at Rockefeller University Report Findings in Psoriasis (A Randomized, Placebo-Controlled Study of SRT2104, a SIRT1 Activator, in Patients with Moderate to Severe Psoriasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Skin Diseases and Conditions - Psoriasis have been published. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Activation of Sirtuin (silent mating type information regulation 2 homolog) 1, or SIRT1, is an unexplored therapeutic approach for treatment of inflammatory diseases. We randomized 40 patients with moderate-to-severe psoriasis (4:1) to three escalating doses of SRT2104, a selective activator of SIRT1, or placebo."

Our news editors obtained a quote from the research from Rockefeller University, "Across all SRT2104 groups, 35% of patients (p <0.0001) achieved good to excellent histological improvement based on skin biopsies taken at baseline and day 84 but was not consistently in agreement with PASI. Improvement in histology was associated with modulation of IL-17 and TNF-a signaling pathways and keratinocyte differentiation target genes. 27 subjects (69%) across all treatment groups, including placebo, experienced at least one treatment emergent adverse event. The majority of AEs were either mild or moderate. Most common were headache (8%), dizziness (8%), upper respiratory tract infection (8%), and psoriatic arthropathy (8%). Average drug exposure increased in a dose-dependent manner for escalating doses of SRT2104 and had high intra-subject variability in exposure (AUC %CV: 51?89%)."

According to the news editors, the research concluded: "Given the interesting signals of clinical activity, impact on gene expression and the generally favorable safety profile seen in this study, further investigation of SIRT1 activators for the treatment of psoriasis is warranted."

For more information on this research see: A Randomized, Placebo-Controlled Study of SRT2104, a SIRT1 Activator, in Patients with Moderate to Severe Psoriasis. Plos One, 2015;10(11):e0142081. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Researchers at Roswell Park Cancer Institute Target Prostate Cancer (Therapeutic Rationales, Progresses, Failures, and Future Directions for Advanced Prostate Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting out of Buffalo, New York, by NewsRx editors, research stated, "Patients with localized prostate cancer (PCa) have several therapeutic options with good prognosis. However, survival of patients with high-risk, advanced PCa is significantly less than patients with early-stage, organ-confined disease."

Our news journalists obtained a quote from the research from Roswell Park Cancer Institute, "Testosterone and other androgens have been directly linked to PCa progression since 1941. In this review, we chronicle the discoveries that led to modern therapeutic strategies for PCa. Specifically highlighted is the biology of androgen receptor (AR), the nuclear receptor transcription factor largely responsible for androgen-stimulated and castrate-recurrent (CR) PCa. Current PCa treatment paradigms can be classified into three distinct but interrelated categories: targeting AR at pre-receptor, receptor, or post-receptor signaling. The continuing challenge of disease relapse as CR and/or metastatic tumors, destined to occur within three years of the initial treatment, is also discussed."

According to the news editors, the research concluded: "We conclude that the success of PCa therapies in the future depends on targeting molecular mechanisms underlying tumor recurrence that still may affect AR at pre-receptor, receptor, and post-receptor levels."

Our news journalists report that additional information may be obtained by contacting K.M. Wadosky, Departments of Cancer Genetics and Urology, Center for Genetics and Pharmacology, Roswell Park Cancer Institute, Elm and Carlton Streets, Buffalo, NY, United States.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiology is now available. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "This study was to investigate the relationship among aortic artery calcification (AAC), cardiac valve calcification (CVC), and mortality in maintenance hemodialysis (MHD) patients. All MHD patients in Shanghai Ruijin Hospital in July 2011 were included."

Our news journalists obtained a quote from the research from Rui Jin Hospital, "To follow up for 42 months, clinical data, predialysis blood tests, echocardiography, and lateral lumbar X-ray plain radiography results were collected. Plasma FGF23 level was measured using a C-terminal assay. Totally, 110 MHD patients were involved in this study. Of which, 64 (58.2%) patients were male, the mean age was 55.2 ± 1.4 years old, and the median dialysis duration was 29.85 (3.0-225.5) months. About 25.5% of the 110 MHD patients had CVC from echocardiography while 61.8% of the patients had visible calcification of aorta from lateral lumbar X-ray plain radiography. After 42 months follow-up, 25 (22.7%) patients died. Kaplan-Meier analysis showed that patients with AAC or CVC had a significant greater number of all-cause and cardiovascular deaths than those without. In multivariate analyses, the presence of AAC was a significant factor associated with all-cause mortality (hazard ratio [HR]: 3.149, p= 0.025) in addition to lower albumin level and lower 25-hydroxy Vitamin D (25(OH)D) level. The presence of CVC was a significant factor associated with cardiovascular mortality (HR: 3.800, p=0.029) in addition to lower albumin level and lower 25(OH)D level. Lateral lumbar X-ray plain radiography and echocardiography are simple methods to detect AAC and CVC in dialysis patients. The presence of AAC and CVC was independently associated with mortality in MHD patients."

According to the news editors, the research concluded: "Regular follow-up by X-ray and echocardiography could be a useful method to stratify mortality risk in MHD patients."

The news correspondents report that additional information may be obtained from N. Chen, Dept. of Nephrology, Ruijin Hospital Affiliated to Shanghai Jiao Tong University, Shanghai 200025, People's Republic of China. Additional authors for this research include Z.J. Chen, X.B. Researchers at Russian Federation Report New Data on Stem Cell Research (Regulation of Adipose Tissue Stem Cells Angiogenic Potential by Tumor Necrosis Factor-Alpha)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Stem Cell Research. According to news reporting from Moscow, Russia, by NewsRx journalists, research stated, "Tissue regeneration requires coordinated 'teamwork' of growth factors, proteases, progenitor and immune cells producing inflammatory cytokines. Mesenchymal stem cells (MSC) might play a pivotal role by substituting cells or by secretion of growth factors or cytokines, and attraction of progenitor and inflammatory cells, which participate in initial stages of tissue repair."

Financial support for this research came from Russian Federation Ministry of Health.

The news correspondents obtained a quote from the research from Russian Federation, "Due to obvious impact of inflammation on regeneration it seems promising to explore whether inflammatory factors could influence proangiogenic abilities of MSC. In this study we investigated effects of TNF-a on activity of adipose-derived stem cells (ADSC). We found that treatment with TNF-a enhances ADSC proliferation, F-actin microfilament assembly, increases cell motility and migration through extracellular matrix. Exposure of ADSC to TNF-a led to increased mRNA expression of proangiogenic factors (FGF-2, VEGF, IL-8, and MCP-1), inflammatory cytokines (IL-1b, IL-6), proteases (MMPs, uPA) and adhesion molecule ICAM-1. At the protein level, VEGF, IL-8, MCP-1, and ICAM-1 production was also up-regulated. Pre-incubation of ADSC with TNF-a-enhanced adhesion of monocytes to ADSC but suppressed adherence of ADSC to endothelial cells (HUVEC). Stimulation with TNF-a triggers ROS generation and activates a number of key intracellular signaling mediators known to positively regulate angiogenesis (Akt, small GTPase Rac1, ERK1/2, and p38 MAP-kinases). Pre-treatment with TNF-a-enhanced ADSC ability to promote growth of microvessels in a fibrin gel assay and accelerate blood flow recovery, which was accompanied by increased arteriole density and reduction of necrosis in mouse hind limb ischemia model."

According to the news reporters, the research concluded: "These findings indicate that TNF-a plays a role in activation of ADSC angiogenic and regenerative potential."

Our news journalists report that additional information may be obtained by contacting E.S. Zubkova, Russian Cardiology Research and Production Complex, Moscow, Russia. Additional authors for this research include I.B. Beloglagova, P.I. Makarevich, M.A. Boldyreva, O.Y. Sukhareva, M.V. Shestakova, K.V. Dergilev, Y.V. Parfyonova and M.Y Menshikov.

Heart Valves

Researchers at San Carlo Hospital Release New Data on Heart Valves (Effective percutaneous "edge-to-edge" mitral valve repair with mitraclip in a patient with acute post-MI regurgitation not related to papillary muscle rupture)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Valves. According to news reporting originating in Potenza, Italy, by NewsRx journalists, research stated, "A 65-year-old woman was admitted to our institution for rest dyspnea and hypotension. EKG showed sinus tachycardia with signs of infero-posterior STEMI. 2D-echocardiogram showed severe left ventricular systolic dysfunction with a-diskynesia of the inferior and posterior walls and severe functional mitral regurgitation (MR)."

The news reporters obtained a quote from the research from San Carlo Hospital, "The patient underwent urgent coronary angiography that showed 3-vessels disease with total occlusion of both first obtuse marginal (OM) branch of the left circumflex artery and right coronary artery (RCA) and critical stenosis of left anterior descending (LAD). Because of extremely high surgical risk, we performed a staged totally percutaneous approach. First, we reopened the presumed culprit vessels (RCA and OM) and then, after 48 hr, we performed angioplasty of the LAD. Since revascularization provided no significant improvement in respiratory and hemodynamic parameters we performed a percutaneous mitral repair with Mitraclip. MR grade was reduced from severe to trivial with rapid improvement of the respiratory and hemodynamic parameters. The post-procedural course was uneventful and the patient was discharged 7 days later. At the 30-day and 6-month follow-up the patient remained asymptomatic in NYHA I functional class with no recurrence of MR. Acute MR due to post-AMI mechanical complications is generally considered a contraindication to MitraClip implantation for several reasons."

According to the news reporters, the research concluded: "However, the present report shows that, in selected cases, the Mitraclip system may be successfully used to reduce the severity of acute MR secondary to AMI and may allow to reverse cardiogenic shock and/or refractory pulmonary congestion related to the acute regurgitation."

Our news correspondents report that additional information may be obtained by contacting G. Tarsia, Heart and Great Vessels Department, San Carlo Hospital, Potenza, Italy. Additional authors for this research include C. Smaildone and M.F Costantino.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/ccd.26416. This DOI is a link to an online electronic document that is either free or for purchase.
Researchers at Sapienza-University Report New Data on Medical Genetics (Which BRCA genetic testing programs are ready for implementation in health care? A systematic review of economic evaluations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genetics - Medical Genetics have been published. According to news originating from Rome, Italy, by NewsRx correspondents, research stated, "There is considerable evidence regarding the efficacy and effectiveness of BRCA genetic testing programs, but whether they represent good use of financial resources is not clear. Therefore, we aimed to identify the main health-care programs for BRCA testing and to evaluate their cost-effectiveness."

Our news journalists obtained a quote from the research from Sapienza-University, "We performed a systematic review of full economic evaluations of health-care programs involving BRCA testing. Nine economic evaluations were included, and four main categories of BRCA testing programs were identified: (i) population-based genetic screening of individuals without cancer, either comprehensive or targeted based on ancestry; (ii) family history (FH)-based genetic screening, i.e., testing individuals without cancer but with FH suggestive of BRCA mutation; (iii) familial mutation (FM)-based genetic screening, i.e., testing individuals without cancer but with known familial BRCA mutation; and (iv) cancer-based genetic screening, i.e., testing individuals with BRCA-related cancers. Currently BRCA1/2 population-based screening represents good value for the money among Ashkenazi Jews only. FH-based screening is potentially very cost-effective, although further studies that include costs of identifying high-risk women are needed. There is no evidence of cost-effectiveness for BRCA screening of all newly diagnosed cases of breast/ovarian cancers followed by cascade testing of relatives, but programs that include tools for identifying affected women at higher risk for inherited forms are promising."

According to the news editors, the research concluded: "Cost-effectiveness is highly sensitive to the cost of BRCA1/2 testing."

For more information on this research see: Which BRCA genetic testing programs are ready for implementation in health care? A systematic review of economic evaluations. Genetics in Medicine, 2016;18(12):1171-1180. Genetics in Medicine can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group - www.nature.com/; Genetics in Medicine - www.nature.com/gim/)

The news correspondents report that additional information may be obtained from P. Villari, Sapienza Univ Rome, Dept. of Public Hlth & Infect Dis, Rome, Italy. Additional authors for this research include C. Marzuillo, C. De Vito, M. Di Marco, E. Pitini, M.R. Vacchio and P. Villari.

Researchers at Sapporo Medical University Have Reported New Data on Liver Cancer (Insulin-like growth factor-related components and the risk of liver cancer in a nested case-control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Liver Cancer are presented in a new report. According to news reporting from Hokkaido, Japan, by NewsRx journalists, research stated, "Insulin-like growth factor-1 (IGF1) is a potent mitogen. IGF-binding protein-3 (IGFBP3) binds and inhibits IGF1."

Financial support for this research came from Daiwa Securities Health Foundation, Japan.

The news correspondents obtained a quote from the research from Sapporo Medical University, "High circulating IGF1 levels and low IGFBP3 levels are associated with increased risk of several cancers. We examined relationships between serum levels of these factors and hepatoma risk in a case-control study nested in a prospective cohort study (the Japan Collaborative Cohort Study (JACC Study)). A baseline survey was conducted from 1988 to 1990, and 39,242 subjects donated blood samples. Participants diagnosed with hepatoma by 1997 were considered cases for nested case-control studies. Ninety-one cases and 263 sex-and age-matched controls were analyzed. A conditional logistic model was used to estimate odds ratios (ORs) for the incidence of hepatoma associated with serum IGF1 and IGFBP3 levels. Neither IGF1 nor the molar ratio of IGF1/IGFBP3 was correlated with hepatoma risk. After adjustment for hepatitis viral infection, body mass index, smoking, and alcohol intake, a higher molar difference of (IGFBP3 - IGF1) was associated with a decreased hepatoma risk more than IGFBP3 alone (p for trend <0.001 and = 0.003, respectively). People in the highest quartile had a lower risk (OR = 0.098; 95 % confidence interval = 0.026-0.368). In subgroup analyses of males and females, the molar difference was associated with a decreased hepatoma risk (p for trend <0.05). In non-elderly individuals, the difference was inversely correlated with the incidence of hepatoma (p for trend <0.01)."

According to the news reporters, the research concluded: "The molar difference of (IGFBP3 -IGF1) may be inversely associated with the incidence of hepatoma."

For more information on this research see: Insulin-like growth factor-related components and the risk of liver cancer in a nested case-control study. Tumor Biology, 2016;37 (11):15125-15132. Drugs and Therapies - Chemical Biology and Drug Design

Researchers at School of Materials Science Target Chemical Biology and Drug Design (Chemical RNA Editing for Genetic Restoration: The Relationship between the Structure and Deamination Efficiency of Carboxyvinyldeoxyuridine Oligodeoxynucleotides)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Chemical Biology and Drug Design are discussed in a new report. According to news reporting out of Ishikawa, Japan, by NewsRx editors, research stated, "Oligodeoxynucleotides containing 5-carboxyvinyl-2'-deoxyuridine ((CV) U-containing ODNs) for successful site-specific transition of cytosine to uridine by photo-cross-linking have three parts: the complementary sequence, hairpin loop and the 5'-terminal photoresponsive nucleobase (CV) U. Photo-cross-linking with (CV) U-containing ODNs was performed using UV (366 nm) irradiation, followed by heat treatment for deamination."

Financial supporters for this research include Japan Society for the Promotion of Science of Japan, Ministry of Health, Labour and Welfare.

Our news journalists obtained a quote from the research from the School of Materials Science, "The cross-linked nucleotide was cleaved by photosplitting (UV, 312 nm). The products were analyzed using restriction fragment length polymorphism and fluorescence measurements. In previous studies, we have successfully performed site-directed photochemical base substitution toward a synthetic single-stranded 100-mer ODN target (ss100-nt) and in vitro-synthesized full-length blue fluorescent protein mRNA as targets. Although the efficiency of C-to-U site-specific transition strongly depends on the sequence and structure of (CV) U-containing ODNs, the relationship between (CV) U-containing ODNs and the deamination efficiency of targeted editing remains unclear. Therefore, in this study, we attempted to identify the optimal sequence and primary structure of (CV) U-containing ODNs for site-directed specific transition. To evaluate the structure-deamination efficiency relationship, a series of eight (CV) U-containing ODNs were designed and studied."

According to the news editors, the research concluded: "We showed that the optimal deamination efficiency was achieved with ODNs having a complementary sequence length slightly more than 14 nt and a hairpin length of 9 nt."

For more information on this research see: Chemical RNA Editing for Genetic Restoration: The Relationship between the Structure and Deamination Efficiency of
Researchers at School of Medicine Detail Findings in Kidney Cancer
(Comparative efficacy and safety of first-line treatments in patients with metastatic renal cell cancer: a network meta-analysis based on phase 3 RCTs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Kidney Cancer are discussed in a new report. According to news reporting originating in Nanjing, People's Republic of China, by NewsRx journalists, research stated, "It is impossible to conduct head-to-head trials of all the therapies to determine optimal treatment in the rapidly advancing era of therapies for metastatic renal cell carcinoma (mRCC). In this network meta-analysis, we aimed to compare efficacy and safety of first-line treatments for mRCC."

The news reporters obtained a quote from the research from the School of Medicine, "We searched PubMed, Embase, the Cochrane Central Register of Controlled Trials, and unpublished studies were also sought through 'clinicaltrials.gov' from their inception through January 31, 2016. A database search identified 1253 articles, with 11 studies meeting the eligibility criteria. A total of 7597 patients in twelve different treatment arms were assessed. Network meta-analysis showed sunitinib had a significantly longer PFS than IFN-a (SMD=-5.68; 95%CI: -10.76,-0.86; p<0.001) and placebo (SMD=-6.71; 95%CI: -12.65,-0.79; p<0.001), meanwhile, pazopanib had a significantly longer PFS compared with placebo (SMD=5.13; 95% CI: 0.43, 10.09; p<0.001). The cumulative ranking probability curve indicated that sunitinib had the highest probability of being the best treatment modality in terms of PFS and it also had the highest probability of being the safest drugs as the first-line treatment when it came to SAE."

According to the news reporters, the research concluded: "Thus, sunitinib might be the best choice of first-line treatment for patients with mRCC because it has the most favorable balance between efficacy and safety."

For more information on this research see: Comparative efficacy and safety of first-

Our news correspondents report that additional information may be obtained by contacting X. Chang, Dept. of Urology, The Affiliated Nanjing Drum Tower Hospital, Medical School of Nanjing University, Nanjing, People's Republic of China. Additional authors for this research include F. Zhang, T. Liu, R. Yang, C. Ji, X. Zhao, L. Xu, G. Liu and H. Guo.

**Lung Diseases and Conditions - Asthma**

**Researchers at School of Medicine Report Findings in Asthma (Polygonum multiflorum Decreases Airway Allergic Symptoms in a Murine Model of Asthma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Asthma have been published. According to news reporting originating from Taichung, Taiwan, by NewsRx correspondents, research stated, "The root of Polygonum multiflorum (also called He-Shou-Wu in Chinese) is a common herb and medicinal food in Asia used for its anti-aging properties. Our study investigated the therapeutic potential of an extract of the root of Polygonum multiflorum (PME) in allergic asthma by using a mouse model."

Our news editors obtained a quote from the research from the School of Medicine, "Feeding of 0.5 and 1 mg/mouse PME inhibited ovalbumin (OVA)-induced allergic asthma symptoms, including airway inflammation, mucus production, and airway hyper-responsiveness (AHR), in a dose-dependent manner. To discern PME's mechanism of action, we examined the profile and cytokine production of inflammatory cells in bronchial alveolar lavage fluid (BALF). We found that eosinophils, the main inflammatory cell infiltrate in the lung of OVA-immunized mice, significantly decreased after PME treatment. Th2 cytokine levels, including interleukin (IL)-4, IL-5, IL-13, eotaxin, and the proinflammatory cytokine tumor necrosis factor (TNF)-[Formula: see text], decreased in PME-treated mice. Elevated mRNA expression of Th2 transcription factor GATA-3 in the lung tissue was also inhibited after oral feeding of PME in OVA-immunized mice."

According to the news editors, the research concluded: "Thus, we conclude that PME produces anti-asthma activity through the inhibition of Th2 cell activation."

The news editors report that additional information may be obtained by contacting
Researchers at School of Medicine Target Eicosanoids (Rostral Ventrolateral Medulla EP3 Receptor Mediates the Sympathoexcitatory and Pressor Effects of Prostaglandin E-2 in Conscious Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biological Factors - Eicosanoids. According to news reporting from Greenville, North Carolina, by NewsRx journalists, research stated, "Whereas few studies have dealt with the central sympathoexcitatory action of the inflammatory prostanoid prostaglandin E-2 (PGE(2)), there is no information on the expression and cardiovascular function of different PGE(2) (EP) receptors in one of the major cardiovascular-regulating nuclei, the rostral ventrolateral medulla (RVLM). The current study aimed at filling this knowledge gap as well as elucidating the implicated molecular mechanisms."

The news correspondents obtained a quote from the research from the School of Medicine, "To achieve these goals, we showed the expression of EP2, EP3, and EP4 receptors in the RVLM and investigated their cardiovascular roles in conscious rats, ex vivo as well as in cultured PC12 cells. Intra-RVLM PGE(2) significantly increased blood pressure and sympathetic dominance (spectral analysis). Studies with selective EP receptor subtype agonists and antagonists showed that these PGE(2)-evoked responses were only replicated by intra-RVLM activation of the EP3 receptor with its agonist sulprostone. The RVLM of PGE(2)-treated rats exhibited increases in c-Fos expression and extracellular signal-regulated kinase 1/2 and neuronal nitric oxide synthase phosphorylation along with oxidative stress, and PGE(2) increased L-glutamate release in PC12 cells (surrogates of RVLM neurons). Abrogation of the PGE(2)-evoked pressor and biochemical responses only occurred following EP3 receptor blockade (N-[(5-Bromo-2-methoxyphenyl)sulfonyl]3-[2-(2-naphthalenylmethyl)phenyl]-2-propenamide, L-798106)."

According to the news reporters, the research concluded: "These findings suggest the dependence of RVLM PGE(2)-mediated sympathoexcitatory/pressor response on local EP3 receptor signaling in conscious rats, and highlight central EP3 receptor blockade as a potential therapeutic modality for hypertension management."

Biological Factors - Eicosanoids

Researchers at School of Medicine Target Eicosanoids (Rostral Ventrolateral Medulla EP3 Receptor Mediates the Sympathoexcitatory and Pressor Effects of Prostaglandin E-2 in Conscious Rats)

**Life Science Research - Chemical Biology**

**Researchers at Scripps Research Institute Target Chemical Biology (Synthetic RORgt Agonists Enhance Protective Immunity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Chemical Biology have been published. According to news reporting originating in Jupiter, Florida, by NewsRx journalists, research stated, "The T cell specific RORgt isoform RORgt has been shown to be the key lineage-defining transcription factor to initiate the differentiation program of TH17 and TC17 cells, cells that have demonstrated antitumor efficacy. RORgt controls gene networks that enhance immunity including increased IL17 production and decreased immune suppression."

Financial support for this research came from National Institute of Mental Health.

The news reporters obtained a quote from the research from Scripps Research Institute, "Both synthetic and putative endogenous agonists of RORgt have been shown to increase the basal activity of RORgt enhancing TH17 cell proliferation. Here, we show that activation of RORgt using synthetic agonists drives proliferation of TH17 cells while decreasing levels of the immune checkpoint protein PD-1, a mechanism that should enhance antitumor immunity while blunting tumor associated adaptive immune resistance. Interestingly, putative endogenous agonists drive proliferation of TH17 cells but do not repress PD-1. These findings suggest that synthetic agonists of RORgt should activate TC17/TH17 cells (with concomitant reduction in the Tregs population), repress PD-1, and produce IL17 in situ (a factor associated with good prognosis in cancer)."

According to the news reporters, the research concluded: "Enhanced immunity and blockage of immune checkpoints has transformed cancer treatment; thus such a molecule would provide a unique approach for the treatment of cancer."

Our news correspondents report that additional information may be obtained by contacting M.R. Chang, Dept. of Molecular Therapeutics, The Scripps Research Institute, 130 Scripps Way, Jupiter, Florida 33458, United States. Additional authors for this research include
Researchers at Second Military Medical University Release New Data on Pancreatic Cancer (Association between vitamin A, retinol and carotenoid intake and pancreatic cancer risk: Evidence from epidemiologic studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Pancreatic cancer is a devastating disease with poor prognosis. The association between vitamin A, retinol and carotenoid intake and the risk of pancreatic cancer occurrence remains controversial, and therefore it is necessary to make a meta-analysis to clarify the association between vitamin A, retinol and carotenoid intake and pancreatic cancer risk."

The news correspondents obtained a quote from the research from Second Military Medical University, "In the present study, PubMed and EMBASE databases were used to identify qualified studies. The association between dietary vitamin A, retinol and carotenoids was estimated by pooled odds ratios (ORs) and corresponding 95% confidence intervals (CIs). It was found that there was an inverse correlation between vitamin A, beta-carotene and lycopene intake and the risk of pancreatic cancer (for vitamin A, pooled OR = 0.85, 95% CI = 0.74-0.97, P = 0.015; for beta-carotene, pooled OR = 0.78, 95% CI = 0.66-0.92, P = 0.003; for lycopene, pooled OR = 0.84, 95% CI = 0.73-0.97, P = 0.020), which was more prominent in case-control study subgroup."

According to the news reporters, the research concluded: "Dietary vitamin A, beta-carotene and lycopene might inversely correlate with pancreatic cancer."

For more information on this research see: Association between vitamin A, retinol and carotenoid intake and pancreatic cancer risk: Evidence from epidemiologic studies. Scientific Reports, 2016;6():1-12. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England.  Researchers at Second Military Medical University Target Heart Failure (Blockade of receptor for advanced glycation end products protects against systolic overload-induced heart failure after transverse aortic constriction in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Failure have been presented. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Heart failure is the consequence of sustained, abnormal neurohormonal and mechanical stress and remains a leading cause of death worldwide. The aim of this work was to identify whether blockade of receptor for advanced glycation end products (RAGE) protected against systolic overload-induced heart failure and investigate the possible underlying mechanism."

Our news journalists obtained a quote from the research from Second Military Medical University, "It was found that RAGE mRNA and protein expression was up-regulated in cardiac tissues from mice subjected to pressure overload by transverse aortic constriction (TAC). Importantly, inhibition of RAGE by treatment with soluble RAGE (sRAGE) or FPS-ZM1 (a high-affinity RAGE-specific inhibitor) for 8 weeks attenuated cardiac remodeling (including cardiac hypertrophy and fibrosis), and dysfunction in mice exposed to TAC. Furthermore, treatment of TAC mice with sRAGE or FPS-ZM1 enhanced phosphorylation of AMPK and reduced phosphorylation of mTOR and protein expression of NF kappa B p65 in cardiac tissues. In addition, treatment of TAC mice with sRAGE or FPS-ZM1 abated oxidative stress, attenuated endoplasmic reticulum stress, and suppressed inflammation in cardiac tissues."

According to the news editors, the research concluded: "These data demonstrated the benefits of blocking RAGE on the progression of systolic overload-induced heart failure in mice, which was possibly through modulating AMPK/mTOR and NF kappa B pathways."

For more information on this research see: Blockade of receptor for advanced glycation end products protects against systolic overload-induced heart failure after transverse aortic constriction in mice. European Journal of Pharmacology, 2016;791():535-543. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Researchers at Semmelweis University Target Liver Volume
(Identification of cofactors influencing hypertrophy of the future liver remnant after portal vein embolization-the effect of collaterals on embolized liver volume)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hepatology - Liver Volume have been published. According to news reporting originating in Hamburg, Germany, by NewsRx journalists, research stated, "The purpose of this retrospective study was to monitor hypertrophy of future liver remnant following portal vein embolization (PVE) before planned extended right hepatectomy. However, because individual responses to PVE are highly variable, our focus was to identify cofactors of successful hypertrophy."

The news reporters obtained a quote from the research from Semmelweis University, "28 patients with primary or secondary liver tumours, mean age 64.1 +/- 12.9 years, underwent PVE. Volumetric analysis of hypertrophy before and after PVE (median 39.0 +/- 15.7 days) was performed. The embolized liver segments were investigated for occurrence of reperfusion of their portal branches. Blood parameters before PVE were additionally investigated. Patients were divided into responders (21/28) and non-responders (7/28) by post-PVE standardized future liver remnant being above or below 25%, respectively. No significant differences between the groups were found regarding biometric and volumetric parameters before PVE. In the entire group after PVE, the mean absolute increase of Segments 2 and 3 was 196.0 +/- 84.7 cm(3) and the median relative increase was 46.6 +/- 98.8%. The formation of left to right hepatic portoportal collaterals exhibited a negative correlation to successful hypertrophy (p = 0.004) as well as low plasma total protein (p = 0.019). Successful embolization of Segment IV showed only a trend to significance (p = 0.098). Cofactors associated with a favourable outcome regarding hypertrophy were the absence of collaterals in the control CT scans and high plasma total protein. Advances in knowledge: Portoportal collaterals negatively influence hypertrophy after PVE."

According to the news reporters, the research concluded: "On the other hand, plasma total protein is a positive prognostic indicator on hypertrophy of the liver in our cohort."

Our news correspondents report that additional information may be obtained by contacting M. Zeile, Semmelweis University, Fac Med, Hamburg, Germany. Additional authors for this research include A. Bakal, J.E. Volkmer, G.A. Stavrou, P. Dautel, J. Hoeltje, A. Stang, K.J. Oldhafer and R. Bruning.

Stroke

Researchers at Seoul National University Hospital Release New Data on Stroke (Novel echocardiographic indicator for potential cardioembolic stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Stroke are presented in a new report. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "In many cardioembolic strokes (CSs), the specific embolic source is uncertain. Despite the high mortality of CS, not enough attention is paid to its potential source."

Funders for this research include Korea Health Industry Development Institute, Ministry of Health and Welfare, Republic of Korea, National Research Foundation of Korea, Ministry of Science, ICT and Future Planning.

Our news journalists obtained a quote from the research from Seoul National University Hospital, "Although atrial fibrillation (AF) is the most common source of embolism, more complex and dynamic multiplicities may influence CS. The aim of this study was to evaluate novel indicators of transthoracic echocardiography (TTE) that have additional value for detecting CS. In total, 1878 patients with acute ischaemic stroke who had TTE during admission were identified. Of the patients with undetermined etiology, 93 patients with incomplete evaluations were excluded. Thereafter, two stroke neurologists reviewed all of the magnetic resonance images to assess cardioembolic lesion patterns. The patients were classified into two groups: potential cardioembolic stroke (PCS) and non-PCS. Amongst a total of 1601 patients, 518 (32.4%) had PCS. About half of the patients with PCS had AF. Patients with PCS were more likely to have larger left ventricular (LV) end-diastolic diameters, larger LV end-systolic diameters, larger left atrial sizes, increased E/A ratios and reduced LV ejection fractions. After adjusting for multiple clinical and TTE variables including AF, an E/A ratio (>=)1.5 had a significant predictive value for PCS (odds ratio 2.89, 95% confidence interval 1.57-5.31, p <0.01)."

According to the news editors, the research concluded: "An E/A ratio (>=)1.5 is independently associated with PCS after adjusting for multiple covariates including AF and provides incremental prognostic information for detecting PCS."

The news correspondents report that additional information may be obtained from Y. Kim, Dept. of Neurology, Seoul National University Hospital, Seoul, South Korea. Additional authors for this research include T.J. Kim, J.B. Park, S. Lee, Y.J. Kim, J.S. Lee and S.H Lee.

Researchers at Seoul National University Target Heart Attack (The role of prehospital advanced airway management on outcomes for out-of-hospital cardiac arrest patients: a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Attack have been presented. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "The objective of this meta-analysis was to compare the benefits of prehospital advanced airway management (AAM) and basic airway management (BAM) for out-of-hospital cardiac arrest (OHCA) patients. Two investigators performed a systematic review of PubMed, EMBASE, and the Cochrane Database to identify all peer-reviewed articles relevant to this meta-analysis."

Our news journalists obtained a quote from the research from Seoul National University, "We included all articles describing emergency medical system-treated nontraumatic OHCAs; specifically, all articles that described intervention of the prehospital AAM type were considered. The primary outcome was survival to discharge, whereas the secondary outcome was neurologic recovery after an OHCA event. For subgroup analysis, we compared the clinical outcome of endotracheal intubation (ETI), a specific type of AAM, vs BAM. We reviewed 1452 studies, 10 of which satisfied all the inclusion criteria and involved 17380 patients subjected to AAM and 67525 subjected to BAM. Based on the full random effects model, patients who received AAM had lower odds of survival (odds ratio [OR], 0.51; 95% confidence interval [CI], 0.29-0.90) compared with BAM. Subgroup analysis for ETI vs BAM showed no significant association with respect to survival (OR, 0.44; 95% CI, 0.16-1.23). There were no significant differences in the odds of neurologic recovery between AAM and BAM (OR, 0.64; 95% CI, 0.03-1.37). Our results reveal decreased survival odds for OHCA patients treated with AAM by emergency medical service personnel compared with BAM."

According to the news editors, the research concluded: "However, the role of prehospital AAM, especially ETI, on achieving neurologic recovery remains unclear."

Our news journalists report that additional information may be obtained by contacting S. Jeong, Seoul National University, Biomed Res Inst, Lab Emergency Med Serv, Seoul 110744, South Korea. Additional authors for this research include K.O. Ahn and S.D. Shin.
Researchers at Shanghai Jiao-Tong University Have Reported New Data on Antineoplastics (Self-Delivery Nanoparticles of Amphiphilic Methotrexate-Gemcitabine Prodrug for Synergistic Combination Chemotherapy via Effect of Deoxyribonucleotide Pools)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antineoplastics is the subject of a report. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The distinct and complementary biochemical mechanisms of folic acid analog methotrexate (MTX) and cytidine analog gemcitabine (GEM) make their synergistic combination effective. Unfortunately, such a combination faces severe pharmacokinetic problems and several transportation barriers."

Financial support for this research came from Ministry of Science and Technology of the People's Republic of China.

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "To overcome these problems, a new strategy of amphiphilic small molecule prodrug (ASMP) is developed to improve their synergistic combination effect. The ASMP was prepared by the amidation of the hydrophilic GEM with the hydrophobic MTX at a fixed ratio. Owing to its inherent amphiphilicity, the MTX-GEM ASMP self-assembled into stable nanoparticles (ASMP-NPs) with high drug loading capacity (100%), in which the MTX and GEM could self-deliver without any carriers and release synchronously in cancer cells. In vitro studies showed that the MTX-GEM ASMP-NPs could greatly improve the synergistic combination effects by the reason of arresting more S phase of the cell cycle and reducing levels of deoxythymidine triphosphate (dTTP), deoxyadenosine triphosphate (dATP), and deoxycytidine triphosphate (dCTP). The stronger synergistic effects caused the higher cell cytotoxicity and apoptotic ratio, and circumvented the multidrug resistance (MDR) of tumor cells."

According to the news editors, the research concluded: "Additionally, MTX-GEM ASMP-NPs could achieve the same anticancer effect with the greatly reduced dosage compared with the free drugs according to the dose-reduction index (DRI) values of MTX and GEM in MTX-GEM ASMP-NPs, which may be beneficial for reducing the side effects."

The news correspondents report that additional information may be obtained from X.Y. Zhu, Shanghai Jiao Tong University, State Key Lab Met Matrix Composites, Sch Chem & Chem Engn, Shanghai 200240, People's Republic of China. Additional authors for this research include P. Huang, M.X. Hu, W. Huang, X.Y. Zhu and D.Y. Yan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.bioconchhem.6b00503. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antiretrovirals

Researchers at Sichuan University Report Findings in Antiretrovirals (Lack of Efficacy of Ulinastatin Therapy During Cardiopulmonary Bypass Surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antiretrovirals. According to news reporting originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "It was believed that inflammatory response induced by cardiopulmonary bypass (CPB) was blamed for complications after cardiac surgery. To improve the outcome, many pharmacological interventions have been applied to attenuate inflammatory response during CPB."

Our news editors obtained a quote from the research from Sichuan University, "The objective of this study was to investigate the effect of ulinastatin (urinary trypsin inhibitor [UTI]) on outcome after CPB surgery. Totally, 208 patients undergoing elective valves replacement between November 2013 and September 2014 were divided into Group U (n=70) and Group C (n=138) based on they received UTI or not. Categorical variables were compared between groups using Fisher's exact test, and continuous variables using unpaired Student's t-test or Mann-Whitney U-test. One-way analysis of variance and Dunnett's or Tukey's tests were used to compare values at different time points within the same group. The risk of outcomes was estimated and adjusted by multivariable logistic regression, propensity scoring, and mixed-effect models for all measured variables. Both the serious complications in total, including death, acute lung injury, acute respiratory distress syndrome and acute kidney injury, and the other complications, including hemodialysis, infection, re-incubation, and tracheotomy were similar between the two groups (p >0.05). After adjusted by multivariable logistic regression and the propensity score, UTI still cannot be found any benefit to improve any outcomes after cardiac surgery. Also, no statistical differences with regard to duration of postoperative mechanical ventilation, the length of Intensive Care Unit and hospital stays (p >0.05)."

According to the news editors, the research concluded: "UTI did not improve postoperative outcomes in our patients after cardiopulmonary bypass surgery."

For more information on this research see: Lack of Efficacy of Ulinastatin Therapy
Researchers at Sichuan University Target Gastrointestinal Neoplasms (A lower dosage of imatinib in patients with gastrointestinal stromal tumors with toxicity of the treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Digestive System Diseases and Conditions - Gastrointestinal Neoplasms have been presented. According to news originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "This study investigated the efficiency and safety of imatinib in the lower dose (300 mg/d) in patients with gastrointestinal stromal tumor (GIST) who cannot tolerate imatinib in the standard dose (400 mg/d). Steady-state imatinib trough concentration (Cmin) values in 18 patients with GIST who were taking 300mg/d or 400mg/d imatinib were measured."

Our news journalists obtained a quote from the research from Sichuan University, "The clinical features, toxicity data, and follow-up data were collected. Around 18 patients with GIST were investigated in which 9 patients received 300mg/d imatinib. The mean imatinib Cmin value of the 18 patients was 1841ng/mL (1018-3897ng/mL). The difference between the patients treated with 400mg/d (n=9) and those treated with 300mg/d (n=9), which have imatinib Cmin values of 2122 +/- 1003ng/mL and 1559 +/- 478ng/mL, respectively, was not significant (P=0.148). In total, 12 of the 18 patients had complete resection of the primary tumor, 8 of whom received postoperative imatinib 300mg/d. After the average follow-up of 15.4 months, no recurrence was documented. Of the 6 patients with unresected GIST, 1 received imatinib 300mg/d for 13 months. The tumor size of this patient continued to decrease. In contrast to patients treated with imatinib 400mg/d, patients treated with imatinib 300mg/d notably exhibited lesser drug-related side effects."

According to the news editors, the research concluded: "Patients with GIST who exhibited intolerance to the standard dose of imatinib (400 mg/d), a lower dose of 300mg/d could provide not only sufficient plasma Cmin and good disease control but also the alleviation
of the side effects."

For more information on this research see: A lower dosage of imatinib in patients with gastrointestinal stromal tumors with toxicity of the treatment. *Medicine, 2016;95(49):202-206. Lung Diseases and Conditions - Pulmonary...

Researchers at Soochow University Release New Data on Pulmonary Hypertension (Risk factors for pulmonary hypertension in patients receiving maintenance peritoneal dialysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Pulmonary Hypertension is the subject of a report. According to news reporting originating from Suzhou, People's Republic of China, by NewsRx correspondents, research stated, "We investigated the risk factors for pulmonary hypertension (PH) in patients receiving maintenance peritoneal dialysis (MPD). A group of 180 end-stage renal disease patients (124 men and 56 women; mean age: 56.43?8.36) were enrolled in our study, which was conducted between January 2009 and June 2014."

Our news editors obtained a quote from the research from Soochow University, "All of the patients received MPD treatment in the Dialysis Center of the Second Affiliated Hospital of Soochow University. Clinical data, laboratory indices, and echocardiographic data from these patients were collected, and follow-ups were scheduled bi-monthly. The incidence and relevant risk factors of PH were analyzed. The differences in measurement data were compared by t-test and enumeration data were compared with the ch2 test. Among the 180 patients receiving MPD, 60 were diagnosed with PH. The remaining 120 were regarded as the non-PH group. Significant differences were observed in the clinical data, laboratory indices, and echocardiographic data between the PH and non-PH patients (all p<0.05). Furthermore, hypertensive nephropathy patients on MPD showed a significantly higher incidence of PH compared with non-hypertensive nephropathy patients (p <0.05). Logistic regression analysis showed that the proportion of internal arteriovenous fistula, C-reactive protein levels, and ejection fraction were the highest risk factors for PH in patients receiving MPD."

According to the news editors, the research concluded: "Our study shows that there is a high incidence of PH in patients receiving MPD and hypertensive nephropathy patients have
an increased susceptibility to PH."

For more information on this research see: Risk factors for pulmonary hypertension in patients receiving maintenance peritoneal dialysis. *Brazilian Journal of Medical and Biological Research*, 2016;49(3);.

The news editors report that additional information may be obtained by contacting Y. Zeng, Dept. of Nephrology, The Second Affiliated Hospital of Soochow University, Suzhou, People's Republic of China. Additional authors for this research include D.D. Yang, S. Feng, H.Y. Shen, Z. Wang, S. Jiang, Y.B. Shi and J.X Fu.

**Oncology - Colon Cancer**

**Researchers at Southern Medical University Report New Data on Colon Cancer (Analysis of the predictive efficiency of MOP on adverse prognosis and the pathogenesis of S100P-mediated invasion and metastasis of colon adenocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Elevated expression of S100P has been detected in several tumor types. To analyze the potential use of S100P for the prediction of colorectal cancer (CRC) metastasis and prognosis, S100P expression was detected in 125 patients with colon adenocarcinoma by immunohistochemistry, followed by correlation and survival analysis."

Our news editors obtained a quote from the research from Southern Medical University, "High S100P expression was correlated with metastasis, as demonstrated by clinically relevant data, and predicted poor survival more effectively than preoperative serum carcinoembryonic antigen (CEA) and carbohydrate antigen 19-9 (CA19-9) levels in colon adenocarcinoma. Stable S100P knockdown CRC cell lines were established to elucidate the relationship between S100P expression and tumor progression in vitro and in vivo. S100P knockdown resulted in reductions in the invasiveness and metastasis of CRC cells. Xenograft growth in nude mice also demonstrated that down-regulated S100P dramatically inhibited peritoneal metastasis of CRC cells. S100P promoted the invasion and metastasis of CRC by activating RAGE/ERK signaling and promoting the epithelial mesenchymal transition (EMT). RAGE was found to be crucial for S100P-mediated EMT in colon cancer. Knockdown of RAGE in S100P-overexpressing colon cancer cells dramatically suppressed EMT process."

According to the news editors, the research concluded: "Our results indicate that overexpression of S100P is related with an invasive and metastatic phenotype of CRC which is EMT-involved and RAGE dependent."

For more information on this research see: Analysis of the predictive efficiency of

Nutritional and Metabolic Diseases and Conditions —

**Researchers at Southern Medical University Report New Data on Obesity (The effects of resveratrol intervention on risk markers of cardiovascular health in overweight and obese subjects: a pooled analysis of randomized controlled trials)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Potential effects of resveratrol consumption on cardiovascular disease risk factors and body weight in overweight/obese adults have not been fully elucidated. Our present analysis was to evaluate the effects of resveratrol consumption on risk markers related to cardiovascular health in overweight/obese Individuals."

Our news editors obtained a quote from the research from Southern Medical University, "Multiple literature databases were systematically searched, and 21 studies were included. Effect sizes were expressed as weighted mean difference (WMD) and 95% confidence interval (CI), and heterogeneity was assessed with the I2 test. Publication bias and subgroup analyses were also performed. There were variations in reporting quality of included studies. Resveratrol intervention significantly lowered total cholesterol (WMD, -0.19 mmol/L; 95% CI, -0.32 to -0.06; P = 0.004), systolic blood pressure (WMD, -2.26 mmHg; 95% CI, -4.82 to -0.49; P = 0.02), and fasting glucose (WMD, -0.22 mmol/L; 95% CI, -0.42 to -0.03; P = 0.03). Heterogeneity was noted for these outcomes (35.6%, 38.7% and 71.4%, respectively). Our subgroup analysis showed significant reductions in total cholesterol, systolic blood pressure, diastolic blood pressure, glucose, and insulin in subjects ingesting higher dose of resveratrol (>= 300 mg/day)."

According to the news editors, the research concluded: "Our finding provides evidence that daily resveratrol consumption might be a candidate as an adjunct to pharmacological management to better prevent and control cardiovascular disease in overweight/obese individuals."

For more information on this research see: The effects of resveratrol intervention on risk markers of cardiovascular health in overweight and obese subjects: a pooled analysis of

**Immune System Diseases and Conditions - HIV/AIDS**

**Researchers at Southwest University Report New Data on HIV/AIDS (Sensitive detection of HIV gene by coupling exonuclease III-assisted target recycling and guanine nanowire amplification)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - HIV/AIDS are presented in a new report. According to news reporting originating in Chongqing, People's Republic of China, by NewsRx journalists, research stated, "In this work, a simple, label-free electrochemical biosensor was constructed with the combination of exonuclease III (Exo III)-assisted target recycling and guanine nanowire amplification for the detection of HIV gene. The presence of target DNA leads to target recycling process, which could obtain a digestion product named as help DNA with the assistance of Exo III."

Financial supporters for this research include National Natural Science Foundation of China, Innovation Foundation of Chongqing City for Postgraduate, Municipal Natural Science Foundation of Chongqing City.

The news reporters obtained a quote from the research from Southwest University, "The released help DNA can hybridize with the G-quadruplex sequence-locked hairpin probe. Then, the active G-quadruplex sequence could form G-quadruplex structure in the presence of IC, which could trigger the formation of guanine nanowire with the help of Mg2+. The hemin/G-quadruplex repeat units could effectively catalyze the H2O2-mediated oxidation of 3,3',5,5'-tetramethyl benzidine dihydrochloride (TMB 2HCl) accompanied by a change in color of the reaction solution and an increased electrochemical current signal in the presence of hemin. The developed amplification strategy provides a sensitive and selective approach for the detection of target DNA with a detection limit of 3.6 pM."

According to the news reporters, the research concluded: "Furthermore, the proposed DNA sensor has a promising potential for biosensing in real settings."

For more information on this research see: Sensitive detection of HIV gene by coupling exonuclease III-assisted target recycling and guanine nanowire amplification. *Sensors and Actuators B-Chemical*, 2017;238():1017-1023. *Sensors and Actuators B-Chemical* can be

Oncology - Liver Cancer

Researchers at Stanford University Hospital Target Liver Cancer (Hepatocellular Carcinoma Screening and Surveillance: Practice Guidelines and Real-Life Practice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Hepatocellular carcinoma (HCC) is the seventh most common malignancy worldwide. HCC meets all the criteria established by the World Health Organization for performing surveillance on those at-risk for developing cancer."

Our news journalists obtained a quote from the research from Stanford University Hospital, "Although there are consensus guidelines in the United States, Europe, and Asia for HCC surveillance, it is unclear if these guidelines are regularly implemented in routine practice to optimize real-life clinical outcomes. We reviewed the current literature on the adherence to current HCC practice guidelines by the American Association for the Study of Liver Diseases (2009), the European Association for the Study of the Liver (2012), and the Asia Pacific Association for the Study of the Liver (2010) for screening/surveillance and outcomes of optimal versus poor adherence. We performed PubMed search for relevant articles regarding HCC surveillance and screening worldwide. Currently, HCC screening is underutilized to a large extent. In most studies, the adherence to HCC screening and surveillance is suboptimal. Various patient, provider, and health care system factors may have all contributed to such nonadherence. Strategies to improve HCC screening and surveillance are urgently needed for early HCC detection and improved survival of HCC patients. Further research is needed to elucidate the various medical and/or cultural knowledge, belief, and practice patterns that can lead to barriers to HCC screening and surveillance at both patient and provider levels."

According to the news editors, the research concluded: "These data will help focus and target advocacy and educational efforts to improve HCC surveillance at all levels: patients, providers, and health care system/government."

For more information on this research see: Hepatocellular Carcinoma Screening and
Researchers at State University of New York Release New Data on Colitis (Alkaline ceramidase 3 deficiency aggravates colitis and colitis-associated tumorigenesis in mice by hyperactivating the innate immune system)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Digestive System Diseases and Conditions - Colitis is now available. According to news reporting originating in Stony Brook, New York, by NewsRx journalists, research stated, "Increasing studies suggest that ceramides differing in acyl chain length and/or degree of unsaturation have distinct roles in mediating biological responses. However, still much remains unclear about regulation and role of distinct ceramide species in the immune response."

The news reporters obtained a quote from the research from the State University of New York, "Here, we demonstrate that alkaline ceramidase 3 (Acer3) mediates the immune response by regulating the levels of C18:1-ceramide in cells of the innate immune system and that Acer3 deficiency aggravates colitis in a murine model by augmenting the expression of pro-inflammatory cytokines in myeloid and colonic epithelial cells (CECs). According to the NCBI Gene Expression Omnibus (GEO) database, ACER3 is downregulated in immune cells in response to lipopolysaccharides (LPS), a potent inducer of the innate immune response. Consistent with these data, we demonstrated that LPS downregulated both Acer3 mRNA levels and its enzymatic activity while elevating C(18:1)-ceramide, a substrate of Acer3, in murine immune cells or CECs. Knocking out Acer3 enhanced the elevation of C(18:1)-ceramide and the expression of pro-inflammatory cytokines in immune cells and CECs in response to LPS challenge. Similar to Acer3 knockout, treatment with C(18:1)-ceramide, but not C18:0-ceramide, potentiated LPS-induced expression of pro-inflammatory cytokines in immune cells. In the mouse model of dextran sulfate sodium-induced colitis, Acer3 deficiency augmented colitis-associated elevation of colonic C(18:1)-ceramide and pro-inflammatory cytokines. Acer3 deficiency aggravated diarrhea, rectal bleeding, weight loss and mortality. Pathological analyses revealed that Acer3 deficiency augmented colonic shortening, immune cell infiltration, colonic..."
epithelial damage and systemic inflammation. Acer3 deficiency also aggravated colonic dysplasia in a mouse model of colitis-associated colorectal cancer."

According to the news reporters, the research concluded: "Taken together, these results suggest that Acer3 has an important anti-inflammatory role by suppressing cellular or tissue C(18:1)-ceramide, a potent pro-inflammatory bioactive lipid and that dysregulation of ACER3 and C(18:1)-ceramide may contribute to the pathogenesis of inflammatory diseases including cancer."

For more information on this research see: Alkaline ceramidase 3 deficiency aggravates colitis and colitis-associated tumorigenesis in mice by hyperactivating the innate immune system. Cell Death & Disease, 2016;7():e2124. (Nature Publishing Group - www.nature.com/cddis/

Hematology - Blood Coagulation Factors

Researchers at State University of New York Upstate Medical University Report New Data on Blood Coagulation Factors (Fibrinogen Reduction and Motor Function Improvement by Hematopoietic Growth Factor Treatment in Chronic Stroke in Aged Mice: A ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematology - Blood Coagulation Factors are discussed in a new report. According to news reporting originating from Syracuse, New York, by NewsRx correspondents, research stated, "Stroke is a serious medical condition that causes long-term neurological disability in mainly elderly adults worldwide. Lack of therapy to improve functional recovery in the chronic phase of stroke is a major challenge for stroke research."

Our news editors obtained a quote from the research from the State University of New York Upstate Medical University, "Combining two hematopoietic growth factors, stem cell factor (SCF) and granulocyte-colony stimulating factor (G-CSF), our previous studies have demonstrated the neurovascular restorative efficacy of this treatment in the chronic phase of experimental stroke. Elevated plasma fibrinogen has been thought to serve as a predictor for ischemic stroke. Here we have determined the treatment frequency in reducing plasma
fibrinogen and in restoring motor function in aged mice with chronic stroke. Our findings show that SCF + G-CSF treatment in chronic stroke decreases plasma fibrinogen and improves motor function in aged mice. No differences have been found between a 2-week treatment regimen and 7-day treatment in the plasma fibrinogen assay, while the 7-day treatment regimen displays a better recovery pattern with regard to motor function.

According to the news editors, the research concluded: "This study provides new insight into understanding the potential contribution of SCF + G-CSF in both reducing the risk of recurrent ischemic stroke and enhancing stroke recovery."

The news editors report that additional information may be obtained by contacting Y. Liu, Dept. of Neurosurgery, State University of New York Upstate Medical University, Syracuse, NY, United States. Additional authors for this research include M. Popescu, S. Longo, M. Gao, D. Wang, S. McGillis and L. R. Zhao.

Peptides and Proteins

Researchers at Stockholm University Report New Data on Peptides and Proteins (Particle-based N-linked glycan analysis of selected proteins from biological samples using nonglycosylated binders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Peptides and Proteins have been published. According to news reporting from Stockholm, Sweden, by NewsRx journalists, research stated, "Glycosylation is one of the most common and important post-translational modifications, influencing both the chemical and the biological properties of proteins. Studying the glycosylation of the entire protein population of a sample can be challenging because variations in the concentrations of certain proteins can enhance or obscure changes in glycosylation."

The news correspondents obtained a quote from the research from Stockholm University. "Furthermore, alterations in the glycosylation pattern of individual proteins, exhibiting larger variability in disease states, have been suggested as biomarkers for different types of cancer, as well as inflammatory and neurodegenerative diseases. In this paper, we present a rapid and efficient method for glycosylation analysis of individual proteins focusing on changes in the degree of fucosylation or other alterations to the core structure of the glycans, such as the presence of bisecting N-acetylgalcosamines and a modified degree of branching. Streptavidin-coated magnetic beads are used in combination with genetically engineered immunoaffinity binders, called VHH antibody fragments. A major advantage of the VHHs is
that they are nonglycosylated; thus, enzymatic release of glycans from the targeted protein can be performed directly on the beads. After deglycosylation, the glycans are analyzed by MALDI-TOF-MS. The developed method was evaluated concerning its specificity, and thereafter implemented for studying the glycosylation pattern of two different proteins, alpha-1-antitrypsin and transferrin, in human serum and cerebrospinal fluid."

According to the news reporters, the research concluded: "To our knowledge, this is the first example of a protein array-type experiment that employs bead-based immunoaffinity purification in combination with mass spectrometry analysis for fast and efficient glycan analysis of individual proteins in biological fluid."

For more information on this research see: Particle-based N-linked glycan analysis of selected proteins from biological samples using nonglycosylated binders. Journal of Pharmaceutical and Biomedical Analysis, 2017;132():125-132. Drugs and Therapies - Chemotherapy

Researchers at Sun Yat-Sen University Cancer Center Report New Data on Chemotherapy (The effect of chemotherapy on programmed cell death 1/programmed cell death 1 ligand axis: some chemotherapeutical drugs may finally work through immune ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Chemotherapy have been presented. According to news reporting originating in Guangzhou, People's Republic of China, by NewsRx journalists, research stated, "Most tumors are immunogenic which would trigger some immune response. Chemotherapy also has immune potentiating mechanisms of action."

The news reporters obtained a quote from the research from Sun Yat-Sen University Cancer Center, "But it is unknown whether the immune response is associated with the efficacy of chemotherapy and the development of chemoresistance. Recently, there is a growing interest in immunotherapy, among which the co-inhibitory molecules, programmed cell death 1/programmed cell death 1 ligand (PD-1/PD-L1) leads to immune evasion."

According to the news reporters, the research concluded: "Since some reports showed that conventional chemotherapeutics can induce the expression of PD-L1, we try to
summarize the effect of chemotherapy on PD-1/PD-L1 axis and some potential molecules relevant to PD-1/PD-L1 in chemoresistance in this review.

For more information on this research see: The effect of chemotherapy on programmed cell death 1/programmed cell death 1 ligand axis: some chemotherapeutical drugs may finally work through immune response. *Oncotarget*, 2016;7(20):29794-803.

**Oncology - Lung Cancer**

**Researchers at Sun Yat-Sen University Have Reported New Data on Lung Cancer (Aberrantly expressed miR-582-3p maintains lung cancer stem cell-like traits by activating Wnt/b-catenin signalling)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lung Cancer. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Cancer stem cells (CSCs) are involved in tumorigenesis, tumor recurrence and therapy resistance and Wnt signalling is essential for the development of the biological traits of CSCs. In non-small cell lung carcinoma (NSCLC), unlike in colon cancer, mutations in b-catenin and APC genes are uncommon; thus, the mechanism underlying the constitutive activation of Wnt signalling in NSCLC remains unclear."

The news reporters obtained a quote from the research from Sun Yat-Sen University, "Here we report that miR-582-3p expression correlates with the overall-and recurrence-free-survival of NSCLC patients, and miR-582-3p has an activating effect on Wnt/b-catenin signalling. miR-582-3p overexpression simultaneously targets multiple negative regulators of the Wnt/b-catenin pathway, namely, AXIN2, DKK3 and SFRP1. Consequently, miR-582-3p promotes CSC traits of NSCLC cells in vitro and tumorigenesis and tumor recurrence in vivo. Antagonizing miR-582-3p potently inhibits tumor initiation and progression in xenografted animal models."

According to the news reporters, the research concluded: "These findings suggest that miR-582-3p mediates the constitutive activation of Wnt/b-catenin signalling, likely serving as a potential therapeutic target for NSCLC."

For more information on this research see: Aberrantly expressed miR-582-3p maintains lung cancer stem cell-like traits by activating Wnt/b-catenin signalling. *Nature Communications*, 2015;6():8640. (Nature Publishing Group - www.nature.com/; Nature Communications - www.nature.com/ncomms/)

Researchers at Sun Yat-Sen University Target Drug Targets (Chemical Structure Similarity Search for Ligand-based Virtual Screening: Methods and Computational Resources)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Targets have been published. According to news reporting out of Guangzhou, People's Republic of China, by NewsRx editors, research stated, "For many years the assumption that 'Chemical compounds with similar structures may have similar activities' has been a foundation for lead identification. The similarity can be computed based upon topological, steric, electronic, and/or physical properties."

Our news journalists obtained a quote from the research from Sun Yat-Sen University, "The chemical structure similarity search differs from the chemical substructure search in that the former requires assessment of the properties of each compound and thus no filter can be applied for skipping structures before they are assessed to accelerate the computation. The latter can be accelerated by pre-screening compounds and omitting those that miss one (or more) specified fragments from the query. Moreover, three-dimensional similarity search requires superimposing many conformation pairs for each compound in the library. This makes 3-D similarity search algorithms time-consuming, and in general requires high performance computing (HPC) resources."

According to the news editors, the research concluded: "This review will summarize recent progress in the techniques for HPC-supported two and three-dimensional chemical structure similarity search algorithms, and their applications in ligand-based virtual screening."

Our news journalists report that additional information may be obtained by contacting Q. Gu, Research Center for Drug Discovery (RCDD), Sun Yat-Sen University, 132 East Circle at University City, Guangzhou 510006, People's Republic of China. Additional authors for this research include C. Liao, Z. Liu, A.T. Hagler, Q. Gu and J. Xu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2174/1389450116666151102095555. This DOI is a link to an online electronic document that is either free or for purchase.
Researchers at Sungkyunkwan University School of Medicine Target Gastric Cancer [Prospective phase II trial of pazopanib plus CapeOX (capecitabine and oxaliplatin) in previously untreated patients with advanced gastric cancer]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Gastric Cancer are presented in a new report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "We designed a single-arm, open label phase II study to determine the efficacy and toxicity of the combination of pazopanib with CapeOX (capecitabine and oxaliplatin) in metastatic /recurrent advanced gastric cancer (AGC) patients. Previously untreated AGC patients received capecitabine (850 mg/m² bid, day 1-14) plus oxaliplatin (130 mg/m², day 1) in combination with pazopanib (800 mg, day 1-21) every three weeks."

Our news editors obtained a quote from the research from the Sungkyunkwan University School of Medicine, "Treatment was continued until progression of the disease or intolerable toxicity was observed. In all, 66 patients were treated with pazopanib plus CapeOx. The median age of the patients was 51.5 years (range, 23.0-77), and the median ECOG performance status was 1 (0-1). Among all 66 patients, one complete response and 37 partial responses were observed (overall response rate, 62.4%; 95% confidence interval (CI), 45.7-73.5% accounting for the 2-stage design of this trial). Stable disease was observed in 23 patients (34.8%), revealing a 92.4% disease control rate. The median progression free survival and overall survival were 6.5 months (95% CI, 5.6-7.4) and 10.5 months (95% CI, 8.1-12.9), respectively. Thirty-four patients (51.5%) experienced a treatment-related toxicity of grade 3 or more. The most common toxicities of grade 3 or more were neutropenia (15.1%), anemia (10.6%), thrombocytopenia (10.6%), anorexia (7.6%), nausea (3.0%), and vomiting (3.0%). There were no treatment-related deaths."

According to the news editors, the research concluded: "The combination of pazopanib and CapeOX showed moderate activity and an acceptable toxicity profile as a first-line treatment in metastatic / recurrent AGC patients (ClinicalTrials)."

For more information on this research see: Prospective phase II trial of pazopanib plus CapeOX (capecitabine and oxaliplatin) in previously untreated patients with advanced gastric cancer. Oncotarget, 2016;7(17):24088-96.

Peptide Proteins - Peptide Hormones

Researchers at Taipei Medical University Have Reported New Data on Peptide Hormones (B-Type Natriuretic Peptide Modulates Pulmonary Vein Arrhythmogenesis: A Novel Potential Contributor to the Genesis of Atrial Tachyarrhythmia in Heart Failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Peptide Proteins - Peptide Hormones are discussed in a new report. According to news reporting out of Taipei, Taiwan, by NewsRx editors, research stated, "BNP Modulates PV Electrophysiology. Heart failure (HF) plays a critical role in the genesis of atrial fibrillation (AF)."

Our news journalists obtained a quote from the research from Taipei Medical University, "A high B-type natriuretic peptide (BNP) level occurs in patients with HF and in patients with AF. However, the role of BNP in the pathophysiology of AF is not clear. The purposes of this study were to evaluate the effects of BNP on pulmonary vein (PV) arrhythmogenesis. Whole-cell patch clamp and fluorescence were used to study the action potential, ionic currents, and calcium homeostasis in isolated single rabbit PV cardiomyocytes before and after a BNP infusion, with or without ODQ (10 mu M), milrinone (50 mu M), or ouabain (1 mu M). BNP increased PV spontaneous activity by 28.2 +/- 7.5% at 100 nM and by 23.8 +/- 9.1% at 300 nM. Similar to those with BNP, milrinone 50 mu M increased the PV beating rate from 3.0 +/- 0.2 to 3.6 +/- 0.3 Hz (P < 0.0005, n = 7). In the presence of ODQ application, BNP didn't change PV spontaneous activity. BNP (100 nM) increased calcium transients (F/F-0 from 1.6 +/- 0.1 to 1.9 +/- 0.2, n = 20, P< 0.05) and increased the pacemaker current (0.4 +/- 0.1 to 1.0 +/- 0.2 pA/pF, n = 17, P< 0.0005) in PV cardiomyocytes. Moreover, BNP (100 nM) increased the transient inward current, sodium currents, sodium-calcium exchanger currents, and L-type calcium current; but reduced late sodium currents and the Na-K pump in PV cardiomyocytes. BNP increases PV arrhythmogenesis, which may contribute to the genesis of atrial tachyarrhythmogenesis in HF."

According to the news editors, the research concluded: "Cyclic GMP activation, phosphodiesterase 3 inhibition and Na+/K+-ATPase inhibition might participate in the BNP modulation of PV electrophysiology."

Our news journalists report that additional information may be obtained by contacting Y.J. Chen, Taipei Medical University, Grad Inst Clin Med, Coll Med, Taipei, Taiwan. Additional authors for this research include Y.C. Chen, Y.A. Chen, Y.H. Yeh, S.A.
Researchers at Tarbiat Modares University Release New Data on Mesenchymal Stem Cells (Inhibition of breast tumor growth and abnormal angiogenesis in mice treated with endothelial cells and their progenitor mesenchymal stem cells derived from ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Stem Cell Research - Mesenchymal Stem Cells. According to news originating from Tehran, Iran, by NewsRx correspondents, research stated, "Incorporation of endothelial cells or their progenitor cells into newly sprouting blood vessels can contribute to tissue vascularization after ischemic injury. However, the interaction of the stem cells-derived endothelial cells with angiogenesis within tumors is not well understood."

Our news journalists obtained a quote from the research from Tarbiat Modares University, "The aim of this study was to examine the efficiency of endothelial-like cells derived from MSCs in controlling breast tumor growth associated with abnormal angiogenesis. For this purpose, Balb/c mouse model of breast carcinoma was developed and subjected to intra tumor (I.T)/intra venous (I.V) therapy with undifferentiated MSCs or endothelial cells derived from them. The homing of the stem cells was approved by measuring different markers as well as tracing green fluorescence protein (GFP)-labeled MSCs in the tumors. Tumor growth was measured following cell therapy using a digital caliper. At the end of treatment period (30 days) the angiogenesis markers; VEGFR2 expression as well as micro-vessel density (MVD) using CD31 were estimated in tumor tissues. Stem cell transplantation to mice bearing breast tumors resulted in tumor growth suppression in all experimental groups. The endothelial markers; CD31 and VEGFR2 were down regulated following I.T delivery of the endothelial cells. Accordingly, angiogenesis was suppressed following I.T administration of endothelial cells which was associated with increased focal necrosis in the tumors."

According to the news editors, the research concluded: "Data show that endothelial cells directly injected into tumors is more efficient compared to undifferentiated MSCs in controlling tumor-associated angiogenesis and tumor growth."

For more information on this research see: Inhibition of breast tumor growth and abnormal angiogenesis in mice treated with endothelial cells and their progenitor mesenchymal stem cells derived from bone marrow. Neoplasma, 2016;63(6):911-924. Neoplasma can be contacted at: Aepress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

The news correspondents report that additional information may be obtained from A. Allameh, Tarbiat Modares Univ, Fac Med Sci, Dept. of Clin Biochem, Tehran, Iran. Additional authors for this research include A. Allameh, S.M. Tavangar, Z.M. Hassan and M. Soleimani.

Researchers at Technical University Release New Data on Escherichia coli (Design of a covalently linked human interleukin-10 fusion protein and its secretory expression in Escherichia coli)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Escherichia coli is now available. According to news reporting out of Dresden, Germany, by NewsRx editors, research stated, "Wild-type human interleukin-10 (hIL-10) is a non-covalent homodimer with a short half-life, thus limiting its therapeutic applications in vivo. To avoid loss of function due to dimer dissociation, we designed a synthetic hIL-10 analog by bridging both monomers via a 15 amino acid-long peptide spacer in a C-terminal to N-terminal fashion."

Financial supporters for this research include Bundesministerium fur Bildung und Forschung, Technische Universität Dresden.

Our news journalists obtained a quote from the research from Technical University, "For secretory expression in Escherichia coli, a 1156 bp fragment was generated from template vector pAZ1 by fusion PCR encoding a T7 promoter region and the signal sequence of the E. coli outer membrane protein F fused in frame to two tandem E. coli codon-optimized mature hIL-10 genes connected via a 45 nucleotide linker sequence. The construct was cloned into pUC19 for high-level expression in E. coli BL21 (DE3). The mean concentrations of hIL-10 fusion protein in the periplasm and supernatant of E. coli at 37 A degrees C growth temperature were 130 +/- 40 and 2 +/- 1 ng/ml, respectively. The molecular mass of the recombinant protein was assessed via matrix-assisted laser desorption ionization time-of-flight (MALDI-TOF) analysis, indicating correct processing of the signaling sequence in E. coli."

According to the news editors, the research concluded: "In vitro biological activity was shown by phosphorylation of signal transducer and activator of transcription protein 3 and suppression of tumor necrosis factor alpha secretion in lipopolysaccharide-stimulated macrophages."

For more information on this research see: Design of a covalently linked human interleukin-10 fusion protein and its secretory expression in Escherichia coli. *Applied Microbiology and Biotechnology*, 2016;100(24):10479-10493. *Applied Microbiology and Biotechnology* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Applied Microbiology and Biotechnology - www.springerlink.com/content/0175-7598/)

Our news journalists report that additional information may be obtained by contacting F. Gunzer, Technical University of Dresden, Inst Med Microbiol & Hyg, D-01307 Dresden, Germany. Additional authors for this research include C. Buttner, W. Rudolph, K. Zimmermann, F. Gunzer and C. Pohlmann.

Researchers at Technical University Target Biological Pigments (Stress responses of human retinal pigment epithelial cells to glyoxal)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Biological Factors - Biological Pigments is now available. According to news reporting originating in Dresden, Germany, by NewsRx journalists, research stated, "Intracellular formation of advanced glycation end products (AGEs) is a crucial pathological process in retinal diseases such as age-related macular degeneration (AMD) or diabetic retinopathy (DR). Glyoxal is a physiological metabolite produced during formation of AGEs and has also been shown to derive from photodegraded bisretinoid fluorophores in aging retinal pigment epithelial (RPE) cells."

Financial support for this research came from Deutsche Forschungsgemeinschaft (DFG).

The news reporters obtained a quote from the research from Technical University, "Flow cytometry was combined with either: 1) immunocytochemical staining to detect glyoxal induced formation of N-epsilon-carboxymethyllysine (CML)-modifications of intracellular proteins (AGEs) and changes in the production of stress response proteins; or 2) vital staining to determine apoptosis rates (annexin V binding), formation of intracellular reactive oxygen species (ROS), mitochondrial membrane potential (MMP), and changes in intracellular pH upon treatment of cells with glyoxal. The percentage of apoptotic cells was further quantified by flow cytometry after staining of fixed cells with propidium iodide to determine cells with a subdiploid (fragmented) DNA content. Apoptosis related activation of caspase 3 was determined by Western blotting. Glyoxal induced changes in VEGF-A(165a) mRNA expression and protein production were determined by real-time PCR and by flow cytometry after immunocytochemical staining. Increasing glyoxal concentrations resulted in enhanced formation of AGEs, such as CML modifications of proteins. This was associated with elevated levels of intracellular reactive oxygen species, a depolarized MMP, and a decreased intracellular pH, resulting in an increased number of apoptotic cells. Apoptosis related caspase 3 activation increased in a dose dependent manner after glyoxal incubation. In consequence, the cells activated compensatory mechanisms and increased the levels of the anti-oxidative and stress-related proteins heme oxygenase-1, osteopontin, heat shock protein 27, copper/zinc superoxide dismutase, manganese superoxide dismutase, and cathepsin D. Furthermore, VEGF-A(165a) mRNA expression and VEGF-A protein production were significantly increased after incubation with glyoxal in ARPE-19 cells."

According to the news reporters, the research concluded: "The glyoxal-induced oxidative stress and apoptosis in ARPE-19 cells may provide a suitable in vitro model for studying RPE cellular reactions to AGEs that occur in AMD or in DR."

For more information on this research see: Stress responses of human retinal...

**Hormones**

**Researchers at Third Military Medical University Report New Data on Hormones (Melatonin prevents abnormal mitochondrial dynamics resulting from the neurotoxicity of cadmium by blocking calcium-dependent translocation of Drp1 to the mitochondria)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hormones. According to news reporting originating in Chongqing, People's Republic of China, by NewsRx journalists, research stated, "Cadmium (Cd) is a persistent environmental toxin and occupational pollutant that is considered to be a potential risk factor in the development of neurodegenerative diseases. Abnormal mitochondrial dynamics are increasingly implicated in mitochondrial damage in various neurological pathologies."

Financial support for this research came from National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Third Military Medical University, "The aim of this study was to investigate whether the disturbance of mitochondrial dynamics contributed to Cd-induced neurotoxicity and whether melatonin has any neuroprotective properties. After cortical neurons were exposed to 10 mM cadmium chloride (CdCl2) for various periods (0, 3, 6, 12, and 24 hr), the morphology of their mitochondria significantly changed from the normal tubular networks into punctuated structures within 3 hr. Following this pronounced mitochondrial fragmentation, Cd treatment led to signs of mitochondrial dysfunction, including excess reactive oxygen species (ROS) production, decreased ATP content, and mitochondrial membrane potential (▵Ψm) loss. However, 1 mM melatonin pretreatment efficiently attenuated the Cd-induced mitochondrial fragmentation, which improved the turnover of mitochondrial function. In the brain tissues of rats that were intraperitoneally given 1 mg/kg CdCl2 for 7 days, melatonin also ameliorated excessive
mitochondrial fragmentation and mitochondrial damage in vivo. Melatonin's protective effects were attributed to its roles in preventing cytosolic calcium ([Ca(2+)]i) overload, which blocked the recruitment of Drp1 from the cytoplasm to the mitochondria. Taken together, our results are the first to demonstrate that abnormal mitochondrial dynamics is involved in cadmium-induced neurotoxicity."

According to the news reporters, the research concluded: "Melatonin has significant pharmacological potential in protecting against the neurotoxicity of Cd by blocking the disbalance of mitochondrial fusion and fission."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jpi.12310. This DOI is a link to an online electronic document that is either free or for purchase.

Genetic Diseases and Conditions - Down Syndrome

Researchers at Third Military Medical University Target Down Syndrome (Two kinds of common prenatal screening tests for Down's syndrome: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetic Diseases and Conditions - Down Syndrome. According to news originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "As the chromosomal examination of foetal cells for the prenatal diagnosis of Down's syndrome (DS) carries a risk of inducing miscarriage, serum screening tests are commonly used before invasive procedures. In this study, a total of 374 records from PubMed, EMBASE, and the ISI Science Citation Index databases were reviewed."

Our news journalists obtained a quote from the research from Third Military Medical University, "As a result of duplication, insufficient data, and inappropriate article types, 18 independent articles containing 183,998 samples were used in the final systematic review and meta-analysis of the diagnostic performance of the serum triple screening test (STS) and the integrated screening test (INS). Data extracted from the selected studies were statistically analysed, and the presence of heterogeneity and publication bias was assessed using specific
software. The overall sensitivity, specificity, positive likelihood ratio, negative likelihood ratio, diagnostic odds ratio, and the area under the curve for the STS were 0.77 (95% confidence interval=0.73-0.81), 0.94 (0.94-0.94), 9.78 (6.87-13.93), 0.26 (0.22-0.31), 44.72 (30.77-65.01), and 0.9064, respectively. For the INS, these values were 0.93 (0.90-0.95), 0.93 (0.93-0.93), 22.38 (12.47-40.14), 0.08 (0.05-0.11), 289.81 (169.08-496.76), and 0.9781, respectively. These results indicate that the INS exhibits better diagnostic value for DS."

According to the news editors, the research concluded: "However, further research is needed to identify other biomarkers to improve prenatal screening tests."

For more information on this research see: Two kinds of common prenatal screening tests for Down's syndrome: a systematic review and meta-analysis. *Scientific Reports*, 2016;6 ():18866. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from Y. Yao, Dept. of Laboratory Medicine, Southwest Hospital, Third Military Medical University of PLA, Chongqing 400038, People's Republic of China. Additional authors for this research include Y. Liao, M. Han, S.L. Li, J. Luo and B. Zhang.

Autoimmune Diseases and Conditions - Multiple

Researchers at Tianjin Medical University General Hospital Target Multiple Sclerosis (Expression Profile of Long Noncoding RNAs in Peripheral Blood Mononuclear Cells from Multiple Sclerosis Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Autoimmune Diseases and Conditions - Multiple Sclerosis is now available. According to news reporting originating in Tianjin, People's Republic of China, by NewsRx journalists, research stated, "Long noncoding RNAs (lncRNAs) play a key role in regulating immunological functions. Their impact on the chronic inflammatory disease multiple sclerosis (MS), however, remains unknown."

Financial supporters for this research include National Natural Science Foundation of China, Youth Top-notch Talent Support Program, National Key Clinical Specialty Construction Project of China.

The news reporters obtained a quote from the research from Tianjin Medical University General Hospital, "We investigated the expression of lncRNAs in peripheral blood mononuclear cells (PBMCs) of patients with MS and attempt to explain their possible role in the process of MS. For this study, we recruited 26 patients with MS according to the revised McDonald criteria. Then, we randomly chose 6 patients for microarray analysis. Microarray assays identified outstanding differences in lncRNA expression, which were verified through
real-time PCR. LncRNA functions were annotated for target genes using Gene Ontology (GO) and Kyoto Encyclopedia of Genes and Genomes (KEGG) analyses, and regulatory relationships between lncRNAs and target genes were analyzed using the 'cis' and 'trans' model. There were 2353 upregulated lncRNAs, 389 downregulated lncRNAs, 1037 upregulated mRNAs, and 279 downregulated mRNAs in patients with MS compared to healthy control subjects (fold change > 2.0). Real-time PCR results of six aberrant lncRNAs were consistent with the microarray data. The coexpression network comprised 864 lncRNAs and 628 mRNAs. Among differentially expressed lncRNAs, 10 lncRNAs were predicted to have 10 cis-regulated target genes, and 33 lncRNAs might regulate their trans target genes. We identified a subset of dysregulated lncRNAs and mRNAs. The differentially expressed lncRNAs may be important in the process of MS."

According to the news reporters, the research concluded: "However, the specific molecular mechanisms and biological functions of these lncRNAs in the pathogenesis of MS need further study."

Blood Diseases and Conditions - Sepsis

Researchers at Tianjin Medical University Report New Data on Sepsis (Clinical prognostic factors for time to positivity in cancer patients with bloodstream infections)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Blood Diseases and Conditions - Sepsis. According to news reporting originating in Tianjin, People's Republic of China, by NewsRx journalists, research stated, "Time to positivity (TTP) has been used in recent years as a simple and rapid method for the additional characterization of the degree of bacteremia. However,
prognostic factors for TTP in cancer patients with bloodstream infections have rarely been studied."

Funders for this research include National Natural Science Foundation of China, Chinese National High Tech (863) Program, Specialized Research Fund for Doctoral Program of Higher Education of China.

The news reporters obtained a quote from the research from Tianjin Medical University, "The aim of this study was to investigate the clinical factors for TTP involving various isolated organisms in cancer patients. We analyzed 386 episodes of bloodstream infections (BSIs) in patients with or without cancer during a 19 month period. Information on age, gender, tumor type, ICU stay, organisms, multidrug resistance (MDR), TTP and outcome was collected. Multivariate logistic regression analysis was performed. The mean TTP of Enterobacteriaceae in patients with hepatocellular carcinoma, gastroenterological cancer, and lung cancer was shorter than in non-cancer patients (9.86 +/- 3.22, 10.05 +/- 3.47, 8.85 +/- 2.78 vs 13.11 +/- 5.37 h). The mean TTP of nonfermentative bacilli in patients with lung cancer (12.37 +/- 5.96 h) and hematologic diseases (8.72 +/- 4.21 h) was also shorter than in non-cancer patients (20.74 +/- 2.46 h), and the mean TTP of Staphylococcus isolates was significantly different between non-cancer patients (22.06 +/- 3.71 h) and hematologic disease patients (11.93 +/- 5.44 h). The presence of a benign tumor was a significant prognostic factor for a long TTP only in the Staphylococci group (OR 0.076, 95 % CI 0.014-0.412), according to multivariate analysis. MDR (OR 2.178, 95 % CI 1.196-4.239) was an independent significant predictor in the Enterobacteriaceae group, with a short TTP, and it was also a significant clinical factor for a long TTP in nonfermentative bacilli and the Staphylococci group (OR 5.037, 95 % CI 1.065-23.82; OR 0.167, 95 % CI 0.059-0.474). Time to positivity provides useful diagnostic and prognostic information for the differentiation of frequently isolated organisms."

According to the news reporters, the research concluded: "This information may help clinicians to use the correct antibiotics in a timely manner to treat cancer patients with BSIs based on clinical factor analysis."

For more information on this research see: Clinical prognostic factors for time to positivity in cancer patients with bloodstream infections. Infection, 2016;44(5):583-588. Infection can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. (Springer - www.springer.com; Infection - www.springerlink.com/content/0300-8126/)

Researchers at Tianjin University Target Transport Vesicles (Blood Exosomes Endowed with Magnetic and Targeting Properties for Cancer Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transport Vesicles. According to news reporting from Tianjin, People's Republic of China, by NewsRx journalists, research stated, "Exosomes are a class of naturally occurring nanoparticles that are secreted endogenously by mammalian cells. Clinical applications for exosomes remain a challenge because of their unsuitable donors, low scalability, and insufficient targeting ability."

Funders for this research include Ministry of Science and Technology of the People's Republic of China, National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from Tianjin University, "In this study, we developed a dual-functional exosome-based superparamagnetic nanoparticle cluster as a targeted drug delivery vehicle for cancer therapy. The resulting exosome-based drug delivery vehicle exhibits superparamagnetic behavior at room temperature, with a stronger response to an external magnetic field than individual superparamagnetic nanoparticles. These properties enable exosomes to be separated from the blood and to target diseased cells. In vivo studies using murine hepatoma 22 subcutaneous cancer cells showed that drug-loaded exosome-based vehicle delivery enhanced cancer targeting under an external magnetic field and suppressed tumor growth."

According to the news reporters, the research concluded: "Our developments overcome major barriers to the utility of exosomes for cancer application."

Our news journalists report that additional information may be obtained by contacting H. Qi, Tianjin Key Laboratory of Composite and Functional Materials, School of Material Science and Engineering, Tianjin University, Tianjin 300072, People's Republic of China. Additional authors for this research include C. Liu, L. Long, Y. Ren, S. Zhang, X. Chang, X. Qian, H. Jia, J. Zhao, J. Sun, X. Hou, X. Yuan and C. Kang.

Researchers at Tokyo Medical and Dental University Report New Data on Autoimmune Diseases and Conditions [Intravital imaging of Ca(2+) signals in lymphocytes of Ca(2+) biosensor transgenic mice: indication of autoimmune diseases before the ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immune System Diseases and Conditions - Autoimmune Diseases and Conditions is the subject of a report. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Calcium ion (Ca(2+)) signaling is a typical phenomenon mediated through immune receptors, such as the B-cell antigen receptor (BCR), and it is important for their biological activities. To analyze the signaling of immune receptors together with their in vivo dynamics, we generated stable transgenic mice with the F? ster/fluorescence resonance energy transfer (FRET)-based Ca(2+) indicator yellow cameleon 3.60 (YC3.60), based on the Cre/loxP system (YC3.60(flox))."

The news correspondents obtained a quote from the research from Tokyo Medical and Dental University, "We successfully obtained mice with specific YC3.60 expression in immune or nerve cells as well as mice with ubiquitous expression of this indicator. We established five-dimensional (5D) (x, y, z, time, and Ca(2+)) intravital imaging of lymphoid tissues, including the bone marrow. Furthermore, in autoimmune-prone models, the CD22(-/-) and C57BL/6-lymphoproliferation (lpr)/lpr mouse, Ca(2+) fluxes were augmented, although they did not induce autoimmune disease."

According to the news reporters, the research concluded: "Intravital imaging of Ca(2+) signals in lymphocytes may improve assessment of the risk of autoimmune diseases in model animals."

For more information on this research see: Intravital imaging of Ca(2+) signals in lymphocytes of Ca(2+) biosensor transgenic mice: indication of autoimmune diseases before the pathological onset. Scientific Reports, 2016;6():18738. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting S. Yoshikawa, Dept. of Immune Regulation, Tokyo Medical and Dental University, Tokyo, 113-8519, Japan. Additional authors for this research include T. Usami, J. Kikuta, M. Ishii, T. Sasano, K. Sugiyama, T. Furukawa, E. Nakasho, H. Takayanagi, T.F. Tedder, H. Karasuyama, A. Miyawaki and T. Adachi.

Researchers at Tokyo Medical and Dental University Report New Data on HIV/AIDS (Fate of HIV-1 cDNA intermediates during reverse transcription is dictated by transcription initiation site of virus genomic RNA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immune System Diseases and Conditions - HIV/AIDS. According to news originating from Bunkyo ku, Japan, by NewsRx correspondents, research stated, "Retroviral reverse transcription is accomplished by sequential strand-transfers of partial cDNA intermediates copied from viral genomic RNA. Here, we revealed an unprecedented role of 5'-end guanosine (G) of HIV-1 genomic RNA for reverse transcription."

Our news journalists obtained a quote from the research from Tokyo Medical and Dental University, "Based on current consensus for HIV-1 transcription initiation site, HIV-1 transcripts possess a single G at 5'-ends (G1-form). However, we found that HIV-1 transcripts with additional Gs at 5'-ends (G2-and G3-forms) were abundantly expressed in infected cells by using alternative transcription initiation sites. The G2-and G3-forms were also detected in the virus particle, although the G1-form predominated. To address biological impact of the 5'-G number, we generated HIV clone DNA to express the G1-form exclusively by deleting the alternative initiation sites. Virus produced from the clone showed significantly higher strand-transfer of minus strong-stop cDNA (-sscDNA). The in vitro assay using synthetic HIV-1 RNAs revealed that the abortive forms of -sscDNA were abundantly generated from the G3-form RNA, but dramatically reduced from the G1-form. Moreover, the strand-transfer of -sscDNA from the G1-form was prominently stimulated by HIV-1 nucleocapsid."

According to the news editors, the research concluded: "Taken together, our results demonstrated that the 5'-G number that corresponds to HIV-1 transcription initiation site was critical for successful strand-transfer of -sscDNA during reverse transcription."

For more information on this research see: Fate of HIV-1 cDNA intermediates during reverse transcription is dictated by transcription initiation site of virus genomic RNA. *Scientific Reports*, 2015;5():17680. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from T. Masuda, Dept. of Immunotherapeutics, Graduate School of Medical and Dental Sciences, Tokyo Medical and Dental University, Yushima, Bunkyo-ku, Tokyo 113-8519, Japan. Researchers at Tufts Medical Center Have Reported New Data on Pericardial Effusion (Pericarditis and Pericardial Effusions in End-Stage Renal Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Pericardial Effusion are discussed in a new report. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Pericarditis and pericardial effusions are not uncommon in patients with end-stage renal disease (ESRD). Etiologies include those found in the general population along with two entities unique to patients with kidney disease, namely uremic and dialysis-associated pericarditis."

Our news editors obtained a quote from the research from Tufts Medical Center, "Uremic pericarditis has been arbitrarily defined as pericarditis that develops before or within 8 weeks of initiation of dialysis, while dialysis-associated pericarditis is used to define pericarditis in patients on dialysis for more than 8 weeks. Retention of uremic toxins is likely a major contributor to uremic and dialysis-associated pericarditis although their exact cause is not known. Indeed, whether they are actually distinct entities is uncertain. Symptoms and signs of pericarditis differ in patients with ESRD compared to the non-ESRD population. Management has not been well studied and ranges from initiation and intensification of dialysis to percutaneous or open drainage for large effusions."

According to the news editors, the research concluded: "This review covers the literature on this topic but emphasizes that most of the data are old and of relatively poor quality, and therefore additional research is needed."

The news editors report that additional information may be obtained by contacting M.J. Sarnak, Tufts Med Center, Div Nephrol, Boston, MA 02111, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/sdi.12517. This DOI is a link to an online electronic document that is either free or for purchase.

Researchers at Tufts University Have Reported New Data on Peptides and Proteins (Proteomic analysis of the gamma human papillomavirus type 197 E6 and E7 associated cellular proteins)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Peptides and Proteins are discussed in a new report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Gamma HPV197 was the most frequently identified HPV when human skin cancer specimens were analyzed by deep sequencing (Arroyo Muhr et al., Int. J. Cancer 136: 2546-55, 2015). To gain insight into the biological activities of HPV197, we investigated the cellular interactomes of HPV197 E6 and E7."

Our news journalists obtained a quote from the research from Tufts University, "HPV197 E6 protein interacts with a broad spectrum of cellular LXXLL domain proteins, including UBE3A and MAML1. HPV197 E6 also binds and inhibits the TP53 tumor suppressor and interacts with the CCR4-NOT ubiquitin ligase and deadenlyation complex. Despite lacking a canonical retinoblastoma (RB1) tumor suppressor binding site, HPV197 E7 binds RB1 and activates E2F transcription."

According to the news editors, the research concluded: "Hence, HPV197 E6 and E7 proteins interact with a similar set of cellular proteins as E6 and E7 proteins encoded by HPVs that have been linked to human carcinogenesis and/or have transforming activities in vitro."

For more information on this research see: Proteomic analysis of the gamma human papillomavirus type 197 E6 and E7 associated cellular proteins. Virology, 2017;500():71-81. Virology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Virology - www.journals.elsevier.com/virology/)

Cardiology

Researchers at Turgut Ozal University Report New Data on Cardiology (Potential beneficial effects of foot bathing on cardiac rhythm)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiology. According to news reporting
from Ankara, Turkey, by NewsRx journalists, research stated, "Foot bathing therapy is a simple technique that induces sensations of comfort and relaxation. The aim of this study was to examine the effect of foot bathing therapy on heart rate variability (HRV) parameters in a healthy population."

The news correspondents obtained a quote from the research from Turgut Ozal University, "Participants were twenty healthy female subjects (median age= 20.67 years, SD= 1.04). The recording ECG was applied for 5 minutes before and for 5 minutes after foot bathing therapy of 10 minutes. Subjects rested for 10 minutes without recording ECG in order to stabilize autonomic parameters. The digital signals were then transferred to a laptop and analyzed using LabChart ® software (MLS310/7 HRV Module). Almost all HRV parameters increased and heart (pulse) rate and LF/HF ratio decreased after foot bathing therapy compared with before foot bathing therapy."

According to the news reporters, the research concluded: "These results indicate for the first time in humans that foot bathing might induce a state of balance between sympathetic and parasympathetic systems and might be helpful to prevent possible cardiac arrhythmias."

For more information on this research see: Potential beneficial effects of foot bathing on cardiac rhythm. Clinical and Investigative Medicine, 2016;39(6):S48-S51. Clinical and Investigative Medicine can be contacted at: Canadian Soc Clinical Investigation, Csci Head Office, 774 Echo Drive, Ottawa, On K1S 5N8, Canada.

Our news journalists report that additional information may be obtained by contacting S. Dane, Turgut Ozal Univ, Sch Med, Dept. of Physiol, Ankara, Turkey. Additional authors for this research include S.S. Hartiningsih, M.G. Izgi, S. Bay, K. Unlu, M.O. Tatar, A.M. Alparslan, M. Ozeri and S. Dane.

Liver Diseases and Conditions - Hepatitis

Researchers at Turkiye Yuksek Ihtisas Hospital Have Reported New Data on Hepatitis (Long term efficacy of pegylated interferone in the treatment of delta hepatitis: a single center experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Liver Diseases and Conditions - Hepatitis is the subject of a report. According to news reporting originating in Ankara, Turkey, by NewsRx journalists, research stated, "Currently there is no satisfactory treatment of chronic HDV. We aimed to evaluate the long term efficacy of PEG-interferones."

The news reporters obtained a quote from the research from Turkiye Yuksek Ihtisas Hospital, "Patients who received PEG-interferone for chronic delta hepatitis during a 7-year period were retrospectively analysed. End of treatment response, virologic response at 6 months after treatment, and long term efficacy were evaluated. Predictors of treatment response were determined. The study group consisted of 31 patients. Twenty-three patients received either PEG-interferone alfa-2a (n= 8) or PEG-interferone alfa-2b (n= 15) for at least 48 weeks. Thirteen patients had an end of treatment virologic response (ITT: 56.5%, PP: 68.4%). HDV RNA negativity after 6 months off PEG-interferone treatment was achieved in 12 patients (ITT:
52.1%, PP: 63.1%). The patients were followed for a median duration of 36 months after PEG-interferone treatment (min-max: 12-120 months). Four patients (33.3%) relapsed during the follow-up. Sustained virologic response (ITT) was 34.8% in the long term. Undetectable HDV RNA level at week 24 of treatment and biochemical response were independent predictors of end of treatment response and sustained virologic response in the long term, respectively.

According to the news reporters, the research concluded: "PEG-interferones have an unsatisfactory efficacy on the treatment of HDV because of a considerable relapse in the long term."

Our news correspondents report that additional information may be obtained by contacting I.H. Kalkan, Turkiye Yuksel Ihtisas Hosp, Dept. of Gastroenterol, Ankara, Turkey. Additional authors for this research include A.S. Koksal, I.H. Kalkan, N. Suna, H. Yildiz and S. Kacar.

**Drugs and Therapies - Antibiotics**

**Researchers at United States Navy Report New Data on Antibiotics (Prevalence of Quinolone Resistance in Enterobacteriaceae from Sierra Leone and the Detection of qnrB Pseudogenes and Modified LexA Binding Sites)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news reporting originating from Washington, District of Columbia, by NewsRx correspondents, research stated, "A collection of 74 Enterobacteriaceae isolates found in Bo, Sierra Leone, were tested for quinolone antibiotic susceptibility and resistance mechanisms."

Funders for this research include DOD | Defense Threat Reduction Agency (DTRA), DOD | United States Navy | Office of Naval Research (ONR).

Our news editors obtained a quote from the research from United States Navy, "The majority of isolates (62%) were resistant to quinolones, and 61% harbored chromosomal gyrA and/or parC mutations. Plasmid-mediated quinolone resistance genes were ubiquitous, with qnrB and aac(6′)-Ib-cr being the most prevalent."

According to the news editors, the research concluded: "Mutated LexA binding sites were found in all qnrB1 genes, and truncated qnrB pseudogenes were found in the majority of Citrobacter isolates."

For more information on this research see: Prevalence of Quinolone Resistance in
Researchers at University College Detail Findings in Rheumatoid Arthritis (Rheumatoid Arthritis and Incidence of Twelve Initial Presentations of Cardiovascular Disease: A Population Record-Linkage Cohort Study in England)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Autoimmune Diseases and Conditions - Rheumatoid Arthritis. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "While rheumatoid arthritis is an established risk factor for cardiovascular disease (CVD), our knowledge of how the pattern of risk varies for different cardiovascular phenotypes is incomplete. The association between rheumatoid arthritis and the initial presentation of 12 types of CVDs were examined in a contemporary population of men and women of a wide age range."

The news reporters obtained a quote from the research from University College, "CALIBER data, which links primary care, hospital and mortality data in England, was analysed. A cohort of people aged (>=)18 years and without history of CVD was assembled and included all patients with prospectively recorded rheumatoid arthritis from January 1997, until March 2010, matched with up to ten people without rheumatoid arthritis by age, sex and general practice. The associations between rheumatoid arthritis and the initial presentation of 12 types of CVDs were estimated using multivariable random effects Poisson regression models. The analysis included 12,120 individuals with rheumatoid arthritis and 121,191 comparators. Of these, 2,525 patients with and 18,146 without rheumatoid arthritis developed CVDs during a median of 4.2 years of follow-up. Patients with rheumatoid arthritis had higher rates of myocardial infarction (adjusted incidence ratio [IRR]=1.43, 95%CI 1.21-1.70), unheralded coronary death (IRR=1.60, 95%CI 1.18-2.18), heart failure (IRR=1.61, 95%CI 1.43-1.83), cardiac arrest (HR=2.26, 95%CI 1.69-3.02) and peripheral arterial disease (HR=1.36, 95%CI..."
1.14-1.62); and lower rates of stable angina (HR=0.83, 95%CI 0.73-0.95). There was no evidence of association with cerebrovascular diseases, abdominal aortic aneurysm or unstable angina, or of interactions with sex or age."

According to the news reporters, the research concluded: "The observed associations with some but not all types of CVDs inform both clinical practice and the selection of cardiovascular endpoints for trials and for the development of prognostic models for patients with rheumatoid arthritis."

Our news correspondents report that additional information may be obtained by contacting M. Pujades-Rodriguez, Farr Institute of Health Informatics Research, University College London, 222 Euston Road, London NW1 2DA, UK. Additional authors for this research include B. Duyx, S.L. Thomas, D. Stogiannis, A. Rahman, L. Smeeth and H. Hemingway.

**Oncology - Cancer Research**

**Researchers at University College Report Findings in Cancer Research (PARP inhibitors in ovarian cancer: Clinical evidence for informed treatment decisions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Research have been published. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "Ovarian cancer is the fifth leading cause of female cancer deaths in the Western world. Significant progress has been made in the treatment of patients with ovarian cancer, however, the majority of patients experience disease recurrence and new therapies are being sought for such patients."

The news reporters obtained a quote from the research from University College, "Clinical investigation of poly(ADP-ribose) polymerase (PARP) inhibitors for ovarian cancer treatment has demonstrated promising activity in this disease. Here, we review the development of PARP inhibitors and their future role in the treatment of patients with ovarian cancer. Studies of olaparib, the first PARP inhibitor to be approved in Europe and the USA, in patients with recurrent ovarian cancer have demonstrated clinical efficacy with improvements in progression-free survival. In maintenance therapy of platinum-sensitive ovarian cancer there is supporting evidence of clinical benefit from exploratory endpoints that include time to first subsequent treatment and time to second subsequent treatment. Adverse events that should be monitored
following treatment with PARP inhibitors include nausea, vomiting, fatigue and anaemia."

According to the news reporters, the research concluded: "Based on the evidence presented, patients who will receive the greatest benefit from PARP inhibition are those with platinum-sensitive relapsed ovarian cancer and a BRCA mutation."

For more information on this research see: PARP inhibitors in ovarian cancer: Clinical evidence for informed treatment decisions. British Journal of Cancer, 2015;113 Suppl ():S10-6. (Nature Publishing Group - www.nature.com/; British Journal of Cancer - www.nature.com/bjc/)

Heart Disorders and Diseases - Endocarditis

Researchers at University Hospital Describe Findings in Endocarditis (Incidence and clinical impact of infective endocarditis after transcatheter aortic valve implantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Endocarditis are discussed in a new report. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "To describe the characteristics of infective endocarditis (IE) after transcatheter aortic valve implantation (TAVI). This study was performed using the GAMES database, a national prospective registry of consecutive patients with IE in 26 Spanish hospitals."

The news reporters obtained a quote from the research from University Hospital, "Of the 739 cases of IE diagnosed during the study, 1.3% were post-TAVI IE, and these 10 cases, contributed by five centres, represented 1.1% of the 952 TAVIs performed. Mean age was 80 years. All valves were implanted transfemorally. IE appeared a median of 139 days after implantation. The mean age-adjusted Charlson comorbidity index was 5.45. Chronic kidney disease was frequent (five patients), as were atrial fibrillation (five patients), chronic obstructive pulmonary disease (four patients), and ischaemic heart disease (four patients). Six patients presented aortic valve involvement, and four only mitral valve involvement; the latter group had a higher percentage of prosthetic mitral valves (0% vs. 50%). Vegetations were found in seven cases, and four presented embolism. One patient underwent surgery. Five patients died during follow-up: two of these patients died during the admission in which the valve was implanted. IE is a rare but severe complication after TAVI which affects about 1% of patients and entails a relatively high mortality rate."

According to the news reporters, the research concluded: "IE occurred during the first year in nine of the 10 patients."

Our news correspondents report that additional information may be obtained by contacting M. Martinez-Selles, Hospital General Universitario Gregorio Maranon, Madrid, Spain. Additional authors for this research include E. Bouza, P. Diez-Villanueva, M. Valerio, M.C. Farinas, A.J. Munoz-Garcia, J. Ruiz-Morales, J. Galvez-Acebal, I. Antorrena, J.M. de la Hera Galarza, E. **Kidney Diseases and Conditions - Chronic Kidney Disease**

**Researchers at University Hospital Discuss Findings in Chronic Kidney Disease [Baseline Characteristics and Prescription Patterns of Standard Drugs in Patients with Angiographically Determined Coronary Artery Disease and Renal Failure (CAD-REF ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Kidney Diseases and Conditions - Chronic Kidney Disease have been published. According to news reporting from Muenster, Germany, by NewsRx journalists, research stated, "Chronic kidney disease (CKD) is strongly associated with coronary artery disease (CAD). We established a prospective observational nationwide multicenter registry to evaluate current treatment and outcomes in patients with both CKD and angiographically documented CAD."

The news correspondents obtained a quote from the research from University Hospital, "In 32 cardiological centers 3,352 CAD patients with (>=)50% stenosis in at least one coronary artery were enrolled and classified according to their estimated glomerular filtration rate and proteinuria into one of five stages of CKD or as a control group. 2,723 (81.2%) consecutively enrolled patients suffered from CKD. Compared to controls, CKD patients had a higher prevalence of diabetes, hypertension, peripheral artery diseases, heart failure, and valvular heart disease (each p<0.001). Myocardial infarctions (p=0.02), coronary bypass grafting, valve replacements and pacemaker implantations had been recorded more frequently (each p<0.001). With advanced CKD, the number of diseased coronary vessels and the proportion of patients with reduced left ventricular ejection fraction (LVEF) increased significantly (both p<0.001). Percutaneous coronary interventions were performed less frequently (p <0.001) while coronary bypass grafting was recommended more often (p=0.04) with advanced CKD. With regard to standard drugs in CAD treatment, prescriptions were higher in our registry than in previous reports, but beta-blockers (p=0.008), and angiotensin-converting-enzyme inhibitors and/or angiotensin-receptor blockers (p <0.001) were given less often in higher CKD stages. In contrast, in the subgroup of patients with moderately to severely
reduced LVEF the prescription rates did not differ between CKD stages. In-hospital mortality increased stepwise with each CKD stage ($p=0.02$). In line with other studies comprising CKD cohorts, patients' morbidity and in-hospital mortality increased with the degree of renal impairment.

According to the news reporters, the research concluded: "Although cardiologists' drug prescription rates in CAD-REF were higher than in previous studies, they were still lower especially in advanced CKD stages compared to cohorts treated by nephrologists."

For more information on this research see: Baseline Characteristics and Prescription Patterns of Standard Drugs in Patients with Angiographically Determined Coronary Artery Disease and Renal Failure (CAD-REF Registry). *Plos One*, 2016;11(2):e0148057. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news journalists report that additional information may be obtained by contacting H. Reinecke, Division of Vascular Medicine, Dept. of Cardiovascular Medicine, University Hospital Muenster, Muenster, Germany. Additional authors for this research include G. Breithardt, C. Engelbertz, R.E. Schmieder, M. Fobker, H.O. Pinnschmidt, B. Schmitz, P. Bruland, K. Wegscheider, H. Pavenstadt and E. Brand.

**Mammary Gland Biology and Neoplasia**

**Researchers at University Hospital Have Reported New Data on Mammary Gland Biology and Neoplasia (Epithelial Plasticity During Human Breast Morphogenesis and Cancer Progression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mammary Gland Biology and Neoplasia is now available. According to news reporting from Reykjavik, Iceland, by NewsRx journalists, research stated, "Understanding the complex events leading to formation of an epithelial-based organ such as the breast requires a detailed insight into the crosstalk between epithelial and stromal compartments. These interactions occur both through heterotypic cellular interactions and between cells and matrix components."

Financial support for this research came from Icelandic Centre for Research.

The news correspondents obtained a quote from the research from University Hospital, "While in vivo models may partially capture these complex interactions, there is a need for in vitro models to study these events. In this review we discuss cell-cell interactions in breast development focusing on the stem cell niche and branching morphogenesis. Given the recent understanding that the basic developmental events underlying branching morphogenesis are closely related to pathways important to cancer progression, i.e. epithelial plasticity and
epithelial to mesenchymal transition (EMT), we will also discuss aspects relevant to cancer progression. In cancer, the adoption of mesenchymal phenotype by the malignant cells allows stromal invasion and subsequent intravasation to blood- or lymphatic vessels, a route that is a prerequisite for metastasis. A number of publications have demonstrated that tumor initiating cells, sometimes referred to as cancer stem cells adopt an EMT phenotype that renders them more resistant to apoptosis and drug therapy. The mechanism behind this phenomenon is currently unknown but this may partially explain relapse in breast cancer patients.

According to the news reporters, the research concluded: "Increased understanding of branching morphogenesis in the breast gland and the regulation of EMT and its reverse process mesenchymal to epithelial transition (MET) may hold the keys for future development of methods/drugs that neutralize the invading properties of cancer cells."

Our news journalists report that additional information may be obtained by contacting T. Gudjonsson, University Hospital, Dept. of Lab Hematol, Landspitali, Reykjavik, Iceland. Additional authors for this research include E. Briem, J.T. Bergthorsson and T. Gudjonsson.

**Heart Disorders and Diseases - Heart Disease**

**Researchers at University Hospital Release New Data on Heart Disease (Assessing the cardiology community position on transradial intervention and the use of bivalirudin in patients with acute coronary syndrome undergoing invasive management: ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Disease are presented in a new report. According to news reporting from Bern, Switzerland, by NewsRx journalists, research stated, "Our aim was to report on a survey initiated by the European Association of Percutaneous Cardiovascular Interventions (EAPCI) collecting the opinion of the cardiology community on the invasive management of acute coronary syndrome (ACS), before and after the MATRIX trial presentation at the American College of Cardiology (ACC) 2015 Scientific Sessions. A web-based survey was distributed to all individuals registered on the EuroIntervention mailing list (n=15,200)."

The news correspondents obtained a quote from the research from University Hospital, "A total of 572 and 763 physicians responded to the pre- and post-ACC survey,
respectively. The radial approach emerged as the preferable access site for ACS patients undergoing invasive management with roughly every other responder interpreting the evidence for mortality benefit as definitive and calling for a guidelines upgrade to class I. The most frequently preferred anticoagulant in ACS patients remains unfractionated heparin (UFH), due to higher costs and greater perceived thrombotic risks associated with bivalirudin. However, more than a quarter of participants declared the use of bivalirudin would increase after MATRIX. The MATRIX trial reinforced the evidence for a causal association between bleeding and mortality and triggered consensus on the superiority of the radial versus femoral approach.

According to the news reporters, the research concluded: "The belief that bivalirudin mitigates bleeding risk is common, but UFH still remains the preferred anticoagulant based on lower costs and thrombotic risks."

Our news journalists report that additional information may be obtained by contacting M. Valgimigli, University Hospital Bern, Dept. of Cardiol, Bern, Switzerland. Additional authors for this research include R.A. Byrne, A. Baumbach, M. Haude, S. Windecker and M. Valgimigli.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4244/EIJY15M12_01. This DOI is a link to an online electronic document that is either free or for purchase.

**Parkinson's Disease**

**Researchers at University Hospital Release New Data on Parkinson's Disease (DAT imaging and clinical biomarkers in relatives at genetic risk for LRRK2 R1441G Parkinson's disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Parkinson's disease is now available. According to news reporting from San Sebastian, Spain, by NewsRx journalists, research stated, "The objective of this study was to study motor and nonmotor symptoms and striatal dopaminergic denervation, as well as the relationship between them, in a cohort of asymptomatic relatives of patients with Parkinson's disease (PD) with the R1441G-leucine-rich repeat kinase 2 mutation. Asymptomatic relatives of patients with PD and this mutation were tested for the presence of the mutation and evaluated for striatal, putamenal, and caudate dopaminergic transporters using (123)I-2b-carbomethoxy-3b-(4-iodophenyl)-N-(3-fluoropropyl)-nortropane single-photon emission computed tomography binding ratios."

The news correspondents obtained a quote from the research from University Hospital, "Clinical and neuropsychological evaluations including timed motor tests, a smell
identification test, and global cognition, attention, executive, visuospatial, and memory functions as well as depression, constipation, and rapid eye movement sleep behavior disorder were also assessed. Twenty-seven carriers and 19 noncarriers were studied. Compared with noncarriers, mutation carriers had significantly lower (123)I-2b-carbomethoxy-3b-(4-iodophenyl)-N-(3-fluoropropyl)-nortropan mean striatal \( p=0.03 \), mean putamenal \( p=0.01 \), and lowest putamenal \( p=0.01 \) binding ratios. Multiple linear regression analysis showed that the carrier status and the execution of timed tests significantly predicted striatal (123)I-2b-carbomethoxy-3b-(4-iodophenyl)-N-(3-fluoropropyl)-nortropane binding. The proportion of variation accounted for by the regression model of these variables was 69\% for the putamen and 53\% for the caudate nucleus. Asymptomatic carriers of the R1441G-leucine-rich repeat kinase 2 mutation have evidence of dopaminergic nigrostriatal denervation, mainly in the putamen, which is associated with a decline in the execution of complex motor tests."

According to the news reporters, the research concluded: "These tests could be early indicators of the ongoing dopaminergic deficit in this group at risk of PD."

Our news journalists report that additional information may be obtained by contacting A. Bergareche, Neurology Service, Hospital Universitario Donostia, San Sebastian, Spain. Additional authors for this research include M.C. Rodriguez-Oroz, A. Estanga, A. Gorostidi, A. Lopez de Munain, T. Castillo-Trivino, J. Ruiz-Martinez, E. Mondragon, C. Gaig, F. Lomena, C. Sarasqueta, E. Tolosa and J.F Marti-Masso.

Cardiovascular Diseases and Conditions - Venous...

Researchers at University Hospital Release New Data on Venous Thromboembolism (Thrombin Generation Assay in Hospitalized Nonsurgical Patients: A New Tool to Assess Venous Thromboembolism Risk?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Venous Thromboembolism is now available. According to news reporting originating in Nantes, France, by NewsRx journalists, research stated, "Assessment of venous thromboembolism (VTE) risk is important to determine optimal primary prophylaxis in hospitalized patients. The Padua score helps to recognize patients with high VTE risk, but quantifying a VTE risk is often challenging in medical patients."
The news reporters obtained a quote from the research from University Hospital, "Thrombin generation assay (TGA) reflects the pro-/anticoagulant balance and thus could help to better quantify VTE risk in medical hospitalized patients. To analyze the relation between TGA and VTE risk according to Padua score in medical hospitalized patients. Between May and October 2013, 105 patients were included in an unselected cohort group of patients admitted to an internal medicine department in a large, university hospital. Within the 36 hours after admission and before any anticoagulant therapy, Padua score was calculated and sample for TGA was collected for each patient. Thrombin generation assay (velocity, peak, and endogenous thrombin potential [ETP]) was performed with 1 and 5 picomol/l (pM) tissue factor (TF) reagent. In patients with high Padua score (n = 29), velocity, peak, and ETP differed from patients with low Padua score. This difference was present at 1 and 5 pM TF, in ETP (P < .0001 and P = .003 respectively), in peak (P < .0001 in both conditions), and in velocity (P < .0001). According to multivariate analysis, myeloid disorders, older age, higher body mass index, myocardial infarction, C-reactive protein >5 mg/L, reduced mobility with bed rest significantly increased velocity 1 pM TF value."

According to the news reporters, the research concluded: "Single thrombin generation measurement could help to identify patients at risk of VTE in medical hospitalized patients."

Our news correspondents report that additional information may be obtained by contacting O. Espitia, Univ Hosp Nantes, Dept. of Internal Med, Nantes, France. Additional authors for this research include M. Fouassier, J.B. Hardouin, M.A. Pistorius, C. Agard, B. Planchon, M. Trossaert and P. Pottier.

stated, "Prostate Cancer (PCa) is an important age-related disease being the most common cancer malignancy and the second leading cause of cancer mortality in men in Western countries. Initially, PCa progression is androgen receptor (AR)-and androgen-dependent."

Our news journalists obtained a quote from the research from University Hospital, "Eventually advanced PCa reaches the stage of Castration-Resistant Prostate Cancer (CRPC), but remains dependent on AR, which indicates the importance of AR activity also for CRPC. Here, we discuss various pathways that influence the AR activity in CRPC, which indicates an adaptation of the AR signaling in PCa to overcome the treatment of PCa. The adaptation pathways include interferences of the normal regulation of the AR protein level, the expression of AR variants, the crosstalk of the AR with cytokine tyrosine kinases, the Src-Akt-, the MAPK-signaling pathways and AR corepressors. Furthermore, we summarize the current treatment options with regard to the underlying molecular basis of the common adaptation processes of AR signaling that may arise after the treatment with AR antagonists, androgen deprivation therapy (ADT) as well as for CRPC, and point towards novel therapeutic strategies."

According to the news editors, the research concluded: "The understanding of individualized adaptation processes in PCa will lead to individualized treatment options in the future."

For more information on this research see: Adaptive responses of androgen receptor signaling in castration-resistant prostate cancer. Oncotarget, 2015;6(34):35542-55.

**Neuroscience - Neurochemistry**

**Researchers at University Hospital Report New Data on Neurochemistry (The mitochondrial kinase PINK1: functions beyond mitophagy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neuroscience - Neurochemistry. According to news originating from Aachen, Germany, by NewsRx correspondents, research stated, "Mutations in the genes encoding the mitochondrial kinase PINK1 and the E3 ubiquitin ligase Parkin cause autosomal recessive Parkinson's disease (PD). Pioneering work in Drosophila melanogaster revealed that the loss of PINK1 or Parkin function causes similar phenotypes including dysfunctional mitochondria."

Financial supporters for this research include Deutsche Forschungsgemeinschaft, Michael J. Fox Foundation for Parkinson's Research, Deutsches Zentrum fur Neurodegenerative Erkrankungen, Munich Cluster for Systems Neurology, Bundesministerium fur Bildung und
Forschung.

Our news journalists obtained a quote from the research from University Hospital, "Further research showed that PINK1 can act upstream of Parkin in a mitochondrial quality control pathway to induce removal of damaged mitochondria in a process called mitophagy. Albeit the PINK1/Parkin-induced mitophagy pathway is well established and has recently been elucidated in great detail, its pathophysiological relevance is being debated. Mounting evidence indicates that PINK1 has additional functions, for example, in regulating complex I activity and maintaining neuronal viability in response to stress."

According to the news editors, the research concluded: "Here, we discuss mitophagy-dependent and -independent functions of PINK1 and their possible role in PD pathogenesis."

The news correspondents report that additional information may be obtained from A. Voigt, Rhein Westfal TH Aachen, University Hospital, Dept. of Neurol, Aachen, Germany. Additional authors for this research include L.A. Berlemann and K.F. Winklhofer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jnc.13655. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Diseases and Conditions - Aneurysm**

**Researchers at University Hospital Target Aneurysm (Management of true visceral artery aneurysms in 31 cases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Aneurysm are discussed in a new report. According to news reporting originating from Erlangen, Germany, by NewsRx correspondents, research stated, "True visceral artery aneurysms (VAA) should be treated under elective conditions in dependency on maximum diameter. In this respect, the traditional accepted threshold is 2 cm, whereas VAA sizing less than 2 cm should conservatively be observed without invasive treatment."

Our news editors obtained a quote from the research from University Hospital, "The aim of this study was to review differences in the treatment outcome over three decades. This was a retrospective review of all treated VAAs at one institution from 1985 to 2015. Patients demographics, aneurysm characteristics, management and outcome were recorded with special regard to differences in the course of time. Thirty-one true VAA in 29 patients (74% female) were repaired (5 ruptured, 26 intact). Mean diameter was 30.27 +/- 11 mm for intact and 38.0 +/- 8.5 mm for ruptured VAA (rVAA) (P = NS). Most patients were asymptomatic (67.8% asymptomatic, 16.1% symptomatic without rupture and 16.1% with rupture). There was a vice-
versa situation in chosen treatment techniques between the first (1985-2000) and the second (2001-2015) time period [first period: 75% open repair (OR) and 25% endovascular repair (ER); second period: 27% OR and 73% ER; P = 0.009]. OR included aneurysm ligation and resection with (end-to-end-anastomosis, graft interposition or without blood flow reconstruction), while ER was exclusively coil embolization with sacrifice of all parent afferent and efferent arteries. Immediate technical success was 81% for all procedures. There was a trend toward higher technical success rate of VAA being treated in second time period, but we found no significant differences (69% in the first, 93% in the second; P = 0.101). Conversion to OR due to technical failures was necessary after 3 endovascular repairs (20%). The overall 30-day-mortality rate decreases in the course of time (25% in the first and 0% in the second period; P = 0.038). Furthermore, there was a lower 30-day mortality rate after ER of all VAA (elective and urgent repair) (20% after OR, 0% after ER; P = 0.038). There was no decrease in 30-day mortality rate of rVAA (100% in the first and 20% in the second period; P = NS). In the fact of medical progress and a growing number of endovascular procedures, this study presents a decrease in mortality rate after elective aneurysm repair over three decades."

According to the news editors, the research concluded: "This might become an argument to reduce the 2-cm threshold in highly selected individuals."

The news editors report that additional information may be obtained by contacting S. Regus, University Hospital, Dept. of Vasc Surg, D-91054 Erlangen, Germany.

Drugs and Therapies - Antiretrovirals

Researchers at University Hospital Target Antiretrovirals (Treatment of autochthonous acute hepatitis E with short-term ribavirin: a multicenter retrospective study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antiretrovirals. According to news originating from Toulouse, France, by NewsRx correspondents, research stated, "Hepatitis E virus (HEV) genotypes 3 and 4 cause sporadic cases of infection in developed countries. Being elderly and having an underlying liver disease are the main risk factors for death in this population."

Our news journalists obtained a quote from the research from University Hospital, "Chronic infection has been described in immunocompromised patients. Ribavirin is now the antiviral treatment of choice in solid-organ-transplant recipients with chronic HEV infection."
We hypothesized that early short-term treatment of acute HEV infection may be useful for patients with risk factors or undergoing chemotherapy. Between July 2010 and January 2014, 21 patients diagnosed with acute HEV infection were treated with ribavirin, at 600-800 mg/day for up to 3 months. All serum samples were positive for HEV RNA. Nine patients were treated for severe hepatitis. Six patients were aged >70 years. Four patients were receiving an immunosuppressive therapy for an autoimmune disease and two patients were undergoing chemotherapy for a malignancy. Two patients received a fixed-dose regimen. For all other patients, ribavirin was stopped when HEV became undetectable in the serum. The median duration of ribavirin treatment was 26 days. Two patients developed severe anaemia. Two patients with encephalopathy died. One patient relapsed transiently. All patients were cleared of HEV and regained normalized liver-enzyme levels. Immunosuppressive treatment and chemotherapy could be resumed. Treatment of acute HEV infection using ribavirin seems safe and effective.

According to the news editors, the research concluded: "Short-term treatment tailored to viraemia may be the best regimen for this indication."

The news correspondents report that additional information may be obtained from J.M. Peron, Service d'Hepato-gastroenterologie, Hopital Purpan, Centre Hospitalier Universitaire de Toulouse, Universite Paul Sabatier Toulouse III, Toulouse, France. Additional authors for this research include F. Abravanel, M. Guillaume, R. Gerolami, J. Nana, R. Anty, A. Pariente, C. Renou, C. Bureau, M.A. Robic, L. Alric, J.P. Vinel, J. Izopet and N. Kamar.

**Transfusion Medicine - Blood Transfusion**

**Researchers at University Hospital Target Blood Transfusion (Coagulation management in trauma-associated coagulopathy: allogenic blood products versus coagulation factor concentrates in trauma care)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transfusion Medicine - Blood Transfusion. According to news reporting originating in Frankfurt, Germany, by NewsRx
journalists, research stated, "Coagulation management by transfusion of allogenic blood products and coagulation factors are competing concepts in current trauma care. Rapid and adequate therapy of trauma-associated coagulopathy is crucial to survival of severely injured patients."

The news reporters obtained a quote from the research from University Hospital, "Standard coagulation tests such as prothrombin time and activated partial thromboplastin time are commonly used, but these tests are inappropriate for monitoring and guiding therapy in trauma patients. Coagulation factor-based treatment showed promising results, but randomized trials have not yet been performed. In addition, viscoelastic tests are needed to guide therapy, although there is in fact limited evidence for these in tests in trauma care. Regarding transfusion therapy with allogenic blood products, plasma transfusion has been associated with improved survival in trauma patients following massive transfusion. In contrast, patients not requiring massive transfusion seem to be at risk for suffering complications with increasing volumes of plasma transfused. The collective of trauma patients is heterogeneous. Despite the lack of evidence, there are strong arguments for individualized patient treatment with coagulation factors for some indications and to abstain from the use of fresh frozen plasma."

According to the news reporters, the research concluded: "In patients with severe trauma and major bleeding, plasma, platelets, and red blood cells should be considered to be administered at a ratio of 1:1:1."

Our news correspondents report that additional information may be obtained by contacting M. Klages, Dept. of Anesthesiology, Intensive Care Medicine and Pain Therapy, University Hospital Frankfurt, Frankfurt, Main, Germany. Additional authors for this research include K. Zacharowski and C.F Weber.

Eye Diseases and Conditions - Retinitis Pigmentosa

Researchers at University Hospital Target Retinitis Pigmentosa (Panel-based NGS Reveals Novel Pathogenic Mutations in Autosomal Recessive Retinitis Pigmentosa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Eye Diseases and Conditions - Retinitis Pigmentosa is the subject of a report. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "Retinitis pigmentosa (RP) is a group of inherited progressive retinal dystrophies (RD) characterized by photoreceptor degeneration. RP is highly heterogeneous both clinically and genetically, which complicates the identification of causative genes and
mutations."

The news reporters obtained a quote from the research from University Hospital, "Targeted next-generation sequencing (NGS) has been demonstrated to be an effective strategy for the detection of mutations in RP. In our study, an in-house gene panel comprising 75 known RP genes was used to analyze a cohort of 47 unrelated Spanish families pre-classified as autosomal recessive or isolated RP. Disease-causing mutations were found in 27 out of 47 cases achieving a mutation detection rate of 57.4%. In total, 33 pathogenic mutations were identified, 20 of which were novel mutations (60.6%). Furthermore, not only single nucleotide variations but also copy-number variations, including three large deletions in the USH2A and EYS genes, were identified. Finally seven out of 27 families, displaying mutations in the ABCA4, RP1, RP2 and USH2A genes, could be genetically or clinically reclassified."

According to the news reporters, the research concluded: "These results demonstrate the potential of our panel-based NGS strategy in RP diagnosis."

For more information on this research see: Panel-based NGS Reveals Novel Pathogenic Mutations in Autosomal Recessive Retinitis Pigmentosa. Scientific Reports, 2016;6 ():19531. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Brasil, "This study describes the development and validation of two real-time reverse-transcription polymerase chain reactions (RT-qPCR) for the specific detection of Mass and BR genotypes in allantoic fluids and clinical samples. Genotype-specific primers, combined with a generic probe targeted to the S1 gene, originated Mass RT-qPCR and BR RT-qPCR-specific assays. Analytical sensitivity and linearity of these assays were determined in comparison with an IBV generic real-time RT-PCR based on the 5' untranslated region (5'UTR RT-qPCR). Mass RT-qPCR detected five Mass field isolates, three vaccine samples, and one coinfected sample (BR and Mass) while BR RT-qPCR detected 16 BR field isolates. Both assays were linear (R(2) >0.98), reproducible, and as sensitive as the classical 5'UTR RT-qPCR used to detect IBV. In the analysis of 141 IBV clinical samples, 8 were positive for Mass RT-qPCR, 76 for BR RT-qPCR, and 2 for both assays. In the remaining 55 samples, 25 were positive only for 5'UTR RT-qPCR and 30 were negative for the three assays."

According to the news editors, the research concluded: "Both assays were able to detect Mass and BR genotypes, allowing rapid and easy IBV molecular typing from allantoic fluids and clinical samples."

For more information on this research see: A Real-Time Reverse-Transcription Polymerase Chain Reaction for Differentiation of Massachusetts Vaccine and Brazilian Field Genotypes of Avian Infectious Bronchitis Virus. Avian Diseases, 2016;60(1):16-21.

Researchers at University Medical Center Report New Data on Heart Failure (Epidemiology of heart failure: the prevalence of heart failure and ventricular dysfunction in older adults over time. A systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news originating from Utrecht, Netherlands, by NewsRx correspondents, research stated, "The 'epidemic' of heart failure seems to be changing, but precise prevalence estimates of heart failure and left ventricular dysfunction (LVD) in older adults, based on adequate echocardiographic assessment, are scarce. Systematic reviews including recent studies on the prevalence of heart failure and LVD are lacking."
Financial support for this research came from Hartstichting.

Our news journalists obtained a quote from the research from University Medical Center, "We aimed to assess the trends in the prevalence of LVD, and heart failure with reduced (HFrEF) and preserved ejection fraction (HFpEF) in the older population at large. A systematic electronic search of the databases Medline and Embase was performed. Studies that reported prevalence estimates in community-dwelling people (>=60 years old were included if echocardiography was used to establish the diagnosis. In total, 28 articles from 25 different study populations were included. The median prevalence of systolic and 'isolated' diastolic LVD was 5.5% (range 3.3-9.2%) and 36.0% (range 15.8-52.8%), respectively. A peak in systolic dysfunction prevalence seems to have occurred between 1995 and 2000. 'All type' heart failure had a median prevalence rate of 11.8% (range 4.7-13.3%), with fairly stable rates in the last decade and with HFpEF being more common than HFrEF [median prevalence 4.9% (range 3.8-7.4%) and 3.3% (range 2.4-5.8%), respectively]. Both LVD and heart failure remain common in the older population at large. The prevalence of diastolic dysfunction is on the rise and currently higher than that of systolic dysfunction."

According to the news editors, the research concluded: "The prevalence of the latter seems to have decreased in the 21st century."

The news correspondents report that additional information may be obtained from E.E. van Riet, Julius Centre for Health Sciences and Primary care, University Medical Centre Utrecht, PO Box 85500, 3508 AB Utrecht, Netherlands. Additional authors for this research include A.W. Hoes, K.P. Wagenaar, A. Limburg, M.A. Landman and F.H Rutten.

Oncology - Neuroectodermal Tumors

Researchers at University Medical Center Report New Data on Neuroectodermal Tumors (Pediatric Primitive Neuroectodermal Tumors of the Central Nervous System Differentially Express Granzyme Inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Neuroectodermal Tumors is the subject of a report. According to news reporting originating in Utrecht, Netherlands, by NewsRx journalists, research stated, "Central nervous system (CNS) primitive neuroectodermal tumors (PNETs) are malignant primary brain tumors that occur in young infants. Using current standard therapy, up to 80% of the children still dies from recurrent disease."
The news reporters obtained a quote from the research from University Medical Center, "Cellular immunotherapy might be key to improve overall survival. To achieve efficient killing of tumor cells, however, immunotherapy has to overcome cancer-associated strategies to evade the cytotoxic immune response. Whether CNS-PNETs can evade the immune response remains unknown. We examined by immunohistochemistry the immune response and immune evasion strategies in pediatric CNS-PNETs. Here, we show that CD4+, CD8+, gd-T-cells, and Tregs can infiltrate pediatric CNS-PNETs, although the activation status of cytotoxic cells is variable. Pediatric CNS-PNETs evade immune recognition by downregulating cell surface MHC-I and CD1d expression. Intriguingly, expression of SERPINB9, SERPINB1, and SERPINB4 is acquired during tumorigenesis in 29%, 29%, and 57% of the tumors, respectively."

According to the news reporters, the research concluded: "We show for the first time that brain tumors express direct granzyme inhibitors (serpins) as a potential mechanism to overcome cellular cytotoxicity, which may have consequences for cellular immunotherapy."

For more information on this research see: Pediatric Primitive Neuroectodermal Tumors of the Central Nervous System Differentially Express Granzyme Inhibitors. Plos One, 2016;11(3):e0151465. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news correspondents report that additional information may be obtained by contacting J.F. Vermeulen, Dept. of Pathology, University Medical Center Utrecht, 3584CX, Utrecht, Netherlands. Additional authors for this research include W. van Hecke, W.G. Spliet, J. Villacorta Hidalgo, P. Fisch, R. Broekhuizen and N. Bovenschen.

assay. The IC[50] was calculated using a dose-response analysis. Immunohistochemistry (IHC) was performed on ascites cells and tumor. Expression of R-spondin 2 (RSPO2), RSPO3, PORCN, WLS, AXIN2, and three previously characterized RSPO fusion transcripts were assessed using Taqman assays. Sixty ascites samples were analyzed for response to WNT974. The ascites samples that showed a decrease in ATP concentration after treatment demonstrated no difference from the untreated cells in percent viability with trypan blue staining. Flow cytometry demonstrated fewer cells in the G2 phase and more in the G1 and S phases after treatment with WNT974. Combination therapy with WNT974 and carboplatin resulted in a higher percentage of samples that showed (>=)30% reduction in ATP concentration than either single drug treatment. IHC analysis of Wnt pathway proteins suggests cell cycle arrest rather than cytotoxicity after WNT974 treatment. QPCR indicated that RSPO fusions are not prevalent in ovarian cancer tissues or ascites. However, higher PORCN expression correlated to sensitivity to WNT974 (p=0.0073)."

According to the news editors, the research concluded: "WNT974 produces cytostatic effects in patient ascites cells with primary ovarian cancer through inhibition of the Wnt/b-catenin pathway. The combination of WNT974 and carboplatin induces cytotoxicity plus cell cycle arrest in a higher percentage of ascites samples than with single drug treatment. RSPO fusions do not contribute to WNT974 sensitivity; however, higher PORCN expression indicates increased WNT974 sensitivity."

For more information on this research see: Targeting the Wnt/b-catenin pathway in primary ovarian cancer with the porcupine inhibitor WNT974. Laboratory Investigation, 2015;96(2):249-59. (Nature Publishing Group - www.nature.com/; Laboratory Investigation - www.nature.com/labinvest/)

Friedreich's Ataxia

Researchers at University of Alabama Release New Data on Friedreich's Ataxia (Alleviating GAA Repeat Induced Transcriptional Silencing of the Friedreich's Ataxia Gene During Somatic Cell Reprogramming)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Friedreich's ataxia. According to news originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "Friedreich's ataxia (FRDA) is the most common autosomal recessive ataxia. This severe
neurodegenerative disease is caused by an expansion of guanine-adenine-adenine (GAA) repeats located in the first intron of the frataxin (FXN) gene, which represses its transcription."

Our news journalists obtained a quote from the research from the University of Alabama, "Although transcriptional silencing is associated with heterochromatin-like changes in the vicinity of the expanded GAAAs, the exact mechanism and pathways involved in transcriptional inhibition are largely unknown. As major remodeling of the epigenome is associated with somatic cell reprogramming, modulating chromatin modification pathways during the cellular transition from a somatic to a pluripotent state is likely to generate permanent changes to the epigenetic landscape. We hypothesize that the epigenetic modifications in the vicinity of the GAA repeats can be reversed by pharmacological modulation during somatic cell reprogramming. We reprogrammed FRDA fibroblasts into induced pluripotent stem cells (iPSCs) in the presence of various small molecules that target DNA methylation and histone acetylation and methylation. Treatment of FRDA iPSCs with two compounds, sodium butyrate (NaB) and Parnate, led to an increase in FXN expression and correction of repressive marks at the FXN locus, which persisted for several passages. However, prolonged culture of the epigenetically modified FRDA iPSCs led to progressive expansions of the GAA repeats and a corresponding decrease in FXN expression. Furthermore, we uncovered that differentiation of these iPSCs into neurons also results in resilingencing of the FXN gene."

According to the news editors, the research concluded: "Taken together, these results demonstrate that transcriptional repression caused by long GAA repeat tracts can be partially or transiently reversed by altering particular epigenetic modifications, thus revealing possibilities for detailed analyses of silencing mechanism and development of new therapeutic approaches for FRDA."

For more information on this research see: Alleviating GAA Repeat Induced Transcriptional Silencing of the Friedreich's Ataxia Gene During Somatic Cell Reprogramming. Stem Cells and Development, 2016;25(23):1788-1800. Stem Cells and Development can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Researchers at University of Alabama Release New Data on Gliomas
(Identification of Small Molecule Inhibitors of Human Cytochrome c Oxidase That Target Chemoresistant Glioma Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gliomas. According to news reporting originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "The enzyme cytochrome c oxidase (CcO) or complex IV (EC 1.9.3.1) is a large transmembrane protein complex that serves as the last enzyme in the respiratory electron transport chain of eukaryotic mitochondria. CcO promotes the switch from glycolytic to oxidative phosphorylation (OXPHOS) metabolism and has been associated with increased self-renewal characteristics in gliomas."

Our news editors obtained a quote from the research from the University of Alabama, "Increased CcO activity in tumors has been associated with tumor progression after chemotherapy failure, and patients with primary glioblastoma multiforme and high tumor CcO activity have worse clinical outcomes than those with low tumor CcO activity. Therefore, CcO is an attractive target for cancer therapy. We report here the characterization of a CcO inhibitor (ADDA 5) that was identified using a high throughput screening paradigm. ADDA 5 demonstrated specificity for CcO, with no inhibition of other mitochondrial complexes or other relevant enzymes, and biochemical characterization showed that this compound is a non-competitive inhibitor of cytochrome c. When tested in cellular assays, ADDA 5 dose-dependently inhibited the proliferation of chemosensitive and chemoresistant glioma cells but did not display toxicity against non-cancer cells. Furthermore, treatment with ADDA 5 led to significant inhibition of tumor growth in flank xenograft mouse models. Importantly, ADDA 5 inhibited CcO activity and blocked cell proliferation and neurosphere formation in cultures of glioma stem cells, the cells implicated in tumor recurrence and resistance to therapy in patients with glioblastoma."

According to the news editors, the research concluded: "In summary, we have identified ADDA 5 as a lead CcO inhibitor for further optimization as a novel approach for the treatment of glioblastoma and related cancers."

The news editors report that additional information may be obtained by contacting C.E. Griguer, Univ Alabama Birmingham, Div Infect Dis, Center Free Radical Biol, Birmingham, AL 35294, United States. Additional authors for this research include T. Markert, L.J. Ross, E.L. White, L. Rasmussen, W. Zhang, M. Everts, D.R. Moellering, S.M. Bailey, M.J. Suto and C.E. Griguer.

Researchers at University of Alberta Hospital Describe Findings in Laboratory Hematology [The use of serial outpatient complete blood count (CBC) results to derive biologic variation: a new tool to gauge the acceptability of hematology testing]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematology - Laboratory Hematology. According to news reporting from Edmonton, Canada, by NewsRx journalists, research stated, "Most estimates of biologic variation (sb ) are based on periodically acquiring and storing specimens from reference subjects, followed by analysis within a tightly controlled analytic run. We demonstrate that reliable estimates of sb can be derived for virtually all constituents of the CBC from previously obtained paired patient results and summary QC data."

The news correspondents obtained a quote from the research from the University of Alberta Hospital, "A laboratory data repository provided all of the outpatient CBC results measured over 20.5 months at a large Canadian referral laboratory. These CBC measurements were taken on one of four Beckman Coulter LH analyzers. A total of 1852 different patients had CBCs repeated at least twice within 84 h. We tabulated the pairs of intrapatient constituents that were separated by 0-6, 6-12, 12-18,? 72-78, and 78-84 h. The standard deviations of duplicates (SDD) of the paired data were then regressed against time. The y-intercept represents the sum of sb and short-term analytic variation (sa ): y0=(s(2) a +s(2) b )/(1/2). The short-term imprecision was determined from normal range Coulter quality control specimens. Patient sb for hematocrit, MCH, absolute monocytes, and absolute neutrophils are extremely close to those determined by biologic variation experiments using healthy volunteers. Most of the other estimates of sb tended to be slightly lower than literature estimates. We describe a novel approach to deriving sb."

According to the news reporters, the research concluded: "The ratio of the sb to sa (a measure of sigma) indicates that the Beckman Coulter LH is extremely suitable for CBC monitoring of outpatients as well as for inpatients, whose sb is generally higher."

Our news journalists report that additional information may be obtained by contacting G. Cembrowski, University of Alberta Hospital, Edmonton, AB, Canada. Additional authors for this research include K. Topping, K. Versluys, D. Tran, M. Malick, D. Holmes and G. Clarke.

Researchers at University of Amsterdam Target Vascular Health (Fractional flow reserve-guided percutaneous coronary intervention: where to after FAME 2?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Vascular Medicine - Vascular Health. According to news reporting originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Fractional flow reserve (FFR) is a well-validated clinical coronary physiological parameter derived from the measurement of coronary pressures and has drastically changed revascularization decision-making in clinical practice. Nonetheless, it is important to realize that FFR is a coronary pressure-derived estimate of coronary blood flow impairment."

Our news editors obtained a quote from the research from the University of Amsterdam, "It is thereby not the same as direct measures of coronary flow impairment that determine the occurrence of signs and symptoms of myocardial ischemia. This consideration is important, since the FAME 2 study documented a limited discriminatory power of FFR to identify stenoses that require revascularization to prevent adverse events. The physiological difference between FFR and direct measures of coronary flow impairment may well explain the findings in FAME 2."

According to the news editors, the research concluded: "This review aims to address the physiological background of FFR, its ambiguities, and its consequences for the application of FFR in clinical practice, as well as to reinterpret the diagnostic and prognostic characteristics of FFR in the light of the recent FAME 2 trial outcomes."

For more information on this research see: Fractional flow reserve-guided percutaneous coronary intervention: where to after FAME 2? Vascular Health and Risk Management, 2015;11():613-22.

The news editors report that additional information may be obtained by contacting T.P. van de Hoef, AMC Heartcentre, Academic Medical Center, University of Amsterdam, Amsterdam, Netherlands. Additional authors for this research include M. Meuwissen and J.J Piek.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2147/VHRM.S68328. This DOI is a link to an online electronic document that is either free or for purchase.

Researchers at University of Arizona Have Reported New Data on Heart Disease (Genetics-Current and Future Role in the Prevention and Management of Coronary Artery Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Disease. According to news reporting from Phoenix, Arizona, by NewsRx editors, the research stated, "Purpose of Review The purpose of this study is to review genetic risk variants for coronary artery disease (CAD) and how they will change the management and prevention of CAD currently and in the future. Through the efforts of international consortia, 58 genetic risk variants for CAD of genome-wide significance have been replicated in appropriate independent populations."

The news correspondents obtained a quote from the research from the University of Arizona, "Only one third of these variants mediate their risk through known conventional risk factors for CAD. Thus, unknown mechanisms contribute to CAD. Secondly, the genetic risk is proportional to the total number of risk variants rather than the intensity of any risk factor. Thirdly, the availability of the genetic risk variants enables one to perform Mendelian randomization (MR) studies since they are randomized at conception, not confounded, fixed for life, and can be used to determine if a risk factor is causative or just a marker. MR can also be used to determine the safety and efficacy of a gene product targeted for drug therapy. Genetic risk variants have been shown to successfully risk stratify for CAD in both primary and secondary preventions. Contrary to dogma, MR documents that plasma HDL-C is not protective of CAD. The use of genetic risk score (GRS) for CAD is shown to be more effective in risk stratifying for CAD than the Framingham risk score and independent of the conventional risk factors including family history. Furthermore, the GRS predicts the response to statin therapy in primary and secondary preventions."

According to the news reporters, the research concluded: "The use of GRS could represent a paradigm shift in the prevention of CAD."

For more information on this research see: Genetics-Current and Future Role in the Prevention and Management of Coronary Artery Disease. Current Atherosclerosis Reports, 2016;18(12):79-86. **Drugs and Therapies - Cancer Therapy**

**Researchers at University of Arizona Target Cancer Therapy (Cardiovascular adverse effects of targeted antiangiogenic drugs: mechanisms and management)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cancer Therapy have been published. According to news reporting originating from Tucson, Arizona, by NewsRx correspondents, research stated, "Anticancer treatment has evolved enormously over the last decade. Drugs targeting receptor tyrosine kinases, VEGFR and EGFR have changed the treatment landscape of certain cancers and have shifted the theme of anticancer therapy toward personalized care."

Our news editors obtained a quote from the research from the University of Arizona, "However, these newer agents also come with unique side-effect profiles not seen with conventional chemotherapy including serious cardiovascular adverse effects. Hence, meticulous understanding of the adverse effects is crucial in maximizing clinical benefits and minimizing detrimental effects of these newer drugs."

According to the news editors, the research concluded: "We have reviewed the cardiovascular adverse effects of anti-VEGF therapy in this article."

For more information on this research see: Cardiovascular adverse effects of targeted antiangiogenic drugs: mechanisms and management. *Future Oncology*, 2016;12(8):1067-80.

The news editors report that additional information may be obtained by contacting S. Sundararajan, Division of Hematology & Oncology, Dept. of Medicine, University of Arizona, Tucson, AZ, United States. Additional authors for this research include A. Kumar, M. Poongkunran, A. **Bone Research**

**Researchers at University of Bern Have Reported New Data on Bone Research [Pre-coating deproteinized bovine bone mineral (DBBM) with bone-conditioned medium (BCM) improves osteoblast migration, adhesion, and differentiation in vitro]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Bone Research. According to news reporting out of Bern, Switzerland, by NewsRx editors, research stated, "Autogenous bone grafting has remained the gold standard for bone augmentation procedures with ability to release..."
growth factors to the surrounding microenvironment. Recent investigations have characterized these specific growth factors released by autogenous bone chips with further isolation into a 'bone-conditioned medium' (BCM).

Our news journalists obtained a quote from the research from the University of Bern, "The aim of the present investigation was to utilize autologous growth factors from bone chips (BCM) in combination with deproteinized bovine bone mineral (DBBM) and investigate the ability for BCM to enhance osteoblast behavior. Mouse ST2 cells were seeded on (1) DBBM particles alone or (2) DBBM + BCM. Thereafter, samples were compared for cell recruitment, adhesion, proliferation, and real-time PCR for osteoblast differentiation markers including Runx2, collagen 1 alpha 2 (COL1A2), alkaline phosphatase (ALP), and osteocalcin (OCN). Alizarin red staining was used to assess mineralization. Coating BCM on DBBM particles improved cell migration of ST2 cells and significantly enhanced a 2-fold increase in cell adhesion. While no significant increase in cell proliferation was observed, BCM significantly increased mRNA levels of COL1A2, ALP, and OCN at 3 days post seeding. Furthermore, a 3-fold increase in alizarin red staining was observed on DBBM particles pre-coated with BCM. Pre-coating DBBM with BCM enhanced the osteoconductive properties of DBBM by mediating osteoblast recruitment, attachment, and differentiation towards bone-forming osteoblasts. Future animal study is necessary to further characterize the added benefit of BCM as an autogenous growth factor source for combination therapies."

According to the news editors, the research concluded: "The application of BCM in combination with biomaterials may serve as an autogenous growth factor source for bone regeneration."

Our news journalists report that additional information may be obtained by contacting R.J. Miron, University of Bern, Sch Dental Med, Lab Oral Cell Biol, Bern, Switzerland. Additional authors for this research include M. Fujioka-Kobayashi, D.D. Bosshardt, R. Gruber, D. Buser and R.J. Miron. **Drugs and Therapies - Androgens and Anabolic…**

**Researchers at University of Bologna Release New Data on Androgens and Anabolic Steroids (Disposition of Stanozolol in Plasma After Intra-articular Administration in the Horse)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
Our news journalists obtained a quote from the research from the University of Bologna, "After aseptically preparing the injection site, 1 mL of an aqueous suspension containing 5 mg of stanozolol was injected into both the right and left tarsal joints of 12 horses; the two remaining animals were not treated and were used as a control group. Five milliliters of blood was collected immediately before stanozolol administration (t0) and at 1, 2, 4, 6, 12, 18, 24, 36, 48, 60, 72, 84, 96, 108, 120, 132, 144, 156, and 168 hours after injection. The plasma concentration was determined by liquid chromatography tandem mass spectrometry (LC-MS/MS) after solid phase extraction. The maximum plasma concentration was 1.7 ng/mL (range, 0.5-3.0 ng/mL), measured at 6 hours (range, 4-12 hours). The plasma elimination half life varied between 4 and 12 hours, whereas the plasma clearance per fraction of dose absorbed was in the 257.85-820.88 L/h range. The results of the present study make a preliminary contribution toward understanding the elimination profile of intra-articularly administered stanozolol in the horse."

According to the news editors, the research concluded: "The drug passes rapidly into the systemic circulation, is eliminated rapidly, and is detected in plasma for no more than 36 hours after local administration."

The news correspondents report that additional information may be obtained from A. Barbarossa, University of Bologna, Dept. of Vet Med Sci, Bologna, Italy. Additional authors for this research include A. Zaghini, G. Fedrizzi, A. Sala, S. Babbini and A. Barbarossa.

Proteomics

Researchers at University of Brescia Target Proteomics (Acute Footshock Stress Induces Time-Dependent Modifications of AMPA/NMDA Protein Expression and AMPA Phosphorylation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Proteomics are presented in a new report. According to news...
reporting originating in Brescia, Italy, by NewsRx journalists, research stated, "Clinical studies on patients with stress-related neuropsychiatric disorders reported functional and morphological changes in brain areas where glutamatergic transmission is predominant, including frontal and prefrontal areas. In line with this evidence, several preclinical works suggest that glutamate receptors are targets of both rapid and long-lasting effects of stress."

The news reporters obtained a quote from the research from the University of Brescia, "Here we found that acute footshock-(FS-) stress, although inducing no transcriptional and RNA editing alterations of ionotropic AMPA and NMDA glutamate receptor subunits, rapidly and transiently modulates their protein expression, phosphorylation, and localization at postsynaptic spines in prefrontal and frontal cortex. In total extract, FS-stress increased the phosphorylation levels of GluA1 AMPA subunit at Ser(845) immediately after stress and of GluA2 Ser(880) 2 h after start of stress. At postsynaptic spines, stress induced a rapid decrease of GluA2 expression, together with an increase of its phosphorylation at Ser(880), suggesting internalization of GluA2 AMPA containing receptors. GluN1 and GluN2A NMDA receptor subunits were found markedly upregulated in postsynaptic spines, 2 h after start of stress."

According to the news reporters, the research concluded: "These results suggest selected time-dependent changes in glutamatergic receptor subunits induced by acute stress, which may suggest early and transient enhancement of AMPA-mediated currents, followed by a transient activation of NMDA receptors."

For more information on this research see: Acute Footshock Stress Induces Time-Dependent Modifications of AMPA/NMDA Protein Expression and AMPA Phosphorylation. Neural Plasticity, 2016;2016():7267865. (Hindawi Publishing - www.hindawi.com; Neural Plasticity - www.hindawi.com/journals/np/)

Researchers at University of British Columbia Discuss Findings in Atherosclerosis (So Much Cholesterol: the unrecognized importance of smooth muscle cells in atherosclerotic foam cell formation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Atherosclerosis are discussed in a new report. According to news reporting originating from Vancouver, Canada, by NewsRx correspondents, research stated, "Smooth muscle cells (SMCs) form the thickened intimal layer in atherosclerosis-prone arteries in early life, and provide the
initial site for retention and uptake of atherogenic lipoproteins. Here we review current knowledge regarding the importance of SMCs in the deposition of cholesterol in atherosclerotic plaque.

Our news editors obtained a quote from the research from the University of British Columbia, "SMCs were found to comprise at least 50% of total foam cells in human coronary artery atherosclerosis, and exhibit a selective loss of expression of the cholesterol efflux promoter ATP-binding cassette transporter A1. Cholesterol loading induced a loss of SMC gene expression and an increase in macrophage and proinflammatory marker expression by cultured mouse and human arterial SMCs, with reversal of these effects upon removal of the excess cholesterol. Mice engineered to track all cells of SMC lineage indicated that, at most, SMCs make up about one-third of total cells in atherosclerotic plaque in these animals. SMCs appear to be the origin of the majority of foam cells in human atherosclerotic plaque."

According to the news editors, the research concluded: "Recent studies suggest a renaissance of research on the role of SMCs in atherosclerosis is needed to make the next leap forward in the prevention and treatment of this disease."

For more information on this research see: So Much Cholesterol: the unrecognized importance of smooth muscle cells in atherosclerotic foam cell formation. Current Opinion In Lipidology, 2016;27(2):155-61. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Lipidology - journals.lww.com/co-lipidology/pages/default.aspx)

Oncology - Carcinomas

Researchers at University of Cairo Detail Findings in Carcinomas (The Predictive and Prognostic Role of Topoisomerase Ila and Tissue Inhibitor of Metalloproteinases 1 Expression in Locally Advanced Breast Carcinoma of Egyptian Patients Treated ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Carcinomas. According to news originating from Cairo, Egypt, by NewsRx correspondents, research stated, "Locally advanced breast cancer (LABC) is a heterogeneous entity that remains a clinical challenge. Anthracycline-based neoadjuvant chemotherapy has emerged as the standard of care for those patients."

Our news journalists obtained a quote from the research from the University of Cairo, "However, it is associated with serious side effects including cardiotoxicity. This study
aimed to evaluate the prognostic and predictive role of topoisomerase IIa (TOP2a) and tissue inhibitor of metalloproteinases 1 (TIMP-1) in Egyptian LABC patients after anthracycline-based neoadjuvant chemotherapy. This retrospective study was conducted on 84 LABC cases. Immunohistochemical expression of TOP2a and TIMP-1 was evaluated in pretreatment needle core biopsies. Results were correlated with clinicopathologic parameters, response to neoadjuvant chemotherapy in postoperative specimens, disease-free survival and overall survival (OS). Positive TOP2a expression was detected in 57/84 (67.9%) cases. It was significantly associated with good response to chemotherapy in breast (p=0.048) and lymph node (p=0.06) as well as prolonged OS (p=0.04). It tended to be the most independent prognostic factor for OS (p=0.06). Positive TIMP-1 expression was detected in 48/84 (57.1%) cases. It was significantly associated with poor response to chemotherapy in breast (p=0.02). The 2T profile (TOP2a+ and TIMP-1-) was significantly associated with good response to chemotherapy in breast (p=0.006)."

According to the news editors, the research concluded: "TOP2a and TIMP-1 are important predictive and prognostic factors in LABC patients who received anthracycline-based chemotherapy."

For more information on this research see: The Predictive and Prognostic Role of Topoisomerase IIa and Tissue Inhibitor of Metalloproteinases 1 Expression in Locally Advanced Breast Carcinoma of Egyptian Patients Treated With Anthracycline-based Neoadjuvant Chemotherapy. *Applied Immunohistochemistry & Molecular Morphology, 2016;24 (3):167-78.* (Lippincott Williams and Wilkins - www.lww.com; Applied Immunohistochemistry & Molecular Morphology - journals.lww.com/appliedimmunohist/pages/default.aspx)

The news correspondents report that additional information may be obtained from H.S. El Rebey, *Pathology Department, Faculty of Medicine, Menofia University, Shebin El Kom †Pathology Dept. of ‡Oncology Department, National Cancer Institute, Cairo University, Cairo, Egypt. Researchers at University of Cairo Release New Data on Chromatography (Stability-Indicating Method and LC-MS-MS Characterization of Forc...
its stressed degradation products."

Our news journalists obtained a quote from the research from the University of Cairo, "Sobosbuvir was subjected to hydrolysis (acidic, alkaline and neutral), oxidation, photolysis and thermal stress, as per international conference on harmonization (ICH) conditions. The drug showed degradation under oxidative, photolysis, acid and base hydrolysis stress conditions. However, it was stable under thermal and neutral hydrolysis stress conditions. Chromatographic separation of the drug from its degradation products was performed on Inertsil ODS-3 C-18 (250mm x 4.6mm i.d., 5 μm) column using a green mobile phase of methanol: water 70:30 (v/v). The degradation products were characterized by LC-MS-MS and the fragmentation pathways were proposed. The developed method was validated as per ICH guidelines."

According to the news editors, the research concluded: "No previous method was reported regarding the degradation behavior of sofosbuvir."

Our news journalists report that additional information may be obtained by contacting M. Nebsen, Cairo University, Fac Pharm, Analyt Chem Department, Cairo 11562, Egypt.

Oncology - Ovarian Cancer

Researchers at University of California Discuss Findings in Ovarian Cancer (Protein-Specific Differential Glycosylation of Immunoglobulins in Serum of Ovarian Cancer Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Ovarian Cancer. According to news reporting out of Davis, California, by NewsRx editors, research stated, "Previous studies indicated that glycans in serum may serve as biomarkers for diagnosis of ovarian cancer; however, it was unclear to which proteins these glycans belong. We hypothesize that protein-specific glycosylation profiles of the glycans may be more informative of ovarian cancer and can provide insight into biological mechanisms underlying glycan aberration in serum of diseased individuals."

Financial support for this research came from Ovarian Cancer Research Fund.

Our news journalists obtained a quote from the research from the University of California, "Serum samples from women diagnosed with epithelial ovarian cancer (EOC, n=84) and matched healthy controls (n=84) were obtained from the Gynecologic Oncology Group. Immunoglobulin (IgG, IgA, and IgM) concentrations and glycosylation profiles were quantified using multiple reaction monitoring mass spectrometry. Differential and classification analyses
were performed to identify aberrant protein-specific glycopeptides using a training set. All findings were validated in an independent test set. Multiple glycopeptides from immunoglobulins IgA, IgG, and IgM were found to be differentially expressed in serum of EOC patients compared with controls. The protein-specific glycosylation profiles showed their potential in the diagnosis of EOC. In particular, IgG-specific glycosylation profiles are the most powerful in discriminating between EOC case and controls."

According to the news editors, the research concluded: "Additional studies of protein-and site-specific glycosylation profiles of immunoglobulins and other proteins will allow further elaboration on the characteristics of biological functionality and causality of the differential glycosylation in ovarian cancer and thus ultimately lead to increased sensitivity and specificity of diagnosis."

Our news journalists report that additional information may be obtained by contacting L.R. Ruhaak, Dept. of Chemistry, University of California, Davis, California 95616, United States. Additional authors for this research include K. Kim, C. Stroble, S.L. Taylor, Q. Hong, S. Miyamoto, C.B. Lebrilla and G. Leiserowitz.

Atrial Septal Defects

Researchers at University of California Have Reported New Data on Atrial Septal Defects (Preprocedural Transthoracic Echocardiography Can Predict Amplatzer Septal Occluder Device Size for Transcatheter Atrial Septal Defect Closure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Atrial Septal Defects are presented in a new report. According to news originating from San Diego, California, by NewsRx correspondents, research stated, "To evaluate whether preprocedural transthoracic echocardiography (TTE) can be used to predict Amplatzer septal occluder (ASO) size for device closure of atrial septal defect (ASD). Retrospective review of patients who underwent ASD device closure at our institution between August 2006 and August 2013 was performed."

Our news journalists obtained a quote from the research from the University of California, "Patients with complex congenital heart disease, devices other than the ASO, multiple devices, or inadequate TTE images were excluded. Those who had transesophageal echocardiography (TEE) guided device placement were evaluated. A blinded observer reviewed their preprocedural TTE images and applied a scaled formula to predict device size. A total of 186 patients underwent ASO placement during the study period, 87 had TEE guidance, of which
45 met inclusion criteria. The mean predicted device size by the scaled formula was 18.0 +/- 5.11 mm, compared to the mean implanted device size of 18.8 +/- 5.22 mm. The mean absolute difference between each predicted and final deployed device size was 1.44 mm with 95% CI [1.08, 1.81]. The Pearson correlation showed that the predicted device size had a positive correlation coefficient of 0.94."

According to the news editors, the research concluded: "Preprocedural TTE assessment of ASD size using a scaling formula in patients with adequate TTE windows can accurately predict ASO device size and aid in device selection."

The news correspondents report that additional information may be obtained from S.P. Sah, University of California, Dept. of Pediat, Sch Med, Div CardiolRady Childrens Hosp, San Diego, CA 92103, United States. Additional authors for this research include S. Bartakian, H. El-Said, D.P. Molkara, B. Printz and J.W. Moore.

Life Science Research - Molecular and Cellular Biology

Researchers at University of California Have Reported New Data on Molecular and Cellular Biology (Characterization of Hippo Pathway Components by Gene Inactivation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Life Science Research - Molecular and Cellular Biology. According to news reporting from La Jolla, California, by NewsRx journalists, research stated, "The Hippo pathway is important for regulating tissue homeostasis, and its dysregulation has been implicated in human cancer. However, it is not well understood how the Hippo pathway becomes dysregulated because few mutations in core Hippo pathway components have been identified."

Funders for this research include NIH, UCSD Pharmacology training grant.

The news correspondents obtained a quote from the research from the University of California, "Therefore, much work in the Hippo field has focused on identifying upstream regulators, and a complex Hippo interactome has been identified. Nevertheless, it is not always clear which components are the most physiologically relevant in regulating YAP/TAZ. To provide an overview of important Hippo pathway components, we created knockout cell lines for many of these components and compared their relative contributions to YAP/TAZ regulation in response to a wide range of physiological signals."

According to the news reporters, the research concluded: "By this approach, we provide an overview of the functional importance of many Hippo pathway components and
demonstrate NF2 and RHOA as important regulators of YAP/TAZ and TAOK1/3 as direct kinases for LATS1/2."

Our news journalists report that additional information may be obtained by contacting K.L. Guan, University of California, Moores Canc Center, La Jolla, CA 92093, United States. Additional authors for this research include Z.P. Meng, K.C. Lin, B.A. Lin, A.W. Hong, J.V. Chun and K.L. Guan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.molcel.2016.10.034. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Cancer Care**

**Researchers at University of California Release New Data on Cancer Care (What do adolescents and young adults want from cancer resources? Insights from a Delphi panel of AYA patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Cancer Care have been presented. According to news reporting from Los Angeles, California, by NewsRx journalists, research stated, "Cancer treatment programs and community-based support organizations are increasingly producing information and support resources geared to adolescent and young adult patients (AYAs); however, systematically-derived knowledge about user preferences for these resources is lacking. The primary purpose of this study was to generate findings from informed AYA cancer patients that resource developers can use to create products consistent with AYAs' expressed preferences for information and support."

Funders for this research include SeventyK, Teen Cancer America.

The news correspondents obtained a quote from the research from the University of California, "Utilizing a modified Delphi technique, AYA cancer patients identified barriers to optimal AYA cancer care, cancer resources that address their needs, and specific characteristics of cancer resources they find helpful. The Delphi panel consisted of a convenience sample of 21 patients aged 18-39 years, who were diagnosed with cancer between ages 15-39 and were no more than 8 years out from cancer treatment at the time of the study. Survey data were collected in three consecutive and iterative rounds over the course of 6 months in 2015. Findings indicated that AYA patients prefer resources that reduce feelings of loneliness, create a sense of community or belonging, and provide opportunities to meet other AYA patients. Among the top barriers to optimal cancer care, AYAs identified a lack of cancer care providers specializing in AYA care, a lack of connection to an AYA patient community, and their own lack of ability to navigate the health system. Participants also described aspects of cancer information and
supportive care resources that they believe address AYAs' concerns. Information derived from this study will help developers of cancer information and support resources to better reach their intended audience. From the point of view of AYA cancer patients, optimal cancer care and utilization of information and support resources requires that cancer support programs foster meaningful connections among AYA patients. Results also suggest that patient resources should equip AYAs with practical knowledge and skills necessary to navigate the health system and advocate for themselves."

According to the news reporters, the research concluded: "Given patient interest in social media, future research should further investigate optimizing online resources to serve the AYA cancer population."

For more information on this research see: What do adolescents and young adults want from cancer resources? Insights from a Delphi panel of AYA patients. Supportive Care in Cancer, 2017;25(1):119-126. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Cardiovascular Diseases and Conditions - Venous...**

**Researchers at University of California Release New Data on Venous Thromboembolism (If some is good, more is better: An enoxaparin dosing strategy to improve pharmacologic venous thromboembolism prophylaxis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Venous Thromboembolism is now available. According to news originating from San Diego, California, by NewsRx correspondents, research stated, "Empiric enoxaparin dosing is inadequate for most trauma patients, leading to below target initial anti-Xa levels and requiring dose adjustment for optimal venous thromboembolism prophylaxis. We hypothesize that patient factors affecting initial anti-Xa levels can be identified based on drug pharmacokinetics, allowing creation of a new dosing protocol that will provide a higher percentage of in-target (0.2-0.4 IU/mL) patients at initial anti-Xa level assessment."

Our news journalists obtained a quote from the research from the University of California, "Records of 318 trauma patients were evaluated, and NONMEM and PSN software were used to analyze 11 variables for their effects on anti-Xa levels. Computer modeling was used to select a new dosing protocol, which was implemented on the trauma service as a quality improvement project. The first 145 patients appropriately enrolled were assessed for response
and complications. Only 29.5% of the pre-intervention group had initial anti-Xa levels in the appropriate prophylactic range (Fig. 1). Levels were most strongly influenced by patient weight, outweighing contributions from all other variables. A new regimen for initial dosing was therefore designed with three weight-defined categories for ease of administration. The post-intervention group showed an increase in in-target initial anti-Xa levels to 74.5% (p < 0.001), with a corresponding decrease in subprophylactic patients from 68.0% to 20.7%. There was an increase in supraphylactic levels to 4.8%, but no supraphylactic patients had hemorrhagic complications. Implementation of a new, categorized, weight-based enoxaparin dosing protocol was safe and significantly improved the percentage of trauma patients with in-target anti-Xa levels on initial assessment."

According to the news editors, the research concluded: "Further studies are needed to determine whether such dosing decreases venous thromboembolism rates."

For more information on this research see: If some is good, more is better: An enoxaparin dosing strategy to improve pharmacologic venous thromboembolism prophylaxis. Journal of Trauma and Acute Care Surgery, 2016;81(6):1095-1100. Journal of Trauma and Acute Care Surgery can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Neurodegenerative Diseases and Conditions -

Researchers at University of California Report New Data on Huntington Disease (Allele-Specific Reduction of the Mutant Huntingtin Allele Using Transcription Activator-Like Effectors in Human Huntington's Disease Fibroblasts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Neurodegenerative Diseases and Conditions - Huntington Disease is the subject of a report. According to news reporting out of Sacramento, California, by NewsRx editors, research stated, "Huntington's disease (HD) is an autosomal dominant neurodegenerative disorder caused by an abnormal expansion of CAG repeats. Although pathogenesis has been attributed to this polyglutamine expansion, the underlying mechanisms through which the huntingtin protein functions have yet to be elucidated."

Our news journalists obtained a quote from the research from the University of California, "It has been suggested that postnatal reduction of mutant huntingtin through protein
interference or conditional gene knockout could prove to be an effective therapy for patients suffering from HD. For allele-specific targeting, transcription activator-like effectors (TALE) were designed to target single-nucleotide polymorphisms (SNP) in the mutant allele and packaged into a vector backbone containing KRAB to promote transcriptional repression of the disease-associated allele. Additional TALEs were packaged into a vector backbone containing heterodimeric FokI and were designed to be used as nucleases (TALEN) to cause a CAG-collapse in the mutant allele. Human HD fibroblasts were treated with each TALE-SNP or TALEN. Allele-expression was measured using a SNP-genotyping assay and mutant protein aggregation was quantified with Western blots for anti-ubiquitin. The TALE-SNP and TALEN significantly reduced mutant allele expression (p <0.05) when compared to control transfections while not affecting expression of the nondisease allele.

According to the news editors, the research concluded: "This study demonstrates the potential of allele-specific gene modification using TALE proteins, and provides a foundation for targeted treatment for individuals suffering from Huntington's or other genetically linked diseases."

For more information on this research see: Allele-Specific Reduction of the Mutant Huntingtin Allele Using Transcription Activator-Like Effectors in Human Huntington's Disease Fibroblasts. Cell Transplantation, 2016;25(4):677-86.

Our news journalists report that additional information may be obtained by contacting K.D. Fink, Stem Cell Program and Institute for Regenerative Cures, University of California Davis Health Systems, Sacramento, CA, United States. Additional authors for this research include P. Deng, J. Gutierrez, J.S. Anderson, A. Torrest, A. Komarla, S. Kalomoiris, W. Cary, J.D. Anderson, W. Gruenloh, A. Duffy, T. Tempkin, G. Annett, V. Wheelock, D.J. Segal and J.A Nolta.

Researchers at University of California School of Medicine Report Findings in Type 2 Diabetes [Lipoprotein(a): novel target and emergence of novel therapies to lower cardiovascular disease risk]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is the subject of a report. According to news reporting originating in La Jolla, California, by NewsRx editors, the research stated, "This article summarizes recent observations on the role of lipoprotein(a) [Lp(a)] as a risk factor mediating cardiovascular disease. Lp(a) is a highly prevalent cardiovascular risk factor, with levels above 30 mg/dl affecting 20-30% of the global population."
The news reporters obtained a quote from the research from the University of California School of Medicine, "Up until now, no specific therapies have been developed to lower Lp(a) levels. Three major levels of evidence support the notion that elevated Lp(a) levels are a causal, independent, genetic risk factor for cardiovascular disease: epidemiologic studies and meta-analyses, genome-wide association studies and Mendelian randomization studies. Recent studies also have noted that individuals with low levels of Lp(a) are associated with a higher risk of incident type 2 diabetes mellitus, and conversely individuals with high levels have a lower risk, but this association does not appear to be causal. Novel therapies to lower Lp(a) include PCSK9 inhibitors and antisense oligonucleotides directly preventing translation of apolipoprotein(a) mRNA. With this robust and expanding clinical database, a reawakening of interest in Lp(a) as clinical risk factor is taking place."

According to the news reporters, the research concluded: "Trials are underway with novel drugs that substantially lower Lp(a) and may reduce its contribution to cardiovascular disease."

For more information on this research see: Lipoprotein(a): novel target and emergence of novel therapies to lower cardiovascular disease risk. Current Opinion In Endocrinology, Diabetes, and Obesity, 2016;23(2):157-64.

Our news correspondents report that additional information may be obtained by contacting S. Tsimikas, Vascular Medicine Program, Sulpizio Cardiovascular Center, University of California San Diego School of Medicine, La Jolla, California, United States.

Biotechnology - Liposomes

Researchers at University of California Target Liposomes (Novel Application of Cellulose Paper As a Platform for the Macromolecular Self-Assembly of Biomimetic Giant Liposomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology - Liposomes. According to news reporting out of Merced, California, by NewsRx editors, research stated, "We report a facile and scalable method to fabricate biomimetic giant liposomes by using a cellulose paper-based materials platform."

Financial supporters for this research include National Aeronautics and Space Administration, National Science Foundation.

Our news journalists obtained a quote from the research from the University of California, "Termed PAPYRUS for Paper-Abetted lipid hYdRation in aqUeous Solutions, the method is general and can produce liposomes in various aqueous media and at elevated temperatures. Encapsulation of macromolecules and production of liposomes with membranes
of complex compositions is straightforward."

According to the news editors, the research concluded: "The ease of manipulation of paper makes practical massive parallelization and scale-up of the fabrication of giant liposomes, demonstrating for the first time the surprising usefulness of paper as a platform for macromolecular self-assembly."

For more information on this research see: Novel Application of Cellulose Paper As a Platform for the Macromolecular Self-Assembly of Biomimetic Giant Liposomes. ACS Applied Materials & Interfaces, 2016;8(47):32102-32107. ACS Applied Materials & Interfaces can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. **Oncology - Breast Cancer**

**Researchers at University of Cambridge Release New Data on Breast Cancer (Incorporating truncating variants in PALB2, CHEK2, and ATM into the BOADICEA breast cancer risk model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting out of Cambridge, United Kingdom, by NewsRx editors, research stated, "The proliferation of gene panel testing precipitates the need for breast cancer (BC) risk model that incorporates the effects of mutations in several genes and family history (FH). We extended the BOADICEA model to incorporate the effects of truncating variants in PALB2, CHEK2, and ATM."

Our news journalists obtained a quote from the research from the University of Cambridge, "The BC incidence was modeled via the explicit effects of truncating variants in BRCA1/2, PALB2, CHEK2, and ATM and other unobserved genetic effects using segregation analysis methods. The predicted average BC risk by age 80 for an ATM mutation carrier is 28%, 30% for CHEK2, 50% for PALB2, and 74% for BRCA1 and BRCA2. However, the BC risks are predicted to increase with FH burden. In families with mutations, predicted risks for mutation-negative members depend on both FH and the specific mutation. The reduction in BC risk after negative predictive testing is greatest when a BRCA1 mutation is identified in the family, but for women whose relatives carry a CHEK2 or ATM mutation, the risks' decrease
slightly. The model may be a valuable tool for counseling women who have undergone gene panel testing for providing consistent risks and harmonizing their clinical management.

According to the news editors, the research concluded: "A Web application can be used to obtain BC risks in clinical practice(http://ccge.medschl.cam.ac.uk/boadicea/)." For more information on this research see: Incorporating truncating variants in PALB2, CHEK2, and ATM into the BOADICEA breast cancer risk model. *Genetics in Medicine*, 2016;18(12):1190-1198. *Genetics in Medicine* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. **Phagocytosis**

**Researchers at University of Cambridge Target Phagocytosis (Retinoid X receptor activation reverses age-related deficiencies in myelin debris phagocytosis and remyelination)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Phagocytosis is the subject of a report. According to news reporting originating in Cambridge, United Kingdom, by NewsRx journalists, research stated, "The efficiency of central nervous system remyelination declines with age. This is in part due to an age-associated decline in the phagocytic removal of myelin debris, which contains inhibitors of oligodendrocyte progenitor cell differentiation."

The news reporters obtained a quote from the research from the University of Cambridge, "In this study, we show that expression of genes involved in the retinoid X receptor pathway are decreased with ageing in both myelin-phagocytosing human monocytes and mouse macrophages using a combination of in vivo and in vitro approaches. Disruption of retinoid X receptor function in young macrophages, using the antagonist HX531, mimics ageing by reducing myelin debris uptake. Macrophage-specific RXRa (Rxra) knockout mice revealed that loss of function in young mice caused delayed myelin debris uptake and slowed remyelination after experimentally-induced demyelination. Alternatively, retinoid X receptor agonists partially restored myelin debris phagocytosis in aged macrophages. The agonist bexarotene, when used in concentrations achievable in human subjects, caused a reversion of the gene expression profile in multiple sclerosis patient monocytes to a more youthful profile and enhanced myelin debris phagocytosis by patient cells."
According to the news reporters, the research concluded: "These results reveal the retinoid X receptor pathway as a positive regulator of myelin debris clearance and a key player in the age-related decline in remyelination that may be targeted by available or newly-developed therapeutics."

For more information on this research see: Retinoid X receptor activation reverses age-related deficiencies in myelin debris phagocytosis and remyelination. *Brain*, 2015;138(Pt 12):3581-97. (Oxford University Press - www.oup.com; Brain - brain.oxfordjournals.org)

17-Hydroxycorticosteroids

**Researchers at University of Cape Town Release New Data on 17-Hydroxycorticosteroids (Salivary Cortisol and Cortisone do not Appear to be Useful Biomarkers for Monitoring Hydrocortisone Replacement in Addison's Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on 17-Hydroxycorticosteroids is now available. According to news originating from Cape Town, South Africa, by NewsRx correspondents, research stated, "Salivary cortisol has been used to monitor hydrocortisone replacement in patients with Addison's disease (AD). Since salivary cortisol is metabolised to salivary cortisone, it may be an adjunctive analyte to assess adequacy of hydrocortisone replacement in patients with AD."

Our news journalists obtained a quote from the research from the University of Cape Town, "We aimed to characterise the exposure of salivary cortisol and cortisone in patients and healthy controls. We measured salivary cortisol and cortisone by liquid chromatography-tandem mass spectrometry and constructed a day curve (08:00 until 24:00 h) with 16 time points in 25 AD patients taking their usual hydrocortisone dose and in 26 healthy controls. The median (interquartile range) area under the curve (AUC) for cortisol was not different for patients, compared with controls [55.63 (32.91-151.07) nmol* min* l(-1) vs. 37.49 (27.41-52.00) nmol* min* l(-1); p = 0.098, respectively], whereas the peak cortisol C-max was higher in patients [32.61 (5.75-146.19) nmol/l vs. 8.96 (6.96-12.23) nmol/l; p = 0.013], compared with controls. The AUC for cortisone [23.65 (6.10-54.76) nmol* min* l(-1) vs. 227.73 (200.10-280.52) nmol* min* l(-1); p<= 0.001, respectively], and peak cortisone C-max was lower in patients than in controls [11.11 (2.91-35.85) nmol/l vs. 33.12 (25.97-39.95) nmol/l; p = 0.002]. The AUC for
salivary cortisol and salivary cortisone were not correlated with any measures of hydrocortisone dose. The time-course and AUC of salivary cortisol were similar between Addison’s patients and healthy controls. Patients had substantially lower salivary cortisone AUC, compared to healthy controls.

According to the news editors, the research concluded: "Salivary cortisol AUC and pharmacokinetics were not related to hydrocortisone dose and thus are not likely useful markers for the adequacy of hydrocortisone replacement."

For more information on this research see: Salivary Cortisol and Cortisone do not Appear to be Useful Biomarkers for Monitoring Hydrocortisone Replacement in Addison’s Disease. Hormone and Metabolic Research, 2016;48(12):814-821. Hormone and Metabolic Research can be contacted at: Georg Thieme Verlag Kg, Rudigerstr 14, D-70469 Stuttgart, Germany. (Thieme - www.thieme.com)

The news correspondents report that additional information may be obtained from I.L. Ross, University of Cape Town, Dept. of Med, Div Endocrinol, Cape Town, South Africa. Mycobacterium Infections - Tuberculosis

Researchers at University of Cape Town Release New Data on Tuberculosis (Bioluminescent Reporters for Rapid Mechanism of Action Assessment in Tuberculosis Drug Discovery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Mycobacterium Infections - Tuberculosis. According to news reporting originating from Cape Town, South Africa, by NewsRx correspondents, research stated, "The tuberculosis (TB) drug discovery pipeline is fueled by compounds identified in whole-cell screens against the causative agent, Mycobacterium tuberculosis. Phenotypic screening enables the selection of molecules that inhibit essential cellular functions in live, intact bacilli grown under a chosen in vitro condition."

Financial supporters for this research include HHS | National Institutes of Health (NIH), Howard Hughes Medical Institute (HHMI), Foundation for the National Institutes of Health (FNIH), National Research Foundation (NRF), South African Medical Research Council (SAMRC).

Our news editors obtained a quote from the research from the University of Cape Town, "However, deducing the mechanism of action (MOA), which is important to avoid promiscuous targets, often requires significant biological resources in a lengthy process that risks decoupling medicinal chemistry and biology efforts. Therefore, there is a need to develop methods enabling rapid MOA assessment of putative 'actives' for triage decisions. Here, we describe a modified version of a bioluminescence reporter assay that allows non-destructive detection of compounds targeting either of two macromolecular processes in M. tuberculosis:
cell wall biosynthesis or maintenance of DNA integrity. Coupling the luxCDABE operon from
Photorhabdus luminescens to mycobacterial promoters driving expression of the iniBAC operon
(PiniB-LUX) or the DNA damage-inducible genes, recA (PrecA-LUX) or radA (PradALUX),
provided quantitative detection in real time of compounds triggering expression of any of these
promoters over an extended 10- to 12-day incubation. Testing against known anti-TB agents
confirmed the specificity of each reporter in registering the MOA of the applied antibiotic in M.
tuberculosis, independent of bactericidal or bacteriostatic activity. Moreover, profiles obtained
for experimental compounds indicated the potential to infer complex MOAs in which multiple
cellular processes are disrupted."

According to the news editors, the research concluded: "These results demonstrate
the utility of the reporters for early triage of compounds based on the provisional MOA and
suggest their application to investigate polypharmacology in known and experimental anti-B
agents."

For more information on this research see: Bioluminescent Reporters for Rapid
Mechanism of Action Assessment in Tuberculosis Drug Discovery. Antimicrobial Agents and
Chemotherapy, 2016;60(11):6748-6757. Antimicrobial Agents and Chemotherapy can be

Methyl Ethers

Researchers at University of Cincinnati Target Methyl Ethers (Long-term
Fate Mapping to Assess the Impact of Postnatal Isoflurane Exposure on
Hippocampal Progenitor Cell Productivity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Researchers detail new data in Methyl Ethers. According to news reporting
originating from Cincinnati, Ohio, by NewsRx correspondents, research stated, "Exposure to
isoflurane increases apoptosis among postnatally generated hippocampal dentate granule cells.
These neurons play important roles in cognition and behavior, so their permanent loss could
explain deficits after surgical procedures."

Our news editors obtained a quote from the research from the University of
Cincinnati, "To determine whether developmental anesthetis exposure leads to persistent
deficits in granule cell numbers, a genetic fate-mapping approach to label a cohort of postnatally generated granule cells in Gli1-CreER(T2)::GFP bitransgenic mice was utilized. Green fluorescent protein (GFP) expression was induced on postnatal day 7 (P7) to fate map progenitor cells, and mice were exposed to 6 h of 1.5% isoflurane or room air 2 weeks later (P21). Brain structure was assessed immediately after anesthesia exposure (n = 7 controls and 8 anesthesia-treated mice) or after a 60-day recovery (n = 8 controls and 8 anesthesia-treated mice). A final group of C57BL/6 mice was exposed to isoflurane at P21 and examined using neurogenesis and cell death markers after a 14-day recovery (n = 10 controls and 16 anesthesia-treated mice). Isoflurane significantly increased apoptosis immediately after exposure, leading to cell death among 11% of GFP-labeled cells. Sixty days after isoflurane exposure, the number of GFP-expressing granule cells in treated animals was indistinguishable from control animals. Rates of neurogenesis were equivalent among groups at both 2 weeks and 2 months after treatment. These findings suggest that the dentate gyrus can restore normal neuron numbers after a single, developmental exposure to isoflurane. The authors' results do not preclude the possibility that the affected population may exhibit more subtle structural or functional deficits."

According to the news editors, the research concluded: "Nonetheless, the dentate appears to exhibit greater resiliency relative to nonneurogenic brain regions, which exhibit permanent neuron loss after isoflurane exposure."

For more information on this research see: Long-term Fate Mapping to Assess the Impact of Postnatal Isoflurane Exposure on Hippocampal Progenitor Cell Productivity. Oncology - Squamous Cell Carcinoma

Researchers at University of Colorado Have Reported New Data on Squamous Cell Carcinoma (Cancer Stem Cells in Squamous Cell Carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Squamous Cell Carcinoma have been presented. According to news reporting from Aurora, Colorado, by NewsRx journalists, research stated, "Cancer stem cells (CSCs) are found in many cancer types, including squamous cell carcinoma (SCC). CSCs initiate cancer formation and are linked to metastasis and resistance to therapies."

The news correspondents obtained a quote from the research from the University of
Colorado, "Studies have revealed that several distinct CSC populations coexist in SCC and that tumor initiation and metastatic potential of these populations can be uncoupled. Therefore, it is critical to understand CSC biology to develop novel CSC-targeted therapies for patients with SCC with poor prognoses."

According to the news reporters, the research concluded: "This review compares the properties of CSCs in SCC with normal stem cells in the skin, summarizes current advances and characteristics of CSCs, and considers the challenges for CSC-targeted treatment of SCC."

Our news journalists report that additional information may be obtained by contacting X.J. Wang, Univ Colorado Denver, Dept. of Pathol, Aurora, CO 80045, United States. Additional authors for this research include A. Strait, A. Jimeno and X.J. Wang.

**Oncology - Colon Cancer**

**Researchers at University of Colorado Release New Data on Colon Cancer (Antitumor activity of a potent MEK inhibitor, TAK-733, against colorectal cancer cell lines and patient derived xenografts)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting originating in Aurora, Colorado, by NewsRx journalists, research stated, "CRC is a significant cause of cancer mortality, and new therapies are needed for patients with advanced disease. TAK-733 is a highly potent and selective investigational novel MEK allosteric site inhibitor."

The news reporters obtained a quote from the research from the University of Colorado, "In a preclinical study of TAK-733, a panel of CRC cell lines were exposed to varying concentrations of the agent for 72 hours followed by a sulforhodamine B assay. Twenty patient-derived colorectal cancer xenografts were then treated with TAK-733 in vivo. Tumor growth inhibition index (TGII) was assessed to evaluate the sensitivity of the CRC explants to TAK-733 while linear regression was utilized to investigate the predictive effects of genotype on the TGII of explants. Fifty-four CRC cell lines were exposed to TAK-733, while 42 cell lines were deemed sensitive across a broad range of mutations. Eighty-two percent of the cell lines within the sensitive subset were BRAF or KRAS/NRAS mutant, whereas 80% of the cell lines within the sensitive subset were PIK3CA WT. Twenty patient-derived human tumor CRC explants were then treated with TAK-733. In total, 15 primary human tumor explants were
found to be sensitive to TAK-733 (TGII (<=) 20%), including 9 primary human tumor explants that exhibited tumor regression (TGII >100%). Explants with a BRAF/KRAS/NRAS mutant and PIK3CA wild-type genotype demonstrated increased sensitivity to TAK-733 with a median TGII of -6%. MEK-response gene signatures also correlated with responsiveness to TAK-733 in KRAS-mutant CRC. The MEK inhibitor TAK-733 demonstrated robust antitumor activity against CRC cell lines and patient-derived tumor explants."

According to the news reporters, the research concluded: "While the preclinical activity observed in this study was considerable, single-agent efficacy in the clinic has been limited in CRC, supporting the use of these models in an iterative manner to elucidate resistance mechanisms that can guide rational combination strategies."

For more information on this research see: Antitumor activity of a potent MEK inhibitor, TAK-733, against colorectal cancer cell lines and patient derived xenografts. Oncotarget, 2015;6(33):34561-72.

Our news correspondents report that additional information may be obtained by contacting C.H. Lieu, Dept. of Medicine, Division of Medical Oncology, University of Colorado Anschutz Medical Campus, Aurora, CO, United States. Additional authors for this research include P.J. Klauck, P.K. Henthorn, J.J. Tentler, A.C. Tan, A. Spreafico, H.M. Selby, B.C. Britt, S.M. Bagby, J.J. Arcaroli, W.A. Messersmith, T.M. Pitts and S.G Eckhardt.

Intranuclear Space

Researchers at University of Connecticut School of Medicine Report New Data on Intranuclear Space (Ethical and practical challenges in providing noninvasive prenatal testing for chromosome abnormalities: an update)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Intranuclear Space. According to news reporting out of Farmington, Connecticut, by NewsRx editors, research stated, "Noninvasive prenatal testing (NIPT) through the analysis of cell-free DNA in maternal plasma has rapidly changed screening for fetal chromosome abnormalities. We review practical and ethical challenges associated with the transition, progress in their resolution, and identify new emerging difficulties."

Our news journalists obtained a quote from the research from the University of Connecticut School of Medicine, "NIPT is an advanced screening test for trisomies 21, 18, and 13 that was initially limited to women at high risk for an affected pregnancy. It is now recognized as suitable for all women. The testing has been expanded to include sex chromosome abnormalities and some microdeletion syndromes. Some ethicists are concerned about inclusion
of disorders that have less severe phenotypes. Clinical providers have experienced difficulty in maintaining an up-to-date knowledge about the scope of NIPT, differences between tests, who should be offered the testing, performance of tests, reasons for false-positive results, and optimal patient management following positive results. Some of the practical difficulties associated with the introduction can be attributed to this knowledge gap. There remain some important ethical issues associated with NIPT."

According to the news editors, the research concluded: "We believe that the same ethical and legal principles that were considered in the justification of conventional prenatal screening can be used to assess the appropriateness of additional NIPT applications."

For more information on this research see: Ethical and practical challenges in providing noninvasive prenatal testing for chromosome abnormalities: an update. Current Opinion In Obstetrics & Gynecology, 2016;28(2):119-24. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Obstetrics & Gynecology - journals.lww.com/co-obgyn/pages/default.aspx)

Oncology - Neuroblastomas

Researchers at University of Copenhagen Release New Data on Neuroblastomas [PKA, novel PKC isoforms, and ERK is mediating PACAP auto-regulation via PAC(1)R in human neuroblastoma NB-1 cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Neuroblastomas. According to news originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "The neuropeptide PACAP is expressed throughout the central and peripheral nervous system where it modulates diverse physiological functions including neuropeptide gene expression. We here report that in human neuroblastoma NB-1 cells PACAP transiently induces its own expression."

Our news journalists obtained a quote from the research from the University of Copenhagen, "Maximal PACAP mRNA expression was found after stimulation with PACAP for 3 h. PACAP auto-regulation was found to be mediated by activation of PACAP specific PAC(1)R as PACAP had >100-fold higher efficacy than VIP, and the PAC(1)R selective agonist Maxadilan potently induced PACAP gene expression. Experiments with pharmacological kinase inhibitors revealed that both PICA and novel but not conventional PKC isozymes were involved.
in the PACAP auto regulation. Inhibition of MAPK/ERK kinase (MEK) also impeded the induction, and we found that PICA, novel PKC and ERK acted in parallel and were thus not part of the same pathways. The expression of the transcription factor EGRI previously ascribed as target of PACAP signalling was found to be transiently induced by PACAP and pharmacological inhibition of either PKC or MEKI/2 abolished PACAP mediated EGRI induction. In contrast, inhibition of PICA mediated increased PACAP mediated EGRI induction. Experiments using siRNA against EGR1 to lower the expression did however not affect the PACAP auto-regulation indicating that this immediate early gene product is not part of PACAP auto-regulation in NB-I cells. We here reveal that in NB-1 neuroblastoma cells, PACAP induces its own expression by activation of PAC(1)R, and that the signalling is different from the PAC(1)R signalling mediating induction of VIP in the same cells."

According to the news editors, the research concluded: "PACAP auto-regulation depends on parallel activation of PICA, novel PKC isoforms, and ERIC, while EGR1 does not seem to be part of the PACAP auto-regulation."

The news correspondents report that additional information may be obtained from B. Georg, University of Copenhagen, Bispebjerg Hospital, Fac Hlth & Med Sci, Dept. of Clin Biochem, Copenhagen, Denmark. Additional authors for this research include B. Falktoft and J. Fahrenkrug.

Digestive System Diseases and Conditions - Peritonitis

Researchers at University of Copenhagen Release New Data on Peritonitis (Pathology and Molecular Characterization of Escherichia Coli Associated With the Avian Salpingitis-Peritonitis Disease Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Digestive System Diseases and Conditions - Peritonitis is the subject of a report. According to news reporting from Frederiksberg, Denmark, by NewsRx journalists, research stated, "Outbreaks of salpingitis and peritonitis cause major economic losses due to high mortality, reduced egg-production, and culling. The aim of the present study was to characterize, in detail, lesions associated with increased mortality in layers due to avianpathogenic Escherichia coli (APEC) and to investigate the population structure of the E. coli involved, which is important for selection of optimal treatment and prophylactic strategies."

The news correspondents obtained a quote from the research from the University of Copenhagen, "Among 322 layers received from eight farms with increased mortality due to E.
coli, three lesion types were observed; sepsis-like lesions, chronic salpingitis and peritonitis, and chronic salpingitis and peritonitis associated with sepsis-like lesions. One hundred isolates of *E. coli* obtained in pure culture from the different lesion types were selected for genetic characterization. Six out of 10 submissions (two farms with two submissions) were considered clonal as defined by more than 85% of the typed isolates of *E. coli* belonging to the same sequence-type (ST). B2 was the most-prevalent phylogroup, including the clonal complex of ST95. The most-important virulence genes of *E. coli* were demonstrated from both clonal and nonclonal outbreaks, and major differences as to phylogeny and virulence genes were not observed between the lesion types. Cannibalism was more-often observed during polyclonal outbreaks. A new pathotype of APEC is suggested based upon lesions and route of infection, high similarity of virulence genes including plasmid-associated genes, and high frequency of ST95 and other isolates belonging to phylogroup B2."

According to the news reporters, the research concluded: "Compared to the best-known pathotypes of *E. coli*, this needs further investigations, including infection experiments to show if single virulence factors can be pointed out that are specific for the salpingitis-peritonitis pathotype and possibly not found in other pathotypes of E."

For more information on this research see: Pathology and Molecular Characterization of Escherichia Coli Associated With the Avian Salpingitis-Peritonitis Disease Syndrome. *Avian Diseases*, 2016;60(1):1-7.

Our news journalists report that additional information may be obtained by contacting R. Heidemann Olsen, A University of Copenhagen, Dept. of Veterinary Disease Biology, Faculty of Health and Medical Sciences, Stigbojen 4, DK-1870 Frederiksberg C, Denmark. Heart Disorders and Diseases - Hypertrophic…

Researchers at University of Defense Have Reported New Data on Hypertrophic Cardiomyopathy (Identification of Novel Biomarker Candidates for Hypertrophic Cardiomyopathy and Other Cardiovascular Diseases Leading to Heart Failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Hypertrophic Cardiomyopathy. According to news reporting out of Hradec Kralove, Czech Republic, by NewsRx editors, research stated, "In-depth proteome discovery analysis represents new strategy in an effort to identify novel reliable specific protein markers for hypertrophic cardiomyopathy and other life threatening cardiovascular diseases."
Our news journalists obtained a quote from the research from the University of Defense, "To systematically identify novel protein biomarkers of cardiovascular diseases with high mortality we employed an isobaric tag for relative and absolute quantitation (iTRAQ) proteome technology to make comparative analysis of plasma samples obtained from patients suffering from nonobstructive hypertrophic cardiomyopathy, stable dilated cardiomyopathy, aortic valve stenosis, chronic stable coronary artery disease and stable arterial hypertension. We found 128 plasma proteins whose abundances were uniquely regulated among the analyzed cardiovascular pathologies. 49 of them have not been described yet."

According to the news editors, the research concluded: "Additionally, application of statistical exploratory analyses of the measured protein profiles indicated the relationship in pathophysiology of the examined cardiovascular pathologies."

For more information on this research see: Identification of Novel Biomarker Candidates for Hypertrophic Cardiomyopathy and Other Cardiovascular Diseases Leading to Heart Failure. *Physiological Research*, 2016;65(5):751-762. *Physiological Research* can be contacted at: Acad Sciences Czech Republic, Inst Physiology, Videnska 1083, Prague 4 142 20, Czech Republic.

Our news journalists report that additional information may be obtained by contacting J. Stulik, Univ Def, Fac Military Hlth Sci, Dept. of Mol Pathol & Biol, Hradec Kralove 50001, Czech Republic. Additional authors for this research include P. Rehulka, A.M. Fucikova, J. Stulik and R. Pudil.

Clinical Research - Clinical Trials and Studies

Researchers at University of Edinburgh Describe Findings in Clinical Trials and Studies (Implications of the BIA-102474-101 study for review of first-into-human clinical trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Clinical Research - Clinical Trials and Studies have been presented. According to news reporting out of Edinburgh, United Kingdom, by NewsRx editors, research stated, "Over the past 10 years, thousands of first-into-human (FIH) clinical trials have been performed in Europe, with few severe adverse events (SAEs). Each has received detailed prior safety review at both the local clinical research facility and at national drug regulatory authority level."

Our news journalists obtained a quote from the research from the University of Edinburgh, "The recent fatal SAE in the BIA-102474-101 clinical trial shows the limitations of this process. Although criticized for not sequentially dosing subjects both within and between cohorts -as recommended by the European Medicines Agency for high-risk compounds after the TeGenero clinical trial disaster in 2006 -BIA-102474-101 was not considered to be high risk. Indeed, compounds with similar mechanisms of action had previously been taken through phase I and II trials without incident, and higher doses had been safely given for longer durations to
nonhuman primates. If the available data are comprehensive and accurate, and further investigation does not reveal unreported warning signs, this study has serious implications for ongoing and future review of FIH clinical trials. All preclinical study documents and clinical data collected during the BIA-102474-101 trial should be made available urgently so that lessons can be learnt. In the meantime, reviewers and clinical researchers should always ask for information on drug and target interactions and full reports of preclinical toxicity studies, and plan sequential dosing with longer delays between patients and cohorts, particularly if late SAEs might be anticipated. The use of individual patient pharmacokinetic and dynamic data should guide sequential dosing."

According to the news editors, the research concluded: "A process for systematic risk assessment, like that currently used in the Netherlands, should be applied routinely to all trials with novel compounds."

Our news journalists report that additional information may be obtained by contacting M. Eddleston, Pharmacology, Toxicology, & Therapeutics, University, BHF Centre for Cardiovascular Science, University of Edinburgh, Edinburgh, UK. Additional authors for this research include A.F. Cohen and D.J Webb.

**Neurodegenerative Diseases and Conditions -...**

**Researchers at University of Edinburgh Discuss Findings in Amyotrophic Lateral Sclerosis (Maturation and electrophysiological properties of human pluripotent stem cell-derived oligodendrocytes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Neurodegenerative Diseases and Conditions - Amyotrophic Lateral Sclerosis is the subject of a report. According to news reporting from Edinburgh, United Kingdom, by NewsRx journalists, research stated, "Rodent-based studies have shown that the membrane properties of oligodendrocytes play prominent roles in their physiology and shift markedly during their maturation from the oligodendrocyte precursor cell (OPC) stage. However, the conservation of these properties and maturation processes in human oligodendrocytes remains unknown, despite their dysfunction being implicated in human neurodegenerative diseases such as multiple sclerosis (MS) and amyotrophic lateral sclerosis (ALS)."

Financial supporters for this research include The Wellcome Trust, Euan MacDonald Centre, Multiple Sclerosis Trials Collaboration, Department of Biotechnology, Government of India (NAV), Patrick Wild Centre/RS Macdonald Trust, Royal Society of
Edinburgh/Caledonian Research Fund Personal Research Fellowship.

The news correspondents obtained a quote from the research from the University of Edinburgh, "Here, we have defined the membrane properties of human oligodendrocytes derived from pluripotent stem cells as they mature from the OPC stage, and have identified strong conservation of maturation-specific physiological characteristics reported in rodent systems. We find that as human oligodendrocytes develop and express maturation markers, they exhibit a progressive decrease in voltage-gated sodium and potassium channels and a loss of tetrodotoxin-sensitive spiking activity. Concomitant with this is an increase in inwardly rectifying potassium channel activity, as well as a characteristic switch in AMPA receptor composition. All these steps mirror the developmental trajectory observed in rodent systems. Oligodendrocytes derived from mutant C9ORF72-carrying ALS patient induced pluripotent stem cells did not exhibit impairment to maturation and maintain viability with respect to control lines despite the presence of RNA foci, suggesting that maturation defects may not be a primary feature of this mutation."

According to the news reporters, the research concluded: "Thus, we have established that the development of human oligodendroglia membrane properties closely resemble those found in rodent cells and have generated a platform to enable the impact of human neurodegenerative disease-causing mutations on oligodendrocyte maturation to be studied."

Our news journalists report that additional information may be obtained by contacting M.R. Livesey, Centre for Integrative Physiology, University of Edinburgh, Edinburgh, UK. Additional authors for this research include D. Magnani, E.M. Cleary, N.A. Vasistha, O.T. James, B.T. Selvaraj, K. Burr, D. Story, C.E. Shaw, P.C. Kind, G.E. Hardingham, D.J. Wyllie and S. Chandran.
